Subject: Scope of Work for the Menifee Valley Specific Plan Project Traffic Study (LSA Project No. CIM2106)

Dear Rob:

LSA is preparing a traffic study (TS) for the proposed Menifee Valley Specific Plan project (Project) to be located at the eastern edge of the City of Menifee (City). The project is bounded by the California State Route 74 (SR-74) to the north, Matthews Road/Case Road to the south, Briggs Road to the east, and Menifee Road to the west. Figure 1 (all figures, tables, and appendices attached) illustrates the regional and project location.

The proposed project divides 590.3 acres of land into 13 planning areas (PAs). Overall, the project includes 1,328 single-family residential dwelling units (DUs), 390 multifamily residential DUs, one elementary school with 750 students, 5,510,000 square feet (sf) of industrial uses, 560,000 sf of retail, 120,000 sf of public facility uses, and a sports park including a 54,000 sf aquatic sports center and other sports amenities. Additionally, based on the information received from the applicant, the industrial uses are being proposed to be developed as follows:

- 50 percent high-cube fulfillment center warehouse – non-sort;
- 5 percent high-cube cold storage warehouse;
- 15 percent high-cube fulfillment center warehouse - sort;
- 15 percent high-cube parcel hub warehouse; and
- 15 percent light industrial land uses.

The proposed project is anticipated to be built in three phases. Phase 1 includes PAs 1, 2, 7, 11, and 12, and is anticipated to be completed by year 2025. Phases 2 and 3 include PAs 3, 4, 5, 6, 9, 10, and 13. Phases 2 and 3 are anticipated to be completed by year 2026. Detailed land uses and phasing information for each PA is included in Table A. Figure 2 illustrates the conceptual land use plan for the project illustrating the corresponding phase for each PA.

The project will extend McLaughlin Road from Menifee Road to Briggs Road. It should be noted that the project will not extend Case Road/Matthews Road between Menifee Road and Briggs Road along the southern border of the project site. For purposes of this TS, the McLaughlin Road extension has been included as part of the study area while the segment of Case Road/Matthews Road between Menifee Road and Briggs Road has been excluded.

1500 Iowa Avenue, Suite 200, Riverside, California 92507 951.781.9310 www.lsa.net

Access to the project site will be provided at project driveways along Menifee Road, SR-74, and Briggs Road. For purposes of this scope of work, the TS analyzed the primary accesses along Menifee Road, SR-74, and Briggs Road. As such, the following project driveways were included in the analysis:

Menifee Road:

- Valley Substation Driveway – Biscayne: This driveway is an existing full access driveway located at the existing signalized intersection of Menifee Road and Valley Substation Driveway – Biscayne. The driveway will be a shared driveway with the existing Southern California Edison facility located along the northern side of the street.
- McLaughlin Road: The project will extend McLaughlin Road from Menifee Road to Briggs Road. This future driveway will be a full access driveway.
- Project Driveway 1: This future driveway will be a full access driveway.

SR-74:

- McKinley: This driveway is an existing full access driveway located at the existing intersection of McKinley and SR-74. Similar to Biscayne, this driveway will be a shared driveway with the existing Southern California Edison facility.
- Project Driveway 2: This future driveway will be a full access driveway that will be aligned with Malaga Road. It should be noted that Malaga Road currently exists as a dirt road on the northern leg of this intersection.
- Project Driveway 3: This future driveway has been evaluated as a right-in-right-out (RIRO) driveway.

Briggs Road:

- McLaughlin Road: The project will extend McLaughlin Road from Menifee Road to Briggs Road. This future driveway will be a full access driveway.
- Project Driveway 4: This future driveway will be a RIRO driveway.
- Project Driveway 5: This driveway will be located at the existing intersection of Briggs Road and Meadow Oak Street. As such, this driveway will be a full access driveway.
- Project Driveway 6: This future driveway will be a RIRO driveway.
- Project Driveway 7: This future driveway will be a full access driveway.

Additionally, LSA will discuss the feasibility of other onsite improvements (roundabout, traffic calming measures and other applicable project design features) with City staff and include them as appropriate in the TS.

The TS will include a Level of Service (LOS) Assessment for General Plan consistency purposes as well as a California Environmental Quality Act (CEQA) Assessment. The LOS Assessment will be prepared as per the City of Menifee Engineering Department *LOS Traffic Study Guidelines,* revised October 2020, while the CEQA Assessment will be prepared as per the City of Menifee *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled*, updated January 2022. As such, LSA anticipates that the following scope of work will be required to prepare the TS for the project.

LEVEL OF SERVICE ASSESSMENT

Study Area

The project study area was generally determined based on select zone model runs from the Riverside County Model (RIVCOM). The model runs are included in Appendix A. However, the model roadway network includes the following roadway network improvements that are yet to be constructed:

- Completion of Ethanac Road extension between SR-74 and west of Goetz Road;
- Completion of Briggs Road extension between Simpson Road and Domenigoni Parkway; and
- Alignment of northern section and southern section of Briggs Road at its intersection of Matthews Road-Case Road.

Since these improvements does not exist under existing conditions, project trip distribution obtained from the RIVCOM select zone model runs were refined based on the existing roadway network.

Though these improvements are not anticipated to be constructed before project completion, LSA will discuss with City staff to identify feasibility and timeline of each of these improvements. If any of these improvements are determined to be implemented before the study Horizon Year (2045), a separate project trip distribution would need to be included in the TS based on the revised network under the Horizon year (2045) analysis scenario.

The project trip distribution was further refined considering the geographic location of the project, location of other land uses within the study area, recommended truck routes, proximity of existing freeway interchanges, and local absorption of commercial and school trips to determine the project study area. The study area intersections and roadway segments to be analyzed in the TS were determined based on these adjustments and are included in Tables B and C respectively. For ease of understanding, the entire study area was divided into five zones. Figure 3-1 illustrates the index of different zones for study area intersections. Figures 3-2 through 3-6 illustrate the study area intersections in the different zones.

Project Trip Generation

Table D summarizes the project trip generation. As shown in Table D, the trip generation was developed using rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition) and other applicable sources.

Typically, ITE trip generation rates are calculated based on surveys conducted across the entire country. For industrial uses that include a high-cube fulfillment center warehouse facility, the ITE rates may not be representative in the context of the Inland Empire. Trip generation studies/surveys were recently conducted at such facilities in the Inland Empire region to accurately estimate passenger vehicle (PV) and truck trip generation for such truck-intensive industrial uses within the region. Therefore, for the business park land uses that are proposed as high-cube fulfillment centers, LSA has used trip generation rates from these studies to estimate the trip generation.

The City's TS guidelines recommend using the City of Fontana *Truck Trip Generation Study,* dated August 2003, to estimate truck trips for these uses. However, the South Coast Air Quality Management District (SCAQMD) provide a more updated PV and truck mix for warehousing projects within its boundaries. Therefore, for the high-cube warehouse land uses, SCQAMD recommendations were applied to estimate the PV and truck mix.

Following is a brief summary of the methodology used to develop trip generation for the different business park land uses:

- High-Cube Fulfillment Center Warehouse – Non-Sort: For this land use, trip generation rates for PVs and trucks were obtained from the Western Riverside Council of Governments' (WRCOG's) Transportation Uniform Mitigation Fee (TUMF) Program *High-Cube Warehouse Trip Generation Study*, dated January 2019. The truck mix was considered as 21.9% 2-axle, 17.7% 3-axle, and 60.3% as 4 or more axle trucks based on SCAQMD recommendations.
- High-Cube Cold Storage Warehouse: Trip generation rates were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 157 – "High-Cube Cold Storage Warehouse." The resulting trips were converted to trucks and PVs based on SCAQMD recommendations. As such, 31 percent of the trips will be trucks, including 6.8% 2-axle, 5.5% 3-axle, and 18.7% 4 or more axle trucks.
- High-Cube Parcel Hub Warehouse: Trip generation rates were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 156 – "High-Cube Parcel Hub Warehouse." The resulting trips were converted to trucks and PVs based on the SCAQMD recommendations. As such, 31 percent of the trips will be trucks, including 6.8% 2-axle, 5.5% 3-axle, and 18.7% 4 or more axle trucks.
- High-Cube Fulfillment Center Warehouse – Sort: As shown in the ITE *Trip Generation Manual*, 11th Edition, trip generation rates for "Land Use 155 – High-Cube Fulfillment Center Warehouse – Sort" was developed using a small sample (two survey sites for the daily trip rate and three survey sites for a.m. and p.m. peak hour trip generation rates). Therefore, using the ITE trip rates will not provide an accurate estimate for the trip generation. Also, as summarized in the "Additional Data" section in the ITE *Trip Generation Manual* for this land use, these sites were surveyed in California, New Jersey, and Texas. As such, these trip rates won't be representative in the context of Inland Empire. Additionally, the project doesn't have confirmed tenants for any of these sort facilities. Typically, certain high-cube sort facilities generate higher trips compared to other sort facilities. Trip generation studies/surveys were recently conducted at such high trip generating high-cube sort facilities in the Inland Empire region to accurately estimate passenger vehicle (PV) and truck trip generation for truck-intensive industrial uses within the region. Therefore, for the "High-Cube Fulfillment Center Warehouse - Sort" land use, LSA has used trip generation rates from these surveys to estimate the project trip generation. As such, PV and 2-axle, 3-axle, and 4 or more axle truck trip generation rates were based on trip generation surveys conducted at seven similar fulfillment center facilities within the Inland Empire region. Appendix B of the scoping letter summarizes a detailed description of the surveyed facilities, as well as average trip rates for passenger vehicles, 2-axle, 3-axle, and 4- and more axle trucks.

