Appendix C

Climate Action Plan Consistency Checklist

CLIMATE ACTION PLAN CONSISTENCY REVIEW CHECKLIST

INTRODUCTION

The City of San Marcos (City) adopted an updated Climate Action Plan (CAP) in December, 2020. The CAP outlines strategies and measures that the City will undertake to achieve its proportional share of State greenhouse gas (GHG) emissions reduction targets. The purpose of the CAP Consistency Checklist (Checklist), in conjunction with the CAP, is to provide a streamlined review process for all proposed development projects that are subject to discretionary review and/or trigger environmental review pursuant to the California Environmental Quality Act (CEQA).

Analysis of GHG emissions and potential climate change impacts from new development is required under CEQA. The City's CAP is a qualified greenhouse gas (GHG) emissions reduction plan in accordance with State CEQA Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of a CAP.

The purpose of this Checklist is to implement GHG reduction measures from the CAP that apply to new discretionary development projects. New development would demonstrate consistency with relevant CAP strategies and would not conflict with the City's ability to achieve the identified GHG reduction targets through implementation of applicable measures. Projects that are consistent with the CAP, as determined through the use of this Checklist, may rely on the CAP for the cumulative impact analysis of GHG emissions. Projects that are not consistent with the CAP must prepare a comprehensive project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and incorporation of the measures in this Checklist to the extent feasible. Cumulative GHG impacts would be significant for any project that is not consistent with the CAP.

This Checklist may be updated periodically to incorporate new GHG reduction techniques or to comply with later amendments to the CAP or local, State, or federal law. Comprehensive updates to this Checklist will be coordinated with each CAP update. Administrative updates to the Checklist may occur regularly, as necessary for the purpose of keeping the Checklist up-to-date and implementable. Updates to the CAP Checklist associated with an update to the City's CAP would also require City Council approval and shall comply with CEQA.

APPLICABILITY AND PROCEDURES

This Checklist is required only for discretionary projects[1] that are subject to and not exempt from CEQA. Projects that are exempt from CEQA are deemed to be consistent with the City's CAP, and no further review is necessary, with the exception of a Class 32 "In-Fill Development Projects" categorical exemption (State CEQA Guidelines Section 15332), for which projects are required to demonstrate consistency with the CAP through this Checklist.

General procedures for Checklist compliance and review are described below. Specific guidance is also provided under each of the questions under Steps 1 and 2 of the Checklist.

- The City's Development Services - Planning Division reviews development applications and makes determinations regarding environmental review requirements under CEQA.
- The specific applicable requirements outlined in the Checklist shall be required as conditions of project approval.
- The project must provide written documentation and supporting evidence that demonstrate how the proposed project would implement each applicable Checklist requirement described herein to the satisfaction of the Planning Division.
- If a question in the Checklist is deemed not applicable (N/A) to a project, written documentation and evidence supporting that conclusion shall be provided to the satisfaction of the Planning Division. Each Checklist question provides the scenario(s) where checking N/A may be acceptable. If a measure is deemed not applicable for reasons other than those outlined in each question, supporting evidence will need to be provided and would be subject to Planning Division approval. A project may be determined to be inconsistent with the CAP if the N/A response is deemed to be not supported by credible evidence.
- Development projects requiring discretionary review that cannot demonstrate consistency with the CAP using this Checklist shall prepare a separate, project-level GHG analysis as part of the CEQA document prepared for the project.

[1] In this context, a project is any action that meets the definition of a "Project" in Section 15378 of the State CEQA Guidelines.

Application Information

Contact Information

Project No. and Name: Gran Vista Project

Property Address and APN: 219-121-1500 and 219-121-1600

Applicant Name and Co.: Meritage Homes

Contact Phone: 949 299 3852 Contact Email: Johanna.Crooker@mlcholdings.net

Was a consultant retained to complete this checklist? ☐ Yes ☐ No
If Yes, complete the following:

Consultant Name: Adam Poll Contact Phone: 805-308-8516

Company Name: Dudek Contact Email: apoll@dudek.com

Project Information

1. What is the size of the project site (acres)? 7.59

2. Identify all applicable proposed land uses:

   ☐ Residential (indicate # of single-family dwelling units):

   ☒ Residential (indicate # of multi-family dwelling units): 120

   ☐ Commercial (indicate total square footage):

   ☐ Industrial (indicate total square footage):

   ☐ Other (describe):

3. Provide a description of the project proposed. This description should match the basic project description used for the CEQA document. The description may be attached to the Checklist if there are space constraints.

GPA, RZ, SP, MFSDP, TSM for development of 120 multi-family dwelling units and private open space.

STEP 1: LAND USE CONSISTENCY

The first step in this section evaluates a project's GHG emissions consistent with the City's *Guidance to Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA* (Guidance Document). New discretionary development projects subject to CEQA review that emit fewer than 500 metric tons of carbon dioxide equivalent ($MTCO_2e$) annually would not contribute considerably to cumulative climate change impacts as stated in the City's Guidance Document, and therefore, would be considered consistent with the CAP and associated emissions projections.

For projects that are subject to CAP consistency review, the next step in determining consistency is to assess the project's consistency with the growth projections used in the development of the CAP. This section allows the city to determine a project's consistency with the land use assumptions used in the CAP.

Step 1: Land Use Consistency

	Checklist Item (Check the appropriate box and provide an explanation and supporting documentation for your answer)	**Yes**	**No**
1.	The size and type of projects listed below would emit fewer than 500 $MTCO_2e$ per year. Based on this threshold, does the proposed project exceed these characteristics? ▪ Single Family Housing: 36 dwelling units ▪ Multi-Family Housing: 55 dwelling units ▪ Office: 43,000 square feet ▪ Commercial Space: 20,000 square feet ▪ Regional Shopping Center: 18,000 square feet ▪ Hotel: 37 rooms ▪ Restaurant (Sit-Down): 6,500 square feet ▪ Restaurant (Drive-Thru, High Turnover): 2,400 square feet ▪ General Light Industrial: 58,000 square feet ▪ University: 263 students ▪ Mixed-Use: See *Guidance to Demonstrating Consistency* memorandum for methods to estimate mixed-use development thresholds ▪ Other: For project types not listed in this section the need for GHG analysis and mitigation will be made on a project-specific basis, considering the 500 $MTCO_2e$ per year screening threshold. If **"Yes",** proceed to Question 2 of Step 1. If **"No",** in accordance with the City's CAP screening criteria, the project's GHG impact is less than significant and is not subject to the measures of the CAP.	☒	☐
2.	Is the proposed project consistent with the City's existing General Plan land use designation? If **"Yes"**, proceed to Step 2. If **"No"**, proceed to Question 3 of Step 1	☐	☒
3.	For projects not consistent with the existing General Plan land use designation, does the project include a General Plan Amendment that would generate GHG emissions equal to or less than estimated emissions generated under the existing designation? If **"Yes"**, proceed to Step 2 and provide estimated project emissions under both existing and proposed designation(s) for comparison. If **"No"**, the project's GHG impact is potentially significant, and a GHG analysis must be prepared in accordance with the City's Guidance Document and applicable CEQA guidelines. The project must incorporate each of the measures identified in Step 2 to mitigate cumulative GHG emissions impacts, along with other mitigation measures as necessary based on a project specific GHG analysis.. Proceed and complete a project specific GHG analysis, and Step 2 of the Checklist.	☒	☐

STEP 2: CAP MEASURES CONSISTENCY

The second step of CAP consistency review is to evaluate a project's consistency with the applicable strategies and measures of the CAP. Each Checklist item is associated with a specific GHG reduction measure in the City's CAP. "N/A" should only be checked based on the direction provided in each Checklist Item question. All projects for which the measure is applicable must demonstrate that they would implement measures consistent with the Checklist Item, or fully substantiate how the item would be infeasible for project implementation. "N/A" responses are subject to Planning Division review and approval. If "No" is provided as a response to a question, the project would be determined to be inconsistent with the CAP and result in a significant GHG impact.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
Project Design			
1. Electric Vehicle Charging Stations (Measure T-2) Multi-Family Residential and Non-Residential: Will the project install electric vehicle charging stations (Level 2 or better) in at least five percent of the total parking spaces provided on-site? Check "N/A" if the project is a single-family residential project or would not provide any parking.	☐	☐	☒
Please substantiate how the project satisfies question 1. Indicate the total number of spaces and the number of EV chargers (should be 5% of more of total spaces): In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.			
2. Bicycle Infrastructure (Measure T-8) Residential and Non-Residential Projects: If the following conditions are met, would the project pay its fair-share contribution to bicycle infrastructure improvements? ☐ Intersection or roadway segment improvements are proposed as part of the project and, ☐ The City's General Plan Mobility Element identifies bicycle infrastructure improvements at any intersection(s) or roadway segment(s) that would be improved as part of the project. Check "N/A" if the conditions above would not be met.	☐	☐	☒
Please substantiate how the project satisfies question 2: In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.			

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
3. Transportation Demand Management (Measure T-9) Multi-Family Residential and Non-Residential: Will the project develop and implement a TDM plan that includes, at a minimum, all of the TDM strategies listed below? ☐ Provide discounted monthly transit pass or provide at least 25 percent transit fare subsidy to residents/employees. ☐ Provide designated car-share, carpool, vanpool, and/or park-and-ride parking spaces.[2] ☐ Provide pedestrian connections between all internal uses and to all existing or planned external streets around the project site(s). ☐ Provide secure bicycle parking spaces or bicycle racks, showers, and clothes lockers. ☐ Encourage telecommuting for employees (allow one telecommute day per week or compressed work weeks) or provide a telecommute work center with common office space and equipment available to residents. *-or-* Would the project implement and monitor for four (4) years a TDM program that demonstrates an alternative transportation (i.e. carpool, public transit, bicycle, walk, telecommute) mode share of at least 29 percent [3] for all residents? Check "N/A" if the project is a single-family residential project or is not subject to the City's TDM Ordinance.	☐	☐	☒
Please state which measure option the project for which the project would comply and substantiate how the project satisfies question 3: In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.			

[2] The designated number of car-share, carpool, vanpool, and/or park-and-ride parking spaces provided at a rate equal to or greater than CALGreen minimum requirements.

[3] Measure T-10 requires projects to increase alternative mode share by seven percent. The baseline mode share for alternative transportation (i.e. carpool, public transit, bicycle, walk, and telecommute) is 22 percent based on 2010 Census Data.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
4. Reduce Parking Near Transit (Measure T-12) Multi-Family Residential: If located within a half-mile of a major transit stop[4], would the project provide at least 27 percent fewer parking spaces than required for the same use based on the City's municipal code parking requirements? Check "N/A" if the project is a single-family residential or non-residential project.	☐	☐	☒
Please substantiate how the project satisfies question 4. Indicate total parking spaces that are required per the City's Zoning Ordinance and the total number of spaces as proposed: In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO_2e per service population per year was used.			
5. Water Heaters (Measure E-1) Residential: Will the project install one of, or a combination of, the following water heater types in place of natural gas water heaters? ☐ Electric heat pump water heater ☐ Instantaneous electric water heater ☐ Electric tank ☐ Solar water heater with heat pump water heater backup ☐ Solar water heater with electric tank backup Check "N/A" if the project is a non-residential project.	☐	☐	☒

[4] Major transit stop is defined as a bus or light-rail station with fixed service and 10-minute minimum headways during peak hours. Project applicants should confirm with City staff if the project site would fall within this proximity tot a major transit stop.

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
Please substantiate how the project satisfies question 5. A note should be added to the Floor plans and site plan to show that Building Permit Plan will include this requirement: In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.			
6. Photovoltaic Installation (Measure E-2) Non-Residential: Will the project install photovoltaic systems with a minimum capacity of two watts per square foot of gross floor area? Check "N/A" if the project is a residential project or if installation of on-site photovoltaic would be infeasible.	☐	☐	☒
Please substantiate how the project satisfies question 6. The Photovotaic systems should be included in the Roof Plan/Site Plan (as applicable) and a note should be added to the Plans set to show that Building Permit Plan will include this requirement:: The Project is residential.			
7. Landscaping Water Use (Measure W-1) Residential and Non-Residential: Will the project comply with the City's Water Efficient Landscape Ordinance?[5] Check "N/A" if the project is not proposing any landscaping or is not subject to the City's Water Efficient Landscape Ordinance.	☐	☐	☒

[5] City of San Marcos Landscape Manual: https://www.san-marcos.net/home/showdocument?id=13984

Step 2: CAP Measures Consistency			
Checklist Item (Check the appropriate box and provide an explanation for your answer. Please use additional sheets if necessary)	**Yes**	**No**	**N/A**
Please substantiate how the project satisfies question 7. Include total landscape area that is subject to WELO: In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.			
8. Urban Tree Canopy (Measure C-2) <u>Single-Family Residential</u>: Will the project plant a minimum of one tree per single-family residential unit? *-or-* <u>Multi-Family Residential and Non-Residential</u>: If the project is providing more than 10 parking spaces, will the project plant at least one tree per five parking spaces provided? Check "N/A" if planting the required number of trees on-site would be infeasible.	☐	☐	☒
Please substantiate how the project satisfies question 8. Include total number of tree (which should be the same as indicated on Landscape Plans): In accordance with the Guidance for Demonstrating Consistency with the City of San Marcos Climate Action Plan: For Discretionary Projects Subject to CEQA (Ascent 2020), the numerical GHG threshold of 2.1 MT CO2e per service population per year was used.

INTENTIONALLY LEFT BLANK

1 Introduction

Dudek prepared this Biological Resources Technical Report (report) for the Gran Vista Project (Project) in support of Project review by the City of San Marcos (City) in the California Environmental Quality Act (CEQA) evaluation process. It is also intended to support environmental review by other applicable regulatory resource agencies as needed.

The purpose of this report is to provide the methods and results of the vegetation mapping, jurisdictional delineation, reconnaissance survey, and literature review. This report includes an impact analysis based on survey results and federal, state, and local regulations, as well as conditions to avoid and minimize impacts to biological resources.

1.1 Regional and Local Setting

The proposed Project is the development of an approximately 7.6-acre vacant lot. The site is located in the land use jurisdictions of both the City of San Marcos and the County of San Diego; however, it is proposed to be annexed into City jurisdiction. The site is located at the southeastern portion of San Marcos, bordering the City of Escondido to the east and unincorporated County of San Diego lands to the south. The Project site is bounded by Las Posas Road along the eastern boundary, W. Mission Road along the southwest boundary, an existing CVS store to the south (with a parking lot that extends into the Project site), and existing single-family residential development to the west/northwest (Figure 1, Project Location). Nearby land uses in the vicinity of the Project site include industrial and commercial uses to the west on the other side of W. Mission Road, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.5 miles to the east. The Project site is composed of Assessor's Parcel Numbers 219-121-1500 and 219-121-1600; it is located on the 7.5-minute San Marcos quadrangle map on Sections 3 and 10, in Township 12 South, Range 3 West of the San Bernardino Base and Meridian. The approximate center of the Project site corresponds to 33.150335° north latitude, and -117.189601° west longitude. The site is General Plan designated Commercial (C) (City of San Marcos 2012).

Topography of the Project site is gently sloping from north to south, with an elevation range of approximately 582 to 568 feet above mean sea level. San Diego County experiences a Mediterranean climate with warm, dry summers and cool, wet winters. The average maximum temperature in the general vicinity of the Project site is 77.2°F, and the average minimum temperature is approximately 52.3°F. Average annual precipitation in the general vicinity of the Project site is 14.93 inches, nearly all of which falls October through April (WRCC 2022).

1.2 Project Description

The residential component of the Project would consist of 120 townhomes with a mix of 2- and 3-bedroom units. The Project would include approximately 92,645 square feet of recreation area onsite and an average of 154 square feet of private open space per unit. Amenities onsite would include tot-lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the Las Posas Road frontage. The Project would include two points of entry using the existing driveway entries on N. Las Posas Road and W. Mission Road that currently provide access to the adjacent CVS store. A total of 264 parking spaces would be provided for the residential dwelling units, including 20 guest spaces, in addition to 37 existing spaces on-site. The Project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial and is within the City's General Plan Neighborhood College area (City of San Marcos 2012). The Project proposes a General Plan and Zoning Amendment to change the land use designation to Specific Plan Area (SPA).

1.3 Land Uses

The majority of the on-site land use is currently unoccupied and disturbed from previous grading and disking. The Project site was graded in the early 1990s and imported fill material from a site in eastern San Marcos and again in the early 2000s based on first-hand knowledge and historical aerial imagery; in 2009, the site was again rough graded, sheet graded, and used as a staging area for construction of the CVS store located just southwest of the site (Historic Aerials 2021), and implemented an approved erosion control plan which utilized a hydroseed mix to stabilize the soil. The southeast portion of the Project site is currently used as a CVS parking lot. In addition, in 2017 the State of California processed a use permit for Palomar Community College District for temporary parking. Once the parking was no longer needed, the area was restored by removing parking fill to the disturbed areas and graded back to its pre-parking condition. The site has been disced every one to three years since the original grading permit was relied upon. This site reportedly is mowed for fire abatement (EAEC 2017). The site is bordered primarily by residential neighborhoods to the north and commercial and industrial development to the east, west, and south (Figure 2, Vegetation Communities and Land Cover Types).

1.4 Soils

The U.S. Department of Agriculture Soil Survey mapped most of the Project site as underlain by the following soil types: Huerhuero loam (HrC), 2% to 9% slopes and Placentia sandy loam (PeC), 2% to 9% slopes (USDA 2022) (Figure 3, Soils). Neither of the soil types are considered hydric soils or are known to support edaphic special-status plant species (i.e., the soils of the site are neither serpentine nor alkaline).

Soils within the Project site have been degraded over time from disturbances such as grading and disking. As a result, the soils no longer maintain their native soil characteristics, and therefore have no particular significance to biological resources of the Project site.

1.5 Watersheds and Hydrology

The Project site is located within the San Marcos Creek Hydrologic Unit (Figure 4, Hydrologic Setting) (HUC 12-180703030503) (USGS 2022). The San Marcos Creek Hydrologic Unit covers an area of approximately 54 square miles. This hydrologic unit is bordered by Lower Escondido Creek Hydrologic Unit to the south, Loma Alta Creek-Frontal Gulf of Santa Catalina Hydrologic Unit to the west, Agua Hedionda Creek Hydrologic Unit to the north, and Upper Escondido Creek Hydrologic Unit to the east. The San Marcos Creek Hydrologic Unit includes one major coastal lagoon, Batiquitos (USGS 2022).

2 Regulatory Context

2.1 Federal

2.1.1 Federal Endangered Species Act

The federal Endangered Species Act of 1973 (16 USC 1531 et seq.), as amended, is administered by the U.S. Fish and Wildlife Service (USFWS) for most plant and animal species, and by the National Oceanic and Atmospheric Administration National Marine Fisheries Service for certain marine species. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend, and provide programs for the conservation of those species, thus preventing extinction of plants and wildlife. The federal Endangered Species Act defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its range." A threatened species is defined as "any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under the federal Endangered Species Act, it is unlawful to take any listed species, and "take" is defined as, "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

The federal Endangered Species Act allows for the issuance of incidental take permits for listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of habitat conservation plans on private property without any other federal agency involvement. Upon development of a habitat conservation plan, USFWS can issue incidental take permits for listed species.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was originally passed in 1918 as four bilateral treaties, or conventions, for the protection of a shared migratory bird resource. The primary motivation for the international negotiations was to stop the "indiscriminate slaughter" of migratory birds by market hunters and others. Each of the treaties protects selected species of birds and provides for closed and open seasons for hunting game birds. The MBTA protects more than 800 species of birds and prohibits the take of any migratory bird or any part, nest, or eggs of any such bird. Under the MBTA, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so (16 USC 703 et seq.). Additionally, Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations (66 FR 3853–3856). The executive order requires federal agencies to work with USFWS to develop a memorandum of understanding. USFWS reviews actions that might affect these species.

Two species of eagles that are native to the United States, bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*), were granted additional protection within the United States under the Bald and Golden Eagle Protection Act (16 USC 668–668d) to prevent the species from becoming extinct.

2.1.3 Clean Water Act

Pursuant to Section 404 of the Clean Water Act, the U.S. Army Corps of Engineers (USACE) regulates the discharge of dredged and/or fill material into "waters of the United States." The term "wetlands" (a subset of waters of the United

States) is defined in Title 33 of the Code of Federal Regulations, Section 328.3(b), as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." In the absence of wetlands, the limits of USACE jurisdiction in non-tidal waters, such as intermittent streams, extend to the ordinary high water mark (OHWM), which is defined in Title 33 of the Code of Federal Regulations, Section 328.3(e).

2.2 State

2.2.1 California Endangered Species Act

The California Department of Fish and Wildlife (CDFW) administers the California Endangered Species Act (CESA), which prohibits the "take" of plant and animal species designated by the California Fish and Game Commission as endangered or threatened in the state of California. Under CESA Section 86, take is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA Section 2053 stipulates that state agencies may not approve projects that will "jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy."

CESA defines an endangered species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." CESA defines a threatened species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the [California Fish and Game] Commission as rare on or before January 1, 1985, is a threatened species." A candidate species is defined as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the Commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the Commission has published a notice of proposed regulation to add the species to either list." CESA does not list invertebrate species.

CESA authorizes the taking of threatened, endangered, or candidate species if take is incidental to an otherwise lawful activity and if specific criteria are met. These provisions also require CDFW to coordinate consultations with USFWS for actions involving federally listed species that are also state-listed species. In certain circumstances, CESA allows CDFW to adopt a CESA incidental take authorization as satisfactory for CEQA purposes based on finding that the federal permit adequately protects the species and is consistent with state law.

A CESA permit may not authorize the take of "fully protected" species that are protected in other provisions of the California Fish and Game Code, discussed further below.

2.2.2 California Fish and Game Code

Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) of the California Fish and Game Code provide that designated fully protected species may not be taken or possessed without a permit. Incidental take of these species is not authorized by law.

Pursuant to Section 3503.5 of the California Fish and Game Code, it is unlawful to take, possess, or destroy any birds of prey; or to take, possess, or destroy any nest or eggs of such birds. Birds of prey refer to species in the orders Falconiformes and Strigiformes.

Nests of all other birds (except English sparrow [*Passer domesticus*] and European starling [*Sturnus vulgaris*]) are protected under Sections 3503 and 3513 of the California Fish and Game Code.

Pursuant to Section 1602 of the California Fish and Game Code, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

2.2.3 Porter–Cologne Water Quality Control Act

The Porter–Cologne Water Quality Control Act (Porter–Cologne Act) protects water quality and the beneficial uses of water. It applies to surface water and groundwater. Under this law, the State Water Resources Control Board develops statewide water quality plans, and the Regional Water Quality Control Boards (RWQCBs) develop regional basin plans that identify beneficial uses, water quality objectives, and implementation plans. The RWQCBs have the primary responsibility to implement the provisions of statewide plans and basin plans. Waters regulated under the Porter–Cologne Act include isolated waters that are not regulated by USACE. RWQCBs regulate discharging waste, or proposing to discharge waste, within any region that could affect a "water of the state" (California Water Code, Section 13260[a]). Waters of the state are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Section 13050[e]). Developments with impacts on jurisdictional waters must demonstrate compliance with the goals of the Porter–Cologne Act by developing stormwater pollution prevention plans, standard urban stormwater mitigation plans, and other measures to obtain a Clean Water Act Section 401 certification. If a Clean Water Act Section 404 permit is not required for a project, the RWQCB may still require a permit (i.e., Waste Discharge Requirement) for impacts to waters of the state under the Porter–Cologne Act.

2.2.4 California Environmental Quality Act

CEQA (California Public Resources Code Section 21000 et seq.) and the CEQA Guidelines (14 CCR 15000 et seq.) require identification of a project's potentially significant impacts on biological resources and feasible mitigation measures and alternatives that could avoid or reduce significant impacts. CEQA Guidelines Section 15380(b)(1) defines endangered animals or plants as species or subspecies whose "survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors" (14 CCR 15000 et seq.). A rare animal or plant is defined in CEQA Guidelines Section 15380(b)(2) as a species that, although not currently threatened with extinction, exists "in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens; or … [t]he species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered 'threatened' as that term is used in the federal Endangered Species Act." Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing, as defined further in CEQA Guidelines Section 15380(c). CEQA also requires identification of a project's potentially significant impacts on riparian habitats (such as wetlands, bays, estuaries, and marshes) and other sensitive natural communities, including habitats occupied by endangered, rare, and threatened species.

In Title 14 of the California Code of Regulations (CCR), Section 1.72 (14 CCR, Section 1.72), CDFW defines a "stream" (including creeks and rivers) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation."

In 14 CCR 1.56, CDFW's definition of "lake" includes "natural lakes or man-made reservoirs." Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

CDFW recognizes that all plants with a California Rare Plant Rank 1A, 1B, or 2, and some ranked 3, of the California Native Plant Society Inventory of Rare and Endangered Plants in California (CNPS 2022) may meet the criteria for listing as threatened or endangered and should be considered under CEQA (CDFW 2021). Some of the California Rare Plant Rank 3 and 4 plants meet the criteria for determination as "rare" or "endangered" as defined in Section 1901, Chapter 10 (Native Plant Protection Act), Division 2, of the California Fish and Game Code, as well as Section 2062 and Section 2067, Chapter 1.5 (CESA), Division 3. Therefore, consideration under CEQA for these California Rare Plant Rank 3 and 4 species is strongly recommended by the California Native Plant Society (CNPS 2022).

