PUBLIC NOTICE

NOTICE OF PREPARATION OF ENVIRONMENTAL IMPACT REPORT AND NOTICE OF A PUBLIC SCOPING MEETING

Date:	March 9, 2022
Case No.:	2015.012491ENV
Project Title:	San Francisco Gateway Project
Project Address:	749 Toland Street and 2000 McKinnon Avenue
Zoning:	PDR-2 – Core Production, Distribution, and Repair Industrial Protection Zone Special Use District 65-J Height and Bulk District
Block/Lot:	5284A/008 and 5287/002
Lot Size:	743,800 square feet
Project Sponsor:	Ken Sun, Prologis Inc. – (510) 661-4027 ksun@prologis.com
Lead Agency:	San Francisco Planning Department
Staff Contact:	Elizabeth White – (628) 652-7557 elizabeth.white@sfgov.org

Introduction

The San Francisco Planning Department (department) prepared this notice of preparation of an environmental impact report (EIR) in connection with the proposed San Francisco Gateway project (749 Toland Street and 2000 McKinnon Avenue) (proposed project). The purpose of the EIR is to provide information regarding the physical environmental effects of the proposed project; identify possible ways to minimize any potentially significant adverse effects; and describe and analyze possible alternatives to the proposed project. The department is issuing this notice to inform the public and responsible and interested agencies about the proposed project and the intent to prepare an EIR, and to provide notice of a public scoping meeting to solicit comments on the scope of the EIR. The department will hold the public scoping meeting on Wednesday, March 30, 2022 at 6 p.m., using an online platform. You may view this notice and register to join the meeting via the online platform link found on the department's webpage, sfplanning.org/sfceqadocs (under "SF Gateway Project); or by phone, using the following phone number and meeting identification number: (408) 638-0968; , meeting ID: 865 7991 0030.

Project Description

The project sponsor, Prologis Inc., proposes to redevelop two parcels in a core industrial area of the City and County of San Francisco (city). The proposed project would construct two new multi-story production, distribution, and repair (PDR)[1] buildings. The project site is in the Bayview Hunters Point Area Plan and is bounded by Kirkwood Avenue to the north, Rankin Street to the east, McKinnon Avenue to the south, and Toland Street to the west. An elevated portion of Interstate 280 bisects the project site. The attached initial study contains a comprehensive project description, including figures, and a preliminary list of required project approvals.

The project sponsor would demolish the four existing single-story buildings that are currently occupied by PDR space, which encompass 448,000 gross square feet.[2] This would be followed by construction of two three-story buildings (with active roofs): buildings A and B. Each building would be 97 feet tall and would have a maximum height of 115 feet, including rooftop appurtenances. The two new buildings (including PDR space, logistics yard, vehicular circulation systems, and ground-floor retail spaces) would total 2,160,000 gross square feet. The proposed project would provide space for several main types of PDR uses: manufacturing and maker space,[3] parcel delivery service including last-mile delivery,[4] wholesale and storage, and fleet management. Each building would include a combination of enclosed and partially enclosed spaces, with a multi-level vehicular system (comprising staging, circulation, and logistics yard areas) serving each level. In both buildings, all three levels of the PDR space would have direct vehicular access via a one-way ramp system for vehicles as large as tractor trailers. The roof level would provide a solar array and a screened, open-air multi-purpose deck that could be used for parking and/or material and vehicle staging. Each building would include 35,000 gross square feet of ground-floor maker space and 8,400 gross square feet of ground-floor retail space.

Proposed Circulation, Access, and Travel Demand Management

Vehicular access to and circulation around the project site would use the existing streets, with two exceptions. The project proposes to convert Kirkwood Avenue (along the northern side of the project site, between Toland and Rankin streets) to a single-lane, eastbound one-way street; and convert a portion of McKinnon Avenue (along the southern side of the project site, between Toland and Selby streets) to a single-lane, westbound one-way street. Both of these streets currently serve travel in both directions. These proposed circulation modifications are shown in Figure 17, Proposed Roadway Modifications Surrounding the Project Site (p. 30) of the attached initial study.

The project site does not currently have sidewalks or curb cuts. The proposed project would construct new 10-foot-wide sidewalks along the site's perimeter (including Selby Street) and would create seven new curb cuts of varying widths for access to each new building. The new sidewalks would be designed in accordance with San

[1] PDR use is a grouping of uses that includes but is not limited to all industrial and agricultural uses, ambulance services, animal hospitals, automotive service stations, automotive repair, automotive wash, arts activities, business services, cat boarding, catering services, commercial storage, kennels, motor vehicle tow services, livery stables, parcel delivery services, public utilities yards, storage yards, trade offices, trade shops, wholesale sales, and wholesale storage.

[2] Square footages presented for the existing and proposed uses are approximate.

[3] This is defined as a light industrial use that provides for the fabrication or production of goods, by hand or machinery, for distribution to retailers, wholesalers, or the public. Makers are often characterized by their production and custom activities, which usually involve individual or special design, handiwork, and/or design-related innovation and experimentation.

[4] Last-mile delivery is defined as the movement of goods from a transportation hub to the final delivery destination (i.e., typically a personal residence or business).

Francisco's Better Streets Plan standards for industrial roads. Other streetscape modifications include new striped parking spaces along the perimeter of the project site; a portion of the required bicycle parking spaces (most of the required spaces would be provided on the ground floor of the buildings); and street trees. The proposed nine street trees on the eastern sidewalk of Toland Street along the northern half of the building (from the building A entrance to Kirkwood Street) would serve as wind mitigation measures; they would be approximately 25-foot-tall evergreen street trees with a 15-foot-diameter canopy.[5] Refer to Figure 19, Proposed Streetscape Plan (p. 34) of the attached initial study for more detailed information on the proposed streetscape modifications.

The proposed project's foundation design is expected to be concrete spread footings and/or grade beams on improved and engineered soil, with excavation for the foundations likely to extend 10 feet below existing grade. Ground improvements, such as stone columns, drill displacement columns, geopiers,[6] soil-cement mixing, or other similar methods, would provide vertical support through the existing soils to strengthen the undocumented fill that underlies the project site. Using drill rigs, approximately 7,000 vibratory replacement stone columns or drill displacement columns[7] would be extended 25 feet deep, and approximately 900 auger cast piles would be extended 60 feet deep, to support the buildings onsite. The proposed project would not require pile-driving activities. Approximately 140,600 cubic yards of soil would be excavated for the proposed project.[8] Of this total, approximately 42,600 cubic yards would be improved and reused, and the remaining 98,000 cubic yards would be exported offsite.

On June 7, 2021, the project sponsor submitted a priority processing application under Planning Director's Bulletin No. 2, committing the project to use the lowest diesel emitting off-road equipment (Tier 4 interim or final) for the duration of construction.[9,10] On June 15, 2021, the department approved this application.[11] Construction work would typically occur five to six workdays per week for eight hours per day over approximately 31 months. Nighttime construction activities (8 p.m. to 7 a.m.) are expected during specific construction phases; the project sponsor would seek city approval to extend specific construction activities beyond standard construction hours. The total number of temporary/short-term workers during construction is anticipated to range from approximately 2,500 to 3,000. Approximately 400 to 500 workers are expected to travel to the site daily at any given time during peak construction periods.

---

[5] BMT, San Francisco Gateway Project Final Wind Microclimate Study, June 23, 2020.

[6] Geopier is an engineering term used to refer to stiff rock columns drilled deep into the earth's surface, down to a hard nonyielding depth. Geopiers are used to support a building foundation and reinforce the soil when the existing ground is unstable, wet or unsuitable for building construction.

[7] Drill displacement columns (or controlled low-strength material columns) are formed in displaced soil cavities and displace liquefiable and compressible soil with cemented controlled low-strength material. Controlled low-strength material column ground improvement can mitigate liquefaction and settlement of heavy foundations and slabs. Controlled low-strength material columns are ideal for sensitive project sites such as those near critical structures that require low noise and no vibration construction methods.

[8] The proposed project would entail excavation of 140,600 cubic yards of soil. This total includes 134,000 cubic yards of soil onsite and 6,600 cubic yards of soil for street improvements.

[11] San Francisco Planning Department, *Signed Application for Priority Application Processing for Director's Bulletin No. 2,* June 15, 2021.

Expanded Streetscape Variant

The environmental review also analyzes an expanded streetscape variant. The expanded streetscape variant comprises the same land uses and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Refer to Figure 21, Expanded Streetscape Variant (p. 39) in the attached initial study project description for more detailed information on the expanded streetscape variant.

Summary of Potential Environmental Issues

The department has prepared an initial study to evaluate the physical environmental effects of the proposed project and expanded streetscape variant. The initial study assessed project-specific and cumulative impacts for all topics required under the California Environmental Quality Act (CEQA); it also identified which environmental topic areas may be significantly impacted by the proposed project and expanded streetscape variant.

The initial study determined that the potential individual and cumulative environmental effects would be less than significant for the following topics: land use and land use planning; population and housing; greenhouse gas emissions; shadow; recreation; utilities and service systems; public services; biological resources; hydrology and water quality; hazards and hazardous materials; mineral resources; energy resources; agriculture and forestry resources; and wildfire. The initial study determined that the proposed project and expanded streetscape variant would result in significant impacts that could be reduced to less-than-significant levels with incorporation of mitigation measures that have been agreed to by the project sponsor for the following topics: cultural resources; tribal cultural resources; wind; and geology and soils.

In addition, the project and expanded streetscape variant meet all requirements of a transit-oriented infill development project under Public Resources Code section 21099[12] (Senate Bill 743); therefore, aesthetics and parking were not considered in determining whether the project or variant have the potential to result in significant environmental effects.

The initial study determined that the proposed project and expanded streetscape variant could result in potentially significant environmental impacts related to transportation and circulation; air quality; and noise. These topics will be discussed in an EIR, as discussed below. The EIR will also address other topics required by CEQA, including growth-inducing impacts; mitigation measures; significant unavoidable impacts; significant irreversible impacts; any known controversy associated with environmental effects, or alternatives; and issues to be resolved by the decision makers.

Transportation and Circulation

The proposed project and expanded streetscape variant would generate new vehicle trips, resulting in additional vehicle miles traveled (VMT) to and from the project site. A transportation analysis will be prepared to evaluate person trips generated by the proposed project and expanded streetscape variant's operation and the associated mode split of these person trips (e.g., vehicle or transit); freight and passenger loading operations; site circulation; VMT impacts; transit service and capacity; code compliance; loading; hazards due to a project design feature, including to pedestrians and bicyclists; construction impacts; and emergency access. The

[12] *San Francisco Planning Department, Eligibility Checklist: CEQA Section 21099 – Modernization of Transportation Analysis, San Francisco Gateway Project, December 19, 2018.*

transportation and circulation issues will be analyzed in accordance with the department's Transportation Impact Analysis Guidelines (2019).

Air Quality

The air quality analysis will evaluate the consistency of the proposed project and expanded streetscape variant with applicable air quality plans; and the potential for the proposed project and variant to result in emissions of criteria air pollutants and other toxic air contaminants that may affect sensitive receptors, such as residents. The air quality analysis will include quantification of both construction-related and operational criteria air pollutant emissions. A health risk assessment will be prepared to evaluate potential long-term health effects from emissions during both construction and operation. The analysis will also discuss the potential for the proposed project and expanded streetscape variant to result in sources of odor.

Noise

The noise analysis will evaluate short-term construction-related and long-term operation-related noise and vibration impacts that could result from the proposed project and expanded streetscape variant. The analysis will investigate the potential for noise sources from the proposed project to adversely affect nearby noise-sensitive receptors. This includes both stationary (e.g., heating, ventilation, and air conditioning and other mechanical systems) and mobile (e.g., delivery trucks arriving or departing from the project site) noise sources.

Alternatives

Pursuant to CEQA and section 15126.6 of the state CEQA Guidelines, the EIR will also analyze a reasonable range of alternatives that would reduce or avoid one or more significant environmental impacts identified in the EIR, and will include an analysis of the comparative environmental impacts of feasible alternatives to the proposed project and variant. Alternatives will include a No Project Alternative, which will assume no change to the existing physical conditions on the project site, and one or more alternatives to address other significant effects of the proposed project that are identified in the EIR.

Finding

The proposed project or variant may have a significant effect on the environment; therefore, an EIR is required. This finding is based on the criteria of the state CEQA Guidelines , sections 15063 (Initial Study), 15064 (Determining Significant Effect), and 15065 (Mandatory Findings of Significance), and the reasons documented in the initial study for the project, which is attached. The purpose of the EIR is to provide information about potentially significant physical environmental impacts of the proposed project, identify possible ways to minimize the potentially significant impacts, and describe and analyze possible alternatives to the proposed project. Publication of a notice of preparation, initial study, or EIR does not indicate a decision by the city to approve or disapprove a proposed project or variant. However, before making any such decision, the decision makers must review and consider the information contained in the EIR.

Public Scoping Meeting

Pursuant to CEQA section 21083.9 and CEQA Guidelines section 15206, the department will hold a public scoping meeting to receive verbal comments concerning the scope of the EIR. You may participate in the public process concerning the project's environmental effects by attending a video and teleconference on Wednesday, March 30, 2022, 6 p.m.. You may register for the meeting via the online platform link the department's webpage,

sfplanning.org/sfceqadocs (under "SF Gateway Project"); or by phone, using the following phone number and meeting identification number: (408) 638-0968; meeting ID: 865 7991 0030. To request assistance in additional languages, please contact candace.soohoo@sfgov.org or call (628) 652-7550; call at least 72 hours in advance of the meeting to ensure availability. Written comments will also be accepted at this meeting and until 5 p.m. on April 8, 2022. Written comments should be sent to Elizabeth White, San Francisco Planning Department, 49 South Van Ness Avenue, Suite 1400, San Francisco, CA 94103, or emailed to CPC.SFGatewayProject@sfgov.org.

The notice of preparation and initial study are available at sfplanning.org/sfceqadocs.[13] If you have questions or comments concerning this notice or the project's environmental review, or would like to request a USB or paper copy of the notice of preparation, contact Elizabeth White at CPC.SFGatewayProject@sfgov.org or (628) 652-7557.

If you work for a responsible or trustee agency, we need to know your agency's views regarding the scope and content of the environmental information that is relevant to your agency's statutory responsibilities in connection with the proposed project; your agency may need to use the EIR when considering a permit or other approval for this project. We will also need the name of the contact person for your agency.

Members of the public are not required to provide personal identifying information when they communicate with the planning commission or the department. All written or verbal communications, including submitted personal contact information, may be made available to the public for inspection and copying upon request and may appear on the department's website or in other public documents.

Anyone receiving this notice is encouraged to pass on this information to others who may have an interest in the proposed project.

Hello again,

Members from the SF Gateway project sponsor team are available to attend this meeting on April 20 at 2pm if the Task Force is interested. If so, would you please let me know and I will coordinate with them on their attendance.

Thank you!
Liz

Hi Mr. Angel,

Yes, I will be able to attend the April 20 meeting to present our scoping meeting video presentation and answer questions about the environmental review process. Please send me the meeting invitation when you get a chance.

Thank you,
Liz

Hello,

I am writing on behalf of the Bayview Hunters Point Environmental Justice Response Task Force to request the Planning Department make a presentation at the upcoming monthly meeting, Wednesday, April 20th, 2-4 pm about the proposed SF Gateway Project.

Many residents including numerous Greenaction staff and members who live in the community are very concerned and would like to hear more about the proposed project and opportunties for public comment and participation.

Please let us know if this can happen, thanks,

Bradley Angel

Elizabeth White
Senior Environmental Planner
San Francisco Planning
City of San Francisco
49 South Van Ness Avenue
San Francisco, California 94103
cpc.sfgatewayproject@sfgov.org

Dear Elizabeth White:

Thank you for providing the California Air Resources Board (CARB) with the opportunity to comment on the Notice of Preparation (NOP) for the San Francisco Gateway (Project) Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2022030286. The Project proposes the demolition of four existing buildings totaling 448,000 square feet and the construction of two industrial buildings totaling 2,160,000 square feet. The Project site is located within the City of San Francisco (City), California, which is the lead agency for California Environmental Quality Act (CEQA) purposes.

Industrial development, such as the proposed Project, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change.[1] The Project will expose nearby communities to elevated levels of air pollution. Residences are located south of the Project with the closest residences located approximately 640 feet from the Project's southwestern boundary. In addition to residences, the Thurgood Marshall Academic High School, Willie L. Brown Jr. Middle School, and Dr. Charles R. Drew Elementary School are located within a mile of the Project. According to the California Communities Environmental Health Screening Tool Version 4.0 (CalEnviroScreen),[2] these communities are located in census tracts that score within the top 13 percent of State's most impacted from air pollution from an environmental hazard and socioeconomic standpoint. Based on this CalEnviroScreen score, the area surrounding the Project is home to some of the most vulnerable neighborhoods in the State. Due to the Project's proximity to residences and schools already burdened by multiple sources of air pollution, CARB is concerned with the potential cumulative health impacts associated with the construction and operation of the Project.

---

1. With regard to greenhouse gas emissions from this project, CARB has been clear that local governments and project proponents have a responsibility to properly mitigate these impacts. CARB's guidance, set out in detail in the Scoping Plan issued in 2017, makes clear that in CARB's expert view, local mitigation is critical to achieving climate goals and reducing greenhouse gases below levels of significance.
2. "CalEnviroScreen 4.0." Oehha.ca.gov, California Office of Environmental Health Hazard Assessment, October 2021, *https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40*

Due to the Project's proximity to residences and schools, CARB is concerned with the potential cumulative health impacts associated with the construction and operation of the Project. CARB has reviewed the NOP and is concerned about the air pollution and health risk impacts that would result from the proposed Project.

The DEIR Should Quantify and Discuss the Potential Cancer Risks from Project Operation

Since the Project is near residences and a school, the City and applicant must prepare a health risk assessment (HRA) for the Project. The HRA should account for all potential operational health risks from Project-related diesel PM emission sources, including, but not limited to, back-up generators, on-site diesel-powered equipment, and heavy-duty trucks. The HRA should also determine if the operation of the Project in conjunction with past, present, and reasonably foreseeable future projects or activities would result in a cumulative cancer risk impact on nearby residences. To reduce diesel PM exposure and associated cancer risks, the City and applicant should include all applicable air pollution reduction measures listed in Attachment A of this letter.

Since the Project description provided in the NOP does not explicitly state that the proposed industrial land would not be used for cold storage, there is a possibility that trucks and trailers visiting the Project-site would be equipped with Transport Refrigeration Units (TRUs.)[3] TRUs on trucks and trailers can emit large quantities of diesel exhaust while operating within the Project-site. Residences and other sensitive receptors (e.g., daycare facilities, senior care facilities, and schools) located near where these TRUs could be operating would be exposed to diesel exhaust emissions that would result in a significant cancer risk impact to the nearby community. If the Project would be used for cold storage, the City must model air pollutant emissions from on-site TRUs in the DEIR, as well as include potential cancer risks from on-site TRUs in the Project's HRA. If the Project will not be used for cold storage, the City and applicant should include one of the following design measures in the DEIR:

- A Project design measure requiring contractual language in tenant lease agreements that prohibits tenants from operating TRUs within the Project-site; or
- A condition requiring a restrictive covenant over the parcel that prohibits the applicant's use of TRUs on the property unless the applicant seeks and receives an amendment to its conditional use permit allowing such use.

The HRA prepared in support of the Project should be based on the latest Office of Environmental Health Hazard Assessment's (OEHHA) guidance (2015 Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments),[4] and CARB's Hot

3. TRUs are refrigeration systems powered by integral diesel engines that protect perishable goods during transport in an insulated truck and trailer vans, rail cars, and domestic shipping containers.
4. Office of Environmental Health Hazard Assessment (OEHHA). Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments. February 2015. Accessed at: *https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf*.

Spots Analysis and Reporting Program (HARP2 model). The Project's mobile diesel PM emissions used to estimate the Project's cancer risk impacts should be based on CARB's latest 2021 Emission Factors model (EMFAC2021). Mobile emission factors can be easily obtained by running the EMFAC2021 Web Database: *https://arb.ca.gov/emfac/.*

The HRA should evaluate and present the existing baseline (current conditions), future baseline (full build-out year, without the Project), and future year with the Project. The health risks modeled under both the existing and the future baselines should reflect all applicable federal, state, and local rules and regulations. By evaluating health risks using both baselines, the public and planners will have a complete understanding of the potential health impacts that would result from the Project.

The DEIR Should Quantify and Discuss the Potential Cancer Risks from Project Construction

In addition to the health risks associated with operational diesel PM emissions, health risks associated with construction diesel PM emissions should also be included in the air quality section of the DEIR and the Project's HRA. Construction of the Project would result in short-term diesel PM emissions from the use of both on-road and off-road diesel equipment. The OEHHA guidance recommends assessing cancer risks for construction projects lasting longer than two months. Since construction would very likely occur over a period lasting longer than two months, the HRA prepared for the Project should include health risks for existing residences near the Project-site during construction.

The HRA should account for all diesel PM emission sources related to Project construction, including, but not limited to, off-road mobile equipment, diesel generators, and on-road heavy-duty trucks. As previously stated in Section I of this letter, the cancer risks evaluated in the construction HRA should be based on the latest OEHHA guidance, and CARB's HARP2 model. The cancer risks reported in the HRA should be calculated using the latest emission factors obtained from CARB's latest EMFAC (currently EMFAC 2021) and off-road models.

Conclusion

To reduce the exposure of toxic diesel PM emissions in disadvantaged communities already impacted by air pollution, the final design of the Project should include all existing and emerging zero-emission technologies to minimize diesel PM and NO_x emissions, as well as the greenhouse gases that contribute to climate change. CARB encourages the City and applicant to implement the applicable measures listed in Attachment A of this letter.

Given the breadth and scope of projects subject to CEQA review throughout California that have air quality and greenhouse gas impacts, coupled with CARB's limited staff resources to substantively respond to all issues associated with a project, CARB must prioritize its substantive comments here based on staff time, resources, and its assessment of impacts. CARB's deliberate decision to substantively comment on some issues does not constitute an

admission or concession that it substantively agrees with the lead agency's findings and conclusions on any issues on which CARB does not substantively submit comments.

CARB appreciates the opportunity to comment on the NOP for the Project and can provide assistance on zero-emission technologies and emission reduction strategies, as needed. Please include CARB on your State Clearinghouse list of selected State agencies that will receive the DEIR as part of the comment period. If you have questions, please contact Stanley Armstrong, Air Pollution Specialist via email at *stanley.armstrong@arb.ca.gov*.

Sincerely,

Robert Krieger, Branch Chief, Risk Reduction Branch

Attachment A
Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution Centers

The California Air Resources Board (CARB) recommends developers and government planners use all existing and emerging zero to near-zero emission technologies during project construction and operation to minimize public exposure to air pollution. Below are some measures, currently recommended by CARB, specific to warehouse and distribution center projects. These recommendations are subject to change as new zero-emission technologies become available.

Recommended Construction Measures

1. Ensure the cleanest possible construction practices and equipment are used. This includes eliminating the idling of diesel-powered equipment and providing the necessary infrastructure (e.g., electrical hookups) to support zero and near-zero equipment and tools.
2. Implement, and plan accordingly for, the necessary infrastructure to support the zero and near-zero emission technology vehicles and equipment that will be operating on site. Necessary infrastructure may include the physical (e.g., needed footprint), energy, and fueling infrastructure for construction equipment, on-site vehicles and equipment, and medium-heavy and heavy-heavy duty trucks.
3. In construction contracts, include language that requires all off-road diesel-powered equipment used during construction to be equipped with Tier 4 or cleaner engines, except for specialized construction equipment in which Tier 4 engines are not available. In place of Tier 4 engines, off-road equipment can incorporate retrofits, such that, emission reductions achieved are equal to or exceed that of a Tier 4 engine.
4. In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) used during project construction be battery powered.
5. In construction contracts, include language that requires all heavy-duty trucks entering the construction site during the grading and building construction phases be model

year 2014 or later. All heavy-duty haul trucks should also meet CARB's lowest optional low-oxides of nitrogen (NO_x) standard starting in the year 2022.[1]

6. In construction contracts, include language that requires all construction equipment and fleets to be in compliance with all current air quality regulations. CARB is available to assist in implementing this recommendation.

Recommended Operation Measures

1. Include contractual language in tenant lease agreements that requires tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on site.
2. Include contractual language in tenant lease agreements that requires all loading/unloading docks and trailer spaces be equipped with electrical hookups for trucks with transport refrigeration units (TRUs) or auxiliary power units. This requirement will substantially decrease the amount of time that a TRU powered by a fossil-fueled internal combustion engine can operate at the project site. Use of zero-emission all-electric plug-in TRUs, hydrogen fuel cell transport refrigeration, and cryogenic transport refrigeration are encouraged and can also be included in lease agreements.[2]
3. Include contractual language in tenant lease agreements that requires all TRUs entering the project-site be plug-in capable.
4. Include contractual language in tenant lease agreements that requires future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans.
5. Include contractual language in tenant lease agreements that requires all service equipment (e.g., yard hostlers, yard equipment, forklifts, and pallet jacks) used within the project site to be zero-emission. This equipment is widely available and can be purchased using incentive funding from CARB's Clean Off-Road Equipment Voucher Incentive Project (CORE).[3]
6. Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering or on the project site to be model year 2014 or later, expedite a transition to zero-emission vehicles, and be fully zero-emission beginning in 2023. A list of commercially available zero-emission trucks can be obtained from the Hybrid

---

1. In 2013, CARB adopted optional low-NOx emission standards for on-road heavy-duty engines. CARB encourages engine manufacturers to introduce new technologies to reduce NOx emissions below the current mandatory on-road heavy-duty diesel engine emission standards for model-year 2010 and later. CARB's optional low-NOx emission standard is available at: *https://ww2.arb.ca.gov/our-work/programs/optional-reduced-nox-standards*

2. CARB's technology assessment for transport refrigerators provides information on the current and projected development of TRUs, including current and anticipated costs. The assessment is available at: *https://www.arb.ca.gov/msprog/tech/techreport/tru_07292015.pdf*

3. Clean Off-Road Equipment Voucher Incentive Project. Accessible at: *https://californiacore.org/how-to-participate/*

and Zero-emission Truck and Bus Voucher Incentive Project (HVIP).[4] Additional incentive funds can be obtained from the Carl Moyer Program and Voucher Incentive Program.[5]

7. Include contractual language in tenant lease agreements that requires the tenant to be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation,[6] Advanced Clean Trucks Regulation,[7] Periodic Smoke Inspection Program (PSIP),[8] and the Statewide Truck and Bus Regulation.[9]
8. Include contractual language in tenant lease agreements restricting trucks and support equipment from idling longer than two minutes while on site.
9. Include rooftop solar panels for each proposed warehouse to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.
10. Include contractual language in tenant lease agreements, requiring the installing of vegetative walls[10] or other effective barriers that separate loading docks and people living or working nearby.
11. Include contractual language in tenant lease agreements, requiring all emergency generators to be powered by a non-diesel fuel.
12. The project should be constructed to meet CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking, and achieve a certification of compliance with LEED green building standards.

---

4. Zero-Emission Truck and Bus Voucher Incentive Project. Accessible at: *https://californiahvip.org/*
5. Carl Moyer Program and Voucher Incentive Program. *https://ww2.arb.ca.gov/carl-moyer-program-apply*
6. In December 2008, CARB adopted a regulation to reduce greenhouse gas emissions by improving the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation is available at: *https://ww2.arb.ca.gov/our-work/programs/ttghg*
7. On June 25, 2020, CARB approved the Advanced Clean Trucks Regulation. The regulation requires manufacturers to start the transition from diesel trucks and vans to zero-emission trucks beginning in 2024. The rule is expected to result in about 100,000 electric trucks in California by the end of 2030 and about 300,000 by 2035. CARB is expected to consider a fleet regulation in 2021 that would be compatible with the Advanced Clean Trucks regulation, requiring fleets to purchase a certain percentage of zero-emission trucks and vans for their fleet operations. *https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks*
8. The PSIP program requires that diesel and bus fleet owners conduct annual smoke opacity inspections of their vehicles and repair those with excessive smoke emissions to ensure compliance. CARB's PSIP program is available at: *https://www.arb.ca.gov/enf/hdvip/hdvip.htm*
9. The regulation requires that newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model-year engines or equivalent. CARB's Statewide Truck and Bus Regulation is available at: *https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm*
10. Effectiveness of Sound Wall-Vegetation Combination Barriers as Near-Roadway Pollutant Mitigation Strategies (2017) is available at: *https://ww2.arb.ca.gov/sites/default/files/classic//research/apr/past/13-306.pdf*

San Francisco, CA 94103

Re: San Francisco Gateway Project – Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR)

Dear Elizabeth White:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the March 2022 NOP.

Project Understanding
The proposed project would demolish four existing single-story buildings and construct two new multi-story production, distribution and repair buildings. Each building would be 97 feet tall with a maximum height of 115 feet, including rooftop appurtenances. An elevated portion of I-280 bisects the project site. The project would also construct new sidewalks, plant street trees, install stormwater control measures, and provide accessible curb ramps surrounding the project site. An elevated portion of I-280 bisects the project site.

Hydrology
The Initial Study states that a certain percentage of the development would be constructed to encourage infiltration and reduce the amount of impervious surface. As proposed, the development would serve to improve on-site infiltration of surface flows. Caltrans looks forward to reviewing plans, reports and calculations demonstrating that post project surface flow runoff will be reduced in accordance

with the City and County of San Francisco's Stormwater Management Requirements and Design Guidelines.

It appears that existing flows from I-280 are conveyed to the City and County of San Francisco's combined stormwater and sewer systems. It does not appear that flow patterns from I-280 will be significantly altered or impeded due to the proposed development. However, if any proposed work will reduce or impede the ability for flow conveyance from the State drainage systems, Caltrans will need to review any changes. Drainage reports accompanied with plans and calculations will need to be provided to Caltrans to review.

Utilities
Any utilities that are proposed, moved or modified within Caltrans' Right-of-Way (ROW) shall be discussed. If utilities are impacted by the project, please provide site plans that show the location of existing and/or proposed utilities. Any proposed development should accommodate the State, City and County of San Francisco and any other utility provider's ability to easily access and maintain their facilities. Any proposed development that restricts easy access will also need to be provided for Caltrans to review as well.

Lead Agency
As the Lead Agencies, the City and County of San Francisco are responsible for all project mitigation, including any needed improvements to the State Transportation Network (STN). The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Equitable Access
If any Caltrans facilities are impacted by the project, those facilities must meet American Disabilities Act (ADA) Standards after project completion. As well, the project must maintain bicycle and pedestrian access during construction. These access considerations support Caltrans' equity mission to provide a safe, sustainable, and equitable transportation network for all users.

Encroachment Permit
Please be advised that any permanent work or temporary traffic control that encroaches onto Caltrans' ROW requires a Caltrans-issued encroachment permit. As part of the encroachment permit submittal process, you may be asked by the Office of Encroachment Permits to submit a completed encroachment permit application package, digital set of plans clearly delineating Caltrans' ROW, digital copy of signed, dated and stamped (include stamp expiration date) traffic control plans, this comment letter, your response to the comment letter, and where applicable, the

following items: new or amended Maintenance Agreement (MA), approved Design Standard Decision Document (DSDD), approved encroachment exception request, and/or airspace lease agreement. Your application package may be emailed to D4Permits@dot.ca.gov.

Please note that Caltrans is in the process of implementing an online, automated, and milestone-based Caltrans Encroachment Permit System (CEPS) to replace the current permit application submittal process with a fully electronic system, including online payments. The new system is expected to be available during 2022. To obtain information about the most current encroachment permit process and to download the permit application, please visit https://dot.ca.gov/programs/traffic-operations/ep/applications.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, or for future notifications and requests for review of new projects, please email LDR-D4@dot.ca.gov.

Sincerely,

MARK LEONG

Re: 2022030286, San Francisco Gateway Project, San Francisco County

Dear Ms. White:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cody.Campagne@nahc.ca.gov.

Sincerely,

Cody Campagne

Greenaction for Health and Environmental Justice
Marie Harrison Community Foundation, Inc.
Bayview Hunters Point Mothers & Fathers Committee

April 21, 2022
Elizabeth White, Senior Environmental Planner
San Francisco Planning Department
Submitted via e-mail to CPC.SFGatewayProject@sfgov.org

Comments on Initial Study and Notice of Preparation of an Environmental Impact Report for the Proposed San Francisco Gateway Project (2015-012491ENV)

1. Introduction

Greenaction for Health and Environmental Justice, the Marie Harrison Community Foundation Inc., and the Bayview Hunters Point Mothers & Fathers Committee submit these comments on behalf of our members and constituents who reside in Bayview Hunters Point, San Francisco, and who would be significantly, negatively, and disproportionately impacted by the proposed project.

2. The Initial Study and project description are vague and lack sufficient detail about the proposed project's operations to enable proper evaluation

The project proponent and the Initial Study fail to provide a sufficient description of the proposed project to enable an adequate assessment of potential impacts as would be required for a proper CEQA review. Beginning the environmental impact review process is thus premature due to the wide range of potential industries and operations that might be part of the proposed project.

It would be improper and premature to begin the environmental impact review process based on such a vague project description found in the Initial Study (IS). The IS describes the proposed buildings' purpose is to "accommodate a variety of users including a combination of the uses [listed]" in the document, and these are expected to "change over time."[1] This is not a comprehensive project description, as it lacks content and specifics. At the same time, by stating that the proposed buildings will be utilized for any combination of uses, the project proponent is creating so many scenarios that it would be difficult if not impossible to properly analyze them all adequately in an EIR.

[1] *See* pg. 9 of the Initial Study.

We call on the Planning Department to at least temporarily halt the CEQA process, and it should require the project proponent to submit a more specific and detailed project description so that it is clear what is being proposed. Currently, the description of the proposed project is open-ended. Without a more comprehensive description, the public and government regulatory agencies would be unable to adequately assess all the potential impacts of the proposed project.

What is clear, however, is that the proposed project which appears to have a major freight and trucking component, would have an unacceptable, harmful, significant, and ongoing air pollution impact in an already heavily impacted community.

3. The San Francisco Planning Department must consider all cumulative impacts from multiple pollution sources and other environmental, health and socio-economic indicators when evaluating the proposed project

Though the Initial Study lists cumulative projects within a ¼ mile radius of the proposed project and sensitive receptors within 300 feet of it, the document fails to consider the impacts outside that range but within the area potentially impacted by the project. Limiting the analysis of cumulative impacts to a 300-foot distance is inadequate. The entire Bayview Hunters Point and adjacent areas need to be part of a cumulative impact analysis, as there would be numerous and widespread cumulative impacts from the proposed project if approved.

This project would clearly have a significant and harmful impact on air quality in this already highly impacted community. In fact, the Bay Area Air Quality Management District (BAAQMD) has designated Bayview Hunters Point and Southeast San Francisco as a "CARE" community. BAAQMD defines a "CARE" community as an area vulnerable to "Cumulative Impacts from Air Pollution" including 24-hour PM 2.5 exceedances.[2]

Bayview Hunters Point is a majority-minority community; one-third of residents are African American, 30% Asian/Pacific Islander, and almost 25% Hispanic/Latino. Residents suffer high rates of infant mortality, asthma, cardiovascular diseases, and cancer.

Very importantly, the EIR needs to include and consider the data from the California Environmental Protection Agency's CalEnviroScreen which evaluates and ranks

[2] *See* Bay Area Air Quality Management District, Community Air Risk Evaluation Program. https://www.baaqmd.gov/community-health/community-health-protection-program/community-air-risk-evaluation-care-program

communities statewide based on environmental, health, and socio-economic characteristics, indicators, and disparities to determine vulnerability. According to CalEnviroScreen 4.0, Bayview Hunters Point ranks in the 90th percentile in terms of pollution. This means that Bayview Hunters Point has a higher pollution burden than 90% of California. For diesel particulate matter, Bayview Hunters Point falls in the 99th percentile and the 97th percentile for groundwater threats. Additionally, most of Bayview Hunters Point is within the 90-100th percentile for hazardous waste facilities in the area, according to the CalEnviroScreen 4.0 Hazardous Waste Map. The effects of this pollution are reflected in the health of the community. Bayview Hunters Point lies in the 97th percentile for low birth weight and the 96th percentile for asthma.

It is thus clear, as confirmed by regional and state government agencies, that Bayview Hunters Point is already overwhelmed and heavily impacted by pollution. The last thing this community needs is another large pollution source.

4. <u>The proposed project would have harmful and significant and unavoidable air quality impact, including from freight transport and other trucking and fleet operations.</u>

While many aspects of the proposed project are vague and not described in detail, it is clear the proposed project would include major freight, trucking and fleet components that would further add to and exacerbate the already poor air quality and health impacts already experienced in Bayview Hunters Point.

Diesel trucks emit harmful Particulate Matter and carcinogens, and adding a large scale operation of enormous scope is reckless, irresponsible, and unacceptable.

5. <u>Environmental justice and civil rights impacts of proposed project.</u>

As this project would clearly have numerous significant and harmful impacts, including on air quality and health, in an already heavily impacted and vulnerable low-income, working class, and people of color community, an EIR must consider all environmental justice and civil rights impacts of the proposed project. The proposed project would benefit corporations yet harm a community that is entitled protection from disproportionate and discriminatory impacts. Approval of this project would constitute a violation of the civil rights of the people of color residents of Bayview Hunters Point.

As recipients of state and federal funds, this City and County of San Francisco are subject to civil rights laws and cannot approve a project that would have such a discriminatory and harmful impact.

6. Community involvement in the project review process

We encourage the Planning Department to provide effective public notices and opportunities for meaningful civic engagement, including language access, for this project and all other Planning Department processes.

Re: San Francisco Gateway, Case No. 2015.012491ENV
Comments Pursuant to Notice of Preparation of an Environmental Impact Report

Dear Ms. White:

On behalf of the San Francisco Market Corporation, which manages The SF Market (formerly known as The San Francisco Wholesale Produce Market, hereafter the "Market"), I submit the following comments pursuant to the Notice of Preparation of an Environmental Impact Report ("NOP") for the San Francisco Gateway Project, Planning Department Case No. 2015.012491ENV.

The Market thanks Prologis, the project sponsor, and the San Francisco Planning Department for their willingness to collaborate with us around a variety of issues of common interest to the City, Prologis and the Market.

The Market is a Vital Resource for San Francisco

The Market is the largest multi-tenanted produce wholesale and distribution facility in Northern California, and the only wholesale produce market of similar scale that is a

nonprofit, spanning over 20 acres and including 485,000 square feet of warehouse and logistics space. We were created in 1963 when the City and County of San Francisco (the "City") relocated independent produce merchants from downtown San Francisco and built a shared facility in the Bayview Hunters Point neighborhood to house them.

Since then, we have grown alongside the City and its produce and food industry. Our merchants, many of whom have been in operation for decades, sell and distribute a wide variety of produce to food businesses across the Bay Area. Today, the Market is the linchpin of San Francisco's world-class food and restaurant scene. We've become integral to the city's culinary fabric by providing the critical, behind-the-scenes infrastructure to wholesale and distribution businesses that link farmers to restaurants, independent grocery stores, and hotels.

Our work at the Market benefits the City in a number of key ways:

- Healthier Bay Area: The Market supplies food businesses throughout the Bay Area with fresh, healthy, and affordable produce.

- Food Security: Market supports food security through its award-winning Food Recovery Program, as well as its Emergency Food Program. Together, these programs have distributed almost nine million pounds of fresh produce to neighbors in need, while helping to reduce food waste and the Market’s climate impact

- Culinary Destination: The Market is central to the supply chain that makes the City a delicious place to live and visit.

- Business Incubator: Home to 26 businesses, the Market provides the space, expertise, and access to produce for anyone launching or growing a food business.

- Support for Farmers: The Market's merchants source from local and regional farms, providing critical market access for growing farms.

- Job Creation: The Market employs over 650 workers via its independent merchants, providing diverse employment opportunities within the important PDR sectors.

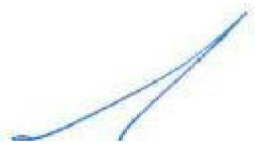
In 2013, the City and the Market finalized a long-term ground lease that envisions a comprehensive, phased replacement and expansion of the Market's facilities and infrastructure ("the Reinvestment Project"). Through the operations, improvement projects, and activities contemplated as part of the Reinvestment Project, the City has made a significant ongoing investment in the success of the Market. As such, the City has a strong interest in protecting its investment by ensuring that the Market can continue to operate successfully far into the future, even while it welcomes appropriate change and new development activities into this neighborhood.

We are in the process of completing design for the next new Reinvestment Project building, 1900 Kirkwood, and expect to be in construction in early 2024. It is possible that construction on the Gateway Project and 1900 Kirkwood occur at the same time. Whether or not that occurs, the Market and the Gateway Project will be neighbors and operating in close proximity to one another long into the foreseeable future.

Comments Pursuant to the NOP

The Market has been closely following the development of the Gateway Project over the last few years and has had ongoing discussions with the Prologis team aimed at coordinating our two development projects. We have also reviewed the NOP and the Initial Study published by the Planning Department for the Gateway Project. All of our comments pursuant to the NOP relate to the Transportation and Circulation topic to be studied in the focused EIR. They are as follows:

1) The Market's peak hours for operations are midnight to 9:00 am, during which a large number of vehicles enter and exit the Market's marshaling yard through entrances at Jerrold/Rankin and Jerrold/Toland. Please ensure the EIR adequately studies potential impacts on Market vehicle movements resulting from truck and other vehicle movements generated by a) activities associated with construction of the proposed project and b) activities associated with the operations of the proposed project.



2) During the Market's hours of operations, a large number of pedestrians and small loading vehicles move around the vicinity of our facility, including Market employees and Market customers arriving and departing, as well as activity from other nearby businesses.

These movements take place largely in the hours before sunrise when visibility is low. Please ensure that the EIR adequately studies pedestrian safety and potential pedestrian conflicts with traffic generated by the proposed project.

3) We note that pursuant to Planning Code section 169, the proposed project is required to include a transportation demand management (TDM) plan. The Market wishes to collaborate with Prologis on these issues since the proposed project and the Market are adjacent neighbors.

Many thanks once again for the opportunity to comment on this NOP and to participate as a neighborhood stakeholder in the development of the project. Please do not hesitate to contact me at mjanis@thesfmarket.org or 415-550-4495 ext. 101 with any questions.

Very truly yours,

Michael Janis

Re: Notice of Preparation of an EIR for San Francisco Gateway Project, Case No. 2015.012491ENV

Dear Ms. White:

On behalf of United Food & Commercial Workers Union Local 5 and International Brotherhood of Teamsters Joint Council 7, and their members who live and work in the Bayview, please accept the following comments addressing the scope of disclosure and analysis in the forthcoming environmental impact report (EIR) for the above-referenced Project, a multi-story production, distribution, and repair (PDR) complex covering 2,160,000 gross square feet in the Bayview Hunters Point Area Plan area. The site is zoned PDR 2 – Core Production, Distribution, and Repair Industrial Protection Zone Special Use District; 65-J Height and Bulk District. The notice of preparation (NOP) indicates that in addition to housing PDR uses such as "manufacturing and maker space," the Project would provide space for "parcel delivery and last-mile delivery, wholesale storage, and fleet management."

The significant environmental impacts associated with construction and operation of a Project of this scale are likely numerous and diverse. Of particular concern are the air quality and human health effects to people living and working in the Bayview near the site. According to the San Francisco Health Department, the site is within a designated Air Pollutant Exposure Zone pursuant to Section 3806 of the San Francisco Health Code. This means the neighborhood already experiences elevated pollutant concentrations that have resulted in a cancer risk to residents. The pollutants of concern include PM 2.5 and toxic air contaminants (TACs) including diesel particulate matter (DPM) from diesel truck traffic, a known carcinogen.

Depending on what kinds of manufacturing uses are ultimately housed in the Project's structures, emissions of air pollutants and/or releases of hazardous materials

and TACs into the ambient air at significant concentrations are reasonably foreseeable. Furthermore, parcel delivery and last-mile delivery facilities will foreseeably bring significantly more truck and van traffic into the area on a daily basis, including heavy diesel truck traffic. These additional sources of these emissions would increase pollutant concentrations, primarily of DPM, to the further detriment to Bayview residents' health and safety.

It is therefore important that the EIR disclose detailed information about the anticipated users/tenants of the Project, and the nature and extent of their operations, so that the public has a meaningful opportunity to critically evaluate the document. At a minimum, the EIR should disclose:

- The identities of any prospective tenants or occupants of the Project, including a description of their business operation, whether manufacturing, distribution, repair, or warehousing, or other uses not currently permitted under the current zoning classification.

- The number and type of diesel trucks expected to travel to and from the site (EMFAC vehicle class with fleet percent diesel), and the frequency of travel on an average daily and peak-hour basis.

- The number of top-mounted refrigeration units (TRUs) anticipated to be included among this number, with estimates of diesel engine idle-times.

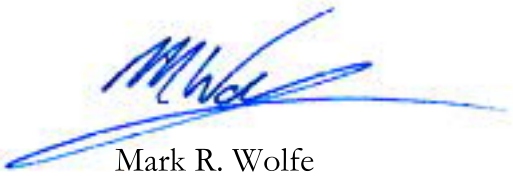
- Daily and peak-hour trip generation rates for each expected occupant/user of the site.

- The number, type, and engine classification of all construction equipment and construction vehicles expected, including expected duration of operation for each.

- Expected truck travel/delivery routes that clearly identify the streets that will be used by parcel delivery/last-mile vehicles.

- An estimate of the existing ambient health risks, reflected as the number of excess cancers per one million individuals, at the nearest residential receptor locations, which appear to be on Oakdale Avenue to the South.

- A study of existing ambient noise levels at the closest residential receptor location, with an analysis of noise impacts from both construction of the Project and its operational phase.



- An analysis of the Project's effects on the potential displacement of opportunities for housing development, including affordable housing, in the Bayview Neighborhood.

Please note that the above is not intended to be an exhaustive list of items that the EIR must be disclosed. We trust the City will comply fully with the information disclosure, analysis, and mitigation requirements of CEQA at the appropriate time.

Thank you for your consideration of these scoping comments. We look forward to reviewing the Draft EIR for this Project when it is released for public review.

Most sincerely,

M. R. WOLFE & ASSOCIATES, P.C

Mark R. Wolfe

INITIAL STUDY

San Francisco Gateway Project
Planning Department Case No. 2015-012491ENV

A. PROJECT DESCRIPTION

Introduction

The project sponsor, Prologis Inc., proposes to redevelop two parcels in a core industrial area of the City and County of San Francisco (city). The proposed San Francisco Gateway project (proposed project) would construct two new multi-story *production, distribution, and repair* (PDR)[1] buildings. The project site is located within the Bayview neighborhood. The site consists of two parcels that combine for a total gross site area of approximately 743,800 square feet (17.1 gross total acres).

Four one-story, metal clad buildings currently occupy approximately 448,000 gross square feet[2] of the project site. The project sponsor would demolish the four existing buildings and construct two three-story buildings (with active roof), buildings A and B. Each building would be approximately 97 feet tall from curb level to the highest point of the active roof level. Roof projections would be limited to the stair and elevator rooftop penthouse which would provide access and a solar array which would also screen the roof while generating electricity for onsite use. Including these elements, the maximum building height would be approximately 115 feet. The two new buildings (including PDR space, logistics yard, vehicular systems, and ground-floor retail spaces) would total approximately 2,160,000 gross square feet. This would result in 1,712,000 gross square feet of net new PDR and PDR support space on site.

The proposed project would provide space for several main types of PDR uses, each of which is described in detail below: manufacturing and maker space, parcel delivery service, including last-mile delivery,[3] wholesale and storage, and fleet management. Additionally, the project would allow for laboratory uses permitted in the PDR-2 zoning district, although this use is not part of the preferred project.[4] Each building would include a combination of enclosed and partially enclosed spaces, with a multi-level vehicular system (comprised of staging, circulation, and logistic yard areas) serving each level. In both buildings, all three levels of the PDR space would have direct vehicular access via a one-way ramp system for vehicles as large as tractor trailers. The roof level would provide a solar array and a screened, open-air multi-purpose deck that could be used for parking and/or material and vehicle staging. The proposed project would include a combined total of approximately 35,000 gross square feet of ground-floor maker space[5] and 8,400 gross square feet of ground-floor retail space in buildings A and B.

---

1 PDR use is a grouping of uses that includes but is not limited to all industrial and agricultural uses, ambulance services, animal hospital, automotive service station, automotive repair, automotive wash, arts activities, business services, cat boarding, catering service, commercial storage, kennel, motor vehicle tow service, livery stable, parcel delivery service, public utilities yard, storage yard, trade office, trade shop, wholesale sales, and wholesale storage.

2 Square footages presented for the existing and proposed uses are approximate.

3 Last mile delivery is defined as the movement of goods from a transportation hub to the final delivery destination (i.e., typically a personal residence or business).

4 Laboratory uses permitted in the PDR-2 zoning district do not include life sciences laboratories.

5 In the preferred use mix, all of the maker and manufacturing space would be on the ground floor (i.e., level 1). However, this use could also be on floors 2 and 3 in the future.

The existing warehouse buildings were built by the U.S. military circa 1943 and were transferred to private ownership sometime in the 1970s. Since then, the project site has contained a functional PDR complex, providing mostly wholesale and storage, vehicle storage, and fleet management spaces within the existing single-story buildings. The proposed project would demolish these four single-story buildings and replace them with two three-story buildings with active roofs that would allow large trucks to access fully functional, upper-level PDR spaces.

Project Location and Site Characteristics

As shown in Figure 1 (p. 3), the approximately 743,800-gross-square-foot (17.1 gross total acres), rectangular project site is located in the Bayview neighborhood of San Francisco, California. The street addresses of the existing buildings are 749 Toland Street and 2000 McKinnon Avenue. The project site consists of assessor's block 5284A, lot 008, and block 5287, lot 002, which are occupied by four structures totaling approximately 448,000 square feet of PDR space. The project site is relatively flat and rectangular. As shown in Figures 2 and 3 (pp. 4 and 5), the project site is fully developed and is covered in impermeable surfaces and has no existing landscaping.

The project site is bounded by Kirkwood Avenue to the north, Rankin Street to the east, McKinnon Avenue to the south, and Toland Street to the west. An elevated portion of Interstate 280 (I-280) bisects the project site, running in a north-south direction above the existing Selby Street right-of-way; the uppermost roadbed deck is approximately 55 feet above grade. Portions of the rights-of-way of the surrounding streets and Selby Street are included in the current lot configuration.

Existing Land Uses

Project Site

The project setting sections of the initial study and technical studies reflect conditions at the project site when the environmental evaluation process began in 2017. As of August 2020, the project sponsor submitted building permit applications for an interim use on the project site.[6] The interim use is a parcel delivery service use, focusing on last-mile e-commerce delivery, and occupies one half of the site (the two buildings west of I-280). One of the two buildings is used for vehicle staging and the other is used for warehousing of goods and loading of delivery vehicles. This use is temporary in nature and would ultimately be replaced by the proposed project, if it were to be approved. The environmental analysis of the initial study and technical sections analyze the changes between the proposed project and the uses at the project site prior to the operation of the interim use, resulting in a more conservative analysis.[7]

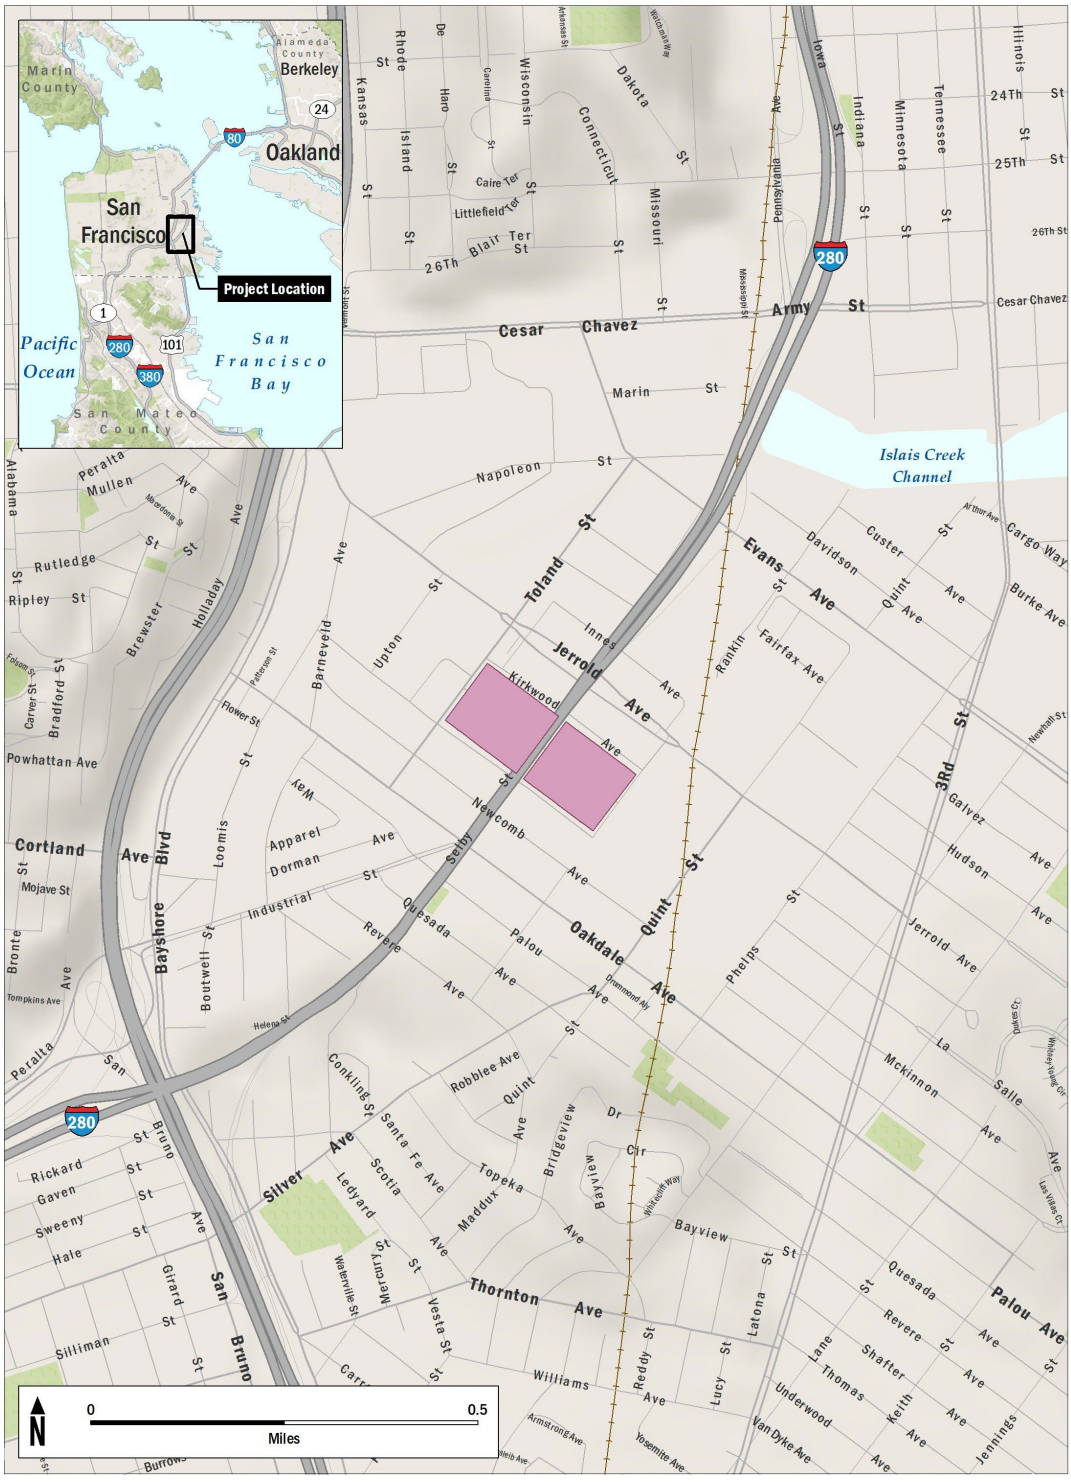

Table 1 (p. 6) lists uses that existed at the project site in 2017. As previously described, these uses included automotive storage, fleet management, general storage, food-related storage, temporary storage, and vacant spaces. The existing buildings are constructed of metal siding over a wood column and truss structure. An aerial California Department of Transportation (Caltrans) easement for I-280 is adjacent to both lots; the existing easement would be maintained.

---

[6] San Francisco Building Department Permit #202008272769 (Building 417 shell) and San Francisco Building Department #202008272770 (Building 418 shell).

[7] Analyzing the change in the environment from the uses that occupied the site in 2017 to the proposed use is considered conservative, or worst-case, because the interim use is more intensive than the uses that existed on site in 2017.

Figure 1 **Project Location**

Source: AECOM 2021

Figure 2 **Aerial View of Project Vicinity**

Legend

Project Site:
749 Toland Street and 2000 McKinnon Avenue

Source: JLA, 2017

Figure 3 **Existing Site Plan**

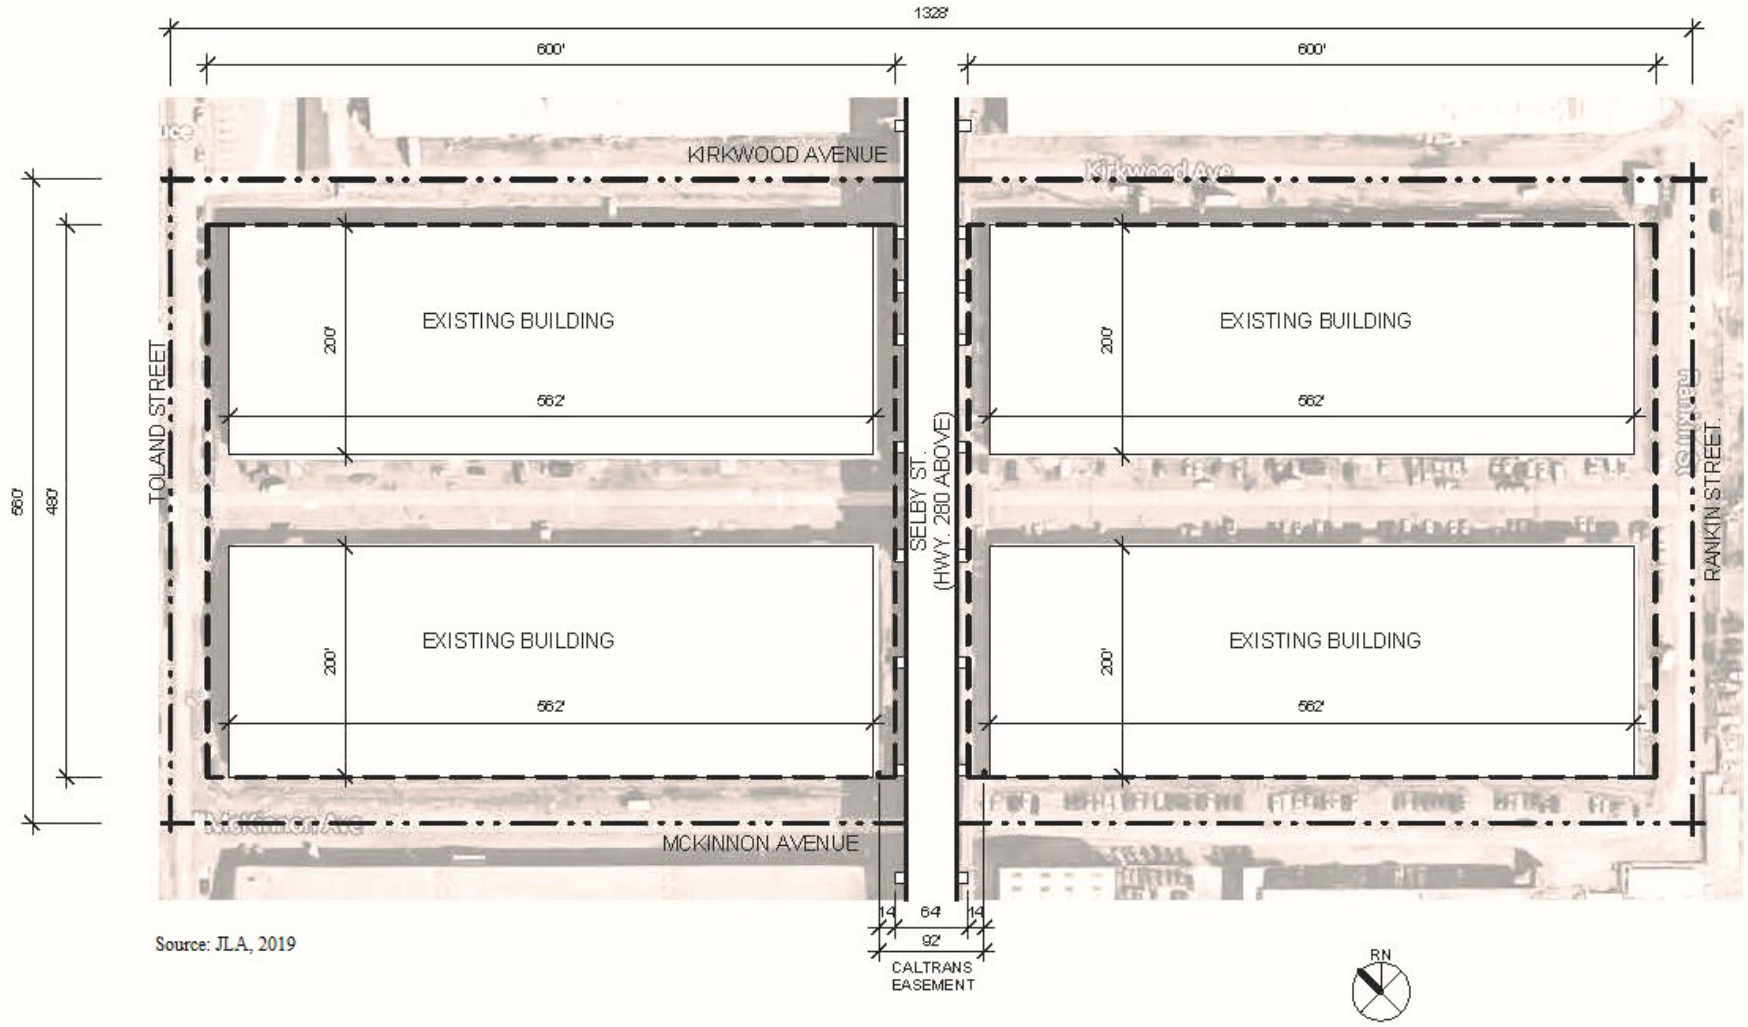

Table 1 Existing Uses at the Project Site

Use	Area (square feet)[1]
Automotive storage and fleet management	141,400
General storage (for contractors, supply companies, etc.)	184,400
Food-related storage and wholesale (multiple tenants)	77,100
Temporary storage	35,700
Vacant	9,400
Total	**448,000**

Source: Prologis, Inc., 2019

[1] These areas are approximations of uses that existed at the project site in December 2017.

The project site is developed and is currently covered by buildings or paved and gravel surfaces. There are no sidewalks surrounding the project site and the site does not contain any *curb cuts*, but vehicle access is designated at four access points. The entire site is fenced in and level with the surrounding road base. Additionally, the project site does not contain any street trees, only a small amount of vegetation and no open space.

The surrounding uses in the project vicinity include predominantly PDR and light industrial uses. The San Francisco Wholesale Produce Market (SF Market) is adjacent to the project site to the north along Kirkwood Avenue; wholesale flooring, art supply, and shipping services are located in the vicinity; and taxicab companies are northwest of the site along Toland Street. A warehouse space for crafts and art supplies, a door supplier, a pet supply store, a van storage company, and several fleet management uses are located south of the project site along McKinnon Avenue. San Francisco Public Utilities Commission (SFPUC) offices and the SF Market are located along Rankin Street east of the project site.

Land Use and Zoning

The project site is in the PDR-2 zoning district within the Bayview Hunters Point Area Plan. San Francisco Planning Code (planning code) section 210.3 states that the intent of the PDR-2 zoning district is to "encourage the introduction, intensification, and protection of a wide range of light and contemporary industrial activities," including industrial activities in enclosed structures, in partially enclosed structures, and in open areas that "may require trucking activities multiple times per day, including trucks with up to 18 wheels or more, and occurring at any time of the day or night."

The project site is in the 65-J height and bulk district (65 feet maximum height). The permitted floor area ratio[8] in the PDR-2 zone is 5:1. The existing floor area ratio of the project site is approximately 0.8:1 and the proposed floor area ratio for the site would be approximately 2.9:1. Because the proposed buildings would be taller than 65 feet, approval of a height and bulk district map amendment would be required for the proposed project. The proposed project would seek a new special use district designation to allow proposed modifications to the existing PDR-2 zoning.

[8] "Floor area ratio" is the gross floor area of a building or buildings on a zoning plot, divided by the area of the zoning plot. The floor area ratio is calculated to assist in determining whether the mass and scale of a project is compatible with the surrounding neighborhood. For the purpose of this calculation, rights-of-way have not been included in the total gross site area, and the open roof area has not been included in the gross floor area of the building.

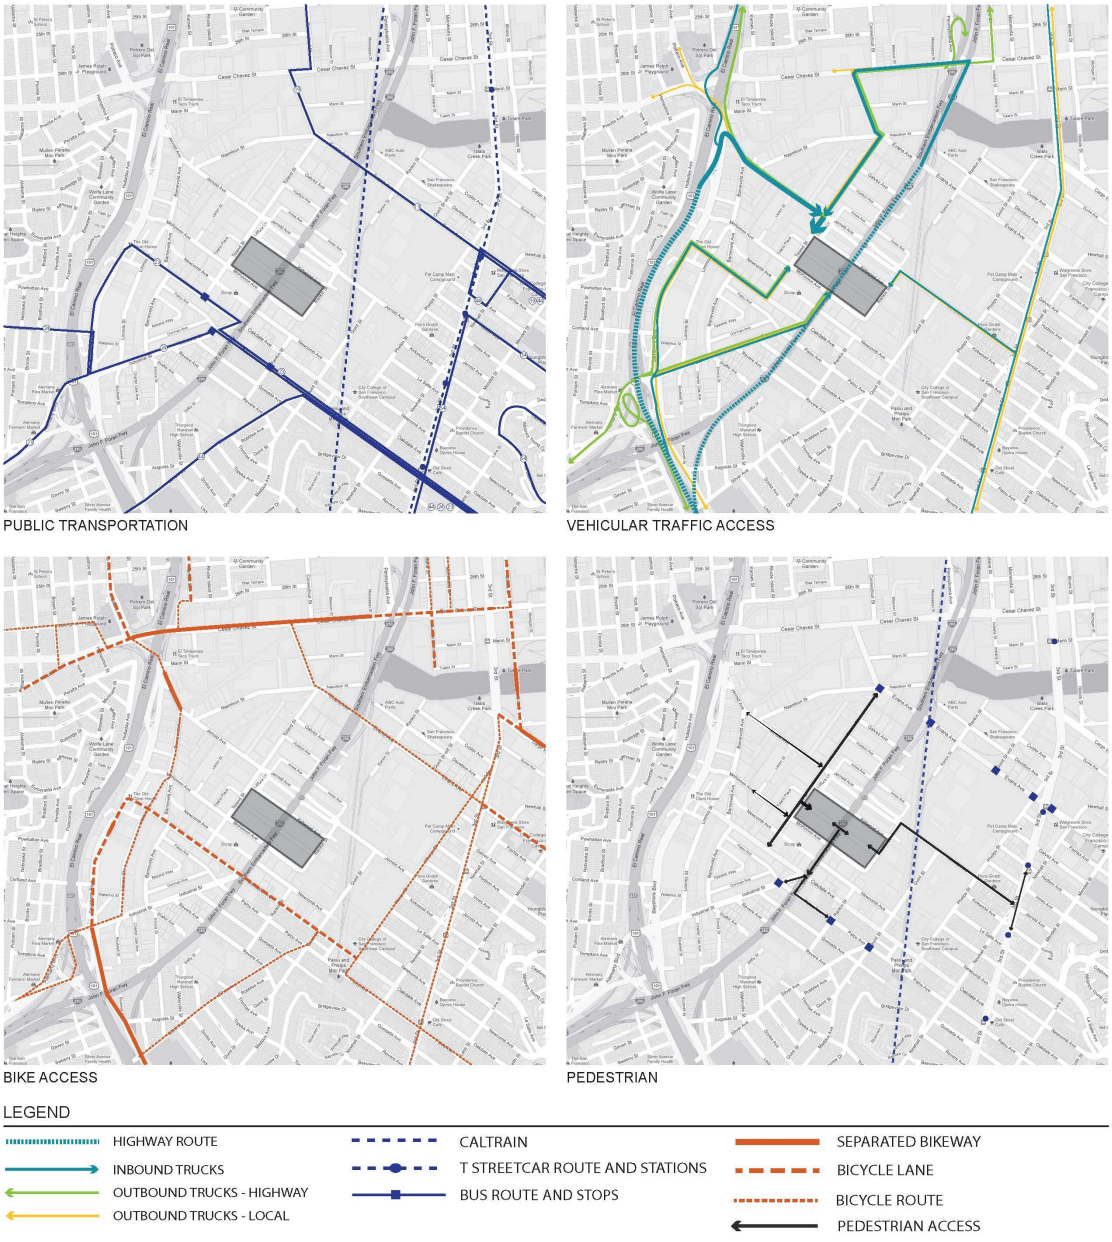
Existing Parking, Circulation, and Loading

The project site currently has two approximately 600-foot-long by 80-foot-wide areas that are used for a truck court and parking. Adjacent to the project site, two sections of Toland Street and two sections of Rankin Street, each approximately 200 feet long, are nonstriped and do not have signed parking areas. These areas are presumed to be parallel on-street parking spaces. Adjacent to the site, two sections of Kirkwood Avenue and one section of McKinnon Avenue, each approximately 600 feet long, are also nonstriped and do not have signed parking areas and are presumed to be parallel on-street parking spaces. Total on-street parking capacity along the project site perimeter is estimated to be approximately 250 to 310 standard vehicles (approximately 50,000 square feet).[9]

The project site is served by one San Francisco Municipal Railway (Muni) light rail line (approximately four blocks to the east) and four bus lines. Transit stops in the project vicinity include stops for Muni bus lines 23-Monterey, 24-Divisadero, and 9-San Bruno, and San Mateo County Transit District bus line 292. The 23-Monterey Muni line operates immediately adjacent to the project site, with the closest stop at the corner of Toland Street and Oakdale Avenue, and the other bus lines operate within approximately four blocks of the site.[10] The proposed project would not directly affect any of these bus lines. The Third Street light rail line lies approximately 2,000 feet east of the project site; the closest stops are Kirkwood/La Salle, Hudson/Innes, and Oakdale/Palou. The closest Bay Area Rapid Transit (BART) station is the 24th Street Mission Station, approximately 1.5 miles to the northwest. The Glen Park BART Station is approximately 2.5 miles to the southwest. The 22nd Street Caltrain Station is located approximately 1.5 miles to the northeast.

I-280 and United States Highway 101 (U.S. 101) are the major regional roadways that serve the project site (Figure 4 on p. 8). Access to the project site is predominantly from Toland Street, from either the north or south. Toland Street provides connections to both Evans and Jerrold avenues north of the project site and to Oakdale Avenue south of the site. These three main east-west connecting streets provide further connections to key city streets and to the highway interchanges of U.S. 101 and I-280, both north and south of the project site.

Many occupants of the existing buildings use portions of the surrounding streets for both parking and movement of vehicles. The existing truck court and parking area serve as the primary vehicular staging area. This area provides space for loading and parking, both of which are organized in an informal manner. Additionally, Selby Street (below I-280) provides mid-site connectivity under the overpass.



Pedestrians use the surrounding streets and the truck court to access specific tenants of the current buildings. Bicycle circulation uses the same facilities as pedestrians and other vehicles.

---

9 There are currently no posted limitations to street parking along the project site perimeter.

10 As part of the Palou Avenue Streetscape Improvement Project, the 23-Monterey Muni line was rerouted three blocks south, from Jerrold Avenue to Palou Avenue. Construction of this project was completed in spring 2020. See *https://www.sfpublicworks.org/sites/default/files/Palou%20Avenue%20factsheet.pdf*.

Figure 4 Existing Access

Source: JLA, 2021

Pedestrian circulation offsite is fairly limited. Bicycle circulation is also limited; the closest formal *class III bicycle lane*[11] is located on Evans Avenue, five blocks to the north, and the closest *class II bicycle lane*[12] is on Oakdale Avenue, two blocks to the south. Connections to these two sets of bike lanes are provided via Toland Street.

Proposed Project

The proposed project would construct two new multi-story PDR buildings that would provide new PDR space in the industrial area of the Bayview neighborhood of San Francisco. The proposed PDR uses are explained further in the Proposed Project Uses section (p. 20).

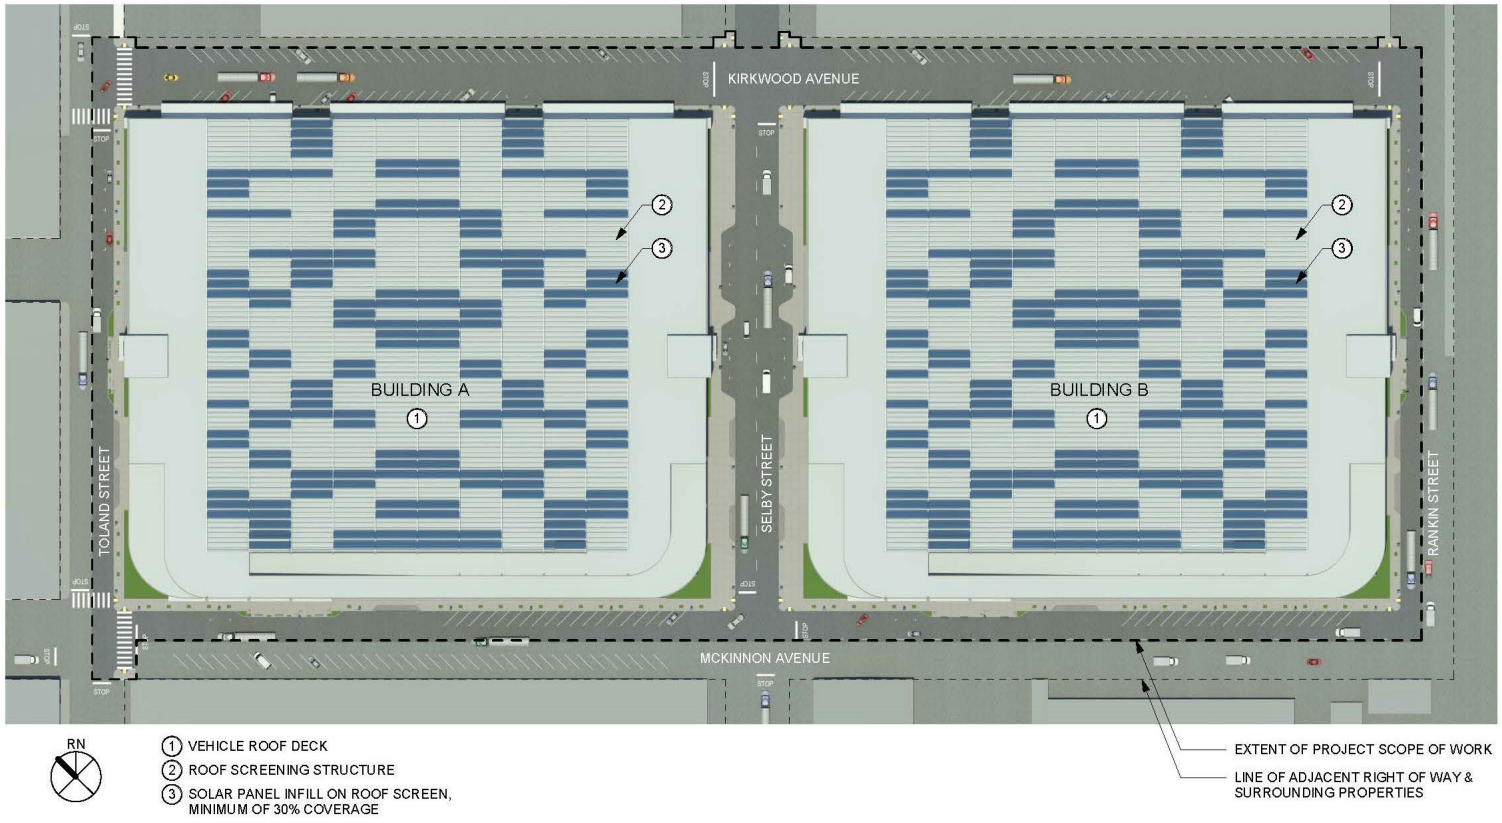
The proposed project would demolish the existing four single-story PDR buildings onsite and would construct two new three-story buildings (with active roof), totaling approximately 2,160,000 gross square feet. Each building would have a maximum height of approximately 97 feet (115 feet with rooftop appurtenances included).[13] As depicted in Figure 5 (p. 10), the proposed building west of I-280 at 749 Toland Street is "building A" and the proposed building east of I-280 at 2000 McKinnon Street is "building B." As shown in Figure 5 (p. 10), buildings A and B would be approximately the same size, shape, and dimensions, and would be oriented similarly onsite. Each of these two buildings would include a one-way ramp system designed to provide full-service, upper-level truck access, and PDR spaces for its tenants.

Both building A and building B would include three levels of PDR space with direct access to vehicle circulation, logistics yards, and rooftop parking, vehicle staging, and storage. In addition, 8,400 gross square feet of ground floor retail space and 35,000 gross square feet of ground-floor maker space[14] would be included in the two buildings. The active roof would be a screened, open air, multi-purpose deck that could be used for materials staging and vehicle staging for box trucks, vans, and personal vehicles. Solar panels would be installed above the parking areas on the roof. Figures 6 through 12 (pp. 11 through 17) provide additional information and a visual representation of the typical building levels. Specifically, floor plans for the proposed project are provided in Figures 7, 9, and 11 (pp. 12, 14, and 16). Table 2 (p. 18) lists the proposed project's characteristics.

The buildings are intended to accommodate a variety of users including any combination of the uses below. It is anticipated that the assortment of PDR tenants would change over time. This initial study describes the project sponsor's preferred mix of PDR uses for the proposed project. Table 3 (p. 19) outlines the proposed project's preferred use mix.

As described above, the project site does not have any existing sidewalks or curb cuts. The proposed project would construct new 10-foot-wide sidewalks along the site's perimeter including Selby Street and would create seven new curb cuts for access to each new building. The new sidewalks would be designed in accordance with San Francisco's Better Streets Plan standards for industrial roads.

---



11 Class III bicycle lanes are signed bicycle routes that allow bicycles to share the travel lane with vehicles.

12 Class II bicycle lanes are bicycle lanes striped within the paved areas of roadways and established for the preferential use of bicycles.

13 Pursuant to section 260(b)(1)(B) of the planning code, the mechanical and elevator penthouses are exempt from the planning code's height limits. However, these features are considered in the context of environmental review.

14 In the preferred use mix, all of the maker and manufacturing space would be on the ground floor (i.e., level 1). However, this use could also be on levels 2 and 3 in the future.

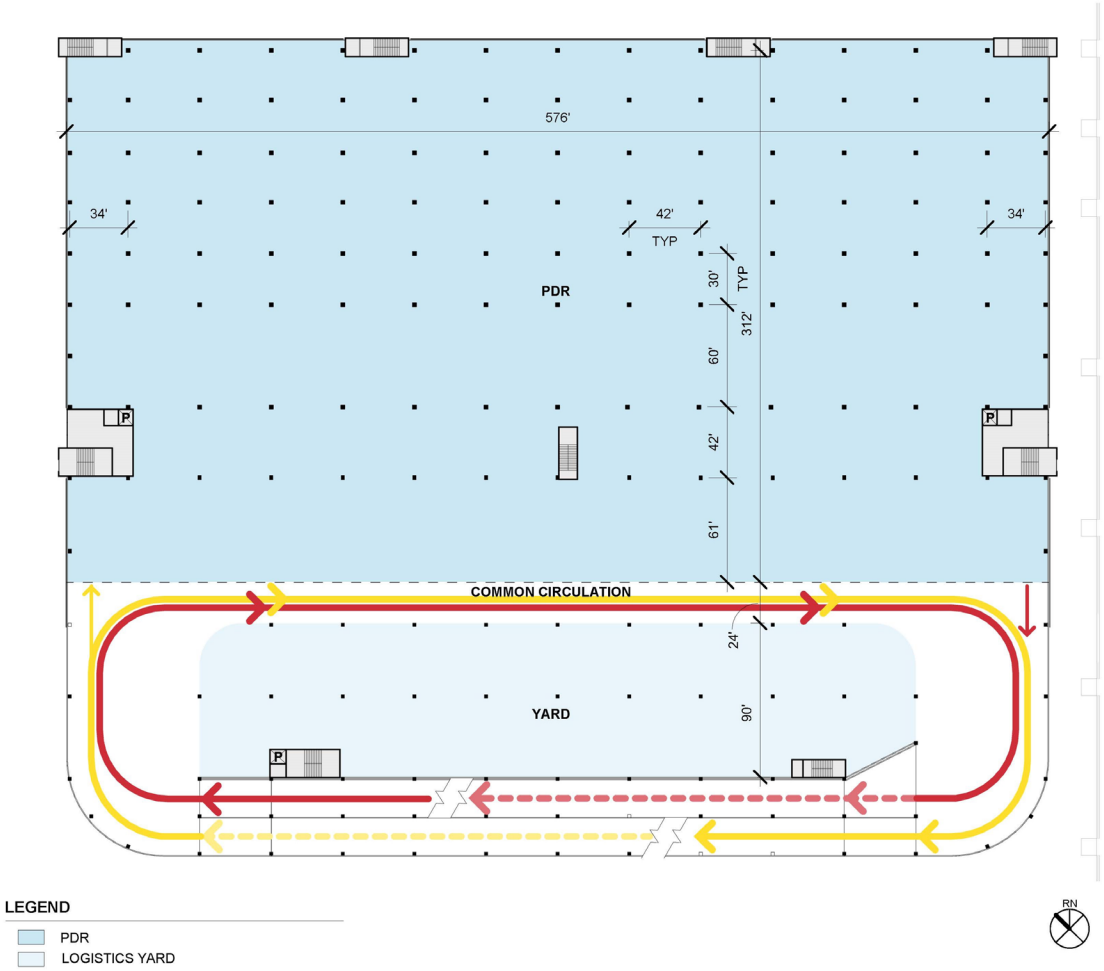
Figure 8 Level 1 Description (Buildings A and B)

This level features traditional dock-high warehouse space to serve a variety of PDR uses and street-oriented maker and retail spaces to animate the surrounding streetscape. Separate ramp access to and from the upper levels provides direct unencumbered access to bring vehicles into the project staging areas.

a PDR
Dock-high space. 180' deep with a 24' clear height.

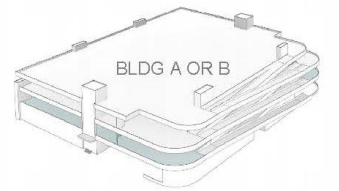
b PDR/Maker Space



c Logistics Yard
An ample yard provides room for vehicle staging and space for flexible logistics support activities including fleet staging, storage, and goods transfer.

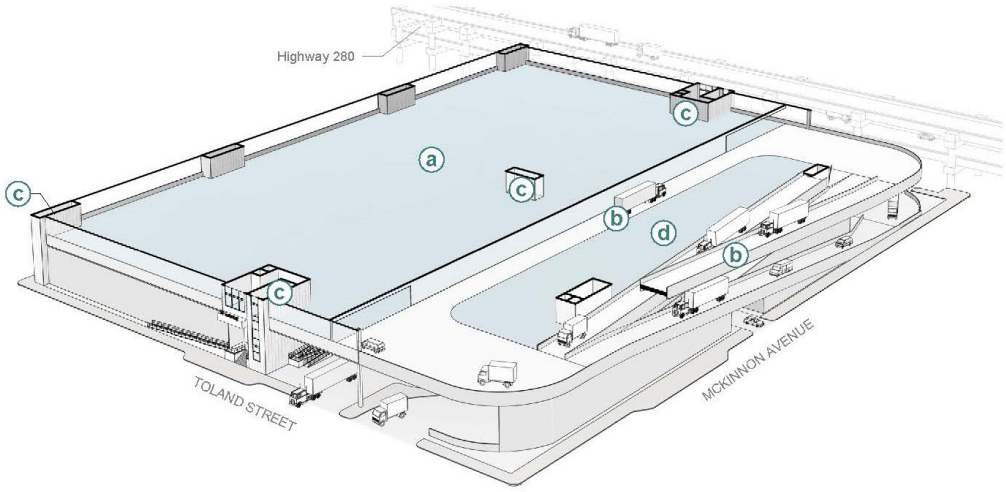
d Accessory Office
Flexible space to support PDR operations.

e Retail
Provide amenities (eg. cafe).



Source: JLA, 2021

Figure 9 **Proposed Project Floor Plan – Levels 2 and 3 (Buildings A and B)**

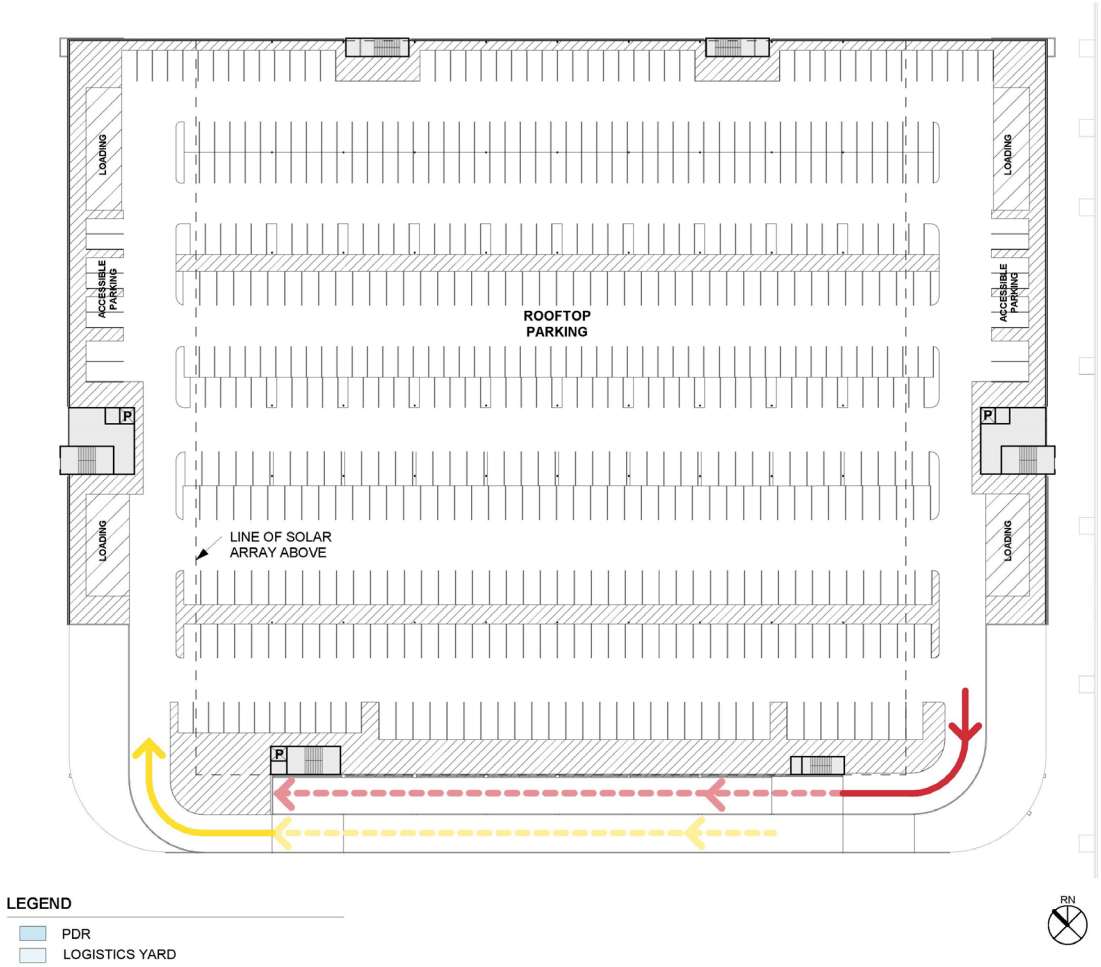


Source: JLA, 2021

Figure 10 Levels 2 and 3 Description (Buildings A and B)

This level features multi-functional space which supports a wide variety of PDR type users. This level is served by a ramp that accommodates vehicles up to the San Francisco legal limit, including trucks, buses and smaller vehicles.

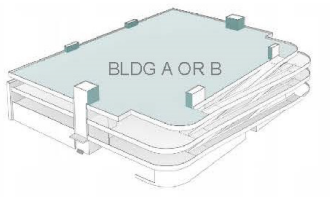
a PDR
22'-24' high clear space at this level.



b Common Vehicle Circulation
Scissor ramp and bypass lane provide one-way circulation up and down throughout building.

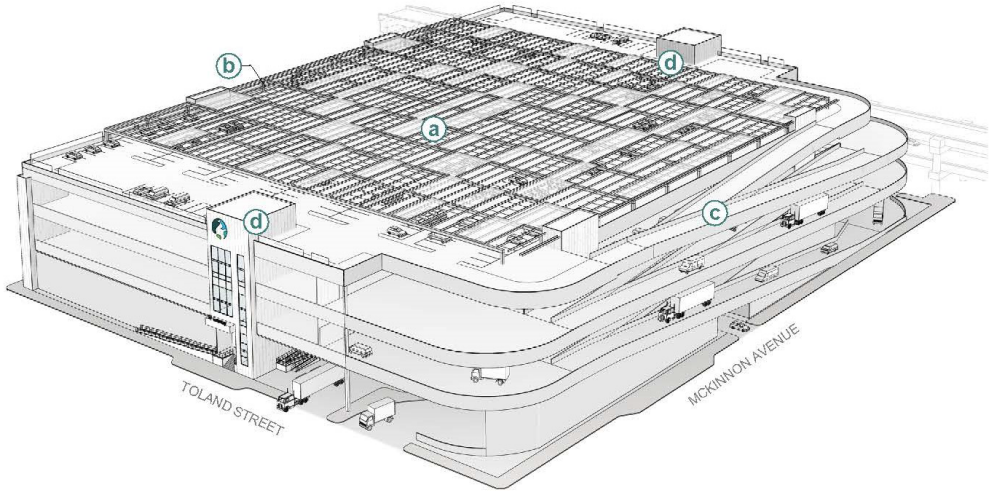
c Elevators & Stairs
Common circulation cores connect all levels.

d Logistics Yard
Provides space for flexible logistics support activities including fleet staging, storage and goods transfer.



Source: JLA, 2021

Figure 11 Proposed Project Roof Plan – Level 4 (Buildings A and B)



Source: JLA, 2021

Figure 12 Level 4 Roof Description (Buildings A and B)

This level features a screened, open air, multi-purpose deck that can be used for materials staging, vehicle staging for box trucks, vans, and personal vehicles. Additional screening is provided by a solar array. Ramps provide access to this level for vehicles as large as a 24' box truck.

a Vehicle Deck
Layout for staging box trucks and vans, and accessory automobile parking.

b Solar Array
Roof is screened by a solar array, which will generate electricity for vehicle charging.

c Ramps up to Roof
Scissor ramp provides one-way traffic access to and from roof.

d Elevators & Stairs
Provide common circulation to all levels.

Notes:
PDR = production, distribution, and repair

1. Total gross site area includes portions of the rights-of-way of the surrounding streets and Selby Street.
2. Fourth story consists of elevator and stair access structures which provide access to active roof.
3. Parking area includes 55,900 sf/building on the ground level and 243,800 sf/building on the roof level.
4. Bicycle parking: 100 *class I bicycle parking* spaces and 12 *class II bicycle parking* spaces. Class I bicycle parking spaces are spaces are in secure, weather-protected facilities intended for use as long-term, overnight, and workday bicycle storage by dwelling unit residents, nonresidential occupants, and employees. Class II bicycle parking spaces are bike racks in publicly accessible, highly visible locations and are intended for transient or short-term use by visitors, guests, and patrons to the building or use. Class II bike racks allow the bicycle frame and one wheel to be locked to the rack (with one U-shaped lock) and provide support to bicycles without damage to the wheels, frame, or components (planning code section 155.1).

No public open space is required or proposed for the project.
All numbers are rounded approximations.

Table 3 Preferred Project Use Mix

Uses below are a combination of areas in buildings A and B					
Uses	**Level 1**	**Level 2**	**Level 3**	**Roof**	**Project Total**

Retail	8,400	0	0	0	8,400
Total					**2,160,000**

Source: Prologis, Inc. 2019

1. Fleet management is not a component of the preferred project land use for the purpose of this environmental analysis. This is because the manufacturer and maker, parcel delivery and last mile, and the wholesale and storage uses would result in higher vehicle trip rates (and corresponding noise and air quality impacts associated with vehicle trips) compared to fleet management uses. However, should the project sponsor elect to have a fleet management component as part of the project in the future, the environmental analysis would have adequately evaluated the transportation (and related air quality and noise) impacts from this use.
2. Laboratory is not a component of the preferred project land use for the purpose of this environmental analysis. However, PDR-2 zoning districts do allow for specific laboratory uses.

PDR = production, distribution, and repair

Proposed Project Uses

The proposed project includes PDR (and other permitted uses in the PDR-2 zoning district) and retail uses as further described below.

Production, Distribution, and Repair Uses

Although tenants have not been selected yet, the project sponsor has identified four major types of PDR uses that could occur onsite under the proposed project:

1. manufacturing and maker space;
2. parcel delivery, including last-mile delivery;
3. wholesale and storage; and
4. fleet management.

The text below defines these uses and provides examples of each. Figure 13 (p. 21) presents a use matrix to further describe the proposed PDR and related uses for the proposed project. For all PDR uses, the building would be accessible to users 24 hours per day.

Manufacturing and Maker Space

This use is defined as a light industrial use that provides for the fabrication or production of goods, by hand or machinery, for distribution to retailers, wholesalers, or the public. Makers are often characterized by their production and custom activities that usually involve individual or special design, handiwork, and/or design-related innovation and experimentation. Examples of this light industrial use include food and beverage processing, apparel and other garment products, furniture and fixtures, printing (including three-dimensional printing), prototyping, and publishing. Manufacturing and maker space tenants would require approximately 2,000 to 20,000 square feet of space per occupant, depending on the needs and size of the company. Accessory retail may be associated with this use. Receiving and shipping vehicles for this use type can range from personal vehicles to pickup trucks/box trucks/vans/cutaway buses to semitrucks (74-foot maximum length). Primary working hours would vary by tenant. Heating, ventilation, and air conditioning (HVAC) and venting requirements would also vary by tenant and would be negotiated with the project sponsor before execution of any lease agreements, as discussed in the Project Sponsor's Tenant Screening Process section (p. 25). The operating hours when most activities occur would vary but would typically be from 4 a.m. to 6 p.m. and would ultimately depend on the tenant.

Parcel Delivery and Last-Mile Delivery

This use is defined as a nonretail automotive use limited to facilities for the unloading, sorting, and reloading of merchandise for deliveries. This use includes both staging of delivery trucks and vans, and the use of small-scale, personal-type vehicles for last-mile deliveries. Examples of regional delivery services include UPS, FedEx, and OnTrac. Last-mile delivery services include services such as Amazon Prime, Google Express, and Good Eggs. Parcel delivery and last-mile delivery tenants would require more space for their operations than maker and manufacturing tenants, at approximately 20,000 to 400,000-plus square feet per occupant. No accessory retail would be necessary for this use. Receiving and shipping vehicles for this use type can range from personal vehicles to pickup trucks/box trucks/vans/cutaway buses to semitrucks (74-foot maximum length). HVAC would be required only for accessory office space, active vehicle areas would be ventilated, and other specialized ventilation equipment would not be required. Primary operating hours would typically be from 4 a.m. to 6 p.m., but would ultimately depend on the tenant.

(Intentionally blank for 11x17 insert)

Wholesale and Storage

This use is characterized by activities that relate to providing goods or commodities for resale or business use and include both the storage and sales areas necessary for these types of businesses. The use also includes the storage (in an enclosed building) of goods without an associated wholesale or retail component. Examples include building material suppliers, food-related wholesale businesses, and import- or export-related storage. Wholesale and storage tenants would typically occupy a space of approximately 20,000 to 100,000 square feet per occupant. No accessory retail would be necessary for this use. This use typically requires a semitruck (74-foot-maximum length) for receiving materials and a pickup truck/box truck/van/cutaway bus for shipping goods. HVAC and venting requirements would vary by tenant and would be negotiated with the project sponsor before execution of any lease agreements, as discussed in the Project Sponsor's Tenant Screening Process section (p. 25). The operating hours would typically be from 12 a.m. to 6 p.m., but could vary by each tenant type.

Fleet Management

This use would allow private and public fleets to be staged and maintained. Uses would range from private retail vehicle staging, to private fleet staging and maintenance, to public fleet staging and maintenance. Private retailers would store and maintain vehicles to be sold or rented. The private vehicles would be mostly parked and the space would be used as storage; light maintenance and washing would be associated with this use. The tenant for this type of use would most likely be a vehicle dealership or vehicle rental agency, such as local retail car dealerships like U-Haul or Hertz. These tenants could require approximately 35,000 to 100,000 square feet per occupant and the spaces would typically hold 60 to 300 vehicles, depending on vehicle type and size. Operating hours when most activities occur would typically be from 5 a.m. to 12 a.m., but would ultimately depend on the occupant.

Private fleet staging and maintenance would involve storage and potential light maintenance of shuttles servicing specific institutions, businesses, and/or independent shuttle services. The tenant could include private company fleets; examples of this user type could include companies such as Google, Academy of Art University, Bauer, and the University of San Francisco or similar tenants. These tenants could require approximately 30,000 to 100,000 square feet per occupant to accommodate approximately 20 to 100 vehicles. No accessory retail would be necessary for this use. The operating hours when most activities occur would typically be from 5 a.m. to 10 p.m., but would ultimately depend on the occupant.

Public fleet staging and maintenance would include the storage and maintenance of buses, trolleys, and/or shuttles for a public transportation agency, such as the San Francisco Municipal Transportation Agency (SFMTA) or San Francisco Paratransit. These tenants would require approximately 400,000 to 1,200,000 square feet to accommodate 200 to 400 vehicles. No accessory retail would be necessary for this use. The operating hours when most activities occur would typically be from 5 a.m. to 12 a.m., but would ultimately depend on the occupant.

Non-PDR Uses

In addition to these PDR uses, other types of uses permitted in the PDR-2 zoning district, such as laboratory (non-life sciences) and retail may occur in the proposed project. These uses are described below.

Laboratory

Laboratory space that is suitable for scientific research (i.e., non-life science laboratory) would complement the manufacturing and maker space component by fostering an atmosphere conducive to innovation and experimentation. The proposed project could support laboratory uses focused on engineering, development, support, quality assurance, and quality control, which are principally permitted in the PDR-2 zoning district. The proposed project would not include chemical testing, or life sciences laboratory uses such as biological research or animal testing (which are not permitted in the PDR-2 zoning district). Laboratory tenants would require approximately 10,000 to 40,000 square feet of space per occupant, depending on the needs and size of the company. Receiving and shipping vehicles for this use type can range from pickup trucks/box trucks/vans/cutaway buses to semitrucks (74-foot maximum length). HVAC and venting would be required throughout the space and requirements would be negotiated with the project sponsor before execution of any lease agreements, as discussed in the Project Sponsor's Tenant Screening Process section (p. 25). Primary operating hours would typically be from 8 a.m. to 6 p.m., but would ultimately depend on the tenant.

Retail

The proposed project would include approximately 4,200 gross square feet of ground floor retail space in each PDR building, resulting in a total of 8,400 gross square feet. The retail space would provide amenities and services to the employees at the project site and potentially workers in the surrounding area. Retail uses would include amenities such as a cafe, convenience store, or sandwich shop. Loading operations for the retail space would occur in the parking area on the ground floor. Primary hours would vary by tenant but would likely be 7 a.m. to 7 p.m.

Peak Times of Daily Activity in the Proposed Project

An average of up to 1,980 employees would be onsite on a typical day. While different types of uses would have varying hours and peak periods, the combined uses by tenants in the buildings would result in two peak periods when the highest number of employees would be onsite at one time as compared to the rest of the day. These two peak periods would include the hours from 7 to 9 a.m. and from 4 to 6 p.m., with the evening peak being the highest.

Mechanical Equipment

The proposed project would require a variety of mechanical system components that would perform specific functions. These systems would be designed to comply with the San Francisco Building Code and Leadership in Energy and Environmental Design (LEED) requirements. Mechanical ventilation in the vehicle circulation area (including ramps) and logistics yard would be provided as necessary to augment the natural ventilation of these unenclosed areas. Mechanical and natural ventilation would be provided to ventilate all enclosed storage areas. Buildings A and B would provide a base level of mechanical systems for each tenant; the project sponsor would facilitate the installation of additional systems as required to support specific tenant-related activities agreed upon during the leasing process. Many tenants for which the project is being designed are anticipated to require minimal additional mechanical systems.

Buildings A and B would each have one generator to accommodate the life safety needs of building users. The maximum capacity of each generator would be 400 kilovolt-ampere. Two additional 200-kilovolt-ampere generators per building would be used to serve the needs of future tenants.

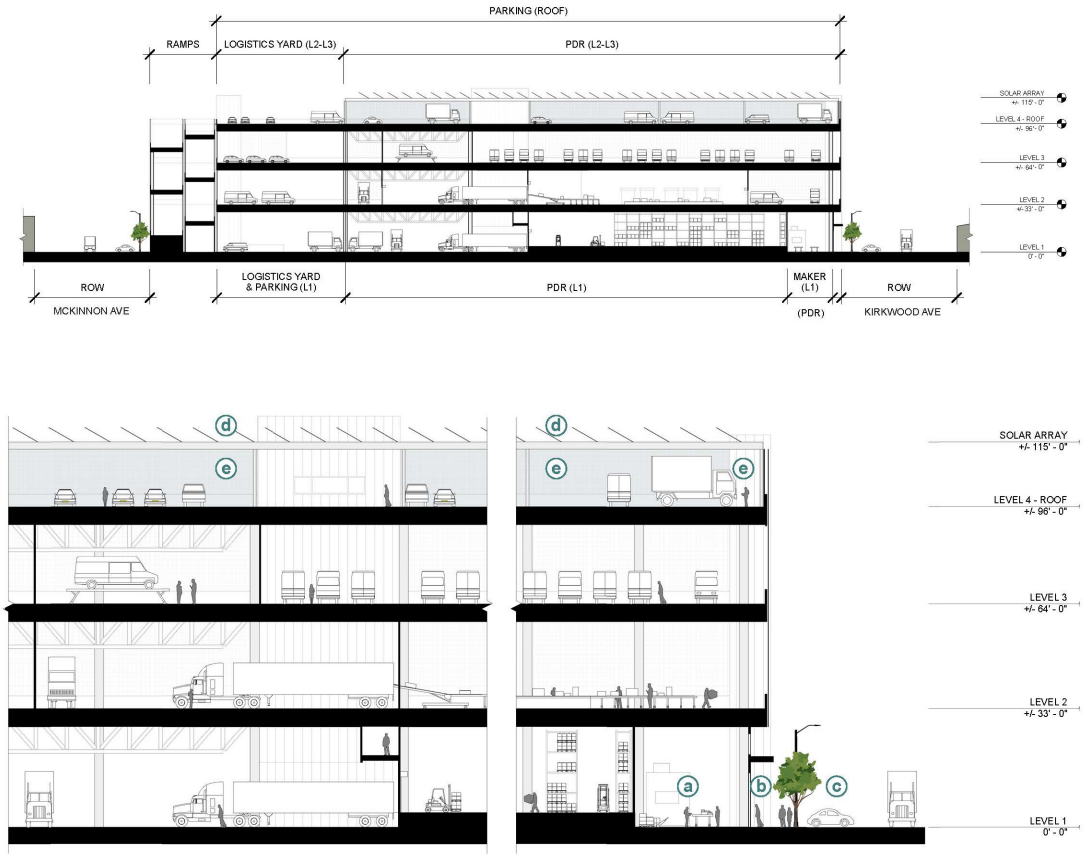
HVAC would be provided for accessory office space and/or tenant spaces with specific process requirements. The accessory office space is limited to one-third or less of the PDR space, per section 204.3 of the planning code. Because of their size, the HVAC systems would likely be located inside the space to be conditioned and on the rooftop. Alternatively, some of the potential tenants would have specific HVAC requirements for their operations. Additional HVAC equipment for potential PDR uses could include mechanical ventilation for production hoods used during food and beverage production; HVAC equipment for laboratory spaces; refrigeration systems to support goods requiring storage at specific temperatures; and ventilation systems related to the production and/or repair of specific goods (e.g., woodworking, upholstery, furniture repair). For a detailed description of how the project sponsor would address tenant needs, see the Project Sponsor's Tenant Screening Process section below (p. 25).

Key Operational Equipment

Many PDR uses depend on a variety of equipment associated with the movement of goods. Goods movement can occur either inside a specific user's space (e.g., between storage and fabrication areas) or within the PDR facility. Because of the size of many PDR facilities, these travel distances can be lengthy (over 500 feet) and can require connecting process-related space. Thus, much of the associated equipment is mechanized.

In addition to moving goods and supplies over long horizontal distances, many PDR businesses take advantage of cubic volume. This is accomplished using a combination of high-bay racking systems and the equipment necessary to lift goods to targeted heights. The specific high-bay racking system and the movement of equipment are based on the products being stored and moved on pallets or being palletized.[15]

Project Sponsor's Tenant Screening Process



The project sponsor would regularly screen potential tenants to confirm that the potential tenants would fit within the context of the specific building or facility. This screening process would focus on an operations review followed by a business and financial review. The operations review would include an executive interview to determine the expected use, number of employees, parking and vehicle requirements, key operations requirements, equipment, hours of operation, and safety records and plans, as well as permits anticipated to be required from local, state, or federal agencies for operations (e.g., the Bay Area Air Quality Management District [air district]). Next, the project sponsor would tour the applicant's current locations to assess operations, the condition of the space and improvements, cleanliness, and equipment used, and to identify issues related to noise, odor, hazardous materials, or other operational issues. The project sponsor would determine whether the user is occupying other facilities and how the applicant has performed in other buildings. Finally, the project sponsor would review the published reputation of the applicant company and its operations.

Section and Elevations

Sections and elevations are included on Figures 14 through 16 (pp. 26 through 28).

[15] To "palletize" means to place, stack, or transport (goods) on a pallet or pallets.

Proposed Parking, Loading, and Circulation

ON-STREET PARKING

The proposed streetscape improvements would provide 223 new striped parking spaces along the perimeter of the project site. The project would establish the following configurations for on-street parking:

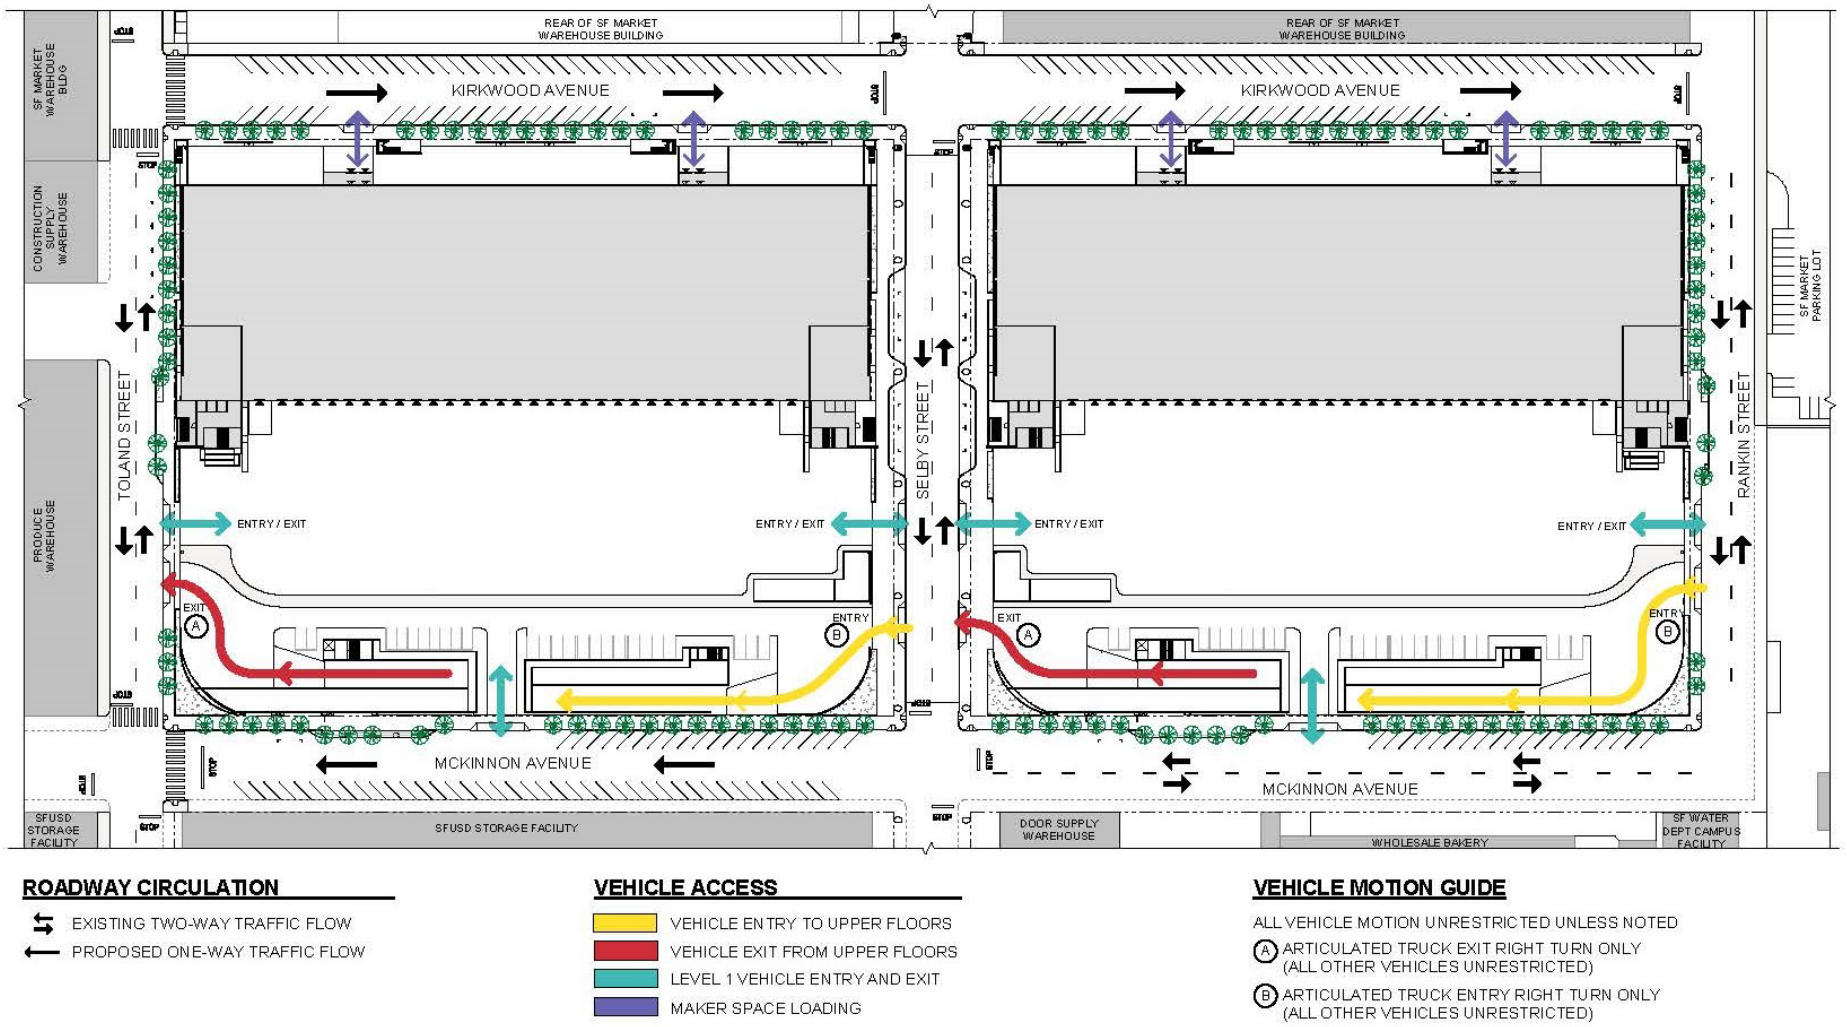
- Striped parallel parking spaces on the eastern side of Toland Street, the eastern and western sides of Selby Street, and western side of Rankin Street, and
- Striped back-in, 45 degree parking spaces on the northern and southern sides of Kirkwood and McKinnon avenues.

OFF-STREET PARKING AND LOADING

The proposed project would include approximately 599,400 gross square feet of parking. Seven new proposed curb cuts per building (14 total) along the project site's perimeter would allow ingress and egress to and from the buildings. Approximately 1,166 parking spaces for standard automobiles would be provided, and each building would include 36 loading dock doors at level 1 with additional tenant-specific loading on the upper levels.

PROPOSED BICYCLE PARKING

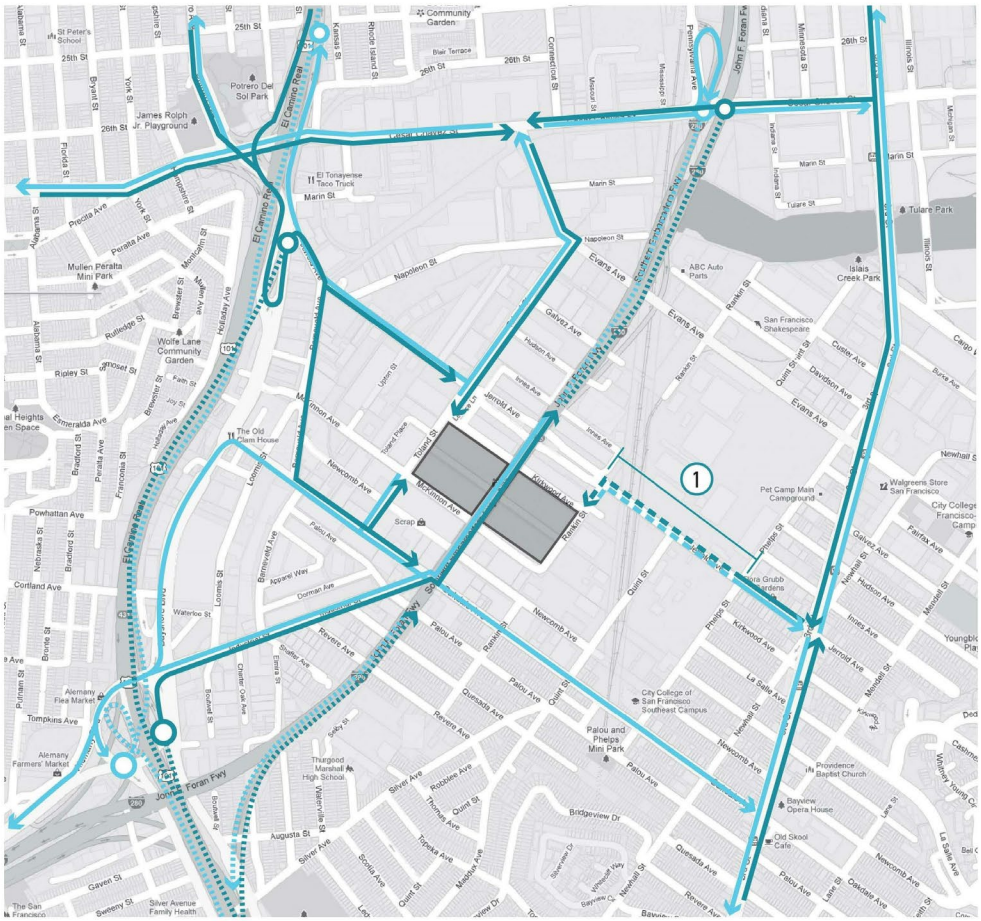
The proposed project would provide 112 bicycle parking spaces in total: 100 class I and 12 class II spaces. The 100 class I bicycle parking spaces would be provided at ground level in buildings A and B, adjacent to the corner lobbies and retail areas of each building. Each building would provide approximately 50 class I spaces. The 12 class II bicycle parking spaces would be provided along the edges of the project site at pedestrian access points and near the building entrances, outside the corner lobbies and retail areas.



