As discussed above, the proposed Project is located on relatively flat terrain and consists of soils that are not considered highly erosive, with the exception of wind erosion for the Cajon sandy loam soil. Due to the characteristics of the on-site soil types and the relatively flat terrain, implementation of the proposed Project has the potential to result in minimal erosion.

Project grading activities would remove or cover existing topsoil that is used for agricultural operations and may expose soils to wind and water erosion both during and after the construction phase of the proposed Project. To mitigate the potential effects of erosion on-site, temporary and permanent erosion control measures would be required, such as the use of sandbags, hydroseeding, landscaping and/or soil stabilizers. The Project proponent(s) would be required to submit a Stormwater Pollution Prevention Plan (SWPPP), which includes erosion control measures in order to comply with the National Pollutant Discharge Elimination System (NPDES) requirements of the Federal Clean Water Act (CWA) and the requirements of the California Water Quality Order No. 2009-0009-DWQ as amended by 2010-0014-DWQ and 2012-0006-0006-DWQ as implemented by the Kern County NPDES Permit Process. Any individual parcel Project proponent(s) would be responsible for the preparation of the SWPPPs for the individual site development. In addition, the proposed Project would be subject to County ordinances and standards relative to soils and geology. Standard compliance requirements include detailed site-specific soil analysis prior to issuance of building permits and adherence to applicable building codes in accordance with the most recent CBC. All earthwork is required to be performed in accordance with applicable County requirements as stipulated in the Kern County Ordinance Code. Implementation of Mitigation Measure MM 4.7-8 as well as mitigation measures in Section 4.10, *Hydrology and Water Quality* and compliance with applicable CBC criteria, goals and policies of the Metropolitan Bakersfield General Plan, and the Kern County Ordinance Code.

Mitigation Measures

Refer to Section 4.10, *Hydrology and Water Quality*, regarding water quality mitigation measures.

MM 4.7-8: **Soil Erosion and Sedimentation Control Plan.** The project proponent shall prepare a Soil Erosion and Sedimentation Control Plan to mitigate potential loss of soil and erosion. The plan shall be prepared by a California registered civil engineer or other professional approved to prepare said Plan and submitted for review and approval by the Kern County Public Works Department. The Soil Erosion and Sedimentation Control Plan shall include, but is not limited to, the following:

1. Best Management Practices to minimize soil erosion consistent with Kern County grading requirements and the California Regional Water Quality Control Board requirements pertaining to the preparation and approval of a Stormwater Pollution Prevention Plan (Best Management Practices recommended by the Kern County Public Works Department shall be reviewed for applicability);

2. Sediment collection facilities as may be required by the Kern County Public Works Department;

3. A timetable for full implementation, estimated costs, and a surety bond or other security as approved by the County; and

4. Other measures required by the County during permitting, including long-term monitoring (post-construction) of erosion control measures until site stabilization is achieved.

Provisions to comply with local and state codes relating to drainage and runoff, including use of pervious pavements, and/or other methods to the extent feasible, to increase stormwater infiltration and reduce runoff onto agricultural lands.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.7-4: The Project Would be Located on an Unstable Geologic Unit or Soil That Would Result in On-site or Off-site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse.

The Metropolitan Bakersfield General Plan indicates that liquefaction most often occurs in areas underlain by young alluvium where the groundwater table is higher than 50 feet bgs. According to the Metropolitan Bakersfield General Plan EIR, the proposed Project is not likely to be located within an area of high groundwater and loose soils. The Project site is underlain by Bakersfield fine sandy loam and Cajon sandy loam-overwash. However, the depth of groundwater on-site is approximately 165-175 feet bgs. Therefore, the potential for liquefaction on the proposed Project is considered low and impacts are anticipated to be less than significant.

The proposed Project is located on relatively flat topography and is not located adjacent to any steep slopes or other areas that would be subject to seismically induced landslides. Therefore, no impacts are anticipated in this regard.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.7-5: The Project Would Result in Adverse Impacts to People or Structures Resulting in a Risk of Loss, Injury or Death Including Flooding, as a Result of the Failure of a Levee or a Dam.

As indicated above, a break in Isabella Dam caused by an earthquake would flood 60 square miles of the Bakersfield area. It would take approximately eight to 12 hours from the time the dam breaks for water to reach the proposed Project. Therefore, allowing from a minimum of eight hours up to 12 hours for evacuation. This lag time would make injury or death from dam failure unlikely in the area of the proposed Project site. The chance of the Isabella Dam failing entirely, with the lake at capacity, is approximately one day out of 10,000 years. The Safety Element of the Metropolitan Bakersfield General Plan has identified policies including a response plan for dam failure as well as the maintenance of disaster response plans, development of discretionary approval procedures for critical facilities and the review of zoning designations, street widths and circulation patterns for compatibility with evacuation plans. The proposed Project would be designed and constructed in strict adherence to policies in the Metropolitan Bakersfield General Plan; therefore, less than significant impacts would occur.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.7-6: The Project Would Result in Impacts from Being Located on Expansive Soil, as Defined in Section 1803.5.3 of the CBC (2016) Creating Substantial Risks to Life or Property.

The proposed Project is located on Bakersfield fine sandy loam and Cajon sandy loam-overwash. None of these soil types exhibits expansive characteristics; shrink-swell potential is low. The proposed Project would be required to construct structures in compliance with State law and local ordinances in accordance with the most recent CBC (CCR Title 24) and to adhere to all modern construction standards. In addition, the proposed Project would be built to modern construction standards, which include the ASCE minimum design load standard, specifically Standard 7-10 and/or

7-15, which base seismic design on-site class (soil specific) and seismic design category (based on risk category). Furthermore, light and medium industrial structures constructed within the proposed Project would be required to comply with the most recent CBC (specifically Section 1803.5.3 regarding expansive soil), Kern County Ordinance Code, and the Metropolitan Bakersfield General Plan. Therefore, the potential for risks to life and property are low.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.7-7: The Project Would Be Constructed on Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Wastewater Disposal Systems Where Sewers Are Not Available for the Disposal of Wastewater.

The proposed Project site area has never been served by a sewer system. There are no existing septic systems located on the proposed Project site. Currently, neighboring residential and commercial properties are served by individual, privately-owned septic systems. A private package sewer treatment plant is proposed to provide services for the proposed Project site. The proposed Project would be designed and constructed in strict adherence to policies in the Metropolitan Bakersfield General Plan, Kern County Ordinance Code, and CBC criteria. In addition, Mitigation Measure MM 4.7-9 would be implemented. Therefore, impacts would be less than significant in this regard.

Mitigation Measures

MM 4.7-9: **Septic Design Plans.** Prior to the issuance of permits, the project proponent shall provide evidence to the Kern County Planning and Natural Resources Department that the siting, design and construction of proposed septic system(s) and leach field disposal system(s) comply with the 2016 Kern County Onsite Systems Manual as authorized by the California Water Board Local Agency Management Program (LAMP) and administered locally by the Kern County Environmental Health Services Department (KCEHS). Proving the proposed septic design plans comply with these requirements will ensure that all standards for septic tanks, seepage pits, and soils are capable of adequately supporting the use of septic tanks.

MM 4.7-10: **Final Leach Field Disposal System.** The final leach field disposal system shall be designed by a licensed engineer, taking into full consideration the requirements provided in the June 2016 Kern County Onsite Systems Manual.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Soils and geologic conditions in the proposed Project vicinity may vary by location. Short-term cumulative impacts such as erosion and sedimentation would occur as a result of implementation of the proposed Project. The only cumulative long-term impact related to geology is the exposure of people to the potential for seismically induced ground shaking. Implementation of other cumulative projects would incrementally increase the number of people and structures potentially subject to a seismic event. However, such exposure would be minimized through strict engineering standards required at each respective site. The seismic and geologic significance would be considered on a project-by-project basis. Therefore, cumulative effects of increased seismic risk would be mitigated to a less than significant level on a project-by-project basis. The required compliance with applicable CBC criteria, goals and policies of the Metropolitan Bakersfield General Plan, and the Kern County Ordinance Code would reduce cumulatively considerable impacts to geologic and seismic hazard to less than significant levels.

Mitigation Measures

Implement Mitigation Measures MM 4.7-1 through MM 4.7-10, above.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.8

Greenhouse Gases

Section 4.8
Greenhouse Gases

4.8.1 Introduction

This section of the Recirculated Draft Environmental Impact Report (RDEIR) evaluates the greenhouse gas (GHGs) conditions associated with buildout of the proposed Project. It also describes the impacts associated with GHGs that would result from implementation of the project, and, as necessary mitigation measures that would avoid or lessen these impacts. Insight Environmental Consultants completed an Air Quality Impact Analysis in June 2009 that evaluated the proposed Project's potential impacts on air quality. Due to the time between the technical study and this RDEIR, a second Air Quality Impact Analysis was prepared by Insight Environmental Consultants in July 2017. See Appendix C, *Air Quality Impact Analysis*, and Appendix N, *Original Technical Studies*. Information supporting this analysis is also based on the information and guidelines provided in the California Environmental Quality Act (CEQA), the San Joaquin Valley Air Pollution Control District (SJVAPCD) 2015 Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI), and Kern County's Guidelines for the Preparation of Air Quality Assessment for Environmental Impact Reports.

4.8.2 Environmental Setting

The California Air Resources Board (CARB) has divided California into regional air basins according to topographic drainage features. The proposed Project site is located in Kern County, which is within the jurisdiction of the San Joaquin Valley Air Basin (SJVAB) and locally controlled by the San Joaquin Valley Air Pollution Control District (SJVAPCD).

Greenhouse Gases (GHGs) and Global Climate Change

In the early 1960's scientists recognized that carbon dioxide (CO_2) levels in the atmosphere were rising every year. It was also noted that several other gases, including methane (CH_4) and nitrous oxides (N_2O) were also increasing. Levels of these gases have increased by about 40 percent since large-scale industrialization began around 150 years ago, according to the United States Environmental Protection Agency (EPA). After numerous computer-simulated model runs on the effects of these increases in the atmosphere, it was concluded that the rising concentrations almost always resulted in an increase of average global temperature. Rising temperatures may, in turn, produce changes in weather, sea levels and land use patterns, commonly referred to as "climate change". There is general scientific consensus that climate change is occurring, and that human activity contributes in some measure (perhaps substantially) to that change. It is difficult to determine the extent of change that humans may be causing due to the natural variability of the Earth's climate.

During the planet's history, the climate has changed many times, with events ranging from ice ages to long periods of warmth. Natural factors such as volcanic eruptions, changes in the Earth's orbit, and the amount of energy released from the sun historically have affected the Earth's climate. Human activities associated with the Industrial Revolution beginning in the late 18th century, have also

changed the composition of the atmosphere. The burning of fossil fuels, such as coal and oil, and deforestation has caused the concentrations of heat-trapping greenhouse gases (GHGs) to increase significantly in our atmosphere.

Many chemical compounds found in the Earth's atmosphere act as GHGs, which allow sunlight to enter the atmosphere freely. When sunlight strikes the Earth's surface, some of it is reflected back towards space as infrared radiation (heat). GHGs absorb this infrared radiation and trap the heat in the atmosphere. Over time, the amount of energy sent from the sun to the Earth's surface should be about the same as the amount of energy radiated back into space, leaving the temperature of the Earth's surface roughly constant. Many gases exhibit these "greenhouse" properties. Some of them occur in nature (water vapor, carbon dioxide, methane, and nitrous oxide), while others are exclusively human-made (like gases used for aerosols). The most relevant GHGs are water vapor (H_2O), carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride. These gases prevent heat from escaping to space.

GHGs, in most cases, have both natural and anthropogenic sources. Natural mechanisms already exist as part of the 'carbon cycle' for removing GHGs from the atmosphere (often called land or ocean sinks). Levels of GHGs, due to the increase in anthropogenic sources, have exceeded the normal rates of natural absorption. This has resulted in increased atmospheric concentrations of GHGs and potentially human-induced global warming.

Our GHG emissions in the United States come mostly from energy use. These are driven largely by economic growth, fuel used for electricity generation, and weather patterns affecting heating and cooling needs. Energy-related carbon dioxide emissions, resulting from petroleum and natural gas account for approximately three-quarters of the human-generated GHG emissions in the United States, primarily in the form of carbon dioxide emissions from burning fossil fuels. More than half the energy-related emissions come from large stationary sources such as power plants; approximately a third comes from transportation; while industrial processes, agriculture, forestry, other land uses, and waste management make up a majority of the remainder of sources.

Methane, another GHG, comes from landfills, coal mines, oil and gas operations, and agriculture; representing nine percent of total GHG emissions in the United States. Nitrous oxide only represents five percent of the gas emissions, and is emitted from burning fossil fuels and through the use of certain fertilizers and industrial processes. Two percent of the total emissions are released as byproducts of industrial processes and through leakage.

The United States has the highest emissions of GHGs of any nation on Earth, though CO_2 emissions in California are less than the national average, both in per capita emissions and in emissions per gross state product. Transportation is the largest source of CO_2 emissions in California, accounting for approximately 41 percent of total emissions. Electricity generation accounts for approximately 22 percent of CO_2 emissions in California, and the industrial sector accounts for approximately 20.5 percent. California GHG emissions and the increase in project emissions of CO_2, methane (CH_4), and N_2O, are summarized in Table 4.8-1*, California Greenhouse Gas Emissions of CO_2, CH_4, AND N_2O*.

Table 4.8-1. California Greenhouse Gas Emissions of CO2, CH4, and N2O

Net - Million Tons – Carbon Dioxide Equivalent			
Greenhouse Gas	2013	2014	2015
Carbon Dioxide (CO_2)	376.1	371.8	369.9
Methane (CH_4)	39.8	40.1	39.6
Nitrous Oxide (N_2O)	12.3	12.2	11.7
High GWP Gases (HFC, PFC, SF_6)	16.8	17.8	19.1
Global Warming Potential	445.0	441.9	440.3

Source: CARB, 2017.

Global carbon dioxide emissions are expected to increase by 1.9 percent annually between 2001 and 2025. Much of the increase in these emissions is expected to occur in the developing world where emerging economies are fueled with fossil energy, such as China and India. Around 2,018 developing countries' emissions are expected to surpass the emissions of industrialized countries; increasing by 2.7 percent annually between 2001 and 2025, faster than the world average.

GHGs are a necessity to life as we know it. They keep the planet's surface warmer than it otherwise would be. However, as the concentrations of these gases increase in the atmosphere and continue to, the Earth's temperature is also increasing, exceeding past levels. The Earth's average surface temperature has increased by about 1.2 to 1.4 degrees Fahrenheit (ºF) since 1900 according to National Oceanic and Atmospheric Administration (NOAA) and National Aeronautical and Space Administration (NASA) data. On average the warmest global temperatures on record have all occurred within the past 15 years. Climate models predict that the average temperature at the Earth's surface could increase from 2.5 to 10.4ºF above 1990 levels by the end of this century if GHGs continue to increase. Other aspects of the climate are also changing such as rainfall patterns, snow and ice cover, and sea level.

Climate change affects people, plants, and animals. Scientists are certain that increasing the concentration of GHGs will change the planet's climate; however, they are not sure by how much it will change, at what rate it will change, or what the exact effects will be. They are working to better understand future climate change and how the effects will vary by region and over time.

Some climate changes are already occurring. These include; rise of sea level, shrinking glaciers, changes in the range and distribution of plants and animals, lengthening of growing seasons, trees blooming earlier, ice on rivers and lakes freezing later and breaking up earlier, and thawing of permafrost.

Scientists believe that most areas in the United States will to continue to warm, although some will likely warm more than others. Predicting which parts of the country will become wetter or drier is extremely difficult, but scientists generally expect increased precipitation and evaporation, and drier soil in the middle parts of the country. The northern regions such as Alaska are expected to experience the most warming. Alaska has already been experiencing significant climate change in recent years that may be attributable to human caused global climate change.

In addition to the changes already discussed, human health can also be affected both directly and indirectly by climate change in part through extreme periods of heat and cold, storms, climate-sensitive diseases such as malaria, and smog episodes.

In order to address climate change concerns the United States government has established a comprehensive policy to deal with global warming. This policy has three basic components:

- Slowing the growth of emissions;
- Strengthening science, technology and institutions; and
- Enhancing international cooperation.

Currently, the Federal government is using voluntary and incentive-based programs to reduce emissions and has established a variety of programs promoting climate technology and science. The United States prepared a comprehensive strategy in February 2002 to reduce the GHG intensity by 18 percent over the 10-year period from 2002 to 2012. Greenhouse gas intensity is a measurement of GHG emissions per unit of economic activity. By meeting this commitment, the United States will prevent the release of more than 500 million metric tons cumulatively between 2002 and 2012.

4.8.3 Regulatory Setting

Regulatory oversight for air quality in the SJVAB rests at EPA Region IX office at the Federal level, the CARB at the State level, and the regional level with the SJVAPCD.

Global Climate Change Regulatory Issues

In 1988, the United Nations established the Intergovernmental Panel on Climate Change to evaluate the impacts of global warming and to develop strategies that nations could implement to curtail global climate change. In 1992, the United Nations Framework Convention on Climate Change established an agreement with the goal of controlling GHG emissions, including methane. As a result, the Climate Change Action Plan was developed to address the reduction of GHGs in the United States. The Plan consists of more than 50 voluntary programs.

The Kyoto Protocol treaty was negotiated in December 1997. The agreement came into force on February 16, 2005 following ratification by Russia on November 18, 2004. As of December 2006, a total of 169 countries and other governmental entities have ratified the agreement. Notable exceptions include the United States and Australia. Other countries, like India and China, which have ratified the protocol, are not required to reduce carbon emissions under the present agreement despite their relatively large populations.

Additionally, the Montreal Protocol was originally signed in 1987 and substantially amended in 1990 and 1992. The Montreal Protocol stipulates that the production and consumption of compounds that deplete ozone in the stratosphere (chlorofluorocarbons [CFCs], halons, carbon tetrachloride, and methyl chloroform) were to be phased out by 2000 (methyl chloroform was to be phased out by 2005).

On September 27, 2006, Assembly Bill (AB) 32, the California Global Warming Solutions Act, of 2006 was enacted by the State of California. The legislature stated that "global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California." (AB 32). The Act caps California's GHG emissions at 1990 levels by 2020. The Act

defines GHG emissions as all of the following gases: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexaflouride. This agreement represents the first enforceable state-wide program in the U.S. to cap all GHG emissions from major industries that includes penalties for non-compliance. While acknowledging that national and international actions will be necessary to fully address the issue of global warming, AB 32 lays out a program to inventory and reduce GHG emissions in California and from power generation facilities located outside the state that serve California residents and businesses.

AB 32 charges CARB with responsibility to monitor and regulate sources of GHG emissions in order to reduce those emissions. By July 1, 2007, CARB adopted a list of discrete early action measures to be adopted and implemented before January 1, 2010, to reduce GHG emissions. CARB staff recommended an amount of 427 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) as the total statewide greenhouse gas 1990 emissions level and 2020 emissions limit. The Board approved the 2020 limit on December 6, 2007. This limit is an aggregated statewide limit, rather than sector- or facility-specific. CARB is then to conduct rulemaking, culminating in rule adoption by January 1, 2011, for reducing GHG emissions to achieve the emissions cap by 2020. The rules must take effect no later than 2012. In designing emission reduction measures, CARB must aim to minimize costs, maximize benefits, improve and modernize California's energy infrastructure, maintain electric system reliability, maximize additional environmental and economic co-benefits for California, and complement the state's efforts to improve air quality.

At this time, the EPA does not regulate GHG emissions; however, in *Massachusetts et al. v, EPA (Environmental Protection Agency)*, the U.S Supreme Court determined that the EPA does have the authority to regulate GHGs under the Clean Air Act (CAA). The Court also instructed the EPA to review its policies toward regulation of vehicle emissions under the CAA. It is now anticipated that regulations will eventually be promulgated by the EPA to further control GHG emissions from vehicles as well as other sources.

Global warming and climate change have received substantial public attention for more than 15 years. For example, the United States Global Change Research Program was established by the Global Change Research Act of 1990 to enhance the understanding of natural and human-induced changes in the Earth's global environmental system, to monitor, understand and predict global change, and to provide a sound scientific basis for national and international decision making. Even so, the analytical tools have not been developed to determine the effect on worldwide global warming from a particular increase in GHG emissions, or the resulting effects on climate change in a particular locale. The scientific tools needed to evaluate the impacts that a specific project may have on the environment are even farther in the future.

Accordingly, there is no local or statewide significance threshold developed to evaluate the impacts of the proposed Project, or any project, on global climate change or on the environment in California.

Federal

U.S. Environmental Protection Agency (EPA)

On April 2, 2007, in *Massachusetts v. EPA*, 549 U.S. 497 (2007), the Supreme Court found that greenhouse gases are air pollutants covered by the CAA. The Court held that the EPA must determine whether or not emissions of GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In making these decisions, the EPA is required to follow the language of section 202(a) of the Clean Air Act. The Supreme Court decision resulted from a petition for rulemaking under section 202(a) filed by more than a dozen environmental, renewable energy, and other organizations.

On April 17, 2009, the Administrator signed Proposed Endangerment and Cause or Contribute Findings for GHGs under Section 202(a) of the CAA. EPA held a 60-day public comment period, which ended June 23, 2009, and received over 380,000 public comments. These included both written comments as well as testimony at two public hearings in Arlington, Virginia and Seattle, Washington. EPA carefully reviewed, considered, and incorporated public comments and has now issued these Final Findings.

The EPA found that six GHGs taken in combination endanger both the public health and the public welfare of current and future generations. The EPA also found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare under CAA section 202(a). These Findings were based on careful consideration of the full weight of scientific evidence and a thorough review of numerous public comments received on the Proposed Findings published April 24, 2009. These Findings were effective on January 14, 2010.

Specific GHG Regulations that the U.S. EPA has adopted to date are as follows:

40 CFR Part 98. Mandatory Reporting of Greenhouse Gases Rule

This rule requires mandatory reporting of GHG emissions for facilities that emit more than 25,000 $MTCO_2e$ emissions per year. CO_2e is a quantity that describes, for a given mixture and amount of GHG, the amount of CO_2 that would have the same GWP, when measured over a specified timescale (generally, 100 years). It is also a measure for comparing CO_2 with other GHGs (which generally have a higher GWP), based on the amount of those other gases multiplied by the appropriate GWP factor, commonly expressed as $MTCO_2e$. CO_2e is calculated by multiplying the metric tons of gas by the appropriate GWP. Additionally, reporting of emissions is required for owners of SF_6- and PFC-insulted equipment when the total nameplate capacity of these insulating gases is above 17,280 pounds. The proposed project would not be expected to trigger GHG reporting according to the rule; however, GHG emissions of the proposed project are quantified in this Recirculated Draft Environmental Impact Report (RDEIR).

40 CFR Part 52. Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule

The U.S. EPA mandated application of the Prevention of Significant Deterioration (PSD) requirements to facilities whose stationary source CO_2e emissions exceed 75,000 tons per year.

National Climate Action Plan

In June 2013, the President enacted a national Climate Action Plan (Plan) that consisted of a wide variety of executive actions and had three pillars discussed below (EOP 2013).

Cut Carbon in America – The Plan consists of actions to help cut carbon by deploying clean energy such as cutting carbon from power plants, promoting renewable energy, and unlocking long-term investment in clean energy innovation.

Prepare the United States for Impacts of Climate Change – The Plan consists of actions to help prepare for the impacts through building stronger and safer communities and infrastructure by supporting climate resilient investments, supporting communities and tribal areas as they prepare for impacts, and boosting resilience of building and infrastructure; protecting the economy and natural resources by identifying vulnerabilities, promoting insurance leadership, conserving land and water resources, managing drought, reducing wildfire risks, and preparing for future floods; and using sound science to manage climate impacts.

Lead International Efforts – The Plan consists of actions to help the United States lead international efforts through working with other countries to take action by enhancing multilateral engagements with major economies, expanding bilateral cooperation with major emerging economies, combating short-lived climate pollutants, reducing deforestation and degradation, expanding clean energy use and cutting energy waste, global free trade in environmental goods and services, and phasing out subsidies that encourage wasteful use of fossil fuels and by leading efforts to address climate change through international negotiations.

In June of 2014, the Center for Climate and Energy Solutions (C2ES) published a one-year review of progress in implementation of the Plan (C2ES, 2014). The C2ES found that the administration had made marked progress in its initial implementation. Notable areas of progress included steps to limit carbon pollution from power plants; improve energy efficiency; reduce CH_4 and HFC emissions; help communities and industry become more resilient to climate change impacts; and end U.S. lending for coal-fired power plants overseas.

Greenhouse Gas Endangerment Findings

As of January 14, 2010, the U.S. EPA's finding that six GHGs, taken in combination, endanger the public health and the public welfare of current and future generations became effective. The U.S. EPA also found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that endangers public health and welfare under CAA Section 202(a). Subsequently, federal agencies have adopted specific GHG-related regulations and initiatives, including:

Transportation/Mobile Sources

U.S. EPA and National Highway Traffic Safety Administration Standards to Cut Greenhouse Gas Emissions and Fuel Use for New Motor Vehicles: coordinated steps to enable the production of a new generation of clean vehicles.

Renewable Fuel Standard Program: transportation fuel sold in the United States is required to contain a minimum volume of renewable fuel.

Stationary Sources

Carbon Pollution Standards for Power Plants: In September 2013, the U.S. EPA proposed a rule to reduce carbon emissions from new power plants. On June 2, 2014, the U.S. EPA issued a proposal to cut carbon pollution from existing power plants (the "Clean Power Plan"). U.S. EPA's May 2015 "Unified Agenda" indicates that both of these rules are expected to be issued in August 2015.

Final Greenhouse Gas Tailoring Rule: On May 13, 2010, the U.S. EPA set GHG emissions thresholds to define when permits under the New Source Review PSD and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule "tailors" the requirements of these CAA permitting programs to limit covered facilities to the nation's largest GHG emitters: power plants, refineries, and cement production facilities.

Timing of Applicability of the PSD Permitting Program to GHGs: On March 29, 2010, the U.S. EPA completed its reconsideration of the December 18, 2008, memorandum entitled "EPA's Interpretation of Regulations that Determine Pollutants Covered by Federal Prevention of Significant Deterioration (PSD) Permit Program" (the so-called "Johnson memo"). The final action confirmed that GHGs become covered under the PSD program on January 2, 2011, when the cars rule took effect.

In June 2014, the U.S. Supreme Court ruled that the U.S. EPA cannot classify facilities as major PSD or Title V sources based solely on its GHG emissions meeting the major source threshold. However, the Supreme Court said that the U.S. EPA could continue to require that PSD permits, required due to criteria pollutant emissions, contain Best Available Control Techniques (BACT) limits for GHG emissions. This ruling struck down Step 2 of the Tailoring Rule but kept in effect Step 1 (U.S. EPA, 2014).

Emissions Reporting

GHG Reporting Program: This program collects reported GHG emissions from facilities that emit more than 25,000 $MTCO_2e$ emissions per year. Additionally, reporting of emissions is required for owners of SF_6- and PFC-insulated equipment when the total nameplate capacity of these insulating gases is above 17,280 pounds. The Petroleum and Natural Gas Systems source category consists of onshore production; offshore production; natural gas processing; natural gas transmission; underground natural gas storage; natural gas distribution; liquefied natural gas import and export terminals; and liquefied natural gas storage equipment.

Notification Requirements for Gas Well Completions (40 CFR Parts 60 and 63): Air pollution standards established by the U.S. EPA under the New Source Performance Standard, Final Rule August 16, 2012, for oil and gas production require companies to provide notifications of natural gas well completions. The U.S. EPA expects to use the notifications required by the 2012 standards and ongoing technical studies through 2014 to make a foundation for determining how best to require additional control of methane and other air pollutants from the oil and gas sector, including completions and associated gas from ongoing production and hydraulically fractured oil wells.

State

Assembly Bill (AB) 1493

On July 22, 2002, Governor Gray Davis signed Assembly Bill (AB) 1493, also known as the Pavley Regulations or the Clean Car Standards. AB 1493 required the State to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of GHG emissions emitted by passenger vehicles and light-duty trucks. Subsequent regulations were adopted by CARB in September 2004.

The regulations were threatened by automaker lawsuits and were stalled by the U.S. EPA's initial denial to allow California to implement GHG standards for passenger vehicles. The U.S. EPA later granted California the authority to implement GHG emission reduction standards for new passenger cars, pickup trucks and sport utility vehicles on June 30, 2009. On September 24, 2009, the CARB adopted amendments to the Pavley regulations that reduce GHG emissions in new passenger vehicles from 2009 through 2016.

Executive Order S-3-05

Executive Order S-3-05 was established by Governor Arnold Schwarzenegger in June 2006. Executive Order S-3-05 establishes statewide emission reduction targets through the year 2050:

- By 2010, reduce greenhouse gas emissions to 2000 levels,
- By 2020, reduce greenhouse gas emissions to 1990 levels, and
- By 2050, reduce greenhouse gas emission to 80 percent below 1990 levels.

This Executive Order does not include any specific requirements that pertain to the proposed Project. However, actions taken by the State to implement these goals may affect the proposed Project, depending on the specific implementation measures that are developed.

Executive Order S-1-07

Issued on January 18, 2007, Executive Order S-1-07 sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO2e grams per unit of fuel energy sold in California. The target of the Low Carbon Fuel Standard is to reduce the carbon intensity of California passenger vehicle fuels by at least 10 percent by 2020. The carbon intensity measures the amount of GHG emissions in the

lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered. CARB adopted the implementing regulation in April 2009. The regulation is expected to increase the production of biofuels, including those from alternative sources, such as algae, wood, and agricultural waste. In addition, the Low Carbon Fuel Standard would drive the availability of plug-in hybrid, battery electric, and fuel-cell power motor vehicles. The Low Carbon Fuel Standard is anticipated to lead to the replacement of 20 percent of the fuel used in motor vehicles with alternative fuels by 2020.

Executive Order Executive Order B-30-15 – 2030 Statewide Emission Reduction Target

EO B-30-15 was signed by Governor Jerry Brown Jr. on April 29, 2015. This EO establishes an interim statewide GHG reduction target of 40 percent below 1990 levels by 2030, which is necessary to guide regulatory policy and investments in California in the midterm, and put California on the most cost-effective path for long-term emission reductions. Under this EO, all State agencies with jurisdiction over sources of greenhouse gas emissions will need to continue to develop and implement emissions reduction programs to reach the State's 2050 target and attain a level of emissions necessary to avoid dangerous climate change. According to CARB's Scoping Plan Update, this EO is in line with the scientifically established levels needed in the United States to limit global warming below 2°C - the warming threshold at which scientists say there will likely be major climate disruptions such as super droughts and rising sea levels (CARB, 2014).

Assembly Bill (AB) 32

AB 32, also known as the California Global Warming Solutions Act of 2006, was established to mandate the quantification and reduction of GHGs to 1990 levels by the year 2020. The law establishes periodic targets for reductions, and requires certain facilities to report emissions of GHGs annually. The legislation authorizes CARB to reduce emissions from certain sectors that contribute the most to statewide emissions of GHGs.

The AB 32 Scoping Plan identifies the strategies for achieving the maximum technologically feasible and cost-effective GHG reductions by 2020, and to maintain and continue reductions beyond 2020. The scoping plan includes a range of GHG emission reduction actions, which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a Cap-and-Trade system, and an AB 32 cost of implementation fee regulation to fund the program. The initial scoping plan was approved at the CARB Board hearing on December 12, 2008. CARB approved the First Update to the Scoping Plan in May 2014.

Senate Bill (SB) 97

Senate Bill (SB) 97, enacted in August 2007, required the Office of Planning and Research (OPR) to develop guidelines for the mitigation of GHG emissions or effects related to releases of GHG emissions. On April 13, 2009, OPR submitted proposed amendments to the California Natural Resources Agency (CNRA), in accordance with SB 97, regarding analysis and mitigation of GHG emissions. Formal rulemaking was conducted in 2009 prior to adopting the amendments.

As part of the guidelines, OPR recommends that CARB set statewide thresholds of significance and emphasized the need to have a consistent threshold available to analyze projects. The draft guidelines also noted that the analyses should be based on the best available information. As directed by SB 97, the CNRA adopted amendments to the State CEQA Guidelines for GHG emissions on December 30, 2009. On February 16, 2010, the Office of Administrative Law approved the amendments and filed them with the Secretary of State for inclusion in the California Code of Regulations. The amendments became effective on March 18, 2010.

Other Mobile Source Reduction Requirements

Several other State provisions address the GHG emissions reduction targets set by CARB for mobile sources, including trucks, passenger vehicles, trains, and ships. These measures include:

- Low Carbon Fuel Standard (EO S-01-07)
- Advanced Clean Cars Program
- SmartWay Truck Efficiency Regulation
- AB 32 Cap-and-Trade Program as applicable to transportation fuel suppliers (beginning January 1, 2015)
- SB 375 (Land Use Planning) including the development of a Sustainable Communities Strategy as part of a Metropolitan Planning Organization's Regional Transportation Plan.

In particular, SB 375 requires the Air Resources Board to set regional targets for GHG emission reductions from passenger vehicles and light duty trucks, and requires each regional Metropolitan Planning Organization (MPOs) to adopt a Sustainable Communities Strategy (SCS) into its regional transportation plan that would allow the region to meet its GHG emission reduction target. The Kern County Council of Governments adopted the SCS for Kern County as part of its Regional Transportation Plan (RTP) in 2014. The RTP and SCS incorporate forecasted development patterns, modeling and measures designed to integrate land use and transportation planning to reduce local and regional GHG emissions. Oil and gas resources, as well as other land uses, are components of the SCS. While SB 375 does not require local governments to amend their General Plans to implement the SCS, it provides incentives for them to do so. Implementation of SB 375 is expected to substantially reduce GHG emissions in the County and throughout the State.

California Air Pollution Control Officers Association (CAPCOA)

The California Air Pollution Control Officers Association (CAPCOA) is the association of air pollution control officers representing all 35 air quality agencies throughout California. CAPCOA is not a regulatory body, but it has been an active organization in providing guidance in addressing the CEQA significance of GHG emissions and climate change as well as other air quality issues. The GHG analysis set forth in this report has been informed, in part, by the expertise and methodologies described in the following documents published by CAPCOA: (1) CEQA & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act (CAPCOA, 2008); and (2) Quantifying Greenhouse Gas Mitigation

Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures (CAPCOA, 2010). The methodologies used in this GHG analysis are consistent with the CAPCOA guidelines

California Environmental Quality Act (CEQA)

There are a variety of statewide rules and regulations which have been implemented or are in development in California which mandate the quantification or reduction of GHGs. Under CEQA, an analysis and mitigation of emissions of GHGs and climate change in relation to a project is required where it has been determined that a project will result in a significant addition of GHGs. Certain Air Pollution Control Districts (APCDs) have proposed their own thresholds of significance and /or best performance standards.

California Code of Regulations Title 24

Title 24 of the California Code of Regulations was established in 1978, and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically establishes energy efficiency standards for residential and non-residential buildings constructed in the State of California in order to reduce energy demand and consumption. Part 6 is updated periodically to incorporate and consider new energy efficiency technologies and methodologies. The current version of the California Building Code became effective January 1, 2017. Local agencies must ensure that development in their jurisdictions complies with guidelines contained in the California Building Code. Cities and counties can, however, adopt building standards beyond those provided in the code.

San Joaquin Valley Air Pollution Control District (SJVAPCD)

On December 17, 2009, the SJVAPCD's Governing Board adopted the first comprehensive regional policy and guidance on addressing and mitigating GHG emission impacts caused by industrial, commercial, and residential development in the San Joaquin Valley. This set of guidance documents is designed to assist local permitting agencies and businesses by answering several questions related to CEQA and how to address GHG impacts under existing CEQA law.

To assist Lead Agencies, project proponents, permit applicants, and interested parties in assessing and reducing the impacts of project specific GHG emissions on global climate change, the SJVAPCD has adopted the guidance: *Guidance for Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA* and the policy: *District Policy – Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency*. The following criteria was outlined in the document to determine whether a project could have a significant impact:

- Projects determined to be exempt from the requirements of CEQA would be determined to have a less than significant individual and cumulative impact for GHG emissions and would not require further environmental review, including analysis of project specific GHG emissions. Projects exempt under CEQA would be evaluated consistent with established rules and regulations governing project approval and would not be required to implement BPS.

- Projects complying with an approved GHG emission reduction plan or GHG mitigation program which avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document adopted by the lead agency. Projects complying with an approved GHG emission reduction plan or GHG mitigation program would not be required to implement BPS.

- Projects implementing Best Performance Standards would not require quantification of project specific GHG emissions. Consistent with CEQA Guideline, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

- Projects not implementing Best Performance Standards would require quantification of project specific GHG emissions and demonstration that project specific GHG emissions would be reduced or mitigated by at least 29 percent, compared to Business-as-Usual (BAU*), including GHG emission reductions achieved since the 2002-2004 baseline period. Projects achieving at least a 29 percent GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

- Notwithstanding any of the above provisions, projects requiring preparation of an Environmental Impact Report for any other reason would require quantification of project specific GHG emissions. Projects implementing BPS or achieving at least a 29 percent GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

Local

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan cites policies to provide decision-makers with long-range guidance affecting the future character of the Metropolitan Bakersfield planning area. The elements within the Metropolitan Bakersfield General Plan provide goals, policies, and implementation measures in order to reduce impacts of projects on air quality. Applicable goals relative to the proposed Project site within these elements are listed in Table 4.8-2, *Metropolitan Bakersfield General Plan Goals and Policies for Air Quality*, below.

Table 4.8-2. Metropolitan Bakersfield General Plan Goals and Policies for Air Quality

Goals and Policies: Air Quality
Conservation/Air Quality Goal #1: "Promote air quality that is compatible with health, well being, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants."
Conservation/Air Quality Goal #2: Continue working toward attainment of Federal, State and Local standards as enforced by the San Joaquin Valley Air Pollution Control District."
Conservation/Air Quality Goal #3: "Reduce the amount of vehicular emissions in the planning area."

Table 4.8-2. Metropolitan Bakersfield General Plan Goals and Policies for Air Quality

Goals and Policies: Air Quality
Conservation/Air Quality Policy #1: "Comply with and promote San Joaquin Valley Unified Air Pollution Control District (SJVAPCD) control measures regarding Reactive Organic Gases (ROG). Such measures are focused on: (a) steam driven well vents, (b) Pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance."
Conservation/Air Quality Policy #2: "Encourage land uses and land use practices which do not contribute significantly to air quality degradation."
Conservation/Air Quality Policy #3: "Require dust abatement measures during significant grading and construction operations."
Conservation/Air Quality Policy #4: Consider air pollution impacts when evaluating discretionary permits for land use proposals. Considerations should include: a) Alternative access routes to reduce traffic congestion, b) Development phasing to match road capacities, c) Buffers including increase vegetation to increase emission dispersion and reduce impacts of gaseous or particulate matter on sensitive uses."
Conservation/Air Quality Policy #11: "Improve the capacity of the existing road system through improved signalization and traffic control systems."
Conservation/Air Quality Policy #12: "Encourage the use of mass transit, carpooling and other transportation options to reduce vehicle miles traveled."
Conservation/Air Quality Policy #13: "Consider establishing priority parking areas for carpoolers in projects with relatively large numbers of employees to reduce vehicle miles traveled and improve air quality."
Conservation/Air Quality Policy #14: "Establish park and ride facilities to encourage car pooling and the use of mass transit."
Conservation/Air Quality Policy #16: "Cooperate with Golden Empire Transit [GET] and Kern Regional Transit to provide a comprehensive mass transit system for Bakersfield; require large-scale new development to provide related improvements, such as bus stop shelters and turnouts."
Conservation/Air Quality Policy #18: "Encourage walking for short distance trips through the creation of pedestrian friendly sidewalks and street crossings."
Conservation/Air Quality Policy #19: "Promote a pattern of land uses which locates residential uses in close proximity to employment and commercial services to minimize vehicular travel."

4.8.4 Impacts and Mitigation Measures

This section describes the air quality significance thresholds, the air quality methodology used to evaluate whether the proposed Project would exceed the thresholds, and an evaluation of the proposed Project's impacts.

Methodology

The primary source of emissions (approximately 50 percent) from the proposed Project is from mobile sources. There are a number of factors available for estimating the GHG from mobile sources. Not all GHGs exhibit the same ability to induce climate change; as a result, GHG contributions are commonly quantified in carbon dioxide equivalencies (CO_2e). The CO_2e portion of GHG emissions from the proposed Project were estimated using the URBEMIS2007 v9.2.4 program and the California Climate Action Registry (CCAR) General Reporting Protocol.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment;
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Project Impacts

Impact 4.8-1: The Project Would Generate Greenhouse Gas Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment.

Neither the SJVAPCD nor any other federal, state, or local agency has adopted a threshold to measure a project's impact on global climate change. Global climate change is an international phenomenon, and the regulatory background and scientific data are changing rapidly. In 2006, the California State Legislature adopted AB 32, the California Global Warming Solutions Act of 2006. AB 32 describes how global climate change would impact the environment in California. The impacts described in AB 32 include changing sea levels, changes in snow pack and availability of potable water, changes in storm flows and flood inundation zones, and other impacts.

The list of impacts included in AB 32 may be considered substantial evidence of environmental impacts requiring analysis in CEQA documents. AB 32 requires CARB, the State agency charged with regulating statewide air quality, to adopt rules and regulations that would achieve greenhouse gas emissions equivalent to statewide levels in 1990 by 2020. By July 1, 2007, CARB adopted a list of discrete early action GHG emission reduction measures that could be implemented by January 1, 2010.

As required by AB 32, CARB determined what the statewide GHG emissions level was in 1990, and approved a statewide GHG emissions limit that is equivalent to that level, to be achieved by 2020. CARB approved the 2020 limit on December 6, 2007. CARB's GHG inventory has estimated 427 million $MTCO_2e$ in California in 1990. In 2004, the emissions were estimated at 480 $MMTCO_2e$.

Climate Change Impacts on the Project

AB 32 indicates that "the potential effects of global climate change include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snow pack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidence of infections, disease, asthma, and other health-related problems" (AB 32, section 38501[a]).

According to the California Climate Change Center (CCCC), climate change impacts would affect all of the sectors considered in this report: sea level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply. Additionally, climate change could produce compounding impact. For instance, in the San Francisco Bay Delta, heightened sea levels and high river inflows from warmer storms would place levee systems in greater jeopardy of flooding. The CCCC indicates that some of the most dramatic climate change impacts would be experienced as increased frequency and severity of extreme events, such as heat waves, wildfires, flooding, and conditions conducive to air pollution formation.

The proposed Project must comply with Title 24 energy efficiency standards. Vehicles purchased by residents would produce fewer GHG emissions than those produced today with implementation of AB 1493. Regulations stemming from AB 32 would result in reductions in emissions from major sources such as electrical power generation and cement production. Although it is unknown if AB 32 alone is enough to reduce California's fair-share contribution to global GHG inventory, it is currently the only well-defined and widely accepted benchmark for GHG emissions in California. The threshold that is to be used for this proposed Project is as follows:

Would the project be consistent with California's strategies to reduce greenhouse gas emissions to the levels in AB 32?

This threshold is qualitative in nature, and is addressed as such in this analysis. Note that the thresholds and the analysis may not be relevant to other projects. Therefore, this analysis does not establish thresholds in Kern County.

Project GHG Inventory

The primary source of GHG emissions (approximately 50 percent) from the proposed Project during operation would result from mobile sources. Proposed Project construction and operational activities would generate GHG emissions. Criteria and GHG emissions were estimated using the California Emissions Estimator Model (CalEEMod) version 2013.2.2 (Insight Environmental Consultants 2017).

There are a number of factors available for estimating the GHGs from mobile sources. Not all GHGs exhibit the same ability to induce climate change; therefore, GHG contributions are commonly quantified in CO_2e.

The 2005 BAU and mitigated proposed Project emissions are summarized shown in Table 4.8-3, *Estimated Annual Greenhouse Gas Emissions*.

Table 4.8-3. Estimated Annual Greenhouse Gas Emissions

Source	CO_2	CH_4	N_2O	CO_2e
Construction Emissions				
2016 Construction Emissions	195.03	0.04	0.00	195.86
2017 Construction Emissions	536.28	0.07	0.00	537.67
2018 Construction Emissions	718.28	0.10	0.00	720.46
2019 Construction Emissions	361.72	0.06	0.00	362.99
2020 Construction Emissions	337.31	0.04	0.00	338.18
2021 Construction Emissions	685.16	0.10	0.00	687.26

Table 4.8-3. Estimated Annual Greenhouse Gas Emissions

Source	CO_2	CH_4	N_2O	CO_2e
2022 Construction Emissions	348.46	0.06	0.00	349.70
2023 Construction Emissions	333.10	0.04	0.00	333.93
2024 Construction Emissions	681.33	0.10	0.00	683.40
Operational Emissions				
Area Emissions	0.05	0.0001	0.00	0.05
Energy Emissions	10,814	0.41	0.13	10,862
Mobile Emissions	43,523	0.94	0.00	43,543
Waste Emissions	689.03	40.72	0.00	1,544.2
Water Emissions	1,103.1	18.64	0.45	1,633.0
Total Proposed Project Operational Emissions	*56,129*	*60.7*	*0.58*	*57,582*
Annualized Construction Emissions[1]	*139.89*	*0.02*	*0.00*	*140.32*
Proposed Project Emissions	**62,301**	**54.44**	**0.55**	**63,614**

Notes: emissions are measures in tons/year; 0.00 could represent <0.00

[1] Per South Coast AQMD's Methodology: Construction emissions are annualized over a 30-year period.

Source: Insight Environmental Consultants, 2017.

Emission Estimation Assumptions

The proposed Project's construction and operational GHG emissions were estimated using the CalEEMOD program and can be found in Appendix C. BAU emissions were calculated based on the proposed Project activities using 2005 regulations and technologies built into CalEEMod, available as defaults. According to the SJVAPCD, in order for the proposed Project to conform with the goals of AB32 at least a 29 percent reduction from the 2002-2004 BAU period by 2020 must be demonstrated (Insight Environmental Consulting 2017). Because 2002 to 2004 emission factors were not available in CalEEMod, year 2005 was used for BAU. Using 2005 as BAU results in more conservative emission reduction estimations as the emission factors in 2005 are lower (more efficient), thereby producing a smaller reduction between mitigated and BAU. Mitigated proposed project emissions were calculated using updated emission factors from CalEEMod for the anticipated years of operation and corresponding land uses (Insight Environmental Consultants 2017).

Electricity usage for industrial land uses was estimated using CCAR Protocol. The CCAR emission factors for electricity use are 804.54 pounds of CO_2 per megawatt hour (MWh), 0.0067 pounds of NH_4 per MWh, and 0.0037 pounds of N_2O per MWh.

The proposed Project does not contribute substantially to water vapor because water vapor concentrations in the upper atmosphere are primarily due to climate feedbacks rather than emissions from project-related activities.

The proposed Project would not result in the emissions of hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), or sulphur hexafluoride (SF_6), the other gases identified as GHG in AB 32. The proposed Project would be subject to any regulations developed under AB32, the California Global Warming Solutions Act of 2006, as determined by CARB. As demonstrated in Table 4.8-4, *Comparison of BAU and Proposed Mitigated Emissions (Tons/Year*), below, the mandated required 29 percent reduction needed to conform with AB 32 goals would be reached with already in place state regulations for mobile sources such as low carbon fuel standards. This would result in a 33 percent reduction from the proposed Project's BAU GHG operation emissions of 85,842 $MTCO_2e$ per year to 57,582 $MTCO_2e$ per year as shown in Table 4.8-4, *Comparison of BAU and Proposed*

Mitigated Emissions (Tons/Year). Therefore, the proposed project would be considered less than significant.

Table 4.8-4. Comparison of BAU and Proposed Project Mitigation Emissions (Tons/Year)

	2011 BAU	Proposed Project Mitigated (2020)
Co2e Emissions	85,842	57,582
Percent Reduction		33%

Attorney General Mitigation Analysis

The Office of the California Attorney General maintains a website with a list of CEQA Mitigations for Global Climate Change Impacts. The Attorney General has listed some examples of types of mitigations that local agencies may consider in order to offset or reduce global climate change impacts from a project. The Attorney General assures that the presented lists are examples and not intended to be exhaustive but instead provides measures and policies that could be undertaken. Moreover, the measures cited may not be appropriate for every project, so the Attorney General suggests that the lead agency should use its own informed judgment in deciding which measures it would analyze, and which measures it would require, for a given project.

The Attorney General suggests measures that could be undertaken or funded by a diverse range of projects, related to energy efficiency; renewable energy; water conservation and efficiency; solid waste measures; land use measures; transportation and motor vehicles; and carbon offsets. Implementation of the required mitigation measures will reduce the project specific generated GHGs to a less than significant level as the project proponent will be required to off-set impacts by 29 percent below business as usual, thus achieving the mandated emission reduction targets established by AB 32. Additionally, the proposed Project is located in an area of similar type industrial development, and along State Route 99, thus allowing existing infrastructure s to serve multiple users. In conclusion, the proposed Project by its design and mitigation measures would satisfy many of the suggested measures proposed by the Attorney General, which are shown in Table 4.8-5 *California Greenhouse Gas Emissions Reduction Strategies*, below.

Table 4.8-5. California Greenhouse Gas Emission Reduction Strategies

Strategy	Project Design/Mitigation to Comply with Strategy
Vehicle Climate Change Standards: AB 1493 (Pavley) required the state to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of climate change emissions emitted by passenger vehicles and light duty trucks. Regulations were adopted by CARB in September 2004.	These are CARB enforced standards; vehicles that access the proposed Project that are required to comply with the standards would comply with these strategies.
Other Light Duty Vehicle Technology: New standards would be adopted to phase in beginning in the 2017 model.	
Heavy-Duty Vehicle Emission Reduction Measures: Increased efficiency in the design of heavy-duty vehicles and an education program for the heavy-duty vehicle sector.	

Table 4.8-5. California Greenhouse Gas Emission Reduction Strategies

Strategy	Project Design/Mitigation to Comply with Strategy
Diesel Anti-Idling: In July 2004, CARB adopted a measure to limit diesel-fueled commercial motor vehicle idling.	Project would be subject to State law.
Hydrofluorocarbon Reduction: 1) Ban retail sale of HFC in small cans; 2) Require that only low GWP refrigerants be used in new vehicular systems; 3) Adopt specifications for new commercial refrigeration; 4) Add refrigerant leak-tightness to the pass criteria for vehicular Inspection and Maintenance programs; 5) Enforce federal ban on releasing HFCs.	This measure applies to consumer products. When CARB adopts regulations for these reduction measures, any products that the regulations apply to would comply with the measures.
Transportation Refrigeration Units (TRU), Off-Road Electrification, Port Electrification: Strategies to reduce emissions from TRUs, increase off-road electrification, and increase use of shore-side/port electrification.	Not applicable.
Manure Management: The proposed San Joaquin Valley Rule 4570 will reduce volatile organic compounds from confined animal facilities through implementation of control options.	Not applicable.
Alternative Fuels - Biodiesel Blends: CARB would develop regulations to require the use of 1 to 4 percent biodiesel displacement of California diesel fuel.	Not applicable.
Alternative Fuels - Ethanol: Increased use of ethanol fuel.	Not applicable.
Achieve 50 percent Statewide Recycling Goal: Achieving the State's 50 percent waste diversion mandate as established by the Integrated Waste Management Act of 1989, (AB 939, Sher, Chapter 1095, Statutes of 1989), will reduce climate change emissions associated with energy intensive material extraction and production as well as methane emission from landfills. A diversion rate of 48 percent has been achieved on a statewide basis. Therefore, a 2 percent additional reduction is needed.	Consistent with Mitigation in Section 4.17, UTILITIES, which requires construction recycling within the proposed Project.
Zero Waste - High Recycling: Additional recycling beyond the State's 50 percent recycling goal.	Consistent with Mitigation in Section 4.17, UTILITIES, which requires construction recycling within the proposed Project.
Landfill Methane Capture: Install direct gas use or electricity projects at landfills to capture and use emitted methane.	Not applicable.
Urban Forestry: A new statewide goal of planting 5 million trees in urban areas by 2020 would be achieved through the expansion of local urban forestry programs.	Consistent. Project would be subject to landscaping standards identified in the Kern County Zoning Ordinance.
Afforestation/Reforestation Projects: Reforestation projects focus on restoring native tree cover on lands that were previously forested and are now covered with other vegetative types.	Not applicable. The proposed Project area was not forested in recent times.
Water Use Efficiency: Approximately 19 percent of all electricity, 30 percent of all natural gas, and 88 million gallons of diesel are used to convey, treat, distribute and use water and wastewater. Increasing the efficiency of water transport and reducing water use would reduce greenhouse gas emissions.	Consistent with Mitigation.

Table 4.8-5. California Greenhouse Gas Emission Reduction Strategies

Strategy	Project Design/Mitigation to Comply with Strategy
Building Energy Efficiency Standards in Place and in Progress: Public Resources Code 25402 authorizes the CEC to adopt and periodically update its building energy efficiency standards (that apply to newly constructed buildings and additions to and alterations to existing buildings).	Consistent with Mitigation. Mitigation requires a 29 percent decrease of annual GHG emissions.
Appliance Energy Efficiency Standards in Place and in Progress: Public Resources Code 25402 authorizes the Energy Commission to adopt and periodically update its appliance energy efficiency standards (that apply to devices and equipment using energy that are sold or offered for sale in California).	Project would be consistent with State law.
Cement Manufacturing: Cost-effective reductions to reduce energy consumption and to lower carbon dioxide emissions in the cement industry.	Consistent with mitigation. The specific use is not proposed at this time. Mitigation requires GHG emission reductions regardless of the proposed project. Additionally, the preparation of a Precise Development (PD) Plan prior to the commencement of any ground disturbing activities will be required. The PD requirement will allow for additional review of any specific use and the incorporation of specific conditions to ensure compliance with State law, consistency with any locally adopted plans and compatibility with surrounding uses.
Smart Land Use and Intelligent Transportation Systems (ITS): Smart land use strategies encourage jobs/housing proximity, promote transit-oriented development, and encourage high-density residential/ commercial development along transit corridors. ITS is the application of advanced technology systems and management strategies to improve operational efficiency of transportation systems and movement of people, goods and services. Governor Schwarzenegger is finalizing a comprehensive 10-year strategic growth plan with the intent of developing ways to promote, through state investments, incentives and technical assistance, land use, and technology strategies that provide for a prosperous economy, social equity, and a quality environment.	The proposed Project is consistent with this strategy as the project is located along an existing State Highway. The site is located in an area with other similar type development, thus allowing all uses to capitalize on existing industrially related infrastructure.
Smart land use, demand management, ITS, and value pricing are critical elements for improving mobility and transportation efficiency. Specific strategies include: promoting jobs/housing proximity and transit-oriented development; encouraging high density residential/commercial development along transit/rail corridor; valuing and congestion pricing; implementing intelligent transportation systems, traveler information/ traffic control, incident management; accelerating the development of broadband infrastructure; and comprehensive, integrated, multimodal/ intermodal transportation planning.	Refer to response, above.
Enteric Fermentation: Cattle emit methane from digestion processes. Changes in diet could result in a reduction in emissions.	Not applicable.

Table 4.8-5. California Greenhouse Gas Emission Reduction Strategies

Strategy	Project Design/Mitigation to Comply with Strategy
Green Buildings Initiative: Green Building Executive Order, S-20-04 (CA 2005), sets a goal of reducing energy use in public and private buildings by 20 percent by the year 2015, as compared with 2003 levels. Consistent with Mitigation.	Mitigation requires compliance with State law and includes increased GHG emission reduction requirements.
California Solar Initiative: Installation of 1 million solar roofs or an equivalent 3,000 MW by 2017 on homes and businesses; increased use of solar thermal systems to offset the increasing demand for natural gas; use of advanced metering in solar applications; and creation of a funding source that can provide rebates over 10 years through a declining incentive schedule.	Not applicable.

Source: Insight Environmental Consulting, 2017.

Feasible and Reasonable Mitigation

CEQA, as well as the SJVAPCD Rule 9510, requires that all feasible and reasonable mitigation be applied to the proposed Project to reduce the impacts from construction and operations on air quality. The SJVAPCD's "Non-Residential On-Site Mitigation Checklist" was utilized in preparing the mitigation measures and evaluating the proposed Project's features. These measures include using controls that limit the exhaust from construction equipment and using alternatives to diesel when possible. Additional reductions will be achieved through the regulatory process of the air district and CARB as required changes to diesel engines are implemented which will affect the product delivery trucks and limits on idling.

While it is not possible to determine whether the proposed Project individually would have a significant impact on global warming or climate change, the proposed Project emissions will constitute a small fraction of the statewide GHG emissions. The strategies currently being implemented by CARB would help in reducing the proposed Project's GHG emissions and are summarized above in Table 4.8-5*, California Greenhouse Gas Emission Reduction Strategies*, above.

The impacts on global warming and climate change are indirect, not direct, and the emissions cannot be correlated with specific impacts based on currently available science. Climate change is a worldwide phenomenon, and local government lacks the expertise, or regulatory authority, to develop the scientific tools and policy needed to select a CEQA significance threshold for climate change or GHG emissions. The proposed Project will be subject to any regulations or requirements adopted under AB 32 or imposed by the state or federal government. In addition, as mentioned above, the proposed Project would result in a 33 percent reduction from the proposed Project's BAU GHG operation emissions of 85,842 $MTCO_2e$ per year to 57,582 $MTCO_2e$ per year as shown in Table 4.8-4, *Comparison of BAU and Proposed Project Mitigation Emissions (Tons/Year)*. Therefore, the proposed Project would be considered less than significant. The determination of project level significance, is therefore, considered less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.8-2: The Project Would Conflict with an Applicable Plan, Policy or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases.

At of the time of this writing, the County of Kern does not have an adopted GHG Climate Action Plan. Implementation of the proposed project with the identified mitigation measure to reduce business as usual (BAU) GHG emissions by 29 percent is consistent with standards established by the CARB and the California Global Warming Solutions Act of 2006. As such, impacts are considered less than significant.

Mitigation Measures

Implement Mitigation Measure MM 4.3-1, as described in Section 4.3, *Air Quality*.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

While it is not possible to determine whether the proposed Project individually would have a significant impact on global warming or climate change, the proposed Project clearly would contribute to cumulative GHG emissions in California (see Table 4.8-3) as well as related potential health effects.

Kern County and the SJVAB currently do not have GHG inventories. On December 6, 2007, the CARB established a GHG emissions limit based on the 1990 level for the year 2020 and adopted regulations requiring mandatory reporting of GHGs for large facilities. After a year of investigation, CARB has established that the state's 1990 emissions are 427 million $MTCO_2e$. Preliminary estimates indicate that 2020 emission projections could be 600 million $MTCO_2e$ if no actions are taken to reduce GHGs ("business as usual" scenario). CARB determined that California must prevent 173 million tons of $CO_e e$ from being emitted by 2020 in order to meet the 1990 level as required by AB 32.

The main contribution of GHG emissions from the proposed Project is from motor vehicles trips. Transportation sources account for approximately 42 percent of California's total GHG emissions. The proposed Project's emissions would, therefore, contribute to the increase in emissions. The effect on these emissions from other anticipated actions by CARB to address transportation issues, such as the development of fuels with less carbon, is not known at this time.

However, without the necessary science and analytical tools, it is not possible to assess, with certainty, whether the proposed Project's contribution would be cumulatively considerable within the meaning of State CEQA Guidelines Sections 15065(a)(3) and 15130. CEQA, however, does note that more severe environmental problems have lower thresholds for determining that a proposed Project's contribution to cumulative impacts is significant. Given the position of the legislature in AB 32, which

states that global warming poses serious detrimental effects, and the requirements of CEQA for the lead agency to determine that a project not have a cumulatively considerable contribution, the effect of 57,582 $MTCO_2e$ can be considered cumulatively considerable. This determination is based on the lack of clear scientific or other criteria for determining the significance of the proposed Project's contribution to the already-degraded air quality in the SJVAB

State CEQA Guidelines Section 15130 notes that sometimes the only feasible mitigation for cumulative impacts may involve the adoption of ordinances or regulations rather than the imposition of conditions on a project-by-project basis. Global climate change is this type of issue. Causes and effects are not just regional or statewide, they are worldwide. Given the uncertainties in identifying, let alone quantifying, the impact of any single project on global warming and climate change, and the efforts made to reduce emissions of GHGs from the project through design, in accordance with State CEQA Guidelines Section 15130, any further feasible mitigation will be accomplished through CARB regulations adopted pursuant to AB 32. The cumulative impacts of the proposed Project to global climate change as demonstrated in Table 4.8-4, above, would achieve greater than the required 29 percent reduction needed to conform with AB 32 goals.

Mitigation Measures

Implement Mitigation Measure MM 4.3-1, as described in Section 4.3, *Air Quality*.

Level of Significance after Mitigation

Cumulative impacts on global climate change and associated health effects are considered significant. and unavoidable.

Section 4.9

Hazards/Hazardous Materials

Section 4.9
Hazards/Hazardous Materials

4.9.1 Introduction

The purpose of this section is to identify, to the extent feasible, the potential for hazards associated with historic and current site uses, surrounding sites and recognized environmental conditions (RECs) in connection with the proposed Project site and to identify potential risks to human health, including future residents surrounding the site, users of the proposed Project site, workers and construction workers. A Hazardous Materials Evaluation was prepared by McIntosh & Associates in November 2008 and a subsequent Hazardous Materials Evaluation was prepared by McIntosh & Associates in July 2017. In addition, A Petroleum and Natural Gas Pipeline Assessment was prepared by McIntosh & Associates in July 2017. See Appendix F, *Hazardous Materials Evaluation*, Appendix G, *Petroleum and Natural Gas Pipeline Assessment*, and Appendix N, *Original Technical Studies*.

4.9.2 Environmental Setting

Local Character

The proposed Project site is undeveloped and is used mainly for agricultural purposes. A shop building is located in the easternmost portion of the Project site, near South Union Avenue. According to the California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR), the proposed Project is not located within an oil or gas field. There is one plugged and abandoned well with the proposed Project boundaries. A Pacific Gas and Electric (PG&E) natural gas transmission pipeline, number L-300B, traverses the site at a diagonal from northwest to southeast. Six pole-mounted electrical transformers (PMT) were observed within and adjacent to the proposed Project boundaries.

Surrounding Property Uses

Existing rural residential, agricultural, and commercial/light industrial land uses currently surround the proposed Project. The land uses for the adjacent properties is presented in the Table 4.9-1, *Surrounding Land Uses.*

Table 4.9-1. Surrounding Land Uses

Location	Adjacent Roads	Land Use
North	DiGiorgio Road Unpaved Western	Agricultural and roadway uses are present to the north. The land is designated R-IA (Resource-Intensive Agriculture), LMR (Low Medium Density Residential, 4 to 10 units per acre), HMR (High Medium Density Residential, 7.26 to 17.42 units per acre), SR (Suburban, 4 units per acre), GC (General Commercial)

Table 4.9-1. Surrounding Land Uses

Location	Adjacent Roads	Land Use
South	Houghton Road	Undeveloped agriculture land and State Route (SR) 99 off-ramp south of Houghton Road. The land is designated as R-IA (Resource-Intensive Agriculture), RR (Rural Residential, 2½ acres per unit), HC (Highway Commercial).
East	South Union Avenue is adjacent to 40 acres in the eastern most portion	Agricultural and rural residential with corralsand equestrian facilities, and mobile homes along South Union Avenue and on the northeast, east and southeast adjacent to the proposed project. There is an automobile wrecking yard (Higgins Auto Wrecking, 12825 South Union Avenue) located adjacent to the southeast portion of the proposed project. The land is designated as R-IA (Resource-Intensive Agriculture), RR (Rural Residential), SI (Service Industrial)
West	SR-99	SR-99 and undeveloped agricultural land. The land is designated as PT (Public Transportation) and R-IA (Resource-Intensive Agriculture)

Historical Use of Property

In 1934, an exploratory oil well was drilled; however, it failed to produce and was abandoned in 1935. The proposed Project has remained undeveloped and has been utilized for agricultural purposes from 1940's to the present. Currently there are approximately 63 acres of alfalfa being grown along the south portion of the Project site, and the balance of the Project site is fallow due to the recent drought conditions but has been prepared to resume farming operations.

A steel shop building is located on the east side of the Project site, near South Union Avenue along Lamb Avenue and was probably used for field equipment, vehicle maintenance, and storage. A retention basin, used for agricultural purposes, is located on the south edge of the Project site at the Houghton Road/Chevalier Road intersection.

A 34-inch diameter high pressure gas transmission pipeline (Line 300B), owned and operated by PG&E, traverses the Project site. The pipeline is marked at the east boundary of South Union Avenue and at the west boundary adjacent to State Route (SR) 99. There is a 6-inch natural gas distribution pipeline operated by Pacific Gas and Electric Company that is located on the west side of the South Union Avenue.

Aerial photographs were provided by Kern County Public Works Department and Western Photogrammetrics. Additionally, aerial photographs from Google Earth online website for the years 2008, 2009, 2011, 2012, 2013, 2014, 2015, and 2016 were reviewed to assess the history of the proposed Project site. (McIntosh & Associates 2017; refer to Appendix F and Appendix N). The following provides a summary of the aerial photographs:

1937: The project site is visible as fallow land. Some scarring from sheet-flooding is visible trending generally north to south. South Union Avenue is visible along the east boundary of the Project site. Small farms and rural residences are visible to the northeast, east, and south.

1952: A grove of trees is visible adjacent to South Union Avenue in the northeast corner of the easternmost portion of the Project site. Two parcels appear to be under cultivation.

Houghton Road is visible along the south boundary of the site. Two small farms/rural residences are visible in the parcel currently occupied by Higgins Auto Wrecking, near the south boundary of the site. The rural residence and corrals immediately north of the easternmost portion of the Project site is visible in this aerial photograph. Agricultural land is visible to the north, south, east, and west.

1956: The proposed Project site appears to be under cultivation with the exception of two fallow portions of the site. The on-site location of the west irrigation well and the concrete ditch are visible. Conditions on the adjacent properties appear relatively similar to those noted in the 1952 aerial photograph.

1963: SR 99 is visible along the west boundary of the Project site, having opened in 1961. The "cloverleaf" on- and off-ramps at Houghton Road, adjacent to the southwest corner of the Project site, appear to be under construction. On- and off-site conditions appear relatively similar to those noted in the 1956 and 1952 aerial photographs.

1975: Plowed/cultivated land has replaced trees in the easternmost portion of the Project site. A clearing with a small structure, possibly a small shed or shop, is visible in the east portion of the site. The south tailwater pit located near Houghton Road is visible. The SR-99/ Houghton Road interchange has been completed, and a dairy appears to be visible on the west side of SR-99, opposite the south half of the proposed Project. The original PG&E natural gas pipeline station is visible adjacent to South Union Avenue. Additional off-site conditions appear relatively similar to those viewed in the 1963 aerial photograph.

1981: A large oak tree is visible in the west part of the site, where the domestic well is located. The north portion of the site appears fallow. Rows of wrecked automobiles are visible at the location of Higgins Auto Wrecking, adjacent to the southern Project boundary. Additional on- and off-site conditions appear relatively similar to those noted in the 1975 aerial photograph.

1990: The steel shop building is visible in the small clearing in the west part of the easternmost portion of the Project site. On- and off-site conditions appear relatively similar to those noted in the 1981 aerial photograph.

1995: Conditions on- and off-site appear relatively similar to those noted in the 1990 aerial photograph. Mobile home lots are visible off-site, located north of the easternmost proposed Project boundary. North of the proposed Project, at a distance of 0.5-mile or greater, several residential subdivisions are visible.

2000: On- and off-site conditions appear relatively similar to those noted in the 1995 aerial photograph.

2002: Conditions on- and off-site appear relatively similar to those observed on the 1995 and 2000 aerial photographs.

2003: Conditions on- and off-site appear relatively similar to those observed on the 1995, 2000, and 2002 aerial photographs. More than 50 percent of the land comprising the proposed Project appears fallow or recently plowed.

2006: Conditions on- and off-site appear relatively similar to those observed on the 1995, 2000, 2002, and 2003 aerial photographs. Approximately 50 percent of the land comprising the proposed Project site appears to have been cultivated with alfalfa.

2008: The proposed Project is comprised of agricultural land. Portions of the Project site have crops growing, and the rest has been disked. A brushy retention basin in on the south edge of the Project site and has been used for agriculture purposes. A steel shop building is located on the east side of the Project site near South Union Avenue along Lamb Avenue. The proposed Project is adjacent to other related agricultural land, rural residential properties, and an automobile wrecking yard (Higgins Auto Wrecking).

2009: Conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the year 2008 and 2009 aerial photograph

2011: Conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the year 2008 and 2009 aerial photograph

2013: Conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the year 2008, 2009, and 2011 aerial photograph.

2014: Conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the year 2008, 2009, 2011, and 2012 aerial photograph.

2015: Conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the year 2008, 2009, 2011, 2012, 2013, and 2014 aerial photograph.

2016: The conditions on the proposed Project and other adjacent properties appear relatively similar to those observed in the years 2008,2009, 2011,2012, 2013, 2014 and 2015. The proposed Project is comprised of agricultural land. A portion of the proposed Project has crop growing, and the remained of the Project site has been disked in preparation for cultivation. A brushy retention basin is on the south edge of the Project site and has been used for agriculture purposes. A steel shop building is located on the east side of the Project site, near South Union Avenue along Lamb Avenue. The proposed Project is adjacent to other related agricultural land, rural residential properties, and an automobile wrecking yard (Higgins Auto Wrecking).

Records Review

A review of regulatory agency records was conducted for the site and surrounding one-mile radius. The following documents have been reviewed: U.S. Environmental Protection Agency (EPA) Toxic Release Inventory (TRI) records; California Air Resources Board (CARB) Community Health Air Pollution Information System (CHAPIS) records, EDR Report; DOGGR records; Kern County

Environmental Health Serves Department (KCEHSD) records; and Kern County Agricultural Commissioner records.

U.S. EPA Toxic Release Inventory (TRI)

Toxics Release Inventory (TRI), a US EPA database, contains information on toxic chemical releases. The 2006 TRI Explorer Chemical Releases Report for Bakersfield area facilities provides information on all regulated industries in Kern County. The report indicated that 1,591,813 pounds of various chemicals and hazardous wastes were disposed to Class I Underground Injection Wells, RCRA Subtitle C Landfills, and other unspecified landfills during the 2006 calendar year. The TRI Explorer report also indicated that 104,181 pounds of point-source air emissions and 61,211 pounds of fugitive air emissions were released into the atmosphere in 2006. This data was released by the EPA to the public on February 21, 2008.

The proposed Project was not identified in the 2006 TRI Explorer report, and no other sites were identified within a one-mile radius of the proposed Project. Additionally, the proposed Project was not identified in the 2017 US EPA TRI Facilities for Explorer Chemical Releases Report for Bakersfield, California area facilities, and no other properties were identified within a one-mile radius of the proposed project. This data was released by the US EPA data source and updated June 2, 2017 (McIntosh & Associates 2017; refer to Appendix F).

California Air Resources Board (CARB) CHAPIS Hazardous Air Pollutant Records

Toxic air pollutants are chemicals that have the potential to cause adverse health effects, such as cancer, birth defects, and organ damage. The online CHAPIS records were reviewed June 2017 and are listed from the year 2015 database for emissions by facilities and reflect the most current data available. The proposed Project was not identified with any emission inventory, and one-mile radius of the proposed project was not identified with any emission inventory and/or any facilities were identified (McIntosh & Associates 2017; refer to Appendix F).

The closest emission facility is Kern Oil & Refining Company located at 7724 East Panama Lane, in Bakersfield. It is approximately 5.75 miles northeast of the proposed Project with Particulate Matter Emissions of 5.671 tons for the year 2015 (McIntosh & Associates 2017; refer to Appendix F).

Environmental Data Resources, Inc. (EDR) Report

In July 2008, an Environmental Data Resources, Inc. (EDR) Radius Search was conducted for the proposed Project site and properties within a one-mile radius. The EDR report includes: 1) search of Federal, State and local agencies environmental records and 2) search for information about the physical setting of the sites and their surroundings. A copy of the EDR Report is included in Appendix N, *Original Technical Studies*.

The search of Federal, State, and local agencies environmental records found no records for the proposed Project site. Three facilities were identified on one or more of the databases searched for the EDR report. In addition, five "orphan sites" were identified in the EDR report. "Orphan sites" are sites that the EDR report cannot map due to insufficient information.

The EDR report indicated that two water wells are located on-site. The irrigation wells were listed by their U.S. Geological Survey well numbers. The west on-site irrigation well was correctly identified as well no. 31S28E-7P1, and the northwest on-site water well was correctly identified as well no. 31S28E-7D1. The total depths for both wells were not reported.

Lamb Chops

Lamb Chops, a Solid Waste/Landfill-listed facility, is located at 12336 South Union Avenue. Its agricultural composting operation was listed at the address of 300 Buena Vista Road. The permitted manure throughput for the composting facility was 1,000 cubic yards per day, and its permitted capacity was 2,500 cubic yards per day. The Lamb Chops composting facility was closed on March 31, 1999.

Young's Commercial Transfer (YCT)

Young's Commercial Transfer (YCT), is located at 300 Buena Vista Road, and is listed on the following databases: Hazardous Waste and Substances Sites (CORTESE); Leaking Underground Storage Tank (LUST); Historical Underground Storage Tank (HIST UST); State Facility Inventory Database (CA FID) UST; and Statewide Environmental Evaluation and Planning System (SWEEPS) Underground Storage Tank (UST).

The CORTESE database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic materials identified through the abandoned site assessment program, sites with USTs having a reportable release, and all solid waste sites from which there is known migration. No details were listed by CORTESE for YCT, and it is not considered a direct or indirect threat to the project site.

The LUST database contains reported leaking UST incidents that originate within the State Water Resources Control Board's Hazardous Substance Storage Container Database. YCT had operated two diesel USTs that leaked into soil only. The case was opened by KCEHSD, on March 4, 1992, and the last reporting date was October 3, 1994; the case was closed.

The HIST UST database contains listings from the State Water Resources Control Board (SWRCB). The diesel USTs were removed from the former YCT facility in 1992 had been installed in 1972 and 1973, respectively.

CA FID UST identified the former YCT facility as located within one-half to one mile of the proposed Project site. SWEEPS UST database identifies two diesel USTs with capacities of 10,000 gallons each on the YCT facility. No further details were provided.

Limi Brothers Farm

The CA FID UST database identified Limi Brothers Farm shop facility located at 11437 South Union Avenue. No further details were provided.

Orphan Sites

No orphan sites were identified less than one mile from the project site. The nearest sites are located at the junction of Taft Highway (SR-119) and SR-99, more than one mile to the north-northwest of the proposed Project. All of the orphan sites are off-site fueling stations/minimarts and none are situated upgradient of the proposed Project. These orphan sites are located at sufficient distances from the proposed Project such that they present no significant risks to the Project site.

Kern County Environmental Health Services (KCEHS) Department Records

The KCEHS was contacted in July 2008 regarding any records associated with aboveground storage tanks (ASTs), USTs, hazardous materials business plans (HMBPs), or hazardous materials incident reports (HMIRs) for the proposed Project site and surrounding locations. One soil remediation report was on file for the proposed Project site, in the location of the irrigation water wells. The remediation report for the proposed Project site was approved by KCEHS and a closure letter was issued on December 1, 2006. No other records were identified for the proposed Project.

One HMBP was identified for Higgins Auto Wrecking and two UST removal files were identified for Louis Limi Farm Shop and Young's Commercial Storage. The KCEHS issued a closure letter on for Louis Limi Farm Shop on October 8, 1991 and a closure letter for young's Commercial Storage on October 3, 1994. At the time the three facilities identified through KCEHS records review do not appear to represent current and/or material environmental risks to the Project site.

On June 26, 2017, KCEHS was contacted regarding the potential for records associated with Aboveground Storage Tanks (ASTs), Underground Storage Tanks (USTs), HMBPs, or Hazardous Materials Incident Reports (HMIRs) for the Project site and within a one-mile radius of the Project site. No HMBPs were on file with KCEHS for the Project site. However, KCEHS reported one Soil Remediation report and three UST removal files. KCEHS also reported several sites with a history of spills and Hazardous Material Business Inventories. Those sites specifically noted in the Hazardous Materials Evaluation (McIntosh & Associates 2017) are summarized below. Refer to Appendix F, *Hazardous Materials Evaluation*, and Appendix G, *Petroleum and Natural Gas Pipeline Assessment*, for further detail.

99 Houghton Industrial Park

In 2006, petroleum hydrocarbon impacted soil was observed in the vicinity of the location of two on-site irrigation wells along the west boundary, and in the northwest corner of, the Project site. Observations regarding soil were also made surrounding a waste oil AST, adjacent to a steel shop building located on the east side near South Union Avenue along Lamb Avenue (refer to Appendix F, *Hazardous Materials Evaluation*).

The Hazardous Materials Evaluation (McIntosh & Associates 2017) also notes information regarding characterizations and cleanups of petroleum hydrocarbon contaminated soil at the two irrigation wells and the waste oil AST in 2006. Impacted, non-hazardous soil, totaling 21.1 tons, was removed and transported to the McKittrick Waste Treatment Site in western Kern County for disposal and/or recycling. Confirmation samples were collected from each of the three on-site locations to ensure that the impacted soil had been removed to appropriate levels as required by the KCEHS. KCEHS issued

a December 1, 2006 closure letter indicating that no further action was required (refer to Appendix F, *Hazardous Materials Evaluation*).

Richard Limi Custom Harvesting

Richard Limi Custom Harvesting is located at 11437 South Union Avenue, approximately 0.45 miles northeast of the proposed Project. On September 19, 1991, one 10,000-gallon capacity, single wall, steel, diesel UST was removed for off-site destruction. Soil samples collected two feet beneath the dispenser exhibited diesel at 36 milligrams per kilogram (mg/kg), less than the KCEHS action level of 100 mg/kg. Groundwater was not affected. KCEHS subsequently issued a closure letter dated October 8, 1991, indicating that no further action was required (refer to Appendix F, *Hazardous Materials Evaluation).*

KCEHS did a routine Hazardous Material Business Plan Inventory (HMBPI) Inspection and Hazardous Waste Generator Inspection on May 26, 2015 at the site. No violations were observed. Limited materials are stored on-site and consist of gear oil, hydraulic oil, and motor oil (55 gallons each), used oil filters (350 pounds), waste oil (500 gallons, and oxygen (250 cubic feet) (refer to Appendix F, *Hazardous Materials Evaluation*).

Young's Commercial Transfer Company

Young's Commercial Transfer Company is located at 300 Buena Vista Road, approximately 0.21 miles east from the proposed Project. On February 18, 1992, two 10,000-gallon capacity, single-wall, steel, diesel USTs were removed and soil samples from under the tank were taken and analyzed. Approximately, 1,000 cubic yards of diesel impacted soil were removed from the former tank settings and bio-remediated on-site between November 1992 and July 1994. Monitoring wells indicated that petroleum hydrocarbons were not detected in groundwater during monitoring activities. A site closure report/letter dated August 11, 1994 indicating that no further action is needed at this site in relation to the former diesel underground tank (McIntosh & Associates 2017; refer to Appendix F, *Hazardous Materials Evaluation*).

Souza Properties

Souza Properties is located 9869 South Union Avenue approximately one-mile northeast of the proposed Project site. In March 1993, a fluid sample was taken from a small waste oil sump and it was determined that future testing was needed. On May 21, 1993 five USTs were removed and soil samples indicated that significant contamination existed beneath the tanks to a depth of 45 feet. On May 23, 1994, a Remedial Action Plan was implemented and excavation to 51 feet was undertaken. A total of 900 cubic yards of soil was removed and spread on-site to be treated via bioremediation and aerated. A closure letter was issues dated November 15, 1994 (McIntosh & Associates 2017; refer to Appendix F, *Hazardous Materials Evaluation*).

DOGGR Records

The primary mineral resource currently under development in portions of Kern County is oil. The proposed Project is located outside the administrative boundaries of any oil or gas field. DOGGR

Wildcat Map 4-2 and records searched as part of the records review for the Hazardous Materials Evaluation identified one plugged and abandoned exploratory oil well. The exploratory well, "Sea Cliff-Houghton" 1, was drilled by the Big McKittrick Oil Company of California between November 1934 and June 1935. The oil well was a dry hole that was subsequently abandoned by October 1935. Because the well was filled only with drilling mud prior to abandonment in 1935, the DOGGR requires that the well be reabandoned to current standards prior to construction.

DOGGR Wildcat Map W4-2 indicates that the nearest active producing oil fields are: the Mountain View Field approximately 4.75 miles northeast of the Project site; the Stockdale Field approximately 4.1 miles northwest of the Project site; and the Lakeside Field approximately 7.7 miles west of the Project site. The nearest producing gas field is the Paloma Field approximately 7.1miles southwest of the Project site (McIntosh & Associates 2017; refer to Appendix G, *Petroleum and Natural Gas Pipeline Assessment*).

Kern County Agricultural Department and Measurement Standards (Agricultural Commissioner)

The Kern County Agricultural Department and Measurement Standards (Agricultural Commissioner) has a monitoring program that maintains information about the farming companies, agricultural activities and pesticides use. A Restricted Materials Permit (RMP), obtained from the Agricultural Commissioner, is required for the application of chemicals to crops. The Project site has been utilized for agricultural purposes since the 1940s. Doug Kaiser Farms (DKF) is the current grower, and alfalfa is the current crop. DKF possesses RMP No. 1500666 for applications of pesticides and herbicides, which expired on December 31, 2008. Mitchell Property Management LP, Permit Number 1502896, was the grower for the years 2010 to 2017. A total of 45 pesticides, herbicides, fertilizers, and general soil amendments have been licensed for application to the proposed Project from the years until the year 2017.

Organochlorine pesticides are defined as persistent because they are stable in the environment and resist decay with time. Organochlorine pesticides include broad groups including: Hexachlorocyclohexane (Lindane), Dichiaro Diphenyl Trichloroethane (DDT) and related compounds, Dichlorodiphenyldichloroethylene (DDE) and Dichlorodiphenyldich loroethane (DOD), Cyclodienes (Aldrin, Heptachlor, and others), and Mirex and Chlordecone. The ability of these organochlorine pesticides to persist in the environment made them highly effective and therefore widely used in agricultural insect control efforts during the years 1940s to 1970s. Most organochlorine pesticides were banned for use in the United States by the mid-years 1980s; those that remain in legal use are the active, low concentration ingredients of some home and garden products and some agricultural and environments.

Table 4.9-2, *Chemicals Used On-Site Between 2008 and 2017* provides a summary of the agricultural crops and chemical products used within the proposed Project boundaries between 2008 and 2017.

Table 4.9-2. Chemicals Used On-site Between 2008 and 2017

Restricted Materials Permitted

Product Name	Years Permitted
41-A	2008, 2016

Table 4.9-2. Chemicals Used On-site Between 2008 and 2017

Restricted Materials Permitted

Product Name	Years Permitted

Site Reconnaissance

Hazardous materials and the generation of hazardous waste raise environmental concerns when altering, changing or developing land uses. Hazardous materials can take the form of petroleum products (including oil and gasoline), vehicular fluids, paint, solvents, cleaning fluids and pesticides. By-products generated as a result of activities using hazardous materials (such as dry-cleaning solvents, oil and gasoline) are considered to be hazardous waste. Commercial uses, especially those with underground storage tanks, are most suspected for the contamination of soils and groundwater. With remediation techniques and strict guidelines currently in practice, soil contamination (unlike groundwater contamination) typically does not pose a serious health risk. The Hazardous Materials Evaluation conducted for the proposed Project noted areas of concern, which are discussed below; for further detail refer to Appendix F, *Hazardous Materials Evaluation*, Appendix G, *Petroleum and Natural Gas Pipeline Assessment*, and Appendix N, *Original Technical Studies*.

A site reconnaissance was conducted on July 1, 2008. The objective of the site reconnaissance was to visually inspect, observe and record the current physical conditions of the proposed Project and surroundings. A subsequent site reconnaissance visit was conducted on June 15, 2017 for the proposed Project and the surrounding area. The site was evaluated using a record search and site visit for the purpose of obtaining information to locate recognized environmental conditions (RECs) such as hazardous substances and petroleum products in connection with the proposed Project, including soils, surface waters, and groundwater. Emphasis was placed on the on-site area to determine if visible and recognizable hazardous materials or substances were present.

On-Site Observations

The following are observations from the July 1, 2008 and June 15, 2017 proposed Project site reconnaissance. Photographs of these observations are available in the Hazardous Materials Evaluation (refer to Appendix F and Appendix N).

- The proposed Project was observed to be agricultural land and cultivated and ready for growing crops. Some areas of the Project site were in production and some appeared to be being prepared or were fallow.
- PG&E has single pole mounted transformers at the southwest corner and approximately in the center along the west boundary edge of the proposed Project. Steel irrigation standpipes were along the west boundary edge of the proposed Project site.

- Four PG&E single Pole-Mounted Transformers (PMTs) were observed on-site. A blue label was observed affixed to one of the PMTs, indicating that it is free of electrolytic fluid containing polychlorinated biphenyls (PCBs).
- In 2017, the proposed Project was observed to be agricultural land and alfalfa was the current crop at the time of the 2017 site visit.
- The west irrigation well, powered by a late-model Cummins engine with an associated diesel AST mounted on a flatbed trailer, was observed near the west boundary, one-half mile north of the southwest corner. A 5-gallon bucket containing a small amount of waste oil was observed between the AST and the pump turbine. No oil- or diesel-stained soil was observed about the location. A decomposing, concrete-lined irrigation ditch was observed adjacent to the well location.
- In 2008, the northwest irrigation well, powered by a late-model Cummins engine with an associated diesel AST mounted on a flatbed trailer, was observed near the northwest corner of the Project site. A 2-gallon, capped plastic container of waste oil was observed on the south side of the pump turbine. By 2017, the engine, AST and 2-gallon plastic container had been removed. Well is now idle. No oil- or diesel-stained soil was observed within the vicinity of the idle irrigation well.
- Steel irrigation standpipes were observed along the west boundary.
- An unlined ditch was observed on the south side of the Di Giorgio Road unpaved alignment at the northeast corner of the proposed Project site. The ditch marks the boundary between the proposed Project and the adjacent off-site agricultural land to the north. In 2008, the ditch was identified to contain rip-rap.
- The proposed Project has an electrically operated domestic water well with associated pressure and a storage tank on the north side of the easternmost portion of the Project site. There is one pole mounted electrical transformer located off-site and to the north of the domestic water well (4) PMT.
- A PG&E Company marker indicating the presence of a natural gas pipeline no. L-300B was observed along the west boundary.
- An off-site PG&E, South Union Avenue natural gas meter and regulation Station 269.45-B, within the chain link fence and gravel surface located at the northwest corner of South Union Avenue and Mugsy Avenue, approximately 1,333 feet north of Houghton Road.
- In the easternmost portion of the Project site, an electrically-operated domestic well with associated pressure and storage tanks was observed at the north boundary. A steel shop building fixed to a concrete foundation with a floor area of 3,840 square feet was observed south of the domestic well. Two transformers, an inoperable electrical switch panel, and a cylinder-shaped, propane AST were observed near the northeast corner of the building in 2008. Propane service lines were observed on the east side of the building. An open canopied carport, out-of-service electrical panel/meter, and one pole mounted electrical transformer located on the north side at the easternmost portion of the proposed Project.

- At the Houghton Road / Chevalier Road intersection at the proposed Project, adjacent to the tail water booster pump, brushy retention basin, wooden beehives and one pole mounted electrical transformer. The wooden beehives were observed on the north side of a dry, brushy tailwater pit located in the south portion of the Project site. An irrigation riser was observed at the west end of the tailwater pit.
- A dry tailwater pit was observed in the southwest corner of the easternmost portion of the Project site.
- An out-of-service electrical turbine for a well booster pump was observed on the west slope of the dry, brushy tailwater pit.
- Two older transformers, with an associated out-of-service electrical panel and meter, were observed west of the tailwater pit.
- Higgins Auto Wrecking, Inc. is located at 12825 South Union Avenue, adjacent to the proposed Project at the southeast corner of the Project site at the intersection of South Union Avenue and Houghton Road.
- Old tire, debris and palm fronds, and row of palm trees are along the east edge of the Project site and South Union Avenue.
- The adjacent property along South Union Avenue and the east edge of the proposed Project site have rural residential units with corrals and equestrian facilities.

Off-Site Observations

The following are observations for the properties surrounding the proposed Project. Observations are from both the July 1, 2008 and June 15, 2017 site reconnaissance's. Photographs of these observations are available in the Hazardous Materials Evaluation (refer to Appendix F and Appendix N).

- Agricultural Land and rural residential with corrals and equestrian facilities, and mobile homes along South Union Avenue and on the northeast, east and southeast adjacent to the proposed project. There is an automobile wrecking yard (Higgins Auto Wrecking, 12825 South Union Avenue) located adjacent to the southeast portion of the proposed Project.
- Approximately ¼-mile southeast of the steel shop building, a fenced, off-site PG&E natural gas facility with a gravel surface was observed at South Union Avenue, adjacent to the southeast corner of the easternmost portion of the Project site.
- A fenced PG&E natural gas valve station no. 269B was observed within an unpaved road easement along the south boundary of the easternmost portion of the Project site.
- An off-site irrigation well was observed immediately east of the northeast corner of the Project site.

On-Site Hazards of Potential Concern

Pole Mounted Electrical Transformers

There are four pole mounted electrical transformer that are located on the proposed Project site, and two addition pole mounted electrical transformers are adjacent to the proposed project. The ground

surface below each pole mounted electrical transformer displayed no evidence of discoloration from fluid leakage.

PG&E is the owner of the PMTs. Mr. Mark Maytubby of PG&E reported that PMTs installed subsequent to 1990 likely did not contain polychlorinated biphenyl (PCB) insulating fluids. PMTs labeled with blue "non-PCB" stickers do not contain PCB fluids. Based on the visual absence of apparent unauthorized releases of insulating fluids from the on-site PMTs during the site reconnaissance activities, the on-site PMTs are not currently anticipated to pose adverse impacts. PG&E should be contacted regarding the disposition of these PMTs prior to development of the Project site. The electrical transformers located within the Project site are summarized in Table 4.9-3 *Electrical Transformers On-Site*.

Table 4.9-3. Electrical Transformers On-Site

Location	Number of *PMTs	*PG&E Power Rating	Year Installed
PMT– (1) - Southwest corner of the proposed project on the north side of the Houghton Road overpass.	1	15 *KvA [1]	1990
PMT– (2) - Along the west boundary adjacent to the overhead electric freeway message sign.	1	15 *KvA [1]	1994
PMT– (3) – Off–site - Adjacent to the Northeast corner of the proposed project. Blue label affixed to the transformer, indicating that it is free of electrolytic fluid containing *PCBs.	1	150 *KvA [3]	1999 [B]
PMT– (4) – Off-site – North of the electrically operated domestic water well and storage tank	1	15 *KvA [1]	2007 [B]
PMT– (5) - Located north of the Northeast corner of steel shop building on the proposed project	2	15 *KvA [1] 25 *KvA [1]	1991 1976
PMT– (6) - North of Houghton Road on the proposed project and adjacent to the tail water booster pump and brushy retention basin	1	10 *KvA [1] 10 *KvA [1]	1986 1986

–PG&E - Pacific Gas and Electric Company

*PMTs – Pole Mounted Transformers

*PCBs – Polychlorinated Biphenyls

Pacific Gas and Electric Company Subsurface Pipelines

PG&E 34-inch diameter active natural gas transmission pipeline (Line 300-B) underlies the proposed project. The 34-inch diameter pipeline external coating includes primer, paint, two coats of asphalt, and two layers of felt. The depth of the pipeline is estimated at 36 inches to 60 inches below surface which allows the surface farmer to shallow plow and disc the soil above the pipeline a reasonable amount without endangering the pipeline. The natural gas transmission pipeline maximum operating pressure is approximately 700 pounds per square inch gauge (psig). The natural gas transmission pipeline traverses from SR-99 in the northwest to the south line bordering the easternmost portion of the proposed Project. The natural gas transmission pipeline then traverses due east for approximately 0.25 mile passing through the off-site PG&E (South Union Avenue natural gas meter and regulation Station 269.45-B), located at the northwest corner of South Union Avenue and Mugsy Avenue, which is located 1,333 feet north of Houghton Road.

PG&E operates a 6-inch diameter steel natural gas distribution pipeline operating at a maximum pressure of 60 psig parallels the west right-of-way of South Union Avenue, a 2-inch plastic distribution pipeline operating at a maximum pressure of 60 psig parallels the east right-of-way of South Union Avenue, and a 3-inch distribution pipeline operating at a maximum pressure of 60 psig parallels the north right-of-way of Houghton Road. Only the 6-inch pipeline has a segment adjacent to the proposed Project, which will require street improvements above the pipeline. The pipelines locate on-site are shown in Table 4.9-4, *Pipelines On-Site*.

Table 4.9-4. Pipelines On-Site

Pipeline Identifier	Diameter Pipeline	Year Installed	Operating Pressure Pounds Per Square Inch
(PG&E*) Natural Gas Transmission Pipeline (Line 300-B) underlies the proposed project	34 Inches	1950	700
(PG&E*) Natural Gas Distribution Pipeline traverses north to south along the west side of South Union Avenue right-a-way	6 Inches	Not available	60

Agricultural Activities

The Project site has been in agricultural production since the 1940s. The Agriculture Commissioner records revealed that herbicides, insecticides, pesticides and other chemicals were used on the proposed Project area. The years of agricultural activity conducted on the Project site has included the application of pesticides, herbicides and associated metals, which may be present in near surface soils at residual concentrations of concern. However, it is not known if environmentally-persistent pesticides and herbicides were applied to the proposed Project site.

Asbestos Containing Materials

It is possible that asbestos-containing materials could be present in subsurface concrete irrigation (transite) pipe on the site. Concrete pipe was documented in information obtained from the Kern County Assessor-Recorder's Office.

Oilfield Activities

DOGGR online website records and the Wildcat Map W4-1 identified that one exploration oil well was drilled near the north boundary of the proposed Project. The Big McKittrick Oil Company drilled one exploration well "Sea Cliff-Houghton", Well Number 1, and American Petroleum Institute (API) Number 02932362 on October 31, 1934, which was drilled to a depth of 6,756 feet. The well is east of present SR-99, along Di Giorgio Road and along the north portion of the proposed project. The well failed to produce oil or gas and was subsequently abandoned in October 9, 1935 (McIntosh & Associates 2017).

Water Wells

Two irrigation wells are located on-site. The first irrigation well is located in the western portion of the Project site and is identified as well no. 31S28E-7P1. The second irrigation well is located in the northwestern portion of the site and is identified as well no. 31S28E-7D1. These wells were confirmed during the site reconnaissance. Well no. 31S28E-7P1 is powered by late-model Cummins engine with

an associated diesel AST mounted on a flatbed trailer. Waste oil containers were observed between the AST and the pump turbine at this location in 2008, but removed since. The Cummins engine at well no. 31S28E-7D1 has been removed, and the well is now idle. Waste oil containers were observed on the south side of the pump turbine at this well location in 2008, but removed since.

As discussed previously, in the fall of 2006, petroleum-stained soil was removed from each well irrigation location and transported to the McKittrick Waste Site in western Kern County. No oil- or diesel-stained soil was observed at either well location. The wells would need to be properly abandoned per KCEHS standards prior to development. If the wells are not used in the planned development, they should be destroyed in accordance with California SWR and KCEHS requirements.

4.9.3 Regulatory Setting

Federal

U.S. Environmental Protection Agency (USEPA)

The USEPA was established in 1970 to consolidate in one agency a variety of Federal research, monitoring, standard-setting, and enforcement activities to ensure environmental protection. The USEPA's mission is to protect human health and to safeguard the natural environment - air, water, and land - upon which life depends. The USEPA works to develop and enforce regulations that implement environmental laws enacted by Congress, is responsible for researching and setting national standards for a variety of environmental programs, and delegates to states and tribes the responsibility for issuing permits and for monitoring and enforcing compliance. Where national standards are not met, the USEPA can issue sanctions and take other steps to assist the states and tribes in reaching the desired levels of environmental quality.

Federal Toxic Substances Control Act/Resource Conservation and Recovery Act (RCRA)/Hazardous and Solid Waste Act (HSWA)

The Federal Toxic Substances Control Act (1976) and the RCRA of 1976 established a program administered by the USEPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the HSWA, which affirmed and extended the “cradle to grave” system of regulating hazardous wastes.

Comprehensive Environmental Response, Compensation, and Liability Act/Superfund Amendments and Reauthorization Act (CERCLA)

CERCLA, commonly known as Superfund, was enacted by Congress on December 11, 1980. This law (U.S. Code Title 42, Chapter 103) provides broad Federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites; provides for liability of persons responsible for releases of hazardous waste at these sites; and, establishes a trust fund to provide for cleanup when no responsible party can be identified. CERCLA also enables

the revision of the National Contingency Plan (NCP). The NCP (Title 40, Code of Federal Regulation [CFR], Part 300) provides the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, and/or contaminants. The NCP also established the National Priorities List (NPL). CERCLA was amended by the Superfund Amendments and Reauthorization Act (SARA) on October 17, 1986.

Clean Water Act (CWA)/Spill, Prevention, Control, and Countermeasure (SPCC) Rule

The CWA (33 U.S.C. Section 1251 et seq., formally the Federal Water Pollution Control Act of 1972), was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. As part of the CWA, the USEPA oversees and enforces the Oil Pollution Prevention regulation contained in Title 40 of the CFR, Part 112 (Title 40 CFR, Part 112), which is often referred to as the "SPCC rule" because the regulations describe the requirements for facilities to prepare, amend, and implement SPCC plans. A facility is subject to SPCC regulations if a single oil storage tank has a capacity greater than 660 gallons, or the total above ground oil storage capacity exceeds 1,320 gallons, or the underground oil storage capacity exceeds 42,000 gallons, and if, due to its location, the facility could reasonably be expected to discharge oil into or upon the "navigable waters" of the U.S.

Other Federal regulations overseen by the USEPA relevant to hazardous materials and environmental contamination include Title 40 CFR Chapter 1, Subchapter D – Water Programs and Subchapter I – Solid Wastes. Title 40 CFR Chapter 1, Subchapter D, Parts 116 and 117 designate hazardous substances under the CWA. Title 40 CFR Part 116 sets forth a determination of the reportable quantity for each substance that is designated as hazardous. Title 40 CFR Part 117 applies to quantities of designated substances equal to or greater than the reportable quantities that may be discharged into waters of the U.S.

Occupational Safety and Health Administration (OSHA)

OSHA's mission is to ensure the safety and health of America's workers by setting and enforcing standards; providing training, outreach, and education; establishing partnerships; and encouraging continual improvement in workplace safety and health. OSHA staff establishes and enforces protective standards and reaches out to employers and employees through technical assistance and consultation programs. OSHA standards are listed in Title 29 CFR Part 1910.

National Weather Service (NWS)

Under extreme fire weather conditions, the NWS issues Red Flag Warnings for all affected areas. A Red Flag Warning means that any ignition could result in a large-scale damaging wildfire. The NWS region encompassed by the project is the San Joaquin Valley/Hanford region. Red Flag Warning criteria for are as follows: the area contains dry fuels, the National Fire Danger Rating System is high to extreme, and the following forecast weather parameters are: 1) relative humidity is 25 percent or less; 2) a sustained wind average of 15 mph or greater; and 3) a temperature of more than 75 degrees Fahrenheit (°F) (NWS, 2014).

Transportation Emergency Preparedness Program

The U.S. Department of Energy (DOE) Office of Environmental Management implements the Transportation Emergency Preparedness Program (TEPP) through the Office of Transportation. TEPP integrates a basic approach to transportation emergency planning and preparedness activities under a single program with the goal to ensure DOE, its operating contractors, and state, tribal, and local emergency responders are prepared to respond promptly, efficiently, and effectively to accidents involving DOE shipments of radioactive material. The TEPP mission is to ensure that federal, state, tribal, and local responders have access to the plans, training, and technical assistance necessary to safely, efficiently, and effectively respond to transportation accidents involving DOE-owned radioactive materials. To accomplish this mission, a suite of tools has been developed to aid the response jurisdictions in their readiness activities.

State

Division of Oil, Gas and Geothermal Resources (DOGGR)

The DOGGR is the State agency responsible for supervising the drilling, operation, maintenance, plugging and abandonment of oil, gas and geothermal wells. DOGGR's regulatory program promotes the wise development of oil, natural gas and geothermal resources in California through sound engineering practices, prevention of pollution and ensurance of public safety. To implement this program, DOGGR recommends avoidance of building over or near plugged and abandoned wells, or the replugging of wells to current DOGGR standards.

Department of Toxic Substances Control (DTSC)

The Department of Toxic Substances Control (DTSC) is responsible for restoration, protection and enhancement of the environment; ensuring public health, environmental quality and economic vitality through regulating hazardous waste; conducting and overseeing cleanups; and developing and promoting pollution prevention. DTSC implements programs that oversee cleanups, prevent releases by ensuring waste is properly generated, handled, transported, stored and disposed of; enforcing laws; promoting pollution reduction; encouraging recycling and reuse; conducted toxicological evaluations; and involving the public in decisions. DTSC also oversees the siting and cleanup of schools.

DTSC maintains the CORTESE List for use by State and local agencies to provide information about hazardous release sites. This list includes the Site Mitigation and Brownfields Reuse Program Database (CalSites).

California Environmental Protection Agency (Cal/EPA)

The Cal/EPA was created in 1991, which unified California's environmental authority in a single cabinet-level agency and brought the California Air Resources Board (CARB), State Water Resources Control Board (SWRCB), Regional Water Quality Control Boards (RWQCBs), California Department of Resources Recycling and Recovery (CalRecycle) - formerly the Integrated Waste Management Board (IWMB), DTSC, Office of Environmental Health Hazard Assessment (OEHHA), and Department of Pesticide Regulation (DPR) under one agency. These agencies were

placed within the Cal/EPA "umbrella" for the protection of human health and the environment and to ensure the coordinated deployment of State resources. Their mission is to restore, protect, and enhance the environment, to ensure public health, environmental quality, and economic vitality.

DTSC is a department of Cal/EPA and is the primary agency in California that regulates hazardous waste, cleans up existing contamination, and looks for ways to reduce the hazardous waste produced in California. DTSC regulates hazardous waste in California primarily under the authority of RCRA and the California Health and Safety Code. Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning.

California Office of Emergency Services (OES)

In order to protect the public health and safety and the environment, the California Office of Emergency Services (OES) is responsible for establishing and managing statewide standards for business and area plans relating to the handling and release or threatened release of hazardous materials. Basic information on hazardous materials handled, used, stored, or disposed of (including location, type, quantity, and the health risks) needs to be available to firefighters, public safety officers, and regulatory agencies and needs to be included in business plans in order to prevent or mitigate the damage to the health and safety of persons and the environment from the release or threatened release of these materials into the workplace and environment. These regulations are covered under Chapter 6.95 of the California Health and Safety Code Article 1–Hazardous Materials Release Response and Inventory Program (Sections 25500 to 25520) and Article 2–Hazardous Materials Management (Sections 25531 to 25543.3).

CCR Title 19, Public Safety, Division 2, Office of Emergency Services, Chapter 4–Hazardous Material Release Reporting, Inventory, and Response Plans, Article 4 (Minimum Standards for Business Plans) establishes minimum statewide standards for Hazardous Materials Business Plans (HMBPs). These plans shall include the following: (1) a hazardous material inventory in accordance with Sections 2729.2 to 2729.7; (2) emergency response plans and procedures in accordance with Section 2731; and, (3) training program information in accordance with Section 2732. Business plans contain basic information on the location, type, quantity, and health risks of hazardous materials stored, used, or disposed of in the State. Each business shall prepare a HMBP if that business uses, handles, or stores a hazardous material or an extremely hazardous material in quantities greater than or equal to the following:

- 500 pounds of a solid substance;
- 55 gallons of a liquid;
- 200 cubic feet of compressed gas;
- A hazardous compressed gas in any amount; or,
- Hazardous waste in any quantity.

California Occupational Safety and Health Administration (Cal/OSHA)

Cal/OSHA is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than Federal regulations. The

employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR Sections 337-340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings.

California Highway Patrol (CHP)

A valid Hazardous Materials Transportation License, issued by the CHP, is required by the laws and regulations of State of California Vehicle Code Section 3200.5 for transportation of either:

- Hazardous materials shipments for which the display of placards is required by State regulations; or,
- Hazardous materials shipments of more than 500 pounds, which would require placards if shipping greater amounts in the same manner.

Additional requirements on the transportation of explosives, inhalation hazards, and radioactive materials are enforced by the CHP under the authority of the State Vehicle Code. Transportation of explosives generally requires consistency with additional rules and regulations for routing, safe stopping distances, and inspection stops (Title 14, CCR, Chapter 6, Article 1, Sections 1150-1152.10). Inhalation hazards face similar, more restrictive rules and regulations (Title 13, CCR, Chapter 6, Article 2.5, Sections 1157-1157.8). Radioactive materials are restricted to specific safe routes for transportation of such materials.

Hazardous Material Business Plan

The State of California requires an owner or operator of a facility or business to complete and submit a Hazardous Material Business Plan (HMBP) to the Kern County Public Health Services Department if the facility or business handles a hazardous material or mixture containing a hazardous material that has a quantity at any one time during the reporting year equal to or greater than: 55 gallons; 500 pounds; 200 cubic feet at standard temperature and pressure for a compressed gas; any amount of hazardous waste; or amounts of radioactive materials requiring an emergency plan pursuant to Parts 30, 40, or 70 of Title 10, Code of Federal Regulations. Lower threshold quantities may be required for acutely hazardous substances. Pursuant to Health and Safety Code Section 25504 (a-c), an HMBP is required to contain detailed information on:

- Hazardous materials at the facility;
- Emergency response plans and procedures in the event of the reportable release or threatened release of a hazardous material; and
- Training for all new employees and annual training, including refresher courses, for all employees in safety procedures in the event of a release or threatened release of a hazardous material.

The intent of the HMBP is to provide basic information necessary for use by first responders in order to: prevent or mitigate damage to the public health and safety and to the environment from a release or threatened release of a hazardous material; and to satisfy federal and State Community Right-to-Know laws.

California Government Code

Government Code Section 65962.5 requires the DTSC, State Department of Health Services, the State Water Resources Control Board and the California Integrated Waste Management Board to assemble and annually update lists of hazardous waste sites and hazardous waste properties within California. The Secretary for Environmental Protection distributes these lists to each city and county where sites on the lists are located. Prior to approval of a development project by a lead agency the applicant shall consult these lists to determine that the project site is not listed.

California Public Resources Code

CEQA statute 21092.6 requires land agencies to consult with the compiled lists discussed above to determine whether a project or alternatives are located on a hazardous waste site.

California Education Code

The California Education Code Section 17213(a)(3) prohibits the approval of a school site if the site "contains one or more pipelines, situated underground or aboveground, which carries hazardous substances, acutely hazardous substances, or hazardous wastes, unless the pipeline is a natural gas line which is used only to supply natural gas to that school or neighborhood."

California Education Code Section 17213.1 requires DTSC to be involved in the environmental review process for the acquisition or construction of a school property utilizing state funding. The responsible school board is required to contract with an environmental assessor to supervise the preparation of a site evaluation to determine the potential for hazards or hazardous materials to exist on or near the site that could affect future staff and students, prior to acquiring a school site.

Petroleum and Natural Gas Pipelines

Pipelines that transport petroleum and natural gas are regulated by the following federal and state agencies:

- US Department of Transportation, Pipeline and Hazardous Materials Safety Administration, Office of Pipeline Safety (OPS).
- California Department of Forestry and Fire Protection, Office of the State Fire Marshal (OSFM).

A setback is a minimum distance required by zoning to be maintained between structures, or between structures and property lines. Kern County has not passed a zoning ordinance specifically addressing the setback distance for petroleum and natural gas pipelines. The Kern County Fire Department has not established setbacks from hazardous liquid pipelines to structures (McIntosh & Associates 2017).

The OSFM restricts encroachments into or on hazardous liquid pipeline easements per Informational Bulletin 03-001 (revised March 13, 2017) as follows:

Section 51014.6 of the California Government Code states the following:

a) Effective January 1, 1987, no person, other than the pipeline operator shall do any of the following with respect to any pipeline easement:

   i. Build, erect or create a structure or improvement within the pipeline easement or permit the building, erection or creation thereof.

   ii. Build, erect or create a structure, fence, wall or obstruction adjacent to any pipeline easement which would prevent complete and impaired surface access to the easement, or permit the building, erection or creation thereof.

b) No shrubbery or shielding shall be installed on the pipeline easement which would impair aerial observation of the pipeline easement. This subdivision does not prevent the revegetation of any landscape disturbed within a pipeline easement as a result of construction of the pipeline and does not prevent the holder of the underlying fee interest or the holder's tenant from planting and harvesting seasonal agricultural crops on a pipeline easement.

c) This section does not prohibit a pipeline operator from performing any necessary activities within a pipeline easement, including, but not limited to the construction, replacement, relocation, repair or operation of the pipeline.

It is the position of the State Fire Marshal that nothing shall encroach into or upon the pipeline easement, which would not impede the pipeline operator from complete and unobstructed surface access along the pipeline ROW, nor shall there by any obstructions which would shield the pipeline ROW from observation. In the interest of public safety and the protection of the environment, it is imperative that the pipeline operator visually assess conditions along the easement to ensure the integrity of the pipeline.

It is the responsibility of the pipeline operator to ensure unimpeded surface access and retain the ability to physically observe all portions of their pipeline rights-of-way. In cases where this is not possible, the pipeline operator shall inform the State Fire Marshall. The State Fire Marshall shall, in conjunction with the pipeline operator, resolve the issue.

The pipeline corridor is the pathway through the jurisdiction (city or county) in which the pipelines and facilities of a pipeline operator are located, including public rights-of-way and easements over and through public or private property. The setback distance shall be measured from the nearest edge of the pipeline corridor.

Pipeline Marker Signs

Transmission and distribution pipelines located both on-site and off-site are recognized by marker signs installed along their respective routes. The signs indicate the approximate location of the pipeline corridor and provide the name of the pipeline company of ownership and toll-free telephone number where the company can be reached in the event of a suspected or witnessed pipeline emergency. It is against the law for any person to willfully and knowingly deface, damage, remove, or destroy any pipeline marker sign or ROW marker. It should be noted that markers placed near

pipelines may not directly overlie them, and a pipeline may not follow a straight line between each marker.

Truck Routes

Currently, Federal regulations allow transportation of hazardous radioactive materials on all interstate highways. Trucks traveling from the highway to sites that use such materials (such as hospitals or nuclear power plants) are allowed to use the most direct route. The California Highway Patrol (CHP) has adopted Interstate 5 (I-5) as a truck route for transporting hazardous radioactive materials.

The Circulation Element of the Metropolitan Bakersfield General Plan designates specific roadways on which trucks may travel within and through the Metropolitan Bakersfield area. These routes direct trucks away from streets that are inappropriate or inadequate to serve substantial truck traffic. Trucks are allowed to access locations on local streets for site deliveries (e.g., goods delivery or moving cars); however, they must take the most direct route to and from the designated truck routes. None of the streets surrounding the proposed Project site are identified as a truck route within the Metropolitan Bakersfield General Plan Circulation Element.

Local

Metropolitan Bakersfield General Plan (MBGP)

The Metropolitan Bakersfield General Plan cites policies to provide decision-makers with long-range guidance affecting the future character of the Metropolitan Bakersfield planning area. The elements within the Metropolitan Bakersfield General Plan provide goals, policies and implementation measures in order to reduce impacts related to public safety. Applicable hazards/hazardous materials goals and policies relative to the proposed Project are listed in Table 4.9-5, *Metropolitan Bakersfield General Plan Goals and Policies for Hazards/Hazardous Materials*, below.

Table 4.9-5. Metropolitan Bakersfield General Plan Goals and Policies for Hazards/Hazardous Materials

Goals and Policies: Public Safety Element
Goal #1: Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.
Goal #2: Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development of metropolitan police and fire facilities and services.
Goal #3: Provide for the coordinated planning and development of service areas for police and fire protection to ensure an equitable burden of responsibility between County and City in Metropolitan Bakersfield.
Policy #4: Monitor, enforce and update as appropriate all emergency plans as needs and conditions in the Planning area change, including the California Earthquake Response Plan, the Kern County Evacuation Plan, and the City of Bakersfield Disaster Plan.
Policy #6: Promote fire prevention methods to reduce service protection costs and costs to the taxpayer.
Policy #7: Enforce ordinances regulating the use/manufacture/sale/transport/disposal of hazardous substances and require compliance with state and federal laws regulating such substances.

Table 4.9-5. Metropolitan Bakersfield General Plan Goals and Policies for Hazards/Hazardous Materials
Goals and Policies: Public Safety Element
Policy #8: The Kern County and Incorporated Cities Hazardous Waste Management Plan and Final Environmental Impact Report serves as the policy document guiding all facets of hazardous waste.
Policy #9: Restrict, after appropriate public hearings, the use of fire-prone building materials in areas defined by the fire services as presenting high-conflagration risk.

Kern County and Incorporated Cities Hazardous Waste Management Plan (HWMP)

In response to the growing concern regarding hazardous waste management, State Assembly Bill (AB) 2948 enacted legislation authorizing local government to develop comprehensive hazardous waste management plans (HWMP). The intent of each plan is to assure that adequate treatment and disposal capacity is available to manage the hazardous wastes generated within this jurisdiction. The Kern County and Incorporated Cities HWMP was first adopted by Kern County and each incorporated city before September 1988 and was subsequently approved by the State Department of Health Services. The HWMP is incorporated by reference into both the Metropolitan Bakersfield General Plan, as permitted by Health and Safety Code Section 25135.7(b), and thus must be consistent with all other aspects of both general plans.

The HWMP provides policy direction and action programs to address current and future hazardous waste management issues that require local responsibility and involvement in Kern County. In addition, the HWMP discusses hazardous waste issues and analyzes current and future waste generation in the incorporated cities, County and State and Federal lands.

The purpose of the HWMP is to coordinate local implementation of a regional action to effect comprehensive hazardous waste management throughout Kern County. The action program focuses on development of programs to equitably site needed hazardous waste management facilities; to promote on-site source reduction, treatment and recycling; and to provide for the collection and treatment of small quantity hazardous water generators.

Prior to or during construction, the remediation of hazardous materials within the proposed Project site will require the removal of hazardous materials from the Project site. Although none of the surrounding roads are identified as truck routes, pursuant to the Metropolitan Bakersfield General Plan Circulation Element, trucks hauling the hazardous materials away from the site are allowed to use the surrounding roads as long as they utilize the most direct route to designated truck routes.

Kern County Emergency Health and Safety Division

The Kern County Emergency Health and Safety Division (KCEHSD) provides oversight for locations within county jurisdiction that pose a threat to human health and safety.

Kern County Wildland Fire Management Plan

The Kern County Wildland Fire Management Plan documents the assessment of wildland fire situations throughout the SRAs within the County. The Kern County Fire Department Wildland Fire Management Plan provides for systematically assessing the existing levels of wildland protection services and identifying high-risk and high-value areas that are potential locations for costly and

damaging wildfires. The goal of the plan is to reduce costs and losses from wildfire by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success. Based on this assessment, preventive measures are implemented, including the creation of wildfire protection zones.

Kern County Building and Construction Ordinance (Title 17 of the Ordinance Code of Kern County)

Chapter 17.32 Fire Code

> Kern County has adopted, by reference, portions of the California Building Standards Code and the International Fire Code, with modifications and amendments. The purpose of this code is to prescribe the minimum requirements necessary to establish a reasonable level of fire safety to protect life and property from hazards created by fire, explosion, and dangerous conditions.
>
> The Kern County Fire Code defines a hazardous fire area as any land that is covered with grass, grain, brush, or forest and situated (e.g., in an inaccessible location) so that a fire originating upon such land would present an abnormally difficult job of suppression and would result in great and unusual damage through fire or the resulting erosion.

Chapter 17.34 Wildland-Urban Interface Code

> Kern County has adopted, by reference the Urban Wildland Interface Code, published by the International Fire Code Institute, with modifications and amendments. The purpose of this code is to safeguard life and property and maintain public welfare to a reasonable degree by addressing hazards related to wildland fire exposures and fire exposures from adjacent structures, and to prevent structure fires from spreading to wildland fuels.

Kern County Operational Area Hazardous Materials Area Plan

The Hazardous Materials Area Plan identifies local, State, and Federal responsibilities during incidents involving the release or threatened release of hazardous substances. According to the Kern County Operational Area Hazardous Materials Area Plan (Kern County Public Health Services Department, 2011):

> [H]azardous materials emergencies are the result of threatened releases, highway accidents, clandestine drug laboratories, train derailments, pipeline transportation accidents, pesticide drift incidents, or related fire and/or spills at fixed facilities.

4.9.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the proposed Project are evaluated on a qualitative basis through a comparison of existing conditions within the proposed Project site and the anticipated Project effects. The potential for impacts to hazards/hazardous materials would occur if the effect described under the criteria below occurs. The evaluation of Project impacts is based on professional judgment, analysis of the County's hazards/hazardous materials policies, and the significance criteria established by Appendix G of the State CEQA Guidelines, which the County has determined to be appropriate criteria for this Recirculated Draft EIR.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accidental conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment;
- For a project located within the adopted Kern County Airport Land Use Compatibility Plan results in a safety hazard for people residing or working in the project area;
- For a project within the vicinity of a private airstrip, results in a safety hazard for people residing or working in the project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

The analysis of the existing environment and the impact analysis indicate that this proposed Project could result in a significant environmental impact if it would result in a release of hazardous materials that would, if not mitigated, adversely affect the public health and safety of future residents, surrounding residents and workers.

Project Impacts

Impact 4.9-1: The Project Would Create in a Significant Hazard to the Public or the Environment Through the Routine Transport, Use or Disposal of Hazardous Materials.

The Kern County and Incorporated Cities Hazardous Waste Management Plan (HWMP) lists goals and policies regarding the transport of hazardous wastes. The HWMP recognizes that the transportation of hazardous waste on roads poses a short-term threat to public health; of prime concern is the safety of the transportation system for hazardous waste, especially extremely hazardous waste, in and throughout Kern County. The HWMP seeks to establish State and federally maintained roads as candidate Commercial Hazardous Waste Shipping Routes in and through the County (except those to collect locally generated hazardous wastes). The current Metropolitan Bakersfield General Plan does not identify designated hazardous material shipping routes. The Kern County General Plan shows the nearest hazardous materials shipping routes to the Project site as the following: SR-99 (adjacent to the western proposed Project boundary); Interstate (I) 5 (approximately 7.5 miles west), and SR-58 (approximately 7.5 miles north).

The proposed Project would introduce approximately 4,613,004 square feet of light and service industrial, and general commercial and highway commercial land uses, which could include warehousing, distribution, and retail showroom uses. Industrial uses often involve the transport of hazardous materials. Because the proposed Project is located adjacent to SR-99, potential delivery trucks would transport materials and chemicals along a County designated hazardous materials shipping route. In addition, the proposed Project is located in an area that is currently surrounded by agricultural and some industrial (i.e., automobile wrecking yard) land uses. The number of deliveries in the area would increase; however, there is already the presence of hazardous material transport within the vicinity of the proposed Project. While the risk of exposure to hazardous materials cannot be fully eliminated, measures can be implemented to maintain risks at acceptable levels. As described above, several federal, state, and local regulatory agencies oversee hazardous materials transportation. Oversight by the appropriate agencies and compliance with applicable regulations are considered adequate to offset the negative effects related to the transport of hazardous materials within the proposed Project area.

The proposed Project would include a private package sewer treatment plant to provide sewer services for the Project site. Sewer System for the proposed Project area has never been provided, and currently the neighboring residential and commercial properties are served by individual and privately owned septic systems. The developer would be required to construct a new wastewater plant facility for the proposed Project that could cause significant environmental effects. Based on wastewater generation rate for general commercial and industrial development uses utilized by the County of Kern, the proposed project would result in the generation of a normal, unpeaked flow of approximately 1.46 million gallons per day, with a peak flow maximum generation rate of 2.91 million gallons per day of wastewater. The new wastewater package plant facility would be constructed according to State specifications and would be operated in such a way as to not contaminate the underlying unconfined aquifer, and not cause a nuisance to existing agricultural land, neighboring residential and commercial properties.

In accordance with the California Health and Safety Code and Kern County regulations, the Project applicant would be required to prepare and submit a HMBP for any uses that would require the use

and storage of hazardous materials (such as a wastewater treatment facility, water treatment facility, maintenance facilities, emergency response services).

Compliance with state and federal law, and the Metropolitan Bakersfield General Plan, as well as the implementation of mitigation measures would ensure impacts associated with routine transport, use, or disposal of hazardous waste during construction or operation of the proposed Project are reduced to less than significant levels.

Mitigation Measures

MM 4.9-1: **Hazardous Materials Business Plan.** During the life of the project, including decommissioning, the project operator shall prepare and maintain a Hazardous Materials Business Plan (HMBP), as applicable, pursuant to Article 1 and Article 2 of California Health and Safety Code 6.95 and in accordance with Kern County Ordinance Code 8.04.030, by submitting all the required information to the California Environmental Reporting System (CERS) at http://cers.calepa.ca.gov/ for review and approval. The HMBP shall:

- Delineate hazardous material and hazardous waste storage areas
- Describe proper handling, storage, transport, and disposal techniques
- Describe methods to be used to avoid spills and minimize impacts in the event of a spill
- Describe procedures for handling and disposing of unanticipated hazardous materials encountered during construction
- Establish public and agency notification procedures for spills and other emergencies including fires.
- Include procedures to avoid or minimize dust from existing residual pesticides and herbicides that may be present on the site

The project proponent shall ensure that all contractors working on the project are familiar with the facility's HMBP as well as ensure that one copy is available at the project site at all times. In addition, a copy of the approved HMBP from CERS shall be submitted to the Kern County Planning and Natural Resources Department for inclusion in the projects permanent record.

MM 4.9-2: **Spill Prevention Control and Countermeasures (SPCC) Response Plan.** Prior to the issuance of a certificate of occupancy for an individual parcel project which exceeds any of the thresholds established by Title 40, Code of Federal Regulations, Part 112, related to facilities requiring a Spill Prevention Control and Countermeasures (SPCC) Response Plan, the individual parcel proponent shall prepare and submit an SPCC Response Plan to the Kern County Public Health Services Department/Environmental Health Division and the California Department of Water Resources. The individual parcel proponent shall ensure the project is

implemented in compliance with the approved Spill Prevention Control and Countermeasures Response Plan.

~~**MM 4.9-3: Hazardous Waste Exclusion/Business Plan.** The individual parcel proponent shall continuously comply with the following:~~

~~1. All hazardous wastes shall be stored and properly managed in accordance with the approved Kern County Waste Management Department Hazardous Waste Exclusion Plan and Hazardous Materials Business Plan, until transported for proper disposal.~~

~~2. A copy of the Hazardous Waste Exclusion Plan shall be submitted to the Kern County Planning and Natural Resources Department.~~

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-2: The Project Would Create a Significant Hazard to the Public or the Environment Through Reasonably Foreseeable Upset and Accidental Conditions Involving the Release of Hazardous Materials into the Environment.

Project construction activities are not anticipated to result in a significant release of hazardous materials into the environment. However, during construction, there is a possibility of accidental release of hazardous substances, such as spilling petroleum-based fuels used for construction equipment. The level of risk associated with the accidental release of hazardous substances is not considered significant because of the small volume and low concentration of hazardous materials utilized during the construction phases. The Project contractor would be required to use standard construction controls and safety procedures that would avoid and minimize the potential for accidental release of such substances into the environment. Standard construction practices would be observed such that any materials released would be appropriately contained and remediated as required by local, State, and Federal law.

Light and medium industrial uses may result in increased risks from hazardous materials. These types of uses may allow the installations of ASTs and USTs utilized for fueling vehicles and backup generators (this short list is not all-inclusive). These uses could potentially result in environmental impacts from hazardous materials and/or substances; however, various government entities require permits for the hazardous materials concerns. These various permits require controls that would reduce the potential impacts to a less than significant level. The proposed Project would comply with all applicable rules and regulations dealing with hazardous materials and/or substances from the following agencies: SJVAPCD, California Regional Water Quality Control Board (CRWQCB), California Integrated Waste Management Board, DTSC, California Office of Environmental Health Hazard Assessment, KCDEHS, and the Kern County Fire Department.

As noted above, a physical inspection of the proposed Project site, as part of the Hazardous Materials Evaluation, revealed evidence of hazardous materials and waste present within the proposed Project site. The evidence consists of abandoned petroleum prospect well, use of pesticides and herbicides,

PMTs, the potential for asbestos containing materials, high-pressure pipelines within and adjacent to the proposed Project site, and water wells.

Local regulatory agency records were reviewed to help determine whether hazardous materials have been handled, stored or generated on the proposed Project site and/or the adjacent properties and businesses. In the fall of 2006, petroleum-stained soil was removed from each irrigation well location and transported to the McKittrick Waste Site in western Kern County. The remediation report for the proposed Project site was approved by KCEHSD and a closure letter was issued on December 1, 1006. No other hazardous materials records related to the Project site were found.

As discussed above, four PMTs were observed within the proposed Project boundaries. The PMTs were observed to be in good condition and no apparent corrosion was noted. The ground surface below each PMT displayed no evidence of discoloration from fluid leakage. PG&E is the owner of the PMTs. According to PG&E, PMTs installed after 1990 likely did not contain PCB insulating fluids. PMTs labeled with blue "non-PCB" stickers do not contain PCB fluids. Based on the visual absence of apparent unauthorized releases of insulating fluids, the on-site PMTs are not currently anticipated to pose adverse impacts.

PG&E maintains two natural gas pipelines, a 34-inch pipeline and 6-inch pipeline within areas that would be improved as part of the proposed Project. The 34-inch pipeline is one of many pipelines monitored for leaks daily by aircraft. The rupture of natural gas pipelines would result in the release of petroleum products to the Project site. A pipeline rupture could result in environmental contamination and human health effects in the rural-residential areas adjacent to the proposed Project site. For safety reasons, State regulations prohibit the construction of any structures directly over the pipeline and a right-of-way (ROW) is usually established. The width of the ROW is negotiated between the property owner and the pipeline operator and usually ranges between 20 and 100 feet. Types of shrubs may be restricted; specifically, structures and large trees cannot be located over pipelines. With the compliance with Federal, State and applicable local regulations, and implementation of mitigation measures, impacts from potential health risks or damaging incidents associated with the pipelines would be reduced to a level of less than significant.

The potential impacts resulting from the operation of the existing pipeline are reduced with the use of pipeline markers, signs and underground warning tape and further reduced by enhanced safety features, including intrusion detection and leak monitoring system (central control room via supervisory control and data acquisition to detect third party dig-in), automatic and remote-controlled shut-off valves. Given the design of the pipeline, recently imposed integrity management protocol for all utility pipeline operators, and pipeline monitoring and reporting requirements, the potential impacts associated with reasonably foreseeable upset and accident conditions during the operation of the existing pipelines within the proposed project would be less than significant with the implementation of mitigation measures.

According to the Hazardous Materials Evaluation, one previously abandoned oil prospect well is present within the proposed Project site. Public Resources Code Section 3208.1 authorizes the State Oil and Gas Supervisor to order the reabandonment of a previously abandoned well when construction of any structure over or in the proximity of the well could result in a hazard. The well was filled only with drilling mud prior to abandonment in 1935, therefore, the DOGGR will require

that the well be reabandoned to current standards prior to grading and development of the proposed Project. DOGGR will furnish the necessary closure specifications. Adherence to closure provisions would serve to reduce impacts to less than significant levels.

One active diesel powered and one idle irrigation well are located within the proposed Project boundary. In 2006, petroleum stained soil was removed from each well irrigation location and transported to the McKittrick Waste Site in western Kern County. No diesel or waste-oil staining was observed on the ground surface at the time of the site reconnaissance. One well may be expected to supply water for dust suppression during construction of the proposed Project. If the wells are not to be used for irrigation or industrial purposes, they should be destroyed in accordance with California Well Standards as governed by the California Department of Water Resources, and permit requirements of the KCEHSD. The wells would have a less than significant impact on the proposed Project.

A domestic well is located north of the modular shop building and should be destroyed in accordance with California Well Standards as governed by the California Department of Water Resources, and permit requirements of the KCEHSD. If it is determined that the well be utilized as a water source, then the well does not need to be destroyed. The well would have a less than significant impact on the proposed Project.

Applications of pesticides and herbicides have been conducted according to RMPs obtained annually from the Kern County Agricultural Commissioner's Office. Agricultural chemicals are typically applied in dilute concentrations, and when used properly, degrade relatively quickly. However, it is not known if environmentally persistent pesticides and herbicides have been applied to the proposed Project in the past. Generally, sampling and analysis of surface soils from properties with similar pesticide and herbicide application histories has typically yielded non-detectable results for analyses of elevated concentrations of environmentally persistent pesticides and/or herbicides. The potential for elevated concentrations of environmentally-persistent pesticides and herbicides to exist in the near-surface soils of the proposed Project, which would require regulatory action, is low. Therefore, less than significant impacts would occur.

It is possible that asbestos-containing materials could be present in subsurface concrete irrigation (transite) pipe on-site. Concrete pipe was documented in information obtained from the Kern County Assessor-Recorder's Office. If subsurface concrete irrigation pipe is located on-site, the SJVAPCB shall be contacted for proper disposal procedures and requirements. If any subsurface concrete irrigation pipe is removed from the proposed Project site, it would be removed according to SJVAPCD regulations and would be considered to be a less than significant impact.

If Valley Fever spores occur within the boundaries of the proposed Project, with the absence of mitigation, there is potential for the infection of construction workers and surrounding residents, as well as within the proposed Project area. Mitigation measures designed to reduce the amount of fugitive dust during grading activities would reduce the likelihood of Valley Fever to a less than significant level; (refer to Section 4.3, *Air Quality*). Covering of portions of the Project site with landscaping material and/or with impervious roadway surfaces and buildings would reduce the long-term potential release of Valley Fever spores to a less than significant level.

Due to the scope and nature of the proposed Project, the level of risk associated with hazardous materials on the proposed Project site is considered significant. However, a less than significant impact would occur in this regard after compliance with State and applicable local regulations and the following mitigation measures.

Mitigation Measures

MM 4.9-34: Discovered/Spilled Hazardous Waste Materials. The Project proponent shall continuously comply with the following:

1. If suspect materials or wastes of unknown origin are discovered during construction on the project site, which is thought to include hazardous waste materials the following shall occur:

    a. All work shall immediately stop in the vicinity of the suspected contaminant;

    b. Project Construction Manager shall be notified;

    c. Area(s) shall be secured as directed by the Project Construction Manager;

    d. Notification shall be made to the Kern County Environmental Health Services Division/Hazardous Materials Section for consultation, assessment, and appropriate actions; and,

    e. Copies of all notifications and correspondence shall be submitted to the Kern County Planning and Natural Resources Department.

MM 4.9-45: Hazardous Materials Specialist. Prior to issuance of the grading permit, a qualified hazardous materials specialist shall inspect each power pole on-site with a transformer. Those containing polychlorinated biphenyls shall be removed by the hazardous specialist and disposed of at an appropriate hazardous materials disposal site to the satisfaction of Department of Toxic Substances Control. The hazardous materials specialist shall provide a short report to the Kern County Planning and Natural Resources Department and the Kern County Environmental Health Services Division/Hazardous Materials Section for review and approval.

Prior to construction, Pacific Gas and Electric Company (PG&E) shall be contacted regarding the disposition of pole-mounted transformers. In the event of a future release or leak of insulating fluids from any of the pole-mounted transformers, PG&E shall be contacted for their removal or replacement.

MM 4.9-56: Known/Discovered Well Remediation. Prior to start of construction, the abandoned petroleum prospect well shall be located, exposed, and re-abandoned, if required, to conform to the current abandonment requirements of the California

Department of Conservation, Division of Oil, Gas and Geothermal Resources and the Kern County Department of Environmental Health Services.

MM 4.9-6~~7~~: **Final Maps and Grading Plans, Notes.** The following note shall appear on all final maps and grading plans: "If during grading or construction, any plugged and abandoned or unrecorded wells are uncovered or damaged, the Department of Oil, Gas and Geothermal Resources will be contacted to inspect and approve any remediation required."

MM 4.9-7~~8~~: **Underground Service Alert One-call.** Prior to grading or excavating the Underground Service Alert One-call center shall be contacted at (800) 227-2600. The proposed excavation area shall be delineated with white marking paint or with other suitable markers such as flags or stakes at least two days prior to commencing any excavation work. A "Dig Alert" ticket number would be issued at the time Underground Service Alert is contacted. Excavating is not permitted without this ticket number and is valid for twenty-eight days. Underground Service Alert would notify its member utilities having underground facilities in the area. Underground Service Alert does not notify nonmember utilities or energy companies, or Caltrans.

MM 4.9-8~~9~~: **Ruptured Pipeline Safety.** If a rupturing of a pipeline should occur during excavation and construction activities the Kern County Fire Department and Pacific Gas and Electric Company should be contacted immediately. Natural gas transmission pipeline rupture most often indicates an emergency situation and 9-1-1 should be dialed. If an emergency is not indicated, the Kern County Fire Department-Greenfield Station 52, located at 312 Taft Highway, should be contacted at (661) 834-5144. Non-Emergency telephone numbers for the Kern County Fire Department number (661) 324-6551 and the project proponent shall follow all safety and cleanup regulations.

MM 4.9-9~~10~~: **On-site Water Wells.** If the on-site water wells are not to be used for irrigation or industrial purposes, they shall be destroyed in accordance with California Well Standards as governed by the California Department of Water Resources, and permit requirements of the Kern County Environmental Health Services Division.

MM 4.9-10~~11~~: **Herbicides.** Prior to the issuance of grading or building permits for the project, if herbicides are to be utilized, the contractor or personnel applying herbicides must have the appropriate State and local herbicide applicator licenses and comply with all State and local regulations regarding herbicide use.

1. Herbicides shall be mixed and applied in conformance with the product manufacturer's directions.

2. The herbicide applicator shall be equipped with splash protection clothing and gear, chemical resistant gloves, chemical spill/splash wash supplies, and material safety data sheets for all hazardous materials to be used.

3. To minimize harm to wildlife, vegetation, and waterbodies, herbicides shall not be applied directly to wildlife, products identified as non-toxic to birds and small mammals shall be used if nests or dens are observed.

4. Herbicides shall not be applied if it is raining at the site, rain is imminent, or the target area has puddles or standing water, and shall not be applied when wind velocity exceeds 10 miles per hour.

5. If spray is observed to be drifting to a non-target location, spraying shall be discontinued until conditions causing the drift have been abated.

MM 4.9-11~~12~~: **Asbestos Containing Materials.** If asbestos containing materials are identified during construction (particularly in the concrete irrigation (transite) pipe located on-site, then the San Joaquin Valley Air Pollution Control District shall be contacted for removal and disposal procedures. These procedures shall be followed in order to eliminate asbestos exposure to construction workers and surrounding workers and residents.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-3: The Project Would Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous, Substances, or Waste Within One-Quarter Mile of an Existing or Proposed School.

Due to the active agricultural uses of the proposed Project site, it is anticipated that pesticides have been used on-site, and that residues remain within the on-site soils. There are no existing schools located within one-quarter mile of the proposed Project. Currently, McKee Middle School and McKee Primary School are located approximately 1.5 miles north of the proposed Project and General Shafter Elementary School is located approximately 1.0 to the southwest. Additionally, the use, storage, and transportation of hazardous materials that would occur as part of construction and operation of the proposed Project would be more than 0.25 miles from these schools, thus potential impacts are considered less than significant in this regard.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-4: The Project Would Be Located on a Site That is Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Code Section 65962.5 and, as a Result, Would Create a Significant Hazard to the Public or the Environment.

An EDR, Inc. radius search and written report for the proposed Project site and properties within one mile were completed in July 2008, in conjunction with the Hazardous Materials Evaluation (McIntosh and Associates 2008; refer to Appendix N). The search of Federal, State, and local agencies environmental records found no records for the proposed Project site. Three facilities were identified on one or more of the databases searched for the EDR report. These facilities are listed on the following databases: Solid Waste/Landfill-listed facility; CORTESE, LUST, HIST UST, CA FID UST; and SWEEPS UST. The facilities identified include Lamb Chops, YCT, and Limi Brothers Farm. In addition, five "orphan sites" were identified in the EDR report. "Orphan sites" are sites that the EDR report cannot map due to insufficient information. In addition, the Hazardous Materials Evaluation (McIntosh and Associates 2017; refer to Appendix F) included a more recent record search.

The proposed Project is not included on any hazardous materials sites lists. The proposed project would not create a hazard to the public or environment through the transport, disposal and/or use of hazardous materials, and it would not create a public hazard through emissions of hazardous materials, accidental or otherwise. Impacts are considered less than significant, and mitigation is not required.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-5: The Project Would Be Located Within an Within the Adopted Kern County Airport Land Use Compatibility Plan Resulting in a Safety Hazard for People Residing or Working in the Project Area.

The proposed Project site is not located within two miles of a public airport or public use airport as shown in the Kern County Airport Land Use Compatibility Plan (ALUCP).

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-6: The Project Would Result in a Safety Hazard for People Residing or Working in the Project Area from a Private Airstrip.

A private airstrip (Costerisan Farms Airport) was located two miles northwest of the proposed Project site; however, this private airstrip is no longer in use (pilotnav 2017). No other private airstrips are within two miles of the proposed Project site. Therefore, this airstrip is not expected to result in a safety hazard for the construction workers and future employees of the proposed Project site. Less than significant impacts are anticipated.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-7: The Project Would Impair Implementation of, or Physically Interfere with, an Adopted Emergency Response Plan or Emergency Evacuation Plan.

There is no information in the record to date that indicates the proposed Project would interfere with the operation of any roadway, facility, or area that would be used as part of an emergency response plan or emergency evacuation plan. Impacts would be less than significant, and mitigation is not required.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.9-8: The Project Would Expose People or Structures to a Significant Risk of Loss, Injury or Death Involving Wildland Fires, Including Where Wildlands are Adjacent to Urbanized Areas or Where Residences Are Intermixed with Wildlands.

As discussed in Impact 4.18-1, the proposed Project is not located adjacent to a wildland area. The proposed Project site is located in an area with a mixture of agricultural, industrial, and residential land uses, which are not considered susceptible to wildland fires. Therefore, wildland fires do not have the potential to affect the site and no impacts would occur.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Impacts related to hazardous materials and hazardous substances are considered site-specific and are generally mitigated to less than significant levels on a project-by-project basis. Compliance with Federal, State, and local regulations would ensure that contamination or exposure to hazardous substances is avoided or controlled to minimize the risk to the public on a project-by-project basis, as the cumulative projects are constructed. For the proposed Project, all potential hazards and potentially hazardous materials or situations that could result from release of hazardous substances would be mitigated to less than significant levels following compliance with Federal, State, and local regulations. Therefore, implementation of the proposed Project in conjunction with future projects would result in less than significant cumulative impacts for hazards or hazardous materials.

Mitigation Measures

Implement Mitigation Measures MM 4.9-1 through MM 4.9-12.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.10

Hydrology and Water Quality

Section 4.10
Hydrology and Water Quality

4.10.1 Introduction

The purpose of this section is to describe the hydrologic and water quality setting of the proposed Project and surrounding area. This section also evaluates the potential impacts the proposed Project will have on water resources. A Water Supply Assessment was prepared by Yarne & Associates in January 2019. See Appendix H, Water Supply Assessment.

4.10.2 Environmental Setting

Climate

The proposed Project lies within the southern Central Valley of California, which has rainy winters and dry summers, characteristic of a Mediterranean climate. The Central Valley has greater temperature extremes than the coastal areas because it is less affected by the moderating influence of the Pacific Ocean.

Ninety percent of annual rainfall in the southern Central Valley occurs during the period between November and April. Infrequent summer thunderstorms and showers from tropical depressions account for the remaining rainfall. Average annual precipitation is about 5.7 inches, which is a relatively small amount. By comparison, Los Angeles County receives an annual average of 14.8 inches, Sacramento receives an average of 17.5 inches per year, and Bishop, which is on the dry eastern side of the Sierra Nevada mountain range (near Death Valley), receives an annual average of 5.4 inches.

Hydrology

Metropolitan Bakersfield, located in a semi-arid region, relies on groundwater, the Kern River and two water importation projects for its water supply for agricultural and municipal usage. The region receives a normal annual precipitation of approximately 5 to 13 inches, which categorizes the area as a desert or steppe; most of the precipitation falls between November and April.

Regional Surface Water Resources

Kern River

The Kern River is the only significant stream in Metropolitan Bakersfield. From an elevation of 775 feet above mean sea level at the mouth of the Kern River Canyon, westward to an elevation of 325 feet at Interstate 5, the Kern River is a unique resource in a desert environment. The river begins on the western flank of Mount Whitney in the southern Sierra Nevada and flows in a southwest direction.

Several minor streams flow into the Kern River, which exists as a contained basin except during high runoff years. The Kern River Basin includes approximately 2,100 square miles of watershed area above Isabella Dam, about 300 square miles of foothill area below the dam, and about 600 square miles of alluvial fan below the mouth of the Kern River Canyon. The basin is fully diverted and used; however, during very wet years, the Kern River reaches the flood channel located on the west of the valley floor and carries water into the Tulare Lake bed. The river flows have been regulated since the completion of Isabella Dam in 1953.

Tulare Lake Basin

The proposed Project is located within the Central Valley's Tulare Lake Basin; the Diablo and Temblor Mountain Ranges are to the west, the San Emigdio and Tehachapi Mountains are to the south, and the Sierra Nevada Mountains are to the east and southeast. The Tulare Lake Basin encompasses approximately 10.5 million acres. The basin is approximately 170 miles long and 140 miles wide; the Central Valley floor comprises less than one-half of the total Basin area. The Tulare Lake Basin drains to the San Joaquin River Basin only during years of heavy rainfall. The Tulare Lake Basin is under the jurisdiction of the Central Valley Regional Water Quality Control Board (RWQCB), which is responsible for designing and implementing the Tulare Basin Plan.

Regional Surface Water Supply

There are three major sources of surface water available in the Metropolitan Bakersfield General Plan area: the Kern River, the Central Valley Project (CVP), and the State Water Project (SWP). Historically, the Kern River has been the primary source of surface water to Kern County. It originates in the southern Sierra Nevada and flows in a south and southwesterly direction to the Central Valley northeast of Bakersfield. SWP water is supplied from the Sacramento/San Joaquin Delta area and is delivered through the California Aqueduct to Kern County and other areas. CVP water is delivered to the Kern County area through the Friant-Kent Canal. This canal begins at Friant Dam and Millerton Lake and flows southerly to its terminus at the Kern River upstream of the Project area.

Of the three principal sources of water, Kern River and Friant-Kern Canal water are higher quality water producers than SWP water. The quality of Kern River water near Bakersfield is excellent, as is the water quality of the Friant-Kern Canal.

Local Surface Water Setting

The proposed Project is relatively level, sloping southwesterly at an average rate of approximately 7.5 feet per mile. Precipitation is rarely enough to cause flowing water from the site, as most of the water percolates into the soil. The proposed Project overlies the Kern County sub-basin of the San Joaquin Valley Groundwater basin within the Tulare Lake Hydrologic Region.

Physical Characteristics of Surface Water Quality

Standard parameters used to assess the quality of stormwater provide a method of measuring impairment. The backgrounds of these typical characteristics assist in understanding water quality requirements. The quantity of a material in the environment and its characteristics determine the

degree of availability as a pollutant in surface runoff. In an urban environment, the quantity of certain pollutants in the environment is a function of the intensity of the land use. For instance, high density of automobile traffic makes a number of potential pollutants (such as lead and hydrocarbons) more available. The availability of a material, such as a fertilizer, is a function of the quantity and the manner in which it is applied. Applying fertilizer in quantities that exceed plant needs leaves the excess nutrients available for loss to surface or ground water.

The physical properties and chemical constituents of water have traditionally served as the means for monitoring and evaluating water quality. Evaluating the condition of water through a water quality standard refers to its physical, chemical or biological characteristics. Water quality parameters for stormwater make up a long list and are classified in many ways. In many cases, the concentration of an urban pollutant, rather than the annual load of that pollutant, is needed to assess a water quality problem.

Flooding

The Kern River has been subject to severe flooding from storms and snowmelt in the upper portion of its watershed. According to the Kern River Floodway Draft Environmental Impact Report dated June 1988, a worst-case maximum precipitation possible storm for the climate of the Kern River area would have produced an estimated peak discharge above Bakersfield of 204,000 cubic feet per second (cfs). In 1867, levees were first constructed in Bakersfield to protect from flood damage. The annual average runoff for the Kern River is estimated at 700,000 acre-feet per year, of which most is diverted to agricultural uses. The flood of November 1950 had a peak flow of 36,000 cfs and led to the construction of the Isabella Dam and Reservoir in 1953, which significantly reduced flood hazards in the southern San Joaquin Valley and the greater Metropolitan Bakersfield area.

Flooding of the Kern River has resulted from high-intensity winter rainstorms which generally occur from November through April. Flooding can also be caused by snowmelt, which occurs in the late spring and early summer months. However, snowmelt is less damaging because it has a longer period of runoff and a lower peak than rain floods.

Within the past 40 years, seven major floods have occurred including, the 1998 flood caused by the El Niño weather pattern. These floods have been investigated by the Kern County Water Agency (KCWA) and the U.S. Army Corp of Engineers (USACE). Since 1971, the United States Department of Housing and Urban Development (HUD) has designated the unincorporated portions of Kern County as a special flood hazard area. In compliance with the Federal Flood Insurance Program, HUD has provided Kern County with a series of eighty-three Flood Hazard Boundary Maps. These maps delineate major areas of flooding throughout the County.

The proposed Project site is located within the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map Zone X. According to FEMA, Zone X consists of: areas within and outside the 0.2 percent annual chance floodplain, areas of 1-percent annual chance sheet flow flooding where average depths are less than 1 foot, areas of 1-percent annual chance stream flooding where the contributing drainage area is less than 1 square mile, or areas protected from the 1-percent annual chance flood by levees. Flood insurance purchase is not required in these zones.

Dam Inundation

Isabella Dam is located approximately 40 miles northeast of the City of Bakersfield, near a major fault line. Isabella Dam is earth-filled and is approximately 185 feet high, 1,725 feet long, and can hold 570,000-acre feet of water.

Because Isabella Dam is near an active fault line, the potential for seismic activity to cause dam failure exists. If the dam fails, the entire lake storage would be released and approximately 60 square miles of the Metropolitan Bakersfield area would be flooded. Flood levels have the potential to reach 30 feet, with peak inundation at the Project site having the potential to be 5 to 10 feet depending on the water level in the lake. The proposed Project is expected to be inundated within ten to twelve hours after dam failure. This lag time would provide adequate time for warning and would substantially decrease the number of deaths and injury; however, property damage would occur. The chance of dam failure occurring is approximately one day in 10,000 years when the lake is at maximum capacity.

Groundwater

Groundwater is subsurface water that occurs beneath the ground surface in fully saturated zones within soils and other geologic formations. Groundwater in a saturated geologic unit with sufficient permeability and thickness to store sufficient water to sustain a well or spring is defined as an aquifer. A groundwater basin is defined as a hydrogeologic unit containing one large aquifer or several connected and interrelated aquifers.

Metropolitan Bakersfield rests above a series of water aquifers that form part of a larger groundwater basin called the San Joaquin Groundwater Basin. The primary aquifer below Metropolitan Bakersfield is made up of unconsolidated sediments bordered by faults or mountain ranges to the east, west and south. Groundwater within the Basin occurs under unconfined, confined and semi-confined conditions.

Groundwater recharge in the basin consists primarily of the percolation of excess irrigation applications, with lesser contributions supplied by river and canal seepage, artificial recharge programs of water agencies, and municipal and industrial wastewater. Direct recharge from precipitation is only a minor source of supply.

Historically, water quality degradation has been noticed in many wells in Kern County. Groundwater contamination in the area includes nitrates, ethylene dibromide (EDB), and dibromochloropropane (DBCP). As a result of the historical use of the area as cultivated agriculture, a number of groundwater contaminants have been introduced over a period of years. In many cases, recent efforts to limit such discharge have led to a reduction or complete cessation of new sources of contamination. Many uses, however, continue to contribute significant quantities of contaminants to the groundwater.

Three principal sources for ongoing groundwater contamination exist in the area: septic systems, cultivated agriculture, and the petroleum industry. By design, septic systems discharge nitrified effluent into soils surrounding the systems. Cultivated agriculture contributes pollutants through nitrogen fertilizer application resulting in a measurable increase in groundwater nitrates throughout

the area. A past source of groundwater contamination was the application of EDB and DBCP to control crop damage.

Petroleum production and refining contributes contamination through direct application of spilled or leaked crude oil and petroleum products to the ground surface and through the use of corrosion inhibitors in the well development process. Pollutants resulting from this activity typically include hydrocarbons and phenols that have entered the subsurface soils through injection or by percolation.

Groundwater recharge in the Basin is currently obtained through the following sources:

Natural Recharge. Natural recharge of groundwater is provided by precipitation runoff, which is defined as the amount of melted snow and rainwater measured after evaporation, evapotranspiration, and percolation.

River and Canal Seepage. Canal seepage is defined as the amount of water that percolates into the ground from earthen canals.

Spreading and Banking. Percolation of water spread in open basins has been used to replenish the groundwater system. Fifteen agencies operate groundwater banking programs in Kern County, which can store up to 5.7 million-acre-feet of water during wet years. The largest is the Kern Water Bank (KWB), a 7,000-acre groundwater recharge facility located in and along the Kern River channel, in response to concerns regarding groundwater supplies. The City of Bakersfield operates the "2800 Acres" groundwater recharge facility, a 2,800-acre groundwater recharge facility located in and along the Kern River channel, in response to concerns regarding groundwater supplies. The facility receives water from the Kern River, the Central Valley Project, and the State Water Project when they have water surpluses. The six-mile long site is made up of river channels, overflow lands and constructed spreading basins. The groundwater is recharged in this facility by spreading water onto spreading basins, then allowing it to percolate. The recharge facility improves groundwater quality by recharging low- salinity water from the Kern River into the aquifers, which dilutes the high-salinity irrigation water that reaches the groundwater from adjacent farming operations.

To eliminate potential overdraft conditions in which more groundwater is used than is replenished, surface water was made available to former groundwater users via the Friant-Kern Canal and the State Water Project. These supplemental surface water supplies, in conjunction with the recharge facilities, have generated inflow into the groundwater basin that exceeds the outflow, as is indicated by the steady rise in groundwater levels since 1992.

Water Quality

Surface water quality is subject to Federal, State, and local water quality requirements that are administered and enforced by the U.S. Environmental Protection Agency (EPA), the California State Water Resources Control Board (SWRCB), and the California Regional Water Quality Control Board (RWQCB), with cooperation from each county.

The principal law governing pollution of the nation's surface waters is the Federal Water Pollution Control Act (Clean Water Act [CWA]). Originally enacted in 1948, it was amended in 1972 and has remained substantially the same since. The CWA consists of two major parts: provisions that

authorize federal financial assistance for municipal sewage treatment plant construction and regulatory requirements that apply to industrial and municipal dischargers. The CWA authorizes the establishment of effluent standards on an industry basis. The CWA also requires states to adopt water quality standards that "consist of the designated uses of the navigable waters involved and the water quality criteria for such waters based upon such uses".

To achieve its objectives, the CWA is based on the concept that all discharges into the nation's waters are unlawful, unless specifically authorized by a permit. The National Pollutant Discharge Elimination System (NPDES) is the permitting program for discharge of pollutants into surface waters of the United States under Section 402 of the CWA. Thus, industrial and municipal dischargers (point source discharges) must obtain NPDES permits from the Central Valley RWQCB. The existing NPDES (Phase I) stormwater program requires municipalities serving more than 100,000 persons to obtain a NPDES stormwater permit for any construction project larger than five acres. Proposed NPDES stormwater regulations (Phase II) expand this existing national program to smaller municipalities with populations of 10,000 persons or more and construction sites that disturb greater than one acre. For other dischargers, such as those affecting groundwater or from non-point sources, a Report of Waste Discharge must be filed with the RWQCB. For specified situations, some permits may be waived and some discharge activities may be handled through being included in an existing general permit.

While the EPA has two permitting options to meet NPDES requirements (individual permits and general permits), the SWRCB has elected to adopt one statewide General Permit for California that applies to all construction-related stormwater discharges, except for those on tribal lands, in the Lake Tahoe Hydrologic Unit, and under the control of the California Department of Transportation (Caltrans).

Construction activity subject to this General Permit includes any clearing, grading, stockpiling, or excavation that results in soil disturbances of at least one acre of total land area. Construction activities disturbing less than one acre are still subject to this permit if the activity is part of a large common plan of development or if significant water quality impairment will result from the activity.

The General Permit requires all dischargers whose construction activity disturbs one acre or more to:

- Develop and implement a Stormwater Pollution Prevention Plan (SWPPP) that specifies Best Management Practices (BMPs) to prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off-site into receiving waters;
- Eliminate or reduce non-stormwater discharge to storm sewer systems and other waters of the United States; and
- Inspect all BMPs.

Construction activities disturbing less than one acre are required to prevent the pollution of stormwater runoff from the construction activities with the usage of erosion and sediment control BMP's as specified in the site development sections of the California Green Code.

4.10.3 Regulatory Setting

Federal Regulations

Clean Water Act (CWA)

The CWA is a federal law that protects the nation's water quality for surface waters, including lakes, rivers, coastal wetlands, and "waters of the United States". The CWA specifies that discharges to waters are illegal, unless authorized by an appropriate permit. The permits regulate the discharge of dredged and fill materials, construction-related stormwater discharges, and activities that may result in discharges of pollutants to waters of the United States. If waters of the U.S. are located on a project site, a proposed project is likely to discharge to them, and if impacts on them are anticipated, the project must obtain a CWA Section 401 Water Quality Certification from the appropriate RWQCB.

National Pollutant Discharge Elimination System (NPDES)

The NPDES program is administered by the EPA, which delegates oversight in California to the Regional Water Quality Control Boards.

The NPDES program provides general permits and individual permits. The general permits are for construction projects that disturb more than one acre of land. The general permit requires the applicant to file a public notice of intent to discharge stormwater and to prepare and implement a SWPPP. The SWPPP includes a site map, description of proposed activities, demonstration of compliance with applicable ordinances and regulations, and a description of BMPs that would be implemented to reduce erosion and discharge of construction-related pollutants.

Stormwater Pollution Prevention Plan (SWPPP)

The SWPPP has two major objectives: to help identify the sources of sediment and other pollutants that affect the quality of stormwater discharges, and to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in both stormwater and in non-stormwater discharges.

BMPs include activities, practices, maintenance procedures, and other management practices that reduce or eliminate pollutants in stormwater discharges and authorized non-stormwater discharges. BMPs include treatment requirements, operation procedures, and practices to control site runoff, spillage, leaks, waste disposal and drainage from raw materials storage. BMP implementation must take into account changing weather conditions and construction activities, and various combinations of BMPs may be used over the life of the project to maintain compliance with the CWA. The General NPDES Permit gives the owner the discretion to determine the most economical, effective and innovative BMPs to achieve the performance-based goals of the General NPDES Permit.

There are two types of BMPs: structural and nonstructural. Structural BMPs are the specific construction, modification, operation, maintenance, or monitoring of facilities that would minimize the introduction of pollutants into the drainage system or would remove pollutants from the drainage system. Nonstructural BMPs are activities, programs and other nonphysical measures that help reduce

pollutants from nonpoint sources to the drainage system. In general, nonstructural BMPs are source control measures.

The issue of pollution in stormwater and urban runoff has been recognized by both Federal and State agencies, and there has been a growing concern regarding activities that discharge water affecting California's surface water, coastal waters, and groundwater. Discharges of water are classified as either point source or non-point source discharges. A point source discharge usually refers to waste emanating from a single, identifiable point. Regulated point sources include municipal wastewater, oil field wastewater, winery discharges, solid waste sites and other industrial discharges. Point source discharge must be actively managed to protect the state's waters. A nonpoint source discharge usually is a waste emanating from diffused locations. As a result, specific sources of nonpoint source pollution may be difficult to identify, treat, or regulate. The goal is to reduce the adverse impact of nonpoint source discharges on water resources through better management of these activities. Nonpoint sources include drainage and percolation from a variety of activities such as agriculture, forestry, recreation, and storm runoff.

Impaired Waterbodies

The CWA Section 303(d) and the California's Porter-Cologne Water Quality Control Act (described below) require the State to establish the beneficial uses of its State waters and to adopt water quality standards to protect those beneficial uses. Section 303(d) establishes a Total Maximum Daily Load (TMDL), which is the maximum quantity of a particular contaminant that a water body can maintain without experiencing adverse effects, to guide the application of State water quality standards. Section 303(d) also requires the State to identify "impaired" streams (water bodies affected by the presence of pollutants or contaminants) and to establish the TMDL for each stream.

State Regulations

Department of Water Resources

The California Department of Water Resources' (DWR's) major responsibilities include preparing and updating the California Water Plan to guide development and management of the State's water resources; planning, designing, constructing, operating, and maintaining the State Water Resources Development System; regulating dams; providing flood protection; assisting in emergency management to safeguard life and property; educating the public; and serving local water needs by providing technical assistance. In addition, DWR cooperates with local agencies on water resources investigations; supports watershed and river restoration programs; encourages water conservation; explores conjunctive use of ground and surface water; facilitates voluntary water transfers; and, when needed, operates a State drought water bank.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act acts in cooperation with the CWA to establish the State Water Resources Control Board (SWRCB). The SWRCB is divided into nine regions, each overseen by a RWQCB. The SWRCB, and thus each RWQCB, is responsible for protecting California's surface waters and groundwater supplies.

The Porter-Cologne Water Quality Control Act develops Basin Plans that designate the beneficial uses of California's rivers and groundwater basins. The Basin Plans also establish narrative and numerical water quality objectives for those waters. Basin Plans are updated every three years and provide the basis of determining waste discharge requirements, taking enforcement actions, and evaluating clean water grant proposals. The Porter-Cologne Water Quality Control Act is also responsible for implementing CWA Sections 401-402 and 303(d) to SWRCB and RWQCBs.

Senate Bills 610 (Chapter 643, Statutes of 2001) and 221 (Chapter 642, Statutes of 2001)

SB 610 and SB 221 are companion measures that seek to promote more collaborative planning among local water suppliers and cities and counties. They require that water supply assessments occur early in the land use planning process for all large-scale development projects. If groundwater is the supply source, the required assessments must include detailed analyses of historic, current, and projected groundwater pumping and an evaluation of the sufficiency of the groundwater basin to sustain a new project's demands. They also require an identification of existing water entitlements, rights, and contracts and a quantification of the prior year's water deliveries. In addition, the supply and demand analysis must address water supplies during single and multiple dry years presented in 5-year increments for a 20-year projection. Under SB 221, approval by a county of a subdivision of more than 500 homes requires an affirmative written verification of a sufficient water supply.

Sustainable Groundwater Management Act

In 2014, California enacted the Sustainable Groundwater Management Act (SGMA; Water Code Section 10720 et seq.). SGMA, and related amendments to California law, require that all groundwater basins designated as high or medium priority in the DWR California Statewide Groundwater Elevation Monitoring (CASGEM) Program, and that are subject to critical overdraft conditions, must be managed under a new Groundwater Sustainability Plan (GSP) or a coordinated set of GSPs, by January 31, 2020. High or medium priority basins that are not subject to a critical overdraft must be regulated under one or more GSPs by 2022. Where GSPs are required, one or more local Groundwater Sustainability Agencies (GSAs) must be formed to implement applicable GSPs. A GSA has the authority to require registration of groundwater wells, measure and manage extractions, require reports and assess fees, and to request revisions of basin boundaries, including establishing new subbasins. GSAs must have been formed for high and medium priority basins by June 2017. All of the Kern County Subbasin has been included in exclusive GSA's as mandated by SGMA.

The 2.8 million acres of valley portion of Kern County has been designated a high priority and the 250,000 acres of the Indian Wells Valley sub-basin which includes the City of Ridgecrest and China Lake Naval Weapons Station has been classified a medium priority basin. Both are under mandatory requirements to form a GSA and create a GSP that achieves sustainability in 20 years.

Each GSP must include a physical description of the covered basin, such as groundwater levels, groundwater quality, subsidence, information on groundwater-surface water interaction, data on historical and projected water demands and supplies, monitoring and management provisions, and a description of how the plan will affect other plans, including city and county general plans. Under the

Act, the GSA is authorized to restrict pumping, levy assessments and fees and undertake water quality and quantity projects to rebalance the basin. The DWR must adopt regulations for the preparation of a GSP by January 2016. Emergency regulations for the preparation of the GSP's were approved by the California Water Commission on May 18, 2016. As defined by the Act, "sustainable groundwater management" means that groundwater use within basins managed by a GSP will not cause any of the following "undesirable results:" (a) chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed); (b) significant and unreasonable reductions in groundwater storage; (c) significant and unreasonable seawater intrusion; (d) significant and unreasonable degradation of water quality; (e) significant and unreasonable land subsidence; and (f) surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

Kern County is a member of the following GSA's: Cuyama Basin Groundwater Sustainability Agency, Indian Wells Valley Groundwater Authority and Kern Groundwater Authority which manages a portion of the valley sub-basin. The Valley portion of Kern County also is managed by the Kern River Groundwater Sustainability Agency which is comprised of the City of Bakersfield, Kern Delta Water District and Improvement District No. 4 of the Kern County Water Agency. An additional nine GSA's have also been formed to sustainably manage their respective portions of the Kern County subbasin.

Note: Effective December 11, 2018, the County of Kern withdrew from the Kern Groundwater Authority. The Kern County Water Agency (KCWA) was brought in as a cooperative member of Joint Powers Agreement to manage the white spaces. Five GSA's are preparing GSP's to manage the Kern subbasin per a Kern County Subbasin Coordination Agreement.

Municipal Recycled Water Landscape Irrigation Use Permit

The General Waste Discharge Requirements for Landscape Irrigation Uses of Municipal Recycled Water (Water Quality Order No. 2009-0006-DWQ) (Landscape Irrigation General Permit) regulates landscape irrigation with recycled water. Specified uses of recycled water considered to be "landscape irrigation" include any of the following: (i) parks, greenbelts, and playgrounds; (ii) school yards; (iii) athletic fields; (iv) golf courses; (v) cemeteries; (vi) residential landscaping and common areas (not including individually owned residential areas); (vii) commercial landscaping, except eating areas; (viii) industrial landscaping, except eating areas; and (ix) freeway, highway, and street landscaping. Producers or distributors of recycled water must submit a Notice of Intent for coverage under the Landscape Irrigation General Permit. This permit is not required for individual recycled water users and does not cover use of harvested stormwater for irrigation.

Producer and Distributor Responsibilities

Producers must deliver disinfected tertiary recycled water as defined by California Code of Regulations (CCR) Title 22, sections 60301.230 and 60301.320, which address disinfection requirements and "filtered wastewater" requirements, respectively. Producers are responsible for ensuring that recycled water meets the quality standards for disinfected tertiary recycled water as described in Title 22 and any associated waste discharge requirement order for the water reclamation plant. Distributors are responsible for drafting and submitting an operations and maintenance plan to

the SWRCB. The operations and maintenance plan contents are contained in a permit, and include operation and maintenance/management of transport facilities and associated infrastructure necessary to convey and distribute recycled water from the point of production to the point of use. Additionally, distributors must designate a Recycled Water Use Supervisor for each use area. A permit also addresses best management practices, including general operations and maintenance, which producers and distributors must apply to manage recycled water and prevent water quality impacts.

Usage

A permit establishes terms and conditions of discharge to ensure that the discharge does not unreasonably affect beneficial uses of groundwater and surface water. This includes minimum setback distances, signage, application control, and use restrictions, along with other preventative measures, such as backflow prevention and cross-contamination programs.

California Green Building Standards Code (CALGreen Code)

The State of California enacted The California Green Building Standards Code (CALGreen Code) as part 11 of The California Building Standards Code (Title 24). The 2016 CALGreen Code, effective on January 1, 2017, contains measures that are designed to improve public health, safety, and general welfare by utilizing design and construction methods that reduce the negative environmental impact of development and encourage sustainable construction practices.

The CALGreen Code provides mandatory direction to developers of all new construction and renovations of residential and non-residential structures with regard to all aspects of design and construction, including but not limited to site drainage design, stormwater management, and water use efficiency. Required measures are accompanied by a set of voluntary standards that are designed to encourage developers and cities to aim for a higher standard of development.

Under the CALGreen Code, all residential and non-residential sites are required to be planned and developed to keep surface water from entering buildings and to incorporate efficient outdoor water use measures. Construction plans are required to show appropriate grading and surface water management methods, such as swales, water collection and disposal systems, French drains, and rain gardens. Plans should also include outdoor water use plans that utilize weather or soil moisture-controlled irrigation systems. In addition to the above-mentioned requirements, non-residential developments are also required to develop:

- A Stormwater soil loss prevention plan[1];
- An irrigation budget for landscapes greater than 2,500 square feet, and
- A quantified plan to reduce waste water by 20 percent through use of water-efficient fixtures or non-potable water systems, such as use of harvested rainwater, grey water, and/or recycled water.

CALGreen also offers a tiered set of voluntary measures to encourage residential and non-residential development that goes beyond the mandatory standards to reduce soil erosion, rainwater capture and infiltration, and use of recycled and/or grey water systems. Non-residential developers are further encouraged to integrate treatment BMPs that result in zero net increase in runoff due to development

[1] Kern County, 2016 Cal Green Stormwater BMP (January 2017).

and can treat runoff from the 85th percentile storms. Furthermore, by meeting overall environmental performance goals for the specified categories (e.g., planning and design, energy efficiency, water efficiency and conservation, etc.), buildings can be designated as CALGreen Tier 1 or Tier 2, with the Tier 2 designation having more stringent goals than the Tier 1 designation.

Assembly Bill (AB) 1750 (Rainwater Capture Act of 2012)

Assembly Bill (AB) 1750 (AB 1750), also known as the Rainwater Capture Act of 2012, allows residential, commercial, and government land owners to install, operate, and maintain rainwater collection systems that would not otherwise directly enter a saltwater body through a constructed conveyance and treatment system. Under AB 1750, rainwater is defined as precipitation on any public or private parcel that has not entered an off-site storm drain system or channel, a flood control channel, or any other stream channel, and has not previously been put to beneficial use. AB 1750 permits the following uses for rooftop runoff: rain barrel system for outdoor non-potable use, rain collection system for outdoor non-potable use or infiltration into groundwater, and rain collection system for indoor non-potable use. Additional requirements are included for indoor non-potable use. Compliance with any local rainwater or stormwater capture programs continues to be required under AB 1750.

California Water Conservation Executive Orders

Beginning in January 2014, Governor Jerry Brown issued three Executive Orders (EOs), B-26-14, B-28-14, B-29-15, B-37-16, and B-40-17 regarding water supply, water demand, and water use within the State during severe drought conditions. EO B-29-15, issued April 1, 2015, sets limitations not only for existing land uses and water supply systems, but also for new construction. Some of these restrictions include:

- The Water Board shall prohibit irrigation with potable water of ornamental turf on public street medians. (EO B-29-15, Save Water, Action #6)
- The Water Board shall prohibit irrigation with potable water outside of newly constructed homes and buildings that is not delivered by drip or microspray systems. (EO B-29-15, Save Water, Action #7)
- The California Energy Commission shall adopt emergency regulations establishing standards that improve the efficiency of water appliances, including toilets, urinals, and faucets available for sale and installation in new and existing buildings. (EO B-29-15, Increase Enforcement Against Water Waste, Action #16)

In addition, EO B-29-15 requires that DWR update the State Model Water Efficient Landscape Ordinance through expedited regulation by the end of 2015. This ordinance will increase water efficiency standards for new and existing landscapes through more efficient irrigation systems, greywater usage, onsite stormwater capture, and by limiting the portion of landscapes that can be covered in turf (EO B-29-15, Increase Enforcement Against Water Waste, Action #11).

On November 13, 2015, Governor Brown issued EO B-36-15, which upheld the previous EOs, and directs the SWRCB to extend of urban water use restrictions through October 31, 2016 based on drought conditions known through January 2016. The SWRCB issued Emergency Regulations on

February 2, 2016, in compliance with EO B-36-15. These emergency regulations maintain the current tiers of required water reductions; however, additional adjustments in response to stakeholders; equity concerns were included in the Emergency Regulations.

In addition, DWR and the U.S. Bureau of Reclamation have finalized the 2016 Drought Contingency Plan that outlines State Water Project and Central Valley Project operations from February through November 2016. The 2016 Drought Contingency Plan was developed in coordination with staff from State and federal agencies. The 2016 Drought Contingency Plan communicates overarching goals for 2016 water management and the potential operations needed to achieve those goals.

In May 2016, Governor Brown issued EO B-37-16, which upheld the previous EOs, and directs local agencies to provide new permanent water use targets for each urban water supplier and concrete improvements to drought preparedness. The order bolstered the State's drought resilience and preparedness by establishing longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating clearly wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. Local agencies are required to publicly disclose the projections and calculations used to determine their conservation standards, and to continue monthly water conservation reporting. EO B-37-16 calls for wise water use and less water waste to become permanent changes to prepare for more frequent and persistent periods of limited water supply. On April 7, 2017, EO B-40-17 lifted the drought emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne counties. EO B-40-17 builds on EO B-37-16, which continues to remain in effect, to continue to make water conservation a way of life in California.

Biosolids Regulations

Biosolids generated during wastewater treatment are regulated by the State under SWRCB Water Quality Order No. 2004-0012-DWQ, Final General Waste Discharge Requirements for Land Application of Biosolids for Use as a Soil Amendment in Agricultural, Silvicultural, Horticultural, and Land Reclamation Activities. This order, implemented under the federal biosolids rules (40 CFR Part 503), applies to all land application of Class A and Class B biosolids and "exceptional quality" biosolids-derived mixtures consisting of 50 percent or more biosolids. The order establishes permitting, monitoring, and reporting requirements. Local ordinances, described below, also regulate the disposal of biosolids in Kern County.

Local

Metropolitan Bakersfield General Plan

The goals and policies of the Metropolitan Bakersfield General Plan relating to water and water quality include water conservation, balancing competing demands for water, and protecting the quality of groundwater and surface water resources. The goals and policies that apply to the proposed Project are listed in Table 4.10-1, *Metropolitan Bakersfield General Plan Goals and Policies for Hydrology and Water Quality*, below.

Table 4.10-1. Metropolitan Bakersfield General Plan Goals and Policies for Hydrology and Water Quality
Goals and Policies: Hydrology and Water Quality
Goal #2: Assure that adequate groundwater resources remain available to the planning area.
Goal #3: Assure that adequate surface water supplies remain available to the planning area.
Goal #4: Continue cooperative planning for and implementation of programs and projects which will resolve water resource deficiencies and water quality problems.
Goal #5: Achieve a continuing balance between competing demands for water resource usage.
Goal #6: Maintain effective cooperative planning programs for water resource conservation and utilization in the planning area by involving all responsible water agencies in the planning process.

4.10.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the proposed Project are evaluated on a qualitative basis through a comparison of the anticipated Project effects with the existing hydrologic environment. The change in the hydrologic environment is significant if the effect described under the criteria below occurs. The evaluation of Project impacts is based on professional judgment, analysis of the County's hydrology and water quality policies and the significance criteria established by Appendix G of the California Environmental Quality Act (CEQA) Guidelines, which the County has determined to be appropriate criteria for this Recirculated Draft EIR.

Thresholds of Significance

- The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:
- Violate any water quality standards or waste discharge requirements;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;

- Substantially degrade water quality;
- Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam; and/or
- Be subject to inundation by seiche, tsunami, or mudflow.

Project Impacts

Impact 4.10-1: The Project Would Violate Any Water Quality Standards or Waste Discharge Requirements.

With future urban development of the site, the proposed Project would increase urban pollutant discharge, especially during short-term construction phases. The discharge of materials other than stormwater from a particular site is prohibited. With urban development projects, the pollutants of concern include silt and sediment, oil and grease, floatable trash, nutrients (including fertilizers), heavy metals, pathogens (such as coliform bacteria) and other substances. Discharge of these substances, referred to as "controlled pollutants," into waters of the United States is prohibited.

Future proposed developments that involve grading and construction would contribute to an increase in pollution discharge. Individual development projects would be required to mitigate short-term construction impacts pursuant to the NPDES criteria and standards on a project-by-project basis. The purpose of the NPDES permit is to ensure that the proposed Project area would eliminate or reduce construction-related sediments and pollutants during stormwater runoff. Construction sediment erosion can be adequately controlled through the application of standard construction BMPs. The goal of BMPs is to capture and treat "first flush" stormwater run-off generated by surrounding and on-site watersheds. Water quality management BMPs for grading and construction scenarios may include the use of sand bags and straw bales for run-off diversion and velocity reduction, mulch topping, hydro-seeding and siltation fencing to prevent soil loss and measures to minimize vehicular leaking and spilling. Additionally, within Kern County, post-development compliance with NPDES is regulated by the Kern County Standard Urban Water Mitigation Plan (SUSMP). Projects within the City are required to comply with the SUSMP through the implementation of the City's Drainage Manual. Implementation of the following mitigation measures, in addition to compliance with the NPDES requirements, would reduce construction-related impacts on water quality to a less than significant level. Implementation and compliance with the SUSMP would reduce post development impacts to less than significant levels.

Mitigation Measures

Implement Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geologic and Seismic Hazards.*

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-2: The Project Would Substantially Deplete Groundwater Supplies or Interfere Substantially With Groundwater Recharge Such That There Would be a Net Deficit in Aquifer Volume or a Lowering of the Local Groundwater Table Level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).

The agricultural uses on the Project site are irrigated using two existing on-site wells that supply groundwater to the existing agricultural uses. It is estimated that 50% of the irrigation supply is from the wells and the other 50% from Kern Delta Water District (KDWD) surface waters. The average annual irritation rate is 977.2-acre feet/year (AFY) and based on this volume, the existing agricultural uses would use approximately 488.6 AFY of groundwater.

Groundwater recharge from irrigated agricultural is a function of many variables which include weather, hydrologic conditions, irrigation practices, crops, soils, geologic conditions, etc. Recharge for the existing Project site was calculated using the total volume of irrigation and precipitation minus water losses associated with other factors. For the proposed Project a general estimate of agricultural recharge to groundwater was made by estimating that groundwater recharge at the existing site is on average 25% of the irrigated amount. Based on this percentage, the existing irrigated agricultural operations would result in approximately 122.15 AFY (25% of 488.6) of the pumped groundwater being returned to the water table with the balance, approximately 366.15 AFY of the pumped groundwater being lost through evapotranspiration.

The estimated water use for the proposed Project at build out in 2025 is approximately 544.5 AFY, which is approximately 432.7 AFY less than the existing agricultural operations and 187.5 AFY less than the water lost through evapotranspiration alone. The initial irrigation water requirement for landscaped areas of the proposed Project is estimated to be 39 AFY and 86.7 AFY at project build out. Water for on-site irrigation of Project landscaping will be provided by recycled water from the on-site wastewater treatment plant. The WSA conservatively estimated that total demand for landscape irrigation at 47.4 AFY. Considering this savings added to the overall reduction in demand as a result of the proposed Project, this results in a total reduction in water demand of approximately 480.12 AFY. This is illustrated in Table 4.10-2, *Different Between Existing and Proposed Water Usage*, below.

Table 4.10-2. Difference Between Existing and Proposed Water Usage

Type	Without Reclaimed Water (AFY)	With Reclaimed Water (AFY)
Avg. Existing Agricultural Use	977.2	977.22
Proposed Project Use	544.5	497.1
Difference	432.7	480.12

AFY = Acre-Feet Per Year
Source: Yarne & Associates, 2019.

Water for the proposed Project would be supplied by CalWater from the Bakersfield District. On average from 2011-2015 water to the District is 58% from groundwater, 16% from the Kern River purchased from the City of Bakersfield and treated by CalWater's North East Bakersfield Water Treatment Plant (NEBWTP); 5% from the Kern River purchased from the City treated at the North West Treatment Plant (NWWTP); and 21% from the Kern River or State Water Project (SWP) water from Improvement District No. 4 (ID-4) of the Kern County Water Agency (KCWA).

The groundwater sub-basin is not anticipated to be affected by the proposed Project, primarily due to the substantial reduction of water required between existing agricultural uses and proposed industrial and commercial uses. Additionally, the use of groundwater will be reduced because the on-site groundwater wells would no longer be used for water for the proposed Project. CalWater and other water suppliers including KDWD, KCWA and the City of Bakersfield also have ongoing and increasing programs to replenish the groundwater aquifers in normal and wet years with water banking programs to be used in future drought years and use of recharge basins. Additionally, groundwater sustainability plans and water conservation programs and best management practices continue to reduce overall water use including groundwater and increase efficiency and recharge. Lastly, according to the Water Supply Assessment, there would be an adequate supply of groundwater over the next 20 years, and there is a surplus groundwater production capacity. Therefore, impacts in this regard would be less than significant.

Because groundwater would no longer be pumped from under the Project site, adjacent water wells would not experience a drawdown effect of their existing supplies from the proposed Project. In addition, infiltration of surface water and lateral transfer of groundwater across the movement gradient would continue to replenish the aquifers beneath the proposed Project site. Please see Section 4.17, *Utilities*, Impact 4.17-4 for additional discussion regarding the proposed Project's impacts to groundwater supplies.

Mitigation Measures

Implementation of Mitigation Measure MM 4.17-1 through MM 4.17-5, as described in Section 4.17, *Utilities*.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-3: The Project Would Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream Or River, in a Manner Which Would Result in Substantial Erosion or Siltation On- or Off-Site.

The proposed Project site is relatively flat, with a low potential for runoff. Additionally, the topography of the Project site would remain similar to the existing conditions during site grading and construction. The development of industrial uses, landscaping, and roadways would alter the drainage pattern within the proposed Project through the introduction of impervious surfaces. Any water that is anticipated to drain off-site would be required by the County to drain into storm drain structures. The use of storm drain infrastructure reduces the amount of surface runoff and would potentially

reduce flooding impacts. Implementation of the following mitigation measures would reduce erosion or siltation impacts to less than significant levels.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geology and Seismic Hazards*.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-4: The Project Would Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner Which Would Result in Flooding On- or Off-Site.

The development of industrial uses, landscaping, and roadways would alter the drainage pattern within the proposed Project through the introduction of impervious surfaces. Any water that is anticipated to drain off-site would be required by the County to drain into an approved storm drain structure or be retained on site. The use of storm drain infrastructure reduces the amount of surface runoff and would potentially reduce flooding impacts.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geologic and Seismic Hazards.*

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-5: The Project Would Create or Contribute Runoff Water Which Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Substantial Additional Sources of Polluted Runoff.

The proposed Project would add impervious surfaces to the Project site with the development of industrial uses and associated landscaping and roadways and potentially increase the amount of stormwater exiting the site. Surface runoff velocities, volumes and peak flow rates would increase as well and could flow off-site if not properly contained. Water that is anticipated to drain off-site would be required by the County to drain to storm drain structures, including detention or retention basins. Drainage collection facilities within the proposed Project would be constructed as development occurs and would be designed in accordance with local improvement standards and specifications. In addition, the Metropolitan Bakersfield General Plan has goals and policies to ensure that adequate storm drainage facilities are constructed to maintain a comprehensive storm drainage system to serve all urban development within Metropolitan Bakersfield. Pursuant to Kern County requirements, new

developments are required to provide their own on-site retention or illustrate that existing facilities have sufficient capacity to carry the additional runoff. If a stormwater drainage study is needed, the study would determine the size of retention basin(s) and optimal pipeline sizes that are needed to accommodate stormwater from the proposed project. These stormwater facility designs would be reviewed and approved by Kern County. Site improvement standards for drainage areas would be determined by the County of Kern as a function of the Precise Development Plan, Conditional Use Permit, or land division procedure. This would ensure that all drainage facilities are designed to accommodate runoff stormwater. With implementation and compliance with legal and regulatory requirements and the goals and policies of the Metropolitan Bakersfield General Plan and Kern County Ordinance Code, drainage impacts would be reduced to a less than significant level.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geologic and Seismic Hazards*.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-6: The Project Would Otherwise Substantially Degrade Water Quality.

With the future urban development of the site, the proposed Project would result in an increase in urban pollutant discharge, especially during short-term construction phases. The discharge of materials other than stormwater from a particular site is prohibited. With urban development projects, the pollutants of concern include silt and sediment, oil and grease, floatable trash, nutrients (including fertilizers), heavy metals, pathogens (such as coliform bacteria), and other substances. Referred to as "controlled pollutants", discharge of these substances into waters of the United States is prohibited.

During construction of the proposed Project, pollutants from the site could potentially increase substantially as a result of soil disturbance and construction operations. Initial clearing and grading operations during construction would expose much of the surface soils and may release pollutants into runoff from the site that would result in an adverse water quality impact.

Erosion and sedimentation caused by construction activities are dependent upon climatic and site conditions, as well as the degree of disturbance and type of construction project. As indicated above sedimentation resulting from the excessive erosion of disturbed soils, is the primary pollutant of concern. Other pollutants of concern include phosphorous and nitrogen from fertilizers, pesticides, petroleum products, construction chemicals, soil additives and solid waste are often generated by construction projects. The following is a brief discussion of typical pollutants related to construction activities:

- Nutrients – Heavy use of commercial fertilizers can result in discharge of nutrients to water bodies where they may cause excessive algae growth. Nitrogen, phosphorous, and potassium are the major nutrients used for fertilizing new landscape and constriction sites.

- Trace Metals – Over half of the metal load carried in stormwater is associated with sediments as metals both absorb to solid particulate matter (total suspended solids) and are washed off in dissolved forms. Galvanized metals, paint, or preserved wood may contain metals which may, if uncontrolled, enter the stormwater and impact downstream receiving waters.
- Pesticides – The three most commonly used forms of pesticides at construction sites are herbicides, insecticides and rodenticides. Unnecessary or improper application of pesticides may directly or indirectly contaminate surface water bodies.
- Other Toxic Chemicals – If improperly stored and/or disposed of, synthetic organic compounds that may be used at construction sites (such as adhesives, cleaners, sealants, and solvents) may have an adverse impact on receiving waters.
- Miscellaneous Wastes – Miscellaneous wastes may include water from concrete mixers, paints and painting equipment cleaning activities, solid wastes from land clearing activities, wood and paper material from packaging of building material, and sanitary wastes. Improper disposal of construction wastes may directly or indirectly pollute runoff and receiving water bodies.

The proposed Project would be required to include a drainage system. Additionally, future proposed developments that involve grading and construction would contribute to an increase in pollution discharge. Individual development projects would be required to mitigate short-term construction impacts pursuant to the NPDES criteria and standards on a project-by-project basis. The purpose of the NPDES permit is to ensure the proposed Project area would eliminate or reduce construction related sediments and pollutants during stormwater runoff. Construction sediment erosion can be adequately controlled through the application of standard construction BMPs. The goal of BMPs is to capture and treat "first flush" stormwater run-off generated by surrounding and on-site watersheds. Water quality management BMPs for grading and construction scenarios may include the use of sand bags and straw bales for run-off diversion and velocity reduction, mulch topping, hydro-seeding and siltation fencing to prevent soil loss and measures to minimize vehicular leaking and spilling. Implementation and compliance with mitigation measures and the NPDES requirements would reduce construction-related impacts to water quality to a less than significant level.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geology and Seismic Hazards.*

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-7: The Project Would Place Housing Within a 100-Year Flood Hazard Area as Mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or Other Flood Hazard Delineation Map.

No residences would be constructed in association with this proposed Project, and the Project is not located within a 100-year flood hazard area. The proposed Project is located within the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map Zone X. According to FEMA,

Zone X consists of: areas within and outside the 0.2 percent annual chance floodplain, areas of 1-percent annual chance sheet flow flooding where average depths are less than 1 foot, areas of 1-percent annual chance stream flooding where the contributing drainage area is less than 1 square mile, or areas protected from the 1-percent annual chance flood by levees. Flood insurance purchase is not required in these zones. Due to this small percentage, it is not anticipated that flooding hazards would occur within the Project site.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-8: The Project Would Place Within a 100-Year Flood Hazard Area Structures Which Would Impede or Redirect Flood Flows.

The proposed Project is not located within a 100-year flood hazard area. Refer to Impact 4.10-7, above.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-9: The Project Would Expose People or Structures to a Significant Risk of Loss, Injury or Death Involving Flooding, Including Flooding as a Result of the Failure of a Levee or Dam.

The closest dam to the proposed Project is the Isabella Dam. Isabella Dam is located approximately forty miles northeast of the proposed Project site and has a capacity to hold 570,000 acre-feet of water. If an earthquake were to occur in the vicinity, it could potentially result in a break in the dam. This could, under certain conditions, cause the entire lake storage to be released, which would result in flooding 60 square miles of the Metropolitan Bakersfield area (Kern County 2008). It would take approximately 10- 12 hours from the time the dam breaks for the water from Isabella Dam to reach the Project site, allowing adequate time for warning and to evacuate the area. The chance of the Isabella Dam failing entirely, with the lake at capacity, is approximately one day out of 10,000 years. The impacts to the proposed Project from dam failure are considered less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.10-10: The Project Would Be Subject to Inundation By Seiche, Tsunami, or Mudflow.

The proposed Project is located far enough from a large body of water that the site would not be impacted by seiche or tsunami. Additionally, as the Project site and surrounding area is relatively flat, the potential for a mudflow to occur is very low.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Cumulative effects related to hydrology resulting from implementation of the proposed Project and development in the vicinity and surrounding areas may expose more persons and property to potential water hazards. Cumulative development may also adversely affect downstream water quality, impacting surface and groundwater supplies. The potential cumulative impact is mitigated through required drainage studies to identify potential impacts, relationship to City and County drainage master plans, and implementation of appropriate on-site and off-site drainage improvements. Projects are also required to implement NPDES and BMP measures on a project basis to reduce potential water quality impacts. In addition, projects may require drainage improvements to be in compliance with the Metropolitan Bakersfield General Plan and Kern County Ordinance Code standards in addition to local and regional agency requirements, as part of the discretionary review process. There are no cumulative impacts associated with the proposed Project.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geology and Seismic Hazards*, and Mitigation Measure MM 4.17-1 through MM 4.17-5, as described in Section 4.17, *Utilities*.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.11

Land Use and Relevant Planning

Section 4.11
Land Use and Relevant Planning

4.11.1 Introduction

This section describes the environmental setting for land use and planning. Information in this section is based on information provided in the technical studies (refer to Appendices A through N). Ground and aerial photographs for the on-site and surrounding land use analysis as well as the following reference documents: Final Environmental Impact Report (EIR) for the Metropolitan Bakersfield General Plan, Metropolitan Bakersfield General Plan, Kern County General Plan, Title 16 of the Bakersfield Municipal Code, and the Kern County Ordinance Code. The purpose of this section is to identify the existing land use conditions, to analyze proposed Project compatibility with existing uses and consistency with relevant planning policies and to recommend mitigation measures to eliminate or reduce the significance of potential impacts.

4.11.2 Environmental Setting

The following section discusses the existing land uses in the Project area and land use conditions, such as type of use and densities adjacent to the Project site that would influence land use compatibility (refer to Figure 4.11-1, *On-Site and Surrounding Uses*). The environmental setting of the Project site consists of the physical conditions or existing land uses on the Project site and in the surrounding areas.

On-Site Land Use

The proposed Project site consists of disked land and has been utilized for agricultural purposes; primarily row-crop agriculture consisting of alfalfa, corn, wheat, and grain. A steel storage building associated with agricultural activities is located in the eastern portion of the site, near South Union Avenue (SR-204). There is one plugged and abandoned oil well located within the proposed Project boundaries (Big McKittrick Oil Company "Sea Cliff-Houghton" 1). In addition, two active, diesel-powered irrigation wells and one domestic well are located on-site.

On-Site and Surrounding Land Uses

Figure 4.11-1

Surrounding Land Use

Existing adjacent land uses include vacant land and agricultural uses to the north, agricultural uses and a small cluster of single-family residential homes to the east, SR-99 to the west, and agricultural uses and an automobile wrecking yard located south/southeast of proposed Project site. The following table, Table 4.11-1, *Surrounding Land Use*, provides a detailed description of the land uses for the properties adjacent to the site:

Table 4.11-1. Surrounding Land Use

Location	Land Use / Metropolitan Bakersfield General Plan Land Use Designations
North	Vacant / Agriculture: R-IA (Resource-Intensive Agriculture), LMR (Low Medium Density Residential, 4 to 10 units per acre), HMR (High Medium Density Residential, 7.26 to 17.42 units per acre), SR (Suburban, 4 units per acre), and GC (General Commercial)
East	Agriculture / Single-Family Residential / State Route 204: R-IA (Resource-Intensive Agriculture), RR (Rural Residential), and SI (Service Industrial)
South	Agriculture / Automobile Wrecking Yard: RI-A (Resource-Intensive Agriculture), RR (Rural Residential, 2½ acres per unit), and HC (Highway Commercial)
West	State Route 99 / Agriculture: PT (Public Transportation) and R-IA (Resource-Intensive Agriculture)

The area surrounding the proposed Project is undergoing various types of land use entitlements and development that will be consistent with the proposed Project.

4.11.3 Regulatory Setting

The proposed Project's relationships with the Metropolitan Bakersfield General Plan, the Kern County Zoning Ordinance, and other related policy planning documents are described below.

Local

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan is a policy document designed to give long-range guidance for decision-making affecting the future character of the Metropolitan Bakersfield planning area. The Metropolitan Bakersfield General Plan is a joint effort between the Kern County Planning Department and the City of Bakersfield Planning Division. It was last adopted on December 11, 2007, includes both City and unincorporated County lands, and is currently undergoing an update. It represents the official statement of the community's physical development as well as its economic, social and environmental goals. The Metropolitan Bakersfield General Plan contains goals and policies regarding the following Elements: Land Use, Circulation, Housing, Conservation, Open Space, Noise, Safety, Public Services and Facilities and Parks. An additional element includes the Kern River Plan, which helps to define goals and policies for issues unique to the Metropolitan Bakersfield area. The Metropolitan Bakersfield General Plan was utilized throughout this RDEIR as the fundamental planning document governing development on the Project site. Background information and policy information from the Metropolitan Bakersfield General Plan are cited in several sections of the RDEIR. Table 4.11-2, *Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies*, below, provides a list of policies applicable to the proposed Project.

The proposed Project site and surrounding area are within the City of Bakersfield Sphere of Influence (SOI), defined as a plan for the probable physical boundary and service area of the City. This is the boundary in which all goals, policies and programs in the Metropolitan Bakersfield General Plan are applicable.

The Metropolitan Bakersfield General Plan has separated the City into four quadrants with State Route 99 (SR-99) serving as the north-south axis and Stockdale Highway (SR-58) serving as the east-west axis. These four quadrants are further subdivided into developed urban and rural-undeveloped areas. As a general rule, the City's SOI boundaries were utilized to help define the boundaries of planned urban growth. However, Pages II-2 through II-5 of the Metropolitan Bakersfield General Plan provide an overview of the basic principles for new urban areas and development in peripheral areas. The development concepts are referred to as "mixed-use activity centers." The following is an excerpt from Pages II-2 through II-5. Figure 4.11-2 *General Plan Land Use Policy Concept* Figure II-2 of the General Plan.

Overview of the General Plan Basic Principles for New Urban Areas

The Metropolitan Bakersfield General Plan Land Use Map is depicted in Figure II-1, located in the back of this document. The plan map provides a graphic depiction of the general plan's development policies and indicated that land use designations for which pertinent policies and standards have been established. Two basic principles govern the plan: the focusing of new development into distinctive centers which are separated by low land use densities and the siting of development to take advantage of the environmental setting. These principles are defined as the "centers" and "resource" concepts respectively. Figure II-2 conceptually illustrates these land use principles.

The "centers" concept provide for a land use pattern consisting of several concentrated mixed-use commercial and high density residential centers surrounded by medium density residential uses. Centers may be differentiated by functional activity, density/intensity, and physical character. Single-family residential uses are located between these mixed-use commercial/residential centers primarily.

CUP #5, CUP #6, GPA #1, ZCC #2, MAP 143-07 • AGRICULTURAL PRESERVE #13 EXCLUSION

General Plan Land Use Policy Concept

Figure 4.11-2

This concept encourages people to live and work in the same area, thus, serves to minimize sprawl, reduce traffic, travel time, infrastructure costs, and air pollution. In addition to promoting the formation of several large concentrated mixed-use centers, the plan attempts to consolidate smaller, neighborhood-serving commercial development by prescribing minimum distances between commercial parcels and by discouraging strip commercial development.

The "resources" concept emphasizes the siting of development to reflect the planning area's natural and visual resources; its river, canals, and foothills. The "resources" concept uses as a point of departure, the 1984 Kern River Plan Element (as amended), which takes advantage of the recreational potential of the river while respecting the river's sensitive natural habitats and aesthetic resources. It is proposed that linkages to unique resources be encouraged. Policies have been included in the plan to promote utilization and sensitivity of natural and visual resources.

Basic Principles for Development of Peripheral Areas

New development on the periphery of urban Bakersfield will be focused in ten new mixed-use activity centers located in the southwest, northwest and northeast. It is expected that the southwest center would include a mix of professional office and retail uses, moderate density residential, and would filter outwards to lower suburban-type densities. Although depicted in Figure II-2 in policy concept form, actual land use designations for the southwest center and the area around it will be determined through a more detailed land use and environmental analysis. In depth analysis of the southwest center is warranted due to its growth potential and its related impacts, impact on prime agricultural lands, and potential to impact the Kern River corridor resource. The northwest center will contain retail commercial, light industrial, moderate and high density residential, and will be surrounded by low and estate residential densities. The center in the northeast will include retail commercial, professional office, moderate and high density residential, and will filter outwards to lower densities.

The plan encourages that each center: (a) focus on a major open space amenity, such as a park or water body; (b) link land uses to the Kern River where possible; and (c) exhibit pedestrian sensitivity with appropriate design applied to encourage pedestrian activity. In addition to these three activity centers, peripheral development will be focused in smaller community centers, such as in the Greenfield and Lamont areas, with local-serving commercial services and residential uses.

As a general rule, the sphere of influence boundary was utilized to help define the boundaries of planned urban growth. However, there are two exceptions to this. The most obvious exception is the southwest center. Here, while the commercial center lies within the sphere of influence, the single-family residential densities extend beyond the western boundary of the present sphere of influence. Justification for extending beyond the sphere of influence boundary includes the following: (a) rapid growth has already taken place in this direction in recent years and show no signs of slowing; (b) the area presents an opportunity to capitalize on the Kern River as a visual and aesthetic resource; and (c) the ease with which services may be extended. The second exception occurs in Oildale. In particular, a major new airport terminal with supporting commercial and industrial uses are master planned just north of the existing terminal at Meadows Field."

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Circulation Element - Streets	
Streets Policy #36: Prevent streets and intersections from degrading below Level of Service "C" where possible due to physical constraints (as defined in a Level of Service Ordinance) or when the existing Level of Service is below "C" prevent where possible further degradation due to new development with a three-part mitigation program: adjacent right-of-way dedication, access improvements and/or on area-wide impact fee. The area-wide impact fee would be used where the physical changes for mitigation are not possible due to existing development and/or the mitigation measures is part of a larger Project, such as freeways, which will be built at a later date.	Appropriate fees would be applied to the future development of the proposed Project in order to accommodate the expansion of required utilities, facilities, and infrastructure.
Streets Policy #37: Require new development and expansion of existing development to pay for necessary access improvements, such as street extensions, widenings, turn lanes, signals, etc., as identified in the transportation impact report as may be required for a Project.	Refer to analysis for Circulation/Streets Goal #3 and Policy #36.
Streets Policy #39: Require new development and expansion of existing development to pay or participate in its pro rata share of the costs of expansions in area-wide transportation facilities and services which it necessitates.	Refer to analysis for Circulation/Streets Goal #3 and Policy #36.
Streets Policy #40: Provide new local street systems that are logical and comprehensible and systems of street names and addresses that are simple, consistent, and understandable.	Future roadway extensions and improvements shall be implemented in accordance with Kern County Ordinance Code requirements.
Streets Policy #41: Plan alignments for local streets to permit economical and practical patterns, shapes, and sizes of development parcels.	Future roadway extensions and improvements shall be implemented in accordance with Kern County Ordinance Code requirements.
Circulation Element - Transit	
Transit Goal #2: Provide a street system and land development policies that support public transportation"	Refer to this section for a detailed description of available public transportation.
Transit Goal #3: Provide cost effective public transportation services.	Refer to analysis in Circulation/Transit Goal #2.
Transit Goal #4: Reduce traffic congestion and parking requirements and improve air quality through improved transportation services.	Refer to analysis in Circulation/Transit Goal #2.
Transit Policy #1: Consider transit service issues in the design of the arterial and collector street system.	Future roadway extensions and improvements shall be implemented in accordance with Kern County Ordinance Code requirements.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Transit Policy #4: Coordinate with GET [Golden Empire Transit] to locate bus stops as close as possible to the facilities they serve.	The Project Applicant shall work with the GET to locate bus stops as close as possible to the proposed Project site in an effort to provide residents with sufficient access to public transit service.
Circulation Element - Bikeways	
Bikeways Goal #1: Provide a circulation system which recognizes and responds to the needs of bicycle travel.	Future roadway extensions and improvements shall be implemented in accordance with Kern County Ordinance Code requirements.
Bikeways Goal #2: Provide a circulation system that minimizes cyclist/motorist conflicts.	Refer to analysis in Bikeways Goal #1.
Bikeways Policy #5: Consider bicycle safety when implementing improvements for automobile traffic operations.	Refer to analysis in Bikeways Goal #1.
Bikeways Policy #7: Provide bicycle parking facilities at activity centers such as shopping centers, employment sites, and public buildings.	Refer to analysis in Bikeways Goal #1.
Circulation/Bikeways Policy #9: Require new subdivisions to provide bike lanes on collector and arterial streets in accordance with the Bikeway Master Plan.	Refer to analysis in Bikeways Goal #1.
Circulation Element - Parking	
Circulation/Parking Goal #1: Provide an efficient parking system to respond to the needs of motorists.	Future parking improvements shall be implemented in accordance with Kern County Ordinance Code requirements.
Circulation/Parking Goal #2: Satisfy parking requirements in all new developments (residential, commercial, industrial, etc.) through off-street facilities.	Refer to analysis in Circulation/Parking Goal #1.
Circulation/Pedestrian Ways Element Goals	
Circulation/Pedestrian Ways Goal #2: Provide adequate sidewalks throughout the planning area.	Development on-site shall be subject to County design review, Kern County Ordinance Code, and Metropolitan Bakersfield General Plan requirements.
Circulation/Pedestrian Ways Element Policies	
Safety Element Goal #2: Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development of metropolitan police and fire facilities and services.	The proposed Project site is within fire and sheriff/police service areas and is not anticipated to create and additional need for police and fire services. Any potential increase in the cost to maintain and staff additional fire or sheriff/police protection services would be paid for by property tax revenues generated by the proposed Project.
PSF School Policy #1: New development will be required to pay its proportional share of the cost of school impact fees within the Plan area.	The Project Applicant/Developer is required to pay developer fees to mitigate impacts to elementary and middle schools.
PSF Park Policy #3: "Require developers to dedicate land, provide improvements and/or in lieu fees to serve the needs of the population in newly developing areas."	Appropriate fees would be applied to the future development of the proposed Project.
Conservation Element – Biological Resources	

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Biological Resources Goal #1: "Conserve and enhance Bakersfield's biological resources in a manner which facilitates orderly development and reflects the sensitivities and constraints of these resources."	A Biota Report was performed for the proposed Project. Due to the site's location within the Metropolitan Bakersfield Habitat Conservation Plan (MBHCP) boundary, the proposed Project would be required to pay biological impact mitigation fees. Additional mitigation measures are also required.
Biological Resources Goal #2: "To conserve and enhance habitat areas for designated 'sensitive' animal and plant species."	Refer to analysis for Biological Resources Goal #1.
Biological Resources Policy #1: "Direct development away from 'sensitive biological resource' areas, unless effective mitigation measures can be implemented."	Refer to analysis for Conservation/Biological Resources Goal #1.
Biological Resources Policy #2: "Preserve areas of riparian vegetation and wildlife habitat within floodways along rivers and streams, in accordance with the Kern River Plan Element and channel maintenance programs designed to maintain flood flow discharge capacity."	No riparian habitat is located within the proposed Project site.
Biological Resources Policy #3: "Discourage, where appropriate, the use of off-road vehicles to protect designated sensitive biological and natural resources."	Upon construction of the proposed Project, the Project site would not be vacant nor available for off-road vehicle use.
Biological Resources Policy #4: "Determine the feasibility of enhancing sensitive biological habitat and establishing additional wildlife habitat in the study area with State and/or Federal assistance."	Refer to the analysis for Conservation/Biological Resources Goal #1.
Biological Resources Policy #5: "Determine the locations and extent of suitable habitat areas required for the effective conservation management of designated "sensitive" plant and animal species."	No sensitive plant species occur on-site. Refer to the analysis for Conservation/Biological Resources Goal #1.
Biological Resources Policy #6: "Investigate the feasibility of including natural areas selected for the habitat conservation plan as a component of the regional park system."	Refer to the analysis for Conservation/Biological Resources Goal #1.
Conservation Element - Mineral Resources	
Mineral Goal #1: Protect areas of significant resources potential for future use.	The proposed Project site is not located within an oil or gas administrative boundary. The prospect well on the northwest portion of the site had no oil shows and one natural gas show and was abandoned in 1935. One natural gas pipeline traverses the proposed Project area. The proposed Project would be required to comply with appropriate setbacks for the on-site abandoned wells and natural gas pipelines in accordance with the Kern County Ordinance Code, Chapter 19.98, Oil and Gas Production, and Kern County Fire Department Pipeline Development Policies.
Mineral Goal #2: Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs.	No mineral and energy resource extraction areas occur on-site.
Mineral Goal #3: Avoid conflicts between the productive use of mineral and energy resource lands and urban growth.	The proposed Project would be required to comply with the Kern County Ordinance Code, Chapter 19.98, Oil and Gas Production. No productive mineral and energy resource lands are within, or adjacent to, the proposed Project site. Therefore, development of

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
	the proposed Project would avoid conflicts between the productive use of mineral and energy resource lands and urban growth.
Mineral Goal #4: Protect land, water, air and visual resources from environmental damage resulting from mineral and energy resource development.	Mineral and energy resource development would not occur as part of the proposed Project. Because the site is outside any oil or gas administrative boundary, future development of mineral and energy resources would be unlikely; however, should future development occur, it shall be evaluated for environmental impacts at the time the development is proposed.
Mineral Policy #1: Maintain maps and descriptions of potential mineral and energy resources as a basis for policy and program implementation.	This RDEIR provides information, including maps, on mineral and energy resources for the proposed Project and adjacent properties. Refer to the analysis for Mineral Goal #1, above.
Mineral Policy #2: Document the location, status and long-term viability of sand and gravel quarries and petroleum drilling sites for purposes of avoiding near and long-term land use conflicts and provide a basis of compliance monitoring.	The proposed Project does not contain sand and gravel extraction areas or petroleum drilling sites.
Mineral Policy #3: Encourage and support the exchange of information on mineral and energy resources between private industry, City of Bakersfield and Kern County.	This RDEIR provides information on mineral and energy resources for the proposed Project site and adjacent properties.
Mineral Policy #4: Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board.	The proposed Project will undergo discretionary review by Kern County. This RDEIR evaluates the presence and absence of mineral resources on the Project site and any potential impacts the proposed Project may have on the proposed mineral resources. This RDEIR will be utilized by decision makers to help them make an educated decision on the proposed Project.
Mineral Policy #5: Protect significant mineral and petroleum resource areas, including potential sand and gravel extraction areas.	Refer to the analysis for Mineral Goals #2 and #3 and Mineral Policy #2, above.
Mineral Policy #6: Continue implementation of the Kern River Channel Maintenance Program for extraction of river sand and gravel.	The proposed Project is not located within the Kern River Channel Maintenance Program.
Mineral Policy #7: Promote development of compatible uses adjacent to mineral extraction areas.	Refer to the analysis for Mineral Goal #3, above.
Mineral Policy #8: Allow development of resource extraction sites subject to the conditional use permit procedure in zones where such uses are not prohibited by right and where it can be shown that the proposed extraction uses are compatible with surrounding areas.	Resource extraction sites are not proposed as part of this Project. Any future development of mineral and energy resources shall be evaluated for environmental impacts at the time the development is proposed.
Mineral Policy #9: Encourage preservation of any known deposits of gemstones and fossils.	The proposed Project has not been identified as a potential quarry. Additionally, according to the Phase I Cultural Resources Survey prepared for the proposed Project, fossils are not anticipated to be encountered within the Project site.
Mineral Policy #10: Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce extraction operations.	Refer to the analysis for Mineral Goal #3 and Mineral Policies #1 and #3, above.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Mineral Policy #11: Prohibit incompatible development in areas, which have a significant potential to harm public health, safety and welfare due to mineral and petroleum extraction and processing.	Refer to the analysis for Mineral Goal #3, Mineral Policies #1 and #3, above, and Section 4.9, *Hazards/Hazardous Materials*.
Mineral Policy #12: Design resource extraction operations subject to discretionary permits to maintain the integrity of areas of "high environmental quality" and unique scenic value.	Resource extraction operations are not proposed as part of the proposed Project; therefore, discretionary permits would not be required. Any future development of mineral and energy resources shall be evaluated for environmental impacts at the time the development is proposed.
Mineral Policy #13: Require surface mineral resource extraction sites to have plans and procedures for land reclamation, conforming with the requirements of the State Mining and Geology Board, to be implemented upon completion of extraction operations at each site or portion thereof.	Refer to the analysis for Mineral Resource Goals #2 and 3, above and Mineral Policy #12, above.
Mineral Policy #14: Review all discretionary mineral or petroleum development including renewal of existing authorizations, under the policies and procedures of the California Environmental Quality Act.	Mineral or petroleum development is not proposed as part of this proposed Project. Refer to the analysis for Mineral Goal #3 and Mineral Policies #1 and #3, above.
Mineral Policy #15: Require petroleum production sites in urban areas, which are subject to discretionary permits to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways.	Resource extraction operations are not proposed as part of this Project. The proposed Project would be subject to the appropriate setbacks and landscaping for the abandoned well and the natural gas pipelines as required by the Kern County Ordinance Code, Chapter 19.98, Oil and Gas Production, and Kern County Fire Department Pipeline Development Policies.
Mineral Policy #16: Require all mineral development to be predicated on appropriate reclamation plans that meet the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and/or the standards of the State Division of Oil and Gas. Reclamation/ restoration of the sites shall be done at each phase of development or as extraction is completed.	Refer to the analysis for Mineral Goal #4, above. It is unlikely that mineral development would occur on-site. Any mineral development shall be required to comply with the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and/or the standards of the DOGGR.
Conservation Element – Soils and Agriculture	
Soils and Agriculture Goal #1: "Provide for the planned management, conservation, and wise utilization of agricultural land in the planning area."	The proposed Project is not consistent with this goal and will result in an unavoidable adverse impact.
Soils and Agriculture Goal #2: "Promote soil conservation and minimize development of prime agricultural land as defined by the following criteria: Capability Class I and/or II irrigated soils, 80-100 Storie Index rating, Gross crop return of $200 or more per acre per year, and Annual carrying capacity of one animal per acre per year."	As defined by the California Land Conservation Act (G.C. Section 51202) and the Metropolitan Bakersfield General Plan, prime agricultural soils comprise Class I and Class II soils, Storie index 80-100 soils, vineyards and orchards and soil that yields a minimum of $200 an acre per year. According to these standards, the proposed Project consists of prime soils.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Soils and Agriculture Goal #3: "Establish urban development patterns and practices that promote soil conservation and that protect areas of agricultural production of food and fiber crops, and nursery products."	Refer to analysis for Soils and Agriculture Element Goal #1.
Soils and Agriculture Policy #1: "Determine the extent and location of all prime agricultural land within the study area."	Approximately 314.30 acres of the proposed Project are located within an area designated prime agricultural land. Additionally, approximately 257.57 acres of the proposed Project are included in Agricultural Preserve No. 13. Therefore, implementation of the proposed Project would result in a significant and unavoidable impact. A Farmland Conversion Study has been prepared for the RDEIR and is included as Appendix B.
Soils and Agriculture Policy #2: "Review projects that propose subdividing or urbanizing prime agricultural land to ascertain how continued commercial agricultural production in the project vicinity would be affected."	Phased development of the proposed Project would allow for the continued use of prime agricultural land until buildout of the Project site occurs.
Soils and Agriculture Policy #3: "Protect areas designated for agricultural use, which includes Class I and II agricultural soils having surface delivery water systems, from the encroachment of residential and commercial subdivision development activities."	The proposed Project has Class II and III agricultural soils. Based on the California Land Conservation Act and the Metropolitan Bakersfield General Plan criteria for prime farmland, the proposed Project consists of 314.30 acres of prime agricultural lands. However, the proposed Project was identified for urbanization within the Metropolitan Bakersfield General Plan. Therefore, the proposed Project would not be considered an encroachment of commercial uses.
Soils and Agriculture Policy #4: "Monitor the amount of prime agricultural land taken out of production for urban uses or added within the plan area."	A Farmland Conversion Study has been prepared for the RDEIR and is included as Appendix B.
Soils and Agriculture Policy #6: "Continue implementing land grading ordinances that reduce soil erosion/siltation commonly associated with land development."	Project grading shall be conducted in accordance with applicable local grading ordinances, standards, and practices to minimize soil erosion and siltation.
Soils and Agriculture Policy #7: "Land use patterns, grading, and landscaping practices shall be designed to prevent soil erosion while retaining natural watercourses when possible."	Natural watercourses are not present within the proposed Project site. However, with implementation of mitigation measures in Section 4.7, *Geologic and Seismic Hazards*, and Section 4.10, *Hydrology and Water Quality*, impacts would be reduced to less than significant levels.
Soils and Agriculture Policy #9: "Protect prime agricultural lands against unplanned urban development by adopting agricultural zoning, general plan agriculture designation, and by encouraging use of the Williamson Act and supporting programs and policies that provide tax and economic incentives to ensure the long-term retention of agricultural lands."	The proposed Project is not situated on land under an existing Williamson Act Contract; however, it is identified as prime farmland. In addition, approximately 257.57 acres of the proposed Project are located in Agricultural Preserve No. 13. Approval and implementation of the proposed Project would result in a significant impact from the conversion of approximately 314.30 acres of soil that meet the requirements for prime farmland if water for irrigation were available.
Soils and Agriculture Policy #10: "Encourage landowners to retain their lands in agricultural production."	The proposed Project will remain under agricultural production as the various phases of the Project are constructed.
Soils and Agriculture Policy #12: "Prohibit premature removal of ground cover in advance of development and require measures to prevent soil erosion during and immediately after construction."	Refer to analysis for Soils and Agriculture Policy #6.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Soils and Agriculture Policy #13: "Minimize the alteration of natural drainage and require development plans to include necessary construction to stabilize runoff and silt deposition through enforcement of grading and flood protection ordinances."	Refer to analysis for Soils and Agricultural Policy #7.
Soils and Agriculture Policy #14: "When considering proposal to convert designated agricultural lands to non-agricultural use, the decision-making body of the city and County shall evaluate the following factors to determine the appropriateness of the proposal: Soil quality; Availability of irrigation water; Proximity to non-agricultural uses; Proximity to intensive parcelization; Effect on properties subject to "Williamson Act" land use contracts; Ability to be provided with urban services (sewer, water, roads, etc.); Ability to effect the application of agricultural chemicals on nearby agricultural properties; Ability to create a precedent-setting situation that leads to the premature conversion of prime agricultural lands; Demonstrated project need; and Necessity of buffers such as lower densities, setbacks, etc.	Refer to analysis for Soils and Agricultural Policy #3 and #9.
Conservation Element – Water Resources	
Water Quality Goal #2: Assure that adequate groundwater resources remain available to the planning area.	Based on the Water Supply Assessment, the proposed Project will withdraw 287.11 acre-feet of groundwater annually regardless of single or sequential dry years. The groundwater sub-basin will not be affected by the proposed Project primarily due to a large reduction of water required between existing agricultural uses and proposed industrial uses.
Water Quality Goal #3: Assure that adequate surface water supplies remain available to the planning area.	No surface water sources will be utilized for the proposed Project except as groundwater recharge.
Conservation Element - Air Quality	
Air Quality Goal #1: "Promote air quality that is compatible with health, well-being, and enjoyment of life by controlling point sources and minimizing vehicular trips to reduce air pollutants."	Stationary point sources (i.e., mechanical equipment) would be subject to applicable regulatory requirements. With regard to mobile emissions, the proposed Project would strive to reduce the number of vehicular trips to the site by the provisions of sidewalks, bicycle lanes and bicycle racks.
Air Quality Goal #2: Continue working toward attainment of Federal, State and Local standards as enforced by the San Joaquin Valley Air Pollution Control District."	Refer to analysis for Conservation/Air Quality Goal #1.
Air Quality Goal #3: "Reduce the amount of vehicular emissions in the planning area."	Refer to analysis for Conservation/Air Quality Goal #1.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Air Quality Policy #1: "Comply with and promote San Joaquin Valley Unified Air Pollution Control District (SJVAPCD) control measures regarding Reactive Organic Gases (ROG). Such measures are focused on: (a) steam driven well vents, (b) Pseudo-cyclic wells, (c) natural gas processing plant fugitives, (d) heavy oil test stations, (e) light oil production fugitives, (f) refinery pumps and compressors, and (g) vehicle inspection and maintenance."	Air Quality impacts have been analyzed and concluded to be significant and unavoidable since operational and cumulative ROG emissions would exceed San Joaquin Valle Air Pollution Control District (SJVAPCD) thresholds.
Air Quality Policy #2: "Encourage land uses and land use practices which do not contribute significantly to air quality degradation."	The proposed Project would provide development consistent with existing and approved development on nearby parcels, and would be located in an area of relatively lesser environmental sensitivity accommodating growth while balancing environmental considerations.
Air Quality Policy #3: "Require dust abatement measures during significant grading and construction operations."	As discussed in Section 4.3, *Air Quality*, the proposed Project would implement dust control techniques during construction activities in conformance with SJVAPCD Regulation VIII, the Kern County Ordinance Code, and required Mitigation Measures.
Air Quality Policy #4: Consider air pollution impacts when evaluating discretionary permits for land use proposals. Considerations should include: a) Alternative access routes to reduce traffic congestion, b) Development phasing to match road capacities, c) Buffers including increase vegetation to increase emission dispersion and reduce impacts of gaseous or particulate matter on sensitive uses."	The rate of development would proceed based largely on economic considerations, infrastructure improvements, market demands and other planning considerations. All plans are subject to review and approval by the Planning Department as part of the final Development Plan review process.
Air Quality Policy #11: "Improve the capacity of the existing road system through improved signalization and traffic control systems."	Refer to analysis for Circulation/Streets Policy #1 and #3.
Air Quality Policy #12: "Encourage the use of mass transit, carpooling and other transportation options to reduce vehicle miles traveled."	Refer to analysis for Circulation/Streets Policy #4.
Air Quality Policy #13: "Consider establishing priority parking areas for carpoolers in projects with relatively large numbers of employees to reduce vehicle miles traveled and improve air quality."	Refer to analysis for Circulation/Parking Element Goal #1 and #4.
Air Quality Policy #14: "Establish park and ride facilities to encourage carpooling and the use of mass transit."	Refer to analysis for Circulation/Streets Policy #4.
Air Quality Policy #16: "Cooperate with Golden Empire Transit [GET] and Kern Regional Transit to provide a comprehensive mass transit system for Bakersfield; require large-scale new development to provide related improvements, such as bus stop shelters and turnouts."	Refer to analysis for Circulation/Streets Policy #4.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Air Quality Policy #18: "Encourage walking for short distance trips through the creation of pedestrian friendly sidewalks and street crossings."	Refer to analysis for Circulation/Pedestrian Ways Goal #1 and #2.
Air Quality Policy #19: "Promote a pattern of land uses which locates residential uses in close proximity to employment and commercial services to minimize vehicular travel."	Refer to analysis for Circulation/Pedestrian Ways Goal #1.
Land Use Element - Aesthetics	
Land Use Goal #3: Accommodate new development which is compatible with and complements existing land uses.	The proposed Project has been evaluated with respect to potential impacts pertaining to the degradation of existing visual character/quality. The Project site is located in close proximity to agricultural farms, orchards, light industrial activities, and single-family residences. However, the Project area is slated for development, which would be subject to County design review standards and regulations that would ensure functional and visual compatibility of both the Project and surrounding projects.
Land Use Goal #7: Establish a built environment which achieves a compatible functional and visual relationship among individual buildings and sites.	Development on-site shall be subject to County design review, Kern County Ordinance Code, and Metropolitan Bakersfield General Plan requirements.
Land Use Policy #26: Encourage adjacent commercial uses to be of compatible height, setback, color and materials.	The Project would be designed with unified materials and colors and would be compatible with the surrounding land uses. Future uses are subject to the development standards of the Kern County Ordinance Code, which regulates all aspects of development including building heights, building massing, setbacks, parking, landscaping, lighting, and signage.
Land Use Policy #28: Require that commercial development provide design features such as screen walls, landscaping and height, setback and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to noise, traffic, parking, and differences in scale.	Refer to the analysis for Land Use Policy #26. The proposed Project's lighting plans would also be reviewed by Kern County on a project-by-project basis to ensure uniformity and adequate public lighting without adding to the light and glare in the proposed Project area.
Land Use Policy #30: Street frontages along all new commercial development shall be landscaped.	Refer to the analysis for Land Use Policy #26.
Land Use Policy #34: Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.	The proposed Project would provide approximately 314.30 acres of industrial development within the southern Metropolitan Bakersfield area, at the Houghton Road and SR-99 interchange.
Land Use Policy #36: Require that industrial uses provide design features, such as screen walls, landscaping and height, setback and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound and vibration.	Development on-site shall be subject to County design review, Kern County Ordinance Code, and Metropolitan Bakersfield General Plan requirements.
Land Use Policy #37: Street frontages along all new industrial development shall be landscaped.	Refer to the analysis for Land Use Policy #26.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Land Use Policy #63: Encourage the use of creative and distinctive signage which establishes a distinctive image for the planning area and identifies principal entries to the metropolitan area, unique districts, neighborhoods and locations.	Signage plans have not been submitted for the proposed Project. Should signage be proposed in the future, signage plans shall be reviewed and approved by the County's Planning Department as part of the final Development Plan review process.
Land Use Policy #72: Promote the establishment of attractive entrances into communities, major districts, and transportation terminals, centers, and corridors within the planning area.	Refer to analysis for Land Use Policy #26.
Land Use Policy #74: Encourage the establishment of design programs which may include signage, street furniture, landscape, lighting, pavement treatments, public art, and architectural design.	Refer to analysis for Land Use Policy #26.
Land Use Element – Cultural Resources	
Land Use Element Goal #6: Accommodate new development that is sensitive to the natural environment, and accounts for environmental hazards.	According to the Phase I Cultural Resource Survey, the proposed Project is not located within an area of significant cultural resources.
Land Use Element Policy #105: Development on land containing known archaeological resources (i.e., high sensitivity areas) shall utilize methodology set forth as described necessary by a qualified archaeologist to locate proposed structures, paving, landscaping and fill dirt in such a way as to preserve these resources undamaged for future generations when it is the recommendation of a qualified archaeologist that said resources be preserved in situ.	Refer to Goal #6.
Land Use Element Policy #107: The preservation of historical resources shall be promoted, and other public agencies or private organizations shall be encouraged to assist in the purchase and/or relocation of sites, buildings, and structures deemed to be of historical significance.	Refer to Goal #6.
Land Use Element - Land Use and Planning	
Land Use Goal #1: Accommodate new development which captures the economic demands generated by the marketplace and establishes Bakersfield's role as the capital of the southern San Joaquin Valley.	The proposed Project would provide industrial and commercial uses that would meet the substantial and unmet service demands of the residents within the southern portion of the City.
Land Use Goal #2: Accommodate new development which provides a full mix of uses to support its population.	Refer to the analysis for Land Use Goal #1.
Land Use Goal #3: Accommodate new development which is compatible with and complements existing land uses.	The proposed Project is located in close proximity to agricultural farms, orchards, light industrial activities, and single-family residences. Development of the proposed Project would be subject to Metropolitan Bakersfield and County requirements, to ensure functional and visual compatibility both internally within the proposed Project and with surrounding uses.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Land Use Goal #4: Accommodate new development which channels land uses in phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.	The Project site is adjacent to other proposed projects, and the proposed Project is located within the logical pathway of continued urbanization, south of the City of Bakersfield. The rate of on-site development would correspond with the availability of appropriate infrastructure.
Land Use Goal #6: Accommodate new development that is sensitive to the natural environment, and accounts for environmental hazards.	The Project site is located within the adopted MBHCP and will be subject to the payment of HCP fees. Upon payment of this fee, a development permit application would become a sub-permittee and would be allowed the "incidental take" of species in accordance with state and federal endangered species laws. Pesticide contamination was deemed not to be a major concern at the site.
Land Use Goal #7: Establish a built environment which achieves a compatible functional and visual relationship among individual buildings and sites.	Development on-site shall be subject to County design review and Kern County Ordinance Code and Metropolitan Bakersfield General Plan requirements.
Land Use Policy #15: Allow for the development of a variety of commercial centers/corridors which are differentiated by their function, intended users and level of intensity, including convenience centers service local residential neighborhoods, subregional centers which serve groupings of neighborhoods, and major regional centers which serve the planning area and surrounding areas.	The proposed Project is located in an urbanizing area and is near existing residential and industrial development. The proposed Project would provide industrial uses that would capture the economic demands generated by the marketplace.
Land Use Policy #16: Allow for development of a variety of commercial uses, including those which serve residents (groceries, clothing, etc.), highway users, and tourists-visitors.	Refer to the analysis for Land Use Policy #15.
Land Use Policy #26: Encourage adjacent commercial uses to be of compatible height, setback, color and materials.	The Project would be designed with unified materials and colors and would be compatible with the surrounding land uses. Future uses are subject to the development standards of the Kern County Ordinance Code, which regulates all aspects of development including building heights, building massing, setbacks, parking, landscaping, lighting, and signage.
Land Use Policy #28: Require that commercial development provide design features such as screen walls, landscaping and height, setback, and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to noise, traffic, parking, and differences in scale.	Refer to the analysis for Land Use Policy #26.
Land Use Policy #30: Street frontages along all new commercial development shall be landscaped (I-1).	Refer to the analysis for Land Use Policy #26.
Land Use Policy #30B: Require perimeter street(s) around new commercial office, retail, mixed-use, and industrial business park land uses where they will enhance pedestrian and vehicular access from adjacent residential neighborhoods or promote convenient access to public transit services, and where anticipated traffic will	Perimeter street(s) will be considered during the development review process upon receipt of definitive site plans.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
not detrimentally impact local streets. Exceptions may be allowed if natural or artificial barriers such as, but not limited to, railroads, utility corridors, canals, or other watercourses, or topographic features exist that create a logical separation between the uses, or to encourage infill development.	
Land Use Policy #31: Allow for a variety of industrial uses, including land-extensive mineral extraction and processing, heavy manufacturing, light manufacturing, warehousing and distribution, transportation-related, and research and development uses (I-1).	Approximately 107.72 acres of LI (Light Industrial), 159 acres of SI (Service Industrial), 22 acres of GC (General Commercial), and 9.01 acres if HC (Highway Commercial) uses are proposed.
Land Use Policy #34: Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.	SR-99 is adjacent to the west and SR-204 is adjacent to the east of the proposed Project.
Land Use Policy #36: Require that industrial uses provide design features, such as screen walls, landscaping and height, setback, and lighting restrictions between the boundaries of adjacent residential land use designations so as to reduce impacts on residences due to light, noise, sound and vibration.	Refer to the analysis for Land Use Policy #26.
Land Use Policy #37: Street frontages along all new industrial development shall be landscaped.	Refer to the analysis for Land Use Policy #26.
Land Use Policy #38: Minimize impacts of industrial traffic on adjacent residential parcels through the use of site plan review and improvement standards.	Refer to the analysis for Land Use Policy #26.
Land Use Policy #52: Locate new development where infrastructure is available or can be expanded to serve the proposed development.	As discussed in Section 4.17, *Utilities*, utility infrastructure is either currently, or will be available for the Project site at build-out, or improvements to the existing infrastructure are planned in order to provide the Project site and other future developments with adequate utilities.
Land Use Policy #53: Ensure that land use and infrastructure development are coordinated.	The development of the Project site will be coordinated with infrastructure improvements.
Land Use Policy #54: The developer shall be responsible for all on-site costs incurred as a result of the proposed project, in addition to a proportional share of off-site costs incurred in service extension or improvements. The availability of public or private services or resources shall be evaluated during discretionary project consideration. Availability may affect project approval or result in a reduction in size, density, or intensity otherwise indicated in the general plan's map provisions.	Refer to analysis for Land Use Policy #52.
Land Use Policy #55: Provide for the mitigation of significant noise impacts on adjacent sensitive uses from transportation corridor improvements.	An Acoustical Analysis was conducted for the proposed Project. Refer to Section 4.13, *Noise*, for impacts and mitigation measures associated with noise impacts of the Project.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Land Use Policy #61: Coordinate a consistent design vocabulary between city and county for all public signage, including fixture type, lettering, colors, symbols, and logos.	Signage plans have not been submitted for the proposed Project. Should signage be proposed in the future, signage plans shall be reviewed and approved by the County's Planning Department as part of the final Development Plan review process.
Land Use Policy #62: Provide signage which is adequately spaced and clearly visible during the day and night to control vehicular traffic, bicycles, and pedestrians.	Refer to the analysis for Land Use Policy #61.
Land Use Policy #63: "Encourage the use of creative and distinctive signage which establishes a distinctive image for the Planning area and identifies principal entries to the metropolitan area, unique districts, neighborhoods and locations."	Refer to the analysis for Land Use Policy #61.
Land Use Policy #65: Encourage that signs be designed and placed on buildings to be visible to pedestrians in areas designated for pedestrian activity.	Refer to the analysis for Land Use Policy #61.
Land Use Policy #72: Promote the establishment of attractive entrances into communities, major districts, and transportation terminals, centers, and corridors within the Planning area.	Refer to analysis for Land Use Policy #26.
Land Use Policy #74: Encourage the establishment of design programs which may include signage, street furniture, landscape, lighting, pavement treatments, public art, and architectural design.	Refer to analysis for Land Use Policy #26.
Land Use Policy #75: Provide adequate land area for the expansion of existing uses and development of new uses consistent with the policies of the general plan.	The proposed Project will be constructed consistent with the policies of the Metropolitan Bakersfield General Plan.
Land Use Policy #76: Provide for a mix of land uses which meets the diverse needs of residents; offers a variety of employment opportunities; capitalizes, enhances, and expands upon existing physical and economic assets; and allows for the capture of regional growth.	The proposed Project will provide light and medium industrial uses at the Houghton Road and SR-99 interchange in the southern metropolitan area adjacent to the City of Bakersfield. The proposed Project will provide a broad range of goods and services to serve the regional market area.
Land Use Policy #77: Allow for the continuance of agricultural uses in areas designated for future urban growth.	Currently, the Project site consists of active agricultural land and fallow land. The proposed Project involves a GPA and zone change to allow for the phased development of the entire property with industrial and commercial uses. Portions of the Project site not under development will remain agricultural land until such time development is approved.
Land Use Policy #79: "Provide for an orderly outward expansion of new "urban" development (any commercial, industrial, and residential development having a density greater than one unit per acre) so that it maintains continuity of existing development, allows for the incremental expansion of infrastructure and public services, minimizes impacts on natural environmental	Refer to analysis for Land Use Goals #1, #3, #4, #6, and #7.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
resources, and provides a high quality environment for living and business."	
Land Use Policy #80: Assure that General Plan Amendment proposals for the conversion of designated agricultural lands to urban development occur in an orderly and logical manner giving full consideration to the effect on existing agricultural uses.	A Farmland Conversion Study was prepared for the proposed Project to evaluate the conversion for the existing on-site farmland to industrial uses. Refer to Section 4.2, *Agriculture*, for a detailed analysis of compatibility of the proposed Project and surrounding land uses.
Land Use Policy #82: "Preserve existing significant sound residential neighborhoods, commercial districts, and industrial areas."	Refer to the analysis for Land Use Goals #1, #3, #4, #6, and #7.
Land Use Policy #99: Develop a plan to ensure that all parking lots are 40 percent shaded at maturity to help alleviate "heat island effect."	Future development phases would be subject to the Kern County Ordinance Code and design review requirements. Final development plans will be reviewed by the County Planning Department on a project-by-project basis.
Land Use Policy #100: "Encourage the use of reflective roofing material and other measures that reduce the "heat island effect."	Refer to the analysis for Land Use Policy #99.
Noise Element	
Noise Goal #1: "Ensure that residents of the Bakersfield Metropolitan Area are protected from excessive noise and existing moderate levels of noise are maintained."	As stated in Section 4.13, *Noise*, the proposed Project would be subject to compliance with the Metropolitan Bakersfield General Plan and County's noise standards during construction and Project operation.
Noise Goal #2: "Protect the citizens of the Planning area from the harmful effects of exposure to excessive noise and protect the economic base of the area by preventing the encroachment of incompatible land uses near known noise-producing roadways, industries, railroads, airports and other sources."	As stated in Section 4.13, *Noise*, the proposed Project would be subject to compliance with the Metropolitan Bakersfield General Plan and County's noise standards during short-term construction and Project operation. Construction activities would adhere to the Kern County Noise Ordinance with respect to hours of operation and all equipment would be fitted with factory equipped mufflers and be in good working order; refer to Mitigation Measures 4.13-1 through 4.13-5.
Noise Policy #1: "Identify noise-impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-4. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified."	The proposed Project would not exceed the Kern County's 65-dBA-CNEL (exterior) criterion for long-term vehicular-related noise.
Noise Policy #2: "Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into project design to acceptable levels."	As indicated within the Noise Impact Assessment, on-site noise levels would be below the 65 dBA exterior noise standards. Therefore, implementation of the proposed Project would comply with the Goals and Policies of the Metropolitan Bakersfield General Plan.
Noise Policy #3: Review discretionary industrial, commercial or other noise generating land use projects for compatibility with nearby noise-sensitive land uses. Additionally, the development of new noise generating	Not applicable. The proposed Project would not be located adjacent to incompatible land uses such as industries, railroads, and airports, that generate high levels of noise.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
land uses which are not preempted from local noise regulation will be reviewed if resulting noise levels will exceed the performance standards contained within Table VII-4 in areas containing residential or other noise-sensitive land uses.	
Noise Policy #4: Require noise level criteria applied to land uses other than residential or other noise-sensitive uses to be consistent with the recommendations of the California Office of Noise Control (see Figure VII-3)	Refer to Noise Policy #2.
Noise Policy #5: Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise.	Future development would comply with County Ordinances requiring setbacks from roadways and landscaping along arterial and collector roads.
Noise Policy #6: Encourage interjurisdictional coordination and cooperation with regard to noise impact issues.	Refer to Noise Goals #1 and #2, and Noise Policy #1, #2, and #5. As stated in Section 4.13, *Noise*, the proposed Project was evaluated against thresholds based on standards set forth by federal, State, and local agencies. In addition, the Project applicant will work with Kern County to implement Mitigation Measures 4.13-1 through 4.13-5.
Noise Policy #7: Establish threshold standards for the determination of the existence of cumulative noise impacts that are significant and will therefore require mitigation to achieve acceptable noise standards that do not exceed the standards contained in this element.	Refer to the consistency analysis for Noise Policy #6.
Safety Element – Public - Hazards/Hazardous Materials	
Safety Goal #1: Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.	The proposed Project would be required to adhere to the Metropolitan Bakersfield General Plan Safety Element, compliance with the County of Kern Department Codes, the Kern County Ordinance Code, DOGGR regulations, and compliance with the CBC and UBC to ensure safety for citizens.
Safety Goal #3: Provide for the coordinated planning and development of service areas for police and fire protection to ensure an equitable burden of responsibility between County and City in Metropolitan Bakersfield.	The proposed Project would be serviced by the Kern County Fire and Sheriff's Departments. Refer to Section 4.15, *Public Services* and Section 4.17, *Utilities*, for additional information.
Safety Policy #4: Monitor, enforce and update as appropriate all emergency plans as needs and conditions in the Planning area change, including the California Earthquake Response Plan, the Kern County Evacuation Plan, and the City of Bakersfield Disaster Plan.	Section 4.15, *Public Services* and Section 4.17, *Utilities*, addresses the potential impacts of the proposed Project on fire and emergency response. Additionally, all emergency plans applicable to the proposed Project would be updated as needed.
Safety Policy #6: Promote fire prevention methods to reduce service protection costs and costs to the taxpayer.	The proposed Project would be reviewed by the Kern County Fire Department. The proposed Project would be designed to comply and/or incorporate the Kern County Fire Department fire prevention requirements.
Safety Policy #7: Enforce ordinances regulating the use/manufacture/sale/transport/disposal of hazardous substances and require compliance with state and federal laws regulating such substances.	The proposed Project is subject to discretionary approval and would be required to comply with and/or adhere to all applicable State, Federal and local laws and regulations related to the use, manufacture, sale, transport and/or disposal of hazardous substances. A Hazardous Materials Evaluation was prepared for

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
	the Project to identify potential hazardous materials present within the proposed Project site and provide mitigation measures to reduce impacts. If hazardous materials are used during site construction, the materials shall be properly handled and disposed.
Safety Policy #8: The Kern County and Incorporated Cities Hazardous Waste Management Plan and Final Environmental Impact Report serves as the policy document guiding all facets of hazardous waste.	The proposed Project would be required to adhere to all applicable standards and requirements of the Kern County and Incorporated Cities Hazardous Waste Management Plan (HWMP). Any hazardous waste created during construction of the proposed Project will be disposed in accordance with the HWMP.
Safety Policy #9: Restrict, after appropriate public hearings, the use of fire-prone building materials in areas defined by the fire services as presenting high-conflagration risk.	As stated in Section 4.15, *Public Services* and Section 4.17, *Utilities* of this DREIR, future development of the proposed Project will be serviced by the Kern County Fire Department. The proposed Project would be reviewed by the Kern County Fire Department and would be required to comply with Kern County Fire Department requirements that prohibit the use of fire-prone building materials, where appropriate.
Safety Element - Seismic	
Seismic Goal #1: Substantially reduce the level of death, injury, property damage, economic and social dislocation and disruption of vital services that would result from earthquake damage.	The proposed Project design would be required to undergo review by the County of Kern. Adherence to and incorporation of the goals and policies of the Metropolitan Bakersfield General Plan Safety Element, compliance with the Kern County Ordinance Code, and compliance with the CBC and UBC would reduce impacts of earthquakes.
Seismic Goal #2: Ensure the availability and effective response of emergency services following an earthquake.	Refer to the analysis for Seismic Goal #1.
Seismic Goal #3: Prepare the Planning area for effective response to, and rapid, services following an earthquake.	Refer to the analysis for Seismic Goal #1.
Seismic Goal #7: Protect land uses from the risk of dam failure inundation including the assurances that: the functional capabilities of essential facilities are available in the event of a flood; hazardous materials are not released; effective measures for mitigation of dam failure inundation are incorporated into the design of critical facilities; and the rapid and orderly evacuation of populations in the inundation area will occur.	Isabella Dam is located approximately 40 miles northeast of Bakersfield, approximately 45 miles from the proposed Project site. The Safety Element of the Metropolitan Bakersfield General Plan has identified policies including a response plan for dam failure as well as the maintenance of disaster response plans and development of discretionary approval procedures for critical facilities for compatibility with evacuation plans. The proposed Project design would be required to undergo review by the County of Kern. The Project would be designed and constructed in strict adherence and incorporation with the goals and policies of the Metropolitan Bakersfield General Plan Safety Element, compliance with the Kern County Ordinance Code, and compliance with the CBC and UBC would reduce impacts related to dam failure.
Seismic Policy #7: Continue to address seismically hazardous buildings pursuant to Chapter 12.2 (8875 et. Seq.), Division 1 of Title 2 of the Government Code.	The proposed Project would be required to comply with the most current seismic standards of the UBC.
Seismic Policy #8: Require seismic review of other potentially hazardous buildings upon any change in their use or occupancy status.	The proposed Project design would be required to undergo review by the County of Kern.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Seismic Policy #9: Adopt and maintain high standards for seismic performance of buildings, through prompt adoption and careful enforcement of the most current seismic standards of the Uniform Building Code.	Refer to the analysis for Seismic Safety Policy #7.
Seismic Policy #10: Prohibit development designed for human occupancy within 50 feet of a known active fault and prohibit any building from being placed astride an active fault.	The proposed Project is not located within 50 feet of a known active fault. Additionally, implementation of the proposed Project would result in light to medium industrial land uses. Buildings associated with the proposed Project would not be intended for human occupancy. Adherence to and incorporation with the goals and policies of the Metropolitan Bakersfield General Plan Safety Element, compliance with the Kern County Ordinance Code, and compliance with the CBC and UBC would reduce impacts of fault rupture.
Seismic Policy #11: Require site-specific studies to locate and characterize specific fault traces within an Alquist-Priolo Earthquake Fault Zone for all construction designed for human occupancy.	The proposed Project is not located within an Alquist-Priolo Earthquake Fault Zone. Therefore, no site-specific study is required.
Seismic Policy #12: Design significant lifeline installations such as highway, utilities and petrochemical pipelines which cross an active fault, to accommodate potential fault movement without prolonged disruption of an essential service or creating threat to health and safety.	No active faults traverse the proposed Project and it is not located within an Alquist-Priolo Earthquake Fault Zone.
Seismic Policy #13: Determine the liquefaction potential at sites in areas of high groundwater prior to development and determine specific mitigation to be incorporated into the foundation design, as necessary to prevent or reduce damage from liquefaction in an earthquake.	The proposed Project is not located within an area of high groundwater. Therefore, the Project site is not susceptible to liquefaction. However, conformance with standard construction and design parameters set forth in the CBC would reduce potential impacts.
Seismic Policy #14: Route major lifeline installations around potential liquefaction areas or otherwise protect them against significant damage from liquefaction in an earthquake.	Refer to the analysis for Seismic Policy #13.
Seismic Policy #15: Compile information on areas of potential hazards and field information developed as part of CEQA investigations and geologic reports and keep geologic reviews and policy development current and accessible for use in report preparation.	The County of Kern will review the proposed Project and will be able to obtain information regarding seismic and geologic hazards on-site from this RDEIR.
Seismic Policy #18: Design discretionary critical facilities located within the potential inundation area for dam failure in order to: mitigate the effects of inundation on the facility; promote orderly shut-down and evacuation (as appropriate); and, prevent on-site hazards from affecting building occupants and the surrounding communities in the event of dam failure.	Isabella Dam is located approximately 40 miles northeast of Bakersfield, approximately 45 miles from the proposed Project. The Safety Element of the Metropolitan Bakersfield General Plan has identified policies including a response plan for dam failure as well as the maintenance of disaster response plans and development of discretionary approval procedures for critical facilities for compatibility with evacuation plans. The proposed Project design would be required to undergo review by the County of Kern. The Project would be designed and constructed in strict adherence and incorporation with the goals and policies of the Metropolitan Bakersfield General Plan Safety Element, compliance with the Kern County Ordinance Code, and compliance with the

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
	CBC and UBC would reduce impacts related to dam failure.
Seismic Policy #19: Design discretionary facilities in the potential dam inundation area used for the manufacture, storage or use of hazardous materials to prevent on-site hazards from affecting surrounding communities in the event of inundation.	Refer to the analysis for Seismic Policy #18.
Seismic Policy #20: Require emergency response plans for the Planning area to include specific procedures for the sequential and orderly evacuation of the potential dam inundation area.	Refer to the analysis for Seismic Policy #18.
Seismic Policy #21: Encourage critical and high-occupancy facilities as well as facilities for elderly, handicapped and other special care occupants located in the potential inundation area below the dam to develop and maintain plans for the orderly evacuation of their occupants.	Refer to the analysis for Seismic Policy #18.
Safety Element - Flooding	
Flooding Goal #1: Minimize hazards to planning area residents resulting from flooding.	The proposed Project would result in light and medium industrial facilities, and commercial uses. No residential land uses would be provided by the proposed Project. Future employees of the Project site are not likely to be impacted as a result of flooding within the proposed Project. The 8 to 12-hour lag time between failure of the Isabella Dam and inundation of the Project site reduces the risks to residents. Additionally, the proposed Project is located within Flood Zone X, which indicates that no flooding would be expected.
Flooding Goal #2: Reduce the risk of flooding to land uses.	Refer to the analysis for Flooding Safety Goal #1.
Flooding Policy #1: Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.	The proposed Project would be required to adhere to and incorporate the goals and policies of the Metropolitan Bakersfield General Plan Safety Element, comply with the Kern County Ordinance Code, and comply with the CBC and UBC to ensure safety for citizens. Refer to Sections 4.9, *Hazards and Hazardous Materials*, of this RDEIR.
Flooding Policy #2: Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development or metropolitan police and fire facilities and services.	The proposed Project would be required to comply with the provisions of the Uniform Fire Code and local amendment; Title 19, 22, and 27 of the California Safety Code Regulation; the Kern County Ordinance Code; and the National Fire Prevention Association Standards. Implementation of the recommended mitigation measures identified in Section 4.15, *Public Services*, of this RDEIR, would serve to ensure adequate levels of police and fire services are provided to meet existing and future demands associated with implementation of the proposed Project.
Public Services and Facilities Element - Aesthetics	
Street Lighting Goal #2: Develop uniform Planning area street light location and design standards.	The proposed Project includes the installation of streetlights and entry lighting that would conform to the intent of the Kern County Ordinance Code and Development Standards.