For purposes of this report, animals considered "rare" under CEQA include endangered or threatened species, Birds of Conservation Concern (USFWS 2021), California Species of Special Concern (CDFW 2022a), and fully protected species.

Section IV, Appendix G, Environmental Checklist Form, of the CEQA Guidelines (14 CCR 15000 et seq.) requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service."

The criteria used to determine the significance of impacts to biological resources under CEQA are provided in Chapter 5, Project Impacts and Significance Determination.

2.3 Local

2.3.1 North County Multiple Habitat Conservation Program

The North County Multiple Habitat Conservation Program (MHCP) is a long-term regional conservation plan established to protect sensitive species and habitats in northern San Diego County. The MHCP is divided into seven Subarea Plans—one for each jurisdiction within the MHCP—that are permitted and implemented separately from one another. The City of Carlsbad is the only city under the MHCP that has an approved and permitted Subarea Plan. The City of San Marcos Subarea Habitat Conservation Plan/Natural Community Conservation Plan (San Marcos Subarea Plan) has not been finalized or implemented, and the City is no longer an active participant in the Natural Community Conservation Plan program or the subregional MHCP conservation planning effort. However, it is the City's policy to comply with the conservation policies identified in the draft San Marcos Subarea Plan, including an assessment of a designated Biological Core and Linkage Area or MHCP Focused Planning Area in the context of a proposed project and the preservation of sensitive biological resources.

3 Methods

3.1 Literature Review

Dudek conducted a review of the existing biological resources and species within the vicinity of the Project site using CDFW's California Natural Diversity Database (CDFW 2022b); the California Native Plant Society's Online Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2022); the San Diego Natural History Museum's Plant Atlas (SDNHM 2022), Mammal Atlas (Tremor et al. 2017), and Bird Atlas (Unitt 2004); and the San Diego Geographic Information System (SanGIS). Dudek obtained special-status species occurrence data from the above sources by querying records within the U.S. Geological Survey (USGS) 7.5-Minute Quadrangle Map and the nine Quadrangle Maps surrounding the Project site: Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos USGS.

For this report, special-status plant and wildlife species are defined as those that are (1) listed, proposed for listing, or candidates for listing as threatened or endangered under the federal Endangered Species Act; (2) listed or candidates for listing as threatened or endangered under the California Endangered Species Act; (3) designated as Fully Protected under the California Fish and Game Code; (4) designated as a California Species of Special Concern by CDFW; and/or (5) assigned a California Rare Plant Rank of 1B or 2B by the California Native Plant Society.

In addition, Dudek reviewed the following available resources to assess the potential for biological and wetland resources within the Project site and vicinity:

- List of potentially occurring listed species generated from a review of USFWS's Information for Planning and Consultation (IPaC) Trust Resources Report list of federal and threatened species (USFWS 2022a)
- USGS National Hydrography Dataset (USGS 2022)
- USFWS National Wetlands Inventory (USFWS 2022b)
- U.S. Department of Agriculture, Natural Resources Conservation Service, Web Soil Survey (USDA 2022)

Prior environmental documents prepared for the Project provided information on biological resources and constraints previously identified. The documents reviewed included the following:

- Biological Site Assessment for the Meritage Homes Project in San Marcos, California (Dudek 2021)
- Directed Surveys for Thread-Leaved and Orcutt's Brodiaea, Mission Pointe (EAEC 2017)
- Potential Biological Constraints to Development for the Property Located at the Corner of Las Posas and Mission, City of San Marcos (BCG 2008)

3.2 Field Surveys

3.2.1 Vegetation Community and Land Cover Mapping

Dudek biologists conducted vegetation mapping to characterize natural vegetation communities, including habitats for special-status species, within the Project site. Vegetation communities and land covers were mapped using the Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986) as modified by the County of San Diego and noted in Vegetation Communities of San Diego County (Oberbauer et al. 2008).

Vegetation mapping was conducted within the Project site in June 2021 in conjunction with the initial reconnaissance-level surveys for sensitive resources. Mapping was performed in the field through interpretation of field maps with a high-quality aerial photographic base map.

3.2.2 Focused Surveys for Thread-Leaved and Orcutt's Brodiaea

Everett and Associates Environmental Consultants conducted a focused survey for thread-leaved brodiaea (*Brodiaea filifolia*) and Orcutt's brodiaea (*B. Orcutti*) in 2017 within the Project site. A reference site approximately 1,300 feet northwest of the Project site, with a known population of thread-leaved brodiaea, was visited the morning of the survey to verify the species was in bloom. The Project site was surveyed using transects to achieve complete visual coverage of the site (EAEC 2017).

3.2.3 Jurisdictional Delineation

3.2.3.1 Previous Jurisdictional Delineation

In 2008, Blue Consulting Group performed a jurisdictional delineation to classify "waters of the United States and State," including wetlands, under the jurisdiction of USACE and CDFW (BCG 2008). The USACE jurisdictional wetlands delineation was conducted in accordance with the 1987 U.S. Army Corps of Engineers Wetland Delineation Manual (USACE 1987). Hydrology, vegetation, and soils were examined at potential wetland sites and were recorded on wetland determination data forms. Additionally, a directed survey for potential vernal pool basins and vernal pool plant species was completed onsite.

3.2.3.2 2021 Jurisdictional Delineation

Dudek biologists field verified the findings of previous jurisdictional delineations within the Project site in June 2021 in conjunction with the initial reconnaissance-level surveys for sensitive resources. Methods followed those described for the 2008 delineation (Section 3.2.3.1).

3.3 Survey Limitations

The reconnaissance survey, vegetation mapping, and jurisdictional delineation were done during the daylight hours under weather conditions that allowed for quality biological observations (e.g., surveys were not conducted during rain). Because surveys were conducted during the day, the likelihood of detecting nocturnal and crepuscular species, such as many mammal species, was relatively low.

4 Results

4.1 Vegetation Communities and Land Covers

Three vegetation communities/land covers were mapped within the Project site: non-native grassland, Diegan coastal sage scrub, and urban/developed (Figure 2).

4.1.1 Non-native Grassland

Non-native grassland consists of dense to sparse cover of annual grasses with flowering culms between 0.5 to 3 feet in height (Oberbauer et al. 2008). In San Diego County, the presence of wild oat (*Avena* spp.), bromes, stork's bill (*Erodium cicutarium*), and mustard (*Hirschfeldia incana*) are common indicators. In some areas, depending on past disturbance and annual rainfall, annual forbs may be the dominant species; however, it is presumed that grasses will dominate. Non-native grassland makes up the majority of the Project site and is dominated by oats and brome grasses (*Bromus* spp.) in the open to continuous herbaceous layer. Other common herbs observed in the grassland include shortpod mustard, prickly Russian thistle (*Salsola tragus*), redstem stork's bill, and Menzies's golden bush (*Isocoma menziesii*). The vegetation community is the result of hydroseed placement over the graded portions of the site. The current owner actively mows the area thus limiting the potential for the area to regenerate to its fullest potential. There is 5.95 acres of non-native grassland onsite.

4.1.2 Diegan Coastal Sage Scrub: Baccharis-dominated

Diegan coastal sage scrub is a subcategory of coastal scrub plant community as described in Oberbauer et al. (2008). The community is typically dominated by low, soft woody drought-deciduous shrubs with shallow root systems and open canopies and contain associated herbaceous species. The community typically occupies xeric sites with shallow soils. Characteristic species include California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), and white sage (*Salvia apiana*). The western slope of the Project site contains approximately 0.6 acres of disturbed Diegan coastal sage scrub, dominated by coyote brush (*Baccharis pilularis*) and ladies' tobacco (*Pseudognaphalium californicum*).

4.1.3 Urban/Developed

The urban/developed land cover refers to areas that have been constructed on or otherwise physically altered to the point where vegetation is no longer present. Urban or developed areas are characterized by permanent or semi-permanent structures, hardscapes, and landscaped areas that require irrigation.

Within the Project site, this mapping unit identifies the developed area in the southern portion of the site containing the CVS parking lot, Peruvian peppertree (*Schinus mole*), Brazilian peppertree (*Schinus terebinthifolious*), and a couple small palm trees. There is 0.9 acres of urban/developed land onsite. As described above, this land cover is not sensitive and does not require habitat compensation.

4.2 Plant and Wildlife Species Observed

The majority of vegetation within the Project site consists of non-native, introduced plant species. Twenty-one species of plants 7 native [33%] and 14 non-native [67%]) were recorded on the site during the 2021 survey (see Appendix A, Plant Species Compendium).

Wildlife was recorded onsite during the initial reconnaissance-level survey in 2021. Common species observed on the Project site included California ground squirrel (*Spermophilus (Otospermophilus*) *beecheyi*), brush rabbit (*Sylvilagus bachmani*), Cassin's kingbird (*Tyrannus vociferans*), and American crow (*Corvus brachyrhynchos*). A full list of wildlife species observed during the survey is included in Appendix B, Wildlife Species Compendium.

4.3 Special-Status/Regulated Resources

Special-status species occurrences are shown in Figure 5A, Special-Status Species Occurrences – Wildlife; Figure 5B, Special-Status Species Occurrences – Plants; and Figure 5C, Special-Status Species Occurrences – Communities, and are discussed further below.

4.3.1 Sensitive Vegetation Communities

Sensitive natural communities are vegetation communities that (1) support concentrations of special-status plant or wildlife species, (2) are of particular value to wildlife, and/or (3) are of limited distribution statewide or within a county or region. The Multiple Habitat Conservation Program organizes vegetation into habitat group types: Wetland Communities, Rare Upland, Coastal Sage Scrub, Chaparral, Annual Grassland, and Other (Table 2) (SANDAG 2003). Vegetation communities listed under each of those groups, except for "other lands", are considered sensitive and impacts to these communities would require mitigation. The City typically requires habitat compensation for impacts to non-native grassland at a 0.5:1 ratio and for impacts to Diegan coastal sage scrub at a 1:1 ratio. No habitat compensation is required for impacts to urban/developed.

4.3.2 Special-Status Plant Species

Results of the California Natural Diversity Database (CNDDB), California Native Plant Society, and IPaC database searches identified 65 special-status plant species as occurring or potentially occurring within the USGS 7.5-minute quadrangle map and the nine quadrangle maps surrounding the Project site—Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos (CDFW 2022b; CNPS 2022)—and within the vicinity (USFWS 2022a) (Appendix C, Special-Status Plant Species Potential to Occur). All 65 were eliminated from further consideration due to a lack of suitable habitat or edaphic conditions, extent of habitat degradation within the Project site (e.g., regular mowing, previous disturbance), or the location of the Project site outside a species' known range. No special-status plant species were observed during the initial site reconnaissance survey (Figure 5B). Everett and Associates Environmental consulting did not observe any special-status plant species onsite during the focused survey for thread-leaved brodiaea or Orcutt's brodiaea, and reported that appropriate soils for these species were not onsite (EAEC 2017). Therefore, the Project site has no value as habitat for endangered, rare, or threatened plant species.

4.3.3 Special-Status Wildlife Species

Results of the CNDDB and IPaC database searches identified 52 special-status wildlife species as occurring or potentially occurring within the USGS 7.5-minute quadrangle map and the nine quadrangle maps surrounding the Project site—Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos USGS quadrangle maps (CDFW 2022b)—and within the vicinity (USFWS 2022a). Of these, 51 species were eliminated from consideration due to the absence of suitable habitat within the Project site (Figure 5A) or the Project site's location outside of their known range (Appendix D, Special-Status Wildlife Species Potential to Occur). The remaining species, burrowing owl (*Athene cunicularia*), was determined to have a moderate potential to occur on the Project site and is discussed in more detail below.

4.3.3.1 Burrowing Owl

Burrowing owl is a California Species of Special Concern. It requires habitat with three basic attributes: open, well-drained terrain; short, sparse vegetation; and underground burrows or burrow surrogates, such as culverts, concrete debris piles, or riprap (Klute et al. 2003). This species occupies grasslands, deserts, sagebrush scrub, agricultural areas (including pastures and untilled margins of cropland), earthen levees and berms, coastal uplands, and urban vacant lots, as well as the margins of airports, golf courses, and roads. This species also prefers sandy soils with higher bulk density and less silt, clay, and gravel (Lenihan 2007).

Although habitat within the Project site is moderately suitable to support burrowing owl foraging and breeding, this species not known to breed and forage within proximity of the Project site. Suitable habitat for this species exists within the non-native grassland and disturbed Diegan coastal sage scrub vegetation communities located within the Project site. California ground squirrel burrows, which can be used by burrowing owls for breeding and shelter, were observed within the Project site during the reconnaissance survey, but no burrowing owls or sign of burrowing owl presence (i.e., whitewash, pellets, feathers) were observed within the Project site during the reconnaissance survey or previous surveys. The nearest CNDDB documented occurrence for this species is a historical occurrence approximately 6.86 miles southeast of the Project site (Occ. No. 567) (CDFW 2022b). In addition, the project site is surrounded by development and has been disturbed multiple times throughout the years. Therefore, although currently there is suitable habitat available for this species, it is not expected to occur.

4.3.4 Nesting Birds

In California, all native birds and active bird nests (with eggs or young) are protected by Sections 3503 and 3503.5 of the California Fish and Game Code. The trees and shrubs within and adjacent to the Project site provide suitable nesting habitat for several native resident and migratory bird species.

4.3.5 Jurisdictional Waters

As described in Chapter 2, Regulatory Context, in 2008, Blue Consulting Group conducted a delineation at the site and observed mulefat (*Baccharis salicifolia*) and deer weed (*Acmispon glaber*) growing in the southwest portion of the site. Wetland sampling points were taken beside the mulefat, and it was concluded that no jurisdictional wetlands were located on the Project site (BCG 2008). Dudek biologists analyzed the Project site in 2021 and confirmed that no jurisdictional aquatic resources occur onsite (see Appendix E, Representative Site Photographs).

4.4 Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for the migration of animals. Wildlife corridors contribute to population viability by ensuring continual exchange of genes between populations, providing access to adjacent habitat areas for foraging and mating, and providing routes for recolonization of habitat after local extirpation or ecological catastrophes (e.g., fires).

Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation. Habitat linkages provide a potential route for gene flow and long-term dispersal of plants and animals. They may also serve as primary habitat for smaller animals, such as reptiles and amphibians. Habitat linkages may be continuous habitat or discrete habitat islands that function as stepping stones for dispersal.

To function effectively, a wildlife corridor must link two or more patches of habitat for which connectivity is desired, and it must be suitable for the focal target species to achieve the desired demographic and genetic exchange between populations. Habitat areas are identified as open space by the City as areas of natural habitats located in patches spread throughout San Marcos. The largest patches of open space occur in the northern and southern portions of San Marcos (City of San Marcos 2012).

The approximately 7.6-acre Project site is not expected to provide for wildlife movement or serve as an important habitat linkage because it is surrounded by residential neighborhoods and commercial and industrial development. Because of regular human activity and considerable vehicle traffic in and surrounding the site, predominantly urban-adapted wildlife species are expected to occur in this area, such as raccoons (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), striped skunk (*Mephitis mephitis*), and brush rabbits (*Sylvilagus* spp.).

5 Project Impacts and Significance Determination

5.1 Definition of Impacts

This chapter defines the types of impacts considered in this report to analyze the potential effects of the Project on biological resources. The entire site would be developed as part of the proposed Project. These impacts are discussed in more detail below.

Direct impacts were quantified by overlaying the anticipated limits of grading onto the biological resources and quantifying impacts. For this Project, "direct permanent impacts" would occur to the entire parcel, so the Project site is considered 100% impacted.

Indirect impacts are reasonably foreseeable effects caused by Project implementation on remaining or adjacent biological resources outside the parcel. Because the entire Project site would be permanently impacted and the surrounding areas consist of developed land, no indirect impacts are anticipated and are not discussed further.

5.2 Explanation of Findings of Significance

This report analyzes impacts to sensitive vegetation communities, special-status wildlife species, and wildlife corridors and habitat connectivity to determine whether such impacts are significant. CEQA Guidelines Section 15064(b) states that an ironclad definition of "significant" effect is not possible because the significance of an activity may vary with the setting. However, CEQA Guidelines Section 15065(a) lists impacts that are helpful in defining whether a project may have a significant effect on the environment. Mandatory findings of significance, which require preparation of an environmental impact report, occur when there is substantial evidence that a project could (1) substantially degrade the quality of the environment, (2) substantially reduce the habitat of a fish or wildlife species, (3) cause a fish or wildlife population to drop below self-sustaining levels, (4) threaten to eliminate a plant or animal community, or (5) reduce the number or restrict the range of a rare or endangered plant or animal.

The following are the significance thresholds for biological resources provided in the CEQA Appendix G environmental checklist, which states that a project could potentially have a significant effect if it would (14 CCR 15000 et seq.):

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

5.3 Special-Status Vegetation Communities

The majority of the non-native grassland would be directly impacted, resulting in the loss of 5.95 acres of non-native grassland (Figure 6, Impacts to Vegetation Communities and Land Cover Types). Impacts to non-native grassland are typically be considered significant, requiring mitigation for impacts. However, the portions of the project site which contain non-native grassland have been subject to repeated disturbance as discussed in Section 1.3. The current conditions are the result of erosion control hydroseed installation following the removal of the temporary parking lot. The non-native grassland is regularly maintained by the current owner, thus reducing the ability for the it to function as habitat for wildlife species. Therefore, any impacts to this vegetation community resulting from the proposed project would be less than significant, and no mitigation would be required. The proposed project does not propose impacts to the Diegan coastal sage scrub. No habitat compensation is required for impacts to urban/developed.

Potential direct impacts could occur if construction work inadvertently extends beyond the authorized work limits where impacts to sensitive natural communities are not anticipated. The proposed project would be required to install temporary fencing to ensure that impacts stay within the project limits (**MM-BIO-1**). Therefore, potential direct impacts to sensitive vegetation communities would be **less than significant**.

5.4 Special-Status Plant Species

The Project site has no value as habitat for endangered, rare, or threatened plant species. No special-status plants have moderate or high potential to occur on the Project site due to lack of suitable vegetation, soil, or microhabitats, or the Project site is outside of known species ranges (Appendix C); therefore, there would be **no impacts** to special-status plants.

5.5 Special-Status Wildlife Species

The Project site has no value as habitat for endangered, rare, or threatened wildlife species. No special-status wildlife species have moderate or high potential to occur on the Project site due to current site conditions (i.e., repeated disturbance and surrounding development; therefore, there would be **no impacts** to special-status wildlife species.

5.6 Jurisdictional Waters

There are no jurisdictional waters or wetlands onsite; therefore, there would be **no impacts** to these features.

5.7 Wildlife Corridors and Habitat Linkages

There are no wildlife corridors or habitat linkages onsite; therefore, there would be **no impacts** to these resources.

5.8 Migratory Birds

Raptors and/or any migratory birds are protected under the MBTA (16 USC 703 et seq.) and California Fish and Game Code (Sections 3503 and 3503.5). The MBTA provides protection for birds by prohibiting the destruction of active nests for most native birds. The MBTA protects more than 800 species of birds, including species such as house finch (*Haemorhous mexicanus*), mourning dove (*Zenaida macroura*), and California towhee (*Melozone crissalis*), which could nest in the grassland, Diegan coastal sage scrub, or urban/developed areas within the Project site. Nesting bird surveys be completed if clearing and grubbing occur during the nesting season (typically February 15 through August 31) (MM-BIO-2). Local governments have the land use authority to protect bird nests during clearing and grubbing activities; therefore, nesting bird surveys are a common and typical mitigation measure for any property in the state and western region due to the wide range of the Pacific Flyway. The incorporation of this mitigation measure, described below, would reduce this impact to **less than significant**.

5.9 Regional Conservation Planning Context

The Project is not located within a designated Biological Core Linkage Area or Focused Planning Area, and therefore, it is consistent with the conservation policies of the Draft San Marcos Subarea Plan. In addition, the Project would be required to conform to the goals and policies in the City of San Marcos General Plan (City of San Marcos 2012) related to the protection of biological resources. Following implementation of proposed mitigation measures, the Project is expected to be found to be in conformance with the Draft San Marcos Subarea Plan and the General Plan. Therefore, no impacts related to regional resource planning are anticipated.

INTENTIONALLY LEFT BLANK

6 Mitigation Measures

Mitigate for Impacts to Vegetation Communities

The loss of 5.95 acres of non-native grassland would be less than significant impact and therefore no mitigation is required for the loss of this vegetation community. However, there is a potential for the project to result in unintentional impacts to vegetation located outside of the project limits. Implementation of Mitigation Measure (MM) BIO-1 would reduce this impact to less than significant.

MM-BIO-1 Temporary Construction Fencing. The Project applicant shall temporarily fence the limits of Project impacts and install appropriate sediment-trapping devices to prevent additional impacts to, and the spread of silt from, the construction zone into adjacent habitats to be avoided. Fencing and sediment trapping devices shall be installed in a manner that does not impact habitats to be avoided.

If work occurs beyond the fenced limits of impacts, all work shall cease until the problem has been remedied to the satisfaction of the City of San Marcos. Any habitat impacts that occur beyond the authorized work area shall be offset at ratios approved by the City of San Marcos. Temporary construction fencing and sediment trapping devices shall be removed upon Project completion.

Avoid and Minimize Impacts to Nesting Birds

The potential loss of migratory birds and/or active nests would be a potentially significant impact on migratory birds protected under the MBTA (16 USC 703 et seq.) and California Fish and Game Code Sections 3503 and 3503.5. However, implementation of MM-BIO-2 would reduce this impact to less than significant.

MM-BIO-2 Pre-Construction Nesting Bird Surveys. To avoid any direct impacts to raptors and/or any migratory birds protected under the Migratory Bird Treaty Act (16 USC 703 et seq.) and California Fish and Game Code (Sections 3503 and 3503.5), removal of habitat shall occur outside of the nesting season for these species (i.e., outside of February 15 through August 31, annually). If, however, removal of habitat must occur during the nesting period, the proposed Project applicant or its designee shall retain a biologist to conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. The pre-construction survey must be conducted within 72 hours prior to the start of construction, and shall be repeated if construction activities discontinue for more than 3 consecutive days.

Impacts to active nests are typically avoided as follows. Clearing and construction shall be postponed or halted within the following buffers to be established by the biologist: (1) no work within 50 feet of a non-listed and non-raptor avifauna nest; and (2) no work within 500 feet of a raptor nest. Raptor nests are not anticipated within the immediate Project site due to lack of suitable nesting habitat; however, trees within 500 feet of the Project boundary could support raptor nesting. The construction avoidance area shall be clearly demarcated in the field with highly visible construction fencing or flagging, and construction personnel shall be instructed on the sensitivity of nest areas. To the extent possible, the no-construction buffer zones shall be avoided until the nesting cycle is complete. However, it may be reasonable for the City of San Marcos to reduce these buffer widths depending onsite conditions. If construction-related activities must take place within an active nest buffer area, the proposed Project applicant or its designee shall present a plan the City of San Marcos with measures to monitor and minimize impacts to nesting birds. No ground-disturbance activities shall occur within the avoidance buffer zone until the qualified biologist has determined that the nest is no longer active and the young are not dependent on the nest.