PROPOSED VEHICULAR ACCESS AND CIRCULATION

Vehicular access to the project site and circulation around its perimeter would be altered from existing conditions. Existing access for vehicles, pedestrians, bicyclists and people on public transportation is shown in Figure 4 (p. 8). Figure 17 (p. 30) illustrates the proposed roadway modifications adjacent to the project site. Proposed vehicle access and circulation is shown in Figure 18 (p. 31).

The project proposes converting Kirkwood Avenue from a two-way street to a single-lane, eastbound, one-way street, and converting a portion of McKinnon Avenue (between Toland and Selby streets) from a two-way street to a single-lane, westbound, one-way street. As discussed below in Required Approvals (p. 40), modifications to the roadway directions and lane configurations on the streets surrounding the project site would require approval by the SFMTA. Large vehicles (such as tractor trailers) traveling to and from the upper levels of both buildings would be restricted to right turns only to enter and exit the buildings, resulting in a clockwise circulation pattern around both buildings.



To access building A, vehicles traveling to the ground level would have two points of entry and exit; one on Toland Street and one on Selby Street. There would be no restrictions for vehicles entering and exiting the ground level (i.e., vehicles using these points of entry and exit could turn left or right). Vehicles traveling to the upper floors (via ramps) of building A would enter the site from Selby Street and exit at Toland Street. Although large trucks would be restricted to right-turn entry and exit, all smaller vehicle turning would be unrestricted.

Figure 17 **Proposed Roadway Modifications Surrounding the Project Site**

Source: JLA, 2021

Figure 18 Proposed Vehicle Access and Circulation

1. Portion of Jerrold to be closed during PUC construction

Source: JLA, 2021

To access building B, vehicles traveling to the ground level would have two points of entry and exit; one on Rankin Street and one on Selby Street. There would be no turning restrictions for vehicles entering and exiting the ground level. Vehicles traveling to the upper floors (via ramps) of building B would enter the site from Rankin Street and exit at Selby Street. Although large trucks would be restricted to right-turn entry and exit, all smaller vehicle turning would be unrestricted.

PEDESTRIAN ACCESS AND CIRCULATION

Pedestrian access to and from the project site would be primarily along Toland and Rankin streets. Secondary points of pedestrian access would be provided along Selby Street (Figure 17, p. 30).

Pedestrians walking around the project site would use the new sidewalks and specific pedestrian-designated walkways. The project proposes continuous sidewalks on all immediately adjacent street frontages (including Selby Street) to promote pedestrian access around the exterior of the site. New sidewalks are proposed on the eastern side of Toland Street, the southern side of Kirkwood Avenue, the western side of Rankin Street, the northern side of McKinnon Avenue, and along both sides of Selby Street.

Pedestrians would enter building A from adjacent streets through one of two ground-level lobbies: one on Toland Street and a second point of entry on Selby Street, both at mid-block. These lobbies would provide access to passenger elevators and stairs that would provide access to all parking and PDR levels of building A.

Pedestrian circulation at building B would be similar to pedestrian circulation at building A, except that the entry points to the main lobbies would differ. The pedestrian lobbies would be located mid-block along Rankin Street and a secondary point of entry mid-block on Selby Street.

Transportation Demand Management Plan

Pursuant to planning code section 169, the project sponsor is required to submit a transportation demand management (TDM) plan application to the San Francisco Planning Department (planning department). The project sponsor expects to meet the TDM target points by implementing a combination of the following TDM measures:

- **Bicycle Parking (TDM Measure ACTIVE-2):** Bicycle parking would be provided for PDR and retail uses. The number of spaces provided for PDR and retail uses would comply with the planning code.
- **Showers and Lockers (TDM Measure ACTIVE-3):** Showers and clothes lockers would be provided with class I bicycle parking spaces. The number of showers and clothes lockers would meet planning code requirements.
- **Car-Share Parking (TDM Measure CSHARE-1):** Car-share spaces would be provided in buildings A and B in accordance with the planning code.

Streetscape Improvements and Wind Mitigation Measures

The proposed project would be required to comply with the city's Better Streets Plan (planning code, section 138.1).[16] Thus, a streetscape plan would be submitted to the planning department. On-street parking would also be provided in accordance with the Better Streets Plan; proposed on-street parking would be comprised of reverse-angle and parallel parking stalls.

[16] San Francisco Planning Department, *San Francisco Better Streets Plan* (2010), *http://www.sf-planning.org/ftp/BetterStreets/proposals.htm#Final_Plan* (also available in hard copy at the San Francisco Public Library), accessed February 10, 2018.

Pursuant to the Better Streets Plan, the proposed project would provide streetscape improvements to the streets immediately adjacent to the project site (Figure 19, p. 34). The project area is classified as an industrial street type under this plan and would require new sidewalks, street trees, stormwater control measures, and accessible curb ramps. There are currently no sidewalks adjacent to the project site. Pursuant to public works code section 806(d), the proposed project would be required to provide 216 street trees along the project's 4,300 linear feet of street frontages or to pay the appropriate in-lieu fees. Due to project and site constraints (e.g., curb cuts, I-280 overpass, line-of-sight restrictions, and location of site utilities), the project sponsor would plant approximately 124 street trees and pay the corresponding in-lieu fee for the remaining required trees that cannot be accommodated onsite.[17] These 124 street trees would be consistent with the Better Streets Plan and subject to the review and approval by the department of public works, Bureau of Urban Forestry. The nine street trees on the eastern sidewalk of Toland Street along the northern half of the building (from the building A entrance to Kirkwood Street) would serve as wind mitigation measures; they would be approximately 25-foot-tall evergreen street trees with a 15-foot diameter canopy.[18]

The streetscape improvements to Toland Street would involve constructing a new 10-foot-wide sidewalk with street trees. An approximately 6-foot-wide, mid-block *bulb-out*[19] with planters and street trees would be constructed along the main pedestrian entrance. This portion of the sidewalk would be 16 feet wide. The project would provide an improved vehicular travel lane and up to four on-street parallel parking spaces on the eastern side of Toland Street. In addition, two approximately 34-foot-wide driveways would be added along Toland Street to provide vehicular access onto the site. This portion of Toland Street would be resurfaced.

Along Kirkwood Avenue, a new 12-foot-wide sidewalk would be constructed, and street trees would be installed adjacent to the project site. Each building would provide two 24-foot wide curb cuts to access the PDR and/or maker space loading areas. A curb and gutter system would be installed on the northern side of Kirkwood Avenue. The full width of Kirkwood Avenue along the project limits would be resurfaced.

Along Rankin Street, new 10-foot-wide sidewalks with street trees would be installed. An approximately 6-foot-wide, mid-block bulb-out with planters and street trees would be constructed along the main pedestrian entrance. This portion of sidewalk would be 16 feet wide. The project would provide a vehicular travel lane and up to five striped parallel, on-street parking spaces on the western side of Rankin Street. In addition, two approximately 34-foot-wide driveways would be added along Rankin Street to provide site access. This portion of Rankin Street would be resurfaced.

Along McKinnon Avenue, a new 12-foot-wide sidewalk would be constructed, and street trees would be installed adjacent to the project site. Two approximately 6-foot-wide mid-block bulb-outs with planters and street trees would be installed adjacent to each building's retail space. These two portions of the sidewalk would be 18 feet wide. Each building would provide a 40-foot-wide curb cut to provide site access. A 16-foot-wide travel lane would be provided and the portions of McKinnon Avenue that extend from the centerline of the right-of-way and the site. This portion of McKinnon Avenue would be resurfaced.

Sustainability

The proposed project has been designed to be sustainable and resilient by providing flexible PDR space that could accommodate an evolving mix of users and serve the changing needs in the city for a 100-year period or longer. Additionally, the project would seek LEED Gold certification or higher. Buildings A and B would be designed to contain sustainability features such as a rooftop screen containing a solar array. This array would be sized to meet the San Francisco Better Roof Ordinance requirements and would generate electricity that could be used to offset the electrical use of the building and/or the electric vehicles housed and/or visiting the site. In addition, all docking stations are being designed to support electric plug-in of trucks to reduce idling time during loading and unloading of trucks serving future land uses onsite, thereby further minimizing onsite idling and resultant fuel use. Additional features to achieve LEED Gold certification would include the use of sustainable building materials, water- and energy-efficient mechanisms in the building design, bicycle facilities to encourage alternate modes of transportation, and indoor air quality measures to ensure tenant safety.

Foundation and Excavation

The proposed project's foundation design is expected to be concrete spread footings and/or grade beams on improved and engineered soil, with excavation for the foundations likely to extend 10 feet below existing grade. Typical foundation excavation is expected to extend to 7 feet below grade, with elevator pits and utility trenching extending to 10 feet below existing grade.

Ground improvements, such as stone columns, drill displacement columns,[20] *geopiers*,[21] soil-cement mixing, or other similar methods, would provide vertical support through the existing soils to strengthen the undocumented fill that underlies the project site. Using drill rigs, approximately 7,000 vibratory replacement stone columns or drill displacement columns would be extended 25 feet deep and approximately 900 auger cast piles would be extended 60 feet deep to support the buildings onsite. The proposed project would not require pile-driving activities. Approximately 140,600 cubic yards of soil would be excavated for the proposed project.[22] Of this total, approximately 42,600 cubic yards would be improved and reused, and the remaining 98,000 cubic yards would be exported offsite. Ground improvements, such as extended piles, stone columns drill displacement columns, geopiers, soil-cement mixing, or other similar methods, would provide vertical support through the existing soils to strengthen the undocumented fill that underlies the project site. The proposed project would import approximately 2,000 cubic yards of soil to the site. At least four underground storage tanks were historically present on the project site along Selby Street and one additional underground storage tank may have been present near the site's easternmost corner.[23] Although the number of underground storage tanks present onsite is not known, the project sponsor would coordinate with the San Francisco Department of Public Health and comply with all permit requirements under the city's Hazardous Materials and Waste Program, which may result in the need for soil excavation and remediation activities. The total soil excavation volume (140,600 cubic yards) and the total volume of exported soil offsite (98,000 cubic yards) included in the estimates above would account for potential excavation, export, and remediation activities.

---

20 Drill displacement columns (or controlled low-strength material columns) are formed in displaced soil cavities and displace liquefiable and compressible soil with cemented controlled low-strength material. Controlled low-strength material column ground improvement can mitigate liquefaction and settlement of heavy foundations and slabs. Controlled low-strength material columns are ideal for sensitive project sites such as those near critical structures that require low noise and no vibration construction methods.

21 "Geopier" is an engineering term used to refer to stiff rock columns drilled deep into the earth's surface, down to a hard nonyielding depth. They are used to support a building foundation and reinforce the soil when the existing ground is unstable, wet or unsuitable for building construction.

22 The proposed project would entail excavation of 140,600 cubic yards of soil. This total includes 134,000 cubic yards of soil onsite and 6,600 cubic yards of soil for street improvements.

23 Phase I and phase II ESAs, pp. v and 3.

Because of the presence of shallow groundwater 3 to 6 feet below ground surface, temporary dewatering and shoring of utility trenches is anticipated to be required in some areas of the site.[24]

Construction Schedule and Phasing

This section describes the construction activities for the proposed project. Construction is anticipated to occur over a total of approximately 31 months. The construction of each building would take approximately 27 months; however, the start of construction for building A would be approximately four months before the start of construction for building B, resulting in a total construction duration of approximately 31 months. As described in Table 4, construction would include demolition and site preparation, grading and ground improvements, building construction, building envelope and interior buildout, sitework, and startup and commissioning.[25] Construction work would typically occur five to six workdays per week for eight hours per day. Nighttime construction activities are anticipated to occur during specific phases of building construction—specifically, the building envelope and interior buildout phase, and the sitework phase. Nighttime construction activities, as defined by article 29 of the San Francisco Department of Public Health, are construction activities occurring between 8 p.m. and 7 a.m. The project sponsor would be required to obtain a permit from the San Francisco Public Works or the Department of Building Inspection (building department) to extend construction activities beyond the allowable construction hours (7 a.m. to 8 p.m.). The total number of temporary/short-term workers during the approximate 31-month duration of construction is anticipated to range from approximately 2,500 to 3,000.

Table 4 Construction Phasing

Construction Phase	Duration (weeks)
Demolition and Site Preparation	8
Grading and Ground Improvements	16
Building Construction	61
Building Envelope and Interior Buildout	60
Sitework	25
Startup and Commissioning	7
Total	**31 months[1]**

Note:

[1] Construction duration would total 31 months, which would include several months of overlapping phases, primarily during Building Construction, Building Envelope and Interior Buildout, and Site Work. In addition, the start of construction for building A would be approximately 4 months before the start of construction for building B.

On June 7, 2021, the project sponsor submitted a priority processing application under Planning Director's Bulletin No. 2, committing the project to use the lowest diesel emitting off-road equipment (Tier 4 interim or final) for the duration of construction.[26,27] On June 15, 2021, the planning department approved this application.[28]

---

[24] Cornerstone Earth Group, *Preliminary Geotechnical Investigation, LaSalle Industrial Park, San Francisco*, April 22, 2015 (hereinafter referred to as "geotechnical investigation").

[25] In the final stages of construction, the project would undergo commissioning of building systems to ensure that they are complete and functioning properly as designed. In addition to the standard building commissioning, LEED components would undergo fundamental commissioning and verification.

[26] Prologis, *Application for Priority Application Processing for Director's Bulletin No. 2,* June 7, 2021.

[27] Prologis, *Priority Application Processing for Clean Construction Projects, Supplemental Application for Type 3 Priority Projects for Director's Bulletin No. 2,* June 7, 2021.

[28] San Francisco Planning Department, *Signed Application for Priority Application Processing for Director's Bulletin No. 2,* June 15, 2021.

Approximately 400 to 500 workers are expected to travel to the site daily at any given time during peak construction periods. Carpooling and use of public transportation would be encouraged. It is anticipated that construction parking would be located onsite, on Selby Street which would be temporarily closed during construction, and on surrounding city streets.

Construction access for truck haul routes are indicated on Figure 20 (p. 38). A traffic control plan established by the construction contractor would be necessary during construction to complete the streetscape improvements in the public right-of-way along with other features. Additionally, use of the right-of-way may be necessary during demolition; soil off-hauling; deliveries of steel, precast concrete, and concrete; and other construction phases.

Expanded Streetscape Variant

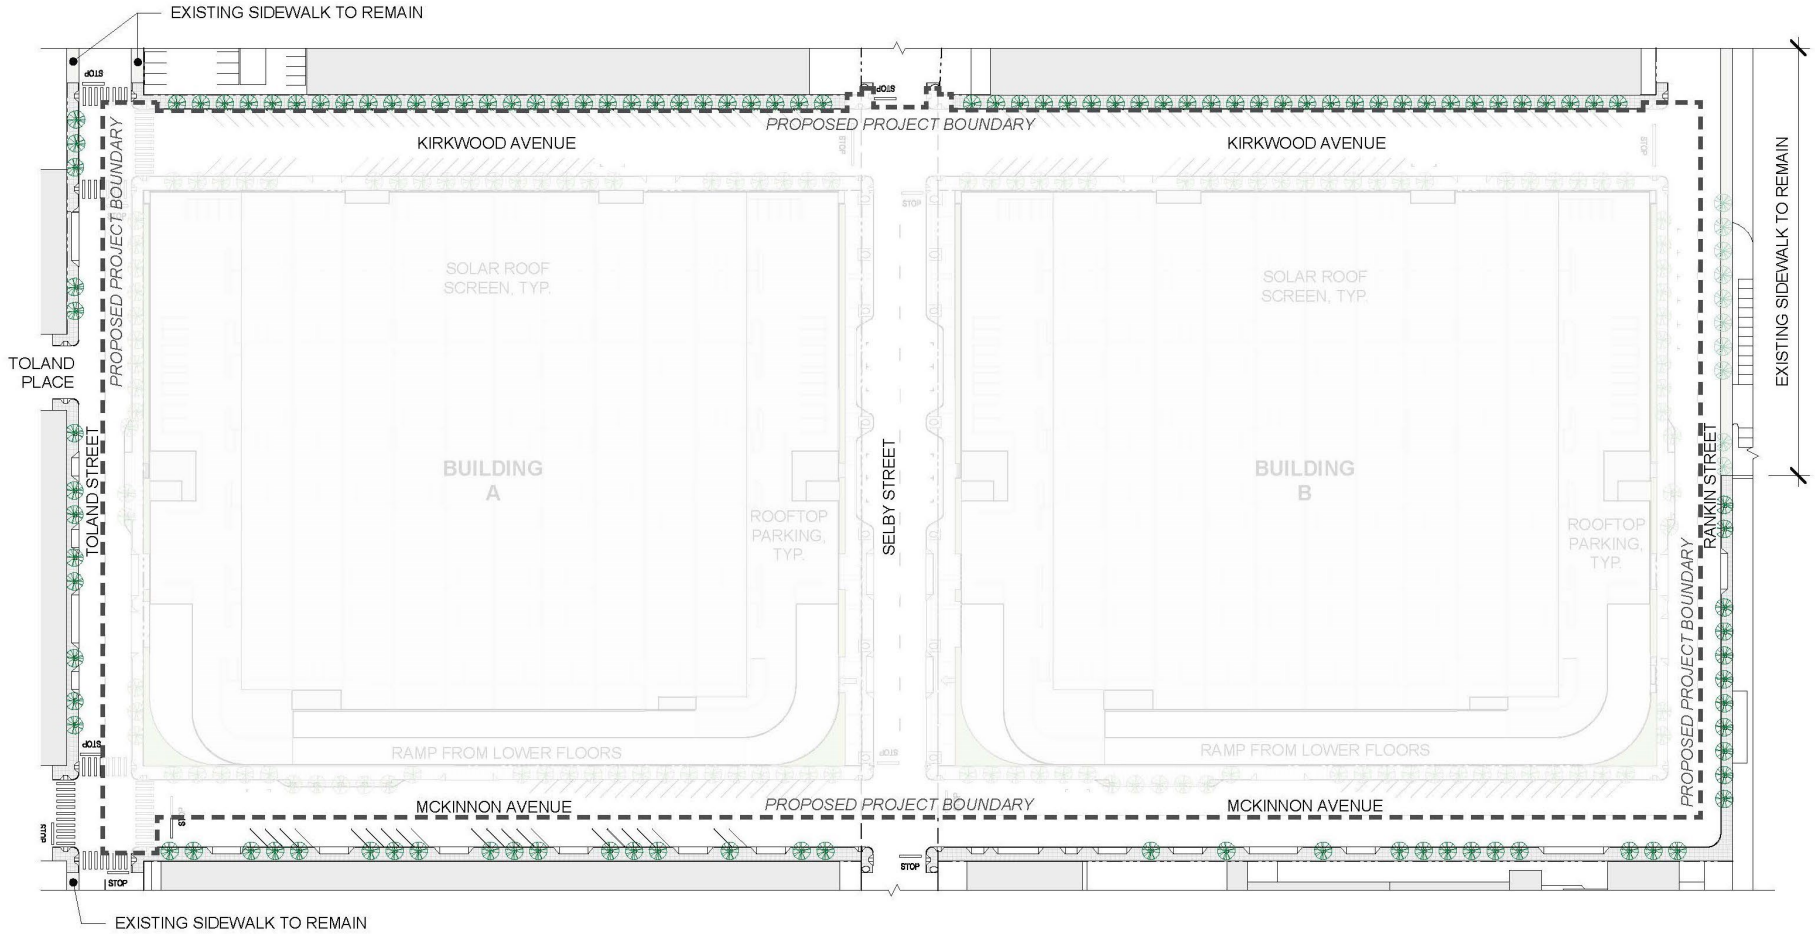
An expanded streetscape variant is analyzed in this environmental review (Figure 21, p. 39). The expanded streetscape variant comprises the same land uses and site plan as the proposed project but would improve the remainder of adjacent public rights-of-way to Better Streets standards. The variant would include improvements from the center line of each adjacent street outward to the property line of the adjacent lots. These improvements would include new roadways, curb cuts, sidewalks, street trees, and other amenities. These improvements are studied to provide environmental clearance in the event the improvements are carried out by the project sponsor or other parties in the future.

Along Toland Street, between Kirkwood Avenue and McKinnon Avenue, the variant would include resurfacing the southbound side of the street. It would include extending the existing 10-foot sidewalk and planting approximately 13 street trees from the Kirkwood intersection to the McKinnon intersection. New curb ramps would be provided at both sides of the Toland Place intersection. Curb ramps and crosswalks would be provided at the southern and western sides of the Toland and McKinnon intersection. Five curb cuts of varying widths (24 to 40 feet) would be provided to maintain existing building access points.

Along Kirkwood Avenue, the variant would include building a 12-foot sidewalk, installing a curb and gutter, and planting approximately 55 street trees on the northern side of the street.

Along Rankin Street, the northbound side of the street would be resurfaced. A 10-foot sidewalk with approximately 11 street trees and curb and gutter would connect the existing sidewalk at 901 Rankin Street to McKinnon Avenue. One 30-foot-wide curb cut would be added to maintain existing access to the 1900 Newcomb Avenue site.

Along McKinnon Avenue, between Selby and Toland streets, the variant would include resurfacing the southern side of the street, installing a new curb and gutter, providing approximately 16 back-in diagonal parking spaces, and building a 12-foot sidewalk with approximately 17 street trees. Six 24-foot-wide curb cuts would be added to maintain existing access to properties on the southern side of McKinnon Avenue. Curb ramps would be included on the southwestern and southeastern corners of the intersection with Selby Street. On McKinnon Avenue, between Selby and Rankin streets, the variant would include resurfacing the southern side of the street, installing a new curb and gutter, and building a 12-foot sidewalk with approximately 12 street trees. Eight curb cuts of varying widths (10 to 50 feet) would be added to maintain existing access to properties on the southern side of McKinnon Avenue.



The maximum depth of ground disturbance associated with the streetscape improvements would be no more than 3 feet. Less than 100,000 square feet of surface area would be disturbed as part of the variant.

Source: AECOM 2019

Figure 21 Expanded Streetscape Variant

Source: JLA 2022

Required Approvals

Certification of the final environmental impact report (EIR) by the San Francisco Planning Commission (planning commission), which would be appealable to the San Francisco Board of Supervisors (board of supervisors), is required before any discretionary approvals or permits can be issued for the proposed project. The following is a preliminary list of anticipated approvals for the proposed project. The list would apply to the proposed project and the expanded streetscape variant and is subject to change.

Actions by the San Francisco Planning Commission

- Recommendation to the board of supervisors to approve the planning code and zoning map amendments for height district reclassification and to adopt a new special use district
- Approval of a Planned Unit Development-Conditional Use Authorization in accordance with planning code sections 303 and 304 to permit a large-scale development on a site larger than one-half acre
- Recommendation to the board of supervisors to approve a development agreement
- Adoption of findings under the California Environmental Quality Act (CEQA)
- Approval of a TDM plan (planning code section 169)
- Recommendation to the board of supervisors to adopt amendments to the San Francisco General Plan (general plan) (if determined to be required)

Actions by the San Francisco Board of Supervisors

- Approval of planning code and zoning map amendments for height district reclassification and to adopt a new special use district
- Approval of the development agreement

Actions by Other City Departments

- *San Francisco Planning Department and San Francisco Department of Building Inspection* – Approval of the site permit and addenda thereto
- *Department of Building Inspection* – Approval of demolition, grading, and building permits for the demolition of the existing buildings, and construction of the new building and night noise permit for work performed outside the normal 7 a.m. to 8 p.m. construction hours
- *San Francisco Department of Public Works* – Approval of street tree application, approval of temporary use permits during construction and permanent streetscape improvements, a permit to plant street trees and a partial waiver from Public Works Code section 806(d) to provide 92 fewer street trees than required, and night noise permit for work performed outside the normal 7 a.m. to 8 p.m. construction hours

- *San Francisco Municipal Transportation Agency* – Approval of temporary use permits during construction, permanent curb modifications, and modifications to the roadway directions and lane configurations on the streets surrounding the project site

- *San Francisco Department of the Environment* – Approval of a Demolition Debris Recovery Plan

- *San Francisco Public Utilities Commission* – Approval of any changes to sewer laterals; approval of a modified Stormwater Control Plan; approval of an erosion sediment control plan before the start of construction, compliance with postconstruction stormwater design guidelines, including a stormwater control plan, new curb and gutter system, cistern design, and groundwater dewatering wells per San Francisco Health Code article 12B (joint approval with the San Francisco Department of Public Health)

- *San Francisco Department of Public Health* – If applicable, approval of a hazardous materials release plan and inventory program pursuant to San Francisco Health Code articles 21 and 21A; approval of a dust control plan pursuant to San Francisco Building Code section 106 and San Francisco Health Code article 22B; approval of a site mitigation plan and soil mitigation plan in compliance with San Francisco Health Code article 22A (the Maher Ordinance), development and implementation of the article 29 guidelines, and review and approval of groundwater dewatering wells (joint approval with the SFPUC)

Actions by Other Agencies

- *Bay Area Air Quality Management District* – Issuance of permits for the installation and operation of emergency generators, and certification to the building department that all asbestos-containing building materials have been removed and properly disposed in accordance with the law before demolition of the existing buildings; additionally, approval of permits for installation, operation, and testing of individual air pollution sources associated with tenant-specific activities would be required on a case-by-case basis

- *Caltrans* – Coordination, review, and issuance of a Caltrans standard encroachment permit

B. PROJECT SETTING

EXISTING SETTING

The project site is bounded by Kirkwood Avenue to the north, Rankin Street to the east, McKinnon Avenue to the south, and Toland Street to the west. The project site is in the Bayview neighborhood and falls within the area covered by the Bayview Hunters Point Area Plan in the general plan. Because of the area's industrial use and specific transportation-related features, the surrounding street network is made up of relatively large blocks and many discontinuous streets with unregulated parking. Surrounding transportation features that shape access to the project site include the Caltrain right-of-way and associated berm and track; the two-level, elevated portion of the I-280 Caltrans right-of-way; and a number of discontinuous and/or uniquely configured surrounding streets. Evans and Jerrold avenues (north of the project site) and Oakdale Avenue (south of the project site) are the only east-west streets that cross the Caltrain tracks in the project area. This condition limits the east-west connectivity of Kirkwood and McKinnon avenues and encourages the flow of traffic from the project site westward onto Toland Street.

The project site is rectangular and is currently occupied by four single-story, 448,000-gross-square-foot PDR buildings. The project site and vicinity are relatively flat. View corridors are limited to streets, from which the most prominent features are the elevated segment of I-280 (approximately 55 feet in height) that bisects the project site and the hills west of U.S. 101 (Bernal Heights), east of Third Street, and south of Palou Avenue. The project vicinity is currently developed with commercial and industrial uses and features a number of large warehouse-type structures, along with some smaller, nonresidential buildings. Structures are one to three stories tall; are usually set close to the sidewalk or offset by paved parking areas, with little or no landscaping; and are constructed with steel frames and metal siding, a style similar to the existing buildings on the project site. The larger warehouse-type structures are generally windowless.

Two warehouses of the SF Market, each approximately 30 feet tall, are immediately adjacent to the project site on the northern side of Kirkwood Avenue to the east and west of Selby Street. Along the eastern side of Rankin Street, there are operations yards associated with the San Francisco Water Department and additional facilities of the SF Market. McKinnon Avenue, east of Selby Street, contains a variety of warehouse buildings that range in height from 20 feet to 30 feet. A warehouse building, with similar design to the buildings currently at the project site, is on McKinnon Avenue, west of Selby Street. There are two approximately 20- to 25-foot-tall warehouse buildings with multiple tenants along the western side of Toland Street, adjacent to Toland Place. North of these warehouses is a 35-foot-tall building occupied by the SF Market.

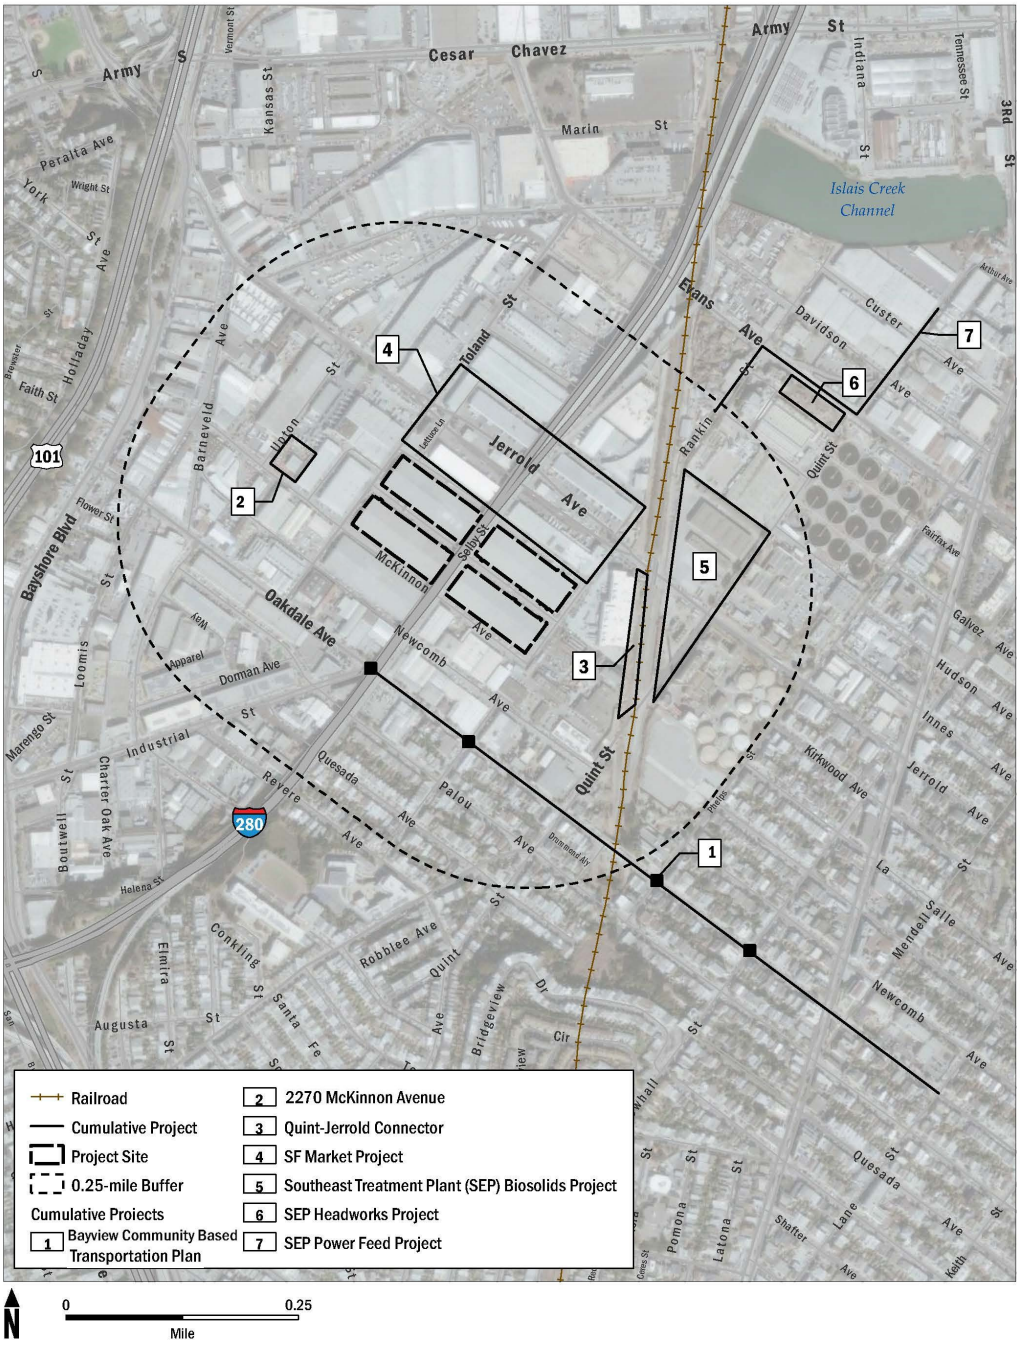
As part of their daily operations, PDR activities in these areas may produce noise, vibration, odor, and other emissions. Existing traffic from I-280 is a dominant noise source in the project vicinity. In general, the immediate vicinity of the project site is very noisy. New housing, large office developments, large-scale retail, and the heaviest industrial uses, such as incinerators, are not permitted in the PDR-2 district in which the site is located. Commercial and industrial uses are to the east toward the inlet for Islais Creek and San Francisco Bay. Residential uses primarily are to the north, west, and south of the PDR-2 use district where the proposed project would be located. The nearest residential use is approximately 450 feet southeast of the project site. There are no schools within 0.25 mile of the site.

The project site is currently served by the Third Street Muni light rail line and four bus lines. Transit stops in the project vicinity include stops for Muni bus lines 23-Monterey, 24-Divisadero, and 9-San Bruno, and San Mateo County Transit District bus line 292. The 23-Monterey Muni line operates immediately adjacent to the project

site,[29] with the closest stop at the corner of Toland Street and McKinnon Avenue, and the other bus lines operate within approximately four blocks of the site. The Third Street light rail line is approximately 0.4 mile east of the project site; the closest stops are Kirkwood/La Salle (0.6 mile southeast), Hudson/Innes (0.5 mile east), and Oakdale/Palou (0.7 mile southeast). The closest BART station is the 24th Street Mission station, approximately 1.5 miles to the northwest; the Glen Park BART station is approximately 2.5 miles to the southwest. The 22nd Street Caltrain Station is approximately 1.5 miles to the northeast.

CUMULATIVE SETTING

Cumulative projects within an approximately 0.25-mile radius of the project site are discussed below and mapped in Figure 22 (p. 44). As of publication of this initial study, each project is undergoing environmental review with the planning department.



1. **Bayview Community Based Transportation Plan:** This is a community-driven planning effort funded through a Caltrans Sustainable Planning Grant. The SFMTA drafted this five-year investment plan for transportation infrastructure; the SFMTA Board of Directors approved it in February 2020. The Bayview Community Based Transportation Plan seeks to improve physical mobility in the Bayview community by focusing on solutions based on the needs of existing residents and businesses in the neighborhood. Through this community plan, the SFMTA proposes to implement a series of quick-build projects that improve pedestrian visibility and comfort at crossings and reduce vehicle speeds. Typical quick-build improvements include road diets (i.e., removing one or more travel lanes), paint, traffic delineators and street signs, parking and load adjustments, traffic signal timing, and transit boarding islands. As of publication of this initial study, Innes Avenue, Oakdale Avenue, and Phelps Street are locations proposed for quick-build improvements; however, only those on Oakdale Avenue are within the approximately 0.25-mile radius of the project site.

2. **2270 McKinnon Avenue (Planning Department Case No. 2021-001639ENV):** The project would demolish the existing accessory building to construct an approximately 119,900-square-foot building containing 111,100 square feet of self-storage use. The new building would be four stories and approximately 40 feet in height.

3. **Quint-Jerrold Connector (Planning Department Case No. 2013-0858E):** The proposed Quint-Jerrold Connector Road project would link Quint Street just north of Oakdale Avenue to Jerrold Avenue via a new road along the western side of the Caltrain tracks. This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue, which is now blocked by a Caltrain berm. The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound. In addition, the project would construct or install several other elements along or beneath the length of the new roadway. Along the western side of the new roadway, the project would construct a new 5.5-foot-wide to 20-foot-wide sidewalk, depending on location; construct a new 27-foot-wide curb cut along the SF Market property; and install street trees and street lighting. Along the eastern side of the new roadway, the project would construct a new 6.5-foot-tall reinforced concrete retaining wall. A new intersection would be constructed at Jerrold Avenue that would allow for turns in all directions, accommodate trucks, and integrate with the SF Market's planned street reconfiguration. New sewer and water pipelines would be installed beneath the new roadway to provide onsite drainage and overall system reliability. The new road could also support a potential new Caltrain station at Oakdale Avenue.

[29] As part of the Palou Avenue Streetscape Improvement Project, the 23-Monterey Muni line was rerouted three blocks south, off Jerrold Avenue and onto Palou Avenue. Construction of this project was completed in spring 2020.

Figure 22 Cumulative Projects near Project Site (0.25 Mile)

AECOM

San Francisco Gateway Project

4. **2270 McKinnon Avenue (Planning Department Case No. 2021-001639ENV):** The project would demolish the existing accessory building to construct an approximately 119,900-square-foot building containing 111,100 square feet of self-storage use. The new building would be four stories and approximately 40 feet in height.

5. **Quint-Jerrold Connector (Planning Department Case No. 2013-0858E):** The proposed Quint-Jerrold Connector Road project would link Quint Street just north of Oakdale Avenue to Jerrold Avenue via a new road along the western side of the Caltrain tracks. This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue, which is now blocked by a Caltrain berm. The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound. In addition, the project would construct or install several other elements along or beneath the length of the new roadway. Along the western side of the new roadway, the project would construct a new 5.5-foot-wide to 20-foot-wide sidewalk, depending on location; construct a new 27-foot-wide curb cut along the SF Market property; and install street trees and street lighting. Along the eastern side of the new roadway, the project would construct a new 6.5-foot-tall reinforced concrete retaining wall. A new intersection would be constructed at Jerrold Avenue that would allow for turns in all directions, accommodate trucks, and integrate with the SF Market's planned street reconfiguration. New sewer and water pipelines would be installed beneath the new roadway to provide onsite drainage and overall system reliability. The new road could also support a potential new Caltrain station at Oakdale Avenue.

6. **SF Market Project (Planning Department Case No. 2009.1153E):** The proposed project is a phased development plan to expand the existing SF Market on its current site and would reconfigure the roadways around the project site to improve site access and safety. This would entail redirecting Jerrold Avenue through-traffic around the Main Site onto Innes Avenue. The project would be constructed in various phases over an approximate 20-year period. The site is split into three subareas: the Main Site, the 901 Rankin Street site to the east, and the 2101 Jerrold Avenue site to the west. The maximum development scenario would demolish 12 of the 13 buildings currently on the site and construct four new warehouse structures on the Main Site and one new warehouse structure on the 901 Rankin Street site. No alterations are proposed at the 2101 Jerrold Avenue site. All warehouses would have accessory office space. The 901 Rankin Street site has been constructed and consists of PDR space and accessory office space. Of the four future warehouse structures to be built on the Main Site, two would have rooftop parking. In addition, a small (approximately 4,000-square-foot) Operations Center would be constructed on the Main Site. There would be a total of 440 parking spaces and 186 loading spaces.

San Francisco Public Utilities Commission Sewer System Improvement Projects in the Southeast Treatment Plant within approximately 0.25 mile of the Proposed Project:

7. **San Francisco Public Utilities Commission Southeast Treatment Plant Biosolids Digester Facility Project (Planning Department Case No. 2015-00644ENV):** The SFPUC Southeast Treatment Plant Biosolids Digester Facility Project would replace and relocate the solids treatment facilities with more efficient, modern technologies and facilities designed to produce Class A biosolids. Demolition activities began in fall 2019, and construction is anticipated through May 2026. Project construction will require a five-year closure of two blocks of Jerrold Avenue, starting at the Caltrain right-of-way and up to the Southeast Treatment Plant entrance west of Phelps Street. It is possible that this project will continue to

be under construction at the time the proposed project commences construction; therefore, this project is included as part of the proposed project's cumulative construction analysis.

8. **San Francisco Public Utilities Commission Southeast Treatment Plant Headworks Project (Planning Department Case No. 2015-006224ENV):** The SFPUC Southeast Treatment Plant Headworks Project is part of the Sewer System Improvement Program (SSIP), a 20-year citywide program to upgrade aging sewer infrastructure projects to ensure a reliable and seismically safe system. The project is on the northwestern portion of the Southeast Treatment Plant at the location of the existing headworks facility, near the intersection of Rankin Street with Evans Avenue. The project would construct a new headworks facility, modify the Bruce Flynn Pump Station, and construct a new odor control structure. The project would demolish the existing headworks facility and would construct a new 250 million gallon per day (mgd), all-weather headworks wastewater treatment facility in its place. Construction began in 2018 and is scheduled for completion in September 2023, with substantial completion in August 2023. Construction staging would be located in the Southeast Plant, in parking and travel lanes of Evans Street (two travel lanes would be maintained), in a lot adjacent to the Bruce Flynn Pump Station, on Southeast Plant property along Phelps Street, and potentially offsite at the Pier 94 Backlands, Pier 94, and/or Pier 96. It is possible that this project will continue to be under construction at the time the proposed project commences construction; therefore, this project is included as part of the proposed project's cumulative construction analysis.

9. **San Francisco Public Utilities Commission Southeast Treatment Plant Power Feed Project (Planning Department Case No. 2017-015855ENV):** The SFPUC Southeast Treatment Plant Power Feed Facility Project would upgrade the existing Southeast Treatment Plant electrical infrastructure from 9 to 12 megavolt-amperes. The proposed electrical building is at the Southeast Treatment Plant, at the corner of Evans Avenue and Phelps Street. The objective of the project is to increase reliability, redundancy, and capacity of the electrical system at Southeast Treatment Plant by upgrading the existing 12-kilovolt primary feed from Hunters Point switchyard and obtaining a new 12-kilovolt feed from Potrero switchyard to provide redundancy for Southeast Treatment Plant facilities. Project work consists of constructing a new two-story building over the existing switching station to house the new primary switchgear. In addition, aging substations would be replaced, and new power monitoring and control system would be installed for additional reliability and efficiency.

In addition, routine infrastructure repair, maintenance, and improvement projects (e.g., roadway repaving, water main replacements, and sewer upgrades) are ongoing throughout the city under existing conditions. It is anticipated that such projects will continue to be implemented through the construction of the proposed project or expanded streetscape variant.

C. COMPATIBILITY WITH EXISTING ZONING AND PLANS

	Applicable	*Not Applicable*
Discuss any variances, special authorizations, or changes proposed to the Planning Code or Zoning Map, if applicable.	☒	☐
Discuss any conflicts with any adopted plans and goals of the City or Region, if applicable.	☒	☐
Discuss any approvals and/or permits from City departments other than the Planning Department or the Department of Building Inspection, or from Regional, State, or Federal Agencies.	☒	☐

REQUIRED PROJECT APPROVALS

Required variances, special authorizations, and changes to the planning code or zoning map; approvals from city agencies (other than the planning department or building department); and approvals from regional, state, or federal agencies (if applicable) are discussed in Section A, Project Description, pp. 37 and 39 through 40.

CONFLICTS WITH ADOPTED PLANS AND POLICIES

This section discusses potential inconsistencies of the proposed project and expanded streetscape variant with applicable local plans and policies, as well as conflicts with regional policies (if applicable). Inconsistencies with existing plans and policies do not, in and of themselves, indicate a significant physical environmental effect within the meaning of CEQA. To the extent that adverse physical environmental impacts may result from such inconsistencies, these impacts are analyzed in this initial study under the specific environmental topic sections in Section E, Evaluation of Environmental Effects.

The proposed project would intensify land uses on an urban infill site, and to the extent that there are conflicts between the proposed project and applicable plans, policies, and regulations, those conflicts would be considered by city decision makers when they decide whether to approve, modify, or disapprove the proposed project. Similarly, the expanded streetscape variant would include additional improvements to local streets, sidewalks, parking, and landscaping, beyond the streetscape improvements of the proposed project. These changes would be similar to the streetscape improvements included as part of the proposed project. The staff reports and approval motions prepared for the decision makers as part of the entitlements approval process would include a comprehensive project analysis and findings regarding the consistency of the proposed project and the variant, if carried out by the project sponsor, with applicable plans and policies, independent of the environmental review process.

San Francisco General Plan

The general plan provides general policies and objectives to guide land use decisions. The general plan contains ten elements (Commerce and Industry, Recreation and Open Space, Housing, Community

Facilities, Urban Design, Environmental Protection, Transportation, Air Quality, Community Safety, and Arts) that set forth goals, objectives, and policies for the physical development of the city.

The general plan Urban Design Element, which guides the physical character and order of the city, addresses both new development and preservation of the landforms, views, and development patterns that define the city's character. This element aims to enhance and conserve the city's positive attributes and improve the living environment by protecting public views of open space and water bodies, and enhancing the aesthetic character of San Francisco.

The Urban Design Element, particularly Policies 3.5 and 3.6,[30,31] include general guidance on building heights and bulk. These policies focus on respecting the natural topography, tapering heights toward San Francisco Bay, and protecting views from major streets. Although the proposed project building height would exceed the existing 65-foot height limits of the site's height and bulk district and would be taller than the surrounding development pattern, it would not conflict with the Urban Design Element guidance allowing for taller buildings along I-280. The height would not substantially detract from views of the hills or open space in the neighborhood, because it would be viewed with the elevated I-280, and because views of the hills (to the west) and San Francisco Bay (to the east) are narrow, channelized views along the major streets. The street grid in the project vicinity is not continuous, so distant views to the hills and San Francisco Bay are blocked by intervening buildings. Policy 3.6 aims to relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction. The intent of this policy is not to limit the total floor space that could be built, but provide guidelines to avoid negative external effects such as encouraging efforts to articulate and soften building surfaces to reduce the appearance of large new buildings. The PDR-2-zoned buildings to the north, west, and south of the project site also consist of large, rectangular buildings with large floor plates.

The planning department, planning commission, board of supervisors, and other city decision makers would evaluate the proposed project and expanded streetscape variant for conformance with all objectives and policies of the general plan and would consider potential inconsistencies as part of the decision-making process. The consideration of general plan objectives and policies is carried out independent of the environmental review process, as part of the decision to approve, modify, or disapprove a proposed project.

San Francisco Planning Code

The planning code, which incorporates the San Francisco zoning maps, governs permitted uses, densities, and configuration of buildings in San Francisco. Permits to construct new buildings (or to alter or demolish existing ones) may not be issued unless the proposed project or expanded streetscape variant either conforms to the planning code or is granted an exception pursuant to provisions of the planning code.

Because the project proposes building heights greater than the 65-foot height allowed in the applicable 65-J height and bulk district (i.e., up to 97 feet, excluding exempted appurtenances), planning code amendments for height district reclassification and associated zoning map amendments would be required to permit the proposed project and expanded streetscape variant. Additionally, because the project site is greater than one-half acre in size, a Planned Unit Development-Conditional Use Authorization would be sought for

[30] San Francisco General Plan Urban Design Element, Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development.

[31] San Francisco General Plan Urban Design Element, Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction.

exceptions to the planning code. If the proposed changes to the planning code and zoning map and the Planned Unit Development-Conditional Use Authorization are approved, the proposed project and expanded streetscape variant would not conflict with the planning code.

Special Use District

The zoning changes and height and bulk district changes would be implemented through the creation of a special use district that would establish zoning controls for the project site. If the proposed special use district is approved, the proposed project and expanded streetscape variant would not conflict with applicable zoning regulations of the planning code.

The Accountable Planning Initiative

In November 1986, the voters of San Francisco approved Proposition M, the Accountable Planning Initiative, which added section 101.1 to the planning code to establish the following eight priority policies:

1. Preservation and enhancement of neighborhood-serving retail uses;
2. Protection of neighborhood character;
3. Preservation and enhancement of affordable housing (see Section E.3, Population and Housing, topic 3 (b), with regard to housing supply and displacement issues);
4. Discouragement of commuter automobiles (see Section E.5, Transportation and Circulation, topic 5 (a));
5. Protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership;
6. Maximization of earthquake preparedness (see Section E.15, Geology and Soils, topics 14 (a) through 14 (d));
7. Landmark and historic building preservation (see Section E.4, Cultural Resources, topic 4 (a)); and
8. Protection of open space (see Section E.10, Shadow, topic 10 (a); and Section E.11, Recreation, topics 11 (a) and 11 (b)).

Prior to issuing a permit for any project that requires an initial study under CEQA; issuing a permit for any demolition, conversion, or change of use; and taking any action that requires a finding of consistency with the general plan, the city is required to find that the proposed project or legislation would be consistent with the priority policies. As indicated above, the compatibility of the proposed project and expanded streetscape variant with general plan objectives and policies that do not relate to physical environmental issues would be considered by city decision makers as part of their decision whether to approve or disapprove the proposed project and expanded streetscape variant. Any potential inconsistencies identified as part of that process would not alter the physical environmental effects of the proposed project.

Bayview Hunters Point Area Plan

The project is in the Bayview Hunters Point Area Plan and in the Oakinba Activity Node. Activity nodes are “community-identified catalyst areas in which to focus public investment.” The Bayview Hunters Point Area Plan calls for maintaining industrial zones for PDR activities in the Oakinba subdistrict to strengthen the role of the Bayview’s industrial sector in the economy of the district, the city, and the region. The PDR nature of the proposed project and expanded streetscape variant are consistent with the objectives of the Bayview Hunters Point Area Plan and would not result in any inconsistencies with the Bayview Hunters Point Area Plan.

Bayview Hunters Point Redevelopment Plan

The project is in the Oakinba Activity Node of the Bayview Hunters Point Redevelopment Plan. The Bayview Hunters Point Redevelopment Plan provides the implementation tools to carry out many of the goals of the 2000 Bayview Hunters Point Community Revitalization Concept Plan. The Bayview Hunters Point Redevelopment Plan identifies the planning goals and objectives for the Bayview Hunters Point area and identifies more specific guiding policies for redevelopment and revitalization activity in the Oakinba Activity Node, including creating a vibrant commercial center, maintaining and expanding industry in the area to increase the job base, and developing employment opportunities for local residents. The proposed project and expanded streetscape variant would not result in any inconsistencies with the plan.

Other Plans and Policies

In addition to local plans and policies, there are several regional planning agencies whose environmental, land use, and transportation plans and policies consider the growth and development of the nine-county San Francisco Bay Area. Some of these plans and policies are advisory, and some include specific goals and provisions that must be adhered to when evaluating a project under CEQA. The regional plans and policies that are relevant to the proposed project and expanded streetscape variant are discussed below:

- The Association of Bay Area Governments/Metropolitan Transportation Commission Plan Bay Area 2050 is a state-mandated integrated long-range transportation and land use plan, establishing targeted growth areas and housing allocations, identifying priority transportation improvements, and setting forth directions and initiatives to reduce greenhouse emissions.

- The air district's 2017 Clean Air Plan – Spare the Air, Cool the Climate is a regional plan to protect public health and climate by reducing air pollution and greenhouse gas emissions and creating a vision for a year 2050 post-carbon economy.

- The San Francisco Regional Water Quality Control Board San Francisco Basin Plan is a state-mandated regional water quality control planning document that identifies beneficial uses for the region's water bodies and standards to achieve or maintain those beneficial uses.

The proposed project and expanded streetscape variant have been reviewed considering these regional plans and policies, and the proposed project and expanded streetscape variant would not obviously or substantially conflict with Plan Bay Area 2050 or the San Francisco Basin Plan. The air quality section in the EIR will evaluate whether the proposed project or the expanded streetscape variant would conflict with or obstruct implementation of the Clean Air Plan.

D. SUMMARY OF ENVIRONMENTAL EFFECTS

The proposed project and the expanded streetscape variant could potentially affect the environmental topics(s) checked below. The following pages present a more detailed checklist and discussion of each environmental topic.

- ☐ Land Use/Planning
- ☐ Population and Housing
- ☒ Cultural Resources
- ☒ Tribal Cultural Resources
- ☒ Transportation and Circulation
- ☒ Noise
- ☒ Air Quality
- ☐ Greenhouse Gas Emissions
- ☒ Wind
- ☐ Shadow
- ☐ Recreation
- ☐ Utilities/Service Systems
- ☐ Public Services
- ☐ Biological Resources
- ☒ Geology/Soils
- ☐ Hydrology/Water Quality
- ☐ Hazards and Hazardous Materials
- ☐ Mineral Resources
- ☐ Energy
- ☐ Agriculture and Forestry Resources
- ☐ Wildfire
- ☐ Mandatory Findings of Significance

APPROACH TO ANALYSIS

This initial study examines the proposed project and expanded streetscape variant to identify potential effects on the environment. For each item on the initial study checklist, the evaluation considered the impacts of the proposed project and expanded streetscape variant, both individually and cumulatively, with the exception of greenhouse gas emissions, which are evaluated only in the cumulative context. All items on the initial study checklist that have been checked "less-than-significant impact with mitigation incorporated," "less-than-significant impact," "no impact," or "not applicable" indicate that, upon evaluation, the planning department has determined that the proposed project and expanded streetscape variant could not have a significant adverse environmental effect related to that topic. A discussion is included for those topics checked "less-than-significant impact with mitigation incorporated" and "less-than-significant impact," as well as most items checked "no impact" or "not applicable." For items designated "no impact" or "not applicable," the conclusions regarding potential significant environmental effects are based on field observations, staff and consultant experience and expertise from similar projects, and/or standard reference materials available at the planning department. Such materials include the Transportation Impact Analysis Guidelines for Environmental Review; the California Natural Diversity Database; and maps published by the California Department of Fish and Wildlife, the California Division of Mines and Geology (e.g., Mineral Resource Zone maps and designations), and the California Department of Conservation's Farmland Mapping and Monitoring Program. Impacts identified as "potentially significant" are analyzed in the EIR or were evaluated in this initial study and found to be significant, but mitigation measures identified in this initial study and agreed to by the project sponsor would reduce those impacts to less-than-significant levels. The "potentially significant" designation used to identify topics that will be addressed in detail in the EIR does not reflect a determination that the proposed project or expanded streetscape variant would result in a significant impact related to a particular topic. Such topics are included in the EIR because additional analysis is needed to determine the potential effect with respect to that environmental topic.

The project setting sections of the initial study and technical studies reflect conditions at the project site when the environmental evaluation process began in 2017. As of August 2020, the project sponsor submitted

building permit applications for an interim use on the project site.[32] The environmental analysis of the initial study and technical sections analyze the changes that result from the construction and operation of the proposed project and the expanded streetscape variant, compared to the uses at the project site prior to the operation of the interim use, resulting in a more conservative analysis.[33]

Effects Found to Be Potentially Significant

On the basis of this initial study, topics for which there are project-specific effects that have been determined to be potentially significant are:

- Transportation and circulation
- Noise (all topics except aviation-related topics)
- Air quality

These environmental topics will be evaluated in the EIR prepared for the proposed project and expanded streetscape variant.

Effects Found Not to Be Significant or Not to Be Significant with Identified Mitigation Measures

The following potential individual and cumulative environmental effects would be less than significant or reduced to a less-than-significant level through implementation of identified mitigation measures included in this initial study and agreed to by the project sponsor:

- Land use and land use planning
- Population and housing
- Cultural resources
- Tribal cultural resources
- Greenhouse gas emissions
- Wind
- Shadow
- Recreation
- Utilities and service systems
- Public services
- Biological resources
- Geology and soils
- Hydrology and water quality
- Hazards and hazardous materials
- Mineral resources
- Energy
- Agriculture and forestry resources
- Wildfire

---

[32] San Francisco Building Department (DBI) Permit #202008272769 (Building 417 shell) and San Francisco Building Department #202008272770 (Building 418 shell)

[33] Analyzing the change in the environment from the uses that occupied the site in 2017 to the proposed use is considered conservative, or worst-case, because the interim use is more intensive than the 2017 uses.

These items, along with appropriate mitigation measures, are discussed in Section E of this initial study and therefore require no further environmental analysis in the EIR. As indicated above, all identified mitigation measures listed in Section F, Mitigation Measures, have been agreed to by the project sponsor and would be incorporated into the proposed project and expanded streetscape variant as conditions of project approval.

CEQA SECTION 21099(B)(1) (SENATE BILL 743)

CEQA section 21099(b)(1) requires the Office of Planning and Research (OPR) to develop revisions to the CEQA Guidelines and establish criteria for determining the significance of the transportation impacts of projects that "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." CEQA section 21099(b)(2) states that, upon certification of the revised guidelines for determining transportation impacts, pursuant to section 21099(b)(1), automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment under CEQA.

In January 2016, OPR published for public review and comment its *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA,*[34] recommending that the transportation impacts of projects be measured using a vehicle-miles-traveled (VMT) metric. On March 3, 2016, based on compelling evidence in that document and the planning department's independent review of literature on level of service and VMT, the planning commission adopted OPR's recommendation to use the VMT metric instead of automobile delay in evaluating the transportation impacts of projects (resolution 19579). In December 2018, OPR released its *Technical Advisory on Evaluating Transportation Impacts in CEQA,*[35] finalizing these recommendations. Also, in December 2018, the Natural Resources Agency finalized updates to the CEQA Guidelines that replaced level of service with VMT as a transportation threshold in the Appendix. In December 2018, the Natural Resources Agency certified and adopted the CEQA Guidelines update package, including the Guidelines section implementing Senate Bill 743 (CEQA Guidelines section 15064.3). Use of a VMT metric for evaluating the transportation impacts of a project is consistent with planning commission resolution 19579, adopted March 3, 2016, replacing level of service with VMT when evaluating the effects of a project on the transportation system. Accordingly, the EIR will not contain a discussion of automobile delay impacts based on level of service criteria; instead, a VMT and induced automobile travel impact analysis will be provided in the EIR.

Aesthetics and Parking Analysis

California Public Resources Code section 21099(d), effective January 1, 2014, provides that "aesthetics and parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, aesthetics and parking are not considered in determining whether a project has the potential to result in significant environmental effects for projects that meet all of the following three criteria:

1. The project is in a transit priority area
2. The project is on an infill site

---

[34] Governor's Office of Planning and Research (OPR), Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA, *https://opr.ca.gov/docs/Revised_VMT_CEQA_Guidelines_Proposal_January_20_2016.pdf,* accessed December 22, 2021.

[35] Governor's Office of Planning and Research (OPR), Technical Advisory on Evaluating Transportation Impacts in CEQA, *https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf,* accessed December 22, 2021.

3. The project is residential, mixed-use residential, or an employment center

The proposed project and expanded streetscape variant meet each of the above three criteria because they (1) are within one-half mile of a major transit stop along the Third Street light rail line and several Muni bus lines,[36] (2) are on a developed site in an urban area and surrounded by urban development along the project site's boundaries, and (3) meet the definition of an employment center because they are on a property zoned for commercial use with a floor area ratio of no less than 0.75 and are in a transit priority area. Because the proposed project and expanded streetscape variant meet each of the above three criteria,[37] the initial study and the EIR do not consider aesthetics and the adequacy of parking in determining the significance of project impacts under CEQA. No aesthetics section is included; however, for informational purposes, the project description includes a three-dimensional rendering of the project in relation to its surroundings (Figure 6, p. 11), and elevations depicting the project (Figures 15 and 16, pp. 27 and 28). Additionally, parking will be addressed in the EIR only for purposes of analyzing whether the project or variant would result in a substantial parking deficit, the secondary effects of which would create potentially hazardous conditions, interfere with accessibility, or substantially delay public transit.

CUMULATIVE IMPACT ANALYSIS

Two approaches to a cumulative impact analysis are provided in CEQA Guidelines section 15130(b)(1): (a) the analysis can be based on a list of past, present, and reasonably foreseeable future projects producing closely related impacts that could combine with those of a proposed project; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The analyses in this initial study employ both a list-based approach and projections from the general plan or other related planning documents, as appropriate for the specific environmental topic being analyzed.

The following factors were used to determine an appropriate level for cumulative analysis in this initial study:

- *Similar Environmental Impacts*. A relevant project contributes to effects on resources that are also affected by the proposed project or expanded streetscape variant. A relevant future project is defined as one that is "reasonably foreseeable," such as a proposed project for which an application has been filed with the approving agency or funding has been approved.

- *Geographic Scope and Location*. A relevant project is located in the geographic area within which effects could combine. The geographic scope varies on a resource-by-resource basis. For example, because wind impacts are generally localized, the cumulative context for wind analysis is the project site and vicinity within about 1,500 feet of the project site. In contrast, the geographic scope for evaluating cumulative effects on regional air quality consists of the affected air basin (i.e., the San Francisco Bay Area Air Basin).

[36] San Francisco Planning Department, San Francisco Transportation Information Map, *https://sfplanninggis.org/TIM/*, accessed December 19, 2018.

[37] San Francisco Planning Department, Eligibility Checklist: CEQA section 21099 – Modernization of Transportation Analysis, San Francisco Gateway Project, December 19, 2018.

- *Timing and Duration of Implementation*. Effects associated with activities for a relevant project (e.g., short-term construction or demolition or long-term operations) would most likely coincide with the related effects of the proposed project or expanded streetscape variant.

The cumulative projects within approximately 0.25 mile of the project site are identified in Section B, Project Setting, Cumulative Setting, pp. 43 through 46. However, additional projects more than 0.25 mile from the project site may also be considered in the cumulative analysis, as appropriate, for the environmental topic being analyzed.

E. EVALUATION OF ENVIRONMENTAL EFFECTS

E.1. Land Use and Planning

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Physically divide an established community?	☐	☐	☒	☐	☐
b) Cause a significant physical environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐	☐

Impact LU-1: The proposed project or variant would not physically divide an established community. (Less than Significant)

PROPOSED PROJECT

The division of an established community would typically involve the construction of a physical barrier to neighborhood access (such as a new freeway segment) or the removal of a means of access (such as a bridge or roadway). The proposed project would demolish four existing buildings and construct two multi-story PDR buildings within the existing lot configuration. The proposed project would not create a barrier or obstruction (such as a new freeway segment) that would physically divide the community or Bayview neighborhood. The proposed project would be developed within already-established city blocks and would not permanently close any streets or sidewalks. The project sponsor proposes converting Kirkwood Avenue from a two-way street to a single-lane, eastbound, one-way street, and converting a portion of McKinnon Avenue (between Toland and Selby streets) from a two-way street to a single-lane, westbound, one-way street. As discussed above in Section A, Project Description, modifications to the roadway directions and lane configurations on the streets surrounding the project site would require approval by the SFMTA. If approved, these proposed changes would change the circulation directly adjacent to the project site; they would not, however, create a barrier or obstruction or close either street, modifications that could physically divide the community. Selby Street would be temporarily closed during construction for equipment staging and construction worker parking. This street would reopen upon completion of construction and would not permanently impede the passage of persons or vehicles through the Bayview neighborhood. For these reasons, the proposed project would have a less-than-significant impact with respect to physically dividing the surrounding community, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensity, and site plan as the proposed project, but would extend streetscape improvements for the entire cross section of the streets along the project perimeter to Better Streets standards. Because these changes would not alter the proposed land uses, their intensities, or layout, or introduce new physical barriers that could alter local circulation or

access, the expanded streetscape variant would have land use impacts similar to those of the proposed project. No mitigation measures would be required. This topic will not be addressed in the EIR.

Impact LU-2: The proposed project or variant would not cause a significant physical environmental due to a conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

PROPOSED PROJECT

Land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect are those that directly address physical environmental issues and/or contain targets or standards that must be met to preserve or improve characteristics of San Francisco's physical environment. Applicable land use plans that regulate development on the project site include the general plan and the planning code. As discussed in Section C, Compatibility with Existing Zoning and Plans, the proposed project would not conform to the existing 65-J height and bulk district, and the project sponsor seeks amendments to the planning code and zoning map to allow taller buildings than permitted under the existing zoning district. Additionally, the project sponsor would apply for a Planned Unit Development-Conditional Use Authorization due to the size of the proposed project. If the proposed changes to the planning code and the Planned Unit Development-Conditional Use Authorization are approved, the proposed project would not conflict with the planning code. The proposed uses, however, are consistent with and allowed under the PDR-2 zoning district. Therefore, with the proposed planning code and zoning map amendments discussed in the project approvals section above, the proposed project would not conflict with relevant planning code regulations.

Conflicts with existing plans and policies do not, in themselves, indicate a significant environmental effect related to the topic of Land Use and Land Use Planning. A significant impact would occur only if the project substantially conflicts with a land use plan/policy that was adopted for the purpose of avoiding or mitigating an environmental effect and would result in a substantial adverse physical change in the environment. The proposed project would adhere to applicable environmental regulations and therefore would not conflict with land use policies or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

Therefore, the proposed project would have a less-than-significant impact with regard to conflicts with existing land use plans, policies, or regulations adopted for the purpose or avoiding or mitigating an environmental effect, and no mitigation measures would be required. The physical environmental impacts from implementation of the proposed project, including the project's proposed building heights, are analyzed in each of the environmental topic sections in this initial study and in the EIR. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have land use impacts similar to those of the proposed project, which were less than significant with regard to conflicts with existing land use plans, policies, or regulations adopted for the purpose or avoiding or mitigating an environmental effect, and no mitigation measures would be required. The physical environmental impacts from implementation of the expanded

streetscape variant, including the proposed building heights (which would be the same as the proposed project), are analyzed in each of the environmental topic sections in this initial study and in the EIR. This topic will not be addressed in the EIR.

Impact C-LU-1: The proposed project or variant, in combination with cumulative projects, would result in less-than-significant cumulative land use impacts. (Less than Significant)

PROPOSED PROJECT

Section B, Cumulative Setting, p. 43, identifies cumulative projects that are within an approximately 0.25-mile radius of the project site. These projects are also shown on Figure 22 (p. 44).

With the exception of the project at 2270 McKinnon Avenue, the identified cumulative projects in the project vicinity are either pedestrian enhancement projects, or infrastructure improvement or replacement projects. The Bayview Community Based Transportation Plan would make the surrounding area more accessible for pedestrians in the Bayview neighborhood. The Quint-Jerrold Connector project would improve neighborhood connectivity and provide pedestrian safety features by connecting Quint Street to Jerrold Avenue adjacent to the Caltrain tracks. The cumulative projects in the Southeast Treatment Plant site (SFPUC Southeast Treatment Plant Biosolids Digester Facilities, SFPUC Southeast Treatment Plant Power Feed, and SFPUC Southeast Treatment Plant Headworks Project) would upgrade aging sewer infrastructure. These SFPUC projects are within the treatment plant boundaries and are largely in-kind replacements and/or interior system or infrastructure improvements. The 2270 McKinnon Avenue project would demolish the existing accessory building onsite and redevelop the site with a larger building that would contain self-storage units. All development for this project would be contained on the existing parcel and would not physically divide an established community.

Upon completion, the proposed project would operate in the existing parcels and would not physically divide an established community; therefore, it would have no potential to combine with cumulative projects to result in a significant physical environmental impact related to dividing an established community.

All projects must conform with the planning code, including its zoning maps, and are required to be generally consistent with general plan. Therefore, the proposed project in combination with cumulative projects would not result in a significant cumulative impact related to a conflict with a land use plan, policy, or regulations adopted for the purpose of mitigating an environmental impact. Conflicts with existing land use plans and policies are policy issues and do not, in themselves, give rise to a significant physical impact related to land use under CEQA. Therefore, the conflicts with plans and policies, considered with those of cumulative projects, could not combine to result in a significant cumulative impact related to land use. To the extent that the proposed project results in physical environmental effects that could combine with those of cumulative projects, the cumulative impact on the environment is addressed under each topic section in this initial study, or will be addressed in the EIR.

For these reasons, the proposed project would not combine with cumulative projects to result in cumulative land use impacts, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets

standards. Therefore, the expanded streetscape variant would have land use impacts similar to those of the proposed project. Upon completion, the expanded streetscape variant would operate in the existing parcels and adjacent streets and sidewalks and would not physically divide an established community; therefore, it would have no potential to combine with cumulative projects to result in a significant physical environmental impact related to dividing an established community. Additionally, conflicts with existing land use plans and policies are policy issues and do not, in themselves, give rise to a significant physical impact related to land use under CEQA. Therefore, the conflicts with plans and policies, considered with those of cumulative projects, could not combine to result in a significant cumulative impact related to land use.

For these reasons, the expanded streetscape variant would not combine with cumulative projects to result in cumulative land use impacts, and no mitigation measures would be required. This topic will not be addressed in the EIR.

E.2. Population and Housing

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐	☐
b) Displace substantial numbers of existing people or housing units, necessitating the construction of replacement housing?	☐	☐	☐	☐	☒

Existing uses on the project site in 2017 consisted of automotive storage, fleet management, general storage, food-related storage, temporary storage, and vacant spaces. Because there are no residences on the project site, the proposed project or the expanded streetscape variant would not displace substantial numbers of existing people or housing that would necessitate the construction of replacement housing elsewhere. Therefore, topic 2 (b) is not applicable to the proposed project or the expanded streetscape variant and is not discussed below.

Impact PH-1: The proposed project or variant would not directly or indirectly induce substantial unplanned population growth. ***(Less than Significant)***

PROPOSED PROJECT

Population growth is considered in the context of local and regional plans and their population, housing, and employment projections. Substantial unplanned population growth is considered an increase in population that occurs without consideration of or planning for infrastructure, services, and housing needs to support new residents, employees, and visitors. Generally, a project that increases population is not viewed as having a significant impact on the environment unless the physical changes that would be needed to accommodate the project-related population growth would have adverse impacts on the environment. Project-related employment growth would result in direct physical environmental changes. Aside from noise, air quality, and transportation and circulation, these physical changes are described and analyzed in the various environmental topic sections in this initial study. The EIR will address noise, air quality, and transportation and circulation impacts associated with the physical changes caused by the proposed project.

An indirect environmental impact is a change to the physical environment that is not immediately related to a proposed project. Specifically, indirect project-related population growth includes ways in which a proposed project could foster economic or population growth in other locations or induce the construction of additional housing. Projects that would remove obstacles to population growth (e.g., a major expansion of a wastewater treatment plant or extension of roadways into a previously unserved area) might, for example, allow development to occur in an area that was not previously considered feasible for development because of infrastructure limitations. This type of development pattern typically occurs in

suburban or rural areas adjacent to undeveloped land and is not generally applicable to a site that is in a built urban environment that is already served by existing infrastructure, such as the proposed project site.

Construction

Construction of the proposed project is anticipated to occur over approximately 31 months (see Table 4, p. 36). During construction, the total number of temporary/short-term workers is anticipated to range from approximately 2,500 to 3,000. Approximately 400 to 500 workers are expected to travel to the site daily at any given time during peak construction periods. The number of construction workers would vary throughout the construction duration, depending on the specific construction phase. Construction of the proposed project would not cause substantial population growth or a substantial increase in housing demand in the region. It is anticipated that construction employees who are not already living in San Francisco would likely commute from their residences elsewhere in the Bay Area rather than permanently relocate to San Francisco from more distant locations; this is typical for employees in the various construction trades. Therefore, construction of the proposed project would not cause a substantial increase in the population of the city or region.

Operation

The proposed project would not involve the construction of residential units that would directly and substantially increase the population in San Francisco. The proposed project would create new employment opportunities through construction of two new multi-story PDR buildings consisting of 1,166,800 gross square feet of PDR uses and 8,400 gross square feet of retail uses. Under the proposed project, an average of up to 1,980 employees would be onsite on a typical day.[38] Prior to commencing the interim use of the project site in 2021, the project site consisted of 438,600 square feet of automotive storage, fleet management, general storage, food-related storage, and temporary storage (Table 1, p. 6). It is estimated that these uses employed 735 workers.[39] Therefore, the proposed project would result in a net increase in employment of 1,242 employees relative to pre-2021 conditions.

The Association of Bay Area Governments and Metropolitan Transportation Commission adopted Plan Bay Area 2050 on October 21, 2021.[40] Plan Bay Area 2050 projects that the Bay Area will add 1.4 million new jobs between 2015 and 2050. Approximately 17 percent of this regional job growth—approximately 236,000 new jobs—is anticipated to occur in San Francisco. Even if new employees relocated to San Francisco as a result of the project, the number of new employees would not be substantial relative to San Francisco's overall employment growth. The increase of 1,242 new employees attributed to the proposed project would represent less than 1 percent of San Francisco's projected employment growth between 2015 and 2050. This increase in employment would not exceed the Association of Bay Area Governments' projections for employment in San Francisco.

In San Francisco's 2019 Jobs Housing Nexus Analysis, San Francisco had an estimated 1.74 workers per household. Based on this number of workers per household, the proposed project's 1,242 new employees

---

38 Assumes one employee per 570 gross square feet of PDR space (1,166,800 gross square feet/570 gross square feet = 1,954 employees) and one employee per 370 gross square feet retail space (8,400 gross square feet/370 gross square feet = 23 employees). This employment density is based on a May 2019 report prepared to update the city's nexus fees: Keyser Marston Associates, Jobs Housing Nexus Analysis, San Francisco, May 2019, *https://commissions.sfplanning.org/cpcpackets/2019-011975PCA.pdf*, accessed January 26, 2020.

39 Assumes one employee per 597 gross square feet of PDR space (438,600 gross square feet/597 gross square feet = 735 employees).

40 Association of Bay Area Governments and Metropolitan Transportation Commission, Plan Bay Area 2050, October 2021, https://www.planbayarea.org/sites/default/files/documents/Plan_Bay_Area_2050_October_2021.pdf, accessed December 9, 2021.

would be equivalent to 714 households. The United States Census Bureau's American Community Survey 1-Year estimate for 2019 reports that approximately 78 percent of the employees in the city currently live in San Francisco.[41] Using this percentage, the new households attributed to the proposed project would generate a potential demand for approximately 557 new residential units in San Francisco.

As of May 2021, the California Department of Finance estimates that there were 408,212 housing units in San Francisco and a vacancy rate of 7.8 percent.[42] Additionally, as of the fourth quarter of 2020, the city estimates that 69,453 new housing units are in the development pipeline, of which 5,509 are under construction.[43] The city's existing available housing stock plus the new housing units under construction could accommodate the project's new employee-generated housing demand.

Extension of Roads and Infrastructure

The proposed project would not induce substantial population growth indirectly through the extension of roads or other infrastructure. The proposed project consists of redevelopment of two parcels in a core industrial area of San Francisco. The proposed project would not require extensions of existing roadways in the vicinity of the project site such as Toland Street, Rankin Street, Kirkwood Avenue, or McKinnon Avenue. As discussed in Section E.12, Utilities, existing utility infrastructure would have capacity to serve the proposed project, and other than tying into these utilities, no new infrastructure or new extension of existing utility infrastructure is required.

Conclusion

In summary, the proposed project would not involve the construction of residential units that would directly increase the population in San Francisco. The overall increase in the number of employees resulting from the proposed project would be consistent with the employment forecasts for San Francisco and would not result in housing demand that would exceed vacant housing units plus housing units currently under construction in San Francisco. In addition, the proposed project would not induce substantial population growth indirectly through the extension of roads or other infrastructure that could support unplanned growth. Therefore, the proposed project would not directly or indirectly induce substantial unplanned population growth in San Francisco, this impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensities, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The variant may result in a relatively small increase in construction personnel to improve streets, sidewalks, and landscaping compared to the proposed project. However, because the proposed expanded streetscape variant would not include new building square footage, involve changes in operations, or require additional employees during operations, it would have the same population and housing impacts as the proposed project and would not directly or indirectly induce substantial unplanned

43 City of San Francisco, 2020 Q4 Pipeline Report, January 2021, *https://sfplanning.org/project/pipeline-report#current-dashboard*, accessed November 11, 2021.

population growth in San Francisco. This impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-PH-1: The proposed project or variant, in combination with cumulative projects, would result in less-than-significant cumulative impacts related to unplanned population growth. (Less than Significant)

PROPOSED PROJECT

The geographic context for the analysis of cumulative impacts to population and housing is San Francisco. The proposed project would not construct residences but would contribute new PDR employment opportunities in San Francisco. Reasonably foreseeable future employment growth is based on development in the city's pipeline. As of the fourth quarter of 2020, the city estimates that nonresidential development in the city's pipeline could generate 73,288 new employees, inclusive of the proposed project.[44] The proposed project's contribution to citywide employment is 1,242 employees. As of 2019, the United States Census Bureau estimates that San Francisco had 673,488 employees. Therefore, the cumulative number of employees in San Francisco would be 748,018 (i.e., existing employees in 2019, the number of employees generated by development in the city's pipeline, and the employees generated by the proposed project). As stated previously, the Association of Bay Area Governments projects that new development in San Francisco would result in the addition of 236,000 new employees by the year 2050, resulting in a citywide total of 918,000 employees by 2050.[45] Thus, the increase in employment attributed to cumulative development would not exceed the Association of Bay Area Governments' planned employment growth in San Francisco. Therefore, the proposed project in combination with cumulative development projects would not result in unplanned employment growth, cumulative impacts related to employment would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensities, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Because the proposed expanded streetscape variant would have the same population and housing impacts as the proposed project, which would not result in unplanned employment growth, the cumulative impacts related to employment would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

E.3. Cultural Resources

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5, including those resources listed in article 10 or article 11 of the San Francisco Planning Code?	☐	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5?	☐	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☒	☐	☐	☐

Impact CR-1: The proposed project or variant would not cause a substantial adverse change in the significance of a historical resource as defined in section 15064.5, including those resources listed in article 10 or article 11 of the planning code. (No Impact)

PROPOSED PROJECT

As defined in section 15064.5 of the CEQA Guidelines, historical resources (including both built-environment and archeological resources) include properties listed in, or formally determined to be eligible for listing in, the California Register of Historical Resources (California Register) or an adopted local historic register. Historical resources also include resources identified as significant in a historical resource survey and meeting one or more of the following criteria:

- Criterion 1 (Events): Is associated with events that have made a significant contribution to the broad pattern of California's history and cultural heritage;
- Criterion 2 (Persons): Is associated with the lives of persons important in our past;
- Criterion 3 (Architecture): Embodies the distinctive characteristics of a type, period, region, or method of construction or represents the work of an important creative individual or possesses high artistic values; or
- Criterion 4 (Information Potential): Has yielded, or may be likely to yield, information important to prehistory or history.

Properties that are not listed but otherwise determined to be historically significant, based on substantial evidence, would also be considered historical resources. Furthermore, resources that are listed in or formally determined to be eligible for listing in the National Register of Historic Places are automatically listed in the California Register and are thus considered historical resources for the purposes of CEQA compliance.

Articles 10 and 11 of the planning code pertain to individual city landmarks and historic districts, and to conservation districts in the city's downtown core area (C-3 zoning district), respectively. Article 10 of the planning code sets forth proposals for city landmark designations, with the aid of the National Register of Historic Places criteria in evaluating a resource's historic significance. Article 11, section 1102 of the planning code codifies the criteria for evaluating buildings in the C-3 zoning district of the city.

Baseline existing conditions for historic architectural resources on the project site and in the project vicinity are documented in the Historic Resource Evaluation Report.[46] The subject properties contain four large, one-story, rectangular industrial warehouses, each with their own building number; Buildings 417 and 418 are associated with the 749 Toland Street address; Buildings 427 and 428 are associated with 2000 McKinnon Avenue. The four warehouses were constructed in the early- to mid-1940s as part of the larger Marine Corps Depot. Each building is similar in appearance, being of wood-frame construction set on a concrete slab foundation. All four structures are clad in cement composite corrugated panels, patched with some corrugated metal panels. All of the buildings feature a combination of original (six-over-six wood sash) windows and replacement (aluminum sash) windows, as well as original wood paneled doors with glazing and replacement flush doors. The moderately pitched, side-gable roofs are clad in composite shingles. Many of the pedestrian doors on the façades facing La Salle Avenue are accessed via wooden stairs. Shed-style awnings clad in either asphalt shingles or corrugated plastic sheets cover many of the pedestrian entryways. The four buildings are utilitarian and have no distinct architectural style, according to the Historic Resource Evaluation Report. The planning department's preservation team reviewed the Historic Resource Evaluation Report and the planning department concurred with these findings, as documented in the Preservation Team Review Form.[47]

Additionally, the four warehouses do not appear to be individually historically significant under California Register criteria, nor do they appear to contribute to any known or potential historic districts.[48] Furthermore, the subject properties have not been identified in any of the older San Francisco listings or surveys, including the 1968 Junior League of San Francisco Architectural Survey, Here Today; the 1976 Department of City Planning Architectural Quality Survey; or the 1979 San Francisco Architectural Heritage Survey, Splendid Survivors. Therefore, they are not considered historical resources for the purposes of CEQA.

The project proposes to demolish the four existing buildings on the project site. As discussed above, none of these structures is a historical resource, either individually or as a contributor to a historic district. Because no historic resources would be demolished, destroyed, relocated, or altered, project implementation would have no impact to a historical resource (built environment only) as defined in section 15064.5, including those resources listed in article 10 or article 11 of the planning code. Furthermore, because the project site is not in or immediately adjacent to a listed historic district, the proposed new construction would not adversely affect any historic district listed in article 10 or article 11 of the planning code. No mitigation measures would be required. This topic will not be addressed in the EIR.

47 San Francisco Environmental Planning Department, Preservation Team Review Form, 2018.

48 ESA, Historic Resource Evaluation Report for 749 Toland Street and 2000 McKinnon Avenue San Francisco, California, report prepared for Prologis (page 8) 2018.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Although the expanded streetscape variant would have a slightly larger footprint than the proposed project, it would not physically alter surrounding structures or substantially modify their setting. Therefore, the expanded streetscape variant would have historical resource impacts similar to those of the proposed project. Similar to the proposed project, the expanded streetscape variant would not adversely affect any historic district listed in article 10 or article 11 of the planning code. No mitigation measures would be required. This topic will not be addressed in the EIR.

Impact CR-2: The proposed project or variant could cause a substantial adverse change in the significance of an archeological resource pursuant to section 15064.5. (Less than Significant with Mitigation)

PROPOSED PROJECT

As described in section 15064.5 of the CEQA Guidelines, archeological resources can be historical resources. In addition to assessing impacts to archeological resources meeting the requirements for listing as historical resources, impacts to unique archeological resources are also considered under CEQA, as described in section 15064.5, as well as under California Public Resource Code section 21083.2. If an archeological site does not meet the criteria for inclusion on the California Register but does meet the definition of a unique archeological resource as outlined in California Public Resource Code section 21083.2, a project that would materially change the resource in an adverse manner would result in a significant archeological impact. A unique archeological resource implies an archeological artifact, object, or site about which it can be clearly demonstrated that—without merely adding to the current body of knowledge—there is a high probability that it meets one of the following criteria:

- The archeological artifact, object, or site contains information needed to answer important scientific questions, and there is a demonstrable public interest in that information;
- The archeological artifact, object, or site has a special and particular quality, such as being the oldest of its type or the best available example of its type; or
- The archeological artifact, object, or site is directly associated with a scientifically recognized important prehistoric or historic event or person.

A nonunique archeological resource is an archeological artifact, object, or site that does not meet the above criteria. Impacts to nonunique archeological resources and resources that do not qualify for listing on the California Register receive no further consideration under CEQA.

Existing conditions for potential archeological resources in the project area are documented in the project's *Preliminary Archeological Review*.[49] According to the Preliminary Archeological Review, no archeological resources have been previously identified in the project site.[50] The project site has never been previously assessed for archeological resource potential, because the structures currently onsite were constructed

[49] San Francisco Environmental Planning Department, Environmental Planning Preliminary Archeological Review, 2018; rev. 2021.
[50] San Francisco Environmental Planning Department, Environmental Planning Preliminary Archeological Review, 2018, rev. 2021.

prior to the enactment of CEQA (or other federal, state, or local regulations focusing on the management or protection of archeological resources). Therefore, the lack of previously identified archeological resources is not indicative of the archeological sensitivity of the project site.

The Preliminary Archeological Review indicates that one previously identified prehistoric archeological site and one historic site have been recorded within one-quarter mile of the project area.[51] Although no archeological fieldwork has been conducted to date in the project area, the planning department uses a consultant-developed prehistoric archeological sensitivity model, which covers the entire city, as one tool for the assessment of the general archeological sensitivity of project sites.[52] This model is based on landform, geology, proximity to water sources and to known resources, and site history. The archeological sensitivities for both prehistoric and historic-era archeological resources are presented in the Preliminary Archeological Review.

According to the Preliminary Archeological Review, the project site is highly sensitive for near-surface prehistoric resources (that is, on the land surface below any imported fill, as it existed prior to development); moderately sensitive for buried prehistoric resources; and, variably, of very high to very low sensitivity for submerged prehistoric resources. Based on the depth of artificial fill, which geotechnical coring suggests is 14 feet or deeper over most of the project site, the potential for effects to prehistoric resources from project grading and excavation may be low, but the potential for impacts to prehistoric resources from pile installation and soil improvements is high to very high. Although the closest known prehistoric resource is more than 600 feet distant from the project site, the project location is a former bank on an infilled portion of Islais Creek and its estuary; this area would have been highly attractive for prehistoric occupation, except where the main stem of Islais Creek ran across the project site prior to infill.

The Preliminary Archeological Review further states that the potential for historic-period archeological resources to be present in the project site appears to be low, because the current project parcels were not developed until after the mid-twentieth century.[53] Although not reported in the Preliminary Archeological Review, this mid-twentieth century development only occurred after the project vicinity was reclaimed from marshland surrounding Islais Creek, further diminishing the potential for the project site to contain historic-period archeological materials.

Under CEQA Guidelines section 15064.5(b), a significant impact would occur if the project "demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance." As described in the Preliminary Archeological Review, there is a moderate to high potential that deeply buried prehistoric deposits occur below the surface of the project site. More specifically, the Preliminary Archeological Review indicates that project-related soil-disturbing activities, both near the surface and at depth, have the potential to impact prehistoric archeological resources. Submerged resources would consist of prehistoric cultural deposits situated on land surfaces that were exposed and available for human use prior to being inundated by rising sea levels between about 6,000 and 2,000 years ago. Archeological resources are not anticipated on the modern surface, because the project site

---

51 San Francisco Environmental Planning Department, Environmental Planning Preliminary Archeological Review, 2018, rev. 2021.

52 Meyer, Jack and Paul Brandy, Far Western Anthropological Research Group, GeoArcheological Assessment and Site Sensitivity Model for the City and County of San Francisco, California, report prepared by Far Western for the Environmental Planning Division of the San Francisco Planning Department, 2019.

53 San Francisco Environmental Planning Department, Environmental Planning Preliminary Archeological Review, 2018.

sits on land reclaimed from bay marshes with imported fill. However, prehistoric resources that lay at the historic surface and along the shores of the marsh lands could be encountered during project excavations.

The proposed project's foundation design would involve concrete spread footings and/or grade beams set on improved and engineered soil, with excavation for the foundations likely to extend 10 feet below existing grade. Typical foundation excavation is expected to extend to 7 feet below grade, with elevator pits and utility trenching extending to 10 feet below existing grade. Although these disturbances are not deep enough to potentially impact deeply buried archeological deposits, they could affect resources buried at shallower depths, depending on the exact depth of twentieth century fill. In addition, it is anticipated that pile foundations would be necessary to support the buildings. Approximately 7,000 25-foot-deep stone columns and approximately 900 60-foot-deep auger-cast piles would be used for the entire site. Each of these auger cast piles would be extended approximately 60 feet below ground surface, and they would be of sufficient depth to potentially impact deeply buried or submerged prehistoric archeological resources. These proposed ground-disturbing construction activities have the potential to alter in an adverse manner the physical characteristics of archeological resources. Therefore, project implementation could result in a substantial adverse change in the significance of an archeological resource pursuant to CEQA guidelines section 15064.5, resulting in a significant impact.

To reduce potentially significant impacts on prehistoric archeological resources, Mitigation Measure M-CR-2 would require the project sponsor to retain the services of an archeologist from the planning department's qualified archeological consultants list to develop and implement an archeological testing program.

Mitigation Measure M-CR-2 **Archeological Testing.** Based on a reasonable presumption that archeological resources may be present in the project site, the following measures shall be undertaken to avoid any potentially significant adverse effects from the proposed project on buried or submerged historical resources. The project sponsor shall retain the services of an archeological consultant from the rotational qualified archeological consultants list maintained by the planning department. After the first project approval action or as directed by the environmental review officer, the project sponsor shall contact the department archeologist to obtain the names and contact information for the next three archeological consultants on the qualified archeological consultants list.

The archeological consultant shall undertake an archeological testing program as specified herein. In addition, the consultant shall be available to conduct an archeological monitoring and/or data recovery program if required pursuant to this measure. The archeological consultant's work shall be conducted in accordance with this measure at the direction of the environmental review officer. All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to the environmental review officer for review and comment and shall be considered draft reports subject to revision until final approval by the environmental review officer. Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the project for a maximum of four weeks. At the direction of the environmental

review officer, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less-than-significant level potential effects on a significant archeological resource as defined in CEQA Guidelines section 15064.5 (a)(c).

Archeological Testing Program. The purpose of the archeological testing program shall be to determine to the extent possible the presence or absence of archeological resources and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

The archeological testing program shall be conducted in accordance with the approved archeological testing plan. The archeological consultant and the environmental review officer shall consult on the scope of the archeological testing plan, which shall be approved by the environmental review officer prior to commencing any project-related soils-disturbing activities. The archeological testing plan shall be submitted first and directly to the environmental review officer for review and comment and shall be considered a draft subject to revision until final approval by the environmental review officer. The archaeologist shall implement the testing as specified in the approved archeological testing plan prior to and/or during construction.

The archeological testing plan shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the proposed project and lay out what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The archeological testing plan shall also identify the testing method to be used, the depth or horizonal extent of testing, the locations recommended for testing, and the archeological monitoring requirements for construction soil disturbance, as warranted.

Paleoenvironmental Analysis of Paleosols. When a submerged paleosol is identified during the testing program, irrespective of whether cultural material is present, samples shall be extracted and processed for dating, flotation for paleobotanical analysis, and other applicable special analyses pertinent to identification of possible cultural soils and for environmental reconstruction.

Discovery Treatment Determination. At the completion of the archeological testing program, the archeological consultant shall submit a written summary of the findings to the environmental review officer. The findings memorandum shall describe and identify each resource and provide

an initial assessment of the integrity and significance of encountered archeological deposits.

If the environmental review officer, in consultation with the archeological consultant, determines that a significant archeological resource is present and that the resource could be adversely affected by the proposed project, the environmental review officer, in consultation with the project sponsor, shall determine whether preservation of the resource in place is feasible. If so, the proposed project shall be redesigned so as to avoid any adverse effect on the significant archeological resource, and the archeological consultant shall prepare an archeological resource preservation plan, which shall be implemented by the project sponsor during construction. The consultant shall submit a draft archeological resource preservation plan to the planning department for review and approval.

If preservation in place is not feasible, a data recovery program shall be implemented, unless the environmental review officer determines that the archeological resource is of greater interpretive than research significance, and that interpretive use of the resource is feasible. The environmental review officer, in consultation with the archeological consultant, shall also determine whether additional treatment is warranted, which may include additional testing and/or construction monitoring.

Consultation with Descendant Communities. On discovery of an archeological site associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, the environmental review officer and an appropriate representative of the descendant group shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to offer recommendations to the environmental review officer regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the archeological resources report shall be provided to the representative of the descendant group.

Archeological Data Recovery Plan. An archeological data recovery program shall be conducted in accordance with an archeological data recovery plan if all three of the following apply: 1) a resource has potential to be significant, 2) preservation in place is not feasible, and 3) the environmental review officer determines that an archeological data recovery program is warranted. The archeological consultant, project sponsor, and environmental review officer shall meet and consult on the scope of the archeological data recovery plan prior to preparation of a draft archeological data recovery plan. The archeological consultant shall submit a draft archeological data recovery plan to the environmental review officer. The

archeological data recovery plan shall identify how the proposed data recovery program shall preserve the significant information the archeological resource is expected to contain. That is, the archeological data recovery plan shall identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical property that could be adversely affected by the proposed project. Destructive data recovery methods shall not be applied to portions of the archeological resources if nondestructive methods are practical.

The scope of the archeological data recovery plan shall include the following elements:

- *Field Methods and Procedures*: descriptions of proposed field strategies, procedures, and operations
- *Cataloguing and Laboratory Analysis*: description of selected cataloguing system and artifact analysis procedures
- *Discard and Deaccession Policy:* description of and rationale for field and post-field discard and deaccession policies
- *Security Measures:* recommended security measures to protect the archeological resource from vandalism, looting, and unintentionally damaging activities
- *Final Report*: description of proposed report format and distribution of results
- *Curation:* description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities

Coordination of Archaeological Data Recovery Investigations. In cases in which the same resource has been or is being affected by another project for which data recovery has been conducted, is in progress, or is planned, to maximize the scientific and interpretive value of the data recovered from both archeological investigations, the following measures shall be implemented:

A) In cases where neither investigation has yet begun, both archeological consultants and the environmental review officer shall consult on coordinating and collaboration on archeological research design, data recovery methods, analytical methods, reporting, curation and

interpretation to ensure consistent data recovery and treatment of the resource.

B) In cases where archeological data recovery investigation is already underway or has been completed for a prior project, the archeological consultant for the subsequent project shall consult with the archeological consultant for the prior project, if available; review prior treatment plans, findings, and reporting; inspect and assess existing archeological collections/inventories from the site prior to preparation of the archaeological treatment plan for the subsequent discovery; and incorporate prior findings in the final report of the subsequent investigation. The objectives of this coordination and review of prior methods and findings shall be to identify refined research questions; determine appropriate data recovery methods and analyses; assess new findings relative to prior research findings; and integrate prior findings into subsequent reporting and interpretation.

Human Remains and Funerary Objects. The treatment of any human remains and funerary objects discovered during any soils-disturbing activity shall comply with applicable state laws, including Section 7050.5 of the Health and Safety Code and Public Resources Code 5097.98. If human remains or suspected human remains are encountered during construction, the contractor and project sponsor shall ensure that ground-disturbing work within 50 feet of the remains is halted immediately and shall arrange for the protection in place of the remains until appropriate treatment and disposition have been agreed upon and implemented in accordance with this section. Upon determining that the remains are human, the project archeologist shall immediately notify the city's Medical Examiner of the find. The archeologist shall also immediately notify the environmental review officer and the project sponsor of the find. In the event of the Medical Examiner's determination that the human remains are Native American in origin, the Medical Examiner shall notify the California State Native American Heritage Commission within 24 hours. The Native American Heritage Commission shall immediately appoint and notify a most likely descendant. The most likely descendant shall complete his or her inspection of the remains and make recommendations or preferences for treatment within 48 hours of being granted access to the site.

If the remains cannot be permanently preserved in place, the land owner may consult with the project archeologist, project sponsor, and CEQA lead agency and shall consult with the most likely descendant on recovery of the remains and any scientific treatment alternatives. The land owner shall then make all reasonable efforts to develop a burial agreement with the most likely descendant, as expeditiously as possible, for the treatment and disposition, with appropriate dignity, of human remains and funerary objects (as detailed in CEQA Guidelines section 15064.5(d)). In accordance

with Public Resources Code 5097.98 (c)(1), the burial agreement shall address, as applicable and to the degree consistent with the wishes of the most likely descendant, the appropriate excavation, removal, recordation, scientific analysis, custodianship prior to reinterment or curation, and final disposition of the human remains and funerary objects. If the most likely descendant agrees to scientific analyses of the remains and/or funerary objects, the archeological consultant shall retain possession of the remains and funerary objects until completion of any such analyses, after which the remains and funerary objects shall be reinterred or curated as specified in the burial agreement.

Both parties are expected to make a concerted and good faith effort to arrive at an agreement, consistent with the provisions of Public Resources Code 5097.98. However, if the land owner and the most likely descendant are unable to reach an agreement, the land owner, environmental review officer, and project sponsor shall ensure that the remains and/or mortuary materials are stored securely and respectfully until they can be reinterred on the property, with appropriate dignity, in a location not subject to further or future subsurface disturbance, consistent with state law.

Treatment of historic-period human remains and/or funerary objects discovered during any soil-disturbing activity shall be in accordance with protocols laid out in the project archeological treatment document, and other relevant agreements established between the project sponsor, Medical Examiner, and environmental review officer. The project archeologist shall retain custody of the remains and associated materials while any scientific study scoped in the treatment document is conducted, after which the remains shall be curated or respectfully reinterred by arrangement on a case-by case-basis.

Archeological Public Interpretation Plan. The project archeological consultant shall submit an archeological public interpretation plan if a significant archeological resource is discovered during a project. If the resource to be interpreted is a tribal cultural resource, the archeological public interpretation plan shall be prepared in consultation with and developed with the participation of tribal representatives, including the Association of Ramaytush Ohlone and other interested Ohlone parties. The archeological public interpretation plan shall describe the interpretive product(s), locations or distribution of interpretive materials or displays, the proposed content and materials, the producers or artists of the displays or installation, and a long-term maintenance program. The archeological public interpretation plan shall be sent to the environmental review officer

for review and approval. The archeological public interpretation plan shall be implemented prior to occupancy of the project.

Archeological Resources Report. Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the testing program to the environmental review officer. The archeological consultant shall submit a draft archeological resources report to the environmental review officer that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken, and if applicable, discusses curation arrangements. Formal site recordation forms (CA DPR 523 series) shall be attached to the archeological resources report as an appendix.

Once approved by the environmental review officer, copies of the archeological resources report shall be distributed as follows: California Archeological Site Survey Northwest Information Center shall receive one copy, and the environmental review officer shall receive a copy of the transmittal of the archeological resources report to the Northwest Information Center. The environmental planning division of the planning department shall receive one bound hardcopy of the archeological resources report. Digital files that shall be submitted to the environmental division include an unlocked, searchable PDF version of the archeological resources report, GIS shapefiles of the site and feature locations, any formal site recordation forms (CA DPR 523 series), and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. The PDF archeological resources report, GIS files, recordation forms, and/or nomination documentation should be submitted via USB or other stable storage device. If a descendant group was consulted during archeological treatment, a PDF of the archeological resources report shall be provided to the representative of the descendant group.

Curation. Significant archeological collections and paleoenvironmental samples of future research value shall be permanently curated at an established curatorial facility. The facility shall be selected in consultation with the environmental review officer. Upon submittal of the collection for curation, the sponsor or archeologist shall provide a copy of the signed curatorial agreement to the environmental review officer.

Significance after Mitigation. The project sponsor has agreed to implement Mitigation Measure M-CR-2: Archeological Testing. This measure would ensure that archeological resources that may be present in soils that would be disturbed by project construction would be identified and assessed. If a significant resource is present, the resource would be preserved in place or archeological data recovery would be carried out to preserve the important information it represents. With implementation of this measure, the potentially

significant impact to archeological resources would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have archeological impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measure M-CR-2: Archeological Testing. With implementation of this measure for the expanded streetscape variant footprint, the potentially significant impact to archeological resources would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

Impact CR-3 The proposed project or variant could disturb human remains including those interred outside of formal cemeteries. (Less than Significant with Mitigation)

PROPOSED PROJECT

No known human burials have been identified in the study area. However, the possibility cannot be discounted that human remains could be inadvertently disturbed during project excavations and pile extension activities in the project site, given the elevated sensitivity for the area to contain near-surface and deeply buried and submerged prehistoric resources. Therefore, project implementation could result in impacts on previously undiscovered human remains, including those interred outside of formal cemeteries, during ground-disturbing activities. If human remains are discovered during construction, this would be considered a significant impact. Implementation of Mitigation Measure M-CR-2: Archeological Testing, would ensure that if human remains are encountered during construction, they would be appropriately addressed and that respectful treatment and disposition would occur.

Significance after Mitigation

The project sponsor has agreed to implement Mitigation Measure M-CR-2: Archeological Testing. This measure would ensure that the treatment of human remains and of associated or unassociated funerary objects discovered during any soil-disturbing activity complies with applicable state and federal laws. This shall include immediate notification of the city's Medical Examiner and adherence to protocols laid out in the project's archaeological treatment documents. With implementation of these measures, the potentially significant impact to human remains would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have archeological impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface.

Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measure M-CR-2: Archeological Testing. With implementation of this measure, the potentially significant impact to human remains would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

Impact C-CR-1: The proposed project or variant, in combination with cumulative projects, could result in cumulative cultural resource impacts. (Less than Significant with Mitigation)

PROPOSED PROJECT

As presented in Impact CR-1, project implementation would have no impact to historical resources of the built environment (i.e., historic architecture). Therefore, the proposed project would not contribute to cumulative impacts on this class of historical resources, and the proposed project would have no cumulative impact on historical resources of the built environment.

The geographic context for cumulative impacts to archeological resources and human remains is generally confined to projects that are close enough to the proposed project site that they could result in impacts to the same archaeological resources. The SF Market Project is adjacent to the project site, and the Quint-Jerrold Connector, 2270 McKinnon Avenue, the SFPUC Biosolids Digester projects are within approximately 500 feet. These are the only cumulative development projects that could affect the same archaeological resources as the proposed project.

Implementation of the proposed project has the potential to result in significant impacts to as-yet undiscovered buried archeological resources and to human remains, although no archeological resources or human remains are known to be present at the project site. The immediate project vicinity is similarly moderately to very highly sensitive for the presence of buried prehistoric archeological resources and human remains: although there are no known resources in the immediate vicinity, there is a known prehistoric site approximately 600 feet away. If a resource were found to be present at the project site, it is possible that its extent could include the adjacent project site, which is where the SF Market project is proposed. The SF Market project involves excavation for all project phases. In the event that both projects impact an archaeological resource during construction, a significant cumulative impact to the resource could occur. Under these circumstances, the proposed project and the SF Market could result in significant cumulative impacts on archaeological resources or human remains, and the project's impact could be cumulatively considerable. However, the project's potential impacts would be reduced to a less-than-significant level with implementation of Mitigation Measure M-CR-2: Archeological Testing, above.[54] Implementation of these measures would ensure that the proposed project's contribution to the significant cumulative impact on archeological resources and human remains would not be cumulatively considerable. Therefore, cumulative impacts to archeological resources and human remains would be less than significant with mitigation. It is noted that the SF Market Project mitigated negative declaration and SFPUC Biosolids Digester Facilities Project EIR include mitigation measures requiring archaeological testing, monitoring, and data recovery similar to Mitigation Measure M-CR-2 for the proposed project.

[54] San Francisco Planning Department, San Francisco Wholesale Produce Market Project Mitigated Final Negative Declaration, Case No. 2009.1153E, July 2011, *https://archives.sfplanning.org/documents/8783-2009.1153E_SFWholesaleProduceMarketFMND.pdf*, accessed June 17, 2020.

Significance after Mitigation

Compliance with the procedures identified in Mitigation Measure M-CR-2 would ensure that in the event archeological resources or human remains are discovered on the project site, the important information they represent would be preserved and interpreted to the public. This would ensure that the project's contribution to a significant cumulative archeological and human remains impact would not be cumulatively considerable, resulting in a less-than-significant impact with mitigation.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have archeological impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. As presented in Impact CR-1, implementation of the expanded streetscape variant would have no impact to historical resources of the built environment (i.e., historic architecture). Therefore, the expanded streetscape variant would not contribute to cumulative impacts on historic architectural resources and would have no cumulative impact on historical resources of the built environment.

Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measure M-CR-2: Archeological Testing. With implementation of this measure, the expanded streetscape variant's contribution to a significant cumulative archeological and human remains impact would not be cumulatively considerable, resulting in a less-than-significant impact with mitigation. This topic will not be addressed in the EIR.

E.4. Tribal Cultural Resources

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:					
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☒	☐	☐	☐
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☐	☒	☐	☐	☐

Impact TCR-1: The proposed project or variant could result in a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code section 21074. (Less than Significant with Mitigation)

PROPOSED PROJECT

Public Resources Code section 21074.2 requires the lead agency to consider the effects of a project on tribal cultural resources. As defined in section 21074, tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are listed, or determined to be eligible for listing, in a national, state, or local register of historical resources. Pursuant to Assembly Bill (AB) 52 (Public Resources Code section 21080.3.1(d)), on October 17, 2019, the planning department contacted Native American individuals and organizations for the San Francisco area, providing a description of the project and requesting comments on the identification, presence, and significance of tribal cultural resources in the project vicinity.[55] During the 30-day comment period, no Native American tribal representatives contacted the planning department to request consultation.

[55] San Francisco Planning Department, Tribal Notification Regarding Tribal Cultural Resources and CEQA, San Francisco Gateway Project, October 17, 2019.

As discussed in Section E.3, Cultural Resources, there is a moderate to high potential that prehistoric archeological resources may be present, buried below the surface of the project site. Based on prior Native American consultation under AB 52, all archeological sites of Native American origin in San Francisco, including all prehistoric archeological sites, are considered to be potential tribal cultural resources. If tribal cultural resources are disturbed during project implementation (i.e., through project excavations or pile extension), this would be considered a significant impact. This impact would be mitigated to a less-than-significant level with implementation of Mitigation Measure M-CR-2: Archeological Testing (presented in Section E.3, Cultural Resources), which requires implementation of an archeological testing program; and Mitigation Measure M-TCR-1: Tribal Cultural Resources Interpretive Program, described below.

Mitigation Measure M-TCR-1 Tribal Cultural Resources Interpretive Program.

Preservation in Place. In the event of the discovery of an archeological resource of Native American origin, the environmental review officer, the project sponsor, and the local Native American representative shall consult to determine whether preservation in place would be feasible and effective. Coordination shall take place with local Native American representatives, including the Association of Ramaytush Ohlone and other interested Ohlone parties. If it is determined that preservation-in-place of the tribal cultural resource would be both feasible and effective, then the archeological consultant, in consultation with the local Native American representative, shall prepare an archeological resource preservation plan, which shall be implemented by the project sponsor during construction. The consultant shall submit a draft archeological resource preservation plan to the planning department for review and approval.

Interpretive Program. If the environmental review officer, in consultation with local Native American representatives (including the Association of Ramaytush Ohlone and other interested Ohlone parties) and the project sponsor, determines that preservation-in-place of the tribal cultural resources is not a sufficient or feasible option, then archeological data recovery shall be implemented as required by the environmental review officer and in consultation with affiliated Native American tribal representatives.

After data recovery, the project sponsor, in consultation with local Native American representatives, shall prepare a tribal cultural resources interpretation plan to guide the interpretive program. The tribal cultural resources interpretation plan may be prepared in tandem with the archeological public interpretation plan described in Mitigation Measure M-CR-2: Archeological Testing. The tribal cultural resources interpretation plan shall be submitted to the environmental review officer for review and approval prior to implementation of the program. The plan shall identify, as appropriate, proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a

long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, cultural displays, educational panels, or other interpretive elements agreed upon by the environmental review officer, sponsor, and local Native American representatives. Upon approval of the tribal cultural resources interpretation and prior to project occupancy, the interpretive program shall be implemented by the project sponsor. Local Native American representatives who are substantially involved in preparation or implementation of the interpretive program shall be appropriately compensated by the project sponsor.

Significance after Mitigation. Mitigation Measure M-CR-2: Archeological Testing (presented in Section E.3, Cultural Resources) would ensure that archeological resources that may be present in soils that would be disturbed by project construction would be identified and assessed. In the event that archeological resources are found, they would be assessed to determine whether they constitute significant tribal cultural resources in accordance with Mitigation Measure M-TCR-1. Preservation in place is the preferred mitigation for tribal cultural resources. However, if it is determined, through the process outlined above in Mitigation Measure M-TCR-1, that preservation in place is not feasible, archeological data recovery would recover a sample of the significant information represented by the resource and public interpretation would help to ensure that the other values represented by the resource are conveyed to the public. Mitigation Measures M-CR-2 and M-TCR-1 therefore would reduce the potential impact to tribal cultural resources to a less-than-significant level. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The proposed expanded streetscape variant would have tribal cultural resources impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measures M-CR-2: Archeological Testing; and M-TCR-1: Tribal Cultural Resources Interpretive Program. With implementation of these measures, the potentially significant impact to tribal cultural resources would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

Impact C-TCR-1: The proposed project or variant, in combination with cumulative projects, could result in cumulative cultural resource impacts. (Less than Significant with Mitigation)

PROPOSED PROJECT

The geographic context for cumulative tribal cultural resources impacts is generally confined to projects in the immediate vicinity of the project site that might affect resources that also could be affected by the project. As discussed under Impact C-CR-1, the SF Market Project is adjacent to the project site and would involve excavation for all project phases; and the Quint-Jerrold Connector, 2270 McKinnon Avenue, and SFPUC Biosolids Digester projects are within 500 feet. These are the only cumulative development projects

that could affect prehistoric archeological resources and potential tribal cultural resources that could also be affected by the proposed project.

As presented under Impact TCR-1, implementation of the proposed project has the potential to result in significant impacts to buried archeological resources, because this area of San Francisco is considered moderately to highly sensitive for the presence of buried prehistoric archeological resources. Such prehistoric archeological resources could also be tribal cultural resources, as explained above. Although no such resources are known at the project site and the closest known site is about 400 feet distant, construction activities at project sites in the immediate vicinity would have a similar potential to that of the project to result in significant impacts to buried prehistoric archeological resources that also may be tribal cultural resources. In this situation, a significant cumulative impact could occur. In the event of the discovery during construction of an archaeological resource that is determined to be a tribal cultural resource, the project's contribution to the cumulative impact would be cumulatively considerable.

However, if the proposed project were to encounter buried archeological resources that include tribal cultural resources, impacts to these resources would be addressed with implementation of Mitigation Measure M-CR-2: Archeological Testing (see Section E.3, Cultural Resources); and Mitigation Measure M-TCR-1: Tribal Cultural Resources Interpretive Program, above. With implementation of these mitigation measures, the proposed project's contribution to cumulative impacts on tribal cultural resources would be mitigated to a less-than-cumulatively-considerable level. Therefore, cumulative impacts on tribal cultural resources would be less than significant with mitigation. It is noted that other nearby projects are subject to the same or similar measures that, in each case, would mitigate each project's impacts to tribal cultural resources to a less-than-significant level.

Significance after Mitigation

Compliance with the procedures identified in Mitigation Measures M-CR-2 and M-TCR-1 would ensure that, if significant tribal cultural resources are discovered, the important values and information represented by these significant tribal cultural resources would be preserved and/or interpreted to the public in consultation with the affiliated Native American tribal representatives. This would reduce the proposed project's contribution to potentially significant cumulative impacts on these tribal cultural resources to a less-than-significant level.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the expanded streetscape variant would have tribal cultural resources impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measures M-CR-2: Archeological Testing; and M-TCR-1: Tribal Cultural Resources Interpretive Program. With implementation of these measures, the expanded streetscape variant would reduce the proposed project's contribution to potentially significant cumulative impacts on these tribal cultural resources to a less-than-significant level.

E.5. Transportation and Circulation

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Involve construction that would require a substantially extended duration or intensive activity, the effects of which would create potentially hazardous conditions for people walking, bicycling, or driving, or public transit operations; or interfere with emergency access or accessibility for people walking or bicycling; or substantially delay public transit?	☒	☐	☐	☐	☐
b) Create potentially hazardous conditions for people walking, bicycling, or driving or public transit operations?	☒	☐	☐	☐	☐
c) Interfere with accessibility of people walking or bicycling to and from the project site, and adjoining areas, or result in inadequate emergency access?	☒	☐	☐	☐	☐
d) Substantially delay public transit?	☒	☐	☐	☐	☐
e) Cause substantial additional vehicle miles traveled or substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow travel lanes) or by adding new roadways to the network?	☒	☐	☐	☐	☐
f) Result in a loading deficit, the secondary effects of which would create potentially hazardous conditions for people walking, bicycling, or driving; or substantially delay public transit?	☒	☐	☐	☐	☐
g) Result in a substantial vehicular parking deficit, the secondary effects of which would create potentially hazardous conditions for people walking, bicycling, or driving; or interfere with accessibility for people walking or bicycling or inadequate access for emergency vehicles; or substantially delay public transit?	☒	☐	☐	☐	☐

The proposed project and the expanded streetscape variant have the potential to result in significant impacts on transportation and circulation. Accordingly, this topic will be analyzed further and included in the EIR.

E.6. Noise

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐	☐
b) Generate excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan area, or, where such a plan has not been adopted, in an area within two miles of a public airport or public use airport, would the project expose people residing or working in the area to excessive noise levels?	☐	☐	☐	☐	☒

There are no private airstrips or public or public use airports in the project vicinity, and the project is not in the vicinity of an airport land use plan. Therefore, topic 6 (c) is not applicable to the proposed project or expanded streetscape variant. However, the proposed project and expanded streetscape variant have the potential to result in significant temporary or permanent noise and vibration impacts. Accordingly, this topic, with the exception of exposing people residing or working near an airstrip or airport to excessive noise, will be analyzed further and included in the EIR.

E.7. Air Quality

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal, state, or regional ambient air quality standard?	☒	☐	☐	☐	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☒	☐	☐	☐	☐

The proposed project and expanded streetscape variant have the potential to result in significant impacts on air quality. Accordingly, this topic will be analyzed further and included in the EIR.

E.8. Greenhouse Gas Emissions

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐	☐
b) Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐	☐

SETTING

Gases that trap heat in the atmosphere are referred to as greenhouse gases because they capture heat radiated from the sun as it is reflected back into the atmosphere. The accumulation of greenhouse gases from human activities contributes to global climate change. The primary greenhouse gases, or climate pollutants, are carbon dioxide, methane, nitrous oxide, ozone, and water vapor. In addition to these primary gases, black carbon is a part of fine particulate air pollution and not a gas, but is an important climate pollutant.

Individual projects contribute to the cumulative effects of climate change by emitting greenhouse gases during demolition, construction, and operation. Emissions of carbon dioxide are largely by-products of fossil fuel combustion, whereas methane results from off-gassing associated with agricultural practices and landfills. Black carbon has been identified as a major contributor to global climate change, possibly second only to carbon dioxide. Human activities produce black carbon as a result of the incomplete combustion of fossil fuels, biofuels, and biomass materials.[56] Nitrous oxide is a by-product of various industrial processes. Other greenhouse gases, including hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, are generated in certain industrial processes. Greenhouse gases are typically reported in "carbon-dioxide-equivalent" measures.[57]

It is unequivocal that human-caused increases in greenhouse gases have warmed the atmosphere, ocean, and land, and that human-induced climate change is affecting every inhabited region in the world, increasing the frequency and severity of extreme events, such as heat waves, precipitation, droughts, and tropical cyclones. Furthermore, the scale of changes observed across the climate system is unprecedented in the thousands of years for which we have data.[58] Secondary effects of climate change in California include impacts on agriculture, the state's electricity system, and the native ecosystems and biodiversity (especially

57 Because of the differential potential of various greenhouse gases to trap heat in the Earth's atmosphere, greenhouse gas emissions are frequently measured in "carbon dioxide equivalents," which present a weighted total, based on each gas's heat trapping (or "global warming") potential relative to that of carbon dioxide.