- General Light Industrial: Trip generation rates were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 110 - "General Light Industrial." The resulting trips were converted to PVs and trucks based on the City of Fontana's *Truck Trip Generation Study* (dated August 2003). As such, 21.4% of the trips will be trucks, including 8.0% 2-axle trucks, 3.9% 3-axle trucks, and 9.5% 4 or more axle trucks.

All truck trips were converted to passenger car equivalent (PCE) trips using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

Since the Specific Plan has a mix of residential and non-residential land uses, it is anticipated that a certain percentage of project trips will remain within the Specific Plan. These trips will be travelling between the different residential and non-residential uses. For purposes of this analysis, these trips have been considered as internal trips. Under full build-out conditions for the project, internal trip percentages from one PA to another were generally developed using select zone runs obtained from RIVCOM. However, the following adjustments were made to the internal trip capture percentages obtained from the RIVCOM select zone model runs:

- RIVCOM select zone runs estimated a percentage of truck trips being absorbed internal to the project site. However, it is not anticipated that majority of these truck trips would remain internal to the project site. Therefore, as a conservative approach, no internal capture was considered for project truck trips.
- For the elementary school, internal trips are typically a part of a.m. peak hour drop-offs and p.m. peak hour pick-ups. Therefore, the RIVCOM select zone internal capture for the elementary school land use was adjusted accordingly to account for local drop-offs and pick-ups during the a.m. and p.m. peak hours respectively.

The internal trips were subtracted from the total trip generations for the different PAs to develop the net external trips from each PA.

The external trips for the different PAs under Phase 1 of the project were added to obtain the external project trip generation under this phase. As such, Phase 1 is anticipated to generate a total of 15,392 daily external PV trips, with 1,332 external PV trips in the a.m. peak hour and 1,717 external PV trips in the p.m. peak hour. Additionally, accounting for truck PCE trips, this phase is anticipated to generate a total of 5,327 daily PCE trips, with 553 PCE trips in the a.m. peak hour and 519 PCE trips in the p.m. peak hour. Overall, Phase 1 is forecasted to generate a total of 20,719 external PCE trips, with 1,885 external PCE trips in the a.m. peak hour and 2,236 external PCE trips in the p.m. peak hour.

For the retail component developed in PA 13 under Phase 3 of the Specific Plan, a certain percentage of external trips will be pass-by trips. A pass-by trip is a trip where an intermediate stop is made on the way from the origin to the primary destination of the trip without making a route diversion. It is not actually a "new" trip added to the surrounding circulation system. Pass-by rates were obtained from the ITE *Trip Generation Manual* (11th Edition). After deducting the pass-by trips from the total external trips for the retail uses, the net external trips for the retail uses were obtained. These net external trips were added to the external trips for the other PAs under Phases 2 and 3 to obtain the net external trip generation for these two phases.

As such, Phases 2 and 3 of the project are anticipated to generate a total of 27,729 daily net external PV trips, with 2,165 net external PV trips in the a.m. peak hour and 2,678 net external PV trips in the p.m. peak hour. Additionally, accounting for truck PCE trips, this phase is anticipated to generate a total of 3,814 daily PCE trips, with 396 PCE trips in the a.m. peak hour and 373 PCE trips in the p.m. peak hour. Overall, Phases 2 and 3 is forecasted to generate 31,543 net external PCE trips, with 2,561 net external PCE trips in the a.m. peak hour and 3,051 net external PCE trips in the p.m. peak hour.

The entire project is anticipated to generate a total of 43,121 daily net external PV trips, with 3,497 net external PV trips in the a.m. peak hour and 4,395 net external PV trips in the p.m. peak hour. Additionally, accounting for truck PCE trips, the entire project is anticipated to generate a total of 9,141 daily PCE trips, with 949 PCE trips in the a.m. peak hour and 892 PCE trips in the p.m. peak hour. Overall, the entire project is forecasted to generate 52,262 net external PCE trips, with 4,446 net external PCE trips in the a.m. peak hour and 5,287 net external PCE trips in the p.m. peak hour.

Detailed project trip generation worksheets are included in Appendix B.

Project Trip Distribution and Assignment

External trip distribution patterns for each PA in the Specific Plan were obtained using P.M. peak period select zone model runs from RIVCOM. The select zone model runs are included in Appendix A.

It should be noted that the intersection LOS analysis typically examines traffic operations during the a.m. and p.m. peak hours, since they usually represent the busiest traffic conditions during the day. Typically, the p.m. peak hour project traffic is higher than the a.m. peak hour conditions. As shown in Table D, the project generates more trips during the p.m. peak hour. Additionally, the select zone distribution plot is based on bi-directional traffic. The in and out splits are accounted for through the ITE trip generation. The project trip assignment is developed by multiplying the corresponding ITE in and out trip generation with the select zone project distribution. Therefore, while the a.m., p.m. and daily select zone plots are similar, the p.m. select zone plots were used as a conservative estimate since they represent the worst case project traffic.

Additionally, since the select zone plots are based on RIVCOM Future scenario (year 2045), project trip distributions were further refined with considerations of the existing regional circulation network. Following are the major refinements considered for the trip distribution considered compared to the RIVCOM select zone plots:

- As illustrated in the select zone model plots for the residential PAs, approximately 12 percent to 14 percent trips travel east using SR-74 towards unincorporated Riverside County, as well as Cities of San Jacinto and Hemet. However, another 10-11 percent trips are also estimated to travel eastbound using Case Road, Grand Avenue, and Simpson Road, and terminate around Hemet and unincorporated Riverside County. However, upon further review of the existing circulation network within these areas, it was determined that majority of these streets are local streets and collectors. As such, it was determined that these trips would rather utilize major arterials/roadways like SR-74 instead of using local

streets. Therefore, the select zone distribution was modified to account for project traffic using travel corridors that would provide shorter travel paths/travel time.

- Based on the select zone distribution for PA-13, approximately one percent of the trips are absorbed between PA-13 and the Southern California Edison (SCE) Menifee Service Center area located at the southeast corner of Menifee Road and SR-74. There is an existing driveway along the eastern border of the SCE Menifee Service Center, located on McKinley. Based on further evaluation, vehicular trips between the two sites (PA-13 and the SCE Menifee Service Center) are feasible via the SCE Menifee Service Center driveway on McKinley without using external intersections along SR-74 or Menifee Road. Therefore, this one percent trip was estimated to not travel through any of the external intersections. The remaining project trips from the commercial area were distributed among the PA-13 driveways.

- Because trucks typically have different travel patterns than PVs, separate trips distributions were developed for PVs and trucks.

Figures 4-1 through 19-5 illustrate the distribution of external trips for the different PAs in the Specific Plan. The trip distribution for each PA at different study intersections was applied to the corresponding net external trip generation to obtain the net external trip assignment for the PA. Figures 20-1 through 26-5 illustrate the net external trip assignment for the different PAs developed under Phase 1 of the project. Figures 27-1 through 27-5 illustrate the total net external trip assignment for all the PAs under Phase 1. Figures 28-1 through 35-5 illustrate the net external trip assignment for the different PAs developed under Phases 2 and 3 of the project. Figures 36-1 through 36-5 illustrate the total net external trip assignment for all the PAs developed under Phases 2 and 3 of the project. Figures 37-1 through 37-5 illustrate the total net external trip assignment for the project. Appendix C includes the Regional Trip Distribution figures for each PAs.

Analysis Scenarios

The TS will satisfy the requirements established by the City and Caltrans where applicable as well as the requirements for the disclosure of potential impacts and mitigation measures pursuant to CEQA. The TS will evaluate the different phases of the project. Since the project proposes completion of phases 2 and 3 by year 2026, the project opening year cumulative scenario for these two phases will be analyzed together in the TS. Therefore, this scenario will include the full build-out of the project. As such, the following scenarios will be included in the TS:

- Existing Conditions;
- Existing Plus Project Conditions;
- Phase 1 Opening Year Cumulative (2025) without Project Conditions;
- Phase 1 Opening Year Cumulative (2025) Plus Project Conditions;
- Phases 2 and 3 Opening Year Cumulative (2026) without Project Conditions;
- Phases 2 and 3 Opening Year Cumulative (2026) Plus Project Conditions;
- Horizon Year (2045) without Project Conditions; and
- Horizon Year (2045) Plus Project Conditions.

Volume Development and Analysis Methodology

Traffic volumes for existing traffic conditions will be based on existing count data collected at study intersections and roadway segments.

Traffic volumes for Phase 1 and Phases 2 and 3 opening year cumulative conditions will be developed by applying an ambient growth rate of 2 percent per annum to the existing traffic volumes and by adding traffic from approved and pending cumulative projects in the study area. Cumulative projects to be included in the TS will be obtained from City staff and adjacent jurisdictions.

