Environmental Impact Report

Gran Vista Specific Plan Project

State Clearinghouse No. 2022040440

MARCH 2023

EIR (EIR22-002); Specific Plan (SP21-0003); General Plan Amendment (GP21-0007); Rezone (R21-0003); Multi-Family Site Development Plan (MFSDP21-0001); Tentative Subdivision Map (TSM21-0003)

Prepared for

CITY OF SAN MARCOS

Printed on 30% post-consumer recycled material.

Table of Contents

SECTION **PAGE NO.**

1 Executive Summary 1-1
1.1 Project Summary 1-1
1.2 Summary of Significant Effects And Mitigation Measures That Reduce or Avoid The Significant Effects 1-1
1.3 Areas of Concern 1-2
1.4 Issues to be Resolved by the Decision-Making Body 1-3
1.5 Project Alternatives 1-3
1.5.1 No Project Alternative 1-4
1.5.2 Existing Land Use Designation Alternative 1-4
1.5.3 Reduced Density Alternative 1-4
1.5.4 Environmentally Superior Alternative 1-4

2 Project Description, Location, and Environmental Setting 2-1
2.1 Project Objectives 2-1
2.2 Project Description 2-1
2.2.1 Discretionary Actions Required of the City 2-2
2.2.2 Project Characteristics 2-3
2.3 Environmental Setting 2-8
2.3.1 Existing Land Uses and Setting 2-8
2.3.2 Existing Land Use and Zoning Designations 2-8
2.3.3 Regional Setting 2-8
2.3.4 Public Services 2-10
2.4 Intended Uses of the EIR 2-10
2.4.1 Scope of the EIR 2-11
2.4.2 Notice of Preparation and Scoping 2-12
2.4.3 Draft EIR and Public Review 2-12
2.4.4 Final EIR Publication and Certification 2-13
2.4.5 Project Approvals and Permits 2-13
2.5 Project Inconsistencies with Applicable Regional and General Plans 2-13
2.6 List of Past, Present, and Reasonably Anticipated Future Projects in the Project Area 2-14

3 Environmental Analysis 3.1-1
3.1 Aesthetics 3.1-1
3.1.1 Existing Conditions 3.1-1
3.1.2 Regulatory Setting 3.1-3
3.1.3 Thresholds of Significance 3.1-5
3.1.4 Project Impact Analysis 3.1-5

3.1.5 Cumulative Impact Analysis 3.1-9
3.1.6 Mitigation Measures 3.1-10
3.1.7 Conclusion 3.1-10
3.2 Air Quality 3.2-1
3.2.1 Existing Conditions 3.2-1
3.2.2 Regulatory Setting 3.2-9
3.2.3 Thresholds of Significance 3.2-14
3.2.4 Project Impact Analysis 3.2-20
3.2.5 Cumulative Impact Analysis 3.2-27
3.2.6 Mitigation Measures 3.2-28
3.2.7 Conclusion 3.2-28
3.3 Biological Resources 3.3-1
3.3.1 Existing Conditions 3.3-1
3.3.2 Methodology 3.3-2
3.3.3 Regulatory Setting 3.3-7
3.3.4 Thresholds of Significance 3.3-12
3.3.5 Project Impact Analysis 3.3-13
3.3.6 Cumulative Impact Analysis 3.3-15
3.3.7 Mitigation Measures 3.3-17
3.3.8 Conclusion 3.3-18
3.4 Cultural Resources 3.4-1
3.4.1 Existing Conditions 3.4-1
3.4.2 Regulatory Setting 3.4-4
3.4.3 Thresholds of Significance 3.4-7
3.4.4 Project Impact Analysis 3.4-8
3.4.5 Cumulative Impact Analysis 3.4-9
3.4.6 Mitigation Measures 3.4-10
3.4.7 Conclusion 3.4-13
3.5 Energy 3.5-1
3.5.1 Existing Conditions 3.5-1
3.5.2 Regulatory Setting 3.5-3
3.5.3 Thresholds of Significance 3.5-10
3.5.4 Project Impact Analysis 3.5-10
3.5.5 Cumulative Impact Analysis 3.5-15
3.5.6 Mitigation Measures 3.5-16
3.5.7 Conclusion 3.5-16
3.6 Geology and Soils 3.6-1
3.6.1 Existing Conditions 3.6-2
3.6.2 Regulatory Setting 3.6-3
3.6.3 Thresholds of Significance 3.6-6
3.6.4 Project Impact Analysis 3.6-7

3.6.5 Cumulative Impact Analysis 3.6-9
3.6.6 Mitigation Measures 3.6-10
3.6.7 Conclusion 3.6-10
3.7 Greenhouse Gas Emissions 3.7-1
3.7.1 Existing Conditions 3.7-1
3.7.2 Regulatory Setting 3.7-5
3.7.3 Thresholds of Significance 3.7-19
3.7.4 Project Impact Analysis 3.7-25
3.7.5 Cumulative Impact Analysis 3.7-41
3.7.5 Mitigation Measures 3.7-42
3.7.6 Conclusion 3.7-42
3.8 Hazards and Hazardous Materials 3.8-1
3.8.1 Existing Conditions 3.8-1
3.8.2 Regulatory Setting 3.8-6
3.8.3 Thresholds of Significance 3.8-12
3.8.4 Project Impact Analysis 3.8-13
3.8.5 Cumulative Impact Analysis 3.8-16
3.8.6 Mitigation Measures 3.8-16
3.8.7 Conclusion 3.8-16
3.9 Hydrology and Water Quality 3.9-1
3.9.1 Existing Conditions 3.9-2

WQIP	water quality improvement plan
ZEV	zero-emission vehicle

1 Executive Summary

1.1 Project Summary

The Gran Vista Specific Plan Project (project) proposes to develop 120 three-story townhomes and associated amenities on an approximately 7.6-acre project site in the City of San Marcos (City). The project would include approximately 92,645 square feet of common recreation area and an average of 146 square feet of private open space per unit. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the N Las Posas Road frontage. The proposed project also includes landscaping, bio-retention areas, and circulation improvements. The proposed project would have a density of approximately 15.7 dwelling units per acre.

The adjacent CVS parcel includes 99 existing parking spaces that would remain for the exclusive and ongoing use of CVS, which only requires 53 spaces to meet the City's Parking Ordinance for commercial uses. The project site currently contains an additional 38 parking spaces that would be shared between the project site and CVS. The project would introduce an additional 20 guest spaces to meet the City's requirement for multifamily dwelling guest parking of 1 space per 3 units (120 units/3 = 40 spaces total). As required, 2 of the 20 additional guest parking spaces would include electric vehicle (EV) charging stations. The project also includes 240 garage spaces, which would provide 2 garage spaces per unit and therefore would comply with the City's Parking Ordinance.

The project site is surrounded by existing development and located in the northwestern portion of the City, at the northwest corner of N Las Posas Road and W Mission Road, comprised of Assessor's Parcel Numbers 219-121-15-00 and 219-121-16-00. The project site is bounded by N Las Posas Road along the eastern boundary, W Mission Road along the southwest boundary, an existing CVS store to the south, and existing single-family residential development to the north and west, as well as to the east across N Las Posas Road. Nearby land uses in the vicinity of the project site include industrial and commercial uses, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.2 miles east. The project location and project site boundary are shown on Figures 2-1 and 2-2.

The project proposes a General Plan Amendment, Rezone, Specific Plan, Tentative Map, and Site Development Plan. The General Plan Amendment and Rezone would change the General Plan designation and zoning from Commercial (C) to Specific Plan Area (SPA). The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan (the Specific Plan is included as Appendix M to this environmental impact report [EIR]). The Tentative Map presents specific lot configuration for the site. The Site Development Plan will configure the site for townhome dwelling units, street configuration, infrastructure, recreational open space, and private open space.

1.2 Summary of Significant Effects and Mitigation Measures That Reduce or Avoid The Significant Effects

Table 1-1 provides a summary of significant environmental impacts resulting from the project, mitigation measures identified to reduce and/or avoid the environmental effects, and a determination of the level of significance of each impact following implementation of the identified mitigation measures. Detailed analyses of significant environmental effects and mitigation are provided in Chapter 3 of this EIR.

The mitigation measures listed in Table 1-1 would reduce impacts related to biological resources, cultural resources, and tribal cultural resources to below a level of significance. Impacts related to traffic would remain significant and unavoidable after implementation of proposed mitigation.

Table 1-1. Summary of Significant Environmental Impacts

Impact	Mitigation Measures	Level of Significance After Mitigation
Biological Resources		
Impact BIO-1: There is potential for project construction activities to cause disturbances that would result in impacts to adjacent habitats.	Implementation of **MM-BIO-1**, refer to Section 3.3.6	Less than significant
Impact BIO-2: There is potential for construction activities to result in indirect impacts to nesting birds.	Implementation of **MM-BIO-2,** refer to Section 3.3.6	Less than significant
Cultural Resources		
Impact CR-1: Unknown archaeological resources may occur on the project site, and the proposed project has the potential to disturb such unidentified resources during project grading.	Implementation of **MM-CR-1** through **MM-CR-4,** refer to Section 3.4.6	Less than significant
Impact CR-2: There is a potential for project construction activities to disturb previously unidentified human remains on the project site.	Implementation of **MM-CR-1** through **MM-CR-4,** refer to Section 3.4.6	Less than significant
Tribal Cultural Resources		
Impact TCR-1: There is potential for impacts to previously unidentified tribal cultural resources	Implementation of **MM-CR-1** through **MM-CR-4,** refer to Section 3.4.6	Less than significant
Traffic		
Impact TRA-1: The project VMT per resident would exceed 16.07 VMT per resident (15% below regional average) threshold.	Implementation of **MM-TRA-1** through **MM-TRA-3,** refer to Section 3.15.6	Significant and Unavoidable

In addition to the measures outlined in Table 1-1, Project Design Feature (PDF) NOI-1 and PDF-NOI-2 outlined in Section 3.11, Noise, of this EIR are proposed to ensure noise during project construction remains less than significant.

1.3 Areas of Concern

A notice of preparation (NOP) was distributed on April 20, 2022, for a 30-day public review and comment period. Additionally, a public information meeting was held on May 12th, 2022, at 6:00 p.m. at the San Marcos City Hall in the Valley of Discovery Room located at 1 Civic Center Drive in San Marcos.

Public comments were received on the NOP for this EIR and reflect concern over a number of environmental issues (refer to Appendix A for the NOP and NOP comment letters). A total of 11 letters were received. Issues and concerns raised in the NOP comment letters include the following:

- Transportation: Scope of the study area, existing roadway congestion, trip generation and distribution, means of alternative transportation, project access, parking, cumulative trip generation from other projects, reducing vehicle miles traveled, pedestrian and friendly development design, pedestrian safety
- Noise: Existing noise from high traffic volumes
- Air quality: Air pollution from traffic
- Biological resources: Conversion of sensitive habitat, potential direct and indirect impacts to special-status species, and inclusion of appropriate mitigation
- Cultural and tribal cultural resources: Compliance with Assembly Bill 52 and Senate Bill 18, direct or indirect impacts to cultural resources, appropriate and adequate mitigation
- Greenhouse gas: Greenhouse gas emission reduction
- Land Use: Rezoning of the site, cumulative conversion of commercial zoning, compatibility with surround land uses/development, commercial uses that would be walkable/bikeable from surrounding residences, cumulative residential projects
- Population/housing: Cumulative residential projects
- Public utilities: Adequate water supply, cumulative water supply, general concern for utility capacity
- Public services: Potential impact to schools, impacts to police services
- Recreation: Cumulative impacts to recreational areas

1.4 Issues to be Resolved by the Decision-Making Body

An EIR is an informational document intended to inform the public agency decision makers and the public of the significant effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project.

The lead agency must respond to each significant effect identified in the EIR by making "Findings" for each significant effect. The issues to be resolved by the decision makers for the project include whether or how to mitigate the associated significant effects, including whether to implement a project alternative. The decision makers must determine whether any of the project alternatives would substantially reduce significant effects while still meeting key objectives of the project (see Section 2.1, Project Objectives).

1.5 Project Alternatives

Three alternatives are proposed to provide an understanding of how environmental effects could be reduced by varying the design and scope of the project. Table 1-2 provides a comparison of the impacts of project alternatives to the impacts of the proposed project. The alternatives outlined below are more fully discussed in Chapter 4 of this EIR.

1.5.1 No Project Alternative

Under the No Project Alternative, the proposed project would not be implemented and the project site would remain undeveloped in its existing condition. This alternative would eliminate all the significant impacts identified for the proposed project. Since the No Project Alternative would not provide any development, overall impacts would be reduced compared to the proposed project. However, certain benefits would not be realized under this alternative, including the provision of housing units as identified in the General Plan in an infill and transit area. As the No Project Alternative would not develop the site or allow for housing, this alternative would not fulfill any of the project objectives. This alternative is further described in Section 4.4.3 in Chapter 4 of this EIR.

1.5.2 Existing Land Use Designation Alternative

Under the Existing Land Use Designation Alternative, the project site would be developed per the City's General Plan as a Commercial (C) land use. The project site would be developed as previously processed with the existing CVS Conditional Use Permit. The Existing Land Use Designation Alternative would include 69,000 square feet of grocery store and gas station uses and 23,000 square feet of office space. This alternative would include 276 parking spaces. This alternative could be processed with a Conditional Use Permit and Site Development Plan and would not require a General Plan Amendment or Rezone of the site.

Other improvements, such as circulation, landscaping, and utility connections would occur as required. Off-site improvements beyond those required by mitigation measures would not occur under this alternative. No open space uses would occur on site.

1.5.3 Reduced Density Alternative

The Reduced Density Alternative would reduce the density on site in comparison to the project by changing the General Plan land use designation to Low Density Residential (LDR) and changing the zoning to Residential 1 (R-1-7.5), which "provides for low-density, single family detached homes that are suitable in massing and character or inclusion in single-family detached neighborhoods." Under this alternative, the site would accommodate approximately 33 single-family homes for a total residential density of 4.34 dwelling units per acre. The Reduced Density Alternative would not incorporate private useable open space area within the residential community since each single-family home would have a backyard. The access points and internal streets would be configured to fit the 33 single-family home layout. This alternative would utilize the entire 7.6-acre site.

1.5.4 Environmentally Superior Alternative

Table 1-2 provides a qualitative comparison of the impacts for each alternative compared to the proposed project. As shown in Table 1-2, the No Project Alternative would eliminate all of the significant impacts identified for the project. However, the No Project Alternative would not meet any of the project objectives. California Environmental Quality Act Guidelines Section 15126.6(e)(2) states that if the No Project Alternative is identified as the environmentally superior alternative, then an environmentally superior alternative should be identified among the other alternatives.

Among the other alternatives, not including the proposed project, the Reduced Density Alternative would be considered the environmentally superior alternative because it would potentially provide a reduced level of impact in some environmental analysis areas including air quality, greenhouse gas, and noise. However, such impacts under this alternative would still remain less than significant, similar to the proposed project. The Reduced Density Alternative would cover the same development footprint as the proposed project, but would result in

decreased unit count and population count on site. Because the Reduced Density Alternative would cover the same development footprint as the project, impacts to biological resources, cultural resources, geology and soils, and tribal cultural resources would remain the same as the proposed project, and mitigation measures would still be required to mitigate impacts to these environmental resources. The Reduced Density Alternative would not meet project objectives 1, 2, and 4. Furthermore, due to the project site being located in an urban setting and the limited options available to mitigate vehicle miles traveled impacts for residential projects, the Reduced Density Alternative would still result in a significant and unavoidable transportation impact due to vehicle miles traveled.

For the Existing Land Use Designation Alternative, although this alternative would be consistent with the existing land use and zoning designation for the site and would promote infill development on site, it would not fulfill any of the project objectives, would not reduce or avoid significant environmental impacts, would not aid the City in achieving its Regional Housing Needs Assessment allocation, and may result in new or more severe impacts related to air quality, greenhouse gas emissions, and hazards.

Table 1-2. Comparison of Impacts of Proposed Project and Alternatives

Environmental Topic	Proposed Project	No Project Alternative	Existing Land Use Designation Alternative	Reduced Density Alternative
Aesthetics	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same)
Air Quality	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same/Reduced)
Biological Resources	LTSM	No Impact (Reduced)	LTSM (Same/Greater)	LTSM (Same/Reduced)
Cultural Resources	LTSM	No Impact (Reduced)	LTSM (Same)	LTSM (Same/Reduced)
Energy	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same)
Geology and Soils	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same/Reduced)
Greenhouse Gas Emissions	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same/Reduced)
Hazards and Hazardous Materials	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same)
Hydrology and Water Quality	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same/Reduced)
Land Use	LTS	No Impact (Reduced)	LTS (Same/Reduced)	LTS (Same)
Noise	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same/Reduced)
Population and Housing	LTS	No Impact (Reduced)	LTS (Same/Reduced)	LTS (Same)
Public Services	LTS	No Impact (Reduced)	LTS (Same/Reduced)	LTS (Same)
Recreation	LTS	No Impact (Reduced)	LTS (Same/Reduced)	LTS (Same)
Transportation	SU	No Impact (Reduced)	SU (Same)	LTSM (Same)
Tribal Cultural Resources	LTSM	No Impact (Reduced)	LTSM (Same)	LTSM (Same/Reduced)
Utilities and Service Systems	LTS	No Impact (Reduced)	LTS (same)	LTS (Same)

Notes: LTS = Less Than Significant Impact; LTSM = Less Than Significant with Mitigation; SU = Significant and Unavoidable

INTENTIONALLY LEFT BLANK

2 Project Description, Location, and Environmental Setting

As required by Section 15124 of the California Environmental Quality Act (CEQA) Guidelines, this section describes the proposed Gran Vista Specific Plan Project (project) and includes a statement of the project objectives; a general description of the proposed project's technical, economic, and environmental characteristics; and a summary of the discretionary actions required to approve the proposed project. The proposed project provides guidelines and standards for the implementation of future development of the project site.

2.1 Project Objectives

Section 15124(b) of the CEQA Guidelines requires that an environmental impact report (EIR) include a statement of the project objectives. The project objectives include the following:

1. Maximize residential densities, to the extent feasible, within proximity to major transit, education facilities, commercial uses, and trails to reduce reliance on automobiles and potentially minimize greenhouse gas emissions.
2. Create a highly connected and efficient system of sidewalks and pathways supported by pedestrian friendly architecture and landscaping to promote walkability and connect people to surrounding transit and destinations.
3. Design a vehicular circulation system that adequately accommodates traffic and minimizes traffic impacts in and around the project site.
4. Support the housing needs of the City of San Marcos (City) and the region by developing high-quality workforce housing that balances density with price-points and long-term maintenance costs, such that new homes remain financially attainable to entry-level home buyers.
5. Establish development standards and design guidelines that ensure distinctive architecture, landscaping, and recreational amenities that complement and enhance the existing surrounding neighborhood while providing a desirable living environment.
6. Identify a program for the long-term maintenance of the community to ensure all facilities are adequately maintained to City standards.
7. Finance or contribute a fair share of funding to all community services and infrastructure needed to support development proposed by the project to promote economic stability.

2.2 Project Description

The approximately 7.6-acre project site is located in the undeveloped northwest corner of the N Las Posas Road/ W Mission Road intersection in the City of San Marcos, California. The project site is bounded by N Las Posas Road along the eastern boundary, W Mission Road along the southwest boundary, an existing CVS Pharmacy to the south, and existing single-family residential development to the north and west, as well as to the east across N Las Posas Road.

The project proposes development of 120 multifamily residential dwelling units on 7.6 acres for an approximate total density of 15.8 dwelling units per acre. The project would include approximately 92,645 square feet of recreation area and an average of146 square feet of private open space per unit. Amenities on site would include

tot lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the N Las Posas Road frontage. The proposed project also includes landscaping, bio-retention areas, and circulation improvements. The project would include two points of entry, the first located off N Las Posas Road and the second located off W Mission Road (please refer to Figure 2-1, Conceptual Site Plan).

The project would include a variety of floorplans for the proposed townhomes. Floorplans include two- and three-bedroom units that vary in size from approximately 1,200 square feet to 1,800 square feet and include differing garage configurations. All townhomes would be three stories high. The number of townhomes per building would vary from 4 to 10. Proposed residential units are designed as entry-level market-rate housing with a range of unit sizes and price points in order to create opportunities for home ownership that would be attractive to varying income levels. The proposed townhomes would also provide for a transition between single-family homes to the north and high-density apartments to the southeast across W Mission Road. All proposed buildings would be equipped with photovoltaic panels (solar panels) on the rooftops to provide solar energy to the proposed homes, in accordance with current California Building Code.

Nearby land uses in the vicinity of the project site include industrial and commercial uses to the west and south on the other side of W Mission Road, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.2 miles to the east. The project site is comprised of Assessor's Parcel Numbers 219-121-15-00 and 219-121-16-00. The project location and project site boundary are shown on Figures 2-2 and 2-3.

The project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial. The project site is within the General Plan's College Area Neighborhood. The project proposes a General Plan Amendment and Rezone to change the land use designation to Specific Plan Area (SPA) (refer to Figures 2-4 through 2-7). Design of the project would be required to follow the design guidelines outlined in the Gran Vista Specific Plan, prepared for the project site (Appendix M). The design guidelines propose transitional architectural styles for the project to allow the project to blend in with the surrounding neighborhood. Landscape screening would be provided along the top of the drainage channel slope to preserve the privacy of adjacent neighbors.

The project site is designated as a High-Quality Transit Area due to its proximity to transit and other facilities and services that support alternatives to vehicle use. Palomar College, a public community college consisting of a 200-acre campus, is located east of the project site. Palomar College Transit Center, a North County Transit District hub, is located less than 0.25 miles from the project site. Palomar College Transit Center consists of a bus depot on the north side of W Mission Road, near the main entrance to Palomar College, and a train station on the south side of W Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the Transit Center provide local and regional connections to schools, employment, shopping, and entertainment options within the City, as well as San Diego and Riverside Counties. An existing bus turnout and stop are also located on W Mission Road in front of CVS. The Inland Rail Trail, a proposed 21-mile Class I bikeway, runs along the south side of W Mission Road and connects the Cities of Oceanside, Vista, San Marcos, and Escondido, as well us areas of unincorporated San Diego County.

2.2.1 Discretionary Actions Required of the City

The project proposes a General Plan Amendment, Zoning Amendment, Specific Plan, Tentative Map, and Site Development Plan. The General Plan Amendment and Rezone would change the General Plan designation and zoning from Commercial (C) to Specific Plan Area (SPA). The Specific Plan (Appendix M to this EIR) serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the

General Plan. The Tentative Map presents specific lot configuration for the site. The Site Development Plan will configure the site for townhome dwelling units, street configuration, infrastructure, recreational open space, and private open space.

The requested project entitlements/discretionary actions by the City include the following:

- General Plan Amendment
- Zoning Amendment (Rezone)
- Specific Plan
- Tentative Subdivision Map
- Multi-Family Site Development Plan

2.2.2 Project Characteristics

Residential Uses

As described above, the project consists of a residential development of 120 townhomes and associated amenities on a currently vacant site. The townhomes are proposed to be located throughout the project site. The disturbance area associated with project construction would encompass most of the project site.

The number of townhomes per building would vary from 4 to 10. Floorplans include two- and three-bedroom units that vary in size from approximately 1,200 square feet to 1,800 square feet and include differing garage configurations as shown in Table 2-1. Each home would include private open space averaging 146 square feet per unit in the form of a patio and/or deck.

Amenities on the project site would include a community garden, dog park, tot lot/exercise station, central recreation area, children's play area, turf play area, and barbecue areas. A total of 92,645 square feet of common open space would be provided throughout the project site through these amenities.

Table 2-1. Conceptual Floor Plan Summary

Square Footage	Bedroom Count	Garage Configuration	Unit Count
1,213	2	2- Car, Side-by-Side	30
1,505	3	2- Car, Tandem	45
1,802	3	2- Car, Side-by-Side	45
		Total	**120**

Circulation and Access

The proposed project is located on a vacant parcel adjacent to W Mission Road to the south. W Mission Road is classified as an arterial four-lane roadway in the City of San Marcos General Plan Mobility Element (City of San Marcos 2012). W Mission Road is a four-lane roadway for its entire length from N Rancho Santa Fe Road to east of W San Marcos Boulevard. W Mission Road transitions to S Santa Fe Ave approximately 0.5 miles northwest of the project site. S Santa Fe Avenue transitions from a four-lane to a two-lane road after Bosstick Boulevard. The Inland Rail Trail Class I Bicycle trail runs along W Mission Road along the project site; additionally, W Mission Road

provides pedestrian facilities. N Las Posas Road borders the northeastern boundary of the project site. N Las Posas Road is currently classified as a six-lane roadway between the State Route 78 westbound ramps and Avenida Azul and a four-lane roadway between Avenida Azul and Avenida Leon. The posted speed limit is 45 mph. On-street parking is prohibited. Class II bike lanes are provided.

The proposed project would be accessible from two points, as shown on Figure 2-1, that are shared with the neighboring CVS parcel. The primary entry to the project site is via a driveway at the signalized intersection of N Las Posas Road and Palm Road and the secondary access point is from a driveway on W Mission Road that includes a left-turn in and right-in/right-out traffic movements. Both driveways have been improved with enhanced paving and landscaping. Shared use of these driveways is controlled through covenants, conditions, and restrictions that cover the project site and the CVS parcel.

Three external public roadways provide access to the project site. N Las Posas Road forms the project site's eastern boundary. Palm Road intersects with N Las Posas Road at the project's main entrance, which is signalized. W Mission Road forms a portion of the project site's southern boundary and provides additional access to the site.

The internal circulation system for the proposed development would consist of a combination of private drives and private drive aisles. Private drives are low-speed streets designed with a minimum curb-to-curb width of 24 feet. This width is adequate to accommodate vehicles, emergency vehicles, and other service vehicles. This cross section allows for two lanes of travel (one in each direction), as well as adequate back-up space where parking spaces are provided. Private drive aisles provide access to private garages, and are designed with a minimum width of 24 feet. A minimum dimension of 30 feet is required between garages to provide adequate back up for vehicles exiting private garages. Parking would be prohibited in private drive aisles.

The California Fire Code, along with the San Marcos Fire Department, administers the rules and regulations on fire access design. The proposed project would be designed to provide fire and emergency responders with suitable fire access roads, dimensions, and surfaces (Chapter 5, Sections 503.1 through 503.4 of the California Fire Code) and an adequate number of emergency rated entrances to the community (Appendix D, Section D106 of the California Fire Code).

Please refer to Section 3.15, Transportation, of this EIR for a detailed description and analysis of proposed access and circulation.

Parking

As described above, the adjacent CVS parcel includes 99 existing parking spaces that would remain for the exclusive and ongoing use of CVS, which only requires 53 spaces to meet the City's Parking Ordinance for commercial uses. The project site currently contains an additional 38 parking spaces that would be shared between the project site and CVS. The project would introduce an additional 20 guest spaces to meet the City's requirement for multifamily dwelling guest parking of 1 space per 3 units (120 units/3 = 40 spaces total). As required, 2 of the 20 additional guest parking spaces would include electric vehicle charging stations. The project also includes 240 garage spaces which would provide 2 garage spaces per unit and therefore would comply with the City's Parking Ordinance.

Guest parking would be evenly distributed throughout the project site, designed to occur along private drives, or divided into small landscaped parking courts to avoid the creation of large parking lots. The 2019 California Green Building Standards Code, Section 4.106.4.2.1, requires the installation of at least one electric vehicle space in common use parking. The project would install two electric vehicle charging stations in the common use parking. Additionally, bicycle racks would be provided throughout the project site. The project would comply with the Gran Vista Specific Plan required vehicle and bicycle parking ratios for development within the project site.

Pedestrian Circulation

The project design would incorporate a pedestrian circulation plan that establishes a connected circulation system of pathways supported by pedestrian friendly architecture and landscaping. Buildings on site would be arranged to create direct and frequent walkway connections throughout the site and to adjacent public sidewalks along N Las Posas Road and W Mission Road. Walkways would be designed to provide access in accordance with the Americans with Disability Act (ADA) and to promote walkability and connect people to surrounding transit and places.

Bicycle Connectivity

The project would provide shared use access for bicycles within the project's private drives that would connect to existing Class II bike lanes on N Las Posas Road and W Mission Road. These facilities also connect to the nearby Inland Rail Trail, located along the south side of W Mission Road. The Inland Rail Trail is a proposed 21-mile Class I bikeway that connects the Cities of Oceanside, Vista, San Marcos, and Escondido, as well as a portion of the unincorporated County of San Diego.

Transit Connection

Exiting public transit facilities are readily available within walking distance to the project site. An existing bus stop is located on W Mission Road, immediately in front of the CVS. Additionally, the Palomar College Transit Center is located less than 0.25 miles from the project site on W Mission Road, at the entrance to Palomar College.

Open Space

Total open space within the project site is approximately 154,743 square feet (3.55 acres), which includes private open space, common open space, and open space with grades of greater than 10%. As described above, each home would include private open space in the form of a patio and/or deck. Approximately 146 square feet of private open space would be provided per unit. Private open space would be directly accessible from the primary interior living space of the unit. Common open space on site includes usable open space areas with grades of less than 10%, which are dispersed throughout the project site amongst the proposed buildings. Common open space would provide for recreational spaces, consisting of approximately 92,645 square feet of open space designed with urban-style amenities such as tot lots, an off-leash dog space, outdoor exercise equipment, a community garden, barbecue areas, and space for a variety of outdoor games. Open space on site with grades of 10% or greater would make up approximately 44,548 square feet and would be located along the western boundary of the project site; this space would act as a buffer between the proposed development and existing single-family homes. This open space is not counted towards useable open space on site and includes slopes along the channel and adjacent to public roadways. These spaces would be landscaped, commonly owned, and maintained by the homeowners association.

All open space areas would be landscaped in accordance with the City's Water Efficient Landscape Standards. The proposed landscape palette for the project utilizes drought tolerant and California native plant palettes. No invasive plant species would be incorporated into site landscaping. All landscaping on site would be required to comply with the landscape plan provided in the Gran Vista Specific Plan (Appendix M).

Architecture

Architecture and landscaping would reflect the urban setting of the area. Buildings would be designed to engage and enhance an interconnected series of internal landscaped pathways and sidewalks along N Las Posas Road and W Mission Road to support convenient, safe, and efficient pedestrian movements that promote walkability and transit use. Development of the site would be designed to minimize walls and fences to support an open and walkable community.

Floorplans include two- and three-bedroom units that vary in size from approximately 1,200 square feet to 1,800 square feet and include differing garage configurations. All townhomes would be three stories high. The number of townhomes per building would vary from 4 to 10. The proposed townhomes would vary by building, incorporating different neutral colors and materials. Please refer to Figures 3-1A through 3-1D in Section 3.1, Aesthetics, for conceptual elevations of the proposed townhomes.

The project would provide a transition between the traditional architectural styles found in the single-family homes to the north, east, and west and the contemporary styles found in urban uses to the south. The architectural style proposed for the project would be selected based on historic and current popularity with homeowners in California. Architectural styles that may be incorporated into project design would be those such as Transitional Craftsman and Transitional Farmhouse, as outlined in Chapter 3 of the Gran Vista Specific Plan (Appendix M).

All proposed lighting on site would be designed to meet City standards and comply with design guidelines in the Gran Vista Specific Plan (Appendix M), while also enhancing the aesthetic of the community.

Public Utilities

Water Facilities

The property is within the Vallecitos Water District for both water and sewer service. Townhome residential sites in the Vallecitos Water District are typically served by on-site private water systems. Private systems consist of separate fire and domestic systems on site. Private fire systems typically supply on-site fire hydrants and building fire sprinkler systems and require a backflow preventer at the connection to the public water system.

The distribution of potable water to each home would be provided by a series of 8-inch public pipes and related infrastructure. The proposed water system would connect to an existing 8-inch pipe in N Las Posas Road. Pipes would be located within private drives and private drive aisles to create a loop system that serves the entire project site. Individual services to homes would be provided by a lateral from the main pipe to the water meter for each home.

A dedicated fire main would provide fire service to a series of new and existing fire hydrants and to the individual units for firefighting purposes. There are two existing fire hydrants on the project site that are already in service and would remain in place.

In accordance with current California Building Code, all buildings would be equipped with fire sprinklers and water conservation features such as water efficient faucets and shower heads and high-performance toilets. Homes would be Water Sense Certified to meet U.S. Environmental Protection Agency standards.

Irrigation for the site would tie into the proposed loop system. Irrigation of landscaping throughout the project site would be required to comply with the City's Water Efficient Landscape Ordinance and the City's Landscape Manual.

Sewer Facilities

There are currently no existing gravity sewer lines on the project site. Wastewater service to the project site would be provided by the Vallecitos Water District. A wastewater system would be incorporated into the project site design, which would include an 8-inch PVC sewer main to adequately service individual homes and community areas discharging wastewater. Pipes would be located underneath internal private drives and private drive aisles. The on-site system would collect wastewater and direct flows into an existing 15-inch pipe in N Las Posas Road.

Site Drainage

Water arrives on site via natural rainfall only. Rainfall runoff from the site typically only occurs during a significant storm event. Water that does accumulate on site generally drains in a southwestern direction to an existing 12-inch corrugated metal piperiser to a 12-inch corrugated metal pipe to meet up with the commercial site to the south of the project site. The total flow eventually discharges into Las Posas Creek south. Per Municipal Separate Storm Sewer System requirements, stormwater flows on site would be conveyed to biofiltration systems through storm drains throughout the project site, where water would be treated prior to being discharged. All surface runoff would be directed to catch basins in private drives and private drive aisles. Once captured, water would be conveyed through a series of 18- to 24-inch pipes to two underground vaults located below common open space areas. Within the underground vaults, water would be passed through a series of mechanical filters to remove pollutants prior to being discharged. Treated water would be conveyed through an existing outfall into the adjacent channel that forms the northwestern edge of the project site.

Storm drainage components would properly handle runoff to meet regulatory requirements and to ensure that post-development runoff quantifies and rates are similar to or less than predevelopment conditions. The project would incorporate appropriate design of on- and off-site drainage facilities and would prepare and implement a stormwater pollution prevention plan, stormwater quality management plan, and best management practices. Please refer to Section 3.17, Utilities and Service Systems, of this EIR, which describes and analyzes project utilities and service systems in detail.

Electrical, Gas, and Telecommunication

Electricity and natural gas would be provided by San Diego Gas & Electric. Electrical facilities throughout the City include a combination of aboveground and belowground electrical distribution lines and utilities structures. The City fiber-optic network is facilitated by a 72-strand fiber-optic line that runs on various streets throughout the City. All major arterials in the City have implemented fiber optics. The project would connect to an existing 12-kilovolt line in a vault on N Las Posas Road.

San Diego Gas & Electric maintains a 4-inch gas distribution system within N Las Posas Road and a 3-inch gas distribution system within W Mission Road. The gas lines would be extended to and through the project site through the same joint trench alignment as electric and telecommunication facilities. Use of gas for the project would be limited to gas cooktops and dryers.

Telecommunication would be provided through Cox Communications and AT&T. Telephone, cable, and internet connections would be available to each home.

Solid Waste

Solid waste collection and recycling services to the project would be provided by EDCO Waste & Recycling. Non-recyclable waste, including general trash and green materials, is collected and transported to the Sycamore Sanitary Landfill in Santee. Recyclable materials are transferred to the Escondido Resources Recovery Transfer Station for further processing. Residents of the City can dispose of household hazardous waste free of charge at the Vista Household Hazardous Waste Collection Facility at 1145 E Taylor Street or the Poway Household Hazardous Waste Collection Facility at 12325 Crosthwaite Circle. Service and facility fees for solid waste collection and recycling would be paid monthly by each resident.

Grading

The project site was previously graded for commercial uses and currently consists of two development pads. The project proposes to clear and grub remaining vegetation on site and alter grading to further define drainage courses and crate pads for each residential building. Proposed grading would generate a total volume of 9,335 cubic yards of cut and 9,335 cubic yards of fill, resulting in balanced earthwork that does not require any import or export of dirt. The proposed grading plan has been designed to maintain the current drainage pattern of the project site, with a high point at the north end of the site and a low point near the southwest corner of the site.

2.3 Environmental Setting

2.3.1 Existing Land Uses and Setting

The site is within the northwestern portion of the City of San Marcos, in the College Area Neighborhood. The project site is currently vacant and has no existing impervious areas. Topography within the project boundary is relatively flat with disturbed vegetation communities throughout. The site was previously graded into two separate development pads. Elevation of the site is approximately 575 feet above mean sea level with terrain sloping downward towards the southwest. Adjacent land uses include mixed commercial development to the south and southwest, residential uses to the northeast and northwest, and an undeveloped parcel located adjacent to the southwestern project boundary. The closest freeway is State Route 78 located approximately 0.4 miles south of the project site.

2.3.2 Existing Land Use and Zoning Designations

Existing General Plan Land Use Designation

As described above, the existing General Plan land use designation for the project site is Commercial. Development allowed under this land use designation must be consistent with those uses outlined in the City's Municipal Code and zoning ordinance, as well as the Commercial land use designation of the General Plan.

Existing Zoning Designation

The existing zoning of the project site is Commercial (C). The purpose of the Commercial land use designation is to "provide a business district for the full range of retail goods, services, and commercial centers that stabilize, maintain, and enhance the vitality of San Marcos in a supportive commercial setting adjacent to thoroughfares. Appropriate C Zone commercial uses will contribute to the range of service and destination retail, shopping centers, entertainment, and restaurant uses that generate a strong tax base" (City of San Marcos 2022). The Commercial zone is intended to implement and be consistent with the Commercial land use designation of the General Plan.

2.3.3 Regional Setting

The following provides a general description of various aspects of the proposed project's environmental setting. Additional descriptions of the proposed project's environmental setting as it relates to environmental issue areas can be found throughout Chapter 3 of this EIR.

Climate

The weather of the San Diego region, as in most of Southern California, is influenced by the Pacific Ocean and its semi-permanent high-pressure systems that result in dry, warm summers and mild, occasionally wet winters. The average summertime high temperature in the region is approximately 74°F. The average wintertime low temperature is approximately 49°F. Average precipitation in the local area is approximately 10 inches per year, with the bulk of precipitation falling between December and March.

Air Basin

The City and project site are within the San Diego Air Basin (SDAB) and under the jurisdiction of the San Diego Air Pollution Control District. The SDAB is 1 of 15 air basins that geographically divide the State of California. The SDAB lies in the southwest corner of California and comprises the entire San Diego region, covering 4,260 square miles; it is an area of high air pollution potential. The SDAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds.

The SDAB is currently classified as a federal nonattainment area for ozone and a state nonattainment area for particulate matter less with a diameter than or equal to 10 microns, particulate matter with a diameter less than or equal to 2.5 microns, and ozone.

Soils

Two soil series are mapped in the project boundary: Huerhuero loam (HrC), 2% to 9% slopes, and Placentia sandy loam (PeC), 2% to 9% slopes (USDA 2022). Soils within the project site have been degraded over time from disturbances such as grading and disking. As a result, the soils no longer maintain their native soil characteristics.

Terrain and Topography

The project site is characterized by undeveloped terrain and has no existing impervious areas, with the exception of a portion of the CVS parking lot. As previously described, topography within the project boundary is relatively flat with sparse vegetation throughout.

Watersheds and Hydrology

The project site occurs within the central portion of the San Marcos Creek Watershed (Hydrologic Unit Code 180703030503), within the greater boundaries of the San Marcos Creek-Frontal Gulf of Santa Catalina Parent Watershed (Hydrologic Unit Code 1807030305). The San Marcos Creek Watershed is approximately 53 square miles (34,246 acres) and consists of two major tributaries: San Marcos Creek and Encinitas Creek. These tributaries converge prior to discharging into the Pacific Ocean at Batiquitos Lagoon. The San Marcos Creek subwatershed consists of two tributaries: Las Posas Branch and Twin Oaks Branch of San Marcos Creek. These tributaries converge prior to discharging into Lake San Marcos south of the project site. The Las Posas Branch tributary to San Marcos Creek runs directly along the border of the western side of the project site.

Habitat

Within the project boundary, three vegetation communities and/or land covers were identified and categorized into non-native grassland, Diegan coastal sage scrub–*Baccharis*-dominated, and urban/developed. Please refer to Section 3.3, Biological Resources, of this EIR for a detailed analysis of biological resources.

2.3.4 Public Services

The following provides a general description of public services within the City that would serve the proposed project. Additional detail on public services can be found in Section 3.13, Public Services, of this EIR.

Fire Protection

The project site is located within the San Marcos Fire Protection District. The City of San Marcos Fire Department would provide fire protection and emergency medical services to development at the project. The City of San Marcos Fire Department provides structural fire protection and advanced life support-level emergency medical services within the City limits; unincorporated territory adjacent to the City's northern boundary; discontinuous, unincorporated areas between the City of San Marcos and the City of Escondido; and the community of Lake San Marcos. The City of San Marcos Fire Department operates four stations, the closest of which is located at 180 W Mission Road, approximately 1.7 miles from the project site.

Police Protection

Police protection services for the proposed project would be provided by the San Diego County Sheriff's Department under contract with the City. The project site would be served by the Sheriff's San Marcos Station, located at 182 Santar Place in the northeast quadrant of the City, approximately 3.2 miles from the project site.

Schools

The San Marcos Unified School District provides educational instruction for children residing within the City. Residents of the project would be served by the following schools:

- Paloma Elementary School, located at 660 Camino Magnifico, approximately 1 mile north of the project site
- San Marcos Middle School, located at 650 W Mission Road, approximately 1 mile east of the project site
- Mission Hills High School, located at 1 Mission Hills Court, approximately 3 miles from the project site

2.4 Intended Uses of the EIR

This EIR was prepared in accordance with CEQA (California Public Resources Code, Section 21000 et seq.), CEQA Guidelines (14 CCR 15000 et seq.), and the City's Environmental Review Procedures.

The EIR is an informational document that will provide the City's decision makers, public agencies, responsible and trustee agencies, and members of the public with information about (1) the potential for significant adverse environmental impacts that would result from the development of the proposed project, (2) possible ways to minimize any significant environmental impacts, and (3) feasible alternatives to the proposed project that would reduce or avoid significant impacts associated with the proposed project (California Public Resources Code,

Section 21002.1[a]; 14 CCR 15121[a]). Responsible and trustee agencies may use this EIR to fulfill their legal authority to issue permits for the proposed project. The analysis and findings in this EIR reflect the independent judgment of the City.