58 Intergovernmental Panel on Climate Change, *Climate Change 2021: The Physical Science Basis*, *Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change*, *https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_SPM.pdf*, accessed October 25, 2021.

those of freshwater and anadromous fish); increasing vulnerability of infrastructure (including levees, such as in the Sacramento-San Joaquin Delta); an increase in the frequency and intensity of extreme wildfires, flooding events, and drought conditions; and changes in disease vectors.[59,60]

EXISTING GREENHOUSE GAS EMISSION ESTIMATES

The California Air Resources Board (air board) estimated that in 2019, California produced about 418 million gross metric tons of carbon dioxide equivalents.[61] The air board found that transportation is the source of 40 percent of the state's greenhouse gas emissions, followed by industrial uses at 21 percent, and electricity generation (both in-state and outside generation) at 14 percent. Commercial and residential fuel use (primarily for heating) accounted for 10 percent of greenhouse gas emissions.[62] In San Francisco, motorized transportation and buildings (i.e., natural gas and electricity use in the buildings) were the two largest sources of greenhouse gas emissions, accounting for 47 percent (approximately 2.2 million metric tons of carbon dioxide equivalents) and 41 percent (1.9 million metric tons of carbon dioxide equivalents), respectively, of the approximately 4.6 million metric tons of carbon dioxide equivalents emitted in San Francisco in 2019.[63] Other sources include landfilled organics (approximately 7 percent), municipal emissions (approximately 3 percent, including both municipal buildings and fleets), and agriculture (approximately 1.8 percent).[64]

Electricity in San Francisco is provided primarily by SFPUC and Pacific Gas and Electric Company (PG&E). In 2019, electricity consumption in San Francisco totaled approximately 5.6 million megawatt-hours.[65] SFPUC produces approximately 80 percent of the City of San Francisco's power through Hetch Hetchy Power and CleanPowerSF, with the City's remaining energy demand being met by PG&E. CleanPowerSF was launched by the SFPUC in 2016 to provide renewable energy to residents and businesses. The organization was formed to achieve the city's ambitious targets regarding the delivery of completely emissions-free electricity by 2030.[66] PG&E's 2019 power mix was as follows: 2 percent natural gas and other, 45 percent nuclear, 25 percent eligible renewables (described below), and 28 percent large hydroelectric.[67]

SFPUC, which operates three hydroelectric power plants as part of San Francisco's Hetch Hetchy water supply system—as well as solar, biomass, and biowaste infrastructure—provides electrical power to the San

Francisco Municipal Railway, city buildings, and a limited number of commercial accounts in San Francisco.[68] Electricity generated by the Hetch Hetchy system achieves net-zero greenhouse gas emissions.[69]

REGULATORY SETTING

This section describes the regulatory framework for greenhouse gases, including policies and regulations applicable to greenhouse gas emissions.

Greenhouse Gas Reduction Goals

At the state level, Executive Order S-3-05[70] sets forth a series of target dates by which time statewide emissions of greenhouse gases would need to be progressively reduced, as follows:

- reduce emissions to 1990 levels by 2020 (approximately 427 million metric tons of carbon dioxide equivalents), and
- reduce emissions to 80 percent below 1990 levels by 2050 (approximately 85 million metric tons of carbon dioxide equivalents).

In 2006, after Executive Order S-3-05 was signed, the California Legislature passed AB 32,[71] also known as the California Global Warming Solutions Act. AB 32 requires the air board to design and implement emission limits, regulations, and other measures so that statewide greenhouse gas emissions are reduced to 1990 levels by 2020.

Pursuant to AB 32, the air board adopted the 2008 climate change scoping plan, which outlines measures to meet the 2020 greenhouse gas reduction limits. To meet the goals of AB 32, California needed to reduce its greenhouse gas emissions to 1990 levels by 2020 (equal to approximately 15 percent below 2008 levels).[72] In 2018, the air board announced that inventory year 2016 emissions had dropped below 1990 levels, which represented early achievement of the AB 32 goal.[73] Since inventory year 2016, emissions have continued to be below the 1990 level.[74]

74 California Air Resources Board, *California Greenhouse Gas Inventory for 2000–2019 by Category as Defined in the Scoping Plan,* n.d., *https://www.arb.ca.gov/cc/inventory/data/data.htm*, accessed August 20, 2021.

For the 2030 horizon, Executive Order B-30-15, signed in 2015, sets an interim statewide greenhouse gas emissions reduction target of 40 percent below 1990 levels by 2030.[75] Executive Order B-30-15 also requires all state agencies with jurisdiction over sources of greenhouse gas emissions to implement measures within their statutory authority for achieving reductions in greenhouse gas emissions and meeting the 2030 and 2050 greenhouse gas emission reduction targets.

On August 24, 2016, the California Legislature passed Senate Bill (SB) 32,[76] thereby amending the California Global Warming Solutions Act of 2006. SB 32 directed the air board to adopt, to the extent technologically feasible and cost effective, the rules and regulations necessary to achieve a reduction in statewide greenhouse gas emissions (i.e., to 40 percent below 1990 levels by 2030). The passage of SB 32 codified the 2030 interim greenhouse gas emissions reduction target established by Executive Order B-30-15.

SB 32 was paired with AB 197 (2016), which amended the health and safety code.[77] AB 197 provides additional guidance on how to achieve the reduction targets established in Executive Order B-30-15 and SB 32. SB 32 and AB 197 became effective January 1, 2017.

In accordance with AB 32, the climate change scoping plan must be updated every five years to evaluate AB 32 policies and ensure that California is on track with respect to achieving long-term climate stabilization goals. The first scoping plan update was approved in 2014, and an additional update was approved in 2017.

The 2017 climate change scoping plan identifies specific measures to reduce greenhouse gas emissions to 1990 levels by 2020 and requires the air board and other state agencies to develop and enforce regulations and other initiatives for reducing greenhouse gases.[78] The plan also highlights California's progress toward meeting the 2030 greenhouse gas emissions reduction goals of SB 32 and evaluates how to align the state's longer-term greenhouse gas reduction strategies with other state policy priorities for water, waste, natural resources, clean energy, transportation, and land use.[79] Specifically, the 2017 climate change scoping plan update articulates a key role for local governments, recommending that they establish greenhouse gas reduction goals for both their municipal operations and the community consistent with those of the state.

The 2017 climate change scoping plan estimates 385 million metric tons (MMT) of carbon dioxide equivalents (CO_2e) would be reduced from known commitments, leaving a gap of 236 MMT CO_2e that is needed to meet the 2030 target codified by SB 32. The air board concluded that the gap in emissions would need to be bridged by the cap-and-trade program's achievement of 236 MMT CO_2e. Table 5 shows the reductions that the air board is expecting from the known commitments of the scoping plan and the amount needed from the cap-and-trade program to achieve the 2030 target.[80]

Notes:

The values displayed in Table 5 do not mathematically sum to 621 MMT CO2e, as a result of embedded significant figures and rounding for graphic display purposes included in California's 2017 Climate Change Scoping Plan.

CO_2e = carbon dioxide equivalents
MMT = million metric tons

For the post-2030 period, Executive Order B-55-18 establishes a statewide goal of achieving carbon neutrality as soon as possible, but no later than 2045, and achieving and maintaining net negative emissions thereafter. The next update to the scoping plan, the 2022 climate change scoping plan, would assess progress toward achieving the SB 32 2030 target and laying out a path to achieve carbon neutrality by mid-century, pursuant to Executive Order B-55-18.[82]

At the regional level, the air district is responsible for attaining and maintaining federal and state air quality standards in the San Francisco Bay Area Air Basin, as established by the federal Clean Air Act and the California Clean Air Act. The acts require plans to be developed for areas that do not meet air quality standards. The most recent air quality plan, the Bay Area 2017 Clean Air Plan, includes a goal that calls for reducing greenhouse gas emissions to 1990 levels by 2020, 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050.[83] The air district also established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the air basin.[84] In addition, the air district's CEQA Air Quality Guidelines help lead agencies comply with the requirements of CEQA with respect to potentially adverse impacts on air quality. The air district advises lead agencies to consider adopting a greenhouse gas emissions reduction strategy that meets climate stabilization goals and then review projects for compliance with the greenhouse gas emissions reduction strategy as a CEQA threshold of significance.[85] This is consistent with the approach to analyzing greenhouse gas emissions described in CEQA Guidelines section 15183.5.

At the local level, the city adopted ordinance 81-08 in May 2008, amending the San Francisco Environment Code to establish greenhouse gas emissions targets and require departmental action plans. Ordinance 81-08 authorized the San Francisco Department of the Environment to coordinate efforts to meet the targets and established the following greenhouse gas emissions reduction limits and target dates:

- determine 1990 citywide greenhouse gas emissions by 2008 (i.e., the baseline level, with reference to which target reductions have been set);
- reduce greenhouse gas emissions to 25 percent below 1990 levels by 2017;
- reduce greenhouse gas emissions to 40 percent below 1990 levels by 2025; and
- reduce greenhouse gas emissions to 80 percent below 1990 levels by 2050.[86]

In July 2021, the city adopted an updated greenhouse gas ordinance to demonstrate the city's commitment to the Paris Agreement by establishing greenhouse gas reduction targets for 2030, 2040, and 2050 and setting other critical sustainability goals. The updated ordinance sets goals for both sector-based emissions and consumption-based emissions. The greenhouse gas targets established under ordinance 81-08 applied solely to sector-based emissions, which are those emissions that are generated within the geographic boundaries of the city. The updated ordinance reflects a more comprehensive effort to reduce greenhouse gas emissions by setting consumption-based targets as well. Consumption-based emissions are those that are associated with producing, transporting, using, and disposing of products and services consumed by people in the city, even those emissions that are generated outside of the city boundaries. The city's updated greenhouse gas reduction targets are as follows:

- by 2030, reduce sector-based greenhouse gas emissions to 61 percent below 1990 levels;
- by 2030, reduce consumption-based greenhouse gas emissions to 30 metric tons of CO_2e per household or less, equivalent to a 40 percent reduction compared to 1990 levels;
- by 2040, reach net-zero sector-based emissions and sequester any residual emissions using nature-based solutions;[87] and
- by 2050, reduce consumption-based greenhouse gas emissions to 10 metric tons of CO_2e per household or less, equivalent to an 80 percent reduction compared to 1990 levels.

These sector-based greenhouse gas reduction targets are more ambitious than those set forth in Executive Order B-30-15 (e.g., a 61 percent reduction in sector-based greenhouse gas emissions by 2030 rather than a 40 percent reduction by 2030) and Executive Order B-55-18 (e.g., achieving carbon neutrality by 2040 rather than by 2045). The consumption-based targets are consistent with the 2030 goal of Executive Order B-30-15 and the 2050 goal of Executive Order S-3-05 (80 percent below 1990 levels, by 2050).

The updated greenhouse gas ordinance also serves to codify the city's "0-80-100-Roots" climate action framework, which comprises climate and sustainability goals in these key areas: waste, transportation, energy, and carbon sequestration. The framework also emphasizes the importance of housing in implementing meaningful climate solutions, which require an increased supply of high-quality housing that

---

[86] City and County of San Francisco, *Greenhouse Gas Emissions Targets and Departmental Action Plans*, May 13, 2008, *https://codelibrary.amlegal.com/codes/san_francisco/latest/sf_environment/0-0-0-908*, accessed November 19, 2019.

[87] Nature-based solutions are those that remove remaining emissions from the atmosphere by storing them in natural systems that support soil fertility or employing other carbon farming practices.

is both affordable and near transit service. The goals in the 0-80-100-Roots framework are defined as follows:

- Zero Waste (***0***-80-100-Roots)
  - By 2030, reduce the generation of solid waste to 15 percent below 2015 levels and reduce the amount of solid waste that is incinerated or sent to landfill to at least 50 percent below 2015 levels.

- Transportation (0-***80***-100-Roots)
  - By 2030, increase the percentage of low-carbon trips to at least 80 percent of measured trips and increase the number of electric vehicles to at least 25 percent of all registered private vehicles.
  - By 2045, increase the number of electric vehicles to 100 percent of all registered private vehicles.

- Energy (0-80-***100***-Roots)
  - By 2025, supply 100 percent renewable electricity.
  - By 2045, supply 100 percent renewable energy.

- Carbon Sequestration (0-80-100-***Roots***)
  - Sequester carbon through ecosystem restoration, including an increased urban tree canopy (i.e., tree roots), green infrastructure, and compost applications.

- Housing and Buildings
  - Build at least 5,000 new housing units per year, with at least 30 percent of these units provided as affordable units.
  - By 2021, require zero onsite fossil fuel emissions from all new buildings.
  - By 2035, require zero onsite fossil fuel emissions from all large existing commercial buildings.

To support the 2021 Housing and Buildings goal of zero onsite fossil fuel emissions from all new buildings, the board of supervisors passed an all-electric new construction ordinance in November 2020. The ordinance prohibits the installation of natural gas and propane space conditioning, water heating, cooking, and clothes drying equipment and appliances in all new residential and commercial buildings with initial building permit applications filed after June 1, 2021.[88]

San Francisco has developed many plans and programs for reducing the city's contribution to global climate change and meeting the goals of ordinance 81-08. The 2017 Greenhouse Gas Reduction Strategy Update[89] documents city actions related to pursuing cleaner energy, reducing energy consumption, supporting alternative transportation, and implementing solid waste policies. For instance, the city has implemented mandatory requirements and incentives that have measurably reduced greenhouse gas emissions, including but not limited to requirements for increased energy efficiency in new and existing buildings, requirements for the installation of solar panels or vegetation on roofs (i.e., living roofs), implementation of a green building strategy, implementation of a transportation sustainability program, adoption of a zero-waste strategy, adoption of a construction and demolition debris recovery ordinance, creation of a solar energy generation subsidy, incorporation of alternative-fuel vehicles in the city's transportation fleet (including

89 San Francisco Planning Department, *2017 Greenhouse Gas Reduction Strategy Update*, July 2017, *https://sfplanning.org/project/greenhouse-gas-reduction-strategies*, accessed October 29, 2021.

buses), and adoption of a mandatory recycling and composting ordinance. The strategy also includes specific regulations for new development, which would reduce greenhouse gas emissions generated by anticipated future development. These greenhouse gas emissions reduction actions resulted in a 41 percent reduction in greenhouse gas emissions in 2019 compared with 1990 levels.[90,91] This level of greenhouse gas emissions substantially surpasses the 2020 and 2030 goals in the air district's 2017 Clean Air Plan, Executive Orders S-3-05 and B-30-15, AB 32, SB 32, and the city's 2017 greenhouse gas emissions reduction goal.

The July 2021 greenhouse gas ordinance requires the San Francisco Department of the Environment to prepare and submit to the mayor a climate action plan by December 31, 2021. Accordingly, the San Francisco Department of the Environment released the 2021 Climate Action Plan.[92] The climate action plan, which is to be updated every five years, would carry forward the efforts of the city's previous climate action plans and align with the Paris Agreement (e.g., limit global warming to 1.5 degrees Celsius) as well as the reduction targets adopted in the greenhouse gas ordinance. The climate action plan also incorporates an equity framework to address historic inequities; prioritizes the social, economic, and environmental benefits from implementing the climate action plan; and ensures that those benefits are distributed equitably.

Transportation Sector Regulations

With respect to transportation-related emissions, the climate change scoping plan relies on the requirements of SB 375[93] (chapter 728, statutes of 2008), also known as the Sustainable Communities and Climate Protection Act of 2008, to reduce carbon emissions from land use decisions. SB 375 requires each of the state's 18 metropolitan planning organizations to incorporate a sustainable communities strategy in their regional transportation plans, which would then achieve the greenhouse gas emissions reduction targets set by the air board. Plan Bay Area 2050, the Metropolitan Transportation Commission's regional transportation plan, was adopted in October 2021 and serves as a roadmap for the San Francisco Bay Area's future through 2050.[94] For the San Francisco Bay Area, the per capita greenhouse gas emissions reduction targets applicable to Plan Bay Area 2050 are 19 percent by 2035 (i.e., emissions from vehicles and light-duty trucks compared with 2005 levels).[95]

The Governor's OPR implemented changes to the CEQA Guidelines, including the addition of section 15064.3, which requires CEQA transportation analyses to move away from a focus on vehicle delay and level of service. In support of these changes, OPR published its *Technical Advisory on Evaluating Transportation Impacts in CEQA*, which states that the determination of a project's transportation impact should be based on whether project-related VMT per capita (or VMT per employee) would be 15 percent

95 These targets became applicable on October 1, 2018. California Air Resources Board, *SB 375 Regional Plan Climate Targets*, *https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets*, accessed October 29, 2021.

lower than that of existing development in the region.[96] OPR's technical advisory explains that this criterion is consistent with CEQA section 21099, which states that the criteria for determining significance must "promote a reduction in greenhouse gas emissions." In addition, the 15 percent reduction is consistent with the VMT reduction that the air board has determined to be necessary to meet the state's 2030 and 2050 greenhouse gas goals.[97] This metric is intended to replace the use of vehicle delay and level of service for measuring transportation-related impacts.

In addition to actions to reduce VMT, the state has also adopted legislation to improve vehicle fuel efficiency. With the passage of AB 1493 (2002),[98] also known as Pavley I, California launched an innovative and proactive approach to dealing with greenhouse gas emissions and climate change at the state level. AB 1493 amended the health and safety code and requires the air board to develop and implement regulations to reduce automobile and light-duty truck greenhouse gas emissions. Although litigation challenged these regulations and the U.S. Environmental Protection Agency initially denied California's related request for a waiver, the waiver request was granted.[99] Additional strengthening of the Pavley standards (referred to previously as Pavley II and now referred to as the Advanced Clean Cars measure) was adopted for vehicle model years 2017–2025 in 2012. Together, the two standards are expected to increase average fuel economy to roughly 54.5 miles per gallon in 2025. In 2020, the air board estimated that fleet-wide fuel economy in California would be 42.5 miles per gallon.[100]

Adopted in December 2018, the Innovative Clean Transit regulation[101] requires public transit agencies to gradually transition to 100 percent zero-emission bus fleets by 2040. According to the air board, this regulation benefits the state by:[102]

- reducing greenhouse gas emissions for all Californians, especially transit-dependent and disadvantaged communities (the majority of these benefits would be in the state's most populated and affected areas where transit buses are most prevalent);
- increasing penetration of the first wave of zero-emission heavy-duty technologies into applications that are well suited to their use to further achieve emission reduction benefits;
- saving energy and reducing dependency on petroleum and other fossil fuels;
- expanding zero-emission vehicle industry to bring high-quality green jobs to local communities and trained workforce to California; and

- providing other societal benefits by encouraging improved mobility and connectivity with zero-emission transportation modes and reduced growth in light-duty VMT.

Energy Sector Regulations

For the energy sector, California established aggressive renewable portfolio standards under SB 1078[103] (chapter 516, statutes of 2002) and SB 107[104] (chapter 464, statutes of 2006) that required retail sellers of electricity to provide at least 20 percent of their electricity from renewable sources by 2010. These bills amended the California Public Resources Code and Public Utilities Code. Executive Order S-14-08 (November 2008) expanded the state's renewable portfolio standards, which call for 20 to 33 percent of electricity to come from renewable sources by 2020.

In April 2011, Governor Brown signed SB X1-2[105] (chapter 1, statutes of 2011), codifying greenhouse gas emissions reduction goals for energy suppliers (i.e., 33 percent of electricity from renewable energy by 2020) by amending the California Fish and Game Code, the Public Resources Code, and Public Utilities Code. Under SB X1-2, all electricity-supplying entities must adopt the goals of the new renewable portfolio standard (i.e., 20 percent of retail sales from renewable sources by the end of 2013, 25 percent by the end of 2016, and 33 percent by the end of 2020).[106]

Eligible renewable sources include geothermal, ocean wave, solar photovoltaic, and wind sources but exclude large hydroelectric facilities (30 megawatts or more). Therefore, because the SFPUC receives more than 67 percent of its electricity from large hydroelectric facilities, the remaining electricity provided by the SFPUC is required to be 100 percent renewable.[107]

SB 350 (chapter 547, statutes of 2015),[108] signed by Governor Brown in October 2015, dramatically increased the stringency of the renewable portfolio standard and amended multiple state codes. SB 350 establishes a renewable portfolio standard that calls for 50 percent of electricity to come from renewable sources by 2030, along with interim targets of 40 percent by 2024 and 45 percent by 2027. SB 100[109] (2018) further accelerates the renewable energy targets that were set by earlier legislation by amending the California Public Utilities Code.

Short-Lived Climate Pollutant Regulations

SB 605[110] (2014) directed the air board, in coordination with other state agencies and local air districts, to develop a comprehensive Short-Lived Climate Pollutant Reduction Strategy; and SB 1383[111] (2016) directed the air board to approve and implement the Short-Lived Climate Pollutant Reduction Strategy to achieve the following reductions in short-lived climate pollutants:

- 40 percent reduction in methane below 2013 levels by 2030;
- 40 percent reduction in hydrofluorocarbon gases below 2013 levels by 2030; and
- 50 percent reduction in anthropogenic black carbon below 2013 levels by 2030.

The bill also established the following targets for reducing organic waste in landfills and methane emissions from dairy and livestock operations:

- 50 percent reduction in organic waste disposal from the 2014 level by 2020;
- 75 percent reduction in organic waste disposal from the 2014 level by 2025; and
- 40 percent reduction in methane emissions from livestock manure management operations and dairy manure management operations below the dairy sector's and livestock sector's 2013 levels by 2030.

The air board and California's Department of Resources Recycling and Recovery (CalRecycle) are currently developing regulations to achieve the organic waste reduction goals under SB 1383. In January 2019 and June 2019, CalRecycle proposed new and amended regulations in titles 14 and 27 of the California Code of Regulations. Among other things, the regulations set forth minimum standards for organic waste collection, hauling, and composting. The final regulations include an incremental approach to implementation, which began January 1, 2022, with full implementation by 2025.

The air board adopted the Short-Lived Climate Pollutant Reduction Strategy in March 2017 as a framework for achieving the methane, hydrofluorocarbon, and anthropogenic black carbon reduction targets set by SB 1383. The Short-Lived Climate Pollutant Reduction Strategy includes 10 measures regarding short-lived climate pollutants, which fit within a wide range of ongoing planning efforts throughout the state, including the air board's and CalRecycle's proposed rulemaking on organic waste diversion.

APPROACH TO ANALYSIS

Greenhouse gas emissions are analyzed in the context of their contribution to the cumulative effects of climate change because individual actions could never generate enough greenhouse gas emissions to result in a noticeable change in the global average temperature. CEQA Guidelines section 15064.4 calls for a "good-faith effort" to "describe, calculate, or estimate" greenhouse gas emissions. CEQA Guidelines section 15064.4 also allows lead agencies to rely on a qualitative analysis to describe greenhouse gas emissions resulting from a project. In accordance with section 15064.4, the significance of greenhouse gas impacts should consider the extent to which the proposed action would increase or reduce greenhouse gas emissions, exceed a locally applicable threshold of significance, or comply with "regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions." The CEQA Guidelines also state that a project may be found to have a less-than-significant impact if it complies with an adopted plan that includes specific measures to reduce greenhouse gas emissions (section 15064[h][3]). Similarly, the air district has prepared guidelines and methodologies for analyzing greenhouse gas emissions.[112] These guidelines are consistent with CEQA Guidelines sections 15064.4 and 15183.5, which pertain to the analysis and determination of significant impacts from a proposed project's greenhouse gas emissions.

[112] The air district is currently updating its existing CEQA Guidelines and the Thresholds of Significance for greenhouse gases. As detailed in the air district's December 9, 2021, public workshop on this update, the air district's proposed thresholds maintain the option to evaluate projects based on consistency with a local greenhouse gas reduction strategy that meets the criteria under CEQA Guidelines section 15183.5(b).

The air district has reviewed the city's Greenhouse Gas Reduction Strategy and concluded that "aggressive greenhouse gas reduction targets and comprehensive strategies like San Francisco's help the Bay Area move toward reaching the state's AB 32 goals and also serve as a model from which other communities can learn."[113] Although the AB 32 milestone year of 2020 passed just two years ago, San Francisco has already met the 2030 greenhouse gas reduction goal of SB 32 (40 percent below 1990 levels); San Francisco's updated greenhouse gas ordinance includes a pathway to reach the 2050 goals of SB 32 to ensure that the city continues to serve as a model for other communities. As discussed above, the climate change scoping plan adopted pursuant to SB 32 is the state's overarching plan for addressing climate change. Its recommendations are intended to curb projected business-as-usual increases in greenhouse gas emissions and reduce them to 40 percent below 1990 levels by 2030. Meeting the emissions targets of SB 32 as well as longer-term goals would result in an overall annual net decrease in greenhouse gas emissions compared with current levels and account for the projected increases in emissions resulting from anticipated growth.

Given that the city's greenhouse gas emissions reduction targets are more aggressive than the state's 2030 and 2045 greenhouse gas emissions reduction targets, the city greenhouse gas ordinance is consistent with the goals of statewide executive orders and bills (i.e., AB 32; SB 32; and Executive Orders S-3-05, B-30-15, and B-55-18). For example, and as detailed above in Section E.8.3, "Regulatory Setting," although the state's 2030 greenhouse gas emission reduction goal is 40 percent below 1990 levels, the city's 2030 reduction target is 61 percent below 1990 levels. Therefore, compliance with policies, programs, and ordinances that comprehensively makeup the city's actions to achieve the greenhouse gas emissions reduction targets of the city greenhouse gas ordinance would also be consistent with the state's greenhouse gas goals and would not conflict with an applicable plan, policy, or regulation adopted for the purposes of reducing greenhouse gas emissions. Similarly, the city's greenhouse gas strategy resulted in a 41 percent reduction in greenhouse gas emissions in 2019 compared with 1990 levels, [114,115] a level of greenhouse gas emissions that substantially surpasses the 2020 and 2030 goals in the air district's 2017 Clean Air Plan, Executive Orders S-3-05 and B-30-15, AB 32, SB 32, and the city's 2017 greenhouse gas emissions reduction goal. The city has developed a Greenhouse Gas Analysis Compliance Checklist to determine project compliance with greenhouse gas reduction regulations, including those specifically applicable to new development. Therefore, actions that are consistent with the city's comprehensive Greenhouse Gas Reduction Strategy and show compliance with the Greenhouse Gas Analysis Compliance Checklist would also be consistent with the state's greenhouse gas goals and would not conflict with an applicable plan or generate greenhouse gas emissions that would make a considerable contribution to global climate change.

Based on the city's comprehensive greenhouse gas reduction strategy, as detailed above, the proposed project is analyzed based on its consistency with applicable local, regional, and state plans, policies, and regulations adopted for the purpose of reducing greenhouse gas emissions and the cumulative impacts of climate change, including review under the planning department's Greenhouse Gas Analysis Compliance Checklist.

Impact C-GG-1: The proposed project or variant would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (Less than Significant)

PROPOSED PROJECT

Individual projects contribute to the cumulative effects of climate change by directly or indirectly emitting greenhouse gases during construction and operational phases. Direct operational emissions include greenhouse gas emissions from new vehicle trips, other operational vehicle and equipment use, and area sources (minor landscape maintenance). Indirect emissions include emissions from electricity providers; energy required to pump, treat, and convey water; and emissions associated with waste removal, disposal, and landfill operations.

The proposed project would increase the intensity of use at the site by replacing four single-story, 30-foot-tall PDR buildings. Existing uses on the project site in 2017 consisted of storage and warehousing. These four buildings would be replaced with two new, larger, multi-story, 97-foot-tall (115-foot-tall with rooftop appurtenances included) PDR buildings (buildings A and B) that would support uses such as manufacturing and maker space, parcel delivery and last-mile delivery, wholesale and storage, fleet management,[116] and a small amount of retail and quick-service restaurant uses. Both buildings would include a one-way ramp system designed to provide full-service, upper-level truck access, and PDR spaces for its tenants. The proposed project would generate operational greenhouse gas emissions from a variety of sources, including area sources (landscape equipment), mobile sources (daily automobile and truck trips), other diesel-powered equipment (emergency generators and transportation refrigeration units supporting a portion of the truck trips), and energy sources (purchased electricity). During operations, the number of vehicles onsite would increase compared to 2017 conditions (i.e., conditions that existed prior to interim land use). Operation of the proposed project would contribute to an increase in greenhouse gas emissions generated at this site, with mobile sources as the primary source of greenhouse gas emissions resulting from the proposed project.

Construction activities would also result in temporary increases in greenhouse gas emissions. Construction activities that are likely to emit greenhouse gases include demolition of the existing buildings onsite, site preparation and grading, excavation and shoring, building construction, and site finishing work. During construction, there would be daily vehicle trips to transport materials to the site and construction workers traveling to the site to work. Equipment used for the construction activities listed above would be fueled by diesel, propane, and gasoline, which would contribute to emissions of nitrogen oxides, particulate matter, sulfur dioxide, carbon monoxide, methane, and carbon dioxide. Any temporary road obstructions caused by construction could lead to temporary traffic congestion and cause an increase in vehicles idling in the project vicinity.

The proposed project would be subject to regulations adopted to reduce greenhouse gas emissions, as identified in the city's greenhouse gas reduction strategy. As discussed below, compliance with the applicable regulations would reduce the proposed project's greenhouse gas emissions related to transportation, energy use, water use, waste disposal, and use of refrigerants.

[116] Fleet management is not a component of the preferred project land use for the purpose of this environmental analysis. This is because the manufacturing and maker, parcel delivery and last mile, and the wholesale and storage uses would result in higher vehicle trip rates (and corresponding noise and air quality impacts associated with vehicle trip rates) compared to fleet management uses. However, should the project sponsor elect to have a fleet management component as part of the project in the future, the environmental analysis would have adequately evaluated the transportation (and related air quality and noise) impacts from this use.

Compliance with the city's regulations that reduce greenhouse gases, as documented in the Greenhouse Gas Analysis Compliance Checklist, including the Commuter Benefits Program, TDM programs, Transportation Sustainability Program, bicycle parking requirements, low-emission car parking requirements, and car sharing requirements, would reduce the proposed project's transportation-related emissions. These regulations reduce greenhouse gas emissions from single-occupancy vehicles by promoting the use of sustainable transportation modes with zero or lower greenhouse gas emissions on a per capita basis. The project sponsor would incorporate multiple TDM measures into the design of the proposed project, such as an increased number of bicycle parking spaces, showers and locker facilities, and car-share parking measures (see Section A, Project Description, pp. 32 and 33). These design features would also contribute to reducing project-related greenhouse gas emissions and would further efforts to meet the city's targeted greenhouse gas reduction goals.

Although there would be an increase in mobile-source greenhouse gas emissions attributed to this site, siting a parcel and last-mile delivery use, as included in the proposed project, closer to its customer base would improve VMT efficiency compared to current locations and the majority of new development of last-mile delivery uses serving the San Francisco market, and minimize the regional greenhouse gas emissions for the portion of the project that may include parcel and last-mile delivery tenants. Currently, most of the last-mile delivery facilities serving customers in San Francisco are outside the city (e.g., South San Francisco, San Bruno, or Hayward). The demand for parcel and last-mile delivery facilities is expected to continue to grow to meet the customer demand for this service. Based on current services for existing demand, if a distribution center is not built at the project site, demand for parcel and last-mile delivery would continue to be served at a location outside San Francisco (e.g., Oakland or South San Francisco).

The siting of a new PDR site that is designed to accommodate parcel and last-mile delivery tenants in San Francisco would serve the existing and growing demand that would otherwise have to be met by more distant facilities and, therefore, would result in an opportunity to reduce regional VMT for parcel and last-mile delivery uses.[117] The relative comparison of miles per delivery route was evaluated in a study of e-commerce facility siting for the region, and the results are documented in Table 6. The change in VMT between a distribution center outside the city (e.g., South San Francisco, which was used in the analysis[118]) and one at the proposed project site was also calculated based on this information. Deliveries from the proposed project site by automobiles, vans, and smaller trucks, which would typically have a local destination, would have a shorter travel distance to the areas with the greatest existing and projected e-commerce market growth and last-mile delivery demand.[119] Larger trucks (such as tractor trailer trucks) making deliveries to the proposed project site would generally come from outside of the city and need to travel farther than would be necessary for such trucks serving a location outside San Francisco, resulting in an increase in VMT and greenhouse gas emissions from these trips compared to a facility in San Francisco.[120]

---

117 Langan Engineering, Urban E-commerce Distribution Facility Selection Criteria, February 26, 2021.

118 South San Francisco was used in the analysis because there is an existing facility that serves San Francisco, and because it was described in the Langan Engineering August 15, 2019, technical memorandum that a facility could be located there based on zoning, proximity to delivery market, and availability of regional road network, among other factors. Other potential facilities that could be developed based on these factors would be located farther from the projected areas of e-commerce growth that would be served by the proposed project and would therefore result in additional mobile greenhouse gas emissions than a facility in South San Francisco.

119 Adavant and LCW Consultants, 749 Toland Street and 2000 McKinnon Avenue Project, Final Estimation of Project Travel Demand, December 10, 2021.

120 Ibid.

Table 6 Relative Comparison of Miles per Delivery Route

Site Location	Miles per Route to San Francisco County Line (one way)
South San Francisco	5.3 miles
Richmond	20.2 miles
Oakland	6.4 miles
San Leandro	20.9 miles
Hayward	25.4 miles

Source: Langan Engineering 2021 [121]

Overall, this lesser travel distance for the majority of parcel and last-mile delivery trips that could be accommodated by the proposed project would substantially reduce the greenhouse gas emissions that would result from existing or future similar operations outside the city. As one of the largest sources of greenhouse gas emissions for the city, improving efficiency and reducing regional VMT supports the city's general plan policy 36.1 to support urban goods movement networks in San Francisco, while simultaneously being in alignment with the city's overall strategy to integrate land use planning to reduce VMT and transportation-related greenhouse gas emissions.

The project site would support a variety of land uses in addition to parcel and last-mile delivery uses, including maker and manufacturing, warehousing, retail, and quick-service restaurant uses. The proposed project would be required to comply with other elements of the Greenhouse Gas Analysis Compliance Checklist, including the energy-efficiency requirements of the city's Green Building Code, Stormwater Management Ordinance, Water Efficient Irrigation Ordinance, and light pollution reduction requirements. The project would seek LEED Gold certification or higher. Such compliance would promote energy and water use efficiency, thereby reducing the proposed project's energy-related greenhouse gas emissions.[122] These regulations and standards are designed to promote principles that improve energy efficiency, water efficiency and conservation, material and resource conservation and efficiency, and environmental and public health, and have been shown to result in an overall reduction in greenhouse gas emissions compared to similar construction that does not incorporate such standards and practices. Because transportation is the largest source of greenhouse gas emissions from the land use development, the fact that the project is sited in a low-VMT region also contributes to a decrease in mobile-source emissions of greenhouse gas compared to similar projects elsewhere. The project site would be designed with electric docking stations to allow electric plug-in of trucks serving the various land uses, thereby reducing idling time during loading and unloading of trucks serving future land uses onsite, and further reducing the generation of mobile-source greenhouse gas emissions.

The proposed project would be required to meet the renewable energy criteria of the city's Green Building Code, including onsite renewable energy generation, further reducing the proposed project's energy-related greenhouse gas emissions. As discussed in Section A, Project Description (p. 1), the project includes a solar photovoltaic system on the top of each building. Furthermore, 8 percent of the proposed parking spaces would be equipped with electric vehicle charging stations, while other spaces would be electric-vehicle-

121 Langan Engineering, Urban E-commerce Distribution Facility Selection Criteria, February 26, 2021.
122 Compliance with water conservation measures reduce the energy (and greenhouse gas emissions) required to convey, pump, and treat water required for the project.

ready. Furthermore, the proposed project would not include natural gas infrastructure, consistent with the city's strategies to reduce natural gas emissions, which are the second-largest greenhouse gas emissions source in the city (after transportation). These design features would contribute to reducing project-related greenhouse gas emissions and would further efforts to meet the city's targeted greenhouse gas reduction goals.

The proposed project's waste-related emissions would be reduced through compliance with the city's Recycling and Composting Ordinance, Construction and Demolition Debris Recovery Ordinance, and Green Building Code requirements. These regulations reduce the amount of materials sent to a landfill, reducing greenhouse gases emitted by landfill operations. These regulations also promote reuse of materials, conserving their *embodied energy*[123] and reducing the energy required to produce new materials.

Compliance with the city's street tree planting requirements would serve to increase *carbon sequestration*.[124] There are no existing street trees on the project site. Based on public works code section 806(d), the proposed project would be required to plant approximately 216 street trees along its 4,300 linear feet of street frontage. However, due to project and site constraints, the project sponsor proposes to plant approximately 124 street trees and pay the corresponding in-lieu fee for the remaining required trees that cannot be accommodated onsite. These 124 net new street trees would increase carbon sequestration at the project site. Other regulations, including those limiting refrigerant emissions and requiring low-emitting finishes, would reduce emissions of greenhouse gases and volatile organic compounds,[125] respectively. Thus, the proposed project was determined to be consistent with the Greenhouse Gas Analysis Compliance Checklist and San Francisco's comprehensive greenhouse gas reduction strategy.[126]

The project sponsor is required to comply with these regulations, which have proven effective because San Francisco's greenhouse gas emissions have decreased measurably compared with 1990 emissions levels, demonstrating that San Francisco has exceeded Executive Order S-3-05, AB 32, and the Bay Area 2017 Clean Air Plan greenhouse gas emission reduction goals for 2020. Furthermore, the city has exceeded its goal to reduce greenhouse gas emissions to 25 percent below 1990 levels by 2017; emissions were reduced by 36 percent for that year. As of 2019, the city has reduced its greenhouse gas emission 41 percent below 1990 levels despite a population increase of 22 percent.[127]

In addition, San Francisco's local greenhouse gas emission reduction targets meet and exceed the long-term greenhouse gas emission reduction goals of Executive Order S-3-05, Executive Order B-30-15, SB 32, the Bay Area 2017 Clean Air Plan, and Executive Order B-55-18. Therefore, because the proposed project would be consistent with the city's greenhouse gas emission reduction strategy, [126] it would be consistent with the greenhouse gas emission reduction goals of Executive Order S-3-05, Executive Order B-30-15, SB 32, the Bay Area 2017 Clean Air Plan, and Executive Order B-55-18; would not conflict with these plans; and would not exceed San Francisco's applicable greenhouse gas threshold of significance. Therefore, the proposed

---

123 Embodied energy is the total energy required for the extraction, processing, manufacture, and delivery of building materials to the building site.

124 Carbon sequestration is the long-term storage of carbon in plants, soils, geologic formations, and the ocean.

125 Although they are not greenhouse gases, volatile organic compounds are precursor pollutants that form ground-level ozone. Increased ground-level ozone is an anticipated effect of future global warming that would result in added health effects locally. Reducing emissions of volatile organic compounds would reduce the anticipated local effects of global warming.

126 San Francisco Planning Department, Greenhouse Gas Analysis: Compliance Checklist for the San Francisco Gateway Project, 749 Toland Street and 2000 McKinnon Avenue, December 19, 2019.

127 San Francisco Department of the Environment, *San Francisco's Carbon Footprint*, https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan, accessed October 12, 2021.

project's contribution to cumulative greenhouse gas impacts would be less than cumulatively considerable, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, site plan, development intensity, and operations as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the proposed expanded streetscape variant would have greenhouse gas impacts similar to those of the proposed project, but would include a slightly larger footprint. The footprint would involve additional ground disturbance to improve the remainder of the adjacent public rights-of-way. As a result, the same construction equipment used for the street and sidewalk improvements for the proposed project would be used for the expanded streetscape variant but only for the limited area and time necessary to complete the roadway, curb cut, sidewalk, planting, and other upgrades. On the other hand, the expanded streetscape variant would also plant approximately 108 additional street trees, further contributing to carbon sequestration. For the same reasons cited for the proposed project, the expanded streetscape variant's contribution to cumulative greenhouse gas impacts would be less than cumulatively considerable, and no mitigation measures would be required. This topic will not be addressed in the EIR.

E.9. Wind

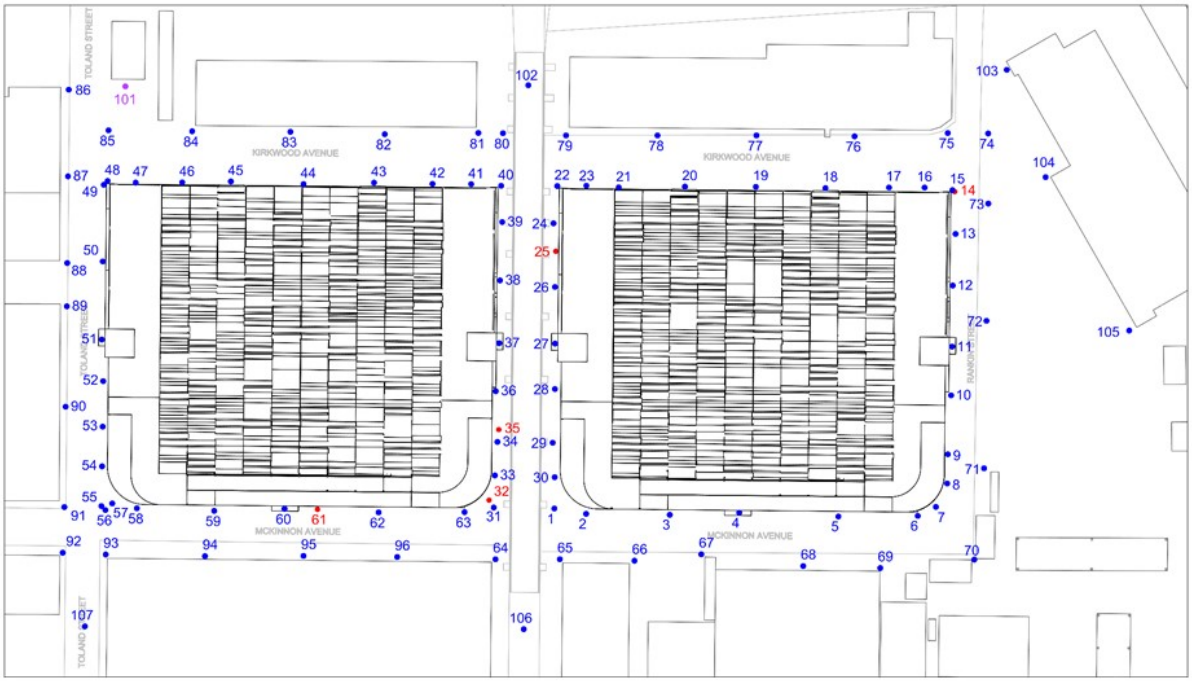
Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Create wind hazards in publicly accessible areas of substantial pedestrian use?	☐	☒	☐	☐	☐

This section evaluates the wind impacts of the proposed project on public areas adjacent to the project site. The discussion of wind impacts in this section is supported by a wind microclimate study.[128]

WIND SETTING

In San Francisco, the primary wind directions are from the northwest, west-northwest, west, and west-southwest. These winds have the greatest frequency of occurrence and make up the majority of the strong winds, based on data collected at the old San Francisco Federal Building at 50 United Nations Plaza between 1945 and 1950. In general, wind speeds are higher in the spring and summer and lower in fall and winter. Daily variation in wind speed is evident, with the strongest winds in the mid- to late-afternoon and the lightest winds in the morning.

Planning code section 148, Reduction of Ground-level Wind Currents in Downtown Commercial (C-3) Districts, requires buildings in the C-3 downtown districts to be shaped so as not to cause ground-level wind currents to exceed defined comfort and hazard criteria. Because the project site is not in a C-3 district, it is not subject to planning code section 148. However, the wind hazard criterion is also used for the assessment of hazardous winds for the purpose of analysis under CEQA. This wind hazard criterion, especially the potential for a project to create new (or additional) locations where the wind hazard criterion would be exceeded, is used in the assessment as the CEQA significance threshold to determine whether the proposed project would substantially alter ground-level winds in public areas in an adverse manner. The hazard criterion of the planning code requires that buildings not cause equivalent wind speeds to reach or exceed the hazard level of 26 miles per hour, as averaged from a single full hour of the year. The hazard criterion is based on winds that are measured for one hour and averaged.



To predict wind speeds and frequencies, many factors are considered, including the geometry and orientation of proposed building(s), the position and height of surrounding buildings, the upwind terrain, and the local wind climate. Buildings taller than their surroundings tend to intercept the stronger winds at higher elevations and redirect them to the ground level. Such a “downwashing” flow is often the main cause for wind accelerations around tall buildings at the pedestrian (or ground) level. These winds can be relatively strong and turbulent, especially around the downwind building corner. Winds can also accelerate between two closely spaced buildings and through a passage underneath a building or bridge. If these building/wind combinations occur for prevailing wind directions, there is a greater potential for increased winds.

[128] BMT, San Francisco Gateway Project Final Wind Microclimate Study, June 23, 2020.

APPROACH TO ANALYSIS

Wind tunnel testing was performed to quantify the pedestrian-level wind microclimate at and around the project site, in accordance with the city's standard test protocols. The testing first involved construction of a 1:300 scale model of the existing buildings at and surrounding the project site up to a 1,500-foot radius of the center of the site, along with a scale model of the project site. Wind speed measurements at assessment locations were made using probes capable of measuring fluctuating pressure differences that are calibrated against wind speed. A system of probes running simultaneously was used to obtain results from 98 test points at a height corresponding to 5 feet at full scale (i.e., pedestrian height). For the cumulative conditions, the total number of test points is reduced to 97 because location 101 would no longer be a publicly accessible ground-level location with the construction of the SF Market Project at 2095 Jerrold Avenue. The test points were selected in publicly accessible areas, including sidewalks, street intersections, and open spaces (Figure 23).

Figure 23 Wind Tunnel Test Point Locations

Source: BMT 2020

Measurements were taken for 16 wind directions in increments of 22.5 degrees (0 degrees represents the compass north). The methodology for quantifying the pedestrian-level wind microclimate of the site is summarized below:

- Measure the building-induced wind speeds at pedestrian level in the wind tunnel.
- Combine these with wind frequency statistics derived from the old San Francisco Federal Building at 50 United Nations Plaza to obtain the expected frequency and magnitude of wind speeds at pedestrian level.
- Compare the results with the section 148 wind hazard criteria to the conditions around the site.

The wind tunnel model compared the wind conditions for the following test scenarios:

1. **Existing Conditions (No Project)**: the existing condition, including buildings currently under construction or recently completed; this serves as the baseline for wind conditions in the study area without the proposed project
2. **Existing Conditions Plus Project**: the proposed project added to the existing conditions; this entails testing a 1:300 scale model of the proposed project in the existing setting to assess the change in ground-level wind conditions as a result of the proposed project
3. **Existing Conditions Plus Project with Wind Mitigation Measures:** wind mitigation measures (nine evergreen street trees; see Figure 24) added to the project in existing conditions to lessen wind hazard impacts
4. **Cumulative Conditions (No Project):** cumulative conditions anticipated in the project vicinity without the proposed project; this serves as the baseline for wind conditions in the study area with reasonably foreseeable development within a 1,500-foot radius from the project site
5. **Cumulative Conditions Plus Project:** the proposed project added to the cumulative conditions scenario—that is, the area and cumulative development that would be expected to contribute to wind effects due to their proximity to the project site (see Figure 24 on p. 105)—so as to assess whether the project could have a considerable contribution to a change in cumulative wind conditions
6. **Cumulative Conditions Plus Project with Wind Mitigation Measures:** wind mitigation measures (nine evergreen street trees; see Figure 24) added to the project in cumulative conditions to lessen cumulative wind hazard impacts

Existing conditions in the project vicinity generally are characterized as fairly windy. However, the site and surrounding study area are not prone to exceedances of the hazard criterion. The wind hazard results from the wind tunnel tests are summarized in Table 6 (p. 99); the wind hazard results are summarized in the top portion of the table, and the aggregate data for all test points are shown in the bottom portion. Under existing conditions (without the proposed project), wind speeds at all 98 test points would comply with the city's hazard criterion. Accordingly, under existing conditions, there are zero hours when winds exceed the wind hazard criterion.

Figure 24 Location of Street Trees for Wind Mitigation

Source: BMT 2020

Impact WI-1: The proposed project or variant would create wind hazards in publicly accessible areas of substantial pedestrian use. (Less than Significant with Mitigation)

PROPOSED PROJECT

Existing conditions in the project vicinity generally are characterized as fairly windy. However, the site and surrounding study area are not prone to exceedances of the hazard criterion. The wind hazard results from the wind tunnel tests are summarized in Table 7 (p. 107); the wind hazard results are summarized in the top portion of the table (indicated in **bold** text), and the aggregate data for all test points are shown in the bottom portion. Where no wind hazards have been identified, the range of wind speeds across all test locations has been included for comparison. Under existing conditions (no project), wind speeds at all 98 test points would comply with the city's hazard criterion. Accordingly, under existing conditions, there are zero hours when winds exceed the wind hazard criterion.

Under existing plus project conditions, the average wind speed would decrease from 11 miles per hour to 10.5 miles per hour, compared to existing conditions without the project. However, with the proposed project, there would be a wind hazard criterion exceedance at two locations, and the number of hours that the wind hazard criterion would be exceeded would increase from zero hours per year to 13 hours per year. Fast upper-level prevailing westerly winds reaching the proposed development would be redirected toward the ground, creating downdraughts[129] and funneling[130] along Toland Street and accelerating around the corner of the proposed project at the junction with Kirkwood Avenue. The exceedances of the hazard criterion would occur around the northern corner of the proposed project on either side of Kirkwood Avenue (Locations 49 and 85).

Therefore, because the proposed project would result in an exceedance of the planning code wind hazard criterion, the proposed project would result in a significant wind impact.

A number of wind mitigation features were tested to reduce the project's wind impact, including various combinations of canopies (both solid and porous) and deciduous trees along Toland Street. Although the canopies were shown to be partially effective in reducing certain wind conditions, they also increased the number of wind hazard hours away from the project or at the northern corner of the project at the intersection of Toland Street and Kirkwood Avenue. Given that deciduous trees lose their leaves in winter, trees without leaves were assessed in the wind tunnel to determine whether they could effectively reduce wind impacts. The wind tunnel tests demonstrated that exceedances of the city's wind criteria would still occur with the inclusion of deciduous trees. Based on the wind tunnel tests, the planting of nine evergreen street trees , which retain their foliage throughout the year, was evaluated. The trees would be placed along the eastern sidewalk of Toland Street (Figure 24); each tree would be approximately 25 feet tall, with a 15-foot-diameter canopy. This planting would eliminate the exceedance of the hazard criterion at all test points in the existing plus project conditions.

[129] A downdraught is the effect of higher-level winds being deflected by a building towards ground level.
[130] Funneling is the acceleration of wind between adjacent buildings due to their proximity.

Table 7 Wind Hazard Criterion Exceedance Results – Scenarios in Existing Conditions

Existing Conditions (No Project)		
Location Number	**Range of Wind Speed Exceeded 1 Hour per Year (mph)[1] for All Test Locations**	**Hours per Year Wind Speed Exceeds Hazard Criterion**
No exceedances at any location	14 – 32	0
	Average Wind Speed Exceeded 1 Hour per Year (mph)[1]	**Total Hours per Year Wind Speed Exceeds Hazard Criterion**
All Test Points	22.9	0

Existing Conditions Plus Project

Source: BMT 2020

Notes:

Results that exceed the city's wind criteria are indicated in **bold.** The table shows that exceedances occur under the Existing Conditions Plus Project at two locations.

[1] The probability of having an equivalent wind speed exceed the 26 mph mean-hourly wind speed hazard criterion for a full hour within any one-year period. The wind hazard criterion is derived from the 26 mph hourly average wind speed that would generate a three-second gust of wind at 20 meters per second, a commonly used guideline for wind safety. In the results table, the 26 mph hourly average is converted to a one-minute average of 36 mph, which is used to determine compliance with the 26 mph one-hour hazard criterion in the planning code (Arens, E. et al., "Developing the San Francisco Wind Ordinance and its Guidelines for Compliance," Building and Environment, Vol. 24, No. 4, p. 297-303, 1989).

[2] Refer to Figure 23, Wind Tunnel Test Point Locations, on p. 103, for the test point locations that would have exceedances as a result of the proposed project.

mph = miles per hour

On February 2, 2021, the San Francisco Bureau of Urban Forestry gave preliminary approval for the use of the proposed nine evergreen street trees on the eastern sidewalk of Toland Street.[131] If the building design changes or the trees are not maintained to be at least 25 feet tall with a 15-foot-diameter canopy, the proposed project could result in an exceedance of the wind hazard criterion. This would also be a significant impact. Mitigation Measures M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications; and M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards, have been included to address these circumstances and ensure that the proposed project would not result in an exceedance of the wind hazard criterion. With implementation of Mitigation Measures M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications; and M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards, exceedances of the city's wind hazard criterion would not occur, and wind impacts on publicly accessible areas of substantial pedestrian use would be less than significant.

Mitigation Measure M-WI-1a **Wind Hazard Evaluation for Building Design and Streetscape Modifications.** If the proposed project's design, including the wind mitigation measures (M-WI-1b), is modified in any way that could affect ground-level wind conditions, the new design shall be evaluated by a qualified wind expert to determine the potential for the modified project to result in a new wind hazard exceedance (defined as the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed). The evaluation may require wind tunnel testing by the qualified expert to determine whether the modified project would result in an exceedance of the wind hazard criterion. If the modified project could exceed the wind hazard criterion, the project buildings shall be shaped (e.g., by including setbacks or using other building design techniques) or other wind-baffling measures shall be implemented, so that the project does not result in an exceedance of the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed.

Mitigation Measure M-WI-1b **Maintenance of Landscaping Features that Reduce Wind Hazards.** The project sponsor shall maintain, for the life of the proposed project buildings, all landscaping features required to ensure that the proposed project does not result in in an exceedance of the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed. These features include installation of nine evergreen street trees, each approximately 25 feet tall with a 15-foot-diameter canopy, along the eastern sidewalk of Toland Street *or* any landscaping features required pursuant to Mitigation Measure M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications.

Significance after Mitigation. Based on wind tunnel testing of the existing conditions plus project with wind mitigation features described in Mitigation Measure M-WI-1b, the 13 hours of wind hazard exceedances would be eliminated and the wind hazard criterion would be met at all test points. Mitigation Measure M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications, would ensure that the proposed project does not exceed the wind hazard criterion in the event of design changes. Additionally, Mitigation Measure M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards, would entail the maintenance, for the life of the project buildings, of any landscaping features required to ensure that the one-hour wind hazard is not exceeded. Therefore, the proposed project would not create wind hazards in publicly

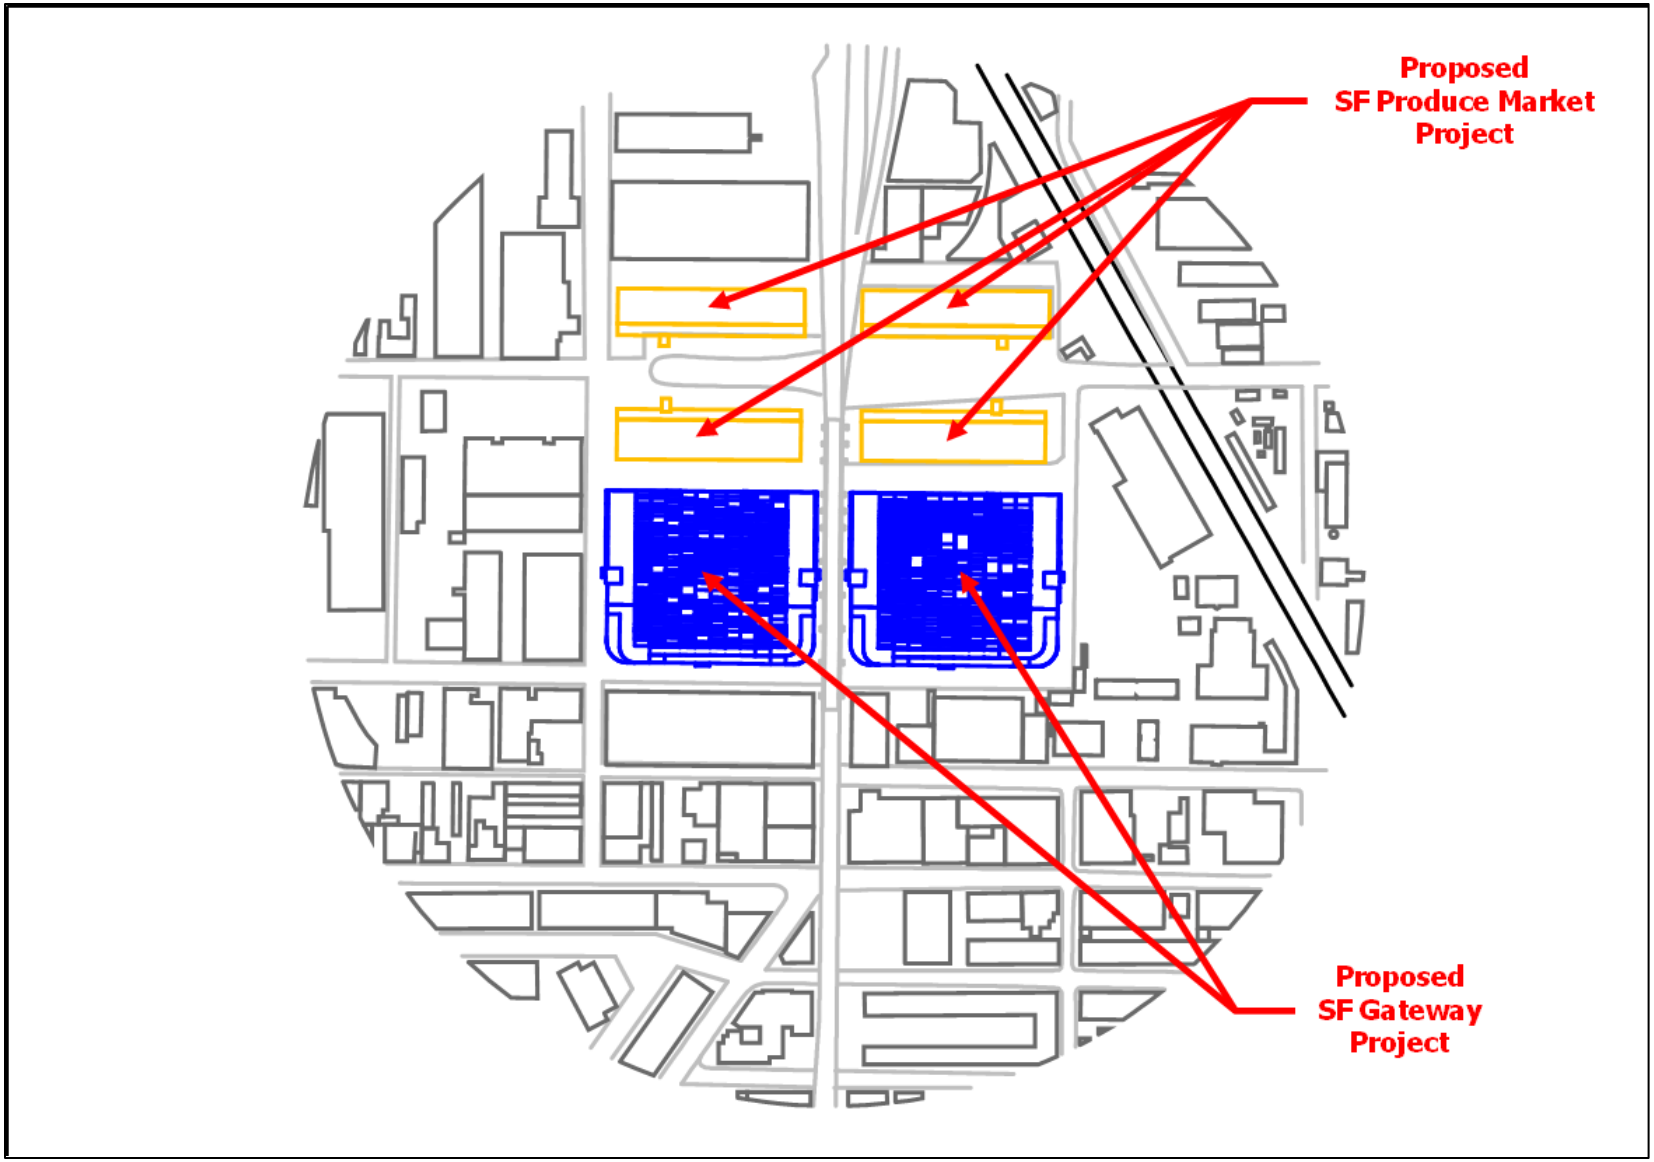
[131] Dottson, Marcus, Urban Forestry Inspector, San Francisco Bureau of Urban Forestry, email correspondence between Marcus Dottson and Chloe Hanna-Corpi and Brian Liles (Jackson Liles Architecture), February 2, 2021.

accessible areas of substantial pedestrian use, and the impact would be less than significant with mitigation. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses; building heights, massing, and design; and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have wind impacts similar to those of the proposed project and would not include construction of any additional structures onsite. The expanded streetscape variant would include additional street trees on the sidewalks of the streets along the project perimeter. These additional street trees could reduce ground-level wind speeds near the project site. However, similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measures M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications; and M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards. With implementation of these measures, the expanded streetscape variant would not create wind hazards in publicly accessible areas of substantial pedestrian use, and the impact would be less than significant with mitigation. This topic will not be addressed in the EIR.

Impact C-WI-1 The proposed project or variant, in combination with cumulative projects in the project site vicinity, could result in cumulative wind impacts. (Less than Significant with Mitigation)



PROPOSED PROJECT

The cumulative conditions analysis involves testing the impact of the proposed project, in conjunction with other cumulative development projects in the study area, on the wind environment in the project vicinity. Of the cumulative projects in the vicinity of the project site, only the SF Market Project would be expected to contribute to ground-level wind effects near the project vicinity (see Figure 25 on p. 110). The other cumulative projects listed in the cumulative project setting (pp. 43 through 46) are too distant from the project site, not of sufficient height, or involve minor reconfiguration of aboveground equipment or facilities that would not affect ground-level wind conditions.

The cumulative conditions (no project) were tested first to define wind conditions resulting from other cumulative developments in the project vicinity. As explained above, only the SF Market Project would be expected to contribute to wind effects within the 1,500-foot study area. The wind hazard criterion exceedance results from the cumulative conditions scenarios wind tunnel tests are summarized in Table 8 (p. 111); the cumulative wind hazard results are summarized in the top portion of the table (indicated in **bold** text), and the aggregate data for all test points are shown in the bottom portion. Where no wind hazards have been identified, the range of wind speeds across all test locations has been included for comparison. Under cumulative conditions (no project), some accelerated winds in localized areas would occur due to increased funneling and acceleration around corners, while equally providing shielding from prevailing winds in other areas. However, all 97 test points[132] would comply with the hazard criterion under cumulative conditions (no project), similar to the existing conditions (no project) scenario. Accordingly, the total number of hazard exceedance hours would be zero.

[132] For the cumulative conditions, the total number of test points is 97 because one of the test sites under existing conditions would no longer be a publicly accessible ground-level location with the proposed development at this site.

Source: BMT 2020

Notes:

Results that exceed the city's wind criteria are indicated in **bold.** The table shows that exceedances occur under the Cumulative Conditions Plus Project at three locations.

[1] The probability of having an equivalent wind speed exceed the 26 mph mean-hourly wind speed hazard criterion for a full hour within any one-year period. The wind hazard criterion is derived from the 26 mph hourly average wind speed that would generate a three-second gust of wind at 20 meters per second, a commonly used guideline for wind safety. In the results table, the 26 mph hourly average is converted to a one-minute average of 36 mph, which is used to determine compliance with the 26 mph one-hour hazard criterion in the planning code (Arens, E. et al., "Developing the San Francisco Wind Ordinance and its Guidelines for Compliance," Building and Environment, Vol. 24, No. 4, p. 297-303, 1989).

[2] Refer to Figure 23, Wind Tunnel Test Point Locations, for the test point locations that would have exceedances as a result of the proposed project.

mph = miles per hour

Under cumulative conditions plus project, wind hazard exceedances are expected to occur at three test locations and would increase the total number of exceedance hours from zero hours per year to 18 hours per year. Because the exposure of the proposed project to prevailing westerly winds would be similar under existing and cumulative conditions, the resulting flow features and wind conditions around the project site for cumulative plus project conditions are similar to the existing plus project conditions. The wind hazard criterion exceedances would occur around the northern corner of the proposed project on either side of Kirkwood Avenue and Toland Street. Therefore, the proposed project, in combination with cumulative projects, would create wind hazards in publicly accessible areas of substantial pedestrian use, resulting in a significant cumulative impact. Given that the wind hazard impacts would only occur in the cumulative scenario with the proposed project, the project's contribution to cumulative wind impacts would be cumulatively considerable. The wind tunnel testing shows that the same wind mitigation identified in Impact WI-1 to eliminate existing plus project wind hazard exceedances also would avoid the cumulative wind hazard exceedances, reducing the cumulative wind impact to a less-than-significant level.

The wind tunnel model did not include the 2270 McKinnon Avenue project, because it had not been proposed when wind tunnel testing commenced for the SF Gateway Project. The principal effect of the 2270 McKinnon Avenue project on wind conditions around the proposed project would be one of shielding from prevailing winds. Thus, including this project as part of the cumulative conditions would not alter the wind tunnel results.[133]

For the reasons cited above for the proposed project, should there be any change to the exterior design of the project buildings or landscaping, the same mitigation measures identified for the proposed project, Mitigation Measures M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications; and M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards, would apply and would ensure that cumulative wind impacts are less than significant.

Significance after Mitigation

Based on the wind tunnel testing under cumulative conditions plus project with wind mitigation, wind conditions at all 97 test points would comply with the hazard criterion, and the total number of wind hazard exceedance hours would be zero. Thus, the proposed project's cumulatively considerable contribution to significant cumulative wind impacts would be eliminated. Mitigation Measure M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications, would ensure that the proposed project does not result in a cumulatively considerable wind impact in the event of design changes. Additionally, Mitigation Measure M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards, would entail the maintenance, for the life of the project buildings, of any landscaping features required to ensure that the proposed project does not cumulatively contribute to a one-hour wind hazard exceedance. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses; building heights, massing, and design; and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The proposed expanded streetscape variant would have wind impacts similar to those of the proposed project and would not include construction of any additional

[133] NOVA Fluid Mechanics (Formerly BMT), 75006 San Francisco Gateway Project – Cumulative Wind Review, February 15, 2022.

structures onsite. The expanded streetscape variant would include additional street trees on the sidewalks of the streets along the project perimeter. These additional street trees could reduce ground-level wind speeds near the project site. However, similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measures M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications; and M-WI-1b: Maintenance of Landscaping Features that Reduce Wind Hazards. With implementation of these measures, the expanded streetscape variant would ensure that cumulative wind impacts are less than significant. This topic will not be addressed in the EIR.

E.10. Shadow

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Create new shadow that substantially and adversely affects the use and enjoyment of publicly accessible open spaces?	☐	☐	☒	☐	☐

Impact SH-1 The proposed project or variant would not create new shadow in a manner that substantially and adversely affects the use and enjoyment of publicly accessible open spaces (Less than Significant)

PROPOSED PROJECT

Planning code section 295 generally prohibits new structures taller than 40 feet that would cast additional shadows on open space that is under the jurisdiction of the San Francisco Recreation and Park Department between one hour after sunrise and one hour before sunset, at any time of the year, unless that shadow would not result in a significant adverse effect on the use of the open space.

The criteria for determining the significance of impacts under CEQA is whether the proposed project would create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas, regardless of whether those facilities or areas are protected by planning code section 295 (i.e., under jurisdiction of public entities other than the Recreation and Park Commission or privately owned and publicly accessible open space). In addition, as under planning code section 295, the CEQA analysis of shadow impacts takes into account the use of the open space; the time of day and year of project shadow; the physical layout and facilities affected; the intensity, size, shape, and location of the shadow; and the proportion of open space affected.

As described in Section A, Project Description, buildings A and B each would be a maximum height of 97 feet (115 feet with rooftop appurtenances included). Because the proposed project would be more than 40 feet tall, the planning department performed a shadow fan analysis to assess the new shadow resulting from the proposed project.[134] Based on this analysis, the proposed project would not affect any parks subject to planning code section 295.

Selby and Palou Mini Park is the nearest San Francisco Recreation and Park Commission property to the project site. It is a 0.29-acre urban park, approximately 900 feet to the southwest of the project site along Selby Street between Quesada and Palou avenues. According to the shadow fan analysis by the planning department, the proposed project would not create new shadow on this park at any time throughout the year. There are no other San Francisco Recreation and Park Commission properties that are within, or near, the potential reach of the proposed project's shadow.

[134] San Francisco Planning Department, Preliminary Shadow Fan Analysis: 749 Toland Street and 2000 McKinnon Avenue, September 9, 2019.

There are no other public parks or open spaces owned by other city agencies that are within, or near, the potential reach of shadow under the proposed project. Therefore, the proposed project would have no shadow impact on public parks or open spaces.

The proposed project would shade portions of streets, sidewalks, and private properties in the project vicinity at various times of the day throughout the year. The shadows on streets and sidewalks would not exceed levels commonly expected in urban areas and would be considered a less-than-significant effect under CEQA. Additionally, these shadows would be transitory in nature, would not substantially affect the use of the sidewalks, and would not increase shadow above levels that are common and generally expected in a developed urban environment.

As discussed above, the proposed project would not create new shadow that substantially affects existing outdoor recreation facilities or other public areas. This impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights and massing, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would not create new shadow because there would not be any additional aboveground structures under the expanded streetscape variant compared to the proposed project. Similar to the proposed project, the impact of the expanded streetscape variant would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-SH-1 The proposed project or variant, in combination with cumulative projects in the project site vicinity, would result in less-than-significant cumulative shadow impacts. (Less than Significant)

PROPOSED PROJECT

The geographic context for shadow impacts is the area in which the proposed project and cumulative projects, in combination, would shade the same public open spaces. Cumulative projects that include aboveground construction in the project vicinity would add shadow to sidewalks immediately surrounding the project site, but would not shadow San Francisco Recreation and Park properties (see Section B, Cumulative Setting, and Figure 22, pp. 43 through 46). The projects that involve aboveground and building footprint changes include the SF Market Project; the 2270 McKinnon Avenue Project; and the SFPUC projects in the Southeast Treatment Plant site, including the Headworks Project and the Biosolids Digester Facility Project. The other cumulative projects are in-kind replacements, underground or street-level improvements, or indoors, and would not affect shadows.

As discussed above under Impact SH-1, shadow from the proposed project would not reach any offsite publicly accessible open spaces (other than sidewalks). Therefore, the proposed project would not have the potential to combine with impacts from cumulative projects to result in cumulative shadow impacts on publicly accessible open spaces.

Although these cumulative projects could also shade public sidewalks, cumulative shadow from these projects would not increase shading on public sidewalks above levels that are common and generally

accepted in developed urban environments. Therefore, the proposed project, in combination with cumulative projects, would have less-than-significant cumulative shadow impacts, and no mitigation measures are required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights and massing, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the proposed expanded streetscape variant would have the same shadow impacts as the proposed project because they would have the same aboveground structures. Similar to the proposed project, the expanded streetscape variant, in combination with cumulative projects, would have less-than-significant cumulative shadow impacts, and no mitigation measures are required. This topic will not be addressed in the EIR.

E.11. Recreation

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?	☐	☐	☒	☐	☐
b) Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	☐	☐	☐	☒	☐

Impact RE-1 **The proposed project or variant would not increase the use of existing parks and recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. (Less than Significant)**

PROPOSED PROJECT

The project site is in an intensely developed urban area that does not contain large regional park facilities. However, there are two small neighborhood parks and two community gardens near the project site. The following parks are within 0.5 mile of the project site:

- The Selby and Palou Mini Park is a 0.29-acre park in the Bayview neighborhood, approximately 900 feet southwest of the project site. The park includes benches, picnic tables, a basketball court, and a children's play area.
- The Palou and Phelps Mini Park is a 2.63-acre park, approximately 0.3 mile south of the project site. The park includes a playground, benches, trails, and a steep grass area.
- The Wolfe Lane Community Garden is a 0.05-acre community garden managed by the San Francisco Recreation and Park Department, where members can grow produce and ornamental plants for personal use. The garden is approximately 0.4 mile west of the project site.
- The Dogpatch/Miller Memorial Garden is an approximately 0.25-acre community garden and park, owned by San Francisco Recreation and Park Department. The garden is approximately 0.4 mile west of the project site.

Construction

During the 31-month construction period, approximately 400 to 500 workers would be onsite per day. Staffing levels would vary throughout the year in accordance with seasons and onsite construction activities. As discussed in Section E.2, Population and Housing, short-term construction workers are not expected to permanently relocate to the city from more distant locations. During construction, there may be temporary demand for these recreational resources because workers could use parks, community gardens,

and recreational facilities when on break. Consequently, any use by project construction workers of the nearby mini-parks, the more distant neighborhood and regional parks facilities, or other recreational facilities would be temporary and minimal. Additionally, community gardens are typically used by members who are actively involved in maintaining them, and it is less likely that construction workers would become members. Therefore, impacts to recreational resources during construction would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Operation

The proposed project does not involve the construction of residential units that would generate an increased demand for recreational services. However, the proposed project would result in an increased number of employment opportunities at the site. This increase in the number of onsite employees could result in an increased demand for and use of neighborhood parks, community gardens, and recreational facilities. In general, it is anticipated that new employees would only visit open spaces during brief periods limited to the lunch hour or other midday breaks.

Additionally, due to the nature of the land uses described in Table 3, Preferred Project Use Mix (p. 19), and the normal hours detailed on Figure 13, Production, Distribution, Repair, and Related Uses (p. 21), a large number of the employees onsite would not be working a "typical" eight-hour workday at the project site. Under each use, employees would work shifts throughout different hours of the day and night. It is anticipated that any employees working after dark would not likely use any recreational facilities during their shift. A majority of the employees onsite would work for parcel delivery and last-mile companies (65 percent of the total gross square footage of the PDR-related uses onsite) and wholesale and storage companies (32 percent of the total gross square footage of the PDR-related uses onsite). As described in Section E.2, Population and Housing, the net new number of employees onsite would be 1,242. The number of workers associated with completing *visitor trips*[135] to and from the project site would be approximately 3,800.[136] These 3,800 workers would spend the majority of their shifts offsite (i.e., a parcel delivery driver would spend a significant amount of time away from the project site delivering goods throughout the day rather than being onsite for long periods of time).

As stated above under "Construction," community gardens are typically used by members who care for the garden. It is less likely that employees would become members of the community gardens. Additionally, the project site is not in a "high need" area according to the general plan, defined as areas with high population densities, high concentrations of seniors and youth, and lower income populations that live outside of existing park service areas.[137] The number of employees that may use these recreational resources is not expected to substantially accelerate the physical deterioration of these facilities. Therefore, the proposed project would have a less-than-significant impact on recreational facilities and resources, and no mitigation measures would be required. This topic will not be addressed in the EIR.

---

135 Visitor trips were defined as all other trips not related to onsite employees in the Final Travel Demand Memorandum. The number of workers associated with the visitor trips (e.g., goods deliveries, parcel and last-mile delivery trips) was estimated based on one worker per round vehicle trip to and from the project sites.

136 Adavant and LCW Consultants, 749 Toland Street and 2000 McKinnon Avenue Project, Final Estimation of Project Travel Demand, December 10, 2021.

137 City and County of San Francisco, San Francisco General Plan: Recreation and Open Space Element, 2014.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the proposed expanded streetscape variant would have the same recreation impacts as the proposed project and would not increase the use of existing parks and recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. This impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact RE-2 The proposed project or variant would not include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. (No Impact)

PROPOSED PROJECT

The proposed project does not include recreational facilities or require the construction or expansion of recreational facilities that could have an adverse effect on the environment. The two new buildings are in a PDR zoning district and would be designed for PDR uses and limited retail uses. In accordance with the city's planning code (article 2), PDR districts are not required to provide recreational space.[138] Therefore, the proposed project would have no impact related to construction or expansion of existing recreational facilities that might result in an adverse physical effect on the environment. No mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have the same recreation impacts as the proposed project and would have no impact related to construction or expansion of existing recreational facilities that might result in an adverse physical effect on the environment. No mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-RE-1 The proposed project or variant, in combination with cumulative projects in the vicinity of the project site, would result in less-than-significant cumulative impacts related to recreation. (Less than Significant)

PROPOSED PROJECT

The geographic context for cumulative recreation impacts for the proposed project is the immediate neighborhood, or generally the area within 0.5 mile of the project site, because workers would not be expected to travel to recreational facilities beyond this distance. The nearest cumulative projects are identified in Section B, Project Setting, pp. 43 through 46. These include the SF Market Project; the Bayview Community Based Transportation Plan; the Quint-Jerrold Connector; the 2270 McKinnon Avenue Project; and the SFPUC projects in the Southeast Treatment Plant site, including the Headworks Project, the Biosolids Digester Facility Project, and the Power Feed Project, but only the SF Market and 2270 McKinnon

[138] American Legal Publishing Corporation, article 2: Use Districts, Sec. 210.3 PDR Districts, 2019, *http://library.amlegal.com/nxt/gateway. dll/California/planning/planningcode? f=templates$fn=default. htm$3. 0$vid=amlegal: sanfrancisco_ca$sync=1*, accessed August 20, 2019.

Avenue Project could increase employment in the immediate area. Beyond the immediate vicinity of the project site mapped in Figure 22 on p. 44, but within 0.5 mile of the project site, additional light industrial projects near U.S. 101 and I-280, additional SFPUC infrastructure projects near the Southeast Treatment Plant, and small-scale residential projects (single family, duplex units, or accessory dwelling unit applications) near the Palou Phelps Mini Park would be constructed. Employees and/or residents might use the nearby recreational facilities or community gardens once these projects are constructed. The proposed project, combined with the cumulative projects, would not increase the residential population in the immediate project vicinity, so the demand and use of recreational resources would be limited to the onsite employees.

Although the cumulative projects would increase the number of employees in the area, potential use of the nearby parks and community gardens likely would be limited to lunch or midday breaks, and thus would not impose a substantial demand on or use of these resources. Because of the limited use and likely few employees who would use the parks and gardens, the proposed project in combination with cumulative projects are not anticipated to increase use of recreational facilities to such a degree that substantial deterioration of these facilities would occur or be accelerated. Therefore, cumulative recreational impacts would be less than significant, and no mitigation measures are required. Additionally, the proposed project does not include recreational facilities and so does not have the potential to contribute to adverse physical environmental effects related to the construction of recreational facilities. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have the same recreation impacts as the proposed project. Because of the limited use and likely few employees who would use the parks and gardens, the expanded streetscape variant in combination with cumulative projects are not anticipated to increase use of recreational facilities to such a degree that substantial deterioration of these facilities would occur or be accelerated. Therefore, cumulative recreational impacts would be less than significant, and no mitigation measures are required. Additionally, the expanded streetscape variant does not include recreational facilities and so does not have the potential to contribute to adverse physical environmental effects related to the construction of recreational facilities. This topic will not be addressed in the EIR.

E.12. Utilities and Service Systems

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater, electrical power, natural gas, or telecommunications facilities the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐	☐
d) Generate solid waste in excess of state or local standards, or in excess of capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐	☐

The project site is in an urban area that is served by water storage, treatment, and distribution facilities; combined wastewater and stormwater collection, storage, treatment, and disposal facilities; electric power and telecommunication facilities; and solid waste collection and disposal service systems.

Impact UT-1 **The proposed project or variant would not require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electric power, natural gas, or telecommunications facilities that could result in environmental effects beyond those evaluated throughout this initial study. (Less than Significant)**

PROPOSED PROJECT

The proposed project would not require or result in the construction of new combined wastewater and stormwater main lines or expansion of the existing Southeast Treatment Plant that provides wastewater and stormwater treatment and management for the project site. No single project alone would warrant expansion of the city's water supply system. Consequently, individual projects are considered in combination with other projects, and their individual contribution to cumulative water demand is examined.

Although the proposed project would not require new or expanded water, wastewater treatment, or stormwater drainage improvements, the proposed project would require relocation of or construction of new or expanded onsite utilities and service systems, including new water transmission pipeline, wastewater collection and conveyance facilities, and stormwater facilities. In addition, the proposed project would install new connections to the surrounding PG&E electric grid to provide service to the proposed buildings. The project would also provide connections to communication lines along adjacent roadways. The proposed project would not require new natural gas connections because the project would not use natural gas.

The activities required to install new or expanded onsite utilities are accounted for in the project description as components required to construct the proposed project (e.g., excavation, trenching, and foundations). Physical impacts associated with construction of project-serving utilities and the buildings are included in the evaluation of the project's physical environmental impact described throughout this initial study, including Section E.3, Cultural Resources; Section E.4, Tribal Cultural Resources; Section E.14, Biological Resources; Section E.15, Geology and Soils; Section E.16, Hydrology and Water Quality; and Section E.17, Hazards and Hazardous Material. These components will also be included in the additional analyses of the project's air quality, noise, and transportation impact; these further analyses will be included in the EIR.

Other than localized connections to the existing systems, the proposed project would not result in the construction or relocation of water, wastewater, stormwater, electric, or telecommunications facilities (e.g., electric substations or telecommunication towers). Therefore, this impact would be less than significant, and no mitigation measures would be required. This topic will not be discussed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the expanded streetscape variant would have utilities and service system impacts similar to those of the proposed project. Other than localized connections to the existing systems, the expanded streetscape variant would not result in the construction or relocation of water, wastewater, stormwater, electric, or telecommunications facilities (e.g., electric substations or telecommunication towers). Therefore, this impact would be less than significant, and no mitigation measures would be required. This topic will not be discussed in the EIR.

Impact UT-2 The proposed project or variant would not exceed the capacity of the Southeast Treatment Plant and would not require the construction of new or expansion of existing wastewater and stormwater treatment facilities. (Less than Significant)

PROPOSED PROJECT

The SFPUC owns and operates San Francisco's combined sewer system, which collects and treats both wastewater and stormwater runoff. The Southeast Treatment Plant provides wastewater and stormwater treatment and management for the eastern portion of the city, including the project site. Wastewater is transported to the Southeast Treatment Plant through a grid of transport/storage boxes, sewers, and five major pump stations. The Southeast Treatment Plant treats an average of 60 mgd of dry-weather flow, has a

current dry-weather design capacity of 85.4 mgd, and has a peak wet-weather capacity of 250 mgd.[139, 140] As part of the SSIP, the Southeast Treatment Plant is undergoing operational improvements and seismic upgrades to ensure the reliability of the sewer system.[141] As described below, the proposed project would have a less-than-significant impact on wastewater and stormwater treatment facilities, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Stormwater

The project site is completely developed with impervious surfaces. Upon completion of the proposed project, pursuant to the requirements of the San Francisco Stormwater Management Ordinance, the proposed project would reduce the overall amount of impervious surface on the site. This would, in turn, reduce or delay the amount of stormwater entering the city's stormwater collection system in comparison to existing conditions. The San Francisco Stormwater Management Ordinance requirements are further described below.

The San Francisco Stormwater Management Ordinance (as codified in section 147 of the San Francisco Public Works Code) requires projects that create and/or replace at least 5,000 square feet of impervious surface and discharges into the combined sewer system to implement postconstruction stormwater runoff measures consistent with the Stormwater Management Requirements and Design Guidelines. Sites with more than 50 percent impervious surfaces (such as the project site) also must be designed so that the stormwater runoff rate and volume do not exceed predevelopment conditions for the one- and two-year, 24-hour design storm.[142] As discussed in the Water Supply Assessment for this project, the project would request a modified compliance with the first submittal of the Stormwater Control Plan. The modified requirements would be a 40 percent reduction in the rate and a 10 percent reduction in the volume of runoff for the 2-year, 24-hour design storm.[143] To meet these modified requirements, the proposed project would include rainwater collection cisterns that would manage stormwater onsite and limit demand on both the collection system and wastewater facilities resulting from stormwater discharges. A stormwater control plan would be designed for review and approval by the SFPUC (refer to Impact HY-1).

Modified compliance with the Stormwater Management Requirements and Design Guidelines would ensure that stormwater generated by the proposed project is managed onsite so that the proposed project would not substantially contribute polluted runoff to the city's existing stormwater infrastructure. This in turn would reduce the demand on both the collection system and wastewater facilities resulting from stormwater discharge, in comparison to existing conditions, minimizing the potential need for additional treatment capacity. Therefore, stormwater impacts of the proposed project on the Southeast Treatment Plant would be less than significant.

143 SFPUC, Water Supply Assessment for San Francisco Gateway Project, adopted June 9, 2020, Resolution No. 20-0126.

Wastewater

SFPUC assumes that nonresidential uses discharge 90 percent of water to the combined sewer.[144] The 90 percent figure is used in these calculations to provide an assessment of the amount of wastewater that would be generated by the project and discharged into the combined sewer system. The proposed project's water supply demand would total 0.006 mgd (0.001 mgd potable demand and 0.005 mgd nonpotable demand); therefore, the proposed project would discharge approximately 0.005 mgd to the combined sewer.[145]

The wastewater generated by the proposed project would contribute an additional 0.008 percent of the Southeast Treatment Plant's average daily treatment of 60 mgd. Because the proposed project would not generate wastewater flows that would exceed the Southeast Treatment Plant's capacity of 85 mgd during dry weather, it would not exceed the Southeast Treatment Plant's capacity or require the construction of new or expansion of existing wastewater treatment facilities. Therefore, wastewater impacts related to the capacity of the combined sewer system would be less than significant.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Because the expanded streetscape variant would not construct additional buildings or add land uses to the site that would generate substantial additional wastewater or require substantial additional stormwater treatment, it would have utilities and service system impacts similar to those of the proposed project. Therefore, the expanded streetscape variant would have a less-than-significant impact on wastewater and stormwater treatment facilities, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact UT-3 SFPUC has sufficient water supply available to serve the proposed project or variant and future development during normal, dry, and multiple dry years. (Less than Significant)

PROPOSED PROJECT

Background on Hetch Hetchy Regional Water System

San Francisco's Hetch Hetchy regional water system, operated by the SFPUC, supplies water to approximately 2.7 million people. The system supplies both retail customers—primarily in San Francisco—and 27 wholesale customers in Alameda, Santa Clara, and San Mateo counties. The system supplies an average of 85 percent of its water from the Tuolumne River watershed, stored in Hetch Hetchy Reservoir in Yosemite National Park, and the remaining 15 percent from local surface waters in the Alameda and Peninsula watersheds. The split between these resources varies from year to year depending on hydrological conditions and operational circumstances. Separate from the regional water system, the SFPUC owns and operates an in-city distribution system that serves retail customers in San Francisco. Approximately 97 percent of the San Francisco retail water supply is from the regional system; the remainder consists of local groundwater and recycled water.

---

144 SFPUC, Wastewater Service Charge Appeal, 2018, *http://www.sfwater.org/index.aspx?page=132*, accessed January 24, 2019.

145 This wastewater demand from the proposed project does not take into account existing wastewater generation at the site. As a result, the net new wastewater generation from the project site would be less than the 0.005 mgd presented here and thus represents a conservative estimate of the increased demand on the city's combined sewer system.

Water Supply Reliability and Drought Planning

In 2008, the SFPUC adopted the Phased Water System Improvement Program (WSIP) to ensure the ability of the regional water system to meet certain level of service goals for water quality, seismic reliability, delivery reliability, and water supply through 2018.[146] The SFPUC's level of service goals for regional water supply are to meet customer water needs in nondrought and drought periods and to meet dry-year delivery needs while limiting rationing to a maximum of 20 percent system-wide. In approving the WSIP, the SFPUC established a supply limitation of up to 265 mgd to be delivered from its water supply resources in the Tuolumne, Alameda, and Peninsula watersheds in years with normal (average) precipitation.[147] The SFPUC's water supply agreement with its wholesale customers provides that approximately two-thirds of this total (up to 184 mgd) is available to wholesale purchasers and the remaining one-third (up to 81 mgd) is available to retail customers. The total amount of water the SFPUC can deliver to retail and wholesale customers in any one year depends on several factors, including the amount of water that is available from natural runoff, the amount of water in reservoir storage, and the amount of that water that must be released from the system for purposes other than customer deliveries (e.g., required instream flow releases below reservoirs). A "normal year" is based on historical hydrological conditions that allow the reservoirs to be filled by rainfall and snowmelt, allowing full deliveries to customers; similarly, a "wet year" and a "dry year" is based on historical hydrological conditions with above and below "normal" rainfall and snowmelt, respectively.

For planning purposes, the SFPUC uses a hypothetical drought that is more severe than what has historically been experienced. This drought sequence is referred to as the "design drought" and serves as the basis for planning and modeling of future scenarios. The design drought sequence used by the SFPUC for water supply reliability planning is an 8.5-year period that combines the following elements to represent a drought sequence more severe than historical conditions:

- Historical Hydrology – This is a six-year sequence of hydrology from the historical drought that occurred from July 1986 to June 1992.
- Prospective Drought – This is a 2.5-year period that includes the hydrology from the 1976-77 drought.
- System Recovery Period – The last six months of the design drought are the beginning of the system recovery period. The precipitation begins in the fall; by approximately the month of December, inflow to reservoirs exceeds customer demands, and SFPUC system storage begins to recover.

Although the most recent drought (2012 through 2016) included some of the driest years on record for the SFPUC's watersheds, the design drought still represents a more severe drought in duration and overall water supply deficit.

Based on historical records of hydrology and reservoir inflow from 1920 to 2017, current delivery and flow obligations, and fully implemented infrastructure under the WSIP, normal or wet conditions occurred in 85 out of 97 years. This translates into roughly nine normal or wet years out of every 10 years. Conversely, system-wide rationing is required roughly one out of every 10 years. The frequency of dry years is expected to increase as climate change intensifies.

---

[146] On December 11, 2018, the SFPUC Commission extended the timing of the WSIP water supply decision through 2028 in its Resolution No. 18-0212.

[147] SFPUC Resolution No. 08-200, *Adoption of the Water System Improvement Program Phased WSIP Variant,* October 30, 2008.

2015 Urban Water Management Plan

The California Urban Water Management Planning Act[148] requires urban water supply agencies to prepare *urban water management plans* to plan for the long-term reliability, conservation, and efficient use of California's water supplies to meet existing and future demands. The act requires water suppliers to update their plans every five years based on projected growth for at least the next 20 years.

At the time the Water Supply Assessment was prepared for the proposed project, the current urban water management plan for the city was the 2015 Urban Water Management Plan update.[149] Subsequently, a 2020 Urban Water Management Plan was adopted, as discussed further below.[150]

The 2015 plan update presents information on the SFPUC's retail and wholesale service areas, the regional water supply system and other water supply systems operated by the SFPUC, system supplies and demands, water supply reliability, Water Conservation Act of 2009 compliance, water shortage contingency planning, and water demand management.

The water demand projections in the 2015 plan reflect anticipated population and employment growth, socioeconomic factors, and the latest conservation forecasts. For San Francisco, housing and employment growth projections are based on the planning department's Land Use Allocation 2012 (see 2015 Urban Water Management Plan, Appendix E, Table 5), which in turn is based on the Association of Bay Area Governments growth projections through 2040.[151] The 2015 plan presents water demand projections in five-year increments over a 25-year planning horizon through 2040.

The 2015 plan compares anticipated water supplies to projected demand through 2040 for normal, single-dry, and multiple-dry water years. Retail water supplies consist of regional water system supply, groundwater, recycled water, and nonpotable water. Under normal hydrologic conditions, the total retail supply is projected to increase from 70.1 mgd in 2015 to 89.9 mgd in 2040. According to the plan, available and anticipated future water supplies would fully meet projected demand in San Francisco through 2040 during normal years.

On December 11, 2018, by Resolution No. 18-0212, the SFPUC amended its 2009 Water Supply Agreement between the SFPUC and its wholesale customers. That amendment revised the Tier 1 allocation in the Water Supply Allocation Plan to require a minimum reduction of 5 percent of the regional water system supply for San Francisco retail customers whenever system-wide reductions are required due to dry-year supply shortages.[152] When accounting for the requirements of this amended agreement, existing and planned supplies would meet projected retail water system demands in all years except for an approximately 3.6 to 6.1 mgd or 5 to 6.8 percent shortfall during dry years through the year 2040. This relatively small shortfall is primarily due to implementation of the amended 2009 water supply agreement. In such an event, the SFPUC would implement the SFPUC's Retail Water Shortage Allocation Plan and could manage this relatively small shortfall by prohibiting certain discretionary outdoor water uses and/or calling for voluntary rationing among all retail customers. Based on experience in past droughts, retail customers could reduce water use

148 California Water Code, division 6, part 2.6, sections 10610 through 10656, as last amended in 2015.
149 SFPUC, *2015 Urban Water Management Plan for the City and County of San Francisco*, June 2016, *https://sfwater.org/index.aspx?page=75*.
150 SFPUC, *2020 Urban Water Management Plan for the City and County of San Francisco*, June 2021, *https://sfpuc.org/about-us/policies-plans/urban-water-management-plan*.
151 Association of Bay Area Governments, *Jobs-Housing Connection Strategy,* May 2012.
152 SFPUC, Resolution No. 18-0212, December 11, 2018.

to meet this projected level of shortfall. The required level of rationing is well below the SFPUC's regional water supply level of service goal of limiting rationing to no more than 20 percent on a system-wide basis.

Based on the 2015 Urban Water Management Plan, as modified by the 2018 amendment to the 2009 Water Supply Agreement, sufficient retail water supplies would be available to serve projected growth in San Francisco through 2040. Although concluding that supply is sufficient, the 2015 Urban Water Management Plan also identifies projects that are underway or planned to augment local supply. Projects that are underway or recently completed include the San Francisco Groundwater Supply Project and the Westside Recycled Water Project. A more current list of potential regional and local water supply projects that the SFPUC is considering is provided below under Additional Water Supplies.

In addition, the plan describes the SFPUC's ongoing efforts to improve dry-year water supplies, including participation in Bay Area regional efforts to improve water supply reliability through projects such as interagency interties, groundwater management and recharge, potable reuse, desalination, and water transfers. Although no specific capacity or supply has been identified, this program may result in future supplies that would benefit SFPUC customers.

2018 Bay-Delta Plan Amendment

In December 2018, the State Water Resources Control Board adopted amendments to the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary, which establishes water quality objectives to maintain the health of the rivers and the Bay-Delta ecosystem.[153] Among the goals of the adopted Bay-Delta Plan Amendment is to increase salmonid populations in the San Joaquin River, its tributaries (including the Tuolumne River), and the Bay-Delta. Specifically, the plan amendment requires increasing flows in the Stanislaus, Tuolumne, and Merced rivers to 40 percent of unimpaired flow[154] from February through June every year, whether it is wet or dry. During dry years, this would result in a substantial reduction in the SFPUC's water supplies from the Tuolumne River watershed.

If this plan amendment is implemented, the SFPUC would be able to meet the projected retail water demands presented in the 2015 Urban Water Management Plan in normal years but would experience supply shortages in single dry years and multiple dry years. Implementation of the Bay-Delta Plan Amendment would result in substantial dry-year water supply shortfalls throughout the SFPUC's regional water system service area, including San Francisco. The 2015 Urban Water Management Plan assumes that limited rationing for retail customers may be needed in multiple dry years to address an anticipated supply shortage by 2040; the 2018 amendment to the 2009 Water Supply Agreement with wholesale customers would slightly increase rationing levels indicated in the 2015 plan. By comparison, implementation of the Bay-Delta Plan Amendment would result in supply shortfalls in all single dry years and multiple dry years and rationing to a greater degree than previously anticipated to address supply shortages not accounted for in the 2015 Urban Water Management Plan or as a result of the 2018 amendment to the Water Supply Agreement.

---

153 State Water Resources Control Board Resolution No. 2018-0059, *Adoption of Amendments to the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary and Final Substitute Environmental Document,* December 12, 2018, *https://www.waterboards.ca.gov/plans_policies/docs/2018wqcp.pdf*.

154 "Unimpaired flow" represents the water production of a river basin, unaltered by upstream diversions, storage, or by export or import of water to or from other watersheds.

The state water board has stated that it intends to implement the plan amendment by the year 2022, assuming that all required approvals are obtained by that time. However, at this time, the implementation of the Bay-Delta Plan Amendment is uncertain for several reasons, as the SFPUC explained in the Water Supply Assessment prepared for this project. First, since adoption of the Bay-Delta Plan Amendment, more than a dozen lawsuits have been filed in state and federal court, challenging the water board's adoption of the plan amendment, including legal challenges filed by the federal government at the request of the United States Bureau of Reclamation. That litigation is in the early stages, and there have been no dispositive court rulings as of this date.

Second, the Bay-Delta Plan Amendment is not self-executing and does not allocate responsibility for meeting its new flow requirements to the SFPUC or any other water rights holders. Rather, the plan amendment merely provides a regulatory framework for flow allocation, which must be accomplished by other regulatory and/or adjudicatory proceedings, such as a comprehensive water rights adjudication or, in the case of the Tuolumne River, the Clean Water Act, section 401 certification process in the Federal Energy Regulatory Commission's relicensing proceeding for Don Pedro Dam. The license amendment process is currently expected to be completed in the 2022-2023 timeframe. This process and other regulatory and/or adjudicatory proceedings would likely face legal challenges and have lengthy timelines, and quite possibly could result in a different assignment of flow responsibility for the Tuolumne River than currently exists (and therefore a different water supply effect on the SFPUC).

Third, in recognition of the obstacles to implementation of the Bay-Delta Plan Amendment, the water board directed its staff to help complete a "Delta watershed-wide agreement, including potential flow measures for the Tuolumne River" by March 1, 2019, and to incorporate such agreements as an "alternative" for a future amendment to the Bay-Delta Plan to be presented to the [water board] as early as possible after December 1, 2019." On March 1, 2019, in accordance with the water board's instruction, and in partnership with other key stakeholders, the SFPUC submitted a proposed project description for the Tuolumne River. This project description could be the basis for a voluntary agreement with the state water board that would serve as an alternative path to implementing the Bay-Delta Plan's objectives. On March 26, 2019, the SFPUC adopted Resolution No. 19-0057 to support its participation in the voluntary agreement negotiation process. In a written progress report to the Voluntary Agreement Plenary Participants dated July 1, 2019, the California secretaries for Environmental Protection and for Natural Resources stated that the collective state agencies should be able "to determine the adequacy" of the various proposed voluntary agreements, including the proposed Tuolumne Voluntary Agreement, by October 15, 2019, and that if the state team recommends the voluntary agreements to the state water board, then (1) scientific peer review of the voluntary agreements would be completed by the spring of 2020, and (2) a draft CEQA document would be released for public comment in the summer of 2020, with a finalized CEQA document completed the following year. Negotiations for the Tuolumne Voluntary Agreement continued beyond the October 15, 2019, date and are ongoing, pushing back the completion timeline anticipated in the July 1, 2019, letter. On February 4, 2020, the secretaries for Environmental Protection and for Natural Resources issued a presentation summarizing the framework of the voluntary agreement process, which did not include new deadlines for completion.

For these reasons, it is currently unknown whether, when, and in what form the Bay-Delta Plan Amendment would be implemented, and how those amendments would affect the SFPUC's water supply.

Additional Water Supplies

In light of the adoption of the Bay-Delta Plan Amendment and the resulting potential limitation to the SFPUC's regional water system supply during dry years, the SFPUC is expanding and accelerating its efforts to develop additional water supplies and explore other projects that would improve overall water supply resilience. Developing these supplies would reduce water supply shortfalls and reduce rationing associated with such shortfalls. The SFPUC has taken action to fund the study of additional water supply projects, which are described in the water supply assessment for the proposed project and listed below:

- Daly City Recycled Water Expansion
- Alameda County Water District Transfer Partnership
- Brackish Water Desalination in Contra Costa County
- Alameda County Water District-Union Sanitary District Purified Water Partnership
- Crystal Springs Purified Water
- Eastside Purified Water
- San Francisco Eastside Satellite Recycled Water Facility
- Additional Storage Capacity in Los Vaqueros Reservoir from Expansion
- Calaveras Reservoir Expansion

The capital projects that are under consideration would be costly and are still in the early feasibility or conceptual planning stages. These projects would take 10 to 30 or more years to implement and would require environmental permitting negotiations, which may reduce the amount of water that can be developed. The yield from these projects is unknown and not currently incorporated into SFPUC's supply projections.

In addition to capital projects, the SFPUC is also considering developing related water demand management policies and ordinances, such as funding for innovative water supply and efficiency technologies and requiring potable water offsets for new developments.

Water Supply Assessment

Under sections 10910 through 10915 of the California Water Code, urban water suppliers like the SFPUC must prepare water supply assessments for certain large projects, as defined in CEQA Guidelines section 15155.[155] Water supply assessments rely on information contained in the water supplier's urban water management plan and on the estimated water demand of both the proposed project and projected growth in the relevant portion of the water supplier's service area. Because the proposed project would include development of more than 650,000 square feet of PDR uses and would employ more than 1,000

[155] Pursuant to CEQA Guidelines section 15155(1), "a water-demand project" means:
(A) A residential development of more than 500 dwelling units
(B) A shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space
(C) A commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor area
(D) A hotel or motel, or both, having more than 500 rooms, an industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area
(F) A mixed-use project that includes one or more of the projects specified in subdivisions (a)(1)(A), (a)(1)(B), (a)(1)(C), (a)(1)(D), (a)(1)(E), and (a)(1)(G) of this section
(G) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project

people, it meets the definition of a water demand project under CEQA. Accordingly, the SFPUC adopted a water supply assessment for the proposed project on June 9, 2020.[156]

The water supply assessment for the proposed project identifies the project's total water demand, including a breakdown of potable and nonpotable water demands. The proposed project is subject to San Francisco's Non-Potable Water Ordinance (article 12C of the San Francisco Health Code). As of January 1, 2022, the Non-Potable Water Ordinance requires new commercial, mixed-use, and multi-family residential development projects with 100,000 square feet or more of gross floor area to install and operate an onsite nonpotable water system. Such projects must meet their toilet and urinal flushing and irrigation demands through the collection, treatment, and use of available graywater, rainwater, and foundation drainage. Although not required, projects may use treated blackwater or stormwater if desired. Furthermore, projects may choose to apply nonpotable water to other nonpotable water uses, such as cooling tower blowdown and industrial processes, but are not required to do so under the ordinance. The proposed project would meet the requirements of the Non-Potable Water Ordinance by using graywater and rainwater for toilet and urinal flushing and irrigation.

Both potable and nonpotable demands for the project were estimated using the SFPUC's Non-Potable Water Calculator and supplemented with additional calculations for cooling tower makeup water, swimming pool, and commercial laundry demands. According to the demand estimates, the project's total water demand would be 0.006 mgd, which would consist of 0.001 mgd of potable water and 0.005 mgd of nonpotable water.[157] Accordingly, 84.8 percent of the project's total water demand would be met by nonpotable water.

The water supply assessment estimates future retail (citywide) water demand through 2040 based on the population and employment growth projections contained in the planning department's Land Use Allocation 2012. The department has determined that the proposed project represents a portion of the planned growth accounted for in Land Use Allocation 2012. Therefore, the project's demand is incorporated in the 2015 Urban Water Management Plan.

The water supply assessment determined that the project's potable water demand of 0.001 mgd would contribute 0.001 percent to the projected total retail demand of 89.9 mgd in 2040. The project's total water demand of 0.006 mgd, which does not account for the 0.005 mgd savings anticipated through compliance with the nonpotable water ordinance, would represent 0.007 percent of 2040 total retail demand. Therefore, the proposed project represents a small fraction of the total projected water demand in San Francisco through 2040.

Due to the 2018 Bay Delta Plan Amendments, the water supply assessment considers these demand estimates under three water supply scenarios. To evaluate the ability of the water supply system to meet the demand of the proposed project in combination with both existing development and projected growth in San Francisco, the water supply assessment describes each of the following water supply scenarios:

- Scenario 1: Current Water Supply
- Scenario 2: Bay-Delta Plan Voluntary Agreement
- Scenario 3: 2018 Bay-Delta Plan Amendment

---

156 SFPUC, *Water Supply Assessment for the San Francisco Gateway Project*, adopted June 9, 2020, Resolution No. 20-0126.
157 SFPUC, *Water Supply Assessment for San Francisco Gateway Project*, adopted June 9, 2020, Resolution No. 20-0126.

As discussed below, the water supply assessment concludes that water supplies would be available to meet the demand of the proposed project in combination with both existing development and projected growth in San Francisco through 2040 under each of these water supply scenarios, with varying levels of rationing during dry years. The following sections summarize the analysis and conclusions presented in the SFPUC's water supply assessment for the project under each of the three water supply scenarios considered.

Scenario 1 – Current Water Supply

Scenario 1 assumes no change to the way in which water is supplied, and that neither the Bay-Delta Plan Amendment nor a Bay-Delta Plan Voluntary Agreement would be implemented. Thus, the water supply and demand assumptions contained in the 2015 Urban Water Management Plan and the 2009 Water Supply Agreement as amended would remain applicable for the project's water supply assessment. As stated above, the project is accounted for in the demand projections in the 2015 Urban Water Management Plan.

Under Scenario 1, the water supply assessment determined that water supplies would be available to meet the demand of the project in combination with existing development and projected growth in all years, except for an approximately 3.6 to 6.1 mgd or 5 to 6.8 percent shortfall during dry years through the year 2040. This relatively small shortfall is primarily due to implementation of the amended 2009 Water Supply Agreement. To manage a small shortfall such as this, the SFPUC may prohibit certain discretionary outdoor water uses and/or call for voluntary rationing by its retail customers. During a prolonged drought at the end of the 20-year planning horizon, the project could be subject to voluntary rationing in response to a 6.8 percent supply shortfall, when the 2018 amendments to the 2009 Water Supply Agreement are taken into account. This level of rationing is well within the SFPUC's regional water system's supply level of service goal of limiting rationing to no more than 20 percent on a system-wide basis (i.e., an average throughout the regional water system).

Scenario 2 – Bay-Delta Plan Voluntary Agreement

Under Scenario 2, a voluntary agreement would be implemented as an alternative to the adopted Bay-Delta Plan Amendment. The March 1, 2019, proposed voluntary agreement submitted to the state water board has yet to be accepted, and the shortages that would occur with its implementation are not known. The voluntary agreement proposal contains a combination of flow and non-flow measures that are designed to benefit fisheries at a lower water cost, particularly during multiple dry years, than would occur under the Bay-Delta Plan Amendment. The resulting regional water system supply shortfalls during dry years would be less than those under the Bay-Delta Plan Amendment and would require rationing of a lesser degree and closer in alignment to the SFPUC's adopted level of service goal for the regional water system of rationing of no more than 20 percent system-wide during dry years. The SFPUC Resolution No. 19-0057, which authorized the SFPUC staff to participate in voluntary agreement negotiations, stated its intention that any final voluntary agreement allow the SFPUC to maintain both the water supply and sustainability level of service goals and objectives adopted by the SFPUC when it approved the WSIP. Accordingly, it is reasonable to conclude that if the SFPUC enters into a voluntary agreement, the supply shortfall under such an agreement would be of a similar magnitude to those that would occur under Scenario 1. In any event, the rationing that would be required under Scenario 2 would be of a lesser degree than under the Bay-Delta Plan Amendment as adopted.

Scenario 3 – Bay-Delta Plan Amendment

Under Scenario 3, the 2018 Bay-Delta Plan Amendment would be implemented as it was adopted by the state water board, without modification. As discussed above, there is considerable uncertainty whether, when, and in what form the plan amendment would be implemented. However, because implementation of the plan amendment cannot be ruled out at this time, an analysis of the cumulative impact of projected growth on water supply resources under this scenario is included in this document to provide a worst-case impact analysis.

Under this scenario, which is assumed to be implemented after 2022, water supplies would be available to meet projected demands through 2040 in wet and normal years with no shortfalls. However, under Scenario 3, the entire regional water system—including both the wholesale and retail service areas—would experience significant shortfalls in single dry and multiple dry years, which over the past 97 years have occurred on average just over once every 10 years. Significant dry-year shortfalls would occur in San Francisco, regardless of whether the proposed project is constructed. Except for the currently anticipated shortfall to retail customers of about 6.1 mgd (6.8 percent) that is expected to occur under Scenario 1 during years seven and eight of the 8.5-year design drought, based on 2040 demand levels; these shortfalls to retail customers would exclusively result from supply reductions resulting from implementation of the Bay-Delta Plan Amendment. The retail supply shortfalls under Scenario 3 would not be attributed to the incremental demand associated with the proposed project, because the project's demand is incorporated already in the growth and water demand/supply projections contained in the 2015 Urban Water Management Plan.

Under the Bay-Delta Plan Amendment, existing and planned dry-year supplies would be insufficient for the SFPUC to satisfy its regional water system supply level of service goal of no more than 20 percent rationing system-wide. The Water Shortage Allocation Plan does not specify allocations to retail supply during system-wide shortages above 20 percent. However, the plan indicates that if a system-wide shortage greater than 20 percent were to occur, regional water system supply would be allocated between retail and wholesale customers in accordance with the rules corresponding to a 16 to 20 percent system-wide reduction, subject to consultation and negotiation between the SFPUC and its wholesale customers to modify the allocation rules. The allocation rules corresponding to the 16 to 20 percent system-wide reduction are reflected in the project's water supply assessment. These allocation rules result in shortfalls of 15.6 to 49.8 percent across the retail service area as a whole under Scenario 3. As shown in Table 5 of the water supply assessment, total shortfalls under Scenario 3 would range from 12.3 mgd (15.6 percent) in a single dry year to 36.1 mgd (45.7 percent) in years seven and eight of the 8.5-year design drought, based on 2025 demand levels; and from 21 mgd (23.4 percent) in a single dry year to 44.8 mgd (49.8 percent) in years seven and eight of the 8.5-year design drought, based on 2040 demand.

2020 Urban Water Management Plan

As described above, following adoption of the Water Supply Assessment for the proposed project, the SFPUC adopted a 2020 Urban Water Management Plan.[158] The plan projects water demand through 2045, based on the population and employment growth projections contained in the planning department's Land Use Allocation 2017.[159] The department has determined that the proposed project represents a portion of the

[158] SFPUC, *2020 Urban Water Management Plan for the City and County of San Francisco*, June 2021, *https://sfpuc.org/about-us/policies-plans/urban-water-management-plan*.

[159] *2020 Urban Water Management Plan* at 4-4.

planned growth accounted for in Land Use Allocation 2017. Therefore, the project's demand is incorporated in the 2020 Urban Water Management Plan.

The 2020 plan incorporates water supply and demand planning scenarios both with and without the Bay-Delta Plan Amendment, consistent with the approach in the proposed project's Water Supply Assessment. Without implementation of the Bay-Delta Plan Amendment, water supplies would be available to meet projected retail demands, including planned growth, in all years—except for an approximately 4.0 mgd or 5.3 percent shortfall during years four and five of multiple dry year conditions in the year 2045, as shown in Table 8-6 of the 2020 Urban Water Management Plan. This shortfall, which is consistent with the potential 2040 shortfall analyzed in Scenario 1 of the project's Water Supply Assessment, would be addressed by a 5 percent reduction in retail demand.

With implementation of the Bay-Delta Plan Amendment, water supplies would be available to meet projected demands through 2045 in normal years with no shortfalls. However, the entire regional water system—including both the wholesale and retail service areas—would experience significant shortfalls in single dry and multiple dry years. Significant dry-year shortfalls would occur in San Francisco, regardless of whether the proposed project is constructed. As shown in Table 8-4 of the 2020 Urban Water Management Plan, total shortfalls under this scenario would range from 11.2 mgd (15.9 percent) in a single dry year to 19.2 mgd (27.2 percent) in years two through five of multiple dry year conditions, based on 2040 demand levels; and from 20.5 mgd (25.4 percent) in a single dry year to 28.5 mgd (35.4 percent) in years four and five of multiple dry year conditions, based on 2045 demand. These shortfalls are within the ranges of the potential 2025-2040 shortfalls analyzed in Scenario 3 of the project's Water Supply Assessment.

The 2020 Urban Water Management Plan incorporates a Water Shortage Contingency Plan (Appendix K) that identifies specific actions that would be taken in response to shortage conditions, including demand reduction, operational efficiency, and supply augmentation actions; it also includes a Retail Water Shortage Allocation Plan, discussed further below.

Impact Analysis

As described above, the supply capacity of the Hetch Hetchy regional water system that provides the majority of the city's drinking water far exceeds the potential demand of any single development project in San Francisco. No single development project alone in San Francisco would require the development of new or expanded water supply facilities or require the SFPUC to take other actions, such as imposing a higher level of rationing across the city in the event of a supply shortage in dry years. Therefore, a separate project-only analysis is not provided for this topic. The following analysis instead considers whether the proposed project, in combination with both existing development and projected growth through 2040, would require new or expanded water supply facilities, the construction or relocation of which could have significant cumulative impacts on the environment. It also considers whether a high level of rationing would be required that could have significant cumulative impacts. It is only under this cumulative context that development in San Francisco could have the potential to require new or expanded water supply facilities or require the SFPUC to take other actions, which in turn could result in significant physical environmental impacts related to water supply. If significant cumulative impacts could result, then the analysis considers whether the project would make a considerable contribution to the cumulative impact.

Impacts Related to New or Expanded Water Supply Facilities

The SFPUC's adopted water supply level of service goal for the regional water system is to meet customer water needs in nondrought and drought periods. The system performance objective for drought periods is to meet dry-year delivery needs while limiting rationing to a maximum of 20 percent system-wide reduction in regional water service during extended droughts. Because the SFPUC has designed its system to meet this goal, it is reasonable to assume that, to the extent the SFPUC can achieve its service goals, sufficient supplies would be available to serve existing development and planned growth accounted for in the 2020 Urban Water Management Plan (which includes the proposed project) and that new or expanded water supply facilities are not needed to meet system-wide demand. Although the focus of this analysis is on the SFPUC's retail service area and not the regional water system as a whole, this cumulative analysis considers the SFPUC's regional water supply level of service goal of rationing of not more than 20 percent in evaluating whether new or expanded water supply facilities would be required to meet the demands of existing development and projected growth in the retail area through 2045. If a shortfall would require rationing more than 20 percent to meet system-wide dry-year demand, the analysis evaluates whether, as a result, the SFPUC would develop new or expanded water supply facilities that result in significant physical environmental impacts. It also considers whether such a shortfall would result in a level of rationing that could cause significant physical environmental impacts. If the analysis determines that there would be a significant cumulative impact, then, in accordance with CEQA Guidelines section 15130, the analysis considers whether the project's incremental contribution to any such effect is "cumulatively considerable."

As discussed above, existing and planned dry-year supplies would meet projected retail demands through 2040 under Scenario 1 in the SFPUC's regional water system's adopted water supply reliability level of service goal. As augmented by the projections in the 2020 Urban Water Management Plan, water demand would be met during multiple dry-year conditions in 2045 by implementing 5 percent retail demand reductions. Therefore, the SFPUC could meet the water supply needs for the proposed project in combination with existing development and projected growth in San Francisco through 2045 from the SFPUC's existing system. The SFPUC would not be expected to develop new or expanded water supply facilities for retail customers under Scenario 1, and there would be no significant cumulative environmental impact.

The effect of Scenario 2 cannot be quantified at this time; but, as explained previously, if it can be designed to achieve the SFPUC's level of service goals and is adopted, it would be expected to have effects similar to those under Scenario 1. Given the SFPUC's stated goal of maintaining its level of service goals under Scenario 2, it is expected that effects under Scenario 2 would be more similar to those under Scenario 1 than under Scenario 3. In any event, any shortfall effects under Scenario 2 that exceed the SFPUC's service goals would be expected to be less than those under Scenario 3. Therefore, the analysis of Scenario 3 would encompass any effects that would occur under Scenario 2 if it were to trigger the need for increased water supply or rationing in excess of the SFPUC's regional water system level of service goals.

Under Scenario 3, the SFPUC's existing and anticipated water supplies would be sufficient to meet the demands of existing development and projected growth in San Francisco, including the proposed project, through 2045 in wet and normal years, which have historically occurred in approximately nine out of 10 years on average. During dry and multiple dry years, as identified in the 2020 Urban Water Management Plan, retail supply shortfalls of 15.9 to 35.4 percent could occur.

The SFPUC has indicated in its water supply assessment and 2020 Urban Water Management Plan that, as a result of the adoption of the Bay-Delta Plan Amendment and the resulting potential limitations on supply to the regional water system during dry years, the SFPUC is increasing and accelerating its efforts to develop additional water supplies and explore other projects that would increase overall water supply resilience. It lists possible projects that it will study. The SFPUC is beginning to study water supply options, but it has not determined the feasibility of the possible projects, has not made any decision to pursue any particular supply projects, and has determined that the identified potential projects would take anywhere from 10 to 30 years or more to implement.