Plant Species Compendium

Vascular Species

Eudicots

ANACARDIACEAE – SUMAC OR CASHEW FAMILY

* *Schinus molle* – Peruvian peppertree
* *Schinus terebinthifolius* – Brazilian peppertree

ASTERACEAE – SUNFLOWER FAMILY

Baccharis pilularis – coyote brush

Isocoma menziesii – Menzies's golden bush

Pseudognaphalium californicum – ladies' tobacco

BRASSICACEAE – MUSTARD FAMILY

* *Hirschfeldia incana* – shortpod mustard

CHENOPODIACEAE – GOOSEFOOT FAMILY

* *Salsola tragus* – prickly Russian thistle

GERANIACEAE – GERANIUM FAMILY

* *Erodium cicutarium* – redstem stork's bill

* signifies introduced (non-native) species

Wildlife Species Compendium

Birds

Flycatchers

TYRANNIDAE – TYRANT FLYCATCHERS

Tyrannus vociferans – Cassin's kingbird

Jays, Magpies and Crows

CORVIDAE – CROWS AND JAYS

Corvus brachyrhynchos – American crow

Mammals

Hares and Rabbits

LEPORIDAE – HARES AND RABBITS

Sylvilagus bachmani – brush rabbit

Squirrels

SCIURIDAE – SQUIRRELS

Otospermophilus beecheyi – California ground squirrel

Appendix C

Special-Status Plant Species Potential to Occur

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Abronia villosa var. *aurita*	chaparral sand-verbena	None/None/1B.1	Chaparral, Coastal scrub, Desert dunes; Sandy/annual herb/ (Jan)Mar–Sep/245–5,245	Y	Y	N	**Not expected to occur**. The Project site lacks suitable chaparral, coastal scrub and dunes as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Acanthomintha ilicifolia	San Diego thorn-mint	FT/SE/1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay, Openings/annual herb/Apr–June/35–3,145	Y	Y	N	**Not expected to occur.** The Project site lacks suitable chaparral, coastal scrub and valley and foothill grassland as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Acmispon prostratus	Nuttall's acmispon	None/None/1B.1	Coastal dunes, Coastal scrub/annual herb/ Mar–June(July)/0–35	Y	N	N	**Not expected to occur**. The Project site lacks suitable coastal dunes and coastal scrub as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Adolphia californica	California adolphia	None/None/2B.1	Chaparral, Coastal scrub, Valley and foothill grassland; Clay/perennial deciduous shrub/ Dec–May/35–2,425	N	Y	N	**Not expected to occur.** The Project site lacks suitable chaparral, coastal scrub and valley and foothill grassland as required for this species, and the Project site is located outside of the species' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Agave shawii var. *shawii*	Shaw's agave	None/None/2B.1	Coastal bluff scrub, Coastal scrub/perennial leaf/ Sep–May/10–395	N	N	N	**Not expected to occur.** The Project site lacks suitable coastal bluff scrub and coastal scrub as required for this species, and the Project site is located outside of the species' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Allium marvinii	Yucaipa onion	None/None/1B.2	Chaparral/perennial bulbiferous herb/Apr–May/2,490–3,490	N	N	N	**Not expected to occur.** The Project site lacks suitable chaparral as required for this species, and The Project site is located outside of the species' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Ambrosia pumila	San Diego ambrosia	FE/None/1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Alkaline (sometimes), Clay (sometimes), Disturbed areas (often), Sandy (sometimes)/ perennial rhizomatous herb/ Apr–Oct/65–1,360	Y	Y	N	**Low potential to occur.** The Project site lacks suitable chaparral, coastal scrub, valley and foothill grassland and vernal pools as required for this species. The species is known to occur in areas of disturbace, however, the species was not observed during the survey. There are no documented occurences of this species within 5 miles of the Project site (CDFW 2022a).
Aphanisma blitoides	aphanisma	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub; Gravelly (sometimes), Sandy (sometimes)/ annual herb/Feb–June/5–1,000	Y	Y	N	**Not expected to occur**. The Project site lacks suitable coastal bluff scrub, coastal dunes and coastal scrub as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Arctostaphylos glandulosa ssp. *crassifolia*	Del Mar manzanita	FE/None/1B.1	Chaparral/perennial evergreen shrub/June–Apr/0–1,195	Y	Y	N	**Not expected to occur**. The Project site lacks suitable chaparral as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Arctostaphylos rainbowensis	Rainbow manzanita	None/None/1B.1	Chaparral/perennial evergreen shrub/Dec–Mar/675–2,195	N	N	N	**Not expected to occur**. The Project site lacks suitable chaparral as required for this species, and the Project site is located outside of the species ' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Atriplex coulteri	Coulter's saltbush	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland; Alkaline (sometimes), Clay (sometimes)/perennial herb/ Mar–Oct/10–1,505	Y	Y	N	**Not expected to occur**. The Project site lacks suitable chaparral, scrub and valley and foothill grasslands as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Blooming during survey?	Elevation appropriate?	Habitats Appropriate?	Potential to Occur
Atriplex pacifica	south coast saltscale	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas/annual herb/Mar–Oct/0–460	Y	N	N	**Not expected to occur.** The Project site lacks suitable coastal dunes and scrub habitat as required for this species, and the Project site is located outside of the species ' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Baccharis vanessae	Encinitas baccharis	FT/SE/1B.1	Chaparral, Cismontane woodland; Sandstone/perennial deciduous shrub/Aug–Nov/195–2,360	N	Y	N	**Not expected to occur.** The Project site lacks suitable chaparral and cismontane woodland habitat as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Bloomeria clevelandii	San Diego goldenstar	None/None/1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools; Clay/perennial bulbiferous herb/Apr–May/165–1,525	N	Y	N	**Not expected to occur**. The Project site lacks suitable chaparral, scrub, and valley and foothill grassland habitat as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Brodiaea filifolia	thread-leaved brodiaea	FT/SE/1B.1	Chaparral, Cismontane woodland, Coastal scrub, Playas, Valley and foothill grassland, Vernal pools; Clay (often)/perennial bulbiferous herb/Mar–June/80–3,670	Y	Y	N	**Not expected to occur**. The Project site lacks suitable chaparral, cismontane woodland, coastal scrub and valley and foothill grassland habitat as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Brodiaea orcuttii	Orcutt 's brodiaea	None/None/1B.1	Chaparral, Cismontane woodland, Closed-cone coniferous forest, Meadows and seeps, Valley and foothill grassland, Vernal pools; Clay, Mesic/perennial bulbiferous herb/May–July/100–5,550	Y	Y	N	**Not expected to occur.** The Project site lacks suitable chaparral, cismontane woodland, coniferous forest, meadows and valley and foothill grassland habitat as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Ceanothus cyaneus	Lakeside ceanothus	None/None/1B.2	Chaparral, Closed-cone coniferous forest/perennial evergreen shrub/ Apr–June/770–2,475	Y	N	N	**Not expected to occur.** The Project site lacks suitable chaparral and coniferous forest habitat as required for this species, and the Project site is located outside of the species' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Ceanothus verrucosus	wart-stemmed ceanothus	None/None/2B.2	Chaparral/perennial evergreen shrub/Dec–May/5–1,245	N	Y	N	**Not expected to occur.** The Project site lacks suitable chaparral as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Centromadia parryi ssp. *australis*	southern tarplant	None/None/1B.1	Marshes and swamps, Valley and foothill grassland, Vernal pools/annual herb/ May–Nov/0–1,570	Y	Y	N	**Not expected to occur**. The Project site lacks suitable marshes, swamps and valley and foothill grasses as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Centromadia pungens ssp. *laevis*	smooth tarplant	None/None/1B.1	Chenopod scrub, Meadows and seeps, Playas, Riparian woodland, Valley and foothill grassland; Alkaline/annual herb/ Apr–Sep/0–2,095	Y	Y	N	**Not expected to occur.** The Project site lacks suitable scrub, meadows, riparian woodlands and valley and foothill grasslands as required for this species. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.
Chaenactis glabriuscula var. *orcuttiana*	Orcutt 's pincushion	None/None/1B.1	Coastal bluff scrub, Coastal dunes/annual herb/ Jan–Aug/0–330	Y	N	N	**Not expected to occur.** The Project site lacks suitable scrub and coastal dunes as required for this species, and the Project site is located outside of the species' known elevation range. Additionally, the Project site has been graded and disturbed, further reducing the likelihood that this species would occur within the site.

Appendix D

Special-Status Wildlife Species Potential to Occur

Scientific Name	Common Name	Status (Federal/State)	Habitat	Appropriate habitats?	Potential to Occur
Amphibians					
Anaxyrus californicus	arroyo toad	FE/SSC	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	N	**Not expected to occur**. The Project site lacks suitable semi-arid habitat near riverbanks as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Spea hammondii	western spadefoot	BCC/SSC	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley–foothill woodlands, pastures, and other agriculture	N	**Not expected to occur.** The Project site lacks suitable vernal pools and ephemeral wetlands as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Birds					
Agelaius tricolor (nesting colony)	tricolored blackbird	BCC/SSC, ST	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberry; forages in grasslands, woodland, and agriculture	N	**Not expected to nest or forage**. The Project site lacks suitable emergent wetland habitat with appropriate nesting substrate for this species and continuous open grassland habitat or agricultural land cover for foraging is absent. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Aquila chrysaetos (nesting and wintering)	golden eagle	None/FP, WL	Nests and winters in hilly, open/semi-open areas, including shrublands, grasslands, pastures, riparian areas, mountainous canyon land, open desert rimrock terrain; nests in large trees and on cliffs in open areas and forages in open habitats	N	**Not expected to nest or forage**. The Project site lacks suitable open and hilly nesting habitat for this species. This species is unlikely to forage within the Project site due to the lack of continuous open grassland habitat, and the close proximity to disturbance. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/SSC	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	Y	**Moderate potential to nest and forage**. The Project site contains California ground squirrel burrows and open grassland as required for this species. Although the Project site is entirely surrounded by development, there are small portions of suitable habitat within the site for this species. There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).
Buteo swainsoni (nesting)	Swainson's hawk	None/ST	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture	N	**Not expected to nest or forage.** The Project site lacks suitable nesting trees for this species, and associated continuous open grassland and agricultural habitat for foraging is absent. Additionally, the Project site is entirely surrounded by development and located outside of the typical central valley range for this species.
Campylorhynchus brunneicapillus sandiegensis (San Diego and Orange Counties only)	coastal cactus wren	None/SSC	Southern cactus scrub patches	N	**Not expected to nest or forage**. The Project site lacks suitable southern cactus scrub as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Charadrius nivosus nivosus (nesting)	western snowy plover	FT, BCC/SSC	On coasts nests on sandy marine and estuarine shores; in the interior nests on sandy, barren or sparsely vegetated flats near saline or alkaline lakes, reservoirs, and ponds	N	**Not expected to nest or forage**. The Project site lacks suitable sandy shores and barren flats as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Circus hudsonius (nesting)	northern harrier	BCC/SSC	Nests in open wetlands (marshy meadows, wet lightly-grazed pastures, old fields, freshwater and brackish marshes); also in drier habitats (grassland and grain fields); forages in grassland, scrubs, rangelands, emergent wetlands, and other open habitats	Y	**Low potential to nest and forage.** The Project site contains marginally suitable grassland for foraging, however, the proximity to surrounding development may preclude this species from occuring. The Project site lacks suitable wetlands and agricultural fields for nesting as required for this species. There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).

Scientific Name	Common Name	Status (Federal/State)	Habitat	Appropriate habitats?	Potential to Occur
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT/SE	Nests in dense, wide riparian woodlands and forest with well-developed understories	N	**Not expected to nest or forage.** The Project site lacks suitable riparian woodlands and forest understory as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Elanus leucurus (nesting)	white-tailed kite	None/FP	Nests in woodland, riparian, and individual trees near open lands; forages opportunistically in grassland, meadows, scrubs, agriculture, emergent wetland, savanna, and disturbed lands	Y	**Not expected to nest but may forage on site from time to time**. The Project site lacks suitable riparian and woodland nesting habitat as required for this species. The Project site does contain marginally suitable grassland for foraging. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	N	**Not expected to nest or forage.** The Project site lacks suitable riparian habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Icteria virens (nesting)	yellow-breasted chat	None/SSC	Nests and forages in dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush	N	**Not expected to nest or forage**. The Project site lacks suitable riparian woodlands and dense brush as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Ixobrychus exilis (nesting)	least bittern	None/SSC	Nests in freshwater and brackish marshes with dense, tall growth of aquatic and semi-aquatic vegetation	N	**Not expected to nest or forage**. The Project site lacks suitable marsh habitat and aquatic vegetation as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Laterallus jamaicensis coturniculus	California black rail	None/FP, ST	Tidal marshes, shallow freshwater margins, wet meadows, and flooded grassy vegetation; suitable habitats are often supplied by canal leakage in Sierra Nevada foothill populations	N	**Not expected to nest or forage**. The Project site lacks suitable marsh and wet meadows as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Passerculus sandwichensis beldingi	Belding's savannah sparrow	BCC/SE	Nests and forages in coastal saltmarsh dominated by pickleweed (*Salicornia* spp.)	N	**Not expected to nest or forage.** The Project site lacks suitable saltmarsh and pickleweed as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Polioptila californica californica	coastal California gnatcatcher	FT/SSC	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet above mean sea level	N	**Not expected to nest and forage**. The Project site lacks suitable continous sage scrub as required for this species.There is a smalll section of disturbed sage scrub on the western boundary of the Project Site, however, it lacks California sagebrush (Artemisia californica), is disturbed, and the Project site is entirely surrounded by development, further reduces the likelihood that this species could occur site. The nearest modern CNDDB documented occurance is approximately 1.5 miles north of the Project site (Occ. No. 177) (CDFW 2022a).
Rallus obsoletus levipes	Ridgway's rail	FE/FP, SE	Coastal wetlands, brackish areas, coastal saline emergent wetlands	N	**Not expected to nest or forage.** The Project site lacks suitable wetlands as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Riparia riparia (nesting)	bank swallow	None/ST	Nests in riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with sandy soils; open country and water during migration	N	**Not expected to nest or forage.** The Project site lacks suitable riparian, lacustrine and coastal areas with vertical cliffs and banks as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Appropriate habitats?	Potential to Occur
Setophaga petechia (nesting)	yellow warbler	None/SSC	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats	N	**Not expected to nest or forage.** The Project site lacks suitable riparian and oak woodlands, montane chaparral and conifer habitats as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Sternula antillarum browni (nesting colony)	California least tern	FE/FP, SE	Forages in shallow estuaries and lagoons; nests on sandy beaches or exposed tidal flats	N	**Not expected to nest or forage**. The Project site lacks suitable estuaries, lagoons, beaches and tidal flats as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	N	**Not expected to nest or forage.** The Project site lacks suitable riparian habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Fishes					
Eucyclogobius newberryi	tidewater goby	FE/None	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County, to the mouth of the Smith River	N	**Not expected to occur.** The Project site lacks suitable aquatic habitat as required for this species.
Gila orcuttii	arroyo chub	None/SSC	Warm, fluctuating streams with slow-moving or backwater sections of warm to cool streams at depths >40 centimeters (16 inches); substrates of sand or mud	N	Not expected to occur. The Project site lacks suitable aquatic habitat as required for this species.
Invertebrates					
Branchinecta sandiegonensis	San Diego fairy shrimp	FE/None	Vernal pools, non-vegetated ephemeral pools	N	**Not expected to occur.** The Project site lacks suitable vernal or ephemeral pools as required for this species.
Danaus plexippus pop. 1	monarch	FC/None	Wind-protected tree groves with nectar sources and nearby water sources	N	**Not expected to occur**. The Project site lacks suitable tree groves as required for this species.
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	Vernal pools, non-vegetated ephemeral pools	N	**Not expected to occur**. The Project site lacks suitable vernal or ephemeral pools as required for this species.
Mammals					
Antrozous pallidus	pallid bat	None/SSC	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees	Y	**Not expected to roost but may forage on site from time to time**. The Project site lacks suitable rocky outcrops, trees and structures for roosting as required for this species. The Project site does contain marginally suitable grassland for foraging. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site. There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).
Chaetodipus californicus femoralis	Dulzura pocket mouse	None/SSC	Open habitat, coastal scrub, chaparral, oak woodland, chamise chaparral, mixed-conifer habitats; disturbance specialist; 0 to 3,000 feet above mean sea level	N	**Not expected to occur.** The Project site does contain marginal open habitat, but lacks significant coastal scrub, oak woodland and chaparral as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site. There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).
Chaetodipus fallax fallax	northwestern San Diego pocket mouse	None/SSC	Coastal scrub, mixed chaparral, sagebrush, desert wash, desert scrub, desert succulent shrub, pinyon–juniper, and annual grassland	N	**Not expected to occur.** The Project site does contain marginal grassland, but lacks significant coastal scrub, chaparral and sagebrush as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site. The nearest CNDDB documented occurrence of the species is located 4.6 miles southwest of the Project site (Occ. No. 7) (CDFW 2022a).

Scientific Name	Common Name	Status (Federal/State)	Habitat	Appropriate habitats?	Potential to Occur
Choeronycteris mexicana	Mexican long-tongued bat	None/SSC	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon–juniper woodland; roosts in caves, mines, and buildings	N	**Not expected to roost or forage.** The Project site lacks suitable riparian habitats, desert scrub, woodland, caves, mines and roosting structures as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Corynorhinus townsendii	Townsend's big-eared bat	None/SSC	Mesic habitats characterized by coniferous and deciduous forests and riparian habitat, but also xeric areas; roosts in limestone caves and lava tubes, man-made structures, and tunnels	N	**Not expected to roost or forage**. The Project site lacks suitable riparian habitats, forests, caves and roosting structures as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Dasypterus xanthinus	western yellow bat	BCC/SSC	Valley–foothill riparian, desert riparian, desert wash, and palm oasis habitats; below 2,000 feet above mean sea level; roosts in riparian and palms	N	**Not expected to roost or forage**. The Project site lacks suitable riparian, desert habitats and roosting trees as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Dipodomys stephensi	Stephens' kangaroo rat	FE/ST	Annual and perennial grassland habitats, coastal scrub or sagebrush with sparse canopy cover, or in disturbed areas	N	**Not expected to occur**. The Project site does contain marginal grassland, but lacks significant coastal scrub and sagebrush as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site. There are no CNDDB documented occurrences of the species within 5 miles of the Project site (CDFW 2022a).
Eumops perotis californicus	western mastiff bat	None/SSC	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels	N	**Not expected to roost or forage.** The Project site lacks significant suitable scrub, forest, woodland, rocky canyons and cliffs as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Leptonycteris yerbabuenae	lesser long-nosed bat	FPD/SSC	Sonoran desert scrub, semi-desert grasslands, lower oak woodlands	N	**Not expected to roost or forage.** The Project site lacks suitable desert scrub, desert grasslands and oak woodlands required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Neotoma lepida intermedia	San Diego desert woodrat	None/SSC	Coastal scrub, desert scrub, chaparral, cacti, rocky areas	N	**Not expected to occur.** The Project site lacks significant coastal scrub, chaparral, cacti and rocky areas as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Nyctinomops femorosaccus	pocketed free-tailed bat	None/SSC	Pinyon–juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oases; roosts in high cliffs or rock outcrops with drop-offs, caverns, and buildings	N	**Not expected to roost or forage.** The Project site lacks suitable desert scrub, woodlands, Joshua tree, riparian habitat, cliffs and rock outcrops required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Nyctinomops macrotis	big free-tailed bat	None/SSC	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water	N	**Not expected to roost or forage.** The Project site lacks suitable open water, caves and rocky outcrops required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Perognathus longimembris pacificus	Pacific pocket mouse	FE/SSC	fine-grained sandy substrates in open coastal strand, coastal dunes, and river alluvium	N	**Not expected to occur**. The Project site lacks sandy substrates, coastal dunes or river alluvium habitats as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Taxidea taxus	American badger	None/SSC	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	Y	**Low potential to occur.** Although the Project site contains marginal non-native grassland habitat for this species, the proximity to development likley deters this species from occurring. The nearest CNDDB documented occurance is 0.4 miles south of the Project site (Occ. No. 313) (CDFW 2022a).

Scientific Name	Common Name	Status (Federal/State)	Habitat	Appropriate habitats?	Potential to Occur
Reptiles					
Anniella stebbinsi	southern California legless lizard	None/SSC	Coastal dunes, stabilized dunes, beaches, dry washes, valley–foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils	N	**Not expected to occur.** The Project site lacks coastal dunes, beaches, dry washes, chaparral, scrubs and woodlands as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Arizona elegans occidentalis	California glossy snake	None/SSC	Arid scrub, rocky washes, grasslands, chaparral, open areas with loose soil	N	**Not expected to occur**. The Project site lacks aird scrub, washes, chaparral and continous grassland as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/SSC	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	N	**Not expected to occur**. The Project site lacks chaparral, woodland and riparian habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Crotalus ruber	red diamondback rattlesnake	None/SSC	Coastal scrub, chaparral, oak and pine woodlands, rocky grasslands, cultivated areas, and desert flats	N	**Not expected to occur**. The Project site lacks significant coastal scrub, chaparral, woodland and desert flats as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Emys marmorata	western pond turtle	None/SSC	Slow-moving permanent or intermittent streams, ponds, small lakes, and reservoirs with emergent basking sites; adjacent uplands used for nesting and during winter	N	**Not expected to occur.** The Project site lacks suitable aquatic habitat and connectivity to adjacent aquatic habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Phrynosoma blainvillii	Blainville's horned lizard	None/SSC	Open areas of sandy soil in valleys, foothills, and semi-arid mountains including coastal scrub, chaparral, valley–foothill hardwood, conifer, riparian, pine–cypress, juniper, and annual grassland habitats	N	**Not expected to occur**. The Project site lacks suitable significant coastal scrub, chaparral, woodland and grassland as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Salvadora hexalepis virgultea	coast patch-nosed snake	None/SSC	Brushy or shrubby vegetation; requires small mammal burrows for refuge and overwintering sites	N	**Not expected to occur**. The Project site lacks suitable brushy and shrubby vegetation as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Thamnophis hammondii	two-striped gartersnake	None/SSC	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools	N	**Not expected to occur.** The Project site lacks suitable aquatic habitat and connectivity to adjacent aquatic habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.
Thamnophis sirtalis ssp. (Southern California coastal plain from Ventura County to San Diego County, and from sea level to about 850 m)	south coast garter snake	None/SSC	Marsh and upland habitats near permanent water and riparian vegetation	N	**Not expected to occur**. The Project site lacks suitable marsh habitat and connectivity to adjacent aquatic and riparian habitat as required for this species. Additionally, the Project site is entirely surrounded by development, further reducing the likelihood that this species would occur within the site.

Ms. Johanna Crooker
Meritage Homes

Subject: Archaeological Resource Inventory – Negative Findings Report for the Gran Vista Project, City of San Marcos, California

Dear Ms. Crooker:

This letter documents the negative archaeological resources inventory conducted by Dudek for the Gran Vista Project (Project), located in the City of San Marcos, San Diego County, California (Figure 1, Project Location). The City of San Marcos (City) is the lead agency for compliance with the California Environmental Quality Act (CEQA). This report was prepared by Dudek archaeologist Matthew DeCarlo, M.A., who meets the Secretary of the Interior's Standards for archaeology.

Dudek previously completed a cultural resources constraints analysis for the Project (DeCarlo et. al. 2021), the results of which were used to construct this archaeological resources inventory. A South Coastal Information Center (SCIC) records search (June 2021) confirms that no previously recorded cultural resources have been recorded within the Project's area of potential effect (APE). A list of historic structures and sites from the City of San Marcos' Development Services Department confirmed that none of these sites are located within the APE. A Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search did not indicate the presence of any Tribal Cultural Resources (TCR) or sacred sites within the Project APE. However, one response letter from Native American outreach mentioned a resource within the Project APE but no specifics were included. An intensive pedestrian survey of the Project (April 2022) did not identify any archaeological resources within the Project APE.

The 7.6-acre Project APE consists of a vacant lot bordering existing residential and commercial developments (Figure 2, Project Site). The Project APE has been previously disturbed by leveling and grading activities. Due to the previous disturbances and the negative archival search, and survey results, Dudek does not recommend cultural resources monitoring for the proposed Project. Ground disturbance is unlikely to impact archaeological resources; however, if archaeological resources are encountered during exposure of subsurface soils, ground-disturbing work should be immediately halted in the area and a qualified archaeologist should be retained to evaluate this resource.

1 Project Description and location

The Project proposes the residential development of an approximately 7.6-acre property resulting in 120 townhomes, recreational areas, and landscaping. The Project APE is located in the City of San Marcos, County of San Diego, and delineated by Las Posas Road, Palm Road, and an existing single-family residential subdivision. The property is mapped within unsectioned land in Township 12 South, Range 3 West on the United States Geological Survey 7.5' San Marcos Quadrangle (Figure 1). The 7.6-acre property comprises the entire APE.

2 Regulatory Background

The City of San Marcos (City) is the lead agency for compliance with the California Environmental Quality Act (CEQA). This study is compliant with cultural resource regulations that apply to the Project APE including provisions for the California Register of Historic Resources (CRHR), the California Native American Graves Protection and Repatriation Act, CEQA, California Health and Safety Code section 7050.5, Assembly Bill (AB) Number 52, Senate Bill 18, and the City's General Plan.

2.1 The California Register of Historic Resources (Public Resources Code Section 5020 et seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code [PRC] Section 5020.1[j]). In 1992, the California legislature established CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria (PRC Section 5024.1[c]):

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (14 CCR Section 4852[d][2]).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

2.2 Native American Historic Cultural Sites (PRC section 5097 et seq.)

State law addresses the following:

- The disposition of Native American burials in archaeological sites and the protection of such remains from disturbance, vandalism, or inadvertent destruction
- The procedures to be implemented if Native American skeletal remains are discovered during construction of a project
- The establishment of the NAHC to resolve disputes regarding the disposition of such remains.

In addition, the Native American Historic Resource Protection Act states that defacing or destroying Native American historic or cultural sites that are listed (or may be eligible for listing) in the CRHR is a misdemeanor punishable by up to 1 year in jail.

