Subject: Asbestos, Lead-Based Paint, and Lead in Drinking Water Sampling
Downey Industrial Center
9300, 9350, 9400, and 9402 Hall Road, and
9301, 9333/9363, and 9399 Stewart & Gray Road
Downey, California 90241 (the "Property")

Dear Ms. Frentzel:

In response to your request, SCS Engineers (SCS) performed asbestos, lead-based paint, and lead in drinking water sampling at the above-referenced Property. The field work was conducted on January 10 and 11, 2017. The object of this investigation was to determine the presence, location, and quantity of asbestos, lead-based paint, and lead in drinking water for the above referenced Property prior to planned demolition activities.

The Property, Downey Industrial Center, is located between Hall Road to the north, Woodruff Avenue to the east, Stewart and Gray Road to the south, and Coldbrook Avenue to the west. The Downey Industrial Center consists of 29.16 acres of land and is currently occupied by four, one-story industrial office/warehouse buildings with mezzanine levels that contain a total of approximately 433,143 ft² and were originally constructed from 1951 to 1967. The buildings were observed to be in generally good condition and were occupied by various industrial tenants at the time of the inspection.

A walk-through of the structures was conducted on January 10 and 11, 2017 by Mr. Bob Pilzer of SCS, a State of California (CA) Division of Occupational Safety and Health (DOSH) Certified Asbestos Consultant (CAC) and a CA Department of Public Health (DPH) Lead-Related Construction Inspector/Assessor (LRC-IA), and Mr. Christopher Romanowski of SCS, a CA DOSH Certified Site Surveillance Technician (CSST) and a CA DPH Lead-Related Construction Sampling Technician (LRC-ST). Access to the structures was provided by Ms. Janet Frentzel from Prologis, Inc. Photocopies of SCS's asbestos and lead licenses are located in Attachment 2.

ASBESTOS SAMPLING

A total of three-hundred and forty-two (342) bulk samples consisting of a total of five-hundred and fifty-seven (557) layers were collected from the structures for laboratory asbestos analysis. The following suspect building materials were sampled:

9300 Hall Road (Building 1A)

- White/beige 2'x4' drop ceiling tile (with fissures)
- White/beige 2'x4' drop ceiling tile (with pinholes)
- White/brown drywall and white joint compound
- Black 4" cove base and beige mastic
- Gray 4" cove base and beige mastic
- Black 6" cove base and beige mastic
- White ceramic wall tile grout
- Gray ceramic floor tile grout
- Yellow carpet mastic
- Brown/gray 12"x12" floor tile and clear mastic
- Gray 12"x12" floor tile and beige mastic
- White 12"x12" floor tile and yellow mastic
- Blue 12"x12" floor tile and yellow mastic
- Pink 12"x12" floor tile and yellow mastic
- Tan 12"x12" floor tile and yellow mastic

9301 Stewart & Gray Road (Building 1B)

- White textured ceiling plaster
- White/gray 1'x1' ceiling tile (with small pinholes)
- White/brown 1'x1' ceiling tiles (with large pinholes)
- White/brown 1'x1' ceiling tiles (with textured finish)
- White/brown drywall and white joint compound
- Gray window putty
- Black 4" cove base and beige mastic
- Tan 9"x9" floor tile and black mastic
- Tan 12"x12" floor tile and black mastic
- Gray 12"x12" floor tile and clear mastic
- Tan/gray 12"x12" floor tile and yellow mastic
- Tan vinyl flooring and gray 12"x12" floor tile
- Gray vinyl flooring and yellow mastic
- Yellow carpet mastic
- Gray Transite pipe (observed, but not sampled)

9333/9363 Stewart & Gray Road (Building 3)

- Gray/black roofing cap-sheet
- Gray/black roof penetration mastic
- White/brown drywall and white joint compound
- White/gray exterior stucco
- White/brown drywall and white joint compound
- Gray/beige wall plaster and button board
- Black tar paper
- Gray 4" cove base and beige mastic
- White 4" cove base and beige mastic

- Black 4” cove base and beige mastic
- Gray ceramic wall tile grout
- Gray ceramic floor tile grout
- Yellow carpet mastic
- Gray 12”x12” floor tile and yellow mastic
- Brown vinyl flooring and clear mastic

9350 Hall Road (Storage Building)

- White/beige 1’x1’ ceiling tile
- White/beige 2’x4’ drop ceiling tile
- White/brown drywall and white joint compound
- Black 4” cove base and beige mastic
- Gray 12”x12” floor tile and yellow mastic
- Gray vinyl flooring and yellow mastic
- Yellow carpet mastic

9399 Stewart & Gray Road (Building 2B)

- White/brown 1’x1’ ceiling tile
- Brown ceiling tile mastic
- White/brown 2’x4’ drop ceiling tile
- White/brown drywall and white joint compound
- Gray 4” cove base and beige mastic
- Black 4” cove base and brown mastic
- Black 6” cove base and brown mastic
- Brown 4” cove base and beige mastic
- White/yellow ceramic wall tile grout
- Gray ceramic floor tile grout
- Yellow carpet mastic
- Green 9”x9” floor tile and black mastic
- Tan 9”x9” floor tile and black mastic
- Gray 9”x9” floor tile and black mastic
- White vinyl flooring and yellow mastic
- Dark gray 12”x12” floor tile and yellow mastic
- Light gray 12”x12” floor tile and yellow mastic
- Brown 12”x12” floor tile and black mastic
- Tan 12”x12” floor tile and black mastic
- Beige 12”x12” floor tile and yellow mastic
- Gray 12”x12” floor tile and yellow mastic

9400 Hall Road (Building 2A)

- White/brown 1’x1’ ceiling tile and brown mastic
- White/brown drywall and white joint compound
- Brown 4” cove base and beige mastic
- Black 4” cove base and beige mastic

- Brown 4” cove base and yellow mastic
- White 4” cove base and brown mastic
- Gray 6” cove base and beige mastic
- Tan 6” cove base and beige mastic
- Gray ceramic wall tile grout
- Gray ceramic floor tile grout
- Yellow carpet mastic
- Green 9”x9” floor tile and black mastic
- Beige 12”x12” floor tile and brown mastic
- White/tan vinyl flooring and gray mastic
- Gray vinyl flooring and beige mastic
- Tan vinyl flooring and beige mastic
- Black tar paper
- Red exterior stucco

9402 Hall Road (Offices)

- White/brown 1’x1’ ceiling tile
- White/beige 2’x4’ drop ceiling tile
- White/brown drywall and white joint compound
- Black 4” cove base and white mastic
- Black 6” cove base and beige mastic
- Black 12”x12” floor tile and yellow mastic
- Gray 12”x12” floor tile and yellow mastic
- Red 12”x12” floor tile and yellow mastic
- Brown 12”x12” floor tile and yellow mastic
- Yellow carpet mastic

The Chain of Custody form and PLM Bulk Sample Summary Logs located in Attachment 1 of this report provide sample descriptions and identifies the locations of all samples collected from the structure.

Bulk samples of exterior and interior building materials collected from the structure were placed in Whirl-Pak bags, labeled, and transported under chain-of-custody to LA Testing, an American Industrial Hygiene Association (AIHA) and National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory for analysis of asbestos content. Bulk samples were analyzed using Polarized Light Microscopy (PLM) and Dispersion Staining in accordance with the Environmental Protection Agency (EPA) Interim Method for the Determination of Asbestos in Bulk Samples (40 CFR 763, Subpart F, Appendix A).

As defined the EPA, any substance that contains more than one percent asbestos (1%) is classified as an Asbestos-Containing Material (ACM). Within the State of California, the Division of Occupational Safety and Health (DOSH) also defines an Asbestos-Containing Construction Material (ACCM) as any manufactured material which contains greater than 1/10 of one percent (0.1%) asbestos by weight. The laboratory’s Limit of Quantification (LOQ) for PLM analysis is 1% asbestos and greater. The designation of “trace” indicates the presence of asbestos below the PLM LOQ.

The LA Testing laboratory report is located in **Attachment 1**. Out of the five-hundred and fifty-seven (557) sample layers collected and analyzed, a total of thirteen (13) samples (gray window putty, tan vinyl flooring, gray 12"x12" floor tile and associated black mastic, white joint compound, yellow carpet mastic, gray 9"x9" floor tile and associated black mastic, black mastic associated with brown 12"x12" floor tile, black mastic associated with tan 12"x12 floor tile, yellow carpet mastic, black mastic associated with green 9"x9" floor tile, and white/tan/gray vinyl flooring) contained asbestos at concentrations over 1.0 percent, and two (2) samples (yellow mastic associated with tan/gray 12"x12" floor tile) contained "trace" concentrations of asbestos less than 1%. A total of seventeen (17) samples were not analyzed due to "positive stops" (previously analyzed homogeneous materials found to be positive or asbestos-containing). The remaining five-hundred and twenty-five (525) samples did **not** contain asbestos above the PLM LOQ. As stated above, the following materials tested positive for asbestos:

9300 Hall Road (Building 1A)

- None of the sampled suspect materials in Building 1A were found to contain asbestos.

9301 Stewart & Gray Road (Building 1B)

- The gray window putty was found to contain 4% chrysotile. A total of approximately 220 linear feet of gray window putty was observed throughout the exterior walls of Building 1B.

- The yellow mastic associated with the tan/gray 12"x12" floor tile was found to contain <1% chrysotile. A total of approximately 200 square feet of yellow mastic with associated tan/gray 12"x12" floor tile was observed in the office area of Building 1B.

- The tan vinyl flooring (top layer) was found to contain 15% chrysotile, the gray 12"x12" floor tile (bottom layer) was found to contain 15% chrysotile, and the associated mastic was found to contain 5% chrysotile. A total of approximately 400 square feet of tan vinyl flooring, gray 12"x12" floor tile, and associated mastic was observed in the office area on the 2nd floor of Building 1B.

- A gray Transite pipe was also observed during the inspection. The Transite pipe was not sampled but is presumed to contain asbestos. Approximately 30 linear feet of 8" outside diameter pipe was observed in the warehouse area of Building 1B.

9400 Hall Road (Building 2A)

- The yellow carpet mastic was found to contain 3% chrysotile. A total of approximately 800 square feet of yellow carpet mastic was observed throughout the office area of Building 2A.

- The black mastic associated with the green 9"x9" floor tile was found to contain 3% chrysotile. A total of approximately 400 square feet of black mastic with associated green 9"x9" floor tile was observed in the warehouse office in Building 2A.

- The white/tan/gray vinyl flooring was found to contain 25% chrysotile. A total of approximately 400 square feet of white/tan/gray vinyl flooring was observed on the 2nd floor in the warehouse office in Building 2A.

9399 Stewart & Gray Road (Building 2B)

- The gray 9"x9" floor tile was found to contain 5% chrysotile, and the associated black mastic was found to contain 2% chrysotile. A total of approximately 200 square feet of gray 9"x9" floor tile and associated black mastic was observed in the office area of Building 2B.

- The black mastic associated with the brown 12"x12" floor tile was found to contain 3% chrysotile. A total of approximately 100 square feet of black mastic with associated brown 12"x12" floor tile was observed in the office area of Building 2B.

- The black mastic associated with the tan 12"x12" floor tile was found to contain 2% chrysotile. A total of approximately 200 square feet of black mastic with associated tan 12"x12" floor tile was observed in the office area of Building 2B.

9333/9363 Stewart & Gray Road (Building 3)

- The white joint compound associated with the white/brown drywall was found to contain 2% chrysotile. A total of approximately 9,000 square feet of white joint compound and associated white/brown drywall was observed throughout the ceilings and walls of Suite #101 in Building 3.

- The yellow carpet mastic was found to contain 2% chrysotile. A total of approximately 2,400 square feet of yellow carpet mastic was observed throughout Suite #101 in Building 3.

9350 Hall Road (Storage Building)

- None of the sampled suspect materials in the Storage Building were found to contain asbestos.

9402 Hall Road (Offices)

- None of the sampled suspect materials in the Offices were found to contain asbestos.

The confirmed ACMs found were observed to be in good condition at the time of the inspection.

LEAD-BASED PAINT SAMPLING

SCS conducted a lead surface coating inspection on January 10 and 11, 2017. Note that only major paint systems and/or those paint systems that were observed to be in poor condition (i.e., loose and flaky) at the time of the inspection were targeted for sampling. All of the painted

surfaces were observed to be in generally good condition at the time of the survey.

SCS tested readily accessible painted surfaces of the structures for lead in general accordance with HUD Title 10, 40 CFR Part 745 and Title 24 Part 35 by collecting paint chip and bulk samples.

A total of eighteen (18) composite bulk samples of paint chips were collected for analysis by use of hand tools. A **Bulk Sample Summary Log** (enclosed) provides a description and identifies locations of the paint chip samples collected from the structures. The following painted surfaces were sampled:

9300 Hall Road (Building 1A)

- White paint on interior wall in office area
- Dark pink paint on interior wall in warehouse breakroom
- Light pink paint on interior wall in warehouse bathroom

9301 Stewart & Gray Road (Building 1B)

- White paint on interior wall in office area
- Gray paint on interior wall in office area – 2nd floor
- Yellow paint on interior wall in warehouse/office area
- Brown paint on interior wall in office area

9400 Hall Road (Building 2A)

- White paint on interior wall in office area – 1st floor
- Green paint on interior wall in office area – 2nd floor

9399 Stewart & Gray Road (Building 2B)

- Green paint on interior wall in office area
- White paint on interior wall in office area

9333/9363 Stewart & Gray Road (Building 3)

- Green paint on interior wall in office area (#101)
- White paint on interior wall in office area (#108)

9350 Hall Road (Storage Building)

- Green paint on interior wall in office area
- White paint on interior wall in restroom

9402 Hall Road (Offices)

- White paint on interior wall in office area
- Green paint on interior wall in office area
- Tan paint on interior wall in office area

Paint samples collected during the inspection were placed in plastic Ziplock bags, labeled, and transported under Chain-of-Custody to LA Testing. All paint samples were analyzed using EPA Method 7000 with EPA Method 3050 used for sample digestion.

Under various guidelines, LBP is typically defined as paint containing lead at concentrations equal to or exceeding 0.06% lead by weight or 600 mg/kg (milligrams per kilogram, equivalent to parts per million [ppm]).

The LA Testing laboratory report for suspect LBP is enclosed. Out of the eighteen (18) paint samples collected, a total of two (2) paint samples were found to contain concentrations of lead greater than 0.06% lead by weight. One (1) paint sample was found to contain a concentration of lead greater than the LOQ (0.01%) but less than 0.06% lead by weight. The remaining fifteen (15) paint samples did **not** contain concentrations of lead greater than the LOQ (<0.01%). A summary of the LBP findings, by building, is presented below:

9300 Hall Road (Building 1A)

- None of the sampled suspect paint in Building 1A was found to contain concentrations of lead greater than the LOQ

9301 Stewart & Gray Road (Building 1B)

- Gray paint on the interior walls of the office area on the 2nd floor of Building 1B (0.015%) – above the LOQ but less than the 0.06% guideline
- None of the remaining sampled suspect paint in Building 1B was found to contain concentrations of lead greater than the LOQ

9400 Hall Road (Building 2A)

- White paint on the interior walls of the office area on the 1st floor of Building 2A (0.11% lead by weight) – approximately 1,200 ft.²
- Green paint on the interior walls of the office area on the 2nd floor of Building 2A (0.24% lead by weight) – approximately 1,200 ft.²

9399 Stewart & Gray Road (Building 2B)

- None of the sampled suspect paint in Building2B was found to contain concentrations of lead greater than the LOQ

9333/9363 Stewart & Gray Road (Building 3)

- None of the sampled suspect paint in Building 3 was found to contain concentrations of lead greater than the LOQ

9350 Hall Road (Storage Building)

- None of the sampled suspect paint in the Storage Building was found to contain concentrations of lead greater than the LOQ

9402 Hall Road (Offices)

- None of the sampled suspect paint in the Offices was found to contain concentrations of lead greater than the LOQ

Based on these results, other similar paint systems to those identified above should also be considered to be lead-containing.

DOSH guidelines (Title 8, California Code of Regulations, Section 1532.1) are applicable to occupational exposures to potential lead-containing materials during renovation or demolition activities. DOSH guidelines indicate that coatings or materials containing lead may constitute a health hazard to employees engaged in lead-related construction work. Poisonings may occur if workers or visitors ingest or inhale lead-containing materials or paint.

As described above, this survey identified painted systems as containing lead at levels that may constitute a health hazard to workers. Procedures should be established whereby all personnel and contractors who may be conducting demolition on the structures are informed, prior to initiating work, as to the presence of lead and any other lead-containing materials, their location and condition.

LEAD IN DRINKING WATER SAMPLING

SCS conducted lead in drinking water sampling on January 10 and 11, 2017. SCS collected a total of four (4) "first draw" drinking water samples from the following locations:

- 9399/9363 Stewart and Gray Road (Building 3): The breakroom sink in Suite #101 of Building 3.
- 9399 Stewart and Gray Road (Building 2B): The breakroom sink in the 2nd floor office area of Building 2B.
- 9300 Hall Road (Building 1A): The breakroom sink in the 2nd floor office area of Building 1A.
- 9350 Hall Road (Storage Building): The breakroom sink on the 1st floor of the Storage Building.

Samples were collected from each of the four (4) major buildings to obtain representative coverage of the Property. All four (4) areas that the drinking water samples were collected from were occupied, and the samples were collected from the most probable drinking water sources in the buildings (i.e. breakroom sinks). The samples were collected into 250-milliliter plastic bottles preserved with nitric acid, labeled, and placed in a chilled cooler for transport to American Environmental Testing Laboratory Inc. (AETL) of Burbank, California.

AETL analyzed the drinking water samples using EPA Method 200.8. AETL is certified by the California Department of Health Services to conduct the specified analysis. The AETL laboratory report, chain-of-custody documentation, and quality assurance/quality control (QA/QC) data are attached to this report. Analytical results are summarized below:

- 9399/9363 Stewart and Gray Road (Building 3): The breakroom sink in Suite #101 of Building 3 – 2.09 micrograms per liter (µg/L).
- 9399 Stewart and Gray Road (Building 2B): The breakroom sink in the 2nd floor office area of Building 2B – Not Detected (ND).
- 9300 Hall Road (Building 1A): The breakroom sink in the 2nd floor office area of Building 1A – 1.09 µg/L.
- 9350 Hall Road (Storage Building): The breakroom sink on the 1st floor of the Storage Building – 0.946 µg/L.

All four (4) drinking water samples were found to contain concentrations of lead that were below the EPA action level for drinking water of 15 µg/L.

CONCLUSIONS AND RECOMMENDATIONS

Asbestos Sampling

The following materials tested positive for asbestos:

9301 Stewart & Gray Road (Building 1B)

- The gray window putty was found to contain 4% chrysotile. A total of approximately 220 linear feet of gray window putty was observed throughout the exterior walls of Building 1B.

- The yellow mastic associated with the tan/gray 12”x12” floor tile was found to contain <1% chrysotile. A total of approximately 200 square feet of yellow mastic with associated tan/gray 12”x12” floor tile was observed in the office area of Building 1B.

- The tan vinyl flooring (top layer) was found to contain 15% chrysotile, the gray 12”x12” floor tile (bottom layer) was found to contain 15% chrysotile, and the associated mastic was found to contain 5% chrysotile. A total of approximately 400 square feet of tan vinyl flooring, gray 12”x12” floor tile, and associated mastic was observed in the office area on the 2nd floor of Building 1B.

- A gray Transite pipe was also observed during the inspection. The Transite pipe was not sampled but is presumed to contain asbestos. Approximately 30 linear feet of 8" outside diameter pipe was observed in the warehouse area of Building 1B.

9333/9363 Stewart & Gray Road (Building 3)

- The white joint compound associated with the white/brown drywall was found to contain 2% chrysotile. A total of approximately 9,000 square feet of white joint compound and associated white/brown drywall was observed throughout the ceilings and walls of Suite #101 in Building 3.

- The yellow carpet mastic was found to contain 2% chrysotile. A total of approximately 2,400 square feet of yellow carpet mastic was observed throughout Suite #101 in Building 3.

9399 Stewart & Gray Road (Building 2B)

- The gray 9"x9" floor tile was found to contain 5% chrysotile, and the associated black mastic was found to contain 2% chrysotile. A total of approximately 200 square feet of gray 9"x9" floor tile and associated black mastic was observed in the office area of Building 2B.

- The black mastic associated with the brown 12"x12" floor tile was found to contain 3% chrysotile. A total of approximately 100 square feet of black mastic with associated brown 12"x12" floor tile was observed in the office area of Building 2B.

- The black mastic associated with the tan 12"x12" floor tile was found to contain 2% chrysotile. A total of approximately 200 square feet of black mastic with associated tan 12"x12" floor tile was observed in the office area of Building 2B.

9400 Hall Road (Building 2A)

- The yellow carpet mastic was found to contain 3% chrysotile. A total of approximately 800 square feet of yellow carpet mastic was observed throughout the office area of Building 2A.

- The black mastic associated with the green 9"x9" floor tile was found to contain 3% chrysotile. A total of approximately 400 square feet of black mastic with associated green 9"x9" floor tile was observed in the warehouse office in Building 2A.

- The white/tan/gray vinyl flooring was found to contain 25% chrysotile. A total of approximately 400 square feet of white/tan/gray vinyl flooring was observed on the 2nd floor in the warehouse office in Building 2A.

Window putty, vinyl flooring, 9”x9” floor tile, 12”x12” floor tile, floor tile mastic, carpet mastic, joint compound, and Transite pipe are non-friable ACMs (a friable ACM is defined as a material that can be crumbled, pulverized, or reduced to a powder by hand pressure, potentially releasing airborne asbestos fibers) and is not anticipated to release asbestos fibers until abated.

Prior to demolition, a Licensed State of California abatement contractor must remove all known ACM consistent with applicable DOSH (Title 8. Industrial Relations, Division 1. Department of Industrial Relations, Chapter 4. Division of Industrial Safety, Subchapter 4. Construction Safety Orders, Article 4. Dusts, Fumes, Mists, Vapors, and Gases, Section 1529. Asbestos) and South Coast Air Quality Management District (SCAQMD, Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities) guidelines. It is also recommended that the abatement contractor demonstrate adequate qualifications and provide sufficient insurance coverage to perform the asbestos removal project. **The estimated cost for asbestos abatement is $35,000.**

SCS recommends that when ACM abatement is performed that it be overseen by an independent third-party consultant who is qualified to provide these services (i.e. a CAC or a Certified Site Surveillance Technician [CSST]).

Lead-Based Paint Sampling

The following materials tested positive for lead greater than the 0.06% guideline:

9400 Hall Road (Building 2A)

- White paint on the interior walls of the office area on the 1st floor of Building 2A (0.11% lead by weight) – approximately 1,200 ft.²
- Green paint on the interior walls of the office area on the 2nd floor of Building 2A (0.24% lead by weight) – approximately 1,200 ft.²

DOSH guidelines (Title 8, California Code of Regulations, Section 1532.1) are applicable to occupational exposures to potential LBP or lead-containing materials during renovation or demolition activities. Coatings or materials containing lead may constitute a health hazard to employees engaged in lead-related construction work as lead dust becomes airborne during construction activities. Poisonings may occur if workers or visitors ingest lead and/or inhale lead dust.

Based on analytical results, lead at concentrations that exceed 0.06% lead by weight or 600 mg/kg are present in painted systems as identified above. Contractors involved in renovation or demolition activities should be informed of the presence of and potential health hazards associated with lead. Care should be taken to protect workers (i.e., respiratory protection) when disturbing lead-containing materials during renovation or demolition activities. **The estimated cost for lead-based paint abatement is $3,000.**

Lead in Drinking Water Sampling

- All four (4) drinking water samples were found to contain concentrations of lead that were below the EPA action level of 15 µg/L. No further action is recommended at this time.

LIMITATIONS/DISCLAIMER

This report has been specifically prepared for use and reliance by Prologis, Inc. with application to a survey for ACMs, LBP, and lead in drinking water within the structures located at **Downey Industrial Center**. This report has been prepared in accordance with the care and skill generally exercised by reputable professionals, under similar circumstances, in this or similar localities. No other warranty, either express or implied, is made as to the opinions presented herein. No other party, known or unknown to SCS, is intended as a beneficiary of this work product, its content, or information embedded therein. Third parties use this report at their own risk. SCS assumes no responsibilities for the accuracy of information obtained, compiled, or provided by others.

This report and analysis represent a limited characterization of materials within the subject structures. Not all of the suspect materials were sampled within each room or common area. Only a representative number of samples were collected from suspect materials within each homogeneous area regardless of the number of areas it was observed in. In addition, no attempt was made to provide a valid statistical approach to completely characterize all of the asbestos within the structures. Note that additional ACMs or LBP may be present within wall or attic spaces, plenums, mechanical systems, etc. that were not accessible during this inspection. Prior to being disturbed during renovation and/or demolition activities, any suspect building material not characterized during this inspection should be appropriately characterized.

CLOSURE

Thank you for the opportunity to work with you on this project. Please call if you have any questions regarding this assessment.

Respectfully submitted,

Bob Pilzer, CAC, LRC-IA, REPA

102-Mastic *511700150-0102A*	Gray/yellow vinyl flooring, Warehouse restroom	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
103-Vinyl Sheet Flooring *511700150-0103*	Gray/yellow vinyl flooring, Warehouse restroom	Gray Non-Fibrous Homogeneous	20% Cellulose	80% Non-fibrous (Other)	None Detected
103-Mastic *511700150-0103A*	Gray/yellow vinyl flooring, Warehouse restroom	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
104-Vinyl Sheet Flooring *511700150-0104*	Gray/yellow vinyl flooring, Warehouse restroom	Gray Fibrous Heterogeneous	20% Cellulose	80% Non-fibrous (Other)	None Detected
104-Mastic *511700150-0104A*	Gray/yellow vinyl flooring, Warehouse restroom	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
105 *511700150-0105*	Yellow carpet mastic, Office - 2nd floor	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
106 *511700150-0106*	Yellow carpet mastic, Office - 2nd floor	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
107 *511700150-0107*	Yellow carpet mastic, Office - 2nd floor	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
108 *511700150-0108*	Gray/black cap sheet, Roof - northside	Black Fibrous Homogeneous	15% Glass	5% Quartz 80% Non-fibrous (Other)	None Detected
109 *511700150-0109*	Black/gray cap sheet, Roof - center	Black Fibrous Homogeneous	15% Glass	5% Quartz 80% Non-fibrous (Other)	None Detected
110 *511700150-0110*	Black/gray cap sheet, Roof - southside	Black Fibrous Homogeneous	15% Glass	5% Quartz 80% Non-fibrous (Other)	None Detected
111 *511700150-0111*	Gray/black penetration mastic, Roof - northside	Black Non-Fibrous Homogeneous	8% Cellulose	92% Non-fibrous (Other)	None Detected
112 *511700150-0112*	Gray/black penetration mastic, Roof - center	Black Non-Fibrous Homogeneous	8% Cellulose	92% Non-fibrous (Other)	None Detected
113 *511700150-0113*	Gray/black penetration mastic, Roof - southside	Black Fibrous Homogeneous	8% Cellulose	92% Non-fibrous (Other)	None Detected
114 *511700150-0114*	White/gray stucco, Westside - exterior	White Non-Fibrous Homogeneous		5% Quartz 95% Non-fibrous (Other)	None Detected
115 *511700150-0115*	White/gray stucco, Northside - exterior	White Non-Fibrous Homogeneous		5% Quartz 95% Non-fibrous (Other)	None Detected
116 *511700150-0116*	White/gray stucco, Eastside - exterior	White Non-Fibrous Homogeneous		5% Quartz 95% Non-fibrous (Other)	None Detected
117-Joint Compound *511700150-0117*	White/brown drywall/joint compound, #101 - Office	Tan Non-Fibrous Homogeneous		98% Non-fibrous (Other)	2% Chrysotile

Test Report: Asbestos Analysis of Bulk Materials via EPA 600/R-93/116 Method using Polarized Light Microscopy

			Non-Asbestos		Asbestos
Sample	**Description**	**Appearance**	**% Fibrous**	**% Non-Fibrous**	**% Type**
329-Floor Tile *511700150-0329*	Gray/yellow 12"x12" floor tile/mastic, Lobby	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
329-Mastic *511700150-0329A*	Gray/yellow 12"x12" floor tile/mastic, Lobby	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
330-Floor Tile *511700150-0330*	Gray/yellow 12"x12" floor tile/mastic, Lobby	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
330-Mastic *511700150-0330A*	Gray/yellow 12"x12" floor tile/mastic, Lobby	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
331 *511700150-0331*	Red/yellow 12"x12" floor tile/mastic, Lobby	Red Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
332-Floor Tile *511700150-0332*	Red/yellow 12"x12" floor tile/mastic, Lobby	Red Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
332-Mastic *511700150-0332A*	Red/yellow 12"x12" floor tile/mastic, Lobby	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
333 *511700150-0333*	Red/yellow 12"x12" floor tile/mastic, Lobby	Red Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
334-Floor Tile *511700150-0334*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
334-Mastic *511700150-0334A*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
335-Floor Tile *511700150-0335*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
335-Mastic *511700150-0335A*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
336-Floor Tile *511700150-0336*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Brown Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
336-Mastic *511700150-0336A*	Brown/yellow 12"x12" floor tile/mastic, Hallway	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
337-Floor Tile *511700150-0337*	Black/yellow 12"x12" floor tile/mastic, Restroom	Black Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
337-Mastic *511700150-0337A* *Result includes a small amount of inseparable attached material*	Black/yellow 12"x12" floor tile/mastic, Restroom	White/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
338-Floor Tile *511700150-0338*	Black/yellow 12"x12" floor tile/mastic, Restroom	Black Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
338-Mastic *511700150-0338A*	Black/yellow 12"x12" floor tile/mastic, Restroom	White/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected

Sample	**Description**	**Appearance**	**% Fibrous**	**% Non-Fibrous**	**% Type**
216 *511700150-0216*	Gray ceramic floor tile grout, Restroom	Gray/White Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
217 *511700150-0217*	Gray ceramic floor tile grout, Restroom	Gray/White Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
218 *511700150-0218*	Gray ceramic floor tile grout, Restroom	Gray/White Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
219 *511700150-0219*	Yellow carpet mastic, Office area	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
220 *511700150-0220*	Yellow carpet mastic, Office area	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
221 *511700150-0221*	Yellow carpet mastic, Office area	Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
222-Floor Tile *511700150-0222*	Green/black 9"x9" floor tile/mastic, Office area	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
222-Mastic *511700150-0222A*	Green/black 9"x9" floor tile/mastic, Office area	Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
223-Floor Tile *511700150-0223*	Green/black 9"x9" floor tile/mastic, Office area	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
223-Mastic *511700150-0223A*	Green/black 9"x9" floor tile/mastic, Office area	Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
224-Floor Tile *511700150-0224*	Green/black 9"x9" floor tile/mastic, Office area	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
224-Mastic *511700150-0224A*	Green/black 9"x9" floor tile/mastic, Office area	Brown Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
225-Floor Tile *511700150-0225*	Tan/black 9"x9" floor tile/mastic, Office area	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
225-Mastic *511700150-0225A*	Tan/black 9"x9" floor tile/mastic, Office area	Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
226-Floor Tile *511700150-0226*	Tan/black 9"x9" floor tile/mastic, Office area	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
226-Mastic *511700150-0226A*	Tan/black 9"x9" floor tile/mastic, Office area	Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
227-Floor Tile *511700150-0227*	Tan/black 9"x9" floor tile/mastic, Office area	Tan/Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
227-Mastic *511700150-0227A*	Tan/black 9"x9" floor tile/mastic, Office area	Black/Yellow Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
228-Floor Tile *511700150-0228*	Gray/black 9"x9" floor tile/mastic, Office area	Gray Non-Fibrous Homogeneous		95% Non-fibrous (Other)	5% Chrysotile

Test Report: Asbestos Analysis of Bulk Materials via EPA 600/R-93/116 Method using Polarized Light Microscopy

			Non-Asbestos		Asbestos
Sample	**Description**	**Appearance**	**% Fibrous**	**% Non-Fibrous**	**% Type**
271-Mastic *511700150-0271A*	White/brown 4" cove base/mastic, Wharehouse office	Clear Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
272-Cove Base *511700150-0272*	Gray/beige 6" cove base/mastic, Restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
272-Mastic *511700150-0272A*	Gray/beige 6" cove base/mastic, Restroom	Beige Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
273-Cove Base *511700150-0273*	Gray/beige 6" cove base/mastic, Restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
273-Mastic *511700150-0273A*	Gray/beige 6" cove base/mastic, Restroom	Beige Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
274-Cove Base *511700150-0274*	Gray/beige 6" cove base/mastic, Restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
274-Mastic *511700150-0274A*	Gray/beige 6" cove base/mastic, Restroom	Beige Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
275-Cove Base *511700150-0275*	Tan/beige 6" cove base/mastic, Restroom	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
275-Mastic *511700150-0275A*	Tan/beige 6" cove base/mastic, Restroom	Beige Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
276-Cove Base *511700150-0276*	Tan/beige 6" cove base/mastic, Restroom	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
276-Mastic *511700150-0276A*	Tan/beige 6" cove base/mastic, Restroom	Beige Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
277-Cove Base *511700150-0277*	Tan/beige 6" cove base/mastic, Restroom	Tan Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
277-Mastic *511700150-0277A*	Tan/beige 6" cove base/mastic, Restroom	White Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
278 *511700150-0278*	Gray ceramic wall tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
279 *511700150-0279*	Gray ceramic wall tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
280 *511700150-0280*	Gray ceramic wall tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
281 *511700150-0281*	Gray ceramic floor tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
282 *511700150-0282*	Gray ceramic floor tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected
283 *511700150-0283*	Gray ceramic floor tile grout, Men's restroom	Gray Non-Fibrous Homogeneous		100% Non-fibrous (Other)	None Detected

EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Samples received in good condition unless otherwise noted. Estimated accuracy, precision and uncertainty data available upon request. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Reporting limit is 1%

Samples analyzed by EMSL Analytical, Inc. Seattle, WA NVLAP Lab Code 200613

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.
2834 & 2908 North Naomi Street, Burbank, CA 91504 • DOHS NO: 1541, LACSD NO: 10181
Tel: (888) 288-AETL • (818) 845-8200 • Fax: (818) 845-8840 • www.aetlab.com

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

1. PROJECT DESCRIPTION

1.1. PROJECT CATEGORY

Category	YES	NO
1. Development [a] of a new project equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet of impervious area [b]	☐	☒
2. Development [a] of a new industrial park with 10,000 square feet or more of surface area [c]	☐	☒
3. Development [a] of a new commercial mall with 10,000 square feet or more surface area [c]	☐	☒
4. Development [a] of a new retail gasoline outlet with 5,000 square feet or more of surface area [c]	☐	☒
5. Development [a] of a new restaurant (SIC 5812) with 5,000 square feet or more of surface area [c]	☐	☒
6. Development [a] of a new parking lot with either 5,000 ft^2 or more of impervious area [b] or with 25 or more parking spaces	☐	☒
7. Development [a] of a new automotive service facility (SIC 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) with 5,000 square feet or more of surface area [c]	☐	☒
8. Projects located in or directly adjacent to, or discharging directly to a Significant Ecological Area (SEA),[d] where the development will: a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and b. Create 2,500 square feet or more of impervious area [b]	☐	☒
9. Redevelopment [e] of 5,000 square feet or more in one of the categories listed above **If yes, list redevelopment category here:** Office building	☒	☐
10. Redevelopment [e] of 10,000 square feet or more to a Single Family Home, without a change in landuse.	☐	☒

a Development includes any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that results in land disturbance.

b Surfaces that do not allow stormwater runoff to percolate into the ground. Typical impervious surfaces include: concrete, asphalt, roofing materials, etc.

c The surface area is the total footprint of an area. Not to include the cumulative area above or below the ground surface.

d An area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and would be disturbed or degraded by human activities and developments. Also, an area designated by the City as approved by the Regional Water Quality Control Board.

e Land-disturbing activities that result in the creation, addition, or replacement of a certain amount of impervious surface area on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain the original line and grade, hydraulic capacity, or original purpose of facility, nor does it include modifications to existing single family structures, or emergency construction activities required to immediately protect public health and safety.