There is also a substantial degree of uncertainty associated with the implementation of the Bay-Delta Plan Amendment and its ultimate outcome; therefore, there is substantial uncertainty in the amount of additional water supply that may be needed, if any. Moreover, there is uncertainty and lack of knowledge regarding the feasibility and parameters of the possible water supply projects the SFPUC is beginning to explore. Consequently, the physical environmental impacts that could result from future supply projects can only be speculated on at this time and would not be expected to be reasonably determined for 10 to 30 years. Although it is not possible at this time to identify the specific environmental impacts that could result, this analysis assumes that if new or expanded water supply facilities were developed, such as those listed above under "Additional Water Supplies," the construction and/or operation of such facilities could result in significant adverse environmental impacts, and this would be a significant cumulative impact.

As discussed above, the proposed project would represent 0.007 percent of total demand and 0.001 percent of potable water demand in San Francisco in 2040, whereas implementation of the Bay Delta Plan Amendment would result in a retail supply shortfall of up to 49.8 percent. Thus, new or expanded dry-year water supplies would be needed under Scenario 3 regardless of whether the proposed project is constructed. This being the case, any physical environmental impacts related to the construction and/or operation of new or expanded water supplies would occur with or without the proposed project. Therefore, the proposed project would not have a considerable contribution to any significant cumulative impacts that could result from the construction or operation of new or expanded water supply facilities developed in response to the Bay-Delta Plan Amendment.

Impacts Related to Rationing

Given the long lead times associated with developing additional water supplies, in the event the Bay-Delta Plan Amendment were to take effect sometime after 2022 and result in a dry-year shortfall, the expected action of the SFPUC for the next 10 to 30 years (or more) would be limited to requiring increased rationing. The remaining analysis therefore focuses on whether rationing at the levels that might be required under the Bay-Delta Plan Amendment could result in any cumulative impacts, and if so, whether the project would make a considerable contribution to these impacts.

The SFPUC has established a process through its Retail Water Shortage Allocation Plan for actions it would take under circumstances requiring rationing. Rationing at the level that might be required under the Bay-Delta Plan Amendment would require changes to how businesses operate, changes to water use behaviors (e.g., shorter and/or less-frequent showers), and restrictions on irrigation and other outdoor water uses (e.g., car washing), all of which could lead to undesirable socioeconomic effects. Any such effects would not constitute physical environmental impacts under CEQA.

High levels of rationing could, however, lead to adverse physical environmental effects, such as the loss of vegetation cover resulting from prolonged restrictions on irrigation. Prolonged high levels of rationing in the

city could also make San Francisco a less desirable location for residential and commercial development than other areas of the state not subject to such substantial levels of rationing, which, depending on location, could lead in turn to increased urban sprawl. Sprawl development is associated with numerous environmental impacts, including, for example, increased greenhouse gas emissions and air pollution from longer commutes and lower density development, higher energy use, loss of farmland, and increased water use from less water-efficient suburban development.[160] In contrast, the proposed project is in an area where VMT per capita are well below the regional average; projects in San Francisco are required to comply with numerous regulations that would reduce greenhouse gas emissions, as discussed in the greenhouse gas section of this initial study; and San Francisco's per capita water use is among the lowest in the state. Thus, the higher levels of rationing on a citywide basis that could be required under the Bay-Delta Plan Amendment could lead directly or indirectly to significant cumulative impacts. The question, then, is whether the project would make a considerable contribution to impacts that may be expected to occur in the event of high levels of rationing.

Although the levels of rationing described above apply to the retail service area as a whole (i.e., 5.3 percent under Scenario 1, and 15.9 to 35.4 percent under Scenario 3, each as augmented by the 2020 Urban Water Management Plan), the SFPUC may allocate different levels of rationing to individual retail customers based on customer type (e.g., dedicated irrigation, single-family residential, multi-family residential, or commercial) to achieve the required level of retail (city-wide) rationing. Allocation methods and processes that have been considered in the past and may be used in future droughts are described in the SFPUC's current Retail Water Shortage Allocation Plan adopted as part of the 2020 Urban Water Management Plan.[161] The updated Retail Water Shortage Allocation Plan will allocate shortages to different customer types to minimize the economic impacts of mandatory demand reductions. The specific allocation method will be determined based on the nature of the water shortage and water use trends, and may include reference to baseline water use levels.

The SFPUC anticipates that, as a worst-case scenario under Scenario 3, because the proposed project would have more than 650,000 square feet of PDR uses and would employ more than 1,000 people, the proposed project could be subject to up to 30 percent rationing during a severe drought.[162] In accordance with the Retail Water Shortage Allocation Plan, the level of rationing that would be imposed on the proposed project would be determined at the time of a drought or other water shortage and cannot be established with certainty prior to the shortage event. However, newly constructed buildings, such as the proposed project, have water-efficient fixtures and nonpotable water systems that comply with the latest regulations. Consequently, if these buildings can demonstrate below-average baseline water use, they may be subject to a lower level of rationing than other retail customers that meet or exceed the average water use for the same customer class.

---

160 Pursuant to the SFPUC 2015 Urban Water Management Plan, San Francisco's per capita water use is among the lowest in the state.

161 SFPUC, *2020 Urban Water Management Plan for the City and County of San Francisco, Appendix Water Shortage Contingency Plan,* section 4. June 2021.

162 This worst-case rationing level for San Francisco multi-family residential was estimated for the purpose of preparing comments on the Draft Substitute Environmental Document in Support of Potential Changes to the Bay-Delta Plan (SED), dated March 16, 2017. See comment letter Attachment 1, Appendix 3, Page 5, Table 3. The comment letter and attachments are available at: *https://www.waterboards.ca.gov/public_notices/comments/2016_baydelta_plan_amendment/docs/dennis_herrera.pdf*. The state water board's SED assumes that the city will develop additional water supplies through large scale water transfers and/or construction of a large-scale desalination plant or new in-Delta diversion. The city's comments on the SED explain why increased rationing is in fact the SFPUC's most reasonably foreseeable response to the water supply reductions that may result from Bay-Delta Plan Amendment.

Although any substantial reduction in water use in a new, water-efficient building likely would require behavioral changes that building occupants would find inconvenient, temporary rationing during a drought is expected to be achievable through actions that would not cause or contribute to significant environmental effects. The effect of such temporary rationing would likely cause occupants to change behaviors but would not cause the substantial loss of vegetation because vegetation on this urban infill site would be limited to ornamental landscaping, and nonpotable water supplies would remain available for landscape irrigation in dry years. The project would not include uses that would be forced to relocate because of temporary water restrictions, such as a business that relies on significant volumes of water for its operations. Although high levels of rationing that would occur under Scenario 3 could result in future development locating elsewhere, existing PDR tenants and businesses occupying the proposed project would be expected to tolerate rationing for the temporary duration of a drought.

As discussed above, implementation of the Bay-Delta Plan Amendment would result in substantial system-wide water supply shortfalls in dry years. These shortfalls would occur with or without the proposed project, and the project's incremental increase in potable water demand (0.001 percent of total retail demand) would have a negligible effect on the levels of rationing that would be required throughout San Francisco under Scenario 3 in dry years.

Temporary rationing that could be imposed on the project would not cause or contribute to significant environmental effects associated with the high levels of rationing that may be required on a city-wide basis under Scenario 3. Therefore, the project would not make a considerable contribution to any significant cumulative impacts that may result from increased rationing that may be required with implementation of the Bay-Delta Plan Amendment, were it to occur.

Conclusion

As stated above, there is considerable uncertainty as to whether the Bay-Delta Plan Amendment will be implemented. If the plan amendment is implemented, the SFPUC will need to impose higher levels of rationing than its regional water system level of service goal of no more than 20 percent rationing during drought years by 2025 and for the next several decades. Implementation of the plan amendment would result in a shortfall beginning in a single dry year in 2025 of 15.9 percent; and dry-year shortfalls by 2045 ranging from 25.4 percent in a single dry year and year one of multiple dry years, to up to 35.4 percent in years four and five. Although the SFPUC may seek new or expanded water supply facilities, it has not made any definitive decision to pursue particular actions and there is too much uncertainty associated with this potential future decision to identify environmental effects that would result. Such effects are therefore speculative at this time. In any case, the need to develop new or expanded water supplies in response to the Bay Delta Plan Amendment and any related environmental impacts would occur irrespective of the water demand associated with the proposed project. Given the long lead times associated with developing additional supplies, the SFPUC's expected response to implementation of the Bay-Delta Plan Amendment would be to ration in accordance with procedures in its Retail Water Shortage Allocation Plan.

Both direct and indirect environmental impacts could result from high levels of rationing. However, the project is a mixed-use urban infill development that would be expected to tolerate the level of rationing imposed on it for the duration of the drought, and so would not contribute to sprawl development caused by rationing under the Bay-Delta Plan Amendment. The project itself would not be expected to contribute to a loss of vegetation because project-generated nonpotable supplies would remain available for irrigation in dry years. Nor would the small increase in potable water demand attributable to the project compared to

citywide demand substantially affect the levels of dry-year rationing that would otherwise be required throughout the city. Thus, the proposed project would not make a considerable contribution to a cumulative environmental impact caused by implementation of the Bay-Delta Plan Amendment. Therefore, for the reasons described above, under all three scenarios, this impact would be considered less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The proposed expanded streetscape variant would have water supply impacts similar to those of the proposed project because it would not construct additional buildings or add uses that would require substantial additional water supply, although it would involve additional street trees. Therefore, this impact would be considered less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact UT-4 **The proposed project or variant would not generate solid waste in excess of state or local standards, or in excess of capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and would comply with applicable waste management and reduction statutes and regulations related to solid waste. (Less than Significant)**

PROPOSED PROJECT

Recology provides solid waste collection, recycling, and disposal services for residential and commercial garbage, recycling, and composting in San Francisco through its subsidiaries, Golden Gate Disposal and Recycling and Sunset Scavenger. Materials are collected and hauled to the Recology transfer station/ recycling center at 501 Tunnel Avenue, near the southeastern city limit, for sorting and subsequent transportation to other facilities. Recyclable materials are taken to Recology's Pier 96 facility, where they are separated into commodities (e.g., aluminum, glass, and paper) and transported to other users for reprocessing. Compostables (e.g., food waste, plant trimmings, and soiled paper) are transferred to a Recology composting facility in Solano County, where they are converted to soil amendment and compost. The remaining material that cannot otherwise be reprocessed ("trash") is transported to landfills.[163]

In September 2015, the city approved an agreement with Recology, Inc., for the transport and disposal of the city's municipal solid waste at the Recology Hay Road Landfill, northeast of Vacaville in Solano County. The city began disposing the majority of its municipal solid waste at this landfill in January 2016, and is anticipated to continue for approximately nine years, or until 3.4 million tons of municipal solid waste have been deposited in that landfill, whichever comes first. The city would have an option to renew the agreement for a period of six years, or until an additional 1.6 million tons of municipal solid waste have been deposited in the landfill, whichever comes first.[164]

---

[163] San Francisco Planning Department, Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County Final Negative Declaration, Case No. 2014.0653E, July 2015, *http://sfmea.sfplanning.org/2014.0653E_Revised_FND.pdf*, accessed January 21, 2019.

[164] San Francisco Planning Department, Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County Final Negative Declaration, Case No. 2014.0653E, July 2015, *http://sfmea.sfplanning.org/2014.0653E_Revised_FND.pdf*, accessed January 21, 2019.

According to CalRecycle, the Recology Hay Road Landfill has a permitted maximum daily disposal capacity of 2,400 tons per day, a total maximum permitted capacity of 37.0 million cubic yards, and a remaining permitted capacity of approximately 30.4 million cubic yards (or 82 percent of its permitted capacity); and an estimated closure date of January 1, 2077.[165]

The California Integrated Waste Management Board requires local agencies to implement source reduction, recycling, and composting that would result in a minimum of 50 percent diversion of solid waste from landfills, thereby extending the life of landfills. For 2017, the target solid waste generation rate for San Francisco was 10.6 pounds per day per employee, and the actual measured generation rate was 4.7 pounds per day per employee, which is less than the target solid waste generation rate.[166]

San Francisco set a goal of 75 percent solid waste diversion by 2010, which it exceeded at 80 percent diversion, and currently has a goal of 100 percent solid waste diversion or "zero waste" to landfill or incineration by 2020. As discussed below, San Francisco implements recycling, composting, and waste reduction programs that would support this goal of 100 percent solid waste diversion.

Construction

Demolition and construction activities would generate various types of solid waste, including scrap lumber, scrap finishing materials, scrap metals, and other recyclable and nonrecyclable solid waste. Construction-related activities would involve soil disturbance of approximately 134,000 cubic yards onsite and 6,600 cubic yards for the street improvements, with approximately 98,000 cubic yards exported offsite. Excavated soil and demolition debris that is contaminated (e.g., with asbestos, polychlorinated biphenyls, or lead-based paint) and classified as a hazardous waste would be taken to a class I facility for disposal in accordance with applicable laws and regulations for the disposal of hazardous waste (see Section E.17, Hazards and Hazardous Materials, for further discussion). Soils not classified as hazardous waste would be transported to local disposal and reuse sites such as Treasure Island, Bay Meadows, or other available sites. Any nonrecyclable material would be disposed of at the Recology Hay Road Landfill.

The Construction and Demolition Debris Recovery Ordinance (San Francisco Ordinance No. 27-06) requires all contractors to prepare a Demolition Debris Recovery Plan. The recovery plan must demonstrate that waste entering landfill facilities from the proposed project would be reduced by a minimum of 65 percent by weight through recycling. The recovery plan must identify the sources of recyclable materials, outline a recycling method (self-separation or mixed recovery), and identify a Registered Transporter to haul mixed construction and demolition debris offsite to a Registered Facility for sorting and recycling. The recovery plan must be submitted to and approved by the San Francisco's Department of the Environment.[167]

---

165 California Department of Resources Recycling and Recovery, Facility Detail: Recology Hay Road Landfill (48-AA-0002), 2019, *https://www2.calrecycle.ca.gov/swfacilities/Directory/48-AA-0002*, accessed January 21, 2019.

166 California Department of Resources Recycling and Recovery, Jurisdiction Diversion/Disposal Rate Detail, San Francisco, 2018, *https://www2.calrecycle.ca.gov/LGCentral/DiversionProgram/JurisdictionDiversionDetail?year=2017&jurisdictionID=438*, accessed January 21, 2019.

167 San Francisco's Department of Environment, Construction and Demolition Debris Recovery Requirements, 2017, *https://sfenvironment.org/construction-demolition-requirements*, accessed January 21, 2019.

In addition, the 2019 California Green Building Standards Code (the CALGreen Code) requires that 100 percent of trees, stumps, rocks, and associated vegetation and soils resulting primarily from land clearing be reused or recycled.[168]

Operation

The proposed project's four main types of PDR uses include manufacturing and maker space, parcel delivery and last-mile delivery, wholesale and storage, and fleet management, and other uses permitted in the PDR-2 district, such as laboratory or retail uses. San Francisco's Mandatory Recycling and Composting Ordinance (San Francisco Ordinance No. 100-09) requires all properties and everyone in the city to separate their recyclables, compostables, and landfill trash.[169] Property owners and managers are required to provide color-coded, labeled bins in convenient locations. Education must also be provided to employees, contractors, and janitors on how to source separate recyclables, compostables, and trash. Recycling, composting, and waste reduction are expected to increasingly divert waste from landfills in accordance with California and local requirements.

CalRecycle estimates that the measured solid waste generation rate in San Francisco in 2017 was 4.7 pounds per day per employee.[170] Under the proposed project, a net increase of up to 1,242 employees would be onsite on a typical day. Therefore, the proposed project would result in approximately 5,837 more pounds per day, or 2.9 tons per day, of solid waste than is generated by existing uses and employment at the project site. The Recology Hay Road Landfill has a maximum permitted throughput of 2,400 tons per day, a remaining capacity of approximately 30.4 million cubic yards, and an expected closure date of 2077.[171] The estimated 2.9 additional tons per day of solid waste generated by the proposed project would be less than 1 percent of the maximum tons per day that could be received at the landfill. Given the city's progress to date on diversion and waste reduction, and given the existing future long-term capacity available at the Recology Hay Road Landfill and other area landfills, the proposed project would be served by regional landfills with sufficient permitted capacity to accommodate its solid waste disposal needs.

Conclusion

The project would comply with applicable solid waste statutes and regulations, including the San Francisco Green Building Code, the 2019 CALGreen Code, the Construction and Demolition Debris Recovery Ordinance (San Francisco Ordinance No. 27-06), and the Mandatory Recycling and Composting Ordinance (San Francisco Ordinance No. 100-09). In addition, the proposed project would not generate solid waste in excess of state or local standards or in excess of capacity of local infrastructure. Sufficient landfill capacity would be available to accommodate solid-waste disposal needs for the proposed project. Therefore, impacts related to sufficient landfill capacity and compliance with applicable statutes and regulations related to solid waste would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

---

168 California Building Standards Commission, California Green Building Standards Code (CALGreen), 2019, *https://calgreenenergyservices.com/wp/wp-content/uploads/2019_california_green_code.pdf*, accessed August 14, 2020.

169 San Francisco's Department of Environment, San Francisco Mandatory Recycling and Composting Ordinance, 2017, *https://sfenvironment.org/sites/default/files/fliers/files/sfe_zw_mandatory_factsheet.pdf*, accessed January 22, 2019.

170 The California Department of Resources Recycling and Recovery measures jurisdictional diversion and disposal rates in terms of per-capita disposal expressed as pounds per day per employee. The per capita disposal measurement system uses an actual disposal measurement based on population, disposal rates reported by disposal facilities, and program implementation efforts.

171 California Department of Resources Recycling and Recovery, Recology Hayward Landfill (48-AA-0002), 2019, *https://www2.calrecycle.ca.gov/swfacilities/directory/48-AA-0002*, accessed January 21, 2019.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would not create significant additional solid waste generation compared to the proposed project and would comply with applicable waste management and reduction statutes and regulations related to solid waste. Therefore, impacts related to sufficient landfill capacity and compliance with applicable statutes and regulations related to solid waste would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-UT-1 The proposed project or variant, in combination with cumulative projects, would result in less-than-significant cumulative impacts on utilities and service systems. (Less than Significant)

PROPOSED PROJECT

Future development in San Francisco would increase demand for utilities, including wastewater and stormwater treatment and disposal, water supply, and solid waste disposal. In terms of cumulative impacts, appropriate service providers are responsible for ensuring adequate provision of utilities within their service boundaries. Wastewater, stormwater, and water services would be provided by the SFPUC, and solid waste collection and disposal services would be provided by Recology. The following discussion analyzes the cumulative impacts on these service providers from implementation of the proposed project and cumulative projects in their respective service areas.

Wastewater and Stormwater

The Southeast Treatment Plant provides wastewater and stormwater treatment and management for the eastern portion of the city, including the project site. As part of the SSIP, the Southeast Treatment Plant is undergoing operational improvements and seismic upgrades to ensure the reliability of the sewer system.[172]

As with the proposed project, cumulative projects served by the Southeast Treatment Plant would be required to comply with all San Francisco regulations regarding wastewater and stormwater generation. Although each cumulative project would result in increased wastewater flows, most would be required to incorporate the SFPUC's Stormwater Management Requirements and Design Guidelines. Compliance, or modified compliance, with these guidelines would ensure that stormwater generated by the proposed project as well as the cumulative projects is managed onsite so that the cumulative projects in the eastern portion of the city would not substantially contribute additional volumes of polluted runoff to the city's existing combined stormwater and wastewater infrastructure. As a result, the proposed project combined with cumulative projects would not result in a cumulative impact related to the need for new sewer systems or expansion of the existing sewer system due to cumulative wastewater and stormwater flows. Therefore, the proposed project, in combination with cumulative projects, would have a less-than-significant cumulative impact on the combined sewer collection and treatment system, and no mitigation measures would be required. This topic will not be addressed in the EIR.

[172] SFPUC, San Francisco's Wastewater Treatment Facilities, June 2014, *http://sfwater.org/modules/showdocument.aspx?documentid=5799*, accessed January 23, 2019.

Water Supply

As described above in Impact UT-3, the SFPUC approved and adopted a water supply assessment for the proposed project. The water supply assessment is a cumulative analysis of the project's water supply demand within the context of the city's overall cumulative water demand through 2040, based on current water supply planning. The SFPUC's approval of the water supply assessment for the proposed project indicates that the proposed project would not make a considerable contribution to a cumulative impact on water supply, the impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Solid Waste

Although the cumulative development projects, in combination with the proposed project, would incrementally increase total waste generation from the city, it is anticipated that the increasing rate of diversion citywide through recycling, composting, and other methods would result in a decreasing share of total waste requiring landfill disposal. Cumulative development throughout the city would be subject to the same recycling and composting requirements, and the same construction demolition and debris ordinances that are applicable to the proposed project.

As discussed in Impact UT-5, the Recology Hay Road Landfill has a maximum permitted throughput of 2,400 tons per day, a remaining capacity of approximately 30.4 million cubic yards, and an expected closure date of 2077.[173] The Recology Hay Road Landfill has sufficient landfill capacity to accommodate solid-waste disposal needs for the proposed project and cumulative projects.

Given the city's progress to date on diversion and waste reduction and given the future long-term capacity available at the Recology Hay Road Landfill, the proposed project, in combination with cumulative projects, would have less-than-significant cumulative impacts related to solid waste, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have utilities and service system impacts similar to those of the proposed project. The expanded streetscape variant, in combination with cumulative projects, would have less-than-significant cumulative impacts related to stormwater, wastewater, water supply, and solid waste, and no mitigation measures would be required. This topic will not be addressed in the EIR.

[173] California Department of Resources Recycling and Recovery, Recology Hayward Landfill (48-AA-0002), 2019, *https://www2.calrecycle.ca.gov/swfacilities/directory/48-AA-0002*, accessed January 21, 2019.

E.13. Public Services

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services such as fire protection, police protection, schools, parks, or other public facilities?	☐	☐	☒	☐	☐

Impact PS-1 **The proposed project or variant would not result in an increase in demand for police protection, fire protection, schools, or other services to an extent that would require new or physically altered fire, police, school, or other public facilities, the construction of which could result in significant environmental impacts. (Less than Significant)**

PROPOSED PROJECT

Fire Protection

The San Francisco Fire Department (fire department) provides fire protection and emergency medical services in San Francisco, including the project site. The fire department consists of 45 active fire stations serving approximately 1.5 million people within San Francisco's 49 square miles. The fire department provides fire suppression and unified emergency medical services, including basic life support and advanced life support services. The closest fire station is Station 9 at 2245 Jerrold Avenue, approximately 0.3 mile northwest of the project site.

The fire department responds to non-life-threatening fire and medical emergencies (code 2) as well as life-threatening fire and medical emergencies (code 3). Response times are measured from the time a unit is dispatched to the time the unit arrives at the scene. According to San Francisco's Emergency Medical Services Agency policy, the target response time for a life-threatening emergency medical incident is within 10 minutes 90 percent of the time. In fiscal year 2018–2019, there were 63,318 code 2 incidents and 86,603 code 3 incidents. Ambulances arrived on scene in response to code 3 calls within 10 minutes 91.4 percent of the time; ambulances arrived on scene in response to code 2 calls within 20 minutes 93.5 percent of the time during the fiscal year.[174] Therefore, in fiscal year 2018–2019, the fire department met its target response time for life-threatening fire and medical emergencies.

[174] City and County of San Francisco, *San Francisco Annual Performance Results for Fiscal Year 2018–19*, *https://sfcontroller.org/sites/default/files/Documents/Auditing/FY19%20Annual%20Performance%20Report%202019-12-10.pdf*, accessed August 14, 2020.

Construction

Construction activities would occur over 31 months. During this time, approximately 400 to 500 workers would be onsite daily; staffing levels would vary throughout the construction duration in accordance with seasons and onsite construction activities. Construction activities have the potential to result in accidental onsite fires from such sources as mechanical equipment and the use of flammable construction materials. However, the proposed project would comply with Occupational Safety and Health Administration and fire and building code requirements; and construction managers and personnel would be trained in emergency response and fire safety operations, which include the monitoring and management of life safety systems and facilities. Additionally, fire suppression equipment (e.g., fire extinguishers) would be maintained onsite throughout the construction duration. Furthermore, construction would comply with all applicable federal, state, and local requirements concerning the handling, disposal, use, storage, and management of hazardous waste (refer to Section E.17, Hazards and Hazardous Materials). Therefore, the likelihood of accidents involving construction personnel and equipment and the need for fire department aid would be reduced and would not increase the demand for fire suppression or emergency response during the temporary construction period; new or altered fire stations would not be necessary to maintain response times.

During construction of the proposed project, road or sidewalk detours may occur but would not require new governmental facilities to be built. Because the project would adhere to applicable federal, state, and local requirements for onsite health and safety and emergency response, the impact of the proposed project on fire protection services that could result in physical environmental effects would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Operation

The proposed project would increase the demand for fire protection and emergency medical services, due to the increase in the number of employees in the area. There would be a net increase of approximately 1,242 employees onsite on a typical day. Although the proposed project would likely increase the number of calls received from the area, the increase in responsibilities would not result in the need for the construction of new or altered fire stations that could then result in physical environmental impacts. According to the fire department, existing stations around the project site would provide adequate fire protection.[175] In the case of a larger event, other stations in addition to Station 9 could be called upon for support.[176] Furthermore, the proposed project would be required to comply with applicable building and fire code requirements, including the California Fire Code, which establishes requirements for fire protection systems, such as providing state-mandated fire alarms, fire extinguishers, appropriate building access and egress, and emergency response notification systems. The project sponsor would also comply with the requirements pertaining to the water volume and pressure needed for fire suppression onsite. Compliance with all applicable building and fire codes would further reduce the demand for fire department service and oversight.

[175] Velo, Jose, Deputy Chief of Administration, San Francisco Fire Department, email correspondence between Jose Velo and Stephanie Osby (AECOM), August 23, 2019.

[176] Velo, Jose, Deputy Chief of Administration, San Francisco Fire Department, email correspondence between Jose Velo and Stephanie Osby (AECOM), August 23, 2019.

For these reasons, the impact of the proposed project on fire protection services that could result in physical environmental impacts would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Police Protection

The San Francisco Police Department (police department) provides police protection services to the project site. There are 10 district stations; the project site is in the Bayview Station jurisdiction.[177] During 2014, the Department averaged 1,691 total full-duty sworn officers.[178] In 2015, the board of supervisors passed resolution number 248-15, which increased the mandated minimum staffing level to 2,200 sworn officers.[179] As of March 2020, the police department had approximately 2,167 full-time sworn officers on duty.[180]

The police department does not have a standard for the ratio of officers to the population; rather, it bases its staffing levels on the number of service calls and crime incidents. The police department's annual statistics for 2017 demonstrate a 3.4 percent decrease in homicides and a 5 percent decrease in homicides by firearm compared to the previous year. In the same report, nonfatal shooting incidents were reported to have decreased by 15.8 percent; however, property crimes in San Francisco increased. Additionally, automobile thefts in San Francisco increased by 24 percent compared to the previous year.[181]

Construction

The proposed project could result in a small increase in demand for police protection services. Construction sites can attract theft and vandalism if not properly secured.[182] Security measures such as security fencing, lighting, and locked entry could be used to prevent theft and vandalism. Although the proposed project could increase the number of calls received from the area, the increase in responsibilities would not be substantial in light of the existing demand for police protection services. Construction of the proposed project would be temporary, for a 31-month construction period, and would not require new or physically altered police facilities that could cause significant environmental impacts. Hence, the proposed project would have a less-than-significant impact related to the provision of police services, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Operation

Project operation would result in an increase of police services due to an increase of employees onsite per day. The project site would be occupied by an average of up to 1,980 employees per day, which is a net increase of approximately 1,242 employees compared to existing conditions. Typical police protection services such as responses to reported crimes, traffic enforcement, and trespassing/vandalism prevention would be required, similar to other PDR uses. Although the site would be used more intensively, which typically is associated with a greater number of calls for service, the increase in employees, lighting, street

181 City and County of San Francisco, City Performance Scorecards, Violent Crime Rate and Property Crime Rate, *https://sfgov.org/scorecards/public-safety/violent-crime-rate-and-property-crime-rate*, accessed December 12, 2018.

182 Berg, Robert, and Jimme Hinze. Theft and Vandalism on Construction Sites, Journal of Construction Engineering and Management, Vol. 131, Issue 7, July 2005.

improvements, and hours of operation can serve to deter crime in the area because of the increased informal surveillance. The Bayview District would be able to provide the necessary police services and crime prevention in the area. Operation of the proposed project would not require the construction of new or physically altered police facilities that could result in a physical environmental impact in order to maintain acceptable service ratios, response times, or other performance objectives for police services. Therefore, the proposed project would have a less-than-significant impact related to the provision of police services, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Schools

The San Francisco Unified School District provides public primary and secondary education throughout the city. The proposed project would not involve the construction of residential units that would in and of itself generate new students. The approximately 1,242 additional employees at the project site are likely to be residents of San Francisco or the Bay Area. Therefore, it is expected that the majority of school-aged children associated with new employees would be part of the existing enrollment at the San Francisco Unified School District or other school districts. Any new enrollment of school-aged children is expected to be small, and the San Francisco Unified School District would be able to accommodate these additional students. The school district manages enrollment at its schools on a district-wide basis so students can be assigned to schools with available capacity.[183] Therefore, the proposed project would have a less-than-significant impact on school capacity and would not require new or altered school facilities the construction of which could result in physical environmental impacts. No mitigation measures would be required. This topic will not be addressed in the EIR.

Other Government Services

The proposed project is not expected to result in a change in demand for government services, including libraries, post offices, and other public facilities. These are community facilities that people typically visit near their residences, rather than where they work. No such government services exist in the immediate project vicinity; the distance from the project site to the nearest public library (Bayview Linda Brooks-Burton Branch Library) is approximately 1 mile, to the nearest post office is approximately 0.6 mile, and to the nearest community facilities (Southeast Community Facility and Bayview Hunter's Point YMCA) is between 0.5 mile and 1.1 miles. Given the distance of these services from the project site and because the number of employees who might use these services is expected to be small, the project would not create a demand for government services that would result in the need to construct or alter existing facilities that could result in physical environmental impacts. Therefore, the proposed project would have a less-than-significant impact on other government services, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the expanded streetscape variant would have the same public services impacts as the proposed project and would not result in an increase in demand for police protection, fire protection, schools, or other services to an extent that would require new or physically

[183] San Francisco Public School District, Enrollment Guide 2019-2020, *http://www.sfusd.edu/en/assets/sfusd-staff/enroll/files/2019-20/2019-20_enrollment_guide_ENG_FINAL_web.pdf*, accessed August 20, 2019.

altered fire, police, school, or other public facilities, the construction of which could result in significant environmental impacts. This impact would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-PS The proposed project or variant would have a less-than-significant cumulative impact on public services. (Less Than Significant)

PROPOSED PROJECT

The geographic context for cumulative fire, police, and library impacts are the police, fire, and library service areas, and the geographic context for cumulative school impacts is the school district. Cumulative projects in the service areas for each of these public services, in combination with the proposed project, would increase the number of employees and residents in the area, leading to an increase in demand for public services, including fire and police protection. These essential city service providers continually assess demand, based on anticipated growth and service needs. By analyzing the applicable metrics, these agencies and services are able to adjust staffing, capacity, response times, and other measures of performance. As a result, the cumulative projects would not result in any service gap in fire, police, schools, library, or other governmental services. Therefore, the proposed project, in combination with cumulative projects, would have less-than-significant cumulative public services impacts, and no mitigation measures are required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, employment, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Similar to the proposed project, cumulative projects in the service areas for each of the public services above, in combination with the expanded streetscape variant, would increase the number of employees and residents in the area, leading to an increase in demand for public services, including fire and police protection. These essential city service providers continually assess demand, based on anticipated growth and service needs. Therefore, the expanded streetscape variant, in combination with cumulative projects, would have less-than-significant cumulative public services impacts, and no mitigation measures are required. This topic will not be addressed in the EIR.

E.14. Biological Resources

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☐	☐	☒
c) Have a substantial adverse effect on federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒	☐
f) Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☐	☒

The project site is in a developed urban area completely covered by impervious surfaces, with no natural land cover. The project site does not support riparian habitat or other sensitive natural communities,[184] as defined by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service. The project site boundary is approximately 0.5 mile from the nearest water body,[185] the Islais Creek Channel, a classified estuarine system that connects to San Francisco Bay. Because it would be physically separated from riparian and aquatic communities in the bay by surrounding urban development, the proposed project and expanded streetscape variant would not involve any changes to riparian habitat or other sensitive natural communities. Therefore, topic 14 (b) is not applicable to the proposed project or expanded streetscape variant. In addition,

[184] California Department of Fish and Wildlife, Natural Communities List, 2018, *https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=153398&inline*, accessed December 19, 2018.

[185] U.S. Fish and Wildlife Service, National Wetlands Inventory, 2018, updated June 25, 2018, *https://www.fws.gov/wetlands/Data/Mapper.html*, accessed December 19, 2018.

the project site and vicinity does not contain wetlands,[186] as defined by section 404 of the Clean Water Act; therefore, topic 14 (c) is not applicable to the proposed project or expanded streetscape variant. The project site is not within the jurisdiction of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan; therefore, topic 14 (f) is not applicable to the proposed project or expanded streetscape variant.

Impact BI-1 **The proposed project or variant would not have a substantial adverse effect, either directly or indirectly through habitat modifications, on species or their habitat identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. (Less than Significant)**

PROPOSED PROJECT

Wildlife species are protected under the federal Endangered Species Act, the Migratory Bird Treaty Act, the California Endangered Species Act, and regulations concerning California Species of Special Concern. Qualified biologists reviewed the California Natural Diversity Database,[187] California Native Plant Society,[188] and United States Fish and Wildlife Service Information for Planning and Conservation[189] occurrences of special-status plant and wildlife species in the city, focusing on occurrences within 2 miles of the project site. The likelihood of special-status species to occur in the vicinity of the project site is based on known species occurrences and natural history parameters, including the species' range, habitat, foraging needs, migration routes, and reproductive requirements.

Nesting birds, their nests, and their eggs are fully protected by California Fish and Game Code, sections 3503 and 3503.5, and the federal Migratory Bird Treaty Act. The lack of natural nesting habitats in urban areas tends to result in resident and migratory birds nesting in ornamental and/or street trees[190] and on structures. Because of existing development on the project site, the lack of natural habitat in the project site, and existing development between the project site and the nearest natural habitat, no candidate, sensitive, or special-status plant or wildlife species are anticipated to occur on the site. The nearest natural habitats are the Islais Creek Channel, approximately 0.5 mile from the project site; and Heron's Head Park, approximately 1.3 miles east of the project site.

Although the project site does not contain any natural habitat, some avian species may use buildings for nesting habitat. American Peregrine falcon (*Falco peregrine anatum)* is a Fully Protected species under the California Fish and Game Code, section 3511, that is found in urban areas and may use tall buildings and bridges for resting and breeding sites. There are two documented occurrences of American peregrine falcon within 2 miles of the project site.[191] Although suitable nesting habitat (i.e., tall buildings) is present near the project site, nesting is unlikely because the project site does not contain suitable nesting habitat and is

190 Public Works Code article 16, Urban Forestry Ordinance, section 802, defines a street tree as any tree growing in the public right-of-way, including unimproved public streets and sidewalks, and any tree growing on land under the jurisdiction of Public Works.

191 California Department of Fish and Wildlife, CNDDB RareFind records search of San Francisco North U.S. Geological Survey 7.5-minute quadrangles, RareFind Version 5, 2018, *https://www.wildlife.ca.gov/Data/CNDDB/Maps-and-Data*, accessed December 19, 2018.

surrounded by urban development. This species prefers more remote areas with multiple foraging habitats. Foraging habitat (open air space) for avian prey is approximately 1.3 miles east of the project site at Heron's Head Park. Due to the distance from the project site, foraging habitat at Heron's Head Park would not be affected by project construction activities. The immediate project vicinity is currently noisy, with noise from traffic on I-280 and from residential and industrial activities. Therefore, potential impacts of the proposed project on the American peregrine falcon would be less than significant.

The project site does not contain any trees, having instead only a small amount of ornamental, nonnative vegetation and no open space. Structures on the project site could, however, support a variety of other non-tree nesting resident and migratory birds, including cliff swallow (*Petrochelidon pyrrhonota*), black phoebe (*Sayornis nigricans*), and house finch (*Haemorhous mexicanus*). Native bird species are protected by both state (California Fish and Game Code, sections 3503 and 3513) and federal (Migratory Bird Treaty Act of 1918) laws. Given the high noise levels at the project site, though, it is unlikely that resident and migratory birds would use the existing structures for nesting, if project construction occurs during the nesting season (January 15 through August 15). Even if present, these bird species would be protected, because removal of existing structures and other construction activities would be required to comply with the California Fish and Game Code and federal Migratory Bird Treaty Act. These laws protect species from the destruction of active nests. Therefore, impacts of construction activities on resident and migratory birds would be less than significant. No mitigation is required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights massing, and design, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have the same biological habitat impacts as the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed and additional street trees would be planted; such disturbances would extend approximately 3 feet below the ground surface. These additional modifications to the streetscape would not introduce new structures or alter natural habitat that could adversely affect nesting resident and migratory birds. Therefore, the expanded streetscape variant would have a less-than-significant impact on sensitive biological species or their habitats, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact BI-2 The proposed project or variant would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Less than Significant)

PROPOSED PROJECT

The project site and surrounding area are covered entirely with impervious surfaces (buildings and pavement) and do not include riparian habitat or other sensitive natural communities as defined by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service. The project site does not contain wildlife nursery sites, fish habitat, or urban bird refuges and lacks natural features associated with wildlife corridors.

The project site is, however, within the Pacific Flyway, a north/south-oriented path stretching from Alaska to Patagonia, along which many species of birds migrate as they travel between breeding and overwintering locations. Glass windows are often not readily obvious to birds because of visually disorienting lights; bird strikes against such windows contribute substantially to avian mortality in urban areas, estimated to

account for as much as 1 to 5 percent of all bird deaths annually.[192] Bird strikes are exacerbated by artificial nocturnal lighting emanating from large buildings, a particular danger for nocturnal migrants and migrating songbirds.[193] The city has adopted guidelines to address this issue and has provided regulations for bird-safe design in planning code section 139, Standards for Bird-Safe Buildings, which establishes building design standards to reduce avian mortality rates associated with bird strikes.[194] The project site is not in or within 300 feet of an urban bird refuge, so the standards concerning location-related hazards are not applicable to the proposed project.[195] Although not in or near an urban bird refuge, the project is required to comply with the hazard-related standards for buildings in section 139. Therefore, with implementation of the regulations to address hazard-related building features as described in planning code section 139, the impact of the proposed project related to interference with the movement of migratory birds would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights, massing, design, lighting, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have same impacts on birds as the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed and additional street trees would be planted; such disturbances would extend approximately 3 feet below the ground surface. These additional modifications to the streetscape would not introduce new structures or light or glare sources that could adversely affect migratory birds. Therefore, the expanded streetscape variant would have a less-than-significant impact on wildlife migration, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact BI-3 The proposed project or variant would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (No Impact)

PROPOSED PROJECT

The city's Urban Forestry Ordinance (Public Works Code section 801 et seq.) requires a permit from the San Francisco Public Works to remove any protected trees. Protected trees include landmark trees,[196] significant trees,[197] or street trees on private or public property anywhere within city limits. There are no existing trees along Rankin Street, Kirkwood Avenue, Toland Street, and McKinnon Avenue bordering the project site. Because there are no existing trees onsite, the proposed project would not remove any trees that would be protected by the Urban Forestry Ordinance.

194 San Francisco Planning Department, Standards for Bird-Safe Buildings, adopted July 14, 2011, *http://sf-planning.org/standards-bird-safe-buildings*, accessed August 26, 2019.

195 San Francisco Planning Department, Urban Bird Refuge Data Viewer, 2011, *https://data.sfgov.org/Energy-and-Environment/Urban-Bird-Refuge/v8rh-bhzp/data*, accessed December 19, 2018.

196 Landmark trees are designated by the board of supervisors for their environmental, cultural, historical, botanical, or other importance. The landmarking process requires extensive assessment by the Urban Forestry Council, based on a set of specific criteria. These trees can be on public or private land.

197 Significant trees are trees of any species within 10 feet of the public right-of-way that are 12 inches in diameter, have a canopy spread of 15 feet, or are 20 feet tall.

Public Works Code section 806(d)(2) requires that one 24-inch box tree be planted for every 20 feet of property frontage along each street, with any remaining fraction of 10 feet or more of frontage requiring an additional tree. Public Works Code section 806(d)(4) includes a provision that the director of public works may waive street tree requirements under extenuating circumstances. However, for each required street tree the public works director waives, the project sponsor must pay an in-lieu fee to fulfill all or a portion of the street tree requirement or provide alternative landscaping comparable to or greater than the number of street trees waived. The proposed project would be required to comply with the applicable San Francisco Public Works code for street tree planting. Therefore, the proposed project would have no impact regarding conflicts with local policies or ordinances protecting trees, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights, massing, design, lighting, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would include a slightly larger footprint, which would involve planting approximately 108 additional street trees in accordance with the applicable San Francisco Public Works code for street tree planting. With compliance with these regulations, the expanded streetscape variant, similar to the proposed project, would have no impact regarding conflicts with local policies or ordinances protecting trees, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-BI-1 The proposed project or variant in combination with cumulative projects would not result in cumulative impacts to biological resources. (Less than Significant)

PROPOSED PROJECT

The project site and the surrounding area do not contain habitat that supports any candidate, sensitive, or special-status species; does not include riparian habitat or other sensitive natural communities as defined by the California Department of Fish and Wildlife and United States Fish and Wildlife Service; does not contain any wetlands as defined by section 404 of the Clean Water Act; and does not fall within any local, regional, or state habitat conservation plans. Therefore, the project would not have the potential to contribute to cumulative impacts on these biological resources and conservation plans. Additionally, the proposed project would have no impact related to conflicts with local policies or ordinances protecting biological resources, such as the Urban Forestry Ordinance; therefore, the proposed project would not have the potential to combine with impacts of cumulative projects to result in a significant impact related to this topic.

Cumulative projects within 0.25 mile of the project site are discussed above under Section B, Cumulative Setting (pp. 43 through 46). The cumulative projects contain onsite or street trees and structures that could provide habitat for birds protected under California Fish and Game Code sections 3503 and 3513 and the Migratory Bird Treaty Act. Like the proposed project, the cumulative projects would be subject to compliance with the California Fish and Game Code sections 3503 and 3513 and Migratory Bird Treaty Act. In addition, the cumulative projects that would include the construction of new buildings, or building additions that could create a bird-strike hazard. These projects would be subject to the requirements of planning code section 139, Standards for Bird-Safe Buildings. Collectively, these requirements would ensure that cumulative impacts on resident and migratory birds would be less than significant. No mitigation measures are required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, building heights, massing, design, lighting, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The larger footprint encompasses paved areas with no natural habitat or existing street trees. Therefore, the proposed expanded streetscape variant would have the same biological impacts as the proposed project. For the same reasons cited for the proposed project, the expanded streetscape variant, in combination with cumulative projects, would have less-than-significant cumulative biological impacts, and no mitigation measures are required. This topic will not be addressed in the EIR.

E.15. Geology and Soils

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:					
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐	☐
ii) Strong seismic ground shaking?	☐	☐	☒	☐	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐	☐
iv) Landslides?	☐	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐	☐
c) Be located on geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐	☐

The proposed project and expanded streetscape variant would connect to the combined municipal sewer system, which is the conveyance system for wastewater in San Francisco, and would not use septic tanks or alternative wastewater disposal systems. Therefore, topic 15 (e) is not applicable to the proposed project or expanded streetscape variant.

There are no unique geologic features at the project site. Therefore, this portion of topic 15(f) is not applicable to the proposed project or expanded streetscape variant.

The information in this section is based on the 2015 Preliminary Geotechnical Investigation prepared for the proposed project.[198] The scope of the geotechnical investigation included reviewing and analyzing the subsurface conditions regarding soil and groundwater at the project site. The preliminary geotechnical investigation's conclusions and recommendations are based on available geotechnical data from the surrounding area and on limited field investigations, which included four cone penetration tests on the project site to maximum depths of 35 to 60 feet below ground surface.

Environmental Setting

SEISMICITY AND SOILS

The project site is relatively flat, with elevations ranging from approximately 15 to 18 feet above sea level. As detailed in the geotechnical investigation, the project site is at the northern end of the bay peninsula. Locally, the site is mapped as being covered with artificial fill overlaying tidal flat alluvial material. The Islais Creek channel, which has been in-filled, previously ran through the middle portion of the site. Estimated depth to bedrock, based on available maps, is likely between 100 and 200 feet below sea level.

Below the surface pavements, the preliminary geotechnical investigation cone penetration tests at the northwestern end of the site generally encountered loose to very dense sands with variable amounts of silt and clay down to a depth of approximately 20.5 to 15 feet below existing grades. Cornerstone Earth Group (Cornerstone) determined that these sandy soils may be fill. These sands were underlain by primarily medium stiff to stiff clays with variable amounts of silt and sands down to approximately 44 feet to 53 feet. Some thin, interbedded sand layers were encountered in the clays. The cone penetration tests at the southeastern end of the site generally encountered loose to very dense sands with variable amounts of silt and clay down to a depth of approximately 14.5 to 12 feet below existing grades. Cornerstone determined that the sandy soils may be fill. Below the sands, primarily medium stiff to stiff clays were encountered to a depth of approximately 24 to 17 feet. The clays were underlain by medium dense to very dense sands with variable amounts of silt and clay down to a depth of approximately 40 to 34.5 feet.

Groundwater was inferred by cone penetration test measurements at depths of approximately 3 to 6 feet below existing grades. Historic high groundwater level is mapped at a depth of less than 10 feet below current grades, and the Cornerstone used a design groundwater depth of 3 feet for the preliminary liquefaction evaluation. The site is in a state-designated liquefaction hazard zone.

The proposed project would involve excavation of approximately 140,600 cubic yards of soil. The proposed project's foundation design would involve concrete spread footings and/or grade beams set on improved and engineered soil, with excavation for the foundations likely to extend 10 feet below existing grade. Typical foundation excavation is expected to extend to 7 feet below grade, with elevator pits and utility trenching extending to 10 feet below existing grade. In addition, it is anticipated that pile foundations would be necessary to support the buildings. Approximately 7,000 25-foot-deep stone columns and approximately 900 60-foot-deep auger-cast piles would be used for the entire site. Each of the auger cast piles would be extended approximately 60 feet below ground surface. Soil improvement would be necessary to support the

[198] Cornerstone Earth Group, geotechnical investigation.

buildings. Ground improvements, such as extended piles, stone columns, drill displacement columns, geopiers,[199] soil-cement mixing, or other similar methods, would provide vertical support through the existing soils to strengthen the undocumented fill that underlies the project site.

GEOLOGIC FORMATIONS AND ASSOCIATED PALEONTOLOGICAL RESOURCES

Paleontological resources are the fossilized evidence of past life found in the geologic record. Fossils are preserved in sedimentary rocks, which are the most abundant rock type exposed at the surface of the earth. Despite the abundance of these rocks, and the vast numbers of organisms that have lived through time, preservation of plant or animal remains as fossils can be a rare occurrence. In many cases, fossils of animals and plants occur only in limited areas and in small numbers relative to the distribution of the living organisms they represent. Fossils of vertebrates—animals with backbones—are sufficiently rare to be considered nonrenewable resources.

The project site is on the northeastern side of the San Francisco Peninsula. San Francisco is primarily underlain by Franciscan Complex bedrock, Merced Formation, Colma Formation, and surficial deposits such as dune sand and artificial fill. The surficial sedimentary deposits found in the city are primarily Holocene-age artificial fill; Holocene- and Pleistocene-age dune sand, Bay Mud, slope debris, and ravine fill; and undifferentiated Quaternary (i.e., Holocene- or Pleistocene-age) sedimentary deposits.

The project site is a former creek bank on an infilled portion of Islais Creek and its estuary, and is mapped as Holocene-age artificial fill overlaying tidal flat alluvial material.[200] The surface of the project site is completely covered with pavement and buildings. The presence of artificial fill was verified, and geologic formations beneath the artificial fill were determined, based on the results of tests performed by Cornerstone as part of the site-specific geotechnical report. Cornerstone performed four cone penetration tests at each corner of the project site to depths ranging from 35 to 53 feet below the ground surface.[201] These test results indicate that the project site is underlain by artificial fill, Bay Mud, and the Colma Formation, which are discussed in further detail below.

Artificial Fill

In the mid-twentieth century, fill material was imported and the project site and vicinity were reclaimed from marshland for purposes of urban development.[202] Cornerstone encountered artificial fill consisting of sandy materials with varying amounts of silt and clay immediately below the ground surface, to depths ranging from 12 to 20 feet.[203]

---

199 "Geopier" is an engineering term used to refer to stiff rock columns drilled deep into the earth's surface, down to a hard, nonyielding depth. Geopiers are used to support a building foundation and reinforce the soil when the existing ground is unstable, wet, or unsuitable for building construction.

200 Bonilla, M.G., *Preliminary Geologic Map of the San Francisco South 7.5' Quadrangle and Part of the Hunters Point 7.5' Quadrangle, San Francisco Bay Area, California: A Digital Database*, U.S. Geological Survey Open-File Report 98-354. Menlo Park, California, 1998.

201 Cornerstone Earth Group, geotechnical investigation.

202 San Francisco Environmental Planning Department, Environmental Planning Preliminary Archeological Review, 2018.

203 Cornerstone Earth Group, geotechnical investigation.

Bay Mud

Cornerstone encountered primarily medium stiff to stiff clays with variable amounts of silt and sands beneath the artificial fill, at depths ranging from 17 to 24 feet and 44 to 53 feet (depending on location); these deposits comprise the Bay Mud.[204] Bay Mud consists of gray, soft, saturated clay and silt with organic material and some sand, that was deposited in the marshes and on the mudflats of San Francisco Bay. Lenses of sand, silt, and organic material (peat) are present within the mud. This geologic unit has been divided into two subunits: Young Bay Mud (Holocene age) and Old Bay Mud (Pleistocene age).

Colma Formation

Cornerstone encountered medium dense to very dense sands below the clay layers, at depths ranging from 34 to 40 feet and 44 to 48 feet (depending on location); these deposits comprise the Colma Formation.[205] The Pleistocene-age Colma Formation primarily consists of sandy deposits laid down between 80,000 and 120,000 years ago, during the last major interglacial period. The origins of the poorly consolidated Colma sands are unclear, but they appear to represent shallow bay-to-dune, and valley-fill debris deposits. The formation extends under San Francisco Bay and may be found as high as 500 feet above sea level.

PALEONTOLOGICAL RESOURCES SENSITIVITY CRITERIA

The city uses a Potential Fossil Yield Classification (PFYC) system as modified from the system developed and refined by the Bureau of Land Management[206] as the basis for its paleontological potential designations. The PFYC system is a predictive resource-management tool founded on two basic facts of paleontology: that occurrences of paleontological resources are closely tied to the geologic units (i.e., formations, members, or beds) that contain them, and that the likelihood of the presence of fossils can be broadly predicted from the distribution of geologic units at or near the surface. The PFYC system is presented in Table 9.

PALEONTOLOGICAL RESOURCES SENSITIVITY ASSESSMENT

The results of a records search at the U.C. Berkeley Museum of Paleontology (UCMP) indicate that there are no recorded vertebrate fossil localities in the project site.[207] However, a vertebra from a Pleistocene-age aquatic mammal (UCMP locality V3410) was recovered from the vicinity of the Islais Creek Channel, approximately 0.5 mile northeast of the project site, in the same geologic formations that are mapped at the project site.[208] The paleontological sensitivity of each of the rock formations at the project site is presented in Table 10.

Table 9 City of San Francisco Paleontological Sensitivity Criteria

Paleontological Potential Designation	Assignment Criteria Guidelines	Geologic Unit Classifications for City of San Francisco
Class 1 = Very Low Potential	Geologic units (Precambrian Age) are not likely to contain recognizable paleontological resources. Units are igneous or metamorphic, excluding air-fall and reworked volcanic ash.	Igneous rocks (not generally encountered in San Francisco)
Class 2 = Low Potential	Geologic units (younger than 10,000 years before present, recent aeolian deposits) are not likely to contain paleontological resources. Fossil preservation unlikely.	Holocene-age surficial deposits and Franciscan Complex (encountered in San Francisco)
Class 3 = Moderate Potential	Sedimentary geologic units (Marine in origin) where fossil content varies in significance, abundance, and predictable occurrence. Scattered occurrences.	Pleistocene-age surficial deposits, Colma Formation, Merced Formation (encountered in San Francisco)
Class U = Unknown Potential	Geologic units that cannot receive an informed class assignment or have not been studied in detail; reports of finds are anecdotal and unverified.	Holocene- to Pleistocene-age surficial deposits (specific age not known)
	Little information about the actual paleontological resources of the unit or area is known.	
	There is no information on the age of the unit. As noted above, most units in San Francisco are identified as Class U.	

Source: City and County of San Francisco, 2022, Paleontological Resource Assessment and Mitigation Measures.

Table 10 Paleontological Sensitivity Assessment

Formation Name	Known Fossil Resources	Paleontological Sensitivity
Artificial Fill	Artificial fill consists of materials that were excavated from another location, transported to the project site, and then graded and compacted. During the excavation and subsequent construction process, any fossils that may have been present in the original materials were likely destroyed.	Low (Class 2)
Young Bay Mud	Holocene-age formations, such as Young Bay Mud, contain only the remains of extant, modern taxa (if any resources are present), which are not considered "unique" paleontological resources.	Low (Class 2)
Old Bay Mud	Pleistocene-age sediments, some of which may be referable to Old Bay Mud, have yielded vertebrate fossils in the Bay Area.[209,210,211] Recently discovered Pleistocene vertebrate fossils near San Francisco Bay include Columbian mammoth (*Mammuthus columbi*), Harlan's ground sloth (*Paramylodon harlani*), horse (*Equus* sp.), Bison sp., and pronghorn antelope (*Capromeryx minor*), among other taxa.[212]	Moderate (Class 3)
Colma Formation	Identified fossils in the Colma Formation include mammoth, bison, and ground sloth remains from various locations in San Francisco. Diatoms, trees, and pollen have also been reported from the Colma Formation. A Columbian mammoth was reported at the Cliff House Beach.[213] Fossil elements from three different mammoths and a bison were reported from the Colma Formation at the southeastern base of Telegraph Hill.[214] In addition, a mammoth tooth was discovered in the Colma Formation during excavation for the Transbay Transit Center in downtown San Francisco in 2012.[215]	Moderate (Class 3)

Regulatory Setting

The following description of existing development regulations and standards provides the regulatory framework governing seismic, geotechnical, and soil hazards.

FEDERAL REGULATIONS TO ADDRESS SEISMIC HAZARDS

Earthquake Hazard Reduction Act of 1977. Federal laws codified in United States Code Title 42, chapter 86, were enacted to reduce risks to life and property from earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards reduction program. Implementation of these requirements are regulated, monitored, and enforced at the state and local levels. Key regulations and standards applicable to the proposed project are summarized in the following paragraphs.

CALIFORNIA REGULATIONS TO ADDRESS SEISMIC HAZARDS

The Alquist-Priolo Earthquake Fault Zoning Act of 1972 (Alquist-Priolo Act). The Alquist-Priolo Act (Public Resources Code section 2621 et seq.) is intended to reduce the risk to life and property from surface fault rupture during earthquakes. The Alquist-Priolo Act prohibits the location and construction of most types of structures intended for human occupancy[216] overactive fault traces and strictly regulates construction in the corridors along active faults (i.e., earthquake fault zones).

State Building Code Chapters 18 and 16. Chapter 18, Soils and Foundations, of the state building code provides the parameters for geotechnical investigations and structural considerations in the selection, design, and installation of foundation systems to support the loads from the structure above. Section 1803 (Geotechnical Investigations) sets forth the scope of geotechnical investigations conducted. Section 1804 (Excavation, Grading, and Fill) specifies considerations for excavation, grading, and fill to protect adjacent structures and to prevent destabilization of slopes due to erosion and/or drainage. In particular, Section 1804.1 (Excavation Near Foundations) requires that adjacent foundations be protected against a reduction in lateral support as a result of project excavation. This is typically accomplished by underpinning or protecting said adjacent foundations from detrimental lateral or vertical movement, or both. Section 1807 (Foundation Walls, Retaining Walls, and Embedded Posts and Poles) specifies requirements for foundation walls, retaining walls, and embedded posts and poles to ensure stability against overturning, sliding, excessive pressure, and water lift, including seismic considerations. Sections 1808 through 1810 (Foundations) specify requirements for foundation systems based on the most unfavorable loads specified in Chapter 16, Structural, for the structure's seismic design category, in combination with the soil classification at the project site. During its review of the building permit for a project, the building department reviews project plans for conformance with the recommendations in a project-specific geotechnical report and may require additional site-specific soils report(s) through the building permit application process.

State Seismic Hazards Mapping Act of 1990 (Landslide and Liquefaction Hazard Zones). Pursuant to the Seismic Hazards Mapping Act of 1990 (seismic hazards act), the California State Geologist has designated seismic hazard zones for landslide and liquefaction hazards. These mapped areas enable cities and counties to adequately prepare the safety element of their general plans and to encourage land use management policies and regulations to reduce and mitigate those hazards in the interest of protecting public health and

[216] With reference to the Alquist-Priolo Act, a structure for human occupancy is defined as one "used or intended for supporting or sheltering any use or occupancy that is expected to have a human occupancy rate of more than 2,000 person-hours per year" (California Code of Regulations, Title 14, division 2, section 3601[e]).

safety.[217] Projects situated in a seismic hazard zone for liquefaction or landslide hazard are subject to the seismic hazards act requirements, which include a geotechnical investigation, performed by a qualified engineer and/or geologist, to delineate the area of hazard and to propose measures to address any identified hazards. The local building official must incorporate the recommended measures to address such hazards into the conditions of the building permit.

SAN FRANCISCO BUILDING CODES TO ADDRESS SEISMIC HAZARDS

Building Department Permit Review Process. San Francisco relies on the state and local regulatory review process for review and approval of building permits pursuant to the following:

- California Building Standards Code (California Code of Regulations, title 24)
- San Francisco Building Code (the state building code), plus local amendments (including administrative bulletins) that supplement the state code
- The building department's implementing procedures, including information sheets
- Seismic Hazards Mapping Act of 1990 (Public Resources Code sections 2690 through 2699.6)
- Administrative Bulletin No. AB-82, which provides guidelines and procedures for structural, geotechnical, and seismic hazard engineering design review[218]
- Information Sheet No. S-05, which identifies the type of work for which geotechnical reports are required, such as for new construction, building additions, and grading, and report submittal requirements[219]

Mandatory Interdepartmental Project Review. Projects that involve new construction of a building eight stories or more, new construction in a seismic hazard zone for liquefaction hazard, or new construction in a seismic hazard zone for landslide hazard are subject to a mandatory interdepartmental project review prior to a public hearing before the planning commission or the issuance of the new construction building permit. The interdepartmental review meeting must include representatives from the planning, building, public works, and fire departments to address compliance with applicable codes, and design and project construction considerations.[220]

San Francisco Public Works Code. Section 146, Construction Site Runoff Control, requires that all construction sites must implement best management practices to minimize surface runoff erosion and sedimentation. In addition, pursuant to section 146.7, if construction activities would disturb 5,000 square feet or more of ground surface, then the project sponsor must have an Erosion and Sediment Control Plan (erosion and sediment control plan) developed and submit a project application to the SFPUC prior to

---

[217] In the context of the seismic hazards act, "mitigation" refers to measures that are consistent with established practice and that will reduce seismic risk to acceptable levels, rather than the mitigation measures that are identified under CEQA to reduce or avoid environmental impacts of a proposed project.

commencing construction-related activities. An erosion control plan is a site-specific plan that details the use, location, and emplacement of sediment and erosion control devices.

Impact Analysis

Impact GE-1 **The proposed project or variant would not directly or indirectly cause potential adverse effects related to the rupture of a known earthquake fault, strong seismic ground shaking, and seismic-related ground failure, including liquefaction, or landslides. (Less than Significant)**

PROPOSED PROJECT

Fault Rupture

The project area is outside the Alquist-Priolo Earthquake Fault Zone and no known active faults are present in the project area. The nearest active faults are the San Andreas Fault (6.8 miles from project site); the San Gregorio Fault (10.3 miles from site); and the Hayward Fault (11.6 miles from project site).[221] Given the distance of the project site from these faults, there is a low risk of surface rupture related to fault movement. Additionally, the geotechnical investigation stated that there is no evidence of surface expression of fault traces on the project site and concluded that the risk of fault rupture hazard is not significant.[222] Furthermore, the project would not increase the risk of fault rupture because it would not add a substantial load to any fault or introduce water, a lubricant, into a fault zone. Therefore, the potential for construction and operation of the proposed project to increase hazards related to the risk of loss, injury, or death involving fault rupture is less than significant. No mitigation measures would be required. This topic will not be addressed in the EIR.

Strong Seismic Ground Shaking

The San Francisco Bay Area is one of the most seismically active areas in the country. The U.S. Geological Survey estimates that there is a 72 percent chance of at least one magnitude 6.7 earthquake occurring in the San Francisco region within the next 30 years.[223] Given the distance of the San Andreas Fault, the San Gregorio Fault, and the Hayward Fault to the project site (approximately 7 to 12 miles), ground shaking could be experienced at the project site during moderate to severe earthquakes. Proposed structures must comply with the standards of the California Building Code Title 24, specifically chapter 16, structural design and chapter 18, soils and foundations, which set forth minimum requirements for building design and construction of public and private buildings relating to fire and life safety, structural safety, and access compliance.[224] Additionally, the proposed project would be required to comply with the San Francisco Building Codes, including administrative bulletins and the building department's implementing procedures.

Complete avoidance of any damage may not be feasible, but incorporation of industry-standard seismic design measures in accordance with current building codes would address the effects of strong seismic ground shaking. The project would not exacerbate the potential for seismic ground shaking, which is a

function of the location of the epicenter, the size of the event, and the underlying geological formations, none of which would be affected by the proposed project. Furthermore, the building department would review the project's construction documents for conformance with recommendations in the site-specific, design-level geotechnical investigation to ensure compliance with state and local building code provisions related to structural design and safety. Therefore, construction or operation of the project would not be expected to increase strong seismic ground shaking that would result in risk of loss, injury, or death, and impacts would be less than significant. This topic will not be addressed in the EIR.

Seismic-Related Ground Failure, Including Liquefaction

Liquefaction is a transformation of soil from a solid to a liquefied state, during which saturated soil temporarily loses strength. This phenomenon results from the buildup of excess pore water pressure during earthquake-induced cyclic loading. Soils susceptible to liquefaction include loose to medium dense sand and gravel, low plasticity silt, and some low-plasticity clay deposits. According to the city's general plan and the state's Seismic Hazards Mapping Act of 1990, the project site is in a liquefaction hazard zone.[225],[226] The preliminary geotechnical investigation found that the project site is underlain by loose to very dense sands with variable amounts of silt and clay to a depth of approximately 12 to 20.5 feet below existing grades. Groundwater was measured at depths of about 3 to 6 feet below existing grades. The methods used to estimate liquefaction settlement assume that there is a sufficient cap of nonliquefiable material to prevent ground rupture or sand boils.[227]

The project could experience liquefaction and differential settlement if not constructed properly, and could expose people and structures to substantial adverse ground failure effects. However, in accordance with the provisions of the 2019 state building code and Special Publication 117A,[228] the preliminary geotechnical report for the proposed project provides recommendations to address these hazards, such as supporting the new buildings with shallow foundations with ground improvement measures extending 20 to 45 feet below existing grades; or supporting the new buildings with deep foundation systems, such as auger-cast or extended piles. Ground improvements would provide vertical support through the existing soils to reduce potential liquefaction impacts. Deep foundation systems would derive support from underlying stiff alluvial soils beneath the fill and underlying soft compressible clays and liquefiable soils. As described in Section A, Project Description, the proposed project would be supported on concrete spread footings and/or grade beams, on improved and engineered soil. Soil improvement would be accomplished using a combination of 7,000 25-foot-deep stone columns and 900 60-foot-deep auger-cast piles.[229] The building department permit review process ensures that the proposed project's structural and foundation plans would comply with applicable building code provisions and be in conformance with the measures recommended in the project-specific geotechnical reports and required by the building department's Administrative Bulletin AB-082.[230] Compliance with these requirements would ensure that the proposed project would not exacerbate the

229 Since preparation of the geotechnical report, the project sponsor has advanced the project design with its engineers/project team so that this description of pile installation is more current and indicative of the project than the description in the geotechnical report.

230 City and County of San Francisco, Administrative Bulletin AB-082, Guidelines and Procedures for Structural, Geotechnical, and Seismic Hazard Engineering Design Review, 2018, *https://codelibrary.amlegal.com/codes/san_francisco/latest/sf_building/0-0-0-95162*, accessed January 9, 2019.

potential for seismically related ground failure, including liquefaction and lateral spreading.[231] Therefore, this impact would be less than significant. This topic will not be addressed in the EIR.

Landslides

The topography around the project site is flat and does not include hills or cut slopes that could be subject to landslide. According to the city's general plan and the state's Seismic Hazards Mapping Act of 1990, the site is not in a designated landslide hazard zone.[232,233] Therefore, construction and operation of the proposed project would have no impact with respect to increasing the potential for landslides. Therefore, this topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensity, excavation and foundation work, and site plan as the proposed project, but would extend streetscape improvements for the entire cross section of the streets along the project perimeter to Better Streets standards. Similar to the proposed project, the expanded streetscape variant would not directly or indirectly cause potential adverse effects related to the rupture of a known earthquake fault, strong seismic ground shaking, and seismic-related ground failure, including liquefaction, or landslides. All of the applicable building codes and standards described for the proposed project would apply to the expanded streetscape variant. In addition, these streetscape improvements in the public right-of-way would be required to comply with city standards for such improvements. Compliance with city codes and standards would ensure that these hazards would not be exacerbated by the expanded streetscape variant; no mitigation measures would be required. Therefore, this topic will not be addressed in the EIR.

Impact GE-2 Construction and operation of the proposed project or variant would not result in substantial erosion or loss of topsoil. (Less than Significant)

PROPOSED PROJECT

San Francisco Public Works Code section 146, Construction Site Runoff Control, requires all construction sites to implement best management practices to minimize surface runoff erosion and sedimentation. In addition, pursuant to section 146.7 of the code, if construction activities disturb 5,000 square feet or more of ground surface, then the project sponsor must develop an erosion and sediment control plan and submit a project application to the SFPUC prior to commencing construction-related activities. An erosion control plan is a site-specific plan that details the use, location, and placement of sediment and erosion control devices.

The project site is generally flat and covered entirely with impervious surfaces. The proposed project would involve excavation of approximately 134,000 cubic yards of soil onsite to a maximum depth of approximately 10 feet below the existing grade at the site. Best management practices in the Stormwater Pollution Prevention Plan and Erosion Control Plan, pursuant to the state requirements and the city's code, respectively, would reduce potential impacts related to erosion and topsoil loss at the project site.

---

231 When *lateral spreading* occurs, the ground tears, opening surface cracks and fissures across the slope.

232 City and County of San Francisco, San Francisco General Plan, Community Safety Element, Map 4, *https://generalplan.sfplanning.org/Community_Safety_Element_2012.pdf*, accessed December 18, 2019.

233 California Department of Conservation, Seismic Hazards Mapping Act of 1990 GIS Data (landslide layer), viewer, *https://maps.conservation.ca.gov/cgs/DataViewer/*, accessed January 4, 2022.

Additionally, the proposed project would not substantially change the general topography of the site because the project site is already generally flat, and there are no unique geologic or physical features at the project site.

Once constructed, the proposed project would continue to be covered entirely with impervious surfaces. As discussed in Impact UT-2, the proposed project would be required to comply with the San Francisco Stormwater Management Ordinance. This ordinance requires sites with more than 50 percent impervious surfaces (such as the project site) to be designed so that the stormwater runoff rate and volume do not exceed predevelopment conditions for the one- and two-year, 24-hour design storm.[234] As discussed in the Water Supply Assessment for this project, the project would request a modified compliance with the first submittal of the Stormwater Control Plan. The modified requirements would be a 40 percent reduction in the rate and a 10 percent reduction in the volume of runoff for the 2-year, 24-hour design storm.[235] To meet these modified requirements, the proposed project would include rainwater collection cisterns that would manage stormwater onsite and limit demand on both the collection system and wastewater facilities resulting from stormwater discharges. The requirements of the San Francisco Stormwater Management Ordinance would slow runoff from the site, further reducing erosion from existing site conditions. For these reasons, the project would not result in substantial erosion or loss of topsoil. The impact would be less than significant, and no mitigation is required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have erosion and top soil loss impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. All of the applicable building codes, regulations, and standards described for the proposed project would apply to the expanded streetscape variant and would ensure that construction of the expanded streetscape variant would not result in substantial erosion or loss of topsoil. The impact would be less than significant, and no mitigation is required. This topic will not be addressed in the EIR.

Impact GE-3 The project site is not located on a geologic unit or soil that is unstable, or that could become unstable as a result of the proposed project or variant. (Less than Significant)

PROPOSED PROJECT

As discussed under Impact GE-1 (landslides), the site is not in a designated landslide hazard zone. Additionally, there are no geologic units within a short distance of the project area that are considered susceptible to lateral spreading; therefore, the potential for lateral spreading to affect the site is low.[236] However, the project site is in a state-designated seismic hazard zone for liquefaction,[237] and the site is mapped as being tidal flat material overlain by artificial fill material. If not designed appropriately, construction on relatively loose materials or over materials of differing properties could be subject to

[234] SFPUC, San Francisco Stormwater Management Requirements and Design Guidelines, May 2016, *https://sfpuc.org/sites/default/files/documents/SMR_DesignGuide_May2016.pdf*, accessed January 23, 2019.

[237] City and County of San Francisco, *General Plan – Community Safety Element*, 2012.

subsidence or differential settlement. As described in Section A, Project Description, the proposed project's foundation is expected to be supported by 7,000 25-foot-deep stone columns and 900 60-foot-deep auger-cast piles designed to address future static or seismic settlement. The proposed project would be required to adhere to site preparation standards in accordance with the California building code requirements, which include site-specific design-level evaluation of underlying materials and their engineering characteristics. The structural engineering design construction documents would be reviewed by the building department for conformance with recommendations in the site-specific geotechnical investigation as part of the building permit review process.[238]

With implementation of industry standard engineering design measures in accordance with building code standards, the potential impacts associated with construction on unstable soils would be reduced, and hazards associated with unstable soils would not be exacerbated by the project. Therefore, the potential impact of project construction on unstable soils would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have geologic impacts similar to those of the proposed project but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, with implementation of industry standard engineering design measures in accordance with building code and public works standards, the potential impacts associated with construction on unstable soils would be reduced, and hazards associated with unstable soils would not be exacerbated by the expanded streetscape variant. Therefore, the potential impact of the expanded streetscape variant construction on unstable soils would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact GE-4 The proposed project or variant would not create substantial direct or indirect risks to life or property as a result of being located on expansive soil. (Less than Significant)

PROPOSED PROJECT

Expansive soils expand and contract in response to changes in soil moisture and are characterized by their ability to undergo significant volume change (i.e., to shrink and swell), particularly when near-surface soils fluctuate from saturated to low moisture-content conditions and back again. Expansive soils are typically very fine grained and have a high to very high percentage of clay. They can damage structures and buried utilities and increase maintenance requirements.

Underlying soils at the project site are generally loose to very dense sands with variable amounts of silt and clay, as described under Impact GE-1 (liquefaction). The site does not contain subsurface soils consisting of clays that have high expansive potential. Therefore, the project would not result in a substantial direct or indirect risk to life or property related to expansive soils. Additionally, compliance with building code

[238] Cornerstone Earth Group, geotechnical investigation.

requirements would ensure that potential impacts related to expansive soils would be less than significant. No mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have geologic impacts similar to those of the proposed project but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, the expanded streetscape variant would not result in a substantial direct or indirect risk to life or property related to expansive soils. Additionally, compliance with building code requirements and public works standards would ensure that potential impacts related to expansive soils would be less than significant. No mitigation measures would be required. This topic will not be addressed in the EIR.

Impact GE-5 The proposed project or variant could directly or indirectly destroy a unique paleontological resource. (Less than Significant with Mitigation)

PROPOSED PROJECT

As described above, rock formations at the project site consist of artificial fill, Bay Mud, and the Colma Formation. Because the artificial fill and Young Bay Mud are too young to contain unique paleontological resources, these formations are considered to be of low paleontological sensitivity (Class 2). Because a limited amount of unique paleontological resources in the form of vertebrate fossils have been recovered from Old Bay Mud and Colma Formation in San Francisco and the greater Bay Area region, these formations are considered to be of moderate paleontological sensitivity (Class 3). The proposed project includes construction of 25-foot-deep stone columns and installation of 60-foot-deep auger-cast piles, which would exceed 2 feet in diameter. Therefore, project-related excavation would encounter Old Bay Mud and the Colma Formation. Damage to or destruction of unique paleontological resources, which may be present in these formations, would represent a potentially significant impact.

To reduce potentially significant impacts on unique paleontological resources to a less-than-significant level, Mitigation Measure M-GE-5 would require the project sponsor to engage a qualified paleontologist to provide pre-construction worker environmental awareness training regarding potential paleontological resources and would require construction to be temporarily halted in the event of the inadvertent discovery of a paleontological resource during construction.

Mitigation Measure M-GE-5 Inadvertent Discovery of Paleontological Resources

Worker Environmental Awareness Training. Prior to commencing construction, the project sponsor shall engage a paleontologist meeting the standards of the Society of Vertebrate Paleontology[239] to conduct training for all onsite construction workers regarding paleontological resources and the

[239] Society of Vertebrate Paleontology, *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources*, 2010, *https://vertpaleo.org/wp-content/uploads/2021/01/SVP_Impact_Mitigation_Guidelines.pdf*, accessed January 2022.

contents of the paleontological resources alert sheet, as provided by the planning department. The paleontological resources alert sheet shall be prominently displayed at the construction site during ground-disturbing activities.

In addition, the project sponsor (through a designated representative) shall inform construction personnel of the immediate stop work procedures and contact information to be followed if bones or other potential fossils are unearthed at the project site, and the laws and regulations protecting paleontological resources. As new workers arrive at the project site for ground-disturbing activities, they shall be trained by the construction supervisor.

The paleontologist shall submit a letter confirming the timing of the worker training to the planning department. The letter shall confirm the project's location, the date of training, the location of the informational handout display, and the number of participants. The letter shall be transmitted to the planning department within five business days of conducting the training.

Discovery of Unanticipated Paleontological Resources. In the event of the inadvertent discovery of a paleontological resource during construction, excavations within 25 feet of the find shall temporarily be halted until the discovery is examined by a qualified paleontologist (as defined by the Society of Vertebrate Paleontology). Work in the sensitive area shall resume only when deemed appropriate by the qualified paleontologist, in consultation with the planning department.

The qualified paleontologist shall determine: 1) whether the discovery is scientifically significant; 2) the necessity for involving other agencies and stakeholders; 3) the significance of the resource; and 4) methods for resource recovery. If a paleontological resource assessment results in a determination that the resource is not scientifically important, this conclusion shall be documented in a paleontological evaluation letter to demonstrate compliance with applicable statutory requirements. The paleontological evaluation letter shall be submitted to the planning department for review within 30 days of the discovery.

If a paleontological resource is determined to be of scientific importance and there are no feasible avoidance measures, a paleontological mitigation program must be prepared by the qualified paleontologist engaged by the project sponsor. The mitigation program shall include measures to fully document and recover the resource and shall be approved by the planning department. Ground-disturbing activities in the project area shall resume and be monitored, as determined by the qualified paleontologist in

collaboration with the planning department, for the duration of such activities.

The mitigation program shall include: 1) procedures for construction monitoring at the project site; 2) fossil preparation and identification procedures; 3) curation into an appropriate repository; and 4) preparation of a paleontological resources report at the conclusion of ground-disturbing activities. The report shall include dates of field work, results of monitoring, fossil identifications to the lowest possible taxonomic level, analysis of the fossil collection, a discussion of the scientific significance of the fossil collection, conclusions, locality forms, an itemized list of specimens, and a repository receipt from the curation facility. The project sponsor shall be responsible for the preparation and implementation of the mitigation program, in addition to any costs necessary to prepare and identify collected fossils, and for any curation fees charged by the paleontological repository. The mitigation program shall be submitted to the planning department for review within 10 business days of the discovery. The paleontology report shall be submitted to the planning department for review within 30 business days from conclusion of ground-disturbing activities, or as negotiated following consultation with the planning department.

Significance after Mitigation. The project sponsor has agreed to implement Mitigation Measure M-GE-5. This measure would ensure that unique paleontological resources that may be present in soils/sediments that would be disturbed by project construction would be identified and assessed. If a paleontological resource of scientific importance is present, the resource would be preserved in place or paleontological data recovery would be carried out to preserve the important information it represents. With implementation of these measures, the potentially significant impact to unique paleontological resources would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have paleontological impacts similar to those of the proposed project but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, under the expanded streetscape variant, the project sponsor would be required to implement Mitigation Measure M-GE-5: Inadvertent Discovery of Paleontological Resources. With implementation of these measures for the expanded streetscape variant footprint, the potentially significant impact to unique paleontological resources would be reduced to a less-than-significant level. This topic will not be addressed in the EIR.

Impact C-GE-1 The proposed project or variant, in combination with cumulative projects in the project site vicinity, would have less-than-significant cumulative impacts related to geology, soils, and seismicity. (Less than Significant)

PROPOSED PROJECT

Geologic, soils, and seismic impacts are generally site-specific and highly localized. Therefore, the potential for the proposed project to combine with cumulative projects and create a cumulative impact related to geology, soils, and seismicity would be low. Furthermore, with respect to geology, soils, and seismicity, all projects in the vicinity would also be subject to building department requirements for geotechnical investigation and required to comply with the state and local building codes. The building permit would be reviewed for conformance with the recommendations in the geotechnical investigation. For these reasons, the proposed project, in combination with cumulative projects, would have less-than-significant cumulative impacts related to geology, soils, and seismicity. No mitigation measures are required. This topic will not be addressed in the EIR.

In the San Francisco peninsula, Pleistocene-age surficial deposits, Old Bay Mud, Colma Formation, and the Plio-Pleistocene-age Merced Formation are of moderate paleontological sensitivity (Class 3). As described above, mitigation would reduce this impact to a less-than-significant level. Other projects considered in the cumulative analysis that involve ground-disturbing activities would not affect potential resources at this site. Therefore, the projects considered in this cumulative analysis would not result in a significant cumulative impact.

This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work and site plan as the proposed project but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the expanded streetscape variant would have geology and paleontology resources impacts similar to those of the proposed project but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface.

Similar to the proposed project, under the expanded streetscape variant, geologic, soils, and seismic impacts are generally site-specific and highly localized. Therefore, the potential for the expanded streetscape variant to combine with cumulative projects and create a cumulative impact related to geology, soils, and seismicity would be low. Furthermore, with respect to geology, soils, and seismicity, all projects in the vicinity would also be subject to public works' requirements and building department requirements for geotechnical review and required to comply with the state and local building codes. No mitigation measures are required. This topic will not be addressed in the EIR.

Similar to the proposed project, under the expanded streetscape variant there would not be a significant cumulative impact. This topic will not be addressed in the EIR.

E.16. Hydrology and Water Quality

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	☐	☐	☒	☐	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would:	☐	☐	☒	☐	☐
i) Result in substantial erosion or siltation on or offsite;	☐	☐	☒	☐	☐
ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or offsite;	☐	☐	☒	☐	☐
iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐	☐
iv) Impede or redirect flood flows?	☐	☐	☒	☐	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐	☐

The project site is not in a 100-year flood hazard area designated on the city's interim floodplain map, and would not place housing or structures within a 100-year flood hazard area that would impede or redirect flood flows as shown on the Federal Emergency Management Agency's Preliminary Flood Insurance Rate Map for the southeastern quadrant of San Francisco.[240] The project site is not within a tsunami hazard zone; therefore, no significant tsunami hazards exist at the site.[241] Additionally, the site is not in a dam inundation

[240] City and County of San Francisco, San Francisco's Interim Floodplain Map, Southeast, November 12, 2015, *http://sfgsa.org/sites/default/files/Document/SF_SE.pdf*, accessed December 19, 2018.

[241] City and County of San Francisco, Community Safety Element of the San Francisco General Plan, 2012, Map 5 (Tsunami Hazard Zones San Francisco, 2012), *http://generalplan.sfplanning.org/Community_Safety_Element_2012.pdf*, accessed December 17, 2018.

zone or subject to flooding from levee failure.[242] The preliminary geotechnical report that was prepared for this project found that the potential for inundation due to seiche is considered low.[243,244] Therefore, topic E.16 (d) is not applicable to the proposed project or expanded streetscape variant.

Impact HY-1 **The proposed project or variant would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or conflict with or obstruct implementation of a water quality control plan. (Less than Significant)**

PROPOSED PROJECT

Water Quality and Wastewater Discharge

Stormwater and wastewater from the project site are collected in the city's combined sewer system, which collects, transports, and treats sanitary sewage and stormwater runoff in the same facilities prior to discharge to the Pacific Ocean or the San Francisco Bay. During dry weather (typically May through September), the flows consist mainly of wastewater. During wet weather (generally October through April), the combined sewer system collects large volumes of stormwater runoff in addition to wastewater; Bayside wet-weather flows are defined as flows greater than 110 mgd due to rain.[245]

The city is divided into drainage basins or watersheds that drain either to the Oceanside Treatment Plant or the Southeast Treatment Plant; flows may also drain to the North Point Wet-Weather Facility during a storm.[246] The combined sewer flows from the project site are treated at the Southeast Treatment Plant, which treats 80 percent of the city's flows.[247] Discharges from the Southeast Treatment Plant are regulated by Bayside National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664 (issued by the San Francisco Regional Water Quality Control Board) and the United States Environmental Protection Agency's (U.S. EPA's) Combined Sewer Overflow Control Policy. The Southeast Treatment Plant has a wet-weather flow capacity of 250 mgd. It has the capacity to provide primary and secondary treatment to up to 150 mgd and is permitted to discharge up to an additional 100 mgd of wastewater that receives primary treatment plus disinfection. If wet-weather flows exceed the capacity of the overall system, the excess is discharged from one of the 29 near-shore combined sewer overflow discharge structures. The permit

requires wet-weather overflows from combined sewer overflow discharges to comply with the technology-based requirements of the U.S. EPA's Combined Sewer Overflow Control Policy.[248]

In addition to compliance with the applicable NPDES permit, new development projects must comply with article 4.2, section 147 of the San Francisco Public Works Code, the San Francisco Stormwater Management Ordinance, which was last updated on April 2, 2016 (No. 64-16). The intent of the San Francisco Stormwater Management Ordinance is to reduce the volume of stormwater entering the city's combined and separate sewer systems. Stormwater Management Ordinance compliance approvals for this project will be conducted by the SFPUC. The SFPUC has developed the 2016 Stormwater Management Requirements and Design Guidelines in accordance with the requirements of this ordinance. The ordinance requires sites with more than 50 percent impervious surfaces (such as the project site) to be designed so that the stormwater runoff rate and volume do not exceed predevelopment conditions for the one- and two-year, 24-hour design storm.[249] As discussed in the Water Supply Assessment for this project, the project would request a modified compliance with the first submittal of the Stormwater Control Plan. The modified requirements would be a 40 percent reduction in the rate and a 10 percent reduction in the volume of runoff for the 2-year, 24-hour design storm.[250] To meet these modified requirements, the proposed project would include rainwater collection cisterns that would manage stormwater onsite and limit demand on both the collection system and wastewater facilities resulting from stormwater discharges. Compliance with the San Francisco Stormwater Management Ordinance would slow runoff from the site, further reducing erosion from existing site conditions.

Construction-Related Stormwater Runoff

As discussed in Section A, Project Description, implementation of the proposed project would create and/or replace more than 5,000 square feet of impervious surface and would involve demolition, excavation (approximately 134,000 cubic yards of soil onsite and 6,600 cubic yards of material for street improvements), site preparation, and construction to occur over a period of approximately 31 months. Excavation, site preparation, and grading would expose soil and could result in erosion and excess sediment in stormwater runoff being carried into the combined sewer system. Excavation and site preparation activities, especially during the wet season, have the greatest potential to adversely affect water quality. In addition, stormwater runoff from demolition debris, soil stockpiles, temporary onsite use and storage of vehicles, fuels, wastes, or other hazardous materials could carry pollutants to the combined sewer system if proper handling methods are not employed.

Runoff from the project site would drain into the city's combined sewer system, so that such runoff would be properly treated to meet the city's Bayside NPDES Permit and the U.S. EPA's Combined Sewer Overflow Control Policy. Construction site runoff from projects that drain to the combined sewer system is regulated under Public Works Code article 4.2, section 146, and requires a project application to the SFPUC, as described in Section E.15, Geology and Soils; and Section E.17, Hazards and Hazardous Materials. In accordance with these regulations, the project sponsor or its contractor(s) must prepare an erosion

250 SFPUC, *Water Supply Assessment for San Francisco Gateway Project*, adopted June 9, 2020, Resolution No. 20-0126.

sediment control plan or a stormwater pollution prevention plan, and are required to submit a construction site runoff control permit application to the SFPUC prior to any land-disturbing activities. An erosion sediment control plan would specify best management practices and erosion and sedimentation control measures to prevent sediment from entering the city's combined sewer system.[251] Construction best management practices that could be implemented as part of the proposed project may address, for example, inspection and maintenance, water conservation, spill prevention and control, street cleaning, and prevention of illicit discharge to the combined sewer system. These best management practices would minimize disturbance to the project site, adjacent areas, and storm drains and would retain sediment.[252] The SFPUC's Construction Runoff Control Program staff enforces this requirement through periodic and unplanned site inspections. In addition, prior to the commencement of any land-disturbing activities, a construction site runoff control permit would be obtained from the SFPUC. With discharge to the combined sewer system, in accordance with the regulatory requirements described above, water quality impacts from construction-related stormwater runoff would be less than significant.

Construction-Related Dewatering

Construction dewatering in areas with shallow groundwater would be required during excavation activities. The SFPUC's Wastewater Enterprise, Collection Systems Division, provides the permits for dewatering. The SFPUC would require any construction dewatering water to be sampled prior to issuance of the batch wastewater discharge permit pursuant to the U.S. EPA's Handbook for Sampling and Sample Preservation of Water and Wastewater.[253] If the groundwater is contaminated, it would undergo specific handling and disposal procedures and would be treated prior to any discharge. As discussed in the project description, the groundwater level at the project site is approximately 3 to 6 feet below ground surface. Because the depth of excavation for the foundation and utilities would be up to 10 feet below ground surface and piles would be extended up to 60 feet below the existing grade, groundwater dewatering would likely be required during construction. If groundwater is encountered during construction, a Batch Wastewater Discharge Permit would be required from the SFPUC, pursuant to article 4.1 of the public works code, to ensure that groundwater discharges meet specified water quality standards before they may be discharged from the proposed project.[254] If soil borings and wells are used for dewatering, these dewatering activities would be required to comply with article 12B of the public health code (the Soil Boring and Well Regulation Ordinance). With discharge to the combined sewer system, in accordance with the regulatory requirements described above, water quality impacts from construction-related dewatering would be less than significant.

Operation – Wastewater and Stormwater Discharges

After construction, the proposed project would be required to comply with applicable water quality regulations for disposal of wastewater in occupied buildings. Typical wastewater discharges would include sanitary sewage from building occupants and employees and commercial wastewater from PDR uses. Stormwater discharges would include runoff from streets, sidewalks, and other impervious surfaces, such as the rooftops of buildings A and B. Wastewater discharges from the proposed project would be subject to the

---

251 Best management practices are detailed in the SFPUC's Construction Best Practices Handbook, August 2013, *http://sfwater.org/modules/showdocument.aspx?documentid=4282*, accessed August 19, 2019.

252 Best management practices are detailed in the SFPUC's Construction Best Practices Handbook, August 2013, *http://sfwater.org/modules/showdocument.aspx?documentid=4282*, accessed August 19, 2019.

253 SFPUC, Batch Wastewater Permit Discharge Application Instructions, July 17, 2019, *https://sfwater.org/modules/showdocument.aspx?documentid=2326*, accessed August 19, 2019.

permit requirements of article 4.1 of the public works code and supplemented by San Francisco Public Works Order No. 158170. Article 4.1 of the public works code addresses the city's industrial waste pretreatment program to protect human health and the environment by preventing the discharge of pollutants into the combined sewer system.[255] The San Francisco Public Works order number 158170 supplements article 4.1 of the public works code and imposes industrial waste discharge limits on wastewater discharges into the city's combined sewer system.[256] Accordingly, commercial users of the site would be required to develop and implement a pollution prevention program and comply with the pretreatment standards and discharge limitations specified in article 4.1. These dischargers would also be required to monitor the discharge quality for compliance with permit limitations. Project-generated wastewater and stormwater would flow into the city's combined sewer system and would be treated to standards in the city's Bayside NPDES Permit prior to discharge to San Francisco Bay.

The city requires all projects creating and/or replacing 5,000 square feet or more of impervious surface to comply with stormwater management requirements and to submit a stormwater control plan, a signed and recorded Maintenance Agreement, and a signed Certificate of Acceptable Construction. The stormwater control plan is required to demonstrate that the project meets the stormwater quality performance standards contained in the 2016 Stormwater Management Requirements and Design Guidelines.[257] As discussed under Impact UT-2 in Section E.10, Utilities and Service Systems, the proposed project would incorporate design features to limit the amount of water entering the combined sewer system. The proposed project would also implement rainwater harvesting by capturing stormwater onsite in cisterns on the first level of each building (see Figure 7, p. 12); the capacity of these cisterns would be designed pursuant to the 2016 Stormwater Management Requirements and Design Guidelines. The captured stormwater would be metered and discharged to the combined sewer system and conveyed to the Southeast Treatment Plant. As discussed in the Water Supply Assessment for the project, the proposed project would request modified compliance with the first submittal of the stormwater control plan. The modified requirements would be a 40 percent reduction in the rate and a 10 percent reduction in the volume of runoff for the 2-year, 24-hour design storm.[258] As explained above on p. 172, the Southeast Treatment Plant has a secondary treatment capacity of 150 mgd but is permitted for peak wet-weather flows of up to 250 mgd. Wet-weather excess flows of up to 100 mgd receive only primary treatment. Measures to slow the discharge of stormwater runoff from the project site reduce the peak flows entering the treatment plant during and after a storm and result in less wastewater discharged that has received only primary treatment, reducing the potential to exceed water quality standards.

In summary, by implementing post-construction best management practices[259] and implementing construction site runoff requirements in accordance with the public works code, conflicts with an existing water quality control plan would not occur. In addition, the project would not create or contribute runoff that would exceed the capacity of existing or planned stormwater drainage systems (as more thoroughly discussed in Impact UT-2) or provide additional sources of polluted runoff. Water quality impacts related to

---

259 Post-construction best management practices are long-lasting treatment features such as cisterns, green roofs, bioretention basins and planters, permeable pavement, and infiltration trenches.

a violation of water quality standards or degradation of water quality or stormwater flows would be less than significant. No mitigation measures are required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have similar water quality impacts to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, the expanded streetscape variant would implement post-construction best management practices and implement construction site runoff requirements in accordance with the public works code, and conflicts with an existing water quality control plan would not occur. In addition, the expanded streetscape variant would not create or contribute runoff that would exceed the capacity of existing or planned stormwater drainage systems (discussed in Impact UT-2) or provide additional sources of polluted runoff. Water quality impacts related to a violation of water quality standards or degradation of water quality or stormwater flows would be less than significant. No mitigation measures are required. This topic will not be addressed in the EIR.

Impact HY-2 The proposed project or variant would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin or conflict with or obstruct implementation of a sustainable groundwater management plan. (Less than Significant)

PROPOSED PROJECT

The project site is in the Islais Valley Groundwater Basin, which covers an area of approximately 5,900 acres.[260] Recharge to the Islais Valley Groundwater Basin is estimated at 1,836 acre-feet per year, with sources of recharge including infiltration of rainfall, irrigation return flows, and leakage from water and sewer pipes.[261] The Islais Valley basin does not currently contribute to the city's water supply. In 2017, the SFPUC began pumping water from the Westside Groundwater Basin aquifer and will continue to expand wells in this basin to blend 4 mgd of treated groundwater with the municipal water supply by 2021.[262] The Islais Valley basin is not included in the SFPUC groundwater management program at this time. The proposed project would continue to be connected to the existing SFPUC potable water infrastructure and would not rely on wells for its water supply. Furthermore, the existing site is covered entirely in impervious surfaces, so that infiltration of rainwater into the groundwater basin and groundwater recharge at the project site is currently minimal. This condition would continue under the proposed project because after construction the site would consist of impervious surfaces, except for the addition of street trees and limited

260 California Department of Water Resources, California's Groundwater Bulletin 118, 2003 Update, Islais Valley Groundwater Basin, February 2004, *https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Groundwater-Management/Bulletin-118/Files/2003-B118-Basin-Descriptions/B118-Basin-Boundary-Description-2003---2_033.pdf*, accessed August 19, 2019.

261 California Department of Water Resources, California's Groundwater Bulletin 118, 2003 Update, Islais Valley Groundwater Basin, February 2004, *https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Groundwater-Management/Bulletin-118/Files/2003-B118-Basin-Descriptions/B118-Basin-Boundary-Description-2003---2_033.pdf*, accessed August 19, 2019.

262 SFPUC, San Francisco Groundwater Supply Project, 2013, *https://sfpuc.sharefile.com/share/view/sfea7a8f29b54f499*, accessed August 26, 2019.

landscaping features. Therefore, operation of the proposed project would not deplete groundwater supplies in the project area or conflict with a sustainable groundwater management plan.

As discussed above on p. 154 and in Section E.15, Geology and Soils, groundwater depths vary between 3 and 6 feet below existing grades across the project site. Dewatering of excavations during construction is likely to occur and could temporarily lower groundwater levels in the project vicinity. However, any effects of construction-related groundwater dewatering would be temporary. Once dewatering is completed, groundwater levels would return to normal over time. Currently, the SFPUC has a groundwater management program that monitors and records data concerning groundwater conditions in the Westside Basin, but this management plan does not include the Islais Valley basin. Therefore, the project would not conflict with any sustainable groundwater management plan.

In summary, the proposed project would not substantially deplete groundwater supplies, interfere substantially with groundwater recharge, or conflict with a sustainable groundwater management plan. The project would have a less-than-significant impact related to groundwater, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have groundwater impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, the expanded streetscape variant would not substantially deplete groundwater supplies, interfere substantially with groundwater recharge, or conflict with a sustainable groundwater management plan. The expanded streetscape variant would have a less-than-significant impact related to groundwater, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact HY-3 **The proposed project or variant would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would result in substantial erosion or siltation onsite or offsite; substantially increase the rate or amount of surface runoff in a manner that would result in flooding onsite or offsite; or impede or redirect flood flows. (Less than Significant)**

PROPOSED PROJECT

The project site is covered entirely by impervious surfaces and does not contain any streams or water courses. Construction activities would require excavation below ground; however, after construction, the ground surface would remain substantially unchanged from existing conditions. Pursuant to the city's Better Streets Plan, trees and landscape features would be installed on the site. Approximately 3,500 square feet of landscaping would be installed, and the existing impervious surfaces that cover the entire project site would be reduced.[263] Incorporation of stormwater management features at the project site in accordance with the

[263] SFPUC, *Water Supply Assessment for the San Francisco Gateway Project*, adopted June 9,2020, Resolution No. 20-0126.

city's Stormwater Management Ordinance and Stormwater Design Guidelines would ensure that drainage from the project site would not cause onsite or offsite erosion, siltation, or flooding. There would be minimal potential for erosion because the site is covered entirely by impervious surface, and the incorporation of these stormwater management design features would further reduce the potential for erosion onsite. As a result, the proposed project would not affect surface drainage patterns, and no substantial impact relative to erosion and siltation, flooding on or offsite, or contributions to exceedances of stormwater drainage systems would occur. Therefore, the proposed project would not be expected to result in substantial erosion or flooding associated with changes in drainage patterns. The impact of the proposed project related to potential erosion or flooding would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have erosion or flooding impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, the expanded streetscape variant would not result in substantial erosion or flooding associated with changes in drainage patterns. The impact of the expanded streetscape variant related to potential erosion or flooding would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-HY-1 The proposed project or variant, in combination with cumulative projects, would not result in cumulative impacts related to hydrology and water quality. (Less than Significant)

PROPOSED PROJECT

The proposed project would result in no impact with respect to a release of pollutants in flood, tsunami, and/or seiche hazard areas. Therefore, the project would not have the potential to contribute to cumulative impacts related to these issue areas.

The geographic context for cumulative hydrology and water quality impacts is the Southeast Treatment Plant drainage basin (in the case of treatment capacity) and the vicinity of the project site (in the case of local stormwater infrastructure capacity). Cumulative projects within 0.25 mile of the project site are discussed above under Section B, Cumulative Setting (pp. 43 through 46).

The proposed project would result in less-than-significant impacts related to water quality, groundwater levels, alteration of drainage patterns, and the capacity of drainage infrastructure. Cumulative projects that exceed the city's threshold of 5,000 square feet of new or replaced impervious surfaces are required to comply with the same or similar water quality and drainage control requirements, such as the development of an erosion sediment control plan for construction activities and a stormwater control plan for postconstruction operation. The cumulative projects that may disturb at least 5,000 square feet of new or replaced impervious surfaces and are required to comply with these water quality and drainage control requirements would include all of the projects listed in Section B, Cumulative Setting, with the exception of the Bayview Community-Based Transportation Plan and the SFPUC Southeast Treatment Plant Projects. The

SFPUC projects included in the cumulative setting would be completed as part of the city's SSIP, which is a program that would upgrade the aging and seismically vulnerable combined sewer system on the city's Bayside and would improve the reliability and capacity at the Southeast Treatment Plant. Should the ground disturbance for any of these projects increase to 5,000 square feet or more, then these projects would also be required to comply with these water quality and drainage control requirements. The Bayview Community-Based Transportation Plan would not affect the drainage basin or infrastructure capacity, because these projects would include short-term traffic-calming projects and pedestrian safety improvements such as lighting, crosswalks, and bus shelters. The Quint-Jerrold Connector project would be subject to the applicable city requirements for water quality and drainage control and would install drainage under the new road. The 2270 McKinnon Avenue and SF Produce Market projects would be required to comply with the same or similar water quality and drainage control requirements for construction activities and postconstruction operation as the proposed project. These plans would be submitted to and approved by the SFPUC before construction and operations would commence.

Because development projects would be required to follow the same regulations as the proposed project, peak stormwater runoff rates and volumes resulting from design storms would gradually decrease over time as new projects are constructed in accordance with the stormwater management requirements. In addition, all stormwater and wastewater flows into the city's combined sewer system would be treated pursuant to the effluent discharge standards contained in the city's NPDES permit for the Southeast Treatment Plant. As a result, cumulative impacts with respect to drainage patterns, water quality, stormwater runoff, and stormwater capacity of the combined sewer system would be less than significant. Therefore, the proposed project would not combine with cumulative projects to result in a cumulative impact related to hydrology and water quality. Cumulative impacts would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have hydrology and water quality impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Because development projects would be required to follow the same regulations as the expanded streetscape variant, peak stormwater runoff rates and volumes resulting from design storms would gradually decrease over time as new projects are constructed in accordance with the stormwater management requirements. In addition, all stormwater and wastewater flows into the city's combined sewer system would be treated pursuant to the effluent discharge standards contained in the city's NPDES permit for the Southeast Treatment Plant. As a result, cumulative impacts with respect to drainage patterns, water quality, stormwater runoff, and stormwater capacity of the combined sewer system would be less than significant. Therefore, the expanded streetscape variant would not combine with cumulative projects to result in a cumulative impact related to hydrology and water quality. Cumulative impacts would be less than significant, and no mitigation measures would be required. This topic will not be addressed in the EIR.

E.17. Hazards and Hazardous Materials

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☒	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☐	☒

The project site is not in an area covered by an airport land use plan or within two miles of a public airport or a public use airport; the project site is not adjacent to or near wildlands such that the project would directly or indirectly expose people or structures to risks associated with wildland fires; and the project site is not within 0.25 mile of an existing or proposed school. Therefore, topics E.17 (c), E.17 (e), and E.17 (g) are not applicable to the proposed project or expanded streetscape variant.

The information in this section is based on the phase I and phase II environmental site assessments[264] for the project site. In addition, the GeoTracker website, the California Department of Toxic Substances Control's EnviroStor website, and the U.S. EPA Envirofacts database were searched for records of toxic releases, hazardous waste, or other violations that could affect the project site. The Department of Toxic Substances Control maintains a hazardous waste and substances site list (Cortese list) pursuant to Government Code section 65962.5. The project site is not listed in the state and/or federal databases as a hazardous waste site on the Cortese list. The closest identified Cortese list site is at 2045 McKinnon Avenue, south of the project site; it consists of a closed leaking underground storage tank hazardous materials clean-up case, described further below.[265], [266]

CURRENT OPERATIONS

The four existing warehouse buildings are used by tenants for product receiving, storage, and distribution; no industrial activities occur onsite. Hazardous materials use onsite is limited to refrigerant and similar compounds used in the refrigeration systems, small volumes of cleaning and maintenance products, a hand-pumped gasoline tank, a wash station for cars, and propane tanks for forklift use. Several warehouse spaces are used to stage or store larger volumes of potentially hazardous materials, such as pallets of containers of building supplies (paints, sealants, etc.). Adjacent to the project site is an informal automobile maintenance and repair operation with empty containers of automobile maintenance compounds (antifreeze and coolant), used oil filters, and similar items along the property fence line.

As described in Section A, Project Description, the project sponsor submitted building permit applications for an interim use on the project site as of August 2020.[267] The interim use is parcel delivery service, focusing on last-mile e-commerce delivery, and occupies one half of the site (the two buildings west of I-280). One of the two buildings is used for vehicle staging and the other is used for warehousing of goods and loading of delivery vehicles. This use is temporary in nature and would ultimately be replaced by the proposed project, if it were to be approved.

FORMER AND EXISTING HAZARDOUS MATERIALS

Former Underground Storage Tanks

As discussed in the Section E.3, Cultural Resources, the subject properties contain four large, one-story, rectangular industrial warehouses, each with their own building number; Buildings 417 and 418 are associated with the 749 Toland Street address, and Buildings 427 and 428 are associated with 2000 McKinnon Avenue. The phase I environmental site assessment for the project site revealed five onsite underground storage tanks as recognized environmental conditions:[268] four underground storage tanks

---

264 Iris Environmental, Phase I and Phase II Environmental Site Assessment, January 6, 2015. No activities have occurred on the project site, such as excavation of onsite soils, significant change in the use of existing buildings, or demolition of existing buildings, that would require preparation of an updated environmental site assessment for purposes of this analysis.

265 California Department of Toxic Substances Control, EnviroStor, 2020, *https://www.envirostor.dtsc.ca.gov/public/map/?myaddress=749+Toland+Street%2C+san+francisco*, accessed September 3, 2020.

266 State Water Resources Control Board, GeoTracker, 2020, *https://geotracker.waterboards.ca.gov/map/?CMD=runreport&myaddress=749+Toland+Street%2C+San+Francisco*, accessed September 3, 2020.

267 San Francisco Building Department (DBI) Permit #202008272769 (Building 417 shell) and San Francisco Building Department #202008272770 (Building 418 shell).

268 ASTM Standard E1527-13 defines a recognized environmental condition as (emphasis in original to indicate formally defined terms): "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions."

along Selby Street and one at the northeastern end of Building 427. The underground storage tanks along Selby Street were 300-gallon capacity each and used for fuel oil to run boilers inside the warehouse buildings.[269] According to previous documentation, these underground tanks cannot be located, and it is speculated that they were removed in conjunction with the construction of the highway overpass. There are no records of soil, groundwater, or other environmental sampling to verify their removal. Regarding the recognized environmental condition at Building 427, there is evidence of a potential underground storage tank but no documentation about the tank.

A phase II environmental site assessment was conducted to investigate the recognized environmental conditions at the project site identified in the phase I environmental site assessment. Soil and groundwater samples were collected downgradient of the five underground storage tanks, adjacent to Buildings 417 and 427, and along the railroad sidings. The collected samples were analyzed for total petroleum hydrocarbons, polycyclic aromatic hydrocarbons, heavy-end hydrocarbons, and metals. The results were compared to U.S. EPA and California Environmental Protection Agency (Cal/EPA) environmental screening criteria to determine whether levels of these compounds exceeded the expected use criteria of the site.[270, 271]

The phase II environmental site assessment concluded that the project site soils contain petroleum hydrocarbons, polycyclic aromatic hydrocarbons, and metals (i.e., arsenic, barium, cobalt, and nickel) above the expected use criteria established by the U.S. EPA and Cal/EPA and determined that these contaminant levels are most likely related to historic fill activities at the project site. Furthermore, the phase II environmental site assessment concluded that onsite groundwater also contain heavy-end hydrocarbons and metals in certain locations, particularly at the western end of the project site.

Historic Pest Control Activities

Historic pest control activities were identified as a potential recognized environmental condition in the phase I environmental site assessment. To control weeds along railroad sidings, herbicides were applied in the past. Historically, warehouse buildings were also treated with termiticides to minimize structural damage. Although there is no documentation related to historic pest control activities, the age, ownership, and historical use of the buildings suggest that pest control compounds were historically used onsite.

Soil testing conducted as part of the phase II environmental site assessment determined that organochlorine pesticides were below risk-based screening levels and thus would not be expected to pose a health hazard for the proposed use.[272]

---

269 Iris Environmental, Phase I and Phase II Environmental Site Assessment, p. 15, January 6, 2015.

270 Expected use criteria are chemical concentrations promulgated for a particular land use (i.e., residential, commercial, industrial). For the expected uses at the project site (commercial/industrial), groundwater samples are compared to non-drinking water environmental screening levels. Soil samples are compared to direct exposure environmental screening levels, including direct contact screening levels for commercial/industrial workers and construction workers.

271 U.S. EPA and Cal/EPA environmental screening levels are defined as chemical concentrations in environmental media (e.g., soil or groundwater) below which no additional regulatory attention is warranted. The screening levels are not regulatory cleanup standards but indicate when additional evaluation may be warranted. The San Francisco Bay Regional Water Quality Control Board Tier 1 groundwater screening levels for potential drinking and nondrinking water are used for the groundwater samples; for the soil sampling, Tier 1 shallow soil screening levels for residential and commercial/industrial land use where groundwater is a potential drinking water resource. The screening levels used to assess onsite contamination are conservative, because groundwater at the site would not be used as a drinking water resource.

272 Risk-based screening levels for this soil gas chemical are defined conservatively as the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels for shallow soil gas under residential land use and commercial land use.

Polychlorinated Biphenyls

Pole-mounted and pad-mounted transformers may contain polychlorinated biphenyls, which are considered hazardous materials because of their toxicity. A plywood enclosure at the base of power poles in front of Building 417 was observed, and it was presumed that a transformer operated and maintained by PG&E is located in this enclosure.

Soil testing conducted as part of the phase II environmental site assessment determined that no polychlorinated biphenyls were present in onsite soils.

Asbestos

Asbestos-containing building materials were confirmed to be present on the project site in the phase I environmental site assessment. Original construction of the warehouse buildings in the 1940s includes asbestos-containing building products such as Transite siding, asbestos-containing concrete, and pipe insulation. Asbestos-containing material was used for its fire-retardant properties during use as the Marine Corps Supply facility. Between 1998 and 2011, asbestos-containing wastes were removed on five occasions, totaling 5.02 tons.[273] Specific materials that may have been removed are unknown, because no specific abatement or removal report is available.

Based on soil samples in the site vicinity, the phase II environmental site assessment determined that there were trace levels of asbestos at several locations, with no discernable pattern to the detection. No screening criteria are available from the San Francisco Regional Water Quality Control Board for asbestos in soil. Low detection of asbestos is a frequent occurrence in fill soils in San Francisco, due to the widespread nature of bedrock containing naturally occurring asbestos in the vicinity.[274]

Naval Radiological Defense Laboratory

Building 418 was used by the Naval Radiological Defense Laboratory for storage of radiological research equipment and possibly to store radioactive sources. Following decommissioning of the laboratory in 1969 and prior to private ownership, all areas involving radiological materials were surveyed and decontaminated.[275] Under the Formerly Used Defense Sites program, the United States Army Corps of Engineers conducted a Radiological Scoping Survey in 2013 to determine the presence of residual radiological impacts. In accordance with Nuclear Regulatory Commission guidelines, the Radiological Scoping Survey checked the area for alpha, beta, and gamma radiation emitters. The survey did not identify any radiation counts above the Nuclear Regulatory Commission screening guidelines, and no further actions were required.

Regulatory Setting

The storage, use, generation, transport, and disposal of hazardous materials are highly regulated by federal, state, and local agencies. Information about relevant agencies and the laws, regulations, and programs they administer are summarized below.

---

273 Iris Environmental, Phase I and Phase II Environmental Site Assessment, p. 13, January 6, 2015.
274 Iris Environmental, Phase I and Phase II Environmental Site Assessment, p. 16, January 6, 2015.
275 Iris Environmental, Phase I and Phase II Environmental Site Assessment, p. 19, January 6, 2015.

FEDERAL AND STATE REGULATIONS

Hazardous Materials Management

The U.S. EPA is the lead agency with responsibility for enforcing federal laws and regulations that govern hazardous materials with the potential to affect public health or the environment. The major federal laws and regulations U.S. EPA enforces that could relate to the management of hazardous materials on the project site are the Resource Conservation and Recovery Act and Toxic Substances Control Act.

Hazardous Materials Release Sites

In California, U.S. EPA has granted most enforcement authority of federal hazardous materials regulations to Cal/EPA. Under the authority of Cal/EPA, the State Water Resources Control Board and Department of Toxic Substances Control are responsible for overseeing the remediation of contaminated soil and groundwater sites. The provisions of Government Code section 65962.5 (also known as the Cortese List) require the State Water Resources Control Board, Department of Toxic Substances Control, California Department of Health Services, and CalRecycle to submit information pertaining to sites that are associated with solid waste disposal, hazardous waste disposal, and/or hazardous materials releases to Cal/EPA.

Hazardous Materials Transportation

In 1990 and 1994, the federal Hazardous Material Transportation Act was amended to improve regulations for the protection of life, property, and the environment from the inherent risks of transporting hazardous materials. The United States Department of Transportation developed hazardous materials regulations that govern the classification, packaging, labeling, transportation, and handling of hazardous materials, as well as employee training and incident reporting.[276] The transportation of hazardous materials is subject to both Resource Conservation and Recovery Act and United States Department of Transportation regulations.

In California, the California Highway Patrol, Caltrans, and Department of Toxic Substances Control are responsible for enforcing federal and state regulations pertaining to hazardous waste haulers for hazardous waste transportation on public roads. The transport of hazardous materials is regulated under the California Vehicle Code (California Code of Regulations Title 13) and can only be conducted under a registration issued by Department of Toxic Substances Control. Identification numbers are issued by Department of Toxic Substances Control or U.S. EPA for tracking hazardous waste transporters and treatment, storage, and disposal facilities for hazardous materials. The identification number is used to identify the hazardous waste handler and to track waste from point of origin to final disposal; all material transport takes place under manifest.

California Hazardous Materials Release Response Plans and Inventory Law of 1985

The California Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act) requires the preparation of hazardous materials business plans and disclosure of hazardous materials inventories. A business plan includes an inventory of hazardous materials handled, facility floor plans showing where hazardous materials are stored, an emergency response plan, and provisions for employee training in safety and emergency response procedures (California Health and Safety Code sections 25500, et seq.). The business plan program is administered by the California Emergency Management Agency. A

[276] Code of Federal Regulations, Title 49, Transportation, Parts 171–180.

business plan is required if a hazardous substance would be stored for more than 30 days in any of the following quantities:

- 500 gallons or more of any solid
- 55 gallons or more of any liquid
- 200 cubic feet or more of any compressed gas
- Any acutely hazardous substance or radiological material that meets the federal threshold planning quantities listed in 40 Code of Federal Regulations Part 355, Subpart A.

Hazardous Building Materials

Workers who conduct asbestos abatement must be trained in accordance with state and federal Occupational Safety and Health Administration requirements. The air district oversees the removal of regulated asbestos-containing materials. All friable (i.e., crushable by hand) asbestos-containing materials or nonfriable asbestos-containing materials that may be damaged must be abated prior to demolition in accordance with applicable requirements. Friable asbestos-containing materials must be disposed of as asbestos waste at an approved facility. Nonfriable asbestos-containing materials may be disposed of as nonhazardous waste at landfills that accept such wastes.

Loose and peeling lead-based paint must be disposed of as a state and/or federal hazardous waste if the concentration of lead equals or exceeds applicable hazardous waste thresholds. State and federal Occupational Safety and Health Administration regulations require a supervisor who is certified with respect to identifying existing and predictable lead hazards to oversee air monitoring and other protective measures during demolition activities in areas where lead-based paint may be present. Special protective measures and notification of California Occupational Safety and Health Administration are required for highly hazardous construction tasks related to lead, such as manual demolition, abrasive blasting, welding, cutting, or torch burning of structures, where lead-based paint is present.

More specifically, demolition where lead-based paint may be present would be subject to the California Occupational Safety and Health Administration Lead in Construction Standard (8 California Code of Regulations section 1532.1), which requires development and implementation of a lead compliance plan when materials that contain lead would be disturbed during construction. The plan must describe activities that could emit lead, methods that would be used to comply with the standard, safe work practices, and a plan to protect workers from exposure to lead during construction activities. California Occupational Safety and Health Administration would require 24-hour notification if more than 100 square feet of materials that contain lead would be disturbed.

LOCAL REGULATIONS

Hazardous and Acutely Hazardous Emissions

The air district oversees the protection of air quality in the San Francisco Bay Area Air Basin, which includes the project site. Hazardous and acutely hazardous emissions during construction (e.g., demolition of buildings containing asbestos) and facility operations (e.g., emissions from diesel generators) are subject to health risk assessment regulations and permitted conditions of operation to protect nearby sensitive receptors.

Lead-Based Paint

The San Francisco Building Code (chapter 34, section 3423) requires that any paint-disturbing repair, remodeling, or renovation work on the exterior of a pre-1979 building, which applies to the existing buildings at the project site, must be performed following lead-safe work practices. Both the San Francisco Building and Health Codes presume that any building built before 1979 has lead-based paint. The city's lead-safe work practices address surface preparation and recommend removal of lead-based paints in stages: wet scraping the surfaces, washing the surfaces, and sanding them with sanders with a high-efficiency particulate-air vacuum. Prior to and during removal, affected parties must be notified, access to the work areas must be restricted, and containment barriers need to be installed to prevent migration of lead-based paint. Site clean-up practices include removing all visible debris, keeping work areas clean by wet sweeping or by using a high-efficiency particulate-air vacuum, and disposing of contaminated debris in secured containers.

Asbestos-Containing Materials and Abatement

The air district is vested by the California legislature with authority to regulate airborne pollutants, including asbestos, through both inspection and law enforcement and is to be notified 10 days in advance of any proposed demolition or asbestos abatement work. The notification must include (1) the address of the operation; (2) the names and addresses of those who are responsible; (3) the location and description of the structure to be altered, including size, age, prior use, and the approximate amount of friable (i.e., easily crumbled) asbestos; (4) scheduled start and completion dates for the asbestos abatement work; (5) the nature of the planned work and methods to be employed; (6) procedures to be employed to meet the air district's requirements; and (7) the name and location of the waste disposal site to be used. The air district randomly inspects asbestos removal operations and would inspect any removal operation about which a complaint has been received. Any asbestos-containing building material disturbance at the project site would be subject to the requirements of air district Regulation 11, Rule 2: Hazardous Materials; Asbestos Demolition, Renovation, and Manufacturing.