2.3 California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological and historic resources:

1. PRC Section 21083.2(g): Defines "unique archaeological resource."
2. PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a): Define historical resources. In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
3. PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. PRC Sections 21083.2(b)–(c) and CEQA Guidelines Section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; CEQA Guidelines Section 15064.5[b]). If a site is either listed or eligible for listing in the CRHR, if it is included in a local register of historic resources, or is identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1[q]), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; CEQA Guidelines Section 15064.5[a]). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; CEQA Guidelines Section 15064.5[a]).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5[b][1]; PRC Section 5020.1[q]). In turn, the significance of a historical resource is materially impaired when a project does the following:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA

2.4 California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (Section 7050.5b). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Section 7050.5c). The NAHC will notify the Most Likely Descendant. With the permission of the landowner, the Most Likely Descendant may inspect the site of discovery. The inspection must be completed within 24 hours of notification of the Most Likely Descendant by the NAHC. The Most Likely Descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

2.5 Assembly Bill 52

California AB 52, which took effect July 1, 2015, establishes a consultation process between California Native American Tribes and lead agencies in order to address tribal concerns regarding project impacts and mitigation to "tribal cultural resources". PRC Section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. Listed or eligible for listing in the CRHR or a local register of historical resources
2. Determined by a lead agency to be a TCR

2.6 Senate Bill 18

Senate Bill 18 amended Section 65351 of the Government Code and dictates the following:

> During the preparation or amendment of the general plan, the planning agency shall provide opportunities for the involvement of citizens California Native American Indian tribes, public agencies, public utility companies, and civic, education, and other community groups, through public hearings and any other means the city or county deems appropriate.

2.7 Guidelines for Determining Significance

According to CEQA (Section 15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

The significance of an historical resource is materially impaired when a project does the following:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant
- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA

Section 15064.5(c) of CEQA applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a)
- If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of Section 21084.1 of the PRC, and this section, Section 15126.4 of the Guidelines, and the limits contained in Section 21083.2 of the PRC do not apply
- If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the PRC, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in PRC

Section 21083.2 (c–f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources

- If an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or Environmental Impact Report (EIR), if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process

Section 15064.5(d) and (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

> When an initial study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the Native American Heritage Commission as provided in Public Resources Code SS5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
>
> 1. The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5); and
> 2. The requirement of CEQA and the Coastal Act.

Under CEQA, an EIR is required to evaluate any impacts on unique archaeological resources (PRC section 21083.2.) A "unique archaeological resource" is defined as:

> [A]n archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
>
> 1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
> 2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
> 3. Is directly associated with a scientifically recognized important prehistoric or historic event or person. (PRC section 21083.2[g])

An impact to a non-unique archaeological resource is not considered a significant environmental impact and such non-unique resources need not be further addressed in the EIR (PRC Section 21083.2[a]; CEQA Guidelines Section 15064.5[c][4]).

As stated above, CEQA contains rules for mitigation of "unique archaeological resources." For example, "[i]f it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an

undisturbed state. Examples of that treatment, in no order of preference, may include, but are not limited to, any of the following:

1. Planning construction to avoid archaeological sites
2. Deeding archaeological sites into permanent conservation easements
3. Capping or covering archaeological sites with a layer of soil before building on the sites
4. Planning parks, greenspace, or other open space to incorporate archaeological sites." (PRC Section 21083.2[b][1]–[4])

PRC Section 21083.2(d) states that "[e]xcavation as mitigation shall be restricted to those parts of the unique archaeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archaeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

The rules for mitigating impacts to archaeological resources to qualify as "historic resources" are slightly different. According to CEQA Guidelines Section 15126.4(b), "[p]ublic agencies should, whenever feasible, seek to avoid damaging effects on any historic resource of an archaeological nature. The following factors shall be considered and discussed in an EIR for a project involving such an archaeological site:

1. Preservation in place is the preferred manner of mitigating impacts to archaeological sites. Preservation in place maintains the relationship between artifacts and the archaeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.
2. Preservation in place may be accomplished by, but is not limited to, the following:
    a. Planning construction to avoid archaeological sites;
    b. Incorporation of sites within parks, greenspace, or other open space;
    c. Covering the archaeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]
    d. Deeding the site into a permanent conservation easement.

Thus, although Section 21083.2 of the PRC, in addressing "unique archaeological sites," provides for specific mitigation options "in no order of preference," CEQA Guidelines Section 15126.4(b), in addressing "historical resources of an archaeological nature," provides that "[p]reservation in place is the preferred manner of mitigating impacts to archaeological sites."

Under CEQA, "[w]hen data recovery through excavation is the only feasible mitigation," the lead agency may cause to be prepared and adopt a "data recovery plan," prior to any excavation being undertaken. The data recovery plan must make "provision for adequately recovering the scientifically consequential information from and about the historic resource." (CEQA Guidelines Section 15126.4[b][3][C]). The data recovery plan also "must be deposited with the California Historical Resources Regional Information Center." (Ibid.) Further, "[i]f an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation." (Ibid.)

However, "[d]ata recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archaeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center." (CEQA Guidelines Section 15126.4[b][3][D]).

2.8 Native American Heritage Values

Federal and state laws mandate that consideration be given to the concerns of contemporary Native Americans with regard to potentially ancestral human remains associated funerary objects, and items of cultural patrimony. Consequently, an important element in assessing the significance of the study site has been to evaluate the likelihood that these classes of items are present in areas that would be affected by the proposed Project.

The category termed "Traditional Cultural Properties" in discussions of cultural resource management performed under federal auspices is also potentially relevant to prehistoric archaeological sites. According to Patricia L. Parker and Thomas F. King (1998), "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include the following:

1. A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world
2. A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents
3. An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices
4. A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice
5. A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity

2.9 City of San Marcos Guidelines

Chapter 4 of the City's General Plan (adopted in 2012 and updated in 2013) describes the City's cultural and paleontological resources, regulatory framework, and policies and plans to protect such resources (City of San Marcos 2013). The planning goals and policies are described below.

The City's General Plan Open Space and Conservation Element identifies goals and policies aimed at preserving cultural and historic resources. The City's goal is to "continue to identify and evaluate cultural, historical, archaeological, paleontological, and architectural resources for protection from demolition and inappropriate actions" in compliance with CEQA guidelines (City of San Marcos 2013).

3 Project Background

3.1 Existing Conditions

The approximately 7.6-acre Project APE consists of a vacant lot bordering existing residential and commercial developments. The Project APE has been previously disturbed as evidenced by graded terraces. There was an elevation difference of approximately 10 feet between the northern and the southern half of the parcel showing complete disturbance of the natural landscape. The Project APE is bound to the east by North Las Posas Road, to the west by a concrete storm channel, and to the south by a drug store parking lot. The Project APE elevations ranging from 560 to 580 feet above mean sea level.

3.2 Prehistoric Context

Evidence for continuous human occupation in the San Diego County region spans the last 12,000 years. Various attempts to parse out variability in archaeological assemblages over this broad time frame have led to the development of several cultural chronologies; some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. Each of these reconstructions describes essentially similar trends in assemblage composition in more or less detail. This research employs a common set of generalized terms used to describe chronological trends in assemblage composition from an archaeological perspective: Paleoindian (pre-5500 BC), Archaic (8000 BC.–AD 500), Late Prehistoric (AD 500–1750), and Ethnohistoric (post-AD 1750). Native American aboriginal lifeways did not cease at European contact. “Protohistoric” refers to the chronological trend of continued Native American aboriginal lifeways at the cusp of the recorded historic period in the Americas. The tribal cultural context spans all of the archaeologically based chronologies further described below.

3.2.1 Paleoindian Period (pre-5500 BC)

Evidence for Paleoindian occupation in coastal Southern California is tenuous, especially considering the fact that the oldest dated archaeological assemblages look nothing like the Paleoindian artifacts from the Great Basin. One of the earliest dated archaeological assemblages in coastal Southern California (excluding the Channel Islands) derives from P-37-004669 (CA-SDI-4669), in La Jolla. A human burial from P-37-004669 was radiocarbon dated to 9,590–9,920 years before present (approximately 95% probability). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of groundstone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of groundstone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1978) on China Lake Naval Air Weapons Station near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (MNO-679)—a multicomponent fluted point site, and MNO-680—a single component Great Basin stemmed point site (Basgall et al. 2002). At MNO-679 and MNO-680, groundstone tools were rare while finely made projectile points were common.

Turning back to coastal Southern California, the fact that some of the earliest dated assemblages are dominated by processing tools runs counter to traditional notions of mobile hunter–gatherers traversing the landscape for highly valued prey. Evidence for the latter—that is, typical Paleoindian assemblages—may have been located along the coastal margin at one time, prior to glacial desiccation and a rapid rise in sea level during the early Holocene (pre-7500 BP) that submerged as much as 1.8 km of the San Diego coastline. If this were true, however, it would also be expected that such sites would be located on older landforms near the current coastline. Some sites, such as P-37-000210 (CA-SDI-210) along Agua Hedionda Lagoon, contained stemmed points similar in form to Silver Lake and Lake Mojave projectile points (pre-8000 BP) that are commonly found at sites in California's high desert (Basgall and Hall 1993). P-37-000210 yielded one corrected radiocarbon date of 8520–9520 BP (Warren et al. 2004). However, sites of this nature are extremely rare and cannot be separated from large numbers of milling tools that intermingle with old projectile point forms.

Warren et al. (2004) claimed that a biface manufacturing tradition present at the Harris site complex P-37-000149 (CA-SDI-149) is representative of typical Paleoindian occupation in the San Diego County region that possibly dates between 10,365 and 8200 BC (Warren et al. 2004, p. 26). Termed San Dieguito, assemblages at the Harris site are qualitatively distinct from most others in the San Diego County region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (Warren 1964, 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987) suggested that the San Dieguito pattern is simply an inland manifestation of a broader economic pattern. Gallegos' interpretation of San Dieguito has been widely accepted in recent years, in part because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the San Diego County region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in southern California deserts, wherein hunting-related tools are replaced by processing tools during the early Holocene (Basgall and Hall 1993).

3.2.2 Archaic Period (8,000 BC – AD 500)

The more than 2500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in the San Diego County region. If San Dieguito is the only recognized Paleoindian component in the San Diego County region, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004)

admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the San Diego County region (Hale 2001, 2009).

The Archaic pattern is relatively easy to define with assemblages that consist primarily of processing tools: millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the San Diego County region, with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous amounts of archaeological work at Archaic sites, little change in assemblage composition occurs until the bow and arrow is adopted at around AD 500, as well as ceramics at approximately the same time (Hale 2009). Even then, assemblage formality remains low. After the bow is adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decrease in proportion relative to expedient, unshaped groundstone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complimented only by the addition of the bow and ceramics.

3.2.3 Late Prehistoric Period (AD 500 - 1769)

The period of time following the Archaic and prior to Ethnohistoric times (AD 1750) is commonly referred to as the Late Prehistoric (Wallace 1955; Warren et al. 2004). However, several other subdivisions continue to be used to describe various shifts in assemblage composition, including the addition of ceramics and cremation practices. In northern San Diego County, the post-AD 1450 period is called the San Luis Rey Complex. Rogers (1929) also subdivided the last 1,000 years into the Yuman II and III cultures, based on the distribution of ceramics. Despite these regional complexes, each is defined by the addition of arrow points and ceramics, and the widespread use of bedrock mortars. Vagaries in the appearance of the bow and arrow and ceramics make the temporal resolution of the San Luis Rey complex difficult. For this reason, the term Late Prehistoric is well-suited to describe the last 1,500 years of prehistory in the San Diego region.

Temporal trends in socioeconomic adaptations during the Late Prehistoric period are poorly understood. This is partly due to the fact that the fundamental Late Prehistoric assemblage is very similar to the Archaic pattern, but includes arrow points and large quantities of fine debitage from producing arrow points, ceramics, and cremations. The appearance of mortars and pestles is difficult to place in time because most mortars are on bedrock surfaces; bowl mortars are actually rare in the San Diego County region. Some argue that the Ethnohistoric intensive acorn economy extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred prior to AD 1400. True (1980) argued that acorn processing and ceramic use in the northern San Diego region did not occur until the San Luis Rey pattern emerged after approximately AD 1450.

3.2.4 Ethnohistoric (post-AD 1769)

Early descriptions of the lifeways of Southern California ethnohistoric groups were provided by explorers, missionaries, administrators, and other travelers, who gave particular attention to the coastal populations (Boscana 1846; Fages 1937; Geiger and Meighan 1976; Harrington 1934; Laylander 2000). Subsequent ethnographers in the early twentieth century were able to give much more objective, detailed, and penetrating

accounts. Most of the ethnographers attempted to distinguish between observations of the customs of surviving Native Americans and orally transmitted or inferred information concerning the lifeways of native groups prior to European intrusion into the region. The second of these subjects provides a terminal baseline for discussing the cultures of the region's prehistory. Despite the relatively rich ethnographic record, attempts to distinguish between the archaeological residues that were produced by the linguistically unrelated but culturally similar Luiseño and Ipai/Kumeyaay have been largely unsuccessful (Pigniolo 2004).

The first systematic ethnographic work in California was done in 1871 and 1872 by Stephen Powers (Heizer 1978); in 1877, Powers collected and printed his ethnographic observations in Tribes of California (Powers 1877). Prior to the work of Powers, there were limited records and accounts that might be broadly considered as ethnohistorical data, such as Boscana (1846). At the beginning of the twentieth century, Alfred L. Kroeber and others began four decades of systematic documentation of tribal ethnographies. Kroeber's (1925) monumental work on the Indians of California continues to be an authoritative source of information. It is important to note that even though there were many informants for these early ethnographies who were able to provide information from personal experiences about native life before the Europeans, a significantly large proportion of these informants were born after 1850 (Heizer and Nissen 1973); therefore, the documentation of pre-contact, aboriginal culture was being increasingly supplied by individuals born in California after considerable contact with Europeans. As Robert F. Heizer (1978) stated, this is an important issue to note when examining these ethnographies, since considerable culture change had undoubtedly occurred by 1850 among the Native American survivors of California. Nonetheless, the enormous value of the ethnographies done under Kroeber's guidance is obvious. The major sources for this review include Lowell John Bean and Florence C. Shipek (1978), Kroeber (1925), Philip S. Sparkman (1908), and Raymond White (1963).

San Marcos is situated within the ethnohistoric territory of the Native American Luiseño cultural group, according to Kroeber's study (1925; see also Rivers 1993). The Luiseño language belongs to the Cupan group of the Takic language branch of the Uto-Aztecan language family. Luiseño is a term given to Native Americans under the administration of Mission San Luis Rey, and later applied specifically to the Payomkawichum ethnic nation who were present in the region where the mission was founded. Meaning the "western people," the name Payomkawichum can also be applied to the closely related coastal Luiseño who lived north of the mission.

Luiseño territory was situated in the north half of San Diego County and the western edge of Riverside County. Their lands encompassed the southern Santa Margarita Mountains and the Palomar Mountains, and their foothills to the Pacific Ocean. The territory extended eastward into the San Jacinto Valley and the western foothills of the San Jacinto Mountains. Their neighbors to the were the Juaneño (Acjachemen) who spoke a Luiseño dialect, the Cahuilla and Cupeño to the east who spoke other Takic Cupan languages, and the Ipai (Kumeyaay) to the south who spoke a California-Delta Yuman language.

The Luiseño resided in permanent villages and associated seasonal camps. Village population ranged from 50–400 with social structure based on lineages and clans. A single lineage was generally represented in smaller villages, while multiple lineages and a dominant clan presided in larger villages. Each clan/village owned a resource territory and was politically independent, yet maintained ties to others through economic, religious, and social networks in the immediate region. There were contact period villages in the vicinity of this segment, near the towns of Vista, San Marcos, and Escondido, but researchers have been unable to place rancheria names from the mission registers with these locations.

Like other Indigenous California groups, the primary food staple was the acorn (Bean and Shipek 1978), supplemented by other plant resources, fish, shellfish, waterfowl, and marine and terrestrial mammals. Villages were situated near reliable sources of water, needed for the daily leaching of milled acorn flour. Other plant foods included pine nuts and grass seeds, manzanita, sunflower, sage, chia, lemonade berry, wild rose, holly-leaf cherry, prickly pear, and lamb's quarter. Large and small prey included deer, antelope, rabbit, jackrabbit, wood rat, mice, and ground squirrel, as well as quail, ducks, and other birds. Fish, such as trout, were caught in rivers and creeks.

The first direct European contact with the Luiseño occurred in July 1769 with the Spanish expedition led by Gaspar de Portolá. During the next six years, eight missions and forts were founded north and south of Luiseño territory. In 1776, Mission San Juan Capistrano was founded less than 10 miles north, and the populations of five northern Luiseño villages had been halved within 15 years. In 1798, Mission San Luis Rey was established within Luiseño territory, and the proselytizing among the Payomkawichum began in earnest.

Several Luiseño leaders signed the statewide 1852 treaty, locally known as the Treaty of Temecula (an interior Luiseño village), but the U.S. Congress never ratified it. By 1875, however, reservations for the Luiseño were established in the Palomar Mountains and nearby valleys, including Pala, Pauma, Rincon, Pechanga, and La Jolla.

4 Methods

4.1 SCIC Records Search

Dudek previously completed a cultural resources constraints analysis for the Project (DeCarlo et. al 2021), the results of which are summarized below. The purpose of the records search is to identify any previously recorded cultural resources that may be located within the property. In addition to a review of previously prepared EIRs, permit application packages, site records, and reports, the records search also reviewed historical maps of the Project APE and vicinity, ethnographies, the NRHP, CRHR, Built Environment Resources Directory, and the lists of California State Historical Landmarks, California Points of Historical Interest, and Archaeological Determinations of Eligibility. Dudek received the results of the records search on June 17, 2021 (Confidential Appendix A, SCIC Records Search Results).

Dudek reviewed the Built Environment Resources Directory on June 16, 2021. No previously recorded built environment resources are located on the Project APE or along the blocks of Las Posas Road and Mission Road that border the Project APE.

The SCIC records search results identified 40 cultural resources within 1 mile of the Project APE, none of which intersect the current Project APE. One resource, P-37-005584/CA-SDI-5584, was identified immediately adjacent to the Project APE and another resource, P-37-005633/CA-SDI-5633, was located 0.15 miles outside of the Project APE. The resources are discussed below. Table 1 summarizes the cultural resources within 1 mile of the Project APE.

Table 1. Cultural Resources Previously Identified within 1 Mile of Project APE

Primary No	Trinomial	Era	Description
Within 1 Mile of Project APE			
P-37-005581	CA-SDI-005581	Prehistoric	Habitation site
P-37-005582	CA-SDI-005582	Prehistoric	Lithic scatter
P-37-005583	CA-SDI-005583	Prehistoric	Lithic scatter
P-37-005584	CA-SDI-005584	Prehistoric	Bedrock milling feature and lithic artifacts
P-37-005632	CA-SDI-005632	Prehistoric	Bedrock milling features and lithic scatter
P-37-005633	CA-SDI-005633	Prehistoric	Habitation site
P-37-005641	CA-SDI-005641	Multicomponent	Habitation site
P-37-005642	CA-SDI-005642	Prehistoric	Lithic scatter
P-37-005643	CA-SDI-005643	Prehistoric	Two lithic cores
P-37-005644	CA-SDI-005644	Prehistoric	Lithic scatter
P-37-005645	CA-SDI-005645	Prehistoric	Lithic scatter
P-37-005646	CA-SDI-005646	Prehistoric	Lithic scatter
P-37-005647	CA-SDI-005647	Prehistoric	Bedrock milling and lithic scatter
P-37-005648	CA-SDI-005648	Prehistoric	Lithic scatter
P-37-005649	CA-SDI-005649	Prehistoric	Bedrock milling feature and lithic artifacts
P-37-008813	CA-SDI-008813	Prehistoric	Bedrock milling feature and lithic artifacts
P-37-008814	CA-SDI-008814	Historic	Remnants of building
P-37-008815	CA-SDI-008815	Prehistoric	Lithic scatter
P-37-008816	CA-SDI-008816	Prehistoric	Lithic and shell scatter
P-37-011661	CA-SDI-011661	Prehistoric	Lithic scatter
P-37-011662	CA-SDI-011662	Prehistoric	Rock shelter and two flakes
P-37-011663	CA-SDI-011663	Prehistoric	Lithic scatter
P-37-011715	CA-SDI-011715	Prehistoric	Quarry and bedrock milling features with lithic scatter
P-37-011716	CA-SDI-011716	Historic	Remains of historic structure
P-37-012592	CA-SDI-012592	Prehistoric, Historic	Prehistoric bedrock milling and artifact scatter; historic refuse
P-37-012593	CA-SDI-012593	Prehistoric, Historic	Prehistoric bedrock milling and artifact scatter; historic refuse
P-37-012594	CA-SDI-012594	Historic	Refuse scatter
P-37-012595	CA-SDI-012595	Prehistoric	Bedrock milling
P-37-012596	CA-SDI-012596	Historic	Refuse scatter
P-37-014950	—	Prehistoric	Isolated scraper
P-37-015064	—	Prehistoric	Isolated handstone
P-37-018190	—	Historic	Industrial building
P-37-018191	—	Historic	Commercial building
P-37-024911	CA-SDI-016492	Prehistoric	Refuse scatter

Table 1. Cultural Resources Previously Identified within 1 Mile of Project APE

Primary No	Trinomial	Era	Description
P-37-025556	CA-SDI-016971	Prehistoric	Bedrock milling
P-37-033557	—	Historic	Highway 395
P-37-036868	—	Historic	Earthen dam
P-37-036869	—	Historic	Earthen dam
P-37-039088	CA-SDI-022954	Historic	Refuse deposit
0 S. Rancho Santa Fe Road	—	Historic	Historic address

P-37-005584/CA-SDI-5584

This site was originally recorded by Randy Franklin in 1977 as a single grinding slick in a boulder outcrop on a small knoll. Franklin (1977a) stated that there was no midden, but lithic flakes, core fragments, and a hammerstone were present near the adjacent road, and suggested that they may have been intrusive. This resource was located immediately east of the Project APE within the current path of Las Posas Road. This resource was destroyed during the road's construction in 1986 and its expansion by 1990.

P-37-005633/CA-SDI-5633

This site was originally recorded by Randy Franklin in 1977 as a bedrock milling station on a small knoll (Franklin 1977b). The site went through several rounds of archaeological testing and was determined significant under CEQA. In 2002, the eastern half of the site underwent data recovery to mitigate developments. The collected deposits include bifaces and projectile points, cores, over 13,000 debitage, groundstone implements, beads, shell, and historic refuse. Human bone was also recovered and repatriated to Native American representatives. This resource is located 0.15 miles from the Project APE.

The records search also identified 55 previous studies that have been performed within 1 mile of the Project APE. Four of these studies have addressed at least a portion of the Project APE, one of which (SD-18210) addressed the entire Project APE. SD-18210, however, was a constraints study and did not include a full pedestrian survey. The findings of SD-18210 are similar to the findings of this inventory so will not be summarized here. These previous 55 studies were conducted between 1974 and 2020. No survey of the Project APE has been conducted within the past 6 years. A complete list of the previous studies conducted within 1 mile of the Project APE is included as Table 2 in Confidential Appendix A.

4.2 Built Environment Historical Resources

There are no built environment resources on the Project APE. The Project APE is surrounded by numerous residential and commercial buildings, all of which were constructed after 1973. No previously identified historical resources are in the vicinity. The commercial building to the south of the Project APE (currently CVS) was constructed in 2010. The width of streets and topography surrounding the Project APE creates a geographic and visual separation between the Project APE and all nearby development. There are no built environment historical resources that require avoidance or evaluation prior to construction.

On June 17, 2021, Dudek Architectural Historian Nicole Frank emailed the City of San Marcos' Development Services Department at planningdivision@san-marcos.net, requesting information on the City of San Marcos' historic preservation program and a list of designated resources. On June 18, 2021, Ms. Frank left a voicemail with the City of San Marcos' general voicemail line asking for information about City's historic preservation program and a list of designated historic properties. On June 21, 2021, Ms. Frank received an emailed response from Art Piñon, Senior Planner at the City of San Marcos. The email contained a list of historic structures and sites in San Marcos. After reviewing the location of these structures and sites, none were found to overlap the Project APE.

4.3 Archival Research

The previous constraints analysis included a review of historic topographic maps and aerial photographs of the Project APE and the general vicinity, to help determine the possible development and land use of the Project APE in the past. The historic aerial imagery available from the website HistoricAerials.com by Nationwide Environmental Title Research, LLC includes historic photographs available since 1953 (NETR 2021). The 1953 aerial photograph shows that the property was undeveloped but still bordered Mission Road to the south. The knoll and rock outcrop on which archaeological resource P-37-005584 was located is vaguely visible on the 1953 aerial photograph. By 1964, a natural drainage that was located west of the Project APE was channelized and demarcates the western boundary of the current Project APE. The Project APE itself was still undisturbed but a residential development was constructed to the northeast. By 1978, the Project APE and the adjacent P-37-005584 knoll were undisturbed, though a new residential development was constructed west of the project boundary. The 1984 aerial photograph shows that the southeastern corner of the Project APE was graded but the rest of the Project APE and the adjacent P-37-005584 knoll was undisturbed. The 1986 aerial photograph, however, shows the grading of the current North Las Posas Road alignment. This grading disturbed the eastern border of the Project APE and destroyed part of the adjacent P-37-005584 knoll. In 1989, the grading of the eastern Project APE boundary was expanded and substantial earth movement was required to support the current alignment of the six-laned North Las Posas Road. This expansion destroyed the P-37-005584 knoll adjacent to the Project APE. By 1991, the entire Project APE had been graded. By 2009, the entire Project APE was graded again leaving the property with a northern terrace that overlooked the southern 3/4ths of the Project APE. The current commercial building and parking lot that bound the southern portion of the Project APE was also constructed in 2009. The historic aerial photographs show that the Project APE has been undeveloped but completely disturbed.