1.2. PROJECT DESCRIPTION

Project Address: 9301 Stewart and Gray Road, Downey, CA 90241

Total Project Area (ft^2): 1,270,434

Total Project Area (Ac): 29.2

Percentage of disturbed area of the total area: 100%

EXISTING CONDITIONS

Condition	Area (Ac)	Percentage (%)
Pervious Area:	0.47	1.6
Impervious Area:	28.73	98.4

PROPOSED CONDITIONS

Condition	Area (Ac)	Percentage (%)
Pervious Area:	1.60	5.5
Impervious Area:	27.6	94.5

SITE CHARACTERISTICS

DRAINAGE PATTERNS/CONNECTIONS	Existing: In the existing condition, runoff flows away from the existing buildings and sheet flows from north to south.
	Proposed: In the proposed condition, improvements include construction of new industrial buildings, parking lots and landscape islands. There will be two on-site drainage management area (DMA) graded for the site. Infiltration has been determined to be infeasible for this project due to contaminated soils on-site. The runoff from the DMAs will be collected via surface runoff into a series of drop inlets that will route to an underground detention vault for stage and a proposed WetlandMOD system unit for treatment. The treated flow will be pumped off-site to spill to grade at the driveway and mimic the drainage pattern in existing conditions. DMA 1 is roughly half of the western portion of the site. Storm water runoff will sheet flow into one of the drop inlets on site. The inlet and storm drain system will transport the storm water southerly into a detention chamber and the proposed WetlandMOD system unit located

	in the southwest corner of the parking lot and the southwest landscaping island. DMA 2 is roughly half of the eastern portion of the site. Storm water runoff will sheet flow into one of the drop inlets in the DMA. The inlet and storm drain system will transport the storm water southerly into a detention chamber and the proposed WetlandMOD system unit located in the southwest corner of the parking lot in a landscaping island in the southeast corner. DMA 1 – 14.50 Ac DMA 2 – 14.66 Ac
NARRATIVE PROJECT DESCRIPTION:	The project involves the resurfacing of a parking lot and the construction of a new office building and parking lot. All existing site paving will be demolished and reconstructed per the geotechnical recommendations.

OFFSITE RUNON	No offsite runon
UTILITY AND INFRASTRUCTURE INFORMATION	Stormwater quality control measures are not anticipated to conflict with proposed and/or existing utilities.
SIGNIFICANT ECOLOGICAL AREAS (SEAS)	N/A

1.3. HYDROMODIFICATION ANALYSIS

DOES THE PROPOSED PROJECT FALL INTO ONE OF THE FOLLOWING CATEGORIES? CHECK YES/NO.	YES	NO
1. *Project is a redevelopment that decreases the effective impervious area compared to the pre-project conditions.*	☒	☐
Describe: Pervious area will increase in the proposed conditions.		
2. *Project is a redevelopment that increases the infiltration capacity of pervious areas compared to the pre-project conditions.*	☐	☒
Describe: Infiltration is infeasible due to the contaminated soils on site.		
3. *Project discharges directly or via a storm drain to a sump, lake, area under tidal influence, into a waterway that has a 100-year peak flow (Q_{100}) of 25,000 cfs or more.*	☐	☒
Describe: The DMA discharges into a municipal storm drain system in the public street.		
4. *Project discharges directly or via a storm drain into concrete or otherwise engineered (not natural) channels (e.g., channelized or armored with rip rap, shotcrete, etc.), which, in turn, discharge into receiving water that is not susceptible to hydromodification impacts.*	☒	☐
Describe: The project discharges into the San Gabriel River.		

HYDROMODIFICATION ANALYSIS

Pervious area is increasing, exempt from hydromodication requirements.

1.4. PROPERTY OWNERSHIP/MANAGEMENT

OWNER INFORMATION	No infrastructure is required to be transferred to public agencies currently. There are currently no street, road, or highway projects that are planned and constructed as a part of this WQMP. **Property Owner Information** Name: Company: Prologis, Inc. Email:

2. BEST MANAGEMENT PRACTICES (BMPS)

2.1. SITE DESIGN

85TH PERCENTILE, 24-HOUR STORM DEPTH	1.00 inch
SITE DESIGN	Infiltration has been determined to be infeasible for this project due to contaminated soils.

BMP LIST

DMA DESIGNATION	ACREAGE (AC)	STORM WATER QUALITY DESIGN VOLUME (SWQVD, CF)	BMP TYPE	MINIMUM BMP VOLUME	BMP VOLUME PROVIDED
1	14.50	44,893	Bioclean Wetland MOD-22-29-V	44,893 CF *1.5 = 67,340 CF	67,340 CF
2	14.66	45,388	Bioclean Wetland MOD-22-29-V	45,388 CF *1.5 = 68,082 CF	68,082 CF
Total	= 29.16 Ac				

2.2. BMP SELECTION

Underground detention	☐
Other:	☐
Other:	☐
Other:	☐

DESCRIPTION	Rainwater and Harvest Use BMPs are infeasible at this site. On-site landscaping is limited and
CALCULATIONS	N/A

2.2.3. ALTERNATIVE COMPLIANCE BMPS

BIORETENTION BMPS

(If Infiltration BMPs and Rainwater Harvest and Use BMPs are Infeasible)

NAME	INCLUDED
Bioretention with underdrains (i.e. planter box, rain garden, etc.)	☒
Constructed Wetland	☒
Vegetated Swale	☐
Vegetated Filter Strip	☐
Tree-Well Filter	☐
Other:	☐
Other:	☐

DESCRIPTION	The stormwater collection and treatment system consists of a detention vault, a Bioclean Wetland MOD-22-27-V for DMA 1 and a Bioclean Wetland MOD-22-28-V for DMA 2, and a Wetland MOD Discharge Pump Station. This setup is the same for DMA 1 and DMA 2, other than the differing Wetland MODs. Water enters the detention chamber through the on-site inlets, is routed to the storage vault and then enters the WetlandMOD for treatment and is pumped to spill to grade at driveway. The WetlandMOD consists of a manufactured planter box with engineering soil, media, planting, and an underdrain. The engineered soil is per the LA County Manual Attachment H specified media. The system has been sized for a 96-hour drawdown time. Since the inlet orifice has been sized to threat the 85th percentile storm, in the event of a large storm event storm water will not be allowed to enter the system and will sheetflow off-site.
CALCULATIONS	Calculations were done through Hydrocalc 1.0.3. The calculations were done by using the 85th percentile and results can be found in Attachment A: Calculations.

OFFSITE BMPS

(If Infiltration BMPs, Rainwater Harvest and Use BMPs, and Bioretention BMPs are Infeasible)

NAME	INCLUDED

INSTALLATION NOTES

1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURER'S SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURER'S CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE FOR VERIFYING PROJECT ENGINEER'S RECOMMENDED BASE SPECIFICATIONS.
3. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL GAPS AROUND PIPES SHALL BE SEALED WATER TIGHT WITH A NON-SHRINK GROUT PER MANUFACTURER'S STANDARD CONNECTION DETAIL AND SHALL MEET OR EXCEED REGIONAL PIPE CONNECTION STANDARDS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. DRIP OR SPRAY IRRIGATION REQUIRED ON ALL UNITS WITH VEGETATION.

GENERAL NOTES

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT MANUFACTURER.

Operations and Maintenance Plan

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Non-Structural Source Control BMPs			
Yes	**Education for Property Owners, Tenants and Occupants** Educational material shall be provided to all employees and tenants.	Within 30 days of tenant occupancy and annually thereafter.	Owner
Yes	**Activity Restriction** The owner shall develop activity restrictions to minimize the threat of hazardous waste or contamination into the storm drainage system. Car washing is not allowed on-site at any time.	Ongoing; Yearly for all employees and within 30 days of hire date for new employees.	Owner
Yes	**Common Area Landscape Management** Training on landscape management consistent with County Water Conservation Resolution or City equivalent, plus Management Guidelines for Fertilizers (DAMP Section 5.5) shall be conducted for all new field landscape maintenance personnel.	Twice Monthly or according to an established maintenance schedule.	Owner
Yes	**BMP Maintenance** Maintenance of BMPs implemented at the project site shall be performed at the frequency prescribed in this WQMP.	Twice Monthly or according to an established maintenance schedule	Owner
No	**Title 22 CCR Compliance** N/A	N/A	N/A
No	**Spill Contingency Plan** N/A	N/A	N/A
No	**Underground Storage Tank Compliance** N/A	N/A	N/A
No	**Hazardous Materials Disclosure Compliance** N/A	N/A	N/A
No	**Uniform Fire Code Implementation** N/A	N/A	N/A

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	**Common Area Litter Control** Litter patrol, violations investigation, reporting and other litter control activities shall be performed in conjunction with maintenance activities.	Weekly	Owner
Yes	**Employee Training** Education programs shall be implemented as they apply to future employees and training of current employees.	Ongoing; Yearly for all employees and within 30 days of hire date for new employees.	Owner
No	**Housekeeping of Loading Docks** N/A	N/A	N/A
Yes	**Common Area Catch Basin Inspection** Litter and debris removal, illicit discharge violations investigation and reporting shall be performed in conjunction with maintenance activities.	Twice a month to remove debris and after every major storm event	Owner
Yes	**Street Sweeping Private Streets and Parking Lots** Private streets and parking area within the project shall be swept at a minimum frequency of once a month.	Monthly	Owner
No	**Retail Gasoline Outlets** N/A	N/A	N/A
Structural Source Control BMPs			
Yes	**Provide Storm Drain System Stenciling and Signage** All proposed inlets shall be marked with the appropriate "No Dumping. Drains to Ocean." Stencil. The stencils must be repainted when they become illegible, but at a minimum once every five years. Inspect stenciling for legibility no later than the beginning of the rainy season on October 1st each year. Stenciling must be re-stenciled to maintain legibility as necessary and when deemed necessary by the local inspecting agency	Yearly	Owner

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	**Design and Construct Outdoor Material Storage Areas to Reduce Pollutant Introduction** Proper design of outdoor storage areas for materials reduces opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the stormwater conveyance system. Materials may be in the form of raw products, by-products, finished products, and waste products. The type of pollutants associated with the materials will vary depending on the type of commercial or industrial activity.	Initial Design	Owner
Yes	**Design and Construct Trash and Waste Storage Areas to Reduce Pollutant Introduction** The trash and waste storage areas will be inspected in conjunction with Litter Control on a weekly basis. The area will be inspected for loose debris and dumpster capacity. If dumpsters are overflowing more frequent pick-ups shall be arranged.	Initial Design, Weekly Inspections	Owner
Yes	**Use Efficient Irrigation Systems & Landscape Design** Verify that landscape design continues to function properly by correctly adjusting to eliminate overspray to hardscape areas, and to verify that irrigation timing and cycle lengths are adjusted in accordance with water demands, given time of year, and day or night time temperatures.	Twice Monthly or according to an established maintenance schedule.	Owner
No	**Protect Slopes and Channels and Provide Energy Dissipation** N/A	N/A	N/A
No	**Loading Docks** N/A	N/A	N/A
No	**Maintenance Bays** N/A	N/A	N/A
No	**Vehicle Wash Areas** N/A	N/A	N/A

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance, and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
No	**Outdoor Processing Areas** N/A	N/A	N/A
No	**Equipment Wash Areas** N/A	N/A	N/A
No	**Fueling Areas** N/A	N/A	N/A
No	**Hillside Landscaping** N/A	N/A	N/A
No	**Wash Water Controls for Food Preparation Areas** N/A	N/A	N/A
No	**Community Car Wash Racks** N/A	N/A	N/A
Treatment Control BMPs			
Yes	**WetlandMOD** The WetlandMOD pre-filter, separation chamber, and Biofiltration media are all designed to allow for the use of vacuum removal of captured pollutants and spent filter media by centrifugal compressor vacuum units without causing damage to the filter, or during normal cleaning and maintenance. Filters and chambers can be cleaned from the finished surface through a standard manhole, hatch, or grate access. Refer to the following BioClean WetlandMOD O&M plan.	Twice Monthly or according to an established maintenance schedule	Owner
Yes	**Bioclean Detention Vault** The underground detention, retention, or infiltration system can be inspected through visual observation without entry into the system. All necessary pre-inspection steps must be carried out before inspection occurs, especially traffic control and other safety measures to protect the inspector and nearby pedestrians from any dangers associated with an open access hatch or manhole. Refer to the following BioClean Detention Vault O&M plan.	Twice Monthly or according to an established maintenance schedule	Owner

Required Permits

This section must list any permits required for the implementation, operation, and maintenance of the BMPs. Possible examples are:

- Permits for connection to sanitary sewer
- Permits from California Department of Fish and Game
- Encroachment permits

If no permits are required, a statement to that effect should be made.

Forms to Record BMP Implementation, Maintenance, and Inspection

The form that will be used to record implementation, maintenance, and inspection of BMPs is attached.

RECORD OF BMP IMPLEMENTATION, MAINTENANCE, AND INSPECTION

Today's Date: _____

Name of Person Performing Activity (Printed): _____

Signature: _____

BMP Name (As Shown in O&M Plan)	Brief Description of Implementation, Maintenance, and Inspection Activity Performed

Bio Clean
A Forterra Company

Maintenance Overview –

A. Every installed WetlandMOD unit is to be maintained by the Supplier, or a Supplier approved contractor. The cost of this service varies among providers.

B. The WetlandMOD is a multi-stage self-contained treatment train for stormwater treatment. Each stage protects subsequent stages from clogging. Stages include: screening, separation, and Biofiltration. The biofiltration stage contains various types of vegetation which will require annual evaluation and trimming.

1. Clean Bio Clean® Pre-Filter Screen – Screening is provided by well proven continuous modular screen filter. The filter removes gross solids, including litter, and sediments greater than 5 mm. This procedure is easily done by hand or with a small industrial vacuum device.

2. Clean Separation (sediment) Chamber – separation occurs in the pre-treatment chamber. This chamber targets TSS, and particulate metals and nutrients. This procedure can be performed with a standard vacuum truck. This chamber is located directly under the manhole, hatch, or grate access cover.

3. Trim Vegetation – The system utilizes multiple plants in the biofiltration chamber to provide enhanced treatment. The vegetation will need to be maintained (trimmed) as needed. This can be done as part of the project normal landscape maintenance. NO FERTILIZER SHALL BE USED IN THIS CHAMBER.

4. Evaluate Biofiltration Media Flow Hydraulic Conductivity – The system's flow can be assessed from the discharge. This should be done during a rain event. By viewing into the discharge pipe, the flow out of the system can be observed. If little to no flow is observed, this is a sign of potential Biofiltration media maintenance needs.

5. Biofiltration Media Replacement –This filter contains a mix that supports abundant plant life. Replacement of the media is simple. Removal of spent media can be done with a shovel and a vacuum truck.

C. The WetlandMOD pre-filter, separation chamber, and Biofiltration media are all designed to allow for the use of vacuum removal of captured pollutants and spent filter media by centrifugal compressor vacuum units without causing damage to the filter, or during normal cleaning and maintenance. Filters and chambers can be cleaned from the finished surface through a standard manhole, hatch, or grate access.

Maintenance Procedures –

1. Clean Bio Clean® Pre-Filter – Bio Clean recommends the **pre-filter** be inspected and cleaned a minimum of once every six months. The procedure is easily done with the use of any standard vacuum truck. *This procedure takes approximately 15 minutes.*

1. Remove grate, manhole, or hatch to gain access to the pre-filter insert. Where possible, the maintenance should be performed from the ground surface. Note: entry into an underground stormwater vault such as an inlet vault may require certification in confined space training.
2. Remove all trash, debris, organics, and sediments collected by the pre-filter. Removal of the trash and debris can be done manually or with the use of a vacuum truck. The hose of the vacuum truck will not damage the screen of the pre-filter.
3. Transport all debris, trash, organics and sediments to an approved facility for disposal in accordance with local and state requirements. Hazardous material can only be handled by a certified hazardous waste trained person (minimum of OSHA 24-hour hazardous waste worker (hazwoper) training).

2. Clean Separation (sediment) Chamber – Bio Clean recommends the **separation chamber** be inspected and cleaned a minimum of once a year. The procedure is easily done with the use of any standard vacuum truck. *This procedure takes approximately 30 minutes.*

1. Remove grate, manhole, or hatch to gain access to the separation chamber.
2. Where possible, the maintenance should be performed from the ground surface. Note: entry into an underground stormwater vault such as an inlet vault may require certification in confined space training.
3. With a pressure washer, spray down pollutants accumulated on walls and pre-filters.
4. Vacuum out separation chamber and remove all accumulated debris and sediments.
5. Replace grate, manhole, or hatch cover.
6. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.

3. Trim Vegetation – Bio Clean recommends the plants/vegetation be inspected and maintained a minimum of once a year. It is also recommended that the plants receive the same care as other landscaped areas. Note: No fertilizer is to be used on this area. *Trimming of vegetation takes approximately 15 minutes.*

4. Evaluate Biofiltration Media Flow Hydraulic Conductivity – Bio Clean recommends system flow be inspected and observed a minimum of once a year. This needs to be done during a rain event. *Inspection and Observation takes approximately 5 minutes.*

1. Observe discharge out of system.
2. Observe the level of flow from the bottom of the pipe.
3. If flow is steady and high, the system is operating normally.
4. If little or no flow is observed exiting the discharge pipe, possible maintenance to the Biofiltration media may be needed. Contact Bio Clean for further assistance.

5. Biofiltration Media Replacement – Bio Clean recommends the Biofiltration media be replaced a minimum of once every 20 years. *Inspection takes approximately 15 minutes. Replacement of rock media takes approximately 6 hours and requires a vacuum truck.*

1. Remove plants from the Biofiltration chamber.
2. Use a vacuum truck or shovel to remove all wetland media.
3. Spray down the walls and floor of the chamber and vacuum out any accumulated pollutants.
4. Spray down perforated piping and netting of flow matrix and the inflow and outflow end to remove any accumulated pollutants.
5. Vacuum out any standing water from the media removal and ensure the chamber is clean.
6. Use a small backhoe to fill chamber with new media. Call Bio Clean for media delivery information.
7. Plant new vegetation in the same configuration and quantity as old vegetation.
8. Spray down the plants and media with water to saturate.
9. Continue supplemental irrigation (spray or drip) for at least 90 days.

6. Other Maintenance Notes –

1. Following maintenance and/or inspection, the maintenance operator shall prepare a maintenance/inspection record. The record shall include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanism.
2. The owner shall retain the maintenance/inspection record for a minimum of five years from the date of maintenance. These records shall be made available to the governing municipality for inspection upon request at any time.
3. Any person performing maintenance activities must have completed a minimum of OSHA 24-hour hazardous waste worker (hazwoper) training.
4. Remove access manhole lid or grate to gain access to filter screens and sediment chambers. Where possible, the maintenance should be performed

from the ground surface. Note: entry into an underground stormwater vault such as an inlet vault requires certification in confined space training.

5. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.
6. The hydrocarbon boom is classified as hazardous material and will have to be picked up and disposed of as hazardous waste. Hazardous material can only be handled by a certified hazardous waste trained person (minimum 24-hour hazwoper).

Weather Condition _____ Additional Notes _____

Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**
Sediment / Silt / Clay		
Trash / Bags / Bottles		
Green Waste / Leaves / Foliage

A Citizen's Guide to Understanding Stormwater

After the Storm

For more information contact:

or visit
www.epa.gov/npdes/stormwater
www.epa.gov/nps

What is stormwater runoff?

Stormwater runoff occurs when precipitation from rain or snowmelt flows over the ground. Impervious surfaces like driveways, sidewalks, and streets prevent stormwater from naturally soaking into the ground.

Why is stormwater runoff a problem?

Stormwater can pick up debris, chemicals, dirt, and other pollutants and flow into a storm sewer system or directly to a lake, stream, river, wetland, or coastal water. Anything that enters a storm sewer system is discharged untreated into the waterbodies we use for swimming, fishing, and providing drinking water.

The effects of pollution

Polluted stormwater runoff can have many adverse effects on plants, fish, animals, and people.

- Sediment can cloud the water and make it difficult or impossible for aquatic plants to grow. Sediment also can destroy aquatic habitats.
- Excess nutrients can cause algae blooms. When algae die, they sink to the bottom and decompose in a process that removes oxygen from the water. Fish and other aquatic organisms can't exist in water with low dissolved oxygen levels.

- Bacteria and other pathogens can wash into swimming areas and create health hazards, often making beach closures necessary.
- Debris—plastic bags, six-pack rings, bottles, and cigarette butts—washed into waterbodies can choke, suffocate, or disable aquatic life like ducks, fish, turtles, and birds.
- Household hazardous wastes like insecticides, pesticides, paint, solvents, used motor oil, and other auto fluids can poison aquatic life. Land animals and people can become sick or die from eating diseased fish and shellfish or ingesting polluted water.
- Polluted stormwater often affects drinking water sources. This, in turn, can affect human health and increase drinking water treatment costs.

Stormwater Pollution Solutions

Education is essential to changing people's behavior. Signs and markers near storm drains warn residents that pollutants entering the drains will be carried untreated into a local waterbody.

Residential

Recycle or properly dispose of household products that contain chemicals, such as insecticides, pesticides, paint, solvents, and used motor oil and other auto fluids. Don't pour them onto the ground or into storm drains.

Lawn care

Excess fertilizers and pesticides applied to lawns and gardens wash off and pollute streams. In addition, yard clippings and leaves can wash into storm drains and contribute nutrients and organic matter to streams.

- Don't overwater your lawn. Consider using a soaker hose instead of a sprinkler.
- Use pesticides and fertilizers sparingly. When use is necessary, use these chemicals in the recommended amounts. Use organic mulch or safer pest control methods whenever possible.
- Compost or mulch yard waste. Don't leave it in the street or sweep it into storm drains or streams.
- Cover piles of dirt or mulch being used in landscaping projects.

Auto care

Washing your car and degreasing auto parts at home can send detergents and other contaminants through the storm sewer system. Dumping automotive fluids into storm drains has the same result as dumping the materials directly into a waterbody.

- Use a commercial car wash that treats or recycles its wastewater, or wash your car on your yard so the water infiltrates into the ground.
- Repair leaks and dispose of used auto fluids and batteries at designated drop-off or recycling locations.

Septic systems

Leaking and poorly maintained septic systems release nutrients and pathogens (bacteria and viruses) that can be picked up by stormwater and discharged into nearby waterbodies. Pathogens can cause public health problems and environmental concerns.

- Inspect your system every 3 years and pump your tank as necessary (every 3 to 5 years).
- Don't dispose of household hazardous waste in sinks or toilets.

Pet waste

Pet waste can be a major source of bacteria and excess nutrients in local waters.

- When walking your pet, remember to pick up the waste and dispose of it properly. Flushing pet waste is the best disposal method. Leaving pet waste on the ground increases public health risks by allowing harmful bacteria and nutrients to wash into the storm drain and eventually into local waterbodies.

Residential landscaping

Permeable Pavement—Traditional concrete and asphalt don't allow water to soak into the ground. Instead these surfaces rely on storm drains to divert unwanted water. Permeable pavement systems allow rain and snowmelt to soak through, decreasing stormwater runoff.

Rain Barrels—You can collect rainwater from rooftops in mosquito-proof containers. The water can be used later on lawn or garden areas.

Rain Gardens and Grassy Swales—Specially designed areas planted with native plants can provide natural places for rainwater to collect and soak into the ground. Rain from rooftop areas or paved areas can be diverted into these areas rather than into storm drains.

Vegetated Filter Strips—Filter strips are areas of native grass or plants created along roadways or streams. They trap the pollutants stormwater picks up as it flows across driveways and streets.

Commercial

Dirt, oil, and debris that collect in parking lots and paved areas can be washed into the storm sewer system and eventually enter local waterbodies.

- Sweep up litter and debris from sidewalks, driveways and parking lots, especially around storm drains.
- Cover grease storage and dumpsters and keep them clean to avoid leaks.
- Report any chemical spill to the local hazardous waste cleanup team. They'll know the best way to keep spills from harming the environment.

Construction

Erosion controls that aren't maintained can cause excessive amounts of sediment and debris to be carried into the stormwater system. Construction vehicles can leak fuel, oil, and other harmful fluids that can be picked up by stormwater and deposited into local waterbodies.

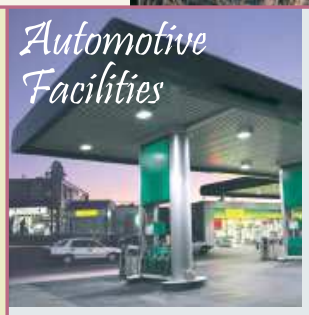
- Divert stormwater away from disturbed or exposed areas of the construction site.
- Install silt fences, vehicle mud removal areas, vegetative cover, and other sediment and erosion controls and properly maintain them, especially after rainstorms.
- Prevent soil erosion by minimizing disturbed areas during construction projects, and seed and mulch bare areas as soon as possible.

Agriculture

Lack of vegetation on streambanks can lead to erosion. Overgrazed pastures can also contribute excessive amounts of sediment to local waterbodies. Excess fertilizers and pesticides can poison aquatic animals and lead to destructive algae blooms. Livestock in streams can contaminate waterways with bacteria, making them unsafe for human contact.

- Keep livestock away from streambanks and provide them a water source away from waterbodies.
- Store and apply manure away from waterbodies and in accordance with a nutrient management plan.
- Vegetate riparian areas along waterways.
- Rotate animal grazing to prevent soil erosion in fields.
- Apply fertilizers and pesticides according to label instructions to save money and minimize pollution.

Automotive Facilities



Uncovered fueling stations allow spills to be washed into storm drains. Cars waiting to be repaired can leak fuel, oil, and other harmful fluids that can be picked up by stormwater.

- Clean up spills immediately and properly dispose of cleanup materials.
- Provide cover over fueling stations and design or retrofit facilities for spill containment.
- Properly maintain fleet vehicles to prevent oil, gas, and other discharges from being washed into local waterbodies.
- Install and maintain oil/water separators.

Forestry

Improperly managed logging operations can result in erosion and sedimentation.

- Conduct preharvest planning to prevent erosion and lower costs.
- Use logging methods and equipment that minimize soil disturbance.
- Plan and design skid trails, yard areas, and truck access roads to minimize stream crossings and avoid disturbing the forest floor.
- Construct stream crossings so that they minimize erosion and physical changes to streams.
- Expedite revegetation of cleared areas.

YOU can prevent Stormwater Pollution following these practices...

Industrial and Commercial Facilities

The Riverside County Stormwater Program has identified a number of Best Management Practices (BMPs) for Industrial and Commercial Facilities. These BMPs control and reduce stormwater pollutants from reaching our storm drain system and ultimately our local water bodies. City and County ordinances require businesses to use these BMPs to protect our water quality. Local cities and the County are required to verify implementation of these BMPs by performing regular facility inspections.

Prohibited Discharges

Discontinue all non-stormwater discharges to the storm drain system. It is *prohibited* to discharge any chemicals, paints, debris, wastes or wastewater into the gutter, street or storm drain.

Outdoor Storage BMPs

- Install covers and secondary containment areas for all hazardous materials and wastes stored outdoors in accordance with County and/or City standards.
- Keep all temporary waste containers covered, at all times when not in use.
- Sweep outdoor areas instead of using a hose or pressure washer.
- Move all process operations including vehicle/equipment maintenance inside of the building or under a covered and contained area.
- Wash equipment and vehicles in a contained and covered wash bay which is closed-loop or connected to a clarifier sized to local standards and discharged to a sanitary sewer or take them to a commercial car wash.

Spills and Clean Up BMPs

- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep up the area.
- Clean up spills immediately when they occur, using dry clean up methods such as absorbent materials or sweep followed by proper disposal of materials.
- Always have a spill kit available near chemical loading dock doors and vehicle maintenance and fueling areas.
- Follow your Business Emergency Plan, as filed with the local Fire Department.
- Report all prohibited discharges and non-implementation of BMPs to your local Stormwater Coordinator as listed on the back of this pamphlet.

- Report hazardous materials spills to 951-358-5055 or call after hours to 951-782-2973 or, if an emergency, call the Fire Department's Haz Mat Team at 911.

Plastic Manufacturing Facilities BMPs

AB 258 requires plastic product manufacturers to use BMPs, such as safe storage and clean-up procedures to prevent plastic pellets (nurdles) from entering the waterway. The plastic pellets are released into the environment during transporting, packaging and processing and migrate to waterways through the storm drain system. AB 258 will help protect fish and wildlife from the hazards of plastic pollution.

Training BMPs

As prescribed by your City and County Stormwater Ordinance(s), train employees in spill procedures and prohibit non-stormwater discharges to the storm drain system. Applicable BMP examples can be found at www.cabmphandbooks.com.

Permitting

Stormwater discharges associated with specific categories for industrial facilities are regulated by the State Water Resources Control Board through an Industrial Stormwater General Permit. A copy of this General Permit and application forms are available at: www.waterboards.ca.gov, select stormwater then the industrial quick link.

To report illegal dumping or for more information on stormwater pollution prevention call: 1-800-506-2555 or e-mail us at: fcnpdes@rcflood.org.

Landscaping and garden maintenance activities can be major contributors to water pollution. Soils, yard wastes, over-watering and garden chemicals become part of the urban runoff mix that winds its way through streets, gutters and storm drains before entering lakes, rivers, streams, etc. Urban runoff pollution contaminates water and harms aquatic life!

In Riverside County, report illegal discharges into the storm drain, call

...Only Rain Down ...the Storm Drain

What you should know for... Landscape and Gardening

Best Management tips for:

- Professionals
- Novices
- Landscapers
- Gardeners
- Cultivators

Tips for Landscape & Gardening

This brochure will help you to get the most of your lawn and gardening efforts and keep our waterways clean. Clean waterways provide recreation, establish thriving fish habitats, secure safe sanctuaries for wildlife, and add beauty to our communities. NEVER allow gardening products or waste water to enter the street, gutter or storm drain.

General Landscaping Tips

- Protect stockpiles and materials from wind and rain by storing them under tarps or secured plastic sheeting.
- Prevent erosion of slopes by planting fast-growing, dense ground covering plants. These will shield and bind the soil.

- Plant native vegetation to reduce the amount of water, fertilizers and pesticides applied to the landscape.
- Never apply pesticides or fertilizers when rain is predicted within the next 48 hours.

Garden & Lawn Maintenance

- Do not overwater. Use irrigation practices such as drip irrigation, soaker hoses or micro-spray systems. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of green waste by composting, hauling it to a permitted landfill, or recycling it through your city's program.

- Consider recycling your green waste and adding "nature's own fertilizer" to your lawn or garden.
- Read labels and use only as directed. Do not over-apply pesticides or fertilizers. Apply to spots as needed, rather than blanketing an entire area.
- Store pesticides, fertilizers and other chemicals in a dry covered area to prevent exposure that may result in the deterioration of containers and packaging.
- Rinse empty pesticide containers and re-use rinse water as you would use the product. Do not dump rinse water down storm drains or sewers. Dispose of empty containers in the trash.
- When available, use non-toxic alternatives to traditional pesticides, and use pesticides specifically designed to control the pest you are targeting.
- Try natural long-term common sense solutions first. Integrated Pest Management (IPM) can provide landscaping guidance and solutions, such as:
  - **Physical Controls** - Try hand picking, barriers, traps or caulking holes to control weeds and pests.
  - **Biological Controls** - Use predatory insects to control harmful pests.
  - **Chemical Controls** - Check out www.ipm.ucdavis.edu before using chemicals. Remember, all chemicals should be used cautiously and in moderation.
- If fertilizer is spilled, sweep up the spill before irrigating. If the spill is liquid, apply an absorbent material such as cat litter, and then sweep it up and dispose of it in the trash.
- Take unwanted pesticides to a Household Waste Collection Center to be recycled.
- *Dumping toxics into the street, gutter or storm drain is illegal!*

Stormwater Pollution

What you should know for...

Outdoor Cleaning Activities and Professional Mobile Service Providers

Storm drain pollution prevention information for:

- Car Washing / Mobile Detailers
- Window and Carpet Cleaners
- Power Washers
- Waterproofers / Street Sweepers
- Equipment cleaners or degreasers and all mobile service providers

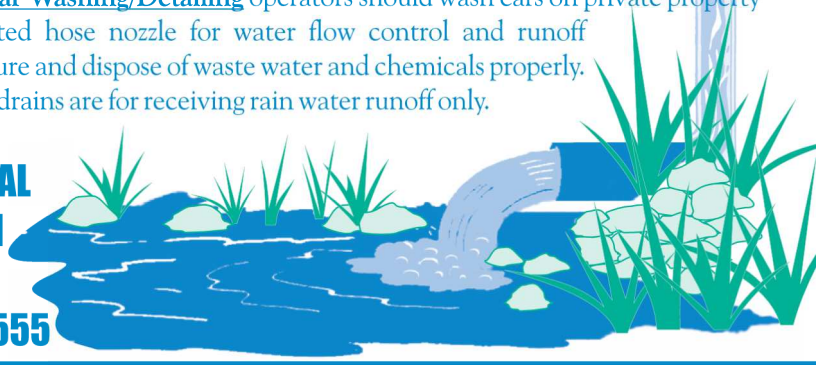
Do you know where street flows actually go?

Storm drains are NOT connected to sanitary sewer systems and treatment plants!

The primary purpose of storm drains is to carry *rain* water away from developed areas to prevent flooding. Pollutants discharged to storm drains are transported directly into rivers, lakes and streams. Soaps, degreasers, automotive fluids, litter and a host of materials are washed off buildings, sidewalks, plazas and parking areas. Vehicles and equipment must be properly managed to prevent the pollution of local waterways.

Unintentional spills by mobile service operators can flow into storm drains and pollute our waterways. **Avoid mishaps.** *Always* have a **Spill Response Kit** on hand to clean up unintentional spills. Only emergency **Mechanical** repairs should be done in City streets, using drip pans for spills. **Plumbing** should be done on private property. Always store chemicals in a leak-proof container and keep covered when not in use. **Window/Power Washing** waste water shouldn't be released into the streets, but should be disposed of in a sanitary sewer, landscaped area or in the soil. Soiled **Carpet Cleaning** wash water should be filtered before being discharged into the sanitary sewer. Dispose of all filter debris properly. **Car Washing/Detailing** operators should wash cars on private property and use a regulated hose nozzle for water flow control and runoff prevention. Capture and dispose of waste water and chemicals properly. Remember, storm drains are for receiving rain water runoff only.

REPORT ILLEGAL STORM DRAIN DISPOSAL 1-800-506-2555



Help Protect Our Waterways!

Use these guidelines for Outdoor Cleaning Activities and Wash Water Disposal

Did you know that disposing of pollutants into the street, gutter, storm drain or body of water is *PROHIBITED* by law and can result in stiff penalties?

Best Management Practices

Waste wash water from Mechanics, Plumbers, Window/Power Washers, Carpet Cleaners, Car Washing and Mobile Detailing activities may contain significant quantities of motor oil, grease, chemicals, dirt, detergents, brake pad dust, litter and other materials.

Best Management Practices, or BMPs as they are known, are guides to prevent pollutants from entering the storm drains. ***Each of us*** can do our part to keep stormwater clean by using the suggested BMPs below:

Simple solutions for both light and heavy duty jobs:

Do...consider dry cleaning methods first such as a mop, broom, rag or wire brush. Always keep a spill response kit on site.

Do...prepare the work area before power cleaning by using sand bags, rubber mats, vacuum booms, containment pads or temporary berms to keep wash water away from the gutters and storm drains.

Do...use vacuums or other machines to remove and collect loose debris or litter before applying water.

Do...obtain the property owner's permission to dispose of ***small amounts*** of power washing waste water on to landscaped, gravel or unpaved surfaces.

Do...check your local sanitary sewer agency's policies on wash water disposal regulations before disposing of wash water into the sewer. (See list on reverse side)

Do...be aware that if discharging to landscape areas, soapy wash water may damage landscaping. Residual wash water may remain on paved surfaces to evaporate. Sweep up solid residuals and dispose of properly. Vacuum booms are another option for capturing and collecting wash water.

Do...check to see if local ordinances prevent certain activities.

Do not let...wash or waste water from sidewalk, plaza or building cleaning go into a street or storm drain.

Report illegal storm drain disposal
Call Toll Free
1-800-506-2555

Using Cleaning Agents

Try using biodegradable/phosphate-free products. They are easier on the environment, but don't confuse them with being toxic free. Soapy water entering the storm drain system can impact the delicate aquatic environment.

When cleaning surfaces with a ***high-pressure washer*** or ***steam cleaner***, additional precautions should be taken to prevent the discharge of pollutants into the storm drain system. These two methods of surface cleaning can loosen additional material that can contaminate local waterways.

Think Water Conservation

Minimize water use by using high pressure, low volume nozzles. Be sure to check all hoses for leaks. Water is a precious resource, don't let it flow freely and be sure to shut it off in between uses.

Screening Wash Water

Conduct thorough dry cleanup before washing exterior surfaces, such as buildings and decks ***with loose paint***, sidewalks or plaza areas. Keep debris from entering the storm drain after cleaning by first passing the wash water through a "20 mesh" or finer screen to catch the solid materials, then dispose of the mesh in a refuse container. Do not let the remaining wash water enter a street, gutter or storm drain.