The local office of the state Occupational Safety and Health Administration must also be notified of any asbestos abatement activities. Asbestos abatement contractors must follow state regulations contained in the California Code of Regulations, Title 8, section 1529, and Title 8, sections 341.6 through 341.14, where there is asbestos-related work involving 100 square feet or more of asbestos-containing building material. Asbestos removal contractors must be certified as such by the Contractors Licensing Board of the State of California. The owner of the property where abatement is to occur must have a Hazardous Waste Generator Number assigned by and registered with the Office of the California Department of Health Services in Sacramento. The contractor and hauler of the material are required to file a Hazardous Waste Manifest that details the hauling of the material from the site and the disposal of it.

Hazardous Materials Management

In California, state hazardous waste and material handling laws are enforced by Cal/EPA with the assistance of local agencies designated as Certified Unified Program Agencies. In San Francisco, the San Francisco Department of Public Health is the designated Certified Unified Program Agency. The Certified Unified Program Agency program consolidates specified administrative requirements, permits, inspections, and enforcement activities for the following existing state programs, as established by five different state agencies, and combines them into what is known as the Unified Program:

- Hazardous Waste Generator and Tiered Permitting Program (California Health and Safety Code chapter 6.5)
- Underground Storage Tank Program (California Health and Safety Code chapter 6.7)
- Aboveground Petroleum Storage Tank Program (Health and Safety Code chapter 6.67)
- California Accidental Release Prevention Program (Health and Safety Code chapter 6.95)
- Hazardous Materials Release Response Plan and Inventory (Business Plan) Program (Health and Safety Code chapter 6.95)
- Hazardous Material Management Plan and Hazardous Material Inventory Statement Program (California Fire Code and Health and Safety Code chapter 1)

The Unified Program requires facilities to properly manage and disclose which hazardous materials are used during facility operations to minimize the risk of a hazardous materials release and improve emergency response actions in the event of a release. In San Francisco, the provisions of the Hazardous Materials Release Plan and Inventory Program (e.g., requirements for preparation of a Hazardous Materials Business Plan) and California Accidental Release Prevention Program (e.g., requirements for preparation of a Risk Management Plan) have also been incorporated into articles 21 and 21A of the San Francisco Health Code to help enforce mandatory measures to minimize the risk of a hazardous materials release. In addition, article 22 of the San Francisco Health Code, entitled "Hazardous Waste Management," provides measures for safe handling of hazardous wastes in the city. It authorizes San Francisco Department of Public Health to implement the state hazardous waste regulations, including authority to conduct inspections and document compliance.

Maher Ordinance

San Francisco Department of Public Health administers article 22A of the San Francisco Health Code (also referred to as the Maher Ordinance), which requires applicable projects to assess, sample, analyze, and remediate (if necessary) subsurface contamination prior to the issuance of building permits. The Maher Ordinance applies to any project that could encounter hazardous materials in the subsurface soil or groundwater in areas that are known to contain fill material or are suspected to contain hazardous materials in the subsurface, sometimes referred to as Maher zones.[277] In these areas, the requirements apply to any sites that would excavate more than 50 cubic yards of soil. The proposed project is subject to the Maher Ordinance because proposed soil excavation would exceed 50 cubic yards, and the project site is mapped within a Maher zone.

In accordance with health code section 22.A.6, the Maher Ordinance requires the project sponsor to retain the services of a qualified professional to prepare a site history report and assess potential and/or known sources of subsurface contamination at the project site. Based on the site history report, the professional recommends whether the project sponsor should conduct subsurface investigation(s) to characterize the quality of the soil and groundwater that would be disturbed during project construction. If so recommended, the professional prepares a subsurface analysis report, based on the subsurface investigation(s), to evaluate hazardous materials in the soil and groundwater at the project site and determine whether they are causing or are likely to cause significant health and safety risks given the intended land use. If the subsurface analysis report indicates that hazardous substances are present in soil or groundwater exceeding the Department of Toxic Substances Control or Regional Water Quality Control

[277] Maher zones include areas with current or historical industrial use or zoning; areas within 100 feet of current or historical underground tanks; filled former Bay, marsh, or creek areas; and areas within 150 feet of a current or former elevated highway.

Board public health risk levels, the applicant must prepare a site mitigation plan. The site mitigation plan must describe the methods (e.g., source removal, treatment, vapor barrier installation, restrictions on uses or activities at the project site) recommended to ensure the intended use would not result in public health or safety hazards in excess of the Department of Toxic Substances Control and Regional Water Quality Control Board acceptable risk levels or other applicable standards. The site mitigation plan must include health and safety measures to protect construction workers and the public during construction, including how to address any unknown conditions encountered. The site mitigation plan must also outline the soil and groundwater handling procedures that would be followed in all areas that would be disturbed during construction, including dust control measures that would be used. The site mitigation plan must also identify any remedial actions that would be taken, including removal or treatment of soil or groundwater, or placing a cover over soil to avoid future exposures, implementing a long-term operations and maintenance plan, or recording use restrictions on the property. All documents required under the Maher Ordinance must be submitted to and approved by the San Francisco Department of Public Health prior to project construction.

Impact HZ-1 **The proposed project or variant would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials or create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. (Less than Significant)**

PROPOSED PROJECT

Construction

Project demolition would involve the abatement and disposal of hazardous building materials. Construction of buildings A and B and other site improvements would involve the storage, use, and transport of small amounts of hazardous materials (e.g., asphalt, fuel, lubricants, paint, and other substances). Site grading could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Each of these potential impacts is discussed in more detail below.

Hazardous Building Materials

Asbestos-containing building materials are present on the project site. Workers and the public could be exposed to hazardous building materials if such materials are not removed or abated prior to demolition of the existing buildings.

Demolition and construction activities would be required to follow all applicable standards and regulations for hazardous building materials, including the California Health and Safety Code. Currently, section 19827.5 of the California Health and Safety Code requires that local agencies not issue demolition or alteration permits until an applicant has demonstrated compliance with notification requirements under applicable federal regulations regarding hazardous air pollutants, including asbestos. As discussed above, the air district is to be notified 10 days in advance of any proposed demolition or abatement work. Pursuant to California law, the building department would not issue the required permit until the project sponsor has complied with the notice requirements described above.

If lead-based paint is discovered during construction activities, construction contractors would be required to comply with section 3425 of the San Francisco Building Code, which contains performance standards for lead-based paint, including clean-up and notification requirements.

Compliance with existing regulations governing the handling and disposal of hazardous building materials would reduce impacts to the public and environment from project construction to a less-than-significant level.

Contaminated Soil and Groundwater

During construction, particularly during excavation and grading, construction workers and nearby residents could be exposed to chemicals in the soil through inhalation of airborne dust or vapors if proper precautions are not implemented. In addition, construction dewatering in areas with shallow and potentially contaminated groundwater may be required during excavation activities (see Section E.16, Hydrology and Water Quality, for further discussion), which could affect construction workers.

U.S. EPA's Envirofacts, the State Water Resources Control Board's GeoTracker, and the Department of Toxic Substances Control's Envirostor websites were searched to identify toxic releases, hazardous waste, or other violations that would report hazardous materials contamination at the project site. The project site is not listed in the state and/or federal databases as a hazardous waste site on the Cortese list. The nearest Cortese listed site is south of the project site (2045 McKinnon Avenue) and consists of a closed leaking underground storage tank. The leaking underground storage tank resulted in soil contamination from diesel fuel. Remediation of the site began in 1992, and the case was closed on June 10, 1997.[278]

Additionally, the project site is in an area subject to San Francisco Health Code article 22A, commonly referred to as the Maher Ordinance. The overarching goal of the Maher Ordinance is to protect public health and safety by requiring appropriate handling, treatment, disposal, and, when necessary, remediation of contaminated soils and groundwater that are encountered in the building construction process. The project would result in 140,600 cubic yards of soil disturbance and excavation of up to 10 feet below existing grade in an area of known soil contamination. Therefore, the project is subject to the Maher Ordinance, which is administered and overseen by the San Francisco Department of Public Health.

In accordance with the Maher Ordinance, the project sponsor enrolled in the Maher program and submitted a phase I environmental site assessment for the project site. The report identified several recognized environmental conditions, including five underground storage tanks onsite. The report also noted the potential for soil and groundwater contamination due to observations of existing used oil filters, empty containers of antifreeze, industrial degreaser, and similar compounds along the property fence.

Subsequently, a phase II environmental site assessment was conducted to determine the level of soil and groundwater contamination in areas identified in the phase I environmental site assessment as having a potential for contamination. The phase II environmental site assessment concluded that the project site soils have levels of petroleum hydrocarbons, polycyclic aromatic hydrocarbons, and metals above the expected use criteria established by U.S. EPA and Cal/EPA and determined that these impacts are most likely related to historic fill activities at the project site. Furthermore, the phase II environmental site assessment

[278] State Water Resources Control Board, GeoTracker, 2020, *https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=T0607500423*, accessed September 3, 2020.

concluded that groundwater also has levels of heavy-end hydrocarbons and metals in certain locations, particularly at the western end of the project site, that are above the expected use criteria.

To comply with regulatory requirements in articles 22A and 22B of the Maher Ordinance, based on the results of the prior phase I and phase II environmental site assessments, the health department notified the project sponsor that a site mitigation plan would be required that includes measures to reduce potential risks to the environment and to protect construction workers, nearby residents, workers, and/or pedestrians from potential exposure to hazardous substances and underground structures during soil excavation and grading activities.[279] The site mitigation plan would be reviewed and approved by the San Francisco Health Department prior to construction. The site mitigation plan would describe known and potential environmental conditions. It would include soil, groundwater, and stormwater management protocols such as sampling and proper disposal of any hazardous waste encountered during excavation. Implementation of a site mitigation plan would reduce potential soil and groundwater contamination prior to or during construction of the proposed project.

In addition, specified construction procedures at a minimum must comply with local building code section 106A.3.2.6.3 related to construction dust control. A required construction dust control plan would identify best management practices to reduce dust during construction, such as limiting travel on unpaved roads; wetting and tarping solid bulk material for offsite transport; and paving main access points to the project site.

As described in Section E.16, Hydrology and Water Quality, the proposed project would be subject to the city's Construction Site Runoff Control Ordinance, and an erosion sediment control plan would be required under article 4.2, section 146 of the San Francisco Public Works Code. In accordance with these regulatory requirements, the project sponsor would also be required to prepare and implement a storm water pollution prevention plan or an erosion sediment control plan, and a construction site runoff control project application to the SFPUC, to minimize construction-related water quality impacts. The storm water pollution prevention plan and erosion sediment control plan would identify hazardous materials sources in the construction area and recommend site-specific best management practices (i.e., stormwater controls) to prevent discharge of these materials into stormwater and bay waters. The minimum best management practices that would be required include maintaining an inventory of materials used onsite; storing chemicals in water-tight containers protected from rain; developing a spill response plan and procedures to address hazardous and nonhazardous spills; maintaining spill cleanup equipment onsite; assigning and training spill response personnel; and preventing leaks of oil, grease, and fuel from equipment. In accordance with the Construction General Stormwater Permit, the project sponsor must ensure that the construction site is visually inspected weekly, and daily during rain events, and must implement corrective actions if any shortcomings are identified.

Through compliance with existing regulations requiring implementation of a site mitigation plan, a dust control plan, a storm water pollution prevention plan, and an erosion sediment control plan, which collectively require the proper disposal and transport of hazardous materials, and response procedures for accidental releases—project construction would not expose the public or the environment to significant

[279] Awwad, Mamdouh, Senior Environmental Health Inspector, San Francisco Department of Public Health, email correspondence between Mamdouh Awwad and Ken Sun (Prologis, Inc.), May 8, 2018.

impacts related to onsite soil and groundwater contamination. Therefore, the potential risk from onsite soil and groundwater contamination during project construction would be less than significant.

Transportation and Use of Hazardous Materials

Small amounts of hazardous materials (e.g., asphalt, fuel, lubricants, or paint) may be used in project construction. These materials would be transported to the project site via local roadways, such as Toland Street, Rankin Street, Kirkwood Avenue, McKinnon Avenue, and I-280 (see Figure 18, p. 31). The transportation of hazardous materials is subject to applicable local, state, and federal regulations, which have been specifically designed to minimize the risk of upset during routine construction activities. As described above under "Regulatory Setting," regulations governing hazardous materials transport are included in California Code of Regulations Title 22 and the California Vehicle Code (California Code of Regulations Title 13), and transportation of hazardous materials can only be conducted under a registration issued by Department of Toxic Substances Control. State agencies with primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol, Caltrans, and the California state fire marshal. Together, these agencies determine container types used and license hazardous waste haulers for transportation of hazardous waste on public roads.

Through compliance with existing regulations, the transport of hazardous materials and the use of such materials onsite during project construction would result in a less-than-significant impact on the public and the environment.

Operation

Operation of the proposed project would require use, storage, and disposal of hazardous materials. The proposed project would provide space for several types of PDR uses, such as manufacturing and maker space, parcel delivery and last-mile delivery, wholesale and storage, and fleet management, as well as retail uses (see Table 3, p. 19). Depending on the particular tenants of the project, their uses could potentially involve the regular use of common hazardous materials such as paints, cleaners, toners, solvents, and disinfectants. These commercial products are labeled to inform users of potential risks and to instruct them in appropriate handling procedures.

Hazardous materials used by tenants (if required) would be transported to the project site via local roadways, such as Toland Street, Rankin Street, Kirkwood Avenue, McKinnon Avenue, and I-280 (see Figure 18, p. 31). During project operations, any future business operations would be required by law to comply with federal, state, and local laws, regulations, and policies regarding the handling, storage, and disposal of hazardous materials described above under "Regulatory Setting," including Cal/EPA's Unified Program (e.g., hazardous materials release response plans and inventories, California Uniform Fire Code hazardous materials management plans and inventories).

In San Francisco, the provisions of the Hazardous Materials Release Plan and Inventory Program (e.g., requirements for preparation of a Hazardous Materials Business Plan) and California Accidental Release Prevention Program (e.g., requirements for preparation of a Risk Management Plan) have also been incorporated into articles 21 and 21A of the San Francisco Health Code to help enforce mandatory measures to minimize the risk of a hazardous materials release. In addition, article 22 of the San Francisco Health Code, entitled "Hazardous Waste Management," provides measures for safe handling of hazardous wastes in the city. It authorizes the San Francisco Department of Public Health to implement the state hazardous

waste regulations, including authority to conduct inspections and document compliance. The San Francisco Department of Public Health is the Certified Unified Program Agency responsible for oversight of local businesses that handle hazardous materials.

In addition to state requirements, city requirements, such as article 22, section 1203 of the San Francisco Health Code, would require the project sponsor to comply with the minimum standards of management of hazardous waste as specified in Title 22 of the California Code of Regulations, chapter 30, division 4, which grants the city the right to conduct inspections of "any factory, plant, construction site, waste disposal site, transfer station, establishment or any other place or environment where hazardous wastes are stored, handled, processed, disposed of, or being treated to recover resources."[280]

Conclusion

Implementation of the proposed project could require routine transport, use, and storage of hazardous materials. Construction and operation of the proposed project are required by law to implement and comply with existing local, state, and federal regulations addressing hazardous materials. Each of these regulations is specifically designed to protect the public health through improved procedures for the handling of hazardous materials, better technology in the equipment used to transport these materials, and a more coordinated, quicker response to emergencies. Through compliance with these existing regulations, impacts related to the creation of significant hazards to the public through routine transport, use, disposal, and risk of accident or upset would be less than significant, and no mitigation measures would be necessary. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, excavation and foundation work, intensity, operations, and site plan as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have hazardous materials impacts similar to those of the proposed project, but would include a slightly larger footprint. Within the expanded footprint, additional ground disturbance would occur where the streetscape improvements would be completed; such disturbances would extend approximately 3 feet below the ground surface. Similar to the proposed project, implementation of the expanded streetscape variant could require routine transport, use, and storage of hazardous materials. Construction and operation of the expanded streetscape variant are required by law to implement and comply with existing local, state, and federal regulations addressing hazardous materials. Each of these regulations is specifically designed to protect the public health through improved procedures for the handling of hazardous materials; better technology in the equipment used to transport these materials; and a more coordinated, quicker response to emergencies. Through compliance with these existing regulations, impacts related to the creation of significant hazards to the public through routine transport, use, disposal, and risk of accident or upset would be less than significant, and no mitigation measures would be necessary. This topic will not be addressed in the EIR.

[280] City Code, *http://library.amlegal.com/nxt/gateway.dll/California/health/article22hazardouswastemanagement?f=templates$fn=default.htm$3.0$vid=amlegal:sanfrancisco_ca$anc=JD_Article22*, accessed December 27, 2018.

Impact HZ-2 The proposed project or variant would not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

PROPOSED PROJECT

In 2017, the city updated its emergency response plan, prepared by the San Francisco Department of Emergency Management as part of the city's Emergency Management Program.[281] This plan covers hazard mitigation and disaster preparedness and recovery, and other emergency scenarios or events. The emergency response plan identifies hazards to which San Francisco is particularly susceptible (e.g., earthquakes, hurricanes, tsunamis, floods, winter storms, and acts of terrorism, including the use of chemical, biological, radiological, nuclear, and explosive weapons). The emergency response plan complies with several relevant state and federal directives for emergency planning, including the California Standardized Emergency Management System and the Incident Command System. The emergency response plan includes sections regarding operations, including management and procedures; staffing, operations, and logistics for the city's emergency operations center; and mutual aid, which involves other agencies. The emergency response plan assigns to city agencies and departments responsibilities for disaster planning; operations, including fire and rescue, law enforcement, human services, infrastructure, transportation, communications, and community support; and logistics, as well as finance and administration. The proposed project would not impair the implementation of the city's emergency response plan because it would not physically interfere with any primary emergency evacuation routes.

Additionally, the city applies fire safety measures primarily through provisions of the building and fire codes. Final building plans are reviewed by San Francisco Fire Department and the building department to confirm conformance with these provisions. In this way, potential fire hazards, including those associated with hydrant water pressures and emergency access, would be addressed during the permit review process. Compliance with fire safety regulations would ensure that construction and operation of the proposed project would not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan, or expose people or structures to a significant risk of loss, injury, or death involving fires. Adherence to the San Francisco Fire Code and Building Code, along with implementation of the emergency response plan, would reduce potential impacts related to interference with emergency response or evacuation plans to less-than-significant levels, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensity, operations, and site plan as the proposed project, but would extend streetscape improvements for the entire cross section of the streets along the project perimeter to Better Streets standards. Because these changes would not alter the proposed land uses, their intensities, or layout, or impair the implementation of the city's emergency response plan by physically interfering with any primary emergency evacuation routes, the expanded streetscape variant would have emergency response or evacuation plan impacts similar to those of the proposed project and would not expose people or structures to a significant risk of loss, injury, or death involving fires. Adherence to the San Francisco Fire Code and Building Code, along with implementation of

[281] City and County of San Francisco, Emergency Response Plan: An Element of the CCSF Emergency Management Program, 2017, *https://sfdem.org/sites/default/files/CCSF%20Emergency%20Response%20Plan_April%202008%20-%20updated%20May%202017_Posted.pdf*, accessed August 9, 2019.

the emergency response plan, would reduce potential impacts related to interference with emergency response or evacuation plans to less-than-significant levels, and no mitigation measures would be required. This topic will not be addressed in the EIR.

Impact C-HZ-1 The proposed project or variant, in combination with cumulative projects, would not result in cumulative impacts related to hazards and hazardous materials. (Less than Significant)

PROPOSED PROJECT

Environmental impacts related to hazards and hazardous materials are generally site specific. As discussed above under Impact HZ-1, impacts associated with hazards or hazardous materials during construction or operation of the proposed project would be less than significant with implementation of and compliance with applicable regulatory requirements for hazardous materials, such as the Maher Ordinance, California Code of Regulations Title 22, the California Vehicle Code, and article 22 of the San Francisco Health Code. Nearby cumulative projects would be subject to the same city, regional, state, and federal regulations designed to protect the public and the environment from risks associated with hazards and hazardous materials, and to ensure that emergency access routes are maintained. Because future development in the project vicinity would be subject to these same laws and regulations described in the "Regulatory Setting" section and discussed in Impact HZ-1, the proposed project combined with cumulative projects in the project vicinity would not create a significant cumulative impact related to hazards and hazardous materials. No mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, intensity, operations, and site plan as the proposed project, but would extend streetscape improvements for the entire cross section of the streets along the project perimeter to Better Streets standards. The expanded streetscape variant would have hazards and hazardous materials impacts similar to those of the proposed project because these changes would not alter the proposed land uses, their intensities, or layout, or impair the implementation of the city's emergency response plan. Impacts associated with hazards or hazardous materials during construction or operation of the expanded streetscape variant would be less than significant with implementation of and compliance with applicable regulatory requirements for hazardous materials, such as the Maher Ordinance, California Code of Regulations Title 22, the California Vehicle Code, and article 22 of the San Francisco Health Code. Nearby cumulative projects would be subject to the same city, regional, state, and federal regulations designed to protect the public and the environment from risks associated with hazards and hazardous materials, and to ensure that emergency access routes are maintained. Because future development in the project vicinity would be subject to these same laws and regulations described in the "Regulatory Setting" section and discussed in Impact HZ-1, the expanded streetscape variant, combined with cumulative projects in the project vicinity, would not create a significant cumulative impact related to hazards and hazardous materials. No mitigation measures would be required. This topic will not be addressed in the EIR.

E.18. Mineral Resources

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☐	☒

In accordance with the California Surface Mining and Reclamation Act, the California Geological Survey has delineated areas by the presence and significance of mineral deposits.[282] The general plan indicates that mineral resources are not found in San Francisco to "any appreciable extent." Mineral resources therefore are not addressed in the general plan.[283] All land in San Francisco, including the project site, is designated Mineral Resource Zone 4 (MRZ-4) by the California Division of Mines and Geology under the Surface Mining and Reclamation Act of 1975.[284] This designation indicates that there is inadequate information available for assignment to any other mineral resource zone; therefore, the project site is not a designated area of significant mineral deposits. No resources are mapped within or near the project boundaries, and no active or proposed mines are present in the project site.[285] Therefore, topics E.18 (a) and E.18 (b) are not applicable to the proposed project or the expanded streetscape variant, and no mitigation measures would be required. These topics will not be addressed in the EIR.

E.19. Energy

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐	☐

Impact EN-1 **The proposed project or variant would not result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation; nor would it conflict with or obstruct a state or local plan for renewable energy or energy efficiency. (Less than Significant)**

PROPOSED PROJECT

The following discussion provides an assessment of the proposed project's construction and operational energy use, including energy use calculations and a discussion of energy conservation measures, and presents the estimated energy use associated with existing land uses at the project site. Electrical energy demand is measured by power flow, expressed in kilowatt-hours, and natural gas is measured in cubic feet of gas or by its heat content in British thermal units,[286] or therms. Diesel and gasoline fuel use is measured in gallons. Energy calculations were estimated in the San Francisco Gateway Project Energy Consumptions Calculations Memorandum and are based on project-specific inputs regarding anticipated construction equipment and vehicle activity for the duration of construction, project-specific operational vehicle trips and operational equipment usage, and CalEEMod default data regarding building operational energy consumption associated with the proposed land uses.[287] The specific construction-related and operational energy consuming activities are described in more detail in the following sections.

Construction Energy

Nonrenewable energy consumption would occur during the proposed project's construction. Construction energy consumption would be primarily in the form of indirect energy inherent in the production of materials used for construction (e.g., the energy necessary to manufacture a steel beam from raw materials) and direct energy consumption in the fuel used by construction equipment and vehicles. Construction-related energy consumption is roughly proportional to the size of the new buildings proposed.

Energy use associated with construction of the proposed project would include that associated with the use of diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline and diesel fuel consumption from on-road worker commute and vendor trips. Construction of the

[286] 1 thousand British thermal units = 3.412 kilowatt-hours.
[287] AECOM, San Francisco Gateway Project Energy Consumption Calculations Memorandum, March 3, 2022.

proposed project would use approximately 98,500 gallons of diesel for off-road construction equipment. Approximately 36,600 gallons of diesel and 71,300 gallons of gasoline would be used for on-road trips during construction of the proposed project. Construction of the proposed project would be phased over a 31-month timeframe, so construction-related energy use would be temporary. The proposed project would also include the use of sustainable building materials, and would comply with the city's Construction and Demolition Debris Recovery Ordinance, which requires all construction and demolition debris material removed from a project to be recycled or reused, thereby conserving its embodied energy[288] and reducing future energy requirements to produce new materials and products. Furthermore, in comparison to other states and the country as a whole, construction projects in California and, in particular in the San Francisco Bay Area, use energy-efficient equipment and best practices. For example, the proposed project would adhere to the California Air Resource Board's heavy-duty equipment idling restrictions,[289] comply with the city's Construction and Demolition Debris Recovery Ordinance described above, and comply with the city's requirements for Director's Bulletin 2 Clean Construction Projects for Type 3 Priority Projects. The provisions relating to Type 3 applications included in planning department Planning Director's Bulletin 2 Clean Construction Project reduce criteria air pollutant and greenhouse gas emissions by requiring the use of lower emitting construction equipment; limiting idling of construction equipment to two minutes; and requiring construction contractors to maintain and properly tune all construction equipment in accordance with the manufacturer's specifications, which would ensure that equipment is operating efficiently. Furthermore, the proposed project would implement applicable regulatory standards of the CALGreen Code and sustainable construction practices consistent with the project's intent to seek LEED Gold certification or higher. CALGreen Code and LEED standards, among other things, reduce physical waste going to landfills and conserve energy associated with the embodied energy of construction materials. These practices limit wasteful and unnecessary energy consumption associated with construction.

State plans adopted for the purpose of promoting energy efficiency include the California Renewable Portfolio Standard, the Clean Energy and Pollution Reduction Act of 2015 (SB 350), the California Energy Efficiency Standards for Nonresidential Buildings, and the CALGreen Code. Construction activities under the proposed project would be conducted in accordance with all applicable laws and regulations, including applicable federal, state, and local laws that are intended to promote efficient utilization of resources and minimize environmental impacts.

As a result, construction activities would not result in inefficient, wasteful, or unnecessary use of fuel or other energy sources and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Operational Energy

Energy use associated with operation of the proposed project would include onsite electricity use associated with PDR and retail uses in the two new buildings (e.g., building space heating, cooling, and lighting, as well as operation of equipment and machines); electricity for offsite water treatment and distribution; and fuel for vehicle travel, including commute trips by onsite employees as they commute to and from work and travel by visiting worker vehicles servicing the proposed land uses (i.e., those vehicles

[288] Embodied energy is the total energy required for the extraction, processing, manufacturing, and delivery of building materials to a project site.
[289] California Air Resources Board, Regulation for In-use Off-road Diesel-fueled Fleets, 2016, *https://ww2.arb.ca.gov/sites/default/files/2019-03/finalregorder-dec2011.pdf*, accessed November 2021.

associated with proposed land use operations but not related to onsite employees, such as parcel delivery trips).

In California, energy consumption in buildings is regulated by Title 24 of the California Code of Regulations. Title 24 includes standards that regulate energy consumption for the heating, cooling, ventilation, and lighting of residential and nonresidential buildings. In San Francisco, documentation demonstrating compliance with Title 24 standards is required to be submitted with a building permit application. Compliance with Title 24 standards is enforced by the building department. The proposed project would be required to comply with the standards of Title 24 and the San Francisco Green Building Code, which incorporates all mandatory elements of the 2019 CALGreen Code and stricter local requirements. [290] In addition, as of January 2018, new construction in the city is required to construct all off-street parking spaces for passenger vehicles and trucks with dimensions capable of accommodating future electrical charging infrastructure, and to install sufficient electrical infrastructure to supply electricity for electric vehicle charging, in accordance with San Francisco's Electric Vehicle Readiness Ordinance. [291]

Energy conservation design features to meet state and local goals for energy efficiency and renewable energy have been incorporated into the project design to further reduce wasteful, inefficient, and unnecessary consumption of energy during project operations. In addition to compliance with Title 24 standards, and accommodating of future electrical charging infrastructure, the proposed project would be designed without natural gas infrastructure. The project would incorporate a solar array that would be sized to meet the San Francisco Better Roof Ordinance; and generate electricity that could be used to offset the electrical use of the building and equipment and/or the electric vehicles housed at and/or visiting the site. Both the elimination of dependence on natural gas power and the inclusion of onsite solar generation would substantially increase the project site's reliance on renewable and clean energy sources. The proposed project would also incorporate TDM measures into its design, such as car-share parking, bicycle parking, and showers and lockers; it would also provide electric docking stations to minimize onsite idling and resultant fuel use by trucks. These features would minimize the amount of transportation fuel consumed. The project would seek LEED Gold certification or higher and would include the use of sustainable building materials; water- and energy-efficient mechanisms in the building design; and other measures that would further minimize the amount of fuel, water, and energy consumed. Furthermore, the project site is in an area with a low level of VMT per capita, in comparison to the regional average. [292] In this way, project siting and co-benefits of land-use and transportation planning would minimize potential transportation-related energy demand.

The following provides a summary of energy consumption in the form of electricity and natural gas for existing onsite uses, and electricity for the proposed project (no natural gas would be used for the proposed project). [293] The total estimated energy consumption for proposed onsite building operations would be approximately 23,689,000 kilowatt-hours per year for the proposed project. The estimated annual electricity

290 City and County of San Francisco Department of Building Inspection, Administrative Bulletin AB093, updated 2020, *https://sfdbi.org/sites/default/files/AB-093.pdf*, accessed June 2020.

291 City and County of San Francisco Department of the Environment, San Francisco's Electric Vehicle Ready Community Blueprint, July 2019 https://sfenvironment.org/sites/default/files/editor-uploads/transportation_vehicle/san_francisco_ev_blueprint.pdf, accessed November 2021.

292 San Francisco Planning Department, Eligibility Checklist: CEQA section 21099 – Modernization of Transportation Analysis, San Francisco Gateway Project, December 19, 2018.

293 AECOM, San Francisco Gateway Project Energy Consumption Calculations Memorandum, March 3, 2022. Note that totals do not necessarily add as a result of rounding.

use associated with water supply, treatment, and distribution during operation of the proposed project would be approximately 7,400 kilowatt-hours per year. Energy consumption by existing land uses at the project site are estimated to be approximately 5,138,000 thousand British thermal units per year in natural gas and 3,708,500 kilowatt-hours per year in electricity to serve onsite building operations, and approximately 1,500 kilowatt-hours per year in electricity for water supply, treatment, and distribution. The net increase in energy consumption by the proposed project relative to existing site land uses would be approximately 19,979,000 kilowatt-hours per year in electricity, but a net decrease of approximately 5,138,000 thousand British thermal units per year due to the elimination of natural gas use onsite. Onsite renewable energy generation is not included in these building energy use estimates and would further reduce the project's dependence on regional energy sources because a portion of the project site's energy requirements would be met by this onsite renewable energy resource. During operation, the solar arrays on the project roofs would be sized to meet the San Francisco Better Roof Ordinance and would generate between approximately 1,600,000 and 1,900,000 kilowatt-hours annually from this renewable energy resource, which could power onsite uses or be sold back to the electricity grid.

Fuel consumption was also estimated for the proposed project and existing onsite operations, the results of which are summarized here.[294] Mobile sources used during operation of the proposed project would use approximately 1,711,500 gallons of diesel and 2,004,300 gallons of gasoline per year, based on an estimate of 49,102,000 annual VMT for worker and visitor trips to and from the site,[295] onsite vehicle activity, use of transportation refrigeration units on a portion of the visiting trucks, and potential fuel use by emergency generators. The existing onsite land use is estimated to require approximately 289,300 gallons of diesel fuel per year and 276,600 gallons of gasoline per year, based on an estimate of 6,965,300 annual VMT for worker and visitor trips. The net increase in fuel use by the proposed project relative to existing site land uses would be approximately 1,422,200 gallons of diesel per year and 1,727,700 gallons of gasoline per year. As described in more detail in Section E.8, Greenhouse Gas Emissions, project siting accounted for demand and regional proximity to the anticipated customer base to minimize VMT for parcel and last-mile delivery uses. Therefore, although the proposed project would result in increased diesel fuel and gasoline consumption, the siting of a new PDR site that is designed to accommodate parcel and last-mile delivery tenants closer to its customer base would improve efficiency over alternate siting, and would minimize the net increase in regional fuel consumption for the portion of the project that may include parcel and last-mile delivery tenants. Additionally, the project siting in a low-VMT region further contributes to the efficiency with which the proposed project's transportation-related energy demands may be met. Therefore, the fuel consumption associated with the proposed project would not be wasteful or inefficient.

Compliance with the Title 24 conservation standards of the California Code of Regulations and the local San Francisco Green Building Code would reduce the proposed project's consumption of fuel, water, and energy. Electric service would be provided to meet the needs of the project, as required by the California Public Utilities Commission, which obligates PG&E and the SFPUC to provide service to its existing and potential customers. PG&E and the SFPUC update their service projections to meet regional energy and water

294 Ibid.

295 VMT estimates reflect data obtained from Adavant and LCW Consultants, 749 Toland Street and 2000 McKinnon Avenue Project, Final Estimation of Project Travel Demand, December 10, 2021, with the exception of visitor trip distances for the Parcel and Last Mile Delivery use. These were revised for the purposes of fuel estimation to not account for the project siting efficiency and trip distance reductions, rather using the same travel distances applied to the other PDR uses for the VMT estimates. This is considered a conservative estimate and does not account for reduced vehicle travel that would be achieved as a result of the project's siting efficiency.

demand.[296] Energy conservation and production measures in the proposed project would decrease reliance on nonrenewable energy sources and increase use of renewable energy sources.

In summary, construction and operation of the proposed project would not use energy resources in an inefficient, wasteful, or unnecessary manner and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Therefore, the proposed project would have a less-than-significant impact on energy resources, and no mitigation measures are required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, site plan, development intensity, employment, and operations as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the proposed expanded streetscape variant would have energy resource impacts similar to those of the proposed project, but would include a slightly larger footprint. The footprint would involve additional ground disturbance to improve the remainder of the adjacent public rights-of-way. As a result, the same construction equipment and related fuel consumption used for the street and sidewalk improvements for the proposed project would be needed for the expanded streetscape variant but only for the limited area and time to complete the additional roadway, curb cut, sidewalk, planting, and other upgrades. For the same reasons cited for the proposed project, construction and operation of the expanded streetscape variant would not use energy resources in an inefficient, wasteful, or unnecessary manner and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Therefore, the expanded streetscape variant would have a less-than-significant impact on energy resources, and no mitigation measures are required. This topic will not be addressed in the EIR.

Impact C-EN-1 The proposed project or variant, in combination with cumulative projects, would not result in a significant cumulative impact related to energy resources. (Less than Significant)

PROPOSED PROJECT

The proposed project would use energy resources. The cumulative development projects identified in Section B, Cumulative Setting, and mapped in Figure 22 (p. 44), as well as other projects in the city, would be required by the building department to comply with Title 24 and the San Francisco Green Building Code. All new construction projects in San Francisco would be required to minimize the use of large amounts of fuel, water, or energy by, for instance, installing energy-efficient appliances and water-efficient fixtures, which would reduce cumulative impacts on fuel, water, and energy consumption. Additionally, statewide efforts are being made to increase power supply and to encourage energy conservation; the demand for energy from the proposed project would not be substantial in the context of the total demand in San Francisco and the state; and the proposed project would not require a major expansion of power facilities. As further detailed in Section E.8.3 of the Greenhouse Gas Emissions section of this initial study, the city also adopted updates to Ordinance 81-08 in July 2021, thereby establishing the following greenhouse gas reduction targets:

[296] Section E.12, *Utilities*, further discusses the project's requirements and impacts associated with utility systems, including power.

- by 2030, reduce sector-based greenhouse gas emissions to 61 percent below 1990 levels;
- by 2030, reduce consumption-based greenhouse gas emissions to 30 metric tons of CO_2e per household or less, equivalent to a 40 percent reduction compared to 1990 levels;
- by 2040, reach net-zero sector-based emissions and sequester any residual emissions using nature-based solutions;[297] and
- by 2050, reduce consumption-based greenhouse gas emissions to 10 metric tons of CO_2e per household or less, equivalent to an 80 percent reduction compared to 1990 levels.

Achieving these emissions reduction targets would be accomplished through a number of different strategies, including energy efficiency.[298]

Furthermore, much of San Francisco is an area with a per capita level of VMT that is low in comparison to the regional average.[299] Therefore, energy associated with transportation fuel for the proposed project and cumulative projects would be lower than for comparable land uses elsewhere in the region and would not result in a wasteful consumption of fuel to support transportation activities. Therefore, the proposed project, combined with cumulative projects in the project vicinity, would not result in a significant cumulative impact on energy resources, and no mitigation measures would be required. This topic will not be addressed in the EIR.

EXPANDED STREETSCAPE VARIANT

The expanded streetscape variant comprises the same land uses, site plan, development intensity, employment, and operations as the proposed project, but proposes rebuilding the entire cross section of the streets along the project perimeter to Better Streets standards. Therefore, the proposed expanded streetscape variant would have energy resource impacts similar to those of the proposed project, but would include a slightly larger footprint. The footprint would involve additional ground disturbance to improve the remainder of the adjacent public rights-of-way. For the same reasons cited for the proposed project, energy associated with transportation fuel for the expanded streetscape variant and cumulative projects would be lower than for comparable land uses elsewhere in the region and would not result in a wasteful consumption of fuel to support transportation activities. Therefore, the expanded streetscape variant, combined with cumulative projects in the project vicinity, would not result in a significant cumulative impact on energy resources, and no mitigation measures would be required. This topic will not be addressed in the EIR.

---

297 Nature-based solutions are those that remove remaining emissions from the atmosphere by storing them in natural systems that support soil fertility, or by employing other carbon farming practices.

298 San Francisco established greenhouse gas emissions targets in section 902 of the environment code, as follows: by 2017, reduce greenhouse gas emissions by 25 percent below 1990 levels; by 2025, reduce greenhouse gas emissions by 40 percent below 1990 levels; and by 2050, reduce greenhouse gas emissions by 80 percent below 1990 levels.

E.20. Agriculture and Forestry Resources

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
. Would the project or variant:					
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland to non-agricultural use or forest land to non-forest use?	☐	☐	☐	☐	☒

The project site is in an urbanized area of San Francisco. Furthermore, no land in the city has been designated by the California Department of Conservation's Farmland Mapping and Monitoring Program as active or important agricultural land. The project site does not contain agricultural uses and is not zoned for such uses; therefore, the proposed project or expanded streetscape variant would not require the conversion of any land designated by the state farmland mapping and monitoring program as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to nonagricultural use. The proposed project or expanded streetscape variant would not conflict with any existing agricultural zoning or Williamson Act contracts because neither applies to the project site, nor would the project involve any changes to the environment that could result in the conversion of farmland.[300] Therefore, topics E.20 (a), (b), and (e) are not applicable to the proposed project or expanded streetscape variant. No mitigation is required, and this topic will not be addressed in the EIR.

No land in San Francisco is designated as forest land or timberland by the California Public Resources Code. The project site does not contain forest land or timberland and is not zoned for such uses; the proposed project or expanded streetscape variant would not convert any forest land or timberland to nonforest use; and they would not conflict with existing zoning for forest land or timberland use, nor would the proposed project or expanded streetscape variant involve any changes to the environment that could result in the

[300] California Department of Conservation Important Farmland in California Map (San Francisco is identified as "Urban and Built-Up Land"), 2012 – Updated 2015, *ftp://ftp.consrv.ca.gov/pub/dlrp/FMMP/pdf/regional/2012/bay_area_2012_fmmp_base.pdf*, accessed December 8, 2018.

conversion of forest land or timberland. Therefore, topics E.20 (c) and (d) are not applicable to the proposed project or expanded streetscape variant. No mitigation is required. This topic will not be addressed in the EIR.

E.21. Wildfire

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, Would the project or variant:					
a) Substantially impair an adopted emergency response plan or emergency evacuation plans?	☐	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☐	☒
d) Expose people or structure to significant risks including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☐	☒

The city does not have any state responsibility areas for fire prevention or lands that have been classified as very high fire hazard severity zones.[301, 302] The project site, as well as the entire city, falls under the local responsibility area of the San Francisco Fire Department and is classified as local responsibility unzoned by the office of the state fire marshal.[303] Therefore, this topic is not applicable to the proposed project or expanded streetscape variant. Refer to Section E.17, Hazards and Hazardous Materials, for a discussion of wildland fire risks. No mitigation is required. This topic will not be addressed in the EIR.

[301] California Board of Forestry and Fire Protection, State Responsibility Area Viewer, updated July 2016, *https://bofdata.fire.ca.gov/projects-and-programs/state-responsibility-area-viewer/*, accessed July 22, 2019.

California Department of Forestry and Fire Protection has determined that the City and County of San Francisco has no Very High Fire Hazard Severity Zones in Local Responsibility Areas.

[303] California Department of Forestry and Fire Protection, Fire Hazard Severity Zones Maps, *https://osfm.fire.ca.gov/divisions/wildfire-prevention-planning-engineering/wildland-hazards-building-codes/fire-hazard-severity-zones-maps/*, accessed July 22, 2019. California Department of Forestry and Fire Protection has determined that the City and County of San Francisco has no Very High Fire Hazard Severity Zones in Local Responsibility Areas.

E.22. Mandatory Findings of Significance

Topics:	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact	Not Applicable
Would the project or variant:					
a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐	☐
b) Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	☒	☐	☐	☐	☐
c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐	☐

The discussion of biological resources in Section E.14, p. 148, shows that the proposed project and expanded streetscape variant would not significantly affect any habitats, plant or animal communities, or threatened or endangered species. The discussion of cultural resources in Section E.3, p. 64, shows that the proposed project and expanded streetscape variant would have no effect on historic resources of the built environment; and that, with mitigation, the proposed project and expanded streetscape variant would not significantly affect archaeological resources or human remains. The discussion of tribal cultural resources in Section E.4, p. 78, shows that, with mitigation, the proposed project and expanded streetscape variant would not significantly affect tribal cultural resources. The discussion of geology and soils in Section E.15, p. 154, shows that the proposed project and expanded streetscape variant, with mitigation, would have a less-than-significant effect on paleontological resources.

The initial study has addressed cumulative impacts under each environmental topic and determined that cumulative impacts related to wind, cultural resources and tribal cultural resources would require mitigation to reduce impacts to a less-than-significant level. For all other topics, except those specifically identified below, the initial study supports a determination that the proposed project and expanded streetscape variant, in combination with cumulative projects, would not result in significant cumulative impacts. The EIR will address potential environmental impacts, including cumulative impacts, related to transportation and circulation, air quality, and noise. These topics will be evaluated in the EIR.

As discussed in Section E.5, Transportation and Circulation, Section E.6, Noise, and Section E.7, Air Quality, the proposed project and expanded streetscape variant have the potential to result in significant impacts on transportation, noise, and air quality, which all could impact human beings. Accordingly, these three topics will be analyzed further and included in the EIR.

The discussion in Section E, Evaluation of Environmental Effects, identifies significant impacts related to wind that could adversely affect human beings. Mitigation measures have been provided in this initial study to reduce these significant project-level impacts to a less-than-significant level. No project-level potentially significant impacts were identified for the following environmental issue areas that could affect human beings: land use and planning, population and housing, greenhouse gas emissions, shadow, recreation, utilities and service systems, public services, geology and soils, hydrology and water quality, and hazards and hazardous materials. Therefore, with implementation of the mitigation measures specified in Section E.9, Wind (Mitigation Measures M-WI-1a and M-WI-1b), the proposed project and expanded streetscape variant would not result in substantial adverse effects, direct or indirect, on human beings.

F. MITIGATION MEASURES

The following mitigation measures have been agreed to by the project sponsor and are necessary to reduce the potentially significant environmental impacts of the proposed project and expanded streetscape variant to less-than-significant levels.

Mitigation Measure M-CR-2

Archeological Testing. Based on a reasonable presumption that archeological resources may be present in the project site, the following measures shall be undertaken to avoid any potentially significant adverse effects from the proposed project on buried or submerged historical resources. The project sponsor shall retain the services of an archeological consultant from the rotational qualified archeological consultants list maintained by the planning department. After the first project approval action or as directed by the environmental review officer, the project sponsor shall contact the department archeologist to obtain the names and contact information for the next three archeological consultants on the qualified archeological consultants list.

The archeological consultant shall undertake an archeological testing program as specified herein. In addition, the consultant shall be available to conduct an archeological monitoring and/or data recovery program if required pursuant to this measure. The archeological consultant's work shall be conducted in accordance with this measure at the direction of the environmental review officer. All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to the environmental review officer for review and comment and shall be considered draft reports subject to revision until final approval by the environmental review officer. Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the project for a maximum of four weeks. At the direction of the environmental review officer, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less-than-significant level potential effects on a significant archeological resource as defined in CEQA Guidelines section 15064.5 (a)(c).

Archeological Testing Program. The purpose of the archeological testing program shall be to determine to the extent possible the presence or absence of archeological resources and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

The archeological testing program shall be conducted in accordance with the approved archeological testing plan. The archeological consultant and the environmental review officer shall consult on the scope of the archeological testing plan, which shall be approved by the environmental review officer prior to commencing any project-related soils-disturbing

activities. The archeological testing plan shall be submitted first and directly to the environmental review officer for review and comment and shall be considered a draft subject to revision until final approval by the environmental review officer. The archaeologist shall implement the testing as specified in the approved archeological testing plan prior to and/or during construction.

The archeological testing plan shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the proposed project and lay out what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The archeological testing plan shall also identify the testing method to be used, the depth or horizonal extent of testing, the locations recommended for testing, and the archeological monitoring requirements for construction soil disturbance, as warranted.

Paleoenvironmental Analysis of Paleosols. When a submerged paleosol is identified during the testing program, irrespective of whether cultural material is present, samples shall be extracted and processed for dating, flotation for paleobotanical analysis, and other applicable special analyses pertinent to identification of possible cultural soils and for environmental reconstruction.

Discovery Treatment Determination. At the completion of the archeological testing program, the archeological consultant shall submit a written summary of the findings to the environmental review officer. The findings memorandum shall describe and identify each resource and provide an initial assessment of the integrity and significance of encountered archeological deposits.

If the environmental review officer, in consultation with the archeological consultant, determines that a significant archeological resource is present and that the resource could be adversely affected by the proposed project, the environmental review officer, in consultation with the project sponsor, shall determine whether preservation of the resource in place is feasible. If so, the proposed project shall be redesigned so as to avoid any adverse effect on the significant archeological resource, and the archeological consultant shall prepare an archeological resource preservation plan, which shall be implemented by the project sponsor during construction. The consultant shall submit a draft archeological resource preservation plan to the planning department for review and approval.

If preservation in place is not feasible, a data recovery program shall be implemented, unless the environmental review officer determines that the archeological resource is of greater interpretive than research significance,

and that interpretive use of the resource is feasible. The environmental review officer, in consultation with the archeological consultant, shall also determine whether additional treatment is warranted, which may include additional testing and/or construction monitoring.

Consultation with Descendant Communities. On discovery of an archeological site associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, the environmental review officer and an appropriate representative of the descendant group shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to offer recommendations to the environmental review officer regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the archeological resources report shall be provided to the representative of the descendant group.

Archeological Data Recovery Plan. An archeological data recovery program shall be conducted in accordance with an archeological data recovery plan if all three of the following apply: 1) a resource has potential to be significant, 2) preservation in place is not feasible, and 3) the environmental review officer determines that an archeological data recovery program is warranted. The archeological consultant, project sponsor, and environmental review officer shall meet and consult on the scope of the archeological data recovery plan prior to preparation of a draft archeological data recovery plan. The archeological consultant shall submit a draft archeological data recovery plan to the environmental review officer. The archeological data recovery plan shall identify how the proposed data recovery program shall preserve the significant information the archeological resource is expected to contain. That is, the archeological data recovery plan shall identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical property that could be adversely affected by the proposed project. Destructive data recovery methods shall not be applied to portions of the archeological resources if nondestructive methods are practical.

The scope of the archeological data recovery plan shall include the following elements:

- *Field Methods and Procedures*: descriptions of proposed field strategies, procedures, and operations

- *Cataloguing and Laboratory Analysis*: description of selected cataloguing system and artifact analysis procedures
- *Discard and Deaccession Policy:* description of and rationale for field and post-field discard and deaccession policies
- *Security Measures:* recommended security measures to protect the archeological resource from vandalism, looting, and unintentionally damaging activities
- *Final Report*: description of proposed report format and distribution of results
- *Curation:* description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities

Coordination of Archaeological Data Recovery Investigations. In cases in which the same resource has been or is being affected by another project for which data recovery has been conducted, is in progress, or is planned, to maximize the scientific and interpretive value of the data recovered from both archeological investigations, the following measures shall be implemented:

A) In cases where neither investigation has yet begun, both archeological consultants and the environmental review officer shall consult on coordinating and collaboration on archeological research design, data recovery methods, analytical methods, reporting, curation and interpretation to ensure consistent data recovery and treatment of the resource.

B) In cases where archeological data recovery investigation is already underway or has been completed for a prior project, the archeological consultant for the subsequent project shall consult with the archeological consultant for the prior project, if available; review prior treatment plans, findings, and reporting; inspect and assess existing archeological collections/inventories from the site prior to preparation of the archaeological treatment plan for the subsequent discovery; and incorporate prior findings in the final report of the subsequent investigation. The objectives of this coordination and review of prior methods and findings shall be to identify refined research questions; determine appropriate data recovery methods and analyses; assess new findings relative to prior

research findings; and integrate prior findings into subsequent reporting and interpretation.

Human Remains and Funerary Objects. The treatment of any human remains and funerary objects discovered during any soils-disturbing activity shall comply with applicable state laws, including Section 7050.5 of the Health and Safety Code and Public Resources Code 5097.98. If human remains or suspected human remains are encountered during construction, the contractor and project sponsor shall ensure that ground-disturbing work within 50 feet of the remains is halted immediately and shall arrange for the protection in place of the remains until appropriate treatment and disposition have been agreed upon and implemented in accordance with this section. Upon determining that the remains are human, the project archeologist shall immediately notify the city's Medical Examiner of the find. The archeologist shall also immediately notify the environmental review officer and the project sponsor of the find. In the event of the Medical Examiner's determination that the human remains are Native American in origin, the Medical Examiner shall notify the California State Native American Heritage Commission within 24 hours. The Native American Heritage Commission shall immediately appoint and notify a most likely descendant. The most likely descendant shall complete his or her inspection of the remains and make recommendations or preferences for treatment within 48 hours of being granted access to the site.

If the remains cannot be permanently preserved in place, the land owner may consult with the project archeologist, project sponsor, and CEQA lead agency and shall consult with the most likely descendant on recovery of the remains and any scientific treatment alternatives. The land owner shall then make all reasonable efforts to develop a burial agreement with the most likely descendant, as expeditiously as possible, for the treatment and disposition, with appropriate dignity, of human remains and funerary objects (as detailed in CEQA Guidelines section 15064.5(d)). In accordance with Public Resources Code 5097.98 (c)(1), the burial agreement shall address, as applicable and to the degree consistent with the wishes of the most likely descendant, the appropriate excavation, removal, recordation, scientific analysis, custodianship prior to reinterment or curation, and final disposition of the human remains and funerary objects. If the most likely descendant agrees to scientific analyses of the remains and/or funerary objects, the archeological consultant shall retain possession of the remains and funerary objects until completion of any such analyses, after which the remains and funerary objects shall be reinterred or curated as specified in the burial agreement.

Both parties are expected to make a concerted and good faith effort to arrive at an agreement, consistent with the provisions of Public Resources Code 5097.98. However, if the land owner and the most likely descendant are

unable to reach an agreement, the land owner, environmental review officer, and project sponsor shall ensure that the remains and/or mortuary materials are stored securely and respectfully until they can be reinterred on the property, with appropriate dignity, in a location not subject to further or future subsurface disturbance, consistent with state law.

Treatment of historic-period human remains and/or funerary objects discovered during any soil-disturbing activity shall be in accordance with protocols laid out in the project archeological treatment document, and other relevant agreements established between the project sponsor, Medical Examiner, and environmental review officer. The project archeologist shall retain custody of the remains and associated materials while any scientific study scoped in the treatment document is conducted, after which the remains shall be curated or respectfully reinterred by arrangement on a case-by case-basis.

Archeological Public Interpretation Plan. The project archeological consultant shall submit an archeological public interpretation plan if a significant archeological resource is discovered during a project. If the resource to be interpreted is a tribal cultural resource, the archeological public interpretation plan shall be prepared in consultation with and developed with the participation of tribal representatives, including the Association of Ramaytush Ohlone and other interested Ohlone parties. The archeological public interpretation plan shall describe the interpretive product(s), locations or distribution of interpretive materials or displays, the proposed content and materials, the producers or artists of the displays or installation, and a long-term maintenance program. The archeological public interpretation plan shall be sent to the environmental review officer for review and approval. The archeological public interpretation plan shall be implemented prior to occupancy of the project.

Archeological Resources Report. Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the testing program to the environmental review officer. The archeological consultant shall submit a draft archeological resources report to the environmental review officer that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken, and if applicable, discusses curation arrangements. Formal site recordation forms (CA DPR 523 series) shall be attached to the archeological resources report as an appendix.

Once approved by the environmental review officer, copies of the archeological resources report shall be distributed as follows: California Archeological Site Survey Northwest Information Center shall receive one

copy, and the environmental review officer shall receive a copy of the transmittal of the archeological resources report to the Northwest Information Center. The environmental planning division of the planning department shall receive one bound hardcopy of the archeological resources report. Digital files that shall be submitted to the environmental division include an unlocked, searchable PDF version of the archeological resources report, GIS shapefiles of the site and feature locations, any formal site recordation forms (CA DPR 523 series), and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. The PDF archeological resources report, GIS files, recordation forms, and/or nomination documentation should be submitted via USB or other stable storage device. If a descendant group was consulted during archeological treatment, a PDF of the archeological resources report shall be provided to the representative of the descendant group.

Curation. Significant archeological collections and paleoenvironmental samples of future research value shall be permanently curated at an established curatorial facility. The facility shall be selected in consultation with the environmental review officer. Upon submittal of the collection for curation, the sponsor or archeologist shall provide a copy of the signed curatorial agreement to the environmental review officer.

Mitigation Measure M-TCR-1 Tribal Cultural Resources Interpretive Program.

Preservation in Place. In the event of the discovery of an archeological resource of Native American origin, the environmental review officer, the project sponsor, and the local Native American representative shall consult to determine whether preservation in place would be feasible and effective. Coordination shall take place with local Native American representatives, including the Association of Ramaytush Ohlone and other interested Ohlone parties. If it is determined that preservation-in-place of the tribal cultural resource would be both feasible and effective, then the archeological consultant, in consultation with the local Native American representative, shall prepare an archeological resource preservation plan, which shall be implemented by the project sponsor during construction. The consultant shall submit a draft archeological resource preservation plan to the planning department for review and approval.

Interpretive Program. If the environmental review officer, in consultation with local Native American representatives (including the Association of Ramaytush Ohlone and other interested Ohlone parties) and the project sponsor, determines that preservation-in-place of the tribal cultural resources is not a sufficient or feasible option, then archeological data recovery shall be implemented as required by the environmental review

officer and in consultation with affiliated Native American tribal representatives.

After data recovery, the project sponsor, in consultation with local Native American representatives, shall prepare a tribal cultural resources interpretation plan to guide the interpretive program. The tribal cultural resources interpretation plan may be prepared in tandem with the archeological public interpretation plan described in Mitigation Measure M-CR-2: Archeological Testing. The tribal cultural resources interpretation plan shall be submitted to the environmental review officer for review and approval prior to implementation of the program. The plan shall identify, as appropriate, proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, cultural displays, educational panels, or other interpretive elements agreed upon by the environmental review officer, sponsor, and local Native American representatives. Upon approval of the tribal cultural resources interpretation and prior to project occupancy, the interpretive program shall be implemented by the project sponsor. Local Native American representatives who are substantially involved in preparation or implementation of the interpretive program shall be appropriately compensated by the project sponsor.

Mitigation Measure M-WI-1a **Wind Hazard Evaluation for Building Design and Streetscape Modifications.** If the proposed project's design, including the wind mitigation measures (M-WI-1b), is modified in any way that could affect ground-level wind conditions, the new design shall be evaluated by a qualified wind expert to determine the potential for the modified project to result in a new wind hazard exceedance (defined as the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed). The evaluation may require wind tunnel testing by the qualified expert to determine whether the modified project would result in an exceedance of the wind hazard criterion. If the modified project could exceed the wind hazard criterion, the project buildings shall be shaped (e.g., by including setbacks or using other building design techniques) or other wind-baffling measures shall be implemented, so that the project does not result in an exceedance of the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed.

Mitigation Measure M-WI-1b **Maintenance of Landscaping Features that Reduce Wind Hazards.** The project sponsor shall maintain, for the life of the proposed project buildings, all landscaping features required to ensure that the proposed project does not result in in an exceedance of the one-hour wind hazard criterion of 26 miles per hour equivalent wind speed. These features include installation

of nine evergreen street trees, each approximately 25 feet tall with a 15-foot-diameter canopy, along the eastern sidewalk of Toland Street *or* any landscaping features required pursuant to Mitigation Measure M-WI-1a: Wind Hazard Evaluation for Building Design and Streetscape Modifications.

Mitigation Measure M-GE-5 Inadvertent Discovery of Paleontological Resources

Worker Environmental Awareness Training. Prior to commencing construction, the project sponsor shall engage a paleontologist meeting the standards of the Society of Vertebrate Paleontology[304] to conduct training for all onsite construction workers regarding paleontological resources and the contents of the paleontological resources alert sheet, as provided by the planning department. The paleontological resources alert sheet shall be prominently displayed at the construction site, during ground-disturbing activities.

In addition, the project sponsor (through a designated representative) shall inform construction personnel of the immediate stop work procedures and contact information to be followed if bones or other potential fossils are unearthed at the project site, and the laws and regulations protecting paleontological resources. As new workers arrive at the project site for ground-disturbing activities, they shall be trained by the construction supervisor.

The paleontologist shall submit a letter confirming the timing of the worker training to the planning department. The letter shall confirm the project's location, the date of training, the location of the informational handout display, and the number of participants. The letter shall be transmitted to the planning department within five business days of conducting the training.

In the event of the inadvertent discovery of a paleontological resource during construction, excavations within 25 feet of the find shall temporarily be halted until the discovery is examined by a qualified paleontologist (as defined by the Society of Vertebrate Paleontology). Work in the sensitive area shall resume only when deemed appropriate by the qualified paleontologist, in consultation with the planning department.

The qualified paleontologist shall determine: 1) whether the discovery is scientifically significant; 2) the necessity for involving other agencies and stakeholders; 3) the significance of the resource; and 4) methods for resource recovery. If a paleontological resource assessment results in a determination that the resource is not scientifically important, this conclusion shall be documented in a paleontological evaluation letter to demonstrate

[304] Society of Vertebrate Paleontology, *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources*, 2010, *https://vertpaleo.org/wp-content/uploads/2021/01/SVP_Impact_Mitigation_Guidelines.pdf*, accessed January 2022.

compliance with applicable statutory requirements. The paleontological evaluation letter shall be submitted to the planning department for review within 30 days of the discovery.

If a paleontological resource is determined to be of scientific importance and there are no feasible avoidance measures, a paleontological mitigation program must be prepared by the qualified paleontologist engaged by the project sponsor. The mitigation program shall include measures to fully document and recover the resource and shall be approved by the planning department. Ground-disturbing activities in the project area shall resume and be monitored, as determined by the qualified paleontologist in collaboration with the planning department, for the duration of such activities.

The mitigation program shall include: 1) procedures for construction monitoring at the project site; 2) fossil preparation and identification procedures; 3) curation into an appropriate repository; and 4) preparation of a paleontological resources report at the conclusion of ground-disturbing activities. The report shall include dates of field work, results of monitoring, fossil identifications to the lowest possible taxonomic level, analysis of the fossil collection, a discussion of the scientific significance of the fossil collection, conclusions, locality forms, an itemized list of specimens, and a repository receipt from the curation facility. The project sponsor shall be responsible for the preparation and implementation of the mitigation program, in addition to any costs necessary to prepare and identify collected fossils, and for any curation fees charged by the paleontological repository. The mitigation program shall be submitted to the planning department for review within 10 business days of the discovery. The paleontology report shall be submitted to the planning department for review within 30 business days from conclusion of ground-disturbing activities, or as negotiated following consultation with the planning department.

G. DETERMINATION

On the basis of this initial study:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, no further environmental documentation is required.

PROJECT SPONSOR-PREPARED PROJECT DESCRIPTION SUPPORTING INFORMATION

Memorandum

To: San Francisco Planning Department
From: Prologis, Project Sponsor
Date: 04/14/2020 [Updated 06/30/2020]
Project: San Francisco Gateway Project, 749 Toland St. & 2000 McKinnon Ave.
Case No: 2015-012491ENV
Regarding: **E-commerce – Existing Demand and Future Trends in San Francisco and the Greater Bay Area**

Introduction

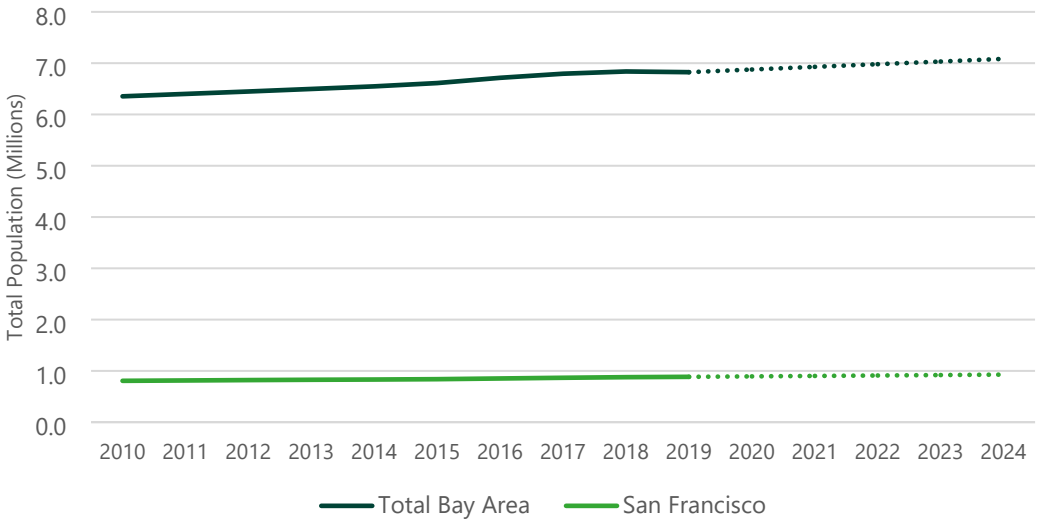
The proposed San Francisco Gateway (SF Gateway) project is located within an area of the City zoned specifically for Production, Distribution and Repair (PDR) uses and will provide approximately 1,166,800 square feet of new space for PDR and other permitted uses, including e-commerce uses.[1] At the request of the San Francisco Planning Department, Prologis has compiled a number of key metrics which illustrate the economic conditions affecting demand for e-commerce uses at the proposed project.

The vision of e-commerce's role in the SF Gateway project is informed by several key factors, namely, the past and projected growth in e-commerce sales and the past and projected growth of e-commerce costumers. These guiding factors are reflected both directly in sales growth and increase in users of e-commerce services as well as indirectly in the continued expansion of e-commerce related distribution facilities throughout the Bay Area. Specifically, the following key metrics underpin the anticipated demand for e-commerce uses at the facility.

A. Population growth in San Francisco and greater Bay Area[2]
B. E-commerce growth in San Francisco and greater Bay Area
C. E-commerce sales per capita for San Francisco and greater Bay Area
D. Growth of e-commerce related distribution centers

This memo covers past statistics relating to these metrics from 2010-2018 as well as projected statistics from 2019-2024. Statistical information underlying the summary below is based on the analysis of multiple sources, including *Oxford Analytics, Euromonitor, San Francisco Planning Department, Bureau of Land Statistics, CBRE* and *Prologis Research*.

---



[1] For the purpose of this memorandum, e-commerce is defined as retail commercial transactions conducted on the internet and involving the delivery of goods to end users.
2 For the purpose of this memorandum, the greater Bay Area comprises the counties of San Francisco, San Mateo, Santa Clara, Alameda, Contra Costa, Solano, Napa, Sonoma, and Marin.

Population growth in San Francisco and Greater Bay Area

The population in San Francisco and the greater Bay Area has grown and continues to grow at a modest pace with the greater Bay Area growth rate outpacing that of San Francisco, as shown in Figure 1: San Francisco and Greater Bay Area Population Growth.[3]

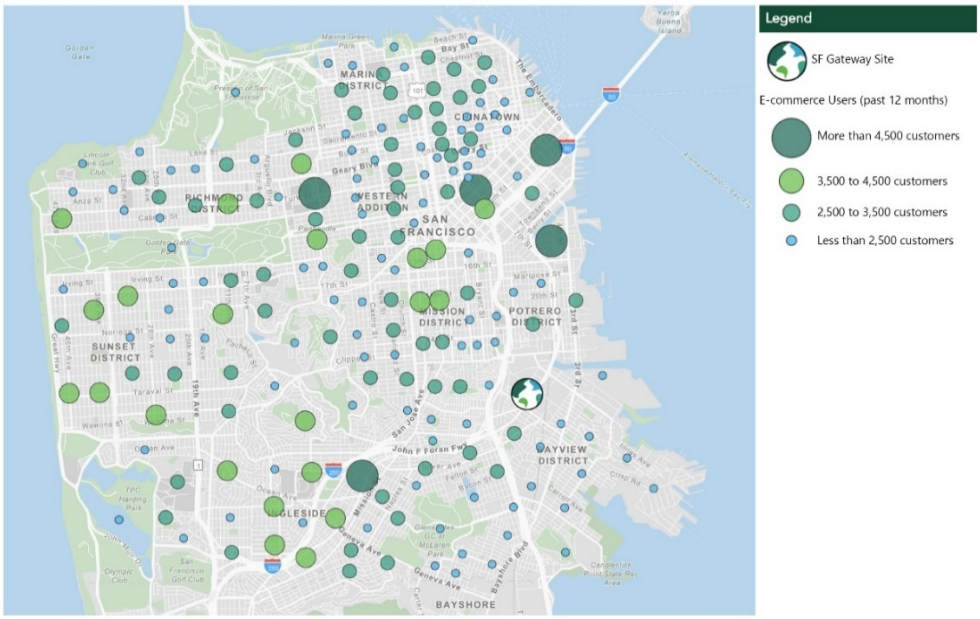
While population growth rates have been declining both locally and nationwide, the particularly modest growth reflected in San Francisco is the result of several factors. As noted in the 2018 *San Francisco Housing Needs and Trends Report* published by the San Francisco Planning Department, there is a complex relationship between the City's housing stock and the changes in the City's population and demographics. In general, the report finds a lack of housing to support a number of the City's diverse populations such as low- and moderate-income households.[4] Along with other factors, this shortage in supply of certain types of housing may be inhibiting population growth in certain areas. The *2019 Q2 Housing Development Pipeline Report,* published by the San Francisco Planning Department notes a total of 72,565 net new residential units in the pipeline at various stages of development. Over 9,000 new units are under construction; over 12,000 units have filed or received building permits; over 28,000 units are a part of major multi-phased projects; and over 18,000 have development applications filed with the Planning Department.[5] This information indicates a residential development landscape that will continue to grow over time and will likely result in a continued modest increase in population.

FIGURE 1: SAN FRANCISCO AND BAY AREA POPULATION GROWTH

[3] Bureau of Land Statistics, Population data from 2010-2019 and projected growth from 2020-2024
[4] San Francisco Housing Needs and Trends Report, San Francisco Planning Department, July 2018
[5] 2019 Q2 Housing Development Pipeline Report, San Francisco Planning Department, updated Sept. 2019

While the residential population is a key metric for understanding the demand for e-commerce services, e-commerce trends also reflect a robust business-to-business component. According to city and regional projections, employment in San Francisco is expected to grow at historic rates, reaching approximately 942,00 jobs in San Francisco by 2050.[6] With the passage of the Central SOMA Plan in 2018 and the approval of numerous large and small development projects, the City has over 7 million square feet of office development underway. According to *2019 Office Development Annual Limitation Program*, there is 2.8 million square feet of office development under construction with an additional 4 million square feet in various stages of permitting.[7] This development will carry with it an estimated additional 30,000 occupants[8]. This additional daytime occupancy may not be reflected in the City's residential population but is expected to continue to contribute to the growth of e-commerce sales and demand for related distribution activities. An overview of areas within the City with the highest rates of user engagement in e-commerce can be seen in Figure 2: Annual E-commerce in San Francisco. This data, based on customer participation in the e-commerce marketplace in the last 12 months[9], indicates a relationship between significant business districts, such as the Financial District and SOMA, and e-commerce activity.[10]

[6] 2019 Statement of Needs Report, ConnectSF, December 2019



[7] Office Development Annual Limitation Program, San Francisco Planning Department, December 20, 2019

[8] This occupancy is generated by dividing the total office development underway by 240 sf, the approximate office occupant load factor per the May 2019 Jobs Housing Nexus Analysis prepared by Keyser Marston Associates to update the city's nexus fees.

[9] Data reflects Esri national household survey data for the number of people who respond "yes" to having ordered an item online in the past 12 months correlated with population segmentation data from the Bureau of Labor Statistics.

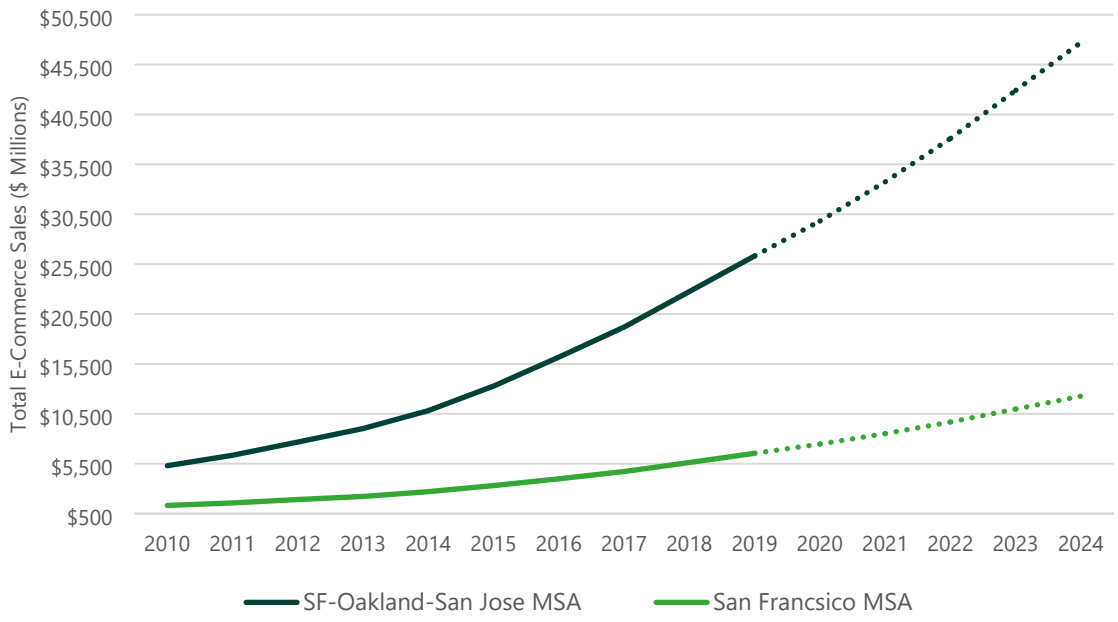
FIGURE 2: ANNUAL E-COMMERCE IN SAN FRANCISCO

As commercial districts experience the expansion described above, one can expect an increase in overall use of e-commerce sourcing to meet the needs of growing commercial districts.

Past, current, and projected e-commerce growth - San Francisco and Bay Area Metropolitan Centers



E-commerce growth, as an emerging trend in urban centers of the greater Bay Area and more specifically San Francisco, can be recognized by examining the growth of retail-based e-commerce sales over the past 10 years. Focusing on the major Bay Area metropolitan statistical areas of San Francisco, Oakland, and San Jose, market share for e-commerce retail transactions have consistently expanded as compared to retail transactions as a whole.[11]

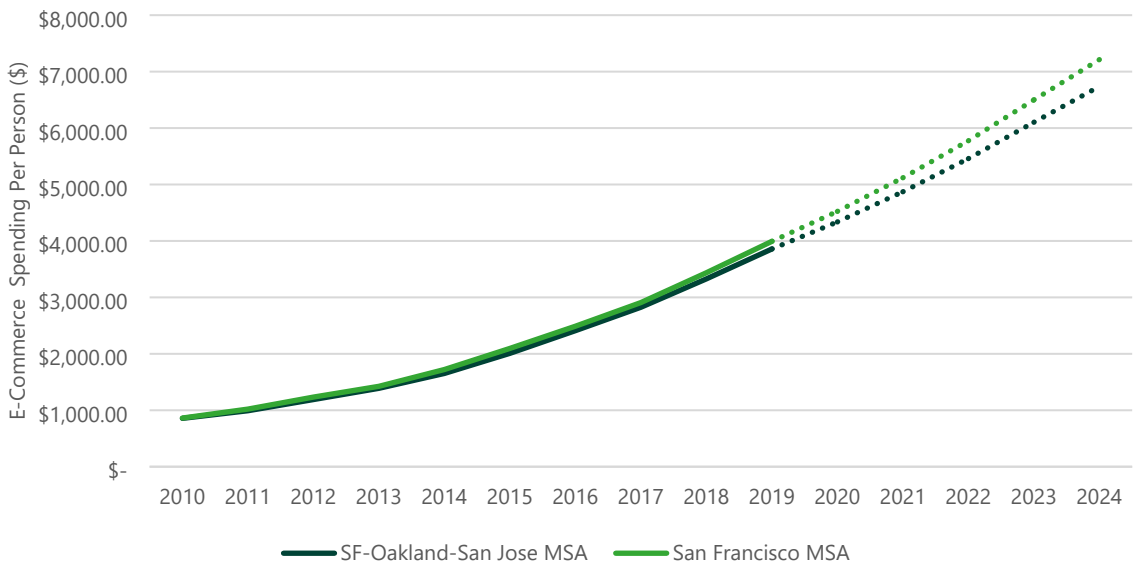
As noted above, San Francisco (and the greater Bay Area) has experienced increases in population over the past 10 years and is projected to stay on a similar trajectory in the near future, however growth of e-commerce sales have increased at a much higher rate over the same period. Nationally, within total retail sales, the proportion of sales occurring on-line has rapidly increased. From 2010 to 2020, the percentage of total retail sales transacted via e-commerce has grown from 5.5% to 16.7% and is expected to continue to grow to 24.2% by 2024.[12] As seen in Figure 3: San Francisco and Bay Area E-commerce Sales, e-commerce sales in

[11] Proportion of e-commerce sales to total retail sales in U.S., Euromonitor Research
[12] Proportion of e-commerce sales to total retail sales in U.S., Euromonitor Research

the combined Bay Area metropolitan centers[13] have seen pronounced growth, increasing more than five-fold over the 10 year period from 2010 – 2020.[14] In 2010, customers in the San Francisco MSA[15] transacted roughly $1.3 billion in e-commerce retail sales. Ten years later, in 2020, total San Francisco e-commerce retail transactions increased over five-fold to $7.5 billion.[16]

FIGURE 3: SAN FRANCISCO AND BAY AREA E-COMMERCE SALES

While it is evident that the rate of growth for e-commerce sales has been increasing rapidly in Bay Area metropolitan centers, the trend in San Francisco is even more pronounced when accounting for San Francisco's population growth rate.



[13] For the purpose of this memo, Bay Area metropolitan centers consist of the San Francisco-Oakland-Berkeley Metropolitan Statistical Area (MSA) and the San Jose-Sunnyvale-Santa Clara MSA

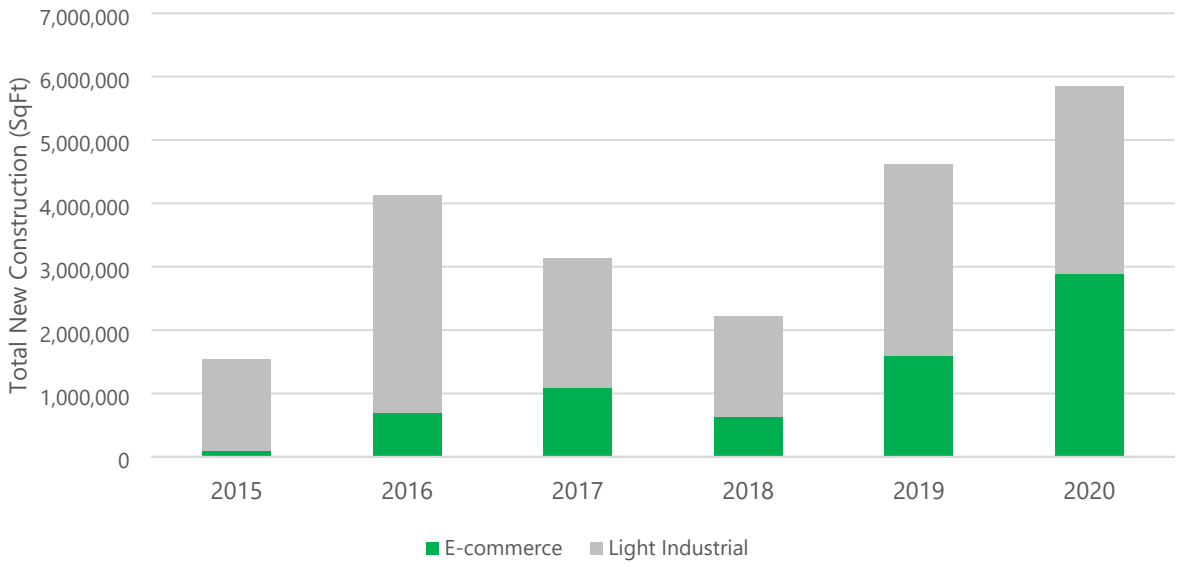
[14] Estimated E-commerce Sales, Euromonitor, Oxford Economics, and Prologis Research

[15] San Francisco-San Mateo-Redwood City Metropolitan Statistical Area (MSA) consists of San Francisco and San Mateo counties

[16] Estimated E-commerce Sales, Euromonitor, Oxford Economics, and Prologis Research

FIGURE 4: SAN FRANCISCO AND BAY AREA E-COMMERCE SALES PER CAPITA

As shown in Figure 4: San Francisco and Bay Area E-commerce Sales Per Capita, per person e-commerce spending in the San Francisco MSA has increased at a faster rate than that of the population, surpassing the per capita spending of the Bay Area in the past few years.[17] This indicates that population growth is not the sole cause nor even a dominant factor driving the expanded market share of e-commerce retail transactions. The increase in per capita e-commerce sales in San Francisco indicates the broadening acceptance and demand in the e-commerce marketplace. In San Francisco, as technology evolves and customer acceptance and engagement increases, e-commerce sales growth rates are projected to continue climbing in the coming years.[18]



As seen above, statistics from 2010 to 2019 clearly document a steady increase of the e-commerce market share within the total retail landscape that is projected to grow at a steadily increasing rate over the coming years. Statistics for 2020 have been affected by global and national impact of the COVID-19 pandemic.[19]

Growth of E-Commerce Related Distribution Centers in the Greater Bay Area

[17] Estimated e-commerce sales and projected growth 2010-2024, Euromonitor, Oxford Economics, and Prologis Research.
[18] Projected e-commerce sales growth 2019-2024, Euromonitor, Oxford Economics and Prologis Research.
[19] In March 2020, the dollar value of online sales for consumer packaged goods had increased by 91% and the number of people who had shopped on line for packaged goods had increased 35% in comparison to March 2019. "Tracking the Unprecedented Impact of Covid-19 on CPG Shopping Behavior", The Nielsen Company, March 30, 2020,

Generally speaking, the increase in e-commerce sales leads to an increase in demand for light industrial facilities which can support e-commerce activities. Growing demand for warehouse space within close proximity to major population centers is a national trend. Demand for warehouse space went from 0.7 percent annually from 2007 to 2012 to 1.1 percent annually from 2012 to 2017. Much of this increase has been attributed to the 11 percent increase in e-commerce sales over the same period.[20] The increase in the greater Bay Area e-commerce sales is reflected in the increased square footage of construction dedicated to this function in the area. In the past 6 years (including the pipeline projects which will be completed and occupied in 2020) a total of approximately 59 new buildings (50,000 sf or larger) have been built to support light industrial uses in the greater Bay Area, of which 46 have been partially or fully dedicated to e-commerce uses. In terms of square footage, of the approximately 12.4 million square feet of new light industrial space developed in the greater Bay Area in the past 6 years , 7 million square feet, or 56.6%, has been leased to logistics users to support e-commerce operations.[21] As seen in Figure 5: Greater Bay Area E-Commerce Related Distribution Center Growth, the overall trend toward e-commerce uses is gaining momentum.[22]

FIGURE 5: GREATER BAY AREA E-COMMERCE RELATED DISTRIBUTION CENTER GROWTH

[20] "The future of the industrial real estate market". Mahajan, Saurabh. Deloitte Insights. May 2019.
[21] CBRE Research, 2020.
[22] CBRE Research, 2020.

The vast majority of new development of light industrial space in the greater Bay Area is occurring in the East Bay market. This market is primarily comprised of locations in Alameda County along the Interstate 880 corridor. Of the 12.4 million new square feet of Bay Area light industrial space constructed since 2015, 79% has been built in the East Bay market The North Bay market (primarily centered in and around Richmond[23]) has seen the development of approximately 11%, while the South Bay market (Santa Clara County) has contributed 10% of the new space in the greater Bay Area.

The Peninsula (San Mateo County) and San Francisco markets have seen very little, if any, development of new light industrial space over this time period. Significant barriers to entry and the changing land use priorities of municipalities in San Mateo and San Francisco Counties may partially explain the lack of new light industrial construction. As discussed in the "Urban E-commerce Distribution Facility Selection Criteria" memorandum,[24] the presence of impediments to traffic flow such as bridges make the locations in the East Bay market less efficient as e-commerce locations to serve the San Francisco market. This combines with the overall lack of new light industrial development occurring in the San Francisco and Peninsula markets to heighten demand for such spaces in San Francisco designed to meet the needs of logistics users in particular. The San Francisco Gateway project is uniquely positioned to serve this increased demand.

Conclusion

Taken as a whole, the combination of the above key metrics provides a compelling picture of the expected growth of e-commerce in San Francisco and the need for logistics spaces to accommodate this growth. It is clear from the above metrics that e-commerce demand in San Francisco exists and is growing at a steady rate As the population of the City and the Bay Area expands and more office space is brought online in San Francisco, demand for e-commerce will grow to meet the needs of the increased number of potential customers. Potentially more impactful is the rapidly increasing popularity of e-commerce as a method for purchasing products.[25] This rapid expansion is expected to continue with the advancement of technology, availability of goods through e-commerce, and marketplace acceptance. The San Francisco Gateway project will not create additional e-commerce demand, but is intended to meet a portion of this existing and growing demand, by providing a distribution facility located in close proximity to the Bay Area's highest-density residential and employment centers.

[23] In Bay Area logistics and distribution real estate market, Richmond is considered as part of the North Bay market.

Re: Urban E-commerce Distribution Facility Selection Criteria

This memorandum describes key criteria that influence the selection of urban e-commerce (last mile logistics)[1] sites and relates these criteria to the San Francisco Gateway site (SF Gateway) and other Bay Area industrial markets. As demand for e-commerce grows in San Francisco, the goal of the SF Gateway project is to provide an efficient location for the collection, sorting and distribution of goods that meets the needs of the current and projected customers of San Francisco while reducing the vehicular impact of deliveries within the City. The key site selection criteria focus on identifying sites which provide an efficient platform for the final handling and distribution of goods to the end customer. Key metrics of this efficiency include time, certainty, and the miles traveled by delivery vehicle. Currently, most last mile delivery for San Francisco originates outside of the City and locating last mile delivery stations within the City will increase efficiency and decrease miles traveled.

I. CURRENT CONDITIONS SERVICING SAN FRANCISCO

In order to contextualize the need for and benefits of last mile facilities located with in San Francisco, understanding the current locations of last mile which serve the San Francisco market is key. The vast majority of new development of light industrial space utilized for e-commerce distribution in the greater Bay Area is occurring in the East Bay Market. The Peninsula and San Francisco markets have seen very little, if any, development in the past 5 years.[2]

Key Site Selection

There are a number of key criteria that lead to the selection of a particular last mile logistics location. These criteria relate primarily to two sets of factors, those that are external to the e-commerce business and those that are internal.

External factors relate primarily to the availability of suitably zoned land and the timing to attain the local government approvals required for the construction of a facility of this nature. As cities evolve, planning agencies and other city leaders have had to balance competing demands on historically industrial areas in and around population centers. These competing interests (e.g. office, commercial, and residential uses) can lead to a reduction in land appropriately zoned to support e-commerce logistics use. This can be seen in San Francisco's recent Eastern Neighborhoods rezoning effort which converted some land formerly zoned for light industrial uses (uses compatible with requirements for e-commerce facilities) to mixed-use zoning centered around residential and offices uses. The rapidly evolving e-commerce industry encourages a quick and reliable response to meet customers' needs. As the industry commits financial

[1] For purposes of this memo, "last mile logistics" is defined as the overall transfer of goods from central distribution hubs (fulfillment centers) via long-haul trucks to last mile delivery facilities for ultimate distribution (typically via delivery vans).

[2] E-commerce – Existing Demand and Future Trends in San Francisco and the Greater Bay Area. Prologis Research. 2020

resources to facility construction, it seeks both a reliable timeframe and a rapid transition from planning to operations. This combination of factors - sites possessing the appropriate land use designation(s) and rapid and reliable municipal approvals process allowing for a nimble response to customers - significantly limits the potential locations for last mile delivery.

In addition, ***internal metrics*** drive site selection for e-commerce companies. While these metrics vary from business to business and tend to change rapidly, they typically focus on physical proximity to population centers, time and efficiency to delivery and access to adequate support for business activities. Last mile delivery facilities serve an area that, on average, is within a 45-minute drive from a particular site. In areas of high population density, the service area could be as small as a 20-minute drive. Additionally, each delivery vehicle (e.g. van) and driver completes a route by delivering 150-200 packages. In more densely populated areas, the distance to complete a route with this volume of packages is typically shorter than in less densely populated areas.

From our experience, in no particular order, the following are key criteria that influence the selection of last mile delivery sites:

1. **Proximity to Regional Road Network** – Sites that are close to the regional network are desirable for last mile delivery facilities because the regional road network connects the location to other nodes in a logistics network such as fulfillment centers[3]. Being close to the regional road network makes travel between the last mile delivery facilities and fulfillment centers more efficient.

   For San Francisco, the closest fulfillment center serving the area is over 60 miles away, driving the need for a last mile facility that is located along the Route 101 and Route 280 corridors either within the city or in other municipalities such as South San Francisco, San Bruno or Daly City.[4]

2. **Natural/Artificial Barriers** – The presence of a physical barrier between the last mile delivery center and its service area raises significant logistical issues. Examples of significant barriers are bridge crossings, toll roads, or having to traverse other significant geographical features such as mountain passes. Barriers can slow delivery times, due to associated traffic or cause reliability issues.

   For San Francisco, locating last mile delivery facilities east or north of the City is not desirable, due to the significant bridge crossings and toll checkpoints. These bridge crossings and/or toll checkpoints typically bring a combination of congestion, delays, reliability concerns, and additional expense. Any delivery facility located in Oakland, for example, would likely serve the market east of San Francisco but not the City itself.

3. **Appropriately Sized Sites** – Sites that can meet the size requirements of a contemporary multi-story last mile delivery program must be significantly sized, providing a minimum of 4 acres and must often be large to meet the contemporary urban logistics center requirements. Available sites of this size are rare in urban areas. Sites must be able accommodate both internal processing functions for last mile delivery and the associated vehicles (long haul trucks, delivery vehicles, and employee vehicles). Accordingly, parameters for space for vehicles (staging and parking) can be high.

[3] For purposes of this memo, "fulfillment centers" are large logistics facilities which aggregate products for distribution to last mile delivery facilities. Fulfillment centers are a middle point in the distribution chain.

[4] See Figure 1 for map of potential last mile delivery facility sites.

4. **Proximity to Workforce** – The majority of last mile delivery facility employees are working the package sorting operation inside the building or are driving delivery vans. A ready blue-collar workforce provides a true synergy between community and a potential facility. The proposed SF Gateway project is located within or close to a number of neighborhoods (Bayview, Visitacion Valley, Excelsior, Mission) whose income and occupation demographics suggest that these communities have workforce capabilities which are in line with employment opportunities an e-commerce facility can provide. According to census occupation data, the largest concentration of blue-collar workforce in San Francisco is primarily located in these districts.[5] A closer look at income inequality statistics further indicates a need for additional workforce opportunities in the southeastern districts of San Francisco.[6]
5. **Site Locations with Public Transit Connectivity** – Sites that have ready access to public transit are attractive because convenient public transit makes a site more accessible to employees. Public transportation provides a cost-effective method of commuting to work for the employees of last mile facilities. Facilities with efficient public transit options to and from neighborhoods which have a ready blue-collar workforce provide for an efficiency in travel that can reduce overall vehicle miles traveled. For San Francisco, this is a key need as potential employees in the industrial sector may continue to disperse throughout the region as cost-of-living increases.[7]

Currently, and for the past 5 years, the closest last mile delivery facilities serving San Francisco have been developed outside of the City in South San Francisco, Richmond, Oakland, San Leandro and Hayward. While external factors may have led to development in these locations, these sites are unable to meet the required internal metrics to efficiently serve present and future San Francisco populations.

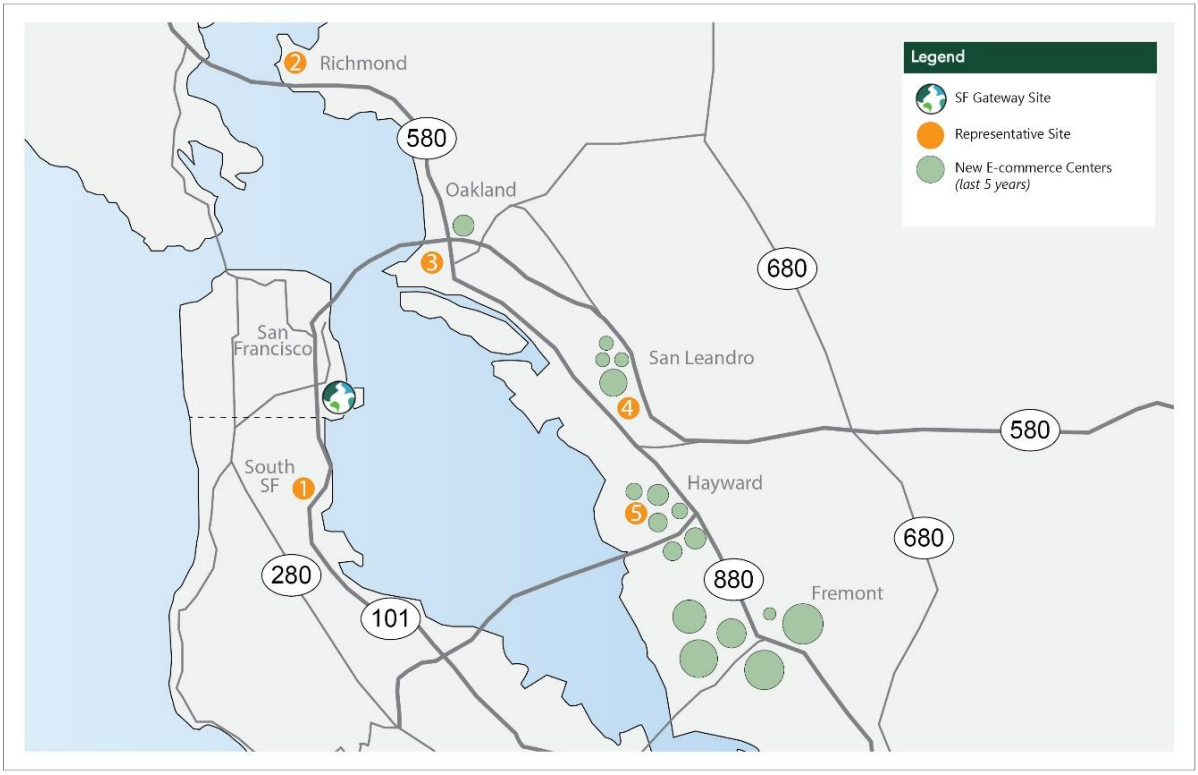
II. DEVELOPMENT WITHIN A TRAVEL-EFFICIENT LOCATION

As noted above, locations for delivery facilities to the north and east are limited due to the presence of several barriers and require delivery vehicles to travel significant distances to complete their routes when servicing San Francisco. Furthermore, there are limited opportunities for last mile delivery facilities in San Francisco and areas south due to current zoning restrictions and availability of appropriately sized sites. The San Francisco Gateway site is located in an appropriately zoned area and its proximity to the City's population center will shorten the trip length for last mile delivery services when compared to both existing and potential facilities located outside of the City limits including potential sites in South San Francisco, Oakland or elsewhere. This shortened trip length increases efficiency and reduces overall vehicle miles traveled.

III. MILES PER DELIVERY ROUTE

To better understand the impact of site location on delivery logistics, alternate sites within similar Bay Area light industrial markets (e.g. Peninsula, East Bay) can be compared to San Francisco, in terms of their ability to service the San Francisco market. A site related examination - limited to an analysis of the miles travelled per delivery route to reach the San Francisco county line - shows an increase in likely miles travelled per service route of any location other than one in San Francisco itself. An analysis of this type

[5] "San Francisco, California" Statistical Atlas. US Census Bureau (2010 census) and American Community Survey (2010-2016) ("US Census")



[6] US Census

[7] Make to Manufacture: An Advanced Manufacturing Playbook. San Francisco Mayor's Office of Civic Innovation, SFOEWD, SFMade. 2016

is *hypothetical in nature* as it does not account for the key criteria of natural/artificial barriers, site size, public transit and workforce availability all which shape and restrict site selection.

The following figure, **Figure 1**: **Greater Bay Area Industrial Markets,** demonstrates the travel distances from several alternate representative sites within the Bay Area to the San Francisco county line (excluding Treasure Island). Other than San Francisco, there are 5 main light industrial markets in the immediate greater Bay Area that could be considered proximate enough to San Francisco to service its growing e-commerce demand: Richmond, Oakland, San Leandro, Hayward and South San Francisco. Distances from each of these alternate sites are shown in **Figure 2: Relative Comparison of Miles per Delivery Route.** Each of the distances shown are one way and would be travelled to and from the site.

Figure 1: Greater Bay Area Industrial Markets[8]

[8] Data for new e-commerce center locations in the past 5 years compiled from CBRE Research and Prologis Research

Figure 2: Relative Comparison of Miles per Delivery Route

	Site Location	Miles per Route to San Francisco County line (one way)
1	South San Francisco	5.3 miles
2	Richmond	20.2 miles
3	Oakland	6.4 miles
4	San Leandro	20.9 miles
5	Hayward	25.4 miles

Routes originating from representative sites in San Leandro and Hayward generate the most miles above baseline at 20.9 and 25.4 respectively, while the representative site in South San Francisco would require traveling an additional 5.3 miles on average to reach the closest San Francisco County line. Along with confirming that SF Gateway is well located to serve the e-commerce demand in San Francisco, this comparative analysis reaffirms that facilities located in other Bay Area light industrial markets will likely generate a significant number of additional delivery related miles to access and serve San Francisco's demand for e-commerce transactions.

The proposed project at the San Francisco Gateway meets the key criteria for the location of a last mile delivery facility. The site is one of the closest appropriately sized and zoned areas to the dense population centers (both residential and commercial) of San Francisco, providing short drive times and distances for distribution routes, which will maximize efficiency. The site is readily accessible to both the Highway 101 and 280 corridors, providing efficient connections to the fulfillment centers to the east and minimizing large long-haul truck miles within the City's neighborhoods. The proposed project provides the needed size for a fully functional last mile delivery center with a design that facilitates both the required internal processes and provides the appropriate accommodations for all vehicles that will service the facility. The proposed site is served by SFMTA transit lines, and is close to the Bayview, Visitacion Valley, Excelsior, and Mission, all neighborhoods for which the project could provide attractive blue-collar employment opportunities while also reducing commute travel times from adjacent neighborhoods thus potentially reducing the employee VMT through the project's siting. In comparison with other greater Bay Area light industrial sites, SF Gateway provides the shortest average route distances and ready access to public transportation making for a travel efficient location for last mile distribution sought by e-commerce businesses and supported governmental agencies.

SUMMARY

Three (3) criteria are key to the selection of the San Francisco Gateway site as a center for parcel last might delivery. First, demand for e-commerce in San Francisco will continue to grow to meet the needs of the increased number of potential customers.[9] New development of distribution centers to meet this

[9] E-commerce – Existing Demand and Future Trends in San Francisco and the Greater Bay Area. Prologis Research. 2020

need will occur regardless of location. As such, the proposed project would not create new delivery trips, but has the potential to positively impact the distance of those trips. Second, based on the trajectory of current and future demand if a distribution center were not developed at the current site, it would likely be located outside of San Francisco (South San Francisco, the East Bay or beyond). Lastly, given San Francisco's unique geography and the Bay Area's regional road grid, locating the facility at the proposed site within San Francisco and proximate to Highways 101 and 280, would be the most travel efficient location, potentially reducing mile traveled by vehicles while meeting the demand of the San Francisco market.

D.2.2: Travel Demand Memorandum

Adavant Consulting

Memorandum

To: Sherie George/Elizabeth White – San Francisco Planning Department

From: José I. Farrán – Adavant Consulting
Luba C. Wyznyckyj – LCW Consulting

Date: December 10, 2021 **FINAL UPDATED**

Re: 749 Toland Street and 2000 McKinnon Avenue Project Case No. 2015-012491ENV
Estimation of Project Travel Demand

This technical memorandum describes the assumptions and methodology used to develop the travel demand, including vehicle trip classification, for the San Francisco Gateway project (proposed project). Travel demand refers to the vehicle, transit, pedestrian, and bicycle trips that would be generated by the proposed project. The analysis presents the estimate of project-generated person and vehicle trips that would travel to and from the project site, including the number of commercial vehicles (i.e., service vans and trucks).

The travel demand analysis presented in this document is based on standard methodology and practices used in the evaluation of transportation impacts as part of environmental review in San Francisco, which are described in detail in the *Transportation Impact Analysis Guidelines for Environmental Review* (SF Guidelines)[1] prepared by the San Francisco Planning Department (department). Detailed travel demand calculations and supporting data are included in the attached appendices.

This memorandum also presents the methodology and analysis results for estimation of the average daily Vehicle Miles Traveled (VMT) per worker for the proposed project. This particular calculation of VMT per worker rate was conducted because specific information on VMT for the types of PDR uses proposed by the SF Gateway project have not been estimated by the department, nor are they available from the San Francisco County Transportation Authority's (SFCTA) travel demand forecasting model.

[1] San Francisco Planning Department, *Transportation Impact Analysis Guidelines for Environmental Review*, October 2002 and *Transportation Impact Analysis Guidelines*, February 2019 (Updated October 2019). Referred to in this memorandum as 2002 SF Guidelines or 2019 SF Guidelines, as appropriate.

PROJECT DESCRIPTION

The project sponsor, Prologis Inc., proposes to redevelop two parcels in an industrial area of San Francisco. The proposed project would construct two similar new multi-story production, distribution, and repair (PDR)[2] buildings that would provide new industrial space in the city. The project site is located within the Bayview Hunters Point Area Plan. The site consists of two parcels that combine for a total gross site area of approximately 743,800 square feet (17.1 total gross acres).

Four one-story, metal clad buildings currently occupy the project site. The project sponsor would demolish these existing buildings and construct two three-story buildings (each building would also have an active roof). Each building would include a combination of enclosed and partially enclosed spaces, with a multi-level vehicular system (comprised of staging, circulation, and logistic yard areas) serving each level. In both buildings, the three levels of the PDR space would have direct vehicular access via a one-way ramp system for vehicles as large as tractor trailers. The roof level would provide a solar array and a screened, open-air multi-purpose deck that could be used for parking, and/or material and vehicle staging. The two new buildings (including PDR space, logistics yard, vehicular systems and ground-floor retail spaces) would total approximately 2,160,000 gross square feet (gsf). **Appendix A** provides a graphic summary of the buildings sizes, possible layout, access, and vehicular circulation.

The proposed development would provide space for a variety of potential PDR uses, including maker and light manufacturing space, parcel delivery and last-mile delivery, wholesale and storage space, and vehicle fleet management uses, as well as other uses permitted within the PDR-2 zoning designation, such as certain types of laboratories, and retail. An average of up to 1,980 employees would be onsite on a typical day.[3]

The travel demand analysis presented in this document was conducted for the project sponsor's preferred mix of PDR uses, which is subsequently referred as the proposed project. The project sponsor proposes to dedicate a total of 1,341,900 gsf to PDR uses within the two buildings (excluding the areas dedicated to vehicle and vertical circulation, and accessory parking), with approximately 35,000 gsf in the ground-floor allocated to maker and light manufacturing space, plus, in the upper floors, about 875,600 gsf allocated to parcel and last-mile delivery, and approximately 431,300 gsf allocated to wholesale/storage space. In addition, the proposed project would provide 8,400 gsf of retail space on the ground floor. **Table 1** presents a summary of the proposed land uses for the two buildings combined.

[2] PDR use is a grouping of uses that includes but is not limited to: all industrial and agricultural uses, ambulance services, animal hospital, automotive service station, automotive repair, automotive wash, arts activities, business services, cat boarding, catering service, commercial storage, kennel, motor vehicle tow service, livery stable, parcel delivery service, public utilities yard, storage yard, trade office, trade shop, wholesale sales, and wholesale storage.

[3] About 25 retail and 1,955 PDR employees; Jillian Betro, Project Manager, AECOM, May 17, 2021.

Total other areas	809,700
Total project area	**2,160,000**
Land Use Summary	
PDR active development [g]	609,290
PDR vehicle staging and yards	732,610
Retail [g]	8,400
Building circulation and accessory parking	809,700
Total project area	**2,160,000**

Notes:
a. Area dedicated to goods handling within the overall Parcel delivery and Last-mile delivery space. Consistent with current industry standards, this area represents about 30 percent of the total space allocated to this use (1,215,715 gsf, including parking).
b. Truck staging, maneuvering, and loading/unloading area within each land use space.
c. Area dedicated to goods handling within the overall Wholesale and Storage space. Consistent with current industry standards, this area represents about 35 percent of the total space allocated to this use (598,785 gsf, including parking).
d. Vehicle ramps and ramp circulation.
e. Stairs and exit corridors.
f. About two thirds of the total accessory parking supply (340,092 gsf) would be allocated to Parcel and Last-mile delivery uses, while the remaining one third (167,508 gsf) would be allocated to Wholesale and Storage uses.
g. Building area used for trip generation estimation purposes.

Source: Prologis – July 2021.

Data Collection and Analysis

The 2019 SF Guidelines do not include specific travel demand information (trip generation rates, peak hour daily percentages, etc.) for most of the types of PDR uses that the project sponsor considers as potential uses that could be accommodated within the proposed project site. As a result, an extensive transportation data collection effort was developed and conducted specifically for this project, in consultation with the department, to document the travel characteristics of these uses. The potential PDR uses for the project include maker and light manufacturing, parcel delivery and last mile delivery, and wholesale and storage. Additionally, public fleet staging and maintenance and private fleet staging and maintenance uses were initially considered as a possible use for the proposed project, and were therefore included as part of the data collection and post-processing analysis effort conducted specifically for this project (but not for the remainder of the analysis).

The data collection effort included several multi-day counts of person and vehicle trips at 15-minute intervals, as well as detailed vehicle classification counts, conducted at various facilities in the San Francisco Bay Area that were considered similar to the proposed project in terms of their size, location (urban industrial area), and planned activities. This information was then supplemented, as needed, with a review of additional data obtained from nationally recognized sources, such as the Institute of Transportation Engineers (ITE). Detailed count information, including daily charts of trip arrivals and departures, is presented in **Appendix B**.

Field Survey Sites

Field data collection was conducted for maker and manufacturing, parcel delivery and last-mile delivery, public fleet staging and maintenance, and private fleet staging and maintenance uses. The site selection was coordinated with and approved by the department. Each use and the details of the data collection effort are described below.

Maker and Manufacturing Uses

This use is defined as a light industrial use that provides for the fabrication or production of goods, by hand or machinery, for distribution to retailers, wholesalers, or the public. Makers are often characterized by their production and custom activities that usually involve individual or special design or handiwork.

Person and vehicle counts were conducted on Thursday, April 19, 2018 at the American Industrial Center building, located at 2345 Third Street in San Francisco. This site was selected because it consists of a single building with multiple varied tenants, similar to those that can be expected to be at the proposed project site. In addition, the limited walk access to the upper floors of the building (four in total, including the docks) made the data collection effort more effective and the count more accurate.

The building is bounded by Third, 20th, Illinois and 22nd streets. Person counts were conducted at the four building entrances serving the upper floors from 4 a.m. until 8 p.m., at 15-minute intervals. The tenants at the two upper floors represent a mixture of food, craft, and small assembly tenants, occupying an area of approximately 200,000 gsf. In

addition, vehicle classification counts were conducted during the same time period at the entrances to the building from the adjacent parking lot and two multi-tenant loading docks serving the two upper floors and located on Illinois Street and Third Street.

Parcel Delivery and Last-Mile Delivery Uses
This use is defined as the movement of retail goods, typically purchased via e-commerce, from a transportation hub to the final delivery destination (typically a personal residence or business) within a specified timeframe (typically as quickly as feasible, e.g. on the same day of purchase). This use includes staging of long-haul trucks delivering good to the facility, small delivery trucks and vans for local deliveries, and the use of some small-scale, personal-type vehicles. Examples of regional delivery services include UPS, FedEx, and OnTrac. Last-mile delivery services include services such as Amazon Prime or Google Express.

Person and vehicle counts were conducted at OnTrac's parcel distribution center and at an Amazon's shipping and package processing center, both located within the approximately 310,000 gsf building at 250 Utah Avenue/299 Littlefield Avenue in South San Francisco. This site was selected because it is an existing parcel distribution and last-mile delivery center currently serving San Francisco, and with similar operations to those that can be expected to occur at the proposed project site. The limited number of entryways in and out of the center facilitated the installation of video cameras to record multiple day person and vehicle trip activity.

The OnTrac site consists of an approximately 112,400 gsf facility, with an adjacent surface parking lot, a truck staging area, and 13 back-in loading docks. The site is accessible from both Utah and Littlefield avenues. Using multiple video cameras, person and vehicle classification counts were recorded continuously during 48 hours at the employee and vehicle entrances to the facility on Tuesday, April 17 and Wednesday, April 18, 2018.

Person and vehicle counts were also conducted at Amazon's shipping and package processing center located at 250 Utah Avenue in South San Francisco. The Amazon site consists of an approximately 75,600 gsf facility with an adjacent surface parking lot, a truck staging area, and eight back-in loading docks. The facility is accessible from two driveways on Utah Avenue. Using multiple video cameras, person and vehicle classification counts were recorded during 48 hours at the employee and vehicle entrances to the facility on Wednesday, April 25 and Thursday, April 27, 2018.

Public Fleet Staging and Maintenance Uses
Public fleet staging and maintenance includes the storage and maintenance of buses, trolleys, and/or shuttles for a public transportation agency, such as Muni, the transit division of the San Francisco Municipal Transportation Agency (SFMTA), or San Francisco Paratransit.

Person and vehicle counts were conducted at Muni's Kirkland Division yard located at 2498 Powell Street, in San Francisco's Fisherman's Wharf area. This site was selected because it represents a self-contained public transit vehicle maintenance and storage facility with clearly defined points of access. The facility covers an entire city block bounded by North

Point, Powell, Beach, and Stockton streets. It has approximately 113,400 square feet (about 2.6 acres) and has a capacity for 135 40-foot long motor coach buses. The operations and maintenance buildings have a combined area of 13,200 square feet; the facility includes three bus maintenance pits and washing facilities.

Vehicular access to the yard is available from North Point and Stockton streets. About 20 personal vehicles of maintenance employees and 80 personal vehicles of bus operators park at the yard during the day when many buses are out of the yard. All personal vehicles are out of the yard by 7 p.m. when buses start to return. Using multiple video cameras, person, bus and other vehicle classification counts were collected at the site entrances for a 72-hour period from Wednesday, June 6 through Friday, June 8, 2018.

Private Fleet Staging and Maintenance Uses
This use includes the storage, staging, and maintenance, and potential light maintenance of shuttles servicing specific institutions, businesses, and/or independent shuttle services, such as Academy of Art University, Bauer Transportation, Hornblower's motorized cable cars, etc. Other related uses include the storage of vehicles to be sold/rented and light maintenance for private vehicles that are operated by a single entity.

Person and vehicle counts were conducted at Bauer's Transportation bus storage and staging facility located at Pier 50 in the San Francisco's Mission Bay area. Bauer leases from the Port of San Francisco approximately 68,800 square feet of covered space in Shed C, at the end of Pier 50, for storage, maintenance, and washing of company vehicles, plus about 4,400 square feet of office space in Shed A at the Pier 50 bulkhead, near Terry A. Francois Boulevard and Mission Rock Street. In addition, Bauer vehicles are also stored on a paved exterior fenced yard adjacent to Shed C. Using multiple video cameras, person, bus and other vehicle classification counts were conducted at Bauer offices in Shed A (persons) and the Pier 50 entrance (Bauer vehicles), for a 72-hour period from Wednesday, June 20 to Friday, June 22, 2018.

Person and vehicle counts were also conducted at Hornblower's motorized cable car storage facility located at 749 Toland Street, in San Francisco (part of the project site). When the counts were conducted, Hornblower's leased approximately 36,000 gsf at the west end of Building 418, near the intersection of Toland Street and McKinnon Avenue. Direct vehicular access to the site is available via Toland Street. Using multiple video cameras, person and vehicle classification counts were recorded for a 72-hour period at the entrance to Building 418 from Wednesday, June 13 through Friday, June 15, 2018.

Person and vehicle counts were also conducted at San Francisco Royal Motor's (an automobile dealership) vehicle storage facility located at 749 Toland Street (part of the project site). At the time of the field survey, SF Royal Motor leased a total of approximately 141,600 gsf inside Buildings 417, 418 and 428 for the storage and set up of vehicles to be sold or rented at the dealerships. Vehicular access to the site is provided onto McKinnon Avenue via Selby Street. Using multiple video cameras, person and vehicle classification counts were recorded for a 72-hour period at each building entrance from Wednesday, June 13 through Friday, June 15, 2018.

The three last sites, located at Pier 50 and at 749 Toland Street, were selected as representatives for private fleet staging and maintenance uses because they provide a range of activities and sizes of facilities similar to those that can be expected at the project site, and because they contain clearly defined points of access that efficiently facilitate the data collection efforts.

Data Analysis

Using the data collected from the surveys described above, a series of travel demand related rates were developed for each of the sites and land uses surveyed. These included, among others, number of total daily vehicle trips per 1,000 gsf, percentage of daily trips occurring during the a.m. and p.m. peak hours, number of daily employee trips per 1,000 gsf, and vehicle classifications. This information, which is summarized in **Table 2**, was then used to develop the project-specific trip generation rates and peak hour trip percentages for these land uses. **Table 2** also includes comparable information from other sources for similar land uses, such as the 2002 SF Guidelines and the Institute of Transportation Engineers (similar information is not available in the 2019 SF Guidelines). Additional factors and rates are presented in **Appendix C**.

As shown in **Table 2**, the 2002 SF Guidelines daily rate for manufacturing/industrial use (which covers light and heavy manufacturing and industrial uses) is higher than the surveyed rate for the maker and manufacturing uses. The Amazon site has the highest value for the parcel delivery and last mile delivery uses, while the OnTrac site shows similar values to those provided by the ITE. Among the private fleet management and staging uses, Bauer's Transportation has the highest values, which are approximately half of those estimated for a public fleet. It can be seen in **Table 2**, as well as in the charts included in **Appendix B**, that several of these land uses (i.e., maker and manufacturing, and private and public fleet staging and maintenance) experience their highest 60-minute vehicle trip generation earlier or later than the typical morning and evening peak hours of adjacent street traffic, which generally occurs between 7 a.m. and 9 a.m., and between 4 p.m. and 6 p.m., respectively. Parcel delivery and last-mile delivery uses on the other hand, experience their highest vehicle trips generation at around 5:30 p.m. or later, which overlaps with the tail end of the evening peak traffic period.

The following section presents the travel demand methodology for the proposed project, including the trip generation information later presented in **Table 3** that was selected for use in the analysis of the proposed project.

Proposed Project Travel Demand Methodology

The travel demand forecasts for the proposed project are based on the methodology and information presented in the SF Guidelines, as appropriate, and supplemented with information that accounts for the specific characteristics of the proposed land uses. The methods commonly used for forecasting travel demand for development projects in San Francisco are based on the SF Guidelines, which are based on a number of detailed travel behavior surveys conducted within San Francisco.

b. Based on the 2002 SF Guidelines; information not available in the 2019 SF Guidelines
c. High-cube Warehouse Vehicle Trip Generation Analysis, Institute of Transportation Engineers, 2016.
d. Person trips by all ways of travel (auto, transit, walking, bicycling, etc.); used for comparison between the two Maker/Manufacturing uses.
e. Start time of the highest measured total traffic volume during a consecutive 60-minute period.
f. Represents the a.m. and p.m. peak hour of the adjacent streets, which typically occurs between 7 a.m. and 9 a.m., and between 4 p.m. and 6 p.m., respectively.

Source: Adavant Consulting – 2021

The data in the SF Guidelines are generally accepted as more appropriate for use in transportation impact analyses for San Francisco development projects than conventional transportation planning data because of the unique mix of uses, density, availability of transit, and cost of parking in San Francisco. In the case of the proposed project, several of the proposed land uses, such as parcel delivery or fleet management uses, are not included in the SF Guidelines data, and, as such, as described in the previous section, additional travel demand information was obtained through local field surveys. Furthermore, the SF Guidelines do not include data for the analysis of the a.m. peak hour, which was instead derived from the field surveys previously described, and nationally recognized sources of trip generation rates.

The travel demand model developed for the analysis of the proposed project follows. The four main steps are outlined first, followed by additional explanation. The detailed travel demand calculations for the proposed project are presented in **Appendix D**.

- **Step 1: Trip Generation**. Total person trip generation was calculated each of the individual land uses. The person-trip generation estimates for the proposed project include employees and visitors associated with the proposed development.
- **Step 2: Trip Distribution**. The person trips estimated in the previous step were then distributed to various points of trip origin or destination for each specific land use. Specifically, the trips origins and destinations were allocated to the four superdistricts of San Francisco (Superdistrict 1 – northeast quadrant, Superdistrict 2 – northwest quadrant, Superdistrict 3 – southeast quadrant, Superdistrict 4 – southwest quadrant), the East Bay, North Bay, South Bay, and outside the region. **Appendix D** includes an aerial view of the four San Francisco superdistrict boundaries.
- **Step 3: Mode of Travel**. The person trips estimated for each geographical are in step 2 were independently allocated to travel modes to determine the number of trips by auto, transit, and other modes. The "auto" mode includes persons traveling by private auto, carpool, app-based ride hailing services (e.g., Uber, Lyft), etc., as well as commercial vehicle traffic generated by the project. The "transit" mode includes individuals traveling by local and regional public means of transportation. The "other" category includes people walking, bicycling, motorcycling, and traveling by additional modes, such as taxis or limousines.
- **Step 4: Trip Assignment**. The project-generated trips and directional distribution obtained in the previous step were then used as the basis for assigning vehicle-trips to the local streets in the study area.