Lead Agency

As defined by CEQA Guidelines Section 15367, a lead agency is the public agency that has the principal responsibility for carrying out or approving a project. The City is the lead agency for the proposed project because it will perform the entitlement processing of the proposed project. As the designated lead agency, the City has assumed responsibility for preparing this EIR, and the analysis and findings in this EIR reflect the City's independent judgment. When deciding whether to approve the proposed project, the City will use the information in this EIR to consider potential impacts to the physical environment associated with the proposed project.

Responsible Agencies

As defined by CEQA Guidelines Section 15381, a responsible agency includes all public agencies other than the lead agency that have discretionary approval power over the project, such as the Vallecitos Water District. Subsequent to certification of the final EIR, agencies with permitting authority over all or portions of the proposed project will use the final EIR as the basis for their evaluation of environmental effects related to the proposed project that will culminate with the approval or denial of applicable permits.

Trustee Agencies

As defined by CEQA Guidelines Section 15386, a trustee agency is a public agency having jurisdiction by law over natural resources affected by a project that are held in trust for the people of the State of California. For example, trustee agencies include the California Department of Fish and Wildlife with regard to the fish and wildlife of the state, designated rare or endangered native plants, and game refuges, ecological reserves, and other areas administered by the California Department of Fish and Wildlife.

2.4.1 Scope of the EIR

For the proposed project, the City determined that a project EIR, as defined by CEQA Guidelines Section 15161, was required. The City made this determination based on the development proposed for the project site and the discretionary actions requested. This EIR evaluates all subject areas listed in Appendix G to the CEQA Guidelines with the exception of those subject areas determined to have no impact on the environment, which are addressed in Chapter 4 of this EIR. Chapter 3 of this EIR evaluates the following subject areas in detail: aesthetics, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, transportation, tribal cultural resources, utilities and service systems, cumulative impacts, and growth-inducing impacts. Chapter 5 analyzes alternatives to the proposed project.

As a project EIR, this EIR is "focused primarily on the changes in the environment that would result from the project" (14 CCR 15161). In addition, as a project EIR, this EIR examines all phases of the proposed project including planning, construction, and operation (14 CCR 15161). Where environmental impacts have been determined to be significant, this EIR recommends mitigation measures directed at reducing or avoiding those significant environmental impacts. Alternatives to the proposed project are identified to evaluate whether there are ways to minimize or avoid significant impacts associated with the proposed project.

2.4.2 Notice of Preparation and Scoping

CEQA establishes mechanisms to inform the public and decision makers about the nature of the proposed project and the extent and types of impacts that the proposed project and alternatives to the proposed project would have on the environment should the proposed project or alternatives be implemented. Pursuant to Section 15082 of the CEQA Guidelines, the City circulated a notice of preparation (NOP) dated April 20, 2022, to interested agencies, organizations, and parties. The NOP was also sent to the State Clearinghouse at the California Office of Planning and Research. The State Clearinghouse assigned a state identification number (SCH No. 2022040440) to this EIR.

The NOP is intended to encourage interagency and public communication regarding the proposed action so that agencies, organizations, and individuals are afforded an opportunity to respond with specific comments and/or questions regarding the scope and content of the EIR. A public scoping meeting was held on May 12, 2022, at San Marcos City Hall (1 Civic Center Drive) to gather additional public input. The 30-day public scoping period ended on May 20, 2022. Comments received during the NOP public scoping period were considered part of the preparation of this EIR. The NOP and written comments are included in Appendix A to this EIR. Comments covered numerous topics, including transportation, noise, air quality, biological resources, cultural and tribal cultural resources, land use, population and housing, utilities, and public services. Public scoping comments regarding the proposed project's potential impact on the environment have been incorporated into the analysis in Chapters 3, 4, 5, and 6 of this EIR.

2.4.3 Draft EIR and Public Review

This draft EIR was prepared under the direction and supervision of the City. The draft EIR will be made available to members of the public, responsible agencies, and interested parties for a 45-day public review period in accordance with CEQA Guidelines Section 15105.

Public review of the Draft EIR is intended to focus "on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated" (14 CCR 15204). The notice of completion of the draft EIR will be filed with the State Clearinghouse as required by CEQA Guidelines Section 15085. In addition, the notice of availability of the draft EIR will be distributed pursuant to CEQA Guidelines Section 15087. Interested parties may provide comments on the draft EIR in written form. This EIR and related technical appendices are available for review during the 45-day public review period at the following locations:

City of San Marcos Planning Division
1 Civic Center Drive
San Marcos, California 92069

San Diego County Library
San Marcos Branch
2 Civic Center Drive
San Marcos, California 92069

City of San Marcos website: https://www.san-marcos.net/departments/development-services/planning/environmental-review-sustainability/environmental-documents

Interested agencies and members of the public may submit written comments on the adequacy of the draft EIR to the City's Development Services Department at the address above, addressed to Norm Pedersen, Associate Planner, or emailed at npedersen@san-marcos.net. Comments on the draft EIR must be received by the close of business on the last day of the 45-day review period. Electronic filing and posting of the EIR would be in compliance with Assembly Bill 819, as applicable.

2.4.4 Final EIR Publication and Certification

Once the 45-day public review period has concluded, the City will review all public comments on the draft EIR and provide a written response to all written comments pertaining to environmental issues as part of the final EIR. The final EIR will include all written comments received during the public review period; responses to comments; and, if applicable, edits and errata made to the draft EIR. The City will then consider certification of the final EIR (14 CCR 15090). If the EIR is certified, the City may consider project approval (14 CCR 15092).

When deciding whether to approve the proposed project, the City will use the information provided in the final EIR to consider potential impacts to the physical environment. The City will also consider all written comments received on the draft EIR during the 45-day public review period in making its decision to certify the final EIR as complete and compliant with CEQA and in making its determination whether to approve or deny the proposed project. Environmental considerations, as well as economic and social factors, will be weighed by the City to determine the most appropriate course of action.

Prior to approving the proposed project, the City must make written findings and adopt a statement of overriding considerations with respect to any significant and unavoidable environmental effect identified in the draft EIR (14 CCR 15091, 15093). If the proposed project is approved, the City will file a notice of determination with the State Clearinghouse and San Diego County Clerk within 5 working days after project approval (14 CCR 15094.)

Subsequent to certification of the final EIR, agencies with permitting authority over all or portions of the proposed project may use the final EIR's evaluation of the proposed project's environmental effects in considering whether to approve or deny applicable permits.

2.4.5 Project Approvals and Permits

Consistent with the City's General Plan and San Marcos Municipal Code Zoning Ordinance Title 20, the proposed project requires certain entitlements be submitted, reviewed, and approved by the City. The requested entitlements include a General Plan Amendment and Rezone to change the General Plan designation and zoning from Commercial (C) to Specific Plan Area (SPA); a Tentative Subdivision Map, which will present specific lot configurations for the site; a Multi-Family Site Development Plan, will configure the site for townhome dwelling units, street configuration, infrastructure, recreational open space, and private open space; and a Specific Plan, which will be required to provide a comprehensive plan to ensure the efficient development of a new residential community within the Specific Plan Area. The City will use this EIR and associated documentation in its decision to approve or deny the required discretionary permits. The City may also use this EIR in its consideration of any future development proposal, together with any additional or supplemental information or CEQA analysis as may be required. Other responsible and/or trustee agencies can use this EIR and supporting documentation in their decision-making process to issue additional approvals. These additional approvals may include, but are not limited to, approval of sewer and water connections, approval of signage permits, and approval of biological resources mitigation.

2.5 Project Inconsistencies with Applicable Regional and General Plans

Throughout Chapter 3 of this EIR, the proposed project has been evaluated in relation to the applicable goals, policies, and objectives of the City's General Plan and San Marcos Municipal Code Zoning Ordinance Title 20 (Section 3.10, Land Use and Planning); San Diego Forward: The Regional Plan (Section 3.10); Regional Air Quality

Strategy (Section 3.2, Air Quality); San Diego Air Pollution Control District policies (Section 3.2); City's Climate Action Plan (Section 3.7, Greenhouse Gas Emissions); Regional Water Quality Control Board plans and permits (Section 3.9, Hydrology and Water Quality); the Multiple Habitat Conservation Program (Section 3.3, Biological Resources); Airport Land Use Compatibility Plans (Sections 3.8, Hazards and Hazardous Materials; Section 3.10; and Section 3.11, Noise); and various other applicable regional and local plans and policies.

As described previously, a General Plan Amendment and Rezone is proposed in order to change the designated land use and zoning for the site from Commercial (C) to Specific Plan Area (SPA), to allow for the proposed residential development of the project site. As discussed in Section 3.10 of the EIR, the proposed project would be consistent with the applicable goals of the various elements and overall vision of the City's General Plan, including the General Plan Housing Element.

2.6 List of Past, Present, and Reasonably Anticipated Future Projects in the Project Area

CEQA requires an EIR to analyze cumulative impacts. Section 15355 of the CEQA Guidelines defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." Section 15130 of the CEQA Guidelines provides guidance for analyzing significant cumulative impacts in an EIR. The discussion of cumulative impacts "need not provide as great detail as is provided for the effects attributable to the project alone," but instead is to be "be guided by standards of practicality and reasonableness" (14 CCR 15130[b]). The discussion should also focus only on significant effects resulting from the project's incremental effects and the effects of other projects. According to Section 15130(a)(1), "an EIR should not discuss impacts which do not result in part from the project evaluated in the EIR."

Cumulative impacts can result from the combined effect of past, present, and future projects located in proximity to the project under review. Therefore, it is important for a cumulative impacts analysis to be viewed over time and in conjunction with other related past, present, and reasonably foreseeable future developments whose impacts might compound or interrelate with those of the project under review.

According to Section 15130(b)(1) of the CEQA Guidelines, a cumulative impact analysis may be conducted and presented by either of two methods:

(A) a list of past, present, and probable activities producing related or cumulative impacts; or

(B) a summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document that has been adopted or certified, which described or evaluated regional or area-wide conditions contributing to the cumulative impact.

With the exception of the air quality and greenhouse gas emissions impact analyses, the cumulative list approach has been used in this cumulative analysis, as discussed below. The cumulative impacts of air quality and greenhouse gas emissions have been evaluated using the summary of projections method because the geographic scope of such impacts are on an air basin and global scale.

An inventory of past, present, and reasonably foreseeable future projects within the vicinity of the project site is presented in Table 2-2 and Figure 2-8, Cumulative Projects.

Table 2-2. Cumulative Projects

No.	Status	Project Name/ Developer	Location	Description
City of San Marcos				
1	Under Construction	Block 3 Student Housing	NW corner of Campus Way and Barham Drive	342-bed student housing development, with a buildout year of 2022
2	Approved	Carmel Street Apartments	SW corner of Industrial St. and Carmel Street	170-unit multifamily affordable housing development, with a buildout year of 2023
3	Under Construction	Kaiser Permanente Plan	Craven Rd.	206-bed hospital, with a buildout year of 2023
4	Approved	Discovery Village North	Craven Rd.	Office/Commercial/Residential on 41 acres
5	Proposed	Main Square	SE corner of San Marcos Blvd. and McMahr Rd.	Mixed-use development with a 468-unit apartment complex and 44,007 sf of commercial space
6	Approved	San Elijo Hills	San Elijo Rd.	11,711 sf Commercial development with a buildout year of 2022
7	Approved	Pacific Commercial	NE corner of Grand Ave. and Pacific St.	122-room hotel, with a buildout year of 2022
8	Under Construction	Brookfield Residential	S Twin Oaks Valley Rd.	220-unit multifamily residential development, with a buildout year of 2021
9	Under Construction	San Marcos Highlands	North end of N Las Posas Rd.	187-unit single-family residential development, with a buildout year of 2023
10	Approved	Villa Serena	Richmar Ave. and Marcos St.	Demolishes 136 units and builds a 148-unit apartment complex, with a buildout year of 2023
11	Approved	Montiel Rd Partners	Montiel Rd.	8-unit single-family residential development, with a buildout year of 2022
12	Approved	Meadowlark Canyon LLC	San Marcos Blvd.	33-unit single-family residential development
13	Under Construction	Mariposa- Phase 1	Richmar Ave. and Los Olivos Dr.	Demolition of 40 units and construction of a 100-unit apartment development, with a buildout year of 2022
14	Approved	Mariposa- Phase 2	Richmar Ave. and Los Olivos Dr.	Demolition of 30 units and building of a 96-unit apartment development
15	Under Construction	Murai-Sab	N Las Posas Rd.	89-unit single-family residential with a buildout year of 2022
16	Approved	Pacifica San Marcos	S Rancho Santa Fe Rd. and Creek St.	Mixed-use development of 31-unit apartment complex and 4,375 sf commercial space with a buildout year of 2022

Table 2-2. Cumulative Projects

No.	Status	Project Name/ Developer	Location	Description
17	Under Construction	Discovery Village South	Future Discovery St.	220-unit single-family residential, with a buildout year of 2022
18	Approved	Breaker Real Estate	SE corner of Twin Oaks Valley Rd and Richmar Ave.	174-bed assisted living facility
19	Approved	Hall Land Company	Barham Dr., east of Woodland Pkwy.	151-unit multifamily condominium development
20	Under Construction	Carkel SM- Starbucks	SE corner of San Marcos Blvd. and Bent Ave.	Drive-thru restaurant with a buildout year of 2023
21	Approved	Southlake Park Phase 1	Twin Oaks Valley Rd., South of Village Dr.	Parking lot, fishing dock
22	Approved	MacDonald Group	San Marcos Blvd. (former Sears site)	Mixed-use development with 82-unit apartment complex and 5,000 sf of commercial space
23	Under Construction	Mission 316 West	Mission Rd. at Woodward St. (east side)	67-dwelling-unit multifamily condominium development with a buildout year of 2021
24	Proposed	Lanikai	Mission Rd. at Woodward St. (west side)	115-unit senior living complex
25	Approved	Artis Senior Housing	San Elijo Rd. at Paseo Plomo	64-bed assisted living facility
26	Under Construction	Sunrise	Barham Dr. (near east city limit)	192-dwelling-unit multi-family condominiums
27	Under Construction	Jump Ball LLC	W San Marcos Blvd. at Bent Ave.	Drive-thru restaurant
28	Proposed	Montiel Commercial	2355/2357 Montiel Rd.	32,971 sf office building
29	Under Construction	California Allstars	East side of Twin Oaks Valley Rd.	28,137 sf industrial building to be completed in 2022
30	Proposed	Budhi Hill Buddhist Center	Poinsettia Ave. south of Linda Vista Dr.	Development of a 36,501 sf. Fellowship Hall and 7,612 sf monk dormitory
31	Proposed	Mercy Hill and Marian Center	Borden Rd.	31,105 sf Christian center
32	Under Construction	Karl Strauss Brewery	Las Posas Rd. and Los Vallecitos Blvd.	10,528 sf tasting room, commercial kitchen, entertainment room within existing commercial building with a buildout year of 2023

Table 2-2. Cumulative Projects

No.	Status	Project Name/ Developer	Location	Description
33	Proposed	Kiddie Academy	Twin Oaks Valley Rd., northeast of Windy Way	11,430 sf preschool
34	Proposed	Edenpark	1601 San Elijo Rd.	Adaptive reuse of existing structures for recreation, sports, and related personal services, and related commercial uses with a buildout year of 2022
35	Under Construction	San Marcos Creek Phase 1 CIP - various numbers	Discovery St. (east–west segment), Bent Ave. to Discovery St. (north–south segment)	San Marcos Creek Phase 1 Infrastructure, Via Vera Cruz Bridge, Bent Avenue Bridge, Discovery Street widening, Levee construction, Promenade, and Creek Channel Wetland Restoration
36	Funded	CIP 88179	Smilax Rd./South Santa Fe Ave. intersection	Smilax Road/South Santa Fe Avenue intersection re-alignment
37	Under Construction	CIP 86002	San Marcos Blvd. at Discovery St. intersection	Intersection improvement 300 ft west and 920 ft east of intersection
38	Funded	PARK CIP	Rancho Tesoro Park Improvements – 2 acres of 41-acre park	City Park – Phase 2 Multi-Use Field and Parking Lot Improvements
39	Programmed	ST006	South side of San Marcos Blvd., 500 ft east of Acacia Dr.	San Marcos Blvd. Slope Stabilization Project
40	Approved	Pacific Grand Ventures	1.49-acre lot east of S Pacific at Seminole St.	26,156 sf industrial building
41	Proposed	Twin Oaks Valley Winery	1451 Mulberry Dr.	3,121 sf two-story winery and tasting room on a 4.23-acre lot
42	Proposed	Pacific Specific Plan	Northwest corner of S Las Posas Rd. and Linda Vista Dr.	449-unit multifamily residential development on 33.2 acres
43	Proposed	Paul Mayer-Santa Fe Las Floras LP	Northwest corner of S Santa Fe Ave. and Las Flores Dr.	50-unit residential apartment building and 117 parking spaces on 2.23 acres
44	Proposed	Water Mill Homes, Inc. (Manning Homes)	SW corner of Mulberry Dr. and Cox Rd.	9 single-family residential lots on a 10-acre property
45	Proposed	San Marcos Hospitality	SW corner of Montiel Rd. and Leora Ln.	Hotel with 107 rooms
46	Proposed	Lonnie Tavvaa – Arco	200 Las Posas Rd.	Gas station, convenience store, car wash

Table 2-2. Cumulative Projects

No.	Status	Project Name/ Developer	Location	Description
47	Proposed	Bennet Manning	South of Woodward St. at Killarney Terrace.	3 single-family residential lots
48	Proposed	SH North City, LLC	Discovery St. west of S Twin Oaks Valley Rd.	532 attached and 94 detached condo units (626 total units), master association community rec center, public and private trail systems that connect to future Knoll Park
49	Proposed	University District Specific Plan Amendment – UVSM, LLC	Generally between North City Dr., Carmel St., Campus Way, and S. Twin Oaks Valley Rd.	Mixed-use development with 557 residential units and associated commercial and office space
50	Approved	Hollandia Dairy	620 E Mission Rd.	Partial demolition and reconstruction of dairy facilities; 48,755 sf
51	Proposed	American Rentals	1030 Linda Vista Dr.	Equipment rental facility
52	Proposed	Hunter Industries	West terminus of Opal Dr.	67,657 sf office building
53	Proposed	Hughes SMCC, LLC	NE corner of Pacific St., approximately 750 ft south of Linda Vista Dr.	67,410 sf industrial building
54	Proposed	Marcos Specific Plan	SW corner of Grand Ave. and Linda Vista Dr.	Horizontal mixed-use project with 102 residential units and 63,641 sf of commercial space and 8 live/work units.

Notes: NW = northwest; SW = southwest; Rd. = Road; SE = southeast; Blvd. = Boulevard; sf = square feet; NE = northeast; Ave. = Avenue; St. = Street; Dr. = Drive; Pkwy = Parkway; Ln. = Lane.

3 Environmental Analysis

3.1 Aesthetics

This section describes the existing visual setting of the proposed Gran Vista Specific Plan Project (project) and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the proposed project.

Table 3.1-1 summarizes the project- and cumulative-level aesthetics impacts, by threshold.

Table 3.1-1. Aesthetics Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Have a substantial adverse impact on a scenic vista.	Less than Significant	Less than Significant	Less than Significant
No. 2: Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway.	Less than Significant	Less than Significant	Less than Significant
No. 3: In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less than Significant	Less than Significant	Less than Significant
No. 4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	Less than Significant	Less than Significant	Less than Significant

3.1.1 Existing Conditions

Scenic Highways

According to the California Department of Transportation's California Scenic Highway System Map, the project site is not located adjacent to, or in the vicinity of, a designated state scenic highway (Caltrans 2018). The nearest officially designated state scenic highway is State Route (SR) 78. SR-78 is a designated state scenic highway from the west boundary to the east boundary of Anza-Borrego Desert State Park. SR-78 is located approximately 0.4 miles southwest of the project site; however, the portion designated as a state scenic highway begins approximately 43 miles east of the project site. The project site is located approximately 35 miles west of the closest point of this eligible state scenic highway. The nearest eligible state scenic highway is Interstate (I) 5. I-5 is located approximately 7.7 miles west of the project site.

At a local level, the City of San Marcos (City) has designated SR-78 as a view corridor for its unobstructed visual passageway. The highway corridor provides views of the Merriam Mountains, Mt. Whitney (located in San Diego County), Double Peak, California State University San Marcos, and Palomar Community College. Views of the project site from SR-78 are obscured from the view of motorists due to existing commercial developments and tall vegetation north of the highway.

Scenic Vista

A scenic vista is typically defined as a panoramic view or vista from an identified view/vista point, public road, public trail, public recreational area, or scenic highway. Potential scenic views from private properties are not under consideration in this analysis, as it is not required by the City. The City of San Marcos General Plan (General Plan) does not identify any designated scenic vistas; however, the General Plan more generally aims to protect the City's scenic resources such as the San Marcos, Merriam, and Double Peak Mountains; creek corridors; mature trees; rock outcroppings; and ocean views (City of San Marcos 2012). The project site is in an urban part of the City, surrounded by existing development. Potential vantage points in the City include Double Peak, Mt. Whitney (located in San Diego County), and Franks Peak. There is a potential for the project site to be visible from the Mt. Whitney peak; however, this peak is accessible only by a private road and peak access is prohibited to the public. The Franks Peak summit is accessible by various public recreational trails, which could serve as potential vantage points of the project site. Double Peak is a prominent landform with long and broad views located approximately 3 miles southeast of the project site that will also have potential views of the project site.

Visual Character

The following is a description of the existing visual characteristics and quality of the project site and surroundings.

Project Site

The 7.6-acre project site is an undeveloped lot located in the northwestern portion of the City at the northwest corner of N Las Posas Road and W Mission Road. A CVS Pharmacy is located directly adjacent to the project site to the southeast. Commercial uses are adjacent to the site's southern and western boundaries. Single-family residences are located to the north and west and to the east across N Las Posas Road. The project location and project site boundary are shown on Figures 2-1 and 2-2 in Chapter 2, Project Description. The project site is immediately visible from adjacent streets and surrounding land uses.

The undeveloped project site reflects a history of disturbance. The project site was previously rough graded during construction of the adjacent CVS. Additionally, the project site has been previously used as overflow parking for Palomar College. Existing vegetation on site is disturbed by an abundance of invasive and weedy plant species, and unpaved roads crossing the project site are visible on historic aerials since 1980 (Appendix F, Phase 1 Environmental Site Assessment). Vegetation on the project site consists of a few trees along the drainage channel and N Las Posas Road; grasses and small shrubs are disbursed throughout the site. The project site is relatively flat and the elevation is approximately 575 feet above mean sea level. As described in the Biological Technical Report (Appendix C), three vegetation communities or habitat types occur within the project site, including wild oats grassland, Diegan coastal sage scrub, and urban/developed land.

Surrounding Area

The project site is immediately bordered by N Las Posas Road to the north/northeast and W Mission Road to the south/southwest. The project site is surrounded by a CVS Pharmacy located directly south of the project site, a vacant lot and single-family residences to the west, single-family residences along the northwest project site boundary, single-family residences and a vacant lot to the east across N Las Posas Road, and light industrial and commercial uses further southwest and southeast across W Mission Road and N Las Posas Road. The project site is located in an urban setting and is surrounded by existing development on all sides. As shown in Figure 2-3, existing land use designations surrounding the project site include Commercial (C) to the west, south, and east

across N Las Posas Road. Open Space (OS) land use designations are located to the north, Low Density Residential (LDR) is located to the northwest, Very Low Density Residential (VLDR) is located further to the northeast, Specific Plan Area (SPA) is located to the southeast, and Industrial (I) uses are located to the southwest across W Mission Road. The closest freeway is SR-78 located approximately 0.4 miles south of the project site.

Existing Light and Glare Conditions

The project site is currently undeveloped and lighting on the project site is limited to parking lot and building façade lighting from the adjacent CVS building. Additionally, the project site does not contain any reflective surfaces that would act as sources of glare. Commercial, industrial, and residential developments surrounding the project site contain sources of lighting typical of these land uses. Sources of nighttime lighting in this area could occur from exterior building lighting, street lighting, lighting in parking lots, and vehicles traveling along the adjacent roadways. No sources of substantial glare are present in this area.

3.1.2 Regulatory Setting

Federal

There are no federal codes, policies, or regulations regarding aesthetics that would apply to the proposed project.

State

California Public Resources Code Section 20199

California Public Resources Code (PRC), Section 20199(d)(1), stipulates that "aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment." The proposed project would qualify as a residential project on an infill site within a transit priority area. This is further addressed in Section 3.1.4, Project Impact Analysis.

California Scenic Highway Program

The California State Legislature created the California Scenic Highway Program in 1963 with the intent "to protect and enhance the natural scenic beauty of California highways and adjacent corridors, through special conservation treatment." The state laws that govern the Scenic Highway Program are Sections 260 through 263 of the California Streets and Highways Code. A highway may be designated scenic based on the natural landscape visible by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the views of the highway. The Scenic Highway Program includes both officially designated scenic highways and highways that are eligible for designation. A highway may be designated as scenic based on aesthetic quality of viewable landscape, extent of views upon the natural landscape, and the degree to which development impedes these views. It is the responsibility of local jurisdictions to apply for scenic highway approval, which requires the adoption of a Corridor Protection Program. There are no state-designated scenic highways in the vicinity of the project site.

Local

City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan identifies one goal and associated policies to protect natural resources that have scenic value. Landforms such as the mountain ranges in the northern and southern portions of the City contribute to its scenic corridors. The following goal and policies pertain to aesthetics and visual quality (City of San Marcos 2012):

Goal COS-3: Protect natural topography to preserve and enhance the natural beauty of San Marcos.

Policy COS-3.1: Preserve scenic resources, including prominent landforms such as Double Peak, Owens Peak, San Marcos Mountains, Merriam Mountains, Cerro de Las Posas, Franks Peak, and canyon areas through conservation and management policies.

Policy COS-3.2: Encourage and maintain high-quality architectural and landscaping designs that enhance or complement the hillsides, ridgelines, canyons, and view corridors that comprise the visual character in San Marcos.

Policy COS-3.3: Continue to work with new development and redevelopment project applicants in designing land use plans that respect the topography, landforms, view corridors, wildlife corridors, and open space that exists.

Policy COS-3.4: Evaluate potential impacts to visual and aesthetic resources, including the potential to create new light sources, while still maintaining and being sensitive to rural lighting standards.

The proposed project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As detailed in Section 3.1.4, the project is consistent with the applicable goals and policies pertaining to aesthetics.

San Marcos Municipal Code Title 20, Zoning Ordinance

The provisions of Title 20 of the San Marcos Municipal Code are referred to as the Zoning Ordinance. The San Marcos Municipal Code Zoning Ordinance is the primary implementation tool for the policies of the General Plan. The Zoning Ordinance provides more detailed direction related to design and development standards; permitted, conditionally permitted, and prohibited uses; and other regulations such as lighting and sign regulations. The land uses specified in the Zoning Ordinance are based upon and consistent with the land use policies set forth in the General Plan. Specifically, the ordinance contains building design, setbacks, lighting, and signage standards, as well as open space requirements, for development to protect open space and ambient light levels in the City. Lighting standards in the ordinance require energy-efficient lighting that limits light and glare for private projects, with exceptions for specialized streetscape lighting. Private developments are required to submit lighting plans to ensure consistency with the dark sky needs of the region (City of San Marcos 2022).

Title 20, Section 20.300.080, Site Planning and General Development Standards

The City's Street Lighting Standards and Specifications describes the lighting and glare standards for the City. These standards require lighting to be directed downward and limit the type and spacing of lighting to maintain reasonable lighting levels that do not contribute to light pollution. The City uses International Dark Sky Association thresholds to inform its own testing, leading to a policy that allows for the use of energy-efficient lighting sources that include, but are not limited to, LED and induction lighting technologies (City of San Marcos 2022).

Title 20, Chapter 20.260, Ridgeline Protection and Management Overlay Zone

The City adopted a Ridgeline Protection and Management Overlay Zone in November 2008, set forth in Ordinance 2008-1314, to minimize visual impacts to important ridgelines. These guiding principles are in place to protect natural viewsheds, minimize physical impacts to ridgelines, and establish innovative site and architectural design standards. The ordinance identifies primary and secondary ridgelines within the City, plus buffer zones, or Ridgeline Overlay Zones, surrounding these ridgelines (City of San Marcos 2022). No primary or secondary ridgelines are located within or adjacent to the project site; the nearest ridgeline is a secondary ridgeline located approximately 1 mile northeast of the project site. The nearest primary ridgeline is located approximately 1.15 miles northeast of the project site.

3.1.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to aesthetics are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to aesthetics would occur if the project would:

- **Threshold No. 1:** Have a substantial adverse effect on a scenic vista.
- **Threshold No. 2:** Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway.
- **Threshold No. 3:** In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?
- **Threshold No. 4:** Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

3.1.4 Project Impact Analysis

As described in Chapter 2 of this environmental impact report, the proposed project consists of the development of 120 three-story townhomes and associated amenities within the 7.6-acre project site. The number of townhomes per building would vary from 4 to 10.

Design of the project would follow the design guidelines outlined in the Gran Vista Specific Plan (Appendix M). The design guidelines propose transitional architectural styles for the project to allow it to blend in with the surrounding neighborhood. The project would include a variety of floorplans for the proposed townhomes. Floorplans include two- and three-bedroom units that vary in size from approximately 1,200 square feet to 1,800 square feet and include differing garage configurations. All townhomes would be three stories high. The project would be designed to provide transition massing between the single-family residences to the north and west and the CVS along the southern border of the project site. Building materials, accents and colors would be used to help compliment neighborhood character, compliment the architectural style and project, define individual units, and create visual interest.

The project would incorporate landscaping and circulation improvements, and would provide 260 new parking spaces, including 20 guest spaces, in addition to 37 existing on site spaces. The project would include approximately 92,645 square feet of common recreation area on site and an average of 146 square feet of private open space per unit. The proposed project would have a density of approximately 15.8 dwelling units per acre.

The project vicinity is designated as a High Quality Transit Area due to its proximity to transit and other facilities and services that support alternatives to vehicle use. Palomar College, a public community college consisting of a 200-acre campus, is located east of the project site. Palomar College Transit Center, a North County Transit District hub, is located less than 0.25 miles from the project site. Palomar College Transit Center consists of a bus depot on the north side of W Mission Road, near the main entrance to Palomar College, and a train station on the south side of W Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the transit center provide local and regional connections to schools, employment, shopping, and entertainment options within the City, as well as San Diego and Riverside Counties. An existing bus turnout and stop are also located on W Mission Road in front of CVS. The Inland Rail Trail, a proposed 21-mile Class I bikeway, runs along the south side of W Mission Road and connects the Cities of Oceanside, Vista, San Marcos, and Escondido as well us areas of unincorporated San Diego County.

The project site is considered an infill site within an urbanized area under CEQA, and is located within a transit priority area such that aesthetic impacts are conclusively not significant under PRC Section 20199(d)(1). As described in Section 3.1.2, PRC Section 20199(d)(1) states that "aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment." According to Section 21099(d)(1), an "infill site" is defined as "a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses." The project site is located on a vacant lot and more than 75% of the project boundary is adjacent to "qualified urban uses" (i.e., residential and commercial) per PRC Section 21072, such that the site is an "infill site."

PRC Section 21071 defines an "urbanized area" as "(a) an incorporated city that meets either of the following criteria: (1) Has a population of at least 100,000 persons, or (2) Has a population of less than 100,000 persons if the population of that city and not more than two contiguous incorporated cities combined equals at least 100,000 persons." As of 2020, the City has an estimated population of 94,833 (see Section 3.12, Population and Housing). While this is less than 100,000 persons, the City of San Marcos is contiguous with the City of Escondido, which has an estimated population of 151,038 persons as of 2020 (U.S. Census Bureau 2020). The combined estimated population of these two contiguous cities is 245,871 persons, which is well over the 100,000 persons threshold. Thus, the City would be considered an urbanized area per CEQA.

As outlined in California Public Resources Code, Section 20199, a "transit priority area" is defined as "an area within one-half mile of a major transit stop that is existing or planned." The project site is located approximately 0.25 miles from the North County Transit District Palomar College Station, and therefore inside of the transit priority area. Accordingly, the proposed project is a residential project in close proximity to transit and is located in an urbanized area on an infill site.

Threshold No. 1: Would the project have a substantial adverse effect on a scenic vista?

Chapter 20.260 of the San Marcos Municipal Code defines Ridgeline Protection and Management Overlay Zones, which are intended to preserve primary ridgelines in their natural state and minimize visual impacts to secondary ridgelines through Ridgeline Development Permits. The purpose of this ordinance is to protect natural viewsheds and unique natural resources, minimize the physical impacts to ridgelines, and establish innovative site and architectural design standards. This ordinance identifies primary and secondary ridgelines located in North City Area #1, Southeast City Area #2, and Southern City Area #3 within the City limits. North City Area #1 is located in the College Area Community Plan and Twin Oaks Valley Community Plan, which includes portions of "P" Mountain and Owens Peak. Southeast City Area #2 is located in the Questhaven/La Costa Meadows Community Plan, which

includes Franks Peak and Mount Whitney (located in San Diego County). This area also includes Double Peak and Cerro de Las Posas as defined by the San Elijo Hills Specific Plan. Southern City Area #3 is located in the Questhaven/La Costa Meadows Community Plan, which includes a southerly primary ridgeline extending from east to west near the San Marcos abandoned landfill. The project site is located on an infill site in an urban part of the City and is not located within a ridgeline overlay zone.

The City's General Plan does not identify any designated scenic vistas; however, the General Plan more generally aims to protect the City's scenic resources such as the San Marcos, Merriam, and Double Peak Mountains; creek corridors; mature trees; rock outcroppings; and ocean views. The project site and surrounding valley terrain are encompassed by mountains to the east and south that provide opportunities for elevated vantage points offering long and broad views, which may include views of the project site. However, due to the relatively flat terrain of the project site and surrounding area, development of the proposed project is not expected to impede views of existing scenic vistas. Additionally, as described above, the townhomes would be designed to help provide a visual transition between the single-family residences to the north and west and the commercial and industrial uses to the south and high-density residential uses to the southeast. Due to the relatively flat terrain of the project site and surrounding area and the project site's location on an infill site in an urbanized area, development of the proposed project is not expected to impede views of existing scenic vistas, nor is the project site considered a scenic vista. Given the limited views of the project site, the distance of the project site from scenic vistas, and the transitional architectural design, impacts related to scenic vistas would be **less than significant.**

Threshold No. 2: Would the project substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?

As described above, SR-78 is located 0.4 miles south of the project site. However, as previously discussed, the section of SR-78 proximate to the project site is not identified as a scenic highway per the State Scenic Highways Program. A portion of SR-78 is identified as an eligible state scenic highway; however, this eligible segment begins 35 miles east of the project site in Santa Ysabel. The nearest eligible state scenic highway is I-5. I-5 is located approximately 7.7 miles west of the project site and is not visible due to distance. Therefore, the project site is not located within a viewshed of a state scenic highway.

While the project site is not in proximity to a designated state scenic highway, the City has designated SR-78 as a view corridor to surrounding ridgelines. As described above, views of the project site from SR-78 are generally limited due to the existing commercial, industrial, and residential developments and vegetation within an urban area of the City. Additionally, the project would provide transitional massing, scale, and architectural style between the industrial uses to the south and single-family development to the north. Therefore, the project would not substantially obstruct views from SR-78.

Further, the project site is currently undeveloped and does not support any historic buildings. There are no rock outcroppings or trees on site. Therefore, implementation of the proposed project would not substantially damage scenic resources within a state scenic highway, and impacts would be **less than significant**.

Threshold No. 3: Would the project, in non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

As previously discussed, the City (which includes the project site) is considered an urbanized area pursuant to PRC Section 21071. Therefore, the first question of Threshold No. 3 does not apply to the proposed project, as it is directed at non-urbanized areas.

The visual character of the site would be altered by the proposed project, from vacant and undeveloped land to residential development. While the proposed project would change the existing visual character on the site, it is not characterized as a substantial degradation since few public vantage points of the project site exist and the site is mainly surrounded by adjacent development in a highly urbanized area. Although the proposed residential uses would differ in land use designation and visual character in comparison to the currently designated land use of Commercial (C) for the project site, the proposed townhomes are designed to provide transitional development between the commercial and industrial land uses to the south and low density residential to the north and west. Generally, the project would conform to the existing urbanized character of the surrounding area and residential uses to the north and west, and would not substantially change the views from any public viewpoint. Renderings of the proposed townhomes are shown in Figures 3.1-1A through 3.1-1D, Project Elevations. Additionally, a landscape plan would be implemented to soften the visual impact of the proposed residential development from adjacent roadways and residences. As the proposed project's location on an infill site would not substantially degrade the existing visual character or quality of the site and its surroundings, impacts would be **less than significant.**

Threshold No. 4: Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Lighting

Lighting in the project vicinity is associated with roadway lighting and with the existing commercial and industrial uses that surround the project site. Development of the proposed project would result in new sources of light from the residential units, landscaping lighting, security lighting, and internal circulation and pedestrian lighting. These proposed land uses would introduce lighting to a site that is currently undeveloped and has no existing source of lighting.

All lighting associated with the project would be required to comply with San Marcos Municipal Code Section 20.300.080, Light and Glare Standards. Additionally, the project would conform to lighting regulations outlined in the Gran Vista Specific Plan (Appendix M), which include the following:

A. Parking area shall be illuminated to levels that achieve a uniform ratio of three to one (3:1) (average to minimum) and maintain an average of one (1) foot candle, with a minimum of one-half (1/2) foot candle.
B. Perimeter lighting, not affiliated with the lighting of parking lots, shall not exceed one-half (1/2) foot candle at any point along the property line of the subject or adjacent parcel.

Although the proposed project would result in new sources of light in the area, the project site is in an urbanized area and is surrounded by existing development with existing sources of day and nighttime lighting. Compliance with the Municipal Code would minimize and restrict nighttime light pollution and light trespass on adjacent properties. Light fixtures on site would be shielded downward as to not spill onto adjacent properties. Therefore, new sources of day or nighttime lighting associated with the project would not be considered substantial, and impacts related to lighting would be **less than significant.**

Glare

Implementation of the proposed project could potentially include sources of glare from architectural finishes or amenities on site. The project developer would be required by Municipal Code Section 20.300.080, Light and Glare Standards, to minimize use of reflective building materials and finishes, as well as reflective lighting structures and metallic surfaces, to the extent feasible to impede any potential generated glare. As shown in the project renderings (Figures 3.1-1A through 3.1-1D), the proposed development would incorporate materials and finishes that would minimize the potential for glare, including recessed windows, window awnings, and neutral colors for building facades. The proposed project would not propose any features that would be characterized as creating a substantial new source of glare that would adversely affect daytime or nighttime views in the area. Therefore, project impacts related to glare would be **less than significant.**

3.1.5 Cumulative Impact Analysis

Projects contributing to a cumulative aesthetic impact include those within the project viewshed. The viewshed encompasses the geographic area within which the viewer is most likely to observe the proposed project and surrounding uses. Typically, this is delineated based on topography, as elevated vantage points, such as scenic vistas, offer unobstructed views of expansive visible landscapes.

Cumulative aesthetic impacts would occur if projects combine to result in substantial adverse impacts to the visual quality of the environment and increase sources of lighting and glare. As discussed above, the proposed project would have no substantial impact on a scenic vista or City-protected scenic resource, would not adversely impact the visual character of the area, and would not introduce a substantial new source of lighting or glare.

Although not technically designated scenic vistas, Mt. Whitney (located in San Diego County), Franks Peak, and the adjacent prominent ridgelines are scenic resources that the City's General Plan aims to protect and preserve for their natural visual quality. As previously discussed, the summit of Mt. Whitney (located in San Diego County) is off limits to the public, but Franks Peak and its surrounding recreational trails are publicly accessible. From Franks Peak, viewers would be able to see cumulative residential projects in the same viewshed, and potentially portions of the project site. The proposed residential development would be three stories tall and the industrial uses to the south consist of one- and two-story buildings of varying height. Due to the light industrial uses to the south, the project would not substantially contrast with the visual patterns of the area, as height and density would be consistent with the existing surrounding development; the project would appear as an extension of the already urbanized landscape. Therefore, the proposed project would not substantially contribute to a cumulative change in visual character of the surrounding area.

As discussed, the closest designated state scenic highway is SR-78; however, the segment designated as a state scenic highway is located in Anza Borrego State Park, approximately 43 miles east of the project site. Therefore, the proposed project would not result in a cumulative impact to the designated state scenic highway segment of SR-78. Nor would the proposed project result in a cumulative impact to the eligible designated state scenic highway I-5, as it is located beyond intervening topography approximately 7.7 miles west of the project site.

As previously described, the project site is surrounded by existing developments that contain sources of lighting typical of residential, commercial, and industrial uses. The proposed project would introduce new sources of lighting to the project site as the proposed project would allow for the development of residential uses. The project site is currently undeveloped and contains no sources of light. The project and cumulative projects would have to comply with the Municipal Code, which would restrict light trespass into adjacent properties and ensure that new sources

of lighting would not result in significant impacts. Concerning glare, implementation of the proposed project would not result in new sources of glare. The project developer, and the developers of any proposed cumulative projects, would be required to minimize use of reflective building materials and finishes, as well as reflective lighting structures and metallic surfaces, to the extent feasible to impede any potential glare effects to comply with the Municipal Code. Impacts pertaining to light and glare from the project and cumulative projects would be minimized through compliance with applicable regulations related to light and glare and design requirements. For the reasons outlined above, cumulative impacts related to aesthetics would be **less than significant**.

3.1.6 Mitigation Measures

No significant impacts to aesthetics were identified and therefore no mitigation measures are required.

3.1.7 Conclusion

In summary, development of the project would not be built upon any primary or secondary ridgelines, nor would the project substantially affect a scenic vista. The project site is not located in close proximity to a designated state scenic highway per the State Scenic Highway Program. Although the City has designated SR-78 as a view corridor to surrounding ridgelines, the project would not significantly change views from SR-78 and the project would not impede views to any primary or secondary ridgelines from SR-78.

The project site is located in an urbanized area on an infill site and would not conflict with applicable zoning and other regulations governing scenic quality, including the scenic resource protection policies in the Conservation and Open Space Element of the City's General Plan (refer to Section 3.10). Implementation of the proposed project would reasonably result in changes to the visual character of the site by allowing residential development; however, impacts would be minimal due to a general lack of public vantage points and visual conformance with adjacent development. Landscaping associated with the project would also soften views of the project site from adjacent uses.

Concerning lighting and glare, the proposed project would not include highly reflective finishes or excessive lighting. Further, any exterior nighttime lighting associated with the project would be required to comply with the City's Street Lighting Standards and Specifications, Municipal Code, and design guidelines in the Gran Vista Specific Plan prepared for the project site.