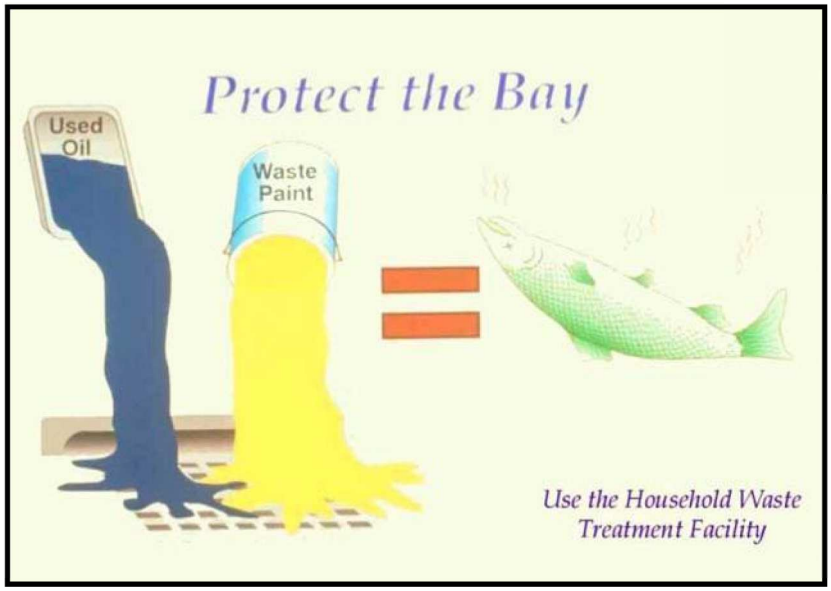
Drain Inlet Protection & Collection of Wash Water

- Prior to any washing, block all storm drains with an impervious barrier such as sandbags or berms, or seal the storm drain with plugs or other appropriate materials.
- Create a containment area with berms and traps or take advantage of a low spot to keep wash water contained.
- Wash vehicles and equipment on grassy or gravel areas so that the wash water can seep into the ground.
- Pump or vacuum up all wash water in the contained area.

Concrete/Coring/Saw Cutting and Drilling Projects

Protect any down-gradient inlets by using dry activity techniques whenever possible. If water is used, minimize the amount of water used during the coring/drilling or saw cutting process. Place a barrier of sandbags and/or absorbent berms to protect the storm drain inlet or watercourse. Use a shovel or wet vacuum to remove the residue from the pavement. Do not wash residue or particulate matter into a storm drain inlet or watercourse.

Non-Stormwater Discharges SC-10



Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

Non-stormwater discharges are those flows that do not consist entirely of stormwater. Some non-stormwater discharges do not include pollutants and may be discharged to the storm drain. These include uncontaminated groundwater and natural springs. There are also some non-stormwater discharges that typically do not contain pollutants and may be discharged to the storm drain with conditions. These include car washing, air conditioner condensate, etc. However there are certain non-stormwater discharges that pose environmental concern. These discharges may originate from illegal dumping or from internal floor drains, appliances, industrial processes, sinks, and toilets that are connected to the nearby storm drainage system. These discharges (which may include: process waste waters, cooling waters, wash waters, and sanitary wastewater) can carry substances such as paint, oil, fuel and other automotive fluids, chemicals and other pollutants into storm drains. They can generally be detected through a combination of detection and elimination. The ultimate goal is to effectively eliminate non-stormwater discharges to the stormwater drainage system through implementation of measures to detect, correct, and enforce against illicit connections and illegal discharges of pollutants on streets and into the storm drain system and creeks.

Targeted Constituents

Sediment	
Nutrients	✓
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	✓
Organics	✓

Approach

Initially the industry must make an assessment of non-stormwater discharges to determine which types must be eliminated or addressed through BMPs. The focus of the following approach is in the elimination of non-stormwater discharges.

CASQA California Stormwater Quality Association

Pollution Prevention

- Ensure that used oil, used antifreeze, and hazardous chemical recycling programs are being implemented. Encourage litter control.

Suggested Protocols

Recommended Complaint Investigation Equipment

- Field Screening Analysis
  - pH paper or meter
  - Commercial stormwater pollutant screening kit that can detect for reactive phosphorus, nitrate nitrogen, ammonium nitrogen, specific conductance, and turbidity
  - Sample jars
  - Sample collection pole
  - A tool to remove access hole covers
- Laboratory Analysis
  - Sample cooler
  - Ice
  - Sample jars and labels
  - Chain of custody forms
- Documentation
  - Camera
  - Notebook
  - Pens
  - Notice of Violation forms
  - Educational materials

General

- Develop clear protocols and lines of communication for effectively prohibiting non-stormwater discharges, especially those that are not classified as hazardous. These are often not responded to as effectively as they need to be.
- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as “Dump No Waste Drains to Stream” stenciled or demarcated next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.

- See SC44 Stormwater Drainage System Maintenance for additional information.

Illicit Connections

- Locate discharges from the industrial storm drainage system to the municipal storm drain system through review of "as-built" piping schematics.
- Isolate problem areas and plug illicit discharge points.
- Locate and evaluate all discharges to the industrial storm drain system.

Visual Inspection and Inventory

- Inventory and inspect each discharge point during dry weather.
- Keep in mind that drainage from a storm event can continue for a day or two following the end of a storm and groundwater may infiltrate the underground stormwater collection system. Also, non-stormwater discharges are often intermittent and may require periodic inspections.

Review Infield Piping

- A review of the "as-built" piping schematic is a way to determine if there are any connections to the stormwater collection system.
- Inspect the path of floor drains in older buildings.

Smoke Testing

- Smoke testing of wastewater and stormwater collection systems is used to detect connections between the two systems.
- During dry weather the stormwater collection system is filled with smoke and then traced to sources. The appearance of smoke at the base of a toilet indicates that there may be a connection between the sanitary and the stormwater system.

Dye Testing

- A dye test can be performed by simply releasing a dye into either your sanitary or process wastewater system and examining the discharge points from the stormwater collection system for discoloration.

TV Inspection of Drainage System

- TV Cameras can be employed to visually identify illicit connections to the industrial storm drainage system.

Illegal Dumping

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste.

- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Once a site has been cleaned:

- Post "No Dumping" signs with a phone number for reporting dumping and disposal.
- Landscaping and beautification efforts of hot spots may also discourage future dumping, as well as provide open space and increase property values.
- Lighting or barriers may also be needed to discourage future dumping.
- See fact sheet SC11 Spill Prevention, Control, and Cleanup.

Inspection

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- Conduct field investigations of the industrial storm drain system for potential sources of non-stormwater discharges.
- Pro-actively conduct investigations of high priority areas. Based on historical data, prioritize specific geographic areas and/or incident type for pro-active investigations.

Reporting

- A database is useful for defining and tracking the magnitude and location of the problem.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained, and cleaned up or eliminated.
- Document that non-stormwater discharges have been eliminated by recording tests performed, methods used, dates of testing, and any on-site drainage points observed.
- Document and report annually the results of the program.
- Maintain documentation of illicit connection and illegal dumping incidents, including significant conditionally exempt discharges that are not properly managed.

Training

- Training of technical staff in identifying and documenting illegal dumping incidents is required.
- Consider posting the quick reference table near storm drains to reinforce training.
- Train employees to identify non-stormwater discharges and report discharges to the appropriate departments.

- Educate employees about spill prevention and cleanup.
- Well-trained employees can reduce human errors that lead to accidental releases or spills. The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur. Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.
- Determine and implement appropriate outreach efforts to reduce non-permissible non-stormwater discharges.
- Conduct spill response drills annually (if no events occurred to evaluate your plan) in cooperation with other industries.
- When a responsible party is identified, educate the party on the impacts of his or her actions.

Spill Response and Prevention

- See SC11 Spill Prevention Control and Cleanup.

Other Considerations

- Many facilities do not have accurate, up-to-date schematic drawings.

Requirements

Costs (including capital and operation & maintenance)

- The primary cost is for staff time and depends on how aggressively a program is implemented.
- Cost for containment and disposal is borne by the discharger.
- Illicit connections can be difficult to locate especially if there is groundwater infiltration.
- Indoor floor drains may require re-plumbing if cross-connections to storm drains are detected.

Maintenance (including administrative and staffing)

- Illegal dumping and illicit connection violations requires technical staff to detect and investigate them.

Supplemental Information

Further Detail of the BMP

Illegal Dumping

- Substances illegally dumped on streets and into the storm drain systems and creeks include paints, used oil and other automotive fluids, construction debris, chemicals, fresh concrete, leaves, grass clippings, and pet wastes. All of these wastes cause stormwater and receiving water quality problems as well as clog the storm drain system itself.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots

- Types and quantities (in some cases) of wastes
- Patterns in time of occurrence (time of day/night, month, or year)
- Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
- Responsible parties

One of the keys to success of reducing or eliminating illegal dumping is increasing the number of people at the facility who are aware of the problem and who have the tools to at least identify the incident, if not correct it. Therefore, train field staff to recognize and report the incidents.

What constitutes a "non-stormwater" discharge?

- Non-stormwater discharges to the stormwater collection system may include any water used directly in the manufacturing process (process wastewater), air conditioning condensate and coolant, non-contact cooling water, cooling equipment condensate, outdoor secondary containment water, vehicle and equipment wash water, sink and drinking fountain wastewater, sanitary wastes, or other wastewaters.

Permit Requirements

- Facilities subject to stormwater permit requirements must include a certification that the stormwater collection system has been tested or evaluated for the presence of non-stormwater discharges. The State's General Industrial Stormwater Permit requires that non-stormwater discharges be eliminated prior to implementation of the facility's SWPPP.

Performance Evaluation

- Review annually internal investigation results; assess whether goals were met and what changes or improvements are necessary.
- Obtain feedback from personnel assigned to respond to, or inspect for, illicit connections and illegal dumping incidents.

Building & Grounds Maintenance SC-41

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	✓
Trash	
Metals	✓
Bacteria	✓
Oil and Grease	
Organics	

Description

Stormwater runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, abnormal pH, and oils and greases. Utilizing the protocols in this fact sheet will prevent or reduce the discharge of pollutants to stormwater from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the stormwater collection system.

Approach

Reduce potential for pollutant discharge through source control pollution prevention and BMP implementation. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Switch to non-toxic chemicals for maintenance when possible.
- Choose cleaning agents that can be recycled.
- Encourage proper lawn management and landscaping, including use of native vegetation.

CASQA California Stormwater Quality Association

- Encourage use of Integrated Pest Management techniques for pest control.
- Encourage proper onsite recycling of yard trimmings.
- Recycle residual paints, solvents, lumber, and other material as much as possible.

Suggested Protocols

Pressure Washing of Buildings, Rooftops, and Other Large Objects

- In situations where soaps or detergents are used and the surrounding area is paved, pressure washers must use a water collection device that enables collection of wash water and associated solids. A sump pump, wet vacuum or similarly effective device must be used to collect the runoff and loose materials. The collected runoff and solids must be disposed of properly.
- If soaps or detergents are not used, and the surrounding area is paved, wash runoff does not have to be collected but must be screened. Pressure washers must use filter fabric or some other type of screen on the ground and/or in the catch basin to trap the particles in wash water runoff.
- If you are pressure washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement.

Landscaping Activities

- Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures on exposed soils.

Building Repair, Remodeling, and Construction

- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.
- Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
- Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.
- Clean paintbrushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.
- Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit, wash water, or other pollutants may escape the work area and enter a catch basin. This is particularly necessary on rainy days. The containment device(s) must be in place at the beginning of the work day, and accumulated dirty runoff and solids must be collected and disposed of before removing the containment device(s) at the end of the work day.

- If you need to de-water an excavation site, you may need to filter the water before discharging to a catch basin or off-site. If directed off-site, you should direct the water through hay bales and filter fabric or use other sediment filters or traps.
- Store toxic material under cover during precipitation events and when not in use. A cover would include tarps or other temporary cover material.

Mowing, Trimming, and Planting

- Dispose of leaves, sticks, or other collected vegetation as garbage, by composting or at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures when soils are exposed.
- Place temporarily stockpiled material away from watercourses and drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Consider an alternative approach when bailing out muddy water: do not put it in the storm drain; pour over landscaped areas.
- Use hand weeding where practical.

Fertilizer and Pesticide Management

- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.
- Use less toxic pesticides that will do the job when applicable. Avoid use of copper-based pesticides if possible.
- Do not use pesticides if rain is expected.
- Do not mix or prepare pesticides for application near storm drains.
- Use the minimum amount needed for the job.
- Calibrate fertilizer distributors to avoid excessive application.
- Employ techniques to minimize off-target application (e.g., spray drift) of pesticides, including consideration of alternative application techniques.
- Apply pesticides only when wind speeds are low.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Irrigate slowly to prevent runoff and then only as much as is needed.
- Clean pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Dispose of empty pesticide containers according to the instructions on the container label.

- Use up the pesticides. Rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Implement storage requirements for pesticide products with guidance from the local fire department and County Agricultural Commissioner. Provide secondary containment for pesticides.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering and repair leaks in the irrigation system as soon as they are observed.

Training

- Educate and train employees on pesticide use and in pesticide application techniques to prevent pollution.
- Train employees and contractors in proper techniques for spill containment and cleanup.
- Be sure the frequency of training takes into account the complexity of the operations and the nature of the staff.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials, such as brooms, dustpans, and vacuum sweepers (if desired) near the storage area where it will be readily accessible.
- Have employees trained in spill containment and cleanup present during the loading/unloading of dangerous wastes, liquid chemicals, or other materials.
- Familiarize employees with the Spill Prevention Control and Countermeasure Plan.
- Clean up spills immediately.

Other Considerations

Alternative pest/weed controls may not be available, suitable, or effective in many cases.

Requirements

Costs

- Cost will vary depending on the type and size of facility.
- Overall costs should be low in comparison to other BMPs.

Maintenance

Sweep paved areas regularly to collect loose particles. Wipe up spills with rags and other absorbent material immediately, do not hose down the area to a storm drain.

Supplemental Information

Further Detail of the BMP

Fire Sprinkler Line Flushing

Building fire sprinkler line flushing may be a source of non-stormwater runoff pollution. The water entering the system is usually potable water, though in some areas it may be non-potable reclaimed wastewater. There are subsequent factors that may drastically reduce the quality of the water in such systems. Black iron pipe is usually used since it is cheaper than potable piping, but it is subject to rusting and results in lower quality water. Initially, the black iron pipe has an oil coating to protect it from rusting between manufacture and installation; this will contaminate the water from the first flush but not from subsequent flushes. Nitrates, poly-phosphates and other corrosion inhibitors, as well as fire suppressants and antifreeze may be added to the sprinkler water system. Water generally remains in the sprinkler system a long time (typically a year) and between flushes may accumulate iron, manganese, lead, copper, nickel, and zinc. The water generally becomes anoxic and contains living and dead bacteria and breakdown products from chlorination. This may result in a significant BOD problem and the water often smells. Consequently dispose fire sprinkler line flush water into the sanitary sewer. Do not allow discharge to storm drain or infiltration due to potential high levels of pollutants in fire sprinkler line water.

Parking/Storage Area Maintenance SC-43

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Description

Parking lots and storage areas can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through stormwater runoff or non-stormwater discharges. The protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants from parking/storage areas and include using good housekeeping practices, following appropriate cleaning BMPs, and training employees.

Approach

The goal of this program is to ensure stormwater pollution prevention practices are considered when conducting activities on or around parking areas and storage areas to reduce potential for pollutant discharge to receiving waters. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Encourage alternative designs and maintenance strategies for impervious parking lots. (See New Development and Redevelopment BMP Handbook)

- Keep accurate maintenance logs to evaluate BMP implementation.

CASQA California Stormwater Quality Association

SC-43 Parking/Storage Area Maintenance

Suggested Protocols

General

- Keep the parking and storage areas clean and orderly. Remove debris in a timely fashion.
- Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
- Utilize sand filters or oleophilic collectors for oily waste in low quantities.
- Arrange rooftop drains to prevent drainage directly onto paved surfaces.
- Design lot to include semi-permeable hardscape.
- Discharge soapy water remaining in mop or wash buckets to the sanitary sewer through a sink, toilet, clean-out, or wash area with drain.

Controlling Litter

- Post "No Littering" signs and enforce anti-litter laws.
- Provide an adequate number of litter receptacles.
- Clean out and cover litter receptacles frequently to prevent spillage.
- Provide trash receptacles in parking lots to discourage litter.
- Routinely sweep, shovel, and dispose of litter in the trash.

Surface Cleaning

- Use dry cleaning methods (e.g., sweeping, vacuuming) to prevent the discharge of pollutants into the stormwater conveyance system if possible.
- Establish frequency of public parking lot sweeping based on usage and field observations of waste accumulation.
- Sweep all parking lots at least once before the onset of the wet season.
- Follow the procedures below if water is used to clean surfaces:
  - Block the storm drain or contain runoff.
  - Collect and pump wash water to the sanitary sewer or discharge to a pervious surface. Do not allow wash water to enter storm drains.
  - Dispose of parking lot sweeping debris and dirt at a landfill.
- Follow the procedures below when cleaning heavy oily deposits:
  - Clean oily spots with absorbent materials.
  - Use a screen or filter fabric over inlet, then wash surfaces.

- Do not allow discharges to the storm drain.
- Vacuum/pump discharges to a tank or discharge to sanitary sewer.
- Appropriately dispose of spilled materials and absorbents.

Surface Repair

- Preheat, transfer or load hot bituminous material away from storm drain inlets.
- Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff.
- Cover and seal nearby storm drain inlets where applicable (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal.
- Use only as much water as necessary for dust control, to avoid runoff.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Inspection

- Have designated personnel conduct inspections of parking facilities and stormwater conveyance systems associated with parking facilities on a regular basis.
- Inspect cleaning equipment/sweepers for leaks on a regular basis.

Training

- Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
- Train employees and contractors in proper techniques for spill containment and cleanup.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible or at a central location.
- Clean up fluid spills immediately with absorbent rags or material.
- Dispose of spilled material and absorbents properly.

Other Considerations

Limitations related to sweeping activities at large parking facilities may include high equipment costs, the need for sweeper operator training, and the inability of current sweeper technology to remove oil and grease.

SC-43 Parking/Storage Area Maintenance

Requirements

Costs

Cleaning/sweeping costs can be quite large. Construction and maintenance of stormwater structural controls can be quite expensive as well.

Maintenance

- Sweep parking lot regularly to minimize cleaning with water.
- Clean out oil/water/sand separators regularly, especially after heavy storms.
- Clean parking facilities regularly to prevent accumulated wastes and pollutants from being discharged into conveyance systems during rainy conditions.

Supplemental Information

Further Detail of the BMP

Surface Repair

Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff. Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal. Only use only as much water as is necessary for dust control to avoid runoff.

Drainage System Maintenance SC-44

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Description

As a consequence of its function, the stormwater conveyance system collects and transports urban runoff and stormwater that may contain certain pollutants. The protocols in this fact sheet are intended to reduce pollutants reaching receiving waters through proper conveyance system operation and maintenance.

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	
Bacteria	✓
Oil and Grease	
Organics	

Approach

Pollution Prevention

Maintain catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis to remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.

Suggested Protocols

Catch Basins/Inlet Structures

- Staff should regularly inspect facilities to ensure compliance with the following:
  - Immediate repair of any deterioration threatening structural integrity.
  - Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.
  - Stenciling of catch basins and inlets (see SC34 Waste Handling and Disposal).

CASQA California Stormwater Quality Association

- Clean catch basins, storm drain inlets, and other conveyance structures before the wet season to remove sediments and debris accumulated during the summer.
- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes if necessary with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed. Do not dewater near a storm drain or stream.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect and pump flushed effluent to the sanitary sewer for treatment whenever possible.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge to reach the storm drain system when cleaning a storm drain pump station or other facility.
- Conduct routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.

Open Channel

- Modify storm channel characteristics to improve channel hydraulics, increase pollutant removals, and enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural (emphasis added) state of any river, stream, or lake in California, must enter into a Steam or Lake Alteration Agreement with the Department of Fish and Game. The developer-applicant should also contact local governments (city, county, special districts), other state agencies (SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Federal Corps of Engineers and USFWS.

Illicit Connections and Discharges

- Look for evidence of illegal discharges or illicit connections during routine maintenance of conveyance system and drainage structures:
  - Is there evidence of spills such as paints, discoloring, etc?

- Are there any odors associated with the drainage system?
- Record locations of apparent illegal discharges/illicit connections?
- Track flows back to potential dischargers and conduct aboveground inspections. This can be done through visual inspection of upgradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
- Eliminate the discharge once the origin of flow is established.

- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Illegal Dumping

- Inspect and clean up hot spots and other storm drainage areas regularly where illegal dumping and disposal occurs.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots
  - Types and quantities (in some cases) of wastes
  - Patterns in time of occurrence (time of day/night, month, or year)
  - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
  - Responsible parties
- Post "No Dumping" signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Training

- Train crews in proper maintenance activities, including record keeping and disposal.
- Allow only properly trained individuals to handle hazardous materials/wastes.
- Have staff involved in detection and removal of illicit connections trained in the following:
  - OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).

- OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and Federal OSHA 29 CFR 1910.146).

- Procedural training (field screening, sampling, smoke/dye testing, TV inspection).

Spill Response and Prevention

- Investigate all reports of spills, leaks, and/or illegal dumping promptly.
- Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags) or dig up, remove, and properly dispose of contaminated soil.
- Refer to fact sheet SC-11 Spill Prevention, Control, and Cleanup.

Other Considerations (Limitations and Regulations)

- Clean-up activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.
- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, liquid/sediment disposal, and prohibition against disposal of flushed effluent to sanitary sewer in some areas.
- Regulations may include adoption of substantial penalties for illegal dumping and disposal.
- Local municipal codes may include sections prohibiting discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.

Requirements

Costs

- An aggressive catch basin cleaning program could require a significant capital and O&M budget.
- The elimination of illegal dumping is dependent on the availability, convenience, and cost of alternative means of disposal. The primary cost is for staff time. Cost depends on how aggressively a program is implemented. Other cost considerations for an illegal dumping program include:

  - Purchase and installation of signs.

  - Rental of vehicle(s) to haul illegally-disposed items and material to landfills.

  - Rental of heavy equipment to remove larger items (e.g., car bodies) from channels.

  - Purchase of landfill space to dispose of illegally-dumped items and material.

- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Teams of at least two people plus administrative personnel are required to identify illicit discharges, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Technical staff are required to detect and investigate illegal dumping violations.

Supplemental Information

Further Detail of the BMP

Storm Drain Flushing

Flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in storm drainage systems. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as an open channel, another point where flushing will be initiated, or the sanitary sewer and the treatment facilities, thus preventing resuspension and overflow of a portion of the solids during storm events. Flushing prevents "plug flow" discharges of concentrated pollutant loadings and sediments. Deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, thereby releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce impacts of stormwater pollution, a second inflatable device placed well downstream may be used to recollect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to recollect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75% for organics and 55-65% for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used or that fire hydrant line flushing coincide with storm sewer flushing.

Landscape Maintenance SC-73

Objectives

- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	
Bacteria	
Oil and Grease	
Organics	
Oxygen Demanding	☑

Description

Landscape maintenance activities include vegetation removal; herbicide and insecticide application; fertilizer application; watering; and other gardening and lawn care practices. Vegetation control typically involves a combination of chemical (herbicide) application and mechanical methods. All of these maintenance practices have the potential to contribute pollutants to the storm drain system. The major objectives of this BMP are to minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters; prevent the disposal of landscape waste into the storm drain system by collecting and properly disposing of clippings and cuttings, and educating employees and the public.

Approach

Pollution Prevention

- Implement an integrated pest management (IPM) program. IPM is a sustainable approach to managing pests by combining biological, cultural, physical, and chemical tools.
- Choose low water using flowers, trees, shrubs, and groundcover.
- Consider alternative landscaping techniques such as naturescaping and xeriscaping.
- Conduct appropriate maintenance (i.e. properly timed fertilizing, weeding, pest control, and pruning) to help preserve the landscapes water efficiency.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Consider grass cycling (grass cycling is the natural recycling of grass by leaving the clippings on the lawn when mowing. Grass clippings decompose quickly and release valuable nutrients back into the lawn).

Suggested Protocols

Mowing, Trimming, and Weeding

- Whenever possible use mechanical methods of vegetation removal (e.g mowing with tractor-type or push mowers, hand cutting with gas or electric powered weed trimmers) rather than applying herbicides. Use hand weeding where practical.
- Avoid loosening the soil when conducting mechanical or manual weed control, this could lead to erosion. Use mulch or other erosion control measures when soils are exposed.
- Performing mowing at optimal times. Mowing should not be performed if significant rain events are predicted.
- Mulching mowers may be recommended for certain flat areas. Other techniques may be employed to minimize mowing such as selective vegetative planting using low maintenance grasses and shrubs.
- Collect lawn and garden clippings, pruning waste, tree trimmings, and weeds. Chip if necessary, and compost or dispose of at a landfill (see waste management section of this fact sheet).
- Place temporarily stockpiled material away from watercourses, and berm or cover stockpiles to prevent material releases to storm drains.

Planting

- Determine existing native vegetation features (location, species, size, function, importance) and consider the feasibility of protecting them. Consider elements such as their effect on drainage and erosion, hardiness, maintenance requirements, and possible conflicts between preserving vegetation and the resulting maintenance needs.
- Retain and/or plant selected native vegetation whose features are determined to be beneficial, where feasible. Native vegetation usually requires less maintenance (e.g., irrigation, fertilizer) than planting new vegetation.
- Consider using low water use groundcovers when planting or replanting.

Waste Management

- Compost leaves, sticks, or other collected vegetation or dispose of at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Place temporarily stockpiled material away from watercourses and storm drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Reduce the use of high nitrogen fertilizers that produce excess growth requiring more frequent mowing or trimming.

- Avoid landscape wastes in and around storm drain inlets by either using bagging equipment or by manually picking up the material.

Irrigation

- Where practical, use automatic timers to minimize runoff.
- Use popup sprinkler heads in areas with a lot of activity or where there is a chance the pipes may be broken. Consider the use of mechanisms that reduce water flow to sprinkler heads if broken.
- Ensure that there is no runoff from the landscaped area(s) if re-claimed water is used for irrigation.
- If bailing of muddy water is required (e.g. when repairing a water line leak), do not put it in the storm drain; pour over landscaped areas.
- Irrigate slowly or pulse irrigate to prevent runoff and then only irrigate as much as is needed.
- Apply water at rates that do not exceed the infiltration rate of the soil.

Fertilizer and Pesticide Management

- Utilize a comprehensive management system that incorporates integrated pest management (IPM) techniques. There are many methods and types of IPM, including the following:
  - Mulching can be used to prevent weeds where turf is absent, fencing installed to keep rodents out, and netting used to keep birds and insects away from leaves and fruit.
  - Visible insects can be removed by hand (with gloves or tweezers) and placed in soapy water or vegetable oil. Alternatively, insects can be sprayed off the plant with water or in some cases vacuumed off of larger plants.
  - Store-bought traps, such as species-specific, pheromone-based traps or colored sticky cards, can be used.
  - Slugs can be trapped in small cups filled with beer that are set in the ground so the slugs can get in easily.
  - In cases where microscopic parasites, such as bacteria and fungi, are causing damage to plants, the affected plant material can be removed and disposed of (pruning equipment should be disinfected with bleach to prevent spreading the disease organism).
  - Small mammals and birds can be excluded using fences, netting, tree trunk guards.
  - Beneficial organisms, such as bats, birds, green lacewings, ladybugs, praying mantis, ground beetles, parasitic nematodes, trichogramma wasps, seed head weevils, and spiders that prey on detrimental pest species can be promoted.
- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.

- Use pesticides only if there is an actual pest problem (not on a regular preventative schedule).
- Do not use pesticides if rain is expected. Apply pesticides only when wind speeds are low (less than 5 mph).
- Do not mix or prepare pesticides for application near storm drains.
- Prepare the minimum amount of pesticide needed for the job and use the lowest rate that will effectively control the pest.
- Employ techniques to minimize off-target application (e.g. spray drift) of pesticides, including consideration of alternative application techniques.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Calibrate fertilizer and pesticide application equipment to avoid excessive application.
- Periodically test soils for determining proper fertilizer use.
- Sweep pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Purchase only the amount of pesticide that you can reasonably use in a given time period (month or year depending on the product).
- Triple rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Dispose of empty pesticide containers according to the instructions on the container label.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering, and repair leaks in the irrigation system as soon as they are observed.
- Inspect pesticide/fertilizer equipment and transportation vehicles daily.

Training

- Educate and train employees on use of pesticides and in pesticide application techniques to prevent pollution. Pesticide application must be under the supervision of a California qualified pesticide applicator.
- Train/encourage municipal maintenance crews to use IPM techniques for managing public green areas.
- Annually train employees within departments responsible for pesticide application on the appropriate portions of the agency's IPM Policy, SOPs, and BMPs, and the latest IPM techniques.

- Employees who are not authorized and trained to apply pesticides should be periodically (at least annually) informed that they cannot use over-the-counter pesticides in or around the workplace.
- Use a training log or similar method to document training.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup
- Have spill cleanup materials readily available and in a know in location
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- The Federal Pesticide, Fungicide, and Rodenticide Act and California Title 3, Division 6, Pesticides and Pest Control Operations place strict controls over pesticide application and handling and specify training, annual refresher, and testing requirements. The regulations generally cover: a list of approved pesticides and selected uses, updated regularly; general application information; equipment use and maintenance procedures; and record keeping. The California Department of Pesticide Regulations and the County Agricultural Commission coordinate and maintain the licensing and certification programs. All public agency employees who apply pesticides and herbicides in "agricultural use" areas such as parks, golf courses, rights-of-way and recreation areas should be properly certified in accordance with state regulations. Contracts for landscape maintenance should include similar requirements.
- All employees who handle pesticides should be familiar with the most recent material safety data sheet (MSDS) files.
- Municipalities do not have the authority to regulate the use of pesticides by school districts, however the California Healthy Schools Act of 2000 (AB 2260) has imposed requirements on California school districts regarding pesticide use in schools. Posting of notification prior to the application of pesticides is now required, and IPM is stated as the preferred approach to pest management in schools.

Requirements

Costs

Additional training of municipal employees will be required to address IPM techniques and BMPs. IPM methods will likely increase labor cost for pest control which may be offset by lower chemical costs.

Maintenance

Not applicable

Supplemental Information

Further Detail of the BMP

Waste Management

Composting is one of the better disposal alternatives if locally available. Most municipalities either have or are planning yard waste composting facilities as a means of reducing the amount of waste going to the landfill. Lawn clippings from municipal maintenance programs as well as private sources would probably be compatible with most composting facilities

Contractors and Other Pesticide Users

Municipal agencies should develop and implement a process to ensure that any contractor employed to conduct pest control and pesticide application on municipal property engages in pest control methods consistent with the IPM Policy adopted by the agency. Specifically, municipalities should require contractors to follow the agency's IPM policy, SOPs, and BMPs; provide evidence to the agency of having received training on current IPM techniques when feasible; provide documentation of pesticide use on agency property to the agency in a timely manner.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect

    Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Trash Storage Areas SD-32

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

Other Resources

Maintenance Bays & Docks SD-31

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Several measures can be taken to prevent operations at maintenance bays and loading docks from contributing a variety of toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to the stormwater conveyance system.

Approach

In designs for maintenance bays and loading docks, containment is encouraged. Preventative measures include overflow containment structures and dead-end sumps. However, in the case of loading docks from grocery stores and warehouse/distribution centers, engineered infiltration systems may be considered.

Suitable Applications

Appropriate applications include commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for vehicle maintenance and repair are governed by Building and Fire Codes, and by current local agency ordinances, and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code requirements.

Designing New Installations

Designs of maintenance bays should consider the following:

- Repair/maintenance bays and vehicle parts with fluids should be indoors; or designed to preclude urban run-on and runoff.
- Repair/maintenance floor areas should be paved with Portland cement concrete (or equivalent smooth impervious surface).

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Repair/maintenance bays should be designed to capture all wash water leaks and spills. Provide impermeable berms, drop inlets, trench catch basins, or overflow containment structures around repair bays to prevent spilled materials and wash-down waters form entering the storm drain system. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

- Other features may be comparable and equally effective.

The following designs of loading/unloading dock areas should be considered:

- Loading dock areas should be covered, or drainage should be designed to preclude urban run-on and runoff.

- Direct connections into storm drains from depressed loading docks (truck wells) are prohibited.

- Below-grade loading docks from grocery stores and warehouse/distribution centers of fresh food items should drain through water quality inlets, or to an engineered infiltration system, or an equally effective alternative. Pre-treatment may also be required.

- Other features may be comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Stormwater and non-stormwater will accumulate in containment areas and sumps with impervious surfaces. Contaminated accumulated water must be disposed of in accordance with applicable laws and cannot be discharged directly to the storm drain or sanitary sewer system without the appropriate permit.

Other Resources

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Section 5
Monitoring, Reporting, and Program Evaluation

Conducting a monitoring program, reviewing the monitoring information, evaluating BMPs, and record keeping and reporting are all important elements of the implementation phase of the SWPPP. The success of the SWPPP depends upon the thorough implementation of the monitoring plan and evaluation of the effectiveness of the plan elements once they have been implemented.

Monitoring, Reporting, and Evaluation Elements

- Conduct monitoring program
- Conduct record keeping and reporting
- Conduct annual site evaluation
  - Review monitoring information
  - Evaluate BMPs
  - Review and revise the SWPPP as necessary

5.1 Conduct Monitoring Program

The General Permit requires that a monitoring program be a component of the SWPPP. The program has the following objectives:

- To monitor the quality of the stormwater discharge
- To aid in SWPPP implementation
- To measure the BMP effectiveness

To meet these objectives the monitoring effort has these elements:

- Training
- Visual observations
- Stormwater monitoring
- Authorized non-stormwater discharges

5.1.1 Training

Familiarity with the requirements of the stormwater monitoring plan and competence in the techniques and protocols specified in the plan are essential to ensure that stormwater samples are collected in a manner that meets the goals of the plan, while protecting the health and safety of the monitoring team members. It is recommended that all stormwater monitoring personnel receive training prior to conducting any stormwater monitoring activities. Stormwater monitoring training should include the following basic elements:

- Review of the Monitoring Plan and Health and Safety Plan

- Classroom training session
- Field training and sampling simulation (dry run)
- Annual refresher training

5.1.2 Visual Observations

Visual observations of both stormwater and non-stormwater discharges should be made at all facilities to document the presence of any discolorations, odors, floating and suspended material, oil and grease, etc., and to identify the source of any pollutants and non-stormwater flows. Visual observations should be made under the leadership of the SWPPP Leader, with appropriate members of the Pollution Prevention Team, according to the following schedule:

- All drainage areas within the facility should be checked for the presence of unauthorized non-stormwater discharges on a quarterly basis, during daylight hours, on days with no stormwater discharges.
- All authorized non-stormwater discharges and their sources should be observed quarterly during daylight hours, on days with no stormwater discharges.
- One storm event per month during the wet season (October 1-May 30) should be visually observed during the first hour of discharge at all discharge locations. These observations are only required of stormwater discharges that occur during daylight hours that are preceded by at least three working days without stormwater discharges and that occur during scheduled facility operating hours.

The results of the visual observations should be recorded and include: the date of the observation, locations observed, observations, response taken to eliminate unauthorized non-stormwater discharges, and actions taken to reduce or prevent pollutants from contacting non-stormwater or stormwater discharges. Results are included in the Annual Report.

5.1.3 Stormwater Monitoring

Each facility should either conduct an individual monitoring plan or participate in a group-sampling program. A group-monitoring program may be developed either by an entity representing a group of similar facilities or by a local stormwater agency that holds its own NPDES permit. According to the General Permit, the monitoring plan is to contain the rationale and description of the visual observation methods, location, and frequency; and the analytical methods and corresponding method detection limits used to detect constituents.

Selection of sites for industrial stormwater monitoring will depend on many factors including the following:

Representativeness

It is important to select sites that are representative of typical site operations.

- Runoff from the facility should combine to form a definable runoff stream.

- The runoff stream should represent the full range of activities at the facility.
- Runoff from the facility should not combine with runoff from other sources.
- Adequate flow volume must be available for sample collection.

Personal Safety

Development of a health and safety plan is recommended. Site selection should insure monitoring personnel from the following potential hazards:

- Traffic
- Uneven or slippery footing surface
- Poor night visibility (lighting)

Site Access

Ease of monitoring site access for monitoring personnel and vehicles parking is essential. Also, for sites that require installation of sample collection or flow metering equipment, adequate equipment access for maintenance and monitoring activities must be available.

Equipment Security

Permanently installed monitoring equipment must be located at a site that will minimize potential vandalism and other possible damage.

Adequate Flow Volume

Monitoring sites should be configured such that adequate flow volume is present for sample collection. Hydraulic conditions should be well mixed and free flowing.

Utility Access

If automated monitoring equipment is required, electrical power should be readily available at selected monitoring sites. Additionally, telephone service may be required for off-site station controlling and data transfer.