STEP 1: TRIP GENERATION

As discussed above, the development program for the proposed project includes various PDR uses, which cover a range of different types of activities with different travel demand characteristics. As shown in **Table 1**, the types of PDR uses that comprise the proposed project include Maker and Manufacturing, Parcel Delivery and Last-Mile Delivery, and Wholesale and Storage. Similarly, the types of retail uses include general retail and café/quick service restaurant uses.

The data developed from the field surveys described in the previous section and presented in **Table 2** was used as input to develop the project-specific trip generation rates for the maker and manufacturing, and parcel delivery and last-mile delivery uses. Where trip generation rates from the field survey data collection effort were used, which for the most part represented vehicle trips, the vehicle trip rates were converted into person trip rates by applying an average vehicle occupancy, and the rates were rounded up to account for other related activities that may not have occurred at the surveyed site.[4]

Table 3 presents the weekday daily, a.m. peak hour, and p.m. peak hour person-trip generation rates used in the analysis for all of the proposed land uses.

Table 3
Proposed Project
Person Trip Generation Rates by Land Use
(number of person trips per 1,000 gsf of area of use) [a]

Land Use Type	Daily Person-trip Rate		AM Peak Hour Person-trips			PM Peak Hour Person-trips		
			% of daily		Rate	% of daily		Rate
PDR Uses								
Maker and Manufacturing	7.9	[b]	11.5%	[e]	0.91	12.4%	[b]	0.98
Parcel delivery and Last-mile delivery	14.7	[c]	7.0%	[c]	1.03	10.0%	[c]	1.47

e. Based on a.m. to p.m. peak hour trip generation ratio, taken from ITE Trip Generation Report, 10th Edition (2017).
f. Assumed half of the a.m. peak hour value, based on traffic data from San Francisco Produce Market Expansion Transportation Study (2011).
g. 2019 San Francisco Guidelines, Table 1.

Source: Adavant Consulting – 2021

[4] For example, the survey of the Amazon and OnTrac facilities in South San Francisco included employees driving and parking on site, while the survey of Muni's and Bauer's facilities in San Francisco did not account for employee person and vehicle trips who parked elsewhere outside the site. Professional judgement assessments were made on a case-by-case basis to account for these differences when making any adjustments to develop the trip generation rates.

- For the maker and manufacturing use, the 2002 SF Guidelines daily and p.m. peak hour trip generation rates were selected for the proposed project, as they are higher than the rates from the field survey of the American Industrial Center. As noted in **Table 3** above, the a.m. peak hour rate was calculated based on the ratio of a.m. to p.m. peak hour trip generation rates from the ITE Trip Generation Report.
- For the parcel and last mile delivery use, the higher of the field-calculated vehicle trip generation rates from either the OnTrac or Amazon facilities were selected for the proposed project. These field survey rates were higher than the trip generation rates included in the ITE Trip Generation Report for the high-cube warehouse use. As noted above, the vehicle trip rates were converted into person-trip rates by applying an average vehicle occupancy for commuter trips and rounded up to account for other activities that may not have occurred at the surveyed site.
- The daily and a.m. peak hour trip generation rates for the Wholesale and Storage use were based on information presented in the San Francisco Wholesale Produce Market project (2011).[5] As noted in the **Table 3** above, the p.m. peak hour rate was calculated as half of the a.m. peak hour trip generation rate.
- Trip generation assumptions for the General Retail and Café/Quick Service Restaurant uses were obtained from the 2019 SF Guidelines. Consistent with previous studies of visitor trips conducted in San Francisco, in order to account for linked visitor trips to retail and restaurant uses, a 33 and 67 percent trips reduction was applied to non-work (visitor) trips to the General Retail and Café/Quick Service Restaurant uses (i.e., one third and two thirds of the visitor trips to the retail and restaurant uses, respectively, are considered to be made by customers who are already in the immediate vicinity).

Table 4 presents the total number of weekday daily, a.m. peak hour, and p.m. peak hour person trips by land use for the proposed project calculated using the project-specific trip generation rates in **Table 3**. The proposed project would generate an estimated 9,666 person-trips on a weekday daily basis, including 741 person-trips during the a.m. peak hour, and 842 person-trips during the p.m. peak hour. The number of project generated p.m. peak hour trips would be greater than during the a.m. peak hour because several land uses, such as parcel delivery and general retail, have a higher proportion of daily trips occurring during the p.m. peak hour than during the a.m. peak hour.

Consistent with the 2019 SF Guidelines, the travel demand analysis included a credit for trips generated by the existing uses on the project site. The credit was based on empirical data collection conducted at the project site.[6] **Table 4** also summarizes the total number of weekday daily, a.m. peak hour and p.m. peak hour person trips for the existing site, based

[5] *San Francisco Wholesale Produce Market Retention and Expansion Project*, Case No. 2009.1153E, Transportation Study Final Report, Adavant Consulting, March 23, 2011.

[6] As described on page 5, the project site currently accommodates private fleet staging on a portion of the site. The proposed project's PDR uses would not be considered a net new expansion of the existing use.

on counts conducted from June 13 through June 15, 2018. (See description of data collection efforts at the site in **page 5**; a count summary is presented in **Appendix D**). As a result, the net new person trips generated by the proposed project would be 8,948 person-trips on a weekday daily basis, including 653 person-trips during the a.m. peak hour, and 798 person-trips during the p.m. peak hour.

Table 4
Proposed Project
Person Trip Generation by Land Use [a]

Land Use Type	Land Use Intensity (gsf)	Daily Person Trips	AM Peak Hour Person Trips	PM Peak Hour Person Trips
Maker and Manufacturing	35,000	278	32	34
Parcel Delivery and Last-mile Delivery	364,715	5,362	376	536
Wholesale and storage	209,575	2,514	176	88
General retail [b]	4,200	448	12	41
Café/Quick service restaurant [c]	4,200	1,064	145	143
Total Proposed Project	**617,690**	**9,666**	**741**	**842**
Peak hour trips as percentage of daily trips			7.7%	8.7%
Existing site [d]		718	88	44
Total Net New Trips		**8,948**	**653**	**798**

Notes:
a. Person trips by all modes of travel. Numbers may not sum to total due to rounding.
b. The General Retail trip generation estimates assume that approximately one third of all visitor trips would be made by customers who are already in the area (a linked visitor trip reduction factors of 33 percent).
c. The Café/Quick service restaurant trip generation estimates assume that approximately two thirds of all visitor trips would be made by customers who are already in the area (a linked visitor trip reduction factors of 66 percent).
d. Based on field daily vehicle counts by vehicle type conducted from June 13 through June 15, 2018; includes people walking plus vehicle trips, assuming an average occupancy of one person per vehicle. (trip generation calculations are presented in **Appendix D**)

Source: Adavant Consulting – 2021

STEP 2: TRIP DISTRIBUTION

The number of person-trips generated by the proposed project (**Table 4**) were then allocated to origins and destinations as follows:

- The trip distribution for General Retail and Café/Quick Service Restaurant trips to or from the site were based on work (commuter) and non-work (visitors, shoppers) origin/destination rates for retail trips obtained from the 2019 SF Guidelines for the Bayshore District, where the project is located.
- The trip origin/destination distribution for employee (i.e., commuter) trips for the Maker/Manufacturing, Parcel/Last mile delivery, and Wholesale/Storage uses were based on trip rates contained in the 2002 SF Guidelines for Superdistrict 3, where the project is located (Appendix E, Table E-5 Work Trips to SD3). The trip

distribution of non-commuter (i.e., visitor, deliveries, etc.) trips were based on non-commuter trip rates from the same sources (Appendix E, Table E-15 All Other Visitor Trips to SD3). Information from the 2002 SF Guidelines information was used, because the 2019 SF Guidelines do not provide data for manufacturing or industrial-type uses.

Table 5 provides a summary of the trip distribution patterns for each land use type.

Table 5
Proposed Project
Person Trip Distribution Patterns by Land Use

Place of Trip Origin or Destination	Maker & Manufacturing / Parcel & Last Mile Delivery / Wholesale & Storage		General Retail / Quick Service Restaurant		All Daily Person Trips [e]
	Commuter Trips [a]	Non-Commuter Trips [b]	Commuter Trips [c]	Non-Commuter Trips [d]	
San Francisco					
Superdistrict 1	8.3%	13.0%	31.7%	12.8%	12.0%
Superdistrict 2	10.6%	14.0%	9.7%	11.6%	12.2%
Superdistrict 3	23.9%	44.0%	41.9%	41.2%	35.6%
Superdistrict 4	7.9%	7.0%	1.2%	16.5%	8.2%
All San Francisco	50.7%	78.0%	84.5%	82.1%	68.0%
East Bay	14.3%	9.0%	1.1%	4.6%	10.2%
North Bay	5.6%	1.0%	1.7%	1.0%	2.9%
Peninsula/South Bay	26.9%	9.0%	12.7%	12.3%	16.6%
Outside of Bay Area	2.5%	3.0%	0.0%	0.0%	2.3%
Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**

Notes:
a. 2002 SF Guidelines Appendix E - Tables E-5 Work Trips to/from SD3 (All).
b. 2002 SF Guidelines Appendix E - Tables E-15 Visitor Trips to/from SD3 (All Other).
c. 2019 SF Guidelines Work Retail Trips to/from Bayshore District (located in SD3).
d. 2019 SF Guidelines Non-Work Trips to/from Bayshore District (located in SD3).
e. Calculated based on the individual land use trip distribution patterns.

Source: Adavant Consulting – 2021

As shown in **Table 5**, about 51 to 85 percent of the project-generated commuter trips would be within San Francisco, while 78 to 82 percent of the non-commuter trips would also occur within San Francisco. Overall, about 68 percent of the trips for all the proposed land uses combined would be within San Francisco, with the largest proportion of trips (about 36 percent) occurring within Superdistrict 3, which includes the project site. These trip distribution patterns were used, as later described in step 4, as the basis for assigning project-generated trips to the local street and highway network.

STEP 3: MODE OF TRAVEL

The SF Guidelines identifies different ratios for mode of travel and average vehicle occupancy for work and visitor trips, which are different for each of the four San Francisco superdistricts, so that factors that influence travel behavior such as transit accessibility, walkability, roadway and transit infrastructure, etc. for that area are considered in the analysis. For example, work trips originating in or destined to Superdistrict 1 exhibit the highest transit usage in San Francisco, while those to or from Superdistrict 3 have the lowest.

For the purposes of this analysis, the person-trips generated by the proposed project (presented in **Table 4**) were assigned to various modes of travel using the information presented in the 2019 SF Guidelines (General Retail and Café/Quick Service Restaurant uses) and 2002 SF Guidelines (all PDR land uses)[7], with the following adjustments:

- The modal split allocation for the general retail and quick service restaurant uses were based on work and visitor rates obtained from the 2019 SF Guidelines for the Bayshore District (where the project is located), except that ⅔ of the transit person trips were shifted to auto person trips to reflect the limited transit accessibility of the site, compared with other locations in the superdistrict, such as along Mission or Third streets. The percentage shift is based on professional judgement and knowledge of the transportation characteristics of the Bayshore District. This shift is consistent with the assumptions presented in the prior transportation analysis of the San Francisco Wholesale Produce Market project, which is adjacent to the project site and included retail uses, and is therefore a reasonable adjustment to the travel mode inputs.[8] Walk and bicycle trips for the general retail and quick service restaurant uses would represent local trips from nearby uses during the day, and were not considered in need of adjustments.
- The modal split allocation for the Maker/Manufacturing, Parcel/Last Mile Delivery, and Wholesale/Storage uses were based on commuter and non-commuter rates contained in the 2002 SF Guidelines for Superdistrict 3, where the project is located (Appendix E, Tables E-5 and E-15). In addition to shifting ⅔ of the transit trips to the auto trips category, as described in the previous paragraph for the retail trips, those person trips in the "other" category[9] were also shifted to "auto", to better account for longer hours of operation of such uses, including the night, when those non-auto modes of transportation may not be as accessible or desirable as during the daytime. This approach is also consistent with the assumptions presented in the

[7] The Site Surveys and Data Collection (**Table 4**) that inform project-specific person-trip generation rates are obtained from locations mostly suburban in nature. The SF Guidelines are the most appropriate source of travel modal split shares applicable to the proposed project.

[8] *San Francisco Wholesale Produce Market Retention and Expansion Project*, Case No. 2009.1153E, Transportation Study Final Report, Adavant Consulting, March 23, 2011.

[9] Other modes include walk, bicycle, motorcycle, and additional modes such as taxis.

prior transportation analysis of the San Francisco Wholesale Produce Market project for PDR uses.

Table 6 presents the travel mode assumptions for the proposed project by trip purpose and land use type. As shown in the table, the person trips by auto represent approximately 85 percent of all the trips made to or from the project site.

Table 6

Source: Adavant Consulting – 2021

Table 7 on the next page presents the number of daily, a.m. peak hour, and p.m. peak hour person trips generated by the proposed project (as presented in **Table 4**) by mode of travel and land use type (as presented in **Table 6**). In addition, the number of vehicle trips that would be generated by each land use is presented. The vehicle trips were calculated using average vehicle occupancy rates obtained from the 2019 SF Guidelines (General Retail and Café/Quick Service Restaurant uses) and 2002 SF Guidelines (all PDR land uses), and applied to the auto person trips; detailed calculations are included in **Appendix D**.

b. Auto mode includes persons traveling by private auto, carpool, and for-hire vehicles.
c. Other modes include walk, bicycle, and motorcycle.
d. Vehicle trips for the proposed project were calculated by dividing the auto person trips by an average occupancy per vehicle (see **Appendix D**).
e. Based on field counts collected at the site in June 2018; calculations are presented in **Appendix D**.

Source: Adavant Consulting – 2021

As shown in **Table 7**, on a daily basis, the proposed project would generate 9,666 person trips (86 percent by auto, 10 percent by transit, and 4 percent by walking, bicycling, and other modes) and 6,726 vehicle trips. During the a.m. peak hour, the proposed project would generate 741 person trips and 519 vehicle trips, while during the p.m. peak hour the proposed project would generate 842 person trips and 615 vehicle trips.

Table 7 also summarizes the total number of weekday daily, a.m. peak hour and p.m. peak hour person and vehicle trips for the existing facility, based on field counts collected at the site in June 2018 (a count summary is presented in **Appendix D**). As a result the net new vehicle trips generated by the proposed project would be 6,008 vehicle-trips on a weekday daily basis, including 431 vehicle-trips during the a.m. peak hour, and 571 vehicle-trips during the p.m. peak hour.

Table 8, on the following page, presents this same trip generation information by mode of travel and place of origin/destination; detailed calculations are included in **Appendix D**. As presented in **Table 8,** the majority of trips would be within Superdistrict 3, to and from the South Bay and Peninsula, to and from Superdistrict 2 (the northwest quadrant), to and from Superdistrict 1 (the northeast quadrant which includes downtown), and to and from the East Bay.

Source: Adavant Consulting – 2021

STEP 4: TRIP ASSIGNMENT

The project-generated trips by the various travel mode and origin/destination presented in **Table 8** were used as a basis for assigning trips to the transportation network during the a.m. and p.m. peak hours. The percentage of trips inbound to the site versus outbound from the site for each land use were based on information presented in the 2002 and 2019 SF Guidelines, values gathered from the ITE Trip Generation Manual, or data collected from the field surveys (see **Appendix B** and **Appendix C**).

Table 9 summarizes the inbound and outbound vehicle and transit trips for the a.m. and p.m. peak hours by place of origin; detailed calculations are included in **Appendix D**. As shown in the table, the proposed project would generate 519 vehicle trips during the a.m. peak hour and 615 vehicle trips during the p.m. peak hour, as well as 74 person transit trips during the a.m. peak hour, and 82 person transit trips during the p.m. peak hour. About 75 to 80 percent of the vehicle and transit trips during the a.m. peak hour would be inbound to the site, while the number of total vehicle and transit trips during the p.m. peak hour would be split approximately 40%/60% between the inbound and outbound directions.

Table 9 also summarizes the inbound and outbound vehicle trips for the a.m. and p.m. peak hours for the existing facility, based on field counts collected at the site in June 2018 (a count summary is presented in **Appendix D**). As a result the net new vehicle trips generated by the proposed project would be 330 inbound and 101 outbound vehicle trips during the a.m. peak hour, as well as 246 inbound and 325 outbound vehicle trips during the p.m. peak hour. The number of existing transit trips generated at the project site is not known, so, conservatively, no transit trip generation credit was assumed in the analysis.

The vehicle trips presented in **Table 9** were then assigned to the local streets near the project site based on the distribution patterns identified in step 3. Travel paths were developed based on the most direct routes according to the type of vehicle, number of travel lanes on streets, and knowledge of current travel patterns in the study area. It was assumed that the existing vehicle trips would generally be distributed in a similar pattern as those of the proposed project.

Figure 1 and **Figure 2** depict the paths for the proposed project inbound and outbound vehicle trips, respectively. As shown in the figures, travel paths to and from the site would be generally evenly split between north and south of the project site. Freeway access would likely be used when approaching the project site from the south due to the options available (U.S. 101 or I-280), and, in general, less freeway congestion than for freeway access from the north. Arterial streets (César Chavez Street, Potrero Avenue, and Third Street) would be used when approaching the site from the north and east.

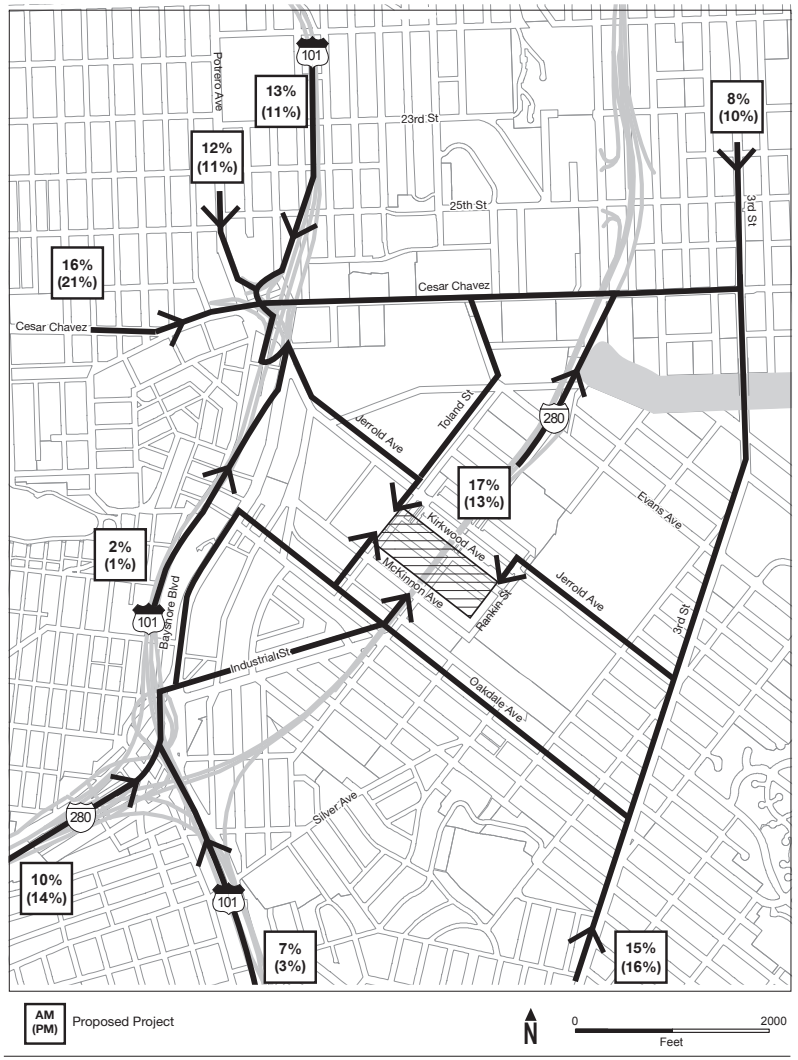

Figure 1: Inbound Vehicle Trip Paths

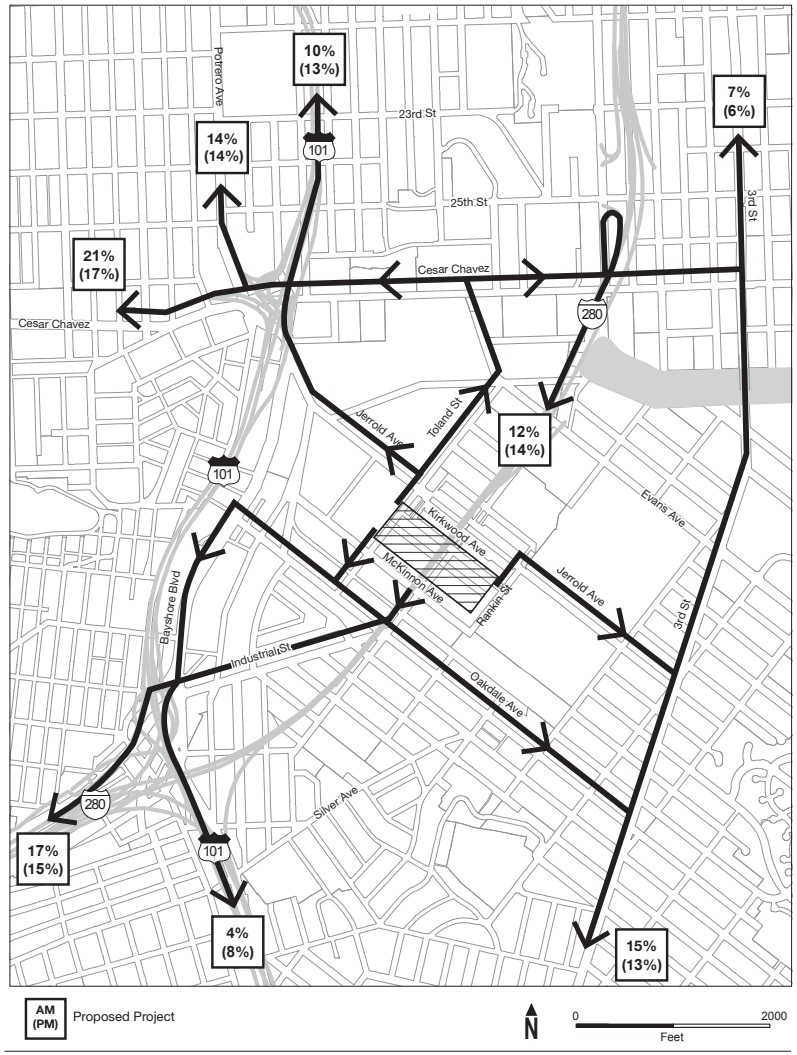

Figure 2: Outbound Vehicle Trip Paths

COMMERCIAL VEHICLE TRIP GENERATION

For development projects in San Francisco, the 2019 SF Guidelines provide a methodology for estimating the number of truck and service vehicles generated by the proposed development project, which is then used to estimate the demand for the number of truck loading spaces required to accommodate the freight delivery and service vehicle demand. Given that most of the proposed project components are truck intensive uses, innate to loading, that would be accommodated within the two buildings, a specific estimate of the number of truck loading spaces typically calculated for development projects was not developed.

A more detailed approach was developed instead, to properly estimate the larger number of truck and service vehicle trips that would be generated by the proposed project compared to a standard development project (e.g., residential and/or commercial office and retail). The number of daily vehicle trips previously estimated, and presented in **Table 8,** were disaggregated by specific vehicle type. This information on vehicle type will be used as part of the transportation site circulation and safety hazards analysis, as well as for the air quality and noise analyses.

Because the ground floor retail space would not be served by internal truck and service vehicle loading facilities (i.e., loading/unloading for the ground floor retail uses would be accommodated at curb yellow loading zones that would be provided as part of the proposed project), the freight loading space demand for this use was calculated using the standard 2019 SF Guidelines methodology.

A preliminary assessment of passenger loading demand associated with the proposed PDR land uses was conducted by the department, and it is anticipated that the proposed project would generate minimal passenger loading activities. Therefore, it was determined that the proposed project would not cause a significant impact as it relates to passenger loading and no further quantification of passenger loading demand analysis was required.[10]

DAILY TRUCK TRIPS AND VEHICLE CLASSIFICATION

Table 10 provides a summary of the estimated vehicle type distribution for project employee and non-commuter (visitors, deliveries, etc.) trips by land use. For this analysis, it was assumed that all employees commuting to and from work by motor vehicle would travel in autos or similar size vehicles (i.e., they would not travel in large size vans or trucks). The non-commuter vehicle trips (i.e., all other motor vehicle trips not related to employee travel to and from work) were disaggregated into autos or small size pickups, vans and large pickups, single-unit trucks, and tractor trailer trucks, based on the following:

- For the Maker/Manufacturing and Parcel/Last Mile Delivery uses, the vehicle classification was based on vehicle data (i.e., number and type of vehicle) collected at

[10] The 2019 Transportation Impact Analysis Guidelines include a methodology for calculating passenger loading demand for office, retail, residential, and hotel land uses.

the OnTrac and Amazon sites as part of the data collection effort described previously within the Data Collection and Analysis section of this document.

- For the wholesale and storage uses, the disaggregation of commercial vehicle trips among the various vehicle types was based on data collected at the American Industrial Center site.
- For the retail uses, the disaggregation of vehicle trips among the various vehicle types (autos, vans, trucks, etc.) was based on previously collected field data in San Francisco.[11]

Table 10
Proposed Project
Daily Commuter and Non-Commuter Vehicle Trip Distribution by Vehicle Type and Land Use [a]

Land Use Type	Commuter Trips	Non-Commuter Trips by Vehicle Type				
	Autos/ Pickups	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	100%	67%	15%	16%	2%	100%
Parcel and Last Mile Delivery	100%	50%	33%	12%	5%	100%
Wholesale and Storage	100%	40%	10%	40%	10%	100%
General Retail	100%	97%	2%	1%	0%	100%
Café/Quick Service Restaurant [b]	100%	94%	4%	2%	0%	100%

Notes:
a. Based on commercial vehicle data collected at various sites as part of the data collection effort. See **Appendix B** and **Appendix E**.
b. Assumed similar to the general retail use.

Source: Adavant Consulting – 2021

As shown on **Table 10,** for all land uses, all of the commuter travel (i.e. to and from work) to and from the site would occur by auto or similar small size vehicles, such as pick-ups or minivans. The majority of non-commuter trips (i.e., visitor trips, pickups, deliveries, etc.) for all land uses would also occur by small size vehicles, with between 3 and 60 percent of those trips occurring by larger commercial vehicles, such as vans and trucks.

Table 11 presents the combined (i.e. work plus non-work) total number of vehicle trips generated on a daily basis by the proposed project, disaggregated by vehicle type. As shown in **Table 11**, the proposed project would generate a total of 6,726 daily vehicle trips, of which 1,640 (24 percent) would be by vans and trucks. Of these, approximately 55 percent would be vans, 34 percent would be single-unit trucks, and 11 percent would be tractor-

[11] *2001 Market Street Mixed-use Development Project*, Case No. 2008.0550E, Final Transportation Impact Study Report, Adavant Consulting; November 1, 2010.

trailer truck combinations. **Table 11** also summarizes the existing number of daily vehicle trips generated at the project site by vehicle type, based on field counts collected at the site in June 2018 (a count summary is presented in **Appendix D**). As a result, the proposed project would generate a total of 6,008 net new daily vehicle trips, of which 1,322 (22 percent) would be made by vans and trucks.

Table 11
Proposed Project
Total Daily Vehicle-trips by Land Use and Vehicle Type [a]

Land Use Type	Vehicle Trips by Vehicle Type				Total Vehicle Trips
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	
Maker and manufacturing	178	20	22	2	222

a. Numbers may not sum to total due to rounding.
b. Based on field counts collected at the site in June 2018; calculations are presented in **Appendix D**; the single unit truck vehicle category includes 18 motorized cable cars.

Source: Adavant Consulting – 2021

RETAIL LOADING SPACE DEMAND

The 2019 SF Guidelines methodology for estimating commercial vehicle and freight loading spaces, in combination with the commercial vehicle trips presented in **Table 11**, was used to calculate the average and peak hour loading space demand for the 8,400 gsf of retail uses proposed by the project (assumed to include about 4,200 gsf general retail and 4,200 café/restaurant uses).

The 8,400 gsf of retail uses would generate approximately 16 delivery /service vehicles per day (see **page A-84** in **Appendix E**), of which approximately 10 vehicles would be vans or trucks, and six vehicles would be autos (i.e., 32 two-way delivery/service trips per day = 16 delivery/service vehicles). This corresponds to a demand for one freight loading space during the peak hour of loading activity, which generally occurs between 10 a.m. and 1 p.m.

VEHICLE MILES TRAVELED

This section presents the methodology and results of the calculations conducted to estimate the average daily vehicle miles traveled (VMT) per capita for the proposed project. A background discussion of the VMT analysis that is part of the department's CEQA analysis is presented first for informational purposes. This discussion is followed by the methodology used to estimate the average daily VMT per capita for the proposed retail and PDR uses, and the last section presents a comparison of the proposed project's VMT results to regional and local values.

BACKGROUND

For development projects in San Francisco, in order to demonstrate that a proposed project is consistent with *CEQA Guidelines section 15064.3*, the transportation analysis must show that the project would not cause substantial additional VMT or substantially induce automobile travel.[12] For land use development projects, the department uses VMT efficiency metrics (per capita or per employee) for thresholds of significance. The department uses the following quantitative threshold of significance to determine whether the project's land uses would generate substantial VMT:

- For residential projects, if it exceeds the regional daily household VMT per capita minus 15 percent.
- For office projects, if it exceeds the regional daily work-related VMT per employee minus 15 percent.[13]
- For retail projects, if it exceeds the regional daily retail-related VMT per retail employee[14] minus 15 percent.

[12] Assessment of induced automobile travel for projects is based on a review of whether the project's features may increase the physical roadway capacity in congested areas or add a new roadway to the network. Induced automobile travel is not discussed further in this memorandum.

[13] The department's map-based screening (TIM web site) identifies the work-related VMT rate as "VMT per employee", in reality (VMT Memo, p. L-4) the rate is calculated by dividing "the total work-related VMT by the applicable geographic area job population", i.e. employment, which results in a VMT per job. There is a subtle difference between employment (jobs) and workers (employees), since the model also calculates the number of daily workers at each TAZ, which is generally lower than jobs, and therefore results in a higher value for the VMT per worker. The distinction is important because the proposed methodology for this project, as described in the text, is based on the number of employees, referred to in this analysis as workers in order to differentiate from employment. For consistency purposes the term employee has been maintained when describing the department's established ratios and thresholds.

[14] Retail travel is not explicitly captured in the SF-CHAMP modeling process, rather, there is a generic "other" purpose which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. Thus, the retail-related VMT metric captures all of the "other" purpose travel generated by Bay Area households. Although defined as VMT per retail employee in the 2019 SF Guidelines, the employee denominator includes retail, cultural, institutional, and educational, and medical employment, as well as school enrollment and number of households, to represent the size, or attraction, of a zone for this type of "other" purpose travel.

- For mixed-use projects, each land use is evaluated independently, per the thresholds of significance described above.

As recommended by the Office of Planning and Research and included in the San Francisco Planning Commission resolution that adopted the VMT metric and the thresholds of significance for transportation impact analysis in San Francisco[15], the department uses a map-based screening criterion to identify types and locations of land use projects that would not exceed these quantitative thresholds of significance. The SFCTA uses a model to estimate VMT for residential, office, and retail in San Francisco and the region, as described above. The department uses that data and associated maps to determine whether a project site's location is below the VMT quantitative threshold of significance. If a project is located in an area that has a low VMT per capita, and it incorporates similar features to other developments in that area (i.e., density, mix of uses, transit accessibility), then the project can be presumed to not have a VMT impact.

As described above, the department's methodology used to calculate the VMT relies on the SFCTA's travel demand forecasting model (SF-CHAMP) as a tool to determine the total daily VMT values at each Transportation Analysis Zone (TAZ)[16] within San Francisco. Separate calculations of VMT are performed for residential, office, and retail uses, each one of which is then divided by the applicable geographic household population, office jobs, or retail employment to calculate the VMT per capita. A slightly different VMT per capita unit is used for the evaluation of the PDR uses of the proposed project; since the number of employees can be approximated from the size and type of the proposed PDR land uses, a VMT per worker ratio is used instead of the VMT per employee ratio presented in the 2019 SF Guidelines.[17]

Typically, PDR uses are part of larger mixed-use development projects, and the department considers PDR uses in mixed-use development as part of the office-type category of land uses. However, the 2019 SF Guidelines methodology states that a different methodology should be used with atypical project land uses that do not fit within the three major categories (residential, office, and retail). In those cases, the 2019 SF Guidelines indicate that a project-specific methodology should be used to calculate the average daily VMT using the most appropriate metric (e.g., per resident, employee, seat, size, job, etc.). In these

[15] San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis, Appendix F, Attachment A*, March 3, 2016.

[16] Transportation Analysis Zones (TAZs) are geographical areas used by planners as part of travel demand forecasting models for transportation analyses and other planning purposes. A TAZ can vary in size from a single city block in the downtown core, to multiple blocks in outer neighborhoods, or even larger zones in historically industrial areas such as the Hunters Point Shipyard area.

[17] The average daily work VMT per employee rate was derived from the same SF-CHAMP model runs used by the department for estimating work VMT per employment for years 2020 and 2050, as presented in the San Francisco Housing Element 2022 Update EIR (Case No. 2019-016230ENV); the SF-CHAMP model output data provided to the consultants by SFCTA in April and September 2021, and is summarized in **Appendix F**.

cases, the analysis should present the change in the average daily VMT per analysis metric as a result of implementation of the proposed project.

Because the proposed project would include almost exclusively PDR uses, with a size and characteristics that are substantially different from more typical PDR uses in new mixed-use developments in San Francisco, a project-specific calculation of the average daily VMT per capita was conducted for the proposed project.

Retail Uses

The proposed project includes approximately 8,400 gsf of retail uses. These include both general retail, as well as quick service restaurant space. Given that these are two of the subcategories of typical retail uses, the same methodology described in the 2019 SF Guidelines was used to estimate the average daily retail VMT per capita for the retail component of the proposed project. For the two TAZs that comprise the project site (TAZs 485 and 488), this results in a combined weighted average[18] of 9.9 average daily retail VMT per retail employment for existing conditions (year 2020), and 12.0 average daily retail VMT per retail employment for 2050 cumulative conditions; detailed calculations are included in **Appendix F.**

PDR Uses

As noted above, due to the size and characteristics of the proposed PDR uses included as part of the proposed project, a project-specific calculation of the average daily VMT per capita was conducted for this use. The calculation takes into account the type and intensity of the proposed land uses to estimate the VMT for project employees, visitors (including repairs and maintenance), and delivery and commercial vehicles. For transportation analysis purposes, VMT generated by project employees driving to or from work will fall within the "commuter" category, while VMT generated by visitors, pickups and deliveries (including services, repairs, maintenance, etc.) would fall under the "non-commuter" category.

[18] The average daily retail VMT per capita for the combination of zones 485 and 488 is a weighted average, which is calculated by multiplying the VMT per capita for each zone obtained from the SF-CHAMP model by the corresponding number size of retail, adding the two together, and then dividing it by the total size of retail. The calculation of the weighted average is shown in the section titled *SFCTA Model Rates* in **Appendix F**.

Because the non-commuter VMT[19] is typically a minimal portion of the total VMT generated by a given land use (e.g., a few daily vehicle trips, made by vehicles that make multiple short stops), the non-commuter portion of the total VMT is not generally included in the SF Guidelines methodology or analysis (i.e., the total VMT is assumed to be practically the same as the commuter VMT). However, the special characteristics of the proposed PDR uses, where a substantial component of the vehicle trips are generated by commercial and service vehicles for pickups and deliveries (more than 25 percent as shown in **Table 11**), a modified, more detailed approach that also accounts for the VMT attributable to those trips was developed. This modified approach, which accounts for all types of trips (i.e., commuter and non-commuter) represents a more appropriate and conservative calculation of the average daily VMT per worker for the project site. Thus, the number of daily non-commuter daily vehicle miles were also estimated for the proposed project, and included in the calculation of total daily VMT per capita for the proposed project.

In addition, because the project site was partially occupied by warehousing and private and public vehicle fleet storage uses at the time of the field data collection efforts, a credit was applied to the project daily VMT to account for the VMT generated by those onsite uses, resulting in a net new daily VMT per capita for the proposed PDR uses. The methodology for calculating the daily VMT per worker for existing plus project conditions is described below; additional information is presented in **Appendix F**, and a summary of the results is shown in **Table 12**.

Daily VMT per worker for the proposed PDR uses consists of two VMT components: the VMT associated with the commuter trips to and from the project site, and the non-commuter VMT, which is associated with all other trips not related to trips generated by workers driving to or from work (i.e., visitor trips, pickups and deliveries, etc.).

- For commuter trips, the daily work VMT was calculated by multiplying the number of PDR-generated vehicle trips originating or destined the four San Francisco superdistricts, the East Bay, North Bay, South Bay and out of region (see **Table 2**) by an average distance between the project site and the estimated center of gravity[20] for each of the eight zones.
- For estimating the non-commuter VMT, the number of new PDR-generated visitor and deliveries/pickup trips under each vehicle type category (see **Table 11**) was multiplied by the average distance traveled on a typical day by each type of vehicle.

[19] VMT generated by visitors and deliveries to the building, as opposed to commuter VMT which is generated by employees driving to and from the site.

[20] For calculation of distance, the center of gravity for an origin-destination location represents the imaginary point where the total population of each Bay Area county is theoretically concentrated. (see estimated locations and distances in **Appendix F**).

Notes:
a. The detailed daily VMT calculations are presented in **Appendix F.**
b. A summary of existing daily vehicle trip counts at the project site is included in **Appendix B.**
c. Comprised of visitor trips, service and maintenance trips, pickups and deliveries, etc.

Source: Adavant Consulting – 2021

- For the Maker/ Manufacturing and Wholesale/Storage uses, average travel distance statistics developed by the Federal Highway Administration (FHWA)[21] and the National Renewable Energy Laboratory (NREL)[22] for various categories of vehicles were applied to the trips by the appropriate vehicle type.
- For the Parcel/Last Mile Delivery use, the total average daily travel distance (i.e., the distance between goods suppliers and the last mile distribution center, as well as the distance between the distribution center and the final destination for the last mile delivery) was compared to the average daily travel distance for vehicles providing Parcel/Last Mile delivery services from a similar site outside of San Francisco for each vehicle type. This approach was used on the basis of the analysis conducted by the project sponsor that looked at the existing and expected demand for distribution centers in the San Francisco Bay Area, and documented projections of continued growth in last mile delivery facilities in the near future to address the substantially unmet demand for these distribution centers within the San Francisco service area.[23] As such, the proposed project would accommodate existing and projected growth in the e-commerce market, and would not induce new last mile delivery trips. Additionally, this approach accounts for key criteria in siting urban e-commerce distribution facilities, based on analysis provided by Langan Engineering.[24]

Thus, the change in vehicle miles traveled between locating the center outside of the city (e.g., South San Francisco, which was used in the analysis[25]) without the project and at the proposed project site was calculated. Trucks and tractor trailers making deliveries to the site would generally need to travel further to

[23] *E-Commerce – Existing Demand and Future Trends in San Francisco and the Greater Bay Area,* technical memorandum from Prologis to the San Francisco Planning Department, April 14, 2020; updated June 30, 2020. This document is available for public review at the San Francisco Planning Department at 49 South Van Ness Avenue, Suite 1400, San Francisco

[24] *Urban E-Commerce Distribution Facility Selection Criteria*: technical memorandum from Daniel D. Disario (Langan Engineering) to Ken Sun (Prologis), February 26, 2021. This document is available for public review at the San Francisco Planning Department at 49 South Van Ness Avenue, Suite 1400, San Francisco.

[25] South San Francisco was used in the analysis because there is an existing facility that serves San Francisco, and because it was described in the Langan Engineering April 2020 technical memorandum (see previous footnote) that a facility could be located there based on zoning, proximity to delivery market, and availability of regional road network, among other factors. Per the Langan Engineering technical memorandum, the majority of last mile delivery trips occurring within San Francisco originate from outside the City, in South San Francisco, San Bruno, Hayward, or other locations. Selecting South San Francisco as the point of comparison is considered to be conservative because it is relatively closer to San Francisco than the other primary origination points.

make deliveries to the project site, resulting in an increase in VMT compared to a facility in South San Francisco, while deliveries from the site conducted by autos, vans and small trucks would have a shorter travel distance to the areas with greatest existing and projected e-commerce market growth and last mile delivery demand, and therefore would result in a reduction in VMT compared to a facility in South San Francisco. The net change in daily non-commuter VMT was calculated and added to the total daily commuter VMT calculated in the two steps above for the other two PDR uses.

- The VMT credit for existing land uses at the project site was estimated based on daily vehicle counts by vehicle type conducted from June 13 through June 15, 2018. (See **Table 11**; a count summary is presented in **Appendix D**) The same distribution and average distance for the various origins and destinations developed for the proposed PDR uses was applied to the total daily vehicle trips, to estimate the existing average daily VMT.

Using the VMT calculations described above and summarized in **Table 12**, and an estimate of the number of workers that would be associated with the various PDR uses, the average total daily VMT per worker was calculated. The average number of PDR workers that would be at the project site on a typical day (1,955 workers) was obtained from the project description. The resulting average daily VMT per capita for the proposed project PDR uses is 18.8 daily vehicle miles per worker.[26]

PROPOSED PROJECT AVERAGE DAILY VMT PER CAPITA

Table 13 provides a summary of the average daily VMT per capita thresholds established by the department for retail and office[27] uses for existing (year 2020) and 2050 cumulative conditions, as well as the corresponding VMT per capita estimated for the proposed project PDR uses, calculated specifically for this project.

[26] Obtained by dividing a total of 36,715 net new daily vehicle miles for the proposed PDR uses (see **Table 12**) by 1,955 PDR workers.

[27] The average daily VMT per capita results estimated by the SF-CHAMP model for the combined office uses in TAZs 485 and 488 are presented in the table for comparison to the VMT per capita project-specific estimates for the proposed PDR uses.

Table 13
Average Daily VMT per Capita
Existing (Year 2020) and 2050 Cumulative Conditions

Analysis Year and Land Use	Bay Area Regional Average		Project Site [a]
	Average Daily	Average Daily minus 15%	
Existing Conditions (2020)			
Retail [b]	14.9	12.7	9.9
PDR [c]	25.7	21.9	21.4
Proposed Project			
Retail [d]			NA
PDR [e]			18.8
2050 Cumulative Conditions			
Retail [b]	15.9	13.5	12.0
PDR [c]	23.9	20.3	18.8

Notes:

a. Average daily VMT per capita for the combination of TAZs 485 and 488 in which the project site is partially located. TAZ 485 is bounded by Bayshore Boulevard, Jerrold Avenue, Selby Street, and Oakdale Avenue, while TAZ 488 is bounded by Selby Street, Jerrold Avenue, Phelps Street and Oakdale Avenue. The average daily VMT per capita for the combination of zones 485 and 488 is a weighted average, which is calculated by multiplying the VMT per capita for each zone obtained from the SF-CHAMP model by the corresponding number workers or size of retail, adding the two together, and then dividing it by the total number of workers or size of retail..

b. Retail Use - Average daily retail-related VMT per employee, as calculated from the SF-CHAMP travel demand model output. The employee denominator includes retail, cultural, institutional, and educational, and medical employment, as well as school enrollment and number of households.

c. PDR Use – Average daily work-related VMT per employee calculated from the SF-CHAMP travel demand model output by dividing the work-related VMT for office uses by the total number of daily workers.

d. Given that the general retail and café/quick service restaurant uses of the proposed project are considered standard retail uses, the specific retail-related daily VMT per capita for the proposed project do not need to be calculated.

e. Average total daily VMT per employee for commuter and non-commuter trips to and from the project site.

San Francisco Superdistrict Boundaries

The boundaries of the four San Francisco Superdistricts are based on the travel analysis zones established by the Metropolitan Transportation Commission (MTC). The four Superdistricts shown in this figure are aggregations of the MTC's 1454 Regional Travel Analysis Zones (May 2002) that encompasses the nine-county San Francisco Bay Area. MTC's 1454-zone system fits within the year 2000 U.S. Census tracts.

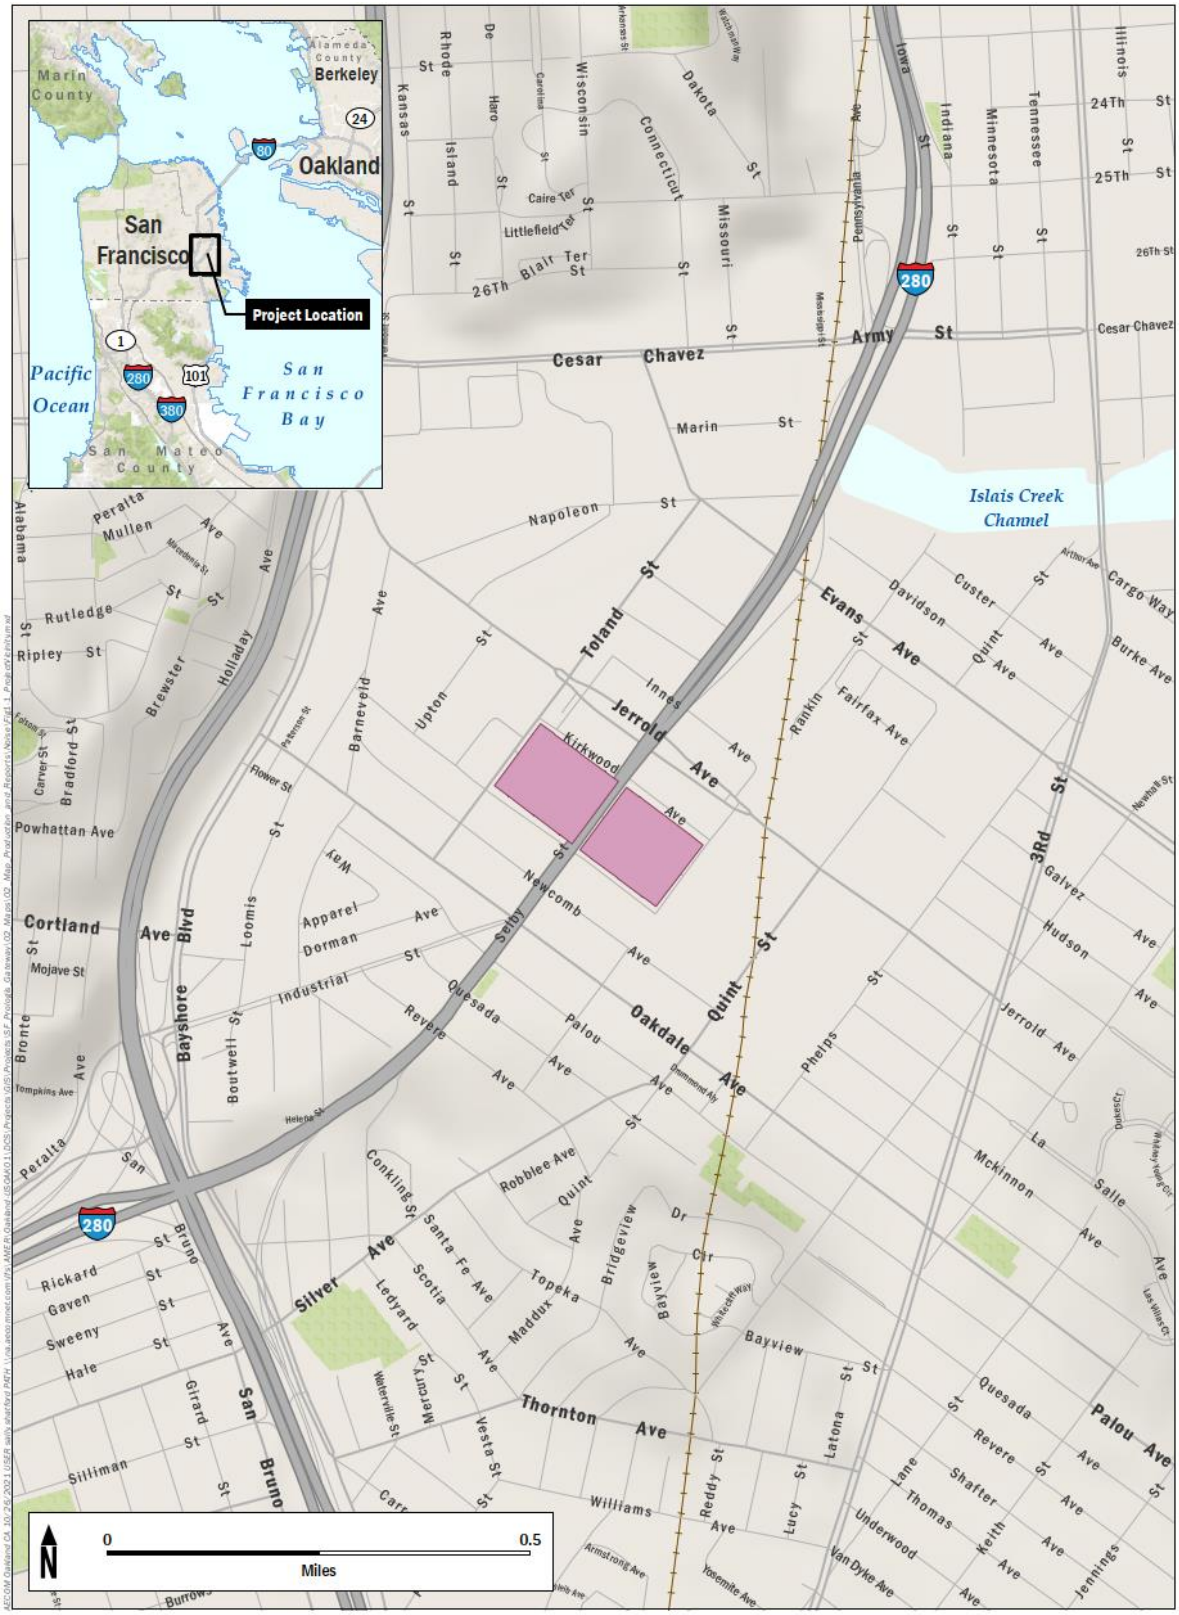
1. Introduction

1.1 Project Overview

The San Francisco Gateway Project (proposed project) would construct two new multi-story buildings that would provide new production, distribution, and repair (PDR) space for the City and County of San Francisco (city). The project sponsor, Prologis Inc., proposes to redevelop two parcels in a core industrial area of the city.

As shown in Figure 1-1, the approximately 743,800-square-foot (17.1 gross total acres), rectangular project site is in the Bayview neighborhood of the city. The project site is bounded by Kirkwood Avenue to the north, Rankin Street to the east, McKinnon Avenue to the south, and Toland Street to the west. An elevated portion of Interstate 280 (I-280) bisects the project site, running in a north-south direction above the existing Selby Street right-of-way; the uppermost roadbed deck is approximately 55 feet above grade.

The street addresses of the existing buildings are 749 Toland Street and 2000 McKinnon Avenue. The project site consists of Assessor's Block 5284A, Lot 008, and Block 5287, Lot 002, which are occupied by four single-story buildings, encompassing approximately 448,000 square feet. These warehouse buildings were built by the U.S. military circa 1943, and were transferred to private ownership sometime in the 1970s. Since then, the project site has contained a functional PDR complex, providing mostly wholesale and storage, vehicle storage, and fleet management spaces.



The proposed project would demolish the existing four single-story, metal-clad buildings that currently occupy the project site, replacing them with two three-story buildings (plus active roofs), allowing large trucks to access fully functional, upper-level PDR spaces. Each new building would be approximately 97 feet tall, with a maximum height of 115 feet, including rooftop appurtenances. The two new buildings (including PDR space, logistics yard, vehicular systems, and ground-floor retail spaces) would encompass approximately 2,160,000 gross square feet (gsf).

The proposed building west of I-280 at 749 Toland Street is "building A," and the proposed building east of I-280 at 2000 McKinnon Street is "building B." As shown in Figure 1-1, buildings A and B would be approximately the same size, shape, and dimensions, and would be oriented similarly on site.

The surrounding land in the project vicinity includes predominantly PDR and light industrial uses. The San Francisco Market is adjacent to the project site to the north along Kirkwood Avenue; wholesale flooring, art supply, and shipping services are in the vicinity; and taxicab companies are northwest of the site along Toland Street. A warehouse space for crafts and art supplies, a door supplier, a pet supply store, a van storage company, and several fleet management uses are south of the project site along McKinnon Avenue. San Francisco Public Utilities Commission offices and the San Francisco Wholesale Produce Market are along Rankin Street east of the project site.

The proposed project would provide space for several main types of PDR uses—manufacturing and maker space, parcel delivery and last-mile delivery, and wholesale and storage. The buildings are intended to accommodate a variety of users, including any combination of the uses shown in Table 1-1; it is anticipated that the assortment of PDR tenants would change over time. Given that there are no identified tenants at this time, the draft EIR describes and analyzes a mix of PDR uses that are likely to occur based on the project sponsor's familiarity with leasing trends for PDR facilities in San Francisco and the Bay Area. This noise study evaluates the physical environmental effects associated with the use mix of PDR uses shown in Table 1-1. The different land uses by building level are also identified.

Each building would include a combination of enclosed and partially enclosed spaces, with a multi-level vehicular system (i.e., staging, circulation, and logistic yard areas) serving each level. In both buildings, all three levels of the PDR space would have direct vehicular access via a one-way ramp system, designed to provide full-service, upper-level truck access for vehicles as large as tractor-trailers, and PDR spaces for its tenants. The roof level would provide a solar array and a screened, open-air multi-purpose deck that could be used for parking and/or material and vehicle staging. In total, the proposed project would have approximately 35,000 gsf of maker space and 8,400 gsf of ground-floor retail space. Figure 1-2 shows an axonometric view of the proposed building design (representing both buildings A and B).

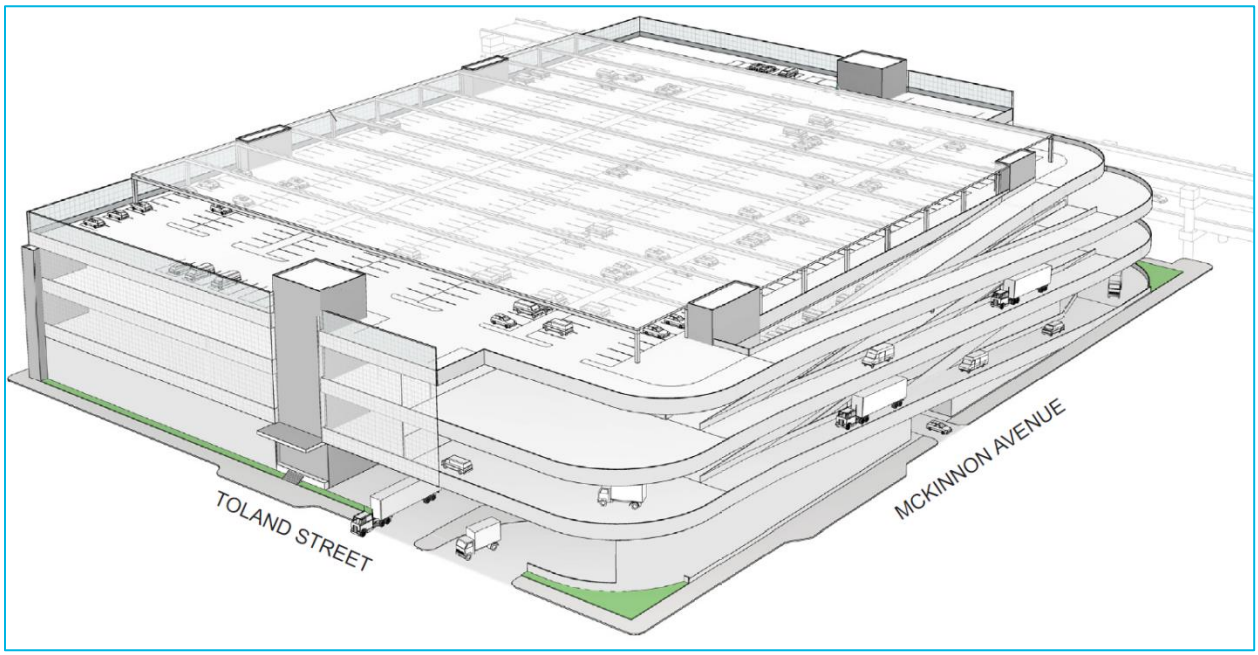
Figure 1-1 Project Location Overview

Table 1-1 SF Gateway Analyzed Tenant Use Mix – Combination of Buildings A and B



Use	Level 1	Level 2	Level 3	Roof	Project Total
PDR Uses					
Light Manufacturing/Maker	35,000	0	0	0	35,000
Parcel Delivery/Last Mile	0	381,000	369,600	8,800	759,400
Wholesale and Storage	372,400	0	0	0	372,400
Fleet Management[1]	0	0	0	0	0
PDR Support Spaces					
Logistics Yard	0	72,400	73,400	0	145,800
Vehicle Circulation	13,800	112,800	95,400	17,600	239,600
Parking	111,800	0	0	487,600	599,400
Laboratory[2]	0	0	0	0	0
Retail	8,400	0	0	0	8,400
Total					2,160,000

Notes:

1. Fleet management is not a component of the analyzed tenant use mix for this environmental analysis. This is because the manufacturing and maker, parcel delivery and last mile, and wholesale and storage uses would result in higher vehicle trip rates (and corresponding noise and air quality impacts associated with vehicle trip rates) compared to fleet management uses. Therefore, if the project sponsor elects to have a fleet management component as part of the project in the future, the environmental analysis will have adequately evaluated the transportation (and related air quality and noise) impacts from this use.
2. Laboratory is not a component of the analyzed tenant use mix for this environmental analysis. However, PDR-2 zoning districts allow specific laboratory uses.

PDR = production, distribution, and repair

Source: San Francisco Planning Department, San Francisco Gateway Project Initial Study, March 2022.

Figure 1-2 Proposed Project Building Design (Building A)

1.1.1 Project Construction

Construction activities would be staggered between the building A and building B plots, beginning with demolition of the existing warehouse buildings on the building A plot. Project construction would be organized across the following six construction phases in the approximate time frames indicated (total for both buildings).

- Phase 1 – Demolition and Site Preparation (8 weeks)
- Phase 2 – Grading and Ground Improvements (16 weeks)
- Phase 3 – Building Construction (61 weeks)
- Phase 4 – Building Envelope and Interior Buildout (60 weeks)
- Phase 5 – Site Work (25 weeks)
- Phase 6 – Startup and Commissioning (7 weeks)

Each of the new buildings would be constructed over an approximately 27-month construction period. However, because construction of one building would start approximately 4 months ahead of the second building, the overall construction period would be approximately 31 months. Because of the staggered construction starts, an overlap of various phases would occur, including the Building Construction, Building Envelope and Interior Buildout, and Site Work phases.

1.1.2 Project Operations

The proposed project's analyzed tenant use mix includes the following PDR uses: manufacturing and maker spaces, parcel delivery and last-mile delivery uses, and wholesale and storage spaces; non-PDR retail spaces also would also be included on the ground floor. When operating, potential noise sources related to project activity are expected to be the following:

- **vehicular noise** from traffic on local roadways
- **vehicular noise** from traffic using the vehicle ramps and logistics yards in each building
- **fixed-source noise** associated with heating, ventilation, and air conditioning (HVAC) units on the building rooftops
- **fixed-source noise** associated with ventilation units in the logistics yards
- **fixed-source noise** associated with emergency generator testing

1.2 Technical Background

1.2.1 Glossary of Common Acoustical Terminology

The following glossary of acoustical terms is intended to frame discussion of project-generated noises and their potential effects on neighboring communities.

Noise: Whether something is perceived as a noise event is influenced by the type of sound, the perceived importance of the sound, and its appropriateness in the setting, the time of day, and the type of activity during which the noise occurs, and the sensitivity of the listener.

Sound: For this analysis, sound is a physical phenomenon generated by vibrations that result in waves that travel through a medium, such as air, and result in auditory perception by the human brain.

Frequency: Sound frequency or "pitch" is measured in hertz (Hz), which is a measure of how many times each second the crest of a sound pressure wave passes a fixed point. For example, when a drummer beats a drum, the skin of the drum vibrates a number of times per second. When the drum skin vibrates 100 times per second, it generates a sound pressure wave oscillating at 100 Hz, and this pressure oscillation is perceived by the brain as a tonal pitch of 100 Hz. Sound frequencies between 20 and 20,000 Hz are within the range of sensitivity of a young and healthy human ear.

Amplitude or Level: Sound levels are measured in decibels (dB) using a logarithmic scale. A sound level of zero dB is approximately the threshold of human hearing and is barely audible under extremely quiet listening conditions. Normal speech has a sound level of approximately 60 dB. Sound levels above approximately 110 dB begin to be felt inside the human ear as discomfort, and eventually as pain, at 120 dB and higher. The minimum change in the sound

level of individual events that the average human ear can detect is about 1 to 2 dB. A 3 to 5 dB change is readily perceived. A change in sound level of about 10 dB usually is perceived by the average person as a doubling (or if decreasing by 10 dB, halving) of the sound's loudness. Figure 1-3 shows typical indoor and outdoor sounds and their corresponding dB levels, arranged on what often is dubbed to be an "acoustic thermometer" to show relative loudness.

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	110	Rock band
Jet flyover at 1,000 feet		
	100	
Gas lawnmower at 3 feet		
	90	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	80	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawnmower, 100 feet	70	Vacuum cleaner at 10 feet
Commercial area		Normal speech at 3 feet
Heavy traffic at 300 feet	60	
		Large business office
Quiet urban daytime	50	Dishwasher in next room
Quiet urban nighttime	40	Theater, large conference room (background)

Figure 1-3 Typical Noise Levels

Sound pressure: Sound level usually is expressed by reference to a known standard. This report refers to sound pressure level, which is expressed on a logarithmic scale with respect to a reference value of 20 microPascals. Sound pressure level depends not only on the power of the source, but also on the distance from the source and the acoustical characteristics of the space surrounding the source.

Sound power: Unlike sound pressure, which varies with distance from a source, sound power (and its counterpart sound power level) is the acoustic power of a source, typically expressed in watts.

A-weighting: Sound from a tuning fork contains a single frequency (a pure tone), but most sounds heard in the environment do not consist of a single frequency and instead are composed of a broad band of frequencies, differing in sound levels. The method commonly used to quantify environmental sounds consists of evaluating all frequencies of a sound according to a weighting system that reflects the typical frequency-dependent sensitivity of average

healthy human hearing. This is called “A-weighting,” and the measured decibel level is referred to as A-weighted decibel (dBA).

Equivalent sound level: Environmental noise levels vary continuously and include a mixture of noise from near and distant sources. A single descriptor, L_{eq}, may be used to describe such sound that is changing in level from one moment to another. L_{eq} is the energy-average sound level during a measured time interval. It is the “equivalent” constant sound level that would have to be produced by a single, steady source to equal the acoustic energy contained in the fluctuating sound level measured.

Maximum or minimum sound level (L_{max} or L_{min}): These values are indicators that represent the root-mean-square (RMS) maximum and minimum noise levels during a given monitoring interval. The L_{min} value obtained for a particular monitoring location often is called the “noise floor.”

Day-night sound level (L_{dn}): The L_{dn} is the energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to A-weighted sound levels occurring between 10 p.m. and 7 a.m. (nighttime).

Community noise equivalent level (CNEL): The CNEL is the energy average of the A-weighted sound levels occurring during a 24-hour period, with 5 dB added to the A-weighted sound levels occurring between 7 p.m. and 10 p.m., and 10 dB added to the A-weighted sound levels occurring between 10 p.m. and 7 a.m.

Sound transmission loss (TL): The TL is a value representing 10 times the base-10 logarithm of the ratio of sound power incident on one side of a partition to the sound power transmitted through and subsequently emitting from the other side of the partition into an adjoining space (separated from the sound in the “source” space by the partition).

Insertion loss (IL): The IL is the reduction in noise level at a location from noise abatement means, placed in the sound path between that location and a sound source.

1.2.2 Acoustical Concepts

1.2.2.1 Sound Propagation

Atmospheric conditions (e.g., wind, temperature gradients, humidity) can change how sound propagates over distance and can affect the level of sound received at a given location. The degree to which the ground surface absorbs acoustical energy also affects sound propagation. Sound traveling over an acoustically absorptive surface (e.g., grass) attenuates at a greater rate than sound traveling over a hard surface (e.g., pavement, expanses of open water). When located near either the sound source or the listener position, physical barriers (e.g., naturally occurring ridgelines or buildings, and other topography that block the line-of-sight between a source and receiver) also increase the attenuation of sound over distance.

1.2.2.2 Multiple Sound Sources

Because sound pressure levels in decibels are based on a logarithmic scale, they cannot be added or subtracted in an arithmetic fashion. Therefore, sound pressure level dB are added logarithmically on an energy summation basis. In other words, adding a new noise source to an existing noise source, both producing noise at the same level, does not double the noise level. Instead, if the difference between two noise sources is 10 dBA or more, the louder noise source dominates, and the resultant noise level is equal to the noise level of the louder source. In general, if the difference between two noise sources is 0 to 1 dBA, the resultant noise level is 3 dBA higher than the louder noise source, or both sources if they are equal. If the difference between two noise sources is 2 to 3 dBA, the resultant noise level is 2 dBA above the louder noise source. If the difference between two noise sources is 4 to 10 dBA, the resultant noise level is 1 dBA higher than the louder noise source.

1.2.2.3 Health Effects of Environmental Noise

According to the World Health Organization (WHO), sleep disturbance can occur when continuous outdoor noise levels exceed 42 dBA L_{eq}, or when intermittent interior noise levels reach 42 dBA L_{max}, but these thresholds may vary greatly, depending on existing noise exposure and characteristics of the noise event(s).[1] Studies with a “moderate” or greater level of evidence suggest additional potential health effects, such as annoyance (10 percent relative risk of

[1] World Health Organization (WHO), Night Noise Guidelines for Europe, 2009.

incidence occurring at 53.3 dBA, CNEL) and ischemic heart disease (5 percent relative risk of incidence occurring at an exposure of 59.3 dBA, CNEL).[2]

1.2.3 Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Groundborne vibration propagates from the source through the ground to adjacent buildings by surface waves, having a frequency measured in cycles per second (Hz). Most environmental vibrations consist of a composite of many frequencies and generally are classified as broadband or random vibrations. The normal frequency range of most groundborne vibration that can be perceived generally ranges between 1 and 200 Hz.

Vibration energy dissipates geometrically as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. Soil properties also affect the propagation of vibration, with stiffer soils, clays, and rock strata enabling more efficient transmission of vibrational energy. On interaction with a building foundation, usually a ground-to-foundation coupling loss occurs; however, the transmitted vibration also can be amplified by structural conditions of the walls and floors, allowing resonance. Vibration in buildings typically is perceived as the rattling of windows or items on shelves, or the motion of building surfaces. At sufficiently high levels and depending on the loudness of the background airborne noise level, the vibration of interior building surfaces can be heard as a low-frequency rumbling sound, also known as groundborne noise.

The peak particle velocity (PPV) and RMS velocity normally are described in inches per second (in/sec). PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is the metric often used to describe blasting vibration and other vibration sources that may result in structural stresses in buildings.[3]

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response to ground vibrations. The human body takes some time to respond to vibration signals; therefore, average vibration amplitude (i.e., the RMS velocity) is the most appropriate descriptor for gauging human response to the typical ground vibration. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over 1 second. As with airborne sound, the RMS velocity often is expressed in dB notation as vibration dB (VdB), which serves to compress the range of numbers required to describe vibration.[4] This VdB scale is based on a reference value of 1 micro-inch per second. The background vibration-velocity level typical of residential areas is approximately 50 VdB.[5]

According to Federal Transit Administration (FTA) guidance,[6] groundborne vibration normally is perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels.

2. Noise and Vibration Regulatory Framework

The following discussions summarize the federal, state, and local noise regulations, ordinances, standards, and guidance that are relevant to the assessment of potential noise and vibration impacts from the proposed project on the existing ambient environment.

2.1 Federal

2.1.1 Noise Control Act

The Noise Control Act of 1972 directed the United States Environmental Protection Agency to develop noise level guidelines that would protect the population from the adverse effects of environmental noise. Subsequently, the agency published the "Levels Document"[7] that contained recommendations for 55 dBA L_{dn} at the exterior and 45 dBA L_{dn} for the interior of noise-sensitive receivers, such as residences. The United States Department of Housing and

[2] World Health Organization (WHO), Environmental Noise Guidelines for the European Region, 2018.

[6] Ibid.
[7] United States Environmental Protection Agency (USEPA). Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety. USEPA 550/9-74-004, 1974.

Urban Development standards define L_{dn} levels below 65 dBA outdoors as acceptable for residential use. The Federal Highway Administration (FHWA), the Federal Interagency Committee on Urban Noise, and the Federal Aviation Administration also have developed standards and guidance.

2.1.2 Occupational Safety and Health Act

Onsite occupational noise exposure levels set by the Occupational Safety and Health Act of 1970 are regulated by the Occupational Safety and Health Administration and in California by the California Occupational Safety and Health Administration. The maximum time-weighted average noise exposure level of workers is 90 dBA, over an 8-hour work shift, and 115 dBA for periods of 15 minutes or less (29 Code of Federal Regulations section 1910.95).

2.2 State

The California Department of Transportation's (Caltrans) Transportation and Construction Vibration Guidance Manual[8] provides guidance for the analysis of vibratory impacts generated by transportation and construction projects, stating the criteria for structural damage and human perception/annoyance. Table 2-1 shows a curated list of damage and annoyance criteria compiled from the Caltrans and FTA manuals, as applicable to various receiver and vibratory source types.

Table 2-1 Maximum Vibration Levels for Construction Equipment for Potential Damage and Sleep Interference

	Potential Damage Criteria (PPV in/sec)		Groundborne Vibration Interference Levels for Residences and Buildings where People Normally Sleep (VdB)		
Structure Type	Transient Sources	Frequent Events	Frequent Events	Occasional Events	Infrequent Events
Historic and some old buildings	0.5	0.25	72	75	80
Older residential structures	0.5	0.3			
New residential structures	1.0	0.5			
Modern industrial and commercial buildings	2.0	0.5			

Notes:

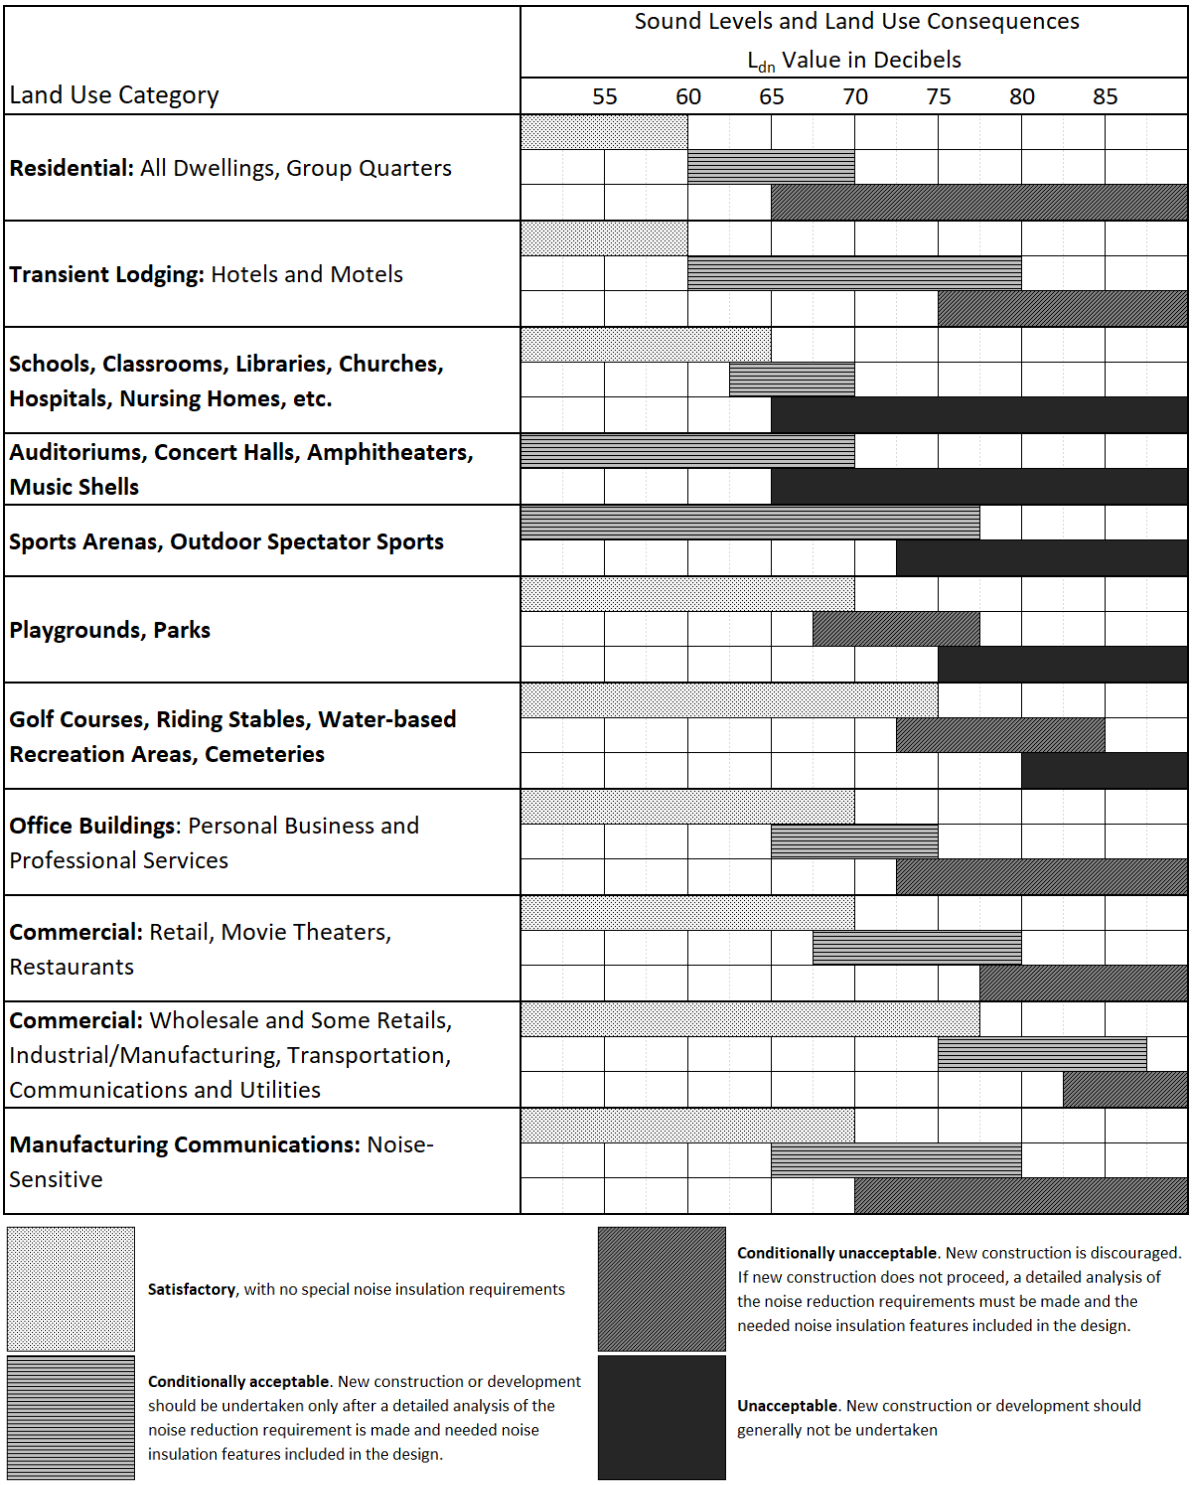
Transient sources generate a single vibratory event, such as blasting.

Infrequent Events: Fewer than 30 events per day.
Occasional Events: 30 to 70 events per day.
Frequent Events: More than 70 events per day.

PPV in/sec = Peak particle velocity in inches per second.
VdB = Vibration velocity level in decibels.

Sources: California Department of Transportation (Caltrans), Transportation and Construction Vibration Guidance Manual. Division of Environmental Analysis, 2020 (April).

Federal Transit Administration (FTA), Transit Noise and Vibration Impact Assessment, FTA Report No. 0123, 2018.



As shown in Table 2-1, vibratory activities have the potential to result in structural damage when vibration levels exceed 0.25 to 2 PPV in/sec, as applicable to the source type and receiver characterization; and the potential for sleep interference when vibration levels exceed 72 to 80 VdB, as applicable to the source type.

2.3 Local

2.3.1 San Francisco General Plan

The San Francisco General Plan generally is focused on the effects of transportation-related noise on the health and welfare of people in their everyday activities. The plan provides officials and developers with a land-use compatibility chart that serves to inform the consideration of new land uses in areas where existing traffic noise may be considered unacceptable. Figure 2-1 shows the ranges of traffic noise-level acceptability for various land uses.

Figure 2-1 City of San Francisco Land Use Compatibility Chart for Community Noise

2.3.2 San Francisco Noise Control Ordinance

Article 29 of the San Francisco Police Code regulates noise generated by a variety of noise source types. The San Francisco Department of Public Health is jointly responsible for implementation of this police code; thus, the Department of Public Health develops and maintains the Guidelines for Noise Control Ordinance Monitoring and Enforcement (article 29 guidelines), which provides both definitions for and guidance on the interpretation of the police code.[9] The following summary of article 29 and the article 29 guidelines applies to the assessment of noise anticipated to be generated by project construction and implementation:

Construction Equipment (article 29, section 2907): Noise generated by any construction equipment on a permitted construction site, except for impact tools such as jackhammers, shall not exceed 80 dBA when measured at a distance of 100 feet from the equipment or the construction site boundary.

Construction Work at Night (article 29, section 2908): The operation of construction equipment located on a permitted construction site during the nighttime hours, defined as 8 p.m. to 7 a.m., shall not increase ambient measured noise levels at the nearest property plane by greater than 5 dBA. Noise permits may be granted that allow exceedance of the noise standards by the San Francisco Department of Building Inspection or San Francisco Department of Public Works. Construction projects with night noise permits are subject to the limits detailed by the enforcing departments in the permit.

Commercial and Industrial Property Noise Limits (article 29, section 2909[b]): Combined operation of machines or devices (such as fixed or stationary mechanical devices), music, or entertainment located on a commercial or industrial property shall not increase ambient noise levels by greater than 8 dBA at any point outside of the property plane.

Fixed Residential Interior Noise Limits (article 29, section 2909[d]): No fixed noise source may cause the noise levels measured in a sleeping or living room in any dwelling unit to exceed 45 dBA between the hours of 10 p.m. and 7 a.m., and 55 dBA between the hours of 7 a.m. and 10 p.m., with windows open—except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

Exceptions (article 29 guidelines, Appendix C): Certain noise sources do not violate local law and will not be investigated by any City of San Francisco department. Those specific to this noise analysis include but are not limited to emergency generators, delivery and service trucks, vehicle and traffic noise, and public roadways.

3. Existing Noise Environment

3.1 Existing Noise Sources

The dominant noise source in the project area is vehicular traffic along I-280, a two-level viaduct freeway that bisects the project site and area and generates nearly continuous traffic noise throughout the day and night. Vehicular traffic on Oakdale Avenue, a four-lane arterial roadway southwest of the project site, also is a notable noise source, but similar to other local roadways, traffic volumes drop precipitously in the late evening hours.

The project site is in a heavily developed urban area that is zoned PDR-2. In addition to the freeway, existing noise also is generated by adjacent land uses that may include delivery vehicle loading/unloading, forklift operation and back-up alarms, noise generated by HVAC units, and operation of power tools and other production-related machinery. The property immediately northeast of the project site is a major wholesale produce distribution facility, with the majority of its noise-generating operations occurring between approximately 12 a.m. and 9 a.m.

The project site is approximately 7.7 miles north of San Francisco International Airport (SFO) and 8.6 miles west-northwest of Oakland International Airport (OAK). The neighborhood surrounding the project site falls outside all predicted 65 dBA CNEL contours, in both the 2019 SFO and 2010 OAK noise exposure maps.

[9] City of San Francisco, San Francisco Police Code Article 29: Regulation of Noise Guidelines for Noise Control Ordinance Monitoring and Enforcement [Article 29 Guidelines], Department of Public Health, 2014.

3.2 Noise-Sensitive Land Uses

The area surrounding the project site primarily consists of PDR land uses. The nearest noise-sensitive land use is a place of worship approximately 350 feet southwest of the nearest project property boundary. The next nearest noise-sensitive land uses are residential uses along Oakdale Avenue, approximately 440 feet southwest of the nearest project property boundary. Figure 3-1 shows the small groups of existing noise-sensitive receptors in the greater project vicinity.

3.2.1 Common Noise Equivalent Areas

To assess the effects of project-generated noise on the greater project vicinity, the surrounding land uses were grouped into discrete assessment areas. Common noise equivalent areas (CNEAs) were established by grouping land uses considered to experience a similar range of existing noise levels, based on their exposure to existing major noise sources (e.g., vehicular traffic on I-280 and Oakdale Avenue). Each CNEA also contains a representative existing noise level measurement that serves as the basis for establishing existing traffic noise exposure for land uses within the CNEA. The 11 delineated CNEAs are described below.

- **CNEA 1:** This CNEA includes commercial and warehouse land uses northwest of the project site. No noise-sensitive receptors were identified in this area. Existing noise levels within this CNEA are represented by measurement M1.
- **CNEA 2:** This CNEA includes primarily commercial and warehouse land uses northwest of the project site, spanning both sides of Toland Street. No noise-sensitive receptors were identified in this area; however, an office building is at 2095 Jerrold Avenue. Existing noise levels within this CNEA are represented by measurement M2.
- **CNEA 3:** This CNEA includes primarily commercial and warehouse land uses west and southwest of the project site. This CNEA features a single church (Grace Good Samaritan Worship Center). Existing noise levels within this CNEA are represented by measurement M3.
- **CNEA 4:** This CNEA includes single-family homes, a park, and commercial/warehouse land uses southwest of the project site. Residential land uses are on both sides of Palou Avenue. Existing noise levels within this CNEA are represented by measurement M4.
- **CNEA 5:** This CNEA includes primarily commercial and warehouse land uses southwest of the project site. A small tract of residential land uses is on Oakdale Avenue near the southeastern boundary of the CNEA. Existing noise levels within this CNEA are represented by measurement M5.
- **CNEA 6:** This CNEA includes commercial and warehouse land uses immediately southwest of the project site. No noise-sensitive receptors were identified in this area. Existing noise levels within this CNEA are represented by measurement M6.
- **CNEA 7:** This CNEA includes single-family homes and commercial/warehouse land uses south of the project site. Residential land uses are along Oakdale Avenue and Palou Avenue. Existing noise levels within this CNEA are represented by measurement M7.
- **CNEA 8:** This CNEA includes commercial and warehouse land uses immediately northeast of the project site. No noise-sensitive receptors were identified in this area. Existing noise levels within this CNEA are represented by measurement M8.
- **CNEA 9:** This CNEA includes single-family homes, a church (Galilee Missionary Baptist Church), and commercial/warehouse land uses south of the project site. Residential land uses are along Oakdale Avenue and Palou Avenue. Existing noise levels within this CNEA are represented by measurement M9.
- **CNEA 10:** This CNEA includes commercial and warehouse land uses immediately southeast of the project site. No noise-sensitive receptors were identified in this area. Existing noise levels within this CNEA are represented by measurement M10.

Figure 3-2 Common Noise Equivalent Areas for Project Traffic Noise Assessment

3.3 Vibration-Sensitive Receptors

The commercial buildings surrounding the project site generally were built between the 1960s and 1980s; however, buildings to the southwest and west have earlier construction dates. The warehouse structures at 801 and 834 Toland Street, approximately 67 feet southwest and 97 feet west of the project site, respectively, match the architectural styles of the four existing warehouse structures that would be removed from the project site. The project site warehouse buildings were constructed by the U.S. military between 1940 and 1943, to support production needs during World War II, and although construction dates were not available for 801 and 834 Toland Street, this analysis assumes that their construction dates are similar if not identical to those of the existing project site warehouses.

There are no known structures featuring vibration-sensitive activities (e.g., research or medical laboratories) in the project vicinity. The nearest structure within which people may sleep is the residential property approximately 440 feet from the edge of the project construction area.

3.4 Existing Noise Conditions Survey Details

After a preliminary review of online aerial imagery and other literature, multiple sound level measurement location candidates were identified in the project vicinity for long-term and short-term sound pressure level measurements. For long-term deployments, a field investigator set up each of the three long-term noise monitors and performed premeasurement instrument calibration checks before the start of monitoring. Secured to existing fixed man-made or natural features, these long-term monitors were left unattended until revisited by the investigator to check instrument function, remaining on-board memory, and power supply.

In addition to long-term monitoring, short-term measurements also were conducted in the project vicinity at additional nearest noise-sensitive land uses and property boundaries to the north, south, and east. All short-term measurements were conducted with an investigator attending the sound level meter and making simultaneous observations of perceived sound sources and environmental conditions.

All sound measurements were conducted with wind-screened microphones. Short-term measurements were performed with the sound level meter mounted atop a camera tripod, with the microphone approximately 5 feet above-grade. The calibration status of sound level meters used for short-term measurements was checked in the field before and after each measurement. Each short-term and long-term sound level meter was set to record L_{eq}, L_{max}, L_{min}, and statistical distributions of sound level (L_{10}, L_{50}, and L_{90}) for each measurement period.

Sound pressure level monitoring was performed with Larson Davis Model 831 and 820 sound level meters, rated by the American National Standards Institute (ANSI) as Class 1, per ANSI S1.4-2014 and Type 1 per ANSI S1.4-1983, respectively. The sound level meter microphones were fitted with standard open-cell foam windscreens and positioned approximately 5 to 6 feet above-grade where practicable. The sound level meters were set using slow time-response and the A-weighting scale. Sound level meter calibration was field-checked before and after each measurement period with a LD Model CAL200 acoustic calibrator, and all meters were factory-calibrated earlier that same year. Where not already described, sound level measurements performed for this field survey were conducted in a manner based on guidance from applicable portions of International Organization for Standardization (ISO) 1996-1, 1996-2, and 1996-3 standards.[10] [11] [12]

A Kestrel Model 3500 handheld weather meter was used to determine or measure average wind speed, temperature, barometric pressure, and relative humidity at each of the long-term and short-term noise measurement locations.

3.5 Existing Noise Conditions Survey Results

Sound level measurements were conducted from July 31 through August 2, 2018,[13] to collect sound pressure level data in the project vicinity. A total of three long-term (48-hour) and 23 short-term (10 to 15-minute) measurements were conducted at representative noise-sensitive land uses and adjacent property boundaries. Short-term measurements were conducted at eight locations during both daytime (7 a.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) periods.

Observed meteorological data during sound level meter setups showed temperatures ranging from 56 to 72 degrees Fahrenheit, humidity ranging from 60 to 69 percent, and wind speeds ranging from 1 to 8 miles per hour (mph). Sound pressure level measurements were conducted at a series of locations throughout the project vicinity. These locations are shown in Figure 3-3 and are described as follows:

- **M1:** Long-term measurement location on Toland Place, approximately 288 feet northwest of the nearest project property boundary and approximately 915 feet northwest of I-280. The dominant noise source during the measurement period was distant vehicular traffic from I-280 and local roadways.
- **M2:** Short-term measurement location on Toland Street, abutting the northwest project property boundary and approximately 630 feet northwest of I-280. During the daytime hours, the dominant noise sources during the measurement periods were vehicular traffic on Toland Street, distant produce delivery truck idling, and distant vehicular traffic on I-280. During the nighttime period, vehicular traffic on Toland Street decreased but contributions from traffic on I-280 were sustained.

[10] International Organization for Standardization (ISO), Description and Measurement of Environmental Noise, Basic Quantities and Procedures Part 1, ISO 1996/1, 1982.
[11] ISO, Description and Measurement of Environmental Noise, Basic Quantities, and Procedures, Acquisition of Data Pertinent to Land Use, Part 2, ISO 1996/2, 1987a.
[12] ISO, Description and Measurement of Environmental Noise, Basic Quantities and Procedures, Application to Noise Limits, Part 3, ISO 1996/3, 1987b.
[13] In the three years since the existing noise condition survey was conducted, surrounding land uses in the survey area have not changed in a manner that would result in notable changes to existing noise levels. Therefore, existing noise conditions measured and reported herein are expected to be representative of the current ambient acoustic environment.

Sources: Map data from Google Imagery © 2020; compiled by AECOM

Figure 3-3 Overview of Baseline Monitoring Locations

- **M3:** Short-term measurement location on the north corner of the intersection of Newcomb Avenue and Toland Street, approximately 285 feet southwest of the nearest project property boundary and approximately 680 feet northwest of I-280. During the daytime hours, the dominant noise sources during the measurement periods were vehicular traffic on Toland Street and Newcomb Avenue, intermittent truck loading at a nearby hardware store, and distant vehicular traffic on I-280. During the nighttime period, vehicular traffic on Toland Street and Newcomb Avenue decreased, but contributions from traffic on I-280 were sustained.

- **M4:** Long-term measurement location on the south side of Palou Avenue, approximately 900 feet southwest of the nearest project property boundary and approximately 100 feet southeast of I-280. The dominant noise source during the measurement period was vehicular traffic on I-280 during all observed hours, with secondary contributions from traffic on Oakdale Avenue and Palou Avenue.

- **M5:** Short-term measurement location on the south side of Oakdale Avenue, approximately 615 feet southwest of the nearest project property boundary and approximately 85 feet southeast of I-280. The dominant noise source during the measurement period was vehicular traffic on I-280 during all observed hours, with secondary contributions from traffic on Oakdale Avenue.

- **M6:** Short-term measurement location on the northern corner of the intersection of McKinnon Avenue and Selby Avenue, approximately 48 feet southwest of the nearest project property boundary and approximately 45 feet northwest of I-280. The dominant noise source during the measurement period was vehicular traffic on I-280, with secondary contributions from intermittent traffic on McKinnon Avenue and intermittent truck loading at nearby warehouses.

- **M7:** Short-term measurement location on the southern corner of the intersection of Oakdale Avenue and Rankin Street, approximately 611 feet south of the nearest project property boundary and approximately 690 feet southeast of I-280. The dominant noise sources during the measurement period were distant vehicular traffic on I-280 and intermittent traffic on McKinnon Avenue.

- **M8:** Short-term measurement location on the southern corner of the intersection of Oakdale Avenue and Rankin Street, approximately 254 feet northeast of the nearest project property boundary and approximately 85 feet southeast of I-280. The dominant noise sources during the measurement period were vehicular traffic on I-280 and intermittent traffic on Jerrold Avenue.

- **M9:** Long-term measurement location near the western corner of the intersection of Oakdale Avenue and Quint Street, approximately 880 feet south-southeast of the nearest project property boundary and approximately 1,255 feet southeast of I-280. The dominant noise sources during the measurement period were vehicular traffic on Oakdale Avenue and distant traffic on I-280.

- **M10:** Short-term measurement location on Rankin Street, abutting the southwest project property line and approximately 645 feet southeast of I-280. The dominant noise sources during the measurement period were continuous vehicular traffic on I-280 and intermittent traffic on Rankin Street.

- **M11:** Short-term measurement location on the southern corner of the intersection of Rankin Street and Jerrold Avenue, approximately 270 feet northeast of the nearest project property boundary and approximately 705 feet southeast of I-280. The dominant noise sources during the measurement period were vehicular traffic on I-280 and intermittent traffic on Jerrold Avenue.

Each short-term measurement location can be compared with specific long-term measurement location data on the basis of shared existing exposure to noise sources. This comparison can then reasonably estimate the existing sound environment at short-term locations during times when short-term measurements were no longer being conducted but long-term measurements continued.

For example, consider two hypothetical measurement locations next to a major freeway that is the dominant source of noise in the vicinity. If a 15-minute short-term measurement conducted at 2 p.m. at location A equals 51 dBA, L_{eq}, and during that same period, the noise level at long-term monitor B is equal to 49 dBA, L_{eq}, a difference of +2 dBA is established between the measurement locations for that period. Therefore, if the full daytime period (i.e., 7 a.m. to 7 p.m.) at location B is calculated to be 56 dBA, L_{eq}, the resulting full daytime period at location A can be estimated as 58 dBA, L_{eq}. This process was performed for the daytime and nighttime short-term measurements at each short-term

measurement location based on their shared exposure to specific traffic noise sources at the adjacent long-term deployment used for 24-hour data extrapolation. Using this technique, the existing 24-hour CNEL and lowest 15-minute L_{90} (using the calculated delta between L_{90} values) were derived for each short-term position based on empirical data collected from both the short-term and long-term survey locations.[14]

Table 3-1 summarizes the calculated daytime, evening (7 p.m. to 10 p.m.), nighttime, and CNEL values as indexed by measurement location identification (ID). Detailed data for long-term and short-term measurements, including referenced times and detailed calculations, are provided in Appendix A.

Table 3-1 Summary of Baseline Sound Pressure Level Measurements

Measurement Location ID	Reference LT Measurement Location ID	Calculated Sound Pressure Level (dBA)				
		Daytime L_{eq} (0700–1900)	Evening L_{eq} (1900–2200)	Nighttime L_{eq} (2200–0700)	Calculated CNEL	Lowest 15-Minute L_{90}
M1 (LT)	-	65	59	58	66	50
M2	M1	71	64	61	71	51
M3	M1	70	63	60	70	50
M4 (LT)	-	77	75	72	80	51
M5	M4	79	77	73	81	55
M6	M4	77	77	75	82	51
M7	M9	71	68	65	73	52
M8	M4	78	77	72	80	52
M9 (LT)	-	66	62	59	68	48
M10	M1	68	62	61	69	50
M11	M1	72	67	67	75	57

Notes:

CNEL = community noise equivalent level
dBA: A-weighted decibels
LT: Long-term measurement
L_{eq}: Energy-average sound level (1-hour)
L_{90}: Sound level exceeded for 90 percent of measurement period

4. Methodology

4.1 Project Construction

4.1.1 Onsite Construction Noise

Project construction noise was estimated by considering the main noise-generating sound sources, calculating their aggregate sound propagation to the project property boundary, and studying the closest receptor locations.

The onsite construction noise analysis approach relies on the FTA “General Assessment” quantitative construction noise estimation guidance. The key assumptions for this analysis include:

- For a given construction phase or combination of phases, the two loudest pieces of equipment or vehicles are assumed to operate on average from the geographic centroid of the closest building A or building B work site.

[14] This is a valid method for extrapolating long-term noise levels from short-term noise measurements when acoustics of the noise monitoring location environment is dominated by the same source throughout the monitoring period, and the measurements are conducted simultaneously, as was the case for the noise measurements conducted for this analysis.

- Each piece of equipment or vehicle is assigned a reference L_{max} value at a reference distance (e.g., 50 feet), and an "acoustical usage factor" that the FHWA Roadway Construction Noise Model User's Guide[15] describes as an estimated portion of a construction operation period when the L_{max} value can be expected. The reference sound level and acoustical usage factor values for each construction phase are provided in Appendix B.

- Free-field conditions and no sound reduction from the ground surface are expected to occur.

- A standard acoustic energy attenuation rate of -6 dBA per doubling of distance from the assumed construction noise sources is assumed.

4.1.2 Construction Traffic Noise

Noise levels generated by construction traffic on local roadways were modeled using the FHWA's Traffic Noise Model Version 2.5. The screening-level analysis assumed a vehicle speed of 30 mph on Oakdale Avenue and Toland Street and 25 mph on smaller roadways. Although the model has the capability to account roadway gradients and shielding effects from terrain and buildings/barriers, this analysis assumed flat topography between the roadways and noise assessment locations, and omitted existing structures that may offer additional shielding. Therefore, the results are conservative (worst-case). Project construction traffic would fall into one of the following three categories:

- **Haul Route**: Would be used by heavy trucks transporting deliveries and debris to and from the construction site. All traffic associated with the haul route would use Toland Street from the project site, travel southwest to Oakdale Avenue, and Oakdale Avenue northwest from Toland Street to Bayshore Boulevard.

- **Concrete Route**: Would be used by heavy trucks transporting concrete to and from the construction site. All traffic associated with the concrete route would use Toland Street from the project site and travel northeast to Evans Avenue.

- **Worker Route**: Would be used by construction workers and fleet vehicles traveling to and from the construction site. To conservatively estimate the various routes by which construction workers would be arriving and departing from the construction site, the construction traffic noise analysis assumed that all roadways in the project vicinity, including the haul and concrete routes, would carry 75 percent of worker traffic.

4.1.3 Construction Vibration

Construction activities can generate groundborne vibration of varying degrees, based on the construction activity and equipment. Vibration associated with project construction activities would occur most notably during major ground-disturbing activities, such as site grading and drilling operations. The Caltrans manual[16] provides an equation for vibration level prediction at a receiver location, which is expressed as:

$$PPV\ (in/sec) = PPV_{ref}(\frac{25}{D})^{n}$$

Where:

PPV_{ref} = reference level of a vibration source at 25 feet

D = distance of the receiver from the vibration-generating activity in feet

n = value related to the vibration attenuation rate through the subject soil type

The reference vibration level for large bulldozers, hoe rams, and caisson drilling is the same for all three of these types of construction equipment. Thus, construction vibration levels were predicted using the shared reference level as reported in the Caltrans manual, 0.089 PPV in/sec at 25 feet and an "n" value of 1.1, which is representative of the

[15] Federal Highway Administration (FHWA), FHWA Roadway Construction Noise Model User's Guide, FHWA-HEP-05-054, 2006.
[16] California Department of Transportation (Caltrans), Transportation and Construction Vibration Guidance Manual, Division of Environmental Analysis, 2020 (April).

compacted alluvial soil type surrounding the project site. This expression provides means for the assessment of compliance with structural damage criteria and human receptor annoyance levels at any given receptor distance.

4.2 Project Operation

4.2.1 Existing Traffic Noise Determination

Vehicular traffic on local roadways and I-280 dominate the existing ambient environment. Thus, the existing noise levels collected at the 11 noise monitoring locations are reasonably representative of the existing traffic noise conditions at nearby land uses (shown in Table 3-1). The traffic noise analysis assesses the increase of project-only contributions to the existing, measured noise levels throughout the project area. This relative increase can be calculated using the expression:

$$(TNL_e + TNL_p) - TNL_e = Relative\ Increase\ in\ Ambient\ Noise\ Level$$

Where:

TNLe = measured existing traffic noise level
TNLp = predicted project-only traffic noise level

4.2.2 Offsite Traffic Noise

Project operation would result in an addition of vehicles to local roadways in the project vicinity. Offsite traffic noise was modeled with FHWA Traffic Noise Model Version 2.5, using the same modeling methodology discussed for the construction traffic noise analysis.

4.2.3 Onsite Traffic Noise

Appendix C of the article 29 guidelines lists vehicle and traffic noise as exceptions from local noise control laws and investigation. Because onsite traffic noise would be characteristic of the existing noise exposure already experienced throughout the studied CNEAs, onsite traffic noise levels were combined logarithmically with the project offsite traffic noise predictions to arrive at an aggregate, future traffic noise level with implementation of the proposed project for each CNEA. The traffic noise generated onsite would occur at onsite vehicle ramps and as a result of idling vehicles, as detailed next.

4.2.4 Vehicle Ramps

The project design includes vehicle ramps that would provide access to the three building levels above-grade. Determination of traffic volumes, vehicle mixes, and 24-hour distributions are based on the offsite traffic noise analysis assumptions and traffic distributions based on the land use type per gsf on each building level.

4.2.5 Logistics Yards

Logistics yards would be located on levels one through three of both buildings. The dominant noise generated by the logistics yards would be the movements and engine idling of medium and heavy trucks after arriving and before departing from each building. The logistics yards were modeled as area sources, matching the dimensions and locations of each logistics yard, and are representative of daytime, evening, and nighttime medium and heavy truck volumes on each level.

The CadnaA® Noise Prediction Model (Version 2020)[17] was used to estimate the propagation of sound from onsite building ramp traffic and logistics yard vehicle idling. Model configuration settings and assumptions are as follows:

- **Outdoor temperature**: 50 degrees Fahrenheit

[17] CadnaA is a Windows-based software program that predicts and assesses noise levels near industrial noise sources based on ISO 9613-2 algorithms for noise propagation calculations (ISO 1996). The software can accept sound power levels (in dB referenced to 1 picoWatt) in octave-band center frequency resolution to describe the multiple sound propagation sources of the site processes or activity to be modeled. The calculations account classical sound wave divergence plus attenuation factors resulting from air absorption, basic ground effects, and barrier/shielding. CadnaA can model the three-dimensional sound propagation complexity of considering realistic, intervening natural and human-made barrier effects, including those resulting from terrain features and structures such as major buildings.

- **Relative humidity**: 70 percent
- **Average ground absorption**: 0.2 (representative of primarily hard ground surfaces)
- **Terrain**: topography of the project site and the immediate vicinity (modeled using terrain data with 1-meter resolution elevation steps)
- **Roadway calculation standard**: replication of FHWA TNM Version 2.5, with Fresnel-zone correction activated (applied to moving ramp traffic only)
- **Reflection order**: 2
- **Ancillary area structures**: building structures beyond those immediately surrounding the project area (imported into the model space using open-source height and locational data, provided by OpenStreetMap (2020)

Because onsite traffic noise would be generated from a central location, modeled receiver points were placed at the closest land use edge of each CNEA to assume the maximum noise contribution to the studied CNEAs.

4.2.6 Fixed-Source Operations Noise

The CadnaA Noise Prediction Model (Version 2021 MR2) also was used to estimate the propagation of sound from aggregate fixed-source project operations, including HVAC and emergency generators. This analysis used the same configuration settings and assumptions as noted above.

4.2.6.1 HVAC

The project configuration was imported into the CadnaA model from available project drawing files, provided by the project sponsor[18] and was modeled using the same configuration settings and assumptions noted above.

5. Project Noise Analysis

5.1 Project Construction

5.1.1 Onsite Construction Noise

Table 5-1 summarizes the two noise-dominant pieces of construction equipment for each construction phase. In several cases, more than one of each are the loudest pieces of equipment; thus, some equipment repeats within a phase. A detailed list of anticipated equipment types and quantities for each construction phase is provided in Appendix B.

The construction scenario with the highest potential for noise effects, Phases 4 and 5 – Building Envelope and Interior Buildout and Sitework, considers the two loudest pieces of equipment during any construction phase. Therefore, overlapping of construction phases between the two building sites is not expected to generate noise levels in excess of what already has been assessed for this phase.

The estimated aggregate sound pressure level from concurrent construction activities was predicted at the following assessment locations:

- The boundary of the construction site (approximately 255 feet from the center of the nearest project building construction site)
- The nearest residential noise-sensitive land use (approximately 440 feet from the nearest project property boundary and 745 feet from the center of the nearest project building construction site)
- The nearest other noise-sensitive land use (a church, approximately 350 feet from the nearest project property boundary and 725 feet from the center of the nearest project building construction site)

[18] Based on drawings provided by Jackson Liles Architecture in a January 10, 2020, response to a request for information.

Table 5-1 Loudest Anticipated Construction Equipment per Phase

Phase	Phase Detail	Duration (weeks)	Loudest Piece of Equipment per Phase	Hourly L_{eq} at 50 feet (dBA)	Combined Hourly L_{eq} at 50 feet (dBA)
1	Demolition and Site Preparation	8	Concrete/Industrial Saw	85	88
			Mounted Impact Hammer	85	
2	Grading and Ground Improvements	16	Grader	83	86
			Grader	83	
3[a]	Building Construction	61	Water Truck	82	85
			Generator Set	81	
4[a]	Building Envelope and Interior Buildout	60	Paver	84	87
			Paver	84	
5[a]	Sitework	25	Concrete/Industrial Saw	85	88
			Concrete/Industrial Saw	85	
6	Startup and Commissioning	7	Aerial Lift	80	82
			Rubber Tired Loaders	78	

Notes:

a. Construction phase may include nighttime work for certain time-dependent tasks, such as concrete pours.

dBA = A-weighted decibels
L_{eq} = energy-average sound level (1-hour)

Source: Data compiled by AECOM

Table 5-2 summarizes predicted hourly noise levels at the three studied assessment locations during the most noise-intensive construction phase and the resulting relative noise increase above the existing noise level.[19] Predicted onsite construction noise levels for all studied construction phases are provided in Appendix B.

Table 5-2 Predicted Onsite Construction Noise Levels

Worst-Case Construction Phase	Assessment Location	Existing Daytime L_{eq}, dBA	Scenario	Predicted Hourly L_{eq}, dBA
Phase 1 Demolition and Site Prep/Phase 5 Sitework[1]	Construction Boundary	68 (M10[2])	Construction-Only Noise Level	74
			Construction Noise Level + Existing	75
			Increase over Existing	7
	Nearest Noise-Sensitive Land Use (Church)	70 (M3[2])	Construction-Only Noise Level	65
			Construction Noise Level + Existing	71
			Increase over Existing	1
	Nearest Residential Noise-Sensitive Land Use	70 (M3[2])	Construction-Only Noise Level	65
			Construction Noise Level + Existing	71
			Increase over Existing	1

Notes:

1. Construction phases 1 and 5 share the same predicted worst-case construction noise levels.
2. Indicates the baseline noise measurement location used to define the existing daytime noise level at the assessment location.

Decibel values presented in this table are rounded to the nearest whole decibel. Therefore, the differences calculated in the "Increase over Existing" rows may be inconsistent with basic arithmetic expectations.

dBA = A-weighted decibels
L_{eq} = energy-average sound level (1-hour)

Source: Compiled by AECOM

[19] Decibel values presented in all report tables are rounded to the nearest whole decibel. Therefore, the differences calculated may be inconsistent with basic arithmetic expectations.

For the most intensive construction period, predicted onsite construction noise levels would not exceed 90 dBA, nor would they result in an increase over existing noise levels of greater than 10 dBA at any noise-sensitive land uses. Thus, the five other construction phases (discussed in detail in Appendix B) similarly would not exceed any of these noise levels.

5.1.2 Nighttime Onsite Construction Noise

Nighttime construction activities, defined by article 29 as construction activities occurring between 8 p.m. and 7 a.m., are expected during specific phases of building construction—the building envelope and interior buildout phase, and the sitework phase. The project sponsor would be required to obtain a permit from the San Francisco Department of Public Works or the Department of Building Inspection to extend construction activities beyond the typical allowable construction hours. Such permits are only granted for activities that are required to occur during nighttime periods, such as concrete pours and/or crane deliveries. Interior noise levels anticipated to be generated by nighttime construction at the closest residential noise-sensitive land use (440 feet from the nearest project site boundary) are shown in Table 5-3.

Table 5-3 Predicted Nighttime Construction Noise Levels at Nearest Residential Receptor

Construction Phase	Equipment Assumed	Predicted Exterior Construction Noise Level (L_{eq}, dBA)	Predicted Interior Construction Noise Level (L_{eq}, dBA)[1]
Building Construction	Two Concrete Pump Trucks	57	32
Building Envelope and Interior Buildout	One Flatbed Truck	56	31
Sitework	One Flatbed Truck	56	31

Note:

1. An exterior to interior transmission loss of 25 dBA was assumed for the studied closest receptor, which is representative of typical residential building construction with windows closed (United States Environmental Protection Agency (USEPA), Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety, USEPA 550/9-74-004), 1974.

dBA = A-weighted decibels

L_{eq} = energy-average sound level (1-hour)

Source: Compiled by AECOM

The nighttime construction noise levels at the interior of the nearest residential noise-sensitive land use would range from 31 to 32 dBA, L_{eq}. Depending on the siting of concrete pump trucks and/or flatbed trucks used for crane deliveries, nighttime construction noise levels at the project property plane could be more than 5 dBA greater than ambient noise levels, which were measured to range between 50 and 52 dBA as shown in Table 3-1. Therefore, a nighttime construction work permit is likely to be required.

5.1.3 Construction Traffic Noise

The construction traffic noise analysis considered three peak-traffic scenarios, made up of the peak-traffic periods when each specified route would experience its maximum daily traffic volume. These scenarios and associated traffic volumes per route are shown in Table 5-4. Nighttime construction traffic routes would have fewer vehicles; thus, this analysis assumed all vehicles would travel on these routes during daytime hours.

Table 5-4 Construction Traffic Noise Scenarios

	Daily Traffic Volumes per Route (ADT)		
Studied Scenario	Haul Route	Concrete Route	Worker Route
Maximum Haul Route Traffic	155 heavy trucks	53 heavy trucks	38 cars
Maximum Concrete Route Traffic	94 heavy trucks	120 heavy trucks	51 cars
Maximum Worker Route Traffic	33 heavy trucks	43 heavy trucks	149 cars

Notes:

ADT = average daily traffic
Cars = vehicles with two axles, four wheels
Heavy Trucks = vehicles with three or more axles

Source: Data compiled by AECOM

Construction traffic noise levels were predicted within each CNEA for each of the three worst-case construction traffic scenarios, shown in Table 5-4 and summarized as follows:

- Maximum Haul Route Traffic Volumes (during “Building Construction” phase for building A and “Demolition and Site Preparation” and “Grading and Ground Improvements” phases for building B)
- Maximum Concrete Route Traffic Volumes (during “Building Construction” phase for building A and “Grading and Ground Improvements” and “Building Construction” phases for building B)
- Maximum Worker Route Traffic Volumes (during “Sitework” phase for building B and “Building Envelope and Interior Buildout” phase for both buildings.)

Using the highest predicted noise levels generated by any of the three studied scenarios, Table 5-5 shows predicted construction traffic noise levels within each CNEA, along with the relative increase in existing noise levels, and shows that construction traffic would not cause a measurable increase in overall traffic noise levels in the project vicinity.

Table 5-5 Construction Traffic Noise Prediction and Comparison

CNEA ID	Measured Daytime L_{eq} (dBA)	Worst-Case Construction Traffic Daytime L_{eq} (dBA)	Aggregate Daytime L_{eq} (dBA)	Difference
1	65	45	65	0
2	71	58	71	0
3	70	58	71	0[1]
4	77	35	77	0
5	79	43	79	0
6	77	44	77	0
7	71	42	71	0
8	78	46	78	0
9	66	40	66	0
10	68	42	68	0
11	72	43	72	0

Notes:

[1] Decibel values presented in this table are rounded to the nearest whole decibel. The actual value for Measured Daytime L_{eq} is 70.3 and Aggregate Daytime L_{eq} is 70.6, resulting in a difference of 0.3 dBA.

CNEA = common noise equivalent area
CNEL = community noise equivalent level
dBA = A-weighted decibels;

Source: Compiled by AECOM

5.1.4 Construction Vibration

Pavement and concrete breaking, grading, and drilling activities would generate groundborne vibration levels and would be the primary concern for vibratory impacts on structures and human receptors. As discussed in Section 2.2, vibratory potential damage criteria for frequent vibration events range from 0.25 PPV in/sec for historic buildings to 0.5 PPV in/sec for modern industrial/commercial buildings. In addition, residences and buildings where people normally sleep could experience sleep interference with vibration levels between 72 and 80 VdB.

The nearest existing structures to project grading or drilling activities would be approximately 70 feet from the closest project building façade. At this distance, the worst-case construction vibration level, which would be generated by the operation of a hoe ram during existing foundation demolition, is estimated to be approximately 0.029 PPV in/sec, which would be below any potential structural damage criterion.

No establishments featuring vibration-sensitive activities (e.g., medical laboratories) were identified in the project area. The closest structure within which people would sleep is approximately 440 feet from the closest edge of the

project construction boundary. Due to nighttime construction activity restrictions, the only notable nighttime vibration sources would be loaded trucks used for transporting cement and/or cranes. A loaded truck at a distance of 440 feet from the nearest residential receptor would generate a vibration level of approximately 49 VdB, approximately 23 VdB below the minimum level that could result in sleep interference (72 VdB).

5.2 Project Operation

5.2.1 Traffic Noise

The following data were used to characterize and quantify the daytime, evening, and nighttime traffic data that were used as inputs for the traffic noise model.

5.2.1.1 Project Total Vehicle Volumes (Daily Average)

Peak-hour PM traffic data per roadway was converted to an average daily traffic (ADT) volume using the common peak-hour conversion multiplier of 10. The studied roadway segments and associated ADT values are shown in Table 5-6.

Table 5-6 Studied Roadway Segments with Existing and Future (with Project) ADT Volumes

Roadway Segment	Existing ADT	Existing with Project ADT	ADT Increase because of Project Traffic
Jerrold Avenue, east of Toland Street westbound	2,125	2,470	345
Jerrold Avenue, east of Toland Street eastbound	2,125	2,470	345
Jerrold Avenue, west of Toland Street	4,510	6,430	1,920
Kirkwood Avenue, Selby Street to Rankin Street	360	780	420
Kirkwood Avenue/Toland Street to Selby Street	270	1,180	910
McKinnon Avenue, Selby Street to Rankin Street	720	1,330	610
McKinnon Avenue, Toland Street to Selby Street	570	1,580	1,010
McKinnon Avenue, west of Toland Street	830	830	0
Oakdale Avenue, east of Toland Street	8,700	9,290	590
Oakdale Avenue, west of Toland Street	9,630	9,880	250
Rankin Street, entrance at Rankin Street to Kirkwood Avenue	720	1,920	1,200
Rankin Street, McKinnon Avenue to entrance at Rankin Street	720	1,330	610
Rankin Street, Kirkwood Avenue to Jerrold Avenue	1,060	2,640	1,580
Selby Street, entrance at Selby Street to Kirkwood Avenue	-	930	930
Selby Street, McKinnon Avenue to entrance at Selby Street	-	2,190	2,190
Selby Street, north of Kirkwood Avenue	90	90	0
Selby Street, south of McKinnon Avenue	250	1,550	1,300
Toland Street, entrance at Toland Street to Kirkwood Avenue	3,260	5,500	2,240
Toland Street, Jerrold Avenue to Evans Avenue	3,450	4,970	1,520
Toland Street, Kirkwood Avenue to Jerrold Avenue	3,530	6,290	2,760
Toland Street, McKinnon Avenue to entrance at Toland Street	3,260	4,770	1,510
Toland Street, Oakdale Avenue to McKinnon Avenue	3,100	3,610	510

Notes:

ADT = average daily traffic

Source: Adavant Consulting/LCW Consulting (Adavant), 2021, 749 Toland Street and 2000 McKinnon Avenue Project Estimation of Project Travel Demand, December.

5.2.1.2 Project Vehicle Classification

Project vehicles would vary in type and quantity, with each discrete project tenant and/or use. The Final Estimation of Project Travel Demand, prepared by Adavant Consulting/LCW Consulting[20] provides a distribution of vehicle classifications for each specified use and a subsequent total distribution of vehicle types, as summarized in Table 5-7.

Table 5-7 Overall Project Average Daily Traffic Vehicle Volumes and Classifications per Project Land Use

Project Use Type	Autos (including vans)	Medium Trucks	Heavy Trucks	Total
Onsite Workers	3,030	0	0	3,030
Maker and Manufacturing	110	22	2	134
Parcel Delivery and Last-Mile Delivery	2,016	292	120	2,428
Wholesale and Storage	302	242	60	604
General Retail/Café/Quick Service	524	6	0	530
Total Project Vehicle Trips (ADT)	**5,982**	**556**	**182**	**6,196**
Traffic from Existing Uses Removed by Project	554	132	14	700
Net New Vehicle Trips (ADT)	**5,428**	**424**	**168**	**5,496**

Note:

ADT = Average Daily Traffic
Medium Trucks = Vehicles with two axles and six tires (e.g., box trucks)
Heavy Trucks = Vehicles with three or more axles

Source: Adavant 2021, Travel Demand Memorandum, Appendix F – Table 1, Appendix D – Existing Site Total Warehouse Summary

5.2.1.3 Project Vehicle Distribution by Time and Vehicle Type

As discussed previously in this section, the daily traffic volumes for each vehicle classification do not consider the late-night/early-morning operations by medium and heavy trucks that could occur from project parcel delivery and last-mile delivery uses. These data serve to establish discrete ratios of vehicle classification volumes across the daytime, evening, and nighttime periods, which are weighted conservatively toward nighttime heavy truck operation. Table 5-8 summarizes these data, which are calculated averages between the two facilities. Detailed tables and vehicle breakdowns are provided in Appendix B.