Table 4.11-2. Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies

GOALS AND POLICIES	PROJECT CONSISTENCY
Street Lighting Policy #4: Require developers to install street lighting in all new developments in accord with adopted city standards and county policies.	The proposed Project includes the installation of streetlights in conformance with adopted County standards and regulations.
Public Services and Facilities Element – General Utilities	
General Utilities Policy #5: Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent.	Appropriate fees would be applied to the future development of the Project site in order to accommodate the expansion of required utilities, facilities, and infrastructure.
Public Services and Facilities Element - Water Distribution	
Water Distribution Goal #1: Ensure the provision of adequate water service to all developed and developing portions of the planning area.	The existing water purveyor, who provides irrigation water solely for agricultural purposes, will not service the proposed Project with domestic water. Instead, the domestic water will be provided by an on-site private well with water treatment and distribution facilities.
Water Distribution Policy #3: Require that all new development proposals have an adequate water supply available.	Refer to Public Services and Facilities - Water Distribution Goal #1, above.
Public Services and Facilities Element – Sewers	
Sewer Services Goal #3: Provide trunk sewer availability to and treatment/disposal capacity for all metropolitan urban areas, to enable cessation or prevention of the use of septic tanks where such usage crates potential public health hazards or may impair groundwater quality, and to assist in the consolidation of sewerage systems. Provide sewer service for urban development regardless of jurisdiction.	The proposed Project site has never been served by a sewer system. A new private package sewer treatment plant is proposed to provide services for the Project site.
Public Services and Facilities Element - Storm Drainage	
Storm Drainage Goal #1: "Ensure the provision of adequate storm drainage facilities to protect Planning area residents from flooding resulting from stormwater excess."	Stormwater facilities would be incorporated into the design of the infrastructure of the Project site. Additionally, future development phases would be subject to the Kern County Ordinance Code and design review requirements. Final development plans would be reviewed by the Kern County Planning Commission on a project-by-project basis.
Public Services and Facilities Element - Street Lighting	
Street Lighting Goal #1: "Provide uniform and adequate public lighting for all developed and developing portions of the Planning area."	Future development phases would be subject to the Kern County Ordinance Code and design review requirements. Final development plans would be reviewed by the Kern County Planning Commission on a project-by-project basis.
Street Lighting Policy #4: "Require developers to install street lighting in all new development in accord with adopted city standards and county policies."	Refer to analysis for PSF Street Lighting Goal #1.
Public Services and Facilities Element - Solid Waste	
Solid Waste Goal #1: "Ensure the provision of adequate solid waste disposal services to meet the demand for these services in the Planning area."	The County has adequate capacity in the Bena Landfill and the Shafter-Wasco Landfill to support the proposed Project.

Zoning Designations

Title 19 of the Kern County Ordinance Code provides a description of permitted uses, building height, yard and distance between buildings for the various zoning designations within the County. The Ordinance consists of two primary parts: a map that delineates the boundaries of zoning districts; and text that explains the purpose of the district, specifies permitted and conditional uses and establishes development and performance standards.

On- and Off-Site Zoning Designations

The proposed Project site is zoned A (Exclusive Agriculture). Zoning designations for properties surrounding the proposed Project include: A (Exclusive Agriculture), A-1 (Limited Agriculture), CH (Highway Commercial), C-2 PD (General Commercial, Precise Development Combining), E(1) RS MH (Estate 1 Acre, Residential Suburban Combining, Mobile Home Combining), E(2 ½) RS (Estate 2.5 Acres, Residential Suburban Combining), E(1/2) RS (Estate 0.5 Acres, Residential Suburban Combining), E(10) RS (Estate 10 Acres, Residential Suburban Combining), R-2 (Medium Density Residential, 16 units per acre), and M-2 PD (Medium Industrial, Precise Development Combining).

Metropolitan Bakersfield Habitat Conservation Plan

The Metropolitan Bakersfield Habitat Conservation Plan (MBHCP), adopted in March 1990, and its implementing agreements and ordinances provide a method of collecting funds for the acquisition and perpetual management of habitat land for the purpose of creating preserves. The MBHCP provides descriptions of species of concern and habitat areas within the Metropolitan Bakersfield General Plan Area. Development projects within Metropolitan Bakersfield pay mitigation fees, which are used to buy habitat lands. These lands are managed by wildlife agencies or entities they approve. Take avoidance measures are also listed in the MBHCP. Implementation of habitat preservation must always occur before project development. The boundaries of the MBHCP study area match the boundaries of the Metropolitan Bakersfield General Plan, which consists of 408 square miles. Refer to Section 4.4, *Biological Resources*, for a detailed discussion and Project consistency with the MBHCP.

Air Quality Attainment Plan

The Air Quality Attainment Plan (AQAP) prepared for the San Joaquin Valley Air Basin (Basin) calls for overall reduction in air quality emissions in the Valley to comply with California Ambient Air Quality Standards (CAAQS) for ozone and carbon monoxide (CO). Stationary and mobile source emission control recommendations and regulations have been developed by the San Joaquin Valley Air Pollution Control District (SJVAPCD) to implement the AQAP.

Metropolitan Bakersfield General Plan Bikeway Master Plan

This Plan includes the location and extent of bikeways within the greater Bakersfield Metropolitan area. The Metropolitan Bakersfield General Plan Bikeway Master Plan, included in the Circulation Element of the General Plan, was prepared by the City of Bakersfield and Kern County.

Emergency Response Plan

This Plan, prepared by the City of Bakersfield, indicates emergency evacuation routes that would be used in emergency situations, as well as other specific measures related to emergency preparedness.

Regional Transportation Plan

The Regional Transportation Plan (RTP) for Kern County identifies future transportation improvements needed to serve the projected transportation needs of the County. The RTP details the existing transportation systems, sets goals, policies, and projects, and identifies funding mechanisms for these projects. Transportation projects identified in the RTP include highway, street, and roadway projects; mass transportation; railroad; and other programs and projects related to the transportation needs of the County.

Solid Waste Management Plan

This plan is a comprehensive guide for all solid waste management activities in the County. The plan identifies the existing solid waste generation and disposal facilities in Kern County, estimates future solid waste disposal demand and identifies programs to meet this future need.

Hazardous Waste Management Plan (HWMP)

This Plan focuses on the siting of hazardous waste disposal facilities, the transport of hazardous waste in the County, protection of water resources from hazardous waste contamination and public education concerning the use and disposal of hazardous waste.

4.11.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the proposed Project are evaluated on a qualitative basis through a comparison of the existing land use and the proposed land uses. The change in the land use on the Project site is significant if the effect described under the Thresholds of Significance below occurs as a result of the proposed actions. The evaluation of Project impacts is based on professional judgment, analysis of the County's visual resources policies and the significance criteria established in Appendix G of the State CEQA Guidelines, which the County has determined appropriate for this RDEIR.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Physically divide an existing community or contribute to the decline of an existing community (a physical change that interrupts the cohesiveness of the neighborhood);

- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; and/or

- Conflict with any applicable habitat conservation plan or natural community conservation plan.

The analysis of the existing environmental and impact analysis indicate that this proposed Project could not result in a significant environmental impact to land use.

Project Impacts

Impact 4.11-1: The Project Would Physically Divide an Existing Community or Contribute to the Decline of an Existing Community.

The proposed Project currently consists of land under agricultural production or fallow agricultural land. A steel storage building associated with agricultural activities is located in the eastern portion of the site, near South Union Avenue. The majority of the Project site is currently designated R-IA (Resource-Intensive Agriculture) and HC (Highway Commercial), with the HC (Highway Commercial) designation located in the southwestern area of the Project site. The proposed Project has a zoning classification of A (Exclusive Agriculture).

Existing land uses surrounding the proposed Project site include agricultural, residential, and industrial uses. The residential uses consist of a small cluster of single-family homes located to the east of the proposed Project. However, areas south and east of the proposed Project are designated for service industrial and highway commercial uses. Given that the proposed Project would develop industrial and commercial facilities in an area with an existing land use mix of industrial and residential, the proposed Project would not physically divide an already established community or neighborhood. Implementation of the proposed Project would not drastically alter the community characteristics in such a manner that would physically divide or contribute to the decline of an established community or neighborhood.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.11-2: The Project Would Conflict with Applicable Land Use Plan, Policy or Regulation of an Agency with Jurisdiction Over the Project.

The proposed Project would require an amendment to the Metropolitan Bakersfield General Plan and a concurrent change to the County of Kern zoning classification. This would result in a conversion of approximately 314.30 acres of agricultural uses and vacant land to industrial uses. The proposed Project has been reviewed for consistency with goals and policies as set forth in the Metropolitan Bakersfield General Plan.

As described in Section 3.0, *Project Description*, the proposed Project includes an amendment to the Land Use Element of the Metropolitan Bakersfield General Plan, amending the existing land use designation from R-IA (Resource – Intensive Agriculture) to LI (Light Industrial), SI (Service Industrial), GC (General Commercial), and HC (Highway Commercial). The subsequent zone change would consist of the removal of the existing A (Exclusive Agriculture) zoning classification and rezone the Project site M-1 PD (Light Industrial, Precise Development Combining), M-2 PD (Medium Industrial, Precise Development Combining), CH PD (Highway Commercial, Precise Development Combining), and C-2 PD (General Commercial, Precise Development Combining). The General Plan Amendment (GPA) and zone change (ZCC) would permit development of a light to medium industrial park containing approximately 4,613,004 square feet (net building area) of warehousing, distribution, and retail showroom uses. In addition, two conditional use permits (CUPs) would permit the development of a sewer treatment plant and a water treatment plant.

Table 4.11-2, *Consistency Analysis with Metropolitan Bakersfield General Plan Goals and Policies for Land Use* (above), assesses the proposed Project's relationship to pertinent goals and policies of the Metropolitan Bakersfield General Plan. Note that goals and policies not included in the assessment are omitted because they have either a negligible relationship or no relationship to the proposed Project or surrounding area. The analysis contained in Table 4.11-2 concludes that there would be no significant consistency impacts of the proposed Project associated with the Metropolitan Bakersfield General Plan goals and policies.

The proposed Project was reviewed and determined to be consistent with the following regional plans: Air Quality Attainment Plan, Metropolitan Bakersfield General Plan Bikeway Master Plan, Regional Transportation Plan, Solid Waste Management Plan, Metropolitan Bakersfield Habitat Conservation Plan and Hazardous Waste Management Plan.

Air Quality Attainment Plan

As the Project proposes to amend the Metropolitan Bakersfield General Plan land use designation to allow industrial uses as opposed to agricultural uses (the current land use and zoning designations), the AQAP anticipated growth of the population and economy within the Basin. The AQAP predicted the workforce in Kern County to increase along with a 2.2 percent population increase between 2002 and 2030. Thus, the proposed Project is viewed as continued growth anticipated by the AQAP (refer to Section 4.3, *Air Quality*, for further discussion). The proposed Project's consistency with the San Joaquin Valley Air Pollution Control District (SJVAPCD) AQAP is also addressed in this Recirculated Draft EIR in Section 4.3, *Air Quality*.

Metropolitan Bakersfield General Plan Bikeway Master Plan

The proposed Project would not affect the City's Metropolitan Bakersfield General Plan Bikeway Master Plan. Bike lanes would be implemented as appropriate along roadways when full improvements are completed.

Regional Transportation Plan

The proposed Project would implement roadway improvements, such as installation of traffic signals and the widening of roadway segments and/or improve intersections on a fair-share basis. These improvements would be consistent with the policies or planned projects of the RTP (refer to Section 4.16, *Transportation and Traffic*, for further information).

Solid Waste Management Plan

Solid waste disposal would be in accordance with the County's Solid Waste Management Plan. Refer to Section 4.15, *Public Services*, and Section 4.17, *Utilities*.

Hazardous Waste Management Plan

Due to the previous oil drilling and gas production activities on-site, the proposed Project would be required to properly dispose of any contaminated soil within the Project site prior to construction. The proposed Project is located on a site that has been historically used for agricultural uses. Therefore, there is potential for contaminated soil to be encountered during construction. In addition, although the Project site has not been identified as being located in an area that has been designated as a candidate site or facility for hazardous materials disposal, removal of hazardous materials on the Project site is required prior to construction. In addition, the proposed Project may result in increased risks from hazardous materials and appropriate rules and regulations would adhere to the completed Project. Therefore, the proposed Project is subject to the Kern County and Incorporated Cities Hazardous Waste Management Plan as discussed in detail in Section 4.9, *Hazards and Hazardous Materials*.

Mitigation Measures

MM 4.11-1: **Master Precise Development Plan.** Prior to the issuance of any grading or building permit issued on the proposed project site, the project proponent shall process through the Kern County Planning and Natural Resources Department a Master Precise Development Plan in accordance with the requirements identified in Chapter 19.56 of the Kern County Zoning Ordinance.

1. All future changes to the physical environment of the site and or the specific characteristics of the existing uses of the site, either by a Master Developer or subsequent future land owners shall require revision and/or modification of the Master Precise Development Plan in accordance with Chapter 19.56 of the Kern County Zoning Ordinance.

2. The following thresholds have been established for the project site.

a. The proposed uses on the site shall not exceed a maximum of 4,613,0045~~,134,253~~ square feet of industrial and/or commercial use as determined by the Kern County Planning Director.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.11-3: The Project Would Conflict with Applicable Habitat Conservation Plan or Natural Community Conservation Plans.

The Project site is located within the permitted area of the MBHCP. The MBHCP addresses mitigation and compensation for the loss of endangered species habitat and impacts on endangered species within the Metropolitan Bakersfield area. The development of the site would require the payment of mitigation fees for the preservation of natural habitat areas in the area (refer to Section 4.4, *Biological Resources*).

Mitigation Measures

No mitigation measures beyond compliance with the Metropolitan Bakersfield Habitat Conservation Plan is required. No additional mitigation measures are proposed.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

The area influenced by cumulative land use effects related to adjacent parcels and the surrounding planned development areas is described in Table 3-5, *Cumulative Projects List* (refer to Chapter 3, *Project Description*). Related land use projects in the surrounding areas have been: (1) submitted for plan processing; (2) approved by the County of Kern and City of Bakersfield; and/or (3) engaged in active construction programs. While the surrounding area is not at buildout, and as yet is relatively rural in nature, the proposed Project would contribute to a cumulative influence on proposed land uses in and around the Project area.

The anticipated proposed Project impacts in conjunction with cumulative development in the site vicinity would increase industrial uses and result in the loss of open space and mineral petroleum uses in the local vicinity. Potential land use impacts are site-specific and require evaluation on a case-by-case basis. This is true with regard to land use compatibility impacts, which are generally a function of the relationship between the interactive effects of a specific development site and those of its immediate environment. Development of the proposed Project site and surrounding planning area is anticipated to occur in accordance with the Metropolitan Bakersfield General Plan, and in accordance with zoning classifications. Potential cumulative effects upon land use and planning are not anticipated to be significant.

Mitigation Measures

No mitigation beyond compliance with the goals, policies, and implementation measures of the Metropolitan Bakersfield General Plan and the Metropolitan Bakersfield Habitat Conservation Plan is required. No additional mitigation measures are proposed.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.12

Mineral Resources

Section 4.12
Mineral Resources

4.12.1 Introduction

The purpose of this section is to evaluate existing mineral resources and the potential impacts on mineral resources, oil and gas, sand and gravel, and any other mineral resources of the proposed Project. This section also describes the environmental and regulatory settings. Mitigation measures are recommended to avoid or lessen impacts, as necessary. Information within this section is based on California Geological Survey (CGS, formerly the Department of Conservation Division of Mines and Geology [DMG]), California Division of Oil, Gas & Geothermal Resources (DOGGR) and Kern County publications and maps, in addition to the Hazardous Materials Evaluation prepared for the proposed Project. A Hazardous Materials Evaluation (2008 HME) was prepared by McIntosh & Associates in November 2008 (refer to Appendix N). A second HME (2017 HME) was prepared by McIntosh & Associates in July 2017. See Appendix F, *Hazardous Materials Evaluation*, and Appendix N, *Original Technical Studies*.

4.12.2 Environmental Setting

Local Character

Metropolitan Bakersfield General Plan

There are approximately 25 oil fields either partially or completely within the Metropolitan Bakersfield General Plan area. The closest oil fields to the proposed Project include Stockdale and Mountain View oil fields. In addition, there are three sand and gravel extraction areas within the Metropolitan Bakersfield General Plan area, primarily along the floodplain and alluvial fan of the Kern River.

Project Site

According to the State Division of Oil, Gas, and Geothermal Resources (DOGGR), the proposed Project is not located within an oil or gas field. One abandoned well, "Sea Cliff-Houghton" 1, is located in the northwest portion of the proposed Project. This well was drilled by Big McKittrick Oil Company of California between November 1934 and June 1935. No oils shows were reported during the drilling period; one gas show was reported at a depth interval from 2,077 feet to 2,079 feet. The well was abandoned in October 1935.

Regional Character

Kern County

Kern County is one of the largest producers of mineral products in California with a production value of almost one-quarter of the State's total. The principal County mineral product is petroleum (an organic derivative material) and related products, which contribute about 75 percent of the total valuation of all County mineral products. The remainder is comprised of sand and gravel, borax, cement products and other construction and gem-like minerals including gold. The majority of the proposed Project is currently designated as Map Code R-IA (Resource - Intensive Agriculture) and a small portion of the southwest corner of the site as Map Code HC (Highway Commercial) by the Metropolitan Bakersfield General Plan.

Kern County produces more oil than any other county in California and is one of the nation's leading petroleum-producing counties. Mineral and petroleum resources are basic to Kern County's economy. As new recovery technologies come into use, petroleum extraction should continue in economic importance. And as long as new urbanization is restricted in areas having important mineral and petroleum resources, the future production of these resources remains promising.

The history of the oil industry in Kern County dates back to the 19th century. The Lakeview Gusher near Taft (of the Midway-Sunset Oil Field) was literally a lake of oil held back by check dams, resulting in the accumulation of nine million barrels of oil in the ground. The Kern River Oil Field was established in 1899 when a 43-foot well dug by hand, by Tom Means, resulted in another sudden stream flow of oil. By 1903, 796 wells produced almost 17 million barrels of oil from the Kern River field. Over the next decade, the Kern River and West Side oil fields set production records and pioneered improvements in oil extraction. In the mid-1930s, several valley oil fields were found in large anticlines in Miocene oil sands beneath the valley floor. These discoveries were made following the advent of the reflection seismograph. Discoveries included the Ten Section, Greeley, Rio Bravo North, Coles Levee, South Coles Levee and Strand oil fields. Today, 71 active fields still continue to produce from the originally established 98 oilfields.

Oil Resources

In order to locate oil, companies drill through the earth to the deposits deep below the surface. The oil is then pumped from below the ground by oilrigs. Typically, oil then travels through pipelines and is stored in large tanks until it is sent to various places to be used for the production of thousands of products. Oil must be changed or refined into other products before it can be used. At oil refineries, crude oil is split into various types of products by heating the thick black oil (crude). Some of the products include gasoline, diesel fuel, aviation fuel, home heating oil, oil for ships and oil to burn in power plants to make electricity. In California, approximately 74 percent of our oil is used for transportation (i.e., cars, planes, trucks, etc.). Oil is found in 18 of the 58 counties in California.

Kern County crude oil is known as "heavy" oil. It is very thick and is difficult to pump from the ground. One of the innovations of the industry is to inject steam into the well, heating up the crude and making it easier to pump. This extends the life of the oil field but is also expensive. Drilling

activity in Kern County hit its peak in the 1950's, and the number of new wells being drilled has since stabilized.

The vast majority of the state's oil activity occurs in the County of Kern where four of the nation's seven most productive oil fields are located. Several of the County's "giant" oil fields are located entirely or partially within the City of Bakersfield. According to the 2016 Annual Report of the State Oil and Gas Supervisor, Kern County produced approximately 134,114,693 oil barrels (bbl) from 42,045 active producing wells (DOGGR 2017). Mineral resources in Kern County include numerous mining operations that extract a variety of materials, including sand and gravel, stone, gold, dimensional stone, limestone, clay, shale, gypsum, pumice, decorative rock, silica, and specialty sand. The State Geologist has classified 2,971 square miles of land in Kern County as Mineral Resource Zones (MRZs) of varying significance.

Natural Gas

Natural gas is lighter than air and is produced in two basic forms, associated gas and non-associated gas. Associated gas is produced along with crude oil while non-associated gas is produced from gas fields that do not produce any crude oil. Natural gas is found underground and then pumped from below ground and transported in large pipelines. Because natural gas usually has no odor and can't be seen, it is mixed with a chemical that gives it an easy to detect smell in the event of an accidental leak. From the storage tanks, natural gas is sent through underground pipelines to its destination (consumer) to be used for cooking, heating, manufacturing and to power plants to make electricity. California's net natural gas production in the year 2016 totaled 156,005,114 million cubic feet (including Outer Continental Shelf). Kern County accounted for 113,014,940 million cubic feet of this natural gas, representing approximately 72 percent of the total natural gas produced statewide.

Project Site

Pacific Gas and Electric Company (PG&E) natural-gas transmission pipeline *No. L-300B*, is located within the proposed Project boundaries. This pipeline was installed in 1954, is 34 inches in diameter, and operates at 700 pounds per square inch (psi). It traverses southeasterly across the property from SR-99 in the northwest to the south line bordering the easternmost portion of the site. The pipeline then traverses due east for one-quarter-mile, passing through PG&E valve station 269B and the original PG&E station situated at South Union Avenue. Refer to Figure 4.12-1, *Natural Gas Pipeline Map*, for an illustration of the location of the on-site pipeline. A 4-inch-diameter, steel, subsurface natural gas distribution line operating at 60 psi was also identified that traverses the west side of South Union Avenue.

Sand and Gravel

Sand and gravel have been determined to be important resources for construction, development and physical maintenance, from highways and bridges to swimming pools and playgrounds. The availability of sand and gravel affects construction costs, tax rates and affordability of housing and commodities. The State of California has statutorily required the protection of sand and gravel operations. Because transportation costs are a significant portion of the cost of sand and gravel, the

long-term availability of local sources of this resource is an important factor in maintaining the economic attractiveness of a community to residents, business, and industry.

Project Site

The proposed Project does not contain sand and gravel resources. There is no evidence of past or current sand and gravel extraction operations occurring within the site or immediate Project vicinity.

The major resources of sand and gravel in Kern County are in stream deposits along the eastern side of the San Joaquin Valley and in the Sierra Nevada foothills, and in alluvial fan deposits along the north flank of the San Emigdio and Tehachapi Mountains at the southern end of the County. Most of the recent alluvium in the San Joaquin Valley floor is composed of sand used as a source of road base material. According to the Metropolitan Bakersfield General Plan, there are three sand and gravel extraction areas within the Metropolitan Bakersfield General Plan area, primarily along the floodplain and alluvial fan of the Kern River. None of these sand and gravel extraction areas are within or in close proximity to the proposed Project site.

Figure 4.12-1

Other Mineral Resources

The following section describes additional mineral resources relevant to local and regional character.

Gold has been the most important metallic mineral mined in Kern County in terms of total dollar value. It has been recovered by both placer and lode mining mainly in the Sierra Nevada and desert regions. While fluctuation in gold prices has caused a reactivation of interest in the commodity over the last two decades, continuous mining activity has been somewhat limited. Placer gold was mined before 1900, with the greatest number of deposits being mined during the late 1920s and 1930s. Principal placer deposits are in the Rand District, El Paso Mountains and along the Kern River. Approximately 1,500 gold claims have been registered in Kern County with approximately 280 of those claims activated as either lode or placer mines. Total amount of gold extracted from Kern County sites is not available since records were not kept during the more active lode mining activities prior to 1900. Placer yields are in excess of 32,000 fine ounces, a 1957 figure, but not likely to be much more since that date.

The Metropolitan Bakersfield General Plan EIR (Section 4.14, *Mineral and Energy Resources*) identifies the foothills of the Sierra Nevada's as having some potential as fossil and gemstone sites. These mineral resources, although possessing scientific and cultural value, are not considered a major economic resource.

Project Site

There is no evidence of other mineral resources being located within the proposed Project site and/or of mining operations occurring within the site or immediate Project vicinity.

4.12.3 Regulatory Setting

Oil, gas, and minerals, like land, are considered forms of property. The mineral resources that are beneath a tract of land (i.e., the mineral estate or subsurface estate) can be owned, and the ownership provides the holder with the mineral rights or subsurface rights, whereas, surface rights refer to ownership of the land (i.e., the surface estate) and the right to use the surface. When different parties own the surface and subsurface estates, it is referred to as split estate or severed estate lands.

The separation of surface and subsurface rights can occur through a mineral reservation. Severance by mineral reservation may occur if a party owning both surface and subsurface rights sells the land, but retains (or reserves) all or a portion of the mineral, oil and/or gas rights. To preserve title to the subsurface estate, the mineral owner has to record their mineral reservation with the county clerk and recorder's office or other government land title office. Mineral reservations often occur when lands are originally patented (e.g., the federal government sells the land but holds onto the mineral rights).

The following regulatory discussion provides applicable Federal, State, local goals, policies, regulations, codes and acts pertinent to development and operation of the proposed Project.

Federal

Bureau of Land Management

The Bureau of Land Management (BLM), an agency within the United States Department of the Interior, administers 261 million surface acres of America's public lands, located primarily in two Western States. The BLM sustains the health, diversity and productivity of the public lands for the use and enjoyment of present and future generations. The public lands provide a myriad of opportunities for commercial activities. Commercially valuable natural resources include energy and mineral commodities, forest products, grazing forage, and special uses such as rights-of-way for pipelines and transmission lines.

BLM is responsible for managing commercial energy and mineral production from the public lands in an environmentally sound and responsible manner. BLM is responsible for the leasing of Federal oil, gas, and geothermal minerals. BLM is also responsible for supervising the exploration, development, and production operations of these resources on both Federal and Indian lands. The proposed Project is privately owned and is not, in part or in total, under ownership of the BLM.

State

Surface Mining and Reclamation Act of 1975

The mineral resources addressed in this report pertain to those resources that are classified under the State Mining and Reclamation Act of 1975 (SMARA). The SMARA mandated the initiation by the State Geologist of mineral land classification in order to help identify and protect mineral resources in areas within the State subject to urban expansion and other irreversible land uses which would preclude mineral extraction. SMARA also allowed the designation of lands containing mineral deposits of regional or statewide significance. SMARA was amended (1980) to provide for the classification of non-urban area subject to land-use threats incompatible with mining. The classification of land within California takes place according to a priority list that was established by the State Mining and Geology Board (SMGB) in 1982, or when the SMGB is petitioned to classify a specific area. Currently, the State Geologist's SMARA classification activities are carried out under a single program for urban and non-urban areas of the state. Mineral lands are mapped using the California Mineral Land Classification System according to jurisdictional boundaries, mapping all mineral commodities at one time in the area, including aggregate, common clay and dimensions stone. Priority is given to areas where future mineral resource extraction could be precluded by incompatible land use or to mineral resources likely to be mined during the 50-year period following their classification. Detailed mineral land classification and designation reports provided by the State Mining and Geology Board are on file at the City of Bakersfield and County of Kern.

The SMGB established Mineral Resources Zones to designate lands that contain mineral deposits. Accordingly, the Mineral Resource Zone (MRZ) classification system is used to evaluate an area's mineral resources pursuant to SMARA. A "resource" is a concentration of naturally occurring solid, liquid, or gaseous material in such form and amount that economic extraction of a commodity from the concentrations is currently potentially feasible. A "reserve" is that part of the resource base which

could be economically extracted or produced within the foreseeable future. For any given mineral resource, an area may be classified as MRZ-1, MRZ-2, MRZ-3, or MRZ-4, as follows:

- MRZ-1: Areas where the available geologic information indicates that no significant mineral deposits are present, or where it is judged that no significant likelihood exists for their presence.
- MRZ-2a: Areas where the available geologic information indicates that significant mineral deposits are present.
- MRZ-2b: Areas where the available geologic information indicates that there is likelihood for the presence of significant mineral deposits.
- MRZ-3a: Areas where the available geologic information indicates that mineral deposits exist, the significance of which cannot be determined from available data.
- MRZ-3b: Areas where the available geologic information indicates that mineral deposits are likely to exist, the significance of which cannot be determined from available data.
- MRZ-4: Areas where available geologic information is inadequate for assignment into any other MRZ, or where there is not enough information available to determine the presence or absence of mineral deposits.

The MRZ classifications are applied based on available geologic information and upon geologic appraisal of the mineral resource potential of the land, including geologic mapping and other information on surface exposures, drilling records, and mine data; and on socioeconomic factors such as market conditions and urban development patterns.

Division of Oil, Gas, and Geothermal Resources (DOGGR)

DOGGR is responsible for supervising the drilling, operation, maintenance, plugging, and abandonment of oil, gas, and geothermal wells. DOGGR's regulatory program promotes the sensitive development of oil, natural gas, and geothermal resources in California through sound engineering practices, prevention of pollution, and implementation of public safety programs. To implement this regulatory program, DOGGR requires avoidance of building over or near plugged or abandoned oil and gas wells or requires the remediation of wells to current DOGGR standards.

All oil and gas wells drilled and constructed in California must adhere to strict requirements. These requirements include general laws and regulations regarding the protection of underground and surface water, and specific regulations regarding the integrity of the well casing, the cement used to secure the well casing inside the bore hole, and the cement and equipment used to seal off the well from underground zones bearing fresh water and other hydrocarbon resources. (See California Public Resources Code sections 3106, 3203, 3211, 3220, 3222, 3224, 3255; Title 14 of the California Code of Regulations, sections 1722.2, 1722.3, 1722.4, etc.). In addition, the DOGGR requires avoidance of building over or near plugged or abandoned oil and gas wells or requires the remediation of wells to current DOGGR standards.

DOGGR also has the authority under the CCR to adopt field rules for oil and gas pools or zones in a field when sufficient geologic and engineering data is available from previous drilling operations. The administrative boundaries of each pool or zone for which field rules have been adopted and geologic and engineering information is available to accurately describe subsurface conditions are designated through a ministerial process by DOGGR. Applicable field rules identify down hole conditions and well construction information that oil and gas operators should consider when drilling and completing onshore oil and gas wells. In addition to DOGGR facilities regulations, operators that have facilities in designated areas must have Spill Prevention, Control and Countermeasure Plans per U.S. Environmental Protection Agency (EPA) requirements.

In California, wells that inject fluids associated with oil and natural gas production operations (Class II injection wells) are regulated by the DOGGR under the Underground Injection Control (UIC) Program. Injection operations regulated under the UIC Program include water flood, steam flood, cyclic steam, water disposal, gas storage, and other enhanced oil recovery projects. DOGGR's UIC program is monitored and audited by the EPA because in 1982 DOGGR entered into a primacy agreement with the EPA for regulation of Class II injection wells under the federal Safe Drinking Water Act (SDWA). The requirements of DOGGR's UIC Program are found in the Public Resources Code (PRC), the Safe Drinking Water Act, and in the state and federal regulations. The main features of the UIC Program include permitting, inspection, enforcement, mechanical integrity testing, plugging and abandonment oversight, data management, and public outreach.

On November 15, 2013, the DOGGR began the formal rulemaking process for Well Stimulation Treatment Regulations, which, at that time were to go into effect no later than January 1, 2015. Interim regulations went into effect on January 1, 2014, which require oil and gas well operators to submit notification of well stimulation treatments and various types of data associated with well stimulation operations, including chemical disclosure of well stimulation fluids, to the DOGGR. In addition, the DOGGR is required to compile submitted information regarding these activities and make it available to the public in a format that is easily searchable.

On June 20, 2014, Governor Brown signed into law Senate Bill (SB) 861 (Committee on Budget and Fiscal Review, Chapter 35, Statutes of 2014), which took effect immediately. SB 861 amended DOGGR's authority to use emergency rulemaking to establish interim regulations for implementation of SB 4. As allowed under the new law, the readopted SB 4 interim well stimulation treatment regulations will remain in effect until the most current version and status if the final well stimulation regulations went into effect July 1, 2015 (DOGGR 2017).

California Geological Survey (Formerly California Division of Mines and Geology)

The California Geological Survey (formerly the California Division of Mines and Geology within the State Department of Conservation) has responsibility to identify and assist in the utilization of mineral deposits, and to identify geological hazards, including fault locations.

Local

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan lists the issues, goals, policies, and implementation measures related to oil, natural gas, sand and gravel, as other minerals and energy resources in the County, as contained in the Energy Element. Project implementation would be guided in part by the goals, policies, and implementation programs, which are presented in Table 4.12-1, *Metropolitan Bakersfield General Plan Goals and Policies for Mineral Resources*.

Table 4.12-1. Metropolitan Bakersfield General Plan Goals and Policies for Mineral Resources

Goals and Policies: Mineral Resources Element
Goal #1: Protect areas of significant resources potential for future use.
Goal #2: Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs.
Goal #3: Avoid conflicts between the productive use of mineral and energy resource lands and urban growth.
Goal #4: Protect land, water, air and visual resources from environmental damage resulting from mineral and energy resource development.
Policy #1: Maintain maps and descriptions of potential mineral and energy resources as a basis for policy and program implementation.
Policy #2: Document the location, status and long-term viability of sand and gravel quarries and petroleum drilling sites for purposes of avoiding near and long-term land use conflicts and provide a basis of compliance monitoring.
Policy #3: Encourage and support the exchange of information on mineral and energy resources between private industry, City of Bakersfield and Kern County.
Policy #4: Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board.
Policy #5: Protect significant mineral and petroleum resource areas, including potential sand and gravel extraction areas.
Policy #6: Continue implementation of the Kern River Channel Maintenance Program for extraction of river sand and gravel.
Policy #7: Promote development of compatible uses adjacent to mineral extraction areas.
Policy #8: Allow development of resource extraction sites subject to the conditional use permit procedure in zones where such uses are not prohibited by right and where it can be shown that the proposed extraction uses are compatible with surrounding areas.
Policy #9: Encourage preservation of any known deposits of gemstones and fossils.
Policy #10: Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce extraction operations.
Policy #11: Prohibit incompatible development in areas, which have a significant potential to harm public health, safety and welfare due to mineral and petroleum extraction and processing.
Policy #12: Design resource extraction operations subject to discretionary permits to maintain the integrity of areas of "high environmental quality" and unique scenic value.
Policy #13: Require surface mineral resource extraction sites to have plans and procedures for land reclamation, conforming with the requirements of the State Mining and Geology Board, to be implemented upon completion of extraction operations at each site or portion thereof.

Table 4.12-1. Metropolitan Bakersfield General Plan Goals and Policies for Mineral Resources
Goals and Policies: Mineral Resources Element
Policy #14: Review all discretionary mineral or petroleum development including renewal of existing authorizations, under the policies and procedures of the California Environmental Quality Act.
Policy #15: Require petroleum production sites in urban areas, which are subject to discretionary permits to install peripheral landscaping to help reduce the noise, dust and visual impacts to adjacent sensitive receptors and public ways.
Policy #16: Require all mineral development to be predicated on appropriate reclamation plans that meet the standards of the State Surface Mining and Reclamation Act and the implementing guidelines of the State Mines and Geology Board, and/or the standards of the State Division of Oil and Gas. Reclamation/restoration of the sites shall be done at each phase of development or as extraction is completed.

Kern County Zoning Ordinance (Title 19 of the Ordinance Code of Kern County)

Chapter 19.98 Oil and Gas Production

This chapter of the Kern County Zoning Ordinance contains the procedures and standards that apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County. The purpose of this chapter is to promote the economic recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety.

This chapter, along with related parts of the zoning ordinance, was amended by the Kern County Board of Supervisors on November 9, 2015 to require a ministerial permit for all oil and gas operations along with updated implementation standards and mitigation measures. A comprehensive project level oil and gas activities EIR was certified and includes mitigation measures to address environmental impacts of pre-drilling exploration, well drilling, and the operation of wells and other oil and gas production–related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring and plugging and abandonment. This required permit is in conjunction with and coordinated with the permit issued by DOGGR.

Kern County Fire Department

A set back is a minimum distance required by zoning to be maintained between structures or between structures and property lines. Kern County does not currently have any adopted zoning ordinance specifically addressing set back distances for petroleum and natural gas pipelines. However, the Kern County Fire Department has set back distance requirements for buildings constructed adjacent to transmission pipelines that transport petroleum and natural gas. The Pipeline Development Policies of the Kern County Fire Department are as follows:

- No habitable portion of a structure shall be construction within 50 feet of a gas main, or transmission line, or refined liquid product line with 36 inches of cover;

- No structure may be within 40 feet of a hazardous liquids pipeline bearing refined product, with 48 inches or more of cover;
- No habitable portion of a structure shall be built within 30 feet of a crude oil pipeline operating at 20 percent of its design strength;
- Prior to or concurrent with filing of a final map, a covenant shall be recorded on all lots of this tract, or portion thereof, which are within 250 feet of any gas transmission line. Covenant shall acknowledge proximity of pipeline easement to said property and describe the name, type and dimension of the pipelines. Prior to recordation, the subdivider shall submit and obtain approval covenant wording with the City Attorney, Office of Environmental services and City Engineer.

4.12.4 Impacts and Mitigation Measures

Methodology

In accordance with the California Environmental Quality Act (CEQA), the effects of a project are evaluated to determine if they will result in a significant adverse impact on the environment. An EIR is required to focus on these effects and offer mitigation measures to reduce or avoid any significant impacts that are identified. The criteria, or standards, used to determine the significance of impacts may vary depending on the nature of the proposed Project. Mineral Resource impacts resulting from the implementation of the proposed Project could be considered significant if they cause any of the following results.

Thresholds of Significance

- The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; and/or
- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

The analysis of the existing environment and the impact analysis indicate that this proposed Project could result in a significant environmental impact if it would result in a loss of mineral resources, if not mitigated.

Project Impacts

Impact 4.12-1: The Project Would Not Result in the Loss of Availability of a Known Mineral Resource That Would be of Value to the Region and the Residents of the State

The proposed Project is not located within the administrative boundary of an oil or gas field. One previously abandoned exploration well, "Sea Cliff-Houghton" 1, is located in the northwest corner of

the Project site. The well was installed in November 1934 and drilled to approximately 6,756 feet, where it had no oil shows and one gas show at a depth interval of 2,077 to 2,079 feet. The well was abandoned as a dry hole with mud in the casing in October 1934 (refer to Appendix F, *Hazardous Materials Evaluation*). No other mineral resources or mineral resource facilities are known to occur on the Project site.

The lack of oil shows in prospect well "Sea Cliff-Houghton" 1 indicates that commercial quantities of oil and/or natural gas are not likely to underlie the proposed Project. As discussed in Section 4.9, *Hazards/Hazardous Materials*, the well must be reabandoned to current DOGGR and Kern County standards. Impacts would be less than significant because no known or potential mineral resources are present within, or in close proximity to, the proposed Project.

The Project does not propose mineral and/or energy resource development. However, PG&E currently operates a natural gas pipeline, number L-300B, that traverses the Project site (refer to Figure 4.12-1, *Natural Gas Pipeline Map*). Transport of natural gas through this pipeline would not be impeded by the proposed Project implementation. Mitigation would be required in order to maintain PG&E access to the pipeline. In addition, development on-site, would, also be required to comply with applicable State and local regulations in order to reduce potential impacts on health and safety related to this pipeline to less than significant levels (refer to Section 4.9, *Hazards/Hazardous Materials*). Impacts would be less than significant.

Mitigation Measures

Implementation of MM 4.9-6, 4.9-7, 5.9-9, and 4.9-10.

MM 4.12-1: **Natural Gas Pipeline Easements.** The Pacific Gas and Electric (PG&E) natural gas pipeline easement shall be included on all maps and grading plans to allow for continuous PG&E access for all maintenance activities.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.12-2: The Project Would Result in the Loss of Availability of a Locally Important Mineral Resource Recovery Site Delineated on a Local General Plan, Specific Plan or Other Land Use Plan.

Extraction and use of mineral resources is a significant economic and social value in Kern County. Challenges occur when oil production and mineral extraction activities are located in close proximity to incompatible land uses, such as residential. As discussed in Impact 4.12-1, above, the Project site is not located within the administrative boundaries of an oil or gas field. No oil shows were observed, and one natural gas show was observed at a depth interval or 2,077 to 2,079 feet in 1934-35. The DOGGR requires reabandonment of the prospect well "Sea Cliff-Houghton" 1.

There is no property within the proposed Project that is contained within an MRZ. Therefore, the proposed Project is not anticipated to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Extraction and use of mineral resources is a significant economic and social value in Kern County. Challenges occur when oil production and mineral extraction activities are located in close proximity to incompatible land uses, such as residential. As discussed in Impact 4.12-1, above, the proposed Project is not located within the administrative boundary of an oil or gas field. No commercial shows of oil or natural gas have been withdrawn from prospect well "Sea Cliff-Houghton" 1. This prospect well is currently abandoned.

The proposed Project in not within an MRZ. Therefore, the proposed Project is not anticipated to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Cumulative impacts to mineral resources would occur if the cumulative projects would result in the loss of oil or aggregate mineral resources. This proposed Project is not within an administrative boundary for oil or gas fields and is not within an area of aggregate mineral resources. Other projects in the Metropolitan Bakersfield area may occur within or near existing oil fields, as well as sand and gravel mining operations. However, where these resources have substantial remnant supplies, none of the cumulative projects would preclude continued extraction or production of these resources. In addition, because the proposed Project has a less than significant impact on mineral resources, it would not add to a cumulative loss of resources within Kern County. Therefore, cumulative impacts would not result.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.13

Noise

Section 4.13
Noise

4.13.1 Introduction

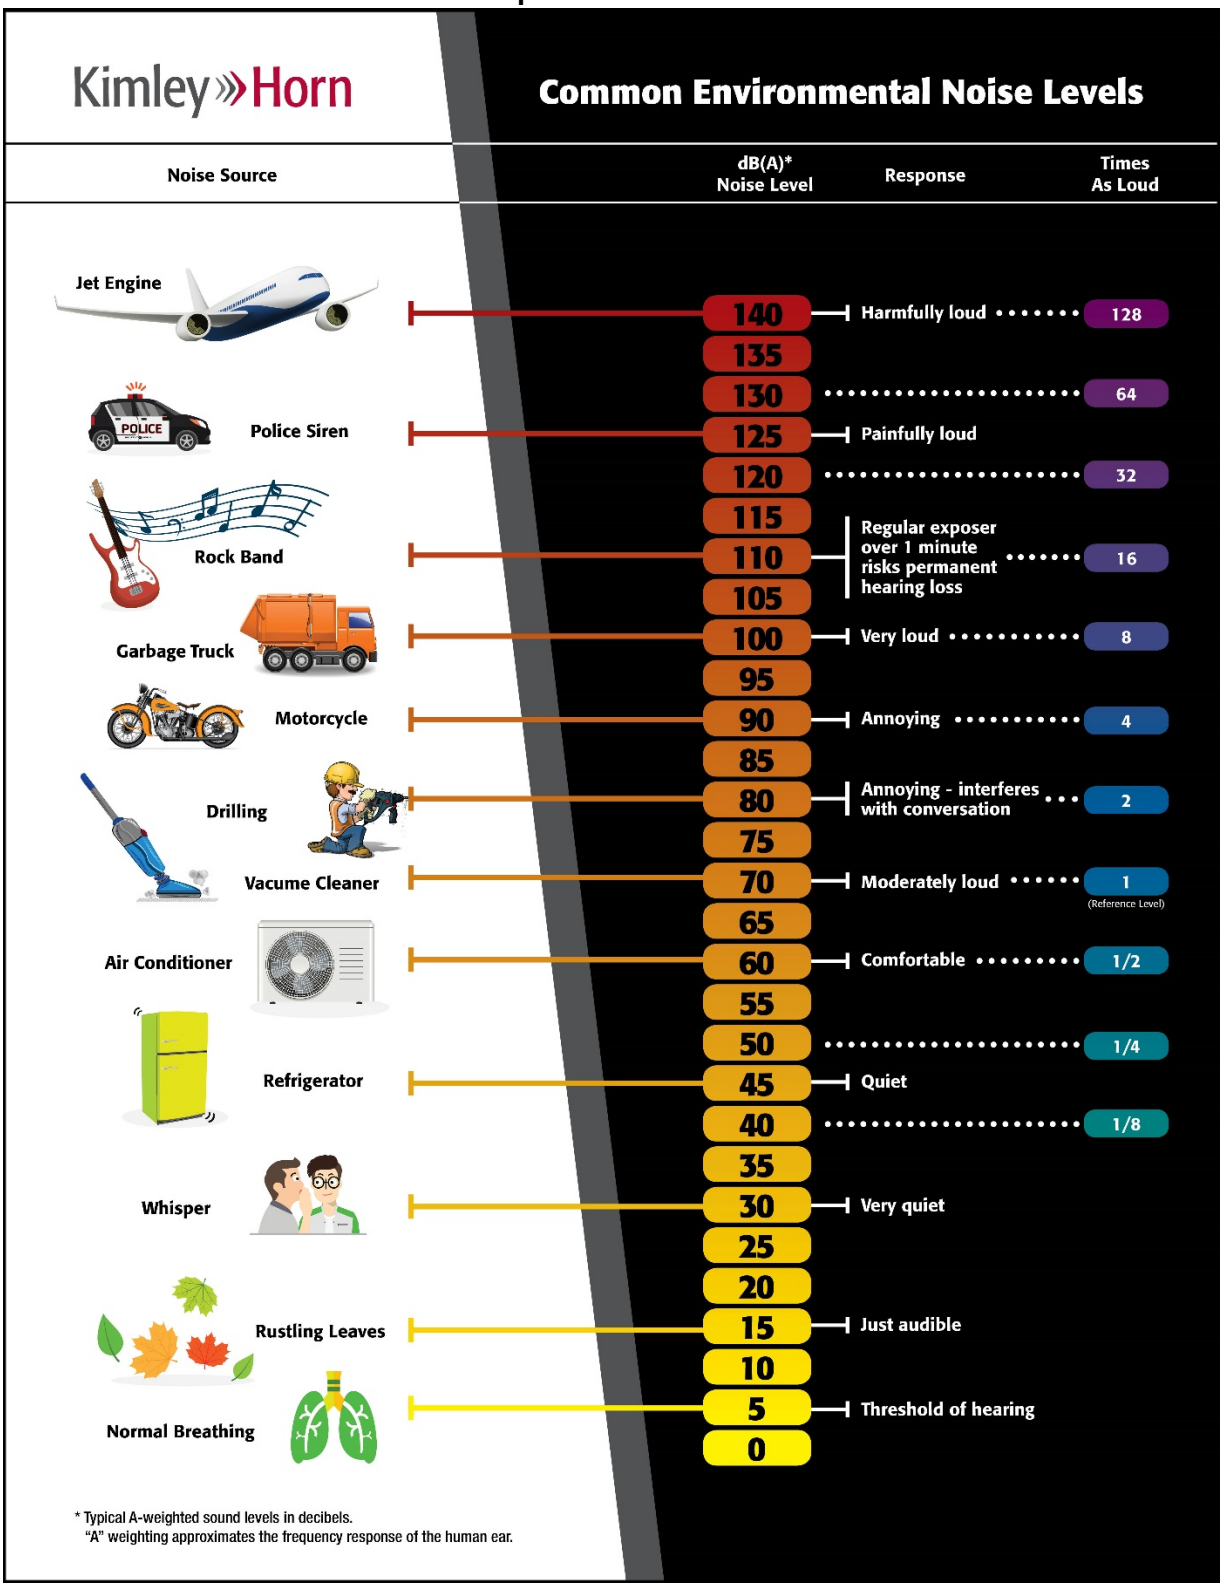
This section of the Recirculated Draft EIR addresses the potential noise impacts associated with construction and operation of the proposed Project. The noise section describes the existing conditions on the proposed Project site, the regulatory setting, the impacts of the proposed Project, and feasible mitigation measures to reduce impacts. An Environmental Noise Assessment was prepared by Bollard Acoustical Consultants, Inc. in April 2009. A second Environmental Noise Assessment was prepared by Bollard Acoustical Consultants, Inc. in May 2016 and an updated Environmental Noise Assessment was prepared in July 2017. See Appendix I, *Environmental Noise Assessment*, and Appendix N, *Original Technical Studies*.

Acoustical Terminology

Sound is technically described in terms of the loudness (amplitude) of the sound and frequency (pitch) of the sound. Noise is typically described as any unwanted or objectionable sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) performs this compensation by discriminating against sound frequencies in a manner approximating the sensitivity of the human ear. The A-weighted sound level of traffic and other long-term noise-producing activities within and around a community varies considerably with time. Measurements of this varying noise level are accomplished by recording values of the A-weighted level during representative periods during the day.

Decibels are based on the logarithmic scale. The logarithmic scale compresses the wide range in sound pressure levels to a more usable range similar to how the Richter scale measures earthquake magnitudes. In terms of human response to noise, a sound 10 dBA higher than another is perceived to be twice as loud; 20 dBA higher, four times as loud; and so forth. Everyday sounds normally range from 30 dBA (very quiet) to 100 dBA (very loud). Examples of various sound levels in different environments are shown in Figure 4.13-1, *Sound Levels and Human Response*.

Figure 4.13-1 Sound Levels and Human Response



In most situations, a three-dBA change in sound pressure level is considered a "just-detectable" difference. A five-dBA change (either louder or quieter) is readily noticeable and a 10-dBA change is a doubling (if louder) or a halving (if quieter) of the subjective loudness. Sound from a small localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates or drops-off at a rate of six dBA for each doubling of the distance (six dBA/DD). This decrease, due to the geometric spreading of the energy over an ever- increasing area, is referred to as the inverse square law. However, highway traffic noise is not a single, stationary point source of sound. The movement of the vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. Since the change in surface area of a cylinder only increases by two times for each doubling of the radius instead of the four times associated with spheres, the change in sound level is three dBA per doubling of distance. Numerous methods have been developed to measure sound over a period of time. These methods include (1) the community noise equivalent level (CNEL); (2) the equivalent sound level (L_{eq}); and (3) the day/night average sound level (L_{dn}). These methods and additional noise related terminology is described below.

Community Noise Equivalent Level (CNEL)

Cumulative noise metrics were developed to assess community response to noise. They are useful because they attempt to take into account the loudness and duration of the noise, the total number of noise events and the time of day these events occur in one single-number rating scale. They are designed to account for the known health effects of noise on people. CNEL is a 24-hour, time-weighted energy-average noise level based on dBA that measures the overall noise during an entire day. Noise that occurs during certain sensitive time periods is penalized for occurring at these times by adding decibels to its L_{eq} measurement. On the CNEL scale, noise between 7:00 AM and 10:00 PM is penalized by approximately five dB, to account for the greater potential for noise to interfere during these hours, as well as typically lower ambient (background) noise levels during these hours. Noise during the night (from 10:00 PM to 7:00 AM) is penalized by ten dB to attempt to account for our higher sensitivity to noise in the nighttime and the expected further decrease in ambient noise levels that typically occur in the night.

Equivalent Sound Level (Leq)

The equivalent sound level, abbreviated L_{eq}, is a measure of the exposure resulting from the accumulation of A-weighted sound levels over a particular time period (e.g., one-hour, eight-hour school day, nighttime or a full 24-hour day). However, because the length of the period can be different depending on the time frame of interest, the applicable period should always be identified or clearly understood when discussing the metric. Such durations are often identified through a subscript, for example $L_{eq(24)}$.

Conceptually, L_{eq} may be thought of as a constant sound level over the period of interest that contains as much sound energy as the actual time-varying sound level with its normal peaks and valleys. It is important to recognize, however, that the two signals (the constant one and the time-varying one) would sound very different from each other if compared in real life. Variations in the "average" sound level suggested by L_{eq} are not an arithmetic value, but a logarithmic ("energy-averaged") sound level. Thus, loud events clearly dominate any noise environment described by the metric.

Day/Night Average Sound Level (L_{dn})

The day/night average sound level (L_{dn}) is a measure of the 24-hour average noise level at a given location. It was adopted by the U.S. Environmental Protection Agency (EPA) for developing criteria for the evaluation of community noise exposure. L_{dn} is based on a measure of the average noise level over a given time period. The L_{dn} is calculated by averaging the L_{eq} for each hour of the day at a given location after penalizing the sleeping hours (from 10:00 PM to 7:00 AM) by 10 dBA to take into account the increased sensitivity of people to noises that occur at night. The sound level exceeded over a specified timeframe can be expressed as L_n (i.e., L_{90}, L_{50}, L_{10}, etc.). L_{50} equals the level exceeded 50 percent of the time; $L_{10,}$ ten percent of the time; etc.

Maximum Sound Level (Lmax)

The maximum sound level recorded during a noise event.

Noise (Exposure) Contours

Noise (exposure) contours illustrate (typical a line drawn on a diagram/map) a noise source indicating constant levels of noise exposure. CNEL contours are frequently utilized to describe a community's exposure to noise.

Sound Propagation and Attenuation

For purposes of sound propagation, noise sources may be classified as point sources or line sources. Point sources usually are localized, such as a piece of machinery, and at a distance, sound from such sources will propagate in a spherical pattern. Sound levels from point sources will attenuate or drop-off at the rate of six dB for each doubling of distance. Sound from line sources, such as a highway, propagates in a cylindrical pattern. Sound from line sources will attenuate at a rate of three dB per doubling of distance.

Additionally, sound levels also may be attenuated by air and ground absorption, and from shielding by natural or man-made obstacles in the sound path. Noise barriers (walls or earth berms) are features that are commonly constructed to interrupt noise propagation and reduce noise levels. Wind and atmospheric temperature inversions also influence sound propagation.

Vibration Characteristics

Vibration is a unique form of noise. It is unique because its energy is carried through structures and the earth, whereas, noise is simply carried through the air. Thus, vibration is generally felt rather than heard. Some vibration effects can be caused by noise; e.g., the rattling of windows from truck pass-bys. This phenomenon is related to the coupling of the acoustic energy at frequencies that are close to the resonant frequency of the material being vibrated. Typically, ground-borne vibration generated by man-made activities attenuates rapidly as distance from the source of the vibration increases. Vibration, which spreads through the ground rapidly, diminishes in amplitude with distance from the source. The ground motion caused by vibration is measured as particle velocity in inches per second and, in the U.S. is referenced as vibration decibels (VdB).

The vibration velocity level threshold of perception for humans is approximately 65 VdB. A vibration velocity of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels for many people. Sources within buildings such as operation of mechanical equipment, movement of people or the slamming of doors causes most perceptible indoor vibration. Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel wheeled trains and traffic on rough roads. Ground type, distance between source and receptor, duration, and the number of perceived vibration events can all influence human and structural responses to vibration. The range of interest is from approximately 50 VdB, which is the typically background vibration velocity, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings.

4.13.2 Environmental Setting

Noise-Sensitive Land Uses

Certain land uses are particularly sensitive to noise, including schools, hospitals, rest homes, long-term medical and mental care facilities, and parks and recreation areas. Residential areas are also considered noise sensitive, especially during the nighttime hours.

The proposed Project is mostly vacant and used for agricultural purposes. Noise sensitive land uses in the immediate vicinity of the proposed Project include existing single-family residences to the east of the proposed Project. These uses may be affected by increased Project-related traffic noise on local area roadways and on-site noise sources.

Existing Noise Environment

The proposed Project consists of approximately 314.30 acres of fallow agricultural land. The topography of the site is relatively flat, sloping slightly from the northwest to the southeast. Elevations range from approximately 331 feet above mean sea level (msl) to 340 feet above msl. Existing noise sources located in the immediate vicinity of the proposed Project include traffic on local roadways and agricultural equipment.

Ambient Noise Measurements

The existing ambient noise environment in the immediate project vicinity is defined primarily by SR-99 traffic, local traffic, and commercial/light industrial operations. In order to quantify existing ambient noise levels in the proposed Project area, a 24-hour ambient noise level measurement survey was completed at the closest residential property to the proposed Project site on December 18-19, 2008 and additional short-term ambient noise measurements were collected in July 10, 2017 (Bollard Acoustical Consultants 2017) at three locations. Figure 4.13-2, *Location of Existing Noise Level Measurements*, shows the location where noise measurements were taken in 2017.

Noise monitoring equipment used for the study consisted of a Larson-Davis Laboratories (LDL) Model 820 precision integrating sound level meter equipped with an LDL Model 2560 1/2" microphone. The instrumentation complies with applicable requirements of the American National

Standards Institute (ANSI) for Type 1 (precision) sound level meters, and was calibrated prior to use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements (Bollard Acoustical Consultants 2017).

Existing Traffic Noise Levels

Vehicular noise along major roadways in the vicinity of the proposed Project was modeled to estimate existing noise levels from mobile sources. The existing and future roadway noise levels were projected using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model, together with several roadway and site parameters. The FHWA Traffic Noise Prediction Model's Lookup Table provides a reference of pre-calculated TNPM results for simple highway geometries, which is adequate for the purposes of this analysis.

Traffic volumes used in the FHWA TNPM were obtained from the Traffic Study prepared by McIntosh & Associates, January 2016. Existing modeled traffic noise levels are shown in Table 4.13-1, *Existing Traffic Noise Levels*. Table 4.13-1 shows existing traffic noise levels at a reference distance of 100 feet from the centerlines of existing Project-area roadways. As illustrated in Table 4.13-1, existing traffic noise levels range from 30 to 70 dBA CNEL. Several roadway segments currently exceed the Metropolitan Bakersfield General Plan noise standard of 65 dBA CNEL standard at 100 feet from the centerline.

Stationary Sources

The proposed Project is located in a primarily agricultural area. Transient noise generation from agricultural operations and equipment occurs within the Project vicinity on a seasonal basis. There are no other sources of stationary noise in the vicinity of the proposed Project.

4.13.3 Regulatory Setting

Federal

There are a number of laws and guidelines at the Federal level that direct the consideration of a broad range of noise and vibration issues. Because the project does not require action by Federal agencies, at this time, the project is not directly subject to Federal noise regulations other than those of the Federal Occupational Safety and Health Administration (OSHA). For perspective, several of the more significant noise-related Federal regulations and guidelines are described below.

Noise Control Act of 1972 (42 USC 4910)

This act establishes a national policy to promote an environment for all Americans free from noise that jeopardizes their health and welfare. To accomplish this, the act establishes a means for the coordination of Federal research and activities in noise control, authorizes the establishment of Federal noise emissions standards for products distributed in commerce, and provides information to the public with respect to the noise-emission and noise-reduction characteristics of such products.

USEPA Recommendations in "Information on Levels of Environmental Noise Requisite to Protect Health and Welfare with an Adequate Margin of Safety" (NTIS 550\9-74-004, USEPA, Washington, D.C., March 1974)

In response to a Federal mandate, U.S. Environmental Protection Agency (EPA) provided guidance in Information on Levels of Environmental Noise Requisite to Protect Health and Welfare with an Adequate Margin of Safety (National Technical Information Service [NTIS], 550\9-74-004, EPA, Washington, D.C., March 1974). Commonly referenced as the "Levels Document," it establishes an Ldn of 55 dBA as the requisite level, with an adequate margin of safety, for areas with outdoor uses, including residential and recreational areas. This document does not constitute EPA regulations or standards but identifies safe levels of environmental noise exposure without consideration of costs for achieving these levels or other potentially relevant considerations. It is intended to "provide State and local governments, as well as the Federal government and the private sector, with an informational point of departure for the purpose of decision-making." The agency is careful to stress that the recommendations contain a factor of safety and do not consider technical or economic feasibility issues and, therefore, should not be construed as standards or regulations.

Federal Highway Administration

The purpose of the Federal Highway Administration (FHWA) Noise Abatement Procedures (23 CFR 772) is to provide procedures for noise studies and noise abatement measures to help protect the public health and welfare, supply noise abatement criteria, and establish requirements for information to be given to local officials for use in the planning and design of highways. The purpose of this regulation is to provide procedures for noise studies and noise abatement measures to help protect the public health and welfare, to supply noise abatement criteria (NAC), and to establish requirements for information to be given to local officials for use in the planning and design of highways. It establishes five categories of noise-sensitive receptors and prescribes the use of the hourly L_{eq} as the criterion metric for evaluating traffic noise impacts.

All highway projects that are developed in conformance with this regulation shall be deemed to be in conformance with the Department of Transportation-FHWA Noise Standards. Title 23 establishes an NAC of 67 dBA $L_{eq(h)}$ applicable to federal highway projects for evaluating impacts to land uses including residences, recreational uses, hotels, hospitals, and libraries (23 CFR Chapter 1, Part 772, Section 772.19). Additionally, FHWA requires that individual states establish an allowable noise level increase (at or above which the increase is deemed to be "substantial" (between 5 and 15 dB) and abatement should be considered) for Type 1 highway projects. Type I projects include projects that would: construct a highway in a new location; physically alter and existing highway where there is a substantial horizontal or vertical alteration; add through-traffic lane(s); add auxiliary lane(s); add or relocate interchange lands or ramps; restripe pavement for the purposes of adding lane(s); and add a new, or substantially altering and existing, weigh station, rest stop, ride-share lot, or toll plaza.

Occupational Safety and Health Administration

The OSHA Occupational Noise Exposure: Hearing Conservation Amendment (Federal Register 48 [46], 9738–9785, 1983) stipulates that protection against the effects of noise exposure shall be provided for employees when sound levels exceed 90 dBA over an 8-hour exposure period. Protection shall consist of feasible administrative or engineering controls. If such controls fail to reduce sound levels to acceptable levels, personal protective equipment shall be provided and used to reduce exposure of the employee. Additionally, a hearing conservation program must be instituted by the employers whenever employee noise exposure equals or exceeds the action level of an 8-hour, time-weighted average sound level of 85 dBA. The hearing conservation program requirements consider periodic area and personal noise monitoring, the performance and evaluation of audiograms, the provision of hearing protection, annual employee training, and record keeping.

State

California Environmental Quality Act (CEQA) Guidelines

The California Environmental Quality Act (CEQA) was enacted in 1970 and requires that all known environmental effects of a project be analyzed, including environmental noise impacts. Under CEQA, a project has a potentially significant impact if the project exposes people to noise levels in excess of standards established in the local general plan or noise ordinance. Additionally, under CEQA, a project has a potentially significant impact if the project creates a substantial increase in the ambient noise levels in the project vicinity above levels existing without the proposed Project. If a project has a potentially significant impact, mitigation measures must be considered. If mitigation measures to reduce the impact to less than significant are not feasible due to economic, social, environmental, legal, or other conditions, the most feasible mitigation measures must be considered.

California Government Code

The California Department of Health Services has studied the correlation of noise levels and their effects on various land uses and established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure. The State requires all municipalities to prepare and adopt a comprehensive long-range general plan. General plans must contain a noise element (California Government Code Section 65302[f] and Section 46050.1 of the Health and Safety Code). The requirements for the noise element of the general plan include describing the noise environment

quantitatively using a cumulative noise metric, such as CNEL or DNL, establishing noise/land use compatibility criteria, and establishing programs for achieving and/or maintaining land use compatibility. Noise elements should address all major noise sources in the community, including mobile and stationary noise sources.

The State Office of Planning and Research (OPR) Noise Element Guidelines include recommended exterior and interior noise level standards for local jurisdictions to identify and prevent the creation of incompatible land uses due to noise. The Noise Element Guidelines contain a land use compatibility table that describes the compatibility of various land uses with a range of environmental noise levels in terms of the CNEL. Table 4.13-2, *California Land Use Compatibility Noise Guidelines*, presents guidelines for determining acceptable and unacceptable community noise exposure limits for various land use categories. The guidelines also present adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution.

Table 4.13-2. California Land Use Compatibility Noise Guidelines

LAND USE CATEGORY	COMMUNITY NOISE EXPOSURE (dBA CNEL)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential – Low Density, Single-Family, Duplex, Mobile Homes	50 - 60	55 - 70	70 – 75	75 – 85
Residential – Multiple Family	50 - 65	60 - 70	70 – 75	70 – 85
Transient Lodging – Motels, Hotels	50 - 65	60 - 70	70 – 80	80 – 85
Schools, Libraries, Churches, Hospitals, Nursing Homes	50 - 70	60 - 70	70 – 80	80 – 85
Auditoriums, Concert Halls, Amphitheaters	NA	50 - 70	NA	65 – 85
Sports Arenas, Outdoor Spectator Sports	NA	50 – 75	NA	70 – 85
Playgrounds, Neighborhood Parks	50 - 70	NA	67.5 – 75	72.5 – 85
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50 - 70	NA	70 – 80	80 – 85
Office Buildings, Business Commercial and Professional	50 - 70	67.5 – 77.5	75 – 85	NA
Industrial, Manufacturing, Utilities, Agriculture	50 - 75	70 - 80	75 – 85	NA

Table 4.13-2. California Land Use Compatibility Noise Guidelines

LAND USE CATEGORY	COMMUNITY NOISE EXPOSURE (dBA CNEL)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable

Source: General Plan Guidelines, Office of Planning and Research, California, October 2003, page 250.

CNEL = community noise equivalent level; NA = not applicable.

Notes:

Normally Acceptable – Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

Conditionally Acceptable – New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

Normally Unacceptable – New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

Clearly Unacceptable – New construction or development should generally not be undertaken.

California Division of OSHA

Occupational exposure to noise is regulated by the California Division of OSHA in Title 8, Group 15, Article 105, Sections 5095–5100. As mentioned above, the agency's standards stipulate that protection against the effects of noise exposure shall be provided when sound levels exceed 90 dBA over an 8-hour exposure period. Protection shall consist of feasible administrative and/or engineering controls. If such controls fail to reduce sound levels to acceptable levels, personal protective equipment shall be provided and used to reduce exposure of the employee. In addition, a hearing conservation program must be instituted by employers whenever employee noise exposure equals or exceeds the action level of an 8-hour time-weighted average sound level of 85 dBA. The hearing conservation program requirements consider periodic area and personal noise monitoring, the performance and evaluation of audiograms, the provisions of hearing protection, annual employee training, and record keeping. The California Environmental Quality Act (CEQA) (PRC Section 21000 et seq.) requires the identification of "significant" environmental impacts and their feasible mitigation.

Section XI of Appendix G to the CEQA Guidelines (CCR Title 14, Appendix G) lists some indicators of potentially significant impacts, which are included below under "Thresholds of Significance."

CEQA does not define a threshold for "significant increase" with respect to noise exposure; however, based on human response and commonly applied industry standards, the following thresholds of significance would be applied to the project, as set forth by the CEQA Guidelines:

- The project causes the ambient noise level measured at the property line of affected uses to increase by 3 dBA in CNEL, to a level at or within the "normally unacceptable" or "clearly unacceptable" noise/land use compatibility category; or
- The project causes any 5-dBA or greater noise increase.

California Noise Control Act of 1973

Sections 46000 through 46080 of the California Health and Safety Code, known as the California Noise Control Act of 1973, declares that excessive noise is a serious hazard to the public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. It also identifies a continuous and increasing bombardment of noise in the urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the state to provide an environment for all Californians free from noise that jeopardizes their health or welfare.

California Noise Insulation Standards

In 1974, the California Commission on Housing and Community Development adopted noise insulation standards for hotels, motels, dormitories, and multifamily residential buildings (Title 24, Part 2, California Code of Regulations [CCR]). Title 24 establishes standards for interior room noise (attributable to outside noise sources). The regulations also specify that acoustical studies must be prepared whenever a multifamily residential building or structure is proposed to be located near an existing or adopted freeway route, expressway, parkway, major street, thoroughfare, rail line, rapid transit line, or industrial noise source, and where such noise source(s) create an exterior CNEL (or L_{dn}) of 60 dBA or greater. Such acoustical analysis must demonstrate that the residence has been designed to limit intruding noise to an interior CNEL (or L_{dn}) of at least 45 dBA (California's Title 24 Noise Standards, Chap. 2-35).

California Department of Transportation

The California Department of Transportations (Caltrans) has oversees the traffic noise analysis protocol for new highway construction and reconstruction projects. This protocol specifies the policies, procedures, and practices that are to be used by agencies that sponsor federal or federal-aid highway projects involving new construction or reconstruction. The NAC specified in the protocol are the same as those specified in 23 CFR 772. The protocol defines a noise increase as substantial when the predicted noise levels with project implementation exceed existing noise levels by 12 dBA. The protocol also states that a sound level is considered to approach an NAC level when the sound level is within 1 dB of the NAC identified in 23 CFR 772 (e.g., 66 dBA is considered to approach the NAC of 67 dBA, but 65 dBA is not).

Local

Most jurisdictions have unique standards and guidelines regarding noise and nuisance. These are set out in county and municipal codes and general plans. Each noise ordinance or noise element within a municipal/county code will address noise levels that create a nuisance in surrounding communities. Noise ordinances and noise elements occasionally classify different areas within these communities according to zoning standards. Such zones can include residential areas, which are analyzed further according to the density of the population; industrial areas; commercial areas; agricultural areas; and rural areas. The possible adverse effects of construction noise are included within the noise standards. The ambient noise level, type of noise source, distance to the noise source, time of day, duration of the noise, and zoning of the areas are variables that are considered when assessing the adverse effects

of noise on noise-sensitive receptors. Virtually all municipal/county codes categorize noise by dBA. Many standards will use a continuous L_{eq}, CNEL, or L_{dn} to express the sound levels over a given timeframe. The applicable standards for noise levels that apply to this proposed Project are those within the Kern County General Plan and the Metropolitan Bakersfield General Plan.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan has established land use compatibility criteria for various community land uses. For noise generated by transportation noise sources such as traffic, the Noise Element of the Metropolitan Bakersfield General Plan specifies that residential land uses are compatible with exterior noise levels of up to 60 dB L_{dn} without the need for noise mitigation. The 60 dB L_{dn} noise level is considered an acceptable noise environment for residential outdoor activities. The Metropolitan Bakersfield General Plan may allow an exterior noise level of up to 65 dB L_{dn} provided that available exterior noise level reduction measures have been implemented and interior noise levels satisfy the Metropolitan Bakersfield General Plan's standard.

An interior noise level criterion of 45 dB L_{dn} is specified in the Noise Element for residential land uses exposed to transportation noise sources. The intent of this interior noise standard is to provide a suitable environment for indoor communication and sleep. In addition to the L_{dn} criteria discussed above, the Metropolitan Bakersfield General Plan establishes noise level performance criteria applied to non-transportation noise exposure at noise sensitive uses. Table 4.13-3, *Hourly Noise Level Performance Standards Metropolitan Bakersfield General Plan*, summarizes the hourly standards. The standards are applied to any hour the noise source is operating, and are five dBA more restrictive during the hours of 10:00 PM to 7:00 AM.

Table 4.13-3. Hourly Noise Level Performance Standards Metropolitan Bakersfield General Plan

Maximum Acceptable Noise Level, dBA		
Min./Hr. (Ln)	Day (7:00 AM – 10:00 PM)	Night (10:00 PM – 7:00 AM)
30 (L_{50})	55	50
15 (L_{25})	60	55
5 ($L_{8.3}$)	65	60
1 ($L_{1.7}$)	70	65
0 (L_{max})	75	70

Note: Ln means the percentage of time the noise level is exceeded during an hour. L50 means the level exceeded 50% of the hour, L25 is the level exceeded 25% of the hour, etc.

Source: City of Bakersfield, Metropolitan Bakersfield General Plan, December 11, 2002.

Significance Criteria for Project-Related Noise Level Increases

The potential increase in traffic noise exposure due to the project is a factor in determining significance. Research into the human perception of changes in sound level indicates the following.

- A 3 dB change is barely perceptible,
- A 5 dB change is clearly perceptible, and
- A 10 dB change is perceived as being twice or half as loud.

A limitation of using a single noise level increase value to evaluate noise impacts is that it fails to account for pre-project noise conditions. Table 4.13-4, *Significance of Changes in Cumulative Noise Exposure*, is based on recommendations made in August 1992 by the Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by the noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, it has been asserted that they are applicable to all sources of noise described in terms of cumulative noise exposure metrics such as the L_{dn}. Specifically, they provide good correlation to transportation-related noise sources.

Table 4.13-4. Significance of Changes in Cumulative Noise Exposure

Significance of Changes in Cumulative Noise Exposure	
Noise Level Without Project (L_{dn})	Increase Required for Significant Impact
<60	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65	+1.5 dB or more

Sources: FICON, City of Bakersfield, Metropolitan Bakersfield General Plan, December 11, 2007.

An increase in the traffic noise levels becomes more significant as the ambient noise levels increase. For instance, a significant increase in traffic noise levels is expected to be 1.5 dB when the no-project traffic noise levels exceed 65 dB L_{dn}. However, a significant increase in traffic noise levels is expected to be 5 dB when the no-project traffic noise levels are less than 60 dB L_{dn}. In other words, as ambient noise levels increase, a smaller increase in noise resulting from the project is sufficient to cause significant annoyance.

Generally, a project may have a significant impact on the environment if it will substantially increase the ambient noise levels at adjoining areas or expose people to severe noise exposure. In practice, more specific professional standards have been developed, as discussed above. These standards state that a noise impact may be considered significant if it would generate noise that would conflict with local planning criteria. Additionally, noise impacts associated with the proposed project would be considered significant if they would expose existing noise-sensitive land uses to traffic noise level increases consistent with Table 4.13-4, above.

The Metropolitan Bakersfield General Plan also provides goals, policies and implementation measures in order to reduce noise impacts. Applicable goals relative to the Project site within these elements are listed below in Table 4.13-5, *Metropolitan Bakersfield General Plans Goals and*

Policies for Noise, followed by a brief explanation of how the proposed Project complies with the goals and policies.

Table 4.13-5. Metropolitan Bakersfield General Plan Goals and Policies for Noise

Goals and Policies: Noise Element
Goal #1: "Ensure that residents of the Bakersfield Metropolitan Area are protected from excessive noise and existing moderate levels of noise are maintained."
Goal #2: "Protect the citizens of the Planning area from the harmful effects of exposure to excessive noise, and protect the economic base of the area by preventing the encroachment of incompatible land uses near known noise-producing roadways, industries, railroads, airports and other sources."
Policy #1: "Identify noise-impact areas exposed to existing or projected noise levels exceeding 65 dB CNEL (exterior) or the performance standards described in Table VII-4. The noise exposure contour maps on file at the City of Bakersfield and County of Kern indicate areas where existing and projected noise exposures exceed 65 dB CNEL (exterior) for the major noise sources identified."
Policy #2: "Prohibit new noise-sensitive land uses in noise-impacted areas unless effective mitigation measures are incorporated into project design to acceptable levels. "
Policy #3: Review discretionary industrial, commercial or other noise generating land use projects for compatibility with nearby noise-sensitive land uses. Additionally, the development of new noise generating land uses which are not preempted from local noise regulation will be reviewed if resulting noise levels will exceed the performance standards contained within Table VII-4 in areas containing residential or other noise-sensitive land uses.
Policy #4: Require noise level criteria applied to land uses other than residential or other noise-sensitive uses to be consistent with the recommendations of the California Office of Noise Control (see Figure VII-1(I-4))
Policy #5: "Encourage vegetation and landscaping along roadways and adjacent to other noise sources in order to increase absorption of noise."
Policy #6: "Encourage interjurisdictional coordination and cooperation with regard to noise impact issues. "
Policy #7: "Establish threshold standards for the determination of the existence of cumulative noise impacts that are significant, and will therefore require mitigation to achieve acceptable noise standards that do not exceed the standards contained in this element."

Vibration Standards

The County does not have regulations that define acceptable levels of vibration. One of the most recent reference suggesting vibration standards is the Federal Transit Administration's (FTA) publication concerning noise and vibration impacts assessment from transit activities (U.S. Department of Transportation, Federal Transit Administration, Transit Noise and Vibration Impact Assessment, April 1995). The term VdB is used by the FTA. To prevent vibration annoyance in residences, a level of 80 VdB or less is suggested to prevent damage to fragile buildings.

Kern County Ordinance

Title 19 Kern County Zoning Ordinance

Section 19.04.252 of the Kern County Zoning Ordinance defines *exterior noise level* as "the noise level near the exterior of a structure usually within fifty (50) feet of the structure."

Section 19.80.030.S (1) restricts noise generated by commercial or industrial uses within 500 feet of a residential use or residential zone district. The commercial or industrial use shall not generate noise that exceeds an average 65 dB L_{dn} between the hours of 7 AM and 10 PM. and shall not generate noise that exceeds 65 dB, or which would result in an increase of 5 dB or more from ambient sound levels, whichever is greater, between the hours of 10 PM and 7 AM. Commercial or industrial facilities that are located in the M-3 zone district are exempt from these noise-generation restrictions.

Title 8 Kern County Health and Safety Ordinance

Chapter 8.36 Noise Control

The Noise Control Ordinance in the Kern County Municipal Ordinance (Section 8.36.020 et seq.) prohibits a variety of nuisance noises. Construction-related noise is regulated by means of a limitation on the hours of construction activity for projects located within 1,000 feet of an occupied residential dwelling. In such cases, construction is prohibited between the hours of 9 PM and 6 AM on weekdays and 9 PM and 8 AM on weekends, except as provided below:

- The development services agency director or his designated representative may for good cause exempt some construction work for a limited time.
- Emergency work is exempt from this section.

4.13.4 Impacts and Mitigation Measures

Methodology

CEQA requires determination of the significance of noise impacts associated with the proposed Project. The process of assessing the significance of noise impacts associated with the proposed Project first involved establishing thresholds at which significant impacts on noise-sensitive uses were considered to occur. Next, noise levels associated with activities related to the proposed Project were predicted and compared to the significance thresholds. Where a noise level is predicted to exceed a threshold, the impact is considered significant. Details about assumptions and methods used to predict noise levels are discussed under each impact type.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Exposes persons to, or generates, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

- Exposes persons to, or generates, excessive ground borne vibration or ground borne noise levels;
- Results in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project;
- Results in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project;
- Exposes persons residing or working in the Project area to excessive noise levels as identified in the Kern County Airport Land Use Compatibility Plan; and/or
- Exposes people residing or working in the Project area to excessive noise levels due to a private airstrip within the vicinity of the project.

Project Impacts

Impact 4.13-1: The Project Would Result in Exposure of Persons to, or Generation of, Noise Levels in Excess of Standards Established in the Local General Plan or Noise Ordinance or Applicable Standards of Other Agencies.

There are a variety of noise sources associated with the future development of the proposed Project site which have the potential to create noise levels in excess of the 65 dB County noise standards. These noise sources could result in annoyance at existing noise-sensitive receivers surrounding the proposed Project area such as the residential uses to the east. Proposed Project implementation would result in both short-term construction-related and long-term operational-related impacts.

The identified, primary noise-producing elements associated with the proposed Project are increased traffic on the local roadway network, Project-related traffic on new roadways, and industrial operations associated with the proposed Project.

At this time, specific industrial uses on the proposed Project site are not available. As a result, it is not feasible to identify specific noise impacts associated with each of the proposed uses; however, a general discussion and assessment of impacts can be conducted based upon the possible types of uses associated with these land use designations. The following is a discussion of the potentially significant noise sources associated with the possible industrial uses proposed at the Project site.

Industrial Land Uses

The conceptual layout of the proposed Project site includes lots zoned for light and service industrial uses, and highway and general commercial uses. Various uses could be permitted under these uses. The purpose of the proposed M-1 PD (Light Industrial Precise Development Combining) District is to designate areas for wholesale commercial, storage, trucking, assembly-type manufacturing, and other similar industrial uses. The purpose of the proposed M-2 PD (Medium Industrial Precise Development Combining) District is to designate areas for general manufacturing, processing and assembly activities. The purpose of the proposed CH PD (Highway Commercial Precise Development Combining) and C-2 PD (General Commercial Precise Development Combining) is to designate areas for retail uses. Uses may not produce fumes, odor, dust, smoke, gas, or vibrations extending beyond zoning district boundaries.

The production of noise is a result of many industrial processes, even when the best available noise control technology is applied. Noise exposures within industrial facilities are controlled by the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) and the California Department of Industrial Relations, Division of Occupational Safety and Health (Cal/OSHA), but exterior noise levels may exceed locally acceptable standards. Commercial, recreational, and public service facility activities can also produce noise which affects adjacent sensitive land uses.

These noise sources can be continuous and may contain tonal components which have a potential to annoy individuals who live nearby. In addition, noise generation from fixed noise sources may vary based upon climatic conditions. Noise production due to future project industrial uses may significantly impact nearby existing residential uses on Lamb Avenue west of South Union Avenue (SR-204). The Project-related industrial uses are unknown at this time and would be considered a potentially significant impact.

Increased Traffic Along Roadways and Site Entrance

Future development within the area would result in additional traffic on adjacent roadways, thereby increasing vehicular noise in the vicinity of existing and proposed land uses. To assess noise impacts due to project-related traffic increases on the local roadway network, traffic noise levels were predicted at a representative distance (100 feet from the roadway centerlines) for the 2025, 2025+Project, 2035, and 2035+Project scenarios. Results of the Project-related traffic noise analyses are summarized in Table 4.13-6 *Predicated Traffic Noise Exposure Levels 100 Feet from Roadway Centerlines*.

* Represent significant noise level impacts. Cumulative noise impact was assessed based on application of the Table 5 criteria to the future plus project increase relative to the existing condition. Project-related traffic noise impact was assessed based on the project's contribution to the cumulative impact or application of the Table 5 criteria to the project-related increase relative to the no project condition. Please see a more detailed presentation of the significance methodology presented in the Regulatory Setting section. Where a cumulative noise impact or project-related noise impact was identified, the roadway segment in question was inspected in order to identify any existing noise-sensitive land uses.

Based on the information presented in Table 4.13-6, significant Project-related traffic noise exposure would be expected along parts of Panama Lane, Hosking Avenue, Taft Highway, Di Giorgio Road, Curnow Road, Houghton Road/Buena Vista Boulevard, Shafter Road, Bear Mountain Boulevard, Hughes Lane, South H Street, Chevalier Road, South Union Avenue (SR-204), Cottonwood Road, and Adobe Road in the proposed Project vicinity.

Chevalier Road between Houghton Road and Di Giorgio Road, Di Giorgio Road west of South Union Avenue, and Lamb Avenue west of South Union Avenue (SR-204) would be constructed as part of the proposed Project. With the exception of a single existing residence along Lamb Avenue, west of South Union Avenue, there are no current noise-sensitive uses in the immediate project vicinity or near the future Chevalier Road, Di Giorgio Road, and Mugsy Avenue on the proposed Project site. Future (2025 and 2035) traffic noise exposure at the home on Lamb Avenue west of South Union Avenue (SR-204) would be approximately 68 and 69 dB L_{dn}, respectively. This level is above the existing measured ambient noise level of 61 dB L_{dn} and would be expected to add significantly to the overall noise environment at this location based on the established significance criteria. There are no current noise-sensitive uses near the future Chevalier Road and Di Giorgio Road on the proposed Project site.

On portions of Di Giorgio Road, Chevalier Road, Cottonwood Road, Shafter Road, Kaiser Lane, and Adobe Road, Project-related traffic noise exposure increases from their respective roadways would generally be considered significant if not for the existing ambient noise exposure dominated by SR-99. In these cases, existing ambient noise exposure in the proposed Project area are assumed to be no less than 53 dB L_{dn} (conservatively 10 dB less than the measured ambient noise exposure near the east side of the proposed Project site), and future (2025 and 2035) project-related traffic noise exposures would not be expected to add significantly to the noise environments.

As shown in Table 4.13-6, future (2025 and 2035) Project-related traffic noise exposure increases would be expected to exceed the applicable significance criterion (+1.5 dB) along sections of Panama Lane, Hosking Avenue, Taft Highway, Houghton Road/Buena Vista Boulevard, Bear Mountain Boulevard, and South Union Avenue (SR-204) in the proposed Project vicinity. There are no noise sensitive land uses adjacent to Houghton Road between SR-99 and Project Entrance #3, and South Union Avenue between Lamb Avenue and Mugsy Avenue. Therefore, there are no Project-related noise impacts along these roadway segments.

As shown in Table 4.13-6, traffic noise impacts would be expected along roadway segments where both significant traffic noise increases were identified and where existing noise-sensitive land uses along those roadway segments were identified. Depending on the proximity of a particular roadway segment to SR-99, a noise impact may not necessarily materialize. The roadway segments closer to SR-99 would have a higher background ambient noise level environment which may mask the significant increases in traffic noise levels identified along some individual roadways. The farther away a roadway segment is from SR-99, the more likely it would be that the background ambient noise level would be low enough that such masking would not be significant, and the noise impact would occur.

Significant project-related traffic noise level increases are assumed along South Union Avenue (SR-204) between Panama Lane and Lamb Avenue where residential uses currently exist. In addition, the proposed Project would generate increased traffic on local area roadways that exceed thresholds. Project-related traffic noise levels impacts would also be expected along roadway segments where both significant increases were identified and where existing noise-sensitive land uses along those roadway segments were identified. These impacts would be significant.

Mitigation Measures

MM 4.13-1: **Acoustical Analysis.** Prior to the submittal of any Precise Development Plan or modification to an approved Master Precise Development Plan:

1. The project proponent shall be required to prepare an acoustical analysis to ensure that all appropriate noise control measures are incorporated in to the proposed project design so as to mitigate any noise impacts to off-site sensitive uses. Such noise control measures may include, but are not limited to: noise barrier use, site redesign, silencers, partial or complete enclosures of critical equipment, etc.

2. Noise impacts shall be evaluated by the Planning and Natural Resources Department during the Precise Development Plan review process.

MM 4.13-2: **Noise Levels.** The following measures are recommended to reduce short-term noise levels associated with project construction:

1. Construction activities at the project site shall comply with the hourly restrictions for noise-generating construction activities, as specified in the Kern County Noise Ordinance (Municipal Ordinance Code 8.36.020). Accordingly, construction activities shall be prohibited between the hours of 9:00 PM to 6:00 AM on weekdays, and between 9:00 PM to 8:00 AM on weekends. These hourly limitations shall not apply to activities where hourly limitations would result in increased safety risk to workers or the public.

2. Equipment staging and laydown areas shall be located at the furthest practical distance from nearby residential land uses. To the extent possible, staging and laydown areas should be located at least 500 feet of existing residential dwellings.

3. Where feasible construction equipment shall be fitted with approved noise-reduction features such as mufflers, baffles, and engine shrouds that are no less effective than those originally installed by the manufacturer.

4. Haul trucks shall not be allowed to idle for periods greater than five minutes, except as needed to perform a specified function (e.g., concrete mixing).

5. On-site vehicle speeds shall be limited to 15 miles per hour, or less (except in cases of emergency).

6. Back-up beepers for all construction equipment and vehicles shall be broadband sound alarms or adjusted to the lowest noise levels possible, provided that the Occupational Safety and Health Administration and California Division of Occupational Safety and Health's safety requirements are not violated. On vehicles where back-up beepers are not available, alternative safety measures such as escorts and spotters shall be employed.

MM 4.13-3: **Noise Disturbance Coordinator.** Prior to the issuance of grading permits, a "Noise Disturbance Coordinator" shall be established. The project operator shall submit evidence of methods of implementation and shall continuously comply with the following during construction:

1. The disturbance coordinator shall be responsible for responding to any local complaints about construction noise.

2. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting to early, bad muffler, etc.) and shall be required to implement reasonable measures such that the complaint is resolved.

Level of Significance after Mitigation

Impacts would be significant and unavoidable.

Impact 4.13-2: The Project Would Expose Persons to or Generation of Excessive Ground Borne Vibration or Ground Borne Noise Levels.

The types of construction vibration impacts include human annoyance and building structural damage. Human annoyance occurs when construction vibration rises significantly above the threshold of perception. Building damage can take the form of cosmetic or structural.

Construction activities such as blasting, pile driving, pavement breaking, demolition, diesel locomotives, and rail-car coupling can produce vibration that may be felt by adjacent uses. It is not anticipated that construction or operation of the proposed Project would require the use of equipment that is known to generate substantial construction vibration levels, however, given the uncertainty as to the specific use, impacts are considered potentially significant.

Mitigation Measures

Implement Mitigation Measure MM 4.13-2, above.

Level of Significance after Mitigation

Impacts would be significant and unavoidable.

Impact 4.13-3: The Project Would Create a Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project.

At this time, specific industrial uses on the Project site are not available. As a result, it is not feasible to identify specific noise impacts associated with each of the proposed uses; however, as identified in Impact 4.13-1, general discussion and assessment of impacts can be conducted based upon the possible types of uses associated with these land use designations.

Although a specific industrial use is not proposed at this time, previous discussion has indicated that the Project site will be subject to the existing Metropolitan Bakersfield General Plan thresholds of significance for noise evaluation and attenuation. The proposed Project is located in an area of similar

type industrial uses as those proposed. With implementation, impacts are not expected to expose people to a substantial permanent increase in the ambient noise level in the project vicinity.

Mitigation Measures

Implement Mitigation Measures MM 4.13-2, above.

MM 4.13-4: **Noise Reduction Methods.** The following notes shall be placed on all grading and building permits issued for the project site:

1. Construction noise reduction methods such as shutting off idling equipment, installing temporary acoustic barriers around stationary construction noise sources, maximizing the distance between construction equipment staging areas and occupied residential areas, and use of electric air compressors and similar power tools, rather than diesel equipment, shall be used where feasible.

2. During construction, stationary construction equipment shall be placed such that emitted noise is directed away from sensitive noise receivers.

3. All equipment shall be fitted with factory equipped mufflers, and be in good working condition. Construction contracts shall specify that all construction equipment, fixed or mobile, shall be equipped with properly operating and maintained mufflers and other state required noise attenuation devices.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.13-4: The Project Would Create a Substantial Temporary or Periodic Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project.

Short-term noise impacts would be associated with the excavation and grading activities during the construction phase. Construction activities would result in short-term noise levels higher than existing ambient noise levels within the proposed Project area. Noise would also be generated during the construction phase(s) of the proposed Project by increased truck traffic on local area roadways. A significant Project-generated noise source would be truck traffic associated with the transport of heavy materials and equipment to and from the construction site.

During the construction phase(s) of the proposed Project, noise from building equipment would be expected to add to the noise environment in the immediate vicinity of the proposed Project. Activities involved in construction would likely generate maximum noise levels, of 77 to 85 dB at a distance of 50 feet. Construction activities would be temporary in nature and are anticipated to occur during normal daytime working hours (7 AM to 6 PM). Although, the noise generated by equipment and experienced at surrounding uses during construction would vary hourly, daily and weekly, due to the number and types of equipment used, existing residences near the proposed Project site would likely be affected by this noise.

Groundborne noise and other types of construction-related noise impacts would typically occur during the initial site preparation, which can create the highest levels of noise; but is also generally the shortest of all construction phases. High groundborne noise levels and other miscellaneous noise levels can be created by the operation of heavy-duty trucks, backhoes, bulldozers, excavators, front-end loaders, compactors, scrapers and other heavy-duty construction equipment. Operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as dropping large pieces of equipment or the hydraulic movement of machinery lifts).

Typically, the site preparation phase, which includes excavation and grading of the site and infrastructure construction, tends to generate the highest noise levels, because the noisiest construction equipment is earthmoving equipment. Earthmoving includes excavation machinery such as back fillers, bulldozers, excavators/front-end loaders and earthmoving equipment (i.e., compactors, scrapers and graders).

Table 4.13-7, *Typical Construction Noise Levels*, indicates the characteristics of specific types of construction equipment. As indicated in Table 4.13-7, noise levels generated by heavy construction equipment could range from 77 dB to 85 dB at 50 feet. The noise generated by equipment and experienced at surrounding uses during construction would vary hourly, daily, and weekly, due to the number and types of equipment used; however, construction activities would be temporary and would likely occur during daytime working hours.

Table 4.13-7. Typical Construction Noise Levels

Type of Equipment	Maximum Equipment Noise Level dBA, CNEL at 50 feet
Backhoe	78
Concrete Mixer Truck	79
Dump Truck	77
Front End Loader	79
Pneumatic Tools	85
Air Compressor	78

Source: Bollard Acoustical Consultants, Inc. 2017.

During construction and grading activities, all equipment would tend to be operated in a localized area. Thus, at any given moment, there would be a combined sound level from multiple pieces of equipment. However, the tendency is for the use to be sequential. For example, the haul trucks dump the dirt, followed by the loaders, bulldozers and graders, which push it around. These activities are then followed by the compactors and water trucks that pass over the area periodically. The period of time for each operation would vary with graders and compactors in an area for the longest period of time.

During the construction of the proposed Project, construction activities have the potential to impacts noise sensitive land uses in the immediate vicinity. Construction noise is usually not considered to be

significant if construction noise limits to the daytime hours (7:00 AM to 10:00 PM), if extraordinary noise-producing activities (e.g., pile driving) are not anticipated, and if construction equipment is adequately maintained and muffled and would not result in an exceedance of noise standards identified in the Metropolitan Bakersfield General Plan. Implementation of mitigation measures would ensure compliance with the Metropolitan Bakersfield General Plan and County's noise standards. As a result, the proposed Project would result in less than significant construction-related noise impacts.

Mitigation Measures

Implementation of Mitigation Measure MM 4.13-2, above.

MM 4.13-5: **Written Notice to the Public.** Prior to commencement of any on-site construction activities (i.e., fence construction, mobilization of construction equipment, initial grading, etc.) the project proponent shall provide written notice to the public through mailing a notice.

1. The mailing notice shall be to all residences within 1,000 feet of the project site, 15 days or less prior to construction activities. The notices shall include: The construction schedule, telephone number and email address where complaints and questions can be registered with the noise disturbance coordinator.

2. A minimum of one sign, legible at a distance of 50 feet, shall be posted at the construction site or adjacent to the nearest public access to the main construction entrance throughout construction activities that shall provide the construction schedule (updated as needed) and a telephone number where noise complaints can be registered with the noise disturbance coordinator.

3. Documentation the public notice has been sent and the sign has been posted shall be provided to the Kern County Planning and Natural Resources Department.

Level of Significance after Mitigation

Impacts would be significant and unavoidable.

Impact 4.13-5: The Project is Not Located Within an Airport Land Use Plan or, Where Such a Plan Has Not Been Adopted, Within Two Miles of a Public Airport or Public Use Airport, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels.

The proposed Project is not located within any area subject to the land use restrictions of the adopted Kern County Airport Land Use Compatibility Plan. The closest public airport is Bakersfield Municipal Airport, located approximately five (5) miles northeast of the proposed Project site. However, no sensitive receptors would be constructed as part of the proposed Project, and the

Bakersfield Municipal Airport would not expose the Project to excessive noise levels. Airport noise would be considered less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.13-6: The Project is Within the Vicinity of a Private Airstrip, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels.

Refer to Impact 4.13-5, above. As previously mentioned, the proposed Project is not located in within any area subject to the land use restrictions of the adopted Kern County Airport Land Use Compatibility Plan. Costerisan Farms Airport, a private airstrip, is located approximately two (2) miles northwest of proposed Project site; however, this airport does not generate significant daily flights. Activities at the airport would not significantly impact the proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Noise by definition is a localized phenomenon, and drastically reduces as distance from the source increases. Consequently, only projects and growth due to occur in the general vicinity of the proposed Project site would contribute to cumulative noise impacts. Cumulative noise impact was assessed based on application of the Table 4.13-3 criteria to the future plus project increase relative to the existing condition. Project-related traffic noise impact was assessed based on the project's contribution to the cumulative impact or application of the Table 4.13-3 criteria to the project-related increase relative to the no project condition.

Cumulative Construction Noise

With regard to the exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies (Impact 4.13-1) and with regard to the project resulting in a substantial temporary or periodic increase (e.g. during construction) in ambient noise levels in the project vicinity above levels existing without the project (4.13-4), construction noise impacts are localized in nature because they are limited to the construction site where construction equipment is operating. As discussed under Impact 4.13-1, noise levels from typical construction equipment range from 78 dBA to 85 dBA L_{eq} at 50 feet from the

source. Although other projects may be constructed in the vicinity at the same time as the proposed Project, construction noise would temporary and all projects would be required to conform to all applicable noise reduction standards. However, the proposed Project could combine with past, present, and reasonably foreseeable future projects. Impacts are potentially significant and mitigation measures are required.

Groundborne Vibration

With regard to exposing persons to, or generation of, excessive ground borne vibration or ground borne noise levels (Impact 4.13-2), the proposed Project would not result in substantial levels of ground-borne vibration at sensitive receptors. As described above, major construction activity within 200 feet of a noise-sensitive land use may be potentially disruptive to sensitive operations. In order to result in a cumulative vibration impact, major construction activities would have to be located within 200 feet of another project. Due to the localized nature of vibration impacts and the fact that all construction would not occur at the same time or at the same location, cumulative development in the surrounding Kern County would not result in the exposure of people to or the generation of excessive groundborne vibration and/or noise levels. Therefore, when considered cumulatively with the construction of the other projects in the surrounding area, it is not anticipated that the project would contribute to substantial groundborne vibration levels at sensitive receptors. Therefore, impacts of the proposed Project would not be cumulatively considerable.

Cumulative Operation Impacts

Roadway Noise Exposure

With regard to the exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies (Impact 4.13-1) and with regard to increasing ambient noise levels with respect to increased traffic noise in the proposed Project vicinity above levels existing without the Project (4.13-4), along with future regional growth, and other projects to be developed within the proposed project vicinity would result in increases in traffic that would cumulatively increase traffic noise at 15 roadway segments. These roadways include: Panama Lane, Hosking Avenue, Taft Highway, Di Giorgio Road, Curnow Road, Houghton Road/Buena Vista Boulevard, Shafter Road, Bear Mountain Boulevard, Hughes Lane, South H Street, Chevalier Road, South Union Avenue (SR-204), Cottonwood Road, and Adobe Road.

With regard to the residential land uses, the residence located along Lamb Avenue, west of South Union Avenue (SR-204), would be subject to cumulative impacts associated with roadway noise from traffic associated with past, present, and reasonably foreseeable projects. Therefore, the proposed Project would have a significant cumulative impact in this regard.

Noise Generation

With regard to the generation of noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies (Impact 4.13-3) and with regard to increasing ambient noise levels with respect to development operations in the Project vicinity above levels existing without the proposed Project, the proposed Project's operational impacts would be less

than significant with the implementation of Mitigation Measures. The implementation of reasonably foreseeable development projects would have the potential to increase ambient noise from new operational noise sources (such as HVAC equipment, parking lots, and truck deliveries) and by increasing human activity throughout the project sites and surrounding areas. Mechanical HVAC equipment located on the ground or on rooftops of new buildings have the potential to generate noise levels that exceed 65 dBA within an approximately 100-foot radius of the equipment. Additionally, commercial development would have the potential to result in noise levels above 65 dBA CNEL within approximately 70 feet of the source. Noise sources from parking lots typically range from about 30 to 66 dBA at a distance of 100 feet. Therefore, the project, in combination with other reasonably foreseeable development project, would have the potential to result in ambient noise levels that exceed 65 dBA CNEL.

In general, the noise levels generated by commercial, industrial and recreational facility operations would not exceed 65 dBA at a distance of 100 feet from each individual source. Thus, impacts from operational noise would be site-specific in nature and reasonably foreseeable development projects would be required to conform to policies in the MBGP and Kern County Zoning Ordinance to minimize exposure to excessive noise levels. In addition, each individual project is required to undergo site-specific analysis to determine individual noise impacts and provide mitigation measures as appropriate. The proposed Project would have the potential to combine with reasonably foreseeable projects in the vicinity to increase ambient noise levels; however, the proposed Project operational noise impacts would be mitigated to a less than significance level with the incorporation of the above measures. It is expected that through conformance with adopted policies and requirements to reduce noise, and project specific mitigation; impacts of the proposed Project, in combination with reasonably foreseeable nearby projects, cumulative impacts would be reduced to less than significant levels.

Private or Public Airstrip Noise

With regard to the project exposing people residing or working in the project area to excessive noise levels from a private or public airstrip (Impact 4.13-5), project impacts would be less than significant; however, the project would result in a greater number of people working in the project site and potentially being exposed to airstrip noise from Costerisan Farms Airport, a private airstrip, located approximately two (2) miles northwest of proposed. As stated above, this airport does not generate significant daily flights and activities at the airport would not significantly impact the proposed Project. As such, these impacts would not combine with impacts from past, present, or reasonably foreseeable projects to make a considerable contribution to a significant cumulative impact. Impacts would be less than significant, and no mitigation measures would be required.

Mitigation Measures

Implement Mitigation Measures MM 4.13-1 through MM 4.13-5 above.

Level of Significance after Mitigation

Cumulative impacts would be significant and unavoidable.

This Page Intentionally Left Blank

Section 4.14

Population and Housing

Section 4.14
Population and Housing

4.14.1 Introduction

This section examines the impacts of the proposed Project on population, housing, and employment in the area. This section also outlines the existing population and housing in the area, as well as projected population growth, future housing demands, and employment growth in Kern County. Information in this section is based on data from the Kern Council of Governments (Kern COG), including its Regional Housing Needs Allocation Plan (2014); the Kern County Housing Element 2015-2023 (December 2016); the U.S. Census Bureau; and California Department of Finance (DOF) demographic information.

4.14.2 Environmental Setting

Population

According to the DOF, the population in Kern County, including incorporated areas, was estimated to be 916,464 persons as of January 1, 2019 (California Department of Finance [DOF] 2019). In 2018 the population was approximately 906,563, which equates to a one-year increase of approximately 9,901 residents, or a 1.09 percent increase (DOF 2018a). As of January 1, 2019, approximately 318,006 persons (or approximately 34.7 percent) resided within the unincorporated area of Kern County (DOF 2019). The 2019 population within the unincorporated area of Kern County represents an increase of 2,531 residents, over the 2018 population of 315,475 (DOF 2018a). According to the DOF's projections, the County's population is anticipated to increase to 996,506 persons by the year 2025 and 1,214,656 persons in 2040 (DOF 2018).

Existing and Projected Housing

Kern County's housing supply totaled 290,706 dwelling units in 2014 and 299,674 dwelling units in 2019. This represents an increase in housing supply of approximately 3.0 percent (8,968 units). The residential vacancy rate, a translation of the number of unoccupied housing units on the market, is a good indicator of the balance between housing supply and demand in the community. Kern County's vacancy rate is approximately 10.7 percent as of January 1, 2019. The average number of persons per household in the County is 3.95 (DOF 2019).

The DOF estimates that 114,973 dwelling units were located within the unincorporated area of Kern County as of January 1, 2019. These units represent approximately 38.3 percent of the total number of dwelling units within Kern County. The average number of persons per household in the unincorporated area of Kern County was 2.74. Approximately 14.5 percent of the dwelling units within the area were vacant.

Employment

As of March 2019, Kern County had a labor force of 388,700 persons (Employment Development Department [EDD] 2019a). An estimated 39,300 people (approximately 10.1 percent) of the labor force was unemployed. In 2012, Kern County had a labor force of 391,900 persons and approximately 51,500 persons (approximately 13.1 percent) of the labor force were unemployed (EDD 2019a). The unemployment rate as of March 2019 is lower than the estimate seven years ago. Kern County's current unemployment rate is higher than California's rate (4.6 percent) and higher than the national rate (3.8 percent) for April 2019 (USDL 2019). The predominant industries for Kern County for employment growth were not available, but information for the Bakersfield MSA is. Within this area software developers, database administrators, web developers, personal care aides, and helpers, brick masons and tile setters have the highest degree of job growth. In 2017 the government industry accounted for approximately 21.1 percent of Kern County's employment as of April 2019 (EDD 2019c).

4.14.3 Regulatory Setting

State

State law requires each city and county to adopt a general plan for future growth. This plan must include a housing element that identifies housing needs for all economic segments and provides opportunities for housing development to meet that need. At the state level, HCD estimates the relative share of California's projected population growth that would occur in each county in the state based on DOF population projections and historic growth trends. Where there is a regional council of governments, as in Kern County, HCD provides the regional housing need to the council. The council then assigns a share of the regional housing need to each of its cities and counties. The process of assigning shares provides cities and counties the opportunity to comment on the proposed allocations. HCD oversees the process to ensure that the council of governments distributes its share of the state's projected housing need.

Each city and county must update its general plan housing element on a regular basis (generally, every 5 years). Among other things, the housing element must incorporate policies and identify potential sites that would accommodate the city's share of the regional housing need. Before adopting an update to its housing element, the city or county must submit the draft to HCD for review. HCD will advise the local jurisdiction whether its housing element complies with the provisions of California Housing Element Law.

The councils of governments are required to assign regional housing shares to the cities and counties within their region on a similar 5-year schedule. At the beginning of each cycle, HCD provides population projections to the councils of governments, who then allocate shares to their cities and counties. The shares of the regional need are allocated before the end of the cycle so that the cities and counties can amend their housing elements by the deadline.

Local

Kern County Housing Element 2015-2023

The Kern County Housing Element (Kern County Planning Department 2016) covers only the unincorporated portions of the Metropolitan Bakersfield General Plan and the Kern County General Plan. The City of Bakersfield has a separate housing element. The housing element is one of the seven mandated elements of the local general plan. Housing element law, enacted in 1969, mandates that local governments adequately plan to meet the existing and projected housing needs of all economic segments of the community. The law acknowledges that, in order for the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems that provide opportunities for, and do not unduly constrain, housing development. As a result, housing policy in the state rests largely upon the effective implementation of local general plans and, in particular, local housing elements. Housing element law also requires the Department of Housing and Community Development (HCD) to review local housing elements for compliance with State law and to report its written findings to the local government. State law requires the Kern County Housing Element be updated regularly; the current 2015-2023 Housing Element Update was adopted by the Kern County Board of Supervisors on April 16, 2016 and approved by the State.

Kern Council of Governments (Kern COG)

Kern COG is an association of city and county governments created to address regional transportation issues while protecting the integrity and autonomy of each jurisdiction. Its member agencies include the County and the 11 incorporated cities within Kern County.

Under California Housing Element Law, Kern COG is the regional council of governments responsible for allocating the regional housing need to the County. Kern COG adopted a Regional Housing Needs Allocation Plan (RHAP) in June 2014 that establishes housing production goals for each jurisdiction within the region for the period between 2013 and 2023.

Future housing needs refer to the projected amount of housing a community is required to plan for during a specified planning period. California's Housing and Community Development Department provides each regional council of governments its share of the statewide housing need. In turn, all councils of governments are required by State law to determine the portion allocated to each jurisdiction within the region. This allocation process is known as the RHAP in the Kern COG region.

The RHAP determines housing needs with a special emphasis on ensuring adequate housing for persons in the very low, low, and moderate income ranges. This assessment allows communities to anticipate growth so that they can grow in a way that enhances quality of life; improves access to jobs, transportation, and housing; and does not adversely affect the environment. Kern COG has determined the total number of units needed in the County by 2023 (the 11-year projection period) is 67,675. For Bakersfield, the number of units is 36,290, or 53.6 percent of the County total, and for Unincorporated County, the number of units is 21,583, or 31.8 percent of the County total, by 2023.

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan lists the issues, goals, policies, and implementation measures related to population and housing in the County, as contained in the Land Use Element.

Project implementation would be guided in part by the goals, policies, and implementation programs, which are presented in Table 4.14-1, *Metropolitan Bakersfield General Plan Goals and Policies for Population and Housing.*

Table 4.14-1. Metropolitan Bakersfield General Plan Goals and Policies for Population and Housing

Goals and Policies: Land Use Element
Goal #3: Accommodate new development which provides a full mix of uses to support its population.
Goal #3: Accommodate new development which is compatible with and complements existing land uses.
Goal #4: Accommodate new development which channels land uses in phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.
Policy #3: Ensure that residential uses are located in proximity to commercial services, employment centers, public services, transportation routes, and recreational and cultural resources.
Policy #15: Allow for the development of a variety of commercial centers/corridors which are differentiated by their function, intended users and level of intensity, including convenience centers serving local residential neighborhoods, sub-regional centers which serve groupings of neighborhoods, and major regional centers which serve the planning area and surrounding areas.
Policy #16: Allow for the development of a variety of commercial uses, including those which serve residents (groceries, clothing, etc.), highway users, and tourists-visitors.
Policy #34: Provide for the clustering of new industrial development adjacent to existing industrial uses and along major transportation corridors.
Policy #76: Provide for a mix of land uses which meets the diverse needs of residents; offers a variety of employment opportunities; capitalizes, enhances, and expands upon existing physical and economic assets; and allows for the capture of regional growth.
Policy #79: Provide for an orderly outward expansion of new "urban" development (any commercial, industrial, and residential development having a density greater than one unit per acre) so that it maintains continuity of existing development, allows for the incremental expansion of infrastructure and public services, minimizes impacts on natural environmental resources, and provides a high-quality environment for living and business.

4.14.4 Impacts and Mitigation Measures

Methodology

The potential impacts to population and housing are based on qualitative and quantitative analyses of the proposed Project's related increases in population and housing compared to planned growth estimates and population projections for the Kern County and the Southern San Joaquin Valley area.

Thresholds of Significance

Significance Criteria

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure);
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere; and/or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

The lead agency determined in the NOP/IS (see Appendix A) that the following environmental issues areas resulted in no impact and were scoped out of requiring further review in this Recirculated Draft EIR. Please refer to Appendix A of this Recirculated Draft EIR for a copy of the NOP/IS and additional information regarding the following impacts:

- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere.

The proposed Project includes approximately 314.30 acres of agricultural land. A steel storage building associated with agricultural activities is located in the eastern portion of the Project site, near South Union Avenue (SR-204). Implementation of the proposed Project would not require the removal or displacement residential structures; therefore, no housing would be displaced, and the project would not require construction of replacement housing elsewhere. No impact would occur.

- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

The proposed Project includes approximately 314.30 acres of agricultural land. A steel storage building associated with agricultural activities is located in the eastern portion of the Project site, near South Union Avenue (SR-204). Implementation of the proposed Project would not require the removal or displacement residential structures or their inhabitants; therefore, no people would be displaced, and the project would not require construction of replacement housing elsewhere. No impact would occur.

Project Impacts

Impact 4.14-1: The Project Would Directly Induce Substantial Population Growth.

The Project proposes the future development of industrial and commercial uses on-site, which would not result in an increase in local population and housing units when compared to current conditions. The proposed Project includes a General Plan Amendment (GPA) to modify the existing Metropolitan Bakersfield General Plan land use designations and a Zone Change (ZCC) for the Project site. The GPA and ZCC would alter the existing land use and zone designations for the Project site's estimated 314.30 acres to allow for light and service industrial uses. The industrial areas would contain approximately 4,613,004 square feet (net building area) of warehousing, distribution, and retail showroom uses. No residential uses would be constructed under the proposed Project.

A project could induce population growth in an area either directly or indirectly. More specifically, the development of new homes or businesses could induce population growth directly, whereas the extension of roads or other infrastructure could induce population growth indirectly. The introduction

of approximately 4,613,004 square feet of light to medium industrial development within the Project site would increase the number of employees needed within the County. Given the current unemployment rate within the County, it is anticipated that any new jobs generated from this proposed Project would not result in a need for new housing or a population increase. This is because the existing labor force can be used to provide employees to the new industrial facilities.

As the Project proposes to amend the Metropolitan Bakersfield General Plan to allow for the industrial uses, the proposed Project would be removing an obstacle to growth in the Project area by changing the existing land use designation from R-IA (Resource-Intensive Agriculture) to LI (Light Industrial), SI (Service Industrial), GC (General Commercial), and HC (Highway Commercial). This allows for additional employment opportunities, which can lead to the relocation of people to jobs and ultimately and increase in population. However, the size of the labor force within Kern County and the current unemployment rates as discussed above, are considered to be sufficient for the current County population to accommodate jobs generated by the proposed Project.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

As discussed above, the proposed Project would not increase population, as no new residences would be constructed and the current labor force would be used to provide the number of employees necessary for the industrial facilities proposed by the Project. This proposed Project would not directly increase population or the housing stock.

Because the proposed Project would not directly increase population and there is a high unemployment rate, the proposed Project is not anticipated to result in a direct or indirect impact on population and housing, nor is it anticipated to be growth inducing. Therefore, the proposed Project, in conjunction with the current and reasonably foreseeable projects discussed in Chapter 3, *Project Description*, would not lead to population growth. The employment opportunities provided by the proposed Project and other reasonably foreseeable projects would help to provide a balance with the current and projected labor force associated with future conditions. Therefore, this cumulative impact would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.15

Public Services

Section 4.15
Public Services

4.15.1 Introduction

This section focuses on public services, comprised of fire protection, sheriff / police protection, schools, parks and recreation, and libraries. The potential impacts on public services were evaluated, based in part, on coordination with the appropriate local service agencies that serve the proposed Project area. This section provides baseline information, and evaluates potential impacts, on public services practices and policies related to the proposed Project. A Public Services Report was prepared by McIntosh & Associates in October 2008 (refer to Appendix N). A second Public Services Report was prepared by McIntosh & Associates in June 2017. See Appendix J, *Public Support Services*, and Appendix N, *Original Technical Studies*.

4.15.2 Environmental Setting

The public services addressed in this section include police and fire protection, parks, schools, libraries, and other countywide public protection facilities.

Fire Protection

The Kern County Fire Department (KCFD) is responsible for fire protection services, fire prevention, emergency medical and rescue services, arson investigation and hazardous materials coordination with citizens within the Metropolitan Bakersfield General Plan area. The KCFD has established a ratio of staff to resident population and operates at a ratio of 1.092 fire personnel per 1,000 residents which slightly exceeds the national standards. The KCFD provides primary fire protection to unincorporated areas of the county and on regional transportation corridors such as Interstate (I) 5. The KCFD also acts as a secondary responder. The Emergency Communications Center was established as a joint dispatch center for the Bakersfield Fire Department and the KCFD in 1988, which provides for the closest station response concept. The center's dispatch covers more than 8,000 square miles, includes more than 65 fire stations, including 15 Kern County Fire Stations, and receives calls from nine separate public safety agencies. A Joint Powers Agreement has been established between the County and City of Bakersfield fire departments that provides for the closest station response concept. The two fire departments have adopted nonoverlapping, but contiguous station response boundaries without regard to City or County limits.

The National Fire Code set forth by the National Fire Protection Association (NFPA), California Fire Code, the California Building Code (CBC) and the Ordinance Code of Kern County are applied and utilized to regulate fire safety in the County.

Facilities and Services

The KCFD would serve the proposed Project. All KCFD first alarm response companies are staffed with a three-person engine company and a three-person truck company that provides basic Emergency Medical Technician medical aid services. Currently, Kern County Fire Station 52, located at 312 Taft Highway, is the first responding station for the Project area. Station 52 also houses a heavy

rescue vehicle that is "shared staffing" with either engine. There is a potentially low, first-unit emergency response time of three minutes to the edge of the site (at South Union Avenue [SR-204]), given the proximity of the project site to Station 52. Due to traffic and distance, the response time could range from four to eight minutes. An overall average response time for engine and truck companies is 5.2 minutes for any property within a 2.6-mile area around a specific station. Station No. 52 is located approximately 1.1 miles from the northeast corner of the project site, while the furthest point (southwest corner) is approximately 2.7 miles away.

Because the proposed Project is located outside of the boundaries of the Joint Powers Agreement, response companies located at City of Bakersfield Fire Station 13 (the closest City Fire Station at Poppyseed Street and Stine Road, south of Panama Lane) are not currently available.

The KCFD has established a ratio of staff to resident population, but the national industry standard is 1.0 fire personnel per 1,000 residents. Currently, the KCFD operates at a ratio of 1.092 fire personnel per 1,000 residents, slightly exceeding the national standard.

Whether the existing facilities, manpower, and equipment are adequate to maintain a sufficient level of service in the Greenfield area would depend on the density of new occupancy. In the last five to ten years, the KCFD has witnessed a marked increase in the population of Kern County. An increase in service requests, such as for residential fires, vehicle accidents, medical aid, mandated business inspections and safe programs, have been associated with this increase in population. As with most businesses, fire service is also impacted with growth, rather small or large impacts.

Sheriff/Police Protection

The Kern County Sheriff's Department is responsible for providing law enforcement services through the enforcement of local, State and Federal laws. The completion of this goal involves crime prevention, field patrol (ground and air), crime investigation, apprehension of offenders, regulation of noncriminal activity and the performance of a number of related and support services. Traffic and parking control functions are also provided, with some investigation of property damage, traffic accidents and complete investigations of all injury, fatal, intoxication and hit-and-run accidents.

The Kern County Sheriff's Department administers police services throughout the County, enforcing local, State and federal laws. The Kern County Sheriff's Department is responsible for crime prevention, field patrol (ground and air), crime investigation, the apprehension of offenders, regulation of noncriminal activity, and a number of related and support services. Traffic and parking control functions are also provided, along with some investigation of property damage reports and traffic accidents.

Response time is the time required to handle a call for service, which is measured from the time a call is received until the time a patrol car arrives at the scene. Response times are variable, particularly because the nearest responding patrol car may be located anywhere in the station's patrol area and may not respond from the nearest substation. The average response used by the Kern County Sheriff's Department is five minutes or less for an emergency or immediate response incident (e.g., a crime that is underway and/or a life-or-death situation) and eight to ten minutes for routine calls (e.g., a crime that has already occurred and/or an incident that is not life threatening). Response to an

emergency at or near the proposed Project site can vary depending on the demands of the substation at the time of the call. If demands are high, response time will be longer than estimated. The response time for a non-emergency call could range from 15 to 30 minutes or more, depending on staffing and other calls for service.

Facilities and Services

The proposed Project is located within the Lamont Substation's jurisdiction of the Kern County Sheriff's Department, located at 12022 Main Street, in the township of Lamont, and is approximately 6 miles east from the proposed project. The Lamont Substation is responsible for providing law enforcement services to the residents and businesses located throughout an almost 500-square-mile area. The Kern County Sheriff's Department Lamont Substation has 20 deputies assigned for patrol within the geographic service area, which includes the proposed Project. The Lamont Substation has 1 sergeant, 3 senior deputies, 16 deputies, and 1 section lieutenant during the day. At night, an additional sergeant and lieutenant are responsible for monitoring calls within the Lamont service area (McIntosh & Associates 2017). If a situation warranted immediate aid, deputies from Frazier Park and Taft would be requested first. The next level of assistance would be requested department side from 10 other Substations, Metro Patrol and Special Units (McIntosh & Associates 2017).

The County of Kern and the City of Bakersfield have a formal mutual aid agreement for law enforcement and emergency services. Beyond departmental capabilities, a formal request for mutual aid will occur by established protocols. Agencies within the County of Kern will be requested first and then request outside the county will begin by region. Additionally, both the Kern County Sheriff's Department and the Bakersfield Police Department aided dispatch systems identify calls for service by City and County aid jurisdiction. The Lamont Substation response time to an emergency in the proposed Project area could range from 15 to 30 minutes depending on call priority (McIntosh & Associates 2017). The Kern County Sheriff's patrol units traveling through the City shall respond to observed public safety problems and then call the City Police Department for follow-up.

California Highway Patrol (CHP)

As a major Statewide law enforcement agency, the California Highway Patrol (CHP) is responsible for the management and regulation of traffic to achieve safe, lawful and efficient use of the California highways as well as provide disaster and lifesaving assistance.

The purpose of the CHP is to ensure safety and provide service to the public on the highway transportation system and to assist local government during emergencies when requested. The primary responsibility of the CHP is to patrol state highways and all county roadways, enforce traffic regulations, respond to traffic accidents, and provide service and assistance to disabled vehicles. The CHP maintains a mutual aid agreement with the Kern County Sheriff's Department.

The CHP is divided into eight different divisions. The proposed Project is located in the CHP Central Division, which includes which includes 15 area offices, two commercial vehicle enforcement facilities (CVEF), and three communications and dispatch centers (CHP 2017). The closest CHP area office to the proposed Project area is the Bakersfield office, located approximately one mile north of the proposed Project site, at 9855 Compagnoni Street (CHP 2017).

Schools

Primary and secondary school facilities are provided throughout Metropolitan Bakersfield by several school districts and collegiate institutions. The educational institutions are responsible for the operation, staffing and scheduling of more than 70 individual school facilities. Two of the key factors that affect existing and future school facilities are funding and student generation rates. The proposed Project is located within the Greenfield Union School and Kern High School Districts.

Greenfield Union School District

The proposed Project is located within the Greenfield Union School District (GFUSD) jurisdiction. The closest elementary school is Granite Point Elementary School, located at 2900 Berkshire Road, approximately 5.5 miles north of the proposed Project. Granite Point Elementary School has a design capacity of 750 students and has a current enrollment of approximately 958 students. The closest middle school is McKee Middle School, located at 205 McKee Road, approximately two miles north of the proposed Project. McKee Middle School has a design capacity of 1,100 students and has a current enrollment of approximately 946 students (McIntosh & Associates 2017).

Kern County High School District

The proposed Project is also located within Kern High School District boundaries. The proposed Project site and the area west of South Union Avenue (SR-204) are located within the Ridgeview High School (8501 Stine Road) attendance area. Ridgeview High School is located at 8501 Stine Road, and is approximately 5.5 miles northwest of proposed Project. The school serves grades 9th through 12th, has a capacity of 2,176 students, and has a current enrollment of approximately 2,274 students. The District has no plans to increase enrollment capacity (McIntosh & Associates 2017).

Collegiate Institutions

Higher education within Metropolitan Bakersfield is provided by Bakersfield College and California State University at Bakersfield (CSU Bakersfield). Bakersfield College is a two-year community college, whereas CSU Bakersfield has four-year and graduate degree programs.

Parks and Recreation

The Kern County Parks and Recreation Department manages eight (8) regional parks, 25 public buildings, and 40 neighborhood parks. There are no recreational facilities currently serving the Project, nor are there existing parks located within ¾-mile of the proposed Project. The nearest developed park to the proposed Project is Kern Delta Park (approximately 1.5 miles north-northwest of the proposed Project).

Libraries

The Kern County Library system consists of 24 branches and two (2) bookmobiles throughout Kern County, with the main branch library (the Beale Memorial Library) located in Bakersfield. Materials for use at county branches include books, government documents, computers, CDs, and other informational media. The Kern County library system maintains a collection of 1.15 million books,

audiovisual items, periodicals, and other informational sources (Kern County Library 2017). The closest libraries to the proposed Project are the Lamont Branch Library, located approximately 5.25 miles northeast of the proposed Project, at 8304 Segrue Road, Lamont, and Wilson Branch Library, located approximately 5.5 miles north of the proposed Project site, at 1901 Wilson Road in Bakersfield.

4.15.3 Regulatory Setting

State

Senate Bill (SB) 50

The Leroy F. Greene School Facilities Act of 1998, or Senate Bill 50 (SB 50), authorizes school districts to levy developer fees to finance the construction or reconstruction of school facilities. In January 2015, the State Allocation Board (SAB) approved maximum Level 1 developer fees at $0.54 per square foot of enclosed and covered space in any commercial or industrial development, and $3.36 per square foot for residential development. These fees are intended to address the increased educational demands on the school district resulting from new development. Public school districts can, however, impose higher fees than those established by the SAB, provided they meet the conditions outlined in the act. Private schools are not eligible for fees collected pursuant to SB 50.

The payment of school mitigation impact fees authorized by SB 50 is deemed to provide full and complete mitigation of project impacts on school facilities. SB 50 provides that a State or local agency may not deny or refuse to approve the planning, use, or development of real property on the basis of a developer's refusal to provide mitigation in amounts in excess of that established by SB 50.

Local

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan cites policies to provide decision-makers with long-range guidance affecting the future character of the Metropolitan Bakersfield planning area. The elements within the Metropolitan Bakersfield General Plan provide goals and policies in order to ensure that public services have adequate capacity to service proposed developments. Applicable public services goals and policies relative to the proposed Project site are identified in Table 4.15-1, *Metropolitan Bakersfield General Plan Goals and Policies for Public Services*, below.

Table 4.15-1. Metropolitan Bakersfield General Plan Goals and Policies for Public Services
Metropolitan Bakersfield General Plan: Safety Element
Safety Element Goal #2: Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development of metropolitan police and fire facilities and services.
Public Services and Facilities (PSF) School Policies
PSF School Policy #1: New development will be required to pay its proportional share of the cost of school impact fees within the Plan area.
Public Services and Facilities (PSF) Parks Element Policies
PSF Park Policy #3: "Require developers to dedicate land, provide improvements and/or in lieu fees to serve the needs of the population in newly developing areas."

Capital Improvement Plan

A countywide Capital Improvement Plan (CIP) was presented to the board of supervisors on October 9, 2007, and adopted in 2008. This report presents the best current understanding regarding new public facilities that would be needed to serve projected development in the County through 2030. The scope of services includes parks; libraries; Kern County Sheriff's Department (public protection and investigation), fire department, animal control, public health, and landfill/transfer facilities; and, general government services. Road and sewer costs, as well as related impacts, are not part of this program. The program includes three phased components:

Phase One: Develop a conceptual CIP for the included facility categories, assessing what additional capacity and conceptual projects are required to provide needed infrastructure for new development through 2030;

Phase Two: Evaluate existing and potential funding sources, and outline options available as financing mechanisms, including a development fee proposal; and

Phase Three: Perform a fiscal (operational) analysis for use in evaluating the ongoing operating and maintenance impact of a new development on the County's general fund.

The adopted CIP includes a summary of proposed service levels for the included facilities and a conceptual list of the planned projects upon which the CIP was based.

Public Facilities Mitigation Program

The changing fiscal landscape in California during the past 30 years has steadily undercut the financial capacity of local governments to fund infrastructure. Three dominant trends stand out:

- The passage of a string of tax limitation measures, starting with Proposition 13 in 1978 and continuing through the passage of Proposition 218 in 1996;
- Declining popular support for bond measures to finance infrastructure for the next generation of residents and businesses; and

- Steep reductions in federal and state assistance.

Faced with these trends, the County has adopted a policy of "growth pays its own way" through use of a public facilities mitigation program. The primary policy objective of this program is to ensure that new development pays the capital costs associated with growth. In 2008, the County adopted a Capital Improvement Plan (CIP) that document identifies the best current understanding of the public facilities that will be needed to accommodate new development anticipated through 2030. The CIP further identified appropriate facility demand standards to be used as a basis for estimating future facility needs and level of service. The basic purpose of the CIP is to identify the facilities and infrastructure needed to serve the population in 2030.

Continued growth within the County and the associated impacts resulting from that growth have increased the demands to Countywide public services and have made it difficult to not only implement and fund many of those facilities identified within the Capital Improvement Plan, but maintain existing public service demand standards as growth occurs. In short, despite the increase in property taxes generated as a result of the proposed project and other similar projects within the County, public facility impacts are still underfunded and unable to maintain existing and adopted facility standards.

The purpose of the Public Facilities Mitigation Program is to identify those impacts on public services and determine the California Environmental Quality Act (CEQA)-required mitigation (in dollars) that would be needed to address the growth impacts adequately. The following categories have been identified to help determine which specific public needs are impacted by the proposed project.

- Countywide Public Protection Facilities;
- Sheriff Patrol and Investigation Facilities;
- Library Facilities;
- Animal Control Facilities:
- Park Facilities;
- Fire Facilities;
- Waste Management Facilities;
- Public Health Facilities; and
- General government Facilities.

4.15.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the proposed Project are evaluated on a quantitative basis through a comparison of the anticipated project effects on public services. The evaluation of project impacts as based on professional judgment, consistency analysis with the goals and polices of Metropolitan Bakersfield General Plan and the significance criteria established by Appendix G of the

State CEQA Guidelines, which the County has determined to be appropriate criteria for this Recirculated Draft EIR. In accordance with CEQA, the effects of a project are evaluated to determine if they will result in a significant adverse impact on the environment. An EIR is required to focus on these effects and offer feasible mitigation measures to reduce or avoid any significant impacts that are identified.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed project would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities; and/or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services, which include:

    i. Fire Protection

    ii. Police Protection

    iii. Schools

    iv. Parks

    v. Other Public Facilities

Project Impacts

Impact 4.15-1: The Project Would Result in Adverse Physical Impacts Associated with New or Physically Altered Governmental Facilities or Result in the Need for New or Physically Altered Governmental Facilities and Have Significant Fiscal Impacts on Public Services.

In May 2009, the County prepared, in consultation with Willdan Financial Services a Public Services Study, the purpose of which was to calculate and present development factors that will enable the County to expand its inventory of public facilities, and therefore maintain its existing facilities standards, as new development leads to service population increases. The applicability of these factors assumes full property taxes and are based on the services provided by the County to a given area to determine the underfunded public service needs. Table 4.15-2, *Applicability of Proposed Mitigation Factors to Residential and Non-Residential Uses*, identified below, summarizes the applicability of each of the proposed mitigation factors to residential and non-residential uses.

Table 4.15-2. Applicability of Proposed Mitigation Factors to Residential and Non-Residential Uses

Fee Category	Geographic Applicability	Service Population	
		Residential	Non-Residential
Public Protection	Countywide	X	X
Sheriff Patrol & Investigation	Unincorporated	X	X
Library	Countywide	X	
Animal Control	Unincorporated areas, Maricopa, McFarland, Tehachapi, Arvin, Bakersfield	X	
Community Parks	Countywide	X	
Regional Parks	Countywide	X	
Fire	Kern County Fire Service Area	X	X
Waste Management	Countywide	X	X
Public Health	Countywide	X	X
General Government	Countywide, different rates for cities	X	X

Future development of industrial uses would create public services typical of any new industrial development. As a non-residential facility, implementation of the proposed Project has the potential to result in a demand for new and/or additions to existing public protection facilities, sheriff facilities, fire facilities, waste management facilities, public health facilities and various general governmental facilities.

At this time, specific industrial uses on the proposed Project site are not available. The proposed M-1 PD (Light Industrial, Precise Development Combining), M-2 PD (Medium Industrial, Precise Development Combining), C-2 PD (General Commercial, Precise Development Combining), and CH PD (Highway Commercial, Precise Development Combining) Zone Districts would allow for, gas stations, restaurants, motels, wholesale commercial, storage, trucking, assembly-type manufacturing, general manufacturing, processing, office, or industrial uses to be constructed on-site. As a result, it is not feasible to specifically identify monetary mitigation for public facilities at this time, given the various commercial, office or industrial uses allowed within the M-2 PD Zone District. Given the proposed Project is non-residential, impacts to library, animal control, community and regional parks are considered less than significant.

The following is a discussion on the various public service impacts that would result with implementation of the proposed Project.

Fire Protection

Construction of the proposed Project has the potential to create an increased demand for fire services on the KCFD due to the increase in urban/industrial development. According to Captain Jim Eckroth, the proposed Project could increase the demand for fire protection and emergency services that could require manpower and equipment that are adequate to maintain a sufficient level of service in the

Greenfield area depending on the density of the new proposed commercial and industrial development (McIntosh &Associates 2017).

At this time mitigation development fees and taxes are undetermined by the KCFD; however, the proposed Project would be required to pay all fees and taxes established for the fire department prior to issuance of building permits. During the plan review phase, the Project Applicant may be required to agree to Conditions of Approval for development of the proposed Project in order to mitigate the demand for additional fire personnel and additional emergency equipment necessary to maintain adequate fire protection service. As such, implementation of the required mitigation measures below would reduce impacts to a less than significant level for fire protection services related to increase fire personnel.

The proposed Project has the potential of having short-term construction-related impacts. If during construction there is a need to redirect traffic or block access routes or residential streets, potential delays in emergency response could result. This temporary impact would be reduced to less than significant with implementation of mitigation measures pertaining to coordination during construction (refer to Section 4.16, *Transportation and Traffic*). Additionally, compliance with fire safety standards and requirements such as interior sprinkler systems, fire alarms, emergency access and adequate fire flow at public and on-site hydrants would be required during the plan review process and would reduce impacts to less than significant levels.

Furthermore, construction of the proposed Project would be subject to the provisions of the Uniform Fire Code and local amendments; Titles 19, 22 and 27 of the California Safety Code Regulations; the Kern County Ordinance Code; and the National Fire Prevention Association Standards. Thus, ensuring adequate fire protection services are maintained within the Project site.

Therefore, the proposed Project and the increase demand would not create an adverse impact because planned growth is something that is simply responded to by the KCFD. The KCFD and the Kern County Planning and Natural Resources Department reviews each new development to ensure that all requirements for emergency access, fire hydrant location and spacing, fire flows, and fire lanes are incorporated into the proposed project designs. Kern County code of Ordinances, regulations, guidelines, and fees are periodically updated. Development projects, including the proposed Project, are required to incorporate the most current code requirement that are in effect at the time of map recordation or building permit issuance. Impacts would be less than significant.

Sheriff/Police Protection

Construction of the proposed Project has the potential to create an increased demand for police services on the Kern County Sheriff's Department due to the increase in urban/industrial development. However, according to Commander Drake Massey, the existing facility, manpower and equipment are adequate to maintain sufficient service for this response area (McIntosh & Associates 2017). Additionally, the addition of officers, clerical staff, and law enforcement equipment pursuant to conditions of approval as set forth by the County, would decrease the demand on the existing police services and reduce the significance of impacts to less than significant levels.

Similar to the fire protection services, the proposed Project has the potential of having short-term construction related impacts. Construction areas may require additional police monitoring throughout

the duration of Project construction both during day and nighttime periods. Additionally, the need to redirect traffic or block access routes or residential streets may arise which would result in potential delays in police response. These temporary impacts would not be considered significant with implementation of mitigation measures pertaining to coordination during construction (refer to Section 4.16, *Transportation and Traffic*).

Other Public Facilities

Public protection facilities include criminal detention facilities, courthouses, coroner, 911 communications, and the Kern County Sheriff's Department administrative buildings. In contrast with sheriff patrol and investigation facilities, which are used primarily to provide services in unincorporated areas of the County, public protection facilities serve residential and nonresidential development countywide. Similar to sheriff facilities, demand for public protection services per employee are less than compared per resident, however implementation of the proposed Project would increase the service need. With implementation of the mitigation measures, impacts will be considered less than significant for public protection.

Refuse collection services for the proposed project is operated and managed by Price Environmental Services, Inc. Refuse collected is transported to one of two landfills, the Metropolitan Bakersfield Sanitary Landfill at (Bena Landfill) or Shafter-Wasco Sanitary Landfill. Calculations made utilizing the Kern County Waste Management Department methodology of solid waste estimation; the proposed project is anticipated to generate 12,883 tons of construction waste to buildout, and 13,519 tons of solid waste annually thereafter. Bena Landfill has reported the remaining capacity at 22,174,654 tons and the landfill is projected to accommodate solid waste for 26.8 years and is currently scheduled for closure in the year 2038. Shafter-Wasco Landfill has reported the remaining capacity at 3,671,755 tons and is projected to accommodate solid waste for 16.4 years (McIntosh & Associates 2017).

The County's waste management facility standard adopted in the CIP is 38.45 tons of landfill capacity per capita. This standard is based on the existing per capita landfill capacity. A planned system-wide transition from the several local sanitary landfill sites to regional sanitary landfills supplemented by local transfer stations is currently in process. The Kern County Waste Management Department presently has plans for eleven new facilities, several facility closures, and numerous miscellaneous capital projects which expand existing disposal facilities, consolidate local disposal sites to three regional disposal sites, and protect landfills from encroachment of incompatible land uses by acquiring buffer zones around disposal sites. Implementation of the project will contribute to the overall service needs for the Kern County Waste Management Department on a Countywide level. Implementation of the mitigation measures below will reduce impacts to waste management to a less than significant level.

General government facilities provide space for the Board of Supervisors and for general County administration including the Assessor, Treasures, Tax Collector and the Auditor-Controller County Clerk. Some general government facilities are primarily used to provide service and administration in unincorporated areas, while others provide service on an equal basis countywide. It is estimated that new development, Countywide, between now and the year 2030 would result in an increase of service population by 448,500 people (residents and workers combined). The Kern County CIP identifies a general government facility standard of 0.25 building square feet per capita, which was

the existing standard of general government facilities at the time the CIP was adopted. The County anticipates that less than 0.25 general government building square feet per capita will be needed to accommodate new development through 2030, therefore, the general government impact fee is based on the cost of planned facilities per capita. With implementation of the mitigation measure below, impacts to general government facilities will be reduced to less than significant levels.

These increased facility demands to public protection, waste management, and general government go above and beyond those funded through the increase in property taxes generated as a result of rezoning the property to industrial use.

Schools

As mentioned above, the proposed Project is located within the Greenfield Union School District and the Kern High School District. No school age children would reside on the proposed Project because no residential structures are proposed for this property. The Project applicant would be required to pay applicable statutory school fees under California Government Code Section 65995-65996. The rate factor for the Greenfield Union School District's students is determined by the factors based on total student generation impact per 1,000 square feet of commercial and industrial development, as shown in Table 4.15-3.

Table 4.15-3. Total Student Generation Impact

Commercial and Industrial Category	Elementary School Inter-District Impact	Middle School Inter-District Impact	Total Inter-District Cost Impact
Banks	0.0878	0.0373	0.1251
Community Shopping Center	0.0477	0.0202	0.0679
Neighborhood Shopping Center	0.0870	0.0370	0.1240
Industrial Business Parks	0.1093	0.0464	0.1557
Industrial Parks/Warehousing	0.0419	0.0178	0.0597
Research & Development	0.0945	0.0402	0.1347
Hospitality (Lodging)	0.0352	0.0149	0.0501
Commercial Offices (Standard)	0.1489	0.0633	0.2122
Corporate Offices	0.0835	0.0355	0.1190
Medical Offices	0.1326	0.0563	0.1889

Source: McIntosh & Associates, Public Services Report, 2017.
Notes: Total student generation impact per 1,000 square feet of commercial and industrial development.

The proposed Project is projected, in a worst-case scenario, to indirectly cause the addition of some residents based on the number people that will move to the area to fill managerial and other positions created by the development. This increase may create a demand for housing that may include school age children, which will indirectly create a demand for school services. Therefore, although the proposed Project would increase the intensity of land use on the Project site, the proposed Project is a commercial and industrial development and will not directly create a demand for school services. Thus, impacts to schools in the proposed Project area would not be considered substantial, as no residential uses are proposed.

In addition, the proposed Project would be required to contribute development impact fees in accordance with Senate Bill 50 (SB 50) (Level 1 impact fees) and the above-mentioned standards and

policies. Therefore, Project-related impacts to schools regarding acceptable service levels would be reduced to less than significant levels following implementation of State law.

Parks and Recreation

The proposed Project includes industrial uses and would not directly result in a demand for park facilities. According to the Metropolitan Bakersfield Kern County General Plan, a level of service standard of 2.5 acres of park area per 1,000 residents shall be implemented; therefore, the demand for park facilities is based on the residential population with the County. Since the proposed Project does not include housing, the proposed Project would not result in a direct demand for park and recreation facilities.

Mitigation Measures

MM 4.15-1: **Fire Safety Plan.** Prior to the issuance of grading or building permits, the project proponent shall develop and implement a Fire Safety Plan for use during construction and operation. The project proponent will submit the Fire Safety Plan, along with maps of the project site and access roads, to the Kern County Fire Department for review and approval. The Fire Safety Plan will contain notification procedures and emergency fire precautions for construction and operations phases of the proposed project.

MM 4.15-2: **Land Development Services Fee Schedule.** Prior to the issuance of grading or building permits, the project proponent shall coordinate with Kern County to determine the need for payment of land development services fees, in accordance with the Kern County Land Development Services Fee Schedule, for impacts to countywide public protection, sheriff's patrol and investigative services, and fire services.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Significant cumulative impacts to public services would occur if the cumulative projects would overburden the public service agencies and if utility providers were unable to provide adequate services. The cumulative impacts of this proposed Project, in conjunction with all the other projects, would result in the need for new fire, sheriff, library, and general governmental facilities. Implementation of the Development Impact Fee Program as directed by the Kern County Board of Supervisors, is appropriate mitigation to reduce cumulative impacts to public services. The cumulative projects would substantially increase the demand for public service providers and utility servers. However, public agencies and utilities have the opportunity to respond to an inquiry for information regarding potential increase in demand on their services. Monetary mitigation is determined on a project-by-project basis to mitigate for the increase in demand on public services and utilities. Incorporation of the mitigation measures would reduce impacts from the proposed Project, in conjunction with other projects in the area, to a less than significant cumulative level.

Mitigation Measures

Implement Mitigation Measures MM 4.15-1 and 4.15-2, above.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.16

Transportation and Traffic

Section 4.16
Transportation and Traffic

4.16.1 Introduction

The purpose of this section is to evaluate existing traffic conditions and the potential traffic impacts of the proposed Project. The evaluation considers impacts on local roadways, intersections, and regional facilities, as well as proposed Project access and internal circulation. Mitigation measures are recommended to avoid or lessen impacts, as necessary. A Traffic Impact Study (Traffic Study) was prepared by McIntosh & Associates in November 2016, and a technical memo regarding trip generation counts was prepared in May 2018. See Appendix M, *Traffic Study*.

The following analysis scenarios are evaluated in this section:

- Existing 2016 Conditions
- Future Year 2025 (Project Buildout) Without Project Conditions
- Future Year 2025 (Project Buildout) With Project Conditions
- Future Year 2035 Without Project Conditions
- Future Year 2035 With Project Conditions

Project impacts were assessed based on intersection and roadway levels of service (LOS). Improvements needed to maintain or improve operational LOS were also identified.

4.16.2 Environmental Setting

Study Area

The proposed Project is located approximately 1.10 miles southeast of the Bakersfield city limits, within the Metropolitan Bakersfield General Plan in Kern County. The proposed Project consists of approximately 314.30 acres, generally located north of Houghton Road, east of State Route 99 (SR-99), west of South Union Avenue, and south of DiGiorgio Road. South Union Avenue, Houghton Road, and the DiGiorgio Road alignment provide the primary access to and from the proposed Project area. The Project study area is illustrated on the figures provided in this section. A total of 43 intersections were analyzed within the study area. Of these intersections, 36 currently exist and seven (7) are proposed. The seven (7) proposed intersections were assumed to be in operation by Year 2025.

Existing and Proposed Street Network

The following is a summary of roadways within the study area:

Panama Lane is a designated east-west arterial west of the SR-99 Southbound Off-Ramp to east of Cottonwood Road in various stages of widening. Panama Lane currently exists as a six-lane, divided

roadway from the west of SR-99 Southbound Off-Ramp to South H Street. It then continues east from South H Street as a four-lane, divided roadway to South Union Avenue. Panama Lane exists at a two-lane, undivided roadway from South Union Avenue to the east of Cottonwood Road.

Hosking Avenue is a designated east-west arterial that exists as a two-lane, undivided roadway from west of SR-99 to Cottonwood Road.

Taft Highway/ State Route 119 (SR-119)/Panama Road is a designated east-west expressway from west of Wible Road to SR-99 and a designated arterial from SR-99 to the east of Cottonwood Road. Taft Highway/SR-119 is aligned with Panama Road to the east of South Union Avenue. Taft Highway/SR-119 currently exists as a two-lane, undivided roadway from west of Wible Road to South Union Avenue. Panama Road exists as a two-lane, undivided roadway from South Union Avenue to the east of Cottonwood Road.

Curnow Road is a designated east-west collector that currently exists as a two-lane, undivided roadway from west of South Union Avenue to Cottonwood Road.

DiGiorgio Road is a designated east-west arterial that currently exists as a two-lane, undivided roadway from South Union Avenue to the east of Cottonwood Road. DiGiorgio Road will be constructed in the future along the project's frontage and from the future Chevalier Road to South Union Avenue. DiGiorgio Road will provide direct access to the project site via the project's northern frontage.

Lamb Avenue is a designated east-west collector that currently exists as a two-lane, undivided roadway to the east of South Union Avenue. Lamb Avenue will be constructed in the future within the project boundary from Chevalier Road to South Union Avenue, and it will serve as direct access to the project site via several entrances on both the north and south sides of Lamb Avenue.

Mugsy Avenue is a designated east-west local roadway that currently exists as a two-lane, undivided roadway from South Union Avenue to east of South Union Avenue. Mugsy Avenue will provide direct access to the project site via several entrances within the project's interior.

Houghton Road/ Buena Vista Boulevard is a designated east-west arterial that currently exists as a two-lane, undivided roadway from west of Stine Road to South Union Avenue. Houghton Road is aligned with Buena Vista Boulevard at South Union Avenue and becomes Buena Vista Boulevard to the east of South Union Avenue. Buena Vista Boulevard is a designated east-west arterial that currently exists as a two-lane, undivided roadway from South Union Avenue to east of Adobe Road. Houghton Road will front the project's southern boundary and provide direct access to the project site via entrances on the project's southern frontage.

Shafter Road is a designated east-west collector that currently exists as a two-lane, undivided roadway from Chevalier Road to South Union Avenue. Shafter Road then becomes a designated arterial to the east of South Union Avenue, and it exists as a two-lane, undivided roadway to the east of South Union Avenue.

Kaiser Lane is a designated east-west collector that currently exists as a two-lane, undivided roadway from Chevalier Road to South Union Avenue.

Bear Mountain Boulevard/State Route 223 (SR-223) is a designated east-west arterial that currently exists as a two-lane, undivided roadway from west of Costajo Street to east of South Union Avenue.

Stine Road is a designated north-south arterial that currently exists as a two-lane, undivided roadway from north of Houghton Road to south of Houghton Road.

Wible Road is a designated north-south arterial that currently exists as a two-lane, undivided roadway from north of Taft Highway/SR-119 to south of Houghton Road.

South H Street is a designated north-south arterial that currently exists in various stages of widening. South H Street currently exists as a four-lane, divided roadway to the north of Panama Lane, and it continues southerly from Panama Lane to south of Houghton Road as a two-lane, undivided roadway. South H Street is aligned with Curnow Road to the south of Taft Highway/SR-119, but it realigns with its original alignment on the west side of SR-99 to the south of Curnow Road.

SR-99 is a designated north-south freeway that currently exists as a six-lane, divided roadway from north of Panama Lane to south of Bear Mountain Boulevard/SR-223. The freeway right-of-way will serve as the western boundary of the project site.

Costajo Road is a designated north-south collector that currently exist as a two-lane, undivided roadway from Houghton Road to Bear Mountain Boulevard/SR-223.

Chevalier Road is a designated north-south collector that currently exists as a two-lane, undivided roadway from Houghton Road to Kaiser Lane. Chevalier Road will be constructed in the future within the project boundary from DiGiorgio Road to Houghton Road. Chevalier Road will provide direct access to the project via several entrances within the project's interior.

South Union Avenue (SR-204)/SR-99 Business is a designated north-south arterial that currently exists as a four-lane, divided roadway from north of Panama Lane to south of Bear Mountain Boulevard/SR-223. This roadway will provide direct access to the project site via entrances along the project's eastern frontage. SR-204 and Union Avenue coexist north of SR-58.

Cottonwood Road is a designated north-south arterial that currently exists as a two-lane, undivided roadway from north of Panama Road to Buena Vista Boulevard.

Adobe Road is a designated north-south arterial that currently exists as a two-lane, undivided roadway from north of Buena Vista Boulevard to south of Buena Vista Boulevard.

Performance Criteria

For California Environmental Quality Act (CEQA) purposes, defined performance criteria are utilized to determine if a proposed project causes a significant impact. In general, according to the Transportation Research Board, National Research Council's 2010 Highway Capacity Manual (HCM), LOS ranges from LOS "A" (free-flow conditions) to LOS "F" (severely congested conditions), based on the average delay experienced per vehicle. The Metropolitan Bakersfield General Plan performance criterion for intersections and roadway segments is LOS "C" or better.

Existing Traffic Conditions

Existing Traffic Volumes

Traffic counts were taken at major intersections within the study area, as required by the City of Bakersfield, County of Kern, and the California Department of Transportation (Caltrans). The counts were used to determine the local peak-hour period, directional distribution, and existing operational LOS. Existing traffic counts were taken at the AM and PM peak hours for all intersections within the study area, and are illustrated in Figure 4.16-1a, *AM Peak Hour Turning Movements,* and Figure 4.16-1b, *PM Peak Hour Turning Movements.*

Existing Intersection Level of Service

Table 4.16-1, *Intersection Level of Service*, outlines the AM and PM peak hour LOS of the study intersections under Year 2016, Year 2025, and Year 2035 conditions. Based on the traffic counts taken for the Traffic Study, and as illustrated in Table 4.16-1, the following study intersections operate at an unacceptable LOS under existing 2016 conditions.

- Panama Lane and South H Street (PM Peak Hour LOS "D")
- Panama Lane and South Union (PM Peak Hour LOS "D")
- Hosking Avenue and South H Street (PM peak hour LOS "D")
- Taft Highway/SR-119 and SR-99 Southbound Ramp/Compagnoni Street (PM Peak Hour LOS "D")
- Taft Highway / SR-119 and South H Street (AM peak hour LOS "D")

U-Unsignalized Intersection; S-Signalized Intersection; AWS - All Way Stop
Notes:
[1] Taft Highway/ SR-119 becomes Panama Road at South Union Avenue.

Source: Traffic Impact Study for 99 Houghton, McIntosh & Associates, November 2016.

Existing Traffic Signal Warrants

Signalization of an intersection is not necessarily justified by the satisfaction of a single warrant. Poor operations (LOS) and poor safety characteristics, as well as satisfaction of multiple warrants are normally the criteria for installing a traffic signal. For purposes of the Traffic Study, a poor operational LOS for multiple movements, and satisfaction of signal warrants, was considered justification for traffic signal installations.

All unsignalized intersections within the Traffic Study scope were analyzed for traffic signal warrants using the procedures outlined in the California Manual on Uniform Traffic Control Devices (MUTCD) for Warrants 1A: ADT – Minimum Vehicular Traffic; 1B: ADT – Interruption of Continuous Traffic; 1A and 1B: ADT – Combinations of Warrants 1A and 1B; and 3: Peak Hour (70% Factor) Warrant.

Under Existing 2016 Conditions, traffic signal warrants are not satisfied at any of the study intersections.

Existing Roadway Volume to Capacity (V/C)

The volume-to-capacity (V/C) ratios were calculated for roadways under existing conditions, based on published average daily traffic (ADT) information. The proposed Project is located within the Metropolitan Bakersfield General Plan; therefore, Metropolitan Bakersfield General Plan performance criterion was utilized for intersections and roadway segments. A V/C of greater than 0.80 corresponds to a LOS "D", "E", or "F".

The following roadway segments operate at unacceptable LOS under Existing 2016 Conditions:

- Taft Highway/SR-119/SR-99 Northbound Ramp: South H Street (V/C=0.98; LOS "E")
- Taft Highway/SR-119/Panama Road: South H Street to South Union Avenue (V/C=1.03; LOS "F")
- Taft Highway/SR-119/Panama Road: South Union Avenue to Cottonwood Road (V/C=0.89; LOS "D")
- Panama Road: East of Cottonwood Road (V/C=0.85; LOS "D")
- Bear Mountain Boulevard/SR-223: SR-99 Northbound Ramp to South Union Avenue (V/C=0.93; LOS "E")
- Bear Mountain Boulevard/SR-223: East of South Union Avenue (V/C=0.94; LOS "E")

Non-Motorized Transportation

There are no dedicated pedestrian or bicycle facilities in the immediate proposed Project vicinity or along the surrounding roadways.

Public Transit

Public transportation in Kern County is provided by Kern Regional Transit. Kern County provides service between Bakersfield and rural communities, such as Lamont and the Kern River Valley, while the private carriers serve other major cities. Kern Regional Transit has 16 fixed routes, and also provides a dial-a-ride general public transportation service for residents in Lake Isabella, Lamont, Mojave, Rosamond, Tehachapi, and Frazier Park. In addition, Kern Regional Transit provides a non-emergency medical dial-a-ride service to passengers traveling to and from the Metropolitan Bakersfield area on the fixed routes for medical appointments.

The largest transit system for the Metropolitan Bakersfield area is Golden Empire Transit (GET), which is the local bus operator. GET operates 18 routes throughout the Metropolitan Bakersfield area and carries approximately 23,000 passengers per day. This amounts to one percent of total travel in the Metropolitan Bakersfield area. GET does not provide service outside of the Metropolitan Bakersfield area.

Intercity bus operators are Greyhound, Orange Belt Stages, Airport Bus of Bakersfield and Kern County. Paratransit providers include the taxicab system and various social service agencies that provide specialized transportation to their clients.

Amtrak provides rail service to and from Bakersfield. The Amtrak station is located at Truxtun Avenue and S Street.

Existing rail lines include two major railroads that provide freight service to Bakersfield: Burlington Northern-Santa Fe (BNSF) and Southern Pacific. The BNSF and the Union Pacific (UPRR) rail yard is located in East Bakersfield between Kentucky and Sumner Streets.

Airport Facilities

Commercial air travel in the area is provided by Meadows Field Airport, which is owned by Kern County and is one of seven airports operated by the Department of Airports. Located approximately seven (7) miles north of downtown Bakersfield and approximately 12 miles north of the proposed Project site, Meadows Field Airport serves more than 700,000 people in or near the southern San Joaquin Valley. The airport is approximately 1,400 acres in size.

The Bakersfield Municipal Airport, owned by the City of Bakersfield, is approximately 200 acres in size with two runways and is located approximately five (5) miles northeast of the proposed Project site. It is a corporate airport that is home to over 100 general aviation aircraft and primarily serves general aviation small aircraft for destinations in southern California.

Costerisan Farms Airport, a private airstrip, was located approximately two (2) miles northwest of proposed Project site. Costerisan Farms Airport was serviced by two grass runways. This private airstrip is no longer in use (pilotnav 2017).

Because several miles exist between the airports and the proposed Project site, neither construction nor completion of the proposed Project is expected to have any effect on air traffic patterns. Thus, air traffic patterns are not further addressed in the impact analysis for this proposed Project.

4.16.3 Regulatory Setting

Federal

Federal Aviation Administration (FAA)

The FAA regulates aviation at regional, public, private, and military airports, such as Lemoore Naval Air Station Tejon Ag Airport. The FAA regulates objects affecting navigable airspace and structures taller than 200 feet according to Federal Aviation Regulation 14 Code of Federal Regulations Part 77 (14 CFR 77). The U.S. and California Departments of Transportation also require the proponent to submit FAA Form 7460-1, Notice of Proposed Construction or Alteration.

As described in 14 CFR 77.9 (Construction or alteration requiring notice), each sponsor who proposes any of the following construction or alteration scenarios shall notify the FAA in the form and manner as follows:

> If requested by the FAA, or if you propose any of the following types of construction or alteration, you must file notice with the FAA of:
>
> (a) Any construction or alteration that is more than 200 feet AGL at its site.

(b) Any construction or alteration that exceeds an imaginary surface extending outward and upward at any of the following slopes:

(1) 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway more than 3,200 ft. in actual length, excluding heliports.

(2) 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway no more than 3,200 feet in actual length, excluding heliports.

(3) 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport described in paragraph (d) of this section.

(c) Any highway, railroad, or other traverse way for mobile objects, of a height which, if adjusted upward 17 feet for an Interstate Highway that is part of the National System of Military and Interstate Highways where overcrossings are designed for a minimum of 17 feet vertical distance, 15 feet for any other public roadway, 10 feet or the height of the highest mobile object that would normally traverse the road, whichever is greater, for a private road, 23 feet for a railroad, and for a waterway or any other traverse way not previously mentioned, an amount equal to the height of the highest mobile object that would normally traverse it, would exceed a standard of paragraph (a) or (b) of this section.

(d) Any construction or alteration on any of the following airports and heliports:

(1) A public use airport listed in the Airport/Facility Directory, Alaska Supplement, or Pacific Chart Supplement of the U.S. Government Flight Information Publications;

(2) A military airport under construction, or an airport under construction that will be available for public use;

(3) An airport operated by a Federal agency or the DOD.

(4) An airport or heliport with at least one FAA-approved instrument approach procedure.

(e) You do not need to file notice for construction or alteration of:

(1) Any object that will be shielded by existing structures of a permanent and substantial nature or by natural terrain or topographic features of equal or greater height, and will be located in the congested area of a city, town, or settlement where the shielded structure will not adversely affect safety in air navigation;

(2) Any air navigation facility, airport visual approach or landing aid, aircraft arresting device, or meteorological device meeting FAA-approved siting criteria or an appropriate military service siting criteria on military airports, the location and height of which are fixed by its functional purpose;

(3) Any construction or alteration for which notice is required by any other FAA regulation.

(4) Any antenna structure of 20 feet or less in height, except one that would increase the height of another antenna structure.

Per 14 CFR 77.7, notification requirements include sending one executed form set of FAA Form 7460-1, Notice of Proposed Construction or Alteration, to the Manager, Air Traffic Division, FAA Regional Office having jurisdiction over the area within which the construction or alteration will be located. The notice required must be submitted at least 45 days before the earlier of the following dates: (1) the date the proposed construction or alteration is to begin, or (2) the date an application for a construction permit is to be filed.

State

California Department of Transportation

The California Department of Transportation (Caltrans) is responsible for operating and maintaining the State highway system. In the project vicinity, SR-99 and associated freeway ramps and ramp terminal intersections fall under Caltrans jurisdiction. Caltrans provides administrative support for transportation programming decisions made by the California Transportation Commission (CTC) for state funding programs. The State Transportation Improvement Program (STIP) is a multi-year capital improvement program that sets priorities and funds transportation projects envisioned in long-range transportation plans. The Caltrans *Guide for the Preparation of Traffic Impact Studies* provides general guidance regarding the preparation of traffic impact studies for projects that may have an impact on the State Highway System. The Caltrans *Highway Design Manual* (HDM) establishes uniform policies and procedures for State highway designs. Caltrans also sets maximum load limits for trucks and safety requirements and administers the following regulations for oversized vehicles that operate on State highways:

California Vehicle Code (CVC), Division 15, Chapters 1 through 5 (Size, Weight, and Load)

Includes regulations pertaining to licensing, size, weight, and load of vehicles operated on highways.

California Street and Highway Code Sections 660-711, 670-695

Requires permits from Caltrans for any roadway encroachment during truck transportation and delivery, includes regulations for the care and protection of State and county highways and provisions for the issuance of written permits, and requires permits for any load that exceeds Caltrans weight, length, or width standards for public roadways.

Local

Metropolitan Bakersfield General Plan

Traffic analysis in the State of California is guided by policies and standards set at the state level by Caltrans and local jurisdictions. Transportation policies that may apply to the proposed Project are discussed within the Metropolitan Bakersfield General Plan. The Metropolitan Bakersfield General Plan is the product of a joint planning effort between the City of Bakersfield and Kern County, and it covers all territory within the Bakersfield Metropolitan Priority Area of the Kern County General Plan. The goals and policies that apply to transportation are discussed below in Table 4.16-2, *Metropolitan Bakersfield General Plan Goals and Policies for Traffic and Circulation.*

Kern Council of Governments (Kern COG) Congestion Management Program (CMP)

All urbanized areas larger than 200,000 persons are required to have a Congestion Management System, Program, or Process. Kern COG refers to its congestion management activities as the Congestion Management Program (CMP). Kern COG was designated as the Congestion Management Agency.

The CMP is a systematic process for managing congestion that provides information on: (1) transportation system performance, and (2) alternative strategies for alleviating congestion and enhancing the mobility of persons and goods to levels that meet state and local needs.

The purpose of the CMP is to help ensure that a balanced transportation system is developed that relates population growth, traffic growth and land use decisions to transportation system LOS performance standards and air quality improvement. The CMP is an effort to more directly link land use, air quality, transportation and the use of new advanced transportation technologies as an integral and complementary part of this region's plans and programs.

The purpose of defining the CMP network is to establish a system of roadways that will be monitored in relation to established LOS standards. At a minimum, all State highways and principal arterials must be designated as part of the Congestion Management System of Highways and Roadways. Kern County has 18 designated state highways.

This Page Intentionally Left Blank

Table 4.16-2. Metropolitan Bakersfield General Plan Goals and Policies for Traffic and Circulation
GOALS AND POLICIES
Circulation Element - Streets Goals
Streets Goal #1: Provide a safe and efficient street system that links all parts of the area for movement of people and goods.
Streets Goal #2: Provide for safe and efficient motorized, non-motorized, and pedestrian traffic movement.
Streets Goal #3: Minimize the impact of truck traffic on circulation, and on noise sensitive land uses.
Streets Goal #4: Provide a street system that creates a positive image of Bakersfield and contributes to residents' quality of life.
Streets Goal #6: Provide a local street network that contributes to the quality and safety of residential neighborhoods and commercial districts.
Streets Goal #7: Develop and maintain a circulation system that supports the land use plan shown in the General Plan.
Circulation Element - Streets Policies
Streets Policy #3: Provide additional right-of-way and pavement width to accommodate turn lanes at intersections.
Streets Policy #4: Provide additional right-of-way and pavement width at other locations for turn lanes, bus lanes, etc., as needed, based on engineering study.
Streets Policy #5: Place traffic signals to minimize delay.
Streets Policy #6: Design and locate site access driveways to minimize traffic disruption where possible considering items such as topography, past parcelization and other factors.
Streets Policy #7: Minimize direct and uncontrolled property access from arterials.
Streets Policy #8: Limit full access median breaks on arterials to a maximum of three per mile and include left-turn lanes at each.
Streets Policy #10: Design local streets to conform to topography. Allow for deviation from "grid" system on local streets when they do not interfere with other traffic policies and traffic flows.
Street Policy #11: Design local collector street systems to minimize through traffic movements and include short block lengths to discourage excessive speeds.
Streets Policy #12: Maintain the integrity of the circulation system.
Streets Policy #18: Provide and maintain landscaping on both sides and in the median of arterial streets within incorporated areas. In unincorporated areas, landscaping within road right-of-way may be allowed and shall be limited to low shrubs; blank irrigation conduit only will be provided within the median of arterial streets.
Streets Policy #19: Provide and maintain landscaping on both sides of collector streets. In unincorporated areas, landscaping within road right-of-way may be allowed and shall be limited to low shrubs.
Streets Policy #21: Route traffic around, rather than through, pedestrian-oriented areas.
Streets Policy #22: Design transportation improvements to minimize noise impacts on adjacent uses.

Table 4.16-2. Metropolitan Bakersfield General Plan Goals and Policies for Traffic and Circulation
GOALS AND POLICIES
Streets Policy #32: Reserve or acquire right-of-way for all future transportation facilities in conformance with the Circulation Plan Map.
Streets Policy #35: Require new development and expansion of existing development in incorporated areas to fully provide for on-site transportation facilities including, streets, curbs, traffic control devices, etc. Within unincorporated areas street improvements will be determined by County Ordinance.
Streets Policy #36: Prevent streets and intersections from degrading below Level of Service "C" where possible due to physical constraints (as defined in a Level of Service Ordinance) or when the existing Level of Service is below "C" prevent where possible further degradation due to new development with a three-part mitigation program: adjacent right-of-way dedication, access improvements and/or on area-wide impact fee. The area-wide impact fee would be used where the physical changes for mitigation are not possible due to existing development and/or the mitigation measures is part of a larger Project, such as freeways, which will be built at a later date.
Streets Policy #37: Require new development and expansion of existing development to pay for necessary access improvements, such as street extensions, widenings, turn lanes, signals, etc., as identified in the transportation impact report as may be required for a Project.
Streets Policy #39: Require new development and expansion of existing development to pay or participate in its pro rata share of the costs of expansions in area-wide transportation facilities and services which it necessitates.
Streets Policy #40: Provide new local street systems that are logical and comprehensible and systems of street names and addresses that are simple, consistent, and understandable.
Streets Policy #41: Plan alignments for local streets to permit economical and practical patterns, shapes, and sizes of development parcels.
Circulation Element - Transit Goals
Transit Goal #2: Provide a street system and land development policies that support public transportation.
Transit Goal #3: Provide cost-effective public transportation services.
Transit Goal #4: Reduce traffic congestion and parking requirements and improve air quality through improved transportation services.
Circulation Element - Transit Policies
Transit Policy #1: Consider transit service issues in the design of the arterial and collector street system.
Transit Policy #2: Consider for bus turnouts along arterials and collectors where appropriate.
Transit Policy #3: Consider transit service issues in the site planning review process.
Transit Policy #4: Coordinate with GET [Golden Empire Transit] to locate bus stops as close as possible to the facilities they serve.
Circulation Element - Bikeways Goals
Bikeways Goal #1: Provide a circulation system which recognizes and responds to the needs of bicycle travel.
Bikeways Goal #2: Provide a circulation system that minimizes cyclist/motorist conflicts.

Table 4.16-2. Metropolitan Bakersfield General Plan Goals and Policies for Traffic and Circulation
GOALS AND POLICIES
Circulation Element - Bikeways Policies
Bikeways Policy #5: Consider bicycle safety when implementing improvements for automobile traffic operations.
Bikeways Policy #7: Provide bicycle parking facilities at activity centers such as shopping centers, employment sites, and public buildings.
Bikeways Policy #9: Require new subdivisions to provide bike lanes on collector and arterial streets in accordance with the Bikeway Master Plan.
Bikeways Policy #11: Construct bike lanes in conjunction with all street improvement Projects that coincide with the Bikeway Master Plan.
Circulation Element - Parking Goals
Parking Goal #1: Provide an efficient parking system to respond to the needs of motorists.
Parking Goal #2: Satisfy parking requirements in all new developments (residential, commercial, industrial, etc.) through off-street facilities.
Parking Goal #3: Preserve and enhance residential neighborhoods through parking policy.
Circulation Element - Parking Policies
Parking Policy #1: Periodic review and, if needed, revision of adopted minimum parking requirements based on parking demand.
Parking Policy #2: Periodic review and, if needed, revision of adopted stall and aisle widths that are convenient and efficient.
Parking Policy #5: Remove abandoned vehicles promptly from city streets.
Parking Policy #6: Regulate parking of vehicle, boats, trailers, etc. on city streets.
Parking Policy #7: Identify on-site parking needs in activity centers and outline procedures to finance and provide the facilities.
Parking Policy #8: Give top priority to satisfying short-term parking needs, i.e., less than or equal to three hours, and second priority to long-term parking needs.
Parking Policy #9: Locate short-term parking to be convenient to the businesses served.
Parking Policy #10: Locate long-term parking on peripheral lands, accessible to arterial streets.
Parking Policy #11: Discourage parking between the sidewalk and buildings in pedestrian sensitive areas.
Circulation Element - Pedestrian Ways Goals
Pedestrian Ways Goal #1: Encourage pedestrian travel as a viable mode of movement throughout the Planning area.
Pedestrian Ways Goal #2: Provide adequate sidewalks throughout the planning area.

Table 4.16-2. Metropolitan Bakersfield General Plan Goals and Policies for Traffic and Circulation
GOALS AND POLICIES
Circulation Element - Pedestrian Ways Policies
Pedestrian Ways Policy #1: Provide sidewalks along streets where pedestrian use warrants.
Pedestrian Ways Policy #4: Provide for the physically handicapped in the design of all pedestrian facilities.
Pedestrian Ways Policy #5: Encourage development of pedestrian sensitive uses and design characteristics in the following areas: a) Downtown b) Baker Street c) Southwest Center d) Northwest Center

4.16.4 Impacts and Mitigation Measures

Methodology

This section presents the methodologies used to perform the traffic analyses. The study methodology is consistent with the guidelines of the City of Bakersfield, Caltrans, Kern County, and the Metropolitan Bakersfield General Plan. The overall methodologies used to develop future traffic volume forecasts and the explicit traffic operations analysis methodologies are summarized herein.

Analyses were performed for Year 2016 for existing conditions, and Years 2025 and 2035 for both the "without Project" and "with Project" scenarios. The Traffic Study obtained Year 2016 traffic volumes by conducting traffic counts in accordance with all agencies within the study area: Kern County, City of Bakersfield, and Caltrans. Year 2025 and Year 2035 traffic volumes in the Traffic Study were determined using data from a regional cumulative projects traffic model prepared by Kern COG. Proposed Project impacts were assessed based on roadway and intersection LOS. Improvements needed to maintain or improve traffic operational LOS were also identified.

Intersection Analysis Methodology

Traffic LOS is commonly used as a qualitative description of intersection operation and is based on the capacity of the intersection and the volume of traffic using the intersection. The methods used to evaluate cumulative plus project traffic conditions were taken from the Transportation Research Board, National Research Council's 2010 Highway Capacity Manual (HCM). Additionally, the SYNCHRO 9 computer software package was utilized to coordinate and facilitate extensive HCM intersection calculations.

The 2010 HCM Operational Analysis Methodology describes the operation of an unsignalized intersection using a range from LOS "A" (free-flow conditions) to "F" (severely congested conditions), based on the average delay experienced per vehicle, as shown in Table 4.16-3, *Level of Service Criteria for Unsignalized Intersections.*

Table 4.16-3. Level of Service Criteria for Unsignalized Intersections

Level of Service	Average Control Delay (Seconds per Vehicle)	Expected Delay to Minor Street Traffic
A	= 10	Little or no delay
B	> 10 and = 15	Short traffic delays
C	> 15 and = 25	Average traffic delays
D	> 25 and = 35	Long traffic delays
E	> 35 and = 50	Very long traffic delays
F	> 50	When demand volume exceeds the capacity of the lane, extreme delays will be encountered. This condition usually warrants improvement to the intersection.

Source: 2010 Highway Capacity Manual.

Operating conditions at intersections are assessed in terms of the LOS during a typical hour-long period. The LOS is based on the volume of traffic passing through an intersection, the number of lanes available to serve the traffic demands, and the type of traffic control at the intersection (i.e., stop sign control or traffic signal). Table 4.16-4, *Level of Service Criteria for Signalized Intersections,* summarizes the LOS criteria for signalized intersections as identified by the HCM. LOS "A" represents free flow conditions, LOS "D" represents conditions where vehicles on some approaches may have to wait through more than one traffic signal cycle to pass through the intersection, LOS "E" represents the theoretical capacity of the intersection, and LOS "F" represents jammed conditions.

Table 4.16-4. Level of Service Criteria for Signalized Intersections

Level of Service	Control Delay (Seconds per Vehicle)	Volume/Capacity
A	< 10	< 0.60
B	> 10 and = 20	0.61-0.70
C	> 20 and = 35	0.71-0.80
D	> 35 and = 55	0.81-0.90
E	> 55 and = 80	0.91-1.00
F	> 80	> 1.0

Source: 2010 Highway Capacity Manual.

Roadway Analysis Methodology

Operating conditions for roadway segments are based on corresponding V/C ratios shown in Table 4.16-5, *LOS Criteria – Roadway Segments*. A V/C of greater than 0.80 corresponds to an LOS "D", "E" or "F", as defined in the Highway Capacity Manual. The Metropolitan Bakersfield General Plan performance criterion for intersections and roadway segments is LOS "C".

Table 4.16-5. LOS Criteria – Roadway Segments

Level of Service (LOS)	Description	Volume/Capacity Ratio
A	Free flow conditions, unimpeded ability to maneuver and pass, very little delay, no platoons, highest average travel speeds.	≤ 0.60
B	Mostly free flow conditions, presence of other vehicles beings to be noticeable. Passing is required to maintain speeds, slightly less average travel speeds than Level of Service "A'.	0.61 – 0.70
C	Traffic density clearly affects the ability to pass and maneuver within the stream. Speeds are reduced to about 50 mph on highways and about 50% of the average on urban arterials.	0.71 – 0.80
D	Unstable flow. Speeds are reduced from 40% to 60% of normal. Passing demand is high although mostly impossible on 2-land highways. Traffic disruptions usually cause extensive queues.	0.81 – 0.90

Table 4.16-5. LOS Criteria – Roadway Segments

Level of Service (LOS)	Description	Volume/Capacity Ratio
E	Very unstable flow at or near capacity. Passing and maneuvering virtually impossible. Extensive platooning on highways and queuing on arterials. Speeds range from 20 mph to less on arterials and 2-lane highways, and up to 50 mph on multi-lane highways.	0.91 – 1.00
F	Forced or breakdown flow. Demand exceeds capacity. Vehicles experience short spurts of movement followed by stoppages. Intersection congestion, long queues and delays are common.	> 1.00

Source: 2010 Highway Capacity Manual.

Definition of Deficiency and Significant Impact

The definition of deficiency was obtained from the Metropolitan Bakersfield General Plan Circulation Element. The performance criteria for all intersections and street segments is LOS "C". Kern County has two standards for determining whether project traffic has a significant impact, and therefore, requires mitigation:

- Mitigation would be required when the addition of project traffic causes the LOS of an intersection or street to drop below LOS "C".
- If an intersection or street operates below LOS "C" prior to the addition of project traffic, mitigation would be required only as necessary to maintain the status quo.

Thresholds of Significance

The traffic issues related to the proposed land use and development have been evaluated in the context of CEQA and the Kern COG Regional Transportation Plan (RTP). Kern County is the lead agency responsible for preparation of the traffic impact analysis, in accordance with both CEQA and CMP authorizing legislation.

The Kern County CEQA Implementation Document and Kern County Environmental Checklist state that a project could potentially have a significance effect if it would:

- Conflict with an applicant plan, ordinance, or policy establishing measures of effectiveness (as designated in a general plan policy, ordinance, etc.), taking into account all relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit;
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency or adopted County threshold for designated roads or highways. Specifically, would implementation of the project cause the LOS for roadways and/or intersections to decline below the following thresholds or further degrade already degraded segment(s);

  - Metropolitan Bakersfield General Plan, below LOS "C";

- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks;
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access;
- Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts and bicycle racks).

A project is considered to have a significant transportation impact where it causes the LOS to drop below LOS "C" on local roadways and intersections and LOS "D" of state facilities and intersections. A project is also considered to have a significant impact if it adds substantial traffic volumes to a roadway segment or intersection that is already operating at unacceptable LOS.

Project Impacts

Impact 4.16-1: The project would not conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit.

The proposed Project components are described in detail in Section 3.0*, Project Description.* The proposed Project would allow for development of a light to medium industrial park containing approximately 4,613,004 square feet (net building area) of warehousing, distribution, and retail showroom uses. South Union Avenue, Houghton Road, and the DiGiorgio Road alignment provide the primary access to and from the Project area.

Project Trip Generation and Design Hour Volumes

The trip generation and design hour volumes indicated in Table 4.16-6, *Project Trip Generation*, were calculated using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition, 2012. Project traffic was estimated for weekday AM and PM peak hour traffic. Rate equations and directional splits for ITE Land Use Code 130 (Industrial Park) and 820 (Shopping Center) were used to estimate trip generation for the Project based on 314.30 acres of development. The ITE Land Use Code of 130 represents a conservative estimate for future traffic generated from the project site because it reflects the maximum vehicle trip generation for the various uses that would be permitted for the potential land uses and zoning of the proposed project (McIntosh and Associates, 2018).

Table 4.16-6. Project Trip Generation

ITE Code	Development Type	Variable / Acres	Daily Trips	AM Peak Hour Trips		PM Peak Hour Trips	
			ADT	In Split/ Trips	Out Split/ Trips	In Split/ Trips	Out Split/ Trips
130	Light Industrial / Service Industrial	267.30 acres	16,351	1,819	373	502	1,778
820	General Commercial	47 acres	15,702	257	165	877	912
20% Reduction to Account for "Pass By"				(44)	(37)	(175)	(183)
	Totals	314.30 acres	32,053 trips	2,029	501	1,203	2,508

Source: May 29, 2018 Response Letter to Kern County Planning from McIntosh & Associates regarding the November 2016 Traffic Impact Study for 99 Houghton.

The Circulation Element of the Metropolitan Bakersfield General Plan is the primary guidance document detailing the planning tools essential for achieving the local transportation goals and policies. The Circulation Element consists of the general location and extent of existing and proposed major thoroughfares, transportation routes, terminals, and other local public utilities and facilities, all correlated with the Land Use Element of the Metropolitan Bakersfield General Plan.

It is not possible to build transportation projects fast enough to keep pace with development in all instances. Both the Metropolitan Bakersfield Circulation Plan and the Kern County Circulation Plan operate on the theory that existing roads will be widened as land use intensity increases. The County is uniquely dependent on State Highway construction and retrofits to satisfy inter-city road travel and assumes that future development will be the trigger for the development of new roads. As such, it is the policy of the County to protect all surveyed section and mid-section lines, through right-of-way dedications in the Valley and Desert Regions of the County for arterial and collector highways. The Circulation Element road standards for arterial and collector highways are identified below. Modifications to these standards are considered on a case-by-case basis.

- Arterial (Major Highway) Minimum 110-foot right-of-way:
- County Standard 110 feet
- Collector (Secondary Highway) Minimum 90-foot right-of-way:
- County Standard 90 feet

In reviewing the total number of trips estimated for the development of the proposed Project site, it is anticipated that implementation of the proposed Project would not exceed the capacity of the identified circulation system when the roadways are built to the identified standards. Roadway dedications are required for all development and are implemented through compliance with the Kern County Land Division Ordinance, Zoning Ordinance and Development Standards. The proposed Project does not include any amendments to the existing Circulation Element. As such, impacts to

the existing road network are considered less than significant through implementation of local and state right-of-way dedication requirements.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.16-2: The Project Would not Conflict with an Applicable Congestion Management Program, Including, but not Limited to Level of Service Standards and Travel Demand Measures, or Other Standards Developed by the County Congestion Management Agency for Designated Roads or Highways.

Unlike future road right-of-way dedications, which can be protected in advance of development, LOS for adjacent and surrounding road segments or roadway intersections are directly impacted by the type of development proposed in a given area. The proposed Project is located within the administrative boundaries of the Metropolitan Bakersfield General Plan. As previously stated, for all roads subject to the Metropolitan Bakersfield General Plan, it is the objective and policy to maintain a minimum LOS "C" or better.

LOS standards are primarily addressed through improvements to intersections such as the installation of signal lights and the addition of turning lanes among other site- specific transportation related improvements. Mitigation is required if development causes affected roadways to fall below LOS "C".

Additionally, State law requires that urbanized counties prepare an annual CMP. City and County eligibility for new gas tax subventions is contingent upon their participation in the congestion management program. The County has designated Kern COG as the County's Congestion Management Agency. To qualify for funding provided through the State Transportation Improvement Program (STIP) or the Federal Transportation Improvement Program (FTIP), the regional transportation agency must keep a current Regional Transportation Plan (RTP) that contains the CMP. Also, the CMP offers local jurisdictions the opportunity to find cooperative solutions to the multi-jurisdictional problems of air pollution and traffic congestion. Requiring projects to maintain a LOS "C" ensures the County is in compliance with the adopted CMP.

The following information was included in the Traffic Study (refer to Appendix M, *Traffic Impact Study*).

Trip Distribution and Assignment

The proposed Project trip distribution and assignment assumptions within the study area are illustrated on Figure 4.16-2a, *Total Project Generated AM Peak Hour Turning Movements*, and Figure 4.16-2b, *Total Project Generated PM Peak Hour Turning Movements*. Project traffic

distribution was estimated based on Kern COG traffic model output and a review of existing development and proposed growth within the study area.

Future Year 2025 Without Project Traffic Volumes

Future Year 2025 peak hour turning movements without Project traffic are illustrated in Figure 4.16-3a, *Future Year 2025 AM Peak Hour Turning Movements Without Project*, and Figure 4.16-3b, *Future Year 2025 PM Peak Hour Turning Movements Without Project*.

Future Year 2025 PM Peak Hour Turning Movements Without Project

Figure 4.16-3b

Future Year 2025 Without Project Intersection LOS

Table 4.16-1, *Intersection Level Of Service*, outlines the AM and PM peak hour LOS of the study intersections under Future Year 2025 Without Project conditions. The Metropolitan Bakersfield General Plan considers LOS "C" acceptable within the general plan area; therefore, as indicated in Table 4.16-1, the anticipated growth in traffic volumes by the Year 2025 would cause the following study intersections to operate at a deficient LOS (LOS "D", "E", or "F") under Future Year 2025 Without Project conditions:

- Panama Lane and South H Street (PM peak hour LOS "D")
- Panama Lane and SR-99 Southbound Ramp (PM peak hour LOS "E")
- Panama Lane and South Union Avenue (AM peak hour LOS "D" and PM peak hour LOS "E")
- Panama Lane and Cottonwood Road (PM peak hour LOS "F")
- Hosking Avenue and Hughes Lane (PM peak hour LOS "F")
- Hosking Avenue and South H Street (AM peak hour LOS "E" and PM peak hour LOS "F")
- Hosking Avenue and South Union Avenue (AM peak hour LOS "F")
- Taft Highway/SR-119 and Compagnoni Street / SR-99 Southbound Ramp (AM peak hour LOS "D" and PM peak hour LOS "F")
- Taft Highway/SR-119 and South H Street (AM peak hour LOS "F" and PM peak hour LOS "E")
- Panama Road and Cottonwood Road (PM peak hour LOS "F")

Future Year 2025 Without Project Traffic Signal Warrants

The results of the signal warrant analysis under Future Year 2025 Without Project conditions are indicated in Table 4.16-7, *Traffic Signal Warrants – Future Year 2025 Without Project Conditions*.

Table 4.16-7. Traffic Signal Warrants – Future Year 2025 Without Project Conditions

Intersection	Warrant(s) Satisfied[1]	Notes
Panama Lane and Cottonwood Road	1 and 3	Signalization of this intersection is included in the Phase IV Metropolitan Bakersfield Regional Transportation Impact Fee Program (RTIF).
Hosking Avenue and Hughes Lane	1 and 3	Signalization of this intersection is included in the Phase IV Metropolitan Bakersfield Regional Transportation Impact Fee (RTIF) Program.
Hosking Avenue and SR-99 Northbound Ramp	1 and 3	Signalization of this intersection is included in the Phase IV Metropolitan Bakersfield Regional Transportation Impact Fee Program (RTIF).
Hosking Avenue and SR-99 Southbound Off-Ramp	1 and 3	Signalization of this intersection is included in the Phase IV Metropolitan Bakersfield Regional Transportation Impact Fee Program (RTIF).
Panama Road[2] and Cottonwood Road	1 and 3	Signalization of this intersection is included in the Phase IV Metropolitan Bakersfield Regional Transportation Impact Fee Program (RTIF).

Intersection	Warrant(s) Satisfied[1]	Notes

[1] Warrants 1A: ADT – Minimum Vehicular Traffic; 1B: ADT – Interruption of Continuous Traffic; 1A and 1B: ADT – Combinations of Warrants 1A and 1B; and 3: Peak Hour (70% Factor) Warrant

[2] Taft Highway/ SR-119 becomes Panama Road at South Union Avenue.

Source: Traffic Impact Study for 99 Houghton, McIntosh & Associates, November 2016.

As indicated in Table 4.16-7, the traffic signal warrant is satisfied at the following intersections under Future Year 2025 Without Project conditions:

- Panama Lane and Cottonwood Road
- Hosking Avenue and Hughes Lane
- Hosking Avenue and SR-99 Northbound Ramp
- Hosking Avenue and SR-99 Southbound Ramp
- Panama Road and Cottonwood Road

Future Year 2025 Without Project Roadway V/C

The V/C ratios were calculated for roadways with published ADT information and future traffic projections. Ultimate capacity is based on functional classification. A V/C of greater than 0.80 corresponds to a LOS "D" or below. Future traffic would cause the following studied roadway segments to operate at a deficient LOS (LOS "D", "E," or "F") in their existing configurations under Future Year 2025 Without Project conditions:

- Panama Lane - South Union Avenue to Cottonwood Road (V/C=1.02, LOS "F")
- Taft Highway/SR-119 – Compagnoni Street/SR-99 Southbound Ramp to SR-99 Northbound Ramp (V/C = 0.85, LOS "D")
- Taft Highway/SR-119 – SR-99 Northbound Ramp to South H Street (2015), (V/C = 1.17, LOS "F")
- Taft Highway/SR-119/Panama Road - South H Street to South Union Avenue (V/C= 1.53, LOS "F")
- Taft Highway/SR-119/Panama Road - South Union Avenue to Cottonwood Road (V/C 1.20, LOS "F")
- Panama Road - East of Cottonwood Road (V/C 1.15, LOS "F")
- Bear Mountain Road/SR-223 – SR-99 Northbound Ramp to South Union Avenue (V/C 1.19, LOS "F")
- Bear Mountain Road – East of South Union Avenue (SR-204) (V/C 1.24, LOS "F")

Future Year 2025 With Project Traffic Volumes

Future Year 2025 peak hour turning movements with Project traffic are illustrated in Figure 4.16-4a, *Future Year 2025 AM Peak Hour Turning Movement with Project*, and Figure 4.16-4b, *Future Year 2025 PM Peak Hour Turning Movement with Project.*

Future Year 2025 With Project Intersection LOS

Table 4.16-1, *Intersection Level of Service*, outlines the AM and PM peak hour LOS of the study intersections under Future Year 2025 With Project conditions. The Metropolitan Bakersfield General Plan considers LOS "C" acceptable within the general plan area; therefore, as indicated in Table 4.16-1, the anticipated growth in traffic volumes by the Year 2025 would cause the following study intersections to operate at a deficient LOS (LOS "D", "E", or "F") under Future Year 2025 With Project conditions:

- Panama Lane and SR-99 Southbound Ramp (PM peak hour LOS "E")
- Panama Lane and South H Street (PM peak hour LOS "D")
- Panama Lane and South Union Avenue (AM and PM peak hour LOS "D")
- Hosking Road and South H Street (PM peak hour LOS "D")
- Taft Highway/SR-119 and Compagnoni Street/SR-99 Southbound Ramp (PM peak hour LOS "D")

Panama Road and Cottonwood Road (PM peak hour LOS "D")

Future Year 2035 Without Project Traffic Signal Warrants

The results of the signal warrant analysis provided in the 2016 Traffic Study (refer to Appendix M, *Traffic Study*) determined that there are no traffic warrants under Future Year 2035 without Project conditions.

Future Year 2035 Without Project Roadway V/C

The V/C ratios were calculated for roadways with published ADT information and future traffic projections. Ultimate capacity is based on functional classification. A V/C of greater than 0.80 corresponds to a LOS "D" or below. Future traffic would cause the following studied roadway segments to operate at a deficient LOS (LOS "D", "E" or "F') in their existing configurations under Future Year 2035 Without Project conditions:

- Panama Lane - West of SR-99 Southbound Ramp – (V/C = 0.94, LOS "E")
- Panama Lane - East of Cottonwood Road – (V/C = 0.93, LOS "E")
- Taft Highway/SR-119 – West of Wible Road – (V/C = 1.03, LOS "F")
- Taft Highway/SR-119 - Wible Road to Compagnoni Street/SR-99 Southbound Ramp (V/C = 1.08, LOS "F")
- Taft Highway/SR-119/Panama Road – South H Street to South Union Avenue (V/C= 0.94, LOS "E")
- Bear Mountain Road – SR-99 Northbound Ramp to South Union Avenue (V/C = 1.36, LOS "F")
- Bear Mountain Road - East of South Union Avenue (V/C = 1.43, LOS "F")
- South H Street - Berkshire Road to Hosking Avenue (V/C = 0.96, LOS "E")
- South H Street - Hosking Avenue to Taft Highway/SR-119 (V/C = 1.09, LOS "F")
- Cottonwood Road – North of Panama Lane (V/C = 0.81, LOS "D")

Future Year 2035 With Project Traffic Volumes

Future Year 2035 peak hour turning movements without Project traffic are illustrated in Figure 4.16-6a, *Future Year 2035 AM Peak Hour Turning Movements with Project*, and Figure 4.16-6b, *Future Year 2035 PM Peak Hour Turning Movements with Project*.

Future Year 2035 With Project Intersection LOS

Table 4.16-1, *Intersection Level of Service*, outlines the AM and PM peak hour LOS of the study intersections under Future Year 2035 With Project conditions. The Metropolitan Bakersfield General Plan considers LOS "C" acceptable within the general plan area; therefore, as indicated in Table 4.16-1, the anticipated growth in traffic volumes by the Year 2035 would cause the following study intersections to operate at a deficient LOS (LOS "D", "E", or "F") under Future Year 2035 With Project conditions:

- Panama Lane and SR-99 Southbound Ramp (PM peak hour LOS "F")
- Panama Lane and South H Street (AM peak LOS "D" and PM peak "LOS "E")
- Panama Lane and South Union Avenue (AM peak hour LOS "D")
- Hosking Avenue and Hughes Lane (AM and PM peak hour LOS "D")
- Hosking Avenue and South H Street (AM and PM peak hour LOS "E")
- Taft Highway/SR-119 and South H Street (AM peak hour LOS "D" and PM peak hour LOS "E")
- Panama Road and Cottonwood Road (AM peak hour; LOS "D" and PM peak hour LOS "E")
- Curnow Road and South Union Avenue (PM peak hour LOS "F")
- Lamb Avenue and South Union Avenue (#2) (PM peak hour LOS "D")
- Houghton Road and SR-99 Southbound Ramp (AM peak hour LOS "F" and PM peak hour LOS "D")
- Houghton Road and SR-99 Northbound Ramp (AM and PM peak hour LOS "F")

Future Year 2035 With Project Intersection Improvements

Intersection improvements needed by the Year 2035 to maintain or improve the operational LOS of the street system in the vicinity of the Project are indicated in Table 4.16-10, *Future Intersection Improvements and Local Mitigation*. As mitigation for the Project, it is recommended that the Project pay fees in accordance with the RTIF program. For mitigation improvements not covered by the RTIF, it is recommended that the Project pay the proportionate share for the local mitigation improvements. Table 4.16-10 identifies which RTIF intersection improvements are not covered by the program.

Table 4.16-10. Future Intersection Improvements and Local Mitigation

Intersection	Total Improvements Required by 2035 Without Project[1]	Total Improvements Required by 2035 With Project[2]	Local Mitigation (Improvements not covered by RTIF)
Panama Lane & South H Street	Add 1 ET & 1 NT	No additional improvements required	
Panama Lane & South Union Avenue	Add 1 ET, 1 EL, 2 WT, 1 WL, 1 WR, 1 NT, 1 NL, 1 SL, 1 ST, & 1 SR	No additional improvements required	
Panama Lane & Cottonwood Road	Provide Signal; Add 1 EL, 1 ER, 1 ET, 1 WL, 1 WR, 1 WT, 1 NL, 1 SL, & 1 SR & NR	No additional improvements required	
Hosking Avenue & Hughes Lane	Provide Signal; Add 1 ET, 1 WT, 1 WL & 1 NR	No additional improvements required	
Hosking Avenue & South H Street	Add 1 EL, 1 ET, 1 ER, 1 WL, 1 WT, 1 NL, 2 NT, 1 NR, 1 SL, 2 ST & 1 SR	No additional improvements required	
Hosking Avenue & South Union Avenue	Add 2 ET, 1 EL, 1 ER, 1 WT, 1 NL, 1 NT, 1 NR, 1 ST, 2 SR & Overlapping SR	No additional improvements required	
Taft Highway/SR-119 & Wible Road	Add 1 ET, 1 WT, 1 NL, 2 SL, & 1 SR	No additional improvements required	
Taft Highway/SR-119 & SR-99 Southbound Ramp/ Compagnoni Street	Add 2 ET, 2 WT, 1 NR, Convert SL to ST/L & 1 SR	No additional improvements required	
Taft Highway/ SR-119 & South H Street	Add 1 EL, 2 ET, 2 WT, 1 WR and 1 SR	Add 1 NL	NL
Taft Highway/ SR-119/ Panama Road & South Union Avenue	Add 1 ET and 1 WT	No additional improvements required	
Taft Highway/ SR-119/ Panama Road & Cottonwood Road	Provide signal; Add 2 EL, 2 ET, 1 ER, 2 WT, 1 WL, 2 WR, 1 NL, 1 NR, 2 NT, 2 ST, 1 SL, & 1 SR	No additional improvements required	
Curnow Road & South Union Avenue	No additional improvements required	Add 1 ER	ER
DiGiorgio Road & Chevalier Road/Project Entrance #1	No additional improvements required	Construct entrance with 1 ET/R, 1 WT/L, & 1 NL/R	ET/R, WT/L, NL/R
DiGiorgio Road & South Union Avenue	No additional improvements required	Construct east approach with 1 EL, 1 ET/R; & 1 SR & 1 WL	EL, ET/R, SR & WL
South Union Avenue & Lamb Avenue/Project Entrance #2	No additional improvements required	Add 1 ER	ER

Table 4.16-10. Future Intersection Improvements and Local Mitigation

Intersection	Total Improvements Required by 2035 Without Project[1]	Total Improvements Required by 2035 With Project[2]	Local Mitigation (Improvements not covered by RTIF)

Future Year 2035 With Project Roadway V/C

The V/C ratios were calculated for roadways with published ADT information and future traffic projections. Ultimate capacity is based on functional classification. A V/C of greater than 0.80 corresponds to a LOS "D" or below. Future traffic would cause the following studied roadway segments to operate at a deficient LOS (LOS "D", "E" or "F") in their existing configurations under Future Year 2035 With Project conditions:

- Panama Lane – West of SR-99 Southbound Ram (V/C – 0.95, LOS "E")
- Bear Mountain Boulevard/SR-223 – SR-99 Northbound Ramp to South Union Avenue (V/C = 1.36, LOS "F")
- Bear Mountain Boulevard/SR-223 - East of South Union Avenue (V/C = 1.44, LOS "F")
- Chevalier Road – DiGiorgio Road to Houghton Road (V/C = 0.85, LOS "D"

It should be noted that the roadway segments along Bear Mountain Boulevard/SR-223 and Panama Lane segment indicated above, currently operation at LOS "E" and Future Year 2035 With Project Conditions are similar to Future Year 2035 Without Project Conditions, with these segments operating at LOS "F" under both scenarios.

Future Year 2035 With Project Roadway Improvements

Roadway improvements needed by the Year 2035 to maintain or improve the operational LOS of the street system in the vicinity of the Project are indicated in Table 4.16-11, *Future Roadway Improvements and Local Mitigation*. As mitigation for the Project, it is recommended that the Project pay fees in accordance with the RTIF program. For mitigation improvements not covered by the RTIF, it is recommended that the Project pay the proportionate share for the local mitigation improvements.

Table 4.16-11. Future Roadway Improvements and Local Mitigation

Roadway	Improvements Required by 2035 Without Project	Improvements Required by 2035 With Project	Project Share for Local Mitigation
Panama Lane – South Union Avenue to Cottonwood Road	Improve 4-lane Collector	No additional improvements required	0.55%
Panama Lane – East of Cottonwood Road	Improve to 4-Lane Collector	No additional improvements required	1.48%
Taft Highway/ SR-119 – West of Wible Road	Improve to 4-lane, undivided	No additional improvements required	6.28%
Taft Highway/SR-119 –Wible Road to Compagnoni Street/SR-99 SB Ramp	Improve to 4-Lane Collector	No additional improvements required	7.0%
Taft Highway/SR-119/ Panama Road – South H Street to South Union Avenue	Improve to 4-Lane Arterial	No additional improvements required	11.83%
Taft Highway/SR-119/ Panama Road – Compagnoni Street/ SR-99 SB Ramp to East of Cottonwood Road	Improve to 4-lane Collector	No additional improvements required	10.72%
DiGiorgio Road – West of Chevalier Road (Project Entrance #1)	No additional improvements required	Construction 2-lane Collector	100%
DiGiorgio Road – Chevalier Road (Project Entrance #1) to South Union Avenue	No additional improvements required	Construction 2-lane Collector	100%
Cottonwood Road – North of Panama Lane	Improve to 4-Lane Collector	No additional improvements required	2.5%
Houghton Road – SR-99 SB Ramp to SR-99 NB Ramp	No additional improvements required	Improve to 4-Lane Collector	75.62%
Houghton Road – SR-99 NB Ramp to Chevalier Road	No additional improvements required	Improve to 6-Lane Arterial	82.14%
Houghton Road – Project Entrance #5 to South Union Avenue	No additional improvements required	Improve to 4-Lane Collector	62.15%
Chevalier Road – DiGiorgio Road to Houghton Road	No additional improvements required	Construct 2-Lane Collector	100%

-- = No percentage provided.

Source: Traffic Impact Study for 99 Houghton, McIntosh & Associates, November 2016.

If the existing operational LOS of a facility is below "C" prior to the addition of project generated traffic and the addition of project traffic substantially degrades the LOS further, then mitigation to

restore the facility to at least its existing operational LOS is deemed appropriate. The following intersection would improve their 2035 LOS levels with the proposed project, but LOS would remain below a "C":

- Panama Lane and S. Union Avenue (AM peak hour), has a LOS "E" under 2035 Future Without Project conditions, and a LOS "D" under 2035 Future with Project conditions;
- Hosking and Hughes (AM peak hour), has a LOS "F" under 2035 Future Without Project conditions, and a LOS "D" under 2035 Future with Project conditions;
- Hosking and South H. Street (AM Peak hour and PM Peak hour), have a LOS "F" under 2035 Future Without Project Conditions, and a LOS "E" under 2035 Future with Project conditions;
- Taft Highway/SR-119 and South H. Street (AM Peak hour), has a LOS "F" under 2035 Future Without Project conditions, and a LOS "D" under 2035 Future with Project conditions;
- Taft Highway/Panama Road and Cottonwood Road (AM Peak hour), has a LOS "F" under 2035 Future Without Project conditions, and a LOS "D" under 2035 Future with Project conditions; and
- Taft Highway/Panama Road and Cottonwood Road (PM Peak hour), has a LOS "F" under 2035 Future Without Project conditions, and a LOS "E" under 2035 Future with Project conditions.

Therefore, all study roadways would operate at an acceptable LOS (LOS "C" or better) under Future Year 2035 With Project conditions (in their mitigated configurations). Thus, with implementation of the recommended roadway improvements, implementation of the proposed Project would result in less than significant impacts on study area roadway segments under Future Year 2035 With Project conditions.

The following CMP intersections are included in the study area:

Existing

- Panama Lane and SR-99 Southbound Off-Ramp
- Panama Lane and SR-99 Northbound Off-Ramp
- Taft Highway/SR-119 and Wible Road
- Taft Highway/SR-119 and SR-99 Southbound Off-Ramp/Compagnoni Street
- Taft Highway/SR-119 and South H Street
- Taft Highway/SR-119/Panama Road and South Union Avenue
- Houghton Road and SR-99 Southbound Ramps/Costajo Street
- Houghton Road and SR-99 Northbound Ramps
- SR-99 Southbound Ramp and Costajo Street
- Bear Mountain Boulevard/SR-223 and Costajo Street

- Bear Mountain Boulevard/SR-223 and SR-99 Northbound Ramp
- Bear Mountain Boulevard/SR-223 and South Union Avenue
- Hosking Avenue and SR-99 Southbound Off-Ramp
- Hosking Avenue and SR-99 Northbound Off-Ramp

Future Year 2025 With Project CMP Intersection LOS

The AM and PM peak hour LOS of the study intersections, including the CMP intersections, under Future Year 2025 With Project conditions are outlined above. Based on established thresholds of significance, the addition of Project-generated trips would not result in significant impacts on CMP intersections and no mitigation is required.

Future Year 2035 With Project CMP Intersection LOS

The AM and PM peak hour LOS of the study intersections, including the CMP intersections, under Future Year 2035 With Project conditions are outlined above. Based on established thresholds of significance, the addition of Project-generated trips is anticipated to result in a significant impact at the following CMP study intersections under Future Year 2035 With Project conditions:

- Taft Highway/SR-119 and South H Street
- Houghton Road and SR-99 Southbound Ramps/Costajo Street
- SR-99 Southbound Ramp and Costajo Street

Mitigation measures, which involve improvements to the impacted CMP intersections, are recommended to reduce or eliminate traffic impacts for Future Year 2025 and 2035 With Project conditions.

Future Year 2025 With Project CMP Traffic Signal Warrants

The results of the signal warrant analysis under Future Year 2025 With Project conditions are outlined above. As indicated above, the traffic signal warrant is satisfied at the following CMP intersection under Future Year 2025 With Project conditions:

- Houghton Road and Chevalier Road (Warrants 1 and 3)

Future Year 2035 With Project CMP Traffic Signal Warrants

The results of the signal warrant analysis under Future Year 2035 With Project conditions are outlined above. As indicated above, the traffic signal warrant is satisfied at the following three CMP intersections under Future Year 2035 With Project conditions:

- Houghton Road and SR-99 Northbound Ramps (Warrants 1 and 3)
- Houghton Road and SR-99 Southbound Ramps/Costajo Street (Warrants 1 and 3)
- Bear Mountain Boulevard/SR-223 and South Union Avenue

Mitigation measures, which involve improvements to the impacted CMP intersections, are recommended to reduce or eliminate traffic impacts for Future Year 2025 and 2035 With Project conditions.

Conclusion

The proposed Project would contribute its pro-rata share for supplemental mitigation not covered under any regional transportation impact fee. The estimated supplemental mitigation amount, as determined by the Kern County Public Works Department, must be paid to the Kern County Public Works Department prior to recordation of any parcel map(s) or issuance of any grading or building permit if a parcel map is not required.

Mitigation Measures

MM 4.16-1: Supplemental Road Improvements. Prior to final approval of any Master Precise Development Plan or recordation of any parcel map, the project proponent will provide to the County a written statement of intent, which will detail the approach used to satisfy obligations for supplemental road improvements. This written statement of intent and method proposed will be approved by the Kern County Public Works Department- Development Review. The applicant will have three approaches to fulfill the road improvement responsibilities:

1. Lump Sum Payment: Any lump sum payment will be made prior to final approval of any Master Precise Development Plan, parcel map recordation or issuance of grading or building permits. All monies will be paid to the Kern County Roads Department. At the time of payment, the Kern County Roads Department will conduct a review of the distributed share amount and make adjustments, if required, based on increases to the construction cost index, other changes in standards or technology for required signalization or improvements, or updated development projects or proposals. The Kern County Roads Department may request, at a cost to be borne by the applicant, a supplemental traffic analysis to determine the correct lump sum payment.

2. Construction of Road Improvements: If, in an approved summary of intent, the Project Applicant seeks to construct road improvements in lieu of a lump sum payment, the improvements will be constructed and accepted by the County prior to issuance of the Certificate of Occupancy for the related building permits. Deviations from this sequence of events may be approved by the Kern County Roads Department.

3. Combination of Approach A and Approach B: The Project Applicant may choose to provide construction for certain roadway improvements and payment for others. This approach must be used in communication with the Kern County Roads Department.

4. All monies designated for roadway improvements shall initially be identified and calculated during processing of the Master Precise Development Plan or parcel map, whichever comes first. All final payments and or construction of

roadway improvements shall be completed at the issuance of any grading or building permit.

MM 4.16-2: Construction Traffic Control Plan. Prior to the issuance of construction or building permits, the project proponent shall:

1. Prepare and submit a Construction Traffic Control Plan to Kern County Public Works Department- Development Review and the California Department of Transportation offices for District 9, as appropriate, for approval. The Construction Traffic Control Plan must be prepared in accordance with both the California Department of Transportation Manual on Uniform Traffic Control Devices and Work Area Traffic Control Handbook and must include, but not be limited to, the following issues:

    a. Timing of deliveries of heavy equipment and building materials;

    b. Directing construction traffic with a flag person;

    c. Placing temporary signing, lighting, and traffic control devices if required including pedestrians and bicyclist; including, but not limited to, appropriate signage along access routes to indicate the presence of heavy vehicles and construction traffic;

    d. Ensuring access for emergency vehicles to the project sites;

    e. Temporarily closing travel lanes or delaying traffic during materials delivery, transmission line stringing activities, or any other utility connections;

    f. Maintaining access to adjacent property; and,

    g. Specifying both construction-related vehicle travel and oversize load haul routes, minimizing construction traffic during the AM and PM peak hour, distributing construction traffic flow across alternative routes to access the project sites, and avoiding residential neighborhoods to the maximum extent feasible.

2. Obtain all necessary encroachment permits for the work within the road right-of-way or use of oversized/overweight vehicles that will utilize county-maintained roads, which may require California Highway Patrol or a pilot car escort. Copies of the approved traffic plan and issued permits shall be submitted to the Kern County Planning and Natural Resources Department and the Kern County Public Works Department-Development Review.