Stormwater samples should be collected during the first hour of discharge from (1) the first storm event of the wet season, and (2) at least one other storm event in the wet season. If the first event is missed, sampling of two events during the wet season is still required. Furthermore, a justification for failing to sample the first event should be provided in the Annual Report. Sample collection is only required of stormwater discharges that occur during scheduled facility operating hours and that are preceded by at least three working days without stormwater discharge. Sample collection is not required if dangerous weather conditions are present (e.g., flooding, electrical storm, etc.), when stormwater discharges begin after scheduled facility operating hours or when stormwater discharges are not preceded by three working days without discharge. When the required samples are not collected due to these exceptions, an explanation must be provided in the Annual Report. Visual observations and sample collection may be conducted more than one hour after discharge begins if it is determined that the

monitoring objectives will be better satisfied. If this occurs, an explanation should be provided in the Annual Report.

Specific sampling and analysis requirements include the following:

- All sampling and sample preservation should be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater".
- All monitoring instruments and equipment should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements.
- All laboratory analyses should be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified by the RWQCB.
- Analyze samples for total suspended solids (TSS), pH, specific conductance, and total organic carbon (TOC). Oil and grease (O&G) may be substituted for TOC.
- Analyze toxic chemicals and other pollutants that are likely to be present in stormwater discharges. Any of these pollutants that are not detected in significant quantities after two consecutive sampling events may be eliminated from future sampling analysis until the pollutant is likely to be present again. (According to the definitions section of the General Permit, "significant quantities" is defined as the volume, concentration, or mass of a pollutant that can cause or threaten to cause pollution, contamination, or nuisance; adversely impact human health or the environment; and/or cause or contribute to a violation of any applicable water quality standards for the receiving water.)
- Other analytical parameters should be included based on the facility's standard industrial classification (see Table D of the General Permit).

Rules to Follow to Reduce Potential Sample Contamination

1. No smoking.
2. Never sample near a running vehicle. Do not park vehicles in immediate sample collection area (even non-running vehicles)
3. Always wear clean, powder-free nitrile gloves when handling composite bottles, lids, sterile grab sample bottles, tubing, or strainers.
4. Never touch the inside surface of a sample bottle or lid, even with gloved hands.
5. Never touch the exposed end of a sampling tube.
6. Never allow the inner surface of a sample bottle, lid, or sampling tube to be contacted by any material other than the sample water.
7. Never allow any object or material to fall into or contact the collected sample water.
8. Avoid allowing rain water to drip from rain gear or other surfaces into sample bottles.
9. Do not eat or drink during sample collection.
10. Do not breathe, sneeze or cough in the direction of an open sample bottle.

In addition to the requirements above, which are outlined in the General Permit, the following procedures are recommended to maximize the ability of sampling personnel to collect samples reliably and with minimal sample contamination.

- Before stormwater samples are collected, personnel must ensure the safety of such activities at each sampling location.

- Select the appropriate sample bottles and equipment for each parameter to be measured. As general guidelines, all sampling equipment and sample bottles used for trace metals determination should be nonmetallic and free from any material that may contain metals. Only high-density plastic or Teflon containers should be used for metals analytical sample storage bottles. All sampling equipment and sample bottles used for trace organics determination should be glass or Teflon. Nutrients and most "conventional" parameters may be sampled using plastic or glass bottles.

- Employ "clean" sampling techniques to minimize potential sources of sample contamination, particularly from trace pollutants. Experience has shown that when clean sampling techniques are used, detected concentrations of constituents tend to be lower.

5.2 Conduct Record Keeping and Reporting

Records of all stormwater monitoring information, inspections and visual observations, certifications, corrective actions and follow-up activities, and copies of all reports should be retained for a period of at least five years. These records should include:

- The date, place, and time of site inspections, sampling, visual observations, and measurements

- The individual(s) who performed the site inspections, sampling, visual observations, and measurements

- Flow measurements or estimates (as required by Section B.6 of the General Permit)

- The date and approximate time of analyses

- The individual who performed the analyses

- Analytical results, method detection limits, and the analytical techniques or methods used

- Quality assurance and quality control records and results

- Non-stormwater discharge inspections and visual observations and stormwater discharge visual observation records

- Visual observations and sample collection exception records

- All calibration and maintenance records of onsite instruments used

- All sampling and analysis exemption and reduction certifications and supporting documentation

- The records of any corrective actions and follow-up activities that resulted from the visual observations

It is also recommended that information regarding the rain event be collected. A nearby recording gage should be identified and used to document the start and stop times and date of precipitation event. Some industries may want to consider installing a recording gage at the monitoring site.

Photographs can be useful. Also keep a record of maintenance activities or any other BMPs that are of an "action" nature. It is easy to demonstrate that a BMP that involves a physical change, such as berming or covering, has been accomplished. But actions that relate to good housekeeping can only be demonstrated by record keeping. Keeping a record of catch basin cleaning, for example, also provides insight into how soon it takes for the catch basin sump to refill.

An Annual Report including the items listed below should be submitted by July 1 of each year to the Executive Officer of the appropriate RWQCB.

- Summary of visual observations and sampling results

- Evaluation of the visual observations and sampling and analysis results

- Documentation that the BMPs in the SWPPP are being implemented and properly maintained as necessary

- Laboratory reports (including detection limits for each analytical parameter)

- The Annual Comprehensive Site Compliance Evaluation Report (as described below)

- Documentation, including the justification, of any deviations from the General Permit requirements (if not already included in the Evaluation Report)

- Records

- Detection limits for each analytical parameter

5.3 Conduct Annual Site Evaluation

All facilities should conduct an annual comprehensive site compliance evaluation. It may be helpful to involve the Pollution Prevention Team (PPT) in this effort (see Section 2). The SWPPP should be revised within 90 days of the evaluation based on the evaluation and the revisions implemented. Evaluations should include the following:

- A review of the results of visual inspections of potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system

- A review of visual observation records, inspection records, and sampling and analysis results
- A review and evaluation of each BMP to determine whether it is adequate, properly implemented, and maintained
- A review of site activities to ascertain if change has occurred, and if so, whether new or modified BMPs are needed
- A review of the list of significant materials to ascertain if the list has changed, and if so, whether new or modified BMPs are needed
- A review of spills that have occurred over the past 12 months, with a determination of cause(s) and possible solutions, including modified or new BMPs
- A determination of whether each BMP must be modified, replaced, and whether additional BMPs are needed
- An evaluation report

Appendix J

Land Use Plan Policy Consistency Analysis Tables

Appendix J
Land Use Plan Policy Consistency Analysis Tables

Table J-1
PROJECT CONSISTENCY WITH SCAG CONNECT SOCAL 2020-2045 RTP/SCS GOALS

RTP/SCS Goal	Project Consistency
1. Encourage regional economic prosperity and global competitiveness	**Consistent.** The Project would provide an industrial use at a site zoned for and currently used for industrial uses. The area roadways proposed for use for Project truck traffic are designated truck routes in the City. The Project would contribute to overall regional economic prosperity by providing additional employment opportunities, utilizing local vendors and support service providers, and increasing the local tax base through sales.
2. Improve mobility, accessibility, reliability, and travel safety for people and goods	**Consistent.** The Project consists of warehouse uses on an existing developed site consistent with land use and zoning designations. The Project would provide a fulfillment center/warehouse in close proximity to regional transportation corridors to facilitate goods movement. Additionally, the Project would utilize an already developed site along one of the City's designated truck routes.
3. Enhance the preservation, security, and resilience of the regional transportation system	**Consistent.** The Project would utilize an already developed site along one of the City's designated truck routes in close proximity to several regional freeways, including Interstates 605, 5, 105, and 710.
4. Increase person and goods movement and travel choices within the transportation system	**Consistent.** The Project would utilize an already developed site along one of the City's designated truck routes and provide a fulfillment center/warehouse in close proximity to regional transportation corridors to facilitate goods movement.
5. Reduce greenhouse gas emissions and improve air quality	**Consistent.** The Project would be designed to achieve 2022 Title 24 energy standards, at a minimum, through implementation of energy-reduction measures, such as energy-efficient lighting and appliances, water-efficient appliances and plumbing fixtures, and water-efficient landscaping and irrigation. The Project would comply with South Coast Air Quality Management District (SCAQMD) rules to reduce air pollution emissions from construction and operation of the Project, including rules 402 (Nuisance), 403 (fugitive dust), and 1113 (architectural coatings).
6. Support healthy and equitable communities	**Consistent.** The Project is an industrial use on a site designated and zoned for industrial uses. As demonstrated in Section 4.2, *Air Quality,* the Project would not result in significant impacts to nearby sensitive receptors related to health and criteria air pollutants. The Project also would not create a

RTP/SCS Goal	Project Consistency
	significant hazard to the community through the use of acutely hazardous materials. No adverse health impacts to the community related to on-site contaminated soils or hazardous building materials would occur due to the ongoing remediation that would continue upon Project implementation under the oversight of the Los Angeles Regional Water Quality Control Board, as well as mitigation measures identified in Section 4,7, *Hazards and Hazardous Materials.* Environmental impacts and benefits resulting from the Project would occur to all populations within the surrounding community and would not fall disproportionately on areas of the community considered disadvantaged. As such, the Project would not detract from the health and equity of the community**.**
7. Adapt to a changing climate and support an integrated regional development pattern and transportation network	**Consistent.** The Project would occur on a site zoned and designated for industrial uses. The Project would replace existing older industrial metal/brick buildings with a new, modern concrete tilt-up building that would be constructed in accordance with the requirements of Title 24, which regulates green building practices and includes standards for planning and design, water efficiency, material conservation and resource efficiency, and environmental quality. The proposed building would incorporate several sustainability features such as solar and electric vehicle infrastructure and would achieve a LEED Silver certification. In addition, the Project site is in close proximity to several freeways to facilitate access and use of the regional transportation network.
8. Leverage new transportation technologies and data-driven solutions that result in more efficient travel	**Consistent.** The Project consists of an industrial use on a developed site zoned and designated for industrial uses. The Project would include electric vehicle charging infrastructure to support transportation technologies that provide more efficient travel. The Project also would implement a Transportation Demand Management (TDM) Program as mitigation (refer to Section 4.11, *Transportation*, that would include transportation programs such as ridesharing, transit incentives, and bicycle facilities to reduce regional vehicle miles traveled (VMT) and improve travel efficiency.
10. Promote conservation of natural and agricultural lands and restoration of habitats	**Consistent.** The Project is located on an existing industrial parcel that is completely developed and does not contain natural or agricultural lands, nor would it support restored habitat.

Table J-2
PROJECT CONSISTENCY WITH DOWNEY GENERAL PLAN VISION 2025 GOALS, POLICIES, AND PROGRAMS

General Plan Goal, Policy, or Program	Project Consistency
Land Use Element	
Goal 1.1. Provide sufficient land areas for uses that serve the needs of residents, visitors, and businesses. ***Policy 1.1.1.*** Maintain a balance of land uses. • Program 1.1.1.1. Discourage the over-concentration of a particular land use that will preclude the establishment of other uses needed to serve the community. • Program 1.1.1.3. Adopt floor-area ratios (FAR) or comparable method to address building intensity for each zoning classification. • Program 1.1.1.4. Discourage non-industrial uses into areas designated for industrial uses.	**Consistent.** The Project would continue the industrial use of the Project site, consistent with the existing General Plan Land Use and Zoning designations. The Project site is located in an existing industrial area and would maintain the balance of land uses within the City.
Goal 1.2. Advance livable community concepts. ***Policy 1.2.1.*** Promote livable communities concepts that allow added flexibility in addressing land use needs. • Program 1.2.1.1. Promote project designs that reduce dependency on vehicles and promote pedestrian, transit, and alternate modes of travel. • Program 1.2.1.6. Promote the placement of buildings at or near the public right-of-way with a primary or secondary entryway facing the sidewalk.	**Consistent.** While the Project would include truck traffic due to its warehouse uses, the Project does include components in support of this goal and policy. The Project site is located within one-quarter mile three Metro bus lines. The Project includes improved sidewalks with landscaping and parkway plantings along Hall Road and Stewart and Gray Road for the entire Project site frontage. Additionally, the proposed building would be placed near the public right-of-way on Stewart and Gray Road, with a primary entrance facing the sidewalk along Stewart and Gray Road.
Circulation Element	
Goal 2.1. Increase the capacity of the existing street system. ***Policy 2.1.2.*** Promote improvements in the street system through the development process. • Program 2.1.2.3. Reduce the number of driveway access points on streets. • Program 2.1.2.5. Discourage projects that generate high amounts of traffic onto local and collector streets. • Program 2.1.1.6. Identify and concentrate land uses with high traffic generation near major transportation corridors and public transit facilities.	**Consistent.** There are currently seven driveway access points to the site. Four occur along Stewart and Gray Road and three occur on Hall Road. The Project site would reduce the number of driveway access points to the site with two along Stewart and Gray Road and the existing three along Hall Road. While the Project would generate additional traffic trips, due to its warehouse/logistics uses, the Project is located in close proximity to several freeways (Interstates 605, 5 105, and 710), which would limit travel on local roadways. Truck traffic would utilize designated truck routes to access the Project site and freeways.

General Plan Goal, Policy, or Program	Project Consistency
Goal 2.2. Promote the use of alternative modes of travel, other than single-occupant vehicles, to relieve traffic congestion. ***Policy 2.2.1.*** Promote walking as an attractive alternative to vehicular transportation. • Program 2.2.1.1. Promote site development design that is safe and convenient to pedestrians. • Program 2.2.1.2. Provide sidewalks in new development and major remodeling consistent with the sidewalk Master Plan.	**Consistent.** Sidewalks are present on streets surrounding the Project site, providing pedestrian access to the site; however, the Project would provide improved sidewalks with landscaping and parkway plantings along Hall Road and Stewart and Gray Road for the entire Project site frontage. The Project site is located within one-quarter mile of three Metro bus lines, which would provide Project employees with access to alternative transportation modes. The Project would implement a TDM Program to reduce transportation VMT impacts, which would include measures to promote alternative transportation modes.
Policy 2.2.2. Promote bicycling as an attractive alternative to vehicular transportation. • Program 2.2.2.3. Promote the provision of bicycle racks at retail service and other businesses for use by customers and employees. • Program 2.2.2.4. Encourage the provision of showers, changing rooms, and bicycle storage areas at retail, office, industrial, and other businesses for use by employees.	**Consistent.** The Project would implement a TDM Program to reduce transportation VMT impacts, which would include measures to promote alternative transportation modes, including the provision of bicycle racks, bicycle storage areas, showers, and changing rooms.
Goal 2.3. Reduce adverse impacts from truck traffic. ***Policy 2.3.1.*** Promote the safe and efficient movement of truck traffic through the City. • Program 2.3.1.1. Enforce truck traffic to use designated truck routes in the City. • Program 2.3.1.5. Support truck mobility efforts to keep container truck traffic traveling through the region on freeways.	**Consistent.** The Project site is located in close proximity to several freeways (Interstates 605, 5 105, and 710) which would facilitate access to and use of regional freeways. Trucks would utilize the City's designated truck routes to access the freeways. The designated truck routes in the area include Stewart and Gray Road, which connects to both Woodruff Avenue and Firestone Boulevard to the east, both of which are also designated truck routes; Firestone Boulevard provides direct access to I-605 east of the Project site. Other designated truck routes include Bellflower Boulevard and Lakewood Boulevard to the west of the Project site; Lakewood Boulevard provides direct access to I-105 to the south of the Project site and to I-5 to the north of the Project site.

General Plan Goal, Policy, or Program	Project Consistency
Policy 2.3.2. Minimize negative impacts associated with truck traffic. • Program 2.3.2.1. Discourage truck parking on public streets. • Program 2.3.2.2. Maintain landscape islands on and/or adjacent to truck routes with mature specimen fully grown landscape screens to minimize noise, dust, and visual impacts. • Program 2.3.2.3. Promote property development designs along truck routes that minimize noise, dust, and visual impacts through the use of berms, landscape screening, walls, and other design features. • Program 2.3.2.4. Ensure that land uses generating high amounts of truck traffic provide compensation to the city for projected pavement wear of public streets.	**Consistent.** The Project would provide 255 trailer parking stalls, which is well in excess of the required 46 trailer stalls. Thus, the Project would not result in the need for truck parking on public streets. The Project would include landscaping and parkway plantings along Hall Road and Stewart and Gray Road (a designated truck route) for the entire Project site frontage. The Project would comply with City requirements, including compensation for projected pavement wear, if applicable.
Policy 2.3.3. Discourage land uses that generate high amounts of truck traffic. • Program 2.3.3.1. Discourage land uses that attract high amounts of truck traffic without corresponding benefits to the community. • Program 2.3.3.2. Provide discretionary approvals for land uses generating high amounts of truck traffic, including general warehouses, truck parking, truck company headquarters, and distribution centers.	**Consistent.** The Project consists of a new industrial building intended to be used for logistics and distribution purposes, and specifically as a fulfillment center and for cold storage. The proposed facility is intended to operate 24 hours a day, 7 days a week. The Project would result in increased truck traffic trips. Over a 24-hour period, the Project is forecast to result in an increase of 167 passenger car equivalent adjusted vehicles trips during a typical weekday, consisting of approximately 84 more inbound trips and 84 more outbound trips. These Project trips would not result in substantial congestion of local roadways. As discussed in Section 4.11, *Transportation*, analyzed intersections in the Project vicinity that are part of the City's Circulation Element roadway network would operate at acceptable conditions consistent with General Plan standards. The Project would provide additional industrial sector uses that provide goods movement services and employment opportunities for the community and region. The Project is subject to the City's discretionary approval process to identify and minimize potential impacts.

General Plan Goal, Policy, or Program	Project Consistency
Goal 2.5. Minimize the impacts from the lack of parking. ***Policy 2.5.1*** Provide for adequate parking supply to meet parking demands. • Program 2.5.1.4. Maximize off-street parking to minimize demands on on-street parking. • Program 2.5.1.5. Minimize parking demand spillover effects onto adjacent streets and properties. • Program 2.5.1.8. Promote safe and efficient design for parking areas. • Program 2.5.1.9. Provide adequate on-site loading areas so that parking areas are not impacted by loading activities.	**Consistent.** The Project would provide adequate on-site parking in excess of City requirements such that it would not increase the demand for on-street parking. The Project would require 670 parking stalls for the proposed warehouse use (including the office portion of the warehouse), and would provide 544 parking stalls, plus an additional 139 stalls in lieu of trailer parking, resulting in a total of 683 parking stalls. Additionally, required trailing parking is 46 trailer parking stalls, but the Project would provide 255 trailer parking stalls.
Housing Element	
No goals, policies, or programs from the Housing Element are applicable to the proposed Project.	
Conservation Element	
Goal 4.1. Provide an adequate water supply for the needs of residents, workers, and visitors to the City. ***Policy 4.1.1.*** Promote conservation of water resources. • Program 4.1.1.4. Encourage the use of reclaimed water, or re-use of water on-site, for new and redevelopment projects. • Program 4.1.1.6. Promote drought-tolerant plants, rain sensors, moisture sensors and other water conservation methods for plant landscaping projects. • Program 4.1.1. 7. Promote water conserving appliances, equipment, and plumbing fixtures for new developments and remodels.	**Consistent.** The Project would comply with California Code of Regulations Title 24, and would utilize low-flow faucets, toilets, and irrigation. Drought-tolerant landscaping would be utilized in the Project design and would be installed around the building and at the Project site's perimeter.

General Plan Goal, Policy, or Program	Project Consistency
Goal 4.2. Prevent the contamination of groundwater. ***Policy 4.2.1.*** Monitor and improve groundwater quality. • Program 4.2.1.3. Coordinate with local, regional, state, and federal efforts to protect the groundwater supply and enhance groundwater quality. • Program 4.2.1.4. Discourage business practices and land use classes that contribute to soil contamination that degrade groundwater quality.	**Consistent.** The Project site is the subject of ongoing groundwater monitoring, due to existing volatile organic compound (VOC) contamination in the groundwater beneath the Project site. Groundwater monitoring wells are present at the Project site. Ongoing monitoring and remediation would continue upon Project implementation under the oversight of the Los Angeles Regional Water Quality Control Board, as well as implementation of mitigation measures identified in Section 4,7, *Hazards and Hazardous Materials,* to improve groundwater quality. The Project would develop and submit a project-specific Stormwater Pollution Prevention Plan (SWPPP) to comply with the requirements of the National Pollutant Discharge Elimination System (NPDES) Construction General Permit and would implement Best Management Practices (BMPs) to minimize pollutant release during Project construction. Further, to reduce the potential for pollutants from operational activities to enter groundwater or surface waters, the Project would implement measures in accordance with local and regional water quality requirements, including an on-site stormwater treatment system.
Goal 4.3. Reduce the contaminant level at beaches and oceans. ***Policy 4.3.1.*** Reduce the contaminant level of stormwater and urban runoff generated within Downey. • Program 4.3.1.1. Provide treatment of runoff generated by properties on-site before release into the storm drain system. • Program 4.3.1.4. Encourage proper storage and handling of construction materials to avoid the contact of pollutants with storm water runoff during construction.	**Consistent.** The Project would incorporate treatment of stormwater runoff. During construction, the Project SWPPP would identify BMPs, which may include the use of silt fences, sandbag barriers, and/or ground covers to control stormwater runoff. During the long-term operation of the Project, surface runoff would be collected for the two drainage management areas (DMAs) on the Project site, via a series of drop inlets. Within each DMA, drop inlets would route runoff to an underground detention vault prior to entering an on-site stormwater treatment system with a 96-hour drawdown time. After treatment, flows would be pumped off-site to spill to grade at the Project driveway, discharging into the City stormwater system.

General Plan Goal, Policy, or Program	Project Consistency
Goal 4.4. Preserve trees wherever possible. ***Policy 4.4.1.*** Preserve trees on private and public property. • Program 4.4.1.1. Discourage the removal of trees on private and public property. • Program 4.4.1.2. Adopt a tree preservation ordinance requiring a permit to remove mature trees.	**Consistent.** The Project site is fully developed and contains very few trees. Approximately half a dozen trees are located in the northern portion of the site, around the northern part of the building at 9300 Hall Road. These trees would be removed to accommodate the Project. Additional trees are present along the Project site boundary with Hall Road, including six mature trees that would remain in place, along northern segment of the Project boundary between the western Project boundary and the western driveway to Hall Road. For the portion of the Project boundary along Hall Road, between the western driveway to Hall Road and Hall Road/Woodruff Avenue intersection, there are approximately 15 trees that would be removed; however, these trees are smaller in size than the trees to be retained, and are scattered at uneven intervals along the Project boundary. These would be removed and replaced with 23 camphor trees which would provide a more consistent and uniform landscape along this Project boundary. Further, the Project landscape plan includes new trees lining the southern Project boundary, and throughout the Project parking areas fronting Stewart and Gray Road. In total, the Project would include removal of approximately 21 trees; retaining 6 existing trees; and planting 18 48-inch box trees, 18 36-inch box trees, 119 24-inch box trees, and 21 15-gallon trees. The Project would be required to obtain a tree removal permit from the City to remove street trees as part of Project implementation. While the Project would result in the removal of trees to implement the Project, it does retain the largest trees in the northwestern corner of the site.

General Plan Goal, Policy, or Program	Project Consistency
Goal 4.5. Encourage activities that improve air quality. ***Policy 4.5.1.*** Pursue every available means and opportunities to reduce air particulate and pollutants within the city and region. • Program 4.5.1.2. Support regional and subregional efforts in strategically managing goods movements in order to reduce emissions from truck traffic. • Program 4.5.1.3. Reduce air particulate and other pollutants created by, but not limited to the operation of diesel engine and increased truck traffic from marine and port operations in the Long Beach and Los Angeles ports and City operations, especially along the 1-710 freeway corridor. • Program 4.5.1.4. Encourage alternative modes of travel, such as walking and cycling, to vehicle use and alternative modes of employment, such as telecommuting and home-based businesses, to reduce emissions associated with vehicle use.	**Consistent.** The Project would comply with South Coast Air Quality Management District (SCAQMD) rules to reduce air pollution emissions from construction and operation of the Project, including rules 402 (Nuisance), 403 (fugitive dust), and 1113 (architectural coatings). A Project-specific air quality impact analysis that includes analysis of construction and operational air quality impacts has been prepared for the Project and is the basis of the analysis contained in Section 4.2, *Air Quality*. As discussed therein, the Project would not result in significant air quality impacts. Refer to Circulation Element Goal 2.2 with regard to supporting alternative transportation modes.
Goal 4.6. Conserve energy resources. ***Policy 4.6.1.*** Promote the conservation of energy by residents and businesses to conserve energy. • Program 4.6.1.1. Provide incentives for people to use renewal energy sources such as solar energy.	**Consistent.** The Project would remove existing on-site buildings and replace them with a newly constructed, single building, which would incorporate updated technology, including improved energy efficiency. The Project would be constructed consistent with the requirements of Title 24, which regulates green building practices and includes standards for planning and design, water efficiency, material conservation and resource efficiency, and environmental quality. The proposed building would incorporate several sustainability features such as solar and electric vehicle infrastructure and would achieve a LEED Silver certification.
Goal 4. 7. Provide efficient and low-cost solid waste disposal. ***Policy 4.7.1.*** Reduce the amount of solid waste generated within the City. • Program 4.7.1.2. Encourage recycling and source reduction to divert recyclable and reusable materials from the solid waste sent to landfills.	**Consistent.** The proposed Project would be required to comply with applicable practices enacted by the City under the California Integrated Waste Management Act of 1989 (AB 939) and any other applicable local, State, and federal solid waste management regulations. The DMC requires that 100 percent of inert debris and at least 50 percent of the remaining construction and demolition debris generated during a construction or demolition project, be diverted from landfill. The Project would comply with applicable regulatory requirements regarding solid waste.

General Plan Goal, Policy, or Program	Project Consistency
Safety Element	
Goal 5.2. Protect the health, safety, and welfare of residents, workers, and visitors from the improper use, storage, handling, and disposal of hazardous materials. ***Policy 5.2.1.*** Monitor the generation, storage, and disposal of hazardous materials. • Program 5.2.1.1. Monitor inactive, active, or potential hazardous material contaminated properties, including the closed landfill at Rio San Gabriel Park for odor and toxic gases.	**Consistent.** The Project does not propose handling substantial amounts of hazardous materials. Some hazardous substances typical of warehouse operations would be used (e.g., cleaning agents, oils) but not the type or quantity that would create a significant health or safety risk. Use of hazardous materials would occur in compliance with applicable regulatory requirements. Due to the historic use of the Project site for manufacturing activities, and associated use of hazardous materials in various manufacturing processes, the soil and groundwater beneath the site have been exposed to various constituents that are now the subject of a voluntary cleanup effort by the property owner. No adverse health impacts to the community related to on-site contaminated soils or hazardous building materials would occur due to the ongoing remediation that would continue upon Project implementation under the oversight of the Los Angeles Regional Water Quality Control Board, as well as mitigation measures identified in Section 4,7, *Hazards and Hazardous Materials.*
Goal 5.3. Maintain and improve fire protection services. ***Policy 5.3.1.*** Provide adequate response to fire emergencies. • Program 5.3.1.2. Promote adequate widths on travel lanes along street and alleys to accommodate emergency vehicles. • Program 5.3.1.3. Promote the design of private properties with fire lane width and turnaround capability appropriate for emergency vehicle access.	**Consistent.** The Project would provide a series of 26-foot-wide fire lanes throughout the Project site to allow for emergency vehicle access.
Goal 5.5. Address the potential hazards associated with seismic activity. ***Policy 5.5.1.*** Minimize damage in the event of a major earthquake. • Program 5.5.1.4. Ensure the preparation of geotechnical reports for developments to address soil liquefaction hazards.	**Consistent.** The Project would be designed and constructed in compliance with the Downey Building Code and the California Building Code to ensure hazards from seismic activity are minimized. Additionally, Project design and construction would incorporate Project-specific geotechnical recommendations for site preparation and building construction.

General Plan Goal, Policy, or Program	Project Consistency
Goal 5.6. Minimize potential adverse impacts from flooding. ***Policy 5.6.2.*** Minimize the potential for flooding due to stormwater generation. • Program 5.6.2.1. Minimize increases in the amount of stormwater generated by existing and proposed land uses.	**Consistent.** The Project would result in a decrease in stormwater runoff as compared to the existing condition. The Project would decrease impervious surfaces at the Project site by 1.13 acres, reducing the surface runoff generated by stormwater. Runoff would be collected and treated on site prior to release to the City stormwater system.
Goal 5. 7. Reduce the likelihood of traffic accidents. ***Policy 5. 7 .1.*** Promote traffic safety along streets. • Program 5. 7.1.3. Promote street design that impedes the use of local residential streets as bypass and through routes. • Program 5. 7.1.6. Promote the parking and access agreements and parking consolidation to reduce the number of driveway access points on streets. • Program 5.7.1.7. Provide for vehicles to enter onto streets in a perpendicular manner. • Program 5.7.1.8. Promote designs to provide for vehicles to enter onto streets in a forward manner.	**Consistent.** Project trucks would utilize the City's designated truck routes to access the freeways and would not use local residential streets as bypass and through routes. Parking would be provided on site consistent with the City's parking standards. Vehicles entering and exiting the Project site would enter the streets in a perpendicular, forward manner utilizing one of the five Project driveways.
Policy 5.7.2. Promote the installation of sidewalks and walkways to improve traffic safety. • Program 5.7.2.2. Encourage the installation of sidewalks in new developments and major remodeling consistent with the sidewalk Master Plan. • Program 5.7.2.4. Promote internal walkways and bikeways on private property that are safe and convenient to bicyclists.	**Consistent.** Sidewalks are present on all streets surrounding the Project site; however, the Project would provide improved sidewalks with landscaping and parkway plantings along Hall Road and Stewart and Gray Road for the entire Project site frontage.
Noise Element	
Goal 6.1. Protect persons from exposure to excessive noise. ***Policy 6.1.1.*** Minimize noise impacts onto noise-sensitive uses. • Program 6.1.1.1. Enforce noise standards. • Program 6.1.1.2. Ensure that new developments within areas with exterior noise at unacceptable levels are designed to maintain interior noise levels at acceptable levels. • Program 6.1.1.3. Continue to enforce provisions prohibiting construction activities during noise-sensitive hours.	**Consistent.** The Project consists of a warehouse/ logistics use that would operate 24 hours per day that is located in an area comprised of various uses, including noise-sensitive land uses (NSLUs). The closest NSLU to the Project site is a single-family home located approximately 240 feet east of the Project site, across Hall Road, Woodruff Avenue, and the Union Pacific Railroad corridor. In addition, multi-family residences are located approximately 250 feet southwest of the Project site, across Stewart and Gray Road. There are also single-family residences located approximately 300 feet west of the Project site and multi-family residences located approximately 320 feet east of the Project site, but these are substantially shielded from noise on the Project site by large existing industrial/commercial buildings.

General Plan Goal, Policy, or Program	Project Consistency
	As discussed in Section 4.10, *Noise*, the Project would not result in significant noise impacts with regard to construction traffic noise, on-site operational noise, and operational traffic noise. The Project would also comply with City requirements for construction-related noise, including adhering to the requirements of Section 4606.5 of the DMC, which prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. unless granted a permit from the City. Project construction would occur within the allowable daytime hours with the exception of concrete pours for the building slabs and tilt-up walls, which are typically done at night for these types of structures primarily due to temperature/weather conditions. The Project includes a special permit request from the City for limited nighttime construction activities for concrete pours. As detailed in Section 4.10, noise levels at some of the nearby NSLUs may be in excess of 10 dBA over existing ambient levels during the limited concrete pours. Mitigation is identified that includes advanced notification to NSLUs within a 300-foot radius of the Project site of the anticipated nighttime construction activities and a noise complaint line. While the issuance of a special permit, which would have specific provisions/requirements, and implementation of this mitigation measure would minimize temporary construction noise impacts to surrounding NSLUs, impacts would be considered significant and unavoidable because it cannot be guaranteed that nighttime noise levels would be reduced to below 10 dBA over existing ambient levels. The Project, however, would be consistent with this goal because nighttime construction activities would be conducted in accordance with City provisions/ procedures per the DMC and would implement measures to reduce/minimize noise impacts.

General Plan Goal, Policy, or Program	Project Consistency
Goal 6.2. Protect persons from exposure to excessive noise generated by various modes of transportation. ***Policy 6.2.1.*** Reduce noise generated by vehicular traffic. • Program 6.2.1.2. Enforce regulations to require truck traffic to use designated truck routes in the City.	**Consistent.** As discussed in Section 4.10, *Noise*, the Project would not result in significant noise impacts with regard to construction traffic noise or operational traffic noise. Project trucks would utilize the City's designated truck routes to access the freeways. The designated truck routes in the area include Stewart and Gray Road, which connects to both Woodruff Avenue and Firestone Boulevard to the east, both of which are also designated truck routes; Firestone Boulevard provides direct access to I-605 east of the Project site. Other designated truck routes include Bellflower Boulevard and Lakewood Boulevard to the west of the Project site; Lakewood Boulevard provides direct access to I-105 to the south of the Project site and to I-5 to the north of the Project site.
Goal 6.3. Minimize noise impacts on noise-sensitive land uses. ***Policy 6.3.1.*** Minimize the amount of noise generated by land uses. • Program 6.3.1.3. Concentrate land uses that generate high amount of traffic at locations where local residential streets will not be used as through traffic routes, thus creating more traffic-related noise. • Program 6.3.1.5. Discourage loading doors, windows, and other openings on buildings from facing residential and other noise-sensitive land uses. • Program 6.3.1.6. Discourage the placement of air conditioning equipment, electric generators, or other noise-generating equipment in close proximity to adjacent properties. • Program 6.3.1.7. Encourage that activities be maintained indoors to reduce noise impacts onto adjacent properties. • Program 6.3.1.9. Concentrate construction activities producing the most noise during midday hours to minimize impacts onto nearby residents.	**Consistent.** As discussed in Section 4.10, *Noise*, the Project would not result in significant noise impacts with regard to construction traffic noise, on-site operational noise, and operational traffic noise. Project trucks would utilize the City's designated truck routes to access the freeways and would not utilize local residential streets for through traffic routes. The Project would occur on an existing industrial site, and is not directly adjacent to residential or other NSLUs and thus, would not have loading doors, windows, and other openings facing NSLUs. On-site noise-generating equipment, such as HVAC units, refrigeration condensers, would be placed on rooftops and not in close proximity to adjacent properties. Besides loading at the docks, proposed operational activities would be conducted within the interior of the proposed building. As previously stated, operational noise impacts were assessed as less than significant and would not adversely impact adjacent properties. With regard to construction noise, the noisiest anticipated construction activity would be during site preparation and demolition of the existing buildings, which would occur during the allowable daytime hours.
Open Space Element	
No goals, policies, or programs from the Open Space Element are applicable to the proposed Project.	

General Plan Goal, Policy, or Program	Project Consistency
Design Element	
Goal 8.1. Promote quality design for new, expanded, and remodeled construction. ***Policy 8.1.1.*** Promote architectural design of the highest quality. • Program 8.1.1.1. Discourage construction with architectural design of poor quality. • Program 8.1.1.5. Encourage applicants to use licensed professionals to prepare architectural and landscaping plans. • Program 8.1.1.6. Encourage developments to be "internally compatible" in architectural design. • Program 8.1.1.8. Promote good quality sign design.	**Consistent.** The Project would remove the existing structures, which are older metal and brick buildings with an overall inconsistent design themes, and are surrounded by extensive parking and fencing. The new structure would provide a more cohesive visual character compared to the existing condition. The Project would improve visual quality from public viewpoints by removing security fencing, providing a single building with modernized architectural design, and installing landscaping within and at the borders of the Project site.
Goal 8.3. Promote the enhancement of the streetscape. ***Policy 8.3.1.*** Enhance the views of property from public streets to exhibit a positive image. • Program 8.3.1.1. Promote prevailing street yard setbacks for buildings consistent with adjacent properties. • Program 8.3.1.2. Maximize the landscaped setback on street yard setbacks. • Program 8.3.1.3. Minimize the amount of pavement and other non-plant material along the street yard setbacks. • Program 8.3.1.5. Discourage security devices and fence/wall designs that portray an image that the community is unfriendly and uninviting.	**Consistent.** The Project would improve visual quality of the site from public viewpoints (adjacent Hall Road and Stewart and Gray Road) by removing security fencing, providing a single building with modernized architectural design, and installing landscaping within and at the borders of the Project site. The proposed landscaping would provide trees along the northern and southern Project boundaries, adjacent to Hall Road and Stewart and Gray Road, enhancing the views of the Project site from these public roads.
Policy 8.3.3. Promote the installation of new trees. • Program 8.3.3.1. Promote the installation of new trees throughout the City, but especially where visible from the street.	**Consistent.** Trees would be placed along the northern and southern Project boundaries, adjacent to Hall Road and Stewart and Gray Road. Additionally, new trees would be placed in the northern and southern portions of the Project site, within sparking areas, around building entrances, and along the southern wall of the proposed building.