Horizon year (2045) traffic volumes will be developed using the growth forecasts from RIVCOM and by applying appropriate post-processing methodologies, per the National Cooperative Highway Research Program (NCHRP). LSA will consult with City staff and adjacent jurisdictions to ensure that all approved and pending projects that will affect the study area are included in the model.

Existing, Horizon year, and project opening year cumulative plus project volumes will be developed by adding project traffic to the traffic for the corresponding without project scenarios.

All study intersections will be analyzed during the a.m. and p.m. peak hours. The a.m. peak hour is defined as the one hour of highest traffic volumes occurring between 7:00 and 9:00 a.m. while the p.m. peak hour is defined as the one hour of highest traffic volumes occurring between 4:00 and 6:00 p.m. Intersection LOS will be calculated using the *Highway Capacity Manual 6* (HCM 6) analysis methodologies and using the Synchro 11 software. Roadway segment analysis will be performed based on the appropriate methodologies recommended by respective jurisdictions.

Analysis of Traffic Operations and Recommended Circulation Improvements

Levels of service without the project will be compared to levels of service with the project for all analysis scenarios to determine operational deficiencies based on the LOS standards and operational deficiency criteria established by different jurisdictions. Further, necessary improvements will be recommended to offset these deficiencies. Improvements may include addition of intersection turn lanes, segment lane additions, signalization, etc. The LOS with the proposed improvements will be calculated and summarized along with a comparison of the LOS without improvements.

Signal Warrant Analysis and Specific Plan Signalization Analysis

A signal warrant analysis would be conducted at external unsignalized intersections if a signal is recommended as an improvement. Additionally, as per the requirements of the City's TS guidelines, a Specific Plan signalization analysis will be performed to determine if a signal is warranted at any of the unsignalized intersections bordering or within the Specific Plan. Peak hour approach volumes for the study intersections will be examined to determine whether signalization may be warranted per the criteria defined in the California supplement of the *Manual on Uniform Traffic Control Devices* (CA-MUTCD). For the signalization analysis intersections, the TS will identify which signalizations are the responsibility of the development and which are covered through the City's Development Impact Fee (DIF) program.

Fair Share Contributions

A fair share percentage will be calculated for the improvements recommended in the TS that are not included in the WRCOG's TUMF program, the City's DIF program, or any other fee program. Typically for large projects or specific plans, the fair share contributions are calculated for the Horizon Year. However, as recommended by the City staff, Fair share contributions will be calculated for Phase 1 Opening Year Cumulative (2025) conditions, Phases 2 and 3 Opening Year Cumulative (2026) Conditions, and Horizon Year (2045) Conditions. LSA will discuss with City staff to determine the appropriate methodologies to develop fair-share percentages for Phase 1 Opening Year Cumulative (2025) conditions and Phases 2 and 3 Opening Year Cumulative (2026) Conditions, along with Horizon Year (2045) Conditions. The percentage of fair share for the project will be calculated at each location using the total trips generated by the project divided by the total "new" traffic, which is the net increase in traffic volumes from existing to corresponding scenario year conditions.

Caltrans Safety Analysis Review

Consistent with Caltrans' *Interim Local Development and Intergovernmental Review* (LDIGR) *Safety Review Practitioners Guidance,* dated December 2020, a safety analysis is required at all Caltrans facilities in which the project traffic may create an operational deficiency and/or a safety concern. The safety analysis includes a collision analysis and a freeway queuing analysis.

The collision analysis will summarize recent traffic accident data from Caltrans' Traffic Accident Surveillance and Analysis System (TASAS) Table C – "All" Crashes and "Wet" Crashes around the project study area.

The freeway queuing analysis will examine the traffic safety impacts at the interchange off-ramps. The queuing analysis will examine how many car lengths the project will add to the existing ramp queues and review the speed differential between the off-ramp queue and mainline traffic during the peak hours. If the project adds two or more car lengths to the existing ramp queues in the peak hour and the speed differential exceeds the significance thresholds as outlined in the *Safety Review Practitioners Guidance*, traffic safety improvements will need to be identified to offset operational deficiencies on traffic safety, if any.

CEQA ASSESSMENT

The VMT analysis for the project will be performed using RIVCOM. The analysis will be based on the City of Menifee *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled*, updated January 2022. The City's VMT analysis guidelines do not state any analysis methodology for Specific Plan projects. However, the guidelines recommend using VMT per service population as the metric for VMT analysis of development projects. As per the guidelines, a project would result in a significant project-generated VMT impact if either of the following conditions are satisfied:

1. The baseline project-generated VMT per service population exceeds the County of Riverside General Plan Buildout VMT per service population, or

2. The cumulative project-generated VMT per service population exceeds the County of Riverside General Plan Buildout VMT per service population.

Additionally, a project's effect on VMT would be considered significant if it resulted in either of the following conditions to be satisfied:

1. The baseline link-level Citywide boundary VMT per service population to increase under the plus project condition compared to the no project condition, or

2. The cumulative link-level Citywide boundary VMT per service population to increase under the plus project condition compared to the no project condition.

As such, the VMT analysis will be prepared as follows:

Establishing Cumulative Scenario Baseline

LSA understands that the project area was a part of the approved Menifee Valley Ranch Specific Plan, which will now be designated as the Menifee Valley Specific Plan with updated land uses. Therefore, the first step in preparation of the VMT analysis would be to ensure that the cumulative scenario baseline appropriately reflects the land use approved in the Menifee Valley Ranch Specific Plan. The traffic analysis zones (TAZs) within this specific plan would be evaluated and be updated (if required) to develop the cumulative baseline VMT conditions for purposes of this analysis.

Project Traffic Analysis Zone Update

Subsequently, the TAZs in the model that include the project area would need to be updated to include the land uses from the proposed project. LSA will convert the specific plan land uses into model socioeconomic categories. This conversion will be based on ITE *Trip Generation Manual* (11th Edition), Appendix E-1: Socioeconomic Build-out Assumptions and Methodology of the County of Riverside General Plan, or other appropriate sources. LSA estimates that approximately twelve TAZs need to be created to incorporate the project land uses. The socioeconomic data (SED) for the Proposed Specific Plan will be included in the project TAZs for baseline conditions, while for cumulative conditions, the SED for the section of the Approved Menifee Valley Ranch Specific Plan in the project TAZs will be isolated and replaced with the proposed project SED. The new TAZs will be utilized to calculate project specific VMT per service population under baseline and cumulative conditions.

Project VMT Analysis

Upon completion of the SED update, LSA will conduct model runs for the baseline and cumulative scenarios. Project generated VMT shall be obtained by multiplying the model's origin-destination trip matrix with the final assignment skims. The project-effect on VMT shall be obtained through a link-level analysis by extracting total link-level VMT for both without and with project conditions within the City's boundary.

LSA will utilize the outputs from the model runs to calculate the project VMT per service population under baseline and cumulative conditions. As per the City's VMT analysis guidelines, this will be compared with the County's General Plan Buildout VMT per service population to determine if the project will generate a significant VMT impact under baseline and cumulative conditions. A net increase in VMT per service population for the project compared to the County's General Plan Buildout VMT per service population under either baseline or cumulative conditions would indicate

a significant VMT impact. Additionally, a net increase in citywide link-level VMT per service population would indicate that the project's effect on VMT is significant.

Mitigations

In case of a significant VMT impact, mitigation measures will be identified to offset the impact. Such measures require mitigation of regional impacts through behavioral changes. In general, transportation demand management (TDM) actions, active transportation amenities, and other measures to reduce the number of trips creating an impact are possible VMT mitigation strategies. Additionally, participation in a VMT fee program and/or VMT mitigation exchange/banking program may also be considered. Feasible VMT mitigation measures for the project and their corresponding VMT reduction percentages, if required, will be determined based on discussion with City staff.

Active Transportation and Public Transit Analysis

In this analysis, potential project impacts on public transit, bicycle, and pedestrian facilities will be evaluated and significant impacts would be determined based on whether the project conflicts with adopted policies, plans, or programs for these facilities, or whether the project decreases the performance or safety of these facilities.

Should you have any questions, please do not hesitate to contact me at (951) 781-9310 or email me at Ambarish.Mukherjee@lsa.net.

Sincerely,

LSA ASSOCIATES, INC.

Notes:

TSF = Thousand Square Feet , DU = Dwelling Units, AC = Acres; PCE = Passenger Car Equivalents

[1] Rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition), Land Use 210 - "Single-Family Detached Housing", Setting/Location - "General Urban/Suburban."

[2] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 488 - "Soccer Complex", Setting/Location - "General Urban/Suburban."

[3] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 490 - "Tennis Courts", Setting/Location - "General Urban/Suburban." Since inbound and outbound splits are not available for the p.m. peak hour, the splits were obtained from a similar Land Use 491 - "Racquet/Tennis Club" in the ITE *Trip Generation Manual.*

[4] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 495 - "Recreational Community Center", Setting/Location - "General Urban/Suburban."