3. Enter into a secured agreement with Kern County to ensure that any County roads that are demonstrably damaged by project-related activities are promptly repaired and, if necessary, paved, slurry-sealed, or reconstructed as per requirements of the state and/or Kern County.

4. Submit documentation that identifies the roads to be used during construction. The project proponent shall be responsible for repairing any damage to non-county-maintained roads that may result from construction activities. The project proponent shall submit a preconstruction video log and inspection report regarding roadway conditions for roads used during construction to the Kern County Public Work Department-Development Review and the Kern County Planning and Natural Resources Department.

5. Within 30 days of completion of construction, the project proponent shall submit a post-construction video log and inspection report to the County. This information shall be submitted in DVD format. The County, in consultation with the project proponent's engineer, shall determine the extent of remediation required, if any.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.16-3: The Project Would Cause an Increase in Operation-Related Safety Hazards or result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that would result in substantial safety risks.

By increasing traffic on area roadways, there is the potential to increase safety hazards by increasing vehicle turning movements and increasing potential for vehicle/pedestrian or vehicle/bicycle conflicts. However, with implementation of the mitigation measures MM 4.16-1 through MM 4.16-3, traffic controls will be included to help calm and control traffic where necessary, including signals, signage, sidewalks, crosswalks, and bicycle lanes, among other safety features. Therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.16.4: The Project Would Cause an Increase in Construction-Related Safety Hazards or Would Substantially Increase Hazards Due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses (e.g., Farm Equipment).

No obstacles to sight distance are expected to result from Project construction. No sharp roadway curves currently exist in the proposed Project area, nor would such curves be created by the proposed Project. However, the maneuvering of construction-related vehicles and equipment among the general-purpose traffic on area roadways could cause safety hazards. This impact is considered potentially significant but can be reduced to a less than significant level with implementation of mitigation measure MM 4.16-2.

Mitigation Measures

Implement mitigation measure MM 4.16-2.

Level of Significance After Mitigation

Impacts would be less than significant.

Impact 4.16.5: The Project Would Result in Inadequate Emergency Access.

Anticipated construction-related traffic and circulation impacts would be considered a temporary nuisance that would cease upon completion of Project construction. Preparation of a detailed Traffic Management Plan (TMP) would be required prior to construction of the proposed Project. The TMP would delineate all road closures, provisions to maintain access to adjacent residential properties at all times, prior notices, adequate sign-postings, detours, provisions for pedestrian and bicycle transportation and permitted hours of construction activity. Proper detours and warning signs would be established along the proposed Project perimeter to ensure public safety. The TMP shall be devised so that construction would not interfere with emergency response or evacuation plans. With implementation of the TMP and mitigation measures, less than significant impacts are anticipated. Therefore, no significant impacts to vehicular and emergency access would occur during construction activities.

South Union Avenue, Houghton Road, and the DiGiorgio Road alignment provide the primary access to and from the proposed Project area. The design of the proposed access locations would allow for adequate vehicular and emergency access to public roadways. Project implementation would result in a less than significant impact in this regard.

Mitigation Measures

Implement MM 4.16-2.

Level of Significance After Mitigation

Impacts would be less than significant.

Impact 4.16.6: The Proposed Project Would Conflict with Adopted Policies, Plans or Programs Supporting Alternative Transportation (e.g., bus turnouts and bicycle racks).

As indicated in the Metropolitan Bakersfield General Plan Environmental Impact Report, as development and population increases within the Metropolitan Bakersfield area, the demand for alternative transportation (i.e., bus transit service, bikeways and pedestrian facilities) would increase. The Metropolitan Bakersfield General Plan Bikeway Master Plan is implemented to link schools, civic centers, service areas, parks, employment centers, and regional bike paths. As the proposed Project vicinity is mostly undeveloped land, or land currently under construction, there are no pedestrian and bicycle facilities in the area. However, as the proposed Project area becomes developed, adherence to General Plan roadway standards and policies would allow for adequate pedestrian and bicycle circulation.

Transit service within the Metropolitan Bakersfield area consists of approximately one percent of the total travel. In accordance with the goals and policies of the Metropolitan Bakersfield General Plan, the Project Applicant shall work with the GET and Kern Transit to locate bus stops as close as possible to the proposed Project site in an effort to provide residents with sufficient access to public transit service. Bus stops would most likely be placed on major arterials. Therefore, development of the proposed Project would not result in a significant impact to transit service in the proposed Project vicinity.

The County requires installation of sidewalks in conjunction with development. Sidewalks would be required to allow for safe and convenient pedestrian movement and would connect with sidewalks planned for adjacent developments. The proposed Project would construct internal roads to the County's roadway standards, which would include sidewalks on both sides of the streets. Therefore, with the proposed Project designed to City and County standards, there would be no impacts to pedestrian and bicycle circulation.

Development of the Project site in accordance with the goals and policies of the Metropolitan Bakersfield General Plan and site plan review by the County, GET and Kern Transit would serve to enhance alternative modes of transportation within the Project area. This would be a long-term beneficial impact.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

The analysis of cumulative impacts in this section included all of the cumulative projects discussed in Chapter 3, Project Description. Projections of future traffic conditions incorporate regional population and employment growth that is expected to occur by the future analysis year, independent of the proposed Project. Because of this, future condition scenarios (2035) without the proposed Project capture the effects of cumulative projects. Future condition scenarios (2035) with the proposed Project capture the effects of both cumulative projects and those of the proposed Project.

Cumulative projects plus anticipated growth in traffic volumes by the Year 2035 will cause 21 intersections to operate below acceptable LOS (without the proposed Project). Additionally, by 2025, future traffic conditions without the Project would result in five (5) intersections meeting signal warrants under future peak hour traffic loads. By 2035, future traffic conditions without the Project would result in an additional zero (0) intersections meeting signal warrants under future peak hour traffic loads. Future cumulative projects and ambient growth would cause 17 studied roadway segments to operate below acceptable LOS in their existing configurations for Future Year 2035 Without Project conditions (LOS "D" or below for the Metropolitan Bakersfield General Plan).

The proposed Project would add 32,053 vehicle trips per day to the existing and future year conditions. With the addition of this Project traffic, six of the intersections that will operate at

acceptable LOS under future traffic loads (2035) will drop below acceptable LOS when Project traffic is added to future peak hour traffic (2035 with project). The proposed Project traffic would also result in 14 intersections meeting signal warrants under future peak hour traffic loads. In addition, three studied roadway segments would operate below acceptable LOS (LOS "C" for Metropolitan Bakersfield General Plan) in their existing configurations under Future Year 2035 With Project conditions. When added to future cumulative conditions, the Project-generated traffic would result in the continued worsening of existing intersections that are at or above operating capacity. However, many of the improvements identified above will be necessary even without the addition of Project-generated traffic. The proposed Project shall contribute its proportionate share of costs to construct necessary improvements required due to future traffic growth projections in the study area.

Additionally, the proposed Project is located approximately 1.10 miles southeast of the Bakersfield City limits, within the Metropolitan Bakersfield General Plan in Kern County. Therefore, it is anticipated that trips generated will utilize the Metropolitan Bakersfield transportation system. The cumulative impacts of the existing and proposed growth in the Metropolitan Bakersfield area on the transportation system has been the subject of various studies since the development of the Transportation Impact Fee (TIF) in 1992. The Kern County Public Works Department and City of Bakersfield Public Works Department have worked with Kern COG since that time to identify major improvements and seek funding for completion of the appropriate segments to ensure roadway capacity. In 1997, the Metropolitan Bakersfield Major Transportation Investment Strategy (MTIS) was completed to identify overall transportation needs and develop a long-term improvement plan. Mass transit options including increased bus systems, transportation systems management, and commuter/light rail transit were considered in the study. However, the MTIS concluded that in Metropolitan Bakersfield, stand-alone mass transit solutions would not provide the same benefits that improvements to the roadway network would provide. The inefficient roadway system, lacking connectivity, was the primary transportation element in need of significant improvement.

The physical constraints that affect the alignment and design of an efficient regional transportation system include:

- the Kern River cutting diagonally across Bakersfield from northeast to the southwest that inhibits both north-south and east-west travel;
- SR-99, which divides Bakersfield east and west;
- SR-58, which divides the east side of Bakersfield into north and south;
- the mainline of both the BNSF and the UPRR run through Bakersfield, dividing the west from the northwest, the northeast from the southwest, and splitting central Bakersfield;
- existing development that breaks up continuity and numerous canals and branch rail lines, which must be crossed to provide a functional roadway network.

To address these challenges, in 2000–2001, Kern County, the City of Bakersfield, Caltrans, and Kern COG jointly commissioned the Bakersfield System Study to perform a comprehensive evaluation of the region's roadway network. The results of that study are reflected in the current adopted circulation element of the Metropolitan Bakersfield General Plan. It identifies a regional network of freeways, parkways, arterials, and collectors that when fully implemented are proposed to provide regional mobility and reduced congestion. Estimates for full buildout of all the necessary regional

improvements, along with additional facilities such as Seventh Standard Road, the South Beltway, and the Snow Road interchange with SR-99, range from $2 to $3 billion in today's dollars. Although construction of regional roadways has occurred with money from TIF, development-constructed improvements, and federal and state highway money, the freeways have not been completed.

The accelerated growth from 2002 to 2004 in the Metropolitan Bakersfield area of 4.7 percent per year resulted in housing construction and amendments to the plan that required road network improvements that are still in the design stage. Environmental clearance, design, right-of-way (ROW) acquisition and construction of a new freeway requires 10 to 15 years to complete. Given the size and scope of required improvements, the impacts from project amendments in the noncore area of the Metropolitan Bakersfield area are significant and cannot be accommodated by the TIF program or the localized supplemental funding proposed by the Bakersfield System Study. While a regional network has been identified, the issues of timing (when the actual improvements will be completed) and funding (guaranteed sources of money that will increase to match inflation) are still considered potentially significant.

Kern County and the City of Bakersfield have commenced a comprehensive update of the Metropolitan Bakersfield General Plan that will include a complete review of the circulation element and propose solutions to resolve the cumulative impacts past 2030. As an interim solution, the Kern County Public Works Department, in consultation with the City of Bakersfield, has reviewed the proposed regional network along with the known funding sources. The proposed future circulation system includes all existing and future arterials, based on the sectional grid system, constructed to their ultimate six-lane width. It also includes a freeway system composed of all existing and currently proposed facilities, constructed to a width of up to 10 lanes as needed. The proposed future freeway system includes the following facilities:

- West Beltway
- Westside Parkway (Completed)
- Centennial Corridor
- Fruitvale Avenue at SR-65 connection/extension
- Snow Road at SR-99 interchange
- South Beltway
- North Beltway (north of Seventh Standard Road)

The issues to be examined include a realistic assessment of the design and available funding over the next 30 years against the background that the County does not have a dedicated sales tax for transportation funding, the funding from the STIP is limited by competition among agency requests across California, federal money (Thomas Road Improvement Program) will not build complete infrastructure, and local matching funds were limited.

Funding for Regional Transportation Improvements

Local Sales Tax

State law provides that a countywide sales tax on goods and services can be applied with two-thirds voter approval for use in operation, maintenance, and construction of transportation projects. The County is then deemed a self-help county and receives priority consideration during state and federal funding allocations. Currently, 19 counties in California are self-help counties. Kern COG estimates that a countywide 0.5-cent sales tax would generate $931.6 million over a 20-year period, while a 1-cent tax would generate $1.8 billion over the same time period. Such funding is then used to match funding for state and federal allocations and to finance local projects that will reduce critical congestion points. Kern County voters failed to pass a proposed 0.5-cent sales tax in 1989 and 2006. There are no legal limits on the number of times the measure may be qualified for the ballot.

Other Local Sources

Supplemental impact fees for regional impacts could be assessed on all new proposals in the metropolitan Bakersfield area under the jurisdiction of the County. An example of this approach is San Joaquin County, which assesses two different fees to address regional and local connectively improvements.

Additional funding could be generated by conditioning development proposals to create geographical funding districts such as bridge and thoroughfare districts or capital facilities districts that would assess new homes for regional improvements. Given the regional nature of the circulation system, identifying the facilities and appropriate segments for assessment that would comply with legal requirements for equity and nexus could be difficult.

In addition to matching funding of over $100 million that the City of Bakersfield has allocated from revenue, Kern County has approved a financing plan that will generate $148 million for transportation projects. Presented to the Board of Supervisors on December 4, 2007, the plan proposes to issue bonds that will provide a framework for debt financing. The financing plan includes the following projects that have been identified in priority order with estimated cost and time periods when bond proceeds will be needed:

1. Seventh Standard Road Corridor from SR-99 to Santa Fe Way (SR-43)	$34.3 million, 12 months
2. Local Transportation Projects	$ 42.3 million, 12 months
3. Thomas Road Improvement Program, County Match	$ 72.0 million, 6 years
Total	**$148.6 million**

This funding could provide immediate construction dollars to implement projects to relieve critical congestion points and ensure timely implementation of TRIP. In addition, the proposed financing plan includes setting aside funds ranging in amounts from $9.5 million to $17.5 million annually to defray future capital costs associated with the transportation projects.

Conclusion

All roadway segments would operate at acceptable LOS under cumulative conditions. In addition, required mitigation measures would result in acceptable LOS for all intersections. Roadway and intersection improvements require participation in the RTIF Program. However, given the uncertainty of the timing and/or ultimate implementation of the recommended improvements which require pro-rata, fair share funding from various sources, along with those improvements necessary within Metropolitan Bakersfield, the proposed Project's contribution would result in significant and unavoidable impacts.

Mitigation Measures

Implement mitigation measure MM 4.16-2.

Level of Significance after Mitigation

Cumulative impacts would be significant and unavoidable.

This Page Intentionally Left Blank

Section 4.17

Utilities

Section 4.17
Utilities

4.17.1 Introduction

This section addresses impacts of the proposed Project pertaining to demand for operational utilities (i.e., water, sewer/wastewater, stormwater control, solid waste disposal, electricity, and natural gas). For each of the utilities addressed in this section, existing infrastructure and levels of service are described, as are improvements that would be required to accommodate the proposed Project. A Public Services Report was prepared by McIntosh & Associates in October 2008 (refer to Appendix N, *Original Technical Studies*). A subsequent Public Services Report was prepared by McIntosh & Associates in June 2017 (Appendix J, *Public Services Report*), and most recently, a Water Supply Assessment was prepared by Yarne & Associates, Inc. in January 2019 [Appendix H, *99 Houghton Industrial Park SB 610 Water Supply Assessment (WSA*)].

4.17.2 Environmental Setting

Water Resources

The existing water purveyor for the proposed Project, who currently provides irrigation water solely for agricultural purposes, would not service the Project site with domestic water. Instead, potable water would be provided to the Project site by the California Water Service Company (Cal Water). Cal Water supplies water service to 1.7 million Californians through 435,000 connections in a total of 24 Districts. The proposed Project is located approximately 0.5 miles from the southern boundary of the Cal Water Bakersfield District (District) near the intersection of State Route (SR-99) and West Curnow Road. In 2015, an Urban Water Management Plan (UWMP) was prepared for the District, but because the proposed Project site is outside the current District boundaries, it was not specifically included in the UWMP. Because the proposed Project was not included in the UWMP, a WSA was prepared to address water service requirements. The information in the WSA was based on the 2015 UWMP, which is the most recent UWMP for the District, as well as information from Cal Water that was compiled from the most recent 2016-2017 data. This information has been used for the analysis in the RDEIR.

Cal Water would require approval from the California Public Utility Commission (CPUC) to expand its service area to include the proposed Project. Cal Water plans on submitting an application to the CPUC and receiving approval for the service extension in mid to late 2019.

Sewer Services

The Metropolitan Bakersfield area is served by five major wastewater treatment facilities: the City of Bakersfield Treatment Plant No. 2, the City of Bakersfield Treatment Plant No. 3, the North of River Sanitary District (NORSD) Treatment Plant, the Mount Vernon/Panorama District Plant and the Lamont Public Utility District Plant (located outside the Metropolitan Bakersfield boundary).

The proposed Project site area has never been served by a sewer system. Currently, neighboring residential and commercial properties are served by individual, privately-owned septic systems. A private package sewer treatment plant is proposed to provide services for the Project site.

Solid Waste

Solid waste is a mixture of items discarded as useless or unwanted arising from residential, commercial, industrial, institutional, agricultural, industrial and mining activities. These wastes include construction and demolition-generated (C&D) waste as well as inert wastes. The general waste classifications utilized by the Kern County Waste Management Department are:

- Non-hazardous solid waste consists mostly of household garbage, commercial wastes, agricultural waste and litter.
- Special waste, which is any waste that requires special handling, includes infectious waste, pesticide containers, sewage sludge, oilfield waste, household hazardous waste, and asbestos waste.
- Designated waste is a waste that consists of or contains pollutants that could be released at concentrations in excess of applicable water quality objectives and standards or hazardous waste that has been granted a variance from hazardous waste management requirements.
- Hazardous waste is a waste that, because of its quantity, concentration, physical, chemical, or infectious characteristics, may either (a) cause or significantly contribute to an increase in mortality or an increase in serious irreversible or incapacitating reversible illness or (b) pose a substantial present or potential hazard to human health or the environment when improperly managed.
- Industrial wastes are hazardous and non-hazardous by-products produced by oil and gas extraction, pesticide, paper, petrochemical, rubber, plastics, electronics, and other industries.

Not all of the above-defined wastes may be disposed of at a landfill. State law regulates the disposal of wastes at landfills. Refer to the following section for a description of appropriate disposal methods of waste generated at the proposed Project site.

Kern County is responsible for meeting the California Integrated Wastewater Management Act of 1989, Assembly Bill 939 (AB 939). AB 939 requires that cities and counties reduce the amount of solid waste being sent to landfills by 50 percent by January 1, 2000, and it requires cities and counties to prepare AB 939 solid waste planning documents. These documents include the Source Reduction and Recycling Element (SRRE), the Household Hazardous Waste Element (HHWE), and the Non-Disposal Facility Element (NDFE). All three of these documents have been approved for Kern County, as well as an Integrated Waste Management Plan approved February 1998 by the California Integrated Waste Management Board [California Integrated Waste Management Board (CIWMB) 2009]. The Kern County Integrated Waste Management Plan is the long-range planning document for landfill facilities.

C&D waste is heavy, inert material. These are processed and reused in construction and improvement projects. Three sites, all in the City of Bakersfield have been approved to accept these wastes. Since C&D waste is heavier than paper and plastic, it is more difficult for the counties and cities to reduce the tonnage of disposed waste. For this reason, C&D waste has been specifically targeted by the State of California for diversion from the waste stream. Projects that will generate C&D waste should emphasize deconstruction and diversion planning, rather than demolition. Deconstruction is the planned, organized dismantling of a prior construction project, which allows maximum use of the

deconstructed materials for recycling in other construction projects and sends a minimum of the deconstruction material to landfills.

The Kern County Waste Management Department administers or sponsors the following recycling programs that contribute towards meeting the State-mandated solid waste diversion goals:

- Recycling programs at landfills to recycle or divert a wide variety of products, such as wood waste, cathode ray tubes, tires, inert materials, appliances, etc.
- Kern County and the City of Bakersfield operate drop-off recycling centers for household recyclables located within the unincorporated metropolitan area and within the City. County and City drop-off recycling centers may be used by both County and City residents.
- Financial assistance for the operation of the City of Bakersfield Green Waste Facility.
- Kern County Special Waste Facility provides disposal of household hazardous waste services to all Kern County residents.
- Cosponsors semi-annual Bulky Waste Collection Events, which are held in the Bakersfield area and are available to both County and City residents.
- Participates, jointly with the City of Bakersfield, on a Christmas Tree Recycling campaign.
- Cosponsors, jointly with the Community Clean Sweep, a Telephone Book Recycling program.
- Sponsors the Community Clean Sweep to conduct summer workshops called "Trash to Treasure", which educates children on recycling and other Kern County Waste Management Department programs.
- Operates, in collaboration with the Community Clean Sweep, an innovative elementary school education program called "Clean Kids Hit the Road Puppet Show".
- Provides recycling trailers to churches, schools and non-profit organization.

Solid waste generated from the proposed Project would be collected by solid waste hauler Price Environmental Services, Inc. For additional details regarding solid waste services, refer to Appendix J, Public Services Report.

Landfills

Refuse collected by the franchise hauler is transported to one of two landfills, the Metropolitan Bakersfield Sanitary Landfill (MBSL) at Bena, located approximately 18 miles east of downtown Bakersfield, or Shafter-Wasco Sanitary Landfill. The Kern County Waste Management Department (KCWMD) opened the MBSL in 1992.

According to the City of Bakersfield Solid Waste Division, refuse from the proposed Project would be deposited at the Bena Landfill located at 2951 Neumarkel Road in Caliente, California and the Shafter-Wasco Sanitary Landfill located at 17621 Scofield Avenue in Shafter, California. Refuse collection services for the proposed Project is operated and managed by Price Environmental Services, Inc.

Bena Landfill has reported the remaining capacity at 22,174,654 tons and the landfill is projected to accommodate solid waste for 26.8 years and is currently scheduled for closure in 2038. Shafter-

Wasco Landfill has reported the remaining capacity at 3,671,755 tons and is projected to accommodate solid waste for 16.4 years.

Should the California Integrated Waste Management Board (CIWMB) grant additional permits to develop the remainder of the site and waste diversion stabilizes at 50 percent, the potential total capacity for the Bena Landfill site exceeds 60 years. The Shafter-Wasco Sanitary Landfill is estimated to reach capacity by July 2024.

Electrical Services

Most of the County's electrical energy is consumed by residential, commercial, industrial, agricultural, and transportation uses. Electric power supply and distribution for the proposed Project area is furnished by Pacific Gas & Electric (PG&E). Two PG&E substations, Old River Substation and Panama Substation presently serve the proposed Project area. Existing PG&E electrical distribution facilities are located on the south side of DiGiorgio Road, on the northeast side of SR-99, along the north side of Houghton Road, and on the west side of South Union Avenue with a little intrusion into the area from South Union Avenue and Houghton Road.

Four pole-mounted electrical transformer locations were observed on the proposed Project site. PG&E is the owner of the transformers and should be contacted for their removal prior to Project site development.

Natural Gas

Natural gas is primarily consumed by the City's residential land uses for heating and cooking purposes. The entire proposed Project site is within PG&E's service territory; therefore, natural gas will be provided by PG&E. Currently, there is approximately 5,000 linear feet of PG&E Transmission Line 300B located in the northeast corner of the proposed Project. There is also a six-inch diameter gas distribution line located on the east side of the proposed Project.

4.17.3 Regulatory Setting

At the federal level, the United States Environmental Protection Agency (U.S. EPA) promulgates regulations that protect surface waters under the Water Pollution Control Act Amendments of 1972, commonly referred to as the Clean Water Act. These federal regulations, published in the Federal Register and codified in Code of Federal Regulations Title 40, establish wastewater treatment policies, effluent requirements for surface water disposal, and requirements for biosolids management and disposal. Regulations also set forth pretreatment requirements for preventing pollutants from entering publicly owned treatment works at levels that could interfere with treatment operation or solids management.

Federal

Clean Water Act (CWA)

At the federal level, the United States Environmental Protection Agency (U.S. EPA) promulgates regulations that protect surface waters under the Water Pollution Control Act Amendments of 1972,

commonly referred to as the Clean Water Act. These federal regulations, published in the Federal Register and codified in Code of Federal Regulations Title 40, establish wastewater treatment policies, effluent requirements for surface water disposal, and requirements for biosolids management and disposal. Regulations also set forth pretreatment requirements for preventing pollutants from entering publicly owned treatment works at levels that could interfere with treatment operation or solids management.

Safe Drinking Water Act

The Safe Drinking Water Act of 1974 (SDWA) gave the U.S. EPA the authority to set standards for contaminants in drinking water supplies. The U.S. EPA was required to establish primary regulations for the control of contaminants that affected public health and secondary regulations for compounds that affect the taste, odor, and aesthetics of drinking water. Under the provisions of SDWA, the California Department of Health Services (DHS) has primary enforcement responsibility. Title 22 of the California Administrative Code establishes DHS authority and stipulates State drinking water quality and monitoring standards.

State

California Department of Resources Recycling and Recovery (CalRecycle) Formerly California Integrated Waste Management Board (CIWMB)

CalRecycle is the State agency designated to oversee, manage, and track California's 76 million tons of waste generated each year. It is one of the six agencies under the umbrella of the California Environmental Protection Agency. CalRecycle develops regulations to control and manage waste, for which enforcement authority is typically delegated to the local government. The board works jointly with local government to implement regulations and fund programs.

Assembly Bill (AB) 939 and Senate Bill (SB) 1016

The California Integrated Waste Management Act of 1989, or Assembly Bill (AB) 939, established the Integrated Waste Management Board, required the implementation of integrated waste management plans, and mandated that local jurisdictions divert at least 50 percent of all solid waste generated (from 1990 levels), beginning January 1, 2000, and divert at least 75 percent by 2010. Projects that would have an adverse effect on waste diversion goals are required to include waste diversion mitigation measures to assist in reducing these impacts to less-than-significant levels. With the passage of Senate Bill (SB) 1016 (the Per Capita Disposal Measurement System) in 2006, only per capita disposal rates are measured to determine if a jurisdiction's efforts are meeting the intent of AB 939.

Assembly Bill (AB) 341

In response to reducing commercial solid waste that is landfilled, the State Legislature passed AB 341 declaring that it is the policy goal of the State that not less than 75 percent of solid waste generated be source separated, reduced, recycled, or composted by the year 2020. AB 341 sets forth the requirements of the statewide mandatory commercial recycling program which defines that a business, including any commercial or public entity, generating four cubic yards or more of commercial solid waste per week are required to recycle. Businesses are required to take one or any

combination of the following actions in order to reuse, recycle, or otherwise divert solid waste from disposal:

- Subscribe to a source separated recycling service with a regional franchise hauler authorized to provide service for the area in which the business is located;
- Subscribe to a mixed solid waste recycling service with a regional franchise hauler authorized to provide service for the area in which the business is located;
- Self-recycle and certify compliance with Kern County Ordinance No. G-8337.

Assembly Bill (AB) 1826

AB 1826, created to drive the recycling of yard trimmings and food scraps, became effective April 2016. The bill requires businesses generating a specified amount of organic solid waste per week to arrange for recycling for that material. This bill will also require the contract or work agreement between a business and a gardening or landscaping service to require the organic waste generated by those services to comply with the requirements of the law. Business within the County would be required to comply with any codes/regulations promulgated from AB 1826.

California Green Building Standards Code

Construction- and demolition-generated (C&D) waste is heavy, inert material. This material creates significant problems when disposed of in landfills. Since C&D debris is heavier than paper and plastic, it is more difficult for counties and cities to reduce the tonnage of disposed waste. For this reason, C&D waste debris has been specifically targeted by the State of California for diversion from the waste stream.

The California Green Building Standards Code (Standards Code) will apply to the construction related activities of this project. The purpose of the Standards Code is to improve public health, safety, and general welfare by enhancing the design and construction of buildings using building concepts that have a positive environmental impact and encouraging sustainable construction practices. Provisions of the Standards Code shall apply to the design and construction of building structures subject to State regulation.

Per Code Section 708.3 – Construction Waste Reduction, Disposal, and Recycling of the Standards Code, a commercial entity is to recycle and/or salvage for reuse a minimum of 50 percent of the nonhazardous construction and demolition debris, or meet a local construction and demolition waste management ordinance, whichever is more stringent.

State Water Resources Control Board

The National Pollution Discharge Elimination System (NPDES) was established per the 1972 amendments to the Federal Water Pollution Control Act, or CWA, to control discharges of pollutants from point sources (Section 402). Amendments to the CWA created a new section to the Act, which is devoted to stormwater permitting (Section 402[p]), with individual states designated for administration and enforcement of the provisions of the CWA and the NPDES permit program. The SWRCB issues both general construction permits and individual permits under this program.

Biosolids generated during wastewater treatment are regulated by the State under SWRCB Water Quality Order No. 2004-0012-DWQ, titled the "Final General Waste Discharge Requirements for Land Application of Biosolids for Use as a Soil Amendment in Agricultural, Silvicultural, Horticultural, and Land Reclamation Activities." This order, implemented under the federal biosolids rules set forth in 40 CFR Part 503, applies to all land application of Class A and Class B biosolids as well as "exceptional quality" biosolids-derived mixtures consisting of 50% or more biosolids. The order establishes permitting, monitoring, and reporting requirements. Local ordinances, described below, would also regulate the disposal of biosolids in Kern County.

Central Valley Regional Water Quality Control Boards

The primary responsibility for the protection of water quality in California rests with the State Water Resources Control Board (SWRCB) and nine regional water quality control boards (RWQCBs). The SWRCB sets Statewide policy for the implementation of State and Federal laws and regulations. The RWQCBs adopt and implement Water Quality Control Plans (Basin Plans) that recognize regional differences in natural water quality, actual and potential beneficial uses, and water quality problems associated with human activities. The jurisdiction of the Central Valley RWQCB extends from the Oregon border, over the valley and foothills, through the Central Valley, to the border with Los Angeles County.

California Department of Water Resources (DWR)

The DWR is a department within the California Resources Agency. The DWR is responsible for the State's management and regulation of water usage.

California Water Code Section 13260

California Water Code Section 13260 requires any person who discharges waste, other than into a community sewer system, or proposes to discharge waste that could affect the quality of waters of the State, to submit a report of waste discharge to the applicable RWQCB. Any actions of the proposed Project that would be applicable under California Water Code Section 13260 would be reported to the Central Valley Regional Water Quality Control Boards (Central Valley RWQCB).

Porter-Cologne Water Quality Control Act

The Porter Cologne Act, passed in 1969, acts in concert with the Federal CWA. The act established the SWRCB and divided the State into nine regions, each overseen by an RWQCB. The SWRCB is the primary State agency responsible for protecting the quality of the State's surface and groundwater supplies; however, much of its daily implementation authority is delegated to the nine RWQCBs. The Project Area is under the jurisdiction of the Central Valley RWQCBs.

The Porter Cologne Act provides for the development and periodic review of water quality control plans (basin plans) that designate beneficial uses of California's major rivers and groundwater basins and establish narrative and numerical water quality objectives for those waters. Basin plans are primarily implemented by using the NPDES permitting system to regulate waste discharges so that water quality objectives are met. Basin plans, updated every three years, provide the technical basis for determining waste discharge requirements, taking enforcement actions, and evaluating clean water grant proposals. The act also assigns responsibility for implementing CWA Sections 401, 402, and

303(d) to the SWRCB and RWQCBs. There are two basin plans in the Central Valley RWQCB region, the Water Quality Control Plan for the Sacramento and San Joaquin Rivers and the Water Quality Control Plan for the Tulare Lake Basin.

Assembly Bill (AB) 1881

AB 1881 expanded previous legislation related to landscape water use efficiency. AB 1881, the Water Conservation in Landscaping Act of 2006, enacted landscape efficiency recommendations of the California Urban Water Conservation Council (CUWCC) for improving the efficiency of water use in new and existing urban irrigated landscapes in California. AB 1881 required the DWR to update the existing Model Local Water Efficient Landscape Ordinance and local agencies to adopt the updated model ordinance or an equivalent. The law also requires the California Energy Commission to adopt performance standards and labeling requirements for landscape irrigation equipment, including irrigation controllers, moisture sensors, emission devices, and valves to reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy or water.

Assembly Bill (AB) 2882

AB was passed in 2008 and encourages public water agencies throughout California to adopt conservation rate structures that reward consumers who conserve water. AB 2882 clarifies the allocation-based rate structures and establishes standards that protect consumers by ensuring a lower base rate for those who conserve water.

Sustainable Groundwater Management Act of 2014

In 2014, California enacted the Sustainable Groundwater Management Act (SGMA; Water Code Section 10720 et seq.). SGMA, and related amendments to California law, require that all groundwater basins designated as high or medium priority in the DWR California Statewide Groundwater Elevation Monitoring (CASGEM) Program, and that are subject to critical overdraft conditions, must be managed under a new Groundwater Sustainability Plan (GSP) or a coordinated set of GSPs, by January 31, 2020. High or medium priority basins that are not subject to a critical overdraft must be regulated under one or more GSPs by 2022. Where GSPs are required, one or more local Groundwater Sustainability Agencies (GSAs) must be formed to implement applicable GSPs. A GSA has the authority to require registration of groundwater wells, measure and manage extractions, require reports and assess fees, and to request revisions of basin boundaries, including establishing new subbasins. GSAs must have been formed for high and medium priority basins by June 2017. All of the Kern County Subbasin has been included in exclusive GSA's as mandated by SGMA.

The 2.8 million acres of valley portion of Kern County has been designated a high priority and the 250,000 acres of the Indian Wells Valley sub-basin which includes the City of Ridgecrest and China Lake Naval Weapons Station has been classified a medium priority basin. Both are under mandatory requirements to form a GSA (or multiple GSA's) and create a GSP that achieves sustainability in 20 years.

Each GSP must include a physical description of the covered basin, such as groundwater levels, groundwater quality, subsidence, information on groundwater-surface water interaction, data on

historical and projected water demands and supplies, monitoring and management provisions, and a description of how the plan will affect other plans, including city and county general plans Under the Act, the GSA is authorized to restrict pumping, levy assessments and fees and undertake water quality and quantity projects to rebalance the basin. The DWR must adopt regulations for the preparation of a GSP by January 2016. Emergency regulations for the preparation of the GSP's were approved by the California Water Commission on May 18, 2016. As defined by the Act, "sustainable groundwater management" means that groundwater use within basins managed by a GSP will not cause any of the following "undesirable results:" (a) chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed); (b) significant and unreasonable reductions in groundwater storage; (c) significant and unreasonable seawater intrusion; (d) significant and unreasonable degradation of water quality; (e) significant and unreasonable land subsidence; and (f) surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

Kern County is a member of the following GSA's: Cuyama Basin Groundwater Sustainability Agency, Indian Wells Valley Groundwater Authority and Kern Groundwater Authority which manages a portion of the valley sub-basin. The Valley portion of Kern County also is managed by the Kern River Groundwater Sustainability Agency which is comprised of the City of Bakersfield, Kern Delta Water District and Improvement District No. 4 of the Kern County Water Agency. An additional nine GSA's have been formed to sustainably manage their respective portions of the Kern County subbasin.

Note: Effective December 11, 2018, the County of Kern withdrew from the Kern Groundwater Authority. The Kern County Water Agency (KCWA) was brought in as a cooperative member of Joint Powers Agreement to manage the white spaces. Five GSA's are preparing GSP's to manage the Kern subbasin per a Kern County Subbasin Coordination Agreement.

Recycled Water Policy

On February 3, 2009, by Resolution No. 2009-0011, the SWRCB adopted a Recycled Water Policy in an effort to move towards a sustainable water future. In the Recycled Water Policy states "we declare our independence from relying on the vagaries of annual precipitation and move towards sustainable management of surface waters and groundwater, together with enhanced water conservation, water reuse and the use of stormwater."

The following goals were included in the Recycled Water Policy:

- Increase use of recycled water over 2002 levels by at least one million acre-feet per year by 2020 and at least two million acre-feet per year by 2030.
- Increase the use of stormwater over use in 2007 by at least 500,000 acre-feet per year by 2020 and at least one million acre-feet per year by 2030.
- Increase the amount of water conserved in urban and industrial areas by comparison to 2007 by at least 20 percent by 2020.
- Included in these goals is the substitution of as much recycled water for potable water as possible by 2030.

The Recycled Water Policy provides direction to the RWQCBs regarding issuing permits for recycled water projects, addresses the benefits of recycled water, addresses a mandate for use of recycled water and indicates the SWRCB will exercise its authority to the fullest extent possible to encourage the use of recycled water.

The Recycled Water Policy also indicates that some groundwater basins contain salts and nutrients that exceed or threaten to exceed water quality objectives established in basin plans and states that it is the intent of this Recycled Water Policy that all salts and nutrients be managed on a basin-wide or watershed-wide basis through development of regional or sub-regional management plans. Finally, the Recycled Water Policy addresses the control of incidental runoff from landscape irrigation projects, recycled water groundwater recharge projects, anti-degradation, control of emerging constituents and chemicals of emerging concern and incentives for use of recycled water.

In accordance with the provisions of the Recycled Water Policy, a Constituents of Emerging Concerns (CEC) Advisory Panel was established to address questions about regulating CECs with respect to the use of recycled water. The CEC Advisory Panel's primary charge was to provide guidance for developing monitoring programs that assess potential CEC threats from various water recycling practices, including groundwater recharge/reuse and urban landscape irrigation. On June 25, 2010, the CEC Advisory Panel provided recommendations to the SWRCB and California Department of Public Health in their Final Report "Monitoring Strategies for Chemicals of Emerging Concern in Recycled Water – Recommendations of a Scientific Advisory Panel". The SWRCB used those recommendations to amend the Recycled Water Policy in 2013 (SWRCB Resolution No. 2013-003).

The April 2013 amendment provides direction to the RWQCBs on monitoring requirements for CECs in recycled water. The monitoring requirements pertain to the production and use of recycled water for groundwater recharge reuse by surface and subsurface application methods, and for landscape irrigation. The amendment identifies three classes of constituents to monitor:

- Human health-based CECs: CECs of toxicological relevance to human health.
- Performance indicator CECs: An individual CEC used for evaluating removal through treatment of a family of CECs with similar physicochemical or biodegradable characteristics.
- Surrogates: A measurable physical or chemical property, such as chlorine residual or electrical conductivity, that provides a direct correlation with the concentration of an indicator compound. Surrogates are used to monitor the efficiency of CEC treatment.

Only groundwater recharge reuse facilities will be required to monitor for CECs and surrogates. Surface application and subsurface application facilities will have different mandatory CECs and a different monitoring schedule. Monitoring is not required for recycled water used for landscape irrigation projects that qualify for streamlined permitting unless monitoring is required under the adopted salt and nutrient management plan. Streamlined permitting projects must meet the criteria specified in the Policy including: compliance with Title 22, application at agronomic rates, compliance with any applicable salt and nutrient management plan, and appropriate use of fertilizers.

Senate Bills 610 (Chapter 643, Statutes of 2001) and 221 (Chapter 642, Statutes of 2001)

SB 610 and SB 221 are companion measures that seek to promote more collaborative planning among local water suppliers and cities and counties. They require that water supply assessments occur early in the land use planning process for all large-scale development projects. If groundwater is the supply source, the required assessments must include detailed analyses of historic, current, and projected groundwater pumping and an evaluation of the sufficiency of the groundwater basin to sustain a new project's demands. They also require an identification of existing water entitlements, rights, and contracts and a quantification of the prior year's water deliveries. In addition, the supply and demand analysis must address water supplies during single and multiple dry years presented in 5-year increments for a 20-year projection. Under SB 221, approval by a county of a subdivision of more than 500 homes requires an affirmative written verification of a sufficient water supply.

California Water Conservation Executive Orders

Beginning in January 2014, Governor Jerry Brown issued three Executive Orders (EOs), B-26-14, B-28-14, B-29-15, B-37-16, and B-40-17 regarding water supply, water demand, and water use within the State during severe drought conditions. EO B-29-15, issued April 1, 2015, sets limitations not only for existing land uses and water supply systems, but also for new construction. Some of these restrictions include:

- The Water Board shall prohibit irrigation with potable water of ornamental turf on public street medians. (EO B-29-15, Save Water, Action #6)
- The Water Board shall prohibit irrigation with potable water outside of newly constructed homes and buildings that is not delivered by drip or microspray systems. (EO B-29-15, Save Water, Action #7)
- The California Energy Commission shall adopt emergency regulations establishing standards that improve the efficiency of water appliances, including toilets, urinals, and faucets available for sale and installation in new and existing buildings. (EO B-29-15, Increase Enforcement Against Water Waste, Action #16)

In addition, EO B-29-15 requires that DWR update the State Model Water Efficient Landscape Ordinance through expedited regulation by the end of 2015. This ordinance will increase water efficiency standards for new and existing landscapes through more efficient irrigation systems, greywater usage, on-site stormwater capture, and by limiting the portion of landscapes that can be covered in turf (EO B-29-15, Increase Enforcement Against Water Waste, Action #11).

On November 13, 2015, Governor Brown issued EO B-36-15, which upheld the previous EOs, and directed the SWRCB to extend of urban water use restrictions through October 31, 2016 based on drought conditions known through January 2016. The SWRCB issued Emergency Regulations on February 2, 2016, in compliance with EO B-36-15. These emergency regulations maintain the current tiers of required water reductions; however, additional adjustments in response to stakeholders; equity concerns were included in the Emergency Regulations.

In addition, DWR and the U.S. Bureau of Reclamation finalized the 2016 Drought Contingency Plan that outlines State Water Project and Central Valley Project operations from February through November 2016. The 2016 Drought Contingency Plan was developed in coordination with staff from State and federal agencies. The 2016 Drought Contingency Plan communicates overarching goals for 2016 water management and the potential operations needed to achieve those goals.

In May 2016, Governor Brown issued EO B-37-16, which upheld the previous EOs, and directs local agencies to provide new permanent water use targets for each urban water supplier and concrete improvements to drought preparedness. The order bolstered the State's drought resilience and preparedness by establishing longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating clearly wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. Local agencies are required to publicly disclose the projections and calculations used to determine their conservation standards, and to continue monthly water conservation reporting. EO B-37-16 calls for wise water use and less water waste to become permanent changes to prepare for more frequent and persistent periods of limited water supply. On April 7, 2017, EO B-40-17 lifted the drought emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne counties. EO B-40-17 builds on EO B-37-16, which continues to remain in effect, to continue to make water conservation a way of life in California.

Local

Metropolitan Bakersfield General Plan

The Metropolitan Bakersfield General Plan Public Services and Facilities Elements include relevant goals and policies related to utilities. Refer to Table 4.17-1, *Metropolitan Bakersfield General Plan Goals and Policies for Utilities*, below.

Table 4.17-1. Metropolitan Bakersfield General Plan Goals and Policies for Utilities
Goals and Policies: Public Services and Facilities Element
General Utilities
Policy #5: Require all new development to pay its pro rata share of the cost of necessary expansion in municipal utilities, facilities and infrastructure for which it generates demand and upon which it is dependent.
Water Distribution
Goal #1: Ensure the provision of adequate water service to all developed and developing portions of the planning area.
Policy #3: Require that all new development proposals have an adequate water supply available.
Sewer Services
Goal #3: Provide trunk sewer availability to and treatment/disposal capacity for all metropolitan urban areas, to enable cessation or prevention of the use of septic tanks where such usage crates potential public health hazards or may impair groundwater quality, and to assist in the consolidation of sewerage systems. Provide sewer service for urban development regardless of jurisdiction.
Solid Waste
Goal #1: Ensure the provision of adequate solid waste disposal services to meet the demand for these services in the Planning area.

Table 4.17-1. Metropolitan Bakersfield General Plan Goals and Policies for Utilities
Goals and Policies: Public Services and Facilities Element
Storm Drainage
Goal #1: Ensure the provision of adequate storm drainage facilities to protect Planning area residents from flooding resulting from stormwater excess.
Street Lighting
Goal #1: Provide uniform and adequate public lighting for all developed and developing portions of the Planning area.
Policy #4: Require developers to install street lighting in all new development in accord with adopted city standards and county policies.

4.17.4 Impacts and Mitigation Measures

Thresholds of Significance

The Kern County California Environmental Quality Act (CEQA) Implementation Document and Kern County Environmental Checklist state that a project could potentially have a significant effect if it:

- Exceeds wastewater treatment requirements of the applicable Regional Water Quality Control Board;
- Requires or results in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which would cause significant environmental effect;
- Requires or results in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Has insufficient water supplies available to serve the Project from existing entitlement and resources and new or expanded entitlement is needed;
- Results in a determination by the wastewater treatment provider which serves or may serve the Project that it does not have adequate capacity to serve the Project's projected demand in addition to the provider's existing commitments;
- Is served by a landfill that does not have sufficient permitted capacity to accommodate the Project's solid waste disposal needs; and/or
- Does not comply with federal, state, and local statues and regulations related to solid waste.
- Exceeds the capacity of the electrical and natural gas facilities within the project area.

Impact 4.17-1: The Project Would Exceed Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board.

With the future urban development of the site, the proposed Project would result in an increase in wastewater in the form of stormwater runoff. The discharge of materials other than stormwater from a particular site is prohibited. With urban development projects, the pollutants of concern include silt and sediment, oil and grease, floatable trash, nutrients (including fertilizers), heavy metals, pathogens

(such as coliform bacteria) and other substances. Referred to as "controlled pollutants", discharge of these substances into waters of the United States, are prohibited.

Future proposed developments that involve grading and construction would contribute to an increase in pollution discharge. Individual development projects would be required to mitigate short-term construction impacts pursuant to the National Pollutant Discharge Elimination System (NPDES) criteria and standards on a project-by-project basis. The purpose of the NPDES permit is to ensure the Project area will eliminate or reduce construction-related sediments and pollutants during stormwater runoff. Construction sediment erosion can be adequately controlled through the application of standard construction Best Management Practices (BMPs). The goal of BMPs is to capture and treat "first flush" stormwater run-off generated by surrounding and on-site watersheds. Water quality management BMPs for grading and construction scenarios may include the use of sand bags and straw bales for run-off diversion and velocity reduction, mulch topping, hydro-seeding and siltation fencing to prevent soil loss and measures to minimize vehicular leaking and spilling. Implementation and compliance with the NPDES requirements would reduce construction-related impacts to water quality to less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-2: The Project Would Require or Result in the Construction of New Water or Wastewater Treatment Facilities or Expansion of Existing Facilities, the Construction of Which Would Cause Significant Environmental Effects.

The implementation of the proposed Project would result in the generation of wastewater on the property. The proposed Project is located outside of the Metropolitan Bakersfield boundary and is not served by a sewer system. The proposed Project would require the construction of a new wastewater package plant facility that could cause significant environmental effects. Based on the wastewater generation rate for general commercial and industrial uses utilized by the County of Kern, the proposed Project would result in the generation of a normal, unpeaked flow of approximately 1.46 million gallons per day, with a peak flow maximum generation of approximately 2.91 million gallons per day of wastewater. Implementation of applicable mitigation measures would reduce impacts to less than significant.

Additional infrastructure would be required to accommodate the proposed Project. A water service line would be extended from an existing 12" Cal Water main located on the east side of Wible Road at the intersection with Engle Road (CR 918), then east along an alignment along the section line, currently a disturbed unimproved dirt dairy access road within the County's road reservation, to the intersection of S. H St. and DiGiorgio Road (CR 704), then continue east and across S.R. 99 to the northwest corner of the proposed project site along DiGiorgio Road. If needed by Cal Water, a second water main extension would begin at the current end of the 12" water main located on the south side of Shafter Road at the east side of the General Shafter Elementary School, continue east along Shafter

Road in an existing right-of-way to the intersection with Costajo Road, then continue east and across S.R. 99 to the intersection with Chevalier Road in existing right-of-way, then continue north in existing right-of-way to the south side of the proposed project north of Houghton Road. A treated water service line would be constructed from the southwest corner of the proposed WWTP westerly under S.R. 99, continuing to the Kern Island Canal and the Kern Island Recharge Basins located near the northwest corner of S. H Street and Houghton Road as an outfall location for excess treated recycled water. It should be noted, although the specific volumes are unknown at this time, the developer intends to work with KDWD to accept any unused recycled water for either blending with irrigation canal water for agricultural irrigation or recharging groundwater at the nearby groundwater recharge basin. This would not require any new infrastructure beyond that already analyzed in the RDEIR but would assist in groundwater recharge.

As development progresses within the Project site water distribution infrastructure would be installed. Water infrastructure within the interior of the proposed Project would occur in areas that would be disturbed as part of the Project and none of these improvements would have an effect on an environmental resource beyond those disclosed in any other section of this RDEIR. The proposed improvements would be required to comply with all applicable development standards required by Kern County. This would ensure that impacts associated with the expansion of water facilities would be less than significant.

Mitigation Measures

MM 4.17-1: All special equipment for the proposed Project, such as package treatment plants, their appurtenances, and their effluent disposal areas and methods shall be designed, located, and constructed in coordination with the Kern County Public Works Department, so as to preclude contamination, pollution, nuisance, and structural and mechanical instability.

MM 4.17-2: **Package Treatment and Disposal Facilities.** Proposals and plans for package treatment and disposal facilities shall be subject to the review and approval of:

1. The State and County Environmental Health Services Departments for design and contamination aspects;

2. The Regional Water Quality Control Board for elements of pollution and nuisance; and

3. The Kern County Public Works Department for structural and mechanical integrity. Special structures, such as pump stations, pressure lines and sags, etc. shall be subject to the approval of the Kern County Public Works Department and the maintaining District.

MM 4.17-3: **Wastewater Package Plant Facility.** The new wastewater package plant facility shall be constructed according to State specifications, with coordination of Kern County Public Works and Kern County Environmental Health Services Departments and shall be operated in such a way as to not contaminate the underlying unconfined aquifer.

MM 4.17-4: **Water System.** All facilities of the water system shall be designed and constructed to comply with Kern County Development Standards and approved by the Kern County Public Works Department.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-3: The Project Would Require or Result in the Construction of New Stormwater Drainage Facilities or Expansion of Existing Facilities.

The development of industrial uses and associated landscaping and roadways would alter the drainage pattern within the proposed Project site through the introduction of impervious surfaces. Water that is anticipated to drain off-site would be required by the County to drain to storm drain structures, including detention or retention basins. Drainage collection facilities within the proposed Project would be constructed as development occurs and would be designed in accordance with local improvement standards and specifications. A stormwater drainage study may be needed to determine the size of a retention basin and optimal pipeline sizes that are needed to accommodate stormwater from the proposed project. This master drainage system would be designed to contain on-site waters within conveyance structures by appropriate means and that are acceptable to Kern County. Drainage waters shall be prevented from flowing onto adjacent properties or topping over the street system. Site improvement standards for drainage areas would be determined by the County of Kern as a function of the Precise Development Plan, Conditional Use Permit, or land division procedure. This would ensure that all drainage facilities are designed to accommodate runoff stormwater.

Mitigation Measures

Implementation of Mitigation Measure MM 4.7-8, as described in Section 4.7, *Geologic and Seismic Hazards Implement*

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-4: The Project Would Have Insufficient Water Supplies Available to Serve the Project from Existing Entitlement and Resources and New or Expanded Entitlement is Needed.

Kern Delta Water District (KDWD) supplies surface water for agricultural irrigation from the Kern Island Canal via an irrigation ditch. The project site has two agricultural wells that supply groundwater. It is estimated that 50% of the irrigation supply is from wells and the other 50% from KDWD surface waters. These sources; however, would not serve the Project site with domestic water. The proposed Project would be served by the Cal Water Bakersfield District upon approval of the application to the CPUC for the service extension to the Project site. Water supply for the District comes from groundwater; untreated local surface water purchased from the City of Bakersfield and treated by Cal Water; and treated local surface water and imported water purchased from KCWA.

Past water demand within the District was calculated between 2015 to 2017 based on seven use categories that included single family, multi-family, commercial, industrial, institutional/ governmental, other, and loses. In 2015 total system demand was 55,033 AFY, and 57,559 AFY, and 62,218 AFY, in 2016 and 2017, respectively. It should be noted that in May of 2015, the Emergency Regulations adopted by the State Water Resources Control Board were in effect and later extended by Executive Order B-37-16. The Bakersfield District was ordered to reduce potable water use by 32 percent over this period and reduced water use approximately by approximately 32.1 percent. However, in 2017 with the end of the drought water use increased at a greater percentage than the year before by approximately 4,659 AFY compared to 2,526 AFY.

Projected water uses within the District is predicated on unrestricted demands under normal weather conditions and is shown in Table 4.17-2 *Bakersfield District Projected Water Demand*, through 2040. Projected water demands are based on customer category and are estimated based on anticipated demand of future services that are based on historical growth rates in the District and the UWMP. In addition, anticipated water demand accounts for weather-normalized historical use, adjusted for future expected water savings from water efficiency requirements of plumbing codes and District conservation programs. The projected average annual growth rate in services across all customer categories is approximately 0.9 percent.

Table 4.17-2. Bakersfield District Projected Water Demand

Use	(AFY)				
	2020	2025	2030	2035	2040
Single Family	49,340	52,107	54,974	57,574	60,273
Multi-Family	3,748	3,859	40,020	4,166	4,334
Commercial	11,976	12,209	12,486	12,651	12,825
Industrial	49	50	50	50	50
Institutional/Governmental	6,690	7,281	7,898	8,492	9,130
Other	216	219	221	221	221
Losses	5,763	6,153	6,543	6,892	7,257
Total	**77,781**	**81,878**	**86,191**	**90,019**	**94,088**

Source: Yarne & Associates, 2019

Cal Water determined water use rates for industrial uses similar in classification to those of the proposed Project on a gallon per day per square foot of development (gallons/day/ft2). The WSA evaluated water use rates for industrial businesses that are similar to those that would occur under the proposed Project. The use rates ranged from 0.0042 to 0.1590 gallons/day/ft^2 and result in an average consumption of 0.0816 gallons/day/ft^2. Based on the total proposed Project square footage, 4,101,174, the resulting demand is approximately 334,660 gallons/day

Commercial office space water usage was estimate using a representative office complex at 0.00834 gallons/day/ft2. Because the specific square footage for the commercial component of the proposed Project is not known, the areas were estimated to be 65 % retail (0.20) + 15% restaurants (1.10) + 20% (office space) (0.00834) = 0.297 gallons/day/ft2. This results in an estimated commercial water use for the proposed Project is of 151,720 gallons/day. Taken in sum with the Industrial development the total water use at build out in 2025 would be approximately 486,380 gallons/day or 544.5 AFY.

As indicated in the WSA, prepared by Yarne & Associates, during the 6-year period from 2010 to 2015 the average annual agricultural water demand on the Project site was 977.2 acre-feet per year

(AFY). Existing groundwater recharge on the site is estimated to be, on average, 25% of the irrigated amount. Based on this, the total water lost to evapotranspiration after being applied for irrigation is approximately 732 AFY. Considering the proposed Project, at build out, would use approximately 544.5 AFY, the proposed Project would require approximately 187.5 AFY less water than the existing uses. The following discussion outlines existing and projected future water supplies compared to Project demand.

The 544.5 AFY equates to approximately 0.66% of projected 2025 Bakersfield District demand (81,191 AFY). In 2040, the proposed Project demand would be approximately 0.57% of the projected 2040 Bakersfield District demand (94,088 AFY). In addition, water demand within the District is project to increase by approximate 26,799 AFY between 2015 and 2025 (81,878 - 55,079). The proposed Project would account for approximately 2.0% of that increase.

The proposed Project includes a wastewater treatment facility to meet Title 22 requirements and use recycled water for landscape irrigation and other non-potable uses. The initial irrigation water requirement for landscaped areas of the proposed Project is estimated to be 39 AFY and at project build out would be approximately 86.7 AFY. This would be supplied entirely by recycled water, which would further reduce the proposed Project's water demand.

The effect of substituting recycled water for potable water further reduces the proposed Project's water demand. Conservatively, estimating that the 39 AFY for landscape irrigation are not included in the estimated project build out demand and that later uses substitute recycled water for potable water (47.7 AFY), this would result in a further reduction of water use by the proposed Project compared to existing agricultural. Accordingly, the proposed Project would reduce water demand, by 187.5 AFY + 47.7 = 235.2 AFY.

The proposed project also was evaluated to determine water use for normal year, single dry year, and multiple dry year periods. Table 4.17-3 *Multiple Dry Years Supply and Demand Comparison* shows the projected supply and demand totals for multiple dry years based on the conservative assumption that demand will increase slightly for a 3-year drought period even though the most recent drought experience (2012 – 2016) shows the opposite. Demand in 2015 decreased by 27.6% compared to demand in 2013 as discussed above. Although treated surface water supplies were reduced due to lower quantities of surface runoff and storage, the difference was made up by groundwater. Importantly, due to very effective conservation programs and public responsiveness ground water pumping decreased by 12,109 AF - the amount pumped in 2014 was 45,499 AF and in 2015 it was 33,390 AF.

Table 4.17-3: Multiple Dry Years Supply and Demand Comparison (AF)

		2020	2025	2030	2035	2040
First Year	Supply Totals	79,717	83,915	88,335	92,259	96,429
	Demand Totals	79,717	83,915	88,335	92,259	96,429
	Difference	0	0	0	0	0
Second Year	Supply Totals	79,717	83,909	88,329	92,252	96,422
	Demand Totals	79,717	83,909	88,329	92,252	96,422

Source: Yarne & Associates						

Cal Water coordinates on an ongoing basis with other water agencies in Kern County to optimize use of surface and groundwater water supplies. Cal Water concludes that for the next 21 years (2019 – 2040), the Bakersfield District will have adequate water supplies to meet projected demands associated with the proposed Project and those of all existing customers and other anticipated future customers for normal, single dry year and multiple dry year conditions (Yarne & Associates, 2019). While adequate water supply is anticipated, MM 4.17-4 related to water supply and the following mitigation measure will help ensure water use is within a reasonable range for future Project uses.

MM 4.17-5: **Water Meters.** Water meters shall be installed on all facilities. Once operations of the first facility constructed on-site have commenced, the Master Developer or subsequent future land owners shall be required to submit annual reports to the Kern County Planning Department and the Kern County Environmental Health Services Department detailing the annual water usage on-site.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-5: The Project Would Result in a Determination by the Wastewater Treatment Provider Which Serves or May Serve the Project That it Does Not Have Adequate Capacity to Serve the Project's Projected Demand in Addition to the Provider's Existing Commitments.

As noted above, no sewer lines are currently located on-site and no wastewater is conveyed from the proposed Project site. Currently, neighboring residential and commercial properties are served by individual, privately-owned septic systems. A private package sewer treatment plant is proposed to provide services for the Project site. Implementation of applicable mitigation measures and service fees would reduce impacts to water facilities to less than significant levels.

Mitigation Measures

Implement Mitigation Measures MM 4.17-1 through MM 4.17-3.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-6: The Project Would be Served by a Landfill That Has Sufficient Permitted Capacity to Accommodate the Project's Solid Waste Disposal Needs.

Implementation of the proposed Project would result in an increase demand for solid waste services and generate additional solid waste disposed of at landfills. As noted above, the City of Bakersfield

Solid Waste Division has indicated that solid waste generated by the proposed Project would go to the Bena Landfill and the Shafter-Wasco Sanitary Landfill. Although C&D waste impacts are short-term and cease upon construction completion, C&D waste disposed of at either landfill would decrease the remaining capacity available. This is considered a potentially significant impact; however, recycling of C&D waste would reduce the amount of waste disposed of at landfills and contribute to the recycling goals set forth by Kern County and AB 939. For any C&D waste disposed of at a landfill, the Kern County Waste Management Department charges a fee of up to $54.50 per ton for the disposal of construction waste. Implementation of the required mitigation measures below would reduce impacts to less than significant in this regard.

Based on an average generation rate for light- and medium-industrial properties of 6 pounds (lb) of refuse per square foot annually, and general commercial/highway commercial properties of 7 lb of refuse per square foot annually, the proposed Project would result in the generation of approximately 37 tons of refuse per day or approximately 13,519 tons per year. The total waste generated during the course of one year of construction (255 working days) is estimated at approximately 12,883 tons, and the daily total is estimated at 50.5 tons (McIntosh & Associates 2017).

As a worst-case situation, it is assumed that all of the project-generated refuse would be deposited at the Bena Landfill. Based on growth projections, 22,174,654 tons of capacity is available at the Bena Landfill, and it is anticipated to have capacity for approximately 26.8 years. Based on the remaining capacity and the anticipated life of the landfill, the average amount of solid waste deposited at the landfill is approximately 827,412 tons per year or 2,267 tons per day over 26.8 years. The solid waste generated by the proposed project would increase refuse deposited at the Bena Landfill by approximately 1.63 percent. This increase in considered a nominal impact on the remaining capacity of the Bena Landfill, and the Landfill would have the available capacity to serve the proposed Project. As identified under Section 4.15, *Public Services*, the proposed Project is subject to the Public Facilities Mitigation Program and mitigation measures have been included that would result in less than significant impacts in this regard.

Mitigation Measures

MM 4.17-6: **Recycling On-Site.** During construction, demolition debris and construction wastes shall be recycled to the extent feasible.

1. An on-site recycling coordinator will be designated by the Project Applicant/ Developer to facilitate recycling of all construction waste through coordination with the on-site contractors, local waste haulers, and/or other facilities that recycle construction/demolition wastes.

2. The name and phone number of the coordinator will be provided to the Kern County Waste Management Department prior to issuance of building permits

3. The on-site recycling coordinator will also be responsible for ensuring that wastes requiring special disposal are handled according to state and County regulations that are in effect at the time of disposal.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-7: The Project Would Comply with Federal, State, and Local Statues and Regulations Related to Solid Waste.

Refer to Section 4.11, *Land Use and Planning*, Table 4.11-2, for a brief explanation of how the proposed Project complies with the goals and policies of the Metropolitan Bakersfield General Plan. The proposed Project would be required to comply with all federal, state, and local statues and regulations related to solid waste. Implementation of the required mitigation measures would help local jurisdictions comply with Assembly Bill 939. Therefore, implementation of the proposed Project would result in less than significant impacts in this regard.

Mitigation Measures

Implement Mitigation Measure MM 4.17-6.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.17-8: The Project Would Exceed the Capacity of the Electrical and Natural Gas Facilities Within the Project Area.

Electrical Services

The proposed Project site is currently served by PG&E's Old River Substation and Panama Substation. According to PG&E, based on the rough size of proposed facilities, the proposed Project would result in a demand for approximately 20 Megawatts (Mw); however, more information is needed. Estimates for electric demands are based on the square footages of the proposed facilities. PG&E has indicated the existing electrical facilities are not adequate to accommodate the proposed Project. PG&E anticipates the Project would result in impacts to existing electric facilities, and that the Old River and Panama Substation be overloaded, as well as distribution facilities in the area. These facilities would need to be upgraded and new distribution and substation equipment would be required to serve the proposed Project. Potential impacts may be reduced if main lines adjacent to roadways are brought to the ultimate width at the initiation of proposed Project construction and if utility easements are made readily available as needed; however, more information is needed to determine specifically what will be required.

Construction of the proposed Project would require temporary electrical power supply for certain equipment and lighting. The proposed Project would also require electricity for street lighting along the roadway. County development standards require street lights at intersections, and at mid-block, where streets are greater than 600 feet in length, with the exception of some industrial areas in which street lights are required only at intersections. For new development, the County does not install street lights, thus, the County requires a developer to install lights and dedicate them to the County.

Street lights installed at the proposed Project are expected to be provided by PG&E at the company's Rate Schedule LS-1 Class A rate (LS-1A). In utilizing the LS-1A rate PG&E would install, own, and maintain the entire street lighting system. The connections would be constructed in accordance with the requirements of the County and PG&E. Therefore, implementation of recommended mitigation measures will ensure that adequate electricity is provided to the Project site; therefore, resulting in a less than significant impact.

Natural Gas

As noted above, the entire proposed Project is in PG&E gas service territory. Approximately 5,000 linear feet of PG&E Transmission Line 300B is located in the northeast corner of the proposed Project. According to PG&E, the proposed Project's gas needs will be supplied by the PG&E distribution system, either by the six-inch pipeline located on the east side of the Project site, on the west side of South Union Avenue, or a new distribution line throughout the development from the adjacent regulating stations. The PG&E Transmission Line 300B would not provide natural gas to the proposed Project. The average estimated gas consumption is calculated at 0.5 million cubic feet per hour (MCFH) for every 2,500 square feet of commercial building space. Therefore, the proposed Project would consume approximately 922.60 MCFH of natural gas (0.5 MCFH per 2,500 SF x 4,613,004 SF). PG&E would prefer that the request for service include all gas appliances in order to calculate a more accurate load.

It is anticipated that new distribution pipelines would be required to accommodate the proposed Project. Where necessary, natural gas pipelines would be installed to serve the proposed Project at the expense of the Project Applicant/Developer. The Project Applicant/Developer would be required to consult with PG&E early in the planning stages to ensure adequate facilities are incorporated into the Project design. New connections would be constructed by the proposed Project in accordance with the requirements of the County of Kern and PG&E. PG&E would not allow new users to connect to the existing natural gas facilities unless there is adequate capacity and supplies to accommodate the proposed Project. Implementation of the recommended mitigation measures will ensure that adequate natural gas supplies and facilities exist prior to Project construction; therefore, resulting in a less than significant impact in this regard.

With respect to safety, the on-site transmission pipeline is under high pressure, and like others, has the potential to rupture, resulting in uncontrolled releases of natural gas. A pipeline rupture could result in environment contamination and human health effects in the residential areas, once they are developed. For safety reasons, State regulations prohibit the construction of any structures directly over the pipeline, and a right-of-way (ROW) is usually established. The width of the ROW is negotiated between the property owner and the pipeline operator and usually ranges between 20 to 50 feet. Shared ROWs may span 60 to 70 feet. Vegetation around and over pipelines may be restricted. Compliance with Federal, State and applicable local regulations would reduce future potential impacts health and safety related to pipelines to less than significant levels.

Mitigation Measures

MM 4.17-7: **Electrical Services.** Prior to approval of a Master Precise Development Plan or modification to an existing precise development plan on-site, the Master Developer or future land owner shall coordinate with Pacific Gas and Electric Company

(PG&E) staff early in the planning stages to ensure that adequate facilities are incorporated into the Project design.

1. Prior to issuance of grading and building permits the Project proponent shall coordinate with PG&E staff to determine the specific requirements regarding any potential electric service or facility issues needed to adequately accommodate the proposed Project. The Project proponent shall comply with and adhere to all requirements identified by PG&E to full mitigate impacts to electric services and facilities, as needed as Project construction progresses.

MM 4.17-8: **Natural Gas.** Prior to approval of a Master Precise Development Plan or modification to an existing precise development plan on-site, the Master Developer or future land owner shall coordinate with Pacific Gas and Electric Company (PG&E) staff early in the planning stages to ensure that adequate facilities are incorporated into the Project design.

1. Prior to issuance of grading and building permits the Project proponent shall coordinate with PG&E staff to determine the specific requirements regarding any potential natural gas service or facility issues needed to adequately accommodate the proposed Project. The Project proponent shall comply with and adhere to all requirements identified by PG&E to fully mitigate impacts to natural gas services and facilities, as needed as Project construction progresses.

MM 4.17-9: **PG&E Notification.** The Project proponent shall notify PG&E six months prior to any construction activities in the immediate vicinity of PG&E Transmission Line 300B.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

Significant cumulative impacts to public services would occur if the cumulative projects would overburden the public service agencies and if utility providers were unable to provide adequate services. The cumulative projects would substantially increase the demand for public service providers and utility servers. However, public agencies and utilities have the opportunity to respond to an inquiry for information regarding potential increase in demand on their services. Development fees are assessed on a project-by-project basis to mitigate for the increase in demand on public services and utilities. Incorporation of the mitigation measures would reduce impacts from the proposed Project, in conjunction with other projects in the area, to a less than significant cumulative level.

Mitigation Measures

Implement Mitigation Measures MM 4.17-1 through MM 4.17-9.

Level of Significance after Mitigation

Impacts would be less than significant.

Section 4.18

Wildfire

Section 4.18
Wildfire

4.18.1 Introduction

The purpose of this section is to identify, to the extent feasible, the potential for wildland fires in connection with the proposed Project site and to identify potential risks to human health, including future residents surrounding the site, users of the proposed Project site, workers and construction workers. A Wildfire Assessment was prepared by McIntosh & Associates in April 2019. See Appendix P, *Wildfire Assessment*.

4.18.2 Environmental Setting

The proposed Project site is undeveloped and is used mainly for agricultural purposes. As discussed in *Section 4.11, Land Use and Planning*, a steel storage building associated with agricultural activities is located in the eastern portion of the site, near South Union Avenue (SR-204). There is one plugged and abandoned oil well located within the proposed Project boundaries (Big McKittrick Oil Company "Sea Cliff-Houghton" 1). In addition, one active, diesel-powered irrigation well, one idle irrigation well, and one domestic well are located on-site. As discussed in *Section 4.9, Hazards and Hazardous Materials*, a Pacific Gas and Electric (PG&E) natural gas transmission pipeline, number L-300B, traverses the site at a diagonal from northwest to southeast. Six pole-mounted electrical transformers (PMT) were observed within and adjacent to the proposed Project boundaries. Existing adjacent land uses include vacant land and agricultural uses to the north, agricultural uses and a small cluster of single-family residential homes to the east, SR-99 to the west, and agricultural uses and an automobile wrecking yard located south/southeast of proposed Project site.

4.18.3 Regulatory Setting

Federal

There are no relevant federal regulations in regard to wildfires.

State

Senate Bill 1241

Senate Bill 1241 requires the legislative body of a city of county to adopt a comprehensive, long-term general plan that includes various elements, including a safety element for the protection of the community from unreasonable risks associated with among other things, wildland and urban fires. The safety element requires for state responsibility areas (SRA), as defined, and very high fire hazard severity zones (FHSZ) as defined in California Government Code (CGC) §51177 & 51178 that is not a SRA, to be updated as necessary to address the risk of fire in these areas pursuant to CGC §65302(g)(3).

California Environmental Quality Act

CEQA, PRC §21000, et seq., was amended in 2018 to address numerous legislative changes to CEQA, to clarify certain portions of existing CEQA Guidelines, and to update the CEQA Guidelines to be consistent with recent court decisions.

Impacts of wildfire to development and a development's contribution to the potential creation of wildfire risk at the Wildland-Urban Interface (WUI) are now addressed as a separate "Environmental Factor" to be addressed in the initial study checklist in Appendix G. The Natural Resources Agency expanded the requirements of SB 1241 to also include development projects "near" the SRA and Very High FHSZs.

California Building Standards Codes

The State of California provides minimum standards for building design through the California Building Code (CBC). The CBC is based on the International Building Code (IBC), which is used widely throughout the United States (generally adopted on a state-by-state or district-by-district basis) and has been modified to address particular California concerns. The primary codes with respect to development in or near the WUI include the California Building Code, Chapter 7A "Materials and Construction Methods for Exterior Wildfire Exposure" and the California Fire Code, Chapter 49 "Requirements for Wildland-Urban Interface Fire Areas". These codes require what materials are required to be used for construction for any Building Permit submitted after January 1, 2009 within the geographical areas with FHSZs designated as Very High, High, or Moderate in SRA's and Very High within Local Response Areas (LRA). Maps of these areas were developed in 2007 for California and each county.

Local

Kern County Wildland Fire Management Plan

The Kern County Wildland Fire Management Plan documents the assessment of wildland fire situations throughout the SRAs within the County. The Kern County Fire Department Wildland Fire Management Plan provides for systematically assessing the existing levels of wildland protection services and identifying high-risk and high-value areas that are potential locations for costly and damaging wildfires. The goal of the plan is to reduce costs and losses from wildfire by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success. Based on this assessment, preventive measures are implemented, including the creation of wildfire protection zones.

Kern County Building and Construction Ordinance (Title 17 of the Ordinance Code of Kern County)

Chapter 17.32 Fire Code

Kern County has adopted, by reference, portions of the California Building Standards Code and the International Fire Code, with modifications and amendments. The

purpose of this code is to prescribe the minimum requirements necessary to establish a reasonable level of fire safety to protect life and property from hazards created by fire, explosion, and dangerous conditions.

The Kern County Fire Code defines a hazardous fire area as any land that is covered with grass, grain, brush, or forest and situated (e.g., in an inaccessible location) so that a fire originating upon such land would present an abnormally difficult job of suppression and would result in great and unusual damage through fire or the resulting erosion.

Chapter 17.34 Wildland-Urban Interface Code

Kern County has adopted, by reference the Urban Wildland Interface Code, published by the International Fire Code Institute, with modifications and amendments. The purpose of this code is to safeguard life and property and maintain public welfare to a reasonable degree by addressing hazards related to wildland fire exposures and fire exposures from adjacent structures, and to prevent structure fires from spreading to wildland fuels.

Metropolitan Bakersfield General Plan (MBGP)

The Metropolitan Bakersfield General Plan cites policies to provide decision-makers with long-range guidance affecting the future character of the Metropolitan Bakersfield planning area. The elements within the Metropolitan Bakersfield General Plan provide goals, policies and implementation measures in order to reduce impacts related to public safety. Applicable wildfire goals and policies relative to the proposed Project are listed in Table 4.18-1, *Metropolitan Bakersfield General Plan Goals and Policies for Wildfires*, below.

Table 4.18-1. Metropolitan Bakersfield General Plan Goals and Policies for Wildfires

Goals and Policies: Public Safety Element
Goal #1: Ensure that the Bakersfield metropolitan area maintains a high level of public safety for its citizenry.
Goal #2: Ensure that adequate police and fire services and facilities are available to meet the needs of current and future metropolitan residents through the coordination of planning and development of metropolitan police and fire facilities and services.
Goal #3: Provide for the coordinated planning and development of service areas for police and fire protection to ensure an equitable burden of responsibility between County and City in Metropolitan Bakersfield.
Goal #4: Assure that fire, hazardous substance regulation and emergency medical service problems are continuously identified and addressed in a proactive way, in order to optimize safety and efficiency.
Policy #4: Monitor, enforce and update as appropriate all emergency plans as needs and conditions in the Planning area change, including the California Earthquake Response Plan, the Kern County Evacuation Plan, and the City of Bakersfield Disaster Plan.
Policy #6: Promote fire prevention methods to reduce service protection costs and costs to the taxpayer.
Policy #9: Restrict, after appropriate public hearings, the use of fire-prone building materials in areas defined by the fire services as presenting high-conflagration risk.

4.18.4 Impacts and Mitigation Measures

Methodology

The potential impacts associated with the proposed project are evaluated on a qualitative basis through a comparison of existing conditions within the proposed Project site and the anticipated Project effects. The potential for impacts from wildfires would occur if the effect described under the criteria below occurs. The evaluation of Project impacts is based on professional judgment, analysis of the County's hazards/hazardous materials policies, and the significance criteria established by Appendix G of the State CEQA Guidelines, which the County has determined to be appropriate criteria for this Recirculated Draft EIR.

Thresholds of Significance

The Kern County CEQA Implementation Document and Kern County Environmental Checklist identify the following criteria, as established in Appendix G of the CEQA Guidelines, to determine if a project could potentially have a significant impact. Such an impact would occur if the proposed Project would:

- Substantially impair an adopted emergency response plan or emergency evacuation plan;
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment;
- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

The analysis of the existing environment and the impact analysis indicate that this proposed Project could result in a significant environmental impact if it would result in impacts from wildfires that would, if not mitigated, adversely affect the public health and safety of future residents, surrounding residents and workers.

Project Impacts

Impact 4.18-1: The Project Would Substantially Impair an Adopted Emergency Response Plan or Emergency Evacuation Plan.

According to the Kern County Wildland Fire Management Plan, the proposed Project is located within the "Valley" Fuel Plan Management Area and the "Agricultural, non-wildland" classification for FHSZ. The Wildfire Assessment prepared by McIntosh & Associates shows that that proposed Project is not located within or adjacent to a SRA or a Very High FHSZ as shown in Figure 4.18-1, *Fire Hazard Severity Zones in SRA* and Figure 4.18-2, *Fire Hazard Severity Zones in LRA*. In

Figure 4.18-2

addition, there is no information in the record to date that indicates the proposed Project would interfere with the operation of any roadway, facility, or area that would be used as part of an emergency response plan or emergency evacuation plan. Thus, impacts would be less than significant and mitigation is not required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.18-2: The Project Would Due to Slope, Prevailing Winds, and Other Factors, Exacerbate Wildfire Risks, and Thereby Expose Project Occupants to, Pollutant Concentrations from a Wildfire or the Uncontrolled Spread of a Wildfire.

The proposed Project site is located adjacent to vacant land and agricultural uses to the north, agricultural uses and a small cluster of single-family residential homes to the east, SR-99 to the west, and agricultural uses and an automobile wrecking yard located south/southeast of proposed Project site. The on-site topography is flat. According to windrose data for the Project area, wind generally travels from the northwest and travels at 8.05 miles per hour (NRCS, 2003). Therefore, the general wind patterns toward the Project site are from other agricultural sites that would not be susceptible to wildland fires. This fact would reduce the impact to the Project site from the uncontrolled spread of wildfire. In addition, the proposed Project is not located within or adjacent a SRA or a Very High FHSZ as discussed in Impact 4.18-1. Thus, impacts would be less than significant.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.18-3: The Project Would Require the Installation or Maintenance of Associated Infrastructure (Such As Roads, Fuel Breaks, Emergency Water Sources, Power Lines or Other Utilities) That May Exacerbate Fire Risk or That May Result In Temporary or Ongoing Impacts to The Environment.

As discussed in *Sections 4.16 Transportation and Traffic and 4.17, Utilities*, the proposed Project would require the extension of utilities and other infrastructure, such as roadways, into the Project site. These extensions are needed to provide services for the proposed future uses. Natural gas and electricity would be supplied by PG&E. Natural gas and electric improvements would be constructed only after planning and coordination with PG&E to ensure that services could be efficiently, and safety delivered to the project site. As part of these efforts, any extension and any connections or new infrastructure would be built in accordance with the requirements of the County of Kern and PG&E. Cal Water would provide water services to the project site and would require approval from the California Public Utility Commission (CPUC) to expand its service area to include the proposed Project. Water service lines would be extended into the project site and improvements also would be made in some adjacent roadways and previously disturbed areas. The construction of new on-site roadways also would be required, and some off-site roadway and transportation improvements would be made to ensure adequate traffic service is maintained.

The proposed Project is surrounded by areas that are predominantly under agricultural production or consist of rural residential uses. or industrial and heavy commercial uses that are themselves not in wildland areas and are not susceptible to wildland fires. In addition, the addition of roads internal to the Project site would allow emergency response personnel to access the Project area, if necessary to suppress fires, if they occur. Further, the Kern County Fire Department, as part of the County's environmental review process, will review all plans to ensure they contain adequate fire suppression, fire access, and emergency evacuation.

Thus, coordination with PG&E regarding natural gas and electric improvements, improvements in the circulation system, and adherence to standard City and Fire Department policies would reduce impacts are less than significant. In addition, *Section 4.17 Utilities*, includes MM 4.17-7 through MM 4.17-9, which require, as part of the Master Precise Development Plan and any electric or natural gas utility improvements, coordination with PG&E to ensure improvements adhere to all requirements and to provide adequate time to review plans for potential conflicts with existing utility locations or demand on service. Implementation of these measures would ensure impacts remain less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Impact 4.18-4: The Project Would Expose People or Structures to Significant Risks, Including Downslope or Downstream Flooding or Landslides, as a Result of Runoff, Post-Fire Slope Instability, or Drainage Changes.

As described in *Section 4.10, Hydrology and Water Quality*, potential hazards related to downstream flooding are less than significant. The proposed Project site is not located within a 100-year flood hazard area. The proposed Project is located within the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map Zone X, which is described by FEMA as an area determined to be outside the 0.2 percent annual chance floodplain. Due to this small percentage, it is not anticipated that flooding hazards would occur within the Project site. In addition, as described in *Section 4.7 Geology and Seismic Hazards*, the proposed Project area is flat and not susceptible to landslides. Thus, impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Cumulative Impacts

The incremental effects of the proposed Project related to wildfire, if any, are anticipated to be minimal, and any effects would be site specific. Compliance with Federal, State, and local regulations would ensure that impacts from wildfires are avoided or controlled to minimize the risk to the public on a project-by-project basis, as the cumulative projects are constructed. Therefore, the proposed Project would not result in incremental effects to wildfire that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed Project would not result in cumulatively considerable impacts to or from wildfires.

Mitigation Measures

No mitigation measures are required.

Level of Significance after Mitigation

Impacts would be less than significant.

Chapter 5

Consequences of Project Implementation

Chapter 5
Consequences of Project Implementation

5.1 ENVIRONMENTAL EFFECTS FOUND TO BE LESS THAN SIGNIFICANT

Section 15128 of the CEQA Guidelines requires that an EIR contain a statement briefly indicating the reasons that various, possible, new significant effects of a project were determined not to be significant, and were therefore not discussed in detail in the RDEIR. The County has engaged the public to participate in the scoping of the environmental document.

The contents of this Recirculated Draft EIR were established based on an NOP/IS prepared in accordance with the CEQA Guidelines, as well as public and agency input that were received during the scoping process. The comments to the NOP/IS are found in Appendix A. Those specific issues that are found to have no impact or less-than-significant impacts during preparation of the NOP/IS do not need to be addressed further in this RDEIR. Based on the findings of the NOP/IS and the results of scoping, a determination was made that this RDEIR must contain a comprehensive analysis of all environmental issues identified in Appendix G of the CEQA Guidelines. After further study and environmental review in this Recirculated Draft EIR, the following environmental impacts (both project-specific and cumulative) were determined to be less than significant or could be reduced to less-than-significant levels with mitigation measures:

- aesthetics,
- biological resources,
- cultural resources,
- energy,
- geologic and seismic hazards,
- hazards and hazardous materials,
- hydrology and water quality,
- land use and planning,
- mineral resources,
- population and housing,
- public services,
- utilities, and
- wildfire

5.2 SIGNIFICANT ENVIRONMENTAL EFFECTS THAT CANNOT BE AVOIDED

Section 15126.2(b) of the CEQA Guidelines requires that the EIR describe any significant impacts, including those that can be mitigated but not reduced to less-than-significant levels. Potential environmental effects of the proposed Project and proposed mitigation measures are discussed in detail in Chapter 4 of this RDEIR. The impacts described in Table 5-1 *Summary of Significant Impacts of the Proposed* Project, would result in significant and unavoidable impacts, even with the incorporation of feasible mitigation measures that attempt to reduce impacts to less-than-significant levels.

Table 5-1. Summary of Significant Impacts of the Proposed Project

Resources	Project Impacts	Cumulative Impacts
Agricultural Resources	The conversion of approximately 314.30 acres of agricultural farmland is considered **significant and unavoidable.**	Although the Metropolitan Bakersfield General Plan has various Land Use policies that direct development to encourage site compatibility with surrounding uses, the cumulative loss of agricultural land results in a significant and unavoidable impact. Notwithstanding this conclusion, Project implementation, when combined with the potential loss of other agricultural lands within the Planning area, over time, would remain a **significant and unavoidable** cumulative impact.
Air Quality	Surrounding sensitive receptors could potentially be exposed to substantial ROG pollutant concentrations from the proposed Project. In addition, operational impacts would result in **significant and unavoidable** impacts of ROG, NO_x, CO, and PM_{10} emissions.	While all feasible and reasonable mitigation has been included, however, the proposed mitigation measures do not result in a reduction of ROG, NO_x, CO, and PM_{10}, below the thresholds. Therefore, the remaining unmitigated emissions and related health effects are considered **cumulatively significant and unavoidable.**
Greenhouse Gases	Project-related greenhouse gases impacts would be reduced to **less than significant** levels with incorporation of mitigation measures.	The cumulative impacts of the proposed Project on global climate change are not known with certainty; therefore, cumulative impacts on global climate change and associated health effects are considered **significant and unavoidable.**
Noise	Given a specific Project use is not currently proposed, and the fact that permitted uses within the M-1 and M-2 Zone Districts allow for operations to be conducted outside of a fully enclosed building, the proposed Project may result in exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies. Impacts are considered **significant and unavoidable.**	While all feasible and reasonable mitigation has been included, noise levels at 14 roadway segments a result of the proposed Project and at 15 roadway segments considering the project with past, present and reasonably, would be significant. In addition, noise levels at one residence in proximity to the proposed Project would exceed thresholds. Therefore, even with the implementation of all feasible mitigation, impacts would be both **significant and unavoidable and cumulatively significant and unavoidable**
Transportation and Traffic	Project-related transportation and traffic impacts would be reduced to **less than**	Given the uncertainty of the timing and/or ultimate implementation of the recommended improvements which

	significant levels with incorporation of mitigation measures.	require pro-rata, fair share funding from various sources, along with those improvements necessary within Metropolitan Bakersfield, the proposed Project's contribution would result in **significant and unavoidable impacts.**

5.3 IRREVERSIBLE IMPACTS

Section 15126.2(c) of the CEQA Guidelines defines the nature of an irreversible impact as an impact that uses nonrenewable resources during the initial and continued phases of the project. Irreversible impacts can also result from damage caused by environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to ensure that such consumption is justified.

Build-out of the proposed Project would commit nonrenewable resources during construction and ongoing utility services. During the operations of the proposed Project, oil, gas, and other nonrenewable resources would be consumed. Therefore, an irreversible commitment of nonrenewable resources would occur as a result of long-term operation under the proposed Project. However, assuming that those commitments occur in accordance with the adopted goals, policies, and implementation measures of the Metropolitan Bakersfield General Plan, as a matter of public policy, those commitments have been determined to be acceptable. The Metropolitan Bakersfield General Plan ensures that any irreversible environmental changes associated with those commitments will be minimized.

5.4 SIGNIFICANT CUMULATIVE IMPACTS

According to Section 15355 of the CEQA Guidelines, the term cumulative impacts "...refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." Individual effects that may contribute to a cumulative impact may be from a single project or a number of separate projects. Individually, the impacts of a project may be relatively minor, but when considered along with impacts of other closely related or nearby projects, including newly proposed projects, the effects could be cumulatively considerable. This RDEIR has considered the potential cumulative effects of the proposed Project along with other current and reasonably foreseeable projects. Impacts for the following have been found to be cumulatively considerable:

- agricultural resources;
- air quality;
- greenhouse gases;
- noise; and
- transportation and traffic.

5.5 GROWTH-INDUCING IMPACTS

The Metropolitan Bakersfield General Plan recognizes that certain forms of growth are beneficial, both economically and socially. CEQA associates development of new utilities and other infrastructure and public services with growth inducement. These facilities will be provided as an accommodation to proposed growth, and growth is expected to occur in the region. A project could induce population growth in an area either directly or indirectly. More specifically, the development of new homes or businesses could induce population growth directly, whereas the extension of roads or other infrastructure could induce population growth indirectly.

This proposed Project would not directly increase population or the housing stock. The Project proposes to amend the Metropolitan Bakersfield General Plan to allow for service industrial and light industrial uses. This allows for additional employment opportunities, which can lead to the relocation of people to jobs and ultimately and increase in population. However, the size of the labor force within Kern County and the current unemployment rates are considered to be sufficient for the current County population to accommodate jobs generated by the proposed Project. Additionally, the proposed Project site is in the vicinity of a Metropolitan Bakersfield General Plan designation for "intensified activity center," and anticipates development of the southern activity center and surrounding areas. Therefore, the introduction of industrial uses on the Project site would not create a growth-inducing impact.

Chapter 6

Alternatives

CHAPTER 6
ALTERNATIVES

6.1 INTRODUCTION AND OVERVIEW

The California Environmental Quality Act (CEQA) requires that an EIR include a discussion of reasonable project alternatives that would "feasibly attain most of the basic objectives of the project, but would "avoid or substantially lessen any significant effects of the project, and evaluate the comparative merits of the alternatives" (CEQA Guidelines Section 15126.6). This chapter identifies potential alternatives to the proposed Project and evaluates them, as required by CEQA.

Key provisions of the CEQA Guidelines on alternatives (Section 15126.6(a) through (f)) are summarized below to explain the foundation and legal requirements for the alternatives analysis in the RDEIR.

- "The discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly" (15126.6(b)).
    - "The specific alternative of 'no project' shall also be evaluated along with its impact" (15126.6(e)).
    - "The no project analysis shall discuss the existing conditions at the time the Notice of Preparation is published, and at the time the environmental analysis is commenced, as well as what would reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services. If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives" (15126.6(e)(2)).
    - "The range of alternatives required in an EIR is governed by a 'rule of reason' that require the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project" (15126.6(f)).
    - "Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability or infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent)" (15126.6(f)(1)).
    - For alternative locations, "only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR" (15126.6(f)(2)(A)).

- "An EIR need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative" (15126.6(f)(3)).

Per the CEQA Guidelines Section 15126.6(d), additional significant effects of the alternatives are discussed in less detail than the significant effects of the Project as proposed.

For each alternative, the analysis: 1) Describes the alternative; 2) Analyzes the impact of the alternative as compared to the proposed Project; 3) Identifies the impacts of the Project which would be avoided or lessened by the alternative; 4) Assesses whether the alternative would meet most of the basic Project objectives; and 5) Evaluated the comparative merits of the alternative and the Project.

6.2 APPLICANT PROJECT OBJECTIVES

As described in Section 3.4, the following objectives have been established for the proposed Project and will aid decision makers in the review of the Project and associated environmental impacts:

- Facilitate quality development that is consistent with and implements the goals of the Kern County General Plan and Metropolitan Bakersfield General Plan.
- To develop the site consistent with the provisions of the Kern County Zoning Ordinance, Land Division Ordinance, and Development Standards.
- Assure adequate planning for all community facilities including circulation improvements, drainage facilities, water, and wastewater facilities.
- Ensure that the project, in and of itself, does not contribute to the conversion of adjacent agricultural areas.
- Cluster commercial retail uses that provide goods and services near an interchange with SR-99 to accommodate interstate freight and reduce traffic congestion and air emissions.
- Accommodate new development that channels land uses in a phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.
- Address community circulation, both vehicular and pedestrian, utilizing available capacity with the existing circulation system, and provide fair-share system improvements to deficient intersections or road segments.
- Facilitate a planned development and related in-line tenants consistent with the market objectives of the applicant and its tenants.
- Accommodate growth within the proposed Project while balancing environmental considerations.
- Provide an industrial center at the Houghton Road and SR-99 interchange in the southern metropolitan area adjacent to the City that would provide a broad range of goods and services that serve the regional market area.

- Allow for the development of a variety of commercial and industrial centers which are differentiated by their function, intended users and level of intensity.
- Provide new industrial development that captures the economic demands generated by the marketplace.
- Provide new development that will assist the County of Kern in obtaining fiscal balance in the years and decades ahead.

6.3 PROPOSED PROJECT SUMMARY

The proposed Project includes a General Plan Amendment (GPA) and concurrent Change of Zoning District (ZCC) to modify the existing MBGP land use designations, and the Kern County Zoning Ordinance classifications on the 314-acre Project site. In addition, the Project includes a petition to exclude the Project site from Agricultural Preserve No. 13. The GPA and ZCC would allow for development of a light to medium industrial park containing approximately 4,613,004 square feet (net building area) of warehousing, distribution, and retail showroom uses. Table 6-1, *Existing and Proposed Land Use and Zoning*, below, provides the proposed GPA and ZCC summary for the proposed Project.

Table 6-1. Proposed Project Site and Surrounding Land Uses

Existing MBGP Land Use Designations	Proposed MBGP Amendment (Land Use Designations)	Existing Zone Classification	Proposed Zone Change (Zone Classification)	Gross Acres
R-IA (Resource-Intensive Agriculture) HC (Highway Commercial)	GC (General Commercial)	A (Exclusive Agriculture)	C-2 PD (General Commercial, Precise Development Combining)	22
	LI (Light Industrial)		M-1 PD (Light Industrial, Precise Development Combining)	108
	SI (Service Industrial)		M-2 PD (Medium Industrial, Precise Development Combining)	159
	HC (Highway Commercial)		CH PD (Highway Commercial, Precise Development Combining)	25
			Total	**314***

Numbers have been rounded to the nearest whole number.
* Petition for Exclusion from Agricultural Preserve No. 13

6.4 ALTERNATIVES ELIMINATED FROM FURTHER CONSIDERATION

Alternatives may be eliminated from detailed consideration in an EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid or substantially lessen any significant environmental effects (CEQA Guidelines, Section 15126.6[c]). Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, also do not need to be considered (CEQA Guidelines, Section 15126[f][2]). Kern County considered several alternatives to reduce impacts on agriculture, air quality, greenhouse gas emissions, noise, or transportation and traffic. Per CEQA, the lead agency

may make an initial determination as to which alternatives are feasible and warrant further consideration and which are infeasible. The following alternative was initially considered but were eliminated from further consideration in this RDEIR because it does not meet project objectives and/or are infeasible.

Alternate Site Alternative

In developing a reasonable range of alternatives, the County considered the potential for an alternate site. To meet the project objectives, the applicant would be required to find a comparable site within Kern County that would meet most of the project objectives. Key project attributes considered included a site adjacent to, or in close proximity of, a major interstate freeway, close proximity to an existing water supply conveyance system, and close proximity to dry utilities (e.g., natural gas, electricity and telecommunication lines), all of which avoid the need for substantial off-site infrastructure construction with related impacts. A further key attribute is a site that is adjacent, or within very close proximity, to existing residential land uses that provide residential and related community land uses for employees. The project site must also be of sufficient size to provide industrial and commercial land uses as well as a water treatment facility and wastewater treatment facility to achieve key objectives such as providing an industrial center that serves a regional market need in the southern metropolitan area. The site would also have to be available for acquisition (e.g., listed as for sale by one land owner). Finally, to serve as a CEQA alternative, it would also need to avoid or significantly reduce at least one project-level or cumulative impact.

There were no alternative sites that met these criteria. For example, to avoid or substantially reduce project-related agricultural impacts (including cumulative impacts or conversion of adjacent agricultural land to non-agricultural land), the alternate site location would need to be in an area with minimal land identified as prime farmland, unique farmland, or farmland of statewide importance, as well as with minimal land currently under agricultural cultivation. In addition, it would need to be proximate to residential land uses to provide appropriate workforce, thus reducing the need for new housing on nearby agricultural land. An alternate site within the Kern County would result in land that is considered prime farmland, unique farmland, or farmland of statewide importance, much of which is currently under agricultural cultivation within the San Joaquin Valley or grazing and other agricultural cultivation within the Mojave Desert. Such a site would have greater agricultural impacts than the project site, and both State and County laws and policy have long discouraged large scale urbanized conversion of agricultural lands.

Alternate sites within existing cities within the County were not considered because these cities already have or have planned for industrial and commercial land uses, and would not achieve a key project objective of developing commercial and industrial centers in close proximity to residential areas, for the workforce, as well as being located in areas proximate to backbone infrastructure.

If an alternate site were identified, development of the project on an alternate site would have similar, if not greater, environmental impacts with respect to cumulative impacts that are more generally linked to air quality and greenhouse gas emissions, noise, and transportation and traffic. Alternate sites in more remote locations, not served by or immediately adjacent to proximate highway, water, and dry utility infrastructure would generally have greater project-level and cumulative impacts than

the proposed Project, based on the need for construction of infrastructure extensions to highway, water, and dry utility infrastructure.

The alternate site alternative has been rejected from further consideration because there were no alternative sites that have the attributes required to achieve key project objectives, and because if an alternate site was available it would likely have impacts that are generally similar to, or for some resources greater than, the 99 Houghton Industrial Park Project.

It should also be noted that, while CEQA requires an EIR to identify project alternatives, it does not require the EIR to identify alternative project locations. Per the CEQA Guidelines, an EIR must include a reasonable range of "alternatives to the project, *or* to the location of the project." (14 California Code of Regulations Section 15126.6(a)(emphasis added)). Applicable case law recognizes that CEQA grants lead agencies flexibility to elect to analyze either onsite or offsite alternatives, or both (Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 447, 491). There is no requirement under CEQA that an EIR always explore an alternative site, or offsite, alternative (California Native Plant Society v. City of Santa Cruz (2009) 177 Cal.App.4th 957, 933). Thus, CEQA does not require this RDEIR to analyze the Alternative Site Alternative.

6.5 ALTERNATIVES ANALYZED IN THIS RDEIR

The following five alternatives have been determined to represent a reasonable range of alternatives which have the potential to feasibly attain most of the basic objectives of the Project but which may avoid or substantially lessen any of the significant impacts of the proposed Project. The "Environmentally Superior" Alternative, as required by CEQA is described in Section 6.6, *"Environmentally Superior" Alternative*. These alternatives are analyzed in detail below:

- Alternative A "No Project/No Development" Alternative
- Alternative B "Buildout Existing General Plan Designation" Alternative
- Alternative C "Reduced Density" Alternative
- Alternative D "Reduced Project Size" Alternative

Table 6-2 *Summary of Development Alternatives*, provides a summary of the relative impacts and feasibility of each Alternative. A complete discussion of each Alternative is provided below.

Table 6-2. Summary of Development Alternatives

Alternative	Description	Basis for Selection and Summary of Analysis
Proposed Project	4,613,004 ft2 of light to medium industrial park, and highway and general commercial uses	
Alternative A No Project/No Development	• No GPA, ZCC, or development. • Existing agricultural uses are maintained	• Required by CEQA • Avoids need for GPA, ZCC, and CUPs • No agricultural preserve exclusion needed • No annexation • Avoids significant impacts

Table 6-2. Summary of Development Alternatives

Alternative	Description	Basis for Selection and Summary of Analysis
		• Does not meet 9 of the 13 Project objectives
Alternative B Buildout Existing General Plan Designation	• Existing land use, R-IA and HC, and zoning, A, designations remain • Develop 15 SFR, 7.6 acres of HC, approximately 132,422 ft2	• Required by CEQA • Avoids need for GPA and ZCC • No agricultural preserve exclusion needed • No annexation • Does not meet 7 of the 13 Project objectives
Alternative C Reduced Density	• Develop entire 314.30-acre site • Reduce development to 3,850,689 ft2 of medium and light industrial facilities	• May lessen some impacts • Does not avoid significant environmental impacts • Meets Project objectives, but not to the degree of the proposed Project
Alternative D Reduced Project Size	• Develop approximately 184.58 acres – area proposed as SI • 2,171,789 ft2 of Service Industrial/Medium Industrial facilities	• May lessen some impacts • Does not avoid significant environmental impacts • Meets most Project objectives, but not to the degree of the proposed Project.

Notes:

R-IA = Intensive Agriculture: minimum 20-acre parcel size; HC = Highway Commercial – Industrial;

A = Exclusive Agriculture; GPA = General Plan Amendment; ZCC = Zone Change; SI = SI – Service Industrial; FAR = Floor Area Ratio; ft^2 = square feet; SFR = single-family residential

Table 6-3. Comparison of Alternatives					
Environmental Resource	**Project**	**Alternative A**	**Alternative B**	**Alternative C**	**Alternative D**
Agriculture: Convert Prime, Unique or Statewide important farmland	Significant / Unavoidable	Fewer	Fewer	Similar	Fewer but still Significant/Unavoidable
Agriculture: Other changes resulting in agricultural conversion	Significant / Unavoidable	Fewer	Similar	Similar	Similar
Agriculture: Cumulative conversion of agricultural or forest land	Significant / Unavoidable	Fewer	Fewer	Similar	Fewer but still Significant/Unavoidable
Air Quality: Operational Emission of ROG, NO_x, and CO	Significant / Unavoidable	Fewer	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable
Air Quality: Cumulative net increase of nonattainment pollutants	Significant / Unavoidable	Fewer	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable
Air Quality: Exposure of sensitive receptors to ROG, NO_x, and CO	Significant / Unavoidable	Fewer	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable
Air Quality: Total Cumulative Project Emissions	Significant / Unavoidable	Fewer	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable	Fewer but still Significant/Unavoidable
Greenhouse Gas Emission: Cumulative effects	Significant / Unavoidable	Fewer	Fewer but still Significant/Unavoidable	Similar	Fewer but still Significant/Unavoidable
Noise: Expose Persons in Excess of Standards	Significant / Unavoidable	Fewer	Fewer	Fewer	Fewer
Noise: Expose Persons to Ground Borne Noise and Vibration	Significant / Unavoidable	Fewer	Fewer	Fewer	Fewer
Noise: Create Substantial Temporary Above Existing Levels	Significant / Unavoidable	Fewer	Fewer	Fewer	Fewer
Noise: Cumulative increase in noise	Significant / Unavoidable	Fewer	Fewer	Fewer	Fewer
Traffic: Cumulative increase in transportation and traffic impacts	Significant / Unavoidable	Fewer	Fewer	Similar	Fewer

Alternative A - "No Project/No Development" Alternative

The "No Project/No Development" Alternative assumes that the proposed GPA, ZCC and subsequent development would not be implemented. Under this scenario, the General Plan Land Use Designation on the Project site would remain R-IA (Resource-Intensive Agriculture) and HC (Highway Commercial); the zoning would remain A (Exclusive Agriculture). Additionally, this Alternative assumes that existing land uses on the Project site would remain unchanged, and, as such, would remain under agricultural production. Because the Project site would remain unchanged, few or no environmental impacts would occur. This Alternative serves as the baseline against which to evaluate the effects of the proposed Project and other Project Alternatives presented below.

Impacts Compared to Project Impacts

The following compares environmental impacts associated with Alternative A, the "No Project/No Development" Alternative, to those identified for the proposed Project.

Aesthetics

Under the "No Project/No Development" Alternative, the Project site would not be altered. Therefore, views across the Project site would remain unobstructed, and no additional lights are proposed. Therefore, under this Alternative no impacts to aesthetics, light and glare would occur.

Agriculture Resources

This Alternative would not alter the existing conditions within the Project site. Therefore, the site will remain under agricultural production and as fallow agricultural land. This Alternative would not require an agricultural preserve exclusion. Thus, no impacts to agricultural resources would occur.

Air Quality

Alternative A, the "No Project/No Development" Alternative, would not result in alterations to the land uses within the Project site. Therefore, any existing impacts to air quality that currently exist on-site will continue to occur, however, no new impacts to air quality would occur under this Alternative.

Biological Resources

Alternative A, the "No Project/No Development" Alternative, would not impact potential habitat for biological resources. The continued agricultural uses would not increase impacts on the biological resources currently within the Project site. No new impacts to biological resources would occur under this Alternative.

Cultural Resources

As this Alternative would not result in alterations to the ground surface within the Project site, no impacts to cultural resources would occur.

Energy Resources

Alternative A, the "No Project/No Development" Alternative, would not result in alterations to the land uses within the Project site. Therefore, any existing impacts to energy that currently exist on-site will continue to occur, however, no new impacts to energy would occur under this Alternative.

Geologic and Seismic Hazards

Under this Alternative, new structures would not be constructed. Therefore, impacts to structures as a result of geologic and seismic hazards would not occur under this Alternative.

Greenhouse Gases

Implementation of this Alternative would result the Project site remaining as cultivated and fallow agricultural land. The land use would remain the same; therefore, no impacts to greenhouse gas emissions would occur beyond what already exists.

Hazards/Hazardous Materials

Under this Alternative, the existing environmental conditions, including those that may be defined as either adverse or significant, would continue to prevail. This Alternative would continue to expose individuals to agricultural production related activities and their associated effects, and to nuisances (i.e., soil contamination, noise, dust). Therefore, no impacts to hazards/hazardous materials would occur under Alternative A, the "No Project/No Development" Alternative.

Hydrology and Water Quality

No industrial structures would be developed under this Alternative; therefore, no change in the usage of groundwater would occur, and no additional storm drain infrastructure would be required. Therefore, no impacts to hydrology and water quality would occur under this Alternative.

Land Use and Relevant Planning

This Alternative would not require a GPA or zone change, as it does not propose to develop the Project site. This Alternative would be consistent with the existing land uses identified in the Metropolitan Bakersfield General Plan. Implementation of this Alternative would not result in any improvements to the Project site; therefore, no impacts to land use would occur.

Mineral Resources

Under this Alternative this proposed Project site would remain under agricultural production and the on-site prospect well would remain. Therefore, under this Alternative no impacts to mineral resources would occur.

Noise

As no development is proposed on the Project site under this Alternative, no change in the existing noise on the Project site would occur.

Population and Housing

Under Alternative A, the "No Project/No Development" Alternative, no industrial structures would be constructed. This Alternative would not directly or indirectly induce an increase in population and would not displace houses or people because the 314.30-acre site would remain agricultural land. No impacts to population and housing would occur under this Alternative.

Public Services and Utilities

With implementation of Alternative A, the "No Project/No Development" Alternative, no industrial structures would be constructed. No changes in demand of public services and utilities would occur.

Traffic and Circulation

Development of this Alternative would not result in changes to average daily vehicle trips (ADT) as no development is proposed. Additionally, this Alternative would not result in impacts on the intersections and roadway segments surrounding the Project site. Overall, this Alternative would not result in an impact on circulation.

Wildfire

Under this alternative no development is proposed, and the existing land uses of the Project site would remain in agricultural production. The potential for the Project site to be affected by wildfire from adjacent areas would be the same and no changes or impacts associated with wildfire would occur.

Conclusion

Avoid or Substantially Lessen Project Impacts

No development would occur under this Alternative; therefore, Project related impacts under the environmental categories discussed above would not occur. Thus, all Project impacts would be avoided or lessened.

Attainment of Project Objectives

Alternative A, the "No Project/No Development" Alternative, does not meet the following Project objectives, as described in Section 6.2:

- Cluster commercial retail uses that provide goods and services near an interchange with SR-99 to accommodate interstate freight and reduce traffic congestion and air emissions.
- Accommodate new development that channels land uses in a phased, orderly manner and is coordinated with the provision of infrastructure and public improvements.
- Address community circulation, both vehicular and pedestrian, utilizing available capacity with the existing circulation system, and provide fair-share system improvements to deficient intersections or road segments.

- Facilitate a planned development and related in-line tenants consistent with the market objectives of the applicant and its tenants.
- Accommodate growth within the proposed Project while balancing environmental considerations.
- Provide an industrial center at the Houghton Road and SR-99 interchange in the southern metropolitan area adjacent to the City that would provide a broad range of goods and services that serve the regional market area.
- Allow for the development of a variety of commercial and industrial centers which are differentiated by their function, intended users and level of intensity.
- Provide new industrial development that captures the economic demands generated by the marketplace.
- Provide new development that will assist the County of Kern in obtaining fiscal balance in the years and decades ahead.

Comparative Merits

This Alternative would reduce impacts compared to the proposed Project in all categories. However, this Alternative was rejected because it does not fulfill 9 of the 13 objectives of the proposed Project described in Section 6.2, *Applicant Project Objectives*.

Alternative B - "Buildout Existing General Plan Designation" Alternative

Under Alternative B, the "Buildout Existing General Plan Designation" Alternative, the Project site would be developed to the maximum intensity allowed under the existing General Plan land use designation. Implementation of this Alternative would consist of development on the 314.30-acre Project site under the current land use designation of R-IA (Resource – Intensive Agriculture) and HC (Highway Commercial). The R-IA designation allows the development of dwelling units at a density of one unit per 20 acres. The HC designation allows the development of 7.6 acres for commercial uses. Therefore, this Alternative would yield 15 single-family dwelling units and approximately 132,422 square feet of highway commercial facilities. This number is based on the allowable Floor Area Ratio (FAR) of 0.4. Therefore, 7.6 acres = 331,056 square feet. The maximum allowable building square footage would be 132,422 square feet (331,056 x 0.4 = 132,422).

Impacts Compared to Project Impacts

The following compares environmental impacts associated with Alternative B, the "Buildout Existing General Plan Designation" Alternative, to those identified for the proposed Project.

Aesthetics

Development of 15 residential units and approximately 132,411 square feet of highway commercial facilities associated with this Alternative would slightly alter views of and across the Project site from surrounding uses. Views of the Project site are currently of agricultural activities. Under this Alternative, these views would be replaced with views of fields subdivided into 20-acre parcels, with

one single-family dwelling unit developed on each parcel and the remaining land would consist of approximately 132,411 square feet of highway commercial. This Alternative would result in a less than significant impact related to aesthetics, light and glare due to the limited development proposed and the limited addition of lighting.

Agriculture

As a limited amount of development would be allowed under this Alternative, minor impacts to agricultural uses would occur. However, approximately 306.71 acres of the Project site would remain under agricultural production. This acreage could potentially be broken down into 20-acre parcels, which could remain in agricultural production. In addition, this Alternative would not require an agricultural preserve exclusion. Therefore, impacts would be less than the impacts for the proposed Project.

Air Quality

Implementation of this Alternative would result in 15 residential units and approximately 132,422 square feet of highway commercial facilities; which would result in a reduction of construction activities and traffic trips. This lower intensity of development would result in a smaller amount of particulate matter greater than 10 microns (PM_{10}) being released during construction activities, compared to the proposed Project. Additionally, the smaller volume of Project-related traffic would result in lower air pollutant emissions associated with traffic. However, this Alternative would still result in a cumulatively significant impact to air quality given the increase in daily trips associated with the increased development.

Biological Resources

Alternative B, the "Buildout Existing General Plan Designation" Alternative, would result in the development of up to 15 single-family residential units, with one unit per 20 acres, and 132,422 square feet of highway commercial on 7.6 acres. Impacts to biological resources would still occur; however, they would be reduced from that of the proposed Project because of the lower intensity of development. Individual dwelling unit locations could be customized as to avoid biologically sensitive areas. The area designated for highway commercial land uses is in the southwest corner of the Project site, adjacent to Houghton Road and SR-99. Overall, this Alternative would result in reduced impacts when compared to the proposed Project; however, compliance with the Metropolitan Bakersfield Habitat Conservation Plan (MBHCP) would be required.

Cultural Resources

This Alternative would have a reduced footprint size because of the introduction of up to 15 dwelling units and a maximum of 132,422 square feet of highway commercial facilities. Therefore, the intensity of development would be less, and less ground disturbing activities would be required. However, similar mitigation measures identified for the proposed Project would be applicable to this Alternative to reduce potential impacts to undocumented cultural and paleontological resources within the areas of the site to be developed.

Energy

Implementation of this Alternative would result in the construction of 15 residential units and 132,422 square feet of highway commercial; which would result in a reduction of construction activities and traffic trips as compared to the proposed Project. The reduced intensity of project development would reduce the amount of energy needed for construction as well as operation of the proposed Project. The reduced ultimate size of the proposed Project also would reduce the overall demand for energy needed for project operation over the long-term. However, the Alternative would include residential uses but a reduction in overall population and vehicle trips. This would result in decreased energy use compared to the proposed Project. This Alternative also would be required to comply with all state and local regulations pertaining to energy reduction and use of alternative energy sources. Although conformance to the green energy requirements would still be required for this Alternative, this would result in further reduced impacts associated with Energy use.

Geologic Resources

Under this Alternative, residential structures would be introduced to the Project site. The site conditions within the development area would remain the same as the proposed Project. Therefore, the geologic resources impacts would be similar to those identified for the proposed Project, including seismic activity, soil erosion and soil conditions. Any existing regulations and mitigation measures identified for the proposed Project would be applicable to this Alternative.

Greenhouse Gases

Implementation of this Alternative would result in the construction of 15 residential units and 132,422 square feet of highway commercial; which would result in a reduction of construction activities and traffic trips as compared to the proposed Project. Additionally, the smaller volume of Project-related traffic would result in substantially lower air pollutant emissions associated with traffic. Although smaller, greenhouse gas emission impacts would need to be mitigated in order to reduce the business as usual (BAU) greenhouse gas emissions by 29 percent to be consistent with the standards established by the California Air Resources Board and the California Global Warming Solutions Act of 2006. Therefore, greenhouse gas emissions impacts would be similar to the proposed Project.

Hazards/Hazardous Materials

Similar to the proposed Project, implementation of Alternative B, the "Buildout of the Existing General Plan" Alternative, would result in potentially significant impacts on public health and safety. With the development of approximately 15 residences and 132,422 square feet of highway commercial, this Alternative would reduce the potential of the transport of hazardous materials. Alternative B, "Buildout Existing General Plan Designation" Alternative, would have a similar impact on the existing PG&E pipeline as the proposed Project. In addition, closure of the prospect well would continue to be required. With the development of 15 single-family homes and 132,422 square feet of highway commercial facilities, this Alternative would expose individuals to similar effects associated with agricultural land uses (i.e., soil contamination, noise, dust). This Alternative would replace a large number of people working on-site, with a smaller number of workers and a small number of people living within the Project boundaries; therefore, public health and safety

impacts would be similar to those of the proposed Project. The mitigation measures identified for the proposed Project would be included in this Alternative.

Hydrology and Water Quality

Development in accordance with the existing General Plan Designation would result in similar impacts to the proposed Project. No change in the usage of groundwater would occur, similar to the proposed Project**.** Implementation and compliance with the NPDES, SUSMP and BMP requirements would reduce construction-related impacts on water quality to a less than significant level.

Land Use and Relevant Planning

This Alternative would not require a GPA, ZCC, annexation into the City, or an Agricultural Preserve exclusions as it proposes to develop the Project site in accordance with the current land use designation. This Alternative would be consistent with land uses identified in the General Plan. Implementation of this Alternative would provide a maximum of 132,422 square feet of highway commercial on 7.6 acres and up to 15 dwelling units on approximately 306.71 acres. The development intensity and subsequent environmental impacts would be less than those identified for the proposed Project.

Mineral Resources

This Alternative proposes to provide up to 132,422 square feet of highway commercial facilities and up to 15 dwelling units. The existing abandoned exploration well would not necessarily be required to be altered. Therefore, overall, this Alternative would result in reduced levels of impacts on mineral resources than the proposed Project, as access to the existing wells would remain available.

Noise

Under Alternative B, the Buildout Existing General Plan Designation Alternative, the Project site would be developed with up to 15 residences on 20-acre parcels and 132,422 square feet of highway commercial facilities. Mitigation measures similar to the proposed Project would be applied to ensure short-term construction impacts remain less than significant. This Alternative would introduce new noise-sensitive land uses as a result of the development of up to 15 dwelling units. Noise from introduced traffic would be reduced for the overall project site; however, the highway commercial would experience a higher volume of ingress and egress customers to the southwest corner of the Project site. The potential for increased noise due to higher traffic volumes at the highway commercial property would be minor. The development of residential instead of industrial land uses would reduce noise impacts as compared to the proposed Project. Therefore, overall, this Alternative would result in reduced noise impacts as compared to the proposed Project.

Population and Housing

Alternative B, the "Buildout Existing General Plan Designation" Alternative, would result in a direct increase in population because it would introduce 15 new residences to Kern County. These 15 residences could increase the Kern County Population by approximately 47 people, assuming an

average of 3.096 persons per household[1], an increase compared to the proposed Project. An increase of approximately 47 people is within the Metropolitan Bakersfield General Plan forecast for anticipated population growth for the area. The introduction of approximately 132,422 square feet of highway commercial development is less than the proposed Project. Impacts under Alternative B would be slightly more than those identified for the proposed Project because of the introduction of residential land uses.

Public Services and Utilities

Alternative B, the "Buildout Existing General Plan Designation" Alternative, would result in the introduction of approximately 15 dwelling units to the Project site. Highway commercial facilities would be provided in the southwest corner of the Project site. The introduction of residents would result in additional public service requirements not needed under the proposed Project. Utility services required may be reduced because there would be an overall reduction in the size of the proposed Project and the developed area within the site. Therefore, overall impacts to public services would be greater for this Alternative than the proposed Project; however, impacts to utilities would be reduced when compared to the proposed Project.

Traffic and Circulation

Development of this Alternative would have no industrial uses and would introduce 15 dwelling units and approximately 132,422 square feet of highway commercial. This changes the site population from employees to residents and a small number of employees, resulting in an overall smaller population within the Project site and consequently fewer average daily vehicle trips (ADT) as compared to the proposed Project. Because of the smaller number of trips when compared to the proposed Project, this Alternative would result in a less than significant impact on the intersections and roadway segments surrounding the Project site. Overall, Alternative B, the "Buildout Existing General Plan Designation" Alternative, would result in a lesser impact on circulation compared to the proposed Project.

Wildfire

This Alternative proposes to provide up to 132,422 square feet of highway commercial facilities and up to 15 dwelling units. Under this alternative, surrounding land uses would not change and the change in on-site land uses would not change the findings related to wildfires. Therefore, the potential for the Project site to be affected by wildfire from adjacent areas would be the same and no changes or impacts associated with wildfire would occur.

[1] Average persons per household as determined by the Department of Finance and discussed in this EIR under Section 4.14, *Population and Housing*. 15 residences * 3.156 persons per household = approximately 47 people.

Conclusion

Avoid or Substantially Lessen Project Impacts

This Alternative would lessen impacts associated with aesthetics, biological resources, land use and relevant planning, noise, public services, utilities and traffic and circulation. However, there would still be significant and unavoidable impacts ~~to~~ on cumulative air quality. Additionally, if septic systems were proposed, then there could be additional impacts to hydrology and water quality, that were not considered with the proposed Project.

Attainment of Project Objectives

Alternative B, the "Buildout Existing General Plan Designation" Alternative, does not necessarily meet the proposed Project objectives, but would require similar mitigation measures to those that are currently proposed. Generally, Alternative B does not meet the following objectives:

- Ensure that the project, in and of itself, does not contribute to the conversion of adjacent agricultural areas.
- Address community circulation, both vehicular and pedestrian, utilizing available capacity with the existing circulation system, and provide fair-share system improvements to deficient intersections or road segments.
- Facilitate a planned development and related in-line tenants consistent with the market objectives of the applicant and its tenants.
- Provide an industrial center at the Houghton Road and SR-99 interchange in the southern metropolitan area adjacent to the City that would provide a broad range of goods and services that serve the regional market area.
- Allow for the development of a variety of commercial and industrial centers which are differentiated by their function, intended users and level of intensity.
- Provide new industrial development that captures the economic demands generated by the marketplace.
- Provide new development that will assist the County of Kern in obtaining fiscal balance in the years and decades ahead.

Comparative Merits

This Alternative would reduce impacts compared to the proposed Project in the categories of aesthetics, agriculture, air quality, biological resources, greenhouse gases, land use and relevant planning, noise, public services and utilities and traffic and circulation; and would have equivalent impacts in the categories of cultural resources, geologic and seismic hazards, hazards/hazardous materials, hydrology and water quality, and mineral resources.

Alternative C - "Reduced Density" Alternative

Under Alternative C, the "Reduced Density" Alternative, the Project site would be developed under the LI (Light Industrial) and SI (Service Industrial) land use designation; however, the industrial facilities would be reduced in area. This Alternative would develop the entire 314.30-acre Project site; however, the square footage of industrial facilities would be reduced by approximately 25 percent. This results in the development of approximately 3,459,753 square feet of light and medium industrial facilities. The Project site would continue to require a GPA, ZCC, annexation, and exclusion from Agricultural Preserve Number 13.

Impacts Compared to Project Impacts

The following discussion evaluates the potential environmental impacts associated with Alternative C, the "Reduced Density" Alternative, compared to impacts of the proposed Project.

Aesthetics

Under this Alternative, the aesthetic impacts would be similar to the proposed Project. This Alternative would continue to develop the entire proposed Project site, therefore, even though the size of the facilities will be reduced, the site would result in similar impacts from site illumination and conversion of open space to a permanent urban environment. Short-term construction impacts would occur under this Alternative, such impacts would be considered equivalent to the proposed Project impacts. Impacts from urban decay would be slightly less than those resulting from the proposed Project because this Alternative would result in fewer industrial and showroom facilities. On a cumulative level, implementation of this Alternative would result in a similar to the proposed Project.

Agriculture

This Alternative would result in the loss of agricultural land over the entire Project site. Agricultural land uses would not occur under this alternative. An exclusion from Agricultural Preserve Number 13 would continue to be required. Therefore, impacts would remain significant and unavoidable.

Air Quality

The "Reduced Density" Alternative would construct approximately 3,459,753 square feet of medium industrial facilities. The reduced size of the facilities would ultimately reduce the number of workers at the site and would therefore have fewer vehicle trips, compared to the proposed Project. As a result, this Alternative would slightly reduce PM_{10} and air pollutant emissions, compared to the proposed Project. Mitigation measures addressing long-term Project emissions similar to the proposed Project would be implemented under this Alternative, therefore, impacts under this Alternative would be similar to those of the proposed Project. Construction impacts to air quality would be similar to the proposed Project.

Biological Resources

This Alternative would occupy the same land as the proposed Project, even though the industrial facilities would be reduced in size. The Alternative would result in similar impacts as the proposed Project. Similar to the proposed Project, development of the site under this Alternative would be

required to fully comply with the applicable provisions of the MBHCP to mitigate for the conversion of undeveloped land to an urbanized condition. Additionally, mitigation measures similar to those recommended for the proposed Project would be required to reduce potential biological impacts, especially to burrowing owl and San Joaquin kit fox. Impacts would be the same under this Alternative as the proposed Project.

Cultural Resources

Because Alternative C, the "Reduced Density" Alternative, would occupy the same land as the proposed Project, the impacts for cultural resources would continue to be less than significant because no cultural resources were identified. Additionally, mitigation measures required for grading and construction activities for the proposed Project would apply to the same activities for this Alternative and would therefore result in less than significant impacts on undiscovered cultural resources. With regard to cultural resources, Alternative C, the "Reduced Density" Alternative, would be neither environmentally superior nor environmentally inferior to the proposed Project.

Energy

Implementation of this Alternative would result a slightly "Reduced Density" of development of on the Project site resulting in a slight reduction in the overall energy use. Although there is a similar amount of land that would be disturbed, fewer structures would be constructed and this alternative includes a reduction in overall Project square footage. This Alternative would be required to comply with all state and local regulations pertaining to energy reduction and use of alternative energy sources. Although conformance to the green energy requirements would still be required for this alterative, overall, the reduced intensity of this Alternative would reduce the amount of energy needed compared to the proposed Project.

Geologic and Seismic Hazards

Since the Project area would occupy the same area as the proposed Project, the geologic and seismic hazard impacts would be equivalent to those identified for the proposed Project, including seismic activity, soil erosion and soil conditions. Alternative C, the "Reduced Density" Alternative, would have equivalent impacts as the proposed Project and the same existing regulations and mitigation measures identified for the proposed Project would be applicable to this Alternative.

Greenhouse Gases

Implementation of this Alternative would result in 3,459,753 square feet of industrial building space to be constructed on the proposed Project site. Construction would continue to occur on the entire property; therefore, construction emissions would be similar to the proposed Project. Because this Alternative would result in slightly fewer workers, a slight reduction in traffic trips would occur as compared to the proposed Project; therefore, the long-term air quality impacts would be slightly less than the proposed Project. Greenhouse gas emission impacts would need to be mitigated in order to reduce the business as usual (BAU) greenhouse gas emissions by 29 percent to be consistent with the standards established by the California Air Resources Board and the California Global Warming Solutions Act of 2006. Therefore, greenhouse gas emissions impacts would be similar to the proposed Project.

Hazards/Hazardous Materials

Similar to the proposed Project, implementation of Alternative C, the "Reduced Density" Alternative, would result in potentially significant impacts on public health and safety. This Alternative includes the disturbance of a portion of the Project site for development of 3,459,753 square feet of industrial building space, slightly less than the proposed Project; therefore, this Alternative would slightly reduce the potential of the transport of hazardous materials. This Alternative would have a similar impact on the existing PG&E pipeline as the proposed Project. In addition, closure of the prospect well would continue to be required. This Alternative would expose individuals to similar effects associated with agricultural land uses (i.e., soil contamination, noise, dust). This Alternative would slightly reduce the number of people working on-site; however, public health and safety impacts would be similar to those of the proposed Project. The mitigation measures identified for the proposed Project would be included in this Alternative.

Hydrology and Water Quality

Development in accordance with this Alternative would result in similar amounts of impervious surfaces and, therefore, similar amounts of runoff volumes compared to the proposed Project. Water consumption would be slightly less than water usage under the proposed Project; however, the impacts would remain similar to those of the proposed Project. As with the proposed Project, this Alternative would comply with standard County provisions related to the incorporation of sufficient storm drain infrastructure to reduce the amount of surface runoff. Implementation and compliance with the NPDES, SUSMP and standard BMP requirements would reduce construction-related impacts on water quality to a less than significant level. Mitigation measures similar to the proposed Project would be applied to ensure short-term water quality construction impacts remain less than significant.

Land Use and Relevant Planning

Implementation of this Alternative would continue to require a GPA, ZCC, annexation, and an agricultural preserve exclusion on 314.30 acres to allow the development of approximately 3,459,753 square feet of light and industrial facilities. Industrial facility square footage would be reduced by 25 percent as compared to the proposed Project. Annexation into the City and agricultural preserve exclusion would still be required. Land use impacts resulting from this Alternative would be similar to the proposed Project because the entire 314.30-acre site would continue to be developed.

Mineral Resources

Although Alternative C, the "Reduced Density" Alternative, would have less intensity of development, the abandoned exploration well would continue to require reabandonment. This Alternative would result in similar impacts to mineral resources as the proposed Project due to the presence of the abandoned exploration oil well on-site.

Noise

Under this Alternative, the number of vehicles would be reduced because the square footage of industrial facilities would be reduced. Therefore, the noise from vehicle trips would be reduced in

comparison to the proposed Project. Noise from implementing the Alternative would be reduced slightly when compared to the proposed Project, because the development intensity would be reduced by approximately 25 percent. Mitigation measures similar to the proposed Project would be applied to ensure short-term construction impacts remain less than significant. Overall, with implementation of noise mitigation measures, noise impacts would be the slightly reduced when compared to the proposed Project.

Population and Housing

Alternative C, the "Reduced Density" Alternative, would reduce the proposed Project size by approximately 25 percent, resulting in the development of approximately 3,459,753 square feet of medium and light industrial facilities. The labor force needed for this Alternative would be less than the labor force needed for the proposed Project. Therefore, the impacts under Alternative C would be less than those identified for the proposed Project. Impacts would remain less than significant.

Public Services and Utilities

The demand for public services and utilities generated at the Project site would be reduced by approximately 25 percent. The reduced square footage for industrial facilities would result in fewer employees and fewer industrial businesses within the Project site, which would in turn have lesser impacts on public services and utilities. All standard mitigation measures identified under the proposed Project would be required in order to reduce impacts to a less than significant level. Therefore, this Alternative would be neither environmentally superior nor environmentally inferior to the proposed Project.

Traffic and Circulation

The reduced amount of square footage for industrial building space developed under this Alternative would result in a slightly reduced number of employees and delivery trucks, which in turn would result in a slight decrease in average daily vehicle trips (ADT) compared to the proposed Project. Slightly fewer AM and PM peak hour trips and ADT would result in slightly reduced impacts on intersections and roadway segments within the area surrounding the Project site. The temporary impacts on transportation within the area surrounding the Project site would be similar to those with the proposed Project because the proposed construction activities would be similar and short in duration. The planned improvements and mitigation measures identified for the proposed Project would still be applicable under this Alternative in order to reduce impacts to a less than significant level. Overall, impacts on traffic and circulation from this Alternative would be similar to those associated with the proposed Project.

Wildfire

This Alternative would result in a reduced development intensity of the Project Site. Under this alternative; however, surrounding land uses would not change and on-site changes to land uses would not change the findings related to wildfires. Therefore, the potential for the Project site to be affected by wildfire from adjacent areas would be the same and no changes or impacts associated with wildfire would occur.

Conclusion

Avoid or Substantially Lessen Project Impacts

This Alternative would lessen impacts associated with air quality, noise, population and housing, and traffic/circulation.

Attainment of Project Objectives

This Alternative would meet the Project objectives stated in Section 6.2.

Comparative Merits

This Alternative would reduce impacts compared to the proposed Project in the categories of air quality, and noise, ~~and traffic and circulation;~~ and would have equivalent impacts in the categories of aesthetics, agriculture, biological resources cultural resources, geologic and seismic hazards, greenhouse gases, hazards/hazardous materials, hydrology and water quality, land use and relevant planning, mineral resources, population and housing, public services and utilities, and traffic and circulation.

Alternative D - "Reduced Project Size" Alternative

Under Alternative D, the "Reduced Project Size" Alternative, the Project site size would be reduced by approximately 50 percent and the square footage size would be reduced accordingly. Therefore, Alternative D would develop the 159-acre portion of the Project site designated to be SI (Service Industrial) with 2,306,502 square feet of medium industrial facilities, as identified in the proposed Project. The approximately 22-acre General Commercial parcel on the north, the 9.01-acre High Commercial parcel, and the approximately 107.72-acres on the east of the Project site to be designated LI (Light Industrial) would not be developed. Therefore, this Alternative assumes that existing land uses on the northern and eastern portions of the site would remain unchanged, and would remain under their current state as fallow and cultivated land. This Alternative would continue to require the GPA, ZCC, annexation, and Agricultural Preserve Exclusion.

Impacts Compared to Project Impacts

The following discussion evaluates the potential environmental impacts associated with Alternative D, the "Reduced Project Size" Alternative, compared to impacts of the proposed Project.

Aesthetics

Under this Alternative, the aesthetic impacts would be less than the proposed Project. Implementation of this Alternative would involve less development on approximately 159 acres of the proposed Project site and the remaining approximately155.3 acres would remain under the current land uses. Overall, decreasing the amount of developed land would potentially result in less impacts from site illumination and conversion of open space to a permanent urban environment. Short-term construction impacts would occur under this Alternative; however, impacts would be considered less than significant. On a cumulative level, implementation of this Alternative would result in a similar less than significant impact as the proposed Project.

Agriculture

This Alternative would result in development on the approximately 184.58 acres of the Project site. As a result, the amount of agricultural land that would be taken out of production for the development of the industrial facilities would be less than the proposed Project. This Alternative lessens the impact on agricultural resources because the total conversion of farmland would be approximately 50 percent of the proposed Project. However, similar to the proposed Project, impacts to agricultural resources would still result in a significant and unavoidable impact on agriculture resources because of the cumulative loss of agricultural land within Kern County. Alternative D, the "Reduced Project Size" Alternative, would reduce the amount of land taken out of agricultural production; however, significant and unavoidable impacts would remain, as compared to the proposed Project.

Air Quality

The "Reduced Project Size" Alternative would construct approximately 2,306,502 square feet of medium to light industrial facilities. The reduced size of the facilities would ultimately reduce the number of workers at the site and would therefore have fewer vehicle trips, compared to the proposed Project. As a result, this Alternative has the potential to reduce operational PM_{10} emissions by enough to be below the threshold of 15 tons per year. The 50 percent reduction is not expected to reduce other air pollutant emissions below the thresholds. Therefore, this Alternative could slightly, reduce air pollutant emissions, compared to the proposed Project. In addition, mitigation measures addressing long-term Project emissions similar to the proposed Project would be implemented under this Alternative, therefore, impacts under this Alternative would be slightly reduced but would remain very similar to those of the proposed Project. Construction impacts to air quality would be reduced by about half compared to the proposed Project.

Biological Resources

This Alternative would continue to provide industrial services by constructing approximately 2,306,502 square feet of medium industrial facilities. This is a reduction of approximately 50 percent. Development of the SI (Service Industrial) area would continue to impact San Joaquin kit fox, as the majority of the kit fox sign identified for the proposed Project are located within the SI area. However, this Alternative may be able to avoid impacts to burrowing owls, as they are located outside the SI proposed boundary. Overall, impacts to biological resources would be reduced. Although total impacts on sensitive species, and habitat would be less compared to the proposed Project, similar mitigation measures would still be required to reduce impacts to a less than significant level. In addition, this Alternative would be required to comply with the MBHCP.

Cultural Resources

This Alternative would occupy 159 acres of the proposed 314.30 acres of land that the proposed Project would occupy. Because no cultural resources were identified for the Project site, impacts to cultural resources would be the same under this Alternative as under the proposed Project. Mitigation measures required for grading and construction activities would apply to the same activities for this Alternative, and would therefore result in less than significant impacts on undiscovered cultural resources. Thus, this Alternative, with regard to cultural resources, would be similar to the proposed Project.

Energy

Implementation of this Alternative would reduce the project site by approximately 50 percent and reduce the energy demand by approximately 50 percent. This Alternative also would be required to comply with all state and local regulations pertaining to energy reduction and use of alternative energy sources. Therefore, overall the reduced intensity of this Alternative would reduce the amount of energy needed compared to the proposed Project.

Geologic Resources

This Alternative would result in similar geologic impacts to the proposed Project as the surrounding geologic environmental remains the same. Therefore, any development on the Project site is subject to the same impacts due to geologic conditions. Mitigation measures comparable to those recommended for the proposed Project would be incorporated into this Alternative to minimize impacts.

Greenhouse Gases

Implementation of this Alternative would result in 2,306,502 square feet of industrial building space to be constructed on the proposed Project site. Construction would continue to occur on the entire property, therefore construction emissions would be similar to the proposed Project. Because this Alternative would result in slightly fewer workers, a slight reduction in traffic trips would occur as compared to the proposed Project; therefore, the long-term air quality impacts would be slightly less than the proposed Project. Greenhouse gas emission impacts would need to be mitigated in order to reduce the business as usual (BAU) greenhouse gas emissions by 29 percent to be consistent with the standards established by the California Air Resources Board and the California Global Warming Solutions Act of 2006. Therefore, greenhouse gas emissions impacts would be similar to the proposed Project.

Hazards/Hazardous Materials

Similar to the proposed Project, implementation of Alternative C, the "Reduced Density" Alternative, would result in potentially significant impacts on public health and safety. This Alternative includes the disturbance of a portion of the Project site for development of 2,306,502 square feet of industrial building space, slightly less than the proposed Project; therefore, this Alternative would slightly reduce the potential of the transport of hazardous materials. This Alternative would have a similar impact on the existing PG&E pipeline as the proposed Project. In addition, closure of the prospect well would continue to be required. This Alternative would expose individuals to similar effects associated with agricultural land uses (i.e., soil contamination, noise, dust). This Alternative would reduce the number of people working on-site by approximately 50 percent; however, the overall public health and safety impacts would be similar to those of the proposed Project. The mitigation measures identified for the proposed Project would be included in this Alternative.

Hydrology and Water Quality

Development in accordance with this Alternative would result in similar amounts of impervious surfaces and, therefore, slightly smaller amounts of runoff volumes compared to the proposed Project.

Water consumption would be slightly less than water usage under the proposed Project; however, the impacts would remain similar to those of the proposed Project. As with the proposed Project, this Alternative would comply with standard County provisions related to the incorporation of sufficient storm drain infrastructure to reduce the amount of surface runoff. Implementation and compliance with the NPDES, SUSMP and standard BMP requirements would reduce construction-related impacts on water quality to a less than significant level. Mitigation measures similar to the proposed Project would be applied to ensure short-term water quality construction impacts remain less than significant.

Land Use and Relevant Planning

Implementation of this Alternative would continue to require a GPA, ZCC, annexation, and an agricultural preserve exclusion. Alternative D, the Reduced Project Size Alternative, would develop 2,306,502 square feet of medium industrial facilities on approximately 159 acres, approximately 50 percent of the original Project site. Development would occur on the portion of the Project site proposed to be SI (Service Industrial). The remaining 50 percent of the Project site, approximately 155.3 acres, would continue to be used for agricultural purposes. Land use impacts from Alternative D, the Reduced Project Size Alternative, would be proportionally reduced from those of the proposed Project.

Mineral Resources

Alternative D, the "Reduced Project Size" Alternative, would develop only the portion of the Project site proposed to be SI (Service Industrial). The development would not occur in the area of the abandoned well and therefore, reabandonment would not be required under this Alternative. Alternative D, the Reduced Project Size Alternative, would result in reduced impacts on mineral resources as compared to the proposed Project.

Noise

Noise impacts from development under Alternative D, the "Reduced Project Size" Alternative, would be reduced compared to those identified for the proposed Project. The noise that would result during construction activities would be similar to the level that would occur from development of the proposed Project but may occur over a shorter duration due to the small project size. Operational noise would be reduced from the proposed Project because the total square footage of industrial space would be less than the proposed Project. Noise from vehicle trips would also be reduced proportionately to the reduction in industrial facility space. Impacts to the residence along Lamb Avenue, west of South Union Avenue, would be reduced due to the increase distance between the residence and area to be developed. Mitigation measures similar to the proposed Project would be applied and could reduce impacts to less than significant level. Overall, impacts would be proportionally reduced from those of the proposed Project.

Population and Housing

Alternative D, the "Reduced Project Size" Alternative, would reduce the proposed Project size by approximately 50 percent, resulting in the development of approximately 2,306,502 square feet of medium industrial facilities. The labor force needed for this Alternative would, be less than the labor

force needed for the proposed Project. Therefore, the impacts under Alternative D would be less than those identified for the proposed Project.

Public Services and Utilities

This Alternative would develop approximately 50 percent of the Project site. The demand for public services and utilities generated at the Project site would be reduced by approximately 50 percent. The reduced square footage for industrial facilities would result in fewer employees and fewer industrial businesses within the Project site, which would in turn have lesser impacts on public services and utilities. All standard mitigation measures identified under the proposed Project would be required in order to reduce impacts to a less than significant level. Therefore, this Alternative would result in reduced impacts on public services and utilities when compared to the proposed Project.

Traffic and Circulation

The reduced amount of square footage for industrial building space developed under this Alternative would result in a slightly reduced number of employees and delivery trucks, which in turn would result in a slight decrease in average daily vehicle trips (ADT) compared to the proposed Project. Fewer AM and PM peak hour trips and ADT would result in a proportional reduction of impacts on intersections and roadway segments within the area surrounding the Project site. The temporary impacts on transportation within the area surrounding the Project site would be similar to those with the proposed Project because the proposed construction activities would occur in a similar area and require access from the same roadways, but would be shorter in duration. The planned improvements and mitigation measures identified for the proposed Project would still be applicable under this Alternative in order to reduce impacts to a less than significant level. Overall, impacts on traffic and circulation from this Alternative would be proportionally reduced compared to those associated with the proposed Project.

Wildfire

This Alternative would result in a reduced development intensity of the Project Site by approximately 50%. Under this alternative; however, surrounding land uses would not change and on-site changes to land uses, although reduced, would not change the impacts associated with wildfires. Therefore, the potential for the Project site to be affected by wildfire from adjacent areas would be the same and no changes or impacts associated with wildfire would occur.

Conclusion

Avoid or Substantially Lessen Project Impacts

This Alternative would reduce impacts to agriculture, air quality, land use and relevant planning, noise, and traffic/circulation.

Attainment of Project Objectives

Alternative D, the "Reduced Project Size" Alternative, does not meet the following Project objectives, as described in Section 6.2.

- Cluster commercial retail uses that provide goods and services near an interchange with SR-99 to accommodate interstate freight and reduce traffic congestion and air emissions.
- Provide an industrial center at the Houghton Road and SR-99 interchange in the southern metropolitan area adjacent to the City that would provide a broad range of goods and services that serve the regional market area.
- Allow for the development of a variety of commercial and industrial centers which are differentiated by their function, intended users and level of intensity.

Comparative Merits

This Alternative would reduce the impacts compared to the proposed Project in the categories of air quality, noise, and traffic and circulation; and would have equivalent impacts in the categories of aesthetics, agriculture, biological resources cultural resources, geologic and seismic hazards, greenhouse gases, hazards/hazardous materials, hydrology and water quality, land use and relevant planning, mineral resources, population and housing, public services and utilities, and traffic and circulation.

6.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The purpose of the Alternatives evaluation is to develop Project Alternatives that have fewer or no significant impacts compared to the proposed Project. CEQA Section 15126(d)(2) indicates that, if the "No Project/No Development" Alternative is the "Environmentally Superior" Alternative, then the EIR shall also identify an Environmentally Superior Alternative among the other Alternatives. In this case, Alternative A, the "No Project/No Development" Alternative (Existing Conditions), is the environmentally superior Alternative, as it would not result in environmental impacts associated with construction. However, Alternative A, the "No Project/No Development" Alternative, would not satisfy the Project's objectives.

Alternative B, "Buildout Existing General Plan Designation", Alternative C "Reduced Density", and Alternative D "Reduced Project Size", would each result in fewer or equivalent environmental impacts when compared to the proposed Project.

Alternative B "Buildout Existing General Plan Designation", would reduce impacts compared to the proposed Project in the categories of aesthetics, agriculture, air quality, biological resources, energy, greenhouse gases, land use and relevant planning, noise, public services and utilities and traffic and circulation; and would have equivalent impacts in the categories of cultural resources, geologic and seismic hazards, hazards/hazardous materials, hydrology and water quality, mineral resources, and wildfire. This Alternative would only partially satisfy the Project objectives, as no industrial land uses would be developed.

Alternative C "Reduced Density", would reduce impacts compared to the proposed Project in the categories of air quality, energy, noise, and traffic and circulation; and would have equivalent impacts in the categories of agriculture, biological resources cultural resources, geologic and seismic hazards, greenhouse gases, hazards/hazardous materials, hydrology and water quality, and land use and

planning, mineral resources, population and housing, public services and utilities, and wildfire. This Alternative would satisfy the Project objectives.

Alternative D "Reduced Project Size", would proportionally reduce the impacts compared to the proposed Project in the categories of air quality, energy, noise, traffic and circulation, agriculture, biological resources cultural resources, geologic and seismic hazards, greenhouse gases, hazards/hazardous materials, hydrology and water quality, land use and relevant planning, mineral resources, population and housing, public services and utilities, and wildfire. This Alternative could eliminate noise impacts to sensitive receptors, and could eliminate associated impacts with some air pollutant emissions. This Alternative, however, would not satisfy any of the Project objectives.

Although development of the Project site in accordance with one of these Alternatives would result in fewer environmental impacts, only one of the Alternatives would fulfill all of the proposed Project's objectives. In addition, one of the Alternatives would have the potential to avoid significant and unavoidable impacts to agricultural resources. Despite the reduced project specific impacts, implementation would not reduce significant and unavoidable cumulative impacts to agriculture, air quality, greenhouse gases, noise, or traffic.

Based on the reasons stated above, Alternative D, the "Reduced Project Size" Alternative, is the environmentally superior Alternative because it significantly reduces the amount of agricultural land impacted, while reducing other Project specific impacts.

Organizations and Persons Consulted

Chapter 8
Organizations and Persons Consulted

Note: All of the below entities were either notified or contacted directly to ask for or directly receive consultation on their applicable area of expertise in respect to this proposed project. This may not be an all-inclusive list.

State of California

California Resource Agency

Department of Conservation

Office of Historic Preservation

Department of Parks and Recreation

Department of Water Resources

Department of Fish and Wildlife

Department of Health Services

Native American Heritage Commission

Public Utilities Commission

Department of Transportation Division of Aeronautics

Department of Transportation District 06

Department of Toxic Substances Control

Regional Water Quality Control Board Central Valley Region

Regional and Local

California Native Plant Society

Kern County Department of Agriculture

Kern County Public Works Department

Kern County Parks and Recreation

Kern County Planning and Natural Resources Department

Kern County Sheriff Department

Kern County Superintendent of Schools

Kern County Water Agency

Kern Council of Governments

Pacific Gas & Electric Company

San Joaquin Valley Unified Air Pollution Control District

Southern San Joaquin Valley Information Center

Southern California Gas Company

Southern California Edison

Native American Consultation

In accordance with Senate Bill 18 and the California Tribal Consultation guidelines, the appropriate native groups were consulted with respect to the project's potential impacts on Native American places, features, and objects. As of the writing of this report, Staff has not received any comments from consulted tribes with regard to the department's SB 18 request. Staff notes consultation with appropriate Native American groups per Senate Bill 18 requirements has occurred.

SUBJECT: NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR THE CARBON TERRAVAULT 1 (CTV 1) CARBON CAPTURE AND SEQUESTRATION PROJECT BY CALIFORNIA RESOURCES CORPORATION (CRC)

The Kern County Planning and Natural Resources Department as Lead Agency (per CEQA Guidelines Section 15062) has determined that preparation of an Environmental Impact Report (per CEQA Guidelines 15161) is necessary for the proposed project identified below. The Planning and Natural Resources Department solicits the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency may need to use the EIR prepared by our agency when considering your permit or other approval of the project.

You are invited to view the NOP and submit written comments regarding the content of the environmental information in connection with the proposed project should you wish to do so. Due to the limits mandated by State law, your response must be received by **April 4, 2022 at 5:00 p.m**. Comments on the scope and content of the EIR can be submitted to the Kern County Planning and Natural Resources Department at the address shown above or to hooverc@kerncounty.com. A Scoping Meeting will be held on **Friday, March 18, 2021 at 1:30 p.m.**

PROJECT TITLE: Carbon TerraVault 1 (CTV 1) by California Resources Corporation (PP22405); PLN21-01378: ZCC No. 5, Map No. 118; ZCC No. 5, Map No. 119; ZCC No. 4, Map No. 120; CUP No. 13, Map No. 118; CUP No. 5, Map No. 119; CUP No. 3, Map No. 120

PROJECT LOCATION: Central Valley portion of unincorporated Kern County, West side of Elk Hills Road and north Side of Skyline Road, within the Elk Hills Oil Field, approximately 26 miles from the City of Bakersfield (pop. 413,098), approximately 8.5 miles from the City of Taft (pop 8945) and approximately 4 miles from the unincorporated community of Buttonwillow (pop. 1443), also being located within within section 12 of Township 30 South, Range 22 East, sections 7, 8, 17, 18, 22, 25, 26, 27, 35 and 36 of Township 30 South, Range 23 East, and section 31 Township 30 South, Range 24 East, Mount Diablo Base and Meridian (MDBM), County of Kern, State of California.

PROJECT DESCRIPTION: The proposed project is a Conditional Use Permit for a 5,332.34 acre carbon capture and sequestration field, associated Class VI geologic sequestration injection wells and related improvements for storage of Carbon Dioxide (CO_2). The project, Carbon TerraVault 1 (CTV 1), is a wholly

owned subsidiary of California Resources Corporation, the applicant for the project. The project comprises the following area:

Table 1: Project Assessor Parcel Numbers, Existing General Plan Designation, Existing Zoning Classification, Proposed Zone Classification, Acreage

APN	Map No.	Zoning	GP Designation	Sec/T/R	Acreage	Ag. Preserve
157-060-02 PTN	118	A (Exclusive Agriculture)	8.4 Mineral and Petroleum	12/ 30 S/R 22 E	159.50	Ag. Preserve 3 Inclusion: Yes
158-040-07	119	A (Exclusive Agriculture)	8.3 Extensive Agriculture; 8.3/2.1 Extensive Agriculture and Seismic Hazard	7/ 30 S/R 23 E	42.95	Ag. Preserve 3 Inclusion: Yes
158-040-06	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	8/30 S/R 23 E	641.20	
158-070-02	119	A-1 (Limited Agriculture)	8.3 Extensive Agriculture	17/ 30 S/R 23 E	156.44	
158-070-03 PTN	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	17/ 30 S/R 23 E	154.38	
158-070-01 PTN	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	18/ 30 S/R 23 E	319.06	
158-080-06 PTN	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	22/ 30 S/R 23 E	160.89	
158-090-03 PTN	119	A-1 (Limited Agriculture)	8.3 Extensive Agriculture	25/ 30 S/R 23 E	340.82	

158-090-02	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	26/ 30 S/R 23 E	637.78	
158-090-01	119	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum	27/ 30 S/R 23 E	637.54	
158-090-19	119	A (Exclusive Agriculture)	8.4 Mineral and Petroleum; 8.3/2.1 Extensive Agriculture & Seismic Hazard	35/ 30 S/R 23 E	637.89	Ag. Preserve 3 Inclusion: Yes
158-090-04	119	A (Exclusive Agriculture)	8.4 Mineral and Petroleum	36/ 30 S/R 23 E	683.74	Ag. Preserve 3 Inclusion: Yes
159-280-07 PTN	120	A-1 (Limited Agriculture)	8.4 Mineral and Petroleum; 8.4/2.4 Extensive Agriculture/ Steep Slope	31/ 30 S/R 24 E	160.15	
				Total Acres	5,332.34	

The proposed project site is located within the Elk Hills Oil Field which comprises approximately 75 square miles (47,800-acre) complex with surface and mineral rights privately held by CRC in the San Joaquin Valley of unincorporated Kern County. The surrounding area is comprised of agricultural fields, both active and fallow, and other existing oilfields. They include the Midway – Sunset Oil Field, McKittrick Oilfield and Cymric Oil Field. Skyline Road is closed to public entry and is the southern boundary of the project. Skyline Road connects to Elk Hills Road, which connects the town of Taft, to the south, with Buttonwillow to the north. California Resource Corporation's gated and guarded entrance to the field is located at the western intersection of Skyline Drive and Elk Hills Road.

The proposed project would take local industrial sources of CO_2 that are transported by a combination of truck, pipeline and/or rail to the dedicated Class VI injection wells for the project. Potential sources and locations of sources will be specifically identified and analyzed to the extent legally required by CEQA in the Draft EIR. The CO_2 would then be injected into identified geographically confined reservoirs for storage in perpetuity. This area has been identified as a location suitable for such storage and a potential to provide a contribution to the goals of California for carbon neutrality by 2045 by reducing industrial uses to no net contribution and potentially supporting direct removal of CO2 from the air. California executive order B-55-18 mandates that the state achieve carbon neutrality by 2045 and maintain net negative emissions thereafter (https://livermorelabfoundation.org/2019/12/19/getting-to-neutral/). The project, as proposed, has the capacity for up to 48 million metric tons of estimated storage and capable of sequestrating over 1.5 million metric tons of CO_2 per year.

Implementation of the project would require permits from the Federal Environmental Protection Agency (EPA) for four (4) to six (6) Class VI injection wells in compliance with the UIC program Class VI geologic

sequestration regulations. Location of the proposed Class VI injection wells will be within the proposed CUP boundary of 5,332.34 acres. All employee facilities needed to manage the project will be provided by the existing Elk Hills oil field facilities.

Implementation of the project as proposed includes the following requests:

- Zone Change Case (ZCC No. 5, Map No. 118; ZCC No. 5, Map No. 119; ZCC No 4, Map No. 120); : From A-1 (Limited Agriculture) to A (Exclusive Agriculture) on approximately 3,208 acres; and
- Issuance of three (3) Conditional Use Permits (CUP No. 13, Map No. 118; CUP No. 5, Map 119; CUP No. 3, Map No. 120) to allow for the construction and operation of a 5,332.34-acre carbon capture and sequestration field and accessory infrastructure with a CO_2 storage capacity of 48 million metric tons, within the A (Exclusive Agriculture) Zone District. Carbon Capture and Sequestration (CCS) has been determined to be a storage operation and not a manufacturing operation and under the Kern County Zoning Ordinance, Section 19.08.085. And under the authority of Section 19.06.020. Storage of CCS in either existing formations or tanks is an allowed use with a Conditional Use Permit (CUP) in the following districts:
    - A District (Exclusive Agriculture)
    - M-2 District (Medium Industrial)
    - M-3 (Heavy Industrial)

TO: Surrounding Property Owners within 1,000 Feet of Project Boundary; and, Interested Parties

FROM: Kern County Planning and Natural Resources Department
2700 "M" Street, Suite 100
Bakersfield, CA 93301

SUBJECT: Notice of Preparation of an Environmental Impact Report – Carbon TerraVault 1 by California Resources Corporation (PP22405)

Dear Sir or Madam:

The Kern County Planning and Natural Resources Department has determined that preparation of an Environmental Impact Report (EIR) is necessary for the proposed project identified below. The purpose of this letter is to notify interested parties and surrounding property owners within 1,000 feet of the project boundaries of this determination. A copy of the Initial Study/Notice of Preparation (IS/NOP) prepared for this proposed project is available for viewing at the following Kern County website:

https://kernplanning.com/planning/notices-of-preparation/

The purpose of the IS/NOP is to describe the proposed project, specify the project location, and to identify the potential environmental impacts of the project so that Responsible Agencies and interested persons can provide a meaningful response related to potential environmental concerns that should be analyzed in the Environmental Impact Report.

You are invited to view the NOP and submit written comments regarding the scope and content of the environmental information in connection with the proposed project should you wish to do so. Due to the limits mandated by State law, your response must be received by **April 4, 2022 at 5:00 p.m**. Comments can be submitted to the Kern County Planning and Natural Resources Department at the address shown above or to hooverc@kerncounty.com. A Scoping meeting will be held on **Friday, March 18, 2022 at 1:30 p.m.**, at the address listed above.

Please be advised that any comments received after the dates listed above will still be included in the public record for this project and made available to decision makers when this project is scheduled for consideration at a public hearing. Please also be advised that you will receive an additional notice in the mail once a public hearing date is scheduled for this project. You will also be provided additional opportunities to submit comments at that time.

PROJECT TITLE: Carbon TerraVault 1 (CTV 1) by California Resources Corporation (PP22405); PLN21-01378: ZCC No. 5, Map No. 119; CUP No. 5, Map No. 119

PROJECT LOCATION: Central Valley portion of unincorporated Kern County, west side of Elk Hills Road and north side of Skyline Road, within the Elk Hills Oil Field, approximately 26 miles from the City of Bakersfield, approximately 8.5 miles from the City of Taft, and approximately 4 miles from the unincorporated community of Buttonwillow, also being located within sections 7, 8, 9, 10, 13, 15, 16, 17,

18, and 26 of Township 30 South, Range 23 East, Mount Diablo Base and Meridian (MDBM), County of Kern, State of California.

PROJECT DESCRIPTION: The proposed project is a Conditional Use Permit for a 5,745.44 acre carbon capture and sequestration field, associated Class VI geologic sequestration injection wells, and related improvements for storage of Carbon Dioxide (CO_2). The project, Carbon TerraVault 1 (CTV 1), is a wholly owned subsidiary of California Resources Corporation, the applicant for the project.

Implementation of the project as proposed includes the following requests:

a) Zone Change Case # 5, Map 119:From A-1 (Limited Agriculture) to A (Exclusive Agriculture) on approximately 4,465 acres; and

b) Issuance of Conditional Use Permit #5, Map 119 to allow for the construction and operation of a 5,745.44-acre carbon capture and sequestration field and accessory infrastructure with a CO_2 storage capacity of 48 million metric tons, within the A (Exclusive Agriculture) Zone District. Carbon Capture and Sequestration (CCS) has been determined to be a storage operation under the Kern County Zoning Ordinance, Section 19.08.085 and Section 19.06.020. Therefore, CCS in either existing formations or tanks is an allowed use with a Conditional Use Permit (CUP) in the following districts:

   - A District (Exclusive Agriculture)
   - M-2 District (Medium Industrial)
   - M-3 (Heavy Industrial)

Should you have any questions regarding this project, or the Initial Study/Notice of Preparation, please feel free to contact me at (661) 862-8629 or hooverc@kerncounty.com

Sincerely,

Cindi Hoover, Supervising Planner
Advanced Planning Division

Project Description: The Carbon TerraVault 1 Project, as proposed by California Resources Corporation would develop an approximate 5,745 acre carbon capture and sequestration field, associated Class VI geologic sequestration injection wells, and related improvements for storage of Carbon Dioxide (CO_2). The proposed project would take local industrial sources of CO_2 that are transported by a combination of truck, pipeline and/or rail to the dedicated Class VI injection wells for the project. Potential sources and locations of sources will be specifically identified and analyzed to the extent legally required by CEQA in the Draft EIR. The CO_2 would then be injected into identified geographically confined reservoirs for storage in perpetuity. This area has been identified as a location suitable for such storage and a potential to provide a contribution to the goals of California for carbon neutrality by 2045 by reducing industrial uses to no net contribution and potentially supporting direct removal of CO2 from the air. California executive order B-55-18 mandates that the state achieve carbon neutrality by 2045 and maintain net negative emissions thereafter. The project, as proposed, has the capacity for up to 40 million metric tons of estimated storage and capable of sequestrating over 1 million metric tons of CO_2 per year.

INTRODUCTION

Pursuant to the California Environmental Quality Act (CEQA), the Kern County Planning and Natural Resources Department (County) will initiate the preparation of an Environmental Impact Report (EIR) for the Carbon TerraVault 1 Carbon Capture and Sequestration Project in the unincorporated area of western Kern County, California.

Project Description

Project Location

The proposed Carbon TerraVault 1 Carbon Capture and Sequestration Project (proposed project) is a proposal by Carbon TerraVault 1, LLC (CRC) (project proponent) to construct and operate a carbon capture and sequestration (CCS) field on approximately 5,332 acres of privately owned land. The CCS field would include four to six injection wells and associated infrastructure, capable of storing approximately 48 million metric tons of Carbon Dioxide (CO_2) within identified geographically confined reservoirs.

The project site is located in the Central Valley portion of unincorporated Kern County, on the west side of Elk Hills Road and the north side of Skyline Road, within the administrative boundary of the Elk Hills Oil Field, approximately 26 miles from the City of Bakersfield (pop. 413,098) , approximately 8.5 miles from the City of Taft (pop 8945), and approximately 4 miles from the unincorporated community of Buttonwillow (pop. 1443), also being located within Sections 7,8,9,10,13,15,16,17,18,26 of Township 30 South, Range 23 East, Mount Diablo Base and Meridian (MDBM), County of Kern, State of California. Please see *Figure 1: Regional Vicinity Map.*

The project site is made up of ten (10) privately owned parcels totaling approximately 5,332 acres of land, predominately developed with oil and gas production and accessory facilities and infrastructure. Please see *Figure 2: Existing Parcel Map.* The total study area for this project includes the entirety of the confined reservoir proposed for CO_2 sequestration.

Primary access to the project site would be via existing access at the western intersection of Skyline Drive and Elk Hills Road. The access road connects to a network of existing dirt roads within the field, depending on the final locations of the injection wells and accessory facilities and infrastructure new internal access roads may be constructed. These new roads would most likely be compacted dirt roads as well. Please see *Figure 3: Aerial Photograph.*

Environmental Setting

The proposed project is located on approximately 5,332acres of privately-owned land located in the south-western extent of Kern County, California. Portions of the project site is located within the boundaries of Agricultural Preserve No. 3, however none of the parcels are currently subject to a Williamson Act Land Use Contract. The project is in the administrative boundary of the Elk Hills Oil Field and the United States Geological Survey (USGS) Elk Hills and West Elk Hills 7.5-minute topographical quadrangle. Development in the area surrounding the project site is predominantly oil and gas production and agricultural.

The project site is within the San Joaquin Valley Air Basin, under the regulatory authority of the San Joaquin Valley Air Pollution Control District. The Federal Emergency Management Agency (FEMA) delineates flood hazard areas on its Flood Insurance Rate Maps (FIRMs). According to the FIRMs for the project area, the project site is designated Flood Zone X; which indicates the site is outside of the 0.2% annual chance floodplain.

The project site is not designated by the California Department of Conservation (DOC) as Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. The project site is designated *Urban Built-Up Land* and *Vacant or Disturbed Land*. Please see *Figure 4: Important Famland.* There is land designated as Non-Prime Farmland, which is subject to a Williamson Act land Use Contract, immediately adjacent to the west of the project site. Please see *Figure 5: Williamson Act Land*

The project site is not within a mineral recovery area, however seven parcels are within designated mineral and petroleum resource site designated by the Kern County General Plan. The project site is not located within the County's NR (Natural Resources) or PE (Petroleum Extraction) Zone Districts. *Table 1: Project Assessor Parcel Numbers, Existing Map Codes, Existing* Zoning, *and Acreage*, below identifies the individual parcels, their respective assessor parcel numbers (APN), acreages, and existing general plan and zoning designations. Please see *Figure 6: Existing General Plan Designations*, and *Figure 7: Existing Zoning Classifications*.

Table 1: Project Assessor Parcel Numbers, Existing Map Codes, Existing Zoning, and Acreage

APN	Existing Map Code Designation	Existing Zoning	Proposed Zoning	Section/Township / Range	Acres	Agricultural Preserve Inclusion
157-060-02	8.4	A	A	12/30 S/R 22 E	159.50*	Ag Preserve No. 3
158-040-07	8.3/2.1	A	A	7/ 30 S/R 23 E	642.85	Ag Preserve No. 3

159-280-07	8.4	A-1	A	31/ 30 S/R 24 E	160.15*	
Project Totals					5,332.34	

* = Represents a portion of total APN acreage.

General Plan Map Code:

8.3 = Extensive Agriculture (Min. 20 Acre Parcel Size)
8.4 = Mineral and Petroleum
2.1 = Seismic Hazard Overlay
2.4 = Steep Slope Overlay

Zone Designation:

A = Exclusive Agriculture
A-1 = Limited Agriculture

Surrounding Land Uses

Table 2, Existing Project Site and Surrounding Properties, Existing Land Use, General Plan Map Code Designations, and Zoning, identifies the existing land use, the existing general plan land use designation, and the existing zoning for each of the two parcels within the project site. Additionally, such conditions are described for adjacent lands to the north, east, south, and west of the project site.

Table 2: Existing Project Sites and Surrounding Properties, Existing Land Use, General Plan Map Code Designations, and Zoning

Location	Existing Land Use	Existing General Plan Map Code Designations	Existing Zoning
Project Site	**Oil and Gas Exploration and Production**	**8.3 (Extensive Agriculture; 8.3/ 2.1 (Extensive Agriculture Seismic Hazard Overlay) 8.4 (Mineral and Petroleum)**	**A (Exclusive Agriculture) A-1 (Limited Agriculture)**
North	Oil and Gas Exploration and Production; Oil and Gas Ancillary Services Undeveloped Private Lands; Elk Hills/Buttonwillow Airport Landing	8.3 (Extensive Agriculture); 8.3/2.1 (Extensive Agriculture and Seismic Hazard); 8.4 (Mineral and Petroleum); 1.1 (State or Federal Land)	A (Exclusive Agriculture); A-1 (Limited Agriculture); PL RS MH (Platted Lands, Residential Suburban Combining, Mobile home Combining); AH (Exclusive Agriculture, Airport Approach Height Combining)
South	Oil and Gas Exploration and Production	8.4 (Mineral and Petroleum)	A-1 (Limited Agriculture)
East	Oil and Gas Exploration and Production	8.3 (Extensive Agriculture); 8.4 (Mineral and Petroleum)	A (Exclusive Agriculture); A-1 (Limited Agriculture); A-1 H (Limited Agriculture, Airport Approach Height Combining)
West	Oil and Gas Exploration and Production	8.3 (Extensive Agriculture); 8.3/2.1 (Extensive Agriculture and Seismic Hazard); 8.4 (Mineral and Petroleum)	A (Exclusive Agriculture)

Existing land use in the vicinity of the project site generally includes oil and gas exploration and production and agricultural lands. The sensitive receptor closest to the project site is the rural residence approximately 1 mile to the south of the project site. Lost Hills Wonderful Park, a local park, is located approximately 14 miles southeast of the project site. The closest schools to the site are the McKittrick Elementary School and the Buttonwillow Elementary School, located approximately 4.5 miles southwest and north, respectively, of the project site. The Elk Hills Elementary is located approximately 6 miles east of the project site.

The proposed project would be served by the Kern County Sheriff's Department for law enforcement and public safety services, with the closest substation being the Taft Area Substation, located at 315 N. Lincoln Street. Fire protection and emergency medical services would be provided by the Kern County Fire Department, with the closest station being Fire Station #25, located at 100 Mirasol Avenue, and Kern County Emergency Medical Services for medical care and emergency services.

The nearest public airport to the project site is the Elk Hills - Buttonwillow Airport located adjacent to the northeast corner of the project. The portion of the project site is located within Zone C of the Elk Hills-Buttonwillow Airport Land Use Compatibility Plan (ALUCP).

Project Description

Project Overview

The proposed project is a Conditional Use Permit for a 5,332.34 acre carbon capture and sequestration field, associated Class VI geologic sequestration injection wells and related improvements for storage of Carbon Dioxide (CO_2). The project, Carbon TerraVault 1 (CTV 1), is a wholly owned subsidiary of California Resources Corporation, the applicant for the project. The project comprises the area shown in *Table 1: Project Assessor Parcel Numbers, Existing Map Codes, Existing* Zoning, *and Acreage, above.*

The proposed project site is located within the Elk Hills Oil Field which comprises an approximately 75- square mile (47,800 acre) complex, with surface and mineral rights privately held by CRC, in the San Joaquin Valley of unincorporated Kern County. The surrounding area is comprised of agricultural fields, both active and fallow, and other existing oilfields. They include the Midway – Sunset Oil Field, McKittrick Oilfield and Cymric Oil Field. Skyline Road is closed to public entry and is the southern boundary of the project. Skyline Road connects to Elk Hills Road, which connects the town of Taft, to the south, with Buttonwillow to the north. California Resource Corporation's gated and guarded entrance to the field is located at the western intersection of Skyline Drive and Elk Hills Road

The proposed project would take local industrial sources of CO_2 that are transported by a combination of truck, pipeline and/or rail to the dedicated Class VI injection wells for the project. The CO_2 would then be injected into identified geographically confined reservoirs for storage in perpetuity. This area has been identified as a location suitable for such storage and a potential to provide a contribution to the goals of California for carbon neutrality by 2045 by reducing industrial uses to no net contribution and potentially supporting direct removal of CO2 from the air. California executive order B-55-18 mandates that the state achieve carbon neutrality by 2045 and maintain net negative emissions thereafter. (https://livermorelabfoundation.org/2019/12/19/getting-to-neutral/). The project, as proposed, has the capacity for up to 48 million metric tons of estimated storage and capable of sequestrating in excess of 1.5 million metric tons of CO_2 per year.

Implementation of the project would require permits from the Federal Environmental Protection Agency (EPA) for up to six (6) Class VI injection wells in compliance with the UIC program Class VI geologic sequestration regulations. Location of the proposed Class VI injection wells will be within the proposed CUP boundary of 5,332.34 acres. All employee facilities needed to manage the project will be provided by the existing Elk Hills oil field facilities.

Implementation of the project as proposed includes the following requests:

- Zone Classification Change (ZCC No. 5, Map No. 118; ZCC No. 5, Map No. 119; ZCC No. 4, Map No. 120) from A-1 (limited Agriculture) Zone District to A (Exclusive Agriculture) Zone District on approximately 3,208 acres. See *Figure 8: Proposed Zoning Classification*

- Conditional Use Permit (CUP No. 13, Map No. 118; CUP No. 5, Map No. 119; CUP No. 3, Map No. 120) to allow for the construction and operation of a Carbon capture and sequestration field, within the A (Exclusive Agriculture) Zone District. Carbon Capture and Sequestration (CCS) has been determined to be a storage operation under the Kern County Zoning Ordinance, Section 19.08.085 and Section 19.06.020. Therefore, CCS in either existing formations or tanks is an allowed use with a Conditional Use Permit (CUP) in the following districts:

    - A District (Exclusive Agriculture)
    - M-2 District (Medium Industrial)
    - M-3 (Heavy Industrial)

Project Objectives

The project proponent had defined the following objectives for the project:

- Construct and operate a permanent underground storage facility for up to 48 million tons of Carbon Dioxide (CO_2) in an economically feasible manner.
- Contribute to California Resources Corporation (CRC) adopted goals of Full-Scope Net Zero emission for Scope 1, 2 and 3 emissions by 2045.
- Support California's Executive Order B-55-18 for Carbon neutrality by 2045 and net negative emissions thereafter.
- Site and design the project in an environmentally responsible manner consistent with current Kern County guidelines.
- To promote economic development and bring living-wage jobs to the region throughout the life of the proposed project.

Proposed Discretionary Actions/Required Approvals

The Kern County Planning and Natural Resources Department as the Lead Agency (per CEQA Guidelines Section 15052) for the proposed project has discretionary responsibility for the proposed project. To implement this project, the project proponent may need to obtain discretionary and ministerial permits/approvals including, but not limited to, the following:

Federal

- Environmental Protection Agency Underground Injection Control – Class VI Permit
- U.S. Fish and Wildlife Service (USFWS) Section 10 Incidental Take Permit and Habitat Conservation Plan (if required)
- United States Army Corps of Engineers Section 404 Permit (if required)

State

- California Department of Fish and Wildlife (CDFW)
    - Section 2081 Permit (State-listed endangered species) (if required)
- Central Valley Water Quality Control Board (RWQCB)
    - Waste Discharge Requirements
    - Regional Water Quality Certification (401 Permit) (if required)
    - National Pollution Discharge Elimination System (NPDES) Construction General Permit
    - General Construction Stormwater Permit (Preparation of a SWPPP) (if required)
- California Department of Transportation (Caltrans)
    - Right-of-Way Encroachment Permit (if required)
    - Permit for Transport of Oversized Loads (if required)

Local

- **Kern County**
    - Certification of Final Environmental Impact Report
    - Adoption of Mitigation Monitoring and Reporting Program
    - Adoption of 15091 Findings of Fact and 15093 Statement of Overriding Considerations
    - Approval of Zone Classification Change
    - Approval of Conditional Use Permits
    - Approval of Kern County Grading (if required)
    - Approval of Kern County Building Permits
    - Approval of Kern County Encroachment Permits (if required)
    - Approval of Fire Safety Plan
- **San Joaquin Valley Air Pollution Control District**
    - Approval of Fugitive Dust Control Plan
    - Authority to Construct (ATC)
    - Permit to Operate (PTO)

The preceding discretionary actions/approvals are potentially required and do not necessarily represent a comprehensive list of all possible discretionary permits/approvals required. Other additional permits or

approvals from responsible agencies may be required for the proposed project.

KERN COUNTY
ENVIRONMENTAL CHECKLIST FORM

Environmental Factors Potentially Affected:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a Potentially Significant Impact" as indicated by the checklist on the following pages.

☒ Aesthetics	☒ Agriculture/Forestry	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Energy
☒ Geology / Soils	☒ Greenhouse Gas Emissions	☒ Hazards & Hazardous Materials
☒ Hydrology / Water Quality	☒ Land Use /Planning	☒ Mineral Resources
☒ Noise	☒ Population / Housing	☒ Public Services
☒ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☒ Utilities / Service Systems	☒ Wildfire	☒ Mandatory Findings of Significance

DETERMINATION.

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (a) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (b) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENT IMPACT REPORT (EIR) is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature	March 4, 2022 Date
Cindi Hoover Printed Name	Supervising Planner Title

Evaluation of Environmental Impacts:

(1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a Lead Agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

(2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

(3) Once the Lead Agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.

(4) Negative Declaration: "Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The Lead Agency must describe the mitigation measure and briefly explain how they reduce the effect to a less than significant level.

(5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or Negative Declaration, Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:

(a) Earlier Analysis Used. Identify and state where they are available for review.

(b) Impacts Adequately Addressed. Identify which effects from the above checklist where within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

(c) Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

(6) Lead Agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

(7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

(8) The adopted guidelines state " This is only a suggested form, and lead agencies are free to use different formats; however, Lead Agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected. "Kern County has adopted this format and included all questions from Appendix G.

(9) The explanation of each issue should identify:

(a) The significance criteria or threshold, if any, used to evaluate each question; and

(b) The mitigation measure identified, if any, to reduce the impact to less than significance.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
I. AESTHETICS.				
Would the project:				
a) Have a substantial adverse effect on a scenic vista?	☒	☐	☐	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☒	☐
c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage points) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☒	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?	☒	☐	☐	☐

RESPONSES:

a)–d) The proposed project is located within the Elk Hills Oil Field which is heavily developed with oil wells and associated infrastructure. The aesthetic features of the existing visual environment in the area are varied with agricultural and oil production/extraction equipment dominating the landscape. As such, there are no unique aesthetic features, identified scenic vistas, or designated scenic highways in the project vicinity. According to the California Department of Transportation's (Caltrans') California Scenic Highway Mapping System, the closest section of highway that would be eligible for State Scenic Highway designation are portions of State Routes 14 and 58 which are located many miles to the east of the project site within the desert region of the county. Portions of the project site may be visible from public roads or other publically accessible vantage points, however as stated previously the project site is currently dominated by oil and gas production facilities and associated infrastructure. The proposed project would introduce four to six CO_2 injection wells into the viewshed, however these would not be easily distinguishable in the viewshed from public roads or public vantage points. The proposed project would likely introduce new lighting features during construction and operations, similar to those currently existing within the project site, however the project would be required to conform to the Kern County Dark Skies Ordinance which would require the minimum lighting possible for safety, as well as shielding of light fixtures and a downward orientation to eliminate light spillover. Because oil and gas production activities and associated infrastructure, which are visually similar to the proposed project, currently dominate the existing

viewshed and no scenic vistas have been identified in the project area, impacts on aesthetic resources are anticipated to be less than significant. However, because the project will introduce a new source of light or glare, and because the project site is located in a non-urban area and may be visible from publicly accessible vantage points, potential impacts to aesthetic resources will be analyzed in the Environmental Impact Report.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
II. AGRICULTURE AND FOREST RESOURCES. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or Williamson Act contract?	☒	☐	☐	☐
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)) or timberland (as defined in Public Resources Code section 4526) or timberland zoned Timberland Production (as defined by Government Code Section 51104 (g),	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forest land to non-forest use?	☒	☐	☐	☐
f) Result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for any parcel of 100 or more acres (Section 15206(b)(3) Public Resources Code?	☒	☐	☐	☐

RESPONSES:

a)-f) The proposed project currently has a zone classification of A (exclusive Agriculture) and A-1 (Limited Agriculture), however is not designated Prime or Unique Farmland or Farmland of Statewide Importance pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, nor is any portion of the project site subject to the California Land Conservation Act of 1965 (Williamson Act Land Use Contract) or Farmland Security Zone Contract. The project site is not designated Timberland or forest land and as no Timberland or Forestland is in the project vicinity would not conflict with existing zoning for, or cause rezoning of land designated as Timberland or forest land to non-forest use. However, land adjacent to the project site is subject to a Williamson Act Land Use Contract and is designated non-prime

farmland pursuant to the Farmland Mapping and Monitoring Program. Portions of the project site are located with Agricultural Preserve number 3. Due to the project site's zone classification of A (Exclusive Agriculture) and adjacent land that is subject to a Williamson Act Land Use Contract, impacts to agricultural resources will be analyzed in the Environmental Impact report.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
III. AIR QUALITY.				
The significance criteria established by the applicable Air pollution control district shall be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard? Specifically, would implementation of the project (in a specific location) exceed any of the following adopted thresholds:				
i. San Joaquin Valley Unified Air Pollution Control District:				
<u>Operational and Area Sources</u>				
Reactive Organic Gases (ROG) 10 tons per year.	☒	☐	☐	☐
Oxides of Nitrogen (NO_x) 10 tons per year.	☒	☐	☐	☐
Particulate Matter (PM_{10}) 15 tons per year.	☒	☐	☐	☐
<u>Stationary Sources as determined by District Rules</u>				
Severe Nonattainment 25 tons per year.	☒	☐	☐	☐
Extreme Nonattainment 10 tons per year.	☒	☐	☐	☐

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
III. AIR QUALITY. (Continued)				
ii. Eastern Kern Air Pollution Control District.				
Operational and Area Sources				
Reactive Organic Gases (ROG) 25 tons per year.	☐	☐	☐	☒
Oxides of nitrogen (NO_x) 25 tons per year.	☐	☐	☐	☒
Particulate Matter (PM_{10}) 15 tons per year.	☐	☐	☐	☒
Stationary Sources - determined by District Rules				
25 tons per year.	☐	☐	☐	☒
c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	☒	☐	☐	☐

RESPONSES:

a) The project would be located within the jurisdiction of the San Joaquin Valley Air Pollution Control District (SJVAPCD), in the San Joaquin Valley Air Basin (SJVAB). The SJVAB is classified by the State as a severe nonattainment area with respect to the 1-hour ozone standard as well as a nonattainment area for the State standards pertaining to particulate matter less than 10 microns (PM_{10}) and particulate matter less than 2 ½ microns ($PM_{2.5}$). In addition, the SJVAB is classified as an extreme nonattainment area for the Federal 8-hour ozone standard, a nonattainment area for the Federal $PM_{2.5}$ standard, and an attainment/maintenance area for the Federal carbon monoxide (CO) and PM_{10} standards.

Project construction activities would generate ozone precursor (i.e., oxides of nitrogen [NOX] and reactive organic compounds [ROC]) emissions as well as CO, $PM_{2.5}$, and PM_{10} emissions that could result in significant impacts on regional air quality. Emissions sources would include heavy equipment used for excavation and grading, cranes, drilling rigs and on-road motor vehicles for equipment and material deliveries as well as construction workers' vehicles. Long-term maintenance and operational activities are other emissions sources. Grading and activities on unpaved roads would contribute to fugitive PM_{10} and $PM_{2.5}$ emissions. This impact is potentially significant. Further analysis of air quality impacts is warranted to determine whether the project

would conflict with or obstruct implementation of the applicable plans for attainment and, if so, the reasonable and feasible mitigation measures that could be adopted to reduce such impacts. These issues will be evaluated in the EIR.

b) The project is located within the jurisdictional boundaries of SJVAPCD. The SJVAB is classified by the State as a severe nonattainment area with respect to the 1-hour ozone standard as well as a nonattainment area for the State standards pertaining to PM10 and PM2.5. In addition, the SJVAB is classified as an extreme nonattainment area for the Federal 8-hour ozone standard, a nonattainment area for the Federal PM2.5 standard, and an attainment/maintenance area for the Federal CO and PM10 standards.

SJVAPCD rules and regulations would apply to all project activities within the SJVAPCD. Construction and operational emissions will be analyzed in the EIR as well as long-term operational emissions. Some construction personnel may commute from outside the SJVAB. Cumulative contributions of emissions to the SJVAB are considered potentially significant and will be evaluated further in the EIR.

c)-d) The project site is located within the administrative boundary of the Elk Hills Oil Field. There are no schools or hospitals located with the vicinity of the project site, however, the project site is located approximately 8.5 miles north of the City of Taft and approximately 4 miles west of the unincorporated community of Buttonwillow, additionally there may be sparse, rural residences located within the project vicinity. The closest disadvantaged community to the project site is the unincorporated community of Buttonwillow (population 1,445). California Environmental Protection Agency's "CalEnviroScreen 4.0" ranks Buttonwillow and the City of Taft as communities in the state, heavily impacted from pollution and other health and socio-economic indicators.

Therefore, impacts on sensitive receptors are potentially significant and further analysis is warranted to determine whether the project would expose sensitive receptors to substantial pollutant concentrations or a substantial number of people to other emissions, and, if so, the reasonable and feasible mitigation measures that could be adopted to reduce such impacts. These issues will be evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES. Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
c) Have a substantial adverse effect on federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☒	☐	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☒	☐	☐	☐

RESPONSES:

a)–f) The proposed Project site is located in the south-western portion of the San Joaquin Valley which hosts a variety of sensitive resources including several listed as threatened or endangered at the

state or federal level. Several conservation programs or mitigation requirements have been approved or proposed to comply with State and federal Endangered Species laws including the issuance of incidental take coverage through habitat conservation plans, federal Section 7 Consultations, Biological Opinions and mitigation measures that are a part of CEQA and NEPA environmental documents.

The proposed project would allow the construction of four to six Class VI injection wells, ancillary infrastructure and facilities, and the injection and storage of up to 48 million metric tons of CO_2 on approximately 5,332 acres.

Impacts could result from activities related to construction of injection and/or monitoring wells or from continued activities related to injection of CO_2 and maintenance of the injection wells and ancillary facilities. These impacts are considered potentially significant and will be discussed in the EIR. The EIR will assess impacts on known resources including protected wetlands, riparian areas and streams; impacts on resources that may occur in the future (e.g., foraging or nesting raptors); and impacts on landscape-level resources, such as wildlife corridors that could provide interconnectivity between existing higher value habitats. The EIR will also evaluate potential conflicts with regulatory policies or procedures for protection of biological resources.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

V. CULTURAL RESOURCES.

Would the project:

a) Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines § 15064.5?	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☒	☐	☐	☐

RESPONSES:

a)–c) The potential for impacts on historical and prehistoric resources is considered potentially significant. Therefore, the EIR will more thoroughly address this issue. The EIR will set forth research criteria and report content needed to enable an evaluation of resource occurrence and possible significant impacts on sensitive historic and prehistoric cultural resources.

VI. ENERGY. Would the project:

a)	Result in potentially significant environmental impact due to wasteful, inefficient or unnecessary consumption of energy resources, during project construction or operation?	☒	☐	☐	☐
b)	Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☒	☐	☐	☐

RESPONSES:

a)-b) Construction of the proposed project would involve on-site energy demand and consumption related to use of oil in the form of gasoline and diesel fuel for construction worker vehicle trips, hauling and materials delivery truck trips, and operation of off-road construction equipment. In addition, diesel-fueled portable generators may be necessary to provide additional electricity demands for temporary on-site lighting, welding, and for supplying energy to areas of the sites where energy supply cannot be met via a hookup to the existing electricity grid. Ongoing injection activities would result in energy consumption for the duration of the project. Additionally, perpetual storage of CO_2 within confined reservoirs would most likely be passive and would not require the use of energy, however ongoing monitoring activities could result in energy consumption. Impacts related to the consumption of energy resources and the potential for the project to obstruct a state or local plan for renewable energy or energy efficiency will be analyzed in the Environmental Impact Report.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
VII . GEOLOGY AND SOILS. Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii. Strong seismic ground shaking?	☒	☐	☐	☐
iii. Seismic-related ground failure, including liquefaction?	☒	☐	☐	☐
iv. Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☒	☐	☐	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, sub-sidence, liquefaction, or collapse?	☒	☐	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (19914), creating substantial risks to life or property?	☒	☐	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☒	☐
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	☒	☐	☐	☐

RESPONSES:

a)–f) Due to the location of active faults in the general region, strong seismic ground shaking could occur at the project site, resulting in damage to above and below ground structures and other site improvements if not properly designed to withstand strong ground shaking. Adherence to applicable regulations would minimize the potential impacts associated with the proposed project.

A geotechnical investigation of the project site may be conducted to determine the physical characteristics of the underlying soils and geologic formations and to identify if any unstable conditions exist that could be exacerbated by proposed construction activities. The results of these investigations will be provided in the EIR.

The above listed project impacts will be further evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
VIII GREENHOUSE GAS EMISSIONS. Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

RESPONSES:

a)–b) Greenhouse gas (GHG) emissions emitted by human activity are implicated in global climate change or global warming. The principal GHGs are CO_2, methane (CH_4), NO_X, ozone, water vapor, and fluorinated gases. The temporary construction activities associated with the proposed project, which would involve operation of heavy off-road equipment, on-road trucks (for deliveries and hauling), and construction worker commute trips, would generate GHGs through exhaust emissions. However, the proposed project is expected to capture traditional sources of CO_2 emissions that have historically been emitted into the environment. As such, the provision of carbon capture and sequestration in perpetuity by the proposed project would reduce GHG emissions and is anticipated to offset GHGs that would otherwise be emitted by traditional sources. The project's GHG emissions generated during construction of the project and the potential GHG offsets resulting from operation of the project, as well as any potential conflicts with any applicable plan, policy or regulation will be identified and quantified in the EIR. Additionally, the project's potential GHG impacts and the potential GHG offsets resulting from operation of the project will be examined in the EIR, with respect to the objectives of statewide programs to reduce GHGs associated with energy generation.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☒	☐	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☒	☐	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 1/4 mile of an existing or proposed school?	☒	☐	☐	☐
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☒	☐	☐	☐
e) For a project located within the adopted Kern County Airport Land Use Compatibility Plan, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☒	☐	☐	☐
f) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?	☒	☐	☐	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?	☒	☐	☐	☐

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IX HAZARDS AND HAZARDOUS MATERIALS. (Continued)				
h) Would implementation of the project generate vectors (flies, mosquitoes, rodents, etc.) or have a component that includes agricultural waste? Specifically, would the project exceed the following qualitative threshold: The presence of domestic flies, mosquitoes, cockroaches, rodents, and/or any other vectors associated with the project is significant when the applicable enforcement agency determines that any of the vectors:				
i. Occur as immature stages and adults in numbers considerably in excess of those found in the surrounding environment; and	☐	☐	☒	☐
ii. Are associated with design, layout, and management of project operations; and	☐	☐	☒	☐
iii. Disseminate widely from the property; and	☐	☐	☒	☐
iv. Cause detrimental effects on the public health or well-being of the majority of the surrounding population.	☐	☐	☒	☐

RESPONSES:

a)-e) The proposed CO_2 capture and storage activities could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials; create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. A small portion of the proposed project site is located within Zone C, as identified in the Elk Hills – Buttonwillow Airport Land Use Compatibility Plan (ALUCP). These impacts are considered potentially significant and will be further analyzed in the Environmental Impact Report.

The project is not anticipated to emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school, however the nearest schools are Buttonwillow Elementary and McKittrick Elementary, which are approximately 4.5 miles from the project site and Elk Hills Elementary, which is approximately 6.5 miles from the project site. Because the project proposes the transport of CO_2

by pipeline, truck, and/or rail, CO_2 could pass within one quarter mile of a school(s) during transport. Therefore, impacts are potentially significant and will be further analyzed in the Environmental Impact Report.

f) The project would generate construction trips, worker construction and maintenance trips, and CO_2 transport trips. The potential for roadway lane closures also exists, which could temporarily affect an emergency response or evacuation plan. This impact is considered potentially significant and will be addressed in the EIR.

g) According to the California Department of Forestry and Fire Protection (CalFire), Kern County Fire Hazards Severity Zone Maps for the Local Responsible Areas, the project site is classified as State Responsibility Area (SRA) Moderate (Calfire 2021). Moderate zones are typically wildland supporting areas of low fire frequency and relatively modest fire behavior. The proposed project would comply with all applicable wildland fire management plans and policies established by CalFire, and Kern County Fire Department. Accordingly, the project is not expected to expose people or structures to a significant risk of loss, injury, or death involving wildland fires. Nonetheless, potential impacts involving wildfires will be discussed in the EIR--please refer to the responses to the Checklist topic concerning Wildfire, later in this Initial Study.

h)i.-iv. Project construction and injection/storage activities are not expected to result in the generation of vectors (flies, mosquitoes, rodents, etc.) or have a component that includes agricultural waste. However, this issue will be addressed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
X HYDROLOGY AND WATER QUALITY. Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☒	☐	☐	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☒	☐	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would:	☒	☐	☐	☐
i) result in a substantial erosion or siltation on – or off-site	☒	☐	☐	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-or offsite;	☒	☐	☐	☐
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☒	☐	☐	☐
iv) impede or redirect flood flows ?	☒	☐	☐	☐
d) In flood hazard, tsunami, seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☒	☐	☐	☐

RESPONSES:

a) The construction of injection wells and ancillary facilities could potentially fail to comply with water quality standards or waste discharge requirements. The potential to create substantial erosion and siltation or violate any water quality standards or waste discharge requirements is considered significant and will be discussed in the EIR.

b) The construction of injection wells and ancillary facilities could potentially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. This impact is considered potentially significant and will be addressed in the EIR.

c) The construction of injection wells and ancillary facilities could potentially result in alteration of drainage patterns and lead to substantial erosion and siltation. The potential to create substantial erosion and siltation is considered significant and will be discussed in the EIR.

The construction of injection wells and ancillary facilities and production facilities could potentially result in alteration of drainage patterns and lead to flooding. The potential to create flooding is considered significant and will be discussed in the EIR.

There are no stormwater drainage systems in the agricultural areas under consideration. It is not considered likely that future oil and gas exploration and production activities would create or contribute sufficient runoff water such that the capacity of existing stormwater drainage systems would be exceeded. Nonetheless, this impact is considered potentially significant and will be addressed in the EIR.

d) None of the injection well construction or storage activities occurs or would occur in locations where tsunamis, mudflows or seiche-related inundation would occur. This impact is considered no impact; however it will be discussed further in the EIR.

e) The proposed project is located with the San Joaquin Valley Groundwater Basin, in the Kern County sub-basin. The construction of injection wells and ancillary facilities could potentially deplete groundwater supplies or interfere substantially with groundwater recharge such that it would conflict with or obstruct implementation of a water quality control plan, the State Groundwater Management Act, or a Groundwater Sustainability Plan (GSP) as adopted by the West Kern Water District Groundwater Sustainability Agency (GSA). This impact is considered potentially significant and will be analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XI. LAND USE AND PLANNING. Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

RESPONSES:

a) Construction of injection wells and CO_2 capture and storage activities are not expected to result in the division of established communities. There would be no impact.

b) The impacts of the proposed project and potential conflicts with County ordinances and policies, or regulation adopted for the purpose of avoiding or mitigating an environmental effect are not expected to be significant; however they will be addressed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XII. MINERAL RESOURCES. Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☒	☐	☐	☐
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☒	☐	☐	☐

RESPONSES:

a)–b) The proposed project is located within the administrative boundary of the Elk Hills Oilfield, however the project site is not a designated mineral resource zone. The project could potentially result in the loss of availability of a known mineral resource of value to the region and the residents of the state. Impacts to mineral resources will be addressed further in the Environmental Impact Report.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XIII. NOISE. Would the project result in:				
a) Generation of a substantial temporary or permanent increase in the ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of, excessive ground borne vibration or ground borne noise levels?	☒	☐	☐	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
d) For a project located within the Kern County Airport Land Use Compatibility Plan, would the project expose people residing or working in the project area to excessive noise levels?	☒	☐	☐	☐

RESPONSES:

a)–c) Construction activities, including injection well pad preparation, drilling, completion and testing of new injection wells, construction of necessary infrastructure, and general maintenance activities could result in temporary or periodic increases in noise and groundborne vibration. The Kern County General Plan Noise Element sets a 65-decibel limit on exterior noise levels from stationary sources (i.e., non- transportation sources) at sensitive receptors. The Noise Control Ordinance in the Kern County Code (Section 8.36.020 et seq.) prohibits a variety of nuisance noises. Construction-related noise is regulated by means of a limitation on the hours of construction activity for projects located within 1,000 feet of an occupied residential dwelling. In such cases, construction is prohibited between the hours of 9 p.m. and 6 a.m. on weekdays and 9 p.m. and 8 a.m. on weekends. The project proponent would adhere to the provisions of Kern County Ordinance Section 8.36.020. Nonetheless, the project could expose persons to or generate noise levels in excess of established standards. This impact is considered potentially significant and will be discussed further in the EIR.

d) A small portion of the project site is located within Zone C of the Elk Hills- Buttonwillow Airport Land Use Compatibility Plan. Depending on the final location of injection wells the project could potentially expose people residing or working in the project area to excessive noise levels. This impact is considered potentially significant and will be further addressed in the Environmental Impact Report

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XIV. POPULATION AND HOUSING. Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☒	☐	☐	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

RESPONSES:

a)-b) Construction of the proposed project and ongoing storage, maintenance and monitoring activities could provide new employment opportunities consistent with adopted Kern County General Plan goals, plans, and policies. If temporary housing should be necessary, it is expected that accommodations would be available in the nearby communities. While the proposed project is not expected to induce substantial population growth in Kern County, displace a substantial number of existing homes or people, or necessitate the construction of replacement housing elsewhere, these issues will be evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XV. PUBLIC SERVICES. Would the project **:**				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or to other performance objectives for any of the public services:				
Fire Protection?	☒	☐	☐	☐
Police Protection?	☒	☐	☐	☐
Schools?	☒	☐	☐	☐
Parks?	☒	☐	☐	☐
Other Public Facilities?	☒	☐	☐	☐

RESPONSES:

a)i. - v. The demand for fire protection, police protection, schools, parks and other public facilities could be affected by the proposed project. Impacts on public services are considered potentially significant and will be addressed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XVI. RECREATION.				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☒	☐	☐	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

RESPONSES:

a)–b) The project would not include the construction or expansion of new recreational facilities. However, an increase in population that might result from an influx of workers and the associated increase in the use of parks or recreational facilities could require the expansion of recreational facilities. This impact is considered potentially significant and will be evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION AND TRAFFIC Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☒	☐	☐	☐
b) Conflict or be inconsistent with CEQA Guidelines § 15064.3 (b)	☒	☐	☐	☐
c) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous inter-sections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☒	☐	☐	☐

RESPONSES:

a) There are no dedicated pedestrian or bicycle facilities in the immediate vicinity of the project site or along the surrounding roadways. Due to the rural nature of the project area, pedestrian and bicycle traffic is limited. The project is not located along an existing bus route and few bus stops exist on roadways that are likely to be used during construction and operation of the proposed project.

Further analysis in the EIR is required to determine whether construction traffic could disrupt normal traffic flows or otherwise conflict with the County's roadway performance policies and programs.

b) CEQA Guidelines section 15064.3, subdivision (b) was adopted in December 2018 by the California Natural Resources Agency. These revisions to the CEQA Guidelines criteria for determining the significance of transportation impacts are primarily focused on projects within transit priority areas and shift the focus from driver delay to reduction of vehicular greenhouse gas emissions through creation of multimodal networks, and creation of a mix of land uses that can facilitate fewer and shorter vehicle trips. Vehicle miles traveled (VMT) is a measure of the total number of miles driven for various purposes and is sometimes expressed as an average per trip or per person. Construction traffic would be temporary and would not permanently affect VMT characteristics in this part of Kern County or elsewhere. Long-term, operational traffic related to the CO_2 storage, maintenance, and monitoring activities would be limited. It is not known where the employees would live or how long their commuting trips would be but is assumed that they would commute from nearby communities. According to technical guidance issued by the Office of Planning and Research, projects generating less than 110 or fewer daily vehicle trips may be presumed to have a less than significant impact involving VMT. Further analysis of the operational VMT characteristics of the project is required to determine whether the project is considered a "low-VMT" project due to small daily traffic volumes alone, or whether more extensive analysis is warranted. An assessment of the project's VMT characteristics will be provided in the EIR, to ensure consistency with state and local guidance.

c) No new roadway design or features (i.e., sharp curves, dangerous intersections, or other hazardous features) that could result in transportation-related hazards or safety concerns are anticipated. The project injection wells and other infrastructure and facilities would be set back from roadways as required by the Kern County Zoning Ordinance. The types and numbers of vehicles utilized during injection well construction and for storage, maintenance, and monitoring activities would be similar to existing activities in the vicinity and therefore would not likely be incompatible. Given these considerations, significant impacts related to increased hazards are not anticipated to occur; however, additional analysis will be included in the EIR.

d) The project would generate construction trips and the potential for roadway lane closures exists during construction of ancillary infrastructure and during transport of CO_2 to the site, which could temporarily increase the daily traffic volumes on local roadways and at intersections. It is anticipated that emergency access would be maintained at all times, and appropriate detours would be provided, as necessary. Nonetheless, impacts related to emergency access are considered potentially significant and will be addressed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES. Would the project:				
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources defined in Public Resources Code section 5020.1 (k) or	☒	☐	☐	☐
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code section 5024.1, the lead agency shall consider the significance of the resource to a California Native America tribe.	☒	☐	☐	☐

RESPONSES:

a)i.-ii. The proposed project site is currently highly disturbed with oil and gas production and ancillary infrastructure, however because the injection well sites may not be on previously disturbed land there is a potential for tribal cultural resources to exist on-site and on surrounding lands. Therefore, the proposed project has the potential to impact tribal cultural resources during injection well pad constructions and drilling as well as during the construction of ancillary infrastructure. All tribes with possible cultural affiliation and interest within the project area will be notified pursuant to the requirements of Assembly Bill 52, and consultation with the potentially affected tribes will occur, as appropriate, between the County and the tribes. Further evaluation in the EIR is warranted to identify potential impacts to tribal cultural resources and to formulate avoidance or mitigation measures, if applicable.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS. Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☒	☐	☐	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☒	☐	☐	☐
c) Result in a determination by the waste water treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☒	☐	☐	☐
e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste	☒	☐	☐	☐

RESPONSES:

a) The proposed project would not require or result in the relocation or construction of new or expanded municipal wastewater facilities, and no connection to a public wastewater system is required or proposed. Impacts would be less than significant in this regard; however, further analysis in the EIR will be provided. The proposed project does not require expanded or new storm drainage facilities because the proposed project is not anticipated to generate a significant increase in the amount of impervious surfaces that would increase runoff during storm events. The proposed project is not anticipated to result in a significant increase in water demand/use; however, water will be needed for dust suppression and injection well drilling. Impacts associated with construction of the electrical lines and telecommunication lines will be evaluated in the EIR.

Impacts would be potentially significant and further analysis in the EIR is warranted.

b) Water consumption during construction would primarily be used for dust-suppression purposes. Water is anticipated to be obtained from existing on-site wells. A water supply assessment will be completed for the project to analyze potential water sources and potential impacts to water supplies.

This potentially significant impact will be addressed further in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XX. WILDFIRE. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☒	☐	☐	☐
b) Due to slope, prevailing winds, or other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☒	☐	☐	☐
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☒	☐	☐	☐
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☒	☐	☐	☐

RESPONSES:

a)-d) According to the California Department of Forestry and Fire Protection (CalFire), Kern County Fire Hazards Severity Zone Maps, the project site is located within a Moderate Fire Hazard Severity Zone in a State Responsibility Area. Therefore, the potential for wildfire on the project site exists. The site is located in a rural area with limited population, primarily developed with oil and gas production facilities and agricultural land. The project site is not identified for any purpose in an adopted emergency evacuation plan to address wildfires or other types of emergencies. Further analysis of prevailing winds is required to determine if there are periodic high winds that could influence the spreading and velocity of wildfires. Adherence to applicable regulations would reduce wildfire ignitions and prevent the spread of wildfires. The proposed project involves the development of a carbon capture and sequestration facility. The proposed project would include the construction of injection wells, internal roads, power transmission lines, and ancillary infrastructure including CO_2 transport pipelines.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE.				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

RESPONSES:

a) The EIR's biological, cultural, and tribal cultural resources sections will discuss specific project impacts on plants and wildlife including avian species and impacts to cultural and tribal cultural resources. The document will also evaluate the project's contribution to cumulative biological, cultural and tribal cultural resources impacts and propose mitigation that will reduce the impacts to less than significant levels, where feasible.

b) The project has the potential to contribute to cumulatively significant air quality, biological resources, cultural resources, tribal cultural resources, greenhouse gas emissions, traffic, and wildfire impacts. Such impacts could occur during the construction phases and/or as a result of the fully built and operational project. The EIR will evaluate the project's contribution to cumulative impacts in these and other areas.

c) The Project could potentially result in environmental effects that have adverse impacts on human beings, either directly or indirectly. These impacts will be fully addressed in the EIR.

SUBJECT: NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR THE ELK HILLS BLUE HYDROGEN PROJECT BY LONE CYPRESS ENERGY SERVICES

The Kern County Planning and Natural Resources Department as Lead Agency (per CEQA Guidelines Section 15062) has determined that preparation of an Environmental Impact Report (per CEQA Guidelines 15161) is necessary for the proposed project identified below. The Planning and Natural Resources Department solicits the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency may need to use the EIR prepared by our agency when considering your permit or other approval of the project.

You are invited to view the Initial Study/NOP and submit written comments regarding the scope and content of the environmental information in connection with the proposed project should you wish to do so. Due to the limits mandated by State law, your response must be received by **Friday, March 29, 2024 at 5:00 p.m**. Comments can be submitted to the Kern County Planning and Natural Resources Department at the address shown above or to Fergusonj@kerncounty.com. A Scoping meeting will be held on **Wednesday, March 20, 2024 at 1:30 p.m**. at the address listed above.

PROJECT TITLE: Elk Hills Blue Hydrogen by Lone Cypress Energy Services (PP24403); GPA No. 4, Map 119; ZCC No. 6, Map 119; PD Plan No. 1, Map 119

DOCUMENT AVAILABILITY: The Notice of Preparation for the above referenced project are available for public review at the Planning and Natural Resources Department, which is located at 2700 "M" Street, Suite 100, Bakersfield, CA 93301, or it can be accessed on the Kern County Planning and Natural Resources Department website at: **https://kernplanning.com/environmental-doc/elk-hills-blue-hydrogen-project/**

PROJECT LOCATION: The proposed project is located in an unincorporated area of western Kern County, within the administrative boundary of Elk Hills Oil Field, approximately one quarter mile southwest of the intersection of Elk Hills Road and Skyline Road and, 8.5 miles north of the City of Taft. The project site is located in Section 35 of Township 30 South, Range 23 East in the Mount Diablo Base and Meridian (MDB&M).

PROJECT DESCRIPTION: The Elk Hills Blue Hydrogen Project would include the construction and operation of a hydrogen processing plant that will produce 65 Metric Tonnes (MT) per day of liquid hydrogen to be used as a low-carbon fuel alternative.

Implementation of the project as proposed includes the following requests:

a) General Plan Amendment No. 4, Map 119 to amend the Land Use Element of Kern County General Plan from a map code designation of Mineral Petroleum (8.4) to Heavy Industrial (7.3) on approximately 32 acres.

b) Zoning Classification Change No. 6, Map 119 to change the existing Zone Classification from Exclusive Agriculture (A) to Heavy Industrial, Precise Development Combining District (M-3 PD) on approximately 32 acres.

c) Precise Development Plan No. 1, Map 119 to allow for the development and operation of a hydrogen facility (A.40.020.E) on the approximate 32-acre project site in an M-3 PD zone district.

d) Parcel Map Waiver No. 4-23 proposing the division of a 1,286.52-acre parcel of record into three separate parcels consisting of a: (1) 43.89-acre parcel; (2) 40.00-acre gross parcel; and (3) 1,202.63-acre gross parcel. The 32-acre project site will be located on the 40.-acre gross parcel.

Present Land Use/Zoning/General Plan Designation:

Agricultural Land/*Zoning:* A (Exclusive Agriculture)/*General Plan:* 8.4 (Mineral Petroleum)

Project Description: The Elk Hills Blue Hydrogen Project would include the construction and operation of a hydrogen processing plant that will produce 65 Metric Tonnes (MT) per day of liquid hydrogen to be used as a low-carbon fuel alternative.

Implementation of the project as proposed includes the following requests:

a) General Plan Amendment No. 4, Map 119 to amend the Land Use Element of Kern County General Plan from a map code designation of Mineral Petroleum (8.4) to Heavy Industrial (7.3) on approximately 32 acres.

b) Zoning Classification Change No. 6, Map 119 to change the existing Zone Classification from Exclusive Agriculture (A) to Heavy Industrial, Precise Development Combining District (M-3 PD) on approximately 32 acres.

c) Precise Development Plan No. 1, Map 119 to allow for the development and operation of a hydrogen facility (A.40.020.E) on the approximate 32-acre project site in an M-3 PD zone district.

d) Parcel Map Waiver No. 4-23 proposing the division of a 1,286.52-acre parcel of record into three separate parcels consisting of a: (1) 43.89-acre parcel; (2) 40.00-acre gross parcel; and (3) 1,202.63-acre gross parcel. The 32-acre project site will be located on the 40.-acre gross parcel.

INTRODUCTION

Pursuant to the California Environmental Quality Act (CEQA), the Kern County Planning and Natural Resources Department (County) will initiate the preparation of an Environmental Impact Report (EIR) for the Elk Hills Blue Hydrogen Project in the unincorporated area of western Kern County, California.

1. Project Description

1.1. Project Location

The Elk Hills Blue Hydrogen (proposed project) is a proposal by Lone Cypress Energy Services (project proponent) for the construction and operation of a hydrogen production facility. The proposed project will include the construction of a hydrogen production facility on an approximate 32 acres of a 40 acre parcel, with an associated 190 square feet Security Room. The proposed project located is on an approximately 32-acre portion of an approximate 590 acre privately owned parcel (current Assessor's Parcel Number 158-090-19) at the southwestern end of the San Joaquin Valley in unincorporated Kern County, California as shown in **Figure 1**, *Regional Vicinity Map.* The project site is within the administrative boundary of Elk Hills Oil Field, one quarter mile southwest of the intersection of Elk Hills Road and Skyline Road, shown in **Figure 2**, *Local Vicinity Map.*

The project site is approximately 26 miles west of the City of Bakersfield, 8.5 miles north of the City of Taft, and 8.5 miles Southwest of the unincorporated community of Buttonwillow. The project site is situated approximately 9 miles southeast of Interstate 5 (I-5) and approximately 6.8 miles east of Highway 33 (HWY-33). Regional Access is approximately 16 miles off I-5 to Stockdale Highway exit. Local access to the project site is available from Highway 119 to Elk Hills Road and then approximately 7 miles north to Skyline Road.

The project site is located on the *West Elk Hills, California* United States Geological Survey (USGS) 7.5-minute Topographic Quadrangle Map, Township 30 South, Range 23 East, Section 35 (Latitude 35° 16' 32.8" North; Longitude 119° 28' 10.2" West).

1.2. Environmental Setting

The project site is situated in the southwestern end of the San Joaquin Valley, in unincorporated Kern County. Kern County is California's third largest county in land area and encompasses approximately 8,161 square miles. The County's geography includes, among others, mountainous areas, agricultural lands, and deserts. Bakersfield is the largest city in Kern County and has a current estimated population of 408,865 residents (California Department of Finance [CDF] 2022). The County's current estimated population is 909,813 residents (CDF 2022).

The project site ranges in elevation from roughly 1,000 to 1,300 feet above mean sea level (AMSL), with elevation sloping gradually upward from north to south. While this area may be generally characterized as "open flats," outside of leveled fields and orchards, it is better described as an uneven plain consisting of extensive alluvial fans, debris flows and over-bank deposits. Vegetation on the valley floor is predominated by modern cultigens and other non-native species, such as Russian thistle (tumbleweed) and grasses, but also includes cheatgrass and doveweed.

Land uses within the region and the area of the site consist of oil fields. Land uses surrounding the site include the following:

North–Oil fields, with Elk Hills Power LLC being directly north of the project site.

South–Oil Fields.

West–Oil Fields.

East–Oil Fields.

The immediate project area has no nearby residences. The nearest residence is approximately 6 miles to the southeast in the community Dustin Acres. **Table 1,** *Project Site and Surrounding Land Uses,* **Figure 3***, Existing General Plan Map, and* **Figure 5***, Existing Zone Classifications.* presents the existing land uses, Kern County General Plan designations, and Zoning classification for the project site and surrounding area. The nearest existing schools are in the City of Taft, approximately 8 miles south and in the Town of McKittrick approximately 8 miles northwest.

Table 1. Project Site and Surrounding Land Uses

	Existing Land Use	Existing Map Code Designation	Existing Zone Classification
Project Site	Oil fields/ Elk Hills Power Substation	8.4 (Mineral Petroleum)	A (Exclusive Agriculture)
North	Oil fields	8.4 (Mineral Petroleum)	A (Exclusive Agriculture) and A-1 (Limited Agriculture)
East	Oil fields	8.4 (Mineral Petroleum)	A (Exclusive Agriculture)
South	Oil fields	8.4 (Mineral Petroleum)	A (Exclusive Agriculture)
West	Oil fields	8.4 (Mineral Petroleum)	A (Exclusive Agriculture) and A-1 (Limited Agriculture)

1.3. Project Description

The Elk Hills Blue Hydrogen Project would include the construction and operation of a hydrogen processing plant that will produce 65 Metric Tonnes (MT) per day of liquid hydrogen using proven technology. The hydrogen will be manufactured by feeding approximately 13 million standard cubic feet per day (MMSCFD) of natural gas and 0.32 acre-feet per day (2,440 barrels per day (bpd)) of water into a Steam Methane Reformer (SMR). In an SMR, water and natural gas react with the help of a catalyzer to produce hydrogen and CO2. A total of 721 MT per day of CO2 will be generated as a byproduct of hydrogen production. From that total, a minimum of 95%, or 686 MT per day, will be captured, compressed to supercritical state, and piped to Carbon TerraVault's EPA Class VI sequestration well. The remaining 5% or 36 MT per day will be released into the atmosphere due to the inherent efficiency of the technology available.

After the hydrogen is produced and separated from the CO2, it will be compressed and liquified to be loaded into cryogenic tanker trucks for distribution throughout California.

The Elk Hills Blue Hydrogen Project will sequester over 200,000 MT of carbon dioxide annually, keeping harmful emissions from impacting the local community all while creating a low-carbon alternative fuel option.

Implementation of the project as proposed includes the following requests:

- General Plan Amendment No. 4, Map 119 to amend the Land Use Element of Kern County General Plan from a map code designation of Mineral Petroleum (8.4) to Heavy Industrial (7.3) on approximately 32 acres.
- Zoning Classification Change No. 6, Map 119 to change the existing Zone Classification from Exclusive Agriculture (A) to Heavy Industrial, Precise Development Combining District (M-3 PD) on approximately 32 acres.
- Precise Development Plan No. 1, Map 119 to allow for the development and operation of a hydrogen facility (A.40.020.E) on the approximate 32-acre project site in an M-3 PD zone district.
- Parcel Map Waiver No. 4-23 proposing the division of a 1,286.52-acre parcel of record into three separate parcels consisting of a: (1) 43.89-acre gross parcel; (2) 40.00-acre gross parcel; and (3) 1,202.63-acre gross parcel, of which the proposed 32-acre project site will be located on the 40.00-acre gross parcel.

The proposed project site is within the administrative boundaries of the Kern County General Plan. **Table 2**, *Project Assessor's Parcel Number, Existing and Proposed Land Uses, and Acreages* identifies the proposed project parcels, existing land uses, and the proposed land uses for the proposed project.

Table 2: Project Assessor's Parcel Number, Existing and Proposed Land Uses, and Acreages

Count	APN	Zone Map	General Plan	Existing Map Code Designation	Proposed Map Code Designation	Existing Zoning	Proposed Zoning	Acres
1.	158-090-19	119	Kern County	8.4	7.3	A	M-3 PD	32
Kern County General Plan (KCGP) Map Code Designation: *8.4 (Resource – Mineral Petroleum); 7.3 (Heavy Industrial)* *Kern County Zoning District:* *A (Exclusive Agriculture); M-3 PD (Heavy Industrial, Precise Development Combining)*								

1.4. Project Facilities, Construction Activities, and Operations

Project Facilities

The overall proposed development is a 32-acre facility dedicated to hydrogen manufacturing, liquefaction, hydrogen storage, hydrogen loading, and CO2 removal and compression for sequestration.

The proposed facility has a footprint of approximately 32-acres, including a 190 square feet Security Room to identify and check-in any person(s) entering the plant. This room includes a small office and a bathroom. **Table 3**, *Project Summary* provides a project summary of the proposed project.

Table 3: Project Summary

Acreage	Proposed End Use	Percentage Building Coverage	Maximum Building Height	Handicapped Parking Spaces	Standard Parking Spaces	Automobile Parking Spaces
32 acres	Hydrogen processing plant with approximately 190 square foot building. Used for security of plant.	0.01%	+/-18 feet	1	4	5 Parking Spaces Total

Source:

Substation

The proposed substation will be located at the northeast portion of the site and will include circuit breakers, disconnect switches, metering protection equipment, and main step-up transformers. The substation will occupy an area that will be approximately 140 feet by 230 feet in size. The substation will be enclosed by a 6-foot-high chain link fence topped with barbed wire, and gravel will cover the ground surface in accordance with Pacific Gas & Electric (PG&E) Substation requirements. Lighting will be installed in the substation for security and for use at times when nighttime emergency repair work is required.

Vehicular Access and Circulation

Primary access to the project site will be via existing access off Elk Hills Road to be upgraded for the proposed project. Such improvements will meet applicable California Department of Transportation (Caltrans) and Kern County Public Works Department development standards. A secondary access point will be at the southwest corner of the plant which connects to an existing field road.

Construction Activities

Schedule and Workforce

The plant construction will last approximately 18 months. Grading of the proposed project will start in September 2024. and last 60 to 90 days. Construction will be completed in a single phase, beginning in September 2024, and concluding in March 2025. It is anticipated that the proposed project will be operational in 2025. Should commencement of construction be delayed, the commencement date of September 2024 represents a conservative estimate for the purpose of this document.

Construction will primarily occur during daylight hours, Monday through Friday, as required to meet the construction schedule. Additional hours/days may be necessary to facilitate the schedule. Any construction work performed outside of the normal work schedule be coordinated with the appropriate agencies and will conform to the Kern County Noise Ordinance (Chapter 8.36).

The on-site construction workforce will consist of up to 125 individuals; however, the average daily workforce will vary depending upon the stage in construction. The average daily workforce will include construction, supervisory, support, and construction management personnel on-site during construction. It is anticipated that the construction workforce will commute to the project site each day from local communities and report to the designated construction staging yards prior to the beginning of each workday. Parking for construction personnel will be provided on-site. Portable toilets will be used and will be maintained by a private off-site company during the construction period.

Construction Activities and Equipment

Construction activities will consist of civil, structural, mechanical, and electrical construction with heavy equipment will be utilized during construction from the beginning of civil through startup.

Construction Water Use and Wastewater

During construction of the proposed project, water will be required for common construction-related purposes, including but not limited to dust suppression, soil compaction, grading, and general site cleanup. Dust-control water may be used for ingress and egress of on-site construction vehicle equipment traffic and for the construction of the warehouse infrastructure. A sanitary water supply will not be required during construction because restroom facilities will be provided by portable units to be serviced by licensed providers.

Operations

The proposed facility will operate 24 hours a day, 365 days a year and typically consist of both day and night shifts. The facility will employ 1 to 5 employees per shift. Approximately 10 operational employees will work remotely.

Vehicular access and circulation operations for the proposed project will generate approximately 16 to 20 daily truck trips.

Ingress to the plant will be off Elk Hills Road and requiring check-in at the Security Room. Employee parking will be located immediately after the entrance, directly to the east of the Security Room. After loading, the cryogenic tanker trucks will egress through the same access point.

1.5. Applicant Submitted Project Objectives

State CEQA Guidelines Section 15124(b) requires that a project description include a clearly written statement of objectives. The statement of objectives should include the underlying purpose of the project and may discuss the project benefits. The following are the applicant objectives for the proposed project:

- Construct and operate a low-carbon hydrogen plant.
- Provide the California Market with clean transportation fuel.
- Support California's Carbon neutrality goals by 2045.
- Site and design the project in an environmentally responsible manner consistent with current Kern County guidelines.
- Promote economic development and bring living-wage jobs to the region throughout the life of the proposed project.

1.6. Proposed Discretionary Actions/Required Approvals

The Kern County Planning and Natural Resources Department as the CEQA Lead Agency (per CEQA Guidelines Section 15052) has discretionary responsibility for the Elk Hills Blue Hydrogen owned by Lone Cypress Energy Services, LLC. To implement this project, the project proponent may need to obtain the following discretionary and ministerial permits/approvals, but not be limited to:

- **Federal**
    - U.S. Fish and Wildlife Service (USFWS) Section 10 Incidental Take Permit and Habitat Conservation Plan (if required).
    - United States Army Corps of Engineers Section 404 Permit (if required)
- **State**
    - California Department of Fish and Wildlife (CDFW)
        - Section 2081 Permit (State-listed endangered species) (if required)
    - Central Valley Regional Water Quality Control Board (RWQCB)
        - Regional Water Quality Certification (401 Permit) (if required)
        - Waste Discharge Requirements
        - National Pollution Discharge Elimination System (NPDES) Construction General Permit
        - General Construction Stormwater Permit (Preparation of a SWPPP)
    - California Department of Transportation (Caltrans)
        - Right-of-Way Encroachment Permit (if required)
        - Permit for Transport of Oversized Loads (if required)
- **Local**
    - Kern County
        - Certification of Final Environmental Impact Report
        - Adoption of 15091 Findings of Fact and 15093 Statement of Overriding Considerations
        - Adoption of Mitigation Monitoring and Reporting Program
        - Approval of Amendment to the Land Use Element of the Kern County General
        - Approval of Change in Zone Classification
        - Approval of Precise Development Plan
        - Approval and recordation of Parcel Map

- Approval of Kern County Grading and Building Permits
- Approval of Kern County Encroachment Permits
- Approval of Fire Safety Plan

- San Joaquin Valley Air Pollution Control District
  - Authority to Construct (ATC)
  - Construction Fugitive Dust Control Plan
  - Permit to Operate (PTO)
  - Indirect Source Rule and Voluntary Emission Reduction Agreement
  - Other permits as required

The preceding discretionary actions/approvals are potentially required and do not necessarily represent a comprehensive list of all possible discretionary permits/approvals required. Other additional permits or approvals from responsible agencies may be required for the proposed project.

2. Kern County Environmental Checklist Form

2.1. Environmental Factors Potentially Affected

In accordance with CEQA Guidelines, the County intends to prepare an Environmental Impact Report (EIR) to evaluate potential environmental effects of the project and to propose mitigation measures to reduce any significant effects identified.

The environmental factors checked below will be potentially affected by this project, involving at least one impact that is a "potentially significant impact" as indicated by the Kern County Environmental Checklist. As such, the analysis contained within the EIR will focus on these issue areas.

☒ Aesthetics	☒ Agricultural and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Energy
☒ Geology and Soils	☒ Greenhouse Gas Emissions	☒ Hazards and Hazardous Materials
☒ Hydrology and Water Quality	☒ Land Use and Planning	☒ Mineral Resources
☒ Noise	☐ Population and Housing	☒ Public Services
☐ Recreation	☒ Transportation and Traffic	☒ Tribal Cultural Resources
☒ Utilities/Service Systems	☒ Wildfire	☒ Mandatory Findings of Significance

Other Environmental Issues

The County conducted a preliminary review of the proposed Project and has determined it is not likely to result in significant environmental effects to the following resources. Therefore, further analysis is not warranted in the EIR.

Population / Housing: The proposed Project will not induce substantial unplanned population growth through the construction of new homes, roads, or other infrastructure nor displace any housing units or people.

Although the proposed project would provide new employment consistent with the adopted Kern County General Plan goals, plan, and policies, long-term employment opportunities would be minimal. The proposed project would require approximately 10 operational employees working remotely per day. Full-time onsite employees will vary from 1 to 5 employees per shift with 3 shifts per 24 hours.

The on-site construction workforce will consist of up to 125 individuals; however, the average daily workforce will vary depending upon the stage in construction. The entire construction process is anticipated to take 18 months. Therefore, the majority of project-generated jobs would be from the local and regional area and would occur on a temporary and short-term basis. If temporary housing should be necessary, it is expected that accommodations (i.e., extended stay hotels, apartments, RV parks, homes for rent or sale) would be available in the nearby communities of Taft City, or Bakersfield. Therefore, the project is not anticipated to directly or indirectly induce the development of any new housing or businesses within the local communities.

The proposed project is located in the administrative boundary of Elk Hills Oil Field which consists of oil fields which has no existing housing.

Recreation: The Kern County General Plan does not identify any existing or proposed recreational facilities near the project area.

The proposed project itself does not include new recreational facilities and is not anticipated to increase demands on existing facilities. The number of workers needed during the construction phase will consist of up to 125 individuals; however, the average daily workforce will vary depending upon the stage in construction. These workers are not likely to visit local parks or recreation facilities during the workday and the workers that are relocating temporarily during construction would create little or no impact on local recreational resources after work hours.

Operation of the proposed project would require from 1 to 5 full-time onsite employees for maintenance and monitoring activities, but they would likely be drawn from the local labor force and would commute from their existing permanent residence to the project site. However, even if the maintenance/monitoring employees were hired from out of the area and relocated to western Kern County, the addition of any such families to the project area would not result in a substantial increase in the number of users at local parks or recreational facilities. As a result, there would not be a detectable increase in the use of existing neighborhood or regional parks or other recreational facilities, and therefore, no deterioration of any such facilities would occur or require the construction of new facilities as a result of project implementation.

2.2. Determination

(To be completed by the Lead Agency)

Based on this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (a) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (b) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENT IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Executive Summary

This Scoping Plan lays out the sector-by-sector roadmap for California, the world's fifth[1] largest economy, to achieve carbon neutrality by 2045 or earlier, outlining a technologically feasible, cost-effective, and equity-focused path to achieve the state's climate target. This is a challenging but necessary goal to minimize the impacts of climate change. There have been three previous Scoping Plans. Previous plans have focused on specific greenhouse gas (GHG) reduction targets for our industrial, energy, and transportation sectors—first to meet 1990 levels by 2020, then to meet the more aggressive target of 40 percent below 1990 levels by 2030. This plan, addressing recent legislation and direction from Governor Newsom, extends and expands upon these earlier plans with a target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045. This plan also takes the unprecedented step of adding carbon neutrality as a science-based guide and touchstone for California's climate work. The plan outlines how carbon neutrality can be achieved by taking bold steps to reduce GHGs to meet the anthropogenic emissions target and by expanding actions to capture and store carbon through the state's natural and working lands and using a variety of mechanical approaches.

What this means for California is an ambitious and aggressive approach to decarbonize every sector of the economy, setting us on course for a more equitable and sustainable future in the face of humanity's greatest existential threat, and ensuring that those who benefit from this transformation include communities hardest hit by climate impacts and the ongoing pollution from the use of fossil fuels. The combustion of fossil fuels has polluted our air—particularly in low-income communities and communities of color—for far too long and is the root cause of climate change. This Scoping Plan helps us chart the path to a future where race and class are no longer predictors of disproportionate burdens from harmful air pollution and climate impacts.

The major element of this unprecedented transformation is the aggressive reduction of fossil fuels wherever they are currently used in California, building on and accelerating carbon reduction programs that have been in place for a decade and a half. That means rapidly moving to zero-emission transportation; electrifying the cars, buses, trains, and trucks that now constitute California's single largest source of planet-warming pollution. It also means phasing out the use of fossil gas used for heating our homes and buildings. It means clamping down on chemicals and refrigerants that are thousands of times more powerful at trapping heat than carbon dioxide (CO_2). It means providing our communities

[1] In October 2022, California was poised to become the world's fourth largest economy.

with sustainable options for walking, biking, and public transit to reduce reliance on cars and their associated expenses. It means continuing to build out the solar arrays, wind turbine capacity, and other resources that provide clean, renewable energy to displace fossil-fuel fired electrical generation. It also means scaling up new options such as renewable hydrogen for hard-to-electrify end uses and biomethane where needed. Successfully achieving the outcomes called for in this Scoping Plan would reduce demand for liquid petroleum by 94 percent and total fossil fuel by 86 percent in 2045 relative to 2022.[2] Despite these world-leading efforts, some amount of residual emissions will remain from hard-to-abate industries such as cement, internal combustion vehicles still on the road, and other sources of GHGs, including high global warming chemicals used as refrigerants.

The plan addresses these remaining emissions by re-envisioning our natural and working lands—forests, shrublands/chaparral, croplands, wetlands, and other lands—to ensure they play as robust a role as possible in incorporating and storing more carbon in the trees, plants, soil, and wetlands that cover 90 percent of the state's 105 million acres while also thriving as a healthy ecosystem. Modeling indicates that natural and working lands will not, on their own, provide enough sequestration and storage to address the residual emissions. For that reason, it is necessary to research, develop, and deploy additional methods of capturing CO_2 that include pulling it from the smokestacks of facilities, or drawing it out of the atmosphere itself and then safely and permanently utilizing and storing it, as called for in recent legislation. Carbon removal also will be necessary to achieve net negative emissions to address historical GHGs already in the atmosphere.

This is a plan that aims to shatter the carbon status quo and take action to achieve a vision of California with a cleaner, more sustainable environment and thriving economy for our children. This ambitious plan will serve as a model for other partners around the world as they consider how to make their transition. As we have so often in the past, California can continue to serve as a leader in innovation that has produced not only the fifth largest economy on the planet, but ultimately one of the most energy-efficient economies, with a track record of demonstrating the ability to decouple economic growth from carbon pollution. This plan also builds upon current and previous environmental justice efforts to integrate environmental justice directly into the plan, to ensure that all communities can reap the benefits of this transformational plan. Specifically, this plan:

[2] See *https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-PATHWAYS-data-E3.xlsx* for energy demand reductions.

- Identifies a path to keep California on track to meet its SB 32 GHG reduction target of at least 40 percent below 1990 emissions by 2030.
- Identifies a technologically feasible, cost-effective path to achieve carbon neutrality by 2045 and a reduction in anthropogenic emissions by 85 percent below 1990 levels.
- Focuses on strategies for reducing California's dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs.
- Integrates equity and protecting California's most impacted communities as driving principles throughout the document.
- Incorporates the contribution of natural and working lands (NWL) to the state's GHG emissions, as well as their role in achieving carbon neutrality.
- Relies on the most up-to-date science, including the need to deploy all viable tools to address the existential threat that climate change presents, including carbon capture and sequestration, as well as direct air capture.
- Evaluates the substantial health and economic benefits of taking action.
- Identifies key implementation actions to ensure success.