4.4 NAHC and Native American Outreach Letters

Dudek requested a NAHC search of the SLF on April 15, 2022, for the proposed Project APE and a 1-mile buffer. The SLF consists of a database of known Native American resources. These resources may not be included in SCIC database. The NAHC replied on May 19, 2022, and reported that the SLF did not identify any known Native American cultural resources within the Project APE or the surrounding 1-mile buffer (Appendix B, Tribal Correspondence). The NAHC additionally provided a list of Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area.

Outreach letters were mailed on May 27, 2022, to all Native American group representatives included on the NAHC contact list (Appendix B). These letters attempted to solicit additional information relating to Native American resources that may be impacted by the Project. Native American representatives were requested to

define a general area where known resources intersect the Project APE. To date, Dudek has received responses to these outreach letters from three tribal representatives. On June 17, 2022, San Pasqual Band of Mission Indians responded to the letter stating that the Project APE is within the boundary of the tribe's Traditional Use Area. San Pasqual stated that they would like to engage in "formal government to government consultation". On June 21, 2022, Pechanga Band of Luiseño Mission Indians stated that the Project APE is within their Ancestral Territory and that they are interested in participating in the Project Area. Pechanga added that the Project APE is within 1.75 miles of two Ancestral Placenames and nine other previously recorded sites within 0.5 miles, one of which is within the Project APE. Unfortunately, no other information about the intersecting resource was included but Pechanga is likely referring to the destroyed Project Area adjacent P-37-005584 knoll. On June 28, 2022 Rincon Band of Luiseño Indians responded to the outreach letter and stated that the Project APE was within the band's specific Area of Historic Interest. Rincon added that they were concerned that the project may impact Tribal Cultural Resources, Traditional Cultural Landscapes, or potential Traditional Cultural Properties. Rincon recommended that an archaeological/cultural resources inventory and that a Tribal monitor from the Rincon Band should accompany the survey. On July 12, 2022, Dudek archaeologist Mattthew DeCarlo met Cheryl Madrigal, the Tribal Historic Preservation Officer for Rincon Band, at the Project APE for a site visit. They discussed the previous disturbance of the area and visited the location of former prehistoric bedrock milling site P-37-005584. Ms. Madrigal stated that she would contact the City about her concerns after she had some time to research the Project Area. On September 8, 2022, Rincon sent a letter to the City critiquing an earlier version of this report. Rincon requested an ethno-historic research and further analysis of adjacent sites P-37-005584 and P-37-005633.

In compliance with Assembly Bill 52 and Senate Bill 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. Rincon Band responded to City outreach for Senate Bill 18 and Assembly Bill 52 on February 16 and April 13 requesting consultation on the Project. The City had a consultation meeting with representatives of Rincon Band on August 16, 2022.

4.5 Intensive Pedestrian Survey

Dudek archaeologist Javier Hernandez conducted a survey of the proposed Project APE on April 22, 2022. Native American monitor Logovii Sialoi from Saving Sacred Sites, Inc., a Luiseño owned company, participated in the pedestrian survey. The Project consists of a vacant lot bordering existing residential and commercial developments. The Project APE has been previously disturbed as evidenced by graded terraces. There was an elevation difference of approximately 10 feet between the northern and the southern half of the parcel showing complete disturbance of the natural landscape. Ground visibility was low throughout the APE due to heavy vegetation with some modern trash and debris scattered throughout the area. Though currently undeveloped, the Project APE is immediately adjacent to residential and commercial development and has been subjected to illicit dumping activities. Pedestrian survey was conducted utilizing formal transects at 15-meter intervals. Deviations from transects also occurred to inspect animal burrows and other locations of exposed sediments and boulders. No remnants of adjacent resource P-37-005584 or other archaeological resources were identified within the Project APE.

5 Summary and Management Considerations

Dudek's archaeological resources inventory for the Project did not identify any archaeological resources within the Project APE. The Project APE has been completely graded and levelled, as evidenced by historic aerial photographs and the pedestrian survey.

Due to the negative results of the SCIC records search, NAHC SLF Search, and intensive-level survey, Dudek anticipates that no known cultural resources will be impacted by the proposed Project. These negative results and the previous disturbance of the area suggest that there is a low probability for impacting unknown cultural resources during construction. Dudek does not recommend cultural resources monitoring or any other cultural resource efforts for the Project; however, in the unlikely event that archaeological materials are identified during earth moving activities, work should be temporary halted in the vicinity of the discovery. A qualified archaeologist should be notified to review the unanticipated find and evaluate the resource for CRHR listing. Should human remains be discovered, work will halt in that area and procedures set forth in the PRC (Section 5097.98) and State Health and Safety Code (Section 7050.5) will be followed, beginning with notification to the County Coroner. If Native American remains are present, the County Coroner will contact the NAHC to designate a Most Likely Descendent, who will provided recommendations for the dignified disposition and treatment of the remains.

Should you have any questions relating to this report and its findings please do not hesitate to contact Dudek directly.

Respectfully Submitted,

Re: Gran Vista Project, San Diego County

Dear Mr. DeCarlo:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

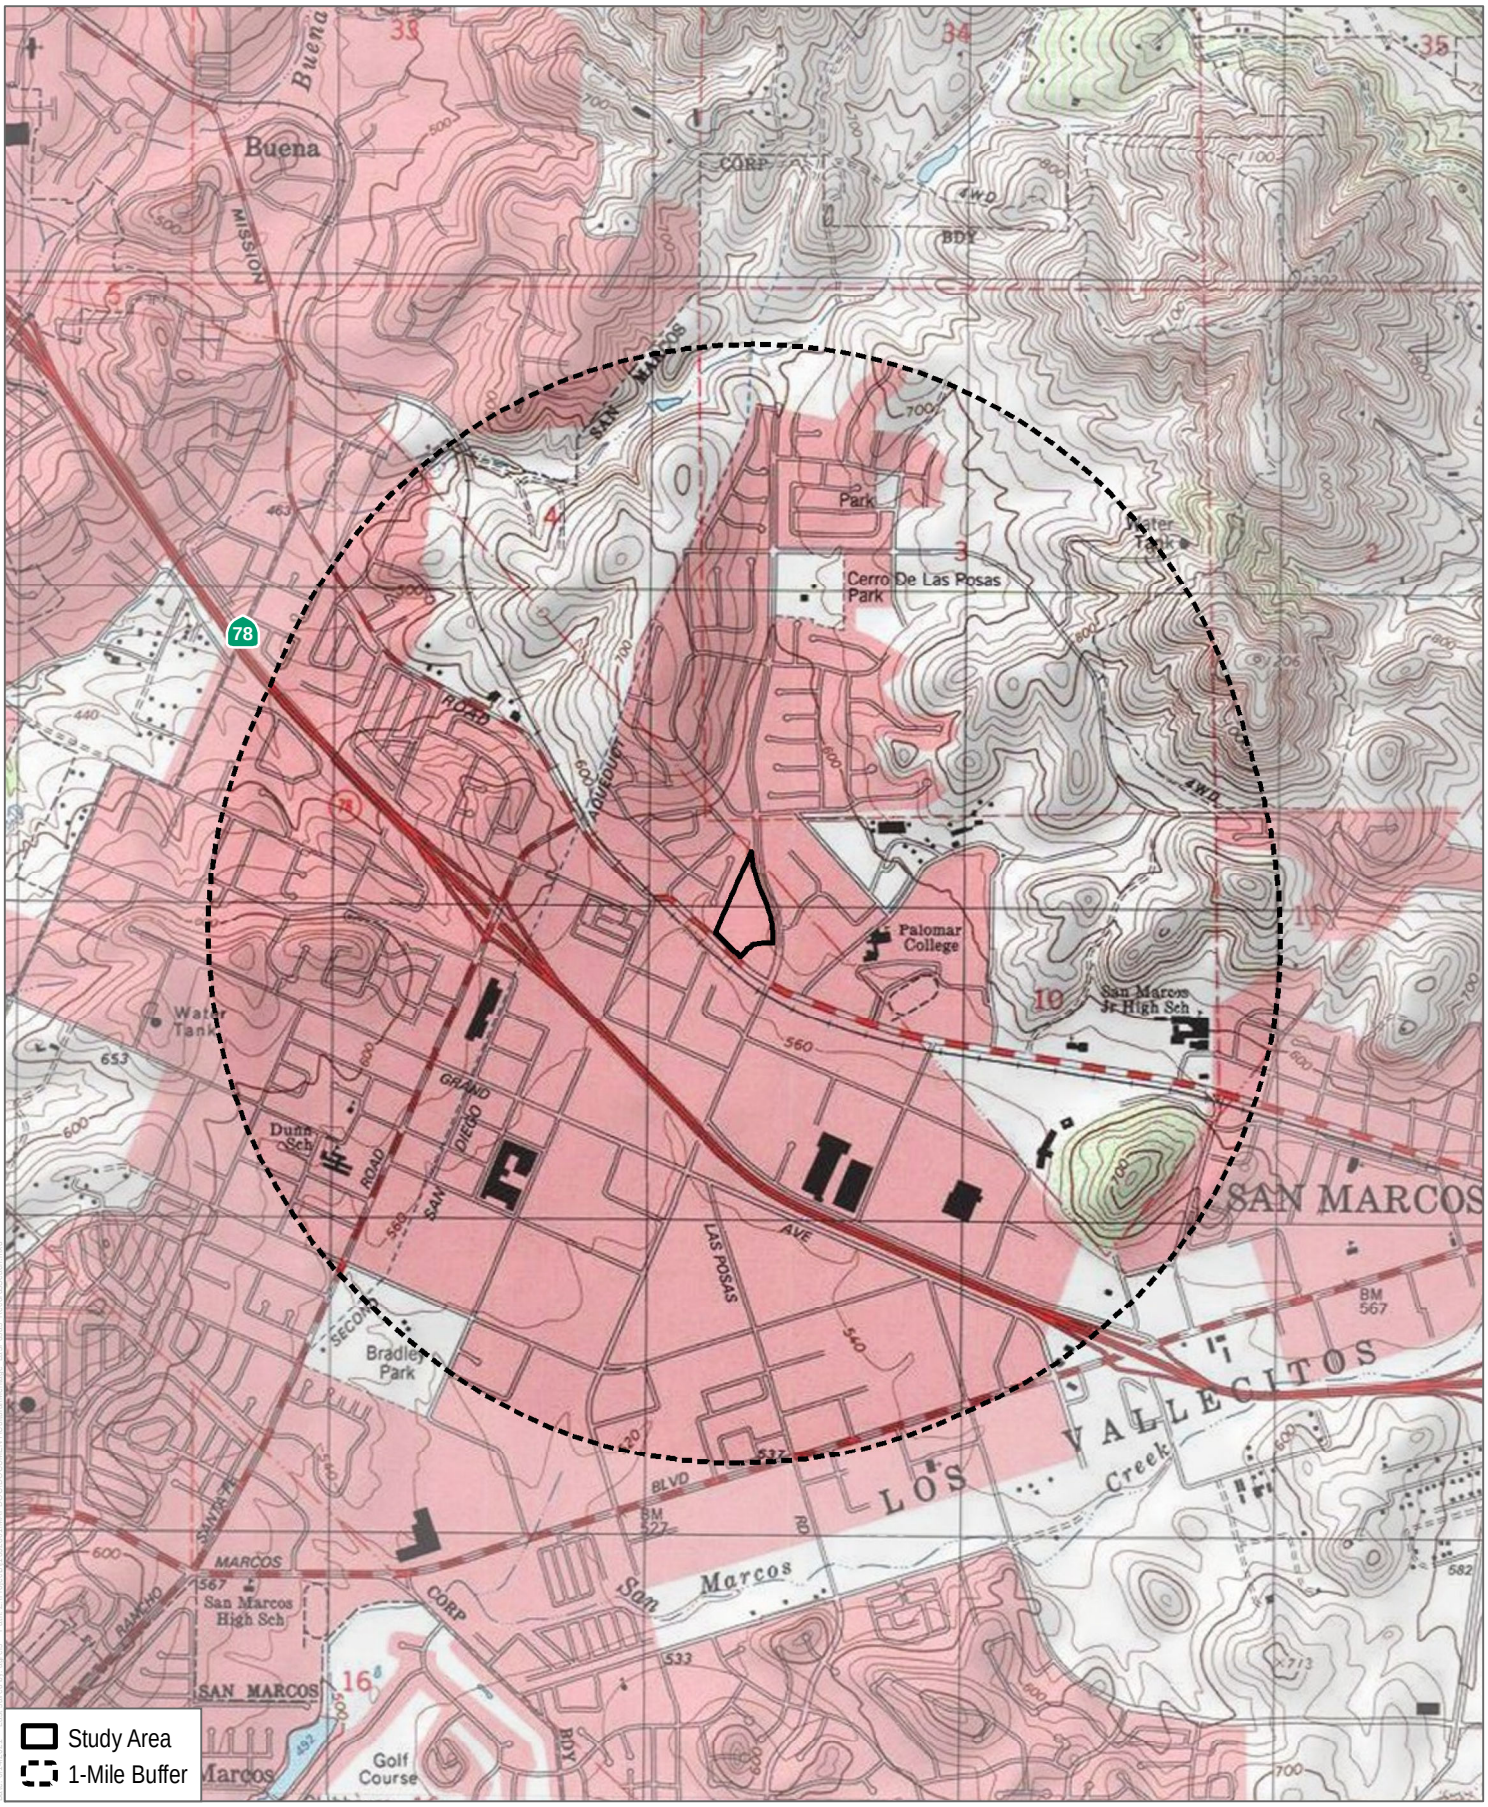
Subject: Information Request for the Gran Vista Project, City of San Marcos, California

Dear Mr. Aguilar,

A private developer has proposed the development of a vacant lot into residential development in the City of San Marcos, California. The project area is located within an existing residential and commercial development at the intersection of by Las Posas Road and Palm Road. The area falls within unsectioned land within Township 12S/ Range 3W of the San Marcos, CA 1:24,000 USGS map (Figure 1).



The Native American Heritage Commission conducted a Sacred Lands file search. The results were negative for Native American cultural resources within or adjacent to the project area. I am writing as part of the cultural inventory process in order find out if you, or your tribal community, have any knowledge of cultural resources or places that may be impacted by the proposed project. This letter does not constitute formal government to government consultation pursuant to Assembly Bill 52.

If you have any information or concerns pertaining to such information, please contact me.

Subject: Information Request for the Gran Vista Project, City of San Marcos, California

Dear Mr. Vivanco,

A private developer has proposed the development of a vacant lot into residential development in the City of San Marcos, California. The project area is located within an existing residential and commercial development at the intersection of by Las Posas Road and Palm Road. The area falls within unsectioned land within Township 12S/ Range 3W of the San Marcos, CA 1:24,000 USGS map (Figure 1).

The Native American Heritage Commission conducted a Sacred Lands file search. The results were negative for Native American cultural resources within or adjacent to the project area. I am writing as part of the cultural inventory process in order find out if you, or your tribal community, have any knowledge of cultural resources or places that may be impacted by the proposed project. This letter does not constitute formal government to government consultation pursuant to Assembly Bill 52.

If you have any information or concerns pertaining to such information, please contact me.

Respectfully,

Matthew H. DeCarlo

RE: Gran Vista Project

Dear Mr. DeCarlo,

The San Pasqual Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of Desiree M. Whitman THPO Officer and San Pasqual Band of Mission Indians.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognized San Pasqual Indian Reservation. It is, however, within the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Furthermore, we would like to engage in formal government to government consultation so that San Pasqual can have a voice in developing the measures that will be taken to protect these sites and mitigate any adverse impacts.

We would appreciate being given access to any cultural resource reports that have been or will be generated during the environmental review process so we can contribute most effectively to the consultation process.

We appreciate your involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone at 760-803-5648 or by e-mail at Angelinag@sanpasqualtribe.org

Respectfully,

Angelina Gutierrez

RE: Request for Information for the SP-21-003 Gran Vista Project, City of San Marcos, San Diego County, CA.

Dear Mr. DeCarlo,

The Pechanga Band of Indians ("the Tribe") appreciates your request for information regarding the above referenced Project. After reviewing the provided maps and our internal documents, we have determined that the Project-area is not within our Reservation land's, although it is located in Our Ancestral Territory. At this time, we are interested in participating in this Project based upon our 'Ayélkwish/Traditional Knowledge of the area, this Project's adjacency to known Ancestral remains, because of proximity to two Ancestral Placenames (one 1.26 and the second 1.75 away), and because this project is directly upon a recorded cultural/archaeological location. Further, because this location is ½-a-mile to eight other of extensive and previously recorded sites the Tribe therefore, is interested in participating in this Project. The Pechanga Tribe believes that the possibility of recovering subsurface resources during ground-disturbing activities for this Project is extremely high.

The Tribe is dedicated to providing comprehensive cultural information to you and your firm for inclusion in the archaeological study as well as to the Lead Agency for CEQA review. At this time, the Tribe requests the following so we may continue the consultation process and to provide adequate and appropriate recommendations for the Project:

1) Notification once the Project begins the entitlement process, if it has not already;
2) Copies of all applicable archaeological reports, site records, proposed grading plans and environmental documents (EA/IS/MND/EIR, etc);
3) Government-to-government consultation with the Lead Agency; and
4) The Tribe believes that monitoring by a San Diego County qualified archaeologist and a professional Pechanga Tribal Monitor may be required during earthmoving activities. Therefore, the Tribe reserves its right to make additional comments and recommendations once the environmental documents have been received and fully

reviewed. Further, in the event that subsurface cultural resources are identified, the Tribe requests consultation with the Project proponent and Lead Agency regarding the treatment and disposition of all artifacts.

As a Sovereign governmental entity, the Tribe is entitled to appropriate and adequate government-to-government consultation regarding the proposed Project. We would like you and your client to know that the Tribe does not consider initial inquiry letters from project consultants to constitute appropriate government-to-government consultation, but rather tools to obtain further information about the Project area. Therefore, the Tribe reserves its rights to participate in the formal environmental review process, including government-to-government consultation with the Lead Agency, and requests to be included in all correspondence regarding this Project.

Please note that we are interested in participating in surveys within Luiseño Ancestral territory. Prior to conducting any surveys, please contact the Cultural Department to schedule specifics. If you have any additional questions or comments, please contact me at pmacarro@pechanga-nsn.gov or 951-770-6306.

Sincerely,

Paul E. Macarro

Re: Gran Vista Project, City of San Marcos, San Diego County, California

Dear Mr. DeCarlo,

This letter is written on behalf of the Rincon Band of Luiseño Indians ("Rincon Band" or "Tribe"), a federally recognized Indian Tribe and sovereign government. We have received your notification regarding the above referenced project and we thank you for the opportunity to provide information pertaining to cultural resources. The identified location is within the Territory of the Luiseño people, and is also within Rincon Band's specific Area of Historic Interest (AHI).

After review of the provided documents and our internal information, the Rincon Band has specific concerns that that the project may impact tangible Tribal Cultural Resources (TCRs), Traditional Cultural Landscapes (TCLs), and potential Traditional Cultural Properties (TCPs). Embedded in these resources and within the AHI are Rincon's history, culture, and continuing traditional identity.

Based on the information provided above, the Rincon Band recommends conducting an archaeological/cultural resources study, to include an archeological record search and complete intensive survey of the property. Additionally, we ask that a professional Tribal monitor from the Rincon Band to accompany the archaeologist during the survey.

The Rincon Band further requests to consult directly with the lead agency regarding project impacts to cultural resources. While it is not the responsibility of consultants to facilitate State-mandated consultation, the request is included in this letter so the lead agency is aware of the Tribe's concerns about the project. If you have additional questions or concerns, please do not hesitate to contact our office at your convenience at (760) 749 1092 ext. 323 or via electronic mail at cmadrigal@rincon-nsn.gov. We look forward to working together to protect and preserve our cultural assets.

Sincerely,

Cheryl Madrigal

Subject: ***Geotechnical Evaluation for the Proposed "Las Posas" Residential Development Located North of the Intersection of North Mission Road and Las Posas Road, San Marcos, California***

In accordance with your request, LGC Geotechnical, Inc. has performed a geotechnical evaluation of the current conditions of the teardrop shaped property located north of the intersection of North Mission Road and Las Posas Road located in San Marcos, California. This geotechnical report presents the results of our evaluation and geotechnical analysis and provides a summary of our conclusions and recommendations relative to the proposed development of the site.

We sincerely appreciate this opportunity to be of service. Should you have any questions, please do not hesitate to contact this office.

Respectfully,

LGC Geotechnical, Inc.

1.0 INTRODUCTION

LGC Geotechnical has performed a geotechnical evaluation to assess the current geotechnical conditions for the project site located north of the intersection of North Mission Road and Las Posas Road located in San Marcos, California (see Site Location Map, Figure 1). We understand that the property is to be developed for multi-story, single-family, attached residential home sites, private drives, parking, underground utilities and associated improvements. This report presents the results of our evaluation and geotechnical analysis and provides a summary of our conclusions and recommendations relative to the proposed development of the site.

1.1 Scope of Services

The conceptual site plan prepared by Hunsaker & Associates (Hunsaker, 2021) has been utilized as a base map for presentation of the data obtained in this study (see Sheet 1).

Our scope of services included:

- Review of pertinent readily available geotechnical reports and geologic maps (Appendix A);
- Excavation, sampling, and logging of nine 8-inch exploratory borings at selected locations across the site;
- Excavation, sampling, and logging of five exploratory test pits at selected locations across the site;
- Conversion of the three of the borings for infiltration testing;
- Reconnaissance level geologic mapping of the site;
- Preparation of a Geotechnical Map (Sheet 1) depicting the interpreted geologic conditions on the site;
- Geotechnical analysis of the data reviewed/obtained; and
- Preparation of this report presenting our findings, conclusions, and preliminary recommendations with respect to the proposed site development.

1.2 Project Description and Background

The site is a teardrop-shaped property originally graded for commercial development. The site is currently undeveloped and is bound to the east by a Las Posas Road, to the west by existing residential development, an existing CVS and North Mission Road to the south, and to the north by similar undeveloped property and existing residential development. Based on as-graded grading plans and historic aerial photos, the grading activities are observed between 2008 and 2010.

Topographically, the majority of the site is relatively flat lying but slopes gradually to the west and southwest from an elevation of approximately 580 feet to 570 feet above mean sea level with an existing approximately 3:1 (horizontal to vertical) slope descending westward to the adjacent residential development.

We understand that the proposed residential development of the site will include grading of the site for construction of approximately 16 multi-family residential structures. In addition,

interior streets, parking, open-space areas, associated underground utilities, and other associated improvements are proposed.

2.0 LIMITED GEOTECHNICAL EVALUATION

2.1 Subsurface Exploration

A geotechnical field evaluation was performed by LGC Geotechnical consisting of excavation of 9 hollow-stem auger borings and 5 test pits. Three of the borings were converted to test wells to perform field percolation testing, only one of the converted borings was logged and sampled.

The borings (HS-1 through HS-6, I-1, I-2, & I-3) were excavated using a truck-mounted drill rig equipped with 8-inch-diameter hollow-stem augers. Borings HS-1 through HS-6 were excavated to depths ranging from approximately 5 to 15.5 feet below existing grades. Borings I-1, I-2, & I-3 were excavated to depths of approximately 10 feet below existing grade. An LGC Geotechnical representative observed the drilling operations, logged the borings, and collected soil samples for laboratory testing. Driven soil samples were collected by means of the Standard Penetration Test (SPT) and Modified California Drive (MCD) sampler. The SPT sampler (1.4-inch ID) and MCD sampler (2.4-inch ID, 3.0-inch OD) were driven using a 140-pound automatic hammer falling 30 inches to advance the sampler a total depth of 18 inches or until refusal. Bulk samples were also collected and logged for laboratory testing at select depths. The raw blow counts for each 6-inch increment of penetration were recorded on the boring logs. Once drilling was completed the borings were backfilled with drill cuttings. Some settlement of the backfill soils may occur over time

The test pits were sampled and logged by a representative from our firm and subsequently backfilled and compacted with the excavated materials. The soils were placed in relatively thin lifts and compacted with a backhoe equipped with a compaction wheel. Considerable effort was used during the backfill operations to ensure appropriate compaction. Approximate test pit and boring locations are presented on our Geotechnical Map (Sheet 1). The subsurface logs are included in Appendix B.

2.2 Infiltration Testing

Three field percolation tests were performed in borings I-1, I-2, and I-3 approximately 10 feet below the existing ground elevation. The borings for the infiltration tests were excavated using a drill rig equipped with 8-inch diameter hollow-stem augers. Estimation of infiltration rates was performed in general accordance with guidelines set forth by the County of San Diego (SD, 2020). In general, a 3-inch diameter perforated PVC pipe was placed in each borehole to be tested and the annulus was backfilled with gravel, including placement of about 2 inches of gravel at the bottom of the borehole. The observed infiltration rates are considered representative of the site soils. These observed infiltration rates do not include any factor of safety. Observed infiltration rates have been normalized to correct the 3-Dimensional flow that occurs within the field test to 1-Dimensional flow out of the bottom of the boring.

