Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bin	Fuel	ROG_tpd	CO_tpd	NOx_tpd	PM10_tpd	PM2.5_tpd	Fuel Consumption	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy	HC_tpd	TOG_tpd	SOx_tpd	NH3_tpd

Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Model Output: OFFROAD2017 (v1.0.1) Emissions Inventory
Region Type: County
Region: San Francisco
Calendar Year: 2022
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2017 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bin	Fuel	ROG_tpd	CO_tpd	NOx_tpd	PM10_tpd	PM2.5_tpd	Fuel Consumption	Total_Activity_hpy	Total_Population	Horsepower_Hours_hhpy	HC_tpd	TOG_tpd	SOx_tpd	NH3_tpd

Paving Off-Gassing[3]	-	-	-	-	-	-	-
Total Emissions (tons)	0.16	2.65	4.10	0.03	0.03	0.41	0.06
2022 Average Daily Emissions (lbs/day)	2.02	34.24	52.88	0.36	0.35	5.23	0.81
BAAQMD Thresholds[4]	54	54	N/A	82	54	N/A	N/A
Exceeds Thresholds?	No	No		No	No		

Notes:
1. On-road fugitive dust includes break wear, tire wear, and re-entrained roadway dust.
2. All Building 1 ground disturbance occurs in 2022. Building 2 ground disturbance occurs in 2022 and 2023. All demolition activities to occur in 2022.
3. Arch coatings to occur in 2023 and 2024. All paving to occur in 2024.
4. BAAQMD thresholds from the May 2017 BAAQMD CEQA Guidelines. PM fugitive dust is addressed through BMPs for the purposes of thresholds, but that the off-site fugitive

Net New Daily Operational Emissions	**43.702**	**148.409**	**41.041**	**12.752**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Table X-X. Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)

Soil Haul	0.2508	
Diesel Fuel Delivered to Site*	Total	43%
Diesel	2.7475	
Haul Dust	2.7475	
Soil Dust	0.2508	
Soil Haul	0.2508	
Annual	Total	100%
Annual	5.9966	

	Vehicle Emissions Factors		
	Exhaust	Brake and Tire Wear	Resuspended Dust PM2.5
Diesel	0.0242	0.0000	0.0000
Haul Dust	0.0242	0.0000	0.0000
Soil Dust	0.0222	0.0000	0.0000
Soil Haul	0.0222	0.0000	0.0000

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 52 hours per year
2. Percent of emissions modeled to be released through exhaust vents or openings along the ramps on each floor is based on the approximate percentage of the total ramp length that is underground. Emissions released through "ramp/portal/exhaust" emissions are modelled as evenly throughout the first three floors as a result for 100% of the true fan trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Table 9: Mobile Emissions added to HRA Example

	Vehicle Emissions: Pollutant (lb/day)			Title 24 Emissions (CO2e in lb/day)
Mobile Emissions Source	NOX[1]	PM2.5 Exhaust[2]	PM2.5 Total[3]	PM2.5 Exhaust[4]

Notes:
1. Pollutant is an Ozone precursor and is given to provide context.
2. PM2.5 Exhaust emissions are from the exhaust of mobile vehicles.
3. PM2.5 Total emissions is sum of PM2.5 Exhaust, Brake & Tire Wear, and PM2.5 Resuspended Dust emissions.
4. 100% of Title 24 emissions are assumed for its exhaust as input to the HRA modeling.
5. Emissions from Diesel Fuel Direct Service Backup Generators are assumed for its exhaust input to the HRA modeling is calculated based on the percentage of the emergency emissions for each land use and the emergency time used as input within the HRA modeling process.

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

	Emissions Factors (g/mi for RunEx, BW, TW and g/trip for StrEx)

VMT Estimates for Proposed Visitor Trips - Supplemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I.

	Net Visitor VMT by Vehicle Type and Land Use[1]				
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	24280	24060	11680	7800	**67,820**
Wholesale and Storage	4840	1800	9680	3900	**20,220**
General Retail /Café/Quick Service Restaurants[2]	756	420	240	0	**1,416**
Total Visitor VMT by Vehicle Type	**31676**	**26880**	**22480**	**11830**	**92,866**

Table II.

	Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1]				
Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	88	29	22	2	141
Parcel and Last Mile Delivery	1,214	802	292	129	2429
Wholesale and Storage	242	69	242	69	661
General Retail /Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[1]	**1924**	**896**	**562**	**182**	3568

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

	Total Daily Auto/Pickup Vehicle Trips by Land Use[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	176
Parcel and Last Mile Delivery	3354
Wholesale and Storage	1,044
General Retail	156
Quick Service Restaurant	354
Total Vehicle Trips[1]	**5086**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV.

	Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	28
Quick Service Restaurant	106
Total Vehicle Trips[1]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V.

	Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]			
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	30	30	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both buildme A and B have identical layouts (just rotated), so the numbers below are applicable to each buildme.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

[1] Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

SF Gateway

Operational Emissions Summary - With Emissions Reduction Measures

Control Scenario incorporates the following actions:

- Manufacturing and Maker Space limited to ensure that sstationary equipment emissions would not exceed a combined total of 10 lb/day of Nox.
- TRUs required to be electric
- Fleet mix restricted to 2016+ model year for single unit and tractor trailer trucks
- Emergency generators meet Tier 4 emissions standards.
- On-site idling of diesel-powered trucks not to exceed 2 minutes per truck

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.002	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	10.00	1.812	1.087
Stationary Sources	1.46	0.42	0.211	0.211
Mobile	8.11	71.15	44.472	12.546
TRUs	0.00	0.00	0.000	0.000
Total Proposed Daily Operational Emissions	***34.1***	***81.6***	***46.496***	***13.846***
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**24.80**	**64.09**	**40.145**	**11.90**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	3.94	0.00	0.000	0.000

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Operational Days Per Year:

Table III. **Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[1]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Visitor Trips - Mobile Source Emissions

Proposed Project Mobile Source Emissions

			Emissions (lbs/day)							Emissions (tons/year)

VMT Estimates for Proposed Visitor Trips - Supplemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I.

	Net Visitor VMT by Vehicle Type and Land Use[1]				
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	24280	24060	11680	7800	**67,820**
Wholesale and Storage	4840	1800	9680	3900	**20,220**
General Retail / Café/Quick Service Restaurants[3]	756	420	240	0	**1,416**
Total Visitor VMT by Vehicle Type	**31676**	**26880**	**22480**	**11830**	**92,866**

Table II.

	Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1]				
Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	90	20	22	2	134
Parcel and Last Mile Delivery	1,214	802	292	120	2428
Wholesale and Storage	242	60	242	60	604
General Retail / Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[1]	**1924**	**896**	**562**	**182**	3564

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

	Total Daily Auto/Pickup Vehicle Trips by Land Use[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	3354
Wholesale and Storage	1,044
General Retail	150
Quick Service Restaurant	354
Total Vehicle Trips[1]	**5086**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV.

	Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	20
Quick Service Restaurant	106
Total Vehicle Trips[1]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for POR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V.

	Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]			
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	20	20	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

[1]Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

*Calculated

Idling Emission Factors
Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.
Model Year 2016+

Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, g/mile for RUNEX, PMBW and PMTW, mph for Speed, kWh/mile for Energy Consumption, gallon/mile for Fuel Consumption. PHEV calculated based on total VMT.

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/hide for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

2035 Operational Emissions Summary - with Emissions Reduction Measures

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	10.00	1.812	1.087
Stationary Sources	1.46	0.42	0.211	0.211
Mobile	4.61	55.46	43.746	12.177
TRUs	0.00	0.00	0.000	0.000
Total Proposed Daily Operational Emissions	***30.6***	***65.9***	***45.770***	***13.477***
Total Existing Daily Operational Emissions	***9.30***	***17.50***	***6.40***	***2.00***
Net New Daily Operational Emissions	**21.32**	**48.39**	**39.37**	**11.48**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**No**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	3.94	0.00	0.000	0.000

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Operational Days Per Year:

VMT Estimates for Proposed Visitor Trips - Supplemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I.

Vehicle Type and Land Use	Net Visitor VMT by Vehicle Type and Land Use[1] Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total Visitor VMT by Land Use
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	24280	24060	11680	7800	**67,820**
Wholesale and Storage	4840	1800	9680	3900	**20,220**
General Retail / Café/Quick Service Restaurants[2]	756	420	240	0	**1,416**
Total Visitor VMT by Vehicle Type	**31676**	**26880**	**22480**	**11830**	**92,866**

Table II.

Vehicle Type and Land Use	Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1] Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	90	20	22	2	134
Parcel and Last Mile Delivery	1,214	802	292	120	2428
Wholesale and Storage	242	60	242	60	604
General Retail / Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[3]	**1924**	**896**	**562**	**182**	3564

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

Vehicle Type and Land Use	Total Daily Auto/Pickup Vehicle Trips by Land Use[1] Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	3354
Wholesale and Storage	1,044
General Retail	156
Quick Service Restaurant	354
Total Vehicle Trips[3]	**5086**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV.

Vehicle Type and Land Use	Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1] Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[3]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V.

Parcel & Last Mile Delivery Land Use	Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1] Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
	20	30	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramps Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.8	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	87.5	87.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	176.4	178	170.4	171.7	178.7	170.7

*Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

Step 1 - Consider Square Feet of Uses Per Floor

USE SCENARIO	L1	L2	L3	L4	Project Total	Source: July 2019 Project Description - Table 3
PDR Uses						
Manufacturing & Maker Space	35,000	-	-	-	35000	
Parcel Delivery /Last Mile	-	381,000	369,600	8,800	759400	
Wholesale and Storage	372,400	-	-	-	372400	
Retail	8,400	-	-	-	8400	
Logistics Yard	-	72,400	73,400	-	145800	
Vehicle Circulation	13,800	112,800	93,400	17,600	237600	
Parking	111,800	-	-	487,600	599400	
Total					2160000	

Step 2 - Estimated % Use per Floor

Sq Ft Per Use Per Floor	L1	L2	L3	L4	
PDR Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
PDR Visiting Workers					
Manufacturing & Maker Space	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Logistics Yard and Parking
Parcel Delivery /Last Mile	0.0%	50.17%	48.67%	1.2%	Utilize Level 2 and 3 Loeistics Yard and Parkine and small area of L4 parkine (assume autos/sidcuars and vans only)
Wholesale and Storage	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Loeistics Yard and Parkine
Retail Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
Retail Visitors	100.0%	0.0%	0.0%	0.0%	Retail Visitors (delivery and consumers) Utilitze Ground Level Loeistics and Parkine

Step 3 - Total Project Daily Traffic Per Use

Use	Auto/Pickup	Van	MT	HT	Source: Dec 10 2021 Traffic Demand Memo - Table 11 and base A-79 for worker trip data
PDR	4576	882	556	182	
On-site Worker	3030	0	0	0	
Visitine Worker	1546	882	556	182	
Manufacturing & Maker Space	90	20	22	2	
Parcel Delivery/Last Mile	1214	602	292	120	
Wholesale and Storage	242	60	242	60	
Retail/QSR	310	14	6	0	
On-site Worker	132	0	0	0	
Visitine Worker/Consumer	378	14	6	0	

Step 4 - Using Total Traffic Per Use and Percent Use Per Floor - Calculate Vehicles Per Floor (Per Building)

Vehicle Type	L1	L2	L3	L4
PDR Auto (incl pickup & vans)	206	306	497	1527
PDR Auto/Pickup	166	303	295	1522
PDR Van	40	201	195	5
PDR MT	130	74	72	0
PDR HT	31	30	30	0
Retail Auto	196	0	0	66
Retail Auto/Pickup	189	0	0	66
Retail Van	7	0	0	0
Retail MT	5	0	0	0
Retail HT	0	0	0	0
Total Daily Auto Per Level	402	306	497	1593
Total Daily Auto/Pickup Per Level	355	303	295	1588
Total Daily Van Per Level	47	201	195	5
Total Daily MT Per Level	135	74	72	0
Total Daily HT Per Level	31	30	30	0

Mobile Trip Data (per Adavant December 10, 2021, Trip Generation Memorandum)

Table 11: Total Daily Vehicle Trips by Vehicle Class and Land Use

Land Use Type	Autos	Buses	Vans	SU Trucks	Tractor Trailers	Total
Maker & Manufacturing	178	0	20	22	2	222
Parcel & Last-mile Delivery	3354	0	802	292	120	4568
Wholesale and Storage	1044	0	60	242	60	1406
Laboratory/&RD	-	0	-	-	-	0
General Retail	156	0	2	0	0	158
Quick Service Restaurant	354	0	12	6	0	372

*Calculated

Idling Emission Factors
Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VM
Model Year 2016+

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2035
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, g/mile for RUNEX, PMBW and PMTW, mph for Speed, kWh/mile for Energy Consumption, gallon/mile for Fuel Consumption. PHEV calculated based on total VMT.

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, g/mile for RUNEX, PMBW and PMTW, mph for Speed, kWh/mile for Energy Consumption, gallon/mile for Fuel Consumption. PHEV calculated based on total VMT.