The path forward is informed by robust science. The recent Sixth Assessment Report (AR6) of the Intergovernmental Panel on Climate Change (IPCC) summarizes the latest scientific consensus on climate change. It finds that atmospheric concentrations of CO_2 have increased by 50 percent since the industrial revolution and continue to increase at a rate of two parts per million each year.[3] By the 2030s, and no later than 2040, the world will exceed 1.5°C warming unless there is drastic action. While every tenth of a degree matters—every incremental increase in warming brings additional negative impacts—climate-related risks to human health, livelihoods, and biodiversity are projected to increase further under 2°C warming, compared to 1.5°C.[4] For example, at 1.5°C of global warming, we would experience increasing heat waves, longer warm seasons, and shorter cold seasons, but at 2°C of global warming, heat extremes would more often reach critical tolerance thresholds for human health and agriculture.[5] We are already seeing unprecedented climate change impacts, such as continued sea level rise, that are

"irreversible" for centuries to millennia, and we are dangerously close to hitting 1.5ºC in the near term.[6] To avoid climate catastrophe and remain below 1.5°C with limited or no overshoot of that threshold, global net anthropogenic CO_2 emissions need to reach net zero by 2050.

It has been 16 years since the Global Warming Solutions Act of 2006 was passed and signed into law. In 2017, the second update to the Assembly Bill (AB) 32 Climate Change Scoping Plan[7] (2017 Scoping Plan) laid out a cost-effective and technologically feasible path to achieve the 2030 GHG reduction target. At the time, many characterized the plan and the AB 32 target as unachievable, citing that it would lead to massive business and job loss, and excessive costs. Those predictions proved to be incorrect as California achieved its AB 32 target years ahead of schedule, all the while growing our economy, with the state distinguishing itself as a hub for green technology investment. This Scoping Plan draws on a decade and a half of proven successes and additional new approaches to provide a balanced and aggressive course of effective actions to achieve carbon neutrality in 2045, if not before, in addition to the 2030 goal.

California's economy is projected to grow vigorously in the coming years and decades. In 2045, under a Reference Scenario, the gross state product would be $5.1 trillion, nearly $2 trillion more than in 2021, and allow growth that would add hundreds of thousands of jobs. Under the Scoping Plan scenario, impacts to economic and job growth would be negligible in both 2035 and 2045, while delivering $199 billion of benefits in the form of reduced hospitalizations, asthma cases, and lost work and school days due to the cleaner air supported by this plan. This should come as no surprise given the tremendous growth of California's economy since the Great Recession of 2007–2009, even as the state has taken drastic measures to lower emissions. As noted, the savings associated with ambitious climate action are extensive, both in terms of avoided climate impacts and health costs. As described in Chapter 1, the health costs of climate and air pollution in the U.S. are well over $800 billion today and will continue to grow in the coming years[8] without robust action. Similarly, the costs of delayed or insufficient climate action could cost the

U.S. upwards of $14.5 trillion over the next 50 years.[9] We can either take action now or pay the cost of inaction, both now and later.

We cannot take on this unprecedented challenge alone. Collaboration with the federal government, other U.S. states, and other jurisdictions around the world will continue to be fundamental for California to succeed in achieving its climate targets, especially as the pace of our efforts increases in the coming years. We believe this collaboration and coordination also creates a race to the top, encouraging and enabling other jurisdictions to achieve climate and air quality goals as well, and often providing lessons for national action.

One example of fruitful collaboration is California's longstanding vehicle emissions standards programs, which have repeatedly been freely adopted by other states, consistent with the federal Clean Air Act. California's programs frequently pioneer more rigorous standards or new technologies—such as the now-standard catalytic converter and the rules that led directly to the nation-leading numbers of zero-emission vehicles on our roads today. From initial standards for cars and trucks decades ago to the world-leading Advanced Clean Trucks program currently helping to electrify heavy-duty vehicles, this partnership continues to offer regulatory options and spread innovative technologies. A major example of future work is the Advanced Clean Cars II program, which lays out California's legally binding path to achieving 100 percent zero emission vehicle (ZEV) sales in 2035.[10] The California Air Resources Board (CARB) continues to work closely with many other states that also see zero-emission vehicles as critical to their climate and public health goals and expects many states to choose to adopt this regulation as well. This partnership with other states also creates market certainty for automakers, which in turn helps to ensure that California consumers have access to a variety of ZEVs at multiple price points.

The Scoping Plan Process

Four scenarios were extensively modeled to develop this Scoping Plan, with the objective of informing the most viable path to remain on track to achieve our 2030 GHG reduction target: a reduction in anthropogenic emissions by 85% below 1990 levels and carbon neutrality by 2045. All four have their merits and are informed by stakeholder input. The scenario ultimately chosen as the basis of this Scoping Plan is the alternative that most

[9] Deloitte. 2022. *The Turning Point: A New Economic Climate in the United States.* https://www2.deloitte.com/content/dam/Deloitte/us/Documents/about-deloitte/us-the-turning-point-a-new-economic-climate-in-the-united-states-january-2022.pdf?id=us:2el:3dp:wsjspon:awa:WSJSBJ:2021:WSJFY22.

[10] Executive Department. State of California. Executive Order N-79-20. *https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf*.

closely aligns with existing statute and Executive Orders. It was selected because it best achieves the balance of cost-effectiveness, health benefits, and technological feasibility.

For the first time, this Scoping Plan includes modeling and quantification of GHG emissions and carbon sequestration in natural and working lands (NWL). To date, the focus has been only on reducing the emissions of GHGs from our transportation, energy, and industrial sectors. The state's 2020 and 2030 GHG reductions targets only include these sources, as they are the primary drivers of climate change and disproportionate harmful air pollution in our vulnerable communities. This Scoping Plan, through the lens of carbon neutrality, expands the scope to more meaningfully consider how our NWL contribute to our long-term climate goals. For the first time, new and cutting-edge modeling tools allow us to estimate the quantitative ability of our forests and other landscapes to remove and store carbon under different scenarios. These cutting-edge tools were developed through a stakeholder process and in coordination with other agencies for the purpose of this update and will continue to be refined over time and made available to others seeking to do similar work.

As recent data and Scoping Plan modeling shows, our NWL also can act as a source of emissions, principally in the form of wildfires. California's forests are experiencing a deadly combination of drought and heat combined with a century of misguided fire suppression management. Scoping Plan modeling shows that, at this time and until our forests reach a balance through appropriate treatments, California's NWL will act as a net source of emissions, not a sink. As such, the Scoping Plan includes policy direction and actions intended to quickly move the sector toward being a net sink and a more natural state, where wildfires will continue to be an important part of the healthy forest cycle but not at the intensity and frequency observed in recent years.

Development of this Scoping Plan also includes careful consideration of, and coordination with, other state agencies, consistent with Governor Gavin Newsom's whole-of-government approach to tackling climate change. State agency plans and regulations, including the SB 100 Joint Agency Report,[11] State Implementation Plan, Climate Action Plan for Transportation Infrastructure,[12] AB 74 Studies on Vehicle Emissions and Fuel

[11] California Public Utilities Commission (CPUC), California Energy Commission (CEC), and CARB. 2021. *SB 100 Joint Agency Report.* https://www.energy.ca.gov/sb100.

Demand and Supply,[13,14,15] Short-Lived Climate Pollutant Strategy (SLCP Strategy),[16] CARB's Achieving Carbon Neutrality Report,[17] Climate Smart Lands Strategy,[18] Natural Working Land Implementation Plan,[19] and the California Climate Insurance Report: *Protecting Communities, Preserving Nature, and Building Resiliency,*[20] among others, provided critical inputs and data points for this plan. This Scoping Plan is the product of work by multiple agencies across the Administration, including dozens of public workshops and years of rigorous analysis and economic modeling by California's leading institutions. This cooperation on planning lays the foundation for even closer coordination among and between state agencies to put the plan into effect.

The plan is also the product of tireless efforts of, and recommendations from, the AB 32 Environmental Justice Advisory Committee (EJ Advisory Committee). The EJ Advisory Committee, created by statute, plays a critical role to inform the development of each Scoping Plan and helps to ensure environmental justice is integrated throughout the plan. CARB reconvened the EJ Advisory Committee in early 2021 to advise on the development of this Scoping Plan. In their advisory role, the EJ Advisory Committee has worked together to provide inputs to CARB to inform the development of scenarios and the associated modeling. And in April 2022, the EJ Advisory Committee provided draft preliminary recommendations in advance of the Draft 2022 Scoping Plan to help ensure the draft plan meaningfully addresses environmental justice. The CARB Board and EJ Advisory Committee held a joint board hearing on September 1, 2022, where the EJ Advisory Committee presented their final recommendations on the Scoping Plan. Over five dozen of the recommendations are reflected in the Scoping Plan. Going forward, as this plan is ultimately acted on by the Board, ongoing input from the EJ Advisory

Committee will be essential to address environmental justice and achieve the ambitious vision outlined in the plan throughout its implementation in the coming years.

Importantly, per legislative direction, the Scoping Plan development includes modeling and analyses of emissions, economics, air quality, health, jobs, and public health. This work is important to inform the discussion around trade-offs and how to balance the various legislative direction in identifying a path to achieve the state's climate goals. The technical work serves as a backdrop to what this means to Californian's daily lives—to how they will work, play, and live as we act to eliminate fossil fuel combustion and achieve the many public health and environmental benefits that will result from that action.

Ensuring Equity and Affordability

The state has a long history of public health and environmental protection. However racist and discriminatory practices such as redlining have resulted in low-income communities and communities of color being disproportionately exposed to health hazards and pollution burdens.[21] These communities are often located adjacent to major roadways and large stationary sources that not only emit GHGs, but also harmful localized air pollution. The plan delivers on the promise to transform the way we move, live, and work by nearly eliminating our dependence on fossil fuels. It includes effective actions to move with all possible speed to clean energy, zero-emission cars and trucks, energy-efficient homes, sustainable agriculture, and resilient NWL. And it prioritizes working with the communities most impacted to ensure that these strategies address their needs.

An important part of our equity consideration is ensuring the transition to a zero-emission economy is affordable and accessible, and that it uplifts disadvantaged, low-income communities and communities of color. Some aspects of the transition will have associated costs (e.g., escalating efforts to retrofit existing homes and businesses to support electric appliances and vehicles and increased costs of insurance). The state must ensure that these costs do not disproportionately burden consumers. In addition, the state has an important role to play in providing financial incentives, especially to low-income consumers, to allow for uptake of clean technologies. The Department of Community Services and Development's Low Income Weatherization Program is a prime example of this approach, enabling low-income Californians to be part of the zero-emission transition, all while lowering energy bills. The program provides low-income households with solar photovoltaic systems and energy efficiency upgrades at no cost to residents, helping cushion the impact of climate change on vulnerable communities.

[21] CalEPA. 2021. Pollution and Prejudice: Redlining and Environmental Injustice in California. August 16. *https://storymaps.arcgis.com/stories/f167b251809c43778a2f9f040f43d2f5*.

With this Scoping Plan, the state also adds another tool to help identify and close climate change impact gaps that will emerge over time. As California invests in climate mitigation and adaptation, it is essential to understand the relative impact of climate change across the state's diverse communities. We know not all communities are equally resilient in the face of climate impacts due to persisting health and opportunity gaps. We also know that a global metric such as the Social Cost of Carbon cannot adequately capture the incremental additional impact faced by overly burdened communities. The Climate Vulnerability Metric (CVM) is specifically focused on quantifying the community-level impacts of a warming climate on human welfare.

Energy and Technology Transitions

To support the transformation needed, we must build the clean energy production and distribution infrastructure for a carbon-neutral future. The solution will have to include transitioning existing energy production and transmission infrastructure to produce zero-carbon electricity and hydrogen, and utilizing biogas resulting from wildfire management or landfill and dairy operations, among other substitutes. In almost all sectors, electrification will play an important role. That means that the grid will need to grow at unprecedented rates and ensure reliability, affordability, and resiliency through the next two decades and beyond. It also means we need to keep all options on the table, as it will take time to fully grow the electricity grid to be the backbone for a decarbonized economy. We also know that electrification is not possible in all situations. As such, this plan systematically evaluates and identifies feasible clean energy and technology options that will bring both near-term air quality benefits and deliver on longer-term climate goals.

This transition will not happen overnight. It will take time and planning to ensure a smooth transition of existing energy infrastructure and deployment of new clean technology. And while this Scoping Plan has the longest planning horizon of any Scoping Plan to date, this 25-year horizon is still relatively short in terms of transforming California's economy. We must avoid making choices that will lead to stranded assets and incorporate new technologies that emerge over time. Importantly, given the pace at which we must transition away from fossil fuels, we absolutely must identify and address market and implementation barriers to be successful. The scale of transition includes adding four times the solar and wind capacity by 2045 and about 1,700 times the amount of current hydrogen supply.

As we transition our energy systems, we must also rapidly deploy the clean technologies that rely on a decarbonized grid. As called for in Executive Order N-79-20, all new passenger vehicles sold in California will be zero-emission by 2035, and all other fleets will have transitioned to zero-emission as fully possible by 2045. This means the percentage of fossil fuel combustion vehicles will continue to rapidly decrease, becoming a fading vision of the past. Successful implementation of this Executive Order (EO) and other zero-emission priorities will have to be attractive to consumers. As an example,

electric and hydrogen transportation refueling must be readily accessible, and active transportation and clean transit options must be cheaper and more convenient than driving.

Cost-Effective Solutions Available Today

Ultimately, to achieve our climate goals, urgent efforts are needed to slash GHG emissions. Fortunately, cost-effective solutions are available to do so in many cases. In short, this plan relies on existing technologies—it does not require major technological breakthroughs that are highly uncertain.

For example, targeted action to reduce methane emissions can be achieved at low or negative cost, and with significant near-term climate and public health benefits. In many cases, renewable energy and energy storage are cheaper than polluting alternatives, and are already firmly part of our business-as-usual approach; modeling related to the most recent integrated resource planning process at the California Public Utilities Commission (CPUC) has shown that scenarios associated with the best emissions outcomes had the lowest average rates. As another example, research from Energy Innovation shows that the U.S. can achieve 100 percent zero-carbon power by 2035 without increasing customer costs.[22]

The same is either already true, or soon to be true, for zero-emission vehicles as well. Myriad studies show cost parity for light-duty and heavy-duty ZEVs being achieved by mid-decade or shortly thereafter. A carbon neutrality study conducted by the University of California (UC) Institute of Transportation Studies and funded by the California Environmental Protection Agency (CalEPA) shows that achieving carbon neutrality in the transportation sector will *save* Californians $167 billion through 2045.[23] Similar research from the Goldman School of Public Policy at UC Berkeley finds that achieving 100 percent light-duty ZEV sales nationwide would save consumers $2.7 trillion through 2050; equivalent to $1,000 per household, per year, for 30 years.[24]

Many of these outcomes are a direct result of California's vision and policy development to advance clean energy and climate solutions, including through the Renewables Portfolio Standard, Advanced Clean Cars II regulations, SLCP Reduction Strategy, and

others. While the world collectively has not yet fully deployed clean energy and climate solutions at the scale needed to adequately address climate change, California has made tremendous progress—even since the last Scoping Plan update in 2017. Continued ambition, leadership, and climate policy development from California will help the state achieve the scale of emissions reductions needed from technologies and strategies that are already cost-effective or close to it today, and will move additional technologies and strategies to that point in the near future. Achieving those outcomes and reducing costs for the entire array of climate solutions needed to achieve carbon neutrality and then maintain net-negative emissions will prove the true measure of California's success. This will enable California to not just meet our own climate targets, but to ultimately develop the replicable solutions that can scale globally to address global warming.

Continue with a Portfolio Approach

Over the past decade and a half, the state has undertaken a successful three-pronged approach to reducing GHGs: incentives, regulations, and carbon pricing. The 2017 Scoping Plan leveraged existing programs such as the Renewables Portfolio Standard, Advanced Clean Cars, Low Carbon Fuel Standard, Short-lived Climate Pollutant Strategy, mobile source measures to achieve federal air quality targets, and a Cap-and-Trade Program, among others, to lay out a technologically feasible and cost-effective path to achieve the 2030 GHG reduction target. When looking toward the 2045 climate goals and the deeper GHG reductions needed across the AB 32 GHG Inventory sectors, all of the existing programs must be evaluated and, as necessary, strengthened to support the rapid production and deployment of clean technology and energy, as well as the increased pace and scale of actions on our natural and working lands.

The challenge before us requires us to keep all tools on the table. Given the climate mitigation co-benefits, critical actions to deliver near-term air quality benefits, such as those included in the State Implementation Plan to achieve the federal air quality standards, are incorporated into this Scoping Plan, as are new legislative mandates to decarbonize the electricity and cement sectors. And, if additional gaps are identified, new programs and policies must be developed and implemented to ensure all sectors are on track to reduce emissions. Opportunities to leverage these programs to address ongoing air quality disparities must also be considered, along with targeted environmental justice policies such as the AB 617 Community Air Protection Program and the investments made possible through the California Climate Investments Program.

Conclusion

California has never undertaken such a comprehensive, far-reaching, and transformative approach to fighting climate change as that called for in this plan. Once implemented, it will place every aspect of how we live, work, play, and travel in California on a more sustainable footing, with a focus on directly benefitting those communities already most burdened by pollution. This comprehensive approach reflects how climate change is

already changing life in California. We have all experienced the impacts of devastating wildfires, extreme heat, and drought. Despite much progress, California still has some of the worst air pollution in the nation, especially in the San Joaquin Valley and the Los Angeles Basin, which is driven by the continued use of fossil fuel-powered trucks and cars.

This Scoping Plan provides a solution; a way forward and a vision of a California where we can and will address those impacts. This plan is fundamentally based on hope. It is a hope grounded in experience and science that we can fundamentally improve the California we leave to future generations. The plan is built on the legacy of effective actions and on the conviction that we can effectively marshal the combined capabilities of California—from state, regional, tribal, and local governments to industry to our research institutions, and most importantly, to the nearly 40 million Californians who will benefit from the actions laid out in the plan. It addresses the challenge of our generation by laying out a pathway and guideposts for action across three decades. But the Scoping Plan is only that: a plan. The hard work—and hopeful work—is putting its recommendations into action. And there is no time to waste.

Post-adoption of the Scoping Plan

As with previous Scoping Plans, CARB Board approval is the beginning of the next phase of climate action. Specifically, approval of this plan catalyzes a number of efforts, including the development of new regulations as well as amendments to strengthen regulations and programs already in place, not just at CARB but across state agencies. The unprecedented rate of transition will also require the identification and removal of market and implementation barriers to the production and deployment of clean technology and energy. All of these actions and more will be needed if we are to achieve our climate goals.

Chapter 1: Introduction

"The debate is over around climate change. Just come to the state of California. Observe it with your own eyes."

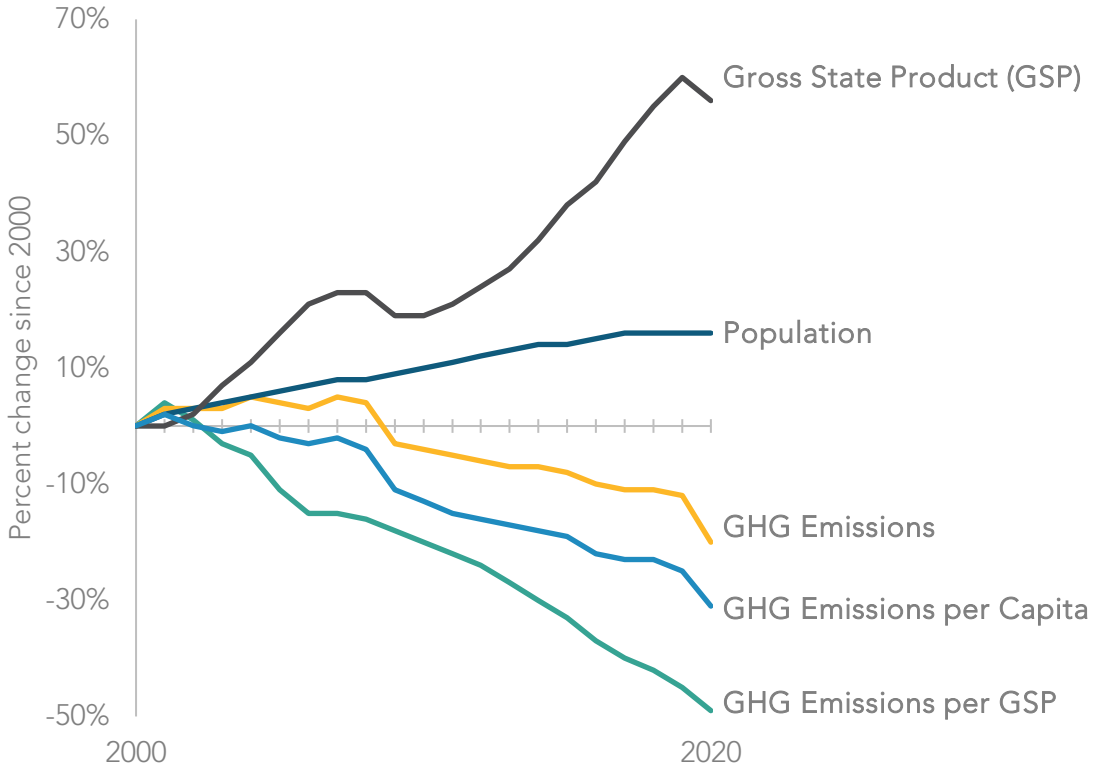
- California Governor Gavin Newsom in September 2020 after surveying the devastation caused by catastrophic wildfires

The impacts of climate change are no longer a distant threat on the horizon—they are right here, right now, with a growing intensity that is adversely affecting our communities and our environment, here in California and across the globe. The science that, decades ago, predicted the impacts we are currently experiencing is even stronger today and unambiguously tells us what we must do to limit irreversible damage: we must act with renewed commitment and focus to do more and do it sooner. That science is indisputable. Unless we increase ambition, we will be faced with more fire, more drought, more temperature extremes, and deadly, choking air pollution. The future of our state—our communities, economy, and ecosystems—is inextricably tied to the way we respond in this decade and the partnerships we forge along the way.

The impacts of climate change fall most heavily on frontline communities that bear the brunt of extreme heat, drought, wildfires, and other effects. Low-income communities and communities of color are also disproportionately impacted by fossil fuel combustion-related air pollution and related health problems. The continued phaseout of fossil fuel combustion will advance both climate and air quality goals and will deliver the greatest health benefits to the most impacted communities.

As it has responded to this climate crisis, California has established itself as a global leader in science-based, public health-focused climate change mitigation and air quality control. The California Legislature has worked with both Republican and Democratic governors to advance action on public health and environmental protections—and California has made progress on addressing climate change during periods of both Republican and Democratic federal administrations. Since the passage of Assembly Bill 32 (AB 32) (Núñez and Pavley, Chapter 488, Statutes of 2006), California has developed bold, creative, and durable policy solutions to protect our environment and public health, all while growing our economy. In fact, California met the target established in AB 32—a return of greenhouse gas (GHG) emissions to 1990 levels by 2020—years ahead of schedule, even as the state established itself as the one of the largest economies in the world. As Figure 1-1 below shows, California's emissions and economic growth have continued to decouple, and California is now the fifth largest economy in the world.

Figure 1-1: California total and per capita GHG emissions[25]



Recognizing both California's early successes in achieving GHG emissions reductions while growing the economy, as well as the worsening impacts of climate change, our governors and legislators have continued to enact ambitious goals. California's unwavering commitment to address climate change is based on indisputable science and data. This commitment is also informed by our collective efforts to address environmental justice and advance racial equity, such that race will no longer be a predictor for disproportionate environmental burdens faced by low-income communities and communities of color. As the Office of Environmental Health Hazard Assessment's

[25] Due to the global pandemic, 2020 is an outlier year and should not be considered indicative of a trend; emissions are likely to increase as economies recover from the impacts of the pandemic.

(OEHHA's) recent analysis of race/ethnicity and air pollution vulnerability and CalEnviroScreen 4.0 scores demonstrate, much work remains to be done.[26]

Many of California's environmental policies have served as models for similar policies in other U.S. states, and at national and international levels. Moving forward, California will continue its pursuit of collaborations and advocacy for action to address climate change at all levels of government. While California is responsible for just one percent of global GHG emissions, and we must do our part, we also play an important role in exporting both political will and technical solutions to address the climate crisis globally.

Today, we have a chance to re-envision California's future and set the state on a path to be carbon neutral no later than 2045 while advancing equity, addressing environmental justice, and continuing to grow our economy. This Scoping Plan provides a roadmap outlining key policies we can implement to achieve our climate goals while improving the health and welfare of Californians and addressing disparities in health outcomes to create a more equitable future. It will enable us to turn the corner in our efforts to protect and preserve our critical natural and public resources, all while providing unparalleled opportunities for clean, pollution-free economic growth.

Severity of Climate Change Impacts

With the increasing severity and frequency of drought, wildfire, extreme heat, and other impacts, Californians just have to look out their windows to know that climate change is real and rapidly getting worse. The impacts we thought we would see in the decades to come are happening now. We must act decisively to both reduce our GHG emissions and build resilience to these impacts for ourselves, future generations, and our iconic landscapes.

Wildfires

Of the twenty largest wildfires ever recorded in California, nine occurred in 2020 and 2021. The worst wildfire season in California's recorded history was in 2018, with over 24,226 structures damaged or destroyed and over 100 lives lost. The largest wildfire season ever recorded in state history was in 2020, where more than 4.3 million acres burned, albeit at different intensity and with varying ecological impacts, and over 112 million metric tons of

[26] OEHHA and CalEPA. 2021. Analysis of Race/Ethnicity and CalEnviroScreen 4.0 Scores. *https://oehha.ca.gov/media/downloads/calenviroscreen/document/calenviroscreen40raceanalysisf2021.pdf*.

carbon dioxide (CO_2) emitted into the atmosphere.[27] The economic damage of these fires was estimated to be over $10 billion in property damage and over $2 billion in fire suppression costs.[28] The Camp Fire, which destroyed much of Paradise, California, was the world's costliest natural disaster in 2018, with overall damages of $16.5 billion.[29] It was also the deadliest fire in California history, with 85 civilian fatalities. Wildfires have always been part of California's natural ecology and will continue to be. However, changes to the state's climate and precipitation expands the footprint of wildfire threat, severity, and intensity, with one quarter of California—more than 25 million acres—now classified as being under very high or extreme fire threat.[30]

The impacts of wildfire smoke have been linked to respiratory infections, cardiac arrests, low birth weight, mental health conditions, and exacerbated asthma and chronic obstructive pulmonary disease.[31] In 2020, with all of California covered by wildfire smoke for over 45 days—and 36 counties for at least 90 days—maximum fine particulate ($PM_{2.5}$) levels persisted in the "hazardous" range of the Air Quality Index for weeks in several areas of the state.[32,33]

Catastrophic wildfire damages extend beyond human health and the economy. The Castle Fire in 2020 and the KNP Complex and Windy Fires in 2021 led to the loss of an unprecedented number of giant sequoias: an estimated 13 to 19 percent of the giant

sequoia population in the Sierra Nevada. An iconic species, giant sequoias are the largest trees on earth, with exceptional longevity outside of climate extremes.[34,35]

It is clear that we must take drastic measures to prepare for future wildfires, which is why California invested $2.7 billion in wildfire resilience from fiscal years 2020 to 2023. The exponential increase in funding launched more than 552 wildfire resilience projects in less than a year, and CAL FIRE met its 2025 goal of treating 100,000 acres a full three years ahead of schedule. Since Fiscal Year 2019–20, treatment work has significantly increased, and CAL FIRE has averaged 100,000 acres treated each fiscal year.

Although we are making progress, we have a lot more work to do in order to achieve our goal of treating one million acres annually by 2025. The Governor's Wildfire and Forest Resilience Strategy details 99 actions needed to address the key drivers of catastrophic wildfires, ramp up the pace and scale of forest management, and make threatened communities more resilient to catastrophic fires. It is also important to note that natural wildfire cycles are a part of a sustainable forest ecosystem and will continue to play a role in a healthy forests' future. We should not expect wildfires to cease, but we must manage our lands to address catastrophic wildfires that result from buildup of carbon stocks due to our interventions to suppress wildfires and from climate change resulting from fossil fuel combustion.

Drought

Drought is a recurring feature of the California climate that has been intensified by increasingly warmer average temperatures. Anthropogenic climate trends have exacerbated drought conditions; human-caused climate change accounts for 19 percent of drought severity and 42 percent of the soil moisture deficit in this region since 2000. The governor declared a drought state of emergency in October 2021, and as of September 2022, 94 percent of California was in severe drought, and 99.8 percent[36] of the state was in at least moderate drought. The first three months of 2022 were the driest January, February, and March on record in California.[37] The harsh drought conditions affecting California are part of a larger megadrought—a drought lasting more than two

decades—that has been ongoing in the Southwestern region of North America since 2000. The past 22 years have been the region's driest period since at least 800 CE.[38]

While large urban water districts with diversified sources of water supply have maintained water deliveries to customers through the drought, hundreds of individual well owners and some small water systems have suffered disruption. The state is providing funding for water system consolidation and modernization projects in small communities, emergency repairs and replacements for dry wells, and bottled and hauled water deliveries. A 2021 law requires small suppliers to create drought contingency plans. During the drought of the last three years the state has delivered emergency drinking water assistance to nearly 10,000 households and 150 water systems.

California agriculture is responsible for more than half of all U.S. domestic fruit and vegetable production, and in 2021 drought resulted in the fallowing of nearly 400,000 acres of fields.[39] Direct crop revenue losses were approximately $962 million, and total economic impacts were more than $1.7 billion, with over 14,000 full- and part-time job losses.[40] During the 2011–2017 drought, California's agricultural industry suffered at least $5 billion in losses.[41] The 2022–23 budget includes $100 million to support agricultural water conservation practices, provide on-farm technical assistance, and provide direct relief to small farm operators.

Though native California species are adapted to drought, human engineering has altered most streams and wetlands in the state, making drought increasingly stressful to fish and wildlife. The state has conducted hundreds of fish and amphibian rescues in this drought to move creatures from diminished habitat, upgraded hatcheries, and boosted hatchery production, and has hauled millions of young hatchery salmon to San Francisco Bay to avoid adverse river conditions. State biologists monitor dozens of streams statewide and have negotiated voluntary agreements with landowners and water users to improve stream flows and temperatures.

California has started to implement major policies to build resilience to combat drought—such as the Sustainable Groundwater Management Act of 2014, the governor's Water Resilience Portfolio (2020), the governor's Water and Supply Strategy (August 2022), and

new standards for indoor, outdoor, and industrial water use. However, it is crucial that we take further actions to minimize the impacts of drought in the years to come.

Extreme Heat

California's hottest summer on record was 2021.[42] Death Valley recorded the world's highest reliably measured temperature (130°F) in July 2021, breaking its own record (129°F) from summer 2020.[43] Meanwhile, Fresno also broke one of its own records, with 64 days over 100°F in 2021.[44] This is part of a trend: the daily maximum average temperature, an indicator of extreme temperature shifts, is expected to rise 4.4°F–5.8°F by 2050 and 5.6°F–8.8°F by 2100.[45] Heat waves that result in public health impacts are also projected to worsen throughout the state. By 2050, these heat-related health events are projected to last two weeks longer in the Central Valley and occur four to ten times more often in the Northern Sierra region.[46]

Heat ranks among the deadliest of all climate hazards in California, and heat waves in cities are projected to cause two to three times more heat-related deaths by mid-century.[47] Climate vulnerable communities[48] will experience the worst of these effects, as heat risk is associated and correlated with physical, social, political, and economic factors. Aging populations, infants and children, pregnant people, and people with chronic illness are especially sensitive to heat exposure.[49,50] Combining these characteristics and existing health inequities with additional factors such as poverty, linguistic isolation,

housing insecurity, and the legacy of racist redlining practices, can put individuals at a disproportionately high risk of heat-related illness and death.[51,52] Rising temperatures will also speed up smog-forming chemical reactions, leading to worse asthma, reduced lung function, cardiac arrest, and cognitive decline. African American, American Indian/Alaskan Native, and Puerto Rican Californians are particularly sensitive to smog, as they are between 28.6 and 132.5 percent more likely to be diagnosed with asthma than white Californians.[53]

In addition to the dangers to public health, California's September 2022 heat wave is particularly illustrative of how more frequent extreme heat strains the state's infrastructure we depend on to adapt to a changing climate. For example, as all-time high temperature records were broken in Sacramento, San Jose, Santa Rosa and Fairfield, electricity demand for air conditioning threatened to overwhelm the state power supply.[54]

California has taken major steps to protect communities from the impacts of extreme heat. Our recent budgets invest $800 million to cool our schools and neighborhoods, including projects to reduce urban overheating. The Extreme Heat Action Plan, released in April 2022, outlines the all-of-government approach California is taking to reduce urgent risks and build long-term resilience to the impacts of extreme heat. In September 2022, Governor Newsom signed multiple bills addressing extreme heat, including AB 2238 (Rivas, Chapter 264, Statutes of 2022), which will create the nation's first extreme heat advance warning and ranking system to better prepare communities ahead of heat waves. The Administration is committed to addressing extreme heat, but we still have a lot of work to do.

Wildfires, drought, and extreme heat are some of the most pronounced climate impacts California is experiencing, but they are not the only ones. Sea level rise, rising ocean temperatures, ocean acidification, and inland flooding are also already having devastating impacts on our communities, ecosystems, and economy, and will continue to do so in the years and decades to come. The decisions and actions that we take today will determine how strongly we will feel the impacts of climate change in the future.

Imperative To Act

Consequences of Further Warming

The Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report (AR6) found that it will not be possible to keep global warming within the threshold of 1.5°C to avoid the most severe impacts of climate change unless we make immediate and large-scale reductions in GHG emissions. It finds that atmospheric concentrations of CO_2 have increased by 50 percent since the industrial revolution, and that they continue to increase at a rate of two parts per million each year.[55] Without immediate action, the world will exceed 1.5°C (or 2.7°F) warming by the 2030s, and no later than 2040.

While every tenth of a degree matters—every incremental increase in warming brings additional negative impacts—climate-related risks to human health, livelihoods, and biodiversity are projected to increase further under 2°C (or 3.6°F) warming, compared to 1.5°C.[56] To remain below 1.5°C with limited or no overshoot of that threshold, global net anthropogenic CO_2 emissions need to be cut by about half by 2030 and reach net-zero by 2050.

If we fail to make rapid changes, we may not be able to limit global warming to 2°C,[57] and the consequences of inaction would be catastrophic. Our planet is already 1.2°C warmer than pre-industrial times due to human-induced warming, and many impacts we are already experiencing, such as sea level rise, are "irreversible" for centuries to millennia.[58] Californians with the fewest resources, who are disproportionately low-income communities and communities of color, are the most vulnerable to the impacts of climate change. While the human costs associated with health impacts can never be fully monetized, a recent report finds that the health costs of climate and air pollution in the U.S. are well over $800 billion today and will continue to grow in the coming years.[59]

Any delays in action or insufficient action are a threat to public health and the environment. The impacts to our economy would be devastating as well. While not specific to California, a 2022 report from Deloitte Economics Institute finds that failing to take sufficient action to reduce emissions could result in economic losses to the U.S. of more than $14.5 trillion over the next 50 years.[60] On a hopeful note, however, the report finds that if the country invests now and in the coming years in a net-zero economy, $3 trillion could be added to the economy over the next 50 years. The U.S. annual gross domestic product (GDP) would be 2.5 percent higher in 2070 in this fast-action scenario than in the delayed action scenario. The lessons for California from these analyses are clear: invest now or pay the price later. As shown in Figure 1-2, inaction can lead to negative consequences for individuals, communities, the economy, and society as a whole. As discussed later, Governor Newsom and the Legislature have accepted this imperative and made significant investments in climate action. This Scoping Plan combined with the historic investments and policy direction from the governor and Legislature, will result in unprecedented action to address the climate crisis.

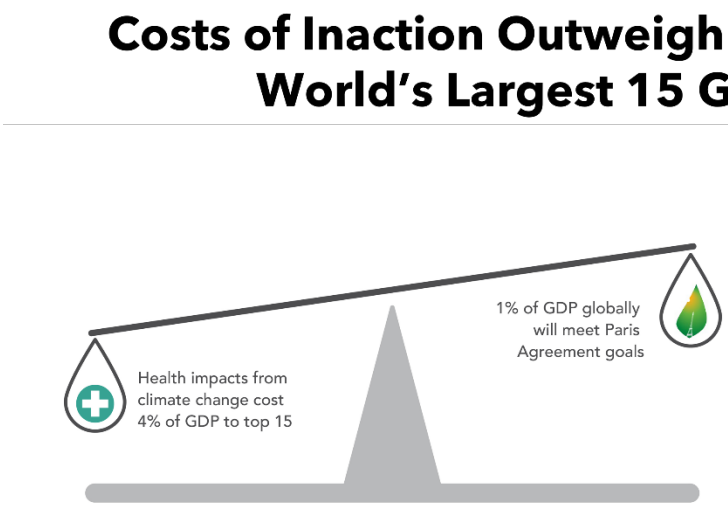
Figure 1-2: The real costs of inaction[61]



Exposure to air pollution causes 7 million deaths worldwide every year and costs an estimated US$5.11 trillion in welfare losses globally. In the 15 countries that emit the most greenhouse gas emissions, the health impacts of air pollution are estimated to cost more than 4% of their GDP. Fossil fuel combustion contributes to both air pollution and climate change. Actions to meet the Paris goals would cost about 1% of global GDP.

Scoping Plan Overview

Previous Scoping Plans

The Scoping Plan is a strategy the California Air Resources Board (CARB) develops and updates at least one every five years, as required by AB 32. It lays out the transformations needed across our society and economy to reduce emissions and reach our climate targets. This Scoping Plan is the third update to the original plan that was adopted in 2008. The initial Scoping Plan laid out a path to achieve the AB 32 2020 limit of returning to 1990 levels of GHG emissions, a reduction of approximately 15 percent below business as usual.[62] The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan assessed progress toward achieving the 2020 limit and made the case for addressing

[61] Katowice, P. 2018. *Health benefits far outweigh the costs of meeting climate change goals.* WHO. https://www.who.int/news/item/05-12-2018-health-benefits-far-outweigh-the-costs-of-meeting-climate-change-goals.

[62] CARB. 2008. *Climate Change Scoping Plan.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/document/adopted_scoping_plan.pdf.

short-lived climate pollutants (SLCPs).[63] The most recent update, the 2017 Scoping Plan,[64] also assessed the progress toward achieving the 2020 limit and provided a technologically feasible and cost-effective path to achieving the Senate Bill 32 (SB 32, Pavley, Chapter 249, Statutes of 2016) target of reducing GHGs by at least 40 percent below 1990 levels by 2030.

Overview of this Scoping Plan

It is paramount that we continue to build on California's success by taking effective actions and doubling down on implementation of the strategies outlined here. As such, this Scoping Plan builds on and integrates efforts already underway to reduce the state's GHG, criteria pollutant, and toxic air contaminant emissions by identifying the clean technologies and fuels that should be phased in as the state transitions away from combustion of fossil fuels. By selecting and pursuing a sustainable and clean economic path, the state will continue to successfully execute existing programs, work to eliminate air pollution inequities, demonstrate the coupling of economic growth and environmental progress, and enhance new opportunities for engagement within the state to address and prepare for climate change.

The 2022 Scoping Plan for Achieving Carbon Neutrality (Scoping Plan) is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible and cost-effective path to achieve carbon neutrality by 2045 while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan.[65] The 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. Modeling for this Scoping Plan shows that this decade must be one of transformation on a scale never seen before to set us up for success in 2045.

The relatively longer path assessed in this Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, this Scoping Plan also includes discussion for the first time of the Natural and Working Lands (NWL) sectors as both sources of emissions and carbon sinks. Chapter 2 of this document

---

[63] CARB. 2014. *First Update to the Climate Change Scoping Plan.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf.
[64] CARB. 2017. *California's 2017 Climate Change Scoping Plan.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/scoping_plan_2017.pdf.
[65] CARB. 2017. *California's 2017 Climate Change Scoping Plan.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/scoping_plan_2017.pdf.

includes a description of a suite of specific actions to drastically reduce GHGs across all sectors. Chapter 3 provides the air quality and economic evaluations of the actions. Chapter 4 provides a broader description of the many actions needed across all sectors to achieve carbon neutrality. Chapter 5 provides an overview of the next steps and partnerships needed to implement this Scoping Plan. Guided by legislative direction, the actions identified in this Scoping Plan reduce overall GHG emissions in California and deliver policy signals that will continue to drive investment and certainty in a low carbon economy. This Scoping Plan builds upon the successful framework established by the Initial Scoping Plan and subsequent updates while identifying new, technologically feasible, and cost-effective strategies.

Principles That Inform Our Approach to Addressing the Climate Challenge

California has decades of experience addressing the climate challenge. Through this experience, and based on extensive engagement with stakeholders through our regulatory and program development processes, we have developed a set of principles to inform our approach.

Unprecedented Investments in a Sustainable Future

The scale of transformation needed over this decade to avoid the worst impacts of climate change and meet our ambitious climate goals is extraordinary. This is why Governor Newsom and the Legislature invested over $15 billion in climate action through the 2021–2022 California Comeback Plan, and why the 2022–2023 budget marks the beginning of the California Climate Commitment—the governor's multi-year plan to invest $54 billion in climate action. The enacted budgets (Figure 1-3) and the California Climate Commitment represent investments of a historic scale and will advance precisely the type of all-of-government approaches necessary to create the whole-of-society changes described in this Scoping Plan that will enable us to avert the worst impacts of climate change.

Figure 1-3: Comprehensive California climate change investments

The *California Climate Commitment* includes the following game-changing elements:

- $10 billion for zero-emission vehicles (ZEVs), including $1.5 billion for electric school buses to protect students' health and $3 billion to build an accessible charging network. ZEV investments will particularly focus on programs such as heavy-duty vehicle and port electrification that will reduce emissions and protect public health in low-income communities.
- $2.1 billion for clean energy investments, such as long duration storage, offshore wind, green hydrogen,[66] and industrial decarbonization.
- $13.8 billion for programs that reduce emissions from the transportation sector, such as improving public transportation while also funding walking, biking, and adaptation projects.
- Over $720 million for California's higher education institutions and research that will support the next generation of climate innovations.

[66] For the purposes of this Scoping Plan, "renewable hydrogen" and "green hydrogen" are interchangeable and are not limited to only electrolytic hydrogen produced from renewables.

- Nearly $1 billion to build sustainable, affordable housing and over $1 billion to help low-income Californians realize energy cost savings through building decarbonization.
- Nearly $9 billion for wildfire risk reduction, drought mitigation, extreme heat resilience, and nature-based solutions.

These investments are incredibly important in the context of this Scoping Plan in that they accompany and help support implementation of the many policies and regulations that will continue to be necessary to achieve our 2030 and carbon neutrality targets. In addition, these incentive programs jump-start emission reduction strategies for priority sectors, sources, and technologies, leveraging private-sector investment and building sustainable, growing markets for clean and efficient technologies. Many of California's incentive programs work in concert with federal and other state programs to drive emission reductions. As an example, as California pushes to move to 100% sales of new zero emission-vehicles, including plug-in hybrid vehicles, the Newsom Administration continues to invest heavily in incentive programs that allow families, communities, and businesses to choose zero-emission vehicles. This is done while simultaneously working with the federal government, other states, and jurisdictions around the world to align policies, regulations, and incentives, creating market certainty for the automakers that serve our markets.

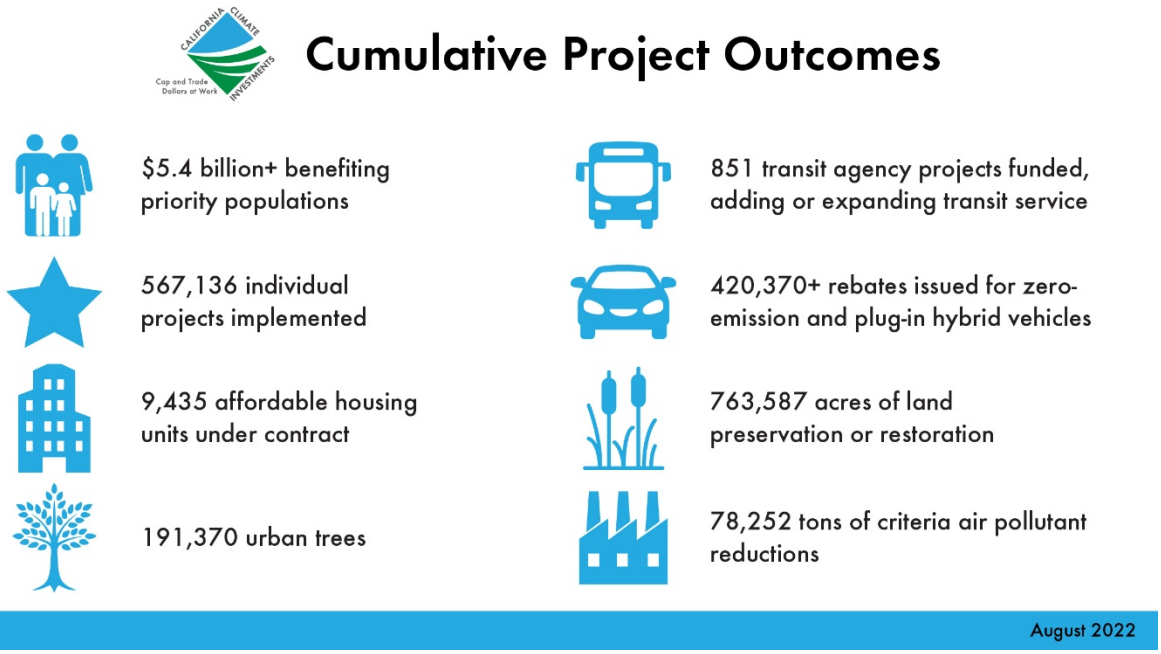
Centering Equity

Prioritizing equity is just as important as the magnitude of the climate investments California is making. Addressing climate change and advancing our equity and economic opportunity goals cannot be decoupled. In line with the governor's Executive Order[67] to take additional actions to embed equity analysis and considerations, this plan works to center equity by addressing disparities for historically underserved and marginalized communities. California strives to ensure that our climate and air research, regulations, investments, and plans include provisions that specifically address and advance equity. This includes reducing and eliminating air pollution disparities, removing barriers that can prevent frontline communities from accessing benefits, lowering costs for low-income Californians, and promoting high-quality jobs. CARB's incentive programs regularly surpass their mandated equity targets, and CARB has incorporated equity-focused provisions in our research, planning, and regulatory efforts. For instance, statute requires that a minimum of 35 percent of California Climate Investments benefit low-income households along with disadvantaged and low-income communities (referred to as *priority*

[67] Executive Department. State of California. 2022. Executive Order N-16-22. *GSS_9320_2-20220912152941 (ca.gov)*.

populations). However, 48 percent—over $5.4 billion—of implemented California Climate Investments project funding is benefiting priority populations, greatly exceeding the statutory minimums (see Figure 1-4). Senate Bill 535 (De León, Chapter 830, Statutes of 2012) and AB 1550 (Gomez, Chapter 369, Statutes of 2016) direct state and local agencies to make significant investments using auction proceeds to assist California's most vulnerable communities. Under these laws, a minimum of 25 percent of the total investments are required to be located within and provide benefits to disadvantaged communities, and at least 10 percent of the total investments must benefit low-income communities and households. Moving forward, the state will continue to devote a greater share of incentive funding to priority populations, with the light-duty vehicle incentive program as just one example. We can simultaneously confront the climate crisis and build a more resilient, just, and equitable future for all communities.

Figure 1-4: California climate investments cumulative outcomes[68,69]



Role of the Environmental Justice Advisory Committee

To inform the development of the Scoping Plan, AB 32 calls for the convening of an Environmental Justice Advisory Committee (EJ Advisory Committee) to advise CARB in developing the Scoping Plan, and any other pertinent matter in implementing AB 32. It requires that the Committee be comprised of representatives from communities with the most significant exposure to air pollution, including communities with minority populations and/or low-income populations. On January 25, 2007, CARB appointed the first

[68] CARB. 2022. California Climate Investments program implements $10.5 billion in greenhouse gas-reducing programs, expected to reduce 76 million metric tons of emissions. April 11. *https://ww2.arb.ca.gov/news/california-climate-investments-program-implements-105-billion-greenhouse-gas-reducing-projects*.

[69] SB 535 and AB 1550 require investments located in and benefiting low-income communities and households, which are termed *priority populations. Disadvantaged communities* are currently defined by CalEPA as the top 25 percent of communities experiencing disproportionate amounts of pollution, environmental degradation, and socioeconomic and public health conditions according to the Office of Environmental Health Hazard Assessment's *CalEnviroScreen tool,* plus certain additional communities including federally recognized Tribal Lands. Low-income communities and households are defined by statute as those with incomes either at or below 80 percent of the statewide median or below a threshold designated as low-income by the Department of Housing and Community Development.

Environmental Justice Advisory Committee to advise it on the Initial Scoping Plan and other climate change programs.

For this Scoping Plan, CARB reconvened the EJ Advisory Committee in May 2021. The committee is currently comprised of 14 environmental justice and disadvantaged community representatives, including the EJ Advisory Committee's first tribal representative, who was appointed in February 2022. In October 2021, the EJ Advisory Committee formally created eight workgroups. These workgroups are a space for EJ Advisory Committee members to better understand specific sectors of the Scoping Plan and to assist the EJ Advisory Committee in the development of recommendations on this Scoping Plan. In December 2021, the EJ Advisory Committee provided scenario input responses to help shape the modeling for this Scoping Plan. In February 2022, San Joaquin Valley EJ Advisory Committee members hosted their first community workshop, with over 100 attendees. In March 2022, the CARB Board held a joint public meeting with the EJ Advisory Committee to discuss their draft preliminary recommendations for this Scoping Plan. In June 2022, over 165 attendees participated in a statewide community workshop held by EJ Advisory Committee members. The full schedule of EJ Advisory Committee Meetings and meeting materials are available on CARB's website.[70] This Scoping Plan includes references where EJ Advisory Committee Final Recommendations[71] are included in the document. The final recommendations were discussed at a joint CARB and EJ Advisory Committee Hearing on September 1, 2022.

The integration of environmental justice is critical to ensure that certain communities are not left behind. The AB 32 EJ Advisory Committee provided recommendations on September 30 in advance of the final Scoping Plan. There are footnotes to indicate where there is alignment between the AB 32 EJ Advisory Committee's recommendations and this Scoping Plan. While the language in the text may not fully incorporate the specific EJ Advisory Committee's recommendation, the footnotes do acknowledge the places in the text where there is general alignment with the spirit of the EJ Advisory Committee's recommendation.

Partnering with Tribes

[70] CARB. Environmental Justice Advisory Committee Meetings and Events. *https://ww2.arb.ca.gov/environmental-justice-advisory-committee-meetings-and-events*.
[71] Environmental Justice Advisory Committee. September 30, 2022. 2022 Scoping Plan Recommendations. *https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2022/090122/finalejacrecs.pdf*.

There are 109 federally recognized tribes and over 60 non-federally recognized tribes in California.[72] In 2011, Governor Brown issued Executive Order B-10-11, recognizing and reaffirming the inherent right of tribes to exercise sovereign authority over their members and territory and directing state agencies to engage in government-to-government consultation with tribe and to work to develop partnerships and consensus.[73] In 2019, Governor Newsom issued Executive Order N-15-19, which acknowledges and apologizes on behalf of the state for the historical "violence, exploitation, dispossession and the attempted destruction of tribal communities."[74] Establishing partnerships with tribal leaders to incorporate their priorities, traditional expertise, and knowledge will be important to achieving California's climate goals. The Scoping Plan includes actions that tribal partners can voluntarily implement for sources under their jurisdiction (e.g., transitioning to zero emission fleets, installing infrastructure and control technologies, conducting climate smart land management). The Scoping Plan also uplifts the importance of having our tribal partners help guide actions that may impact tribal cultural resources and of benefitting from tribal input.

We also need alignment between state and local partners and tribes on actions related to land-use decisions. This means respecting and reinforcing tribal sovereignty and self-determination. As tribes do not always draw clear lines between the "natural" and "cultural" resources of a place, taking a holistic perspective will result in positive impacts in ability to address the complex issues of land management and regulatory undertakings.

Tribes have an intimate and historical knowledge of places and should be engaged early on to inform planning and future management related to activities that may impact tribal resources and areas including potential funding opportunities, technical assistance, and capacity building, where appropriate. Additionally, tribes should be involved in the identification of their own significant resources and areas of use. As decisions are made related to Scoping Plan undertakings, agencies should recognize and appropriately consider cultural resources and management from the beginning, not as an afterthought; and consider how the project could impact tribes.

---

[72] These numbers are subject to change depending on determinations made by the Bureau of Indian Affairs (BIA) and the Native American Heritage Commission (NAHC). Please consult the most current Federal Register for a list of federally recognized tribes and the NAHC for a list of non-federally recognized tribes in California. As of the date of the Scoping Plan, the current list for federally recognized tribes is located at 87 Fed. Reg. 4636 (Jan. 28, 2022).

[73] Executive Order B-10-11. *https://www.ca.gov/archive/gov39/2011/09/19/news17223/index.html#:~:text=EXECUTIVE%20ORDER%20B-10-11%20Published%3A%20Sep%2019%2C%202011%20WHEREAS,and%20affirmed%20in%20state%20and%20federal%20law%3B%20and*.

[74] Executive Order N-15-19. *https://tribalaffairs.ca.gov/wp-content/uploads/sites/10/2020/02/Executive-Order-N-15-19.pdf*.

Finally, to the extent allowed by law, traditional ecological knowledge and culturally sensitive information should be protected, as this is information that may not be common knowledge and may not be known outside the tribe, as each tribe is unique and influenced by its local environment and cultural practices. Protection of this information will help foster productive relationships with tribes and should be included as part of the process. CARB and other agencies should continue to foster relationships with tribal partners.

Maximizing Air Quality and Health Benefits

The state has over 50 years of experience successfully cleaning the air in California by addressing criteria pollutants and toxic air contaminants from mobile and stationary sources. CARB has been a leader in measuring, evaluating, and reducing sources of air pollution that impact public health. Its air pollution programs have been adapted for national programs and emulated in other countries. Significant progress has been made in reducing diesel particulate matter (PM), which is a designated toxic air contaminant, and many other hazardous air pollutants. CARB partners with local air districts to address stationary source emissions and adopts and implements state-level regulations to address sources of criteria and toxic air pollution, including mobile sources. CARB also collaborates with federal agencies to address air pollution from sources primarily under federal jurisdiction. In many instances, actions to reduce fossil fuel combustion and achieve federal air quality standards also help to reduce GHG emissions.

However, air pollution disparities still exist, and more must be done to ensure the most vulnerable populations have safe air to breathe. California must continue to evaluate opportunities to harmonize our climate and air quality programs through innovative policymaking and by building on existing programs like the Low Carbon Fuel Standard (LCFS) and Community Air Protection Program. The LCFS includes a provision that allows electric utilities to opt-in and generate residential electric vehicle (EV) charging credits, where some of the revenues are invested back into rebate programs that address air quality and climate pollution.[75] The Community Air Protection Program[76] is the first of its kind in the country and brings together diverse stakeholders, including CARB, local air districts, and residents of environmental justice communities to increase local air monitoring and develop community-led plans to improve air quality in the communities most impacted by air pollution.

This Scoping Plan identifies actions that will deliver near-term air quality benefits to communities with the highest exposures and provide long-term GHG benefits. Many of the actions in this Scoping Plan are key elements of the 2022 State Strategy for the State

[75] CARB. LCFS Utility Rebate Programs. *https://ww2.arb.ca.gov/resources/documents/lcfs-utility-rebate-programs*.
[76] CARB. Community Air Protection Program. *https://ww2.arb.ca.gov/capp*.

Implementation Plan to meet federal air quality standards,[77] which has a primary focus of reducing harmful air pollution and achieving federal air quality targets. California's approach of leveraging air quality and GHG policies together has yielded results. A 2022 report by the Office of Environmental Health and Hazard Assessment (OEHHA)[78] that evaluated GHG and harmful air pollution emissions from the heavy-duty vehicle (HDV) and large stationary source sectors found declines in emissions in both sectors, with the greatest declines in disadvantaged communities. Both sectors are subject to state GHG and air quality policies, in addition to federal and local rules on harmful air pollution. Because of historically racist and discriminatory practices such as redlining, both types of sources are disproportionately located adjacent to vulnerable communities, which are predominantly communities of color.[79] The key findings from the OEHHA report are as follows:

- Both HDVs and facilities subject to the Cap-and-Trade Program have reduced emissions of co-pollutants, with HDVs showing a clearer downward trend when compared to stationary sources. These emission reductions have major health benefits, including a reduction in premature pollution-related deaths.
- The greatest beneficiaries of reduced emissions from both HDVs and facilities subject to the Cap-and-Trade Program have been in communities of color and in disadvantaged communities in California, as identified by CalEnviroScreen (CES). This has reduced the emission gap between disadvantaged and non-disadvantaged communities, but a wide gap still remains.
- The transition to zero-emission HDVs will expedite further emissions reductions.
- While the progress observed is encouraging, inequities persist, and federal, state, and local climate and air quality programs must do more to reduce emissions of GHGs and co-pollutants to reduce the burden of emissions on disadvantaged communities and communities of color.

It will take all tools at all levels of government, with robust enforcement, to ensure that vulnerable communities continue to see improvements in air quality until no disparities exist in air pollution across the state.

---

Economic Resilience

The state's efforts to tackle the climate crisis will create economic and workforce development opportunities in the clean energy economy in communities across the state. Transitioning existing skills and expanding workforce training opportunities in climate-related fields are critical for reducing harmful emissions and supporting workers in transitioning to new, high-quality jobs. The Administration's recent budgets acknowledge the challenges facing workers in industries most affected by the state's response to climate change—especially those in the fossil fuel industry. It will invest $1 billion in regional partnerships and economic diversification to create new jobs and support a local tax base and workforce transition and development once opportunities are identified. It also will invest in safety nets to protect, and support impacted communities as part of the transition to a carbon neutral economy. Specifically, the Community Economic Resilience Fund Program[80] (CERF) supports communities and regional groups in producing regional roadmaps for economic recovery and transition that prioritize the creation of accessible, high-quality jobs in sustainable industries. The budget investments create the opportunity to future-proof and increase economic resilience in the face of more frequent climate impacts and shifting economic conditions. For these investments and implementation of the Scoping Plan to be successful in supporting the transition to a carbon neutral economy, workers and affected communities must be included in ongoing dialogue to ensure a high-road transition for regional economies.

That state also recognizes it can play a more direct role in supporting a sustainable work force through its incentive programs. In 2021, Assembly Bill 680 (AB 680) (Burke, Chapter 746, Statutes of 2021) was signed into law, requiring CARB to work with the California Labor and Workforce Development Agency to update the Funding Guidelines to include new workforce standards. CARB's Funding Guidelines currently include requirements for administering agencies to, wherever possible, foster job creation within California, provide employment opportunities or job training tied to employment, and target these opportunities to priority populations. The Funding Guidelines also recommend administering agencies prioritize investments in projects that directly support jobs or a job training and placement program, and that they report the estimated employment benefits and employment outcomes for projects that meet specified criteria. These new requirements apply to agencies administering certain California Climate Investments

[80] Office of Planning and Research. Community Economic Resilience Fund. *https://opr.ca.gov/economic-development/cerf/*.

programs that receive continuous appropriations from the Greenhouse Gas Reduction Fund and fall into the following six categories of standards:

- fair and responsible employer standards,
- inclusive procurement policies,
- prevailing wage for construction work,
- community workforce agreements for construction projects over one million dollars,
- preference for projects with educational institutions or training programs, and
- creation of high-quality jobs. CARB will be updating the Funding Guidelines through a public process over the next year to operationalize these new requirements.

Partnering Across Government

The Scoping Plan is an actionable plan to identify and align programs and policies to achieve California's climate targets. To realize the outcomes and deliver results in any Scoping Plan, action is critical. For this Scoping Plan, there are also actions that rely on our federal partners to take on sources primarily under their jurisdiction (such as aviation, and federally owned/managed lands) while they also continue to develop national programs for GHG reductions. The federal government is already taking major steps to advance these types of programs. The Inflation Reduction Act of 2022[81] includes $369 billion for domestic energy production and manufacturing and is expected to lead to U.S. GHG emission reductions of roughly 40 percent by 2030. Direct incentives will include those for clean vehicles and ENERGY STAR appliances, as well as improving transportation and clean energy in underserved communities.

We also need our local partners to align on actions related to land-use decisions that support sustainable, resilient, low-carbon communities and permitting for clean energy production facilities and infrastructure; diversion of organics from landfills; and other climate-related projects. State agencies also should use the Scoping Plan to review and update their own programs and policies to support the actions identified in this Scoping Plan. Importantly, the Scoping Plan also can serve as a resource as the Legislature considers new legislative direction and funding to support the state's path to carbon neutrality and continue action to address near-term air pollution disparities.

Partnering with the Private Sector

Government cannot achieve our climate targets alone. The scale of investment needed requires both private-sector investment and partnerships with philanthropies. Public

[81] Pub.L. No. 117-169 (August 16, 2022).

sector dollars, accompanied by strong and steady policy signals, must be a catalyst for deeper and broader investments by the private sector in both reducing emissions and building the resilience of our communities. Governor Newsom is committed to working collaboratively with businesses, including small businesses, to deploy the technologies, capital, and ingenuity that are hallmarks of the private sector.

California structures our climate policies and regulations to create market signals and certainty that spur private sector investment. For example, the Governor's Executive Order on Zero-Emission Vehicles[82] set 2035 as the target year for 100 percent zero-emission vehicle sales, creating a time horizon that allows automakers to scale up zero-emission fleets and sending a clear signal to the companies and utilities that would deploy charging infrastructure. The Executive Order has been followed by development and adoption of the Advanced Clean Cars II regulation. CARB convened auto manufacturers, environmental justice groups, labor organizations, and many other stakeholders to provide input into development of the regulation in a robust and transparent manner; again, with the aim of providing certainty for producers and consumers.

California also pursues public-private partnerships (PPP) as a mechanism to advance our collective climate goals. We know these vehicles can be effective at increasing the impact of public sector dollars and helpful in moving markets in a direction aligned with state policy. A new PPP the Administration is advancing is the Climate Catalyst Revolving Loan Fund, housed at the state's Infrastructure and Economic Development Bank (IBank). The fund offers a range of financial instruments—including flexible credit and credit support—to help bridge financing gaps currently preventing advanced climate solutions from scaling in the marketplace. The Catalyst Fund's initial areas of investment include forest biomass management and utilization (unlocking innovation to reduce wildfire threats), climate-smart agriculture, and clean energy transmission. The fund leverages public sector investments by mobilizing private finance for shovel-ready projects that are stuck in the deployment phase. As such, IBank is ideally positioned as the state's all-purpose "Green Bank," with increasing connection to federal financing programs such as US DOE's Loan Programs Office and the United States Environmental Protection Agency's (U.S. EPA) Greenhouse Gas Reduction Fund.

The Catalyst Fund builds from existing IBank financing programs that are themselves increasingly focused on the climate imperative. The IBank's Infrastructure State Revolving Fund provides supportive capital to climate-aligned projects promoted by local governments and certain nonprofit entities, and will be refining its criteria and market outreach strategies to increase its level of service. IBank's bonds program has supported

[82] Executive Department. State of California. Executive Order N-79-20. *https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf.*

multiple large environmental projects, including more than $2 billion in "green bonds," and is poised to help expand access to the state's deep and liquid bond capital market. Within IBank's Small Business Finance Center, the new Climate Tech Loan Guarantee program encourages commercial banks to back climate-focused small businesses, leveraging federal capital to insure a portion of the private bank's loan. And through IBank's Expanding Venture Capital Access Fund program, the state is promoting greater diversity in the venture capital community, including climate equity and climate justice.

All of these financing programs exist to leverage private capital in support of the state's climate goals, and to partner with state policy agencies driving the transition. IBank will also continue to collaborate closely with the State Treasurer's Office in its provision of capital support to climate solutions, ensuring that funding flows to programs best positioned to deliver success. This partnership of public and private capital, responsive to and in communication with the climate policy community, will ensure that California gets the maximum possible benefit from its allocation of scarce resources.

Supporting Innovation

Reaching our ambitious, deep decarbonization goals will require continued technological innovation. Investment in research, development, and deployment of clean technologies has never been more critical. Sending clear and sustained market and policy signals will encourage large and small companies alike to pursue innovation that can be scaled up and deployed here and beyond our borders. The full suite of AB 32 policies[83] has touched nearly every sector of California's economy and spurred technology innovation in the state, including the growth of technology developers, manufacturers, processors, and assemblers in many areas. Specifically, AB 32 policies and programs support both the supply side and the demand side to build new markets in California. On the supply side, AB 32 policies support businesses to demonstrate and refine technologies, and to help establish critical supply chains. On the demand side, AB 32 policies and programs provide outreach, education, and incentives—as well as disincentives—to motivate everyone from consumers to institutional purchasers to utility planners to adopt new, climate smart technologies. Innovations resulting directly from the state's climate policies include the following:

- In the past 10 years, a growing market for heavy-duty zero-emission vehicles (HD ZEVs) was established in California, and this market now represents the largest single share of North American supply and demand for HD ZEVs. Vehicle

[83] CARB. Climate Change Programs. *https://ww2.arb.ca.gov/our-work/topics/climate-change*.

and component manufacturers are making long-term investments to develop and produce HD ZEVs within California.

- Total consumption of renewable diesel in the California LCFS market has skyrocketed from approximately 1.8 million gallons in 2011 to nearly 589 million gallons in 2020. The LCFS is a key driver of market development for renewable diesel and its coproducts. While the federal renewable fuel standard (RFS) and blenders tax credit also benefit producers, an analysis of their respective contributions to market development, and interviews with industry representatives and independent experts, point to LCFS as a more important factor in market development, at least in recent years.
- In the past five years, a market for small-scale energy storage in California was created where none previously existed. As of 2020, 185 megawatts (MW) of small-scale energy storage projects have been interconnected to the grid. The significant increase in deployment in the last five years is a result of the Self-Generation Incentive Program (SGIP), which significantly reduces the upfront costs to purchase and install small-scale energy storage devices, and of growing customer interest in disaster resiliency in the face of increasing risk from wildfire and related utility outages. These systems have already provided disaster resiliency benefits for residential and non-residential customers.

We have seen how quickly market barriers can be overcome in response to strong policy signals, as occurred in the solar panel and electric vehicle battery space. Government-stated priorities have a significant role in guiding private and public research, development, and deployment. This Scoping Plan unequivocally puts the marker down on the need for innovation to continue in non-combustion technologies, clean energy, CO_2 removal options, and alternatives for SLCPs. The five-year update to the Scoping Plan allows for a periodic evaluation of new tools to add to the state's toolkit.

Engagement with Partners to Develop, Coordinate, and Export Policies

California works closely with other states, tribal governments, the federal government, and international jurisdictions to identify the most effective strategies and methods to reduce GHGs, manage GHG control programs, and facilitate the development of integrated and cost-effective regional, national, and international GHG reduction programs. For example, the state's Cap-and-Trade Program has been linked with Québec's since 2014, and CARB staff regularly engage with jurisdictions throughout the world on the design features of our Cap-and-Trade Program through memoranda of understanding (MOUs) and venues such as the International Climate Action

Partnership.[84] Low carbon fuel mandates similar to California's LCFS have been adopted by the U.S. EPA and by other jurisdictions, including Oregon, Washington, British Columbia, the European Union, and the United Kingdom. Many other jurisdictions from Japan to New Zealand, Australia, and the European Commission also continue to seek information and technical experience on our LCFS. California has and will continue to share information and encourage ambitious emissions reductions with interested jurisdictions, with a focus on China, India, Mexico, Canada, and the European Union. California's early action to reduce super-pollutants such as methane and other SLCPs was reaffirmed by the 2021 Global Methane Pledge signed by the U.S. and over 100 other countries at the 26th Conference of the Parties to the United Nations Framework Convention on Climate Change (UNFCCC).[85]

In addition, under the Clean Air Act, the federal government is authorized to allow California to set more stringent vehicle emissions regulations than federal standards. California's goals and regulations to transition to 100 percent sales of new zero-emission passenger vehicles by 2035 (including plug-in hybrid vehicles), to drayage trucks by 2035, and other trucks and buses where feasible by 2045 are being emulated by partner states across the U.S. and in jurisdictions around the world. CARB's Advanced Clean Cars II regulation, [86] which codifies these targets, was approved in August 2022, and already at least four other states have announced their plans to adopt this regulation. Earlier in June 2020 CARB adopted the Advanced Clean Truck regulation, which requires truck manufacturers to meet increasing sale targets of zero-emission trucks in California through 2035. Since adoption, at least five other states—20 percent of the U.S. truck market—have adopted this regulation. These kinds of coordinated policies help signal to vehicle manufacturers a widespread and growing demand for zero-emissions technology, which in turn helps scale production and lower costs for consumers.

With the Mexican Secretariat for Environment and Natural Resources (SEMARNAT), California has engaged in a technical exchange on clean vehicle policies and helped to establish Mexico's Emissions Trading System (being piloted in 2022). A 2019 MOU signed between California and Environment and Climate Change Canada enables in-depth collaboration on policies and programs to decarbonize vehicles, engines, and fuels. This partnership has led to tangible emissions reductions, from aligning vehicle emissions targets and policies to collaborating on emissions testing and research critical to enforcing

[84] International Carbon Action Partnership (ICAP). Homepage. *https://icapcarbonaction.com/en?msclkid=dac30cb7b4f511ec94ccd0f1ae323e98*.
[85] Global Methane Pledge. Homepage. *https://www.globalmethanepledge.org/*.
[86] Cal. Code Regs., tit. 13, §§ 1900,1961.2, 1961.3, 1962.2, 1962.3, 1962.4, 1962.5, 1962.6, 1962.7, 1962.8, 1965, 1968.2, 1969, 1976, 1978, 2037, 2038, 2112, 2139, 2140, 2147, and 2903; and Test Procedures located here: *https://ww2.arb.ca.gov/rulemaking/2022/advanced-clean-cars-ii*.

emissions limits for vehicle manufactures. At the national level, China has looked to California for cutting-edge requirements for car diagnostics and policies that promote zero-emissions vehicles. At a local level, Beijing has adopted California's vehicle emissions standards and several other progressive environmental regulations. California will continue and renew such efforts across China, including through a 2022 MOU signed with China's Ministry of Ecology and Environment.

Between 2021 and 2023, California also will serve as president of the Transport Decarbonisation Alliance, a global network of countries, regions, cities, and companies that come together to share experiences and technical expertise, and to increase the ambition and accelerate the deployment of targeted transportation decarbonization policies across freight, electric vehicle infrastructure, and active mobility. Throughout its presidency, California will focus its leadership on decarbonizing the cross-jurisdiction network of medium- and heavy-duty vehicles, both to ensure cleaner air in freight-adjacent communities and to stem the effects of climate change.

Over the years, California has also asserted the importance of and supported the ongoing efforts of state and local clean air and climate leadership. Through our participation in the Pacific Coast Collaborative alongside British Columbia, Washington, and Oregon,[87] the Under2 Coalition,[88] the U.S. Climate Alliance,[89] the International ZEV Alliance,[90] the Transportation Decarbonisation Alliance, and many more organizations, California has and will continue to build climate partnerships with state and local governments.

California also recognized the need to address the substantial emissions caused by the deforestation and degradation of tropical and other forests, and continues its work alongside other subnational governments as part of the Governors' Climate and Forests Task Force (GCF).[91] Founded in 2008, there are currently 39 GCF members, including states and provinces in Brazil, Colombia, Ecuador, Indonesia, Ivory Coast, Mexico, Nigeria, Peru, Spain, and the United States—all of whom are considering or operating programs to reduce emissions from deforestation, land-use, and rural development, and to benefit local and indigenous communities. CARB's California Tropical Forest Standard provides a rigorous methodology to assess jurisdiction-scale programs that reduce deforestation and to incentivize responsible action and investment.[92] The standard

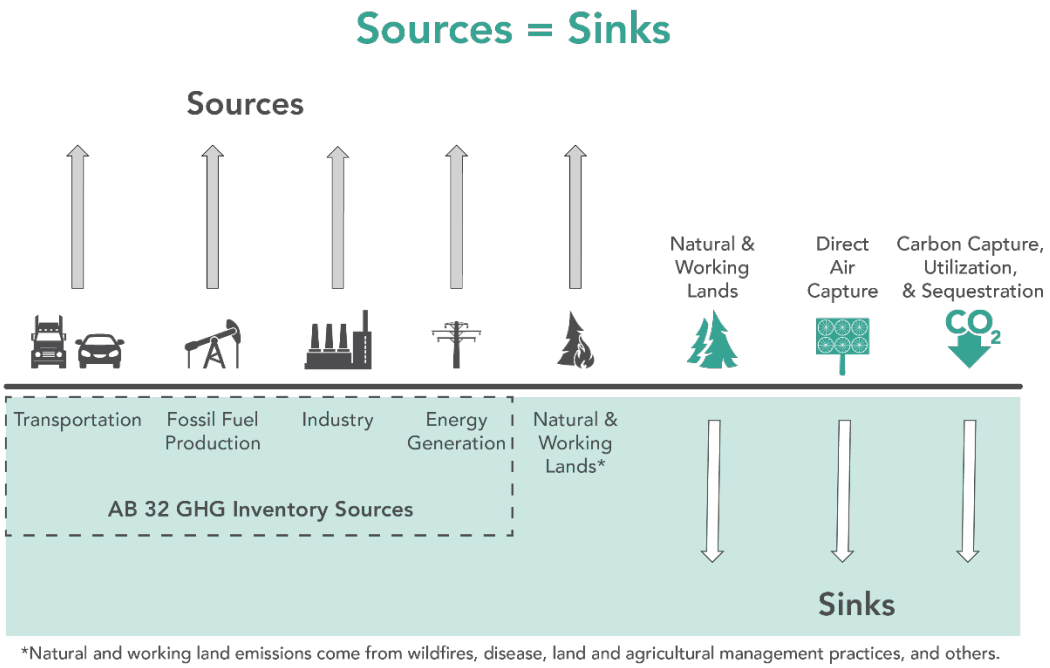
provides a strong signal to value the preservation of tropical forests over continued destructive activities such as oil exploration and extraction and ensures rigorous social and environmental safeguards for indigenous peoples and local communities.

Working Toward Carbon Neutrality

To date, California and many other regions have focused on reducing GHG emissions from the industrial, energy, and transportation sectors. As defined in statute, the state's 2020 and 2030 targets include all in-state sources of GHG emissions—and those emissions associated with imported power that is consumed in the state. By moving to a framework of carbon neutrality, the scope for accounting is expanded to include all sources and sinks. As such, carbon neutrality is achieved when the GHG fluxes are at equilibrium—when sources equal sinks. Figure 1-5 depicts the sources included in the AB 32 GHG Inventory and the new sources and sinks added in this Scoping Plan under the framework of carbon neutrality. Natural and working lands are able to sequester carbon and therefore play an increasingly important role in this framework. However, modeling for this plan shows that carbon sequestration in our natural and working lands alone will be insufficient to achieve carbon neutrality no later than 2045. Therefore, this plan also considers the role of carbon capture and sequestration, as well as biological and mechanical carbon sequestration processes that are included in the IPCC Sixth Assessment Report,[93] as necessary tools for climate change mitigation.

[93] IPCC. 2021. *Climate Change 2021: The Physical Science Basis*. https://www.ipcc.ch/report/ar6/wg1/.

Figure 1-5: Carbon neutrality: Balancing the net flux of GHG emissions from all sources and sinks



Supporting Healthy and Resilient Lands

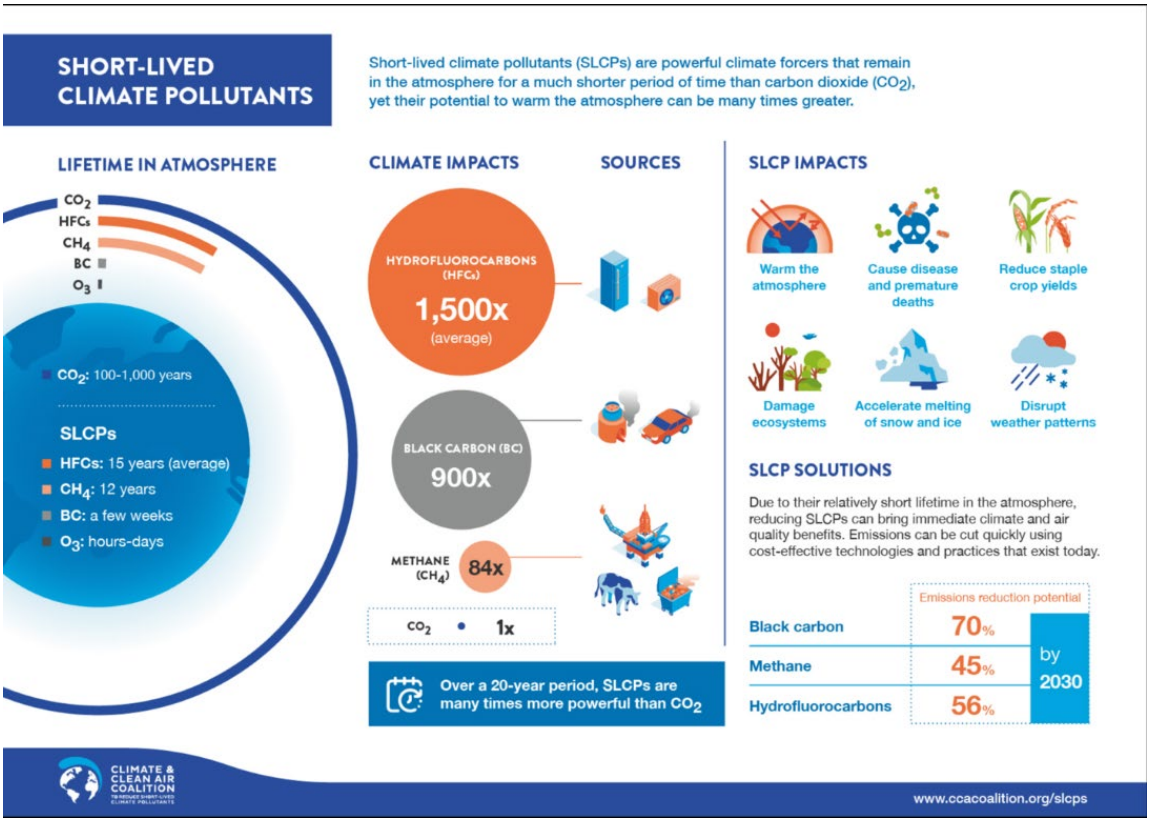
Our natural and working lands are an important piece in California's fight to achieve carbon neutrality and build resilience to the impacts of climate change. Healthy land can sequester and store atmospheric carbon dioxide in forests, grasslands, soils, and wetlands. Healthy lands can also reduce emissions of powerful short-lived climate pollutants, limit the release of future GHG emissions, protect people and nature from the impacts of climate change, and build our resilience to future climate risks. Unhealthy lands have the opposite effect—they release more GHGs than they store and are more vulnerable to future climate change impacts. Through climate smart land management that focuses on supporting healthy living systems, we can support our carbon neutrality goals, reduce emissions, advance sequestration, and support healthy and more climate-resilient lands.

Maintaining the Focus on Methane and Short-Lived Climate Pollutants

Given the urgency of climate change, the often-disproportional impacts already being felt by underserved populations across California and the world, and the need to rapidly decarbonize and avoid climate tipping points as identified in the most recent IPCC assessment, efforts to reduce short-lived climate pollutants are especially important. SLCPs include methane (CH_4), black carbon (soot), and fluorinated gases (F-gases,

including hydrofluorocarbons, or HFCs), and they are among the most harmful pollutants to both human health and the global climate. SLCPs are more potent than CO_2 in terms of their impact on climate change (and subsequently, global warming) and have a much shorter lifetime in the atmosphere than CO_2 does. That means they have an outsized impact on climate change in the near term—they are responsible for up to 45 percent of current climate forcing. It also means that targeted efforts to reduce short-lived climate pollutant emissions can provide outsized climate and health benefits, within weeks to about a decade (see Figure 1-6).

Figure 1-6: Short-lived climate pollutant impacts[94]



California has been a leader in addressing SLCP emissions. As part of the 2014 Scoping Plan,[95] CARB committed to developing a dedicated strategy to reduce SLCP emissions.

[94] Climate and Clean Air Coalition. Short-Lived Climate Pollutants (SLCPs). https://www.ccacoalition.org/en/content/short-lived-climate-pollutants-slcps.
[95] CARB. 2014. *First Update.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf.

The resulting SLCP Reduction Strategy,[96] adopted by CARB in 2017, implements targets codified in SB 1383 (Lara, Chapter 395, Statutes of 2016) to reduce methane and HFC emissions by 40 percent by 2030 and anthropogenic black carbon emissions by 50 percent. California worked with several other states through the U.S. Climate Alliance to establish a similar goal to reduce SLCP emissions in line with the requirements of the Paris Agreement,[97] identifying the potential to reduce SCLPs by 40 to 50 percent by 2030 across the U.S. Climate Alliance.[98]

Process for Developing the Scoping Plan

This Scoping Plan was developed in coordination with the Governor's Office and state agencies, in accordance with direction from the Chair and Members of CARB, through engagement with the Legislature, with advice from the EJ Advisory Committee, in consultation with tribes, and with open and transparent opportunities for stakeholders and the public to engage in workshops and other meetings. Appendix A (Public Process) includes details of the public workshops, and Chapter 5 includes details of the EJ Advisory Committee's role in the Scoping Plan update process.

Guidance from the Administration and Legislature

This Scoping Plan reflects existing and recent direction in the Governor's Executive Orders and Statutes. Table 1-1 provides a summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan.

[96] CARB. 2017. *Short-Lived Climate Pollutant Reduction Strategy.* https://ww2.arb.ca.gov/sites/default/files/2020-07/final_SLCP_strategy.pdf.

Table 1-1: Major climate legislation and executive orders enacted since the 2017 Scoping Plan

Bill/Executive Order	Summary
Assembly Bill 1279 (AB 1279) (Muratsuchi, Chapter 337, Statutes of 2022) *The California Climate Crisis Act*	AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies. This bill is reflected directly in this Scoping Plan.
Senate Bill 905 (SB 905) (Caballero, Chapter 359, Statutes of 2022) *Carbon Capture, Removal, Utilization, and Storage Program*	SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology. The bill requires CARB, on or before January 1, 2025, to adopt regulations creating a unified state permitting application for approval of CCUS and CDR projects. The bill also requires the Secretary of the Natural Resources Agency to publish a framework for governing agreements for two or more tracts of land overlying the same geologic storage reservoir for the purposes of a carbon sequestration project. The Scoping Plan modeling reflects both CCUS and CDR contributions to achieve carbon neutrality.
Senate Bill 846 (SB 846) (Dodd, Chapter 239, Statutes of 2022) *Diablo Canyon Powerplant: Extension of Operations*	SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant. The Scoping Plan explains the emissions impact of this legislation.
Senate Bill 1020 (SB 1020) (Laird,	SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040.

Chapter 361, Statutes of 2022) *Clean Energy, Jobs, and Affordability Act of 2022*	It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified requirements. This bill requires the CPUC, California Energy Commission (CEC), and CARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability. The bill also modifies the requirement for CARB to hold a portion of its Scoping Plan workshops in regions of the state with the most significant exposure to air pollutants by further specifying that this includes communities with minority populations or low-income communities in areas designated as being in extreme federal non-attainment. The Scoping Plan describes the implications of this legislation on emissions.
Senate Bill 1137 (SB 1137) (Gonzales, Chapter 365, Statutes of 2022) *Oil & Gas Operations: Location Restrictions: Notice of Intention: Health protection zone: Sensitive receptors*	SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires CARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.
Senate Bill 1075 (SB 1075) (Skinner, Chapter 363, Statutes of 2022) *Hydrogen: Green Hydrogen: Emissions of Greenhouse Gases*	SB 1075 requires CARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen, and specifically the use of green hydrogen, in California; a description of strategies supporting hydrogen infrastructure, including identifying policies that promote the reduction of GHGs and short-lived climate pollutants; a description of other forms of hydrogen to achieve emission reductions; an analysis of curtailed electricity; an estimate of GHG and emission reductions that could be achieved through deployment of green hydrogen through a variety of scenarios; an analysis of the potential for opportunities to integrate hydrogen production and applications with drinking water supply treatment needs; policy recommendations for regulatory and permitting processes

	associated with transmitting and distributing hydrogen from production sites to end uses; an analysis of the life-cycle GHG emissions from various forms of hydrogen production; and an analysis of air pollution and other environmental impacts from hydrogen distribution and end uses. This bill would inform the production of hydrogen at the scale called for in this Scoping Plan.
Assembly Bill 1757 (AB 1757) (Garcia, Chapter 341, Statutes of 2022) *California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands*	AB 1757 requires the California Natural Resources Agency (CNRA), in collaboration with CARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience. This bill also requires CARB to develop standard methods for state agencies to consistently track GHG emissions and reductions, carbon sequestration, and additional benefits from natural and working lands over time. These methods will account for GHG emissions reductions of CO_2, methane, and nitrous oxide related to natural and working lands and the potential impacts of climate change on the ability to reduce GHG emissions and sequester carbon from natural and working lands, where feasible. This Scoping Plan describes the next steps and implications of this legislation for the natural and working lands sector.
Senate Bill 1206 (SB 1206) (Skinner, Chapter 884, Statutes of 2022) *Hydrofluorocarbon gases: sale or distribution*	SB 1206 mandates a stepped sales prohibition on newly produced high- global warming potential (GWP) HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires CARB to develop regulations to increase the adoption of very low-, i.e., GWP < 10, and no-GWP technologies in sectors that currently rely on higher-GWP HFCs.
Senate Bill 27 (SB 27) (Skinner, Chapter 237, Statutes of 2021)	SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires CARB to establish specified CO_2 removal targets for 2030 and beyond as part of its Scoping Plan. Under SB 27, CNRA is to establish and maintain a registry to identify projects in the state

Carbon Sequestration: State Goals: Natural and Working Lands: Registry of Projects	that drive climate action on natural and working lands and are seeking funding. CNRA also must track carbon removal and GHG emission reduction benefits derived from projects funded through the registry. This bill is reflected directly in this Scoping Plan as CO_2 removal targets for 2030 and 2045 in support of carbon neutrality.
Senate Bill 596 (SB 596) (Becker, Chapter 246, Statutes of 2021) *Greenhouse Gases: Cement Sector: Net-zero Emissions Strategy*	SB 596 requires CARB, by July 1, 2023, to develop a comprehensive strategy for the state's cement sector to achieve net-zero-emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. The bill establishes an interim target of 40 percent below the 2019 average GHG intensity of cement by December 31, 2035. Under SB 596, CARB must: • Define a metric for GHG intensity and establish a baseline from which to measure GHG intensity reductions. • Evaluate the feasibility of the 2035 interim target (40 percent reduction in GHG intensity) by July 1, 2028. • Coordinate and consult with other state agencies. • Prioritize actions that leverage state and federal incentives. • Evaluate measures to support market demand and financial incentives to encourage the production and use of cement with low GHG intensity. The Scoping Plan modeling is designed to achieve these outcomes.
Executive Order N-82-20	Governor Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed CARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy.

	Executive Order N-82-20 also calls on the CNRA, in consultation with other state agencies, to establish the California Biodiversity Collaborative (Collaborative). The Collaborative shall be made up of governmental partners, California Native American tribes, experts, business and community leaders, and other stakeholders from across the state. State agencies will consult the Collaborative on efforts to: • Establish a baseline assessment of California's biodiversity that builds upon existing data and can be updated over time. • Analyze and project the impact of climate change and other stressors in California's biodiversity. • Inventory current biodiversity efforts across all sectors and highlight opportunities for additional action to preserve and enhance biodiversity. CNRA also is tasked with advancing efforts to conserve biodiversity through various actions, such as streamlining the state's process to approve and facilitate projects related to environmental restoration and land management. The California Department of Food and Agriculture (CDFA) is directed to advance efforts to conserve biodiversity through measures such as reinvigorating populations of pollinator insects, which restore biodiversity and improve agricultural production. The Natural and Working Lands Climate Smart Strategy informs this Scoping Plan.
Executive Order N-79-20	Governor Newsom signed Executive Order N-79-20 in September 2020 to establish targets for the transportation sector to support the state in its goal to achieve carbon neutrality by 2045. The targets established in this Executive Order are: • 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035. • 100 percent of medium- and heavy-duty vehicles will be zero-emission by 2045 for all operations where feasible, and by 2035 for drayage trucks. • 100 percent of off-road vehicles and equipment will be zero-emission by 2035 where feasible. The Executive Order also tasked CARB to develop and propose regulations that require increasing volumes of zero-electric passenger vehicles, medium- and heavy-duty

	vehicles, drayage trucks, and off-road vehicles toward their corresponding targets of 100 percent zero-emission by 2035 or 2045, as listed above. The Scoping Plan modeling reflects achieving these targets.
Executive Order N-19-19	Governor Newsom signed Executive Order N-19-19 in September 2019 to direct state government to redouble its efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy. This Executive Order instructs the Department of Finance to create a Climate Investment Framework that: • Includes a proactive strategy for the state's pension funds that reflects the increased risks to the economy and physical environment due to climate change. • Provides a timeline and criteria to shift investments to companies and industry sectors with greater growth potential based on their focus of reducing carbon emissions and adapting to the impacts of climate change. • Aligns with the fiduciary responsibilities of the California Public Employees' Retirement System, California State Teachers' Retirement System, and the University of California Retirement Program. Executive Order N-19-19 directs the State Transportation Agency to leverage more than $5 billion in annual state transportation spending to help reverse the trend of increased fuel consumption and reduce GHG emissions associated with the transportation sector. It also calls on the Department of General Services to leverage its management and ownership of the state's 19 million square feet in managed buildings, 51,000 vehicles, and other physical assets and goods to minimize state government's carbon footprint. Finally, it tasks CARB with accelerating progress toward California's goal of five million ZEV sales by 2030 by: • Developing new criteria for clean vehicle incentive programs to encourage manufacturers to produce clean, affordable cars. • Proposing new strategies to increase demand in the primary and secondary markets for ZEVs. • Considering strengthening existing regulations or adopting new ones to achieve the necessary GHG reductions from within the transportation sector.

	The Scoping Plan modeling reflects efforts to accelerate ZEV deployment.
Senate Bill 576 (SB 576) (Umberg, Chapter 374, Statutes of 2019) *Coastal Resources: Climate Ready Program and Coastal Climate Change Adaptation, Infrastructure and Readiness Program*	Sea level rise, combined with storm-driven waves, poses a direct risk to the state's coastal resources, including public and private real property and infrastructure. Rising marine waters threaten sensitive coastal areas, habitats, the survival of threatened and endangered species, beaches, other recreation areas, and urban waterfronts. SB 576 mandates that the Ocean Protection Council develop and implement a coastal climate adaptation, infrastructure, and readiness program to improve the climate change resiliency of California's coastal communities, infrastructure, and habitat. This bill also instructs the State Coastal Conservancy to administer the Climate Ready Program, which addresses the impacts and potential impacts of climate change on resources within the conservancy's jurisdiction.
Assembly Bill 65 (AB 65) (Petrie-Norris, Chapter 347, Statutes of 2019) *Coastal Protection: Climate Adaption: Project Prioritization: Natural Infrastructure: Local General Plans*	This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change. The bill requires the conservancy to provide information to the Office of Planning and Research on any projects funded pursuant to the above provision to be considered for inclusion into the clearinghouse for climate adaption information. The bill authorizes the conservancy to provide technical assistance to coastal communities to better assist them with their projects that use natural infrastructure.
Executive Order B-55-18	Governor Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter. Policies and programs undertaken to achieve this goal shall: • Seek to improve air quality and support the health and economic resiliency of urban and rural communities, particularly low-income and disadvantaged communities. • Be implemented in a manner that supports climate adaptation and biodiversity, including protection of the state's water supply, water quality, and native plants and animals.

	This Executive Order also calls for CARB to: • Develop a framework for implementation and accounting that tracks progress toward this goal. • Ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. This Scoping Plan is designed to achieve carbon neutrality no later than 2045 and the modeling includes technology and fuel transitions to achieve that outcome.
Senate Bill 100 (SB 100) (De León, Chapter 312, Statutes of 2018) *California Renewables Portfolio Standard Program: emissions of greenhouse gases*	SB 100 mandates that the CPUC, CEC, and CARB plan for 100 percent of total retail sales of electricity in California to come from eligible renewable energy resources and zero-carbon resources by December 31, 2045. This bill also updates the state's Renewables Portfolio Standard (RPS) to include the following interim targets: • 44% of retail sales procured from eligible renewable sources by December 31, 2024. • 52% of retail sales procured from eligible renewable sources by December 31, 2027. • 60% of retail sales procured from eligible renewable sources by December 31, 2030. Under SB 100, the CPUC, CEC, and CARB shall use programs under existing laws to achieve 100 percent clean electricity. The statute requires these agencies to issue a joint policy report on SB 100 every four years. The first of these reports was issued in 2021. This Scoping Plan reflects the SB 100 Core Scenario resource mix with a few minor updates.
Assembly Bill 2127 (AB 2127) (Ting, Chapter 365, Statutes of 2018) *Electric Vehicle Charging Infrastructure: Assessment*	This bill requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of GHGs to 40% below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure. This bill supports the deployment of ZEVs as modeled in this Scoping Plan.

Senate Bill 30 (SB 30) (Lara, Chapter 614, Statutes of 2018) *Insurance: Climate Change*	This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure. The bill requires the policies recommended to address specified questions.
Assembly Bill 2061 (AB 2061) (Frazier, Chapter 580, Statutes of 2018) *Near-zero-emission and Zero-emission Vehicles*	Existing state and federal law sets specified limits on the total gross weight imposed on the highway by a vehicle with any group of two or more consecutive axles. Under existing federal law, the maximum gross vehicle weight of that vehicle may not exceed 82,000 pounds. AB 2061 authorizes a near-zero-emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds. This bill supports the deployment of cleaner trucks as modeled in this Scoping Plan.

Consideration of Relevant State Plans and Regulations

Development of this Scoping Plan also included careful consideration of, and coordination with, other state agency plans and regulations, including the SB 100 Joint Agency Report,[99] the 2022 State Strategy for the State Implementation Plan,[100] Climate Action Plan for Transportation Infrastructure,[101] AB 74 Studies on Vehicle Emissions and Fuel Demand and Supply,[102,103,104] Short-Lived Climate Pollutant Strategy (SLCP Strategy),[105]

Input from Partners and Stakeholders

CARB also collaborated with other state agencies, held consultations with tribes, and solicited comments and feedback from affected stakeholders, including labor organizations and the public. The process to update the Scoping Plan began with kickoff workshops in early June 2021,[109] followed by over a dozen public workshops, including engagement with tribes,[110] and featured a series of EJ Advisory Committee and environmental justice community meetings.[111] The June 2021 workshop and several others were a joint agency effort, as there are many agencies with direct authority or jurisdiction over different sectors of the economy. Consultation with agencies also included bi-weekly, monthly, and weekly meetings.

During the summer of 2022 CARB held three community listening sessions, hosted by the CARB Chair and Board, in communities around the state, along with one virtual community listening session and one tribal listening session specifically for tribes. Many tribes provided written feedback, which was incorporated into this Scoping Plan. In addition, CARB respects tribal sovereignty and also engaged in a consultation campaign with tribes, which resulted in government-to-government consultations, and this Scoping Plan is reflective of this process.[112]

Emissions Data That Inform the Scoping Plan

Greenhouse Gas Emissions

AB 32 includes which GHGs are to be regulated, reduced, and included in the state's targets and goals. That list includes seven GHGs: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs),

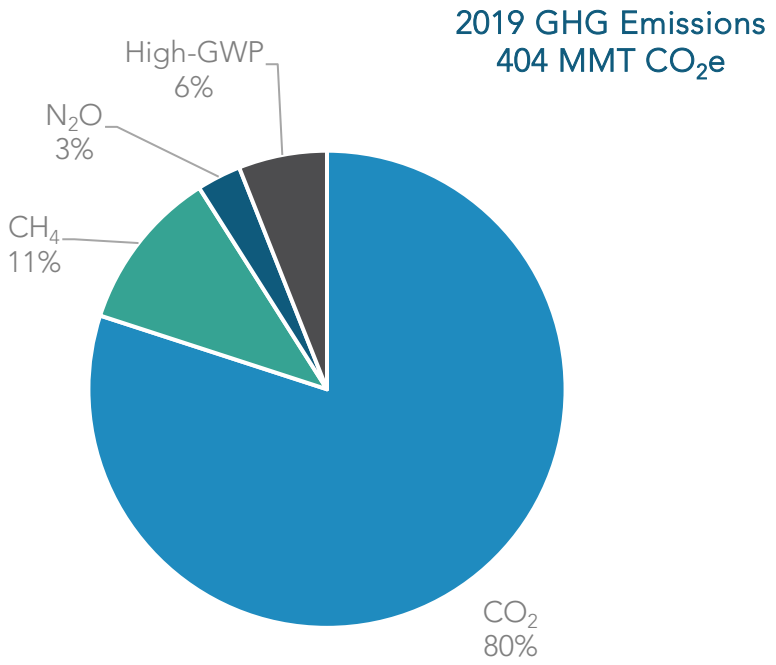
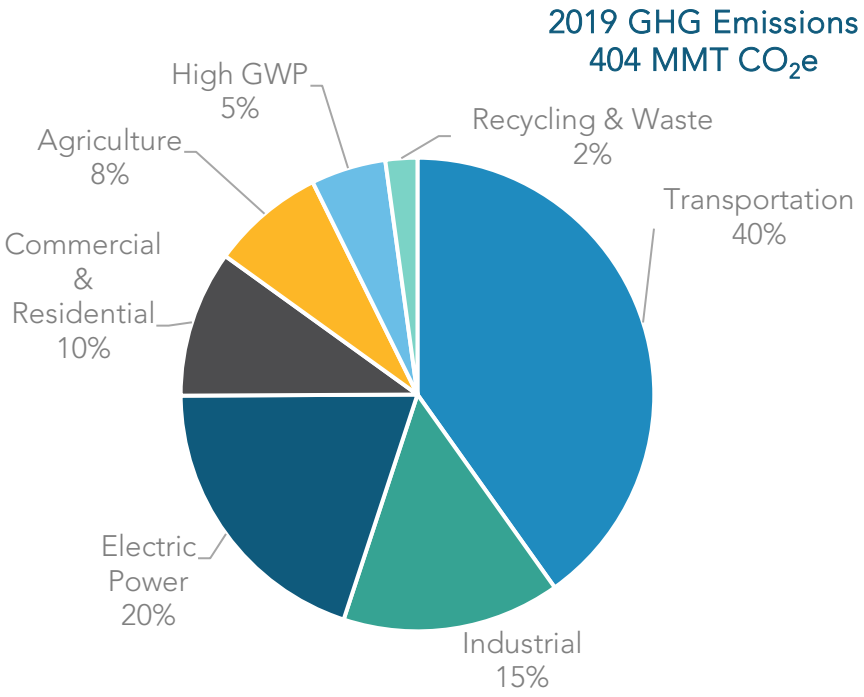
perfluorocarbons (PFCs), and nitrogen trifluoride (NF_3). Carbon dioxide is the primary GHG emitted in California, accounting for 83 percent of the total GHG emissions in 2019, as shown in Figure 1-7 below. Figure 1-8 illustrates that transportation (primarily on-road travel) is the single largest source of CO_2 emissions in the state. Upstream transportation emissions from the refinery and oil and gas sectors are categorized as CO_2 emissions from industrial sources and constitute about 50 percent of the industrial source emissions. When including these emissions, the transportation sector accounts for approximately half of statewide GHG emissions. Other significant sources of CO_2 include electricity production, industrial sources like refineries and cement plants, and residential sources like fossil gas. Figures 1-7 and 1-8 show state GHG emission contributions by GHG and sector based on the 2020 Greenhouse Gas Emission Inventory; GHG emissions for 2019 are shown because 2020 was an outlier due to the global pandemic. Emissions in Figure 1-8 are depicted by Scoping Plan sector, which includes separate categories for high-global warming potential (GWP) and recycling/waste emissions that are otherwise typically included within other economic sectors.

Figure 1-7: 2019 State GHG emission contributions by GHG[113]



[113] CARB. 2022. *California Greenhouse Gas Emissions for 2000 to 2020: Trends of Emissions and Other Indicators.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf.

Figure 1-8: 2019 State GHG emission contributions by Scoping Plan sector[114]



The scope of the AB 32 GHG Inventory encompasses emission sources within the state's borders, as well as imported electricity consumed in the state. This construct for the inventory is consistent with IPCC practices to allow for comparison of statewide GHG emissions with those at the national level and with other international GHG inventories. Statewide GHG emissions calculations use many data sources, including data from other state and federal agencies. However, a significant source of data comes from reports submitted to CARB through the Regulation for the Mandatory Reporting of GHG Emissions (MRR). The MRR requires facilities and entities with more than 10,000 metric tons of carbon dioxide equivalent ($MTCO_2e$) of combustion and process emissions, all facilities belonging to certain industries, and all electric power entities to submit an annual GHG emissions data report directly to CARB. Furthermore, this regulation requires that reports from entities that emit more than 25,000 $MTCO_2e$ be verified by a CARB-

[114] The High GWP sector includes high global warming potential gas emissions from releases of ozone depleting substance (ODS) substitutes, SF_6 emissions from the electricity transmission and distribution system, and gases that are emitted in the semiconductor manufacturing process. ODS substitutes, which are primarily HFCs, are used in refrigeration and air conditioning equipment, solvent cleaning, foam production, fire retardants, and aerosols.

accredited third-party verification body. More information on MRR emissions reports can be found at CARB's Mandatory Greenhouse Gas Emissions Reporting website.[115]

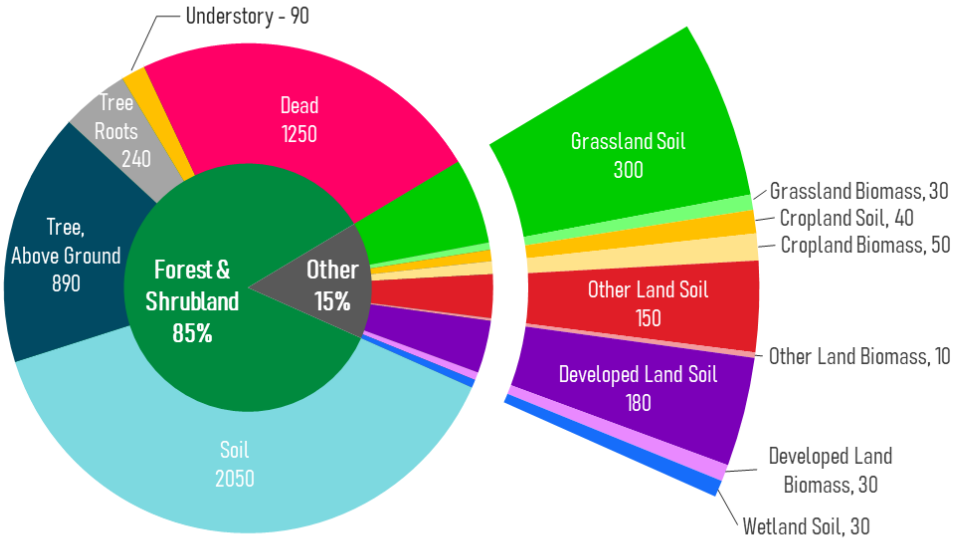
All data sources used to develop the GHG Emission Inventory are listed in CARB's inventory supporting documentation.[116]

Natural and Working Lands

For natural and working lands, the 2018 ecosystem carbon inventory (NWL Inventory)[117] shows there are approximately 5,340 million metric tons (MMT) of carbon in the carbon pools[118] (reservoirs of carbon that have the ability to both take in and release carbon) that CARB has quantified (see Figure 1-9). For purposes of comparison, 5,340 MMT of ecosystem carbon stock is equivalent to 19,600 MMT of atmospheric CO_2. Forests and shrublands contain the majority of California's carbon stock because they cover the majority of California's landscape and have the highest carbon density of any land cover type. All other land categories combined comprise over 35 percent of California's total acreage, but only 15 percent of carbon stocks. Roughly half of the 5,340 MMT of carbon resides in soils and half in plant biomass.

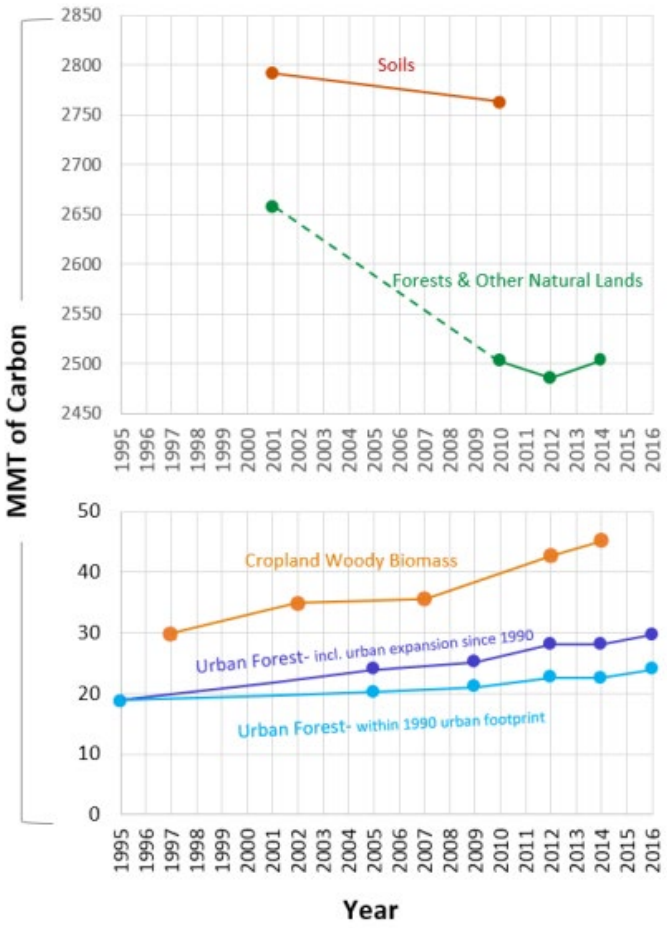
[115] CARB. Mandatory Greenhouse Gas Emissions Reporting. https://ww2.arb.ca.gov/our-work/programs/mandatory-greenhouse-gas-emissions-reporting.
[116] CARB. Current California GHG Emission Inventory Data. www.arb.ca.gov/cc/inventory/data/data.htm.
[117] CARB. 2018. *An Inventory of Ecosystem Carbon in California's Natural and Working Lands.* https://ww3.arb.ca.gov/cc/inventory/pubs/nwl_inventory.pdf.
[118] "Carbon pools" are Above-Ground Live Biomass (boles, stems, and foliage in shrubs, trees, grasses, and herbaceous vegetation), Below-Ground Live Biomass (roots in shrubs, trees, grasses, and herbaceous vegetation), Dead Organic Matter (standing or downed dead wood and litter), Harvested Wood Products (all wood and bark material that leaves harvest sites regardless of whether it is eventually incorporated into merchandisable products), and Soil Organic Matter (organic carbon in the top 30 centimeters of soil).

Figure 1-9: Carbon stocks in natural and working lands (MMT carbon)



In addition to providing an estimate of the ecosystem carbon that exists on California's landscape, the NWL Inventory also shows how those carbon stocks are changing (see Figure 1-10). The inventory attributes stock change to human activity, such as land use change, or to disturbances, such as wildfire. CARB's inventory shows these lands were a source of GHG emissions from 2001 to 2011, releasing more carbon than they stored, and then they returned to be a slight carbon sink from 2012 to 2014. These trends highlight the interannual and interdecadal variability of lands and their ability to be both a source and a sink of carbon.

Figure 1-10: Changes in carbon stock by landscape type



For natural and working lands, California's inventory is also based on IPCC methods for tracking ecosystem carbon over time, providing for comparability with other national and subnational inventories and carbon accounting. As such, the NWL Inventory is an important tool for tracking both carbon stock changes in California over time and the impacts that interventions such as those identified in this Scoping Plan, actions identified in the Climate Smart Land Strategy, and others have on NWL carbon stocks.

All data sources used to develop the NWL Inventory are listed in the technical support documentation at CARB's California Natural & Working Lands Inventory website.[119]

[119] CARB. California Natural & Working Lands Inventory. *https://ww2.arb.ca.gov/nwl-inventory*.

Black Carbon

In addition, CARB has developed a statewide emission inventory for black carbon in support of the SLCP Strategy. The inventory is reported in two categories: non-forestry (anthropogenic) sources and forestry sources.[120] The black carbon inventory is calculated using existing $PM_{2.5}$ emission inventories combined with speciation profiles that define the fraction of $PM_{2.5}$ that is black carbon. The black carbon inventory helps support implementation of the SLCP Strategy, but it is not part of California's GHG Inventory that tracks progress toward the state's climate targets under AB 32 or SB 32. The state's major anthropogenic sources of black carbon include off-road transportation, on-road transportation, residential wood burning, fuel combustion, and industrial processes. CARB estimated 2017 black carbon emissions to be approximately 8 $MTCO_2e$.[121] The majority of anthropogenic sources come from transportation—specifically, heavy-duty vehicles. The share of black carbon emissions from transportation is dropping rapidly and is expected to continue to do so between now and 2030 as a result of California's air quality programs. The remaining black carbon emissions will come largely from woodstoves/fireplaces, off-road applications, and industrial/commercial combustion. The forestry category includes non-agricultural prescribed burning and wildfire emissions.

Tracking Life-Cycle and Out-of-State Emissions

In recent years there has been increased interest in the embedded carbon in products, also known as *life-cycle emissions.* A life-cycle accounting framework refers to all of the GHG emissions generated from the sourcing, production, and transportation of products to an endpoint. In doing such assessments for a product, emissions may be associated with sourced materials and production activity outside a jurisdiction's borders. While life-cycle emissions can provide a more comprehensive picture of the emissions associated with the goods we consume and ongoing demand, life-cycle inventories are inconsistent with IPCC standards, as they would result in double counting of emissions across jurisdictions. Other countries and regions do produce their own inventory reports consistent with IPCC methods and are taking action to reduce emissions within their jurisdictions. In addition, jurisdictions often lack legal authority to regulate sources outside of their borders. Finally, it is difficult to obtain accurate data for sources and production activities outside of a region's border that would impact the accuracy of such an inventory. For these reasons, the inventory used in the Scoping Plan does not use a life-cycle

[120] SB 1383. https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201520160SB1383.
[121] This is a preliminary estimate developed for this Scoping Plan. Official Black Carbon emissions estimates are provided in the SLCP inventory here: https://ww2.arb.ca.gov/ghg-slcp-inventory.

approach and remains consistent with international accounting standards and consistent with how other countries and regions track emissions within their jurisdictions.

However, GHG mitigation action may cross geographic borders as part of subnational and international collaboration, or as a natural result of implementation of regional policies. In addition to the state's existing GHG inventory, CARB will develop an accounting framework that reflects the benefits of our policies accruing outside of the state. This accounting framework will be important to better understand the true impact of the state's policies on what is emitted into the atmosphere. For example, the LCFS incentivizes GHG reductions along the entire supply chain for the production and delivery of transportation fuel imported for use in the state. However, our inventory only captures the change in emissions from the tailpipe of when that fuel is used in California and does not capture any GHG reductions that occur in the production process if the fuel is produced out of state.

Natural and working lands forestry actions are another example, where California's policies are inspiring forest management actions in other states that result in increased permanent carbon sequestration. California's NWL inventory does not capture the increased carbon stocks resulting from forestry projects happening outside of California, and the CO_2 removals resulting from these projects are not applied in either CARB's NWL inventory or CARB's AB 32 GHG Emissions Inventory. For GHG reductions outside of the state to be attributed to our programs, those reductions must be real, quantifiable, verifiable, and permanent.

It also will be important to avoid any double counting (including claims to those reductions by other jurisdictions) and to transparently indicate whether any extra-jurisdictional emissions reductions might be included in another region's inventory. CARB is collaborating with other jurisdictions to ensure GHG accounting rules are consistent with international best practices, as robust accounting rules instill confidence in the reductions claimed and maintain support for joint action across jurisdictions. The policy goals of consistency and transparency are critical as we work together with other jurisdictions on our parallel paths to achieve our GHG targets with real benefits to the atmosphere.

Tracking Progress

Historically, the AB 32 GHG Inventory has been the primary metric to track progress toward achieving climate targets.[122] However, we must now deploy clean technology at unprecedented rates. The emissions modeling underpinning this Scoping Plan and

[122] Starting with the 2022 Edition of the AB 32 GHG inventory, the inventory development now relies more directly on the annually reported and third-party verified emissions from the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions.

targets for clean technology in statute can serve as leading indicators across the economy on how our actions compare to the pace of action needed to be on track to achieve carbon neutrality. The California Climate Dashboard[123] was launched in 2022 and provides high-level metrics for clean energy production and technology deployment. Statistics such as the deployment of zero emission vehicles and clean electricity generation are just some of the examples of metrics across the economy that can be tracked, in addition to GHG emissions, to understand if the state is on track to meet its climate goals. A key indicator to track will be building of new energy infrastructure and deployment of clean technology as evaluated in the uncertainty analysis in Chapter 2. CARB will coordinate with state agencies to establish and make public similar metrics across all economic sectors to help provide transparency on the state's progress in deploying clean technology at the pace and scale needed to achieve carbon neutrality no later than 2045.

[123] CalEPA. California Climate Dashboard. *https://calepa.ca.gov/climate-dashboard/*.

Chapter 2: The Scoping Plan Scenario

This chapter describes the Scoping Plan Scenario, which for the first time includes sources in both the AB 32 GHG Inventory and Natural and Working Lands (NWL). It begins with a short description of the alternatives evaluated. Four scenarios for the AB 32 GHG Inventory and NWL were considered separately and helped to inform the Scoping Plan Scenario. Each of the alternatives were considered in terms of the important criteria and priorities that the state's comprehensive climate action must deliver, including the need for GHG reductions that are not only technologically feasible and cost-effective, but also can deliver health and economic benefits for the state. All the scenarios were set against what is called the *Reference Scenario*—that is, what the GHG emissions would look like if we did nothing at all beyond the existing policies that are required and already in place to achieve the 2030 target of at least 40 percent below 1990 levels, or those expected with no new actions in the NWL sector. For this Scoping Plan, two sets of modeling tools were used to evaluate the AB 32 GHG Inventory and NWL sectors because no single model can assess both AB 32 sectors and NWL together. As a result, two different sets of scenarios were developed for each sector type. While this chapter breaks out discussion separately for the two sector types, the Scoping Plan Scenario reflects the combined actions across both sectors by choosing an alternative from each sector type. The modeling provides point estimates; however, that does not imply precision. As discussed in the uncertainty section, several types of uncertainties are associated with any outcomes projected by the modeling results. There will be ranges of estimates associated with each point that are not shown in the graphs or results.

Scenarios for the AB 32 GHG Inventory Sectors

The Reference Scenario for the AB 32 GHG Inventory sectors shows continuing but modest GHG reductions beyond 2030 that level off toward mid-century. The comprehensive analysis of all four alternatives indicates that the Scoping Plan Scenario is the best choice to achieve California's climate and clean air goals while balancing the legislative direction on prioritizing direct emissions reductions, reducing anthropogenic emissions by at least 85 percent by 2045, being technologically feasible, and being cost-effective. It also protects public health, provides a solid foundation for continued economic growth, and drastically reduces the state's dependence on fossil fuel combustion and does not disproportionately impact disadvantaged communities. Each of the alternative scenarios was the product of a process of development informed by public input, the

governor,[124] CARB, legislative direction, and input by the EJ Advisory Committee.[125,126] Future updates to the Scoping Plan may consider new clean technologies and fuels beyond those included in this Scoping Plan.

The four scenarios evaluated shared many similarities. They each embodied the following characteristics:

- Drastic reduction in fossil fuel dependence, with some remaining in-state demand for fossil fuels for aviation, marine, and locomotion applications, and for fossil gas for buildings and industry
- Ambitious deployment of efficient non-combustion technologies such as zero emission vehicles and heat pumps
- Rapid growth in the production and distribution of clean energy such as zero carbon electricity and hydrogen
- Progressive phasedown of fossil fuel production and distribution activities as part of the transition to clean energy
- Remaining emissions of fugitive SLCPs such as refrigerants and fugitive methane
- Strong consumer adoption of clean technology and fuel options
- Removal of remaining CO_2 emissions to achieve carbon neutrality
- Some reliance on carbon capture and sequestration (CCS)

While the four scenarios had a lot in common, they also had some differences:

- Year in which carbon neutrality is achieved (2035 or 2045)
- Rate of deployment of clean technology and production and distribution of zero carbon energy
- Remaining amount of demand for fossil energy in the year carbon neutrality is achieved
- Constraints on technology and fuels deployed in certain sectors
- Consumer adoption rates of clean technologies and fuels
- Degree of reliance on CO_2 removal
- Degree of reliance on CCS

[126] CARB. January 25, 2022. Update on PATHWAYS Scenario Modeling Assumptions. *https://ww2.arb.ca.gov/sites/default/files/2022-01/Scenario%20Slides%20for%20Jan25%20EJAC%20Mtg_01242022.pdf*.

The summary below provides an overview of the alternatives designed and considered for the energy and industrial sectors in this update. Full details of each scenario considered can be found in the *Draft 2022 Scoping Plan Update*

Scoping Plan Scenario (modeling scenario Alternative 3 from the Draft): carbon neutrality by 2045, deploy a broad portfolio of existing and emerging fossil fuel alternatives and clean technologies, and align with statutes, Executive Orders, Board direction, and direction from the governor

Alternative 1: carbon neutrality by 2035, nearly complete phaseout of all combustion, limited reliance on carbon capture and sequestration and engineered carbon removal, and restricted applications for biomass-derived fuels

Alternative 2: carbon neutrality by 2035 and aggressive deployment of a full suite of technology and energy options, including engineered carbon removal

Alternative 4: carbon neutrality by 2045, deployment of a broad portfolio of existing and emerging fossil fuel alternatives, slower deployment and adoption rates than the Scoping Plan Scenario, and a higher reliance on CO_2 removal

Other considerations for the AB 32 GHG Inventory sectors include the following:

- To what extent does an alternative meet the statewide targets and any sector targets, and also deliver clean air benefits (especially in the near term) to address ongoing healthy air disparities, prioritize reductions for mobile and large stationary sources, and emphasize continued investment in disadvantaged communities?
- Does an alternative support California in building on efforts to collaborate with other jurisdictions and include exportable policies based on robust science?
- Does an alternative provide for compliance options and a cost-effective approach to reduce GHG emissions?
- Does the alternative present a realistic and ambitious path forward consistent with statute and science, and support economic opportunities, particularly in anticipated growth sectors?

Scenarios for Natural and Working Lands

For the natural and working lands sector, the Reference Scenario shows that NWL will continue to emit GHGs and lose carbon stocks into the future as the combined effects of past unhealthy management practices and climate change impact our lands. Relative to the Reference Scenario, the four NWL scenarios represent different scales of land management on seven landscapes (forests, shrublands/chaparral, grasslands, croplands, developed lands, wetlands, and sparsely vegetated lands) to support carbon neutrality.

The analysis of the four NWL scenarios shows that the Scoping Plan Scenario is the preferred choice because it prioritizes sustainable land management to sequester carbon over the long term, GHG and air pollution reductions, ecosystem health and resilience, and implementation and technological feasibility and cost-effectiveness. The Scoping Plan Scenario reduces catastrophic wildfire risk to the state; increases the health and resilience of California's forests, shrublands, and grasslands; increases soil health; and protects, restores, and enhances California's natural and working lands for future generations. The Scoping Plan Scenario takes into consideration the priority landscapes and nature-based strategies identified in California's Climate Smart Strategy[127] and reflects the state's priorities to manage lands in ways that support the multiple benefits they provide. The Scoping Plan Scenario, as well as each of the alternative NWL scenarios, were informed by input from other agencies, the public, and the EJ Advisory Committee. Additional landscapes and land management activities will be added and evaluated in future Scoping Plan updates and in response to AB 1757.

Each of the NWL scenarios have several similarities, including the following:

- Prioritizing NWL management actions on forests, shrublands, grasslands, croplands, developed lands, wetlands, and sparsely vegetated lands. These actions can reduce GHG emissions from these lands, protect ecosystems against future climate change, protect communities, and enhance the ecosystem benefits they provide to nature and society.
- Exploring the potential impacts of different levels of NWL management actions that are designed to achieve the objective associated with each scenario.
- Analyzing the carbon impacts of land management actions, climate change, wildfire, and water use on California's diverse natural and working lands through 2045.

There are also differences across the four NWL scenarios. These include:

- The level of NWL management actions taken on each landscape, such as varying the acres of healthy soils practices for croplands.
- The types of NWL management actions taken on each landscape, such as prescribed burning or thinning for forests, grasslands, and shrublands.

[127] CNRA. 2022. Natural and Working Lands Climate Smart Strategy. *https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/CNRA-Report-2022---Final_Accessible_Compressed.pdf*.

The summary below provides an overview of the alternatives designed and considered for the NWL sectors in this Scoping Plan. Full details of each scenario considered can be found in the *Draft 2022 Scoping Plan Update*.

Scoping Plan Scenario (NWL Alternative 3 from the Draft): land management activities that prioritize restoration and enhancement of ecosystem functions to improve resilience to climate change impacts, including more stable carbon stocks

NWL Alternative 1: land management activities that prioritize short term carbon stocks in our forests and through increased climate smart agricultural practices on croplands

NWL Alternative 2: land management activities representative of California's current commitments and plans

NWL Alternative 4: land management activities that prioritize reducing catastrophic wildfires in forests, shrublands, and grasslands

Evaluation of Scoping Plan Alternatives

CARB staff solicited feedback from topical experts, affected stakeholders, and the EJ Advisory Committee, including a tribal representative, at public meetings to assemble input assumptions for four carbon neutrality scenarios to model using PATHWAYS. Revisions to the Draft Scoping Plan were informed by direction in statute, the Governor's Executive Orders, public comments, and the recommendations of the EJ Advisory Committee. The three alternative scenarios were designed to explore the potential speed, magnitude, and impacts of transitioning California's energy demand away from fossil fuels. The modeling assumptions listed below identify the primary fossil fuel alternative that is commercially available and technically feasible for widespread use by 2045 for each sector. CARB assumes that any energy demand that remains after the alternative technology or fuel is applied—such as on-road internal combustion engines, industrial processes, and gas use in existing buildings that have not yet decarbonized—will continue to be met by fossil fuels, resulting in residual GHG emissions.

NWL Scoping Plan Alternatives

For the NWL sectors, staff significantly expanded the scale of the scientific analysis for NWL from previous Scoping Plan efforts. CARB staff utilized modeling tools for this expanded analysis to assess both the carbon and other ecological, public health, and economic outcomes of management actions on forests, shrublands, grasslands, croplands, developed lands, wetlands, and sparsely vegetated lands. CARB staff aligned the scenarios with both the landscape types and actions identified in other efforts called for in Governor Newsom's Executive Order N-82-20 (e.g., California's Climate Smart Strategy and Pathways to 30x30). As part of this Scoping Plan, CARB staff modeled as many of the management actions identified in the Natural and Working Lands Climate

Smart Strategy as were feasible. The management actions that were included in the model were selected because of the State of California's previous work to quantify these actions' impacts. It was not feasible to model every land management strategy for NWL, and so it is possible that larger volumes of sequestration (e.g., in soils or in oceans) could result from additional non-modeled activities. California's Natural and Working Lands Climate Smart Strategy includes a more comprehensive listing of priority nature-based solutions and management actions. It is important to note that the absence of a particular management action or its climate benefit in the modeling is not an indication of its importance or potential contributions toward meeting the target or toward supporting the carbon neutrality target for California.

Forests: Management strategies were modeled for forests: biological/chemical/ herbaceous treatments (e.g., herbicide application), clearcut, various timber harvests (e.g., variable retention, seed tree / shelterwood, selection harvesting), mastication, other mechanical treatments (e.g., piling of dead material, understory thinning), prescribed burning, and thinning. Avoided land conversion to another land use was also included in the modeling. Wildfire was modeled and is responsive to management strategies and climate conditions.

Shrublands and chaparral: Management strategies were modeled for shrublands and chaparral: biological/chemical/herbaceous treatments, prescribed burning, mechanical treatment (e.g., mastication, crushing, mowing, piling), and avoided conversion from shrubland to another land use. Wildfire was modeled and is responsive to management strategies and climate conditions.

Grasslands: Management strategies were modeled for grasslands: biological/chemical/herbaceous treatments, prescribed burning, and avoided land conversion from grasslands to another land use. Wildfire was modeled and is responsive to management strategies and climate conditions.

Croplands: Management strategies were modeled for row crops: cover cropping, no till, reduced till, compost amendment, transition to organic[128] farming, avoided conversion of annual crop agricultural land through easements, establishing riparian forest buffers, alley cropping, establishing windbreaks/shelterbelts, establishing tree and shrubs in croplands, and establishing hedgerows. For perennial crops, windbreaks/shelterbelts, hedgerows, conversion from annual crops to perennial crops, and avoided conversion to other land uses were modeled.

[128] Note: N_2O reductions from decreases in synthetic fertilizer application in organic farming were not modeled.

Developed lands: Management strategies were modeled for developed lands: Increasing tree canopy cover through planting trees and improved management of existing trees, and removing vegetation surrounding structures in accordance with the CAL FIRE Defensible Space PRC 4291.

Wetlands: Management strategies were modeled for wetlands: Restoring wetlands through submerging cultivated land in the Sacramento-San Joaquin Delta and avoided land conversion in the Sacramento-San Joaquin Delta.

Sparsely vegetated lands: Management strategies were modeled for sparsely vegetated lands: Avoided conversion of sparsely vegetated lands to another land use.

Scoping Plan Scenario

The Scoping Plan Scenario achieves GHG emission reductions that exceed the levels expected based on existing policies represented in the Reference Scenario, keeping California on track to achieve the SB 32 GHG reduction target for 2030 and become carbon neutral no later than 2045. Actions that reduce GHG emissions and transition AB 32 GHG Inventory sources away from fossil fuel combustion affect each economic sector. Actions that lead to improved carbon stocks affect each landscape.

AB 32 GHG Inventory Sectors

The AB 32 GHG Inventory Sector Reference scenario is the forecasted statewide GHG emissions through mid-century, with existing policies and programs but without any further action to reduce GHGs beyond those needed to achieve the 2030 limit. The Reference Scenario was developed based on other projections of business-as-usual conditions. Sources of data and policies included are:

- California Energy Demand Forecast[129]
- The two transportation carbon neutrality studies required by AB 74[130]
- The Mobile Source Strategy[131]
- SB 100 60 percent Renewables Portfolio Standard
- A Low Carbon Fuel Standard carbon intensity reduction target of 20 percent

Policies that are under study or design, such the Advanced Clean Fleets regulation, are not included. The Reference Scenario reflects current trends and expected performance of policies identified in the 2017 Scoping Plan—some of which are performing better (such as the RPS and LCFS) and others that may not meet expectations (such as vehicle miles traveled [VMT] reductions and methane capture). Figure 2-1 provides the modeling results for a Reference Scenario for the AB 32 GHG Inventory sectors compared to the Scoping Plan Scenario.

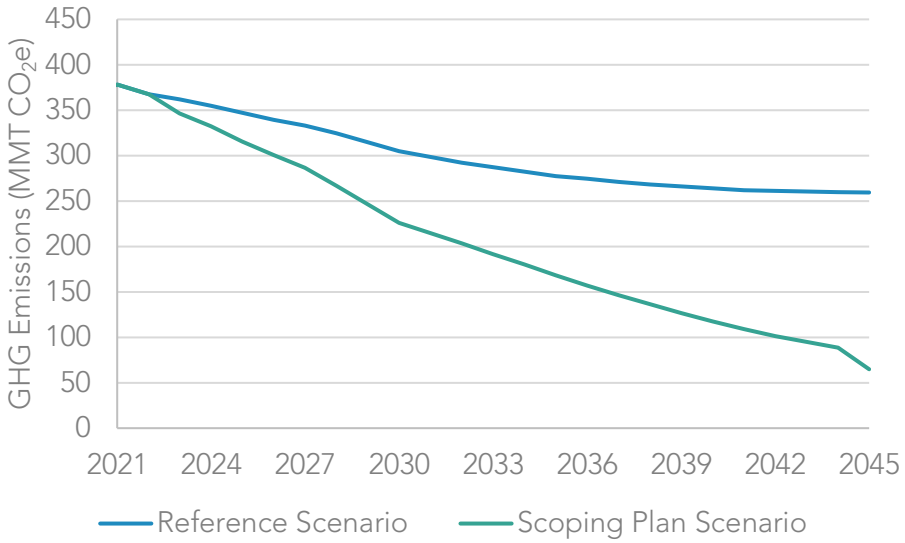
Figure 2-1: Reference and Scoping Plan Scenario GHG emissions[132]



The Scoping Plan Scenario is summarized in Table 2-1. The table shows the types of technologies and energy needed to drastically reduce GHG emissions from the AB 32 Inventory sectors. It also includes references to relevant statutes and Executive Orders, although it is not comprehensive of all existing new authorities for directing or supporting the actions described. Each action is expected to both reduce GHGs and help improve air quality, primarily by transitioning away from combustion of fossil fuels. The Scoping Plan Scenario achieves the AB 1279 target of 85 percent below 1990 levels by 2045 and identifies a need to accelerate the 2030 target to 48 percent below 1990 levels.

[132] The drop in emissions in 2045 reflects both the need to achieve an 85% reduction below 1990 levels in anthropogenic emissions per AB 1279 and Governor Newsom's request for a 100 MMT CO2e carbon removal and capture target in 2045. This was modeled by extending CCS to electric sector emissions.

Table 2-1: Actions for the Scoping Plan Scenario: AB 32 GHG Inventory sectors

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
GHG Emissions Reductions Relative to the SB 32 Target[133]	40% below 1990 levels by 2030	SB 32: Reduce statewide GHG emissions. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Smart Growth / Vehicle Miles Traveled (VMT)	VMT per capita reduced 25% below 2019 levels by 2030, and 30% below 2019 levels by 2045	SB 375: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. In response to Board direction and EJ Advisory Committee recommendations
Light-duty Vehicle (LDV) Zero Emission Vehicles (ZEVs)	100% of LDV sales are ZEV by 2035	EO N-79-20: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory 2035 target aligns with the EJ Advisory Committee recommendation.

[133] While the SB 32 GHG emissions reduction target is not an Action that is analyzed independently, it is included in this table for reference.

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Truck ZEVs	100% of medium-duty (MDV)/HDV sales are ZEV by 2040 (AB 74 University of California Institute of Transportation Studies [ITS] report)	EO N-79-20: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Aviation	20% of aviation fuel demand is met by electricity (batteries) or hydrogen (fuel cells) in 2045. Sustainable aviation fuel meets most or the rest of the aviation fuel demand that has not already transitioned to hydrogen or batteries.	Reduce demand for petroleum aviation fuel and reduce GHGs. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter to CARB Chair Liane Randolph
Ocean-going Vessels (OGV)	2020 OGV At-Berth regulation fully implemented, with most OGVs utilizing shore power by 2027. 25% of OGVs utilize hydrogen fuel cell electric technology by 2045.	Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Port Operations	100% of cargo handling equipment is zero-emission by 2037. 100% of drayage trucks are zero emission by 2035.	Executive Order N-79-20: Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Freight and Passenger Rail	100% of passenger and other locomotive sales are ZEV by 2030. 100% of line haul locomotive sales are ZEV by 2035. Line haul and passenger rail rely primarily on hydrogen fuel cell technology, and others primarily utilize electricity.	Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Oil and Gas Extraction	Reduce oil and gas extraction operations in line with petroleum demand by 2045.	Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Petroleum Refining	CCS on majority of operations by 2030, beginning in 2028 Production reduced in line with petroleum demand.	Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Electricity Generation	Sector GHG target of 38 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2030 and 30 $MMTCO_2e$ in 2035 Retail sales load coverage[134] 20 gigawatts (GW) of offshore wind by 2045 Meet increased demand for electrification without new fossil gas-fired resources.	SB 350 and SB 100: Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter, Board direction, and EJ Advisory Committee recommendation
New Residential and Commercial Buildings	All electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter

[134] SB 100 speaks only to retail sales and state agency procurement of electricity. The *2021 SB 100 Joint Agency Report* reflects the agency authors' understanding that other loads—wholesale or non-retail sales and losses from storage and transmission and distribution lines—are not subject to the law.

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Existing Residential Buildings	80% of appliance sales are electric by 2030 and 100% of appliance sales are electric by 2035. Appliances are replaced at end of life such that by 2030 there are 3 million all-electric and electric-ready homes—and by 2035, 7 million homes—as well as contributing to 6 million heat pumps installed statewide by 2030.	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter
Existing Commercial Buildings	80% of appliance sales are electric by 2030, and 100% of appliance sales are electric by 2045. Appliances are replaced at end of life, contributing to 6 million heat pumps installed statewide by 2030.	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter
Food Products	7.5% of energy demand electrified directly and/or indirectly by 2030; 75% by 2045	Reduce demand for fossil gas and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Construction Equipment	25% of energy demand electrified by 2030 and 75% electrified by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Chemicals and Allied Products; Pulp and Paper	Electrify 0% of boilers by 2030 and 100% of boilers by 2045. Hydrogen for 25% of process heat by 2035 and 100% by 2045 Electrify 100% of other energy demand by 2045.	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Stone, Clay, Glass, and Cement	CCS on 40% of operations by 2035 and on all facilities by 2045 Process emissions reduced through alternative materials and CCS	SB 596: Reduce demand for fossil energy, process emissions, and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Other Industrial Manufacturing	0% energy demand electrified by 2030 and 50% by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Combined Heat and Power	Facilities retire by 2040.	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Agriculture Energy Use	25% energy demand electrified by 2030 and 75% by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions
Low Carbon Fuels for Transportation	Biomass supply is used to produce conventional and advanced biofuels, as well as hydrogen.	Reduce demand for petroleum fuel and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory
Low Carbon Fuels for Buildings and Industry	In 2030s biomethane[135] blended in pipeline Renewable hydrogen blended in fossil gas pipeline at 7% energy (~20% by volume), ramping up between 2030 and 2040 In 2030s, dedicated hydrogen pipelines constructed to serve certain industrial clusters	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory

[135] *Biomethane* is also known as renewable natural gas (RNG).

Sector	Action	Statutes, Executive Orders, Other Direction, Outcome
Non-combustion Methane Emissions	Increase landfill and dairy digester methane capture. Some alternative manure management deployed for smaller dairies Moderate adoption of enteric strategies by 2030 Divert 75% of organic waste from landfills by 2025. Oil and gas fugitive methane emissions reduced 50% by 2030 and further reductions as infrastructure components retire in line with reduced fossil gas demand	SB 1383: Reduce short-lived climate pollutants.
High GWP Potential Emissions	Low GWP refrigerants introduced as building electrification increases, mitigating HFC emissions	SB 1383: Reduce short-lived climate pollutants.

Natural and Working Lands

The Reference Scenario for NWL represents the amount of land management that occurred between 2001 and 2014, and projects the outcomes from maintaining the 2001–2014 levels of land management until 2045. The management and land use practices that occur within the Reference Scenario were derived from empirical data used by staff. For forests, shrublands/chaparral, and grasslands, the Reference Scenario constitutes approximately 250,000 acres of annual statewide treatments. For croplands, the Reference Scenario represents no healthy soil practices because during this period the healthy soil program did not yet exist. For land use change within all land types that consider land use change, historical rates of land conversion from 2001–2014 also were taken from empirical data and modeled into the future for the Reference Scenario.

Table 2-2 summarizes the Scoping Plan Scenario. The table also includes references to relevant statutes and Executive Orders where available.

Table 2-2: Actions for the Scoping Plan Scenario: NWL sectors

Sector	Action	Statutes, Executive Orders, Outcome
Natural and Working Lands	Conserve 30% of the state's NWL and coastal waters by 2030. Implement near- and long-term actions to accelerate natural removal of carbon and build climate resilience in our forests, wetlands, urban greenspaces, agricultural soils, and land conservation activities in ways that serve all communities—and in particular low-income, disadvantaged, and vulnerable communities.	EO N-82-20 and SB 27: CARB to include an NWL target in the Scoping Plan. AB 1757: Establish targets for carbon sequestration and nature-based climate solutions. SB 1386: NWL are an important strategy in meeting GHG reduction goals.

Sector	Action	Statutes, Executive Orders, Outcome
Forests and Shrublands	At least 2.3 million acres[136] treated statewide annually in forests, shrublands/chaparral, and grasslands, comprised of regionally specific management strategies that include prescribed fire, thinning, harvesting, and other management actions. No land conversion of forests, shrublands/chaparral, or grasslands.	Restore health and resilience to overstocked forests and prevent carbon losses from severe wildfire, disease, and pests. Improve air quality and reduce health costs related to wildfire emissions. Improve water quantity and quality and improve rural economies. Provide forest biomass for resource utilization. EO B-52-18: CARB to increase the opportunity for using prescribed fire. AB 1504 (Skinner, Chapter 534, Statutes of 2010): CARB to recognize the role forests play in carbon sequestration and climate mitigation.

[136] The 2.3 million acre target is what the Scoping Plan modeling shows would be needed to realize the carbon stock target called for in this Scoping Plan by 2045.

Sector	Action	Statutes, Executive Orders, Outcome
Grasslands	At least 2.3 million acres[137] treated includes increased management of grasslands interspersed in forests to reduce fuels surrounding communities using management strategies appropriate for grasslands. No land conversion of forests, shrublands/chaparral, or grasslands.	Help to achieve climate targets, improve air quality, and reduce health costs.
Croplands	Implement climate smart practices for annual and perennial crops on ~80,000 acres annually. Land easements/ conservation on annual crops at ~5,500 acres annually. Increase organic agriculture to 20% of all cultivated acres by 2045 (~65,000 acres annually).	Reduce short-lived climate pollutants. Increase soil water holding capacity. Increase organic farming and reduce pesticide use. SB 859: Recognizes the ability of healthy soils practices to reduce GHG emissions from agricultural lands. Target increased in response to Governor Newsom's direction to prioritize sustainable land management.

[137] The 2.3 million acre target is what the Scoping Plan modeling shows would be needed to realize the carbon stock target called for in this Scoping Plan by 2045.

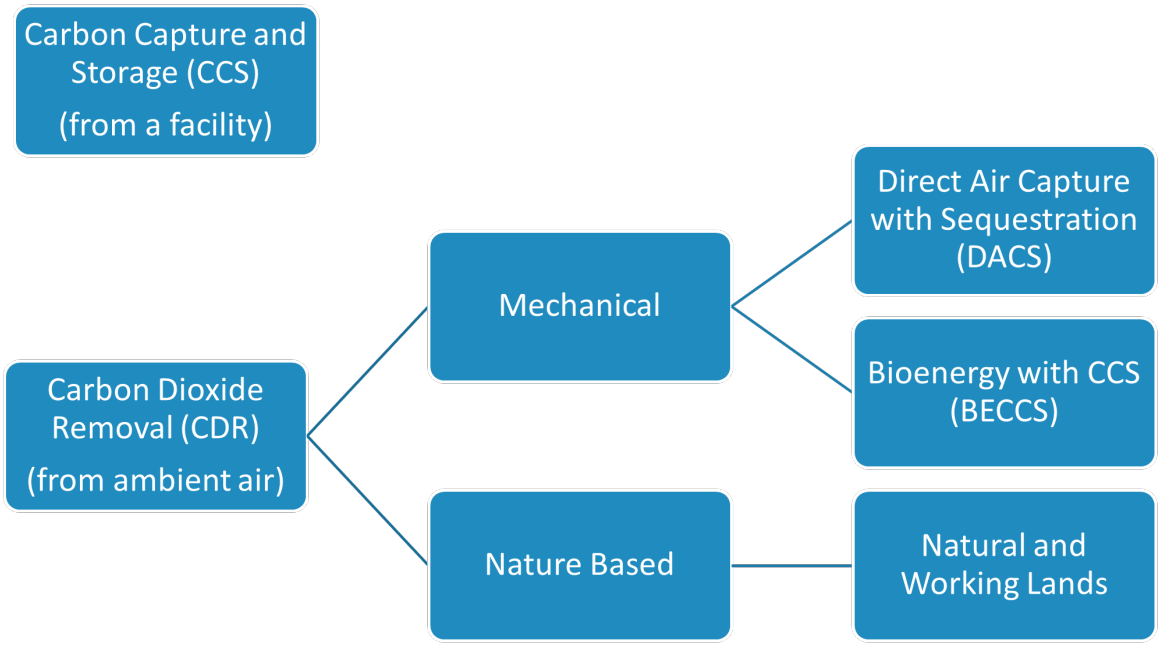
Sector	Action	Statutes, Executive Orders, Outcome
Developed Lands	Increase urban forestry investment by 200% above current levels and utilize tree watering that is 30% less sensitive to drought. Establish defensible space that accounts for property boundaries.	Increase urban tree canopy and shade cover. Reduce heat island effects and support water infrastructure. Reduce fire risk via defensible space. AB 2251 (Calderon, Chapter 186, Statutes of 2022): Increase urban tree canopy 10% by 2035. Target increased in response to AB 2251 and Governor Newsom's direction on CO_2 removal targets in his July 2022 letter.
Wetlands	Restore 60,000 acres of Delta wetlands.	Increase carbon sequestration and reduce short-lived climate pollutants. Helps to reverse land subsidence while improving flood protection and providing critical habitat.
Sparsely Vegetated Lands	Land conversion at 50% of the Reference Scenario land conversion rate.	Reduce the rate of land conversion to more GHG-intensive land uses.

Strategies for Carbon Removal and Sequestration

To achieve carbon neutrality, any remaining emissions must be compensated for using carbon removal and sequestration tools. The following discussion presents more detail

on the options available to capture and sequester carbon. Carbon removal and sequestration will be an essential tool to achieve carbon neutrality, and the modeling clearly shows there is no path to carbon neutrality without carbon removal and sequestration. Governor Newsom also recognized the importance of CO_2 removal strategies and directed CARB to establish CO_2 removal and carbon capture targets of 20 $MMTCO_2$ and 100 $MMTCO_2$ by 2030 and 2045, respectively, as well as signing 2022 legislation on carbon removal and sequestration, including: AB 1279, SB 905, SB 1137, and AB 1757. Carbon removal and sequestration can take different forms. Figure 2-2 illustrates the types of carbon removal and sequestration included in this Scoping Plan. There are numerous other carbon removal options undergoing research, development, and pilot deployment. As these options mature and new approaches emerge, they can be considered in future Scoping Plan updates.

Figure 2-2: Forms of carbon removal and sequestration considered in this Scoping Plan



The Role of Carbon Capture and Sequestration

Carbon capture and sequestration (CCS) will be a necessary tool to reduce GHG emissions and mitigate climate change while minimizing leakage and minimizing emissions where no technological alternatives may exist. CCS is a process by which large amounts of CO_2 are captured, compressed, transported, and sequestered. CCS projects are paired with a source of emissions, as the CCS project captures CO_2 as it leaves a facility's smokestack. CCS projects are often paired with large GHG-emitting facilities such as energy, manufacturing, or fuel production facilities. The sequestration component

of CCS includes CO_2 injection into geologic formations (such as depleted oil and gas reservoirs and saline formations), as well as use in industrial materials (e.g., concrete). CCS is distinct from biological sequestration, which is typically accomplished through NWL management and conservation practices that enhance the storage of carbon or reduce CO_2 emissions with nature-based approaches. CCS is also distinct from mechanical CO_2 removal technologies, where CO_2 is removed directly from the atmosphere using mechanical and/or chemical processes.

CARB adopted a CCS Protocol in 2018 as part of amendments to the Low Carbon Fuel Standard.[138] At this time, no CCS projects have been implemented or have generated any credits under that protocol. However, CCS projects have been implemented elsewhere since the 1970s, largely on coal-fired power plants, with over two dozen projects operational around the world. Over 100 are at the stages of advanced or early development and are expanding beyond coal-fired plants to fossil gas, fuel production, and electricity generation facilities.[139] CCS projects are in development for addressing emissions from fuel, gas, energy production, and chemical production. As of November 2019, more than half of global large-scale CCS facilities (representing approximately 22 $MMTCO_2$/yr in capacity[140]) were in the U.S., mostly as a result of sustained governmental support for these technologies.[141] This support includes the federal 45Q tax credit for CCS[142,143] and research and deployment grants from federal agencies.[144, 145] California's deep sedimentary rock formations in the Central Valley represent world-class

CO_2 storage sites that would meet the highest standards, with storage capacities of at least 17 billion tons of CO_2.[146,147]

In this Scoping Plan, CCS is included to address emissions from limited sectors, including electricity generation, cement production facilities, and refineries, to ensure anthropogenic emissions are reduced by at least 85 percent below 1990 levels in 2045, as directed in AB 1279. While the modeling outputs show CCS not being applied to the electricity sector until 2045, CCS could be implemented earlier on the electricity sector with a similar ramp up over time as that for refineries and cement plants. An earlier application of CCS in the electricity sector would yield additional reductions in years prior to 2045. In addition, CCS can support hydrogen production until such time as there is sufficient renewable power for electrolysis and an abundant water source.

Cement plants have emissions associated with combustion and process-related activities. Combustion emissions account for approximately 40 percent of the total emissions at cement plants. The remaining emissions are related to process-related activities. Due to the high heat content needed to produce cement, there is currently no technically feasible alternative to combustion. SB 596 calls for a 40 percent reduction in GHG intensity in cement emissions from 2019 levels by 2035, and then net zero emissions by 2045. To meet in-state demand, the state relies on cement both produced in state and imported. There are seven cement plants operating in California.[148] To minimize emissions leakage and address emissions from cement plants, the Scoping Plan Scenario includes CCS for cement plants. Additional reductions will need to be pursued and considered as part of implementation of SB 596, which calls for CARB to develop a comprehensive strategy by July 1, 2023, for the state's cement sector to achieve net-zero emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. This effort began in the summer of 2022 and included sector specific workshops.

Even with implementation of EO N-79-20, and despite all of the ambitious efforts in the Scoping Plan Scenario, there will remain some demand for petroleum fuels for legacy vehicles on road applications, and in aviation, rail, and marine applications. Petroleum refineries will need to implement technology to decarbonize their operations and reduce their emissions. This Scoping Plan also assumes CCS at petroleum refineries as one of those potential strategies. Currently, there are seventeen petroleum refineries operating

[146] For comparison purposes, California's emitted 418.2 million metric tons of CO_2e in 2019.
[147] Lawrence Livermore National Laboratory. 2020. *Getting to Neutral: Options for Negative Carbon Emissions in California.* Revision 1. https://www-gs.llnl.gov/content/assets/docs/energy/Getting_to_Neutral.pdf.
[148] CARB. Mandatory GHG Reporting – Reported Emissions. https://ww2.arb.ca.gov/mrr-data

in the state.[149] On the supply side, the modeling assumes all in-state demand is met through some very limited refining activities in California. Figure 2-3 shows the emissions from the refining sector with and without CCS. If CCS is not deployed, the emissions would be directly emitted into the atmosphere, and CO_2 removal by NWL or direct air capture would need to increase to compensate for the sector's emissions.

Refineries can have a variety of point sources that emit CO_2—such as steam methane reformers for producing hydrogen, combined heat and power units, and catalytic crackers—that are best suited for CCS. Each configuration of a refinery can be unique to its footprint, onsite operations, and the types of crude oils processed. There are newer technologies with smaller footprints[150] that can be deployed in modular configurations to capture CO_2 in space-constrained and multiple-point-source facilities such as refineries. CCS can provide a path to reducing GHG emissions from these facilities to meet petroleum demand while avoiding leakage and until such time as some refineries can be transitioned to produce clean energy to support the transition away from fossil fuels.

While the Scoping Plan modeled deployment of CCS on refineries and identifies significant emissions reductions that can be achieved, the refineries in California are large and complex. The actual deployment of CCS at these facilities as modeled in the Scoping Plan is uncertain. It will be important to closely monitor the evolution of CCS deployment in the refinery sector and, in the next Scoping Plan update, to evaluate the progress toward use in this sector to determine whether the projected reductions will be achieved.

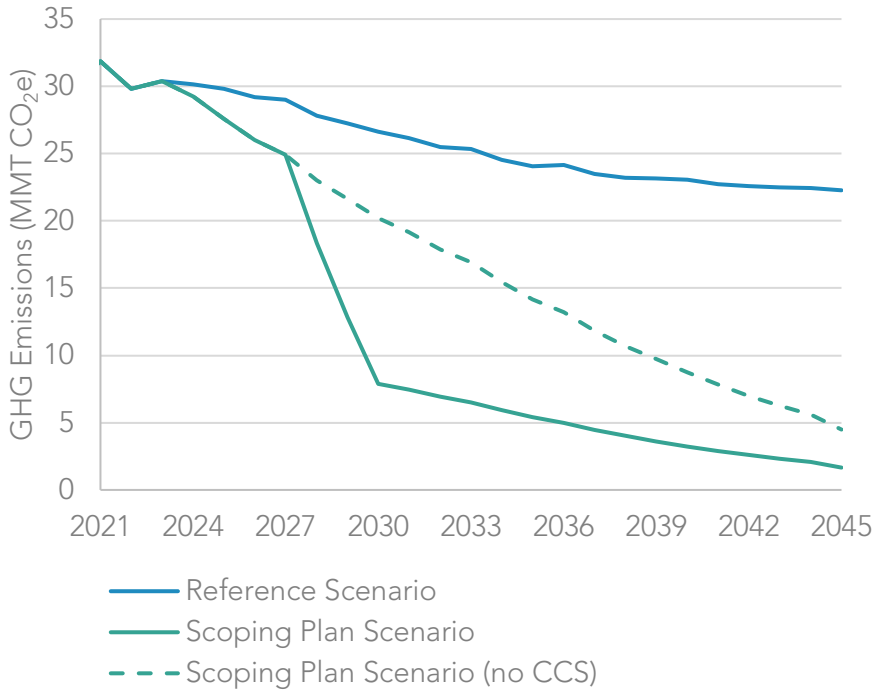
Figure 2-3: Petroleum refining emissions with and without carbon capture and sequestration



This Scoping Plan also calls for accelerating the transition from combustion of fossil fuels to hydrogen. Hydrogen can be produced through electrolysis with renewable electricity or through steam methane reformation of biomethane. There is a high degree of uncertainty around the availability of solar to support both electrification of existing sectors and the production of hydrogen through electrolysis. Producing hydrogen required under the Scoping Plan Scenario with electrolysis would require about 10 gigawatts (GW)[151] of additional solar capacity. If steam methane reformation is paired with CCS, the hydrogen produced could potentially be low carbon. Additionally, the biomethane used to generate hydrogen could be sourced from gasification of forest or agricultural waste resulting from forest management and other NWL management practices, which could also lead to net negative carbon outcomes. Steam methane reformation paired with CCS can thus ensure a rapid transition to hydrogen and increase hydrogen availability until such time as

[151] The Draft Scoping Plan included an estimate for solar capacity (40 GW) to support only electrolysis to produce all hydrogen in the Proposed Scenario. The Scoping Plan now includes steam methane reformation of biomethane and biomass gasification with CCS to produce hydrogen, along with electrolysis from off-grid solar. See Appendix H (AB 32 GHG Inventory Sector Modeling) for additional details.

electrolysis with renewables can meet the ongoing need, assuming there is also sufficient water supply. Additional background and next steps for CCS can be found in Chapter 4.

The EJ Advisory Committee has raised multiple concerns related to the inclusion of CCS and mechanical CDR in the Scoping Plan. Concerns range from potential negative health and air quality impacts in communities from operation of facilities utilizing CCS that continue to emit other emissions, to safety concerns related to potential leaks, to the viability of the current technology. Additionally, the EJ Advisory Committee has policy concerns about the strategy and wants to ensure that engineered carbon removal is not used as a substitute for strategies to achieve emissions reductions onsite and that it does not result in delays in phasing out fossil fuel use. Given these and other concerns and the importance of building public awareness, CARB recognizes the need for a multi-stakeholder process including other state, federal, and local agencies; tribes; independent experts; and community residents to further understand and address community concerns related to CCS. CARB hosted a CCS Symposium with U.S. EPA Region 9 and the Stanford Doerr School of Sustainability to discuss some of these critical issues with community members and other participants. As CARB begins the process of implementing SB 905 in 2023, that will provide an opportunity for further engagement.

In the context of CCS deployment, the Council of Environmental Quality (CEQ) also highlighted the need to further assess and quantify potential impacts on local criteria air pollutants and other emissions resulting from carbon capture retrofits at industrial facilities in response to concerns regarding potential cumulative emissions from single and/or multiple sources.[152] An October 2020 Stanford report[153] discussed how the potential post-combustion capture for CO_2 could also reduce emissions of criteria air pollutant emissions from certain facilities. Exploring these potential outcomes will be important to ensure deployment of CCS does not exacerbate air pollution impacts in communities and maximizes any air pollution benefits. The need for these types of evaluations is also included in SB 905.

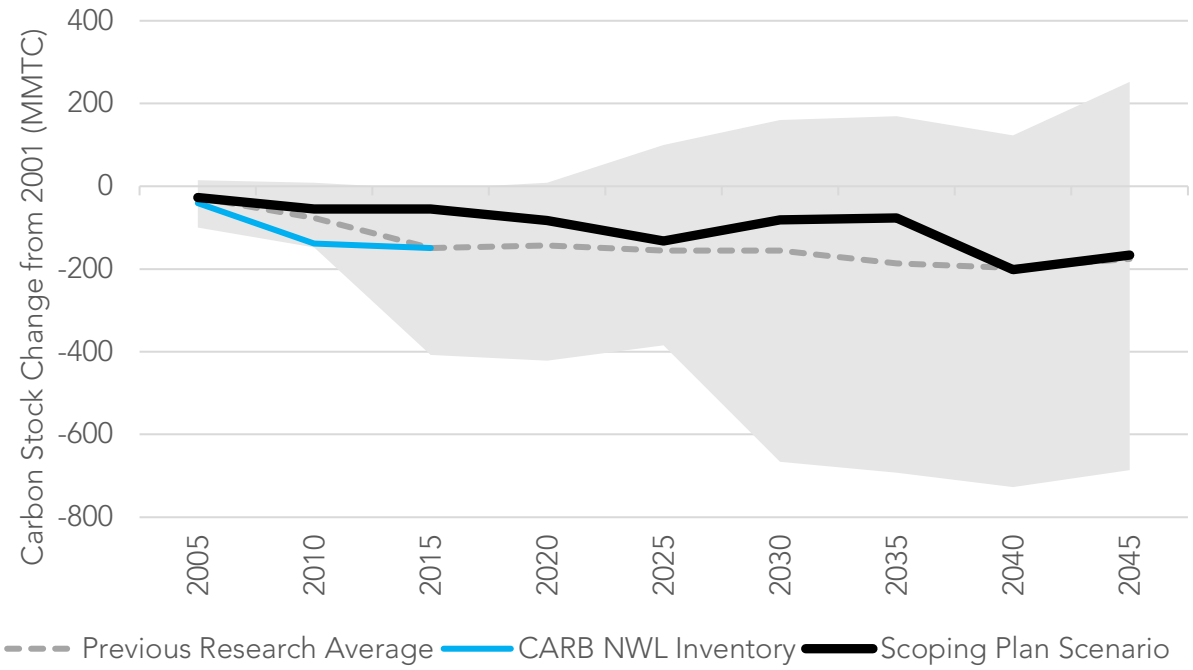
The Role of Natural and Working Lands Emissions and Sequestration

California's NWL assessments highlight the importance of increasing the pace and scale of NWL actions to ensure that our ecosystems are better equipped to withstand future climate change so they continue to provide the benefits that nature and society depend

[152] Carbon Capture, Utilization, and Sequestration Guidance. 87 Fed. Reg. 8808 (Feb. 16, 2022), *2022-03205.pdf (govinfo.gov)*.
[153] Stanford Center for Carbon Storage. 2020. *An Action Plan for Carbon Capture and Storage in California: Opportunities, Challenges, and Solutions.* October. *https://sccs.stanford.edu/ccs-in-ca/full-report-form?msclkid=6f9177f6c57811ecbebc473e75203b21*.

upon for survival. As climate change increases the likelihood of extreme wildfires, drought, heat, and other impacts, carbon stocks in California's NWL will face increased risks and impacts. We know from previous climate change and Scoping Plan work[154] that lands can be a net source of GHG emissions or a net sink, and that the magnitude of carbon stock changes and GHG emissions and sequestration from NWL are dependent on the effects of climate change and land management. The expanded modeling conducted for this Scoping Plan shows that NWL are projected to be a net source of emissions through 2045 and indicates a probable decrease of carbon stocks into the future. This projection is further corroborated by previous, independent research that has reached the same conclusion, showing a range of varying levels of carbon stock loss. Figure 2-4 shows the modeling results of the Scoping Plan Scenario overlaid with the NWL inventory and findings from independent research.

Figure 2-4: Comparison of the Scoping Plan Scenario (NWL) with existing research



The modeling indicates that immediate and aggressive climate action can reduce the environmental impacts that would occur in the absence of this action. The results of the modeling demonstrate that regular NWL management over the next two decades can

[154] CARB. 2019. January 2019. *Draft California 2030 Natural and Working Lands Climate Change Implementation Plan*. https://ww2.arb.ca.gov/sites/default/files/2020-10/draft-nwl-ip-040419.pdf.

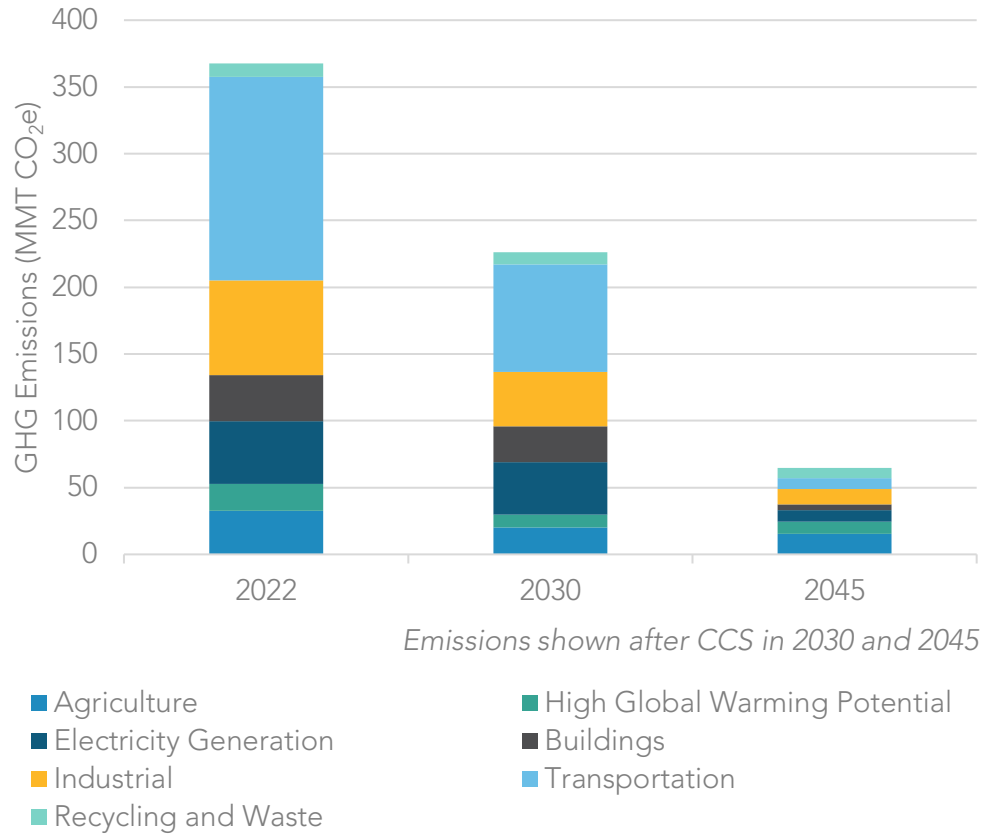
increase carbon stocks from the Reference Scenario trajectory, reduce GHG emissions from lands, and improve ecosystem and public health. This effort is the most comprehensive scientific effort taken by any government to include NWL within its overall climate strategy. Even so, we know that uncertainty exists about future climate and economic forces and the impacts they may have on our ecosystems, so it is important that the state take decisive and aggressive action to improve and diversify ecosystem structures and management.

The effects of climate change, including increased drought, wildfire, and extreme heat, play a significant role in determining the future of California's carbon stocks. And while management actions will help to reduce the impact that climate change will have on California, it is clear from the analysis that NWL sinks and sources are highly variable from year to year, and short time frames do not adequately demonstrate the impact that climate and management are having on ecosystems. For the purposes of climate planning, therefore, it is best to focus on carbon stock changes over longer periods rather than focusing on sequestration or emissions on shorter time frames. The Scoping Plan Scenario is estimated to result in additional NWL emissions of 7 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) annually from 2025–2045. The Reference Scenario is estimated to result in annual emissions of 9 $MMTCO_2e$ over the same time period, and so the Scoping Plan Scenario slows the rate of emissions and provides an approximate 2 $MMTCO_2e$ in additional annual sequestration relative to the Reference Scenario. Because NWL are projected to be a net emissions source, the annual NWL emissions of approximately 7 $MMTCO_2e$ from the Scoping Plan Scenario will need to be compensated by additional CO_2 removal approaches to ensure California can achieve carbon neutrality by 2045.

The Role for Carbon Dioxide Removal (Direct Air Capture)

Even if anthropogenic emissions are reduced to at least 85 percent below 1990 levels by 2045 as called for by AB 1279, there will still be residual emissions in the AB 32 GHG Inventory sectors in 2045 that must be addressed in order to achieve the California's carbon neutrality target. Figure 2-5 includes the emissions by sector for the AB 32 GHG Inventory Sectors in 2022, 2030, and 2045 for the Scoping Plan Scenario.

Figure 2-5: Residual emissions in 2022, 2030, and 2045 for the Scoping Plan Scenario[155]



To achieve carbon neutrality, mechanical CDR will therefore need to be deployed. Because NWL management is not estimated to be a significant carbon removal path in the near term, additional CDR options will be needed. *Mechanical CDR* refers to a range of technologies that capture and concentrate ambient CO_2. Direct air capture (DAC) is one available option that is under development today and could be widely deployed. Note that, unlike CCS, DAC technologies are not designed to be attached to a specific source or smokestack. These technologies include chemical scrubbing processes that capture CO_2 through absorption or adsorption separation processes. Another carbon removal

[155] The High GWP sector includes high global warming potential gas emissions from releases of ozone depleting substance (ODS) substitutes, SF_6 emissions from the electricity transmission and distribution system, and gases that are emitted in the semiconductor manufacturing process. ODS substitutes, which are primarily hydrofluorocarbons (HFCs), are used in refrigeration and air conditioning equipment, solvent cleaning, foam production, fire retardants, and aerosols.

option that involves rapid mineralization of CO_2 at the Earth's surface is called *mineral carbonation.*[156] As is the case with CCS, mechanical CDR technologies will need governmental or other incentive support to overcome technology and market barriers. In the United States, the U.S. Department of Energy announced financing specifically for DAC in March 2020[157] and March 2021.[158] Additionally, almost $9 billion in CCS support was included in the $ 1 trillion Infrastructure Investment and Jobs Act of 2021.[159] This includes funding to establish four DAC hubs. The Inflation Reduction Act of 2022[160] increases the value of the 45Q tax credit to USD 85 per metric ton of CO_2 captured and stored in geologic formations from some industrial applications and USD 180 per metric ton for DAC with storage in geologic formations. In 2021, there were approximately 19 DAC facilities globally.[161]

Ultimately, the role for mechanical CDR will depend on the success of reducing emissions directly at the source in the AB 32 GHG Inventory sectors and the ability of the NWL to sequester carbon. However, mechanical CDR also provides an opportunity to not just achieve carbon neutrality, but also remove legacy GHG emissions from the atmosphere. As such, increased deployment of DAC can help achieve net negative emissions. This would further help avoid the most damaging impacts of climate change. While the federal incentives for DAC provide some support for this technology, the only California program that recognizes this technology is the LCFS program. Permitting must also happen across different levels of government and across multiple state agencies. Energy availability must also be addressed if DAC is to be implemented in remote areas. Additional information and next steps on DAC can be found in Chapter 4.

Carbon Dioxide Removal and Capture Targets for 2030 and 2045

Recognizing the importance of CO_2 removal, Governor Newsom and the Legislature identified the need for targets to send policy and regulatory signals to pilot, deploy, and scale action for those efforts. Governor Newsom requested that CARB set a CO_2 removal and capture target of 20 MMT for 2030 and 100 MMT for 2045, first prioritizing sequestration in NWL. And while this Scoping Plan prioritizes and recommends significant increased climate-smart action on all NWL to support carbon neutrality and healthy and resilient lands, the modeling indicates that, across all NWL, lands will be a net source of emissions when accounting for both carbon sequestration and GHG (CO_2, CH_4, and N_2O) emissions from lands.

Some landscapes, however, are projected to have a net increase in carbon stocks under the Scoping Plan Scenario between 2025 and 2045 relative to the reference case, indicating that NWL actions can help California achieve Governor Newsom's CO_2 removal targets. Carbon stocks in urban forests and grasslands are projected to increase relative to historical levels from implementation of the 2022 Scoping Plan. To support the governor's CO_2 removal targets, CARB estimates that lands would contribute an average of 1.5 MMT of CO_2 removals each year between 2025 and 2045. Any carbon sequestration contributions from lands need to reflect both long-term storage and an overall net increase in carbon stocks over time to ensure these NWL actions are contributing toward California's achievement and maintenance of carbon neutrality over time.

CARB will work to update and revise these estimates as part of implementation of AB 1757, which was signed by the governor in September 2022 and requires that CARB and the California Natural Resources Agency (CNRA) work with an expert advisory committee to determine an ambitious range of carbon sequestration targets by January 1, 2024, for the years 2030, 2038, and 2045.

For the AB 32 GHG Inventory sectors, the Scoping Plan Scenario modeling indicates that the scenario would meet or exceed the 2030 SB 32 target through GHG reduction policies without the need for CDR. CDR will, however, be necessary to increase ambition for an accelerated 2030 target and in increasing amounts over the following decades to achieve carbon neutrality by 2045.[162] Given the likelihood of NWL to be a net source of emissions, and the need for CDR to compensate for residual emissions to achieve carbon neutrality

[162] The modeled scenarios assume that residual emissions will be compensated using DAC technologies by including the direct cost in terms of dollars per ton CO_2 removed. The energy source for DAC is not modeled, but renewable electricity and/or hydrogen produced from electrolysis are zero carbon options consistent with the carbon neutrality targets in this Scoping Plan.

by 2045, California will need increasing deployment of mechanical CDR over the coming decades. In the immediate future, scaling nature-based CDR approaches also can help to provide some CO_2 removal quickly while mechanical CDR is scaled up between now and 2045. Table 2-3 provides estimates of CO_2 removal and capture needed in 2030[163] and 2045.

[163] As identified in Chapter 1, SB 27 (Skinner, Chapter 237, Statues of 2021) directed CARB to "establish carbon dioxide removal targets for 2030 and beyond" as part of this Scoping Plan. CARB is establishing these targets to satisfy both the requirements of SB 27 and the directive from Governor Newsom to establish CO_2 removal targets for 2030 and 2045.

Table 2-3: GHG emissions and removals needed to achieve carbon neutrality and meet the 20 $MMTCO_2$ removal and capture target in 2030 and the 100 $MMTCO_2$ removal and capture target in 2045.[164]

	2030 ($MMTCO_2e$)	2045 ($MMTCO_2e$)
GHG Emissions	233	72
AB 32 GHG Inventory Sector Emissions	226	65
Net NWL GHG Emissions Across All Landscapes (annual average from 2025–2045)	7	7
Carbon Capture and Sequestration (CCS): Avoided GHG Emissions from Industry and Electric Sectors	(13)	(25)
Carbon Dioxide Removal (CDR) including natural and working lands carbon sequestration,[165] Direct Air Capture, and Bioenergy with CCS (BECCS).	(7)	(75)
Net Emissions (GHG Emissions + CDR)	226	(3)

In 2030, the CO_2 removal and capture target is 20 MMT, but because the SB 32 target only encompasses the AB 32 GHG Inventory sectors, only CCS that reduces GHG emissions on AB 32 sources count toward achieving more ambitious GHG emission reductions in 2030. In 2045, the CO_2 removal and capture must compensate for any residual emissions from the AB 32 Inventory sectors and NWL emissions to support achieving carbon neutrality while also totaling at least 100 MMT. It is important to note that NWL, particularly forests, need a natural wildfire cycle to remain healthy. While the modeling projected wildfires, and implementing the Scoping Plan will result in a reduction in future wildfire emissions, getting to zero wildfires in the sector is not the goal, nor the

[164] Modeled estimates from the Scoping Plan Scenario indicate the relative quantity of emissions and removals to achieve carbon neutrality and meet carbon removal and capture targets. These estimates are not intended to imply precision, as the required policies are yet to be implemented and all models have some uncertainty in their forecasts.

[165] For the purposes of quantifying how to achieve the governor's 20 MMT and 100 MMT CO_2 removal and capture target, CARB included 1.5 $MMTCO_2e$ sequestration from NWL, which is the sequestration from urban forests. This is included as CO_2 removal because it is this sequestration that CARB can consider as having some permanence. Permanence is necessary for incorporating NWL into carbon neutrality. The net NWL emissions of 7 $MMTCO_2e$, identified in the second row of Table 2-3, includes *all* emissions and sinks from all NWL landscapes, which is inclusive of the 1.5 $MMTCO_2e$ sequestration. CARB will develop an accounting framework to accommodate NWL carbon stocks.

right approach to a sustainable forestry sector. In contrast in 2045, the reductions from programs and policies are estimated to reduce emissions by 169 $MMTCO_2e$ from business as usual.

The 2030 target for engineered CDR also provides a near term milestone for California and can serve as an important marker for progress in deploying CDR to support California's carbon neutrality goal. Preliminary estimates indicate that, globally, capacity from already announced projects will range from about 2 million metric tons per year ($MMTCO_2/y$) to 8 $MMTCO_2/y$ from bioenergy paired with CCS, and from about 2,000 metric tons per year ($MTCO_2/y$) to 1 $MMTCO_2/y$ from DACs by 2027,[166] which indicates that California's 2030 target is an ambitious, but achievable, goal.

Scenario Uncertainty

Greenhouse Gas Emissions Modeling

Several types of uncertainty are important to understand in both forecasting future emissions and estimating the benefits of emission reduction actions. In developing this Scoping Plan we forecasted a reference scenario and estimated the GHG emissions outcome of the AB 32 GHG Inventory sectors using the PATHWAYS[167] model. Inherent in the reference scenario modeling is the expectation that many of the existing programs will continue in their current form, and that the expected drivers for GHG emissions, such as energy demand, population growth, and economic growth, will match our current projections.

However, there is also the expectation that each of the policies included and implemented to achieve the 2030 target in the 2017 Scoping Plan will deliver their exact outcomes. It is unlikely the future will precisely match our projections, and this will lead to uncertainty in the forecast. For example, we never could have foreseen and forecasted economic and emissions impacts related to the extended disruptions from the COVID-19 pandemic. Thus, the single "reference" or "forecast" line should be understood to represent one possible future in a range of possible predictions. For this Scoping Plan, PATHWAYS utilized inputs that reflect technically feasible levels of deployment or adoption of low- or zero-carbon fuels and technologies. Each of the input assumptions provided to PATHWAYS has some uncertainty, which also contributes to uncertainty in the resulting reference scenario.

---

[166] IHS Markit. August 2021. Carbon Removal Potential. *https://ww2.arb.ca.gov/sites/default/files/2021-08/ihsmarkit_presentation_sp_engineeredcarbonremoval_august2021.pdf*.
[167] See Appendix H (AB 32 GHG Inventory Sector Modeling).

Similarly, for the NWL modeling, CARB used a mix of individual modeling tools[168] to estimate the carbon and other ecological, public health, and economic outcomes. The Reference scenario assumes that the level of land management actions that occurred between 2001 and 2014 for forests, shrublands, grasslands, croplands, developed lands, wetlands, and sparsely vegetated lands continues into the future. Alternative scenarios assessed the effect of increasing levels of management actions from the reference scenario beginning in 2025. There is a great deal of uncertainty about exactly how lands are currently managed, and a larger uncertainty about how they may be managed in the future. For NWL, it is unlikely that the future will precisely match the carbon stock outcomes CARB has projected, particularly given the uncertainties around current and future land management and the effects climate change will have on our lands. For any modeling exercise these uncertainties exist; however, this modeling effort brings together the best available science, data, and models to quantify the impact our actions may have on the landscape under an unknown future.

Implementation

As this Scoping Plan is designed to chart a path to achieving carbon neutrality, additional work will be required to fully design and implement any policies and actions identified in this plan. During the subsequent development of policies, the Legislature, CARB, and other state agencies will learn more about the technologies and their costs, as well as how each industry works, as a more comprehensive evaluation is conducted in coordination with stakeholders, including community engagement. Significant areas of uncertainty include permitting wait times[169] and local ordinances that might limit or slow the build-out of utility scale renewables.[170,171] In another example, times to reach commercial operations for solar projects after securing an interconnection agreement also have increased in recent years, to 3.5 to 5.5 years.[172]

The level of natural and working lands climate action identified in this Scoping Plan is ambitious. Achieving the level of action needed to result in the quantified carbon,

emissions, health, and economic outcomes within this Scoping Plan requires coordination, investment, and partnerships across all levels of government and sectors of the economy. It is possible that not all of the actions at the identified level will begin in 2025. This uncertainty will result in diminished levels of beneficial outcomes quantified in the Scoping Plan Scenario. The levels of NWL action identified in this Scoping Plan represent CARB's assessment of the pace and scale of action needed to achieve the carbon stock targets and CO_2 removal targets identified in this Scoping Plan.

The Scoping Plan Scenario identifies that 2.3 million acres of forests, shrubland, and grassland management annually would achieve substantial levels of fire emissions reductions and the concomitant health and economics benefits. Currently, 1 million acres of forest treatment annually is the joint federal and state government goal (500,000 acres each). This target of one million acres annually by 2025 is for the purposes of increasing forest health and wildfire resilience in the near term, whereas the 2.3 million acre target is what the Scoping Plan modeling shows would be needed to realize the carbon stock target called for in this Scoping Plan by 2045. By identifying 2.3 million acres of climate action annually in forests, shrublands, and grasslands, this Scoping Plan emphasizes the importance of that 1 million acre annual goal as a milestone on the way to even more action and improved fire and air quality outcomes. The modeling indicates that substantial improvements to statewide fire emissions will occur at levels of action greater than 1 million acres per year. If these levels of action do not occur starting in 2025, the Scoping Plan has quantified climate benefits that will still occur, but to a lesser extent. In terms of fire emissions, compared to the Reference Scenario, 2.3 million acres of forest, shrubland and grassland management will result in a 10% reduction in wildfire emissions. At 1 million acres per year, this decreases to a 2.5% reduction. If 1 million acres per year is also not accomplished, then the emissions and health benefits are even lower.

Climate action in other NWL sectors also generates many co-benefits. Climate action identified in this Scoping Plan is aimed at not only fighting climate change but also improving air quality and public health. The climate action identified in the agricultural sector, for example, should result in decreased pesticide and synthetic fertilizer use. This decrease of synthetic chemical use in agriculture across California also should result in improved public health, especially for communities that work and live in and around agricultural lands. However, as with the forestry sector, the benefits of climate action in agricultural lands and in any other land are dependent on how much implementation takes place. Ramping up increased healthy soils practices and increasing organic agriculture in California will require continued and sustained implementation by private industry and public agencies. For example, achieving the carbon stock outcomes for the annual crops called for in this Scoping Plan would require deployment and maintenance of healthy soils practices on 80,000 additional acres of croplands in California every year between 2025 and 2045. For context, CDFA's Healthy Soils Program, which is an incentive program

supporting healthy soils practices, took almost four years of sustained funding to achieve approximately 50,000 acres total under healthy soils practices.[173]

Given the uncertainty around the modeling assumptions, and performance uncertainty as specific policies are fully designed and implemented, estimates associated with the Scoping Plan Scenario are certain to be different than what is ultimately implemented. One way to mitigate for this is to develop policies that can adapt and increase certainty in GHG emissions reductions. Periodic reviews of progress toward achieving the 2030 target and longer term deeper decarbonization, as well as performance of specific policies, also provide opportunities for the state to consider any changes to ensure we remain on course to achieve the 2030 target and carbon neutrality. The need for this periodic review process was anticipated in AB 32, as it calls for updates to the Scoping Plan at least once every five years. For this Scoping Plan, the metrics provided on the rate of deployment of clean fuels and technologies, along with the annual AB 32 GHG Inventory, provide additional information that can be used to assess progress on sectors and aggregate emissions. This is also true of CARB's NWL carbon inventory. An uncertainty analysis for achieving an accelerated 2030 target is provided toward the end of this chapter.

Targeted Evaluations for the Scoping Plan: Oil and Gas Extraction and Refining

To achieve California's air quality and climate goals, we must end our dependence on petroleum. This will not happen overnight. There are about 28 million combustion engine heavy- and light-duty trucks and passenger vehicles in California, and these are almost always replaced at their end of life. The ZEV Executive Order (EO N-79-20) calls for 100 percent new ZEV car sales beginning in 2035 and a 100 percent ZEV medium- and heavy-duty fleet sales by 2045 where feasible. The result is an ongoing, albeit shrinking, pool of vehicles that will continue to require petroleum fuels. To avoid leakage, as called for in AB 32, and to meet that remaining demand for petroleum fuel, a complete phaseout of oil and gas extraction and refining is not possible by 2045. This Scoping Plan assumes a phasedown in both oil and gas extraction as well as petroleum refining in line with the reduction in demand for in-state on-road petroleum fuel demand. Since the transportation sector is the largest source of GHG emissions and harmful local air pollution, we must continue to research and invest in efforts to deploy zero emissions technologies and clean fuels, and to reduce VMT. An assessment of ongoing progress and efforts to reduce

[173] California Department of Food and Agriculture. 2021. *Incentives Program 2017–2020 Summary by the Numbers.* https://www.cdfa.ca.gov/oefi/healthysoils/docs/HSP_Incentives_program_level_data_funded_projects.pdf.

demand for petroleum fuels and of opportunities to phase down oil and gas extraction and refining will be included in the next Scoping Plan update.

In addition to supplying in-state demand, California is a net exporter of gasoline, diesel, and jet fuel. California pipelines supply the Nevada and Arizona regions[174] with approximately 87 million barrels gasoline equivalent of refined products annually.[175] California pipelines deliver approximately 85% of Nevada's and 40% of Arizona's refined product. Most finished fuels flowing from California to Nevada and Arizona are currently produced by California refineries. To manage the phasedown of oil and gas extraction and petroleum refining in California, exports of finished fuels must be considered and factored into that process, in addition to the declining in-state demand. The authorities and considerations related to supply and demand of petroleum fuels span federal, state, and local agencies. If supply of fossil fuels is to decline along with demand, a multi-agency discussion is needed to systematically evaluate and plan for the transition to ensure that it is equitable.

This inter-agency work should also consider related topics, such as the following:

- Direct and indirect job and economic impacts
- Demand for other liquid fuel types such as renewable fuels, and expected volumes
- Legal considerations
- Public health benefits
- Demand and supply strategies for petroleum fuels, including how to avoid short term supply constraints that may impact low-income consumers

Some of these topics were also discussed as part of two studies[176] supported by the California Environmental Protection Agency, which can serve as a starting point for a working group to analyze these questions and develop policy recommendations.

Oil and Gas Extraction

On April 23, 2021,[177] Governor Newsom directed CARB to evaluate the phaseout of oil and gas extraction no later than 2045 as part of this Scoping Plan. As noted above, this Scoping Plan still has some California demand for finished fossil fuels (gasoline, diesel,

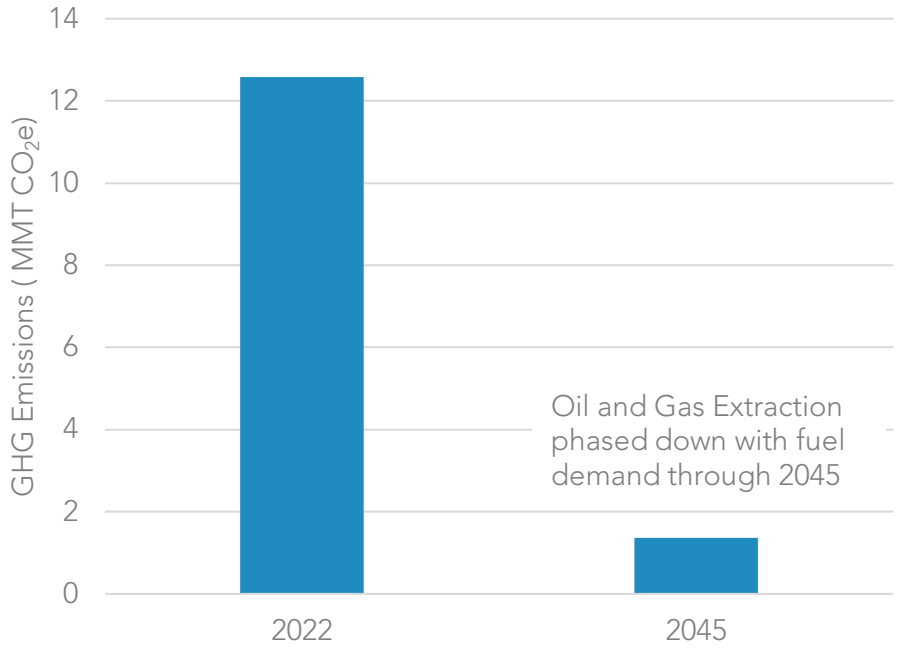
[177] Governor Newsom. April 23, 2021. Governor Newsom Takes Action to Phase Out Oil Extraction in California. Press Release. https://www.gov.ca.gov/2021/04/23/governor-newsom-takes-action-to-phase-out-oil-extraction-in-california/.

and jet fuel) in 2045. This demand is primarily for transportation, including for sectors that are directly regulated by the state and some that are subject to federal jurisdiction, such as interstate locomotives, marine, and aviation. As discussed more fully below, while significant GHG reductions from oil and gas extraction could be achieved as demand for fossil fuels is reduced due to strategies in this Scoping Plan, it is not feasible to phase out oil and gas production fully by 2045 given this remaining demand.

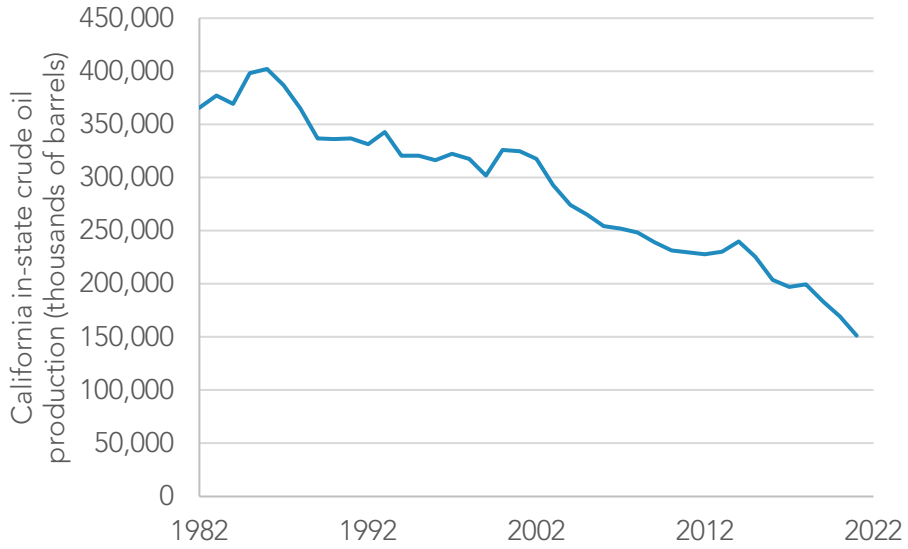
In the Scoping Plan Scenario, with successful deployment of zero carbon fuels and non-combustion technology to phase down petroleum demand, GHG emissions from oil and gas extraction could be reduced by approximately 89 percent in 2045 from 2022 levels if extraction decreases in line with in-state finished fuel demand. If in-state extraction were to be phased out fully, the future petroleum demand by in-state refineries would be met through increased crude imports to the state relative to the Scoping Plan Scenario. AB 32 defines leakage as, "a reduction in emissions in greenhouse gases within the state that is offset by an increase in emissions of greenhouse gases outside the state." AB 32 also requires any actions undertaken to reduce GHGs to "minimize leakage." Increases in imported crude could result in increased activity outside California to extract and transport crude into California. Therefore, our analysis indicates that a full phaseout of in-state extraction could result in GHG emissions leakage and in-state impacts to crude oil imported into the state. Figure 2-6 compares the 2022 emissions from this sector with the modeled results when the sector is phased down with in-state petroleum demand.

Figure 2-6: Oil and gas extraction sector GHG emissions in 2022 and 2045 when activity is phased down with in-state fuel demand



According to California Energy Commission (CEC) data used in Figure 2-7, the total oil extracted in California peaked at 402 million barrels in 1986. Since then, California crude oil production has decreased by an average of 6 million barrels per year, to about 200 million barrels in 2020. This steadily decreasing production of crude in California is expected to continue as the state's oil fields deplete.

Figure 2-7: California in-state crude oil production[178]



A UC Santa Barbara report estimated that, under business-as-usual conditions, California oil field production would decrease to 97 million barrels in 2045.[179] The business-as-usual model assumed no additional regulations limiting oil extraction in California.

Any crude oil demand by California refineries not met by California crude oil will be met by marine imports of Alaskan and foreign crude.[180] As shown in Figure 2-8, approximately 99 percent of crude imports into California are delivered by marine transportation. The

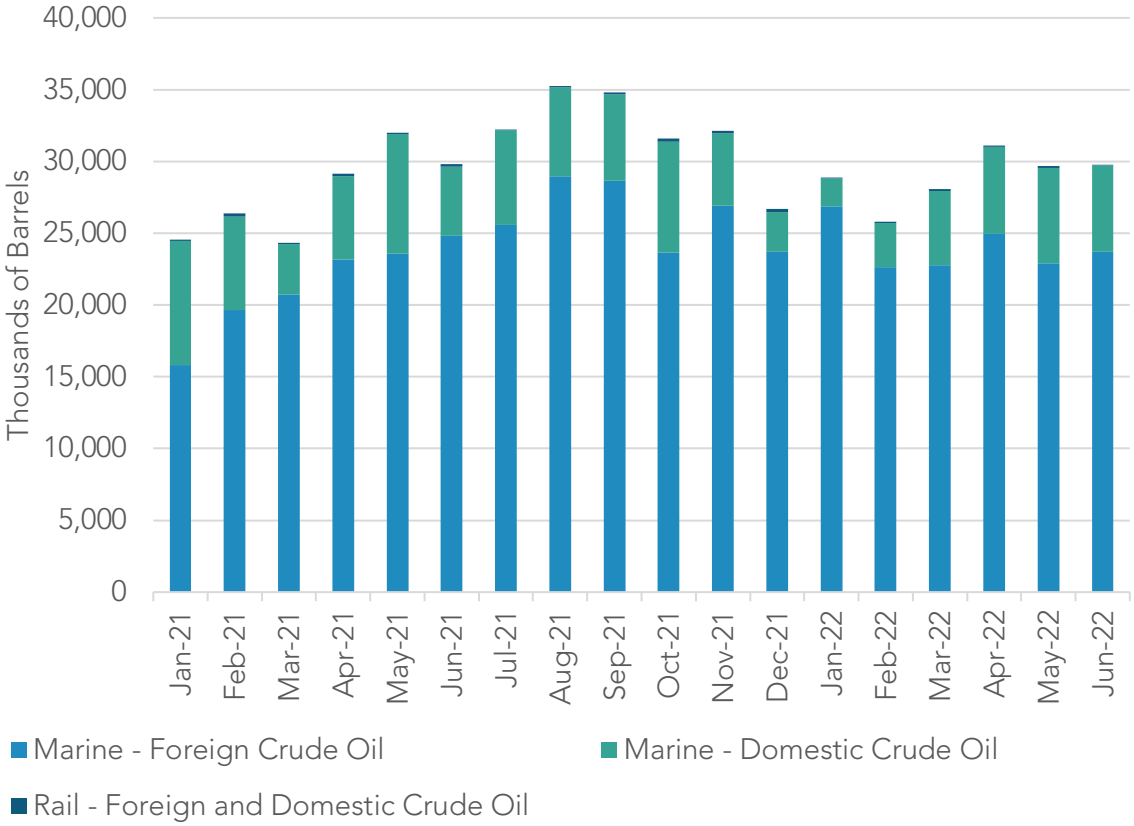
remaining imports occur by rail.[181] There are no pipelines that bring crude oil into California from out of state.[182]

Figure 2-8: Crude oil imports by transportation type[183]



Crude oil delivered by marine tankers is delivered to onshore storage tanks and subsequently to refineries via pipeline. Most crude oil produced in California is delivered to California refineries by pipeline. Using historical trends, any increases in imported crude above historic levels would result in increased deliveries through the marine ports. This increased activity could require more infrastructure to store and move larger volumes of crude to the refineries in state.

[183] CEC. June 2021. Crude Oil Imports. https://www.energy.ca.gov/data-reports/energy-almanac/californias-petroleum-market/crude-oil-imports-source.

California refineries import a variety of crude oils to meet refinery needs. California petroleum refineries are generally designed to process relatively heavy crude relative to other U.S. refineries. In 2018, crude inputs to California refineries had an average American Petroleum Institute (API) gravity of 26.18 and an average sulfur content of 1.64 percent. Processing significantly lighter or heavier crude blends would require significant changes to a refinery.[184] Most crude imported from Alaska and the Middle East is relatively light (API gravity > 30) compared to California crude (API gravity < 20).[185] If California crude production is insufficient to meet the demand at California refineries, then California refineries will need access to a similarly heavy source of crude so that the average API gravity of crude remains within their established operating window. South American crude oil imports into California are the heaviest relative to other regions, and therefore they may be the most likely to replace decreased California crude oil supply.[186]

In summary, the modeling indicates that demand for petroleum will persist due to legacy fleets that will not be replaced until end of life. The modeling also shows what the GHG emissions reductions would be if oil and gas extraction activities were phased down in line with the reduction of in-state petroleum demand. Trend data shows that oil and gas extraction already has been on the decline and will continue to decline. It is possible to anticipate the likely regions and types of crude that would be imported to meet in-state petroleum demand if in-state extraction was fully phased out by 2045. Importantly, activity at the ports would increase, and new infrastructure would be needed to store and deliver crude to in-state refineries. And while GHG emissions from this sector would go to zero in our AB 32 GHG Inventory with a full phaseout, emissions related to the production and transport of crude to California might increase elsewhere, resulting in emissions leakage.

As the state continues to reduce demand for petroleum, efforts to protect public health for communities located near oil and gas extraction sites must also continue. In October 2021, Governor Newsom directed action to prevent new oil drilling near communities and

[184] CEC. 2020. *Petroleum Watch: What Types of Crude?* February. https://www.energy.ca.gov/sites/default/files/2020-02/2020-02_Petroleum_Watch_ADA_0.pdf.

expand health protections.[187,188] In 2022, the Legislature passed, and the governor signed, SB 1137 to protect communities from existing and any new oil and gas extraction activities through 3,200 foot setbacks.

Petroleum Refining

In the Scoping Plan Scenario CARB modeled a phasedown of refining activity in line with petroleum demand. Meeting petroleum demand means sufficient availability of finished fuel (gasoline, diesel, and jet fuel). Crude is processed at in-state refineries to produce finished fuel. In response to stakeholder requests,[189] this evaluation focuses on the Scoping Plan Scenario, but with an evaluation of a complete phasedown of refinery operations in state.

The Scoping Plan Scenario results in California petroleum refining emissions of 4.5 $MMTCO_2e$ in 2045; a reduction of approximately 85 percent relative to 2022 levels, which is in line with the decline in in-state finished fuel demand.[190] Emissions from refining can be reduced further through the application of CCS technology, as shown in Figure 2-9. If in-state refining is phased down to zero and the demand for the finished fuels produced by that refining persists, imported finished fuels may be needed to meet the remaining in-state demand.[191] The current data shows unmet demand for liquid petroleum transportation fuels would most likely be met by marine imports. A CEC report notes, "The only way for California to receive large amounts of crude and refined products is by marine."[192]

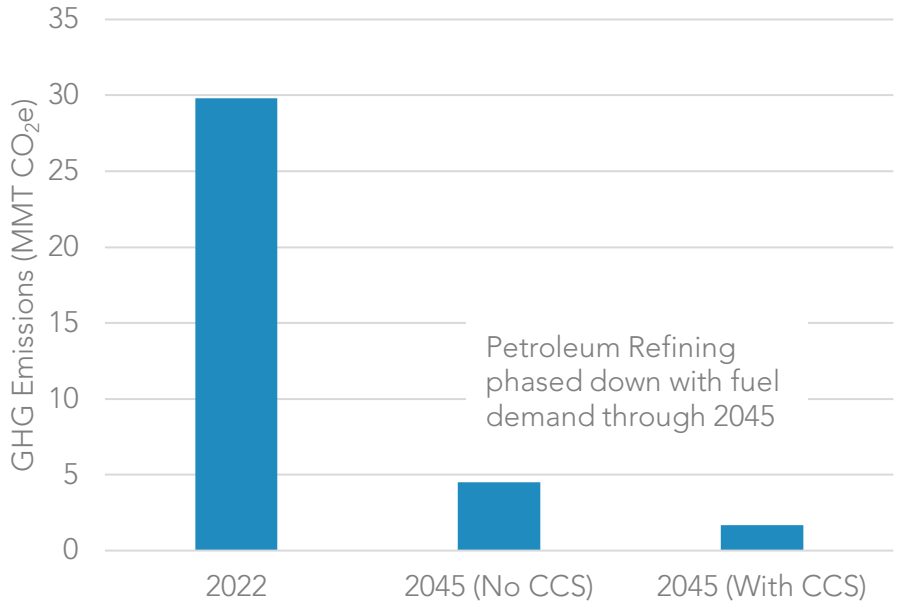
[190] This reduction in demand does not assume any need for ongoing operations to support exports to neighboring states.

[191] If demand assumes an ongoing need to support exports to neighboring states, the residual demand would require a five-fold increase in finished fuel imports.

[192] CEC. 2020. *Petroleum Watch: How Petroleum Products Move.* March. *https://www.energy.ca.gov/sites/default/files/2020-03/March_2020_Petroleum_Watch.pdf*.

There are currently no pipelines capable of bringing refined products to the state, and rail imports of refined products have historically made up less than 1 percent of all imports.[193] Significant increases in marine imports would likely require significant reconfiguring, retrofitting, or replacement of crude pipelines and storage tanks at current marine terminals, and possible reconfiguring of existing finished fuel infrastructure to account for changes in volumes and locations of supply points.

Figure 2-9: Petroleum refining sector GHG emissions in 2022 and 2045 (with and without CCS) when activity is phased down with fuel demand



If California's finished fuel demand is not met by continued refining activity in California, the state would need to import finished fuels to meet the ongoing demand. This would likely result in a two- to five-fold increase in the number of finished fuel ship deliveries to marine terminals. Marine tankers delivering refined products are often much smaller than crude oil tankers, so changes in fuel use and emissions cannot be easily estimated from the change in both the type and the number of ship deliveries.[194]

[193] CEC. 2020. *Petroleum Watch: How Petroleum Products Move.* March. https://www.energy.ca.gov/sites/default/files/2020-03/March_2020_Petroleum_Watch.pdf.
[194] Personal communication with CEC staff, March 2022; U.S EIA. 2017. *World Oil Transit Chokepoints*. 3. https://www.eia.gov/beta/international/regions-topics.php?RegionTopicID=WOTC.

If refining ceased in California, the rail and marine deliveries currently needed to support both refining processes and the export of waste products, such as petroleum coke, would cease.

In summary, the modeling indicates that demand for petroleum will persist through 2045. The modeling also shows what the GHG emissions reductions would be if refining activities were phased down in line with the reduction in in-state petroleum demand. CCS can further reduce emissions for this sector. Importantly, activity at the ports would increase, and new infrastructure would be needed to store and deliver finished fuel across the state, if in-state refining were fully phased down by 2045. And while GHG emissions from this sector would go to zero in our AB 32 GHG Inventory with a full phaseout, emissions related to the refining and transport of finished fuel to California might increase elsewhere, resulting in emissions leakage.

Progress Toward Achieving the Accelerated 2030 Target

The 2017 Scoping Plan laid out a path to achieving the SB 32 target of at least a 40 percent reduction of GHG emissions below 1990 levels by 2030 that focused on reducing emissions in the state and was technologically feasible and cost-effective, reflecting statutory direction. Many of the programs to achieve the 2030 target increased in stringency beginning January 1, 2021. However, the 2030 target must be increased to help achieve the deeper reductions needed to meet the state's statutory carbon neutrality target specified in AB 1279 and Executive Order B-55-18.

Starting in 2020 and extending into 2022, the COVID-19 pandemic impacts reverberated across the globe in a multitude of ways, including the devastating loss of millions of lives. The pandemic also had a significant impact on GHG emissions by virtue of its impact on global economies and lifestyle changes for Californians, with extended work and school disruptions. Thus, assessing our progress toward meeting our SB 32 target is confounded by the unprecedented nature of the pandemic. Nevertheless, an assessment of progress toward the 2030 target is critical, in particular the accelerated 2030 target called for in this Scoping Plan, since achieving the accelerated 2030 target would make the state well positioned to achieve its carbon neutrality goals and bring critical near-term air quality benefits to address historical and ongoing disparities in access to healthy air. Because there is only one year of data available for this decade, the analysis takes a prospective look using projected emissions over the remainder of this decade.

Estimating GHG emissions in 2030 requires projecting the effect of policies or measures that are currently deployed and undergoing implementation. Table 2-4 shows three distinct estimates of GHG emissions in 2030 that were created at different times and used different modeling approaches.

Table 2-4: Estimates of 2030 GHG emissions

Scenario Description	2030 GHG Emissions ($MMTCO_2e$)
2017 Scoping Plan: the projected outcome from implementing policies identified in the 2017 Scoping Plan that was approved by the CARB Board in December 2017.	320
Reference Scenario: the assessment of current trends and expected performance of policies identified in the 2017 Scoping Plan, as of February 2022, using the PATHWAYS model (E3).	305
Reference Scenario (Rhodium): the analysis of projected emissions from 2021 to 2030 from state and federal policies implemented as of July 2022, including the estimated impact of the Inflation Reduction Act and Advanced Clean Cars II using RHG-NEMS and other Rhodium Taking Stock 2022 methods (https://rhg.com/wp-content/uploads/2022/07/Taking-Stock-2022_US-Emissions-Outlook.pdf).	324

These three estimates of 2030 GHG emissions differ, which is expected. The estimates reflect different outcomes of the current and future impact of policies and measures. They also vary due to fundamental differences in the way these models work. For example, PATHWAYS is an economy-wide, scenario-based GHG accounting tool that tracks energy demands and supplies in line with scenario assumptions and is benchmarked to historical values. RHG-NEMS optimizes both the supply and demand sides of the energy system while factoring in consumer constraints and dynamic economic and energy systemwide feedback. Importantly, while these point estimates give the appearance of certainty and accuracy, there is significant uncertainty in future emissions projections that is documented thoroughly in each of the three emissions scenarios described above. No model can predict the future given unforeseen factors such as notable economic swings and implementation delays for programs. However, the range of emissions estimates provides a useful indication of possible outcomes from successful implementation of policies and measures.

An important source of uncertainty is the impact of delayed implementation of policy measures and market actions. The successful rate of deployment of clean technology and fuels—including consumer adoption patterns, economic recovery from the pandemic, and the permitting and build-out of necessary new assets and reuse of existing assets to produce and deliver clean energy—is essential to reach GHG emission reduction targets. Any delays will only increase GHG emissions in 2030.

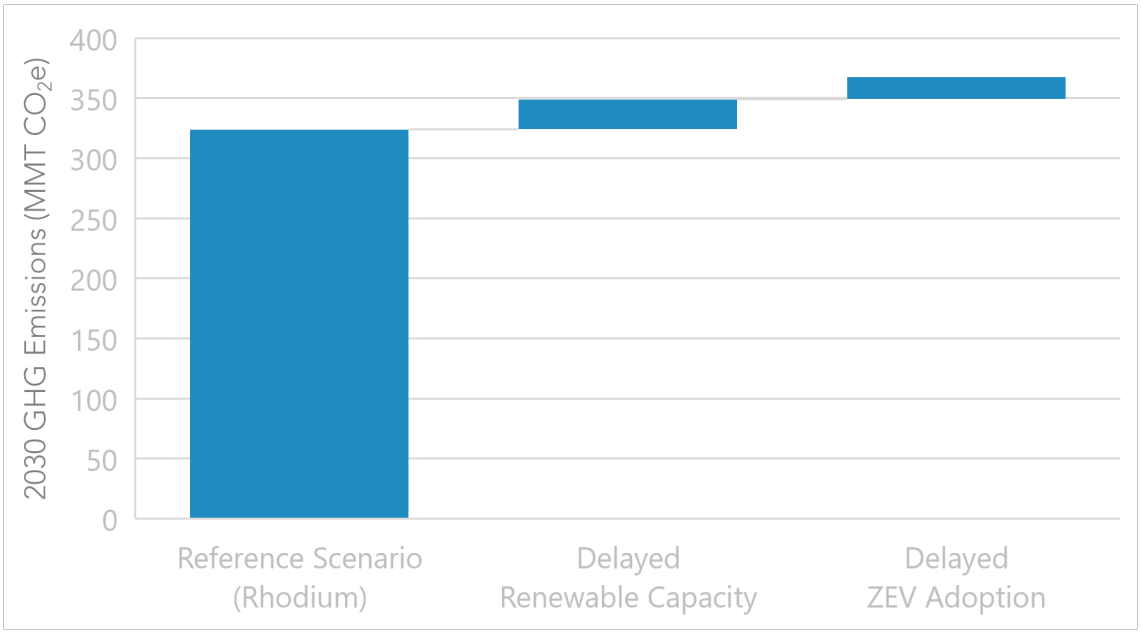
It is important to note that incentives, carbon pricing, and regulations all can result in similar types of responses including, but not limited to:

- Build-out of clean energy and infrastructure
- Deployment of clean technology
- Reduced demand for fossil energy
- Efficiency improvements

As such, the uncertainty analysis discussion focuses on implementation (technology and infrastructure deployment), and not any specific programs or policies. It is successful implementation that must ultimately happen for emissions reductions to be realized.

The uncertainty analysis described in Appendix J (Uncertainty Analysis) quantifies the impact of delayed permitting and building of renewable generation and transmission in the power sector and delayed adoption of ZEVs across all vehicle fleets in the transportation sector. The Reference Scenario (Rhodium) estimates emissions in 2030 to be 324 MMTCO2e. A five-year delay in renewable capacity would increase emissions by 8 percent in 2030 (25 MMTCO2e) relative to the Reference Scenario. If similar delays in clean energy production and deployment occur in other sectors, a larger increase in emissions relative to the reference scenario would be expected, jeopardizing the state's ability to achieve the 2030 target. Similarly, a delay in consumer adoption of zero emission vehicles (LDV, MDV, HDV) would increase emissions by 6 percent in 2030 (19 MMTCO2e) relative to the Reference Scenario. Delays in transitioning to electric equipment and appliances in homes and businesses would also lead to increased emissions in 2030. Figure 2-10 illustrates the impact on projected emissions in 2030 associated with delayed renewable capacity and delayed transportation vehicle electrification.

Figure 2-10: Impact of delayed implementation on 2030 GHG emissions[195]



Appendix J (Uncertainty Analysis) includes additional details on the assumptions and model used for the uncertainty analysis and the risks to achieve the emissions reductions from 2022 to 2030 that are anticipated in the Scoping Plan Reference Scenario. While the analysis focuses on renewable capacity and transportation, the analysis identifies a common set of themes that can impact emissions reductions across economic sectors, including permitting, technology availability, and consumer adoption. The impact of delayed emissions reductions will vary by sector and by the specific policy at risk of delay.

We give these quantitative examples of the impact implementation delays can have on GHG reductions, but almost every economic sector will have the need for permitting to enable at least a 40 percent reduction below 1990 levels. If we consider the increased ambition of the Scoping Plan Scenario, which identifies an accelerated 2030 target, the same types of uncertainty manifest themselves in successful implementation of the Scoping Plan Scenario, with the added need for CCS and CDR and a need to grow other energy sectors such as hydrogen.

[195] The implementation delay scenarios were modeled separately and do not necessarily reflect the combined impact of delayed renewable capacity and transportation vehicle electrification.

Cap-and-Trade Program Update

Since the adoption of the first Scoping Plan in 2008, carbon pricing in the form of a Cap-and-Trade Program has been part of the portfolio to achieve the state's GHG reduction targets, and it will remain critical as we work toward carbon neutrality. This section provides an update on the program and its role in achieving the 2030 target.

The Cap-and-Trade Program first came into effect in 2012, under AB 32, and included declining allowance caps through 2020. In 2017, AB 398[196] was passed by a supermajority in the Legislature and included prescriptive direction on the design of the program from 2021 through 2030. The AB 398 Cap-and-Trade Program came into effect on January 1, 2021, and it included the following changes:

- Doubling of stringency with an annual cap decline of 4 percent per year from 2021–2030
- AB 398 price ceiling
- AB 398 redesigned allowance price containment reserve with two tiers
- AB 398 100 percent leakage assistance factor for industry
- AB 398 lower offset limits: Usage limit cut from 8 percent to 4 percent, and half of offsets must provide direct benefits to California

The reduction in the role of offsets in the program was in recognition of ongoing concerns raised by environmental justice advocates regarding the ability of companies to use offsets for compliance instead of investing in actions on site to reduce GHG emissions that could also potentially reduce criteria or toxic emissions.[197,198] Note that data show the relationship between facility emissions of GHGs and co-pollutants is highly variable by sector and pollutant.[199] Changes to the allowance price containment reserve and the addition of the price ceiling were included to ensure protections against price spikes in the program, while the changes to the leakage assistance factors were to ensure the maximum protection against leakage in the program. The original design of the program included an auction floor price that increases by 5 percent plus inflation each year, and

[197] OEHHA. 2022. *Impacts of Greenhouse Gas Emission Limits Within Disadvantaged Communities*. https://oehha.ca.gov/media/downloads/environmental-justice/impactsofghgpoliciesreport020322.pdf.

[198] The OEHHA report also found that companies that use the most offsets often own the facilities that contribute to local $PM_{2.5}$ exposure. However, there was no causal relationship found to indicate that implementation of the Cap-and-Trade Program was contributing to increases in local air pollution. Also see: CARB. FAQ Cap-and-Trade Program. https://ww2.arb.ca.gov/resources/documents/faq-cap-and-trade-program.

[199] OEHHA. 2022. *Impacts of Greenhouse Gas Emission Limits Within Disadvantaged Communities*. https://oehha.ca.gov/media/downloads/environmental-justice/impactsofghgpoliciesreport020322.pdf.

that escalation factor is retained in the post-2020 program and is also applied to the allowance price containment reserve and price ceiling. These features, combined with the self-ratcheting mechanism for unsold allowances at auctions,[200] help to ensure the program is able to handle periods of high and low demand for allowances while continuing to ensure a steadily increasing price signal for regulated entities to invest in GHG reduction technologies.

As a result of achieving the 2020 target several years earlier than mandated by law, there are unused allowances in circulation. CARB estimated the amount to be approximately 310 million allowances after the conclusion of the third compliance period (2018–2020).[201] AB 398 had also called for a similar analysis, which was completed in 2018.[202] This bank represents approximately 5 percent of the total number of vintage 2013–2030 allowances issued within the joint market. This bank of allowances can only remain banked if year-over-year the covered emissions are declining by 14 MMT. If the annual decline in actual emissions is less than 14 MMT, regulated entities will need to use the banked allowances to cover their compliance obligations. It is likely that the existing bank of 310 million allowances will be needed over the early part of this decade and will be exhausted by the end of the decade. During the same period, prices for allowances will continue to increase at least 5 percent plus inflation year-over-year, sending a steadily increasing price signal to spur investment in onsite reductions for covered entities.

With the passage of AB 1279, the state has a statutory target to achieve carbon neutrality no later than 2045. This Scoping Plan demonstrates that planning on a longer time frame for the new carbon neutrality target means we must accelerate our near-term ambition for 2030 in order to be on track to achieve our longer-term target. CARB will use the modeling for this Scoping Plan to assess what changes may be warranted to the Cap-and-Trade or other programs to ensure we are on track to achieve an accelerated 2030 target. Since the original adoption of the Cap-and-Trade regulation, the program has been amended eight times through a robust public process. Moreover, then-California Environmental Protection Agency Secretary Jared Blumenfeld testified at a Senate hearing in 2022 that CARB will report back to the Legislature by the end of 2023 on the status of the allowance supply with any suggestions on legislative changes to ensure the number of allowances

---

[200] The self-ratcheting mechanism temporarily removes unsold allowances from the market until either sufficient demand manifests for two consecutive auctions and they are incrementally reintroduced at future auctions, or they are permanently removed from general circulation if demand remains low.
[201] CARB. 2022. BR 18-51 Cap-and-Trade Allowance Report. Attachment A. *https://ww2.arb.ca.gov/sites/default/files/cap-and-trade/Allowance%20Report_Reso18_51.pdf*.
[202] CARB. 2018. Staff Report: Initial Statement of Reasons: Proposed Amendments to the Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation. September 4. *https://www.arb.ca.gov/regact/2018/capandtrade18/ct18398.pdf?_ga=2.134288305.1735610122.1664813952-1100516233.1657841496*.

is appropriate to help the state achieve its 2030 target of at least 40% below 1990 levels. As part of that status update, CARB will also provide information on any potential program changes that may be needed to allowance supply to help achieve an accelerated target for 2030 identified in this Scoping Plan as necessary to achieve carbon neutrality no later than 2045. Engaging in this process in 2023 will allow for the consideration of this Scoping Plan, inclusion of additional data points for the second year of operation of the AB 398-designed program (which only came into force in January 2021), and an opportunity to hold public workshops.

It is also worth noting that the COVID-19 pandemic had significant impacts on economic activity in California and elsewhere.[203] Emissions were significantly lower in 2020 due to the impacts of the global pandemic. There is an expectation that emissions will increase as the economy recovers and behaviors continue to shift from the impacts of the ongoing pandemic. As a result, 2020 should be regarded as an outlier in the emissions trends. This scenario of increasing emissions is similar to what happened in the first compliance period for Cap-and-Trade, where the state economy was recovering from the Great Recession and does not correlate to a problem with the structure of this program or other programs that cover emissions related to the manufacturing or transportation sectors. In any assessment of this and other programs, it is essential to consider external factors such as economic activity and availability of zero carbon energy such as hydropower, among others.

To better understand the role of the Cap-and-Trade Program in achieving the 2030 target, Table 2-5 compares the 2030 GHG emissions estimates from the three reference scenarios described in Table 2-4. The 2017 Scoping Plan projection is from the PATHWAYS model for the Scoping Plan Scenario approved by the Board in late 2017. It excludes the contribution of the Cap-and-Trade Program, without any consideration of uncertainty factors (i.e., a characterization of the uncertainty that a given GHG reduction measure included in the 2017 Scoping Plan will actually achieve the GHG reductions it is projected to deliver). The Reference Scenario represents what GHG emissions would look like if we did nothing beyond the existing policies that are required and already in place to achieve the 2030 target; this scenario is based on the recent PATHWAYS modeling, excluding the contribution of the Cap-and-Trade Program, and without any consideration of uncertainty factors. It indicates that GHG emissions will be lower over this decade than originally projected when the 2017 Scoping Plan was approved. The

[203] CARB. November 4, 2021. Mandatory Greenhouse Gas Reporting - 2020 Emissions Year Frequently Asked Questions. *https://www.arb.ca.gov/cc/reporting/ghg-rep/reported-data/2020mrrfaqs.pdf?_ga=2.264251343.1760432228.1650736660-1644197524.1577749754*.

Reference Scenario (Rhodium) which also does not include uncertainty bounds, is the modeling used for the uncertainty analysis above.

Importantly, PATHWAYS is not able to explicitly model a carbon pricing policy, and therefore the Cap-and-Trade Program is not represented in the 2017 Scoping Plan or the Reference Scenario. Carbon pricing is included in RHG-NEMS, which reflects state and federal policies included in the U.S. Energy Information Administration (EIA) Annual Energy Outlook 2022 and the National Energy Systems Model (NEMS), which is the basis for RHG-NEMS.[204]

As detailed in EIA's documentation, California's Cap-and-Trade Program is represented through increased energy prices, which flow across economic sectors.[205] However, many of the emissions covered by the California Cap-and-Trade Program are not energy- and fuel-related emissions. Given that, the energy systems model RHG-NEMS was used to model the impact of California Cap-and-Trade on the energy system. However, RHG-NEMS does not explicitly model the entire program, which includes non-energy related emissions from the industrial, agricultural, waste, and transportation sectors.

Table 2-5: Comparison of 2017 Scoping Plan and two Reference Scenarios

	2030 GHG Emissions ($MMTCO_2e$) (2017 Scoping Plan)	2030 GHG Emissions ($MMTCO_2e$) (Reference Scenario)	2030 GHG Emissions ($MMTCO_2e$) (Reference Scenario-Rhodium)
Reference Scenarios	320	305	324
Gap to Accelerated 2030 Target under the Scoping Plan Scenario (226)[206]	94	79	98

Under the Scoping Plan Scenario, in 2030 California emissions are anticipated to be 48% below 1990 levels. This represents an acceleration of the current SB 32 target of a 40% reduction below 1990 levels. Table 2-5 includes the gap between the different reference scenarios and the accelerated 2030 target achieved under the Scoping Plan Scenario. It also shows that depending on the modeling, there are a range of potential emissions levels in 2030 prior to accounting for the full impact of the Cap-and-Trade Program on emissions. That range is from 305 to 324 $MMTCO_2e$ in 2030. That represents a 19 $MMTCO_2e$ spread, or about 8.4 percent of the accelerated 2030 target of 226 $MMTCO_2e$. Importantly, none of these scenarios includes all of the actions identified in the Scoping Plan Scenario for this Scoping Plan; many of those actions, such as SB 596, CCS, and a more stringent LCFS program, will only begin to happen in this decade, and their contributions toward meeting the accelerated 2030 target are therefore not included in the reference scenarios. The actual emissions for the remainder of this decade will therefore likely be lower than in each of the scenarios in Table 2-5 once policies and regulations are in place to support an accelerated 2030 target. However, the degree of this difference between actual and projected emissions will differ across the modeled reference scenarios.

[206] Table 3 from the 2017 Scoping Plan included a range of 34 to 79 $MMTCO_2e$ for reductions needed from the Cap-and-Trade Program to achieve a 2030 target of 40 percent below 1990 levels.

Regardless of the uncertainty and differences in the models, it is clear additional GHG reductions must happen over this decade to achieve an accelerated 2030 target. This will require an evaluation of all major programs to assess the need to increase their stringency between now and 2030. As the actual reductions from non-Cap-and-Trade Program measures increase, California will be less reliant on the Cap-and-Trade Program to "fill the gap" to meet an accelerated 2030 reduction target. For example, CARB is developing a proposal to increase the stringency of the LCFS program for 2030, the recently adopted Advanced Clean Cars II regulation is more stringent than modeled for the 2030 40 percent target in the 2017 Scoping Plan, and SB 596 requires specific reductions in the cement sector over this decade and beyond. However, we also know we are not on track to achieve the VMT reduction called for in the 2017 Scoping Plan and will need to double down to achieve the even more ambitious target called for in the Scoping Plan Scenario. Also, we will need additional actions over the coming years to reduce short-lived climate pollutants to meet the emission reductions called for in SB 1383.

Collectively, any additional legislation or prescriptive policies for sectors, delays in successful implementation of non-Cap-and-Trade programs and policies, increases in incentive program funding, and delays in economic recovery from the pandemic will continue to affect the role the Cap-and-Trade Program will need to play over this decade to meet the state's GHG reduction obligations. In summary, the Cap-and-Trade Program must continue to be able to scale across a range of possibilities. With passage of AB 1279 and the need to accelerate the 2030 target, CARB will initiate a public process to utilize the modeling results from this Scoping Plan, specifically the Scoping Plan Scenario, to evaluate and potentially propose changes to the design of the Program, including the annual caps. This process will ensure that the Program supports an increased ambition for 2030 while retaining the ability to scale as other factors, such as changing economic conditions and implementation of non Cap-and-Trade programs, impact the actual emissions at the sources covered by the Program. Any changes to the Program must continue to support a well-designed system that continues to send a steadily increasing price signal, minimizes for leakage, reduces emissions in the covered sectors toward the state's targets, is cost-effective and technologically feasible, and avoids energy rate spikes. Importantly, the Program should support air quality benefits, especially in overly burdened communities, and not exacerbate existing air quality disparities.

Chapter 3: Economic and Health Evaluations

This chapter provides two approaches for quantifying the economic and health outcomes of the Scoping Plan Scenario. One approach is to consider the combined impact of all measures[207] in a scenario. The other approach is required by AB 197, where each measure within a scenario is evaluated independently. In addition to these two evaluation approaches, this chapter also includes a discussion of the Public Health implications for the Scoping Plan Scenario, an overview of the Climate Vulnerability Metric, and the Environmental Analysis conducted in accord with the California Environmental Quality Act (CEQA).

It is important to note that all of the analyses in this chapter use a variety of data sources, but because the modeling is economy-wide at the state level, none of them produce community specific detail outputs. The AB 32 GHG Inventory Sector analysis relies on PATHWAYS data at the state level that is proportionally applied across all regions of the state to translate changes in state level fuel combustion to local level changes. The NWL analysis similarly utilizes a variety of data sources and a suite of models that produce data that are scaled up to the statewide level. All of the models, except the Wildland Urban Interface (WUI) defensible space model, which is conducted at the county level, create aspatial projections that are not applicable at the community level.

Economic Analysis

As part of the process to develop this Scoping Plan, alternative scenarios that transition energy needs away from fossil fuels and achieve carbon neutrality no later than 2045 were developed. Alternative scenarios that assess the impact of different land management strategies on carbon stocks in NWL were also developed. These alternatives are described in Appendix C (AB 197 Measure Analysis). The following sections describe the Scoping Plan Scenario in terms of direct cost, the economy, employment, and health outcomes.[208]

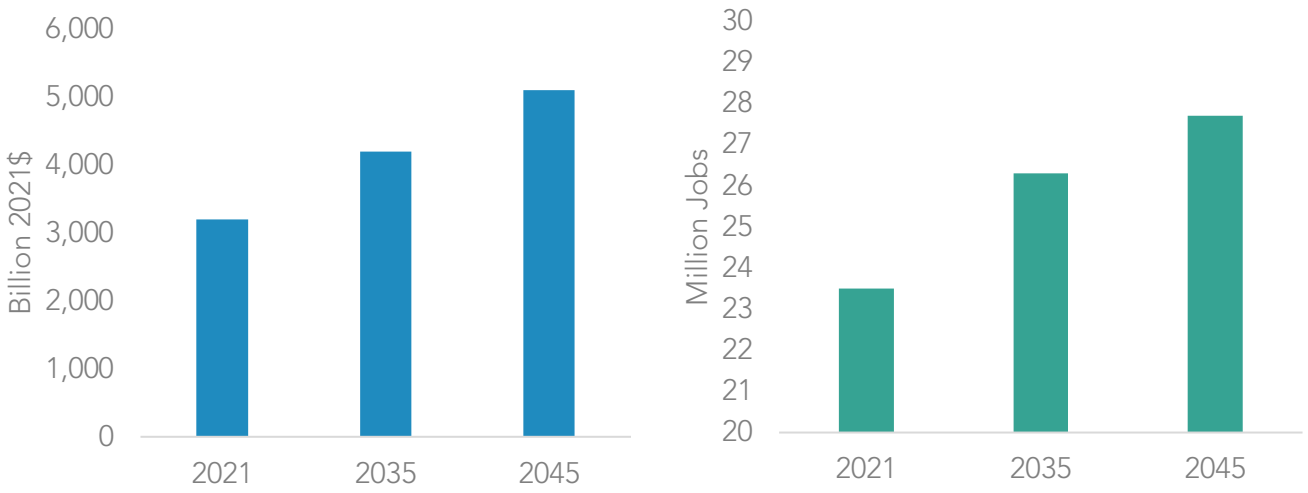
---

[207] AB 197 calls for the evaluation of "measures." This Scoping Plan treats each action and its variants on stringency as measures for the purposes of this chapter. Appendix C (AB 197 Measure Analysis) lists the measures and corresponding modeling assumptions for each alternative and the Scoping Plan Scenario. The modeling assumptions for the Scoping Plan Scenario are summarized in Table 2-1.

[208] For the Draft 2022 Scoping Plan Update, achieving carbon neutrality in 2035 and 2045 was evaluated. The AB 32 GHG Inventory sector direct cost, the economy, employment, and health outcomes were assessed in those years. Similarly, the Scoping Plan Scenario assessments that are presented in this chapter were made for years 2035 and 2045.

The California economy is growing, and it is projected to continue to grow about 2 percent each year, from $3.2 trillion in 2021 to $5.1 trillion in 2045, as shown in Figure 3-1. Similarly, employment in California is anticipated to grow 0.7 percent per year, from 23.5 million jobs in 2021 to 27.7 million jobs in 2045. It is in this context, termed the *Reference Scenario,* that CARB evaluates the Scoping Plan Scenario in terms of its impact on economic growth and employment. The projections shown in Figure 3-1 were produced by CARB to evaluate the incremental impact of regulations.