General Plan Goal, Policy, or Program	Project Consistency
Goal 8.4. Enhance Downey's cultural resources. ***Policy 8.4.1.*** Identify the city's cultural resources. • Program 8.4.1.1. Conduct a survey to identify historic and architecturally significant structures, locations, and archeological resources. • Program 8.4.1.2. Seek listing for appropriate properties on the National Register of Historic Places and the California State Register of Historic Resources.	**Consistent.** A Cultural Resources Report has been prepared for the Project, which included a survey, records search, and an evaluation of the existing on-site buildings to identify if cultural resources are present on or adjacent to the site. Based on the results of this analysis, the Project would not impact any known cultural resources. Mitigation measures are identified in Section 4.3, Cultural Resources, to address unknown subsurface resources if encountered during Project construction.
Economic Development	
Goal 9.1. Attract and retain businesses. ***Policy 9.1.1.*** Develop programs to attract and retain businesses. • Program 9.1.1.5. Continue the revitalization of commercial and industrial corridors.	**Consistent.** The Project would attract a new business to the Project site, which is in an existing industrial area. The Project would revitalize the site with the new proposed structure, eliminating the piece-meal appearance of the site caused by multiple older buildings, outdoor storage, and fencing, and would provide a cohesive development, in support of revitalizing this industrial portion of the City.
Goal 9.2. Promote Downey as an employment center. ***Policy 9.2.1.*** Promote job-generating land uses. • Program 9.2.1.1. Discourage nonresidential land uses that do not produce jobs. • Program 9.2.1.2. Promote employment centers that have potential to serve as catalyst for the creation of additional jobs. • Program 9.2.1.3. Promote employment that increases the daytime population of the city creating customer demand for other businesses.	**Consistent.** The Project would continue to provide jobs associated with industrial land uses at the Project site. The Project is expected to create approximately 300 construction jobs and approximately 250 permanent jobs.
Policy 9.2.2. Promote employment in various economic sectors to shield against business cycles. • Program 9.2.2.1. Promote a diversified employment base with jobs in sectors in addition to retail sales.	**Consistent.** The Project would continue to provide jobs associated with industrial land uses at the Project site. The Project is expected to create approximately 300 construction jobs and approximately 250 permanent jobs.
Goal 9.3. Ensure the continued fiscal balance of the community. ***Policy 9.3.1.*** Balance the maximization of revenue generation with costs for providing services. • Program 9.3.1.1. Encourage land uses that generate property tax and sales tax revenue.	**Consistent.** The Project consists of a land use that would continue to generate property tax and sales tax revenue.

EXECUTIVE SUMMARY

This report assesses potential construction and operational noise impacts associated with Prologis Stewart and Gray Road Warehouse Project (project) located in the City of Downey, (City) California. The project would replace the existing businesses on the project site, remove five existing buildings totaling approximately 433,000 square feet (SF), and construct and operate an approximately 535,685-SF industrial concrete tilt-up building for warehouse/logistics uses. The new industrial building would be used for logistics and distribution purposes, and specifically as a fulfillment center and for cold storage. Approximately 95 percent of the warehouse would be high cube fulfillment and the remaining 5 percent would be for cold storage (i.e., refrigerated warehouse space).

Per the City Municipal Code, construction noise is exempt from the provisions of City Noise Ordinances provided a valid permit for such construction has been obtained from the City and the construction activity does not occur outside the hours of 7 a.m. to 9 p.m. However, construction activity which results in a 10 dBA or more increase in ambient noise levels would be potentially significant. Anticipated site preparation/demolition and earthmoving activities would generate temporary elevated noise levels for residential uses approximately 290 feet south of the project site. Project site preparation/demolition and earthmoving noise would not result in a significant increase over daytime ambient noise levels. However, nighttime site preparation/demolition and earthmoving could result in a potentially significant increase in ambient noise levels for the residences south of the project site. Due to potentially high daytime temperatures, pouring of concrete for the project building and sidewalks could be required to occur at night. Nighttime concrete pouring work could result in a potentially significant temporary construction noise increase over ambient noise levels for residences within 300 feet of the project site. Mitigation measure NOI-01 would limit project construction to the hours between 7 a.m. and 9 p.m., in accordance with the City Noise Ordinance, and prohibit construction on Sundays and City recognized holidays. If nighttime concrete pouring work is required, mitigation measure NOI-01 requires prior notification of all affected residences within 300 feet of the project site, and the logging of noise complaints. While mitigation measure NOI-01 would inform residents of the potential timing and duration of disturbance, the mitigation would not reduce the project construction noise to acceptable limits. Project temporary construction noise impacts would therefore be significant and unavoidable.

Operational noise sources would include ventilation and refrigeration equipment on the project's rooftop, trucks circulating on the project site, transport refrigeration units (TRUs) used on the project site, and loading docks (truck idling and truck backup alarms). Operational noise produced on the project site would not exceed the City daytime or nighttime noise standards measured at surrounding land uses. Noise generated by project traffic would not increase noise levels on nearby roadways by significant amounts. Therefore, project operational noise impacts would less than significant.

Project construction would not result in significant vibrations affecting nearby residents or damaging nearby buildings. Project operations would not be a significant source of vibrations. Therefore, project vibration impacts would be less than significant.

Although aircraft overflights are common in the Downey area, particularly overflights by commercial aircraft approaching Los Angeles International Airport, the project site is not located within the influence area or the noise contours for any area airports. Therefore, persons residing or working in the project area would not be exposed to substantial noise from airports or aircraft.

This page intentionally left blank

1.0 INTRODUCTION

This report assesses the potential noise impacts that would be associated with construction noise, operational noise, and project-generated traffic noise for the Prologis Stewart and Gray Road Warehouse Project (project). The analysis includes a description of existing conditions in the project vicinity, an assessment of potential impacts associated with project construction, and an evaluation of project operational impacts. Analysis within this report addresses the relevant issues listed in Appendix G of the California Environmental Quality Act (CEQA) Guidelines.

1.1 PROJECT LOCATION

The approximately 29.16-acre project site is located in the southeastern portion of the City of Downey (City) in southwestern Los Angeles County. The project site is located approximately ten miles southeast of downtown Los Angeles and nine miles northwest of the County of Orange. Regional access is provided via the following freeways: the Santa Ana Freeway (Interstate 5 [I-5]), the San Gabriel Freeway (I-605), the Century Freeway (I-105), and the Long Beach Freeway (I-710). Primary vehicular access to the project site is provided by Stewart and Gray Road and Hall Road. See Figure 1, *Regional Location* and Figure 2, *Aerial Photograph*.

1.2 PROJECT DESCRIPTION

The project would remove existing buildings totaling approximately 433,000 square feet (SF) on the project site and construct and operate an approximately 535,685 SF industrial concrete tilt-up building for warehouse/logistics uses. The project would include 683 auto parking spaces, 255 trailer and/or container parking spaces and 109 dock loading doors. The new industrial building would be used for logistics and distribution purposes, and specifically as a fulfillment center and for cold storage. Approximately 95 percent of the warehouse (484,605 SF) would be high cube fulfillment and the remaining 5 percent (26,785 SF) would be for cold storage (i.e., refrigerated warehouse space). The facility would also include 20,000 SF of office area and 25,000 SF of mezzanine area within the 535,685-SF building. On-site activities would include storage, distribution, and/or consolidation of manufactured goods, and last-mile fulfillment and delivery; and general industrial/warehouse with refrigeration and cold storage component for the purposes of receiving, storing, shipping of food and/or beverage products. The office space would be used for office uses ancillary to the warehouse operations. See Figure 3, *Site Plan*. The proposed facility would operate 24 hours a day, seven days a week. The project would also include off-site improvements within the right-of-way of Hall Road and Stewart and Gray Road along the project's roadway frontage. Off-site improvements would include underground utilities, project site driveway access, sidewalks, curbs and gutters, landscaping, and lighting.

1.3 CONSTRUCTION ACTIVITIES AND PHASING

Construction of the Project would begin in Spring 2024 with demolition/site preparation to remove all existing on-site structures, paving, and other improvements. Demolition/site preparation would last approximately 4 to 5 months. Following demolition/site preparation, grading, off-site improvements, construction, and paving of the proposed new buildings would begin in late spring 2024 and continue for approximately 14. Construction activities would finish in Spring 2025. Demolition and site preparation

would include the removal of the existing structures on the site totaling approximately 433,000 SF. Approximately 75,000 cubic yards (CY) of soil would be exported from the site during grading.

2.0 ENVIRONMENTAL SETTING

2.1 NOISE AND SOUND LEVEL DESCRIPTORS AND TERMINOLOGY

All noise level or sound level values presented herein are expressed in terms of decibels (dB), with A-weighting (dBA) to approximate the hearing sensitivity of humans. Time-averaged noise levels are expressed by the symbol L_{EQ}, with a specified duration. The Community Noise Equivalent Level (CNEL) is a 24-hour average, where noise levels during the evening hours of 7:00 p.m. to 10:00 p.m. have an added 5 dBA weighting, and sound levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. have an added 10 dBA weighting. This is similar to the Day Night sound level (L_{DN}), which is a 24-hour average with an added 10 dBA weighting on the same nighttime hours but no added weighting on the evening hours. Sound levels expressed in CNEL are always based on dBA. These metrics are used to express noise levels for both measurement and municipal regulations, as well as for land use guidelines and enforcement of noise ordinances.

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air) to a hearing organ, such as a human ear. Noise is defined as loud, unexpected, or annoying sound.

In the science of acoustics, the fundamental model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver contribute to the sound level and characteristics of the noise perceived by the receiver. The field of acoustics deals primarily with the propagation and control of sound.

Continuous sound can be described by frequency (pitch) and amplitude (loudness). A low frequency sound is perceived as low in pitch. Frequency is expressed in terms of cycles per second, or Hertz (Hz) (e.g., a frequency of 250 cycles per second is referred to as 250 Hz). High frequencies are sometimes more conveniently expressed in kilohertz (kHz), or thousands of Hertz. The audible frequency range for humans is generally between 20 Hz and 20,000 Hz.

The amplitude of pressure waves generated by a sound source determines the loudness of that source. A logarithmic scale is used to describe sound pressure level (SPL) in terms of dBA units. The threshold of hearing for the human ear is about 0 dBA, which corresponds to 20 micro Pascals (mPa).

Because decibels are logarithmic units, SPL cannot be added or subtracted through ordinary arithmetic. Under the decibel scale, a doubling of sound energy corresponds to a 3 dBA increase. In other words, when two identical sources are each producing sound of the same loudness, the resulting sound level at a given distance would be 3 dBA higher than one source under the same conditions.

Under controlled conditions in an acoustical laboratory, the trained, healthy human ear is able to discern 1 dBA changes in sound levels, when exposed to steady, single-frequency (“pure-tone”) signals in the mid-frequency (1,000 Hertz [Hz]–8,000 Hz) range. In typical noisy environments, changes in noise of 1 to 2 dBA are generally not perceptible. It is widely accepted, however, that people begin to detect sound level increases of 3 dB in typical noisy environments. Further, a 5 dBA increase is generally

perceived as a distinctly noticeable increase, and a 10 dBA increase is generally perceived as a doubling of loudness.

2.2 GROUNDBORNE VIBRATION DESCRIPTORS AND TERMINOLOGY

Groundborne vibration consists of rapidly fluctuating motions or waves transmitted through the ground with an average motion of zero. Sources of groundborne vibrations include natural phenomena and anthropogenic causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous (e.g., factory machinery) or transient (e.g., explosions). Several different methods are typically used to quantify vibration amplitude. One is the peak particle velocity (PPV); another is the RMS velocity. The PPV is defined as the maximum instantaneous positive or negative peak of the vibration wave. For the purposes of this analysis, a PPV descriptor with units of inches per second (in/sec) is used to evaluate construction-generated vibration for building damage and human complaints. Generally, a PPV of less than 0.08 in/sec does not produce perceptible vibration. At 0.12 PPV in/sec is the level at which there is a risk of architectural damage (e.g., cracking of plaster) to historical buildings and other vibration-sensitive structures and the level at which continuous vibration may become noticeable to building occupants. A level of 0.20 PPV in/sec is commonly used as a threshold for risk of architectural damage to non-engineered timber and masonry buildings (California Department of Transportation [Caltrans] 2020).

2.3 NOISE AND VIBRATION SENSITIVE LAND USES

Noise-sensitive land uses (NSLUs) are land uses that may be subject to stress and/or interference from excessive noise, such as residential dwellings, schools, transient lodging (hotels), hospitals, educational facilities, and libraries. Industrial and commercial land uses are generally not considered sensitive to noise. Noise receptors are individual locations that may be affected by noise. The nearest NSLU is a single-family home located approximately 240 feet east of the project site, across Hall Road, Woodruff Avenue, and the Union Pacific Railroad corridor. Additional nearby NSLUs include multi-family residences are located approximately 290 feet southwest of the project site, across Stewart and Gray Road; single-family residences are located approximately 300 feet west of the project site beyond a row of industrial businesses; and multi-family residences are located approximately 320 feet east of the project site, across Woodruff Avenue and the Union Pacific Railroad corridor. See Figure 4, *Receiver Locations*.

Land uses in which ground-borne vibration could potentially interfere with operations or equipment, such as research, hospitals, and university research operations (Caltrans 2020) are considered "vibration-sensitive." The degree of sensitivity depends on the specific equipment that would be affected by the ground-borne vibration. In addition, excessive levels of ground-borne vibration of either a regular or an intermittent nature can result in annoyance to residential uses, schools, or transient lodging. Land uses in the project area that are subject to annoyance from vibration include the residences described above.

2.4 REGULATORY FRAMEWORK

2.4.1 California Noise Control Act

The California Noise Control Act is section within the California Health and Safety Code (HSC §46000) that describes excessive noise as a serious hazard to the public health and welfare and that exposure to

certain levels of noise can result in physiological, psychological, and economic damage. It also finds that there is a continuous and increasing bombardment of noise in the urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians free from noise that jeopardizes their health or welfare.

2.4.2 City of Downey Municipal Code

The following City of Downey Municipal Code sections would be applicable to noise generated by the project (City 2023).

4600.2 Equipment and Machinery

(b) No person shall use, operate, or permit to be used or operated within any commercial (C) or manufacturing (M) Zone, as defined in Chapter 1 of Article IX of this code, which is within three hundred feet of a residential use, any power tool, machine, or equipment, or any other tool, machine, or equipment, between the hours of 10:00 p.m. and 7:00 a.m. in such a manner that the noise there from disturbs or interferes with the peace, comfort, or welfare of the neighboring residential inhabitants.

4606.3 Maximum Permissible Noise Levels by Sound Sources Across Property Boundaries

(a) All activities to which this chapter is applicable shall be conducted in such a manner that any noise produced shall not create a disturbance. The maximum permissible sound pressure level measured at the property boundary of any land use in Subsection (b) of this section from any noise source not operating on a public right-of-way shall constitute prima facie evidence of a public nuisance when such noise level exceeds five dBA above the ambient noise level at any period during the course of a 24-hour day.

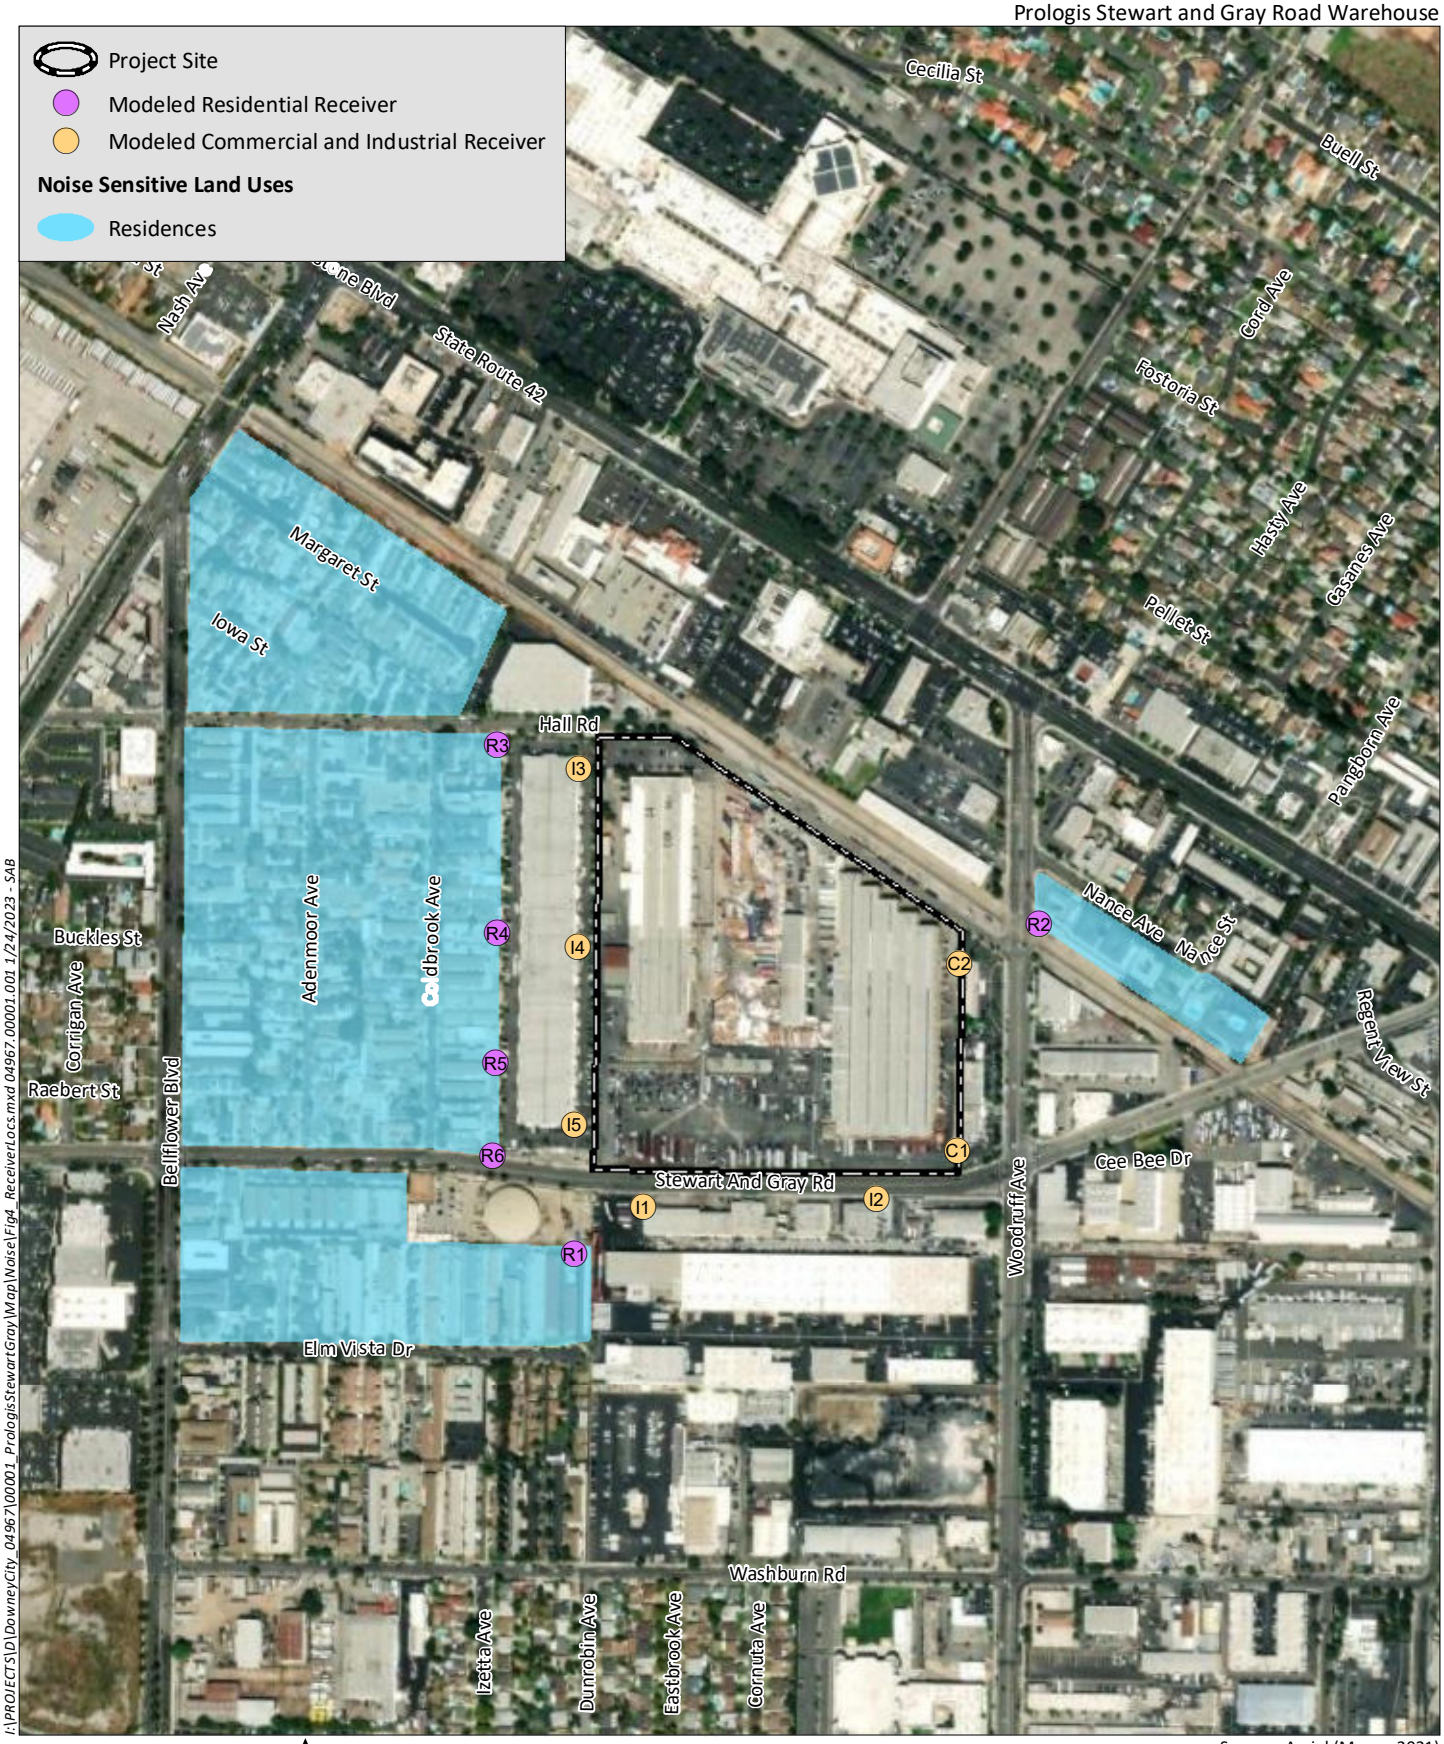
(b) If the alleged noise source is of a continuous nature and cannot reasonably be discontinued for a time period wherein the ambient noise level can be determined, the maximum permissible steady noise level by sound sources across the property boundary of any land use cited below may be less, but not greater than [noise levels in section 4606.3(b) [reproduced as Table 1, *City of Downey Exterior Noise Limits*]:

Table 1
CITY OF DOWNEY EXTERIOR NOISE LIMITS

Receiving Land Use	7:00 a.m. to 10 p.m.	10:00 p.m. to 7:00 a.m.
Residential	55 dBA	45 dBA
Commercial	65 dBA	65 dBA
Manufacturing	70 dBA	70 dBA

Source: City of Downey Municipal Code Section 4606.3(b)
dBA = A-weighted decibel

(c) If any parcel of real property is developed and used for multiple land uses, the lower land use noise level standard shall apply.



Source: Aerial (Maxar, 2021)

HELIX Environmental Planning

Receiver Locations

Figure 4

(d) In the hours between 7:00 a.m. to 10:00 p.m., the noise levels permitted in Subsection (b) of this section may be adjusted by the inclusion of the following factors when applicable:

(1) Noise source operated 12 minutes per hour or less: + 5 dBA
(2) Noise source operated 3 minutes per hour or less: + 10 dBA
(3) Noise source operated 1 minute per hour or less: + 15 dBA

(e) Impulsive sounds, pure tone, or sounds with a cyclically varying amplitude shall be considered a public nuisance when such noises are at a sound pressure level of five dBA less than those listed in Subsection (b) of this section, with the inclusion of the corrective factors listed in Subsection (d) of this section, when applicable.

4606.4 Exemptions

The standards established in this chapter shall not apply to any of the following noise sources:

(a) Any activity to the extent preempted from regulation by State or Federal law;

(f) The unamplified human voice;

(g) Warning systems used to protect the public health, safety, or welfare.

4606.5 Construction Projects

Construction, repair or remodeling equipment and devices and other related construction noise sources shall be exempted from the provisions of this chapter provided a valid permit for such construction, repair, or remodeling shall have been obtained from the City. In any circumstance other than emergency work, no repair or remodeling shall take place between the hours of 9:00 p.m. of one day and 7:00 a.m. of the following day, and no repair or remodeling shall exceed 85 dBA across any property boundary at any time during the course of a 24-hour day.

2.4.3 City of Downey General Plan Noise Element

The Downey Vision 2025 General Plan Noise Chapter establishes noise compatibility guidelines for land uses. Residential land uses would be normally acceptable with ambient noised levels at or below 60 CNEL exterior and 45 CNEL interior; commercial land uses would be normally acceptable with ambient noised levels at or below 70 CNEL exterior and 60 CNEL interior; and industrial land uses would be normally acceptable ambient noised levels at or below 75 CNEL exterior and 60 CNEL interior (City 2005).

2.5 EXISTING CONDITIONS

The project site is currently completely developed with industrial uses, currently in operation. The existing industrial buildings and related improvements are currently used by the following industrial tenants: EJ Lauren (Furniture Manufacturing), 88 Logistics/88 Transportation (Biotechnology/ Pharmaceutical Logistics), Western Pacific Pulp and Paper (Paper Recycler), OmniTeam (Commercial Kitchen Manufacturer) and Duray (Commercial Kitchen Manufacturer). The existing structures were likely developed in the mid-1970s.

2.5.1 Surrounding Land Uses

The Project site is surrounded by the following land uses:

- North: Hall Road and Union Pacific Railroad rail corridor, beyond which are commercial and industrial uses.
- South: Stewart and Gray Road, beyond which are industrial and public utility uses; multi-family residential uses are located further to the southwest.
- East: Adjacent commercial and industrial uses, Woodruff Avenue, additional commercial and industrial uses further east; multi-family residential uses are located further to the northeast beyond the UPRR rail corridor.
- West: Industrial uses, beyond which are multi-family residential uses.

2.5.2 Existing Noise Sources

The existing on-site noise environment dominated by typical noise from industrial businesses on and around the project site and by transportation noise. Transportation noise sources in the area include the Union Pacific Railroad approximately 95 feet north of the project site; major roads including Stewart and Gray Road, Woodruff Avenue, and Firestone Boulevard; and commercial aircraft overflying the city. According to the City's Noise Element Noise Contour Map, the noise levels on the project site range from 70 CNEL (to the north along Hall Road and to the south along Stewart and Gray Road) to 60 CNEL near the center of the project site (City 2005). The distances from the centerline of major roads to the transportation noise contours, as reported in the City's Noise Element, in the project vicinity are shown in Table 2, *2004 Transportation Noise Contours*.

Table 2
2004 TRANSPORTATION NOISE CONTOURS

Road Segment	Distance to 70 CNEL (feet)	Distance to 65 CNEL (feet)	Distance to 60 CNEL (feet)

3.0 METHODOLOGY, ASSUMPTIONS, AND THRESHOLDS

3.1 EQUIPMENT AND METHODOLOGY

3.1.1 Noise Modeling Software

Project construction noise was analyzed using the Roadway Construction Noise Model Version 1.1 (RCNM; USDOT 2008), which utilizes estimates of sound levels from standard construction equipment.

Modeling of the exterior noise environment for this report was accomplished the Computer Aided Noise Abatement (CadnaA) model version 2021. Traffic noise was evaluated within CadnaA using the Traffic Noise Model (TNM) version 2.5. CadnaA is a model-based computer program developed by DataKustik for predicting noise impacts in a wide variety of conditions. CadnaA assists in the calculation, presentation, assessment, and mitigation of noise exposure. It allows for the input of project-related information, such as noise source data, barriers, structures, and topography to create a detailed CadnaA model, and uses the most up-to-date calculation standards to predict outdoor noise impacts. CadnaA traffic noise prediction is based on the data and methodology used in the TNM. TNM version 2.5, incorporated into CadnaA, was released in February 2004 by the U.S. Department of Transportation (USDOT) and calculates the daytime average hourly L_{EQ} from three-dimensional model inputs and traffic data (USDOT 2004). Input variables included road alignment, elevation, lane configuration, area topography, existing and planned noise control features, projected traffic volumes, estimated truck composition percentages, and vehicle speeds.

The one-hour L_{EQ} noise level is calculated utilizing peak-hour traffic. Peak hour L_{EQ} can be converted to CNEL using the following equation, where $L_{EQ}(h)pk$ is the peak hour L_{EQ}, P is the peak hour volume percentage of the average daily trips (ADT), d and e are divisions of the daytime fraction of ADT to account for daytime and evening hours, and N is the nighttime fraction of ADT:

$$CNEL = L_{EQ}(h)pk + 10*\log_{10}(4.17/P) + 10*\log_{10}(d + 4.77*e + 10*N)$$

For urban roads in California with typical traffic patterns, the last two terms of the equation are near zero and the model-calculated one-hour L_{EQ} noise output is approximately equal to the CNEL (Caltrans 2013).

3.2 ASSUMPTIONS

3.2.1 Construction

Construction activities would include demolition/site preparation, grading and installation of underground utilities, building construction, architectural coating (e.g., painting), and paving. Based on the project air quality analysis modeling, demolition would include the removal of the existing structures on the site totaling approximately 433,000 SF resulting in approximately 1,969 one-way haul trips (22 per day); grading would result in approximately 75,000 CY of total soil export and approximately 9,375 one-way haul trips (208 trips per day); and paving would require the import of approximately 12,640 CY of aggregate/asphalt (45 trips per day; HELIX 2023). Assuming an 8-hour construction day, up to 26 one-way haul truck trips would occur each hour.

Construction would occur primarily Monday through Friday during daytime hours (not before 7 a.m. or after 9 p.m.) with equipment operating up to 8 hours per workday. However, due to high daytime temperatures, it is likely that pouring of concrete for the building slab, walls, and sidewalks would require nighttime work. Per the project engineering team, nighttime concrete pouring work would occur on approximately 40 nights during project construction. Included in those 40 nights, approximately 12 consecutive nights (including on weekends) would be required to pour the building slab foundation/floor. Typical nighttime concrete pouring work would require the use of multiple concrete mixer trucks, a concrete pump truck, and a backhoe. Nighttime concrete pouring work would typically commence at midnight with pouring completed by mid-morning and concrete finishing work continuing into the afternoon.

3.2.2 Operation

Anticipated operational noise sources are assumed to include delivery trucks with backup alarms; transport refrigeration units (TRUs; typically, a diesel-powered refrigeration unit mounted on the truck trailer or box); rooftop heating, ventilation, and air conditioning (HVAC) systems; rooftop-mounted refrigeration condenser units; and vehicular traffic.

3.2.2.1 Delivery Trucks

Operation of the project would involve diesel-powered heavy trucks for the delivery of goods to the project site and it would be operational for 24 hours a day. According to Table 2-1 of the project's Transportation Impact Study (TIS), 98 one-way truck trips would occur each day, with 12 one-way truck trips during the peak hour entering and exiting the site (Linscott, Law & Greenspan [LLG] 2023).

The proposed project building would have 39 loading docks on the west side, 28 loading docks on the north side, and 42 loading docks on the east side. Delivery trucks access the site via three driveways on Hall Road, and two driveways on Stewart and Gray Road (see Figure 3). Modeling of peak hour noise assumed that the delivery trucks would be divided between the driveways in accordance with the project truck distribution analysis in the TIS: 35 percent on Hall Road and 65 percent on Stewart and Gray Road (LLG 2023). On-site truck circulation was modeled assuming 35 percent of trucks (four peak hour trucks) would enter via the middle driveway on Hall Road and proceed to the north docks, 33 percent of trucks (four peak hour trucks) would enter via the east driveway on Stewart and Gray Road and proceed to the east docks, and 32 percent of trucks (four peak hour trucks) would enter via the west driveway on Stewart and Gray Road and proceed to the west docks. Each truck was assumed to circulate on the project site at an average speed of eight miles per hour (mph), then reverse to a loading bay at 3 mph. Each truck was assumed to idle at the loading bay for the maximum allowable time of five minutes, in accordance with California Code of Regulations Title 13, Section 2485.

The project would provide a parking area for trucks/trailers along the project's western, northern, and eastern sides. It is unknown how many trucks would use the parking areas during each day or peak hour. To be conservative in evaluating the highest potential noise, every truck entering the project site was assumed to travel to a nearby parking area, reverse into a parking spot, and idle for five minutes before departing the project site. Truck circulation noise was modeled using the default heavy truck noise in CadnaA.

Some trucks would generate noise from the use of transport refrigeration units (TRUs; typically, a diesel-powered refrigeration unit mounted on the truck trailer or box). Specific TRU noise would vary from unit to unit. Typical noise from a TRU was modeled as producing 75 dBA at 21 feet, based on field measurements of truck and TRU noise conducted by HELIX. Only trucks transporting goods to and from the project's refrigerated warehouse space (five percent of the total project warehouse space) would be anticipated to be equipped with an operating TRU. Because the location of the refrigerated warehouse space within the project building was unknown at the time of this analysis, one out of the four peak hour trucks going to each loading dock area was assumed to be equipped with an operating TRU. Each TRU was assumed to operate at a 50 percent duty cycle during the analyzed peak noise hour.

There are no California or federal regulations which require on-road trucks to be equipped with backup warning devices. However, backup alarms are commonly used on delivery trucks due to safety/liability concerns. The most common truck backup alarm is a pulsing single tone, typically at one kHz. Recently, in response to noise complaints, backup alarms which produce a less intrusive pulsing broad-spectrum noise have been introduced. To be conservative, all trucks were assumed to be equipped with a traditional one kHz back up alarm, mounted on the back of the truck at a height of three feet. Backup alarms were modeled with typical noise levels of 109.7 dBA measured at a distance of four feet.

3.2.2.2 Stationary Refrigeration Units

The project would include stationary commercial-sized refrigeration units for the refrigerated warehouse space (approximately 26,785 SF). The location of the refrigerated warehouse space within the project building was not known at the time of this analysis. To be conservative, four rooftop refrigeration condensers were assumed, one located near the roof edge on each side of the building and would be surrounded by standard parapet walls approximately four feet high. For this analysis, four Hussman Proto-Air 3280 refrigeration systems were assumed, which have a sound power level (S_{WL}) of 86.3 dBA when operating at the maximum speed of 1,150 revolution per minute. Noise data for the rooftop refrigeration condenser unit and associated fan is shown in Table 3, *Stationary Refrigeration Unit Fan Noise Data*. The manufacturer's data sheets are included in Appendix A to this report.

Table 3
STATIONARY REFRIGERATION UNIT FAN NOISE DATA

Fan Type	63 Hz	125 Hz	250 Hz	500 Hz	1 kHz	2 kHz	4 kHz	Overall Noise Level in A-weighted Scale (dBA)[1]

Hz = Hertz; kHz = kilohertz; RPM = revolutions per minute

3.2.2.3 Heating, Ventilation, and Air Conditioning Units

The project would use commercial-sized HVAC units located on the rooftop of the building for the proposed office space. Specific planning data for the future HVAC systems was not available at the time of this analysis. Standard HVAC planning assumes approximately one ton of HVAC for every 350 to 500 SF of occupied office space (American Society of Heating, Refrigeration, and Air Conditioning Engineers [ASHRAE] 2012). For the purposes of this analysis, one Carrier 50PG 12-ton HVAC unit, which

has a sound power level (S_{WL}) of 80.0 dBA, was assumed for each of the project three office spaces (see Figure 3). The HVAC systems were assumed to be mounted on the project building roof and would be surrounded by standard parapet walls approximately four feet high. The manufacturer's noise data for the HVAC units is provided below in Table 4, *Condenser Noise Data*; more detailed data can be found in Appendix C, *Carrier 50PG Condenser Data*. The manufacturer's data sheets are included in Appendix A to this report.

Table 4

Hz = Hertz; kHz = kilohertz

3.2.2.4 Vehicular Traffic

Modeled existing traffic data for the roadways in the project vicinity were based on volumes provided by the project's TIS (LLG 2023) for four scenarios: existing, existing plus project, cumulative 2024, and cumulative 2024 plus project. The mix of cars and trucks on the analyzed roadways was not provided in the TIS. Therefore, all analyzed road segments were assumed to carry a mix typical of urban areas with significant industrial activity: 92 percent cars and light trucks, 4 percent medium trucks; and 4 percent heavy duty trucks. Trip generation rates and trip distribution were also provided in the TIS. Speed limits and road widths analyzed road segments were used in the modeling to calculate existing and future noise levels. Table 5, *PM Peak Hour Traffic Volumes*, shows the p.m. peak hour traffic volumes used in the modeling for the analyzed roadway segments.