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2035
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

2035 Operational Emissions Summary - without Emissions Reduction Measures

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.002	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	34.78	1.812	1.087
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	5.12	66.82	43.851	12.261
TRUs	17.59	16.29	0.125	0.115
Total Proposed Daily Operational Emissions	***48.7***	***121.9***	***46.000***	***13.675***
Total Existing Daily Operational Emissions	***9.3***	***17.5***	***6.4***	***2.0***
Net New Daily Operational Emissions	**39.42**	**104.41**	**39.60**	**11.68**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	3.94	0.0002	0.0001	0.0001

Worker Trips - Mobile Source Emissions

				Emissions (lbs/day)							Emissions (tons/year)						
Vehicle Category	Predominant Fuel Type	Starts/Day[1]	VMT/Day[2]	ROG	CO	NO_X	PM_{10} Exhaust	PM_{10} BW, TW, roadway dust	$PM_{2.5}$ Exhaust	$PM_{2.5}$ BW, TW, roadway dust	ROG	CO	NO_X	PM_{10} Exhaust	PM_{10} BW, TW, roadway dust	$PM_{2.5}$ Exhaust	$PM_{2.5}$ BW, TW, roadway dust
Autos/Pickups (on-site worker)	gasoline	1581	47054	1.12860	61.43808	3.10281	0.09121	12.36316	0.08389	3.14167	0.20597	11.21245	0.56626	0.01665	2.25628	0.01531	0.57335

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Operational Days Per Year:

Autos/Pickups (on-site worker) 365

Quick Service Restaurant	106
Total Vehicle Trips[3]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Visitor Trips - Mobile Source Emissions

Proposed Project Mobile Source Emissions

Vehicle Category	Starts/Day[1]	VMT/Day[2]	Emissions (lbs/day) ROG	CO	NO_x	PM_{10} Exhaust	PM_{10} BW, TW	$PM_{2.5}$ Exhaust	$PM_{2.5}$ BW, TW	Emissions (tons/year) ROG	CO	NO_x	PM_{10} Exhaust	PM_{10} BW, TW	$PM_{2.5}$ Exhaust	$PM_{2.5}$ BW, TW

VMT Estimates for Proposed Visitor Trips - Supllemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I. **Net Visitor VMT by Vehicle Type and Land Use[1]**

Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total Visitor VMT by Land Use
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	24280	24060	11680	7800	**67,820**
Wholesale and Storage	4840	1800	9680	3900	**20,220**
General Retail / Café/Quick Service Restaurants[2]	756	420	240	0	**1,416**
Total Visitor VMT by Vehicle Type	**31676**	**26880**	**22480**	**11830**	**92,866**

Table II. **Total Daily Visitior Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	90	20	22	2	134
Parcel and Last Mile Delivery	1,214	802	292	120	2428
Wholesale and Storage	242	60	242	60	604
General Retail / Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[1]	**1924**	**896**	**562**	**182**	3564

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III. **Total Daily Auto/Pickup Vehicle Trips by Land Use[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	3354
Wholesale and Storage	1,044
General Retail	156
Quick Service Restaurant	354
Total Vehicle Trips[1]	**5086**

Notes:
1. Trip Rates are per Travel Demand Memo Table 11
Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV. **Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[1]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V. **Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]**

	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	20	30	40	65

Notes:
1. Page A-93, Appendis F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

[1]Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

Step 1 - Consider Square Feet of Uses Per Floor

(GSF/GSF/GSF)	L1	L2	L3	L4	Project Total	Source: July 2019 Project Description - Table 3
PDR Uses						
Manufacturing & Maker Space	35,000	-	-	-	35000	
Parcel Delivery/Last Mile		381,000	369,600	8,800	759400	
Wholesale and Storage	372,400	-	-	-	372400	
Retail	8,400	-	-	-	8400	
Logistics Yard	-	72,400	73,400	-	145800	
Vehicle Circulation	13,800	112,800	95,400	17,600	239600	
Parking	111,800	-	-	487,600	599400	
Total					2160000	

Step 2 - Estimated % Use per Floor

Sq Ft Per Use Per Floor	L1	L2	L3	L4	
PDR Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
PDR Visiting Workers					
Manufacturing & Maker Space	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Logistics Yard and Parking
Parcel Delivery/Last Mile	0.0%	50.2%	48.7%	0.0%	Utilize Level 2 and 3 Logistics Yard and Parking
Wholesale and Storage	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Logistics Yard and Parking
Retail Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
Retail Visitors	100.0%	0.0%	0.0%	0.0%	Retail Visitors (delivery and consumers) Utilitize Ground Level Logistics and Parking

Step 3 - Total Project Daily Traffic Per Use

Use	Auto/Pickup	Van	MT	HT	Source: Dec 10 2021 Traffic Demand Memo - Table 11 and page A-79 for worker trip data
PDR	4576	882	556	182	
On-site Worker	3030	0	0	0	
Visiting Worker	1546	882	556	182	
Manufacturing & Maker Space	*90*	*20*	*22*	*2*	
Parcel Delivery/Last Mile	*1214*	*802*	*292*	*120*	
Wholesale and Storage	*242*	*60*	*242*	*60*	
Retail/QSR	510	14	6	0	
On-site Worker	132	0	0	0	
Visiting Worker/Consumer	378	14	6	0	

Step 4 - Using Total Traffic Per Use and Percent Use Per Floor - Calculate Vehicles Per Floor (Per Building)

Vehicle Type	L1	L2	L3	L4
PDR Auto (incl pickup & van)	206	506	491	1515
PDR Auto/Pickup	*166*	*305*	*293*	*1515*
PDR Van	*40*	*201*	*192*	*0*
PDR MT	132	73	71	0
PDR HT	31	30	29	0
Retail Auto	196	0	0	66
Retail Auto/Pickup	*189*	*0*	*0*	*66*
Retail Van	*7*	*0*	*0*	*0*
Retail MT	3	0	0	0
Retail HT	0	0	0	0
Total Daily Auto Per Level	402	506	491	1581
Total Daily Auto/Pickup Per Level	*355*	*305*	*295*	*1581*
Total Daily Van Per Level	*47*	*201*	*195*	*0*
Total Daily MT Per Level	135	73	71	0
Total Daily HT Per Level	31	30	29	0

Mobile Trip Data (per Adavant December 10, 2021, Trip Generation Memorandum)

Table 11: Total Daily Vehicle Trips by Vehicle Class and Land Use

Land Use Type	Autos	Buses	Vans	SU Trucks	Tractor Trailers	Total
Maker & Manufacturing	178	0	20	22	2	222
Parcel & Last-mile Delivery	3354	0	802	292	120	4568
Wholesale and Storage	1044	0	60	242	60	1406
Laboratory/&RD	-	0	-	-	-	0
General Retail	156	0	2	0	0	158
Quick Service Restaurant	354	0	12	6	0	372
Public feel staging/maintenance	-	0	-	-	-	0
Private fleet/staging maintenance	-	0	-	-	-	0
Total	5086	0	896	562	182	6726
% of Total Trips	76%	0%	13%	8%	3%	100%
% of Commercial/Service Trips	N/A	N/A	55%	34%	11%	100%

1. Average horsepower within each horsepower bin, per CARB 2021 TRU Emissions Inventory. https://ww3.arb.ca.gov/board/rulemaking/tru2021/apph.pdf. Hp < 25 assumed for single-unit trucks (consistent with document assumption that all "Only California-based TRUs have a group for units
under 23 horsepower because all single body trucks are assumed to be California based units, and all trailer units are over 23 horsepower."
2. Average load factor within each TRU category, per CARB 2021 TRU Emissions Inventory. https://ww3.arb.ca.gov/board/rulemaking/tru2021/apph.pdf.
3. Average Truck Travel Speeds on Select Metropolitan Area Interstates (2012-2015), selected for San Francisco, CA, per Bureau of Transportation Statistics. Table 4-1. https://www.bts.dot.gov/sites/bts.dot.gov/files/docs/FFF_2017.pdf

Average Horsepower for TRU:

CATTrailer (hp bin: 50)	33.8
CATTrailer (hp bin: 25)	24.8
CATTruck (hp bin: 23)	17.2

1. 07Aug2019 response to 'CEQA Analysis Air Quality & Noise Information Request'

UPDATED TO REFLECT UPDATED TRAFFIC DATA IN NEW "MOBILE TRIP DATA" TAB.

Table II.

	Gross Visitor Daily VMT by Vehicle Type and Land Use[1]				
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	24280	24060	11680	7800	**67,820**
Wholesale and Storage	4840	1800	9680	3900	**20,220**
Total Visitor VMT by Vehicle Type	**30920**	**26460**	**22240**	**11830**	**91,450**

Notes:
1. Unless otherwise noted, VMT is based upon Table 12 of June 2021 Trip Gen Data.
2. Parcel and Last Mile Delivery VMT reflects gross trip distances of 20 miles per trip for autos, 30 miles per trip for vans, 40 miles per trip for single-unit trucks, and 65 miles per trip for tractor trailer trucks, and not taking credit for the project siting and -7.5 mile trip credit that is applicable to the traffic analysis.

2050 Operational Emissions Summary - with Emissions Controls

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	10.00	1.812	1.087
Stationary Sources	1.46	0.42	0.211	0.211
Mobile	3.29	42.63	43.068	11.833
TRUs	0.00	0.00	0.000	0.000
Total Proposed Daily Operational Emissions	***29.3***	***53.0***	***45.093***	***13.132***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	0.81	14.54	6.15	1.79
Total Existing Daily Operational Emissions	***9.30***	***17.50***	***6.40***	***2.00***
Net New Daily Operational Emissions	**20.00**	**35.55**	**38.69**	**11.13**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**No**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)

Notes: tpy = tons per year; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors.

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Operational Days Per Year:

Autos/Pickups (on-site worker) 365

	Emissions Factors (g/mi for RunEx, BW, TW and g/trip for StrEx)

South Bay	6	22	28	21%	22
Out of Region	0	0	0	0%	65
Total	26	106	132	100%	
			Weighted Average Retail Worker Trip Distance:		9.11

Notes:
1. Based on page A-81 Daily Work Vehicle Trips Travel Demand Memo for Retail and QSR Land Uses
2. Based on Table 3.2 of Appendix F of Travel Demand Memo (page A-92).

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Table III.

	Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[3]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramps Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	87.5	87.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	176.4	178	170.4	171.7	178.7	170.7

[1] Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

	Total Daily Vehicle Trips by Land Use and Vehicle Type

Step 1 - Consider Square Feet of Uses Per Floor

USE SCENARIO	L1	L2	L3	L4	Project Total
PDR Uses					
Manufacturing & Maker Space	35,000	-	-	-	35000
Parcel Delivery /Last Mile	-	381,000	369,600	8,800	759400
Wholesale and Storage	372,400	-	-	-	372400
Retail	8,400	-	-	-	8400
Logistics Yard	-	72,400	73,400	-	145800
Vehicle Circulation	13,800	112,800	93,400	17,600	237600
Parking	111,800	-	-	487,600	599400
Total					2160000

Source: July 2019 Project Description - Table 3

Step 2 - Estimated % Use per Floor

Split Per Use Per Floor	L1	L2	L3	L4	
PDR Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
PDR Visiting Workers					
Manufacturing & Maker Space	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Logistics Yard and Parking
Parcel Delivery /Last Mile	0.0%	50.17%	48.67%	1.2%	Utilize Level 2 and 3 Logistics Yard and Parking and small area of L4 parking (assume autos/pickups and vans only)
Wholesale and Storage	100.0%	0.0%	0.0%	0.0%	Utilize Level 1 Logistics Yard and Parking
Retail					
Retail Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
Retail Visitors	100.0%	0.0%	0.0%	0.0%	Retail Visitors (delivery and consumers) Utilitze Ground Level Logistics and Parking

Step 3 - Total Project Daily Traffic Per Use

Use	Auto/Pickup	Vans	MT	HT	Source: Dec 10 2021 Traffic Demand Memo - Table 11 and asaw A-79 for worker trip data
PDR	4576	882	556	182	
On-site Worker	3030	0	0	0	
Visiting Worker	1546	882	556	182	
Manufacturing & Maker Space	90	20	22	2	
Parcel Delivery/Last Mile	1214	802	292	120	
Wholesale and Storage	240	60	240	60	
Retail/QSR	510	14	6	0	
On-site Worker	132	0	0	0	
Visiting Worker/Consumer	378	14	6	0	

Step 4 - Using Total Traffic Per Use and Percent Use Per Floor - Calculate Vehicles Per Floor (Per Building)

Vehicle Type	L1	L2	L3	L4
PDR Auto (incl pickups & vans)	206	504	491	1527
PDR Auto/Pickup	166	303	295	1522
PDR Van	40	201	195	5
PDR MT	132	74	72	0
PDR HT	30	30	30	0
Retail Auto	176	0	0	66
Retail Auto/Pickup	189	0	0	66
Retail Van	0	0	0	0
Retail MT	3	0	0	0
Retail HT	0	0	0	0
Total Daily Auto Per Level	402	504	491	1593
Total Daily Auto /Pickup Per Level	355	305	295	1588
Total Daily Van Per Level	47	201	195	5
Total Daily MT Per Level	135	74	72	0
Total Daily HT Per Level	31	30	30	0

Table II. **Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[3]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	90	20	22	2	134
Parcel and Last Mile Delivery	1,214	802	292	120	2428
Wholesale and Storage	242	60	242	60	604
General Retail / Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[4]	**1924**	**896**	**562**	**182**	3564

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III. **Total Daily Auto/Pickup Vehicle Trips by Land Use[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	3354
Wholesale and Storage	1,044
General Retail	156
Quick Service Restaurant	354
Total Vehicle Trips[3]	**5086**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV. **Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	2,140
Wholesale and Storage	802
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[3]	**3162**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V. **Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]**

Parcel & Last Mile Delivery Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
	20	30	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Paved Roadway Re-entrained Fugitive Dust Emissions

Paved Roads	100%

Paved Road Dust $EF_{DUST} = [(k(sL)^{0.91} \times (W)^{1.02}](1 - P/4N))$

Source: AP-42 Section 13.2.1 (Paved Roads) - http://www.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf

Variable	Value	Description
k (PM10)	0.0022	particle size multiplier for particle size range and units of interest (lb/VMT)
k (PM2.5)	0.00054	particle size multiplier for particle size range and units of interest (lb/VMT)
sL	0.032	road surface silt loading (g/m^2) based on EPA 2011 default for collector streets (https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf)
W	2.40	average weight (short tons) of all the vehicles traveling the road. The statewide default is 2.4 short tons (CARB 2021e); California Air Resources Board (CARB). 2021e. Miscellaneous Process Methodology 7.9. Entrained Road Travel, Paved Road Dust. Available: https://ww3.arb.ca.gov/ei/areasrc/fullpdf/2021_paved_roads_7_9.pdf.
P	64	number of "wet" days with at least 2.54 mm of precipitation during the averaging period
N	365	number of days in averaging period

All Vehicle Trip Types

EF (PM10)	0.101653639	g/mile
EF (PM2.5)	0.024951348	g/mile

SFG Operational Emission Factors in Year 2025

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2050
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.
Average Fleet Mix for Autos/Pickups and Vans; Model Year 2016+ for SU and TT Trucks

*Calculated

Idling Emission Factors
Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2050
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.
Model Year 2016+

SF Gateway
2050 Operational Emissions Summary with 2050 Mobile Source and TRU Emissions Factors - no emissions reduction measures

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	34.78	1.812	1.087
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	3.63	47.36	43.080	11.842
TRUs	17.59	16.29	0.098	0.090
Total Proposed Daily Operational Emissions	***47.2***	***102.5***	***45.202***	***13.232***
Total Existing Daily Operational Emissions	***9.30***	***17.50***	***6.40***	***2.00***
Net New Daily Operational Emissions	**37.93**	**84.95**	**38.80**	**11.23**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Operational Days Per Year:

Autos/Pickups (on-site worker) 365

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2050
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

1. Introduction

At the request of the San Francisco Planning Department (planning department), AECOM Technical Services, Inc. (AECOM) conducted an analysis of local air quality and health impacts associated with the construction and operation of the San Francisco Gateway Project (proposed project) at 749 Toland Street and 2000 McKinnon Avenue. The Air Quality and Health Risk Assessment Methodology Memorandum (methodology memorandum) describes the approach for the evaluation of air quality and health impacts from construction and operational sources, existing sources, and cumulative sources at modeled sensitive receptors. The results of this approach and data inputs described in the methodology memorandum are provided in the Air Quality Results Memorandum (results memorandum). Those two memoranda along with this memorandum comprise Appendix F to the San Francisco Gateway Project Environmental Impact Report (EIR).

The draft EIR determined that the proposed project would conflict with or obstruct the Bay Area Air Quality Management District's 2017 Clean Air Plan (Impact AQ-1) and that it would result in a cumulatively considerable net increase in oxides of nitrogen (NO_X), a criteria air pollutant for which the region is in nonattainment (Impact AQ-3). These impacts would be reduced to a less-than-significant level with implementation of Mitigation Measures M-AQ-3a through M-AQ-3i. The project's operational mass emissions from all other criteria air pollutants were found to be less than significant without mitigation. The draft EIR determined that construction activities for the proposed project would result in a less-than-significant level of criteria air pollutants (Impact AQ-2). In addition, potential health risks from construction and operation of the proposed project would be less than significant without mitigation (Impact AQ-4).