Figure 3-1: Projected California gross state product (left) and employment growth (right) from 2021 to 2035 and 2045



Source: California Air Resources Board

Transitioning away from fossil fuels to alternatives and increasing action on NWL will affect employment opportunities, household spending, businesses, and other economic aspects of our lives. Sectors expected to see growth include renewable electricity and hydrogen production, while other sectors may shrink. The deployment of clean technology may require higher upfront costs for things like heat pumps and induction stoves, but those could be offset by energy efficiency savings. Employment and economic development in NWL-related industries and sectors are expected to increase as land management actions increase, especially for the Forestry sector (in which a significant increase is called for under the Scoping Plan Scenario). The net impact of these actions on employment and jobs is presented in this chapter.

Estimated Direct Costs

One key metric is the direct cost, or net investment, reflecting any savings that result from actions. Similar approaches were used to estimate direct costs for the AB 32 GHG Inventory sectors and for the NWL, as described in this section.

AB 32 GHG Inventory Sectors

Transitioning away from fossil fuels requires investment in new equipment and infrastructure throughout the economy. It involves developing the capacity to produce fuels and electricity from renewable sources rather than producing fossil energy. This transition also takes time. One approach is to eliminate combustion of fossil fuels by replacing all equipment in a specified year. Another approach is to establish a future point at which all sales of new equipment rely on alternative energy sources and allow the transition to occur over time as equipment is replaced upon its end of life.

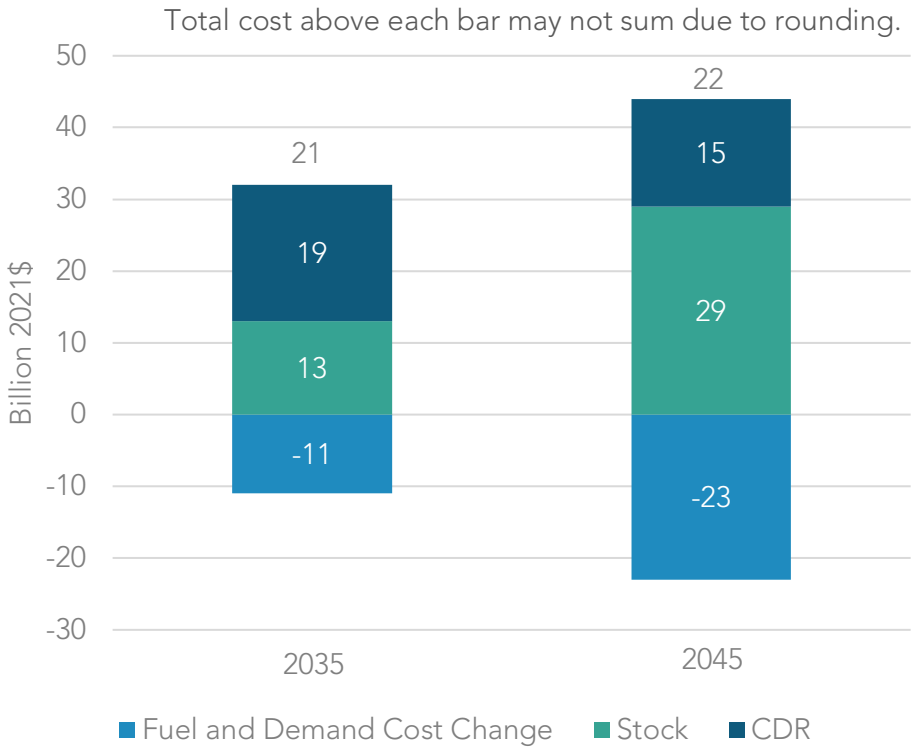
To evaluate the investment required through 2045, the PATHWAYS model was used to represent equipment stock and its turnover to non-fossil fuel alternatives over time. The annualized, incremental cost of infrastructure in excess of the annualized cost of the Reference Scenario[209] was computed for each year from 2022 through 2045. These costs were computed by first taking the absolute cost in each year—which includes both new equipment investment and also expenditures on energy, operations, and maintenance in each year—and then levelizing the costs (in the same way car or house payments are annualized or spread out over time) to arrive at an annualized cost. Fuel savings, and resulting cost savings, associated with changing energy demand—from gasoline to electricity for vehicles, for example—are included as a result of this methodology. Carbon dioxide removal includes DAC technology powered primarily by off-grid solar, BECCS to produce hydrogen or other fuels, and NWL sequestration, as discussed in Chapter 2.[210]

Figure 3-2 shows the stock investment cost, fuel/efficiency savings, and CDR cost. The Scoping Plan Scenario allows end-of-life transition of equipment. The cost of investing in new equipment is partially offset by savings associated with efficiency gains and reduced demand for fuels like gasoline. This is particularly relevant in the transportation sector, which leads to the majority of savings in 2045 in the Scoping Plan Scenario, which models near complete electrification of transport relying only on end-of-life replacement of vehicles. Appendix H (AB 32 GHG Inventory Sector Modeling) includes additional detail on direct costs in each sector and how costs change over time.

[209] The Reference Scenario described in Chapter 2 and in Appendix H (AB 32 GHG Inventory Sector Modeling) was the basis for the direct cost comparison.

[210] The energy source for DAC is not modeled, but renewable electricity and/or hydrogen produced from electrolysis are zero-carbon options consistent with the carbon neutrality targets in this Scoping Plan. The economic analysis associated the investment in DAC with the solar industry for consistency with the carbon neutrality targets.

Figure 3-2: Cost and savings relative to the growing California economy for the Scoping Plan Scenario in 2035 and 2045 (AB 32 GHG Inventory sectors)



Natural and Working Lands

For NWL, the direct costs of each management strategy were estimated using available academic literature, monitoring and reporting data, survey data, and cost data from existing subsidy programs on the per acre cost of implementing the management strategy. These cost data, in combination with the acreage of each management strategy under the scenarios, provided estimates of the overall direct cost to either the government or the private sector. The direct costs are independent of the policy lever used to implement the action and do not include many important benefits and externalities of the actions. They are assumed to be constant for each scenario and into the future. Avoided or secondary costs, such as those from reductions in wildfire suppression expenses, are not included. Appendix I (NWL Technical Support Document) includes additional direct cost details.

Table 3-1 includes the direct cost estimates for the Scoping Plan Scenario compared to the Reference Scenario.[211] Direct costs for the NWL sector are expected to be significant due to the ambitious level of action for each land type.

Table 3-1: Cost and savings relative to a growing California economy for the Scoping Plan Scenario (NWL)

Measure	Scoping Plan Scenario: Average Direct Annual Cost, 2025–2045 (millions $/year)
Forests / Shrublands / Grasslands	1,780
Annual Croplands	284
Perennial Croplands	4
Urban Forest	4,230
Wildland Urban Interface (WUI)	114
Wetlands	28
Sparsely Vegetated Lands	4
Totals	6,460
Note: Table values may not add to total due to rounding.	

CARB estimates that all jurisdictions, including private landowners, currently spend approximately $4 billion dollars annually on planting, maintenance, sidewalk repair, tree removal, and other expenses related to urban forests, and that reaching the theoretical maximum tree cover would require increasing that spending by a factor of 20. The cost of the Scoping Plan Scenario is predominantly a mix of urban forests and forests, shrubland, and grasslands spending.

[211] The Reference Scenario described in Chapter 2 and in Appendix I (NWL Technical Support Document) was the basis for the direct cost comparison.

Economy and Employment

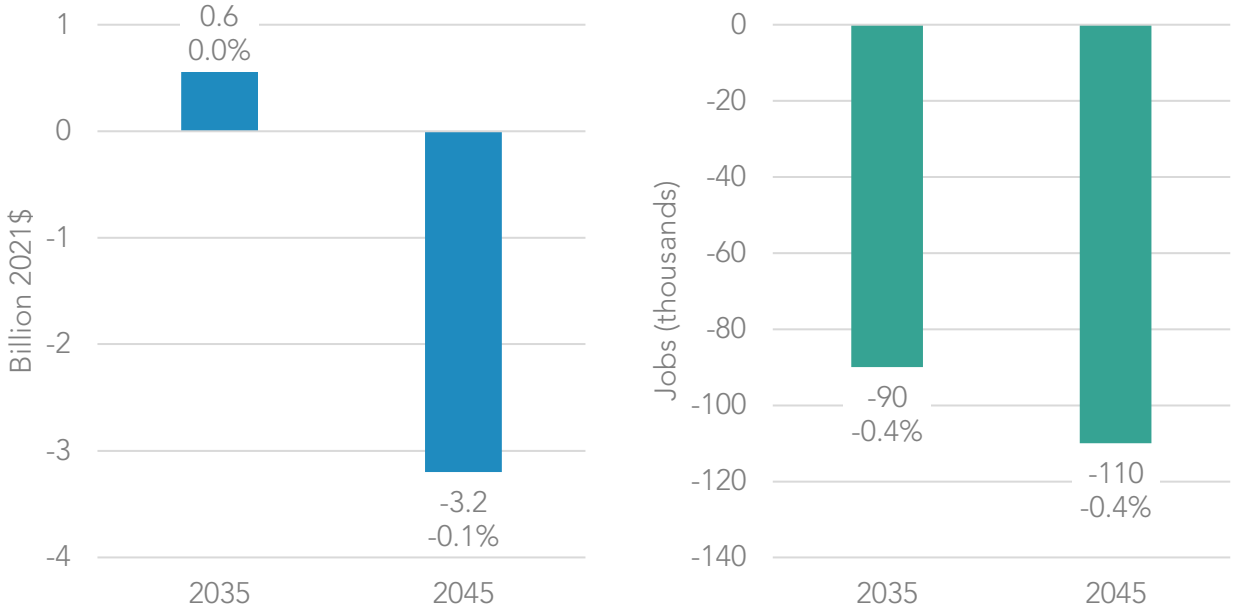
Two different models were used to estimate the overall impact that investing in a transition away from fossil fuels and in our NWL may have on the growing California economy. The transition away from fossil fuels was evaluated using the IMPLAN economic analysis model. The NWL investments were evaluated using the REMI PI+ economic model. These models provide similar outputs relative to the same economic and employment forecasts used to develop a Reference Scenario for use in each model.

AB 32 GHG Inventory Sectors

To estimate the overall impact that investing in a transition away from fossil fuels may have on the California economy, CARB used the IMPLAN model. Additional detail regarding the model, assumptions, and methodology are included in Appendix H (AB 32 GHG Inventory Sector Modeling). The IMPLAN model is a multisector representation of private industries in the U.S. economy that maps economic relationships across industries, households, and governments. This model translates direct costs and savings associated with transitioning away from fossil fuels with indirect effects such as wages, purchases of goods and services, business tax impacts, and supply chain effects. In addition, the induced effects of household purchases, local and import purchases, wages paid, and household tax impacts are estimated. This comprehensive assessment of the interactions between capital investment in fossil fuel alternatives and household purchases provides an indication of the response of the California economy to the Scoping Plan Scenario.

The Scoping Plan Scenario results in a small impact on the Gross State Product (GSP) and employment relative to the Reference Scenario, as shown in Figure 3-3. Economic growth is largely unaffected by the Scoping Plan Scenario in 2035 and slowed by 0.1 percent in 2045. Employment growth is also slowed a small amount, 0.4 percent in 2035 and in 2045, and employment still grows. Assuming annual growth rates of 0.7 percent means there would be more than 193,000 additional jobs in 2045.

Figure 3-3: Gross state product (left) and employment (right) relative to a growing California economy for the Scoping Plan Scenario in 2035 and 2045 (AB 32 GHG Inventory sectors)



California households will see increased costs from the purchase of new capital stock and savings from reduced spending on fuel, as shown in Figure 3-2. Households also will face increased costs associated with CDR, costs associated with energy efficiency measures, and commercial stock purchases—all of which are assumed to be passed directly to consumers. The impact to California households, however, is not limited to these direct costs, as changes in relative prices, employment, and wages can affect household well-being. Personal income, which captures the direct, indirect, and induced impacts, is a metric commonly used to evaluate the impact of policies on households.

Personal income in California is projected to grow from $2.7 trillion in 2021 to $3.6 trillion in 2035 and $4.4 trillion in 2045. Household projections are based on California Department of Finance population projections, which estimate the state's population to grow an average of 0.3 percent each year from 2021 to 2045.[212] California households are projected to increase from 13.3 million in 2020 to 14.6 million in 2035 and 15.0 million in 2045.

[212] California Department of Finance. Population Projections (Baseline 2019). https://dof.ca.gov/forecasting/demographics/projections/.

While the transition away from combustion of fossil fuels will improve air quality for all Californians (and even, more so in overly burdened communities), the economic impacts of the Scoping Plan Scenario are unlikely to be equal among Californians. Table 3-2 presents the change in income by household income group relative to the Reference Scenario in 2035 and 2045. While in 2035 there is a net decrease in personal income of $600 million, total income for households that make less than $100,000 per year is estimated to decline by $4.1 billion dollars, and the total income for households that make more than $100,000 per year will increase by $3.5 billion under the Scoping Plan Scenario. In 2045, although there is no net change in personal income across all California households, results vary by income level. Total income for households that make less than $100,000 per year are estimated to decline by $5.3 billion dollars, while the total income for households that make more than $100,000 per year will increase by $5.3 billion under the Scoping Plan Scenario.

Table 3-2: Income Impacts by California household income group in 2035 and 2045 for the Scoping Plan Scenario (AB 32 GHG Inventory Sectors)

Household Income Group ($2021)	Percentage of 2021 California Households[213]	Change in Income (Billion $2021)	
		2035	2045
Less than $50,000	30	-2.9	-3.9
$50,000 to $100,000	27	-1.2	-1.4
$100,000 to $200,000	28	2.5	4.0
More than $200,000	15	1.0	1.3
Total	100	-0.6	0.0

[213] U.S. Census Bureau. 2021. Household Income. California. https://data.census.gov/cedsci/table?q=california%20income.

In addition to income level, there is likely to be an impact to California personal income that varies based on race/ethnicity.[214] Table 3-3 shows the percentage of households within each income group based on eight race/ethnicity categories identified in the American Community Survey 2021. As shown in Table 3-2, households in lower income groups are anticipated to see negative impacts, while households in higher income groups are anticipated to see positive impacts from the Scoping Plan Scenario in both 2035 and 2045. Because more than 60% of households in the race/ethnicity categories of Hispanic, Black alone, Native Hawaiian (HI) or Pacific Islander, American Indian or Alaskan Native, Other, and Two or More make less than $100,000 per year, these populations generally are likely to experience reduced income. White and Asian households will generally experience both increased and decreased income because these households are distributed more evenly across all four income groups.

The state recognizes the need to ensure that accessibility to clean technology and energy do not further exacerbate health and opportunity gaps for low-income households and communities of color. The Climate Change Investments program exceeds the statutory minimums to invest in projects to benefit disadvantaged communities.[215] Utilities implement programs for reduced energy bills for qualifying low-income customers.[216] There are also resources for waste and water bills that leverage federal funds.[217] CARB also coordinated with the CPUC to ensure that the Climate Credit[218] funded from the sale of Cap-and-Trade allowances provided to utilities on behalf of ratepayers is credited equally to households and not based on how much energy is used. These are just a few examples of how the state is designing and implementing programs to avoid increasing existing disparities. The state must continue to find ways to relieve economic burdens on low-income households.

[214] The number of households in each bracket and the race/ethnicity categories are from American Community Survey 2021 results. Population changes through 2035 and 2045 are not forecast. Table 3-3: Percentage of households in each race/ethnicity category by household income group

Household Income Group ($2021)	Households in Income Group (%)							
	White Not Hispanic	Hispanic	Black Alone	Asian Alone	Native HI or Pacific Islander	American Indian or Alaskan Native	Other	Two or More
Less than $50,000	26	35	45	25	30	35	37	32
$50,000 to $100,000	25	32	27	21	31	33	33	30
$100,000 to $200,000	29	25	21	30	30	26	24	27
More than $200,000	19	7	7	24	9	7	5	11

Natural and Working Lands

The macroeconomic impact of the NWL scenario was evaluated separately in the REMI PI+ model. For the Scoping Plan Scenario, the macroeconomic impact was modeled by assuming that economic activity in the relevant industries grows in proportion to the proposed implementation spending in that industry. All funds for implementing the actions were assumed to be sourced from within the state. For urban forests, the funds were modeled as being sourced from a combination of state government and private property owners in proportion to the current estimated private/public spending ratio. For all other actions, funds were assumed to be sourced from the state government. In each modeled scenario, government spending and income to property owners were reduced relative to the Reference Scenario in proportion to the annual costs of implementation. None of the proposed spending was modeled as being sourced from increased taxes. Additional details on the methodology for evaluating macroeconomic impacts are in Appendix I (NWL Technical Support Document).

While the macroeconomic model does count the increased economic activity in the affected industries as part of GSP, it does not quantify many of the important economic, health, and environmental benefits that would occur if these actions were implemented. While these benefits—like the reduced use of pesticides, value of urban trees, and increased recreational opportunities—would be very significant, they are outside the scope of the macroeconomic model.

The macroeconomic model also makes projections about the total level of employment in the state. The model forecasts that the Scoping Plan Scenario, which greatly increases the level of NWL management actions, channels economic activity toward related industries and would lead to a slight increase in total employment. (Table 3-4). While the model does aim to accurately represent many labor market dynamics, including adjustments of wages and migration rates, it does not account for many costs that might be associated with dramatically scaling up employment in a particular industry, such as the cost of job training.

Table 3-4: Gross state product and employment relative to a growing California economy for the Scoping Plan Scenario in 2035 / 2045 (NWL)

	Scoping Plan Scenario (%)
Gross State Product	0.00 / 0.01
Employment	0.12 / 0.10
Personal Income	-0.04 / -0.04
Personal Income per Capita	-0.04 / -0.14

Health Analysis

Air quality is affected by pollutant emissions from various processes associated with energy systems, including the combustion of fossil fuels, as well as the combustion of vegetation biomass from NWL during wildfires. Pollutants that are important contributors to degraded air quality in California include nitrogen oxides (NO_x), particulate matter (PM), reactive organic gases (ROG), and others. Further, in the atmosphere these pollutants are transported away from the locations of the emissions by wind and other phenomena, and undergo chemical reactions that result in the formation of new pollutants such as ground-level ozone and fine particulate matter ($PM_{2.5}$). Both primary (emitted) and secondary (formed) pollutants are important from a public health standpoint and contribute to the incidence of air pollution-related mortality and disease within California populations. Measures focused on GHGs do not incorporate specific targets to reduce emissions of $PM_{2.5}$ or air toxics like benzene. These co-pollutants, which are emitted from many of the same pollution sources as GHGs, affect local air quality and pose known risks to public health, such as the risk of asthma and cardiovascular disease. Generally, for stationary sources, certain harmful pollutants are regulated via local rules and regulations that are reflected in permits for stationary sources and are enforced by local air districts, with CARB also regulating air toxics contaminants from stationary sources with the air districts.

AB 32 GHG Inventory Sectors

To assess health impacts for the AB 32 GHG Inventory sectors, an integrated modeling approach was used to quantify and value the air pollution-related public health benefits of the Scoping Plan Scenario relative to the Reference Scenario. Additional details about the models, assumptions, and methodology are included in Appendix H (AB 32 GHG Inventory Sector Modeling). Using output from the PATHWAYS model, projections of pollutant emissions to 2045 were developed for stationary, area, and mobile source emissions using a detailed base year CARB pollutant emissions inventory. Further, the emissions are processed, including for where and when they occur in California, using the Sparse Matrix Operator Kernels Emissions (SMOKE) model. For example, on-road vehicle emissions were allocated along existing roadways, and refining emissions were assigned to the locations of existing refineries. It should be noted that the emissions projections represent statewide average reductions associated with high-level assumptions about alternative fuels and technologies. For example, emissions occurring from refineries to produce liquid fuels are reduced in line with petroleum demand. This reduction is applied equally to all refineries in the Scoping Plan Scenario and does not specify individual facility responses to changing demand. Similarly, the Scoping Plan Scenario does not specify which refineries transition to biofuel production or where new electricity generation facilities are built.

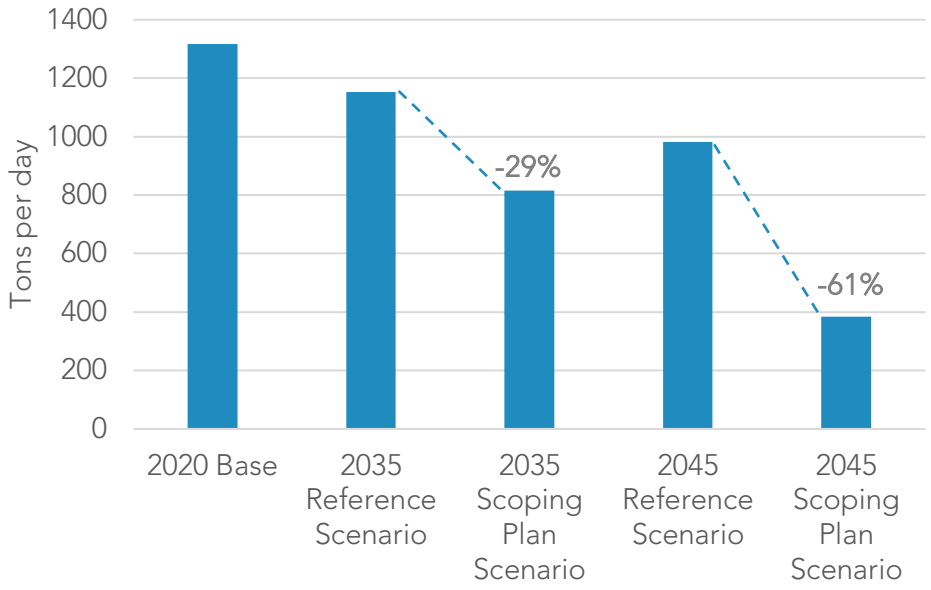
Next, emission changes were translated into impacts on atmospheric pollution levels, including ground-level ozone and $PM_{2.5}$, via an advanced photochemical air quality model called the Community Multiscale Air Quality (CMAQ) model, which accounts for atmospheric chemistry and transport. A comprehensive assessment of how pollutant concentrations are impacted throughout the year was achieved by simulating all months in 2035 and 2045 for the Scoping Plan Scenario.[219] Health benefits were estimated using the U.S. EPA's environmental Benefits Mapping and Analysis Program (BenMAP) model to translate pollutant changes into avoided incidence of mortality, hospital admissions, emergency room visits, and other outcomes as a result of reduced exposure to ozone and $PM_{2.5}$. These outcomes are associated with an economic value in order to aggregate health impacts.

The Scoping Plan Scenario shows a substantial reduction in pollutant emissions relative to the Reference Scenario, including NO_x, $PM_{2.5}$, and ROG. Reductions in NO_x are shown in Figure 3-4. Even under a business-as-usual trajectory, emissions are reduced from present levels by 26 percent in 2045 in the Reference Scenario, demonstrating the impact of current regulations and trends in energy sectors. The Scoping Plan Scenario further reduces NO_x

[219] This annual approach differs from the episodic modeling approach applied to the Proposed Scenario and Alternatives in the Draft 2022 Scoping Plan Update. Appendix H (AB 32 GHG Inventory Sector Modeling) describes both approaches.

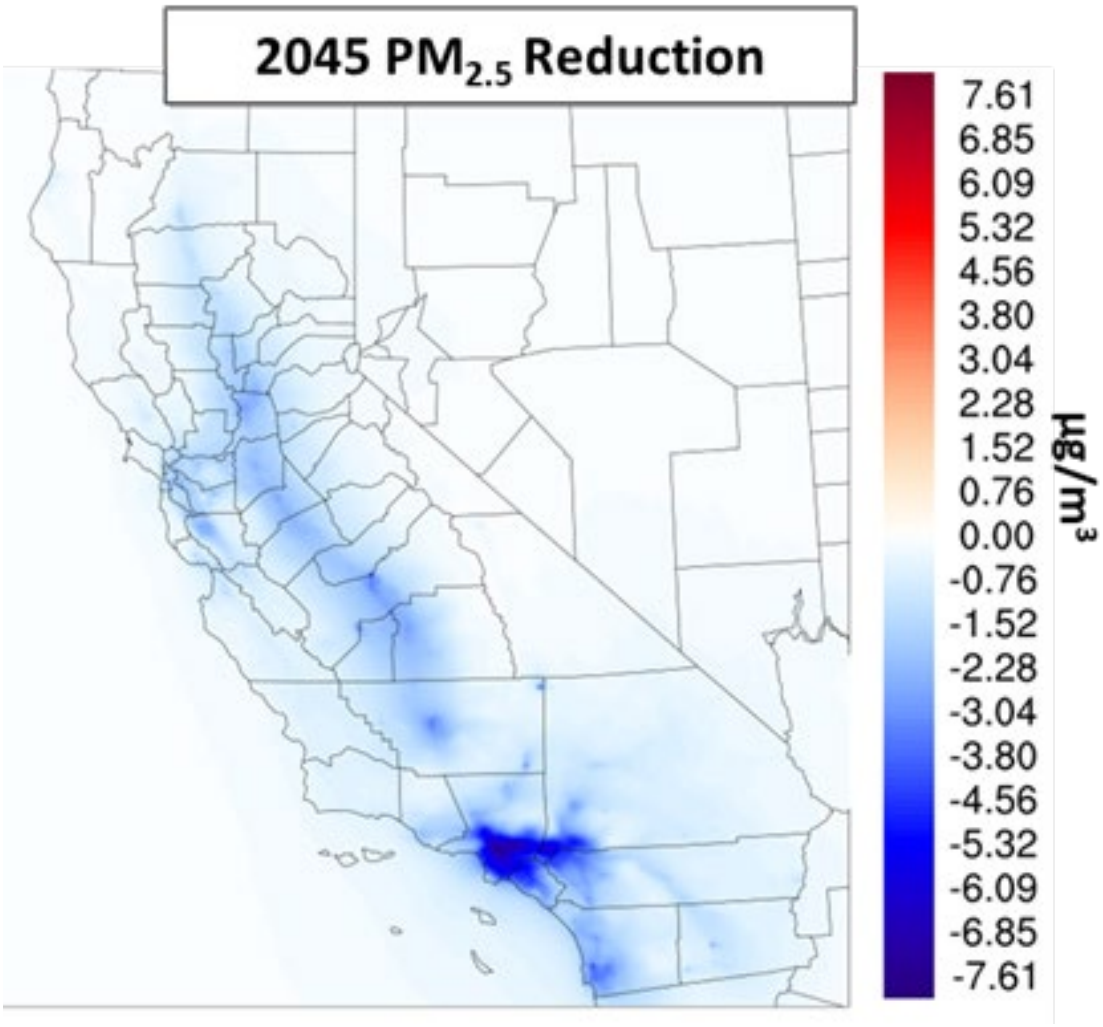
emissions from the Reference Scenario by 29% in 2035 and 61% in 2045. Emission reductions occur throughout the state with particular prominence in urban areas, including the South Coast Air Basin, due to the large presence and activity of emission sources. Appendix H (AB 32 GHG Inventory Sector Modeling) contains additional information about the pollutant emissions modeling and results.

Figure 3-4: Illustration of NOx emission reductions from current levels for the Reference Scenario and the Scoping Plan Scenario (AB 32 GHG Inventory sectors)



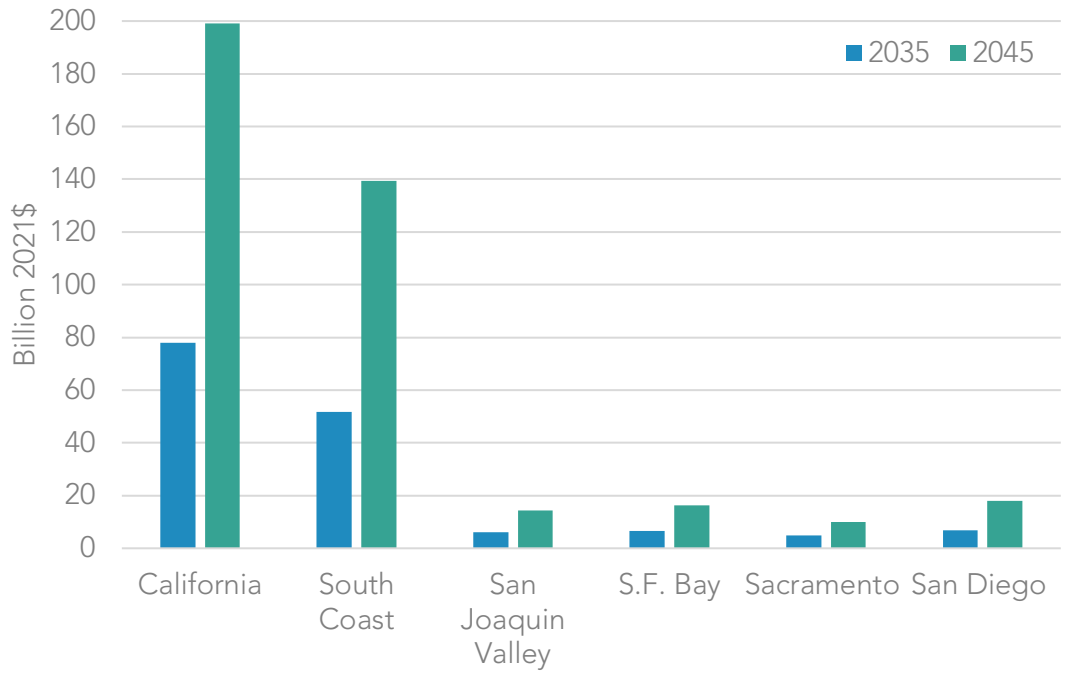
The emission reductions achieve important improvements in air quality throughout California, including reductions in the levels of ozone and $PM_{2.5}$. Reductions in annual $PM_{2.5}$ levels are shown in Figure 3-5. The greatest reductions are evident in Southern California, the San Joaquin Valley, the San Francisco Bay area, and the Greater Sacramento area due to the large presence and activity of emission sources, meteorology, topography, and others. To highlight the extent of the air quality improvements: reductions reach nearly 8 micrograms per cubic meter ($\mu g/m^3$) in 2045 and lead to 76% fewer exceedances of the health-based National Ambient Air Quality $PM_{2.5}$ standard of 12 $\mu g/m^3$. Similarly, ozone improvements reach 19 parts per billion (ppb) and yield 62% fewer exceedance events. Furthermore, the locations of improvements carry important implications for human health as these areas support large urban populations and generally experience the most degraded ozone and $PM_{2.5}$ pollution. Appendix H (AB 32 GHG Inventory Sector Modeling) provides details regarding the atmospheric modeling and results, including differences in ozone and $PM_{2.5}$.

Figure 3-5: Difference in annual average $PM_{2.5}$ (µg/m^3) in the Scoping Plan scenario relative to the Reference scenario in 2045 (AB 32 GHG Inventory sectors)



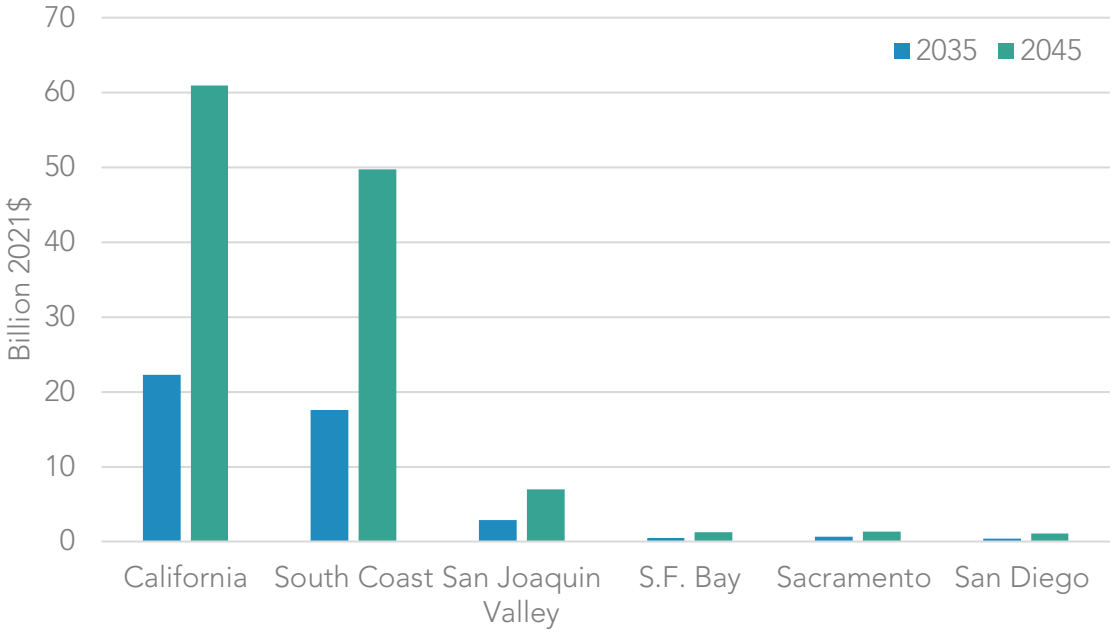
Notable health benefits representing the economic value of the avoided incidence of health effects are associated with the Scoping Plan Scenario. In total, the benefits reach $78 billion in 2035 and $199 billion in 2045, as shown in Figure 3-6. Populations in Southern California benefit the most due to preexisting air quality challenges, significant emission sources and activity, and the presence of a large, dense urban population. Additional details regarding the health impact assessment are provided in Appendix H (AB 32 GHG Inventory Sector Modeling).

Figure 3-6: Total health benefits estimated from air quality improvements in the Scoping Plan Scenario (AB 32 GHG Inventory sectors)



Furthermore, these benefits accrue within socially and economically disadvantaged communities identified by CalEnviroScreen, where they are most needed. Total health benefits within census tracts identified as disadvantaged communities using CalEnviroScreen 4.0 reach $22 billion in 2035 and $61 billion in 2045, as shown in Figure 3-7. Similarly to the statewide health benefits, the largest share of benefits occurs within disadvantaged communities in Southern California. Additional information on the health benefits within disadvantaged communities can be found in Appendix H (AB 32 GHG Inventory Sector Modeling).

Figure 3-7: Disadvantaged community health benefits relative to the Reference Scenario for the Scoping Plan Scenario (AB 32 GHG Inventory sectors)

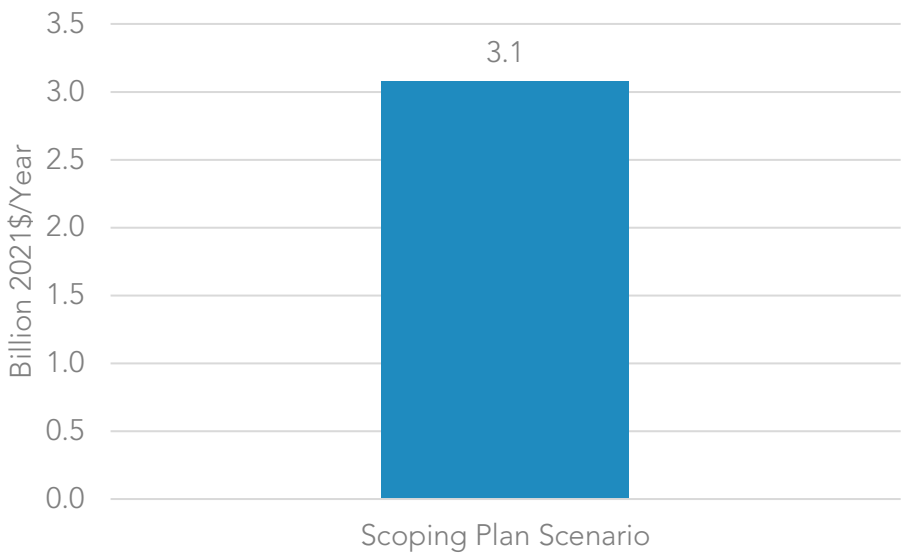


Natural and Working Lands

For NWL, health benefits were evaluated based on projected $PM_{2.5}$ wildfire emissions on forests, shrublands, and grasslands, discussed in the AB 197 Measure Analysis section of the chapter that follows.[220] The health endpoints for the Scoping Plan Scenario and in Appendix I (NWL Technical Support Document) for the alternative scenarios were the basis for the estimated health benefits shown in Figure 3-8. Health benefits were derived from the preliminary University of California, Los Angeles (UCLA) study that estimated annual health impacts and associated costs from California's wildfires from 2008–2018. Additional details are included in Appendix I (NWL Technical Support Document). These costs were applied to the health endpoints discussed in the AB 197 Measure Analysis section of the chapter.

[220] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11, N14. *finalejacrecs.pdf (arb.ca.gov)*.

Figure 3-8: Total average annual health benefits relative to the Reference Scenario for the Scoping Plan Scenario (NWL)



As health impacts analyzed here are driven by wildfire emissions, the health benefits for the Scoping Plan Scenario are directly related to the amount of forest, shrubland, and grassland management action. These management actions reduce vegetation fuels and, as a result, wildfire activity. The Scoping Plan Scenario increases the amount of these management actions, reducing wildfire emissions and avoiding incidence of emission-related health effects. The health benefits, or economic value of the avoided incidence of health effects, correspondingly increase with an increasing management implementation rate. Additional details are included in Appendix I (NWL Technical Support Document).

Estimated health benefits do not include the direct impact of wildfires on injuries, deaths, or mental health, nor the indirect costs of lost ecosystem benefits to wildfire. Additional direct health costs may result from wildfire that would likely increase the health benefits from increased forest, shrubland, and grassland management to reduce wildfire activity. Nonetheless, the conservative health benefits under the Scoping Plan Scenario are estimated to be $3.1 billion per year relative to the Reference Scenario for all NWL actions identified in the Scoping Plan Scenario.

AB 197 Measure Analysis

This section provides estimates for information associated with GHG emissions reduction measures evaluated in this Scoping Plan.[221] These estimates, which were developed as part of the process for meeting the requirements of AB 197 (E. Garcia, Chapter 250, Statutes of 2016), provide information on the relative impacts of the evaluated measures when compared to each other. To support the design of a suite of policies that result in GHG reductions, air quality co-benefits, and cost-effective measures, it is important to understand if a measure will increase or reduce criteria pollutants or toxic air contaminant emissions, or if increasing stringency at additional costs yields few additional GHG reductions. To this end, AB 197 requires the following for each potential emissions reduction measure evaluated in any Scoping Plan update:

- The range of projected GHG emissions reductions that result from the measure;
- The range of projected criteria pollutant emission reductions that result from the measure; and
- The cost-effectiveness, including avoided social costs, of the measure.

The following sections describe the evaluation of measures for the AB 32 GHG Inventory sectors and NWL. For the purposes of this Scoping Plan, the identified emissions reduction measures for the analysis required by AB 197 are actions grouped by sectors where several policies and programs are expected to overlap. This approach reflects the most granular feasible analysis given the modeling tools available,[222] the overlap and interaction effects among policies and incentive programs, the longer planning horizon used for this Scoping Plan compared to previous efforts, and the scale of transition needed to achieve carbon neutrality. To implement this Scoping Plan, dozens of individual regulations, policies, and incentive programs are anticipated that work together to drive down emissions across all economic sectors and support actions. Every specific policy or incentive program that could contribute to the deployment of clean technology and energy called for in this plan may overlap in ways that make it infeasible to tease out those policies and programs' individual effects with any reasonable degree of certainty. For example, in the transportation sector, deploying ZEVs and reducing driving demand may be achieved through a combination of the implementation of new or existing regulations, fuels programs, incentive programs, and VMT reduction initiatives that can each contribute to reductions in emissions for the sector. It is not feasible to isolate each sub action from each other at this time in terms of the share of contribution to total reductions. The estimated emission

[221] AB 197 calls for the evaluation of "emission reduction measures." This Scoping Plan treats each action and its variants on stringency as emission reduction measures for the purposes of this chapter. Appendix C (AB 197 Measure Analysis) lists the measures and corresponding modeling assumptions for each alternative.
[222] See Appendix H (AB 32 GHG Inventory Sector Modeling and Appendix I (NWL Technical Support Document).

reductions, health endpoints, and costs by measure for the Scoping Plan Scenario are presented in this chapter, and the corresponding estimates for the Proposed Scenario and Alternatives 1, 2, and 4 are included in Appendix C (AB 197 Measure Analysis).

Because many of the measures and underlying assumptions interact with each other, isolating the GHG emission reductions, corresponding changes to fuel combustion, and associated cost of an individual measure is analytically challenging. Each measure is evaluated by examining the change in fuel combustion, cost, and emissions associated with just that measure using the PATHWAYS model. The difference between the Scoping Plan Scenario and the Reference Scenario is estimated for each measure. Starting from the Scoping Plan Scenario, the modeling assumptions for an individual measure are reverted to the Reference Scenario values, resulting in GHG reductions, changes to fuel combustion, and costs (or savings). This approach does not reflect interactions between sectors in PATHWAYS that influence the results for each complete alternative, presented earlier. As such, the values associated with each measure should not be added to obtain an overall scenario estimate.

To arrive at the 2045 target for NWL, CARB modeled the ecological impact that climate smart land-based management strategies (suites of on-the-ground actions, or *treatments,* that are used across the landscape to manipulate an ecosystem) will have on ecosystem carbon; and whenever possible, additional co-benefits from those actions. The Scoping Plan Scenario incorporates a set of land management actions at varying scales of implementation for each land type to achieve the GHG emission reductions. Each land type, and its associated management actions, was considered a measure for this analysis. For modeling individual landscapes and management actions, CARB used a suite of models. The complexity of these models varies by land type, depending on the existing science, data, and availability of existing models to use. Appendix I (NWL Technical Support Document) provides detailed modeling assumptions for each NWL type. The estimated emission reductions, health endpoints, and costs by measure under the Scoping Plan Scenario for each NWL type are presented in this chapter, and the corresponding estimates for the Proposed Scenario and NWL Alternatives 1, 2, and 4 are included in Appendix C (AB 197 Measure Analysis).

Estimated Emissions Reductions

Both GHG emissions reductions and emissions of criteria air pollutants were evaluated for the AB 32 GHG Inventory sectors and for NWL. The methods and results are described in this section.

AB 32 GHG Inventory Sectors

In the absence of having direct modeling results for criteria pollutant estimates from PATHWAYS, CARB estimated criteria pollutant emissions impacts by using changes in fuel combustion in units of exajoules from PATHWAYS and emission factors in units of tons per exajoule to estimate the change in emissions in tons per year. Emission factors from a variety

of sources for each sector were utilized, including but not limited to CARB's mobile source emissions models,[223] U.S. EPA's AP 42 Emissions Factors,[224] and the South Coast Air Quality Management District's (AQMD's) District Rules.[225] These emission factors were applied to fuel burn change by fuel type, sector, equipment type, and process, where applicable. Statewide annual average emissions were estimated for three criteria pollutants: NO_x, $PM_{2.5}$, and ROG.

Table 3-5 provides the estimated GHG and criteria pollutant emission reductions for the measures in the Scoping Plan Scenario in 2035 and 2045. The other alternatives are presented in Appendix C (AB 197 Measure Analysis). Based on the estimates below, these measures are expected to provide air quality benefits. The estimates provided in this chapter and Appendix C (AB 197 Measure Analysis) are appropriate for comparing across alternatives considered for the development of this Scoping Plan, but they are not precise estimates.

Table 3-5: Estimated GHG and criteria pollutant emission reductions relative to the Reference Scenario for the Scoping Plan Scenario in 2035/2045 (AB 32 GHG Inventory sectors)

Measure	GHG Reductions ($MMTCO_2$)	NOx Reductions (Short Tons/Year)	$PM_{2.5}$ Reductions (Short Tons/ Year)	ROG Reductions (Short Tons/Year)
Deploy ZEVs and reduce driving demand	-46 / -84	-51,620 / -122,806	-2,008 / -6,506	-18,967 / -30,410
Coordinate supply of liquid fossil fuels with declining California fuel demand	-25 / -30	-1,601 / -2,707	-978 / -1,705	-747 / -1,323
Generate clean electricity	-8 / -31	-92 / -1,555	-177 / -1,382	-41 / -425
Measure	**GHG Reductions ($MMTCO_2$)**	**NOx Reductions (Short Tons/Year)**	**$PM_{2.5}$ Reductions (Short Tons/ Year)**	**ROG Reductions (Short Tons/Year)**
Decarbonize industrial energy supply	-9 / -22	-21,172 / -34,876	-1,188 / -2,527	-3,710 / -6,298
Decarbonize buildings	-14 / -35	-8,105 / -94,455	-826 / -6,877	-1,093 / -8,109
Reduce non-combustion emissions[a]	-0.41 / -0.52 ($MMTCH_4$)	N/A	N/A	N/A
Compensate for remaining emissions	-25 / -64	N/A	N/A	N/A

[a] Methane emissions reductions are reported for this measure.

The measures related to reducing non-combustion emissions and compensating for the remaining emissions do not include changes to fuel combustion, and therefore are not

associated with changes to air pollutants. Biomethane combustion is captured in measures that reduce combustion of fossil gas, such as decarbonizing industrial energy supply and buildings.

Natural and Working Lands

NWL ecosystems naturally vary between being a source and a sink for carbon over time. The NWL ecosystem carbon stock changes projected through mid-century by the suite of models were used to estimate net emissions or emissions reductions relative to the Reference Scenario. These changes in carbon stocks were affected by projected climate change, the implementation of management actions under the various scenarios, land conversion, and (for forests, shrublands, grasslands) wildfire. Each NWL type was evaluated, and an overview of all NWL is presented in Table 3-6. More detailed results for each NWL type can be found in Appendix C (AB 197 Measure Analysis).

Table 3-6: Estimated average annual GHG and criteria pollutant emission reductions relative to the Reference Scenario for the Scoping Plan Scenario from 2025–2045 (NWL)

Measure	GHG Reductions ($MMTCO_2e$/year)	$PM_{2.5}$ Reductions (MT/Year)
Forests/Shrublands/Grasslands	-0.12	-17,500
Annual Croplands	-0.25	N/A
Perennial Croplands	-0.01	N/A
Urban Forest	-1.29	N/A
Wildland Urban Interface (WUI)	0.75	N/A
Wetlands	-0.43	N/A
Sparsely Vegetated Lands	<-0.01	N/A

Fine particulate wildfire emissions were evaluated for forests, shrublands, and grasslands only. Wildfire emissions decreased under the Scoping Plan Scenario compared to the Reference Scenario. The Scoping Plan Scenario's higher level of management actions that reduce tree or shrub densities, protect large trees, reintroduce fire to the landscape, and diversify species and structures result in greater reductions in wildfire emissions.

Estimated Health Endpoints

Climate change mitigation will result in both environmental and health benefits. This section provides information about the potential health benefits of the Scoping Plan Scenario. Health benefits are primarily the result of reduced $PM_{2.5}$ pollution, both from stationary and mobile sources, as well as wildfire in forests, shrublands, and chaparral.

AB 32 GHG Inventory Sectors

CARB used the criteria pollutant emissions in Table 3-5 to understand potential health impacts. Similar to the air quality estimates, this information should be used to understand the relative health benefits of the various measures and should not be taken as absolute estimates of health outcomes. CARB used the incidence-per-ton (IPT) methodology to quantify the health benefits of emission reductions. The IPT methodology is based on a methodology developed by the U.S.

EPA.[226,227,228,229] Under the IPT methodology, changes in emissions are approximately proportional to the resulting changes in health outcomes. IPT factors are derived by calculating the number of health outcomes associated with exposure to $PM_{2.5}$ for a baseline scenario using measured ambient concentrations and dividing that number by the emissions of $PM_{2.5}$ or a precursor. To estimate the reduction in health outcomes, the emission reductions are multiplied by the IPT factor. For future years, the number of outcomes is adjusted to account for population growth. IPT factors were computed for the two types of $PM_{2.5}$: primary $PM_{2.5}$ and secondary $PM_{2.5}$ of ammonium nitrate aerosol formed from precursors.

For this AB 197 analysis, CARB calculated the health benefits associated with the five key measures that are represented by changes to fuel combustion. The health benefits associated with emission reductions for the Scoping Plan Scenario were estimated for each air basin and then aggregated for the entire state of California. CARB assumed that the statewide emission reductions distribution among the air basins is proportional to the baseline emissions in that air basin.

Calculated health endpoints include premature mortality, cardiovascular emergency department (ED) visits, acute myocardial infarction, respiratory ED visits, lung cancer incidence, asthma onset, asthma symptoms, work loss days, hospitalizations due to cardiopulmonary illnesses, hospitalizations due to respiratory illnesses, hospital admissions for Alzheimer's disease, and hospital admissions for Parkinson's disease.[230,231,232] These health endpoints were calculated using the IPT method for estimated emission reductions. Table 3-7 compares the health benefits of emission reductions associated with each measure for the Scoping Plan Scenario in the year

[232] Cardio-pulmonary mortality, hospitalizations due to cardiopulmonary illnesses, and hospital admissions due to respiratory illnesses endpoints utilize studies documented in CARB's methodology document. For future assessments, CARB will use more recent studies to estimate cardiovascular hospital admissions and respiratory hospital admissions, as documented in CARB's updated health endpoints memo.

specified (2035 or 2045). The other alternatives are presented in Appendix C (AB 197 Measure Analysis).

Table 3-7: Estimated avoided incidence of mortality, cardiovascular and respiratory disease onset, work loss days and hospital admissions relative to the Reference Scenario for the Scoping Plan Scenario (AB 32 GHG Inventory sectors)

Measure	Mortality	Cardiovascular ED Visits	Acute Myocardial Infarction	Respiratory ED Visits	Lung Cancer Incidence	Asthma Onset	Asthma Symptoms	Work Loss Days	Hospital Admissions, Cardiovascular	Hospital Admissions, Respiratory	Hospital Admissions, Alzheimer's Disease	Hospital Admissions, Parkinson's Disease
Deploy ZEVs and reduce driving demand in 2035	635	170	70	400	45	1,475	128,930	92,510	95	115	245	40
Deploy ZEVs and reduce driving demand in 2045	1,820	475	200	1,115	135	3,995	343,095	255,800	295	350	745	125
Coordinate supply of liquid fossil fuels with declining CA fuel demand in 2035	115	30	15	70	10	275	23,530	16,880	20	20	50	10

Measure	Mortality	Cardiovascular ED Visits	Acute Myocardial Infarction	Respiratory ED Visits	Lung Cancer Incidence	Asthma Onset	Asthma Symptoms	Work Loss Days	Hospital Admissions, Cardiovascular	Hospital Admissions, Respiratory	Hospital Admissions, Alzheimer's Disease	Hospital Admissions, Parkinson's Disease
Coordinate supply of liquid fossil fuels with declining CA fuel demand in 2045	215	55	25	130	15	490	40,860	30,445	35	40	95	15
Generate clean electricity in 2035	20	5	0	10	0	45	3,930	2,820	5	5	10	0
Generate clean electricity in 2045	170	45	20	105	15	385	32,065	23,890	25	30	75	10
Decarbonize industrial energy supply in 2035	300	80	35	190	20	695	60,660	43,520	45	55	115	20
Decarbonize industrial energy supply in 2045	595	155	65	365	45	1,310	111,925	83,435	95	115	245	40

Measure	Mortality	Cardiovascular ED Visits	Acute Myocardial Infarction	Respiratory ED Visits	Lung Cancer Incidence	Asthma Onset	Asthma Symptoms	Work Loss Days	Hospital Admissions, Cardiovascular	Hospital Admissions, Respiratory	Hospital Admissions, Alzheimer's Disease	Hospital Admissions, Parkinson's Disease
Decarbonize buildings in 2035	155	40	15	95	10	360	31,130	22,335	25	30	60	10
Decarbonize buildings in 2045	1,610	420	175	985	120	3,550	303,830	226,500	260	310	665	115
Note: All values are rounded to the nearest 0 or 5.												

The measures related to reducing non-combustion emissions and compensating for remaining emissions do not include changes to fuel combustion and therefore are not associated with changes to air pollutants or health endpoints. Biomethane combustion is captured in measures that reduce combustion of fossil gas, such as decarbonizing industrial energy supply and buildings.

Although the estimated health outcomes presented are based on a well-established methodology, they are subject to uncertainty. For instance, future population estimates are subject to increasing uncertainty as they are projected further into the future, and baseline incidence rates can experience year-to-year variation. Also, the relationship between changes in pollutant concentrations and changes in pollutant or precursor emissions is assumed to be approximately proportional.

In addition, emissions are reported at an air basin level and do not capture local variations. These estimates also do not account for impacts from global climate change, such as temperature rise, and are only based on the scenarios in this Scoping Plan.

The fuel changes for each AB 197 measure are estimated based on the impact of each measure compared to the Reference Scenario for the years 2035 and 2045. Therefore, aggregating the effect of each measure would overestimate the impacts of the Scoping Plan Scenario because the implementation of each measure would affect the level of benefits of the other measures. This measure-by-measure analysis uses a different methodology for calculating health endpoints than does the health analysis for the complete Scoping Plan Scenario provided earlier.

Natural and Working Lands

Implementation of NWL management strategies to mitigate and adapt to climate change will result in both environmental and health benefits. This section provides information about the potential health benefits of measures evaluated for the Scoping Plan Scenario. For this analysis, health benefit estimates were focused on increases or decreases to $PM_{2.5}$ resulting from wildfire emissions on forests, shrublands, and grasslands.[233] Other health benefits resulting from NWL management actions in the Scoping Plan Scenario are not quantified here but are important for all Californians. This includes, but is not limited to, reductions in exposure to synthetic pesticides when switching to organic agricultural systems, improvements in shade availability and mental health with increasing urban forest cover, improved mental health from opportunities for recreation in resilient and healthy environments, and protection from floods and rising sea levels.

[233] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11, N14. *finalejacrecs.pdf (arb.ca.gov)*.

These examples are by no means exhaustive, as our natural and working lands provide immense health benefits to everyone.

For this analysis, CARB used the $PM_{2.5}$ emissions in Table 3-6 to understand potential health impacts. This information should be used to understand the relative health endpoints of the various measures and should not be taken as absolute estimates of health outcomes of this Scoping Plan statewide or within a specific community. The IPT methodology was used to calculate health endpoints, similar to the AB 32 GHG Inventory Sector analysis. CARB calculated the annual health endpoints associated with the wildfire emissions changes resulting from the implementation of management strategies on forests, shrublands, and grasslands under each alternative. The annual health endpoints associated with emission reductions for the Scoping Plan Scenario were estimated for the entire state. Calculated health endpoints include emissions-caused mortality, hospital admittance, and emergency room visits from asthma; hospital admittance from chronic obstructive pulmonary disease; and emergency room visits from respiratory and cardiovascular outcomes. Table 3-8 compares the average annual health endpoints of wildfire emission reductions associated with the Scoping Plan Scenario over the period 2025–2045. The other alternatives are presented in Appendix C (AB 197 Measure Analysis).

Table 3-8: Estimated average annual avoided incidence of hospital admissions, emergency room visits, and mortality relative to the Reference Scenario for the Scoping Plan Scenario resulting from forest, shrubland, and grassland wildfire emissions (NWL)

Health Endpoints from Forest, Shrubland, and Grassland Wildfire Emissions	Average Annual Avoided Incidence
Hospital admissions from asthma	22
Hospital admissions from chronic obstructive pulmonary disease without asthma	19
Hospital admissions from all respiratory outcomes	63
Emergency room visits from asthma	155
Emergency room visits from all respiratory outcomes	419
Emergency room visits from all cardiovascular outcomes	156
All causes of mortality	394

Estimated Social Cost

Social costs are generally defined as the cost of an action on people, the environment, or society and are widely used to understand the impact of regulatory actions. One tool, the social cost of greenhouse gases (SC-GHG), is an estimate of the present value of the costs associated with the emission of GHGs in future years. It combines climate science and economics to help understand the benefits of reducing GHG emissions. The estimates of the social cost of carbon (SC-CO_2) and social cost of methane (SC-CH_4), two types of SC-GHGs presented here, estimate the value of the net harm to society associated with adding GHGs to the atmosphere in a given year; they do not represent the cost of actions taken to reduce GHG emissions (known as the *cost of abatement*) nor the cost of GHG emissions reductions. In principle, the SC-GHG includes the value of climate change impacts, including but not limited to, changes in net agricultural productivity, human health effects, property damage from increased flood risk and other natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services. It reflects the societal value of reducing emissions

of the gas in question by one metric ton.[234] Many of these damages from GHG emissions today will affect economic outcomes throughout the next several centuries.

In 2008, federal agencies began incorporating SC-CO_2 estimates into the analysis of their regulatory actions. U.S. EPA has used various models and discount rates to determine the value of future impacts. Generally, these models begin with assumptions to predict economic activity over time, along with projected GHG emissions. The modeled emissions are input into a model of the global climate system, which then translates into estimates of surface temperature, sea level rise, and other impacts. These outputs are used to estimate economic damages per ton of GHG emitted in a given year in the future. Since the models are calculating the present value of future damages, a discount rate is applied. For example, the SC-CO_2 for the year 2045 represents the value of climate change damages from a release of CO_2 in 2045 discounted back to today. The present value is significantly affected by the discount rate used; a higher discount rate results in a lower present value. For example, in 2021 dollars the SC-CO_2 in 2045 is $31 using a 5 percent discount rate, $88 using a 3 percent discount rate, and $122 using a 2.5 percent discount rate. Additional detail is included in Appendix C (AB 197 Measure Analysis).

The 2017 Scoping Plan utilized SC-CO_2 and SC-CH_4 Obama Administration-era values developed by the Council of Economic Advisors and the Office of Management and Budget-convened Interagency Working Group on the Social Cost of Greenhouse Gases (IWG)[235] to consider the social costs of actions to reduce GHG emissions. The Biden Administration reinstated these values in February 2021,[236] after they had been rescinded and significantly revised by the Trump Administration. The reinstatement was considered an interim step, and the Biden Administration also reconvened the IWG to continue its work to evaluate and incorporate the latest climate science and economic research and

A Return to Science: Evidence-Based Estimates of the Benefits of Reducing Climate Pollution. *https://www.whitehouse.gov/cea/written-materials/2021/02/26/a-return-to-science-evidence-based-estimates-of-the-benefits-of-reducing-climate-pollution/*.

respond to the National Academies' recommendations from 2017 as it develops a more complete revision of the estimates.

It is important to note that the models used to produce SC-GHG estimates do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate literature. There are additional costs to society, including the costs associated with changes in co-pollutants and costs that cannot be included due to modeling and data limitations. The IWG has stated that the range of the interim SC-GHG estimates likely underestimates societal damages from GHG emissions.[237] The revised estimates were originally slated to be released in early 2022 but were stalled.[238] CARB staff is applying the interim values presented in the IWG February 2021 Technical Support Document (TSD), which reflect the best available science in the estimation of the socioeconomic impacts of GHGs.[239] This Scoping Plan utilizes the TSD standardized range of discount rates, from 2.5 to 5 percent, to represent varying valuation of future damages.

AB 32 GHG Inventory Sectors

Table 3-9 presents the estimated social cost, in terms of avoided economic damages, for each measure of the Scoping Plan Scenario. For each measure, Table 3-9 includes the range of the SC-CO_2 and SC-CH_4 that results from the GHG emissions reductions in 2035 and 2045 at 2.5 and 5 percent discount rates. Additional background on the SC-GHG and methodology for calculating the SC-CO_2 and SC-CH_4 estimates in this Scoping Plan, as well as estimates for the alternatives, are provided in Appendix C (AB 197 Measure Analysis).

[237] Interagency Working Group on Social Cost of Greenhouse Gases. 2021. Technical Support Document. https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf

[238] See *Louisiana v. Biden* (W.D. La. 2022) 585 F.Supp.3d 840, stayed pending review (5th Cir. Mar. 16, 2022) 2022 WL 866282. A federal district court ruling issued in early February 2022 had granted a preliminary injunction blocking the Biden Administration from using the interim IWG SC-GHG estimates. However, a federal appeals court overturned the lower court's preliminary injunction in March 2022, which allows the Biden Administration to continue using the policy as legal proceedings continue. CARB will continue to monitor the litigation. However, the federal action does not prohibit CARB from using social cost of carbon and CARB will use the best available science regardless of politics. A separate federal appeals court upheld the Biden administration's use of the IWG SC-GHG estimates in October 2022. *Missouri v. Biden* (8th Cir. 2022) ____ F.4th ____.

[239] Interagency Working Group on Social Cost of Greenhouse Gases. 2021. Technical Support Document. https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf

Table 3-9: Estimated social cost (avoided economic damages) of measures considered in the Scoping Plan Scenario (AB 32 GHG Inventory sectors)

Measure	Social Cost of Carbon in 2035, 5%–2.5% Discount Rate Billion USD (2021 dollars)	Social Cost of Carbon in 2045, 5%–2.5% Discount Rate Billion USD (2021 dollars)
Deploy ZEVs and reduce driving demand	1.12–4.87	2.64–10.23
Coordinate supply of liquid fossil fuels with declining California fuel demand	0.61–2.63	0.95–3.67
Generate clean electricity	0.20-0.88	0.97–3.75
Decarbonize industrial energy supply	0.23–1.01	0.69–2.67
Decarbonize buildings	0.35–1.52	1.11–4.32
Reduce non-combustion emissions	0.51–1.29 (SC-CH_4)	0.86–2.01 (SC-CH_4)
Compensate for remaining emissions	0.61–2.66	2.03–7.84
Scoping Plan Scenario SC-CO_2	2.4–10.4	5.6–21.9
Scoping Plan Scenario SC-CH_4	0.51–1.3	0.86–2.0
Scoping Plan Scenario (Total)[a]	2.9–11.7	6.5–23.9

[a] CARB staff could not precisely separate some CO_2 and CH_4 from other GHGs from PATHWAYS outputs, but the contribution is believed to be small for purposes of calculating the social cost of carbon. The approach used to estimate GHG emissions reductions for individual measures in PATHWAYS does not reflect cross-sector interactions. Therefore, the GHG values for each measure do not sum to the overall scenario total. The total GHG emissions reduction used in this calculation is 97 $MMTCO_2e$ in 2035 and 180 $MMTCO_2e$ in 2045.

Natural and Working Lands

The SC-CO_2 estimates for the NWL measures shown in Table 3-10, in terms of avoided economic damages, reflect 2021 IWG interim values, updated for inflation, similar to the AB 32 GHG Inventory Sector analysis. This analysis utilizes the 2.5 percent and 5 percent

discount rate and the average annual emissions reductions from each NWL type from 2025–2045. Estimates for all alternatives are included in Appendix C (AB 197 Measure Analysis).

Table 3-10: Estimated social cost (avoided economic damages) of measures considered in the Scoping Plan Scenario (NWL)

Measure	Social Cost of Carbon in 2035, 5%–2.5% Discount Rate Billion USD (2021 dollars)	Social Cost of Carbon in 2045, 5%–2.5% Discount Rate Billion USD (2021 dollars)
Forests/Shrublands/Grasslands	0.003–0.012	0.004–0.014
Annual Croplands	0.006–0.027	0.008–0.031
Perennial Croplands	<0.001–0.001	0.000–0.001
Urban Forest	0.032–0.138	0.041–0.157
Wildland Urban Interface (WUI)	(0.018) – (0.080)[a]	(0.023) – (0.090)
Wetlands	0.011–0.046	0.014–0.053
Sparsely Vegetated Lands	<0.001	<0.001

[a] Parentheses indicate an increase in estimated social cost, i.e., an increase in economic damages. This is only the case for WUI measures where emissions are increased, shown in Table 3-6. The estimated social cost does not account for the decrease in wildfire risk or decrease in wildfire damages resulting from the WUI measures.

Social Costs of GHGs in Relation to Cost-Effectiveness

AB 32 includes a requirement that rules and regulations "achieve the maximum technologically feasible and cost-effective" greenhouse gas emissions reductions.[240] Under AB 32, *cost-effectiveness* means the relative cost per metric ton of various GHG reduction strategies,[241] which is the traditional cost metric associated with emission control. In contrast, the SC-CO_2, SC-CH_4, and social cost of nitrous oxide (SC-N_2O), because they are estimates of the cost to society of additional GHG emissions, can be used to estimate of the economic benefits of reducing emissions, but do not take into account the cost of the actions that must be taken to achieve those GHG emissions reductions.

There may be technologies or policies that do not appear to be cost-effective when compared to the SC-CO_2, SC-CH_4, and SC-N_2O associated with GHG reductions. However, these technologies or policies may result in other benefits that are not reflected in the IWG social costs. Examples include the evaluation of social diversification of the portfolio of transportation fuels (a goal outlined in the Low Carbon Fuel Standard) and reductions in criteria pollutant emissions from power plants (as in the Renewables Portfolio Standard). Additionally, costs for new technology may be higher early on in a technology's development cycle and may drop over time as use of the technology is scaled up.

Estimated Cost per Metric Ton

AB 197 requires an estimation of the cost-effectiveness of the measures evaluated for this Scoping Plan. The cost (or savings)[242] per metric ton of CO_2e reduced for each measure is one metric for comparing the performance of the measures. Additional factors beyond the cost per metric ton that could be considered include continuity with existing laws and policies, implementation feasibility, contribution to fuel diversity and technology transformation goals, and health and other benefits to California. These considerations are not reflected in the cost per metric ton estimates presented below. It is important to understand the relative cost-effectiveness of individual measures as presented in this section. However, the economic analysis presented earlier in this chapter, in Appendix H

---

[240] AB 32 Air pollution: greenhouse gases: California Global Warming Solutions Act of 2006. (AB 32, Nuñez, Chapter 488, Statutes of 2006). https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=200520060AB32.

[241] Health & Saf. Code § 38505(d).

[242] Similarly, to the direct costs reported earlier, the cost per metric ton of a measure reflects the stock costs and any fuel or efficiency savings associated with a measure divided by the GHG emission reduction achieved by the measure. Costs are reported as positive values, and savings are reported as negative values.

(AB 32 GHG Inventory Sector Modeling), and in Appendix I (NWL Technical Support Document) provides a more comprehensive analysis of how the Scoping Plan Scenario and alternative scenarios affect the state's economy and jobs.

AB 32 GHG Inventory Sectors

The cost per metric ton for the AB 32 GHG Inventory sectors was computed for each measure independently relative to the Reference Scenario using the sensitivity calculations based on PATHWAYS and RESOLVE outputs. The difference in the annualized cost between the Scoping Plan Scenario and the Reference Scenario was computed for each measure in 2035 and in 2045. The incremental cost was divided by the incremental GHG emissions impact to calculate the cost per metric ton in each year. To capture the fuel and GHG impacts of investments made from 2022 through 2035, or from 2022 through 2045, CARB computed an average annual cost per metric ton. The incremental cost in each year was averaged over the period. This value is divided by the corresponding annual, incremental GHG impact averaged over the same period.

The cost metric includes the annualized incremental cost of energy infrastructure, such as zero-emission vehicles, electric appliances, and required revenue to support all electric assets. A residual value for equipment such as vehicles or appliances that are retired early is included. The annual fuel cost or avoided fuel cost that results from efficiency improvements or changes to demand for fuels associated with transitioning to alternative fuels is included. Not included in this cost metric are costs that represent transfers within the state, such as incentive payments for early retirement of equipment.

It is important to note that this cost per metric ton does not represent an expected market price value for carbon mitigation associated with these measures. In addition, the values do not capture fuel savings or GHG reductions associated with the full economic lifetime of measures that have been implemented by the target date of 2035 or 2045 but whose impacts extend beyond the target date.

Table 3-11 includes the cost per metric ton and annual average cost per metric ton estimates for the Scoping Plan Scenario. The other alternatives are presented in Appendix C (AB 197 Measure Analysis). Measures that are relatively less costly in 2035 or 2045 are also less costly over the extended period. As noted earlier, incremental costs of new vehicles are generally offset by gains in efficiency and avoided fuel consumption resulting in negative cost per metric ton.

Table 3-11: Estimated cost per metric ton of reduced CO_2e relative to the Reference Scenario for measures considered in the Scoping Plan Scenario (AB 32 GHG Inventory sectors)

Measure	Annual Cost, 2035 ($/ton)	Average Annual Cost, 2022–2035 ($/ton)	Annual Cost, 2045 ($/ton)	Average Annual Cost, 2022–2045 ($/ton)
Deploy ZEVs and reduce driving demand	-171	-99	-103	-122
Coordinate supply of liquid fossil fuels with declining CA fuel demand	60	109	-50	39
Generate clean electricity[a]	101	156	145	161
Decarbonize industrial energy supply	290	217	257	274
Decarbonize buildings	235	230	112	213
Reduce non-combustion emissions	93	94	106	99
Compensate for remaining emissions	745	823	236	485

[a] Note: The denominator of this calculation (2045) does not include GHG reductions occurring outside of California resulting from SB 100. If these reductions were included, this number would be lower.

Natural and Working Lands

The cost per metric ton for NWL measures were computed for the Scoping Plan Scenario relative to the Reference Scenario using the projected carbon stock/sequestration data from the NWL modeling and the direct cost estimates for each management action, described earlier. Direct costs represent the cost of implementing a certain management action. The projected emissions reductions take into account the loss of carbon that results from the management action, such as fuels reduction treatments in forests, as well as climate change effects on growth. The direct cost for each NWL measure was divided by the average annual emission reductions presented in Table 3-6 to produce the cost

per metric ton. The increasing effect of climate change on diminished future growth reduces the ability of the land to sequester or store carbon, driving up the cost per ton.

It is important to note that this cost per metric ton does not represent an expected market price value for carbon mitigation associated with these measures. In addition, emissions benefits of NWL management actions often take longer time periods to accrue, and these values only capture GHG reductions up to 2045.

Table 3-12 includes the average cost per metric ton estimates for the average annual CO_2e reductions from 2025 through 2045 for the Scoping Plan Scenario. The other alternatives are presented in Appendix C (AB 197 Measure Analysis).

Table 3-12: Estimated average cost per metric ton of reduced CO_2e relative to the Reference Scenario for measures considered in the Scoping Plan Scenario (NWL)

Measure	Average Cost per Reduced Ton CO_2e ($/Ton)
Forests/Shrublands/Grasslands	15,500
Annual Croplands	1,100
Perennial Croplands	412
Urban Forest	3,270
Wildland Urban Interface (WUI)	N/A
Wetlands	64
Sparsely Vegetated Lands	451,000

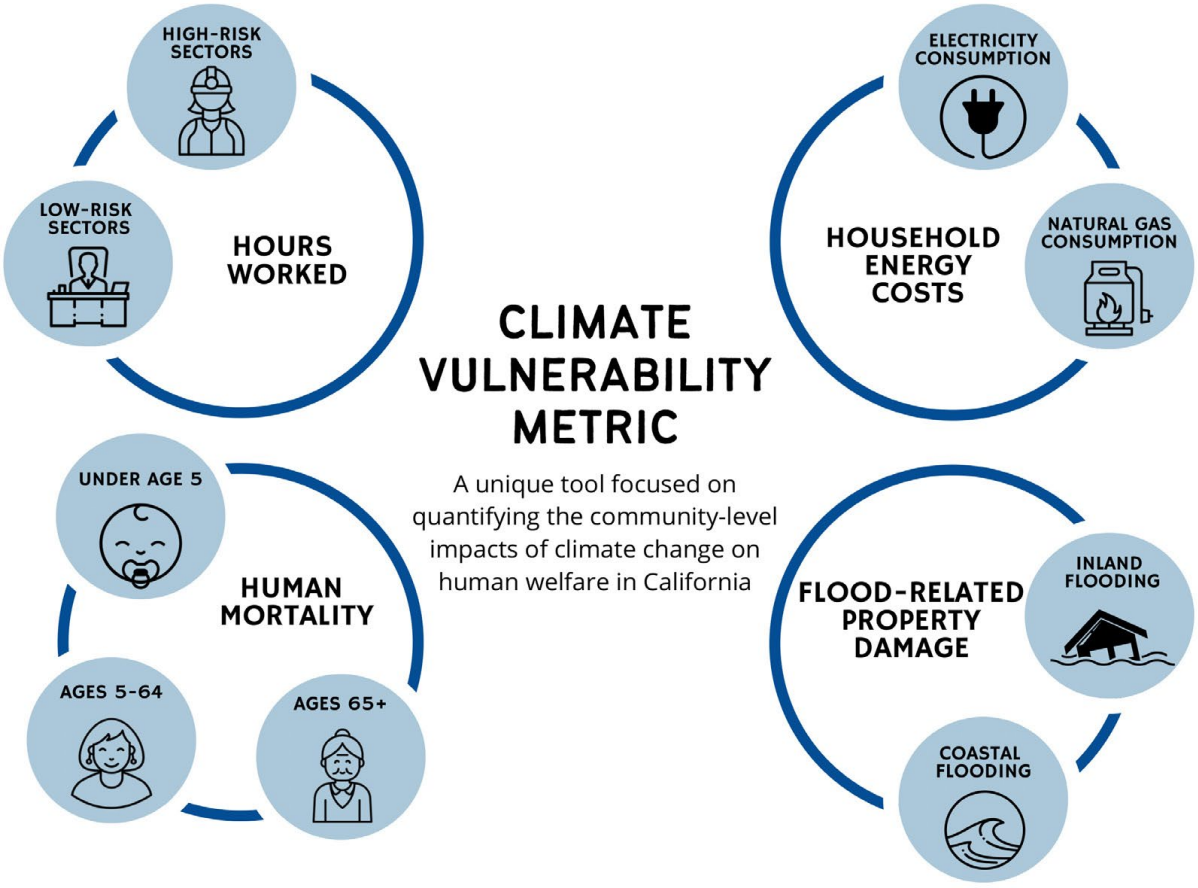
Climate Vulnerability Metric

As California invests in climate mitigation and adaptation, it is essential to understand that the relative impact of climate change will vary across the state's communities. Due to persisting health and opportunity gaps, not all communities are equally resilient in the face of climate impacts. A global metric such as the Social Cost of Carbon cannot adequately capture the incremental additional economic impact faced by overly burdened communities. The Climate Vulnerability Metric (CVM) is specifically focused on quantifying the community-level impacts of a warming climate on human welfare and the additional costs. Additional details and results are included in Appendix K (Climate Vulnerability Metric).

The CVM aggregates the impacts of climate change that can be quantified at the census tract level using robust and currently available research. The CVM includes the projected impacts of climate change on human welfare across four categories (hours worked, household energy costs, human mortality, and flood-related property damage) through midcentury. The CVM identifies nine components of the four climate impacts as shown in Figure 3-9 and aggregates the data to generate a total CVM result for each census tract. To ensure that the CVM represents the diversity of California communities, it is reported as the aggregate monetized impact of climate change as a percentage of census tract-specific incomes.[243] For example, a CVM value of 3 implies that by 2050, a census tract is projected to experience human welfare impacts of climate change that amount to 3% of annual income in that tract.

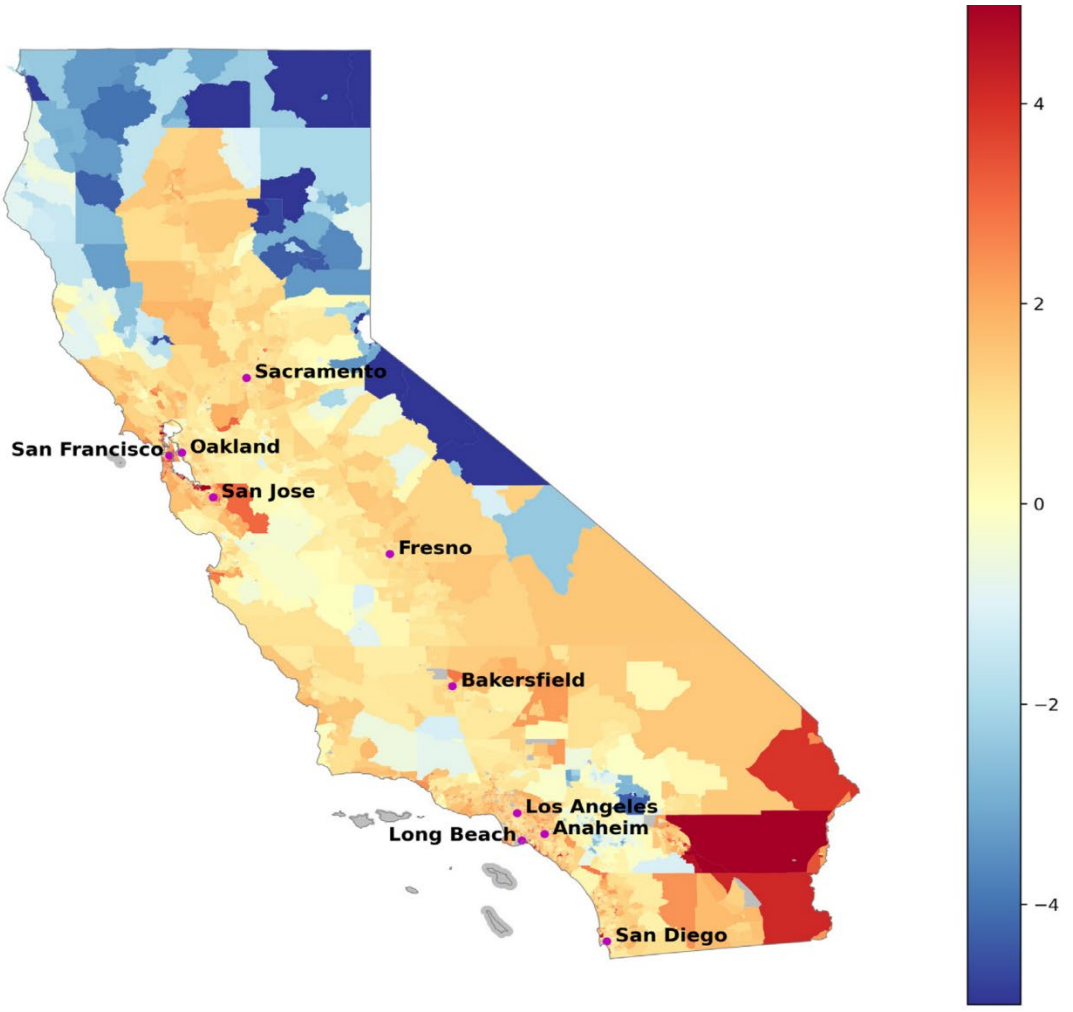
[243] Per capita income in 2019 for census tracts across California ranges from $633 to $176,388, with a median of $32,181 ($2019). Source: American Community Survey.

Figure 3-9: Categories of climate change impacts on human welfare included in the Climate Vulnerability Metric.



The CVM shows that climate change will have highly unequal impacts across California. While some southeastern regions of California are estimated to suffer damages that exceed 5% of annual income, other high-elevation northeastern regions of California are estimated to see benefits of up to 10%. Some low-lying urban areas, such as the San Francisco Bay Area, are estimated to be particularly vulnerable, while much of the Central Valley is estimated to suffer at least moderate economic damages relative to the rest of the state. It is important to note that the CVM does not set a threshold for vulnerability. Instead, it shows relative impacts across census tracts. The CVM is limited to the impacts that can currently be quantified at the census tract level.

Figure 3-10: Combined impacts of climate change in 2050 under a moderate emissions scenario; damages as share of 2019 tract income (%)



The map shows combined impacts of climate change in 2050 under a moderate emissions scenario (RCP 4.5), reported as a share of 2019 census tract income. For example, a CVM value of 3 implies that by 2050, a census tract is projected to experience human welfare impacts of climate change that amount to 3% of annual income. Impacts are combined across the categories shown in Figure 3-9. The higher the CVM for a given census tract, the more damaging the projected impacts of climate change on human welfare. Census tracts with high CVMs are represented by positive percentages in orange and red. A lower CVM is associated with lower projected impacts of climate change, shown in yellow, while a negative CVM value represents a projected beneficial impact of climate change (e.g., through reductions in deaths caused by extremely cold winter weather). Negative CVMs are represented by negative percentages in blue.

By providing information about how climate vulnerability varies across California (Figure 3-10), the CVM results can be used to direct resources to enhance resiliency in the state's

most vulnerable communities based on the specific impacts, such as heat or flooding, they are experiencing. The CVM may be used in combination with existing screening tools, such as CalEnviroScreen 4.0, to identify communities that face environmental and health hazards that contribute to disproportionate economic impacts in addition to climate vulnerability. The CVM can become an essential source of information to implement this Scoping Plan and build a more resilient, just, and equitable future for all communities.

Public Health

Health Analysis Overview

This section focuses on a broader evaluation of public health and climate change. Science demonstrates that taking action to address climate change presents one of the most significant opportunities to improve public health outcomes.[244] Transitioning to clean energy and technology and improving land and ecosystem management will lead to a much healthier future. Many actions to reduce GHG emissions also have health co-benefits that can improve the health and well-being of populations across the state, as well as address climate change. This section and the accompanying Appendix G (Public Health) provide a qualitative analysis of health benefits to accompany the quantitative health analysis included in this chapter, in Appendix C (AB 197 Measure Analysis), and in Appendix H (AB 32 GHG Inventory Sector Modeling). Together the qualitative and quantitative analyses of benefits are demonstrating the many ways that climate action and health improvements go hand in hand.

Climate change can lead to a wide range of direct health impacts such as increased heat-related illnesses (i.e., heat exhaustion and heat stroke), and injuries and deaths from extreme weather events or disasters (e.g., severe storms, flooding, wildfires). Indirect impacts include:

- more air pollution-related exacerbations of cardiovascular and respiratory diseases (e.g., due to increased smog, wildfire smoke)
- increased vector-borne and fungal diseases due to changes in the distribution and geographic range of disease-carrying species (e.g., mosquitoes, ticks, fungi in dust)
- negative nutritional consequences related to decreases in agricultural food yields
- stress and mental trauma due to extreme weather-related catastrophes
- anxiety, depression, and other mental health impacts associated with gradual changes in the climate (e.g., prolonged drought or temperature shifts affecting jobs and industries) that result in unemployment and income loss

[244] Watts, N., W. N. Adger, P. Agnolucci, et al. 2015. “Health and climate change: Policy responses to protect public health.” *Lancet* 386, 1861–1914.

- residential displacement and home loss (e.g., sea level rise impacting coastal communities)

Wildfires and wildfire smoke are one area where we have already seen and expect to see even further drastic impacts on the health of Californians. According to CalFire, since 1932 the top eight largest wildfires in California have occurred in the past five years (2017–2022), with 151 deaths due directly to fires during that period.[245] Researchers estimate that wildfire smoke during fall 2020 may have led to as many as 3,000 excess deaths, with at least 95% of Californians suffering unhealthy levels of particle pollution due to wildfires in 2020.[246] Continued climate change is projected to further increase smoke exposure from wildfires through the end of the century.[247] Wildfires also create a high-risk environment for outdoor workers, including agricultural workers. While the direct medical and physical health impacts are often most noticeable, the psychological impacts can develop and persist well after the event. Estimates indicate that 20%–65% of survivors of extreme weather events have mental health issues following the event.[248]

Extreme heat, drought, and associated worsened air quality impacts are among the most serious climate-related exposures affecting the health of Californians. Numerous studies find a wide range of adverse health effects accompanying extreme heat, including heat stroke and adverse birth outcomes, and find that extreme heat can harm most body systems. Climate change exacerbates air pollution problems that cause difficulty breathing and can lead to serious illness and death in many parts of California. Increasing temperatures cause increases in ozone and other pollution concentrations, including for California's most polluted regions, and heighten health risks for the vulnerable and marginalized populations living in these areas.[249] In 2020, there were 157 ozone polluted days across Los Angeles, Orange, Riverside, and San Bernardino Counties—the most days since 1997. In addition, particulate matter exposure is a heightened problem during

droughts, which are expected to increase over this century.[250,251] Worse air quality leads to illnesses, emergency room visits, and hospitalizations for chronic health conditions, including chronic obstructive pulmonary disease (COPD), asthma, chronic bronchitis, and other respiratory and cardiovascular conditions, as well as increased risk for respiratory infections, which all result in greater health costs to the state.[252,253,254] These and other climate-related health impacts are discussed in more detail in Appendix G (Public Health).

Health Analysis Components

This Scoping Plan health analysis focuses on the contrast between a California that is still dependent on a fossil fuel-based economy and a California that is transitioned to a carbon-neutral, clean energy future. This qualitative analysis evaluates and demonstrates the broad range of benefits of a dramatic reduction in fossil fuels by 2045 combined with healthier ecosystem management, comparing health outcomes for a "no-action" scenario (Reference) to a "take-action" decarbonization scenario. As this is a qualitative analysis, it looks more broadly at the public health benefits of a drastic reduction in fossil fuel combustion. While this analysis provides scientific evidence for Scoping Plan benefits based on achieving carbon neutrality by 2045, it does not analyze a specific scenario.

The key areas of focus for the analysis are: heat impacts, children's health and development, economic security, food security, mobility and physical activity, urban greening, wildfires and smoke impacts, and housing affordability. For each area of focus, the analysis covers the scientific evidence and compares expected health effects between the Reference and decarbonization scenarios. This analysis looks at the major health outcomes, provides directional effects for each health outcome, and where possible provides information on the strength and scale of health impacts. Some areas include quantitative information where tools are available to measure health outcomes. While the analysis is focused on health outcomes statewide, it also includes discussion

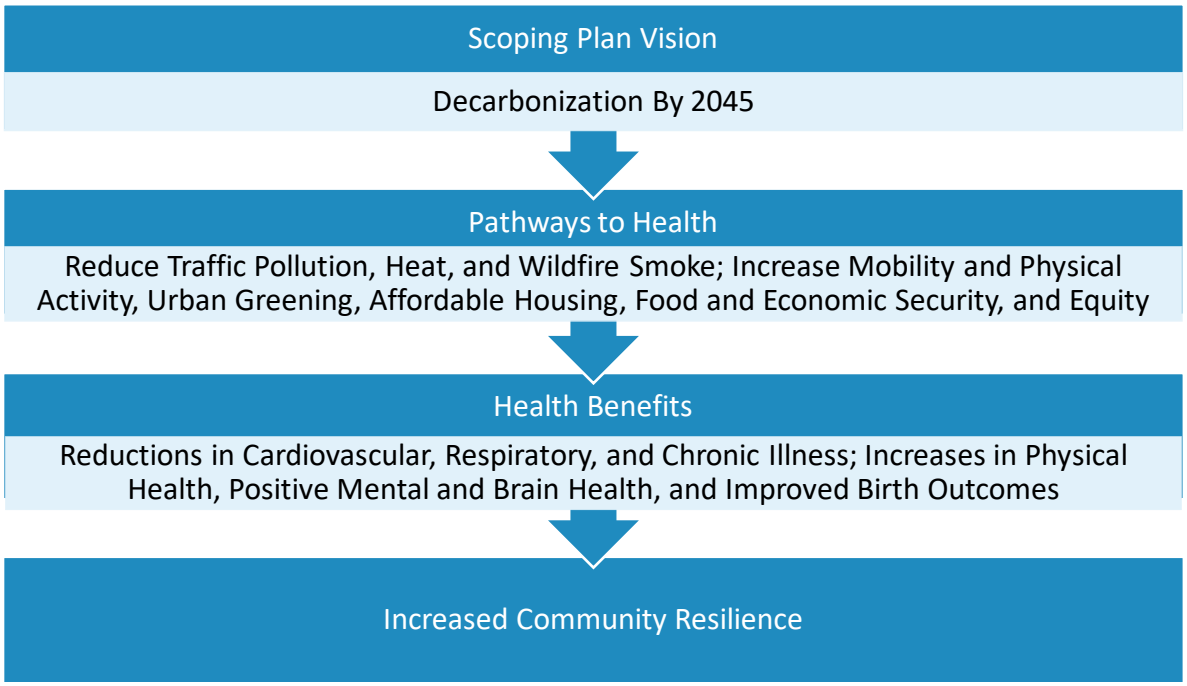
of benefits to community health and climate resilience, as well as potential inequities experienced at a community level. Figure 3-11 shows the co-benefit areas covered in this Scoping Plan and the path to health improvements and increased community resilience.

Figure 3-11: Scoping Plan outcome and the path to health improvements



Social and Environmental Determinants of Health Inequities

Communities across the state do not experience exposure to pollution sources and the resulting effects equally. Low-income communities and communities of color (including Black, Latino and Indigenous communities) consistently experience significantly higher rates of pollution and adverse health conditions than others due to factors including historic marginalization rooted in systemic racism. As shown in Figure 3-12, the most impacted neighborhoods according to CalEnviroScreen (CES) are home to very high percentages of people of color while the least impacted neighborhoods are predominantly white. Recent findings show that Black Californians have 19% higher $PM_{2.5}$ exposure from vehicle emissions than the state average, and the census tracts with the highest $PM_{2.5}$ pollution burden from vehicle emissions have a high proportion of people of color.[255] Air pollutant emissions from mobile sources have disproportionate impacts on low-income communities and communities of color due to their proximity.[256] Diesel-fueled vehicles traveling on California's freeways and major roads expose nearby residents to pollution that is linked to lung cancer, hospitalizations and emergency department visits for chronic heart and lung disease, and premature death.[257,258] A combination of historical and social inequities are evident in communities of color disproportionately living close to freeways and other major sources of vehicle pollution. Environmental exposures and contaminants are one component of a broader set of social, economic, and environmental factors that can amplify health conditions, and the combination of all these factors can compound the health effects of individual exposures. This broader set of community factors can be referred to as "cumulative impacts." In addition, specific populations are more sensitive to pollution and face greater susceptibility. This includes young children, older adults, and individuals with existing health conditions.

Social Determinants of Health Inequities

The physical and mental health of individuals and communities is shaped, to a great extent, by the social, economic, and environmental circumstances in which people live, work, play, and learn. According to the World Health Organization, these same circumstances—or social determinants of health—are "mostly responsible for health inequities: the unfair and avoidable differences in health status seen within and between countries." In fact, a strong body of research demonstrates that more than 50 percent of long-term health outcomes are the result of social determinants affecting an individual.[260] Race/ethnicity and socioeconomic status, for example, have been found to amplify impacts from long- and short-term environmental exposures for several health outcomes,

[259] The figure represents the top and bottom decile scoring of CalEnviroScreen census tracts for pollution burden. This chart is modified from Figure 2. Race in the Least and Most Impacted Census Tracts of CalEnviroScreen 4.0 in the Office of Environmental Health Hazard Assessment, California Environmental Protection Agency. Analysis of Race/Ethnicity and CalEnviroScreen 4.0 Scores. 2021. *https://oehha.ca.gov/media/downloads/calenviroscreen/document/calenviroscreen40raceanalysisf2021.pdf*.

such as mortality and birth outcomes.[261,262,263,264] Social factors combine in low-income communities and communities of color to create levels of toxic chronic stress and limit opportunities for healthy food and healthy lifestyles. Social factors also can cause health disparities through psychosocial pathways such as discrimination and social exclusion.[265] While the importance of social determinants is well known, measuring the specific and cumulative impacts of social determinants is challenging.

There are several important tools to evaluate and map cumulative impacts and factors contributing to the results of historical practices such as redlining, and these tools have been used for air quality and climate planning, community protection, and investments. CalEnviroScreen is a tool that maps cumulative pollution burdens and vulnerabilities on a statewide basis and ranks census tracts based on environmental, exposure, population, and socioeconomic indicators. An analysis using CES shows a direct, persistent relationship between exposure to environmental burdens and socioeconomic and health vulnerabilities affecting communities of color and historical redlining practices. OEHHA has evaluated health impacts of certain climate change policies on disadvantaged communities and communities of color utilizing CES rankings.[266] The Healthy Places Index (HPI) maps indicators that affect life expectancy on a statewide basis. In the future, these and other tools can be helpful to prioritizing investments and informing implementation efforts for GHG emission reductions policies.

Environmental Determinants of Health Inequities

Communities with large percentages of Black and other socially vulnerable and marginalized groups are disproportionately located near pollution sources, such as traffic

and freight facilities, industrial facilities, and hazardous waste sites.[267,268,269,270] Research shows large disparities in exposure to pollution between white and non-white populations in California, and between low-income and communities of color (Figure 3-13). The research also shows Black and Latino populations experience significantly greater air pollution impacts than white populations in California.[271] Additionally, Native Americans are disproportionately impacted by air pollution with high rates of exposure to industrial, diesel, and residential pollution sources and higher rates of diseases linked to air pollution.[272, 273]

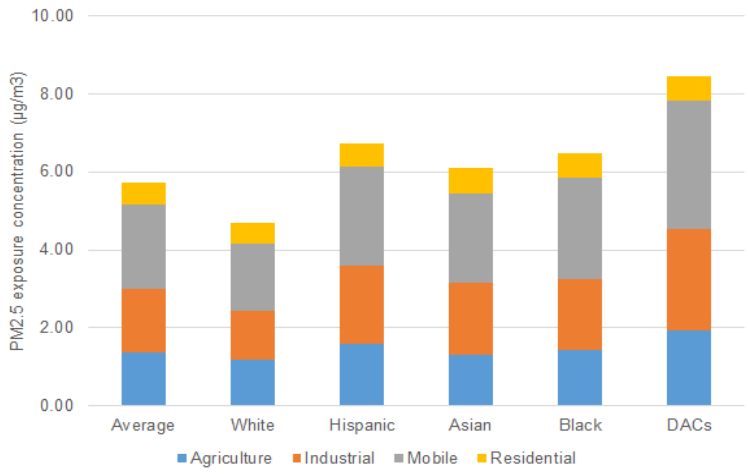
Figure 3-13: Top sources of $PM_{2.5}$ and their contribution to $PM_{2.5}$ exposures by race and in disadvantaged communities



These disparities in exposure to pollution sources generate health inequities. Communities located near major roadways are at increased risk of asthma attacks and other respiratory and cardiac effects. Studies consistently show that mobile source pollution exposure near major roadways or freight sources contributes to and exacerbates asthma, impairs lung function, and increases cardiovascular mortality.[274] The exposure to mixtures of gaseous and particulate pollutants in mobile sources (including PM, NO_x, and benzene) is associated with higher rates of heart attacks, strokes, lung cancer, autism, and dementia.[275]

Environmental hazards found in communities also can include exposures to toxic substances and emissions, as well as occupational exposures. Due to historical inequities, under-resourced communities and communities of color are often located close to sources of toxic pollution, including chrome platers; metal recycling facilities; oil and gas operations; agricultural burning; railyards; facilities transporting, managing, or disposing of hazardous waste; and areas impacted by pesticides, among others. Some populations may be at increased risk of exposure to pollutants, both at work and home.

Children are more susceptible to environmental pollutants for many reasons, including the ongoing development of their nervous, immune, digestive, and other bodily systems. Moreover, children eat more food, drink more fluids, and breathe more air relative to their

body weight, as compared to adults.[276] Exposure to high levels of air pollutants, including indoor air pollutants, increases the risk of respiratory infections, heart disease, and asthma.[277] Children living in low-income communities near industrial operations, rail yards, and heavily trafficked freeways and streets in urban areas are at especially high risk of chronic respiratory conditions. Black children are four times more likely to be hospitalized for asthma compared with white children, and urban Black and Latino children are two to six times more likely to die from asthma than white children.[278] Native American children also experience more impacts from asthma and Native American children, along with Black children, have the highest prevalence of asthma.[279]

For older adults, increased vulnerability is linked to respiratory, cardiovascular, and immune systems weakened by aging.[280] Preexisting health conditions interact with environmental pollutants to enhance risks of adverse health outcomes.[281,282] The recent COVID-19 pandemic has highlighted the heightened vulnerability of older adults as well as communities of color to respiratory disease, as hospital admissions and mortality data linked to COVID-19 cases for these groups have been higher than other groups. Research has also underscored the important link between COVID-19 mortality and morbidity and air pollution, demonstrating significantly higher mortality and morbidity for COVID-19 in areas of elevated $PM_{2.5}$ pollution.

Climate Vulnerabilities

Climate change is expected to exacerbate the existing disparities of health conditions and worsen climate vulnerability, which is the degree to which natural systems and people or

communities are at risk of experiencing the negative impacts of climate change.[283] A report from the California Climate Change Center warned that the impacts of climate change will likely create especially heavy burdens on low-income and other vulnerable populations: "*Without proactive policies to address these equity concerns, climate change will likely reinforce and amplify current as well as future socioeconomic disparities, leaving low-income, minority, and politically marginalized groups with fewer economic opportunities and more environmental and health burdens*."[284]

In the U.S. Environmental Protection Agency's "Climate Change and Social Vulnerability in the United States: A Focus on Six Impacts,"[285] investigators analyzed risks of six primary climate change impacts disproportionately affecting communities across income, educational attainment, race/ethnicity, and age groups. Four socially vulnerable populations—low income, communities of color, no high school diploma, and age 65 and older—were identified as having a higher likelihood of experiencing the greatest impacts of a changing climate (according to the projected 2°C of global warming or 50 centimeters of global sea level rise). Disproportionate impacts were projected for climate events, including air quality, extreme temperature, coastal flooding, and other impacts, leading to increased risk of health and other adverse outcomes. The study projected significant health impacts for low-income communities, certain racial and ethnic subgroups, and those with lower educational attainment.

Several climate vulnerability tools have been developed or are under development to better understand and map areas at higher risk of climate impacts. The Climate Change and Health Vulnerability Indicators (CCHVIs) for California helps state and local health officials prepare for and reduce adverse health impacts due to a changing climate.[286] For example, Los Angeles County shows higher than state average climate vulnerability overall, particularly for those who are linguistically isolated (more than twice the state average).

In summary, there are many environmental, social, individual, and economic factors affecting health and equity in California and contributing to worsening health outcomes from climate change impacts. This section and Appendix G (Public Health) reference a substantial and growing body of research documenting the different social and

environmental factors affecting health outcomes and the many groups that are vulnerable to increased effects or that experience health inequities in California (see Table 3-13).

Table 3-13: Examples of vulnerable groups due to socioeconomic, environmental, developmental, and climate change factors

Examples of Vulnerable Groups Due to Socioeconomic, Environmental, Developmental, and Climate Change Factors		
Older People	People with Existing Chronic Illness	People Impacted Due to Working Conditions
Tribal Groups	Infants and Children	Low-Income People
People with Disabilities	People Experiencing Homelessness	Pregnant People
Communities of Color	Marginalized People	Immigrants/Refugees
People with Less Educational Options	Linguistically Isolated Households	People Impacted Due to Poor Housing Conditions

Summary of the Qualitative Health Analysis

CARB has developed a detailed health analysis that covers eight social and environmental co-benefit areas that impact public health (listed below). These co-benefit areas were selected due to ongoing research in these areas as well as discussion in a public workshop on climate change and health impacts held in summer 2018. For each social and environmental area, the analysis includes:

- a discussion of health impacts and disparities,
- key health metrics or epidemiological research on this topic,
- a discussion of how these areas would be affected by "no-action" (i.e., Reference) scenario compared to a "take-action" (i.e., Scoping Plan) scenario
- a discussion of where there are actions to consider for further success, and
- the types of mitigation actions that can help reduce or eliminate disparities and promote greater health equity and resilience.

All co-benefit areas are interconnected, and pursuing benefits in all areas has the potential to multiply positive results and further support building community resilience. *Community resilience* is the ability of a community to reduce harm and maintain an acceptable quality of life in the face of climate-induced stresses, which vary depending on that community's circumstances and location. Below is a brief description of the areas evaluated for public health co-benefits. The specific health outcomes impacted by each

area, as well as the directional health benefits, are included in the Summary of Health Benefits section of the chapter and covered in more detail in Appendix G (Public Health).

Heat Impacts

Globally, increased GHG concentrations in the atmosphere are causing a continuing increase of the planet's average temperature. California temperatures have risen since records began in 1895, and the rate of increase is accelerating. Recent heat waves have broken heat records and caused serious illness across the state, and these events are becoming more frequent. Heat waves have a particularly high impact in Southern California, where they have become more intense and longer lasting. In the past two years, Los Angeles recorded 121°F, and the Coachella Valley had its hottest year ever, with temperatures reaching 123°F. Heat island effects in urbanized areas can elevate heat effects and disproportionately affect low-income communities and communities of color. Heat events exacerbate respiratory and cardiac illness and cause emergency room visits to soar. Strategies that reduce the impacts of heat exposure promote improved health outcomes.

Wildfires and Smoke

California's NWL cover more than 90 percent of California and include rangeland, forests, woodlands, grasslands, and urban green space. They provide biodiversity and ecosystem benefits, including their ability to sequester carbon from the atmosphere. Protecting and managing California's forests and other natural lands and maintaining their ecosystem health are key practices for maximizing GHG benefits and minimizing negative climate change impacts. Vegetation plays an important role in storing carbon; however, it can also release CO_2 back into the atmosphere when it dies or is burned by fires. California's wildfires are getting worse with increased fire risks, higher frequency of occurrence, larger burn areas, more costly damage, and a longer fire season due to climate change. Strategies that promote healthy ecosystem management of natural and working lands and increased urban greening promote improved health outcomes. Healthy ecosystems provide many health and environmental benefits and can maximize carbon sequestration.

Children's Health and Development

There are a wide range of interconnected environmental, social, biological, and community factors associated with climate change that are adversely affecting children's health. This section focuses on air pollution and near-roadway or traffic pollution as environmental impacts that have a profound effect on children's health. Children's bodies and lungs are still developing, and they take in more air per body weight than adults do. Many low-income communities and communities of color in California experience disproportionately high levels of air pollution, as well as high levels of traffic and freight that impact children. This excess exposure harms children's development and

predisposes them to increased risk of illness throughout their lives. Strategies that reduce air pollution and traffic emissions promote improved health outcomes for children.

Economic Security

Climate change is expected to result in serious adverse socioeconomic effects across many sectors. Economic factors, such as income inequality (among geographic regions), poverty, wealth, debt, unemployment rate, and job security are among the strongest determinants of health. Along the entire income spectrum, higher income is associated with increased life expectancy and improved health outcomes in the United States. Additionally, economic insecurity and negative health impacts are more pronounced in low-income communities and communities of color. Economic strategies, such as the promotion of clean energy and other green jobs and investments in low-income communities and communities of color, and promoting a transition to high road jobs in economic sectors tied to the current fossil fuel economy, can promote improved health outcomes.[287]

Food Security

The food system is under pressure from numerous factors, and climate change is a key concern. Climate change can affect food production and agricultural yield, impact culturally significant plants and animals for Native American tribes, and exacerbate factors that limit food availability, such as supply chain disruption. Food security is defined as stable access to affordable, sufficient food for an active, healthy life. Many Californians routinely experience food insecurity, and while that impacts Californians of all races and groups, low-income communities and communities of color and children are disproportionately affected by food insecurity. Many Native Americans depend on resources from the land, such as animals and plants for consumption and cultural practices. Strategies that promote sustainable agriculture, access to healthy foods, and reduced organic food waste promote improved health outcomes.

Mobility and Physical Activity

Physical activity is one of the most important factors for a healthy lifestyle, and lack of activity increases the risk of chronic illness and premature death. Research shows that regular physical activity improves health in people of all ages by improving heart and lung

---

[287] According to the California Labor and Workforce Development Agency's High Road Training Partnership program, high road jobs are considered "Quality jobs [that] provide family-sustaining wages, health benefits, a pension, worker advancement opportunities, and collective worker input and are stable, predictable, safe and free of discrimination." *https://cwdb.ca.gov/wp-content/uploads/sites/43/2020/08/OneSheet_Job-Quality_ACCESSIBLE.pdf*.

function, muscle fitness, mental health and brain function, and sleep quality. A sedentary lifestyle contributes to chronic illnesses, including obesity, heart disease, and Type 2 diabetes among other chronic illnesses. Promoting community design that supports sustainable patterns of land use and transportation enables active transportation choices like walking, biking, and public transit over driving, and can significantly increase physical activity, leading to many valuable health benefits.

Affordable Housing

Housing is an important social determinant of health. The stability of housing, housing quality, conditions inside and outside the home, the cost of housing, and the environmental and social characteristics of the places people live all affect health (including energy efficiency and insulation, cooler building material, tree canopy, home size). Housing affordability is a key factor, and this section highlights how housing affordability supports not only improved health but also more sustainable land use and transportation patterns. A lack of affordable housing is increasing commute distances for low-income renters and creating health burdens. Strategies that support sustainable transportation and housing patterns, together with increased housing affordability, promote improved health outcomes.

Urban Greening

Urban Greening is well recognized as an important amenity, but the inherent health benefits are not always well understood. Under-resourced and vulnerable areas consistently show a lack of urban greening and higher percentages of concrete, asphalt, and impervious surfaces. Under-resourced communities have a greater proportion of concrete and heat-trapping surfaces and a lower amount of tree cover in the neighborhoods in which they live. Areas with reduced urban greening have the potential to create areas of higher temperatures as heat is reflected from pavements and buildings. By contrast, increasing urban greening can provide air pollution buffers and promote physical activity. Strategies that preserve and create urban parks, green space, natural infrastructure, and sustainable agricultural practices support improved physical and mental health outcomes.

No Action Scenario (Reference)

In a no-action scenario, California would remain dependent on fossil fuels and other GHG emitting technologies. Fossil-fuel powered mobile sources including cars, trucks, trains, tractors, and a myriad of other on-road and off-road vehicles and equipment are the largest source of criteria pollutants and toxic air contaminants that directly affect

community health and contribute the largest portion of GHG emissions.[288] Other key GHG emission sources include buildings, natural and working lands, and power production and industry. The no-action scenario reflects a continued reliance on fossil fuels in mobile and stationary sectors, including buildings. The continued production and use of fossil fuels; ongoing dependence on gasoline and diesel cars, trucks, buses, and equipment; continued releases of short-lived climate pollutants; and decreased emphasis on forest and ecosystem health will impact communities by reducing climate resilience and health benefits. Green space will likely remain at the same levels or degrade, and urban heat islands will likely increase. With continued growth of vehicle miles traveled, physical activity and the accompanying health benefits will not increase.

Exposure to wildfire smoke will increase, and air quality is expected to worsen as rising temperatures will increase levels of harmful air pollution. Jobs and economic security will be affected by the continuing potential for price spikes in fossil fuels, impacts to the economy from climate change, and fewer job opportunities in green technologies such as solar and electric vehicles. Food security in California will decrease due to the effects of accelerating climate impacts to agriculture; and without increased recovery of organic waste, including food products, food security will continue to decline under a no action scenario. All these impacts can be linked to worse health outcomes. Adverse health impacts are often most felt by Black, Latino, Native American, and other people of color and in low-income communities. These groups are affected more intensely by the physical stress of environmental pollution, social inequities, and the psychological stress of extreme weather events and food and economic insecurity.

Take Action Scenario

In the Take Action scenario, California will drastically reduce reliance on fossil fuels for motor vehicles, freight, buildings, electricity, or other sectors. This scenario is not a specific scenario within this Scoping Plan but examines the broad outcomes of actions to achieve carbon neutrality in 2045. Implementation of this Scoping Plan would achieve a transition to ZEVs, with 100% sales of light-duty ZEVs by 2035 and 100% sales of zero emission trucks by 2040, along with 30% VMT reductions below 2019 levels by 2045. State and local action that supports sustainable land use and transportation patterns and enables more transit and active transportation will lead to substantial health benefits from physical activity, including reduced illness and deaths.

[288] CARB. 2022. *California Greenhouse Gas Emissions for 2000 to 2020.* *https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf*.

The economic benefits of improved health through active transportation can be modeled using the Healthy Mobility Options Tool (HMOT).[289] In order to demonstrate the important health and economic benefits of VMT reduction, CARB and CDPH used the HMOT to analyze an illustrative trip reduction scenario for 2050 from the California Transportation Plan (CTP). The CTP has a goal of increasing active modes of travel and transit from the current level of 13 percent to a level of 23 percent of all travel trips. While the CTP goal of 23 percent for active modes of travel is not a VMT reduction target, the scenario increases active transportation through a mix of changes in land use planning for increased transportation options, including increases in biking, walking, and transit use, and it helps to show the health benefits of increased active transportation. By achieving the CTP 2050 goals, nearly 8,000 deaths would be avoided in 2050 alone (see Figure 3-14), along with significant reductions in chronic diseases. Achieving this would rank among the top public health accomplishments (see Appendix G [Public Health] for additional modeling results and detailed discussion).

The dramatic reduction in fossil fuel combustion, combined with reductions in VMT and freight and traffic emissions projected in this Scoping Plan will significantly reduce air pollution and its associated health impacts on a statewide basis and in communities near freight sources. Coordinated action strategies will emphasize natural and working lands management changes, including healthy forests, increased vegetative cover, and increased organic farming. Wildfire smoke exposure will reduce significantly with healthy ecosystem management strategies. Since many communities in California are disproportionately impacted by high levels of traffic pollution, the reduction in petroleum fueled vehicles will reduce the additional impacts of living or going to school near historically highly polluting sources. Indoor air quality is also likely to improve through a shift to non-fossil fuel appliances. Concerted state and local action to support sustainable land use and transportation patterns can enable more active transportation with health benefits from physical activity.

[289] ITHIM California. 2020. Transportation Planning for Health, Equity, and Climate Change. *https://skylab.cdph.ca.gov/HealthyMobilityOptionTool-ITHIM/*.

Figure 3-14: Quantified health benefits of active transportation from increased physical activity

*Calculated by the Healthy Mobility Options Tool, active transportation (including walking, rolling, cycling, and taking public transit) from the California Transportation Plan 2050 compared to business as usual for 2050.

Overall community resilience is expected to increase as physical activity and green space increases—potentially decreasing urban heat islands. Efforts to support VMT reduction will include coordination across state agencies on affordable housing measures. Reduced fossil fuel dependence will reduce economic pressure from wildfires, droughts, and price spikes in fossil fuels, especially as more jurisdictions implement plans with similar actions. Investment in sustainable agriculture, healthy forests, urban greening, and clean energy technologies will add sustainable jobs and further promote economic security. More sustainable agriculture and food recovery efforts will add to food security. All these impacts can be linked to wide ranging health benefits, including positive respiratory and cardiovascular effects, healthier birth and brain outcomes, improved mental health indicators, improved life expectancy, reductions in chronic illness and cancers, improved children's health and development, reduced depression, and other benefits. The magnitude of the possible co-benefits is extremely large, especially in areas that are currently the most affected.

Summary of Health Benefits

Below, Tables 3-14 and 3-15 show overall summaries of the directional benefits by co-benefit area estimated for this Scoping Plan. The supporting epidemiological studies used for qualitative or quantitative analysis of each co-benefit area are included in Appendix G (Public Health). Another section of Chapter 3, together with Appendix C (AB 197 Measure Analysis) and Appendix H (AB 32 GHG Inventory Sector Modeling), also includes the quantitative analysis of air pollution related health impacts, including recently added health endpoints for CARB's ongoing analysis.

Table 3-14: Scoping Plan directional benefits for health co-benefit areas (heat, affordable housing, food security, economic security, and urban greening)

Health Co-benefit Areas*					
Quantitative vs. Qualitative	**Reduced Heat Impacts**	**Increased Affordable Housing**	**Increased Food Security**	**Increased Economic Security**	**Increased Urban Greening**
Research was used for Qualitative Analysis	↓ Mortality ↓ Emergency Room Visits for cardiovascular and respiratory causes and intestinal infections ↓Hospitalization for cardiovascular, respiratory causes ↓ Preterm Birth ↓ Mental Illness	↓ Infectious Disease ↓ Chronic Illness ↓ Asthma ↓ Injuries ↓ Mental Illness ↑ Children's Performance in Schools ↑ Children's Health ↓ Children's Behavioral Problems	↓ Mental Illness ↓ Iron Deficiency ↓ Chronic Diseases ↑ Life Expectancy ↓ Children's Mental Illness ↓ Children's Cognitive Problems ↓ Children's Behavioral Health Problems ↓ Children's Iron Deficiency ↓ Children's Oral Health Problems	↑ Life Expectancy ↑ Health Status ↑ Mental Health	↓ Mortality ↓ Asthma Prevalence ↓ Depression ↓ Adverse Birth Outcomes including low birth weight and small for gestational age ↑ Life Expectancy

*See Appendix G (Public Health) for a table with references to research for each health outcome listed.

Table 3-15: Scoping Plan directional benefits for health co-benefit areas (traffic pollution, wildfire, and active transportation)

Health Co-benefit Areas*			
Quantitative vs. Qualitative	**Reduced Traffic Pollution**	**Reduced Wildfire Smoke**	**Increased Active Transportation**
Research was used for Quantitative Analysis	↓ Children's Respiratory Outcomes, Hospital Admissions ↓ Children's Respiratory Outcomes, Emergency Room Visits ↓ Children's Asthma Onset ↓ Children's Asthma Symptoms	↓ All-Cause Mortality ↓ Asthma, Hospital Admissions ↓ COPD, Hospital Admissions ↓ All Respiratory Outcomes, Hospital Admissions ↓ Asthma, Emergency Room Visits ↓ All Respiratory Outcomes, Emergency Room Visits ↓ All Cardiac Outcomes, Emergency Room Visits	↓ Cardiovascular Diseases ↓ Colon Cancer ↓ Breast Cancer ↓ Diabetes ↓ Dementia ↓ Lung Cancer ↓ Respiratory Disease ↓ Depression ↑ Traffic Accidents
Research was used for Qualitative Analysis	↑ Children's Lung Function Growth ↓ Children's Bronchitic Symptoms ↓ Children's Impaired Cognitive Development ↓ Children's Adverse Birth Outcomes, including low birth weight and preterm birth		

*See Appendix G (Public Health) for a table with references to research for each health outcome listed.

In summary, the qualitative health analysis of the No-Action versus Take-Action scenarios for this Scoping Plan shows an overwhelming benefit for the state by taking action to move forward to carbon neutrality while continuing efforts to increase health equity and resilience in individual communities. Taking action can improve physical and mental health for adults and children, reduce a range of chronic illnesses, and promote improvements in life expectancy. Development and implementation of actions to achieve the outcomes called for in this Scoping Plan should consider how to engage affected communities in implementation, address the existing health and opportunity gaps, and pursue equitable implementation statewide and locally. This Scoping Plan deployment of clean technology and fuels, together with improved land management, will reduce GHGs and air pollution and create more resilient communities that are better able to prepare for and recover from extreme climate events.

Environmental Analysis

In May 2022, CARB, as the lead agency for the Scoping Plan, released for public review the Draft Environmental Analysis (Draft EA) for this Scoping Plan; it assessed the potential environmental impacts of implementing the Scoping Plan. CARB circulated the Draft EA for public review and comment for a period of 45 days that began on May 10, 2022, and ended on June 24, 2022. CARB held a public hearing on June 23, 2022 to provide the opportunity for public comment. During the review period, written and oral comments were received on the Draft EA. CARB reviewed the comments to identify environmental topics and began preparation of responses to those comments.

After the end of the Draft EA public review period, CARB identified potential revisions to certain aspects of this Scoping Plan that merit revisions to the project description. This new information results from, among other things, revisions to the project description regarding energy sector goals (including offshore wind), revised carbon removal targets, and additional strategies for natural and working lands. CARB released a Recirculated Draft EA for a written public comment period that started September 9, 2022, and ended on October 24, 2022. See Chapter 2 of the Recirculated Draft EA[290] for further information regarding the changes. The Recirculated Draft EA assesses the potential for significant adverse and beneficial environmental impacts associated with all proposed actions in this Scoping Plan, and provides a programmatic environmental analysis of the reasonably foreseeable compliance responses that could result from implementation of the Scoping

[290] CARB. 2022. Recirculated Draft EA. *https://ww2.arb.ca.gov/sites/default/files/2022-09/2022-draft-sp-appendix-b-draft-ea-recirc.pdf*.

Plan.[291] The Recirculated Draft EA concluded implementation of this Scoping Plan could result in the following:

- Beneficial impacts to: air quality (long-term operational-related) and GHG emissions (short-term construction-related and long-term operational-related)
- Less than significant impacts to: energy demand, mineral resources, population and housing, public services, recreation (short-term construction-related), and wildfire (short-term construction-related)
- Potentially significant and unavoidable adverse impacts to: aesthetics, agriculture and forest resources, air quality (construction-related and operational odors), biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, recreation (long-term operational-related), transportation and traffic, tribal cultural resources, utilities and service systems, and wildfire (long-term operational-related

Before the public meeting at which the Board will consider this Scoping Plan Update, CARB will publish the Final EA as Appendix B (Final Environmental Analysis) to this Scoping Plan, along with written responses to timely submitted comments raising significant environmental issues received on the Draft EA and the Recirculated Draft EA, which will be presented to the Board for consideration.

[291] The Recirculated Draft EA is available at *https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents*.

Chapter 4: Key Sectors

Chapter 4 provides an overview of the major energy sources and technology in use today, and of alternative clean technology and fuels to support decarbonization based on the latest information available. Every sector of the economy will need to begin to transition in this decade to meet our GHG reduction goals and achieve carbon neutrality no later than 2045. AB 32 requires climate change mitigation policies to be considered in the context of the sector's contribution to the state's total GHG emissions. The transportation, electricity (in-state and imported), and industrial sectors are the largest contributors of GHGs in the state and present the largest opportunities for GHG reductions. Actions to reduce fossil fuel combustion in these sectors also can provide critical air pollution reductions in low-income communities and communities of color, which are often located adjacent to these sources. A carbon neutrality framework also elevates the role of CO_2 removal through natural and working lands and mechanical capture and storage. Actions that support energy efficiency, reduced VMT, alternative fuels, and renewable power also can provide benefits by reducing both criteria and toxic air pollutants.

What sets this plan apart from previous Scoping Plans is the focus on the accelerated rate of deployment of clean technology and energy within every sector. As a result, specific actions, including accelerated rates of deployment of clean technology and fuels identified within this Scoping Plan, will need to be translated into both new and amended regulations, policies, and incentive programs. State agencies will need to evaluate current authority to align existing policies or develop new ones to achieve outcomes called for in this Scoping Plan. Legislative support may be needed in some cases to ensure authority and funding is sufficient to ensure this Scoping Plan is translatable to action on the ground. Most regulations, or change to existing regulations, ultimately considered by the Board or other state agencies for adoption will be subject to administrative procedure requirements. Accordingly, they must rely on specific subsequent supporting analysis and extensive public processes and consultations with interested tribes to develop and identify appropriate proposals for effective implementation. For example, any proposal to strengthen the LCFS regulations through amendments increasing the stringency of the carbon intensity (CI) targets would be considered on the basis of a public process, including workshops, and focused environmental, economic, and public health analyses.

Policies that ensure economy-wide investment or program decisions that incorporate consideration of GHG emissions are particularly important. As we pursue GHG reduction targets, we must acknowledge the manner in which built and natural environments are connected, how changes in one may impact the other, and how policy choices in one sector can and do impact other sectors. For example, fostering more compact, transportation-efficient development in infill areas and increasing transportation choices with the goal of reducing VMT not only reduces demand for transportation fuel but also requires less energy for buildings and helps to conserve natural and working lands that

sequester carbon. Therefore, the multiple and often interwoven actions that reduce VMT both reduce emissions from the transportation sector and support reductions needed in other sectors.

Legislation, such as SB 350[292] (De León and Leno, Chapter 457, Statutes of 2015), has recognized the need for CARB, the CEC, and the CPUC to work together to ensure the state's energy and climate goals are integrated in procurement decisions by load serving entities as part of Integrated Resource Plans. Moving forward, it is especially critical that similar approaches are adopted to break down silos across state agencies to ensure policies and programs are aligned with multiple state priorities outlined in this plan. Finally, supportive legislative direction, such as SB 905 that requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program, may also benefit emerging areas of policy to provide express agency authority and roles for these nascent efforts, including streamlining of permitting, while ensuring that protections for communities are in place.

Unlike previous Scoping Plans that separated out individual economic sectors, this Scoping Plan approaches decarbonization from two perspectives: (1) managing a phasedown of existing energy sources and technology and (2) ramping up, developing, and deploying alternative clean energy sources and technology over time. This approach supports a more comprehensive consideration of our energy infrastructure, the ability to repurpose existing assets, and the need to build new assets. It also provides multiple metrics beyond just the annual AB 32 GHG Inventory to better enable tracking progress. For example, it clearly demonstrates the production and distribution rates of specific types of clean energy, such as adding 4.3 GW of utility solar and 2.5 GW of storage year-over-year between now and 2035 to be on track to achieve carbon neutrality no later than 2045, and does the same for technology deployment, such as 11 million ZEVs in 2035.

The sections below include key actions to support success in the necessary transition away from fossil combustion, which is an overriding goal of this plan. The wide array of complementary and supporting actions being contemplated or to be undertaken across state government are detailed here. The broad view of actions described in this chapter thus provides context for the specific deployment of clean technology and fuels identified in the Scoping Plan Scenario described in Chapter 2. Actions identified in this Scoping Plan are based on currently known options and the latest science. As part of future Scoping Plan updates, additional clean technology and fuels may be identified and added to the mix of needed tools to continue to reduce the state's GHG emissions, support air quality co-benefits, and remove carbon from the atmosphere.

Transportation Sustainability

The transportation sector has long relied on liquid petroleum fuels as the primary energy source for internal combustion engine (ICE) vehicles, including cars, trucks, locomotives, marine equipment, and aircraft. Combustion of fossil fuels in vehicles emits significant amounts of GHGs, criteria pollutants, and toxic air contaminants. In 2019,[293] the transportation sector accounted for approximately 50 percent of statewide GHG emissions[294] and thus was by far the single largest source of carbon pollution in the state. In addition, the transportation sector accounted for over 80 percent of statewide NOx emissions and 30% of fine particulate matter emissions, including toxic diesel particulate matter.[295]

Communities adjacent to congested roadways, including ports and distribution centers, are exposed to the highest concentration of toxic pollutants from vehicles and equipment consuming fossil fuels, leading to a number of demonstrated health impacts such as respiratory illnesses, higher likelihood of cancer development, and premature death. In addition, communities located near oil extraction operations or crude oil refineries often experience higher exposure to poor air quality. While CARB's programs, along with local action, have made substantial progress over the past few decades, it is clear that California must transition away from fossil fuels to zero-emission technologies with all possible speed and pursue policies that result in less driving, in order to meet our GHG and air quality targets.

The transportation sector can be divided into three general categories: Technology, Fuels, and Vehicle Miles Traveled.

- *Technology* refers to the vehicles themselves, as well as the associated refueling infrastructure for those vehicles.
- *Fuels* refers to the energy source used to power vehicles and the facilities that produce them.
- Vehicle travel is measured as *vehicle miles traveled* (VMT), and is a product of development patterns and available transportation options.

---

[293] In 2020 the state experienced shelter-in-place orders in response to the COVID-19 pandemic. The orders, and the effects of the pandemic, led to a significant year-over-year decline in transportation emissions in 2020. This means 2019 is likely a more representative year for overall transportation emissions and 2020 a likely outlier in the historical transportation emissions trend data.
[294] CARB. 2022. *California Greenhouse Gas Emissions for 2000 to 2020.* *https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf*. This includes upstream oil extraction and refining emissions.

Sector Transition

Technology

Vehicles must transition to zero emission technology to decarbonize the transportation sector. Executive Order N-79-20[296] reflects the urgency of transitioning to zero emission vehicles (ZEVs) by establishing target dates for reaching 100 percent ZEV sales or fleet transitions to ZEV technology. The primary ZEV technologies available today are battery-electric and hydrogen fuel cell electric vehicles (FCEVs), both of which emit zero tailpipe GHGs, criteria pollutants, and toxic air contaminants, as they do not burn fuel. These vehicles are rapidly growing in performance, affordability, and popularity.[297] Plug-in hybrid electric vehicles also offer a limited but increasing range of zero emission operation and will play a role in the transition to ZEVs.

Light-duty passenger vehicles consume the majority of gasoline in the state—12.9 billion gallons in 2019[298]—and are well-suited for transitioning to ZEVs. EO N-79-20 calls for 100 percent ZEV sales of new light-duty vehicles by 2035, and this target is reflected in this Scoping Plan.[299] The Advanced Clean Cars II regulation fulfills the goal in the Executive Order and serves as the primary mechanism to help deploy ZEVs. A number of existing incentive programs also support this transition, including the Clean Cars 4 All Program.[300] Heavy-duty trucks are the largest source of diesel particulate matter, a toxic air contaminant that is directly linked to a number of adverse health impacts, and EO N-79-20 also sets targets for transitioning the medium- and heavy-duty fleet to zero emissions: by 2035 for drayage trucks and by 2045 for buses and heavy-duty long-haul trucks where feasible. Replacing heavy-duty vehicles with ZEV technology will significantly reduce GHG emissions and diesel PM emissions in low-income communities and communities of color adjacent to ports, distribution centers, and highways. The existing Advanced Clean Trucks regulation, paired with the proposed Advanced Clean Fleets regulation, are designed to transition a significant amount of the

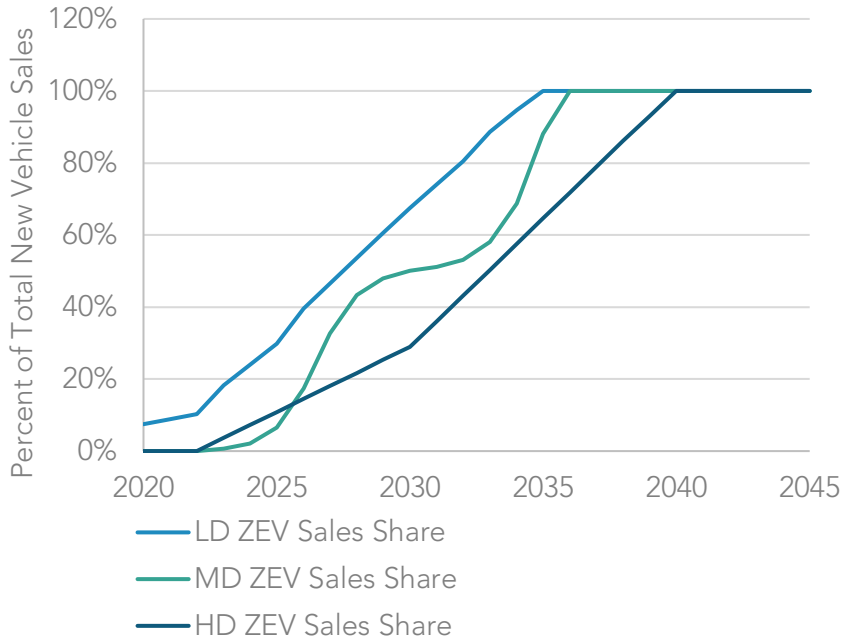
[300] CARB. Clean Cars 4 All. *https://ww2.arb.ca.gov/our-work/programs/clean-cars-4-all*. The Clean Vehicle Rebate Project (CVRP) also supports the transition to ZEVs. *https://cleanvehiclerebate.org/en*.

California truck fleet to ZEV technology. As with the LDV sector, a number of incentive programs support this transition, such as the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP).[301]

Figure 4-1 below illustrates the pace of transition in vehicle technology needed to drastically reduce GHG emissions from vehicles. All vehicle classes reach 100 percent ZEV sales before 2045, with some achieving this well before. The ZEV technology across the vehicle classes is assumed to be primarily battery electric and hydrogen fuel cell (reflecting the primary ZEV technologies available today).[302]

Figure 4-1: Transition of on-road vehicle sales to ZEV technology in the Scoping Plan Scenario



Today, off-road vehicles also rely heavily on ICE technology. Executive Order N-79-20 sets an off-road equipment target of transitioning the entire fleet to ZEV technology by 2035, where feasible. There is a great need for both investment and innovation in the off-road space in order to develop and commercialize zero emission equipment types that meet or exceed the performance of existing equipment. A number of funding sources currently support this transition, including programs such as FARMER, Carl Moyer, and

[301] California HVIP. Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project. https://californiahvip.org/?msclkid=efaf65f2c26f11eca6bdd08ecc323864.

[302] The light-duty fleet includes more than 11 million battery electric and hydrogen fuel cell vehicles in 2035 and over 23 million battery electric and hydrogen fuel cell vehicles in 2045.

the Community Air Protection Incentives—as well as Low Carbon Transportation Incentives, including the Clean Off-Road Equipment (CORE) program. In addition, the 2021–22 California budget provided record-high allocations for funding ZEVs, including off-road equipment, and the 2022–23 budget is similarly ambitious.[303] Several regulations focused on transitioning to zero emission off-road equipment have recently been adopted or are in the works, and apply to locomotives,[304] forklifts, ocean-going vessels at berth,[305] commercial harbor craft,[306] small off-road engines,[307] and more.

Intrastate aviation relies on ICE technology today, but battery-electric and hydrogen fuel cell aviation applications are in development, along with sustainable aviation fuel. The Scoping Plan Scenario includes a transition of 20% of aviation fuel demand to ZEV technologies by 2045 and sustainable aviation fuel for the rest.

Refueling infrastructure is a crucial component of transforming transportation technology. Electric vehicle chargers and hydrogen refueling stations must become easily accessible for all drivers to support a wholesale transition to ZEV technology. Deployment of ZEV refueling infrastructure is currently supported by a number of existing local and state public funding mechanisms, the new National Electric Vehicle Infrastructure (NEVI) federal funding mechanism, California's electric utilities, the Electrify America initiative that was established in response the Volkswagen ZEV commitment, and by numerous companies, such as EVgo, ChargePoint, Tesla, Ford, FirstElement Fuel, Chevron, Shell, and Iwatani, who are investing substantial private resources into developing these networks. Private investment in reliable, affordable and ubiquitous refueling infrastructure must drive the transition as the business case for ZEVs continues to strengthen.

Strategies for Achieving Success

- Achieve 100 percent ZEV sales of light-duty vehicles by 2035[308] and medium-heavy-duty vehicles by 2040.
- Achieve a 20% zero emission target for the aviation sector.

- Develop a rapid and robust network of ZEV refueling infrastructure to support the needed transition to ZEVs.
- Ensure that the transition to ZEV technology is affordable for low-income households and communities of color, and meets the needs of communities and small businesses.[309]
- Prioritize incentive funding for heavy-duty ZEV technology deployment in regions of the state with the highest concentrations of harmful criteria and toxic air contaminant emissions.[310]
- Promote private investment in the transition to ZEV technology, undergirded by regulatory certainty such as infrastructure credits in the Low Carbon Fuel Standard for hydrogen and electricity[311] and hydrogen station grants from the CEC's Clean Transportation Program[312] pursuant to Executive Order B-48-18.[313]
- Evaluate and continue to offer incentives similar to those through FARMER,[314] Carl Moyer,[315] the Clean Fuel Reward Program,[316] the Community Air Protection Program,[317] and Low Carbon Transportation,[318] including CORE.[319] Where feasible, prioritize and increase funding for clean transportation equity programs.[320]
- Continue and accelerate funding support for zero emission vehicles and refueling infrastructure through 2030 to ensure the rapid transformation of the transportation sector.

- Evaluate and align with this Scoping Plan relevant CARB policies such as Advanced Clean Cars II,[321] Innovative Clean Transit,[322] Zero Emission Airport Shuttle,[323] California Phase 2 GHG Standards,[324] Advanced Clean Trucks, Advanced Clean Fleets, Zero Emission Forklifts,[325] In-use Locomotives,[326] the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation,[327] Commercial Harbor Craft,[328] Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation,[329] carbon pricing through the Cap-and-Trade Program,[330] and the Low Carbon Fuel Standard.[331]
- Identify and address permitting and market barriers to successful rapid ZEV technology deployment while protecting public health and the environment.

Fuels

Transitioning away from conventional ICE vehicles is part of the solution, but we must ensure that an adequate supply of zero-carbon alternative fuel and distribution is available to power these vehicles. Electricity and hydrogen are currently the primary fuels for ZEVs,

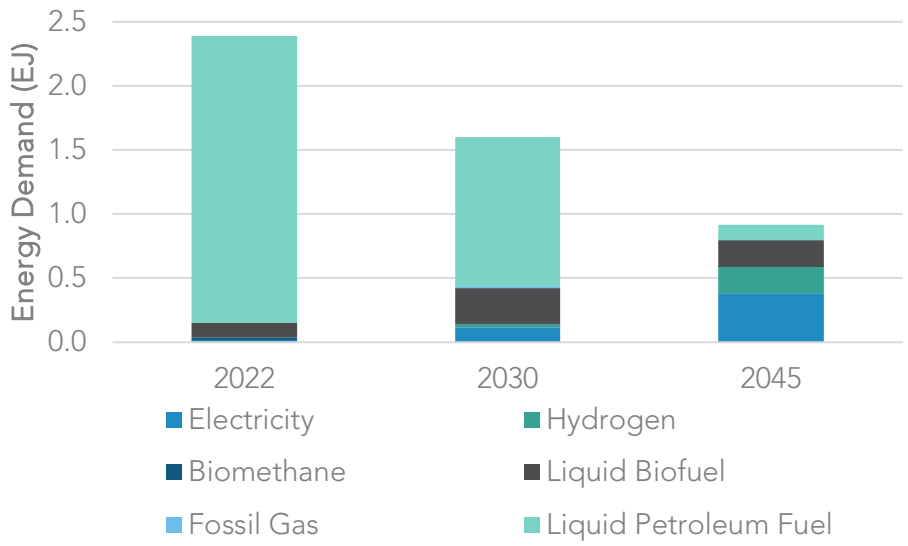
and both fuels must be produced using low-carbon technology and feedstocks to minimize upstream emissions.

The transition to complete ZEV technology will not happen overnight. Conventional ICE vehicles from legacy fleets will remain on the road for some time, even after all new vehicle sales have transitioned to ZEV technology. In addition, some equipment types are only now in the initial stages of development of ZEV technology for propulsion, such as commercial aircraft or ocean-going vessels. In addition to building the production and distribution infrastructure for zero-carbon fuels, the state must continue to support low-carbon liquid fuels during this period of transition and for much harder sectors for ZEV technology such as aviation, locomotives, and marine applications. Biomethane currently displaces fossil fuels in transportation and will largely be needed for hard-to-decarbonize sectors but will likely continue to play a targeted role in some fleets while the transportation sector transitions to ZEVs. Figure 4-2 provides the detail on fuels used in 2020 and the fuel mix under the Scoping Plan Scenario for 2035 and 2045.

Figure 4-2: Transportation fuel mix in 2022, 2030, and 2045 in the Scoping Plan Scenario[332]



Private investment in alternative fuels will play a key role in diversifying the transportation fuel supply away from fossil fuels. The Low Carbon Fuel Standard is the primary mechanism for transforming California's transportation fuel pool with low-carbon

[332] See https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-PATHWAYS-data-E3.xlsx for transportation fuels by year.

alternatives and has fostered a growing alternative fuel market. Partially as a result of the powerful market signals from the LCFS, fuels like renewable diesel, sustainable aviation fuel, biomethane, and electricity have all gained significant market shares and continue to displace gasoline and diesel in both on- and off-road vehicles. In addition, Executive Order N-79-20 calls on state agencies to support the transition of existing fuel production facilities away from fossil fuels and directs that this transition also protect and support workers, public health, safety, and the environment. In line with this direction, existing refineries could be repurposed to produce sustainable aviation fuel, renewable diesel, and hydrogen. This trend has already begun, and continuing to develop fuel production capacity in-state to support the energy transition while making the most efficient use of existing assets is critical to avoiding emissions leakage. If fuel demand persists after fuel production facilities have ceased operations, fuel demand will have to be met through imports.

As we transition or build new energy production facilities and infrastructure, it will be important to ensure low-income communities, tribes, and communities of color do not experience increases in existing air pollution disparities and continue to experience a reduction in the air pollution disparities that exist today. California must use the best available science to ensure that raw materials used to produce transportation fuels do not incentivize feedstocks with little to no GHG reductions from a life cycle perspective. A dramatic increase in alternative fuel production must not come at the expense of global deforestation, unsustainable land conversion, or adverse food supply impacts, to name a few examples. CARB will continue to monitor scientific findings on these topics to ensure that California policies, such as the LCFS, send the appropriate market signals and do not result in unintended consequences.[333]

Strategies for Achieving Success

- Accelerate the reduction and replacement of fossil fuel production and consumption in California.[334]
- Incentivize private investment in new zero-carbon fuel production in California.
- Incentivize the transition of existing fuel production and distribution assets to support deployment of low- and zero-carbon fuels while protecting public health and the environment.
- Invest in the infrastructure to support reliable refueling for transportation such as electricity and hydrogen refueling.

---

[333] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1E. *finalejacrecs.pdf (arb.ca.gov)*.
[334] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F3. *finalejacrecs.pdf (arb.ca.gov)*.

- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Initiate a public process focused on options to increase the stringency and scope of the LCFS:
    - Evaluate and propose accelerated carbon intensity targets pre-2030 for LCFS.
    - Evaluate and propose further declines in LCFS post-2030 carbon intensity targets to align with this 2022 Scoping Plan.
    - Consider integrating opt-in sectors into the program.
    - Provide capacity credits for hydrogen and electricity for heavy-duty fueling.
- Monitor for and ensure that raw materials used to produce low-carbon fuels or technologies do not result in unintended consequences.[335]

Vehicle Miles Traveled

Transforming the transportation sector goes beyond phasing out combustion technology and producing cleaner fuels. Managing total demand for transportation energy by reducing the miles people need to drive on a daily basis is also critical as the state aims for a sustainable transportation sector in a carbon neutral economy. Though GHG emissions are declining due to cleaner vehicles and fuels, rising VMT can offset the effective benefits of adopted regulations.

Even under full implementation of Executive Order N-79-20 and CARB's Advanced Clean Cars II Regulations, with 100 percent ZEV sales in the light-duty vehicle sector by 2035, a significant portion of passenger vehicles will still rely on ICE technology, as demonstrated in Figure 4-2 above. Accordingly, VMT reductions will play an indispensable role in reducing overall transportation energy demand and achieving the state's climate, air quality, and equity goals. After a significant pandemic-induced reduction in VMT during 2020, passenger VMT has steadily climbed back up and is now closing in on pre-pandemic levels.[336] Driving alone with no passengers remains the primary mode of travel in California, amounting to 75 percent of the mode share for daily commute trips. Conversely, the transit industry, which was significantly impacted during

[335] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1E. *finalejacrecs.pdf (arb.ca.gov)*.
[336] U.S. Department of Transportation. 2021. December 2021 Traffic Volume Trends. Figure 3 - Seasonally Adjusted Vehicle Miles Traveled by Month. *https://www.fhwa.dot.gov/policyinformation/travel_monitoring/21dectvt/figure3.cfm*.

the lockdown months, and has struggled to recover; ridership only averages two-thirds of pre-pandemic levels,[337] [338] and service levels also lag behind.

Sustained VMT reductions have been difficult to achieve for much of the past decade, in large part due to entrenched transportation, land use, and housing policies and practices. Specifically, historic decision-making favoring single-occupancy vehicle travel has shaped development patterns and transportation policy, generating further growth in driving (and making transit, biking and walking less viable alternatives). These policies have also reinforced long-standing racial and economic injustices that leave people with little choice but to spend significant time and money commuting long distances, placing a disproportionate burden on low-income Californians, who pay the highest proportion of their wages on housing and transportation. While CARB has included VMT reduction targets and strategies in the Scoping Plan and appendices, these targets are not regulatory requirements, but would inform future planning processes. CARB is not setting regulatory limits on VMT in the 2022 Scoping Plan; the authority to reduce VMT largely lies with state, regional, and local transportation, land use, and housing agencies, along with the Legislature and its budgeting choices.

Appendix E (Sustainable and Equitable Communities) elaborates on reasons for reducing VMT and identifies a series of policies that, if implemented by various responsible authorities, could help to achieve the recommended VMT reduction trajectory included in this Scoping Plan (and related mode share increases for transit and active transportation). These policies aim to advance four strategic objectives:

1. Align current and future funding for transportation infrastructure with the state's climate goals, preventing new state-funded projects from inducing significant VMT growth and supporting an ambitious expansion of transit service and other multimodal alternatives.
2. Move funding for transportation beyond the gasoline and diesel taxes and implement fuel-agnostic pricing strategies that accomplish more productive uses of the roadway network and generate revenues to further improve transit and other multimodal alternatives.
3. Deploy autonomous vehicles, ride-hailing services, and other new mobility options toward high passenger-occupancy and low VMT-impact service models that complement transit and ensure equitable access for priority populations.
4. Encourage future housing production and multi-use development in infill locations and other areas in ways that make future trip origins and destinations

[337] U.S. Government Accountability Office. January 25, 2022. During COVID-19, Road Fatalities Increased and Transit Ridership Dipped. *https://www.gao.gov/blog/during-covid-19-road-fatalities-increased-and-transit-ridership-dipped*.
[338] American Public Transportation Association. APTA - Ridership Trends. *https://transitapp.com/APTA*.

closer together and create more viable environments for transit, walking, and biking.

The pace of change to reduce VMT must be accelerated. Certainly, structural reform will be challenging, but California has demonstrated time and again that it possesses the collective leadership and commitment to break away from ideas that no longer represent Californians' values and their aspirations for the many generations to come.

Strategies for Achieving Success

- Achieve a per capita VMT reduction of at least 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045. [339]
- Reimagine new roadway projects that decrease VMT in a way that meets community needs and reduces the need to drive.
- Invest in making public transit a viable alternative to driving by increasing affordability, reliability, coverage, service frequency, and consumer experience.[340]
- Implement equitable roadway pricing strategies based on local context and need, reallocating revenues to improve transit, bicycling, and other sustainable transportation choices.[341]
- Expand and complete planned networks of high-quality active transportation infrastructure.[342]
- Channel the deployment of autonomous vehicles, ride-hailing services, and other new mobility options toward high passenger-occupancy and low VMT-impact service models that complement transit and ensure equitable access for priority populations.
- Streamline access to public transportation through programs such as the California Integrated Travel Project.
- Ensure alignment of land use, housing, transportation, and conservation planning in adopted regional plans, such as regional transportation plans (RTP)/ sustainable communities strategies (SCS), regional housing needs assessments (RHNA), and local plans (e.g., general plans, zoning, and local transportation plans), and develop tools to support implementation of these plans.

[340] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1D. finalejacrecs.pdf (arb.ca.gov).
[341] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1D. finalejacrecs.pdf (arb.ca.gov).
[342] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1F. finalejacrecs.pdf (arb.ca.gov).

- Accelerate infill development and housing production at all affordability levels in transportation-efficient places, with a focus on housing for lower-income residents.

Clean Electricity Grid

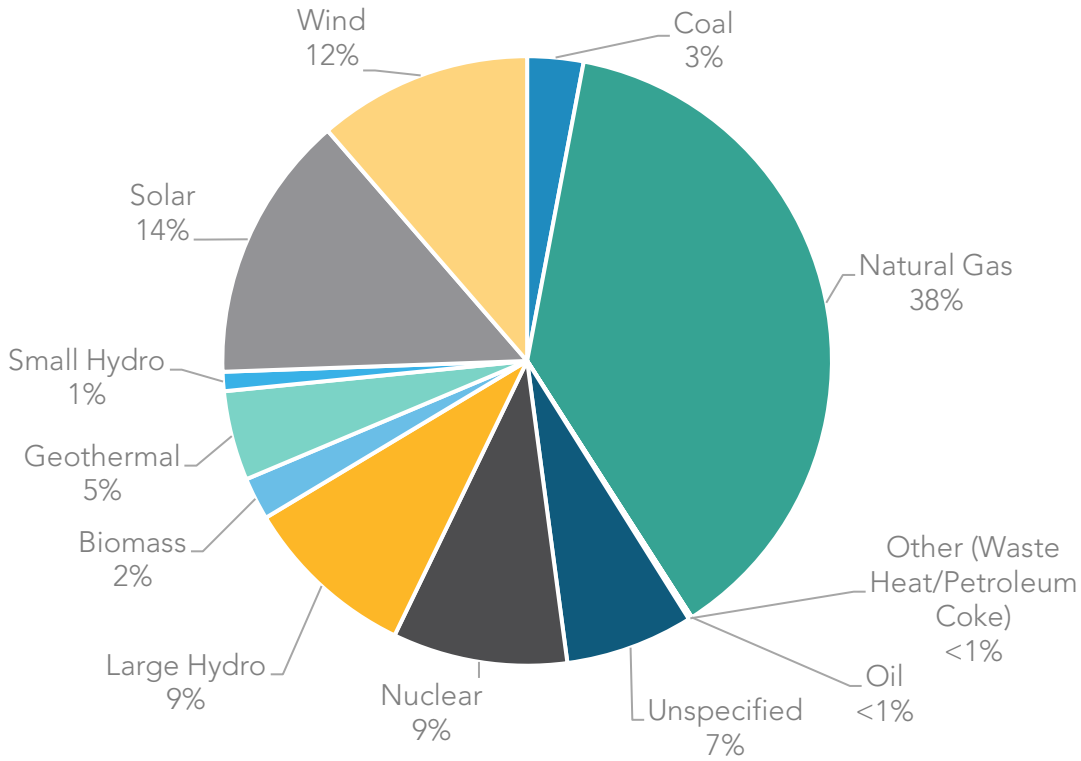
Much of the state's success to date in reducing GHGs is due to decarbonization of the electricity sector as a result of the RPS, SB 100 implementation, and the Cap-and-Trade Program. Moving forward, a clean, affordable, and reliable electricity grid will serve as a backbone to support deep decarbonization across California's economy. Under this Scoping Plan, the role of electricity in powering the economy will grow in almost every sector.

In 2021, 70 percent of California electricity demand was served by in-state power plants totaling about 82 GW, with the rest coming from out-of-state imports.[343] Additionally, approximately 8 GW of customer solar photovoltaic capacity has been installed to date to help with in-state demand.[344] Figure 4-3 shows the breakdown of in-state and imported sources of electricity.

[343] CEC. 2021. Electric Generation Capacity and Energy. Data available at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/electric-generation-capacity-and-energy and CEC. 2021. Total System Electric Generation. Data available at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation. Capacity values are nameplate capacity from sources 1 MW and larger.

[344] CEC. 2021. *SB 100 Joint Agency Report Summary: Achieving 100% Clean Electricity in California, An Initial Assessment.* 10. https://www.energy.ca.gov/publications/2021/2021-sb-100-joint-agency-report-achieving-100-percent-clean-electricity.

Figure 4-3: 2021 total system electric generation (based on GWh)[345]



Note: Imports contributing to total system generation are comprised of 58% zero-carbon energy and 42% non-renewable and unspecified energy. Percentages do not add to exactly 100 due to rounding.

In 2021, about 48 percent of electricity generation serving California came from non-renewable and unspecified[346] resources, while 52 percent came from renewable and zero-carbon resources. The state's Strategic Reliability Reserve, established in AB 205 to provide additional reliability insurance during extreme events, may make three of the fossil gas-fired OTC plants planned for retirement available to support the grid on a limited basis after 2023. The state also adopted legislation to facilitate extension of the Diablo Canyon Nuclear Power Plant for five years beyond its 2025 planned closure.[347] At the

[345] *Total system generation* is the sum of all utility-scale, in-state generation, plus net electricity imports. CEC. 2021 Total System Electricity Generation. https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation.

[346] *Unspecified power* refers to electricity that is not traceable to a specific generating facility, such as electricity traded through open market transactions. It typically consists of a mix of resources and may include renewables.

[347] In accordance with SB 846 (Dodd, Chapter 239, Statutes of 2022).

same time, the state continues to rapidly expand deployment of clean energy generation and storage resources and plan for increased electrification.[348] This is critical to reducing GHG emissions and addressing the long-term impacts of climate change.

Climate change is causing unprecedented stress on California's energy system—driving high demand and constraining supply. Heat, drought, and wildfires can both reduce electricity supply from reductions in hydropower generation and impacts on generation and transmission performance, and increase demand, especially in the evening hours when solar generation is declining.

California has experienced three straight years of energy reliability challenges, including a multi-day extreme heat event across the western United States with temperatures up to 20 degrees above normal in California, resulting in rotating outages in August 2020. In 2021, heat waves in June prompted a Grid Warning and the onset of emergency conditions, and the Bootleg Fire caused the loss of one transmission line, reducing import capability by 3,000 megawatts into the California Independent System Operator (CAISO) balancing authority area. And from August 31–September 9, 2022, a 10-day extreme heat event resulted in an unprecedented, sustained period of high peak loads in the CAISO system, averaging 47,000 MW and maxing at an all-time record of over 52,000 MW on September 6. The Western region also hit its record peak load on September 6, at 167.5 GW.

Reliable electricity service was maintained throughout the 10-day September 2022 heat wave in spite of the record breaking load levels. Factors that contributed to this outcome include the installation of over 3,500 MW of lithium-ion battery storage since summer 2020, enhanced coordination and communication within and outside of California, engagement with customer groups and other stakeholders, state actions to reduce load during critical times, and the additional capacity provided through the Strategic Reliability Reserve and other new state programs authorized in the 2022 Budget to provide load reduction and support the grid in extreme events. CEC, CPUC, CAISO, and the California Department of Water Resources will continue to build out strategies to enhance reliability in light of the increasing and compounding impacts of climate change on the electricity system.

[348] In June 2021, the CPUC adopted D.21-06-035 directing procurement of 11,500 MW of new capacity between 2023 and 2026 to ensure systemwide electric reliability as Diablo Canyon and several OTC facilities retire. It requires that, out of the 11,500 MW, 2,500 MW must be from zero-emission resources. Additionally, 2,000 MW must be long lead-time resources, with at least 1,000 MW of long-duration storage and 1,000 MW of firm capacity with zero on-site emissions or that qualifies under the RPS eligibility requirements.

While the electricity sector is using less fossil fuel due to increasing amounts of renewables,[349] existing fossil gas generation will continue to play a critical role in grid reliability until other clean, dispatchable alternatives can be deployed at scale. The integration of greater amounts of variable renewable generation resources[350] is changing power system planning and operations, and system operators need resources with flexible attributes to balance shifting supply and demand.

High levels of solar generation can lead to instances of oversupply during the middle of the day, when the sun is brightest.[351] In the evening hours, as the sun is setting, solar generation declines to zero and customers with solar generation shift back to the electric grid. In hot weather, customer demand remains high well into the summer evening period to power air conditioning, which can lead to reliability challenges.[352]

Figure 4-4 shows the energy sources used throughout one summer day in July. Renewable energy is consistent during the middle of the day, but it cannot meet all of the evening demand in the gray area. As illustrated in the figure, fossil gas generation is currently a resource that is typically ramped up to meet this evening demand as solar production begins to drop and electrical loads increase To help address this challenge, resource installations that pair solar with batteries, as well as a greater amount of battery build-out, are coming online currently and over the next five years. Nevertheless, the state's electricity grid is expected to be stressed further in the coming years by heat waves, drought, wildfires, and the growing intermittent power supply from renewables. California must accelerate deployment of diverse clean energy resources to maintain reliability and affordability in the face of climate change.

---

[349] CARB. 2022. *California Greenhouse Gas Emissions for 2000 to 2020.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf.

[350] A *variable renewable generation resource* is a renewable source of electricity that is non-dispatchable due to its fluctuating nature and only produces electricity when weather conditions are right, such as when the sun is shining or the wind is blowing. Renewable resources that can be controlled and are dispatchable include geothermal, biomass, and dam-based hydroelectric power.

[351] *Brightness* is used colloquially here; solar energy depends on insolation (e.g., sun-hours), which is the measurement of cumulative solar energy that reaches an area over a period of time.

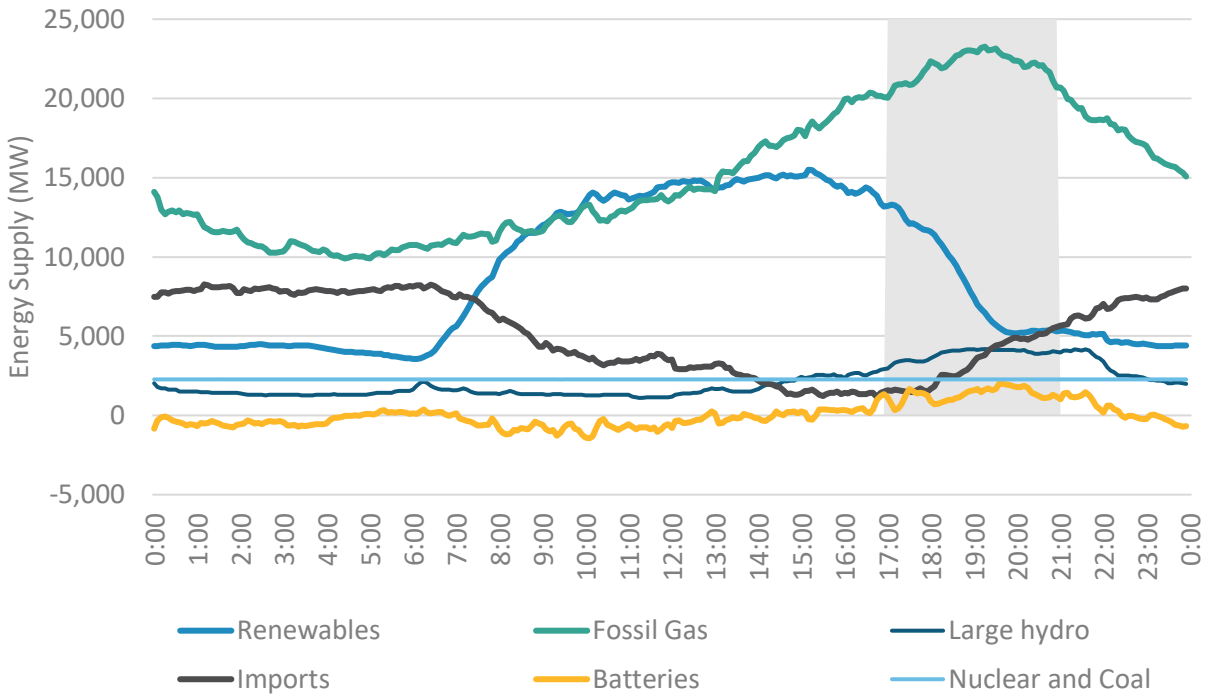
Figure 4-4: Electricity supply trend by resource for a California summer day, July 2022



Sector Transition

Decarbonizing the electricity sector is a crucial pillar of this Scoping Plan. It depends on both using energy more efficiently and replacing fossil-fueled generation with renewable and zero carbon resources, including solar, wind, energy storage,[353] geothermal, biomass, and hydroelectric power. The RPS Program[354] and the Cap-and-Trade Program continue to incentivize dispatch of renewables over fossil generation to serve state demand. SB 100 increased RPS stringency to require 60 percent renewables by 2030 and for California to provide 100 percent of its retail sales[355] of electricity from renewable and zero-carbon resources by 2045. Furthermore, SB 1020 has added interim targets to

[353] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF1, NF2. *finalejacrecs.pdf (arb.ca.gov)*.

[354] The CEC estimates that 36 percent of California's 2019 retail electricity sales was served by RPS-eligible renewable resources (see CPUC. 2021. CPUC Perspectives on Electric Sector Decarbonization. *https://ww2.arb.ca.gov/sites/default/files/2021-11/CPUC-sp22-electricity-ws-11-02-21.pdf*).

[355] SB 100 speaks only to retail sales and state agency procurement of electricity. The *2021 SB 100 Joint Agency Report* interprets this to mean that other loads—wholesale or non-retail sales and losses from storage and transmission and distribution lines—are not subject to the law.

SB 100's policy framework to require renewable and zero-carbon resources to supply 90 percent of all retail electricity sales by 2035 and 95 percent of all electricity retail sales by 2040; the governor has asked the CEC to establish a planning goal of at least 20 GW of offshore wind by 2045; and the governor directed that state agencies plan for an energy transition that avoids the need for new fossil gas capacity to meet California's long-term energy goals.[356] In addition to grid-level resources, state efforts have supported rapid growth of the distributed solar industry through key actions like the California Solar Initiative (SB 1, Murray, Chapter 132, Statues of 2006).[357] Steps to commercialize microgrids powered by clean resources[358] are also being examined as part of SB 1339 (Stern, Chapter 566, Statutes of 2018).[359]

California also continues to advance its appliance and building energy efficiency standards to reduce growth in electricity consumption and meet the SB 350 goal to double statewide energy efficiency savings in electricity and fossil gas end uses[360] by 2030. In 2018, the CEC adopted a building energy efficiency code requiring most new homes to have solar photovoltaic systems[361] (or be powered by a solar array nearby) starting January 1, 2020. In 2019, California reached the milestone of 1 million solar rooftop installations.

Increased transportation and building electrification and continued policy commitment to behind-the-meter solar and storage will continue to drive growth of microgrids and other distributed energy resources (DER).[362] The CPUC's High-DER proceeding is examining how to prepare the electric grid for a high DER future by determining how to integrate

[356] Newsom, Gavin. July 22, 2022. Letter from Governor Newsom to CARB Chair Liane Randolph. *https://www.gov.ca.gov/wp-content/uploads/2022/07/07.22.2022-Governors-Letter-to-CARB.pdf*.
[357] More information on the program, which closed in 2016, can be found on the CPUC website, including annual program assessment reports, at: *https://www.cpuc.ca.gov/industries-and-topics/electrical-energy/demand-side-management/california-solar-initiative*.
[358] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, In part (NF2, NF13). *finalejacrecs.pdf (arb.ca.gov)*.

[360] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF1, ES1. *finalejacrecs.pdf (arb.ca.gov)*.
[361] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF2. *finalejacrecs.pdf (arb.ca.gov)*.
[362] Distributed energy resources include rooftop solar and other distributed renewable generation resources, energy storage, electric vehicles, time variant and dynamic electric rates, flexible load management, demand response, and energy efficiency technologies.

millions of DERs within the distribution grid to maximize societal and ratepayer benefits from DERs while ensuring grid reliability and affordable rates.[363]

SB 350 also aims to connect long-term planning for electricity needs with the state's climate targets. This is primarily accomplished through CARB's establishment of 2030 GHG emissions targets for the electricity sector in general and for each electricity provider, which inform the CPUC and publicly owned utilities' integrated resource planning. A GHG planning target range of 30 to 53 MMTCO_2e—informed by the 2017 Scoping Plan—was originally developed and adopted by CARB in 2018. In its 2021 IRP planning cycle, the CPUC adopted a 38 MMT GHG target for the electricity sector in 2030, which drops to 35 MMT in 2032.[364]

The Scoping Plan Scenario incorporates SB 350's energy efficiency doubling goal, aligns with the CPUC's IRP 2030 GHG target and latest GHG emissions benchmarks through 2035,[365] the governor's 20 GW offshore wind and no new gas generation[366] goals, and SB 100's 2030 RPS and 2045 zero-carbon retail sales targets to reduce dependence on fossil fuels in the electricity sector by transitioning substantial energy demand to renewable and zero-carbon resources.[367] As described in Chapter 2, CCS is applied in limited sectors, including on 16.7 MMT of CO_2 from existing fossil gas electricity generation in 2045, to ensure the state achieves the 85 percent reduction in anthropogenic emissions required by AB 1279. Continued transition to renewable and

---

[363] The High-DER proceeding is one of four "anchor" proceedings in the CPUC's DER Action Plan 2.0 and is within the Action Plan's infrastructure track. Information on the High-DER proceeding is available at: *https://www.cpuc.ca.gov/industries-and-topics/electrical-energy/infrastructure/distribution-planning*. The Action Plan can be accessed at: *https://www.cpuc.ca.gov/about-cpuc/divisions/energy-division/der-action-plan*.

[364] The February 10, 2022, Decision 22-02-004 by the CPUC adopts the 2021 Preferred System Plan, completing the 2019–21 IRP cycle. *https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M451/K412/451412947.PDF*. The Decision requires load serving entities to submit plans in the next IRP cycle detailing how they will meet their proportionate share of a 30 MMT electric sector target, as well as a 38 MMT GHG target.

[365] June 15, 2022, Administrative Law Judge's Ruling for 2022 integrated resource plan filings specifies the need for GHG targets to plan for in 2035 to continue progress toward the 2045 goal. The ruling proposes a straight-line projection from the GHG planning target for 2030. Corresponding to the adopted Preferred System Plan in D.22-02-004, 38 MMT in 2030 leads to a target of 30 MMT in 2035. *https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M485/K625/485625915.PDF*.

[366] The governor's July 22, 2022, letter specifies no new gas generation but does not place any constraints on existing gas resources. Therefore, for purposes of RESOLVE electricity sector modeling, existing gas capacity is an available resource that is able to be reduced over time based on announced retirements or if selected for retirement by the model.

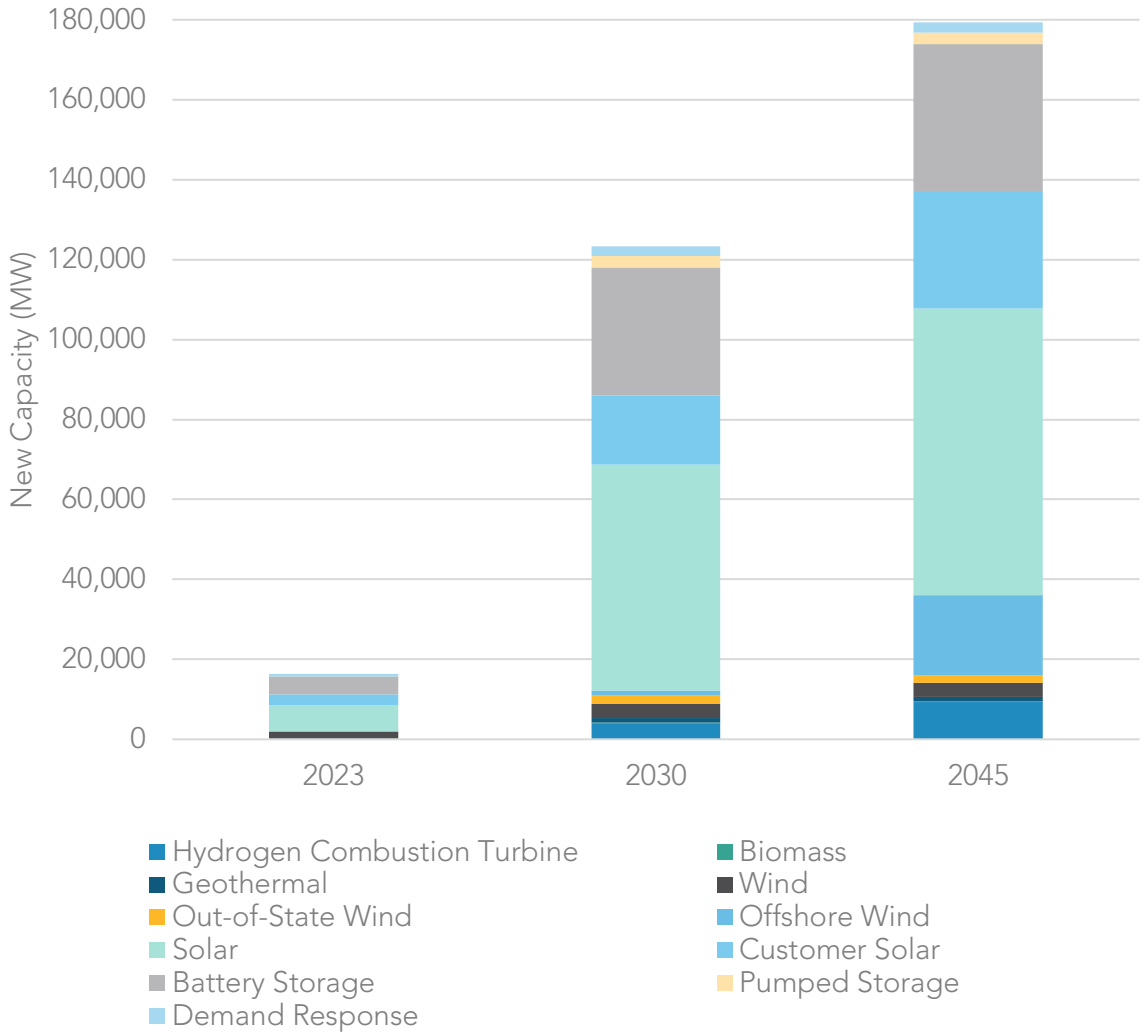
[367] CARB. 2021. PATHWAYS Scenario Modeling: 2022 Scoping Plan Update – Attachment B: Generation Technologies to be included in Modeling. *https://ww2.arb.ca.gov/sites/default/files/2021-12/Revised_2022SP_ScenarioAssumptions_15Dec.pdf*.

zero-carbon electricity resources will enable electricity to become a zero-carbon substitute for fossil fuels across the economy.

Figure 4-5 shows the modeled resource capacity to meet the SB 100 retail sales target.[368] Energy efficiency moderates some of the need for additional electricity generation. However, that is quickly surpassed by growing electricity demand of 26 percent by 2030 and 76 percent by 2045 compared to today (2022) from increased population and electrification of other sectors, as shown in Figure 4-6. The estimated resource build needed to meet this level of demand amounts to approximately 72 GW of utility solar[369] and 37 GW of battery storage by 2045. Annual build rates (over the 2022–2035 period) for the Scoping Plan Scenario will need to increase by about 60 percent and over 700 percent for utility solar and battery storage, respectively, compared to historic maximum rates.[370] To reach the 2045 target, the state will need to quadruple its current level of wind and solar capacity. This does not include capacity associated with hydrogen production nor mechanical CDR, which was modeled off-grid; assuming hydrogen production via electrolysis, this would roughly be equivalent to an additional 10 GW[371] of solar generation needed in 2045, and an additional 64 GW of solar generation for direct air capture in 2045. The scale of solar and battery build rates needed could be reduced through the commercialization of new zero-carbon technologies.

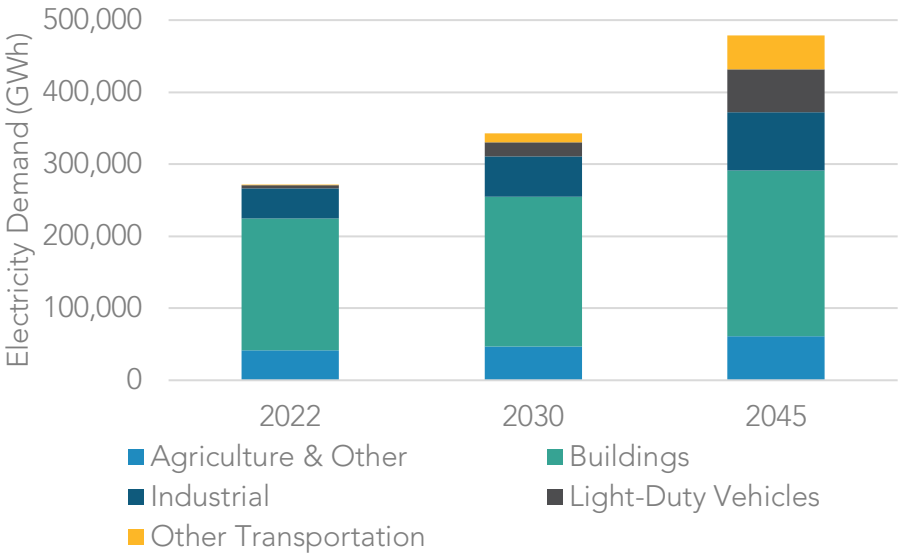
[368] SB 846 requires that load-serving entities exclude energy, capacity, or any attribute from the Diablo Canyon power plant in their resource plans. The Scoping Plan Scenario excludes energy, capacity, or any attribute from the Diablo Canyon power plant after the prior planned retirement date of 2025.
[369] The amount of additional customer solar included in the Scoping Plan Scenario is 29,208 MW by 2045.
[370] E3. 2022. CARB Scoping Plan: AB32 Source Emissions Final Modeling Results. PowerPoint. *https://ww2.arb.ca.gov/sites/default/files/2022-11/SP22-MODELING-RESULTS-E3-PPT.pdf*. Build rates are from EIA data historical builds in the 2011–2021 time frame.
[371] The estimate does not include hydrogen production assumed to be produced with bioenergy with carbon capture and storage (BECCS) and steam methane reforming (SMR).

Figure 4-5: Projected new electricity resources needed by 2045 in the Scoping Plan Scenario[372]



[372] See https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-PATHWAYS-data-E3.xlsx for the capacity build-out by resource type.

Figure 4-6: Electric loads in 2022, 2030 and 2045 for the Scoping Plan Scenario[373]



This transformation will drive investments in a large fleet of generation and storage resources but will also require significant transmission to accommodate these new capacity additions. Transmission needs include high-voltage lines to access out-of-state resources and major in-state generation pockets. In consideration of typical 8- to 10-year lead times for many projects, the CAISO published its first 20-Year Transmission Outlook to inform transmission planning focused on meeting the needs identified through the 2021 SB 100 Joint Agency Report process. The outlook calls for significant transmission development to access offshore wind and out-of-state wind and reinforce the existing CAISO footprint at an estimated cost of $30.5 billion.[374]

Presently, fossil gas power plants provide about 75 percent of the flexible capacity for grid reliability as more renewable power enters the system. Moving forward, other resources such as storage and demand-side management are essential to maintain reliability with high concentrations of renewables. Hydrogen produced from renewable resources and renewable feedstocks can serve a dual role as a low-carbon fuel for existing combustion turbines or fuel cells, and as energy storage for later use. Reliability

[373] *Other Transportation* includes all non-light-duty vehicles and reflects electrification of modes like passenger and freight rail, aviation, and ocean-going vessels.
[374] CAISO. 2022. *20 Year Transmission Outlook.* http://www.caiso.com/InitiativeDocuments/20-YearTransmissionOutlook-May2022.pdf.

also can be supported through increased coordination and markets in the interconnected western power grid; this is already helping to better integrate renewables.[375]

Strategies for Achieving Success

- Use long-term planning processes (Integrated Energy Policy Report, IRP, CAISO Transmission Planning Process, AB 32 Climate Change Scoping Plan) to support grid reliability and expansion of renewable and zero-carbon resource and infrastructure deployment.
- Complete systemwide and local reliability assessments across CAISO and other balancing authority areas, using realistic assumptions for land use, build rates, statewide and distribution system level constraints, and energy needs. Such assessments should be completed before state agencies update their electricity sector GHG targets.
- Prioritize actions to mitigate impacts to electricity reliability and affordability and provide sufficient flexibility in the state's decarbonization roadmap for adjustments as may be needed.
- Facilitate long lead-time resource development through the IRP and the SB 100 interagency process and through technology development and demonstration funding[376] that includes resources such as long-duration energy storage and hydrogen production.
- Continue coordination between energy agencies and energy proceedings to maximize opportunities for demand response.
- Continue to explore the benefits of regional markets to enhance decarbonization, reliability, and affordability.
- Address resource build-out challenges, including permitting, interconnection, and transmission network upgrades.
- Explore new financing mechanisms and rate designs to address affordability.[377]
- Per SB 350, double statewide energy efficiency savings in electricity and fossil gas end uses by 2030, through a combination of energy efficiency and fuel substitution actions.[378]
- Per SB 100 and SB 1020, achieve 90 percent, 95 percent, and 100 percent

[375] CEC. 2021. *2021 SB 100 Joint Agency Report – Achieving 100 Percent Clean Electricity in California: An Initial Assessment.* Publication Number: CEC-200-2021-001.

renewable and zero-carbon retail sales by 2035, 2040, and 2045, respectively.

- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Target programs and incentives to support and improve access to renewable and zero-carbon energy projects (e.g., rooftop solar, community owned or controlled solar or wind, battery storage, and microgrids) for communities most at need, including frontline, low-income, rural, and indigenous communities.[379]
- Prioritize public investments in zero-carbon energy projects to first benefit the most overly burdened communities affected by pollution, climate impacts, and poverty.[380]

Sustainable Manufacturing and Buildings

Fossil gas is the primary gaseous fossil fuel used to produce heat at industrial facilities, as well as in residential and commercial buildings. In buildings, space and water heating, cooking, and clothes drying all rely on gaseous fuels today. Industrial processes that require heat for conventional boilers and other processes also rely on gaseous fuels. Refineries rely on fossil gas and other gaseous fossil fuels, like liquefied petroleum gas and refinery fuel gas, and fossil gas is also used to generate electricity, as discussed earlier.

Gaseous fossil fuel use can be displaced by four primary alternatives: zero-carbon electricity, solar thermal heat, hydrogen, and biogas/biomethane. Displacing gaseous fossil fuel use can yield indoor air quality benefits, protect public health and property from unexpected fossil gas leaks, and reduce short-lived climate pollutants, which are many times more potent in affecting climate change than CO_2. The Scoping Plan Scenario reduces dependence on fossil gas in the industrial and building sectors by transitioning substantial energy demand to alternative fuels. Reducing fossil gas combustion also will help toward achieving our air quality and equity goals by reducing pollution in neighboring areas and communities. In addition, reduced dependence on gasoline and diesel in the transportation sector diminishes the need for gaseous fossil fuels to support oil and gas production and petroleum refining operations as those are phased down relative to the demand.

Sector Transition

Industry

California's industrial sector contributes significantly to the state's economy, with a total output from manufacturing in 2019 of $324 billion (10.4 percent of the state total)[381] and employment of 1,222,000 manufacturing jobs (7.6 percent of the total state workforce).[382] California industry includes a diverse range of facilities, including cement plants, refineries, glass manufacturers, oil and gas producers, paper manufacturers, mining operations, metal processors, and food processors. Combustion of fossil gas, other gaseous fossil fuels, and solid fossil fuels provide energy to meet three broad industry needs: electricity, steam, and process heat. Non-combustion emissions result from fugitive emissions and from the chemical transformations inherent to some manufacturing processes. About 20 percent of the GHG emissions from the industrial sector are non-combustion emissions.

Decarbonizing industrial facilities depends upon displacing fossil fuel use with a mix of electrification, solar thermal heat, biomethane, low- or zero-carbon hydrogen, and other low-carbon fuels to provide energy for heat and reduce combustion emissions. Emissions also can be reduced by implementing energy efficiency measures and using substitute raw materials that can reduce energy demand and some process emissions. Some remaining combustion emissions and some non-combustion CO_2 emissions can be captured and sequestered. The strategy employed will depend on the industrial subsector and the specific processes utilized in production. The left side of Figure 4-7 illustrates the fuels used to meet industrial manufacturing energy demand in 2020. Industrial manufacturing energy demand needs to transition to the fuel mix shown for 2035 and 2045. The right side of Figure 4-7 illustrates the fuel mix needed to meet the energy demand of oil and gas extraction and petroleum refining operations for the same years. Energy demand in this portion of the industrial sector declines along with decreased demand for gasoline and diesel in the transportation sector. In both figures there is a continuing demand for fossil gas due to lack of non-combustion technologically feasible or cost-effective alternatives for certain industrial sectors. Policies that support decarbonization strategies like electrification, use of renewable energy, and transition to alternative fuels are needed.

---

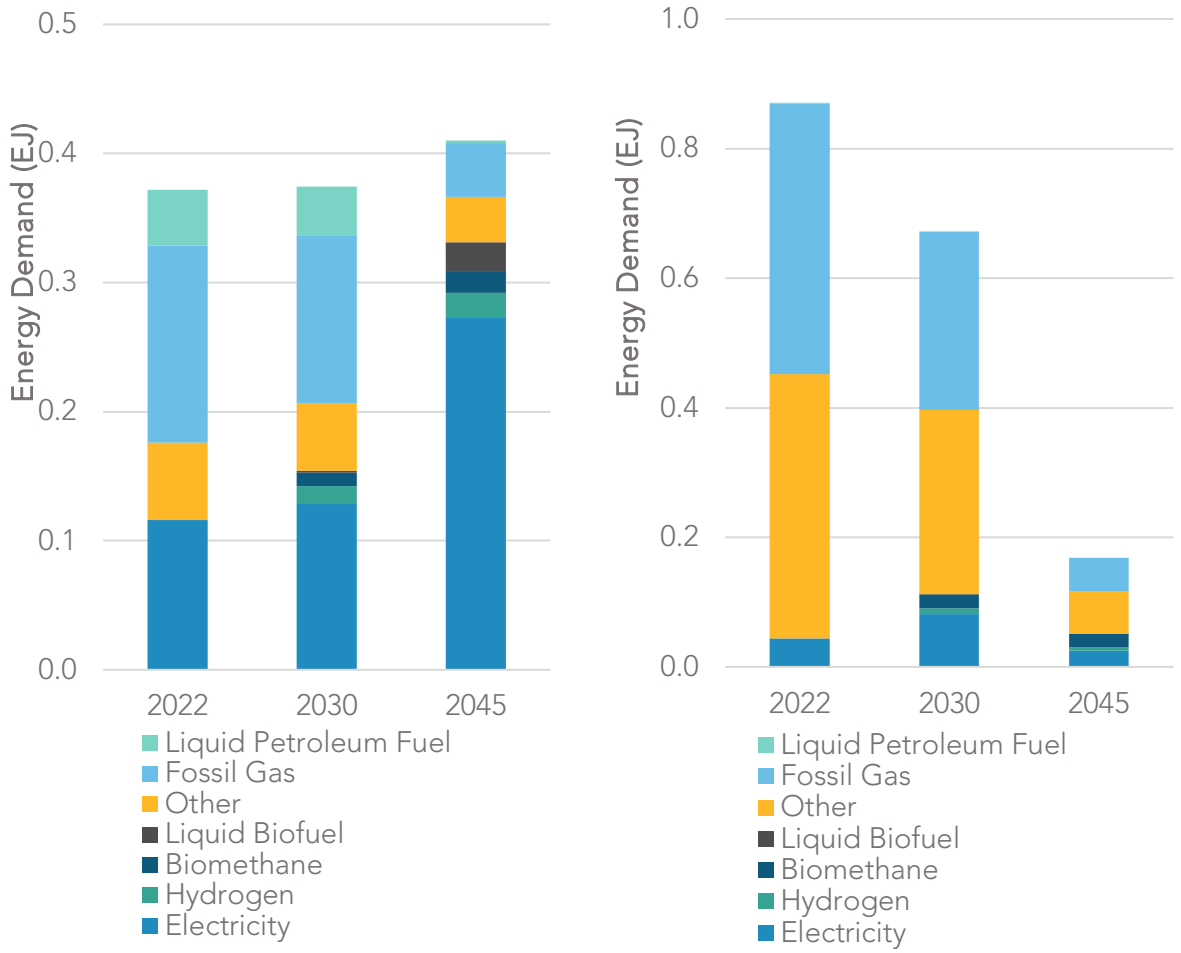
[382] NAM. 2021 California Manufacturing Facts. https://www.nam.org/state-manufacturing-data/2021-california-manufacturing-facts/.

Figure 4-7: Final energy demand in industrial manufacturing (left) and in oil and gas extraction and petroleum refining (right) in 2022, 2030, and 2045 in the Scoping Plan Scenario[383]



Electrification and solar thermal heat are best-suited to industrial processes that have relatively low heat requirements, such as food processors, paper mills, and industries that use low-pressure steam in their processes. Approaches could include replacing fossil gas boilers with electric boilers, process heaters with industrial electric heat pumps, steel forging furnaces with induction heaters, and implementing other sector-specific process electrification. Under current rate structures for industrial electricity and fossil gas in

[383] *Other* fuel in the industrial manufacturing sector is primarily coke and coal for cement production. *Other* fuel in the petroleum refining sector is primarily fossil gas associated with refining petroleum products.

California, most projects to electrify a fossil gas-powered industrial process will face operating cost barriers and potential reliability concerns. Microgrids powered by renewable resources and with battery storage are emerging as a key enabler of electrification and decarbonization at industrial facilities.

There are fewer commercially available and economically viable electrification options to replace industrial processes that require higher-temperature heat. For these processes, onsite combustion may continue to be needed, and decarbonization will require fuel substitution to hydrogen,[384] biomethane, or other low-carbon fuels. Fuel substitution and continued combustion will require monitoring and mitigation of any potential air quality impacts, especially in low-income and communities of color which already face disproportionate air pollution burdens. Industries in California with high heat needs include steel forging, glass manufacturing, and industries with calcination processes, such as manufacturing lime and cement.

Onsite emissions from cement manufacturing derive from two main sources: (1) fuel combustion to heat the kiln to a very high temperature and (2) process CO_2 emissions from the chemical transformation of limestone. Over 60 percent of emissions from the sector are process emissions unrelated to fuel use, and most emissions related to fuel use are from coal and petroleum coke combustion. Process emissions from cement manufacturing are significant and will continue even if the sector were to operate using only zero-carbon fuels; thus carbon capture and use/sequestration will be a likely component of any strategy to fully decarbonize cement manufacturing. There are additional opportunities to reduce GHG emissions from cement manufacturing via the combination of fuel-switching to low-carbon fuels (e.g., biomethane, municipal solid waste, biochar), increased blending of non-clinker materials, and efficiency improvements. High technological and economic barriers exist to electrifying kiln process heat at cement plants, as clinker production requires temperatures in excess of 1,500°C. There are potential decarbonization opportunities throughout the value chain of cement use, including in cement manufacturing, concrete mixing, and construction practices.[385] SB 596 (Becker, Chapter 246, Statutes of 2021), which was signed by Governor Newsom in September 2021, requires CARB to develop a comprehensive strategy for cement use in California to achieve a GHG intensity 40 percent below 2019 levels by 2035, and net-zero emissions by 2045.

"Industrial decarbonization via hydrogen: A critical and systematic review of developments, socio-technical systems and policy options." *Energy Research & Social Science* 80. 102208, ISSN 2214-6296. *https://doi.org/10.1016/j.erss.2021.102208*.

[385] California Nevada Cement Association. Achieving Carbon Neutrality in the California Cement Industry. *https://cncement.org/attaining-carbon-neutrality*.

Oil and gas extraction and refining make up over half of California's industrial GHG emissions. Reduced demand for transportation fossil fuels corresponds to reduced supply of fossil gas and other gaseous fossil fuels for refineries to produce these fuels. Some refining operations will continue to operate to produce fossil fuel for the remaining transportation energy demands, along with renewable diesel and sustainable aviation fuel, as discussed in the Transportation Sustainability section of this chapter.

Across industrial subsectors and processes, California facilities also could realize significant reductions in GHG emissions and energy-related costs by implementing advanced energy efficiency projects and tools.[386] While enhanced operation and maintenance practices are typical at industrial facilities, additional strategic energy management practices offer greater efficiency gains by focusing on setting goals, tracking progress, and reporting results.

Strategies for Achieving Success

- Maximize air quality benefits using the best available control technologies for stationary sources in communities most in need, including frontline, low-income, disadvantaged, rural, and tribal communities.[387]
- Prioritize alternative fuel transitions first in communities most in need, including frontline, low-income, disadvantaged, rural, and tribal communities.[388]
- Invest in research and development and pilot projects to identify options to reduce materials and process emissions along with energy emissions in California's industrial manufacturing facilities, leveraging programs like the CEC's Electric Program Investment Charge (EPIC).[389]
- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Support electrification with changes to industrial rate structures.
- Develop infrastructure for CCS and hydrogen production to reduce GHG emissions where cost-effective and technologically feasible non-combustion alternatives are not available.
- Implement SB 905.

- Establish markets for low-carbon products and recycled materials using Buy Clean California Act and other mechanisms relying on robust data
- Develop a net-zero cement strategy to meet SB 596 targets for the GHG intensity of cement use in California.
- Continue to leverage energy-efficiency programs, including the U.S. DOE's ENERGY STAR program,[390] U.S. DOE's Superior Energy Performance program,[391] and ISO 50001.[392]
- Evaluate and continue to offer incentives to install energy efficiency and renewable energy technologies through programs such as CPUC decisions as part of rulemaking R.19-09-009[393] and the CEC's Food Production Investment Program (FPIP) and EPIC programs.[394]
- Leverage low-carbon hydrogen programs, including the Bipartisan Infrastructure Law, for regional hydrogen hubs, hydrogen electrolysis, and hydrogen manufacturing and recycling.
- Evaluate the role of hydrogen in meeting GHG emission reductions, including policy recommendations regarding the use of hydrogen in California as required by SB 1075.
- Address cost barriers to promote low-carbon fuels for hard-to-electrify industrial applications.

Buildings

Buildings have cross-sector interactions that influence our public health and well-being and affect land use and transportation patterns, energy use, water use, and indoor and outdoor environments.[395] There are about 14 million existing homes and over 7.5 billion square feet of existing commercial buildings[396] in California. Fossil gas supplies about half of the energy consumed by end uses in these buildings. In addition to GHG emissions, fossil gas usage in buildings also produces CO_2, NOx, $PM_{2.5}$, and

[396] CEC. 2021. California Building Decarbonization Assessment. https://efiling.energy.ca.gov/GetDocument.aspx?tn=239311&DocumentContentId=72767.

formaldehyde.[397] Each year, about 120,000 new homes[398] and more than 100 million-square feet[399] of commercial buildings are newly constructed across California. These new buildings will represent between a third to half of the total building stock by mid-century.

Achieving carbon neutrality must include transitioning away from fossil gas in residential and commercial buildings, and will rely primarily on advancing energy efficiency while replacing gas appliances with non-combustion alternatives. This transition must include the goal of trimming back the existing gas infrastructure so pockets of gas-fueled residential and commercial buildings do not require ongoing maintenance of the entire limb for gas delivery. Blending low-carbon fuels such as hydrogen and biomethane into the pipeline further displaces fossil gas. Pipeline safety and reliability must be evaluated to accommodate low-carbon fuels. Figure 4-8 illustrates the energy Californians use in buildings at present compared with the Scoping Plan Scenario, which introduces alternatives to fossil gas. In that scenario almost 90 percent of energy demand is electrified by 2045, and the remaining energy demand is met with combustion of hydrogen, biomethane, and fossil gas.

[397] Zhu, Yifang, et al. 2020. *Effects of Residential Gas Appliances on Indoor and Outdoor Air Quality and Public Health in California.* UCLA Fielding School of Public Health Department of Environmental Health Sciences.

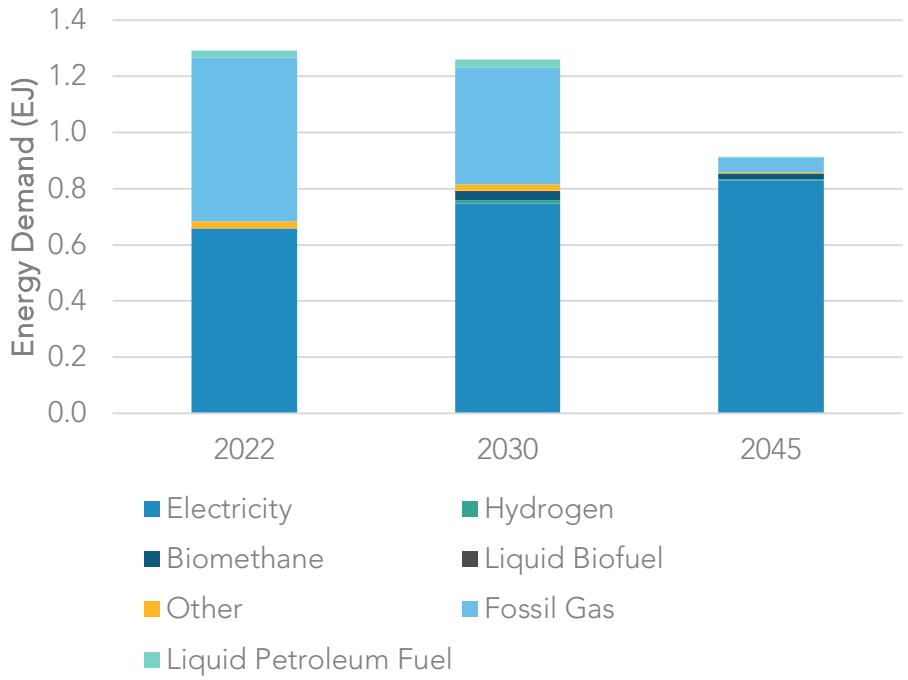
[399] Delforge, Pierre. August 11, 2021. California Forging Ahead on Zero Emission Buildings. Blog. NRDC. *https://www.nrdc.org/experts/pierre-delforge/california-forging-ahead-zero-emission-buildings*.

Figure 4-8: Final energy demand in buildings in 2022, 2030, and 2045 in the Scoping Plan Scenario[400]

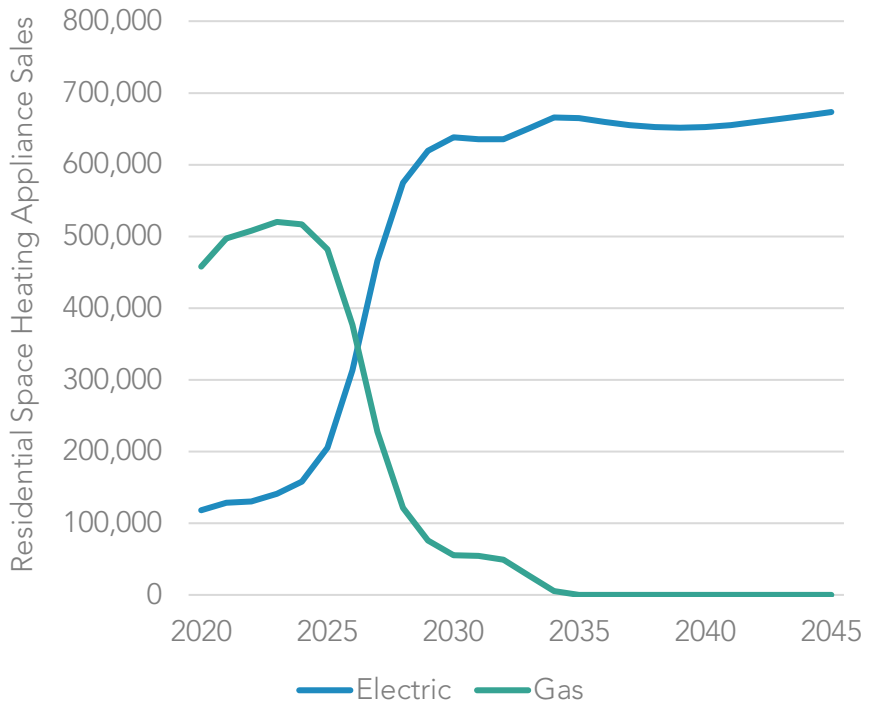


This transition is achieved when all new buildings constructed include non-combustion appliances, and appliances in existing buildings are replaced at the end of their useful life with non-combustion alternatives. Currently, electric alternatives, combined with the decarbonizing of California's grid, are the most effective alternatives, and the Scoping Plan Scenario modeled these alternatives. The Scoping Plan Scenario assumes three million all-electric and electric-ready homes by 2030 and seven million by 2035. Figure 4-9 illustrates the pace at which electric space heating appliance sales increase and gas space heating appliance sales decrease in residences in the Scoping Plan Scenario, such that by 2035 100 percent of residential home appliance sales are electric. By 2030 over six million electric heat pumps are installed statewide. The residential electric space heating appliance sales increases rapidly in the near term as new all-electric buildings are constructed and as existing buildings are renovated to utilize electric appliances. A similar transition is envisioned for other home appliances. Commercial buildings also will undergo a transition away from gas appliances to electric appliances, achieving 80 percent sales of all-electric appliances by 2035 and 100 percent by 2045. Appendix F (Building Decarbonization) describes a holistic policy approach to rapidly grow the

[400] *Other* fuel in the buildings sector is primarily liquid petroleum gas and waste heat.

number of zero emission appliances and buildings, to surmount the market barriers, and to prioritize an equitable transition for vulnerable communities.

Figure 4-9: Residential space heating appliance sales in the Scoping Plan Scenario



Strategies for Achieving Success

- Prioritize California's most vulnerable residents with the majority of funds in the new $922 million Equitable Building Decarbonization program, created through the 2022–2023 state budget. This would include residents in frontline, low-income, disadvantaged, rural, and tribal communities. This program is dedicated to a statewide direct-install building retrofit program for low-income households to replace fossil fuel appliances with electric appliances, energy-efficient lighting, and building insulation and sealing while also coordinating reductions in gas infrastructure in specific geographic areas.
- Achieve three million all-electric and electric-ready homes by 2030 and seven million by 2035 with six million heat pumps installed statewide by 2030.
- Expand incentive programs to support the holistic retrofit of existing buildings, especially for vulnerable communities.
- Ensure that incentive programs prioritize energy affordability and tenant protections, promote affordable and low-income household retrofits that improve habitability and reduce expenses, protect and empower small landlords and homeowners, address overlooked consumer groups, and pair decarbonization

with other critically needed renovation efforts to ensure that buildings support human health and are climate- and weather-resistant.[401]

- End fossil gas infrastructure expansion for newly constructed buildings.[402]
- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Strengthen California's building standards to support zero-emission new construction.
- Develop building performance standards for existing buildings.
- Adopt a zero-emission standard for new space and water heaters sold in California beginning in 2030, as specified in the 2022 State Strategy for the State Implementation Plan.
- Expand use of low-GWP refrigerants within buildings.
- Support electrification with changes to utility rate structures and by promoting load management programs.
- Increase funding for incentive programs and expand financing assistance programs focused on existing buildings and appliance replacements.
- Expand consumer education efforts to raise awareness and stimulate the adoption of decarbonized buildings and appliances, especially in vulnerable communities.
- Implement biomethane procurement targets for investor-owned utilities as specified in SB 1440 (Hueso, Chapter 739, Statutes of 2018) to reduce GHG emissions in remaining pipeline gas and reduce methane emissions from organic waste.

Carbon Dioxide Removal and Capture

Climate Change 2022: Mitigation of Climate Change,[403] a report by the IPCC released in early 2022, states "The deployment of CDR to counterbalance hard-to-abate residual emissions is unavoidable if net zero CO_2 or GHG emissions are to be achieved. The scale and timing of deployment will depend on the trajectories of gross emission reductions in different sectors. Upscaling the deployment of CDR depends on developing effective approaches to address feasibility and sustainability constraints especially at large scales." In line with that report, this Scoping Plan considers CDR as a complement to technologically feasible and cost-effective GHG emissions mitigation, and the size of its role will depend on the degree of success in reducing GHG emissions at the source across the economy. [404] The modeling shows that emissions from the AB 32 GHG Inventory sources will continue to persist even if all fossil related combustion emissions are phased out. These residual emissions must be compensated for to achieve carbon neutrality. Options for CDR include both sequestration in natural and working lands and mechanical approaches like direct air capture. Chapter 2 provides estimates on how much CO_2 removal is possible by our natural and working lands and how much must be removed by mechanical CDR.

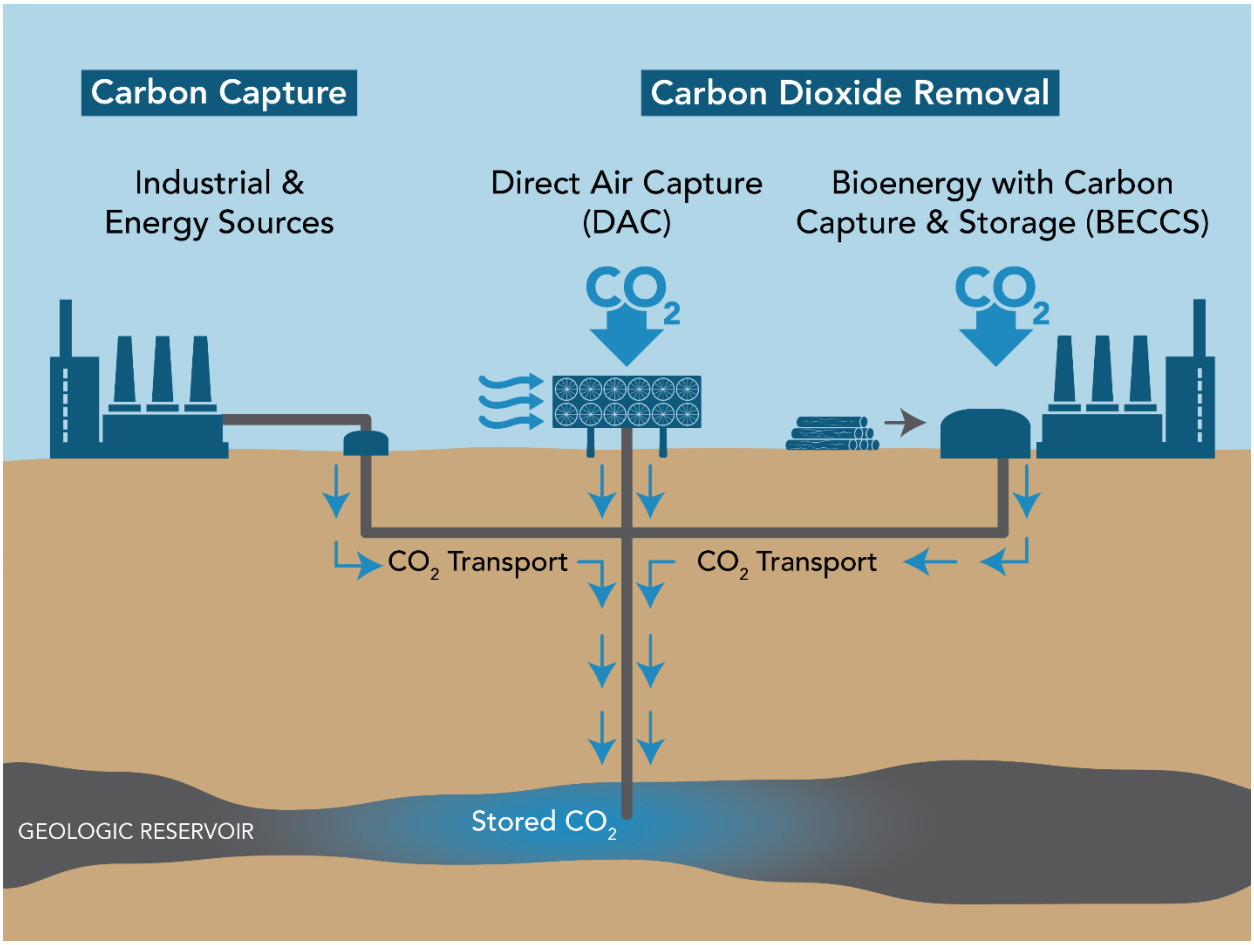
CCS, which is carbon capture from anthropogenic point sources, is described in Chapter 2 and involves capturing carbon from a smokestack of an emitting facility. Direct air capture, on the other hand, captures carbon directly from the atmosphere. Direct air capture technologies, unlike CCS, are not associated with any particular point source.

For this section, *carbon management* refers to the capture, movement, and sequestration of CO_2 through mechanical solutions for both capture at point sources and direct removal from the atmosphere through direct air capture.[405] Enabling policies and regulations across each of these steps are necessary for individual projects, and on a broader scale, for delivering reductions in support of the state's carbon neutrality and long-term carbon-negative goals. Figure 4-10 provides a graphic of the typical carbon management infrastructure.

---

[403] IPCC. 2022. *Climate Change 2022: Mitigation of Climate Change.* https://www.ipcc.ch/report/sixth-assessment-report-working-group-3/.
[404] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F4.7. finalejacrecs.pdf (arb.ca.gov).
[405] CDR through natural and working lands is discussed in Chapter 2 and later in this chapter.

Figure 4-10: Carbon management infrastructure



Carbon dioxide removal directly from the atmosphere itself refers to a suite of carbon negative technologies that can be used to draw down ongoing and historical carbon emissions already in the atmosphere. Some CO_2 removal technologies leverage the abilities of both natural photosynthesis and mechanical removal by using biomass wastes as inputs to make low- or zero-carbon energy or fuels, all while capturing and storing produced CO_2.

Captured CO_2 from point sources or from the atmosphere is permanently stored in specialized geologic formations, typically half a mile or more underground. A recent Stanford University study estimated the state's commercial storage potential is nearly 70,000 million metric tons of CO_2, even when excluding oil and gas reservoirs.[406] California is well-positioned because few other places on the West Coast are suitable for

[406] Stanford Center for Carbon Storage. Opportunities and Challenges for CCS in California. https://sccs.stanford.edu/california-projects/opportunities-and-challenges-for-CCS-in-California.

geologic storage at scale. To inform discussion around CO_2 removal, CARB held two full-day workshops exploring the types of options for carbon capture and geologic storage and utilization in products.[407,408,409]

The modeling results provided in Chapter 2 demonstrate the targeted need for CCS on large facilities such as refineries and cement. The CCS numbers do not include the potential additional applications for producing hydrogen with biomethane, other manufacturing, electricity, or other bioenergy. If CCS is not deployed, those emissions would be released directly into the atmosphere and instead need to be addressed through CDR to achieve carbon neutrality. Although a study finds California has 76 existing electricity and industrial facilities that are suitable candidates for CCS retrofit,[410] this Scoping Plan proposes a targeted role for this technology such that it would only be used to address sectors where non-combustion options are not technologically feasible or cost-effective at this time, to the extent needed to achieve the 85 percent reduction in anthropogenic emissions as called for in AB 1279. In future updates to the Scoping Plan, there may be additional options for technologically feasible or cost-effective technologies that may be deployed, which would further reduce the need for CCS and CDR except in situations to address historical GHG emissions.

Recognizing the need for carbon capture and utilization sequestration and removal, the Legislature passed, and the governor signed, SB 905. It includes several key requirements in the development of the state's Carbon Capture Removal, Utilization, and Storage Program. The following is a summary of the work to be completed to establish and administer this program. Many of these steps will address the need to evaluate the safety and efficacy of actions to support carbon removal, sequestration, and transfer via pipelines. Note that not all of these actions are under CARB's authority.

- Review technology to evaluate efficacy, safety, viability of CCUS/CDR methodologies.
- Develop monitoring and reporting requirements and schedules.
- Develop a unified permit application.
- Develop financial responsibility requirements.
- Develop a centralized public database for project status.

- Consult with CNRA on pore space requirements as CNRA develops a framework for pore space governing agreements.
- Establish a Geologic Carbon Sequestration Group to identify suitable injection well locations, subsurface monitoring, and potential hazards that may require suspension of injection.

SB 905 also has requirements for project developers such as to develop monitoring plans and to avoid any adverse health and environmental impacts at the carbon capture location—or mitigation of unavoidable impacts as required under existing requirements. For the site of injection, there are requirements for site stability, monitoring, and reporting plans. SB 905 also bans CCS with enhanced oil recovery in California and prohibits the transfer of CO_2 via pipeline until the U.S. Department of Transportation's Pipelines and Hazardous Materials Safety Administration (PHMSA) completes its current rulemaking to update existing CO_2 pipeline safety requirements.

An often-cited example of pipeline concerns involves a CO_2 pipeline in Mississippi. On February 22, 2020, a CO_2 pipeline operated by Denbury Gulf Coast Pipelines LLC (Denbury) ruptured in proximity to the community of Satartia, Mississippi. The rupture followed heavy rains that resulted in a landslide, creating excessive axial strain on a pipeline weld (DOT 2022). The combination of weather and topography resulted in a slower dissipation of the gas. The pipeline was also carrying hydrogen sulfide, a flammable and toxic gas. The pipeline failed on a steep embankment, which had recently subsided. Heavy rains are believed to have led to a landslide, which created axial strain on the pipeline and resulted in a full circumferential girth weld failure. The PHMSA investigation also revealed several contributing factors to the accident, including but not limited to: Denbury not addressing the risks of geohazards in its plans and procedures, underestimating the potential affected areas that could be impacted by a release in its CO_2 dispersion model, and not notifying local responders to advise them of a potential failure.

As the Satartia example highlights, appropriate pipeline safety and environmental standards in California are critical to minimize any risks from CO_2 transport in the future. As such, SB 905 also tasks CNRA, in consultation with the Public Utilities Commission, to, no later than February 1, 2023, provide a proposal to the Legislature to establish a state framework and standards for the design, operation, siting, and maintenance of intrastate pipelines carrying CO_2 fluids of varying composition and phase to minimize the risk posed to public and environmental health and safety. The recommended framework shall be designed to minimize risk to public health and environmental health and safety, to the extent feasible. Because SB 905 prohibits the transfer of CO_2 via pipeline until the PHMSA completes its current rulemaking to update existing CO_2 pipeline safety requirements, CCS or CDR projects that would require a pipeline to transfer CO_2 are not feasible at this time within California.

Ultimately, and in accordance with SB 905, the merits of each CCS or CDR project must be evaluated on a case-by-case basis.[411] Deployment of CCS and CDR could support skilled jobs and workforces, including those in traditional fossil energy communities. Other co-benefits could include criteria air pollutant reductions and water production. It will be important to design projects that do not exacerbate community health impacts, include early and ongoing community engagement, and are in compliance with local, state, and federal public health and environmental protection laws. It also should be noted that, as these types of projects are an emerging area of governance, additional coordination and discussion will be needed among the various levels of authorities involved. SB 905 has already initiated this process by assigning specific agencies with tasks related to their expertise and authority.

Chapter 2 includes a more detailed discussion about the proposed role of CO_2 removal in this Scoping Plan.

Sector Transition

State,[412] national,[413,414] and global decarbonization analyses[415] indicate a significant role for carbon management infrastructure, yet relatively few projects are operational. Around the world, about two dozen large CCS projects are capturing tens of millions of metric tons of CO_2 each year, with about a dozen operating in the United States.[416] The vast majority of capacity is at industrial facilities, such as ethanol and fertilizer plants, that would otherwise vent nearly pure CO_2 into the atmosphere as a by-product of normal, non-combustion processes. Future research, development, and demonstration projects must refine and commercialize capture systems for more complex applications, especially

[415] IPCC. Mitigation Pathways Compatible with 1.5°C in the Context of Sustainable Development. Chapter 2. *https://www.ipcc.ch/sr15/chapter/chapter-2/*. All analyzed pathways limiting warming to 1.5°C with no or limited overshoot use CDR to some extent to neutralize emissions from sources for which no mitigation measures have been identified and, in most cases, also to achieve net negative emissions to return global warming to 1.5°C following a peak (high confidence). The longer the delay in reducing CO_2 emissions toward zero, the larger the likelihood of exceeding 1.5°C, and the heavier the implied reliance on net negative emissions after mid-century to return warming to 1.5°C (high confidence).
[416] Congressional Research Service. 2021. Carbon Capture and Sequestration (CCS) in the United States. R44902. *https://crsreports.congress.gov/product/pdf/R/R44902?msclkid=e45e0012c25911ec8085ca575cb61e82*.

for those with limited decarbonization options. It has only been in the last few years that attention has seriously turned to mechanical CDR. As new information and modeling on climate change have been made available, the science has become clearer that avoiding the most catastrophic impacts of climate change requires both reducing emissions and deploying mechanical CDR.

California is paving a path forward on a science-based carbon management infrastructure policy that can serve as an example for other jurisdictions. The LCFS, which reduces the carbon intensity of transportation fuels, includes a protocol for select carbon management projects to become certified and generate LCFS credits.[417] CCS is not a new concept or technology. Twenty years of CCS testing show it is a safe and reliable tool.[418] As mentioned in Chapter 2, while no new CCS projects have been implemented or generated any credits under the CARB CCS protocol, CCS projects have been implemented elsewhere since the 1970s. Moreover, there has been a U.S. Department of Energy CCS research program underway for more than two decades. These all form a foundation of information for future efforts. Certified projects must successfully demonstrate adherence to rigorous pre-construction, operational, and site closure standards designed to strengthen environmental performance, as described in CARB's CCS Protocol. The protocol is designed to layer on top of existing federal carbon sequestration regulations designed to protect the environment. The protocol would need to be reevaluated if CCS were to be more broadly applied across sectors beyond transportation fuel production.

Direct air capture and carbon mineralization have high potential capacity for removing carbon, but direct air capture is currently limited by high cost. Carbon mineralization may also have high potential for removing carbon from the atmosphere, but understanding of the technology is still limited.[419] Direct air capture could also be deployed at higher rates to remove legacy GHG emissions from the atmosphere. Chapter 2 contains additional information on the current status of CCS and mechanical CDR projects globally, as well as federal support of such technologies.

Strategies for Achieving Success

- Implement SB 905.

---

[417] CARB. 2018. Carbon Capture and Sequestration Protocol under the Low Carbon Fuel Standard. August 13. *https://ww2.arb.ca.gov/sites/default/files/2020-03/CCS_Protocol_Under_LCFS_8-13-18_ada.pdf*.

[419] Aines, Roger. No date. Options for Removing CO_2 from California's Air. Lawrence Livermore National Laboratory. *https://ww2.arb.ca.gov/sites/default/files/2021-08/llnl_presentation_sp_engineeredcarbonremoval_august2021.pdf*.

- Convene a multi-agency Carbon Capture and Sequestration Group comprised of federal, state, and local agencies to engage with environmental justice advocates, tribes, academics, researchers, and community representatives to identify the current status, concerns, and outstanding questions concerning CCS, and develop a process to engage with communities to understand specific concerns and consider guardrails to ensure safe and effective deployment of CCS.[420]
- Iteratively update the CARB CCS Protocol with the best available science and implementation experience.
- Incorporate CCS into other sectors and programs beyond transportation where cost-effective and technologically feasible options are not currently available and to achieve the 85 percent reduction in anthropogenic sources below 1990 levels as called for in AB 1279.
- Evaluate and propose, as appropriate, financing mechanisms and incentives to address market barriers for CCS and CDR.
- Evaluate and propose, as appropriate, the role for CCS in cement decarbonization (SB 596) and as part of hydrogen production pathways (SB 1075).
- Support carbon management infrastructure projects through core CEC research, development, and demonstration (RD&D) programs.
- Continue to explore carbon capture applications for producing or leveraging zero-carbon power for reliability needs as part of SB 100.
- Consider carbon capture infrastructure when developing hydrogen roadmaps and strategy, especially for non-electrolysis hydrogen production.
- Evaluate and streamline permitting barriers to project implementation while protecting public health and the environment.
- Explore options for how local air quality benefits can be achieved when CCS is deployed.
- Explore opportunities for CCS and CDR developers to leverage existing infrastructure, including subsurface infrastructure.
- Explore permitting options to allow for scaling the number of sources at carbon sequestration hubs.

Short-Lived Climate Pollutants (Non-Combustion Gases)

Short-lived climate pollutants (SLCPs) include black carbon (soot), methane (CH_4), and fluorinated gases (F-gases, including hydrofluorocarbons [HFCs]). They are powerful climate forcers and harmful air pollutants that have an outsized impact on climate change

[420] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F4.9. finalejacrecs.pdf (arb.ca.gov).

in the near term, compared to longer-lived GHGs, such as CO_2. According to the IPCC's *Climate Change 2021: The Physical Science Basis,* in the near-term (i.e., 10- to 20-year time scale) the warming influence of all SLCPs combined will be at least as large as that of CO_2.[421] The United Nations Environment Programme's Global Methane Assessment[422] advises that achieving the least-cost pathways to limit warming to 1.5°C requires global methane emission reductions of 40–45 percent by 2030 alongside substantial simultaneous reductions of all climate forcers, including CO_2 and SLCPs. Action to reduce these powerful emissions sources today will provide immediate benefits—both to human health locally and to reduce warming globally—as the effects of our policies to transition to low carbon energy systems and achieve carbon neutrality further unfold.

In 2017, the Board approved the comprehensive Short-Lived Climate Pollutant Reduction Strategy (Strategy).[423] This strategy explained how the state would meet the following SB 1383-established targets:

- 40 percent reduction in total methane emissions[424] (including a separate 40 percent reduction in dairy and livestock emissions)
- 40 percent reduction in hydrofluorocarbon gas emissions
- 50 percent reduction in anthropogenic black carbon emissions
- 50 percent reduction of organic waste disposal from 2014 levels by 2020, and 75 percent by 2025, including recovery of at least 20 percent of edible food for human consumption

The state is expected to achieve roughly half of the SB 1383 targeted emissions reductions by 2030 through strategies currently in place (See Figure 4-11). As directed by the Legislature under SB 1383, state agencies focused on voluntary, incentive-based mechanisms to reduce SLCP emissions in the early years of implementation to overcome technical and market barriers. Under this "carrot-then-stick" strategy, incentives are replaced with requirements as the solutions become increasingly feasible and cost-effective. To meet legislated targets, more aggressive action is needed.

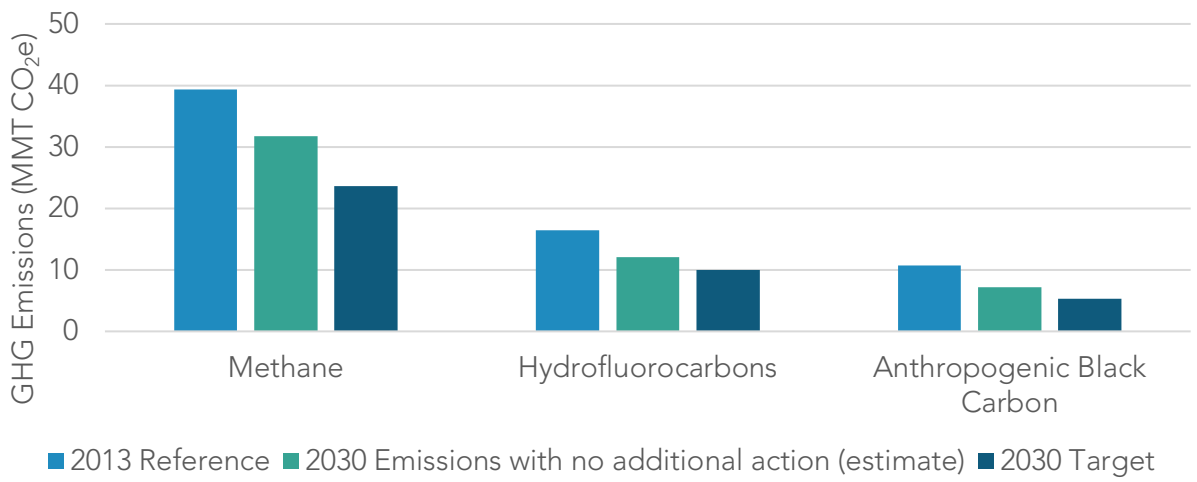
[424] All SB 1383 emissions reductions are mandated to be realized by 2030 and are relative to 2013 levels.

Figure 4-11: Expected progress toward SB 1383 targeted emissions reductions by 2030 through strategies currently in place



While the state's overall GHG emissions have declined by 9 percent over the past decade, SLCP emissions reductions have not kept pace with broader progress toward decarbonization. After growing steadily in the preceding decade, methane emissions have remained relatively flat since 2013.

HFCs are the fastest growing source of GHG emissions, primarily driven by their use to replace ozone-depleting substances and an increased demand for cooling and refrigeration.[425] Since 2005, statewide HFC emissions have more than doubled. While the rate of increase has slowed in recent years due to the state's measures, HFC emissions are still on the rise in California, and have grown by over 50 percent since 2010.[426] Globally, as temperatures rise, adoption of cooling technologies (and refrigerants) is increasing rapidly. If no measures are taken, it is estimated that HFCs will account for 9 to 19 percent of the total global GHG emissions by 2050.[427]

Methane

Human sources of methane emissions are estimated to be responsible for up to 25 percent of current warming.[428] Fortunately, methane's short atmospheric lifetime of ~12 years[429] means that emissions reductions will rapidly reduce concentrations in the atmosphere, slowing the pace of temperature rise in this decade. Further, a substantial portion of the targeted reductions can be achieved at low cost and will provide significant human health benefits. For example, the UN's *Global Methane Assessment* (2021)[430] found that over half of the available targeted measures have mitigation costs below $21/MTCO$_2$e, and that each million metric tons of methane reduced would prevent 1,430 premature deaths annually due to ozone pollution caused by methane.

Following the Twenty Sixth Conference of Parties (COP26) (the United Nations Convention on Climate Change in 2021), over 110 nations have signed onto the Global Methane Pledge (Pledge)[431] to limit methane emissions by 30 percent relative to 2020 levels. The Pledge covers countries that emit nearly half of all methane and make up 70 percent of global GDP. The UN's Global Methane Assessment[432] shows that human-caused methane emissions can be reduced by up to 45 percent this decade, which would avoid nearly 0.3°C of global warming by 2045.

As shown in Figure 4-12, the three largest sources of California's methane emissions are the dairy and livestock industry, landfills, and oil and gas systems.

---

[428] IPCC. 2021. *Climate Change 2021:The Physical Science Basis.* https://www.ipcc.ch/report/ar6/wg1/.
[429] In contrast, the lifetime of CO_2 is hundreds of years. The IPCC Third Assessment Report concluded that no single lifetime can be defined for CO_2 because of the different rates of uptake by different removal processes. According to IPCC Fourth Assessment Report, the majority of an increase in CO_2 will be removed from the atmosphere within decades to a few centuries, while the remaining 20 percent may stay in the atmosphere for many thousands of years.

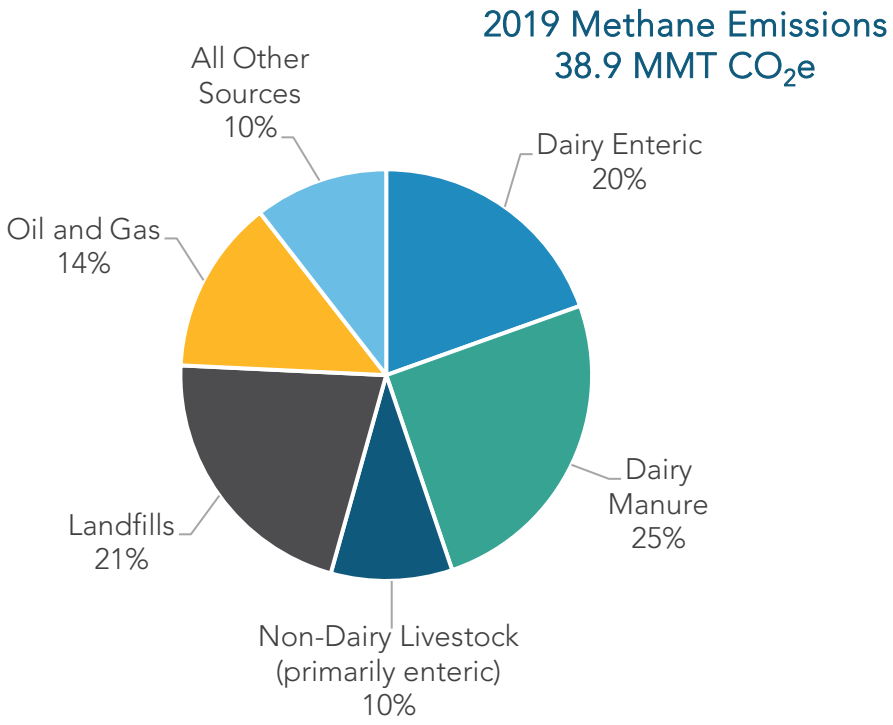
Figure 4-12: Sources of California methane emissions (2019)



Emissions from dairy and livestock operations come from two main sources: (1) enteric fermentation and (2) manure management operations, especially at dairies that employ open anaerobic lagoons that allow methane to escape into the atmosphere. Landfills, the second largest source of methane emissions, produce methane from the decomposition of organic waste. Although approximately 95 percent of all the waste that has been disposed of in the state has been deposited in a landfill that is equipped with a gas collection and control system, as required by California's Landfill Methane Regulation,[433] a portion of the methane still escapes into the atmosphere. Fugitive methane emissions can be intermittent and highly variable, both seasonally and spatially, particularly at landfills. Research has shown that landfills are complex systems and a wide range of conditions (e.g., atmospheric, operational, biological, chemical, and physical) may contribute to variability in rates of organic waste degradation, methane generation, and capture efficiency, so reducing the amount of organics deposited in landfills is critical to reducing overall landfill methane emissions. And despite the variability in individual landfill emissions, landfill gas collection and control systems remain the most effective strategy

[433] CARB. Landfill Methane Regulation. https://ww2.arb.ca.gov/our-work/programs/landfill-methane-regulation.

for reducing methane emissions from waste once it is placed in a landfill. Non-combustion methane emissions from the oil and gas sector are the third largest source of methane emissions in California. Almost three-quarters of the methane emissions from this sector come from leaks and venting from fossil gas transmission and distribution pipelines and equipment.

Hydrofluorocarbons

HFCs are synthetic GHGs that are powerful climate forcers. They are used mainly as refrigerants or heat transfer fluids in refrigeration, space conditioning, and heat pump equipment. Refrigerants are ubiquitous and are used everywhere from supermarkets, convenience stores, cold storage warehouses and wineries, to vending machines and residential and motor vehicle air-conditioners. Additionally, HFCs are also used as foam-blowing agents, solvents, aerosol-propellants, and fire suppressants. While HFCs remain in the atmosphere for a much shorter time than CO_2, the relative global warming potential (GWP) values of HFCs can be hundreds to thousands of times greater than CO_2. The mix of HFCs currently in use in California, weighted by usage (tonnage), have an average 100-year GWP of 1,700.[434] The average atmospheric lifetime of the mix of HFCs in use is 15 years.[435] Given the short average lifetimes, rapid reductions in HFC emissions can translate into near-term reductions in climate change effects.

As the global temperatures increase, the demand for cooling and refrigerants will continue to grow, as will the use of electric heat pumps to replace conventional fossil gas heating options. Unless addressed, continued use of high-GWP HFCs will perpetuate a feedback loop, where the cooling agents themselves cause additional warming.

In 2016, representatives from 197 nations signed the Kigali Amendment, which amended the existing Montreal Protocol (to reduce ozone-depleting substance production and consumption) to include a global phasedown in the production and consumption of HFCs beginning in 2019.[436] As of September 2022, 137 nations have either accepted, approved, or ratified the Kigali Amendment. On September 21, 2022, the U.S. Senate approved ratification of the Kigali Amendment, and it is expected that the United States

---

will soon join the 137 nations that have already ratified.[437] In the United States, Congress enacted the federal *American Innovation and Manufacturing (AIM) Act* in December 2020.[438] The AIM Act authorizes the U.S. EPA to address HFCs in several ways, including a national HFC phasedown that nearly mirrors the schedule of the global phasedown under the Kigali amendment.[439]

Nearly 90 percent of HFC emissions in California come from their use as refrigerants in the commercial, industrial, residential, and transportation sectors. The timescales over which the HFC emissions occur vary, depending on the type of application. Thus, strategies to reduce HFC emissions must be tailored by equipment type. CARB has several measures in place to tackle HFC emissions from the various sources shown in Figure 4-13 below. This includes the Refrigerant Management Program[440] that tracks and manages emissions from large commercial, industrial, and cold storage refrigeration facilities in the state. CARB has adopted regulations to reduce HFC emissions from consumer product aerosol propellants, semiconductor manufacturing, and small cans of automotive refrigerant.[441]

In 2018, California adopted HFC prohibitions via regulation and legislation for several sectors, including stationary refrigeration and foam end uses to backstop the partially vacated federal Significant New Alternatives Policy (SNAP) program.[442] Most recently, in 2020, CARB adopted additional measures that place GWP limits on refrigerants used in refrigeration and air conditioning equipment, which are the largest sources of HFC emissions, and are commonly used in residential, commercial, and industrial buildings. Additionally, CARB adopted a unique pilot program requiring the use of reclaimed refrigerant: the Refrigerant Recovery, Reclaim, and Reuse (R4) Program. The newly adopted HFC rules for the refrigeration and air conditioning sectors are the first of their kind in the nation.