[5] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 433 - "Batting Cages", Setting/Location - "General Urban/Suburban." Since there is no data available for daily trips, the ratio of daily and p.m. peak hour rates was obtained from Land Use 490 - "Tennis Courts" and applied to the p.m. peak peak hour rate for this land use.

[6] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 411 - "Public Park", Setting/Location - "General Urban/Suburban."

[7] Passenger vehicle and truck rates were obtained from Western Riverside Council of Government (WRCOG) Transportation Uniform Mitigation Fee (TUMF) Program "High-Cube Warehouse Trip Generation Study", dated January 2019. Passenger vehicles and truck inbound and outbound splits were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 155 – "High-Cube Fulfillment Center Warehouse - Non-Sort", Setting/Location - "General Urban/Suburban." The truck mix percentages were obtained from South Coast Air Quality Management District (SCAQMD) recommendations for warehousing projects. As such, The truck mix was considered as 21.9% 2-axle trucks, 17.7% 3-axle trucks, and 60.3% 4 or more axle trucks. All truck trips were converted to passenger PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[8] Rates from ITE Trip Generation Manual (11th Edition) for Land Use 157 – "High-Cube Cold Storage Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks. Since peak hour inbound and outbound splits are not available for Land Use 157, inbound and outbound splits for total vehicles (passenger vehicles + trucks) and trucks for Land Use 155 - "High Cube Fulfillment Center Warehouse" have been used to determine the inbound and outbound split in the peak hours. Inbound and outbound splits for passenger vehicles have been developed by subtracting all truck inbound and outbound rates from the total vehicles inbound and outbound rates, respectively. All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[9] Trip generation rates, including passenger vehicle and 2-axle, 3-axle and 4 or more axle truck trip rates are based on survey data of seven Amazon fulfillment centers in the Inland Empire.

[10] Rates from the ITE Trip Generation Manual (11th Edition) rates for Land Use 156 – "High-Cube Parcel Hub Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks.All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[11] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 110 - "General Light Industrial", Setting/Location - "General Urban/Suburban." Project trips were converted to trucks and passenger vehicles based on the *City of Fontana Truck Trip Generation Study* , dated August 2003. As such, 21.4 percent of project traffic will be trucks. Based on Vehicle Mix from the Fontana study, the truck mix is 8.0% 2-axle trucks, 3.9% 3-axle trucks, and 9.5% 4 or more axle trucks. All truck trips were converted to PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[12] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 220 - "Multifamily Housing (Low-Rise)", Setting/Location - "General Urban/Suburban."

[13] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 520 - "Elementary School", Setting/Location - "General Urban/Suburban." The estimated enrollment for this school is 750 students.