Implementation of the proposed project would result in less-than-significant impacts related to aesthetics, and no mitigation is required.

3.2 Air Quality

This section evaluates the potential impacts of the proposed Gran Vista Specific Plan Project (project) on air quality and its contribution to regional air quality conditions and identifies associated regulatory requirements. This section is based on the Air Quality and Greenhouse Gas Emissions Technical Report for the Gran Vista Specific Plan Project prepared by Dudek in February 2023. The complete Air Quality and Greenhouse Gas Emissions Technical Report is included as Appendix B of this environmental impact report (EIR).

Table 3.2-1 summarizes the project- and cumulative-level air quality impacts under each applicable threshold of significance.

Table 3.2-1. Air Quality Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Conflict with or obstruct implementation of the applicable air quality plan.	Less than Significant	Less than Significant	Less than Significant
No. 2: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard.	Less than Significant	Less than Significant	Less than Significant
No. 3: Expose sensitive receptors to substantial pollutant concentrations.	Less than Significant	Less than Significant	Less than Significant
No. 4: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	Less than Significant	Less than Significant	Less than Significant

3.2.1 Existing Conditions

This section introduces the environmental setting of the project site, including the meteorological/climate conditions for the project area, current physical setting, and pollutant levels in proximity to the proposed project.

The City of San Marcos (City) is located within the San Diego Air Basin (SDAB) and is under the jurisdiction of the San Diego Air Pollution Control District (SDAPCD). The project site is bounded by N Las Posas Road along the eastern boundary, W Mission Road along the southwest boundary, an existing CVS store to the south, and existing single-family residential development to the west/northwest. Nearby land uses in the vicinity of the project site include industrial and commercial uses to the west on the other side of W Mission Road, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.2 miles to the east.

Baseline Air Quality

The SDAB is one of 15 air basins that geographically divide the State of California. The SDAB is currently classified as a federal nonattainment area for ozone (O_3) and a state nonattainment area for particulate matter with a diameter less than or equal to 10 microns (PM_{10}), particulate matter with a diameter less than or equal to 2.5 microns ($PM_{2.5}$), and O_3.

The SDAB lies in the southwest corner of California and comprises the entire San Diego region, covering 4,260 square miles; it is an area of high air pollution potential. The SDAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds.

The SDAB experiences frequent temperature inversions. Subsidence inversions occur during the warmer months as descending air associated with the Pacific High Pressure Zone meets cool marine air. The boundary between the two layers of air creates a temperature inversion that traps pollutants. Another type of inversion, a radiation inversion, develops on winter nights when air near the ground cools by heat radiation and the air aloft remains warm. The shallow inversion layer formed between these two air masses also can trap pollutants. As the pollutants become more concentrated in the atmosphere, photochemical reactions occur that produce O_3, commonly known as smog (CARB 2014).

Light daytime winds, predominantly from the west, further aggravate the condition by driving air pollutants inland, toward the mountains. During the fall and winter, air quality problems are created due to carbon monoxide (CO) and oxides of nitrogen (NO_x) emissions. CO concentrations are generally higher in the morning and late evening. In the morning, CO levels are elevated due to cold temperatures and the large number of motor vehicles traveling. Higher CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO is produced almost entirely from automobiles, the highest CO concentrations in the SDAB are associated with heavy traffic. Nitrogen dioxide (NO_2) levels are also generally higher during fall and winter days.

Under certain conditions, atmospheric oscillation results in the offshore transport of air from the Los Angeles region to San Diego County (County). This often produces high O_3 concentrations, as measured at air pollutant monitoring stations within the County. The transport of air pollutants from Los Angeles to San Diego has also occurred within the stable layer of the elevated subsidence inversion, where high levels of O_3 are transported.

Pursuant to the 1990 Clean Air Act amendments, the U.S. Environmental Protection Agency (EPA) classifies air basins (or portions thereof) as “attainment” or “nonattainment” for each criteria air pollutant, based on whether the National Ambient Air Quality Standards (NAAQS) have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as “attainment” for that pollutant. If an area exceeds the standard, the area is classified as “nonattainment” for that pollutant. As previously discussed, these standards are set by EPA or the California Air Resources Board (CARB) and represent the maximum level of a given air pollutant that can exist in the outdoor air without unacceptable effects on human health or the public welfare. If there are not enough data available to determine whether the standard is exceeded in an area, the area is designated as “unclassified” or “unclassifiable.” The designation of “unclassifiable/attainment” means that the area meets the standard or is expected to meet the standard despite a lack of monitoring data.

Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved maintenance plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, calls for the designation of areas as “attainment” or “nonattainment,” but based on the California Ambient Air Quality Standards (CAAQS) rather than the NAAQS. Current attainment designations for the SDAB for the criteria pollutants are presented in Table 3.2-2. In summary, the SDAB is designated as a nonattainment area for the 2008 8-hour O_3 NAAQS. The SDAB is designated as a nonattainment area for O_3, PM_{10}, and $PM_{2.5}$ CAAQS. The portion of the SDAB where the project site is located is designated as attainment or unclassifiable/unclassified for all other criteria pollutants under the NAAQS and CAAQS.

Table 3.2-2. San Diego Air Basin Attainment Classification

Pollutant	Federal Designation	State Designation
O3 (1-hour)	Attainment[a]	**Nonattainment**
O3 (8-hour–1997) (8-hour–2008)	Attainment (maintenance) **Nonattainment (moderate)**	**Nonattainment**
NO2	Unclassifiable/attainment	Attainment
CO	Attainment (maintenance)	Attainment
SO2	Not designated[b]	Attainment
PM10	Unclassifiable/attainment	**Nonattainment**
PM2.5	Unclassifiable/attainment	**Nonattainment**
Lead	Unclassifiable/attainment	Attainment
Sulfates	No federal standard	Attainment
Hydrogen sulfide	No federal standard	Unclassified
Visibility-reducing particles	No federal standard	Unclassified
Vinyl chloride	No federal standard	No designation

Sources: EPA 2020 (federal); CARB 2021a (state).
Notes: O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter with a diameter less than or equal to 10 microns; $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns.
Attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.

[a] The federal 1-hour standard of 0.12 parts per million was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in State Implementation Plans.

[b] Federal designations for SO_2 are on hold by EPA; EPA expects to make the designations by December 2017 (EPA 2016).

The SDAPCD operates a network of ambient air monitoring stations throughout San Diego County that measure ambient concentrations of pollutants and determine whether the ambient air quality meets the CAAQS and NAAQS. The SDAPCD monitors air quality conditions at 11 locations throughout the SDAB. Camp Pendleton monitoring station is the closest to the project site for O_3 and NO_2. The Escondido–East Valley Parkway monitoring station ceased to collect data after 2015; thus, due to proximity to the site and similar geographic and climactic characteristics, the San Diego–11403 Rancho Carmel Drive monitoring station concentrations are considered most representative for the project site. Data at this station was also available for CO. The El Cajon–609 S 1st Street monitoring station was used for SO_2, PM_{10}, and $PM_{2.5}$. Ambient concentrations of pollutants from 2018 through 2020 are presented in Table 3.2-3. Air quality within the project region was in compliance with the CAAQS and NAAQS for NO_2, CO, SO_2, and PM_{10} (NAAQS only) during this monitoring period.

		Federal	12.0	9.6	8.6	10.3	—	—	—

Sources: CARB 2021b; EPA 2021.
Notes: ppm = parts per million by volume; — = not available; µg/m³ = micrograms per cubic meter; ND = insufficient data available to determine the value.
Data taken from CARB iADAM (http://www.CARB.ca.gov/adam) and EPA AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour ozone, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.
Camp Pendleton monitoring station is located at 21441 West B Street, Camp Pendleton, California.
San Diego monitoring station is located at 11403 Rancho Carmel Drive, San Diego, California.
The El Cajon–Lexington Elementary School monitoring station is located at 533 First Street, El Cajon, California.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

Climate and Topography

The weather of the San Diego region, as in most of Southern California, is influenced by the Pacific Ocean and its semi-permanent high-pressure systems that result in dry, warm summers and mild, occasionally wet winters. The average summertime high temperature in the region is approximately 74°F. The average wintertime low temperature is approximately 49°F. Average precipitation in the local area is approximately 10 inches per year, with the bulk of precipitation falling between December and March (WRCC 2017). The topography in the San Diego region varies greatly, from beaches on the west to mountains and desert on the east. Along with local meteorology, topography influences the dispersal and movement of pollutants in the air basin. The mountains to the east prevent dispersal of pollutants in that direction and help trap them in inversion layers. The interaction of ocean, land, and the Pacific High Pressure Zone maintains clear skies for much of the year and influences the direction of prevailing winds (western to northwestern). Local terrain is often the dominant factor inland, and winds in inland mountainous areas tend to blow through the valleys during the day and down the hills and valleys at night.

Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, the elderly, and people with cardiovascular and chronic respiratory diseases. Sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes. The closest existing sensitive receptors include single-family residents bordering the western boundary of the project site.

Pollutants and Effects

Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, NO_2, CO, sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$, and lead. These pollutants, as well as toxic air contaminants (TACs), are discussed in the following text. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants (Appendix B).

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors, such as hydrocarbons and NO_x. These precursors are mainly NO_x and volatile organic compounds

(VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere ozone layer (stratospheric ozone) and at the Earth's surface in the troposphere (ozone). O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. These health problems are particularly acute in sensitive receptors such as the sick, the elderly, and young children.

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide, which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections.

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil, fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas such as the project location, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions; primarily, wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent. In terms of adverse health effects, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can include dizziness, fatigue, and impairment of central nervous system functions.

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs and can cause acute respiratory symptoms and diminished lung function in children. When combined with particulate matter, SO_2 can injure lung tissue and reduce visibility and the level of sunlight. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles, which can include smoke, soot, dust, salts, acids, and metals, floating in the air. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. $PM_{2.5}$ (fine particulate matter) is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs. PM_{10} (respirable particulate matter or coarse particulate matter) is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles

traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle, as well as producing haze and reducing regional visibility.

People with influenza, people with chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death as a result of breathing particulate matter. People with bronchitis can expect aggravated symptoms from breathing in particulate matter. Children may experience a decline in lung function due to breathing in PM_{10} and $PM_{2.5}$. Other groups considered sensitive are smokers, people who cannot breathe well through their noses, and exercising athletes (because many breathe through their mouths).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient (IQ) performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon, and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs. Combustion engine exhaust, oil refineries, and fossil-fueled power plants are sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry-cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

Non-Criteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic noncancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the State of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and noncarcinogenic effects. Noncarcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

CARB classified "particulate emissions from diesel-fueled engines" (i.e., diesel particulate matter [DPM]) as a TAC in August 1998. DPM is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. DPM is emitted from a broad range of diesel engines: on-road diesel engines of trucks, buses, and cars and off-road diesel engines including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with diesel particulate matter, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000).

Valley Fever. Coccidioidomycosis, more commonly known as valley fever, is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. When fungal spores are present, any activity that disturbs the soil, such as digging, grading, or other earth-moving operations, can cause the spores to become airborne and thereby increase the risk of exposure. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline sandy soils.

Valley fever is not considered highly endemic to San Diego. Per the San Diego County Health and Human Services Agency, the 10-year average (2008–2017) for Coccidioidomycosis cases in the County is 4.5 cases per 100,000 people per year. The project site is within the 92069 zip code. For the 92069 zip code, there were 16 cases of Coccidioidomycosis between 2008 and 2017, which is equivalent to a rate of 3.4 cases per 100,000 people (Nelson, pers. comm., 2018). Statewide incidences in 2016 were 13.7 per 100,000 people (CDPH 2017).

Even if present at a site, earth-moving activities may not result in increased incidence of valley fever. Propagation of *Coccidioides immitis* is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. *Coccidioides immitis* spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores

to be at increased risk of developing valley fever. Moreover, exposure to *Coccidioides immitis* does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

3.2.2 Regulatory Setting

The following section provides a general description of the applicable regulatory requirements pertaining to air quality, including federal, state, and local guidelines.

Federal

Federal Clean Air Act

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. EPA is responsible for implementing most aspects of the Clean Air Act, including setting NAAQS for major air pollutants, setting hazardous air pollutant standards, approving state attainment plans, setting motor vehicle emission standards, issuing stationary source emission standards and permits, and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the criteria pollutants O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare state implementation plans (SIPs) that demonstrate how those areas will attain the standards within mandated time frames.

State

Federal Clean Air Act

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established CAAQS, which are generally more restrictive than the NAAQS. The CAAQS describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard. Air quality is considered “in attainment” if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, $PM_{2.5}$, and visibility-reducing particles are values that are not to be exceeded. All other criteria air pollutants regulated in California (e.g., sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles) are not to be equaled or exceeded. The NAAQS and CAAQS are presented in Table 3.2-4.

Table 3.2-4. Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS[a]	NAAQS[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as primary standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as primary standard
	Annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as primary standard
	Annual arithmetic mean	20 µg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as primary standard
	Annual arithmetic mean	12 µg/m³	12.0 µg/m³	15.0 µg/m³
Lead[j,k]	30-day average	1.5 µg/m³	—	—
	Calendar quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as primary standard
	Rolling 3-month average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24- hours	25 µg/m³	—	—
Visibility reducing particles	8 hour (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to particles when the relative humidity is less than 70%	—	—

Source: Appendix B

Notes: CAAQS = California Ambient Air Quality Standards; NAAQS = National Ambient Air Quality Standards; O_3 = ozone; ppm = parts per million by volume; µg/m³ = micrograms per cubic meter; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter—PM_{10}, $PM_{2.5}$, and visibility-reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth-highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National primary standards: the levels of air quality necessary, with an adequate margin of safety to protect the public health.

[e] National secondary standards: the levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the primary and secondary NAAQS for O_3 were lowered from 0.075 ppm to 0.070 ppm.

[g] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. Air pollution from commercial and industrial facilities is regulated by local air quality management districts, whereas mobile sources of air pollution are regulated by CARB and the EPA. All air pollution control districts have been formally designated as “attainment” or “nonattainment” for each state air quality standard, as shown in Table 3.2-2. Areas in California where ambient air concentrations of pollutants are higher than the state standard are considered to be in nonattainment status for that pollutant. Nonattainment designations are categorized into three levels of severity: (1) moderate, (2) serious, and (3) severe. If there are inadequate or inconclusive data to make a definitive attainment designation, districts are considered “unclassified.”

Toxic Air Contaminants

The state Air Toxics Program was established in 1983 under AB 1807. The California TAC list identifies more than 700 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) hazardous air pollutants. In 1987, the legislature enacted the Air Toxics “Hot Spots” Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of

effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from new and existing diesel-fueled vehicles and engines (CARB 2000). Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression-Ignition (Diesel) Engines and Equipment Program. These regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. There are several airborne toxic control measures that reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et. seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

California Health and Safety Code Section 41700

Section 41700 of the California Health and Safety Code states that a person must not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

Local

San Diego Air Pollution Control District

Although CARB is responsible for the regulation of mobile emission sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. The project site is located within the SDAB and is subject to SDAPCD guidelines and regulations.

SDAPCD and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB. The Regional Air Quality Strategy (RAQS) for the SDAB was initially adopted in 1991 and is updated every 3 years (last updated in 2016, with the 2022 RAQs pending adoption) (SDAPCD 2023). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS relies on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in San Diego County and the cities in the County, to project future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of development of their general plans.

The 8-Hour Ozone Attainment Plan for San Diego County indicated that local controls and state programs would allow the region to reach attainment of the federal 8-hour O_3 standard by 2018 (SDAPCD 2016). In this plan, SDAPCD relied on the RAQS to demonstrate how the region will comply with the federal O_3 standard. The RAQS details how the region will manage and reduce O_3 precursors (NO_x and VOCs) by identifying measures and regulations intended to reduce these contaminants. The control measures identified in the RAQS generally focus on stationary sources; however, the emissions inventories and projections in the RAQS address all potential

sources, including those under the authority of CARB and EPA. Incentive programs for reduction of emissions from heavy-duty diesel vehicles, off-road equipment, and school buses are also established in the RAQS. In response to court decisions, some elements in the 8-hour Ozone Attainment Plan for San Diego County required updates. CARB staff prepared the 2018 Updates to the California SIP to update SIP elements for nonattainment areas throughout the state. The applicable ozone attainment date for San Diego County is in 2032. The 2020 Ozone Attainment Plan complies with the Severe Nonattainment Area classification planning requirements and includes demonstrations for attainment of the 75 parts per billion and 70 parts per billion O_3 standards by 2026 and 2032, respectively. The 2020 plan includes a regionwide inventory of O_3 forming emissions, a reasonably further progress demonstration showing emissions reductions during the years leading to the attainment dates, an assessment of Reasonably Available Control Technology and Reasonably Available Control Measures, and contingency measures in the event the emissions controls fall short of achieving the needed reductions.

In December 2005, the SDAPCD also prepared a report titled Measures to Reduce Particulate Matter in San Diego County to address implementation of Senate Bill 656 in San Diego County (Senate Bill 656 required additional controls to reduce ambient concentrations of PM_{10} and $PM_{2.5}$). In the report, the SDAPCD evaluates implementation of source-control measures that would reduce particulate matter emissions associated with residential wood combustion (SDAPCD 2005).

In addition to SDAPCD's regional planning efforts, the following SDAPCD rules and regulations also would apply to the project:

- **SDAPCD Regulation II: Permits; Rule 20.2: New Source Review Non-Major Stationary Sources.** Requires new or modified stationary source units (that are not major stationary sources) with the potential to emit 10 pounds per day or more of VOC, NO_x, SO_x, or PM_{10} to be equipped with best available control technology. For those units with a potential to emit above Air Quality Impact Assessments Trigger Levels, the units must demonstrate that such emissions would not violate or interfere with the attainment of any national air quality standard (SDAPCD 1998).
- **SDAPCD Regulation IV: Prohibitions; Rule 50: Visible Emissions.** Prohibits discharge into the atmosphere from any single source of emissions whatsoever any air contaminant for a period or periods aggregating more than 3 minutes in any period of 60 consecutive minutes that is darker in shade than that designated as Number 1 on the Ringelmann Chart, as published by the U.S. Bureau of Mines, or of such opacity as to obscure an observer's view to a degree greater than does smoke of a shade designated as Number 1 on the Ringelmann Chart (SDAPCD 1997).
- **SDAPCD Regulation IV: Prohibitions; Rule 51: Nuisance.** Prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, annoyance to people and/or the public, or damage to any business or property (SDAPCD 1976).
- **SDAPCD Regulation IV: Prohibitions; Rule 55:** Fugitive Dust. Regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project site (SDAPCD 2009).
- **SDAPCD Regulation IV: Prohibitions; Rule 67.0.1: Architectural Coatings.** Requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015).

City of San Marcos General Plan

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing air pollutant emissions. Applicable policies include the following:

Land Use and Community Design Element

Goal LU-2: Promote development standards and land use patterns that encourage long-term environmental sustainability.

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Goal LU-3: Develop land use patterns that are compatible with and support a variety of mobility opportunities and choices.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Goal M-3: Promote and encourage use of alternative transportation modes, including transit, bicycles, neighborhood electric vehicles (NEVs), and walking, within the City.

The proposed project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning, and throughout Chapter 3 of this EIR.

3.2.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to air quality are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to air quality would occur if the project would:

- **Threshold No. 1:** Conflict with or obstruct implementation of the applicable air quality plan.
- **Threshold No. 2:** Result in a cumulatively considerable new increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
- **Threshold No. 3:** Expose sensitive receptors to substantial pollutant concentrations.
- **Threshold No. 4:** Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or pollution control district may be relied upon to determine whether the project would have a significant impact on air quality. For purposes of this EIR, reference has been made to thresholds established by SDAPCD in Rule 20.2 for permitted stationary sources.

SDAPCD sets forth quantitative emission thresholds in Rule 20.2 below which a stationary source would not have a significant impact on ambient air quality. For CEQA purposes, these thresholds can be used to demonstrate that a project's total emissions (e.g., stationary and fugitive emissions, as well as emissions from mobile sources) would not result in a significant impact to air quality. While the proposed project is a land use development project (and not a stationary source project), the Rule 20.2 thresholds provide a representative and relevant proxy for purposes of assessing project impacts. Therefore, project-related air quality impacts assessed in this EIR would be considered significant if any of the applicable significance thresholds developed by SDAPCD for Rule 20.2, as presented in Table 3.2-5, are exceeded. Emissions below the screening-level thresholds would not cause a significant impact. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 3.2-5, a project could have the potential to result in a cumulatively considerable net increase in these pollutants and thus could have a significant impact on the ambient air quality.

Table 3.2-5. San Diego Air Pollution Control District Air Quality Significance Thresholds

Construction Emissions			
Pollutant	**Total Emissions (Pounds per Day)**		
Respirable particulate matter (PM_{10})	100		
Fine particulate matter ($PM_{2.5}$)	55		
Oxides of nitrogen (NO_x)	250		
Sulfur oxides (SO_x)	250		
Carbon monoxide (CO)	550		
Volatile organic compounds (VOC)	137[a]		
Operational Emissions			
	Total Emissions		
Pollutant	**Pounds per Hour**	**Pounds per Day**	**Tons per Year**
Respirable particulate matter (PM_{10})	—	100	15
Fine particulate matter ($PM_{2.5}$)	—	55	10
Oxides of nitrogen (NO_x)	25	250	40
Sulfur oxides (SO_x)	25	250	40
Carbon monoxide (CO)	100	550	100
Lead and lead compounds	—	3.2	0.6
Volatile organic compounds (VOC)	—	137[a]	13.7

Source: SDAPCD Rules 1501 and 20.2(d)(2).
Note:
[a] VOC threshold based on South Coast Air Quality Management District (SCAQMD) levels per the SCAQMD and the Monterey Bay Air Pollution Control District, which have similar federal and state attainment status to San Diego.

Methodology

Construction

Construction assumptions, including timing, phasing, and equipment type and quantity, as well as worker and vendor truck trips, were based on information provided by the applicant. Default values provided by the California Emissions Estimator Model (CalEEMod) were used where detailed project information was not available. For purposes of most conservatively estimating project air quality emissions, it is assumed that construction would

commence in December 2023[1] and would end in March 2025. Construction is anticipated to occur in five phases consisting of site preparation, grading, paving, building construction, and architectural coating. The analysis contained herein is based on the following assumptions (the duration of phases is approximate):

- Site preparation – 6 days (December 2023)
- Grading – 24 days (December 2023–January 2024)
- Paving – 20 days (January 2024–February 2024)
- Building construction – 262 days (February 2024–February 2025)
- Architectural coating – 20 days (February 2025–March 2025)

The construction equipment mix used for estimating construction emissions herein is based on CalEEMod defaults and is shown in Table 3.2-6. For this analysis, it was estimated that heavy construction equipment would operate 5 days a week during project construction. The equipment used in each phase as shown in Table 3.2-6 was based on the CalEEMod default equipment mix for each phase of construction. Construction worker and vendor estimates by construction phase were generated by CalEEMod. Based on the project's grading plans, the project would be balanced on site. The applicant has committed to using offroad construction equipment with EPA Tier 4 Interim certification or better for equipment over 50 horsepower and electric equipment less than 50 horsepower[2] (Appendix B).

Table 3.2-6. Construction Scenario Parameters

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Site preparation	12	4	0	Rubber Tired Loaders	1	8
				Tractors/Loaders/ Backhoes	3	8
Grading	16	4	0	Graders	1	8
				Rubber Tired Dozers	1	8
				Scrapers	4	8
				Tractors/Loaders/ Backhoes	1	8
Paving	16	4	0	Pavers	2	8
				Paving Equipment	2	8
				Rollers	3	8

[1] The analysis assumes a construction start date of December 2023, which represents the earliest date construction would initiate (although unlikely). Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

[2] In the case that a piece of equipment is not available in Tier 4 Interim, the applicant may upgrade another piece of equipment to better than Tier 4 Interim (i.e., Tier 4 Final) to compensate for the piece of equipment with a lower tier.

Table 3.2-6. Construction Scenario Parameters

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Building Construction	192	54	0	Welders	1	8
				Air Compressors	2	8
				Cranes	1	4
				Forklifts	2	8
				Generator Sets	1	8
				Skid Steer Loaders	1	4
				Tractors/Loaders/ Backhoes	1	4
Architectural coating	38	4	0	Air Compressors	1	6

Health Risk Assessment

As a precautionary measure, a health risk assessment (HRA) was performed to assess the impact of construction on sensitive receptors proximate to the project. Appendix B to this EIR includes an HRA associated with emissions from construction of the project based on the methodologies prescribed in the Office of Environmental Health Hazard Assessment Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015). To implement the Office of Environmental Health Hazard Assessment Guidelines based on project information, the SDAPCD has developed a three-tiered approach where each successive tier is progressively more refined, with fewer conservative assumptions. The SDAPCD Supplemental Guidelines for Submission of Air Toxics "Hot Spots" Program Health Risk Assessments provides guidance with which to perform HRAs within the SDAB (SDAPCD 2022).

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends a carcinogenic (cancer) risk threshold of 10 in a million. Additionally, some TACs increase non-cancer health risk due to long-term (chronic) exposures. The Chronic Hazard Index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. The SDAPCD recommends a Chronic Hazard Index significance threshold of 1.0 (project increment). The exhaust from diesel engines is a complex mixture of gases, vapors, and particles, many of which are known human carcinogens. DPM has established cancer risk factors and relative exposure values for long-term chronic health hazard impacts. No short-term, acute relative exposure level has been established for DPM; therefore, acute impacts of DPM are not addressed in this assessment. The HRA evaluated the risk to future residents from diesel emissions from exhaust from on-site construction equipment and diesel haul and vendor trucks.

The dispersion modeling of DPM was performed using the American Meteorological Society/EPA Regulatory Model (AERMOD), which is the model SDAPCD requires for atmospheric dispersion of emissions. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain (EPA 2022). For the project, AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the "X/Q" values. X/Q is a dispersion factor that is the

average effluent concentration normalized by source strength and is used as a way to simplify the representation of emissions from many sources. The X/Q values of ground-level concentrations were determined for construction emissions using AERMOD and the maximum concentrations determined for the 1-hour and Period averaging periods. Principal parameters of this modeling are presented in Table 3.2-7.

Table 3.2-7. AERMOD Principal Parameters

Parameter	Details
Meteorological Data	The latest 3-year meteorological data (2010–2012) for the Escondido Station (Station ID 3177) from SDAPCD were downloaded and then input to AERMOD. For cancer or chronic noncancer risk assessments, the average cancer risk of all years modeled was used.
Urban versus Rural Option	Urban areas typically have more surface roughness, as well as structures and low-albedo surfaces that absorb more sunlight—and thus more heat—relative to rural areas. However, based on the SDAPCD guidelines, the rural dispersion option was selected due to the project's proximity to the ocean.
Terrain Characteristics	The terrain in the vicinity of the modeled project site is generally flat. The elevation of the modeled site is about 575 feet above sea level. Digital elevation model files were imported into AERMOD so that complex terrain features were evaluated as appropriate.
Elevation Data	Digital elevation data were imported into AERMOD and elevations were assigned to the emission sources and receptors. Digital elevation data were obtained through AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with a 10-meter resolution.
Emission Sources and Release Parameters	Air dispersion modeling of DPM from construction equipment was conducted using emissions estimated using the CalEEMod, assuming emissions would occur 8 hours per day, 5 days per week. The project area was modeled as a series of volume sources.
Source Release Characterizations	Based on EPA methodology, the modeled line volume sources would result in a release height of 3.4 meters, a plume height of 6.8 meters, and a plume width of 8.6 meters for off-road equipment and diesel trucks (EPA 2015).
Discrete Receptors	A uniform Cartesian grid overlaying residential receptors in close proximity to the project with 20-meter resolution was placed. Additional discrete receptors were placed over residences not within the uniform Cartesian grid.

Source: Appendix B.
Note: SDAPCD = San Diego Air Pollution Control District; AERMOD = American Meteorological Society/Environmental Protection Agency Regulatory Model; DPM = diesel particulate matter; CalEEMod = California Emissions Estimator Model; EPA = U.S. Environmental Protection Agency.

Dispersion model plotfiles from AERMOD were then imported into CARB's Hotspots Analysis and Reporting Program Version 2 to determine health risk, which requires peak 1-hour emission rates and annual-averaged emission rates for all pollutants for each modeling source. For the residential health risk, the HRA assumed exposure would start in the third trimester of pregnancy. The results of the HRA are provided in Appendix B to this EIR.

Operation

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating were calculated in the building energy use module of CalEEMod, as described in the following text.

Area Sources

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint

products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2021). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of residential buildings and on the default factor of pounds of VOC per building square foot per day. The CalEEMod default values for consumer products were modeled.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings, such as in paints and primers used during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings; SDAPCD's Rule 67.0.1 (Architectural Coatings) governs the VOC content for interior and exterior coatings (SDAPCD 2015). The model default reapplication rate of 10% of area per year was assumed. Consistent with CalEEMod defaults, it was assumed that the surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2021). Consistent with the architectural coatings used during the construction phase, the applicant will use architectural coatings with a VOC content of 50 grams per liter for internal reapplication, and exterior architectural coatings would have a VOC content of 100 grams per liter for any reapplication during operation.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of nonresidential building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. Emissions associated with potential landscape maintenance equipment were included to conservatively capture potential project operational emission sources. As a project design feature, the project would not include wood burning stoves or fireplaces.

Energy Sources

As represented in CalEEMod, energy sources would include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for greenhouse gases in CalEEMod, since criteria pollutant emissions occur at the site of the power plant, which is typically off site.

Operational criteria air pollutant emissions from energy sources include natural gas combustion for appliances and space heating. The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. CalEEMod defaults were assumed for electricity and natural gas. The project is also designed to include energy star appliances.

Mobile Sources

The project would generate air quality emissions from mobile sources (vehicular traffic) as a result of the residents of the project. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix B). The trip generation rates for the project residential land use were adjusted in CalEEMod to match the overall weekday daily trip rate and trip length based on the Vehicle Miles Traveled Analysis and Local Transportation Analysis (Appendices K-1 and K-2 to this EIR, respectively). CalEEMod default data, trip modes, fleet mix, and emissions factors were used for the model inputs. CalEEMod default vehicle emission factors and vehicle fleet mix for 2025, as based on the CARB EMFAC2017 model, were used to estimate emissions associated with vehicular sources. In accordance with 2019 California Green Building Standards Code requirements, the project would install a listed raceway to accommodate a dedicated 208/

240-volt branch circuit in each residential garage for future installation of an electric vehicle charger. No quantitative credit was taken for this requirement. 2019 California Green Building Standards Code Section 4.106.4.2.1 requires the installation of at least one electric vehicle space in common use parking. The project will install two electric vehicle charging stations in the common use parking. According to Table 25 of Appendix B of the City's Climate Action Plan, every electric vehicle charging station in a multifamily development is assumed to reduce 1.65 metric tons of carbon dioxide equivalent per year (City of San Marcos 2013).

Due to the project's location and design, the following reduction measures were accounted for in CalEEMod:

- Increase Density (LUT-1): 120 dwelling units/7.6 acres = 15.8 dwelling units/acre
- Increase Diversity (LUT-3): Nearby land uses in the vicinity of the project site include industrial and commercial uses to the west on the other side of W Mission Road, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.2 miles to the east
- Increase Transit Accessibility (LUT-5): The project would be 0.3 miles from the Palomar College SPRINTER station.

3.2.4 Project Impact Analysis

Threshold No. 1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

As mentioned in Section 3.2.2, the SDAPCD is responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the SDAB—specifically, the SIP and RAQS.[3] SANDAG is responsible for developing growth projection forecasts and data that are used by the SDAPCD in preparing the SIP and RAQS. The federal O_3 maintenance plan, which is part of the SIP, was adopted in 2012. The SIP includes a demonstration that current strategies and tactics will maintain acceptable air quality in the basin based on the NAAQS. The RAQS was initially adopted in 1991 and is updated every 3 years (most recently in 2020). The RAQS outlines SDAPCD's plans and control measures designed to attain the state air quality standards for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County as a whole and the cities in San Diego County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of development of their general plans.

Although the SDAPCD and City do not provide guidance regarding the analysis of impacts associated with air quality plan conformance, the County's Guidelines for Determining Significance and Report and Format and Content Requirements – Air Quality does discuss conformance with the RAQS (County of San Diego 2007). The guidance indicates that, if the project, in conjunction with other projects, contributes to growth projections that would not exceed SANDAG's growth projections for a city, the project would not be in conflict with the RAQS. If a project includes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might be in conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality (County of San Diego 2007).

The project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial and is within the City's General Plan College Area Neighborhood. The project proposes a General Plan and Zoning Amendment to change the land use designation to Specific Plan Area (SPA). The SANDAG Series 13 forecast

[3] For the purpose of this discussion, the relevant federal air quality plan is the Ozone Attainment Plan (SDAPCD 2020). The RAQS is the applicable plan for purposes of state air quality planning. Both plans reflect growth projections in the SDAB.

projects that the City will see an increase of 3,170 housing units between 2020 and 2035 (SANDAG 2013); the project would only account for 3.8% of that increase in City housing. The project's proposed General Plan Amendment and Rezone would be within the growth projections for the City; thus, the project would result in regional growth that is accounted for within the RAQS. Furthermore, at a regional level, the growth is consistent with the underlying growth forecasts in the SIP and RAQS. Therefore, implementation of the proposed project would not conflict with the RAQS or SIP, and potential future development would be consistent with the growth in the region. Impacts would be **less than significant.**

Threshold No. 2: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

In analyzing cumulative impacts from a project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the air basin is designated as nonattainment for the CAAQS and NAAQS. If a project does not exceed thresholds and is determined to have less-than-significant project-specific impacts, it may still contribute to a significant cumulative impact on air quality if the emissions from the project, in combination with the emissions from other proposed or reasonably foreseeable future projects, are in excess of established thresholds. However, a project would only be considered to have a significant cumulative impact if the project's contribution accounts for a significant proportion of the cumulative total emissions (i.e., it represents a "cumulatively considerable contribution" to the cumulative air quality impact).

Additionally, for the SDAB, the RAQS serves as the long-term regional air quality planning document for the purpose of assessing cumulative operational emissions to ensure that the SDAB continues to make progress toward NAAQS and CAAQS attainment status. As such, cumulative projects located in the San Diego region would have the potential to result in a cumulative impact to air quality if, in combination, they would conflict with or obstruct implementation of the RAQS. Similarly, individual projects that are inconsistent with the regional planning documents upon which the RAQS is based would have the potential to result in cumulative operational impacts if they represent development and population increases beyond regional projections.

The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. PM_{10} and $PM_{2.5}$ emissions associated with construction generally result in "near-field" impacts. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SDAB. As discussed previously, the emissions of all criteria pollutants would be below the significance levels. Construction would be short term and temporary, and once construction is completed, construction-related emissions would cease. Operational emissions generated by the project would not exceed the significance thresholds for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$, and would not cause a significant impact. As such, the project would result in less-than-significant impacts to air quality relative to operational emissions.

Construction of the proposed project would result in the temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts. Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. NO_x and CO emissions would primarily result from the use of construction equipment and motor vehicles.

Construction emissions were calculated using CalEEMod for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2023 and 2024). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant, and are intended to represent a reasonable scenario based on the best information available. A detailed depiction of the construction schedule—including information regarding phasing, equipment used during each phase, haul trucks, vendor trucks, and worker vehicles—is included in Section 2.4.2.1, Construction, of Appendix B to this EIR.

Construction of the proposed project would generate temporary air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The proposed project would be subject to SDAPCD Rule 55, Fugitive Dust Control. This rule requires that a project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) that may be generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the active sites would be watered at least two times daily, resulting in an approximately 55% reduction of particulate matter. Compliance with Rule 55 would be required as a standard condition of project approval or for issuance of a grading permit.

Exhaust from internal combustion engines used by construction equipment, hauling trucks (dump trucks), vendor trucks (delivery trucks), and worker vehicles would result in temporary emissions of NO_x, VOC, CO, SO_x, PM_{10}, and $PM_{2.5}$. Application of architectural coatings, such as exterior/interior paint and other finishes, would also produce VOC emissions; however, the contractor is required to procure architectural coatings from a supplier in compliance with the requirements of SDAPCD Rule 67.0.1, Architectural Coatings (SDAPCD 2021). This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015). The proposed project would comply with SDAPCD Rule 67.0.1 through the incorporation of low-VOC architectural coatings. The VOC content assumed for the analysis was 50 grams per liter for interior coatings and 100 grams per liter for exterior coatings.

Table 3.2-8 shows the estimated maximum daily construction emissions associated with the construction of the proposed residential use. Details of the emissions calculations are provided in Appendix B of this EIR.

Table 3.2-8. Estimated Maximum Daily Construction Emissions – Unmitigated

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
2023	1.36	21.59	43.15	0.08	5.39	1.92
2024	1.36	21.59	43.12	0.08	5.39	1.92
2025	48.50	11.21	19.58	0.05	2.02	0.08
Maximum daily emissions	**48.50**	**21.59**	**43.15**	**0.08**	**5.39**	**1.92**
Emission threshold	*75*	*250*	*550*	*250*	*100*	*55*
Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Appendix B
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.

See Appendix B for output files and modeling details.
The values shown are the maximum summer or winter daily emissions results from CalEEMod and provided in Appendix B. The maximum emissions assumes compliance with SDAPCD Rule 67.0.1, Architectural Coatings, and SDAPCD Rule 55, Fugitive Dust Control.

As shown in Table 3.2-8, daily construction emissions would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Following completion of construction activities, the proposed residential use would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic generated by residents; area sources, including the use of landscaping equipment and consumer products; and architectural coatings.

Table 3.2-9 presents the maximum daily emissions associated with operation of the proposed residential use. The values shown for mobile sources (motor vehicles), energy sources, and area sources are the maximum of either the summer or winter daily emissions results from CalEEMod, whichever is greater.

Table 3.2-9. Estimated Project Maximum Daily Operational Emissions – Unmitigated

Emission Source	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix B for output files and modeling details.

As shown in Table 3.2-9, the daily operational emissions from implementation of the proposed project would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Regarding long-term cumulative operational emissions in relation to consistency with local air quality plans, the SIP and RAQS serve as the primary air quality planning documents for the state and SDAB, respectively. The SIP and RAQS rely on SANDAG growth projections based on population, vehicle trends, and land use plans developed by the cities and the County as part of the development of their general plans. Development that is consistent with the growth anticipated by local plans would be consistent with the SIP and RAQS and would result in emissions that are accounted for. Projects that conform to the permitted land use or result in a less emissions-intensive use and are therefore accounted for in the SIP and RAQS would not be considered to result in cumulatively considerable impacts from operational emissions. As stated previously, the project would result in fewer emissions than buildout of the existing permitted land use that was anticipated by the RAQS and therefore would not result in significant regional emissions that are not accounted for within the RAQS. As a result, the project would not result in a cumulatively considerable contribution to regional O_3 concentrations or other criteria pollutant emissions. Therefore, the project's cumulative impacts would be **less than significant**.

Threshold No. 3: Would the project expose sensitive receptors to substantial pollutant concentrations?

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed sensitive receptors are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, older adults, athletes, and people with cardiovascular and chronic respiratory diseases; however, for the purposes of this analysis, residents are also considered sensitive receptors. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes.

Health Impacts of Toxic Air Contaminants

In addition to impacts from criteria pollutants, project impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be DPM from heavy-duty equipment operations and heavy-duty trucks, and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce diesel particulate emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (13 CCR 2449), the purpose of which is to reduce DPM and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to 5 minutes; electric auxiliary power units should be used whenever possible.

The greatest potential for TAC emissions during construction would be DPM emissions from heavy-duty equipment operations and heavy-duty trucks during construction of the project and the associated health impacts to sensitive receptors.

However, as a precautionary measure, an HRA was performed to evaluate the risk from diesel exhaust emissions on existing sensitive receptors and future on-site receptors from construction activities. The HRA methodology was described in Section 3.2.3, and the detailed assessment is provided in Appendix B. Table 3.2-10 summarizes the results of the HRA for proposed project construction.

Table 3.2-10. Construction Activity Health Risk Assessment Results

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Cancer Risk	Per Million	5.9	10.0	Less than Significant
HIC	Not Applicable	0.005	1.0	Less than Significant

Source: Appendix B.
Notes: CEQA = California Environmental Quality Act; HIC = Chronic Hazard Index.

The results of the HRA demonstrate that the TAC exposure from construction diesel exhaust emissions would result in cancer risk on site below the 10 in 1 million threshold, as well as Chronic Hazard Index less than 1.0. Therefore, TAC emissions from construction of the proposed project would not expose sensitive receptors to substantial pollutant concentrations and would result in a less than significant impact. Upon completion of construction, the project would not generate substantial TAC emissions. As such, impacts would be **less than significant** during construction and operation.

Health Impacts of Carbon Monoxide

As described previously, exposure to high concentrations of CO can result in dizziness, fatigue, chest pain, headaches, and impairment of central nervous system functions. Mobile-source impacts, including those related to CO, occur on two scales. Regionally, project-related construction travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, construction traffic would be added to the roadway system in the vicinity of the project site. Although the SDAB is currently an attainment area for CO, there is a potential for the formation of microscale CO "hotspots" to occur immediately around points of congested traffic. Hotspots can form if such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles cold-started and operating at pollution-inefficient speeds, and/or is operating on roadways already crowded with non-project traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing. The SDAB is a CO maintenance area (western and central part of the SDAB only).

The Governor's Office of Planning and Research and the California Natural Resources Agency have issued new CEQA Guidelines for analyzing transportation impacts. By July 1, 2020, all CEQA lead agencies must analyze a project's transportation impacts using vehicle miles traveled. Vehicle miles traveled measures the distances vehicles will travel to and from a project, rather than congestion levels at intersections (level of service, graded on a scale of A–F). To account for this shift from LOS to vehicle miles traveled—such that vehicle congestion is no longer modeled and available—but to nonetheless evaluate the potential for CO hotspots for the hypothetical development scenario, this EIR utilizes CO modeling analyses performed by the South Coast Air Quality Management District (SCAQMD) relative to 1-hour and 8-hour concentrations as follows.

The SCAQMD conducted CO modeling for the 2003 Air Quality Management Plan (Appendix V of SCAQMD 2003) for the four worst-case intersections in the South Coast Air Basin: (1) Wilshire Boulevard and Veteran Avenue, (2) Sunset Boulevard and Highland Avenue, (3) La Cienega Boulevard and Century Boulevard, and (4) Long Beach Boulevard and Imperial Highway. At the time the 2003 Air Quality Management Plan was prepared, the intersection of Wilshire Boulevard and Veteran Avenue was the most congested intersection in Los Angeles County, with an average daily traffic volume of about 100,000 vehicles per day. Using CO emission factors for 2002, the peak modeled CO 1-hour concentration was estimated to be 4.6 parts per million (ppm) at the intersection of Wilshire Boulevard and Veteran Avenue.