2. Purpose

The purpose of this memorandum is to identify the operational NO_X emissions associated with each draft EIR alternative. Because health risks are directly correlated to the level and distribution of emissions, this memorandum also considers and evaluates potential health risks from the draft EIR alternatives. This memorandum does not discuss mass emissions of other criteria air pollutant emissions because other criteria air pollutants would not exceed significance thresholds. This Air Quality Alternatives Memorandum (alternatives memorandum) is the third part of Appendix F to the San Francisco Gateway Project EIR and provides supplemental technical information for the evaluation of potential air quality impacts associated with implementation of the project alternatives.

The draft EIR evaluates the following alternatives:

- No Project Alternative
- Code-Compliant Alternative
- Fleet Management Use Mix Alternative
- Expanded Parcel Delivery Use Alternative

Detailed descriptions of each alternative are presented in Chapter 5, Alternatives, of the draft EIR and are summarized in Section 3, Approach, which includes the assumptions used in analyzing the air quality impacts of each alternative. In addition, Section 3 describes the semi-quantitative approach used to estimate emissions reductions that would be achieved under each of the project alternatives (except for the No Project Alternative) with implementation of the mitigation measures identified for the proposed project that reduced the proposed project air quality impacts to less than significant. The results of this analysis are presented in Section 4, Results.

In addition to these draft EIR alternatives, two variants of an expanded wholesale/storage use mix alternative were analyzed:

- Expanded Wholesale/Storage Use Mix (32 percent parcel and last-mile delivery; 65 percent wholesale use)
- Expanded Wholesale/Storage Use Mix (49 percent parcel and last-mile delivery; 49 percent wholesale use)

3. Approach

Table 1, comparing the proposed project to each of the alternatives that were analyzed in the draft EIR, is presented in this section. This section also discusses the methods applied to estimate emissions and health risks for each alternative. The level of analysis for determining health risk impacts varied according to the alternatives' differences from or similarities to the proposed project. This section also describes the methods to estimate emissions for the expanded wholesale/storage use mix alternative variants, the results of which were the basis for withdrawing them from further consideration in the EIR.

Detailed emissions calculations and health risk analysis inputs and results are provided in Attachments A and B, respectively, to this memorandum.

The project setting sections of the initial study, draft EIR, and technical studies reflect baseline conditions at the project site when the environmental review process began in 2017. However, in August 2020, the project sponsor submitted building permit applications for an interim use of the project site. The No Project Alternative takes into account the change in site conditions and the effects attributable to site activities with the interim use. This same assessment of impacts from 2017 is presented in Chapter 3 of the draft EIR, for the proposed project and for each of the alternatives analyzed in this chapter. All of the alternatives described below (including the No Project Alternative) and their effects are then compared to the proposed project and expanded streetscape variant to determine, for the benefit of the public and decision-makers, whether the alternatives could have less, similar, or greater environmental impacts than the proposed project.

3.1 No Project Alternative

Under the No Project Alternative, the existing four single-story production, distribution, and repair (PDR) buildings would not be demolished; and, other than minimum tenant improvements (such as interior upgrades), no construction or site improvements, such as grading, excavation, or alterations to the height and massing of the buildings, would occur at the site.

3.1.1 Operational Emissions

Operational emissions estimates do not include emissions associated with retail or manufacturing and maker space use under the No Project Alternative. Existing onsite natural gas infrastructure would remain and could serve future users. Emissions associated with onsite natural gas use were calculated based on California Emissions Estimator Model (CalEEMod) emissions estimates for the existing site, which includes some vacant space, and was scaled for the total active No Project Alternative operational area square footage. The No Project Alternative is not anticipated to require emergency generator use; therefore, no stationary source emissions were calculated for the No Project Alternative operations. In addition, up to 5 percent of the total PDR space could be used for refrigerated uses; therefore, emissions were estimated for a parallel percentage of transportation refrigeration units on single-unit and tractor trailer trucks serving PDR uses.

Table 1 Proposed Project and Alternatives Comparison

Building Characteristics	Proposed Project	No Project Alternative	Code-Compliant Alternative	Fleet Management Use Mix Alternative	Expanded Parcel Delivery Use Alternative
Number of Buildings	2	4	2	2	2
Stories	3 (plus active roof)[1]	1	2 (plus active roof)[1]	3 (plus active roof)[1]	3 (plus active roof)[1]
Height	97 feet (115 feet maximum, including rooftop appurtenances)	32 feet	65 feet (75 feet maximum, including rooftop appurtenances)	97 feet (115 feet maximum, including rooftop appurtenances)	97 feet (115 feet maximum, including rooftop appurtenances)
Proposed Uses	Area (gross square feet)	Area (gross square feet)	Area (gross square feet)	Area (gross square feet)	Area (gross square feet)
Total Building Square Footages	**2,160,000**	**448,000**	**1,363,000**	**2,160,000**	**2,160,000**
PDR Uses and Percent of Total PDR Space	1,166,800	448,000	733,538	1,131,800	1,131,800
Manufacturing and Maker Space[2]	35,000 (3%)	NA	22,006 (3%)	NA	NA
Parcel Delivery	759,400 (65%)	336,000 (75%)	476,800 (65%)	567,200 (50%)	1,131,800 (100%)
Wholesale/Storage	372,400 (32%)	112,000 (25%)	234,732 (32%)	NA	NA
Fleet Management[3]	NA	NA	NA	564,600 (50%)	NA

New Docks	Yes	No	Yes, but with reduced capacity	Yes	Yes
Generators	Yes (two 400 kV generators)	No	Yes (two 400 kV generators)	Yes (two 400 kV generators)	Yes (two 400 kV generators)

Source: Prologis, L.P. 2022

Notes for Table 1:

1. The top level (Level 4) for the proposed project, the Fleet Management Use Mix Alternative, and the Expanded Parcel Delivery Use Alternative consists of elevator and stair access structures, solar array, and a screened, open-air multi-purpose deck for parking and/or material and vehicle staging. The top level (Level 3) of the Code-Compliant Alternative consists of a small portion of enclosed space, solar array, and a screened, open-air multi-purpose deck for parking and/or material and vehicle staging.
2. Manufacturing and Maker Space: This use is defined as a light industrial use that provides for the fabrication or production of goods, by hand or machinery, for distribution to retailers, wholesalers, or the public. Makers are often characterized by their production and custom activities that usually involve individual or special design, handiwork, and/or design-related innovation and experimentation. Examples of this light industrial use include food and beverage processing, apparel and other garment products, furniture and fixtures, printing (including three-dimensional printing), prototyping, and publishing. This use is defined in Chapter 2, Project Description, of the EIR.
3. Fleet Management: This use would allow private and public fleets to be staged and maintained. Uses would include private retail vehicle staging, private fleet staging and maintenance, and public fleet staging and maintenance. Private retailers would store and maintain vehicles to be sold or rented. The private vehicles would be mostly parked, and the space would be used as storage; light maintenance and washing would be associated with this use. Private fleet staging and maintenance would involve storage and potential light maintenance of shuttles servicing specific institutions, businesses, and/or independent shuttle services. Public fleet staging and maintenance would include the storage and maintenance of buses, trolleys, and/or shuttles for a public transportation agency, such as the San Francisco Municipal Transportation Agency or San Francisco Paratransit. This use is defined in Chapter 2, Project Description, of the EIR.
4. Class I bicycle parking spaces are spaces are in secure, weather-protected facilities intended for use as long-term, overnight, and workday bicycle storage by dwelling unit residents, nonresidential occupants, and employees. Class II bicycle parking spaces are bike racks in publicly accessible, highly visible locations and are intended for transient or short-term use by visitors, guests, and patrons to the building or use. Class II bike racks allow the bicycle frame and one wheel to be locked to the rack (with one U-shaped lock), and provide support to bicycles without damage to the wheels, frame, or components (planning code section 155.1).
5. As calculated in the initial study (Appendix B), there were 735 existing employees prior to commencing the interim use of the project site in 2021; the project would result in a total of 1,980 (rounded), or a net increase of 1,242 employees relative to pre-2021 conditions. These calculations assume one employee per 597 gross square feet of PDR space and one employee per 370 gross square feet retail space. This employment density is based on a May 2019 report prepared to update the city's nexus fees: Keyser Marston Associates, Jobs Housing Nexus Analysis, San Francisco, May 2019, *https://commissions.sfplanning.org/cpcpackets/2019-011975PCA.pdf*, accessed January 26, 2020, and April 4, 2023.

No public open space is required or proposed for the project.

All numbers are rounded approximations.

kV = kilovolt

NA= not applicable
PDR = production, distribution, and repair

The No Project Alterative relied on the following data developed for the proposed project:

- fleet mix and vehicle trip rates;
- trip distances by vehicle category; and
- mobile-source emissions factors.

The No Project Alternative required a refinement of emissions associated with onsite mobile activity to reflect the existing site layout of single-story buildings and ground-floor mobile activity, rather than the proposed project's configuration.

3.1.2 Health Risk Modeling

A qualitative approach was performed to assess health risk impacts from the No Project Alternative relative to the proposed project. This qualitative approach is used because of the substantially lower emission estimates associated with this alternative.

3.2 Code-Compliant Alternative

The Code-Compliant Alternative would entail demolishing the existing four single-story PDR buildings on site and constructing two new three-story buildings. Under the Code-Compliant Alternative, the buildings would not exceed the 65-J height and bulk district requirements (65 feet maximum height). This alternative would include the same tenant use mix as the proposed project, but less space than analyzed for the proposed project

3.2.1 Operational Emissions

Operational emissions estimates include emissions associated with manufacturing and maker use, following the same approach used for the proposed project but accounting for the reduced square footage under the Code-Compliant Alternative. The Code-Compliant Alternative is anticipated to require one emergency generator for each building, and each generator is estimated to be of the same horsepower used for the proposed project. Therefore, there is no change in stationary source emissions relative to the proposed project. Refrigeration use and the related transportation refrigeration units would be required for uses under the Code-Compliant Alternative. To calculate the percentage of each use that would be refrigerated and the applicable emissions, the methodology that was used under the proposed project was also used under the Code-Compliant Alternative.

The Code-Compliant Alternative relied on the following data developed for the proposed project:

- fleet mix and vehicle trip rates;
- trip distances by vehicle category; and
- mobile-source emissions factors by vehicle category.

Emissions associated with onsite mobile activity were refined to reflect the reduced building height and internal circulation patterns of the buildings under the Code-Compliant Alternative, compared to the proposed project.

To evaluate the Code-Compliant Alternative with implementation of emissions reduction measures, emissions reductions achieved for the proposed project were scaled for the Code-Compliant Alternative, based on the percent reduction in operational building size of this alternative compared to the proposed project. This percent reduction was applied to mobile source and transportation refrigeration unit emissions, which depend on the size of the building. The mass emissions limit required of manufacturing and maker space was applied directly to the Code-Compliant Alternative, without any scaling, because the building size for this use is not directly relevant to this limit.

3.2.2 Health Risk Modeling

Although the Code-Compliant Alternative would result in less vehicle trips and related emissions than the proposed project, there would be no change to vehicle circulation associated with offsite traffic for this

alternative compared to the proposed project. However, the reduced building height under the Code-Compliant Alternative compared to the proposed project would result in changes to the distribution of onsite vehicle exhaust emissions and heights of stationary source exhaust points. These changes would cause the dispersion of emissions to occur at lower heights than under the proposed project, and thus closer to model receptors. Accordingly, a detailed quantitative health risk assessment was prepared to evaluate the potential health effects associated with this alternative.

This section discusses differences in health risk modeling between the Code-Compliant Alternative and the proposed project. Unless otherwise stated, the inputs and assumptions used for the health risk modeling of the proposed project were also used for the Code-Compliant Alternative.

Building heights for the two code-compliant buildings would be reduced to a maximum height of 65 feet, compared to 97 feet for the proposed project. The internal vehicle circulation for the first and second floors remains unchanged from the proposed project. The configuration for the third-floor vehicle circulation is the same as used for the fourth floor under the proposed project because the top floors of both Code-Compliant Alternative and the proposed project include an active rooftop. The release heights of the rooftop exhaust vents would be reduced to 67 feet under the Code-Compliant Alternative, compared to 99 feet for the proposed project. The third-floor horizontal exhaust vent stacks included under the proposed project have been removed from the Code-Compliant Alternative model setup because they have been replaced with the rooftop exhaust fans.

Emissions associated with onsite vehicle exhaust were distributed between the exhaust vents (60 percent) and ramps (40 percent), the same proportion used for the proposed project. However, the percentage allocated by floor was changed for the Code-Compliant Alternative to account for the one fewer floor than the proposed project.

The total emissions assigned to the exhaust vents were distributed evenly between the first two floors (30 percent per floor, for a total of 60 percent). Emissions from the exhaust vents were further distributed between the exhaust vents on the floor (two vents for first floor and four vents on the second floor) and the exhaust vents on the roof (six per building). For example, the 30 percent of exhaust emissions allocated to the first floor were evenly distributed through the two first floor vents and six roof vents. The remaining 40 percent of vehicle exhaust emissions from onsite vehicles were assigned to the adjacent volume sources that were used to characterize the openings along the ramps and the active roof. The emissions were distributed according to the following breakdown in the model: 18 percent to the first floor, 13 percent to the second floor, and 9 percent to the third floor. The first floor was assigned the highest percentage because all vehicles would originate here. The percentages gradually decrease for the higher floors to reflect the smaller number of vehicles that would travel to them.

3.3 Fleet Management Use Mix Alternative

The Fleet Management Use Mix Alternative would entail demolishing the existing four single-story PDR buildings on site and constructing two new three-story buildings, with a fourth-floor active roof, in the same configuration used for the proposed project. The combined building square footage of the Fleet Management Use Mix Alternative (2,160,000 square feet) is the same as that under the proposed project. Unlike the proposed project, this alternative would eliminate the manufacturing and maker space, as well as the wholesale/storage space. The active PDR floor area would be divided equally between parcel delivery service, including last-mile delivery, and fleet management, which is not included in the analyzed tenant use mix for the proposed project.[1] The amount of space for parcel delivery under this alternative would be less than under the proposed project (567,200 square feet under the Fleet Management Use Mix Alternative versus 759,400 square feet under the proposed project). In addition, the retail use that is included in the proposed project would be removed under the Fleet Management Use Mix Alternative and would instead be allocated as PDR support space.

[1] Fleet management uses allow private and public fleets to be staged and maintained. Uses could include private retail vehicle staging, private fleet staging and maintenance, or public fleet staging and maintenance. See Section 2.D in Chapter 2 of the EIR for further discussion.