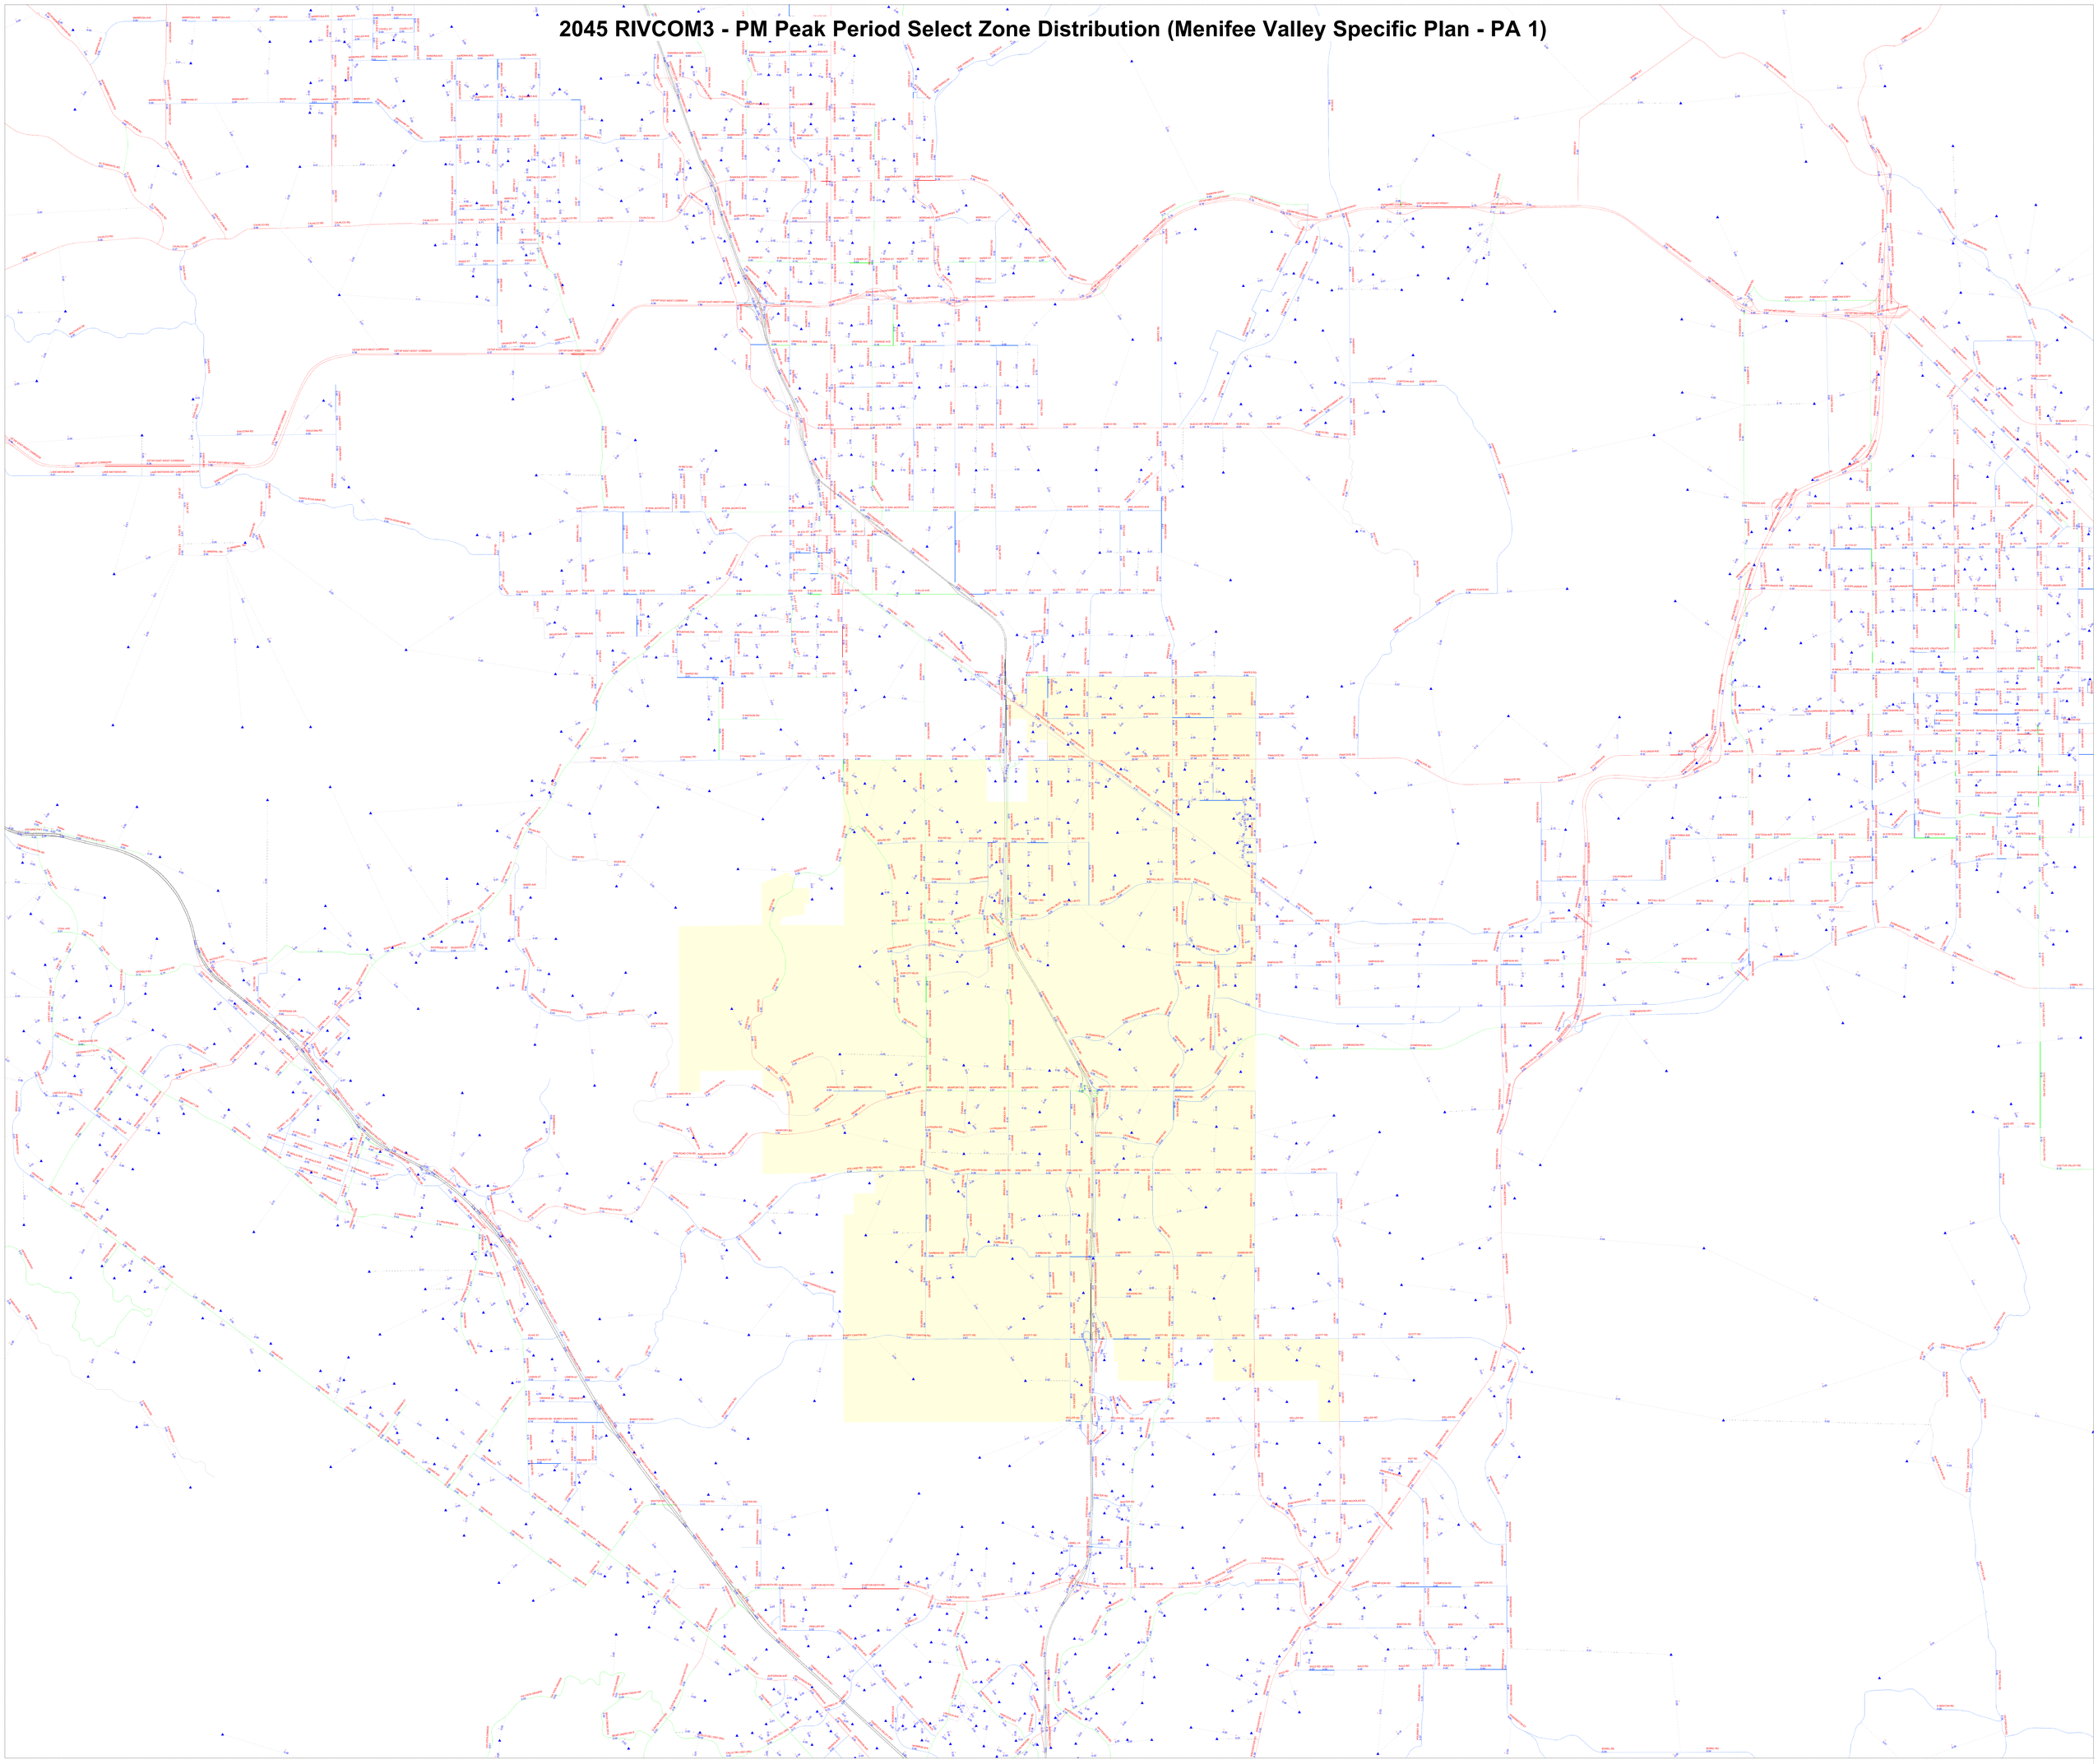