A daily traffic volume of 100,000 vehicles (as considered in the SCAQMD modeling) as a result of the proposed project would be at least double the traffic volumes of nearby intersections (Appendix K). However, if "peak" modeled 1-hour concentration from SCAQMD's analysis of 100,000 vehicle traffic volumes of 4.6 ppm were added to the maximum 1-hour CO concentration from 2018 through 2020 at the San Diego–11403 Rancho Carmel Drive monitoring station (see Table 3, Local Ambient Air Quality Data, in Appendix B to this EIR) of 4.1 ppm (in 2019), the 1-hour CO concentration in the project area would total 8.7 ppm. This worst case scenario—modeling at least double the traffic experienced in the project area—would still result in 1-hour CO concentrations well below the CAAQS 1-hour CO threshold of 20 ppm.

Concerning 8-hour concentrations, SCAQMD modeled future year 8-hour CO concentrations at the Central Los Angeles monitoring site of 4.6 ppm in 2020. Adding 4.6 ppm to the maximum 8-hour CO concentration from 2018 through 2020 at the San Diego–11403 Rancho Carmel Drive monitoring station of 2.5 ppm (in 2019) would result in a total 8-hour CO concentration of 7.1 ppm. Again, this worst case scenario 8-hour CO concentration, assuming traffic counts far above that experienced in the project area, would still be well below the CAAQS 8-hour threshold of 9.0 ppm.

Therefore, CO concentrations at congested intersections would not exceed the 1-hour or 8-hour CO CAAQS unless projected daily traffic would cause area traffic volumes to exceed 100,000 vehicles per day. The proposed project would not increase daily traffic volumes at any study intersection to more than 100,000 vehicles per day (Appendix K). Therefore, the proposed project is not anticipated to create a CO hotspot. As such, impacts to sensitive receptors with regard to potential CO hotspots resulting from the project and hypothetical development scenario's contribution to cumulative traffic-related air quality impacts would be **less than significant.**

Health Impacts of Criteria Air Pollutants

Construction and operation of the project would not result in emissions that exceed the SDAPCD significance thresholds for any criteria air pollutants including VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Regarding VOCs, some VOCs would be associated with motor vehicles and construction equipment, while others are associated with architectural coatings, the emissions of which would not result in the exceedances of the SDAPCD significance thresholds. Generally, the VOCs in architectural coatings are of relatively low toxicity. Additionally, the project would use low-VOC architectural coatings that would comply with SDAPCD Rule 67.0.1, which restricts the VOC content of coatings for both construction and operational applications (SDAPCD 2015).

In addition, VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS (the SDAB is designated by EPA as an attainment area for the 1-hour O_3 NAAQS). The health effects associated with O_3 are generally associated with reduced lung function. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 ambient air quality standards tend to occur between April and October when solar radiation is highest.

The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of quantitative methods to assess this impact. Nonetheless, the VOC and NO_x emissions associated with project construction could minimally contribute to regional O_3 concentrations and the associated health impacts. Due to the minimal contribution during construction and operation, health impacts would be considered less than significant.

Similar to O_3, construction of the project would not exceed the SDAPCD significance thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter. Due to the minimal contribution of particulate matter during construction and operation, health impacts would be considered less than significant.

Regarding NO_2, according to the construction emissions analysis, construction of the project would not contribute to exceedances of the NAAQS and CAAQS for NO_2. NO_2 and NO_x health impacts are associated with respiratory irritation, which may be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. Off-road construction equipment would be operating at various portions of the site and

would not be concentrated in one portion of the site at any one time. Construction of the project would not require any stationary emission sources that would create substantial, localized NO_x impacts. Therefore, health impacts would be considered less than significant.

In summary, construction and operation of the project would not result in exceedances of SDAPCD significance thresholds for criteria pollutants. The VOC and NO_x emissions, as described previously, would minimally contribute to regional O_3 concentrations and the associated health effects. In addition to O_3, NO_x emissions would not contribute to potential exceedances of the NAAQS and CAAQS for NO_2. The existing NO_2 concentrations in the area are well below the NAAQS and CAAQS. Thus, the project's operational NO_x emissions are not expected to result in exceedances of the NO_2 standards or contribute to the associated health effects. PM_{10} and $PM_{2.5}$ would not contribute to potential exceedances of the NAAQS and CAAQS, would not obstruct the SDAB from coming into attainment for these pollutants, and would not contribute to significant health effects associated with particulates. Therefore, health impacts associated with criteria air pollutants would be considered **less than significant**.

Valley Fever Exposure

Valley fever is not highly endemic to San Diego County, and within the County, the incidence rate in the project area is below the County average and the statewide average. Construction of the project would comply with SDAPCD Rule 55, which limits the amount of fugitive dust generated during construction. Strategies the project would implement to comply with SDAPCD Rule 55 and control dust include watering two times per day and limiting speed on unpaved roads to 15 miles per hour.

Based on the low incidence rate of Coccidioidomycosis in San Diego County and the project's implementation of dust control strategies, it is not anticipated that earth-moving activities during project construction would result in exposure of nearby sensitive receptors to valley fever. Therefore, the project would have **a less-than-significant** impact with respect to valley fever exposure for sensitive receptors.

Threshold No. 4: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Odors would be generated from vehicle and equipment exhaust emissions during construction of the proposed project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment and from architectural coatings. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be **less than significant**.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (CARB 2005). The proposed project would not allow for any of these activities. Moreover, typical odors generated from operation of the proposed project residential land uses would primarily include vehicle exhaust generated by residents and through the periodic use of landscaping and maintenance equipment. Therefore, the proposed project would result in an odor impact that is **less than significant**.

3.2.5 Cumulative Impact Analysis

The project's cumulative air quality impacts were previously addressed above under Threshold No. 2 in Section 3.2.4. In analyzing cumulative impacts from the project, the analysis must specifically evaluate a

project's contribution to the cumulative increase in pollutants for which the basin is designated as nonattainment for the CAAQS and NAAQS.

The project would include a 120-unit residential development on undeveloped land. The residential development would result in fewer emissions than buildout of the existing permitted commercial land use that was anticipated by the RAQS and therefore would not result in significant regional emissions that are not accounted for within the RAQS. As a result, the project would not result in a cumulatively considerable contribution to regional O_3 concentrations or other criteria pollutant emissions.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. As it is unknown whether the cumulative projects under review will be approved or not, and, if approved, when actual construction would begin, it would be speculative to estimate any potential overlap of the proposed project. Construction schedules for potential future projects near the project site are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be speculative. However, future projects would be subject to CEQA and would require an air quality analysis and, where necessary, mitigation if the project would exceed the SDAPCD significance thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by SDAPCD. Cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SDAPCD Rule 55, Fugitive Dust, which sets forth general and specific requirements for all construction sites in the SDAPCD.

As construction and operation of the project would be typical of townhome development uses, implementation of the project is not expected to contribute to any cumulative health risks. Cumulative impacts would be **less than significant**.

3.2.6 Mitigation Measures

The project would not result in significant impacts; therefore, no mitigation is required.

3.2.7 Conclusion

The proposed project would change the allowable land use and zoning designation of Commercial (C) to allow for residential uses under a proposed Specific Plan Area (SPA). However, the project's proposed growth would be within the growth projections for the City and, at a regional level, the proposed project is consistent with the underlying growth forecasts in the SIP and RAQS. Therefore, implementation of the proposed project would not conflict with the RAQS or SIP and proposed development would be consistent with the growth in the region.

Implementation of the proposed project also would not violate any air quality standards or contribute substantially to an existing or projected air quality violation during construction with mitigation or operation. Additionally, the proposed project would not expose a substantial number of people to objectionable odors.

As construction and operations of the proposed project would not exceed the significance thresholds for criteria air pollutants, the potential for the proposed project to result in a cumulatively considerable net increase of any criteria pollutant (here, O_3) for which the project region is nonattainment under an applicable national or California ambient air quality standard is less than significant.

3.3 Biological Resources

This section describes the existing biological resources of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed project. This section is based on the Biological Resources Technical Report prepared by Dudek in July 2022, which is included as Appendix C to this environmental impact report.

Table 3.3-1 summarizes the project- and cumulative-level biological resource impacts by threshold.

Table 3.3-1. Biological Resources Summary of Impacts

Threshold of Significance	Project Impact	Project Cumulative Impact	Significance Determination
No. 1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	Potentially Significant	Less than Significant with **MM-BIO-1** and **MM-BIO-2**	Less than Significant with **MM-BIO-1** and **MM-BIO-2**
No. 2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	Potentially Significant	Less than Significant with **MM-BIO-1** and **MM-BIO-2**	Less than Significant with **MM-BIO-1** and **MM-BIO-2**
No. 3: Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	No impact	No impact	No impact
No. 4: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	Less than Significant	Less than Significant	Less than Significant
No. 5: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	Less than Significant	Less than Significant	Less than Significant
No. 6: Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.	Less than Significant	Less than Significant	Less than Significant

3.3.1 Existing Conditions

The 7.6-acre project site consists of undeveloped land in the northwestern portion of the City of San Marcos (City). Although undeveloped, the project site reflects a history of disturbance. Vegetation is disturbed from previous grading and disking. Based on historical aerial imagery, the project site was graded and disked in the early 1990s and again in the early 2000s; between 2005 and 2009 the site was graded and used as a staging area for construction of the CVS store located just south of the site. In addition, in 2017 the site was utilized by Palomar Community College District for temporary parking. Once the parking was no longer needed, the area was restored by removing parking fill and applying a hyrdroseed to the disturbed areas (Appendix C).

The project site is immediately adjacent to roadways. The site is located at the northwest corner of N Las Posas Road and W Mission Road. Existing development occurs on all sides of the site. An existing CVS Pharmacy abuts the project site to the south. Nearby land uses in the vicinity of the project site include industrial and commercial uses to the west on the other side of W Mission Road, a residential community to the north and west, and Palomar College approximately 0.2 miles to the east.

The project site is gently sloping from north to south, ranging in elevation from approximately 582 to 568 feet above mean sea level. Two soil types have been mapped on the project site: Huerhuero loam (HrC), 2% to 9% slopes, and Placentia sandy loam (PeC), 2% to 9% slopes. Soils within the project site have been degraded over time from disturbances such as grading and disking. As a result, the soils no longer maintain their native soil characteristics and therefore have no particular significance to biological resources of the project site (Appendix C).

The biological study area for the project includes the entire project site. Prior to conducting the field surveys, Dudek performed a review of relevant maps, databases, and literature pertaining to biological resources known to occur within the project vicinity. In addition, a query of sensitive species and habitats within vicinity of the project site was conducted, including the U.S. Fish and Wildlife Service (USFWS) species records; California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB); San Diego Natural History Museum's Plant Atlas, Mammal Atlas, and Bird Atlas (Unitt 2004); the San Diego Geographic Information Source, and California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (Appendix C).

The project site is generally located within the boundaries of the North County Multiple Habitat Conservation Program (MHCP) Plan area (Appendix C), specifically within the area of the City of San Marcos Subarea Habitat Conservation Plan/Natural Community Conservation Plan (Draft San Marcos Subarea Plan). The Draft San Marcos Subarea Plan has not been completed, approved, or adopted (City of San Marcos 2001). However, it is the City of San Marcos General Plan (General Plan) policy to comply with the conservation policies identified in the MHCP through use of the Draft San Marcos Subarea Plan as an implementation tool.

3.3.2 Methodology

Literature Review

Prior to conducting the field surveys, Dudek conducted a review of the existing biological resources and species within the vicinity of the survey area using the CDFW CNDDB; the CNPS Online Inventory of Rare, Threatened, and Endangered Plants of California; the San Diego Natural History Museum's Plant Atlas, Mammal Atlas, and Bird Atlas; and the San Diego Geographic Information Source. Dudek obtained special-status species occurrence data from the above sources by querying records within the U.S. Geological Survey (USGS) 7.5-minute quadrangle map for the project site and the nine quadrangle maps surrounding the project site, including the Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos USGS quadrangle maps (Appendix C).

For this analysis, special-status plant and wildlife species are defined as those that are (1) listed, proposed for listing, or candidates for listing as threatened or endangered under the federal Endangered Species Act (FESA); (2) listed or candidates for listing as threatened or endangered under the California Endangered Species Act; (3) designated as Fully Protected under the California Fish and Game Code; (4) designated as a California Species of Special Concern by CDFW; and/or (5) assigned a California Rare Plant Rank of 1B or 2B by the CNPS.

In addition, Dudek reviewed the following available resources to assess the potential for biological and wetland resources within the project site and vicinity:

- List of potentially occurring listed species generated from a review of the USFWS's Information for Planning and Consultation Trust Resources Report list of federal and threatened species (USFWS 2022a)
- USGS National Hydrography Dataset (USGS 2022)
- USFWS National Wetlands Inventory (USFWS 2022b)
- U.S. Department of Agriculture, Natural Resources Conservation Service, Web Soil Survey (USDA 2022)

Prior environmental documents prepared for the project provided information on biological resources and constraints previously identified. The documents reviewed include the following:

- Biological Site Assessment for the Meritage Homes Project in San Marcos, California (Dudek 2021)
- Directed Surveys for Thread-Leaved and Orcutt's Brodiaea, Mission Pointe (EAEC 2017)
- Potential Biological Constraints to Development for the Property Located at the Corner of N Las Posas and W Mission Road, City of San Marcos (BCG 2008)

Field Surveys

Vegetation Community and Land Cover Mapping

Dudek conducted vegetation mapping to characterize natural vegetation communities, including habitats for special-status species, within the project site. Vegetation communities and land covers were mapped using the Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986) as modified by the County of San Diego and noted in Vegetation Communities of San Diego County (Oberbauer 2008).

Vegetation mapping was conducted within the project site in June 2021 in conjunction with the initial reconnaissance-level surveys for sensitive resources. Mapping was performed in the field through interpretation of field maps with a high-quality aerial photographic base map.

Focused Surveys for Thread-Leaved and Orcutt's Brodiaea

Everett and Associates Environmental Consultants conducted a focused survey for thread-leaved brodiaea (*Brodiaea filifolia*) and Orcutt's brodiaea (*B. orcutti*) in 2017 within the project site. A reference site approximately 1,300 feet northwest of the project site with a known population of thread-leaved brodiaea was visited the morning of the survey to verify the species was in bloom. The project site was surveyed using transects to achieve complete visual coverage of the site (EAEC 2017).

Jurisdictional Delineation

In 2008, Blue Consulting Group performed a jurisdictional delineation to classify waters of the United States and state, including wetlands, under the jurisdiction of the U.S. Army Corps of Engineers (USACE) and CDFW (BCG 2008). The USACE jurisdictional wetlands delineation was conducted in accordance with the 1987 U.S. Army Corps of Engineers Wetland Delineation Manual (USACE 1987). Hydrology, vegetation, and soils were examined at potential wetland sites and were recorded on wetland determination data forms. Additionally, a directed survey for potential vernal pool basins and vernal pool plant species was completed on site.

Dudek field verified the findings of previous jurisdictional delineations within the project site in June 2021 in conjunction with the initial reconnaissance-level surveys for sensitive resources. Methods followed those described for the 2008 delineation above.

Survey Limitations

The reconnaissance survey, vegetation mapping, and jurisdictional delineation were done during daylight hours under weather conditions that allowed for quality biological observations (e.g., surveys were not conducted during rain). Because surveys were conducted during the day, the likelihood of detecting nocturnal and crepuscular species, such as many mammal species, was relatively low.

Vegetation Communities and Land Covers

Three vegetation communities or habitat types occur within the project site: non-native grassland, Diegan coastal sage scrub: Baccharis-dominated, and urban/developed (see Table 3.3-2). Vegetation community locations on the project site can be seen on Figure 3.3-1, Vegetation Communities and Land Cover Types.

Table 3.3-2. Existing Vegetation/Habitat Types

Vegetation Community/Habitat Type	Area (Acres)[1]
Non-native grassland	5.95
Diegan coastal sage scrub: Baccharis-dominated	0.6
Urban/developed	0.9
Total	**7.6**

Source: Appendix C.
Note:
[1] Acres rounded to the nearest 0.01 acres for wetland habitat and 0.1 acres for upland habitat.

Non-Native Grassland

Non-native grassland consists of dense to sparse cover of annual grasses with flowering culms between 0.5 to 3 feet in height (Oberbauer 2008). In San Diego County, the presence of wild oat (*Avena* spp.), bromes (*Bromus* spp.), redstem stork's bill (*Erodium cicutarium*), and shortpod mustard (*Hirschfeldia incana*) are common indicators. In some areas, depending on past disturbance and annual rainfall, annual forbs may be the dominant species; however, it is presumed that grasses will dominate. Non-native grassland makes up the majority of the project site and is dominated by oats and brome grasses in the open to continuous herbaceous layer. Other common herbs observed in the grassland include shortpod mustard, prickly Russian thistle (*Salsola tragus*), redstem stork's bill, and Menzies's golden bush (*Isocoma menziesii*). There are 5.95 acres of non-native grassland on site (Appendix C). The vegetation community is the result of hydroseed placement over the graded portions of the site. The current owner actively mows the area, thus limiting the potential for the area to regenerate to its fullest potential. Typically, this vegetation community is considered sensitive and impacts would require mitigation.

Diegan Coastal Sage Scrub: Baccharis-dominated

Diegan coastal sage scrub: Baccharis-dominated is a subcategory of coastal scrub plant community as described in Oberbauer (2008). The community is typically dominated by low, soft woody drought-deciduous shrubs with shallow root systems and open canopies and associated herbaceous species. The community typically occupies xeric sites with shallow soils. Characteristic species include California sagebrush (*Artemisia californica*), California

buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), and white sage (*Salvia apiana*). The western slope of the project site contains approximately 0.6 acres of disturbed Diegan coastal sage scrub, dominated by coyote brush (*Baccharis pilularis*) and ladies' tobacco (*Pseudognaphalium californicum*) (Appendix C). This vegetation community is considered sensitive and impacts would require mitigation.

Urban/Developed

The urban/developed land cover refers to areas that have been constructed on or otherwise physically altered to the point where vegetation is no longer present. Urban or developed areas are characterized by permanent or semi-permanent structures, hardscapes, and landscaped areas that require irrigation.

Within the project site, this mapping unit identifies the developed area in the southern portion of the site containing the CVS parking lot, Peruvian peppertree (*Schinus mole*), Brazilian peppertree (*Schinus terebinthifolius*), and a couple small palm trees. There are 0.9 acres of urban/developed land on site. This land cover is not sensitive and does not require habitat compensation (Appendix C).

Plants

A total of 21 plant species were observed within the project site during the biological surveys, of which 7 (33%) are native species and 14 (67%) are non-native species. Please refer to Appendix C for a list and details regarding the 21 plant species observed within the project site.

Animals

Wildlife was recorded on site during the initial reconnaissance-level survey in 2021. Common species observed on the project site included California ground squirrel (*Spermophilus [Otospermophilus] beecheyi*), brush rabbit (*Sylvilagus bachmani*), Cassin's kingbird (*Tyrannus vociferans*), and American crow (*Corvus brachyrhynchos*).

Special-Status/Regulated Resources

Special-Status Vegetation Communities

Sensitive natural communities are vegetation communities that (1) support concentrations of special-status plant or wildlife species, (2) are of particular value to wildlife, and/or (3) are of limited distribution statewide or within a county or region. The MHCP organizes vegetation into habitat group types: Wetland Communities, Rare Upland, Coastal Sage Scrub, Chaparral, Annual Grassland, and Other Lands (SANDAG 2003). Vegetation communities listed under each of those groups, except for Other Lands, are considered sensitive and impacts to these communities would require mitigation. The City typically requires habitat compensation for impacts to non-native grassland at a 0.5:1 ratio and for impacts to Diegan coastal sage scrub at a 1:1 ratio. No habitat compensation is required for impacts to urban/developed.

Special-Status Plant Species

Results of the CNDDB, CNPS, and Information for Planning and Consultation database searches identified 65 special-status plant species as occurring or potentially occurring within the USGS 7.5-minute quadrangle map and the nine quadrangle maps surrounding the project site—Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos (CDFW 2022a; CNPS 2022)—and within the vicinity (USFWS 2022a). All 65 were eliminated from further consideration due to a lack of suitable habitat or edaphic

conditions, extent of habitat degradation within the project site (e.g., regular mowing, previous disturbance), or the location of the project site being outside a species' known range. No special-status plant species were observed during the initial site reconnaissance survey. Everett and Associates Environmental Consulting did not observe any special-status plant species on site during the focused survey for thread-leaved brodiaea and Orcutt's brodiaea, and reported that appropriate soils for these species were not on site (EAEC 2017). Therefore, the project site has no value as habitat for endangered, rare, or threatened plant species.

Special-Status Wildlife Species

Results of the CNDDB and Information for Planning and Consultation database searches identified 52 special-status wildlife species as occurring or potentially occurring within the USGS 7.5-minute quadrangle map and the nine quadrangle maps surrounding the project site—Valley Center, Morro Hill, Bonsall, Pala, Encinitas, Escondido, Rancho Santa Fe, San Luis Rey, and San Marcos USGS quadrangle maps (CDFW 2022a)—and within the vicinity (USFWS 2022a). Of these, 51 species were eliminated from consideration due to the absence of suitable habitat within the project site or the project site being outside of their known range (Appendix C). The remaining species, burrowing owl (*Athene cunicularia*), was determined to have a moderate potential to occur on the project site based on the presence of suitable habitat.

Burrowing Owl

Burrowing owl is a California Species of Special Concern. It requires habitat with three basic attributes: open, well-drained terrain; short, sparse vegetation; and underground burrows or burrow surrogates, such as culverts, concrete debris piles, or riprap (Klute et al. 2003). This species occupies grasslands, deserts, sagebrush scrub, agricultural areas (including pastures and untilled margins of cropland), earthen levees and berms, coastal uplands, and urban vacant lots, as well as the margins of airports, golf courses, and roads. This species also prefers sandy soils with higher bulk density and less silt, clay, and gravel (Lenihan 2007).

Although habitat within the project site is moderately suitable to support burrowing owl foraging and breeding, this species is not known to breed and forage within proximity of the project site. Suitable habitat for this species exists within the non-native grassland and disturbed Diegan coastal sage scrub vegetation communities located within the project site. California ground squirrel burrows, which can be utilized by burrowing owls for breeding and shelter, were observed within the project site during the reconnaissance survey; however, no burrowing owls or sign of burrowing owl presence (i.e., whitewash, pellets, feathers) was observed within the project site during the reconnaissance survey or previous surveys. The nearest CNDDB documented occurrence for this species is a historical occurrence approximately 6.86 miles southeast of the project site (Occ. No. 567) (CDFW 2022b). In addition, the project site is surrounded by development and has been disturbed multiple times throughout the years. Therefore, although there is suitable habitat available for this species, it is not expected to occur.

Nesting Birds

Habitats within the project site could provide suitable nesting habitat for bird species, including raptors, known to occur in the region. In California, all native birds and active bird nests (with eggs or young) are protected by Sections 3503 and 3503.5 of the California Fish and Game Code. The trees and shrubs within and adjacent to the project site provide suitable nesting habitat for several native resident and migratory bird species.

Jurisdictional Aquatic Resources

In 2008, Blue Consulting Group conducted a delineation at the site and observed mulefat (*Baccharis salicifolia*) and deer weed (*Acmispon glaber*) growing in the southwest portion of the site. Wetland sampling points were taken beside the mulefat and concluded that no jurisdictional wetlands were located on the project site. Dudek analyzed the project site in 2021 and confirmed that no jurisdictional aquatic resources occur on site (Appendix C).

Wildlife Corridors/Core Wildlife Areas

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for the migration of animals. Wildlife corridors contribute to population viability by ensuring continual exchange of genes between populations, providing access to adjacent habitat areas for foraging and mating, and providing routes for recolonization of habitat after local extirpation or ecological catastrophes (e.g., fires).

Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation. Habitat linkages provide a potential route for gene flow and long-term dispersal of plants and animals. They may also serve as primary habitat for smaller animals, such as reptiles and amphibians. Habitat linkages may be continuous habitat or discrete habitat islands that function as stepping stones for dispersal.

To function effectively, a wildlife corridor must link two or more patches of habitat for which connectivity is desired, and it must be suitable for the focal target species to achieve the desired demographic and genetic exchange between populations. Habitat areas are identified by the City as areas of open space natural habitats located in patches spread throughout the City. The largest patches of open space occur in the northern and southern portions of the City (City of San Marcos 2012).

The approximately 7.6-acre project site is not expected to provide for wildlife movement or serve as an important habitat linkage because it is surrounded by residential neighborhoods and commercial and industrial development. Because of regular human activity and considerable vehicle traffic in and surrounding the site, predominantly urban-adapted wildlife species are expected to occur in this area, such as raccoons (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), striped skunk (*Mephitis mephitis*), and brush rabbits (*Sylvilagus* spp.).

3.3.3 Regulatory Setting

Federal

Federal Endangered Species Act

FESA of 1973 (16 USC 1531 et seq.), as amended, is administered by USFWS for most plant and animal species and by the National Oceanic and Atmospheric Administration National Marine Fisheries Service for certain marine species. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend and provide programs for the conservation of those species, thus preventing extinction of plants and wildlife. FESA defines an endangered species as “any species that is in danger of extinction throughout all or a significant portion of its range.” A threatened species is defined as “any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.” Under FESA, it is unlawful to take any listed species, and “take” is defined as, “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.”

FESA allows for the issuance of incidental take permits for listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of habitat conservation plans on private property without any other federal agency involvement. Upon development of a habitat conservation plan, USFWS can issue incidental take permits for listed species.

Clean Water Act

Pursuant to Section 404 of the Clean Water Act, USACE regulates the discharge of dredged and/or fill material into waters of the United States. The term "wetlands" (a subset of waters of the United States) is defined in Title 33 of the Code of Federal Regulations, Section 328.3(b), as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." In the absence of wetlands, the limits of USACE jurisdiction in non-tidal waters, such as intermittent streams, extend to the ordinary high water mark, which is defined in Title 33 of the Code of Federal Regulations, Section 328.3(e).

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was originally passed in 1918 as four bilateral treaties, or conventions, for the protection of a shared migratory bird resource. The primary motivation for the international negotiations was to stop the "indiscriminate slaughter" of migratory birds by market hunters and others. Each of the treaties protects selected species of birds and provides for closed and open seasons for hunting game birds. The MBTA protects more than 800 species of birds and prohibits the take of any migratory bird or any part, nest, or eggs of any such bird. Under the MBTA, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so (16 USC 703 et seq.). Additionally, Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations (66 FR 3853–3856). The executive order requires federal agencies to work with USFWS to develop a memorandum of understanding. USFWS reviews actions that might affect these species.

Two species of eagles that are native to the United States, bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*), were granted additional protection within the United States under the Bald and Golden Eagle Protection Act (16 USC 668–668d) to prevent the species from becoming extinct.

State

California Environmental Quality Act

The California Environmental Quality Act (CEQA) (California Public Resources Code, Section 21000 et seq.) and the CEQA Guidelines (14 CCR 15000 et seq.) require identification of a project's potentially significant impacts on biological resources and feasible mitigation measures and alternatives that could avoid or reduce significant impacts. CEQA Guidelines Section 15380(b)(1) defines endangered animals or plants as species or subspecies whose "survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors." A rare animal or plant is defined in CEQA Guidelines Section 15380(b)(2) as a species that, although not currently threatened with extinction, exists "in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens; or … [t]he species is likely to become endangered within the foreseeable

future throughout all or a significant portion of its range and may be considered 'threatened' as that term is used in the federal Endangered Species Act." Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing, as defined further in CEQA Guidelines Section 15380(c). CEQA also requires identification of a project's potentially significant impacts on riparian habitats (such as wetlands, bays, estuaries, and marshes) and other sensitive natural communities, including habitats occupied by endangered, rare, and threatened species.

In Title 14 of the California Code of Regulations, Section 1.72, CDFW defines a "stream" (including creeks and rivers) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation."

In Title 14 of the California Code of Regulations, Section 1.56, CDFW's definition of "lake" includes "natural lakes or man-made reservoirs." Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

CDFW recognizes that all plants with a California Rare Plant Rank 1A, 1B, or 2, and some ranked 3, of the CNPS Inventory of Rare and Endangered Plants in California (CNPS 2022) may meet the criteria for listing as threatened or endangered and should be considered under CEQA (CDFW 2021). Some of the California Rare Plant Rank 3 and 4 plants meet the criteria for determination as "rare" or "endangered" as defined in Section 1901, Chapter 10 (Native Plant Protection Act), Division 2, of the California Fish and Game Code, as well as Section 2062 and Section 2067, Chapter 1.5 (CESA), Division 3. Therefore, consideration under CEQA for these California Rare Plant Rank 3 and 4 species is strongly recommended by the CNPS (CNPS 2022).

For purposes of this report, animals considered "rare" under CEQA include endangered or threatened species, Birds of Conservation Concern (USFWS 2021), California Species of Special Concern (CDFW 2022b), and fully protected species.

Section IV, Appendix G, Environmental Checklist Form, of the CEQA Guidelines requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service."

The criteria used to determine the significance of impacts to biological resources under CEQA are provided under Section 3.3.4, Thresholds of Significance, and in Chapter 5 of the Biological Resources Technical Report (Appendix C).

California Endangered Species Act

CDFW administers the California Endangered Species Act (CESA), which prohibits the "take" of plant and animal species designated by the California Fish and Game Commission as endangered or threatened in the state of California. Under CESA Section 86, take is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA Section 2053 stipulates that state agencies may not approve projects that will "jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy."

CESA defines an endangered species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or

disease." CESA defines a threatened species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the [California Fish and Game] Commission as rare on or before January 1, 1985, is a threatened species." A candidate species is defined as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the Commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the Commission has published a notice of proposed regulation to add the species to either list." CESA does not list invertebrate species.

CESA authorizes the taking of threatened, endangered, or candidate species if take is incidental to an otherwise lawful activity and if specific criteria are met. These provisions also require CDFW to coordinate consultations with USFWS for actions involving federally listed species that are also state-listed species. In certain circumstances, CESA allows CDFW to adopt a CESA incidental take authorization as satisfactory for CEQA purposes based on finding that the federal permit adequately protects the species and is consistent with state law.

A CESA permit may not authorize the take of "fully protected" species that are protected in other provisions of the California Fish and Game Code, as discussed further below.

California Fish and Game Code

Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) of the California Fish and Game Code provide that designated fully protected species may not be taken or possessed without a permit. Incidental take of these species is not authorized by law.

Pursuant to Section 3503.5 of the California Fish and Game Code, it is unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy any nest or eggs of such birds. Birds of prey refer to species in the orders Falconiformes and Strigiformes.

Nests of all other birds (except English sparrow [*Passer domesticus*] and European starling [*Sturnus vulgaris*]) are protected under Sections 3503 and 3513 of the California Fish and Game Code.

Pursuant to Section 1602 of the California Fish and Game Code, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) protects water quality and the beneficial uses of water. It applies to surface water and groundwater. Under this law, the State Water Resources Control Board develops statewide water quality plans, and the Regional Water Quality Control Boards develop regional basin plans that identify beneficial uses, water quality objectives, and implementation plans. The Regional Water Quality Control Boards have the primary responsibility to implement the provisions of statewide plans and basin plans. Waters regulated under the Porter-Cologne Act include isolated waters that are not regulated by USACE. Regional Water Quality Control Boards regulate discharging waste, or proposing to discharge waste, within any region that could

affect waters of the state (California Water Code, Section 13260[a]). Waters of the state are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Section 13050[e]). Developments with impacts on jurisdictional waters must demonstrate compliance with the goals of the Porter-Cologne Act by developing stormwater pollution prevention plans, standard urban stormwater mitigation plans, and other measures to obtain a Clean Water Act Section 401 certification. If a Clean Water Act Section 404 permit is not required for a project, the Regional Water Quality Control Board may still require a permit (i.e., Waste Discharge Requirement) for impacts to waters of the state under the Porter-Cologne Act.

Local

City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan contains several policies pertaining to the protection of biological resources (City of San Marcos 2012). The following goals and policies apply to the project:

Goal COS-1: Identify, protect, and enhance significant ecological and biological resources within San Marcos and its adaptive Sphere of Influence.

Policy COS-1.1: Support the protection of biological resources through the establishment, restoration, and conservation of high-quality habitat areas.

Policy COS-1.2: Ensure that new development, including Capital Improvement Projects, maintain the biotic habitat value of riparian areas, oak woodlands, habitat linkages, and other sensitive biological habitats.

Policy COS-1.3: Continue to work with other federal, State, regional, and local agencies to implement, SANDAG's MHCP.

Goal COS-2: The City is committed to conserving, protecting, and maintaining open space, agricultural, and limited resources for future generations. By working with property owners, local organizations, and state and federal agencies, the City can limit the conversion of resource lands to urban uses.

Policy COS-2.1: Provide and protect open space areas throughout the City for its recreational, agricultural, safety, and environmental value.

Policy COS-2.2: Limit, to the extent feasible, the conversion of open space to urban uses and place a high priority on acquiring and preserving open space lands for recreation, habitat protection and enhancement, flood hazard management, water and agricultural resources protection, and overall community benefit.

Policy COS-2.6: Preserve healthy mature trees where feasible; where removal is necessary, trees shall be replaced at a ratio of 1:1.

Goal COS-3: Protect natural topography to preserve and enhance the natural beauty of San Marcos.

Policy COS-3.3: Continue to work with new development and redevelopment project applicants in designing land use plans that respect the topography, landforms, view corridors, wildlife corridors, and open space that exists.

Policy COS-3.4: Evaluate potential impacts to visual and aesthetics resources, including the potential to create new light sources, while still maintaining and being sensitive to rural lighting standards.

Goal COS-8: Focus watershed protection, surface and groundwater quality management on sources and practices that the City has the ability to affect.

Policy COS-8.4: Require new development and redevelopment to protect the quality of water bodies and natural drainage systems through site design, source controls, storm water treatment, runoff reduction measures, Best Management Practices (BMPs), low impact development hydromodification strategies consistent with the current San Diego Regional Water Quality Control Board Municipal Stormwater National Pollutant Discharge Elimination System Permit, and all future municipal stormwater permits.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As shown in Section 3.10.4, the project is consistent with the applicable goals and policies related to biological resources.

North County Multiple Habitat Conservation Program

The North County MHCP is a long-term regional conservation plan established to protect sensitive species and habitats in northern San Diego County. The MHCP is divided into seven subarea plans—one for each jurisdiction within the MHCP—that are permitted and implemented separately from one another. The City of Carlsbad is the only city under the MHCP that has an approved and permitted subarea plan. The Draft San Marcos Subarea Plan has not been finalized or implemented, and the City is no longer an active participant in the Natural Community Conservation Plan program or the subregional MHCP conservation planning effort. However, it is the City's policy to comply with the conservation policies identified in the Draft San Marcos Subarea Plan, including an assessment of any designated Biological Core and Linkage Area or MHCP Focused Planning Area in the context of a proposed project and the preservation of sensitive biological resources.

3.3.4 Thresholds of Significance

The significance criteria used to evaluate the project impacts to biological resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to biological resources would occur if the project would:

- **Threshold No. 1:** Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
- **Threshold No. 2:** Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
- **Threshold No. 3:** Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- **Threshold No. 4:** Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- **Threshold No. 5:** Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- **Threshold No. 6:** Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

3.3.5 Project Impact Analysis

The project consists of 120 townhomes on an approximately 7.6-acre project site The proposed project would have a density of approximately 15.8 dwelling units per acre.

The significance of impacts to biological resources present, or with potential to occur on the project site, was determined based upon the sensitivity of each resource and the extent of the anticipated impact. For certain highly sensitive resources (e.g., a federally listed species), any impact would be considered significant. Conversely, other resources that are of low sensitivity (e.g., species with a large, locally stable population in the County of San Diego but declining elsewhere) could sustain some impact with a less-than-significant effect.

The issues addressed in this section are derived from Appendix G of the CEQA Guidelines. Mitigation, monitoring, and reporting requirements to eliminate or reduce project impacts to a less-than-significant level are also provided herein.

Threshold No. 1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Direct impacts could occur during construction if activities inadvertently encroach into areas outside the authorized limits of work. However, the project site has no value as habitat for endangered, rare or threatened plant species. No special-status plants have moderate or high potential to occur on the project site due to lack of suitable vegetation, soil, or microhabitats or the project site being outside of their known range (Appendix C). In addition, the site does not support any known populations of special-status wildlife. The project site has been disturbed several times in the past and is also located within a developed portion of the City. Therefore, any suitable habitat on site would be considered isolated, and the past disturbance would preclude special-status species from utilizing the site.

Raptors and/or any migratory birds are protected under the MBTA (16 USC 703 et seq.) and California Fish and Game Code (Sections 3503 and 3503.5). The MBTA provides protection for birds by prohibiting the destruction of active nests for most native birds. The MBTA protects more than 800 species of birds, including species such as house finch (*Haemorhous mexicanus*), mourning dove (*Zenaida macroura*), and California towhee (*Melozone crissalis*), which could nest in the grassland, Diegan coastal sage scrub, or urban/developed areas within the project site. Impacts to nesting birds would be potentially significant (**Impact BIO-1**). The project would include a mitigation measure requiring nesting bird surveys be completed if clearing and grubbing occur during the nesting season (typically February 15 through August 31) (**Mitigation Measure [MM] BIO-2**). Local governments have the land use authority to protect bird nests during clearing and grubbing activities; therefore, nesting bird surveys are a common and typical mitigation measure for any property in the state and western region due to the wide range of the Pacific Flyway. Impacts to nesting birds would be **less than significant with mitigation incorporated**.

Threshold No. 2: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Development of the proposed project has the potential to result in impacts to special-status vegetation communities on site. The majority of the non-native grassland would be directly impacted, resulting in the loss of 5.95 acres of this vegetation community. Impacts to non-native grassland are typically considered significant, requiring mitigation for impacts. However, the portions of the project site that contain non-native grassland have been subject to repeated disturbance, as discussed in Appendix C. The current conditions are the result of erosion control

hydroseed installation following the removal of the temporary parking lot. The non-native grassland is regularly maintained by the current owner, thus reducing the ability for the grassland to function as habitat for wildlife species. Therefore, any impacts to this vegetation community resulting from the proposed project would be **less than significant**, and no mitigation would be required.

Potentially significant direct impacts could also occur if construction work inadvertently extends beyond the authorized work limits where impacts to sensitive natural communities, specifically Diegan coastal sage scrub, are not anticipated (**Impact BIO-2**). The proposed project would be required to install temporary fencing to ensure that impacts stay within the project limits (**MM-BIO-1**). Therefore, potential direct impacts to sensitive vegetation communities would be **less than significant with mitigation incorporated**.

Potential indirect impacts as a result of increased human presence, noise, domestic animals, the spread of non-native species, and artificial lighting are not anticipated due to the urban nature of the project location. Therefore, indirect impacts to sensitive natural communities as a result of the proposed project would not occur.

Threshold No. 3: Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

As described in Appendix C, in 2008, Blue Consulting Group conducted a delineation at the site and observed mulefat and deer weed growing in the southwest portion of the site. Wetland sampling points were taken beside the mulefat and it was concluded that no jurisdictional wetlands were located on the project site. Dudek analyzed the project site in 2021 and confirmed that no jurisdictional aquatic resources occur on site. Based on the analysis above, no substantial adverse effect on state or federally protected wetlands would occur as a result of project implementation; **no impact** would occur.

Threshold No. 4: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The project site does not support fish habitat, as the site is entirely bounded by existing development, is not contiguous with native habitats, and is outside of areas where wildlife movement opportunities do occur (along undeveloped open space habitat corridors). Development on the project site would not interfere with wildlife movement or nursery functions. Areas may be used by smaller urban-adapted mammal species and bird species, but such areas are not considered refuge as a wildlife corridor or habitat linkage. Further, the project site is located in an urban and developed area that does not support wildlife movement or nursery functions. As outlined in Appendix C, there are no wildlife corridors or habitat linkages on site. Based on the analysis above, development of the project site would not interfere or impede with wildlife movement, corridors, or nursery sites. Impacts would be **less than significant**.

Threshold No. 5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Section 14.12.200 of the San Marcos Municipal Code provides that where a permit is required for excavation, fill, or obstruction for installation or repair of utilities under any public street, sidewalk, trail, or public place, such construction should be located away from trees. The proposed project would likely require some utility work within adjacent public streets, including sewer and water connections, storm drainage facilities, and circulation

improvements. However, as a requirement to obtain an excavation permit under the San Marcos Municipal Code, such construction would be located away from trees and would not otherwise require the removal of trees within the public right-of-way. In the case that construction near trees is unavoidable, the applicant will confer with the Director of Development Services, or their designee, to determine how best to avoid conflicts with mature trees and their root systems. The project would be required to demonstrate compliance with this requirement to the satisfaction of the Director to obtain an excavation permit.

Per General Plan Policy COS-2.6, healthy mature trees are to be preserved, where feasible; where removal is necessary, trees shall be replaced at a ratio of 1:1. The project does not propose any tree removal at this time, and thus would not require the removal of any healthy mature trees. The project would plant approximately 288 trees. The proposed project would incorporate a conceptual landscape plan that would detail tree planting plans and would be drafted to be aligned with all relevant General Plan policies, including this tree preservation policy.

Further, as discussed in Section 3.10, the project would be consistent with the City's General Plan Conservation and Open Space Element. Development of a commercial use on site, which the project site is currently zoned for, would likely result in greater impacts to biological resources in comparison to the proposed residential use due to increased impervious areas, no required open space uses, and hazards associated with commercial development. Therefore, it is determined that the project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and impacts would be **less than significant**.

Threshold No. 6: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The project is not located within a designated Biological Core Linkage Area or Focused Planning Area, and therefore it is consistent with the conservation policies of the Draft San Marcos Subarea Plan. In addition, the project would be required to conform to the goals and policies in the City's General Plan (City of San Marcos 2012) related to the protection of biological resources. Following implementation of proposed mitigation measures, the project is expected to be found to be in conformance with the Draft San Marcos Subarea Plan and the General Plan. Therefore, impacts related to regional resource planning would be **less than significant**.