Table 5

3.3 GUIDELINES FOR THE DETERMINATION OF SIGNIFICANCE

Based on Appendix G of the CEQA Guidelines, implementation of the project would result in a significant adverse impact if it would:

Threshold 1: *Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the City General Plan or noise ordinance.*

Per the City Municipal Code Section 4606.3, noise generated on the project site would be significant if noise exceeds ambient noise levels by 5 dBA or more, measured at the receiving land use property line. If ambient noise levels cannot be measured, noise generated on the project site would be significant if steady noise exceeds 55 dBA L_{EQ} between the hours of 7:00 a.m. and 10:00 p.m. or 45 dBA L_{EQ} between the hours of 10:00 p.m. and 7:00 a.m. for residential uses; 65 dBA L_{EQ} for commercial uses; or 70 dBA L_{EQ} for industrial uses.

The City has not established standards for determining the significance of increases in transportation noise resulting from a development project. Therefore, the standards of significance are based on perceived increases in ambient noise levels. Impacts would be significant in areas where existing traffic noise at NSLUs exceeds 60 CNEL (the City General Plan noise compatibility level for residential uses) and implementation of the project would result in an increase of the noise level by 3 CNEL or more (a just perceivable increase in typical noisy environments), or where existing traffic noise is less than 60 CNEL and implementation of the project results in an increase of 5 CNEL or more.

Per the City Municipal Code Section 4606.5, construction noise is exempt from the provisions of City Noise Ordinances provided a valid permit for such construction has been obtained from the City. CEQA case law establishes that a project's noise impact analysis must consider the increase in ambient noise levels (King and Gardiner Farms v. County of Kern). Neither the City nor any state regulatory agency have established criteria for determining the significance of an increase in ambient noise levels resulting from temporary and short-term construction noise. Therefore, temporary project construction noise measured at off-site NSLUs would be significant if it would result in a perceived doubling of loudness, estimated to be an increase of 10 dBA above exterior ambient noise levels (Caltrans 2013). This threshold provides a reasonable balance between the need to operate noise generating equipment for most temporary construction activities and the desire to protect NSLUs from temporary disturbances.

Threshold 2: *Generate excessive ground-borne vibration or ground-borne noise levels.*

Ground-borne vibration would be potentially significant if the project would result in ground-borne vibration which exceeds the "strongly perceptible" vibration annoyance potential criteria for human receptors of 0.1 inch per second peak particle velocity (PPV) for nearby residences, or exceed the threshold for architectural damage potential criteria for buildings in good repair with gypsum bard walls of 0.4 inch per second PPV, for continuous/frequent intermittent construction sources (such as impact pile drivers, vibratory pile drivers, and vibratory compaction equipment; Caltrans 2020).

Threshold 3: *For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public use airport or private airstrip, expose people residing or working in the project area to excessive noise.*

Excessive noise exposure is defined as noise levels that exceed the standards in the City General Plan Noise Element for the associated land use.

4.0 IMPACTS

4.1 ISSUE 1: EXCESSIVE NOISE LEVELS

Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the City General Plan or noise ordinance?

4.1.1 Temporary Construction Noise

Construction of the project would require site clearing, grading, installation of underground utilities/infrastructure, construction of new buildings, paving, and architectural coating. The magnitude of the noise impact would depend on the type of construction activity, equipment, duration of each construction phase, distance between the noise source and receiver, and any intervening structures. Construction would generate elevated noise levels that may disrupt NSLUs in the area. As described in Section 2.5.2, above, the closest NSLU to the project site is a single-family home located approximately 240 feet east of the project site, across Hall Road, Woodruff Avenue, and the Union Pacific Railroad corridor. In addition, multi-family residences are located approximately 290 feet southwest of the project site, across Stewart and Gray Road. The single-family residences located approximately 300 feet west of the project site and multi-family residences located approximately 320 feet east of the project site are substantially shielded from noise on the project site by large existing industrial/commercial buildings.

Construction equipment would not all operate at the same time or location and would not be in constant use during the 8-hour operating day. Further, not all the pieces of equipment would be used within 240 feet of the closest off-site residences. It is anticipated that, over the course of an hour, demolition and earthmoving equipment would operate an average distance of 100 or more feet from the project property lines, or 340 or more feet from the closest NSLU. Table 6, *Construction Equipment Noise Levels*, provides the 340-foot distance noise levels for equipment anticipated to be used for general construction activities.

Table 6
CONSTRUCTION EQUIPMENT NOISE LEVELS

Unit	Percent Operating Time	L_{MAX} at 340 feet	dBA L_{EQ} at 340 feet
Backhoe	40	60.9	56.9
Compressor	40	61.0	57.0
Concrete/Industrial Saws	20	72.9	65.9
Concrete Mixer Truck	40	60.9	58.2
Concrete Pump Truck	20	62.1	57.8
Crane	16	63.9	55.9
Dozer	40	65.0	61.0
Excavator	40	64.1	60.1
Generator	50	64.0	61.0
Grader	40	68.3	64.4
Paver	50	60.6	57.6
Scraper	40	66.9	63.0
Roller	20	63.3	56.4

Source: RCNM
L_{MAX} = maximum noise level; dBA = A-weighted decibel; L_{EQ} = time-averaged noise level

The noisiest anticipated construction activity would be during site preparation/demolition, a dozer, an excavator, and a concrete saw may be working concurrently and would produce a combined noise level of 67.9 dBA L_{EQ} at 340 feet, as modeled using the RCNM. The RCNM output is included in Appendix B to this report. The closest NSLU, a single-family residence is approximately 100 feet from the Union Pacific railroad tracks and approximately 50 feet from the centerline of Woodruff Avenue. According to the City General Plan Noise Element, this residence is located in an area with an ambient noise level of 70 CNEL or more and project construction would not exceed ambient noise levels. The next closest NSLU, multi-family residences are south of Stewart and Gray Road and adjacent to existing industrial land uses. According to the City General Plan Noise Element, these residences are located in an area with an ambient noise level of 65 CNEL resulting from traffic on Stewart and Gray Road. Therefore, the maximum calculated project site preparation/demolition noise level of 67.9 dBA L_{EQ} would be approximately 3 dBA above daytime ambient noise levels at the multi-family residences to the south, and the increase over ambient noise would be less than the 10 dBA increase significance level. However, nighttime ambient noise levels are typically lower than daytime levels—the CNEL reported in the General Plan Noise Element includes a 10 dBA weighting during nighttime hours. Therefore, project site preparation/demolition noise would be potentially significant if it would occur at night or during other periods with reduced transportation noise, such as Sundays and holidays.

As described in Section 3.2.1, due to high daytime temperatures, pouring of concrete for project construction may be required to be conducted at night. The combined noise from two concrete mixer trucks, a concrete pump truck, and a backhoe (all working in close proximity to each other) would result in a combined noise level of 64.9 dBA L_{EQ} at 300 feet, as modeled using the RCNM. Unlike demolition and earthmoving activities, concrete pouring equipment could be stationary for more than an hour and positioned near the project property lines. Therefore, NSLUs within 300 feet of the project site could be exposed to temporary construction noise more than 10 dBA above nighttime ambient noise levels, and project nighttime concrete pouring noise would be potentially significant.

4.1.2 Construction Traffic Noise

As stated in Section 3.2.1, project grading would result in approximately 208 daily one-way haul truck trips, or approximately 26 hourly haul truck trips over the course of an 8-hour workday. The closest NSLU to the project site is a single-family residence east of the project site on Woodruff Avenue just north of the railroad tracks (between Firestone Boulevard and Hall Road). As shown in Table 6, this segment of Woodruff Avenue carries 1,342 vehicle trips during the peak hour, of which approximately 54 (4 percent) are heavy trucks. Using the CadnaA and the TNM model, an additional 26 heavy truck trips per hour would temporarily increase the hourly noise level along that roadway from 68.3 dBA to 68.6 dBA. This increase in noise levels of 0.3 dBA would be well below the just perceivable 3 dBA increase level for noisy outdoor environments. Therefore, construction traffic noise impacts would be less than significant.

4.1.3 Warehouse Operational Noise Generation

The proposed on-site truck circulation routes, loading dock areas, rooftop HVAC units, and rooftop refrigeration condensers would generate elevated noise levels compared to existing conditions. The primary noise sources for the loading dock areas are delivery truck engines idling, truck backup alarms, and TRU engines, as described in Section 3.2.2.

Operation of all noise-generating components was modeled using CadnaA. The project building and four surrounding existing buildings were included in the model. As described in Section 2.5.2, the closest existing NSLU to the project site is a single-family home located approximately 240 feet east of the project site, across Hall Road, Woodruff Avenue, and the Union Pacific Railroad corridor. In addition, multi-family residences are located approximately 250 feet southwest of the project site, across Stewart and Gray Road; single-family residences are located approximately 300 feet west of the project site beyond a row of industrial businesses; and multi-family residences are located approximately 320 feet east of the project site, across Woodruff Avenue and the Union Pacific Railroad corridor. Six receivers were placed in the model at the property line of the closest residential properties east, west, and southwest of the project site (R1 through R6). Five receivers were placed in the model at the industrial buildings west and south of the project site (I1 through I5). Two receivers were placed in the model at the commercial buildings east of the project site (C1 through C2). See Figure 4.

As shown in Section 2.4.2, the City's standard for noise produced on the project site and measured at the receiving property line is a maximum of 5 dBA over the ambient noise level for any period during the course of a 24-hour day (City Municipal Code Section 4606.3(a)). Where the subject noise cannot be discontinued in order to measure ambient noise levels, the maximum permissible steady noise level by sound sources across the property boundary shall not exceed the limits shown in Table 1, above (City Municipal Code Section 4606.3(b)). Because existing condition on the project site include active industrial businesses, ambient noise measurements without noise produced on the project site cannot be made. Three of the modeled residential receivers are close to high volume roadways and the ambient noise levels can be estimated from the noise contours reported in the City General Plan Noise Element (see Table 2, above): receiver R1 is approximately 200 feet from Stewart and Gray Road and within the 65 CNEL contour; receiver R2 is approximately 65 feet from Woodruff Avenue and within the 70 CNEL contour; and receiver R6 is approximately 45 feet from Stewart and Gray Road and within the 70 CNEL contour (City 2005). Because the CNEL calculations include a 10 dBA nighttime weighting, nighttime ambient noise levels for receivers R1, R2, and R6 were assumed to be 10 dBA below the reported CNEL level.

The calculated daytime peak hour noise level results are compared to the City's noise standard for the maximum permissible level measured at the receiving property boundary in Table 7, *Daytime Operational Noise*. The CadnaA modeling output tables are included in Appendix C to this report.

[1] Existing ambient noise based on 2004 traffic noise contours from City General Plan Noise Element, see Table 2 of this report.

[2] Noise standard is 5 dBA above existing ambient level Per City Municipal Code Section 4606.3(a).

[3] Noise standard is per City Municipal Code Section 4606.3(b) based on receiving land use and time of day, see Table 1 of this report.

dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level; L_{EQ} = time-averaged noise level

The project would operate 24 hours per day resulting in nighttime noise generated on the project site. HVAC systems and refrigeration condensers were assumed to operate for one hour or more continuously at night. For truck circulation and loading dock operations, it is unknown how many trucks per hour would arrive and depart the project site at night. As discussed in Section 3.2.2, the TIS estimated the project would result in 98 one-way daily truck trips (LLG 2023). If truck trips were spread throughout the day evenly, the result would be approximately 4 trucks per hour. However, the traffic report estimated that 12 of the truck trips (approximately 12 percent of the daily trips) would occur during the peak afternoon hour (LLG 2023) indicating truck trips would not be distributed uniformly throughout the day. To be conservative in analyzing the highest reasonably foreseeable nighttime noise level, 6 nighttime peak hour trucks (50 percent of daytime peak truck trips) entering and exiting the project site were assumed. The calculated peak nighttime hour noise level results are compared to the City's noise standard for the maximum permissible level measured at the receiving property boundary in Table 8, *Nighttime Operational Noise*. The CadnaA modeling output tables are included in Appendix C to this report.

Table 8
NIGHTTIME OPERATIONAL NOISE

[1] Existing nighttime ambient noise based on 2004 traffic noise contours from City General Plan Noise Element and removing the CNEL 10 dBA nighttime weighting, see Table 2 of this report.

[2] Noise standard is 5 dBA above existing ambient level Per City Municipal Code Section 4606.3(a).

[3] Noise standard is per City Municipal Code Section 4606.3(b) based on receiving land use and time of day, see Table 1 of this report.

dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level; L_{EQ} = time-averaged noise level

As shown in Table 7 and Table 8, noise levels from the project on-site operational sources would not exceed the limits for land uses in the vicinity of the project at any of the modeled receivers. Impacts would be less than significant.

4.1.4 Operational Off-Site Transportation Noise Generation

The project would generate vehicular traffic along nearby roadways. CadnaA/TNM software was used to calculate the peak p.m. hour noise for the Existing, Existing + Project, Cumulative (year 2024) and Cumulative (year 2024) + Project conditions along project-affected roadways. As noted in the Section 3.2.2, traffic noise levels presented in this analysis are based on traffic volumes provided in the project's TIS (LLG 2023). The off-site roadway modeling represents a conservative analysis that does not consider topography or attenuation provided by existing structures. The results of the analysis for the Existing and Existing + Project conditions are shown in Table 9, *Existing Off-Site Traffic Noise Levels.* The results of the analysis for the Cumulative and Cumulative + Project conditions are shown in Table 10, *Cumulative (Year 2024) Off-Site Traffic Noise Levels.* The CadnaA modeling output tables are included in Appendix C to this report.

[1] No NSLU along this roadway segment, distance and noise level shown for nearest commercial or industrial building.

NSLU = noise sensitive land use; dBA = A-weighted decibels; L_{EQ} = 1-hour time-averaged noise level

Impacts would be significant in areas where existing traffic noise at NSLUs exceeds 60 CNEL and implementation of the project would result in an increase of the noise level by 3 CNEL or more (a just perceivable increase in typical noisy environments), or where existing traffic noise is less than 60 CNEL and implementation of the project results in an increase of 5 CNEL or more. As shown in Table 7 and Table 8, the existing traffic noise exceeds 60 CNEL for all road segments except on Hall Road. The maximum traffic noise increase as a result of the addition of project traffic on any analyzed road segment would be 1.5 dBA on Hall Road for both the Existing and Cumulative conditions. The segment of Hall Road analyzed (from Woodruff Avenue to the Project's western driveway) does not have any NSLUs (Hall Road west of the project site would not carry any project truck traffic and was not analyzed). The maximum traffic noise increase along a roadway segment with NSLUs would be 0.2 dBA (segments on Woodruff Avenue, Stewart and Gray Road, and Washburn Road) for the Existing conditions. Therefore, the increase in traffic noise resulting from the addition of project-related traffic would be less than 3 dBA and would not result in a perceptible increase in ambient noise levels. Noise impacts from project-generated traffic would be less than significant.

4.1.5 Significance of Impacts

Project construction equipment noise would be potentially significant if it would occur at night or during other periods with reduced transportation noise, such as Sundays and holidays. Project construction traffic noise, on-site operational warehouse noise, and off-site operational traffic noise would all be less than significant.

4.1.6 Mitigation Framework

Mitigation measure NOI-01 would prohibit project construction noise generating activities during nighttime hours (as defined in the City's Noise Municipal Code Section 4606.5) and provides procedures to follow if nighttime concrete pouring is required.

Mitigation Measure NOI-01: Construction Activity Limits

> The project applicant or designated contractor shall obtain permits for project construction activities from the City. The City shall ensure all permits contain restrictions to construction hours, and nighttime work requirements described below.
>
> All construction activity with the exception of concrete pouring as specified below shall be prohibited between the hours of 9:00 p.m. and 7:00 a.m. Monday through Saturday, and at any time on Sundays or on any City recognized public holiday. Delivery of materials or equipment to the site and construction truck traffic coming to and from the site shall be prohibited during the same hours specified above.

If, due to weather condition (e.g., high temperatures), pouring of concrete at night or on Sundays or on any City recognized public holiday is required, the project applicant or designated contractor shall provide written notification of nighttime/weekend concrete work to all residences located within 300 feet of the project site. The notification shall:

- Be delivered a minimum of 48 hours prior to commencement of nighttime work;
- Include the days and hours of upcoming concrete pouring nighttime work; and
- Include noise complaint contact information, including phone numbers and email addresses to register noise complaints with both the construction contractor and the City.

The City and the construction contractor shall log all received noise complaints. The construction contractor shall submit to the City a daily log of all noise complaints received, including the date and time of the complaint and address of the complainant (if provided). The City shall work with the construction contractor to respond to noise complaints and limit nighttime work and locations of noise generating equipment to the extent feasible.

4.1.7 Significance After Mitigation

With implementation of mitigation measure NOI-01, affected residents would be informed of potential nighttime and weekend disturbances and the duration of those disturbances. However, mitigation measure NOI-01 would not reduce project temporary construction-related noise levels to acceptable limits.

Further, because some of the affected residents within 300 feet of the project site are within the upper levels of a two-story building, other noise-reducing mitigation such as temporary sound walls would have to be unreasonably high (more than 20 feet) to provide adequate noise reduction and would not be feasible.

Therefore, the project would generate a substantial temporary increase in ambient noise levels in the vicinity of the project, and the impact would be significant and unavoidable.

4.2 ISSUE 2: EXCESSIVE VIBRATION

Generate excessive ground-borne vibration or ground-borne noise levels?

4.2.1 Construction Vibration

Construction activities known to generate excessive ground-borne vibration, such as pile driving, would not be conducted by the project. A possible source of vibration during general project construction activities would be a vibratory roller used for gravel or pavement compaction. A vibratory roller could be used up to 25 feet from the closest off-site structure (two commercial buildings to the east). A large vibratory roller can create approximately 0.210 inch per second PPV at 25 feet (Caltrans 2020), which would not exceed the 0.4 inch per second PPV threshold for damage to buildings in good repair with gypsum wall boards, for continuous/frequent intermittent construction sources. The closest residential building would be a single-family residence appropriately 240 feet east of the project site. A 0.210 inch

per second PPV vibration level would equal 0.017 inch per second PPV at a distance of 240 feet.[1] This would be lower than what is considered a "strongly perceptible" level for humans of 0.1 inches per second PPV. Therefore, although a vibratory roller may be perceptible to nearby human receptors within the commercial building east of the project site, temporary impacts associated with the roller (or other construction equipment) would be less than significant.

4.2.2 Operational Vibration

Land uses that may generate substantial operational vibration include heavy industrial or mining operations that would require the use of vibratory equipment. The proposed warehouse land use does not include equipment that would generate substantial vibration. Therefore, operational vibration impacts are less than significant.

4.2.3 Significance of Impacts

Construction or long-term operation of the project would not excessive ground-borne vibration or ground borne noise levels, and the impact would be less than significant.

4.2.4 Mitigation Framework

Construction or long-term operation of the project would not exceed ground-borne vibration or ground borne noise levels, the impact would be less than significant, and no mitigation measures would be required.

4.2.5 Significance After Mitigation

Construction or long-term operation of the project would not generate excessive ground-borne vibration or ground borne noise levels, and the impact would be less than significant.

4.3 ISSUE 3: AIRPORT NOISE EXPOSURE

For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The closest airports to the project site are Compton Woodley Airport (7.5 miles southwest); Long Beach Airport (7.7 miles south); Fullerton Municipal Airport (8.7 miles southeast); Hawthorne Municipal Airport (11.8 miles west); and Los Angeles International Airport (LAX; 15 miles west). The project site is located approximately 2 miles south of one of the main approach paths to Los Angeles International Airport. However, the project site is not located within the airport influence area, nor within the 65 CNEL noise contour of any of the Los Angeles County airports, including LAX (Los Angeles County Airport Land Use Commission 2022). Therefore, although aircraft may be commonly audible in the airspace around the project site, persons residing or working in the project area would not be exposed to excessive noise levels from aircraft or airports.

[1] Equipment PPV = Reference PPV * $(25/D)^n$ (in/sec), where Reference PPV is PPV at 25 feet, D is distance from equipment to the receiver in feet, and n = 1.1 (the value related to the attenuation rate through the ground); formula from Caltrans 2020.

4.3.1 Significance of Impacts

The project would not expose people residing or working in the project area to excessive noise levels from aircraft or airports, and the impact would be less than significant.

4.3.2 Mitigation Framework

The project would not expose people residing or working in the project area to excessive noise levels from aircraft or airports, the impact would be less than significant, and no mitigation measures would be required.

4.3.3 Significance After Mitigation

The project would not expose people residing or working in the project area to excessive noise levels from aircraft or airports, and the impact would be less than significant.

† Single phase/three phase

HUSSMANN®

Proto-Aire Outdoor Protocol

Environmental Benefits Compared to Traditional Rack Systems.

- Better energy efficiency reduces use of fossil fuels, reduces air pollution.
- Significantly smaller refrigerant charge reduces use of HFCs.
- Significantly lower refrigerant leak rate.

PROTO-AIRE

Outdoor Small Footprint Protocol Solution.

Proto-Aire is a compact footprint outdoor Protocol unit with an integrated air-cooled condenser and weatherproof skins. Units can be installed outside next to the store or on the roof. This allows for more flexibility with Protocol store designs and reduces space requirements for equipment inside the store.

Sustainable Solutions.

Protocol is the most widely used refrigeration system directly addressing today's environmental concerns. We are using the phrase "Sustainable Solutions" to underscore Protocol's important role in helping address environmental issues.

Hussmann is committed to developing advanced technologies that reduce the use of HFCs and improve energy efficiency. Protocol is just one of many alternatives we offer to promote sustainable solutions.

Several condenser sizes.

Proto-Aire is sized based on the compressor load and the heat of rejection requirements for the compressors. The largest condenser can support up to 450 MBH at a 20˚F TD.

Features and options.

- Weatherproof outdoor enclosure.
- Factory installed suction filters and liquid driers.
- Optional factory-installed gas defrost valves and winter control.
- Optional Polyfin and Electrofin coil coating.
- Optional oversized receiver with heat tape and insulation.
- Optional hail guards and rain doors.

All standard Protocol options.

Since the Proto-Aire builds upon the Protocol frame, all standard Protocol mechanical and electrical options are available with Proto-Aire.

Proto-Aire environmental advantages.

- Significant reduction in refrigerant charge.
- Significant reduction in greenhouse gas emissions.
- Better energy efficiency in virtually all applications.
- Less copper refrigerant piping.
- Fewer braze joints for fewer leaks.

Other advantages.

- Easy to install.
- No machine room needed.
- Lower installation costs.
- Decreases or eliminates the need for EPRs.
- Compact footprint.

Proto-Aire dimensions.

TRANSPORTATION IMPACT STUDY

PROLOGIS STEWART & GRAY ROAD WAREHOUSE PROJECT

City of Downey, California
September 18, 2023

1.0 INTRODUCTION

1.1 Transportation Study Overview

This transportation impact study has been conducted to identify and evaluate the potential transportation impacts of the proposed Prologis Stewart & Gray Road Warehouse project ("proposed project"). The project site is located at 9300, 9350, and 9400 Hall Road and 9301, 9333, and 9399 Stewart & Gray Road in the City of Downey. The proposed project site is generally bounded by Hall Road to the north, Stewart & Gray Road to the south, a dance center and a collision repair business to the east, and industrial use to the west. The project site and general vicinity are shown in ***Figure 1-1***.

The transportation assessment follows the requirements set forth by the City of Downey. It is noted that the City of Downey has not yet adopted revised transportation assessment guidelines, however, a vehicle miles traveled (VMT) assessment has been prepared in compliance with Senate Bill (SB) 743. In addition, the City maintains vehicle Level of Service (LOS) standards for local transportation infrastructure. Therefore, the City has identified both CEQA based analysis requirements and non-CEQA based analysis requirements for analyzing the potential transportation impacts of proposed development projects.

This study evaluates potential project-related VMT impacts pursuant to the screening criteria and analysis tools approved for use by the City of Downey. The study also evaluates potential project-related effects on LOS at eight (8) key intersections in the vicinity of the project site. The study intersections were determined in consultation with City of Downey staff. The Intersection Capacity Utilization (ICU) method was used to determine LOS for the City of Downey study intersections.

This report (i) presents the proposed project's existing transportation network context, (ii) presents existing traffic volumes, (iii) forecasts cumulative baseline conditions, (iv) forecasts project-generated traffic, (v) assesses the potential for project-related transportation impacts consistent with the CEQA compliant and non-CEQA compliant metrics set forth by the City of Downey, and (vi) recommends transportation mitigation and/or improvement measures, where necessary.

1.2 Study Methodology

The CEQA and non-CEQA analysis criteria for this transportation assessment were identified in consultation with City of Downey staff. The analysis criteria were determined based on the City's

Guidelines, the proposed project description and location, and the characteristics of the surrounding transportation system.

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743 (Steinberg, 2013). Among other things, SB 743 created a process to change the methodology to analyze transportation impacts under CEQA (Public Resources Code section 21000 and following) in order to promote 1) the reduction of greenhouse gas emissions, 2) the development of multimodal transportation networks, and 3) a diversity of land uses. On December 30, 2013, the State of California Governor's Office of Planning and Research (OPR) released a preliminary evaluation of alternative methods of transportation analysis, which included analysis based on project VMT rather than impacts to intersection LOS. OPR issued other draft discussion documents in March 2015 and January 2016, suggesting some new revisions to the state CEQA Guidelines. In November 2017, OPR submitted the proposed amendments to the CEQA Guidelines to the State's Natural Resources Agency (that include a proposed new Guidelines section 15064.3 which governs how VMT-based analyses of potential traffic impacts should be conducted). On January 26, 2018, the Natural Resources Agency published a Notice of Rulemaking, commencing the formal rulemaking process for the amendments to the CEQA Guidelines. On December 28, 2018, the California Office of Administrative Law adopted the proposed amendments, formally implementing the use of VMT as the metric for transportation analysis under CEQA and providing a grace period allowing local agencies to opt-in to the new metrics. State-wide implementation of the new metric was required by July 1, 2020.

Pursuant to current statutes, the County of Los Angeles has adopted VMT as the metric for determining environmental impacts in compliance with SB 743. On July 23, 2020, the County of Los Angeles Department of Public Works (LACPW) Traffic Safety & Mobility Division released its VMT-focused transportation analysis methodology and guidelines, *Transportation Impact Analysis Guidelines*[1]. Although the City of Downey has not yet adopted revised transportation impact assessment guidelines, a VMT assessment has been prepared to comply with this State legislation. In general, the City of Downey may elect to utilize LACPW's current *Transportation Impact Analysis Guidelines* as a benchmark for the TIA requirements, with variations as outlined in the City's future guidelines. While the City may formally adopt VMT methodology for environmental impact analysis, it should be noted that the City has retained a requirement for local intersection operational analyses. Therefore, this study also assumes preparation of intersection LOS analysis. Specifically, the Intersection Capacity Utilization (ICU) methodology is utilized to evaluate LOS at the City of Downey signalized study intersections.

1.3 Los Angeles County Congestion Management Program Status

The Los Angeles County Congestion Management Program (CMP) was previously a state-mandated program that was enacted by the California State Legislature with the passage of Proposition 111 in 1990 that primarily utilized a level of service (LOS) performance metric. Pursuant to California Government Code §65088.3, local jurisdictions may opt out of the CMP requirement without

[1] *Los Angeles County Department of Public Works (LACDPW) Transportation Impact Analysis Guidelines*, *July 23, 2020.*

penalty if a majority of the local jurisdictions representing a majority of the County's population formally adopt resolutions requesting to opt out of the program. As of November 2019, the majority of local agencies representing the majority of the County's population have adopted resolutions to opt out of the program. Therefore, the CMP is no longer applicable in Los Angeles County.

2.0 PROJECT DESCRIPTION

2.1 Existing Project Site

The project site is located at 9300, 9350, and 9400 Hall Road and 9301, 9333, and 9399 Stewart & Gray Road in the City of Downey, California. The proposed project site is generally bounded by Hall Road to the north, Stewart & Gray Road to the south, a dance center and a collision repair business to the east, and industrial use to the west. The proposed project site and general vicinity are shown in *Figure 1-1*. The 29.16-acre project site consists of five parcels (APN's: 6284-019-013, 6284-019-014, 6284-019-015, 6284-019-017& 6284-019-016) and is currently developed with five industrial buildings located along Stewart & Gray Road to the south and Hall Road to the north, totaling approximately 433,000 square feet. An aerial photograph of the existing project site is presented in ***Figure 2-1***.

Vehicular access to the project site is currently provided via two driveways off Stewart & Gray Road and three driveways off Hall Road that lead to private internal roads, which connect together around the separate buildings. These internal roads provide parking for employees, parking for trailers and containers, recycling equipment and storage of heavy operation equipment.

2.2 Proposed Project Description

The proposed project consists of the demolition of the existing buildings (totaling approximately 433,000 square feet) and the construction of an industrial concrete tilt building for warehouse/logistics uses totaling 535,685 square feet of building floor area. The proposed project will include 544 automobile parking spaces, 255 trailer and/or container parking spaces and 109 48 foot dock high loading doors. The warehouse building will have a 40-foot clear height.

The new speculative industrial building is intended to be used for logistics and distribution purposes, and specifically as a fulfillment center and for cold storage. The facility will include up to 20,000 square feet of office and 25,000 square feet of mezzanine areas. On-site activities will include: General industrial/warehouse with refrigeration and cold storage component for the purposes of receiving, storing, shipping of food and/or beverage products, storage, distribution, and/or consolidation of manufactured goods, and last-mile fulfillment and delivery. All activities will occur within the property boundary and the main industrial building. The office and mezzanine space is intended to be used for office uses ancillary to the warehouse operations. Although the future tenancy for the proposed project is currently unknown, the proposed facility is intended to operate 24 hours a day, seven days a week. The conceptual project site plan is shown in ***Figure 2-2***. The project build-out and occupancy year is anticipated by the year 2024.

[A] Left-Turns by Trucks Exiting Project Site at Hall Road Are Not Permitted

Figure 2-2
Site Plan

2.3 Project Site Access

Access to the project site will be accommodated by five driveways, including three driveways along Hall Road and two driveways along Stewart & Gray Road. The proposed driveways are described in further detail below:

- Hall Road Driveways
  Three project driveways are planned to be located along the south side of Hall Road along the project frontage. The east and west driveways are proposed to be approximately 40 feet wide while the middle driveway is proposed to be approximately 45 feet wide. The Hall Road project driveways will provide both passenger vehicle access to the on-site parking areas as well as truck access to the loading areas located north, east, and west of the building. All three driveways will accommodate full access (i.e., left and right-turning inbound and outbound movements) for passenger vehicles. However, outbound left-turn movements for trucks will not be permitted at the Hall Road project driveways.

- Stewart & Gray Road Driveways
  Two project driveways are planned to be located along the north side of Stewart & Gray Road along the project frontage. Both driveways are proposed to be approximately 40 feet wide and will accommodate full access (i.e., left and right-turning inbound and outbound movements). The two project driveways will provide both passenger vehicle access to the on-site parking areas as well as truck access to the loading areas located east and west of the building.

All current site access points will be closed, with sidewalk, curb, and gutter reconstructed to the City of Downey's current standards.

2.4 Project Parking

Based on information provided by the project applicant team, the proposed project is planned to provide a total of 544 automobile parking spaces, 255 trailer and/or container parking spaces, and 109 48-foot dock high loading doors. The dock doors are planned to be located on the north, east, and west sides of the proposed building. The parking spaces will be provided in the surface parking areas surrounding the proposed building. Of the total parking spaces provided on-site, 12 will be designated as accessible spaces.

2.5 City Code Parking Requirements

A calculation of the Code parking requirement was prepared in accordance with the City of Downey Municipal Code nonresidential parking requirements (Section 9712, Nonresidential Parking Requirements). In accordance with the Municipal Code parking regulations, the off-street parking requirements applicable to the proposed project are as follows:

- Warehousing — 1.0 space per 800 square feet of gross floor area, plus office space exceeding 30% of gross floor area must meet the parking requirements for office use

_____Source: City of Downey Municipal Code (Section 9712).

Through strict application of the Municipal Code parking regulations, the following parking requirement would be calculated for the proposed project. As noted previously in the project description, the project will consist of the construction of a total of 535,685 square feet of building floor area:

- Warehousing: 535,685 SF x 1.0 space/800 SF = rounded to 670 spaces

Based on the above calculation, the City Code parking requirement for the project would total 670 spaces. Thus, the proposed project parking supply of 544 automobile parking spaces and 255 trailer and/or container parking spaces would exceed the minimum Code parking requirement.

2.6 Project Trip Generation and Distribution

2.6.1 *Project Trip Generation*

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Trip rates provided in the ITE *Trip Generation Manual*, 11th Edition, published by the Institute of Transportation Engineers (ITE), [Washington, D.C., 2021] were utilized to forecast project traffic generation for the proposed project. As noted previously, the future tenant of the proposed warehouse project is not yet known. The trip rates for High-Cube Fulfillment Center Warehouse are among the highest rates published in the ITE *Trip Generation Manual* for industrial and warehousing land uses, and are the most appropriate rates to utilize for the proposed project in the absence of tenant information which would support a more specific land use category. In addition, based on information provided by the project Applicant, approximately five percent (5%) of the proposed 535,685 square-foot industrial concrete tilt building maybe occupied by a high-cube cold storage warehouse use. Thus, traffic volumes expected to be generated by the proposed project were based upon average rates per 1,000 square feet of gross floor area for High-Cube Fulfillment Center Warehouse land use (ITE Land Use Code 155) and High-Cube Cold Storage Warehouse land use (ITE Land Use Code 157) in general urban/suburban locations.

Trip generation forecasts were also prepared for the existing industrial buildings which currently occupy the project site. Based on information provided by the project applicant team, the existing industrial use was operating at full capacity (i.e., 100% utilization) at the time of the release of the Notice of Preparation (NOP) for the environmental document. ITE Land Use Code 110 (General Light Industrial) trip generation average rates were used to forecast the expected traffic generation for the existing uses, which are planned to be demolished to accommodate the proposed project.

The trip rates published in the ITE *Trip Generation Manual* account for all vehicle trips generated by the land use. In the case of a high-cube fulfillment center warehouse land use, it is expected that a

small proportion of the vehicles accessing the project site would consist of delivery trucks and/or tractor-trailer trucks, in addition to passenger vehicles. Information related to truck trips as percent of total vehicle trips for the proposed high-cube fulfillment center warehouse use was obtained from Appendix C of the ITE *Trip Generation Manual*, 10th Edition Supplement, published by the Institute of Transportation Engineers (ITE), [Washington, D.C., February 2020]. It should be noted that the fulfillment center land use has a significantly higher percentage of passenger vehicles during the AM and PM peak hours and daily conditions due largely to the significantly higher number of employees at a fulfillment center compared to the other types of high-cube warehouse uses.

The ratios of trucks to passenger vehicles and trucks by number of axles identified in the *Truck Trip Generation Study, City of Fontana, County of San Bernardino, State of California*, prepared by Transportation Engineering and Planning, Inc., August 2003 for heavy warehouse land uses were applied to the general vehicle trip forecast for the existing light industrial uses. Lastly, a passenger car equivalent (PCE) factor was applied to the truck trips based on the number of axles to account for the effect of the larger vehicles on intersection traffic operations.

The trip generation rates and forecast of the vehicular trips anticipated to be generated by the proposed project are presented in ***Table 2-1***. As summarized in *Table 2-1*, the proposed project is expected to generate a net decrease of 47 PCE-adjusted vehicle trips (73 fewer inbound trips and 26 more outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project is expected to generate a net increase of 189 PCE-adjusted vehicle trips (187 more inbound trips and 2 more outbound trips). Over a 24-hour period, the proposed project is forecast to generate a net increase of 167 PCE-adjusted vehicle trips (approximately 84 more inbound trips and 84 more outbound trips) during a typical weekday.

2.6.2 *Project Trip Distribution and Assignment*

Project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- The site's proximity to major traffic corridors (i.e., Hall Road, Stewart & Gray Road, Woodruff Avenue, Firestone Boulevard, Imperial Highway, etc.);
- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;
- Existing intersection traffic volumes;
- Ingress/egress scheme planned for the proposed project; and
- Nearby population and employment centers.

The general, directional traffic distribution pattern for the proposed project are presented in ***Figures 2-3*** and 2***-4*** for the passenger cars and trucks, respectively. The forecast weekday AM and PM peak hour net project traffic volumes at the study intersections associated with the proposed project are presented in ***Figures 2-5*** and ***2-6***, respectively. The traffic volume assignments presented in *Figures*

2-5 and *2-6* reflect the traffic distribution characteristics shown in *Figures 2-3* and *2-4* (which show the directional distribution of all passenger cars and trucks), and the project traffic generation forecasts presented in *Table 2-1*.