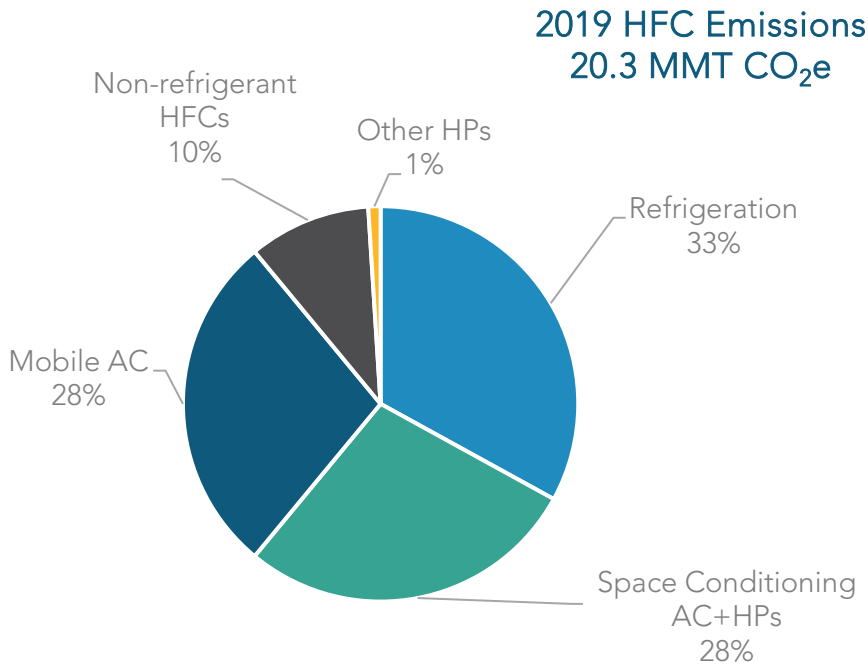
Figure 4-13: Sources of hydrofluorocarbon (HFC) emissions (2019)

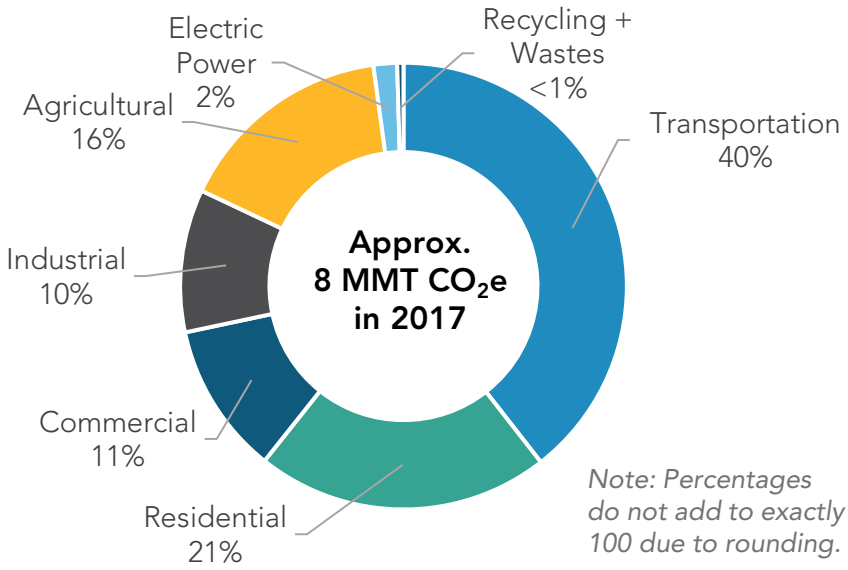


Anthropogenic Black Carbon

Black carbon is not included in AB 32 or the state's AB 32 GHG inventory that tracks progress toward the state's climate targets; however, it has been identified as a powerful climate forcer and is included California's Short-Lived Climate Pollutant Reduction Strategy. The majority of anthropogenic black carbon emissions come from transportation, specifically heavy-duty vehicles, and they have decreased since 2013 due to engine certification standards and in-use rules for on-road and off-road fleets, along with clean fuel requirements and incentives, including California Climate Investments and LCFS credits. Additionally, fuel combustion for residential, commercial, and industrial applications contribute significantly to overall black carbon emissions. Approximately 95 percent of residential black carbon emissions are due to wood combustion; these emissions are being reduced through programs like the Woodsmoke Reduction Program established by SB 563 (Lara, Chapter 671, Statutes of 2017). Alternatives to agricultural burning and policies that phase out agricultural burning will also result in agricultural black carbon emissions reductions. In 2021 CARB provided a preliminary estimate of 2017

black carbon emissions (Figure 4-14).[443] This estimate will be finalized as part of a future update to the Short-Lived Climate Pollutant Inventory.

Figure 4-14: Sources of anthropogenic black carbon (preliminary 2017 estimates; AR5 100-yr GWP 900)



Sector Transition

California has long recognized the importance of mitigating non-combustion SLCPs and took several early action measures as part of a comprehensive, ongoing program to reduce in-state GHG emissions under AB 32. The early action measures included CARB's Landfill Methane Regulation,[444] Refrigerant Management Program,[445] and Oil and Gas Methane Regulation.[446]

Methane

The methane abatement strategies currently in place are projected to achieve half of the methane emissions needed to meet the overall methane reduction target of SB 1383 (40 percent reduction by 2030). The reduction target translates to a limit of less than 24 MMTCO_2e in 2030 (Figure 4-15). It is anticipated that, since some sectors have fewer

[443] CARB. 2021. 2022 Scoping Plan Update – Short-Lived Climate Pollutants Workshop Presentation, September 8. https://ww2.arb.ca.gov/sites/default/files/2021-09/carb_presentation_sp_slcp_september2021_1.pdf.

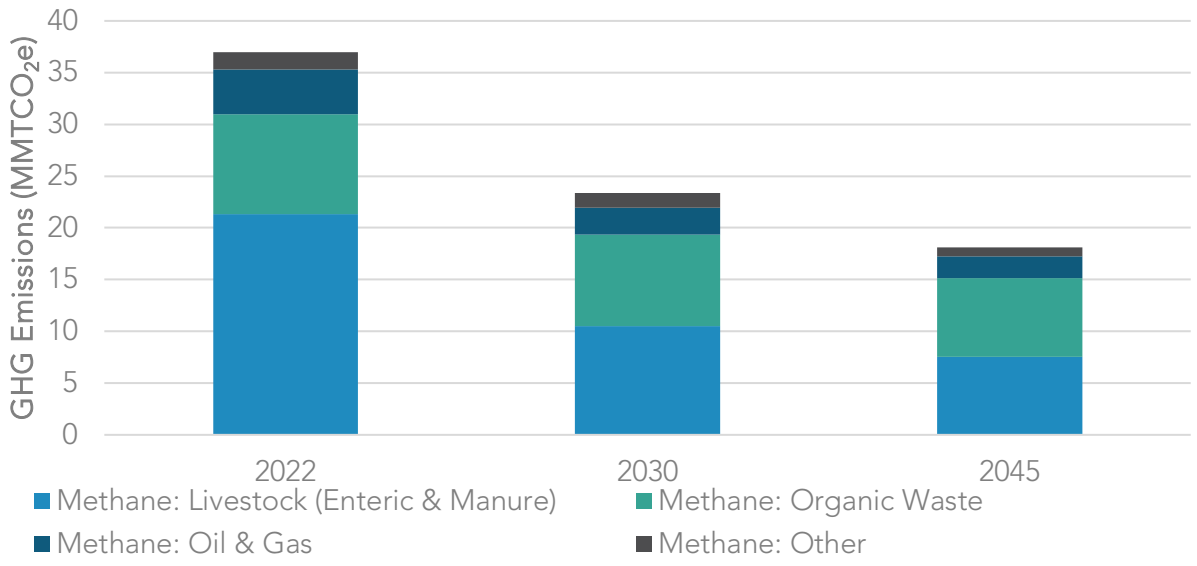
strategies that can be implemented to reduce methane in the near-term, other sectors will need to go beyond the 40 percent reduction to meet the target.

Figure 4-15: Methane emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario[447]



Dairy and Livestock Methane

California is the largest dairy-producing state, home to one in five U.S. dairy cows. To date, methane emissions reductions from the dairy and livestock sector have mainly been driven by a decreasing animal population and the growing adoption of manure management strategies, including anaerobic digesters and conversion to dry manure systems and pasture systems. CARB recently completed a detailed analysis of the emission reductions expected by 2030 and the estimated additional investment needed to reach the dairy and livestock sector methane reduction target. [448]

Assuming no adoption of additional manure management and enteric mitigations strategies beyond the projects that have committed funding, and a continued annual animal population decrease of 0.5 percent per year through 2030, further reductions of approximately 4.4 $MMTCO_2e$ will be needed to achieve the 2030 methane emissions reduction target for the sector set by SB 1383. If the remaining reductions are met through

[447] The *Organic Waste* category includes methane from landfills, wastewater treatment, and compost facilities.
[448] CARB. 2021. Analysis of Progress toward Achieving the 2030 Dairy and Livestock Sector Methane Emissions Target. June. *https://ww2.arb.ca.gov/sites/default/files/2021-06/draft-2030-dairy-livestock-ch4-analysis.pdf*.

a mix of dairy projects in which half are dairy digesters and half are alternative manure management projects, then it is estimated that at least 420 additional projects will be necessary. Additional emissions reductions beyond this level will likely be necessary to ensure that the overall state methane emissions reduction targets are met.

Despite the considerable methane emissions mitigation potential of enteric strategies like feed additives, little progress has been made, as few products with proven mitigation potential have become commercially available, and unlike manure management strategies, there is a lack of financial incentives for their adoption.

Market conditions favoring farm consolidation and improved production efficiencies have driven reductions in the California and U.S. dairy population over the past decade. [449] These efficiency gains have allowed California to maintain production levels despite the decreasing population. If demand for dairy and beef products remains steady or increases, continued improvements in production efficiency and adoption of effective manure management and enteric mitigation strategies will be important to support dairy and livestock methane emission reductions.

Strategies for Achieving Success

- Install state of the art anaerobic digesters that maximize air and water quality protection, maximize biomethane capture, and direct biomethane to sectors that are hard to decarbonize or as a feedstock for energy.
- Increase alternative manure management projects, including but not limited to conversion to "solid," "dry," or "scrape" manure management; installation of a compost-bedded pack barn; an increase in the time animals spend on pasture; and implementation of solid-liquid separation technology into flush manure management systems.
- Implement enteric fermentation strategies that are cost-effective, scientifically proven, safe for animal and human health, and acceptable to consumers, and that do not impact animal productivity. Provide financial incentives for these strategies as needed.
- Accelerate demand for dairy and livestock product substitutes such as plant-based or cell-cultured dairy and livestock products to achieve reductions in animal populations.
- In consideration of pace of deployment of methane mitigation strategies and the scale of complimentary incentives, consider regulation development to ensure that the 2030 target is achieved, assuming the conditions outlined in SB 1383 are met.

[449] MacDonald, James M., Jonathan Law, and Roberto Mosheim. 2020. *Consolidation in U.S. Dairy Farming.* ERR-274. July. https://www.ers.usda.gov/webdocs/publications/98901/err-274.pdf.

Landfill Methane

Achieving the 75 percent organic waste disposal reduction target[450] of SB 1383, and maintaining that level of disposal in subsequent years, would bring annual landfill emissions in 2030 to just below the 2013 baseline. Annual methane emissions will be higher through 2030 than originally anticipated by the SLCP Strategy because the state did not achieve the anticipated reductions in organic waste disposal of 50 percent below 2014 levels by 2020. SB 1383 prohibited the organic disposal regulations from taking effect until 2022,[451] and, as a result, emissions have continued to increase.

Due to the multidecadal time frame required to break down landfilled organic material, the emissions reductions from diverting organic material in one year are realized over the course of several decades. For example, one year of waste diversion in 2030 is expected to avoid 8 $MMTCO_2e$ of landfill emissions, cumulatively, over the lifetime of that waste's decomposition.[452] Near-term diversion efforts are critical to avoid locking in future landfill methane emissions.

CalRecycle's 2020 report, *Analysis of the Progress Toward the SB 1383 Waste Reduction Goals,*[453] estimated that 8 million short tons of composting and anerobic digestion capacity will be needed to manage organic wastes, above the existing and new capacity expected to be available by 2025. The 2019 report, *Co-Digestion Capacity in California,*[454] from the State Water Resources Control Board estimated that at least 2.4 million tons of digester capacity is available at urban wastewater treatment plants if sufficient incentives or funding for collection, receiving, and processing operations are provided to enable utilization of this capacity. The CPUC approved a decision in February 2022 implementing the biomethane procurement program, which will require investor-owned utilities by 2025 to procure 17.6 billion cubic feet (BCF) of biomethane produced from organic wastes to support the landfill disposal reduction and SLCP target and reduce fossil gas reliance for

---

[450] The target is from 2014 levels by 2025.
Public Resources Code, § 42652.5. CalRecycle approved the SLCP: Organic Waste Reductions regulations (*https://calrecycle.ca.gov/organics/slcp/*) in 2020 and began implementing them in January 2022. These regulations are designed to achieve the 2025 disposal reduction and edible food recovery targets.

[452] The life cycle emissions reduction is based on anticipated diversion of 27 million short tons of organic waste from CalRecycle (2020) Analysis of the Progress Toward the SB 1383 Organic Waste Reduction Goals (*https://www2.calrecycle.ca.gov/Publications/Details/1693*). Under CalRecycle's SLCP regulations, an alternative to landfill disposal must achieve a life cycle GHG reduction of 0.3 $MTCO_2e$ per short ton of waste diverted.

[453] CalRecycle. 2020. *Analysis of the Progress Toward the SB 1383 Waste Reduction Goals.* *https://www2.calrecycle.ca.gov/Publications/Details/1693*.

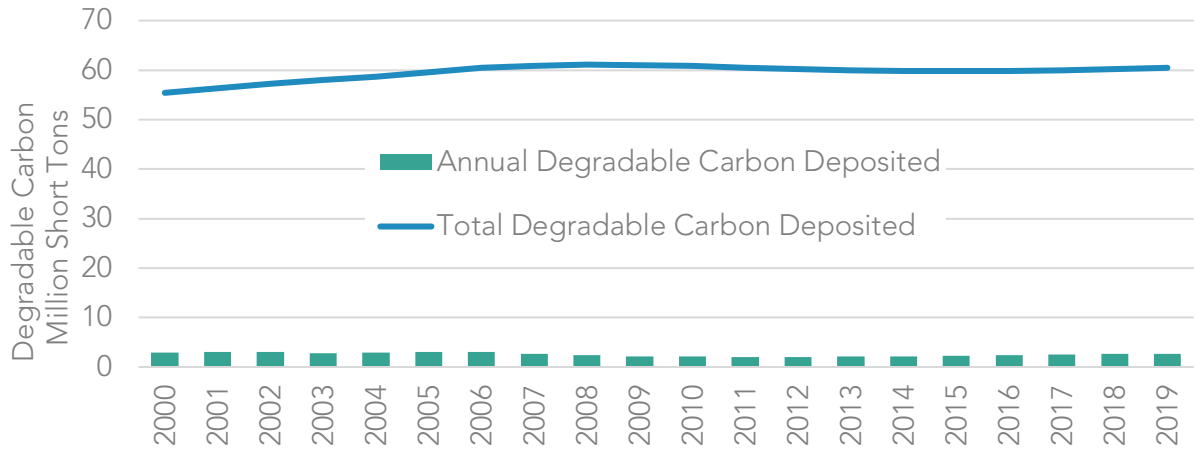
[454] State Water Resources Control Board. 2019. *Co-Digestion Capacity in California.* *https://www.waterboards.ca.gov/water_issues/programs/climate/docs/co_digestion/final_co_digestion_capacity_in_california_report_only.pdf*.

residential and commercial customers.[455] Additionally, the organic waste stream includes more than one million tons of edible food that could be recovered before it enters the waste stream through food rescue programs that combat hunger in communities throughout California.

While reducing organic waste disposal is the most effective means of achieving reductions in waste sector methane, strategies to reduce emissions from waste already in place in landfills also will play a role in achieving near-term reductions. As Figure 4-16 shows, the total degradable carbon (a measure of the amount of waste with potential to generate methane) that is accumulated from waste deposited in previous years is over 20 times greater than the amount added each year. This illustrates that even if we were able to entirely phase out landfilling of organic waste today, the existing waste in place at landfills would continue to generate methane for decades into the future.

Through a combination of improvements in operational practices, use of lower permeability covers, advanced landfill gas collection systems, and increased monitoring to detect and repair leaks, it is estimated that a direct emission reduction of 10 percent is achievable across the state's landfills by 2030. Technologies to utilize landfill gas efficiently can contribute further emission reductions in the energy sector.

Figure 4-16: Degradable carbon deposited in landfills



Strategies for Achieving Success

- Maximize existing infrastructure and expand it to reduce landfill disposal, with strategies including composting, anaerobic digestion, co-digestion at wastewater treatment plants, and other non-combustion conversion technologies.

[455] CPUC. 2022. Decision 22-02-025.

- Expand markets for products made from organic waste, including through recognition of the co-benefits of compost, biochar, and other products.[456]
- Recover edible food to combat food insecurity.
- Invest in the infrastructure needed to support growth in organic recycling capacity.
- Utilize existing digesters at wastewater treatment facilities to rapidly expand food waste digestion capacity.
- Direct biomethane captured from landfills and organic waste digesters to sectors that are hard to decarbonize.
- Implement improved technologies and best management practices at composting and digestion operations.
- Reduce emissions from landfills through improvements in operational practices, lower permeability covers, advanced collection systems, and technologies to utilize landfill gas.
- Leverage advances in remote sensing capabilities to quickly pinpoint large methane sources and mitigate leaks, improve understanding of the factors that lead to better capture efficiency, and explore new technologies and practices that can reliably improve methane control at landfills.

Upstream Oil and Gas Methane Reduction

For oil and gas production, processing, and storage, California is currently on track to achieve a 41 percent reduction in methane emissions by 2025 relative to 2013. The additional reductions needed to meet the 2030 target may be achieved by implementing additional regulatory requirements to further reduce intentional venting of fossil gas from equipment. If necessary, additional reductions from transmission and distribution facilities may be achieved by requiring the utilities to increase inspection and repair activities or further reduce emissions from pipeline blowdowns by implementing methods such as using portable compressors, using plugs to isolate sections of pipelines, flaring vented gas, routing gas to fuel gas systems, and installing static seals on compressor rods. Advances in methane detection technologies (e.g., satellites equipped to detect large methane sources) may also help to identify and mitigate methane emissions quickly across the oil and gas sector.

As California transitions away from fossil fuels, in-state oil and gas production will likely decline. This could result in an increase over time in the number of long-term idle and orphan wells (idle wells lacking a financially solvent, responsible owner) in the state. While California has regulations aimed at helping ensure operators manage their idle wells,

[456] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F4.4. finalejacrecs.pdf (arb.ca.gov).

there could likely be an increase in California's orphan well population. Plugging all orphan wells, of which there are currently over 5,000, could take decades due to the limited resources California has for orphan well plugging. The benefits from plugging wells include methane emission reductions and job creation; employment gains from well plugging and site remediation activities could help temporarily offset job losses from the oil and gas industry. The California Council on Science and Technology's 2018 report on orphan wells, *Orphan Wells in California: An Initial Assessment of the State's Potential Liabilities to Plug and Decommission Orphan Oil and Gas Wells,*[457] found that the potential cost to the state of plugging current orphan wells could be approximately $500 million, and the cost of plugging all active and idle wells could total over $9.1 billion. As oil and gas production in California declines due to reduced demand for fossil fuels, additional funding will likely be needed to cover the costs of plugging wells that have no viable operator.

Strategies for Achieving Success

- Mitigate emissions from leaks by regular leak detection and repair (LDAR) surveys at all facilities.
- Replace high emitting equipment with zero emission alternatives wherever feasible.[458]
- Have CARB and CalGEM lead a Task Force to identify and address methane leaks from oil infrastructure near communities.
- Pursuant to SB 1137, develop leak detection and repair plans for facilities in health protection zones, implement emission detection system standards, and provide public access to emissions data.
- Minimize emissions from equipment that must vent fossil gas by design (e.g., fossil gas powered compressors).
- Install vapor collection systems on high emitting equipment.
- Phase out venting and routine flaring of associated gas (gas produced as a by-product during oil production).
- Continuous ambient monitoring at fossil gas underground storage facilities to quickly detect large methane sources.
- Reduce pipeline and compressor blowdown emissions.

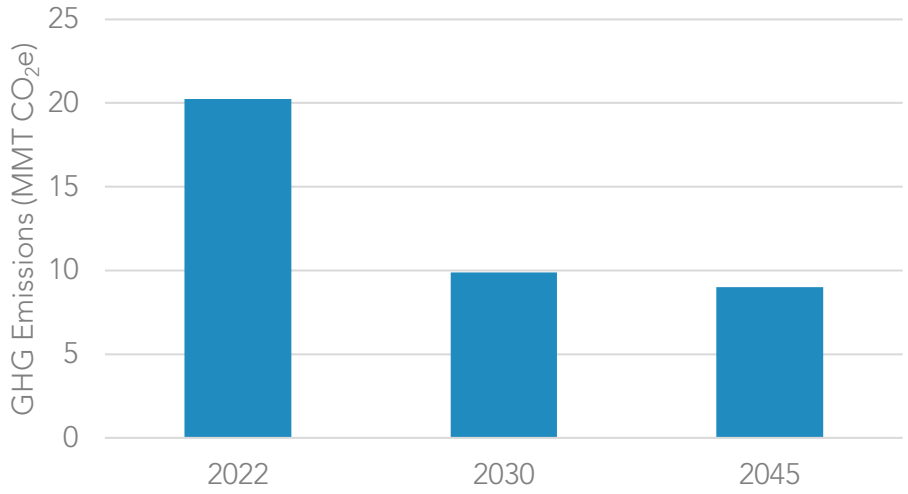
[458] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, P5. *finalejacrecs.pdf (arb.ca.gov)*.

- Leverage advances in remote sensing capabilities to quickly pinpoint large methane sources and mitigate leaks.[459]

Hydrofluorocarbons

In California, all the HFC measures currently in place will help achieve more than 70 percent of the reductions needed to achieve the 2030 HFC goal and provide very significant emissions reductions by 2045 and beyond. However, new targeted measures will be needed to maintain the pace of reductions, as demand for technologies that currently predominantly use high-GWP refrigerants is anticipated to grow. Despite decarbonization efforts, high-GWP HFCs are expected to be among the last remaining persistent GHG emission sources, as shown in Figure 4-17.[460]

Figure 4-17: Hydrofluorocarbon emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario



HFC emissions from new and existing sources should be addressed in tandem with building decarbonization efforts to maximize reductions.[461] As buildings are electrified in an effort to decarbonize them, the use of heat pumps for space conditioning, water heaters, and clothes dryers is expected to increase significantly. Heat pumps, while using

[459] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, CC17. finalejacrecs.pdf (arb.ca.gov).
[460] Energy and Environmental Economics, Inc. 2020. *Achieving Carbon Neutrality.* https://ww2.arb.ca.gov/sites/default/files/2020-10/e3_cn_final_report_oct2020_0.pdf.
[461] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF26. finalejacrecs.pdf (arb.ca.gov).

electricity, not fossil gas, currently rely predominantly on high-GWP refrigerants. Very low- or no-GWP technologies and solutions are either available or emerging for various heat pump technologies, and likely to develop further as international efforts to mitigate HFCs continue. However, most of these technologies are still nascent in the United States. In addition, some of the alternatives cannot be used until California building codes are updated, which is currently expected at the earliest in mid-2024 for some technologies based on the recently adopted provisions in AB 209[462] requiring the California Building Standards Commission to adopt the latest safety standards for refrigerant containing equipment into California's building codes. The current updates to the building codes will allow the use of many refrigerants with lower GWPs than HFCs currently in use. However, additional building code updates are needed to expand the choices of ultra-low-GWP alternatives, and that will need to happen in the next few years. The adoption of low-GWP refrigerants must occur in parallel with building decarbonization efforts; without such efforts, the vast GHG benefits of the latter will be partially offset, and the proportion of HFC emissions from buildings will continue to grow.

Leaks from existing air conditioning and refrigeration equipment are a major source of statewide and global HFC emissions. Once installed, refrigeration and air conditioning equipment can stay in place for decades, while leaking refrigerants into the atmosphere. This makes it very important that new installed equipment use refrigerants with a GWP as low as possible. The refrigerants inside existing equipment are sometimes collectively referred to as the *installed base* or *banks* of potential HFC emissions. If released spontaneously, the existing HFC banks would equal 60 percent of all annual statewide GHG emissions in California, as illustrated in Figure 4-18.[463]

The sales prohibitions on newly produced refrigerants set forth in SB 1206 (2022) and the national/international HFC phasedown will help in reducing HFC emissions from existing equipment by restricting the supply of and increasing the value of existing high-GWP HFCs, thus enabling a circular economy. In the 2022–2023 state budget, CARB received $45 million in incentive funding for climate-friendly refrigerant technologies; this funding will be critical in shifting the market toward the best available refrigerant technologies in various sectors.

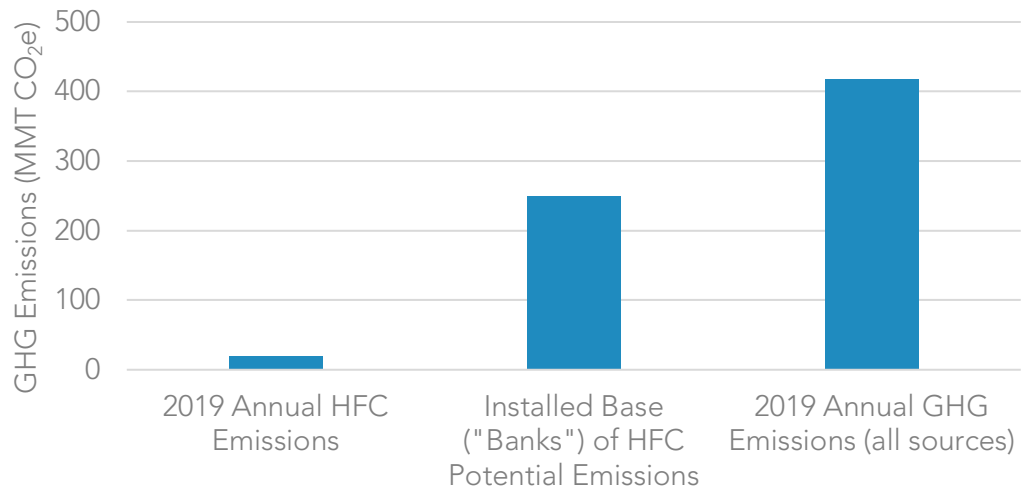
Figure 4-18: Potential emissions from refrigerants in existing equipment



Strategies for Achieving Success

- Expand the use of very low- or no-GWP technologies in all HFC end-use sectors, including emerging sectors, like heat pumps for applications other than space conditioning, to maximize the benefits of building decarbonization.[464]
- Convert large HFC emitters such as existing refrigeration systems to the lowest practical GWP technologies.[465]
- Prioritize small-scale and independent grocers serving priority populations in addressing existing "banks" of high-GWP refrigerants.[466]
- Improve recovery, reclamation, and reuse of refrigerants by limiting sales of new or virgin high-GWP refrigerants and requiring the use of reclaimed refrigerants where appropriate.[467]
- Assist low-income and disadvantaged communities in obtaining low-GWP space conditioning units to protect vulnerable communities from heat stress and wildfire smoke.[468]

[464] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF26. finalejacrecs.pdf (arb.ca.gov).
[465] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF22. finalejacrecs.pdf (arb.ca.gov).
[466] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, JT5 and JT6. finalejacrecs.pdf (arb.ca.gov).
[467] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, JT1. finalejacrecs.pdf (arb.ca.gov).
[468] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF28, JT5, and JT6. finalejacrecs.pdf (arb.ca.gov).

- Accelerate technology transitions in California and the U.S. overall by collaborating with international partners committed to taking action on HFCs under the Kigali Amendment to the Montreal Protocol; this includes addressing barriers to adoption of very low- or no-GWP refrigerant technologies such as high upfront costs, shortage of trained technicians, and lag in updating safety standards and building codes.

Anthropogenic Black Carbon

Significant progress has been made since 2013 to reduce anthropogenic black carbon emissions, primarily from decreased combustion of distillate fuels in the agricultural sector, as well as improvements to provide cleaner, on-road combustion technologies. Under current strategies, anthropogenic black carbon from transportation is expected to be reduced by over 60 percent in 2030. Continued reductions in combustion emissions across all sectors from both the state's climate and air quality programs will also help reduce anthropogenic black carbon emissions going forward.

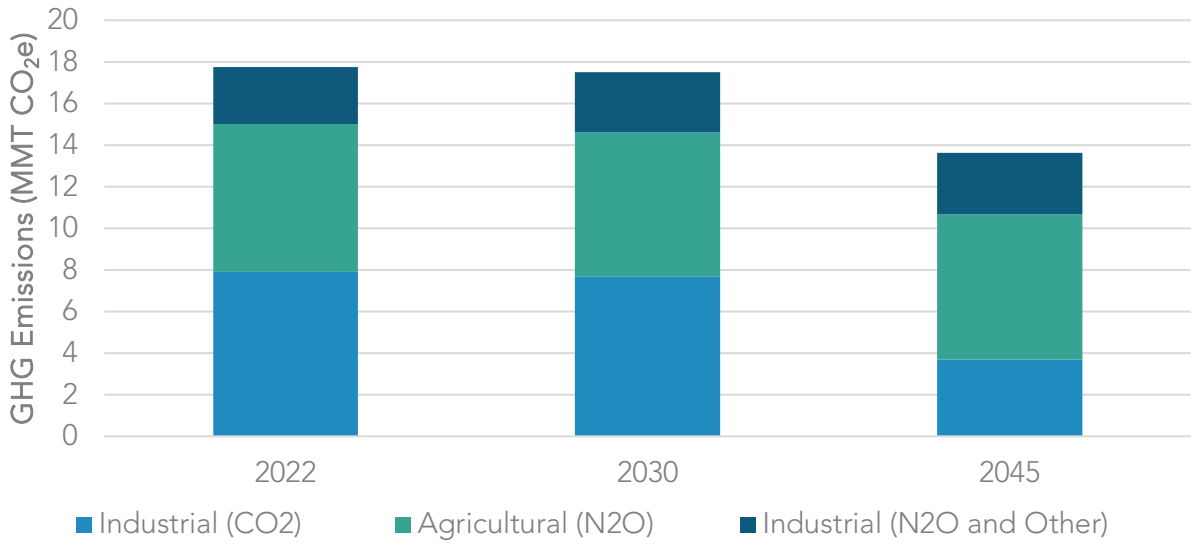
Strategies for Achieving Success

- Reduce fuel combustion commensurate with state's climate and air quality programs, particularly from reductions in transportation emissions and agricultural equipment emissions.[469]
- Invest in residential woodsmoke reduction.

In addition to SLCP emissions, some remaining non-combustion emissions are anticipated to persist in the coming decades, as shown in Figure 4-19. These include CO_2 from industrial processes such as cement manufacturing, oil and gas extraction, and geothermal electric power; N_2O from wastewater treatment, fertilizers, and livestock manure applied to agricultural soils; and other industrial, non-HFC GHG emissions.

[469] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1A and Appendix A (Table Summary of Direct Emission Reduction Strategies). "Emissions reductions from energy consumed by California's agricultural sector, including post-harvest processing, use of tractors and other farm equipment, and water import and irrigation." finalejacrecs.pdf (arb.ca.gov).

Figure 4-19: Remaining non-combustion emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario



Natural and Working Lands

California's natural and working lands (NWL) cover approximately 90 percent of the state's 105 million acres,[470] and include forests, grasslands, shrublands and chaparral, croplands, wetlands, sparsely vegetated lands, and the green spaces in urban and built environments. These lands include California Native American tribes' ancestral and cultural lands, parks and green spaces in our cities and communities, and the waters and the iconic landscapes we know and love. The diverse landscapes and biodiversity found throughout California's NWL provide a multitude of benefits to the people of California, including clean water, clean air, biodiversity, food, economic prosperity, recreational opportunities, continuation of traditional tribal ways of life, mental health benefits, and many others.

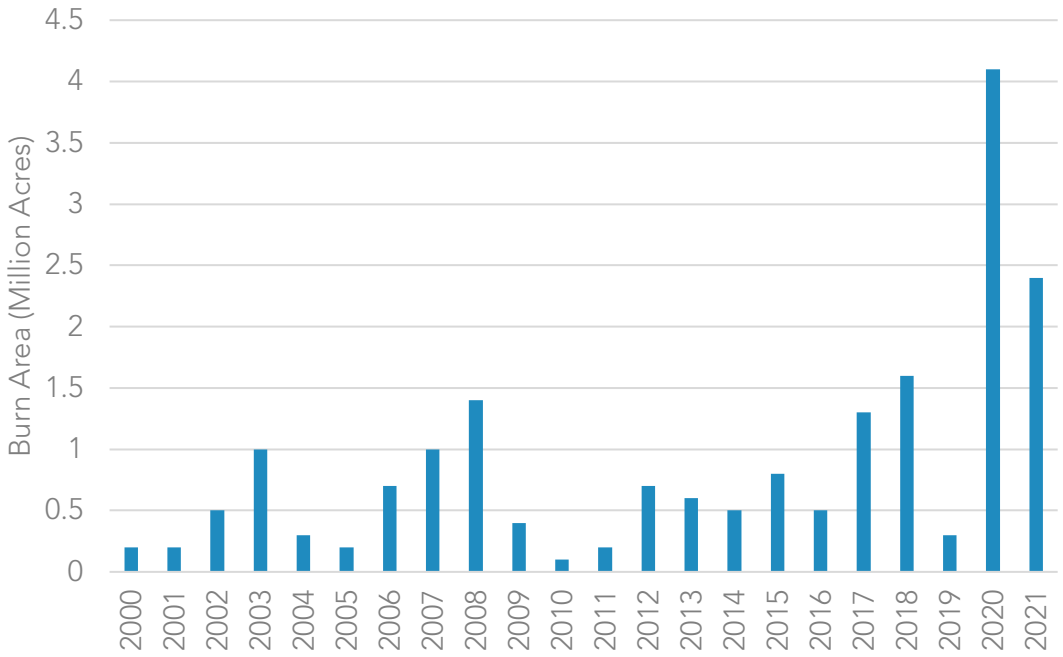
Our lands are a critical sector in California's fight to achieve carbon neutrality and build resilience to the impacts of climate change. Healthy land can sequester and store atmospheric CO_2. Healthy lands also can reduce emissions of powerful SLCPs, limit the release of future GHG emissions, protect people and nature from the impacts of climate change, and build our resilience to future climate risks. Creation of healthy lands through

[470] CNRA. 2022. Natural and Working Lands Climate Smart Strategy. *https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/CNRA-Report-2022---Final_Accessible_Compressed.pdf*.

multi-benefit and mitigation measures can also support tribal and local traditional lifeways. Unhealthy lands have the opposite effect—they release more GHGs than they store and are more vulnerable to future climate change impacts.

Climate change impacts have become more apparent in recent years and are having significant effects on communities throughout the state. One of these impacts is the much more frequent occurrence of unusually large, high-severity wildfires, which are being driven by climate change and by a recent history of fire-exclusion and land management practices that have resulted in forests with high levels of biomass. These recent large and high-severity wildfires have resulted in a significant amount of burned acreage and emissions in California (Figure 4-20).[471]

Figure 4-20: Acreage of burned wildland vegetation area



These wildfires deviate from the lower-severity fires that previously occurred at frequent intervals, around which California's forests evolved. As climate change accelerates, these large, uncharacteristic wildfires are likely to become more common and impact more of our landscapes. Climate change is also expected to have other significant effects on our lands, including more extreme droughts, floods, extreme heat, and the spread of invasive aquatic and terrestrial species, pests, diseases, and parasites. These impacts can lead

[471] CARB. 2022. Wildfire Emission Estimates for 2021. https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/Wildfire%20Emission%20Estimates%202000-2021.pdf.

to negative feedback loops on human and ecological health; for example, increasing the spread of invasive species can lead to increases in pesticide use, if not managed through regulation or mitigation, which can pose risks to human health and the environment.

California's approach to climate action in the NWL sector is not solely focused on maximizing carbon stocks but instead on supporting carbon management that holistically fosters ecosystem health, resilience, provision of overall climate function, and other co-benefits.

Natural systems operate on a longer timescale than the energy and industrial sectors, and benefits from climate action on our lands can take decades to accrue. Scaling climate smart land management in California requires taking action now and playing the "long game" by establishing and maintaining consistent, patient approaches and programs.

Landscapes

For the first time, this Scoping Plan includes modeling for the NWL sector. The focus of the initial modeling is limited to seven land types that align with the those in the NWL Climate Smart Strategy.[472] Work will continue to incorporate more landscapes and management practices into the modeling over time. The initial landscapes included in the modeling for this Scoping Plan are:

- Forests
- Shrublands and Chapparal
- Grasslands
- Croplands
- Wetlands
- Developed Lands
- Sparsely Vegetated Lands

Each of these land types are a key component to the state's approach to increasing climate action in the NWL sector, as called for in Executive Order N-82-20 and AB 1757.[473] The Executive Order directs CARB to update the target for this sector in support of carbon neutrality by 2045 as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy. AB 1757 calls for the development of an

[472] CNRA. 2022. *Natural and Working Lands Climate Smart Strategy. Appendix B.* *https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/Appendix-B_04132022_ada.pdf*.

[473] AB 1757 California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands. *https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=202120220AB1757*.

ambitious range of targets for the NWL sector to be integrated into the Scoping Plan and other state policies. It directs CARB and CNRA to work closely together to update the NWL Climate Smart Strategy, and establish an expert advisory committee to inform and advise on NWL modeling, targets, and implementation strategies.[474] Additionally, in 2021, the governor signed SB 27[475] (Skinner, Chapter 237, Statutes of 2021) into law. It directed CARB to establish CO_2 removal targets for 2030 and beyond and take into consideration the NWL Climate Smart Strategy. The governor's Executive Order, AB 1757, and SB 27 go beyond previous direction from the Legislature and past administrations. These directives emphasize the importance of quantifying land-based carbon both statewide,[476] and in programs and policies,[477] setting targets[478] for NWL to support the state's climate objectives, and advancing land management actions[479] that support the health and resiliency of these lands.

Blue carbon (also known as carbon captured and held in coastal vegetation and soils, such as seagrasses, seaweeds, and wetlands)—is also important to consider as we look at long-term climate goals. While this landscape is not currently covered by IPCC inventory guidelines or included in California's NWL Inventory, the United States was the first nation to include blue carbon in its national GHG emissions inventory. California's Ocean Protection Council and San Francisco Estuary Institute are partnering to create a new coastal wetlands, beaches, and watersheds inventory. CARB staff will utilize information from this effort and assess other available data to evaluate how this landscape may be integrated into our efforts in the future as more data become available.[480]

Trends of Carbon on Landscapes

CARB currently tracks the carbon stock changes though the Inventory of Ecosystem Carbon in California's Lands[481] (NWL Inventory), which is summarized in Chapter 1. The NWL Inventory is a key tool for tracking changes in carbon stocks across the state, and it will serve as the inventory of record for this sector, tracking sector-wide progress toward the target. The NWL Inventory provides a retrospective snapshot of the status of California's lands, and captures the gains or losses of carbon stocks that occur over time. In addition to tracking carbon stock changes, the NWL Inventory is an important tool for understanding the impacts of our efforts to increase climate action in this sector (such as those identified in this Scoping Plan and the NWL Climate Smart Strategy) on NWL carbon stocks. The inventory is also used as the foundation for Scoping Plan scenario modeling and target setting.

CARB's inventory shows that carbon stocks decreased in NWL lands from 2001 to 2011, releasing more carbon than they were storing, and then increased slightly from 2012 to 2014.[482] These trends highlight the interannual and interdecadal variability of lands and their ability to be both a source and a sink of carbon, and the importance of looking at NWL data and trends over multiyear and multidecadal time periods, as opposed to looking only at annual changes. This movement is part of the Earth's carbon cycle, where carbon transfers between the land, ocean, and atmosphere. As part of the carbon cycle, over decades or centuries, fire and plant respiration and decomposition move carbon from the land to the atmosphere, while plant growth and other processes move carbon from the atmosphere to the land. Emissions from fossil-fuel combustion are contributing to putting this cycle out of balance.

Additionally, some historic land management practices that have resulted in the loss of carbon from the soil are also contributing to the atmospheric rise of CO_2 while simultaneously exacerbating the imbalance of the water cycle, which is influenced by and linked to the carbon cycle. These emissions are also contributing to a feedback loop for California's lands: as CO_2 emissions accumulate in the atmosphere—and California experiences more warming, extreme heat events, and droughts—the risk and intensity of carbon losses also increases, which in turn transfers more carbon from the land to the atmosphere. And because forests and shrublands comprise approximately 85 percent of the carbon stocks in California, management strategies and disturbances in forest and

[481] CARB. *An Inventory of Ecosystem Carbon in California's Natural & Working Lands.* 2018 Edition. *nwl_inventory.pdf (ca.gov).* Accessed 3/2/2022.
[482] These trends are consistent estimates in the most recent AB 1504 reporting period.

shrubland carbon play an important role in determining whether California's lands are providing either net carbon sequestration or net emissions on an annual basis.

The gains and losses of carbon on our lands will fluctuate in the future; what is important is to restore carbon in places where it has been lost and reduce large carbon losses on our NWL through active, attentive, and adaptive management. For additional details on the nexus between NWL and GHGs, see pages 5–6 of the NWL Climate Smart Strategy.

Goals and Accelerating Nature-Based Solutions

The state's climate mitigation targets are traditionally identified by individual years, (i.e., tons of GHG emissions in 2020 or 2030). However, because NWL processes fluctuate year to year and because it can sometimes take decades for climate action to fully impact carbon in NWL, it is important to consider the statewide, long-term trends of carbon stock change when identifying how this sector contributes to California's pathway to achieving carbon neutrality. Tracking carbon stock change over a multi-decadal period is the best way to assess the full direct impact climate action has on carbon storage. Such an approach filters out fluctuations from year-to-year weather variations and multi-year natural climate cycles, such as El Niño patterns.

Current data sources and methods allow us to track only certain carbon stocks that exist on NWL. For target tracking to be successful, each carbon pool must be inventoried using a methodology that can detect changes due to management and climate change. Certain carbon pools lack the scientific data and methodologies necessary for target-setting and tracking. For example, soils in forests, shrublands, and grasslands are not included in the Scoping Plan carbon stock target because, currently, there is no way to track statewide soil carbon through time in a way that would capture the effects of increased climate action and climate change.

When considering how NWL contribute to the state's goal of carbon neutrality, all lands' carbon stock gains and losses must be considered, and the Scoping Plan target is set in these terms. It is not sufficient to aggregate climate benefits only within areas where projects, management, or climate action occur. Much of the state does not receive active or quantifiable management, but these areas still contribute to the state's overall carbon stock change and GHG emissions. To incorporate the entire carbon balance toward true carbon neutrality, the Scoping Plan target is set in terms of carbon stock change across the entire state. This incorporates all lands that both receive and do not receive active management, and includes the end result of all sequestration, emissions, and other changes to carbon on the landscape.

However, carbon stock change is not equivalent to emissions. Currently, the data and emission quantification science is not sufficient to enable inventories to comprehensively track all NWL emissions in a way that would enable us to set an NWL target in terms of

statewide emissions and sequestration. There is a great need, across the entire NWL sector statewide, for more empirical data, science, and tools to track all carbon stocks across each carbon pool, and to begin to track emission and sequestration rates. As California implements AB 1757, there is an opportunity to update the data, science, and tools to enable this level of tracking and target setting in the future.

As outlined in Chapter 2, California is projected to lose carbon stocks over the coming decades, but this Scoping Plan analysis also shows that increasing the pace and scale of climate smart land management in California will reduce the carbon stock losses and GHG emissions from the NWL sector. In response to EO N-82-20 and AB 1757, the proposed target for NWL is shown in Table 4-1.

Table 4-1: Scoping Plan modeled target for NWL, based on increasing action on NWL

	Total Carbon Stock % Change from 2014
2045	-4

Achieving this target will require significant expansion of the pace and scale of climate action on California's NWL, including the following:

- Increasing climate smart forest, shrubland, and grassland management to at least 2.3 million acres a year—an approximate 10x increase in management from current levels.
- Increasing climate smart agricultural practices by at least 78,000 acres adopted a year, annually conserving at least 8,000 acres a year of croplands, and increasing organic agriculture to comprise at least 20 percent of cultivated acres in California by 2045—an approximate 7.5x increase in healthy soils practices from previous levels and a 2x increase in total acres of organic agriculture.
- Increasing annual investment in urban trees in developed lands by at least 200 percent above historic levels and establishing defensible space on all parcels by 2045.
- Restoring at least 60,000 acres, or approximately 15 percent of all Sacramento–San Joaquin River Delta (Delta) wetlands, by 2045.
- Cutting land conversion of deserts and sparsely vegetated landscapes by at least 50 percent annually from current levels, starting in 2025.

If the carbon stock target above is met, and the management actions above are implemented, the modeling for NWL indicates that California's lands will be a net source of emissions, producing approximately 7 $MMTCO_2e$ of average annual emissions.

Additional climate smart management practices and additional landscapes, such as those included in the Climate Smart Strategy and discussed below in Additional Management Strategies, have the potential to increase carbon stocks and reduce GHG emissions from NWL beyond the levels modeled for this Scoping Plan.

The purpose of the NWL target and the above estimated outcomes is to provide a numerical guide that can support the state's efforts to accelerate both near-term and long-term climate action on California's lands, prioritizing durable solutions that deliver multiple outcomes. Taking these actions over the coming decades will reduce the potential carbon losses from NWL, reduce GHG emissions from some landscape types (such as croplands and Delta wetlands), and support sequestration of GHGs from NWL between 2025 and 2045. These actions will also deliver significant benefits to Californians beyond advancing our climate goals, such as reducing wildfire emissions and their associated health impacts, increasing habitat for biodiversity, reducing urban heat island effects, reducing harmful pesticide exposure, expanding economic opportunities, and others. Additional information on several economic and health outcomes from the Scoping Plan Scenario is included in Chapters 2 and 3.

Statewide planning and target setting for the NWL sector will only create meaningful change if followed by effective on-the-ground implementation. State government cannot accomplish this implementation alone. Effective large scale climate action is dependent on partnerships among tribal, federal, state, regional, and local partners, and across governmental, private, nonprofit, and commercial sectors. The NWL sector of the Scoping Plan sets a carbon target with climate action recommendations that can be used to achieve the quantified carbon, health, and economic outcomes. Implementation of these actions must be led by local or regional partnerships that plan and execute projects appropriate to the specific conditions. The technical expertise and local knowledge of land managers and stewards in all sectors must be elevated to ensure relevant, efficient, and effective climate action.

Implementation of climate action should contribute to state targets, maximize local benefits, and alleviate environmental injustices and other social inequities. On-the-ground action is largely executed and managed by local and regional actors, but state government agencies must support communities across the state in implementing nature-based climate solutions that address statewide objectives, such as the Scoping Plan carbon target. This includes providing resources and developing frameworks, while greatly increasing capacity and technical assistance to assist and empower local partners. Examples of how this can be done are the Regional Forest and Fire Capacity Program within the forestry sector, the UC Cooperative Extension in the agricultural and forestry sectors—as well as the work of the state's 10 regional Conservancies. These programs provide strong examples to emulate as they facilitate statewide coordination, and information and resource transfer from the state to the regional and local levels. The Regional Forest and Fire Capacity Program provides funding for local and regional groups

to build their organizational capacity to plan and implement wildfire and forest management projects that are informed by their own local expertise. The UC Cooperative Extension is an example of how the state provides technical assistance to local landowners and community organizations, helping them apply the latest science-based management strategies to their lands. California's regional Conservancies play a pivotal role in implementing regional conservation, restoration, and land management efforts through activities such as grant funding, science generation, and planning assistance.

The state also has identified the need to incorporate and elevate traditional indigenous knowledge into climate action on the regional and local scales. Accomplishing this requires close partnerships with tribes for mutual knowledge and resource sharing, while protecting culturally sensitive knowledge and resources. As Tribes are sovereign nations with specialized cultural knowledge and experience in managing lands, climate action on these lands that contribute to the State of California's climate targets can only be accomplished with the full participation and under the leadership of the Tribes that govern those lands.

Strategies for Achieving Success: Crosscutting Items for all NWL

- Implement AB 1757 and SB 27.
- Implement the Climate Smart Strategy.
- Accelerate the pace and scale of climate smart action, consistent with the management levels identified above, as part of a collective effort between federal, state, private, nonprofit, and individual land managers.
- Prioritize and practice equity, including through meaningful community engagement and prioritizing implementation of nature-based solutions that benefit the communities most vulnerable to climate change.[483]
- Advance multi-benefit, collaborative, landscape-level approaches that engage communities and landowners, and incorporate adaptive managements.
- Consult and partner with California Native American tribes to increase co-management and tribal management authority; restore, protect, and enhance natural cultural resources, traditional foods, and cultural landscapes; respect tribal sovereignty; and support tribes' implementation of tribal expertise and Traditional Ecological Knowledge and cultural easements.[484]

[483] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N8. *finalejacrecs.pdf (arb.ca.gov).*
[484] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N1, N6, N16, N17, N18. *finalejacrecs.pdf (arb.ca.gov)*.

- Leverage existing innovative financial and market mechanisms, and explore new ones, between the public, private, and philanthropic sectors to secure funding of climate smart land management.
- In partnership with communities, tribes, and the private sector, expand and develop new infrastructure for manufacturing and processing of climate smart agricultural and biomass products.
- Leverage and support technical assistance providers: such as the UC Cooperative Extension and California's 98 Resource Conservation Districts, that have track records of providing technical assistance to local landowners and implementing agriculture, forestry, natural resource management, and restoration projects across the state.
- Establish and expand mechanisms that ensure NWL are protected from land conversion and parcelization (e.g., conservation easements or Williamson Act), in line with the strategies outlined in CNRA's Pathways to 30x30 California.[485,486] Pair land conservation projects with management plans that increase carbon sequestration, where feasible.
- Increase opportunities for private and philanthropic investments in nature-based climate solutions, utilizing existing voluntary and compliance carbon markets, existing state and local programs, and the California Carbon Sequestration and Climate Resiliency Project Registry established pursuant to SB 27.
- Expand monitoring and tracking of management actions and outcomes consistent with the tracking and monitoring recommendations of the Climate Smart Strategy.

Forests, Shrublands, and Chaparral

At roughly 29 million acres, forests cover 27 percent of California. Shrublands and chaparral cover 31 percent of the state; roughly 33 million acres. Both types are distinct, with their own ecological dynamics and management strategies, and are modeled within a single model that is calibrated to treat them uniquely.

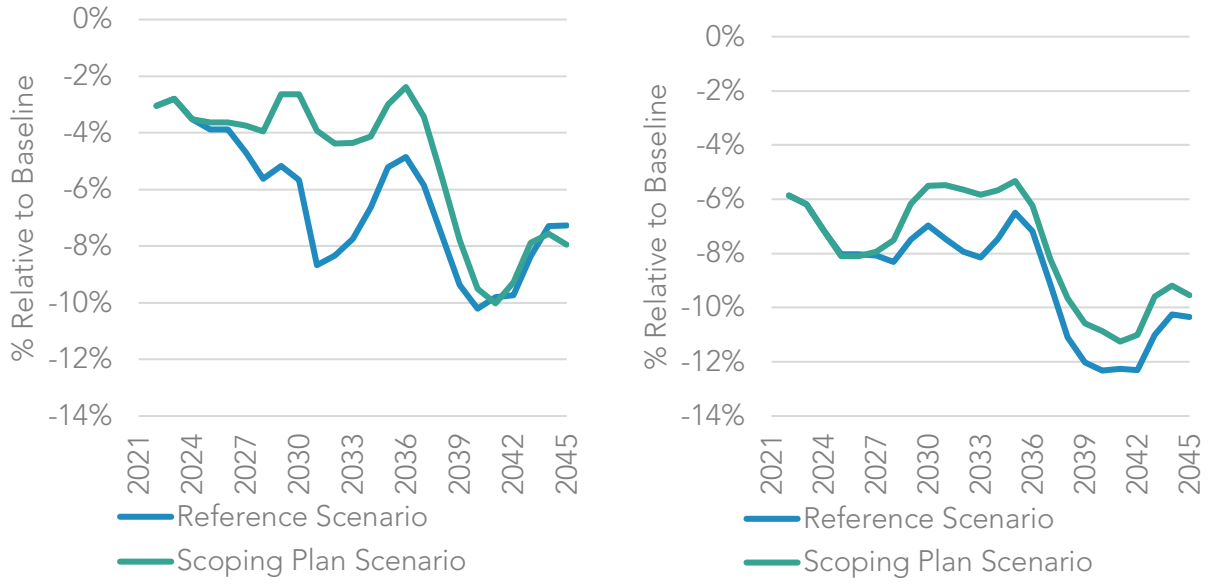
Together, forests, shrublands, and chaparral support a high biodiversity of plants and animals, in addition to high levels of carbon stocks. They provide important air and water quality benefits to all Californians, as well as recreational opportunities and, for forests, harvested wood products for the state. These landscapes are fire-adapted, and historical tribal management of these lands has fostered ecosystem health and resilience. Over the past century, these lands have been impacted severely by fire exclusion, including

[485] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N5, N26, N27. finalejacrecs.pdf (arb.ca.gov).
[486] CNRA. 2022. *Pathways to 30x30 California*. https://www.californianature.ca.gov/pages/30x30.

exclusion of indigenous people's management and past management practices, which has resulted in less resilient ecosystems and communities and more destructive wildfires today. This, along with drought induced stress and mortality, has changed these landscapes from a carbon sink to a carbon source. Climate smart management can help make forests more resilient to climate change and less prone to catastrophic wildfire. Climate-smart management in shrublands and chaparral face additional challenges and uncertainty, but can still provide protection for threatened communities and natural resources. This management, if conducted on a regular basis to maintain forest health, can help reduce emissions from forests, shrublands, and chaparral, and help strengthen and maintain the co-benefits that Californians experience from them.

Under all management levels, forests and shrublands are expected to lose carbon over the next two decades due to climate change and wildfire (Figure 4-21).

Figure 4-21: Forest (left) and shrubland (right) carbon stocks by 2045[487,488]



While this decrease in carbon stocks may be inevitable, forest management under the Scoping Plan Scenario can help direct where and how carbon loss occurs. By proactively managing forests and shrublands, the loss of carbon from wildfire can be lessened as the risk of high severity fire is decreased, with the removed biomass going toward a more

[487] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N13. *finalejacrecs.pdf (arb.ca.gov)*.
[488] This analysis is the aggregation of all forests and shrublands from all ownerships across the entire state of California.

useful purpose such as harvested wood products, bioenergy, and engineered carbon removal. Managing for a diverse and resilient forest landscape also can help forests recover more quickly so that when climate change and wildfire impacts occur, forests will be less affected and can continue to thrive and sequester carbon. Additional details on the climate benefit potential of forests and shrublands/chapparal can be found in Section 2 of the NWL Climate Smart Strategy.

Strategies for Achieving Success

- Accelerate the pace and scale of climate smart forest management to at least 2.3 million acres annually by 2025, in line with the climate smart management strategies identified in this Scoping Plan, the NWL Climate Smart Strategy, and the Wildfire and Forest Resilience Action Plan.[489]
- Establish and expand mechanisms that ensure forests, shrublands, and grasslands are protected from land conversion and that support ongoing, rather than one-time, management actions.
- In collaboration with state and local agencies, accelerate the deployment of long-term carbon storage from waste woody biomass residues resulting from climate smart management, including storage in durable wood products, underground reservoirs, soil amendments, and other mediums.
- Expand infrastructure to facilitate processing of biomass resulting from climate smart management.
- Expand permit streamlining in collaboration with state and local agencies to accelerate implementation of climate smart forest management while protecting natural resources.

Grasslands

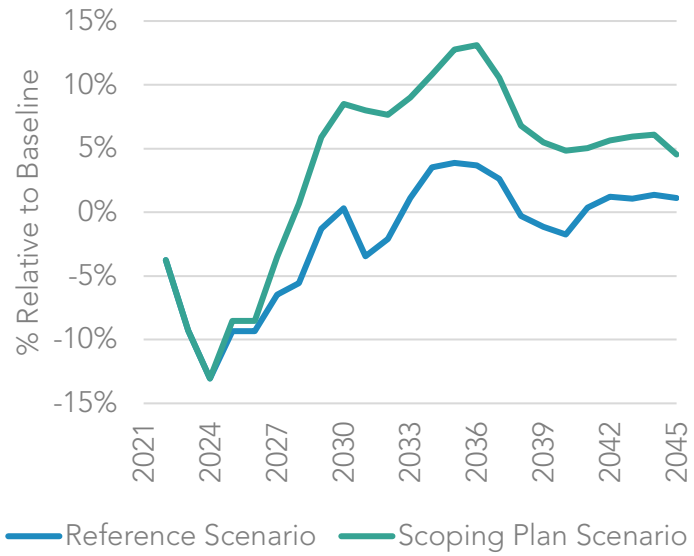
Grasslands cover 9 percent of California, roughly 10 million acres, and are found throughout the state in various landscapes, with concentrations in the foothills surrounding the Sacramento and San Joaquin Valleys. In addition to carbon storage (primarily in the soil), grasslands provide open space, wild habitat, grazing land, and important water filtration and recharge benefits. The protection of grasslands provides an opportunity to reduce sprawl and complement VMT reduction strategies. As grasslands are susceptible to invasive species, climate smart strategies can increase grassland

[489] Forest Management Task Force. 2021. *California's Wildfire and Forest Resilience Action Plan: Recommendations of the Governor's Forest Management Task Force.* https://www.fire.ca.gov/media/ps4p2vck/californiawildfireandforestresilienceactionplan.pdf.

resilience to climate change by improving species diversity and maintaining or increasing soil carbon stocks.

Modeling results show that increased fuels treatments and avoided land conversion can increase carbon stocks on grasslands by 2045, but sequestration rates fluctuate annually. Grasslands are capable of high carbon sequestration rates but are susceptible to carbon losses from wildfire and land conversion. Soil carbon is the major carbon pool on these lands, and continued future improvement of the monitoring and modeling of soil carbon is needed. Similar to forests and shrubland/chaparral, modeling alternatives that include fuels treatments resulted in greater carbon stocks compared to no management, and had lower wildfire emissions. Unlike forests and shrubland/chaparral, which have a general declining carbon stocks trend, the modeling results (Figure 4-22) show grasslands can maintain or increase carbon stocks with active management. Details on the climate benefit potential of grasslands can be found in Section 2 of the NWL Climate Smart Strategy.

Figure 4-22: Grassland carbon stocks by 2045



Strategies for Achieving Success

- Establish and expand mechanisms that ensure grasslands are protected from land conversion/parcelization and that support ongoing, rather than one-time, management actions that improve carbon sequestration.
- Deploy grassland management strategies, like prescribed grazing, compost application, and other regenerative practices, to support soil carbon sequestration, biodiversity, and other ecological improvements.

- Increase adoption of compost production on farms and application of compost in appropriate grassland settings for improved vegetation and carbon storage, and to deliver waste diversion goals through nature-based solutions.

Croplands

Croplands cover 9 percent of the state, roughly 9.5 million acres. This land is some of the most productive agricultural land in the world, and enables California to be a global leader in agriculture. Aside from developed lands, croplands are the most intensively managed landscapes in the state, and are closely tied to society through the food they produce and the constant, direct contact that people have with croplands through the course of management. In addition to food security, croplands provide considerable carbon storage in the soil and, in perennial croplands, in aboveground biomass. Climate smart practices can improve public health; for example, by reducing synthetic fertilizer and pesticide use. They also help to maintain or increase the climate resilience of cropland productivity through improved soil conditions and increased pollinator habitat.

There is also significant potential to transform this sector to increase soil carbon storage, reduce GHG emissions (Figure 4-23), and reduce pesticide exposure and health impacts. Moving to an agricultural system that improves soil health and water holding capacity reduces over-application of nitrogen, reduces the use of pesticides and fumigants, and increases biodiversity and pollinator habitat, supporting California's pathway to carbon neutrality while simultaneously improving the lives of those who live and work in the agricultural community. Croplands are intricately tied to people, communities, and their health, and through climate smart practices and cropland conservation, these lands have the potential to contribute more to society than just food.[490] The implementation of climate smart agricultural practices and diversified organic agriculture can help California achieve social and environmental benefits, like improving water use efficiency, increasing pollinator habitat, and reducing synthetic fertilizer and pesticide use.[491] Additional details on the climate benefit potential of croplands can be found in Section 2 of the NWL Climate Smart Strategy.

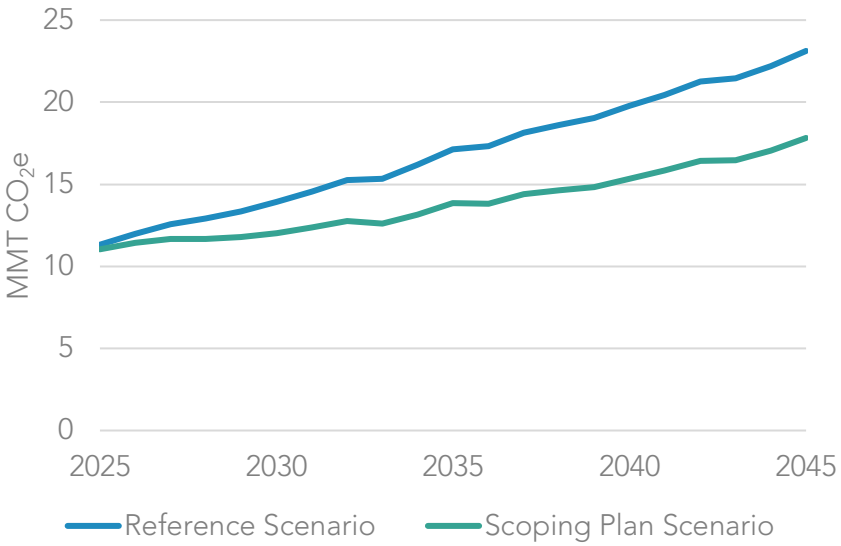
[491] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. *finalejacrecs.pdf (arb.ca.gov)*.

Figure 4-23: Cumulative CO_2e emissions from annual croplands in 2045[492]



CARB recognizes the complex nature of croplands, cross-sector relationships, and the need to build on this analysis to further our understanding of cropland dynamics. Many more aspects of cropland management need to be explored for potential climate benefits, such as water and nutrient use management, pest control methods, crop rotations, and other management practices. The impacts of climate change on water availability, annual/perennial crop growth, and future carbon sequestration trends are uncertain, and recent policies such as the Sustainable Groundwater Management Act may also influence cropland management in unforeseen ways. Nonetheless, it is clear that greater climate smart practice implementation can prepare California for the future and yield tangible benefits for the state.

Strategies for Achieving Success

- Accelerate the pace and scale of healthy soils practices to 80,000 acres annually by 2025, conserve at least 8,000 acres of annual crops annually, and increase organic agriculture to 20 percent of all cultivated acres by 2045.

[492] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. *finalejacrecs.pdf (arb.ca.gov)*.

- Utilize the recommendations included in CDFA's Farmer and Rancher-Led Climate Change Solutions[493] report to accelerate deployment of healthy soils practices, organic farming, and climate smart agriculture practices.
- Establish or expand financial mechanisms that support ongoing deployment of healthy soils practices and organic agriculture.[494]
- Support strategies that achieve co-benefits of safer, more sustainable pest management practices and the health and preservation of ecosystems, such as implementing the California Department of Pesticide Regulation's (DPR's) Sustainable Pest Management Work Group recommendations.[495]
- Conduct research on the intersection of pesticides, soil health, GHGs, and pest resiliency via a multi-agency effort with DPR, CDFA, and CARB.[496]
- Conduct outreach and education to develop and facilitate the increased adoption of safer, more sustainable pest management practices and tools; reduce the use of harmful pesticides; promote healthy soils; improve water and air quality; and reduce public health impacts.
- In collaboration with state and local agencies, accelerate the deployment of alternatives to agricultural burning that increase long-term carbon storage from waste agricultural biomass, including storage in durable wood products, underground reservoirs, soil amendments, and other mediums.
- Work across state agencies to reduce regulatory and permitting barriers around some healthy soils practices (e.g., composting), where appropriate.
- Utilize innovative agriculture energy use and carbon monitoring and planning tools to reduce on-farm GHG emissions from energy and fertilizer application or to increase carbon storage, as well as to promote on-farm energy production opportunities.

[493] California Department of Food and Agriculture. 2021. Farmer and Rancher Led Climate Change Solutions. *https://www.cdfa.ca.gov/oefi/climate/docs/cdfa_farmer_and_rancher-led_climate_solutions_meetings_summary.pdf*.

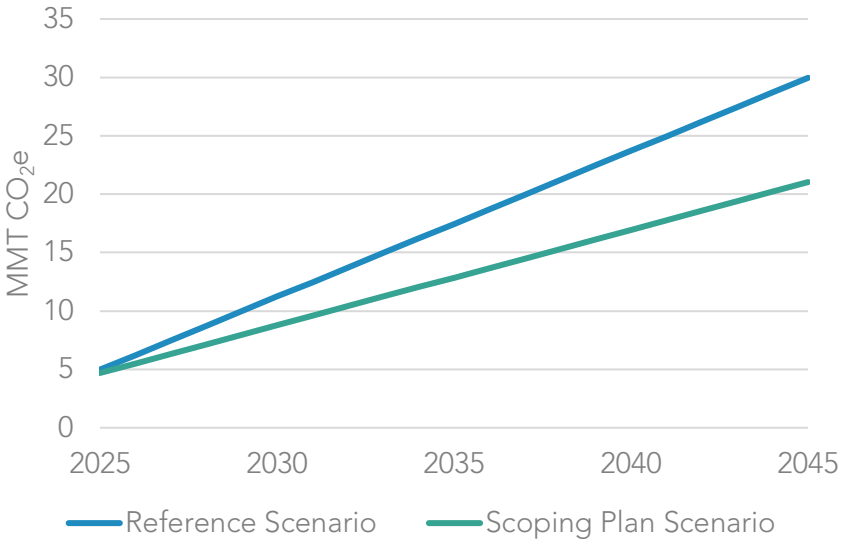
[496] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. *finalejacrecs.pdf (arb.ca.gov)*.

Wetlands

Wetlands cover 2 percent of the state (roughly 1.7 million acres) and include inland and coastal wetlands, such as vernal pools, peatlands, mountain meadows, salt marshes, and mudflats. These lands are essential to California's communities as they serve as hotspots for biodiversity, contain considerable carbon in the soil, are critical to the state's water supply, and protect upland areas from flooding due to sea level rise and storms. Wetlands have been severely degraded through reclamation, diking, draining, and dredging practices in the past, resulting in the emissions of the carbon stored in the soils and the loss of ecosystem benefits. Climate smart strategies to restore and protect all the types of wetlands can reduce emissions while simultaneously improving the climate resilience of surrounding areas and improving the water quality and yield for the state. Restored wetlands also can reduce pressure on California's aging water infrastructure. These benefits beyond emissions reductions will help in the future, as climate change is predicted to negatively affect water supply.

Avoided conversion and restoration of Delta wetlands reduces CO_2 and methane emissions from wetlands, with GHG reductions scaling with implementation rates (Figure 4-24). Expansion of conservation and restoration efforts will generate benefits such as the conservation of biodiversity, improved water quality and supply, and reduced flood risk. Additional details on the climate benefit potential of wetlands can be found in Section 2 of the NWL Climate Smart Strategy.

Figure 4-24: Cumulative CO_2e emissions from Delta wetlands by 2045



Strategies for Achieving Success

- Restore 60,000 acres of Delta wetlands annually by 2045 to reduce methane emissions from wetlands and reverse the resulting subsidence.

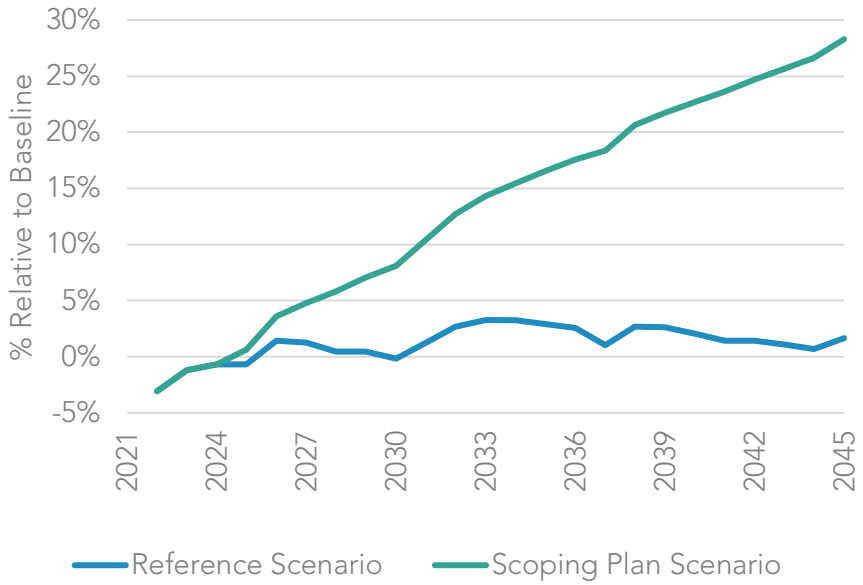
- Identify and prioritize wetland restoration efforts around climate vulnerable communities.
- Leverage other funding and institutions to support wetland restoration projects, including land trusts, local funding (e.g., San Francisco Measure AA), federal funding, and private and philanthropic funding to support wetlands restoration projects.
- Work across state agencies to reduce regulatory and permitting barriers around wetland restoration projects, where appropriate.

Developed Lands

Developed lands cover 6 percent of the state (roughly 6.8 million acres) and include urban, suburban, and rural areas, as well as transportation and supporting infrastructure throughout California. This area encapsulates the land on which the vast majority of Californians reside and call home. The vegetation within cities and communities, and along infrastructure, are all part of developed lands. This vegetation provides numerous benefits to surrounding areas, including carbon storage, air and water filtration, reduced urban heat island effect, and access to nature, aesthetics, and mental health, among others. These areas are susceptible to climate change as well, and climate smart strategies to protect and expand the urban forests, landscaping, green spaces, parks, and associated vegetation can increase their climate resilience and the benefits Californians derive from them. These strategies also have a significant opportunity to benefit disadvantaged communities, who may not have equitable access to these practices or the benefits they provide. Additional details on the climate and equity benefit potential of developed lands can be found in Section 2 and the Introduction of the NWL Climate Smart Strategy.

Urban forests have a significant potential to sequester carbon (Figure 4-25). They are vastly different from wildland forests, as they require investments to maintain and irrigate. This results in the need for a significant increase in investment to increase urban forest carbon. As urban forests become denser and management difficulty increases, the carbon stock returns on investment diminish, making it expensive to maximize carbon in urban forests. Water availability and irrigation efficiency are also an important consideration for increasing urban forest cover. As water becomes scarcer, the prioritization of irrigating trees over lawns or gardens may be required to achieve increases in urban forest carbon.

Figure 4-25: Carbon stocks in urban forests by 2045



Within wildland-urban interface (WUI) areas, defensible space can protect urban and rural communities from wildfire. Analysis results show that 48 percent of parcels are currently fully compliant with defensible space requirements. This highlights how much work needs to be done to protect communities and homes. Defensible space results in a decrease in carbon stocks, as expected when reducing fuels for wildfire.

Strategies for Achieving Success

- Increase urban forestry investment annually by 200 percent, relative to business as usual.
- Increase public awareness of urban forest benefits and, where appropriate, prioritizing irrigation of trees over lawns.
- Provide technical assistance and resources to disadvantaged communities to implement community urban greening projects to provide equitable access to the benefits of urban greening projects.[497]
- Work with state and local agencies to expand technical assistance for and enforcement of the defensible space requirements of PRC 4291 to reduce wildfire risk to homes and structures.

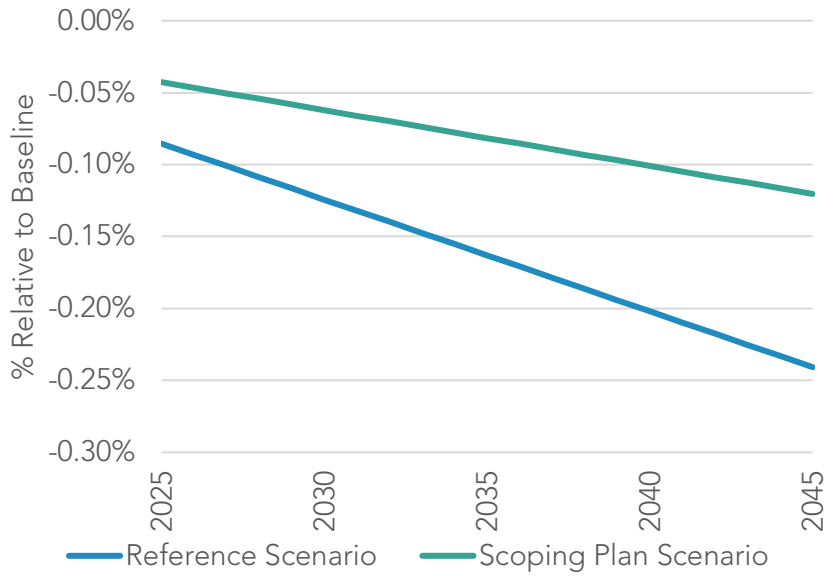
[497] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N8. *finalejacrecs.pdf (arb.ca.gov)*.

Sparsely Vegetated Lands

Sparsely vegetated lands cover 10 percent of the state, roughly 10.2 million acres, primarily in the east and southern parts of California. These lands include deserts, beaches, dunes, bare rock, and areas covered in ice and snow (e.g., higher mountain elevations). The limited carbon storage of these lands varies from bare rock and mineral soil to more vegetated areas, though severe climate limits the amount of biomass. Nonetheless, sparsely vegetated lands are important for open space and provide rare and unique habitats for endemic species and a diversity of wildlife. These lands present important recreational opportunities for Californians and serve as important protective buffers in coastal and low-lying areas. Land use change threatens these lands, and conservation efforts are important for protecting these unique areas of California.[498]

Avoided conversion of sparsely vegetated lands reduces the organic carbon lost from the soil, which is the major carbon pool in this land type (Figure 4-26). In identifying the outcomes for sparsely vegetated lands, CARB modeled avoided land conversion to another land use.

Figure 4-26: Carbon stocks in sparsely vegetated lands by 2045



Strategies for Achieving Success

- Establish and expand mechanisms that ensure sparsely vegetated lands are

[498] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N26. finalejacrecs.pdf (arb.ca.gov).

protected from land conversion, prioritizing those areas most vulnerable to climate change and loss.

Additional Management Strategies

Additional nature-based climate solutions beyond those management strategies modeled for this Scoping Plan are available for implementation, but either cannot currently be modeled and/or affect carbon and the landscape in ways that cannot currently be tracked. Nevertheless, it is important to take action even where these technical gaps exist. Some of these actions, such as cultural burning and indigenous farming practices, have been used on large scales for decades or even centuries, while others are relatively new concepts. The state nevertheless recommends implementing the additional solutions listed here to achieve potential additional climate benefits, as well as other co-benefits. These additional solutions were drawn from the NWL Climate Smart Strategy and stakeholder, tribal government, and interagency feedback.[499]

Considerations

Although these practices are recommended, because of the lack of in-depth modeling and analysis available, several considerations must be addressed when implementing them. These considerations also apply to the management strategies included in the Scoping Plan Scenario.

- Future climate change impacts are uncertain: The negative impact that climate change can have on the ability of these practices to maintain expected climate benefits is uncertain and may significantly change in the future. Climate change is expected to further diminish the already constricting growing conditions in California, with increasing droughts, more extreme weather events, and expanding disturbances from fire, insects, and disease. It is estimated that suitable habitat for many native plant and animal species could shift, creating novel ecosystems without historical precedent. Close monitoring of all practices, including no management, across our NWL will be critical to understand if and how future climate change affects outcomes and how to adapt management to meet the needs of the system under climate change.[500]

[499] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N24. *finalejacrecs.pdf (arb.ca.gov)*.
[500] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N15. *finalejacrecs.pdf (arb.ca.gov)*.

- Local conditions: Not every practice is applicable, feasible, or even desirable in every location across California. Implementation of these practices should account for local conditions and needs that may affect the appropriateness of that practice.
- Long-term carbon storage: The ability to sequester additional carbon into NWL is only beneficial to the climate if that carbon stays out of the atmosphere. Many of the additional practices listed here may require continual incentives or interventions to ensure permanence of carbon storage in the soil and biomass. For example, in croplands, it is difficult to estimate how much of the carbon stored by no-tillage can be released by a single subsequent tillage, but a return to conventional tillage would usually be expected to erase most gains.[501,502]
- Scaling actions: There are uncertainties on how these practices may impact both the environment and communities when significantly expanded. For this reason, it is best to take a cautious and measured approach to ramping up actions to a larger scale.
- Infrastructure and operational needs: Scaling up the implementation of some of these practices demands transformational change in the supporting infrastructure and operational frameworks. For example, increasing forest management to the degree included in the Scoping Plan Scenario will require significant changes to wood-processing infrastructure, workforce capacity, permitting processes, technical assistance, and other operational constraints. The increased application of compost to croplands, and potentially to rangelands, will require a significant increase in organic waste and dairy manure collection to increase compost supply, in line with SB 1383. This will also require additional compost production facilities as well as compost/organic waste transportation and application methods.
- Co-benefits: Many co-benefits from these practices exist beyond the climate benefits. These co-benefits include improved public and worker health; improved microbial, insect, and wildlife habitat; enhanced biodiversity; greater labor demand in the nature-based economy; and improved climate resilience.
- Labor and Economics: Many of these practices require additional labor, and an evaluation of how many more jobs are needed to carry out many of these practices

[501] Muñoz-Romero, V., R. J. Lopez-Bellido, P. Fernandez-Garcia, R. Redondo, S. Murillo, and L. Lopez-Bellido. 2017. “Effects of tillage, crop rotation and N application rate on labile and recalcitrant soil carbon in a Mediterranean Vertisol.” *Soil Tillage Res.* 169, 118–123.
[502] Mitchell, J. P., A. Shrestha, W. R. Horwath, R. J. Southard, N. Madden, J. Veenstra, and D. S. Munk. 2015. “Tillage and cover cropping affect crop yields and soil carbon in the San Joaquin Valley.” *California. Agron. J.* 107, 588–596.

is currently unknown. There will also be the need to explore the costs and economic benefits of implementing these additional practices.

- Retreatments: All of these practices have limits on how long they can enhance carbon sequestration. Many of these practices need to be periodically repeated, followed by complementary practices, or maintained through time. This increases costs and requires diligence and long-term stewardship.

Additional NWL Actions and Strategies

Below is a set of additional actions that should be taken on California's natural and working lands. Again, these practices were not modeled for this Scoping Plan, and all of the considerations listed above should be taken into account before implementing the following actions.

- Conservation of all NWL types (in line with the NWL Climate Smart Strategy and CNRA's Pathways to 30x30 California) is critical to ensuring continued carbon sequestration and provision of co-benefits from these lands for all Californians.[503]
- Reforestation following disturbance, using appropriate species, is an impactful practice that can help prevent conversion away from forestland and establish new trees to sequester carbon. The number of acres that may need reforestation following high severity wildfires is estimated to continue to increase into the future.
- Restoration of shrublands, chaparral, riparian zones, and oak woodlands across California includes a variety of practices to alter their structure and return endemic species to the areas. These unique habitats provide multiple co-benefits to the state, such as clean water, reduced wildfire risk, and biodiverse habitats for flora and fauna.
- Conservation and restoration of wetlands, beyond the Delta wetlands included in the NWL modeling, can protect these unique habitats and the climate benefits they provide. These wetland types can include but are not limited to coastal wetlands, mountain meadows, vernal pool complexes, alkali sinks and meadows, and floodplains.
- Conservation and restoration of seagrasses and seaweeds provide a number of benefits, including carbon storage and sequestration, habitat provision for many culturally and commercially important species of fishes and invertebrates, shoreline protection, and tourism opportunities.[504]

---

[503] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N26, N27. finalejacrecs.pdf (arb.ca.gov).
[504] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N2. finalejacrecs.pdf (arb.ca.gov).

- Prescribed herbivory utilizes various livestock to consume vegetation to reduce fuel loads across an area. This fuel management practice can be used in forests, grasslands, and shrublands as an effective alternative to herbicide use, and should be considered wherever local conditions allow.
- Urban and community greening efforts such as green schoolyards, urban farms, rain gardens, community gardens, community composting, and many more provide numerous health benefits to communities.
- Additional Healthy Soils Program practices on annual croplands such as conservation cover and crop rotation, biomass planting for borders, wind barriers, riparian areas, and improved nutrient management can improve soil health, water retention, and increase carbon stocks.
- Healthy Soils Program practices on perennial croplands and rangelands, such as compost application and alley cropping/cover cropping to improve soil health, water retention, erosion control, and biomass growth.[505]
- Stacking of these Healthy Soils Program practices, where appropriate, in perennial and annual systems, can synergistically improve soil health and provide multiple benefits.
- Mulching adds high carbon materials to croplands or fallowed lands to reduce competing vegetation and retain moisture. This practice can support other benefits such as reduced water use and reduced synthetic pesticide and fertilizer use, as well as provide a use for suitable forest and agricultural waste biomass.
- Reductions in the use of synthetic fertilizers in cropland management, generally supported by the implementation of new management tools or technologies, can lead to reductions in GHG emissions from the production and application of fertilizers. This benefit is in addition to the co-benefits of reduced chemical runoff into waterways and reduced exposure of human populations to their harmful effects.

[505] Various types of organic amendments are being researched for application to particular landscape types. For example, compost application to rangelands is a relatively new practice that has been shown to improve soil health and increase carbon sequestration in the short term, though the science on the long-term impacts of this practice is still developing and the supply of available compost may be limiting.

Chapter 5: Challenge Accepted

This chapter provides an overview of the next steps and partnerships that will be needed to successfully implement this Scoping Plan. The path forward is not dependent on one agency, one state, or even one country. It will take action on a global level to address the threat climate change poses. But, the work begins at home.[506] The state can lead by engaging Californians and demonstrating how action at the state, regional, and local levels of government, as well as action at community and individual levels, can contribute to addressing the challenge before us. We must build partnerships with academic institutions, private industry, and others to support and accelerate the transition to carbon neutrality. Ultimately, the success of this Scoping Plan will be measured by our ability to implement the actions modeled in the Scoping Plan Scenario at all levels of government and society. This will depend on a mix of legislative action, regulatory program development, incentives, institutional support, workforce and business development, education and outreach, community engagement, and research and development and deployment. Optimizing this mix will help to ensure that clean energy and other climate mitigation strategies are clear, winning alternatives in the marketplace and in communities—to promote equity, drive innovation, and encourage consumer adoption. Bold institutional action will catalyze continued research and push private investment to create jobs and bring innovative ideas to reality.

State-level Action

Achieving the targets described in this Scoping Plan will require continued commitment to and successful implementation of existing policies and programs and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians.

[506] This "polycentric" approach to climate challenges, engaging many levels of government, was articulated in leading papers by Nobel laureate Elinor Ostrom. See, for example, Ostrom, E. 2014. "A Polycentric Approach to Coping with Climate Change." *Annals of Economics and Finance* 15-1, 97–134.

Regulations and Programmatic Development

Meeting the AB 32 2020 GHG emissions reduction target several years earlier than mandated demonstrated that developing mitigation strategies through a public process, where all stakeholders have a voice, leads to effective actions that address climate change and yields a series of additional economic and environmental co-benefits to the state. Following adoption of this Scoping Plan, state agencies will continue to update and implement new and existing programs to align with the outcomes in the plan. Community, tribal, and stakeholder engagement will be a critical part of this work. Several state agencies, including CARB, the CEC, the California State Transportation Agency (CalSTA), the CPUC, and others will need to be part of various subsequent rulemaking processes. Each of these agencies' leadership and technical staff will engage with the public through public meetings, written and oral comment, and other methods of engagement. This work will be informed by evaluations of the health, air quality, environmental, equity, and economic benefits and impacts of regulations, including an assessment of the societal cost of carbon, as required under AB 197.

Incentive Programs

As described in Chapter 1, incentive programs are one of the most important tools the state has in advancing our low carbon future, especially for climate vulnerable communities. The programs ensure clean technology and energy are accessible and are critical to closing ongoing opportunity gaps. These programs also leverage private-sector investment and build sustainable, growing markets for clean and efficient technologies, and they are particularly necessary to support GHG emission reduction strategies for priority sectors, sources, and technologies. Clean technologies are often already the best and lowest cost option over their lifetimes but incentive funding is critical to ensure that they are broadly available, especially in climate vulnerable communities. Incentives also build on California's long track record of driving innovative technology developments, and creating new industries, with targeted investment. The Inflation Reduction Act also provides a new source of funding and tax incentives that must be leveraged to help achieve the state's climate goals.

Many state funding programs are designed to achieve multiple objectives simultaneously: reduce emissions from GHGs, criteria pollutants, and toxic air contaminants; manage natural and working lands for carbon sequestration; and address health and opportunity gaps in disadvantaged communities. California's incentive programs focused on jump-starting the transition to a zero emission transportation future are a good example of this "stacked" approach. The state is investing billions of dollars through programs such as the On-Road Heavy-Duty Voucher Incentive Program and Clean Cars 4 All in order to replace the light- and heavy-duty vehicles most responsible for the state's GHG emissions and poor air quality, all while bolstering the nascent ZEV market. Further strategies aid in developing new technologies, in ramping up access for all, and in shifting to cleaner

modes of transport; for instance, by supporting investments in walkable, bikeable communities and transit, as well as in vehicles. This funding strategy is, of course, paired with the regulatory approach described above.

Local Action

Local action by cities can support and amplify efforts to reduce GHGs. For example, the City of Oakland requires all new construction to be all-electric and is currently working on electrifying existing buildings.[507] In addition, starting in 2023, the City of Sacramento will require all new buildings under three stories to be all-electric, and it extends the mandate to all new construction by 2026 with some limited exemptions. The City of Sacramento also requires levels of EV charging infrastructure in new construction starting in 2023, higher than the minimum state requirements, and provides parking incentives for zero-emission carsharing and EV charging.[508] Local governments asserting this type of leadership are critical partners in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment.

California must accommodate population and economic growth in a far more sustainable and equitable manner than in the past. Good climate policy can and should create affordable and pleasant places to live, with effective transport and clean air for all—a future in which local governments and communities are central partners. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements, and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority.

Local governments are also frequently the source of innovative and practical climate solutions that can be replicated in other areas. Their efforts to reduce GHG emissions within their jurisdictions are vital to achieving the state's near-term air quality and long-term climate goals. Local governments must continue to take action that affirmatively

---

[507] City of Oakland. Building Electrification. *https://www.oaklandca.gov/projects/building-electrification*.

[508] City of Sacramento. Electrification of New Construction. *http://www.cityofsacramento.org/SacElectrificationOrdinance*.

builds the projects and expend the funds needed to further the state's collective path toward equitable emissions reductions. As such, aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in this Scoping Plan is critical to achieving the statutory targets for 2030 and 2045. Local governments can implement climate strategies that can effectively engage residents by addressing local conditions and issues that also deliver local economic benefits.

Local Climate Action Planning and Permitting

California encourages local jurisdictions to take ambitious, coordinated climate action at the community scale; action that is consistent with and supportive of the state's climate goals.[509] As discussed in more detail in Appendix D (Local Actions), local jurisdictions can do much to enable statewide priorities, such as taking local action to help the state develop the housing, transport systems, and other tools we all need. Indeed, state tools—such as the Cap-and-Trade Program or zero-emission vehicle programs—do not substitute for these local efforts. Multiple legal tools are open to local jurisdictions to support this approach, including development of a climate action plan (CAP), sustainability plan, or inclusion of a plan for reduction of GHG emissions and climate actions within a jurisdiction's general plan. Any of these can help to align zoning, permitting, and other local tools with climate action.

Once adopted, the GHG emissions reductions plans detailed in CAPs can provide local governments with a valuable tool for coordinated climate planning in their community. When a local CAP complies with CEQA requirements, individual projects that comply with the CAP are allowed to streamline the project-specific GHG analysis.[510,511] Effectively, local governments that adopt a CEQA-compliant CAP enable project developers to use this streamlined approach. This saves time and resources and provides more consistent expectations for how GHG reduction measures are applied across projects in the jurisdiction. While the state encourages local governments to follow this approach, we acknowledge not all jurisdictions have the resources to develop a CAP that meets the CEQA requirements.

In addition to being required for a local CAP to comply with CEQA, local GHG reduction targets have long been recommended as part of the process of developing a climate

[509] This plan provides more detailed guidance and tools to local governments in Appendix D (Local Actions).
[510] Cal. Code of Regs., tit. 14, § 15183.5.
[511] California Governor's Office of Planning and Research. n.d. "General Plan Guidelines - Chapter 8 Climate Change."

action plan.[512] One challenge local jurisdictions have faced is how to evaluate and adopt quantitative, locally appropriate goals that align with statewide goals. An effective response to this challenge is to focus on goals that can help implement overall state priorities—enabling the key transformations California needs.

There are many ways that local governments can make key contributions to this transformation, depending on the characteristics of their jurisdiction and community. For example, some jurisdictions will inherently have more land capacity to remove and store carbon, whether through natural and working lands or by other means. Other jurisdictions will be host to GHG-emitting facilities that serve necessary functions and will take time to transition to clean technology (e.g., municipal wastewater treatment plants, landfills, and energy generation and transmission facilities). It is important to recognize that we will need to build new energy production and distribution infrastructure, and repurpose existing ones, for clean technology and energy before we are able to phase down existing fossil sources. There also will be a need to handle the significant amount of biomass resulting from sustainable forest management for catastrophic wildfire prevention, agricultural waste, and landfill diversion.

Regional efforts can support change too: energy and transportation systems that serve Californians do not stop at jurisdictional boundaries, and some local decisions can have ramifications for other communities. For instance, Metropolitan Planning Organizations (MPOs) can help to integrate local efforts by planning consistent with the Scoping Plan and Climate Action Plan for Transportation Infrastructure, including by removing polluting roadway capacity expansions from project pipelines and instead focusing on climate-friendly solutions. These varied capabilities and needs should be taken into account in setting targets for local climate plans. For instance, although net zero targets can often be valuable and achievable, and mitigation is important, targets should be considered in the larger context of these goals. This all means any GHG targets on a local scale should take into consideration the actions and outcomes included in this Scoping Plan. Jurisdictions considering “net zero” targets should carefully consider the implications such targets may have on emissions in neighboring communities and the ability of the state to meet our collective targets.

Jurisdictions without formal CAPs also have important opportunities within this context. These jurisdictions can still take actions that effectively translate key state plans, goals, and targets, including those articulated in this Scoping Plan for local action. For instance, state ZEV targets can advance local efforts to promote broad and equitable access to charging and fueling. Similarly, local jurisdictions can enable reduced dependence on

[512] Climate Smart Communities. 2014. Climate Action Planning Guide. https://cdrpc.org/wp-content/uploads/2015/05/CAP-Guide_MAR-2014_FINAL.pdf.

single-occupancy vehicles by supporting dense infill housing and transit, among other actions. Such actions can be reflected in particular project plans, in general plans, or through other local policies. Regional partnerships among these jurisdictions can also help tap resources and provide for more effective overall action.

Unlocking CEQA Mitigation for Local Success

The California Environmental Quality Act also provides important tools for lead agencies to support the achievement of the state's GHG and VMT reduction goals. Although many climate-friendly local government actions already fall into categories that may not require a full CEQA analysis, thanks to streamlining or other tools, and although certain product types (such as affordable infill housing) are generally clearly consistent with state climate goals, CEQA analyses may still sometimes be required. CEQA can be a powerful and useful tool to engage the public, identify additional opportunities to support climate efforts, and localize change. It is important that lead agencies look for ways to use CEQA to support these core purposes, ensuring that these processes do not become sources of delay but instead unlock more opportunities. The uncertainty analysis in Chapter 2 evaluates how project implementation delays can lead to missed state climate targets and continued dependence on fossil energy. Mitigation measures applied in the communities affected by projects subject to CEQA have the added benefit of improving health, social, and economic resiliency as climate impacts worsen.

Appendix D (Local Actions) explores the role of local government action and CEQA in detail. As discussed there, an important CEQA-related tool is mitigation—which can be used to further drive local action consistent with state climate goals. When a lead agency determines that a proposed project would result in potentially significant GHG impacts due to its GHG emissions or a conflict with state climate goals, the lead agency must impose feasible mitigation measures to minimize the impact. Appendix D (Local Actions) provides suggestions for prioritizing the various types of mitigation, starting with on-site GHG-reducing design features[513] and mitigation measures, such as methods to reduce VMT and support building decarbonization, access to shared mobility services or transit, and EV charging. After exhausting all the on-site GHG mitigation measures, CARB recommends prioritizing local, off-site GHG mitigation measures, including both direct investment and voluntary GHG reduction or sequestration projects, in the neighborhoods impacted by the project. This could include, for example, development of a neighborhood green space, investment in street trees, or expansion of transit services. Implementing GHG mitigation measures in the project's vicinity would allow the project proponent and the lead agency to work directly with the affected community to identify and prioritize the

[513] Cal. Code of Regs., tit. 14, § 15126.4(c)(2) and (3).

mitigation measures that meet their needs while minimizing multiple environmental and societal impacts.

Once all potential on-site and local off-site GHG mitigation measures have been incorporated to the extent feasible, Appendix D (Local Actions) provides further suggestions for prioritizing other mitigation types, including non-local off-site mitigation, and voluntary offsets issued by a recognized and reputable voluntary carbon registry (as listed on CARB's website[514]) may be appropriate. Additional in-state mitigation also may be available in the upcoming SB 27[515] (Skinner, Chapter 237, Statues of 2021) registry, which will serve as a database of projects in the state that drive climate action on natural and working lands. Lead agencies should use substantial evidence to demonstrate that the project proponent explored and prioritized investments in feasible, local mitigation prior to moving mitigation to a geography located farther away from the project.

Communities and Environmental Justice

As noted in Board Resolution 20-33,[516] it is incumbent on CARB to function as an agent of responsible social change, especially when it is clear that environmental injustices continue to persist for low-income communities, tribes, and communities of color.

State law defines *environmental justice* as the fair treatment of all people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.[517] Government Alliance for Race and Equity (GARE)[518] defines *racial equity* as when race can no longer be used to predict life outcomes and outcomes for all groups are improved.

For this Scoping Plan to be successful, it must address environmental justice and advance racial equity. Implementation of the plan needs to address the needs of those communities that are disproportionately burdened by climate impacts and continue to face significant health and opportunity gaps. Now, we need to ensure our actions allow these communities to not only have a seat at the table, but also inform and shape the policies

to ensure their communities thrive. With this Scoping Plan, the state also adds a new tool to identify which communities will be the least resilient in the face of selected climate impacts and will see disproportionate economic impacts as a result. As described in Chapter 3, the CVM will enable the state to target programs and policies to build resiliency in the specific regions that will feel climate impacts more acutely due to existing health and opportunity disparities leading to disproportionate economic impacts. This tool will be critical in the state's efforts to address climate impacts while accounting for environmental injustices and racial inequities. CARB will incorporate the CVM into its work as it moves forward and will share this new tool with other agencies to align our efforts. The goal is to keep expanding the CVM to incorporate additional climate impacts to better identify disproportionate economic impacts as community level data becomes available.

AB 617 is another important tool for both Air Districts and CARB to bring resources to communities that have long been disproportionately burdened by poor air quality. While AB 617 does not require local agencies to participate in the Community Air Protection Program, several AB 617 communities are finding ways to bring local land use agencies to the table to respond to community priorities. We look forward to more opportunities to foster relationships with local authorities and continued collaboration between state and air district programs.

In alignment with AB 32, and to ensure environmental justice and racial equity were integrated into this Scoping Plan, CARB reconvened the AB 32 Environmental Justice Advisory Committee (EJ Advisory Committee) to advise CARB on the development of this Scoping Plan. Since reconvening in May 2021, the EJ Advisory Committee has engaged in the following activities:

- In October 2021, the EJ Advisory Committee sent a letter to the governor requesting a timeline extension for the Scoping Plan process. In response to the EJ Advisory Committee's letter, CARB modified this Scoping Plan process[519] and committed to an active engagement with the EJ Advisory Committee following the approval of this Scoping Plan. The EJ Advisory Committee also presented to the CARB Board[520] at its October 2021 Board meeting, reiterating its request for a timeline extension, as well as sharing additional concerns about process.

- In December 2021, the EJ Advisory Committee shared its responses to Scenario Input Questions,[521] as well as a narrative document outlining their concerns[522] around the process, the need for evaluation, and the need for a tribal representative. In response to the EJ Advisory Committee Scenario Input Questions, CARB incorporated the EJ Advisory Committee responses into the Scenario Assumptions document,[523] and modeled results from PATHWAYS.[524] In response to the EJ Advisory Committee's concerns, CARB worked diligently to appoint a tribal representative[525] in February 2022, and to outline additional opportunities for the EJ Advisory Committee to engage in the Scoping Plan process.[526]
- In March 2022, the EJ Advisory Committee presented at the joint EJ Advisory Committee / CARB Board meeting[527] and walked through their preliminary draft recommendations to inform this Scoping Plan. In April, the EJ Advisory Committee shared its revised preliminary draft recommendations[528] to inform this Scoping Plan.
- In September 2022, the EJ Advisory Committee presented at the joint EJ Advisory Committee / CARB Board meeting[529] and engaged in discussion about priority items as they relate to incorporating environmental justice into the Scoping Plan. By the end of September, the EJ Advisory Committee shared its final

recommendations[530] to inform this Scoping Plan. To the extent possible, CARB has incorporated and cited these recommendations through this Scoping Plan.

In addition to the activities listed above, Central Valley EJ Advisory Committee members hosted a successful community engagement workshop[531] in San Joaquin Valley in February 2022 with over 100 attendees. Members of EJ Advisory Committee hosted a statewide community engagement workshop[532] in June 2022 with more than 165 attendees. Throughout the EJ Advisory Committee's process, members of the Committee continued to work with their communities to ground truth their recommendations to inform the development of the Scoping Plan. The EJ Advisory Committee worked hard to ensure the voices of those communities most burdened by climate impacts were reflected in the plan. The EJ Advisory Committee will continue to play an ongoing role in the implementation of this Scoping Plan to ensure environmental justice and racial equity are prioritized in our effort to address the climate challenge before us.

To the extent possible, the EJ Advisory Committee's recommendations were integrated throughout the plan. This plan directly cites instances where there is alignment between the plan and the EJ Advisory Committee recommendations. This approach seeks to ensure there is more transparency and identify consensus that exists, as well as relevant ways equity and environmental justice are addressed in this plan and in the planning for future related implementation activities. CARB is dedicated to its efforts to ensure this plan does not leave communities behind.

As this Scoping Plan moves into the implementation phase, there will be a need to better understand how to address EJ Advisory Committee recommendations on the following topics:

- Actions under the jurisdiction of other agencies: there are certain EJ Advisory Committee recommendations that are outside of CARB's jurisdiction. As the EJ Advisory Committee continues to convene, it would be helpful to understand the

[530] EJ Advisory Committee. 2022. EJAC 2022 Scoping Plan Recommendations. September 30. https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2022/090122/finalejacrecs.pdf

[531] San Joaquin Valley Climate Justice & the Scoping Plan. 2022. https://ww2.arb.ca.gov/sites/default/files/2022-07/SJV%20Climate%20Justice%20%26%20the%20Scoping%20Plan%20Workshop%20Report%20out%20%26%20Recommendations_5.2022.pdf

[532] EJAC. 2022. *EJAC/Community Engagement Synthesis Report '22.* https://ww2.arb.ca.gov/sites/default/files/2022-07/EJAC-CommunityEngagement-SynthesisReport-2022-English%26Spanish.pdf.

role that CARB can play as it relates to the EJ Advisory Committee's recommendations for actions outside CARB's jurisdiction and coordinates with sister agencies.

- Actions that require legislative direction: there are certain EJ Advisory Committee recommendations that would require legislative action. As the EJ Advisory Committee continues to convene, it will be helpful to understand how CARB can work with the EJ Advisory Committee to share these recommendations with the appropriate members of the Legislature.
- Actions directly tied to implementation activities: This Scoping Plan is not an implementation document; it is a plan to chart a course to continue to reduce GHG emissions and achieve carbon neutrality. Once the Scoping Plan is approved, there will be follow-up action at CARB, as well as at other agencies. In these follow-up efforts, there will be a role for ongoing EJ Advisory Committee engagement.
- Actions to implement recent legislation, such as SB 905.

CARB proposes to continue to work with the EJ Advisory Committee to better understand how to move forward on EJ Advisory Committee recommendations that fall into the topics listed above and any other recommendations that were not included in this plan. It is also important to note that there are numerous recommendations where CARB shares the goals of the EJ Advisory Committee and can assist in implementation steps. Examples include the following:

- CARB shares the goal of prioritizing non-fossil energy generation and supports non-fossil projects and opportunities to locate behind-the-meter clean resources in communities of concern in programs such as the Solar on Multifamily Affordable Housing program.
- CARB will engage with agencies and academic institutions to further workforce development.
- Many other recommendations related to financial support for various energy projects, such as microgrids, are within the purview of the CPUC or local publicly owned utilities. Similarly, utility scale projects are within the jurisdiction of other agencies. However, CARB supports strategies identified in the recommendations such as offshore wind to reduce the reliance on fossil fuel generation.
- CARB is supportive of rooftop solar, although it is not within CARB's jurisdiction to determine how incentives for those projects are structured.
- CARB is supportive of strong energy decarbonization goals, recognizing that increased reliance on electrification in transportation and other sectors will create significant demand for electricity, and therefore ensuring reliability of a decarbonized grid is a critical need for the state.
- In the transportation sector, CARB is supportive of the EJ Advisory Committee's recommendations to maintain aggressive zero emission vehicle goals consistent

with its statutory mandate to ensure regulations are technologically feasible and in alignment with Governor Newsom's ZEV Executive Order (EO N-79-20). CARB looks forward to continued engagement on rulemakings that will implement these goals.

- As noted elsewhere in this plan, CARB is supportive of the Caltrans California Transportation Plan 2050 and the California Climate Action Plan for Transportation Infrastructure.
- CARB is supportive of additional public support for transit. CARB is supportive of locating EV charging in low-income communities and communities of color.
- CARB is supportive of prioritizing funding incentives for transit and heavy- and medium-duty vehicles, although CARB does believe there is an important role for incentives that support adoption of light-duty vehicles for the time being. CARB will also be opening a rulemaking on the Low Carbon Fuel Standard to ensure it continues to support clean fuels that will displace petroleum fuels and will consider the EJ Advisory Committee recommendations on this program.
- In the industrial sector, in addition to the strategies discussed more fully in this Scoping Plan, CARB continues to work with the Legislature, local agencies, and air districts to support, implement, and enforce effective reductions in emissions of GHGs and air pollutants in stationary sources. The air districts have the authority to directly issue permits addressing a facility's criteria pollutant and toxics emissions levels. These levels are set after careful permit review, under district regulation and statute. However, AB 617 directs and authorizes CARB to take several actions to improve data reporting from facilities, air quality monitoring, and pollution reduction planning for communities affected by a high cumulative exposure burden. CARB will continue to implement AB 617 and look for ways to strengthen the Community Air Protection Program.
- Considerations around the phaseout of oil and gas extraction and refining, and the role of carbon capture are discussed more thoroughly in Chapter 2.

As CARB continues to engage with the EJ Advisory Committee—in addition to the EJ Advisory recommendations that have been integrated throughout this plan—below are the following commitments that CARB is making to ensure that environmental justice is integrated in this plan and its implementation:

- Building decarbonization is a pillar of this Scoping Plan and CARB commits to working closely with state and local agencies to implement the EJ Advisory Committee recommendations that call for prioritization for residents in low-income communities and communities of color in this transition.
- CARB commits to sharing the EJ Advisory Committee's recommendations with the CEC, CPUC, and other agencies administering funds to support building

decarbonization, and to work closely with those agencies as they engage in public processes to further building decarbonization.

- CARB has committed to review the Cap-and-Trade program and determine what potential legislative or regulatory amendments could be necessary to ensure the program continues to deliver GHG reductions needed to achieve the statutory climate goals. In that process, CARB will consider the recommendations of the EJ Advisory Committee[533] and Independent Emissions Market Advisory Committee,[534] as well as others.

Critically, the EJ Advisory Committee makes numerous recommendations centered around tracking progress of the various strategies in this Scoping Plan. Currently, progress is tracked and reported in numerous ways, including the annual GHG inventory and reports to the Legislature. Part of the ongoing work of implementation, however, will include consideration of ways to provide more data and information to the public, such as rates of deployment of clean energy and technology as described in Chapter 1. CARB will also continue to collaborate with CDPH and OEHHA on health metrics to track cumulative benefits of air pollution and climate programs, especially in low-income communities and communities of color.

As noted earlier in this document, the EJ Advisory Committee will continue to play a vital role in the Scoping Plan and its implementation to ensure environmental justice and racial equity are prioritized in our effort to address the climate challenge before us. This includes ongoing EJ Advisory Committee engagement to advise CARB on the development of the Scoping Plan and any other pertinent matters in implementing AB 32. The ongoing EJ Advisory Committee will help to ensure integration of environmental justice in implementation efforts as it relates to AB 32, and also help CARB as we work toward a future where race is no longer a predictor for life outcomes.

Academic Institutions and the Private Sector

Academic institutions produce and present the latest science on both the impacts of, and actions to reduce, climate change damages. They are also leading the way by

[533] California Legislative Information. Bill Text – AB 32. Air pollution: greenhouse gases: California Global Warming Solutions Act of 2006. (AB 32, Nuñez, Chapter 488, Statutes of 2006). *https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=200520060AB32*.

[534] California Legislative Information. Bill Text – AB 398. California Global Warming Solutions Act of 2006: market-based compliance mechanisms: fire prevention fees: sales and use tax manufacturing exemption. (AB 398). *https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180AB398*.

establishing their own climate goals and GHG emissions reductions targets.[535, 536, 537] They are incubators for innovation and knowledge in clean energy and technology and play an important role in adding to the wealth of robust information to inform policies and programs. Academic institutions have the ability to fill knowledge gaps and push us toward new frontiers. As we move forward, we will continue to see these institutions as partners and resources that can help CARB look for ways to accelerate and introduce actions to reduce GHG emissions and remove and store carbon.

As such, it will be important to maintain and enhance relationships with academic institutions, including community colleges. Community colleges are more likely to have a large proportion of first generation students or students that come from low-income communities or communities of color. The perspective of this diverse student body will be critical to inform discussions on climate change damages and mitigation efforts. This student body is also a future workforce, and courses to teach the skills for a sustainable economy are a chance to close historical opportunity gaps. Importantly, many of the students at community colleges are local residents and community members. This engagement provides another way to invest in communities across our state. The Foundation for California Community Colleges is already leading the way through innovate programs such as their Good Jobs Challenge - California Resilient Careers in Forestry.[538] These types of programs could be replicated across other sectors. CARB will evaluate how to leverage the requirements in AB 680 on workforce development in the California Climate Investments programs with the work at the Foundation for California Community Colleges.

As noted in Chapter 1, public and private partnerships will be important as we move forward in the great energy transition. But the private sector is also important in the context of research and development and deployment. Many of these companies have the resources and expertise to build and produce the clean technology and energy we will need. It was through the efforts of several private companies (Bell, Exxon, Telecom

Australia) that the photovoltaic solar panels in use today were developed.[539] Similarly, it was companies such as General Electric and Texas Instruments that contributed to the development of hydrogen fuel cells.[540] This Scoping Plan includes the known and emerging clean technologies and fuels available today. The private sector spirit of invention, improvement, and innovation must continue to deliver new tools in the fight against climate change.

Individuals

This Scoping Plan not only projects ambitious availability of clean technology and energy, but also includes aggressive assumptions about consumer adoption of ZEVs, heat pumps, and other energy efficiency practices, among others. When it comes to climate change mitigation, the sum of the parts matters. Only when we add up the impacts of the choices we make do we understand the true impact on GHG emissions. Today, many Californians have opportunities to choose between driving a car, taking a bus, biking, or walking. Many can choose to install a heat pump or buy an electric cooktop. Together, we can increase these opportunities and pick the future we want. We can start or transform businesses that create clean jobs, innovate new technologies, or introduce new systems. We can engage with fellow workers to support durable paths for labor in a clean economy. And we can choose to engage with our community, tribes, and our governments to advocate for change, call out challenges, and propose solutions. Our choices will help determine California's climate future. Down one path is a future of climate impacts that will continue to worsen and further increase disparities across communities. Down the other is a future that avoids the worst impacts of climate change, improves air quality—especially for the most burdened communities—and fosters new economic and job opportunities to support a sustainable economy.

Importantly, we must acknowledge that historical decisions have resulted in health and opportunity gaps for residents in low-income communities and communities of color. Not everyone has the resources or access to make these choices—to buy a ZEV, install a heat pump, or use public transit to get to work. It is here that government can help. Government, at multiple levels, can fund programs and structure policies to provide consumers with more choice and to support them in adopting cleaner technology options. Whether through affordable energy rates or assistance in purchasing zero emission vehicles and appliances, we can use the transition to a carbon neutral economy as an opportunity to close some of these persisting opportunity gaps. By acting now, we can

change our planet’s fate and build a more resilient, healthier, and equitable future for all Californians.

Elk Hills Power Project

The Elk Hills Power Project is a nominal 550-megawatt natural gas-fired, combined-cycle, cogeneration power plant located near the community of Tupman, Kern County. The project was certified by the CEC on December 6, 2000, and began commercial operation on July 24, 2003.

PROJECT TYPE

Application for Certification

Project Description

The Elk Hills Power Plant (EHPP) is located on a 12-acre site within the Elk Hills Oil and Gas Field, in western Kern County, near the community of Tupman. The project is directly adjacent to the highly disturbed and developed 35R Gas Processing Facilities and the 35R Cogeneration Plant, both operated by Occidental of Elk Hills, Inc. (OEHI). The 74-square mile Elk Hills Oil and Gas Field is a fenced and secured area. The nearest residence is located more than 5 miles from EHPP.

EHPP is a nominal 550-megawatt (MW) combined-cycle, natural gas-fired, cogeneration power generating plant. The plant is powered by two General Electric 7FA technology combustion turbine generators (CTGs). Exhaust gas from the CTGs is directed to two supplementary fired heat recovery steam generators (HRSG) for the generation of high-pressure, intermediate pressure, and low-pressure steam that drives the steam turbine generator. Supplementary firing (duct burner firing) capability is provided in each HRSG to generate additional steam for peak power production. The EHPP facility utilizes Selective Catalytic Reduction systems for the control of oxides of nitrogen emissions and oxidation catalysts for the control of carbon monoxide and volatile organic compound emissions. A mechanical draft cooling tower provides heat rejection for the steam cycle. The cooling tower is comprised of six cells and is equipped with high-efficiency drift eliminators. One diesel-fired internal combustion engine is used to drive a fire water pump.

EHP delivers electricity to the EHP 230-kilovolt switchyard, which then is transmitted via a generation tie line to the interconnection point at the Pacific Gas and Electric's Midway Substation. The 9.8-mile water supply pipeline extends from the plant site east to the West Kern Water District facilities near Tupman. In addition, a 4.4-mile wastewater disposal pipeline extends from the plant heading south generally paralleling Elk Hills Road, terminating at Class 1 injection wells.

On August 16, 2011, the California Energy Commission approved Post-Certification Amendment (TN 61726) to allow EHPP to deliver useful cogenerated thermal energy to support natural gas processing facilities in the adjacent OEHI 35R Gas Processing Facilities.

Providing thermal energy to the 35R Gas Processing Facilities reduces load at the EHPP cooling tower and thereby reduces the overall water use by EHPP.

Collapse All

Project Amendment List

- **Correction to Verification for Facility Design Condition of Certification GEN-6**, TN 18596, 01/12/2001, Staff approval of inaccurate verification concerning appropriate documentation and CBO/CPM notification procedures.
- **Approval of Modification of LAND-1 Verification**, Not in Docket, 03/19/2001, Staff approval of a modification to verification permitting the project to submit required documents to Energy Commission prior to the start of construction of permanent facilities, rather than prior to ground disturbance activities.
- **Approval of Integration of New or Re-Powered Generating Units with CAL-ISO**, TN 21920, 08/09/2001, Staff approval to add Condition of Certification TSE-4 to Ensure Coordinated Integration of New Generating Unit with California's Electricity Grid.
- **Approval of Modifications to Condition of Certification AQ-C2**, TN 22856, 10/24/2001, Staff Approval of Modifications to Condition of Certification AQ-C2 to clarify requirements of oxidizing soot filter suitability reports for diesel-fired construction equipment, and revision of timing of suitability report submittals.
- **Order Approving Revision of Transportation Condition of Certification TRANS-7**, TN 27815, 01/13/2003, Order No. 03-0108-01d, Commission approval to modify Condition of Certification TRANS-7 to allow the existing temporary construction equipment access road to be used as the permanent, primary entrance road to the project.
- **Order Approving Modification of Air Quality Conditions of Certification**, TN 28447, 03/21/2003, Order No. 03-0319-01a, Commission approval to allow for tendering of PM10 emission reduction credits based on the outcome of initial source tests and allow for a temporary increase in commissioning emissions.
- **Order Approving Increase of Startup-Shutdown Emissions**, Not in Docket, Order No. 03-0723-09, Commission approval for an increase in criteria air emissions during startup-shutdown phases, increase in the size of emergency fire water pump, and modification of cooling tower operation.
- **Order Approving a Petition to Reduce PM10 Emission Rates**, TN 31147, 03/24/2004, Order No. 04-0317-1(c), Commission approval to reduce PM10 emission rates based on results of initial source tests and operating data from similar combined-cycle power plants.
- **Order Approving a Petition to Extend Cold Startup Time Limits**, TN 33792, 03/30/2005, Order No. 05-0316-02, Commission approval to extend the duration of cold startup time limits from four to six hours.

- **Order Approving Change of Nine Air Quality Conditions of Certification**, TN 44066, 01/09/2008, Order No. 08-0102-04, Commission approval to change nine Air Quality conditions of certification.
- **Approval of Petition to Move Approximately 1,200 Feet of Water Line**, TN 45734, 04/07/2008, Staff approval of modifications to approximately 1,200 feet of water line 4 miles SE of project.
- **Approval of Phase 1 Switchyard Modifications**, TN 50883, 04/07/2009, Staff approval of Phase 1 Switchyard conversion of PG&E 115kV system to PG&E 230 kV system.
- **Approval of Phase 2 Switchyard Modifications**, TN 53544, 10/05/2009, Staff approval of Phase 2 Switchyard conversion of PG&E 115kV system to PG&E 230 kV system.
- **Order Approving Amending Air Quality Conditions of Certification**, TN 58487, 09/16/2010, Order No. 10-0908-07, Commission approval to change the cooling tower PM10 emission limits for consistency with SJVAPD.
- **Approval of Requested Modification to Allow Operation as a Cogeneration Facility**, TN 61726, 08/19/2011, Staff approval to add connections to high/intermediate pressure steam and condensate system allowing EHP to deliver cogenerated thermal energy to support natural gas processing facilities in the adjacent Occidental of Elk Hills, Inc. facilities.
- **Order Approving a Petition to modify Air Quality Condition of Certification AQ-11**, TN 203237, 10/22/2014, Order No. 14-1007-04, Commission approval to modify condition of certification AQ-11 to comply with all current applicable LORS.
- **Approval of Requested Modification to Install Two Vacuum Pump Skids**, TN 210259, 02/10/2016, Staff approval to install two 100 percent capacity vacuum pump skids to replace the present steam-jet-based vacuum system.

POWER PLANT CERTIFICATION AND EXEMPTION PROCESSES

The CEC has the exclusive authority to certify all thermal power plants 50 megawatts (MW) and larger and related facilities proposed for construction in California. The Application for Certification (AFC) process is a certified regulatory program under the California Environmental Quality Act (CEQA). As a certified regulatory program, the CEC does not prepare environmental impact reports (EIRs) in an AFC proceeding, but instead prepares environmental assessment documents that are functionally equivalent to EIRs. A certificate issued by the CEC is in lieu of any permit, certificate, or similar document otherwise required by any state, local or regional agency, or federal agency to the extent permitted by federal law, and supersedes any applicable statute, ordinance, or regulation of any state, local, or regional agency, or federal agency to the extent permitted by federal law.

2023 ANNUAL REPORT OF THE INDEPENDENT EMISSIONS MARKET ADVISORY COMMITTEE

February xx, 2024

Dallas Burtraw, Committee Chair, Darius Gaskins Senior Fellow – Resources for the Future

Danny Cullenward, Committee Vice Chair, Policy Director – CarbonPlan,

Meredith Fowlie, Class of 1935 Endowed Chair in Energy – University of California, Berkeley, Department of Agricultural & Resource Economics

Brian Holt, Business Manager/ Financial Secretary – IBEW Local 428

Katelyn Roedner Sutter: Senior Manager, U.S. Climate – Environmental Defense Fund

Ross Brown: Principal Fiscal and Policy Analyst – Legislative Analyst's Office, California (Nonvoting Committee Member)

Convener: California Environmental Protection Agency – Yana Garcia, Secretary; Sarah Izalt, Deputy Secretary; Bill Dean, Senior Advisor.

Introduction

Dallas Burtraw and Danny Cullenward

This is the sixth annual report of the Independent Emissions Market Advisory Committee (IEMAC), which was established by AB 398 in 2017. Pursuant to Health and Safety Code § 38591.2, the Committee is directed to report annually to the California Air Resources Board (CARB) and the Joint Legislative Committee on Climate Change Policies on the environmental and economic performance of California's carbon market and other relevant climate policies.

Across its first five annual reports, the Committee has commented on the role and performance of the carbon market, which now plays a larger role in the state's overall climate policy portfolio than it did when it was first created. As the Committee has emphasized, the carbon market adds an important element of cost effectiveness and provides an incentive to achieve additional low-cost emission reductions that might not otherwise be achieved through direct regulation. The market's carbon price also signals the state's long-term commitment to its climate policy goals and can help guide new investments. A well-designed emissions limit with the market's supply-demand balance in order provides the greatest possible confidence of achieving greenhouse gas reduction goals.

The IEMAC's 2023 report arrives at an important time for the carbon market. The program completed its eleventh year of successful administration and compliance, with policymakers and stakeholders increasingly focused on its future. In 2023, CARB began a series of informal workshops to discuss potential updates to the program to increase its ambition in line with the 2022 Scoping Plan. The outcome of CARB's formal regulatory process, which is expected to begin in 2024, will be especially important in charting the carbon market's future — a future that matters not just for California's climate goals, but also for other jurisdictions that directly collaborate with California or look to its example for guidance.

The Committee has commented previously on several issues now before CARB. Central to the potential update to the carbon market is an adjustment of allowance supply and how allowances are initially distributed. The program update provides an opportunity for CARB to reevaluate the balance between freely allocated and auctioned allowances and the impact of the design on affordability, leakage, and proceeds accruing to the Greenhouse Gas Reduction Fund. The Committee welcomes CARB's discussion of potential adjustments to future allowance supplies that address the accumulation (or "bank") of unused allowances in private accounts and options for post-2030 program allowance budgets. We have observed that changes in the allowance supply will likely change the allowance price which will affect the financial value of banked allowances, potentially constituting a windfall increase in the value of banked allowances. The committee has discussed the advantages of rule-based adjustments to

the market including for example a program design that automatically locks in emissions reductions stemming from regulatory programs by ratcheting down the market allowance supply. For two years the Committee has engaged the Environmental Justice Advisory Committee in considering whether emissions reductions are achieved evenly and to the benefit of disadvantaged communities. The program update provides an opportunity to ensure this outcome as well.

The Committee has repeatedly emphasized the importance of providing confidence in the program's continued operation, which is relevant to shaping investor expectations and achieving cost-effective reductions. Last year's IEMAC report included a chapter introducing some of the legal issues that might arise in the market's operation after 2030. It recommended that policymakers take appropriate steps to clarify the program's post-2030 future, to which CARB's subsequent workshops have meaningfully contributed. Whether or not legislative action is legally required, the Committee highlights the value that legislative reauthorization would provide.

The Committee notes that California has recently increased the pace of its statewide emission reductions. The most recent inventory data indicate statewide emission reductions fell about 11.6 million tCO_2e/year from 2019 through 2021 — a period that includes the slowdown from the global pandemic that led to a sharp one-time reduction in emissions as well as the first major recovery year. Emissions in 2021 were reported at 381.3 million tCO2e. CARB is projecting a provisional emission reduction of about 10.9 million tCO_2e in 2022. The trend since 2019 is a significant improvement over the trend from 2017 through 2019, for which CARB reports emission reductions of about 3.0 million tCO_2e/year. Nevertheless, the faster pace in recent years is not yet on track to achieve either the minimum statutory target of 258.6 million tC02e set by SB 32 (40% below 1990 emissions) by 2030 nor the more ambitious 2022 Scoping Plan Scenario 224.1 million tCO2e (48% below 1990 emissions) by 2030. Together, these trends highlight the importance of clarifying the carbon market's future.

This year's annual report contains four chapters on greenhouse gas accounting, carbon market links with other jurisdictions, affordability, and carbon management. We hope it will contribute to some of the pressing questions about the design of the carbon market and its role in furthering California's statewide greenhouse gas emission limits. A brief summary of each chapter follows.

Greenhouse gas accounting. The first chapter addresses greenhouse gas accounting systems in California. Emissions accounting is central to the design and effectiveness of climate policy programs. California's greenhouse gas emissions accounting system includes three key components: the statewide greenhouse gas inventory used to track compliance with statutory emission limits, the mandatory reporting regulation under which CARB calculates compliance obligations in the carbon market, and CARB's official estimate of 1990 emissions, which forms the baseline against which statutory targets for 2020, 2030, and 2045 are expressed.

Notably, the chapter describes how the exclusion of biogenic CO2 emissions from the statewide greenhouse gas inventory may exaggerate the climate benefits of replacing fossil fuels with biofuels in the transportation sector. It also illustrates how updates to the statewide greenhouse gas inventory to improve the inventory's accuracy have also had the practical effect of weakening California's statutory policy targets, a downside that could be mitigated by updating the 1990 emissions baseline. Finally, it recommends that CARB report additional information in its annual statewide greenhouse gas inventory to give context about the emission reduction trends needed to achieve its statutory and Scoping Plan targets.

Affordability. The second chapter addresses two sides of affordability. California households are forcefully affected by the changing climate through reduced labor productivity and agricultural yields, increased property damage, escalating wildfire risk, and more. Further, households pay for the costs of policy to reduce emissions of greenhouse gases. Californians with the fewest resources are the most vulnerable to both climate change impacts because they have fewer resources to adapt and respond, and to policy costs because they spend a larger share of their income on energy.

How we choose to pay for climate change mitigation and adaptation will determine, to a significant extent, how cost effectively and equitably we make the climate transition. This report elevates two affordability imperatives: cost containment and equitable cost allocation. Where it is possible to do so, overall costs of meeting emissions reduction targets can be lessened by placing a stronger reliance on the GHG emissions market and reducing the reliance on prescriptive regulation. Nonetheless, regulations often have a justification, and market outcomes can be better aligned with regulations by reducing allowance supply in the market in response to emissions reductions achieved by regulation.

Reducing allowance supply is key to achieving the ambitious emissions goals in the 2022 Scoping Plan. How the reduction is implemented will affect the share of allowance value that is distributed for free to utilities and industry and the share that accrues to the Greenhouse Gas Reduction Fund. The ongoing program review provides CARB with an opportunity to review the role of these channels for distributing allowances to ensure that each serves its intended purposes.

Market links. The third chapter addresses opportunities to link the carbon market with other jurisdictions. Even as California has played an important leadership role on climate policy, the state alone cannot reverse climate change nor ensure the livelihood and health of California residents. Those outcomes depend on national and global action. Successful climate policy in California requires the fulfilment of AB 32's directive to provide policy leadership nationally and globally. Linking carbon markets provides one avenue in this direction.

Market links have played a prominent role in carbon markets around the world. California's market is already linked to a similar program in Québec and was previously

linked with an earlier program in Ontario; other leading programs, such as the east coast states' Regional Greenhouse Gas Initiative and the European Union's Emissions Trading System, are also multilateral efforts that feature links between individual jurisdictions' carbon markets.

California is likely to have the opportunity to explore linkage with Washington state's new carbon market, and its eleven years of experience operating a carbon market is likely to serve as a key point of reference for policymakers in other states, such as New York. A market link is one of the ways the state can exhibit climate policy leadership and collaborate with other jurisdictions, similar to the work California has done in designing standards for energy efficiency, mobile source emission regulations, and clean energy policies that are frequently copied and modified by other governments. Cooperation is particularly important as California and a handful of other climate leaders — including Washington state, Canada, and the European Union — have made carbon pricing a central pillar of their climate policy portfolios.

Subsurface carbon management. The fourth chapter addresses point-source carbon capture and storage (CCS) technologies and a subset of carbon removal technologies such as direct air capture (DAC) that contemplate injecting captured CO2 underground. These technologies could play a significant role in reducing emissions and achieving California's 2045 carbon neutrality target, as well as increase investment in communities that have historically relied on the fossil fuel industry for economic development. At the same time, their deployment raises significant questions about their climate, social, and local environmental impacts. This chapter introduces some of the critical issues that face policymakers focused on these technologies. The IEMAC plans to continue working on these issues in 2024.

Greenhouse Gas Emissions Accounting

Danny Cullenward

Introduction

The California Air Resources Board (CARB) maintains three important accounting systems that track greenhouse gas emissions: the state's 1990 emissions baseline ("1990 baseline"), emissions data collected under its mandatory greenhouse gas reporting regulation ("MRR data") (CARB 2023a), and the statewide greenhouse gas inventory ("GHG Inventory") (CARB 2023b). These three systems play a critical role in the state's climate policy portfolio. Compliance obligations in the statewide cap-and-trade program are based on the MRR data, which also directly inform the GHG Inventory as of its 2022 Edition. Meanwhile, the GHG Inventory tracks the state's progress toward statutory emission reduction targets that are defined in relation to the 1990 baseline — reducing emissions below 1990 levels by 2020, at least 40% below 1990 levels by 2030, and at least 85% below 1990 levels by 2045.[1]

Because the 1990 baseline determines the overall level of state policy ambition and CARB uses the GHG Inventory data to measure progress toward state climate targets, it is important to understand how the state's greenhouse gas accounting systems are constructed and whether there are any opportunities to improve their consistency and accuracy. To that end, this chapter looks at how California's greenhouse gas accounting systems address four methodological issues: global warming potentials, biogenic CO_2 emissions, land sector emissions and removals, and a recent change to integrate the MRR data with the GHG Inventory. It then closes with a discussion and two technical recommendations.

Global warming potentials and CO_2-equivalence

Following convention and statutory guidance,[2] CARB reports the CO_2-equivalence (CO_2e) of emissions of multiple greenhouse gases across its accounting systems using global warming potentials (GWPs). The idea is straightforward: the CO_2e of a non-CO_2 greenhouse gas is determined by multiplying the number of tons emitted by that gas'

[1] Health & Safety Code § 38550 (2020 target) (added by Assembly Bill 32 (Stat. 2006, Ch. 488)); *id*. at § 38566 (2030 target) (added by Senate Bill 32 (Stat. 2016, Ch. 249)); *id.* at § 38562.2(c) (2045 target) (added by Assembly Bill 1279 (Stat. 2022, Ch. 337)).

[2] *Id*. at § 38505(g) (defining "greenhouse gases" to include seven different species); *id*. at § 38505(c) (defining "carbon dioxide equivalent" as "the amount of carbon dioxide by weight that would produce the same global warming impact as a given weight of another greenhouse gas"); *id*. at § 38505(h) (defining "greenhouse gas emissions limit" in terms of carbon dioxide equivalent).

GWP. Like an exchange rate, a GWP makes it possible to quickly convert one gas (or currency) into another.

Technically, a GWP is calculated over a fixed time horizon by comparing the cumulative radiative forcing of two greenhouse gases over that fixed time horizon. In practice, most greenhouse gas inventories, including CARB's, use 100-year GWPs. For example, the 100-year GWP for methane (CH_4) is defined as the ratio between (1) the cumulative radiative forcing of one ton of CH_4 summed over 100 years and (2) the cumulative radiative forcing of one ton of CO_2 summed over 100 years. Perhaps the most prominent exemption to this general convention is New York's statutory requirement to use 20-year GWPs.[3]

When California began regulating greenhouse gas emissions, it was common to use 100-year GWPs published in the 1995 IPCC Second Assessment Report. CARB initially adopted the same approach and determined that 1990 statewide emissions were 427 million tCO_2e (CARB 2007a, CARB 2007b). As other regulators began to update their GWPs to reflect the best available science, CARB updated its estimate of 1990 emissions using 100-year GWPs drawn from the 2007 IPCC Fourth Assessment Report. CARB re-estimated 1990 emissions at 431 million tCO_2e, based on 2007 IPCC 100-year GWPs (CARB 2014a, CARB 2014b) — a modest increase of about 1% that reflected the higher GWPs reported by the IPCC.

Although the 1990 baseline and GHG Inventory adopted 2007 IPCC GWPs in 2014, the MRR data used 1995 IPCC GWPs through 2020. As of 2021, all three inventory systems consistently report CO_2e based on 2007 IPCC 100-year GWPs. Additional updates might be needed going forward, as the United States has committed to track its CO_2e emissions using 100-year global warming potentials from the 2013 IPCC Fifth Assessment Report (U.S. EPA 2023: ES-3).

Biogenic CO_2 emissions

Burning fossil fuels releases CO_2. CO_2 is also emitted when combusting biomass, such as wood waste or crop residues. But across California's greenhouse gas accounting systems, CO_2 emissions are treated differently depending on whether they derive from fossil fuels or biogenic sources: fossil CO_2 emissions are "included," while biogenic CO_2 emissions are "excluded." Excluded biogenic CO_2 emissions are still reported to CARB, but CARB does not include them as a liability in the cap-and-trade program nor as part of its statewide emissions.

[3] New York Environmental Conservation Law § 75-0101 [4] (defining "carbon dioxide equivalent" as "the amount of carbon dioxide by mass that would produce the same global warming impact as a given mass of another greenhouse gas over an integrated twenty-year time frame after emission.").

As climate policy scholar Leehi Yona explains, the special treatment afforded to biogenic CO_2 emissions derives from a set of little-known 2006 IPCC guidelines developed for land-sector emissions (Yona et al. 2022, Yona 2023).[4] The standard argument for excluding biogenic CO_2 emissions from official greenhouse gas inventories is premised on the notion that biogenic CO_2 emissions re-release carbon that plants originally sequestered from the atmosphere, such that there is no net climate consequence. But scientists have long understood that the land-use and supply chain consequences of bioenergy and biomass production vary widely, such that the presumption of zero net emissions from all biofuels is inaccurate (Searchinger et al. 2009).

CARB's Low Carbon Fuel Standard (LCFS) reflects this understanding and uses lifecycle assessment methods instead of broad assumptions about biogenic CO_2 emissions. Under the LCFS, fuels sold in California are assigned a carbon intensity score, calculated as the total CO_2e per unit of fuel energy content. Consistent with the contemporary understanding of the climate costs and benefits of biofuels, LCFS carbon intensity scores are based on lifecycle assessment methods that account for carbon sequestration, production emissions, land use impacts, and combustion emissions.

For example, CARB estimates that the lifecycle emissions of conventional gasoline sold in California results in emissions of 100.82 gCO_2e/MJ fuel.[5] Meanwhile, CARB estimates that the average carbon intensity of a prominent gasoline substitute, ethanol, has emissions of just under 60 gCO_2e/MJ fuel (CARB 2024a: Figure 5a) — about 40% less than gasoline.

Although CARB calculates that ethanol reduces emissions by about 40% relative to gasoline in the LCFS program, it books the outcome in the GHG Inventory as though ethanol reduces emissions by 100% because the GHG Inventory excludes all biogenic CO_2 emissions. Booking a 40% reduction as a 100% reduction exaggerates its benefits by about 250%.

The accounting consequences of this practice are substantial. CARB's GHG Inventory shows that excluded biogenic CO_2 emissions — which are tracked, but not included in the statewide data used to measure compliance with California's greenhouse gas emission limits — rose 22.9 million tCO_2, from 24.8 million tCO_2e in 2000 to 47.7 million tCO_2e in 2021 (CARB 2023b). Transportation fuel suppliers, who are the entities responsible for most biofuel-related emissions, reported that their excluded biogenic

[4] The GHG Inventory included biogenic CO_2 emissions until its 2016 Edition.

[5] California Code of Regulations, Title 17, § 95488.5 (Table 7-1).

CO_2 emissions rose 16.4 million tCO_2, from 8.7 million tCO_2 in 2012 to 25.1 million tCO_2 in 2022 (CARB 2023a).[6]

Land sector emissions and removals

Biogenic CO_2 emissions aren't the only excluded category of greenhouse gas emissions that are reported but not included in key California accounting systems. The other major category of excluded emissions comes from the land sector, often called AFOLU (agriculture, forestry, and other land use) in international climate policy circles.[7]

Land sector emissions can be difficult to estimate and are frequently controversial. They have recently re-emerged in California climate policy debates after the record-breaking 2020 and 2021 wildfire seasons, which CARB projects caused emissions of 106.7 and 85.1 million tCO_2, respectively (CARB 2022b: Figure 2). Although CARB published a separate Natural and Working Lands Inventory (CARB 2018), neither those data nor the wildfire emissions are included in the GHG Inventory and therefore neither is used as a basis for evaluating California's progress in reducing statewide emissions.[8]

However, CARB's 1990 baseline emissions include both emissions from and sequestration in the land sector, which CARB estimated resulted in a net sink of about 6.7 million tCO_2 (CARB 2007a: Table 2). Thus, although the GHG Inventory does not include land sector emissions or atmospheric removals, the 1990 baseline does.

Integrating the MRR data and the GHG Inventory

In 2022, CARB made a substantial change to the methodology used to calculate the GHG Inventory (CARB 2022a: 5). Previously, the MRR data were one of many sources used to inform the GHG Inventory, but CARB now describes the MRR data as the "primary" source used today (CARB 2023b: 36). These changes produced a substantial change in California's historical emissions, which CARB has retroactively updated to reflect the latest GHG Inventory methods, consistent with longstanding practice.

Figure 1 shows the change in the GHG Inventory data from comparing the most recent 2023 Edition (CARB 2023b) against the 2021 Edition, which was the last version

---

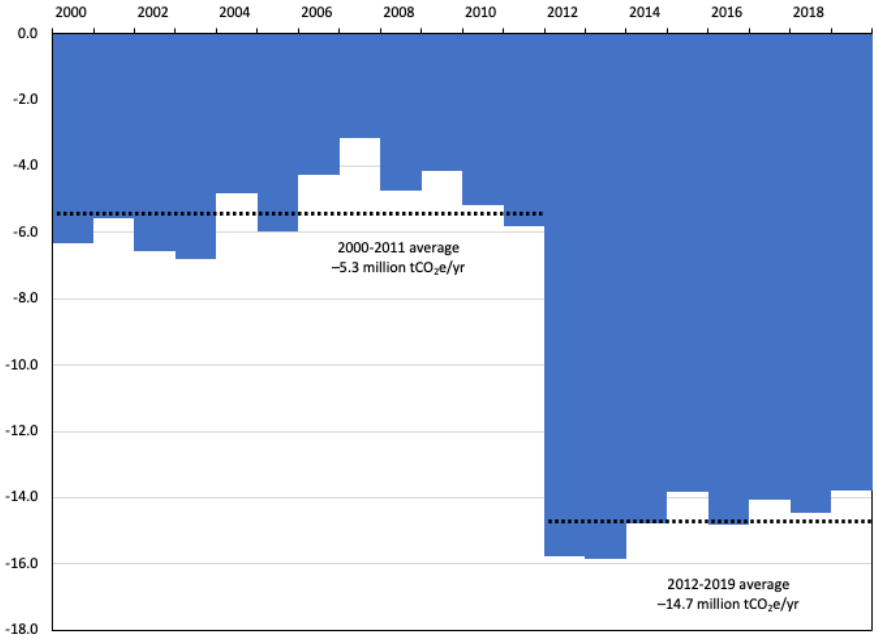
6 As explained further below, the MRR program began to collect full-scope data beginning in 2012, whereas the GHG Inventory includes projections back to 2000. MRR data are lagged by about one year, and thus 2022 data are the most recent as of this writing; in contrast, GHG Inventory data are lagged by about two years, and thus 2021 data are the most recent as of this writing.

7 California's GHG Inventory also tracks but excludes other emissions sources, such as international air travel and marine shipping. These sources are deemed international bunker fuels and their emissions are separately regulated by international treaties.

8 Land sector emissions are not included in the MRR data, although they are part of the cap-and-trade program, in which about 208 million tCO_2 in forest carbon offsets have been issued (CARB 2024b).

published before the decision to rely more directly on MRR data (CARB 2021). Two results are notable. First, reported emissions fell substantially across the entire historical period. Second, the pattern of changes exhibits a discontinuity in the year 2012. The bifurcation reflects the lack of full-scope MRR data prior to 2012; due to these limits, CARB's GHG Inventory methods rely primarily on MRR data only beginning in emissions in calendar year 2012 and afterwards (CARB 2022a).

Figure 1: Change in GHG Inventory, 2023 Edition vs. 2021 Edition (million tCO_2e)



For the earlier period in which MRR data are not available (2000 through 2011), CARB's current estimate of statewide emissions fell by an average of 5.3 million tCO_2e each year. And for the later period in which MRR data are available (since 2012), CARB's current estimate of statewide emissions fell by an average of 14.7 million tCO_2e each year.

The impact of these changes is substantial, both in terms of the lower emissions now reported in the GHG Inventory and because the methodological changes have not yet been applied to re-estimate the 1990 baseline. The premise of CARB's methodological update is that the MRR data are more accurate and reliable, in part because the MRR program requires third-party verification and has been subject to extensive refinement over more than a decade (CARB 2022a). Because California's greenhouse gas emissions limits are expressed relative to the 1990 baseline, however, changing the GHG Inventory methods without updating the 1990 baseline can reduce the stringency of state climate policy targets.

Specifically, if the 1990 baseline is artificially high, which is implied by the substantial reduction in the GHG Inventory observed since adopting the MRR data as its primary source, then the emissions limits may be similarly biased because the emission limits

are expressed as reductions relative to the 1990 baseline. This would result in a *de facto* weakening of statewide greenhouse gas emission limits (IEMAC 2022: 32-34). If such an outcome has occurred, it could be remedied by re-estimating the 1990 baseline.

Discussion

A comparison of four methodological issues common across three California greenhouse gas accounting systems illustrates some of the challenges facing climate regulators, as well as opportunities to improve the consistency and accuracy of reported outcomes (see Table 1).

Table 1: Greenhouse gas accounting issues in California

Methodology	**1990 Baseline**	**MRR data**	**GHG Inventory**
Global warming potentials used?	2007 IPCC GWPs (beginning in 2014)	2007 IPCC GWPs (beginning in 2021)	2007 IPCC GWPs (beginning in 2014)
Biogenic CO_2 emissions included?	No	No (Yes before 2016)	No
Land use emissions and removals included?	Yes	No	No
Based on current MRR data?	No	Yes	Yes

Two of the methodological issues are treated consistently across the three accounting systems. As of 2021, the 1990 baseline, MRR data, and GHG Inventory all use common 100-year global warming potentials drawn from the 2007 IPCC Fourth Assessment Report. Similarly, as of 2016, all three accounting systems exclude biogenic CO_2 emissions.

Although the choice of global warming potentials and biogenic CO_2 emissions are now consistently addressed across the three accounting systems, the resulting outcomes are not as accurate as they could be. When it comes to global warming potentials, the differences are not likely to be particularly large due to the relatively modest changes in GWP metrics across the 2007, 2013, and 2021 IPCC reports (U.S. EPA 2023: Table 1-

3). In contrast, excluding biogenic CO_2 emissions has much more significant consequences. Notably, the GHG Inventory does not capture the lifecycle emissions CARB assigns to the growing quantity of biofuels credited under the Low Carbon Fuel Standard.

Meanwhile, the third and fourth methodological issues illustrate significant inconsistencies. Although neither the MRR data nor the GHG Inventory include land-sector emissions and removals, the land sector was included in the 1990 baseline as a net sink of about 6.7 million tCO_2. More recently, CARB's decision to integrate the MRR data and GHG Inventory programs substantially reduced emissions reported in the GHG Inventory by about 14.7 million tCO_2e in each year. Although there are good reasons to believe this methodological update has significantly increased the accuracy of reported statewide emissions, the large changes it caused in the GHG Inventory suggest that the 1990 baseline may need to be reviewed for consistency.

Finally, however CARB determines California's 1990 baseline and reports progress toward statutory greenhouse gas emission limits in the GHG Inventory, it would help to provide additional context on the pace of observed emission reductions and trends needed to achieve policy targets going forward.

For example, the GHG Inventory reports that 2021 emissions were 381.3 million tCO_2, down about 23.1 million tCO_2 since 2019 (or about 11.5 million tCO_2 per year since 2019) (CARB 2023b). Furthermore, based on the reductions reported in the final 2022 MRR data, CARB projects preliminary 2022 GHG Inventory emissions of 370.4 million tCO_2, or an additional 10.9 million tCO_2 reduction from 2021. These data represent good news that reflect well on the efforts CARB and other policymakers have made to reduce emissions. Nevertheless, it is difficult to interpret the meaning of these accomplishments without additional context about what is required to meet California's climate targets.

To help give additional context, Table 2 and Table 3 report the annual reductions required to achieve California's minimum 2030 climate target (40% below 1990 emissions)[9] and the higher ambition target identified in the 2022 Scoping Plan (48% below 1990 emissions),[10] based on the official 2021 data and preliminary 2022 projections from the GHG Inventory, respectively (CARB 2023b). These tables show that a reduction of 10-12 million tCO_2 per year is close to but still below the pace needed to realize the statewide emissions limit set by Senate Bill 32 (about 13-14 million tCO_2 each year) and significantly below the pace required to realize the emission

[9] Calculated here as 60% of CARB 1990 baseline estimate (431 million tCO_2e), 258.6 million tCO_2e.

[10] Based on the total gross emissions projected in 2030 for the 2022 Scoping Plan scenario, not including gross carbon dioxide removals (CARB 2022c), 226.3 million tCO_2e.

reductions contemplated by the 2022 Scoping Plan (about 17-18 million tCO_2 each year).

Table 2: Annual reductions needed through 2030, based on official 2021 data (units: million tCO_2)

Scenario	2030 Target	2021 emissions (official data)	Annual Reductions Needed
Senate Bill 32 40% below 1990	258.6	381.3	–13.6
2022 Scoping Plan 48% below 1990	226.3	381.3	–17.2

Table 3: Annual reductions needed through 2030, based on preliminary 2022 projections
(units: million tCO_2)

Scenario	2030 Target	2022 emissions (projection)	Annual Reductions Needed
Senate Bill 32 40% below 1990	258.6	370.4	–14.0
2022 Scoping Plan 48% below 1990	226.3	370.4	–18.0

Recommendations

1. CARB should evaluate the four accounting issues discussed in this chapter — the choice of global warming potentials, the treatment of biogenic CO_2 emissions, the inclusion of land-sector emissions and removals, and the integration of the MRR data into the GHG Inventory — to determine if there are ways to more consistently and accurately report greenhouse gas emissions and removals

across its 1990 baseline estimate, MRR data, and statewide GHG Inventory.

2. As part of its annual GHG Inventory update, CARB should report the average annual pace of emission reductions across the emissions included in its GHG Inventory that would be required to meet all statutory targets (e.g., 40% below 1990 emissions by 2030) as well as any higher levels of ambition CARB adopts in Scoping Plans or similar documents (e.g., the 48% target identified in the 2022 Scoping Plan).

Affordability and the Climate Transition

Meredith Fowlie and Dallas Burtraw

California is on the front lines of the climate crisis. Extreme heat, drought, rising sea levels, and escalating wildfire risk are significantly impacting the health, safety, and well-being of all Californians. These climate impacts are imposing large economic costs through multiple channels (e.g. reduced labor productivity, reduced agricultural yields, and property damages). Moreover, these costs are not equally distributed. Californians with the fewest resources are the most vulnerable to these climate change impacts.

Avoiding the most damaging effects of climate change will require significant investment in economy-wide decarbonization. This includes investments in new renewable energy generation; electricity transmission and distribution infrastructure; the electrification of transportation, buildings, and some industrial sectors. Adapting to climate change impacts will also require large investments in wildfire risk mitigation, disaster preparedness, flood controls, and other adaptation strategies.

As California confronts both the formidable costs of unmitigated climate change, and the formidable costs of slowing the pace of climate change, concerns about affordability and equity loom large. The 2022 Scoping Plan notes:

An important part of our equity consideration is ensuring the transition to a zero-emission economy is affordable and accessible, and that it uplifts disadvantaged, low-income communities and communities of color. Some aspects of the transition will have associated costs (e.g., escalating efforts to retrofit existing homes and businesses to support electric appliances and vehicles and increased costs of insurance). The state must ensure that these costs do not disproportionately burden consumers.

Low-income households will be disproportionately burdened if California does not change how we pay for climate change adaptation and mitigation investments. A recent increase in California's retail electricity prices provides an important case in point. Residential customers of California's largest utility recently saw that their monthly utility bills will increase by $34.50 (on average) in 2024. Two key drivers of this increase: massive investments in wildfire risk mitigation (a form of climate change adaptation) and a growing "cost shift" caused by net energy metering incentives for rooftop solar PV customers.[11]

This practice of increasing retail electricity prices above the social marginal cost of providing electricity services to pay for non-incremental costs (such as wildfire risk

[11] The January 2024 Electric Rates Report issued by the Public Advocates Office at the CA Public Utilities Commission lists wildfire mitigation and rooftop PV solar incentives among the top three drivers of retail electricity rate increases statewide. https://www.publicadvocates.cpuc.ca.gov/-/media/cal-advocates-website/files/press-room/reports-and-analyses/240119-caladvocates-q4-2023-quarterly-rate-report.pdf

mitigation) will slow our progress on electrification. Importantly, it is also inequitable. Rising electricity prices impact low-income households disproportionately because these households spend a relatively greater share of their income on direct energy use for electricity, gasoline, and home heating (Borenstein, Fowlie, and Sallee, 2022).

How we choose to pay for climate change mitigation and adaptation will determine, to a significant extent, how cost effectively and equitably we make the climate transition. The severe risks posed by climate change warrant significant investments in mitigation and adaptation. As the costs of mitigating and adapting to climate change increase, policymakers must work to contain these costs and allocate them judiciously.

The directive of this Committee is to report on the design and performance of California's greenhouse gas (GHG) emissions market. In what follows, we discuss the role of GHG market with respect to these two affordability imperatives: **cost containment** and **equitable cost allocation**.

Cost Containment

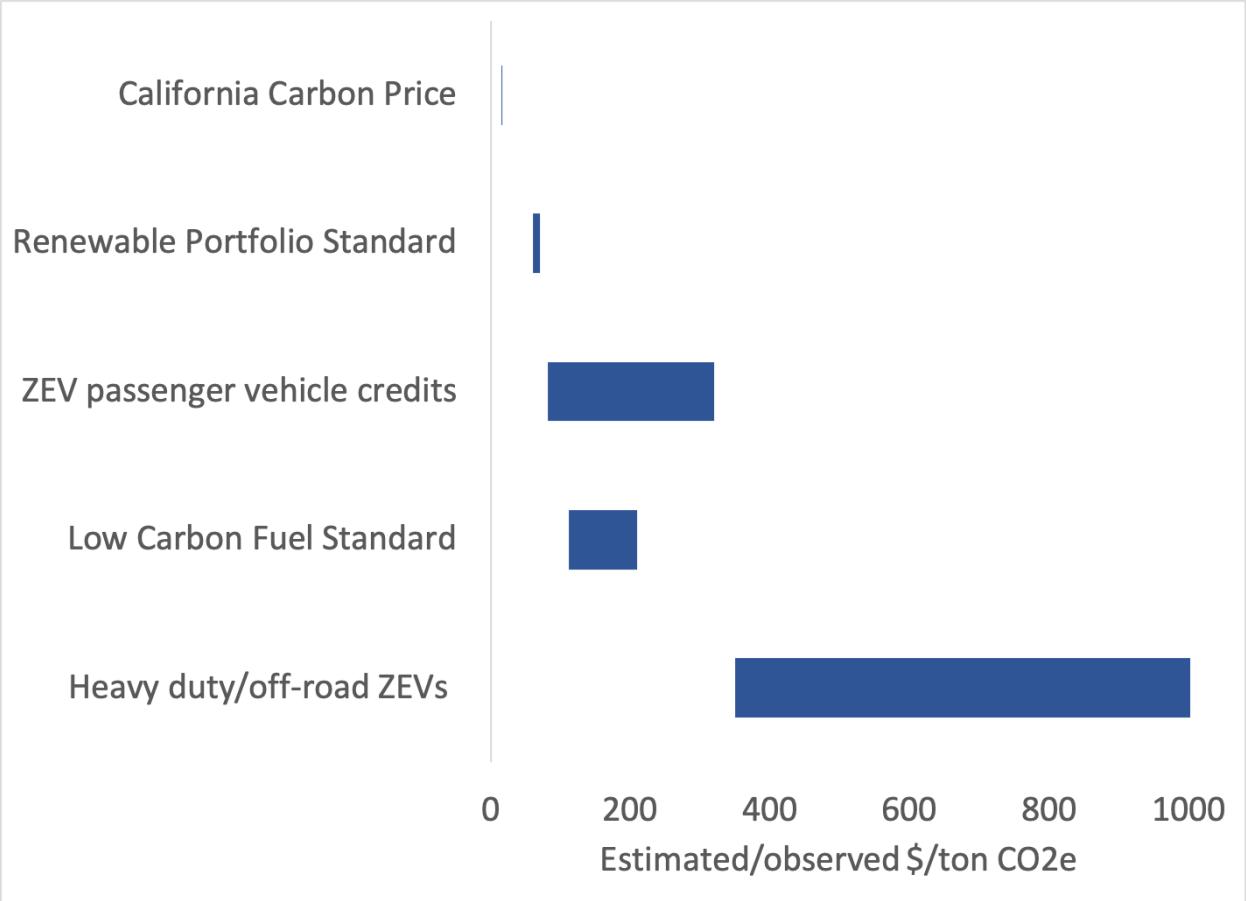
California climate policy makers are using emissions pricing, in combination with direct regulation, to achieve our GHG abatement goals. In previous reports from the Committee, and again in discussions this year, a recurring theme has been how to improve the alignment of prescriptive regulations with the GHG emissions market to improve cost effectiveness and to amplify the effectiveness of each.

California's market based GHG emissions trading program offers some important cost advantages relative to prescriptive regulation. Under a cap-and-trade program, regulated firms must acquire and surrender tradeable allowances to offset their GHG emissions. The compliance flexibility enabled by a GHG allowance trading system provides an incentive for regulated entities to seek out and deploy least-cost GHG emissions abatement strategies, including those that are not visible or known to the regulator when the policy is implemented. A related advantage of this more flexible approach: the GHG market can flexibly deploy abatement strategies in a way that leverages technological innovations and responds to changes in economic activity, weather events, etc.

California has historically relied more heavily on prescriptive, sector-specific regulations, versus the GHG market, to deliver GHG emissions reductions. These include regulations promoting vehicle fuel efficiency, renewable energy investments, etc. Sometimes these regulations are justified by the intent to drive innovation or overcome technology adoption coordination failures. However, a strong reliance on prescriptive approaches can increase the overall cost of meeting our GHG abatement targets if the prescriptive approaches target relatively costly GHG abatement options.

The cost per ton of CO2e emissions avoided is one coarse metric which can be used to compare climate change mitigation strategies and associated programs. The graph below

compares an assortment of estimated cost-per-ton-of-GHG-abated (some marginal, some average) for some key California programs:



Notes: This graph illustrates comparisons across programs at different points in time drawing from the following sources: GHG allowance prices (2018-2020) are reported here. LCFS prices (2018-2020) are reported here. Cost estimates for the RPS in 2018 are from this LAO report. Cost estimates for the ZEV credit program are estimated here. Cost estimates for heavy-duty ZEVS are from this LAO report (other ZEV program costs estimated in this report are off the chart).

The graph shows that the estimated cost-per-ton CO2e abated under some prescriptive California programs have at various times significantly exceeded what we've been paying for GHG abatement in the emissions market. Table 3-11 from the Scoping Plan also estimates high abatement costs for some measures considered in the Scoping Plan Scenario (e.g. building electrification). Mandating expensive GHG abatement measures when emissions allowance prices are relatively low could significantly increase the costs of meeting our CO2e abatement targets. Put differently, a well-functioning GHG market has a critical role to play in our cost containment efforts.

A stronger reliance on the GHG emissions market to deliver cost-effective abatement could significantly reduce the overall costs of meeting our GHG emissions reduction targets. But this would require policy changes that would tighten the GHG market and thus increase the market clearing GHG allowance price. The structure of the supply schedule for introducing allowances into the market with a price floor and a series of price steps - price-responsive allowance supply – is expected to reduce price volatility and assure compliance entities that they will have access to allowances in a tight market. Additional price steps, including an emissions containment reserve, could further improve integration of prescriptive regulations with the GHG allowance market by harvesting emissions reductions achieved by direct regulation to ratchet down allowance supply.

Cost Allocation

Roughly half of California's GHG market emissions allowances enter the market through a revenue-raising auction with proceeds going to the Greenhouse Gas Reduction Fund. The other half of the allowance supply is freely distributed to industry to protect competitiveness, mitigate emissions leakage, and benefit ratepayers (in the case of utilities). How these allowances are allocated, and how auction revenues are used, has potentially significant implications for cost allocation. A potential update to the design of California's GHG market provides an opportunity to re-evaluate the distributional implications of free allocation, and the protocols guiding the use of the GGRF funds.

As part of its ongoing workshop process to update the GHG market and align it with the with the state's more ambitious climate policy goals reflected in the 2022 Scoping Plan, CARB is considering an adjustment to the supply of allowances, which is likely to increase the GHG market allowance price. We are already observing price movements consistent with anticipation of a more stringent cap. Since the first quarter of 2021, with the pandemic recovery, completion of the Scoping Plan process, and the initiation of workshops to consider updates to the GHG market, the allowance price has increased 117%.[12] This increase in price maps into an increase in the value of banked allowances held in private hands.[13] We expect that reducing the supply of allowances will likely cause further increases in the allowance price.[14] Depending on how the allowance supply is adjusted, this increase in value will accrue to the Greenhouse Gas Reduction Fund and/or the million recipients of free allocations.

If the reduction in allowance supply is implemented primarily through a reduction in allowances allocated to industry, the increase in the allowance price will cause proceeds to the Greenhouse Gas Reduction Fund to increase. How these funds are allocated is a

[12] The auction clearing price in the first quarter of 2021 was $17.80 and for the fourth quarter of 2023 it was $38.73 (nominal dollars).
[13] The value of over 300 million privately held (banked) allowances have increased by more than $6 billion (nominal dollars).
[14] The effect of limiting allowance supply on the asset value of allowances depends on the elasticity of allowance demand. Borenstein et al. 2019 find allowance demand to be relatively inelastic especially in the short run. Burtraw et al. 2022 arrive at a similar finding in modeling the electricity sector.

policy decision ultimately shaped by the legislature. Using these funds to reduce the cost burden borne by low-income households and communities could offer an important way to advance our overarching equity and affordability goals.

Alternatively, if reductions in allowance supply are implemented primarily through a reduction in auctioned allowances, a greater share of the allowance value increase will flow into free allocations. The distributional impacts of this approach will depend significantly on how GGRF expenditures are impacted and which of the industry or utility allocations are preserved. California's GHG emissions market reform thus presents an important opportunity to re-evaluate how allowance value is being distributed to ensure that allowances are being allocated judiciously and in line with affordability/equity objectives.

Recommendations

1. A well-functioning GHG emissions market has a critical role to play in identifying least cost abatement options and containing the overall cost of meeting GHG targets. The role of the GHG market should be maintained and expanded over time.
2. Cost-containment and equitable cost allocation should be guiding principles of California's GHG market design, reform, and implementation.
3. Allowance supply changes will be needed to bring the GHG market in line with California's increasingly ambitious GHG targets. How these supply adjustments are implemented will impact how future GHG abatement costs are allocated across households and firms. These adjustments should be evaluated according to the guiding principles we describe.
4. Free allowance allocations to industry and the designated use of free allocation to utilities should be reviewed judiciously to ensure that these allocations are serving their intended purpose.

Propagating California's Program Success and the Vision of AB32 through Program Linking

Katelyn Roedner Sutter and Dallas Burtraw

California is rightly proud of its world-leading efforts to address climate change, but greenhouse gas emissions and even air pollution do not respect state borders. Furthermore, California emits only approximately 1% of global greenhouse gas emissions. However, a similar effect is true for emission reductions – the benefits of California's success spill over into other jurisdictions. While efforts to reduce climate pollution within the state are essential to meeting our greenhouse gas reduction goals, often the even greater value is in exporting our innovations in climate and air quality to other jurisdictions to maximize reductions. California's leadership in policy design and technology development provides global benefits. To maximize the value of these efforts, California should not remain passive and should indeed encourage the propagation of its climate and technology policies.

The state's seminal Global Warming Solutions Act of 2006 (AB32) accelerated the state's tradition of environmental leadership and placed it at the forefront of national and international efforts to reduce emissions of greenhouse gases. Acknowledging that national and international efforts are necessary, the Act calls for California's actions to have far-reaching effects by encouraging other states, the federal government, and other countries to act. These actions by other jurisdictions have positive feedback effects for California that have been documented extensively elsewhere, such as:

- Creating new economic opportunities for California's clean energy technology and economy;
- Reducing the specter of emissions leakage and economic activity to businesses in unregulated jurisdictions;
- Improving regional air quality;
- Aligning the regulatory environment for business;
- Improving administrative, monitoring, and enforcement activity;
- Influencing climate policy development at an ever-broadening scale; and
- Most importantly, driving emission reductions to slow the impending environmental crisis.

Many transformational climate policies developed in California have been adopted in other jurisdictions including vehicle efficiency standards enabled under the federal Clean Air Act, clean energy and storage policy directives, and energy efficiency

standards. Notably, Quebec has a cap-and-trade program like California's, which enabled early linking of the two markets under the Western Climate Initiative (WCI) to maximize emission reductions. State agencies have a history of generosity in sharing insights into the state's policy experiences in all these areas. However, the propagation of emissions caps has been slower than proponents of AB32 would have hoped or anticipated.

Linking the California and Quebec carbon market with additional jurisdictions would yield numerous benefits for each jurisdiction including the opportunity for greater emission reductions, easing the administrative burden of program implementation, potentially lower cost of compliance for covered entities, and the less-tangible but essential momentum for climate action. California has a well-thought-out framework for regulation and enforcement of the carbon market that can serve as a model for other jurisdictions. CARB might look for opportunities to further build on its existing openness in sharing expertise with even greater technical assistance for other jurisdictions because the adoption of ambitious policies elsewhere and the emergence of a regional carbon market would benefit California.

In 2021, Washington State passed the Climate Commitment Act, which established an economy-wide cap-and-invest program. This program was created with the intention of future linkage with the California-Quebec market. Illustrating the depth of California's influence in policy design, Washington's program mirrors California's in key ways, making it likely a compatible partner for program linkage. Washington's Department of Ecology announced in November 2023 that they intend to pursue formal program linkage with the California-Quebec market, and the state legislature is currently considering a bill that would further align the Washington program with the WCI to facilitate a smooth linkage process. Given the strides Washington is making in aligning with California, and the urgent need to maximize greenhouse gas emission reductions, California should now initiate its own process for evaluating linkage.

By linking markets, California and Quebec can join forces with Washington to drive even greater climate progress through a broader and more stable regionally linked market. A bigger, linked market provides more opportunities for companies to identify lower-cost options to reduce their emissions, and the increased liquidity of a larger market provides greater insulation against price shocks and reduced volatility – whether those fluctuations are influenced by natural disasters or political conditions. A more stable regional market provides incentives for covered entities to invest in emissions abatement and provides greater confidence in the ability of all participating jurisdictions to achieve their climate goals at a time when multiple analyses show the importance of sub-national action to achieving climate targets.

California's leadership is needed to meet this moment – both in the state and across borders. California could be an active and proactive partner to the many states for which its policy is a model. In the near term, this could include expeditiously undertaking the

linkage evaluation process regarding Washington's program, and continuing conversations between agency staff and other policy leaders.

In addition to Washington's cap-and-invest program, the prospect of economy-wide carbon pricing is gaining momentum elsewhere; New York is in the process of finalizing the rules for its own cap-and-invest program, and Maryland is considering cap-and-invest as part of their Climate Pollution Reduction Plan. As these programs grow across the country, California's decade of experience in running an economy-wide carbon market is an invaluable source of knowledge – one that other states will need to tap into as they design their programs. When these programs become operational, California should prioritize exploring program linkage and seek out all opportunities for collaboration in the building and operation of compatible markets.

Recommendation

1. IEMAC calls for CARB to look for opportunities to expand its administrative and logistical support to jurisdictions developing or considering carbon limit policies, including but not limited to New York and Maryland; consider soliciting carbon limits and carbon pricing on a regional and national basis; and initiate its process for a linkage determination with Washington.

Subsurface Carbon Management

Brian Holt and Dallas Burtraw

CARB's 2022 Scoping Plan lays out an official pathway to achieve carbon neutrality within California. This plan and existing climate policy emphasize the prevention of greenhouse gas emissions as the dominant and preferred pathway to carbon neutrality. By most accounts, renewable energy resources with energy storage is the least-cost pathway to deep emissions reductions, but obstacles to the complete substitution away from fossil fuels remain. In addition, process emissions in industry remain a significant challenge. To achieve carbon neutrality, any remaining emissions after achieving maximal sectoral reductions through substitution away from fossil fuel will likely require add-on post-combustion technology at point sources such as natural gas power plants, biomass power plants and concrete plants to capture and concentrate carbon dioxide from flue gas and store it underground. The storage component primarily involves injection of CO_2 into geologic formations (such as depleted oil and gas reservoirs and saline formations), and to a small degree its use in industrial materials (e.g., concrete).

Carbon capture and storage (CCS) may also play a role in the application of technology to lessen the effect of prior legacy emissions. CCS may be coupled with direct air capture (DACCS) of carbon from the atmosphere to reduce atmospheric concentrations. When biomass is used for electricity production and coupled with CCS (BECCS), it can yield negative emissions if the captured emissions are greater than the net emissions from bioenergy combustion, the energy used to capture and inject flue gas CO_2, and the complex dynamics of land use and land opportunity costs. Because bioenergy with CCS involves the combustion of biomass that regrows over time, its physical climate impact is characterized by emissions upfront that are reduced by CCS and climate benefits that accrue over time. Other examples of technologies that may yield negative emissions involve the development of carbon sinks in soils and forests, production of biochar, biochemical processes in oceans and enhanced chemical weathering of rock.

The focus of this chapter is on CCS as applied to emissions reductions at emitting facilities. As mentioned above, CCS is directly relevant to some approaches to carbon dioxide removals from the atmosphere, and recent legislation (SB 905) comingles directives to CARB for development of a unified framework for subsurface carbon management for captured emissions and direct air capture. Consequently, this chapter also has relevance to a subset of carbon removal technologies that involve subsurface carbon management.

Possibilities

The 2022 Scoping Plan shows that CCS at industrial and electricity generating facilities is anticipated to capture 13 $MMTCO_2e$ by 2030 and 25 $MMTCO_2e$ by 2045. Carbon dioxide removals at natural and working lands, DACCS, and BECCS are expected to

total 7 $MMTCO_2e$ in 2030 and 75 $MMTCO_2e$ by 2045. Governor Newsom has recognized the importance of strategies for CO_2 capture at industrial facilities and removal from the atmosphere. The Governor directed CARB to accelerate development of natural and engineered carbon removal and carbon abatement projects with a CO_2 target of 20 $MMTCO_2$ for 2030 and 100 $MMTCO_2$ for 2045, as well as signing 2022 legislation on carbon abatement and removal and storage, including: AB 1279, SB 905, and SB 1137. Related legislation (AB 1757) addresses carbon sequestration in natural and working lands.

CCS projects have been implemented at various locations since the 1970s, largely on coal-fired power plants, with over two dozen projects operational around the world. As of November 2019, more than half of global large-scale CCS facilities (representing approximately 22 $MMTCO_2$/yr in capacity) were in the U.S., mostly due to sustained governmental support for these technologies. Over 100 projects are at the stages of advanced or early development and are expanding beyond coal-fired plants to fossil gas, fuel production, and electricity generation facilities.

In California, subsurface carbon management presents opportunities for economic development in industries and communities that are subject to the greatest losses from the energy transition away from fossil fuels. California's deep sedimentary rock formations in the San Joaquin Valley represent world-class CO2 storage sites that would meet the highest standards, with storage capacities of at least 17 billion tons of CO2.

There are seven cement plants operating in California currently. These plants have emissions associated with combustion and process-related activities. Combustion emissions account for 30-40 percent of the total emissions at cement plants, with the remaining emissions are related to process-related activities (Rissman et al. 2020). Cement is a good candidate for CCS due to the high temperature processes needed to produce cement, although high temperature electric heat and non-fossil hydrogen may soon provide feasible alternatives to combustion. SB 596 calls for a 40 percent reduction in GHG intensity in cement emissions from 2019 levels by 2035, and then net zero emissions by 2045. To meet in-state demand, the state relies on cement both produced in the state and imported. Additional reductions will need to be pursued and considered as part of implementation of SB 596, which directed CARB to develop a comprehensive strategy for the state's cement sector, and to achieve net-zero emissions of greenhouse gases associated with cement used within the state as soon as possible, but no later than December 31, 2045.

Currently, there are seventeen petroleum refineries operating in California. Despite ambitious emissions reductions at refineries described in the Scoping Plan, and implementation of Executive Order N-79-20 that precludes the sale of new emitting vehicles by 2035, there will remain some demand for petroleum fuels for legacy vehicles on road applications, and in aviation, rail, and marine applications. Petroleum refineries will need to implement technology to decarbonize their operations and reduce their

emissions. The Scoping Plan assumes CCS at petroleum refineries as one of those potential strategies, although only a small number of these sources may be technically amenable to continuous operation of CCS. Some advocates of carbon management anticipate that construction activity from a build out of CCS at existing and new facilities would contribute to the production of low carbon intensity hydrogen, transportation fuels, and electricity, although some experts would question what constitutes "low-carbon" hydrogen, potential leakage of methane and CO_2 capture rates.

Addressing Risks

Stakeholders have raised multiple concerns related to the inclusion of CCS and carbon dioxide removal in the Scoping Plan. One focus has been on potential negative health and air quality impacts in communities from operation of facilities utilizing CCS that continue to emit other emissions, especially in communities already overburdened by air pollution. Community-level concerns have also focused on safety concerns related to potential leaks of carbon dioxide from storage facilities.

Critics have also questioned the economic viability of the CCS and direct air capture carbon dioxide removal technology, suggesting that modeling and policy planning are misguided by including them in future scenarios. The economic viability of these technologies depends on policy support at the federal and state level. There has yet to be a comprehensive evaluation of technological impacts or identification of best practice and preferred policy pathways, especially with respect to carbon dioxide removals. The development of a unified policy framework mandated under SB 905 may take important steps in resolving this shortcoming.

Environmental advocacy stakeholder concerns also focus on the presumed moral hazard resulting by the focus on mechanical carbon management because it may enable continued fossil fuel use and delay investments in non-emitting technologies. Attention given to carbon dioxide removal, in particular, may deter mitigation by reducing the salience of climate change mitigation. This may be especially true if carbon dioxide removal substitutes directly for mandatory emissions reductions.

Industry stakeholders express uncertainty about the lack of understanding and clarity over the potential role for CCS in the cap-and-trade program. A protocol exists for the LCFS program, but uncertainty about is applicability to the carbon market introduces regulatory risk that is a barrier to project development.

These stakeholder concerns are already substantially covered under the scope of SB 905 and may be resolved with full implementation of the legislation, which we discuss below. Nonetheless, successful policy must address these concerns, including through the development of guardrails that define which types of carbon management projects are consistent with the state's climate goals as well as those that appropriately balance the economic development opportunities for and environmental risks to local communities.

Policy

Substantial government support for CCS and some forms of carbon dioxide removals from the atmosphere is in place at the federal and state level depending on the specific application and products. The Inflation Reduction Act provides tax incentives for the capture and sequestration of CO_2 in Section 45Q, although we note it is calibrated to gross CO_2 sequestration rather than net emissions reductions, providing imperfect incentives for efficient implementation. The Act incentivizes low-carbon hydrogen production under Section 45V with a lifecycle calculation that rewards low-carbon production. At the state level, CARB adopted a CCS Protocol in 2018 as part of amendments to the Low Carbon Fuel Standard that enables crediting of CCS projects for oil and fuels production under lifecycle pathway applications. At this time, no CCS projects have been credited under the LCFS protocol.

The next expected policy advances in facilitating carbon management in California will be implemented under SB 905, adopted in 2022, which directs CARB in consultation with other state agencies, to create a CCS program aimed at accelerating the deployment of carbon management technologies. Responsibilities for CCS in California are assigned to CARB, the California Natural Resources Agency, and California Geological Survey. Under SB 905, CARB must adopt regulations for CCS and technologies or strategies to remove CO_2 from the atmosphere and put it into long-term storage. CARB must also make available a permitting portal to allow project operators to submit all permit-related information through one online platform. SB 905 also requires California Natural Resources Agency to: 1) establish a framework for intrastate pipelines carrying carbon dioxide fluid and 2) to publish a framework for governing agreements for the purposes of managing carbon dioxide storage project reservoirs. The California Geological Survey is tasked with developing a Geologic Carbon Storage Group that will provide expertise and guidance on carbon storage.

There are various unresolved policy questions that are important for subsurface carbon management. For CCS to be applied to emitting sources covered under the cap-and-trade program, it would be valuable to clarify whether the CCS protocol applied to the LCFS is sufficient guidance for the cap-and-trade program. While some proponents feel the application is a straightforward extension of that protocol, others seek greater certainty including clarity about the liability for leakage and protocols to ensure permanence of carbon storage. Regulatory uncertainty, whether justified or not, will impede investment, and this uncertainty needs to be resolved before investments will occur.

There remain difficult questions about the role of mandates and additional incentives for carbon dioxide removals in California's policy framework that stretch beyond the framework that will be established under SB 905. The cap-and-trade programs' carbon price provides an economic incentive to reduce covered entities' CO_2 emissions and serves as a price point against which CCS could be economically justified. However, there are conflicting views on whether carbon dioxide removals should be given credit

as offsets in the cap-and-trade market and resolving this will be an important issue for CARB and the legislature. A different approach might involve the introduction of a new compliance obligation, analogous to a storage mandate or renewable energy mandate in the electricity sector, mandating a removal credit for each specified number of tons of emissions covered in the cap-and-trade market. Other approaches to introducing incentives or requirements are possible.

California policy makers have a chance to incentivize and shepherd the development of subsurface carbon management in a way that respects environmental integrity and community values. Discussions about how this is achieved should move to central stage in 2024.

Recommendations

1. The state should develop of guardrails that define which types of subsurface carbon management projects are consistent with the state's climate goals as well as those that appropriately balance the economic development opportunities for and environmental risks to local communities.
2. CARB should move to resolve and clarify the protocol for the application of CCS at emitting sources.
3. CARB and the legislature must clarify the incentives and/or mandates for application of carbon removals through direct air capture before such investments can take place.

CARBON
TERRAVAULT
THE FOREFRONT OF CARBON MANAGEMENT

Announcing CRC's First Capture to Storage Project at Elk Hills Gas Plant

A DIFFERENT KIND OF ENERGY COMPANY

DECARBONIZING CRC'S OPERATIONS & TARGETING

~6.5% REDUCTION[1] IN EMISSIONS INTENSITY OF ELK HILLS POWER PLANT

CTV'S FIRST CCS PROJECT TO CAPTURE AND STORE 100 KMTPA

PROJECT DETAILS FOR CAPTURE TO STORAGE PROJECT AT ELK HILLS

- CRC to construct a pre-combustion project at the CTV Clean Energy Park at Elk Hills to remove CO_2 from inlet gas, *increasing operational efficiency of the cryogenic gas processing plant, improving propane recovery, and reducing the carbon intensity of the electricity* generated from the Elk Hills Power Plant
- Expected to capture *100KMTPA of CO_2 and* to be stored at CTV I storage vault
- The capture project is targeting *45Q credit generation as well as the potential for LCFS qualification and Cap & Trade (C&T) avoidance,* and anticipates paying *CTV JV an injection fee for CO_2 sequestration services*
- *Project provides the ability to control the full CCS value chain*
  - CTV JV storage only economics are in line with previously disclosed type curve[2]
  - Capture + storage economics net to CRC are in line with previously disclosed IRR range[2] of 10% to 30%
- Project *FID targeted in 1H24*[3]; commercial *operations targeted in 2H25*

CO_2 INJECTION RATE (KMTPA)	✓	100 KMTPA (Planned)
PROJECT EST. CAPITAL REQUIREMENTS ($/MT)	✓	WITHIN OUR PREVIOUSLY DISCLOSED TYPE CURVE[2] OF $5 TO $15 OF CAPITAL PER MT OF CO_2 FOR A STORAGE-ONLY SOLUTION
PROJECT EST. EBITDA[4] ($/ MT)	✓	WITHIN OUR PREVIOUSLY DISCLOSED TYPE CURVE[2] OF $50 TO $75 OF EBITDA[4] PER MT OF CO_2 FOR A STORAGE-ONLY SOLUTION

Note: Due to CTV's 51% ownership of the storage entity, CTV JV, the metrics above are shown on a storage-only basis for comparison purposes to previously announced projects.

Note: please see slide 30 for details on the footnotes on this slide.

NLC Energy Greenfield Renewable Natural Gas (RNG) Facility

ABOUT NLC ENERGY

- NLC Energy LLC, (NLCE) designs, builds, owns, and operates RNG facilities that convert organic waste into useful commodities like clean Renewable Natural Gas (RNG)
- Low-carbon RNG replaces higher-carbon fossil fuels across the transportation, utilities, and manufacturing sectors
- The company is headquartered in Nashua, NH and has an operational RNG plant in Denmark, WI

CDMA DETAILS FOR NLCE GREENFIELD RNG FACILITY[1]

- NLCE to construct a *greenfield production facility* at the CTV Clean Energy Park at Elk Hills that *is expected to generate up to 7,000 MMBtu per day of RNG*
- CTV JV will provide *permanent sequestration for 150KMTPA of CO_2 initially* using CTV I storage vault, including the lease of land for the *RNG* facility
- Project *FID targeted for late 2024*; commercial *operations targeted by 2027*
- CTV JV and NLC are also discussing *CRC's potential financial participation in the RNG facility*

CO_2 INJECTION RATE (KMTPA)	✓	150 KMTPA (Planned)
PROJECT EST. CAPITAL REQUIREMENTS ($/MT)	✓	WITHIN OUR PREVIOUSLY DISCLOSED TYPE CURVE[3] OF $5 TO $15 OF CAPITAL[2] PER MT OF CO_2 FOR A STORAGE-ONLY SOLUTION
PROJECT EST. EBITDA[2] ($/ MT)	✓	WITHIN OUR PREVIOUSLY DISCLOSED TYPE CURVE[3] OF $50 TO $75 OF EBITDA[2] PER MT OF CO_2 FOR A STORAGE-ONLY SOLUTION
OFFTAKE INTEREST	✓	RNG PRODUCTION OFFTAKE WITHIN THE CTV CLEAN ENERGY PARK AND CRC OPERATIONS COULD FURTHER REDUCE EXISTING AND FUTURE EMISSIONS OF FACILITIES

Note: please see slide 30 for details on the footnotes on this slide.

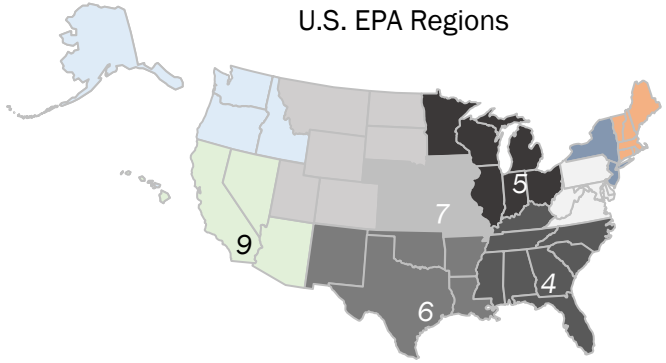
Solidifying CTV Class VI Permitting Leadership

CTV Leads CA/Region 9 with EPA Class VI Permit Submissions

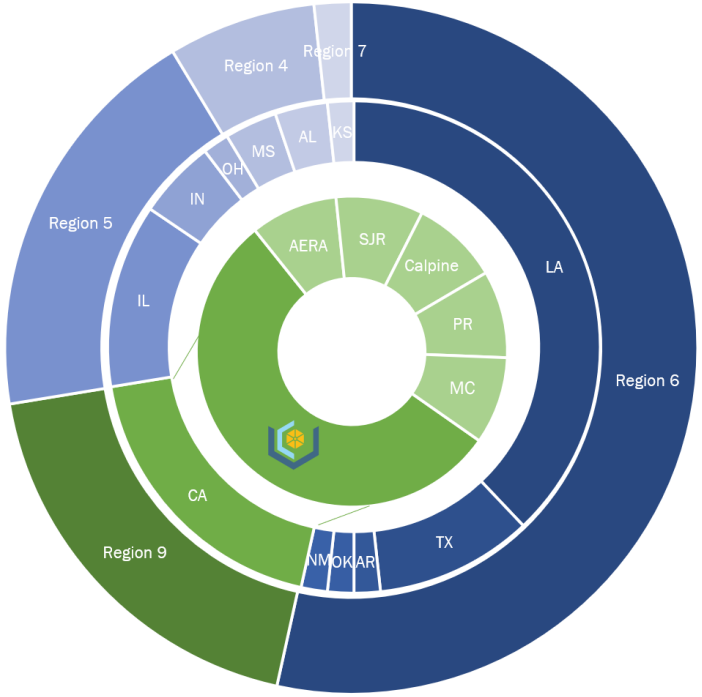
~10%

of Currently Submitted EPA Class VI Permits are From CTV[1]

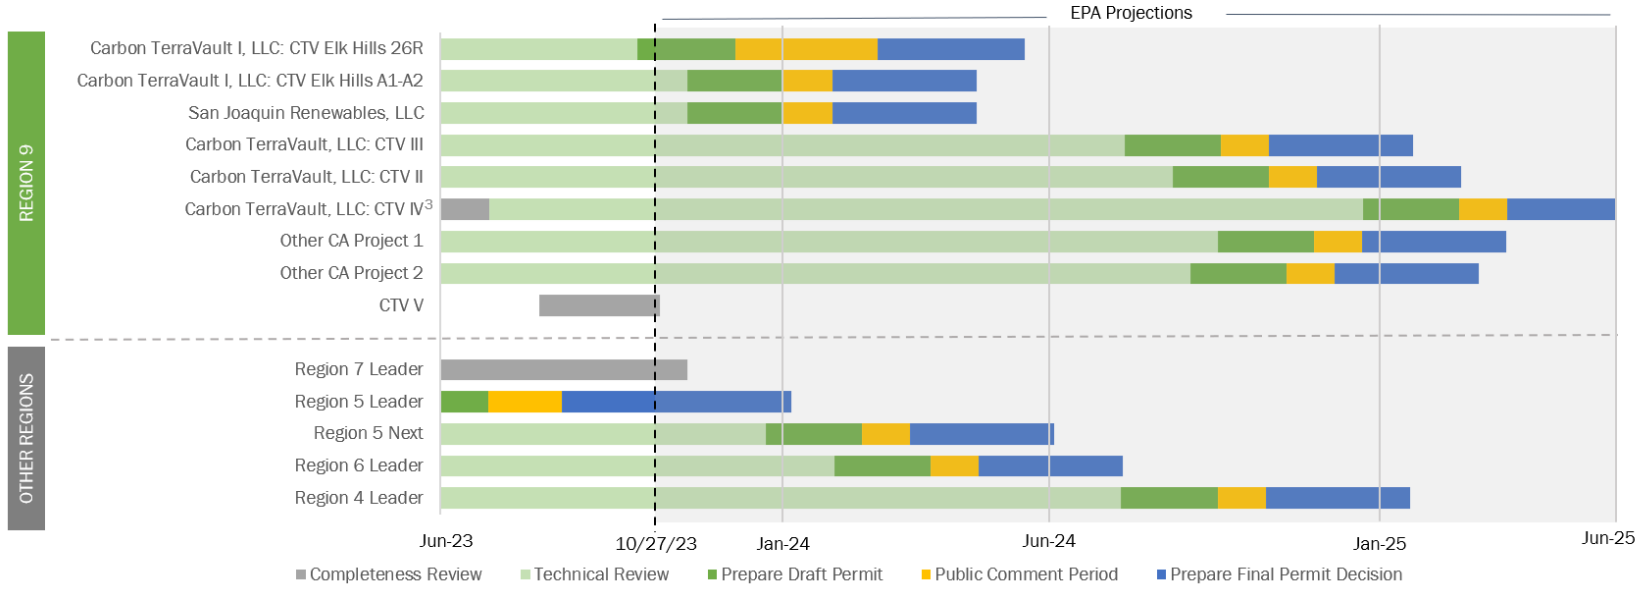
U.S. EPA Regions



- CTV Elk Hills 26R (CTV I) is expected to be receive draft permit before year end
- CTV Elk Hills 26R (CTV I) permit approval would be first in California and first permit for storage into a depleted oil and gas reservoir
- Proactively engaging with the local communities to share information about the positive benefits of these projects in the local communities



EPA Projected Permit Timeline[2]



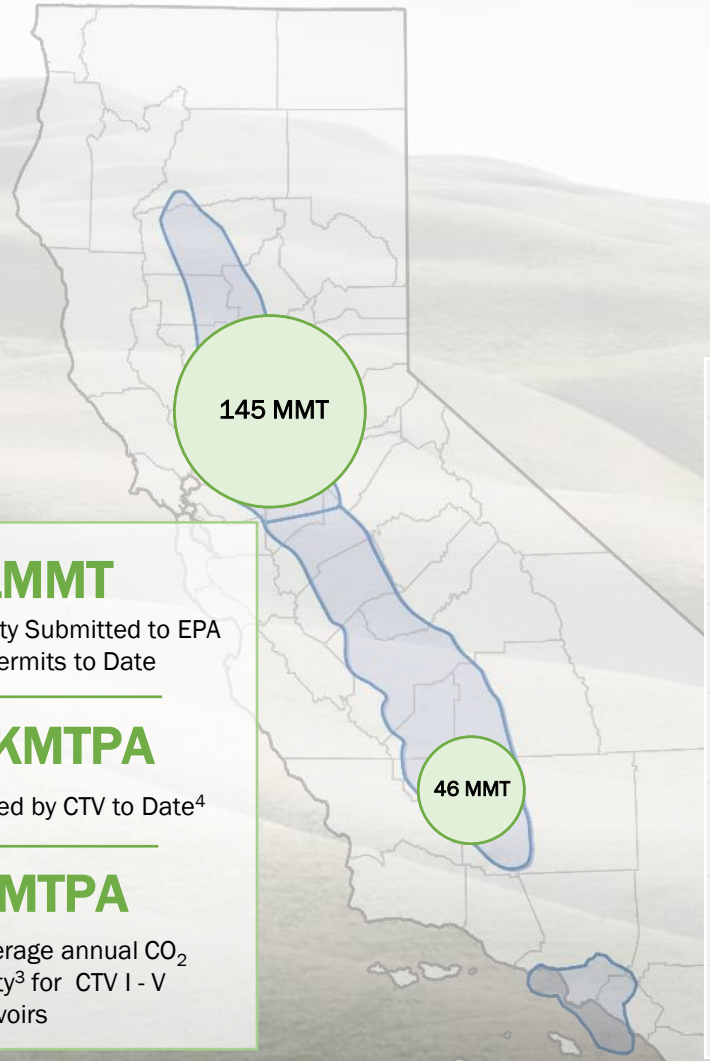
(1) Subject to issuance of EPA class VI permits. (2) Source: EPA Tracker, https://www.epa.gov/uic/current-class-vi-projects-under-review-epa,
(3) Projected to complete preparation of final permit decision at the end of June '25

Positioned to Be California's Premier Carbon Management Provider

100KMTPA for CRC's own CCS brownfield project within the CTV Clean Energy Park at Elk Hills

Signed an additional storage only CDMA[1] for an injection rate of 150KMTPA with NLC Energy

Targeting first CO_2 injection at CTV I by the end of 2025



191MMT

CTV Storage Capacity Submitted to EPA For Class VI Permits to Date

1,065KMTPA

of CDMAs Announced by CTV to Date[4]

4.8MMTPA

Est. combined average annual CO_2 injection capacity[3] for CTV I - V reservoirs

Vault	CTV I	CTV II	CTV III	CTV IV	CTV V

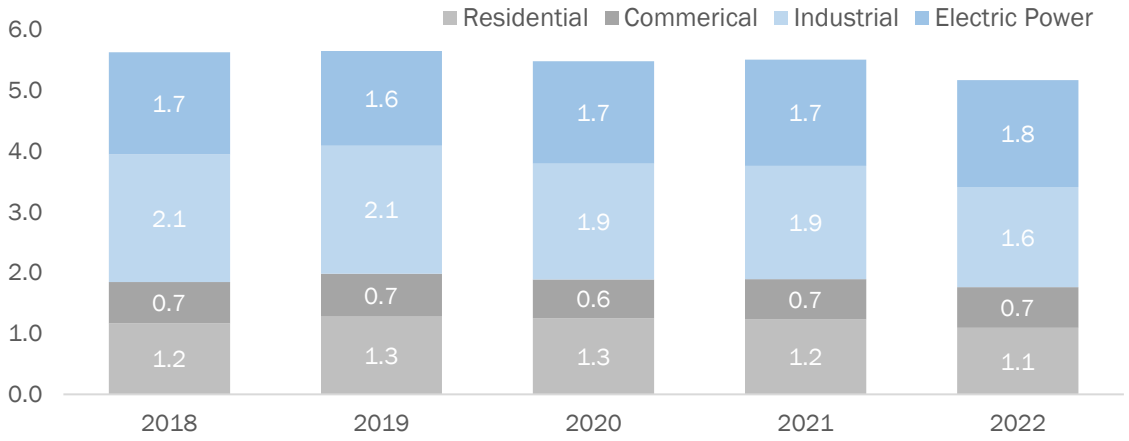
California

California Needs Low Carbon Intensity Domestic Natural Gas

A DIFFERENT KIND OF ENERGY COMPANY

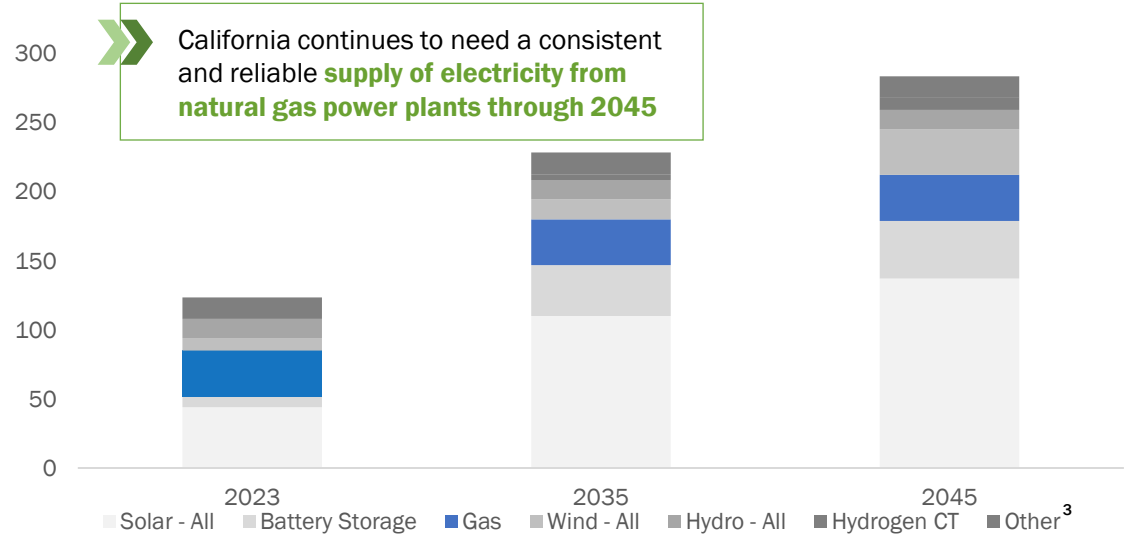
POWER AND INDUSTRY CONSUME ~70% OF THE STATE'S NATURAL GAS[1]

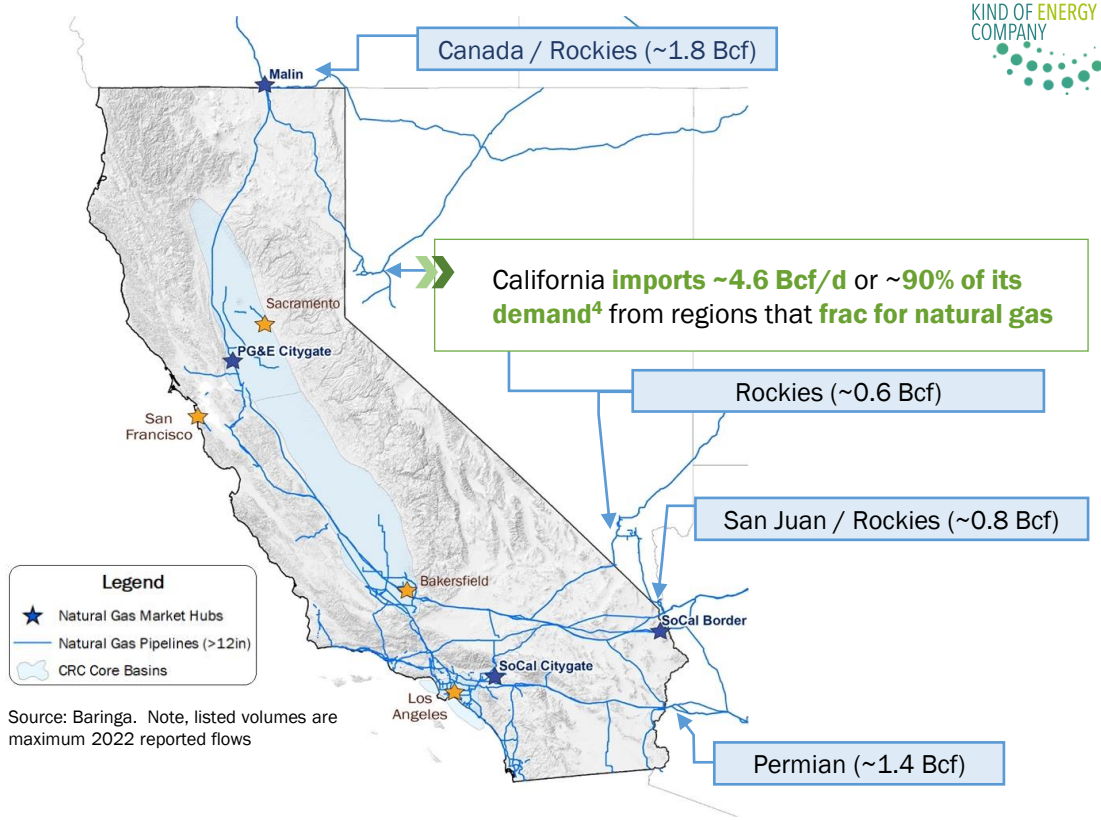
California's Natural Gas Demand (Bcf/d)



EVEN IN 2045, NATURAL GAS POWER PLANTS PLAN TO CONTRIBUTE 12%[2]

Total Capacity (Giga-watts)





Source: Baringa. Note, listed volumes are maximum 2022 reported flows

California Will Continue to Receive a Premium to Henry Hub

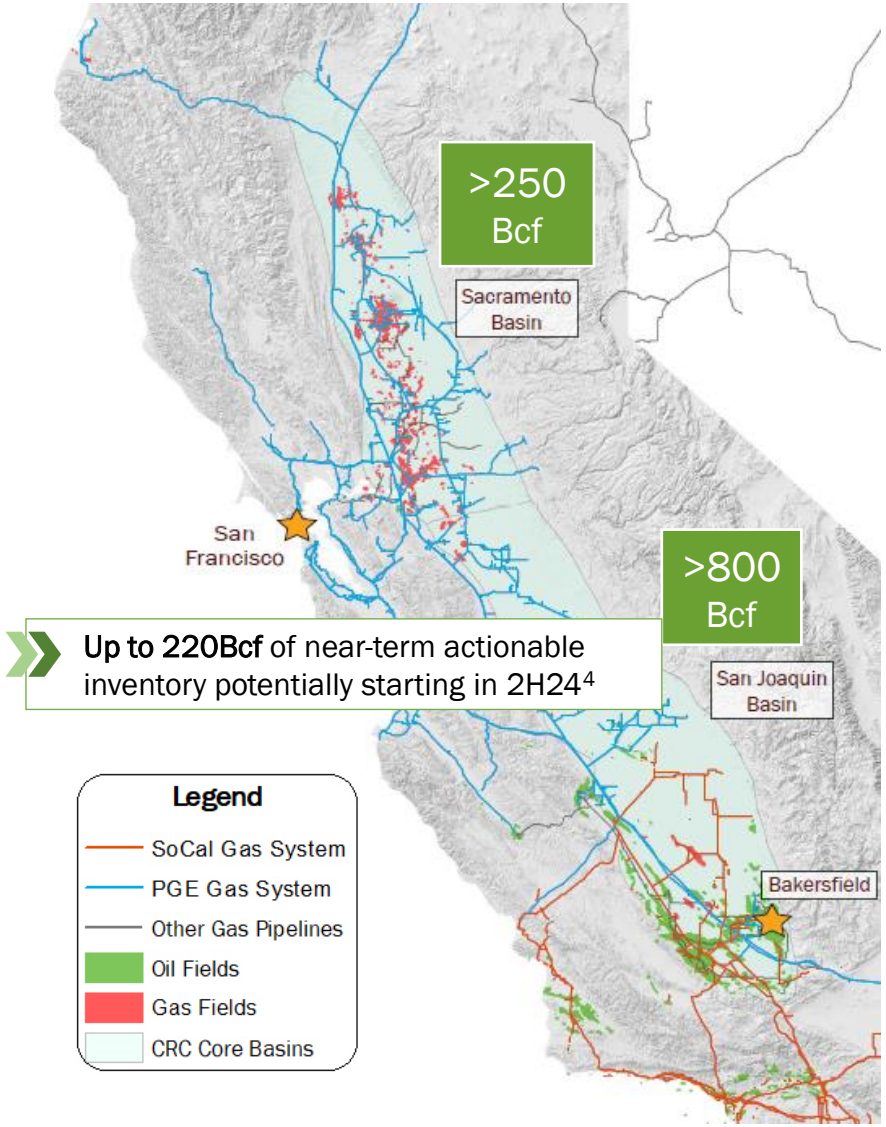
- CRC expects natural gas to play a key role in supporting energy transition
- CA imports 90% of its gas needs. Lack of flexibility with the legacy natural gas infrastructure will continue to drive elevated prices and volatility in periods of high demand[5]
- CRC expects relatively strong natural gas prices with the premium to Henry Hub to continue

(1) EIA; excludes Vehicle Fuel which was less than 0.029 mcf/d from 2018 to 2022 (2) CARB Scoping Plan 2022 (3) Other includes pumped storage, shed DR, geothermal, nuclear, biomass, CHP and coal (4) CARB (5) Internal estimates

CRC's Natural Gas Inventory Depth – 1Tcf[1] Opportunity

A DIFFERENT KIND OF ENERGY COMPANY

CRC's Incremental Inventory[1] by Basin



Up to 220Bcf of near-term actionable inventory potentially starting in 2H24[4]

CRC is pursuing a **Responsibly Sourced Gas[2] (RSG)** certification for the majority of its natural gas assets

Sacramento Basin Incremental Inventory[1]

- ~110Bcf of actionable inventory
- Resource:
  - >250 Bcf of dry gas
  - ~300 locations

San Joaquin Basin Incremental Inventory[1]

- ~700Bcf of actionable inventory
- Resource:
  - >800 Bcf of associated gas
  - ~1,100 locations

CALIFORNIA'S NATURAL GAS FORWARD CURVES[3]

	Avg. 2024 – 2032 Price
NYMEX HH	$3.85
PG&E City-gate	$5.42
SoCal Bdr	$4.93
SoCal City-gate	$5.98

Note: please see slide 31 for details on the footnotes on this slide.

Preliminary 2024 E&P Business Outlook

A DIFFERENT KIND OF ENERGY COMPANY

LINE OF SIGHT TO WELL PERMITTING PROGRESSION IN 2024

EXPECTED INVENTORY OF SIDETRACKS, WORKOVERS, NATURAL GAS TO INCREASE ACTIVITY IN 2H24

CONTRACTED CAPACITY REVENUE[1] FROM EHPP TO INCREASE BY ~$45MM

IN 2024 VS 2023E

ON PATH TO ACHIEVE $55MM +

IN TARGETED YE2023 RUN RATE REDUCTIONS[2]
IMPLIES ~$2/BOE REDUCTION TO CRC'S OPERATING COST[3]

EST. ELK HILLS PLANTS TURNAROUND IMPACT IN 1Q24

20	$34MM
MMCF/D	CAPITAL

(1) Capacity revenue is a part of electricity revenue on CRC's income statement. (2) Includes YE2023 reduction in non energy operating costs and Adj. E&P corporate and other G&A. (3) Internal estimates.

4Q23 Guidance

2023E Corporate Guidance *(as of November 1st, 2023)*

A DIFFERENT KIND OF ENERGY COMPANY

CRC 2023E GUIDANCE[1]:	FY 2023E E&P, Corp. & Other	FY 2023E CMB	FY23E Combined	4Q23E E&P, Corp. & Other	4Q23E CMB	4Q23E Combined
Net Total Production[1] (MBOE/D)	**85 – 87**	—	85 – 87	**82 – 85**	—	82 – 85
Net Oil Production[1] (MBO/D)	**51 – 53**	—	51 – 53	**49 – 51**	—	49 – 51
Operating Costs ($MM)	**$815 – $850**	—	$815 – $850	**$185 – $195**	—	$185 – $195
CMB Expenses[2] ($MM)	—	$40 - $50	$40 - $50	—	$10 - $20	$10 - $20

Oil - % of Brent:	94%	97%	96%	99%
NGL - % of Brent:	56%	60%	50%	60%
Natural Gas - % of NYMEX:	275%	325%	165%	185%

Includes:
~$20MM in new CMB land purchases /easements

2023E Guidance Assumptions ($/Bbl)
2023E Brent Price: $84.16
4Q23E Brent Price: $90.46

Note: please see slide 31 for details on the footnotes on this slide. Current 2023 guidance doesn't include targeted cost reduction initiatives mentioned on page 15 of this deck.

Appendix

Why California Resources Corporation?

A DIFFERENT KIND OF ENERGY COMPANY

CALIFORNIA RESOURCES CORPORATION | CARBON TERRAVAULT | 2045

- LEADING CARBON MANAGEMENT BUSINESS
- PREMIER BALANCE SHEET WITH STRONG FREE CASH FLOW GENERATION
- STRONG SHAREHOLDER RETURNS STRATEGY
- DISCIPLINED CAPITAL ALLOCATION

Executing on our Low Carbon Intensity O&G Operations

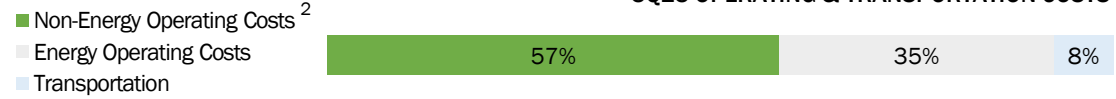
A DIFFERENT KIND OF ENERGY COMPANY

Key Operational Results:

85MBOED
3Q23 NET PRODUCTION

$33MM
3Q23 E&P, CORP, & OTHER ADJ. CAPITAL[1]

$212MM
3Q23 OPERATING & TRANSPORTATION COSTS



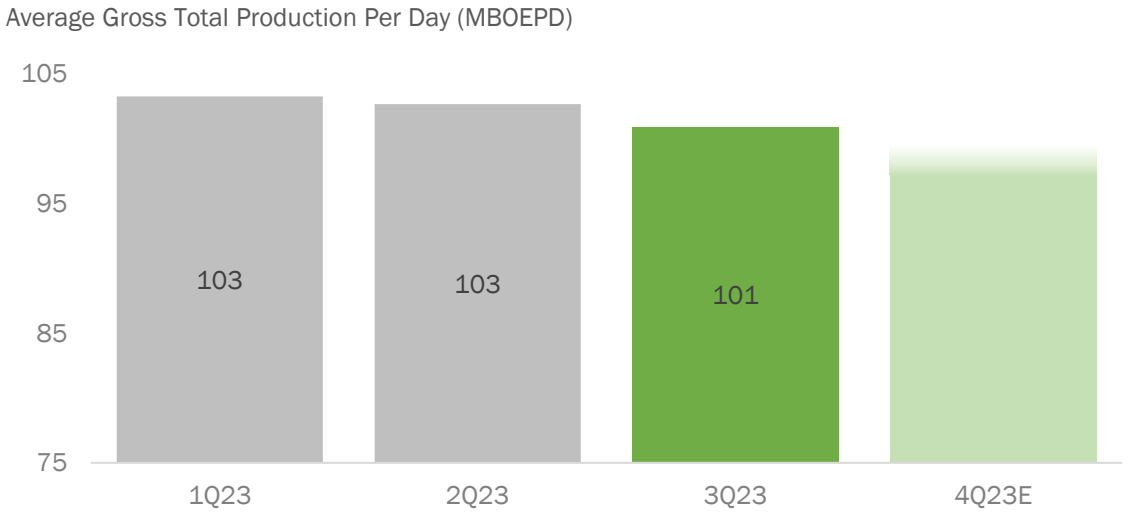
3Q23 OPERATIONAL PERFORMANCE COMMENTARY:

- Continue strong HSE performance above internal goals
- Wells: Drilled[3] 9 wells in 3Q23
- Rig Activity: Exited the quarter with 1 drilling rig in the LA basin and 34 maintenance rigs across CRC's asset base

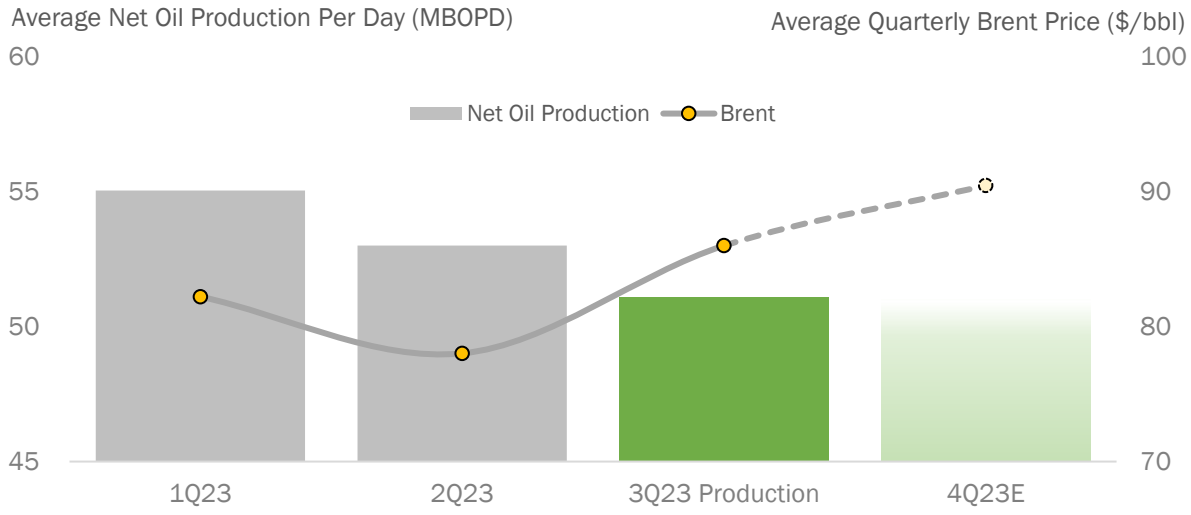
3Q23 PRODUCTION PERFORMANCE COMMENTARY:

- PSC Effects: On a net basis, higher than anticipated Brent prices resulted in a negative quarterly 1.2MBOED of net oil production impact due to PSC effects
- Higher oil prices contributed ~$7MM of higher than planned operating cash flow[4]
- Targeting gross production annual decline rate in line with previously provided 5% to 7% range

RESILIENT ASSET BASE DESPITE LIMITED CAPITAL INVESTMENT



CRC'S NET OIL PRODUCTION



(1) Represents a non-GAAP measure. For all historical non-GAAP financial measures please see the Investor Relations page at www.crc.com for a reconciliation to the nearest GAAP equivalent and other additional information. (2) Non-Energy Operating Costs includes gas processing costs. (3) Includes steam injectors and drilled but uncompleted wells, which are not included in the SEC definition of wells drilled. (4) Impact to cash flow after hedges and before changes in working capital.

Wilmington Production Sharing Contracts (PSC) At Higher Commodity Prices

For every $1/BBL increase/decrease in Brent price, we expect a ~90BOD decrease/increase in our net oil production related to PSCs[1]

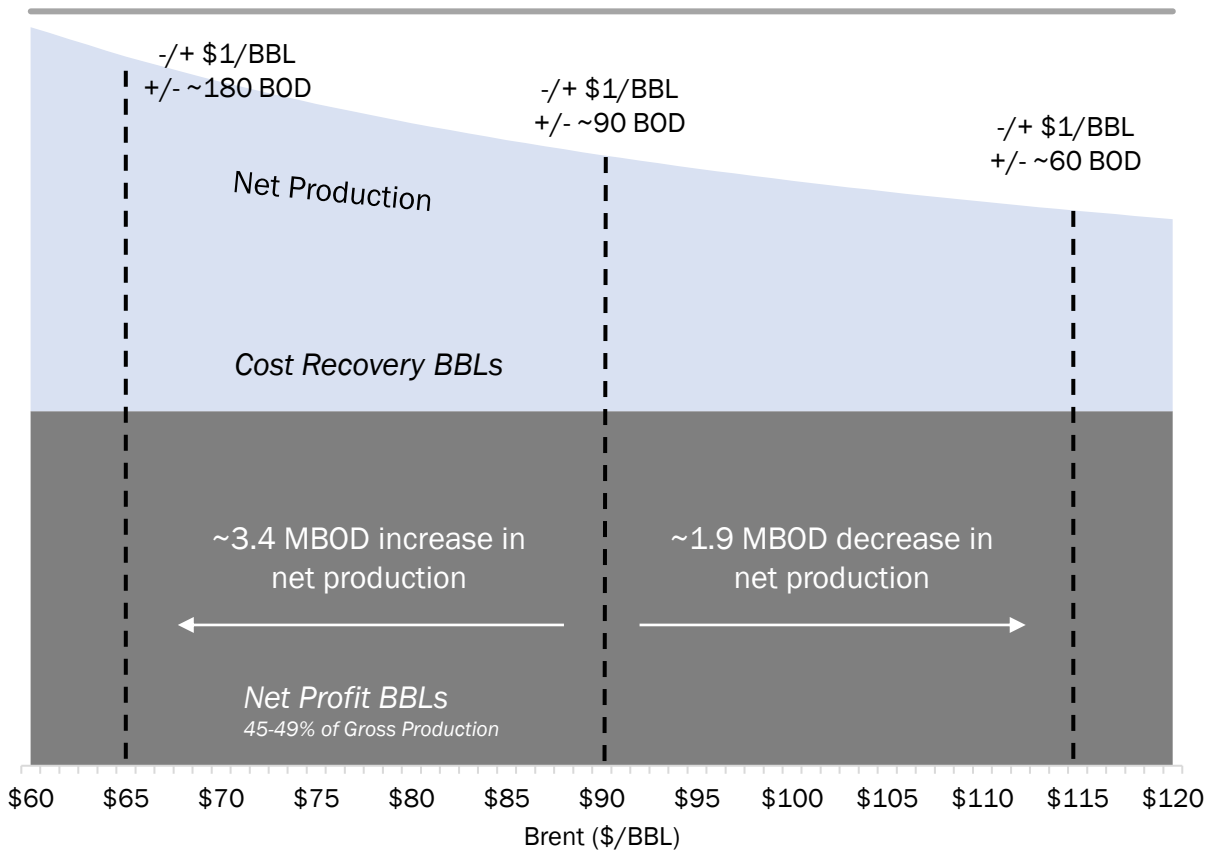
Approximately 30% of CRC's oil production is subject to PSCs Mechanics:

- As operator, CRC pays our partners' share of the Operating and Capital Cost
- CRC recovers our partners' share of operating and capital costs through production sharing, where CRC's cost recovery is reported as revenue
- CRC receives 45-49% of the gross production as "Profit Barrels" after cost recovery
- CRC's net share of production includes cost recovery and profit barrels

As prices rise, fewer barrels are required to recover our partners' portion of the cost

CRC sees a difference of ~5.3MBOD in net oil production between $65/BBL and $115/BBL

EFFECT OF OIL PRICE ON NET PRODUCTION[2]



(1) Based on Brent price of $90 per barrel of oil (2) Net Production from Wilmington field only. Includes the effects of a development program in LA Basin.

Huntington Beach – Asset Optimization & Value Unlock

A DIFFERENT KIND OF ENERGY COMPANY

1 ACRE PARCEL – FT APACHE

Source: Newmark

- 1810 Pacific Coast Highway, Huntington Beach, CA
- Completed the abandonment of six wells
- In the process of completing surface abandonment
- Targeting call for offers for ~1 acre parcel of land (Fort Apache) by YE23

Over 1 mile of direct access to **Pacific Coast Highway**

~90 ACRES PARCEL – HUNTINGTON BEACH

- Continuing the re-zoning, re-entitlements and due diligence processes
  - Multi year process
- Developing strategy to optimize production and ARO schedule
  - Huntington Beach field 2022 gross production[1] was ~3,000BOD
  - The field is connected to a producing offshore platform Emmy
  - Free cash flow[2] generating asset
- Plugged and abandoned 20 wells year to date
- Targeting to P&A an additional 40 wells in 2024

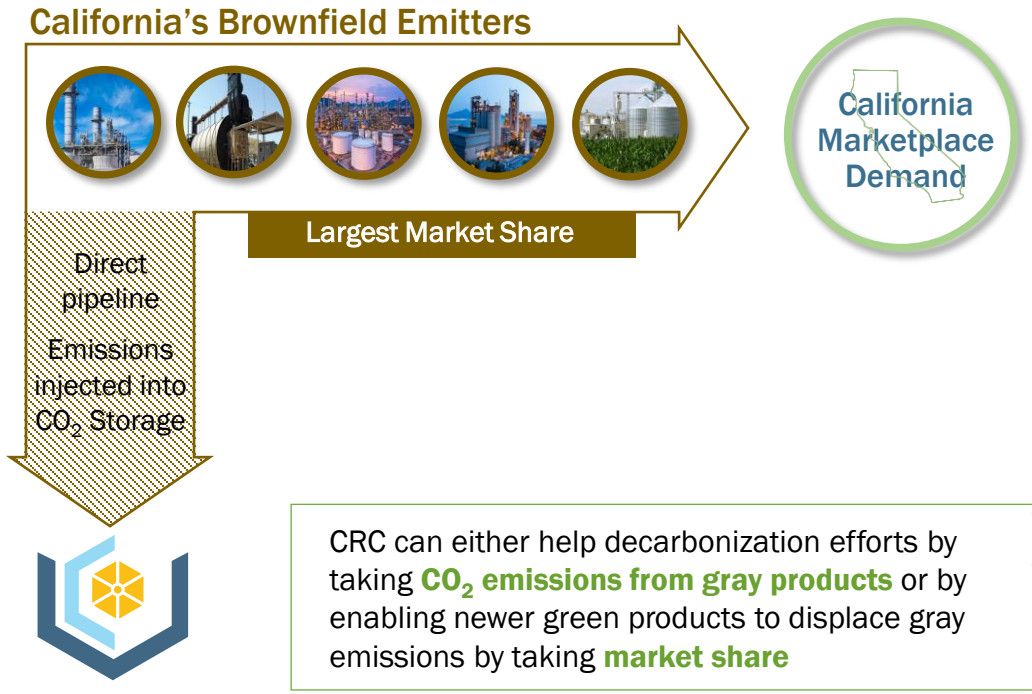
Source: CRC. (1) Source: CalGEM (2) Represents a non-GAAP measure. For all historical non-GAAP financial measures please see the Investor Relations page at www.crc.com for a reconciliation to the nearest GAAP equivalent and other additional information. Free cash flow is equal to operating cash flow less total capital requirements.

Multiples Paths to Decarbonize

A DIFFERENT KIND OF ENERGY COMPANY

Conventional Brownfield CCS

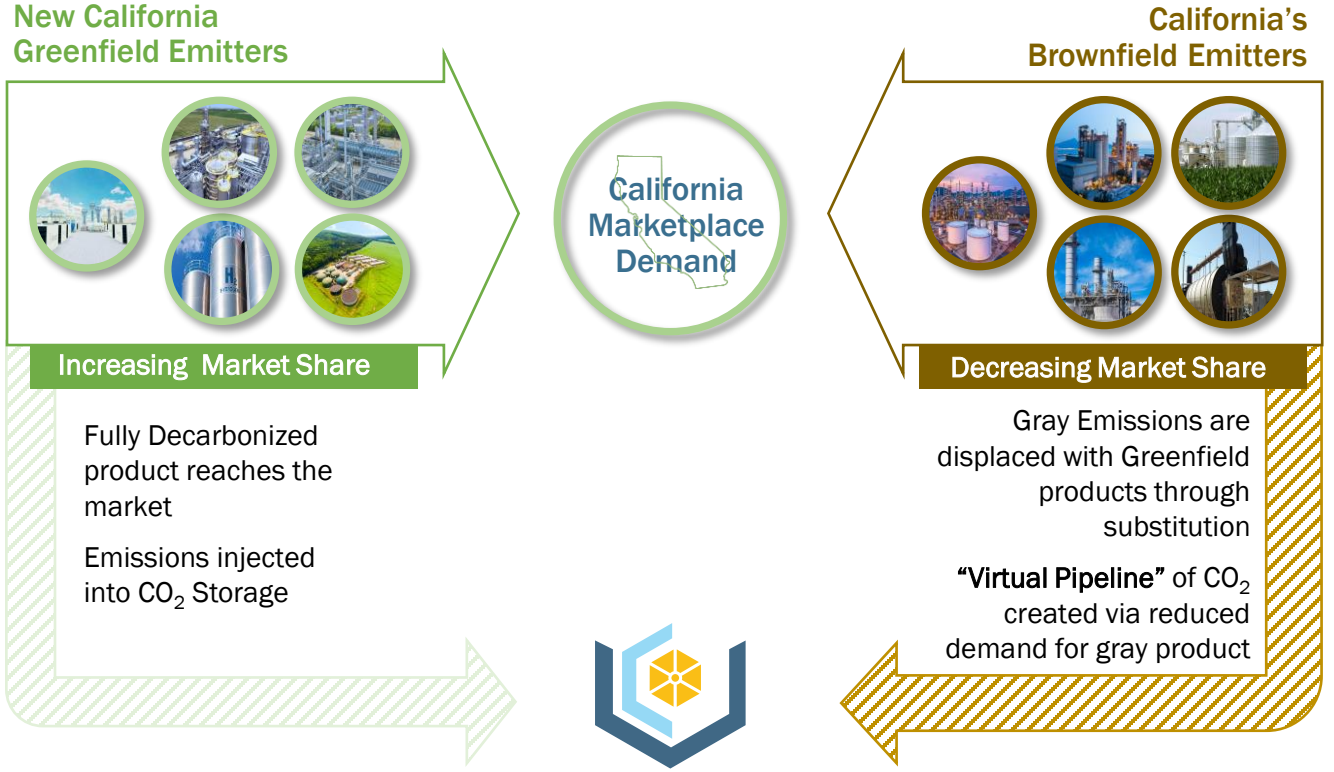
- Brownfield emitters provide a decarbonized product by capturing the CO_2 molecules used in the creation of their products and transporting CO_2 for permanent storage
- This lowers the carbon intensity of their product and the brownfield takes the decarbonized product to market
- Decarbonization enabled by emissions which are transported by physical pipe



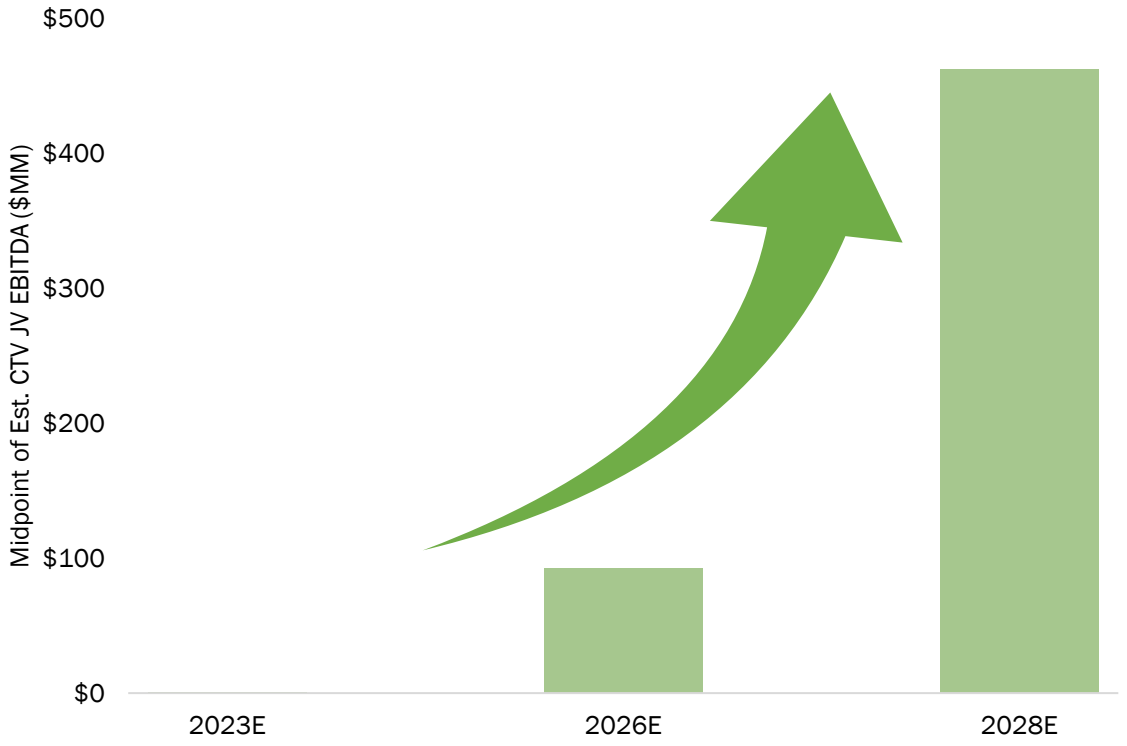
CRC can either help decarbonization efforts by taking **CO_2 emissions from gray products** or by enabling newer green products to displace gray emissions by taking **market share**

Greenfield CCS

- Greenfield projects provide product with an inherently lower carbon intensity than gray products
- Greenfield decarbonized product acts as a substitute for gray product and captures market share
- Decarbonization occurs via products which displace higher CI products thus creating a **"Virtual Pipeline"** that takes lower CI products to market rather than taking the CO_2 from gray products



Illustrative CTV JV Type Curve Demonstrates Potential Valuation Upside



First Full Year of Est. Impact	2026E	2028E
Est. CO_2 Injection Rate per Year	1MMTPA	5MMTPA
Est. CTV JV EBITDA ($MM)	$50 - $135	$250 - $675

Example **Strategic Partnership Economics** An average CTV project could generate on average **$50 to $135 of EBITDA per metric ton injected per annum** depending on project structure

EXAMPLE CTV JV PROJECT ECONOMICS – "TYPE CURVE"

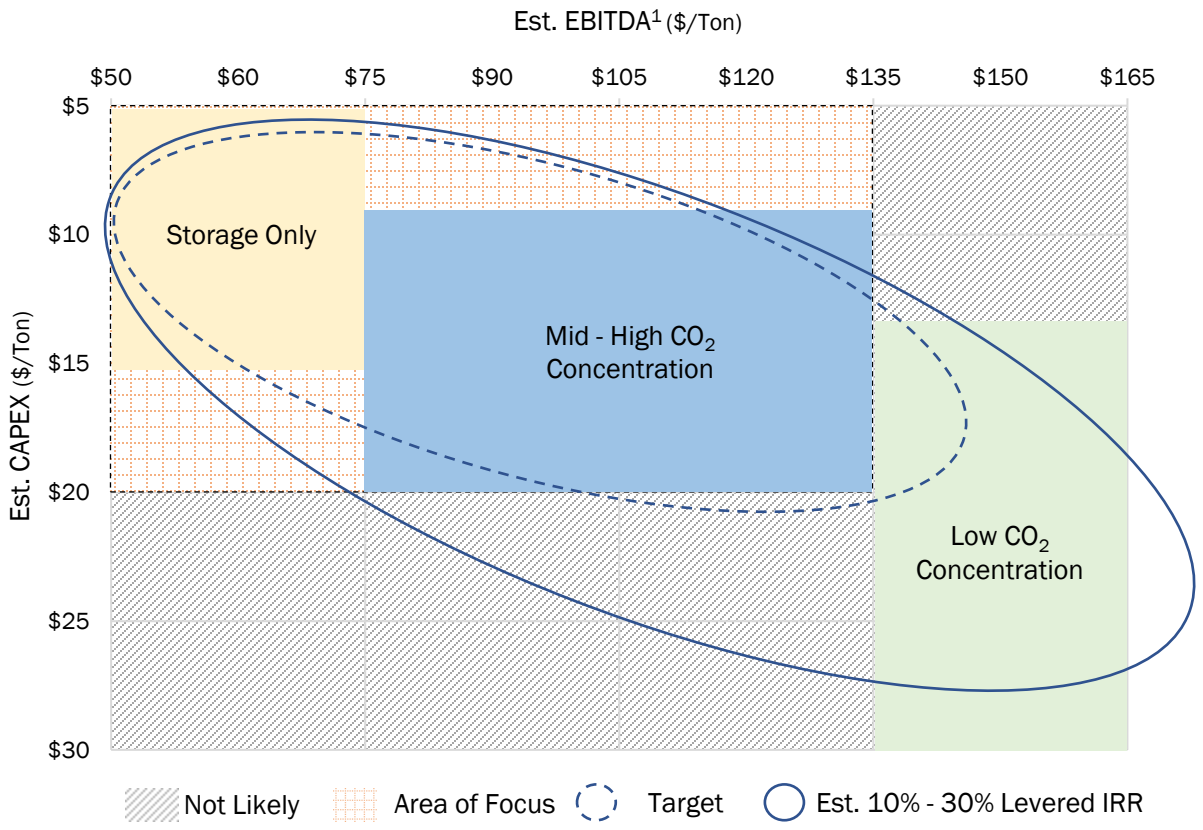
(PER MT OF INJECTED CO_2)

	Unit	Low	High	Notes/Incorporated Assumptions
Total Incentive Potential (LCFS + 45Q)	$/MT	$170	$205	45Q ($/MT): $85, LCFS ($/MT): $85 - $120, 100% LCFS eligibility
Opex	$/MT	$10	$75	Range reflects costs associated with full range of business model possibilities and includes G&A of dedicated staff.
Capex	Avg $/MT	$5	$20	Range of capital includes cost of capture facility and pipeline retrofit. Cost of capture facility depends on CO_2 concentration at source. Pipeline costs depend on distance from source to sink and size of pipe. Pace of capex deployment is expected to be ~5% to ~10% of Total Project Capex in Year 1, ~10% to ~35% in Year 2 and ~55% to ~85% in Year 3. Depending on project structure and location, capex could be lower or higher than range represented.