The tested infiltration rate provided in this report is considered a general representation of the infiltration rate at the location and depth performed. Please note, the testing of infiltration rates is highly dependent upon the materials encountered at the point of testing (i.e., location and depth of testing). Varying subsurface conditions may exist outside of the test location which could alter the calculated infiltration rate. Please refer to Section 5.6 for subsurface water infiltration recommendations, a summary of the infiltration data and, pertinent factors of safety.

2.3 Laboratory Testing

Representative bulk and driven samples were obtained for laboratory testing during our field evaluation. Laboratory testing included in-situ moisture content and dry density, fines content, Atterberg limits, consolidation, expansion index, laboratory compaction, and corrosion (sulfate, chloride, pH and minimum resistivity).

- Dry density of the samples collected ranged from approximately 97.6 pounds per cubic foot (pcf) to 123.4 pcf, with an average of 113.2 pcf. Field moisture contents ranged from approximately 5.6 percent to 12.9 percent, with an average of 8.5 percent.
- One fines content tests was performed and indicated a fines content (passing No. 200 sieve) of approximately 45 percent. Based on the Unified Soils Classification System (USCS), the tested sample would be classified "fine-grained."
- One Atterberg Limit (liquid limit and plastic limit) test was performed. Results indicated Plasticity Index (PI) value of 23.
- One consolidation test was performed, the plot is provided in Appendix C.
- Two Expansion Index (EI) tests of a near-surface samples indicated EI values of 32 and 55, corresponding to "Low" and "Medium" expansion potential, respectively.
- One laboratory compaction test resulted in a maximum dry density of 125.5 pcf at an optimum moisture content of 10.0 percent.
- Corrosion testing indicated a soluble sulfate content of less than approximately 0.019 percent, a chloride content of 149 parts per million (ppm), pH of 7.99, and a minimum resistivity of 740 ohm-centimeters.

Laboratory test results obtained from our field evaluation are provided in Appendix C. The moisture and dry density results are presented on the boring logs in Appendix B.

3.0 GEOTECHNICAL CONDITIONS

3.1 Site Geology

The findings of our limited geotechnical evaluation indicate that the site is generally underlain by older artificial fill overlying Quaternary older alluvium. Cretaceous Tonalite underlies the site at depth but was not encountered during our subsurface evaluation. The typical onsite characteristics of the materials are described in the following subsections (from youngest to oldest). The approximate lateral extent of the geologic units encountered is presented on the Geotechnical Map (Sheet 1). It should be noted that geotechnical explorations are only representative of the location where they are performed and varying subsurface conditions may exist outside of each location. In addition, subsurface conditions can change over time. The soil descriptions provided herein should not be construed to mean that the subsurface profile is uniform and that soil is homogeneous within the project area. For detailed descriptions of the materials at the exploration locations, refer to the exploration logs provided in Appendix B.

3.1.1 Older Artificial Fill (Map Symbol – afo)

Older artificial fill as depicted on the Geotechnical Map generally indicates material that has been placed over native on-site soils as part of prior rough grading activities. The materials encountered consisted of light to medium brown clayey sands and sandy clays that are slightly moist to moist, dense and/or stiff. The artificial fill materials encountered during our subsurface evaluation ranged from approximately at existing grade to 8 feet in depth.

3.1.2 Quaternary Older Alluvium (Map Symbol - Qcol)

Quaternary-aged alluvium was encountered in each of the exploratory test pits and borings excavated across the site. In general, the alluvial materials encountered consisted of light to dark brown, slightly moist, dense to very dense clayey sands and stiff to hard sandy clays with gravel and lesser amounts of cobbles. The alluvial materials encountered during our subsurface evaluation ranged from approximately 2 feet to a maximum 15.5 feet in depth.

3.2 Seismic Design Criteria

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2019 California Building Code (CBC) and applicable portions of ASCE 7-16 which has been adopted by the CBC. **Please note that the following seismic parameters are only applicable for code-based acceleration response spectra and are not applicable for where site-specific ground motion procedures are required by ASCE 7-15.** Representative site coordinates of latitude 33.1503 degrees north and longitude -117.1897 degrees west were utilized in our analyses. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class C are provided in Table 1 on the following page. The structural designer should contact the geotechnical consultant if structural conditions (e.g., number of stories, seismically isolated structures, etc.) require site-specific ground motions.

TABLE 1

Seismic Design Parameters

Selected Parameters from 2019 CBC, Section 1613 - Earthquake Loads	Seismic Design Values	Notes/Exceptions
Distance to applicable faults classifies the site as a "Near-Fault" site.		Section 11.4.1 of ASCE 7
Site Class	C	Chapter 20 of ASCE 7
Ss (Risk-Targeted Spectral Acceleration for Short Periods)	0.899g	From SEAOC, 2021
S_1 (Risk-Targeted Spectral Accelerations for 1-Second Periods)	0.331g	From SEAOC, 2021
F_a (per Table 1613.2.3(1))	1.2	For Simplified Design Procedure of Section 12.14 of ASCE 7, F_a shall be taken as 1.4 (Section 12.14.8.1)
F_v (per Table 1613.2.3(2))	1.5	-
S_{MS} for Site Class C [Note: $S_{MS} = F_aS_S$]	1.078g	-
S_{M1} for Site Class C [Note: $S_{M1} = F_vS_1$]	0.497g	-
S_{DS} for Site Class C [Note: $S_{DS} = (^2/_3)\ S_{MS}$]	0.719g	-
S_{D1} for Site Class C [Note: $S_{D1} = (^2/_3)\ S_{M1}$]	0.331g	-
C_{RS} (Mapped Risk Coefficient at 0.2 sec)	0.920	ASCE 7 Chapter 22
C_{R1}(Mapped Risk Coefficient at 1 sec)	0.922	ASCE 7 Chapter 22

A deaggregation of the PGA based on a 2,475-year average return period (MCE) indicates that an earthquake magnitude of 5.58 at a distance of approximately 18.10 km from the site would contribute the most to this ground motion. A deaggregation of the PGA based on a 475-year average return period (Design Earthquake) indicates that an earthquake magnitude of 5.63 at a distance of approximately 25.89 km from the site would contribute the most to this ground motion (USGS, 2014).

Section 1803.5.12 of the 2019 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 0.466g (SEAOC, 2021). The design PGA is equal to 0.311g (2/3 of PGA_M).

3.3 Landslides

Regional geologic mapping and local topographic expressions do not indicate the presence of large-scale landslides within the area of the subject site. Indications of deep-seated landsliding or gross slope instability of the existing natural slopes were not observed during our site

evaluation.

3.4 Groundwater

Shallow groundwater conditions were not encountered during the subject study, which included excavations up to 15.5 feet below the existing ground surface. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present within the near-surface deposits due to local seepage or during rainy seasons. Local perched groundwater conditions may develop once site development is completed and landscape irrigation commences.

3.5 Faulting

California is located on the boundary between the Pacific and North American Tectonic Plates. The average motion along this boundary is on the order of 50-mm/yr in a right-lateral sense. The majority of the motion is expressed at the surface along the northwest trending San Andreas Fault Zone with lesser amounts of motion accommodated by sub-parallel faults located predominantly west of the San Andreas Fault including the Elsinore, Newport-Inglewood, Rose Canyon, and Coronado Bank Faults. Within Southern California, a large bend in the San Andreas Fault north of the San Gabriel Mountains has resulted in a transfer of a portion of the right-lateral motion between the plates into left-lateral displacement and vertical uplift. Compression south and west of the bend has resulted in folding, left-lateral reverse thrust faulting, and regional uplift creating the east-west trending Transverse Ranges and several east-west trending faults. Farther south, within the Los Angeles Basin, "blind thrust" faults are believed to have developed below the surface also as a result of this compression, which have resulted in earthquakes such as the 1994 Northridge event along faults with little to no surface expression.

Prompted by damaging earthquakes in Northern and Southern California, State legislation and policies concerning the classification and land-use criteria associated with faults have been developed. Their purpose was to prevent the construction of urban developments across the trace of active faults. The result is the Alquist-Priolo Earthquake Fault Zoning Act, which was most recently revised in 2007 (CGS, 2007). According to the State Geologist, an active fault is defined as one, which has had surface displacement within the Holocene Epoch (roughly the last 11,000 years). A potentially active fault is defined as any fault, which has had surface displacement during Quaternary time (last 1,600,000 years), but not within the Holocene. Earthquake Fault Zones have been delineated along the traces of active faults within California. Where developments for human occupation are proposed within these zones, the state requires detailed fault evaluations be performed so that engineering geologists can mitigate the hazards associated with active faulting by identifying the location of active faults and allowing for a setback from the zone of previous ground rupture.

The site is not located within a mapped Earthquake Fault Zone (Alquist-Priolo Special Studies Zone) and no known active or potentially active faults have been identified on or in the immediate vicinity of the site. The nearest known active or potentially active fault is the offshore portion of the Rose Canyon Fault located approximately 18.8 kilometers (11.7 miles) to the west.

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the

Southern California region, which may affect the site, include ground lurching and shallow ground rupture, soil liquefaction, dynamic settlement, seiches, and tsunamis. These secondary effects of seismic shaking are a possibility throughout the Southern California region and are dependant on the distance between the site and causative fault and the onsite geology. The nearest known major active faults that could produce these secondary effects include the Rose Canyon Fault, the Newport-Inglewood Fault and the Elsinore-Julian Fault. A discussion of these secondary effects is provided in the following sections.

3.5.1 Lurching and Shallow Ground Rupture

Soil lurching refers to the rolling motion on the ground surface by the passage of seismic surface waves. Effects of this nature are not likely to be significant where the thickness of soft sediments does not vary appreciably under structures. Minor cracking of near-surface soils, due to shaking from distant seismic events, is not considered a significant hazard, although it is a possibility at any site.

3.5.2 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that loose, saturated, near-surface, cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils, and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction, depending on their plasticity and moisture content. Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Dynamic settlement of dry loose sands can also occur as the sand particles tend to settle and densify as a result of a seismic event.

Based on the lack of shallow groundwater (greater than 15.5 feet below ground surface), dense nature of the onsite soils (hollow-stem refusal at 15.5 feet below ground surface), and the presence of fine-grained soils, the potential for liquefaction or dynamic settlement to impact the site is considered very low.

3.5.3 Lateral Spreading

Lateral spreading is a type of liquefaction induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the very low potential for liquefaction, the potential for lateral spreading is also considered very low.

3.5.4 Tsunamis and Seiches

Based on the distance of the site from the sea and other large bodies of water, the possibility of seiches and/or tsunamis affecting the site is considered to be very low.

3.6 Rippability

Based on our evaluation, rippability is not anticipated to be an issue during site construction. It is anticipated that the onsite materials may be excavated with conventional construction equipment.

3.7 Oversized Material

Significant amounts of oversized material (material larger than 8 inches in maximum dimension) were not encountered during the site subsurface evaluations. However, there is the potential for some oversized material to be encountered during site grading, in the form of cobbles or concretions within the site materials and/or concrete debris from previous site improvements. For any oversized material encountered that cannot be broken down to workable size, recommendations are provided for appropriate handling in Appendix D.

3.8 Expansive Soil Characteristics

Expansion potential testing of two samples obtained from borings HS-1 and I-2 yielded Expansion Index values of 32 and 55, respectively, classified as “Low” and “Medium” potential for expansion.

3.9 Corrosion Potential

Corrosion testing indicated a sulfate content of approximately 193 ppm (less than 0.019 percent), chloride content of 149 parts per million (ppm), a pH of 7.99 and a minimum resistivity of 740 ohm-cm. Based on Caltrans Corrosion Guidelines (Caltrans, 2021), soils are considered corrosive to structural elements if the pH is 5.5 or less, or the chloride concentration is 500 ppm or greater, or the sulfate concentration is 2,000 ppm (0.2 percent) or greater.

4.0 ***CONCLUSIONS***

Based on the results of our limited evaluation, review of the project geotechnical report, and our understanding of the proposed development, it is our opinion that the proposed development is feasible from a geotechnical standpoint, provided the recommendations contained in the following sections are incorporated during site design, grading, and construction.

The following is a summary of the primary geotechnical factors, which may affect future redevelopment of the site.

- The site is predominately underlain by competent older artificial fill which overlies Quaternary older alluvial material. Based on the Geologic Map of Oceanside 30' x 60' Quadrangle (CGS, 2007), the site is underlain at depth by hard bedrock consisting of Cretaceous age plutonic tonalite. This is not expected to impact site development.
- In general, our borings indicate that the site contains primarily medium dense to dense silty/clayey sands (artificial fill) underlain by dense clayey sands, silty sands, and sandy silts (older alluvium) to the maximum explored depth of approximately 15.5 feet below existing grade. The near-surface soils are not suitable for the planned improvements in their present condition.
- From a geotechnical perspective, the existing onsite soils are suitable material for use as general fill, provided that they are relatively free from rocks (larger than 8 inches in maximum dimension), construction debris, and significant organic material.
- The site contains soils that are not suitable for retaining wall backfill due to their fines content and expansion potential, therefore import will be required by the contractor for obtaining suitable backfill soil for any planned site retaining walls. The contractor should consider that import of sandy soils may be required for retaining wall backfill.
- Groundwater was not encountered to the maximum explored depth of approximately 15.5 feet below existing ground surface.
- The subject site is not located within an Alquist-Priolo Earthquake Fault Zone and no faults were identified on the site during our site evaluation. The possibility of damage due to ground rupture is considered low since no active faults are known to cross the site.
- The site will generally consist of compacted fill over existing medium dense to very dense/stiff soils. Due to the dense nature of site soils, the lack of shallow groundwater (greater than 15.5 feet below ground surface), and the presence of fine-grained soils the potential for liquefaction and dynamic settlement is considered very low.
- Based on preliminary laboratory testing, site soils are anticipated to have "Medium" expansion potential. Mitigation measures are required for foundations and site improvements like concrete flatwork to minimize the impacts of expansive soils. Final design expansion potential must be determined at the completion of grading.
- Generation of a surplus of oversized material (material greater than 8 inches in maximum dimension) is generally not anticipated during site grading.
- It is recommended that moisture content of the subgrade soils below slabs be maintained up to the time of concrete placement due to site expansive soils. The contractor should anticipate watering and wetting down subgrade soils to maintain the moisture content of the compacted fill soils and not allow the subgrade to dry out up until the placement of concrete.
- Three field percolation tests resulted in negligible infiltration. Site will consist of compacted fill over stiff cohesive soils; these soils have very low permeability and therefore have very low infiltration rates.

5.0 PRELIMINARY RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the City. It is the responsibility of the owner to ensure these recommendations are provided to the appropriate parties.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2019 California Building Code (CBC) requirements. With regard to the potential occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed redevelopment to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "the level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvement may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed redevelopment, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that although our recommendations are intended to maintain the structural integrity of the proposed redevelopment and structures given the site geotechnical conditions, they cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual exposed conditions.

5.1 Site Earthwork

We anticipate that earthwork at the site will generally consist of excavation for the remedial removals, foundation construction, and utility line installation and backfill. We recommend that earthwork onsite be performed in accordance with the following recommendations, future grading plan review report(s), the 2019 CBC/City of San Marcos grading requirements, and the General Earthwork and Grading Specifications included in Appendix D. In case of conflict, the following recommendations shall supersede those included in Appendix D. The following recommendations should be considered preliminary and may be revised after review of the grading plans or based on the actual conditions encountered during site grading.

5.1.1 Site Preparation

Prior to grading of areas to receive structural fill or engineered improvements, the areas should be cleared of existing building structures, asphalt, surface obstructions, and demolition debris. Vegetation and debris should be removed and properly disposed of off-site. Holes resulting from the removal of buried obstructions, which extend below proposed removal bottoms, should be replaced with suitable compacted fill material. Any

abandoned utility lines should be completely removed and replaced with properly compacted fill.

5.1.2 Removal Depths

In order to provide a relatively uniform bearing condition for the planned building structures and improvements, we recommend the site native soils be removed and recompacted according to the criteria outlined below. All unsuitable near-surface soils within the influence of proposed structural improvements should be completely removed to suitable, competent native or existing artificial fill materials prior to placement of additional artificial fill to design grades. For preliminary planning purposes, the depth of required removals and recompaction may be estimated as indicated below. It should be noted that updated recommendations may be required based on changes to building layouts and/or grading plan or based on field observations once grading commences. In general, removal bottoms should be scarified a minimum of 6 inches before placement of structural fill.

Building Structures: We recommend that removals extend a minimum depth of 18 inches below the existing surface or 12 inches below proposed footings, whichever is greater. In general, the envelope for removals should extend laterally a minimum horizontal distance of 5 feet beyond the edges of the proposed improvements. Building lines may be defined as the perimeter of the building, plus attached or adjacent foundation supported features, including canopies, elevators, or walls.

Minor Site Structures: For minor site structures such as free-standing walls, retaining walls, trash enclosures, etc., we recommend removals extend a minimum of 18 inches below native soils or 12 inches below proposed footings, whichever is greater. In general, the envelope for removal and recompaction should extend laterally a minimum distance equal to the depth of removal or a minimum distance of 2 feet beyond the edges of the proposed foundations, whichever is larger, where space permits.

Pavement and Hardscape: We recommend removals should extend a minimum of 18 inches below the native soils or 12 inches below the proposed subgrade (i.e., below planned aggregate base/asphalt concrete section), whichever is greater. In general, the envelope for removals should extend laterally a minimum distance of 1-foot beyond the edges of the proposed pavement and hardscape improvements.

Local conditions may be encountered during excavation that could require additional over-excavation beyond the above-noted minimum in order to obtain an acceptable subgrade. The actual depths and lateral extents of grading will be determined by the geotechnical consultant based on subsurface conditions encountered during grading.

5.1.3 Cut/Fill Transitions

To reduce the potential for differential settlement, we recommend site foundations be founded either completely on suitable native material or completely on suitable compacted fill. If suitable native material is anticipated or encountered in any part of the proposed footings, either the entire footing of the structure should be deepened to the suitable native material or the area of native material should be over-excavated and

replaced with compacted fill to a depth resulting in at least 2 feet of compacted fill beneath the bottom of the proposed footings. The over-excavation should also extend horizontally outside of the perimeter of the portion of the proposed foundation to be undercut. The horizontal extent beyond the footings should be equal to the depth of the over-excavation. Where this condition is anticipated, it would be prudent to perform the over-excavation with heavy-duty equipment during site rough grading. The bottom of the over-excavation should be graded to flow towards deeper fill areas. The over-excavated material should then be replaced by compacted fill material to design grade.

5.1.4 Removal Bottoms and Subgrade Preparation

In general, removal bottom areas and any areas to receive compacted fill should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition, and recompacted per project recommendations.

Removal bottoms and areas to receive fill should be observed and accepted by the geotechnical consultant prior to subsequent fill placement. Soil subgrade for planned footings and improvements (e.g., slabs, etc.) should be firm and competent.

5.1.5 Temporary Excavation

Temporary excavations should be performed in accordance with project plans, specifications, and all Occupational Safety and Health Administration (OSHA) requirements. Excavations should be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. Excavations should be sloped back to 1:1 or flatter or be properly shored. Some sandy soils are present and should be considered susceptible to caving. Soil conditions should be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Close coordination with the geotechnical consultant should be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor.

Vehicular traffic, stockpiles, and equipment storage should be set back from the perimeter of excavations a distance equivalent to a 1:1 projection from the bottom of the excavation. Once an excavation has been initiated, it should be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations should be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain.

It should be noted that any excavation that extends below a 1:1 (horizontal to vertical) projection of an existing foundation will remove existing support of the structure foundation. If requested, temporary shoring parameters will be provided.

5.1.6 Material for Fill

From a geotechnical perspective, the onsite soils are generally considered suitable for use as general compacted fill (i.e., non-retaining wall backfill), provided they are screened of

organic materials, construction debris and any oversized material (8 inches in greatest dimension). Moisture conditioning of site soils should be anticipated as outlined in the section below.

From a geotechnical viewpoint, any required import soils for general fill (i.e., non-retaining wall backfill) should consist of clean, granular soils of "Medium" expansion potential (EI of 90 or less per ASTM D4829), and free of organic materials, construction debris and any material greater than 3 inches in maximum dimension. Import for retaining wall backfill should meet the criteria outlined in the following paragraph. Source samples should be provided to the geotechnical consultant for laboratory testing a minimum of four working days prior to any planned importation.

Retaining wall backfill should consist of sandy soils with a maximum of 35 percent fines (passing the No. 200 sieve) per American Society for Testing and Materials (ASTM) Test Method D1140 (or ASTM D6913/D422) and a Very Low expansion potential (EI of 20 or less per ASTM D4829). Soils should also be screened of organic materials, construction debris and any material greater than 3 inches in maximum dimension. The site contains soils that are not suitable for retaining wall backfill due to their fines content and expansion potential, therefore import will be required by the contractor for obtaining suitable backfill soil for planned site retaining walls.

Aggregate base (crushed aggregate base or crushed miscellaneous base) should conform to the requirements of Section 200-2 of the Standard Specifications for Public Works Construction ("Greenbook") for untreated base materials (except processed miscellaneous base) or Caltrans Class 2 aggregate base.

The placement of demolition materials in compacted fill is acceptable from a geotechnical viewpoint provided the demolition material is broken up into pieces not larger than typically used for aggregate base (approximately 2 inches in maximum dimension) and well blended into fill soils with essentially no resulting voids. Demolition material placed in fills must be free of construction debris (wood, organics, etc.) and reinforcing steel. If asphalt concrete fragments will be incorporated into the demolition materials, approval from an environmental viewpoint may be required and is not the purview of the geotechnical consultant. From our previous experience, we recommend that asphalt concrete fragments be limited to fill areas within planned street areas (i.e., not within building pad areas).

5.1.7 Fill Placement and Compaction

Material to be placed as fill should be brought to near-optimum moisture content (generally at about 2 percent above optimum moisture content) and recompacted to at least 90 percent relative compaction (per ASTM D1557). Moisture conditioning of site soils should be anticipated in order to achieve the required degree of compaction. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in compacted thickness. Each lift should be thoroughly compacted and accepted prior to subsequent lifts. Generally, placement and compaction of fill should be performed in accordance with local grading ordinances and with observation and testing by the geotechnical consultant. Oversized material as previously defined should be

removed from site fills.

Fill placed on any slopes greater than 5:1 (horizontal to vertical) should be properly keyed and benched into firm and competent soils as it is placed in lifts.

Aggregate base material should be compacted to a minimum of 95 percent relative compaction at or slightly above-optimum moisture content per ASTM D1557. Subgrade below aggregate base should be compacted to at least 90 percent relative compaction per ASTM D1557 near optimum moisture content (generally within optimum and 2 percent above optimum moisture content).

If gap-graded ¾-inch rock is used for backfill (around storm drain storage chambers, retaining wall backfill, storm drainpipe, etc.) it will require compaction. Rock shall be placed in thin lifts (typically not exceeding 6 inches) and mechanically compacted with observation by the geotechnical consultant. Rock backfill shall meet the requirements of ASTM D2321. Gap-graded rock is required to be wrapped in filter fabric (Mirafi 140N or approved alternative) to prevent the migration of fines into the rock backfill.

5.1.8 Trench Backfill and Compaction

If trenches are shallow or the use of conventional equipment may result in damage to the utilities, sand having a sand equivalent (SE) of 30 or greater (per Caltrans Test Method [CTM] 217) may be used to bed and shade the pipes within the bedding zone. Onsite soils are not anticipated to meet this criterion. The onsite soils may generally be suitable as subsequent trench backfill (zone defined as 12 inches above the pipe to subgrade), provided the soils are screened of rocks, construction debris, other material greater than 3 inches in diameter and significant organic matter. Trench backfill should be compacted in uniform lifts (as outlined above in Section "Material for Fill") by mechanical means to at least 90 percent relative compaction (per ASTM D1557).

Retaining wall backfill should consist of granular, sandy soils as outlined in Section 5.1.6. The limits of select sandy backfill should extend at minimum ½ the height of the retaining wall or the width of the heel (if applicable), whichever is greater (Refer to Figure 3). Retaining wall backfill soils should be compacted in relatively uniform thin lifts to a minimum of 90 percent relative compaction (per ASTM D1557). Jetting or flooding of retaining wall backfill materials should not be permitted.

In backfill areas where mechanical compaction of soil backfill is impractical due to space constraints, typically sand-cement slurry may be substituted for compacted backfill. The slurry should contain about one sack of cement per cubic yard. When set, such a mix typically has the consistency of compacted soil. Sand cement slurry placed near the surface within landscape areas should be evaluated for potential impacts on planned improvements.

A representative from LGC Geotechnical should observe, probe, and test the backfill to verify compliance with the project recommendations.

5.2 Slope Stability

Site slopes designed with a slope ratio of 2:1 (horizontal to vertical), are anticipated to be both grossly and surficially stable as built. Slopes should be protected with properly designed vegetative covers. If trees are planned on cut slopes, tree wells should be considered.