It should be noted that the proportion of passenger vehicle and truck trips anticipated to be generated by the proposed project differs from the existing site land use. Therefore, net decreases in vehicle trip ends are anticipated to occur for certain turning movements at some of the study intersections; specifically, where PCE-adjusted truck trip ends represent the dominant trip type assigned to the movement, and the higher proportion of existing truck trips is anticipated to be replaced by a lesser amount of truck trip ends generated by the proposed project.

3.0 PROJECT SITE CONTEXT

The project site is located within a well-established multi-modal transportation network maintained by the City of Downey. The following sections provide an overview of the transportation infrastructure in the vicinity of the proposed project, including infrastructure which supports both motorized and non-motorized transportation modes.

3.1 Non-Vehicle Network

Non-vehicular transportation generally encompasses walking, biking, and other active transportation modes. Distinct facilities are often provided for these non-vehicular modes. Most prominently, paved sidewalks are typically provided to facilitate pedestrian travel outside of the roadway. In some cases, bicycle facilities such as painted bike lanes or separated bike paths are provided within the roadway in order to separate bike traffic from vehicular traffic. Roadways which are designed to prioritize non-vehicular transportation modes utilize complimentary non-vehicular infrastructure in order to promote comfortable, safe travel for both pedestrians and bicyclists. A review of the pedestrian and bicycle infrastructure provided in the vicinity of the project site is provided below.

3.1.1 *Pedestrian System*

Pedestrian infrastructure consists of facilities such as sidewalks, crosswalks, pedestrian signals, curb access ramps, Americans with Disabilities Act (ADA) compliant tactile warning strips, and curb extensions, among other things. These facilities are provided within the study area at major intersections, including the Woodruff Avenue/Stewart & Gray Road intersection. Sidewalks are provided along most major corridors in the study area, and marked crosswalks, pedestrian signals, and curb ramps are also provided at signalized intersections.

Existing public sidewalks in closest proximity to the project site are provided on the south side of Hall Road west of Woodruff Avenue, on both sides of Woodruff Avenue between Hall Road and Stewart & Gray Road, and on both sides of Stewart & Gray Road west of Woodruff Avenue. Existing pedestrian facilities within an approximate 1,320-foot (0.25 mile) radius of the project site are presented in ***Figure 3-1***. Development of the proposed project would not conflict with the existing pedestrian system.

3.1.2 *Bicycle System*

Bicycle infrastructure consists of both facilities within the roadway as well as public bicycle parking spaces. The Federal and State transportation systems recognize three primary bikeway facilities: Bicycle Paths (Class I), Bicycle Lanes (Class II), and Bicycle Routes (Class III). Bicycle Paths (Class I) are exclusive car free facilities that are typically not located within a roadway area. Bicycle Lanes (Class II) are part of the street design that is dedicated only for bicycles and identified by a striped lane separating vehicle lanes from bicycle lanes. Bicycle Routes (Class III) are preferably located on collector and lower volume arterial streets.

The existing and proposed bicycle infrastructure in the City of Downey is illustrated in ***Figure 3-2***. The Southern California Regional Bikeway Shapefile (RBS) identifies potential future bicycle routes

Existing and Proposed Bikeway

within the City. As shown in *Figure 3-2*, potential bicycle routes in closest proximity to the proposed project site include Woodruff Avenue, Firestone Boulevard, Stewart & Gray Road, Washburn Road, and Imperial Highway. Additionally, the Downey Bike Master Plan Implementation Phase 1 Downtown/Transit project under Capital Improvement Program (CIP) 19-14 would include installation of Class II bicycle facilities on nine roadway segments, bicycle parking facilities, and way-finding signs. Development of the proposed project would not conflict with the existing or proposed bicycle system.

3.2 Transit Network

Public bus transit service is provided within the project study area. Public bus transit service is currently provided by the City of Downey (DowneyLink) and the Los Angeles County Metropolitan Transportation Authority (Metro). A summary of the existing transit service in the vicinity of the project site is presented in ***Table 3-1***. The existing public transit routes in the vicinity of the project site are illustrated in ***Figure 3-3***. As summarized in *Table 3-1*, a total of seven (7) public transit routes provide service within the project study area. The nearest Metro transit stops are provided on both sides of Firestone Boulevard, west of Woodruff Avenue (within an approximate 0.3-mile walk (north) of the project site) and at the northwest and southwest corners of the Stewart & Gray Road/Firestone Boulevard intersection (within an approximate 0.4-mile walk (east) of the project site). Transit service at these stops is provided every 15 minutes during the weekday morning and afternoon peak hours.

3.3 Vehicle Network

3.3.1 *Roadway Classifications*

The City of Downey utilizes the roadway categories recognized by regional, state and federal transportation agencies. There are four categories in the roadway hierarchy, ranging from freeways with the highest capacity to two-lane undivided roadways with the lowest capacity. The roadway categories are summarized as follows:

- *Freeways* are limited-access and high speed travel ways included in the state and federal highway systems. Their purpose is to carry regional through-traffic. Access is provided by interchanges with typical spacing of one mile or greater. No local access is provided to adjacent land uses.

- *Arterial* roadways are major streets that primarily serve through-traffic and provide access to abutting properties as a secondary function. Arterials are generally designed with two to six travel lanes and their major intersections are signalized. This roadway type is divided into two categories: principal and minor arterials. Principal arterials are typically four-or-more lane roadways and serve both local and regional through-traffic. Minor arterials are typically two-to-four lane streets that service local and commuter traffic.

- *Collector* roadways are streets that provide access and traffic circulation within residential and non-residential (e.g., commercial and industrial) areas. Collector roadways connect local

★ Project Site

Figure 3-3
Existing Transit Routes

streets to arterials and are typically designed with two through travel lanes (i.e., one through travel lane in each direction) that may accommodate on-street parking. They may also provide access to abutting properties.

- *Local* roadways distribute traffic within a neighborhood, or similar adjacent neighborhoods, and are not intended for use as a through-street or a link between higher capacity facilities such as collector or arterial roadways. Local streets are fronted by residential uses and do not typically serve commercial uses. Generally, travel lanes are not striped, and parking may be accommodated on one or both sides of the roadway.

3.3.2 *Regional Highway System*

Primary regional access is provided by the San Gabriel River (I-605) Freeway and the Glenn Anderson (I-105) Freeway as shown in *Figure 1-1*. The *I-605 Freeway* is a major north-south freeway connecting the I-210 Freeway to the north and I-405 Freeway to the south. In the project vicinity, five to six mixed-flow freeway lanes and one HOV lane are provided in each direction on the I-605 Freeway with auxiliary merge/weave lanes provided between some interchanges. Northbound and southbound on/off ramps are provided to and from the I-605 Freeway at Firestone Boulevard in the project area. The *I-105 Freeway* an east-west oriented freeway connecting the LAX/El Segundo area to the west with the I-605 Freeway to the east. In the project vicinity, three to four mixed-flow freeway lanes and one HOV lane are provided in each direction on the I-105 Freeway. Eastbound and westbound on/off ramps are provided to and from the I-105 Freeway at Bellflower Boulevard in the project area.

3.3.3 *Roadway Descriptions*

The current lane configurations and traffic control measures at each study intersection is presented in ***Figure 3-4***. Descriptions of the roadways which comprise the study area are provided in ***Table 3-2***, including the roadway classification, number of lanes, median types, and speed limits designated by the City of Downey.

3.4 Traffic Count Data

Manual counts of vehicular, pedestrian, and bicycle volumes were conducted at each of the eight (8) study intersections during the weekday morning (AM) and afternoon (PM) commuter periods to determine the peak hour traffic volumes. The manual counts utilized in this transportation assessment were conducted in 2016, 2020, and 2021 by various independent traffic count subconsultants at the study intersections from 7:00 AM to 9:00 AM and from 4:00 PM to 6:00 PM to determine the AM and PM peak commute hours, respectively. Specifically, traffic counts were conducted in 2016 at three (3) study intersections and 2020 at two (2) study intersections as part of traffic impact analyses prepared for other projects in the study area. Historic traffic counts for the remaining three (3) study intersections were not identified through a search of LLG records and data on file with the City. Therefore, manual counts were conducted in October 2021 for the remaining three (3) study intersections.

[3] Number of lanes in both directions on the roadway.
[4] Median type of the road: RMI = Raised Median Island; 2WLT = 2-Way Left-Turn Lane; and N/A = Not Applicable.
[5] City of Downey
[6] City of Norwalk

Based on a review of the collected count data, it was determined that the 2020 traffic count data conducted for Intersection No. 3 (Woodruff Avenue & Stewart & Gray Road) and Intersection No. 4 (Woodruff Avenue & Washburn Road) were substantially lower due to the Covid-19 pandemic conditions. In addition, the 2016 traffic count data conducted for Intersection No. 6 (Newville Avenue-Stewart & Gray Road & Firestone Boulevard) were noted to be lower. As a result, the traffic count data collected at these three intersections were adjusted accordingly to reflect typical conditions of study area intersections and ensure peak hour traffic flow consistency on a corridor-level basis.

Furthermore, based on review of the general traffic growth factors provided in the Los Angeles County 2010 Congestion Management Program[2] (CMP) for RSA 22 (Downey) where the study intersections are located, an annual growth rate of one percent (1.0%) per year has been conservatively applied to bring all count data to the year 2022 existing condition.

The existing weekday AM and PM peak hour intersection traffic volumes by approach are summarized in ***Table 3-3***. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are shown in ***Figures 3-5*** and ***3-6***, respectively. For each study intersection, the highest one-hour total traffic volumes (i.e., four consecutive 15-minute time intervals) traversing through the intersection during the 7:00 to 9:00 AM and 4:00 to 6:00 PM time periods were selected so as to determine the respective weekday AM and PM peak hour traffic volumes for each study intersection. For purposes of the transportation analysis, this common traffic engineering practice ensures that a more conservative (i.e., worst case) assessment of existing operating conditions be attained for each study intersection. Therefore, the traffic volumes shown in *Figures 3-5* and *3-6* for the study intersections do not necessarily reflect the same exact one-hour time period during the morning and/or afternoon peak commuter conditions (i.e., one intersection's peak hour may have occurred between 7:30 and 8:30 AM, while another intersection's peak hour may have occurred between 7:45 and 8:45 AM). Summary data worksheets of the manual traffic counts of the study intersections, as well as the available pedestrian and bicycle counts, are contained in ***Appendix A***.

In addition, 24-hour average daily traffic (ADT) counts were collected for the roadway segments. The daily traffic counts were collected by an independent traffic count subconsultant on two consecutive weekdays in October 2021. Consistent with the intersection count data, an annual growth rate of one percent (1.0%) has been conservatively applied to bring the ADT count data to the year 2022 existing condition. Summary data worksheets of the daily traffic counts for the roadway segments are also contained in *Appendix A*.

3.5 Cumulative Development Projects

The forecast of future pre-project conditions was prepared in accordance to procedures outlined in Section 15130 of the CEQA Guidelines. Specifically, the CEQA Guidelines provide two options for developing the future traffic volume forecast:

[2] Los Angeles County Metropolitan Transportation Authority (Metro) 2010 Congestion Management Program.

Weekday PM Peak Hour
Prologis Stewart & Gray Road Warehouse Project

o:\job_file\4450\dwg\f3-6.dwg 01/04/2023 16:35:05 rodriquez

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency."

Although the CEQA Guidelines do not strictly apply to the local transportation assessment required by the City of Downey, this traffic analysis provides a highly conservative estimate of future pre-project traffic volumes as it incorporates both the "A" and "B" options for purposes of developing the forecast.

3.5.1 *Related Projects*

A forecast of on-street traffic conditions prior to occupancy of the proposed project was prepared by incorporating the potential trips associated with other known development projects (related projects) in the area (i.e., within an approximate one-mile radius from the project site). With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impacts of all ongoing development. The related projects research was based on information on file with the City of Downey Community Development Department and the City of Norwalk Economic Development Program. The list of related projects in the project site area is presented in ***Table 3-4***. The location of the related projects is shown in ***Figure 3-7***.

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*[3]. The related projects' respective traffic generation for the weekday AM and PM peak hours, as well as on a daily basis for a typical weekday, is summarized in *Table 3-4*. The related projects traffic volumes were distributed and assigned to the street system based on the projects' locations in relation to the study intersections, their proximity to major traffic corridors, proposed land uses, nearby population and employment centers, etc. The anticipated distribution of the related projects traffic volumes to the study intersections during the weekday AM and PM peak hours are displayed in ***Figures 3-8*** and ***3-9***, respectively.

3.5.2 *Ambient Traffic Growth Factor*

Horizon year background traffic growth estimates have been calculated using an ambient traffic growth factor. The ambient traffic growth factor is intended to include unknown related projects in the study area as well as account for typical growth in traffic volumes due to the development of projects outside the study area. An annual growth rate of one percent (1.0%) per year was selected for this analysis.

Therefore, application of this one percent (1.0%) annual ambient growth factor in addition to the forecast traffic generated by the related projects allows for a very conservative forecast of future traffic volumes in the project study area as incorporation of both (i.e., an ambient traffic growth rate and a detailed list of cumulative development projects) is expected to overstate potential future traffic volumes.

4.0 CEQA TRANSPORTATION ASSESSMENT

The State of California Governor's Office of Planning and Research (OPR) issued proposed updates to the CEQA guidelines in November 2017 that amends the Appendix G question for transportation impacts to delete reference to vehicle delay and level of service and instead refer to Section 15064.3, subdivision (b)(1) of the CEQA Guidelines asking if the project will result in a substantial increase in vehicle miles traveled (VMT). The California Natural Resources Agency certified and adopted the revisions to the CEQA Guidelines in December of 2018, and as of July 1, 2020 the provisions of the new section are in effect statewide. Concurrently, OPR developed the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018), which provides non-binding recommendations on the implementation of VMT methodology which has significantly informed the way VMT analyses are conducted in the State. The City of Downey has not formally adopted VMT methodology, screening criteria, or thresholds for VMT analysis of land use development projects within its jurisdiction. Instead, the City follows the methodology set forth in the Los Angeles County Public Works Transportation Impact Analysis Guidelines[4] ("County Guidelines").

4.1 Vehicle Miles Traveled (VMT) Project Screening

Traditionally, public agencies have set certain thresholds to determine whether a project requires detailed transportation analysis or if it could be assumed to have less than significant environmental impacts without additional study. Consistent with the recommendations provided by OPR in the *Technical Advisory*, the County Guidelines recognize four screening criteria which may be applied to screen proposed projects out of detailed VMT analysis. Proposed projects are not required to satisfy all of the screening criteria in order to screen out of further VMT analysis; satisfaction of one criterion is sufficient for screening purposes. The following sections provide a detailed explanation of each screening criteria as it relates to the proposed project.

4.1.1 *Non-Retail Project Trip Generation Screening Criteria*

Section 3.1.2.1 of the County Guidelines states that: "If the answer is no to the question below, further analysis is not required, and a less than significant determination can be made.

- Does the development project generate a net increase of 110 or more daily vehicle trips?"

The County Guidelines further indicate that a proposed project's daily vehicle trip generation should be estimated using the most recent edition of the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, or through use of empirical trip generation data if the project's land use is not listed in the *Manual*.

As presented in *Table 2-1*, the proposed project is forecast to generate a net increase of 1,168 daily non-PCE-adjusted vehicle trips (i.e., 3,277 project trips – 2,109 existing trips = 1,168 net new trips). Application of the PCE-adjustment factors also results in a net increase of 167 daily PCE-adjusted trips. The answer to the screening question is "Yes"; therefore, the non-retail project trip generation screening criterion is not satisfied.

4.1.2 *Retail Project Screening Criteria*

New local serving retail development typically redistributes shopping trips rather than creating new ones. By adding retail opportunities into the urban fabric and improving retail destination proximity, local serving retail developments tend to shorten trips and reduce VMT, and may be presumed to cause less than significant impacts. Consistent with OPR's guidance, the County assumes that retail projects of any type which are less than 50,000 square feet may be considered local serving retail.

Therefore, Section 3.1.2.2 of the County Guidelines states: "A project that contains a local serving retail use is assumed to have less than significant VMT impacts for the retail portion of the project. If the answer to the following question is no, a less than significant determination can be made for the portion of the project that contains retail uses.

- Does the project contain retail uses that exceed 50,000 square feet of gross floor area?"

The proposed project does not include any retail components; therefore, this screening criterion does not apply.

4.1.3 *Proximity to Transit Screening Criteria*

CEQA Guidelines Section 15064.3(b)(1) states in part: "Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high-quality transit corridor should be presumed to cause a less than significant transportation impact." In keeping with the statutory presumption of less than significant impacts due to nearby high-quality transit, the County Guidelines include a screening criterion based on proximity to transit. Consistent with the recommendations provided by OPR, the County also notes certain project-specific or location-specific information which might indicate that the presumption is not appropriate.

Thus, Section 3.1.2.3 of the County Guidelines states that: "If the project is located near a major transit stop or high-quality transit corridor, the following question should be considered:

- Is the project located within a one-half mile radius of a major transit stop[5] or an existing stop along a high-quality transit corridor[6]?

If the answer to the above question is yes, then the following subsequent questions should be considered:

- Does the project have a Floor Area Ratio (FAR) less than 0.75?
- Does the project provide more parking than required by the County Code?

---

[4] Los Angeles County Public Works, "Transportation Impact Analysis Guidelines", July 23, 2020.

[5] Public Resources Code Section 21064.3: ""Major transit stop" means a site containing any of the following: (a) An existing rail or bus rapid transit station. (b) A ferry terminal served by either a bus or rail transit service. (c) The intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.

[6] Public Resources Code Section 21155(b): "For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours."

- Is the project inconsistent with the SCAG RTP/SCS?
- Does the project replace residential units set aside for lower income households with a smaller number of market-rate residential units?

If the answer to all four subsequent questions is no, further analysis is not required, and a less than significant determination can be made."

The project site is located within a high quality transit corridor. As described in *Section 3.2*, transit service along Firestone Boulevard is provided every 15 minutes during the weekday morning and afternoon peak periods. The project site is located within a 0.5-mile walking distance from existing transit stops at the Woodruff Avenue/Firestone Boulevard intersection and the Stewart & Gray Road/Firestone Boulevard intersection. Therefore, the answer to the first question is "Yes", and the subsequent questions should be considered:

- Does the project have a Floor Area Ratio (FAR) less than 0.75?

  Yes. The project will have an FAR of 0.42 (535,685 total building SF/1,270,210 total site SF = 0.42), which is less than 0.75.

- Does the project provide more parking than required by the County Code?

  Yes. The proposed project's parking supply was compared to the City of Downey's Municipal Code since the County's Code is not applicable to the project site. As presented in *Section 2.5*, the Downey Municipal Code parking requirement for the proposed project is 670 parking spaces. The project proposes to provide a total of 799 parking spaces (i.e., 544 automobile parking spaces and 255 trailer/container parking spaces), therefore the project provides more parking spaces than required by the City's Municipal Code.

- Is the project inconsistent with the SCAG RTP/SCS?

  No. The project site is currently zoned for Manufacturing (M-2). Downey Municipal Code Section 9318.04 lists warehousing as a permitted land use in M-2 zones. Since the project is consistent with the City's adopted zoning, and is not expected to result in substantial changes to the existing transportation network/infrastructure, it is assumed to be consistent with the land use and transportation network assumptions incorporated in the Southern California Council of Government's (SCAG) Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS).

- Does the project replace residential units set aside for lower income households with a smaller number of market-rate residential units?

  No. The existing project site is currently occupied by five industrial buildings, which will be removed to accommodate the proposed project. The project will not result in the loss of affordable housing units.

Two of the answers to the above subsequent questions are "Yes". As stated above, the answer to all four questions must be "No" in order to satisfy the screening criterion. Therefore, the proximity to transit screening criterion is not fully satisfied.

4.1.4 *Residential Project Screening Criteria*

In the *Technical Advisory*, OPR refers to research indicating that low-income housing in infill locations generally improves the jobs-housing match, shortening commutes and reducing VMT. OPR asserts that evidence supports presuming less than significant transportation impacts for 100% affordable residential developments, and that a project consisting of a high percentage of affordable housing may be a basis for a lead agency to find a less than significant impact on VMT, thereby screening out of detailed VMT analysis.

Consistent with the recommendations provided by OPR, Section 3.1.2.4 of the County Guidelines indicate that certain projects which further the State's affordable housing goals are presumed to have less than significant impacts on VMT. The Guidelines state: "If the project requires discretionary action and the answer is yes to the question below, further analysis is not required, and a less than significant determination can be made.

- Are 100% of the units, excluding manager's units, set aside for lower income households?"

The proposed project does not include any residential or low-income housing components; therefore, this screening criterion does not apply.

4.1.5 *Summary of Screening Conclusions*

The proposed project does not satisfy any of the four screening criteria stated in the County Guidelines and is not screened out of further analysis. Therefore, a VMT analysis is required in order to determine whether the proposed project will result in any significant transportation impacts.

4.2 Impact Criteria

The County Guidelines provides the following impact criteria for office land uses: "The project's employment VMT per employee[7] would not be 16.8% below the existing employment VMT per employee for the Baseline Area in which the project is located." While the proposed project is not an office project, employees are expected to be the main source of VMT generated by the project. Therefore, the office land use impact criteria presented above is applicable to the proposed project.

The proposed project is located in the South County Baseline Area, which generally consists of the region of Los Angeles County which is situated below the Santa Susana and San Gabriel Mountain Ranges. The County Guidelines state that the South County employment VMT baseline is 18.4 VMT per employee. Therefore, the threshold of 16.8% below the baseline employment VMT is 15.3 VMT per employee. A significant transportation impact would result if the project VMT exceeds 15.3 VMT per employee.

[7] "Employment VMT is the VMT generated by Home-Based Work trip attractions."

As of the preparation of this report, Los Angeles County is preparing revised VMT thresholds for use in determining the significance of VMT impacts in response to further guidance from OPR. It is understood that the revised thresholds will be applied County-wide, rather than separated by the North or South County Baseline areas. Based on coordination with Los Angeles County Public Works staff, it is further understood that the current South County thresholds are more environmentally protective (i.e., reflect a lower VMT threshold) than the forthcoming revised thresholds. Therefore, continuing to apply the current South County thresholds to the proposed project results in a conservative VMT impact analysis.

4.3 VMT Analysis

The Southern California Association of Governments Regional Travel Demand Model (SCAG RTDM) has been utilized to determine the employment VMT per employee for the proposed project. The project site is located within Traffic Analysis Zone (TAZ) 21791300. The TAZ is generally bounded by Firestone Boulevard to the north, Woodruff Avenue to the east, Stewart & Gray Road to the south, and Lakewood Boulevard and Bellflower Boulevard to the west as illustrated in ***Figure 4-1***. The existing land uses within the TAZ includes a mix of residential, commercial, and industrial land uses. Therefore, the proposed project is consistent with the land uses assumed for the TAZ, and the existing VMT per employee for the TAZ is an adequate proxy for the VMT per employee expected to be generated by the proposed project. Based on the SCAG RTDM model output for TAZ 21791300, the proposed project is forecast to generate a baseline employment VMT of 19.2 VMT per employee.

4.3.1 *CAPCOA Guidance and Project Design Features*

The California Air Pollution Control Officers Association's (CAPCOA*) Handbook for Analyzing Greenhouse Gas Emissions Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*[8] ("2021 Handbook") provides a comprehensive set of guidelines for assessing and quantifying reductions in greenhouse gas emissions. The emissions reduction measures are grouped by emission sector into nine categories, including transportation, energy, water, and other related areas. Transportation emissions can be reduced by improving the emissions profile of the vehicle fleet, or by reducing VMT. Reductions in VMT are achieved when any of the following occurs: 1) vehicle ownership declines, 2) vehicle trips are reduced, 3) vehicle trip lengths are reduced, or 4) any combination of the first three variables. The 2021 Handbook lists 30 quantified measures covering a total of six transportation subsectors, including land use, trip reduction programs, parking or road pricing/management, neighborhood design, transit, and clean vehicles and fuels. The majority of the measures quantified in the 2021 Handbook aim to reduce VMT, although two strategies are aimed at improving the emissions profile of the vehicle fleet and thus do not result in quantified VMT reductions. The VMT reducing strategies are broadly referred to as transportation demand management (TDM) strategies due to the focus on reducing the amount of automobile travel generated by a project.

[8] *Handbook for Analyzing Greenhouse Gas Emissions Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity Final Draft*, California Air Pollution Control Officers Association, December 2021, adopted December 15, 2021.

LINSCOTT LAW & GREENSPAN engineers

Project Site

TAZ 21791300

Figure 4-1
Los Angeles County Transportation Analysis Zones

The 2021 Handbook acknowledges that interactions between transportation measures are complex and sometimes counterintuitive, whereby combining measures can have substantive impact on reported emissions reductions. Therefore, in order to safeguard the accuracy and reliability of the methods, certain rules are recommended when combining reductions achieved by transportation measures. First, the quantified measures may be applied at one of two scales of application: 1) the Project/Site scale, which refers to measures that reduce VMT at the scale of a parcel, employer, or development project, or 2) the Plan/Community scale, which refers to measures that reduce emissions at the scale of a neighborhood (e.g., specific plan, general plan, or climate action plan), corridor, or entire municipality (e.g., city- or county-level). According to the 2021 Handbook, measures from different scales of application should never be combined. Second, the effectiveness of multiple measures within a subsector should be multiplied (i.e., not added) in order to determine a combined level of effectiveness. Each quantified measure has a maximum allowable reduction, and in turn each subsector has a maximum allowable reduction which is intended to ensure that emissions reductions are not double counted when measures within the subsector are combined. The subsector maximums vary by scale of application. Finally, there is limited research directly analyzing the combined VMT impact from implementation of all, or a majority, of transportation sector measures. However, the 2021 Handbook adopts a 70 percent (70%) maximum for the combined VMT reduction from the following four subsectors: land use, neighborhood design, parking or road pricing/management, and transit. The multi-subsector maximum does not include the trip reduction program subsector, since these measures are implemented by individual employers and not as directly correlated with place type as the other subsectors. For the purpose of this VMT analysis, measures at the Project/Site scale of application were determined to be the most appropriate for the proposed project.

Certain TDM strategies may qualify as a project design feature (PDF). Generally, PDFs are those measures which are required in order to comply with local ordinances, affordable housing incentives, state law, etc. PDFs also include reductions in VMT that are inherent to the proposed project, such as reductions that result from changes in land use mix, planned parking supply, etc. The following TDM strategies have been determined to be applicable as project design features:

- T-2. Increase Job Density

  This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of jobs compared to the average job density in the country. When reductions are being calculated from a baseline derived from a travel demand model, the job density of the relevant TAZ is used for the comparison instead. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose. Increasing job density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction in VMT.

  The project VMT forecast is derived from the SCAG RTDM output data. Therefore, the reduction in VMT that is expected to result due to the development of the proposed project is determined by comparing the existing job density in TAZ 21791300 without and with the

proposed project. The number of existing jobs and acres in the TAZ was obtained from the RTDM. The number of jobs with the proposed project was developed based on trip rates provided by ITE for the proposed project and for the existing land use, resulting in a forecast net increase of 2,097 employees in the TAZ.

The project design feature described above is expected to result in a 9.9 percent (9.9%) reduction in VMT generated by the proposed project. Calculation and summary worksheets for the VMT reduction associated with the project design feature is provided in ***Appendix B***. Application of the VMT reduction to the baseline VMT forecast derived from the RTDM results in the following VMT forecast:

- The proposed project is forecast to generate 17.3 VMT per employee (i.e., 19.2 VMT/employee * (1-0.099) = 17.3 VMT/employee), when accounting for project design features.

The forecast of project-generated VMT per employee exceeds the South County threshold of 15.3 VMT per employee; therefore, the proposed project is expected to result in a significant VMT impact. A summary of the project-level VMT analysis is presented in ***Table 4-1***, which presents the baseline VMT forecast and the VMT reductions due to project design features.

4.4 CEQA Transportation Mitigation Measures

As described above, based on the baseline VMT forecasts from RTDM and application of appropriate VMT reductions due to project design features, the proposed project is expected to result in a significant VMT impact. CEQA requires identification of mitigation measures to reduce a significant environmental impact to the greatest extent possible. The 2021 Handbook was reviewed to identify any additional TDM measures which would further mitigate the project VMT impact. The measures were reviewed for applicability to the proposed project based on land use type, location, and feasibility of implementation. The TDM strategies which have been selected for the proposed project as VMT mitigation measures are described in further detail below.

- T-7. Implement Commute Trip Reduction Marketing

  This measure reflects implementation of a marketing strategy to promote the CTR. Information sharing and marketing educates employees about their travel choices to and from the location and promotes alternatives to driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT. Effective marketing strategies incorporate the following features or similar alternatives:

  - On-site or online commuter information services.
  - Employee transportation coordinators.
  - On-site or online transit pass sales.
  - Guaranteed ride home service.

Table 4-1
SUMMARY OF VEHICLE MILES TRAVELED (VMT) ANALYSIS [1]

VMT ANALYSIS CONDITIONS	VMT
Baseline VMT per Employee from SCAG RTDM [2]	19.2
VMT Reductions Due to Project Design Features [3]	*-9.9%*
Project-Generated VMT per Employee [4]	17.3
Significant Impact? (Yes/No) [5]	YES
VMT Reductions Due to Mitigation Measures [3]	*-11.90%*
Project-Generated VMT per Employee After Mitigation [6]	15.2
Significant Impact? (Yes/No) [5]	NO

[1] The VMT analysis presented in this table, including all adjustments and VMT reductions, is described in detail in *Section 4.0.*
[2] Baseline VMT per employee obtained from the Southern California Association of Governments (SCAG) Regional Travel Demand Model (RTDM) for transportation analysis zone (TAZ) 21791300.
[3] The VMT reduction calculations are presented in *Appendix B.*
[4] Baseline VMT * (1-0.099) = Project-Generated VMT
[5] A significant impact occurs when the project-generated VMT per Employee exceeds the South County threshold of 15.3 VMT per Employee.
[6] Project-Generated VMT * (1-0.119) = Project-Generated VMT After Mitigation

The project applicant should provide information on available travel options to and from the project site in a clear and easily accessible location (e.g., a bulletin board in a common employee area), including information on where transit passes may be purchased online or in person. The project applicant should also designate an employee transportation coordinator who will be able to provide information and/or administer a guaranteed ride home service. Such services may consist of providing free or subsidized rides upon request via taxis or other transportation network companies (TNC) such as Uber or Lyft.

- T-8. Provide Ridesharing Program

  This measure reflects implementation of a ridesharing program. Ridesharing encourages carpooled vehicle trips in place of single-occupancy vehicle trips, thereby reducing the number of trips and VMT. Ridesharing may be promoted through a multifaceted approach, such as designating parking spaces for ridesharing/carpooling vehicles, dedicating loading and waiting zones, and coordinating rides.

  The project applicant should provide designated parking spaces for carpool vehicles in a convenient/preferential location, and a designated waiting area for employees participating in ridesharing which is comfortable and convenient. The project applicant should facilitate the process of arranging ridesharing or carpooling matches, either through a website/app or via the employee transportation coordinator (refer to measure T-7 above).

- T-10. Provide End-of-Trip Bicycle Facilities

  This measure reflects provision of end-of-trip bicycle facilities such as secure bike parking, showers, and personal lockers. Providing and maintaining securing bike parking and related facilities encourages commuting by bicycle, thereby reducing VMT.

  Current research indicates that employees are more likely to commute to work by bicycle when showers and personal lockers are provided. However, the project applicant should at a minimum provide secure bicycle parking (e.g., bicycle lockers) in an easily accessible, well-lit location.

The mitigation measures described above are expected to result in an 11.9 percent (11.9%) reduction in commute VMT generated by the proposed project. Calculation and summary worksheets for the VMT reductions associated with these mitigation measures are provided in *Appendix B*. Since the VMT per employee analysis for the proposed project is based on home-based work trips (i.e., commute trips), the 11.9% reduction in commute VMT equates to an 11.9% reduction in VMT per employee. Application of the 11.9 % VMT reduction would therefore result in the following project VMT after mitigation:

- The proposed project is expected to generate 15.2 VMT per employee (i.e., 17.3 VMT/employee * (1-0.119) = 15.2 VMT/employee) with implementation of mitigation measures.

The VMT reductions due to mitigation measures and the resulting project-level VMT per employee are summarized in *Table 4-1*. The proposed project's mitigated VMT per employee would fall below the threshold of 15.3 VMT per employee. Therefore, with implementation of the mitigation measures, the proposed project is expected to have a less than significant VMT impact.

It is recommended that the project applicant prepare a formal TDM Plan for review and approval by the City prior to the issuance of any grading or building permits. The TDM Plan should identify the TDM measures that will be implemented for the project site, and should include documentation of how both physical measures (e.g., bike lockers, designated carpool parking spaces, etc.) and programmatic measures (e.g., guaranteed ride home program, employee transportation coordinator, etc.) will be provided. The TDM Plan should be implemented for the life of the project. If the project site owner or tenant proposes to provide different TDM measures after City approval of the TDM Plan, a new TDM Plan should be submitted for review and approval, and an analysis should be provided to demonstrate that the selected measures are expected to achieve the same trip and VMT reductions required by the analysis presented herein.

4.5 Cumulative Impact Analysis

The County's Guidelines state that short-term effects are evaluated in the detailed project-level VMT analysis, while long-term or cumulative effects are determined through consistency with SCAG's current RTP/SCS, which is called Connect SoCal. Connect SoCal is the regional plan that demonstrates compliance with air quality conformity requirements and greenhouse gas (GHG) reduction targets. As such, projects that are consistent with this plan in terms of development location, density, and intensity are part of the regional solution for meeting air pollution and GHG goals. Projects that are deemed to be consistent would have a less than significant cumulative impact on VMT. Developments in a location where the RTP/SCS does not specify any development may indicate a significant impact on transportation. However, if a project does not demonstrate a significant impact in the project impact analysis, a less than significant impact in the cumulative impact analysis can also be determined. Projects that fall under an efficiency-based impact threshold (e.g., residential VMT per capita, employment VMT per employee, or total VMT per service population) are already shown to align with the long-term VMT and GHG reduction goals. Land use projects that demonstrate a project-level impact and which are not found to be consistent with the SCAG RTP/SCS could have a significant transportation impact.

The Technical Advisory provides the following additional discussion of cumulative impacts: "[M]etrics such as VMT per capita or VMT per employee, i.e., metrics framed in terms of efficiency (as recommended below for use on residential and office projects), cannot be summed because they employ a denominator. A project that falls below an efficiency-based threshold that is aligned with long-term goals and relevant plans has no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice-versa."

The proposed project has been determined to have a less than significant project-level impact after mitigation in comparison to the County's efficiency-based employment VMT impact thresholds. Therefore, it is concluded that the proposed project will not result in a significant cumulative impact.

5.0 NON-CEQA ANALYSIS

Based on coordination with City of Downey staff, the following eight (8) study intersections were identified for operational evaluation of the proposed project and other cumulative developments in the study area:

1. Woodruff Avenue & Firestone Boulevard (Signalized)
2. Woodruff Avenue & Hall Road (Two Way Stop Control)
3. Woodruff Avenue & Stewart & Gray Road (Signalized)
4. Woodruff Avenue & Washburn Road (Signalized)
5. Woodruff Avenue & Imperial Highway (Signalized)
6. Newville Avenue-Stewart & Gray Road & Firestone Boulevard (Signalized)
7. I-605 Freeway Southbound Ramps & Firestone Boulevard (Signalized)
8. I-605 Freeway Northbound Ramps-Hoxie Avenue & Firestone Boulevard (Signalized)

5.1 Analysis Methodology

In order to estimate the proposed project's effect on intersection operations, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis. The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area. The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area. The proposed project's forecast trip generation, distribution, and assignment is presented in *Section 2.6* herein. With the forecasting process complete and project traffic assignments developed, the effect of the proposed project is isolated by comparing operational conditions at the selected study intersections using existing and expected future traffic volumes without and with forecast project traffic.

The City of Downey signalized study intersections were evaluated using the Intersection Capacity Utilization (ICU) method of analysis which determines Volume-to-Capacity (*v/c*) ratios on a critical lane basis. The overall intersection *v/c* ratio is subsequently assigned a Level of Service (LOS) value to describe intersection operations. Level of Service varies from LOS A (free flow) to LOS F (jammed condition). A description of the ICU method and corresponding Levels of Service is provided in ***Appendix C***.

The I-605 Freeway Southbound Ramps/Firestone Boulevard and I-605 Freeway Northbound Ramps-Hoxie Avenue/Firestone Boulevard intersections (i.e., both located outside the City of Downey boundaries and under Caltrans jurisdiction) as well as the City of Downey unsignalized/two-way stop-control (TWSC) Woodruff Avenue/Hall Road study intersection were evaluated using the Highway Capacity Manual (HCM) method of analysis. The HCM method calculates the control

delay for each of the subject traffic movements at a study intersection and determines the level of service for each constrained movement. The control delay for any particular movement is a function of the capacity of the approach and the degree of saturation. The overall control delay is measured in seconds per vehicle, and includes delay due to deceleration to a stop at the back of the queue from free-flow speed, move-up time within the queue, stopped delay at the front of the queue, and delay due to acceleration back to free-flow speed. The Level of Service (LOS) for the intersection is then calculated based on the overall control delay.