Note: Please see Slide 31 for important information regarding the assumptions used in the preparation of the information show on this slide. CTV JV economics are shared 51% to CRC and 49% to Brookfield. EBITDA is a non-GAAP measure.

Large Opportunity Set With a Variety of Potential Emitters

ILLUSTRATIVE EBITDA[1] VS CAPEX REQUIREMENTS FOR VARIOUS CO_2 PROJECTS



STORAGE ONLY PROJECTS

- CTV JV is the off-taker of CO_2 at storage site through Storage Co.
- Lower expected capital requirements for project development, including injection and monitoring wells, facilities and compression

MID - HIGH CO_2 CONCENTRATION PROJECTS
(≥15% CO_2 STREAM CONCENTRATION)

- CTV JV controls the entire value chain (capture to storage) and majority of the incentives
- Capital requirements for capture systems, while still significant, are expected to be on the lower end of the capture cost curve due to higher CO_2 concentration of stream
- Project financing more likely vs. storage only and provides opportunity to increase levered returns
- Potential LCFS expansion could provide further EBITDA potential

LOW CO_2 CONCENTRATION PROJECTS
(<15% CO_2 STREAM CONCENTRATION)

- CTV JV controls value chain and incentive but lower expected IRR due to higher costs of capture (*Ex: Natural Gas Combined Cycle Power Plants*)
- Inflation Reduction Act of 2022 expands potential project opportunities
- Advancements in capture technology to play key role in improving project economics
- CARB considering new incentive programs to unlock traditionally hard to decarbonize sectors (e.g. cement)
- CalCapture[2] is an advantaged low CO_2 concentration project given its proximity to storage (insignificant transport capital)

Note: Depicts illustrative examples of expected and estimated IRR, EBITDA and capital expenditure requirements based on internal estimates. Actual results could differ materially. (1) EBITDA is a non-GAAP measure. EBITDA estimates include 45Q tax credits which may change based on further guidance from IRS and other factors and assumes that 45Q wage and apprenticeship requirements are met. (2) CalCapture refers to CRC's project at the Elk Hills Power Plant.

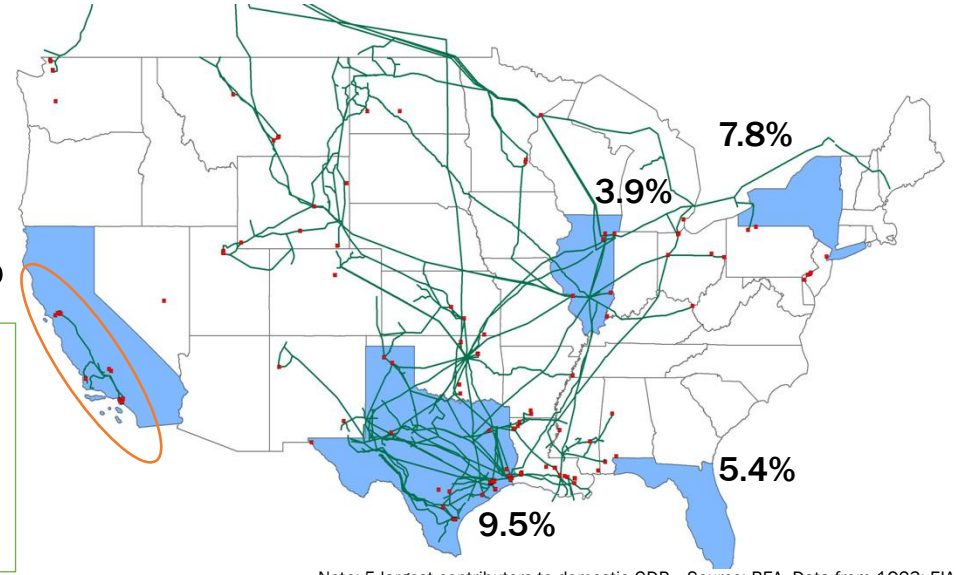
Strong Price Realizations in CA's Unique Market Dynamics

- **Crude:** California crude prices continued move in tandem with the broader market with realizations for 3Q23 firming slightly from 2Q. For the balance of the year, local (permits, refining margins & outages) and geopolitical dynamics (OPEC+, central bank policies, Middle East tensions) remain key determinants as to where prices will trend in California
- **NGLs:** 3Q23 NGL prices across North America continued to weaken driven by seasonal trend and general over-supply. As reflected within 2Q23 realizations - and as projected for the balance of the year - California has been and should remain a premium-priced NGL marketplace
- **Natural Gas:** California 3Q23 natural gas prices increased relative to 2Q23 as storage inventories were replenished. A material increase in Aliso Canyon natural gas storage capacity stands to support prices this Fall while – along with an abundance of hydro generation capacity - limiting the potential for gas price run-ups this winter
- **Power:** As measured on year/year basis, 3Q power prices retreated on the back of record snowpack & hydro output, incremental on-peak solar output, and uncharacteristically mild weather

CRC's commodity realizations continue to trend above domestic WTI averages

CALIFORNIA IS AN OIL ISLAND AND THE LARGEST U.S. GDP CONTRIBUTOR

(amounts shown as % of U.S. domestic GDP)



Note: 5 largest contributors to domestic GDP. Source: BEA, Data from 1Q23; EIA

Oil w/ Hedges ($/BBL)

	4Q22	1Q23	2Q23	3Q23

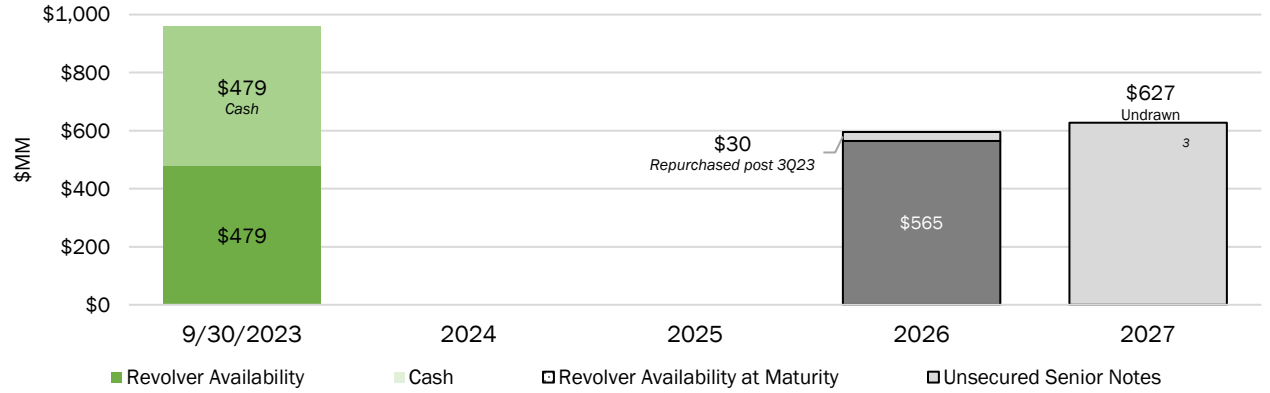
Less Cash & Cash Equivalents	(479)
Net Debt[3]	**$ 116**

NO SIGNIFICANT MATURITIES UNTIL 2026



RECENT CREDIT UPDATES

- Repurchased $5MM of senior notes at par during 3Q23
- Subsequent to quarter end, repurchased an additional $30MM in face value of our senior notes
- S&P Global reaffirmed CRC's 'B+' rating on strong financial metrics and stable outlook despite lower production

MULTIPLES DEMONSTRATE FLEXIBILITY

($MM)	
RCF Borrowing Base	$ 1,200
3Q23 Free Cash Flow[2]	$71
3Q23 Net Debt[2] / LTM Adjusted EBITDAX[2]	0.1x
LTM Adjusted EBITDAX[2] / LTM Interest & Debt Expense, net	15.6x

(1) Liquidity at 9/30/23 calculated as unrestricted cash of $479MM and $627MM capacity on CRC's Revolving Credit Facility less $148MM in outstanding letters of credit. (2) Adj. EBITDAX, Net Debt and Free Cash Flow are non-GAAP measures. For all historical non-GAAP financial measures please see the Investor Relations page at www.crc.com for a reconciliation to the nearest GAAP equivalent and other additional information. (3) Undrawn RCF as of September 30, 2023, excluding outstanding letters of credit. Subject to a springing maturity to August 4, 2025, if any of our Senior Notes are outstanding on that date.

Glossary

Term	Definition
Bcf	Billion Cubic Feet
BMT	Billion Metric Tons
CARB	California Air Resources Board
CCS	Carbon Capture and Storage
CCS+	Carbon Capture and Storage + EOR
CDMA	Carbon Dioxide Management Agreement
CEQA	California Environmental Quality Act
CGP	Cryogenic Gas Plant
CI	Carbon Intensity
CMB	Carbon Management Business
CO_2	Carbon Dioxide
CTV	Carbon TerraVault (a subsidiary of CRC)
DAC	Direct Air Capture
D&C	Drilling and Completions
E&P	Exploration and Production
EHPP	Elk Hills Power Plant
EIR	Environmental Impact Report
EOR	Enhanced Oil Recovery
EPA	Environmental Protection Agency
ESG	Environmental, Social and Governance
FCF	Free Cash Flow
FEED	Front End Engineering and Design

Term	Definition
FID	Final Investment Decision
GHG	Greenhouse Gas
IRR	Internal Rate of Return
KMTPA	Thousand Metric Tons Per Annum
LCFS	Low Carbon Fuel Standard
MMT	Million Metric Tons
MMTPA	Million Metric Tons Per Annum
MRV	Monitoring, Reporting and Verification Plan
MT	Metric Tons
MTPA	Metric Tons Per Annum
OCF	Operating Cash Flow
PD	Proved Developed
PUD	Proved Undeveloped
RSG	Responsibly Sourced Gas
ROFL	Right of First Look
R/P	Reserves to Production Ratio
RTC	Round-the-Clock
SFDR	Sustainable Finance Disclosure Regulation
SRP	Share Repurchase Program
SJV	San Joaquin Valley
TBA	To Be Announced
Tcf	Trillion Cubic Feet
WI	Working Interest

Slide 17:

- (1) 2023E guidance assumes a 2023 Brent price of $84.16 per barrel of oil, NGL realizations consistent with prior years and an average daily NYMEX gas price of $2.77 per mcf. 4Q23E guidance assumes a 4Q23 Brent price of $90.46 per barrel of oil, NGL realizations consistent with prior years and an average daily NYMEX gas price of $3.00 per mcf. Generally, CRC's share of production under PSCs decreases when commodity prices rise and increases when prices decline.
- (2) CMB Expenses includes advocacy, and other startup related costs.
- (3) A reconciliation of historical non-GAAP financial measures to the nearest GAAP equivalent and other additional information can be found on the Investor Relations page at www.crc.com. A GAAP reconciliation of forward-looking non-GAAP financial measures can be found in Attachment 3 to the Company's earnings release dated November 1, 2023, also available at www.crc.com.
- (4) Adjusted E&P Capital and Adjusted CMB Capital are Non-GAAP measures. These measures reflect the reclassification of ~$4 million from E&P, Corporate & Other Capital to Adjusted CMB Capital related to investment in facilities to advance carbon sequestration activities.

Slide 24:

The information on slide 24 is an example of project economics for the strategic partnership with Brookfield, which are shared 51% to CRC and 49% to Brookfield. The terms and availability of third-party sources of financing, if needed, could also affect returns and outcomes. The following assumptions were used:

- Assumes that projects are completed and online with no material delays or impediments to the issuance of necessary permits, government approvals, or third party third-party arrangements.
- Assumes development at the mid-point of the CTV JV economic "Type Curve".
- Assumes 1MMT injected per year for 40-year project life unless specified otherwise.
- Assumes Brookfield fully participates in CCS projects up to JV target of 5MMTPA of injection and 200MMT of CO_2 storage.
- EBITDA amounts that are shown as a range assume the top and bottom ranges of the EBITDA assumptions and are multiplied by 1MM and 5MM to represent 1MMTPA of projects and 5MMTPA of projects, respectively. The EBITDA range presented has been reduced by ~20% – 50% to reflect uncertainties related to project structure, financing and ownership.
- EBITDA estimates include 45Q tax credits which may change based on further guidance from IRS and other factors and assumes that 45Q wage and apprenticeship requirements are met. Based on incentives available under current regulatory framework.
- Assumes total incentive potential can be monetized through tax equity brokers and LCFS monetized in the LCFS trading marketplace and recorded as revenue.
- For simplicity, a 5-year accelerated straight line depreciation and amortization is assumed. Assumes no bonus depreciation. which may change based on further guidance from IRS and other factors.
- Assumes that a project is cash flow positive in year 4 with payback period of ~ 4 to 6 years and reflects the midpoint of range estimates. Payback period is defined as total CRC investment / annual cash flow and is specifically for CTV JV project level economics.
- High end of Opex range assumes end-to-end value chain business model and low-end assumes carbon storage business model, both described on slide 23 of CRC's Carbon Storage Update on October 6, 2021.
- Capex range assumes project capital of between $200MM and $800MM for an end-to-end business model. Project/partnership structures where CRC provides storage only could result in capital ranges below stated ranges.

Forward Looking / Cautionary Statements – Certain Terms

This document contains statements that we believe to be "forward-looking statements" within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934. All statements other than historical facts are forward-looking statements, and include statements regarding our future financial position, business strategy, projected revenues, earnings, costs, capital expenditures and plans and objectives of management for the future. Words such as "expect," "could," "may," "anticipate," "intend," "plan," "ability," "believe," "seek," "see," "will," "would," "estimate," "forecast," "target," "guidance," "outlook," "opportunity" or "strategy" or similar expressions are generally intended to identify forward-looking statements. Such forward-looking statements are subject to risks and uncertainties that could cause actual results to differ materially from those expressed in, or implied by, such statements.

Although we believe the expectations and forecasts reflected in our forward-looking statements are reasonable, they are inherently subject to numerous risks and uncertainties, most of which are difficult to predict and many of which are beyond our control. No assurance can be given that such forward-looking statements will be correct or achieved or that the assumptions are accurate or will not change over time. Particular uncertainties that could cause our actual results to be materially different than those expressed in our forward-looking statements include:

- fluctuations in commodity prices, including supply and demand considerations for our products and services;
- decisions as to production levels and/or pricing by OPEC or U.S. producers in future periods;
- government policy, war and political conditions and events, including the wars in Ukraine and Israel and oil sanctions on Russia, Iran and others;
- regulatory actions and changes that affect the oil and gas industry generally and us in particular, including (1) the availability or timing of, or conditions imposed on, permits and approvals necessary for drilling or development activities or our carbon management business; (2) the management of energy, water, land, greenhouse gases (GHGs) or other emissions, (3) the protection of health, safety and the environment, or (4) the transportation, marketing and sale of our products;
- the impact of inflation on future expenses and changes generally in the prices of goods and services;
- changes in business strategy and our capital plan;
- lower-than-expected production or higher-than-expected production decline rates;
- changes to our estimates of reserves and related future cash flows, including changes arising from our inability to develop such reserves in a timely manner, and any inability to replace such reserves;
- the recoverability of resources and unexpected geologic conditions;
- general economic conditions and trends, including conditions in the worldwide financial, trade and credit markets;
- production-sharing contracts' effects on production and operating costs;
- the lack of available equipment, service or labor price inflation;
- limitations on transportation or storage capacity and the need to shut-in wells;
- any failure of risk management;
- results from operations and competition in the industries in which we operate;
- our ability to realize the anticipated benefits from prior or future efforts to reduce costs;
- environmental risks and liability under federal, regional, state, provincial, tribal, local and international environmental laws and regulations (including remedial actions);
- the creditworthiness and performance of our counterparties, including financial institutions, operating partners, CCS project participants and other parties;
- reorganization or restructuring of our operations;
- our ability to claim and utilize tax credits or other incentives in connection with our CCS projects,
- our ability to realize the benefits contemplated by our energy transition strategies and initiatives, including CCS projects and other renewable energy efforts;
- our ability to successfully identify, develop and finance carbon capture and storage projects and other renewable energy efforts, including those in connection with the Carbon TerraVault JV, and our ability to convert our CDMAs to definitive agreements and enter into other offtake agreements;
- our ability to maximize the value of our carbon management business and operate it on a stand alone basis;
- our ability to successfully develop infrastructure projects and enter into third party contracts on contemplated terms;
- uncertainty around the accounting of emissions and our ability to successfully gather and verify emissions data and other environmental impacts;
- changes to our dividend policy and share repurchase program, and our ability to declare future dividends or repurchase shares under our debt agreements;
- limitations on our financial flexibility due to existing and future debt;
- insufficient cash flow to fund our capital plan and other planned investments and return capital to shareholders;
- changes in interest rates;
- our access to and the terms of credit in commercial banking and capital markets, including our ability to refinance our debt or obtain separate financing for our carbon management business;
- changes in state, federal or international tax rates, including our ability to utilize our net operating loss carryforwards to reduce our income tax obligations;
- effects of hedging transactions;
- the effect of our stock price on costs associated with incentive compensation;
- inability to enter into desirable transactions, including joint ventures, divestitures of oil and natural gas properties and real estate, and acquisitions, and our ability to achieve any expected synergies;
- disruptions due to earthquakes, forest fires, floods, extreme weather events or other natural occurrences, accidents, mechanical failures, power outages, transportation or storage constraints, labor difficulties, cybersecurity breaches or attacks or other catastrophic events;
- pandemics, epidemics, outbreaks, or other public health events, such as the COVID-19; and
- other factors discussed in Part I, Item 1A – Risk Factors.

We caution you not to place undue reliance on forward-looking statements contained in this document, which speak only as of the filing date, and we undertake no obligation to update this information. This document may also contain information from third party sources. This data may involve a number of assumptions and limitations, and we have not independently verified them and do not warrant the accuracy or completeness of such third-party information.

Flaws in EPA's Monitoring and Verification of Carbon Capture Projects

Thursday, December 14, 2023

Carbon capture and sequestration (CCS) is a major focus of President Biden's environmental agenda. The federal government has allocated billions of dollars to subsidize this expensive and controversial technology in an attempt to make it a viable option to combat climate change. In theory, the process captures carbon dioxide (CO_2) from industry and injects it into underground rock formations, permanently removing the gas from the atmosphere. But there are very good reasons to remain skeptical about whether sequestered carbon will remain out of the atmosphere in the long term. One reason is that the laws and regulations governing the technology are still being developed, and the existing framework is too weak to ensure that large-scale sequestration projects – which will be heavily subsidized by taxpayers – will deliver on the carbon reductions they promise.

The Environmental Integrity Project (EIP) examined one central component of carbon capture and sequestration regulation in the U.S.: monitoring, reporting, and verification (MRV) plans required by the EPA's Greenhouse Gas Reporting Program. These plans describe the monitoring strategies in place at each site to validate that the carbon dioxide is securely stored underground and is not leaking or migrating in an unexpected manner. If approved by EPA, the plans can also be used to qualify for tax subsidies. However, the 21 plans that EPA approved as of October 31, 2023, are ambiguous and lack key elements to ensure safe and long-term carbon sequestration. Specifically, these plans:

- **Are not required to include specific monitoring strategies or technologies**, allowing companies to write their own rules.
- **Often contain ambiguous language** that does not commit to explicit monitoring timelines or activities. Several plans lack specific timelines for monitoring and testing, state they will only continue with the monitoring actions described in the plan "if beneficial,"[1] or even promise to "determine the most appropriate method" to quantify leaks in the event a leak occurs,[2] instead of describing quantification strategies within the plan itself.
- **Are difficult to enforce**, with no third-party verification of the data.

This report discusses these weaknesses and the tax incentives at stake. With billions available in grants and tax subsidies, companies have moved quickly to announce additional carbon capture and sequestration projects, especially in the oil and

The Petra Nova carbon capture and storage project, southwest of Houston, is one of the largest in the world. It collects carbon dioxide from the burning of coal at the W. A. Parish power plant and pipes the carbon underground for injection into aging oil fields, to increase oil output. The system restarted in September after being shut down for more than three years.

gas industry. Sixteen of the 21 approved monitoring plans were submitted by oil and gas companies, which stand to benefit the most from the push for carbon sequestration. The expanded tax credit is estimated to result in over $30 billion going from taxpayers to industry by 2032.[3] Before this flood of CCS projects becomes operational, EPA needs to enact strong industry regulations that can protect the environment while combating climate change. EPA must ensure the monitoring plans contain comprehensive and clearly defined monitoring strategies that can adequately detect leaks, prevent environmental harm, and confirm that carbon is successfully stored long-term.

Tax Credits Spurring Additional CCS Project Announcements

Congress created a tax credit for carbon sequestration in 2008. Lawmakers then expanded it in 2018 and again in September 2022 with the Inflation Reduction Act. The expanded tax credit now allows companies that meet certain wage, hiring, and operation date requirements to claim up to $85 per metric ton of geologically sequestered CO_2 and up to $60 per metric ton of CO_2 used with a qualifying method, such as enhanced oil recovery. This increases to $180 per metric ton of CO_2 captured from the atmosphere (direct air capture).[4] According to EPA data, the oil and gas and ethanol industries sequestered nearly 8 million metric tons of CO_2 in 2022,[5] an amount worth an estimated $213 million in tax credits that year.[6] Sequestering the same amount in 2023 could be worth up to $504 million, thanks to a sharp increase in the value of tax credits (Table 1).[7]

Table 1. Estimated Maximum Tax Credits Available to Companies That Sequestered Carbon in 2022

Company	Number of Projects	Project Type	Well Type	Metric Tons of CO_2 Sequestered in 2022	Potential Value of Tax Credits in 2022	Potential Value of Tax Credits in 2023
Occidental Petroleum/Oxy	3	Enhanced Oil Recovery	II	5,894,969	$148,258,470	$353,698,140
Perdure Petroleum/ CapturePoint	2	Enhanced Oil Recovery	II	744,631	$18,727,470	$44,677,860
Archer Daniels Midland Co.	1	Ethanol Plant Long-Term Carbon Storage	VI	428,580	$16,221,753	$36,429,300
ExxonMobil	1	Gas Processing Waste Disposal (Acid Gas)	II	395,332	$14,963,316	$33,603,220
Core Energy	1	Enhanced Oil Recovery	II	311,308	$7,829,396	$18,678,480
Red Trail Energy, LLC	1	Ethanol Plant Long-Term Carbon Storage	VI	81,964	$3,102,337	$6,966,940
Stakeholder Gas Services, LLC	2	Gas Processing Waste Disposal (Acid Gas)	II	89,013	$3,369,142	$7,566,105
Lucid Energy Delaware, LLC	1	Gas Processing Waste Disposal (Acid Gas)	II	23,775	$899,884	$2,020,875
Petra Nova, LLC[8]	1	Enhanced Oil Recovery	II	-16,815	$0	$0
Total	**13**			**7,952,757**	**$213,371,769**	**$503,640,920**

Source: EPA's Facility-Level Information on Greenhouse Gases Tool and the Internal Revenue Service.
Note: Type II wells can be used for enhanced oil recovery and the disposal of gas processing waste. Type VI wells are for long-term carbon sequestration, including by ethanol plants. In 2022, long-term carbon sequestration projects were eligible for up to $37.85 in tax credits per metric ton of CO_2 sequestered, depending on the date the equipment was placed in service. Enhanced oil recovery projects were eligible for up to $25.15 per metric ton. Carbon sequestered from the processing of natural gas (acid gas waste disposal) was assumed to be eligible for the higher credit rate. Please see endnote for more detailed information.[9]

The increased potential pay-out for CCS has spurred a wave of announcements about new carbon capture projects and storage hubs. As of October 31, 2023, EPA had permitted only two wells designed for long-term carbon sequestration (called Class VI wells under EPA's Underground Injection Control Program) and issued draft permits for two more wells.[10] But EPA is also reviewing 58 additional applications for these projects (which include a total of 169 wells.) More than two thirds of these proposed projects were submitted after September 2022, when the IRA became law.[11] These highly complex applications need a thorough review from experts, and in many cases, companies have taken months to submit complete applications or were asked to provide additional information during the technical review. Some of these projects could rack up a lot in tax credits. For example, the proposed Blue Flint ethanol plant in central North Dakota plans to capture and sequester up to 200,000 metric tons of CO_2 annually, making it eligible for up to $17 million in tax credits each year.

Companies can also claim the tax credit for carbon dioxide injected into the ground through wells designed for oil and gas-related underground injection operations (called Class II wells). While Class II wells can be used for a number of purposes, those that can earn tax credits are used for enhanced oil or gas recovery or the disposal of waste from the processing of natural gas (acid gas, which is a mixture of carbon dioxide and hydrogen sulfide). Enhanced recovery facilities employ carbon dioxide injection to dislodge and extract hard-to-reach petroleum from the ground. This process produces both oil and carbon dioxide, but some of the injected carbon dioxide remains underground and is considered sequestered. Acid gas injection facilities inject carbon dioxide along with hydrogen sulfide, a waste product of natural gas processing, as a method of disposal. Many of these facilities have been operating for a long time, especially enhanced oil recovery sites, some of which have been injecting carbon dioxide for decades. Encouraging more of these projects by increasing the tax credits available to them seems unnecessary.

There are many concerns about enhanced oil recovery and acid gas disposal facilities being able to claim the tax credit, especially because it directly subsidizes further oil and gas extraction. Enhanced oil recovery wells are also subject to permits with much less stringent requirements. Unlike carbon waste disposal wells, which have injection permits that specifically regulate carbon sequestration, enhanced oil recovery and acid gas sites are governed by broader permits that regulate "injection related to oil and gas." The number of enhanced oil recovery and acid gas injection projects is expected to increase in the short term. In addition to the projects with approved monitoring plans, there are at least 80 more projects with these permits already injecting carbon dioxide into the ground.[12] If they qualify, they could choose to submit a monitoring plan to EPA and apply for the tax credits.

As mentioned earlier, 13 facilities reported sequestering 8 million metric tons of carbon dioxide to EPA in 2022, roughly equivalent to the greenhouse gas emissions from two coal-fired power plants.[13] This was a fraction of one percent of the 2.7 billion metric tons of greenhouse gases companies reported emitting in the United States in the same year.[14] Of the 13, 11 were of the variety used by the oil and gas industry to produce more fossil fuels or dispose of acid gas (Table 2). About 87 percent of the carbon dioxide was sequestered through enhanced oil recovery. While the tax credits are nominally larger for carbon storage wells, the enhanced oil recovery projects that qualify for the increased tax credits would benefit the most.

Table 2. Geologic Sequestration of Carbon Dioxide Reported to EPA in 2022

Project Type	Number of Projects	Metric Tons of CO_2 Sequestered in 2022
Enhanced Oil Recovery	7	6,934,093
Disposal of Gas Processing Waste (Acid Gas)	4	508,120
Ethanol Plant Long-Term Carbon Sequestration	2	510,544

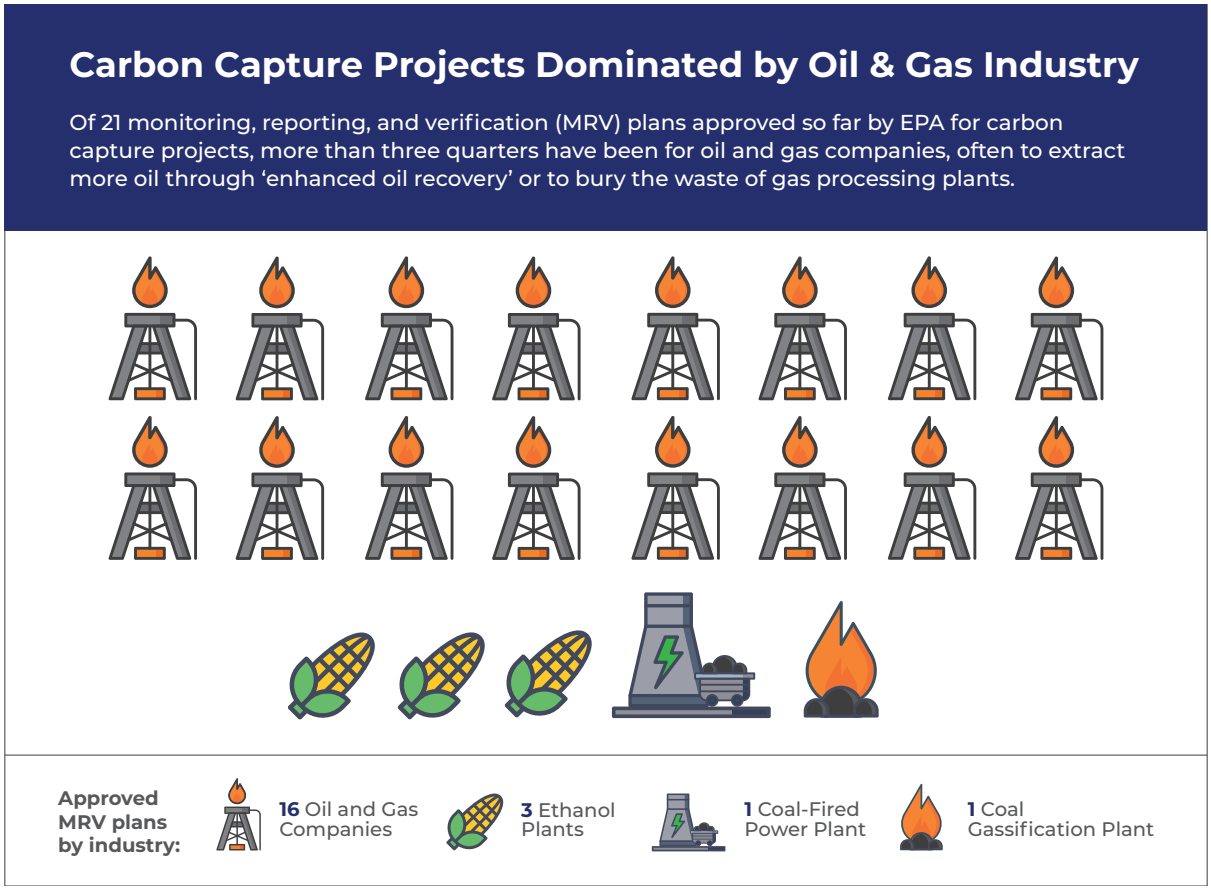
Source: EPA's Facility-Level Information on Greenhouse Gases Tool.

To qualify for the tax credits, companies must have and implement an EPA-approved monitoring, reporting, and verification plan (MRV) or meet an international standard.[15] The plans aim to ensure that companies are accurately accounting for the carbon they inject underground. However, between 2010 and 2019, companies without approved monitoring plans tried to claim nearly $900-million worth of tax credits.[16] Monitoring is critical to accurately account for the amount of carbon sequestered and to prevent its subsequent release into the atmosphere or underground sources of drinking water through either slow and steady leaks or catastrophic releases.

Review of Monitoring, Reporting, and Verification Plans

EPA's Greenhouse Gas Reporting Program requires all carbon storage (Class VI well) permit holders to report data on carbon sequestration each year. To do so, each operator must first submit and have approved a monitoring, reporting, and verification (MRV) plan that demonstrates that the facility is able to accurately report the amount of carbon dioxide sequestered. Enhanced oil recovery or acid gas well (Class II well) permit holders may choose to submit a plan and report data, in addition to their existing reporting requirements, in order to qualify for the tax credit.

In this report, EIP reviewed all 21 monitoring, reporting, and verification plans approved by EPA as of October 31, 2023, which are publicly available on EPA's website.[17] For a spreadsheet with details on all 21 plans, click here. Of these, only five sites are primarily injecting carbon dioxide for long-term geologic sequestration. Ten of the sites are using carbon dioxide for enhanced oil recovery, and six are injecting acid gas to dispose of waste from gas processing plants (see Appendix). Thirteen of these 21 sites have already implemented their monitoring plans and begun reporting to EPA. Four additional facilities are already operating oil recovery fields that will likely begin reporting carbon sequestration data next year, while the rest have not yet started operating.



Regulations Allow Companies to Write Their Own Rules

Monitoring, reporting, and verification (MRV) plans are prepared by Class VI carbon storage permit holders or companies reporting sequestered carbon to the Greenhouse Gas Reporting Program. The plans are submitted to EPA for approval and must contain certain components at a minimum. However, as written in the regulations, these minimum components read as open-ended questions with no right or wrong answers. EPA does not set any minimum monitoring requirements, nor are any specific technologies or methods required. The regulations allow companies to define their own strategies for detecting and quantifying surface leakage of CO_2 and establishing their own baselines for monitoring leakage. Monitoring plans only need to contain a few elements in addition to those strategies, including outlining the monitoring area, identifying, and evaluating potential pathways for CO_2 to leak to the surface, and a list of well identification numbers.[18]

EPA approves each plan through a technical review process. However, these regulations leave considerable room for interpretation, and the approved MRV plans vary quite a bit in how they design and implement monitoring at the site. Companies can also amend the plans at any time, for any reason, and are required to update their plans under certain circumstances.[19]

Inconsistent Monitoring and Testing

Since EPA does not require operators to use any specific monitoring methods or technologies, the monitoring plans vary significantly in how they address potential leaks at a site. These variations may be expected due to differing geological features and monitoring needs, but there needs to be some assurance that the plans will accurately and adequately detect leaks.

Many plans are vague about which monitoring actions will be performed and when. At the Wasson San Andres field in West Texas, for example, mechanical integrity tests will be used to ensure that there are no leaks from the injection well structure, but the monitoring plan does not state how often these tests will be performed.[20] Other sites plan to perform mechanical integrity tests annually, or once every 5 years, which makes a considerable difference in how quickly leaks would be found. Groundwater sampling is another common method used to identify carbon dioxide that may have migrated out of the injection zone. Many companies perform quarterly or annual groundwater sampling, even if the plan states that CO_2 migration into groundwater is unlikely, such as the acid gas injection site at 30-30 Gas Plant in West Texas.[21] However, Camrick Unit, an enhanced oil recovery field on the border between Oklahoma and Texas, claims that there is minimal risk of groundwater contamination at the site, and therefore, there is no need for further groundwater sampling.[22]

Many of the MRV plans claim that there is little to no danger of seismic activity at the storage sites because there are no faults or fractures in the underground formations or earthquakes aren't known to occur in the area. However, oil and gas operations have been known to induce earthquakes, especially from wastewater disposal through produced water disposal wells (also regulated as Class II injection wells).[23] While there are risk factors known to increase the likelihood of induced quakes, there is no way to definitively predict whether injection activities will induce earthquakes.[24] If there is no evidence of induced quakes in the past, that does not mean that continued activity at the site could not lead to one in the future. Monitoring plans need to adequately address seismic activity. But, for example, Blue Flint Sequestration, a carbon sequestration (Class VI) permitted site in central North Dakota, plans to perform seismic surveys of the monitoring area to detect potential leaks caused by seismic activity during the first and fourth years of operation at the site, but will "reevaluate" the timing of the seismic surveys after that.[25]

Monitoring Areas with Thousands of Wells

This need for comprehensive, accurate monitoring is compounded by the large number of old wells present at some of these sites, especially oil fields which have been actively extracting petroleum for decades. These wells present a huge challenge, as they are essentially holes through which CO_2 can leak. While operators promise to comply with applicable regulations for well construction, operation, and abandonment to reduce the risk of surface leakage, this is not always guaranteed, especially for sites which have very old wells that may have been drilled before the

regulations took effect. There are 120,000 documented "orphan" wells in the United States which have not been properly plugged, including over 7,000 in Texas alone, where many existing and proposed carbon capture and storage projects are located.[26] There are even more orphan wells that have not yet been identified; EPA estimates that there are over 3 million abandoned wells in the United States.[27]

The sheer number of documented wells poses a significant challenge for monitoring. The Wasson San Andres Field in West Texas, where oil production has been ongoing for at least 50 years, has nearly 4,700 known wells within the monitoring area, about 1,300 of which are inactive, shut-in, or temporarily or permanently abandoned. The regulations require the company to evaluate these wells as potential leakage pathways in the MRV plan, but Oxy claims the risk of leakage is low, and that they are all in "material compliance" with Texas Railroad Commission rules.[28] Even if all these wells are in compliance at the time of the evaluation, they still need to be monitored for any leaks that may develop.

Oxy uses visual inspections and hydrogen sulfide monitors worn by personnel on site to detect surface leakage. The monitors are used as a proxy for detecting CO_2 leakage, as the injection stream contains an "insignificant" amount of hydrogen sulfide.[29] In some cases, visual inspections could detect the white vapor or ice that often forms when cold carbon dioxide in its supercritical form escapes through pipes and wells. But these methods need to be sensitive enough to detect even small leaks across a huge monitoring area. While the site also continuously monitors injection and wellbore pressures for any abnormalities, these methods must be able to detect small, continuous leaks that may not significantly impact pressure.

Leak Repair

In addition, monitoring plans outline strategies to detect and quantify leaks, but not leak prevention or repair. Some plans do set general time limits for how quickly problems must be fixed. For example, in Texas, the West Seminole San Andres Unit promises to address issues "within days."[30] However, the nearby Seminole San Andres Unit simply promises that leaks will be fixed "in a timely manner."[31] If carbon dioxide is allowed to leak from the storage site for an extended period of time, it defeats the purpose of sequestering the carbon in the first place. This limits the benefits of CCS as a decarbonization strategy, while still taking on all the risks of underground carbon injection.

Monitoring Timelines

Carbon is supposed to be stored long-term, and ideally, permanently. However, the regulations for monitoring plans leave it up to companies to decide how long they want to monitor as long as it's greater than one year.[32] Class VI carbon storage permits require that sequestered carbon stay underground. By default, companies with these permits must monitor the mass of CO_2 sequestered for 50 years, unless they can prove that a shorter timeframe would be sufficient.[33] Monitoring plans from the five Class VI enhanced oil recovery sites EIP reviewed all commit to monitoring the site for 10 years after injection.

Class II enhanced oil recovery or acid gas disposal permits do not have the same requirements. MRV plans from these facilities only promise to continue monitoring until they can establish that the sequestered carbon is not "expected to migrate in the future in a manner likely to result in surface leakage." Many sites claim that this will be possible within two to three years, or even less. West Seminole San Andres Unit expects to be able to demonstrate this "almost immediately" after injection is concluded.[34]

Plans to Make Plans

The plans don't always set specific guidelines for how leaks will be quantified, but instead say that the "most appropriate" method will be chosen depending on the type and variety of leak, with little elaboration. While operators do need flexibility to be able to address problems as they come up, this cannot come at the expense of good methodology. The monitoring plan for Seminole San Andres Unit in Texas states, "In the event CO_2 Surface Leakage is confirmed, the most appropriate methods for quantifying the mass of CO_2 Surface Leakage will be determined, and the information will be reported as part of the required annual Subpart RR submission."[35] In this

case, this "plan" is simply a commitment to develop an actual plan once a leak has occurred. There needs to be some guarantee that the chosen method will be as accurate as possible and will not underestimate emissions. In contrast, the monitoring plan for Barnett RDC #1, a Class II waste disposal well in north Texas, also states that they may use several methods for quantification depending on the nature of the leak but additionally includes examples of potential methods and what kinds of leaks they would be used for.[36]

MRV Plan Enforcement and Verification

For the monitoring plans to have meaning, EPA must have a clear enforcement strategy in place. EPA can pursue enforcement actions against operators who misreport their emissions to its Greenhouse Gas Reporting Program, but it is not clear what actions will be taken to ensure the monitoring plan is being followed and is working to detect and fix leaks. In addition to sequestration data, each operator also must submit annual monitoring reports, which describe all the monitoring actions taken at the site during the reporting year and note any leakage events or monitoring anomalies. These annual monitoring reports are short summaries, usually only a few pages long. EPA should take strict action if a company's monitoring report does not follow through with the monitoring actions outlined in an MRV plan.

Enforcement also becomes even more uncertain when the plans themselves are ambiguous about their monitoring activities. If the monitoring plan itself doesn't define how often a monitoring action will be performed, how can EPA ensure that the monitoring is taking place as planned? For example, at Great Plains Synfuels Plant in North Dakota, one of the methods used to detect leakage from seismicity is a survey method called a vertical seismic profile. Great Plains only commits to performing this survey once, in the first year of injection, and will continue with the profiles "if beneficial."[37] When the plan itself does not commit to continuing with the monitoring actions, how can monitoring be properly enforced?

The data is also all self-reported by operators. While the Greenhouse Gas Reporting Program does not generally require any third-party verification, carbon sequestration is a relatively new field where several projects are being rushed into development, and at great cost to taxpayers. Operators are allowed to devise their own monitoring plans because the sites have unique geologies and requirements. However, EPA and taxpayers need some assurance that the monitoring plan is effective and that any leaks are being detected.

According to EPA data, the oil and gas and ethanol industries sequestered nearly 8 million metric tons of CO_2 in 2022, an amount worth an estimated $213 million in tax credits that year. Pictured above is the Poet ethanol refinery in Chancellor, South Dakota.

EPA Must Strengthen MRV Requirements

If the Federal government wants to wager our tax dollars and climate futures on a costly and energy-intensive technology, at a minimum it must be conducted in a manner protective of human health and the environment. Proper parameters need to be put in place to ensure the carbon is being sequestered safely in the long term. To do that, the monitoring plans need to be specific, enforceable, and comprehensive.

While companies need flexibility to develop appropriate, site-specific monitoring plans, there are ways to allow for flexibility while ensuring the plans are rigorous. EPA could, for example, identify specific types of monitoring that are required (such as atmospheric monitoring, seismicity, etc.), with a list of preferred monitoring methods and technologies for each, similar to the California Air Resources Board's Carbon Capture and Sequestration Protocol.[38] EPA should not accept industry assertions that the carbon dioxide will not leak or migrate. Subsurface studies are not infallible, as shown by an offshore carbon sequestration field in Norway, where, despite conducting pre-operational field assessments and geological studies, carbon dioxide began to migrate in an unexpected direction.[39] Even if companies conclude that CO_2 leakage would be unlikely (as most would, for any proposed carbon sequestration project), they should be required to plan to detect the unexpected and address any leaks immediately.

EPA should also have longer-term monitoring requirements that apply to all plans. Class VI carbon storage wells are already required to continue monitoring the site after injection. EPA's MRV plans should set equivalent requirements for Class II enhanced recovery and acid gas wells, especially if these operations continue to be allowed to claim credit for carbon stored underground. EPA cannot simply accept that the carbon dioxide will not migrate after only two or three years of monitoring. If carbon dioxide escapes from its underground reservoir into the atmosphere years after injection, companies must be able to account for that and report it to the EPA. The monitoring plans should also include some contingency for companies that go out of business or are unable to fulfill longer-term monitoring, reporting, and verification requirements.

Enhanced oil recovery and acid gas projects should not be eligible for tax credits. While these wells should still be required to have and implement an approved monitoring plan to ensure accurate reporting of greenhouse gas emissions, the carbon injection at these sites is secondary to the production of more fossil fuels, which, when used or processed, will emit more carbon dioxide into the atmosphere. This undermines the primary goal of carbon sequestration, which endeavors to reduce carbon dioxide emissions and mitigate climate change.

EPA should also require plan revisions every time monitoring or operational practices change. As is, companies are required to revise their plans if "a material change was made to monitoring and/or operational parameters that was not anticipated in the original MRV plan".[40] This leaves a grey area for companies that plan to reevaluate how often or when specific monitoring actions are performed. Instead, if the company decides that one of their monitoring strategies is not providing any useful information, the company should have to submit a revised plan for EPA approval that explains why this decision was made.

EPA also needs to establish a clear and consistent framework through which companies can be held responsible for monitoring and reporting carbon sequestration data. Companies will also be more likely to prioritize monitoring if the consequences of non-compliance are explicitly stated. Clear expectations help to ensure compliance and accountability.

As is, monitoring, reporting, and verification plans allow for too much leeway that could lead to inadequate monitoring and allow significant carbon leaks to remain undetected and go unaddressed. Accurate and comprehensive monitoring strategies are crucial to evaluating the efficacy and the environmental impacts of carbon sequestration. EPA must address the weaknesses in these monitoring plans before more carbon sequestration projects begin operating.

[6] This is an estimate of potential tax credit claims based on 2022 data. This calculation assumes that the company meets all the eligibility criteria and completes all the formalities to apply for the credit. See endnote 8. Internal Revenue Service Department of the Treasury. "Instructions for Form 8933." Rev. December 2022. Link: https://www.irs.gov/pub/irs-pdf/i8933.pdf

[7] This is an estimate of potential tax credit claims based on 2022 data. This calculation assumes that the company meets all the eligibility criteria and completes all the formalities to apply for the credit. See endnote 9. Internal Revenue Service Department of the Treasury. "Instructions for Form 8933." Rev. December 2022. Link: https://www.irs.gov/pub/irs-pdf/i8933.pdf

[8] Petra Nova, which emitted more carbon than it sequestered in 2022, is not expected to receive any 45Q tax credits in 2022. If the facility received tax credits for carbon sequestration in the past, the company may have to repay some of that amount. This is called credit "recapture." Congressional Research Service. "The Section 45Q Tax Credit for Carbon Sequestration," Updated August 25, 2023. Link: https://sgp.fas.org/crs/misc/IF11455.pdf

[9] These dollar amounts are calculated using 2022 sequestration data and the highest possible tax credit available in the applicable tax year according to the IRS. We assume that that the company meets all the eligibility criteria, including the new hiring, wage, and operation date requirements established by the Inflation Reduction Act, and applies for the tax credit. However, many of the already operating facilities may not meet all the requirements for the expanded tax credit. In 2022, facilities with carbon capture equipment placed in service on or after February 9, 2018 were eligible for $35.85 per metric ton of carbon sequestered and $25.15 per metric ton of carbon utilized in enhanced oil recovery or another qualifying method. If the equipment was placed in service before that date, the rate is reduced to $25.07 and $12.53 respectively. However, placed-in-service dates for the equipment at these facilities are not known, so not all these facilities may qualify for the higher rate. In addition, these calculations do not account for tax credits that may need to be repaid (see endnote 8). The estimated credit amount for 2023 assumes that each company will sequester the same amount of carbon each year. This is also not an exhaustive list of tax credits that could be claimed in 2023; the 2023 tax year has not yet closed, and additional companies may apply for and receive the tax credit in 2023. Appendix: Summary of Carbon Capture Projects with EPA-Approved Monitoring, Reporting and Verification (MRV) Plans

Project Name	Company	County/ State	Industry	Planned Injection or Storage Volumes (Metric Tons of CO_2 Per Year)*	Operating Status
Wasson San Andres Field (prev. Denver Unit)	OXY USA, INC	Yoakum, Gaines, TX	Oil & Gas	3,500,000 stored	Operating (as Denver Unit)
Seminole San Andres Unit	OXY USA, INC	Gaines, TX	Oil & Gas	5,300,000 stored	Operating (not yet reporting)
Kinder Morgan CCS Complex	Kinder Morgan Permian CCS, LLC	Stonewall, TX	Oil & Gas	Up to 1,200,000 injected	Injection expected to begin June 2024
Barnett RDC Well No. 1	BKV dCarbon Ventures, LLC	Wise, TX	Oil & Gas	Up to 280,000 injected	Injection expected to begin Dec. 2023
Blue Flint CO_2 Storage Project	Blue Flint Sequester Company, LLC	McLean, ND	Biofuels	200,000 injected	Injection expected to begin 2024
Great Plains CO_2 Sequestration Project	Dakota Gasification Company, LLC	Mercer, ND	Coal Gasification	Up to 2,700,000 injected	Not yet operating
Camrick Unit	CapturePoint, LLC	Beaver and Texas (OK), Ochiltree (TX)	Oil & Gas	230,000 stored	Operating (not yet reporting)
30-30 Gas Plant	Stakeholder Gas Services, LLC	Yoakum, TX	Oil & Gas	Up to 2,170,000 injected	Operating
Seminole East Field (SEF)	CapturePoint, LLC	Gaines, TX	Oil & Gas	225,000 stored	Operating (not yet reporting)
Campo Viejo Gas Processing Plant	Stakeholder Gas Services, LLC	Yoakum, TX	Oil & Gas	340,000 injected	Operating
Red Trail Energy, LLC	Red Trail Energy, LLC	Stark, ND	Biofuels	180,000 injected	Operating
Tundra SGS LLC	Minnkota Power Cooperative, LLC	Oliver, ND	Coal Power Plant	4,000,000 injected + 1,200,000 through potential third well	Injection expected to begin 2024-2025
Red Hills Gas Processing Plant	Lucid Energy Delaware, LLC	Lea, NM	Oil & Gas	Up to 500,000 injected	Operating
Petra Nova West Ranch	Petra Nova, LLC	Jackson, TX	Oil & Gas	1,500,000 stored	Operating
Farnsworth Unit CO_2 Flood	Perdure Petroleum, LLC	Ochiltree, TX	Oil & Gas	860,000 injected	Operating
West Seminole San Andres Unit	OXY USA WTP LP	Gaines, TX	Oil & Gas	780,000 injected	Operating
North Burbank Unit	Perdure Petroleum, LLC	Osage, OK	Oil & Gas	800,000 stored	Operating
Shute Creek Facility	ExxonMobil	Lincoln, WY	Oil & Gas	1,925,000 stored	Operating
Core Energy Otsego County EOR Operations	Core Energy	Otsego, MI	Oil & Gas	100,000 injected	Operating
Illinois Industrial Carbon Capture and Sequestration Project	Archer Daniels Midland Co.	Macon, IL	Biofuels	1,100,000 injected	Operating
Hobbs Field	Occidental Permian Ltd, Occidental Petroleum Corporation, and affiliates	Lea, NM	Oil & Gas	1,200,000 stored	Operating

Source. EPA Subpart RR Final Decisions as of October 1, 2023.

*These values are estimates based on project forecasts, historical operating levels, and permit capacities as discussed in the relevant MRV plans. For permit capacities expressed in standard cubic feet, the proportion of CO_2 in the injection stream was assumed to be constant. For project forecasts or previous operational data that estimated an amount sequestered over a period of several years, the average annual injection or storage rate was calculated.

Statement: Offsets Don’t Stop Climate Change

Climate-driven wildfires, flooding, droughts and other extreme weather events daily impact every corner of the globe.

Yet the fossil fuel industry, big utilities, big agriculture, big finance — and their political allies — are pushing carbon offset schemes to allow them to continue releasing the greenhouse gases driving the climate crisis, harming Indigenous, Black, and other already-marginalized

communities, and undermining sustainable farming and forestry practices.

The science is clear: we need to rapidly phase out fossil fuels and emissions-intensive agricultural practices like factory farming, while protecting forests, wetlands, and other natural carbon sinks. Every delay means greater impacts on our climate and more pollution in historically overburdened communities.

We call on leaders around the world to join us in rejecting offset schemes because these pay-to-pollute practices are nothing more than false and harmful solutions to the climate crisis.

- **Nature-based offsets cannot "offset" fossil fuel combustion.** While fossil fuel companies and other polluters would like fossil carbon and biological carbon to be fully interchangeable, this has no scientific basis. Fossil carbon emissions are effectively permanent, coming from reservoirs deep in the earth where they have been stored for millions of years. When burned, the carbon pollution remains in the atmosphere for hundreds to thousands of years. In contrast, crops, soils, oceans, and forests are "fast-exchange" carbon reservoirs that have limited carbon storage capacity and can re-release carbon back into the atmosphere over the course of a few decades, or sometimes even over a few days. Offsets confuse this basic science by wrongly treating the Earth's biosphere as an endless source of potential storage for fossil carbon emissions.
- **Offsets of any kind perpetuate environmental injustice.** Greenhouse gas emitting industries are disproportionately sited in poor communities and communities of color, causing them to bear the brunt of pollution. Offset schemes increase pollution in these communities, worsening environmental injustice. Furthermore, by allowing pollution to continue in exchange for land grabs elsewhere, offsets often shift the burden of reducing emissions from the Global North to the Global South.
- **The use of offsets is likely to increase greenhouse gas emissions.** Polluters frequently purchase offsets for emissions-reducing practices by one entity, so that their own emissions can continue. In this case, emissions are still added to the atmosphere, so global warming continues. Polluters also purchase offsets for practices that could pull carbon out of the atmosphere, such as by planting forests or protecting existing forests. However, carbon storage in natural ecosystems is inherently temporary and highly reversible, as has been seen so clearly in the tragic forest fires in the U.S. west in the past few years. All that carbon can be released very quickly back into the atmosphere, again increasing emissions.
- **Offsets can result in violations of the rights of Indigenous and tribal peoples.** Satisfying market demands for offsets will require access to huge expanses of land and forest, lands already occupied by Indigenous Peoples, peasants, and local communities. As such, Indigenous lands are increasingly targeted by forest offset project developers, creating pressure and division in Indigenous communities.

- **Offsets undermine sustainable farming and increase consolidation in agriculture.** Carbon offset programs give additional leverage to already powerful corporations, including agribusinesses and factory farms, that have long squeezed farm income and drained rural economies, while increasing environmental pollution. Corporations and large landowners are best-positioned to develop offset projects, which further entrenches the factory farm and corn/soybean monocultural model at the expense of small farmers, including Black and Indigenous farmers and Tribal Nations. Instead of allowing the industrial, extractive model of agriculture to further prosper by selling offsets to industrial polluters, policy makers should support traditional and ecologically regenerative agricultural practices.
- **Offsets markets create more conditions for fraud and gambling than for climate action.** Existing offset schemes have already proven to be easily open to fraud. Yet the speculative trading of offsets derivatives and other financial products has already begun, prioritizing profit-seeking traders and speculators over economic and climate justice.

We call on global policy makers to reject offset schemes and embrace real climate solutions that will keep fossil fuels in the ground, support sustainable food systems, and end deforestation, while eliminating pollution in frontline communities.

Undoing Equivalence: Rethinking Carbon Accounting for Just Carbon Removal

Wim Carton[1]*, *Jens Friis Lund*[2] *and Kate Dooley*[3]

[1] Lund University Center for Sustainability Sciences (LUCSUS), Lund, Sweden, [2] Department of Food and Resource Economics (IFRO), Copenhagen University, Copenhagen, Denmark, [3] Climate and Energy College, University of Melbourne, Parkville, VIC, Australia

Concerns are increasingly raised over the centrality of carbon removal in climate policy, particularly in the guise of "net-zero" targets. Most significantly perhaps, treating emissions and removals as equivalent obscures emission reductions, resulting in "mitigation deterrence." Yet the conflation of emission reductions and removals is only one among several implicit equivalences in carbon removal accounting. Here, we examine three other forms—carbon, geographical, and temporal equivalence—and discuss their implications for climate justice and the environmental risks with carbon removal. We conclude that "undoing" these equivalences would further a just response to the climate crisis and tentatively explore what such undoing might look like in practice.

Keywords: carbon removal, negative emissions, equivalence, carbon accounting, climate justice, net-zero

INTRODUCTION

Carbon removal is steadily making its way into mainstream climate governance. As countries and corporations embrace net-zero emission goals, the ambition to remove large amounts of carbon from the atmosphere is becoming an implied if not always outspoken pillar of mitigation policies. This development raises a number of, by now, well-known concerns about the feasibility of proposed "negative emission technologies" (Low and Schäfer, 2020; Waller et al., 2020) and the likely environmental and social justice impacts of their implementation (Dooley and Kartha, 2018; Doelman et al., 2020). These concerns remain largely invisible in the modeled pathways that assume large-scale deployment of negative emissions later in this century (Larkin et al., 2017; Beck and Mahony, 2018). Apprehensions are also voiced about the likely "moral hazard" or "mitigation deterrence" effects that promises of future carbon removal have on current emission reduction efforts (Anderson and Peters, 2016; McLaren, 2020; McLaren and Markusson, 2020).

To address some of these issues, McLaren et al. (2019) propose to disaggregate net-zero targets into separate objectives for carbon removal and emission reductions. Doing so, they argue, would "expose interests and politics" in the formulation of emission targets and "reveal both where negative emissions investment and development is inadequate, and where negative emissions (or future promises thereof) could undermine emissions reduction" (p. 4). McLaren et al.'s proposal reflects a long-standing social science critique of carbon accounting as an often misguided exercise in "making things the same" (MacKenzie, 2009).

This critique asserts that common carbon accounting practices are rendering disparate technologies, socioeconomic contexts, and climate change temporalities equivalent, while concerns for climate justice and environmental integrity demand that they are kept separate (Lohmann, 2009, 2011). It fundamentally questions the idea that a ton of CO_2 should be treated as functionally

equivalent irrespective of how, where or when it is avoided, removed, or stored. While "a ton is a ton" might be a useful abstraction for creating and apportioning carbon budgets, the argument goes, it is a poor guide in the design of climate policy, where different options for mitigation and their distribution in time and space correspond to radically different values, socioeconomic effects, and risk profiles (Lövbrand, 2009; Corbera and Brown, 2010; Leach and Scoones, 2015; Turnhout et al., 2015). Hence, while carbon accounting fulfills an important function to create consistency and unity in assessing progress toward identified targets, the specific forms it takes are not neutral and require close consideration.

Seen in this light, the conflation of removals and emission reductions that McLaren et al. are concerned with, is one among several implicit equivalences in carbon accounting. In this perspective piece, we critically examine the social and environmental implications of three other equivalences. We argue that these too must be undone as part of a movement toward ensuring socially and environmentally just carbon removal and mitigation policies—which require that states with greater capability take the lead on climate action and that the needs of the most vulnerable are protected against the effects of climate change and of measures taken to limit it (Shue, 2019; Dooley et al., 2021). While concerns over the equivalences that we examine have long been raised in the social science literature on e.g., carbon accounting and carbon markets (Lohmann, 2009; Carton et al., 2020), they are now resurfacing under the guise of a rapidly evolving carbon removal agenda, and therefore warrant being discussed and scrutinized as part of this new conversation.

UNDOING EQUIVALENCE

We describe three common forms of equivalence in carbon accounting and discuss their implications for climate justice concerns and risks with respect to carbon removal. We then suggest what "undoing" these equivalences might look like in practice.

Carbon Equivalence

Carbon accounting often renders fossil and biotic forms of carbon, i.e., from fossil fuels vs. land use, land use change, and forestry, equivalent. Both categories of carbon are commonly included under the same climate targets, which allows fossil fuel emissions to be "offset" by increases in biological carbon sequestration. The European Union's new 2030 "net-emissions" target, for instance, now includes forests and land use within the bloc's overall mitigation target, which though constrained by accounting rules introduces a degree of flexibility between fossil and land sector emissions (Kulovesi and Oberthür, 2020). Such accounting practices are responding to political rather than scientific considerations and involve a number of risks and complexities (Lövbrand, 2004; Höhne et al., 2007), raising concerns about the weakening of targets (Climate Action Tracker, 2020). While the technical accounting difficulties with making fossil and biotic carbon equivalent have long been recognized, the social, environmental, and climate implications often remain obscured (Fogel, 2005; Dooley and Gupta, 2017).

A key concern with this equivalence pertains to the different timescales involved: fossil carbon sinks are essentially permanent (or inert) if left unused, while biotic carbon is part of the short-term (or active) carbon cycle. While accounting systems try to deal with the risk of reversal from biotic sinks in various ways, for example through temporary crediting, these solutions do not take away the long-term uncertainties involved (Brander et al., 2021). The different temporal characteristics of fossil vs. biotic carbon represent a fundamental barrier to equivalence.

Mackey et al. (2013) explain why using carbon sinks on land as a means to "offset" emissions from burning fossil fuels is scientifically flawed. Current terrestrial removal and storage potential primarily reflects the depletion of carbon sinks due to past land use. Since the capacity of forests and other ecosystems to sequester carbon is finite, increasing carbon in terrestrial sinks simply replaces carbon that has been lost to the atmosphere over past centuries. Fossil carbon, on the other hand, is permanently locked away. Thus, burning fossil fuels moves carbon from permanent storage into the active carbon cycle, causing an aggregate increase in land, ocean, and atmospheric carbon. Once added, this additional carbon cannot be removed through natural sinks on time-scales relevant to climate mitigation, leading to increased warming (Steffen et al., 2016).

Rendering biotic and fossil carbon equivalent also conflates the drivers of climate change. It obscures whether mitigation is achieved through reduced fossil emissions or increased biotic sequestration (Dooley and Gupta, 2017), suggesting that full decarbonization of the energy sector can be avoided (or delayed) by sufficient "greening" in the land sector. However, the technological, social, and economic transitions required in these sectors differ significantly, as do their relative contributions to climate change. Considering them fully fungible therefore has considerable social and environmental implications. Bioenergy with carbon capture and storage (BECCS), for example, is promoted as a biotic carbon removal solution that largely overcomes the permanence issue by geologically sequestering the carbon captured from bioenergy combustion. Yet treating BECCS as a solution to continued fossil fuel emissions implicitly shifts the burden of mitigation from energy, industry, and transport to the land use sector, with ramifications for distributional justice and ecosystem functioning (Buck, 2016; DeCicco and Schlesinger, 2018; Seddon et al., 2020).

A similar suite of issues arises from the establishment of equivalence across different biotic systems. The quality, integrity, and stability of biotic carbon stocks differs between different land-uses. Ecosystem integrity and function, including carbon storage, depends on biodiversity (Labrière et al., 2016), with diverse intact natural ecosystems known to be more resilient and stable than monocultures of non-native species (Seddon et al., 2019). Yet, carbon accounting systems do not differentiate between the "quality" of terrestrial carbon stocks on the basis of ecosystem health or diversity (Keith et al., 2021).

A just framing of carbon removal would require separate accounting and policy agendas on biotic and fossil fuel emissions. Such separation was already recommended several decades ago (WGBU, 1998) and has recently reappeared in the academic and political debate (NewClimate Institute, 2020; Skelton et al.,

2020; Smith, 2021). Separation would help avoid the substitution of fossil fuel emission reductions for land-based actions that risk exacerbating climate injustices through environmental and social impacts. Rather than using biotic carbon removals to compensate for past, ongoing, or residual fossil emissions, restricting removals on a sectoral basis (e.g., land-based removals for land-based emissions) would encourage improved agricultural practices, minimize reliance on land sequestration, and force a faster transformation of sectors reliant on fossil fuels (Upton, 2019).

A further step should be to separate different land-based efforts, recognizing that these come with very different social and ecological implications. A further undoing of equivalences within the "biotic carbon" category is therefore necessary. Actions that minimize problems of impermanence through geological storage (such as BECCS) or create equivalences between terrestrial carbon stocks of different quality (such as between diverse forest ecosystems and monoculture plantations) need to be assessed for their impacts and risks related to *both* social impacts *and* biodiversity, ecosystems, and mitigation effectiveness. Taken together, this means that research and policy agendas need to distinguish between emissions avoided or removed in the land sector; the difference in quality of carbon stocks between different land-uses and ecosystems; and mitigation action in sectors reliant on fossil fuels.

Geographical Equivalence

A second equivalence embedded in carbon accounting is between carbon emissions and removals across different geographies, i.e., across locations that differ widely in terms of their biophysical and socio-political characteristics.

Climate change is commonly construed as a global problem where the spatial location of emissions and removals is irrelevant. It is also widely seen as a problem that should be mitigated at the lowest possible cost, a principle that is written into the U.N. Framework Convention on Climate Change (Article 3.3) (Boyd et al., 2009). This combination of factors makes the idea of geographical equivalence intuitively appealing. From a neoclassical economics perspective, differences in the marginal costs of mitigation efforts across the world derive from comparative advantage premised on different innate abilities and preferences, i.e., some places provide better conditions for carbon removal than others and some people prefer low-carbon lifestyles over others. This logic has given rise to a variety of mechanisms to facilitate the international exchange of mitigation responsibilities, allowing countries and corporations to finance climate action elsewhere to meet their targets. The use of carbon removal within such mechanisms is already common practice on the voluntary carbon market and is actively discussed in the context of a future trading mechanism under the Paris Agreement (Mace et al., 2021).

Carbon removal and storage does come with specific geo- and biophysical conditions that lend support to geographical equivalence and the international exchange of removal responsibilities. Geological storage capacity, for instance, is unevenly distributed across space, implying that some countries will be unable to store captured CO_2 within their jurisdictions (Kelemen et al., 2019; Wei et al., 2021). Similarly, higher biological sequestration rates in the tropics favors them as locations for afforestation/reforestation and bioenergy production in global estimates of mitigation potentials (Griscom et al., 2017). Yet prioritizing such geo- and biophysical conditions in global carbon removal estimates tends to disregard important social and political factors that put these estimates in question (Creutzig et al., 2021), and that caution against the adoption of geographical equivalence. Studies that identify "available" locations for land-based carbon removal (Griscom et al., 2017; Bastin et al., 2019; Pozo et al., 2020), for instance, commonly disregard the existing uses and users (such as pastoralists) of these areas. This amounts to a discursive marginalization of certain land uses and users and may implicitly legitimate processes of "green grabbing" (Fairhead et al., 2012).

Similarly, the notion of comparative advantage, which underpins the alleged mutual benefits of exchanging mitigation responsibilities, has been repeatedly criticized for disregarding global inequality and power structures (Sheppard, 2012; McAfee, 2016). Critics point out that the differences allowing for market exchange reflect uneven capacities and opportunities within a structurally unequal world, and are predicated on historical and present exploitation and unequal power relations (Smith, 2008). Focusing on cost-effectiveness as the driving criterion for the location of carbon removal efforts will therefore, inter alia, tend to reproduce climate injustices (Fairhead et al., 2012).

We currently see rapid growth in the use of offsetting to offer "climate neutral" products and services and/or to make good on corporate and country-level net-zero pledges (Gross, 2020; NewClimate Institute, 2020). Many of these promises build on geographical equivalence, where offsetting occurs through carbon removal—often in the form of afforestation projects—in countries in the global South. This incentivizes delay—by providing cheap alternatives to difficult or inconvenient emission reductions—and deepens climate injustice in several ways. First, by depriving poor nations and regions of "cheap" carbon removal options, making their path toward the coveted "net-zero" harder, while giving wealthy nations and regions an easier path toward realizing the same goal (Rogelj et al., 2021). Second, by limiting the livelihood opportunities afforded to poor (mostly rural) people so that a wealthy global elite can continue its ways (Shue, 2017; Gore et al., 2020). Third, by facilitating the continued release of fossil carbon into the atmosphere (Pearse and Böhm, 2014; Green, 2021), thereby contributing to future demand for carbon removal rollout as well as inflicting more severe climate damages that will shape the lives of poor and vulnerable people in the global South the most [Intergovernmental Panel on Climate Change (IPCC), 2014a].

Just climate policy requires that we abandon the notion of geographical equivalence. Undoing the equivalence between biotic and fossil carbon would contribute toward undoing geographical equivalence in practice, because much of the offsetting done by global North corporations occurs via forest offsets. However, further efforts are necessary to avoid the deepening of climate injustices entailed by global carbon markets. This involves a stronger prioritization of domestic or at least regional mitigation efforts, and a move away from global market

mechanisms that neglect differentiated social and economic capabilities. Efforts to reform such mechanisms have so far failed to curb their negative social fallout as well as concerns related to additionality and leakage, among others (Asiyanbi and Lund, 2020; Cullenward and Victor, 2020; West et al., 2020). Current discussions surrounding voluntary market standards and a possible global compliance market under the Paris Agreement do not indicate a substantial break with failures of the past (Timperley, 2019; Harvey, 2021), hence offer little hope that markets can be reformed to the extent needed. Rather than relying on the principle of geographical equivalence, shared responsibility for carbon removal must start from an acknowledgment of wealthy nations' historical responsibility for climate change and a moral imperative that mandates against shifting the burden and risks associated with removal to poor and vulnerable parts of the world. Ultimately, this means decoupling support for mitigation and adaptation efforts in the global South from any trade in carbon removal claims.

Temporal Equivalence

A third prominent equivalence in discussions on carbon removal is between present (and near-term) mitigation actions, and those projected to occur in the more distant future. This temporal equivalence underpins much of the current discourse on large-scale removal but raises a number of concerns.

Proposals for large-scale removal derive from modeled pathways that seek to stay within 1.5 or 2°C warming limits. In the majority of these pathways carbon removal compensates for a temporary overshoot of the temperature target [Intergovernmental Panel on Climate Change (IPCC), 2014b, 2018]. For instance, more than 80% of scenarios in the IPCC's Special Report on 1.5°C overshoot the 1.5°C temperature threshold before returning to these levels using large-scale carbon removal in the second half of the twenty-first century [Intergovernmental Panel on Climate Change (IPCC), 2018; Rogelj et al., 2019]. This use of temperature overshoot and subsequent decline suggests that it does not matter when, over the next 80 years, mitigation actions occur, as long as the end-result by 2100 stays within agreed-upon temperature targets. It assumes substitutability between emission reductions in the near-term and further-off removals, a notion that is rapidly being institutionalized in net-zero targets. It is this equivalence that most directly lies behind concerns with "mitigation deterrence," because if it does not matter *when* we balance the carbon budget, then there might be incentives to push uncomfortable and difficult decisions and investments into the future.

The idea that future actions can straightforwardly be substituted for present ones is however problematic. For one, as Anderson and Peters (2016) point out, it neglects the different risk profiles that characterize different time horizons: we know what can be done in the present and what technologies are available, and can therefore reasonably assess their risks, flaws, and economic and political feasibility. Future removals on the other hand often rely on technologies that are hypothetical at scale and their roll-out is therefore inherently more difficult to assess. Second, significant uncertainties remain concerning future climate feedback processes and tipping points (Tokarska and Zickfeld, 2015; Lenton et al., 2019; Creutzig et al., 2021), which could affect the effectiveness of carbon removal to reduce temperatures (Rogelj et al., 2018, p. 127). If increased warming weakens natural carbon sinks (Hubau et al., 2020; Li et al., 2020; Wang et al., 2020; Duffy et al., 2021) or turns them into sources of carbon emissions (Wang et al., 2018), then assumptions about our ability to bring down atmospheric CO_2 concentrations in the second half of the century might prove overly optimistic.

Third, equating present with future actions ignores potentially important differences in the climate damages and mitigation burdens that occur as a result of different peak CO_2 concentrations. While the geophysical implications of temporary temperature overshoot remain unclear (Geden and Löschel, 2017), an increasing amount of research points to levels of sea level rise, changes in ocean circulation, and changes in other aspects of the cryosphere that exceed those under straightforward temperature stabilization scenarios and that would be difficult to reverse (Palter et al., 2018; ICCINET, 2019). In other words, while temperature overshoots might be reversible, this is not necessarily the case for other climate and geophysical dynamics. Fourth, the more societies push actions into the future, the greater the scale at which removals will need to happen, and the larger the social and economic burdens associated with mitigation [Intergovernmental Panel on Climate Change (IPCC), 2018]. Rapid short-term emission reductions also entail a significant burden, but there are clear societal co-benefits from transitioning to a renewable energy-oriented transport and industry system, and from making agricultural systems more sustainable. That is not necessarily the case with large-scale carbon removal. Technologies such as Direct Air Capture would likely be a pure cost to society, while in the case of "natural climate solutions" any co-benefits are highly dependent on the form and scale they end up taking [Intergovernmental Panel on Climate Change (IPCC), 2019; Fyson et al., 2020].

Cutting across these different concerns are the uneven intergenerational effects of temporal equivalence. As Shue (2017) notes, the conflation of present with future climate actions entails a risk-transfer to future generations, in which the people deciding that future removal is a reasonable strategy to pursue are different from those that will need to deal with any of the consequences arising should that strategy fail. Substituting near-term mitigation for future removals "sentences young people to either a massive, implausible cleanup or growing deleterious climate impacts or both' (Hansen et al., 2016, p. 578). This occurs against a background where any costs of mitigating climate change in the face of insufficient removal will be significantly larger than today, and where those costs and consequences are likely to disproportionately fall on the poorest.

A commitment to climate justice therefore demands a clear distinction between actions in the present, and more hypothetical, future promises of mitigation (mostly in the form of carbon removal). It demands the introduction of barriers to substitution, for example by moving away from the use of high discount rates in models, which value future generations less than present ones (Stanton et al., 2009) and hence facilitate substitution and bias results in favor of future removals (Emmerling et al., 2019). Foregrounding justice considerations also requires constraints on the use of overshoot scenarios (Geden and Löschel, 2017) and a carbon accounting system that

internalizes the considerable added risks of delaying mitigation, for instance by institutionalizing a risk premium in mitigation pathways. For policy makers, minimizing risk transfer means much stronger prioritization of ambitious near-term actions over distant mitigation targets and open acknowledgment of the important differences between the two. This would guarantee that a majority of the mitigation burden is borne by those most responsible for the problem.

CONCLUSION

In sum, we argue that a just research and policy agenda on carbon removal needs to, first, distinguish between removals in the land use sector, and emissions from the use of fossil fuels in energy production, industry and transport. The purpose here should be to question the logic that allows biotic carbon sinks to be used as offsets for fossil fuel emissions, while also problematizing substitution between biotic sinks without regard for ecosystem quality or justice effects. Second, it needs to resist the temptations of global markets in carbon removal, where the domestic climate obligations of corporations or countries are substituted for removals in distant, often less affluent places. Such cost-shifting perpetuates existing inequalities by outsourcing the responsibility for climate action on economic grounds. Third, it needs to take a cautionary approach to tipping points, climate feedbacks, and the reversibility of climate impacts so as to avoid shifting the risks of climate change onto future generations. Taking these risks seriously would significantly constrain the use of future carbon removal as a way to compensate for continued emissions, and allow an open discussion on when such strategy might be justified, and when it is not.

In practice, the three equivalences that we have discussed are difficult to keep apart. They do not stand side by side but in numerous ways overlap and intersect with each other, and with the "net" equivalence that McLaren et al. (2019) problematize. Attention to these interrelations highlights that the problems and perverse incentives characterizing the carbon removal conversation run deeper than the conflation of removals and emission reductions alone—acknowledgment of which might help overcome some of the criticisms raised against a proposed undoing of the "net" equivalence (see Smith, 2021). Indeed, our discussion here does not exhaust the full range of concerns pervading the construction of equivalence in climate research and policy (Lohmann, 2011). Other equivalences are worthy of renewed scrutiny as well, including for example the conflation of different greenhouse gas emissions under a single CO_2 equivalent metric (see e.g., MacKenzie, 2009; Cooper, 2015). In this article, we merely sought to illustrate how common approaches to carbon accounting tend to disregard important social, environmental, and geophysical differences—among others—between different sources and sinks of greenhouse gas emissions. This accounting logic serves the interest of simplicity, substitutability, and economic flexibility but introduces important social and environmental concerns that undermine climate justice. It is time to acknowledge that carbon accounting equivalences are political choices fulfilling political functions, with important consequences for climate policy. If researchers and policy makers are serious about incorporating social and environmental justice considerations into their climate mitigation work, then models and accounting frameworks must make explicit, and indeed actively minimize, the risks involved in the creation of multiple equivalences.

Beyond separate targets for emission reductions and removals, we also need differentiated targets and policies that separate land-use from fossil fuel emissions, and that prioritize and incentivize near-term domestic actions, using existing technologies, over distant net-zero targets. This would help to direct wealthy corporations and nations—those mainly responsible for climate change and most capable of mitigating it—toward ambitious emissions reductions and just forms of carbon removal, putting us on a path toward stabilizing the climate.

DATA AVAILABILITY STATEMENT

The original contributions presented in the study are included in the article/supplementary material, further inquiries can be directed to the corresponding author/s.

AUTHOR CONTRIBUTIONS

WC conceived of the article idea and drafted the introduction, the section on temporal equivalence, and the conclusion. JL drafted the section on geographical equivalence. KD drafted the section on carbon equivalence. All authors helped conceptualize the argument and contributed to extensive editing and revising of the text.

FUNDING

WC gratefully acknowledges research funding by the Swedish Research Council FORMAS (dnr. 2019-01953) for his work on carbon removal. Part of the work going into this paper was funded by The Independent Research Fund Denmark (0217-00078B).

Gambling With the Climate: How Risky of a Bet Are Natural Climate Solutions?

William R. L. Anderegg[1]

[1]School of Biological Sciences, University of Utah, Salt Lake City UT, US

This article is a companion to Coffield et al. (2021), https://doi.org/10.1029/2021AV000384.

Key Points:

- Forests may help climate mitigation if they can store carbon for centuries
- Climate-driven disturbances may greatly undermine these aims in California
- Multi-disciplinary and open research is urgently needed to inform policy

There is widespread and growing interest in using forests and, more broadly "natural and working lands," as nature-based climate solutions (NCS) to mitigate human-caused climate change. NCS frequently bring an array of potential co-benefits, including to biodiversity and conservation, and thus make an attractive potential tool to tackle climate change (Griscom et al., 2017). Crucially, to function as climate mitigation, NCS efforts must meet several fundamental criteria including: (a) providing additional carbon storage beyond what would have occurred otherwise, (b) accounting for emissions that shift elsewhere due to NCS activities (termed "leakage"), (c) having a net cooling effect on the climate by integrating the central biophysical and biogeochemical impacts of ecosystem changes, and finally (d) achieving a level of carbon storage "permanence" over long periods of time (typically considered to be 100 years or longer) (Figure 1) (Anderegg et al., 2020; Anderson et al., 2011; Hurteau et al., 2013; Ruseva et al., 2017). If climate change drives losses of carbon storage in forests, that would dramatically undermine the role and potential of NCS in climate goals and policy (Baldocchi & Penuelas, 2019; Anderegg et al., 2020). Thus, cutting-edge science to evaluate the permanence of forest carbon storage in the 21st century is critically important to a wide array of stakeholders from governments to corporations to non-governmental organizations.

The State of California has set an ambitious suite of climate goals that aim to leverage forest-based NCS strategies through several key avenues. Forest carbon offsets are currently widely used as part of the cap-and-trade carbon market and the State's Natural and Working Lands Climate Change Implementation Plan aims to broadly leverage California landscapes to contribute to carbon sequestration goals. In light of these ambitious and rapidly developing efforts, Coffield and colleagues draw upon four complimentary and widely used empirical approaches to quantify and project future carbon storage of California forests across a wide range of climate models and future scenarios (Coffield et al., 2021). This study is incredibly timely, exemplifies science that is important and directly applicable to policy and planning, and provides one of the most thorough and rigorous studies to date examining California's carbon sequestration projections in natural lands.

The two most important findings of the study are that rising temperatures are projected on average to drive declines in forest biomass and carbon storage in California's forests across the 21st century in all emissions scenarios and that the declines are most dramatic in high emissions scenarios. Precipitation strongly regulates projected biomass, but consistent with much other work (e.g., Cayan et al., 2008; Polade et al., 2017), there is large uncertainty of future precipitation changes across climate models at regional scales, including in California. Differences among climate scenarios highlight that NCS efforts are most likely to be potentially useful for climate mitigation if they are paired with aggressive reductions of greenhouse gas emissions from human sources. However, net losses of carbon over the 21st century even in the lower emissions scenario reveal that NCS efforts are a risky gamble that might not actually contribute to climate change mitigation in highly climate-sensitive regions like California.

Two other central findings of Coffield et al. are important to note. First, the climate risks to forest offset projects located in California are remarkably high and substantially underestimated in current versions of voluntary and compliance markets' forest offset protocols (Anderegg et al., 2020). Second, the authors find consistent spatial patterns of vulnerability with higher climate losses of carbon projected at low elevations and in the coastal and northern areas of California's conifer forests. The spatial patterns in climate-driven biomass loss are also consistent with where widespread drought- and insect-driven tree mortality was observed in the 2011–2017 severe drought in California (Goulden & Bales, 2019; Young et al., 2017).

10.1029/2021AV000490

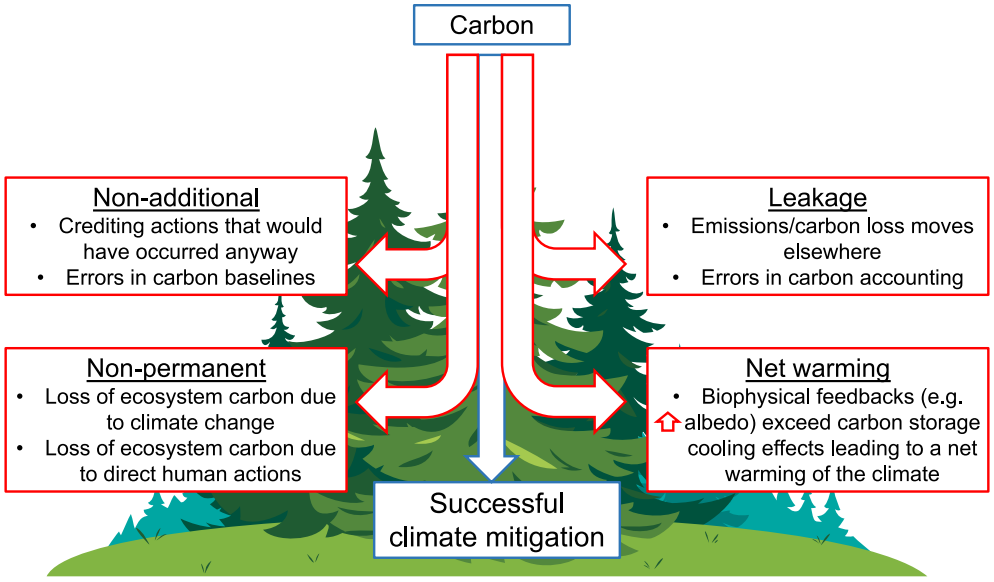

Figure 1. Key requirements for making forest-based natural climate solutions successful for climate mitigation. Prominent examples of potential pitfalls are provided under each category. Improved evidence and science is urgently needed in all of these categories.

Several key uncertainties and limitations in this work provide crucial avenues for future research to inform NCS policies and efforts. First, this study uses an array of empirical or statistical models, which have strengths in the data required, computational demands, and feasibility, but more mechanistic vegetation model simulations are urgently needed as well. Mechanistic vegetation models have the potential to more directly capture important climate-sensitive disturbances, such as fire and drought, and also incorporate other key ecological dynamics such as effects of forest age and demography, land use legacies and management, and the effects of rising atmospheric CO_2 concentrations, which were not directly considered in this study. Mechanistic vegetation models have limitations and large uncertainties as well, such as structural uncertainty in process representation such as wildfires or drought-induced tree mortality (Hantson et al., 2020; Trugman et al., 2021; Venturas et al., 2021), but combinations of both approaches would more fully capture future risk profiles and the uncertainty around them. There are also common, long-standing uncertainties to both empirical and mechanistic approaches, including tree species' migration rates, future precipitation projections from climate models, role of land management in historical biomass patterns and in mediating future changes. Coffield et al. did include a method to examine migration rates and found large uncertainties across different migration scenarios. The study focuses only on forests and shrublands, as well, and thus does not look at potential changes in carbon storage in grasslands (Dass et al., 2018) or human-dominated landscapes.

Finally, NCS efforts broadly represent a clarion call to Earth Scientists and Ecologists where more research is urgently needed. The fundamental and longstanding questions about carbon balance of ecosystems and future climate impacts have an increasingly urgent policy need and audience. The scientific community and funding agencies can and must provide as much guidance as possible about when and where the climate risks are highest, how land management might influence carbon storage potential and risk patterns, co-benefits and trade-offs to different NCS approaches, environmental justice implications of NCS deployment, and whether and where forest-based NCS efforts are a win for both ecosystems and the climate or a risky gamble that could go up in flames.

Conflict of Interest

Review of the San Joaquin Valley Air Pollution Control District Emission Reduction Credit System

June 2020

Enforcement Division
California Air Resources Board

Executive Summary

On January 24th, 2019, the California Air Resources Board (CARB) directed staff to conduct a review of the San Joaquin Valley Air Pollution Control District (SJVAPCD or District) Emission Reduction Credit (ERC) program. This report provides our analysis, results, findings, and recommendations. The goal of this project was to review the SJVAPCD ERC system, including the equivalency determination, and explain it in the context of the broader District program for reducing emissions from stationary sources including New Source Review (NSR), permitting, and regulatory requirements.

CARB staff has shared the findings of its review with the District management and discussed with the District leadership the need to update the Districts ERC program and processes to address the following overarching findings.

- The program needs to be more transparent to the public and industry and more rigorous.
- Implementation procedures and policies need to be upgraded.
- Assumptions in the equivalency demonstration need to be reviewed and revised as needed.

In response to these overarching findings, the District has committed to take the following specific steps.

- Develop a new equivalency tracking database, including associated documentation.
- Conduct a public workshop each year, beginning with the 2020 equivalency demonstration, to present the results of the annual equivalency demonstration prior to taking the report to the District's Governing Board.
- Enhance the annual demonstration report to make the report more understandable beginning with the 2020 equivalency demonstration, including more fully characterizing adjustments made to year-to-year carry-overs to ensure the public can better understand all adjustments effective in a tracking year.
- Convene a public advisory working group consisting of affected stakeholders, including regulated Valley businesses, Valley residents, and federal, state, and local public agencies, to assist in developing solutions related to the District's offset equivalency system, as needed to maintain an effective permitting system that allows for strong economic growth and protection of public health.
- Adjust calculated emission reductions from all affected AG-ICE projects to reflect the appropriate load-factor, and incorporate these adjustments into the 2020 equivalency demonstration. The District will include a discussion of the analysis and adjustments in the 2020 report.

- Analyze the orphan shutdowns projects identified by CARB, and make adjustments, as appropriate, for inclusion in the 2020 equivalency demonstration. The District will include a discussion of the analysis and adjustments in the 2020 report.
- Update the District's policies that pertain to the quantification of emissions reductions from orphan shutdowns, and ensure procedures and associated staff training maintain consistency with District NSR criteria for creditability of emissions reductions.

CARB staff plans to work with the district as it implements the above commitments as well as periodically update its Board on progress.

The SJVAPCD was formed in 1992 by the unification of eight individual county districts. Prior to unification, each county had independent rules and requirements, and made their own permitting decisions. With unification, the District developed a single set of rules and regulations, including those governing its NSR and ERC programs. While new ERCs issued after unification were developed in a consistent manner, older ERCs generated prior to unification needed to be carried over. These ERCs exist today and may be available to offset new emissions. About half of all NOx and VOC ERCs were generated prior to unification.

The District adopted its NSR rule in 1991. The rule established BACT requirements, offset thresholds, and offset requirements that when originally put in place applied to more sources, and applied a much greater level of stringency to those sources than required under federal and state law. The rule also diverged from federal requirements in one important respect: under the District rules, the value of an ERC is calculated when the ERC is issued and retains this value over the life of the ERC. This is referred to as "time of issuance" value, and was supported by CARB at the time.

Federal law requires an ERC to be valued at time-of-use, meaning that if a regulation would have reduced emissions from a source granted an ERC, that ERC must be discounted when used as an offset to reflect emissions after required controls from the regulation. The value of an ERC will always be the same or lower at time-of-use than time of issuance. The federal Clean Air Act allows local NSR programs to differ from federal NSR so long as the local program is at least as stringent as federal NSR. In order to demonstrate that the District's NSR program is at least as stringent as federal NSR, in 1999 U.S. EPA and SJVAPCD entered into an agreement requiring the District to implement an annual federal offset equivalency tracking system. U.S. EPA required this agreement as a condition of approving the District's amended NSR rule for incorporation into the State Implementation Plan.

From the time the tracking system was adopted in August 2001 until present, SJVAPCD has never failed to show equivalency based on its annual demonstration to U.S. EPA. However, in 2010, the San Joaquin Valley's federal non-attainment ozone

classification was bumped up from severe to extreme. As a result, the federal major source and major modification thresholds for ozone precursors dropped to levels that were equivalent to emissions thresholds established in the District's NSR rule. This effectively eliminated the primary advantage SJVAPCD's NSR program had in offset stringency over the federal NSR program for NOx, VOC, and CO. Once the District's offset threshold was no longer lower than the federally required threshold, in most cases more offsets are required for major sources under federal requirements than under District rules.

The current SJVAPCD ERC bank contains nearly 11 million pounds per year of NOx ERCs when valued at time of issuance, more than 80% of which were generated more than 20 years ago. However, over the years, the District's regulatory program has become more stringent, and the District estimated in 2016 that these NOx ERCs, when valued at time-of-use, were worth about 18% of the time of issuance value. This reduction in time of issuance value is directly related to the stringency of the District's regulatory program. In effect, as the District increases the stringency in its regulatory program, it also reduces the time-of-use value in its ERC bank, which makes achieving equivalency more difficult.

To demonstrate equivalency, the District has been increasingly relying on the carry-over of past mitigations and reductions, including past unbanked reductions from orphan shutdowns and electrification projects. These emission reductions are not generated as part of the ERC system, but are used to demonstrate offset equivalency between the District program and federal requirements. Between 2010 and 2018, half of all VOC reductions, and 75% of all NOx reductions included in the District's equivalency demonstrations were provided by orphan shutdowns and electrification projects, with the remaining value provided by ERCs.

CARB's review identifies three areas of findings. First, many of the District's engineering evaluations of ERC and permit applications, and the District's equivalency database system, can both be more transparent, and rigorous. These documents could be improved by including supporting explanation or documentation. Without this information, the public and industry cannot verify or fully review the District's actions. Staff also identified calculation discrepancies in electrification projects and orphan[1] shutdowns used for offset equivalency. These issues could be avoided through stronger review procedures.

Second, the District should make adjustments to how it implements its rule for the timeliness of ERC application submittals, and could be more rigorous in its determination of surplus reductions in individual ERCs. For example, in 15 of the 52 ERC projects reviewed, the District granted ERCs, generated by facility shutdowns, in

[1] Orphan shutdowns are unclaimed emission reductions from a facility surrendering all their operating permits.

which emissions ceased more than 180 days before submission of the ERC application. This is consistent with the District's long-standing policy, CARB staff interpret the District's rule as requiring an ERC application to be submitted within 180 days of the shutdown, and that it defines shutdown as the earlier of the permanent cessation of emissions, or the surrender of the operating permit. In addition, in four of the 52 ERC projects reviewed, CARB determined that it is unclear whether the emission reductions were surplus of every federal, State, or district law, rule, order, permit, or regulation. This benefitted the applicant by providing a greater face value to the ERC. But, as a result, the District had to find additional reductions to cover the non-surplus ERCs.

In the third set of findings, staff identified issues in the District's equivalency demonstration. The District relies on electrification projects, generated through the Agricultural Internal Combustion Engine (AG-ICE) incentive program, to demonstrate NOx equivalency with federal requirements. In calculating and claiming credit for these projects, the District used an incorrect load factor, resulting in an overvaluing of reductions in the equivalency demonstration. While the reductions are real, they were not sufficiently documented to have resulted from a permitting action nor could CARB staff identify documentation showing that they were permanent and enforceable. CARB staff also concluded that potentially half of the credited projects appeared to be funded in part through the Carl Moyer program.

The issues identified in this report are substantial and complex, potentially impacting a wide array of stakeholders in the San Joaquin Valley including residents of the Valley, industries that rely on offsets and ERCs in order to expand or build new business, environmental organizations who advocate for cleaner air, and community groups representing those living near stationary and mobile sources who are impacted the most by emissions at the local level.

The Valley has always faced substantial air quality challenges due to its geography, meteorology, and climate. The SJVAPCD has over 150 rules applicable to specific types of equipment (e.g., turbines, internal combustion engines, boilers), to specific industries (e.g., confined animal facilities, oil production, composting), and to all sources (e.g., nuisance, visible emissions). As technologies have improved, the District has continued to improve the stringency of its regulations. The Valley's stationary source emissions have been reduced because of source-specific regulations and now represent 15% of total NOx emissions in the Valley. Despite these successes, the San Joaquin Valley continues to face major air quality challenges. Air pollution concentrations of ozone and particulate are often above standards, and the District continues to experience some of the worst air quality in the United States. Further improvements in air quality will require both stationary and mobile source emissions to be minimized.

Many of the findings in this report - regarding the issuance of individual ERCs, the time of issuance valuation of ERCs, the use of electrification projects from the AG-ICE program, and others - relate to decisions made decades ago. Since these decisions were made, conditions have changed. Air quality has improved substantially, but ambient air quality standards have increased in stringency. Even though these decisions were made decades ago, they generate implications for air quality today. Consistent with the staff recommendations as well as the District commitments the primary focus of this report is on improvements to the district's ERC program moving forward. This report identifies potential improvements in the District's ERC program, which will help in ensuring an effective permitting program that protects public health and supports economic growth and development, which in turn strengthens the District's overall regulatory program.

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

HEALTHY AIR LIVING™

June 4, 2020

Richard Corey, Executive Officer
California Air Resources Board
P.O. Box 2815
Sacramento, California 95812

Re: California Air Resource Board's Review of San Joaquin Valley Air Pollution Control District Emission Reduction Credit System

Dear Mr. Corey,

The San Joaquin Valley Air Pollution Control District (District) has received the California Air Resources Board's (CARB) report titled *Review of San Joaquin Valley Air Pollution Control District Emission Reduction Credit System.* The District staff would like to thank CARB for the opportunity to review and comment on the recommendations of this review. District staff and CARB have worked cooperatively over the past year-and-a-half during this review to evaluate the District's Emission Reduction Credit (ERC) program and identify opportunities to enhance the District's ERC program moving forward in a manner that will help to ensure an effective permitting program that protects public health and supports economic growth and development in the Valley. Furthermore, the District is committed to working closely and collaboratively with CARB and Valley stakeholders to address the recommendations in the report and implement the District's commitments contained in this letter. Additionally, the District is appreciative of CARB's general recognition of the stringency of the District's air quality control program and of the success in reducing stationary source emissions in the Valley.

Both federal and state law mandate New and Modified Stationary Source Review (NSR) permitting programs that contain offsetting and ERC banking provisions. ERCs are intended by both federal and state law to be only one part of a comprehensive NSR permitting program that has been specifically designed by Congress and the state legislature to allow for industrial growth while tightly regulating any emissions increases. Additionally, any emission increases due to growth are accounted for in State Implementation Plans that demonstrate how the District's overall air quality control program will require sufficient emissions reductions to attain national ambient air quality standards, despite that growth.

While it is mentioned in the report, the District feels that it is important to reiterate that, despite a seemingly common misconception, ERCs cannot be used in lieu of meeting

other air pollution control requirements, such as through market-based systems that other agencies may have in place. Instead, ERCs are required in addition to, and only after, establishing that the new emissions are controlled with the best available control technology (BACT) and will not cause a health risk to surrounding communities. The San Joaquin Valley's NSR permitting program, including the accompanying ERC program, ensures that new emissions are controlled with the best technologies, prevents the permitting of any operation that will cause a significant health impact, demonstrates on a project-by-project basis and in each attainment plan that attainment is not endangered, and has historically been found by the state and federal governments to comply with state and federal laws governing NSR/ERC programs.

Businesses can only generate ERCs by voluntarily reducing emissions to levels below those required by any rule or regulation, and then applying to the District to have those reductions recognized in the form of an ERC banking certificate. Because the District's air quality regulations are among the most stringent requirements in the nation, it is exceedingly difficult and expensive for businesses to reduce emissions beyond rule requirements to generate ERCs. In fact, as more effective controls are developed, they are generally required through regulatory action by the District, limiting the time that new and innovative techniques can be used to generate ERCs. Reductions beyond the level required by those regulations generally involve innovative or untested control techniques, which entail considerable financial risk to develop and implement. The opportunity to bank ERCs for reductions that result from these types of extraordinary and voluntary efforts, and then to be able to sell them on the open market, encourages innovation in emissions control technologies.

The difficulty in the ability to generate and rely on new ERCs for future permitting projects underscores the challenges faced by businesses, especially in extreme ozone non-attainment areas, which even after installing the best available control technology must still provide ERCs to offset emission increases. Without sufficient ERCs, new and modifying businesses and essential public services including, but not limited to, hospitals, waste-water treatment facilities, and composting facilities may not be able to obtain necessary operating permits to serve Valley communities.

While the District and CARB agree on many of the areas identified in the report and on a general path moving forward, there are areas where the District and CARB have differing opinions, especially as it relates to the interpretation and application of certain provisions of District rules and regulations as they pertain to the ERC program. This is not uncommon in a review of this complexity and scale, and the District does not believe that these points of contention undermine the overall cooperative process and ultimate agreement by CARB and the District on a path to move forward relying on the recommendations of CARB and commitments by the District.

In completing this comprehensive review, CARB reached three overarching findings to which the District will respond in turn. The findings as detailed in the report are as follows:

- *The [ERC] program needs to be more transparent to the public and industry and more rigorous.*
- *Implementation procedures and policies need to be upgraded.*
- *Assumptions in the equivalency demonstration need to be reviewed and revised as needed.*

The program needs to be more transparent to the public and industry and more rigorous

Consistent with the District's core values of continuous improvement and open and transparent public processes, the District respects CARB's recommendations which identify opportunities to enhance transparency as it relates to the District's equivalency database system and specific engineering evaluations of ERC and permit applications. It is important, however, to consider these opportunities in the larger context of the existing transparency measures that the District employs in its permitting program.

For years, the District has provided bilingual notice of all significant proposed permitting projects and ERC transactions on our public website. The complete engineering and compliance evaluations are posted with the associated public notice documentation. Furthermore, any interested parties are provided the opportunity to receive, by email, this same set of documents. They can sign up to receive notices for all projects issued by the District, they can sign up to receive notices for all projects in a specific region of the Valley, or they can sign up to receive all notices associated with an individual facility. Through this process, the public receives direct access to the same exact documents that we send to CARB and EPA for their review. All comments received on the District's preliminary analyses are addressed and responded to in writing before finalizing any ERC issuance or permitting project, and all associated documents, including the District's final analysis and final public notice, are also posted to the District website. Similarly, the District's written analyses and preliminary and final public notices of permitting projects that are required to surrender ERCs to obtain a permit are posted to the District's public website for the same review and comment process.

Specific permitting and ERC projects that have been reviewed contemporaneously by CARB, EPA, and the public without comment on the lack of transparency, are now being highlighted when reviewed under this review. While the District believes that CARB's recommendations highlight opportunities to further enhance transparency, we believe it is important to view the recommendations in a larger context so it is clear they should be interpreted through the lens of continuous improvement.

Regarding the District's equivalency database system and annual offset equivalency report, each year the District makes publicly available the equivalency report and accepts comments on the report and its findings up through the public hearing by the District's Governing Board. Additionally, this report is also sent to U.S. EPA and CARB every year. While we believe that the database and report contain the information necessary to demonstrate that the District's ERC system is equivalent to the federal system, we agree that the database system could benefit from modernization and the annual report could be made more consumable to a reviewer that may not possess a comprehensive understanding of complex NSR and offset equivalency concepts.

Implementation procedures and policies need to be upgraded

As recognized in the report, the rules and regulations that implement NSR and ERC banking programs are very complex and require a deep understanding of policy, regulations, and decisions that have been made at the federal, state, and local level over the past 40 years. As a best practice, the District believes that it is prudent to revisit and update, as necessary, policies and procedures that implement District rules and regulations. In the review, CARB questions the District's interpretation of rule provisions relating to the timeliness of ERC applications and the determination of what are considered surplus emission reductions at the time of ERC banking. While the District recognizes the complexity associated with these issues identified in the review, it is important to note that the District has adopted and follows policies and procedures to ensure consistent, fair, and reasonable application of its rules. Furthermore, the areas in question are local requirements of the District's NSR and ERC banking programs, and are beyond any requirements in state or federal law relating to ERCs.

Assumptions in the equivalency demonstration need to be reviewed and revised as needed

Consistent with the District's offset equivalency agreement with the federal EPA and with the provisions of the District's NSR rule, the District utilizes the surplus value of emission reductions across various categories to demonstrate equivalency with federal offsetting requirements on an annual basis. As detailed in the report, there was an inconsistency in the District's methodology for calculating emission reductions from agricultural engine electrification projects associated with the AG-ICE program relative to the Moyer methodology. The District is committed to adjusting the calculated emission reductions from all affected AG-ICE projects to reflect the appropriate emission reductions, and incorporate these adjustments into the 2020 equivalency demonstration.

Another category of emission reductions used in equivalency are those from unbanked facility shutdowns ("orphan shutdowns"). Each orphan shutdown

presents a unique set of circumstances that determines the amount of credit that can be claimed. CARB's review identified some inconsistency in the crediting of emission reductions from certain orphan shutdown projects. The District is committed to analyzing the orphan shutdowns projects identified by CARB, and making adjustments, as appropriate, for inclusion in the 2020 equivalency demonstration. Furthermore, District staff intends to review and update as necessary the policies that pertain to the quantification of emissions reductions from orphan shutdowns.

In response to CARB's overarching findings, the District is committed to taking the following specific steps to enhance the ERC program as needed to maintain an effective permitting system that allows for strong economic growth and protection of public health:

- Develop a new equivalency tracking database, including associated documentation.
- Conduct a public workshop each year, beginning with the 2020 equivalency demonstration, to present the results of the annual equivalency demonstration prior to taking the report to the District's Governing Board.
- Enhance the annual demonstration report to make the report more understandable beginning with the 2020 equivalency demonstration, including more fully characterizing adjustments made to year-to-year carry-overs to ensure the public can better understand all adjustments effective in a tracking year.
- Convene a public advisory working group consisting of affected stakeholders, including regulated Valley businesses, Valley residents, and federal, state, and local public agencies, to assist in developing solutions related to the District's offset equivalency system, as needed to maintain an effective permitting system that allows for strong economic growth and protection of public health.
- Adjust calculated emission reductions from all affected AG-ICE projects to reflect the appropriate load-factor, and incorporate these adjustments into the 2020 equivalency demonstration. The District will include a discussion of the analysis and adjustments in the 2020 report.
- Analyze the orphan shutdowns projects identified by CARB, and make adjustments, as appropriate, for inclusion in the 2020 equivalency demonstration. The District will include a discussion of the analysis and adjustments in the 2020 report.
- Update the District's policies that pertain to the quantification of emissions reductions from orphan shutdowns, and ensure procedures and associated staff training maintain consistency with District NSR criteria for creditability of emissions reductions.

As I stated earlier, the District staff is committed to working closely with CARB and Valley stakeholders to address the recommendations collaboratively to ensure an ERC program that serves our shared goals of public health protection and economic viability in the Valley. Please contact me if you have any questions or wish to discuss any of our comments. I can be reached at 559-230-6036 or via email at samir.sheikh@valleyair.org.

Sincerely,

Samir Sheikh
Executive Director/APCO

List of Acronyms

AG-ICE – Agricultural Internal Combustion Engine incentive program
AIPE – Adjusted Increase in Permitted Emissions
APCO – Air Pollution Control Officer at an Air District
AQMD – Air Quality Management District
ATC – Authority to Construct
BACT – Best Available Control Technology
CAAQS – California Ambient Air Quality Standards
CARB – California Air Resources Board
CARL – Carl Moyer emissions database
CEMS – Continuous Emissions Monitoring System
CNG – Compressed Natural Gas
CO – Carbon Monoxide
DCF – Discounted Cash Flow
DOQ – District Offset Quantity
EACM – Equivalent Annual Cost Method
ERC – Emission Reduction Credit
FCAA – Federal Clean Air Act
FMM – Federal Major Modification
FOQ – Federal Offset Quantity
GHG – Greenhouse Gas
HAP – Hazardous Air Pollutant
HC – Hydrocarbon
hr – Hour
HSC – California Health and Safety Code
lb – Pounds
MMBTU – Million Metric British Thermal Units
MST – Major Source Threshold
NAAQS – National Ambient Air Quality Standard
NMS – New Major Source
NOx – Nitrogen Oxides
NSR – New Source Review
PAS – San Joaquin Valley's Permit Administration System
PG&E – Pacific Gas and Electric Company

PM10 – Particulate Matter 10 microns in size or smaller
PM2.5 – Particulate Matter 2.5 microns in size or smaller
ppm – Parts per Million
ppmv – Parts per Million by Volume
PTE – Potential to Emit
RACT – Reasonably Available Control Technology
SB 288 – Protect California Air Act of 2003, "NSR anti-backsliding"
SCE – Southern California Edison
SIP – State Implementation Plan
SJVAPCD – San Joaquin Valley Air Pollution Control District
SOx – Sulfur Oxides
t/y – tons per year
U.S. EPA – United States Environmental Protection Agency
VOC – Volatile Organic Compound
yr – Year

I. Review Process

CARB conducted this review consistent with State law, including as defined in sections 41500 et seq. of the California Health and Safety Code (HSC). State law defines CARB's important role in reviewing district attainment plans, rules, regulations, and enforcement practices. CARB's role includes programmatic reviews, such as this one, and day-to-day review of individual district actions, such as permits for major sources and major modifications, issuance of ERCs, adoption of rules, and granting of variances.

For the past decade, CARB has reduced its focus on air district stationary source permitting programs due to demands associated with developing, implementing, and enforcing an unprecedented number of mobile source related regulations, many of which focus on reducing emission of diesel particulate matter. As we have implemented these regulations we have also sought to analyze and improve them, including programmatic improvements, regulatory updates, and in some cases new laws to support implementation and enforcement. This iterative approach has generated improvements in both the regulations and implementation. CARB staff is taking a similar approach with stationary sources, re-engaging in district permitting programs and working as a constructive partner with the districts and federal government to ensure existing programs are as successful as possible. In doing so, as evidenced in this review, CARB hopes to provide answers to questions posed by stakeholders and provide assurance that District programs are effective and consistent with underlying regulations.

CARB staff has worked extensively with SJVAPCD staff and executive management to conduct this review. Through data and information requests from CARB, the District provided electronic copies of hundreds of documents related to over 50 ERC projects, 30 Authority to Construct permits, and the federal offset equivalency tracking system. The documents include SJVAPCD and Kern County Air Pollution Control District NSR and banking rules, SJVAPCD policies and guidance documents related to ERC banking, ERC applications and supporting documents related to CARB-selected ERC projects, SJVAPCD engineering evaluations supporting the decision to issue the ERC certificates, and SJVAPCD engineering evaluations and supporting documents related to CARB-selected NSR actions. Information related to Kern County APCD was needed because prior to unification of the San Joaquin Valley Air District in 1991, Kern County had an independent permitting program, which banked a large number of ERCs that were moved over to the unified air district upon unification.

In addition, SJVAPCD provided CARB staff with electronic access to the SJVAPCD Permits Administration System (PAS). PAS is a comprehensive database where all permitting and ERC related actions are recorded and related documents are stored. From PAS, CARB staff retrieved hundreds of documents including permit applications,

engineering evaluations, ERC transaction histories, emission inventories, source test records, and inspection reports related to the original ERC projects under review.

SJVAPCD also provided CARB staff with access to the federal offset equivalency tracking system at District offices. SJVAPCD shared information about the tracking system, access to database files, and tracking system output.

1. *Public Participation*

In November 2018, Earthworks released the report that helped initiate this review -- *Undeserved Credit: Why emissions banking in California's San Joaquin Valley puts air quality at risk*. The Earthworks report made the following findings and conclusions, among others: "a significant proportion of ERCs in the San Joaquin Valley Air Pollution Control District's bank appear to be invalid"; "CARB should audit the San Joaquin Valley Air District ERC system"; "equivalency should be questioned"; and "CARB should not allow ERCs to last forever."

Further, in a January 9, 2019 letter to Mary Nichols, Chairman of the Board, and in testimony at the January 24, 2019 Board Meeting, a coalition of environmental and health advocacy groups representing the Southern San Joaquin Valley requested that CARB "…conduct a thorough review of the Emission Reduction Credit (ERC) banks administered by the San Joaquin Valley Air Pollution Control District…."

CARB staff has considered input from these and other stakeholders in planning and executing this review. CARB staff has also taken steps to ensure this review is an open, public process. Staff held three workshops: in April and September 2019, and in June 2020. During these workshops, staff presented material and solicited comments. These workshops were hosted at the Bakersfield District office, which was linked to the Fresno and Modesto offices by the District's video teleconference system. The workshops were also webcast through CARB's web site, and translation services were made available at all three District office locations.

CARB staff has also had numerous in person meetings and conference calls with stakeholders regarding this project. Staff maintains a website[2] specifically for this project and an email address (valleyERCs@arb.ca.gov) for project questions. The website includes posting of documents related to the current ERC review, past CARB reviews of the District ERC banking program, and ERC banking in general.

2. *Public Stakeholder Concerns*

Stakeholders have identified a number of issues of potential relevance to CARB's review, including the following concerns:

[2]San Joaquin Valley Emission Reduction Credit Program Review, https://ww2.arb.ca.gov/our-work/programs/san-joaquin-valley-emission-reduction-credit-program-review.

- Validity of Older ERCs

Stakeholders have questioned whether certain ERCs were banked in conformance with legal requirements. Some stakeholders believe that the use of older, improperly issued ERCs could result in a large amount of new emissions in the Valley, which could impact local air quality and regional attainment demonstrations. Other stakeholders are concerned the ERCs they hold may be devalued.

- Impacts on Equivalency

Stakeholders have expressed concerns regarding the District's ability to continually identify additional offsets beyond ERCs to account for the difference between time of issuance valuation (as under the District's NSR program) and time-of-use valuation (as under federal NSR) in order to demonstrate equivalency with the federal program. Additional offsets are needed to demonstrate equivalency because the vast majority of ERCs currently in the bank in the San Joaquin Valley appear to have relatively little value at time-of-use. Many times, the value of an ERC has degraded by the time it is used due to more stringent regulations that are adopted or proposed between the time of issuance and time-of-use.

Stakeholders have expressed concern that the use of a large number of older ERCs could result in a failure to demonstrate federal equivalency. At the same time, some stakeholders believe that the use of a large number of older ERCs could result in a large amount of new emissions in the Valley, which could impact local air quality and regional attainment demonstrations.

- No Net-Increase

Under the District program, offsets are required above certain thresholds, but not below those thresholds. Stakeholders have asked whether this maintains the general goal of no-net-increase in emissions from stationary sources.

- Local Air Quality

Under State and federal law, ERCs are a tradeable commodity, and as such allow emissions to increase at one location while decreasing at another location. Some stakeholders have questioned whether emissions trading is appropriate. Further, while districts have rule provisions intended to protect the public from local increases of criteria pollutant and toxics emissions; such as emissions modeling, health risk assessments, and application of BACT; some stakeholders have questioned the effectiveness of these approaches.

- Transparency

NSR programs are quite complicated. While public documents regarding the SJVAPCD NSR program are available upon request, stakeholders have expressed difficulty in accessing relevant information necessary to understand the program. Stakeholders have expressed difficulty in understanding how to formulate and submit

requests for information to meet the District's requirements. This difficulty may be a result of stakeholders not knowing exactly how to specifically identify or describe the information they need to understand the program, or not being able to ascertain the connections and relevance of the provided information in the larger context of the District's NSR program. There appears to be a desire for stakeholders to understand how permitting and NSR works, and the District has indicated it is willing to offer training to stakeholders upon request.

3. Industry Stakeholder Concerns

- Availability of ERCs and Economic Growth

Some stakeholders expressed concern over possible "invalidation" of some ERCs, which could have an effect on ERC availability and pricing. Because ERCs are the currency of offsets, and offsets are often needed in order to modify or build a new emissions source, ERCs are critical to on-going economic development in the San Joaquin Valley.

Additionally, stakeholders have expressed concern with the permitting impacts associated with a failure to demonstrate equivalency. More specifically, concerns have been expressed regarding the unavailability of surplus at time-of-use ERCs required under permitting actions for federal new major sources and major modifications, particularly given the low major source thresholds in the San Joaquin Valley and large number of major sources across all sectors.

II. Part 1: Explaining the Emission Reduction Credit System

A. Overview of Emission Reduction Credits

The federal Clean Air Act establishes requirements for the permitting of stationary sources. Generally, states have the direct responsibility to meet requirements of the federal Clean Air Act and corresponding federal regulations with respect to permitting. California law, however, allows for delegation of permitting activities to the local and regional air districts. All thirty-five California air districts have taken advantage of the opportunity to implement their own permitting program for stationary sources. In California, maintaining a structure of air districts performing permitting with CARB review has been largely successful. Individual air districts are generally well suited to maintain localized regulations, which has led to improved air quality across the State. CARB has central oversight authority to monitor the performance of district programs and to conduct district functions if the district fails to meet certain responsibilities.

In accordance with the federal Clean Air Act, U.S. EPA sets ambient air quality standards for criteria pollutants. A geographic area that does not meet these standards is called a non-attainment area. The San Joaquin Valley is classified as extreme non-attainment for 8-hour ozone and serious non-attainment for PM2.5. Non-attainment areas must develop State Implementation Plans (SIPs) that either include, or commit to adopt, emission control measures to attain and maintain ambient air quality standards. The local air districts develop and implement portions of the SIP that cover stationary sources through rulemaking, permitting, and enforcement.

Generally, any stationary source that emits or has the potential to emit air pollution is subject to local air district permitting requirements. New or modified sources of air pollution must obtain approval from the local air district in the form of an Authority-to-Construct (ATC) permit. Most ATC permit applications are subject to NSR, and in California NSR is implemented at the district level. The federal Clean Air Act, implementing regulations, and State law establish the minimum requirements for non-attainment NSR permitting programs. U.S. EPA allows implementing authorities to tailor their NSR requirements to address local air quality conditions, provided the local NSR program is at least as stringent as federal standards. Generally speaking, NSR programs require sources exceeding a defined emissions threshold to install best available control technology (BACT) and to offset emission increases which occur after the installation of BACT with emissions reductions. These requirements for mitigating emissions reductions are generally referred to as offsets. NSR programs generally require offsets so that there is no net increase in emissions, on a regional basis, of nonattainment pollutants and their precursors.

NSR rules require either past or contemporaneous emission reductions to be used to counter-balance newly permitted emission increases. Emission reductions above and beyond what is required by rules and regulations, and not immediately used to counter balance new emission increases, can be stored in the form of ERCs. ERCs are the currency of offsets, and are a way of "banking" emission reductions for future use, either at the site they were generated or elsewhere within the air basin (or, in limited circumstances, in a downwind air basin).

Due to the emission-offsetting requirement of NSR, both the federal Clean Air Act and State law require non-attainment areas to have an ERC banking system. To qualify for banking as an ERC, an emission reduction must meet the following criteria:

- Real – the reduction must be in actual emissions not potential, allowed or permitted emissions.
- Quantifiable – the reduction must be calculable based on actual verifiable operational data and the best available emission factors and source test data.
- Surplus – the reduction must go beyond what is required by law, regulation, or SIP commitment at the time the ERC was originally banked.
- Permanent and Enforceable – the reduction must be legally and practically enforceable and permanent through permit conditions and limits, or surrender of the operating permit.

These ERC criteria help ensure the integrity of an ERC program. These criteria are also universal to programs across the United States, and provide the framework CARB staff used in the review of SJVAPCD ERC projects and the equivalency demonstration.

B. Demonstrating Equivalency

The offsetting requirements of the District's NSR rule are different from the offsetting requirements under federal NSR. For example, federal NSR requires offsets from major sources but not from minor sources, whereas the District's NSR rule requires offsets from both major and minor sources if the emissions are calculated to exceed specified offset thresholds. The federal Clean Air Act allows local NSR programs to differ from federal NSR so long as the local program is at least as stringent as federal NSR.

An important caveat to bear in mind when interpreting District and federal offset thresholds is that the District and federal calculation methods that determine "when" offsets are required and "how much" offsets are required are different, especially for modified sources. Thus, even where the pollutant thresholds are the same, the same project will produce different offset quantities for the same pollutant when evaluated under District versus federal NSR.

Other differences exist, which, depending on the facts of a given ATC project, may make either federal NSR or SJVAPCD NSR more stringent regarding offset requirements for a particular project (though the local NSR *program* must remain more stringent overall). Among the most significant difference in offsetting requirements is when the "surplus" value of an ERC is determined. SJVACPD values ERCs at the "time of issuance" whereas federal NSR values ERCs at the "time-of-use."

Specifically, under the SJVAPCD NSR rule, the value of an ERC is calculated when the ERC is issued, and the ERC retains that value throughout its life until it is used. In contrast, under the federal NSR rules, the value of an ERC is calculated first when it is created, and again when it is used. In a 1993 memorandum, entitled "Use of Shutdown Credits for Offsets," U.S. EPA stated that this approach is designed to avoid double counting emission reductions in a SIP. Under the federal approach, each ERC must be re-evaluated based on the rules, regulations, and SIP commitments that apply at the time-of-use. Because many years often elapse between when an ERC is created and when it is used, the adoption of progressively stricter emissions standards can cause the surplus value of an ERC to drop significantly.

For example, if a boiler in compliance with all applicable requirements has actual NOx emissions of 30 ppmv and 1.0 ton per year and ceases operation permanently, the operator could apply to bank the resulting NOx emission reductions as an ERC. Following receipt of an application, the air district verifies the reductions are timely, real, surplus, enforceable, permanent, and quantifiable and issues the operator an ERC with a time of issuance or face value of 1.0 tons per year NOx.[3] Suppose 10 years later the owner of this ERC wishes to use it to offset a new permitted emission increase of NOx, and, in the intervening 10 years, the air district has amended its boiler rule to require a NOx standard of 15 ppmv. Under a surplus-at-time-of-use offset system, the portion of the ERC representing a reduction in NOx from 30 to 15 ppmv is no longer surplus, which leaves the portion from 15 to 0 ppmv as the surplus-at-time-of-use value. Thus, the offset value of the ERC is reduced to 0.5 tons per year NOx[4] because half of the NOx emission reductions represented by the ERC are required by the amended boiler rule. However, under a surplus-at-time-of-issuance offset system, the ERC holds it value of 1.0 tons per year in perpetuity even if new rules are subsequently adopted that require stricter emission standards.

---

[3] SJVAPCD would deduct 10% for an air quality improvement deduction (AQID); however, the AQID is omitted in this example for demonstration purposes.

[4] Discount Percentage = [(EF1 – Rule EF) ÷ (EF1 – EF2)] = [(30 – 15) ÷ (15 – 0)] = 0.50
ERC Surplus Value = (Current ERC Value) x (1 – Discount Percentage) = 1 tons per year x (1.0 – 0.50) = 0.5 tons per year
Where: EF1 = Pre-project emission factor used to calculate AER from the original banking action
EF2 = Post project emission factor used to calculate AER from the original banking action
EF Rule = Current emission factor required by a rule or regulation
Source: SJVAPCD Draft Staff Report Annual Offset Equivalency Demonstration (April 19, 2016).

Due to the differences between the federal and District NSR programs, in 1999 U.S. EPA and SJVAPCD entered into an agreement requiring SJVAPCD to implement an annual federal offset equivalency tracking system. U.S. EPA required this agreement as a condition of approving SJVAPCD's amended NSR rule for incorporation into the SIP. The purpose of the equivalency tracking system is to show, on a program-wide basis, that SJVAPCD's NSR rule requires an equal or greater amount of offsets than would be required under the terms of federal NSR. Equivalency is tracked on a pollutant-by-pollutant basis for each of the District's non-attainment pollutants. The District issues an annual offset equivalency report to U.S. EPA. The report is based on the outputs from the District's internal equivalency system.

From the time the tracking system was adopted in August 2001 until present, SJVAPCD has never failed to show equivalency in its annual demonstration report submitted to U.S. EPA. As a result, SJVAPCD has been able to maintain its offsetting system instead of adopting federal offset requirements for new major sources (NMS) and federal major modifications (FMM) to existing major sources. If SJVAPCD were to fail to show equivalency, they would be required, by their existing NSR rule and the agreement with U.S. EPA, to follow federal offsetting standards, including valuing ERCs at time-of-use rather than at time-of-issuance.

C. Role of ERCs under the Federal Clean Air Act

The federal Clean Air Act (FCAA) forms the basis for the national air pollution control effort, including among other elements, national ambient air quality standards for major air pollutants, hazardous air pollutants standards, state attainment plans, stationary source emissions standards and permits, and enforcement provisions. Both the federal government (under the FCAA) and California (under the California Clean Air Act) set air quality standards for clean air. An air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harming public health.

The FCAA requires U.S. EPA to set primary National Ambient Air Quality Standards (NAAQS) to protect public health, and secondary NAAQS to protect plants, forests, crops, and materials from damage due to exposure to six air pollutants that are harmful to public health and to the environment. These pollutants include particulate matter (PM 10 and PM 2.5), ozone (O3), nitrogen oxides (NOx), sulfur oxides (SOx), carbon monoxide (CO), and lead (Pb).

Federal law requires that all states attain the NAAQS. Geographic areas within each state that do not meet a standard are called non-attainment for that air pollutant. The designation of an area as non-attainment is also important because it triggers the regulatory requirements for banking and use of emission reductions credits. The San Joaquin Valley is one of the non-attainment areas in the State. U.S. EPA classified the San Joaquin Valley as extreme non-attainment for ozone and serious non-attainment

for PM2.5. Non-attainment areas must develop plans, called State Implementation Plans (SIPs), to attain the NAAQS. SIPs are comprehensive plans that describe how an area will attain, or maintain, NAAQS.

The SIPs' main purposes are to demonstrate that the State has the basic air quality management program components in place to implement a new or revised NAAQS, to identify the emissions control requirements the State will rely upon to attain and/or maintain the primary and secondary NAAQS, to prevent air quality deterioration for areas that are in attainment with the NAAQS, and to reduce criteria pollutants emitted in nonattainment areas.

The FCAA Amendments of 1970 also authorize California to set its own separate and stricter-than-federal emissions standards to address California's extraordinary circumstances of population, climate, and topography that pose serious air quality challenges. CARB focuses on California's unique air quality challenges by setting the State's own stricter emissions standards for a range of statewide pollution sources including vehicles, fuels, and consumer products.

The FCAA sets deadlines for attainment based on the severity of an area's air pollution problem. Failure of a state to reach attainment of the NAAQS by the target date can trigger a change in attainment status, new planning, and possibly penalties, including withholding of federal highway funds.

State law makes CARB the lead agency for all purposes related to the California SIP. CARB and local air pollution control districts work together in developing clean air plans to demonstrate how and when California will attain, or maintain, air quality standards established under both the FCAA and the California Clean Air Act. Local air pollution control districts, such as the SJVAPCD, develop plans that describe how the districts will reduce emissions to meet air quality standards by the deadlines, and implement control measures in their areas. These controls primarily affect stationary sources, such as manufacturing and goods processing facilities.

As part of the control strategy at the local level, districts regulate stationary emission sources by adopting control strategies such as district permitting rules and prohibitory rules (prohibitory rules are rules that apply to specific types of equipment or industries). The rules achieve emissions reductions by setting limits and by requiring controls, certifications, or work practices that minimize emissions. Many of these rules have been made stricter over time. The permitting process is the vehicle by which the District implements and enforces rule requirements. An operating permit contains clear, enforceable conditions that spell out each of the rule requirements, and includes associated recordkeeping, monitoring, or testing requirements to ensure that it can be demonstrated that the conditions are being adhered to.

D. Permitting – Federal Requirements

There are two layers of permitting for major sources: 1) federal process and standards; and 2) district process and standards. In many cases, the district will perform both reviews if the district has a SIP-approved program or is delegated authority to implement the federal permitting program. If a district is not delegated such authority, then U.S. EPA will perform the federal permitting and the district will perform its own permitting. Many of the terms used in both federal and local permitting are the same or similar, however some are different, so it is important to distinguish between them.

Major sources of emissions are subject to Title V (of the FCAA), which establishes a federal operating permit program designed to standardize air quality permits and the permitting process for major sources of emissions across the country. Title V only applies to "major sources." U.S. EPA defines a major source as a facility that emits, or has the potential to emit (PTE) any criteria pollutant or hazardous air pollutant (HAP) at levels equal to or greater than federal Major Source Thresholds (MST). The MST for criteria pollutants varies depending on the pollutant and attainment status (e.g., marginal or moderate, serious, severe, and extreme) of the geographic area in which the facility is located.

The FCAA[5] requires NMSs and FMMs to existing major sources of criteria pollutants to undergo a preconstruction review and permitting process conforming to federal law and regulations. In nonattainment areas, the process is called federal "non-attainment new source review" ("NNSR" or simply "NSR"). Existing "major sources" must comply with certain minimum emission reduction requirements and obtain a Title V operating permit. Federal new source review and District new source review differ in several ways, as discussed further below.

E. Permitting – Local Requirements

Air districts issue permits and monitor new and modified sources of air pollutants in accordance with national, State, and local emission standards. A primary purpose of permitting is to ensure that emissions from such sources will not interfere with the attainment and maintenance of ambient air quality standards adopted by CARB and U.S. EPA. Permit requirements apply to individual processes and devices at major sources and to individual processes and devices at facilities that fall below major source thresholds. Local air district permitting activity falls into two broad categories. The districts must approve any new or modified source that has the potential to emit air pollution before it is constructed. This is called an ATC permit for the source. Most ATC permit approvals are subject to NSR. Once a district inspects a source and

[5] CAA 172(c)(5).

finds that the source complies with its ATC permit, the district will issue a permit to operate (PTO). The operating permits of major facilities must include federal Title V requirements in addition to local district requirements.

F. New Source Review

New Source Review (NSR) is the title applied to programs regulating the new construction of, and/or modifications to, industrial sources, that have the potential to emit, or will emit, air pollutants. NSR programs establish standards for the construction of new stationary sources and the modification of existing stationary sources such as power plants, refineries, and incinerators. State and federal law mandate requirements for NSR, including offset requirements for new and expanding stationary sources. There are two types of NSR in California: federal and local.

The requirements of NSR must be met before a district will issue an ATC. The minimum requirements of NSR are specified in federal and State laws, but in California NSR is implemented at the local level. The local air districts incorporate the applicable state and federal requirements in their own local NSR rule(s). In addition, the districts may include more stringent requirements in their NSR rule(s). Emissions offsetting and ERCs are required components of NSR in non-attainment areas, such as the San Joaquin Valley.

The California Clean Air Act sets basic requirements for NSR programs in the State. Specific to NSR, each district is to include in its attainment plan, a stationary source control program designed to achieve no net increase in emissions of nonattainment pollutants or their precursors for all new or modified sources that exceed particular emission thresholds.[6]

Each of the 35 districts in California has its own NSR program and issues its own ATCs and PTOs. Each district has adopted its own NSR rules and regulations to comply with state and federal laws. These regulations usually incorporate both the California and federal regulations into one or more rules. Two of the key components of NSR in each of the districts are Best Available Control Technology (BACT) and offsets.

1. Best Available Control Technology

Depending on the type and quantity of emissions of air pollutants that will be emitted from the source and the area designation for that pollutant, the new or modified source may be required to install BACT. In general terms, BACT means an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation, emitted from, or which results from any major emitting facility. The SJVAPCD defines BACT as follows:

[6] HSC 40918 – 40920.5.

> [T]he most stringent emission limitation or control technique of the following:
>
> Achieved in practice for such category and class of source;
>
> Contained in any State Implementation Plan approved by the Environmental Protection Agency for such category and class of source. A specific limitation or control technique shall not apply if the owner of the proposed emissions unit demonstrates to the satisfaction of the APCO that such a limitation or control technique is not presently achievable; or
>
> Contained in an applicable federal New Source Performance Standard; or
>
> Any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found by the APCO to be cost effective and technologically feasible for such class or category of sources or for a specific source.

At a minimum, a specific limitation or control technique must be proposed as BACT if it has been achieved in practice on the same type of equipment, anywhere. Even more stringent emission limitation or control techniques are required, including alternative basic equipment or process or changes of control equipment, if found by the APCO to be technologically feasible for such class or category of sources or for a specific source, and cost effective, even if such a control has never been achieved before.

2. *Offsets*

The California and federal Clean Air Acts each require offsets as an element of air quality attainment plans. State law specifies that each non-attainment area's attainment plan contain a stationary source control program designed to achieve no net increase in emissions of non-attainment pollutants from all new or modified stationary sources. Under California law, a new or modified facility at, or above, a certain threshold must mitigate all emission increases so that the result is no net increase in emissions.

Therefore, new and/or modified sources in California may be required, depending on the type and quantity of pollutants emitted, to mitigate or "offset" the increases in emissions that result from the project, even after installation of BACT. The concept behind offsets is that new and expanding stationary sources of air pollution mitigate, or "offset," new emissions with reductions in air pollution at existing sources. The system is designed to accommodate new emissions so that industrial growth can continue in areas not meeting NAAQS (or CAAQS) while not undermining progress toward achieving clean air mandates.

An offset threshold refers to the level of emissions from a new or modified stationary source above which the source is required to provide offsets to mitigate a new emissions increase. Offset requirements are triggered on a pollutant-by-pollutant basis. For example if the offset threshold for VOC in a given district is 10 tons per year, and a new or modified source is projected to emit 8 tons per year, then the source would not be required to provide offsets to mitigate the 8 ton emission increase. However, if the source is projected to emit 12 tons of VOC, then the source would be required to provide offsets.

Once offsets are triggered, a source must provide ERCs to offset either all or a portion of the permitted emissions. Each district's NSR program differs in whether a source must offset the entire permitted amount of emissions, or only down to the offset threshold. Meaning, in the case described above, where the source is permitted to emit 12 tons of VOC, some districts require the source to offset 12 tons of VOC, where others only require the source to offset 2 tons of VOC down to the 10 ton offset threshold. SJVAPCD requires offsetting down to the offset threshold.

G. The San Joaquin Valley Air Pollution Control District ERC System

This section provides an overview of how the SJVAPCD implements the ERC element of its NSR program.

The history of the SJVAPCD is important for understanding the current ERC program. The SJVAPCD was formed in 1992 by the unification of eight individual county districts. Prior to unification of the District, the eight counties each had independent air quality management programs. Each county had its own set of rules and requirements and thus each county made its own permitting decisions. While each county was subject to essentially the same State and federal requirements pertaining to air quality, there were differences in the way counties made permitting and ERC approval decisions.

The unification of these county programs through the formation of the SJVAPCD created a consistent air quality program Valley-wide. Prior to unification, some counties, such as Kern, had fully developed rules for granting ERCs while other counties had more informal procedures for recognizing ERCs. While permits issued under the new unified District were consistent, it was recognized that the ERCs generated by the individual counties before unification needed to be carried over to the unified District. The SJVAPCD NSR and ERC rules facilitated this by creating procedures and timelines for recognizing and carrying over ERCs created in the individual counties. Thus old ERCs generated by county air districts prior to unification became unified District recognized ERCs. These ERCs still exist today, comprise roughly half of available NOx and VOC ERCs, and may be available to offset new emissions.

Following unification, the District established its own requirements for ERC banking, as further detailed below.

1. The SJVAPCD New Source Review Program

The SJVAPCD operates its NSR program to meet federal and State legal requirements. Elements of the program have been approved by CARB and U.S. EPA through the SIP approval process.

Rule 2201 is the District's NSR rule. First adopted in 1991, the District has updated and amended the rule sixteen times, most recently in August 2019. The rule establishes BACT requirements, offset thresholds, and offset requirements. Key elements of the rule include:

- BACT Requirements

BACT requirements are triggered on a pollutant-by-pollutant basis and on an emissions unit-by-emissions unit basis. Under Rule 2201, a BACT analysis is required (unless exempted) on (a) any new emissions unit or relocation from one Stationary Source to another of an existing emissions unit with a Potential to Emit exceeding 2.0 pounds in any one day; (b) modifications to an existing emissions unit with a valid Permit to Operate resulting in an Adjusted Increase in Permitted Emissions (AIPE) exceeding 2.0 pounds in any one day; and (c) any new or modified emissions unit, in a stationary source project, which results in an SB 288 Major Modification[7] or a FMM.

- Emissions Offset Threshold

Offset requirements are triggered on a pollutant-by-pollutant basis. Unless exempted, offsets are required if the post-project Stationary Source Potential to Emit (SSPE2) equals or exceeds the following offset threshold levels: VOC and NOx – 20,000 pounds per year; CO – 200,000 pounds per year; SOx – 54,750 pounds per year; PM10 – 29,200 pounds per year. SJVAPCD requires offsets down to the offset threshold.

- Offset Ratios

Rule 2201 establishes distance offsets designed to require additional offsets where the original location of emissions offsets is 15 miles or more away from the source under review. For NMSs and FMMs involving VOC or NOx, and for sources more than 15 miles away from the offset source, the ratio is 1.5. This means that every 1 pound of emissions increase must be offset by 1.5 pounds of emission decrease.

[7] The SB 288 Major Modification calculation procedure is included in Rule 2201 to comply with the requirements of California SB288 which prohibited air district's from relaxing requirements for Federal new source review (as they existed on 12/19/02) as a result of Federal NSR reform.

- Air Quality Improvement Deduction Requirements

New ERCs are discounted by 10% prior to banking, which is called an air quality improvement deduction. For example, if an emission reduction of 10 TPY qualifies for ERCs, then a certificate would be issued to the applicant for 9 TPY, and 1 TPY would be permanently retired by the District. This requirement is designed to help ensure that the implementation of the ERC program results in an overall air quality benefit within the boundaries of the air district.

- Calculation Requirements

Rule 2201 defines calculation methods for applying the NSR rule, including for baseline periods, daily emissions limits, historical actual emissions, and potential to emit. These definitions and requirements apply to both permit engineering review calculations, and to the equivalency demonstration. There are several important calculation differences between the SJVAPCD's rule and the federal program.

The most important distinction for purposes of this review concerns whether ERCs are discounted when they are used. Under federal NSR rules, the value of an ERC is discounted at the time-of-use. Under this approach, each ERC must be re-evaluated based on the rules, regulations, and SIP commitments that apply at the time-of-use. Because many years often elapse between when an ERC is created and when it is used, the adoption of progressively stricter emissions standards can cause the surplus value of an ERC to drop significantly.

Under the SJVAPCD rules, the value of an ERC is calculated when the ERC is issued, and the ERC retains this value for the life of the ERC. This is referred to as "time-of-issuance" value. This means the District grants ERCs based on the "surplus" (in excess of any rules, requirements or plans on the books) value at the time of banking. If at some point in the future a rule is adopted that would have reduced emissions from the banked source, the rule has no effect on the ERC. CARB supported this approach at the time it was originally adopted. In a 1993 letter to U.S. EPA, CARB expressed its view that this approach created incentives for companies to produce and use ERCs, "no company exercising good business judgment would ever purchase ERCs which could become worthless within an unforeseeable future time. This would also tend to discourage modernization, since a valuable ERC would be rendered useless on the open market."

A second calculation difference between SJVAPCD NSR and federal NSR is how an emissions increase is calculated to determine the offset quantity for FMMs. For modified sources that qualify as "clean emissions units,"[8] the emissions increase under SJVAPCD NSR is calculated as the difference between the pre-project PTE and the post-project PTE, i.e. a potential-to-potential basis (for all sources). In contrast, under

[8] Clean emissions units are emissions units equipped with emissions controls 95% efficient or meeting achieved-in-practice Best Available Control Technology requirements in the previous 5 years.

federal NSR (for new major sources and federal major modifications), the emission increase is calculated as the difference between the pre-project actual emissions and the post-project PTE, i.e. an actual-to-potential basis. An actual-to-potential basis (as under federal NSR) will always produce an emissions increase that is equal to or greater than an emission increase determined on a potential-to-potential basis (as under SJVAPCD NSR). Thus, the actual-to-potential calculation is more stringent. Districts differ in terms of the emissions increase calculation for their particular NSR rule. Some, including SJVAPCD, use a potential to potential calculation, while others use an actual to potential calculation, which results in a larger number of offsets required.

Due to the differences between the federal and District NSR programs, in 1999 U.S. EPA and SJVAPCD entered into an agreement requiring SJVAPCD to implement an annual federal offset equivalency tracking system. U.S. EPA required this agreement as a condition of approving SJVAPCD's amended NSR rule for incorporation into the SIP. The purpose of the tracking system is to show, on a program-wide basis, that SJVAPCD's NSR rule requires an equal or greater amount of offsets than would be required under the terms of federal NSR. This is the "equivalency determination" that a major section of this review discusses below.

The District's NSR Rule contains language that describes how the district would modify its program if it were to fail to show equivalency. From the time the tracking system was adopted in August 2001 until present, SJVAPCD has never failed to show equivalency based on its annual demonstration to U.S. EPA. As a result, SJVAPCD has been able to maintain its offsetting system instead of adopting federal offset requirements for NMSs and FMMs to existing major sources. If SJVAPCD were to fail to show equivalency, they would be required, by their existing NSR rule and the agreement with U.S. EPA, to follow federal offsetting standards.

2. The SJVAPCD ERC Bank

The District publishes on its website[9] a daily summary of the available (or currently valid) ERCs. Table 1 provides an example of the daily summary from August 1, 2019. The summary reports the ERCs by the region in which the ERCs were banked, however an ERC from one region may be used (retired) to mitigate emission increases in any other region. In 2016, the District estimated[10] that approximately 18% of its NOx ERCs were surplus as of that the time, if evaluated and discounted under a "surplus-at-time-of use" assumption.

Table 1. Available Annual ERCs in the San Joaquin Valley by Region (August 2019)

Pollutant (lbs/yr)	Northern Region	Central Region	Southern Region	Total District
VOC	748,373	589,690	8,847,980	10,186,043
NOx	2,005,863	740,185	8,242,410	10,988,458
CO	1,691,911	1,011,453	51,328,838	54,032,202
PM10	739,839	980,277	962,531	2,681,897
SOx	1,654,602	664,580	3,914,109	6,233,291
Acetone	71,826	2,695	None	74,521
Ethane	None	14,134	1,879,617	1,893,751
Hydrogen Sulfide	None	107	45,005	45,112
PM2.5	None	None	3,218	3,218
Sulfate Particulate	None	None	191,193	191,193
-	-	-	-	-
CO2E (MMT/yr)	2,444	259,575	636,315	636,315

Figures 1 and 2 below show the percentage of available VOC and NOx ERCs in the bank according to the age (grouped by decade) of the emission reductions that created them. The charts show that the majority of VOC (89%) and NOx (85%) ERCs remaining in the bank unused are based on emission reductions that occurred more than 20 years ago.[11]

[11] Note that the ERC totals (lb/yr) for VOC and NOx in the charts below will not equal the VOC and NOx totals in Table 1 above because the charts only represent banking actions through 2018, whereas Table 1 is current as of August 1, 2019.

Figure 1. Age of VOC ERCs Available in the SJVAPCD Bank

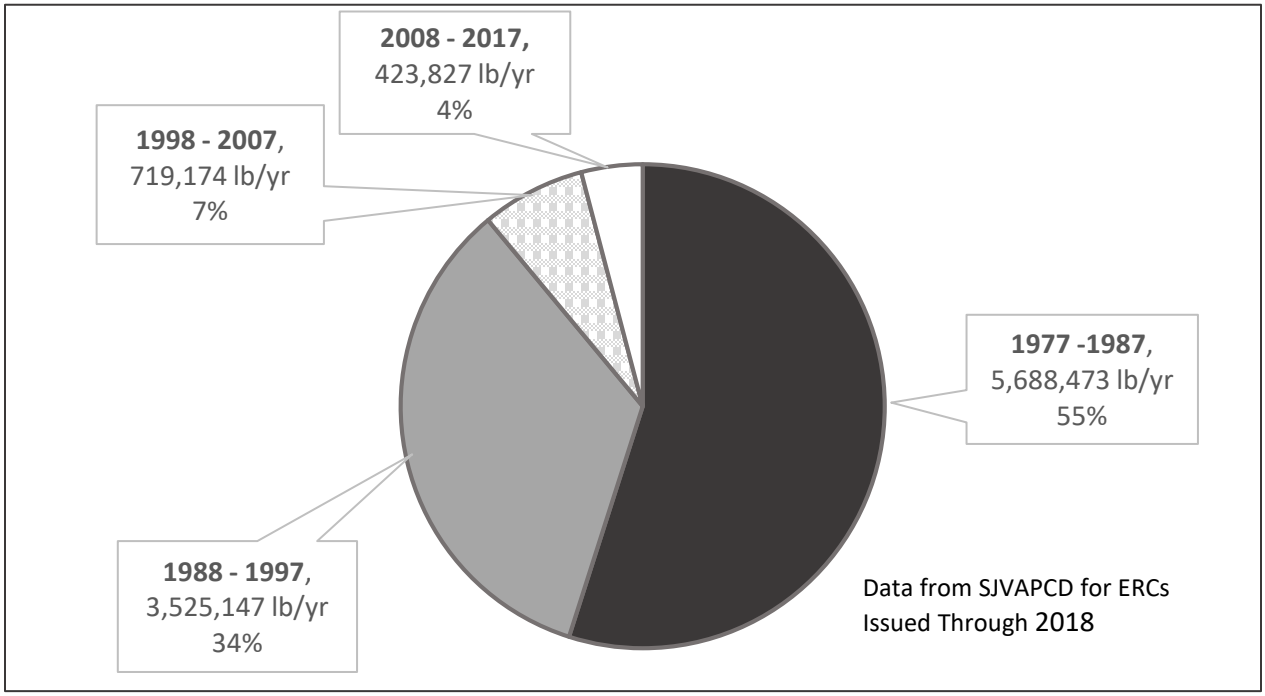

Figure 2. Age of NOx ERCs Available in the SJVAPCD Bank

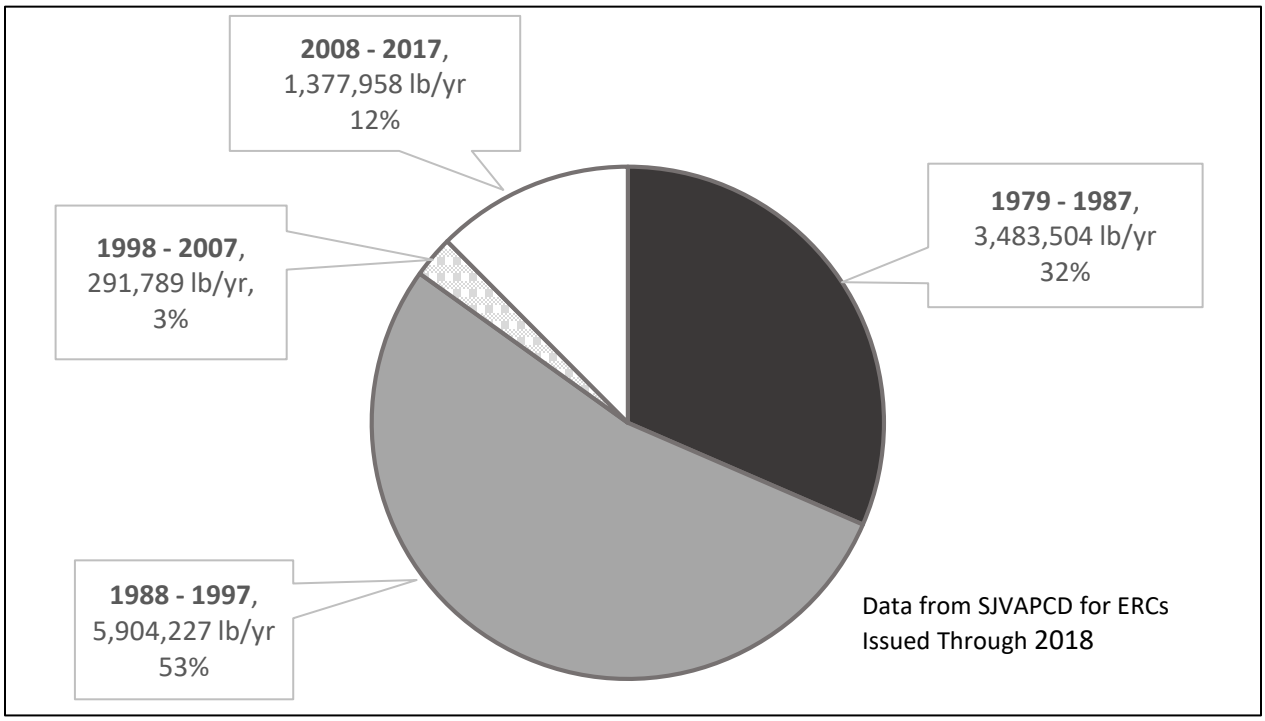

3. Demonstrating Equivalency

When originally established, the District's NSR program required more offsets than the federal NSR program, primarily because District emissions offset thresholds and offset ratios were more stringent compared to federal NSR. However, in 2010, the San Joaquin Valley's federal non-attainment ozone classification was bumped up from severe to extreme. As a result, the federal major source and major modification thresholds for ozone precursors dropped to levels that eliminated the primary advantage SJVAPCD's NSR program had in offset stringency over the federal NSR program for NOx, VOC, and CO.

Since the reclassification to extreme non-attainment for ozone in 2010, SJVAPCD's tracking system frequently relies on the carry-over of past mitigations and reductions. To demonstrate equivalency for NOx and VOC the District has relied heavily on past, unbanked reductions from orphan shutdowns and electrification projects (i.e., reductions not used for ATC projects). For example, between 2010 and 2018, half of all VOC reductions, and 75% of all NOx reductions included in the District's equivalency demonstrations were provided by orphan shutdowns and electrification projects, with the remaining value provided by ERCs.

Figures 3 and 4 below display the emissions reductions claimed by source type by the District to demonstrate federal offset equivalency between 2010 and 2018. For NOx, electrification projects comprised the majority of offsets used to demonstrate equivalency, and for VOC both ERCs and orphan shutdowns were used to demonstrate equivalency.

Part 3 of this report provides further discussion and analysis of the District's equivalency program.

Figure 3. Surplus at Time-of-use Equivalency: NOx Mitigation by Source

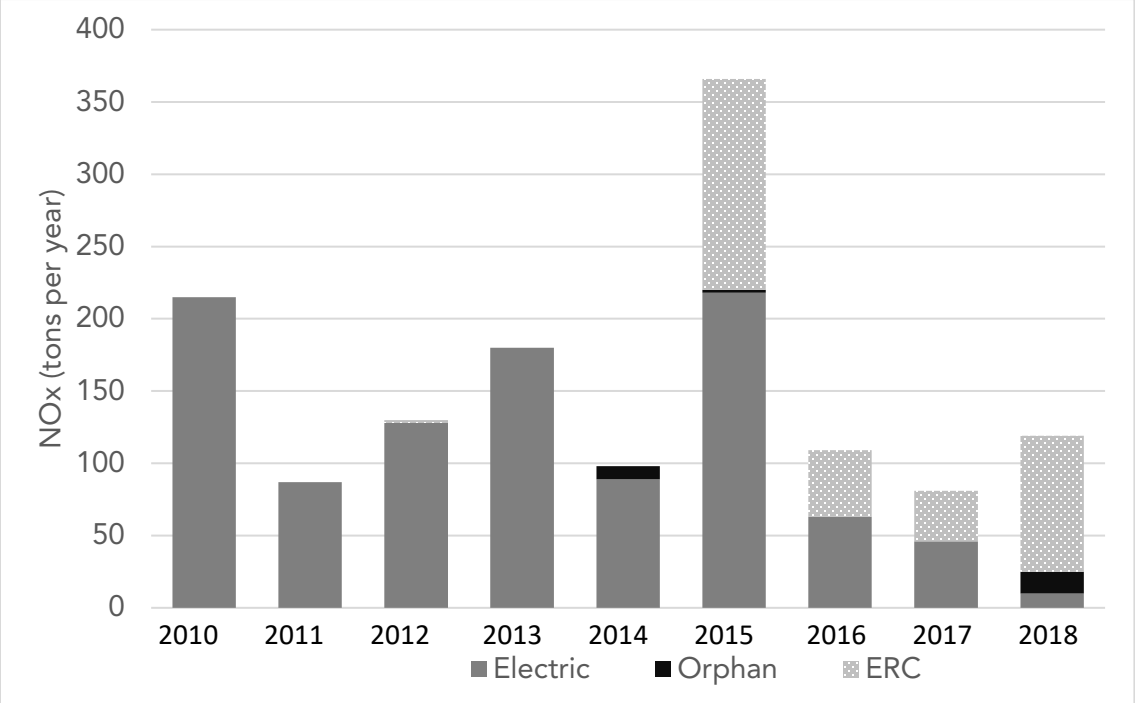

Figure 4. Surplus at Time-of-use Equivalency: VOC Mitigation by Source

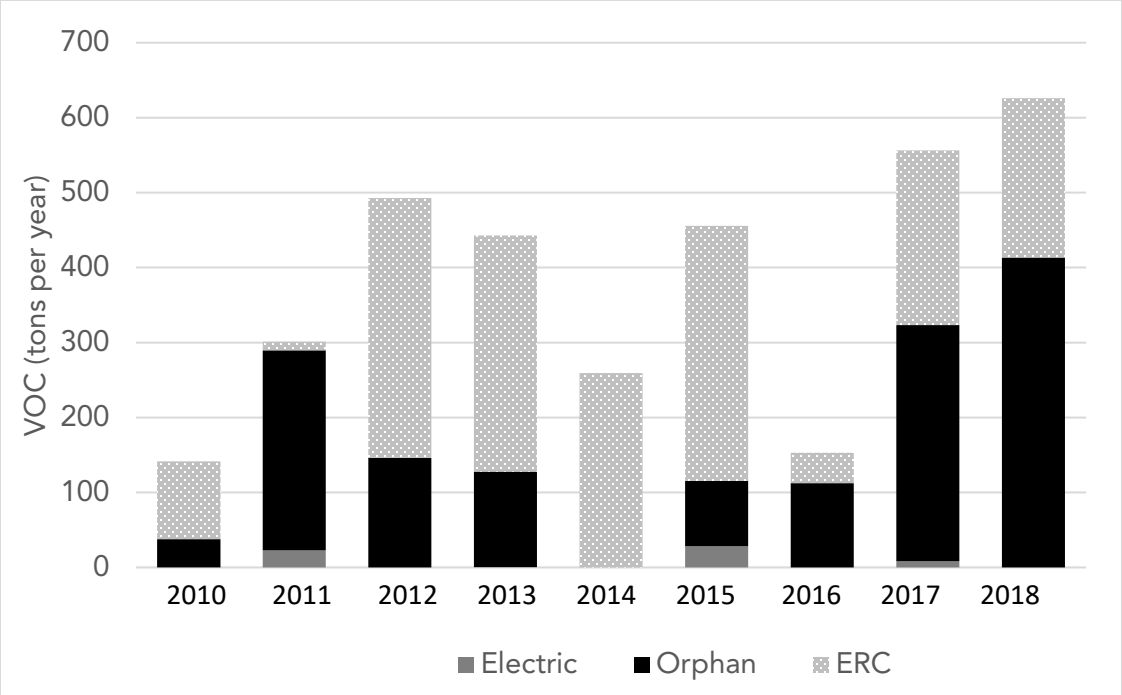

H. Summary of Findings for Part 1

The current SJVAPCD ERC bank contains nearly 11 million pounds per year of NOx ERCs when valued at time-of-issuance, more than 80% of which were generated more than 20 years ago. However, over the years, the District's regulatory program has become more stringent, and the District estimated in 2016 that these NOx ERCs, when valued at time-of-use, were worth about 18% of the time-of-issuance value.[12] This reduction in time-of-issuance value is directly related to the stringency of the District's regulatory program. In effect, as the District increases the stringency in its regulatory program, it also reduces the time-of-use value in its ERC bank, which makes achieving equivalency more difficult. By way of example, when a business uses a 100 TPY ERC to offset a 100 TPY emissions increase, the business gets full use of the 100 TYP face value of the ERC. However, when the District accounts for the use of the same 100 TPY ERC in the context of the equivalency determination, its surplus-at-time-of-use value may be much less. In the case of NOx, on average, the 100 TPY NOx ERC would only be able to "offset" 18 TPY in the equivalency determination calculation.

At the same time, the District's NSR program, once significantly more stringent than federal requirements no longer is for NOx and VOC because of the District's reclassification to extreme non-attainment status for ozone in 2010. Prior to reclassification, the District's offsets thresholds for major sources were below the federal offset threshold and therefore the District required a greater use of offsets to mitigate emissions increases than what was federally required. However, upon reclassification, the District's offset threshold was no longer lower than the federally required threshold, which created a situation in which more offsets are generally required for major sources under federal requirements than under district rules. This change has been exacerbated by the fact that there generally are not sufficient reductions from the application of the NSR ERC program to offset the difference between time-of-issuance and time-of-use value of ERCs. The District uses orphan shutdowns and electrification projects to provide additional emissions reductions that are needed to demonstrate equivalency because the remaining portions of the program do not appear to provide sufficient additional offsets. These emission reductions are not generated as part of the ERC system, but are used to demonstrate offset equivalency between the District program and federal requirements. On the other hand, the District has not to date incorporated other eligible and more stringent requirements of their NSR rule into the offset equivalency demonstration, such as the application of BACT requirements to minor sources which is beyond federal requirements.

[12] SJVAPCD Draft Staff Report for Annual Offset Equivalency Determination, April 19, 2016, page 6

III. Part 2: Evaluating ERC Projects

This section discusses Part 2 of the review, in which staff evaluated 52 individual ERC projects, which represents 201 individual ERC banking certificates.[13] Staff's evaluation focused on whether the projects conformed to District rules, as well as federal and State requirements. Staff focused particularly on timeliness of applications; baseline determinations and calculations; and the evaluation criteria (real, quantifiable, surplus, permanent, and enforceable). In addition, staff reviewed emission calculations and engineering evaluations for accuracy and completeness of information. Because the Earthworks Report identified potential issues with specific ERCs, CARB staff included in this review all of the ERCs discussed in the Earthworks Report. To ensure the sample of ERCs in this review provides an adequate representation of the entire ERC program, CARB selected additional ERCs for evaluation using a random selection and representing the following criteria:

- A variety of locations, including varied regions of SJVAPCD;
- A variety of industries;
- A range of magnitude of emissions banked; and
- A range of dates in which the project took place.

To select ERCs for review, staff first identified the full population of projects and ERCs. Staff identified 1,358 projects and 2,101 ERC certificates listed in the District's ERC bank. From this population, staff selected 52 ERC projects representing 201 individual single pollutant ERC certificates, including those addressed in the Earthworks Report and additional projects chosen by CARB staff to provide a representative overview of the program.

Table 2 below lists the ERC project codes associated with the 52 ERC projects selected for review. District staff assign ERC project codes when an ERC application is submitted. The first letter of the project code indicates which region the reduction originated in (N for northern, C for central, and S for southern). The remaining numbers uniquely identify each project. Each ERC project code represents between one and five actual ERC certificates because a unique ERC certificate is issued for each pollutant banked, even if they result from the same project. For each of these projects, staff requested the contents of the project file from the District, and reviewed information available in the District's permitting database, PAS. Key publicly available information which staff used to review these projects can be found on CARB's website at the following address: https://ww2.arb.ca.gov/our-work/programs/san-joaquin-valley-emission-reduction-credit-program-review

[13] An ERC banking action, or "project", can involve a banking of multiple pollutants, and an individual ERC certificate is issued for each pollutant banked in an action or project.

A. Findings

In reviewing the 52 ERC projects, staff identified four areas in which the District's program requires improvement:

1. Transparency
2. Timeliness of Application and Selection of Baseline Periods
3. Real and Permanent Reductions
4. Surplus Reductions

This section provides an overview of each of these areas of concern, with reference to the affected ERC projects.

1. Transparency

In about half of (27 of 52) ERC projects reviewed, the District's project files lacked sufficient supporting documentation that would be necessary to replicate or verify the information used in the District evaluation or provided in the facility application. The ERC projects were missing information such as emissions inventory submittals, choice of baseline period, Continuous Emission Monitoring (CEMS) data, source test data, and other information. The following ERCs lacked sufficient documentation: C-920318, C-920255, C-1010009, C-1032163, C-1130364, C-1162737, C-1172943, C-1173456, N-930450, N-950107, N-950288, N-960487, N-980337, N-1062909, N-1131840, S-851028, S-870731, S-910276, S-920024, S-1020209, S-1075362, S-1113860, S-1122749, S-1122845, S-1123816, S-1141060, and S-1144501.

The ERC process should ensure that the ERC file is complete and transparent, such that a reviewer, or member of the public, can readily replicate the decision made. Three examples of transparency issues found during the review are illustrative of ERCs with similar issues.

- S-1144501: The proposed reduction resulted from shutdown of two floating roof crude oil production tanks. The referenced ERC was issued in 2017. The District's files provide no discussion of the reason the District chose an alternative baseline period for the facility, rather than the two years immediately preceding the date of

application. There is no detail of the quarterly average production data calculations, and using the raw data, the District values cannot be duplicated. In addition, the District relied on the permit surrender date for justification of application timeliness, yet the letter from the applicant surrendering permits is not included in the District's files.

- N-960487: The proposed reduction resulted from the shutdown of a sugar manufacturing facility. The throughput and fuel usage were supplied by a consultant on behalf of the applicant, without any supporting documentation or records. The file did not include any emission inventory submittals, nor any evidence that the District verified the information in the application.
- N-1062909: The proposed reduction resulted from the shutdown of a steel storage system manufacturing facility. The District sent several letters requesting more information from the applicant regarding amount of paint used and VOC contents of paints, but the file contains no resolution of the requests. The project files do not contain final issuance letters. The District took over four years to determine the application was complete, but the file contains no explanation for this delay.

2. Timeliness of Application and Selection of Baseline Period

District's banking rule (Rule 2301) governs the timeline for applications for ERC banking. CARB staff interprets the rule as being clear that the application must be submitted within 180 days of when emission reductions occurred. To interpret Rule 2301, District follows Policy APR 1805 (4/9/1992)[19]. CARB staff believes that Rule 2301 and APR 1805 are inconsistent. The District maintains that the rule and policy are consistent but has committed to making adjustments to reduce the likelihood of future actual or perceived inconsistencies.

In the San Joaquin Valley, most ERCs are generated from the shutdown of a facility or process. In 15 of the 52 projects reviewed, the District granted ERCs for reductions generated by a facility shutdown that occurred more than 180 days before submission of the ERC application following Policy APR 1805. The 15 affected ERC projects are: S-1075362, C1010009, C-950579, C-970158, C-1032163, C-1063777, C-1130364, C-1162473, C-1172943, C-1173456, S-430424, N-1001257, S-870731, S-1080067, S-1122845. For many of these ERCs, the District also selected baseline periods reflecting operation of the facility even though the facility had not operated within 180 days of, and sometimes in years prior to, the ERC application.

District Rule 2301, Sections 4.2 and 4.2.3 states:

[19] https://www.valleyair.org/policies_per/Policies/APR%201805.pdf

4.2 Affected Pollutant Emissions Reductions Occurring After September 19, 1991

For emission reductions occurring after September 19, 1991, the following criteria must be met in order to deem such reductions eligible for banking: …

4.2.3 An application for ERC has been filed no later than 180 days after the emission reductions occurred.

The District does not define the date "emission reductions occurred," however, it is the District's position that the date the "emission reductions occurred" for facilities which are shutting down and applying for ERCs is the date of the "shutdown." The District defines "shutdown" in their regulations, although the term is not used in the timeliness language. Specifically, District regulations define shutdown as *the earlier* of the permanent cessation of emissions from an emitting unit or the surrender of that unit's operating permit. Rule 2301, Section 3.14, defines "shutdown" as:

Shutdown: shall mean either the earlier of the permanent cessation of emissions from an emitting unit or the surrender of that unit's operating permit. If, prior to the surrender of the operating permit, the APCO determines that:

the unit has been removed or fallen into inoperable and unmaintained condition such that startup would require an investment exceeding 50% of the current replacement cost; and

the owner cannot demonstrate to the satisfaction of the APCO that the owner intended to operate again, then the APCO may cancel the permit and deem the source shutdown as of the date of last emissions. Evidence of an intent to operate again may include valid production contracts, orders, other agreements, or any economically based reasons which would require the operation of the emitting unit after initial cessation of emissions.

District Policy APR 1805, Definition of a Shutdown defines shutdown as follows:

For permitted sources, the date of the shutdown shall be the date of the surrender of the operating permit, unless the Control Officer determines that: a) the unit has been removed or has fallen into an inoperable and unmaintained condition such that start-up would require an investment exceeding 50% of the current replacement cost; and, b) the owner cannot demonstrate to the satisfaction of the Control Officer that the owner intended to operate again. Evidence of "intent to operate again" may include valid production contracts, orders, other agreements, or any

economically based reasons which would require the operation of the emissions unit.

Should the Control Officer make determinations a) and b), the date of the shutdown shall be the date of the last emissions from the emissions unit.

District Policy APR 1805 further states "*We further recommend that the definition be changed, by rule amendment, at the first opportunity. The wording of the attached interpretation may be appropriate for such an amendment.*"

By following Policy APR 1805 in reviewing the timeliness of ERC projects, the District is accepting ERC applications submitted more than 180 days after the date emission reductions occurred, which CARB staff interprets as in conflict with the District's Rule. The acceptance of applications more than 180 days after cessation of emissions impacts the selection of the baseline period. District Rule 2201, Section 3.9, defines the baseline period as: "the two consecutive years of operation immediately prior to the submission date of the Complete Application" or "[a]t least two consecutive years within the five years immediately prior to the submission of the complete application if it is determined by the APCO as more representative of normal source operation."[20] In 14 of the 15 ERCs identified as being issued more than 180 days since cessation of emissions, the District defined a baseline period consisting of two years that were not immediately prior to the submission of the application.

While the District's reliance on District Policy APR 1805 with respect to application timeliness appears to have been consistent since 1992, CARB staff concludes that the policy and the rule are not aligned and should be modified accordingly. When coupled with the District's selection of baseline periods, the application of the policy has led to the issuance of ERCs for facility shutdowns that occurred more than 180 days prior to application, with credit for normal levels of activity prior to shutdown. The district has committed to a process to align the policy and the rule.

3. Source Shifting Considerations

In 10 projects (6 criteria pollutant and 4 GHG) of 52 ERC projects reviewed the reductions may not have been real and permanent as the pollution activity and emissions may have shifted to a different facility.[21]

In ERC projects for criteria pollutants, the District may consider the potential for the emissions reductions proposed for banking being shifted to another nearby source or

[20] Different baseline periods apply to sources that have been in operation for less than two years in total. These periods do not apply to the projects staff reviewed.

[21] CARB includes this review of GHG issues in part because non-profit groups raised concerns on this program as well. CARB recognizes that the GHG program is not directly linked to NOx offsets for ozone attainment, but GHG reductions, too, should be properly handled, given the significant public health implications of GHG emissions.

source within the air basin. This "source shifting" consideration is expressed implicitly in Rule 2301, Section 4.4.1 which bans certain source categories such as gasoline stations from banking emission reductions. The rationale for this exclusion is that the shutdown of a gasoline station will not result in any permanent or real emission reductions because the demand for gasoline will remain the same and the activity of refueling will be shifted to another nearby gasoline station. Thus, the air basin will see the same emissions as before the shutdown.

Where an emissions reduction creates a potential for source shifting, it is best practice for the ERC application to address this issue specifically by conducting an analysis to demonstrate source shifting is not occurring or that it is being compensated for in the amount of ERC being issued.

Staff observed that the issue of source-shifting was not explained adequately in some criteria pollutant banking actions where it could be an issue, in particular, in the banking of emissions from cotton gins in projects C-1032163, C-1040561, C-1063777, C-1162473, C-1171943, and C-1173456. While the District explained that cotton production was declining as an industry within the San Joaquin Valley, which CARB staff concurs, the District did not explain how this ensured that the production from one cotton gin shutting down was not being shifted to another nearby gin. In some cases, there was another nearby gin within a few miles. The District could improve its assessments by addressing source shifting more explicitly and comprehensively in its review of ERC applications.

The District considered the issue of source shifting when amending Rule 2301 to allow banking of GHG reductions. In presenting the Rule change, District staff noted certain reductions would be ineligible for banking –including shutdowns where "global demand for product/service does not decrease, product/service will be produced elsewhere (and result in GHG emissions)."[22] While this language was not directly incorporated into the Rule, the stated interpretation is consistent with the requirement that reductions be real and permanent.

Because the effects of GHGs are global, some account of global demand and therefore source shifting, on a global basis, is appropriate to ensure reductions are real and permanent. However, in the analysis of GHG banking projects (S-1122749, S-1123816, S-1122845, and C-1130364) for the shutdown of oil and gas production equipment (pre-Cap and Trade), the District did not apply this global level of scrutiny. The District assumed the GHG reductions would be real and permanent based on documentation of declining oil and gas production in California. However, a global boundary and demonstration of source shifting would have been more appropriate to

[22] http://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2012/January/Item11-Rule2301011912presentation.pdf

show the reductions are real and permanent given that oil and gas are global commodities not on a downward trend, many producers are global, and the effects of GHGs are global.

Ultimately, the impact of these GHG ERCs is not clear, as there is no currently authorized use in an NSR context consistent with District rules or in the context of GHG Cap and Trade programs. To CARB's knowledge, none of these GHG ERCs have been used.

4. Surplus Reductions

In four of the 52 ERC applications reviewed (S-1075362; S-981134; S-851028; and C-1010009), it is unclear whether a portion of the reductions issued an ERC were not surplus. These issues are particularly complicated – influenced by federal, state, and local requirements.

For purposes of ERC banking, State law requires:[23]

> *(a) Every district board shall establish by regulation a system by which all reductions in the emission of air contaminants that are to be used to offset certain future increases in the emission of air contaminants shall be banked prior to use to offset future increases in emissions. The system shall provide that only those reductions in the emission of air contaminants that are not otherwise required by any federal, state, or district law, rule, order, permit, or regulation shall be registered, certified, or otherwise approved by the district air pollution control officer before they may be banked and used to offset future increases in the emission of air contaminants.*

Federal law requires:[24]

> *(c) Offsets (2) Emission reductions otherwise required by this chapter shall not be creditable as emissions reductions for purposes of any such offset requirement*

District rules require:[25]

> *3.2.2 To be considered surplus, [actual emissions reductions] shall be in excess, at the time the application for an Emission Reduction Credit or an Authority to Construct authorizing such reductions is deemed complete, of any emissions reduction which:*

[23] California Health and Safety Code 40709.
[24] Clean Air Act Section 173(c)(2).
[25] SJVAPCD Rule 2201, 3.2.2.

3.2.2.1 Is required or encumbered by any laws, rules, regulations, agreements, orders, or

3.2.2.2 Is attributed to a control measure noticed for workshop, or proposed or contained in a State Implementation Plan, or

3.2.2.3 Is proposed in the APCO's adopted air quality plan pursuant to the California Clean Air Act.

CARB recognizes that these rules and requirements are complex. However, all these requirements focus on a careful evaluation of whether an ERC is truly surplus relative to controlling law. This issue is particularly important to reevaluate, as a policy matter, because the time-of-issuance program in San Joaquin can mean ERCs issued under one legal regime are no longer truly surplus at use in light of changes in law since issuance. This becomes more important because the District, not the applicant, must identify sufficient time-of-use reductions in the context of the Equivalency Demonstration.

The four applications where it is unclear as to whether the full value of the ERCs were in fact surplus in light of changes in law.

- ERC S-981134 involved a refinery applying for ERCs for emissions reductions achieved from the required installation of BACT in 1998. The facility received an Authority to Construct (ATC) Permit # S-33-56-11 to increase the firing rate capacities of two heaters on a hydrocracking unit. This modification triggered BACT for NOx, and the District determined BACT for NOx to be a technology capable of meeting a NOx emission rate of 0.036 lb/MMBtu. The District granted an ERC for reductions achieved between the rule requirement and BACT.

  This approach was consistent with District Rule 2201 as adopted in 1995, which required emissions reductions selected for banking to be in excess of any emissions reduction required by any law, rules, regulations, agreements, or orders – except controls required by the District's NSR Rule. However, District Rule 2201 as adopted in 1995 was inconsistent with California Health and Safety Code section 40709 and federal Clean Air Act section 173(c)(2), discussed above, which require banked reductions to be surplus of all requirements including NSR requirements for BACT. The District subsequently amended Rule 2201 in 1998 to remove the language allowing banking of emissions reductions required by installation of BACT in NSR.

- ERC S-851028 involved benzene emissions reductions from the installation of a boiler on a fluid coker at a refinery in 1987. CARB and USEPA appeared to differ with the Kern County Air Pollution Control District on whether or not the reductions were surplus and therefore eligible for banking. EPA and CARB both commented that the reductions had occurred 10 years earlier and were already

accounted for in the non-attainment plan, and RACT at the time of banking was incineration. This ERC was discussed extensively in the Earthworks evaluation, and the record regarding this ERC is not clear. Ultimately, the Kern County Air Pollution Control District issued the ERCs, despite comments from CARB and U.S. EPA at the time which raised issues about the eligibility of the emissions reductions that the Kern County Air Pollution Control District did not fully address.

- ERC C-1010009 involved an ERC application in July 2000 for the shutdown of equipment at an oil mill used for seed processing. The facility continued to operate exclusively as a cottonseed receiving and storage facility. Prior to the ERC application, in May of 2000, the US EPA had published a notice to update a NESHAP (40 CFR Part 63 Subpart GGGG) applicable to the source. The District did not discount the ERC for the proposed NESHAP because it believed its rules did not require it to do so, and finalized the ERC in March 2001. However, US EPA finalized the NESHAP in April 2001, which reduced the time-of-use value of the ERC by 280,000 pounds of VOC per year, a reduction of roughly 80%, just weeks after the ERC was issued. This example highlights why time-of-issuance ERCs can be problematic as a policy matter, given this notable difference in reduction value.
- ERC S-1075362 involved the shutdown of six CNG engines. In this application, the applicant requested ERCs for reductions above the most stringent regulatory internal combustion emissions limit incorporated into a SIP in California – the 36 ppm NOx limit set forth in South Coast AQMD Rule 1110.2 (revised on June 3, 2005). The applicant used South Coast AQMD Rule 1110.2 for the Reasonably Available Control Technology (RACT) adjustment because the 36 ppm NOx limit was more stringent than the emissions limit under SJVAPCD Rule 4702. The application noted that SJVAPCD Rule 4702 had been identified as a further study measure, but no new draft potential emission limits had been published. As a result, the applicant calculated reductions using the 36 ppm NOx emissions limit.

  The District granted the ERC assuming an emissions limit of 65 ppm NOx, rather than the 36 ppm NOx emissions limit proposed by the applicant. This increased the value of the ERC. The District's evaluation did not include an explanation for the decision to use the 65 ppm limit. During this review process, however, the District explained that prior to the issuance of the ERC, the District had consulted with U.S. EPA in relation to a different banking action, and U.S. EPA had advised the District by letter "*actual emission reductions are required to be surplus of any other SIP requirement the source is subject to, not the requirement of other agencies SIPs which do not apply to the source.*"

IV. Part 3: Examining the District's Federal Offset Equivalency Demonstration

This section describes the District's federal offset equivalency demonstration and presents the analysis and findings of staff's review.

Summary of findings:

- The District's equivalency database is not a self-contained, relational database and lacks a complete data dictionary and technical documentation. CARB staff noted a number of stranded records, data-handling discrepancies, and transparency concerns related to these issues.
- The District over-credited the amount of emission reductions claimed for equivalency from PG&E's AG-ICE diesel-to-electric incentive program for agricultural irrigation pumps (Table 13). The over-credit is due to the use of a load factor of 1.0 instead of the Carl Moyer Guidelines' recommended load factor of 0.65 in the calculation of the amount of actual emission reductions creditable from these projects. (Table 11).
- Six of the ten AG-ICE projects reviewed received Carl Moyer co-funding, which, according to California Health and Safety Code section 44281(b) and Carl Moyer Guidelines, call into question their appropriateness for use in the equivalency demonstration. However, CARB staff found no evidence that the emission reductions from the AG-ICE projects were relied on in the California State Implementation Plan (SIP), which indicates the District's use of these reductions likely did not result in double-counting in both the SIP and equivalency demonstration, and found evidence that only a portion of the reductions, and not all of the reductions, were claimed for offset equivalency.
- AG-ICE projects were emission reductions from agricultural sources and not all agricultural sources were/are subject to permitting and NSR. Pursuant to SB 700 (2003, Florez), the District requires permits for agricultural sources (including spark- and compression-ignited irrigation pumps) if their emissions are greater than one-half of the major source emissions threshold. For agricultural sources with emissions less than one-half of the major source emissions threshold, the District issues registrations for spark- and compression-ignited irrigation pumps. It is unclear whether the emission reductions associated with the AG-ICE projects met the enforceability and permanence criteria under Rule 2201 Sections 7.2.2.2 and 7.1.5 in all cases.
- The District over-credited the amount of NOx and VOC emission reductions from some orphan shutdowns claimed for surplus-at-time-of-use equivalency for ten of the eleven projects reviewed (Table 14). Collectively, orphan shutdowns account for nearly 50 percent of the emission reductions the District used to

show surplus-at-time-of-use equivalency for VOC from 2001 – 2018 and over 60 percent of the excess VOC and NOx emission reductions available for use in future equivalency demonstrations at the end of the 2018 reporting period (Table 12).

A. Equivalency Overview

Since 2001, U.S. EPA has required the District to demonstrate program equivalency with federal NSR offset requirements by showing that the emissions reductions generated by SJVAPCD's NSR requirements as a whole are equal to or greater than the reductions that would have been required by federal NSR.[26] U.S. EPA and the District entered into an agreement on August 30, 1999 establishing the requirements for the equivalency demonstration. The District subsequently amended its NSR rule (District Rule 2201), to reflect the requirements of the agreement. The equivalency provisions in Rule 2201 have been incorporated into the SIP, and through that process were subject to CARB review and U.S. EPA approval. The District submits its federal offset equivalency report each November to U.S. EPA and CARB. The reports are available on the District's web site. The reports provide a summary of the reductions the District relies on to demonstrate equivalency, but the full data set underlying the equivalency demonstration is within the District's internal equivalency tracking system, which is not subject to regular review by U.S. EPA or CARB.

The federal offset equivalency demonstration consists of two distinct tests: Test 1 (offset requirement equivalency) and Test 2 (surplus-at-time-of-use equivalency).

Test 1 – offset requirement equivalency – compares the annual quantity of offsets that would have been required under the federal program (i.e., the "Federal offset quantity" or FOQ) to the annual quantity of offsets actually required by the District's program (i.e., the "District offset quantity" or DOQ).[27] This test requires the District to calculate and track the total FOQ and DOQ from all ATC projects it issues each period. To demonstrate equivalency under this test, the total DOQ must be equal to or greater than the total FOQ.

Although the District is required to report this demonstration annually, the report is best understood as an update because the District must demonstrate equivalency since August 20, 2001. In other words, when the District makes an equivalency

[26] Technical Support Document for EPA's Notice of Proposed Rulemaking for the California State Implementation Plan, San Joaquin Valley Unified Air Pollution Control District: Rule 2020, Exemptions Rule 2201, New And Modified Stationary Source Review Rule, p. 15 - 17 (8/30/1999); *see also* August 26, 1999 Letter from David Howekamp, U.S. EPA Region IX Director Air Division to Mark Boese, Deputy APCO, SJVAPCD, enclosing EPA-District NSR Offset Tracking Agreement.

[27] The abbreviations FOQ and DOQ will be used to represent the federal and district offset quantities both for individual ATC projects and the total for all ATC projects during a tracking period. The context will make clear which meaning is intended.

demonstration, it represents federal offset equivalency over the life of the NSR program since 2001. Thus, in Test 1 (the offset requirement equivalency test), any extra DOQ beyond what is needed to show equivalency with the FOQ in the current year's equivalency demonstration may be carried forward and used to show equivalency in future years if the ATC projects issued in that year show a shortfall in DOQ relative to the FOQ.

While Test 1 is focused on the amount of offsets required, Test 2 is focused on the emission reductions used to satisfy the offset requirements.

Test 2 – surplus-at-time-of-use equivalency – requires the District to reserve or retire sufficient surplus-at-time-of-use creditable emission reductions[28] to mitigate the current years' FOQ plus any unmitigated FOQ from prior years.[29] The creditable emission reductions the District uses to mitigate the FOQ can be drawn from any time from August 20, 2001, the start of the tracking system, to the end of the current tracking period. The creditable emission reductions used to satisfy the FOQ have come from three principle sources: (1) ERCs reserved or withdrawn for ATC projects, (2) orphan shutdowns, and (3) electrification of agricultural irrigation pump engines from 2005 – 2008.[30]

Each test has its own accounting rules and different remedies for a failure to demonstrate equivalency. The failure of one test would not necessarily entail failure of the other. Both tests are pollutant specific, meaning equivalency must demonstrated for every pollutant (i.e. NOx, VOC, PM10, PM2.5, CO, and SOx). Because the demonstration represents federal offset equivalency over the life of the program since 2001, both tests permit the District to carry forward any excess or shortfall in credit for use in a future year's equivalency demonstration. The District has an excess margin of credits to draw on to remedy future potential shortfalls for both tests. That substantial margin of excess credits, however, rests on the integrity of the prior credits used for equivalency.

Because almost all NMSs and FMMs in SJVAPCD involve NOx and VOC offsets, CARB's review of SJVAPCD's federal offset equivalency demonstration focused on NOx and VOC.

[28] A creditable emission reduction meets the same integrity criteria as ERCs, i.e. the emission reductions must be real, quantifiable, permanent, enforceable, and surplus.
[29] The District has never had a year where it did not fully mitigate the current tracking year's FOQ based on the data provided in the District's equivalency demonstration reports.
[30] PG&E's Ag-ICE program will be discussed in detail in Part III. C. 3. a. See Tables 13 and 14 for the total amount of reductions claimed for NOx and VOC equivalency by type.

B. Interpreting the District's Federal Offset Equivalency Report

The District must submit to U.S. EPA and CARB its annual federal offset equivalency report by November 20 every year.[31] The District publishes the equivalency reports on its web site.[32] Each report summarizes the offsetting and emissions reduction (i.e. mitigation) activity during the tracking period August 20 of the previous year to August 19 of the current year. The dates coincide with the effective date of the equivalency demonstration requirements in SJVAPCD's NSR Rule 2201 on August 20, 2001. The report summarizes the activity during the tracking period. The determination of equivalency in the report reflects not only that current year's activity, but also the entire history since the beginning of the tracking system in 2001. Table 3 is reproduced from SJVAPCD's 2019 Annual Offset Equivalency Report for the tracking period 8/20/2018 to 8/19/2019 and summarizes the demonstration of equivalency made for Test 1.

Table 3 : Test 1 – Offset Requirement Equivalency (from SJVAPCD 2019 Annual Offset Equivalency Report)

Pollutant	Number of New Federal Major Sources (NMS)	Number of Federal Major Modifications (FMM)	Offsets Required under Federal NSR (FOQ) (tons per year)	Offsets Required under District NSR (DOQ) (tons per year)	Excess or Shortfall This Year (tons per year)	Excess or Shortfall Previous Year (tons per year)	Total Excess or Shortfall (tons per year)
NOx	0	16	83.4	84.4	1.0	4,312.9	4,313.9
VOC	0	19	69.5	43.3	-26.2	733.4	707.2
PM10	0	0	0.0	3.2	3.2	837.5	840.7
PM2.5	0	0	0.0	0.0	0.0	377.7	377.7
CO	0	0	0.0	0.0	0.0	198.1	198.1
SOx	0	0	0.0	47.5	47.5	2,863.6	2,911.1

The equivalency test is performed pollutant-by-pollutant. In 2019, for NOx, there were 16 FMM, which required 83.4 tons per year of NOx reductions under federal requirements. Thus, 83.4 tons per year is the FOQ. The actual quantity of offsets or DOQ required by SJVAPCD for all ATC projects issued during the tracking period was 84.4 tons per year NOx. Therefore, SJVAPCD required 1.0 tons per year more NOx offsets under their NSR rule than they would have required if they were following federal NSR to determine the offset quantity. The extra 1.0 tons per year is added to the accumulated 4,312.9 tons per year of excess NOx accumulated from prior years, and is carried forward for use in future years. As long as the Total Excess (last column of Table 4) is equal to or greater than 0.0 tons per year, SJVAPCD has shown it meets

[31] Rule 2201, 7.3.2 (amended 8/15/19)
[32] http://www.valleyair.org/busind/pto/annual_offset_report/annual_offset_report.htm

Test 1 "offset requirement equivalency" for NOx as of the end of the tracking period. Moreover, the Total Excess NOx (4 313.9 tons per year) is available to use for future Test 1 equivalency demonstrations when the FOQ is larger than the DOQ in a future year.

Table 4 is reproduced from SJVAPCD's 2019 Annual Offset Equivalency Report for the tracking period 8/20/2018 to 8/19/2019 and summarizes the demonstration of equivalency made for Test 2.

Table 4: Test 2 – Surplus at the Time-of-Use Equivalency (from SJVAPCD 2019 Annual Offset Equivalency Report)

Pollutant	Number of New Federal Major Sources	Number of Federal Major Mods	Offsets Required under Federal NSR (FOQ) (tons per year)	Shortfall from previous year (tons per year)	Reduction (surplus at the time of use) used for equivalency this year (tons per year)	Shortfall this year (tons per year)	Reductions eliminated by discounting at the time of use (tons per year)	Unused Carry-over Creditable Reductions (tons per year)
NOx	0	16	83.4	0.0	83.4	0.0	5,559.8	408.0
VOC	0	19	69.5	0.0	69.5	0.0	2,300.3	1,428.0
PM10	0	0	0.0	0.0	0.0	0.0	135.0	1,898.0
PM2.5	0	0	0.0	0.0	0.0	0.0	8.4	1,020.0
CO	0	0	0.0	0.0	0.0	0.0	110.7	763.0

Similar to Test 1, Test 2 is performed on a pollutant-by-pollutant basis. The first three columns for Test 2 are the same as for Test 1. During the 2019 tracking period, the FOQ was 83.4 tons per year of NOx. The current years' FOQ is added to the shortfall from the previous year (in this case zero) to get the total amount of surplus-at-time-of-use emission reductions the District must reserve, withdraw, or retire to show equivalency. The District mitigated or matched the 83.4 tons per year NOx FOQ with 83.4 tons per year NOx worth of surplus-at-time-of-use reductions as indicated in the column "Reduction (surplus at the time-of-use) used for equivalency this year." The District identifies the amount and source of those reductions in an attachment to the report. The sources of the NOx reductions for 2019 are from ERCs and orphan shutdowns. Since the District was able to match the FOQ with enough surplus-at-time-of-use reductions based on its calculations, the District does not have any shortfall in 2019, which means it has passed Test 2. In the column "Reductions eliminated by discounting at time-of-use," the District presents the sum total since 2001 of reductions required by its NSR program that were not surplus and so were not counted as mitigation in Test 2. Finally, the last column, "Unused carry-over creditable reductions" are the excess reductions still available for use in next year's surplus-at-time-of-use demonstration.

C. Equivalency Review Approach

The District's offset equivalency demonstration is complex and involves large and diverse data sets, covering a nearly 20-year period. CARB staff evaluated the data system functionality, approaches, and calculations in order to evaluate the equivalency determination. Staff reviewed both the data system as a whole and individual projects, selected at random, which were part of the equivalency demonstration. To conduct the evaluation, staff reviewed the District's equivalency database and associated documentation including individual tables, inputs to the database, and outputs from the database. Staff reviewed select reduction types and the underlying source data to determine whether it was correct and accurately input to the database system. The purpose of the evaluation was to determine whether the equivalency database is accurately reporting information and calculating equivalency.

1. Findings Regarding the Equivalency Database

The equivalency database is a system written in Microsoft Access, and originally developed in the mid-2000s. Overall, the database's lack of documentation limits the ability to determine if the system is functioning properly. In addition, the database is not self-contained, meaning that many calculations are conducted external to the database system (e.g., input from spreadsheet files), and not adequately documented in the database. This impedes the ability to assure the quality of the calculations in the demonstration.

To facilitate the review, District staff provided CARB staff with access to the database in the District's Fresno office, along with a manual describing how to operate the system, including copying and clearing data tables, renaming the tables, performing analyses in Microsoft Excel, and inputting data from Excel to Microsoft Access. District staff also provided a partial data dictionary based on specific CARB requests. CARB staff created copies of two summary tables in the database (Track_Master and Track_Allocate). These tables represent the results of core calculations and information tracked and used in the database system. District staff could not provide a complete data dictionary or technical documentation describing the calculations within the system.

The Track_Master table is the parent table for the Track_Allocate table. They are connected through the TrackNum field in each table. Each time a portion of an ERC is allocated (used), a record is put in the Track_Allocate table and the quantity of the ERC used is in the quantity column of the Track_Allocate table. Based on this understanding, there should never be a record in the Track_Allocate table that does not have a parent record in the Track_Master table. Otherwise, referential integrity is not enforced in the database. CARB staff's analysis identified what appear to be orphan records, including 194 NOx and 98 VOC records in Track_Allocate that did not have a record in Track_Master.

The used_NOx and used_VOC fields in Track_Master represent the amount of NOx and VOC used from an ERC (or other creditable reduction) in the surplus-at-time-of-use equivalency demonstration. This amount should always be less than or equal to the total value of the Actual Emission Reductions (AER), which is shown in the aer_NOx and aer_VOC fields. As a result, the used_NOx and used_VOC fields should always be less than or equal to the aer_NOx and aer_VOC fields. CARB's analysis identified 6 records where the used_VOC exceeded the aer_VOC, although the difference was negligible (0.122 t/y VOC).

District staff has investigated and identified the source of most of the discrepancies identified by CARB staff and have committed to making the appropriate corrections immediately. District staff has also conveyed their assurance that none of the orphan records identified above had any effect on the equivalency demonstration. Finally, District staff has indicated a willingness to explore the development of a new database with documentation to reduce the types of issues noted above and improve transparency.

2. Findings Regarding Test 1 – Offset Requirement Equivalency

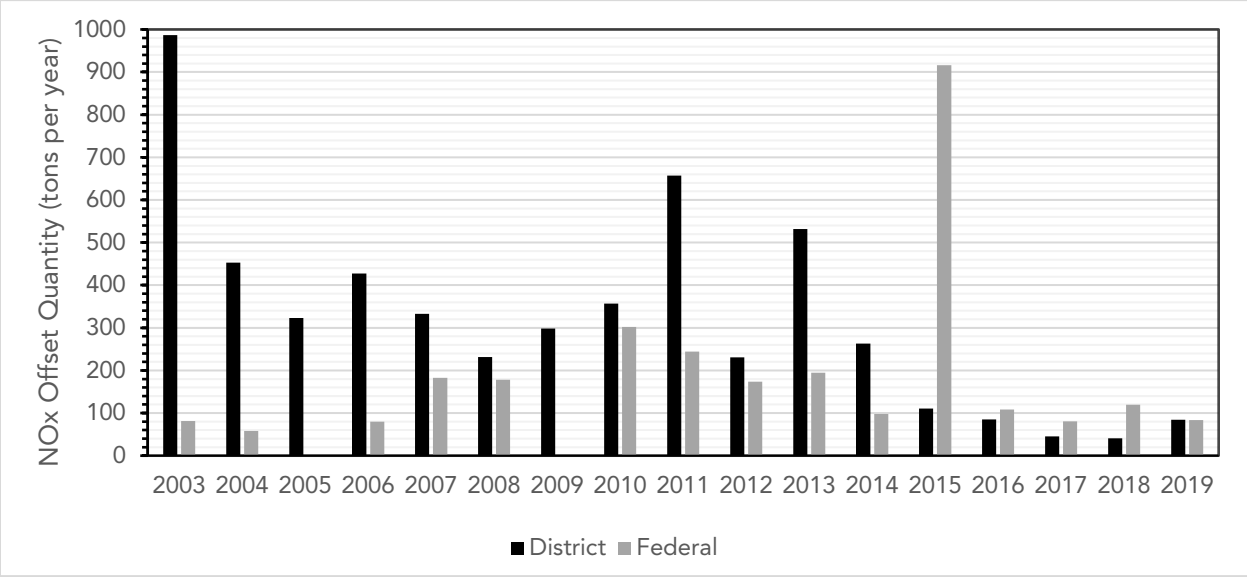
Figures 5 and 6 compare the DOQ to the FOQ for all ATCs issued by tracking year.[33] Between 2001 and 2010, the District's NSR program required more offsets for NOx and VOC than what would have been required by the federal NSR program, primarily because the District required offsets at a lower emissions threshold than federal NSR during that time. However, after the bump-up to extreme non-attainment for ozone in 2010, the FOQ usually tends to be greater than the DOQ for NOx and VOC for the ATCs issued in a given year.

Overall, the database indicates the District has accumulated a significant excess DOQ for every pollutant from previous years' equivalency demonstrations. The most current statement of the amount of excess credits the District has for Test 1 is from the District's 2019 equivalency report, presented in Table 3 in the last column labeled "Total Excess or Shortfall". A positive number indicates an excess, a negative number, a shortfall. The Total Excess DOQ for NOx is 4,313.9 tons per year, for VOC 707.2 tons per year. This will be the starting point for the District's equivalency demonstration in 2020.

CARB identified a transparency issue associated with the equivalency demonstrations each year. In essence, the carryover from year-to-year relies on adjustment terms that are not clearly provided in the tables, and which are difficult to check.

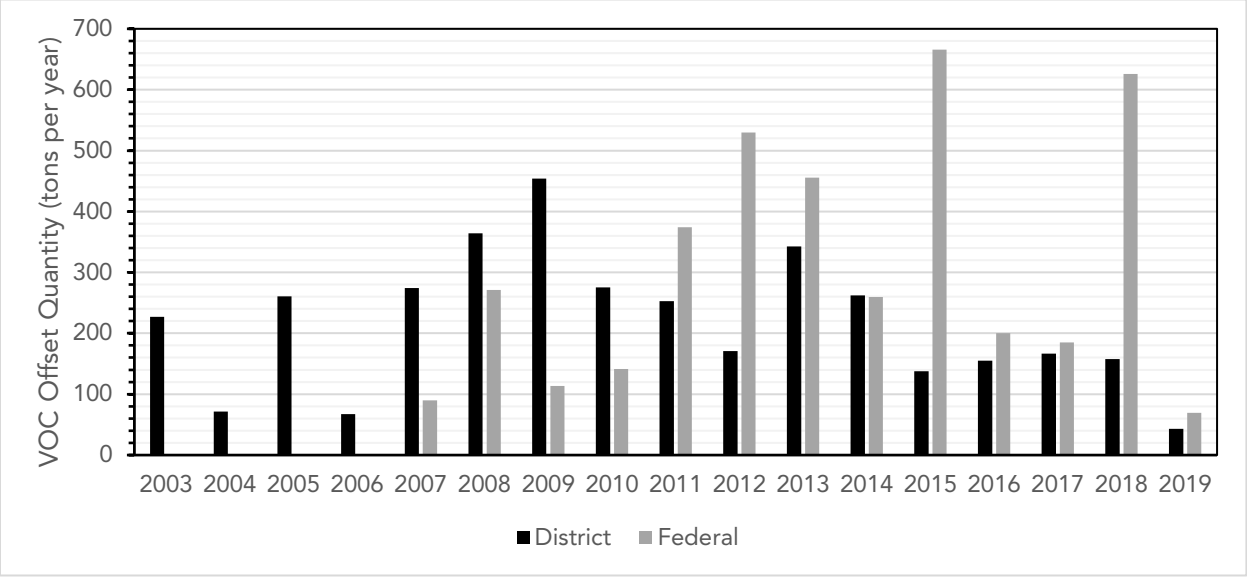
[33] A given tracking period runs from August 20 of one year to August 19 of the following year. The tracking year is the later year in this period. For example, for the tracking period running from August 20, 2015 to August 19, 2016, the tracking year is 2016.

Figure 5. NOx District Offset Quantity and Federal Offset Quantity by Tracking Year



Source: SJVAPCD Equivalency Reports Published on http://www.valleyair.org/busind/pto/annual_offset_report/annual_offset_report.htm

Figure 6. VOC District Offset Quantity and Federal Offset Quantity by Tracking Year



Source: SJVAPCD Equivalency Reports Published on http://www.valleyair.org/busind/pto/annual_offset_report/annual_offset_report.htm

The quantities displayed in Figures 5 and 6 are taken from each individual annual equivalency demonstration. The Total Excess or Shortfall values in the 2019 Report (Table 3) consists of the sum of the DOQs and FOQs from all previous equivalency reports plus adjustments for any projects removed (or sometimes added to) the tracking system each year. Simply adding quantities displayed in Figures 5 and 6 will not equal the Total Excess DOQ, which takes into consideration the annual adjustments related to projects being removed or added to the tracking system. The necessary adjustment is not explicitly stated in the tables but its cumulative effect over all the years is significant.

These adjustments come from ATC projects that previously were included in the tracking system in one year, but for various reasons (usually the ATCs have been cancelled or expired unimplemented), it becomes necessary to remove them. In the annual equivalency reports published by the District since 2011, the District lists the ATC projects that are being removed from the current year's demonstration and provides a reason for the removal. For example, the adjustment taken in the 2019 Equivalency Report is summarized in Table 5.

CARB staff attempted to verify the net adjustment in Table 4 above by summing the net effect from the three ATC projects removed from the 2019 Equivalency Demonstration (Table 5). In Table 5, removal of a project from the tracking system is accompanied by a negative sign in the corresponding DOQ and/or FOQ value. CARB staff found the DOQ and the FOQ from the ATC application reviews of the three projects on the District's public notification web site. The ATC application reviews are the source documents for the DOQ and FOQ that are used for the equivalency demonstration. CARB staff calculated a net adjustment of +0.5 tons per year for NOx and +22.3 tons per year for VOC, compared to the District's adjustment of +35.4 tons per year for NOx and +77.3 tons per year for VOC.

Table 5. Adjustment to Excess DOQ Credit Implied in SJVAPCD 2019 Equivalency Report

	NOx DOQ (tons per year)	**VOC DOQ (tons per year)**
Total Excess from 2018 Report (ending)	4,277.5	656.1
Total Excess from 2019 Report (beginning)	4,312.9	733.4
Net Adjustment	+35.4	+77.3

Table 6. CARB Calculated Adjustment to Excess DOQ Credit from 2019 Project Removed List

Project Number removed	NOx DOQ (tons per year)	NOx FOQ (tons per year)	VOC DOQ (tons per year)	VOC FOQ (tons per year)
C-1133313	0	0	-13.7	-13.7
C-1161110	0	-0.5	0	0
N-1133659	0	0	-41.5	-63.8
Total Adjustments	0	-0.5	-55.2	-77.5
CARB Net Adjustment	+0.5		+22.3	
District Net Adjustment	+35.4		+77.3	
Discrepancy	+34.9		+55.0	

District staff has explained that the source of the NOx difference was related to ATC project N-1161175 from the 2017 – 2018 tracking period, which had a DOQ of 35.0 tons per year NOx. According to District staff, the District included the FOQ for this project during the 2017 – 2018 tracking period, but not the DOQ because the facility had not specifically identified which ERC certificates it was going to use to satisfy the DOQ. The facility did identify which specific NOx ERCs it would use as offsets during the 2018 – 2019 tracking period, at which point the District added the DOQ amount as a 35.0 tons per year NOx adjustment. District staff has indicated verbally a similar explanation for the VOC difference noted in Table 6 above.

In effect, the District delayed counting the DOQ, is conservative and understandable under the circumstances, and had no impact to the outcome of equivalency demonstration. However, this explanation should have been included in the list of projects accounting for the adjustment in the 2018 – 2019 report – so that the report and calculations are more clear to the interested public, CARB, and U.S. EPA.

CARB staff also checked the District's calculations of the DOQ and FOQ by examining the ATC application reviews for the 2016 - 2017 tracking period. The ATC application reviews are the building blocks for the equivalency demonstration. The FOQ and DOQ values provided in the equivalency reports -- on which the determination of equivalency rests -- should be traceable back to the ATC application reviews. CARB staff obtained from the District and the District's web site the application reviews for the ATC projects from the 2017 tracking year (8/20/2016 – 8/19/2017) that were identified as NMS (1 ATC project) or FMM (32 ATC projects). Most ATC projects that had a FOQ also had a DOQ. For example, of the 14 ATC projects that were FMM for NOx, 11 also had a DOQ associated with the project.

Staff spot-checked the emissions increase calculations used to determine the FOQ and the DOQ in the ATC application reviews for all the NMS (1) and FMM (32) projects identified by the District for the 2017 tracking year. All reviewed calculations appeared to have been completed correctly. Staff then summed the FOQ and DOQ from all the ATC application reviews in order to compare to values reported by the District in the 2017 report. These results are summarized in Tables 9 and 10 below.

Table 7 shows a minor discrepancy discovered between the calculated and reported FOQ for VOC. The source of this discrepancy is ATC projects S-1151973 and S-1152366, which were associated with a FOQ of 7.9 tons per year VOC. However, the District entered the FOQ as 5.3 tons per year VOC for these projects (in the ini_i_VOC field of the Track_Master table). This results in a difference in the FOQ of 2.6 tons per year VOC. Thus, CARB staff calculated a FOQ of 187.6 tons per year VOC, while the district reported a FOQ of 185.0 tons per year VOC.

Table 7. Comparison Between CARB Calculated and SJVAPCD Reported Federal Offset Quantities for One New Major Source and 32 FMMs Reported in the 2017 Equivalency Demonstration.

FOQ Calculation Method	NOx (tons per year)	VOC (tons per year)
FOQ calculated using CARB reviews of each NMS and FMM	80.5	187.6
FOQ reported in the 2017 Equivalency Report	80.5	185.0
FOQ calculated in the Equivalency Database Track_Master table.	80.5	185.0

Verification of the DOQ for Test 1 must take account of a different subset of ATC projects because the District can require offsets (DOQ) both from projects that are NMS or FMM and from new minor sources or minor modifications. CARB staff reviewed ATC application reviews for all the NMS (1) and FMM (32) identified by the District for the 2017 tracking year to identify the DOQ. However, staff did not request the ATC application reviews for those projects that had a DOQ but were not NMS or FMM. The DOQ from those projects was taken at face value from Track_Master.

Staff added up the DOQ from FMM, NMS, and minor projects. Table 8 shows the results of this analysis, by comparing differences between the CARB calculated DOQ and District reported DOQ for NOx and VOC from the 2017 Report. CARB staff identified 75.9 tons per year NOx DOQ from FMM and NMS, and 0.8 tons per year from minor projects, for a total of 76.7 tons per year NOx DOQ. However, the District in its 2017 Equivalency Demonstration, presented a DOQ of 45.6 tons per year NOx – a difference of 31.1 tons per year NOx from the CARB value.

CARB staff identified 100.2 tons per year VOC DOQ from FMM and NMS, and 119.2 tons per year VOC DOQ from minor projects for a total of 219.4 tons per year VOC DOQ. However, the District in its 2017 Equivalency Demonstration, presented a DOQ of 166.8 tons per year VOC DOQ – a difference of 52.6 tons per year VOC from the CARB value.

Table 8. Comparison between CARB Calculated and SJVAPCD Reported District Offset Quantities in the 2017 Equivalency Demonstration

DOQ Calculation Method	NOx (tons per year)	VOC (tons per year)
DOQ calculated using CARB reviews of each NMS and FMM	75.9	100.2
DOQ from minor projects in Track_Master	0.8	119.2
Total DOQ	76.7	219.4
DOQ reported in the 2017 Equivalency Report*	45.6	166.8
Possible under-credit of DOQ	31.1	52.6

*The source of the DOQ in the equivalency report is sum of erc_pollutant fields in Track_Master.

CARB staff identified ATC projects whose application reviews identified a DOQ, but had a different value noted in the erc_NOx field in Track_Master (Table 9). The erc_NOx field in Track_Master is the source for the DOQ in the equivalency reports.

Table 9. List of ATC Projects from 2017 Report with a District Offset Quantity for NOx in the Authority to Construct Application Review Different from what is Recorded in the Equivalency Database (as erc_nox)

ATC Project Number	DOQ for NOx (tons per year) in ATC Application Review	erc_NOx (tons per year) from Track_Master*
S-1143503	1.1	0
S-1144548	32.6	33.2**
S-1151973 (and S-1152366)	18.4	0.0000001
S-1162420	8.5	0.0000001
S-1162746	0.3	0.2
S-1170679	0.3	0.2
S-1171052	0.9	0.1
S-1171635	6.9	4.1
Net Difference	+31.2	

* Each ERC certificate reserved or withdrawn for a given ATC project will have its own separate entry (erc_NOx) in the District's Track_Master equivalency database under erc_NOx (or erc_pollutant more generally). The DOQ for each ATC project in Table 9 could represent more than one ERC certificate.

** Both District and CARB staff agree that the erc_nox value for project S-1144548 should be 32.6 tons per year. 33.2 tons per year is the total face value of the NOx ERCs proposed for use as offsets in project S-1144548, not the DOQ.

Finally, CARB staff noted three examples where the DOQ for individual ATC projects appeared to be over-credited because the face value of the ERCs reserved for an ATC project were counted (in erc_nox field of Track_Master) instead of the actual DOQ calculated in the application review. This is shown in Table 10. District staff has acknowledged these issues and assured CARB staff that they would be corrected.

Table 10: ATC projects where the DOQ was Over-credited in the Report Because the Face Value of the ERCs Instead of the DOQ from the ATC Application review was Transferred to erc_nox in Track_Master*

Report year	ATC project	erc_nox from Track_Master (tons per year)	ERC # from ATC application review	Face value of ERC (tons per year)	Amount of NOx offset required in ATC project (tons per year)	Over-credit to DOQ in Test 1 Demonstration [sum of erc_nox – amount of offset required in ATC project]
2017	S-1144548	33.2	S-3208-2	33.2	32.6	0.6
-	-	-	-	-	-	-
2016	S-1151996	5.7	S-4515-2	5.7	7.4	7.6
2016	S-1151996	1.4	S-4514-2	5.8		
2016	S-1151996	0.5	S-4516-2	0.5		
2016	S-1151996	3.7	S-4530-2	3.7		
2016	S-1151996	1.5	N-1302-2	1.5		
2016	S-1151996	2.2	N-1332-2	2.2		
-	-	-	-	-	-	-
2016	S-1153671	0.4	S-3326-2 (?)	0.4	6.8	6.6
2016	S-1153671	1.2	S-3625-2	1.2		
2016	S-1153671	0.7	N-1327-2	0.7		
2016	S-1153671	0.4	N-1329-2 (?)	0.4		
2016	S-1153671	10.7	C-1059-2	4.1 (?)		

Overall, CARB staffs' review of federal offset equivalency identifies issues with the accuracy and transparency of the equivalency demonstration because of the data handling system, which, for reasons noted in the findings on the equivalency database, makes it difficult to ensure the accuracy of the demonstration. The current data handling system may have been adequate when the District began the tracking system in 2001 until 2010 -- when the number of NMS and FMM projects in a tracking period

was between zero to four for every pollutant. However, after the bump-up to extreme non-attainment for ozone in 2010, the number NMS and FMM projects for NOx and VOC together has ranged from 35 to 90 every tracking period, creating a quality assurance challenge in an already complex system. The data handling issues point to a clear need for better quality control and transparency.

3. Findings Regarding Test 2 – Surplus at Time-of-Use Equivalency

The second federal offset equivalency test requires the District to reserve or retire sufficient surplus-at-time-of-use creditable emission reductions to mitigate the current years' FOQ. In other words, the District must demonstrate that it has retired sufficient reductions valued as surplus-at-time-of-use to match the number of reductions that would have been required under federal NSR. The emission reductions used as mitigation may come from any year since the start of the equivalency tracking system in 2001, and, as such, each annual report represents a running-total demonstration of equivalency.

The "surplus-at-time-of-use" federal requirement is based in the Clean Air Act requirements that all creditable emission reductions be surplus to all requirements under the Act. Further, this valuation is necessary to avoid double counting of reductions claimed in the SIP.[34] As U.S. EPA has explained ". . . the State cannot rely on emission reduction credits in its overall attainment plan and rely on the same credits in the issuance of an NSR permit (i.e., no 'double counting')."[35] U.S. EPA requires Test 2 as part of the equivalency demonstration because SJVAPCD relies on surplus-at-time-of-issuance valuation and does not discount the value of ERCs at time-of-use based on additional requirements that have been imposed between issuance and use.[36]

Performing a surplus-at-time-of-use determination for an ERC requires looking back at the original emission reduction, but applying the strictest applicable law or emission standard in effect at the time the ERC is used as an offset for NSR (i.e., at time of ATC issuance). As the emission standards become more stringent, the amount of the

[34] See footnotes 9 and 10.

[35] July 21, 1993 U.S. EPA Memorandum from John Seitz, Director, Office of Air Quality Planning and Standards to Air Branch Chiefs, Regions I-X, et al., "Use of Shutdown Credits for Offsets."; *see also* August 26, 1994 U.S. EPA Memorandum from John Seitz, Director, Office of Air Quality Planning and Standards, to David Howekamp, Director Region IX, Air and Toxics Division: "Response to Request for Guidance on Use of Pre-1990 ERC's and Adjusting for RACT at Time-of-use."

[36] Bay Area AQMD and Ventura County APCD are required to perform similar surplus-at-time-of-use equivalency demonstrations by U.S. EPA because they likewise only require emission reductions banked as ERCs to be surplus-at time-of-issuance. South Coast AQMD also does not discount ERCs for their time-of-use; however, South AQMD discounts emission reductions banked as ERCs to applicable Best Available Control Technology (BACT) levels at time-of-issuance. South Coast AQMD is required by U.S. EPA to make an annual demonstration of federal offset equivalency for emission reductions held in its internal bank per Rule 1315, Federal New Source Review Tracking System.

original emission reduction that is still surplus will be reduced. In aggregate, the requirement that ERC value be determined at time-of-use has a deflationary effect on the offset value of an ERC bank.[37] This is discussed in Part 1, which illustrates that the District's estimate that its NOx ERC bank's time-of-use value (as of 2016) is on average about 18 percent of its time-of-issuance value.

Test 2 requires the District to match or mitigate the federal offset quantity (FOQ) from the current tracking period with an equal amount of surplus-at-time-of-use emission reductions drawn from an "equivalency bank" of creditable emission reductions. These reductions are not formally banked, but rather tracked by the District internally through its equivalency-tracking database. To be "creditable" means an emission reduction is real, surplus,[38] quantifiable, enforceable, and permanent.[39] Rule 2201 further defines the eligibility criteria for use of such reductions in the equivalency demonstration.[40]

In practice, the District has used the following types of creditable emission reductions in its "equivalency bank" for use in the surplus-at-time-of-use equivalency demonstration:

- ERCs reserved or withdrawn for ATC projects,
- Unclaimed reductions from orphan shutdowns (i.e. closed facilities), [41]
- Electrification projects from PG&E's AG-ICE program,
- 10 percent air quality improvement deduction (AQID) from newly banked ERCs, returned credits from unimplemented NMS and FMS,
- ERCs surrendered for non-NSR actions (e.g. CEQA, variance, consent decree),

As with Test 1, Test 2 allows any excess in the amount of surplus-at-time-of-use creditable emission reductions to remain in the equivalency bank and be carried forward to future years for equivalency purposes.

To evaluate Test 2, CARB staff began by spot-checking the emission reduction calculations for the types of reductions that have been the most significant for the surplus-at-time-of-use equivalency demonstration. Table 11 compares the amount of NOx reductions used, and the amount remaining for future use in equivalency demonstrations, over the period 2001-2018. Table 11 shows that electrification

[37] The surplus value of the ERC at time-of-use could vary from 0 to 100 percent of its face value. In a April 19, 2016 draft staff report on its equivalency system, SJVAPCD estimated that approximately 18 percent of its banked NOx ERCs were currently surplus (ref. http://www.valleyair.org/Workshops/postings/2016/05-11-16_OEI/DRAFT-Staff-Report.pdf)
[38] For purposes of Test 2, surplus is understood to mean "at time-of-use," i.e. when the creditable reduction is used for a mitigation.
[39] Rule 2201, section 7.1.5.
[40] Rule 2201, section 7.2.2.2.
[41] The electrification projects discussed later in this review could be classified as a type of orphan reduction that the generator of the reduction did not claim or ceded to the District.

projects have accounted for more than 50 percent of the mitigations used to show surplus-at-time-of-use equivalency for NOx from 2001 to 2018, and were completely used by the end of the 2017 to 2018 tracking period. Table 12 shows orphan shutdowns have accounted for nearly 50 percent of the mitigations used to show surplus-at-time-of-use equivalency for VOC from 2001 to 2018 and comprise over 60 percent of the excess VOC and NOx mitigations available for use at the end of the 2018 reporting period.

Table 11: NOx Reductions Used and Remaining by Type for Surplus-at-Time-of-Use Equivalency 2001 – 2018. (All values are tons per year from Track_Master Table.)

Type of Reduction	Amount Used as Mitigation (used_nox)	Remaining Reductions Available for Future Equivalency Demonstrations (r_nox)
Emission Reduction Credits	720.7	160.6
Electrification Projects	1,210.7	0
Orphan Shutdowns	122.5	273.8
Totals	2,053.9	*434.4

*Unused Carry-Over Reductions in 2018 Report = 434.0 tons per year NOx

Table 12: VOC Reductions Used and Remaining by Type for Surplus-at-Time-of-Use Equivalency 2001 – 2018. (All values are tons per year from Track_Master Table.)

Type of Reduction	Amount Used as Mitigation (used_voc)	Remaining Reductions Available for Future Equivalency Demonstrations (r_voc)
Emission Reduction Credits	1,752.4	466.2
Electrification Projects	61.2	0
Orphan Shutdowns	1,720.4	819.2
Totals	3,534.0	*1,285.4

*Unused Carry-Over Reductions in 2018 Report = 1,286.0 tons per year VOC

The source of the creditable reductions from electrification projects is the Agricultural Internal Combustion Engine or AG-ICE program, which funded replacements of diesel internal combustion engines with utility electricity to power agricultural irrigation pumps from approximately 2005 - 2008. The District's equivalency database shows that 1,210.7 tons per year of surplus NOx reductions from 919 engines were claimed from AG-ICE. The electrification projects comprise 77 percent of the mitigations used to show surplus-at-time-of-use equivalency for NOx from 2008 to 2018.

CARB reviewed data and other background information to determine the amount of creditable emission reductions from a randomly selected sample of 10 electrification projects that were listed in the 2017 Equivalency Report. The diesel internal combustion engines replaced were all Tier 0, Tier 1, or Tier 2.

Because the District claimed the reductions from all 919 diesel-to-electric projects at the same time for use in the equivalency demonstration in 2008, and all the reductions were generated by replacing diesel internal combustion engines with electric motors, the sample of 10 projects appears representative of the emission reduction calculations from all 919 projects.

a. Electrification Projects

There are multiple issues with the use of the electrification projects for equivalency.

- *Issues Regarding Whether Reductions Were Real, Due to Load-Factor Discrepancies*

Emission reductions from the AG-ICE electrification projects involved the replacement of Tier 0, 1, or 2 diesel IC engines with electric motor power. The reductions from AG-ICE were divided into two parts: (a) the replacement of Tier 0, 1, 2 diesel emissions to the equivalent activity with Tier 3 levels of emissions, and (b) the replacement of Tier 3 level of emissions to zero (i.e. the electric motor emissions being counted as zero).

The District used the reductions from Tier 3 emissions to zero for the equivalency demonstration. The District did not use the emissions reduction benefit from the replacement of Tier 0, 1, 2 diesel emissions to the equivalent activity with Tier 3 levels of emissions. That reduction benefit was not utilized for equivalency. To be eligible for the equivalency demonstration, an emission reduction must be creditable meaning, among other criteria, that it must be based on real or actual emissions.[42] A portion of the reductions claimed by the District from AG-ICE do not qualify as real because the calculation methodology used by the District assumed the replaced engines' operated with a load factor of 1.0 rather than the actual load or the default load factor provided by the Carl Moyer Program Guidelines.

The Carl Moyer Program ensures reductions it funds are real (and thus SIP creditable) by using calculation methods that represent real emissions. For emission reductions based on the AG-ICE program, the Carl Moyer Program Guidelines in Appendix C prescribe the following method when the engine activity level is based on annual hours of operation:[43]

[42] District Rule 2201, Section 7.1.5 (amended 8/15/19)
[43] The Carl Moyer Program Guidelines Part IV, Appendix C, 1. Calculating Annual Emissions Based on Hours of Operation, C-3 (November 17, 2005)

Formula C-4: Estimated Annual Emissions based on hours of Operation (tons/yr):

*Emission Factor or Converted Emission Standard (g/bhp-hr) * Horsepower * **Load Factor** * Activity (hr/yr) * Percent Operation in CA * ton/907,200g*

The engine load factor is an indicator of the nominal amount of work done by the engine for a particular application. It is given as a fraction of the rated horsepower of the engine and varies with engine application. For projects in which the horsepower of the baseline technology and reduced technology are different by more than 25 percent, the load factor must be adjusted following formula C-5 below. It is important to understand the replacement load factor must never exceed 100 percent in cases where the reduced technology engine is significantly smaller than the baseline technology engine.

Formula C-5:

*Replacement Load Factor = Default Load Factor $_{baseline}$ * hp $_{baseline}$/hp $_{reduced}$*

Moyer uses a default load factor for agricultural irrigation pumps of 0.65 as determined from historical emissions inventory.[44] The default load factors for dozens of types of off-road heavy-duty diesel engines are given in Table B-13 of the Guidelines, and those range from 0.30 to 0.78.

Following the above Appendix C method, the CARL database uses the horsepower of the electric motor in the formula C-4 above and bases the Tier 3 emission factor on the horsepower rating of the electric motor. The CARL database uses the electric motor horsepower only in conjunction with the replacement load factor in the calculation of emissions. This ensures the activity used to calculate the reduction, measured as horsepower-hours, does not increase beyond the baseline of the replaced diesel IC engine.

However, in Appendix D of the same Carl Moyer Program Guidelines, an example calculation for an AG-ICE project is given where no adjustment to the default load factor (0.65) is made although the electric motor that replaced the diesel IC engine has a horsepower that is more than 25 percent different.[45] The example calculation uses the horsepower rating of the replaced diesel IC engine in the formula C-4 above and bases the Tier 3 emission factor on the rated horsepower of the IC engine. This method likewise ensures that the activity used to calculate the reduction equals the baseline of the replaced diesel IC engine.

[44] Carl Moyer Program Guidelines, Part IV, Appendix B, Table B-13 (November 17, 2005)
[45] The Carl Moyer Program Guidelines Part IV, Appendix D, XII. Zero-Emission Technologies, Example 2, D-64 (November 17, 2005)

CARB staff believe that either of the two methods (Appendix C or Appendix D of the Carl Moyer Guidelines Part IV) is an acceptable calculation for determining the amount of actual emission reductions from an AG-ICE project. The District used the Appendix D method with one significant deviation -- the District used a load factor of 1.0 rather than the default load factor of 0.65.

Staff reviewed District calculations from the 10 sample electrification projects. Table 13 lists the variables used and the results of the calculated amount of creditable emission reductions by the District compared to the Carl Moyer Program Guidelines Appendix D and CARL (Appendix C) described above. The District calculation for the amount of creditable NOx reductions that can be claimed for these projects is higher for all 10 projects compared to either Carl Moyer method. CARB staff believes the District over-credited these 10 electrification projects by 35 percent or more because of the use of a load factor of 1.0 tied to the horsepower of the diesel engine being replaced.

Table 13: Creditable Emission Reduction Calculations from 10 Electrification Projects[46]

[46] Supplemental calculations and tables related to the electrification projects will be included in a document on the San Joaquin Valley ERC Program Review Public Documents web page.

[47] Tier 3 Emission Factors from 2008 Carl Moyer Program Guidelines Part IV, Appendix B, Tables for Emission Reduction and Cost Effectiveness Calculations, Table B-13. The emissions factor from the 2005 and 2008 guidelines differ for some horsepower ranges. CARB staff used the guideline the District proposed.

[48] District calculation: NOx (t/yr) = BHP × **Load Factor (1.0)** × Operating Hours (hr/yr) × EF (g-NOx/bhp-hr) × 1 lb/453.6 g × 1 ton/2,000 lb

[49] CARB staff calculation following Carl Moyer Guidelines Appendix D:
NOx (tons per year) = BHP × **Load Factor (0.65)** × Operating Hours (hr/yr) × EF (g-NOx/bhp-hr) × 1 lb/ 453.6 g × 1 ton/ 2,000 lb [equation from 2005 Carl Moyer Program Guidelines Part IV, Appendix D, Examples Calculations, XII. Zero Emission Technologies. Also 2008 Carl Moyer Program Guidelines Part IV, Appendix E, Examples Calculations, VII. Agricultural Sources]

[50] CARL calculation following Carl Moyer Guidelines Appendix C:
NOx (tons per year) = BHP (ICE) × Default Load Factor (0.65) × (BHP (ICE)/HP electric motor) × Operating Hours (hr/yr) × EF (g-NOx/bhp-hr) × 1 lb/ 453.6 g × 1 ton/ 2,000 lb [modified load factor equation from 2005 Carl Moyer Program Guidelines Part IV, Appendix C.

- *Issues Regarding Permitted Sources*

To be eligible for use in the surplus-at-time-of-use demonstration an unbanked reduction must have been generated as a result of a permitting action:

> *For purposes of the demonstration described in Section 7.2.2, the comparison may also include the surplus value of additional creditable emission reductions that have not been used as offsets and have been banked or have been generated as a result of permitting actions. [Rule 2201, section 7.2.2.2]*

According to the District, none of the replaced engines from the sample of 10 projects had a permit prior to removal, nor was a permit issued for the electrified pump that replaced it. Thus, the reductions associated with the replacement engines were not generated as a result of a permitting action.

- *Issues Regarding Crediting of State-Funded Projects*

Some of the AG-ICE projects received co-funding from the Carl Moyer Program. California law prohibits the use of any project funded by Carl Moyer from being used as an emissions offset. While the District recognizes that some of the projects were co-funded by Moyer and the utilities, the District believes that because they are using only the portion of the total emission reductions generated equal to the replacement of a Tier 3 engine with an electric motor the requirements of State law are met. Aside from the funding issue, it is important to note that there does not appear to have been any double counting of emissions reductions, meaning the emissions the District claimed for use in equivalency were not counted in any other way for SIP purposes.

California Health and Safety Code, section 44281 (b) states:

> *No project funded by the [Carl Moyer] program shall be used for credit under any state or federal emissions averaging, banking, or trading program. No covered emission reduction generated by the program shall be used as marketable emission reduction credits or to offset any emission reduction obligation of any person or entity.*

The 2005 Moyer Guidelines, which are incorporated by reference under the Health & Safety code and implemented the Moyer statute at the time when the AG-ICE program was implemented, also specifically provided that the reductions from AG-ICE funded project belonged to the Carl Moyer Program if the project also received Moyer funds:

> *Carl Moyer Program applicants using the PG&E and SCE incentive programs will also have to make adjustments to the emission reduction calculations. Because to date virtually no electric agricultural pump projects have been funded through Carl Moyer Program grants, the PG&E and SCE incentive programs take credit for the emission reduction*

between a Tier 3 engine and an electric motor. ***As a condition of the PG&E and SCE incentive programs, these emission reductions must be donated to the Carl Moyer Program for clean air.*** *The emission reduction benefit between the replaced engine and a Tier 3 engine, may be included in the cost-effectiveness calculation to determine the grant amount. An example of this calculation is provided in Appendix D. (ref. 2005 Carl Moyer Program Guidelines, Part II, Project Criteria, Chapter XII, Zero Emission Technologies, XII-p. 5)*

The AG-ICE program operated with both funding between public utilities, and the State of California in part through the Carl Moyer program. Specifically, the Carl Moyer program funded conversion to electric pumps, and the public utilities provided line extensions and rate incentives. Joint funding was necessary because funding levels from the Carl Moyer program alone were not sufficient to entice a transition from diesel to electric agricultural pumps.

A joint settlement between the California Public Utilities Commission, Pacific Gas and Electric Company (PG&E), Southern California Edison Company (SCE), the Office of Ratepayer Advocates, the Utility Reform Network, Agricultural Energy Consumers Association, the California Farm Bureau Federation, and the California Air Resources Board[51] in March 2005 established favorable electric rates which helped encourage the transition from diesel to electric pumps.

The District believes the record of the CPUC proceedings show that the agreement apportioned emission reductions between the utilities, the State, and the District. The District believes that under the agreement the State would retain criteria pollutant emission reductions generated by the transition between the engine being replaced and a Tier 3 engine, and the District (through the utilities) would retain criteria pollutant emission reductions from a Tier 3 engine to zero emissions. The District relied on their understanding of this agreement when deciding to use the AG-ICE emission reductions from Tier 3 to zero emissions for demonstrating offset equivalency. CARB staff does not concur with this assessment.

CARB staff has not determined the exact number of electrification projects that received Carl Moyer funding. In the sample of ten AG-ICE electrification projects using serial numbers for the replaced diesel engines along with other project specific information[52] CARB staff noted that six of the ten engines matched engine records in CARB's Clean Air Reporting Log (CARL) database strongly indicating these six projects received Moyer funding or co-funding.

[51] http://docs.cpuc.ca.gov/publishedDocs/published/Graphics/47069.PDF

[52] CARB staff does not have the serial number for all 919 diesel engines replaced as this information is not part of the District's equivalency tracking database that CARB staff has access to.

A preliminary review of the 919 electrification projects suggests that a large number of those could have also received Carol Moyer funding.

Issues Regarding Permanency of Reductions

Another of the criteria for claiming a reduction in the surplus-at-time-of-use demonstration is that the reductions be permanent.