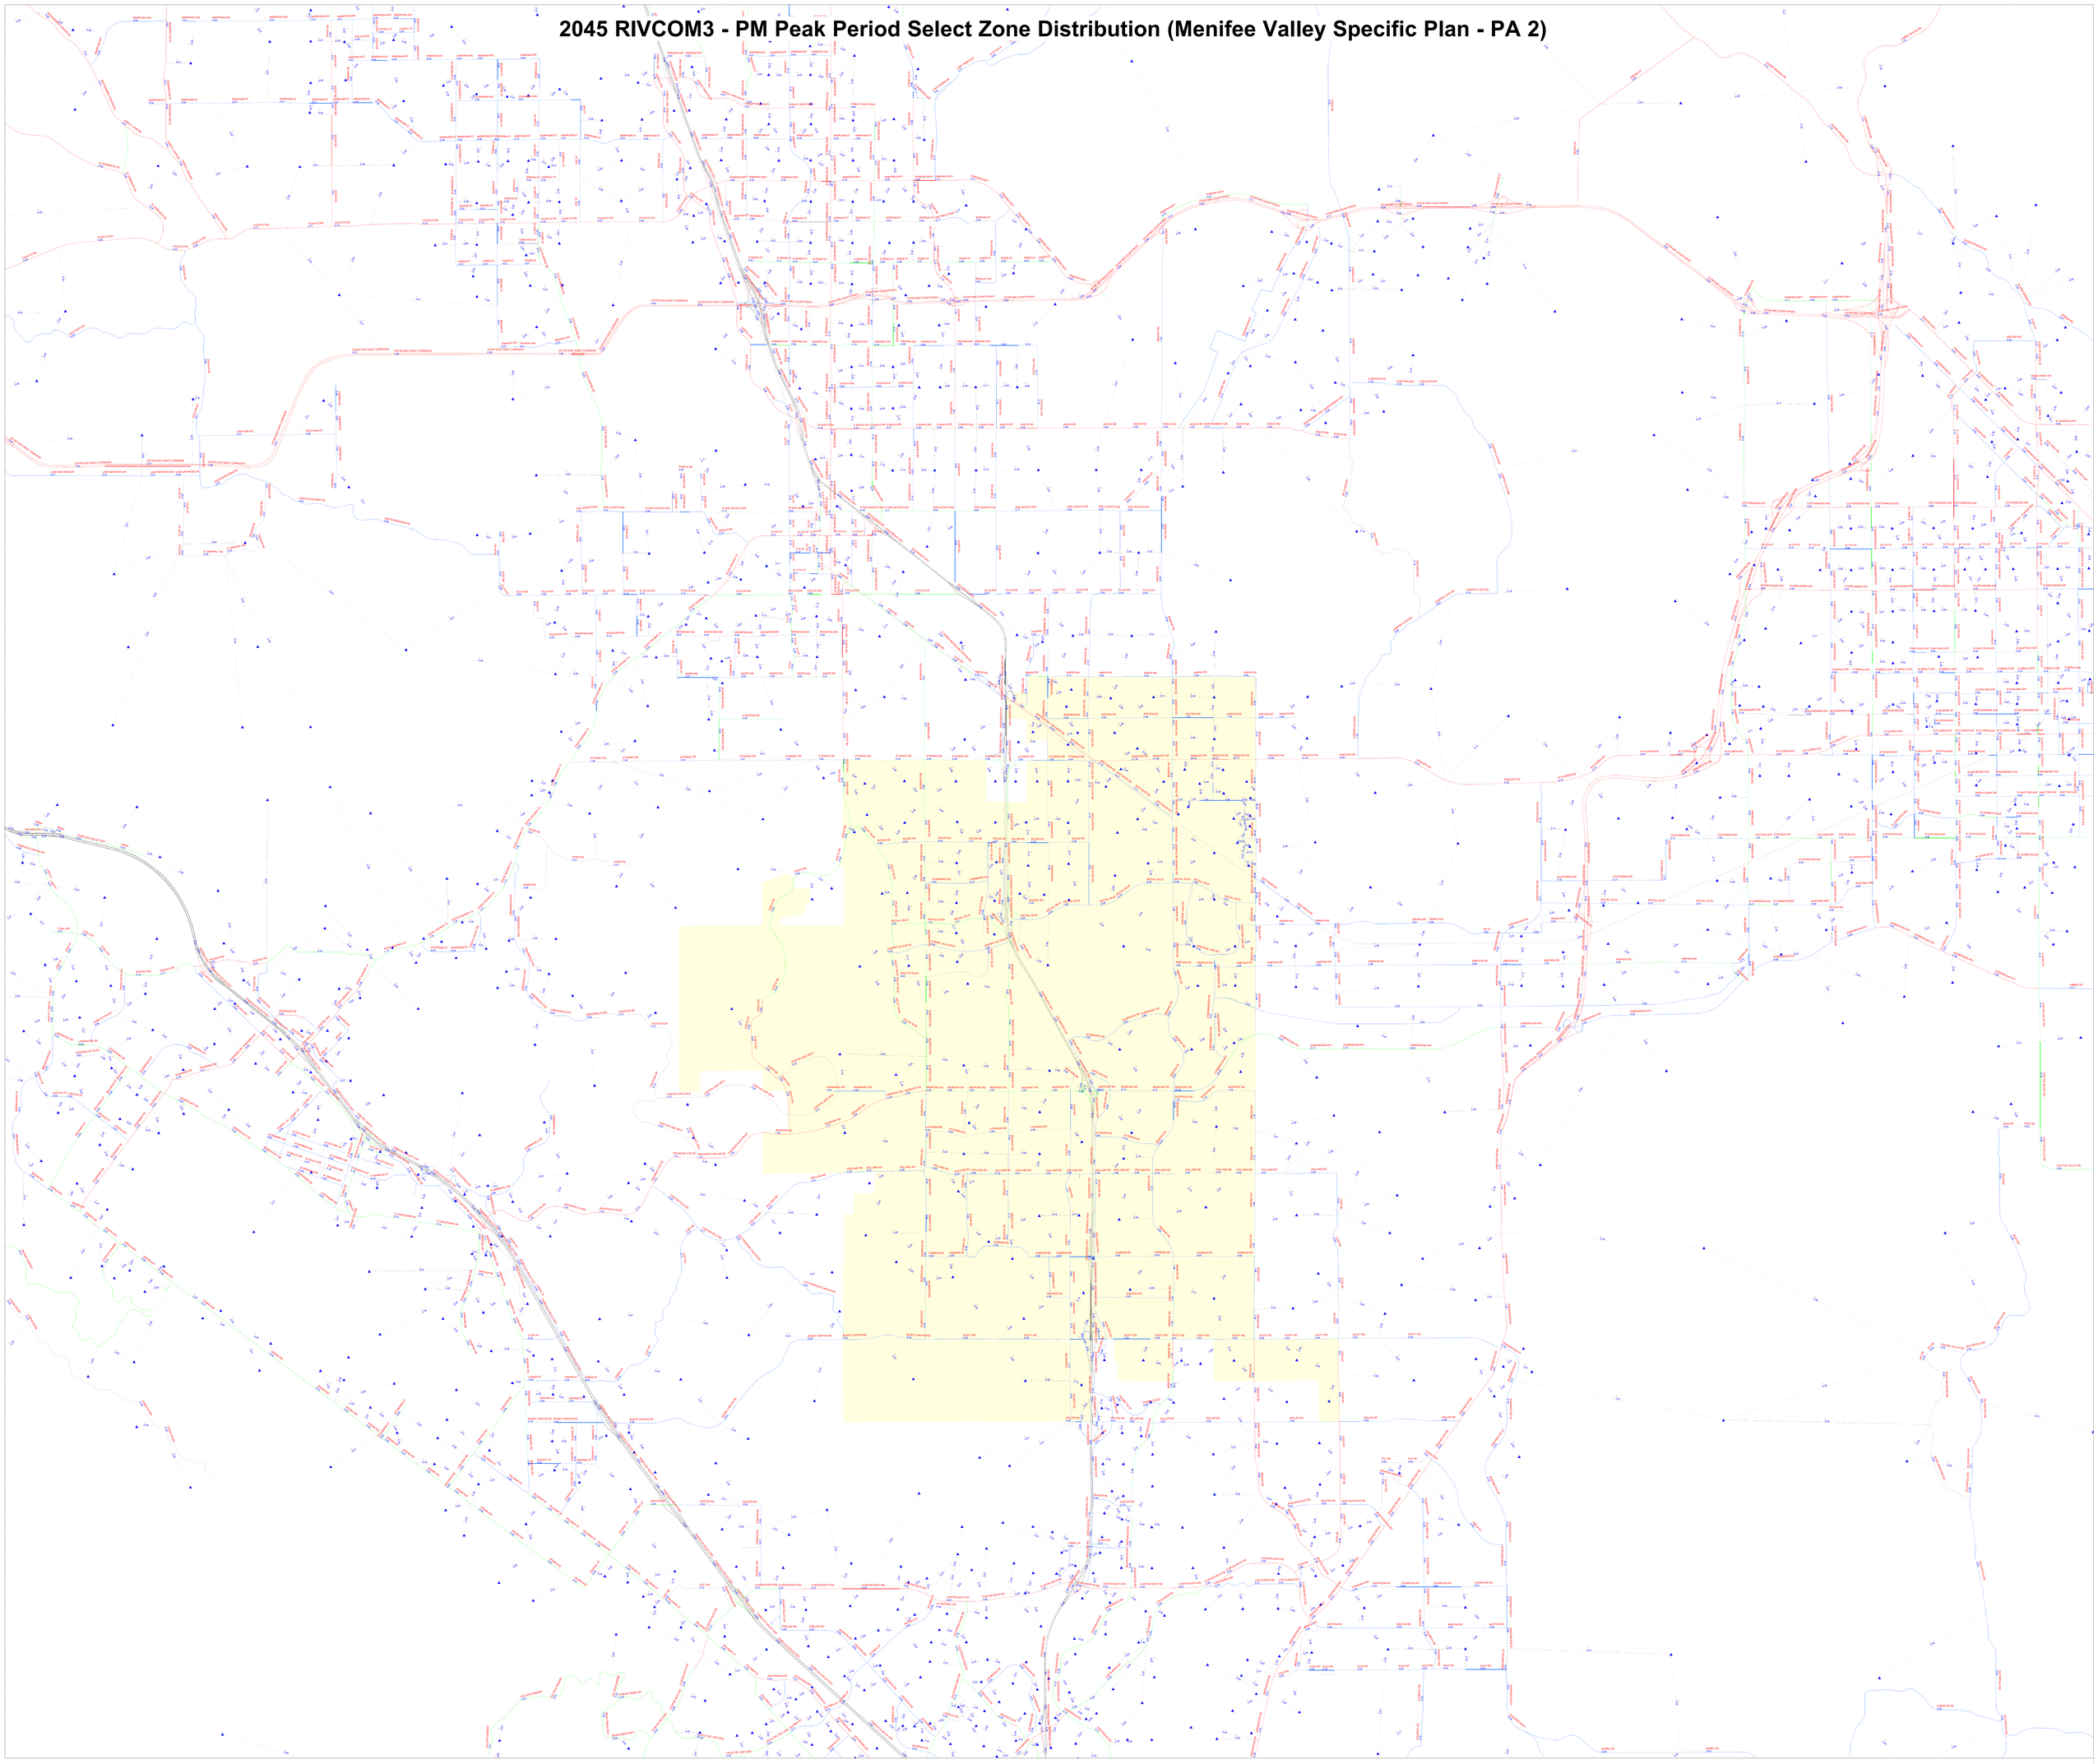
Table D - Project Trip Generation