3.3.6 Cumulative Impact Analysis

Sensitive Natural Communities

The project would directly contribute to the cumulative loss of 5.95 acres of non-native grassland. These impacts would typically be considered significant prior to mitigation; however, due to the previous years of disturbance on the site and the active mowing, impacts to non-native grassland would be considered less than significant. With the implementation of **MM-BIO-2,** as identified below, the project would reduce cumulative impacts to a level below significance.

Cumulative projects would be required to mitigate their individual impacts to sensitive vegetation communities through either on-site preservation/restoration or off-site habitat acquisition. Therefore, because the proposed project and cumulative projects would be required to mitigate for habitat loss, impacts related to the loss of sensitive vegetation communities would not be cumulatively considerable.

Special-Status Plant and Animal Species

Cumulative impacts consider the potential regional effects of a project and how a project may affect an ecosystem or one of its members beyond the project limits and on a regional scale. As discussed, the project would have potentially significant impacts associated nesting birds; however, implementation of MM-BIO-1 and MM-BIO-2 would reduce these impacts to a level below significance.

Similar to the project, cumulative projects would be required to mitigate impacts by avoiding the grading or clearing of suitable habitat for sensitive wildlife during breeding season, or by conducting pre-construction surveys to avoid sensitive species if construction would occur during breeding season. Through the implementation of required mitigation, impacts to present and potentially present sensitive wildlife species would be reduced to a level below significance for the proposed project and for cumulative projects. Therefore, cumulative impacts with regard to special-status wildlife species would not be cumulatively considerable.

Jurisdictional Waters and Wetlands

As analyzed above, the project site does not contain any jurisdictional waters or wetlands and no impact would occur. Like the proposed project, it is presumed that all reasonably foreseeable cumulative projects would be required to conform to existing regulations with respect to avoidance, minimization, and mitigation of impacts to sensitive habitat, achieving no-net-loss of wetlands and like/kind replacement for impacts to sensitive habitat that cannot be avoided. The regulatory permitting process ensures that every project with unavoidable impacts on jurisdictional resources implements required avoidance, minimization, and compensatory mitigation measures and obtains the appropriate permits. Projects in the region are required to meet a no-net-loss standard for both function and spatial area of wetland and non-wetland resources. Therefore, the project would not contribute to a cumulative impact to jurisdictional waters and wetlands.

Wildlife Corridors and Habitat Linkages

The project site does not support fish habitat, as the site is entirely bounded by existing development, is not contiguous with native habitats, and is outside of areas where wildlife movement opportunities do occur (along undeveloped open space habitat corridors). Development on the project site would not interfere with wildlife movement or nursery functions. The project site and many cumulative projects are located in an urban and developed area that does not support wildlife movement or nursery functions. However, cumulative projects would be required to analyze wildlife corridors or habitat linkages on their respective sites and mitigate their individual impacts. Therefore, because the proposed project does not contain any wildlife corridors or habitat linkages on site, impacts would not be cumulatively considerable.

Conflict with Local Ordinances/Tree Preservation Policies

Like the proposed project, it is presumed that all reasonably foreseeable cumulative projects would be required to conform to the San Marcos Municipal Code requirements and General Plan policies for tree replacement. Therefore, the project would not contribute to a cumulative impact related to a conflict with tree preservation policies.

Conflict with Adopted Habitat Management Plan

The Draft San Marcos Subarea Plan has not been adopted and remains in draft form since 2001; therefore, the project would not be in conflict with an adopted habitat conservation plan. The project is not located within a designated Biological Core Linkage Area or Focused Planning Area, and therefore it is consistent with the

conservation policies of the Draft San Marcos Subarea Plan. In addition, the project would be required to conform to the goals and policies in the General Plan (City of San Marcos 2012) related to the protection of biological resources. Following implementation of proposed mitigation measures, the project is expected to be found to be in conformance with the Draft San Marcos Subarea Plan and the General Plan. Therefore, no impacts related to regional resource planning are anticipated.

All reasonably foreseeable cumulative projects would be required to conform to existing regulations with respect to avoidance, minimization, and mitigation of impacts to sensitive habitat, achieving no-net-loss of wetlands and like/kind replacement for impacts to sensitive habitat that cannot be avoided. Impacts would be assessed on a regional basis and mitigated pursuant to CEQA, and those projects within the City's jurisdiction would be reviewed by the City during the project review and approval process. For these reasons, project impacts to biological resources would not be cumulatively considerable.

3.3.7 Mitigation Measures

MM-BIO-1 and **MM-BIO-2** outlined below would address **Impact BIO-1** and **Impact BIO-2** and would ensure consistency with the MHCP and Draft San Marcos Subarea Plan, reduce potential impacts related to special status animals and nesting birds, and reduce potential impacts to sensitive natural communities. With implementation of **MM-BIO-1** and **MM-BIO-2**, impacts to biological resources as a result of project implementation would be reduced to less than significant.

MM-BIO-1 Temporary Construction Fencing. Prior to issuance of a grading permit, the project applicant shall provide the limits of grading, including staging areas, and plans shall be provided to the City of San Marcos (City) and a qualified biologist for review and approval. Temporary fencing shall be installed in accordance with the approved grading plan and inspected by a qualified biologist.

The project applicant shall temporarily fence the limits of project impacts and install appropriate sediment-trapping devices to prevent additional impacts to, and the spread of silt from, the construction zone into adjacent habitats to be avoided. Fencing and sediment trapping devices shall be installed in a manner that does not impact habitats to be avoided.

If work occurs beyond the fenced limits of impacts, all work shall cease until the problem has been remedied to the satisfaction of the City. Any habitat impacts that occur beyond the authorized work area shall be offset at ratios approved by the City. Temporary construction fencing and sediment trapping devices shall be removed upon project completion.

MM-BIO-2 Pre-Construction Nesting Bird Surveys. To avoid any direct impacts to raptors and/or any migratory birds protected under the Migratory Bird Treaty Act (16 USC 703 et seq.) and California Fish and Game Code (3503 and 3503.5), removal of habitat shall occur outside of the nesting season for these species (i.e., outside of February 15 through August 31, annually). If, however, removal of habitat must occur during the nesting period, the proposed project applicant or its designee shall retain a biologist to conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. The pre-construction survey must be conducted within 72 hours prior to the start of construction and shall be repeated if construction activities discontinue for more than 3 consecutive days.

Impacts to active nests are typically avoided as follows. Clearing and construction shall be postponed or halted within the following buffers to be established by the biologist: (1) no work within 50 feet of a non-listed and non-raptor avifauna nest and (2) no work within 500 feet of a raptor nest. Raptor nests are not anticipated within the immediate project site due to lack of suitable nesting habitat; however, trees within 500 feet of the project boundary could support raptor nesting. The construction avoidance area shall be clearly demarcated in the field with highly visible construction fencing or flagging, and construction personnel shall be instructed on the sensitivity of nest areas. To the extent possible, the no-construction buffer zones shall be avoided until the nesting cycle is complete. However, it may be reasonable for the City of San Marcos to reduce these buffer widths depending on site conditions. If construction-related activities must take place within an active nest buffer area, the proposed project applicant or its designee shall present a plan to the City of San Marcos with measures to monitor and minimize impacts to nesting birds. No ground-disturbance activities shall occur within the avoidance buffer zone until the qualified biologist has determined that the nest is no longer active and the young are not dependent on the nest.

3.3.8 Conclusion

As described throughout Section 3.3.5, Project Impact Analysis, implementation of the proposed project would result in potentially significant impacts to biological resources (**Impact BIO-1** and **Impact BIO-2**). However, compliance with existing regulations and implementation of **MM-BIO-1** and **MM-BIO-2** outlined in Section 3.3.7, Mitigation Measures, would ensure that the proposed project would not result in significant impacts to sensitive vegetation communities, special-status species, or nesting birds. Implementation of proposed mitigation and City review of proposed project plans for the site would ensure impacts to biological resources would be reduced to a level of less than significant.

3.4 Cultural Resources

This section describes the existing cultural resources of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed project. Potential impacts to tribal cultural resources are analyzed in Section 3.16 of this environmental impact report (EIR).

The analysis in this section relies on the Archaeological Resource Inventory Negative Findings Report for the Gran Vista Project (Cultural Resources Report) prepared by Dudek in February 2023. The Cultural Resources Report included a record search, literature review, correspondence with Native American contacts, and a field survey. The analysis also considers the California Environmental Quality Act (CEQA) Guidelines Appendix G and applicable state and local regulations, including the City of San Marcos General Plan (General Plan). The Cultural Resources Report is included as Appendix D to this EIR.

Table 3.4-1 summarizes the project- and cumulative-level cultural resources impacts, by threshold.

Table 3.4-1. Cultural Resources Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5.	No Impact	No Impact	No Impact
No. 2: Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.	Potentially Significant	Less than Significant	Less Than Significant with **MM-CR-1** through **MM-CR-4**
No. 3: Disturb any human remains, including those interred outside of dedicated cemeteries.	Potentially Significant	Less than Significant	Less Than Significant with **MM-CR-1** through **MM-CR-4**

3.4.1 Existing Conditions

This section provides information on the cultural setting of the project site, as well as information on the research methodology used to prepare the Cultural Resources Report for the proposed project. Additional detail can be found in Appendix D of this EIR.

The project's area of potential effect (APE), as analyzed in the Cultural Resources Report, includes the entire 7.6-acre project site, which is located in the City of San Marcos (City), County of San Diego, and is comprised of Assessor's Parcel Numbers 219-121-15-00 and 219-121-16-00. The project APE is located at the northwest corner of N Las Posas Road and W Mission Road and is surrounded by commercial, residential, and light industrial uses. The project site is undeveloped and reflects a history of disturbance. Vegetation is disturbed by an abundance of invasive and weedy plant species (Appendix C, Biological Resources Technical Report).

Methodology

South Coastal Information Center Records Search

Dudek previously completed a cultural resources constraints analysis for the project (Appendix D). The purpose of the records search is to identify any previously recorded cultural resources that may be located within the project site. In addition to a review of previously prepared EIRs, permit application packages, site records, and reports, the records search also reviewed historical maps of the project APE and vicinity, ethnographies, the National Register of Historic Places (NRHP), the California Register of Historic Resources (CRHR), the Built Environment Resources Directory, and the lists of California State Historical Landmarks, California Points of Historical Interest, and Archaeological Determinations of Eligibility. Dudek received the results of the records search on June 17, 2021 (Appendix D).

Dudek reviewed the Built Environment Resources Directory on June 16, 2021. No previously recorded built environment resources are located within the project APE or along the blocks of N Las Posas Road and W Mission Road that border the project APE.

The South Coastal Information Center records search results identified 40 cultural resources within 1 mile of the project APE, none of which intersect the current project APE. One resource, P-37-005584/CA-SDI-5584, was identified immediately adjacent to the project APE and is discussed below. Table 1 in Appendix D summarizes the cultural resources within 1 mile of the project APE.

P-37-005584/CA-SDI-5584

This site was originally recorded by Randy Franklin in 1977 as a single grinding slick in a boulder outcrop on a small knoll. Franklin (1977) stated that there was no midden but that lithic flakes, core fragments, and a hammerstone were present near the adjacent road, and suggested that they may have been intrusive. This resource was located immediately east of the project APE within the current path of N Las Posas Road. This resource was destroyed during the road's construction in 1986 and its expansion by 1990.

The records search also identified 55 previous studies that have been performed within 1 mile of the project APE. Four of these studies addressed at least a portion of the project APE, one of which (SD-18210) addressed the entire project APE. SD-18210, however, was a constraints study and did not include a full pedestrian survey. The findings of SD-18210 are similar to the findings of this inventory and so will not be summarized here. These previous 55 studies were conducted between 1974 and 2020. No survey of the project APE has been conducted within the past 6 years. A complete list of the previous studies conducted within 1 mile of the project APE is included in Appendix D.

Built Environment Historical Resources

There are no built environment resources on the project APE. The project APE is surrounded by numerous residential and commercial buildings, all of which were constructed after 1973. No previously identified historical resources are in the vicinity. The commercial building to the south of the project APE (currently CVS) was constructed in 2010. The width of streets and topography surrounding the project APE creates a geographic and visual separation between the project APE and all nearby development. There are no built environment historical resources that require avoidance or evaluation prior to construction.

Archival Research

The previous constraints analysis included a review of historic topographic maps and aerial photographs of the project APE and the general vicinity, to help determine the possible development and land use of the project APE in the past. The historic aerial imagery available from Nationwide Environmental Title Research LLC includes historic photographs available since 1953 (NETR 2021). The 1953 aerial photograph shows that the property was undeveloped but still bordered W Mission Road to the south. The knoll and rock outcrop on which archaeological resource P-37-005584 was located is vaguely visible on the 1953 aerial photograph. By 1964, a natural drainage that was located west of the project APE was channelized and demarcates the western boundary of the current project APE. The project APE itself was still undisturbed but a residential development was constructed to the northeast. By 1978, the project APE and the adjacent P-37-005584 knoll were undisturbed, though a new residential development was constructed west of the project boundary. The 1984 aerial photograph shows that the southeastern corner of the project APE was graded but the rest of the project APE and the adjacent P-37-005584 knoll was undisturbed. The 1986 aerial photograph shows the grading of the current N Las Posas Road alignment. This grading disturbed the eastern border of the project APE and destroyed part of the adjacent P-37-005584 knoll. In 1989, the grading of the eastern project APE boundary was expanded and substantial earth movement was required to support the current alignment of the six-laned N Las Posas Road. This expansion destroyed the P-37-005584 knoll adjacent to the project APE. By 1991, the entire project APE had been graded. By 2009, the entire project APE was graded again, leaving the property with a northern terrace that overlooked the southern 75% of the project APE. The current commercial building and parking lot that bound the southern portion of the project APE were also constructed in 2009. The historic aerial photographs show that the project APE has been undeveloped but completely disturbed.

Intensive Pedestrian Survey

Dudek archaeologist conducted a survey of the proposed project APE on April 22, 2022. Native American monitor Logovii Sialoi from Saving Sacred Sites Inc., a Luiseño owned company, participated in the pedestrian survey. The project consists of a vacant lot bordering existing residential and commercial developments. The project APE has been previously disturbed, as evidenced by graded terraces. There was an elevation difference of approximately 10 feet between the northern and the southern half of the parcel, showing complete disturbance of the natural landscape. Ground visibility was low throughout the project APE due to heavy vegetation, with some modern trash and debris scattered throughout the area. Though currently undeveloped, the project APE is immediately adjacent to residential and commercial development and has been subjected to illicit dumping activities. The pedestrian survey was conducted utilizing formal transects at 15-meter intervals. Deviations from transects also occurred to inspect animal burrows and other locations of exposed sediments and boulders. No remnants of adjacent resource P-37-005584 or other cultural resources were identified within the project APE (Appendix D).

Native American Heritage Commission and Native American Outreach Letters

Dudek requested a Native American Heritage Commission (NAHC) search of the Sacred Lands File on April 15, 2022 for the project APE and a 1-mile buffer. The Sacred Lands File consists of a database of known Native American resources. These resources may not be included in the South Coastal Information Center database. The NAHC replied on May 19, 2022, and reported that the Sacred Lands File did not identify any known Native American cultural resources within the project APE or the surrounding 1-mile buffer (Appendix D). The NAHC additionally provided a list of Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area.

Outreach letters were mailed on May 27, 2022, to all Native American group representatives included on the NAHC contact list (Appendix D). These letters attempted to solicit additional information relating to Native American resources that may be impacted by the project. Native American representatives were requested to define a general area where known resources intersect the project APE. To date, Dudek has received responses to these outreach letters from three tribal representatives. On June 17, 2022, San Pasqual Band of Mission Indians responded to the letter stating that the Project APE is within the boundary of the tribe's Traditional Use Area. San Pasqual stated that they would like to engage in "formal government to government consultation". On June 21, 2022, Pechanga Band of Luiseño Mission Indians stated that the Project APE is within their Ancestral Territory and that they are interested in participating in the Project Area. Pechanga added that the Project APE is within 1.75 miles of two Ancestral Placenames and nine other previously recorded sites within 0.5 miles, one of which is within the Project APE. Unfortunately, no other information about the intersecting resource was included but Pechanga is likely referring to the destroyed Project Area adjacent P-37-005584 knoll. On June 28, 2022 Rincon Band of Luiseño Indians responded to the outreach letter and stated that the Project APE was within the band's specific Area of Historic Interest. Rincon added that they were concerned that the project may impact Tribal Cultural Resources, Traditional Cultural Landscapes, or potential Traditional Cultural Properties. Rincon recommended that an archaeological/ cultural resources inventory and that a Tribal monitor from the Rincon Band should accompany the survey. On July 12, 2022, Dudek archaeologist Mattthew DeCarlo met Cheryl Madrigal, the Tribal Historic Preservation Officer for Rincon Band, at the Project APE for a site visit. They discussed the previous disturbance of the area and visited the location of former prehistoric bedrock milling site P-37-005584. Ms. Madrigal stated that she would contact the City about her concerns after she had some time to research the Project Area. On September 8, 2022, Rincon sent a letter to the City critiquing an earlier version of this report. Rincon requested an ethno-historic research and further analysis of adjacent sites P-37-005584 and P-37-005633.

In compliance with Assembly Bill (AB) 52 and Senate Bill (SB) 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. Rincon Band responded to City outreach for Senate Bill 18 and Assembly Bill 52 on February 16 and April 13 requesting consultation on the Project. The City had a consultation meeting with representatives of Rincon Band on August 16, 2022.

3.4.2 Regulatory Setting

The following section provides a general description of the applicable regulatory requirements pertaining to cultural resources, including federal, state, and local guidelines.

Federal

National Historic Preservation Act

The National Historic Preservation Act (NHPA) established the NRHP program under the Secretary of the Interior. The act authorized funding for state programs with provision for pass-through funding and participation by local governments, created an Advisory Council on Historic Preservation, and established the Section 106 review process for protecting historic resources. The goal of the Section 106 review process is to offer protection to sites that are determined eligible for listing in the NRHP. The National Historic Preservation Act provides the legal framework for most state and local preservation laws.

Traditional Cultural Properties (Native American Heritage Values)

Federal and state laws mandate that consideration be given to the concerns of contemporary Native Americans with regard to potentially ancestral human remains, associated funerary objects, and items of cultural patrimony. Consequently, an important element in assessing the significance of the study site has been to evaluate the likelihood that these classes of items are present in areas that would be affected by the proposed project. Also, potentially relevant to prehistoric archaeological sites is the category termed Traditional Cultural Properties in discussions of cultural resource management performed under federal auspices. According to Parker and King (1998), "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices.

State

California Register of Historic Resources (California Public Resources Code, Section 5020 et. seq.)

In California, the term "historical resource" includes, but is not limited to, "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code, Section 5020.1[j]). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code, Section 5024.1[a]). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following NRHP criteria (California Public Resources Code, Section 5024.1[c]):

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Resources less than 50 years old are not considered for listing in the CRHR unless it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR 4852[d][2]). The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

California Points of Historic Interest

California Points of Historical Interest are buildings, structures, site or features of local (city and county) significance that have anthropological, cultural, military, political, architectural, economic, scientific/technical, religious,

experimental, or other value. Points of Historical Interest designated after December 1997 are recommended by the State Historical Resources Commission to also be listed in the CRHR. The criteria for designation of Points of Historical Interest are the same as those that govern the California Historic Landmarks program.

Native American Historic Cultural Sites (California Public Resources Code, Section 5097 et. seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy Native American historic or cultural site that is listed or may be eligible for listing in the CRHR.

California Environmental Quality Act

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code, Section 21084.1; 14 CCR 15064.5[b]). If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code, Section 5024.1[q]), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code, Section 21084.1; 14 CCR 15064.5[a]). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code, Section 21084.1; 14 CCR 15064.5[a]).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5[b][1]; California Public Resources Code, Section 5020.1[q]).

California Health and Safety Code, Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code, Section 7050.5, requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the county coroner has examined the remains (Section 7050.5b). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Section 7050.5c). The NAHC will notify the most likely descendant. With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 24 hours of notification of the most likely descendant by the NAHC. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

California Health and Safety Code, Section 8010-8011

This code is intended to provide consistent state policy to ensure that all California Native American human remains and cultural material are treated with dignity and respect. The code extends policy coverage to non-federally recognized tribes and federally recognized groups.

Assembly Bill 2461

The bill provides procedures for private landowners to follow upon discovering Native American human remains. Landowners are encouraged to consider culturally appropriate measures if they discover Native American human remains as set forth in California Public Resources Code, Section 5097.98.

Senate Bill 18

SB 18, approved in 2004, amends the California Civil Code and the California Government Code, requiring cities and counties to contact and consult with California Native American tribes prior to adopting or amending any general plan or specific plan, or designating land as open space in order to preserve or mitigate impacts to specified Native American places, features, and objects that are located within the city's or county's jurisdiction. SB 18 also requires cities and counties to hold in strict confidence any information about the specific identity, location, character or use of these resources. In 2005, the Governor's Office of Planning and Research published Tribal Consultation Guidelines to guide cities and counties on the process of engaging in consultation in accordance with SB 18. The NAHC maintains a list of California Native American tribes with whom cities and counties must consult pursuant to SB 18.

Assembly Bill 52

AB 52 was approved in 2014 and adds new requirements regarding consultation with California Native American tribes and consideration of tribal cultural resources. The law went into effect on July 1, 2015, and after that date, if requested by a California Native American tribe, lead agencies must consult prior to the release of a negative declaration, mitigated negative declaration, or draft EIR. City consultation efforts in accordance with SB 18 and AB 52 are discussed in the Section 3.16, Tribal Cultural Resources, of this EIR.

Local

City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan contains several policies pertaining to the protection of archaeological and historic resources. The following goals and policies apply to the project (City of San Marcos 2012):

> Policy COS-2.5: Continue to review future development proposals to ensure that cultural resources (including prehistoric, historic, paleontological, and SB 18 Tribal resources) are analyzed and conserved in compliance with CEQA requirements.

Goal COS-11: Continue to identify and evaluate cultural, historic, archaeological, paleontological and architectural resources for protection from demolition and inappropriate actions.

> Policy COS-11.1: Identify and protect historic and cultural resources including individual properties, districts and sites (e.g., archaeological sites) in compliance with CEQA.

> Policy COS-11.2: Prohibit the demolition or removal of a historic structure without evaluation of the condition of the structure, the cost of rehabilitation, and the feasibility of alternatives to preservation in place including but not limited to relocation, or reconstruction off-site, and/or photo-preservation.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning, of this EIR. As detailed in Section 3.10.4, the project is consistent with the applicable General Plan goals and policies pertaining to cultural resources.

3.4.3 Thresholds of Significance

The determination of significance for cultural resources is based on CEQA Guidelines Appendix G. Impacts to cultural resources would be significant if the proposed project would:

- **Threshold No. 1:** Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5;
- **Threshold No. 2:** Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5;
- **Threshold No. 3:** Disturb any human remains, including those interred outside of dedicated cemeteries.

3.4.4 Project Impact Analysis

Impacts to cultural resources that may result from ground disturbing activities associated with the proposed project are analyzed below.

Threshold No. 1: Would the project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5?

Section 15064.5 of the CEQA Guidelines defines a historical resource as one that meets one or more of the following criteria:

1. Is listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the CRHR; or
2. Is included in a local register of historical resources or identified as significant in a historical resource survey meeting the requirements of Section 5024.1(g) of the Public Resources Code; or
3. Is determined to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.

As described in Appendix D to this EIR, there are no built environment resources on the project APE. The project APE is surrounded by numerous residential and commercial buildings, all of which were constructed after 1973. No previously identified historical resources are in the vicinity. The commercial building to the south of the project APE (currently CVS) was constructed in 2010. The width of streets and topography surrounding the project APE creates a geographic and visual separation between the project APE and all nearby development. There are no built environment historical resources that require avoidance or evaluation prior to construction. After reviewing the list of historic structures and sites in San Marcos (list provided by the City), none were found to overlap the project APE. Therefore, it is determined that **no impact** related to historical resources would occur as a result of project implementation.

Threshold No. 2: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?

As identified in Section 3.4.1, Existing Conditions, no cultural resources were found at the project site during the field survey for South Coastal Information Center records search. As described in the Cultural Resources Report (Appendix D), the NAHC Sacred Lands File search, Native American outreach, and intensive-pedestrian survey suggest that no

known cultural resources would be impacted by the proposed project, pending the results of the Native American outreach and AB 52 and SB 18 consultation. However, construction activities associated with the project could result in potentially significant impacts to undocumented archaeological resources. In the unlikely event that archaeological resources are identified during earth moving activities associated with the project, mitigation is proposed that would require work be temporarily halted in the vicinity of the discovery. The project developer would then be required to notify a qualified archaeologist, who would review the unanticipated find and evaluate the resource for CRHR listing. Accordingly, although unlikely, ground-disturbing activities on the project site associated with the project could result in a potentially significant impact (**Impact CR-1**), and mitigation would be required. Implementation of **Mitigation Measure (MM) CR-1** through **MM-CR-4** would mitigate potentially significant impacts to unknown archaeological resources (**Impact CR-1**). Impacts would be **less than significant with mitigation incorporated**.

Threshold No. 3: Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

The cultural resources intensive pedestrian survey conducted for the proposed project did not identify any human remains or find any indications that they would be expected to be found on the project site. However, although unlikely, there is the possibility of human remains being discovered during ground disturbing activities on the project site. If remains are discovered during project construction activities, mitigation is proposed that would require work in the vicinity of the discovery be halted and procedures set forth in the California Public Resources Code (Section 5097.98) and California Health and Safety Code (Section 7050.5) be followed. Therefore, potential discovery of undocumented human remains on the project site could result in a potentially significant impact (**Impact CR-2**) and mitigation would be required. Implementation of **MM-CR-1** through **MM-CR-4** would also mitigate potentially significant impacts to human remains (**Impact CR-2**). Impacts would be **less than significant with mitigation incorporated**.

3.4.5 Cumulative Impact Analysis

According to CEQA, the importance of cultural resources comes from the research value and the information they contain, as well as the loss of recognized cultural landmarks and vestiges of our community cultural history. The cumulative study area includes the project APE and cumulative project sites.

As identified in Section 3.4.4, no historic resources exist at the project site. Thus, no impact to historic resources would occur with implementation of the proposed project. It is expected that cultural resources studies would be prepared for all cumulative projects to assess potential impacts, and that these projects would avoid or mitigate impacts to historic resources, as required by local jurisdictions and state law.

As identified in Section 3.4.4, no cultural resources were found at the project site during the field survey. However, the potential to unearth a cultural resource during project construction would be potentially significant (**Impact CR-1**). **MM-CR-1** through **MM-CR-4** would be implemented to reduce impacts to less-than-significant levels. It is expected that cultural resources studies would be prepared for all other cumulative projects to assess potential impacts, and that these projects would similarly avoid or mitigate impacts to cultural resources, as required by local jurisdictions and state law.

Similar to the project, the presence of human remains on cumulative project sites would typically remain unknown until earthwork activities commence for project construction. As identified in Section 3.4.4, the cultural resources field survey conducted for the project did not identify any human remains or find any indications that they would be expected to be found on the project site. If human remains are encountered during project construction, there is a potential for a significant impact **(Impact CR-2).** However, **MM-CR-1** through **MM-CR-4** would ensure any impacts to

human remains would be less than significant. It is expected that all cumulative projects would similarly assess potential impacts to human remains, and that these cumulative projects would avoid or mitigate these impacts, as required by local jurisdictions and state law.

Because the project and those projects identified within the cumulative study area would be required to mitigate cultural impacts through the collection and curation of information, construction monitoring, and the preservation of the most important resources, cumulative cultural impacts would be **less than significant**.

3.4.6 Mitigation Measures

MM-CR-1 Pre-Excavation Agreement: Prior to the issuance of a Grading Permit or ground disturbing activities, the Applicant/Owner shall enter into a Tribal Cultural Resources Treatment and Repatriation Agreement (Pre-Excavation Agreement) with a Traditionally and Culturally Affiliated Native American Tribe (TCA Tribe), identified in consultation with the City of San Marcos. The purpose of the Pre-Excavation Agreement shall be to formalize protocols and procedures between the Applicant/Owner and the TCA Tribe for the protection, treatment, and repatriation of Native American human remains, funerary objects, cultural and/or religious landscapes, ceremonial items, traditional gathering areas, and other tribal cultural resources. Such resources may be located within and/or discovered during ground disturbing and/or construction activities for the proposed project, including any additional culturally appropriate archaeological studies, excavations, geotechnical investigations, grading, preparation for wet and dry infrastructure, and other ground disturbing activities. Any project-specific monitoring plans and/or excavation plans prepared by the project archaeologist shall include the TCA Tribe requirements for protocols and protection of tribal cultural resources that were agreed to during the tribal consultation.

The landowner shall relinquish ownership of all non-burial-related tribal cultural resources collected during construction monitoring and from any previous archaeological studies or excavations on the project site to the TCA Tribe for proper treatment and disposition per the Pre-Excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The requirement and timing of such release of ownership, and the recipient thereof, shall be reflected in the Pre-Excavation Agreement. If the TCA Tribe does not accept the return of the cultural resources, then the cultural resources will be subject to curation.

MM-CR-2 Construction Monitoring: Prior to the issuance of a Grading Permit or ground disturbing activities, the Applicant/Owner or Grading Contractor shall provide written documentation (either as signed letters, contracts, or emails) to the City of San Marcos (City) Planning Division stating that a Qualified Archaeologist and Traditionally and Culturally Affiliated (TCA) Native American monitor have been retained at the Applicant/Owner or Grading Contractor's expense to implement the construction monitoring program, as described in the Tribal Cultural Resources Treatment and Repatriation Agreement.

The Qualified Archaeologist and TCA Native American monitor shall be invited to attend all applicable pre-construction meetings with the General Contractor and/or associated subcontractors to present the construction monitoring program. The Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground-disturbing activities that occur in areas of native soil or other permeable natural surfaces that have the potential to

unearth any evidence of potential archaeological resources or tribal cultural resources. In areas of artificial paving, the Qualified Archaeologist and TCA Native American monitor shall be present on site during grubbing, grading, trenching, and/or other ground disturbing activities that have the potential to disturb more than 6 inches below the original pre-project ground surface to identify any evidence of potential archaeological or tribal cultural resources. No monitoring of fill material, existing or imported, will be required if the General Contractor or developer can provide documentation to the satisfaction of the City that all fill materials being utilized at the site are either from existing commercial (previously permitted) sources of materials or are from private or other non-commercial sources that have been determined to be absent of tribal cultural resources by the Qualified Archaeologist and TCA Native American monitor.

The Qualified Archaeologist and TCA Native American monitor shall maintain ongoing collaborative coordination with one another during all ground disturbing activities. The requirement for the construction monitoring program shall be noted on all applicable construction documents, including demolition plans and grading plans. The Applicant/Owner or Grading Contractor shall provide written notice to the Planning Division and the TCA Tribe, preferably through email, of the start and end of all ground disturbing activities.

Prior to the release of any grading bonds, or prior to the issuance of any project Certificate of Occupancy, an archaeological monitoring report that describes the results, analysis, and conclusions of the construction monitoring shall be submitted by the Qualified Archaeologist, along with any TCA Native American monitor's notes and comments received by the Qualified Archaeologist, to the Planning Division Manager for approval. Once approved, a final copy of the archaeological monitoring report shall be retained in a confidential City project file and may be released, as a formal condition of Assembly Bill 52 consultation, to Rincon Band of Luiseño Indians, San Pasqual Band of Mission Indians, or any parties involved in the project specific monitoring or consultation process. A final copy of the report, with all confidential site records and appendices, will also be submitted to the South Coastal Information Center after approval by the City of San Marcos.

MM-CR-3 Unanticipated Discovery Procedures: Both the Qualified Archaeologist and the Traditionally and Culturally Affiliated (TCA) Native American monitor may temporarily halt or divert ground disturbing activities if potential archaeological resources or tribal cultural resources are discovered during construction activities. Ground disturbing activities shall be temporarily directed away from the area of discovery for a reasonable amount of time to allow a determination of the resource's potential significance. Isolates and clearly non-significant archaeological resources (as determined by the Qualified Archaeologist, in consultation with the TCA Native American monitor) will be minimally documented in the field. All unearthed archaeological resources or tribal cultural resources will be collected, temporarily stored in a secure location (or as otherwise agreed upon by the Qualified Archaeologist and the TCA Tribe), and repatriated according to the terms of the Tribal Cultural Resources Treatment and Repatriation Agreement (Pre-Excavation Agreement), unless ordered to do otherwise by responsible agency or court of competent jurisdiction.

If a determination is made that the archaeological resources or tribal cultural resources are considered potentially significant by the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor, then the City of San Marcos (City) and the TCA Tribe shall determine, in consultation with the Applicant/Owner and the Qualified Archaeologist, the culturally appropriate treatment of those resources.

If the Qualified Archaeologist, the TCA Tribe, and the TCA Native American monitor cannot agree on the significance or mitigation for such resources, these issues will be presented to the Planning Division Manager for decision. The Planning Division Manager shall make a determination based upon the provisions of CEQA and California Public Resources Code, Section 21083.2(b), with respect to archaeological resources and California Public Resources, Sections 21704 and 21084.3, with respect to tribal cultural resources, and shall take into account the religious beliefs, cultural beliefs, customs, and practices of the TCA Tribe.

All sacred sites, significant tribal cultural resources, and/or unique archaeological resources encountered within the project area shall be avoided and preserved as the preferred mitigation. If avoidance of the resource is determined to be infeasible by the City as the Lead Agency, then the City shall require additional culturally appropriate mitigation to address the negative impact to the resource, such as, but not limited to, the funding of an ethnographic study and/or a data recovery plan, as determined by the City in consultation with the Qualified Archaeologist and the TCA Tribe. The TCA Tribe shall be notified and consulted regarding the determination and implementation of culturally appropriate mitigation and the drafting and finalization of any ethnographic study and/or data recovery plan and/or other culturally appropriate mitigation. Any archaeological isolates or other cultural materials that cannot be avoided or preserved in place as the preferred mitigation shall be temporarily stored in a secure location on site (or as otherwise agreed upon by the Qualified Archaeologist and TCA Tribe) and repatriated according to the terms of the Pre-Excavation Agreement, unless ordered to do otherwise by responsible agency or court of competent jurisdiction. The removal of any artifacts from the project site will be inventoried with oversight by the TCA Native American monitor.

If a data recovery plan is authorized as indicated above and the TCA Tribe does not object, then an adequate artifact sample to address research avenues previously identified for sites in the area will be collected using professional archaeological collection methods. If the Qualified Archaeologist collects such resources, the TCA Native American monitor must be present during any testing or cataloging of those resources. Moreover, if the Qualified Archaeologist does not collect the cultural resources that are unearthed during the ground disturbing activities, the TCA Native American monitor may, at their discretion, collect said resources for later reburial or storage at a local curation facility, as described in the Pre-Excavation Agreement.

In the event that curation of archaeological resources or tribal cultural resources is required by a superseding regulatory agency, curation shall be conducted by an approved local facility within San Diego County and the curation shall be guided by California State Historical Resources Commission's Guidelines for the Curation of Archaeological Collections. The City shall provide the Applicant/Owner final curation language and guidance on the project grading plans prior to issuance of the Grading Permit, if applicable, during project construction. The Applicant/Owner shall be responsible for all repatriation and curation costs and provide to the City written documentation from the TCA Tribe or the curation facility, whichever is most applicable, that the repatriation and/or curation have been completed.

MM-CR-4 Human Remains: As specified by California Health and Safety Code, Section 7050.5, if human remains, or remains that are potentially human, are found on the project site during ground disturbing activities or during archaeological work, the person responsible for the excavation, or his or her authorized representative, shall immediately notify the San Diego County Medical Examiner's Office by telephone. No further excavation or disturbance of the discovery or any nearby area

reasonably suspected to overlie adjacent remains (as determined by the Qualified Archaeologist and/or the Traditionally and Culturally Affiliated [TCA] Native American monitor) shall occur until the Medical Examiner has made the necessary findings as to origin and disposition pursuant to California Public Resources Code, Section 5097.98.

If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the Qualified Archaeologist and/or the TCA Native American monitor) and consultation and treatment could occur as prescribed by law. As further defined by state law, the Medical Examiner will determine within 2 working days of being notified if the remains are subject to his or her authority. If the Medical Examiner recognizes the remains to be Native American, and not under his or her jurisdiction, then he or she shall contact the Native American Heritage Commission by telephone within 24 hours. The Native American Heritage Commission will make a determination as to the most likely descendent, who shall be afforded 48 hours from the time access is granted to the discovery site to make recommendations regarding culturally appropriate treatment.

If suspected Native American remains are discovered, the remains shall be kept in place until after the Medical Examiner makes their determination and notifications and until after the most likely descendent is identified, at which time the archaeological examination of the remains shall only occur on site in the presence of the most likely descendent. The specific locations of Native American burials and reburials will be proprietary and not disclosed to the general public. According to California Health and Safety Code, six or more human burials at one location constitutes a cemetery (Section 8100) and disturbance of Native American cemeteries is a felony (Section 7052). In the event that the Applicant/Owner and the most likely descendant are in disagreement regarding the disposition of the remains, state law will apply, and the mediation process will occur with the Native American Heritage Commission. In the event that mediation is not successful, the landowner shall rebury the remains at a location free from future disturbance (see California Public Resources Code, Sections 5097.98[e] and 5097.94[k]).

3.4.7 Conclusion

Implementation of the proposed project would not impact any identified archaeological resources, historical resources, or any known human remains interred outside a formal cemetery. However, based on the analysis presented in Section 3.4.4, the potential exists for impacts to unknown cultural resources resulting from construction of the proposed project.

These potentially significant impacts to archaeological resources and human remains would be mitigated to below a level of significance through implementation of **MM-CR-1** through **MM-CR-4**. With incorporation of these mitigation measures, potential impacts to cultural resources associated with the proposed project would be reduced to a level of less than significant.

INTENTIONALLY LEFT BLANK

3.5 Energy

This section describes the existing setting of the project site with respect to energy use and conservation, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the proposed Gran Vista Specific Plan Project (project).

Appendices F and G of the California Environmental Quality Act (CEQA) Guidelines require that an environmental impact report (EIR) discusses the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy, to ensure that energy implications are considered in project-related decision-making processes. As such, this section analyzes the energy impacts of the project. Specifically, this section summarizes the existing conditions in the project area, discusses the regulatory framework, and discloses estimated energy use during the construction and operational phases of the proposed project. This analysis considers the electricity, natural gas, and transportation fuel (petroleum) demand of the proposed project.

Information in this section is based on the proposed project's Air Quality and Greenhouse Gas Emissions Technical Report (February 2023), prepared by Dudek, which is included as Appendix B of this EIR.

Table 3.5-1 summarizes the project- and cumulative-level energy impacts by threshold.

Table 3.5-1. Energy Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.	Less than Significant	Less than Significant	Less than Significant
No. 2: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	Less than Significant	Less than Significant	Less than Significant

3.5.1 Existing Conditions

The environmental setting for the project related to electricity, natural gas, and petroleum, including associated service providers, supply sources, and estimated consumption, is discussed below. In summary, in 2019 (the latest calendar year for which data are uniformly available for all three types of energy sources), California's estimated annual energy use included the following:

- Approximately 250,379 gigawatt hours of electricity (EIA 2020a)
- Approximately 21.5 billion therms of natural gas (EIA 2021)
- Approximately 28.7 billion gallons of petroleum (EIA 2020b)

Electricity

According to the U.S. Energy Information Administration (EIA), California used approximately 250,379 gigawatt hours of electricity in 2019 (EIA 2020a). Electricity usage in California for different land uses varies substantially by the types of uses in a building, type of construction materials used in a building, and the efficiency of all

electricity-consuming devices within a building. By sector in 2017, commercial uses utilized 46% of the state's electricity, followed by 35% for residential uses, and 19% for industrial uses (EIA 2019). Due to the state's energy efficiency building standards and efficiency and conservation programs, California's electricity use per capita in the residential sector is lower than any other state except Hawaii (EIA 2020b).

San Diego Gas & Electric (SDG&E) provides electric services to 3.6 million customers through 1.4 million electric meters located in a 4,100-square-mile service area that includes San Diego County (County) and southern Orange County (SDG&E 2018). SDG&E is a subsidiary of Sempra Energy and would provide electricity to the proposed project. According to the California Public Utilities Commission (CPUC), SDG&E customers consumed approximately 19,169 million kilowatt-hours (kWh) of electricity in 2015 (CPUC 2016).

SDG&E receives electric power from a variety of sources. According to the California Energy Commission (CEC) Biennial Renewable Portfolio Standard Program Update, 39% of SDG&E's power came from eligible renewable energy sources in 2020, including biomass/waste, geothermal, small hydroelectric, solar, and wind sources (CPUC 2021).

Based on recent energy supply and demand projections in California, statewide annual peak electricity demand is projected to grow an average of 3,333 gigawatt-hours per year through 2030, or 1.2% annually (CEC 2020).

In the County, CEC reported an annual electrical consumption of approximately 19.0 billion kWh in 2019, with 12.4 billion kWh for non-residential use and 6.7 billion kWh for residential use (CEC 2020).

Natural Gas

CPUC regulates natural gas utility service for approximately 10.8 million customers who receive natural gas from Pacific Gas & Electric, Southern California Gas (SoCalGas), SDG&E, Southwest Gas, and several smaller natural gas utilities. CPUC also regulates independent storage operators Lodi Gas Storage, Wild Goose Storage, Central Valley Storage, and Gill Ranch Storage (CPUC 2021). SDG&E provides natural gas service to the counties of San Diego and Orange and would provide natural gas to the proposed project. SDG&E is a wholesale customer of SoCalGas and currently receives all of its natural gas from the SoCalGas system (CPUC 2021).

CPUC regulates California natural gas rates and natural gas services, including in-state transportation over transmission and distribution pipeline systems, storage, procurement, metering, and billing. Most of the natural gas used in California comes from out-of-state natural gas basins. California gas utilities may soon also begin receiving biogas into their pipeline systems (CPUC 2021).

In 2017, California customers received 38% of their natural gas supply from basins located in the Southwest, 27% from Canada, 27% from the Rocky Mountains, and 8% from basins located within California (CPUC 2021). Natural gas from out-of-state production basins is delivered into California through the interstate natural gas pipeline system. The major interstate pipelines that deliver out-of-state natural gas to California are the Gas Transmission Northwest Pipeline, Kern River Pipeline, Transwestern Pipeline, El Paso Pipeline, Ruby Pipeline, Southern Trails, and Mojave Pipeline. The North Baja–Baja Norte Pipeline takes gas off the El Paso Pipeline at the California/Arizona border and delivers it through California into Mexico. The Federal Energy Regulatory Commission regulates the transportation of natural gas on interstate pipelines, and CPUC often participates in Federal Energy Regulatory Commission regulatory proceedings to represent the interests of California natural gas consumers (CPUC 2021).