3.3.1 Operational Emissions

Operational emissions estimates include emissions associated with the proposed PDR uses, following the same approach used for the proposed project, as applicable. Like the proposed project, the Fleet Management Use Mix Alternative is anticipated to require one emergency generator for each building, estimated to be of the same horsepower used for the proposed project; therefore, there is no change in stationary source emissions relative to the proposed project. Although not anticipated to be applicable to the fleet management spaces, refrigeration use and the related transportation refrigeration units could be required for parcel delivery uses under this alternative. To calculate the percentage of this use that would be refrigerated and the applicable emissions, the same methodology used for the proposed project was used for the Fleet Management Use Mix Alternative.

The Fleet Management Use Alternative relied on the following data developed for the proposed project:

- For parcel delivery use, data included fleet mix, vehicle trip rates, trip distances by vehicle category, and mobile source emissions factors by vehicle category.
- Because the fleet management use was not included as part of the proposed project, emissions factors and trip distances for bus trips associated with the fleet management use were incorporated to estimate the mobile source emissions. Specifically, emissions factors from California Air Resources Board EMFAC 2021 for buses were used, and the trip distances for bus trips rely on data developed by the project's transportation analysis (i.e., an average of 5 miles per trip for public bus fleets and 40 miles per trip for private bus fleets). The calculation of air quality emissions followed the same methodology as that applied to the PDR uses of the proposed project, but with refined emissions factors and trip distances specific to the bus trips associated with the fleet management use.

Emissions associated with onsite mobile activity were refined to reflect the onsite travel and idling associated with the fleet management use mix, compared to the PDR mix evaluated for the proposed project.

The evaluation of emissions reduction measures under the Fleet Management Use Mix Alternative was a qualitative analysis focused only on the emissions reductions applicable to the comparable uses in both the Fleet Management Alternative and the proposed project.

3.3.2 Health Risk Modeling

A high-level quantitative analysis was selected for the assessment of health risk impacts associated with the Fleet Management Use Mix Alternative. The configuration of buildings, vehicle circulation, and stationary sources for this alternative are identical to those for the proposed project; therefore, the air dispersion would also be the same as that under the proposed project. As a result, the percent change of emissions of the Fleet Management Use Mix Alternative—compared to the percentage change for the proposed project for onsite, offsite last-mile, and offsite worker/delivery activities—was used to evaluate the health risk impacts for this alternative.

3.4 Expanded Parcel Delivery Use Alternative

The Expanded Parcel Delivery Use Alternative would entail demolishing the existing four single-story PDR buildings on the site and constructing two new three-story buildings, with a fourth-floor active roof, in the same configuration used for the proposed project. The combined building square footage of the Expanded Parcel Delivery Use Mix Alternative (2,160,000 square feet) is the same as that under the proposed project. Unlike the proposed project, this alternative would eliminate the manufacturing and maker space, retail, and the wholesale/storage space, and the entire floor area in both buildings would be used for parcel delivery.

3.4.1 Operational Emissions

Operational emissions estimates include emissions associated with the parcel delivery use, following the same approach used for the proposed project. The Expanded Parcel Delivery Use Alternative is anticipated to require one emergency generator for each building, estimated to be of the same horsepower used for the proposed project. Therefore, there is no change in stationary source emissions relative to the proposed project. Refrigeration use and the related transportation refrigeration units would be required for uses under the Expanded Parcel Delivery Use Alternative. To calculate total refrigeration use and related trucks with transportation refrigeration units and the applicable emissions, the Expanded Parcel Delivery Use Alternative used the same methodology as applied to the proposed project.

The Expanded Parcel Delivery Use Alternative relied on the following data developed for the proposed project:

- fleet mix and vehicle trip rates;
- trip distances by vehicle category; and
- mobile-source emissions factors by vehicle category.

Emissions associated with onsite mobile activity were refined to reflect the onsite travel and idling associated with the expanded parcel delivery use, compared to the PDR mix of the proposed project.

The evaluation of emissions reduction measures under the Expanded Parcel Delivery Use Alternative was a qualitative analysis, focused only on the emissions reductions applicable to the comparable uses in both the Expanded Parcel Delivery Use Alternative and the proposed project.

3.4.2 Health Risk Modeling

A high-level quantitative analysis was used to assess health risk impacts of the Expanded Parcel Delivery Use Alternative. The configuration of buildings, vehicle circulation, and stationary sources for this alternative are identical to those for the proposed project; therefore, the air dispersion would also be the same as the proposed project. As a result, the percent change of emissions from the Expanded Parcel Delivery Use Alternative—compared to the percentage change for the proposed project for onsite, offsite last-mile, and offsite worker/delivery activities—was used to evaluate the health risk impacts for this alternative.

3.5 Expanded Wholesale/Storage Use Mix

An Expanded Wholesale/Storage Use Mix Alternative was considered but ultimately determined to have greater mass emissions than the proposed project. The Expanded Wholesale Use Mix Alternative would entail demolishing the existing four single-story PDR buildings on site and constructing two new three-story buildings, with a fourth-floor active roof, in the same configuration used for the proposed project. The combined building square footage of the Expanded Wholesale/Storage Use Mix Alternative (2,160,000 square feet) is the same as that of the proposed project. Similar to the proposed project, the Expanded Wholesale/Storage Use Mix Alternative would provide space for several main types of PDR uses. These uses could consist of manufacturing and maker spaces; parcel delivery service, including last-mile delivery; and wholesale/storage use. Similar to the proposed project, this alternative would also accommodate ground-floor retail space. This alternative would have the same square footage of maker space (3 percent of the total PDR space) and ground-floor retail (0.4 percent of the total building space) as the proposed project, but with less space for parcel delivery and more space for wholesale/storage. Two variants of the PDR use mix under the Expanded Wholesale/Storage Use Mix Alternative were considered: one variant considered a scenario with 32 percent of the PDR space allocated to parcel and last-mile delivery use, and 65 percent allocated to wholesale/storage use; the second variant considered a scenario with an approximately even split of 49 percent of the PDR space allocated to parcel and last-mile delivery use and 49 percent allocated to wholesale/storage use.

3.5.1 Operational Emissions

Operational emissions estimates include emissions associated with manufacturing and maker use, following the same approach used for the proposed project. The Expanded Wholesale/Storage Mix Use Alternative is anticipated to require one emergency generator for each building, estimated to be of the same horsepower used for the proposed project; therefore, there is no change in stationary source emissions relative to the proposed project. Refrigeration use and the related transportation refrigeration units would be required for uses under the Expanded Wholesale/Storage Mix Use Alternative. To calculate the percentage of each use that would be refrigerated and the applicable emissions, the methodology that was used under the proposed project was also used under the Expanded Wholesale/ Storage Use Mix Alternative.

The Expanded Wholesale/Storage Use Mix Alternative relied on the following data developed for the proposed project:

- fleet mix and vehicle trip rates;
- trip distances by vehicle category; and
- mobile-source emissions factors by vehicle category.

Emissions associated with onsite mobile activity were refined to reflect the onsite travel and idling associated with the expanded wholesale/storage use mix, compared to the PDR mix of the proposed project.

The evaluation of emissions reduction measures under the Expanded Wholesale/Storage Use Mix Alternative was done semi-quantitatively, based on the emissions reductions achieved under the proposed project and how such reductions would or would not be similarly achieved under this alternative. The percent reduction in mobile source emissions under the proposed project was applied to the Expanded Wholesale/Storage Use Mix Alternative, but with a margin of error to account for the differences in fleet mix between the proposed project and this alternative, and the resultant differences in mitigation applicable to mobile source emissions.

3.5.2 Health Risk Modeling

The mass emissions results for the Expanded Wholesale/Storage Mix Use Alternative (presented in Section 4.1, Operational Emissions) indicate that either variant of this alternative would result in operational mass emissions greater than those of the proposed project. Consequently, this alternative was not considered for further analysis, and health risks were not assessed.

4. Results

This section presents the results of the quantitative emissions estimates and health risk modeling that inform the evaluation of potential air quality impacts associated with the proposed project alternatives.

Unless otherwise specified, the calculations are based on the analysis approach and data inputs described in the methodology memorandum of this Appendix F to the EIR. Detailed emissions calculations and health risk modeling files are provided in Attachments A and B, respectively, to this memorandum.

4.1 Construction Emissions

Construction-related mass emissions associated with each alternative were evaluated qualitatively relative to the proposed project. As with the proposed project, all build scenario alternatives (i.e., Code Compliant, Fleet Management Use Mix, Expanded Parcel Delivery Use, and Expanded Wholesale/ Storage Use Mix) would require demolition of the four existing buildings onsite, and compliance with the City of San Francisco Construction Dust Control Ordinance. In addition, construction under each of these

alternatives would involve pursuing priority processing as a Type 3 Clean Construction Project; this requires, at a minimum, the use of equipment that meets Tier 4 interim emissions standards for all equipment greater than 25 horsepower. The following paragraphs summarize the relative level of construction emissions of each alternative compared to the proposed project.

- Under the No Project Alternative, the existing four single-story PDR buildings would not be demolished. As a result, no demolition and construction activities would occur at the site beyond minimal tenant improvements (such as interior upgrades) and no heavy construction equipment would be required. This would result in minimal construction-related emissions. The No Project Alternative would have substantially lower construction-related emissions than the proposed project.

- Under the Code-Compliant Alternative, the existing four single-story buildings would be demolished, resulting in demolition-related emissions similar to those for the proposed project. However, under the Code-Compliant Alternative, the total proposed building area would be approximately 1,363,000 square feet, about 63 percent of the size of the proposed project or expanded streetscape variant. Construction emissions under this alternative would be less than those for the proposed project because the construction period would be shortened to 26 months from 31 months. Additionally, the size of the buildings would be reduced, which would lower air emissions during the building construction phase and during the building envelope and interior buildout phase. In particular, during these phases, the Code-Compliant Alternative would reduce equipment use, and off-gassing emissions from the application of architectural coatings would be less, compared to the proposed project.

- Under the Fleet Management Use Mix, Expanded Parcel Delivery Use, and the Expanded Wholesale/Storage Use Mix Alternative, the disturbance area, proposed building space, and building configuration would be the same as under the proposed project. Consequently, construction of these alternatives would have the same construction schedule, on-road and off-road construction equipment usage, and paving and architectural coating activities as the proposed project. Therefore, these alternatives would result in construction emissions comparable to those of the proposed project.

4.2 Operational Emissions

Operational emissions for the proposed project, the four alternatives analyzed in the draft EIR, and two wholesale/storage alternative variants that were ultimately not analyzed further are presented in Table 2 and Table 3. As explained in Section 2, Purpose, only proposed project long-term oxides of nitrogen (NO_X) emissions exceed quantitative air quality significance thresholds. Therefore, Table 2 and Table 3 present NO_X emissions for the proposed project and each of the above-described alternatives; all other pollutants would trend similarly to NO_X emissions unless otherwise noted. The analysis represents operational activities occurring without any emission reduction measures. Consistent with the approach to evaluating the net increase in emissions from the proposed project, the existing emissions associated with existing onsite uses that would be eliminated or replaced by operations under each alternative are also provided in Table 2 and Table 3. This demonstrates the net increase in NO_X emissions from implementation of each alternative. The evaluation methodology and detailed results for existing onsite uses are provided in the Appendix F methodology memorandum and the results Memorandum, respectively.

As shown in Table 2 and Table 3, the No Project Alternative would result in a net increase in NO_X emissions of approximately 45 pounds per day, or 8 tons per year. Emissions reduction measures developed for the proposed project would not be applicable to the No Project Alternative and therefore were not evaluated.

Table 2 Summary of Daily Operational Emissions of NO_X from Proposed Project and Alternatives (pounds per day)

Emissions Source	Proposed Project	No Project Alternative	Code-Compliant Alternative	Fleet Management Use Mix Alternative	Expanded Parcel Delivery Use Alternative	Expanded Wholesale/ Storage Use Mix Alternative, 32/64 Use Split Scenario	Expanded Wholesale/ Storage Use Mix Alternative, 49/49 Use Split Scenario
Area[1]	< 0.1	< 0.1	< 0.1	< 0.1	< 0.1	< 0.1	< 0.1
Energy[2]	0.0	1.7	0.0	0.0	0.0	0.0	0.0
Manufacturing and Maker Space[3]	34.8	0.0	21.9	0.0	0.0	34.8	34.8
Stationary Sources[4]	4.0	0.0	4.0	4.0	4.0	4.0	4.0

Total Existing Onsite Average Daily Emission	*17.5*	*17.5*	*17.5*	*17.5*	*17.5*	*17.5*	*17.5*
Net Increase in Project- (Alternative-) Generated Daily Operational Emissions	*148.4*	*44.7*	*97.6*	*53.6*	*107.5*	*153.6*	*151.0*

Notes: Emissions presented in this table do not account for any emissions reduction measures.

1. Area sources are modeled using CalEEMod defaults for the proposed land uses.
2. The project and the build alternatives would be designed without natural gas; therefore, no emissions would occur from energy sources. For the No Project Alternative, estimated natural gas emissions were based on scaling of the CalEEMod energy-related emissions for existing onsite uses (which included some vacant inactive space) to the total active area square footage of this alternative.
3. For applicable alternatives, manufacturing and maker space emissions are based on emissions profiles from existing similar land uses, and the maximum potential emissions for a "worst-case" use emissions profile are presented for each pollutant.
4. Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod, using both CalEEMod input factors and U.S. EPA emissions factors.
5. Mobile emissions account for onsite activity and trips to/from the site, based on the project-specific vehicle miles traveled analysis and relevant travel assumptions, as detailed in the methodology memorandum. Emissions were calculated using CARB EMFAC 2021 emission factors.
6. Transportation refrigeration unit emissions account for travel to and from the site, as well as onsite idling. Emissions were estimated using CARB OFFROAD 2021 Emissions Inventory.
7. Totals may not add due to rounding.

CalEEMod = California Emissions Estimator Model

Source: Modeled by AECOM 2023 (see Attachment A, Alternatives Emissions Estimates)

The Code-Compliant Alternative would result in a net increase in operational NO_X emissions of approximately 98 pounds per day, or 16 tons per year. These daily and annual emissions would be approximately 34 percent less than those for the proposed project. The Code-Compliant Alternative proposes the same mix of uses at the same relative percentage of total development as the proposed project. Therefore, the emissions reductions estimated through implementation of Mitigation Measures M-AQ-3a through M-AQ-3f under the proposed project would apply similarly to the Code-Compliant Alternative, but at a reduced rate comparable to the reduced project size under this alternative. The proposed project mitigated operational mobile source emissions of NO_X would be reduced by approximately 35 percent with implementation of emissions reduction measures. Applying the same proportion of emissions reductions to the Code-Compliant Alternative mobile source emissions would reduce the Code-Compliant Alternative operational emissions of NO_X of approximately 27 pounds per day, or 5 tons per year. In addition, manufacturing and maker space emissions of NO_X would be limited to 10 pounds per day (a reduction of about 12 pounds per day, or 1.5 tons per year), and emissions from use of transportation refrigeration units would be reduced to zero through use of electric or other clean-powered units. The combination of these emissions reductions would decrease overall emissions from the Code-Compliant Alternative compared to the proposed project and result in a net increase compared to baseline 2017 conditions of approximately 48 pounds per day, or about 7.5 tons per year under the Code-Compliant Alternative with implementation of Mitigation Measures M-AQ-3a through M-AQ-3f.