Land Use	Units	A.M. Peak Hour In	A.M. Peak Hour Out	A.M. Peak Hour Total	P.M. Peak Hour In	P.M. Peak Hour Out	P.M. Peak Hour Total	Daily



[14] Planning area 9 is designateded to be a Public Facility (PF)/ Civic Node site, as included in the *Menifee Valley Specific Plan* , dated February 16, 2022 prepared by Brookfield Properties. The document also include all the permitted land uses for this planning area. Trip generation rates for all these permitted land uses were reviewed to determine the land use with the highest trip generation rates as a conservative estimate. Though the highest trip generator land use was found to be Land use 732 - "United States Post Office", due to presence of an existing post office near the project site that land use was not selected, and rates from the ITE Trip Generation Manual(11th Edition), Land Use 495 - "Recreational Community Center", Setting/Location - "General Urban/Suburban" was used to develop the trip generation for this facility.

[15] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 820 - "Shopping Center (>150k)", Setting/Location - "General Urban/Suburban."



[16] Pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 820 - "Shopping Center (>150k)." A pass-by rate of 19% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE *Trip Generation Manual* , the p.m. pass-by rate was used as the daily pass-by rate.

APPENDIX B:

PROJECT TRIP GENERATION WORKSHEETS

TRIP GENERATION MEMORANDUM FOR AMAZON AND SIMILAR HIGH-CUBE FULFILLMENT CENTER WAREHOUSE FACILITIES

The trip generation for Amazon or similar high-cube fulfillment center warehouse facilities may be developed either by using the rates included in this appendix or any other source approved by City staff. This memorandum provides a brief summary of the development of trip generation rates for Amazon type high-cube fulfillment center warehouse facilities using survey data:

SURVEY-BASED TRIP GENERATION RATES FOR AMAZON TYPE HIGH-CUBE FULFILLMENT CENTER WAREHOUSE FACILITIES

The following Amazon fulfillment center warehouse sites were surveyed to develop the trip generation rates for Amazon and similar fulfillment center warehouse facilities:

Serial No.	Traffic Count Site	Site Code	Function	Area (Square Feet)	Dock Doors	Trailer Parking (Not at Active Dock Doors)	Auto Parking
1	Rialto Building 5	LGB8	Receiving Center	614,848	144	360	995
2	Southgate - Project Infinity - Small Sortable	ONT2/ ONT3	ONT2 - AR Sort - Small Sortable & ONT3 - "Make On Demand Printing"- 2,000 employees ONT3	951,660	87	238	1,993
3	Southgate Building 4	ONT4/ ONT5/ ONT7	ONT4 - Amazon Fresh & ONT5 - Sortation Center for LA region & ONT7 - Amazon Pantry	514,603	113	676	142
4	Gateway South Building 3 - Small Sortable	SNA7/ SNA8	AR Sort - Small Sortable	1,102,360	97	222	1,062
5	Eastvale - Small Sortable	SNA6/ SNA9	AR Sort - Small Sortable	1,033,192	74	88	650

Serial No.	Traffic Count Site	Site Code	Function	Area (Square Feet)	Dock Doors	Trailer Parking (Not at Active Dock Doors)	Auto Parking
6	MV Fulfillment 6 - Small Sortable & Apparel Fulfillment Center - 3,000 employees	ONT6	AR Sort - Small Sortable & Apparel Fulfillment Center - 3,000 employees	1,250,000	94	240	2,541
7	MV Fulfillment 8	ONT8	Receiving - Inbound Cross Dock	769,320	118	219	334

Driveway survey counts were conducted for these facilities, following the methodology specified in the Institute of Transportation Engineers (ITE) *Trip Generation Handbook*. Survey counts were conducted for three typical non-holiday weekdays during the months of September 2017 and May 2018. On each weekday, 15-minute class counts were conducted for the entire day at all the driveways for a site, and counts from all the driveways were added to obtain the total trip generation for the site. The following classes of vehicles were considered for the counts: Passenger Vehicles, Large 2-Axle Trucks, 3-Axle Trucks, and 4+ Axle Trucks. For each site, the trip generation for each 15-minute period was averaged out over the survey dates to obtain the average trip generation for the site. Further, the average trip generation for each period was added up for all the sites to obtain the combined trip generation for the seven sites. Finally, the a.m., p.m., and daily trip generation rates were obtained by dividing the combined trips for the seven sites by their total area (in thousand square feet (TSF)).

From this combined trip generation rate, the a.m. peak hour was identified as the 1-hour period between 7 a.m. and 9 a.m. that has the highest trip rate. As for the p.m. peak hour, it was observed from the survey data that the p.m. peak period continued beyond 6 p.m. Therefore, the p.m. peak hour was identified as the 1-hour period between 4 p.m. and 7 p.m. that has the highest trip rate. As such, the following peak hour and daily trip generation rates were obtained:

Trips/TSF	A.M. Peak Hour			P.M. Peak Hour			Daily
	In	Out	Total	In	Out	Total	
Passenger Vehicles	0.2367	0.0500	0.2867	0.3372	0.3150	0.6522	3.6671
2-Axle Trucks	0.0008	0.0008	0.0016	0.0002	0.0008	0.0010	0.1129

Notes:

TSF = Thousand Square Feet , DU = Dwelling Units, AC = Acres

[1] Rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition), Land Use 210 - "Single-Family Detached Housing", Setting/Location - "General Urban/Suburban."

[2] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 488 - "Soccer Complex", Setting/Location - "General Urban/Suburban."

[3] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 490 - "Tennis Courts", Setting/Location - "General Urban/Suburban." Since there is no data available for p.m. split, the p.m. split for similar Land Use 491 Racquet/Tennis Club was used as the p.m. split.

[4] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 495 - "Recreational Community Center", Setting/Location - "General Urban/Suburban."

[5] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 433 - "Batting Cages", Setting/Location - "General Urban/Suburban."Since there is no data available for daily trips, the ratio of daily trips and p.m. trip of Land Use 490 -Tennis Courts was used as the daily trips.

[6] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 411 - "Public Park", Setting/Location - "General Urban/Suburban."

[7] Passenger vehicle and truck rates were obtained from Western Riverside Council of Government (WRCOG) Transportation Uniform Mitigation Fee (TUMF) Program "High-Cube Warehouse Trip Generation Study", dated January 2019. Passenger vehicles and truck inbound and outbound splits were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 155 – "High-Cube Fulfillment Center Warehouse - Non-Sort", Setting/Location - "General Urban/Suburban." The truck mix percentages were obtained from South Coast Air Quality Management District (SCAQMD) recommendations for warehousing projects. As such, The truck mix was considered as 21.9% 2-axle trucks, 17.7% 3-axle trucks, and 60.3% 4 or more axle trucks. All truck trips were converted to passenger PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[8] Rates from ITE Trip Generation Manual (11th Edition) for Land Use 157 – "High-Cube Cold Storage Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks. Since peak hour inbound and outbound splits are not available for Land Use 157, inbound and outbound splits for total vehicles (passenger vehicles + trucks) and trucks for Land Use 155 - "High Cube Fulfillment Center Warehouse" have been used to determine the inbound and outbound split in the peak hours. Inbound and outbound splits for passenger vehicles have been developed by subtracting all truck inbound and outbound rates from the total vehicles inbound and outbound rates, respectively. All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[9] Trip generation rates, including passenger vehicle and 2-axle, 3-axle and 4 or more axle truck trip rates are based on survey data of seven Amazon fulfillment centers in the Inland Empire.

Land Use	Units	A.M. Peak Hour			P.M. Peak Hour			Daily
		In	Out	Total	In	Out	Total	

[10] Rates from the ITE Trip Generation Manual (11th Edition) rates for Land Use 156 – "High-Cube Parcel Hub Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks.All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[11] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 110 - "General Light Industrial", Setting/Location - "General Urban/Suburban." Project trips were converted to trucks and passenger vehicles based on the *City of Fontana Truck Trip Generation Study* , dated August 2003. As such, 21.4 percent of project traffic will be trucks. Based on Vehicle Mix from the Fontana study, the truck mix is 8.0% 2-axle trucks, 3.9% 3-axle trucks, and 9.5% 4 or more axle trucks. All truck trips were converted to PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[1] Rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition), Land Use 210 - "Single-Family Detached Housing", Setting/Location - "General Urban/Suburban."

[2] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 220 - "Multifamily Housing (Low-Rise)", Setting/Location - "General Urban/Suburban."

[3] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 520 - "Elementary School", Setting/Location - "General Urban/Suburban." Estimated total enrolled student of 750 students.

[4] Planning area 9 is designateded to be a Public Facility (PF)/ Civic Node site, as included in the *Menifee Valley Specific Plan* , dated February 16, 2022 prepared by Brookfield Properties. The document also include all the permitted land uses for this planning area. Trip generation rates for all these permitted land uses were reviewed to determine the land use with the highest trip generation rates as a conservative estimate. Though the highest trip generator land use was found to be Land use 732 - "United States Post Office", due to presence of an existing post office near the project site that land use was not selected, and rates from the ITE Trip Generation Manual(11th Edition), Land Use 495 - "Recreational Community Center", Setting/Location - "General Urban/Suburban" was used to develop the trip generation for this facility.