Most of the natural gas transported through interstate pipelines, as well as some California-produced natural gas, is delivered through the Pacific Gas & Electric and SoCalGas intrastate natural gas transmission pipeline systems (commonly referred to as California's "backbone" natural gas pipeline system). Natural gas on the backbone pipeline system typically is then delivered into local transmission and distribution pipeline systems or to natural gas storage fields. CPUC has regulatory jurisdiction over 100,000 miles of utility-owned natural gas pipelines, which transported 82% of the natural gas delivered to California's gas consumers in 2017 (CPUC 2021).

Petroleum

According to the U.S. Energy Information Administration, California used approximately 681 million barrels of petroleum in 2018, with the majority (584 million barrels) used for the transportation sector (EIA 2020b). This total annual consumption equates to a daily use of approximately 1.9 million barrels of petroleum. There are 42 U.S. gallons in a barrel, so California consumes approximately 78.4 million gallons of petroleum per day, adding up to an annual consumption of 28.7 billion gallons of petroleum. By sector, transportation sources utilize approximately 85.5% of the state's petroleum, followed by 11.1% from industrial, 2.5% from commercial, 0.9% from residential, and 0.01% from electric power uses (EIA 2018). Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel. California has implemented policies to improve vehicle efficiency and to support use of alternative transportation, which are described in Section 3.5.2, Regulatory Setting, below. As such, CEC anticipates an overall decrease of gasoline demand in the state over the next decade.

Existing Infrastructure

Electricity and natural gas would be provided by SDG&E. Electrical facilities throughout the City of San Marcos (City) include a combination of aboveground and belowground electrical distribution lines and utilities structures. The City's fiber-optic network is facilitated by a 72-strand fiber-optic line that runs on various streets throughout the City. All major arterials in the City have implemented fiber optics. There are existing electrical lines and a natural gas pipeline adjacent to the project site within N Las Posas Road.

3.5.2 Regulatory Setting

Federal, state, and local agencies regulate energy use and consumption through various means and programs. On the federal level, the U.S. Department of Transportation, the U.S. Department of Energy, and the U.S. Environmental Protection Agency (EPA) are three federal agencies with substantial influence over energy policies and programs. On the state level, CPUC and CEC are two agencies with authority over different aspects of energy. Relevant federal, state, and local energy-related regulations are summarized below. This information helps to place the impact analysis within its proper regulatory context.

Federal

Infrastructure Investment and Jobs Act

On November 6, 2021, Congress passed the Bipartisan Infrastructure Deal (Infrastructure Investment and Jobs Act), a once-in-a-generation investment in our nation's infrastructure and competitiveness. This Bipartisan Infrastructure Deal will rebuild America's roads, bridges, and rails; expand access to clean drinking water; ensure every American has access to high-speed internet; tackle the climate crisis; advance environmental justice; and invest in communities that have too often been left behind. The legislation will help ease inflationary pressures

and strengthen supply chains by making long-overdue improvements for our nation's ports, airports, rail, and roads. It will drive the creation of good-paying union jobs and grow the economy sustainably and equitably so that everyone gets ahead for decades to come. Combined with the President's Build Back Framework, it will add on average 1.5 million jobs per year for the next 10 years. It will improve transportation options for millions of Americans to reduce energy use and greenhouse gas (GHG) emissions. It will also increase investment in electric vehicle chargers and renewable energy production.

Federal Energy Policy and Conservation Act

In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the National Highway Traffic Safety Administration is responsible for establishing additional vehicle standards. In 2012, new fuel economy standards for passenger cars and light trucks were approved for model years 2017 through 2021 (77 FR 62624–63200). The National Highway Traffic Safety Administration is proposing to amend the Corporate Average Fuel Economy standards set in 2020 for passenger cars and light trucks manufactured in model years 2024–2026, so that standards would increase in stringency at a rate of 8% per year rather than the 1.5% per year set previously (49 CFR Part 531). Fuel economy is determined based on each manufacturer's average fuel economy for the fleet of vehicles available for sale in the United States.

Intermodal Surface Transportation Efficiency Act of 1991

The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) promoted the development of intermodal transportation systems to maximize mobility and address national and local interests in air quality and energy. ISTEA contained factors that metropolitan planning organizations were to address in developing transportation plans and programs, including some energy-related factors. To meet the new ISTEA requirements, metropolitan planning organizations adopted policies defining the social, economic, energy, and environmental values guiding transportation decisions.

Transportation Equity Act for the 21st Century

The Transportation Equity Act for the 21st Century was signed into law in 1998 and builds on the initiatives established in the ISTEA legislation, discussed above. The act authorizes highway, highway safety, transit, and other efficient surface transportation programs. The act continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of transportation decisions. The act also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of intelligent transportation systems to help improve operations and management of transportation systems and vehicle safety.

Energy Independence and Security Act of 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased fuel efficiency standards for motor vehicles, the EISA includes the following other provisions related to energy efficiency:

- Renewable Fuel Standard (RFS) (Section 202)
- Appliance and Lighting Efficiency Standards (Sections 301–325)
- Building Energy Efficiency (Sections 411–441)

This federal legislation requires ever-increasing levels of renewable fuels (the RFS) to replace petroleum (EPA 2013). EPA is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. The RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders.

The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the EISA, the RFS program was expanded in several key ways that lay the foundation for achieving significant reductions in GHG emissions from the use of renewable fuels, reducing imported petroleum, and encouraging the development and expansion of the renewable fuels sector in the United States. The updated program is referred to as "RFS2" and includes the following:

- EISA expanded the RFS program to include diesel in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel and set separate volume requirements for each one.
- EISA required EPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

Additional provisions of the EISA address energy savings in government and public institutions, research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green" jobs.

State

The discussion below focuses primarily on those policies, regulations, and laws that directly pertain to energy-related resources. Refer to Section 3.7, Greenhouse Gas Emissions, of this EIR, which addresses various policies, regulations, and laws targeted to the reduction of GHG emissions that are expected to achieve co-benefits in the form of reduced demand for energy-related resources and enhanced efficiencies in the consumption of energy-related resources.

Warren-Alquist Act

The California Legislature passed the Warren-Alquist Act in 1974. The Warren-Alquist Act created the CEC. The legislation also incorporated the following three key provisions designed to address the demand side of the energy equation:

- It directed CEC to formulate and adopt the nation's first energy conservation standards for both buildings constructed and appliances sold in California.
- The act removed the responsibility of electricity demand forecasting from the utilities, which had a financial interest in high demand projections, and transferred it to a more impartial CEC.
- CEC was directed to embark on an ambitious research and development program, with a particular focus on fostering what were characterized as non-conventional energy sources.

State of California Energy Action Plan

CEC and CPUC approved the first State of California Energy Action Plan in 2003. The plan established shared goals and specific actions to ensure that adequate, reliable, and reasonably priced electrical power and natural

gas supplies are provided, and identified policies, strategies, and actions that are cost-effective and environmentally sound for California's consumers and taxpayers. In 2005, a second energy action plan was adopted by CEC and CPUC to reflect various policy changes and actions of the prior 2 years.

At the beginning of 2008, CEC and CPUC determined that it was not necessary or productive to prepare a new energy action plan. This determination was based in part on a finding that the state's energy policies have been significantly influenced by the passage of Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (discussed below). Rather than produce a new energy action plan, CEC and CPUC prepared an "update" that examines the state's ongoing actions in the context of global climate change.

Senate Bill 1078 (2002)

This bill established the California Renewable Portfolio Standard Program and required that a retail seller of electricity purchase a specified minimum percentage of electricity generated by eligible renewable energy resources as defined in any given year, culminating in a 20% standard by December 31, 2017. These retail sellers include electrical corporations, community choice aggregators, and electric service providers. The bill relatedly required CEC to certify eligible renewable energy resources, design and implement an accounting system to verify compliance with the Renewable Portfolio Standard by retail sellers, and allocate and award supplemental energy payments to cover above-market costs of renewable energy.

Senate Bill (SB) 350 (2015) requires retail seller and publicly owned utilities to procure 50% of their electricity from eligible renewable energy resources by 2030, with interim goals of 40% by 2024 and 45% by 2027.

SB 100 (2018) accelerated and expanded the standards set forth in SB 350 by establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 also states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources does not increase the carbon emissions elsewhere in the western grid and that the achievement not be attained through resource shuffling.

Assembly Bill 1007 (2005)

AB 1007 (2005) required CEC to prepare a statewide plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). CEC prepared the plan in partnership with the California Air Resources Board (CARB) and in consultation with the other state, federal, and local agencies. The plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Assembly Bill 32 (2006) and Senate Bill 32 (2016)

In 2006, the California Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. AB 32 required California to reduce its GHG emissions to 1990 levels by 2020. In 2016, the California Legislature enacted SB 32, which extended the horizon year of the state's codified GHG reduction planning targets from 2020 to 2030, requiring California to reduce its GHG emissions to 40% below 1990 levels by 2030. In accordance with AB 32 and SB 32, CARB prepares scoping plans to guide the development of statewide policies and regulations for the reduction of GHG emissions. Many of the policy and regulatory concepts identified in the

scoping plans focused on increasing energy efficiencies and the use of renewable resources, and on reducing the consumption of petroleum-based fuels (such as gasoline and diesel). As such, the state's GHG emissions reduction planning framework creates co-benefits for energy-related resources. Additional information on AB 32 and SB 32 is provided in Section 3.7 of this EIR.

California Building Standards

Part 6 of Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Part 6 establishes energy efficiency standards for residential and non-residential buildings constructed in California to reduce energy demand and consumption. Notably, Title 24 categorizes residential buildings that are four or more habitable levels as high-rise residential rather than mid-rise. High-rise residential buildings are included in the nonresidential section of Title 24 and subject to the nonresidential (not residential) code. Part 6 is updated periodically to incorporate and consider new energy efficiency technologies and methodologies.

The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. In general, single-family residences built to the 2019 standards are anticipated to use approximately 7% less energy due to energy efficiency measures than those built to the 2016 standards; once rooftop solar electricity generation is factored in, single-family residences built under the 2019 standards will use approximately 53% less energy than those under the 2016 standards (CEC 2018). Nonresidential buildings built to the 2019 standards are anticipated to use an estimated 30% less energy than those built to the 2016 standards (CEC 2018). The 2022 Title 24 Building Energy Efficiency Standards become effective on January 1, 2023. The 2022 standards encourage electric heat pump technology and use, establish electric-ready requirements when natural gas is installed, expand solar photovoltaic system and battery storage standards, and strengthen ventilation requirements to improve indoor air quality (CEC 2021).

Title 24 also includes Part 11, the California Green Building Standards (CALGreen). CALGreen establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The 2019 CALGreen standards are the current applicable standards. For nonresidential projects (which the project is subject to), some of the key mandatory 2019 CALGreen standards involve requirements related to bicycle parking, designated parking for clean air vehicles, electric vehicle charging stations, shade trees, water conserving plumbing fixtures and fittings, outdoor potable water use in landscaped areas, recycled water supply systems, construction waste management, excavated soil and land clearing debris, and commissioning (24 CCR Part 11).

Integrated Energy Policy Report

CEC is responsible for preparing integrated energy policy reports that identify emerging trends related to energy supply, demand, and conservation; public health and safety; and maintenance of a healthy economy. CEC's 2021 Integrated Energy Policy Report discusses the state's policy goals of decarbonizing buildings, doubling energy efficiency savings, and increasing flexibility in the electricity grid system to integrate more renewable energy (CEC 2021). Specifically for the decarbonizing of building energy, the goal would be achieved by designing future commercial and residential buildings to have their energy sourced almost entirely from electricity in place of natural gas. Regarding the increase in renewable energy flexibility, the goal would be achieved through increases in energy storage capacity within the state, increases in energy efficiency, and adjusting energy use to the time of day when the most amount of renewable energy is being generated. Over time, these policies and trends would serve to beneficially reduce the project's GHG emissions profile and energy consumption as they are implemented.

Advanced Clean Cars Program

In January 2012, CARB approved the Advanced Clean Cars program, a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars (CARB 2011). To improve air quality, CARB established emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that in 2025 cars will emit 75% less smog-forming pollution than the average new car sold today. To reduce GHG emissions, CARB, in conjunction with EPA and the National Highway Traffic Safety Administration, has adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The zero-emission vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years. The Clean Fuels Outlet regulation will ensure that fuels such as electricity and hydrogen are available to meet the fueling needs of the new advanced-technology vehicles as they come to the market.

Executive Order N-79-20

Executive Order N-79-20 (2020) sets the goal for the state that 100% of in-state sales of new passenger cars and trucks will be zero emission by 2035. Executive Order N-79-20 also sets goals for transition to 100% zero emission for all medium- and heavy-duty vehicles by 2045, zero emission for drayage trucks by 2035, and zero emission for off-road vehicles and equipment by 2035, where feasible. Among other directives to further this executive order, for passenger cars and trucks, the governor directed CARB to develop and propose regulations requiring increasing volumes of new zero-emission vehicles sold in the state toward the target of 100% of in-state sales by 2035. The governor also directed the Governor's Office of Business and Economic Development to develop a Zero-Emissions Vehicle Market Development Strategy, which was completed in February 2021[1]. The executive order also directs updates and assessments to ensure zero-emission vehicle infrastructure is in place to support the levels of electric vehicle adoption required by the order.

Sustainable Communities Strategy

The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet its GHG emissions reduction mandates. As codified in California Government Code, Section 65080, SB 375 requires metropolitan planning organizations (San Diego Association of Governments) to include a sustainable communities strategy in their regional transportation plan. The main focus of the sustainable communities strategy is to plan for growth in a fashion that will ultimately reduce GHG emissions, but the strategy is also a part of a bigger effort to address other development issues within the general vicinity, including transit and vehicle miles traveled (VMT), which influence the consumption of petroleum-based fuels.

[1] https://static.business.ca.gov/wp-content/uploads/2021/02/ZEV_Strategy_Feb2021.pdf

Local

SDG&E Long-Term Procurement Plan

In 2009, CPUC approved SDG&E's Long-Term Procurement Plan (LTPP), which identifies how SDG&E will meet the future energy needs of customers in SDG&E's service area (SDG&E 2009). The LTPP identifies several energy demand reduction targets (i.e., conservation) and goals for increasing renewable energy supplies, new local power generation, and increased transmission capacity.

The LTPP sets a standard for acquiring 20% of SDG&E's energy mix from renewables by 2010 and 33% by 2020. The LTPP also calls for greater use of in-region energy supplies, including renewable energy installations. The LTPP states that, by 2020, SDG&E intends to achieve and maintain the capacity to generate 75% of summer peak demand energy with in-County generation. The LTPP also identifies 44% of its renewables to be generated and distributed in-region by 2020.

San Diego Association of Governments Regional Plan

The 2021 Regional Plan provides a long-term blueprint for the San Diego region that seeks to meet regulatory requirements, address traffic congestion, and create equal access to jobs, education, healthcare, and other community resources (SANDAG 2021). The plan is the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies.

The 2021 Regional Plan includes a Sustainable Communities Strategy, as required by California SB 375, for the San Diego region. This Sustainable Communities Strategy describes coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by CARB. The state-mandated target is a 19% reduction—compared with 2005—in per-capita GHG emissions from cars and light-duty trucks by 2035. The 2021 Regional Plan achieves a 20% reduction by then.

The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity.

City of San Marcos General Plan

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing GHG emissions and the co-benefit of reducing energy consumption. The project's consistency with the City's General Plan is provided in Section 3.10, Land Use and Planning. Applicable policies include the following:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.3: Require the incorporation of green building practices, technologies, and strategies into development projects per code standards.

Policy LU-2.5: Promote landscaping (e.g., native, drought tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the instillation of trees to reduce the urban heat-island effect and green infrastructure to reduce storm water runoff.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Conservation and Open Space Element

Policy COS-4.5: Encourage energy conservation and the use of alternative energy sources within the community.

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

City of San Marcos Climate Action Plan

The City adopted its Climate Action Plan (CAP) on December 8, 2020 (City of San Marcos 2020). The CAP acts as a roadmap to address challenges of climate change within the City. The CAP builds on the efforts and strategies identified in the City's 2013 CAP, and establishes GHG emission reduction targets and identifies achievable, locally based actions to reduce GHG emissions from municipal and community activities. The City has included energy-reducing measures in the CAP Consistency Review Checklist, such as electric vehicle charging stations, bicycle infrastructure, transportation demand management, reduced parking, electric water heaters, photovoltaic systems, landscaping water use, and urban tree canopy.

3.5.3 Thresholds of Significance

The significance criteria used to evaluate the proposed project's impact on energy are based on Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). According to Appendix G, a significant impact would occur if development of the project would do any of the following:

- **Threshold No. 1:** Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
- **Threshold No. 2:** Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

3.5.4 Project Impact Analysis

Threshold No. 1: Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Electricity

Construction Use

Temporary electric power for as-necessary lighting and electronic equipment (such as computers inside temporary construction trailers and heating, ventilation, and air conditioning) would be provided by SDG&E. The amount of electricity used during project construction would be minimal because typical demand stems from the use of electronic equipment, in addition to electrically powered hand tools.

As the electricity used for construction activities would be temporary and minimal, impacts related to electricity consumption during project construction are determined to be **less than significant**.

Operational Use

The operation of the project would require electricity for multiple purposes, including cooling, lighting, appliances, and various equipment. Additionally, the supply, conveyance, treatment, and distribution of water would indirectly result in electricity usage.

The California Emissions Estimator Model (CalEEMod), version 2020.4.0, default values for electricity consumption for the residential land use were applied, which account for the 2019 Title 24 building code (CAPCOA 2021). The electricity use for residential buildings is calculated in CalEEMod using energy intensity value (electricity use per square foot per year) assumptions, which were based on the Residential Appliance Saturation Survey (CEC 2010). Per CEC's Impact Analysis for the 2019 Update to the California Energy Efficiency Standards for Residential and Non-Residential Buildings, single-family homes built with the 2019 standards will use about 7% less energy due to energy efficiency measures versus those built under the 2016 standards. Once rooftop solar electricity generation is factored in, homes built under the 2019 standards will use about 53% less energy than those under the 2016 standards (CEC 2019).

The proposed project's residential uses are estimated to have a total electrical demand of approximately 0.7 million kWh of electricity per year, including indirect electricity for water and wastewater use.

The project would also implement applicable City's CAP measures that would reduce operational electricity consumption, including installing electric water heaters. While this would increase electricity use, it would result in less natural gas use and is more efficient than heating water with natural gas as 15% of the energy is lost in the exhaust.

In summary, although electricity consumption would increase at the project site due to project implementation, the project would be required to comply with Title 24 and the City's CAP by implementing energy-efficiency measures. Furthermore, the project would be subject to the Title 24 building code that is adopted at the time building permits are obtained and thus may be subject to a more stringent energy standard than what was assumed herein. For these reasons, electricity consumption of the project would not be considered inefficient, wasteful, or unnecessary, and impacts would be **less than significant.**

Natural Gas

Construction Use

Natural gas is not anticipated to be required during construction of the proposed project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection titled "Petroleum." Any minor amounts of natural gas that may be consumed as a result of construction would be temporary and negligible and would not have an adverse effect on the environment; therefore, impacts would be **less than significant**.

Operational Use

The operation of residential units would require natural gas for space heating and to power appliances. Default natural gas usage rates in CalEEMod for the proposed land use and climate zone were used based on compliance with 2019 Title 24 standards, which are assumed within CalEEMod 2020.4.0.

The operation of the project is estimated to use approximately 870 million British thermal units of natural gas per year, which is equivalent to 8,731 therms of natural gas per year.

As previously discussed, the project would be subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Prior to building permit application, the applicant would ensure that project plans would meet Title 24 requirements applicable at that time, as required by state regulations, through their plan review process. Additionally, the project would implement the City's CAP measure that reduces operational natural gas consumption, which requires the installation of electric water heaters.

In summary, although natural gas usage would increase due to project implementation, project design features would be implemented, and usage would be decreased through green building standards. For these reasons, the natural gas consumption of the project would not be considered inefficient or wasteful, and impacts would be **less than significant.**

Petroleum

Construction Use

Petroleum would be consumed throughout construction of the proposed project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment associated with construction activities would rely on diesel fuel. Construction workers would travel to and from the project site throughout the duration of construction. It is assumed that construction workers would travel to and from the project site in gasoline-powered vehicles.

Heavy-duty construction equipment of various types would be used during each phase of construction. CalEEMod was used to estimate construction equipment usage, and results are included in Appendix B. Based on that analysis, over all phases of construction, diesel-fueled construction equipment would operate for an estimated 18,496 hours, as summarized in Table 3.5-2.

Table 3.5-2. Project Hours of Operation for Construction Equipment

Phase	Hours of Equipment Use
Site Preparation	192
Grading	1,344
Paving	15,720
Building Construction	1,120
Architectural Coating	120
Total	**18,496**

Source: Appendix B.

Fuel consumption from construction equipment was estimated by converting the total carbon dioxide (CO_2) emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. Construction is estimated to occur over an 18-month period (2023 through 2025) based on the construction phasing schedule. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2021). The estimated diesel fuel use from construction equipment is shown in Table 3.5-3.

Table 3.5-3. Project Construction Equipment Diesel Demand

Phase	Equipment CO_2 (MT)	kg CO_2/Gallon	Gallons
Site Preparation	4.11	10.21	402.58
Grading	83.26	10.21	8,154.88
Building Construction	261.47	10.21	25,609.69
Paving	22.33	10.21	2,187.28
Architectural Coating	2.55	10.21	250.08
		Total	36,604.50

Sources: Appendix B (pieces of equipment and equipment CO_2); The Climate Registry 2021 (kg CO_2/gallon).
Notes: CO_2 = carbon dioxide; MT = metric ton; kg = kilogram.

Fuel consumption from worker and vendor trips is estimated by converting the total CO_2 emissions from each construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Worker vehicles are assumed to be gasoline fueled, and vendor vehicles are assumed to be diesel fueled. Calculations for total worker and vendor fuel consumption are provided in Tables 3.5-4 and 3.5-5.

Table 3.5-4. Project Construction Worker Vehicle Gasoline Demand

Phase	Vehicle CO_2 (MT)	kg CO_2/Gallon	Gallons
Site Preparation	0.23	8.78	26.01
Grading	1.20	8.78	137.06
Building Construction	153.80	8.78	17,516.67
Paving	0.98	8.78	111.86
Architectural Coating	2.25	8.78	256.61
		Total	18,048.21

Sources: Appendix B (construction worker CO_2); The Climate Registry 2021 (kg CO_2/gallon).
Notes: CO_2 = carbon dioxide; MT = metric ton; kg = kilogram.

Table 3.5-5. Project Construction Vendor Truck Diesel Demand

Phase	Vehicle CO_2 (MT)	kg CO_2/Gallon	Gallons
Site Preparation	0.24	10.21	23.58
Grading	0.96	10.21	93.72
Building Construction	139.17	10.21	13,631.10
Paving	0.79	10.21	77.24
Architectural Coating	0.77	10.21	75.77
		Total	13,901.41

Sources: Appendix B (vendor truck CO_2); The Climate Registry 2021 (kg CO_2/gallon).
Notes: CO_2 = carbon dioxide; MT = metric ton; kg = kilogram.

As shown in Tables 3.5-3 through 3.5-5, implementation of the project is estimated to consume a total of 68,554 gallons of petroleum from off-road equipment and worker vehicle and vendor truck trips during the construction phase. Within the County, the estimated petroleum use in 2023 would be 1.7 billion gallons per year (CARB 2022).

The project would be required to comply with CARB's Airborne Toxics Control Measure, which restricts heavy-duty diesel vehicle idling time to 5 minutes. While construction activities would consume petroleum-based fuels, consumption of such resources would be temporary and would cease upon the completion of construction.

Further, the petroleum consumed related to construction would be typical of construction projects of similar types and sizes and would not necessitate new petroleum resources beyond what are typically consumed in California. Therefore, because petroleum use during project construction would be temporary and minimal and would not be wasteful or inefficient, impacts would be **less than significant**.

Operational Use

The majority of fuel consumption resulting from the operational phase of the project would be attributable to the use of resident motor vehicles traveling to and from the project site, as well as fuels used for alternative modes of transportation that may be used by residents. There is also gasoline use that could be associated with landscaping equipment.

Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of VMT as a result of operation. As shown in Appendix B, the VMT attributable to the project is expected to be approximately 1,422,938 VMT per year.

Similar to construction worker and vendor trips, fuel consumption was estimated by converting the total CO_2 emissions from each land use type to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Based on the annual fleet mix provided in CalEEMod, 80% of the fleet range from light-duty to medium-duty vehicles and motorcycles was assumed to run on gasoline. The remaining 20% of vehicles represents medium-heavy duty to heavy-duty vehicles and buses/recreational vehicles, which were assumed to run on diesel.

Calculations for annual mobile-source fuel consumption are provided in Table 3.5-6.

Table 3.5-6. Mobile Source Fuel Consumption – Operation

Fuel	Vehicle MT CO_2	kg CO_2/Gallon	Gallons
Gasoline	367.82	8.78	41,893.04
Diesel	89.49	10.21	8,764.83
		Total	**50,657.87**

Sources: Appendix B (mobile source CO_2); The Climate Registry 2020 (kg CO_2/gallon).
Notes:
CO_2 = carbon dioxide; kg = kilogram; MT = metric ton

As shown in Table 3.5-6, mobile sources associated with the project would result in approximately 41,893 gallons of gasoline per year and 8,765 gallons of diesel consumed per year beginning in 2025. This is a conservative estimate because it does not account for usage of electric vehicles.

By comparison, California as a whole consumes approximately 28.7 billion gallons of petroleum per year (EIA 2017). Within the County, the estimated petroleum use in 2024 is 1.5 billion gallons per year (CARB 2022).

Over the lifetime of the project, the fuel efficiency of the vehicles being used by residents is expected to increase. As such, the amount of petroleum consumed as a result of vehicular trips to and from the project site during operation would decrease over time. As discussed under Section 3.5.2, there are numerous regulations in place that require and encourage increased fuel efficiency. For example, CARB has adopted a new approach to passenger vehicles by combining the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The new approach also includes efforts to support and accelerate the numbers of plug-in hybrids and ZEVs in California (CARB 2017). Additionally, in response to SB 375, CARB has adopted the goal of reducing per-

capita GHG emissions from 2005 levels by 15% by the year 2020 and 19% by the year 2035 for light-duty passenger vehicles in the San Diego Association of Governments planning area. This reduction would occur by reducing vehicle miles traveled through the integration of land use planning and transportation (CARB 2019). As such, petroleum use is anticipated to decrease over time due to advances in fuel economy.

Bus service is located in front of the project site. The project site is located approximately 0.3 miles from the SPRINTER station, which provides light rail access into the nearby cities of Escondido, Vista, and Oceanside. Additionally, the SPRINTER connects to the Surfliner and Coaster routes, which provide north–south access to Los Angeles County, Orange County, and the City of San Diego. Furthermore, the project would implement applicable measures in Title 24 and the City's 2020 CAP, including installing electric vehicle charging stations, installing bicycle infrastructure, implementing a Transportation Demand Management plan, and reducing parking near transit. These measures would further reduce VMT and petroleum consumption from operation, increase access to transit, and encourage alternative modes of transportation.

In summary, although the project would increase petroleum use during operation, the use would be a small fraction of the statewide use and, due to efficiency increases, would diminish over time. Given these considerations, petroleum consumption associated with the project would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, and impacts would be **less than significant**.

Threshold No. 2: Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and non-residential buildings constructed in California in order to reduce energy demand and consumption. The project would also be subject to Part 11 of Title 24, also known as the CalGreen building standards. These standards were adopted into the City's building design criteria. Furthermore, the project would be consistent with the City's CAP measures through its implementation of installing electric vehicle charging stations, bicycle infrastructure, and electric water heaters; reducing landscaping water use; and planting trees that would further reduce operational energy use. The project would be built and operated in accordance with all existing, applicable regulations at the time of construction. For these reasons stated, the project would result in a **less-than-significant** impact associated with the potential to conflict with energy standards and regulations.

3.5.5 Cumulative Impact Analysis

Potential cumulative impacts on energy would result if the proposed project, in combination with past, present, and future projects, would result in the wasteful or inefficient use of energy. This could result from development that would not incorporate sufficient building energy efficiency features, would not achieve building energy efficiency standards, or would result in the unnecessary use of energy during construction and/or operation. The cumulative projects within the areas serviced by the energy service providers would be applicable to this analysis; this includes existing aging structures that are energy inefficient. Projects that include development of large buildings or other structures that would have the potential to consume energy in an inefficient manner would have the potential to contribute to a cumulative impact. Projects that would mostly include construction, such as transportation infrastructure, could also contribute to a cumulative impact; however, the impact of these projects would be limited because they would typically not involve substantial ongoing energy use.

As described previously, the project would not result in significant environmental impacts due to wasteful, inefficient, or unnecessary use of energy due to various design features, including installing electric vehicle charging stations, installing electric water heaters, reducing landscaping water use, and planting trees that would be required of the proposed project. Like the project, cumulative projects would be subject to CALGreen, which provides energy efficiency standards for commercial and residential buildings. Over time, CALGreen would implement increasingly stringent energy efficiency standards that would require the project, and the cumulative projects, to minimize the wasteful and inefficient use of energy. In addition, cumulative projects would be required—at a minimum—to meet Title 24 building standards, further avoiding the inefficient use of energy. Furthermore, various federal and state regulations, including the Low Carbon Fuel Standard, Pavley Clean Car Standards, and Low Emission Vehicle Program, would serve to reduce the transportation fuel demand of cumulative projects. Project impacts to energy are not determined to be cumulatively considerable and would be **less than significant**.

3.5.6 Mitigation Measures

Impacts would be less than significant, and no mitigation measures are required.

3.5.7 Conclusion

The project would comply with regulatory requirements and would implement project design features in the City's CAP that would reduce operational energy consumption. For example, the project would be required to install electric vehicle charging stations, install electric water heaters, incorporate solar panels, reduce landscaping water use, and plant trees. Furthermore, the project's location as an infill development and its close proximity to resident services and transit would inherently result in less VMT and petroleum use compared to a sprawling project. As such, the project would not result in the wasteful or inefficient use of electricity. Additionally, the project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy consumption, including the City's General Plan policies and City's CAP. As a result, impacts would be less than significant.

3.6 Geology and Soils

This section describes the existing geological setting of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project, including seismic activity, liquefaction, landslides, loss of topsoil, soil erosion, soil stability, and soil expansion. Preparation of this environmental impact report (EIR) section relied on information provided in the Geotechnical Evaluation prepared for the project by LGC Geotechnical Inc. dated July 15, 2021. The Geotechnical Evaluation is included as Appendix E to this EIR.

A summary of the project- and cumulative-level geology and soils analysis by threshold is provided in Table 3.6-1.

Table 3.6-1. Geology and Soils Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42.	Less than Significant	Less than Significant	Less than Significant
No. 2: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.	Less than Significant	Less than Significant	Less than Significant
No. 3: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic-related ground failure, including liquefaction.	Less than Significant	Less than Significant	Less than Significant
No. 4: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides.	Less than Significant	Less than Significant	Less than Significant
No. 5: Result in substantial soil erosion or the loss of topsoil.	Less than Significant	Less than Significant	Less than Significant
No. 6: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.	Less than Significant	Less than Significant	Less than Significant
No. 7: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.	Less than Significant	Less than Significant	Less than Significant
No. 8: Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.	Less than Significant	Less than Significant	Less than Significant
No. 9: Directly or indirectly destroy a unique paleontological resource or site unique geologic feature.	Less than Significant	Less than Significant	Less than Significant

3.6.1 Existing Conditions

Soils

A brief description of the earth materials encountered during subsurface exploration is presented in the following sections. Based on field observations and review of published geologic maps, the project site is locally underlain by older artificial fill overly Quaternary older alluvium.

A field study was conducted on June 7, 2021, and consisted of a site reconnaissance and excavation of nine geotechnical hollow stem auger borings. Borings HS-1 through HS-6 were excavated to depths ranging from approximately 5 to 15.5 feet, and Borings I-1 through I-3 were excavated to approximately 10 feet below grade. The borings were drilled and included collection of bulk and relatively undisturbed driven soil samples for subsequent laboratory testing.

Older Artificial Fill (Map Symbol afo)

Older artificial fill as depicted on the Geotechnical Map (Appendix E) generally indicates material that has been placed over native on-site soils as part of prior rough grading activities. The materials encountered consisted of light to medium brown clayey sands and sandy clays that are slightly moist to moist and dense and/or stiff. The artificial fill materials encountered during the subsurface evaluation ranged from approximately existing grade to 8 feet in depth (Appendix E).

Quaternary Older Alluvium (Map Symbol Qal)

Quaternary older alluvium was encountered in the exploratory test pits and borings on the project site. These soils consisted of light to dark brown, slightly moist, dense to very dense clayey sands and stiff to hard sand clays with gravel and lesser amounts of cobbles. The alluvial materials encountered during the subsurface evaluation ranged from approximately 2 feet to a maximum of 15.5 feet in depth.

Surface Water and Groundwater

Surface Water

Surface water was not observed during the project site visit. If encountered during earthwork construction, surface water on this site is likely the result of precipitation. Overall site area drainage is in a southeast direction.

Groundwater

Shallow groundwater conditions were not encountered during the field visit, which included excavations up to 15.5 feet below the existing ground surface. Groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present within the near-surface deposits due to local seepage or during rainy seasons (Appendix E).

Earthquake Hazards

California and the project site are located between the Pacific and North American Tectonic Plates. Several major fault zones are found in Southern California including the San Andreas Fault Zone, with sub parallel faults including the Elsinore, Newport-Inglewood, Rose Canyon, and Coronado Banks Faults. No faults are shown in the immediate project site vicinity (Appendix E).

Surface Fault Rupture

The geologic structure of the entire Southern California area is dominated mainly by northwest trending faults associated with the San Andreas system. The project site is in a seismically active region. No active or potentially active fault is known to exist at the project site nor is the project site situated within an Alquist-Priolo Earthquake Fault Zone or a Special Studies Zone (Appendix E). The nearest known active fault is the Rose Canyon fault located about 11.7 miles west of the project site.

Liquefaction/Seismic Settlement

Liquefaction describes a phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. These soils may thereby acquire a high degree of mobility, which can lead to lateral movement, sliding, consolidation and settlement of loose sediments, sand boils, and other damaging deformations. The factors known to influence liquefaction potential include soil type and grain size, relative density, groundwater level, and intensity and duration of ground shaking. Based on the lack of shallow groundwater, the dense nature of the on-site soils, and the presence of fine-grained soils, the potential for liquefaction or settlement to impact the site is considered very low (Appendix E).

Other Seismic Hazards

Due to the relatively flat nature of the project site, the potential for landslides and rockfall is considered negligible. The project site is located in a zone with zero susceptibility to landslides (City of San Marcos 2012).

In addition, the potential for secondary seismic hazards such as seiche and tsunami is remote due to site elevation and distance from an open body of water.

Paleontological Resources

The project site is underlain by older artificial fill (afo) and Quaternary older alluvium (Qcol). The preliminary geotechnical evaluation prepared for the project did not identify any unique geologic features on the project site. Furthermore, as determined in the Cultural Resources Report prepared for the project site (Appendix D), no archaeological resources were identified within the project site's area of potential effect. As such, the project site is unlikely to yield paleontological resources.

3.6.2 Regulatory Setting

This section describes the federal, state, and local regulations related to geology and soils.

Federal

Federal Disaster Mitigation Act of 2000

The Disaster Mitigation Act of 2000 provides a set of mitigation plan requirements that encourage state and local jurisdictions to coordinate disaster mitigation planning and implementation. The act also encourages states to complete a natural mitigation plan. California's relevant and updated State Hazard Mitigation Plan was adopted and approved by the Federal Emergency Management Agency Region IX in 2007. In accordance with this act, the County of San Diego prepared its Multi-Jurisdictional Hazard Mitigation Plan, which is discussed in more detail below.

Federal Response Plan

The Federal Response Plan of 1999 is a signed agreement among 27 federal departments and agencies, including the American Red Cross, that provides the mechanism for coordinating delivery of federal assistance and resources to augment efforts of state and local governments overwhelmed by a major disaster or emergency; supports implementation of the Robert T. Stafford Disaster Relief and Emergency Act, as well as individual agency statutory authorities; and supplements other federal emergency operations plans developed to address specific hazards. The Federal Response Plan is implemented in anticipation of a significant event likely to result in a need for federal assistance or in response to an actual event requiring federal assistance under a presidential declaration of a major disaster or emergency.

U.S. Geological Survey Landslide Hazard Identification Program

The U.S. Geological Survey, in fulfillment of the requirements of Public Law 106-113, created the National Landslide Hazards Program to reduce long-term losses from landslide hazards by improving understanding of the causes of ground failure and suggesting mitigation strategies. The Federal Emergency Management Agency is the responsible agency for the long-term management of natural hazards.

International Building Code

The International Building Code (IBC) is a model building code developed by the International Code Council that provides the basis for the California Building Code (CBC). The purpose of the IBC is to provide minimum standards for building construction to ensure public safety, health, and welfare. Prior to the creation of the IBC, several different building codes were used; however, by the year 2000, the IBC had replaced these previous codes. The IBC is updated every 3 years.

State

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act mitigates the hazard of surface fault rupture by regulating structures designated for human occupancy near active faults. As required by the act, the California Geological Survey has delineated Earthquake Fault Zones along known active faults in California.

California Geologic Survey

The California Geologic Survey provides guidance with regard to seismic hazards. The California Geologic Survey's Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California (CGS 2008), provides guidance for the evaluation and mitigation of earthquake-related hazards for projects located within certain designated zones.

California Surface Mining and Reclamation Act

Enacted to promote conservation and protection of significant mineral deposits, the California Surface Mining and Reclamation Act requires cities address the significant aggregate resources classified by the State Geologist and designated by the State Mining and Geology Board in their general plans. The act ensures that significant aggregate resources are recognized and considered before land use decisions are made that may compromise the availability of these resources.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act was enacted in 1997 to protect the public from strong ground shaking, liquefaction, landslides, or other ground failure and from other hazards caused by earthquakes. This act requires the State Geologist to map areas subject to seismic hazard. Before a development permit may be granted for projects located in designated areas, a geotechnical evaluation of the site must be prepared and appropriate mitigation measures incorporated into the project design. Additionally, the act requires a Standardized Natural Hazards Disclosure Statement form be completed by real estate sellers if a property is within one of the designated natural hazards areas.

Natural Hazards Disclosure Act

The Natural Hazards Disclosure Act (effective June 1, 1998), requires "sellers of real property and their agents provide prospective buyers with a 'Natural Hazard Disclosure Statement' when the property being sold lies within one or more state-mapped hazard areas, including a Seismic Hazard Zone." The Seismic Hazards Mapping Act, discussed above, specifies two ways this disclosure can be made:

- The Local Option Real Estate Transfer Disclosure Statement as provided in Section 1102.6a of the Civil Code
- The Natural Hazard Disclosure Statement as provided in Section 1103.2 of the Civil Code

The Local Option Real Estate Disclosure Statement can be substituted for the Natural Hazards Disclosure Statement if it contains substantially the same information and substantially the same warning as the Natural Hazards Disclosure Statement. Both the Alquist-Priolo Act and the Seismic Hazards Mapping Act require that real estate agents, or sellers of real estate acting without an agent, disclose to prospective buyers that the property is located in an Alquist-Priolo Earthquake Fault Zone or Seismic Hazard Mapping Zone.

California Building Code

The CBC is codified in Title 24 of the California Code of Regulations. Part 2 of the CBC specifies standards for geologic and seismic hazards, other than surface faulting. Chapter 23 of the CBC addresses seismic safety and includes regulations for earthquake-resistant design and construction. The 2022 edition of the CBC went into effect January 1, 2023 (California Building Standards Commission 2021).

Local

County of San Diego Multi-Jurisdictional Hazard Mitigation Plan

To comply with the Disaster Mitigation Act of 2000, the County of San Diego prepared the Multi- Jurisdictional Hazard Mitigation Plan in 2004, revised in 2017. The plan serves as both a county-wide plan and a plan for local jurisdictions that identifies risks posed by natural and human-made disasters before a hazard event occurs. The plan includes overall goals and objectives shared by many jurisdictions, as well as specific goals, objectives, and mitigation action items for each of the participating jurisdictions, including the City of San Marcos (City), developed to help minimize the effects of the specified hazards that potentially affect their jurisdiction (County of San Diego 2017).

San Marcos Grading Ordinance

The City's Grading Ordinance (found in Chapter 17.32 of the San Marcos Municipal Code) contains regulations for the purpose of protecting public health and safety with respect to the design and construction of building sites and

the development of property by grading. The ordinance sets forth rules and regulations to control excavation, grading and earthwork construction, engineering analysis of soil conditions, and the administrative procedure for issuance of grading permits, approval of grading plans, and site inspections.

City of San Marcos General Plan

The Safety Element of the City of San Marcos General Plan (General Plan) contains several policies pertaining to natural geologic hazards. The following goal and policies apply to the project (City of San Marcos 2012):

Goal S-1: Reduce risks to the community from earthquakes by regulating new development and redevelopment to prevent the creation of new geologic and seismic hazards.

Policy S-1.1: Reduce the risk of impacts from geologic and seismic hazards by applying current and proper land use planning, development engineering, building construction, and retrofitting requirements.

Policy S-1.2: Investigate specific groundwater levels and geologic conditions underlying all new development or redevelopment proposals in areas where potential fault rupture, liquefaction, or other geologic hazards are suspected.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As detailed in Section 3.10, the project is consistent with the applicable General Plan goals and policies pertaining to geology and soils.

3.6.3 Thresholds of Significance

As defined in Appendix G of the California Environmental Quality Act Guidelines, project impacts to geological resources are considered significant if the project would:

- **Threshold No. 1:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of as known fault. Refer to Division of Mines and Geology Special Publication 42.
- **Threshold No. 2:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.
- **Threshold No. 3:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction.
- **Threshold No. 4:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides.
- **Threshold No. 5:** Result in substantial soil erosion or the loss of topsoil.
- **Threshold No. 6:** Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
- **Threshold No. 7:** Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.

- **Threshold No. 8:** Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.
- **Threshold No. 9:** Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

3.6.4 Project Impact Analysis

The project area of potential effect includes the entire 7.6-acre project site. Impacts to geology and soils that may result from ground disturbing activities associated with the project are analyzed below.

Threshold No. 1: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of as known fault. (Refer to Division of Mines and Geology Special Publication 42)?