The Fleet Management Use Mix Alternative would result in a net increase in operational NO_X emissions of just less than 54 pounds per day, or about 9 tons per year. These daily and annual emissions would be approximately 56 percent less than those for the proposed project. Emissions reduction measure M-AQ-3b would reduce emissions from use of transportation refrigeration units to zero through use of electric or other clean-powered units—a reduction of more than 8.6 pounds per day, or about 1.6 tons per year. Under the proposed project, parcel delivery use and wholesale/storage use accounted for approximately 96 percent of the total operational space (the remainder being manufacturing and maker space and retail), whereas parcel delivery use accounts for 50 percent of the total operational space under the Fleet Management Use Mix Alternative. Therefore, the mobile source emissions reductions that were applicable to 96 percent of proposed operational space under the proposed project would be applicable to 50 percent of the operational space under the Fleet Management Use Mix Alternative, or approximately 48 percent less of the operations under the Fleet Management Alternative. As noted above, the proposed project operational mobile source emissions of NO_X would be reduced by approximately 35 percent with implementation of emissions reduction measures. Therefore, emissions reduction measures M-AQ-3c and M-AQ-3d, directly applicable to heavy-duty truck mobile source emissions associated with parcel delivery use, would result in approximately 48 percent of the mobile source emissions rate achieved under the proposed project. As a result, these measures would reduce mobile source emissions by 9.8 pounds per day, or 1.8 tons per year under the Fleet Management Mix Use Alternative. Because the Fleet Management Use Alternative would not include manufacturing and maker space use, emissions reduction measure M-AQ-3e, which would limit manufacturing and maker space emissions, is not applicable to this alternative. Total quantifiable emissions reductions achieved under the Fleet Management Use Mix Alternative would be approximately 18.4 pounds per day, or 3.3 tons per year, resulting in a net increase of operational NO_X emissions of just over 35 pounds per day, or 5.8 tons per year.

The Expanded Parcel Delivery Use Alternative would result in a net increase in operational NO_X emissions of approximately 107.5 pounds per day, or 19 tons per year. These daily and annual emissions represent approximately 28 percent less than those for the proposed project. Emissions reduction measure M-AQ-3b would reduce emissions from use of transportation refrigeration units to zero through use of electric or other clean-powered units—a reduction of more than 17 pounds per day, or about 3.1 tons per year. In addition, although the fleet mix is slightly different for the Expanded Parcel Delivery Use Alternative compared to the proposed project, emissions reduction measures M-AQ-3c and M-AQ-3d would result in comparable emissions reductions for the Expanded Parcel Delivery Use Alternative. These measures are particularly applicable to single-unit and tractor trailer trucks, of which total trips are reduced by approximately 15 percent under this alternative. Therefore, assuming that the mobile source emissions reductions are also reduced by approximately 15 percent compared to those reductions achieved under the proposed project, emissions reduction measures M-AQ-3c and M-AQ-3d would reduce mobile source emissions under the Expanded Parcel Delivery Use Alternative by approximately 30.9 pounds per day, or 5.6 tons per year. In addition, emissions reduction measure M-AQ-3e would require onsite backup

generators to meet or exceed Tier 4 emissions standards, thereby reducing such emissions by nearly 4 pounds per day. Because the Expanded Parcel Delivery Use Alternative would not include manufacturing and maker space use, emissions reduction measure M-AQ-3f, which would limit manufacturing and maker space emissions, is not applicable to this alternative. Total quantifiable emissions reductions from emissions reduction measures M-AQ-3a through M-AQ-3e achieved under the Expanded Parcel Delivery Use Mix Alternative would be approximately 52 pounds per day, or 8.8 tons per year, resulting in a net increase of operational NO_X emissions of approximately 55.6 pounds per day, or 10.2 tons per year.

4.3 Health Risk Assessment

This analysis evaluates the EIR alternatives' excess cancer risk and impacts from particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$) on sensitive receptors, including nearby residents and workers within 1,000 feet of project-generated construction emissions and future operations (i.e., receptors along the haul routes for construction and along transportation routes for operational traffic).

Health risks were not quantified for the No Project Alternative, because estimated emissions would be substantially reduced, given the smaller footprint and reductions in the square footage for parcel delivery and wholesale/storage uses compared to the proposed project. Therefore, health risks would be substantially less for this alternative than for the proposed project. Health risks were not evaluated for the expanded wholesale/storage use alternative variants, because their emissions were greater than estimated for the proposed project as explained previously and shown in Tables 2 and 3.

The percent change of annual $PM_{2.5}$ exhaust (diesel particulate matter) and total $PM_{2.5}$ (which includes tire and brake wear and resuspended dust) emissions of each alternative evaluated relative to the proposed project is summarized in Table 4. Onsite stationary emissions include the emergency generators and manufacturer and maker space activities, as applicable. There is no change with the emergency generators between the proposed project and the build alternatives; however, $PM_{2.5}$ exhaust decreases by 31 percent for the Code-Compliant Alternative due to the reduced area for manufacturing and maker space, and is completely eliminated for the Fleet Management Use Mix and Expanded Parcel Delivery Use alternatives. Offsite last-mile uses consist of parcel delivery; offsite workers and deliveries are counted under on-road traffic to and from the project site and nearby highways. As discussed in Section 3, Approach, offsite traffic patterns are identical for the proposed project and all build alternatives.

Table 4 Percent Change in Emissions of Alternatives from Proposed Project by HRA Emission Source Groups

Emission Sources – Pollutant	Code-Compliant Alternative	Fleet Management Use Mix Alternative	Expanded Parcel Delivery Use Alternative
Onsite (Mobile) – $PM_{2.5}$ Exhaust	-30%	-47%	-8%
Onsite (Mobile) – $PM_{2.5}$ Total	-24%	-18%	-1%
Onsite (Stationary) – $PM_{2.5}$ Exhaust	-31%[1,2]	-84%[3]	-84%[3]
Onsite (Stationary)[1] – $PM_{2.5}$ Total	0%	0%	0%
Offsite (last-mile vehicle travel) – $PM_{2.5}$ exhaust	-30%	-23%	+52%
Offsite (last-mile vehicle travel) – $PM_{2.5}$ total	-30%	-23%	+53%
Offsite (other vehicle trips)[4] – $PM_{2.5}$ exhaust	-30%	-2%	-8%
Offsite (other vehicle trips)[4] – $PM_{2.5}$ total	-31%	+20%	-18%

Notes:

1 Stationary sources include emergency generators and maker space activities exhausted from rooftop vents.
2 Reduction is associated with less emission from maker space activities due to the smaller space allocated under the alternative.
3 All manufacture and maker space is removed. The only stationary sources are the emergency generators.
4 Other vehicle trips include workers, deliveries to/from the proposed project site and nearby highways, and buses.

HRA = health risk assessment; $PM_{2.5}$ = particulate matter less than or equal to 2.5 microns in diameter.

Source: Modeled by AECOM 2023

As shown in Table 4, $PM_{2.5}$ exhaust and total $PM_{2.5}$ emissions from onsite and offsite sources for the Code-Compliant Alternative generally decrease by about 30 percent, reflecting this alternative's

approximately one-third reduction in size compared to the proposed project. The Fleet Management Use Mix Alternative includes less parcel delivery and less onsite mobile sources overall. There is an increase of approximately 20 percent in offsite mobile emissions for the Fleet Management Use Mix Alternative, as shown in Table 4. This change is attributed to an increase in vehicle trips for this category, inclusive of worker commute trips, patrons and vendors/deliveries to the site, and bus trips. However, $PM_{2.5}$ exhaust is slightly lower under the Fleet Management Use Mix Alternative than under the proposed project because there would be an increase in vehicles trips by buses that would replace trips by diesel trucks (i.e., single-unit and tractor trailer trucks) under the proposed project. Parcel delivery use is expanded in the Expanded Parcel Delivery Use Alternative and is reflected in increases of $PM_{2.5}$ exhaust and total emission of about 52 percent and 53 percent, respectively.

Health risks were evaluated for sources emitting toxic air contaminants during construction and future operations of the proposed project and project alternatives. Consistent with the analysis of the proposed project, two scenarios[2] were evaluated to assess long-term cancer risk and annual $PM_{2.5}$ concentrations for both residential and worker exposure. These included:

- *Residential Exposure Scenario 1:* This scenario includes project emissions from both construction activities and operation of the proposed project. Cancer risk was assessed over a 30.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 28 years of an approximately 30-year total exposure period.
- *Residential Exposure Scenario 2:* This scenario includes only operation of the proposed project for a 30-year period.
- *Worker Exposure Scenario 1:* This scenario includes project emissions from both construction activities and operation of the proposed project. Cancer risk was assessed over a 25.6-year period, with construction occurring during the first 2.6 years, and operations for the remaining 23 years of an approximately 25-year total exposure period.
- *Worker Exposure Scenario 2:* This scenario includes only operation of the proposed project for a 25-year period.

Health risks calculated at the maximally exposed individual residential and worker receptors are summarized in Table 5 and Table 6 for cancer risk and annual $PM_{2.5}$, respectively. The cancer risk and $PM_{2.5}$ concentration for the Code-Compliant Alternative were obtained through a full modeling analysis, as discussed in Section 3.2.1, Operational Emissions. Supporting modeling files for the Code-Compliant Alternative are provided in Attachment B. The health risks for the Fleet Management Use Mix and Expanded Parcel Delivery Use alternatives shown in Table 5 and Table 6 were computed by taking the product of the percent change of emissions between the alternative and the proposed project for a given emission source group, multiplied by the health risk associated with that same source group from the proposed project analysis. For example, the 30-year cancer risk for the maximally exposed individual residential receptor of the proposed project for Scenario 2 was 4.68 per one million. The contribution from onsite sources (both mobile and stationary) is 3.07 per one million, or approximately 66 percent. Therefore, the percent change for the Fleet Management Use Mix Alternative onsite $PM_{2.5}$ exhaust is negative 47 percent multiplied by 3.07 per one million (of the proposed project onsite sources), which results in a cancer risk of 1.63 per one million for onsite sources. This process is repeated for offsite last-mile and offsite worker/deliveries to arrive at the total cancer risk for that scenario. Tables showing this step-by-step process are provided in Attachment B, Alternatives Health Risk Assessment and $PM_{2.5}$ Model Inputs, for both the Fleet Management Use Mix and Expanded Parcel Delivery Use alternatives.

[2] Both scenarios include the use of Tier 4 Interim emission standards for construction equipment rated 25 horsepower or greater as part of the proposed project's approval as a Type 3 Clean Construction Project, pursuant to Director Bulletin No. 2, *https://sfplanning.org/sites/default/files/forms/DB2_Type3_SupplementalApplication.pdf*.

Table 5 Lifetime Cancer Risk at the Maximally Exposed Individual Sensitive Residential and Worker Receptors from the Proposed Project and the Build Alternatives

				Lifetime Cancer Risk (per one million) (percent change from proposed project)[1]			
UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Proposed Project	Code-Compliant Alternative	Fleet Management Use Mix Alternative	Expanded Parcel Delivery Use Alternative
553,000	4,177,080	Residential	Scenario 1	4.05 (0%)	3.72 (-8%)	3.14 (-23%)	4.14 (+2%)
552,920	4,177,300	Worker	Scenario 1	5.09 (0%)	4.09 (-20%)	3.27 (-37%)	5.22 (+2%)
553,000	4,177,080	Residential	Scenario 2	4.68 (0%)	4.11 (-12%)	3.02 (-36%)	4.84 (+3%)
552,920	4,177,300	Worker	Scenario 2	4.82 (0%)	3.75 (-22%)	2.84 (-41%)	4.96 (+3%)

Notes:

Table 6 Annual Average $PM_{2.5}$ Concentration at the Maximally Exposed Individual Sensitive Residential and Worker Receptors from the Proposed Project and the Build Alternatives

				$PM_{2.5}$ Concentration ($\mu g/m^3$) (percent change from proposed project)[1]			
UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Proposed Project	Code-Compliant Alternative	Fleet Management Use Mix Alternative	Expanded Parcel Delivery Use Alternative
553,000	4,177,080	Residential	Scenarios 1 and 2	0.080 (0%)	0.065 (-19%)	0.068 (-14%)	0.098 (+22%)
552,920	4,177,300	Worker	Scenarios 1 and 2	0.174 (0%)	0.142 (-19%)	0.159 (-9%)	0.176 (+1%)

Notes:

[1] $PM_{2.5}$ concentrations presented in this table do not account for any emissions reduction measures.

m = meter
$\mu g/m^3$ = micrograms per cubic meter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter
UTM = Universal Transverse Mercator

Source: Modeled by AECOM 2023 (see Attachment B, Alternatives Health Risk Assessment and $PM_{2.5}$ Model Inputs)

As shown in Table 5, the cancer risk at the maximally exposed individual residential and worker receptors for the Code Compliant and Fleet Management Use Mix Alternatives decreased in comparison to the proposed project. For the Expanded Parcel Delivery Use Alternative, there is a slight increase (approximately 2 to 3 percent at the maximally exposed individual resident and worker receptors) in cancer risk.

Estimated annual $PM_{2.5}$ concentrations for the build alternatives compared to the proposed project are shown in Table 6. Annual $PM_{2.5}$ concentration decreases for the Code-Compliant and Fleet Management Use Mix alternatives in comparison to the proposed project at the maximally exposed individual worker receptor. A slight increase in annual $PM_{2.5}$ concentration of approximately 1 percent occurs at the maximally exposed individual worker receptor for the Expanded Parcel Delivery Use Alternative. A decrease in annual $PM_{2.5}$ concentration is projected at the maximally exposed individual residential receptor for the Code-Compliant and Fleet Management Use Mix alternatives, and an increase of about 22 percent is projected from the Expanded Parcel Delivery Use Alternative.

As part of the detailed health risk analysis conducted for the Code-Compliant Alternative, noncancer chronic health risks were also computed. Table 7 summarizes the noncancer chronic and acute hazard indices for this alternative at the maximally exposed individual residential and worker receptors. It is presumed that the noncancer health risks would follow a trend similar to those seen in the cancer risk calculations for the Fleet Management Use Mix and Expanded Parcel Delivery Use alternatives.

Table 7 Noncancer Chronic and Acute Health Risks from the Code-Compliant Alternative at Offsite Maximally Exposed Individual Residential and Worker Receptors

UTM_x (m)	UTM_y (m)	Receptor Type	Scenario	Project Phase	Noncancer Chronic HI[1]	Acute HI[1]
553,000	4,177,080	Residential	Scenarios 1 and 2	Operation	1.54E-03	7.28E-04
552,920	4,177,300	Worker	Scenarios 1 and 2	Operation	4.53E-03	1.87E-03

Notes:

[1] Noncancer chronic and acute risk presented in this table do not account for any emissions reduction measures.