5.2.1 Slope Maintenance Guidelines

It is recommended that any graded slopes be planted with groundcover vegetation as soon as practical to protect against erosion by reducing runoff velocity. Deep-rooted vegetation should also be established to protect against surficial slumping. Irrigation levels should be kept to the minimum level necessary to establish a healthy plant growth. Slopes must not be overwatered. If automatic sprinklers are used, they must be adjusted during periods of rainfall. Continuous erosion control, rodent control, and maintenance are essential to the long-term stability of all slopes. A program for the elimination of burrowing animals in slope areas must be established to protect slope stability by reducing the potential for surface water to penetrate into the slope face. Observation/testing and acceptance by the geotechnical consultant during trench backfill are recommended. V-ditches should be inspected and cleared of loose soil and/or debris on a routine basis, especially prior to and during the rainy season.

5.3 Preliminary Foundation Design Parameters

Given that the expansion index exceeds 20, the foundation systems shall be designed for effects of expansive soil. Preliminary conventional and post-tensioned foundation recommendations are provided in the following sections. Recommended soil bearing and estimated static settlement are provided in Section 5.3.5. Please note that the following foundation recommendations are preliminary and must be confirmed by LGC Geotechnical at the completion of project plans (i.e., foundation, grading and site layout plans) as well as completion of earthwork.

5.3.1 Preliminary Conventional Foundation Design Parameters

Conventional foundations may be designed in accordance with Wire Reinforcement Institute (WRI) procedure for slab-on-ground foundations per Section 1808 of the 2019 CBC to resist expansive soils. The following preliminary soil parameters may be used:

- Effective Plasticity Index: 30
- Climatic Rating: Cw = 15
- Reinforcement: Per structural designer.
- Minimum Footing Depth: 24 inches below lowest adjacent grade.
- Moisture condition (presoak) slab subgrade to 140% of optimum moisture content to a minimum depth of 24 inches prior to trenching.

The recommended moisture content should be maintained up to the time of concrete placement. It should be noted that deepened footings may be required in certain areas in order to avoid surcharge loading adjacent existing retaining walls.

5.3.2 Preliminary Post-Tensioned Foundation Design Parameters

We recommend that post-tensioned slabs should be designed using the geotechnical parameters provided in Table 2. These parameters have been determined in general accordance with the Post-Tensioning Institute (PTI, 2012) Standard Requirements (PTI DC 10.5), referenced in Chapter 18 of the 2019 CBC. In utilizing these parameters, the foundation engineer should design the foundation system in accordance with the allowable deflection criteria of applicable codes and the requirements of the structural designer/architect. Other types of stiff slabs may be used in place of the CBC post-tensioned slab design provided that, in the opinion of the foundation structural designer, the alternative type of slab is at least as stiff and strong as that designed by the CBC/PTI method.

Soil-moisture change below slabs is the major factor in foundation damage relating to expansive soils. The PTI design methodology has no consideration for presoaking, homeowner irrigation, or other non-climate related influences on the moisture content of subgrade soils. In recognition of these factors, and our previous experience and work on the geotechnical PTI subcommittee, we have modified the geotechnical parameters obtained from this methodology to account for man-made conditions such as influence of irrigation. Our design parameters are based on our experience with similar residential projects and the anticipated nature of the soil (with respect to expansion potential). Please note that implementation of our recommendations will not eliminate foundation movement (and related distress) should the moisture content of the subgrade soils fluctuate. It is the intent of these recommendations to help maintain the integrity of the proposed structures and reduce (not eliminate) movement, based upon the anticipated site soil conditions. Should future owners not properly maintain the areas surrounding the foundation, for example by overwatering, then we anticipate for highly expansive soils the maximum differential movement of the perimeter of the foundation to the center of the foundation to be on the order of a couple of inches. Soils of lower expansion potential are anticipated to show less movement.

TABLE 2

Preliminary Geotechnical Parameters for Post-Tensioned Foundation Slab Design

Parameter	PT Slab with Perimeter Footing	PT Mat with Thickened Edge
Expansion Index	Medium[1]	Medium[1]
Thornthwaite Moisture Index	-20	-20
Constant Soil Suction	PF 3.9	PF 3.9
Center Lift Edge moisture variation distance, e_m Center lift, y_m	 9.0 feet 0.5 inch	 9.0 feet 0.6 inch
Edge Lift Edge moisture variation distance, e_m Edge lift, y_m	 4.7 feet 1.1 inch	 4.7 feet 1.3 inch
Modulus of Subgrade Reaction, k (assuming presoaking as indicated below)	150 pci	150 pci
Minimum perimeter footing/thickened edge embedment below finish grade	18 inches	6 inches

1. Assumed for preliminary design purposes. Further evaluation is needed at the completion of grading.
2. Recommendations for foundation reinforcement and slab thickness are ultimately the purview of the foundation engineer/structural engineer based upon geotechnical criteria and structural engineering considerations.
3. Recommendations for vapor retarders below slabs are also the purview of the foundation engineer/structural engineer and should be provided in accordance with applicable code requirements.
4. Moisture condition to 120 % of optimum moisture content to a depth of 18 inches prior to trenching.

5.3.3 Post Tensioned Foundation Subgrade Preparation and Maintenance

Presoaking of the subgrade soils is recommended prior to trenching the foundation. Presoak recommendations specific to the anticipated site soil conditions are presented in Table 2. The subgrade moisture condition of the building pad soils should be maintained at near optimum moisture content up to the time of concrete placement. This moisture content should be maintained around the immediate perimeter of the slab during construction and up to occupancy of the homes.

The geotechnical parameters provided in Table 2 assume that if the areas adjacent to the foundation are planted and irrigated, these areas will be designed with proper drainage and adequately maintained so that ponding, which causes significant moisture changes below the foundation, does not occur. Our recommendations do not account for excessive irrigation and/or incorrect landscape design. Plants should only be provided

with sufficient irrigation for life and not overwatered to saturate subgrade soils. Sunken planters placed adjacent to the foundation, should either be designed with an efficient drainage system or liners to prevent moisture infiltration below the foundation. Some lifting of the perimeter foundation beam should be expected even with properly constructed planters.

In addition to the factors mentioned above, future homeowners should be made aware of the potential negative influences of trees and/or other large vegetation. Roots that extend near the vicinity of foundations can cause distress to foundations. Future homeowners (and the owner's landscape architect) should not plant trees/large shrubs closer to the foundations than a distance equal to half the mature height of the tree or 20 feet, whichever is more conservative unless specifically provided with root barriers to prevent root growth below the house foundation.

It is the homeowner's responsibility to perform periodic maintenance during hot and dry periods to ensure that adequate watering has been provided to keep soil from separating or pulling back from the foundation. Future homeowners should be informed and educated regarding the importance of maintaining a constant level of soil-moisture. The owners should be made aware of the potential negative consequences of both excessive watering, as well as allowing potentially expansive soils to become too dry. Expansive soils can undergo shrinkage during drying, and swelling during the rainy winter season, or when irrigation is resumed. This can result in distress to building structures and hardscape improvements. The builder should provide these recommendations to future homeowners.

5.3.4 Slab Underlayment Guidelines

The following is for informational purposes only since slab underlayment (e.g., moisture retarder, sand or gravel layers for concrete curing and/or capillary break) is unrelated to the geotechnical performance of the foundation and thereby not the purview of the geotechnical consultant. Post-construction moisture migration should be expected below the foundation. The foundation engineer/architect should determine whether the use of a capillary break (sand or gravel layer), in conjunction with the vapor retarder, is necessary or required by code. Sand layer thickness and location (above and/or below vapor retarder) should also be determined by the foundation engineer/architect.

5.3.5 Soil Bearing

An allowable soil bearing pressure of 1,500 pounds per square foot (psf) may be used for the design of footings having a minimum width of 12 inches and minimum embedment of 12 inches below lowest adjacent ground surface. This value may be increased by 300 psf for each additional foot of embedment or 100 psf for each additional foot of foundation width to a maximum value of 2,500 psf. An allowable soil bearing pressure of 1,200 psf may be used for a mat post-tensioned slab a minimum of 6 inches below lowest adjacent grade. These allowable bearing pressures are applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. Bearing values indicated are for total dead loads and frequently applied live loads and may be increased by ⅓ for short duration loading (i.e., wind or seismic loads).

In utilizing the above-mentioned allowable bearing capacity and provided our earthwork recommendations are implemented, foundation settlement due to structural loads is anticipated to be 1-inch. Differential settlement may be taken as half of the total settlement (i.e., ½-inch over a horizontal span of 40 feet).

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. For concrete/soil frictional resistance, an allowable coefficient of friction of 0.35 may be assumed with dead-load forces. An allowable passive lateral earth pressure of 250 psf per foot of depth (or pcf) to a maximum of 2,500 psf may be used for the sides of footings poured against properly compacted fill. This passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. The passive pressure may be increased by one-third due to wind or seismic forces. We recommend that the upper foot of passive resistance be neglected if finished grade will not be covered with concrete or asphalt. Frictional resistance and passive pressure may be used in combination without reduction. The provided allowable passive pressures are based on a factor of safety of 1.5 and 1.1 for static and seismic loading conditions, respectively.

5.3.6 Foundation Setback from Top-of-Slope and Bottom-of-Slope

Foundations should have adequate setback from top and bottom of slopes in accordance with the city of San Marcos Grading Code and the 2019 CBC.

Building footings located at tops of slopes will require a minimum setback distance, as measured horizontally from the bottom of the foundation to the nearest slope or MSE wall face. In general, building setbacks should be at least one-third of the slope height, with a maximum required horizontal setback of 40 feet. When determining the height of the slope, retaining wall heights should be included in the total slope height. Setback requirements may be accomplished by construction of deepened footings. Foundation setback criteria should be reviewed based on the precise grading plans.

5.3.7 Footing/Foundation Excavations

Footing/foundation excavation bottoms should be firm, relatively unyielding, and free of loose material. Footing/foundation excavations should be observed and accepted by the geotechnical consultant prior to placement of steel reinforcement.

5.4 Lateral Earth Pressures and Retaining Wall Design Considerations

Retaining walls of any significance are not anticipated for this site. The following lateral earth pressures may be used for minor site retaining walls.

Lateral earth pressures for imported select sandy soils are provided below. Lateral earth pressures are provided as equivalent fluid unit weights, in psf per foot of depth (or pcf). These values do not contain an appreciable factor of safety, so the retaining wall designer should apply the applicable factors of safety and/or load factors during design. A soil unit weight of 120 pcf

may be assumed for calculating the actual weight of soil over the wall footing.

The following lateral earth pressures are presented on Table 4 for approved select granular soils with a maximum of 35 percent fines (passing the No. 200 sieve per ASTM D-421/422) and "Very Low" expansion potential (EI of 20 or less per ASTM D4829). The wall designer should clearly indicate on the retaining wall plans the required sandy soil backfill criteria.

TABLE 4

Lateral Earth Pressures – Select Sand Backfill

Condition	Equivalent Fluid Weight (pcf)
	Level Backfill
Active	35
At Rest	55

If the wall can yield enough to mobilize the full shear strength of the soil, it can be designed for "active" pressure. If the wall cannot yield under the applied load, the earth pressure will be higher. This would include 90-degree corners of retaining walls. Such walls should be designed for "at-rest." The equivalent fluid pressure values assume free-draining conditions. Retaining wall structures should be provided with appropriate drainage and appropriately waterproofed, refer to Figure 3. Please note that waterproofing and outlet systems are not the purview of the geotechnical consultant. If conditions other than those assumed above are anticipated, the equivalent fluid pressure values should be provided on an individual-case basis by the geotechnical consultant.

Surcharge loading effects from any adjacent structures should be evaluated by the retaining wall designer. In general, structural loads within a 1:1 (horizontal to vertical) upward projection from the bottom of the proposed retaining wall footing will surcharge the proposed retaining structure. In addition to the recommended earth pressure, retaining walls adjacent to streets should be designed to resist vehicular traffic if applicable. Uniform surcharges may be estimated using the applicable coefficient of lateral earth pressure using a rectangular distribution. A factor of 0.5 and 0.30 may be used for at-rest and active conditions, respectively. The vertical traffic surcharge may be determined by the structural designer. The structural designer should contact the geotechnical engineer for any required geotechnical input in estimating any applicable surcharge loads.

If retaining walls greater than 6 feet in height are proposed, the retaining wall designer should contact the geotechnical engineer for specific seismic lateral earth pressure increments based on the configuration of the planned retaining wall structures.

Soil bearing and lateral resistance (friction coefficient and passive resistance) are provided in Section 5.3.5.

5.5 Fences and Freestanding Walls

As their name indicates, freestanding walls are those walls not designed to retain soil and/or water. To reduce the potential for unsightly cracks, due to differential settlement, expansive soils or possible slope creep, we recommend the inclusion of construction joints at a maximum of 20 feet on-center. This spacing may be altered by the structural engineer based upon the wall reinforcement. If the soil-moisture content below the wall foundation varies significantly, some wall movement should be expected. However, this movement is unlikely to cause more than cosmetic distress. Allowable soil bearing values for wall footing design are provided in Section 5.3.5.

Additionally, for fences near the tops-of-slopes, the fence designer should engineer the construction of the fence to be as flexible as possible while still maintaining integrity. Typical design features should include such items as slip couplings at the junction of top-of-slope fences and fences/walls perpendicular to the slope.

5.6 Subsurface Water Infiltration

Recent regulatory changes mandate that storm water be infiltrated rather than discharged via conventional storm drainage systems, for sites underlain by appropriate soils. It should be noted that intentionally infiltrating storm water conflicts with the geotechnical engineering objective of directing surface water away from structures and improvements. The geotechnical stability and integrity of the project site is reliant upon appropriately handling surface water.

In general, the vast majority of geotechnical distress issues are directly related to improper drainage. Distress in the form of movement of foundations and other improvements could occur as a result of soil saturation and loss of soil support of foundations and pavements, settlement, collapse, internal soil erosion, and/or expansion. Additionally, off-site properties and improvements may be subjected to seeps, springs, slope instability, movements of foundations or other impacts as a result of water infiltration and migration. Infiltrated water may enter underground utility pipe zones and migrate along the pipe backfill, potentially impacting other improvements located far away from the point of infiltration.

Adequate distances should be maintained between infiltration locations and structures. The invert of any storm water infiltration system should be set back a minimum of 15 feet from building structures and outside a 1:1 plane drawn up from the bottom of adjacent foundations.

Based on the results of our field infiltration testing the observed infiltration rate (not including required factors of safety for design) for I-1, I-2, and I-3 are presented below.

TABLE 4

Summary of Field Percolation Testing

Infiltration Test Location	Percolation Rate* (inch/hr.)
I-1	0.02
I-2	0.04
I-3	0.02

*Normalized to One-Dimensional Flow, does not include any Factor of Safety.

TABLE 5

Infiltration Factors of Safety (SD, 2020)

Suitability Assessment Factors of Safety			
Consideration	**Weight**	**Factor Value**	**Product**
Infiltration Testing Method	0.25	2	0.50
Soil Texture Class	0.25	3	0.75
Soil Variability	0.25	1	0.25
Depth to Groundwater/Obstruction	0.25	2	0.50
Suitability Assessment Safety Factor (S_A)			**2**
Design Factors of Safety			
Pretreatment	0.50	To be Selected by Designer	TBD
Resiliency	0.25	To be Selected by Designer	TBD
Compaction	0.25	To be Selected by Designer	TBD
Suitability Assessment Safety Factor (S_A)			**TBD**

The factor of safety used to determine the design infiltration rate is determined by multiplying the calculated suitability assessment factor of safety of 2.00 by the design factor of safety which is to be determined by the infiltration system designer. The design infiltration rate is thereby equal to the observed infiltration rate (inch per hour) divided by the product of 2.0 times the calculated design factor of safety. The combined factor of safety must be a minimum of 2.0 but not greater than 9.0.

These values are for native materials only and are not to be utilized for compacted fill. Infiltration shall not be permitted directly on or into compacted fill soils. The infiltration values provided are based on clean water and this requires the removal of trash, debris, soil particles, etc., and on-going maintenance. Over time, siltation, plugging, and clogging of the system may reduce the infiltration rate and subsequently reduce the effectiveness of the infiltration system. It should be noted that methods to prevent this shall be the sole responsibility of the infiltration designer and are not the purview of the geotechnical consultant. If adequate measures cannot be incorporated into the design and maintenance of the system, then the infiltration rates may

need to be further reduced. These and other factors should be considered in selecting a design infiltration rate.

5.7 Preliminary Pavement Section

The following provisional minimum asphalt concrete (AC) pavement sections are provided in Table 6 based on a preliminary R-value of 20 for Traffic Indices (TI) of 5 through 7. These recommendations should be confirmed with R-value testing of representative near-surface soils at the completion of earthwork. Final pavement sections should be confirmed by the project civil engineer based upon the final design Traffic Index. Determination of the TI is not the purview of the geotechnical consultant. If requested, LGC Geotechnical will provide sections for alternate TI values.

TABLE 6

Paving Section Options

Assumed Traffic Index	5.0	5.0	7.0
AC Thickness	4.0 inches	4.0 inches	4.0
Aggregate Base Thickness	5.0 inches	8.5 inches	12.0 inches

The thicknesses shown are for minimum thicknesses. Increasing the thickness of any or all of the above layers will reduce the likelihood of the pavement experiencing distress during its service life. The above recommendations are based on the assumption that proper maintenance and irrigation of the areas adjacent to the roadway will occur through the design life of the pavement. Failure to maintain a proper maintenance and/or irrigation program may jeopardize the integrity of the pavement.

Earthwork recommendations regarding aggregate base and subgrade are provided in the Section 5.1 and the related sub-sections of this report.

5.8 Corrosivity to Concrete and Metal

Although not corrosion engineers (LGC Geotechnical is not a corrosion consultant), several governing agencies in Southern California require the geotechnical consultant to determine the corrosion potential of soils to buried concrete and metal facilities. We therefore present the results of our testing with regard to corrosion for the use of the client and other consultants, as they determine necessary.

Preliminary corrosion testing indicated a soluble sulfate content of approximately 0.019 percent, chloride content of 149 parts per million (ppm), pH value of 7.99, and a minimum resistivity value of 740 ohm-cm. Soils are considered corrosive to structural elements if the pH is 5.5 or less, or the chloride concentration is 500 ppm or greater, or the sulfate concentration is 2,000 ppm (0.2 percent) or greater (Caltrans, 2021).

Based on laboratory sulfate test results, the near-surface soils have a severity categorization of "Not Applicable" and are designated to a class "S0" per ACI 318, Table 4.2.1 with respect to

sulfates. Concrete in direct contact with the onsite soils can be designed according to ACI 318, Section 4.3 using the "S0" sulfate classification. This must be verified based on as-graded conditions.

At completion of grading, additional testing will be required to confirm the characteristics of the fill materials including expansion potential and corrosivity characteristics. While LGC Geotechnical does not provide recommendations for corrosion, based on our experience typical mitigation measures include increased compressive strength for structural concrete, decreased water-to-cement ratio for structural concrete and/or encapsulation of post-tensioned cables. A corrosion consultant should provide recommendations for mitigation of corrosivity based on laboratory testing results of near-surface soils at completion of grading.

5.9 Nonstructural Concrete Flatwork

Concrete flatwork (such as walkways, bicycle trails, patio slabs, etc.) has a high potential for cracking due to changes in soil volume related to soil-moisture fluctuations. To reduce the potential for excessive cracking and lifting, concrete may be designed in accordance with the minimum guidelines outlined in Table 7. These guidelines will reduce the potential for irregular cracking and promote cracking along construction joints, but will not eliminate all cracking or lifting. Thickening the concrete and/or adding additional reinforcement will further reduce cosmetic distress.

TABLE 7

Nonstructural Concrete Flatwork for Medium Expansion Potential

	Homeowner Sidewalks	Private Drives	Patios/Entryways	City Sidewalk Curb and Gutters
Minimum Thickness (in.)	4 (nominal)	5 (full)	5 (full)	City/Agency Standard
Presaturation	Wet down	Presoak to 12 inches	Presoak to 12 inches	City/Agency Standard
Reinforcement	—	No. 3 at 24 inches on-centers	No. 3 at 24 inches on-centers	City/Agency Standard
Thickened Edge (in.)	—	8 x 8	—	City/Agency Standard
Crack Control Joints	Saw cut or deep open tool joint to a minimum of 1/3 the concrete thickness	Saw cut or deep open tool joint to a minimum of 1/3 the concrete thickness	Saw cut or deep open tool joint to a minimum of 1/3 the concrete thickness	City/Agency Standard
Maximum Joint Spacing	5 feet	10 feet or quarter cut whichever is closer	6 feet	City/Agency Standard
Aggregate Base Thickness (in.)	—	—	2	City/Agency Standard

To reduce the potential for driveways to separate from the garage slab, the builder may elect to install dowels to tie these two elements together. Similarly, future homeowners should consider the use of dowels to connect flatwork to the foundation.

5.10 Control of Surface Water and Drainage Control

Positive drainage of surface water away from structures is very important. Water should not be allowed to pond adjacent to buildings or to flow freely down a graded slope. As a general guideline, positive drainage may be accomplished by providing drainage away from buildings at a gradient of at least 5 percent for earthen surfaces for a distance of at least 10 feet away from the face of wall. If a distance of 10 feet cannot be achieved, an alternative of a gradient of at least 5 percent to an area drain or swale having a gradient of 2 percent is acceptable. Where necessary, drainage paths may be shortened by use of area drains and collector pipes. Eave gutters are recommended and should reduce water infiltration into the subgrade soils if the downspouts are properly connected to appropriate outlets.

Planters with open bottoms adjacent to buildings should be avoided. Planters should not be designed adjacent to buildings unless provisions for drainage, such as catch basins, liners, and/or area drains, are made. Overwatering must be avoided.

5.11 Construction Observation and Testing

The recommendations provided in this report are based on limited subsurface observations and geotechnical analysis. The interpolated subsurface conditions should be checked in the field during construction by a representative of LGC Geotechnical.

Foundation plans, precise grading plans, and final project drawings should be reviewed by this office prior to construction to verify that our geotechnical recommendations have been incorporated.

Construction observation and testing should also be performed by the geotechnical consultant for the following:

- During grading activities;
- During utility trench backfill and compaction;
- During retaining wall backfill and compaction;
- During subgrade processing and roadway pavement section construction;
- After presoaking building pads and other concrete-flatwork subgrades, and prior to placement of aggregate base or concrete;
- After building and wall footing excavation and prior to placing concrete and/or reinforcement; and
- When any unusual soil conditions are encountered during any construction operation subsequent to issuance of this report.

6.0 LIMITATIONS

Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report. The samples taken and submitted for laboratory testing, the observations made, and the in-situ field testing performed are believed representative of the entire project; however, soil and geologic conditions revealed by excavation may be different than our preliminary findings. If this occurs, the changed conditions must be evaluated by the project soils engineer and geologist and design(s) adjusted as required or alternate design(s) recommended.

This report is issued with the understanding that it is the responsibility of the owner, or of his/her representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and/or project engineer and incorporated into the plans, and the necessary steps are taken to see that the contractor and/or subcontractor properly implements the recommendations in the field. The contractor and/or subcontractor should notify the owner if they consider any of the recommendations presented herein to be unsafe.

The findings of this report are valid as of the present date. However, changes in the conditions of a property can and do occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. Therefore, the findings, conclusions, and recommendations presented in this report can be relied upon only if LGC Geotechnical has the opportunity to observe the subsurface conditions during grading and construction of the project, in order to confirm that our preliminary findings are representative for the site.

In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and modification, and should not be relied upon after a period of 3 years.

Appendix C
Laboratory Test Results

APPENDIX C

Laboratory Test Results

The laboratory testing program was formulated towards providing data relating to the relevant engineering properties of the soils with respect to residential construction. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve) or ASTM D422 (sieve and hydrometer).

Sample Location	**Description**	**% Passing # 200 Sieve**
HS-2, R-1	Sandy SILT	45

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined in accordance with ASTM Test Method D4318 for engineering classification of fine-grained material and presented in the table below:

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-2, R-2	35	12	23	CL

Laboratory Compaction: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below.

Sample Location	**Sample Description**	**Maximum Dry Density (pcf)**	**Optimum Moisture Content (%)**

HS-3, B-1 @ 1-5’	Brown Silty Sand	125.5	10.0

Expansion Index: The expansion potential of selected samples were evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	Expansion Index	Expansion Potential
HS-1, B-1 @ 1-5’	32	Low
I-1 @ 1-5’	55	Medium

Consolidation: A consolidation test was performed per ASTM D2435. A Sample (2.4 inches in diameter and 1 inch in height) was placed in a consolidometer and increasing loads were applied. The sample was allowed to consolidate under “double drainage” and total deformation for each loading step was recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curves are provided in this Appendix.