The project site is located in tectonically active Southern California. However, no Alquist-Priolo Fault Hazard Zones or other known active faults run through the project site. The closest known active fault is the Rose Canyon Fault, located 11.7 miles southwest of the project site. Based on the lack of active or potentially active faults underlying the project area, the potential for surface rupture is low and the project site would not be subject to a greater seismic risk than other locations within the region. Additionally, per the Alquist-Priolo Earthquake Fault Zoning Act, because the project site is not located in an Alquist Priolo Fault Zone, the project would not place any prohibited uses (e.g., uses containing structures with a capacity of 300 people or more; uses with the potential to severely damage the environment or cause major loss of life; or specific civic uses including police and fire stations, schools, hospitals, rest homes, nursing homes, and emergency communication facilities) within an Alquist–Priolo Fault Zone. Thus, the potential for loss, injury, or death involving rupture of a known earthquake fault is considered low.

The project would be required to comply with applicable CBC requirements and proposed plans would be subject to City review. For these reasons, impacts would be **less than significant.**

Threshold No. 2: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

There are no known active faults that run through the project site. The project would be designed in accordance with applicable CBC criteria, including those specific to resistance to seismic shaking. Furthermore, the project would be constructed in accordance with other applicable regulations, current seismic design specifications of the Structural Engineers Association of California, and applicable requirements of the State of California Occupational Safety and Health Administration. These required seismic design considerations are used to minimize structural damage in the event of ground shaking.

Additionally, the project would implement all recommendations from the Preliminary Geotechnical Evaluation (Appendix E), as well as any project-specific recommendations from any potential supplemental geotechnical evaluations in compliance with Section 17.32.040(d) of the San Marcos Municipal Code. Section 17.32.040(d) of the Municipal Code requires the incorporation of recommendations of geotechnical reports into grading plans prior to the approval of a grading permit. These recommendations include general provisions regarding compliance with grading ordinances, as well as recommendations related to property clearing and preparation, removal depths, remedial grading, engineered fill, excavation, shrinkage and bulking, trench compacting, and backfill. The Geotechnical Evaluation includes design recommendations, retaining wall design and construction recommendations, and post-construction considerations. The detailed recommendations are included in Section 5 of the Geotechnical Evaluation

(see Appendix E). The Development Services Department shall review and approve project design and construction to verify that the recommendations of the geotechnical evaluation have been incorporated. With adherence to all regulations and geotechnical recommendations from the Geotechnical Evaluation conducted for the project, impacts related to seismic ground shaking would be considered **less than significant**.

Threshold No. 3: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

As described in Section 3.6.1, Existing Conditions, liquefaction occurs when site conditions include shallow groundwater, low density non-cohesive (granular) soils, and high-intensity ground motion. Based on the Geotechnical Evaluation mapping, subsurface exploration, and laboratory testing, the project site is not identified as being susceptible to liquefaction (Appendix E). No shallow groundwater was identified on site, and soils on site consist of relatively dense material. The potential for liquefaction or dynamic settlement to occur on site is considered very low. Additionally, the project site is identified in the City's Safety Element as having zero susceptibility to liquefaction (Figure 6-1 of the General Plan) (City of San Marcos 2012). As such, the project site is not considered susceptible to liquefaction or significant amounts of seismic settlement.

Furthermore, the project would implement all remedial grading and drainage recommendations contained within the Geotechnical Evaluation (see Appendix E of this EIR), which would ensure potential impacts would not be substantial. For these reasons, implementation of the project would not result in seismic-related ground failure, including liquefaction, and impacts would be **less than significant.**

Threshold No. 4: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

The project site is relatively flat, ranging in elevation from approximately 570 to 580 feet above mean sea level. The project site is identified in the City's Safety Element as having zero susceptibility to landslides (Figure 6-1 of the General Plan) (City of San Marcos 2012). Therefore, the project site is not considered susceptible to landslides and project impacts would be **less than significant.**

Threshold No. 5: Would the project result in substantial soil erosion or the loss of topsoil?

The project would be required to comply with the City's Grading Ordinance, which contains design standards and performance requirements that must be met to avoid or reduce, to an acceptable level, excessive erosion. Furthermore, in accordance with Municipal Code requirements, the project would implement all recommendations pertaining to soil erosion or loss of topsoil as contained within the Geotechnical Evaluation (see Appendix E of this EIR), in addition to any additional recommendations from any supplemental geotechnical reports prepared for the project and the stormwater pollution prevention plan to be prepared for the project. For these reasons, implementation of the project would not result in substantial soil erosion or the loss of topsoil, and impacts would be **less than significant.**

Threshold No. 6: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

As previously described under Threshold Nos. 3 and 4, the potential for landslides and/or liquefaction on site is considered low. The project would be required to comply with the recommendations of the Geotechnical Evaluation (Appendix E). Site preparation, removals, and excavation associated with the project would be performed consistent

with Chapter 5 of the Geotechnical Evaluation (Appendix E) and any supplemental geotechnical evaluation. In addition, grading associated with the project would be accomplished under the observation and testing of the project geotechnical engineer and engineering geologist, in accordance with the requirements of the CBC, the City, and the County of San Diego. Areas to receive fill would be required to be properly cut and/or benched in accordance with current industry standards of practice, CBC guidelines, and City requirements.

Therefore, compliance with applicable regulations and the recommendations in the Geotechnical Evaluation would ensure that impacts from unstable conditions that could result in on- or off-site lateral spread, subsidence, liquefaction, or collapse would be **less than significant**.

Threshold No. 7: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

As described in the Geotechnical Evaluation (Appendix E), two of the nine borings yielded Expansion Index values of 32 and 55, which are classified as low and medium potential for expansion, respectively. The project would be required to implement CBC guidelines, regulations, and further recommendations to ensure that such soils are fully remediated and/or the project is designed appropriately to minimize impacts of expansive soils. The geotechnical evaluation also recommends concrete flatwork, use of sandy soils with a maximum of 35% fines and very low expansion potential for backfill materials, and the foundation design parameter implementation. With adherence to the Geotechnical Evaluation recommendations, as required for grading permit issuance, impacts related to expansive soils would be **less than significant**.

Threshold No. 8: Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

The project does not include septic tanks or alternative wastewater disposal systems. As described in Section 3.17, Utilities and Service Systems, the project would construct private on-site sewer lines that would connect to existing City infrastructure. Therefore, impacts would be **less than significant**.

Threshold No. 9: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

As discussed in Section 3.6.1, the potential for paleontological resources to be located on the project site is considered low. Although ground-disturbing activities associated with the project have the potential to unearth previously unidentified paleontological resources, the Geotechnical Evaluation prepared for the project did not identify any unique geologic features on the project site, and therefore impacts would be **less than significant**.

3.6.5 Cumulative Impact Analysis

Due to the localized nature of geology and soils, cumulative projects would address potential impacts to geology and soils on a project-by-project basis, as potential geologic hazards and soil composition vary by site. Each cumulative project would be required to assess individual and site-specific geologic conditions, which would inform construction and development of each site. All cumulative development would be subject to similar requirements to those imposed and implemented for the project and would be required to adhere to applicable regulations, standards, and procedures.

Further, as discussed in Section 3.6.4, the project site is unlikely to yield paleontological resources. Thus, impacts to paleontological resources from implementation of the project would be less than significant. While some of the projects on the cumulative list are located in areas that may contain paleontological resources, the presence of these resources is typically unknown prior to construction, and it is expected that mitigation measures would be included with approval of cumulative projects to ensure that impacts to paleontological resources are minimized. As implementation of the project would not result in any significant impacts to geology and soils on the project site, and all cumulative projects would be required to analyze site-specific conditions and implement recommendations or mitigation, cumulative impacts related to geology and soils would be **less than significant**.

3.6.6 Mitigation Measures

Based upon the analysis presented in Sections 3.6.4 and 3.6.5, all project- and cumulative-level geology and soil related impacts would be less than significant, and no mitigation is required.

3.6.7 Conclusion

Based upon the analysis presented in Section 3.6.4, impacts associated with seismicity, liquefaction, landslides, erosion/loss of topsoil, compressible soils, expansive soils, and paleontological resources were determined to be less than significant. The project would be required to adhere to all recommendations in the Geotechnical Evaluation prepared for the project and would be required to comply with all applicable regulations outlined in Section 3.6.2.

3.7 Greenhouse Gas Emissions

This environmental impact report (EIR) section describes the existing setting of the project site related to greenhouse gas (GHG) emissions and climate change, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the proposed Gran Vista Specific Plan Project (project). Information for this section relies on the Air Quality and Greenhouse Gas Emissions Technical Report prepared for the project by Dudek in February 2023. The Air Quality and Greenhouse Gas Emissions Technical Report is included as Appendix B to this EIR.

A summary of the project- and cumulative-level GHG analysis by threshold is provided in Table 3.7-1.

Table 3.7-1. Greenhouse Gas Emissions Summary of Impacts

Threshold of Significance	Project Direct Impact	Project Cumulative Impact	Significance Determination
No. 1: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	Less than Significant	Less than Significant	Less than Significant
No. 2: Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHGs.	Less than Significant	Less than Significant	Less than Significant

3.7.1 Existing Conditions

This section introduces the environmental setting as it relates to GHG emissions, providing a climate change overview; information on GHG and climate forcing substances, global warming potential, and sources of GHG emissions; and descriptions of potential effects of climate change in the region of the proposed project.

Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017a).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process: short-wave radiation emitted by the sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and is the most significant driver of observed climate change (EPA 2017a; IPCC 2013). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system.

Greenhouse Gases and Other Climate Forcing Substances

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), ozone (O_3), water vapor, hydrofluorocarbons (HFCs), hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).[1] Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted to the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as HFCs, HCFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. A summary of the most common GHGs and their sources is included in the following text.[2] Also included is a discussion of other climate-forcing substances.

Carbon Dioxide. CO_2 is a naturally occurring gas and a byproduct of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. CH_4 is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal waste, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers; manure management; industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants); vehicle emissions; and using N_2O as a propellant (such as in rockets, racecars, and aerosol sprays).

[1] California Health and Safety Code, Section 38505, identifies seven GHGs that CARB is responsible for monitoring and regulating to reduce emissions: CO_2, CH_4, N_2O, SF_6, HFCs, PFCs, and nitrogen trifluoride.

[2] The descriptions of GHGs are summarized from the Intergovernmental Panel on Climate Change (IPCC) Second Assessment Report (IPCC 1995), IPCC Fourth Assessment Report (IPCC 2007), CARB's Glossary of Terms Used in GHG Inventories (CARB 2015), and EPA's Glossary of Climate Change Terms (EPA 2016).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are powerful synthetic GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric O_3-depleting substances (e.g., chlorofluorocarbons, HCFCs, and halons). The most prevalent fluorinated gases are the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to O3-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as byproducts of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the O3-depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** Nitrogen trifluoride is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

Chlorofluorocarbons. Chlorofluorocarbons are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. They are chemically unreactive in the lower atmosphere (troposphere). The production of chlorofluorocarbons was prohibited beginning in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds whose structure is very close to that of chlorofluorocarbons—containing hydrogen, fluorine, chlorine, and carbon atoms—but that include one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of chlorofluorocarbons for some applications; however, their use is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and wildfires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify its global warming potential. Diesel particulate matter emissions are a major source of black carbon and are toxic air contaminants that have been regulated and controlled in California for several decades to protect public health. In relation to declining diesel particulate matter from the California Air Resources Board (CARB) regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have been reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affects cloud formation or albedo) (EPA 2017b). The Intergovernmental Panel on Climate Change developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of carbon dioxide equivalent (CO_2e).

Sources of Greenhouse Gas Emissions

Anthropogenic GHG emissions worldwide in 2019 (the most recent year for which data is available) totaled approximately 52.4 million metric tons (MMT) of CO_2e, excluding land use change and forestry (PBL 2020). Six countries—China, the United States, the Russian Federation, India, Japan, and Brazil—and the European community accounted for approximately 62% of the total global emissions, or approximately 32.5 MMT CO_2e (PBL 2020).

Per the U.S. Environmental Protection Agency (EPA) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2019, total United States GHG emissions were approximately 6,558.3 MMT CO_2e in 2019 (EPA 2021). Overall, from 1990 to 2019, total emissions of CO_2 increased by 142.4 MMT CO_2e (2.8%), while total emissions of CH_4 decreased by 117.2 MMT CO_2e (15.1%) and emissions of N_2O increased by 4.5 MMT CO_2e (1.0%). During the same period, aggregate weighted emissions of HFCs, PFCs, SF_6, and nitrogen trifluoride rose by 86.0 MMT CO_2e (86.3%). From 1990 to 2019, HFCs increased by 128.1 MMT CO_2e (275.4%), PFCs decreased by 19.8 MMT CO_2e (81.5%), SF_6 decreased by 22.9 MMT CO_2e (79.5%), and nitrogen trifluoride increased by 0.6 MMT CO_2e (1,162.7%).

According to California's 2000–2019 GHG emissions inventory (2021 edition), California emitted 418.2 MMT CO_2e in 2019, including emissions resulting from out-of-state electrical generation (CARB 2021). The sources of GHG emissions in California include transportation, industrial uses, electric power production from both in-state and out-of-state sources, commercial and residential uses, agriculture, high-GWP substances, and recycling and waste. The California GHG emission source categories and their relative contributions in 2019 are shown in Table 3.7-2.

Table 3.7-2. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Transportation	166.1	40%
Industrial uses	88.2	21%

Table 3.7-2. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Electricity generation[b]	58.8	14%
Residential and commercial uses	43.8	10%
Agriculture	31.8	8%
High global warming potential substances	20.6	5%
Recycling and waste	8.9	2%
Totals	**418.2**	**100%**

Source: CARB 2021.
Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent.
Emissions reflect 2019 California GHG inventory.
[a] Percentage of total has been rounded and total may not sum due to rounding.
[b] Includes emissions associated with imported electricity, which account for 21.7 MMT CO_2e.

The City's community-wide GHG emissions baseline inventory in 2012 was estimated to be 599,000 MT CO_2e (City of San Marcos 2020). On-road transportation is the largest contributor to the emissions, accounting for 54% (or 322,000 MT CO_2e) of the City's 2012 total, followed by electricity at 27% (or 162,000 MT CO_2e) of the emissions. Accounting for future population and economic growth, the City projects GHG emissions of 526,000 MT CO_2e in 2020 and 429,000 MT CO_2e in 2030. The projections assume population, housing, employment, and transportation activity will continue to grow over time, and accounts for GHG emission reductions associated with implementation of the City's Climate Action Plan (CAP) and legislative reductions (City of San Marcos 2020).

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 Intergovernmental Panel on Climate Change Synthesis Report indicated that warming of the climate system is unequivocal, and many of the observed changes since the 1950s are unprecedented. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice pack, and rising sea levels (IPCC 2014). In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, frequency of severe weather events, and electricity demand and supply. Potential effects of climate change are outlined in detail in Appendix B to this EIR.

3.7.2 Regulatory Setting

The following section provides a summary of the applicable regulatory requirements pertaining to GHGs, including federal, state, and local guidelines; additional detail can be found in Appendix B.

Federal

Infrastructure Investment and Jobs Act

On November 6, 2021, Congress passed the Bipartisan Infrastructure Deal (Infrastructure Investment and Jobs Act), a once-in-a-generation investment in our nation's infrastructure and competitiveness. This Bipartisan Infrastructure Deal will rebuild America's roads, bridges, and rails; expand access to clean drinking water; ensure every American has access to high-speed internet; tackle the climate crisis; advance environmental justice; and invest in communities that have too often been left behind. The legislation will help ease inflationary pressures and strengthen supply chains

by making long overdue improvements for our nation's ports, airports, rail, and roads. It will drive the creation of good-paying union jobs and grow the economy sustainably and equitably so that everyone gets ahead for decades to come. Combined with the president's Build Back Framework, it will add on average 1.5 million jobs per year for the next 10 years. It will improve transportation options for millions of Americans to reduce energy use and GHG emissions. It will increase investment in electric vehicle chargers and renewable energy production.

Massachusetts v. U.S. Environmental Protection Agency

In *Massachusetts v. EPA* (2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal Clean Air Act:

- The Administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The Administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

Energy Independence and Security Act

The Energy Independence and Security Act of 2007, among other key measures, did the following to aid in the reduction of national GHG emissions:

1. Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
2. Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
3. Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards

In August 2016, EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018–2027 for certain trailers and model years 2021–2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

On September 27, 2019, EPA and NHTSA also published their Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program (84 FR 51,310), which became effective November 26, 2019. The Part One Rule revoked California's authority to set its own GHG emissions standards and set ZEV mandates in California. On March 31, 2020, EPA and NHTSA issued Part Two of the SAFE Rule, which went into effect June 29, 2020 (85 FR 24174). The Part Two Rule set CO_2 emissions standards and corporate average fuel economy standards for passenger vehicles and light duty trucks for model years 2021 through 2026. On January 20, 2021, President Joe Biden issued an executive order titled Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, which included review of the Part One Rule by April 2021 and review of the Part Two Rule by July 2021 (The White House 2021). On April 22, 2021, NHTSA issued a notice of proposed rulemaking that would repeal those portions of the Part One Rule (including the regulatory text and interpretive statements in the preamble) that found California's GHG and ZEV mandates pre-empted by EPA. One day after NHTSA issued its notice, EPA announced its parallel action on SAFE Part One. On December 21, 2021, after reviewing all the public comments submitted on NHTSA's April 2021 Notice of Proposed Rulemaking, NHTSA finalized the SAFE pre-emption rulemaking to withdraw its portions of the SAFE Part One Rule.

State

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes executive orders, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

Executive Order S-3-05

Executive Order (EO) S-3-05 (2005) established the following statewide goals: GHG emissions should be reduced to 2000 levels by 2010, GHG emissions should be reduced to 1990 levels by 2020, and GHG emissions should be reduced to 80% below 1990 levels by 2050.

Assembly Bill 32

In furtherance of the goals established in EO S-3-05, the legislature enacted AB 32. The bill is referred to as the California Global Warming Solutions Act of 2006. AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020 and initiate the transformations required to achieve the state's long-range climate objectives.

Executive Order B-55-18

EO B-55-18 (2018) established a statewide policy for the state to achieve carbon neutrality as soon as possible, no later than 2045, and achieve and maintain net negative emissions thereafter. The goal is an addition to the existing statewide targets of reducing the state's GHG emissions. CARB will work with relevant state agencies to ensure that future scoping plans identify and recommend measures to achieve the carbon neutrality goal.

California Air Resources Board's Climate Change Scoping Plan

One specific requirement of AB 32 was for CARB to prepare a scoping plan for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (California Health and Safety Code Section 38561[a]) and to update the plan at least once every 5 years. In 2008, CARB approved the first scoping

plan. The Climate Change Scoping Plan: A Framework for Change (Scoping Plan) included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emissions limit and initiate the transformations needed to achieve the state's long-range climate objectives. The key elements of the Scoping Plan included the following (CARB 2008):

1. Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
2. Achieving a statewide renewable energy mix of 33%.
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions.
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets.
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (17 CCR 95480 et seq.).
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations, and for community emissions to reduce GHGs by approximately 15% from then levels (2008) by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years and laid the groundwork to start the transition to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012. The First Update concluded that California is on track to meet the 2020 target but recommended a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the state's 1990 emissions level, using more recent GWPs identified by the Intergovernmental Panel on Climate Change, from 427 MMT CO_2e to 431MMT CO_2e (CARB 2014).

In 2015, as directed by EO B-30-15 (discussed below), CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40% below 1990 levels to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in EO S-3-05. The governor called on California to pursue a new and ambitious set of strategies, in line with the five climate change pillars from his inaugural address, to reduce GHG emissions and prepare for the unavoidable impacts of climate change. In the summer of 2016, the legislature affirmed the importance of addressing climate change through passage of SB 32.

In December 2017, CARB adopted California's 2017 Climate Change Scoping Plan (2017 Scoping Plan) for public review and comment (CARB 2017). The 2017 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update while identifying new, technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target as established by SB 32 and define the state's climate change priorities to 2030 and beyond. The strategies' commitments include implementing renewable energy and energy efficiency strategies (including the mandates of SB 350), increasing stringency of the Low Carbon Fuel Standard, implementing measures identified in the Mobile Source and Freight Strategies, implementing measures identified in the proposed Short-Lived Climate Pollutant Reduction Strategy, and increasing stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, it recommends continuing the Cap-and-Trade Program.

For local governments, the 2017 Scoping Plan replaced the initial Scoping Plan's 15% reduction goal with a recommendation to aim for a community-wide goal of no more than 6 MT CO_2e per capita by 2030, and no more than 2 MT CO_2e per capita by 2050, which are consistent with the state's long-term goals. These goals are also consistent with the Under 2 Memorandum of Understanding (Under 2 Coalition 2016) and the Paris Agreement, which are developed around the scientifically based levels necessary to limit global warming to below 2°C. The 2017 Scoping Plan recognized the benefits of local government GHG planning (e.g., through CAPs) and provided more information regarding tools CARB is working on to support those efforts. It also recognized the California Environmental Quality Act (CEQA) streamlining provisions for project-level review where there is a legally adequate CAP.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the executive orders, and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and executive orders if it meets the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and does not impede attainment of those goals. A project would be consistent if it would further the objectives and not obstruct their attainment.

CARB is presently preparing the 2022 Scoping Plan Update, which will assess progress towards achievement of the state's 2030 reduction target and lay out a path for the state's achievement of carbon neutrality by 2045. CARB has held a number of public workshops to provide information on the plan update and solicit feedback from stakeholders. A draft plan has not yet been released for public review and comment.

Executive Order B-30-15

EO B-30-15 (2015) identified an interim GHG reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 specifically set an interim target goal of reducing statewide GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing statewide GHG emissions to 80% below 1990 levels by 2050, as set forth in EO S-3-05. To facilitate achievement of this goal, EO B-30-15 called for an update to CARB's Scoping Plan to express the 2030 target in terms of MMT CO_2e. The executive order also called for state agencies to continue to develop and implement GHG emissions reduction programs in support of the reduction targets. Sector-specific agencies in transportation, energy, water, and forestry were required to prepare GHG reduction plans by September 2015, followed by a report on action taken in relation to these plans in June 2016. EO B-30-15 did not require local agencies to take any action to meet the new interim GHG reduction target.

Senate Bill 32 and Assembly Bill 197

SB 32 and AB 197 (enacted in 2016) are companion bills that set new statewide GHG reduction targets, made changes to CARB's membership and increased legislative oversight of CARB's climate change-based activities, and expanded dissemination of GHG and other air-quality-related emissions data to enhance transparency and accountability. More specifically, SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and toxic air contaminants from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

Senate Bill 605 and Senate Bill 1383

SB 605 (2014) required CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants in the state, and SB 1383 (2016) required CARB to approve and implement that strategy by January 1, 2018. SB 1383 also established specific targets for the reduction of short-lived climate pollutants (40% below 2013 levels by 2030 for CH_4 and HFCs and 50% below 2013 levels by 2030 for anthropogenic black carbon) and provided direction for reductions from dairy and livestock operations and landfills. The Short-Lived Climate Pollutants Reduction Strategy was approved by CARB in March 2017 and lays out a range of options to reduce short-lived climate pollutant emissions in California, including regulations, incentives, and other market-supporting activities.

Building Energy

Title 24, California Code of Regulations, Part 6

Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Although not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and California Energy Commission (CEC) and revised if necessary (California Public Resources Code [PRC], Section 25402[b][1]). The regulations receive input from members of industry and the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (PRC Section 25402[d]) and cost effectiveness (PRC Sections 25402[b][2] and [b][3]). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

The 2019 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2020. The 2019 Title 24 Building Energy Efficiency Standards will further reduce energy used and associated GHG emissions compared to prior standards. In general, single-family residences built to the 2019 standards are anticipated to use approximately 7% less energy due to energy efficiency measures than those built to the 2016 standards; once rooftop solar electricity generation is factored in, single-family residences built under the 2019 standards will use approximately 53% less energy than those under the 2016 standards

(CEC 2018). Nonresidential buildings built to the 2019 standards are anticipated to use an estimated 30% less energy than those built to the 2016 standards (CEC 2018). The project's apartments and affordable flats are subject to the nonresidential standards due to the number of stories, while the rowhomes and villas are subject to the residential standards.

On August 11, 2021, CEC adopted the 2022 Energy Code. In December 2021, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

Title 24, California Code of Regulations, Part 11

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24 of the California Code of Regulations) is commonly referred to as CALGreen, and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings, schools, and hospitals. The CALGreen 2019 standards, which are the current standards, became effective January 1, 2020.

Title 20, California Code of Regulations

Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. Performance of appliances must be certified through CEC to demonstrate compliance with standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwashers; clothes washers and dryers; cooking products; electric motors; low voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing for each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance, and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

Assembly Bill 1109

Enacted in 2007, AB 1109 required CEC to adopt minimum energy efficiency standards for general-purpose lighting to reduce electricity consumption by 50% for indoor residential lighting and by 25% for indoor commercial lighting.

Senate Bill 1

SB 1 (2006) established a $3 billion rebate program to support the goal of the state to install rooftop solar energy systems with a generation capacity of 3,000 megawatts through 2016. SB 1 added sections to the PRC, including Chapter 8.8 (California Solar Initiative), that require building projects applying for ratepayer-funded incentives for

photovoltaic systems to meet minimum energy efficiency levels and performance requirements. Section 25780 established that it is a goal of the state to establish a self-sufficient solar industry. The goals included establishing solar energy systems as a viable mainstream option for homes and businesses within 10 years of adoption and placing solar energy systems on 50% of new homes within 13 years of adoption. SB 1, also termed "Go Solar California," was previously titled "Million Solar Roofs."

Assembly Bill 1470

This bill established the Solar Water Heating and Efficiency Act of 2007. AB 1470 makes findings and declarations of the Legislature relating to the promotion of solar water heating systems and other technologies that reduce natural gas demand. AB 1470 defines several terms for purposes of the act. The bill required a commission to evaluate the data available from a specified pilot program and to design and implement a program of incentives for the installation of 200,000 solar water heating systems in homes and businesses throughout the state by 2017.

Renewable Energy and Energy Procurement

SB 1078 (2002) established the Renewables Portfolio Standard (RPS) program, which requires an annual increase in renewable generation by the utilities. Initially, the RPS required utilities to obtain 20% of their power from renewable sources by 2010. SB X1-2 (2011) subsequently expanded the RPS by establishing that 33% of the total electricity sold to retail customers in California per year by December 31, 2020, and in subsequent years, be secured from qualifying renewable energy sources. SB 350 (2015) further expanded the RPS by establishing that 50% of the total electricity sold to retail customers in California per year by December 31, 2030, be secured from qualifying renewable energy sources. And SB 100 (2018) further accelerated the RPS, requiring achievement of a 50% RPS by December 31, 2026, and a 60% RPS by December 31, 2030. SB 100 also established a new state policy goal that calls for eligible renewable energy resources and zero-carbon resources to supply 100% of electricity retail sales and 100% of electricity procured to serve all state agencies by December 31, 2045.

Under the program, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation of 30 megawatts or less, digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location.

California Air Resources Board's Mobile Source Strategy

On May 16, 2016, CARB released the 2016 Mobile Source Strategy that demonstrates how the state can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next 15 years. The actions contained in the 2016 Mobile Source Strategy will deliver broad environmental and public health benefits, as well as support much needed efforts to modernize and upgrade transportation infrastructure, enhance system-wide efficiency and mobility options, and promote clean economic growth in the mobile sector. The 2016 Mobile Source Strategy would also result in a 45% reduction in GHG emissions and a 50% reduction in the consumption of petroleum-based fuels (CARB 2016).

On October 28, 2021, CARB received and heard the 2020 Mobile Source Strategy, which continues and builds upon the foundation established by the 2016 Mobile Source Strategy. The 2020 Mobile Source Strategy, if implemented, would achieve a 76% reduction in GHG emissions from 2020 levels from mobile sources by 2045, as largely attributable to transitioning towards a zero-emissions fleet. Moving forward, CARB anticipates that the programs and concepts in the 2020 Mobile Source Strategy will be incorporated into other aspects of CARB's regulatory and planning frameworks.

State Vehicle Standards

AB 1493 (2002) was enacted in response to the transportation sector accounting for more than one-half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. AB 1493 required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004.

As explained under the "Federal Vehicle Standards" subsection above, EPA and NHTSA approved the SAFE Vehicles Rule Part One and Two, which revoked California's authority to set its own GHG emissions standards and set ZEV mandates in California. Because the EPA rule is the subject of pending legal challenges, and because President Biden issued an executive order to review Part One and Part Two, this analysis used the best available information at this time, as set forth in EMFAC and assumed in the California Emissions Estimator Model (CalEEMod).

The Advanced Clean Cars program (2012) is an emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that by 2025, cars will emit 75% less smog-forming pollution than the average new car sold in 2012. To reduce GHG emissions, CARB, in conjunction with EPA and NHTSA, adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The ZEV program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years.

Executive Order S-1-07

Issued on January 18, 2007, EO S-1-07 sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The initial target of the Low Carbon Fuel Standard was to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The Low Carbon Fuel Standard was subsequently amended in 2018 to require a 20% reduction in carbon intensity by 2030. This new requirement aligns with the California's overall 2030 target of reducing climate changing emissions to 40% below 1990 levels by 2030, set by SB 32. CARB has adopted implementing regulations for both the 10% and 20% carbon intensity reduction targets.

Senate Bill 375

SB 375 (2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 required CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035. Regional metropolitan planning organizations are then responsible for preparing a Sustainable Communities Strategy (SCS) within their Regional Transportation Plan (RTP). The goal of the SCS is to establish a forecasted development pattern for the region that, after considering transportation measures and policies, will achieve, if feasible, the GHG reduction targets. If an SCS is unable to achieve the GHG reduction target, a metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to California Government Code Section 65080(b)(2)(K), an SCS does not regulate the use of land; supersede the land use authority of cities and counties; or require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets adopted for the San Diego Association of Governments (SANDAG) in 2010 are a 7% reduction in per-capita passenger-vehicle GHG emissions by 2020 and a 13% reduction by 2035, measured relative to 2005 GHG emissions. In 2018, CARB adopted the second round of SB 375 reduction targets and increased SANDAG's 2020 target to a 15% reduction in per-capita passenger-vehicle GHG emissions, and the 2035 target to a 19% reduction using the same 2005 baseline.

Senate Bill 350

In 2015, SB 350—the Clean Energy and Pollution Reduction Act—was enacted into law. As one of its elements, SB 350 establishes a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see California Public Utilities Code, Section 740.12).

Assembly Bill 1236

AB 1236 (2015) required a city, county, or city and county to approve an application for the installation of electric vehicle charging stations, as defined, through the issuance of specified permits unless the city or county makes specified written findings based on substantial evidence in the record that the proposed installation would have a specific, adverse impact upon the public health or safety, and there is no feasible method to satisfactorily mitigate or avoid the specific, adverse impact. AB 1236 provided for appeal of that decision to the planning commission, as specified. The bill provided that the implementation of consistent statewide standards to achieve the timely and cost-effective installation of electric vehicle charging stations is a matter of statewide concern. The bill required electric vehicle charging stations to meet specified standards. AB 1236 required a city, county, or city and county with a population of 200,000 or more residents to adopt an ordinance, by September 30, 2016, that created an expedited and streamlined permitting process for electric vehicle charging stations. The bill also required a city, county, or city and county with a population of fewer than 200,000 residents to adopt this ordinance by September 30, 2017.

Executive Order B-16-12

EO B-16-12 (2012) directs state entities under the governor's direction and control to support and facilitate the development and distribution of ZEVs. On a statewide basis, EO B-16-12 also establishes a GHG emissions reduction target from the transportation sector equaling 80% less than 1990 levels by 2050. In furtherance of this executive order, the governor convened an Interagency Working Group on ZEVs that has published multiple reports regarding the progress. It ordered CARB, CEC, the California Public Utilities Commission, and other relevant agencies to work with the Plug-In Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve goals by 2015, 2020, and 2025. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

Executive Order N-79-20

EO N-79-20 (2020) sets the goal for the state that 100% of in-state sales of new passenger cars and trucks will be zero-emission by 2035. EO-N-79-20 also sets goals for transition to 100% zero emission medium- and heavy-duty vehicles by 2045, zero emission drayage trucks by 2035, and zero emission off-road vehicles and equipment by 2035, where feasible. Among other directives to further this executive order, for passenger cars and trucks, the governor directed CARB to develop and propose regulations requiring increasing volumes of new ZEVs sold in the state towards the target of 100% of in-state sales by 2035. The governor also directed the Governor's Office of Business and Economic Development to develop a Zero-Emissions Vehicle Market Development Strategy, which was completed in February 2021.[3] The executive order also directs updates and assessments to ensure ZEV infrastructure is in place to support the levels of electric vehicle adoption required by the order.

Small Offroad Engines

CARB approved a measure on December 9, 2021, that will require most newly manufactured small off-road engines such as those found in leaf blowers, lawn mowers, and other equipment be zero emission starting in 2024. Portable generators, including those in recreational vehicles, would be required to meet more stringent standards in 2024 and meet zero-emission standards starting in 2028.

Assembly Bills 939 and 341

In 1989, AB 939, known as the Integrated Waste Management Act (PRC Sections 40000 et seq.), was passed because of the increase in waste stream and decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed of, where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (Chapter 476, Statutes of 2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by 2020 and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle conducted several general stakeholder workshops and several focused workshops, and in August 2015 published a discussion document titled AB 341 Report to the Legislature, which identified five priority strategies that CalRecycle believed would assist the state in reaching the 75% goal by 2020, legislative and regulatory recommendations, and an evaluation of program effectiveness (CalRecycle 2015).

Senate Bill 1383

Beginning in 2022, SB 1383 required every jurisdiction to provide organic waste collection services to all residents and businesses. Jurisdictions can select from a variety of organic waste collection services to match their unique communities and local infrastructure, while producing clean streams of organic feedstock that can be recycled into high-quality, marketable recycled products, including compost, renewable natural gas, electricity, and paper. Jurisdictions will educate all residents and businesses about collection requirements, including what materials to put in curbside bins. Education to residents and businesses may vary by jurisdiction and educational content may be provided electronically, through hard copy materials, or through direct outreach.

Executive Order B-29-15

In response to the ongoing drought in California, EO B-29-15 (2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the executive order extended through February 28, 2016, although many of the directives have since become permanent water-efficiency standards and requirements. The executive order includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increased the requirements for landscape water use efficiency and broadened its applicability to include new development projects with smaller landscape areas.

Executive Order B-37-16

Issued May 2016, EO B-37-16 directed the State Water Resources Control Board to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply conditions across the state. The State Water Resources Control Board also developed a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The State Water Resources Control Board and Department of Water Resources developed new, permanent water use targets that build on the existing state law requirements that the state achieve 20% reduction in urban water usage by 2020. EO B-37-16 also specifies that the State Water Resources Control Board permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in fountains and other decorative water features; watering lawns in a manner that causes runoff or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.

Senate Bill 97

SB 97 (2007) directed the Governor's Office of Planning and Research to develop guidelines under CEQA for the mitigation of GHG emissions. The California Natural Resources Agency adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010. The CEQA Guidelines were subsequently amended in 2018 and the changes became effective on December 28, 2018.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines provide that a lead agency should also consider the extent to which a project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features; off-site measures, including offsets that are not otherwise required; measures in an existing plan or mitigation program; and measures that sequester GHGs (14 CRR 15126.4[c]). The adopted amendments do not establish a GHG emissions threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts (14 CCR 15064.7). The CEQA Guidelines also permit using environmental standards (i.e., an applicable and relevant quantitative, qualitative or performance requirement found in an ordinance, resolution, rule, regulation, order, plan or other environmental requirement that has been adopted for the purpose of environmental protection) as a threshold of significance to promote consistency in significance determinations (14 CCR 15064.7[d]).

With respect to GHG emissions, the CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either quantifying the emissions resulting from a project or by relying on "qualitative analysis or other performance-based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should focus on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. The analysis should consider a timeframe appropriate for the project, and must reasonably reflect evolving scientific knowledge and state regulatory schemes (14 CCR 15064.4[b]).

Section 15183.5 of the CEQA Guidelines allows agencies to tier from qualified GHG reduction plans developed in accordance with subsection (b). Specifically, the GHG reduction plan must quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area; establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable; identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area; specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level; establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and be adopted in a public process following environmental review.

Executive Order S-13-08

EO S-13-08 (2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the executive order directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009 (CNRA 2009a); an update, Safeguarding California: Reducing Climate Risk, followed in July 2014 (CNRA 2014), and another was published in 2018, Safeguarding California Plan: 2018 Update California's Climate Adaptation Strategy (CNRA 2018). The draft 2021 California Climate Adaptation Strategy was released for public comment on October 18, 2021, and closed on November 17, 2021. The 2021 California Climate Adaption Strategy has since been adopted (State of California 2023). To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, transportation, and water.

Local

San Diego Association of Governments Regional Transportation Plan/Sustainable Communities Strategy

SANDAG completed and adopted its 2050 RTP/SCS in October 2011. In November 2011, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

In October 2015, SANDAG adopted San Diego Forward: The Regional Plan (SANDAG 2015). Like the 2050 RTP/SCS, San Diego Forward: The Regional Plan meets CARB's 2020 and 2035 reduction targets for the region (SANDAG 2015). In December 2015, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

The 2021 Regional Plan, adopted by SANDAG on December 10, 2021, provides a long-term blueprint for the San Diego region that seeks to meet regulatory requirements, address traffic congestion, and create equal access to jobs, education, healthcare, and other community resources (SANDAG 2021). The plan is the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies.

The 2021 Regional Plan includes an SCS, as required by California SB 375 (2008), for the San Diego region. This SCS describes coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by CARB. The state-mandated target is a 19% reduction—compared with 2005—in per capita GHG emissions from cars and light-duty trucks by 2035. The 2021 Regional Plan achieves a 20% reduction by then.

The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity.

City of San Marcos Climate Action Plan

The City adopted its currently applicable CAP on December 8, 2020 (City of San Marcos 2020). The CAP acts as a roadmap to address challenges of climate change within the City. The CAP builds on the efforts and strategies identified in the City's 2013 CAP and establishes GHG emission reduction targets and identifies achievable, locally based actions to reduce GHG emissions from municipal and community activities. The CAP includes a baseline GHG emissions inventory for 2012, GHG emissions forecasts for 2020 and 2030, local GHG emissions reduction strategies and measures to help the City achieve the 2030 target, climate adaptation measures for the City, and implementation and monitoring mechanisms to ensure the City's measures and targets are achieved. The CAP establishes GHG emissions reduction goals of 4% below 2012 levels by 2020 and 42% below 2012 levels by 2030 (City of San Marcos 2020).

The CAP was prepared in accordance with the requirements within CEQA Guidelines Section 15183.5, and the CAP Consistency Checklist is used in this analysis to evaluate the proposed project's significance with respect to GHG emissions. As provided in the checklist, projects that are consistent with the CAP "may rely on the CAP for the cumulative impact analysis of GHG emissions" and "may be determined not to be cumulatively considerable" (City of San Marcos 2020)

City of San Marcos General Plan

The City's General Plan (City of San Marcos 2012) includes various policies related to reducing GHG emissions. Applicable policies include the following.

Land Use and Community Design Element

Goal LU-1: Achieve a balanced distribution and compatible mix of land uses to meet the present and future needs of all residents and the business community.

Policy LU-1.1: Ensure that adjacent land uses complement one another by considering compatibility of activities, development patterns and architectural character elements and access to various mobility choices.

Goal LU-2: Promote development standards and land use patterns that encourage long-term environmental sustainability.

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.3: Require the incorporation of green building practices, technologies, and strategies into development projects per code standards.

Policy LU-2.5: Promote landscaping (e.g., native, drought tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the instillation of trees to reduce the urban heat-island effect and green infrastructure to reduce storm water runoff.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-1.3: Require new developments to prepare and implement Transportation Demand Management (TDM) programs to minimize vehicle trip generation and promote alternative modes of travel within the City.

Goal M-3: Promote and encourage use of alternative transportation modes, including transit, bicycles, neighborhood electric vehicles (NEVs), and walking, within the City.

Policy M-3.1: Develop an integrated, multimodal circulation system that accommodates transit, bicycles, pedestrians, and vehicles; provides opportunities to reduce air pollution and GHG emissions; and reinforces the role of the street as a public space that unites the City.

Conservation and Open Space Element

Goal COS-4: Improve regional air quality and reduce greenhouse gas emissions that contribute to climate change.

Policy COS-4.5: Encourage energy conservation and the use of alternative energy sources within the community.

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

3.7.3 Thresholds of Significance

California has developed guidelines to address the significance of GHG emissions impacts that are contained in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). Appendix G provides that a project would have a significant environmental impact if it would:

- **Threshold No. 1:** Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
- **Threshold No. 2:** Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The CEQA Guidelines provide that in determining the significance of impacts from GHG emissions, an agency may consider the extent to which the project complies with a local plan for the reduction or mitigation of GHG emissions. (See CEQA Guidelines Sections 15064.4(b)(3) and 15183.5.) Relatedly, project specific GHG analyses can tier from plans adopted for the reductions of GHGs (14 CCR 15183.5.) As indicated above, the City has adopted such a plan when it adopted its CAP on December 8, 2020. Accordingly, for the purposes of GHG Threshold No. 1, the project's GHG emissions are assessed by evaluating the project's consistency with the City's CAP, which is discussed below in detail. For purposes of GHG Threshold No. 2, the project is assessed based on its potential to conflict with the City's CAP, as well as with statewide and regional plans for emissions reductions.

Analysis Approach and Methodology

City of San Marcos Climate Action Plan Consistency

The City adopted an updated CAP on December 8, 2020. The CAP outlines strategies and measures that the City will undertake to achieve its proportional share of state GHG emissions reduction targets. The CAP is a plan for the reduction of GHG emissions in accordance with CEQA Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of the CAP. The City has also developed a CAP Consistency Checklist, in conjunction with the CAP, to provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to CEQA.

A GHG screening threshold of 500 MT CO_2e per year is established for new development projects to determine if a project would need to demonstrate consistency with the CAP through the checklist. Projects that are projected to emit fewer than 500 MT CO_2e annually would not make a considerable contribution to the cumulative impact of climate change and would not need to provide additional analysis to demonstrate consistency with the CAP. For proposed projects at or above the screening threshold of 500 MT CO_2e, applicants are required to complete the CAP Consistency Checklist, which is meant to provide a streamlined review process for proposed new development projects that are subject to discretionary review and require environmental review pursuant to CEQA. A properly completed checklist documents how a project complies with the CAP and, in so doing, demonstrates that the project's contribution to climate change impacts is not cumulatively considerable. The City also developed a service population threshold for the CAP to show that projects are consistent with GHG reduction measures. The City determined that a GHG threshold of 2.1 MT CO_2e per service population per year (SP/yr) would be consistent with GHG emissions within the CAP. Because of this, this EIR quantifies the projected GHG emissions of the project using the following methodology to compare them against the City's service population threshold.