HI = hazard index
m = meter
UTM = Universal Transverse Mercator

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

% Vehicle Activity Per Floor

Floor	Single Unit Trucks	Tractor Trailer Trucks[3]
1st/Ground	100%	100%
2nd	0%	0%
3rd	0%	0%
4th/Roof	0%	0%
Total	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps on each floor is detailed in the methodology memo page 18 of 24. No tractor trailer trucks would operate on the 4th floor; these 'ramp exhaust' emissions are redistributed evenly throughout the first three floors to account for 100% of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Notes:
1. ROG emissions are those generated by gasoline-powered vehicles.
2. PM2.5 Exhaust emissions are those generated by diesel-powered vehicles.
3. PM2.5 Total emissions are all PM2.5 Exhaust, Tire Wear, Break Wear, and RE-entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions accounted for to serve as an input to the HRA modeling.
5. Percent of off-site worker vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of off-site visitor vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each land use and vehicle category that would occur within the HRA modeling domain.

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

	Emissions Factors (g/mi for RunEx, BW, TW and g/trip for StrEx)

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	**Length (m)**	**Levels**
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	**L1**	**L2**	**L3**	**L4**
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	**Row 1**	**Row 2**	**Row 3**	**Row 4**	**Row 5**	**Row 6**
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

[1]Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

1. 07Aug2019 response to 'CEQA Analysis Air Quality & Noise Information Request'

UPDATED TO REFLECT UPDATED TRAFFIC DATA IN NEW "MOBILE TRIP DATA" TAB.

Table II.

Vehicle Type and Land Use	Gross Visitor Daily VMT by Vehicle Type and Land Use[1]				
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	0	0	0	0	-
Parcel and Last Mile Delivery	14920	14760	7120	4810	**41,610**
Wholesale and Storage	2560	960	5200	2080	**10,800**
Total Visitor VMT by Vehicle Type	**17480**	**15720**	**12320**	**6890**	**52,410**

Notes:
1. Unless otherwise noted, VMT is based upon Table 12 of June 2021 Trip Gen Data.
2. Parcel and Last Mile Delivery VMT reflects gross trip distances of 20 miles per trip for autos, 30 miles per trip for vans, 40 miles per trip for single-unit trucks, and 65 miles per trip for tractor trailer trucks, and not taking credit for the project siting and -7.5 mile trip credit that is applicable to the traffic analysis.

Paved Roadway Re-entrained Fugitive Dust Emissions

Paved Roads	100%

Paved Road Dust $EF_{DUST} = [(k(sL)^{0.91} \times (W)^{1.02}](1 - P/4N))$

Source: AP-42 Section 13.2.1 (Paved Roads) - http://www.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf

Variable	Value	Description
k (PM10)	0.0022	particle size multiplier for particle size range and units of interest (lb/VMT)
k (PM2.5)	0.00054	particle size multiplier for particle size range and units of interest (lb/VMT)
sL	0.032	road surface silt loading (g/m^2) based on EPA 2011 default for collector streets (https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf)
W	2.40	average weight (short tons) of all the vehicles traveling the road. The statewide default is 2.4 short tons (CARB 2021e); California Air Resources Board (CARB). 2021e.
P	64	number of "wet" days with at least 2.54 mm of precipitation during the averaging period
N	365	number of days in averaging period

All Vehicle Trip Types

EF (PM10)	0.101653639	g/mile

SF Gateway - Code Compliant **Operational Emissions Summary**

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	13.62	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	1.86	21.87	1.139	0.684
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	6.90	77.28	31.417	9.090
TRUs	12.01	11.89	0.311	0.287
Total Proposed Daily Operational Emissions	***35.87***	***115.06***	***33.080***	***10.273***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	1.30	16.10	6.25	1.84
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**26.54**	**97.58**	**26.73**	**8.32**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]

	0.325
	0.225
Total	60%
Total	100%

	% Vehicle Activity Per Floor	
Floor	Single Unit Trucks	Tractor Trailer Trucks[1]
1st/Ground	48%	34%
2nd	52%	66%
3rd	0%	0%
4th/Roof	0%	0%
Total	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps on each floor is detailed in the methodology memo page 18 of 24. No tractor trailer trucks would operate on the 4th floor; these 'ramp exhaust' emissions are redistributed evenly throughout the first three floors to account for 100% of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Notes:
1. ROG emissions are those generated by gasoline-powered vehicles.
2. PM2.5 Exhaust emissions are those generated by diesel-powered vehicles.
3. PM2.5 Total emissions are all PM2.5 Exhaust, Tire Ware, Break Ware, and RE-entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions accounted for to serve as an input to the HRA modeling.
5. Percent of off-site worker vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of off-site visitor vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each land use and vehicle category that would occur within the HRA modeling domain.

1. Starts per day reflect 1/2 of total trips. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.
2. VMT per day based on Alterantives Trip Generation data. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

VMT Estimates for Proposed Visitor Trips - Supplemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I.

Net Visitor VMT by Vehicle Type and Land Use[1]					
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	1120	420	480	130	**2,150**
Parcel and Last Mile Delivery	17000	16800	8160	5590	**47,550**
Wholesale and Storage	3400	1260	6800	2730	**14,190**
General Retail / Café/Quick Service Restaurants[2]	448	240	160	0	**848**
Total Visitor VMT by Vehicle Type	**21968**	**18720**	**15600**	**8450**	**64,738**

Table II.

Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1]					
Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	56	14	12	2	84
Parcel and Last Mile Delivery	850	560	204	86	1700
Wholesale and Storage	170	42	170	42	424
General Retail / Café/Quick Service Restaurants	224	8	4	0	236
Total Vehicle Trips[1]	**1300**	**624**	**390**	**130**	2444

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

Total Daily Auto/Pickup Vehicle Trips by Land Use[1]	
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	112
Parcel and Last Mile Delivery	2350
Wholesale and Storage	732
General Retail	92
Quick Service Restaurant	212
Total Vehicle Trips[1]	**3498**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV.

Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]	
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	56
Parcel and Last Mile Delivery	1,500
Wholesale and Storage	562
General Retail	16
Quick Service Restaurant	64
Total Vehicle Trips[1]	**2198**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses.

Table V.

Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]				
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	20	30	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2
Straight DOWN	123.8	3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	0	0
Curve A (m)	43.1	87.5	87.5	0
Curve B (m)	46.5	58.7	58.7	0

Level 3 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	176.4	178	170.4	171.7	178.7	170.7

*Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

Total Daily Vehicle Trips by Land Use and Vehicle Type

Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
On-site workers	2118	-	-	-	-
Visiting Workers Maker and Manufacturing	56	14	12	2	84

1. Average horsepower within each horsepower bin, per CARB 2021 TRU Emissions Inventory. https://ww3.arb.ca.gov/board/rulemaking/tru2021/apph.pdf. Hp < 25 assumed for single-unit trucks (consistent with document assumption that all "Only California-based TRUs have a group for units
under 23 horsepower because all single body trucks are assumed to be California based units, and all trailer units are over 23 horsepower."
2. Average load factor within each TRU category, per CARB 2021 TRU Emissions Inventory. https://ww3.arb.ca.gov/board/rulemaking/tru2021/apph.pdf.
3. Average Truck Travel Speeds on Select Metropolitan Area Interstates (2012-2015), selected for San Francisco, CA, per Bureau of Transportation Statistics. Table 4-1. https://www.bts.dot.gov/sites/bts.dot.gov/files/docs/FFF_2017.pdf

Average Horsepower for TRU:

CATTrailer (hp bin: 50)	33.8
CATTrailer (hp bin: 25)	24.8
CATTruck (hp bin: 23)	17.2

Total Visitor VMT by Vehicle Type	**21520**	**18480**	**15440**	**8450**	**63,890**

Notes:
1. Unless otherwise noted, VMT is based upon Table 12 of June 2021 Trip Gen Data.
2. Parcel and Last Mile Delivery VMT reflects gross trip distances of 20 miles per trip for autos, 30 miles per trip for vans, 40 miles per trip for single-unit trucks, and 65 miles per trip for tractor trailer trucks, and not taking credit for the project siting and -7.5 mile trip credit that is applicable to the traffic analysis.

*Travel Demand Memo Tractor Trailer

Truck One-Way Distance: 110

Note: One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Trip Rate Data

	Daily Vehilce Trips								
Trip Type	Maker & Man	Parcel & Las	Wholesale and Stor	Laboratory/&RD	General Retail	Quick Serv	Public feel	Private fleet/stag	Total

Non-work	84	1700	424	0	78	158	0	0	2444
Total	140	3200	986	0	94	222	0	0	4642

Paved Roadway Re-entrained Fugitive Dust Emissions

Paved Roads	100%

Paved Road Dust $EF_{DUST} = [(k(sL)^{0.91} \times (W)^{1.02}](1 - P/4N))$

Source: AP-42 Section 13.2.1 (Paved Roads) - http://www.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf

Variable	Value	Description
k (PM10)	0.0022	particle size multiplier for particle size range and units of interest (lb/VMT)
k (PM2.5)	0.00054	particle size multiplier for particle size range and units of interest (lb/VMT)
sL	0.032	road surface silt loading (g/m^2) based on EPA 2011 default for collector streets (https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf)
W	2.40	average weight (short tons) of all the vehicles traveling the road. The statewide default is 2.4 short tons (CARB 2021e); California Air Resources Board (CARB). 2021e.
P	64	number of "wet" days with at least 2.54 mm of precipitation during the averaging period
N	365	number of days in averaging period

All Vehicle Trip Types

EF (PM10)	0.101653639	g/mile
EF (PM2.5)	0.024951348	g/mile

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Region	Calendar Y	Vehicle Category	Model Yea	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Energy Consumption	NOx RUNEX	NOx IDLEX	NOx STREX	PM2.5 RUNEX	PM2.5 IDLEX	PM2.5 STREX	PM2.5 PMTW	PM2.5 PMBW	PM10 RUNEX	PM10 IDLEX	PM10 STREX	PM10 PMTW	PM10 PMBW	ROG RUNEX	ROG IDLEX	ROG STREX	ROG HOTSOAK	ROG RUNLOSS	ROG DIURN	TOG RUNEX	TOG IDLEX	TOG STREX	TOG HOTSOAK	TOG RUNLOSS	TOG DIURN	NHS RUNEX	CO RUNEX	CO IDLEX	CO STREX	SOx RUNEX	SOx IDLEX	SOx STREX

SF Gateway - Fleet Management Use Mix **Operational Emissions Summary**

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	0.00	0.00	0.000	0.000
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	6.76	58.40	30.400	8.615
TRUs	8.77	8.63	0.222	0.204
Total Proposed Daily Operational Emissions	***38.58***	***71.05***	***30.834***	***9.031***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	1.30	16.10	6.25	1.84
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**29.25**	**53.57**	**24.48**	**7.08**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**No**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$

****Note that emissions in all tables above represent total emissions for all sources on the project site.**
***** Forklifts are all electric (no diesel) and therefore are not incuded.**

Operational Days/Year	
Manufacturing & Maker Space TACs	0
Stationary Sources[1]	50
Vehicle activity	365
Operational Hrs/Day	
Manufacturing & Maker Space TACs	0
Stationary Sources	1
Vehicle activity	12
Ramp Exhaust Emissions by Floor[2]	Total 40%
Ground Level	0.12
2nd Floor	0.12
3rd Floor	0.08
4th Floor	0.05
Total Fan Exhaust Emissions by Floor[2]	Total 60%
Ground Level	0.2
2nd Floor	0.2
3rd Floor	0.2
4th Floor	0
Idling Exhaust Emissions	Total 100%
Remos	0.1
Fans	0.9

	% Vehicle Activity Per Floor		
Floor	**Single Unit Trucks**	**Tractor Trailer Trucks**	**Buses**
1st/Ground	7%	1%	66%
2nd	46%	49%	17%
3rd	46%	49%	17%
4th/Roof	0%	0%	0%
Total	100%	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps on each floor is detailed in the methodology memo page 18 of 24. No tractor trailer trucks would operate on the 4th floor; these 'ramp exhaust' emissions are redistributed evenly throughout the first three floors to account for 100 % of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Table IV. Mobile Emissions within HRA Domain

	Vehicle Emissions: Pollutant lb/day			TRU Emissions (DPM in lb/day)

Notes:
1. ROG emissions are those generated by gasoline-powered vehicles.
2. PM2.5 Exhaust emissions are those generated by diesel-powered vehicles.
3. PM2.5 Total emissions are all PM2.5 Exhaust, Tire Wore, Break Wore, and RE-entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions accounted for to serve as an input to the HRA modeling.
5. Percent of offsite worker vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of offsite visitor vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each land use and vehicle category that would occur within the HRA modeling domain.

Table III.a

% of Total One-way Trip Within HRA Modeling Domain per Vehicle Category for Visitor Trips

Land Use Type	Autos/Pickups	Vans	Single Unit Trucks	Tractor Trailer Truck	Buses
Maker and Manufacturing	3.38%	2.24%	1.68%	1.03%	3.46%
Parcel and Last Mile Delivery	8.08%	5.38%	4.03%	1.03%	8.37%
Wholesale and Storage	3.38%	2.24%	1.68%	1.03%	3.46%

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

	Emissions Factors (g/mi for RunEx, BW, TW and g/trip for StrEx)

Gatewayy Center Distribution Ramp Lenaths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both buildine A and B have identical layouts (just rotated). so the numbers below are applicable to each buildine.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.8	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.8
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

[1]Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

Step 1 - Consider Source Fact of Uses Per Floor

USE SCENARIO	L1	L2	L3	L4	Project Total
PDR Uses					
Manufacturing & Maker Space	-	-	-	-	0
Parcel Delivery /Last Mile		280,764	280,764	5,472	567200
Fleet Management	372,434	93,592	93,592	-	564600
Retail	-	-	-	-	0
Logistics Yard	43,400	72,400	73,400	-	189200
Vehicle Circulation	69,700	112,800	93,400	17,600	293500
Parking	35,900	-	-	507,600	543500
Total	521,434	561,946	543,546	530,872	2160000

assiled similar ratios of space by floor for parcel deliviry under Proposed Project to Alt 3 distribution of parcel delivery by floor
applied similar total sq ft of fleet management of L1 as was occupied by warehousing for Proposed Project, and distributed the remaining evenly to L2 and L3.