Table 5-8 Summary of 24-Hour Vehicle Distribution Data

	Percent Distribution Across 24-Hour Period per Vehicle Class		
Vehicle Class	Daytime (7 a.m. to 7 p.m.)	Evening (7 p.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
Autos (including vans)	76.1%	9.6%	14.3%
Medium Trucks	84.6%	9.9%	5.5%
Heavy Trucks	22.1%	13.5%	64.4%

Source: Adavant Consulting/LCW Consulting (Adavant), 749 Toland Street and 2000 McKinnon Avenue Project Estimation of Project Travel Demand, 2021 (December).

The majority of heavy truck traffic activity would occur during the nighttime period for parcel delivery/last-mile delivery facility operations. Although traffic associated with project operation would include non-parcel delivery/last-mile delivery uses that would follow normal business hours, the percentages shown above were incorporated into the traffic noise model inputs, to ensure a conservatively representative assessment of traffic noise, weighted toward nighttime heavy truck operation.

Table 5-9 summarizes the 24-hour traffic volume, auto mix, and truck mix inputs for each modeled building ramp pair. A detailed, step-by-step description of how these volumes were determined is provided in Appendix B.

[20] Adavant Consulting/LCW Consulting (Adavant), 749 Toland Street and 2000 McKinnon Avenue Project Estimation of Project Travel Demand, 2021 (December).

Table 5-9 Project Building Internal Ramp Traffic Volume Inputs per Building

	Daytime (hourly)	Evening (hourly)	Nighttime (hourly)
Circulating through Level 1			
Hourly Average Volume	211	109	56
Auto Mix	90%	88%	85%
Medium Truck Mix	10%	8%	3%
Heavy Truck Mix	1%	4%	12%
Ramps between L1 and L2			
Hourly Average Volume	176	90	46
Auto Mix	90%	89%	88%
Medium Trucks	9%	8%	3%
Heavy Trucks	1%	3%	9%
Ramps between L2 and L3			
Hourly Average Volume	138	70	36
Auto Mix	91%	90%	91%
Medium Trucks	9%	8%	3%
Heavy Trucks	0%	2%	6%
Ramps between L3 and L4			
Hourly Average Volume	101	51	25
Auto Mix	100%	100%	100%
Medium Trucks	0%	0%	0%
Heavy Trucks	0%	0%	0%

Source: Data compiled by AECOM

The modeling for traffic noise on the vehicle ramps assumed that vehicles were traveling approximately 6 mph. Vehicles assigned to ascending ramps were assigned a full-throttle engine status, increasing their noise emission by approximately 9 dBA.

Using the traffic volumes, mix, and 24-hour distributions from the building ramp analyses, Table 5-10 summarizes the inputs assigned to each area source.

Table 5-10 Logistics Yard Medium and Heavy Truck Volumes and Distributions

Logistics Yard	Vehicle Type	Daytime Total Volume	Evening Total Volume	Nighttime Total Volume
Level 1	Medium Trucks	57	7	4
	Heavy Trucks	3	2	10
Level 2	Medium Trucks	31	4	2
	Heavy Trucks	3	2	10
Level 3	Medium Trucks	30	4	2
	Heavy Trucks	3	2	9

Notes:

Automobiles (e.g., cars and vans) were not assumed in the area source determinations within logistics yard levels because they are presumed to be using each level primarily for the purpose of parking; and also because their acoustic contributions, relative to medium and heavy truck engine idling, are negligible.

Source: Compiled by AECOM

5.2.1.4 Project Vehicle Noise Levels on Studied CNEAs

Onsite and offsite traffic noise would vary by both vehicle trips and vehicle type throughout each 24-hour operating period. Project-only traffic noise levels within each studied CNEA are shown in Table 5-11.

CNEAs would experience project traffic noise levels ranging from 59 to 71 dBA, CNEL. Table 5-12 shows potential project-related traffic noise compared with existing traffic noise levels for each studied area.

Table 5-11 Summary of Predicted Project Traffic Noise Levels

CNEA ID	Onsite Traffic Noise (CNEL, dBA)	Offsite Traffic Noise (CNEL, dBA)	Combined Total Project-Only Traffic Noise (CNEL, dBA)
CNEA 1	53	51	55
CNEA 2	65	62	67
CNEA 3	61	56	62
CNEA 4	52	45	52
CNEA 5	55	57	59
CNEA 6	66	61	67
CNEA 7	53	55	57
CNEA 8	46	58	58
CNEA 9	52	53	56
CNEA 10	65	59	66
CNEA 11	49	59	60

Notes:

CNEA = common noise equivalent area
CNEL = community noise equivalent level
dBA = A-weighted decibels

Source: Compiled by AECOM

Table 5-12 Predicted Project Traffic Noise Level Increase over Existing Noise Level

CNEA ID	CNEA Contains Noise-Sensitive Land Uses?	Existing Traffic Noise Level within CNEA (CNEL, dBA)	Predicted Project Traffic Noise Level (CNEL, dBA)	Existing + Project Traffic Noise Level (CNEL, dBA)	Relative Increase over Existing Traffic Noise Level (dBA)
CNEA 1	No	66	55	67	0
CNEA 2	No	71	67	72	+1

Notes:

Decibel values presented in this table are rounded to the nearest whole decibel. Therefore, the logarithmic and arithmetic calculations may be inconsistent with expectations.

CNEA = common noise equivalent area
CNEL = community noise equivalent level
dBA = A-weighted decibels

Source: Compiled by AECOM

All CNEAs containing noise-sensitive land uses experience existing traffic noise levels in excess of conditionally acceptable criteria pursuant to the general plan. Table 5-10 shows that traffic noise levels at CNEAs containing noise-sensitive land uses would increase by a maximum of 1 dBA.

CNEA 10, the area surrounding the project site to the southeast and east (made up of warehouse, storage, distribution, and San Francisco Public Utilities Commission land uses), would experience the largest traffic noise increase of 2 dBA.

5.2.2 Fixed-Source Operations

Fixed-source operations associated with typical project operations would include the HVAC systems and testing of the emergency power generator systems.

5.2.2.1 Heating, Ventilation, and Air Conditioning

The project structures would require the following three discrete mechanical systems:

- **Logistics yard ventilation:** Non-ducted system of ceiling-mounted ventilation fans to exhaust air from the logistics yards; these units would be on the proposed buildings' northwestern and southeastern façades, at building levels one through three.
- **Interior space ventilation:** Ducted ventilation systems serving interior PDR spaces within the buildings; these units would be on the proposed buildings' rooftops.
- **Interior space air conditioning:** Ducted split air conditioning (AC) systems serving interior accessory office and retail spaces in the buildings; condenser units associated with the split AC systems would be on the proposed buildings' rooftops.

To ensure a worst-case operational scenario for these systems, the stationary operational noise analysis assumed an event during which carbon dioxide detection systems on all three project logistics yard levels would reach ventilation system activation levels. This would result in full-power, simultaneous operation of logistics yard ventilation units throughout both project buildings. Considering rooftop ventilation unit operation, this unlikely worst-case scenario would generate a combined ventilation flow rate of more than 1 million cubic feet per minute. Table 5-13 lists the units assumed for each HVAC source and their relative unweighted sound power levels.

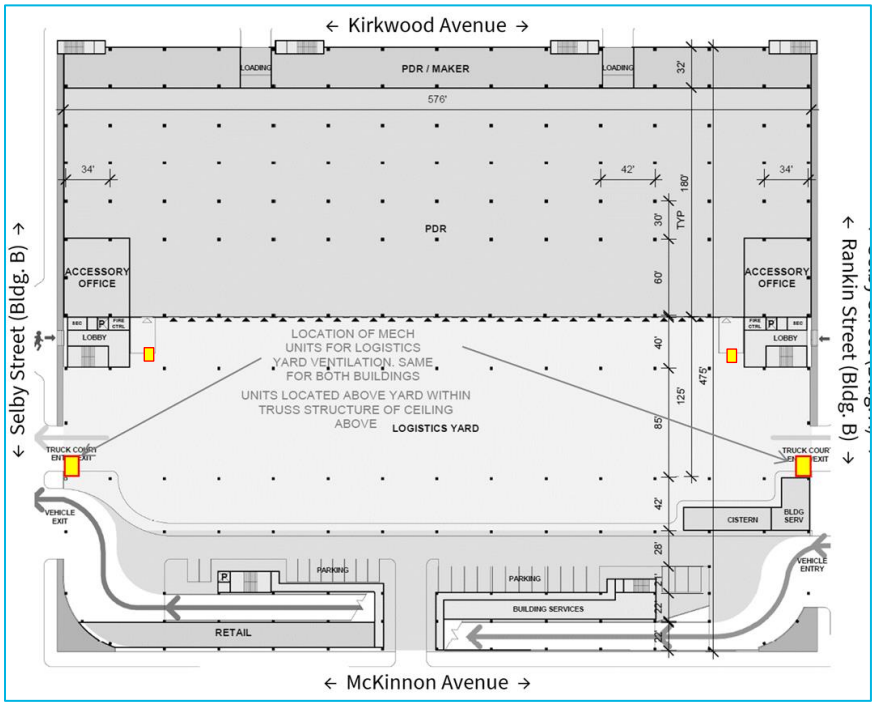
Table 5-13 Project HVAC Sound-Generating Sources

System Association	Type	Quantity per Project Building	Unweighted Sound Power Levels
Logistics Yard Ventilation System	Ceiling-Mounted Ventilation Fan	10	98
PDR Ventilation System	Rooftop Ventilation Fan	8	101
PDR Accessory Office Split AC System	Rooftop Condenser Fan Array	3	89
Retail Split AC System	Rooftop Condenser Fan Array	1	87

Notes:

Manufacturer reference sound level data and conversions are provided in Appendix B. Each building features six discrete rooftop HVAC areas. To model the 12 rooftop units of this table (i.e., the sum of ventilation and condenser fan arrays), each of the six rooftop areas was modeled assuming one condenser fan array and two ventilation fans. This generated a worst-case scenario for each of the six rooftop areas

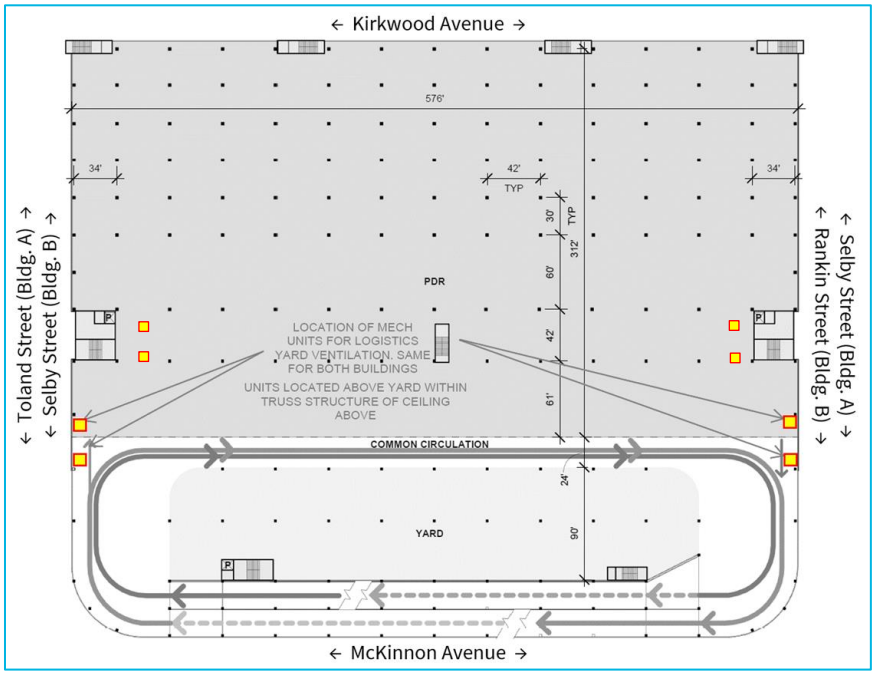
AC = air conditioning



dB = decibel

HVAC = heating, ventilation, and air conditioning

PDR = production, distribution, and repair



Source: Compiled by AECOM

Figure 5-1, Figure 5-2, and Figure 5-3 show the proposed locations of these units on each project building level, which would be the same for both buildings. Logistics yard ventilation fan locations shown in Figure 5-1 and Figure 5-2 may represent multiple ceiling-mounted ventilation fan units.

Figure 5-3 Locations of Rooftop Ventilation and Condenser Units

Façade ventilation units for the logistics yards were modeled as vertical area sources at an elevation of the ceiling height for each building level. Rooftop mechanical equipment were modeled as individual point sources at each of the six locations shown in Figure 5-3, at 5 feet above the rooftop elevation. Discrete locations of individual rooftop mechanical units have yet to be defined; thus, this analysis assumed an even distribution of HVAC equipment across the six rooftop mechanical areas for each building, resulting in a combined equipment unweighted noise level of approximately 102 dB sound power level at each location. Figure 5-4 shows a three-dimensional axonometric view of the stationary operations prediction model with equipment call-outs.

Figure 5-4 Axonometric View of the Stationary Operations Noise Prediction Model from West

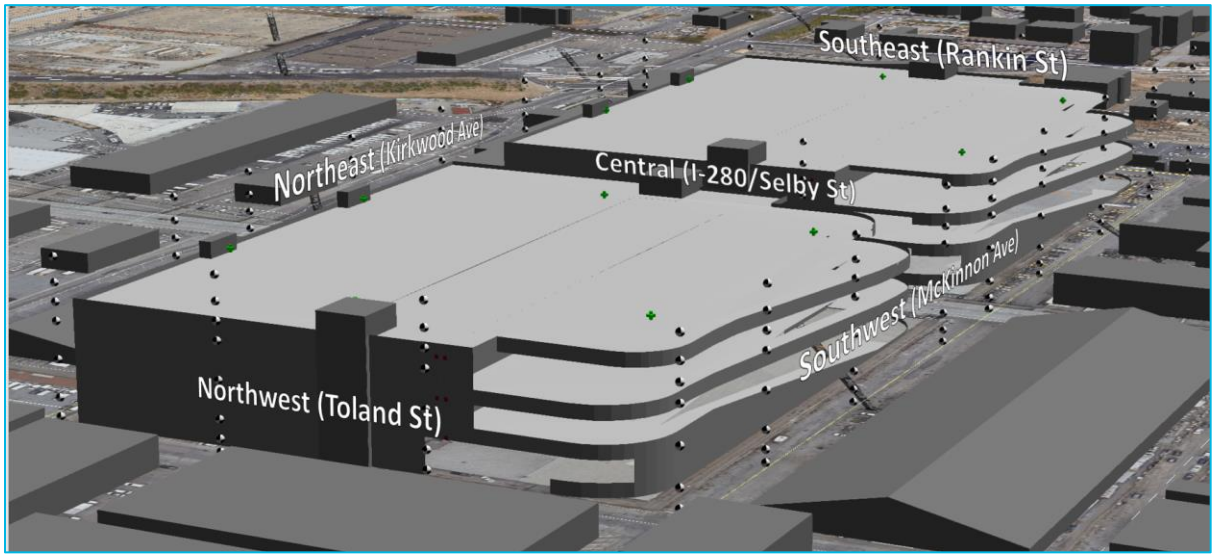
Determination of Article 29 2909(b) Criteria

Article 2909(b) limits noise from the combination of all project stationary sources to an 8 dBA or lower increase over ambient noise levels along the project property plane. Table 5-14 summarizes existing ambient noise levels along each property plane and the resulting project stationary source noise limits.

Table 5-14 Ambient Noise Levels at Property Planes and Stationary Noise Source Limits

Project Property Boundary	Associated Adjacent CNEA ID[1]	Lowest Measured Existing 10-minute L_{90} (dBA)	Stationary Noise Source Requirement (for Section 2909(b) compliance) (L_{90} + 8 dBA)
Northwest (Toland Street)	CNEA 2	51	59
Southeast (Rankin Street)	CNEA 10	50	58
Central (I-280/Selby Street)	CNEA 6	51	59
Southwest (McKinnon Avenue)	CNEA 6	51	59
Northeast (Kirkwood Avenue)	CNEA 8	52	60

Notes:



1. Although CNEAs are not drawn to meet the actual project property plane on map figures, they are being used in this table to delineate the side of the project property plane at which the existing L_{90} values are assigned to determine compliance criteria.

CNEA = common noise equivalent area
dBA = A-weighted decibels
L_{90} = sound level exceeded for 90 percent of measurement period

Source: Compiled by AECOM

Assessment of Article 29 2909(b) Compliance

To assess project fixed-source operation noise levels consistent with the article 29 (2909[b]) requirements, receiver points were modeled along multiple property boundary locations, at elevations of 5, 15, 30, 60, 90, 105, 120, and 140 feet. These elevations aligned the modeled receiver points with project fixed-source heights and elevations, where lines-of-sight to rooftop sources were maximized for a worst-case analysis. Figure 5-5 shows a three-dimensional view of these vertical receiver arrays.

Source: Compiled by AECOM

Figure 5-5 Axonometric View of Modeled Vertical Receiver Arrays at the Property Plane

Table 5-15 shows the maximum predicted noise levels generated from onsite project operation at each project property plane. Predicted operation noise levels were compared with calculated noise level limits associated with these property boundaries.

Table 5-15 Predicted Project Fixed-Source Operation Noise Levels at Property Planes

Project Property Boundary	Fixed-Source Noise Limit (measured L_{90} + 8 dBA)	Highest Predicted Fixed-Source Noise Level along Property Plane (L_{eq}, dBA)	Elevation of Highest Noise Level along Property Plane (feet)	Exceeds Noise Limit?	Noise Reduction Required for Article 29 Compliance (dBA)
Northwest (Toland Street)	59	77	30	Yes	-16
Southeast (Rankin Street)	58	74	60	Yes	-16
Central (I-280/Selby Street)	59	74	30	Yes	-15
Southwest (McKinnon Avenue)	59	64	30	Yes	-4
Northeast (Kirkwood Avenue)	60	62	60	Yes	-2

Notes:

Decibel values presented in this table are rounded to the nearest whole decibel. Therefore, the logarithmic and arithmetic calculations may be inconsistent with expectations.

Article 29 refers to Section 2909(b)

dBA = A-weighted decibels
I-280 – Interstate 280
L_{eq} = equivalent-energy sound pressure level
L_{90} = sound level exceeded for 90 percent of measurement period

Source: Compiled by AECOM

Predicted fixed-source noise levels that are expected to be generated by the proposed project would exceed the article 29 requirement (8 dBA above ambient) at all project property boundaries by 2 to 18 dBA. Implementation of noise reduction measures would be required for fixed-source noise sources, to achieve compliance with the article 29 requirements (section 2909[b]).

Assessment of Article 29 2909(d) Compliance

Table 5-16 shows predicted noise levels generated from onsite project operation at the nearest residential receptors. Predicted operation noise levels were compared with the article 29 section 2909(d) requirements to establish a maximum allowable interior noise level rating.

Predicted fixed-source noise levels expected to be generated by the proposed project would range from 15 to 23 dBA at the interior locations of the nearest residential structures. These values would not exceed the lowest article 29 (Section 2909[d]) interior noise level limit of 45 dBA.

5.2.2.2 Emergency Generators

The proposed project would install two emergency generator units to prevent operational restrictions during periods of grid failure. Each building would be outfitted with one 400-horsepower, 400-kilovolt-ampere (kVA) generator. The Bay Area Air Quality Management District permit requirements would limit the number of allowable testing hours to 50 hours per year per generator unit.

Consistent with the air quality model, the noise analysis assumed that these units would be at ground level along the northeastern perimeter of the project site along Kirkwood Avenue, with an exhaust stack height of 12 feet. The reference noise source level input into the model for each of the two units was 69.9 dBA at 23 feet (Caterpillar 2020).[21] This level is representative of the 75 percent-load reference sound level of a slightly larger 450 kVA emergency generator.

[21] Caterpillar, 2020, Specification Sheet: LEHX0031-06 Model XQP500 500 kVA Generator.

Table 5-16 Predicted Project Fixed-Source Operation Noise Levels at Residential Receptors

Receiver Point	Approximate Distance from Project Site Boundary (feet)	Predicted Fixed-Source Noise Level at Residential Façade (Exterior) (L_{eq}, dBA)	Interior Noise Level Assuming 10 dBA[1] Open-Window Noise Reduction (L_{eq}, dBA)	Nighttime Interior Noise Level Limit for Article 29 Compliance (dBA)	Exceeds Noise Limit?
2018-2022 Oakdale Avenue, 1st Floor	445	41	31	45	No
2018-2022 Oakdale Avenue, 2nd Floor	445	44	34	45	No
2039 Oakdale Avenue, 1st Floor	600	40	30	45	No
2039 Oakdale Avenue, 2nd Floor	600	42	32	45	No
1987 Oakdale Avenue, 1st Floor	600	41	31	45	No
1987 Oakdale Avenue, 2nd Floor	600	44	34	45	No
1996 Palou Avenue, 1st Floor	745	46	36	45	No
1996 Palou Avenue, 2nd Floor	745	47[2]	37	45	No

Notes:

1. An exterior to interior transmission loss of 10 dBA was assumed for the studied receptors, which is representative of typical residential building construction with windows open. Federal Highway Administration (FHWA), Highway Traffic Noise: Analysis and Abatement Guidance, 2011 (December).
2. Counter to typical expectations, predicted operational noise levels show a pattern of increasing with distance from the project noise sources. This is a result of vicinity terrain sloping upward with distance. The closest homes benefit from notable line-of-sight shielding from project noise sources due to adjacent multi-story buildings. However, at greater distances from the project, homes at higher elevations on the hillside are afforded a direct line-of-sight to project noise sources, resulting in higher predicted noise levels. The noise level predicted at the second story of 1996 Palou Avenue (a single-family home) represents the highest predicted fixed-source noise level calculated at any residential receptor in the study area (i.e., including homes farther up the slope that also experience a direct line-of-sight to project noise sources).

Article 29 refers to Section 2909(d).

dBA = A-weighted decibels
L_{eq} = equivalent-energy sound pressure level

Source: Compiled by AECOM

Emergency generator testing typically would need to occur once per month, during daytime hours, to help ensure that the equipment was working properly and could be relied on to operate during actual emergencies. Because of the location of the generator units on the northwest side of the project buildings (along McKinnon Avenue), generator operational noise at the nearest noise-sensitive receptors would be reduced substantially by the shielding effects of project and non-project structures. Emergency generator noise at the nearest noise-sensitive receptor would be approximately 21 dBA, L_{eq}, a noise level that would be wholly inaudible in the existing urban acoustic environment during both daytime and nighttime hours. For reference, a whisper is approximately 20 to 25 dBA to a listener. Considering a 10 dBA reduction from the residential building shell with open windows, interior noise levels would be below the 55 dBA, L_{eq} daytime noise limit in article 29, section 2909(d).

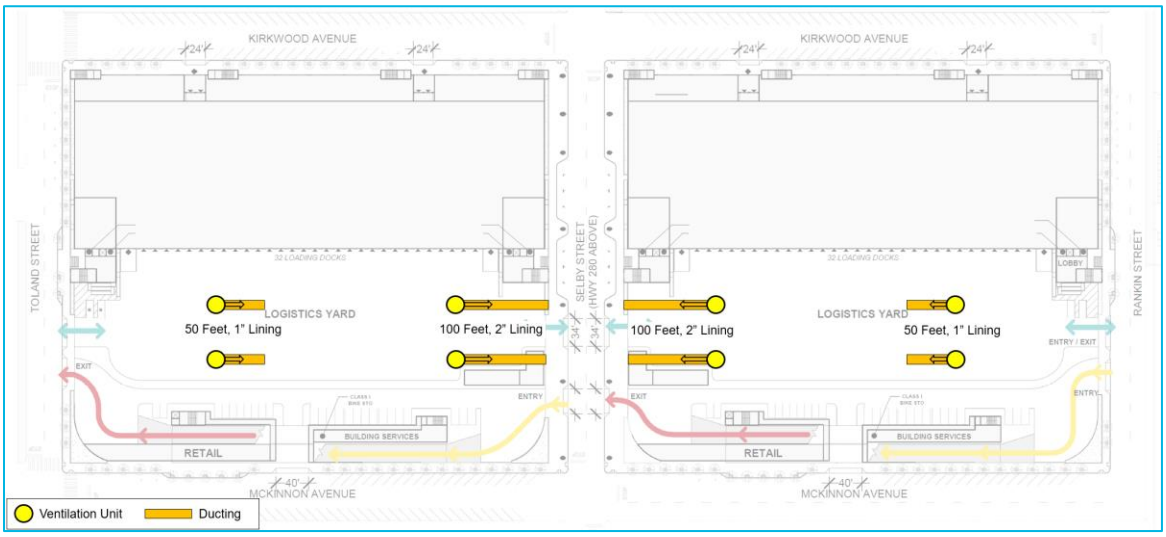
To assess project fixed-source operation noise levels at the property plane, receiver points were modeled along the northeastern property boundary along Kirkwood Avenue, matching those used in the fixed-source model. The maximum predicted noise level generated from emergency generator testing and emergency operation at the northeastern property plane was 68 dBA.

6. Recommended Noise Attenuation Measures

6.1 Limitations on Recommendations

The recommendations described herein are based on noise source assumptions determined to be representatively appropriate in the absence of project-specific mechanical designs and equipment. As project mechanical system designs progress, specific recommendations may be further refined and updated based on the available information.

6.2 Project Ventilation System



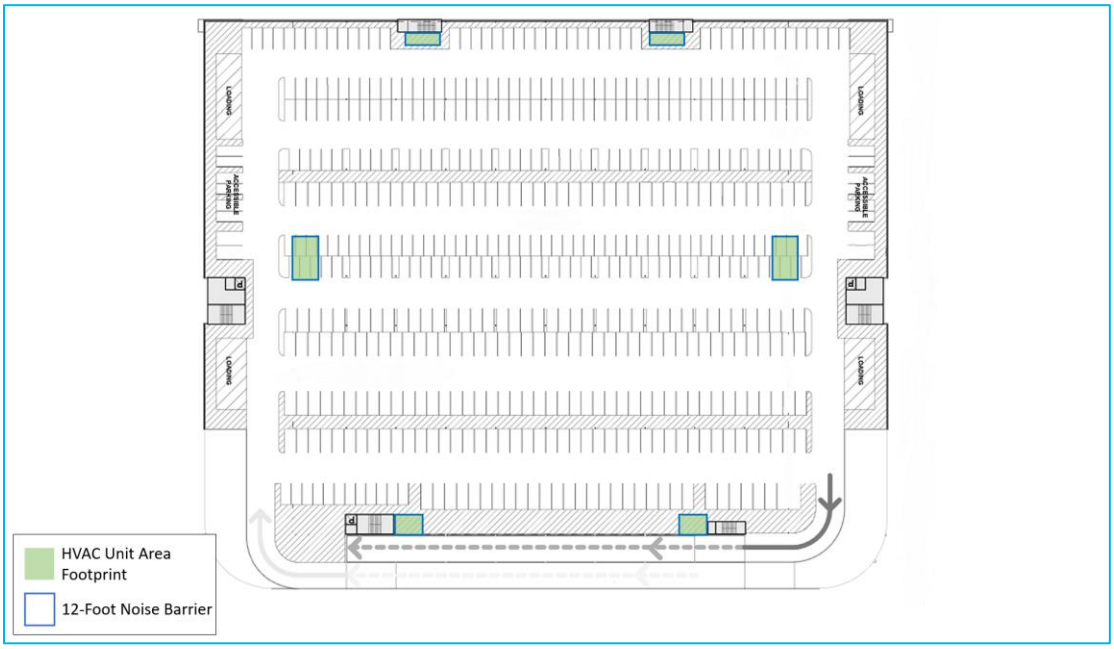
Noise expected to be generated by the logistics yard ventilation system is the primary cause of predicted non-compliance with the article 29 requirements at elevations below the project buildings' rooftop heights. The current location of these units, exhausting outward from the building façades, would result in exceedances of the article 29 requirements for stationary noise sources at the project property boundary. Implementation of the following two measures, or equivalent or more effective measures, would achieve compliance with the property plane requirements in section 2909(b) of article 29.

6.2.1 Ventilation Routing

Routing or directing the ventilation units to exhaust away from the adjacent land uses (i.e., outside the property planes) would reduce project operational noise levels at the property planes. Although the two project buildings would be bisected by Selby Street and I-280, the legal property lines of the two properties are adjoined at the center of this public right-of-way. Rerouting the ventilation units to exhaust inward toward this shared property line (i.e., toward the opposing project building on either side) would reduce project-generated noise at the surrounding noise-sensitive and non-noise-sensitive land uses. Although this adjustment would greatly reduce operational noise levels by up to 27 dBA at the northwestern and southeastern property planes, the redirection of ventilation units toward the shared, central property line would increase noise levels by up to 7 dBA along Selby Street and along portions of McKinnon Avenue and Kirkwood Avenue. Therefore, additional attenuation measures would be required to achieve compliance with the article 29 requirements at these specified locations, as described below.

6.2.2 Acoustically Treated Ducting

To address noise levels at the southwestern and northeastern property line intersections with Selby Street and I-280, a scenario was modeled that assumed approximately 100 feet of 2-inch-thick, acoustically lined ducting and 50 feet of 1-inch-thick, acoustically lined ducting from a more centralized ventilation unit arrangement on each building level. Figure 6-1 shows a graphic representation of the assumed ventilation system measures.

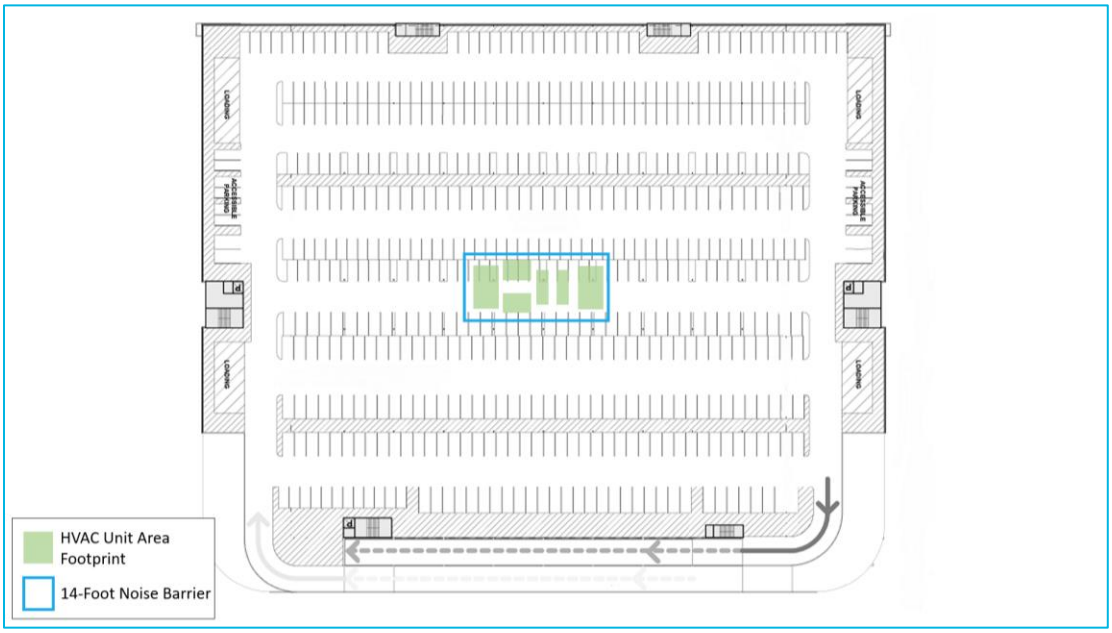


Source: Jackson Liles Architects (JLA), SF Gateway Conditional Use Authorization/Planned Unit Development Application, 749 Toland Street/ 2000 McKinnon, 2019 (October). Adapted by AECOM.

Figure 6-1 Approximate Ventilation System Rerouting and Minimum Ducting Specifications per Building Level

The project sponsor also may implement quieter ventilation fan units, duct silencers, or acoustical louvers at the outlets of the ventilation system at its terminations with the two building edges. These measures or combinations thereof should be analyzed and recommended by an acoustical consultant as a requirement for building permit approval.

6.3 Project Rooftop HVAC System



Noise generated by the operation of HVAC units on the project rooftops also would be a cause of predicted non-compliance with the article 29 requirements at elevations above the two buildings' rooftop heights. Several barrier-type noise attenuation measures around the dominant rooftop noise sources were modeled to assess their effectiveness at reducing noise. Implementation of a 12-foot-tall barrier surrounding each of the six rooftop unit areas was determined to comply with the article 29 requirements at all property plane assessment elevations. This HVAC system arrangement, shown in Figure 6-2, would allow HVAC unit areas to remain in their original locations with implementation of 12-foot-tall noise barriers.

Source: Jackson Liles Architects (JLA), SF Gateway Conditional Use Authorization/Planned Unit Development Application, 749 Toland Street/2000 McKinnon, 2019 (October). Adapted by AECOM.

Figure 6-2 Example of article 29-Compliant Rooftop HVAC Unit Layout with 12-foot-tall Noise Barrier, per Building

Nominal additional noise attenuation could be achieved with centralization of the HVAC units at the rooftop center. Figure 6-3 shows a graphic representation of an alternative, compliant rooftop system arrangement that would offer slightly greater noise reduction along certain property planes.

Source: Jackson Liles Architects (JLA), SF Gateway Conditional Use Authorization/Planned Unit Development Application, 749 Toland Street/ 2000 McKinnon, 2019 (October). Adapted by AECOM.

Figure 6-3 Example of Alternative, article 29-Compliant Rooftop HVAC Unit Layout with Centralized Arrangement and a 14-foot-tall Noise Barrier, per Building

The preceding description of noise attenuation measures includes rerouting of the ventilation units to exhaust away from surrounding land uses and toward I-280, as shown in Figure 6-1; installation of acoustical lining inside ventilation ducts; and two options for rooftop HVAC unit noise reduction, as shown in Figure 6-2 and Figure 6-3. Table 6-1 provides the noise levels that would result if project implementation includes rerouting the ventilation units, the acoustical lining inside ventilation ducts, and the rooftop HVAC unit layout and barriers as depicted in Figure 6-2. The table shows the predicted noise levels relative to the 2909(b) standards at the property plane and to the 2909(d) standards at the interior of the nearest residential receptors. The predicted noise levels at these locations assume that all fixed-source operational equipment is active, as described in Section 5.2.2 and Appendix B.5. Table 6-2 provides the noise levels that would result if project implementation includes the same noise reduction measures used for Table 6-1, except that the rooftop HVAC units are configured as shown in Figure 6-3.

Table 6-1 Predicted Operational Noise Levels with Minimum Noise Attenuation Measures

Assessed Property Plane/ Receiver	Applicable Article 29 Criterion	Applicable Article 29 Limit (dBA, L_{eq})	Predicted Highest Noise Level with Noise Attenuation Measures Implemented (dBA, L_{eq})	Compliant with Article 29 Criterion?
Northwest (Toland Street)	2909(b)	59	53	Yes
Southeast (Rankin Street)	2909(b)	58	52	Yes
Central (I-280/Selby Street)	2909(b)	59	58	Yes
Southwest (McKinnon Avenue)	2909(b)	59	59	Yes
Northeast (Kirkwood Avenue)	2909(b)	60	55	Yes
2018-2022 Oakdale Avenue (residential receptor)	2909(d)	45	34	Yes[1]
2039 Oakdale Avenue (residential receptor)	2909(d)	45	33	Yes[1]
1987 Oakdale Avenue (residential receptor)	2909(d)	45	33	Yes[1]
1996 Palou Avenue (residential receptor)	2909(d)	45	33	Yes[1]

Notes:

The analyzed scenario assumed the minimum-required HVAC relocation approach depicted in Figure 6-2.

1. Predicted project operational noise levels at all residential properties were determined to be compliant with Section 2909(d) without noise attenuation measures, as shown in Table 5-16. These properties are included here to show potential future noise levels with the measures considered. Note that the nighttime interior noise limits of 45 dBA for the residential receptors are different from the exterior noise limits used to determine Section 2909(b) compliance.

dBA = A-weighted decibels
HVAC = heating, ventilation, and air conditioning
I-280 = Interstate 280
L_{eq} = energy-average sound level (1-hour)

Source: Compiled by AECOM 2022

Table 6-2 Predicted Operational Noise Levels with Alternative Rooftop Noise Attenuation Measures

Assessed Property Plane/ Receiver	Applicable Article 29 Criterion	Applicable Article 29 Limit (dBA, L_{eq})	Predicted Highest Noise Level with Noise Attenuation Measures Implemented (dBA, L_{eq})	Compliant with Article 29 Criterion?
Northwest (Toland Street)	2909(b)	59	53	Yes
Southeast (Rankin Street)	2909(b)	58	52	Yes
Central (I-280/Selby Street)	2909(b)	59	58	Yes

Northeast (Kirkwood Avenue)	2909(b)	60	50	Yes
2018-2022 Oakdale Avenue (residential receptor)	2909(d)	45	33	Yes[1]
2039 Oakdale Avenue (residential receptor)	2909(d)	45	33	Yes[1]
1987 Oakdale Avenue (residential receptor)	2909(d)	45	32	Yes[1]
1996 Palou Avenue (residential receptor)	2909(d)	45	33	Yes[1]

Notes:

The analyzed scenario assumed the minimum-required HVAC relocation approach depicted in Figure 6-3.

1. Predicted project operational noise levels at all residential properties were determined to be compliant with Section 2909(d) without noise attenuation measures, as shown in Table 5-16. These properties are included here to show potential future noise levels with the measures considered. Note that the nighttime interior noise limits of 45 dBA for the residential receptors are different from the exterior noise limits used to determine Section 2909(b) compliance.

dBA = A-weighted decibels
HVAC = heating, ventilation, and air conditioning
I-280 – Interstate 280
L_{eq} = energy-average sound level (1-hour)

Source: Compiled by AECOM 2022

7. Conclusion

Without implementation of noise control measures, the proposed project's fixed-noise sources would result in exceedances of section 2909(b) requirements. However, design measures described above could be incorporated into the proposed project. These design measures—which include redirection of ventilation units, installation of acoustically lined ducts for ventilation units, and implementation of barriers for rooftop HVAC units—would meet article 29 noise limits at all property planes and noise-sensitive receptors. Other design measures, such as centralizing the rooftop HVAC layout behind a continuous barrier while maintaining recommended ventilation unit measures, would further reduce noise levels at some property planes by up to 7 dBA.

A.3 Summary of Short-Term Measurement Data

M2 Daytime (Morning)

Date	Time	L_{eq}	L_{min}	L_{max}	L(10)	L(50)	L(90)
2018-08-01	11:18	64.5	71.0	56.8	69.1	60.5	57.4
2018-08-01	11:19	65.0	72.0	57.9	69.9	62.2	58.3
2018-08-01	11:20	68.0	77.4	59.3	72.3	64.4	60.9
2018-08-01	11:21	65.6	73.2	58.5	70.1	61.8	59.1
2018-08-01	11:22	66.4	76.8	58.0	70.7	61.2	58.8
2018-08-01	11:23	67.6	77.2	58.5	70.5	65.0	59.4
2018-08-01	11:24	62.9	70.9	56.4	66.8	59.4	56.7
2018-08-01	11:25	68.2	76.6	58.1	71.4	66.3	59.5
2018-08-01	11:26	65.0	73.0	57.6	68.7	61.5	58.1
2018-08-01	11:27	66.9	73.5	59.3	71.6	63.6	60.3
Summary:		**66.3**	**77.4**	**56.4**	**70.1**	**62.6**	**58.9**

Noise Sources and Observations: Traffic on Toland Street and delivery truck idling at nearby produce facility.

M2 Nighttime

Date	Time	L_{eq}	L_{min}	L_{max}	L(10)	L(50)	L(90)
2018-08-01	22:46	59.4	61.2	57.9	59.9	59.5	58.4

		10:39	Daytime	67.2	61.0	6.2	Nighttime	9.6
		-	-	-	-	-	Evening	8.2

1. Evening CNEL-Period deltas are calculated as an average of the daytime and nighttime deltas. In cases where two daytime ST measurements were conducted at a single measurement location, daytime deltas presented are averages of the two calculated deltas.

	Reference LT CNEL-Period L_{eq}, dBA[1]			Extrapolated ST CNEL-Period L_{eq}, dBA			Calculated CNEL, dBA at ST Location
ST Measurement ID	Daytime	Evening	Nighttime	Daytime	Evening	Nighttime	
M2	65.4	59.0	57.5	70.8	63.8	61.4	70.9
M3	65.4	59.0	57.5	70.3	63.0	60.2	70.0
M5	76.9	75.1	72.1	78.9	76.7	73.3	81.4
M6	76.9	75.1	72.1	76.9	76.9	75.2	82.3
M7	65.7	62.4	59.2	71.2	67.8	64.5	72.9
M8	76.9	75.1	70.0	77.8	76.5	72.0	80.3
M10	65.4	59.0	57.5	67.6	61.7	60.6	68.9
M11	65.4	59.0	57.5	71.6	67.3	67.2	74.6

1. For LT measurements spanning two 24-hour periods, the reference CNEL-Period L_{eq} values presented in these columns represent an average of the CNEL-period values across both days.

ST Measurement ID	Representative Reference LT Location	ST Measurement Time	ST Measured L_{90}, dBA	Reference LT Equivalent Time Period L_{90}, dBA	Delta	Reference LT Measured Lowest L_{90} (15 m)	Calculated Lowest L_{90}, dBA at ST Location

Appendix B Noise and Vibration Inputs

B.1 Construction Noise Inputs and Calculations

Full Equipment Roster Per Phase – Phases 1 through 3

Phase 1 – Demolition and Site Prep **Phase Duration: Eight (8) Weeks – 40 Days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
Air Compressors	2	4	20	Compressor (Air)	80.0	40.0	78.2
Concrete/Industrial Saws	2	4	20	Concrete Saw	90.0	20.0	85.2
Crushing/Processing Equipment	1	6	30	Mounted Impact Hammer	90.0	20.0	85.2
Excavators (demo)	2	8	40	Excavator	85.0	40.0	83.2
Forklifts, Rough Terrain	1	6	30	Backhoe	80.0	40.0	78.2
Generator Sets	1	8	40	Generator	82.0	50.0	81.2
Rubber Tired Loaders (demo)	1	6	30	Front End Loader	80.0	40.0	78.2
Sweepers/Scrubbers	1	6	40	Vacuum Street Sweeper	80.0	10.0	72.2
Water Truck	1	6	30	Flatbed Truck	84.0	40.0	82.2

Phase 2 – Grading and Ground Improvements **Phase Duration: Sixteen (16) Weeks – 80 Days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
Bore/Drill Rigs (auger cast)	1	8	50	Auger Drill Rig	85.0	20.0	80.2
Bore/Drill Rigs (stone columns)	1	8	50	Drill Rig Truck	84.0	20.0	79.2
Dumpers/Tenders	2	5	40	Dump Truck	84.0	40.0	82.2
Generator Sets	1	8	60	Generator	82.0	50.0	81.2
Graders	3	8	40	Grader	85.0	40.0	83.2
Concrete Pumps	2	6	100	Concrete Pump Truck	82.0	20.0	77.2
Sweepers/Scrubbers	1	6	60	Vacuum Street Sweeper	80.0	10.0	72.2
Tractors/Loaders/Backhoes (utilities)	2	8	60	Front End Loader	80.0	40.0	78.2
Water Truck	1	6	60	Flatbed Truck	84.0	40.0	82.2

Phase 3 – Building Construction **Phase Duration: Sixty-one (61) Weeks – 305 Days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
Aerial Lifts (jlg)	12	6	80	Man Lift	85.0	20.0	80.2
Air Compressors	4	4	80	Compressor (Air)	80.0	40.0	78.2
Cranes (Precast)	4	8	80	Crane	85.0	16.0	79.3
Cranes (Steel)	2	6	60	Crane	85.0	16.0	79.3
Forklifts (Precast)	4	6	80	Backhoe	80.0	40.0	78.2
Forklifts (Precast)	4	6	80	Backhoe	80.0	40.0	78.2
Forklifts (Steel)	4	8	80	Backhoe	80.0	40.0	78.2
Generator Sets	4	6	80	Generator	82.0	50.0	81.2
Plate Compactors (building phase)	4	8	120	Compactor	82.0	20.0	77.2
Concrete Pumps	2	6	100	Concrete Pump Truck	82.0	20.0	77.2
Skid Steer Loaders	1	6	40	Front End Loader	80.0	40.0	78.2
Sweepers/Scrubbers	1	6	60	Vacuum Street Sweeper	80.0	10.0	72.2
Tractors/Loaders/Backhoes (building phase)	2	8	80	Front End Loader	80.0	40.0	78.2
Water Truck	1	6	30	Flatbed Truck	84.0	40.0	82.2
Welders	6	8	60	Welder/Torch	73.0	40.0	71.2

Full Equipment Roster Per Phase – Phases 4 through 6

Phase 4 – Building Envelope and Interior Build Out **Phase Duration: Sixty (60) Weeks – 300 days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
Aerial Lifts (jlg)	4	6	100	Man Lift	85.0	20.0	80.2
Cranes (MEP)	2	8	100	Crane	85.0	16.0	79.3
Cranes (Cladding)	2	8	120	Crane	85.0	16.0	79.3
Forklifts (MEP)	10	8	120	Backhoe	80.0	40.0	78.2
Generator Sets	2	8	120	Generator	82.0	50.0	81.2
Pressure Washers	2	4	60	Generator	82.0	50.0	81.2
Rollers	2	4	40	Roller	85.0	20.0	80.2
Surfacing Equipment	2	4	20	Paver	85.0	50.0	84.2
Tractors/Loaders/Backhoes (arch)	2	6	40	Tractor	85.0	40.0	83.2
Tractors/Loaders/Backhoes (mep)	4	8	120	Tractor	85.0	40.0	83.2
Trenchers	1	6	40	Slurry Trenching Machine	82.0	50.0	81.2
Welders	2	8	60	Welder/Torch	73.0	40.0	71.2

Phase 5 – Sitework **Phase Duration: Twenty-Five (25) Weeks – 125 days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
AC Rollers	2	4	50	Roller	85.0	20.0	80.2
Air Compressors Truck Mounted	2	4	60	Compressor (Air)	80.0	40.0	78.2
Concrete/Industrial Saws	2	4	20	Concrete Saw	90.0	20.0	85.2
Crawler Tractors	2	4	40	Tractor	85.0	40.0	83.2
Excavators (paving)	2	6	30	Excavator	85.0	40.0	83.2
Excavators (utilities)	2	6	60	Excavator	85.0	40.0	83.2
Graders	2	6	40	Grader	85.0	40.0	83.2
Oil Distributor	2	4	20	Flatbed Truck	84.0	40.0	82.2
Pavers	2	8	10	Paver	85.0	50.0	84.2
Plate Compactors (site phase)	2	4	60	Compactor	82.0	20.0	77.2
Rubber Tired Loaders (utilities)	4	6	60	Front End Loader	80.0	40.0	78.2
Rubber Tired Loaders (paving)	2	6	40	Front End Loader	80.0	40.0	78.2
Scrapers	2	4	20	Scrapers	85.0	40.0	83.2
Surfacing Equipment	2	6	60	Roller	85.0	20.0	80.2
Tack Truck	2	4	20	Flatbed Truck	84.0	40.0	82.2
Tractors/Loaders/Backhoes (utilities)	2	6	60	Tractor	85.0	40.0	83.2
Trenchers	1	6	60	Slurry Trenching Machine	82.0	50.0	81.2
Water Truck	2	4	20	Flatbed Truck	84.0	40.0	82.2

Phase 6 – Startup and Commissioning **Phase Duration: Seven (7) Weeks – 35 days**

Equipment Type	Quantity	Avg Hours Per Day	Days Per Phase	Selected FTA/RCNM Equivalent	L_{max} at 50'	Usage Factor	L_{eq}, dBA
Aerial Lifts (jlg)	1	6	30	Man Lift	85.0	20.0	80.2
Forklift (demobilization)	1	8	30	Backhoe	80.0	40.0	78.2
Rubber Tired Loaders (landscaping)	1	6	30	Front End Loader	80.0	40.0	78.2
Sweepers/Scrubbers	1	6	20	Vacuum Street Sweeper	80.0	10.0	72.2

See Report Table 5-1 for Phase-Based Equipment Assumptions

Predicted Onsite Construction Noise Levels at Studied Assessment Locations Per Project Construction Phase

Nearest Property Boundary

Construction Phase	Distance to Project Property Boundary	Combined L_{eq} at Distance
Demolition and Site Prep	255	74.1
Grading and Ground Improvements	255	72.1
Building Construction	255	70.6
Building Envelope and Interior Build Out	255	73.1
Sitework	255	74.1
Startup and Commissioning	255	68.2

Nearest Noise-Sensitive Land Use (Church)

Construction Phase	Distance to Nearest NSLU	Combined L_{eq} at Nearest NSLU
Demolition and Site Prep	725	65.0
Grading and Ground Improvements	725	63.0
Building Construction	725	61.5
Building Envelope and Interior Build Out	725	64.0
Sitework	725	65.0
Startup and Commissioning	725	59.1

Nearest Residential Noise-Sensitive Land Use

Construction Phase	Distance to Nearest Residence	Combined L_{eq} at Nearest Residence
Demolition and Site Prep	745	64.8
Grading and Ground Improvements	745	62.8
Building Construction	745	61.3
Building Envelope and Interior Build Out	745	63.8
Sitework	745	64.8
Startup and Commissioning	745	58.9

Predicted Aggregate Noise Level and Increase-Over-Existing Calculations Per Project Construction Phase

	Assessment Location	Existing Daytime L_{eq}, dBA	Condition	Predicted Hourly L_{eq}, dBA
Phase 1 Demolition and Site Prep	Construction Site Boundary	67.6	Construction Noise Level	74.1
			Combined Noise Level	75.0
			Increase over Existing	7.4
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	65.0
			Aggregate Noise Level	71.4
			Increase over Existing	1.1
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	64.8
			Aggregate Noise Level	71.4
			Increase over Existing	1.1
Phase 2 Grading and Ground Improvements	Construction Site Boundary	67.6	Construction Noise Level	72.1
			Combined Noise Level	73.4
			Increase over Existing	5.8
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	63.0
			Aggregate Noise Level	71.0
			Increase over Existing	0.7
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	62.8
			Aggregate Noise Level	71.0
			Increase over Existing	0.7
Phase 3 Building Construction	Construction Site Boundary	67.6	Construction Noise Level	70.6
			Combined Noise Level	72.4
			Increase over Existing	4.8
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	61.5
			Aggregate Noise Level	70.8
			Increase over Existing	0.5
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	61.3
			Aggregate Noise Level	70.8
			Increase over Existing	0.5
Phase 4 Building Envelope and Interior Build Out	Construction Site Boundary	67.6	Construction Noise Level	73.1
			Combined Noise Level	74.2
			Increase over Existing	6.6
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	64.0
			Aggregate Noise Level	71.2
			Increase over Existing	0.9
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	63.8
			Aggregate Noise Level	71.2
			Increase over Existing	0.9
Phase 5 Sitework	Construction Site Boundary	67.6	Construction Noise Level	74.1
			Combined Noise Level	75.0
			Increase over Existing	7.4
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	65.0
			Aggregate Noise Level	71.4
			Increase over Existing	1.1
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	64.8
			Aggregate Noise Level	71.4
			Increase over Existing	1.1
Phase 6 Startup and Commissioning	Construction Site Boundary	67.6	Construction Noise Level	68.2
			Combined Noise Level	70.9
			Increase over Existing	3.3
	Nearest Noise Sensitive Land Use (Church)	70.3	Predicted Const. Noise	59.1
			Aggregate Noise Level	70.6
			Increase over Existing	0.3
	Nearest Residential Noise Sensitive Land Use	70.3	Predicted Const. Noise	58.9
			Aggregate Noise Level	70.6
			Increase over Existing	0.3

B.2 Construction Vibration Inputs and Calculations

Construction Equipment Activity	Reference PPV in/sec at 25 Feet	Assessment Location	Distance from Vibration Source (Feet)	Resulting PPV in/sec
Hoe Ram	0.089	Closest Adjacent Structure of Any Type	70	0.029

Construction Equipment Activity	Reference VdB at 25 Feet	Assessment Location	Distance from Vibration Source (Feet)	Resulting VdB
Loaded Trucks (Nighttime)	86	Closest Residential Land Use	440	49

B.3 Operation – Offsite Traffic Noise Sources and Inputs

Subject: Alternatives Analysis - Traffic Noise Assessment of Fleet Management Use Mix Alternative

This memo briefly summarizes the comparative analysis of traffic noise generated by the proposed project and the Fleet Management Use Mix Alternative. The nighttime period was the primary focus for the comparison of impacts between the proposed project and the Fleet Management Use Mix Alternative because traffic during this period would have the greatest effect on the predicted community noise equivalent level. The draft EIR Chapter 5, Alternatives, in section 5.C.3.2, states that the Fleet Management Use Mix Alternative would result in the following:

- Reduction of onsite and offsite traffic volumes by approximately 14 percent (overall)[1]
- Reduction of heavy truck trips by approximately 50 percent during the nighttime period (10 p.m. to 7 a.m.) period[1]
- Increase of bus trips during the nighttime period (10 p.m. to 7 a.m.) resulting from public fleet operations of 425 percent (concentrated in the 5 a.m. and 7 a.m. period, when buses are leaving the facility to begin public transportation services)[1]
- Considering all of the above, the noise-reducing effects from the halving of nighttime heavy trucks assumed in the proposed project would offset the potential increase in bus noise, resulting in a net nighttime traffic noise reduction of approximately 0.1 dBA

The quantification of the 0.1 dBA reduction was performed using Table 3-3 of the 2013 Caltrans Technical Noise Supplement to the Traffic Noise Analysis Protocol (TeNS). This table provides a method to convert medium and heavy truck quantities into one standardized auto quantity for simplified comparisons. The table suggests that at 35 miles per hour, one medium and heavy truck is equivalent to 7.1 and 19.1 cars, respectively. Once converted, a 10*Log comparison of the car values can be used to roughly quantify the relative increase or reduction in traffic noise between the two scenarios as follows:

$$Change\ in\ Traffic\ Noise\ Level\ dB = 10 * Log(\frac{Equivalent\ \#\ Cars\ Alternative}{Equivalent\ \#\ Cars\ Project})$$

During the nighttime period, the proposed project would result in approximately 31 nighttime medium trucks and 117 nighttime heavy trucks, equating to approximately 2,456 equivalent-cars. The Fleet Management Use Mix Alternative would result in 12 nighttime medium trucks and 59 nighttime heavy trucks from the parcel delivery and last-mile delivery use, 39 nighttime medium trucks/buses from the private fleet use, and 130 medium trucks/buses from the public fleet use, equating to approximately 2,420 equivalent-cars. When entered into the formula above, the resulting difference from the 36 fewer equivalent-cars is -0.06 dB.

[1] The change in travel demand by vehicle types is based on the transportation analysis prepared for the project by Adavant Consulting/LCW Consulting, 2023, included as Appendix D to the EIR. Details from that analysis and assumptions used for this noise assessment of the Fleet Management Use Mix Alternative are presented on the next page.

Data Tables and Assumptions for Proposed Project and Fleet Management Use Mix Alternative

Proposed Project Daily Traffic

Project Use Type	Total Trips	Autos (Including Vans)	Medium Truck (MT)	Heavy Trucks (HT)	Nighttime MT	Nighttime HT

San Francisco Gateway Project

Air Quality and Health Risk Assessment Methodology Memorandum

To	Elizabeth White; Jessica Range	Pages	65
CC	Ken Sun; Courtney Bell		
Subject	San Francisco Gateway Project: Final Air Quality and Health Risk Assessment (HRA) Methodology Memorandum		
From	Mary Kaplan; Christopher Warren; Paola Peña; Suzanne McFerran Jillian Betro; Rod Jeung		
Date	March 5, 2020; revised September 2021, revised January 2022; revised July 2023		

AECOM Technical Services, Inc. (AECOM) has prepared this methodology memorandum to describe the preparation of the air quality assessment and Health Risk Assessment (HRA) for the proposed San Francisco Gateway Project (proposed project). This methodology memorandum is required by the San Francisco Planning Department Environmental Planning Division (planning department) for compliance with the California Environmental Quality Act (CEQA), and is consistent with the 2022 Bay Area Air Quality Management District (air district) CEQA Guidelines[1] and 2020 Citywide HRA.[2] This memorandum describes the proposed project, the approach to the HRA, and the modeling methodologies to be used to perform the analysis. The mass emissions estimates and HRA results will be provided in a separate Air Quality Results Memorandum. A third memorandum analyzing the air quality effects of the project alternatives will also be prepared. These memoranda together comprise the Air Quality Technical Report (AQTR) for the proposed project.

In accordance with the city's procedures, the modeling methodologies and assumptions must be approved prior to conducting the analyses and producing air quality and HRA results. The methodology memorandum was initially approved in 2020; however, as the analysis progressed, guidance from the city and the air district evolved, and project construction and operations details were refined, this memorandum has been revised several times. The methodological approaches and assumptions have been updated in this final version of the methodology memorandum and were used to produce the mass emissions estimates and HRA results. Because this memorandum was first prepared in 2020, it uses the future tense to describe the methodologies and assumptions that were intended to be used (e.g., the evaluation "will" analyze …). In finalizing this memorandum, the methodologies and assumptions have been updated to reflect how the air quality and HRA analyses *were* performed for the final Air Quality Results Memorandum and the draft Environmental Impact Report (EIR).

This memorandum addresses the following topics, as listed below by section:

- **Section 1.0 – Introduction** describes the project understanding and the objectives and methodology for the AQTR.
- **Section 2.0 – Emissions Estimates** describes the methods proposed to be used to estimate the emissions of criteria air pollutants, precursors, and toxic air contaminants (TACs) generated from project construction and operations.

[1] Bay Area Air Quality Management District (air district), 2022, *California Environmental Quality Act Air Quality Guidelines (Air District CEQA Guidelines)*, https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines, accessed June 2023.

[2] San Francisco Department of Public Health (SFDPH). September 2020. San Francisco Citywide Health Risk Assessment: Technical Support Documentation, accessed May 2021.

- **Section 3.0 – Air Dispersion Modeling** describes the proposed methods for modeling pollutant dispersion and estimating pollutant concentration contributions from project sources.

- **Section 4.0 – Health Risk Assessment Analysis** provides an overview of the proposed methodology for estimating potential health risks to sensitive receptors.

- **Section 5.0 – Measures to Reduce Project Impacts** describes how measures to reduce project impacts will be identified in coordination with the planning department and the project sponsor, if required by the planning department.

- **Section 6.0 – Uncertainties** provides a discussion of uncertainties and limitations associated with the Health Risk Analysis.

1.0 Introduction

At the request of the planning department, AECOM Technical Services, Inc. (AECOM) will conduct an analysis of local air quality and health impacts associated with the construction and operation of the proposed project at 749 Toland Street and 2000 McKinnon Avenue. This Air Quality and HRA Methodology Memorandum describes the approach for evaluation of air quality and health risk impacts from proposed project construction and operational sources, existing sources, and cumulative sources at the modeled sensitive receptors.

1.1 Project Understanding

The project sponsor, Prologis, L.P., proposes to redevelop two parcels in a core industrial area of the City and County of San Francisco. The proposed project would construct two new multi-story *production, distribution, and repair* (PDR)[3] buildings that would provide new industrial space for the city. The street addresses of the existing buildings are 749 Toland Street and 2000 McKinnon Avenue. Figure 1 shows the proposed project location. The project site consists of two parcels—Assessor's Block 5284A, Lot 008; and Block 5287, Lot 002—which are occupied by four existing structures totaling approximately 448,000 square feet of PDR space. The total gross site area is approximately 743,800 square feet (17.1 gross total acres).

The project sponsor proposes to build a flexible PDR space that can accommodate an evolving mix of users or tenants for a 100-year period or longer. Given that there are no identified tenants at this time, the environmental analysis for the proposed project evaluates a mix of PDR uses that are likely to occur based on the project sponsor's familiarity with leasing trends for PDR facilities in San Francisco and the Bay Area and that represent reasonably conservative assumptions about possible tenants' environmental impacts. The term "proposed project" means the construction and operation of the San Francisco Gateway facility, the operation of which is based on the analyzed tenant use mix, and the related streetscape improvements.

The proposed project would result in the demolition of four one-story, metal-clad buildings that currently occupy the project site; and the construction of two three-story buildings (plus active roof)[4]—buildings A and B. Each building would be approximately 97 feet tall, with a maximum height of 115 feet, including rooftop appurtenances. The two new buildings (including vehicular structures and ground-floor retail spaces) would comprise approximately 2,160,000 gross square feet,[5] of which 1,166,800 square feet would be PDR space; 984,800 square feet would be PDR support space for logistics yard, vehicle circulation, and parking; and 8,400 square feet would be ground-floor retail space. The proposed project would provide space for several main types of PDR uses: manufacturing and maker space, parcel delivery and last-mile delivery,[6] and wholesale and storage. Additionally, the project would allow for fleet management and laboratory uses permitted in the PDR-2 zoning district, although neither of these uses is part of the analyzed tenant use mix for the proposed project.[7]

[3] PDR use is a grouping of uses that includes but is not limited to all industrial and agricultural uses, ambulance services, animal hospitals, automotive service stations, automotive repair, automotive wash, arts activities, business services, cat boarding, catering services, commercial storage, kennels, motor vehicle tow services, livery stables, parcel delivery services, public utilities yards, storage yards, trade offices, trade shops, wholesale sales, and wholesale storage.

[4] The active roof is the top level (Level 4) of each building and consists of elevator and stair access structures, solar array, and a screened, open-air multi-purpose deck for parking and/or material and vehicle staging.

[5] Gross square footages and square footages presented for the existing and proposed uses are approximate.

[6] Last-mile delivery is defined as the movement of goods from a transportation hub to the final delivery destination (i.e., typically a personal residence or business).

[7] Laboratory uses permitted in the PDR-2 zoning district do not include life sciences laboratories.

Figure 1
Project Location

The project site is in southeastern San Francisco in the San Francisco Bay Area Air Basin, and is in the Air Pollutant Exposure Zone.[8] The project site is near a number of sensitive receptors, primarily to the southeast of the project site, that could be exposed to project-generated emissions; other sensitive receptors would be exposed to project-generated vehicle exhaust emissions along routes to and from the project site. The air district defines sensitive receptors as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with preexisting serious health issues affected by air quality.[9] Examples include schools, hospitals, and residential areas. Land uses such as schools, daycare centers, hospitals, and senior-care facilities are considered to be sensitive to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Residential areas are considered more sensitive to air quality conditions compared to commercial and industrial areas because people generally spend longer periods of time at their residences, with associated greater exposure to ambient air quality conditions.[10] Offsite workers may not always be considered sensitive receptors because all employers must follow regulations set forth by the Occupational Safety and Health Administration to ensure the health and well-being of their employees. However, for the purposes of this analysis, offsite workers (workers within 1,000 feet of the proposed project) will be considered sensitive receptors.

The closest residential dwelling is approximately 440 feet to the south of the project site (along Oakdale Avenue). There are existing schools within 1,900 feet of the project site, and within 50 feet (at the closest distance) of routes to and from the project. The closest child-care (Eva's Day Care) is approximately 950 feet to the southeast of the proposed project site and 50 feet from vehicle routes along Palou Avenue between Rankin Street and Quint Street. The closest offsite worker receptors are approximately 40 feet from the proposed project boundary in all directions. A description of the proposed air pollutant dispersion modeling and health risk analyses is provided in Section 3.0, "Dispersion Modeling," and Section 4.0, "Health Risk Analysis," respectively, of this document.

The proposed project has the potential to generate emissions during both the construction and operational phases. The construction phases would include demolition and site preparation; grading and ground improvements; building construction; building envelope and interior buildout; sitework; and startup and commissioning. Both proposed buildings would generally be completed at the same time (with some staggering due to logistics and equipment staging). Occupancy of both buildings is expected to begin at the same time. The operations phase would include increased vehicular traffic once the buildings are occupied; new area sources of emissions (i.e., landscape maintenance, periodic architectural coating, and consumer products); and new stationary sources of emissions (i.e., manufacturing and maker space, and two 400-kilovolt emergency power sources). The buildings would be constructed without natural gas infrastructure.

1.2 Objective and Approach

The project description, summarized in Section 1.1, Project Understanding, above and presented in detail in the San Francisco Gateway Project draft EIR (Case No. 2015-012491ENV), and responses to requests for information provided by the project sponsor were used as the basis for the air quality assumptions and proposed methodology presented in this document.

The purpose of the air quality analysis is to assess potential criteria air pollutant, ozone precursor, and TAC emissions impacts associated with construction and operation of the proposed project. Analyses will

[8] San Francisco Department of Public Health, Air Pollutant Exposure Zone Map, 2020, *https://www.sfdph.org/dph/files/EHSdocs/AirQuality/AirPollutantExposureZoneMap_2020.pdf*.

[9] Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, Appendix E: Recommended Methods for Screening and Modeling Local Risks and Hazards. April 25, 2023, p. E-14, *https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines*, accessed May 1, 2023.

[10] Bay Area Air Quality Management District, 2022. California Environmental Quality Act Air Quality Guidelines, *https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines*

be conducted consistent with guidance and methodologies from local, regional, state, and federal agencies, including the air district, the California Air Resources Board (air board), the Office of Environmental Health Hazard Assessment (OEHHA), and the United States Environmental Protection Agency (U.S. EPA).

Consistent with CEQA requirements, the analysis will evaluate:

1. the proposed project's short-term construction and long-term operational criteria air pollutant and ozone precursor emissions; and

2. excess cancer risk and impacts from particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$) on existing and potential future offsite sensitive receptors, including nearby residents within 1,000 feet of project-generated construction emissions and future operations (i.e., receptors along the haul routes for construction and along transportation routes for operational traffic). As described above, for the purposes of this analysis, offsite workers (workers within 1,000 feet of the proposed project) will also be considered sensitive receptors.

The preliminary draft results will be presented to the planning department for review and will be shared with the project sponsor team. AECOM and the planning department will assess the results and determine whether modeling refinements are necessary. If required, feasible emissions reduction measures will be identified and evaluated in the environmental document to reduce significant air quality impacts.

1.3 Project Sources

The air quality analysis and HRA will evaluate the following sources of air pollutant emissions or exposures:

1. **Construction Emissions:** The proposed project's construction-related emissions potentially affecting regional air quality and local sensitive receptors. Emissions sources include off-road construction equipment, on-road vehicles, demolition of existing onsite structures, earthmoving activities, architectural coating activities, and off-gas from paving activities.

2. **Operational Emissions:** The proposed project's operational emissions potentially affecting regional air quality and local sensitive receptors. Emission sources include consumer products, new vehicle trips and associated transportation refrigeration units, onsite vehicle circulation and idling, onsite off-road material handling equipment, manufacturing and maker space activities, and the proposed two emergency generators.

2.0 Emissions Estimates

The proposed project's construction and operational air pollutant emissions will be quantified according to guidance and methods from the air district, air board, and U.S. EPA. The process for determining the parameters and assumptions used to model these emissions, along with the modeling methods, are described below.

2.1 Calculation Methodologies for Construction Emission Sources

Construction of the proposed project would generate emissions of criteria air pollutants, precursors, and TACs (i.e., diesel particular matter [DPM]) from a variety of sources, including off-road construction equipment, on-road vehicles, demolition of existing onsite structures, earthmoving activities, architectural coating activities, and off-gas from paving activities. Estimates of construction emissions would require the following project information:

- Schedule and duration of construction phases
- Types and sizes (site acreages and building square footages) of land uses to be demolished and developed
- Off-road construction equipment lists and activity schedules
- Construction-related haul-truck traffic volumes for removing demolition and debris, bringing construction equipment and materials to the project site, and concrete trucks.
- Construction worker traffic volumes
- Earthmoving activities (e.g., cut/fill quantities, grading area)
- Acres of asphalt paving
- Square footage of areas to receive onsite architectural coatings

This analysis will evaluate the construction emissions associated with the proposed project. Emissions estimates will be calculated using emission factors and calculation methodology equivalent to that used by California Air Pollution Control Officers Association's (CAPCOA's) California Emissions Estimator Model (CalEEMod[11]), with one exception for on-road mobile sources. The current emission factors from the air board's on-road emissions inventory model, EMission FACtors (EMFAC) 2021[12] will be substituted to estimate emissions associated with on-road mobile sources. Emissions will not be quantified directly within CalEEMod, because detailed project-specific inputs are available to inform the emissions estimates and because the current version of CalEEMod (version 2020.4.0) does not include the most recent air board emissions factors (OFFROAD 2017 and EMFAC 2021). The proposed project is a clean construction priority project pursuant to Planning Director Bulletin No. 2, thereby incorporating, at a minimum, use of the lowest diesel emission equipment (Tier 4) during construction.[13,14,15] Therefore, exhaust emissions from off-road construction equipment greater than 25 horsepower will be estimated using emissions factors for U.S. EPA Tier 4 (interim) emissions standards. Details regarding data inputs, emission factors, and calculation methodology are provided in Sections 2.1.1 through 2.1.4.

During construction of the proposed project, fugitive dust emissions associated with demolition and earthwork (grading, stockpiling, and truck loading) activities, and vehicle travel on paved roadways would be generated. Section 2.1.4 discusses the approach to quantitatively estimate fugitive dust emissions from these activities in order to inform the analysis of potential exposure of sensitive receptors to fugitive dust $PM_{2.5}$.

Construction of the proposed project is currently anticipated to take up to 27 months for each individual building, with the anticipated phases identified in Table 1. The start of construction for building A would be approximately 4 months before that for building B, so that the total construction duration for the proposed project would be approximately 31 months. The 31-month construction period will be modeled as 2.6 years, which is just slightly longer than 31-months. Work would typically occur five to six days per week for eight hours per day; however, average daily emission estimates will be conservatively estimated assuming a five-day construction work week. Some nighttime (8 p.m. to 7 a.m.) construction activities are anticipated; the project sponsor will obtain a permit from the San Francisco Department of Public Works or Department of Building Inspection to extend construction activities beyond allowable construction

[11] CalEEMod was developed for the California Air Pollution Control Officers Association (CAPCOA) in collaboration with the California air districts and is a widely accepted model for estimating project-related emissions. The most current model is Version 2020.4.0. The model uses both default data and project-specific inputs that can be defined by the user when available to calculate both the criteria air pollutants and greenhouse gas emissions associated with construction and operational sources as part of development projects.

[12] EMFAC is California Air Resources Board's database of on-road vehicle activity data (e.g., emissions rates, vehicle population, vehicle miles traveled, etc.) for different regions throughout California (e.g., at the air basin, air district, county, or statewide level). Emission factors will be developed using EMFAC 2021 to generate emissions rates (in grams per mile) for the county of San Francisco.

hours, as required. Additional information on phasing, equipment and vehicles is included in the Responses to Request for Information from the project team dated September 18, 2018 and updated on September 24, 2019 and March 2, 2020, April 21, 2020, and April 28, 2020 (see Attachment A).

Table 1
Construction Phasing

Construction Phase	Duration (weeks)
Demolition and Site Preparation	8
Grading and Ground Improvements	16
Building Construction	61
Building Envelope and Interior Buildout	60
Site Work	25
Startup and Commissioning	7
Total	**31 Months**[1]

Note:

[1] Construction duration would total 31 months, which would include several months of overlapping phases primarily during Building Construction, Building Envelope and Interior Buildout, and Site Work. In addition, the start of construction for building A would be approximately 4 months before the start of construction for building B.

2.1.1 *Off-Road Construction Equipment*

Off-road construction equipment would generate exhaust-related criteria air pollutants, precursors, and TAC emissions. The data collection process will identify the number and types of construction equipment required for each construction phase and subphase. Other parameters needed to quantify construction equipment emissions include hours of operation per day, horsepower, and load factor for each respective piece of equipment. Project-specific equipment data will be provided by the project sponsor. When project-specific parameters are not available, default assumptions contained in CalEEMod will be used to quantify emissions, pursuant to the air district's guidance.

The analysis will be performed using emission factors for U.S. EPA Tier 4 (interim) emissions standards for equipment greater than 25 horsepower, consistent with equipment requirements for clean construction priority projects pursuant to Planning Director Bulletin No. 2. To calculate emissions, total equipment-use hours will be multiplied by the appropriate Tier 4 (interim) emissions factors. For equipment less than 25 horsepower, emissions will be estimated using equipment-specific emission factors and aggregate model years provided in OFFROAD2017.[16] If a project-specific equipment list is not available, assumptions for equipment type and number will be based on CalEEMod defaults for the proposed land use type and size.

For informational purposes, exhaust emissions from off-road construction equipment will also be calculated using emission factors for aggregate model years and horsepower provided in OFFROAD2017 and compared to the emissions associated with equipment that meets U.S. EPA Tier 4 (interim) emissions standards.

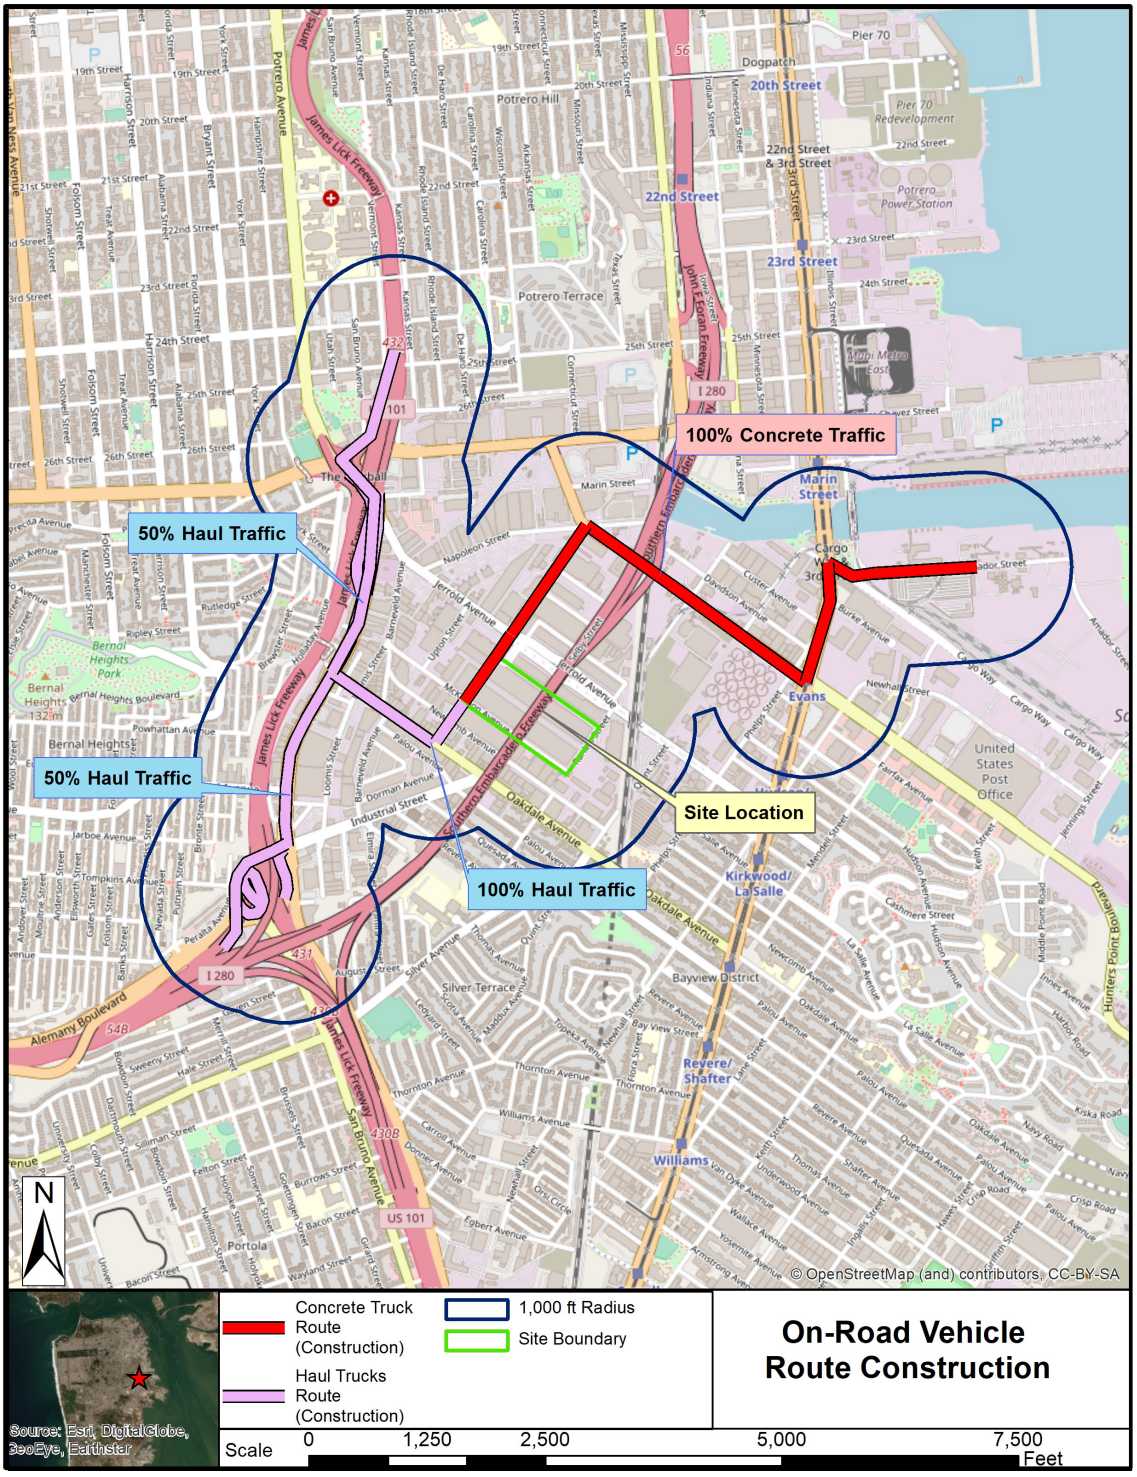
[16] OFFROAD2017 is a California Air Resources Board's emissions inventory database for off-road diesel engines, used to quantify the amount of pollutants from thousands of engines in equipment used in industrial applications, agriculture, construction, mining, oil drilling, power generation, and many other industries. OFFROAD2017 is anticipated to be the most current available and approved source to be used to generate emission factors for the different types of equipment anticipated to be used for the project.

2.1.2 *On-Road Vehicles*

On-road construction sources would include construction-worker vehicles, haul trucks, concrete trucks, material delivery trucks, and onsite work trucks. The proposed routes for the on-road vehicles are shown in Figure 2. The data collection process will identify the number of trips for each vehicle type during each construction subphase. Depending on the construction phase, the number of workers on a given day would range from approximately 45 up to 400. During the peak construction periods, approximately 400 to 500 workers are expected to travel to the site daily. Construction parking is anticipated to be onsite, and carpooling and use of public transportation would be encouraged. An offsite parking area and shuttle service will not be required. If certain project-specific information is not available, default assumptions for parameters such as construction trip generation, trip distance, and vehicle type will be obtained from CalEEMod. Emissions from on-road motor vehicles will be estimated using total vehicle trips, average trip distances, and EMFAC 2021 mobile source emission factors for the aggregate fleet mix, inclusive of running and starting exhaust emissions.

2.1.3 *Off-Gas Reactive Organic Gas Emissions*

Construction activities would generate reactive organic gas (ROG) emissions associated with off-gas from asphalt paving and architectural coating activities. ROG emissions from paving and architectural coatings will be calculated off-model using the CalEEMod default emission factors or project-specific information and assumptions provided by the project sponsor team that would otherwise be used within the CalEEMod software.



The data collection process will determine the acres of asphalt paving required; this project-specific data input will be used to determine associated ROG emissions. For interior architectural coatings, the analysis will use CalEEMod coating application assumptions and ROG emission factors for coatings based on the land use type and square footage of buildings to be constructed. For exterior architectural coatings, the analysis will use the proposed square footages of the building facades and information of the ROG content of the anticipated coatings to be used (e.g., anti-graffiti coatings and metal sealants). The sum of interior and exterior ROG emissions will be the total ROG emissions from architectural coatings.

2.1.4 *Fugitive Dust*

2.1.4.1 Demolition

Consistent with the methodology used in the CalEEMod, emissions will be calculated based on the Midwest Research Institute report prepared for the U.S. EPA for mechanical or explosive dismemberment and debris loading activities, based on the estimated building square footage to be demolished for the proposed project. Consistent with the city's Construction Dust Control Ordinance, enforced by the Department of Building Inspection under San Francisco Building Code – San Francisco Administrative Code, chapter 1A; and the San Francisco Department of Public Works under Public Works Code article 22B and San Francisco Department of Public Works order no. 171,378, the emission estimates will account for implementation of fugitive dust control practices during demolition activities (watering the demolition area twice per eight-hour workday).

Figure 2
Vehicle Routes for Construction

2.1.4.2 Truck Loading and Stockpiling

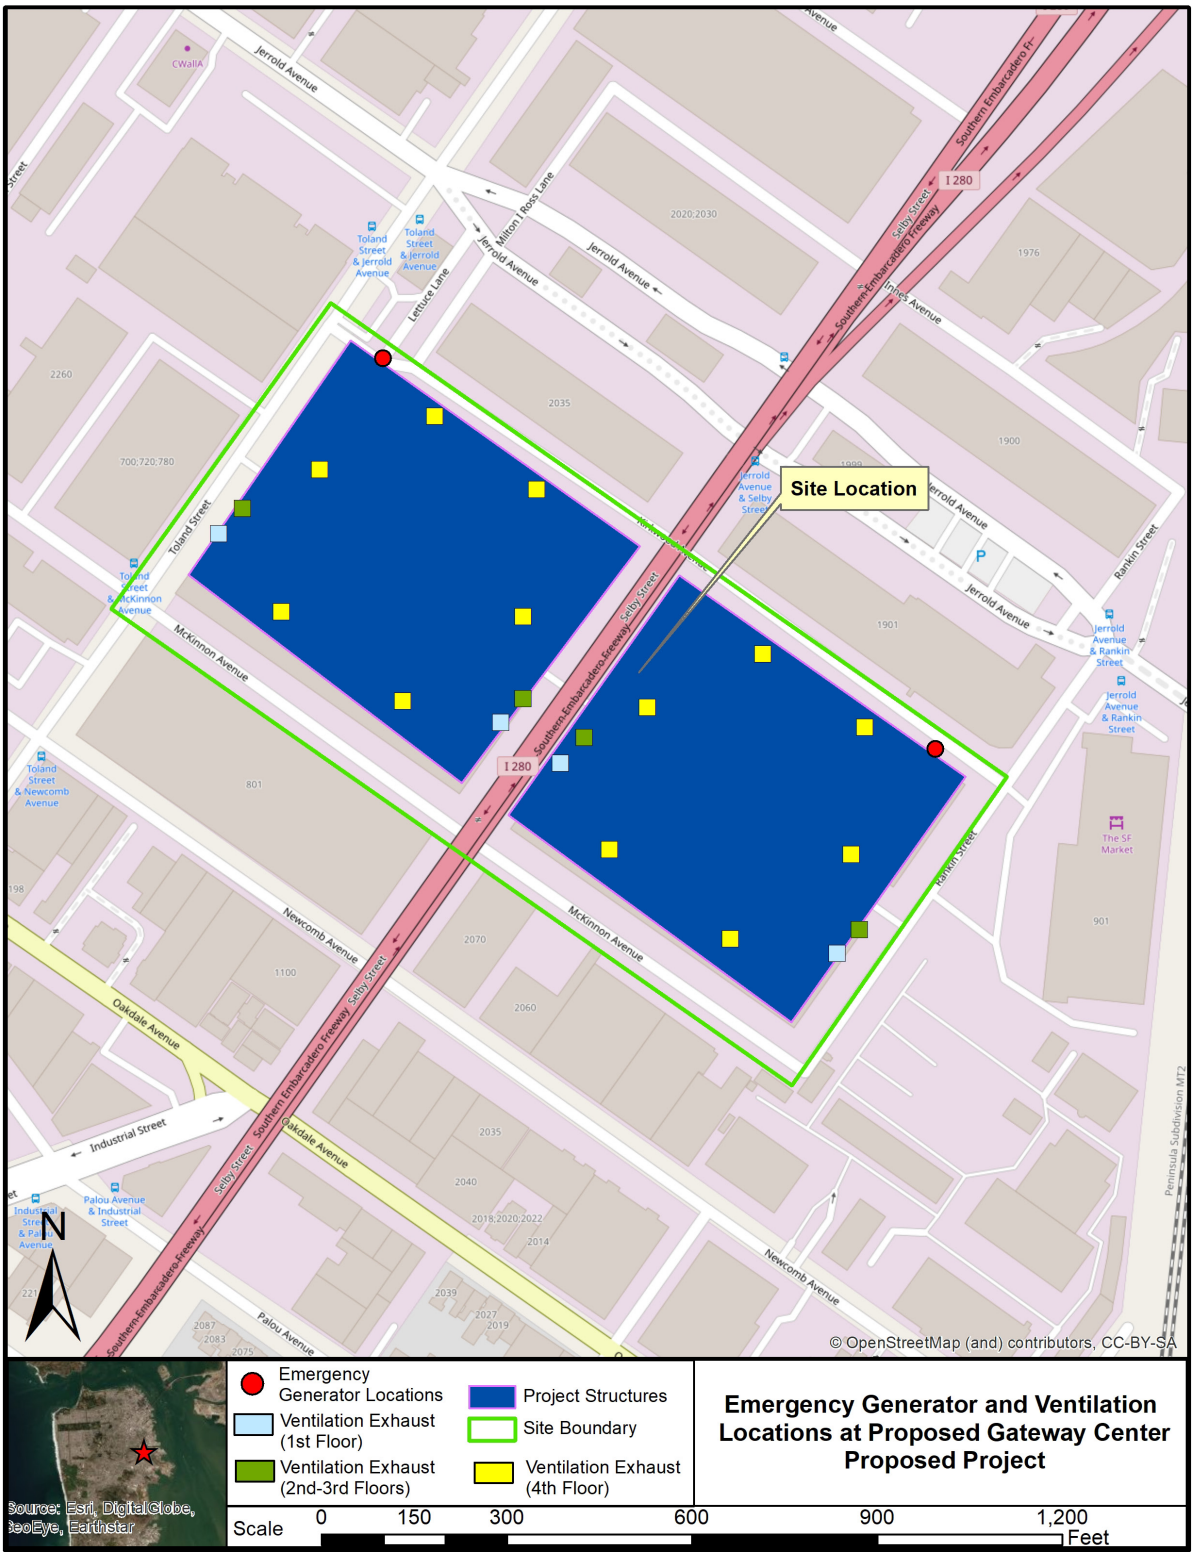
Consistent with the methodology used in the CalEEMod, emissions will be calculated using the methodology described in section 13.2, Introduction to Fugitive Dust Sources, of U.S. EPA's AP-42: Compilation of Air Emissions Factors, based on the amount of cut and fill of material required for onsite and street improvements. Consistent with the city's Construction Dust Control Ordinance section 1242(c)(1), the emission estimates will account for implementation of fugitive dust control practices during truck loading and stockpiling activities (watering areas around soil improvement operations, visibly dry disturbed soil surface areas, and visibly dry disturbed unpaved driveways at least three times per shift per day).

2.1.4.3 Earthwork

Consistent with the methodology used in the CalEEMod, emissions associated with scraping and grading activities will be calculated using the methodology described in section 11.9, of U.S. EPA's AP-42, based on the quantities of scrapers, graders, and crawler tractors during the sitework and grading phases of construction; and on the daily activity level for each type of equipment. Consistent with the city's Construction Dust Control Ordinance section 1242(c)(1), the emission estimates account for implementation of fugitive dust control practices during truck loading and stockpiling activities (watering areas around soil improvement operations, visibly dry disturbed soil surface areas, and visibly dry disturbed unpaved driveways at least three times per shift per day).

2.1.5 *Summary of Construction Criteria Pollutant Emissions*

AECOM will present annual construction-related emissions of ozone precursors (i.e., ROG and oxides of nitrogen [NO_x]) and criteria air pollutants (i.e., particulate matter less than or equal to 10 microns in diameter [PM_{10}] and $PM_{2.5}$ exhaust). The annual emissions for each construction year will be divided by the total number of construction work days for each respective year (based on the total number of weeks of construction to occur in the given year and conservatively assuming five construction workdays per week) to calculate average daily construction emissions for each individual year of construction.



2.2 Calculation Methodologies for Operational Emission Sources

After construction of the proposed project, long-term operations would generate emissions of criteria air pollutants, ozone precursors, and TACs (i.e., DPM) from a variety of sources, including stationary sources, area sources, and mobile sources. Operational emissions will be calculated for the proposed project as described below.

2.2.1 *Stationary Sources*

The proposed project may include the installation and use of up to two 400 kiloVolt [kV] (440 horsepower) emergency generators—a source of criteria air pollutants and TACs. Figure 3 depicts the proposed locations of the emergency generators and ventilation exhaust for the proposed project. Emission factors and methods prescribed by the air board and the U.S. EPA (e.g., AP-42 Compilation of Air Pollutant Emission Factors) will be used to estimate emissions from the generators. The emergency generators would meet a minimum of Tier 3 emission standards when they are installed, in the year 2025; would comply with the air district Regulation 2, Rule 5 New Source Review for Toxic Air Contaminants; and would comply with the air district testing limits of no more than 50 hours per year per generator. These assumptions will be used to estimate emissions from the generators.

Figure 3
Emergency Generators and Ventilation Locations Associated with Proposed Project

Potential tenants in either of the multi-story PDR buildings may include manufacturing and maker space, consisting of food and beverage processing, apparel and other garment products, furniture and fixtures, printing (including three-dimensional), prototyping, and publishing. These uses may generate gaseous criteria pollutants, particulate matter, and TACs from the use of kilns, presses, refrigeration, varnishes, and welding. Example TAC profiles from existing manufacturing facilities in the Bay Area were obtained from the air district (Attachment B). Based on the proposed uses described in the project description, and discussions with city staff and the project sponsor, TAC profiles from a brewery, coffee roastery, bakery, furniture and cabinetry maker space, printing and graphic design, and graphic apparel facilities were selected as representative of the likely types of manufacturing and maker spaces for the proposed project. The emissions from these examples will be scaled based on square footage of the example to the 35,000 square feet of space for manufacturing and maker space in the analyzed tenant use mix for the proposed project. The modeling will include the highest emitting TAC profile type. A comparison of the carcinogenic TAC emissions is included in Attachment B, showing that the graphic apparel facility emissions would likely result in the highest CO and NO_X emissions, as well as the highest cancer risk, and the bakery facility would have the highest ROG and $PM_{2.5}$ emissions.

Although not part of the analyzed tenant use mix for the proposed project, laboratory space suitable for scientific research that would support engineering, development, quality assurance, and quality control is a permitted use in the PDR-2 zoning for the project site and laboratory tenants may occupy the site.[17] Laboratories onsite would not include those associated with chemical testing, biological research, or animal testing, and would generally be geared toward technological research. These uses may potentially include permitted sources of TAC emissions, because the air district regulates emissions from laboratories. If the laboratories have less than 50 fume hoods or less than 25,000 square feet of laboratory space, they are exempted from permitting requirements because emissions would be *de minimis*. Larger laboratories that exceed the fume hood count or the 25,000-square-foot *de minimis* criteria will be analyzed based on a performance standard. The performance standard will be developed in consultation with the planning department and the project sponsor following quantitative analysis results. The performance standard will focus on avoiding significant air quality impacts from the project as a whole, and if that is not feasible, reducing the air quality impact from the project to the degree feasible. Because laboratory use is not part of the analyzed tenant use mix for the proposed project, and the specific use of any potential future laboratory space, equipment, and fume hood count is unknown at this time, emissions from the laboratory space will not be quantitatively included in the mass emissions estimates or HRA.

2.2.2 *Area Sources*

CalEEMod will be used to estimate long-term operational area source emissions of criteria pollutants and ozone precursors under the proposed project. Area source emissions include consumer products, and landscape maintenance equipment. Emissions from area sources, except consumer products, will be estimated using CalEEMod default values based on the proposed size and type of land uses. Emissions from consumer products will be estimated using a ROG emissions factor of 0.0000151 pound per square foot per day.[18] This emission factor is based on San Francisco ROG emissions data and land use data.

In addition, area sources from existing onsite land uses, as detailed in Table 1 (p. 6) of the San Francisco Gateway Project Initial Study (Case No. 2015-012491ENV) will be similarly modeled using CalEEMod and deducted from the area source emissions of the proposed project to determine the net increase in area source emissions from implementation of the proposed project.

[17] The proposed project will be entitled through a special use district that would establish a consistency review process to ensure that permits are consistent with the project's development agreement; the planning code; the project's conditions of approval, including the mitigation measures adopted as part of the project's approval; and this EIR. If the uses are not consistent, further analysis may be required pursuant to CEQA.

[18] E-mail from Wade Wietgrefe to Alison Kirk and Sigalle Michael on March 17, 2014, provided in Attachment C.

2.2.3 *Mobile Sources*

Generally, mobile source emissions, inclusive of exhaust emissions and fugitive dust associated with vehicle travel on roads, will be calculated using emissions factors from the air board's EMFAC[19] 2021 and daily trip generation and vehicle miles traveled estimates from the project's travel demand memorandum by Adavant/LCW Consulting.[20] The one exception to this is the trip distance for parcel delivery and last-mile delivery visitor trips (i.e., motor vehicle trips to and from the project site by anyone that is not an onsite employee, including trips for pickups and deliveries). The project's travel demand memorandum recognizes that locating a parcel delivery and last-mile delivery facility closer to consumers results in a reduced trip distance for deliveries, compared to a facility located farther from the consumers. The transportation analysis accounts for the relative change in travel distance between the proposed project and the projected final consumers, compared to existing facilities that accommodate similar land uses, which are primarily located outside of San Francisco. Based on this approach, which is also consistent with the analysis conducted by Langan Engineering[21] that looked at the expected demand for distribution centers in the San Francisco Bay Area, the transportation analysis calculated a relative reduction in the trip distance for autos, vans, and small trucks (i.e., single-unit trucks) and a relative increase in the trip distance for large trucks (i.e., tractor trailer trucks). These relative trip distances were accounted for in the transportation analysis when calculating the project's vehicle miles traveled for the parcel delivery and last-mile delivery land use, resulting in a net reduction in vehicle miles traveled for trips by this land use. However, in order to disclose the change in criteria air pollutants that would occur as a result of this project, the air quality analysis does not take a mileage reduction (credit) for locating parcel delivery and last-mile delivery land uses closer to the San Francisco customer base.

Therefore, the air quality analysis will use the same trip distances by vehicle category for the parcel delivery and last-mile delivery land use as those identified for all other proposed land uses (i.e., does not take a credit or reduction in miles traveled).[22] Table 2 below provides the parcel delivery and last-mile delivery land use trip distances as applicable to the air quality analysis and those applicable to the transportation analysis.[23]

Table 2
Trip Distances Applicable to Parcel Delivery and Last-mile Delivery Land Use

Parcel Delivery and Last-mile Delivery Land Use	Distance used for Transportation Analysis (one- way)	Distance used for Air Quality Analysis (one-way)
Automobiles	-7.5	20 miles
Vans	-7.5	30 miles
Single-unit trucks	-7.5	40 miles
Tractor-Trailer Trucks	7.5	65 miles

Source: Adavant and LCW Consultants, 749 Toland Street and 2000 McKinnon Avenue Project, Final Estimation of Project Travel Demand, December 10, 2021.

Emissions factors will be for the operational year 2025, as the earliest possible operational year, and will use the aggregate model year for each of the specific vehicle categories identified in the project's travel

[19] EMFAC is California Air Resources Board's database of on-road vehicle activity data (e.g., emissions rates, vehicle population, vehicle miles traveled, etc.) for different regions throughout California (e.g., at the air basin, air district, county, or statewide level). The most recent available and approved version of EMFAC will be used; currently that is EMFAC 2021.

[20] Adavant and LCW Consultants, 749 Toland Street and 2000 McKinnon Avenue Project, Final Estimation of Project Travel Demand, December 10, 2021. This memorandum is included in Appendix D, Transportation Supporting Information, of the draft EIR.

[21] Urban E-commerce Distribution Facility Selection Criteria Technical Memorandum, from Daniel D. Disario (Langan Engineering) to Ken Sun (Prologis); February 26, 2021.

[22] Total criteria air pollutant mass emissions that account for a credit or reduction in miles traveled that is reflective of the project's efficiency demonstrated by the Traffic Impact Analysis will also be provided in the final air quality results for informational purposes. These mass emissions results will not be applied to the project's health risk analysis nor used to determine project significance as it relates to air quality impacts.

[23] One-way distances for each vehicle category applied to estimate the vehicle miles traveled for the parcel delivery and last-mile delivery use are based on Appendix D, Transportation Supporting Information (p. D-79), of the draft EIR .

demand memorandum. The fuel type-mix will be assumed to reflect the aggregate fleet mix from EMFAC 2021 for each vehicle category. Maps showing the roadway segments to be modeled for parcel delivery and last-mile delivery are presented in Figure 4 and Figure 5, respectively.

Vehicles traveling within buildings A and B will also be modeled using the air board's EMFAC 2021 model emission factors for each respective vehicle category for the speed bins of 5 miles per hour and 10 miles per hour, as vehicles traverse the internal ramp and parking areas on each floor. Emissions associated with onsite vehicle starts and idling will similarly be calculated using EMFAC 2021 emission factors and assuming one start per vehicle trip to the project site and up to 5 minutes of idling per vehicle arrival to and departure from the site. Emissions associated with internal vehicle circulation will be apportioned by floor based on the relative percentage of each proposed land use anticipated to occupy each floor and the associated vehicles anticipated to serve each land use type. Emissions from on-road mobile sources will include fuel combustion, tire and brake wear, and resuspended roadway dust. Mobile-source emissions from existing onsite operational uses will be estimated using methodology similar to that described above for the proposed mobile sources traveling to and from the project site.

Total mobile source emissions from existing onsite land uses will be deducted from the mobile source emissions of the proposed project, including both offsite and onsite travel, to determine the net increase in mobile source emissions from implementation of the proposed project.

A portion of the trucks serving the proposed land uses are anticipated to require transportation refrigeration units. Emissions associated with these units will be calculated based upon the percentage of daily truck trips anticipated to include transportation refrigeration units, reflective of the anticipated percentage of refrigeration required by land use type. Emissions will be calculated for in-transit operational time of each transportation refrigeration unit, reflective of the on-road truck travel information from the travel demand memorandum, assumed operational time at the project site as the host truck travels to and from the docking or parking site based on travel speeds and distances through the buildings' ramp and parking areas, and idling for up to 15 minutes per transportation refrigeration unit per trip per day. Emission factors will be obtained from the air board's OFFROAD emissions database for the aggregate model year equipment fleet and using the average horsepower and load factor from the air board's 2021 transportation refrigeration unit emissions inventory documentation.

Onsite off-road equipment is also anticipated to be required for materials movement and handling, but will be all electric, and therefore will not generate criteria pollutant emissions and will not contribute toward the onsite operational emissions estimates.

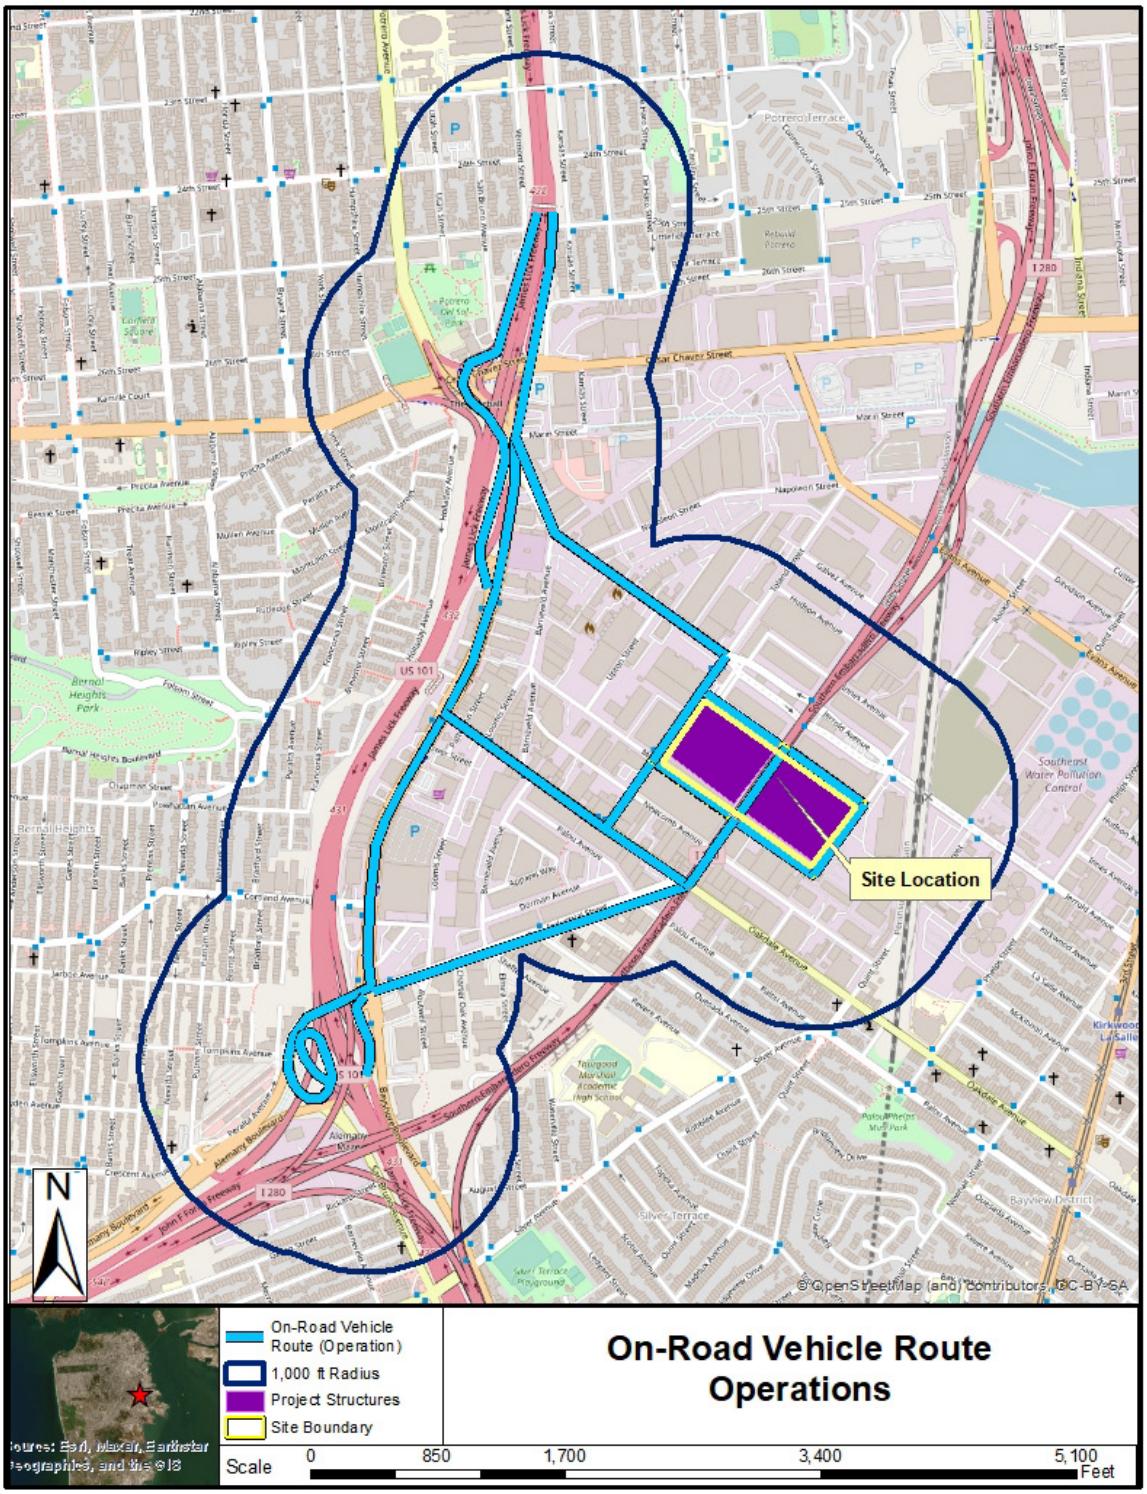
2.2.4 *Summary of Project Operational Criteria Pollutant Emissions*

Maximum annual and average daily operational emissions of criteria air pollutants and ozone precursors will be presented in separate air quality and HRA results memorandum.

3.0 Air Dispersion Modeling

The air toxics analysis will evaluate health risks and $PM_{2.5}$ concentrations resulting from the proposed project on the surrounding community. The American Meteorological Society/U.S. EPA Regulatory Model (AERMOD) dispersion model (Version 21112) will be used to estimate pollutant concentrations at specific distances from project emission sources using one year (2008) of hourly meteorological data from the Mission Bay station, consistent with the 2020 Citywide HRA. The Mission Bay station is approximately 2 miles north-northeast of the project site. The Mission Bay station is the most representative of the meteorological conditions at the project site and would provide meteorological data consistent with the 2020 Citywide HRA.

Figure 4
Operational Parcel Delivery Routes



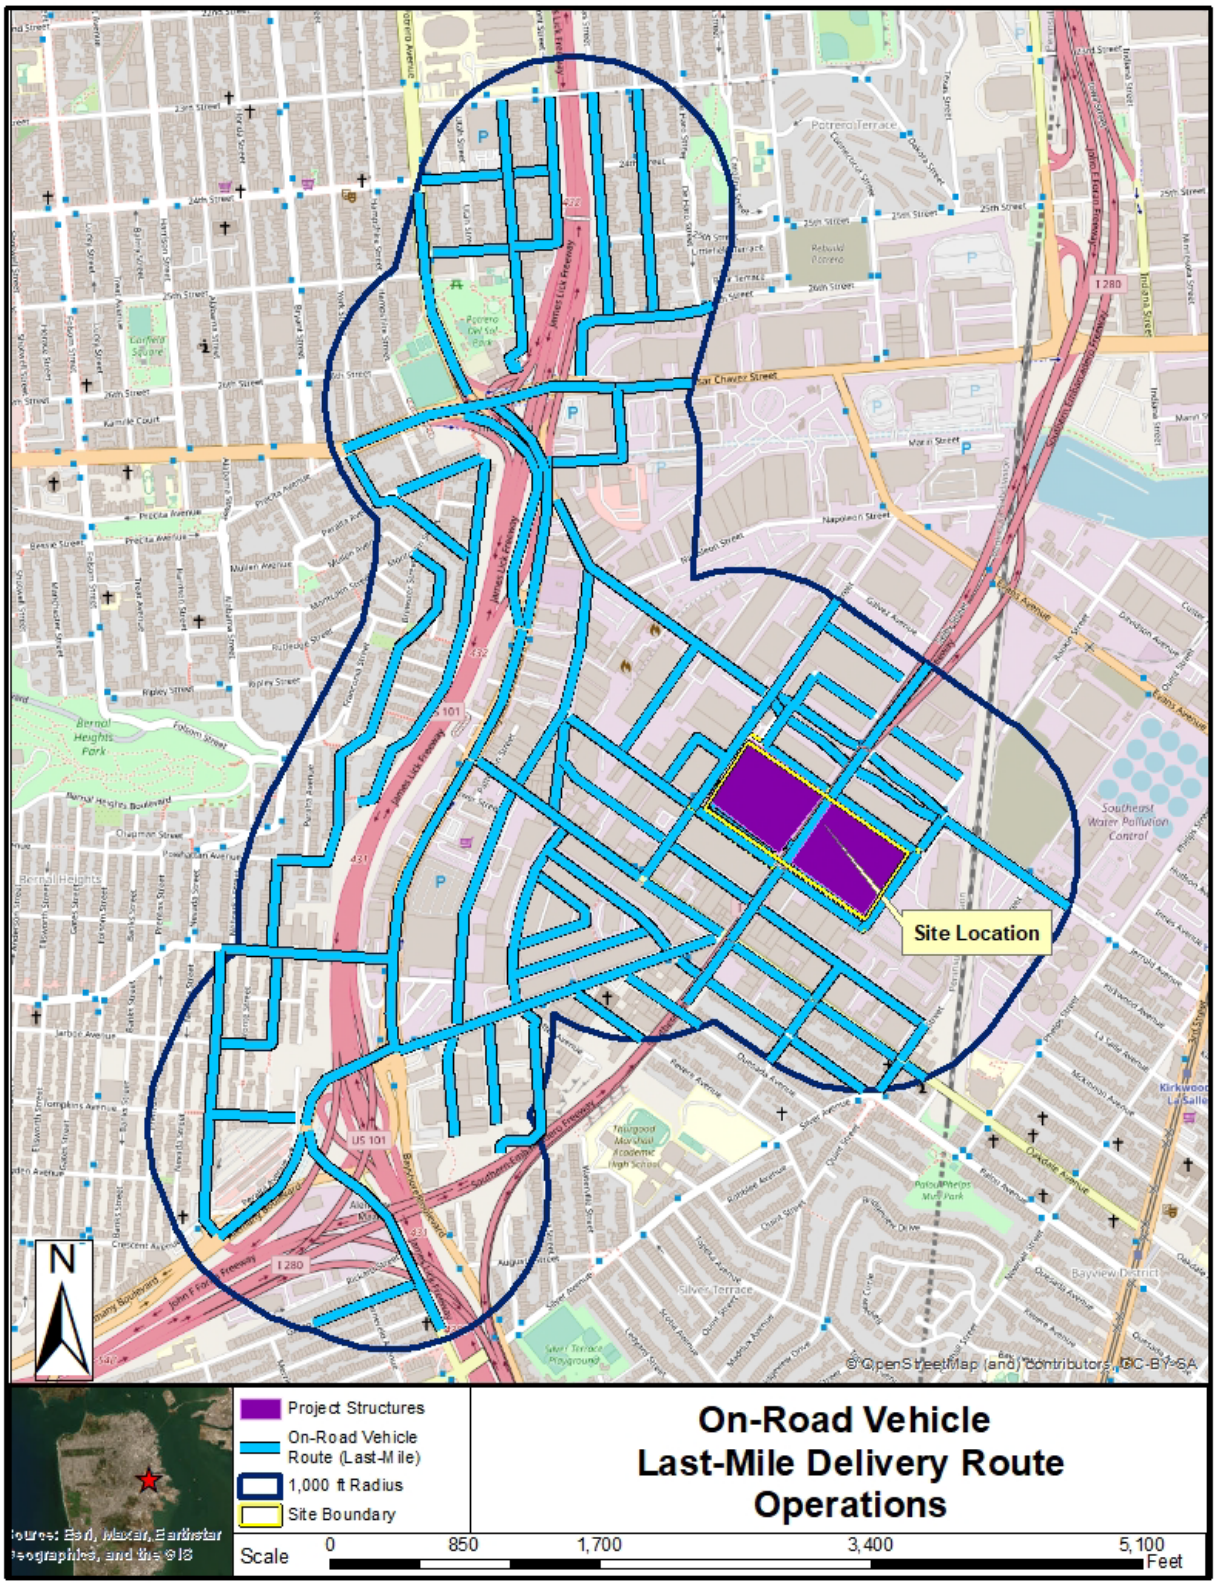


Figure 5
Operational Last Mile Delivery Routes

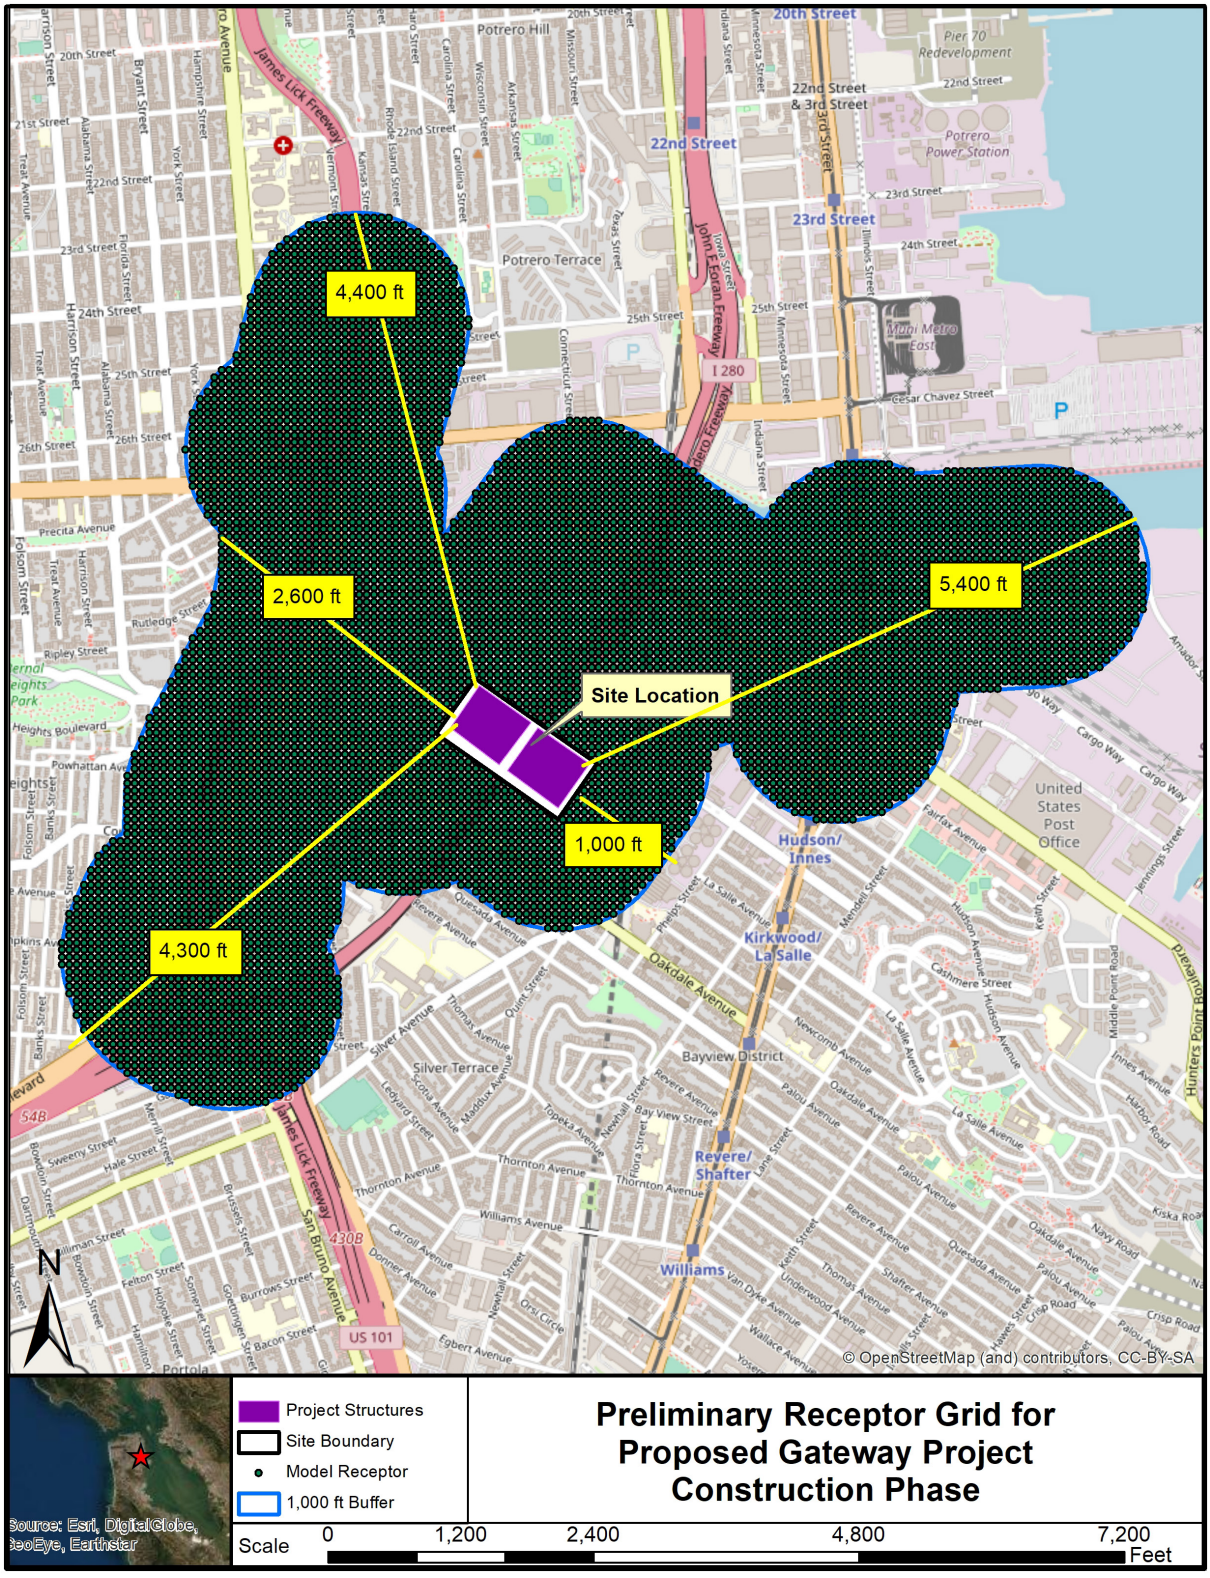
Terrain elevations will be obtained from commercially available digital terrain elevations developed by the United States Geological Survey (USGS) National Elevation Dataset (NED). The NED data provide terrain elevations with 1-meter vertical resolution and 10-meter (1/3 arc-second) horizontal resolution based on a Universal Transverse Mercator (UTM) coordinate system. The USGS specifies coordinates in North American Datum 83, UTM Zone 10. Lakes Environmental software will be used to process the NED data and assign elevations to the receptor locations and sources.