The AG-ICE Program had a limited life, as explained in a July 27, 2005 document titled *Agricultural Internal Combustion (IC) Engine Conversion Incentive Program Questions and Answers*, published by PG&E, California Farm Bureau Federation, and Agricultural Energy Users Association[53]

> *Q7. Do I have to stay on the AG-ICE rate for the whole 10 years?*
>
> *A. No. You will only be required to stay on the AG-ICE rate for 12 months under Electric Rule 12. However, if you elect to leave the AG-ICE rate for a different PG&E electric tariff, you may not return to the AG-ICE rate.*
>
> *After the program expires on December 31, 2015, nothing in the AG-ICE program precludes a grower from leaving PG&E to disconnect or choose an alternative power source such as an IC engine, although there is no certainty as to the air quality regulations that will be in place at that time. The customer would still be responsible for non-passable charges if going to an alternate electrical source provided those charges are in existence at the time of departure.*

With the Carl Moyer Program, to ensure satisfaction of the permanence requirement, SIP creditability of reductions ends with the contract expiration. Similarly, with the AG-ICE program, reductions from the electrification projects may not be enforceable after the expiration of the contract, meaning, after the contract expires, they may not meet the criterion for permanence under Rule 2201, section 7.1.5 to be used in the equivalency demonstration.

b. Orphan Shutdowns

Orphan shutdowns are unclaimed emission reductions from facilities that have shut down and surrendered their air permits, but did not claim the actual emission reductions, if any, from the cessation of emissions. The District collects the actual emission reductions from orphan shutdowns and retires them for use in the equivalency demonstration. The District never uses emission reductions from orphan shut downs to directly offset emission increases from ATC projects.

[53] Ref. Agricultural Internal Combustion (IC) Engine Conversion Incentive Program Questions and Answers from July 27, 2005, Published by PG&E, California Farm Bureau Federation, and Agricultural Energy Users Association.

Although orphan emission reductions are not formally banked as ERCs, Rule 2201 does require them to meet the same evaluation criteria as ERCs.[54] The reductions must be real, surplus, permanent, quantifiable, and enforceable.

According to the District's internal guideline document "Offset Equivalency Step-by-Step Instructions," actual emissions reductions from orphan shutdowns are calculated using the following method:[55]

> *The database will calculate the emissions for units at the deleted facilities using the following protocol:*
>
> - *use the two most recent [Emissions Inventory] years from the past 5 years.*
> - *if both years are available, average the two*
> - *if only one year is available, use that year (no average)*
> - *if both years are blank[56], use 1/2 of the PE [potential to emit]*

The District's method for crediting emission reductions from orphan shutdowns is an attempt to treat orphan shutdowns in a manner similar to ERC banking applications by applying the concepts "baseline period" and "actual emission reductions" from Rule 2201.[57] That is, the District bases the amount of creditable emissions reductions on actual operating data from the most recent two-year period from the past five years preceding shutdown. The period immediately preceding shutdown is usually the lowest emitting period in the life of a facility. Rule 2201 and federal NSR allow a different 24-month period from the past five years if the permitting authority determines that a different 24-month period is more representative of normal operation. Therefore, in this respect, by using the most recent time period instead of the most representative operating period, the District's method for crediting orphan shutdowns is more conservative than Rule 2201 or federal NSR for crediting emission reductions.

However, the District's orphan credit procedure is less stringent than its normal ERC banking procedure or federal NSR for establishing real emissions in that it allows for use of one years' worth of data, or the use of half of the potential to emit, if no emissions inventory record is available from the previous five years. For facilities where the record on actual emissions is absent or missing, relying on some fraction of the permitted or potential to emit of a source as a way of representing actual emissions may be a reasonable practical accommodation. Unlike with ERC applications, where the applicant has an active interest in providing operating data,

---

[54] District Rule 2201, section 7.1.5 (8/15/19)
[55] SJVAPCD *Offset Equivalency Step-by-Step Instructions*, III.C. Entering Deleted Facilities (C.III.6)
[56] The word "blank" implies missing or absent data. However, CARB staff would note that in practice "blank" appears to include instances of zero emissions, i.e. zero actual emissions is taken to be the same as missing data, justifying the use of ½ of the potential to emit.
[57] District Rule 2201, sections 3.2 and 3.9 (8/15/19)

the District is forced to rely on its own records of operating history to discern the actual emissions from the operation, which may be incomplete for older shutdowns. The question of whether the multiplier of half of the permitted emissions is appropriate here would require further research beyond the scope of this review. For purposes of this review, CARB staff assumed, consistent with District practice, half of the potential or permitted emissions where no emissions inventory or operating record was available.

The District does not discount or surplus the orphan shutdowns when they are added to the federal offset equivalency tracking system. This practice is indicated in their internal guidance document Offset Equivalency Step-by-Step Instructions*:* [58]

> *For deleted facilities, the District does not discount the emissions reductions. Therefore, enter "0" for:*
>
> - *"Permitted Potential to Emit after the initial action (t/y)",*
> - *"Discount quantity for federal rules in place at the time of initial action (t/y)"*
> - *"Discount quantity for federal rules SINCE the time of initial action (t/y)".*

CARB staff would agree that for most orphan shutdowns, the permit at the time of surrender should reflect all the applicable emission standards. Therefore, any actual emission reductions generated in conformity with the permit should be surplus at the time of permit surrender. However, CARB staff would note several examples discovered in this review where this assumption turned out to be unwarranted, e.g. permits representing "non-compliant dormant emissions units" or "fee-paying units," which contain emission limits that are not reflective of the applicable rule standards. Nevertheless, this by itself should not cause any inaccuracies in the equivalency demonstration provided the surplus value of the reductions is determined at the time the reductions are used as mitigation.

CARB staff has determined that the District's procedure above for assessing actual emissions reductions from orphan shutdown is reasonable and appropriate, with four clarifications. First, in step 4 of the procedure for determining the amount of emission reduction, the word "blanks" should be understood to refer to an absence of data, not actual zeros, i.e., where the record clearly indicates zero emissions or non-operation. Second, orphan reductions should be subject to the surplus-at-time-of-use requirement as required by Rule 2201. Third, when a shutdown involves multiple emissions units, only one consecutive 24-month period (or 12-month period per the District's procedure referenced above) should be used to determine the actual emissions. This stipulation should be observed for determining the amount of creditable reductions from orphan shutdowns because it prevents double counting of emissions that are merely shifting from unit to unit over time (i.e., shifting to a similar

[58] SJVAPCD Offset Equivalency Step-by-Step Instructions, III.C. Bullet point i (C.III.24).

source within a facility or counting emissions that were relied on in an internal offset or netting action). Thus, to use a specific period of emissions inventory for one unit, but not for other units, (and instead using, for example, ½ PE) is inconsistent with this stipulation and inconsistent with how the District would normally bank these reductions were they to go through a formal banking process. Fourth, related to the previous point, the District should not credit emission reductions related to older cancelled permits that could not legally operate or emit at the claimed levels within the five-year look-back period to determine the actual emissions.

CARB staff reviewed a random sample of 11 orphan shutdowns used as mitigation in the 2018 tracking period (Table 14).[59] CARB staff determined a lower value for the reductions than the District had for most of the orphan shutdowns. The differences between CARB's determination and the District's determination appear to result mainly from (1) the District not following the procedure in Steps 1 – 4 noted above, or (2) the District not appropriately discounting the emission reductions to reflect their surplus value.

In orphan reduction 2011-S-9990046-4884, the District did not use the available emission inventory record, the compliance record, correspondence from the operator, or the PE value as indicated on the permit to determine the amount of creditable emission reductions. This shutdown consisted of six petroleum storage tanks and one wastewater storage tank. The District received a letter from the operator requesting cancellation of the permits on November 29, 2010. In the letter, the operator noted the tanks had not operated since summer of 2001. The District's June 29, 2010 inspection report also stated the facility had been out of service since 2001. In June of 2011, the facility submitted a 2010 emission inventory report indicating no throughput for any of the equipment in 2010.

The District claimed 525.8 tons per year of VOC creditable reductions for the surplus-at-time-of-use equivalency in 2011 as indicated by the equivalency database entries showing ini_r_voc and aer_voc = 528.8 tons per year. As of the 2018 equivalency report, 320.1 tons per year VOC had been used in the equivalency demonstrations since 2011 (used_voc) with 205.7 tons per year remaining (r_voc).

CARB staff found that the record demonstrated that actual emissions were zero for this facility since summer of 2001. Following the District's rules for crediting reductions from deleted facilities, the amount of creditable VOC reductions available from the shutdown should have been 0 tons per year. If one allows that the District system tracked these zeros as "blanks" or missing data, then ½ PE would be used. The facility-wide Title V permit S-46-0-2 renewed for this facility in 2009 had a facility-wide cap on

[59] All orphan reductions can be identified in the tracking system and annual reports by the "999----" in their tracking number. The tracking number also reveals the facility identification number associated with the permits and when the District claimed the emission reductions for the tracking system. For example, orphan reduction 2011-S-9990046-4884-1 was from the shutdown of facility S-46, and the District claimed those reductions for the equivalency demonstration in 2011.

VOC emissions of 50 tons per year. Using the District rule that would credit ½ PE for a shutdown facility in the absence of any emission inventory data from the previous five years. At most, the District could claim 25 tons per year of VOC for use in the equivalency demonstration. CARB staff believes the permissible creditable reductions for the shutdown of this facility in 2011 should be 0 tons per year VOC; however, in no case should the amount of creditable reductions be greater than 25 tons per year VOC. The District acknowledged and indicated they would address this issue.

The results from CARB staff's review of the sample of 11 emission reductions from orphan shutdowns used in whole or in part in the 2018 Equivalency Report is presented in Table 14. For each of these shutdowns, CARB staff calculated the amount of orphan actual emission reductions (AER) that could be claimed or used and compared to the amount of credit taken in the District Track_Master and Track_Allocate databases. CARB's results were consistently lower than District's recorded values. These results may or may not be representative of other orphan shutdowns, because each orphan shutdown presents a unique set of circumstances that determines the amount of credit that can be claimed. Detailed explanations and reference documents for all the orphan shutdowns indicated in Table 14 will be included on the San Joaquin Valley ERC Program Review Public Documents web page.

*CARB staff did not have the information to verify the District's value.

[60] The District values in the table below are found in Track_Master under one or more fields aer_pollutant ini-r_pollutant, and used_pollutant.

V. Part 4: Application of Offset Requirements to Permitting

The District's ERC system works as part of a larger NSR program to accomplish the air quality goals in the San Joaquin Valley. ERCs are the currency of offsets, and offsets are a NSR requirement. In most cases, BACT is triggered and evaluated prior to offsets being required. As a result, BACT has a direct relation to whether offsets are triggered and how many are required as part of NSR. Therefore, the final portion of the review focused on how the District calculated and used offsets in the permitting process.

Based on the limited analysis we have conducted, we found the District generally appears to apply its NSR program consistent with its rules and policies. In addition, we found no difference in the application of the District's NSR program between ATCs selected from the community list, and those selected at random.

CARB staff selected 30 ATC projects for this portion of the review. Most of the projects were drawn from a list generated by District staff of approximately 7,200 ATC projects issued by the District from 2016 to 2018. A few projects outside this window were chosen when staff could not locate a project within the 2016 - 2018 window that met the other selection criteria. Half (15 of the ATCs) were selected from random facilities, and the other half (15 of the ATCs) were selected from a list of facilities raised by community groups: Rio Bravo Fresno, Vitro, San Fe Petroleum Terminal, MB Technology, Chevron USA Inc, Aera Energy LLC, Kern Oil and Refining, Alon Bakersfield Refining, and Gallo Glass Company. It should be noted that for the 15 facilities from the list, there were hundreds of individual ATCs from which one was selected at random, from each facility.

CARB selected projects based on several criteria. The main criterion was that the projects had to illustrate some facet of the offsetting requirements, offset exemptions, or calculation methods that feed offset determinations in District Rule 2201. Other aspects of the projects, e.g., BACT, risk assessments, application of prohibitory rules, were also reviewed, however, as they were integral to the ATC project approval. Table 15 lists the projects selected for analysis:

Table 15. Authority-to-Construct Applications Selected for Review

^ Project selected at random from one of 9 facilities requested by community stakeholders.

Consistent with CARB staff's evaluation of ERCs in Part 2 of this report, CARB staff's analysis identified transparency and record gaps as an issue. In a majority (21 of 30) of projects reviewed, the evaluation did not provide enough information to replicate or verify the information used in the District evaluation or provided in the facility application, or did not clearly document calculations. In some cases, citations were not provided for assumptions or the evaluation lacked explanation for determinations. The following ATCs were impacted by lack of information: S-1150871, S-1153263, S-1153552, S-1153809, S-1160023, S-1163220, S-1170151, S-1171639, S-1173694, S-1173785, S-1182363, S-1182997, S-1182998, S-1183515, S-1183520, N-1152244, N-1183369, C-1172937, C-1181006, C-1181525, and C-1182872.

Examples of transparency issues found include:

- S-1183520: The engineering evaluation did not include emission factors or emission calculations used to determine the potential to emit. There was no explanation for the ranking of control technologies in the BACT analysis. The PE and BE calculations were not clear, which affects the quantity of offsets required.
- S-1173694: There were no emission calculations provided, so it was not possible to verify if the District's conclusion that there would be no change in emissions. This affects applicability of BACT, Offsets, and public notice.
- S-1153552: The project was for a relaxation in monitoring requirements, but was classified as a Title V minor modification without a justification in the evaluation. Calculation issues in the PE1 and PE2 tables make the values difficult to follow.

Finally, CARB staff conducted a cursory review of the SJVAPCD and other district's offset thresholds, BACT trigger levels, BACT cost-effectiveness thresholds, and BACT cost-effectiveness assumptions. There are clear differences between the District's BACT trigger and threshold levels compared to other districts. There are also clear differences in these factors among all the districts. While all air district NSR programs have the same basic structure, they vary in their detail. As a result, staff's review of offset thresholds, BACT trigger levels, BACT cost-effectiveness thresholds, and BACT cost-effectiveness assumptions was not sufficient to make specific conclusions about the overall stringency of the District's NSR program. Such an assessment of the district's NSR program is beyond the scope this report.

California air quality policy and management is increasingly focused on addressing community scale impacts along with the long-standing focus on regional attainment of air quality standards governed by both the Clean Air Act and State law. As a result, there is a growing need to understand how existing NSR programs address both regional and community scale needs. The review necessary to develop a sufficient understanding of NSR programs and how they are applied must be broader than an evaluation of a single district's program. As noted NSR programs can vary in complex and nuanced ways. Understanding how they work and what the opportunities are to optimize the systems to ensure they meet current and future needs will require the focused efforts of staff from multiple air districts as well as CARB staff. CARB staff proposes to begin a discussion with the air districts as well as stakeholders concerning the approach for conducting such a review.

VI. Summary and Recommendations for Future Action

The current SJVAPCD ERC bank contains nearly 11 million pounds of NOx ERCs when valued at time-of-issuance. While the bank is large, 80% of the ERCs it contains were issued more than 20 years ago. As the District's programs have become more stringent, the time-of-use value of these ERCs has declined. The District estimated in 2016 that these ERCs, when valued using time-of-use assumptions, are worth about 18% of the time-of-issuance value. This decline has no immediate impact on the holders of the ERCs, because the value of these ERCs under the District's NSR program is based on time-of-issuance. However, this decline is the reason why EPA requires the equivalency determination – to ensure that the difference between time-of-issuance and time-of-use ERC value is accounted for through sufficient offsets generated by the overall increased stringency of the District's program relative to federal requirements.

The equivalency demonstration was designed to allow the District to take credit for other reductions that are generated through their NSR program, such as the application of NSR to non-major sources, and other areas where the District's program is more stringent than federal requirements. However, when the District was reclassified to extreme non-attainment, the major source emission thresholds were reduced, which substantially reduced the advantage between the District's and federal NSR requirements. For the past decade, the District has heavily relied on orphan shutdowns and electrification projects to demonstrate equivalency. It should be noted that these projects are not related to the stringency of the District's NSR rules.

This review identified three groups of findings which, when viewed together, indicate that the District should strengthen its ERC system, to ensure the program will result in no net increase emissions across the basin, while also providing the ERCs industry needs in the San Joaquin Valley. In reviewing ERC banking actions, ATC evaluations, and the District's equivalency database, staff identified general findings in three areas:

A. Transparency and Rigor of Analysis

- In many of the ERC and ATC projects reviewed, the evaluations lacked supporting documentation that is necessary to replicate, verify or fully review the District's actions. ERC banking actions were missing information such as emissions inventory submittals, choice of baseline period, Continuous Emissions Monitoring data, source test data, and other information. ATCs in some cases were missing citations for assumptions, and some evaluations lacked explanation for determinations.
- The District's equivalency system database is lacking technical documentation, and is not self-contained, meaning that many calculations are conducted external to the database system, performed by input from or output to spreadsheet files for additional analysis. As a result, the calculations are not fully trackable within the

database system. Staff's analysis identified orphan records in the system and calculation discrepancies in the District's offset requirement equivalency demonstration (i.e., Test 1), caused in part by issues in data entry and data processing procedures before data is entered into the database. Overall, these issues highlight areas for improvement, both in District's staff's analysis, and in the database environment where staff perform calculations and engineering analyses. After the bump-up to extreme non-attainment in 2010, the number of projects has increased, creating a quality assurance challenge in an already complex system.

- Staff's analysis identified several calculation issues relating to orphan shutdowns and electrification projects affecting the surplus-at-time-of-use equivalency demonstration (i.e., Test 2). Electrification projects and orphan shutdowns both appear to be overestimated. In particular, the emission reductions from electrification projects appear overestimated by at least 35 percent. These issues need to be addressed going forward to provide confidence in the surplus-at-time-of-use equivalency demonstration to be submitted in 2020.

B. Rule Implementation

In the second set of findings, staff identified rule implementation issues:

- ERC Timeliness

In 15 of the 52 ERC projects reviewed, the District granted ERCs, generated by facility shutdowns, in which emissions ceased more than 180 days before submission of the ERC application. The District followed its long-standing policy defining shutdown as the surrender of the operating permit, when deciding to grant these ERCs. However, the District's policy conflicts with its Rule, which requires the application to be submitted no later than 180 days after the emission reductions occurred. The District should follow its Rule as written and make adjustments so that both the policy and rule are consistent.

- ERC Surplus Reductions

In four of the 52 ERC projects reviewed, the District granted ERCs even though they appeared to not be surplus of every federal, State, or district law, rule, order, permit, or regulation. This increased the value of the ERC to the applicant, and decreased the value of the ERC in the equivalency demonstration when the ERCs are used. Over time these types of decisions may put the District's offset equivalency demonstration at risk.

C. Offset Equivalency

In the third set of findings, staff identified several issues in the District's equivalency demonstration.

- ERC Electrification Project Eligibility and Calculations

The District relies on electrification projects, generated through the Agricultural Internal Combustion Engine (AG-ICE) incentive program, to demonstrate NOx equivalency with federal requirements. In calculating and claiming credit for these projects, the District used an incorrect load factor, resulting in a significant overvaluing of reductions in the equivalency demonstration. In addition, these reductions were not documented to have resulted from a permitting action, were not documented to be permanently enforceable, and potentially half of the credited projects appeared to be funded in part through the Carl Moyer program. These issues affect the magnitude and eligibility of electrification projects that are the primary basis for NOx equivalency over the past ten years. The District should address these issues in its 2020 Equivalency Demonstration.

Recommendations for Future Action

The issues identified in this report are complex, and impact a wide array of stakeholders in the San Joaquin Valley including residents of the Valley, industries that rely on offsets and ERCs in order to expand or build new business, environmental organizations who advocate for cleaner air, and community groups representing those living near stationary and mobile sources who are impacted the most by emissions at the local level.

As a result of the findings highlighted in this report, CARB staff recommends that the District take specific action to address the following overarching findings as detailed in this evaluation.

- Revise the program to make it more transparent to the public and industry and more rigorous.
- Upgrade the District's Implementation procedures and policies.
- Review and revise assumptions in the equivalency demonstration as identified.

California Resources Corporation Announces Carbon Dioxide Management Agreement For CTV's First Permanent Carbon Storage Project

07 Dec, 2022

Project Aims to Sequester Initial 100,000 Metric Tons of CO_2 Per Annum in 2025

LONG BEACH, Calif.--(BUSINESS WIRE)-- California Resources Corporation (NYSE: CRC) today announced a Carbon Dioxide Management Agreement (CDMA) between Carbon TerraVault JV Holdco, LLC (CTV JV) and Lone Cypress Energy Services, LLC (Lone Cypress), an independent energy company focused on the development of low-carbon hydrogen generation facilities and energy infrastructure, to sequester 100,000 metric tons (MT) of carbon dioxide (CO_2) per annum from a newly constructed blue hydrogen plant at the Elk Hills Field in Kern County. Called the Lone Cypress Hydrogen Project, the project aims to be California's first blue hydrogen facility producing 30 tons per day and has the potential to expand to 60 tons per day of blue hydrogen with up to 200,000 MT of CO_2 sequestration per annum.

Blue hydrogen is a net zero-carbon intensity fuel produced from natural gas. The CO_2 generated during the methane reforming process is captured and will be stored permanently underground.

"We are excited to be at the forefront of the energy transition in California. CRC is enabling the net zero energy economy by partnering with Lone Cypress to site a brand-new hydrogen facility at our Elk Hills Field as well as offering permanent CO_2 sequestration through Carbon TerraVault," said Mac McFarland, CRC's President and Chief Executive Officer. "Because capture and compression are built into the project development, we anticipate limited capital requirements from the CTV JV and EBITDA per metric ton within our previously stated range. This CTV storage project is a meaningful

Skip to main content

step forward in CRC's rollout of carbon capture and sequestration technology across the state and is the first of, what we believe, will be many projects to come. We are also excited about the ability to leverage our Elk Hills asset to create a Net Zero Industrial Park by combining green field development and carbon sequestration."

CDMA Highlights:

- The CDMA frames the contractual terms between parties by outlining the material economics and terms of the project and includes conditions precedent to close. The CDMA provides a clear path for the parties to reach final definitive documents and a Final Investment Decision (FID)
- The Lone Cypress Hydrogen Project will employ a proprietary steam methane reformation technology with an integrated carbon capture system. The facility is expected to produce 30 tons per day of hydrogen at startup with the ability to expand to 60 tons per day of hydrogen which is under consideration. This translates to an initial 100,000 MT per annum of associated CO_2 that will be permanently sequestered through CTV or 200,000 MT per annum of CO_2 that will be permanently sequestered if the project is expanded
- Project FID is targeted in late 2023, with full operations by the end of 2025, in line with the CTV JV's stated goal of first injection in 2025
- The CDMA provides Lone Cypress with access to 50 surface acres at the Elk Hills Field with the option for an additional 50 acres if expansion to a 60 ton per day project is pursued
- The CTV JV will provide infield transportation and a permanent CO2 sequestration site at 26R in exchange for an injection fee on a per ton basis that fits within the previously disclosed economic type-curve for projects that require a storage-only solution
- The project's location at Elk Hills will eliminate the need for long haul CO_2 transportation and certain midstream capital requirements
- CO_2 capture capital will be effectively eliminated as CO_2 capture equipment, the most capital-intensive portion of carbon capture and sequestration (CCS) projects, will be built into the design of the new Lone Cypress hydrogen facility
- These project attributes will enable CTV JV and Lone Cypress to supply cost competitive, blue hydrogen to California's burgeoning zero emissions mobility and industrial markets
- In addition, the CTV JV has the right to take a majority equity stake in the project, as well as to provide sequestration services for all subsequent Lone Cypress hydrogen projects in California

Skip to main content

“Partnering with CTV JV represents an incredible opportunity to continue the growth of our hydrogen and carbon capture businesses. California is at the forefront of the global energy transition and through this partnership, we intend to be a leader in its low-carbon fuels market,” said Greg Brooks, President and Founder of Lone Cypress Energy Services. “CTV’s unique expertise in subsurface operations and permitting, large CO_2 storage position and ability to deliver on highly complex and capital-intensive projects provide us with a clear line of sight as we continue to evaluate additional projects in California. We are excited to generate the first blue hydrogen molecule in the state of California and provide the market with a low-cost low-carbon option to meet its decarbonization goals.”

In line with Governor Newsom’s recently announced climate measures, the construction process of the new Lone Cypress Hydrogen Project and associated CCS infrastructure is expected to provide at its peak approximatively 125 temporary construction jobs and 18 permanent technical jobs, further benefitting California’s economy and supporting the state’s leading climate goals.

About Carbon TerraVault Joint Venture

Carbon TerraVault Joint Venture (CTV JV) is a carbon management partnership focused on carbon capture and sequestration development, and was formed between Carbon TerraVault (CTV), a subsidiary of CRC, and Brookfield Renewable. The CTV JV develops both infrastructure and storage assets required for CCS development in California. CRC owns 51% of the CTV JV with Brookfield Renewable owning the remaining 49% interest.

About California Resources Corporation

California Resources Corporation (CRC) is an independent oil and natural gas company committed to energy transition in the sector. CRC has some of the lowest carbon intensity production in the US and CRC is focused on maximizing the value of our land, mineral and technical resources for decarbonization by developing CCS and other emissions reducing projects. For more information about CRC, please visit www.crc.com.

About Lone Cypress Energy Services

Lone Cypress Energy Services, LLC is an independent energy company focused on the development and operation of infrastructure across the entire energy value chain. Headquartered in Tulsa, OK, Lone Cypress offers a full suite of technology-enabled solutions including project development, project management, EPC contracting, and asset operations. Lone Cypress specializes in the development of hydrogen generation and

distribution projects, waste to energy plant solutions, and traditional oil and gas midstream facilities. For more information, please visit www.lonecypressenergyservices.com.

Forward-Looking Statements

This document contains statements that CRC believes to be “forward-looking statements” within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934. All statements other than historical facts are forward-looking statements, and include statements regarding CRC's future financial position, business strategy, projected revenues, earnings, costs, capital expenditures and plans and objectives of management for the future. Words such as "expect," “could,” “may,” "anticipate," "intend," "plan," “ability,” "believe," "seek," "see," "will," "would," “estimate,” “forecast,” "target," “guidance,” “outlook,” “opportunity” or “strategy” or similar expressions are generally intended to identify forward-looking statements. Such forward-looking statements are subject to risks and uncertainties that could cause actual results to differ materially from those expressed in, or implied by, such statements.

Although CRC believes the expectations and forecasts reflected in CRC's forward-looking statements are reasonable, they are inherently subject to numerous risks and uncertainties, most of which are difficult to predict and many of which are beyond CRC's control. No assurance can be given that such forward-looking statements will be correct or achieved or that the assumptions are accurate or will not change over time. Particular uncertainties that could cause CRC's actual results to be materially different than those expressed in CRC's forward-looking statements include:

- fluctuations in commodity prices and the potential for sustained low oil, natural gas and natural gas liquids prices;
- equipment, service or labor price inflation or unavailability;
- legislative or regulatory changes, including those related to (i) the location, drilling, completion, well stimulation, operation, maintenance or abandonment of wells or facilities, (ii) the management of energy, water, land, greenhouse gases (GHGs) or other emissions, (iii) the protection of health, safety and the environment, (iv) CRC's ability to claim and utilize tax credits or other incentives, or (v) the transportation, marketing and sale of CRC's products and CO_2;
- availability or timing of, or conditions imposed on, permits and approvals necessary for drilling or development activities and carbon management projects;
- changes in business strategy and CRC's capital plan;
- lower-than-expected production, reserves or resources from development projects or acquisitions, or higher-than-expected decline rates;

Skip to main content

- incorrect estimates of reserves and related future cash flows and the inability to replace reserves;
- the recoverability of resources and unexpected geologic conditions;
- CRC's ability to successfully execute on the construction and other aspects of the infrastructure projects and enter into third party contracts on contemplated terms;
- CRC's ability to realize the benefits contemplated by the business strategies and initiatives related to energy transition, including carbon capture and storage projects and other renewable energy efforts;
- CRC's ability to successfully identify, develop and finance carbon capture and storage projects and other renewable energy efforts, including those in connection with the Carbon TerraVault JV;
- CRC’s ability to finalize definitive documents and reach a final investment decision with respect to the project contemplated by a carbon development management agreement, and its ability to enter into new carbon development management agreements that are under discussion with other counterparties;
- the ability of the Lone Cypress Hydrogen Project to achieve expected production volumes of hydrogen and associated CO_2 and the ability of the CTV JV to sequester such CO_2 volumes;
- global geopolitical, socio-demographic and economic trends and technological innovations;
- changes in CRC's dividend policy and its ability to declare future dividends under its debt agreements;
- changes in CRC's share repurchase program and its ability to repurchase shares under its debt agreements;
- production-sharing contracts' effects on production and operating costs;
- limitations on CRC's financial flexibility due to existing and future debt;
- insufficient cash flow to fund CRC's capital plan and other planned investments, stock repurchases and dividends;
- insufficient capital or lack of liquidity in the capital markets or inability to attract potential investors;
- limitations on transportation or storage capacity and the need to shut-in wells;
- inability to enter into desirable transactions, including acquisitions, asset sales and joint ventures;
- CRC's ability to achieve expected synergies from joint ventures and acquisitions;
- CRC's ability to utilize its net operating loss carryforwards to reduce its income tax obligations;

Skip to main content

- CRC's ability to successfully gather and verify data regarding emissions, its environmental impacts and other initiatives;
- the compliance of various third parties with CRC's policies and procedures and legal requirements as well as contracts it enters into in connection with CRC's climate-related initiatives;
- the effect of CRC's stock price on costs associated with incentive compensation;
- changes in the intensity of competition in the oil and gas industry;
- effects of hedging transactions;
- climate-related conditions and weather events;
- disruptions due to accidents, mechanical failures, power outages, transportation or storage constraints, natural disasters, labor difficulties, cyber-attacks or other catastrophic events;
- pandemics, epidemics, outbreaks, or other public health events, such as the COVID-19; and
- other factors discussed in Part I, Item 1A – Risk Factors in CRC's Annual Report on Form 10-K and its other SEC filings available at www.crc.com.

CRC cautions you not to place undue reliance on forward-looking statements contained in this document, which speak only as of the filing date, and CRC undertakes no obligation to update this information. This document may also contain information from third party sources. This data may involve a number of assumptions and limitations, and CRC has not independently verified them and do not warrant the accuracy or completeness of such third-party information.

The toxic legacy of old oil wells: California's multibillion-dollar problem

By MARK OLALDE and RYAN MENEZES

Co-published with the Center for Public Integrity

February 6, 2020

ARVIN, Calif. — Across much of California, fossil fuel companies are leaving thousands of oil and gas wells unplugged and idle, potentially threatening the health of people living nearby and handing taxpayers a multibillion-dollar bill for the environmental cleanup.

From Kern County to Los Angeles, companies haven't set aside anywhere near enough money to ensure these drilling sites are cleaned up and made safe for future generations, according to a months-long data analysis and investigation by the Los Angeles Times and the Center for Public Integrity.

Of particular concern are about 35,000 wells sitting idle, with production suspended, half of them for more than a decade. Though California recently toughened its regulations to ensure more cleanup funds are available, those measures don't go far enough, according to a recent state report and the Times/Public Integrity analysis.

California's oil industry is in decline, which increases the chances that companies will go out of business. That in turn could leave the state with the costs for cleaning up their drilling sites, which if left unremediated can contaminate water supplies and waft fumes into people's homes.

Under federal, state and local laws, fossil fuel companies are required to post funds, called bonds, to ensure that wells are ultimately plugged and remediated. These set-aside funds are a response to the oil industry's history in the United States, in which thousands of companies went out of business without banking enough financial reserves to pay for remediation.

Steam comes off the down pipe of an oil pump at the Belridge Oil Field in northwestern Kern County. (Robert Gauthier / Los Angeles Times)

Industry representatives say they are doing their part to pay for cleanup in California, but their bonds are woefully inadequate to meet the expected costs. The Times/Public Integrity investigation found that bonds posted to the state by California's seven largest drillers, which account for more than 75% of oil and gas wells, amount to about $230, on average, for every well they must decommission. Other bonds held by federal and local regulators don't significantly raise those amounts.

By contrast, the average per-well cost for capping wells and dismantling associated surface infrastructure in California is between $40,000 and $152,000, depending on whether a well is in a rural or urban area, according to a study released in January by the California Council on Science and Technology.

The result is a yawning gap between what the industry has provided and what ultimately will be needed. Companies have given the state only $110 million to clean up the state's onshore oil and gas wells, the council found. In actuality, it

could cost roughly $6 billion for that cleanup, according to a Times/Public Integrity analysis of state data provided to the science and technology council.

Decommissioning offshore oil wells and platforms, which is not included in those figures, will cost several billion dollars.

“These liabilities are hiding in plain sight,” said Clark Williams-Derry, an energy finance analyst at the Institute for Energy Economics and Financial Analysis. “They’re huge, but somehow they’ve become invisible to us.”

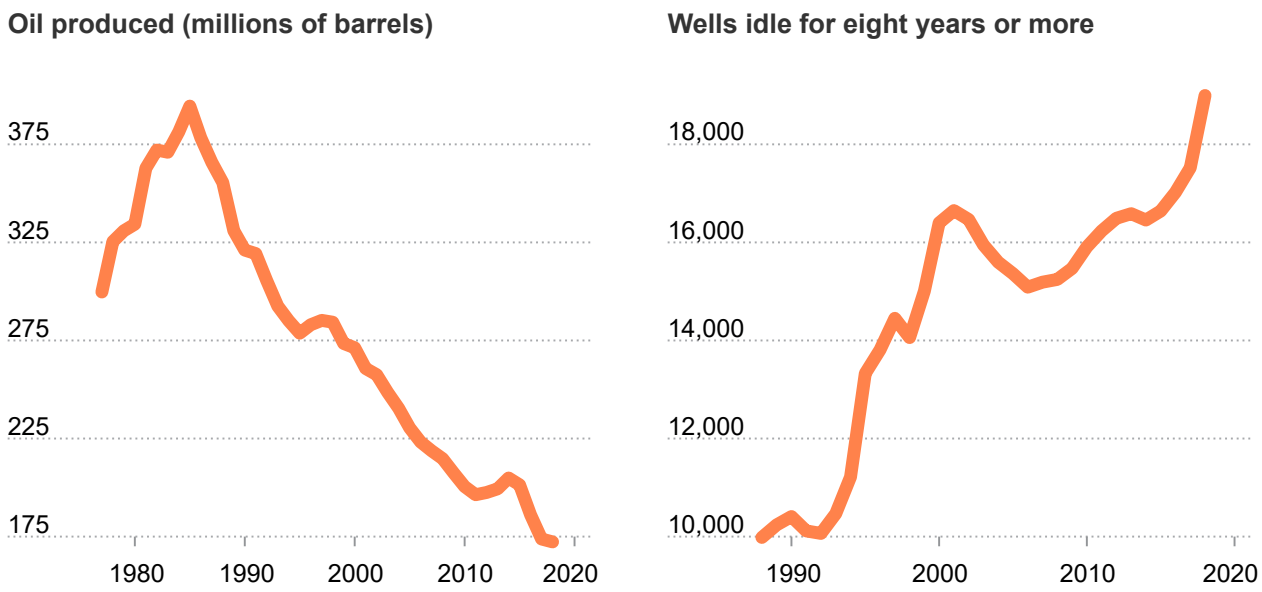
A key question is whether California’s oil industry — once a top-three U.S. producer — has the resources and staying power to pay for future cleanups.

Industry representatives contend that they will be in the state as long as Californians consume fossil fuels. “There are significant projects that are being proposed,” said Rock Zierman, chief executive of the California Independent Petroleum Assn., adding that the state’s oil industry supports roughly 18,000 jobs.

But California oil production has fallen nearly 60% from its peak in 1985, in part because the state’s deposits of heavy crude can’t compete in a world that prefers cheaper natural gas.

California's withering oil industry

As the state extracts less oil, more and more wells sit unused.



California Geologic Energy Management Division, Times/Public Integrity analysis

If output continues to drop, more communities may be left in the predicament of Arvin, a largely Latino town of 20,000 in Kern County that's dotted by drill sites. Many of those wells sit idle or produce little.

Until such wells are plugged, they can release toxic emissions and flammable gases from both their casings and the pipes that connect to them. Elvia Garcia knows that all too well.

In 2014, flames shot out of wall sockets in Garcia's home. Her pregnant daughter suffered from sudden blackouts. Government inspectors drilled test holes in lawns and found explosive levels of gas leaking from a pipe servicing wells at the end of the block.

They gave residents one hour to evacuate. It was nine months before Garcia's family was allowed to return.

"We smelled strong odors of something decaying, and that smell was coming from the outlets," she said in Spanish. "We thought there was something in between the walls that had died."

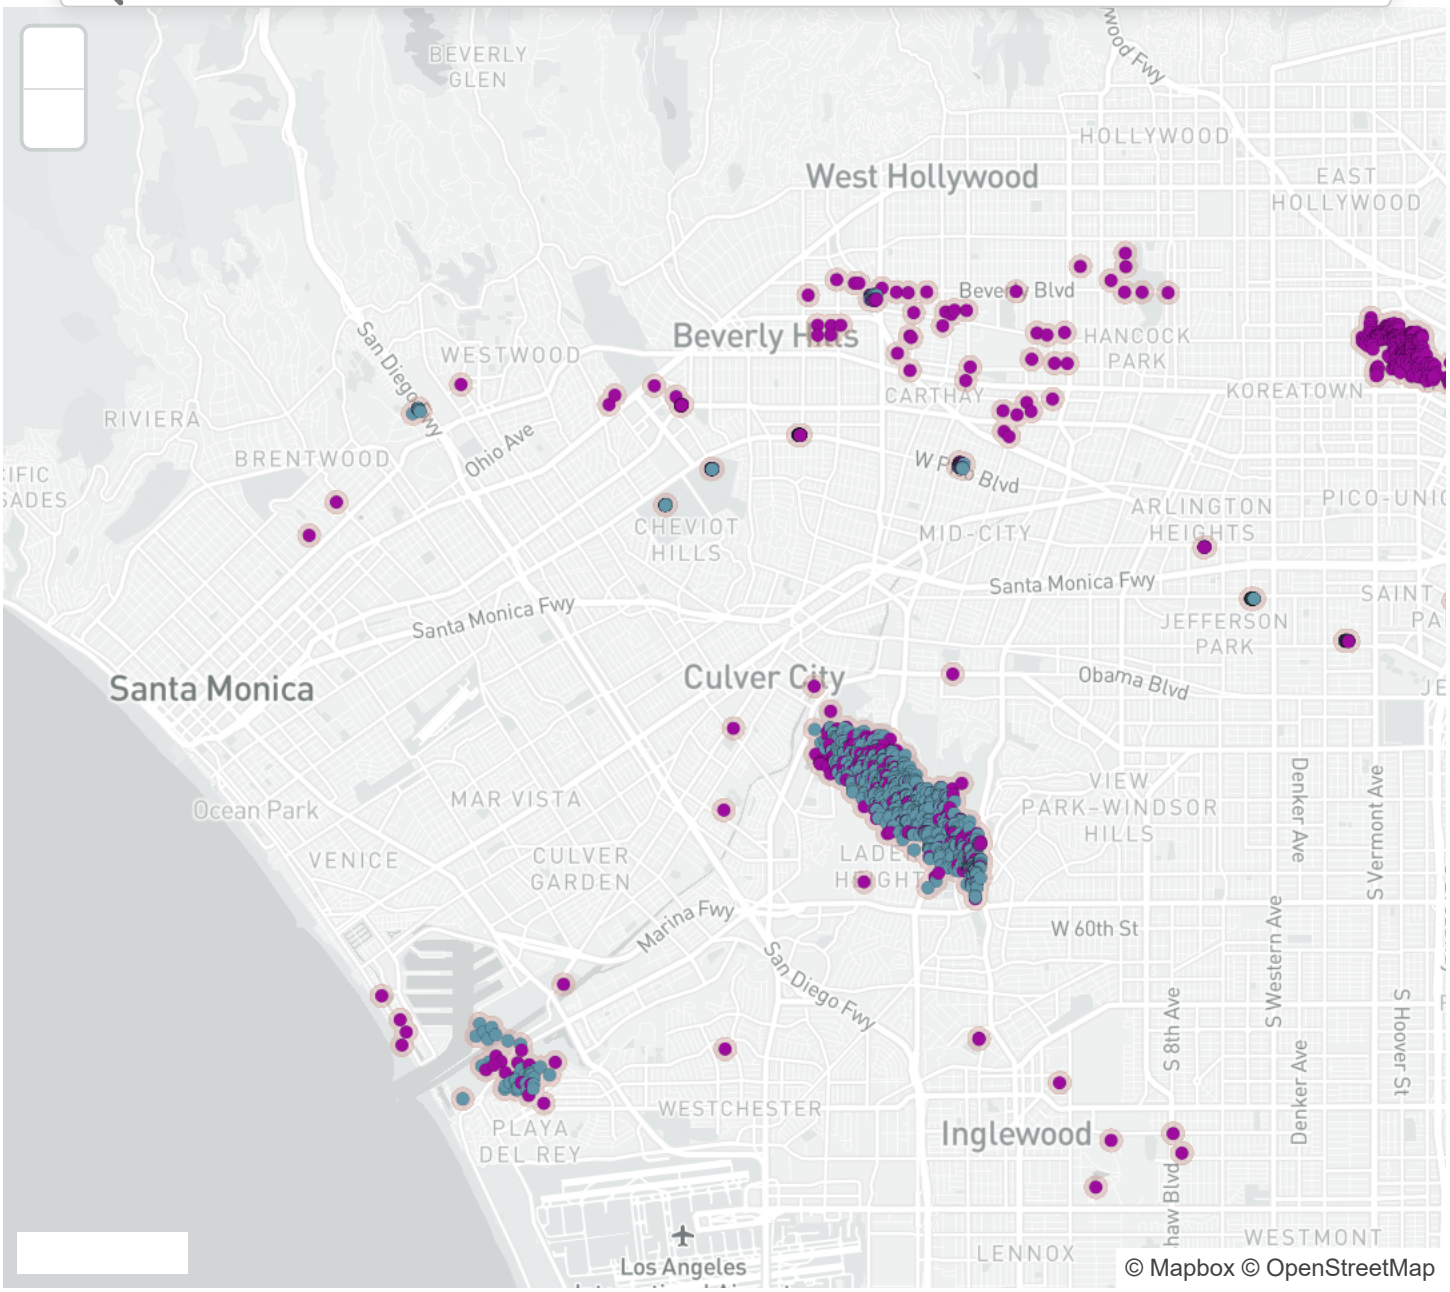
Elvia Garcia stands by an idle pump station near her home on Nelson Court in Arvin, Calif. (Robert Gauthier / Los Angeles Times)

More than 350,000 Californians live within 600 feet of unplugged wells, a Times/Public Integrity analysis of census data found. That's the distance at which people are exposed to degraded air quality, according to a 2019 report from the office overseeing oil and gas in Los Angeles.

Oil wells are known to emit likely carcinogens including benzene and formaldehyde. Uncapped, these wells also release a potent greenhouse gas, methane, that helps drive climate change.

The Times/Public Integrity investigation raises questions about the effects of these ongoing emissions if more of the state's idle wells are deserted without enough money to clean them up.

Do you live within 600 feet of California's 70,000 active or 35,000 idle wells?



It has long been industry practice to let wells go temporarily idle — for maintenance purposes, for example, or when commodity prices are low. But according to data maintained by the California Geologic Energy Management Division, or CalGEM, the agency that regulates oil and gas producers, the oil industry since its peak-production days has doubled the instances in which it idles wells for at least two years at a time.

Most cases of oil and gas wells going idle in California are short-term. But once a well has been dormant for just 10 months, there's a 50-50 chance it will never produce again, a Times/Public Integrity analysis of 40 years of state data

found. By the time federal regulators begin raising concern — at five years of inactivity — the chance that a well is ever active again falls to 1 in 4.

Industry critics say lax state regulations are allowing oil companies to walk away from wells and the liability they represent.

“All they want to do is rape the land and leave,” said state Sen. Hannah-Beth Jackson, a Santa Barbara Democrat deeply involved in attempts to regulate the oil and gas industry. “They are taking the resources of California, monetizing them and leaving us with the mess.”

Zierman, of the California Independent Petroleum Assn., rejected such claims, arguing that the use of cleanup bonds and fees on both idling and production means companies bear their share of costs.

Such bonds act like a security deposit on an apartment, with the money returned if a company meets its cleanup obligations and kept by the state if it does not. If a company goes out of business without adequate bonds, the state is on the hook for the difference or, alternately, could leave the site contaminated.

Zierman also disputed the idea that the state’s industry has no future. The problem, he said, is that state and local governments are blocking proposed projects. “Part of it is just a concerted effort to stop oil in California,” he said.

For their part, state regulators say they’re operating under the assumption that California oil and gas is on the way out.

The role of CalGEM “is really to manage that decline,” said Jason Marshall, the Department of Conservation’s chief deputy director and until late 2019 the acting head of its oil and gas division. “To make sure that when the last barrel of oil gets produced, that there are resources available so the well that produced it and all the other wells can be plugged.”

State regulators say they have new tools in place to protect taxpayers and the environment.

In October, Gov. Gavin Newsom signed legislation that gave California more authority to limit the financial liability shouldered by taxpayers. It also mandated companies conduct more thorough reporting of emissions and liability. A month later, Newsom announced the state would study the possibility of a no-drilling buffer zone around communities.

A pump station sits idle near homes on Nelson Court, where toxic fumes from a nearby well sickened residents and forced evacuations. (Robert Gauthier / Los Angeles Times)

Last April, CalGEM enacted regulations targeting idle wells. Those included increased fees on idle wells to create an incentive for producers to plug them. CalGEM, previously called the Division of Oil, Gas, and Geothermal Resources, collected $4.3 million in such fees in 2018.

Though state officials say these new regulations will better protect the state from liability, they still leave California exposed, experts say.

“The amount of the bonds currently on file is really small compared to the magnitude of the plugging obligations,” said Judson Boomhower, an environmental economist and assistant professor at UC San Diego who was the lead author of the California Council on Science and Technology report.

California’s ability to handle the shrinking size of the industry could soon be tested. One of the state’s largest producers, California Resources Corp., is responsible for the third-most idle wells of any company in the state and faces cleanup costs that far outstrip its total market value. CRC and its subsidiaries operate more than 17,000 unplugged wells, either idle or active, including four artificial islands built to tap offshore reserves.

If CRC were to fold, other companies would probably buy some of those wells, but many could become the state’s problem.

More than 7,600 wells on pause

On many days, there’s no horizon in western Kern County. Dust and pollution thrown up by the area’s twin economic engines, fossil fuel extraction and large-scale agriculture, blend the hazy sky with land that’s been sculpted into miles of straight-lined farms and oil fields hosting three-quarters of the state’s oil and gas wells.

In this part of the county, only a chain-link fence and 1,000 feet of dusty ground separate the fewer than 200 people living in the mobile homes and modest houses of Tupman from the 75-square-mile Elk Hills Field. This oil patch is so contaminated that a flock of sheep, 500 animals by one count, died here in 1960 when they drank from a pool of water tainted with arsenic, historically used to prevent corrosion in wells.

“Here’s a nice place to come out and eat your lunch,” Rosanna Esparza, a gerontologist and Bakersfield-based community activist, said sarcastically during a September visit to the eerily quiet Tupman. She gestured toward two gray picnic tables outside Elk Hills Elementary School, which sits on the oil field’s border.

Rosanna Esparza looks over a Bakersfield irrigation system that uses “produced water,” which is pulled up by drill rigs alongside oil and gas. (Robert Gauthier / Los Angeles Times)

Elk Hills is the largest gas-producing field in the state and the prize of California Resources Corp.’s portfolio. But this 109-year-old field is home to nearly 1,400 of the more than 7,600 CRC wells that were sitting idle statewide as of mid-January, according to CalGEM data examined by The Times and Public Integrity. The analysis of the most recent idle well inventory, published in September, found that CRC’s idle wells haven’t produced oil or gas, on average, for nearly 14 years.

This field is riddled with contaminants left behind by fossil fuel extraction. The U.S. Navy previously managed Elk Hills, and the federal government is paying the state to remediate 131 areas of concern here that contain arsenic, metals such as chromium and lead, and carcinogenic chemicals called polycyclic aromatic hydrocarbons.

“This is an example of what’s going to happen in the foreseeable future when other huge oil fields start to lose their glitter,” Esparza said. “This is what happens when the oil industry starts to slip.”

CRC was born in 2014 when Occidental Petroleum Corp. packaged its California assets and spun them off as a new company, shedding millions of dollars in environmental liability for Occidental in the process.

CRC has since faced harsh market forces. Oil production at the wells now owned by the company is down more than 70% since the 1980s. Gas is down more than 50%. CRC's shares had lost more than four-fifths of their value as of mid-January. The company's cash generated after expenses — a key financial measure known as net free cash flow — is several hundred million dollars in the red since splitting from Occidental, according to an analysis of U.S. Securities and Exchange Commission filings compiled by the energy analyst Williams-Derry, who has tracked CRC.

And CRC has nearly $5 billion worth of debt that's maturing by the end of 2022. Its credit rating is CCC+, which Standard & Poor's describes as "currently vulnerable" and just steps above default.

"The significant risk of this company is avoiding bankruptcy," said Paul Sankey, an oil and gas analyst and managing director with financial firm Mizuho.

On top of all this, CRC will eventually need to address its environmental liabilities. The company's most recent SEC filing lists $511 million in future cleanup costs called "asset retirement obligations."

After examining the state's historical costs, The Times and Public Integrity found it could cost more than $1 billion to plug all the wells CRC operates.

In emailed responses, CRC spokeswoman Margita Thompson said the company delivered strong third-quarter 2019 results, with record free cash flow, some debt repayment and stable production. She also said the $1-billion figure is misleading because the state would shoulder the responsibility only if CRC were unable to pay, which she indicated would not be necessary because

the company expects to make far more money off its reserves than it needs to address those liabilities. And she contended that the company can plug its own wells at a lower cost than if the state were to take over.

CRC across all its subsidiaries has more than $80 million in cleanup bonds outstanding with various agencies, satisfying its obligations, Thompson said.

She said the company takes its oil well "plugging and abandonment duties seriously," adding that idle wells are an important part of the company's inventory because they can eventually be used again to access oil and gas formations.

Oil pumps dot the landscape at the Belridge Oil Field near Lost Hills Road in northwestern Kern County. (Robert Gauthier / Los Angeles Times)

"Prematurely closing wells would worsen Californians' dependence on imports from places like Saudi Arabia," said Thompson, who earlier served as press secretary for Gov. Arnold Schwarzenegger.

Critics say CRC's approach to its aging wells raises questions about its long-term commitment to remediation.

Under California law, operators can either pay fees or agree to plug long-idled wells. Of the 10 operators with the most long-idled wells in the state, the only ones that opted for fees instead of cleanup were two CRC subsidiaries, according to data obtained via public records requests.

Holding off on decommissioning minimizes short-term costs, but it comes with uncertain consequences for California if CRC gets into deeper financial difficulties.

"A single bankruptcy among one of these large companies could potentially create a large number of orphan wells," the recent California Council on Science and Technology report said, specifically mentioning CRC.

Williams-Derry compared CRC's situation to short-lived coal companies that took on high levels of liability in recent years as they spun off from major producers that were financially hurting. "Those were companies that to all appearances were designed to fail," he said.

Industry lobbies to limit cleanup obligations

People living near unplugged oil and gas wells face exposure to cancer-causing chemicals, and toxic residue brought up by drilling below Earth's surface can contaminate aquifers that could become future drinking water supplies.

This year, California lawmakers are considering a bill that would create a 2,500-foot buffer separating wells from homes, schools, hospitals and other public buildings.

According to a Times/Public Integrity analysis, more than 2 million Californians live within that distance of an unplugged oil or gas well, with Latino, black and low-income people living nearby at a slightly higher rate than

the California population as a whole. Half of those 2 million people reside in Los Angeles.

A strict buffer requirement faces long odds in the Legislature. It's opposed by labor and oil industry groups, two of Sacramento's most well-funded lobbying forces.

In 2016, when lawmakers were considering legislation that ultimately overhauled the management of idle wells, the Western States Petroleum Assn., a trade group representing oil and gas interests, reported spending $7 million to lobby on it and other bills. Over the last five years, the trade group pumped more than $41 million into lobbying in California, by far the most of any organization in the state.

Das Williams, now a Santa Barbara County supervisor and formerly a Democratic member of the Legislature, sponsored the 2016 legislation after it became clear that decommissioning offshore oil infrastructure would be costly for the state. That law also increased state bonding, although not to the level its authors had hoped. Williams said that industry groups occupied an opposing seat at the bargaining table and that the bill's language was "a product of haggling."

The resulting changes to how the state manages idle wells have produced some progress on cleanup, according to a study CalGEM released in November. Companies plugged 988 long-term idle wells in 2018, and nine operators decommissioned more wells than the statute required.

"It's doing what we wanted it to do," said Marshall, with the Department of Conservation.

But companies continue to put off more expensive cleanup jobs in urban areas such as Los Angeles, instead focusing on rural wells that are easier to decommission, mainly in Kern County. That finding is based on data The

Times and Public Integrity obtained for every well-plugging plan that operators submitted and CalGEM approved in 2019.

The Inglewood Oil Field in unincorporated L.A. County is home to nearly 1,000 wells. It abuts the residental neighborhood of View Park-Windsor Hills. (Al Seib / Los Angeles Times)

If these wells are left open, the state will need to step in.

Because the money that defunct companies had set aside for cleanup usually falls short, the state relies on fees on idle wells and production. By law, CalGEM isn't allowed to spend more than $3 million a year to plug orphan wells, a temporary increase that will drop back to $1 million after 2021. The agency has plugged more than 1,350 such wells since 1977.

From Appalachia to the Mountain West, many other states are in a similar predicament, struggling to address cleanup of old oil wells. Utah acknowledged a funding shortfall in November, for example, and Colorado announced its cleanup would cost 14 times more than what companies set aside.

Boomhower, the California Council on Science and Technology bonding report's lead author, said oil companies often find it cheaper to forfeit an

insufficient bond than to pay for cleanup and capping. “You do have to worry that some of these small and mid-sized operators don’t have incentive to clean up,” he said.

In Arvin, fumes remain near homes and schools

Five years ago, Elvia Garcia returned to her home in Arvin, which she said had been looted while she was gone. Since then, her family has continued to suffer from lingering headaches brought on by occasional odors. State regulators fined the company responsible for the leak, Petro Capital Resources LLC. The company installed machines on homes in the neighborhood, including Garcia’s, to remove gas — and vent it into backyards.

During a September visit to Arvin, various wells near Garcia’s neighborhood hummed as they pulled up a trickle of hydrocarbons. The odor of mercaptan, the compound added to natural gas to give it its distinctive smell, hung in the air. At one site, oil stained a patch of dirt, the leak appearing to originate from another company’s storage tank.

Elvia Garcia, left, walks with community organizer Elizabeth Perez past an idle pump station in Arvin. (Robert Gauthier / Los Angeles Times)

The largely disused wells here are part of a trend. At the industry's peak, about 2.5 times as many wells produced as sat idle statewide. That ratio has fallen to about 1.5 times as many active as idle wells, the Times/Public Integrity analysis found.

Francisco Gonzalez, who lives down the street from Garcia, moved to Arvin to enjoy a quiet retirement outside Los Angeles. He said his family still smells nauseating levels of gas at certain times, and he worries about the health of children attending the schools across the street from wells.

"What is the company going to do?" he asked in Spanish. "They are not going to do anything."

Jeff Williams, Petro Capital Resources' production manager, said there can't be leaks in homes, because the pipeline hasn't been used since 2014 and wells are pulling up only enough gas to relieve pressure buildup. He said the company has no near-term plans to plug and abandon the wells because it hopes to one day restart production there.

Two blocks away, next to Arvin High School, 25 unplugged wells owned by a company called Sunray Petroleum Inc. sit deserted, 40 years after some of them last operated. Pump jacks rise above fields of almond saplings like rusting scarecrows.

Sunray, which filed for bankruptcy in 2011 and has racked up numerous violations for unpaid fees and inadequate pollution monitoring, saw its production fall off a cliff in the late 1980s. The last of its wells went quiet in 2015.

A phone number listed for the company has been disconnected, and other attempts to reach Sunray proved futile. The company has posted a cleanup

bond for its wells, but it is far less than what the law requires and what will ultimately be needed for cleanup.

In March 2017, CalGEM mailed a notice of violation to the Las Vegas-based company. In a certified letter, the division wrote that Sunray ignored requirements to test its long-idled wells, including those near Arvin High School, for indications of groundwater contamination. The agency said that failure to submit those tests could constitute a crime.

The post office sent the letter back to CalGEM with this stamp: "RETURN TO SENDER. UNCLAIMED. UNABLE TO FORWARD."

Abstract

Earthquakes occurring naturally or induced by human activities can damage surface and subsurface infrastructure. Oil and gas wells represent a category of subsurface infrastructure that can act as leakage pathways connecting oil and gas reservoirs, groundwater aquifers, and the atmosphere. The integrity of these wells can be compromised through a wide range of processes and contribute to groundwater contamination, greenhouse gas emissions, and air quality degradation. We estimate the increase in such subsurface leakage potential due to seismic activity through geospatial analysis of 579,378 oil and gas well and 196,315 earthquake (magnitudes greater than 1.0) locations in Oklahoma, California, and British Columbia. We perform density-based clustering analysis and point density mapping using *ArcGIS*. We combine the well and earthquake point density maps to identify hot spots of joint high well and earthquake densities. We find that oil and gas wells and earthquakes are clustered in space, with densities reaching ~60 wells per km^2 and ~40 earthquakes per km^2 in California. There are at least two hot spots where these clusters overlap in each state/province. In Oklahoma and British Columbia, the hot spots are more correlated with earthquake densities; while, in California, the hot spots are more correlated with well densities. Our findings indicate the need to investigate the role of earthquakes on wellbore leakage through additional analysis of earthquake characteristics, wellbore attributes, improved data collection, and empirical field studies for all oil and gas wells, including those that are abandoned. In particular, large scale geospatial analysis establishing the scope of the problem and empirical field studies focusing on identified hot spots are needed to understand potential environmental impacts of earthquakes, especially those induced by oil and gas activities.

1. Introduction

Oil and gas wells can act as pathways for fluid leakage leading to groundwater contamination and emissions of greenhouse gases and air pollutants, thereby impacting climate, air quality, and water resources. Subsurface leakage via oil and gas wells are identified as a major concern in geologic storage of carbon dioxide projects and oil and gas production [1]. Failure in barriers to well leakage, or wellbore integrity issues, can occur due to thermal, chemical, and/or mechanical stresses during oil and gas production and other activities and create or enhance fluid leakage in and around wellbores [2–5]. Database analysis are used to estimate rates of wellbore integrity failures such as cement and casing impairment and to link these issues to well characteristics, spud date, well type and construction, production history, well location, geology, operator, abandonment method, oil price, and regulatory changes [6–11]. However, there remain uncertainties in the relative contribution of these factors to wellbore integrity, and a recent study shows that we are likely to be missing important controlling factors [12]. A particularly salient process that is yet to be studied in linkage with oil and gas well leakage is earthquakes.

Earthquakes or seismic events induced by oil and gas development activities is gaining scientific and media attention due to recent earthquakes of magnitude 4 and greater ($M \geqslant 4$) in central and eastern US [13] and

© 2019 The Author(s). Published by IOP Publishing Ltd

Western Canada [14, 15]. Although there is active research on mechanisms leading to induced seismicity, relatively few studies have looked at its role on creating or enhancing subsurface leakage and associated environmental impacts [16]. Although earthquakes and other tectonic activities are listed as geomechanical factors to consider in risk assessments for geologic storage of carbon dioxide [5] and oil and gas production [4], the level of risk that earthquakes pose to such engineering projects has not been quantified.

Fluids originating from an oil-and-gas reservoir or gas pockets in non-producing formations can migrate through a leakage pathway and contribute to (1) groundwater contamination and gas emissions to the atmosphere, (2) groundwater contamination only, or (3) gas emissions only. The oil and gas industry has developed standards for well integrity in drilling and operations [17, 18] so that any leakage can be quickly detected and mitigated. However, oil and gas well leaks continue to impact our environment. Furthermore, there are no standards or requirements to monitor oil and gas wells after they have been abandoned in any jurisdiction [19] and many leaks remain undetected. Monitoring can be costly, and leakage is difficult to detect and attribute [20]. Wellbore integrity studies using laboratory testing and modeling demonstrate the wide range of potential pathways and mechanisms through which a well can fail and cause leakage [2, 4, 5, 21]. The failure can lead to fluid migration ranging from small hard-to-detect leaks to catastrophic events [22], all of which can be caused by strong shaking or finite offset during earthquakes. Furthermore, small- and large-scale failures may not necessarily be independent and small failures accumulated over time may reduce the integrity of a wellbore barrier system to withstand earthquakes and other drivers of leakage. In addition to understanding wellbore integrity and the hydraulic characteristics of each leaky well, there is a need to define the geographic scope of the wellbore leakage problem, including smaller but more prevalent leaks.

We perform geospatial analysis of earthquakes and oil and gas well data in California (CA), Oklahoma (OK), and British Columbia (BC) to make the first evaluation of enhanced subsurface leakage potential due to earthquakes. The three different regions are chosen based on oil and gas production history and seismic activity. CA is the fourth-largest oil producer (174,107 thousand barrels in 2017) by state in the US and is well-known for natural and induced earthquakes [23]. OK is the sixth-largest crude oil (165,920 thousand barrels in 2017) and fourth-largest natural gas (8518 million cubic feet per day in December 2018) producing state and has recently experienced numerous earthquakes due to oil-and-gas-related wastewater injection. BC has limited oil production but is the second-largest natural gas (5018 million cubic feet per day in December 2018) producing province in Canada with increasing use of hydraulic fracturing, which has been linked to recent $M \geqslant 4$ earthquakes [14]. Due to the range in oil and gas development and seismic activity, the analysis of these three states/province can provide broad insights on the potential link between earthquakes and well leakage.

2. Methods

We analyze 27,679 permitted well records from the BC Oil and Gas Commission (downloaded in February 2019), 229,561 wells in the CA Division of Oil, Gas, and Geothermal Resources Well Records (downloaded in February 2019), and 534,662 oil and gas well data for OK from the National Oil & Gas Gateway (downloaded in September 2019). Wells in the CA database were drilled from 1887 to 2018 and 10% of the wells were drilled in 2009 to 2018. Wells in the BC databases were drilled from 1912 to 2018, with most (77%) being drilled from 2009 to 2018. Wells in the OK database were completed from 1894 to 2019 with only 5% of the wells drilled from 2009 to 2018. These date ranges are based on available drilling, completion, or spud dates, which are not available for all well records. For BC and CA, we neglect 'cancelled' wells because we assume that these wells were never drilled and cannot act as leakage pathways. For OK, we do not analyze wells with the status 'Expired Permit Not Drilled' for the same reason. Table 1 describes the data used to represent all oil and gas wells and abandoned oil and gas wells in our analysis.

We analyze 196,315 seismic events with $M \geqslant 1.0$ in the US Geological Survey (USGS) catalog from 2009 to 2018. Most of the data (179,969 or 92%) is for CA. There are 10,109 and 6237 events for OK and BC respectively. The completion magnitudes are 1.1, 2.5, and 1.6 for CA, OK, and BC respectively (figure S7). We include all earthquake data with $M \geqslant 1.0$ to evaluate the role of frequently-occurring small-magnitude seismic events. We also map major fault traces from the USGS fault and fold database for CA and OK [24] and the BC Geological Survey's Geology Faults database for BC [25]. Faults can be a conduit, a barrier, or a conduit-barrier system, and the impact of faults on leakage can be highly variable. However, there is no available database, to our knowledge, that we can use to characterize the mapped major faults as conduits or barriers.

We perform two different spatial analysis using tools in *ArcGIS* to (1) identify clusters of wells and earthquakes and (2) combine point density distributions to determine hot spots where high well and earthquake densities overlap. First, we use the Density-Based Spatial Clustering of Applications with Noise (DBSCAN) algorithm [26] in the *ArcGIS Density-Based Clustering Analysis* tool to identify the number of clusters in each state/province for cell sizes of 5 km and 10 km and with 10 as the minimum number of wells or earthquakes. The

Table 1. Description of all and abandoned oil and gas well data by state/province with sufficient location and status information (as of February 2019 for BC and CA and October 2019 for OK).

		All wells		Abandoned wells	
	Source(s)	Count	Description	Count	Description
BC	BCOGC permitted well records	27,679	All well activity statuses, except cancelled	12,195	Well activity statuses: suspended ('SUSP'), abandoned ('ABAN')
CA	DOGGR well search	229,561	All well status codes, except cancelled	153,308	Well status codes: B (Buried-Idle), I (Idle), U (Unknown), P (Plugged and Abandoned)
OK	National Oil and Gas Gateway	322,138	All standard well status, except expired permit, not drilled	70,341	Standard well status: Abandoned, Inactive

resulting density-based clusters are used to evaluate spatial clustering in each dataset and how the number, shape, size, and distribution of clusters vary between regions. The second analysis is used to determine hot spots of high well and earthquake densities within a region and employs a two-step approach. First, we use the *Point Density* tool with a cell size of 10 km and a rectangular neighborhood to develop maps of well and earthquake densities, $w_i(x, y)$ and $e_i(x, y)$, where i denotes the state/province and x and y are the geographical coordinates. Then, using the *ArcMap Spatial Analyst Map Algebra Operators*, we normalize $w_i(x, y)$ and $e_i(x, y)$ by the maximum point density in each province/state, w_i^{max} and e_i^{max}, and estimate the enhanced leakage potential in region i, $L_i(x, y) = (w_i(x, y)/w_i^{max}) \times (e_i(x, y)/e_i^{max})$. In other words, the leakage potential ($L_i(x, y)$) represents the combination of normalized well and earthquake densities for a given state/province i. We then normalize the leakage potentials in each region by the maximum leakage potential in that region and map $L_i'(x, y) = L_i(x, y)/L_i^{max}$. We define 'hot spots' of joint high well and earthquake densities as $L_i'(x, y) \geqslant 0.1$ but also present $0.05 < L_i'(x, y) < 0.1$ (figure 1).

3. Results

Oil and gas wells and earthquakes are clustered in space in all three study areas (figure 1 and S1–S6). In CA, oil and gas wells are densely clustered in highly productive oil and gas regions, specifically the southern portion of the Central Valley of CA and the southern coastal region (Los Angeles, Ventura, and Santa Barbara Counties). Earthquakes in CA are clustered in the vicinity of the San Andreas Fault and the Eastern California Shear Zone. Oil and gas production in BC is confined to the gas-bearing Montney Basin and Horn River Basin in the northeastern portion of the province. The increase in seismicity in this northeastern BC area over the past decade is mainly attributed to hydraulic fracturing activities [14], while the earthquake clusters along the coast are mostly due to plate tectonics. Oil and gas production is prevalent throughout OK. However, earthquakes in OK are clustered in the north-central portion of the state.

California has the highest maximum densities of oil and gas wells and earthquakes with $M \geqslant 1.0$, reaching 60 wells per km^2 and 40 earthquakes per km^2 (figure 1). State-wide average earthquake densities are also highest in CA at 0.42 earthquakes per km^2 (table 3). However, OK has the highest state-wide well densities of 1.8 wells per km^2 (table 2) but with a maximum well density of 15 wells per km^2 (figure 1). BC has the smallest region-wide density of oil and gas wells at 0.03 wells per km^2 and the lowest density of earthquakes at 0.007 earthquakes per km^2 (tables 2 and 3). Correspondingly, the maximum point densities of wells and earthquakes are the lowest in BC at 3 wells per km^2 and 3 earthquakes per km^2 (figure 1).

Spatial clusters of wells are found throughout OK, whereas in BC and CA, the well clusters are concentrated in a few regions (see supporting information and figures S1–S6 available online at stacks.iop.org/ERC/1/121004/mmedia). There are 0.2 to 1.2 clusters of all wells per 1000 wells in CA and BC and 0.028 to 0.084 clusters of all wells per 1000 wells in OK (table 2) with the number of clusters increasing by a factor of 2.9 to 4.9 when the search radius is decreased from 10 km to 5 km. The well clusters in CA clearly delineate the Central Valley and southern coastal regions where oil and gas development is prevalent (figure S1). A decrease in the search radius from 10 km to 5 km separates northern and southern Central Valley into two separate clusters with the divide occurring around the Delta and the southern coastal area is separated into clusters for Los Angeles, Ventura, and Santa Barbara (figure S1). For BC, the 10-km search radius identifies the entire northeastern oil and gas-producing region as a single cluster, with a few small clusters in the northern portion (figure S2). The

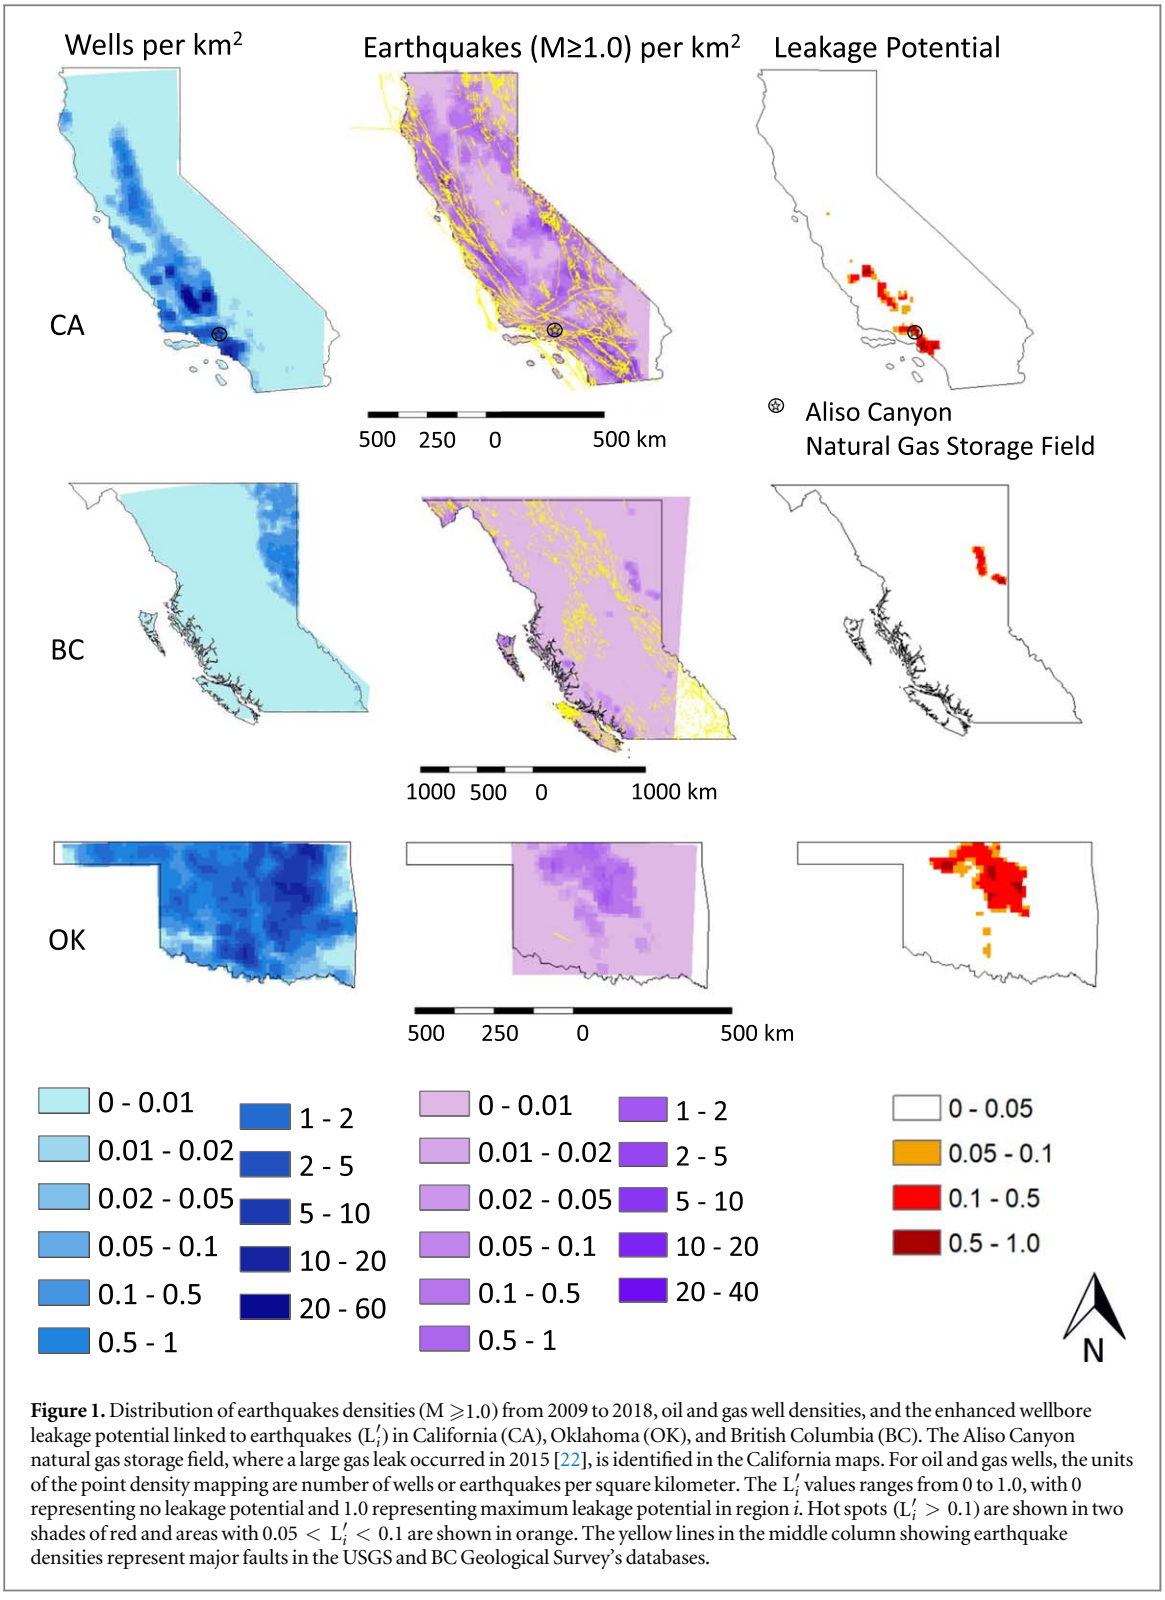

Figure 1. Distribution of earthquakes densities (M $\geqslant$1.0) from 2009 to 2018, oil and gas well densities, and the enhanced wellbore leakage potential linked to earthquakes (L_i') in California (CA), Oklahoma (OK), and British Columbia (BC). The Aliso Canyon natural gas storage field, where a large gas leak occurred in 2015 [22], is identified in the California maps. For oil and gas wells, the units of the point density mapping are number of wells or earthquakes per square kilometer. The L_i' values ranges from 0 to 1.0, with 0 representing no leakage potential and 1.0 representing maximum leakage potential in region *i*. Hot spots ($L_i' > 0.1$) are shown in two shades of red and areas with $0.05 < L_i' < 0.1$ are shown in orange. The yellow lines in the middle column showing earthquake densities represent major faults in the USGS and BC Geological Survey's databases.

5-km search radius divides the large cluster into one large cluster in the southern portion of the oil and gas region, representing the Montney Basin, and many small clusters in the northern region. However, these small clusters do not obviously follow boundaries of the Horn River or Liard Basin. In OK, there are 1.1 and 3.2 well clusters per 1000 wells when using a search radius of 10 km and 5 km respectively, both producing one large cluster in the middle and several small clusters around the fringes of the state (figure S3). The earthquake clusters also show that both 5-km and 10-km search radiuses produce meaningful clusters, some of which can be linked to tectonic activities (figures S4–S6).

Abandoned wells generally follow the same distribution as all wells in CA and BC (figures S1 and S2). This is in line with the expectation that wells are clustered in oil and gas basins, which is likely to have both abandoned

Table 2. Average state/province-wide densities of oil and gas well locations and numbers of well clusters per 1000 earthquakes using the DBSCAN algorithm with two search radiuses, 10 km and 5 km, for all wells and only abandoned wells. The well data is described in table 1.

	All wells			Abandoned wells		
	Density $\left(\frac{\text{Wells}}{\text{km}^2}\right)$	Number of clusters per 1000 wells		Density $\left(\frac{\text{Wells}}{\text{km}^2}\right)$	Number of clusters per 1000 wells	
		10 km	5 km		10 km	5 km
CA	5.4×10^{-1}	8.7×10^{-2}	2.5×10^{-1}	3.6×10^{-1}	1.3×10^{-1}	3.8×10^{-1}
OK	1.8×10^{0}	2.8×10^{-2}	8.4×10^{-2}	3.9×10^{-1}	1.3×10^{-1}	1.4×10^{0}
BC	2.9×10^{-2}	2.5×10^{-1}	1.2×10^{0}	1.3×10^{-2}	5.7×10^{-1}	4.5×10^{0}

Table 3. Average state/province-wide densities of earthquakes and numbers of earthquake clusters per 1000 earthquakes using the DBSCAN algorithm with two search radiuses, 10 km and 5 km, for earthquakes with $M > 1.0$ and $M > 3.0$. The earthquake data includes earthquakes that occurred from 2009–2018.

	$M > 1.0$			$M > 3.0$		
	Density $\left(\frac{\text{Earthquakes}}{\text{km}^2}\right)$	Number of clusters per 1000 earthquakes		Density	Number of clusters per 1000 earthquakes	
		10 km	5 km		10 km	5 km
CA	4.2×10^{-1}	2.2×10^{-1}	9.5×10^{-1}	5.5×10^{-3}	1.6×10^{1}	1.2×10^{1}
OK	5.6×10^{-2}	1.1×10^{0}	3.2×10^{0}	1.5×10^{-2}	1.5×10^{0}	1.4×10^{1}
BC	6.6×10^{-3}	6.3×10^{0}	9.3×10^{0}	3.3×10^{-4}	1.9×10^{1}	3.2×10^{0}

and active wells. Because of the general lower number of abandoned well densities, there are more abandoned well clusters per 1000 abandoned wells than all oil and gas well clusters per 1000 all oil and gas wells, differing by factors of 1.5(CA) to 17 (OK). This is because we use the same DBSCAN parameters for all wells, causing points to no longer be density-reachable and density-connected.

A larger number of clusters per 1000 earthquakes are found when using earthquakes with $M \geqslant 3.0$, than $M \geqslant 1.0$ (figures S4–S6). As with all and abandoned well clusters, this is because of the lower density of higher-magnitude earthquakes and the use of the same DBSCAN parameters. For $M \geqslant 1.0$, there are 0.22 to 9.3 clusters of earthquake events per 1000 earthquakes; and for $M \geqslant 3.0$, there are 1.5 to 19 earthquake clusters per 1000 earthquakes. The number of earthquake clusters consistently increase with decreasing search radius (10 km to 5 km) for $M \geqslant 1.0$ but not for $M \geqslant 3.0$. In CA and BC, the number of $M \geqslant 3.0$-earthquakes per 1000 earthquakes decrease from 16 to 12 clusters per 1000 earthquakes in CA and from 19 to 3.2 clusters per 1000 earthquakes in BC because of the minimum points criteria. In other words, many $M \geqslant 3.0$-earthquake clusters defined with a 10-km search radius become noise rather than multiple smaller clusters when a 5-km search radius is used. In OK, the number of earthquake clusters increase almost 10-fold from 1.5 to 14 clusters per 1000 earthquakes for $M \geqslant 3.0$-earthquakes. A comparison of the major fault locations and earthquakes shows that there are regions in each province/state where a major fault is not mapped but an earthquake cluster exists (figure 1). In all three regions, the $M \geqslant 3.0$ clusters are captured in the $M \geqslant 1.0$ clusters but there are numerous $M \geqslant 1.0$ clusters that are not co-located with $M \geqslant 3.0$ clusters (figures S4–S6).

Overlapping oil and gas well and earthquake locations shows that there are at least two hot spots with increased potential ($L' > 0.1$) for earthquakes to create or enhance leakage pathways in and around wellbores in each province/state (last column in figure 1). In CA, the hot spots are in the southern portion of the Central Valley and Los Angeles County, which are regions with large oil and gas production. The Aliso Canyon natural gas storage facility, which experienced one of the largest methane leakages in US history in 2015 [22], is located in this seismically active area with high well densities. However, other oil and gas well clusters such as those in coastal regions around Santa Barbara and southwestern Central Valley are not found to be hot spots due to lower earthquake densities. In BC, the hot spots are in the northeastern region, where all wells and a major cluster of earthquakes are located. Because there is no oil and gas activity in western BC, there are no hot spots, despite numerous earthquakes clusters along the coast of BC (figure S5). In OK, because oil and gas distribution is distributed throughout the state, the hot spots are in the southern portion of the earthquake cluster, where well

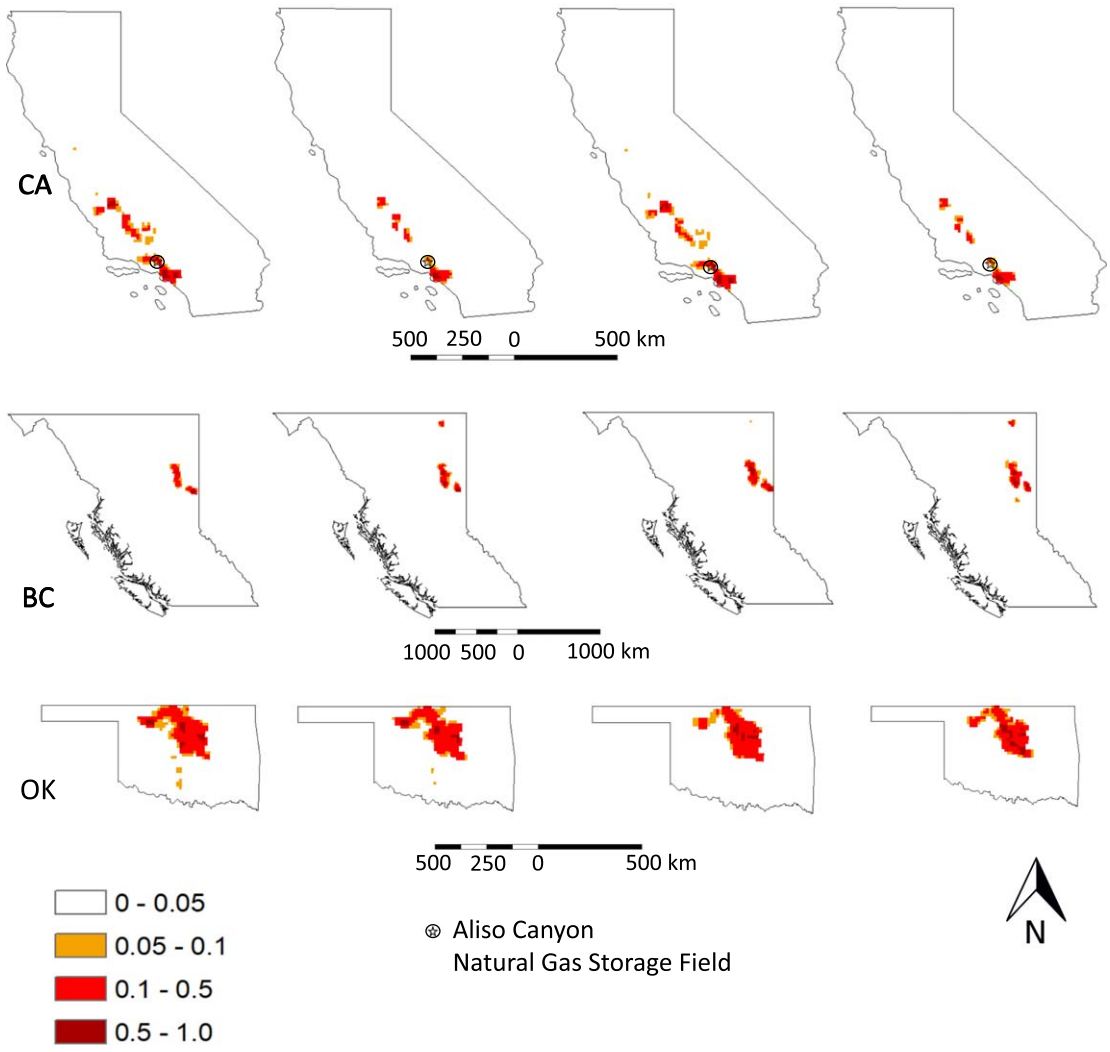

Figure 2. Distribution of enhanced wellbore leakage potential linked to earthquakes (L_i') in California (CA), Oklahoma (OK), and British Columbia (BC) for four scenarios: (1) all wells and earthquakes with $M \geqslant 1.0$, (2) all wells and earthquakes with $M \geqslant 3.0$, (3) abandoned wells and earthquakes with $M \geqslant 1.0$, and (4) abandoned wells and earthquakes with $M \geqslant 3.0$. The leakage potential ranges from 0 to 1.0, with 0 representing no leakage potential and 1.0 representing maximum leakage potential in the given study region. Hot spots ($L_i' > 0.1$) are shown in shades of red and areas with $0.05 < L_i' < 0.1$ are shown in orange.

densities are larger. Overall, hot spots are more correlated with well locations in CA and earthquake locations in BC and OK but with important local-scale differences.

The general trends in increased leakage potential do not change substantially if we consider earthquakes with magnitudes greater than 3.0, rather than 1.0, and if we consider only abandoned wells, rather than all wells (figure 2). However, there are few small but important changes. Looking only at larger-magnitude earthquakes creates new hot spots, with the most prominent one being in northeastern BC. Most notably, the Aliso Canyon Natural Gas Storage Field is no longer in a hot spot ($L' > 0.1$) when only earthquakes with $M \geqslant 3.0$ are considered. Therefore, if any leakage is enhanced by earthquakes in this region, it is due to frequent low magnitude ($M \leqslant 3.0$) events.

4. Discussion

Earthquakes and the presence of vulnerable subsurface structures such as oil and gas wells can potentially enhance or create subsurface leakage. Our geospatial analysis point to hot spots where leakage can be enhanced by earthquakes and how low magnitude but frequent seismic events may be as important as few large events. This is in line with previous findings that show earthquake magnitudes poorly predict local damages and consequences [27]. Therefore, our findings indicate the need to investigate the role of earthquakes on wellbore

leakage through analysis of different earthquake characteristics (e.g. peak ground velocity or peak ground acceleration) and wellbore attributes (e.g. age, operational status, type), demonstrate how geospatial and temporal analysis may be used to quantify the scope of the leakage problem, and identify hot spots where future measurement efforts can be focused.

There are no studies, to our knowledge, focusing on the relationship between wellbore integrity and earthquakes. There is only one study, that we know of, with air and groundwater monitoring at one unconventional well site in Poland [16], where they found elevated atmospheric methane concentrations following an earthquake of $M = 0.5$ [16]. However, the authors were not able to attribute the elevated methane concentrations to seismic activity because methane emissions associated with normal production activities on site were not characterized. They were also unable to observe any correlations between injected volumes, seismicity, and groundwater parameters [16]. Even for natural earthquakes, the relationship between groundwater contamination/gas emissions and earthquakes remain poorly defined due to the difficulty of differentiating between the wide range of anthropogenic and natural processes governing groundwater quality and methane emissions [28]. Nonetheless, methane and other gas emissions are linked to natural earthquakes and are suggested as potential warning signals for earthquake risk [29]. Groundwater contamination due to brine and seawater intrusion through leakage pathways created by natural earthquakes are also documented [30]. Impacts of earthquakes on buildings and pipelines, including those that are buried, have long been an active area of civil engineering research. There are many empirical estimates of pipeline damage that relate the number of repairs to peak ground acceleration, peak ground velocity, maximum ground strain, and other factors [31, 32]. There is great potential to extend this existing body of research to subsurface wellbore leakage caused by earthquakes. However, there are key differences between these previous studies and the wellbore leakage problem presented here such as those related to fluid and geologic formation properties at deeper depths and to wellbore construction, use, and abandonment.

4.1. The detection problem

The limited empirical evidence linking earthquakes to leakage is due to the difficulty of detecting leakage in the first place. Environmental degradation associated with subsurface leakage appears in a subset of measurements and is not easy to detect [33, 34]. In one study across the Marcellus shale basin in Pennsylvania, where there is widespread unconventional gas production, 12 household wells out of 141 had methane concentrations exceeding the US Department of the Interior's threshold for immediate remediation, while little to no methane was found in many of the sampled wells [33]. A study synthesizing numerous studies on methane emissions from natural gas systems found that emissions follow extreme distributions with only 5% of emitters accounting for more than 50% of emissions [34]. This is also in line with government data analysis studies that show only a small percentage of wells have compromised cement and/or casing integrity (e.g. 0.7 to 9.5% in Pennsylvania [7]). Furthermore, many studies and industry risk assessment procedures focus on large, catastrophic events, ignoring smaller but more prevalent leaks. As a result, the vast majority of subsurface leakage, including those enhanced or created by earthquakes, are likely to go undetected.

The scope of the subsurface leakage problem may be substantial but is also difficult to quantify. Large differences in areal size of the province/state, the level and history of oil and gas production, and earthquake frequency, magnitudes, and distribution make comparison of leakage potential between regions difficult. The leakage potential values presented here are not designed to be used for direct comparison between states/province because they are normalized by the maximum number of earthquakes or wells in the state/province. Although the DBSCAN clusters are aimed at inter-region comparisons of the distribution of wells and earthquakes, we do not use them to provide quantitative information for leakage potential estimates. Therefore, there is a need for a generalized framework to quantify leakage potential that includes local information but also allows for inter-region comparisons.

Database analysis with oil and gas industry and government data have provided many new insights on possible controls of leakage. However, they are unable to predict leakage and leakage pathway formation remains a largely random process [12]. For example, predictive modeling using logistic regression models, support vector machines, random forests, and back-propagation neural networks with data on Alberta wells show that the database is missing important predictors of leakage [12]. This is especially true for abandoned wells, for which the number of available measurements are small and information on wellbore integrity, location, and other critical factors are lacking. For example, there are approximately ~500 measurements of methane emissions from abandoned wells, yet there are at least five million abandoned wells in North America alone [35]. To better understand subsurface leakage and to identify the role of earthquakes on subsurface leakage, the current gap in data and empirical studies needs to be addressed through efficient use of, often limited, monitoring funds, especially for abandoned wells.

4.2. Wellbore integrity

There is a large body of literature on wellbore integrity, in addition to oil and gas industry standards [17, 18], considering environmental impacts of oil and gas development [3, 4, 35–37] and potential leakage in geologic storage of carbon dioxide projects [2, 5, 6, 38]. These studies show that wellbore integrity failures can occur due to a wide range of chemical and mechanical alterations or defects that could be caused by existing or injected fluids, oil and gas operations, and existing or induced geomechanical stresses [4]. Tectonic or seismic activities are listed as one of the many ways in which mechanical alterations, which involve fracture initiation and propagation, can occur. Chemical alterations may also be promoted by earthquakes as changes in pore fluid pressure drive fluids with corrosive substances to the wellbore. To avoid leakage, wellbores typically contain numerous barriers including multiple layers of steel casing and cementing [3]. Nevertheless, leakage along a wellbore can occur within cemented zones, between cement and steel casing, and between cement and the neighboring rock formation [2, 5]. The initiation and evolution of leakage pathways often involve a combination of a wide range of chemical, mechanical, and physical factors, including corrosion and dissolution of cement in acidic environments, thread leaks, poor cementing operations, pressure changes, and thermal stresses.

It is difficult to attribute wellbore leakage to earthquakes because there typically are other contributing factors and because of the detection problem. There are many factors that influence leakage with or without earthquakes that can be broadly categorized into technical degradation of the system, human intervention, process disturbance, inherent design errors, and external events, as identified to assess leakage risk on offshore petroleum installations [39]. Although advanced wireline downhole methods for determining well casing and cementing issues exist, they are not frequently done due to high cost and instrusiveness. In response, low-cost, non-intrusive, and fast monitoring system are being developed to obtain spatiotemporal data that can better detect wellbore integrity issues [40]. However, such systems are not yet available and are not widely deployed at scales needed to evaluate the large range of wellbore integrity failures and impacts. This is particularly true at abandoned wells, where measurements and data are lacking the most. Meanwhile, abandoned wells may be more prone to leakage due to their age and lack of management once the wells are abandoned. To investigate the potential link between earthquakes and subsurface-based leakage, new low-cost, non-intrusive, and fast monitoring methods [40], database analysis [6, 7, 10] and targeted field studies are needed at active and abandoned well sites. The results in this paper provide the first step to conducting additional database analysis and designing effective field studies for leakage along all and abandoned oil and gas wells.

5. Conclusions

Hotspots with frequent earthquakes and large well counts exist in CA, BC, and OK. One well-documented catastrophic leakage (Aliso Canyon Natural Gas Storage Field) is located in one of the CA hot spots. There may be many smaller leaks that remain undetected, especially in the hot spots. Furthermore, low magnitude ($M \leqslant 3.0$) but frequent seismic activity may play an important role in subsurface leakage. However, there are many gaps in oil and gas well databases and a lack of empirical field studies of all wells, especially those that are abandoned, to make a clear link. In parallel to overcoming the detection problem and improving our understanding of leakage mechanisms, geospatial analysis such as those performed in this study provide valuable insight into developing effective empirical field studies.

There are likely many oil-and-gas-producing regions outside of CA, BC, and OK, where wellbore leakage are being or have been created or enhanced by earthquakes. Although natural earthquakes are difficult to predict, there are many opportunities to minimize anthropogenic earthquakes and associated environmental impacts. Millions of wells have been and will continue to be drilled to meet growing oil and gas demands. Efforts to estimate the scale of the problem and minimize impacts of oil and gas development are needed. This need is becoming increasingly urgent as groundwater resources are depleted and contaminated and as atmospheric greenhouse gas emissions continue to grow.

Drilling for Earthquakes

Scientists are increasingly confident about the link between earthquakes and oil and gas production, yet regulators are slow to react

BY ANNA KUCHMENT

July 2016 Issue | Environment

Editor's Note (11/7/2016): A magnitude 5.0 earthquake struck central Oklahoma on Sunday, Nov. 6, damaging buildings across the area. Experts have not yet tied the quake to oil and gas production, but the epicenter is near wastewater disposal wells, structures that have been implicated in earlier quakes in the state.

To Cathy Wallace, the earthquakes that have been rattling her tidy suburban home in Dallas feel like underground thunderstorms. First comes a distant roar, then a boom and a jolt. Her house shakes, and the windows shudder. Framed prints on the walls clatter and tilt. A heavy glass vase tips over with a crash.

The worst moments are the ones between the rumble and the impact. "Every time it happens you know it's going to hit, but you don't know how severe it's going to be," she says. "Is this going to be a bigger one? Is this the part where my house falls down? It's scary. It's very scary."

Until 2008 not a single earthquake had ever been recorded by the U.S. Geological Survey from the Dallas–Fort Worth (DFW) area, where Wallace has lived for more than 20 years. Since then, close to 200 have shaken the cities and their immediate suburbs. Statewide, Texas is experiencing a sixfold increase in earthquakes over historical levels. Oklahoma has seen a 160-fold spike in quakes, some of which have sent people to hospitals and damaged buildings and highways. In 2014 the state's earthquake rate surpassed California's.

Credit: USGS

The rise in quakes coincides with an increase in drilling activity. Wallace's house, for instance, sits above the Barnett Shale Formation, a layer of hard black rock that holds the U.S.'s second-largest deposit of natural gas. Between

1998 and 2002 companies started drilling this deposit using hydraulic fracturing, or fracking, which involves pumping millions of gallons of water, plus sand and chemicals, into the ground at high pressure to crack the rock and release the gas. As the gas comes up the well so does the fracking fluid, along with volumes of brine so salty it is hazardous. The fluids are pumped back down a different hole drilled far below the shale into porous rock for permanent disposal. As more and more fluid is injected into these wastewater wells, pressure can start to build up on deep geologic faults. Eventually one can slip, causing an earthquake.

Researchers at the USGS and other institutions have tied earthquake surges in eight states, including Texas, Oklahoma, Ohio, Kansas and Arkansas, to oil and gas operations. Some state regulators have been slow to accept scientists' findings. Residents have become increasingly angry, and environmental groups have sued. “This is a public safety issue, and there's been a lot of denial and ignoring of the problem,” says Wallace, who has joined neighbors to push for the shutdown of nearby wastewater wells.

As scientists continue to study the phenomenon, they have found more reason for concern. Evidence suggests that earthquake risks can spread for miles beyond the original disposal sites and can persist for a decade or more after drilling stops. And although the biggest earthquake from wastewater injection was a 5.6 on the Richter scale, near Oklahoma City in 2011, scientists think that temblors as powerful as 7.0—enough to cause fatalities and damage buildings across a wide area—are possible, though unlikely.

THE FIRST SIGNS OF A LINK

Geologists have known since the 1960s that pushing fluids into the ground can set off quakes. In 1961 crews drilled a deep well at a chemical weapons plant

outside Denver, known as the Rocky Mountain Arsenal. Within months after workers started pumping hazardous waste into the well, residents felt tremors. More than 700 small to modest-size quakes shook the ground between 1962 and 1966.

A local geologist, David Evans, noticed that the volume and pressure of the injections corresponded with earthquake rates. In a 1966 paper he concluded that the well was likely to blame for the quakes. “It is believed that a stable situation,” he wrote, “is being made unstable by the application of fluid pressure.”

A wellhead in Coyle, Okla., pumps wastewater into a deep, underground rock formation for permanent disposal. Thousands of disposal wells operate across the state. Credit: J PAT CARTER Getty Images

The U.S. Army shut down the disposal well that same year. Yet the earthquakes continued and even grew stronger as pressure from the injections propagated belowground, encountering new faults and disturbing them. Matthew Hornbach, a geophysicist at Southern Methodist University (S.M.U.) in Dallas, compares the phenomenon with spilling a cup of water on a paper towel. “Even if you stop pouring, the water is still there spreading out, and it's very difficult to stop it,” he says. The largest quakes, including one that reached magnitude 4.8—strong enough to knock objects off shelves but generally not damage buildings—struck in 1967 and then gradually petered out. Residents continued to feel smaller tremors until 1981.

The case intrigued seismologists, and the USGS set up an experiment based on it a few years later. In 1969 Chevron Oil allowed the USGS to use one of its wells to more closely study the effects of fluid pressure on faults. The well was in a seismically active zone of the Rangely oil reservoir in Colorado, and Chevron had been injecting water into the well to stimulate petroleum production. USGS scientists turned the injections on and off and followed the fluid pressure as it migrated through deep rocks. They came up with the exact injection pressure required to trigger quakes. When the pressure exceeded that level, earthquakes rumbled; when the pressure fell below the level, they quieted down.

The experiment showed that human-triggered earthquakes could be controlled by adjusting wastewater-injection pressure. Unfortunately, the lessons of Rangely and the Rocky Mountain Arsenal were apparently forgotten by the early 2000s, when fossil-fuel companies embarked on the shale-gas boom. "Scores of papers on injection-induced earthquakes were published in the geophysical literature in the following 40-plus years, and the problem was well understood and appreciated by seismologists," says Bill Ellsworth, a Stanford University geophysicist who launched his career at the USGS while the Rangely experiment was under way. He believes professional skepticism slowed the formation of a consensus. "There were a lot of doubts expressed by very good petroleum engineers that [earthquakes caused by injection wells] were even possible," he says. "Knowledge of the whole physical process was either lost or had not been effectively communicated to a broad community."

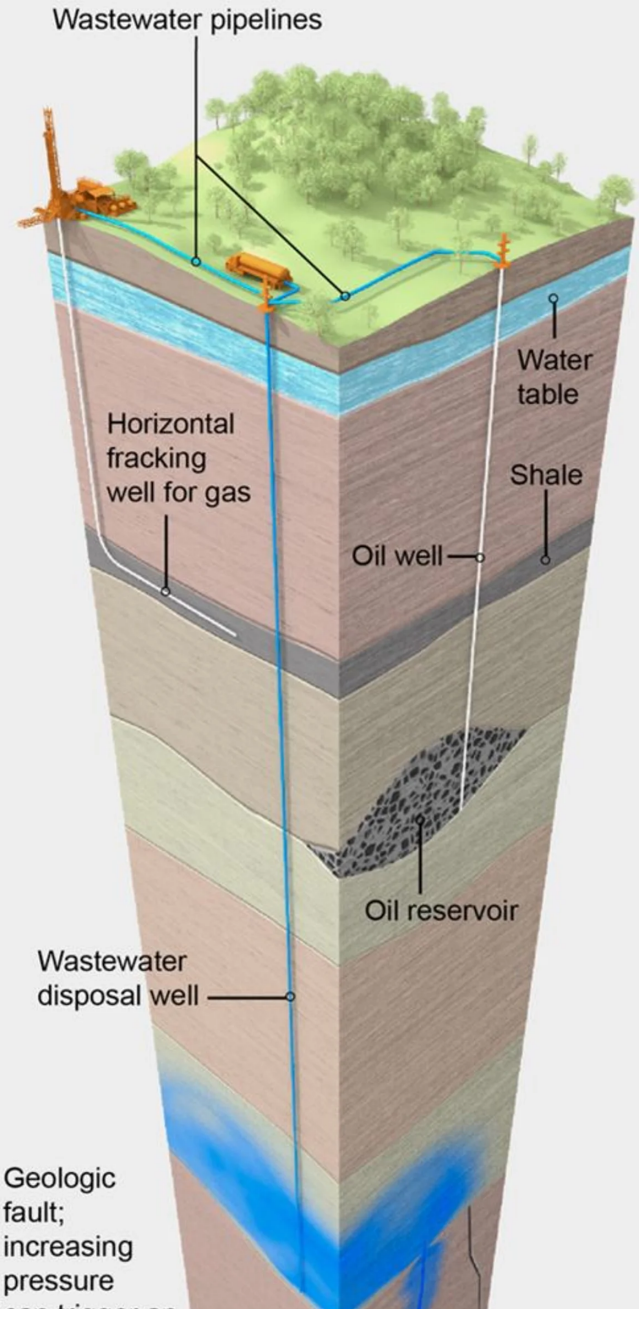
IT STARTED IN TEXAS

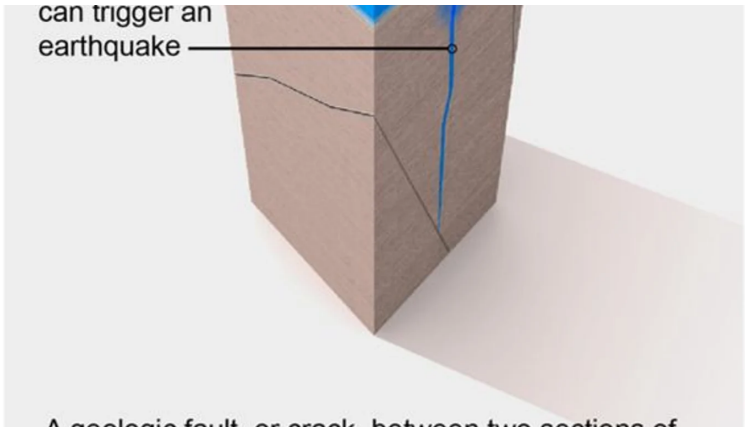
Soon after more aggressive drilling began in Texas and Oklahoma shales, reports of quakes started coming in. On October 30, 2008, Dallas–Fort Worth

residents called 911 to report loud booming noises accompanied by shaking walls and furniture. Many wondered if something had blown up.

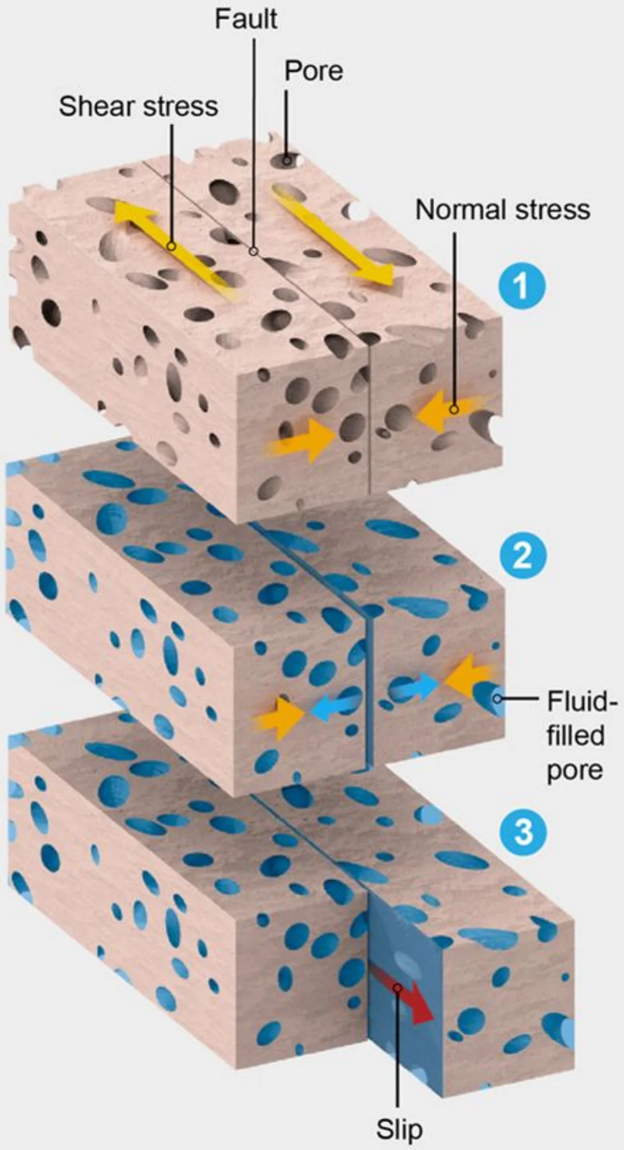
Wastewater Triggers an Earthquake

Large volumes of extremely salty brine, and chemicals, come back up gas and oil wells (*left and right, respectively*). Companies often inject this wastewater down a shaft (*blue*) into a deep layer of porous rock for permanent disposal, which can trigger an earthquake (*inset diagrams below*).





A geologic fault, or crack, between two sections of rock is held in place by “normal” stresses pushing against the crack from each side 1, negating sheer stresses that would slide the sections along the crack. When wastewater is injected it fills pores and the crack 2, which can counteract the normal stresses (*blue arrows*). That change can allow the sections to slip along the fault 3 — an earthquake.



Credit: Illustration by Bryan Christie

Seismologists Cliff Frohlich of the University of Texas at Austin and Brian Stump of S.M.U. investigated. They put out numerous seismometers and recorded more than 180 small earthquakes between October 30 and May 31, 2009. They then found that a major gas producer had recently drilled a wastewater well at Dallas–Fort Worth International Airport, less than half a mile from the center of the quake cluster. “On the basis of time and spatial correlations, we conclude the DFW sequence may be the result of fluid injection at the SWD [saltwater-disposal] well,” they wrote in a paper published in March 2010 in *The Leading Edge*.

The paper, Frohlich says, might have been ignored were it not for several other events. In June 2009 another set of quakes had rustled a small industrial city south of Fort Worth. A few months later stronger quakes shook the towns of Guy and Greenbrier in Arkansas. In March 2011 the typically steady ground of Ohio started shifting as 12 quakes rattled the Youngstown area.

From their offices in Menlo Park, Calif., USGS scientists noticed that something unusual was happening. “On a daily basis, we could see there were earthquakes occurring in places where they didn't belong,” says Ellsworth, who worked at the USGS until 2015. He began to look broadly at earthquake rates in the U.S. and discovered an unsettling pattern: Between 1967 and 2000 the average rate of earthquakes east of the Rocky Mountains was 21 per year. Between 2010 and 2012 the rate had jumped to 100. He plotted the data and presented them at a scientific conference. “It generated a lot of interest,” he says, from the general public as well as from scientists in industry and academia.

DRILLING SIDEWAYS

Behind the rise of earthquakes is the rise of wastewater injection wells. And behind those wells is a technological breakthrough known as horizontal drilling. The technique allows operators to drill wells vertically and then bend them 90 degrees like flexible straws. Instead of drilling right through a gas deposit that is 300 feet thick but miles across, these wells can turn when they are inside the deposit and run for thousands of feet, collecting significantly more gas and oil.

With that gas and oil, however, come vast quantities of very salty water. “The oil and gas business is really a water-handling business,” says Scott Tinker, Texas's state geologist and director of the University of Texas at Austin's Bureau of Economic Geology. The water comes from the same rocks as the oil and gas. All three are remnants of ancient seas that heat, pressure and time transformed. “The pore spaces, or tiny holes, in the rock remain filled with these ancient oceans, so when we drill wells today that water is produced to the surface,” Tinker says. Although the water is natural, it can be several orders of magnitude more saline than seawater and is often laced with naturally occurring radioactive material. It is toxic to plants and animals, so operators bury it deep underground to protect drinking-water supplies closer to the surface.

A legendary Texas natural gas baron named George Mitchell, who died in 2013, was the first to tap the Barnett shale using hydraulic fracturing. Oklahoma's Devon Energy combined horizontal drilling with hydraulic fracturing to extract even more gas. The technique soon caught on across Texas, Oklahoma and other petroleum-producing states.

As drilling proliferated, U.S. shale-gas production rose steeply, from 1.3 trillion cubic feet in 2007 to 5.3 trillion in 2010 and 13.4 trillion in 2014. The volume

of wastewater that was brought to the surface and had to be disposed of soared, too.

In Texas the amount of water pumped into wastewater wells grew from 33.8 million barrels per month in 2007 to 81.1 million in 2014. In Oklahoma it nearly doubled from 849 million barrels per month in 2009 to 1.54 billion in 2014. Soon regular injection wells were not large enough, and operators turned to so-called high-volume injection wells with names like "Deep Throat." Many absorbed more than 300,000 barrels of water per month.

OKLAHOMA LIGHTS UP

As the quakes mounted, scientists moved from loosely associating them with wastewater injection to deducing a more direct link. In 2011 University of Oklahoma seismologist Katie Keranen returned from a field study in Alaska with half a dozen seismometers in tow. As they stood in storage in her basement lab, a magnitude 4.8 earthquake jolted the town of Prague, about 60 miles east of Oklahoma City. No sooner had she and her students put out the instruments than a 5.6 quake rocked the same town. To date, that November earthquake is the largest event related to wastewater injection, according to the USGS. It injured two people, destroyed 14 homes, buckled parts of a highway and was felt in at least 17 states.

4

In 2011 a magnitude 5.6 quake shook homes in Prague, Okla., knocking down Sandra and Gary Landra's chimney, which struck Sandra (1). It also cracked their basement floor (2). More quakes in the state since then have prompted residents to protest against disposal wells, linked to the Prague temblor and others (3). Scientists are installing additional seismographs to increase their data, in some cases powered by solar panels (4). Credits: (1, 2 & 4) LINDA DAVIDSON Getty Images; (3) J PAT CARTER Getty Images

Keranen and her students recorded that temblor, and hundreds of aftershocks, and used the data to publish papers in *Geology* and *Science*. For the *Geology* paper, published in March 2013, Keranen and her colleagues created a geophysical model to estimate how quickly fluid pressure could build up underground and how far it could spread. It showed that the pressure was likely strong enough to have caused the first earthquake, which then set off a domino effect; stress changes from the first rupture caused nearby faults to slip. The *Science* paper, released in July 2014, tied four high-volume injection wells to a cluster of earthquakes in Jones, just west of Prague.

Keranen compares the movement of fluid and pressure through the earth's subsurface to water filling a vase that someone broke and glued back together. "If you have high enough pressure, the fluid could just force its way down the fractured pathways," she says. The pressure counteracts the friction that holds faults together and allows them to slip apart—a phenomenon known as an induced earthquake.

Unconvinced, the Oklahoma Geological Survey (OGS) issued a statement disputing Keranen's findings in the *Geology* paper. "Our point was just that it looked like a natural earthquake, and there was no reason to call it induced," says Randy Keller, who was director of the survey until he retired at the end of 2014. The statement, signed by Keller and Oklahoma's state seismologist at the time, Austin Holland, pointed to evidence of historical natural earthquakes in the area.

Keranen was surprised by the response but now thinks her reaction was naive. “I have more appreciation for the fact that they wouldn't necessarily believe one report,” she says. “They wanted to see the bulk of the scientists and multiple studies point in that direction.” Still, she felt frustrated that Oklahoma did not quickly slow down or stop injections in some wells, a step the state did not take on a wide scale until early 2015. She says she also received pushback from administrators at her university who were not convinced that a link between disposal wells and quakes could be demonstrated. In mid-2013 Keranen left the University of Oklahoma for Cornell University.

RUMBLES NEAR FORT WORTH

A few months after Keranen's paper came out, Texas started shaking again. This time quakes struck two rural towns northwest of Fort Worth—Azle and Reno, in one of the densest areas of oil and gas development.

By this time S.M.U. had hired several new geophysicists, who joined Frohlich and Stump's investigation. Heather DeShon, a seismologist, deployed seismic stations and began mapping faults underneath the towns. Hornbach, along

with Stanford's Ellsworth, began studying lake, river and aquifer levels to see if North Texas's drought could have altered stresses on faults. The team also collected data on nearby saltwater-disposal wells and built a 3-D model to simulate pressure from injection wells and estimate how it would move through underground rock. Their conclusion: wastewater injection from two nearby wells was the most likely cause of the earthquakes.

Even before the study was published in April 2015, state regulators began questioning its findings. After I sent an embargoed version of the S.M.U. paper to Craig Pearson, a seismologist who works for the Railroad Commission of Texas (RRC)—the state agency that regulates oil and gas—he responded with a statement saying the research raised "many questions with regard to its methodology, the information used and conclusions it reaches." But he declined to elaborate before meeting with the paper's authors.

The RRC (its name is a historical artifact) is overseen by three commissioners. One received campaign contributions from an oil-company political-action committee, and the two others received contributions from the CEO of EnerVest, one of the two operators implicated in the S.M.U. study. Nevertheless, "regulatory decisions are made based on science, data and best practices to ensure protection of public safety and our natural resources," wrote Gaye McElwain, an RRC spokesperson, in a statement to *Scientific American*.

The RRC did eventually summon both well operators to full-day hearings in Austin to demonstrate why their wells should not be shut down. "As a result of those highly technical hearings, based on scientific data and evidence presented, it was determined the operators were not contributing to seismic activity," McElwain wrote. By September 2015, when the commission issued

its ruling, the volumes of wastewater being injected in the vicinity of the earthquakes had been reduced, the earthquakes had died down and the well operators were officially allowed to continue business as usual.

OHIO SAYS STOP

Other states have reacted differently. After a series of tremors disturbed the residents of Youngstown, Ohio, in 2011, the state shut down nearby injection wells and installed additional seismic stations to detect earthquakes too tiny to be felt. It established new rules dictating that a quake as small as magnitude 2.0, about 10 times too weak to create noticeable shaking, would trigger well shutdowns and investigations. Ohio's earthquakes peaked at 11 in 2011 before decreasing to four in 2015, according to USGS data.

Kansas also responded relatively quickly. Rex Buchanan, interim director of the Kansas Geological Survey, was watching a Kansas City Royals game in September 2014 when his cell phone started buzzing with alerts from the USGS. Tremors were shaking south-central Kansas near the state's border with Oklahoma. This was not a surprise, because more than 100 earthquakes had visited Kansas during that year, up from an average of one every two years. But the tremors were growing stronger and soon reached magnitude 4.2. Kansas governor Sam Brownback convened an induced-seismicity task force to evaluate the quakes. The task force, chaired by Buchanan, recommended restricting injection volumes within five seismic zones across two counties.

How were Kansas officials able to reach a consensus? “I don't think we could come up with any other explanation,” Buchanan says. “You see a level of activity like we saw: a dramatic, dramatic increase, and in almost exactly the place where the really large-volume wells are going in—and where you see the

same correlation in Oklahoma. It's pretty hard to come to any other conclusion." He adds that he and his colleagues had the benefit of watching science and regulations develop in Ohio, Texas and Oklahoma. So far the measures Kansas took seem to have had an impact. "Certainly our activity has been down lately," he says, in terms of both earthquake rates and size. "But I have pressed people real hard not to take the approach that this is some sort of problem solved, because it's not."

The reduced activity is at least partly related to the currently low price of oil, which has prompted some operators to drill less and therefore to produce less wastewater. But prices will eventually rise again, Buchanan says, and he wants to be ready "so we don't have to go through this again."

HOW BIG CAN QUAKES GET?

Engineers who set building codes and officers at insurance companies need to know where the next induced earthquakes will strike and how big they will be. To find out, geologists at the USGS's Earthquake Hazards Program are analyzing the rates of the induced quakes that have been multiplying across the U.S. and how induced earthquakes shake the ground differently from natural ones.

USGS scientists have found that ground movements from induced quakes are stronger just above the epicenter but less so away from the immediate area, possibly because they tend to be shallower than natural ones. Because the uppermost layers of the earth's crust east of the Rocky Mountains are denser than those in California, however, they transmit energy efficiently, and induced quakes can still be felt at great distances.

Next, the group had to come up with a maximum magnitude for these temblors: How strong could they get? After comparing central U.S. earthquakes with tremors in geologically similar parts of the world—and noting that induced quakes, so far, tended to rupture either smaller faults or smaller sections of faults than West Coast quakes—they settled on an upper limit of magnitude 6, which can damage even well-built structures. “But we can't rule out quakes of magnitude 7 and above,” says Mark Petersen, chief of the National Seismic Hazard Mapping Project. Because scientists have evidence in the prehistoric record of quakes that large in the Texas-Oklahoma region, the USGS's new maps include a low-probability chance for that possibility.

Finally, the geologists had to work out the time period over which to make a reasonable earthquake forecast. They settled on a one-year forecast based on the previous year's earthquake rate and put that information in a series of maps. “It's kind of like the weather,” Petersen says. “If it rained today, it's more likely that it will rain tomorrow.”

The USGS issued the maps on March 28 of this year. The computer models used to generate the maps also estimate where, how often and how strongly ground shaking from an earthquake could occur, so that residents, engineers and city planners can see the likelihood that their community will experience a damaging earthquake over the next year.

CURBING THE THREAT

To many Oklahomans, it is clear that that risk has risen sharply. Data back up their experiences. The earthquake rate in the state has grown at an astounding pace. In 2013 the state recorded 109 quakes of magnitude 3 and greater. The following year the number jumped to 585, and in 2015 it reached 890.

The escalation prompted two unusual warnings jointly issued by the USGS and the OGS in October 2013 and May 2014. Seismologists stated that Oklahoma had a significantly increased chance of seeing a damaging magnitude 5.5 temblor. “It was the first time I think we'd ever issued an earthquake advisory east of the Rockies,” says Robert Williams, the USGS central and eastern U.S. coordinator for earthquake hazards.

Scientists such as Keranen and Mark Zoback, a geophysicist at Stanford, are producing even more detailed analyses of why quakes happen so frequently in some places but less—or not at all—in others. For example, North Dakota, the second-largest crude oil–producing state after Texas, has logged only one earthquake in the past five years. One possibility is that fluid pressure has not yet built up strongly enough to cause quakes. And only a fraction of faults may have the necessary orientation, relative to natural stresses in the earth's crust, that is conducive to a slip.

As the science has advanced, so have regulations. The OGS formally declared in April 2015 that disposal wells were triggering its quakes. “The OGS considers it very likely that the majority of recent earthquakes, particularly those in central and north-central Oklahoma, are triggered by the injection of produced water in disposal wells,” it wrote in a statement.

Since then, the state has asked that more than 600 disposal wells operating in quake-prone areas cut injection volume by 40 percent below 2014 levels. Although it is too early to know if the actions will have a lasting effect, Jeremy Boak, director of the OGS, says he is starting to see declines in earthquake rates in the areas where injections have been reduced. Overall, the state saw an uptick in stronger quakes at the beginning of 2016, however. Stanford's Ellsworth does not offer policy prescriptions but wonders if the volume

reductions in Oklahoma will be sufficient. “If you pump less, you're still pumping,” he says, “and it doesn't guarantee you won't encounter a fault and cause an earthquake.”

Many wonder why Oklahoma waited until 2015, after the state had experienced more than 750 earthquakes over seven years, to take significant action.

Matt Skinner, a spokesperson for the Oklahoma Corporation Commission, which regulates oil and gas in the state, says the agency had been shutting down individual wells and taking other steps to manage earthquake risk since 2013. The agency did not take wider action until last year, he says, because by that time researchers had published more scientific studies showing how far fluid pressure could travel from a wastewater well. “The issue changed from which well do we take action on to what group of wells do we need to take action on to reduce potential risk?” Skinner says.

Keller, the retired OGS director, says he was also aware of the state's economic dependence on oil and gas. “We were absolutely slower than those that were quick to pull the trigger,” he says. “We were sitting there trying to balance the economic impact and trying to not push the panic button and at the same time trying to be responsible. It was not an easy task to figure out what to do.” For well operators, a volume reduction means a loss of income and the possibility of having to truck wastewater over long distances to other facilities.

Texas has introduced new measures to monitor earthquakes. Last year the state allocated nearly $4.5 million for the installation of a seismic network and additional earthquake research. Over the past two years the Railroad Commission has also given itself new powers to shut down wells and ask operators to perform tests in areas of new seismic activity. Although the

agency has expressed concern about the quakes, it has not yet formally concluded that any have been triggered by energy production.

Other mitigation strategies that states and oil and gas companies are exploring include recycling the wastewater or injecting it into layers of rock that are farther removed or isolated from deep faults. They may also space injection wells farther apart.

To the oil and gas industry, a moratorium on injections—even in a single broad area—is unacceptable. “A ban on injection is a ban on oil and gas production,” says Steve Everley, a spokesperson for Energy InDepth, which is part of the Independent Petroleum Association of America. That is because there are not yet any cost-effective alternatives to injection, and many come with their own environmental costs, such as trucking water over longer distances, he says.

Even if Oklahoma shut down all its wells today, many experts say the quakes would continue. “We're trying to calculate how much energy is in the system right now and how long it may continue on—and at the current earthquake rate the numbers are very big,” says Daniel McNamara, a seismologist at the USGS Geologic Hazards Science Center in Golden, Colo.

Pressed for details, he paused. Then he added: “It's hundreds of years.”

EXECUTIVE SUMMARY

As new drilling and stimulation techniques, including hydraulic fracturing ('fracking'), are heralded as the key to unlocking a new oil boom in California, there is mounting evidence that these technologies, and the expansion of oil and gas development that they enable, threaten public health. As California contemplates the safety of these technologies and necessary protections, it is important to identify the populations at risk. New analysis of oil and gas development in California shows that, already, approximately 5.4 million people (14 percent of the state's population) live within a mile of one, or more, of more than 84,000 existing oil and gas wells. More than a third of these people (1.8 million) also live in areas most burdened by environmental pollution as identified by California EPA's tool (CalEnviroscreen 2.0). These communities, highly vulnerable to additional pollution from oil and gas development, consist primarily of Latinos/Hispanics (69 percent), African Americans (10 percent), and Asian Americans (11 percent). In total, people of color make up nearly 92 percent of the 1.8 million people living within a mile of oil and gas development and in communities already heavily burdened by pollution.

Currently, the drill sites that use stimulation technologies like hydraulic fracturing are generally located near existing oil and gas extraction, primarily in Kern (2,361 wells), Los Angeles (124 wells), and Ventura (456) counties. However, a smaller number of sites have also been recorded in nine other counties, including Monterey, Fresno, and Santa Barbara. The push to use hydraulic fracturing and other well stimulation technologies to access oil from formations underlying some of the state's most fertile agricultural lands and densely populated urban areas raises public health concerns, including harmful air pollution, contaminated ground and surface waters, and large amounts of toxic waste. Increased oil and gas production using these new technologies can bring more contaminants—many of which have been linked to respiratory and neurological problems, birth defects, and cancer[1,2]—to backyards, communities, and cities. Future unconventional oil and gas development using hydraulic fracturing and other well stimulation techniques in these areas, and its expansion into new areas, may exacerbate environmental problems and health threats for communities that have already been disproportionately impacted. A comprehensive evaluation of the safety of expanding oil drilling must include and ensure protections for the most vulnerable, and already overburdened, communities.

Of the statewide population living within one mile of oil and gas development and in communities identified as most vulnerable by CalEPA's new alEnviroScreen 2.0, nearly 92 percent are people of color (69 percent Hispanic/Latino, 10 percent African American, 11 percent Asian, and 2 percent Other).

Oil wells in Los Angeles

MAPPING OIL AND GAS ACTIVITY AND COMMUNITIES BURDENED BY ENVIRONMENTAL POLLUTION IN CALIFORNIA

The objective of our analysis is to examine where and how communities, especially those that are vulnerable to environmental pollution and degradation, are affected by existing and potential oil and gas development in California. In light of the impacts associated with the rapid scale-up of tight oil[3] and shale gas[4] development in Pennsylvania, Texas, Colorado, and North Dakota, the prospect of new and expanded oil exploration and production in California must be closely evaluated, including identifying who will be impacted by it and where.

We used the California Division of Oil, Gas and Geothermal Resources (DOGGR) "AllWells" and "Well Stimulation Treatment Notices Index" databases, the South Coast Air Quality Management District (SCAQMD) "Oil and Gas Wells Activity Notification" database, and the chemicals disclosure registry database FracFocus.org (all as of July, 2014) to map and describe oil and gas wells.[5,6]

The oil and gas wells that we selected from the "AllWells" database for our analysis are classified by DOGGR as either "New" or "Active". "New" wells are those that have been permitted to be drilled, while "Active" wells include producing wells and wells not plugged according to DOGGR standards. These wells may hence pose an ongoing threat as potential production sites or conduits for pollution.[7] We used the "New" and "Active" codes because they provide a measure of the number of wells that may—now or in the future—contribute to the total environmental burden on the communities. We then expanded this database to include the SB4 notification, SCAQMD, and FracFocus.org information while eliminating duplicate well entries. (For more details on well selection see Appendix I).

In a second step, we mapped the vulnerability of communities to environmental pollution and overlaid the location of oil and gas wells. We used the CalEnviroScreen 2.0—a tool developed by CalEPA to evaluate multiple pollution sources (including air, water, and soil pollution) in a community while accounting for its vulnerability to pollution's adverse health effects. The tool is now being used by several state agencies in their decision-making processes and to identify areas and communities that are in particular need of resources to address these pollution sources and cope with the negative health effects.[8] CalEnviroScreen 2.0 provides a means to identify communities that could be most vulnerable to pollution from new and existing oil and gas development. It aggregates a pollution burden index with Census characteristics that have been linked to pollution sensitivity and ranks census tracts from lowest to highest. We focus in particular on the subset of communities—the top 20% of census tracts—that CalEnviroScreen 2.0 identifies as the most highly burdened, and most vulnerable, communities in the state with respect to cumulative environmental pollution.[9]

Using spatial buffering techniques, we then calculated the number and demographics of people who live near oil and gas wells (within a quarter mile and within one mile).[10] (More detail on the calculation methods is included in Appendix I.)

EXTRACTION TECHNOLOGIES POISED TO EXPAND OIL DRILLING IN CALIFORNIA

Advanced well drilling and stimulation technologies such as horizontal drilling, hydraulic fracturing, and acidizing have brought a huge boom over the past decade in unconventional oil and gas development in at least 17 states.[11] The term 'unconventional' refers to reservoirs that have low permeability and porosity and require technologies such as hydraulic fracturing to produce oil or gas. Hydraulic fracturing ('fracking') involves pumping large volumes of water mixed with chemicals underground at high pressures to fracture the rock.[12] Acidizing is a process that increases the flow of oil and gas by injecting acids into the well to dissolve rocks and/or sediments and mud solids that are clogging the rock pores.[13] Hydraulic fracturing, as well as cyclic steam and water flooding, is also used for enhanced oil recovery (EOR) to improve formation permeability and oil flow.[14]

The Monterey Formation (see Map 1) contains various oil-bearing components known as members,[15] including the Puente or Modelo formations and the Nodular Shale in the Los Angeles Basin and the McClure, Reef Ridge, and Antelope shales in the San Joaquin Basin.[16] The Temblor Formation (including the Santos Shale), which underlies the central and southern San Joaquin Valley, has also been identified as prospective for oil. The Monterey Formation underlies much of the Central Valley's rich agricultural soils and important groundwater aquifers. In Los Angeles and Santa Barbara counties, it overlaps with one of the most populated regions in the country.

Despite uncertainty about how much oil is recoverable in the Monterey Formation tight oil play,[17] the industry continues to aggressively use and develop unconventional stimulation and enhanced recovery methods such as hydraulic fracturing to unlock oil deposits in California.[18,19] This could result in hundreds if not thousands of new wells— in addition to the more than 84,000 existing oil and gas wells (see Map 1)— in heavily drilled areas such as Kern County and new areas, even those near towns and cities.

Our database counts 84,434 active and new oil and gas wells. Of that, 7,177 are 'new' wells that have recently received a permit to be drilled, and, at least 3,003 wells that have been stimulated using hydraulic fracturing, acidizing, and other stimulation methods (including 596 SB4 notices). Since DOGGR only began adding this information recently, however, this estimate may be too low. Differences in reporting requirements also led to discrepancies between the South Coast Air Quality Management District (SCAQMD) well notices[20] and DOGGR's databases. These discrepancies, and the resulting underreporting in California, highlight the need for more effective regulation of an industry that hydraulically fractured approximately 82,000 wells in 17 other states between 2005 and 2013[21] while taking advantage of exemptions from portions of the nation's major environmental and public health protection laws.[22]

POLLUTION AND HEALTH THREATS ASSOCIATED WITH OIL AND GAS DEVELOPMENT

Experts are concerned that expanded oil drilling in California by developing the Monterey tight oil play could pose significant threats to health and the environment from hydraulic fracturing and other stimulation methods.[23,24,25] Although the extent to which these methods will be deployed in California is debated,[26,27] the literature linking oil and gas development, including hydraulic fracturing, to significant releases of air, water, and soil pollutants as well as physical, safety, and health hazards raises the potential for significant impacts.[28,29,30] Recent review studies of shale gas development identified pollutant emissions at all stages beginning with well pad construction and continuing through drilling, well completion, production, and ultimately well abandonment.[31,32] The majority of these pollutants, detailed below, are also present in unconventional oil development, which also uses hydraulic fracturing and acidizing.

AIR POLLUTION

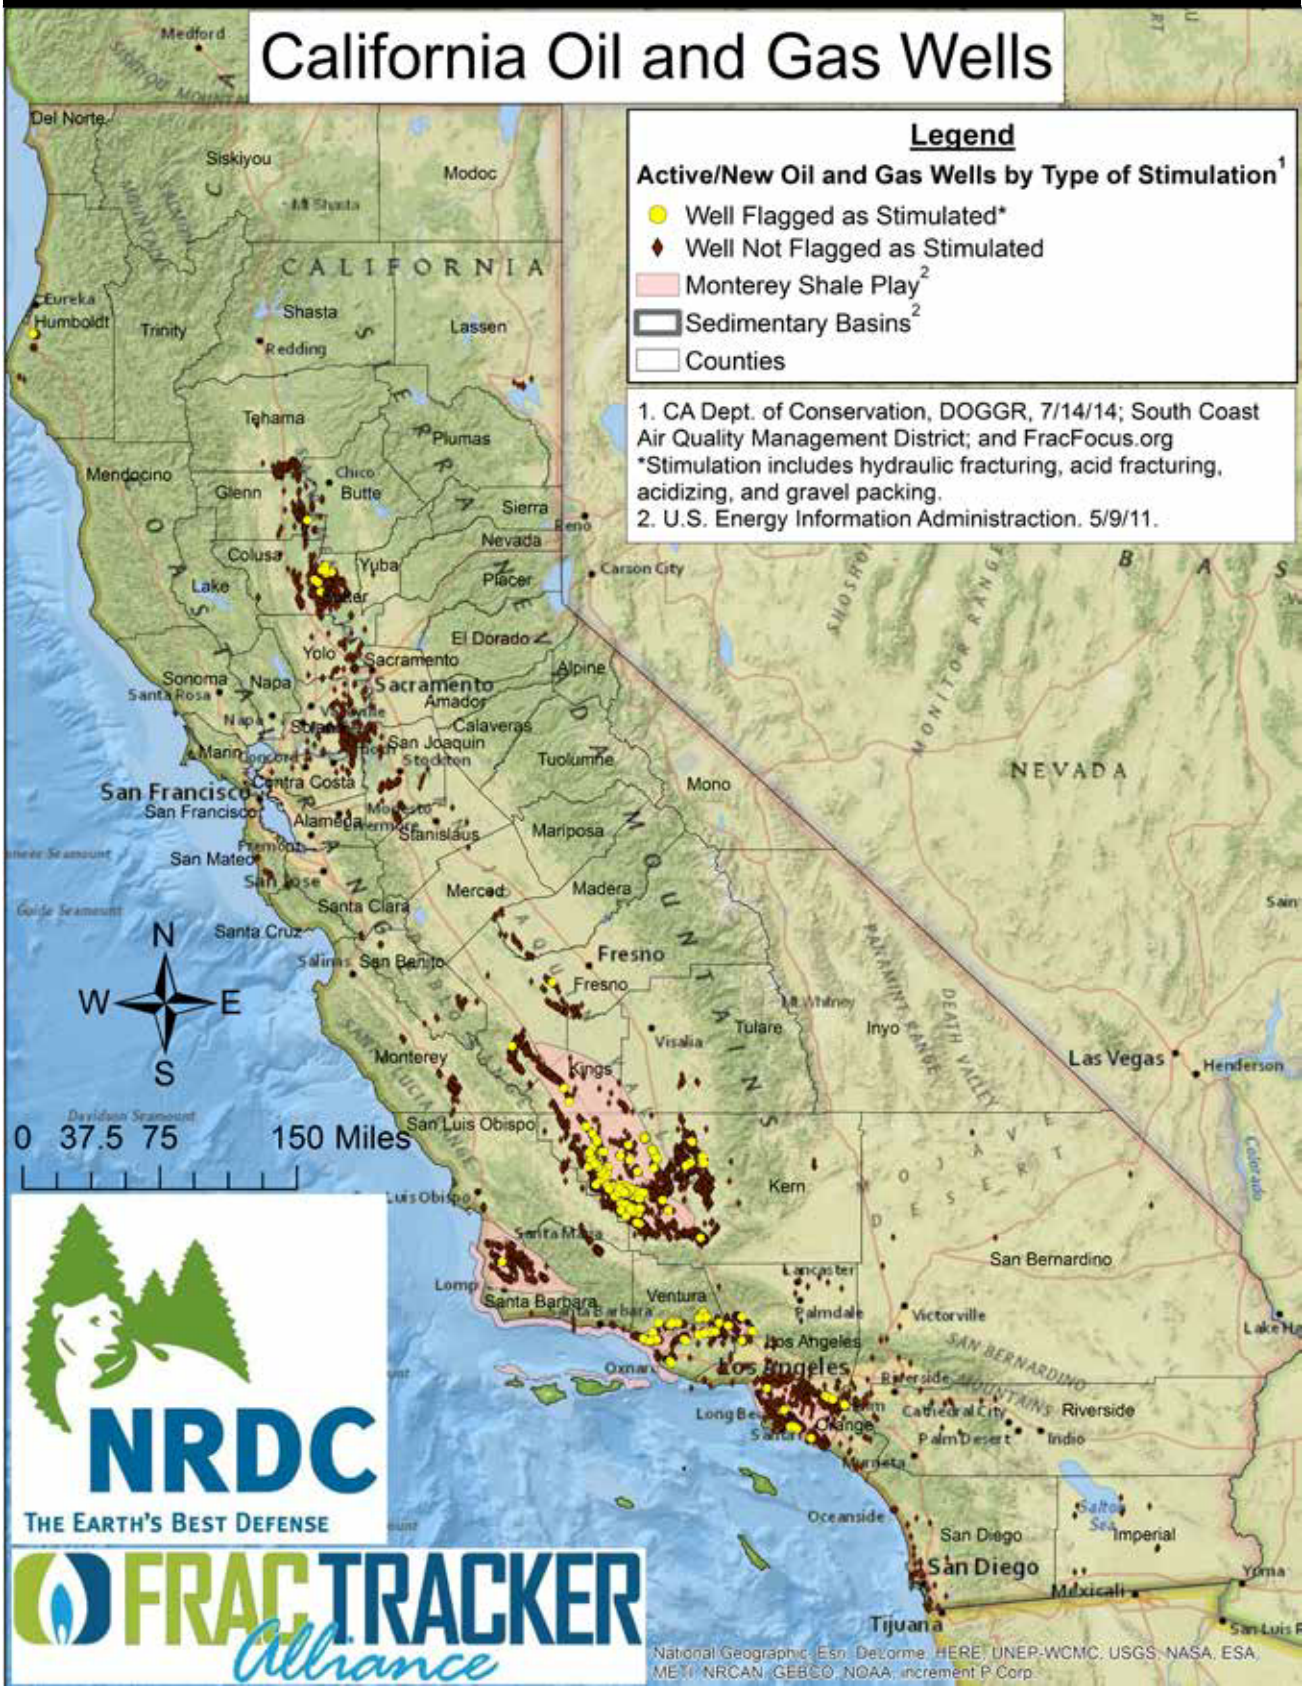
Multiple studies have found that air pollution from oil and gas development can reach levels associated with adverse health impacts for residents and communities in regions with intense oil and gas development. Air pollution from unconventional oil and gas development can be classified into emissions during preproduction, production, transmission and storage, use, and after well abandonment.[33] Preproduction emissions (i.e., well pad preparation, drilling, well stimulation, and completion) include methane, benzene, toluene, ethylbenzene, and xylene (BTEX),[34] volatile organic compounds (VOCs), nitrogen oxides (NO_x), fine particulate matter ($PM_{2.5}$), hydrogen sulfide, and silica dust.[35,36,37,38] VOCs and NO_x contribute to the formation of regional ozone, which causes smog and harms the respiratory system.[39,40,41] During production, methane and non-methane VOCs, including numerous toxic air contaminants (TACs), may continue to be released from the wellhead and other equipment such as condensate tanks, compressor stations, and open wastewater impoundment pits. Oil and gas transmission and storage release VOCs and methane.[42,43] Improper plugging of a well at the end of its life cycle can cause continued leakage of oil, methane, and other VOCs even after the well has ceased production.[44]

A broad range of health effects are associated with exposure to these air pollutants, including mild to severe respiratory and neurological problems, cardiovascular damage, endocrine disruption, birth defects, cancer, and premature mortality.[45,46]

CONTAMINATION OF DRINKING WATER AND SOILS

The large-scale exploration and production of conventional and tight oil deposits using hydraulic fracturing and related stimulation techniques risks water and soil contamination from spills and leaks; well blowouts; and faulty well casings, cement, and equipment. A recent analysis estimated that between 2012 and 2013, the number of reported spills in 15 major oil and gas producing states rose by 17 percent to more than 7,000.[47] Although many of these spills were small, their combined volume totaled more than 26 million gallons of oil, hydraulic fracturing fluid, wastewater, and other chemicals and compounds used or produced during oil and gas production. Hydraulic fracturing fluid and wastewater are often a toxic soup of chemicals. For example, a study of 353 fracking fluid constituents found that more than 75 percent of them have been shown to affect the

Map 1: Active and new oil and gas wells as of July 2014 and the Monterey shale play and sedimentary basins



skin, eyes, other sensory organs, and the respiratory and gastrointestinal systems. Approximately 40–50 percent can affect the central nervous system and the brain, the immune and cardiovascular systems, and the kidneys. Thirty-seven percent are known endocrine disruptors and 25 percent are linked to cancer and mutations.[48] Underground, the hydraulic fracturing fluid mixes with formation brines. This so-called "produced water" can be much saltier than seawater and can contain heavy metals and Naturally Occurring Radioactive Materials (NORM).[49,50,51] It is brought to the surface along with oil and gas over a well's lifespan. During "flowback" (several days following the fracturing process), between 10 and 80 percent of the hydraulic fracturing fluid returns to the surface.[52] The handling and disposal of this wastewater has been linked to air pollution when volatile contaminates evaporate and to water contamination incidents involving local groundwater and nearby waterways.

Methane, hydrocarbons, hydraulic fracturing fluid components, heavy metals, and formation fluids have been found in water wells near oil and gas sites.

Another potential source of water contamination is loss of mechanical integrity from improper well construction, maintenance, or plugging.[53] Failure of well casings and cement bonds could allow oil, gas, hydraulic fracturing fluids, and naturally occurring toxic and radioactive materials to migrate into shallower groundwater aquifers. While well integrity failure may not necessarily lead to groundwater contamination, monitoring and effective regulations are needed to detect and remediate well integrity problems and to properly plug wells. For example, a 2009 study examined records of more than 315,000 oil and gas production and injection wells drilled through 2004 in Alberta, Canada and found that 4.6 percent had gas migration problems due to improper construction. It remains unclear what percentage of these wells may have impacted groundwater.[54]An examination of more than 75,000 compliance reports for 41,381 conventional and unconventional oil and gas wells drilled in Pennsylvania between 2000 and 2012 found that the incidence of cement and/or casing issues was six-fold higher for unconventional wells compared with conventional wells and that incidence varied by geographical location.[55]

Several other studies have found methane, hydrocarbons (including BTEX), hydraulic fracturing fluids, formation brine, heavy metals, and NORM in water samples from drinking water wells and surface water bodies near oil and gas sites.[56,57,58,59,60] It is, however, difficult to determine the exact origin and pathways that led to the contamination. NORM also poses risks to workers at the well site, neighboring communities, and the environment. It can accumulate in pipes and other well equipment, build up in sediments downstream of wastewater treatment facilities, and contaminate the air and soil when wastewater is sprayed on roads.[61,62] Illegally dumped radioactive solid waste from oil and gas production has also caused contamination problems.[63]

NOISE AND LIGHT POLLUTION

Hydraulic fracturing and other well stimulation methods can lead to prolonged periods of noise and light pollution for nearby communities. Well pad preparation, drilling, and well stimulation generate significant noise levels for neighboring residences, schools, and work places. The noise—from trucks, generators, drilling operations, and pumps—can occur intermittently for days at a time over several years as wells are hydraulically fractured and reworked many times.[64] Produced gas that is not captured and sold may be flared, i.e., burned off, 24 hours a day, producing not only additional air pollution but a constant roar and bright light.[65] The health effects associated with noise and light pollution include sleep disturbance, fatigue, reduced school and work performance, hypertension, and cardiovascular problems.[66]

PUBLIC SAFETY

In areas with inadequate road infrastructure, traffic accidents are one of the largest sources of injuries and fatalities related to tight oil and shale gas development, because of the substantial amount of heavy truck traffic involved.[67,68] Other impacts include increased crime and social disruption, accidents at well sites and pipelines, fires, and explosions.[69]

SEISMIC RISKS

Researchers have known for a long time that underground injection can lubricate faults and change fault pressures potentially resulting in seismic events. The injection of oil and gas wastewater into deep underground wells (so-called UIC Class II wells) has repeatedly been linked to such events, known as induced seismicity.[70] Researchers at the U.S. Geological Survey found that the rate of earthquakes of magnitude 3.0 and higher in the central and eastern United States has increased from an average of 21 per year from 1967 through 2000 to more than 300 in the years 2010 through 2012. In 2011 alone, there were 188.[71] An analysis of the disposal of toxic wastewater in deep injection wells in California showed that 54 percent of 1,553 active and new injection wells are within 10 miles of a recently (within the past 200 years) active seismic fault line. Another 23 percent are within five miles and 6 percent are within one mile.[72] Most earthquakes caused by oil and gas activities have been relatively small. Some, like the 2011 magnitude 5.7 earthquake in Oklahoma that was triggered by wastewater injection, have been large enough to cause property damage and injuries.[73] Even small induced earthquakes, however, may compromise well integrity or other infrastructure, leading to water and soil contamination.

OIL AND GAS WELLS ARE CONCENTRATED IN COMMUNITIES STRUGGLING WITH AND VULNERABLE TO POLLUTION

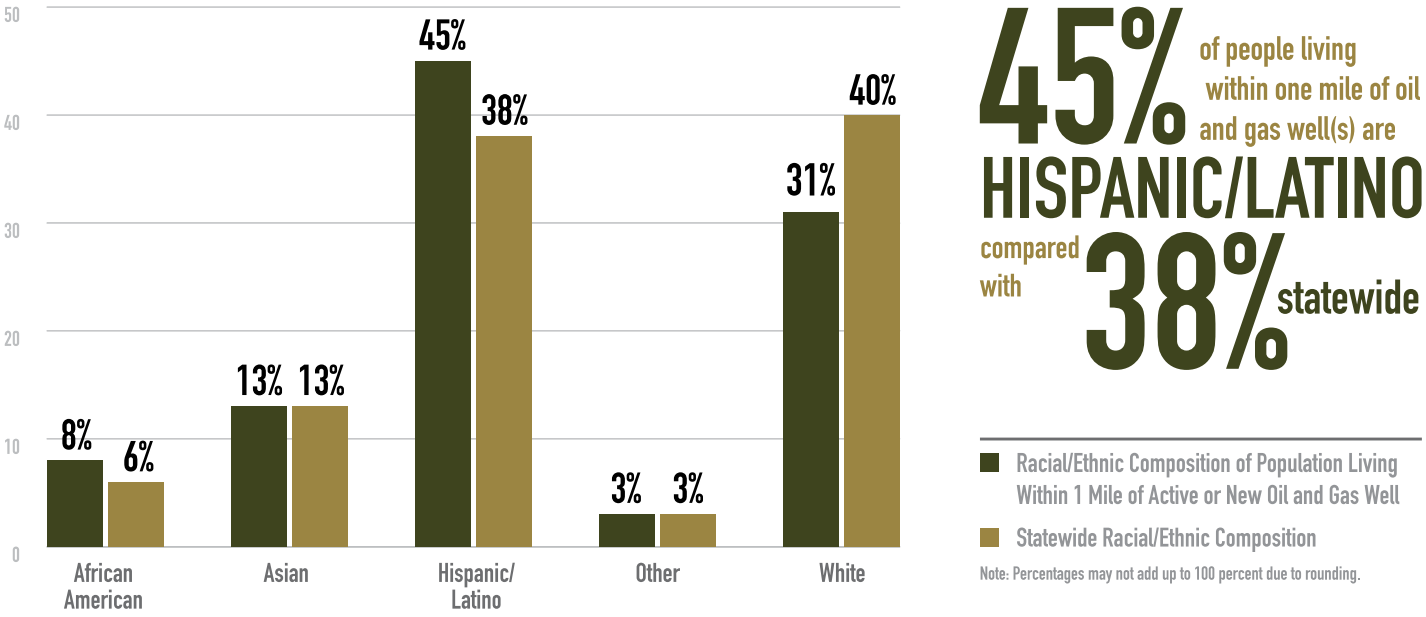
The number of oil and gas wells per census tract varies widely in California. The largest number of wells, more than 28,000, is found in a rural census tract west of Bakersfield in Kern County. Kern and Los Angeles counties top the charts with total well counts of 63,430 and 6,065, respectively. Map 2 shows the number and distribution of wells in relation to the 20 percent of census tracts identified by CalEnviroScreen 2.0 as most vulnerable. Since census tracts are roughly linked to population sizes, rural census tracts tend to be larger in area and therefore tend to have a greater number of wells. In Los Angeles, high population density means that the census tracts are much smaller and well counts of 1–100 are more typical and often found near other urban pollution sources.[74] Our maps show that residents in the southern part of the San Joaquin Valley and the greater Los Angeles area suffer from high pollution concentrations as well as a high concentration of oil and gas wells.

In California, approximately 5.4 million people (14 percent of the state's population) live within a mile of one or more oil and gas wells. This translates to roughly 1 in 5 African Americans, 1 in 6 Hispanics/Latinos, 1 in 7 Asians, and 1 in 9 Whites. More than a third of these people, 1.8 million (mainly in Los Angeles and Kern Counties), also live in areas identified by CalEnviroScreen 2.0 as most burdened by environmental pollution. A breakdown by race and ethnicity, as shown in Figure 1, reveals disparities in potential exposure for communities of color compared to the state's total population.[75]

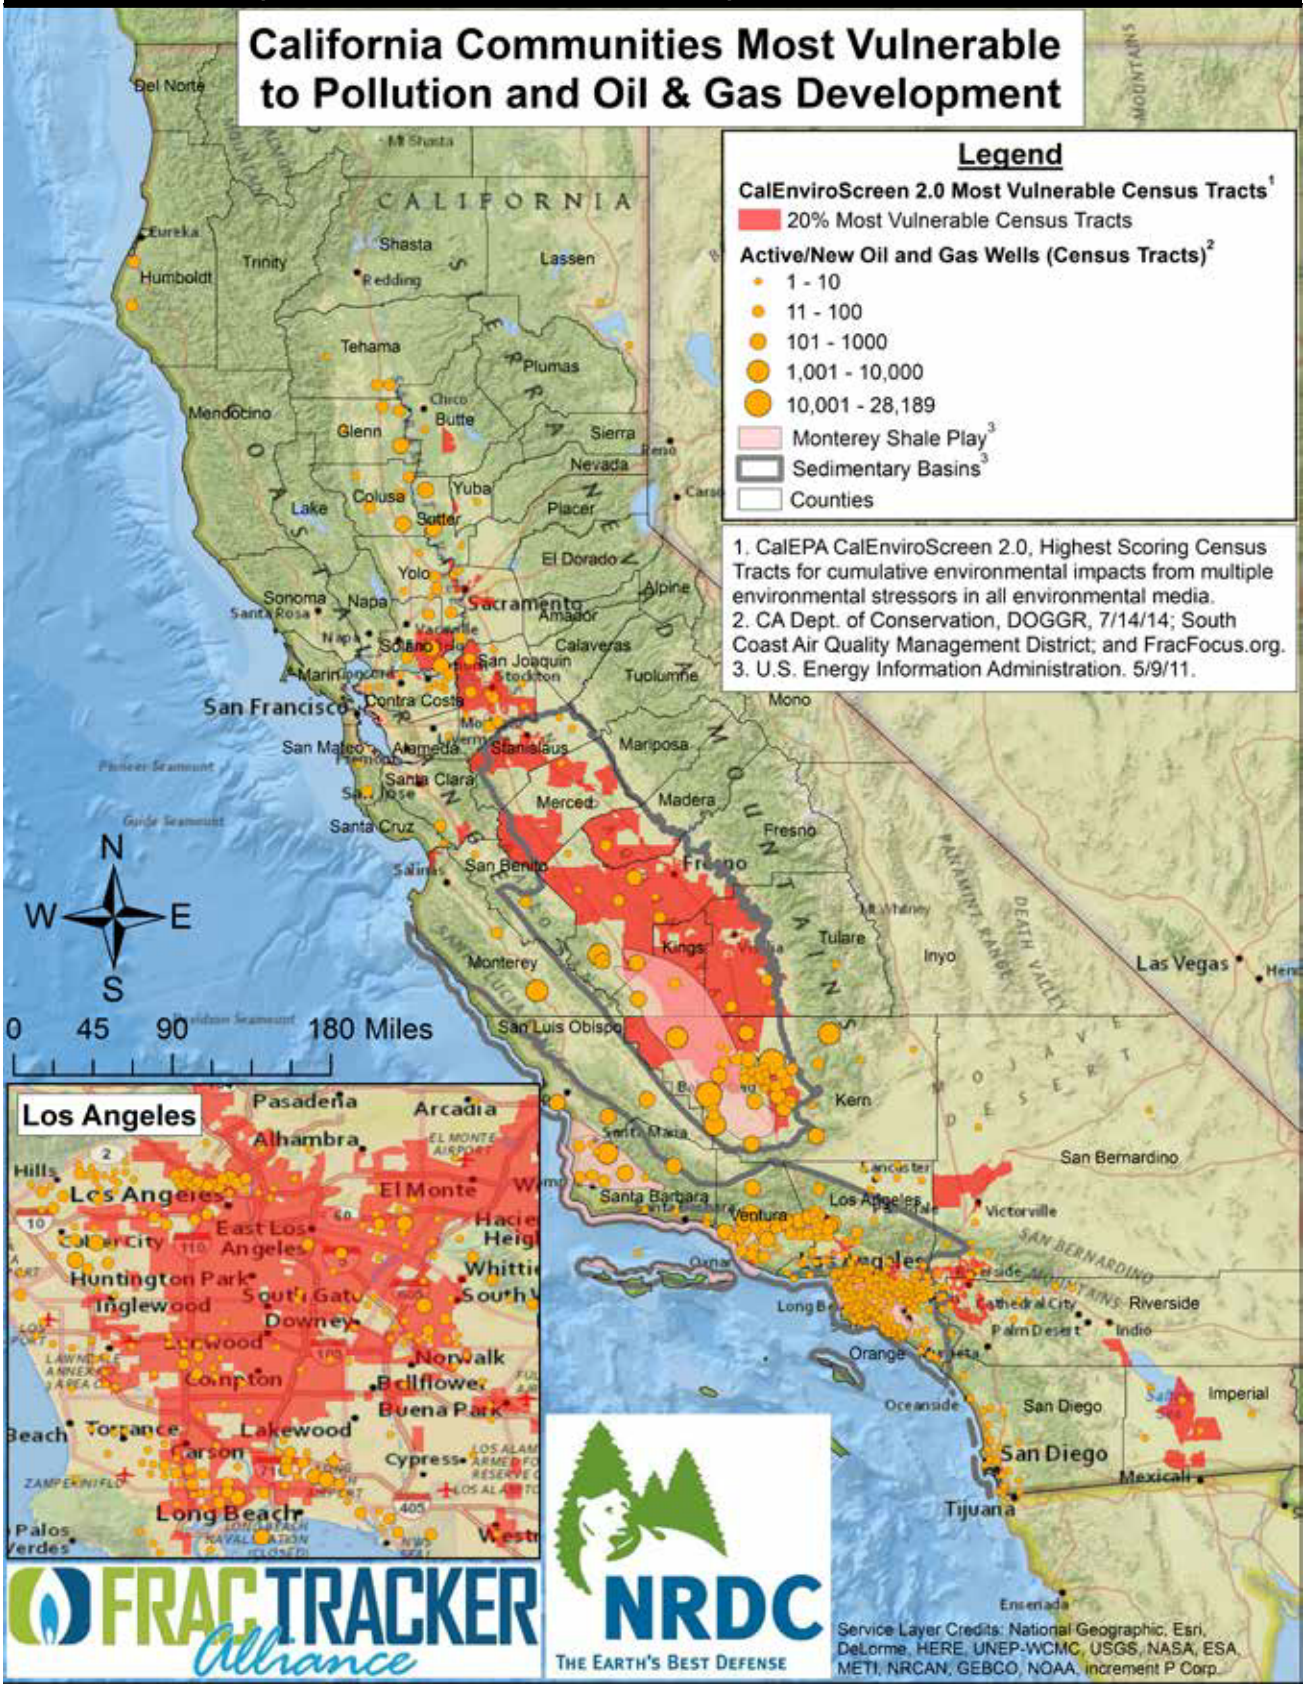
Of the statewide population living within one mile of oil and gas development and in communities identified as most vulnerable by CalEPA's new CalEnviroScreen 2.0, nearly 92 percent are people of color (69 percent Hispanic/Latino, 10 percent African American, 11 percent Asian, and 2 percent Other). Within the top 20 percent of census tracts ranked as most vulnerable—with a combined population of nearly 7.5 million—the number of oil and gas wells ranges from 0 to 6,575 per census tract, with a total of 11,329 wells. (See Appendix II for more detail.) Without the necessary monitoring data, scientific understanding, and health regulations, expanded oil development in these parts of the state could further exacerbate the toll on the most vulnerable communities.

Additionally, the geologic formations targeted for potential new exploration using hydraulic fracturing and other techniques include areas that are already heavily burdened by pollution, particularly in the Central Valley. So far, most of the new drilling and well stimulation techniques have been concentrated in areas of existing oil and gas drilling in Kern County. Los Angeles and Ventura counties each also have more than 100 stimulated wells. Fresno and Monterey counties, too, are seeing hundreds of new well permits and a handful of wells flagged as stimulated (Table 1 in Appendix II). Although it remains to be seen whether, and how, this exploration will be conducted given the geology of these basins in California, which is challenging for large-scale hydraulic fracturing, even small increases in pollution in already heavily burdened areas could result in increased health threats.

Figure 1: Demographics of Population Living Near Wells and Statewide in California



Map 2: Active and new oil and gas well counts as of July 2014 by census tract and the 20 percent most vulnerable census tracts according to the CalEnviroScreen 2.0 released in August 2014



Although the 3,003 wells identified as having been stimulated using hydraulic fracturing and other techniques (including 596 well stimulation notices under SB4) are likely an undercount, more than 80 percent of them are located in just three census tracts. Two of those tracts are in Kern County and one in Ventura County.[76] The two Kern County tracts (west and northwest of Bakersfield) also have the most new well permits and account for 591 of the 596 SB4 well stimulation notifications included in our database (430 and 161 notices, respectively). Of the 7,177 newly permitted wells—6,141, or 86 percent—are located in Kern County. More than half (3,209) are in the census tract with the most wells followed by 1,194 and 843 new wells in the next two tracts. The three census tracts surround Bakersfield to the west, northwest and northeast. This area also ranks in the top third of census tracts for environmental pollution.

According to CalEnviroScreen 2.0, the communities already experiencing new drilling, hydraulic fracturing, and acidizing are also exposed to high levels of ozone, particulate matter, diesel particulate pollution, water and soil contamination, and hazardous waste sites. If current drilling trends continue—and new well drilling, hydraulic fracturing and other stimulation techniques are concentrated in areas with existing oil and gas activity—more than 1.8 million Californians, already heavily burdened by pollution, may be saddled with even more health threats.

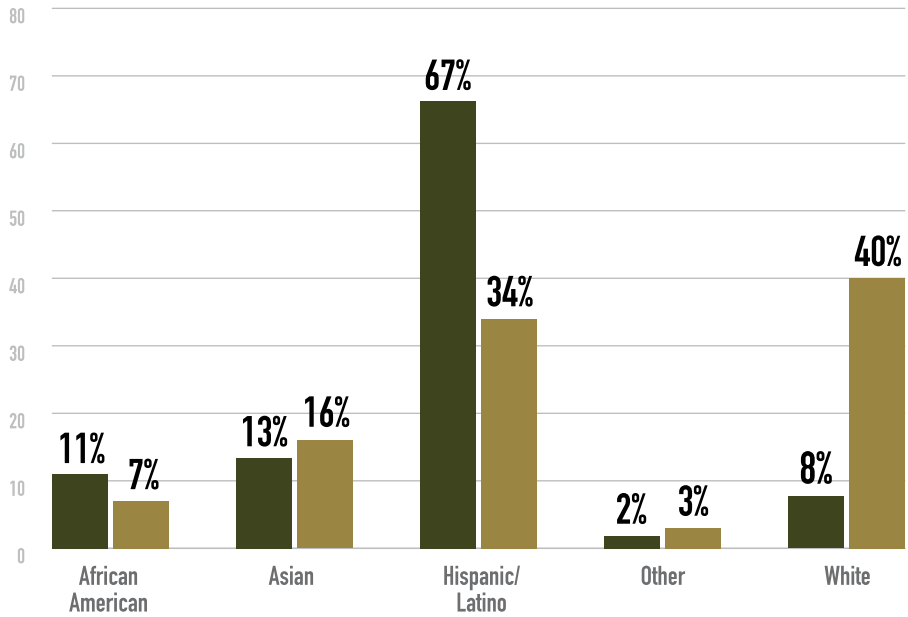
HOTSPOTS IN SOUTHERN CALIFORNIA: GREATER LOS ANGELES AND THE SOUTHERN SAN JOAQUIN VALLEY

GREATER LOS ANGELES

Los Angeles is home to the Inglewood Oil Field, the largest urban oil field in the United States.[77] This field is in the Baldwin Hills' community, which includes 300,000 residents.[78] Well pads often contain 30 or more wells within a few feet of buildings, roads, and parks. Map 3 illustrates that in Los Angeles, oil and gas wells are frequently in immediate proximity to, or even part of, neighborhoods and communities that are burdened by multiple environmental stressors with limited ability to address and cope with the associated health risks.

In Los Angeles County, 580,000 people live within a quarter mile of 5,715 active and 350 newly permitted oil and gas wells. At a one mile distance the number grows to 3.5 million (i.e., one third of the County's population), nearly half are Hispanic/Latino. Ninety-seven of Los Angeles County's 855 census tracts with the highest environmental pollution burden have at least one well for a total number of 1,723 wells (28 percent of the total number of wells in Los Angeles County). Furthermore, people of color are more likely to live near oil and gas wells in Los Angeles County: 44 percent of African Americans, 37 percent of Hispanics/Latinos and 38 percent of Asians compared with 31 percent of Whites.

Figure 2: Racial/Ethnic Composition According to the CalEnviroScreen 2.0 and 1/4 Mile Distance to Oil and Gas Wells in Los Angeles County



67%

of people living within a quarter mile of oil and gas well(s) and in areas facing the worst environmental health threats are

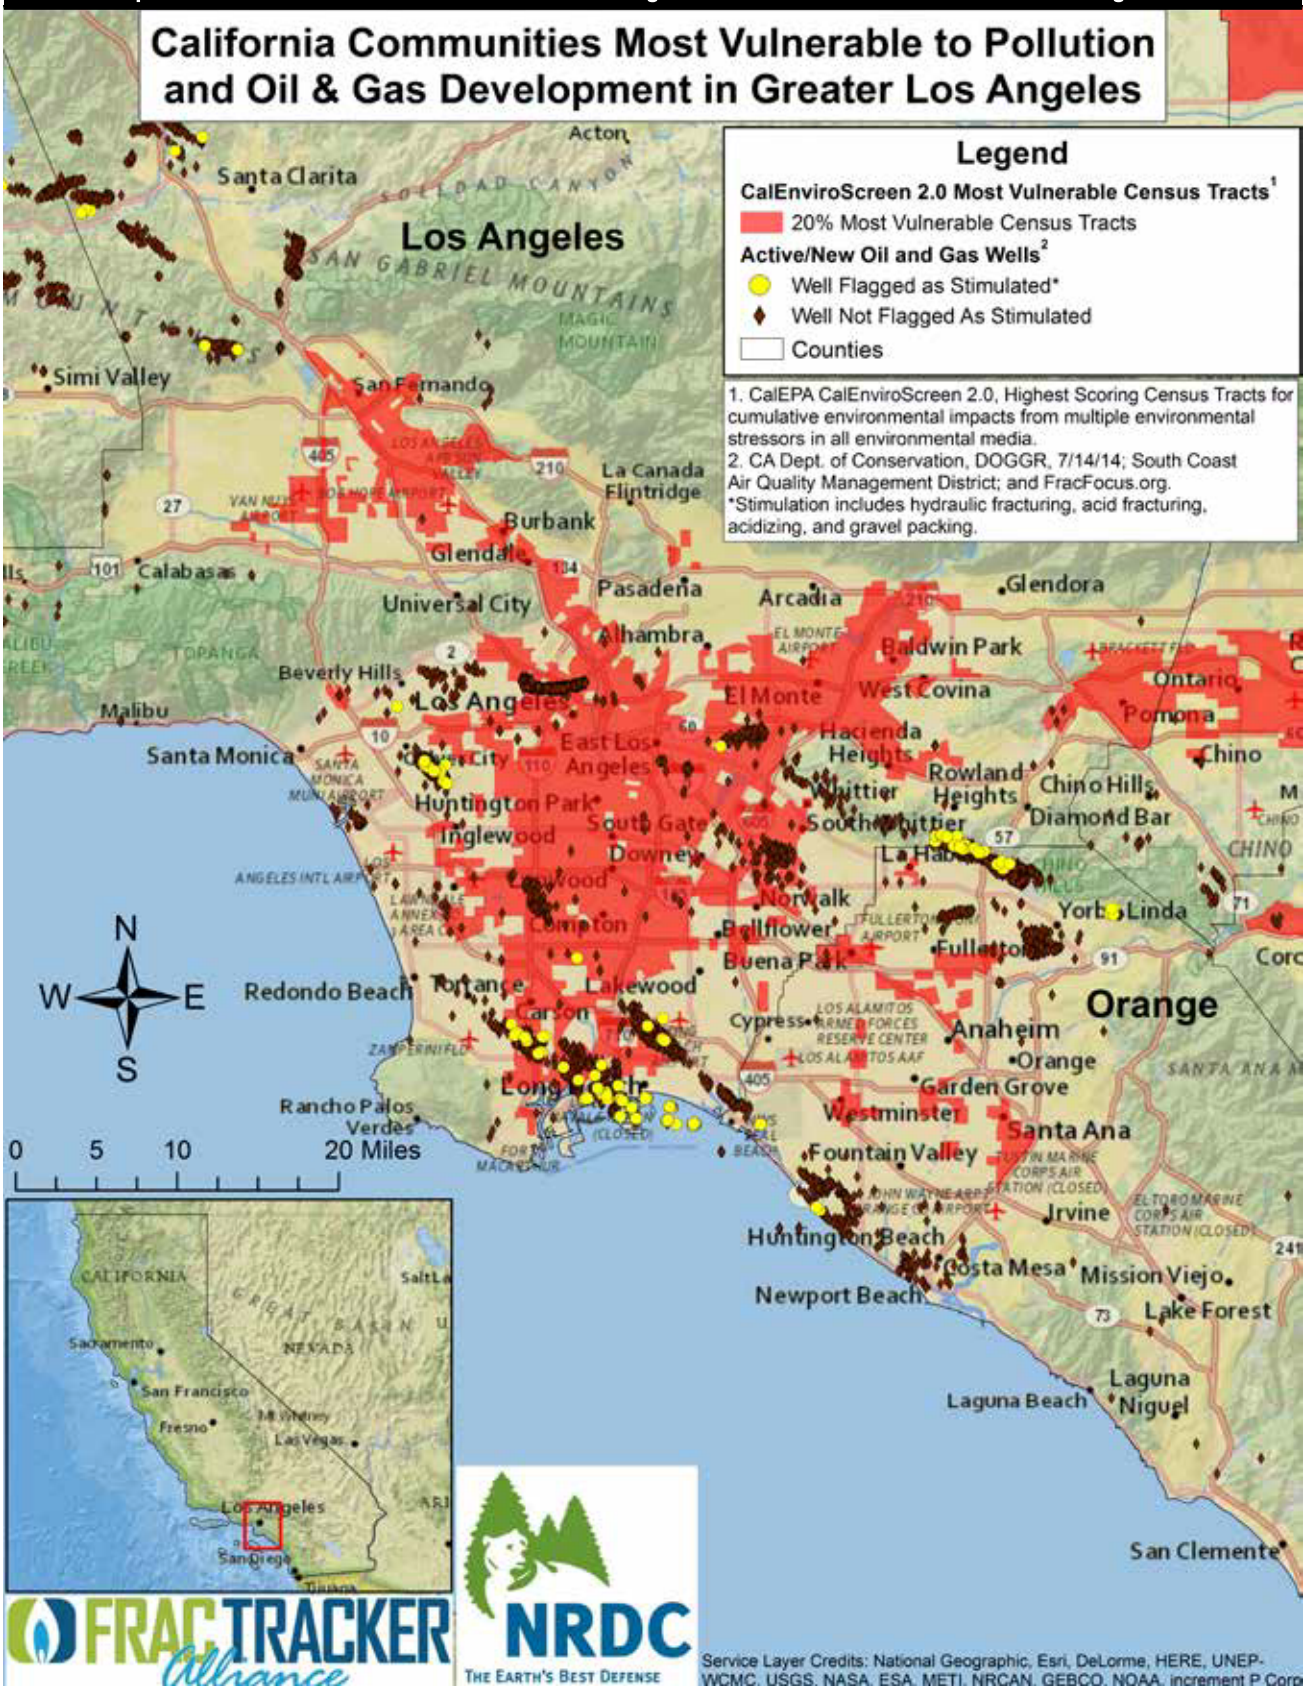
HISPANIC/LATINO.

Most Vulnerable Communities With Oil and Gas Wells Within 1/4 Mile

Less Vulnerable Communities Without Oil and Gas Wells Within 1/4 Mile

Note: Percentages may not add up to 100 percent due to rounding.

Map 3: Greater Los Angeles area showing the density of active and new oil and gas wells as of July 2014 and the 20 percent most vulnerable census tracts according to the CalEnviroScreen 2.0 released in August 2014



Of the more than 262,000 Los Angeles County residents that live within a quarter mile of oil and gas wells *and* in areas facing the worst health threats from pollution in the state; 67 percent are Hispanics/Latinos, 11 percent African Americans, 13 percent Asians, and 2 percent Other. In contrast, the communities less impacted by environmental pollution and not living in close proximity to oil and gas wells have a significantly higher White population (Figure 2).

Although many of Los Angeles' oil fields have been tapped for several decades, new stimulation and recovery techniques could bring currently idle wells back into production.[79] Much of the greater Los Angeles region is underlain by the Monterey Formation, which could soon be explored using unconventional drilling and stimulation techniques.

SAN JOAQUIN VALLEY AND KERN COUNTY

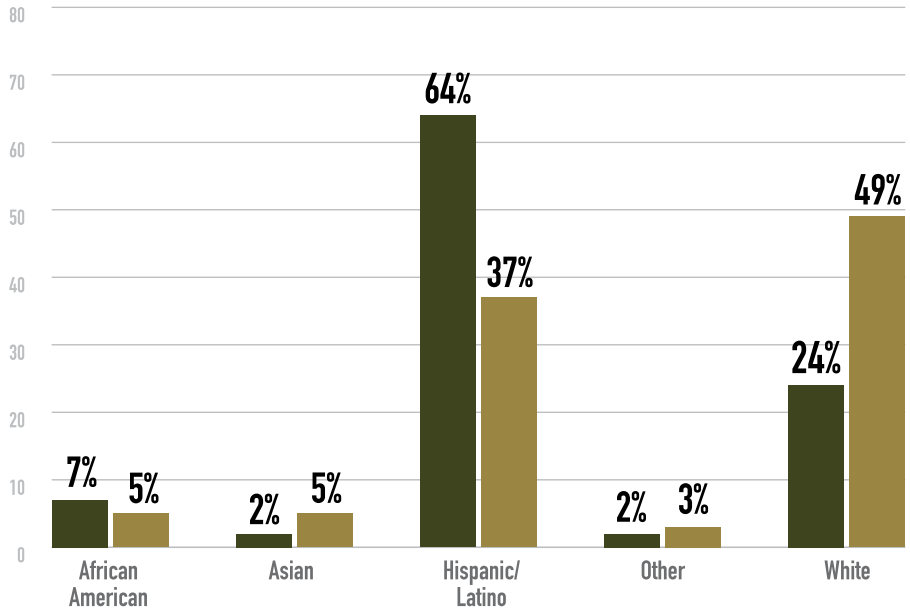
The San Joaquin Valley stretches from San Joaquin County in the north to Kern County in the south. Although mostly rural, this region contains several larger metropolitan areas, including Fresno, Bakersfield, Stockton, and Modesto.[80] The region is a major producer of agricultural crops, livestock, and other products, but also suffers from a high rate of food insecurity and poverty.[81] The San Joaquin Valley's air quality consistently ranks as among the worst in the nation with high levels of ozone and fine particulate matter ($PM_{2.5}$). More than 36 percent of the census tracts in the San Joaquin Valley rank in the top 20 percent for combined pollution threats, including air pollution and toxic releases.

While CalEnviroScreen 2.0 flags many census tracts throughout the San Joaquin Valley as highly impacted and vulnerable, we focus on Kern County because of its high concentration of oil and gas development and because new development using hydraulic fracturing and acidizing of the Monterey Formation is already underway there. Kern County produces approximately 75 percent of California's oil and about 58 percent of its natural gas.[82] Map 4 shows the dense distribution of the 63,430 active and new oil and gas wells in the County—6,141 of which are newly permitted and at least 2,361 have been stimulated—with up to 28,188 wells per census tract.

Kern County has 63,430 active and new oil and gas wells and at least 2,361 of them have been stimulated using hydraulic fracturing or other methods.

CalEnviroScreen 2.0 ranks 55 Kern County census tracts, with a population of 330,000, as among the most vulnerable to pollution and this includes many tracts with a high well density. Slightly more than 290,000 people (35 percent of the population) live within one mile of one of the 63,430 oil and gas wells. In Kern County, Hispanic/Latino and African American communities carry a disproportionate environmental pollution burden, which may be exacerbated by the effects of oil and gas production. Of the approximately 122,000 people living close to oil and gas wells *and* suffering

Figure 3: Demographics of Kern County According to the CalEnviroScreen 2.0 and 1 Mile Distance to Oil and Gas Wells in Kern County



64%

of people living within one mile of oil and gas well(s) and in areas facing the worst environmental health threats are

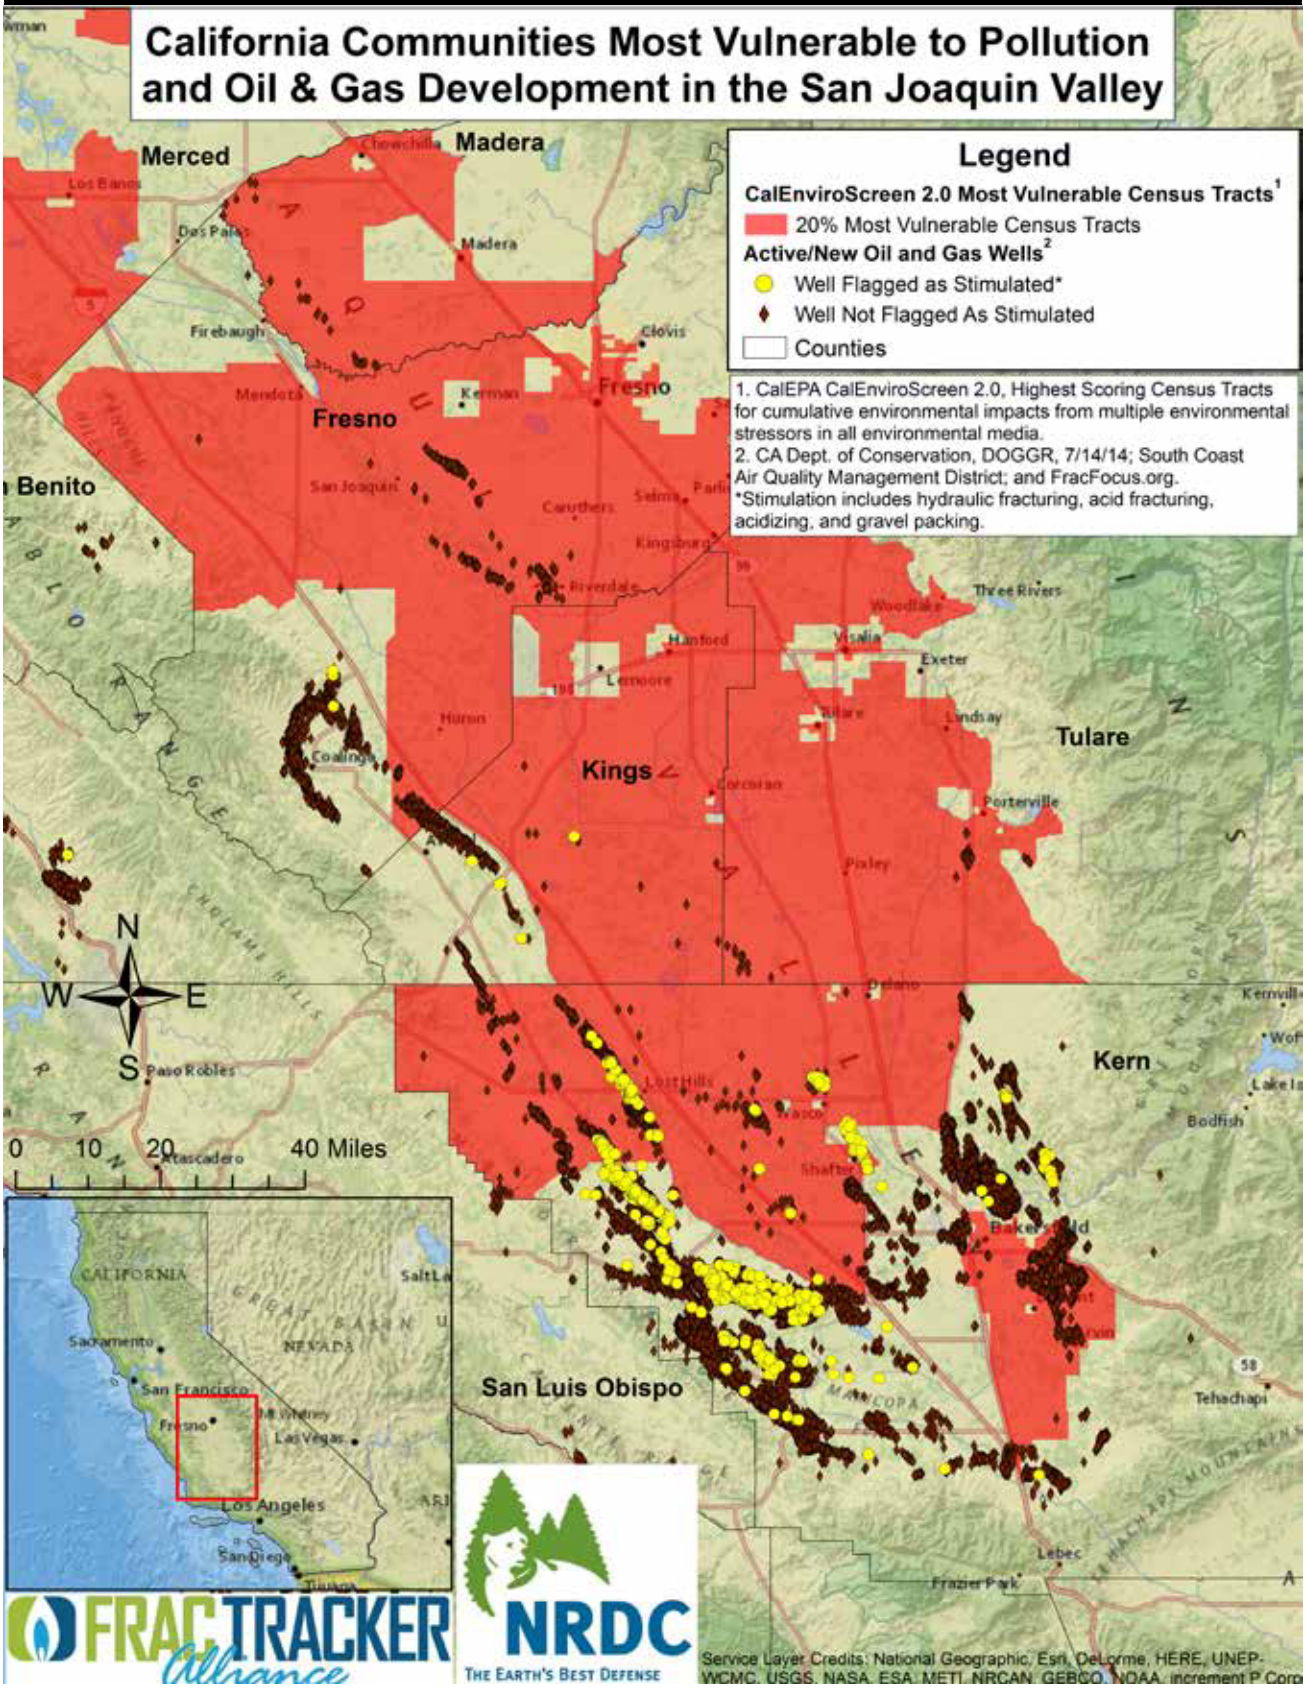
HISPANIC/LATINO.

Most Vulnerable Communities With Oil and Gas Wells Within 1 Mile

Less Vulnerable Communities Without Oil and Gas Wells Within 1 Mile

Note: Percentages may not add up to 100 percent due to rounding.

Map 4: Southern San Joaquin Valley showing the density of active and new oil and gas wells as of July 2014 and the 20 percent census tracts most vulnerable census tracts according to the CalEnviroScreen 2.0 released in August 2014



the most health threats from pollution as measured by CalEnviroScreen 2.0, nearly 92,000 (76 percent) are people of color.[83] In contrast, the communities less impacted by environmental pollution and not near oil and gas wells are majority white (49 percent) (see Figure 3).

Kern County is also the epicenter of well stimulation notices filed under the SB4 interim regulations. As of July 2014, 596 notices for well stimulation using hydraulic fracturing, acidizing, and other techniques have been filed, 591 of them for wells in Kern County. The majority of these wells were hydraulically fractured, while a smaller proportion used acid matrix stimulation. The western part of the county overlies the Monterey tight oil play and is considered prospective for development. There is also current production from the Monterey Formation.[84] Kern County's rural communities, which are already heavily impacted by pollution and predominantly Latino/Hispanic and low-income, are at the frontlines of new drilling and technologies with the accompanying health risks from heavy truck traffic, air pollutant emissions, accidents, and wastewater disposal.

CONCLUSIONS

Expanding oil production in California, in areas already heavily drilled or in new areas, can threaten the health of communities. For many already living with oil and gas wells and at ground zero for new drilling activity, these threats are piled on top of a heavy burden of environmental contamination. Evaluations of the safety of new drilling techniques must account for the threats to these communities and California policymakers must ensure that new oil exploration and development does not come at their expense.

RECOMMENDATIONS

To prevent further environmental damage and public health threats, major improvements are required before hydraulic fracturing, acidizing, and other stimulation techniques are allowed in California:

A comprehensive evaluation of pollution and health threats from oil and gas development, including well stimulation using hydraulic fracturing and other methods, must include the following:

- a full inventory and assessment of the types, sources, and quantities of contaminants associated with oil and gas development and production, including hydraulic fracturing and acidizing;
- an assessment of their health threats; and
- an evaluation and quantification of additional pollution, health threats, and environmental degradation from increased oil and gas extraction in existing oil fields and expansion into new areas within the Monterey tight oil play.

The current tracking, reporting, and notification system for oil and gas well development, activity, and stimulation methods is inaccurate and fragmented and is not transparent. DOGGR must work to overhaul its databases and improve data integration and reporting. Comprehensive measures are needed to ensure that oil and gas development does not contribute to environmental degradation, pollution, or threatens the health of residents in neighboring communities. Until this is complete, communities already overburdened with environmental pollution will remain in harm's way.

10 We used a quarter mile distance in urban areas while for the statewide calculation we used a one mile distance to take into account the lower population density in rural areas. These distances were chosen to reflect common, and understandable, measures of proximity because there is a limited, and inconclusive, literature evaluating distances and health risks. Additionally, some pollution is regional and can impact populations not immediately proximal.

APPENDIX I: METHODS

Our analysis uses well location data from California's Division of Oil, Gas, and Geothermal Resources (DOGGR), the South Coast Air Quality Management District (SCAQMD), and FracFocus.org to locate existing and potentially new oil and gas development.[1] We overlay this information with the total environmental burden and vulnerability score from the California EPA's (CalEPA) cumulative environment impact tool (CalEnviroScreen 2.0).[2]

OIL AND GAS WELL DATA

We located active (AOG) wells and new (NOG) wells through the DOGGR's AllWells database (version released July 14, 2014) using the *GISSymbol* field. Active wells, according to DOGGR's classification, include producing wells and unplugged wells that may not be producing (e.g., idle and buried wells) but that can still be brought back into production or become a conduit for pollution.[3] New wells have recently been permitted to be drilled.[4] We used the AOG and NOG codes because they provide a more complete measure of the total number of wells that may be sites of active development or serve as a conduit for pollution and contribute to the total environmental burden. We note that the "AllWells" database also includes the *WellStatus* field. There are discrepancies between the *GISSymbol* field and the *WellStatus* field and neither is fully accurate at this point. The discrepancies should be investigated and corrected by DOGGR. Communication with DOGGR staff, and other experts, suggested that although the *GISSymbol* field is not perfect, DOGGR staff regularly use it for spatial analysis of well data. We, therefore, concluded that the use of this field is justified to account for wells that are currently producing or may be brought back into production in the future.

We then added information from DOGGR's new Well Stimulation Notices database, which was developed in response to Senate Bill 4 (SB4), California's law for oil and gas well stimulation enacted in 2013 (SB4 notices as of July 2014).[5] The SB4 interim regulations[6]—developed by DOGGR and effective since January 1, 2014—require well operators to file notices at least 30 days prior to commencing well stimulation using controversial technologies such as hydraulic fracturing and acidizing. We also added information from the South Coast Air Quality Management District's Oil and Gas Wells Activity Notification database, which was developed under Rule 1148.2, as well as the Chemicals Disclosure Registry website FracFocus.org. We then removed duplicates, multiple entries for well reworks, offshore wells, and wells without correct latitude and longitude coordinates. Our final total came to 84,434 wells (77,257 active and 7,177 newly permitted wells).

To determine the number of wells that have been stimulated, we used the DOGGR AllWells database, the SB4 Well Stimulation Treatment Notification Index, the SCAQMD Oil and Gas Well Activity Notification database, and FracFocus.org. We counted 3,003 wells that have used or plan to use hydraulic fracturing, acid fracturing, acidizing, and/or gravel packing. These 3,003 wells include 596 wells, for which SB4 stimulation notices are available.

In 2012 DOGGR added the field *HydraulicallyFractured* to its "AllWells" database as a basic yes/no indicator and is still adding this information to the database. Therefore, our count of stimulated wells—while it is the best currently available—is still likely an undercount. According to the DOGGR, the new field will be used to identify future wells using hydraulic fracturing techniques and former wells that have used hydraulic fracturing techniques.[7]

ENVIRONMENTAL POLLUTION AND VULNERABILITY DATA

The CalEnviroScreen 2.0 data layer (released in August 2014) was downloaded from the California Office of Environmental Health Hazard Assessment's (OEHHA) CalEnviroScreen website.[8] We use the census tracts falling into the top 20 percent of most vulnerable communities according to the CalEnviroScreen 2.0 aggregate score. The CalEnviroScreen tool was developed to evaluate multiple pollution sources (including air, water, and soil) in a community while accounting for a community's vulnerability to pollution's adverse health effects.[9]

CALCULATING THE POPULATION VULNERABLE TO ENVIRONMENTAL POLLUTION AND AFFECTED BY OIL AND GAS DEVELOPMENT

The number and percentage of people living within 0.25 and 1 mile of active and new oil and gas wells was estimated using 2012 population data from the U.S. Census Bureau[10] and well location information from our well database. The 0.25 and 1 mile distances were chosen to represent oil- and gas-related health threats at scales relevant to urban and rural settings, respectively, and to reflect both local and regional pollution.[11] To do so, circles of 0.25 and 1 mile, as appropriate to the area, were drawn around each well to create a buffered well layer. The boundaries of these circles were merged and the resulting shape was intersected with the census tract population layer. We then calculated the portions of each census tract that overlapped with the buffered well layer. Assuming that the census tract population (total population and population by race and ethnicity) is uniformly distributed across the census tract, we then determined the fraction (total population and by race and ethnicity) that lived within the buffered well layer. All maps were produced in ArcGIS version 10.1.

11 There is as of yet no commonly accepted distance over which air or water pollution effects from oil and gas development are assessed for local populations. McKenzie et al. (2012) used a ½ mile for their health risk assessment in a mostly rural area in Colorado and a 10 mile radius to calculate the inverse-distance-weighted metric in their 2014 paper. Hill applied a 2.5 km (1.55 miles) radius in Pennsylvania and Osborn et al. (2011) used a 1 km (0.62 miles) distance in their study of methane contamination of drinking water.

APPENDIX II: TABLES

The tables in this Appendix provide details on the number and location of oil and gas wells in California. The data was extracted from public databases maintained by California's Division of Oil, Gas, and Geothermal Resources (DOGGR), the South Coast Air Quality Management District (SCAQMD), and FracFocus.org. Data from the AllWells database is current as of July 14, 2014 and the information on SB4 Well Stimulation Notices Index, the SCAQMD Oil and Gas Activity Notification database, and FracFocus.org are current as of July 2014.

The following well types are included in our analysis:

- Active Oil and Gas Wells (AOG): According to DOGGR's classification, these wells include producing wells and wells that have not been plugged and may not be producing, such as idle and buried wells, but can still represent a potential for reactivation or conduit for pollution.
- New Oil and Gas Wells (NOG): These wells have recently been permitted to be drilled.
- Stimulated wells: These wells have been stimulated using hydraulic fracturing, acid fracturing, acidizing, and/or gravel packing as compiled from the DOGGR AllWells database, and SB4 Well Stimulation Treatment Notices Index, the SCAQMD Oil and Gas Activity Notification database, and FracFocus.org.
- SB4 Wells: These wells are listed as approved in DOGGR's SB4 interim well stimulation notices database. These wells are a subset of the stimulated wells.

Table 1: Counties with at least one active or new oil and gas well

County	Total Number of Active and New Oil and Gas Wells	Active Wells	New Wells	Stimulated Wells	Stimulated Wells with SB4 Notifications

U.S.

California Earthquakes Caused $200 Million in Damage, Report Says

The estimate doesn't include damage to infrastructure, such as roads or to a nearby naval base

A magnitude 7.1 earthquake shook Southern California earlier this month, cracking buildings, breaking roads and causing power outages on Friday night.

By Ethan Millman
July 24, 2019 6:15 pm ET

A pair of earthquakes that shook California earlier this month caused about $200 million in property damage, according to a new report.

Residents of the small towns of Argus and Trona, located in San Bernardino County between the Sierra Nevadas and Death Valley National Park, suffered the most significant damage, according to catastrophe modeling firm Karen Clark and Co. Homes and buildings in those towns are generally older than those in the nearby larger city of Ridgecrest and weren't built to sustain shaking as well.

Several Trona residents had their homes red-tagged following the earthquakes, meaning their homes were deemed unlivable by the county. Others suffered less structural damage to their homes but lost personal belongings.

The larger quake, which struck the rural region east of the Sierra Nevada mountains on July 5, measured magnitude 7.1.

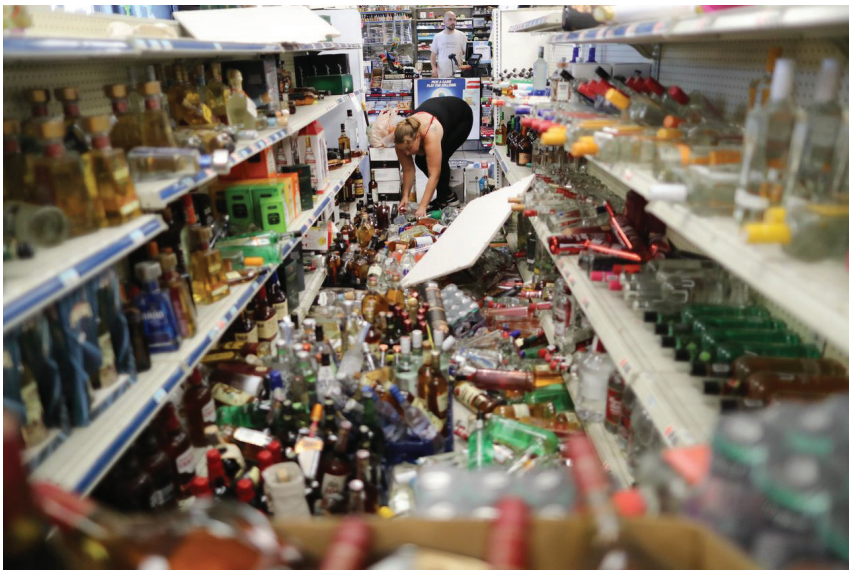
The estimate doesn't include damage to infrastructure, such as roads, or to a nearby naval base, which had closed following the quakes. Operations have since begun to normalize, according to the posts on the base's official Facebook page.



A convenience store employee in Ridgecrest, Calif., cleans an aisle with bottles scattered on the floor after a magnitude 7.1 struck nearby on July 6.

PHOTO: MARIO TAMA/GETTY IMAGES

Less than $40 million of the damage in the area will be covered by insurance, Karen Clark and Co. estimated, as only about 20% of residents in the area have earthquake insurance. Statewide, 10% of Californians with residential insurance also have earthquake coverage, according to the California Earthquake Authority.

Earthquakes are often more economically damaging than other disasters such as fires and tornadoes because of how few people are covered, said Karen Clark, the catastrophe modeling company's chief executive.

"Insurance companies do offer earthquake insurance, but in a homeowner's mind, it's too expensive," Ms. Clark said. "Ridgecrest might cause a little blip for people to buy more insurance...but as time goes on, people stop buying it."

Earthquake triggering and large-scale geologic storage of carbon dioxide

Mark D. Zoback[a,1] and Steven M. Gorelick[b]

Departments of [a]Geophysics and [b]Environmental Earth System Science, Stanford University, Stanford, CA 94305

Edited by Pamela A. Matson, Stanford University, Stanford, CA, and approved May 4, 2012 (received for review March 27, 2012)

Despite its enormous cost, large-scale carbon capture and storage (CCS) is considered a viable strategy for significantly reducing CO_2 emissions associated with coal-based electrical power generation and other industrial sources of CO_2 [Intergovernmental Panel on Climate Change (2005) IPCC Special Report on Carbon Dioxide Capture and Storage. Prepared by Working Group III of the Intergovernmental Panel on Climate Change, eds Metz B, et al. (Cambridge Univ Press, Cambridge, UK); Szulczewski ML, et al. (2012) *Proc Natl Acad Sci USA* 109:5185–5189]. We argue here that there is a high probability that earthquakes will be triggered by injection of large volumes of CO_2 into the brittle rocks commonly found in continental interiors. Because even small- to moderate-sized earthquakes threaten the seal integrity of CO_2 repositories, in this context, large-scale CCS is a risky, and likely unsuccessful, strategy for significantly reducing greenhouse gas emissions.

carbon sequestration | climate change | triggered earthquakes

The combustion of coal for electrical power generation in the United States generates approximately 2.1 billion metric tons of CO_2 per year, ~36% of all US emissions. In 2011, China generated more than three times that much CO_2 by burning coal for electricity, which accounted for ~80% of its total emissions. (According to the Energy Information Agency of the US Department of Energy, total CO_2 emissions in China were 8.38 billion metric tonnes in 2011, with 6.95 billion tons from coal burning, nearly all of which is used electrical power generation.) From a global perspective, if large-scale carbon capture and storage (CCS) is to significantly contribute to reducing the accumulation of greenhouse gases, it must operate at a massive scale, on the order of 3.5 billion tons (1) of CO_2 per year, a volume roughly equivalent (2) to the ~27 billion barrels of oil currently produced annually around the world. (Under reservoir conditions, one billion tons of CO_2 occupies a volume of ~1.3 billion cubic meters, equivalent to 8.18 billion barrels. Thus, 3.5 billion tons of carbon dioxide would correspond to a volume of approximately 28.6 billion barrels. There are currently ~850,000 wells producing oil around the world.) Moreover, a leak rate from underground CO_2 storage reservoirs of less than 1% per thousand years is required for CCS to achieve the same climate benefits as renewable energy sources (3).

Before embarking on projects to inject enormous volumes of CO_2 at numerous sites around the world, it is important to note that over time periods of just a few decades, modern seismic networks have shown that earthquakes occur nearly everywhere in continental interiors. Fig. 1, *Upper* shows instrumentally recorded earthquakes in the central and eastern United States and southeastern Canada. Fig. 1, *Lower* shows instrumentally recorded intraplate earthquakes in south and east Asia (4). The seismicity catalogs are complete to magnitude (M) 3. The occurrence of these earthquakes means that nearly everywhere in continental interiors a subset of the preexisting faults in the crust is potentially active in the current stress field (5, 6). This is sometimes referred to as the *critically stressed* nature of the brittle crust (7). It should also be noted that despite the overall low rate of earthquake occurrence in continental interiors, some of the most devastating earthquakes in history occurred in these regions. In eastern China, the M 7.8, 1976 Tangshan earthquake, approximately 200 km east of Beijing, killed several hundred thousand people. In the central United States, three M 7+ earthquakes in 1811 and 1812 occurred in the New Madrid seismic zone in southeast Missouri.

Because of the critically stressed nature of the crust, fluid injection in deep wells can trigger earthquakes when the injection increases pore pressure in the vicinity of preexisting potentially active faults. The increased pore pressure reduces the frictional resistance to fault slip, allowing elastic energy already stored in the surrounding rocks to be released in earthquakes that would occur someday as the result of natural geologic processes (8). This effect was first documented in the 1960s in Denver, Colorado when injection into a 3-km-deep well at the nearby Rocky Mountain Arsenal triggered earthquakes (9). Soon thereafter it was shown experimentally (10) at the Rangely oil field in western Colorado that earthquakes could be turned on and off by varying the rate at which water was injected and thus modulating reservoir pressure. In 2011 alone, a number of small to moderate earthquakes in the United States seem to have been triggered by injection of wastewater (11). These include earthquakes near Guy, Arkansas that occurred in February and March, where the largest earthquake was M 4.7. In the Trinidad/Raton area near the border of Colorado and New Mexico, injection of produced water associated with coalbed methane production seems to have triggered a number of earthquakes, the largest being a M 5.3 event that occurred in August. Earthquakes seem to have been triggered by wastewater injection near Youngstown, Ohio on Christmas Eve and New Year's Eve, the largest of which was M 4.0. Although the risks associated with wastewater injection are minimal and can be reduced even further with proper planning (11), the situation would be far more problematic if similar-sized earthquakes were triggered in formations intended to sequester CO_2 for hundreds to thousands of years.

Deep borehole stress measurements confirm the critically stressed nature of the crust in continental interiors (12), in some cases at sites directly relevant to the feasibility of large-scale CCS. For example, deep borehole stress measurements at the Mountaineer coal-burning power plant on the Ohio River in West Virginia indicate a severe limitation on the rate at which CO_2 could be injected without the resulting pressure build-up initiating slip on preexisting faults (13). Because of the low permeability of the formations at depth, pore pressure increases would be expected to trigger slip on preexisting faults if CO_2 injection rates exceed approximately 1% of the 7 million tons of CO_2 emitted by the Mountaineer plant each year. Similarly, stress measurements at Teapot Dome, Wyoming, the US government-owned oil field where pilot CO_2

Both data sets are available from the US Geological Survey (4).

injection projects have been considered, show that very small pressure buildups are capable of triggering slip on some preexisting faults (14).

Dam construction and water reservoir impoundment produce much smaller pore pressure changes at depth than are likely to occur with CO_2 sequestration, but many have triggered earthquakes at various sites around the world (15) (red dots in Fig. 1). Except for the much smaller pore pressure increases at depth, reservoir-triggered earthquakes are a good analog for the potential for seismicity to be triggered by CO_2 injection. Both activities cause pore pressure increases that act over large areas and are persistent for long periods. Three reservoir impoundments in eastern Canada (located in the ancient, stable core of the North American continent) triggered earthquakes as large as M 4.1 and M 5 at the two sites (Fig. 1), despite the fact that the pore pressure increases at depth were extremely small.

Triggered Earthquakes and Seal Integrity

Our principal concern is not that injection associated with CCS projects is likely to trigger large earthquakes; the problem is that even small to moderate earthquakes threaten the seal integrity of a CO_2 repository. In parts of the world with good construction practices, it is unusual for earthquakes smaller than approximately M 6 to cause significant human harm or property damage. Fig. 2 uses well-established seismological relationships to show how the magnitude of an earthquake is related to the size of the fault that slipped and the amount of fault slip that occurred (16). As shown, faults capable of producing M ~6 earthquakes are at least tens of kilometers in extent. (The fault size indicated along the abscissa is a lower bound of fault size as it refers to the size of the fault segment that slips in a given earthquake. The fault on which an earthquake occurs is larger than the part of the fault that slips in an individual event.) In most cases, such faults should be easily identified during geophysical site characterization studies and thus should be avoided at any site chosen for a CO_2 repository. (Faults in crystalline basement rocks might be difficult to recognize in geophysical data. We assume, however, that any site chosen as a potential CO_2 repository would be carefully selected, avoiding the possibility of pressure changes in the CO_2 repository from affecting faults in crystalline basement.) The problem is that site characterization studies can easily miss the much smaller faults associated with small to moderate earthquakes.

Although the ground shaking from small- to moderate-sized earthquakes is inconsequential, their impact on a CO_2 repository would not be. Most of the geologic formations to be used for long-term storage of CO_2 are likely to be at depths of approximately 2 km—deep enough for there to be adequate sealing formations to isolate the CO_2 from the biosphere but not so deep as to encounter formations with very low permeability. Given large volumes of CO_2 injected into selected formations for many decades, if a small to moderate earth-

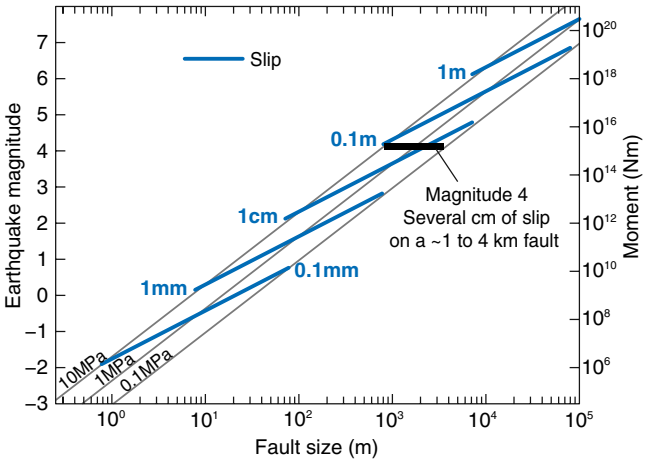

Fig. 2. Relationships among various scaling parameters for earthquakes. The larger the earthquake, the larger the fault and amount of slip, depending on the stress drop in a particular earthquake. Observational data indicate that earthquake stress drops range between 0.1 and 10 MPa.

quake were to be triggered in a geologic formation at approximately 2 km depth, it could jeopardize the seal integrity of the storage formation. For example, if a M ~4 earthquake were to be triggered by CO_2 sequestration (17)—an event that would be widely felt in a populated area but for which shaking would be unlikely to cause harm or damage—it would be associated with several centimeters of slip on a fault several kilometers in size. Because laboratory studies show that just a few millimeters of shear displacement are capable of enhancing fracture and joint permeability (18), several centimeters of slip would be capable of creating a permeable hydraulic pathway that could compromise the seal integrity of the CO_2 reservoir and potentially reach the near surface.

Safe Sequestration

It is important to emphasize that CCS can be valuable and useful for reducing greenhouse gas emissions in specific situations. A good example is the injection of CO_2 into the Utsira formation (19) at the Sleipner gas field in the North Sea, where a significant amount of CO_2 is coproduced with natural gas. After separating the CO_2 from the produced gas, approximately 1 million tons of CO_2 per year has been injected over the past 15 y without triggering seismicity. Assuming isolation from the near surface, injection into highly porous and permeable reservoirs that are laterally extensive would produce small increases in pressure in response to CO_2 injection. Moreover, weak, poorly cemented sandstones are expected to deform slowly in response to applied geologic forces. In such reservoirs, the stresses *relax* over time, and such formations are not prone to faulting (20). In this regard, the Utsira formation is ideal for CO_2 sequestration. It is isolated from vertical migration by impermeable shale formations, and it is highly porous, permeable, laterally extensive, and weakly cemented.

To contribute significantly to greenhouse gas emission reductions (2), roughly 3,500 sites similar to the Utsira formation would have to be found at convenient locations around the world, assuming comparable injection rates of approximately 1 million tons of CO_2 per year. In fact, it would take approximately 85 such sites coming on line each year to reach a goal of storing approximately 1 billion tons of CO_2 by midcentury. Clearly this is an extraordinarily difficult, if not impossible, task if only highly porous and permeable and weakly cemented formations are to be used.

Of course, rather than using potentially problematic geologic formations close to coal-burning power plants for sequestration (as illustrated by the Mountaineer case study cited above), relatively ideal formations for CO_2 storage could be sought on a regional basis to accommodate emissions from a number of plants. One example of this is the potential use of the Mt. Simon sandstone in the Illinois basin. The Mt. Simon is porous, permeable, and regionally extensive. However, models of injection of 100 million tons of CO_2 per year for 40 y predicts (21) increases in pore pressure of several megapascals over a region of ~40,000 km^2. The approximate area of significantly increased pore pressure resulting from injection is shown as the blue-shaded area in Fig. 3, essentially adjacent to the Wabash fault zone, where a series of moderate natural earthquakes occurred in the spring of 2008, the largest being M 5.2. Paleoseismic data indicate the occurrence of much larger nearby earthquakes (some greater than M ~7) in the recent geologic past (22). Importantly, the 100 million ton annual CO_2 injection rate used in the

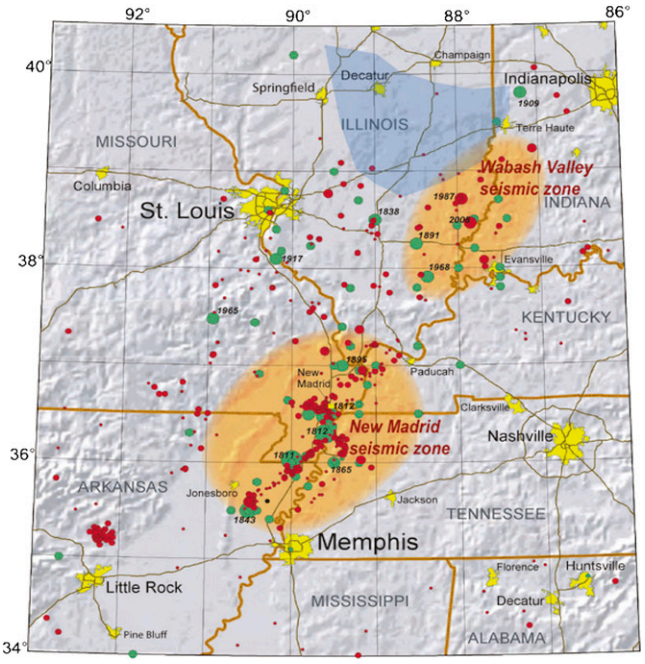

Fig. 3. Instrumentally recorded seismicity in the New Madrid and Wabash Valley seismic zones (modified from ref. 23). Red circles indicate earthquakes that occurred from 1974 to 2002 with magnitudes larger than 2.5 located using modern instruments. Green circles denote earthquakes that occurred before 1974. Larger earthquakes are represented by larger circles. The area shown in blue corresponds to the area where a pressure increase of several megapascals would result from injecting 100 million tons per year of CO_2 into the Mt. Simon sandstone in the Illinois Basin for 40 y (19).

modeling only represents approximately one seventh of the CO_2 generated by the coal-burning power plants in the Ohio River Valley alone.

Because of the need to carefully monitor CO_2 repositories with observation wells, geophysical and geochemical monitoring systems, etc., it is likely that most sites will have to be located on land or very near shore. Otherwise, highly porous reservoirs located offshore, like those adjacent to salt domes along the US Gulf Coast, would be relatively ideal sites because salt formations are known to be excellent seals for hydrocarbons.

Depleted oil and gas reservoirs are potentially suitable for CO_2 storage for a variety of reasons—an infrastructure of wells and pipelines exist, and there is a great deal of geologic and subsurface property data available to characterize the subsurface from decades of study. In addition, from an earthquake-triggering perspective, depleted reservoirs are attractive because at the time injection of CO_2 might start, the pore pressure would be below the value that existed before petroleum production. Thus, there could be significant injection of CO_2 before pressures increase to preproduction values, thereby reducing the potential for triggering earthquakes.

There are a number of potential issues to consider before using depleted oil and gas reservoirs for CO_2 storage, the most important of which are capacity and geographic distribution. The reasons that there is such interest in using saline aquifers for CO_2 storage is that they are potentially well distributed with respect to likely sources of CO_2, and they could presumably accommodate the enormous volumes of CO_2 that need to be stored. If one were only to consider the United States, storing the 2.1 billion tons of CO_2 currently generated annually by coal-burning power plants in depleted oil and gas reservoirs would require injection of CO_2 at a rate of approximately 17 billion barrels per year; a rate equivalent to eight times current US annual oil production and more than four times US peak annual oil production that occurred in the early 1970s. In addition, it is important to make sure that production-related activities, such as water flooding during secondary recovery, did not compromise the seal capacity of the reservoirs. There also needs to be careful study of the wells in the depleted oil or gas field to make sure that poorly cemented well casings, especially in older wells, will not be pathways for release of stored CO_2 (23). Finally, there are likely to be complicated legal questions concerning ownership and liability that will need to be worked out on a case-by-case basis.

Although enhanced oil recovery (EOR) using CO_2 (in which CO_2 is injected to dissolve in oil and reduce its viscosity) would be a beneficial use of CO_2, it is important not to confuse this with CCS. In CCS the goal is to inject large quantities of CO_2 into available pore space and store it there for hundreds to thousands of years. When CO_2 is used for EOR, the CO_2 dissolved in the oil is separated and captured from produced oil and then reinjected. Thus, smaller volumes of CO_2 are used, and the long-term storage capacity of the reservoir is not an issue.

Many CCS research projects are currently underway around the world. Much of this work involves characterization and testing of potential storage formations and includes a number of small-scale pilot injection projects. Because the storage capacity/pressure build-up issue is critical to assess the potential for triggered seismicity, small-scale pilot injection projects do not reflect how pressures are likely to change (increase) once full-scale injection is implemented. Moreover, even though limitations on pressure build-up are among the many factors that are evaluated when potential formations are considered as sequestration sites, this is usually done in the context of not allowing pressures to exceed the pressure at which hydraulic fractures would be initiated in the storage formation or caprock. In the context of a critically stressed crust, slip on preexisting, unidentified faults could trigger small- to moderate-sized earthquakes at pressures far below that at which hydraulic fractures would form.

As mentioned above, sequences of small to moderate earthquakes were apparently induced by injection of waste water near Guy, Arkansas, Trinidad, Colorado, and Youngstown, Ohio in 2011 and on the Dallas-Ft. Worth airport, Texas. Although these earthquakes were widely felt, they caused no injury, and only the Trinidad earthquake resulted in any significant damage. However, had similar earthquakes been triggered at sites where CO_2 was being injected, the impacts would have raised pressing and important questions: Had the seal been breached? Was it still safe to leave previously injected CO_2 in place?

In summary, multiple lines of evidence indicate that preexisting faults found in brittle rocks almost everywhere in the earth's crust are subject to failure, often in response to very small increases in pore pressure. In light of the risk posed to a CO_2 repository by even small- to moderate-sized earthquakes, formations suitable for large-scale injection of CO_2 must be carefully chosen. In addition to being well sealed by impermeable overlaying strata, they should also be weakly cemented (so as not to fail through brittle faulting) and porous, permeable, and laterally extensive to accommodate large volumes of CO_2 with minimal pressure increases. Thus, the issue is not whether CO_2 can be safely stored at a given site; the issue is whether the capacity exists for sufficient volumes of CO_2 to be stored geologically for it to have the desired beneficial effect on climate change. In this context, it must be recognized that large-scale CCS will be an extremely expensive and risky strategy for achieving significant reductions in greenhouse gas emissions.

The Gassing Of Satartia

A CO2 pipeline in Mississippi ruptured last year, sickening dozens of people. What does it forecast for the massive proposed buildout of pipelines across the U.S.?

By Dan Zegart
August 26, 2021

It was just after 7 p.m. when residents of Satartia, Mississippi, started smelling rotten eggs. Then a greenish cloud rolled across Route 433 and settled into the valley surrounding the little town. Within minutes, people were inside the cloud, gasping for air, nauseated and dazed.

Some two dozen individuals were overcome within a few minutes, collapsing in their homes; at a fishing camp on the nearby Yazoo River; in their vehicles. Cars just shut off, since they need oxygen to burn fuel. Drivers scrambled out of their paralyzed vehicles, but were so disoriented that they just wandered around in the dark.

The first call to Yazoo County Emergency Management Agency came at 7:13 p.m. on February 22, 2020.

“CALLER ADVISED A FOUL SMELL AND GREEN FOG ACROSS THE HIGHWAY,” read the message that dispatchers sent to cell phones and radios of all county emergency personnel two minutes later.

First responders mobilized almost immediately, even though they still weren't sure exactly what the emergency was. Maybe it was a leak from one of

several nearby natural gas pipelines, or chlorine from the water tank.

The first thought, however, was not the carbon dioxide pipeline that runs through the hills above town, less than half a mile away. Denbury Inc, then known as Denbury Resources, operates a network of CO2 pipelines in the Gulf Coast area that inject the gas into oil fields to force out more petroleum. While ambient CO2 is odorless, colorless and heavier than air, the industrial CO2 in Denbury's pipeline has been compressed into a liquid, which is pumped through pipelines under high pressure. A rupture in this kind of pipeline sends CO2 gushing out in a dense, powdery white cloud that sinks to the ground and is cold enough to make steel so brittle it can be smashed with a sledgehammer.

Even Durward Pettis, a contract welder for Denbury and chief of the local Tri-Community Volunteer Fire Department, didn't figure out that the mystery fog was CO2 for a full 15 minutes. He'd directed first responders to set up three roadblocks to prevent traffic from entering the area. But it wasn't until 7:30 p.m. that word went out that they'd need self-contained breathing apparatus, or SCBA, to enter Satartia and evacuate the town's 42 residents, many of them elderly, and about 250 others who lived just outside town. By then, rescuers and residents were already in motion, fleeing the gas or evacuating others.

Even once Pettis figured it out, none of the sheriffs' deputies and volunteer firefighters had any emergency training in CO2 leaks. Neither did staff at two area hospitals, which had detrimental consequences for gas victims, according to interviews with many of the 49 who were hospitalized.

"It was bad enough that I thought my mama wouldn't make it, and she still has trouble breathing," said Army veteran Hugh Martin, who fled Satartia in a pickup truck with his 78-year-old mother as he struggled to remain conscious. "She never had asthma or COPD, now she's on inhalers full time."

Even months later, the town's residents reported mental fogginess, lung dysfunction, chronic fatigue and stomach disorders. They said they have

trouble sleeping, afraid it could happen again.

This story is the result of a 19-month HuffPost/Climate Investigations Center investigation into the Satartia pipeline rupture, and the safety of CO2 pipelines. It is based on interviews with more than 60 witnesses, victims, first responders, lawyers, medical and toxicological experts, pipeline and petroleum experts, and public health officials; and a review of medical records, police and fire reports, 911 recordings, emergency dispatch logs, internal documents from the Mississippi Emergency Management Agency and the state Department of Environmental Quality, as well as federal pipeline incident reports.

Meanwhile, the federal government is taking the first steps to vastly increase the size of the nation's carbon dioxide pipeline network as a way of fighting climate change. Our investigation reveals that such pipelines pose threats that few are aware of and even fewer know how to handle.

"We got lucky," said Yazoo County Emergency Management Agency director Jack Willingham, who oversaw the rescue effort. "If the wind blew the other way, if it'd been later when people were sleeping, we would have had deaths."

A Deadly Gas

Carbon dioxide has long been used to euthanize laboratory rodents and other small animals, a practice animal welfare organizations now consider inhumane due to the suffering the gas inflicts on the animals. Each year, CO2 accidents kill about 100 workers worldwide — often in basements of restaurants that use CO2-charged systems for their bar mixers — or in industrial accidents.

Carbon dioxide is an asphyxiant that displaces ambient oxygen, making it more difficult to breathe. Smaller exposures cause coughing, dizziness and a panicky feeling called "air hunger." As CO2 concentrations get higher and exposure times

longer, the gas causes a range of effects from unconsciousness to coma to death. Even at lower levels, CO2 can act as an intoxicant, impairing cognitive performance and inducing a confused, drunken-like state.

Denbury's entire business is built around piping carbon dioxide to oilfields and a few industrial users in two operational centers in the Gulf Coast and the Rockies. It owns or has an interest in 14 oil fields in Mississippi, Texas and Louisiana, which are connected by five CO2 pipelines spanning 925 miles. Among its properties is Tinsley Field, adjacent to Satartia, which became Mississippi's first commercially successful oil field in 1939.

ADVERTISEMENT

Left: The Tinsley oil field in Tinsley, Mississippi, on July 23, 2021. Right: A CO2 gas pipeline remains active in Satartia, Mississippi, that same day.

Rory Doyle for HuffPost

In 2007, Denbury built its 31-mile Delta pipeline to connect Tinsley to the Jackson Dome, an extinct volcano under Jackson, Mississippi, whose 4.6 trillion cubic feet of naturally occurring CO2 gas supplies all of the company's fields. Denbury extended the Delta line 77 miles to Louisiana's Delhi field in 2009.

Denbury uses the CO2 for enhanced oil recovery, or EOR, which uses the gas to flush more oil out of wells. About 20% to 40% of the oil in a field can be recovered through conventional drilling and injecting water into the reservoir. Injecting CO2 after that can increase the yield up to 60%.

CO2 use in oil fields has resulted in accidents in several states and abroad. Tinsley itself suffered a sizeable CO2 "blowout" — where injected CO2 explodes out of the ground along with water, mud and drilling fluids — in 2011 that took 37 days to bring under control, sickened one worker, and killed deer, birds, fish and other animals.

ADVERTISEMENT

Denbury had already had two other blowouts in Mississippi, one requiring the evacuation of local homes in Amite County in 2007. Another underground CO2

blowout at Delhi field in 2013 lasted for more than six weeks and contaminated the air with unsafe levels of both CO2 and methane.

Denbury and other companies that do EOR are well versed in the dangers of CO2. At Denbury's Heidelberg Field in eastern Mississippi, signs warn of a CO2 hazard and say SCBA must be worn, and there are muster stations where workers gather if there is a release. The company also has safety pamphlets on its website — one for the public called "Pipeline Safety Is Everybody's Responsibility" and another for first responders titled, "AWARE: Tactics for Responding to a CO2 Pipeline Leak." None of the emergency workers interviewed for this story had seen either.

While the risks of CO2 exposure were well established, the Satartia gassing was the first known instance of an outdoor mass exposure to piped CO2 gas anywhere in the world, according to Marcelo Korc, chief of the World Health Organization's Climate Change and Environmental Determinants of Health Unit, whose staff researched injuries from CO2 pipeline leaks in response to an inquiry from HuffPost.

The sun sets on the village of Satartia alongside the Yazoo River in July.
Rory Doyle for HuffPost

Korc's staff also found that CO2 from the Jackson Dome is contaminated with hydrogen sulfide, a deadly gas that likely worsened residents' symptoms and also accounts for the gas cloud's odor and greenish color, since pure CO2 is odorless and colorless.

ADVERTISEMENT

Denbury declined to answer specific questions for this story, sending only a statement:

> *On February 22, 2020, at approximately 7:00 p.m., Denbury Enterprises' Delta pipeline experienced a sudden rupture and release of CO2 gas near Satartia, Mississippi. Before, during, and after the event, Denbury's main interest has been the health and safety of the residents in the vicinity of the release and the surrounding environment. Denbury and its personnel were quickly in the community, working directly with nearby leadership and any individual residents affected by the event to ensure that any needs arising from the event were met. We have continued to work closely with the community and have made significant contributions to local emergency response organizations to support the important role they play in keeping the community safe. Denbury has cooperated fully with all federal, state, and local agencies who responded to the incident. The federal agency charged with regulating the pipeline continues its review and investigation of the incident, and Denbury continues to cooperate fully with their efforts.*

Beyond the suffering of those who lived through it, the fact that the Biden administration is poised to commit unprecedented billions to carbon capture and sequestration (CCS) technology — putting CCS at the center of the country's strategy for reducing greenhouse gas emissions — further magnifies the importance of Satartia's CO2 accident.

The historic hike in federal support for CCS infrastructure includes taking the first steps toward the construction of a continent-spanning network of pipelines in order to move America's many millions of tons of CO2 to storage areas where,

theoretically, the gas can be injected deep underground and sequestered indefinitely.

Some experts estimate this network will need to be as large as or even larger than the 2.6 million miles of existing petroleum pipelines. Meanwhile, there are only 5,000 miles of existing CO2 lines, meaning there is little experience with a wide range of operational — and safety — issues likely to arise from such a massive new system.

ADVERTISEMENT

Nevertheless, Biden's climate team; his Department of Energy and three of its former secretaries; most utilities; the coal industry and the governments of several coal states; ExxonMobil, the rest of Big Oil and other major industrial corporations; several climate NGOs; the AFL-CIO; and a bipartisan group that spans both houses of Congress all support CCS and the pipeline expansion in some form.

"We want to build more pipes," DOE Secretary Jennifer Granholm told a reporter in June. "There's a lot of jobs that are associated with decarbonizing ... and I think pipes are one of those opportunities."

But the rush to build and operate an integrated CCS and pipeline system has so far taken place with little examination of the safety issue, as the people of

Satartia learned.

Korc of the WHO worried that the basic science done long ago on many toxic chemicals, including petroleum products, has never been done for CO2.

“The exposure studies simply don’t exist,” he said.

Satartia was, in effect, an unwitting case study for a monumental project.

Gas victim DeEmmeris Burns in July 2021, near the site where he was rescued in Satartia.
Rory Doyle for HuffPost

ADVERTISEMENT

“They Can’t Come Evacuate Y’all”

DeEmmeris Burns was returning to his mother’s house in Satartia from a fishing trip with his brother Andrew Burns and cousin Victor Lewis when they heard an explosion and then a deafening roar, like a jet engine. The stench of rotten eggs filled the car.

DeEmmeris Burns immediately thought: pipeline explosion. He knew there was one nearby, but other than its approximate location, knew nothing else about it.

They were driving on Perry Creek Road, a gravel and dirt country lane that hugs its namesake waterway and passes close to but below the location of the pipe rupture. They were almost at his mother’s house.

He called his mother’s cellphone at 7:18 p.m. and told her there had been a gas explosion.

“You got to get out. We’re close, we’re coming to get you,” Burns shouted over the roar of escaping gas.

On the other end of the call, 65-year-old Thelma Brown was trying to figure out why her son sounded so strange. He was hollering, breathing heavily, not making sense. She knew the pipeline he was talking about; it runs about half a mile from her house. But she hadn’t smelled anything. She heard her son frantically repeating, “Cut the air! Cut everything off! Cut the air!” And then, silence.

ADVERTISEMENT

She tried calling him back. No answer. She rang the other two men's cell phones, but got nothing.

Inside the car, the three men rolled up the windows to keep out whatever it was they were driving through. Then the engine died.

"Hunh," Burns said. "Car shut off."

Minutes later, Thelma's sister, Linda Garrett, who lived just down the road, smelled the gas and called too. Thelma repeated what her sons had told her before their call dropped.

Garrett hung up with Thelma and called 911, but the dispatcher didn't seem to know about a gas leak.

"Do I need to be getting out of here?" Garrett asked. The 911 operator said she'd call her back and let her know.

"She can't breathe. She's

Garrett noticed her own breathing was becoming labored. Then her daughter Lynett Garrett and 14-year-old granddaughter, Makaylan Burns, who had been out picking up a pizza for dinner, staggered in the door.

Makaylan seemed to be in full-blown respiratory distress, and Lynett was unable to talk. She pounded on the dining room table and panted.

“What is it? What’s wrong? What is it?” Garrett shouted.

Makaylan dropped to the floor, unconscious.

Garrett tried 911 again. This time the operator acknowledged that there was a gas leak.

“They have shut the highway down because of it. They’re not letting anyone in, they can’t come evacuate y’all,” she said.

Garrett was afraid if they left the house, all three of them would pass out. She insisted on an ambulance. The dispatcher said one would meet them outside of town.