Caltrans released the *Transportation Impact Study Guide*[9] (TISG) in May 2020 which replaced the 2002 Guide for the Preparation of Traffic Impact Studies. Per the TISG, Caltrans has transitioned away from requesting LOS or other vehicle operations analyses of land use projects. Thus, the following operational assessment pertaining to Caltrans intersections is provided for informational purposes only. In addition, it should be noted that level of service is not defined for two-way stop-control intersections because major-street movements with no delays typically result in a weighted average delay that is extremely low. Therefore, for the purpose of this analysis the delay associated with the most constrained approach at the intersection was utilized to determine the overall intersection level of service for the two-way stop-control intersection. The six qualitative categories of level of service and detailed description of the HCM signalized and unsignalized intersection methods and corresponding LOS are provided in *Appendix C*.

5.2 Criteria for Non-CEQA Analysis

The relative effect of the added project traffic volumes to be generated by the proposed project during the weekday AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the study intersections, without and with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the future *v/c* or delay relationships and service level characteristics at each study intersection.

The effect of project-generated traffic at each City of Downey study intersection was compared to the City of Downey's intersection LOS standards as presented below. The Downey Vision 2025 Circulation Element of the General Plan has established vehicle Level of Service (LOS) standards which local infrastructure will strive to maintain. The Circulation Element defines acceptable level of service as LOS D or better, along with the following applicable policy and program:

- Policy 2.1.1. Maintain a street system that provides safe and efficient movement of people and goods.
    - Program 2.1.1.1. Maintain intersections and street segments at acceptable service levels and not worsen those intersections and street segments currently operating at unacceptable levels.

[9] "Vehicle Miles Traveled-Focused Transportation Impact Study Guide", Caltrans, May 20, 2020.

For purposes of this analysis, an intersection would be found inconsistent with the City's Circulation Element if project traffic causes the intersection to degrade from an acceptable LOS to an unacceptable LOS (i.e., LOS E or LOS F). For an intersection already operating at unacceptable LOS, any increase in the intersection's Volume-to-Capacity ratio would be found inconsistent with the City's Circulation Element. The following section presents the operational (i.e., Level of Service) analysis prepared for the proposed project pursuant to this requirement.

The operational analysis was prepared utilizing the following data previously presented herein:

- Project Peak Hour Traffic Generation: Refer to Section 2.6.1 herein for the project traffic generation forecasts.
- Project Trip Distribution and Assignment: Refer to Section 2.6.2 herein.
- Existing Roadway Network: Refer to Section 3.3 herein.
- Existing Weekday AM and PM Peak Hour Traffic Count Data: Refer to Section 3.4 herein.
- Related Projects: Refer to Section 3.5.1 herein.

5.3 Analysis Scenarios

Level of Service calculations have been prepared for the following scenarios for the study intersections:

[a] Existing conditions.

[b] Existing with project conditions.

[c] Condition [a] plus one percent (1.0%) per year annual ambient traffic growth through year 2024 and with completion and occupancy of the related projects (i.e., future without project conditions).

[d] Condition [c] with completion and occupancy of the proposed project.

[e] Condition [d] with implementation of intersection improvement measures, if necessary.

The weekday AM and PM peak hour LOS analysis prepared for the study intersections using the ICU and HCM methodologies is summarized in ***Table 5-1***. The ICU and HCM data worksheets for the analyzed intersections are provided in *Appendix C*.

5.4 Existing Conditions

5.4.1 *Existing Conditions*

As indicated in column [1] of *Table 5-1*, seven of the eight study intersections are presently operating at LOS D or better during the AM and PM peak hours under existing conditions. The

[a] Level of Service (LOS) is based on the reported ICU value for the City of Downey signalized intersections and the delay value for unsignalized intersections.

[b] Caltrans signalized Intersection Levels of Service were based on the following criteria:

Control Delay (s/veh)	LOS
<= 10	A
> 10-20	B
> 20-35	C
> 35-55	D
> 55-80	E
> 80	F

Two-Way Stop-Controlled Intersection Levels of Service were based on the following criteria:

Control Delay (s/veh)	LOS
<= 10	A
> 10-15	B
> 15-25	C
> 25-35	D
> 35-50	E
> 50	F

[c] Two-Way Stop-Controlled Intersection. Reported values represent the delays (in seconds) associated with the most constrained approach of the intersection.

following study intersection is operating at LOS E or LOS F during the peak hours shown under existing conditions:

- Int. 8: I-605 NB Ramps-Hoxie Ave & Firestone Bl
  AM Peak Hour: Delay > 80.0 seconds, LOS F
  PM Peak Hour: 64.8 seconds, LOS E

The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 3-5*, and *3-6*, respectively.

5.4.2 *Existing With Project Conditions*

As shown in column [2] of *Table 5-1*, seven of the eight study intersections are expected to continue operating at LOS D or better during the AM and PM peak hours under the existing with project conditions. The following study intersection is expected to continue operating at LOS E or LOS F during the peak hours shown under the existing with project conditions:

- Int. 8: I-605 NB Ramps-Hoxie Ave & Firestone Bl
  AM Peak Hour: Delay > 80.0 seconds, LOS F
  PM Peak Hour: 73.2 seconds, LOS E

The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in ***Figures 5-1*** and ***5-2***, respectively.

5.5 Future Year 2024 Cumulative Conditions

5.5.1 *Future Year 2024 Cumulative Without Project Conditions*

The future year 2024 cumulative baseline conditions were forecast based on the addition of traffic generated by the completion and occupancy of the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The *v/c* ratios and delay values at the study intersections are incrementally increased with the addition of ambient traffic and traffic generated by the related projects listed in *Table 3–4*. As presented in column [3] of *Table 5-1*, seven of the eight study intersections are expected to continue to operate at LOS D or better during the AM and PM peak hours under the future year 2024 cumulative without project conditions. The following study intersection is expected to continue operating at LOS E or LOS F during the peak hours shown under the future year 2024 cumulative without project conditions:

- Int. 8: I-605 NB Ramps-Hoxie Ave & Firestone Bl
  AM Peak Hour: Delay > 80.0 seconds, LOS F
  PM Peak Hour: 66.1 seconds, LOS E

The future year 2024 cumulative without project traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in ***Figures 5-3***, and ***5-4***, respectively.

5.5.2 *Future Year 2024 Cumulative With Project Conditions*

As shown in column [4] of *Table 5-1,* seven of the eight study intersections are expected to continue to operate at LOS D or better during the AM and PM peak hours under the future year 2024 cumulative with project conditions. The following study intersection is expected to continue operating at LOS E or LOS F during the peak hours shown under the future year 2024 cumulative with project conditions:

- Int. 8: I-605 NB Ramps-Hoxie Ave & Firestone Bl
  AM Peak Hour: Delay > 80.0 seconds, LOS F
  PM Peak Hour: 74.1 seconds, LOS E

Application of the City's criteria to the "Future Year 2024 Cumulative With Project" scenario indicates that the project-related effects at the City of Downey study intersections are not expected to exceed the City's threshold criteria. Incremental v/c and delay increases, but not exceeding the City's criteria, are noted at the study intersections. As none of the City of Downey study intersections would be found inconsistent with the City's Circulation Element, no intersection improvement measures are required or recommended for the study intersections. The future year 2024 cumulative with project traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in ***Figures 5-5***, and ***5-6***, respectively.

6.0 ROADWAY SEGMENT ANALYSIS

Based on coordination with City of Downey staff, the following three (3) roadway segments were selected for analysis as part of the transportation analysis:

1. Woodruff Avenue, between Hall Road and Stewart & Gray Road

2. Hall Road, west of Woodruff Avenue

3. Stewart & Gray Road, west of Woodruff Avenue

The street segment analysis criteria was previously shown in Section 5.2 herein. The following section presents the roadway segment analysis prepared for the proposed project.

6.1 Roadway Segment Analysis

As described in *Subsection 3.4*, average daily traffic data collected in October 2021 was utilized for the roadway segment analysis. The forecast traffic conditions at the analyzed street segments for existing, existing with project, future pre-project, and future with project scenarios for weekday conditions are summarized in ***Table 6-1***. As shown in Column [1] of *Table 6-1*, all three study roadway segments are presently operating under acceptable service levels (i.e., LOS D or better). As shown in Column [3] of *Table 6-1*, the proposed project is forecast to result in a net increase of 33 PCE-adjusted daily vehicle trips on Woodruff Avenue, 70 daily trips on Hall Road, and 70 daily trips on Stewart & Gray Road.

As shown in Column [5] of *Table 6-1*, for purposes of estimating future pre-project traffic volumes, a one percent (1.00 %) annual ambient growth rate through the year 2024 was added to the existing ADT volume in order to estimate the future pre-project traffic volumes to account for increases in general ambient traffic. Based on the relatively small net increases in project daily traffic, all three study roadway segments are expected to continue to operate at acceptable LOS D or better under the future year 2024 cumulative with project conditions. Therefore, no roadway improvement measures are required or recommended for the study roadway segments.

Table 6-1
ROADWAY SEGMENT ANALYSIS

Segment	[1] Existing ADT Volume	Proposed Project				Future 2024 Conditions	
		[2] Proposed Project Dist %		[3] Project Daily Trips	[4] Existing + Proj. Vol	[5] Future ADT Vol	[6] Fut + Proj ADT Vol
		In	Out				
1 Woodruff Avenue btwn Hall Rd and Stewart and Gray Rd	13,959	20%	20%	33	13,992	14,378	14,411
2 Hall Road west of Woodruff Avenue	2,292	42%	42%	70	2,362	2,361	2,431
3 Stewart and Gray Road west of Woodruff Avenue	18,810	42%	42%	70	18,880	19,375	19,445

[1] Existing Average Daily Traffic (ADT) volume represents two-way average daily traffic. Counts were conducted in October 2021 by Counts Unlimited.

[2] Distribution of inbound and outbound proposed project daily traffic at the analyzed street segment.

[3] Daily project volume includes inbound and outbound trips based on the proposed project net new daily total volume of 167 weekday daily trip ends.

[4] Derived by combining the existing traffic volumes and the proposed net new project volumes (i.e., total of columns [1] and [3]).

[5] An ambient growth rate of 1.00% per year was assumed to derive the year 2024 traffic volumes based on the 2010 CMP for Los Angeles County document.

[6] Derived by combining the proposed net new project volumes with the future traffic volumes (i.e., column [3]+column [5]).

7.0 NEIGHBORHOOD TRAFFIC IMPACT

Based on coordination with City of Downey staff, the neighborhood on Hall Road west of the project site was identified for evaluation of potential impacts due to the proposed project. Specifically, the residential neighborhood on Hall Road, west of Coldbrook Avenue, was evaluated. While existing traffic count data was not specifically collected for this neighborhood roadway segment, the nearby Hall Road segment west of Woodruff Avenue was evaluated as part of the project's roadway segment analysis, as described in *Subsection 6.1*. Based on a review of the traffic volume data, it was determined that the existing traffic volumes on Hall Road, west of Coldbrook Avenue, would be similar and likely be less than the existing traffic volumes conducted at the analyzed roadway segment of Hall Road, west of Woodruff Avenue.

As discussed in Subsection 2.6.2 and shown in *Figure 2-3*, approximately eight percent (8%) of the project's passenger vehicle traffic is forecast to utilize Hall Road to and from the west (i.e., west of Coldbrook Avenue). Furthermore, based on the recommended restriction of no outbound left-turn movements for trucks at the Hall Road project driveways, no project-related truck traffic is expected to be added on Hall Road to and from the west. As part of the entitlement, a condition of approval will be applied to further prohibit truck traffic through Hall Road west of the project site. Thus, the proposed project is forecast to result in a net increase of 13 PCE-adjusted daily vehicle trips on Hall Road west of Coldbrook Avenue based on the estimated 8% of the 167 net new daily PCE vehicle trips forecast to be generated by the project as previously shown in *Table 2-1*. Based on the character of Hall Road adjacent to the project site and the existing network connectivity in the vicinity, the proposed project is not anticipated to generate substantial traffic in the vicinity of the project site which would adversely affect the character and function of nearby roadways. Therefore, no additional measures to prevent potential traffic impacts in the nearby neighborhoods are required or recommended.

8.0 CALIFORNIA DEPARTMENT OF TRANSPORTATION ASSESSMENT

The California Department of Transportation (Caltrans) has formally adopted VMT as the metric for evaluating the transportation impacts of local development projects on the State Highway System. Caltrans' *Transportation Impact Study Guide*[10] (TISG) references the December 2018 *Technical Advisory on Evaluating Transportation Impacts in CEQA*[11] prepared by the Governor's Office of Planning and Research (OPR) as the basis for its guidance on VMT assessment. For the purpose of this transportation assessment, it is understood that Los Angeles County's adopted VMT methodology and screening criteria is substantially consistent with the recommendations provided in the *Technical Advisory* and thus satisfy Caltrans' VMT analysis requirements as well.

Caltrans' TISG states, "Additional future guidance will include the basis for requesting transportation impact analysis that is not based on VMT. This guidance will include a simplified safety analysis approach that reduces risks to all road users and that focuses on multi-modal conflict analysis as well as access management issues." While the final guidance is still being developed, Caltrans has released the "Interim Land Development and Intergovernmental Review (LDIGR) Safety Review Practitioners Guidance"[12]. The proposed project does not take direct access to/from a State facility; however, it is situated approximately one mile from the I-605 Freeway corridor, and is expected to generate net new project trips at nearby ramp intersections. Therefore, the interim safety guidance was reviewed and analyses relevant to the proposed land use development project were identified for inclusion in the transportation assessment.

8.1 Vehicle Miles Traveled Analysis

Caltrans' TISG references the December 2018 *Technical Advisory* prepared by OPR as the basis for its guidance on VMT assessment. For the purpose of this transportation assessment, it is understood that Los Angeles County's adopted VMT analysis methodology is substantially consistent with the recommendations provided in the *Technical Advisory* and thus satisfy Caltrans' VMT analysis requirements as well. Therefore, no separate VMT analysis has been prepared for Caltrans' review of the proposed project.

8.2 Off-Ramp Vehicle Queuing Analysis

The "Interim LD-IGR Safety Review Practitioners Guidance" provides direction on a simplified safety analysis approach that reduces the risk to all road users and that focuses on multi-modal conflict analysis as well as access management issues. District traffic safety staff are encouraged to consider the proposed project's potential influence on safety on state roadways, including the following factors:

- Increased presence of pedestrians and bicyclists

[10] "Vehicle Miles Traveled-Focused Transportation Impact Study Guide", Caltrans, May 20, 2020.
[11] "Technical Advisory on Evaluating Transportation Impacts in CEQA", Governor's Office of Planning and Research, December 2018.
[12] "Traffic Safety Bulletin 20-02-R1: Interim Local Development Intergovernmental Review Safety Review Practitioners Guidance", Caltrans, December 18, 2020.

- Degradation of the walking and bicycling environment and experience
- New pedestrian and bicyclist connection desires
- Multimodal conflict points, especially at intersections and project access locations
- Change in traffic mix such as an increase in bicyclists or pedestrians where features such as shoulders or sidewalks may not exist or are inconsistent with facility design (sidewalks, bike and multi-user paths, multimodal roadways, etc.)
- Increased vehicular speeds
- Transition between free flow and metered flow
- Increased traffic volumes
- Queuing at off-ramps resulting in slow or stopped traffic on the mainline or speed differentials between adjacent lanes
- Queuing exceeding turn pocket length that impedes through-traffic

The proposed Prologis Stewart & Gray Road Warehouse project does not take direct access from a State facility; therefore, the project has not been reviewed for factors pertaining to site access or local roadways. However, the proposed project is expected to generate net new project trips at the I-605 Freeway ramp interchange at Firestone Boulevard (i.e., Int. No. 7 – I-605 Freeway Southbound Ramps/Firestone Boulevard and Int. No. 8 – I-605 Freeway Northbound Ramps-Hoxie Avenue/Firestone Boulevard). Therefore, an analysis of the project's effect on off-ramp queuing was prepared in order to determine if the project would cause, or contribute towards, slowing or stopped traffic on mainline travel lanes resulting in unsafe speed differentials between adjacent lanes.

The off-ramp queueing was analyzed using the Highway Capacity Manual (HCM) operational methodology for signalized intersections. The off-ramp queuing calculations were prepared using the *Synchro 11* software package which implements the HCM operational methodology. A *Synchro* network was created based on existing conditions field reviews at the above noted ramp intersections. In addition, specifics such as traffic volume data, lane configurations, available vehicle storage lengths, crosswalk locations, posted speed limits, traffic signal timing and phasing, etc., were coded to complete the network. The corresponding weekday AM and PM peak hour HCM worksheets for purposes of determining the 95th percentile vehicle queues are contained in *Appendix C*.

The queuing analysis was prepared for the existing, existing with project, and future cumulative without and with project traffic conditions. The corresponding freeway off-ramp intersection approaches were reviewed in terms of expected maximum vehicle queues (i.e., 95th percentile queues) which represent the maximum back of vehicle queues with 95th percentile traffic volumes. The corresponding maximum vehicle queue lengths were then compared to the total ramp storage lengths (i.e., the available storage length as measured from the applicable off-ramp lane striping to the respective off-ramp approach limit lines/merge points). The total queuing for the off-ramp was

determined based on the sum of the maximum vehicle queues for each off-ramp lane. The total ramp storage length was determined based on the sum of the striped storage for all lanes provided at the off-ramp location.

As presented in ***Table 8-1***, adequate storage area is provided at the respective I-605 Freeway northbound and southbound off-ramps to accommodate the forecast 95th percentile queues under existing and future cumulative conditions, both without and with project-generated traffic. Therefore, the proposed project is expected to neither cause nor contribute towards vehicle queuing which extends back into the I-605 Freeway northbound and southbound mainline travel lanes. Therefore, the proposed project is not anticipated to negatively influence safety on the State Highway System.

Table 8-1
SUMMARY OF OFF-RAMP VEHICLE QUEUING [1]

NO.	INTERSECTION	PEAK HOUR	AVAILABLE OFF-RAMP STORAGE [2] (FEET)	EXISTING		EXISTING WITH PROJECT		FUTURE WITHOUT PROJECT		FUTURE WITH PROJECT	
				95th PERCENTILE QUEUE [3] (FEET)	EXCEEDS STORAGE? (YES/NO)	95th PERCENTILE QUEUE [3] (FEET)	EXCEEDS STORAGE? (YES/NO)	95th PERCENTILE QUEUE [3] (FEET)	EXCEEDS STORAGE? (YES/NO)	95th PERCENTILE QUEUE [3] (FEET)	EXCEEDS STORAGE? (YES/NO)
7	I-605 Fwy SB Ramps/ Firestone Boulevard	AM	1,310	838	No	628	No	910	No	695	No
		PM	1,310	798	No	973	No	873	No	1,068	No
8	I-605 Fwy NB Ramps-Hoxie Avenue/ Firestone Boulevard	AM	4,410	2,520	No	2,253	No	2,565	No	2,260	No
		PM	4,410	1,123	No	1,355	No	1,148	No	1,380	No

[1] Queuing analysis based on the Highway Capacity Manual, 6th Edition operational analysis methodologies.
[2] Available storage represents the sum of storage space provided by all off-ramp lanes, as measured via Google Earth, 2022.
[3] The 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes. An average vehicle length of 25 feet (including vehicle separation) was assumed for analysis purposes. The reported queue represents the sum of queues for all off-ramp lanes.

9.0 SUMMARY AND CONCLUSIONS

- ***Project Description*** – The proposed project site is located at 9300, 9350, and 9400 Hall Road and 9301, 9333, and 9399 Stewart & Gray Road in the City of Downey, California. The proposed project consists of the demolition of the existing buildings (totaling approximately 433,000 square feet) and the construction of an industrial concrete tilt building for warehouse/logistics uses totaling 535,685 square feet of building floor area. The new speculative industrial building is intended to be used for logistics and distribution purposes, and specifically as a fulfillment center and for cold storage. The facility will include up to 20,000 square feet of office and 25,000 square feet of mezzanine areas. The project build-out and occupancy year is anticipated by the year 2024.

- ***Project Site Access*** – Vehicular access to the project site is planned to be accommodated by five driveways, including three driveways along Hall Road and two driveways along Stewart & Gray Road. The Hall Road project driveways will accommodate full access (i.e., left and right-turning inbound and outbound movements) for passenger vehicles. However, outbound left-turn movements for trucks will not be permitted at the project's Hall Road driveways. The Stewart & Gray Road project driveways will accommodate full access for both passenger vehicles and trucks. Development of the proposed project would not conflict with the existing pedestrian system or the existing/proposed bicycle system.

- ***Project Parking –*** The proposed project is planned to provide a total of 544 automobile parking spaces and 255 trailer and/or container parking spaces. Application of the parking ratios provided in the City of Downey Municipal Code Section 9712 to the proposed project results in a parking requirement of 670 parking spaces. Thus, the proposed project parking supply would exceed the minimum Code parking requirement.

- ***Project Trip Generation*** – The proposed project is expected to generate a net decrease of 47 PCE-adjusted vehicle trips (73 fewer inbound trips and 26 more outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project is expected to generate a net increase of 189 PCE-adjusted vehicle trips (187 more inbound trips and 2 more outbound trips). Over a 24-hour period, the proposed project is forecast to generate a net increase of 167 PCE-adjusted vehicle trips (approximately 84 more inbound trips and 84 more outbound trips) during a typical weekday.

- ***CEQA Vehicle Miles Traveled Analysis*** – Based on the applicable VMT metric for the South County Baseline Area (i.e., VMT per employee), the proposed project is expected to result in a significant VMT impact. With the recommended TDM strategies, including implementation of a marketing strategy to promote commute trip reduction, a ridesharing program, and provision of end-of-trip bicycle facilities such as secure bike parking, showers, and personal lockers, the forecast significant project VMT impact is expected to be reduced to a less than significant level.

- ***Non-CEQA Analysis*** – In consultation with the City of Downey, eight (8) study intersections and three (3) roadway segments were selected for operational evaluation of the proposed project and other cumulative developments in the study area. In addition, the residential area located on Hall Road west of the project site was also evaluated for potential neighborhood traffic impacts. Based on application of the City of Downey's intersection and street segment LOS standards, none of the City of Downey study locations would be found inconsistent with the City's Circulation Element under all analysis conditions. Further, the project is forecast to add only a nominal number of vehicle trips onto the residential portion of Hall Road west of the project site.

- ***Caltrans Transportation Assessment*** – It is understood that Los Angeles County's adopted VMT methodology is consistent with the recommendations provided in the *Technical Advisory* prepared by OPR and thus satisfy Caltrans' VMT analysis requirements as well. Therefore, no separate VMT analysis has been prepared for Caltrans' review of the proposed project. Pursuant to the direction provided in the "Interim LD-IGR Safety Review Practitioners Guidance", an analysis of the project's effect on off-ramp queuing at Int. No. 7 – I-605 Freeway Southbound Ramps/Firestone Boulevard and Int. No. 8 – I-605 Freeway Northbound Ramps-Hoxie Avenue/Firestone Boulevard determined that the proposed project is not expected to cause or contribute towards vehicle queuing which extends back into the respective I-605 Freeway southbound and northbound mainline travel lanes.

Measure T-2. Increase Job Density	
Subsector	Land Use
Measure Scale	Project/Site
Maximum Reduction	30.0%

Project VMT Reduction Due to Increased Job Density		
B	Job density of project development (jobs per acre)	26.21
C	Job density of typical development (jobs per acre)	10.87
D	Elasticity of VMT with respect to job density	-0.07
A	VMT Reduction = [(B - C) / C] * D	9.9%
	VMT Reduction	***9.9%***

Notes:

C Pursuant to the guidance provided in the 2021 Handbook, when reductions are being calculated from a specific baseline derived from a travel demand forecasting model, the job density of the relevant TAZ should be used instead of the default value provided for C. The existing job density for TAZ 21791300 without the project is calculated as follows:

1,486 employees/136.72 acres = 10.87 jobs per acre

B Based on trip rate data provided by ITE for Land Use 155: High-Cube Fulfillment Center Warehouse - Sort, a total of 2,777 employees are expected for the proposed project. Based on trip rate data provided by ITE for Land Use 110: General Light Industrial, a total of 680 employees are expected for the existing land use. Therefore, the proposed project is expected to result in a net increase of 2,097 employees (i.e., 2,777 project employees - 680 existing employees = 2,097 net new employees. The job density for TAZ 21791300 with the project is calculated as follows:

(1,486 + 2,097) employees/136.72 acres = 26.21 jobs per acre

APPENDIX C

ICU/HCM AND LEVELS OF SERVICE EXPLANATION
ICU DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
HCM DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS

INTERSECTION CAPACITY UTILIZATION (ICU) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Levels of Service concept denotes any one of a number of differing combinations of operating conditions which may occur as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*, published by the Transportation Research Board. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

The Intersection Capacity Utilization (ICU) method of intersection capacity analysis has been used in our studies. It directly relates traffic demand and available capacity for key intersection movements, regardless of present signal timing, The capacity per hour of green time for each approach is calculated based on the methods of the *Highway Capacity Manual*. The proportion of total signal time needed by each key movement is determined and compared to the total time available (100 percent of the hour). The result of summing the requirements of the conflicting key movements plus an allowance for clearance times is expressed as a decimal fraction. Conflicting key traffic movements are those opposing movements whose combined green time requirements are greatest.

The resulting ICU represents the proportion of the total hour required to accommodate intersection demand volumes if the key conflicting traffic movements are operating at capacity. Other movements may be operating near capacity, or may be operating at significantly better levels. The ICU may be translated to a Level of Service as tabulated below.

The Levels of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding ICU and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Intersection Capacity Utilization Characteristics

Level of Service	Load Factor	Equivalent ICU
A	0.0	0.00 - 0.60
B	0.0 - 0.1	0.61 - 0.70
C	0.1 - 0.3	0.71 - 0.80
D	0.3 - 0.7	0.81 - 0.90
E	0.7 - 1.0	0.91 - 1.00
F	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more than one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (ICU = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of incidents, and when there are no other vehicles on the road. Only the portion of total delay attributed to the control facility is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for traffic signals are stated in terms of the average control delay per vehicle. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the *v/c* ratio for the lane group in question.

Level of Service Criteria for Signalized Intersections

Level of Service	Control Delay (Sec/Veh)
A	≤ 10
B	> 10 and ≤ 20
C	> 20 and ≤ 35
D	> 35 and ≤ 55
E	> 55 and ≤ 80
F	> 80

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay values.

LOS B describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.

LOS C describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

LOS D describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high *v/c* ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

LOS E describes operations with control delay greater than 55 and up to 80 seconds per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high *v/c* ratios. Individual cycle failures are frequent occurrences.

LOS F describes operations with control delay in excess of 80 seconds per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the lane groups. It may also occur at high *v/c* ratios with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

LEVEL OF SERVICE FOR UNSIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for unsignalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions, in the absence of incidents, control, traffic, or geometric delay. Only the portion of total delay attributed to the traffic control measures, either traffic signals or stop signs, is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for unsignalized intersections are stated in terms of the average control delay per vehicle. The level of service is determined by the computed or measured control delay and is defined for each minor movement. Average control delay for any particular minor movement is a function of the service time for the approach and the degree of utilization. (Level of service is not defined for the intersection as a whole for two-way stop controlled intersections.)

Level of Service Criteria for TWSC/AWSC Intersections

Level of Service	Average Control Delay (Sec/Veh)
A	≤ 10
B	> 10 and ≤ 15
C	> 15 and ≤ 25
D	> 25 and ≤ 35
E	> 35 and ≤ 50
F	> 50

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle.

LOS B describes operations with control delay greater than 10 and up to 15 seconds per vehicle.

LOS C describes operations with control delay greater than 15 and up to 25 seconds per vehicle.

LOS D describes operations with control delay greater than 25 and up to 35 seconds per vehicle.

LOS E describes operations with control delay greater than 35 and up to 50 seconds per vehicle.

LOS F describes operations with control delay in excess of 50 seconds per vehicle. For two-way stop controlled intersections, LOS F exists when there are insufficient gaps of suitable size to allow side-street demand to safely cross through a major-street traffic stream. This level of service is generally evident from extremely long control delays experienced by side-street traffic and by queuing on the minor-street approaches.

Re: Formal Notification for the 9350 Hall Road Industrial Building Project, Pursuant to Assembly Bill 52

Dear Anthony Morales,

Pursuant to California Assembly Bill (AB) 52, the City of Downey (City) is providing you with formal notification of the 9350 Hall Road Industrial Building Project (project), located in the City of Downey, in Los Angeles County, California. The City of Downey, as lead agency, is reaching out to all groups that have requested AB 52 consultation in writing. The City received your request for formal notification of proposed projects within your Tribe's traditional use area. This correspondence is intended as formal notification of the proposed project pursuant to AB 52.

The present notice includes:

- A description of the proposed project and location;
- A summary of cultural resources work to date, and summary of associated information that can be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

Project Location and Description

The project site is located in the eastern portion of the City, which is located in the County of Los Angeles. Regionally, the City borders the cities of Pico Rivera, Santa Fe Springs, Norwalk, Bellflower, Paramount, South Gate, and Commerce. Locally, the project site is immediately bounded by Woodruff Avenue to the east, Stewart & Gray Road to the south, and Hall Road to the north. There are existing manufacturing uses to the east, west, and south. Commercial uses are located to the North and in close proximity to residential properties to the west. The project site consists of five parcels (Assessor's Parcel Numbers 6284-019-013, 6284-019-015, 6284-019-017, 6284-019-016, 6284-019-014). The addresses associated with the project site are 9350 Hall Rd, 9300 Hall Rd and 9363 Stewart and Gray Rd Downey, California 90241 (see attached Records Search Map). The 29-acre site currently consists of approximately 433,00 square feet of industrial buildings located directly west of Woodruff Avenue and north of Stewart and Gray Road.

The proposed scope includes the construction of an approximately 510,110-square-foot industrial tilt-up building for warehousing use. The project would include 614 parking spaces for passenger vehicles, 215 spaces for freight trucks, and 109 loading docks.

Project Involves Ground Disturbance: Yes

Summary of Cultural Resources Work and Documentation

Cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

Consultation Request

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the City of Downey at the address below or via email to Alfonso Hernandez, Senior Planner, ashernandez@downeyca.org within 30 days of receipt of this notice with a formal request for consultation. Please include in this response the name of a designated lead contact person.

Sincerely,

Alfonso Hernandez

Alfonso S. Hernandez
Senior Planner
Community Development Department
11111 Bookshire Ave, Downey, CA 90241

Re: PROPOSED MITIGATION MEASURES RE KIZH NATION TRIBAL CULTURAL RESOURCES

Dear Alfonso Hernandez,

Pursuant to California Assembly Bill 52 and/or Senate Bill 18 (and any/all other applicable Federal, State, and local laws), the *Gabrieleño Band of Mission Indians – Kizh Nation* ("Tribe" or "Kizh") requested to and did consult with the City of Downey (the "lead agency"), regarding 9350 Hall Rd. (the "Project"). As we explained, this Project site is located within the boundaries of Kizh ancestral territory.

As such, we discussed at length the adverse impacts of this Project on Kizh historical landscapes, ceremonial places, subsurface artifacts, and other Kizh tribal cultural resources ("TCR"). Significant, confidential information was shared, including *inter alia*, Kizh oral history, elder testimony, testimony by Kizh Certified Archaeologist, John Torres, data on Native American discoveries in proximity to the Project, historical information on Kizh cultural and historical uses of the area at and surrounding the Project site, historical maps, and relevant historical literature.

Collectively, this evidence substantiated the irreparable harm Kizh TCRs will sustain unless you adopt and enforce the proposed mitigations for this Project, which are attached hereto. Please ensure to maintain the confidentiality of all information the Kizh has provided, and any/all additional information the Kizh provides in the future. (Pub. Res. Code §21082.3(c).) The laws preserving the confidentiality of Native American documents and records prohibits the inclusion of any information about the location of Native American artifacts, sites, sacred lands, or any other information that is exempt from public disclosure

pursuant to the Public Records Act. (Cal. Code Regs. § 15120(d); Clover Valley Foundation v. City of Rocklin (2011) 197 Cal.App.4th 200, at p. 220).

Finally, as a reminder, CEQA requires lead agencies to evaluate a project's impacts to TCRs separate and apart from all other factors, such as cultural resources, archaeological, historical, and paleontological.[1] Moreover, the California Court of Appeal made clear in the 2020 published opinion, Save the Agoura Corndell Knoll v. City of Agoura Hills, et al. (2020) 46 Cal.App.5th 665, that upon adoption, it must be clear that the TCR mitigations adopted will sufficiently reduce the project's impacts to TCRs below the threshold of significance; otherwise, the mitigations do not comply with CEQA and cannot be enforced.[2] As you know, as lead agency, CEQA mandates you to oversee *and enforce* compliance with the mitigations and conditions of approval adopted for the Project, CEQA, and all applicable state and local laws. (Pub. Res. Code § 21081.6(a)(1) [The reporting or monitoring program shall be designed to ensure compliance during project implementation].)

Thank you for your anticipated cooperation. We look forward to working with you.

Sincerely,

Andrew Salas, Chairman
Gabrieleno Band of Mission Indians – Kizh Nation

_____

Enclosures

[1] Public Resources Code Section 21083.09 required the Office of Planning and Research to revise the CEQA guidelines to include separate consideration of tribal cultural resources.

[2] (*Id*. at pp. 685-6 ["[i]t is improper to defer the formulation of mitigation measures until after project approval; instead, the determination of whether a project will have significant environmental impacts, and the formulation of measures to mitigate those impacts, must occur before the project is approved."]; see also CEQA Guidelines §15126.4(a)(1)(B).)

GABRIELENO BAND OF MISSION INDIANS – KIZH NATION - PROPOSED TCR MITIGATION MEASURES

TCR-1: Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities

A. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.
B. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the earlier of the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity.
C. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs will be provided to the project applicant/lead agency upon written request to the Tribe.
D. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.
E. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh monitor and/or Kizh archaeologist. The Kizh will recover and retain all discovered TCRs in the form and/or manner the Tribe deems appropriate, in the Tribe's sole discretion, and for any purpose the Tribe deems appropriate, including for educational, cultural and/or historic purposes.

TCR-2: Unanticipated Discovery of Human Remains and Associated Funerary Objects

A. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute.
B. If Native American human remains and/or grave goods discovered or recognized on the project site, then all construction activities shall immediately cease. Health and Safety Code Section

7050.5 dictates that any discoveries of human skeletal material shall be immediately reported to the County Coroner and all ground-disturbing activities shall immediately halt and shall remain halted until the coroner has determined the nature of the remains. If the coroner recognizes the human remains to be those of a Native American or has reason to believe they are Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission, and Public Resources Code Section 5097.98 shall be followed.

C. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2).
D. Construction activities may resume in other parts of the project site at a minimum of 200 feet away from discovered human remains and/or burial goods, if the Kizh determines in its sole discretion that resuming construction activities at that distance is acceptable and provides the project manager express consent of that determination (along with any other mitigation measures the Kizh monitor and/or archaeologist deems necessary). (CEQA Guidelines Section 15064.5(f).)
E. Preservation in place (i.e., avoidance) is the preferred manner of treatment for discovered human remains and/or burial goods. Any historic archaeological material that is not Native American in origin (non-TCR) shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.
F. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.

TCR-3: Procedures for Burials and Funerary Remains:

A. As the Most Likely Descendant ("MLD"), the Koo-nas-gna Burial Policy shall be implemented. To the Tribe, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains.
B. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created.
C. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials.
D. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed.
E. In the event preservation in place is not possible despite good faith efforts by the project

applicant/developer and/or landowner, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects.

F. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if possible. These items should be retained and reburied within six months of recovery. The site of reburial/repatriation shall be on the project site but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.
G. The Tribe will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically and respectfully. If data recovery is approved by the Tribe, documentation shall be prepared and shall include (at a minimum) detailed descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Tribe. If any data recovery is performed, once complete, a final report shall be submitted to the Tribe and the NAHC. The Tribe does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.

PLEASE NOTE THE FOLLOWING:

Any/all revisions to the Kizh's proposed TCR mitigations set forth above must be requested in writing, and not more than ten (10) calendar days from the date that we consulted on the subject Project. Requested revisions shall be delivered to the Kizh via email at admin@gabrielenoindians.org, and in a Word document, redline format. Please include as the email subject: "REQUEST FOR MITIGATION REVISIONS," and identify the project name and location/address. If revisions are not requested within 10 calendar days of consultation, the Kizh's proposed mitigations are presumed accepted as proposed (i.e., as set forth above).

Thank you for your anticipated cooperation.