Step 2 - Estimated % Use per Floor

Sq Ft Per Use Per Floor	L1	L2	L3	L4	
PDR Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
PDR Visiting Workers					
Manufacturing & Maker Space	0.0%	0.0%	0.0%	0.0%	No Manufacturing & Maker Space for this Expanded Parcel Delivery Alternative
Parcel Delivery /Last Mile	0.0%	49.50%	49.50%	1.0%	Utilize Level 2 and 3 Logistics Yard and Parking and small area of L4 parking (assume autos/pickups and vans only)
Fleet Management	66.00%	17.00%	17.00%	0.00%	Utilize Level 1, 2, 3 Logistics Yard and Parking
Retail Onsite Workers	0.0%	0.0%	0.0%	0.0%	All on-site workers park rooftop
Retail Visitors	0.0%	0.0%	0.0%	0.0%	No Retail for this Expanded Parcel Delivery Alternative

Step 3 - Total Project Daily Traffic Per Use

Use	Auto/Pickup	Bus	Van	MT	HT	*Source: Sec 10 2021 Traffic Demand Memo - Table 11 and page A-79 for worker trip data*
PDR	3774	1040	636	252	94	5796

Idling Emission Factors

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

*Calculated

* Note, UBUS idling emissions reflect emissions factors from EMFAC for the 5mph speed bin for the UBUS vehicle category, consistent with EMFAC2021 Volume II – Handbook for Project-Level Analysis (March 2021), Note that EMFAC does not model extended idle emissions for urban buses, therefore we suggest using running emissions at the lowest speed bin – 5 mph to approximate idle emission rates.

Source: EMFAC2021 (v1.0.1) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, g/mile for RUNEX, PMBW and PMTW, mph for Speed

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Region	Calendar Y	Vehicle Category	Model Yea	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Energy Consumption	NOx RUNEX	NOx IDLEX	NOx STREX	PM2.5 RUNEX	PM2.5 IDLEX	PM2.5 STREX	PM2.5 PMTW	PM2.5 PMBW	PM10 RUNEX	PM10 IDLEX	PM10 STREX	PM10 PMTW	PM10 PMBW	ROG RUNEX	ROG IDLEX	ROG STREX	ROG HOTSOAK	ROG RUNLOSS	ROG DIURN	TOG RUNEX	TOG IDLEX	TOG STREX	TOG HOTSOAK	TOG RUNLOSS	TOG DIURN	NHS RUNEX	CO RUNEX	CO IDLEX	CO STREX	SOx RUNEX	SOx IDLEX	SOx STREX

SF Gateway - Expanded Parcel Delivery
Operational Emissions Summary

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	0.00	0.00	0.000	0.000
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	10.41	103.96	48.372	13.865
TRUs	17.32	17.04	0.436	0.401
Total Proposed Daily Operational Emissions	***50.79***	***125.01***	***49.019***	***14.479***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	1.30	16.10	6.25	1.84
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**41.46**	**107.53**	**42.67**	**12.53**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)

3rd Floor	0.08
4th Floor	0.05
Total Fan Exhaust Emissions by Floor[2]	
Ground Level	0.2
2nd Floor	0.2
3rd Floor	0.2
4th Floor	0
Idling Exhaust Emissions	
Ramps	0.1
Fans	0.9

Total 40%
Total 60%
Total 100%

% Vehicle Activity Per Floor		
Floor	Single Unit Trucks	Tractor Trailer Trucks[2]
1st/Ground	33%	33%
2nd	33%	33%
3rd	33%	33%
4th/Roof	0%	0%
Total	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps on each floor is detailed in the methodology memo page 18 of 24. No tractor trailer trucks would operate on the 4th floor; these 'ramp exhaust' emissions are redistributed evenly throughout the first three floors to account for 100 % of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Table IV. Mobile Emissions within HRA Domain

Notes:
1. ROG emissions are those generated by gasoline-powered vehicles.
2. PM2.5 Exhaust emissions are those generated by diesel-powered vehicles.
3. PM2.5 Total emissions are all PM2.5 Exhaust, Tire Wear, Break Wear, and RE-entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions accounted for to serve as an input to the HRA modeling.
5. Percent of off-site worker vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of off-site visitor vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each land use and vehicle category that would occur within the HRA modeling domain.

1. Starts per day reflect 1/2 of total trips. Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.
2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

VMT Estimates for Proposed Visitor Trips - Supplemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I.

	Net Visitor VMT by Vehicle Type and Land Use[1]				
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	0	0	0	0	-
Parcel and Last Mile Delivery	37120	36720	17760	12090	**103,690**
Wholesale and Storage	0	0	0	0	-
General Retail / Café/Quick Service Restaurants[3]	0	0	0	0	-
Total Visitor VMT by Vehicle Type	**37120**	**36720**	**17760**	**12090**	**103,690**

Table II.

	Total Daily Visitor Vehicle Trips by Land Use and Vehicle Type[1]				
Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	0	0	0	0	0
Parcel and Last Mile Delivery	1,856	1,224	444	186	3710
Wholesale and Storage	0	0	0	0	0
General Retail / Café/Quick Service Restaurants	0	0	0	0	0
Total Vehicle Trips[1]	**1856**	**1224**	**444**	**186**	3710

Source: Adavant LCW 2023, SF Gateway Trip Gen...ALT 5 v4 (March 15, 2023)

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

Total Daily Auto/Pickup Vehicle	
Vehicle Type and Land Use	Autos/ Pickups
Maker and Manufacturing	0
Parcel and Last Mile Delivery	5126
Wholesale and Storage	0
General Retail	0
Quick Service Restaurant	0
Total Vehicle Trips[1]	**5126**

Source: Adavant LCW 2023, SF Gateway Trip Gen...ALT 5 v4 (March 15, 2023)

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV.

Total Daily Work Vehicle Trips by Land	
Vehicle Type and Land Use	Autos/ Pickups
Maker and Manufacturing	0
Parcel and Last Mile Delivery	3,270
Wholesale and Storage	0
General Retail	0
Quick Service Restaurant	0
Total Vehicle Trips[1]	**3270**

Source: Adavant LCW 2023, SF Gateway Trip Gen...ALT 5 v4 (March 15, 2023)

Notes:
1. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these

Table V.

Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]				
	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	20	30	40	65

Notes:
1. Page A-93, Appendix F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.8	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	87.5	87.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	176.4	178	170.4	173.7	178.7	170.7

*Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

Step 1 - Consider Square Feet of Uses Per Floor

USE SCENARIO	L1	L2	L3	L4	Project Total	Source: July 2019 Project Description - Table 3
PDR Uses						
Manufacturing & Maker Space	-	-	-	-	0	
Parcel Delivery/Last Mile	373,494	373,494	373,494	11,318	1131800	*Split evenly among L1, L2, L3, and a small amount of space on L4
Wholesale and Storage	-	-	-	-	0	
Retail	-	-	-	-	0	
Logistics Yard	43,400	72,400	73,400	-	189200	
Vehicle Circulation	69,700	112,800	93,400	17,600	293500	
Parking	35,900	-	-	507,600	543500	
Total	522,494	558,694	542,294	536,518	2160000	

*Added Logistics Yar. Veh Circ. and Parkine to L1. the level from which M&M and Retail/QSR space was removed for this alt.

Step 2 - Estimated % Use per Floor

Sq Ft Per Use Per Floor	L1	L2	L3	L4	
PDR Onsite Workers	0.0%	0.0%	0.0%	100.0%	All on-site workers park rooftop
PDR Visiting Workers					
Manufacturing & Maker Space	0.0%	0.0%	0.0%	0.0%	No Manufacturing & Maker Space for this Expanded Parcel Delivery Alternative
Parcel Delivery/Last Mile	33.0%	33.00%	33.00%	1.0%	Utilize Level 2 and 3 Logistics Yard and Parking and small area of L4 parking (assume autos/pickups and vans only)
Wholesale and Storage	0.00%	0.00%	0.00%	0.0%	
Retail Onsite Workers	0.0%	0.0%	0.0%	0.0%	All on-site workers park rooftop
Retail Visitors	0.0%	0.0%	0.0%	0.0%	No Retail for this Expanded Parcel Delivery Alternative

Step 3 - Total Project Daily Traffic Per Use

Land Use Type	Auto/Pickup	Van	MT	HT
PDR	5126	1224	444	186
Onsite Worker	3270	0	0	0
Visiting Worker	1856	1224	444	186
Manufacturing & Maker Space	0	0	0	0
Parcel Delivery/Last Mile	1856	1224	444	186
Wholesale and Storage	0	0	0	0
Retail/QSR	0	0	0	0
Onsite Worker	0	0	0	0
Visiting Worker/Consumer	0	0	0	0

Step 4 - Using Total Traffic Per Use and Percent Use Per Floor - Calculate Vehicles Per Floor (Per Building)

Vehicle Type	L1	L2	L3	L4
PDR Auto (incl escous & vans)	308	308	308	1650
PDR Auto/Pickup	306	306	306	1644
PDR Van	202	202	202	6
PDR MT	74	74	74	0
PDR HT	31	31	31	0
Retail Auto (incl pickup & vans)	0	0	0	0
Retail Auto/Pickup	0	0	0	0
Retail Van	0	0	0	0
Retail MT	0	0	0	0
Retail HT	0	0	0	0
Total Daily Auto Per Level	308	308	308	1650
Total Daily Auto/Pickup Per Level	306	306	306	1644
Total Daily Van Per Level	202	202	202	6
Total Daily MT Per Level	74	74	74	0
Total Daily HT Per Level	31	31	31	0

SF Gateway - Expanded Wholesale Storage Use - 32/64 split
Operational Emissions Summary

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	34.78	1.812	1.087
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	8.88	115.23	40.256	11.791
TRUs	17.14	17.09	0.459	0.422
Total Proposed Daily Operational Emissions	***52.04***	***171.11***	***42.738***	***13.513***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	1.30	16.10	6.25	1.84
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**42.71**	**153.64**	**36.39**	**11.57**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_x = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.
1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$

Ground Level	0.2
2nd Floor	0.2
3rd Floor	0.2
4th Floor	0
Idling Exhaust Emissions	Total 100%
Ramps	0.1
Fans	0.9

	% Vehicle Activity Per Floor	
Floor	**Single Unit Trucks**	**Tractor Trailer Trucks[3]**
Subterranean	25%	50%
1st	25%	25%
2nd	25%	25%
3rd/Roof	25%	0%
Total	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps on each floor is detailed in the methodology memo page 18 of 26. No tractor trailer trucks would operate on the 4th floor; these "ramp exhaust" emissions are redistributed evenly throughout the first three floors to account for 100 % of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Notes:
1. ROG emissions from gasoline powered vehicles.
2. PM2.5 Exhaust emissions from diesel powered vehicles.
3. PM2.5 Total emissions and PM2.5 Exhaust, Tire Wear, Brake Wear, and RE entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions are counted for to serve as a proxy for the TAC modeling.
5. Percent of off-site worker vehicle trip mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of off-site visitor vehicle trip mobile emissions counted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each landuse and vehicle category that would occur within the HRA modeling domain.

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

	Emissions Factors (g/mi for RunEx, BW, TW and g/trip for StrEx)

VMT Estimates for Proposed Visitor Trips - Supllemental Calculations for Retail/QSR and Parcel & Last Mile Delivery Land Uses

Table I. **Net Visitor VMT by Vehicle Type and Land Use[1]**

Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	**Total Visitor VMT by Land Use**
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	11920	11820	5760	3900	**33,400**
Wholesale and Storage	9800	3720	19600	7930	**41,050**
General Retail / Café/Quick Service Restaurants[2]	756	420	240	0	**1,416**
Total Visitor VMT by Vehicle Type	**24276**	**16560**	**26480**	**11960**	**79,276**

Table II. **Total Daily Visitior Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total
Maker and Manufacturing	90	20	22	2	134
Parcel and Last Mile Delivery	596	394	144	60	1194
Wholesale and Storage	490	124	490	122	1226
General Retail / Café/Quick Service Restaurants	378	14	6	0	398
Total Vehicle Trips[1]	**1554**	**552**	**662**	**184**	2952

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10
Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use

Table III. **Total Daily Auto/Pickup Vehicle Trips by Land Use[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	1648
Wholesale and Storage	2,122
General Retail	156
Quick Service Restaurant	354
Total Vehicle Trips[1]	**4458**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates are per Travel Demand Memo Table 11 Total Daily Vehicle Trips by Vehicle Class and Land Use.

Table IV. **Total Daily Work Vehicle Trips by Land Use and Vehicle Type[1]**

Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	88
Parcel and Last Mile Delivery	1,052
Wholesale and Storage	1,632
General Retail	26
Quick Service Restaurant	106
Total Vehicle Trips[1]	**2904**

Source: Adavant LCW 2021, SF Gateway Final Travel Demand Memo - Adavant LCW 2021 12 10

Notes:
1. Trip Rates for Maker and Manufacturing, General Retail, and QSR are per Travel Demand Memo page A-79, Daily Work Vehicle Trips. Trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the Appendix F Table 4 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter)

Table V. **Gross VMT Travel Distance for Parcel and Last Mile Delivery Visitor Trips by Vehicle Type[1]**

	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks
Parcel & Last Mile Delivery Land Use	20	30	40	65

Notes:
1. Page A-93, Appendis F Table 4 of Travel Demand Memo; One-way miles for Tractor Trailer Trucks is 65 miles, per average distance to BAAQMD boundary as calculated by Urban Crossroads 2020.

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	58.7	58.7	0

Level 4 Parking aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	178.4	170.4	173.7	173.7	178.7	170.7

*Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

Step 1 - Consider Square Feet of Uses Per Floor

Square Footage (1)	L1	L2	L3	L4	Passed Total
FOR Uses					
Manufacturing	30000			-	30000
Parcel Delivery/Last Mile		194,700	194,700	9,750	379,450
W holesale and Storage	329,700	189,850	189,850	-	709400
Retail	8,400			-	8400
Vehicle Yard		91,600	91,600	-	183200
Vehicle Circulation	15,000	112,800	95,400	17,400	239600
Parking	111,800		-	487,400	599200
Total					2168200

Source: Lic 1998 Square Footage - Table 3

*Assumed similar split as 80 with most on 1 and 13 and 5% on L4

* assumed half on around floor and split the additional 50% that is new to this Alt between L2 and L3 which now has less Parcel/Last Mile

Step 2 - Estimate # Use per Floor

Est # Per Use Per Floor	L1	L2	L3	L4	
FOR On-site W orkers	0.05	0.05	0.05	100.05	All on-site workers park rooftop
FOR Visiting W orkers					
Manufacturing	100.05	0.05	0.05	0.05	Utilize Level 1 Loaistics Yard and Parkina
Parcel Delivery/Last Mile	0.05	49.30%	49.30%	1.05	Utilize Level 2 and 3 Loaistics Yard and Parkina and small area of L4 parkina (assume autos/pickups and vans only)
W holesale and Storage	50.00%	25.00%	25.00%	0.05	Utilize Level 1, 2, and 3 Loaistics Yard and Parkina
Retail					
Retail On-site W orkers	0.05	0.05	0.05	100.05	All on-site workers park rooftop
Retail Visitors	100.05	0.05	0.05	0.05	Retail Visitors (delivery and consumer) Utilitize Ground Level Loaistics and Parkina

Step 3 - Total Project Daily Traffic Per Use

Use	Auto/Pickups	Van	MT	HT	Source: Dec 16 2021 Traffic Demand Memo - Table 11 and page A-79 for worker trip data
FOR	3981	538	454	184	
On-site W orkers	3993	0	0	0	
Visiting W orkers	1176	538	454	184	
Manufacturing	96	20	22	2	
Parcel Delivery/Last Mile	490	354	164	161	
Wholesale/St	590	154	490	122	
Retail/CQSR	315	14	6	0	
On-site W orkers	193	0	0	0	
Visiting W orkers/Cons	378	14	6	0	

Step 4 - Using Total Traffic Per Use and Percent Use Per Floor - Calculate Vehicles Per Floor (Per Building)

Vehicle Type	L1	L2	L3	L4
FOR Auto (Incl eBuses & vans)	209	322	322	1391
FOR Auto/Pickups	168	209	209	1389
FOR Van	41	113	113	2
FOR MT	154	97	97	0
FOR HT	32	30	30	0
Retail (Incl eBuses & vans)	76	0	0	66
Retail Auto/Pickups	186	0	0	66
Retail Van	7	0	0	0
Retail MT	3	0	0	0
Retail HT	0	0	0	0
Total Daily Auto Per Level	405	322	322	1457
Total Daily Auto/Picku	357	209	209	1455
Total Daily Van Per Lev	48	113	113	2
Total Daily MT Per Level	137	97	97	0
Total Daily HT Per Level	32	30	30	0

1. 07Aug2019 response to 'CEQA Analysis Air Quality & Noise Information Request'

UPDATED TO REFLECT UPDATED TRAFFIC DATA IN NEW "MOBILE TRIP DATA" TAB.