3.1 Receptor Locations

Consistent with the 2020 Citywide HRA, a grid of receptors with 20-meter spacing (approximately 66 feet) will be modeled for receptors from the 2020 Citywide HRA geodatabase that reside within 1,000 feet of the project site. To account for the offsite high-traffic nature of the proposed project, additional receptors from the 2020 Citywide HRA geodatabase will be included that reside within 1,000 feet of proposed traffic routes between the project site and U.S. 101 and Interstate (I-)280. The proposed receptors for modeling are shown in Figure 6 and Figure 7. Figure 6 shows a 1,000-foot radius from the project site and also includes the receptors along the construction traffic routes to where the on- and off-ramps merge onto or exit U.S. Highway 101 (U.S. 101) or I-280. The concrete haul trucks would follow Toland Street north to turn right onto Evans Avenue towards the concrete plant, while the construction haul trucks and material delivery trucks would go south to Oakdale Avenue then split to go north and south on Bayshore Boulevard to the highway interchanges. Since the concrete haul truck route is only applicable to the construction phase, receptors within 1,000 feet of this route are not included in the proposed future operations modeling scenario (Figure 7). The land uses along the concrete route are composed primarily of industrial land uses. When the project is complete and operational, potential last-mile delivery routes from the project site within 1,000 feet of the project, in addition to routes to and from U.S. 101 and I-280, are included.

The receptors will be assigned a flagpole height of 1.8 meters (approximately 6 feet) for the ground-level residences and 3.8 meters (approximately 12 feet) for second floor residences. All receptor points will be modeled. The sensitive receptor location with the highest modeled concentration will be evaluated to determine if the location is a sensitive receptor. If the highest modeled concentration is not a sensitive receptor location, the next highest modeled concentration will be evaluated to determine if it is a sensitive receptor location, and so on. The highest modeled concentration that corresponds with a sensitive receptor location will be labeled as the maximally exposed individual sensitive receptor. The closest sensitive receptors are approximately 440 feet to the south of the project site along Oakdale Avenue, east of I-280 and west of Rankin Street. There are also sensitive receptors to the northwest of the project site in the block bordered by Upton Street and Barneveld, McKinnon, and Jerrold avenues. The closest school is the Big City Montessori School on Industrial Avenue, approximately 2,200 feet from the project site and is located on the route to and from U.S. 101 and I-280 interchange to the south. Further information regarding exposure scenarios evaluated for these receptor locations is provided in Section 4.0, “Health Risk Analysis.”

Figure 6
Preliminary Receptors for HRA Modeling – Construction Phase



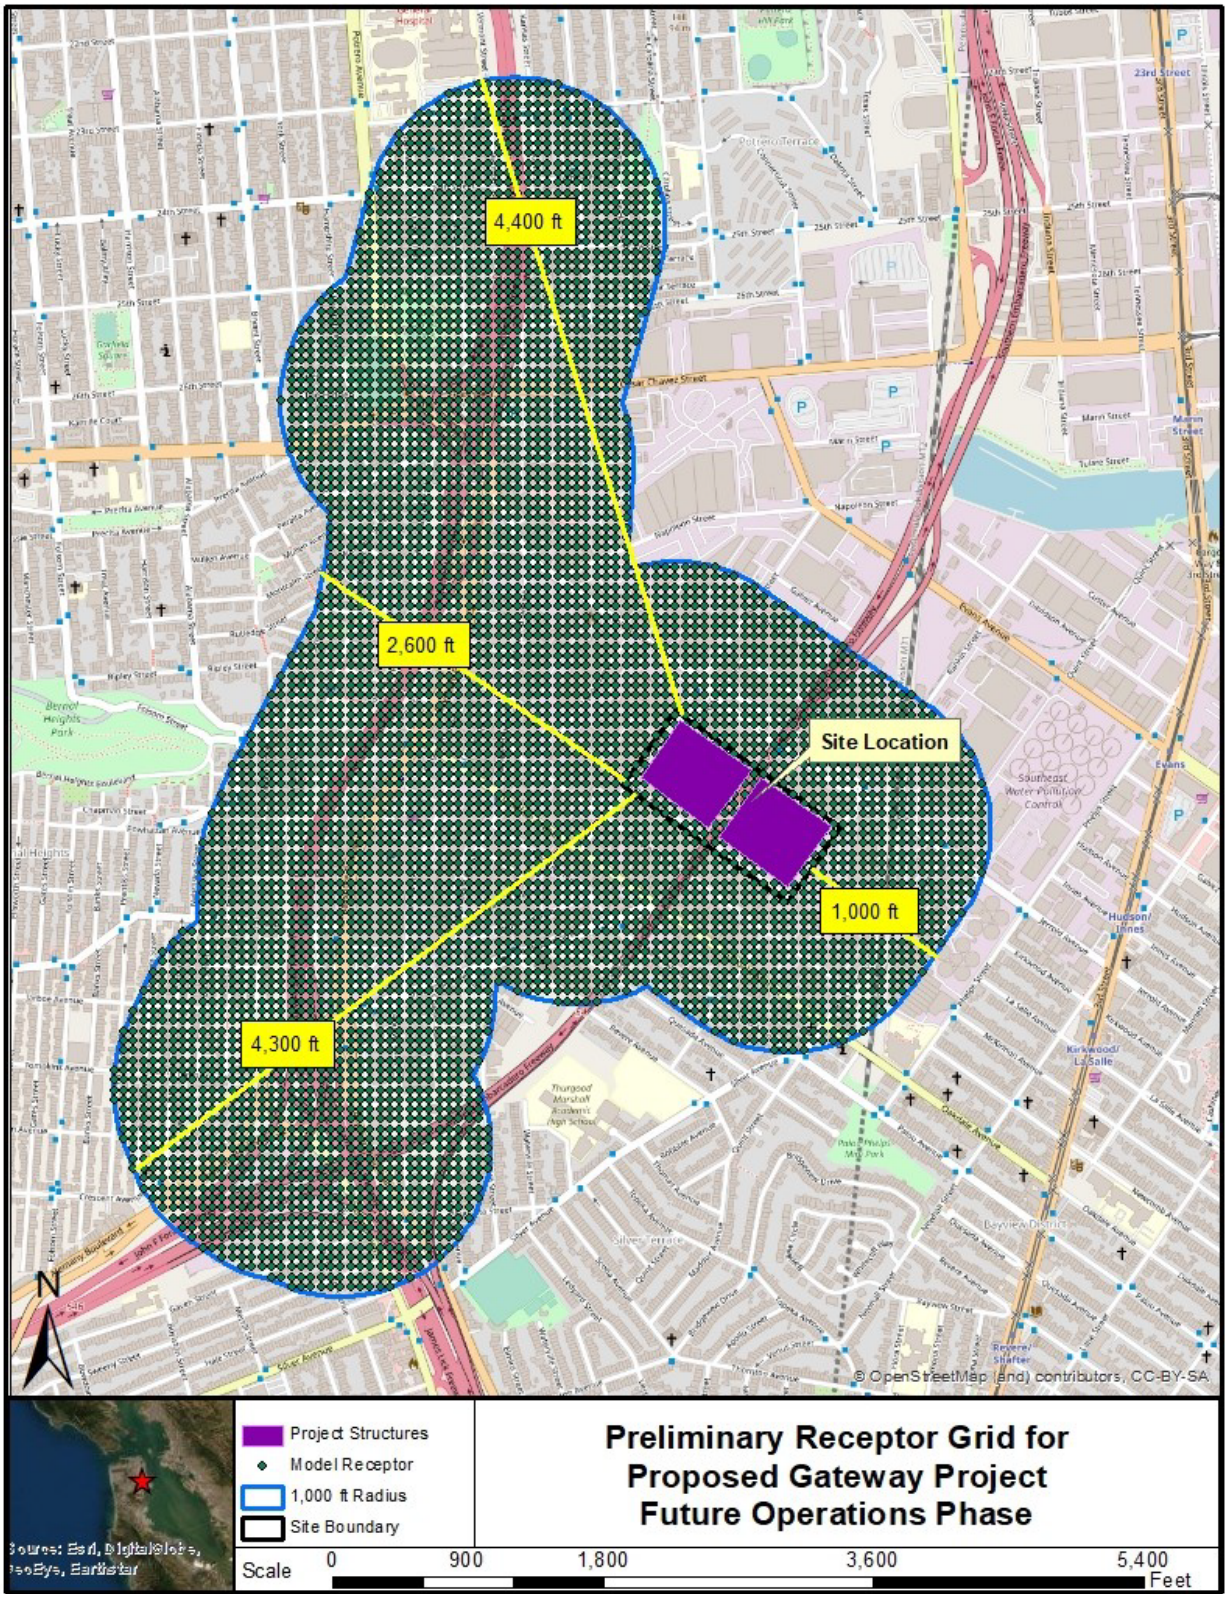


Figure 7
Preliminary Receptors for HRA Modeling – Operations Phase

3.2 Construction Sources

Diesel exhaust associated with off-road construction equipment will be represented by adjacent volume sources. The volume sources will cover the footprint of the proposed project site for all phases of construction. Fugitive dust emissions associated with demolition, excavation, and rough and fine grading will be represented by an area source of the same footprint as the project site. For construction of the project buildings, adjacent volume sources will be applied and located over areas of the project site where the buildings are proposed. To account for potential turbulent mixing that can occur with construction equipment exhaust release, an initial vertical dimension of 1.4 meters (approximately 4.6 feet) for each volume source will be used. The 1.4-meter vertical dimension is based on South Coast Air Quality Management District Localized Significance Threshold Methodology,[24] because the air district does not provide a specific value to use.

On-road emissions from construction-worker vehicles, haul trucks, material delivery trucks, and onsite work trucks traveling to and from the project site will be modeled as adjacent volume sources. To be consistent with the 2020 Citywide HRA, the release height of these sources will be set to 2 meters (approximately 6.6 feet), which is half the height of a typical truck height. The initial vertical dimension will be set to 2.3 meters (approximately 7.5 feet), based on a 5-meter (approximately 16 feet) release height divided by 2.15. The initial lateral dimensions will vary depending on roadway width. According to the transportation consultants, Adavant/LCW Consulting, construction-worker vehicles would approach the project site using the same routes that would be used by personnel when the project is operational. On-road traffic will be modeled to and from the U.S. 101 and I-280 on- and off-ramps and the project site.

For the purpose of the air quality analysis, the modeling will use a 10-hour period from 7 a.m. to 5 p.m., on average (3,120 hours per year). Nighttime (8 p.m. to 7 a.m.) construction activities are not anticipated during construction phases of demolition, site preparation, grading and commissioning, based on information provided by the project sponsor. During building construction and architectural coating phases, nighttime activity could occur up to 12 percent of the time. During the paving site improvements phase, nighttime activity could occur up to 25 percent of the time. Therefore, the model will use these maximum percentages for their respective phases for hours between 8 p.m. and 7 a.m. These assumptions for hours of construction will be used to model project emissions in AERMOD. This would include construction DPM and $PM_{2.5}$ emissions.

3.3 Operational Sources

Operational emission sources evaluated in the dispersion modeling will include on-road vehicles; onsite vehicles on multi-story ramps to and from the PDR spaces (manufacturing and maker space); and the two emergency generators. AECOM will model the on-road emissions from operational vehicles associated with the project site as adjacent volume sources. The release height of the on-road vehicle sources will be set to 2 meters (approximately 6.6 feet) and the initial vertical dimension will be set to 2.3 meters (approximately 7.5 feet), as recommended by 2020 Citywide HRA. The initial lateral dimensions will vary depending on roadway width. On-road traffic will be modeled to and from the U.S. 101 and I-280 on- and off-ramps and the project site. AECOM will use the EMFAC Gasoline Total Organic Gases Speciation to model TACs from non-diesel vehicles, as shown in Table 3.

[24] South Coast Air Quality Management District, July 2008, Localized Significance Threshold Methodology (Final), *http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2.*

Table 3
Proposed EMFAC Gasoline TOG Speciation

Toxic Compounds	EMFAC Gasoline TOG Speciation (% of TOG)
Acetaldehyde	0.28%
Acrolein	0.13%
Benzene	2.47%
1,3-Butadiene	0.55%
Ethylbenzene	1.05%
Formaldehyde	1.58%
Hexane	1.60%
Methanol	0.12%
Methyl ethyl ketone	0.02%
Naphthalene	0.05%
Propylene	3.06%
Styrene	0.12%
Toluene	5.76%
Xylenes	4.80%

Source: EMFAC2017 Model (2018)

Notes:

EMFAC = EMission FACtors
TOG = total organic gases

On-road vehicles and associated transportation refrigeration units that are expected to use the multi-level ramps will also be modeled. These ramps will include half-walls that will allow air and exhaust to circulate through these open areas. Since vehicle exhaust would be emitted out of the buildings from both the exhaust vents and openings along the ramps, an analysis of onsite traffic will be conducted to quantitatively determine the split of vehicle and transportation refrigeration unit exhaust between vents and ramps during onsite transit within the buildings. The vehicle travel times for interior and ramp sections for each level of the project structures are included in Attachment A. Based on this analysis, a split of 60 percent via vents and 40 percent via ramps will be used to allocate vehicle and transportation refrigeration unit exhaust emissions from onsite travel.

In the modeling, AECOM will allocate 20 percent exhaust vents on each of the first three floors (for a total of 60 percent). Emission from the exhaust vents will be further distributed between the exhaust vents located on each floor (two vents for first floor and four vents each on the second and third floors) and the six exhaust vents on the roof (per building). For example, the 20 percent of exhaust emissions allocated to the first floor will be evenly distributed through the two first floor vents and six roof vents. The remaining 40 percent of vehicle exhaust from the openings along the ramps and the active roof will be modeled according to the following breakdown: 15 percent to the first floor, 12 percent to the second floor, 8 percent to the third floor, and 5 percent to the active roof. The first floor was assigned the highest percentage because all vehicles would originate here. The percentages gradually decrease as floors increase, reflecting how fewer vehicles would travel to the upper floors.

Idling of onsite vehicles and associated transportation refrigeration units (includes maneuvering for parking and docking) are assumed to occur within the interior sections of the project buildings. Based on

this assumption, the modeling will assume 90 percent of idling emissions exhaust from the vents and 10 percent exit from the openings along the ramps.

The release height of the onsite ramp vehicles will be set to 2 meters (approximately 6.6 feet) and the initial vertical dimension will be set to 2.3 meters (approximately 7.5 feet). The initial lateral dimensions will vary depending on the ramp type (i.e., sloped versus flat). The straight sections of the ramps are expected to be approximately 28 feet in width, while the curved sections of the ramps are expected to be approximately 22 feet wide. The modeling will divide the ramps into segments (straight and curve sections) because the emission rates will vary with speed. Slower speeds are expected at curved ramp segments. Base elevations for each ramp will be incorporated into the modeling of ramp traffic. This will include assigning elevations consistent with the proposed building drawing heights provided by Prologis, L.P.

AECOM assumes that TAC emissions associated with vehicle exhaust will be emitted from 16 exhaust vents for each building. Two horizontal exhaust vents on the first floor, four horizontal exhaust vents on the second and third floors each, and six vertical exhaust vents on the active roof. The vehicle staging and logistic yard on each of the first three floors will have continuous exhaust of a minimum of 1 cubic foot per minute per square foot, calculated to be 49 cubic meters per second, and the exhaust vents will be 1 meter or less in diameter. Plot plans show that the mechanical units will be above the logistic yards/parking areas in the truss structure of the ceiling on each level. Proposed stack parameters for the vehicle exhaust vents are presented in Table 4. AECOM assumes that the two emergency generators will be located next to the buildings at ground level. They will be modeled as point sources, with a stack height equal to 12 feet (3.66 meters). The exhaust will exit the stack vertically. Other proposed stack parameters include the values presented in Table 5, consistent with the 2020 Citywide HRA.

In the model, TAC emissions associated with manufacturing and maker space are assumed to exhaust from four of the six rooftop exhaust vents (the northern four vents are not located above the ramp section of the buildings). Stack parameters for these emissions are the same as those outlined in Table 4 for the active roof.

Table 4
Proposed Logistic Yard Horizontal Exhaust Stack Parameters

Stack Parameter	First Floor[2]	Second Floor[2]	Third Floor[2]	Active Roof
Stack Height	9.14 meters (30 feet)	18.59 meters (61 feet)	28.35 meters (93 feet)	30.18 meters (99 feet)
Stack Diameter[1]	1.0 meters (3.28 feet)			
Stack Temperature	293 K/Ambient (~72 F)			
Flow Rate[1]	49 m^3/sec (103,800 ft^3/min)			
Stack Velocity[1]	38.48 m/sec (7,574.8 feet/min)			

Notes:

°F = degrees Fahrenheit
ft/min = feet per minute
ft^3/min = cubic feet per minute
K = Kelvin
m/sec = meters per second
m^3/sec = cubic meters per second

4.0 Health Risk Analysis

4.1 Pollutant Concentrations

AERMOD will be run using unit emissions; that is, each source will be modeled assuming emissions of 1 gram per second (g/s). The unitized AERMOD results for each source are output in micrograms per cubic meter per g/s [$(\mu g/m^3)(g/s)^{-1}$]. Maximum hourly and period average plot files generated by AERMOD as described above will be input to HARP2, with corresponding TAC emission rates for each phase of construction as well as the proposed project operational emissions to calculate project concentration contributions. These concentrations will then be used to estimate the acute and long-term health effects on sensitive receptors.

4.2 Receptor Exposure and Health Risk Calculations

Exposure factors will be used to calculate dose associated with exposure to the estimated unit concentration results obtained using AERMOD. The air board created the HARP2 software to assist in the development of emissions inventories, dispersion modeling, and risk assessment. For this project, HARP2 will be used solely to estimate cancer risk via HARP2's Air Dispersion Modeling and Risk Tool (ADMRT Version 21081), which was developed to encapsulate the exposure factors and guidance of the 2015 OEHHA Air Toxics Hot Spots Program Guidance Manual.[25] AECOM will evaluate the cancer risk for sensitive receptors exposed to 30 years (residential) and 25 years (worker) of project emissions through the inhalation pathway, as recommended in OEHHA 2015. Factors that affect the dose that a receptor would receive include, but are not limited to, age-specific daily breathing rates and exposure time, frequencies, and duration. The general formula for calculating residential inhalation risk is as follows:

$$\mathbf{RISK_{inh\text{-}res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH}$$

Where:

$RISK_{inh\text{-}res}$ = Residential inhalation cancer risk
$DOSE_{air}$ = Daily inhalation dose (milligrams/kilogram [mg/kg]-day)
CPF = Inhalation cancer potency factor $(mg/kg\text{-}day^{-1})$
ASF = Age sensitivity factor for a specified age group (unitless)
ED = Exposure duration (in years) for a specified age group
AT = Averaging time for lifetime cancer risk (years)
FAH = Fraction of time spent at home (unitless)

[25] Office of Environmental Health Hazard Assessment (OEHHA), February 2015, *Air Toxics Hot Spots Program Guidance Manual*.

The inhalation risk will be calculated in HARP2 using the OEHHA 2015-recommended default values for these parameters:

CPF	= Substance-specific
A^{SF}	= 10 for 3rd trimester of pregnancy to age 2, 3 for age 2 to 16, 1 for age 16 to 30
ED	= 0.25 year for 3rd trimester, 2 years for age 0 to 2, 7 years for age 2 to 9, 14 years for age 2 to 16, 14 years for age 16 to 30
AT	= 30 years
FAH	= 1.0 (no adjustment)

The daily inhalation dose for a resident receptor is defined as:

$$\mathbf{DOSE_{air} = C_{air} \times \{BR/BW\} \times A \times EF \times 10^{-6}}$$

Where:

$DOSE_{air}$	= Dose through inhalation (mg/kg-day)
C_{air}	= Concentration in air ($\mu g/m^3$)
{BR/BW}	= Daily Breathing rate normalized to body weight (Liters/kilogram body weight per day)
A	= Inhalation absorption factor (unitless)
EF	= Exposure frequency (unitless), days/365 days
10^{-6}	= Micrograms to milligrams conversion, liters to cubic meters conversion

The daily inhalation dose will be calculated in HARP2 using OEHHA 2015-recommended default values for these parameters:

C_{air}	= Concentration as calculated from AERMOD
{BR/BW}	= RMP derived method (i.e., 95th percentile) estimates (361 for 3rd trimester of pregnancy, 1,090 for age 0 to 2, 745 for age 2 to 16, 335 for age 16 to 30)
A	= 1
EF	= 0.96 (350 days/365 days in a year for a resident)

The general formula for calculating worker inhalation risk is as follows:

$$\mathbf{RISK_{inh\text{-}work} = DOSE_{air} \times CPF \times ASF \times ED/AT}$$

Where:

$RISK_{inh\text{-}work}$	= Worker inhalation cancer risk
$DOSE_{air}$	= Daily inhalation dose (milligrams per kilogram per day [mg/kg-day])
CPF	= Inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF	= 1 for working age 16-70 years (unitless)
ED	= 25 (years)
AT	= 70 (years)

The daily inhalation dose for a worker receptor is defined as:

$$\mathbf{DOSE_{air} = (C_{air} \times WAF) \times \{BR/BW\} \times A \times EF \times 10^{-6}}$$

Where:

$DOSE_{air}$ = Dose through inhalation (mg/kg-day)
C_{air} = Concentration in air ($\mu g/m^3$)
WAF = Worker air concentration adjustment factor (unitless)
{BR/BW} = Daily Breathing rate normalized to body weight (liters/kilogram body weight per day)
A = Inhalation absorption factor (unitless)
EF = Exposure frequency (unitless), days/365 days
10^{-6} = Micrograms to milligrams conversion, liters to cubic meters conversion

The daily inhalation dose will be calculated in HARP2 using OEHHA 2015-recommended default values for these parameters:

C_{air} = Concentration as calculated from AERMOD
WAF = 4.2 based on (24 hrs/day / 8 hrs/day) x (7 days/week / 5 days/week)
{BR/BW} = OEHHA derived method (i.e., 95th percentile) estimates for age 16 to 41)
A = 1
EF = 0.68 (250 days/365 days in a year for a worker)

AERMOD and HARP2 programs represent the most advanced model/tool used to assess risk in the State of California, according to the air board and OEHHA.

4.3 Summary of Health Risks

Health risks will be calculated for all receptors and for the maximally exposed individual at a sensitive receptor location. Two scenarios each will be presented for resident and worker receptors:

- *Residential Scenario 1:* This scenario will include project emissions from both construction activities and operation of the proposed project. Cancer risk will be assessed over a 30.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 28 years.
- *Residential Scenario 2:* This scenario will include only operation of the proposed project for a 30-year period.
- *Worker Scenario 1:* This scenario will include project emissions from both construction activities and operation of the proposed project. Cancer risk will be assessed over a 25.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 23 years.
- *Worker Scenario 2:* This scenario will include only operation of the proposed project for a 25-year period.

Two scenarios will be analyzed to determine which scenario would be more impactful. The approximately 30-year residential exposure scenarios 1 and 2, and the 25-year worker exposure scenarios 1 and 2 are consistent with 2015 OEHHA health risk guidance.[26]

[26] California Environmental Protection Agency, *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessment*, February 2015, *http://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf*, accessed July 15, 2021.

For residential exposure, the starting age for the first year of construction will be the third trimester in utero, with operations having a starting age of 2 years. The second scenario (Uncontrolled Scenario 2) assumes future operations for an exposure period of 30 years, with a starting age of third trimester in utero.

For worker exposure, the starting age for the first year of construction will be 16 years of age, with operations having a starting age of 18 years. The second scenario (Uncontrolled Scenario 2) assumes future operations for an exposure period of 25 years, with a starting age of 16 years.

For both scenarios, existing plus project cancer risks and total project annual average $PM_{2.5}$ concentrations will be estimated by adding these project contributions to the 2020 Citywide HRA background risks and concentrations. An Excel database file will be provided that includes the project health risk and $PM_{2.5}$ concentrations in addition to existing and total risks. Isopleths will be presented for both scenarios from the proposed project.

4.4 Cumulative Projects

Once the project maximally exposed individual sensitive resident and worker receptors are identified, AECOM and the project sponsor will work with the planning department to identify projects to include as part of the cumulative analysis.

For projects with a completed air quality analysis, AECOM will add the cancer risk and annual $PM_{2.5}$ values calculated in those analyses to the project's maximally exposed individual sensitive resident and worker receptors. Where quantitative information from cumulative projects is not known, the health risks and $PM_{2.5}$ contributions from those projects will be discussed qualitatively.

5.0 Measures to Reduce Project Impacts

If, based on the analysis outlined above and in consultation with the planning department, it is determined that the proposed project may exceed significance thresholds, AECOM will coordinate with the planning department and the project sponsor to develop feasible control measures to incorporate into the proposed project, and appropriate methodologies for assessing the effectiveness of such measures at reducing emissions, which may include qualitative and/or quantitative analysis. AECOM will present the proposed measure(s), methodology for assessing the reductions from those measures, and a summary of project findings.

6.0 Uncertainties

This section summarizes the main uncertainties associated with the emissions estimation, air dispersion modeling, and risk estimation components of the HRA methodology.

6.1 Emissions Estimates

There are uncertainties associated with the estimation of emissions from construction equipment. Where project-specific data are not available, CalEEMod default values or conservative (worst-case) input assumptions will be used. Similarly, operational activities could vary from day-to-day, but worst-case input assumptions will be used to inform the most conservative maximum average daily and maximum annual emissions that would result from long-term operations of the proposed project.

6.2 Air Dispersion Modeling

The limitations of the air dispersion model provide a source of uncertainty in the estimation of exposure concentrations. According to U.S. EPA, errors due to the limitation of the algorithms implemented in the

air dispersion model in the highest estimated concentrations of ±10 percent to 40 percent are typical.[27] AECOM's methodologies use conservative assumptions and techniques to produce conservative (worst-case) results; therefore, predicted exposure concentrations are likely to be at or above actual exposure concentrations. The source parameters used to model emission sources also add uncertainty. For all emission sources, AECOM will use source parameters that are either recommended as defaults or expected to produce more conservative results. Discrepancies might exist between the actual emissions characteristics of a source and its representation in the model; exposure concentrations used in this assessment represent approximate exposure concentrations.

6.3 Health Risk Analysis

Numerous assumptions must be made to estimate human exposure to pollutants. These assumptions include parameters such as breathing rates, exposure time and frequency, exposure duration, and human activity patterns. Although a mean value derived from scientifically defensible studies is the best estimate of central tendency, most of the exposure variables used in this HRA are conservative estimates. For example, it is assumed that residential receptor exposure to project emissions occurs during the entire construction duration, and that exposure to the emissions sources occurs 24 hours per day for 350 days per year—a highly conservative assumption, because most residents do not remain in their homes for this period of time. The combination of several high-end estimates used as exposure parameters may substantially overestimate chemical intake. The excess lifetime cancer risks calculated in this assessment are therefore likely to be higher than may be necessary to be protective of public health.

The OEHHA CPF for DPM is used to estimate cancer risks associated with exposure to DPM from the proposed project. However, the CPF derived by OEHHA for DPM is highly uncertain in both the estimation of response and dose. In the past, due to inadequate animal test data and epidemiology data on diesel exhaust, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization, had classified DPM as Probably Carcinogenic to Humans (Group 2); the U.S. EPA had also concluded that the existing data did not provide an adequate basis for quantitative risk assessment.[28] However, based on two scientific studies,[29,30] IARC re-classified DPM as Carcinogenic to Humans to Group 1.[31] This means that the agency has determined that there is "sufficient evidence of carcinogenicity" of a substance in humans and represents the strongest weight-of-evidence rating in IARC's carcinogen classification scheme. This determination by the IARC may provide additional impetus for the U.S. EPA to identify a quantitative dose-response relationship between exposure to DPM and cancer.

OEHHA states that the conservative assumptions used in a risk assessment are intended to avoid underestimation of actual risks posed by a site, and are designed to err on the side of health protection.[32] The estimated risks for this HRA will be based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. Although it is difficult to quantify the uncertainties associated with all the assumptions made in this risk assessment, the use of conservative assumptions is likely to result in substantial overestimates of exposure, and hence risk.

To: AECOM
From: JLA

RFI #: Varies
Request date: Varies
Original Response: Varies
Revision: 09.18.18

The following are revised responses to construction related RFI items as issued in the RFI Request from AECOM for CEQA analysis and scope of work/project description documentation. RFI numbers reference the numbers used in the request spreadsheet.

Description:

Note: For the purposes of these RFI responses, the Base Project and Fleet Management Variant responses are similar in many cases. Where the Fleet Management is the subject of the questions or if the response to a question differs in a significant way, a specific response tailored to the Fleet Management Variant is provided.

RFIs

7. Expected start date, duration, days per week, and hours per day of construction activity

   Response:
   See attached Base Project & Fleet Management Variant Construction Comparison document

8. Number of construction workers anticipated

   Response:
   See attached Base Project & Fleet Management Variant Construction Comparison document

9. Construction phasing, including duration of each phase

   Response:
   See attached Base Project & Fleet Management Variant Construction Comparison document

10. Truck routing and estimated daily truck volumes per phase

    Response:
    See attached Base Project & Fleet Management Variant Construction Comparison document

14. Number of worker trips for each phase

    Response:
    See attached Base Project & Fleet Management Variant Construction Comparison document

15. Construction equipment list (equipment type, number of units, horsepower, load factor, operating hours per day, days of operation) for each phase.

    Response:
    See Section b of attached San Francisco Planning Department Memo – Attachment B. Project Construction Information document.

16. Cubic yards of soil excavated - subdivide between street improvements & onsite improvements

    Response:
    See attached Base Project & Fleet Management Variant Construction Comparison document

17. Cubic yards of soil reused

    Response:
    See attached Base Project & Fleet Management Variant Construction Comparison document

18. Cubic yards of soil exported

    Response:
    See attached Base Project & Fleet Management Variant Construction Comparison document

19. Cubic yards of soil imported

Response:
See attached Base Project & Fleet Management Variant Construction Comparison document

20. Confirmation of excavation depth bgs (confirm 10 ft bgs)

Response Base Project:
Confirmed. A maximum excavation depth below grade surface of 10 feet for grade beam construction. This does not include ground improvements

Response Fleet Management Variant:
The FMV contains a basement level at a portion of building C. In this area below grade surface excavation will be 14 feet

53. Are any dewatering activities proposed as part of construction?

Response Base Project:
Yes, temporary dewatering during construction will be required for foundation excavation.

Response Fleet Management Variant:
Yes, temporary dewatering during construction will be required for foundation excavation and during basement construction at building C.

54. Describe the "commissioning" phase of construction.

Response:
The "commissioning" phase of the project occurs during the last couple months of construction. Activities include:

- *Start-up and checkout of all equipment*
- *Inspection of mechanical and electrical systems and signed off*
- *Life Safety (Fire Alarm) testing, including elevator sign-off*
- *AHJ Inspections and sign-offs – municipal, utilities, etc.*
- *Final Inspection and Sign-off (TCO & C of O)*

55. Are shuttles planned for the proposed project during construction? Where would the construction workers be shuttled from? Where would the construction workers park?

Response:
The project is not anticipating requiring the use of shuttles for construction worker transportation. There is sufficient parking at and around the site to accommodate the workers.

During year 1 of construction & craft workers will park around the perimeter of the building and parking will be coordinated with demo, building pad and digging and pouring foundations activities. (range 90 -200 craft workers)

During the 2nd year of construction, we will utilize a combination of parking around the perimeter of building as well as parking inside of the buildings.

56. Where would soil be exported to?

Response:
Soil is expected to be exported to the Recology Facility at Tunnel Avenue in Brisbane, California.

81. Has there been any more information on pile driving activities during construction? Describe construction method, pile type, depth of piles etc. (the 4/19 RFI indicated further studies are being completed to determine foundation type for variant etc.)

Response:
See attached Base Project & Fleet Management Variant Construction Comparison document

82. Do you anticipate "exceptional circumstances" from 4/19 RFI would occur during construction? Is it appropriate to state "no nighttime work is anticipated during construction" or is it more appropriate to state "no nighttime work is anticipated, however if extraordinary circumstances arise, the project sponsor would obtain the proper documentation from the City"?

Response:
See attached Base Project & Fleet Management Variant Construction Comparison document response to RFI #7 for normal working hours.

There are a few “exceptional circumstances” that may require nighttime work during construction.

This includes:

1) Large Concrete Pours - These could be scheduled as early as 1am because of traffic. The project would apply for the necessary permits to be coordinated with the City of San Francisco.
2) Delivery of Oversized Loads – There are a number of oversized loads (structural trusses, precast members etc) that may special permitting and or truck delivery times, in order to avoid traffic. The project would apply for the necessary permits to be coordinated with the City of San Francisco.

83. The City would like to see more information about the construction worker shuttles. The 4/19 RFI states "Parking and shuttle service logistics are yet to be established" - has this been further analyzed?

Response:
See response to RFI #55 above

84. Would a traffic control plan be necessary during construction for work in the public ROW? What work in the public ROW is anticipated? Describe any changes to pedestrian access where/during what phases; street closures; parking space closures (how many, where)

Response:
Yes, as part of the project, repaving of portions of the public right of way to install new underground utilities and new city street and sidewalk sections will occur. No sidewalks currently exist adjacent to the project.

1) A new sidewalk adjacent to the project and half the width of city street of Rankin Street, McKinnon Avenue & Toland Street will be repaved. The full width of Kirkwood Avenue will be repaved with a new curb added on the north side of Kirkwood Avenue. (About 292,000 sf of city street will be repaved and 4,440 lf of sidewalk will be installed.)

97. Please identify the laydown and staging areas and describe the construction phases more

Response:
Trailers will be set up on the west end of the project, with parking being along the side of McKinnon, Toland, Rankin & Kirkwood right of ways in the area that is created between the current fence line and the existing buildings. This will change as work flow changes. Staging area for truck unloading, of precast and or steel, will be staged in this area as well**.**

Date: June 27, 2017
Case No.: 2015-012491ENV
Project Address: **749 Toland Street and 2000 McKinnon Avenue**

To inform the air quality analysis for the 749 Toland Street and 2000 McKinnon Avenue Project, the San Francisco Planning Department requires more information about construction activities. Please answer the questions listed below.

Construction Schedule. Please estimate the following information regarding the project's construction schedule:

a. Overall construction schedule (number of months or weeks).
b. Cubic yards of material transport, separated by import and export.

Construction Phasing and Equipment. Please provide estimates for the following information.

a. Phases using the following categories:

Construction Phase	Definition	Associated Schedule	Total Acres Disturbed	Material Imported/Exported
Demolition (Identify the square footage of buildings to be demolished.)	Involves tearing down of buildings or structures.	Jan - Mar 2021	12.92 acres (563,146 sf)	Export: 448,000 gsf of demolition 44,000 cy of debris
Site Preparation	Involves clearing vegetation (grubbing and tree/stump removal) and stones prior to grading	Jan 2021	2.66 acres (116,000 sf)	Export: 4,000 cy of debris
Grading	Involves the cut and fill of land to ensure the proper base and slope for the construction foundation	Mar - May 2021	12.92 acres (563,146 sf)	Export: 54,000 cy (BP) Export: 87,000 (FMV) Import: 0 cy (BP) Import: 0 cy (FMV)
Building Construction	Involves the construction of structures and buildings	Apr 2021 - Apr 2022	12.92 acres (563,146 sf) 2,451,316 gsf	Import: 164,000 cy Export: 38,000 cy
Architectural Coatings	Involves the application of coatings to both the interior and exterior of buildings or structures	Sep 2021 - Nov 2022	12.92 acres (563,146 sf) 2,451,316 gsf	Import: 4,000 cy
Paving	Involves the laying of concrete or asphalt such as in parking lots or roads	June - Nov 2022	5.78 acres (252,000 sf)	Export: 6,600 cy Import: 9,200 cy (above quantities are to half street width only ~~except Kirkwood &~~ Selby)
Other: TENANT FIT OUT - FMV ONLY	Provide a general description if the phase does not fit within the above definitions	Nov 2022 - Feb 2023	6.46 acres (281,573 sf)

06.28.19

PROJECT
San Francisco Gateway

CEQA Analysis

PROJECT No.
1501.07

PAGES
2

To: AECOM
From: JLA

RFI #:
Request date: 06.28.19
Original Response: 06.28.19
Revision: -

The following are responses to RFI items as issued by email from AECOM. Emails dated 6.26.19 and 6.27.19

1. Would there still be painting, fueling, etc. somewhere in the building?
   Response:
   No painting or fueling

2. Confirm generators are the same.
   Response:
   Yes, the generators remain unchanged

3. Confirm pile numbers are the same.
   Response:
   Yes, currently the pile numbers are the same.

4. Need start date for construction, we will need to plug that into the AQ model
   Response:
   Construction start date is: 06.01.2021.

5. Please confirm that the construction routes have not changed. Attached is a figure showing the previous routes. If the routes have changed, please provide a map.
   Response:
   Yes, construction routes remain unchanged.

6. The revised PD indicates that construction (including demo) will now take 30 months instead of the previous 25 months. Table 4 “Construction Phasing” of the revised PD implies that none of the phases will occur concurrently. Please confirm as previously that some phases will overlap.
   Response:
   Construction durations and overlap remain unchanged.

DRAFT

7. Based on the revised PD, the Manufacturing and Maker Space would be 35,000 gsf combined between buildings A and B. There are now only 4 types (Food & Beverage Processing, Apparel & Other Garment Products, Furniture & Fixtures, and Printing & Publishing including 3-D) of the uses listed. Therefore, we would propose a breakdown of 25% for each type resulting in 8,750 gsf per type (4,375 gsf for each building). Does this seem like a reasonable breakdown in the Manufacturing and Maker Space?

   Response:

   The Manufacturing and Maker Space is 35,000 sf (3% of the total area). This should be evaluated in a method that would allow for flexibility for the specific type of maker/manufacturing use. The four (4) types are illustrative examples and do not represent a specific mix of maker users. The concept discussed to date is to bound or limit Maker use by compliance existing regulatory restrictions related to noise and air quality.

ROG Calculations and Mitigation

Subject: RE: ROG Calculations and Mitigation
Date: Monday, March 24, 2014 11:05:09 AM

Hello,

My understanding of electric loading docks is basic – it allows trucks to plug in at docks so they don't need to idle to keep cool or warm. This is particularly a concern if carrying items that need to be temperature controlled, like food. It also allows the driver to continue to use air conditioning, etc. in the cab while waiting to unload or unloading.

Unfortunately, we don't have any VOC programs at this time.

Hi Allison,

Thank you. Sorry for not getting back to you; I was at a conference Thursday and Friday. Regarding your questions.

1. Can you elaborate what an electric loading dock is and how it reduces idling?
2. The project-specific transportation study takes into account development scale, density of project, density of uses, and design of project; all factors that may influence travel behavior. Currently, we do not have any substantial evidence to support quantifying the efficacy of TDM programs for land use projects in San Francisco. That being said, you are correct, the proposed project would include a number of TDM measures (e.g., bike parking, car share, parking maximum, etc.).
3. I am not aware of any programs in SF that reduce VOC, but I am checking with our Department of Public Health to see if they are aware of a program. I was hoping the BAAQMD may have such a program.

Hello,

You wrote:
"San Francisco's ROG emissions from consumer products was 5.30 tons in 2008 (Source: ARB, same source as statewide ROG emissions). San Francisco's square footage was 703,541,231 square feet (Source: 2011 SF Land Use data). Therefore, the emission factor would be (5.30 tons/day * 2000 lbs/ton)/703,541,231 = **1.51e-5 lbs/(sq.ft-day)**. In your opinion, does this seem appropriate to use as an emission factor given it utilizes local, more accurate building data?"

Yes, we support the use of more accurate and local data. I think this is appropriate here.

Regarding reducing operational VOC, I haven't come up with any easy ways to reduce emissions. The uses described would result in some truck deliveries, so here are some ideas:

1. Electric loading docs to reduce idling (mainly used to reduce PM, but would reduce VOC, too)
2. San Francisco has progressive TDM programs – anyway to take this further for this site? Say, further reductions in private parking in favor of more bike parking, more car share, bulk transit pass purchase for residents or employees?
3. On-site reductions are preferred, but are there any possibilities of off-site reductions to reduce VOC elsewhere in SF?

We can certainly discuss this further.

It could mean a bunch of things (retail, office, cultural, educational, arts uses), but for the purposes of CalEEMod we assumed regional shopping center.

Yes,
There are two project options being studied:

Option 1, Office Scheme: 1,827,000 gross square feet (gsf) or renovated existing buildings and new construction, comprising up to:

- 871,900 gsf of office uses (554,200 gsf net new office space)
- 802,500 gsf of residential uses (914 dwelling units)
- 152,600 gsf of active ground floor uses

Option 2, Residential Scheme: 1,808,800 gsf of renovated existing buildings and new construction, comprising up to:

- 598,500 gsf of office uses (280,800 gsf of net new office space)
- 1,057,700 gsf of residential uses (1,209 dwelling units)
- 152,600 gsf of active ground floor uses

Subject: RE: ROG Calculations and Mitigation

Hello,

Thank you for getting back to me. Yes, I mean operational VOC. First, in regards to the default CalEEMod uses, I was considering using a different default for San Francisco based on SF specific data:

> San Francisco's ROG emissions from consumer products was 5.30 tons in 2008 (Source: ARB, same source as statewide ROG emissions). San Francisco's square footage was 703,541,231 square feet (Source: 2011 SF Land Use data). Therefore, the emission factor would be (5.30 tons/day * 2000 lbs/ton)/703,541,231 = **1.51e-5 lbs/(sq.ft-day)**. In your

opinion, does this seem appropriate to use as an emission factor given it utilizes local, more accurate building data?

Second in terms of mitigation, the proposed project is a large mixed-use project, so the heavy-duty vehicle mitigation would not be applicable. CalEEMod estimates area sources as approximately 75 percent of the proposed project's total ROG emissions, of which consumer products are approximately 85 percent of the estimated area source ROG emissions. The vehicle trip generation number used in CalEEMod is based on a project-specific transportation study, which takes into account project location, so this will not be adjusted either. The proposed project would not include fireplaces. As shown by the calculation above, consumer product estimates are a function of total square footage. Therefore, a way to reduce this would be to reduce the size of the project; however, the market demand for this square footage may just be displaced to another project in the Air Basin. Thus, I was curious if the BAAQMD had any programs that could reduce this regional air pollutant for an individual project.
Thank you again for your help on this,

Subject: RE: ROG Calculations and Mitigation

Hello,

I asked our Emissions Inventory staff and we know of any other estimates for VOC in the SFBAAB and we do not. Emissions Inventory staff reports that our consumer product emissions inventory will match ARB's inventory, category by category.

As for mitigations, we are definitely open to discussion about this and would like to hear your ideas. It sounds like you mean operational VOC so I don't know if requiring cleaner-than-required heavy-duty equipment would help, but here are a few ideas:

1. Cleaner than required heavy-duty vehicles (electric, hybrid, etc.)
2. Reduced VOC paint, architecture coatings
3. Reduced VOC cleaning supplies

Reducing VOC may be difficult, but again, we are open to suggestions.
Let me know if you would like to discuss further.

Subject: ROG Calculations and Mitigation

Hi Sigalle and Alison,

I am reviewing an air quality analysis for a proposed project that has estimated high ROG emissions, driven primarily by consumer products emissions using CalEEMod. The CalEEMod defaults are described in Appendix E of the User's Guide (page 23). The calculation is statewide daily VOC (ROG) emissions* divided by statewide total building square footage.
-Has a similar calculation ever been done for the Bay Area using SFBAAB VOC emissions? **
-Either way, do you have any recommendations for feasible mitigation for ROG (e.g., offset fee program)?

**See link for statewide ROG emissions from consumer products:*

1. Introduction

At the request of the San Francisco Planning Department (planning department), AECOM Technical Services, Inc. (AECOM) conducted an analysis of local air quality and health impacts associated with the construction and operation of the proposed buildings for the San Francisco Gateway Project (proposed project) at 749 Toland Street and 2000 McKinnon Avenue. The Air Quality and Health Risk Assessment (HRA) Methodology Memorandum (methodology memorandum) describes the approach for evaluation of air quality and health impacts from construction and operational sources, existing sources, and cumulative sources at modeled sensitive receptors (see preceding memorandum in this appendix). The results of the detailed calculations used to apply the analysis approach and data inputs described in the methodology memorandum are provided in this Air Quality Results Memorandum (results memorandum).

Section 1.1, Project Understanding, of the methodology memorandum summarizes the project description for the proposed project. Chapter 2, Project Description, of the San Francisco Gateway Project Draft EIR (Case No. 2015-012491ENV) describes the proposed project in detail.

2. Modeling Results

This section presents the proposed project's criteria air pollutant emissions, as well as results of the project's HRA and concentrations of particulate matter less than or equal to 2.5 micrometers in diameter ($PM_{2.5}$) at sensitive receptors.

To address criteria air pollutant emissions generated as a result of the proposed project's operations, operational emissions control measures were identified, and operational emissions with implementation of such control measures were quantified. The proposed project's controlled operational emissions are also presented below.

The detailed calculations based on the analysis approach and data inputs described in the methodology memorandum are provided in Attachments A and B to this results memorandum.

2.1 Criteria Air Pollutant Emissions

2.1.1 Proposed Project without Emissions Control Strategies

Sections 2.1.1.1 and 2.1.1.2 present the average daily and maximum annual emissions that would result from construction and operation of the proposed project, without implementation of emissions control strategies. Section 2.1.2 then presents the emissions control strategies evaluated to reduce emissions associated with the proposed project, the methodology to estimate emissions reductions that would be achieved through implementation of such strategies, and the resulting criteria air pollutant emissions.

2.1.1.1 Construction Emissions

Table 1 through Table 3 summarize the proposed project's average daily construction emissions of criteria air pollutants and ozone precursors (without emission reduction measures) for each year of construction (2022 through 2024).[1]

Table 1 Summary of Year 1 (2022) Proposed Project Total and Average Daily Construction Emissions (Without Emission Reduction Measures)

Year 1 (2022) Emissions Source	ROG	NO_X	PM_{10} (Exhaust Only)	$PM_{2.5}$ (Exhaust Only)	$PM_{2.5}$ (Fugitive Dust)[2]
Off-Road Equipment (tons)	0.12	2.21	0.02	0.02	-
On-Road Equipment (tons)	0.04	0.44	0.01	0.01	0.02
Fugitive Dust (Earthwork, Demolition, Scraping/Grading, Truck Loading/Stockpiling) Activities (tons)	-	-	-	-	0.04
Year 1 (2022) Total Emissions (tons)	**0.16**	**2.65**	**0.03**	**0.03**	**0.06**
Average Daily (2022) Emissions (pounds per day) [1]	**2.02**	**34.24**	**0.36**	**0.35**	**0.81**

Notes:
Ground disturbance activities associated with building A would occur in 2022; while ground disturbance activities associated with building B would occur in 2022 and 2023. All demolition activities would occur in 2022.
1. Average daily emission estimates are based on 155 construction workdays in 2022.
2. Fugitive dust totals presented account for implementation of fugitive dust control measures in accordance with requirements of the San Francisco Construction Dust Control Ordinance (Health code article 22B and San Francisco Building Code section 106.A.3.2.6)
NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas
- = not applicable

Source: Modeled by AECOM 2022 (see Attachment A, Emissions Estimates)

[1] The emissions analysis conservatively assumed a construction start year of 2022. Considering that exhaust emissions from construction equipment and on-road vehicles are expected to decrease over time as stricter standards take effect—and advancements in engine technology, retrofits, and turnover in the equipment fleets occur—construction activities are anticipated to result in lower levels of emissions as construction occurs in later years.

Table 2 Summary of Year 2 (2023) Proposed Project Total and Average Daily Construction Emissions (Without Emission Reduction Measures)

Year 2 (2023) Emissions Source	ROG	NO_X	PM_{10} (Exhaust Only)	$PM_{2.5}$ (Exhaust Only)	$PM_{2.5}$ (Fugitive Dust)[2]
Off-Road Equipment (tons)	0.24	4.65	0.06	0.06	-
On-Road Equipment (tons)	0.04	0.41	0.01	0.01	0.03
Fugitive Dust (Earthwork, Scraping/Grading, Truck Loading/Stockpiling) Activities (tons)	-	-	-	-	<0.01
Architectural Coatings (tons)	0.69	-	-	-	-
Year 2 (2023) Total Emissions (tons)	**0.97**	**5.05**	**0.07**	**0.07**	**0.03**
Average Daily (2023) Emissions (pounds per day) [1]	**7.47**	**38.85**	**0.53**	**0.52**	**0.23**

Notes:

Ground disturbance activities associated with Building 2 would occur in 2022 and 2023. Architectural coating activities would occur in 2023 and 2024.

1. Average daily emission estimates are based on 260 construction workdays in 2023.
2. Fugitive dust totals presented account for implementation of fugitive dust control measures in accordance with requirements of the San Francisco Construction Dust Control Ordinance (Health code article 22B and San Francisco Building Code section 106.A.3.2.6)

NO_X = oxides of nitrogen

Table 3 Summary of Year 3 (2024) Proposed Project Total and Average Daily Construction Emissions (Without Emission Reduction Measures)

Year 3 (2024) Emissions Source	ROG	NO_X	PM_{10} (Exhaust Only)	$PM_{2.5}$ (Exhaust Only)	$PM_{2.5}$ (Fugitive Dust)
Off-Road Equipment (tons)	0.25	4.65	0.04	0.04	-
On-Road Equipment (tons)	0.04	0.30	<0.01	<0.01	0.02
Architectural Coatings (tons)	1.39	-	-	-	-
Paving Activities (tons)	0.02	-	-	-	-
Year 3 (2024) Total Emissions (tons)	**1.69**	**4.95**	**0.05**	**0.04**	**0.02**
Average Daily (2024) Emissions (pounds per day) [1]	**13.28**	**38.79**	**0.36**	**0.35**	**0.18**

Notes:

All ground disturbance activities modeled to occur in 2022 and 2023. Architectural coating activities would occur in 2023 and 2024.

All paving activities would occur in 2024.

1. Average daily emission estimates are based on 255 construction workdays in 2024.

NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas

- = not applicable

Source: Modeled by AECOM 2022 (see Attachment A, Emissions Estimates)

2.1.1.2 Operational Emissions

Table 4 summarizes the proposed project's daily operational emissions of criteria air pollutants and ozone precursors (without emission reduction measures). The operational emissions represent the proposed project at full buildout—without accounting for a reduction in emissions at the site that would be removed due to build out of the proposed project, and without emissions control measures. As described in Section 1.1, Project Understanding, in the methodology memorandum, and summarized in Table 5, the project site is currently occupied. Uses at the site generate existing daily operational emissions that are considered part of the baseline existing conditions of the site; these emissions would be eliminated with the demolition of existing onsite land uses as part of the proposed project.[2] Table 6 presents the net increase in operational emissions (without emission reduction measures) as a result of the proposed project (i.e., the delta between existing site operational emissions and those of the proposed project without emissions control measures).

Table 4 Summary of Proposed Project Daily Operational Emissions (Without Emission Reduction Measures) (pounds per day)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	21.6	<0.1	<0.1	<0.1
Energy[1]	0.0	0.0	0.0	0.0
Manufacturing and Maker Space[2]	3.0	34.8	1.8	1.1
Stationary Sources[3]	1.5	4.0	0.2	0.2
Mobile[4]	9.9	110.2	44.9	13.0
Transportation Refrigeration Units[5]	17.1	16.9	0.5	0.4
Total Proposed Project Daily Operational Emissions (Without Emission Reduction Measures)[6]	*53.0*	*165.9*	*47.4*	*14.7*

Notes:

1. Area and energy sources are modeled using CalEEMod defaults for the proposed land uses. The project would be designed without natural gas; therefore, no emissions would occur from energy sources.
2. Manufacturing and maker space emissions are based on emissions profiles from existing similar land uses, and the maximum potential emissions for a "worst-case" use emissions profile are presented for each pollutant.
3. Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod, using both CalEEMod input factors and U.S. EPA emissions factors.
4. Mobile emissions account for onsite activity and trips to/from the site based on the project-specific vehicle miles traveled analysis and relevant travel assumptions, as detailed in the Air Quality Methodology Memorandum. Emissions account for PM generated by exhaust emissions and brake wear, tire wear, and resuspended roadway dust, and were calculated using CARB EMFAC 2021 emission factors for exhaust, brake wear and tire wear, and U.S. EPA AP-42 methodology for resuspended roadway dust.
5. Transportation refrigeration unit emissions account for travel to and from the site, as well as onsite idling. Emissions were estimated using CARB OFFROAD 2021 Emissions Inventory.
6. Totals may not add due to rounding.

CalEEMod = California Emissions Estimator Model
CARB = California Air Resources Board
NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas
U.S. EPA = United States Environmental Protection Agency

Source: Modeled by AECOM 2022 (see Attachment A, Emissions Estimates)

[2] As of August 2020, the project sponsor submitted building permit applications for an interim use on the project site. The interim use is a parcel delivery service use, focusing on last-mile e-commerce delivery, and occupies one-half of the site (the two buildings west of Interstate 280). Analyzing the change in the environment from the uses that occupied the site in 2017 to the proposed use is considered conservative, or worst-case, because the interim use is more intensive than the uses that existed on site in 2017; therefore, the impact of the project would be greater when compared to the uses that existed on the site in 2017.

Table 5 Existing Site Daily Operational Emissions (pounds per day)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	7.9	<0.1	<0.1	<0.1
Energy[1]	0.2	1.4	0.1	0.1
Mobile[2]	1.3	16.1	6.3	1.8
Total Existing Daily Operational Emissions[3]	*9.3*	*17.5*	*6.4*	*2.0*

Notes:

1. Area and energy sources are modeled using CalEEMod defaults for the existing onsite land uses.
2. Existing daily VMT estimates calculated as part of the Transportation Demand Memorandum for the proposed project were used to inform the mobile emissions estimates. In addition, mobile emissions account for PM generated by exhaust emissions and brake wear, tire wear, and resuspended roadway dust, and were estimated using CARB EMFAC 2021 emission factors for exhaust, brake wear, and tire wear, and U.S. EPA AP-42 methodology for resuspended roadway dust..
3. Totals may not add due to rounding.

CalEEMod = California Emissions Estimator Model
CARB = California Air Resources Board
NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas
U.S. EPA = United States Environmental Protection Agency
VMT = vehicle miles traveled

Source: Modeled by AECOM 2022 (see Attachment A, Emissions Estimates)

Table 6 Net New Daily Operational Emissions (Without Emission Reduction Measures) (pounds per day)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Total Proposed Project Daily Operational Emissions (Without Emission Reduction Measures)[1]	53.0	165.9	47.4	14.7
Total Existing Daily Operational Emissions[2]	9.3	17.5	6.4	2.0
Total Net New Daily Operational Emissions (Without Emission Reduction Measures)[3]	*43.7*	*148.4*	*41.0*	*12.8*

Notes:

1. See Table 4 for additional details.
2. See Table 5 for additional details.
3. Totals may not add due to rounding.

NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas

Similarly, Table 7, Table 8, and Table 9 present the parallel set of operational emissions (i.e., proposed project operational emissions (without emission reduction measures), existing site operational emissions, and proposed project net increase in operational emissions (without emission reduction measures), respectively), but for total annual rather than daily emissions, presented in tons.

Table 7 Summary of Proposed Project Annual Operational Emissions (Without Emission Reduction Measures) (tons per year)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	3.9	<0.1	<0.1	<0.1
Energy[1]	0.0	0.0	0.0	0.0
Manufacturing and Maker Space[2]	0.4	4.6	0.2	0.1
Stationary Sources[3]	<0.1	0.1	<0.1	<0.1
Mobile[4]	1.8	20.1	8.2	2.4
Transportation Refrigeration Units[5]	3.1	3.1	0.1	0.1
Total Proposed Project Annual Operational Emissions (Without Emission Reduction Measures)[6]	*9.3*	*27.9*	*8.5*	*2.6*

Notes:

1. Area and energy sources are modeled using CalEEMod defaults for the proposed land uses. The project would be designed without natural gas; therefore, no onsite natural gas combustion emissions would be generated by the proposed project.
2. Manufacturing and maker space emissions are based on emissions profiles from existing similar land uses, and the maximum potential emissions for a "worst-case" use emissions profile are presented for each pollutant.
3. Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod, using both CalEEMod input factors and U.S. EPA emissions factors.
4. Mobile emissions account for onsite activity and trips to/from the site based on the project-specific VMT analysis and relevant travel assumptions, as detailed in the Air Quality Methodology Memorandum. Emissions account for PM generated by exhaust emissions and brake wear, tire wear, and resuspended roadway dust, and were calculated using CARB EMFAC 2021 emission factors for exhaust, brake wear and tire wear, and U.S. EPA AP-42 methodology for resuspended roadway dust.
5. Transportation refrigeration unit emissions account for travel to and from the site, as well as onsite idling. Emissions were estimated using CARB OFFROAD 2021 Emissions Inventory.
6. Totals may not add due to rounding.

CalEEMod = California Emissions Estimator Model
CARB = California Air Resources Board
NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas
U.S. EPA = United States Environmental Protection Agency
VMT = vehicle miles traveled

Table 9 Net New Annual Operational Emissions (Without Emission Reduction Measures) (tons per year)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Total Proposed Project Annual Operational Emissions (Without Emission Reduction Measures)[1]	9.3	27.9	8.5	2.6
Total Existing Annual Operational Emissions[2]	1.7	3.2	1.2	0.4
Total Net New Annual Operational Emissions (Without Emission Reduction Measures)[3]	*7.6*	*24.6*	*7.4*	*2.2*

Notes:

1. See Table 7 for additional details.
2. See Table 8 for additional details.
3. Totals may not add due to rounding.

NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas

Over time, certain emissions control technologies will advance, and regulations will become more stringent with regard to air pollutant standards, resulting in a reduction in long-term operational emissions with no change in operational activity. Although it is speculative to estimate emissions reductions associated with some sources, such as reactive organic gas emissions from consumer products, California Air Resources Board (air board) provides mobile source emissions factors for vehicle activity in future years, reflecting how mobile source emissions will change over time with fleet turnover and changes in regulations and technology. Air board emissions factors for the years 2035 and 2050 were used to estimate future emissions associated with the proposed project's mobile and transportation refrigeration unit sources; emissions generated by all other sources associated with the proposed project were assumed to remain constant in future years. Table 10 through Table 13 summarize the proposed project's daily and annual operational emissions of criteria air pollutants and ozone precursors (without emission reduction measures). Total emissions associated with project operations in 2035 and 2050, as well as the net increase in emissions that accounts for elimination of existing onsite emissions from demolition, are provided in each table.

Table 10 Summary of Proposed Project and Net Daily Operational Emissions in Year 2035 (Without Emission Reduction Measures) (pounds per day)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	21.6	<0.1	<0.1	<0.1

2.1.2 Proposed Project with Emissions Reduction Measures

This section summarizes the feasible emissions reduction measures that can be quantitatively evaluated, and the related calculation methodology. This section also presents an analysis of the effectiveness of the reduction measures in reducing the project's criteria air pollutant emissions.

2.1.2.1 Quantitative Analysis of Construction Emission Reduction Measures

The construction emissions reduction measures and the methodology to estimate emissions reductions are described in the following paragraphs:

- *Require off-road equipment with engines greater than 25 horsepower be rated Tier 4 Final,[3] as certified by CARB.* Emissions reductions were estimated using the Tier 4 Final engine standards by equipment horsepower category for the proposed equipment fleet mix, rather than Tier 4 Interim standards.
- *To the maximum extent feasible during each construction phase and activity, require electric engines for all equipment that is readily available as plug-in or battery-electric equipment.* Emission reductions were estimated by assuming that the concrete/industrial saws, sweepers/scrubbers, concrete pumps, aerial lifts, pressure washers, and welders would be electric-powered rather than diesel-powered (i.e., removing the emissions associated with this equipment because electric equipment would not generate criteria pollutant exhaust emissions).

These measures can be quantitatively evaluated, and have been assumed for the purposes of this analysis to reduce project construction emissions. Table 14 through Table 16 summarize the proposed project total and average daily construction emissions inclusive of the quantified reduction measures described above.

Additional emissions reduction measures applicable to construction of the proposed project but for which emissions reductions cannot be feasibly quantified at this time are also presented below in Section 2.1.2.2.

[3] The project applied for project approval as a Type 3 Clean Construction Project, committing to use the lowest diesel-emission equipment (Tier 4) during construction, which was assumed to be U.S. EPA Tier 4 Interim standards for the purposes of the emissions (without emission reduction measures). Emissions reductions were estimated by using the more stringent Tier 4 Final engine standards by equipment horsepower category for the proposed equipment fleet mix, rather than the Tier 4 Interim standards. The San Francisco Planning Department approved the proposed project's application on June 15, 2021.

Table 14 Summary of Year 1 (2022) Proposed Project Total and Average Daily Construction Emissions with Reduction Measures

Year 1 (2022) Emissions Source	ROG	NO_X	PM_{10} (Exhaust Only)	$PM_{2.5}$ (Exhaust Only)	$PM_{2.5}$ (Fugitive Dust)[2]
Off-Road Equipment (tons)	0.07	0.37	0.01	0.01	-
On-Road Equipment (tons)	0.04	0.44	0.01	0.01	0.02
Fugitive Dust (Earthwork, Demolition, Scraping/Grading, Truck Loading/Stockpiling) Activities (tons)	-	-	-	-	0.04
Year 1 (2022) Total Emissions (tons)	**0.10**	**0.81**	**0.02**	**0.02**	**0.06**
Average Daily (2022) Emissions (pounds per day) [1]	**1.35**	**10.44**	**0.22**	**0.22**	**0.81**

Notes:

Ground disturbance activities associated with building A would occur in 2022; while ground disturbance activities associated with. building B would occur in 2022 and 2023. All demolition activities would occur in 2022.

1. Average daily emission estimates are based on 155 construction workdays in 2022.
2. Fugitive dust totals presented account for implementation of fugitive dust control measures in accordance with requirements of the San Francisco Construction Dust Control Ordinance (Health code article 22B and San Francisco Building Code section 106.A.3.2.6)

NO_X = oxides of nitrogen
PM_{10} = particulate matter less than or equal to 10 micrometers in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
ROG = reactive organic gas

- = not applicable

2.1.2.2 Additional Construction Emissions Reduction Measures

The following emissions reduction measures are also applicable to construction of the proposed project; however, emissions reductions cannot be feasibly quantified at this time. With implementation of the following emission control measures, construction related emissions would be further reduced.

- *Diesel engines, whether for off-road or on-road equipment, shall not be left idling for more than two minutes, at any location, except as provided in exceptions to the applicable state regulations regarding idling for off-road and on-road equipment (e.g., traffic conditions and safe operating conditions).*

- *Require that construction workers and equipment operators properly maintain and tune equipment in accordance with manufacturer specifications.*

2.1.2.3 Quantitative Analysis of Operational Emissions Reduction Measures

The operational emissions reduction measures and the methodology to estimate emissions reductions are described in the following paragraphs.

- *Require all yard equipment be electric-powered.* This requirement was identified by the project sponsor to be included in the project. It has been included as an emissions reduction measure for that reason, and to ensure implementation and monitoring of this requirement. No additional emissions reductions are quantified because this requirement is a key assumption related to lowering onsite diesel emission (without emission reduction measures) from long-term project operations.

- *Require that all transportation refrigeration units entering the project site be electric or alternative technology to limit emissions, including hydrogen fuel cell transport refrigeration and cryogenic transport refrigeration.* Any electric or hybrid transportation refrigeration units shall be charged via grid power (i.e., not an idling truck or diesel engine). This measure would also require project design include necessary infrastructure; for example, requiring all dock doors serving transportation refrigeration units to be equipped with charging infrastructure to accommodate the necessary plug-in requirements for electric transportation refrigeration units while docked or otherwise idling, as well as the electrical capacity to support the onsite power demand associated with electric transportation refrigerator unit charging requirements. The emissions scenario

(without emission reduction measures) assumed these units would be diesel-powered. To estimate the emissions reductions achieved through this measure, criteria pollutant emissions associated with these units were removed because the electrification or other clean technology units would not generate criteria pollutants during use.

- *Prohibit onsite idling by visiting gasoline- or diesel-powered vans and trucks to no more than two minutes, and provide appropriate signage and training for onsite workers and truck drivers to support effective implementation of this limit.* Emissions reductions were estimated by setting the average idling time to two minutes per truck trip—rather than the five-minute time that was used for the emissions scenario (without emission reduction measures), and which is reflective of air board on-road idling emissions regulations. The idling duration of two minutes was multiplied by the number of truck trips and the idling emissions factor in grams per vehicle per idle-hour for each criteria pollutant.

- *Require any gasoline- or diesel-powered vehicle, whether owned or operated by tenant(s), that enters or operates on the project site and has a gross vehicle weight rating greater than 14,000 pounds, have a model year dated no more than nine years* upon the completion of project construction activities (e.g., should construction be completed in year 2026, visiting trucks must be model year 2017 or newer). Emissions reductions were estimated by calculating a weighted average emissions factor for the single unit and tractor trailer trucks. These calculations used emissions factor and vehicle population data from EMFAC for all data inputs. Based on the earliest possible operational year of 2025, this measure would require applicable trucks to be no older than model year 2016. As such, the weighted average emissions factors for single unit and tractor trailer trucks of model year 2016 through 2025 were calculated using both the emissions factors for each individual model year (2016 through 2025) for these vehicle categories and the estimated number of vehicles of each respective model year that would be in operation in calendar year 2025 as the weighting factor. The other vehicle categories (i.e., automobiles/ pickups and vans) were assumed to include the aggregate fleet mix in calendar year 2025; the emissions factors were those in EMFAC for this aggregate fleet mix in 2025.

- *Ensure that diesel backup generators meet or exceed the air board's Tier 4 off-road emission standards.* Once operational, the diesel backup generators shall be maintained in good working order for the life of the equipment, and any future replacement of the diesel backup generators shall be required to be consistent with these emissions specifications.

- *Limit the allowable manufacturing and maker space uses to prohibit the use of stationary equipment sources whose combined emissions for the manufacturing and maker space would exceed 10 pounds per day in oxides of nitrogen (NOx) emissions, such as boilers.* The emissions reductions achieved through this measure are demonstrated by limiting the NO_X emissions for this PDR use to a maximum of 10 pounds per day.

These measures can be quantitatively evaluated, and have been assumed for purposes for this analysis to reduce project operational emissions.

Table 17 and Table 18 summarize the average daily and maximum annual emissions, respectively, that would result from operation of the proposed project with implementation of emissions control strategies that can be quantitatively evaluated. Each table presents the proposed project's operational emissions of criteria air pollutants and ozone precursors with implementation of operational control measures; the existing site operational emissions that are considered part of the baseline existing conditions of the site (see Table 5 and Table 8 for existing site daily and annual emissions, respectively); and the net increase in controlled operational emissions of the proposed project (i.e., the delta between existing site operational emissions that would be eliminated from the site as a result of demolition, and those of the proposed project with implementation of emissions control measures). The controlled operational emissions represent those of the proposed project in its entirety at full buildout, with implementation of emissions control measures that can be quantitatively evaluated.

Additional emissions reduction measures applicable to the proposed project but for which emissions reductions cannot be feasibly quantified at this time are also presented below in Section 2.1.2.4.

Table 17 Total and Net Change in Daily Operational Emissions from Proposed Project with Emission Reduction Measures in 2025 (pounds per day)

Emissions Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	21.6	<0.1	<0.1	<0.1

Notes:

1. Area and energy sources are modeled using CalEEMod defaults for the proposed land uses.
2. Manufacturing and maker space emissions for ROG and particulate matter are based on emissions profiles from existing similar land uses, and the maximum potential emissions for a "worst-case" use emissions profile; NO_X emissions presented are based on the control measure to limit manufacturing and maker space stationary equipment sources to a combined total of 10 pounds per day.
3. Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod, using both CalEEMod input factors and U.S. EPA emissions factors.
4. Mobile emissions account for onsite activity and trips to/from the site based on the project-specific VMT analysis and relevant travel assumptions, as detailed in Section 2.2.3, Mobile Sources, in the Air Quality Methodology Memorandum. Emissions account for PM generated by exhaust emissions and brake wear, tire wear, and resuspended roadway dust, and were calculated using CARB EMFAC 2021 emission factors for exhaust, brake wear and tire wear, and U.S. EPA AP-42 methodology for resuspended roadway dust. Exhaust emissions calculations applied the CARB EMFAC 2021 emission factors for the 2016 model year and newer fleet mix in the initial operational year of 2025.
5. The control measure to electrify transportation refrigeration units eliminates this emissions source.
6. Totals may not add due to rounding.
7. See Table 5 for additional detail.

2.1.2.4 Additional Operational Emission Reduction Measures

The following emissions control measures are also applicable to project operations; however, emissions reductions cannot be feasibly quantified at this time. With implementation of the following emission control measures, operational emissions would be further reduced.

- *Meet CalGreen Tier 2 green building standards*, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking.
- *Develop and implement an Operational Emissions Management Plan (OEMP)* to demonstrate that the project's net operational NO_X emissions do not exceed a performance standard of 54 pounds per day and 10 tons per year. The intent of this measure would be to monitor the NO_X emissions of tenants and to ensure that the total emissions from the San Francisco Gateway facility remain below this performance standard by implementing various emissions reduction measures such as requiring specific fleet performance metrics including electric vehicle and zero-emission vehicle standards; modification of project operations, including through the use of different equipment, limitations on types of tenants/uses, or limitations on the size or intensity of specific uses; and funding or completing projects in coordination with community groups.

2.1.2.5 Operational Emissions in Future Years

As described above for operational emissions (without emission reduction measures), the project's operational emissions in future years would decrease over time with implementation of more stringent emissions control regulations and implementation of cleaner technologies. Project operational daily and annual emissions were estimated for the years 2035 and 2050 with implementation of the quantifiable operational emissions reduction measures identified above.

The average daily and maximum annual emissions that would result from proposed project operational scenario for years 2035 and 2050 (with emission reduction measures) are summarized in Table 19 through Table 22. These tables present the operational emissions of criteria air pollutants and ozone precursors of the proposed project in years 2035 and 2050 (with emission reduction measures) and take into account air board mobile source emissions factors for these future years. As described above, Table 5 and Table 8 present the existing site daily and annual emissions, respectively and are used to determine the net increase in controlled operational emissions of the proposed project (i.e., the delta between existing site operational emissions that would be eliminated from the site as a result of demolition, and those of the proposed project).

2.2 Health Risks and $PM_{2.5}$ Results of Proposed Project

Health risks were evaluated for sources emitting toxic air contaminants (TACs) during construction and future operations of the proposed project. Two scenarios[4] were evaluated to assess long-term cancer risk and annual $PM_{2.5}$ concentrations for both residential and worker exposure. These included:

- *Residential Exposure Scenario 1:* This scenario includes project emissions from both construction activities and operation of the proposed project. Cancer risk was assessed over a 30.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 28 years.
- *Residential Exposure Scenario 2:* This scenario includes only operation of the proposed project for a 30-year period.
- *Worker Exposure Scenario 1:* This scenario includes project emissions from both construction activities and operation of the proposed project. Cancer risk was assessed over a 25.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 23 years.
- *Worker Exposure Scenario 2:* This scenario includes only operation of the proposed project for a 25-year period.

The purpose of having multiple scenarios (without emission reduction measures) is to analyze which scenario would be more impactful. The approximately 30-year residential exposure scenarios 1 and 2, and the 25-year worker exposure scenarios 1 and 2 are consistent with air district and 2015 Office of Environmental Health Hazard Assessment (OEHHA) health risk guidance.[5,6]

For residential exposure, the starting age for the first year of construction was the third trimester in utero, with operations having a starting age of 2 years. The second scenario (scenario 2) assumes future operations for an exposure period of 30 years, with a starting age of third trimester in utero.

For worker exposure, the starting age for the first year of construction was 16 years, with operations having a starting age of 18 years. The second scenario (scenario 2) assumes future operations for an exposure period of 25 years, with a starting age of 16 years.

Off-road construction equipment and fugitive dust generated by demolition and earthwork activities were included in the model, in the footprint of the proposed project. On-road construction vehicles (consisting of haul and concrete trucks) were modeled along designated routes, as discussed in the methodology memorandum. TAC emissions included in the model for operations consisted of the following: two 400-kilovolt emergency generators, vehicle exhaust from onsite on-road vehicles, maker space activities, and vehicle exhaust from offsite on-road vehicles. Figure 1 and Figure 2 illustrate the location of the modeled sources for construction and operation, respectively. Additional details on these emissions sources are provided in the methodology memorandum.

[4] These scenarios include the use of Tier 4 Interim emission standards for construction equipment rated 25 horsepower or greater as part of the proposed project's approval as a Type 3 Clean Construction Project, pursuant to Director Bulletin No. 2, *https://sfplanning.org/sites/default/files/forms/DB2_Type3_SupplementalApplication.pdf*.

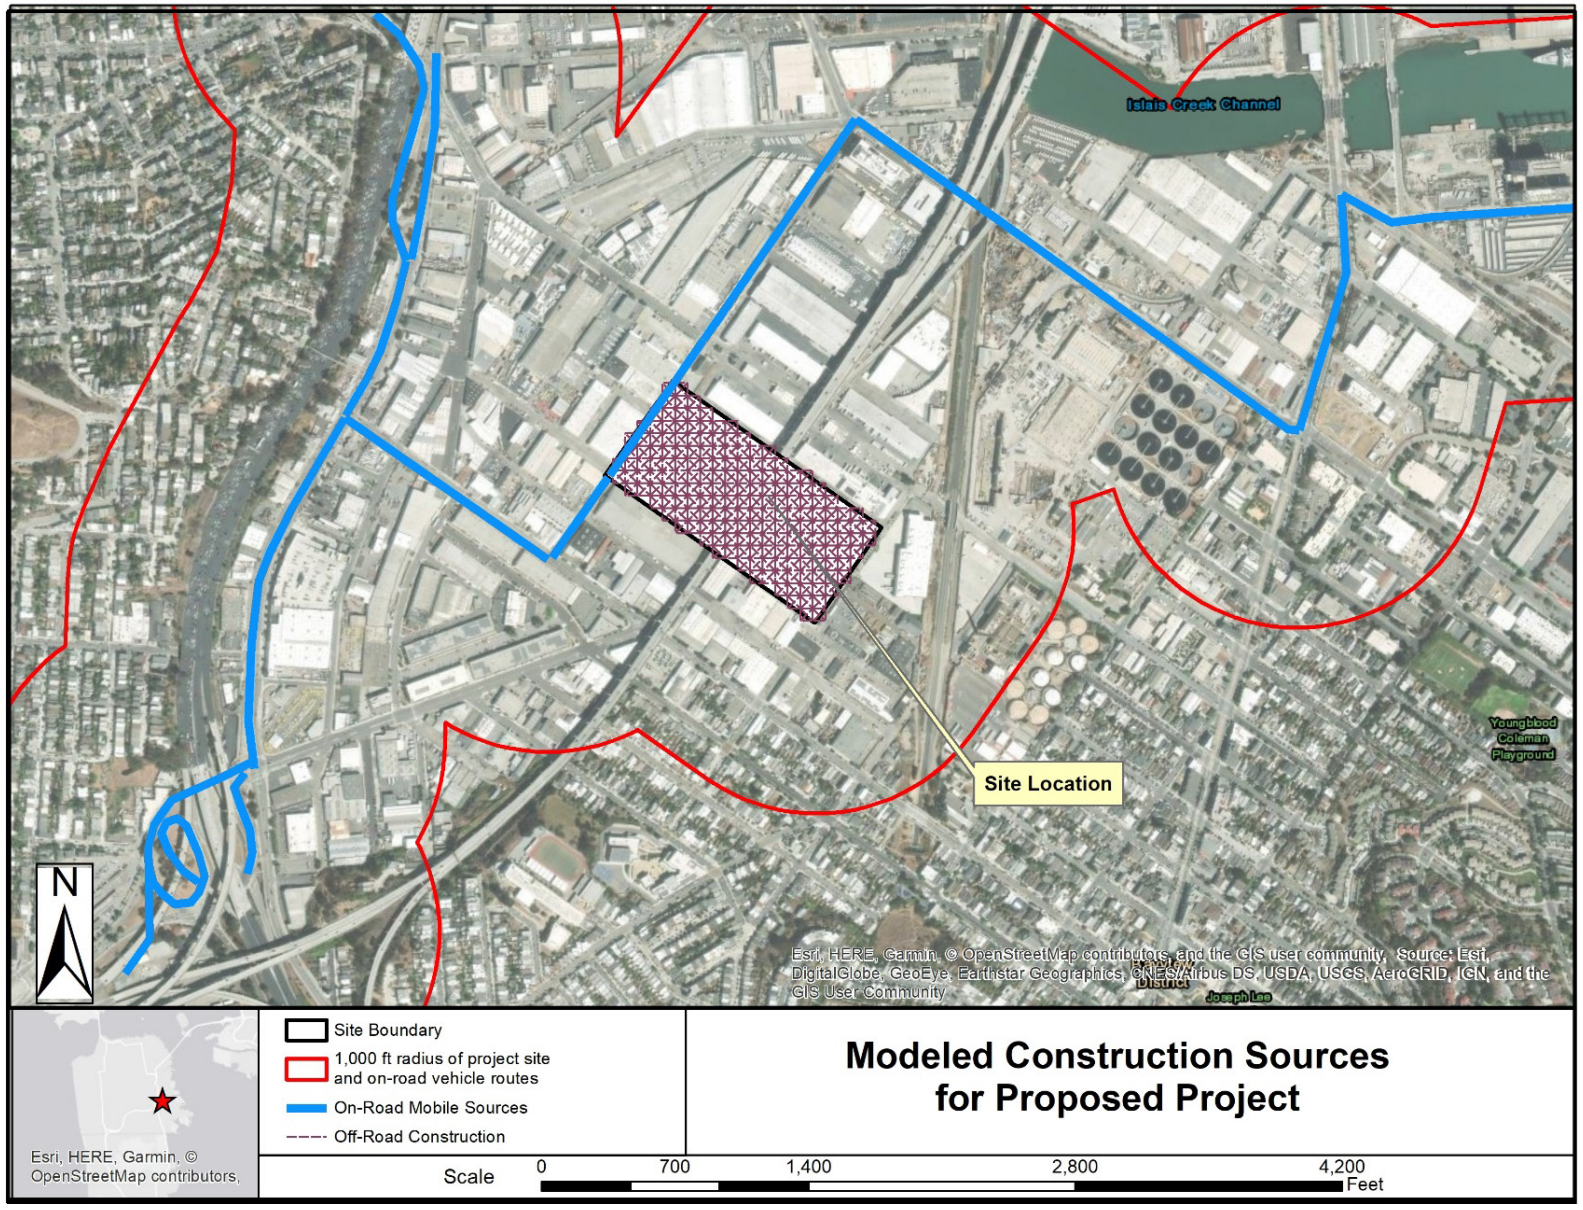

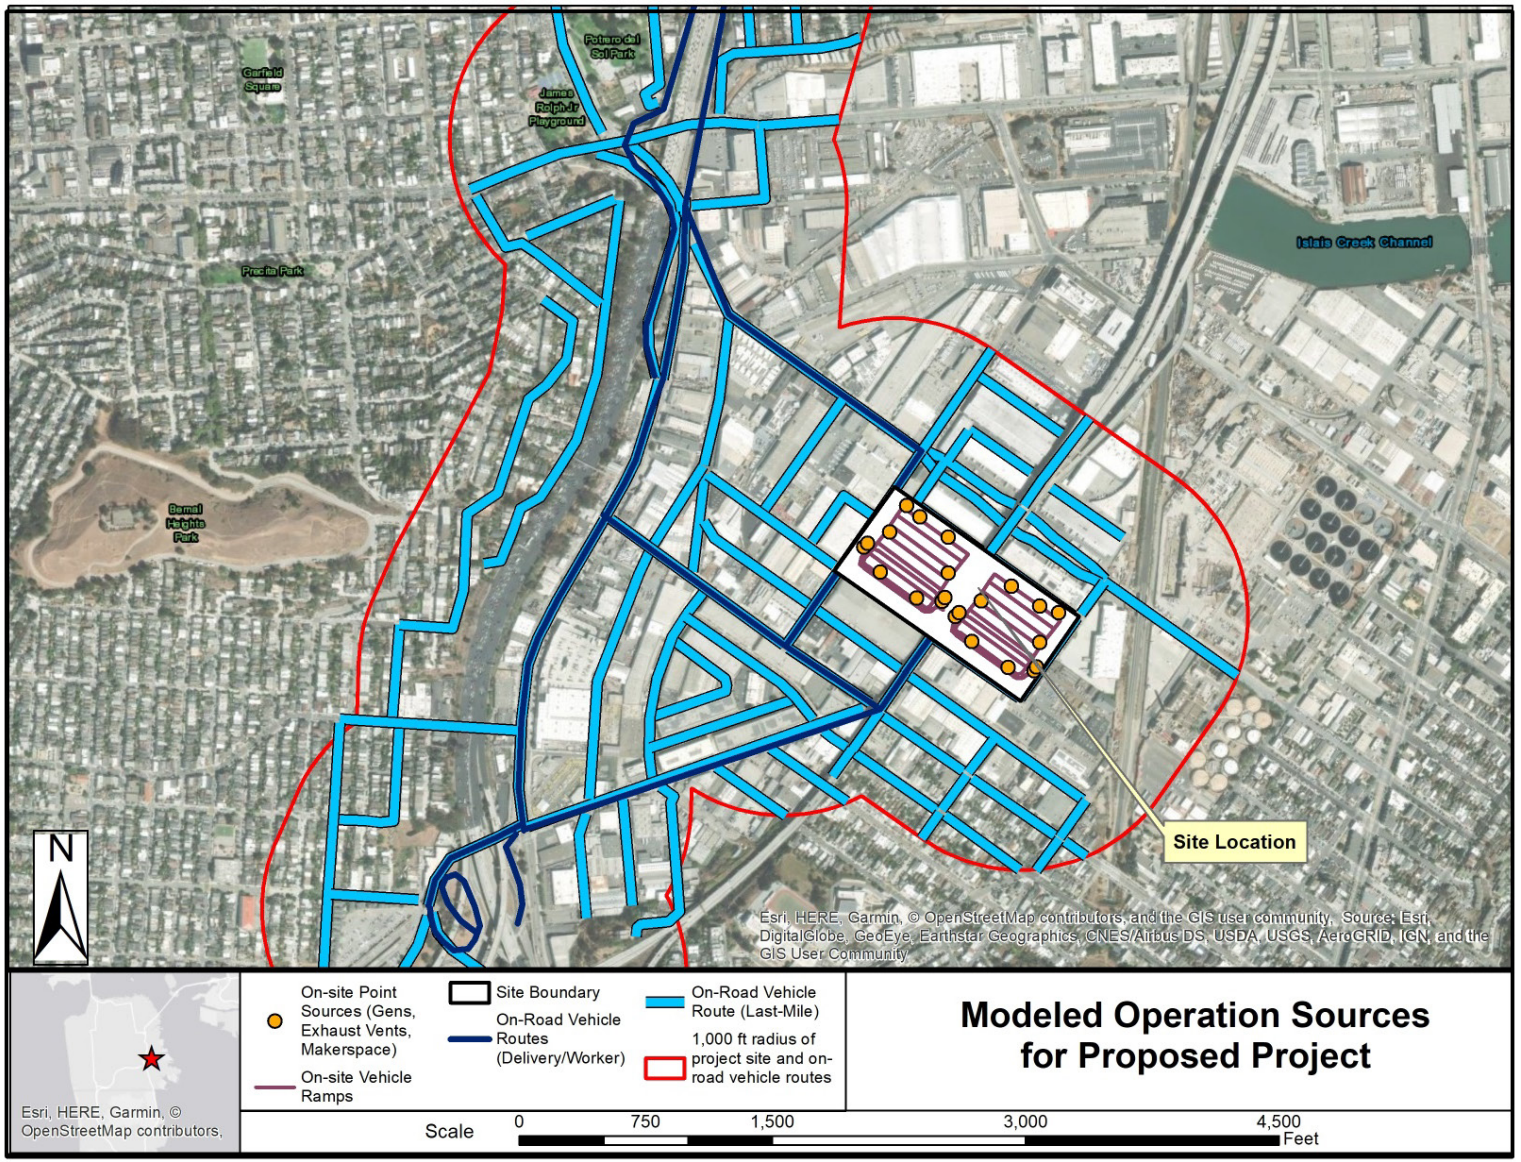

Figure 1 Modeled Project Construction Sources

Note: Onsite point sources include two emergency generators and 16 exhaust fans (including eight for manufacturing and maker space) for the proposed project.

Figure 2 Modeled Project Operational Sources

2.2.1 Existing Conditions

The project site is in southeastern San Francisco in the San Francisco Bay Area Air Basin, in an Air Pollutant Exposure Zone[7] identified by the planning department and San Francisco Department of Public Health. As shown in Figure 3, the project site and nearby surroundings (e.g., within 1,000 feet) have an estimated cancer risk that ranges from 150 cases per one million (150 in a million) to 404 per one million, due to nearby mobile (e.g., traffic, railways, and maritime vessels) and stationary (e.g., generators, boilers) sources.[8] The project site and nearby surroundings have an estimated annual $PM_{2.5}$ concentration that ranges from 10 micrograms per cubic meter ($\mu g/m^3$) to 16 $\mu g/m^3$, as shown in Figure 4. The existing cancer risk and $PM_{2.5}$ concentrations are due to nearby mobile and stationary sources, as determined by year 2020 traffic and stationary source modeling conducted as part of the 2020 Citywide HRA.

2.2.2 Proposed Project Health Risks and $PM_{2.5}$ Concentrations

Two health risk scenarios were assessed for the proposed project for both lifetime cancer risk and annual $PM_{2.5}$. The first scenario (scenario 1) includes project emissions from both construction activities and operation of the proposed project. Cancer risk for residential sensitive receptors was assessed over a 30.6-year period; for worker sensitive receptors, cancer risk was assessed over a 25.6-year period. This accounted for construction occurring during the first 2.6 years; with an operational exposure period of 28 years for the residential and 23 years for the worker sensitive receptor, the total long-term exposure periods are approximately 30 and 25 years, respectively. The second scenario (scenario 2) includes only operation of the proposed project for 30-year and 25-year periods for residential and worker exposure, respectively.

The offsite health risks and annual $PM_{2.5}$ concentrations for scenarios 1 and 2 at the maximally exposed individual receptors for residential and worker are shown in Table 23. The maximally exposed individual receptor is the sensitive receptor location with the maximum cancer risk and $PM_{2.5}$ concentration associated with the proposed project. Separate maximally exposed individual receptors were identified for offsite residential and worker receptors. The offsite residential maximally exposed individual receptor was identified to be a resident approximately 440 feet to the south of the project site, along Oakdale Avenue. The offsite worker maximally exposed individual receptor was identified to be a commercial building approximately 40 feet to the south of the project site, along McKinnon Avenue. Schools proximate to the routes to and from the project site include Big City Montessori School along Industrial Street and Meadows Livingstone School at Potrero Avenue off U.S. 101. The closest child-care (Eva's Day Care) is approximately 950 feet to the southeast of the proposed project site and 50 feet from vehicle routes along Palou Avenue between Rankin Street and Quint Street There are no onsite health risks to evaluate because the proposed project does not include residential dwellings or other sensitive receptors, such as a daycare.

[7] San Francisco Department of Public Health, Air Pollutant Exposure Zone Map, 2020, *https://www.sfdph.org/dph/files/EHSdocs/AirQuality/AirPollutantExposureZoneMap_2020.pdf*.

[8] To identify areas of San Francisco most adversely affected by sources of TACs, San Francisco partnered with the Bay Area Air Quality Management District to conduct a citywide health risk assessment based on an inventory and assessment of air pollution and exposures from mobile, stationary, and area sources in San Francisco. Areas with poor air quality, termed the "Air Pollutant Exposure Zone," were identified based on health-protective criteria that consider estimated cancer risk, exposures to fine particulate matter, proximity to freeways, and locations with particularly vulnerable populations.

				Total/Maximum[12]	**4.82**	**0.17**

Notes:

1. Construction cancer risk exposure with starting age at third trimester in utero.
2. Construction cancer risk exposure with starting age at zero year.
3. Construction cancer risk exposure with starting age at one year for a 0.6-year duration.
4. Cancer risk assessed for 28-year exposure period with starting age of two years.
5. Construction cancer risk exposure with starting age of 16 years.
6. Construction cancer risk exposure with starting age of 17 years.
7. Construction cancer risk exposure with starting age of 18 years.
8. Cancer risk assessed for 25-year exposure period with starting age of 18 years.
9. Cancer risk assessed for 30-year exposure period with starting age at third trimester in utero.
10. Cancer risk assessed for 25-year exposure period with starting age of 16 years.
11. Operational sources include generators, maker space, and onsite and offsite vehicle exhaust.
12. Total lifetime cancer risk is represented as a sum of all years for the given scenario; maximum annual $PM_{2.5}$ concentration represents the highest annual average concentration for the given modeled project phase.
13. Annual $PM_{2.5}$ Worker maximally exposure individual receptor for construction year 2022 is at receptor x = 553,020; y = 4,177,460.

m = meter
UTM = Universal Transverse Mercator (map projection system)
µg/m^3= micrograms per cubic meter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
Source: Modeled by AECOM 2022

Contour maps illustrating the cancer risk and annual $PM_{2.5}$ concentrations attributed to the proposed project during construction, operations, and the total exposure period are shown in Figure 5 through Figure 13. Figure 5 and Figure 6 show the cancer risk during the 2.6-year modeled construction period for Residential Scenario 1 and Worker Scenario 1, respectively. Figure 7 and Figure 8 show the 28-year cancer risk map for the Residential Scenario 1 operation phase and 23-year cancer risk map for the Worker Scenario 1 operation phase, respectively. Figure 9 shows the annual $PM_{2.5}$ concentrations attributed to operation for Residential and Worker Scenarios 1 and 2 (there is no difference between the scenarios). The total Residential Scenario 1 (construction plus operation) cancer risk map is shown on Figure 10. The total Worker Scenario 1 (construction plus operation) cancer risk map is shown on Figure 11. The total Residential Scenario 2 and Worker Scenario 2 (operation only) cancer risk maps are shown on Figure 12 and Figure 13, respectively.

Additionally, offsite non-cancer chronic health risks were evaluated for project construction and operation at the maximally exposed individual residential and worker receptors, as shown in Table 24. Acute health risk due to total organic gas (TOG) emissions from gasoline vehicles and other TACs from the maker space is provided in Table 24 for operations. There is no acute risk assessment health value for diesel

particulate matter; therefore, an acute hazard index[9] is not calculated for the construction phase or for DPM emissions in the operations phase of the project.

Table 24 Non-Cancer Chronic and Acute Health Risks from Proposed Project at Maximally Exposed Individual Residential and Worker Receptors

UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Project Phase	Non-Cancer Chronic HI	Acute HI

2.2.3 Existing Plus Project Health Risks and $PM_{2.5}$ Results

2.2.3.1 Existing Plus Project Health Risks and $PM_{2.5}$ Concentrations

Existing plus project health risks and annual $PM_{2.5}$ concentrations at offsite receptors from the proposed project's construction and operation were evaluated. Existing cancer risk and annual $PM_{2.5}$ concentrations were determined by year 2020 traffic and stationary source modeling conducted as part of the 2020 citywide HRA.[10] The offsite health risks and annual $PM_{2.5}$ concentrations for the two scenarios at the residential and worker maximally exposed individual receptors are summarized in Table 25.

Table 25 Existing Plus Project Lifetime Cancer Risk and Annual $PM_{2.5}$ Concentration at Project Maximally Exposed Individual Residential and Worker Receptors

UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Source	Lifetime Cancer Risk (per one million)	Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)
553,000	4,177,080	Residential	Scenario 1	Proposed Project	4.05[1]	0.080[2]

2.2.4 2035 and 2050 Baseline Conditions Plus Project Health Risks and $PM_{2.5}$ Concentrations

The city evaluated future baseline health risks and $PM_{2.5}$ concentrations as part of the San Francisco Housing Element 2022 Update Environmental Impact Report (EIR).[11] The Housing Element 2022 Update EIR evaluates the impacts of constructing 150,000 housing units in San Francisco by 2050. The EIR analysis compares the housing element update's impacts to a future baseline that assumes no implementation of the update.[12] To disclose future baseline plus project health risk impacts for the

[10] San Francisco Department of Public Health (SFDPH), San Francisco Citywide Health Risk Assessment: Technical Support Documentation, September 2020.

[11] San Francisco Planning Department, San Francisco Housing Element 2022 Update EIR, 2022, *https://sfplanning.org/environmental-review-documents?title=HOusing+Element&field_environmental_review_categ_target_id=All&items_per_page=10*.

[12] Projections for the 2035 and 2050 baseline years include assumptions about the buildout of the department's development pipeline as well as additional growth that may occur by 2035 and 2050 without implementation of the housing element 2022 update. At the time of preparation, the department's Q1 2019 development pipeline was the most recent data available. San

years 2035 and 2050, this project air quality analysis applies the lifetime cancer risk and annual $PM_{2.5}$ concentration identified through the Housing Element 2022 Update EIR modeling for the 2035 and 2050 baseline years (assuming no housing element update). The analysis below discloses the 2035 and 2050 baseline health risks (assuming no housing element update) plus the health risks of the proposed project at the offsite maximally exposed individual residential and offsite worker receptors. This analysis is conservative (worst-case) because it does not account for reduced health risks from the project in future years 2035 and 2050 resulting from lower vehicle emissions due to increasingly stringent regulations. Table 26 and Table 27 summarize the results of this analysis for years 2035 and 2050, respectively.

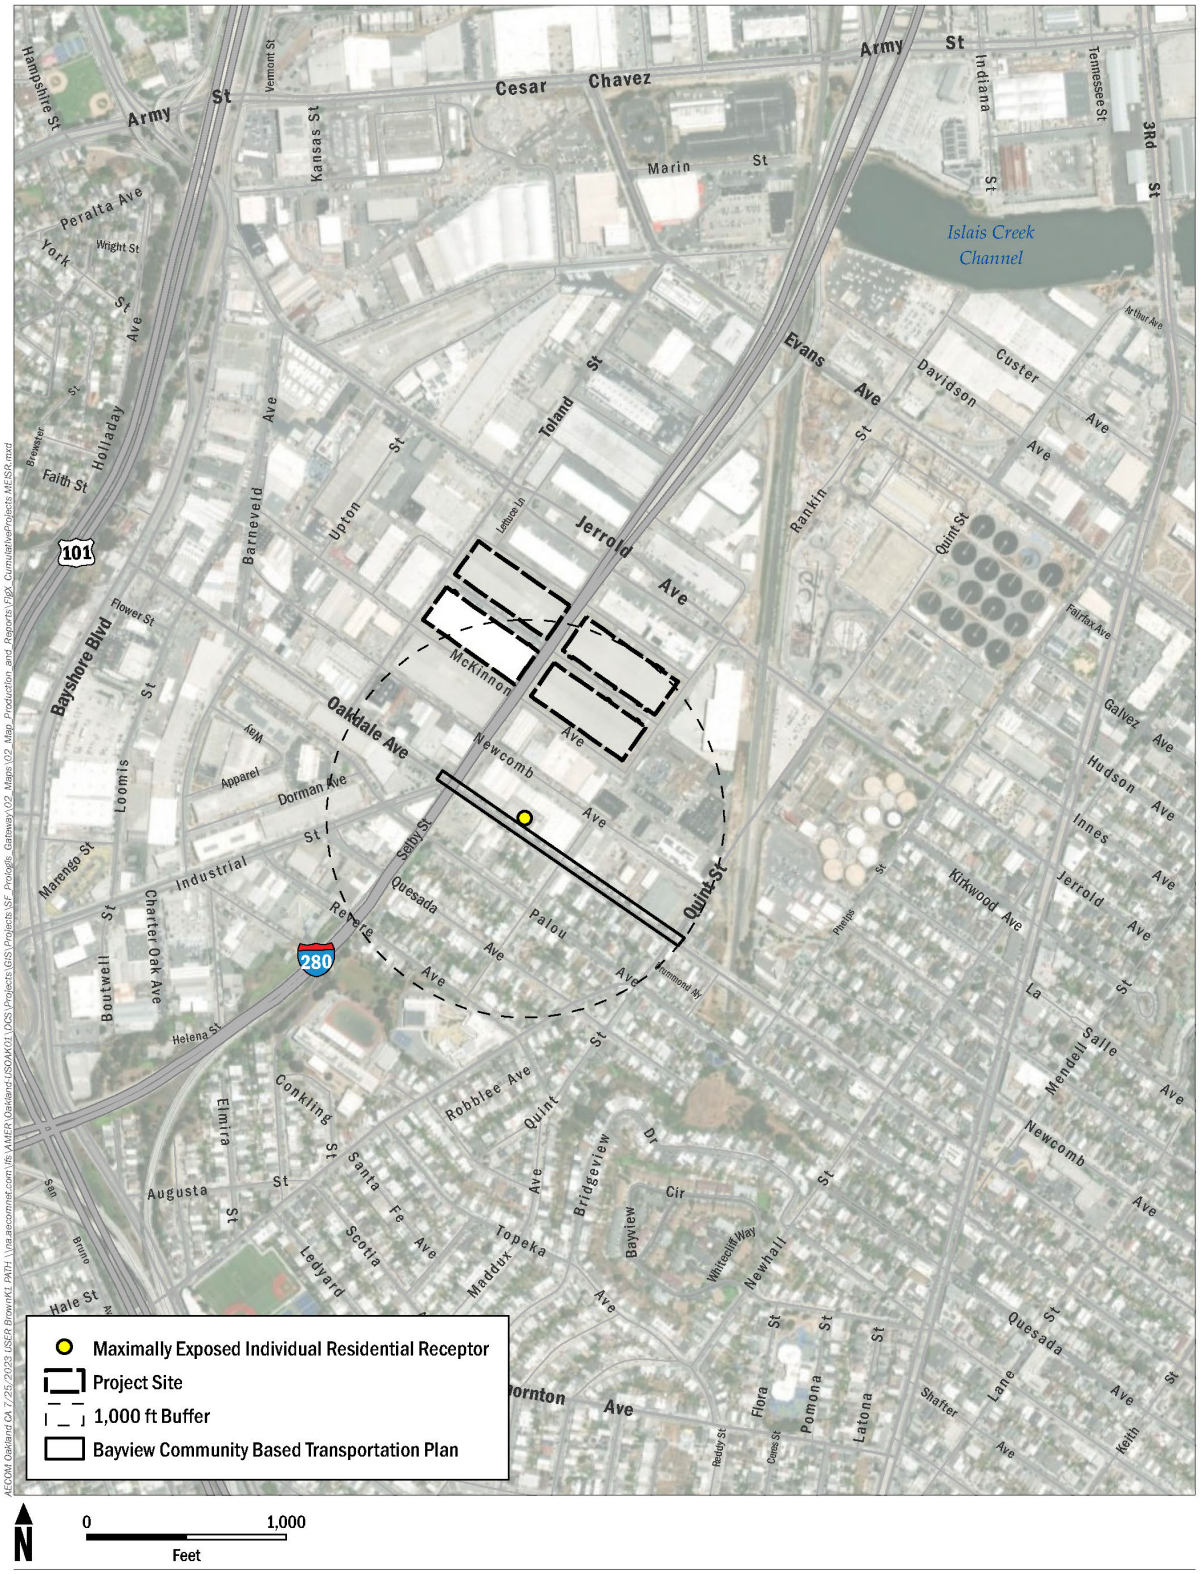
2.3 Cumulative Health Risks and $PM_{2.5}$ Results

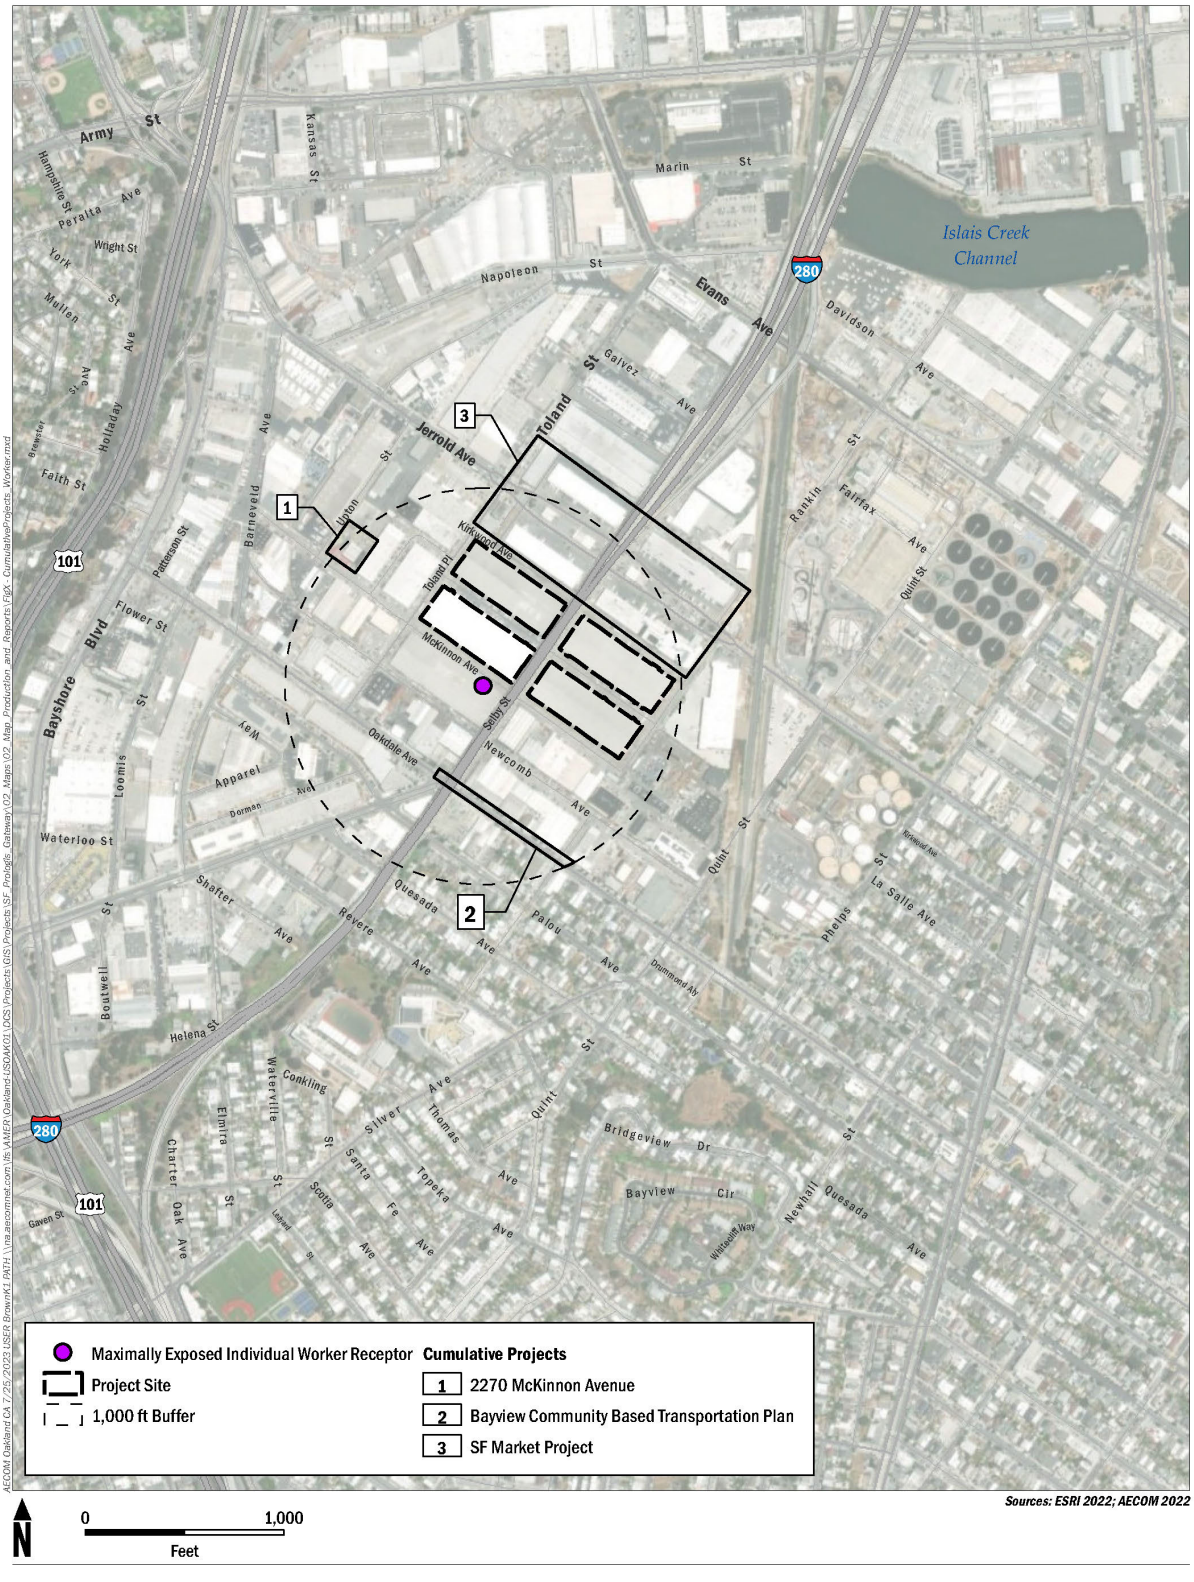
2.3.1 Quantitative Cumulative Health Risk and $PM_{2.5}$ Analysis



The cumulative analysis evaluates the impacts of the proposed project's construction and operation in combination with other projects within 1,000 feet of the maximally exposed individual residential and worker receptors and also accounts for growth anticipated under the Housing Element 2022 Update. Table 28 and Figure 14 identify projects within 1,000 feet of the maximally exposed individual residential and worker receptors that may pose health risks in combination with those estimated for the proposed project.

As discussed in Section 2.2.4, 2035 and 2050 Baseline Conditions Plus Project Health Risks and $PM_{2.5}$ Concentrations, the planning department developed future year health risk databases as part of the Housing Element 2022 Update EIR for 2035 and 2050. In addition to projects within 1,000 feet of the maximally exposed individual residential and worker receptors, this cumulative analysis assumes implementation of the housing element 2022 update. This is because the housing element 2022 update is a reasonably foreseeable action and therefore, using 2035 and 2050 data that includes the housing element update is appropriate. As such, this analysis uses the 2035 and 2050 health risk databases from the Housing Element 2022 Update EIR (assuming implementation of the housing element update) for the project's cumulative analysis.

Table 28 Cumulative Projects Within 1,000 feet Radius of the Maximally Exposed Individual Residential and Worker Receptors



Project Name/ Planning Department Case No.	Description of Cumulative Project	Located within 1,000 feet of Maximally Exposure Individual Receptor[1]
Bayview Community-Based Transportation Plan	The transportation plan discusses several quick-build projects involving pedestrian, bicycle, streetscape, and bus improvements (including better bus shelters and signals). Quick-build projects that are currently planned to occur within a 1,000-foot radius of the residential and worker maximally exposed individual receptor, along Oakdale Avenue, include improvements to street signs, pedestrian lighting, sidewalks, and crosswalks, and an improved bus shelter.	Residential and Worker
2270 McKinnon Avenue (Case No. 2021-001639PRJ)	The project would demolish the existing accessory building to construct an approximately 119,881-square-foot building containing 111,073 square feet of self-storage use. The new building would be four stories and approximately 40 feet in height.	Worker
San Francisco Market Project (Case No. 2009.1153ENV-03)	The proposed project would demolish existing buildings to construct four new buildings containing a total of approximately 275,000 square feet. The project also proposes roadway changes and improvements, including vacating Jerrold Avenue on SF Market site and rerouting through-traffic around the main site on Innes Avenue. Innes Avenue would become the primary route for non-market destined traffic traveling through the area	Worker

[1] This column indicates if the cumulative project is within 1,000 feet of the proposed project's maximally exposed individual receptor, whether that receptor is a residential receptor, a worker receptor, or both.

San Francisco Gateway Project

Figure 14 Cumulative Projects within 1,000 feet of Maximally Exposed Residential Receptor

San Francisco Gateway Project

Figure 15 Cumulative Projects within 1,000 feet of Maximally Exposed Worker Receptor

Table 29 and Table 30 summarize the cumulative health risk results at the maximally exposed individual residential and worker receptors in years 2035 and 2050, respectively. The results in these tables do not reflect cumulative health risks from the Bayview Community Based Transportation Plan cumulative project listed in Table 28 because quantitative health risk data are not available from that project analysis. Rather, Table 29 and Table 30 reflect the cumulative health risk that would result with implementation of the Housing Element Update 2022 in years 2035 and 2050, respectively. An additional qualitative analysis of cumulative health risks addressing the projects in Table 28 is provided in Section 2.3.2.

Table 29 2035 Cumulative Cancer Risk and Annual $PM_{2.5}$ Concentration at Project Maximally Exposed Individual Residential Receptor

UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Source	Lifetime Cancer Risk (per one million)	Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)

$PM_{2.5}$ = particulate matter less than or equal to 2.5 micrometers in diameter
UTM = Universal Transverse Mercator

2.3.2 Additional Qualitative Cumulative Health Risk Analysis

The San Francisco Municipal Transportation Agency adopted the Bayview Community-Based Transportation Plan (CBTP) final plan[13] on February 28, 2020. For the area within 1,000 feet of the maximally exposed individual residential and worker receptors, along Oakdale Avenue, proposed CBTP improvements include installing new crosswalks, painted median islands, and painted safety zones; reducing travel lanes; and installing edge lines to calm traffic. The potential also exists for protected bikeways to be installed. According to the Bayview CBTP quick-build project status, all of these improvements would have been completed by 2021; however, the city plans additional improvements in this corridor. The construction of any improvements would be required to follow the clean construction ordinance requirements for projects in the air pollutant exposure zone, which would limit diesel particulate matter emissions. Additionally, any construction emissions would be temporary in nature and would spread out along the corridor. On completion, the Bayview CBTP along Oakdale Avenue would likely result in minimal changes to TACs and $PM_{2.5}$ from diesel traffic.

The 2270 McKinnon Avenue CEQA Exemption Determination (dated October 25, 2022), prepared by the planning department, stated that the project is a Clean Construction priority project pursuant to Planning Director Bulletin No. 2, committing to the use of Tier 4 engines on all diesel-fueled construction equipment and resulting in substantially reduced DPM and $PM_{2.5}$ emissions compared to the construction fleet average emissions.[14] No emergency generators or fire water pumps have been proposed by the project sponsor for this project. Minimal changes to TACs and $PM_{2.5}$ from diesel traffic would be anticipated upon the completion of this project.

The San Francisco Market Project 2011 Mitigated Negative Declaration identified less-than-significant project-level and cumulative air quality impacts. In July 2022, the planning department issued Addendum 2 to Mitigated Negative Declaration[15] for the San Francisco Market project. The Addendum 2 analyzed changes to the project's construction phasing and determined that the changes to the project would not result in any new or more severe impacts than previously identified in the 2011 Mitigated Negative Declaration. It did not identify any significant cumulative construction or operational transportation impacts, and no mitigation measures were identified. Minimal changes to TACs and $PM_{2.5}$ from construction and operations would be anticipated upon the completion of this project.

Although the changes to TAC and $PM_{2.5}$ emissions from each of the cumulative projects would be minimal as described above, they could contribute additional emissions that may incrementally increase health risks at the proposed project maximally exposed individual receptor above those levels provided in Table 29 and Table 30. However, as discussed above, health risks in future years are expected to decline substantially due to more stringent emissions standards, adoption of cleaner vehicles as a greater portion of the passenger and truck fleet mixes, and development and availability of other cleaner technologies. Therefore, cumulative health risks may be similar to or perhaps less than that shown in Table 25, which shows the existing plus project health risks based on 2020 background health risk data.

Scraping and Grading Fugitive Dust Emissions

	TSP ≤ 30 µm	≤ 15 µm	lb/VMT PM10	lb/VMT PM2.5
Formulas for Emission Factors (lb/VMT)	0.040 (S)^2.5	0.051 (S)^2.0	1.542546	0.16655879

Scaling Factor (PM10/≤15µm) 0.6

Scaling Factor (PM2.5/TSP) 0.031

S (mean vehicle speed, mph) AP-42 default= 7.1

VMT = As/Wb x UC1 ÷ UC2

As = the acreage of the grading site (acre/day).

Wb = Blade width of the grading equipment. The program uses a default blade width of 12 feet based on Caterpillar's 140 Motor Grader (Caterpillar 2021).

UC1 = unit conversion from acre to square feet (43,560 sqft/acre)

UC2 = unit conversion from feet to miles (5,280 feet/mile).

Equipment	Acres Graded per 8-Hour Day
Crawler Tractor	0.5
Graders	0.5
Rubber Tired Dozer	0.5
Scrapers	1

Source: CalEEMod Table G-14, Formulas based on CalEEMod User's Guide Section 4.4.1 and AP-42 Table 11.9-1 for grading-related fugitive dust emissions.

Controlled Emissions Application 74%

Notes: Assumes implementation of fugitive dust control practices per San Francisco Dust Control Ordinance

Based on assumption of watering 3 times per day per Sec. 1242(c)(1)

Fugitive dust control efficacy based on CalEEMod User's Guide Appendix C

Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours