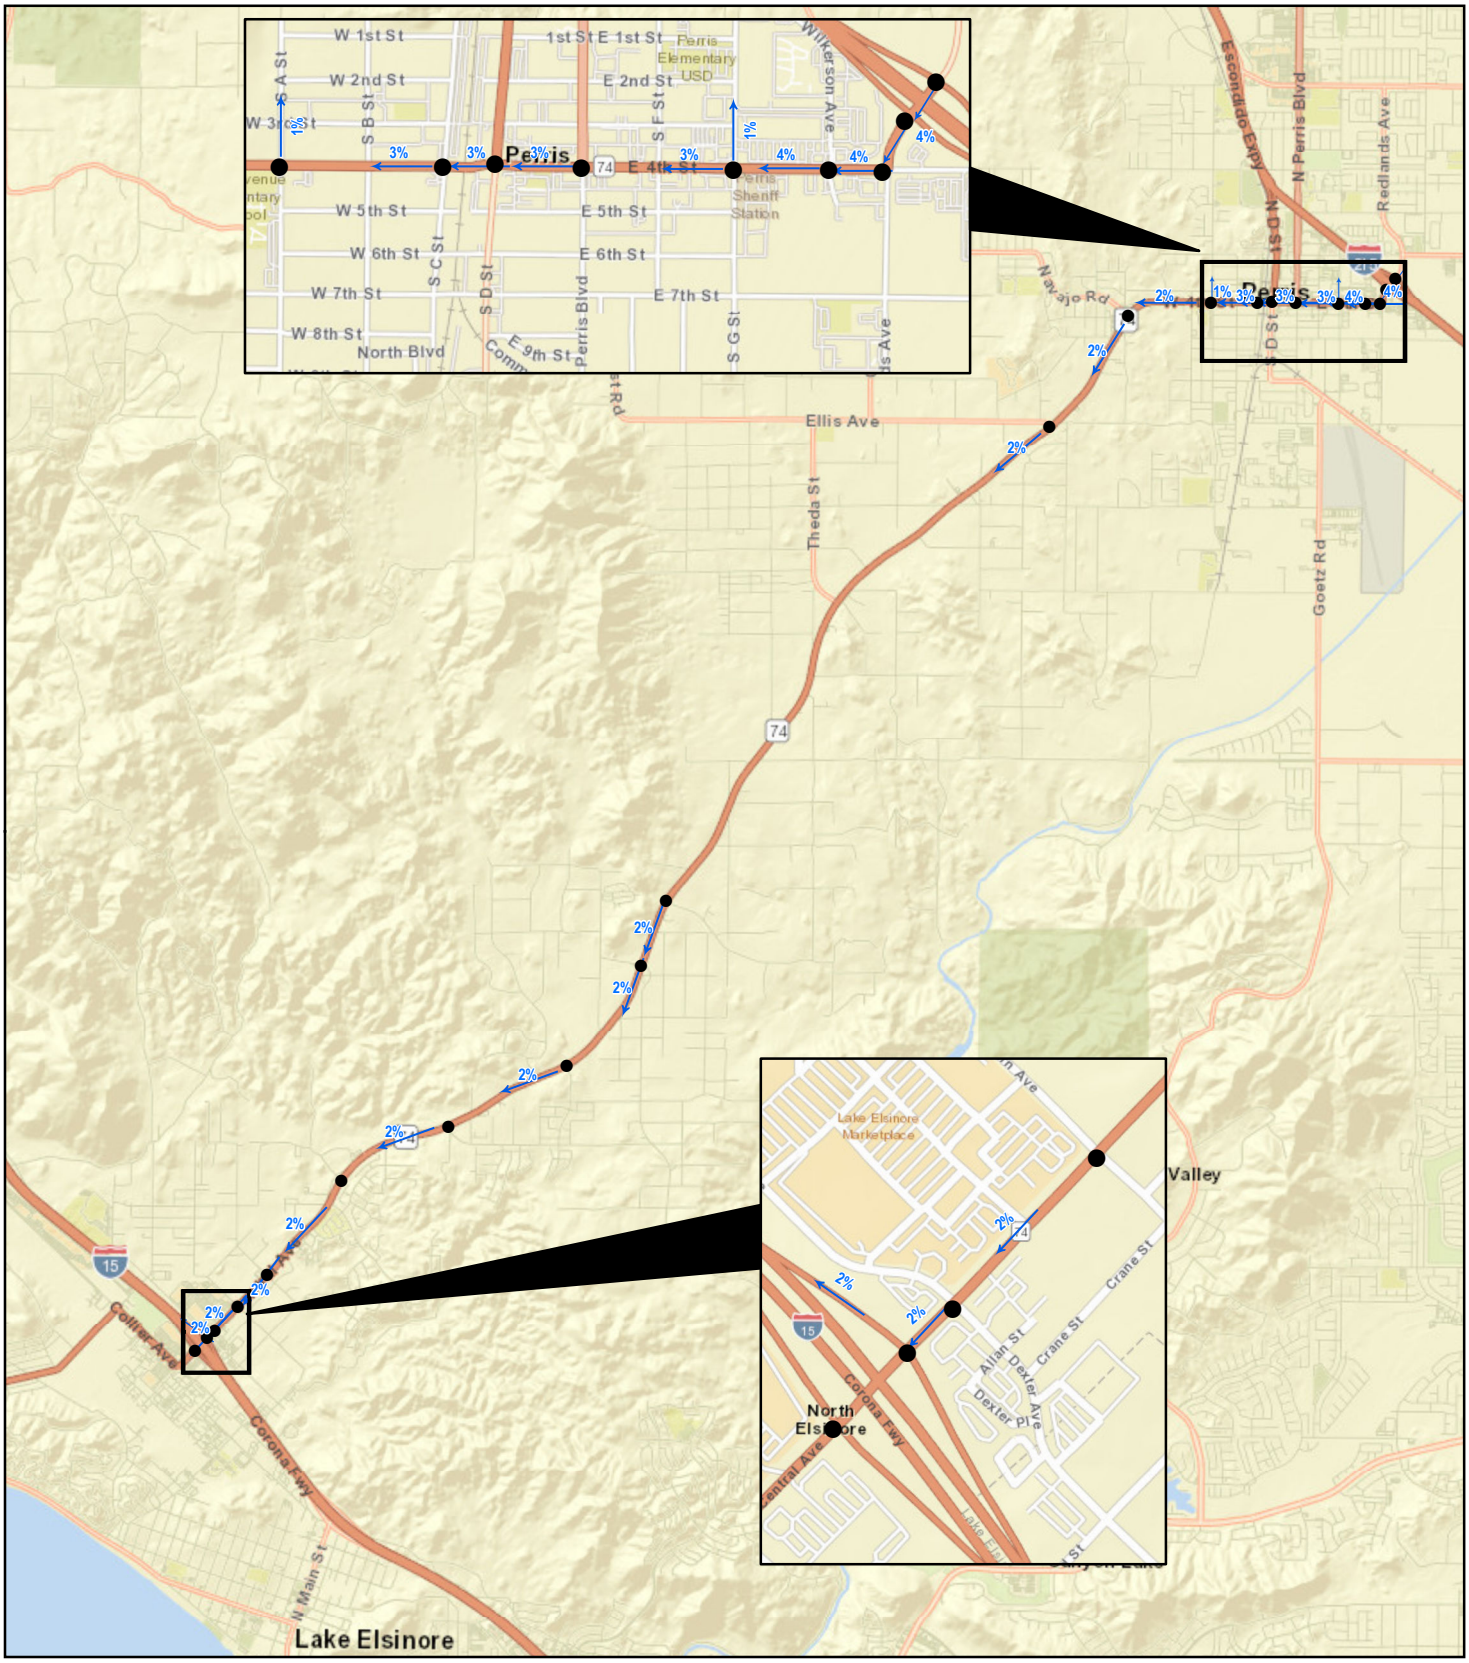
[5] Passenger vehicle and truck rates were obtained from Western Riverside Council of Government (WRCOG) Transportation Uniform Mitigation Fee (TUMF) Program "High-Cube Warehouse Trip Generation Study", dated January 2019. Passenger vehicles and truck inbound and outbound splits were obtained from the ITE *Trip Generation Manual* (11th Edition) for Land Use 155 – "High-Cube Fulfillment Center Warehouse - Non-Sort", Setting/Location - "General Urban/Suburban." The truck mix percentages were obtained from South Coast Air Quality Management District (SCAQMD) recommendations for warehousing projects. As such, The truck mix was considered as 21.9% 2-axle trucks, 17.7% 3-axle trucks, and 60.3% 4 or more axle trucks. All truck trips were converted to passenger PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[6] Rates from ITE Trip Generation Manual (11th Edition) for Land Use 157 – "High-Cube Cold Storage Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks. Since peak hour inbound and outbound splits are not available for Land Use 157, inbound and outbound splits for total vehicles (passenger vehicles + trucks) and trucks for Land Use 155 - "High Cube Fulfillment Center Warehouse" have been used to determine the inbound and outbound split in the peak hours. Inbound and outbound splits for passenger vehicles have been developed by subtracting all truck inbound and outbound rates from the total vehicles inbound and outbound rates, respectively. All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4 or more axle trucks.

[7] Trip generation rates, including passenger vehicle and 2-axle, 3-axle and 4 or more axle truck trip rates are based on survey data of seven Amazon fulfillment centers in the Inland Empire.



[8] Rates from the ITE Trip Generation Manual (11th Edition) rates for Land Use 156 – "High-Cube Parcel Hub Warehouse", Setting/Location - "General Urban/Suburban." The resulting trips were converted to trucks and passenger vehicles based on SCAQMD recommendations for warehousing projects. As such, 31 percent of project traffic will be trucks. Based on Vehicle Mix from the SCAQMD, the truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks.All truck trips were converted to passenger Passenger Vehicle equivalents (PCEs) using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[9] Rates from the *ITE Trip Generation Manual* (11th Edition), Land Use 110 - "General Light Industrial", Setting/Location - "General Urban/Suburban." Project trips were converted to trucks and passenger vehicles based on the *City of Fontana Truck Trip Generation Study* , dated August 2003. As such, 21.4 percent of project traffic will be trucks. Based on Vehicle Mix from the Fontana study, the truck mix is 8.0% 2-axle trucks, 3.9% 3-axle trucks, and 9.5% 4 or more axle trucks. All truck trips were converted to PCEs using a 1.5 PCE factor for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4- and more axle trucks.

[10] Rates from the ITE *Trip Generation Manual* (11th Edition), Land Use 820 - "Shopping Center (>150k)", Setting/Location - "General Urban/Suburban."