Table II.

	Gross Visitor Daily VMT by Vehicle Type and Land Use[1]				
Vehicle Type and Land Use	Autos/ Pickups	Vans	Single Unit Trucks	Tractor Trailer Trucks	Total Visitor VMT by Land Use
Maker and Manufacturing	1800	600	880	130	**3,410**
Parcel and Last Mile Delivery	11920	11820	5760	3900	**33,400**
Wholesale and Storage	9800	3720	19600	7930	**41,050**
Total Visitor VMT by Vehicle Type	**23520**	**16140**	**26240**	**11960**	**77,860**

Notes:
1. Unless otherwise noted, VMT is based upon Table 12 of June 2021 Trip Gen Data.
2. Parcel and Last Mile Delivery VMT reflects gross trip distances of 20 miles per trip for autos, 30 miles per trip for vans, 40 miles per trip for single-unit trucks, and 65 miles per trip for tractor trailer trucks, and not taking credit for the project siting and -7.5 mile trip credit that is applicable to the traffic analysis.

Paved Roadway Re-entrained Fugitive Dust Emissions

Paved Roads	100%

Paved Road Dust $EF_{DUST} = [(k(sL)^{0.91} \times (W)^{1.02}](1 - P/4N))$

Source: AP-42 Section 13.2.1 (Paved Roads) - http://www.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf

Variable	Value	Description
k (PM10)	0.0022	particle size multiplier for particle size range and units of interest (lb/VMT)
k (PM2.5)	0.00054	particle size multiplier for particle size range and units of interest (lb/VMT)
sL	0.032	road surface silt loading (g/m^2) based on EPA 2011 default for collector streets (https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf)
W	2.40	average weight (short tons) of all the vehicles traveling the road. The statewide default is 2.4 short tons (CARB 2021e); California Air Resources Board (CARB). 2021e.
P	64	number of "wet" days with at least 2.54 mm of precipitation during the averaging period
N	365	number of days in averaging period

All Vehicle Trip Types

EF (PM10)	0.101653639	g/mile

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Operational Emissions Summary

Summary of Average Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Daily Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Proposed Operational Emissions[1]				
Area	21.59	0.00	0.001	0.001
Energy	0.00	0.00	0.000	0.000
Manufacturing & Maker Space Industry TACs	2.96	34.78	1.812	1.087
Stationary Sources	1.46	4.01	0.211	0.211
Mobile	9.44	112.69	42.760	12.437
TRUs	17.13	17.01	0.451	0.415
Total Proposed Daily Operational Emissions	***52.58***	***168.50***	***45.235***	***14.152***
Existing Site Operational Emissions[2]				
Area	7.88	0.00	0.00	0.00
Energy	0.15	1.38	0.10	0.10
Mobile	1.30	16.10	6.25	1.84
Total Existing Daily Operational Emissions	***9.33***	***17.48***	***6.35***	***1.95***
Net New Daily Operational Emissions	**43.25**	**151.02**	**38.88**	**12.20**
BAAQMD Thresholds of Significance	54	54	82	54
Exceeds Thresholds?	**No**	**Yes**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area and Energy Sources are modeled using CalEEMod defaults for the proposed and existing land uses. , On-site Equipment and Stationary (i.e., backup generator) emissions sources are modeled outside of CalEEMod using both CalEEMod input factors and EPA emissions factors. Manufacturing & Maker Space TACs are based upon TAC profiles from existing similar land uses and the maximum potential emissions are presented for each pollutant; Mobile emissions are modeled for on-site activity and trips to/from the site based upon the project-specific VMT analysis and EMFAC 2021 emission factors.
2. Area and Energy emissions are modeled using CalEEMod for the exisitng land use at the Project site. Mobile emissions are modeled for existing mobile trips using empirical traffic data and EMFAC 2021 emission factors. Existing operational emissions modeled based on year 2023 - the proposed year for demolition of existing uses under the proposed project.

Summary of Maximum Annual Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

Emissions Source	Annual Emissions (tpy)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$

Vehicle Activity	24
Ramp Exhaust Emission by Floor[2]	Total 40%
Ground Level	0.55
2nd Floor	0.22
3rd Floor	0.08
4th Floor	0.15
Total Fan Exhaust Emissions by Floor[3]	Total 60%
Ground Level	0.2
2nd Floor	0.2
3rd Floor	0.2
4th Floor	0.4
Idling Exhaust Emissions	Total 100%
Ramps	0.1
Fans	0.9

	% Vehicle Activity Per Floor	
Floor	**Single Unit Trucks**	**Tractor Trailer Trucks[4]**
Subbasement	10%	10%
2nd	10%	10%
3rd	32%	10%
4th/Roof	3%	3%
Total	100%	100%

Notes:
1. Backup generators assumed to operate 1 hr/wk, up to 50 hours per year.
2. Percent of emissions modeled to be released through exhaust vents vs openings along the ramps as each floor is detailed in the methodology memo page 18 of 26. No tractor trailer trucks would operate on the 4th floor; these "ramp exhaust" emissions are redistributed evenly throughout the first three floors to account for 100 % of the tractor trailer truck exhaust emissions that would release through openings along the ramps.

Mobile Emissions Breakdown

Table IV. Mobile Emissions within HRA Domain

	Vehicle Emissions: Pollutant (lb/day)			TAC Emissions (DPM in lb/day)

Notes:
1. ROG emissions are those generated by gasoline powered vehicles.
2. PM2.5 Exhaust emissions are those generated by diesel powered vehicles.
3. PM2.5 Total emissions are PM2.5 Exhaust, Tire Wear, Brake Wear, and RE-entrained dust generated by mobile activity.
4. 100% of on-site mobile source emissions are counted for its service as origin to the HRA modeling.
5. Percent of off-site worker vehicle trip-mobile emissions accounted for to serve as an input to the HRA modeling is calculated based on the percentage of the average worker trip distance that would occur within the HRA modeling domain.
6. Percent of off-site visitor vehicle trip-mobile emissions counted for to serve as an input to the HRA modeling is calculated based on the percentage of the average trip distance for each land use and vehicle category that would occur within the HRA modeling domain.

Table III-a

% of Total One-way Trip Within HRA Modeling Domain per Vehicle Category for Visitor Trips

Land Use Type	Autos/Pickups[1]	Vans	Single Unit Trucks	Tractor Trailer Trucks
Maker and Manufacturing	3.34%	3.21%	1.49%	1.49%

1. Starts per day reflect 1/2 of total trips based upon trip Rates for Maker and Manufacturing, General Retail, and QSR from Sep 2020 Travel Demand Memo page A-79, Daily Work Vehicle Trips and trip rates for Parcel & Last Mile Delivery and Wholesale & Storage are calculated based upon the June 2021 Trip Gen Memo Table 12 Daily VMT for PDR Use, dividing total Non-Commuter VMT for Automobile vehicle category by the miles per trip to estimate total non-commuter trips and subtracting this from the Total Automobile trips for these land uses to estimate the remaining worker (commuter) trips for these land uses. One-half of the total trip starts would occur within the facility and are accounted for within the "On-Site Mobile" emissions estimates.

*Note that starts / day for worker mobile trips + starts / day for visitor mobile trips is equal to the total auto/pickup on-site starts.

2. VMT per day based on Table 12 of June 2021 Trip Gen Memo for PDR use VMT. Retail worker VMT added to this total based on weighted average trip distance from Table 3.2 and worker trip rate from Table 6, as calculated in Table III below.

Notes:
1. Trip Rates for all vehicle categories except for Autos/Pickus are per Table 11 of Travel Demand Memo. Table 11 data for autos/pickups includes worker and visitor trips; data above for autos/pickups reflects the total visitor VMT for autos/trucks divided by the trip distance for autos / trucks.
2. Trip rate for Visitor Trips of Auto/Pickups is based upon Table 11 of Travel Demand Memo, subtracting "Work" vehicle trips for each land use type from the total Automobile Vehicle Trips by Type for each Land Use.

Table III.

	Total Daily Auto/Pickup Vehicle Trips by Land Use[1]
Vehicle Type and Land Use	Autos/ Pickups[2]
Maker and Manufacturing	178
Parcel and Last Mile Delivery	2546

Gateway Center Distribution Ramp Lengths

Vehicles within distribution center will travel along straight or curved ramp segments. These can be flat or inclinded.
Both building A and B have identical layouts (just rotated), so the numbers below are applicable to each building.
Ramp includes and Straights assumed to be travelled at 10mph, as well as Level 4 Parking Aisles.
Ramp curves assumed to be travelled at 5mph.

Ramp Inclines	Length (m)	Levels
Straight UP	127.5	1, 2, 3
Straight DOWN	123.6	4, 3, 2

Ramp Levels	L1	L2	L3	L4
Straight (m)	0	127.5	127.5	0
Curve A (m)	43.1	67.5	67.5	25.6
Curve B (m)	46.5	0	58.7	0

Level 4 Parkine aisles	Row 1	Row 2	Row 3	Row 4	Row 5	Row 6
Straight (m)	174.4	178	170.4	171.7	178.7	170.7

*Assumed that each vehicle that is active on Level 4 would traverse one aisle start to end and then return; used maximum row distance to conservatively estimate distance per trip.

UPDATED TRIP RATES IN THIS TABLE - SEE NOTES 1 AND 2 BELOW TABLE

Idling Emission Factors

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: Sub-Area
Region: San Francisco (SF)
Calendar Year: 2025
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Alternatives Health Risk Assessment and $PM_{2.5}$ Modeling Inputs

Alternative Emission Percent Changes from Proposed Project and Estimated Health Risks for Alternatives C and D

Percent Change from Project

Pollutant by Alternative	Emission Source Group				
	Onsite (Mobile)	Onsite (Generators)	Onsite (Makerspace)	Offsite (Last Mile)	Offsite (Deliveries/Workers)
Alternative B - Code Compliant					
ROG	-31%	0%	-31%	-30%	-31%
PM2.5 Exhaust	-30%	0%	-31%	-30%	-30%
PM2.5 Total	-24%	0%	0%	-30%	-31%
Alternative C - Fleet Management					
ROG	-27%	0%	-100%	-24%	-13%
PM2.5 Exhaust	-47%	0%	-100%	-23%	-2%
PM2.5 Total	-18%	0%	-100%	-23%	+20%
Alternative D - Expanded Parcel Delivery					
ROG	+4%	0%	-100%	+53%	-16%
PM2.5 Exhaust	-8%	0%	-100%	+52%	-8%
PM2.5 Total	-1%	0%	-100%	+53%	-18%

Project

Cancer Risk - Resident

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Scenario 1					
Risk (in-a-mil)	1.48	1.69	0.49	0.39	4.05
% Culp	37%	42%	12%	10%	100%
Scenario 2					
Risk (in-a-mil)	N/A	3.07	0.89	0.72	4.68
% Culp	N/A	66%	19%	15%	100%

Cancer Risk - Worker

Parameter		Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Scenario 1					
Risk (in-a-mil)	0.66	3.48	0.8	0.15	5.09
% Culp	13%	68%	16%	3%	100%
Scenario 2					
Risk (in-a-mil)	N/A	3.79	0.87	0.16	4.82
% Culp	N/A	79%	18%	3%	100%

Annual PM2.5 - Resident (553000, 4177060)

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.028	0.039	0.013	0.080
% Culp	N/A	35%	48%	16%	100%

Annual PM2.5 - Worker (552920, 4177300)

Parameter		Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.111	0.019	0.044	0.174
% Culp	N/A	64%	11%	25%	100%

Cancer Risk for Alternative C - Fleet Management

Cancer Risk - Resident

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
		Scenario 1			
Risk (in-a-mil)	1.48	0.90	0.38	0.38	3.14
% Culp	47%	29%	12%	12%	100%
		Scenario 2			
Risk (in-a-mil)	N/A	1.63	0.69	0.71	3.02
% Culp	N/A	54%	23%	23%	100%

Cancer Risk - Worker

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
		Scenario 1			
Risk (in-a-mil)	0.66	1.84	0.62	0.15	3.27
% Culp	20%	56%	19%	4%	100%
		Scenario 2			
Risk (in-a-mil)	N/A	2.01	0.67	0.16	2.84
% Culp	N/A	71%	24%	6%	100%

Annual PM2.5 - Resident (553000, 4177060)

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.023	0.030	0.016	0.068
% Culp	N/A	34%	44%	23%	100%

Annual PM2.5 - Worker (552920, 4177300)

Parameter		Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.091	0.015	0.053	0.159
% Culp	N/A	57%	9%	33%	100%

Cancer Risk for Alternative D - Expanded Parcel Delivery

Cancer Risk - Resident

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
		Scenario 1			
Risk (in-a-mil)	1.48	1.55	0.74	0.36	4.14
% Culp	36%	38%	18%	9%	100%
		Scenario 2			
Risk (in-a-mil)	N/A	2.82	1.35	0.66	4.84
% Culp	N/A	58%	28%	14%	100%

Cancer Risk - Worker

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
		Scenario 1			
Risk (in-a-mil)	0.66	3.20	1.22	0.14	5.22
% Culp	13%	61%	23%	3%	100%
		Scenario 2			
Risk (in-a-mil)	N/A	3.49	1.32	0.15	4.96
% Culp	N/A	70%	27%	3%	100%

Annual PM2.5 - Resident (553000, 4177060)

Parameter	Construction	Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.028	0.059	0.011	0.098
% Culp	N/A	29%	61%	11%	100%

Annual PM2.5 - Worker (552920, 4177300)

Parameter		Onsite (Mobile + Stationary)	Offsite (Last Mile)	Offsite (Deliveries/Workers)	Total
Risk (in-a-mil)	N/A	0.110	0.030	0.036	0.176
% Culp	N/A	63%	17%	21%	100%