Soluble Sulfates: The soluble sulfate contents of selected samples were determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content (ppm)	Sulfate Exposure Class*
HS-1, B-1 @ 1-5’	193	S0

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-1, B-1 @ 1-5’	149

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-1, B-1 @ 1-5’	8.2	740

Appendix D
General Earthwork and Grading Specifications for Rough Grading

General Earthwork and Grading Specifications for Rough Grading

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ a qualified Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to confirm that the attained level of compaction is being accomplished as specified. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the project plans and specifications. The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of “equipment” of work and the estimated quantities of daily earthwork

contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the
Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate personnel will be available for observation and testing. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified. It is the contractor's sole responsibility to provide proper fill compaction.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed. The contractor is responsible for all hazardous waste relating to his work. The Geotechnical Consultant does not have expertise in this area. If hazardous waste is a concern, then the Client should acquire the services of a qualified environmental assessor.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be over-excavated as specified in the following section. Scarification shall continue until soils are broken down and free of oversize material and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Over-excavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. Please see the Standard Details for a graphic illustration. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of the geotechnical consultant. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than
5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and the Standard Details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

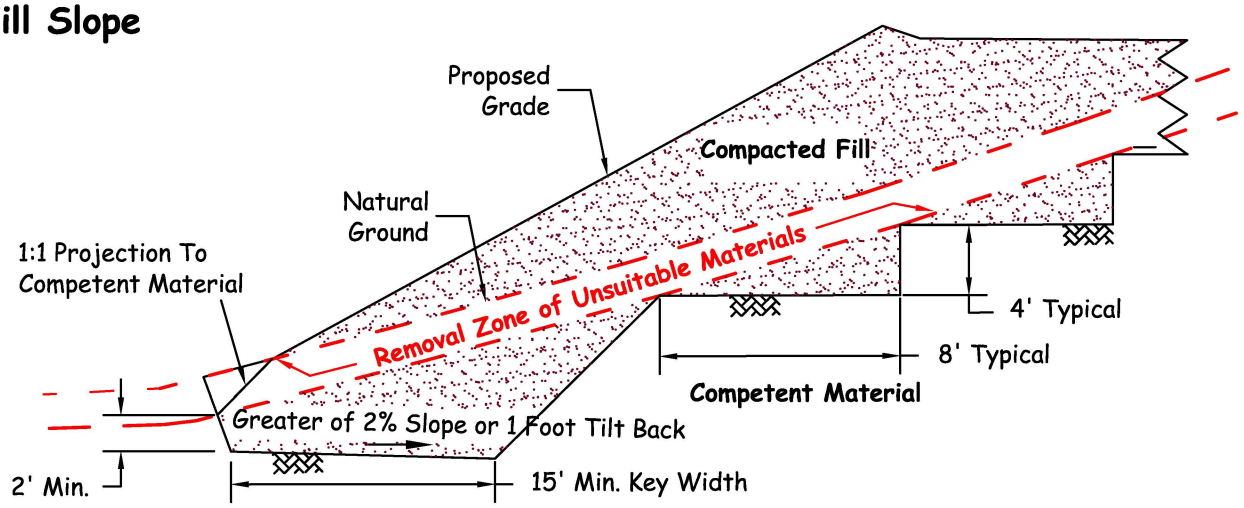
6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

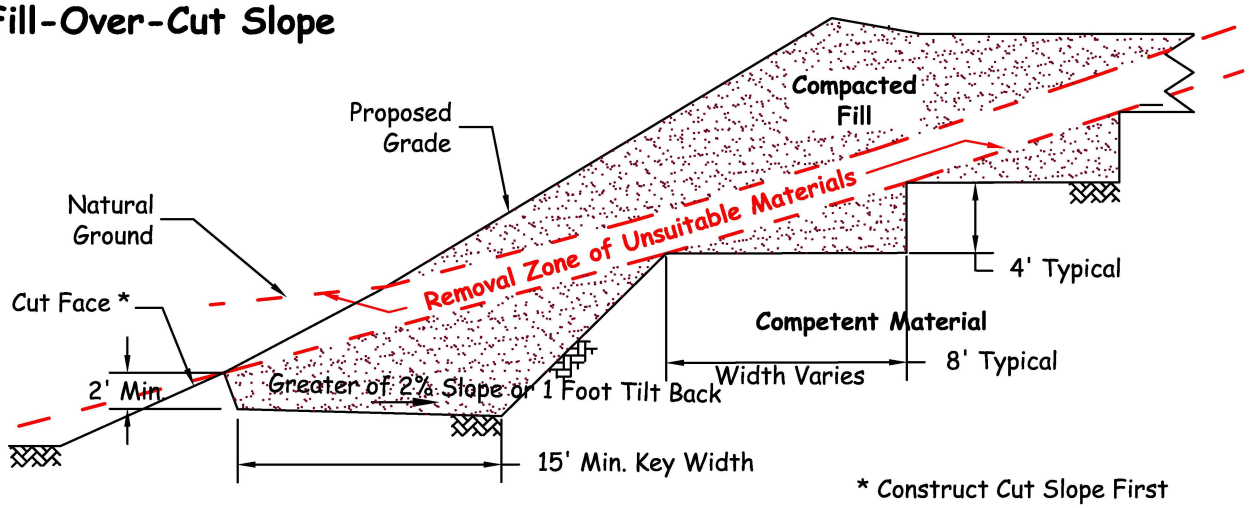
7.1 The Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.

7.2 All bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over



the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of maximum from 1 foot above the top of the conduit to the surface.

7.3 The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.



7.4 The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

RE: Phase I Environmental Site Assessment
Las Posas Road and West Mission Road
San Marcos, California 92069
Hillmann Project No: C3-8450

Dear Ms. Crooker:

Hillmann Consulting LLC is pleased to provide the results of our Phase I Environmental Site Assessment of the above referenced property. This assessment was performed in general accordance with the scope and limitations of ASTM Practice E1527-13, which is the latest version of the E1527 standard published by the ASTM.

We appreciate the opportunity to provide environmental due diligence services. If you have any questions concerning this report, or if we can assist you in any other matter, please contact our office at 714-634-9500.

Sincerely,

Hillmann Consulting, LLC

List of Abbreviations/Acronyms

Hillmann may use the following abbreviations and acronyms for common terminology described in our report. Not all abbreviations or acronyms may be applicable to this report:

ACM	– Asbestos Containing Material
AOC	– Area of Concern
AST	– Aboveground Storage Tank
ASTM	– American Society for Testing Materials
BER	– Business Environmental Risk
CEA	– Classification Exception Area
CERCLA	– Comprehensive Environmental Response Compensation and Liability Act
CERCLIS	– Comprehensive Environmental Response Compensation and Liability Information System
CESQG	– Conditionally Exempt Small Quantity Generator
COC	– Chemicals of Concern
CORRACTS	– Corrective Action Sites
CREC	– Controlled Recognized Environmental Condition
DNPL	– Delisted National Priority List
DTSC	– Department of Toxic Substances Control
ENG	– Engineering
ERNS	– Emergency Response Notification System
FDEP	– Florida Department of Environmental Protection
FDNY	– Fire Department, City of New York
FDOT	– Florida Department of Transportation
FOI/FOIA/FOIL	– Freedom of Information / Freedom of Information Act / Freedom of Information Letter
HVAC	– Heating Ventilation & Air Conditioning
HREC	– Historic Recognized Environmental Condition
IAQ	– Indoor Air Quality
ISRA	– Industrial Site Recovery Act
LBP	– Lead-Based Paint
LQG	– Large Quantity Generator
LTANK	– Leaking Storage Tank
LUST	– Leaking Underground Storage Tank
MassDEP	– Massachusetts Department of Environmental Protection

1.0 FINDINGS, OPINIONS, AND CONCLUSIONS

Hillmann Consulting, LLC (Hillmann) performed a Phase I Environmental Site Assessment (ESA) of Las Posas Road and West Mission Road , San Marcos, California (the Property). The assessment has been conducted in accordance with our contracted scope of work and the ASTM Standard Practice E 1527-13 for Phase I Environmental Site Assessments and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312. This section contains a summary of findings, opinions and conclusions made by this assessment. However, this section, alone, does not constitute the complete assessment. The report must be read in its entirety.

1.1 Summary of Project Details

Primary Street Address:		Las Posas Road and West Mission Road			
City:	San Marcos	**County:**	San Diego	**State:**	California
Tax ID/Parcel Number:		219-121-1500 and 219-121-1600			
Property Owner:		WPI- Las Posas and Mission LLC			
Zoning Designation:		Commercial			
Approx. Property Area:		7.59 acres			
Buildings/# of Floors		N/A			
Approx. Building Area:		N/A			
Approx. Year Built:		N/A			
Commercial Occupants:		None - vacant			
Current Use:		Undeveloped			
Prior Uses:		Agricultural			
Inspected By:		Ms. Gabriela Cyrulik			
Site Contact/Company:		Ms. Johanna Crooker/MLC Holdings, LLC			
Site Escort/Company:		Unescorted			
Inspection Date:		June 8, 2021			
Weather Conditions:		Fair, 60 degrees F			

1.2 Findings Summary Table

Prior Env. Reports/User Provided Info:	X				3.0
Data Gaps:	X				2.3

1.3 Findings, Opinions and Conclusions

1.3.1 Recognized Environmental Conditions

Hillmann has performed a Phase I Environmental Site Assessment in accordance with the scope and limitations of ASTM Practice E1527-13 of the Property as described in Section 2 of this report. Any additions to, exceptions to, or deletions from this practice are also described in Section 2 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the Property, except for the following:

RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No RECs were identified.
HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No HRECs were identified.
CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No CRECs were identified.
SIGNIFICANT DATA GAPS	
	No SDGs were identified.

1.3.2 REC Response Action Recommendations

The following table presents recommended response actions to the identified RECs for further investigation and/or corrective action:

REC RESPONSE ACTION SUMMARY TABLE	
REC	**Response Action**
	None identified

1.3.3 Notable Environmental Conditions / De Minimis Conditions

The following environmental conditions were identified, but are not considered to be a REC in connection with the Property:

NOTABLE ENVIRONMENTAL CONDITIONS / DE MINIMIS CONDITIONS	
1.	Multiple large stockpiles of undocumented soil fill material were observed at the southwest boundary of the Property. Due to a concern of undocumented soil piles on the Property, a limited soil sampling and analysis was conducted at the time of the site inspection. Four (4) soil samples were collected from each of the undocumented soil piles, and analyzed for organochlorine pesticide (OCP) via EPA method 8081A, heavy metals, and VOCs. The analytical results indicated only minor detections of OCPs and heavy metals, all below the RSLs for residential use, and no TPH and/or VOCs were detected in any of the soil samples. Therefore, the undocumented soil piles do not indicate a REC with connection to the Property.
2.	Continental Cleaners at 1342 W. Mission Road is reportedly adjoining to the south-southwest of the Property. This site was listed as a garment pressing and cleaners' agent in 1994. However, no such structures were adjoining to the south-southwest during the time period when this site was listed as a historical cleaner and may have been mis-mapped. Additionally, there have been no commercial development adjoining to the Property until the CVS was developed in the mid-2000s. As such, this site is not considered to be a REC in connection with the Property.

1.3.4 Environmental Professional Statement

I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training and experience to assess a *property* of the nature, history and setting of the subject *property*. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Ryan Terwilliger
Environmental Professional

1.4 Business Environmental Risks / Non-ASTM Scope

Hillmann has performed a limited review of the following potential Business Environmental Risks (BER), also known as "Non-ASTM Scope concerns", in accordance with the contracted scope of work scope for this assessment. The following is a summary of findings for applicable BERs. For a more detailed discussion of the findings and contracted scope of work, please see the referenced report section.

BUSINESS ENVIRONMENTAL RISKS / NON-ASTM SCOPE			
Subject	**Findings**	**Not Appl.**	**Rpt. Ref.**
Asbestos		X	7.1
Lead Paint		X	7.2
Radon	Property is located in the USEPA radon designation Zone 3 or 'low risk' area for radon.		7.3
Mold / Microbial Damage		X	7.4
NWI Wetlands	No mapped wetland areas were depicted at the Property.		7.5
Lead in Drinking Water	No potable water service at the Property is provided at the Property.		7.6

2.0 INTRODUCTION

2.1 Purpose and Scope

This assessment was conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E1527-13. The ASTM describes these methodologies as representing good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and petroleum products. As such, this practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner or bona fide prospective purchaser limitations on CERCLA liability (hereinafter, the "landowner liability protections," or "LLPs"): that is, the practice that constitutes all appropriate inquiries into the previous ownership and uses the property consistent with good commercial and customary practice as defined at 42 U.S.C. §9601(35) (B). The primary goal of the processes established by ASTM E1527-13 is to identify *recognized environmental conditions* in connection with the Property.

The term *recognized environmental condition (REC)* is defined by the ASTM as the presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

The ASTM has also defined the terms *historical recognized environmental conditions* and *controlled recognized environmental conditions* as two additional types of RECs. The term *historical recognized environmental condition (HREC)* is defined as a past release of any hazardous substances or petroleum products that has occurred in connection with the Property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the Property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls or engineering controls).

The term *controlled recognized environmental condition (CREC)* is defined as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

Conditions determined to be *"de minimis conditions"* are not considered to be RECs, HRECs or CRECs. *De minimis condition* is defined by the ASTM, "…as a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

The chief components of this assessment are generally described as follows:

- A non-invasive visual reconnaissance of the Property and adjoining properties in accordance with ASTM guidelines for evidence of RECs.

- Interviews of past and present owners and occupants and state and local government officials, seeking information related to the potential presence of RECs at the Property.

- A review of standard physical record sources for available topographic, geologic and groundwater data.

- A review of standard historic record sources, such as fire insurance maps, city directories, aerial photographs, prior reports and interviews, etc., to determine prior uses of the Property from the present, back to the Property's first developed use, or back to 1940, whichever is earlier.

- A review of standard environmental record sources including federal and state environmental databases, and additional environmental record sources, to identify potential regulatory concerns with the Property, adjoining properties and properties located within the surrounding area.

An evaluation of environmental or other regulatory compliance matters is excluded from the scope of this assessment.

These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

2.1.1 Business Environmental Risks/Non-ASTM Scope Considerations

In accordance with our contract agreement, Hillmann may have addressed the following potential environmental subject matters that are outside of the requirements of the ASTM E1527-13 standard:

Asbestos-Containing Materials (ACM): A cursory non-intrusive visual screening for the presence of suspect ACM within the accessed areas of buildings built prior to 1990 on the Property. It is emphasized that this cursory non-intrusive visual screening does not constitute an asbestos survey/inspection of the premises. An asbestos survey/inspection should be sought by the report User(s) if more certainty is desired regarding ACM and potential asbestos hazards at the Property. Furthermore, a review of regulatory compliance matters pertaining to asbestos is excluded from the scope of work.

Lead-Based Paint (LBP): A cursory non-intrusive visual screening of the condition of painted surfaces in the accessed areas of residential buildings/units built prior to 1980 on the Property. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for LBP or potential lead hazards. A comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding LBP at the Property. Furthermore, a review of regulatory compliance matters pertaining to lead-based paint is excluded from the scope of work.

USEPA Designated Radon Potential: Review of general non-site specific data published by the USEPA regarding the Radon Zone classification for the area of the Property.

Mold/Microbial Damage: A cursory non-intrusive visual screening within the accessed areas of buildings on the Property for evidence of systemic microbial problems, including visible mold

growth, water damaged building materials or musty odors. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for moisture/mold/microbial damage. A more comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding the potential for moisture/mold/microbial damages at the Property.

NWI Wetlands: Review of US Fish and Wildlife Service National Wetland Inventory digitized data of mapped wetlands as presented in the attached EDR Radius Map plus Geocheck Report.

It is emphasized that, regardless of the wetlands data obtained via the EDR Geocheck-Physical Setting Source Addendum, a delineation of regulated wetlands by a qualified professional would be warranted to determine the presence or absence of regulated wetlands at the Property.

Lead in Drinking Water: Review of the potential for elevated levels of lead in the drinking water by determining the source of the drinking water supply and a review of available testing or compliance data reports.

2.2 Property Location/Legal Description

Property location and legal description details are described as follows:

Primary Street Address:	Las Posas Road and West Mission Road				
City:	San Marcos	**County:**	San Diego	**State:**	California
Tax ID/Parcel Number:	219-121-1500 and 219-121-1600				
Approx. Land Area:	7.59 acres				
Apprx. Latitude/Longitude:	North 33.1504410 degrees/West 117.1896180 degrees				
Additional Details (if appl.):	NA				
Property Owner:	WPI- Las Posas and Mission LLC				
Zoning Designation:	Commercial				

2.3 Data Gaps

A *data gap* is defined by the ASTM as a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. A data gap is only significant if other information and/or professional experience raises reasonable concerns involving the data gap and the ability to determine the presence or absence of recognized environmental conditions. The following table summarizes data gaps encountered during the assessment as well as a discussion of their significance.

Data Gap:	Significant (Yes/No)?	Discussion
Historical records data failure	No	The date and/or type of the first developed use of the Property was not documented.

		Record gaps exceeding five years were encountered; however, no significant site use changes are suspected during these intervals.
Response to agency records requests not received as of date of report.	No	Any additional information indicative of a REC will be forwarded upon receipt.

2.4 User Reliance

This report is for the exclusive use of the User(s) named on the front cover. No other party(ies) shall have any right to rely on the content of this report without first obtaining the consent of the original report User; and without obtaining written consent from Hillmann in the form of a letter of reliance or report recertification.

2.5 Significant Assumptions

The following significant assumptions are made:

- The site operations at the time of the site visit are assumed to reflect typical site conditions relative to potential environmental conditions and that no concealment of environmental conditions or releases by site owners or occupants has occurred. Likewise, it is assumed that no areas of the Property with potential environmental concerns or RECs were concealed or otherwise not reported, intentionally or unknowingly, by the Property owners/occupants and/or site escort at the time of the site visit.

- For the purpose of estimating the approximate direction of groundwater flow in the absence of site specific groundwater data, unless indicated otherwise, an assumption has been made that the gradient of groundwater flow follows the surface topography of the Property and immediate surrounding area.

2.6 General Limitations and Exceptions

2.6.1 Limitations

The report turnaround time specified by the contract agreement for this assessment may present a limitation to the availability of pertinent regulatory agency records. Such limitations, if encountered, are further specified in Section 4.4.

Significant limitations related to the condition or accessibility of the Property at the time of the site reconnaissance, if encountered, are reported in Section 5.1.

2.6.2 Other Exceptions or Deletions

No other exceptions or deletions from the ASTM Standard E1527-13 are reported.

2.6.3 Special Terms and Conditions

This Phase I Environmental Site Assessment has been prepared using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances, wastes and petroleum products at the Property. Findings within this report are based on information collected from observations made on the day of the site reconnaissance and from reasonably ascertainable information obtained from governing public agencies and private sources.

This report is not definitive and should not be assumed to be a complete or specific definition of the conditions above or below grade. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation, site development, redevelopment, or other construction purposes. No representation or warranty is made that the past or current operations at the Property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes.

Findings, conclusions and recommendations presented in this report are based on visual observations of the Property, interviews conducted, the records reviewed, information provided by the Client, and/or a review of readily available and supplied drawings and documents. Information obtained during the assessment, whether written, graphic or verbal, provided by the Property contact(s) or as shown on any documents reviewed or received from the Property contact, owner or agent, or government agency source; is assumed to be accurate except as specifically stated otherwise in this report. Independent verification of the accuracy or completeness of all information reviewed or received during the course of this assessment is not made and excluded from the scope of work for this assessment. No warranty or guarantee is made of the accuracy or completeness of information that was obtained from ostensibly knowledgeable individuals, regulatory agency representatives or other secondary sources.

Regardless of the findings stated in this report, Hillmann is not responsible for consequences or conditions arising from facts that were concealed, withheld or not fully disclosed at the time the assessment was conducted.

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The regulatory research is designed to meet the requirements of ASTM Standard E1527-13. Hillmann can neither warrant nor guarantee the accuracy or completeness of the information obtained from the regulatory database report provider during the course of this assessment.

Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques.

Reasonable efforts have been made during this assessment to identify aboveground and underground storage tanks and ancillary equipment. Reasonable efforts are limited to information gained from visual observation of largely unobstructed areas, recorded database information held in public record and available information gathered from interviews. Such methods may not identify

surficial and subsurface features that may have been hidden from view due to parked automobiles and other vehicles, snow cover, vegetative growth, pavement, construction or debris pile storage or incorrect information from sources.

No guarantee, explicit or implied, is made that the records pertaining to historical ownership or occupancy which were reviewed represent a comprehensive or precise delineation of past Property ownership or tenancy for legal purposes.

The ASTM E1527-13 standard states that recommendations are not required to be included in a Phase I ESA report; however, further that recommendations are an additional service that may be useful in the User's analysis of landowner liability protections or business environmental risks; and that the User should consider whether recommendations for additional inquiries or other services are desired.

The recommended response actions to the identified RECs presented in Section 1.3, if any, are not intended to represent the only course(s) of action to take; nor does it imply any opinion as to the timing of the action. Furthermore, it is emphasized that additional response actions may become warranted depending on the outcome of the initial action(s) taken. Hillmann advises that consultation with legal counsel familiar with environmental and real estate law may be beneficial to the decision making process for the type and timing of a response action to identified RECs, if any.

Due to the limited nature of our review of potential Business Environmental Risks, the User of the report should consider whether to take additional action(s) to further define, properly manage and/or mitigate potential BERs.

In the event of any conflict between the terms and conditions of this report and the terms and conditions of the consulting services agreement for this project, the consulting services agreement shall control.

3.0 USER PROVIDED INFORMATION

The term "User" is defined by ASTM as the party seeking to use Practice E1527 to complete an environmental site assessment of the Property; specifically, the entities named on the front cover to which the report has been addressed.

3.1 Prior Environmental Reports/Documentation

The following prior environmental reports/documentation was provided:

Phase I Environmental Site Assessment Report for vacant parcel northwest corner of West Mission Road and Las Posas Road, San Marcos, CA 92069; prepared by Krazan and Associates, Inc. and dated October 15, 2003. The report concluded the following:

"This assessment has revealed no evidence of RECs in connection with the subject site."

3.2 User Questionnaire

Section 6 of the ASTM E1527-13 standard describes certain tasks required to be performed by the report User in order to qualify for landowner liability protections to CERCLA liability. To assist the report User to meet these requirements, the ASTM E1527-13 standard recommends a questionnaire of inquiries (User Questionnaire) specified in 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31 be provided to the original report User. The following is a summary of the User's response:

Question:	Yes/No:	Detail:
Environmental liens that are filed or recorded against the property: Did a search of recorded land title records identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?	No	
Activity and use limitations that are in place on the property or that have been filed or recorded against the property: Did a search of recorded land title records (or judicial records where appropriate, identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?	No	
Specialized knowledge or experience of the person seeking to qualify for the LLP: Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	No	
Relationship of the purchase price to the fair market value of the property if it were not contaminated: Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower	Yes	

Question:	Yes/No:	Detail:
purchase price is because contamination is known or believed to be present at the property?		
Commonly Known or Reasonably Ascertainable Information: Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,		
-Do you know the past uses of the property?	No	
-Do you know of specific chemicals that are present or were once present at the property?	No	
-Do you know of spills or other chemical releases that have taken place at the property?	No	
-Do you know of any environmental cleanups that have taken place at the property?	No	
The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation: Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?	No	
Litigation/Administrative Proceedings/Government Notices As the User of this ESA, do you have knowledge of (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property; (2) any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property; and (3) any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.	No	

NR-no response

3.3 Reason for Performing Phase I ESA

The User did not indicate the purpose of the assessment. In accordance with ASTM E1527-13, it is assumed that the Phase I ESA was being performed in order to qualify for landowner liability protection to CERCLA liability.

4.0 RECORDS REVIEW

4.1 Physical Setting Sources

The following physical setting sources were reviewed:

Source	Discussion
USGS 7.5 minute Topographic Map Data: (EDR Geocheck-Physical Setting Source Addendum)	The Property lies at an elevation of approximately 575 feet above mean sea level. An interpretation of topographic contour lines as well as a review of the EDR Geocheck-General Topographic Gradient suggested terrain sloping downward towards the south-southwest.
USDA SCS Soil Data: (EDR Geocheck-Physical Setting Source Addendum)	The soil type at the Property is classified as "Escondido". This soil type is described as soils with layers impending downward movement of water, or soils with moderately fine or fine texture that have very fine sandy loam texture.
Geologic Data: (EDR Geocheck-Physical Setting Source Addendum)	The geologic formation in the vicinity of the Property is described as eugeosynclinal deposits of the Mesozoic Era, Lower Jurassic and Upper Triassic System, and Lower Mesozoic Series.
Prior Env. Reports: (Section 3.1)	No additional relevant site specific geologic data was noted from a review of the prior environmental reports listed in Section 3.1.
Additional Sources/ Data:	No additional physical setting sources or data was obtained.
Groundwater Flow Discussion:	Based on a review of the above information as well as observation of the site, the direction of shallow groundwater flow at the site is inferred to be towards the south-southwest.
NWI Wetlands Data: (EDR Geocheck-Physical Setting Source Addendum)	No NWI mapped wetlands areas were depicted at the Property.

4.2 Historical Use – Property and Adjoining Properties