Construction

CalEEMod Version 2020.4.0 was used to estimate potential project-generated GHG emissions during construction. Construction of the project would result in GHG emissions primarily associated with the use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All construction-related details discussed in Section 3.2, Air Quality, of this EIR are also applicable for the estimation of construction-related GHG emissions for the proposed project.

Existing Land Use Designation

To compare the GHG emissions intensity of the proposed project and the land use built under the existing land use designation, the following section summarizes the construction methodology for the existing land use designation. Construction assumptions, including timing, phasing, equipment type and quantity, and worker and vendor truck trips, were based on the maximum allowed buildout of the existing land use designation for the site. The Commercial (C) zoning buildout, consistent with the existing land use alternative, would include 69,000 square feet of grocery store and gas station uses, as well as 23,000 square feet of office space. This alternative would include 276 parking spaces. An assumption of 10 fueling positions (5 pumps) was made for calculation purposes.

Default values provided by CalEEMod were used where zoning information was not available. For purposes of estimating GHG emissions, it was assumed that construction of the land use built under the existing land use designation would commence in December 2023[4] and would end in December 2024. Construction of the land use built under the existing land use designation would be anticipated to occur in five phases. Accordingly, five phases consisting of site preparation, grading, building construction, paving, and architectural coating were assumed. The analysis contained herein is based on the following assumptions (the duration of phases is approximate):

- Site Preparation: 1 week (December 2023)
- Grading: 1 week (December 2023)
- Building Construction: 11 months (December 2023–November 2024)
- Paving: 1 month (November 2024)
- Architectural Coating: 1 month (December 2024)

The construction equipment mix used for estimating the construction emissions of the existing land use designation is based on CalEEMod defaults and is shown in Table 3.7-3. For worker and vendor truck trips, the default CalEEMod assumptions for one-way trips were rounded up to the nearest even number to account for whole round trips. For this analysis, it was generally assumed that heavy construction equipment would operate 5 days a week (22 days per month) during project construction. Grading activities were anticipated to be minimal for the land use built under the existing land use designation; therefore, no haul trucks would be required to import or export material.

Table 3.7-3. Construction Scenario Assumptions – Existing Land Use Designation

Construction Phase	One-Way Trips			Equipment	Quantity	Hours Per Day
	Daily Workers	Daily Vendor Trucks	Total Haul Trucks			
Site Preparation	18	0	0	Rubber Tired Dozers	3	8
				Tractors/Loaders/ Backhoes	4	8
Grading	16	0	0	Excavators	1	8
				Graders	1	8
				Rubber Tired Dozers	1	8
				Tractors/Loaders/ Backhoes	3	8

[4] The analysis assumes a construction start date of June 2023, which represents the earliest date construction would initiate (although unlikely). Assuming the earliest start date for construction represents the worst-case scenario for emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 3.7-3. Construction Scenario Assumptions – Existing Land Use Designation

Construction Phase	One-Way Trips			Equipment	Quantity	Hours Per Day
	Daily Workers	Daily Vendor Trucks	Total Haul Trucks			
Building Construction	76	34	0	Cranes	1	7
				Forklifts	3	8
				Generator Sets	1	8
				Tractors/Loaders/ Backhoes	3	7
				Welders	1	8
Paving	20	0	0	Cement and Mortar Mixers	2	6
				Pavers	1	8
				Paving Equipment	2	6
				Rollers	2	6
				Tractors/Loaders/ Backhoes	1	8
Architectural Coating	16	0	0	Air Compressors	1	6

Note: See Appendix B.

Operation

Existing Land Use Designation

Similar to construction, emissions from the operational phase of the existing land use designation and project were estimated using CalEEMod. Operational year 2030 was assumed consistent with Appendix D of the City's CAP (City of San Marcos 2020).

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating were calculated in the building energy use module of CalEEMod, as described in the following text.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated with landscape equipment use were estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. Based on CalEEMod defaults for the County, the average annual number of summer days is estimated at 180 days (CAPCOA 2021).

Energy Sources

CalEEMod default values for electricity use and natural gas consumption for each land use type (industrial park) were applied for the existing land use designation. The energy use from commercial and industrial land uses is calculated in CalEEMod based on the Commercial End-Use Survey (CAPCOA 2021). Energy use in buildings (both natural gas and electricity) is divided by CalEEMod into end-use categories subject to Title 24 requirements (end uses associated with the building envelope, such as the heating, ventilation, and air conditioning system; water heating system; and integrated lighting) and those not subject to Title 24 requirements (such as appliances, electronics, and miscellaneous "plug-in" uses).

Operational GHG emissions from energy sources include natural gas combustion for appliances and space and water heating. The current California Code of Regulations, Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. The current version of CalEEMod assumes compliance with the 2019 Title 24 Building Energy Efficiency Standards (CAPCOA 2021).

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt hour) for San Diego Gas & Electric (SDG&E) were based on the value for SDG&E's energy mix in 2021. As explained in Section 3.7.2, SB X1-2 established a target of 33% from renewable energy sources for all electricity providers in California by 2020, and SB 350 calls for further development of renewable energy, with a target of 50% by 2030. SB 100 revised this target to 60% by 2030. Consistent with the City's CAP, the GHG intensity for 2030 was assumed to be 44 pounds per megawatt-hour for SDG&E (City of San Marcos 2020). In accordance with the City's CAP Measure E-2, the existing land use designation was assumed to install 2 watts of solar photovoltaics for every square foot of gross floor area. This resulted in 184 kilowatts of solar. The production of the solar photovoltaic system was estimated using the National Renewable Energy Laboratories's PVWatts calculator (Appendix B).

Mobile Sources

The land use built under the existing land use designation would generate GHG emissions from mobile sources (vehicular traffic) as a result of trucks, customers, and employee vehicles. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix B). CalEEMod default data, including trip rates, trip modes, trip lengths, fleet mix, and emissions factors, were used for the model inputs. CalEEMod default vehicle emission factors and vehicle fleet mix for 2030, as based on CARB's EMFAC2017 model, were used to estimate emissions associated with vehicular sources. Consistent with Measure T-2 of the City's CAP, 5% of the proposed parking spaces (14) were assumed to be EV charging stations.

Solid Waste

The land use built under the existing land use designation would generate solid waste and therefore would result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values were used to estimate GHG emissions associated with solid waste.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the land use built under the existing land use designation would require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the land use built under the existing land use designation would require the use of electricity for conveyance and treatment, and additional GHG emissions would be generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use relied on CalEEMod default assumptions.

Proposed Project

CalEEMod Version 2020.4.0 was used to estimate potential project-generated operational GHG emissions from vehicular sources, area sources (natural gas combustion and landscape maintenance), electrical generation (including electrical generation associated with water supply and wastewater treatment), and solid waste. Emissions from each category—area sources, energy sources, mobile sources, solid waste, and water supply and wastewater treatment—are discussed in the following text with respect to the project. See Section 3.2 of this EIR for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (natural gas), and mobile sources. Consistent with Appendix D of the City's CAP, operational year 2030 was assumed consistent with the CAP horizon year (City of San Marcos 2013). The following additional methodologies beyond those described in Section 3.2 are included for evaluating GHG emissions.

Energy Sources

Consistent with the City's CAP, the GHG intensity for 2030 was assumed to be 44 pounds per megawatt-hour for SDG&E (City of San Marcos 2020).

The project would include alternatively fueled water heaters in accordance with the City's CAP Measure E-1. When using the CAP's GHG reduction methodology as shown in Appendix B, the net GHG reduction (emissions avoided from natural gas minus emissions from electricity) would be 84 MT CO_2e per year. However, this exceeds the total GHG emissions from natural gas from the project as estimated in CalEEMod. Therefore, using the Energy Information Administration's estimate of 46% of residential natural gas use being attributed to water heating, this amount was applied to the CalEEMod GHG estimate to account for the reduction from alternatively fueled water heaters (Appendix B).

Mobile Sources (Motor Vehicles)

CalEEMod was used to estimate mobile source emissions from the project. See Section 3.2 for a discussion of mobile source emissions calculations. The operational year was adjusted to 2030 consistent with the City's CAP Guidance Appendix D (City of San Marcos 2020).

Solid Waste

The project would generate solid waste and therefore would result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the project requires the use of electricity for conveyance and treatment, and GHG emissions would be generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use and associated electricity consumption from water use and wastewater generation were estimated using CalEEMod default values. The project is designed to include low-flow fixtures and water-efficient irrigation systems consistent with CAP Measure W-1.

Due to the project's location and design, the following reduction measures were estimated using a spreadsheet based model (see Appendix B for calculation details):

- California Air Pollution Control Officers Association Final Handbook: T-1 Increase Residential Density
- California Air Pollution Control Officers Association Final Handbook: T-18 Provide Pedestrian Network Improvement

- City of San Marcos CAP: Measure T-2 Require Electric Vehicle Charging Stations in New Development
- City of San Marcos CAP: Measure E-1 Require New Residential Developments to Install Alternatively-Fueled Water Heaters

3.7.4 Project Impact Analysis

This section evaluates the GHG emissions impacts associated with the proposed project. The significance criteria described in Section 3.7.3, Thresholds of Significance, were used to evaluate impacts associated with the construction and operation of the proposed project.

Threshold No. 1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

This section includes a comparison of the existing land use designation's GHG emissions to the project's GHG emissions. This section then evaluates the proposed project's impacts to GHGs in accordance with the City's 2020 CAP Consistency Checklist. The City's numerical GHG threshold of 2.1 MT/SP/yr is used to evaluate the project's consistency with the City's CAP and determine its impact with respect to GHG emissions. The project's construction and operational GHG emissions are quantified below in accordance with the methodology presented in Section 3.7.3 and compared to the City's threshold.

Existing Land Use Designation

Construction Emissions

Construction of the existing land use designation would result in GHG emissions that are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. CalEEMod was used to calculate the GHG emissions based on the construction scenario described in Section 3.7.3 and Appendix B. Construction of the existing land use designation would be anticipated to commence in December 2023, lasting a total of approximately 11 months. On-site sources of GHG emissions include off-road equipment and off-site sources include on-road vehicles (haul trucks, vendor trucks, and worker vehicles). Table 3.7-4 presents construction emissions for the existing land use designation from on-site and off-site emission sources.

Table 3.7-4. Estimated Annual Construction GHG Emissions – Existing Land Use Designation

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2023	33.41	0.01	0.00	33.76
2024	402.57	0.07	0.01	407.95
			Total	**441.71**
			Emissions amortized over 30 years	**14.72**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix B for complete results.

As shown in Table 3.7-4, the estimated total GHG emissions during construction of the existing land use designation would be approximately 442 MT CO_2e. Construction GHG emissions of the existing land use designation amortized over 30 years would be approximately 15 MT CO_2e per year. Amortized construction emissions are added to operational emissions to be compared to the proposed project for this assessment.

Operational Emissions

Operation of the existing land use designation would generate GHG emissions through area sources; motor vehicle trips to and from the project site; energy use (natural gas and generation of electricity consumed by the existing land use designation); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. CalEEMod was used to calculate the annual GHG emissions based on the operational assumptions described in Section 3.7.3. The estimated operational emissions of the existing land use designation are presented in Table 3.7-5.

Table 3.7-5. Estimated Annual Operational GHG Emissions – Existing Land Use Designation

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
Area	0.01	0.00	0.00	0.01
Energy	167.08	0.00	0.00	167.78
Mobile[1]	3,181.44	0.31	0.19	3,245.70
Waste	84.43	4.99	0.00	209.18
Water	6.47	0.33	0.01	17.10
			Total	**3,639.77**
			Amortized construction emissions	**14.72**
			Total with amortized construction emissions	**3,654.49**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix B for complete results.
[1] Mobile emissions include reductions from EV charging stations.

As shown in Table 3.7-5, estimated annual GHG emissions from the existing land use designation would be approximately 3,640 MT CO_2e per year. With amortized construction emissions, the annual operational emissions would be approximately 3,655 MT CO_2e per year.

Proposed Project

Construction Emissions

Construction of the project would result in GHG emissions that are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. Table 3.7-6 presents construction emissions for the project from construction-related sources.

Table 3.7-6. Estimated Annual Construction GHG Emissions – Proposed Project

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2023	57.99	0.02	0.00	58.49
2024	549.96	0.06	0.02	558.00
2025	66.17	0.01	0.00	67.14
			Total	**683.63**
			Emissions amortized over 30 years	**22.79**

Source: Appendix B
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.

As shown in Table 3.7-6, the estimated total GHG emissions during construction of the project would be approximately 684 MT CO_2e. Construction GHG emissions amortized over 30 years would be approximately 23 MT CO_2e per year. Amortized construction emissions are added to operational emissions to be compared to the City's threshold.

Operational Emissions

Operation of the project would generate GHG emissions through area sources; motor vehicle trips to and from the project site; energy use (natural gas and generation of electricity consumed by the project); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. The estimated operational emissions of the project are presented in Table 3.7-7.

Table 3.7-7. Estimated Annual Operational GHG Emissions – Proposed Project

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
Area	1.46	<0.01	0.00	1.49
Energy	36.62	<0.01	<0.01	36.77
Mobile[1]	517.81	0.04	0.03	526.46
Waste	11.26	0.67	0.00	27.91
Water	5.48	0.20	<0.01	12.01
			Total	**604.64**
			Amortized construction emissions	**22.79**
			Total with amortized construction emissions	**627.43**

Source: Appendix B.
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent; <0.01 = reported value less than 0.01.
1 Includes reduction from EV chargers as discussed in Section 3.2.3.

As shown in Table 3.7-7, estimated annual GHG emissions from the project would be approximately 605 MT CO_2e per year. With amortized construction emissions, the annual operational emissions would be approximately 627 MT CO_2e per year.

Using the land use in the Master Geographic Reference Area file obtained from the SANDAG activity-based regional travel demand model, the number of multifamily households and corresponding household population within the City was reviewed. The values for the base year (2016) of the 2021 Regional Plan and the Series 14 land use forecast were used. It was found that the average household size for multifamily households in San Marcos is approximately 3.4 (SANDAG 2022). Using this household ratio of 3.4, development of 120 residential dwelling units at the project site would generate approximately 408 people.

As outlined above, the project would result in an estimated 627 MT CO_2e per year, including amortized construction GHG emissions. With an estimated service population of 408 persons, the project would result in 1.5 MT CO_2e/SP/yr. The project would result in GHG emissions below the City's significance threshold of 2.1 MT CO_2e/SP/yr. Therefore, implementation of the project would be consistent with the City's 2020 CAP and impacts to GHG emissions would be **less than significant**. In addition, this analysis is based upon the project's compliance with Title 24 of the California Code of Regulations as adopted in 2019. However, Title 24 will be updated effective January 2023. The project will be required to comply with the updated Title 24 regulations. These updated regulations likely will lead to a reduction in GHG emissions compared to what was analyzed in the September 2022 Air Quality and GHG Emissions Technical Report (Appendix B).

Threshold No. 2: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Consistency with Statewide Greenhouse Gas Reduction Strategies

The proposed project's consistency with statewide GHG reduction strategies is summarized in detail in Table 3.7-8 through consideration of the project's various construction and operational components and their relationship to specified laws and regulations designed to reduce GHG emissions from such components.

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
Building Components/Facility Operations		
Roofs/Ceilings/Insulation	CALGreen Code (Title 24, Part 11) California Energy Code (Title 24, Part 6)	The project must comply with efficiency standards regarding roofing, ceilings, and insulation. For example: Roofs/Ceilings: New construction must reduce roof heat island effects per CALGreen Code Section 106.11.2, which requires use of roofing materials having a minimum aged solar reflectance, thermal emittance complying with Section A5.106.11.2.2 and A5.106.11.2.3 or a minimum aged Solar Reflectance Index as specified in Tables A5.106.11.2.2, or A5.106.11.2.3. Roofing materials must also meet solar reflectance and thermal emittance standards contained in Title 20 Standards. Roof/Ceiling Insulation: There are also requirements for the installation of roofing and ceiling insulation. (See Title 24, Part 6 Compliance Manual, Section 3.2.2.)
Flooring	CALGreen Code	The project must comply with efficiency standards regarding flooring materials. For example, 80% of floor area receiving "resilient flooring" must meet applicable installation and material requirements contained in CALGreen Code Section 5.504.4.6.
Window and Doors (Fenestration)	California Energy Code	The project must comply with fenestration efficiency requirements. For example, the choice of windows, glazed doors, and any skylights for the project must conform to energy consumption requirements affecting size, orientation, and types of fenestration products used. (See Title 24, Part 6 Compliance Manual, Section 3.3.)
Building Walls/Insulation	CALGreen Code California Energy Code	The project must comply with efficiency requirements for building walls and insulation. Exterior Walls: Must meet requirements in current edition of California Energy Code, and comply with Sections A5.106.7.1 or A5.106.7.2 of CALGreen

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		Code for wall surfaces, as well as Section 5.407.1, which required weather-resistant exterior wall and foundation envelope as required by California Building Code Section 1403.2. Construction must also meet requirements contained in Title 24, Part 6, which vary by material of the exterior walls. (See Title 24, Part 6 Compliance Manual, Section 3.2.3.) Demising (Interior) Walls: Mandatory insulation requirements for demising walls (which separate conditioned from non-conditions space) differ by the type of wall material used. (Id. at 3.2.4.) Door Insulation: There are mandatory requirements for air infiltration rates to improve insulation efficiency; they differ according to the type of door. (Id. at 3.2.5.) Flooring Insulation: There are mandatory requirements for insulation that depend on the material and location of the flooring. (Id. at 3.2.6.)
Finish Materials	CALGreen Code	The project must comply with pollutant control requirements for finish materials. For example, materials including adhesives, sealants, caulks, paints and coatings, carpet systems, and composite wood products must meet requirements in CALGreen to ensure pollutant control. (CALGreen Section 5.504.4.)
Wet Appliances (Toilets/Faucets/Urinals, Dishwasher/Clothes Washer, Spa and Pool/Water Heater)	CALGreen Code California Energy Code Appliance Efficiency Regulations (Title 20 Standards)	Wet appliances associated with the project must meet various efficiency requirements. For example: Spa and Pool: Use associated with the project is subject to appliance efficiency requirements for service water heating systems and equipment, spa and pool heating systems and equipment. (Title 24, Part 6, Sections 110.3, 110.4, 110.5; Title 20 Standards, Sections 1605.1[g], 1605.3[g]; see also California Energy Code.) Toilets/Faucets/Urinals: Use associated with the project is subject to new maximum rates for toilets, urinals, and faucets effective January 1, 2016: Showerheads maximum flow rate 2.5 gpm at 80 psi Wash fountains 2.2 × (rim space in inches/20) gpm at 60 psi Metering faucets 0.25 gallons/cycle Lavatory faucets and aerators 1.2 gpm at 60 psi Kitchen faucets and aerators 1.8 gpm with optional temporary flow of 2.2 gpm at 60 psi

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		Public lavatory faucets 0.5 gpm at 60 psi Trough-type urinals 16 inches length Wall mounted urinals 0.125 gallons per flush Other urinals 0.5 gallons per flush (Title 20 Standards, Sections 1605.1[h], [i] 1065.3[h], [i].) Water Heaters: Use associated with the project is subject to appliance efficiency requirements for water heaters. (Title 20 Standards, Sections 1605.1(f), 1605.3[f].) Dishwasher/Clothes Washer: Use associated with the project is subject to appliance efficiency requirements for dishwashers and clothes washers. (Title 20 Standards, Sections 1605.1[o], [p], [q], 1605.3[o], [p], [q].)
Dry Appliances (Refrigerator/Freezer, Heater/Air Conditioner, Clothes Dryer)	Title 20 Standards CALGreen Code	Dry appliances associated with the project must meet various efficiency requirements. For example: Refrigerator/Freezer: Use associated with the project is subject to appliance efficiency requirements for refrigerators and freezers. (Title 20 Standards, Sections 1605.1[a], 1605.3[a].) Heater/Air Conditioner: Use associated with the project is subject to appliance efficiency requirements for heaters and air conditioners. (Title 20 Standards, Sections 1605.1[b], [c], [d], [e], 1605.3[b], [c], [d], [e] as applicable.) Clothes Dryer: Use associated with the project is subject to appliance efficiency requirements for clothes dryers. (Title 20 Standards, Section 1605.1[q].)
	CALGreen Code	Installations of HVAC, refrigeration and fire suppression equipment must comply with CALGreen Code Sections 5.508.1.1 and 508.1.2, which prohibits CFCs, halons, and certain HCFCs and HFCs.
Lighting	Title 20 Standards	Lighting associated with the project will be subject to energy efficiency requirements contained in Title 20 Standards. General Lighting: Indoor and outdoor lighting associated with the project must comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1[j], [k], [n], 1605.3[j], [k], [n].)

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		Emergency lighting and self-contained lighting: the proposes project must also comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1[l], 1605.3[l].) Traffic Signal Lighting: For any necessary project improvements involving traffic lighting, traffic signal modules and traffic signal lamps will need to comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1[m], 1605.3[m].)
	California Energy Code	Lighting associated with a use implementing the project will also be subject to energy efficiency requirements contained in Title 24, Part 6, which contains energy standards for non-residential indoor lighting and outdoor lighting. (See Title 24, Part 6 Compliance Manual, Sections 5, 6.) Mandatory lighting controls for indoor lighting include, for example, regulations for automatic shut-off, automatic daytime controls, demand responsive controls, and certificates of installation. (Id. at Section 5.) Regulations for outdoor lighting include, for example, creation of lighting zones, lighting power requirements, a hardscape lighting power allowance, requirements for outdoor incandescent and luminaire lighting, and lighting control functionality. (Id. at Section 6.)
	AB 1109	Lighting associated with implementing the project will be subject to energy efficiency requirements adopted pursuant to AB 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general purpose lighting, to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.
Bicycle and Vehicle Parking	CALGreen Code	A use implementing the project will be required to provide compliant bicycle parking, fuel-efficient vehicle parking, and electric vehicle charging spaces (CALGreen Sections 5.106.4, 5.106.5.1, 5.106.5.3)
	California Energy Code	The project is also subject to parking requirements contained in Title 24, Party 6. For example, parking capacity is to meet but not exceed minimum local zoning requirements, and the project should employ approved strategies to reduce parking capacity (Title 24, Part 6, Section 106.6)

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
Landscaping	CALGreen Code	The CALGreen Code requires and has further voluntary provisions for: A water budget for landscape irrigation use For new water service, separate meters or submeters must be installed for indoor and outdoor potable water use for landscaped areas of 1,000-5,000 square feet Provide water-efficient landscape design that reduces use of potable water beyond initial requirements for plant installation and establishment
	Model Water Efficient Landscaping Ordinance	The model ordinance promotes efficient landscaping in new developments and establishes an outdoor water budget for new and renovated landscaped areas that are 500 square feet or larger. (Title 23, Division 2, Chapter 2.7.)
	Cap-and-Trade Program	Transportation fuels used in landscape maintenance equipment (e.g., gasoline) would be subject to the Cap-and-Trade Program. Fuel refineries and suppliers are subject to the Cap-and-Trade requirements. (See "Energy Use," below.)
Refrigerants	CARB Management of High GWP Refrigerants for Stationary Sources	Any refrigerants associated with the project will be subject to CARB standards. CARB's Regulation for the Management of High GWP Refrigerants for Stationary Sources (1) reduces emissions of high-GWP refrigerants from leaky stationary, non-residential refrigeration equipment; (2) reduces emissions resulting from the installation and servicing of stationary refrigeration and air conditioning appliances using high-GWP refrigerants; and (3) requires verification GHG emission reductions. (Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5.1, Section 95380 et seq.)
Consumer Products	CARB High GWP GHGs in Consumer Products	All consumer products associated with the project will be subject to CARB standards. CARB's consumer products regulations set VOC limits for numerous categories of consumer products, and limits the reactivity of the ingredients used in numerous categories of aerosol coating products (Title 17, Division 3, Chapter 1, Subchapter 8.5.)
Construction		
Use of Off-Road Diesel Engines, Vehicles, and Equipment	CARB In-Use Off-Road Diesel Vehicle Regulation	Any relevant vehicle or machine use associated with the project will be subject to CARB standards. The CARB In-Use-Off-Road Diesel Vehicle Regulation applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		regulation (1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; (2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; (3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and (4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits). The requirements and compliance dates of the Off-Road regulation vary by fleet size, as defined by the regulation.
	Cap-and-Trade Program	Transportation fuels (e.g., gasoline) used in equipment operation would be subject to the Cap-and-Trade Program. Fuel refineries and suppliers are subject to the Cap-and-Trade requirements. (See "Energy Use," below.)
Greening New Construction	CALGreen Code	All new construction must comply with CALGreen Code, as discussed in more detail throughout this table. Adoption of the mandatory CALGreen Code standards for construction has been essential for improving the overall environmental performance of new buildings; it also sets voluntary targets for builders to exceed the mandatory requirements.
Construction Waste	CALGreen Code	The project will be subject to CALGreen Code requirements for construction waste reduction, disposal, and recycling, such as a requirement to recycle and/or salvage for reuse a minimum of 50% of the non-hazardous construction waste in accordance with Section 5.408.1.1, 5.408.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent.
Solid Waste		
Solid Waste Management	Landfill Methane Control Measure	Waste associated with a use implementing the project will be disposed per state requirements for landfills, material recovery facilities, and transfer stations. Per the statewide GHG emissions inventory, the largest emissions from waste management sectors come from landfills, and are in the form of CH_4. In 2010, CARB adopted a regulation that reduces emissions from methane in landfills, primarily by requiring owners and operators of certain uncontrolled municipal solid waste landfills to install gas collection and control systems, and requires

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		existing and newly installed gas and control systems to operate in an optimal manner. The regulation allows local air districts to voluntarily enter into a memorandum of understanding with CARB to implement and enforce the regulation and to assess fees to cover costs of implementation.
	Mandatory Commercial Recycling (AB 341)	AB 341 will require a use implementing the proposed project, if it generates four cubic yards or more of commercial solid waste per week, to arrange for recycling services, using one of the following: self-haul; subscribe to a hauler(s); arranging for pickup of recyclable materials; subscribing to a recycling service that may include mixed waste processing that yields diversion results comparable to source separation. The project will also be subject to local commercial solid waste recycling program required to be implemented by each jurisdiction under AB 341.
	CALGreen Code	The project will be subject to CALGreen Code requirement to provide areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling (CALGreen Section 5.410.1)
Energy Use		
Electricity/Natural Gas Generation	Cap-and-Trade Program	Electricity and natural gas generated and/or imported into the state which may be used for the project will be subject to the Cap-and-Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants. In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade Program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 metric tons or more of CO_2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
Renewable Energy	California RPS (SB X1-2, SB 350, and SB 100)	Energy providers to the project will be required to comply with RPS set by SB X1 2, SB 350, and SB 100. SB X1 2 requires investor-owned utilities, publicly owned utilities, and electric service providers to increase purchases of renewable energy such that at least 33% of retail sales are procured from renewable energy resources by December 31, 2020. In the interim, each entity was required to procure an average of 20% of renewable energy for the period of January 1, 2011, through December 31, 2013; and will be required to procure an average of 25% by December 31, 2016, and 33% by 2020. SB 350 requires retail sellers and publicly owned utilities to procure 50% of their electricity from eligible renewable energy resources by 2030. SB 100 increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California by 2045.
	Million Solar Roofs Program (SB 1)	The project will participate in California's energy market by pre-wiring roofs for future installation of solar, which is affected by implementation of the Million Solar Roofs Program. As part of Governor Schwarzenegger's Million Solar Roofs Program, California has set a goal to install 3,000 megawatts of new, solar capacity through 2016. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time.
	California Solar Initiative- Thermal Program	The project will derive energy from California's energy market, which is affected by implementation of the California Solar Initiative – Thermal Program. The program offers cash rebates of up to $4,366 on solar water heating systems for single-family residential customers. Multifamily and Commercial properties qualify for rebates of up to $800,000 on solar water heating systems and eligible solar pool heating systems qualify for rebates of up to $500,000. Funding for the California Solar Initiative-Thermal program comes from ratepayers of Pacific

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		Gas & Electric, Southern California Edison, Southern California Gas Company, and San Diego Gas & Electric. The rebate program is overseen by the CPUC as part of the California Solar Initiative.
	Waste Heat and Carbon Emissions Reduction Act (AB 1613, AB 2791)	The project will derive energy from California's energy market, which is affected by implementation of the Waste Heat and Carbon Emissions Reduction Act. Originally enacted in 2007 and amended in 2008, this act directed the CEC, CPUC, and CARB to implement a program that would encourage the development of new combined heat and power systems in California with a generating capacity of not more than 20 megawatts, to increase combined heat and power use by 30,000 gigawatt-hour. The CPUC publicly owned electric utilities, and CEC duly established policies and procedures for the purchase of electricity from eligible combined heat and power systems. CEC guidelines require combined heat and power systems to be designed to reduce waste energy; have a minimum efficiency of 60%; have NO_x emissions of no more than 0.07 pounds per megawatt-hour; be sized to meet eligible customer generation thermal load; operate continuously in a manner that meets expected thermal load and optimizes efficient use of waste heat; and be cost effective, technologically feasible, and environmentally beneficial.
Vehicular/Mobile Sources		
General	SB 375 and SANDAG RTP/SCS	The project complies with, and is subject to, the SANDAG adopted RTP/SCS, which CARB approved as meeting its regional GHG targets in 2016. The most recent plan was adopted in December 2021, but CARB has not accepted it as of this writing. See discussion below.
Fuel	Low Carbon Fuel Standard (LCFS)/ EO S-01-07	Auto trips associated with the project will be subject to LCFS (EO S-01-07), which requires a 20% or greater reduction in the average fuel carbon intensity by 2030 with a 2010 baseline for transportation fuels in California regulated by CARB. The program establishes a strong framework to promote the low carbon fuel adoption necessary to achieve statewide GHG reduction goals.

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
	Cap-and-Trade Program	Gasoline used for project implementation will be subject to the Cap-and-Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants. In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade Program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, RBOB, distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 MT or more of CO_2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.
Light-Duty Vehicles	AB 1493 (or the Pavley Standard)	Cars that drive to and from the project will be subject to AB 1493, which directed CARB to adopt a regulation requiring the maximum feasible and cost-effective reduction of GHG emissions from new passenger vehicles. Pursuant to AB 1493, CARB adopted regulations that establish a declining fleet average standard for CO2, CH4, N2O, and HFCs (air conditioner refrigerants) in new passenger vehicles and light-duty trucks beginning with the 2009 model year and phased-in through the 2016 model year. These standards are divided into those applicable to lighter and those applicable to heavier portions of the passenger vehicle fleet. The regulations will reduce “upstream” smog-forming emissions from refining, marketing, and distribution of fuel.
	Advanced Clean Car and ZEV Programs	Cars that drive to and from the project will be subject to the Advanced Clean Car and ZEV Programs. In January 2012, CARB approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards called Advanced Clean

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
		Cars. By 2025, new automobiles will emit 34% fewer global warming gases and 75% fewer smog forming emissions. The ZEV program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018-2025 model years.
	Tire Inflation Regulation	Cars that drive to and from the project will be subject to the CARB Tire Inflation Regulation, which took effect on September 1, 2010, and applies to vehicles with a gross vehicle weight rating of 10,000 pounds or less. Under this regulation, automotive service providers must, inter alia, check and inflate each vehicle's tires to the recommended tire pressure rating, with air or nitrogen, as appropriate, at the time of performing any automotive maintenance or repair service, and to keep a copy of the service invoice for a minimum of three years, and make the vehicle service invoice available to the CARB, or its authorized representative upon request.
	EPA and NHTSA GHG and CAFE Standards	Mobile sources that travel to and from the project would be subject to EPA and NHTSA GHG and CAFE standards for passenger cars, light-duty trucks, and medium-duty passenger vehicles. (75 FR 25324–25728 and 77 FR 62624–63200.)
Water Use		
Water Use Efficiency	Emergency State Water Board Regulations	Water use associated with the project will be subject to emergency regulations. On May 18, 2016, partially in response to EO B-27-16, the State Water Board adopted emergency water use regulations (CCR, title 23, Section 864.5 and amended and re-adopted Sections 863, 864, 865, and 866). The regulation directs the State Water Board, Department of Water Resources, and CPUC to implement rates and pricing structures to incentivize water conservation, and calls upon water suppliers, homeowners' associations, California businesses, landlords and tenants, and wholesale water agencies to take stronger conservation measures.

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
	EO B-37-16	Water use associated with the project will be subject to Emergency EO B-37-16, issued May 9, 2016, which directs the State Water Resources Control Board to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply conditions across the state. The Water Board must also develop a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The Water Board and Department of Water Resources will develop new, permanent water use targets to which the project will be subject. The Water Board will permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in a fountain or other decorative water feature; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.
	EO B-40-17	EO B-40-17 lifted the drought emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne. It also rescinds EO B-29-15, but expressly states that EO B-37-16 remains in effect and directs the State Water Resources Control Board to continue development of permanent prohibitions on wasteful water use to which the project will be subject.
	SB X7-7	Water provided to the project will be affected by SB X7-7's requirements for water suppliers. SB X7-7, or the Water Conservation Act of 2009, requires all water suppliers to increase water use efficiency. It also requires, among other things, that the Department of Water Resources, in consultation with other state agencies, develop a single standardized water use reporting form, which would be used by both urban and agricultural water agencies.
	CALGreen Code	The project is subject to CALGreen Code's water efficiency standards, including a required 20% mandatory reduction in indoor water use. (CALGreen, Division 4.3.)

Table 3.7-8. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/Regulations	GHG Reduction Measures Required for Project
	California Water Code, Division 6, Part 2.10, Sections 10910–10915.	Development and approval of the project would require the development of a project-specific Water Supply Assessment assessing the projects water demand and its inclusion within the City's urban water management plan.
	Cap-and-Trade Program	Electricity usage associated with water and wastewater supply, treatment and distribution would be subject to the Cap-and-Trade Program.
	California RPS (SB X1-2, SB 350, SB 100)	Electricity usage associated with water and wastewater supply, treatment and distribution associated with the project will be required to comply with RPS set by SB X1-2, SB 350, and SB 100.

Source: Appendix B.
Notes: AB = Assembly Bill; CARB = California Air Resources Board; CEC = California Energy Commission; CFC = chlorofluorocarbon; CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; CPUC = California Public Utilities Commission; EO = Executive Order; EPA = Environmental Protection Agency; GHG = greenhouse gas; GWP = global warming potential; HCFC = hydrochlorofluorocarbon; HFC = hydrofluorocarbon; gpm = gallons per minute; MT = metric tons; N_2O = nitrous oxide; NHTSA = National Highway Traffic Safety Administration; PM = particulate matter; RPS = Renewable Portfolio Standard; RTP/SCS = Regional Transportation Plan/Sustainable Communities Strategy; SB = Senate Bill; SANDAG = San Diego Association of Governments; VOC = volatile organic compound; ZEV = zero emission vehicle

As shown in the table above, the project would be consistent with and would not conflict with the applicable GHG-reducing strategies of the state that apply to the construction and operational components.

In addition, the project would help support achievement of the statewide 2030 goal (as codified in SB 32) and the long-term, carbon neutrality 2045 goal (as set forth in EO B-55-18) by being infill development with access to multimodal transportation options and incorporating features such as electric vehicle charging stations, bicycle infrastructure, transportation demand management, electric water heaters, smart landscaping irrigation, and an urban tree canopy.

Consistency with San Diego Association of Governments' Regional Transportation Plan/ Sustainable Communities Strategy

At the regional level, SANDAG's RTP/SCS has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In December 2021, SANDAG adopted its RTP/SCS (The 2021 Regional Plan), which shows that the San Diego region reduced per capita CO_2 emissions by 17.9% in 2020 compared to 2005 baseline, which exceeds the 2020 target set for SANDAG of 15% reduction. Implementation of the 2021 RTP/SCS is estimated to result in a 20% CO_2 emissions reduction for cars and light-duty trucks by 2035, exceeding the 19% target from 2005 levels set by CARB. The RTP/SCS does not regulate land use or supersede the exercise of land use authority by SANDAG's member jurisdictions, but it is a relevant regional reference document for purposes of evaluating the intersection of land use and transportation patterns and the corresponding GHG emissions.

For purposes of the RTP/SCS consistency evaluation, the project would increase access to transit because it is located approximately 0.3 miles from the Palomar College SPRINTER station and two bus stops are located in front of the project site off W Mission Road.[5] The project site's proximity to State Route 78 further allows for easy regional connectivity to employment centers, shopping areas, and recreation opportunities. The proposed density, land use type, and location are consistent with the SANDAG's RTP/SCS, which increases access to transit and promotes regional connectivity to employment centers, shopping areas, and recreation opportunities. The features mentioned above would help facilitate alternative transit usage and reduce the overall vehicle trips, thereby reducing the project's regional GHG emissions.

Based on the considerations outlined above, the project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and potential impacts would be **less than significant**.

3.7.5 Cumulative Impact Analysis

A "cumulative impact" refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental effects. Pursuant to CEQA Guidelines Section 15130(b)(1)(A)(B), an adequate discussion of a project's significant cumulative impact, in combination with other closely related projects, can be based on either a list of past, present, and probable future producing related impacts or a summary of projections contained in an adopted local, regional, or statewide plan or related planning document that describes conditions contributing to the cumulative effect.

Due to the global nature of the assessment of GHG emissions and the effects of global climate change, GHG emissions analysis, by its nature, is a cumulative impact analysis. Therefore, the information and analysis provided above in Section 3.7.4 to determine project-level impacts applies here and the project's contribution to global climate change would not be cumulatively considerable.

This approach is consistent with the supporting documentation published by the California Natural Resources Agency when promulgating the SB 97-related CEQA amendments, which indicated that the impact of GHG emissions should be considered in the context of a cumulative impact, rather than a project-level impact (CNRA 2009b). The California Natural Resources Agency similarly advised that an environmental document must analyze the incremental contribution of a project to GHG levels and determine whether those emissions are cumulatively considerable (CNRA 2009a). The adopted CEQA Guideline (14 CCR 15064.4) confirms that the analysis of climate change impacts is cumulative and, in the most recent update to the Guidelines, text was added to Section 15064.4 to clarify as much (CNRA 2018). Section 15064.4 now states, "In determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change."

For the reasons stated above, the project's cumulative impacts would be **less than significant**.

[5] The City uses the North County Transit District (NCTD) for Coaster rail service, SPRINTER light rail service, and Breeze bus service for connections throughout the County of San Diego. SPRINTER service operates between Escondido and Oceanside with connections to Interstate 5 and the Coaster rail service operating out of the City of Oceanside. The NCTD operates the Palomar College SPRINTER, which is within a short walk from the project area. In addition, a bus stop is located in front of the project site. Connections to Orange County can be made via the Metrolink in the City of Oceanside. Similarly, connections to Riverside Transit Authority buses can be made via the transit station in Oceanside and Escondido. Both the Metrolink connection in Oceanside and the Riverside Transit Authority Bus connection in Oceanside and Escondido are accessible through SPRINTER light rail service. These public transit options will offer residents of the project area quick access to a variety of alternative modes of transportation.

3.7.5 Mitigation Measures

The project would not result in significant impacts; therefore, no mitigation is required.

3.7.6 Conclusion

As presented in Section 3.7.4, the project would result in approximately 749 MT CO_2e per year and would not exceed the City's significance threshold of 2.1 MT CO_2e/SP/yr. Therefore, the project would be consistent with the City's 2020 CAP. Furthermore, the project would be consistent with and would not conflict with the applicable GHG-reducing strategies of the state, would be consistent with CARB's Scoping Plan, and would be consistent with SANDAG's RTP/SCS. In summary, impacts with regard to GHG emissions would be less than significant.

3.8 Hazards and Hazardous Materials

This section describes the existing hazards and hazardous materials within the vicinity of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project. Information from the Phase I Environmental Site Assessment (Phase I ESA), prepared for the project by Hillmann Consulting on June 23, 2021, was used in preparation of this chapter and is included as Appendix F to this EIR.

Table 3.8-1 summarizes the hazards and hazardous materials and cumulative-level impact analysis, by threshold, for the project.

Table 3.8-1. Hazards and Hazardous Materials Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	Less than Significant	Less than Significant	Less than Significant
No. 2: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	Less than Significant	Less than Significant	Less than Significant
No. 3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	Less than Significant	Less than Significant	Less than Significant
No. 4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.	Less than Significant	Less than Significant	Less than Significant
No. 5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.	Less than Significant	Less than Significant	Less than Significant
No. 6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	Less than Significant	Less than Significant	Less than Significant
No. 7: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.	Less than Significant	Less than Significant	Less than Significant

3.8.1 Existing Conditions

This section describes the existing conditions on the project site related to hazards and hazardous materials. The Phase I ESA assesses the likelihood of any recognized hazardous substances or petroleum products that might be present on site as a result of current or historical land uses or adjacent uses. The Phase I ESA included a review of the historical records of the project site, a site reconnaissance of the project site, reconnaissance of adjoining properties, a vapor encroachment screen for the project site, and a limited soil investigation. The Phase I ESA did not identify any evidence of recognized environmental conditions on the project site.

The 7.6-acre project site is an undeveloped lot located in the northwestern portion of the City of San Marcos (City) in an urbanized area. The project site is located in an area largely characterized by commercial and industrial facilities, and residences, with Palomar College approximately 0.2 miles to the east. The project site is bounded by N Las Posas Road along the eastern boundary, W Mission Road along the southwest boundary, an existing CVS Pharmacy to the south, and existing single-family residential development to the north and west, as well as to the east across N Las Posas Road.

Visual evidence of hazardous substances and wastes was not observed during the project site reconnaissance, and no visual indication of spills or leaks was observed. No other pungent or acrid odors were observed emanating from the project site. Additionally, there was no evidence of underground or aboveground fuel storage tanks or equipment that may contain polychlorinated biphenyls.

Site and Surrounding Area History

The Phase I ESA completed for the project reviewed reasonably ascertainable public documents, including aerial photographs, topographic maps, city directories, and fire insurance maps.

Aerial photographs were reviewed for the following years: 1928, 1939, 1946, 1953, 1964, 1967, 1970, 1979, 1985, 1989, 1990, 1994, 2005, 2009, 2012, and 2016 (Appendix F). In each photograph, the project site appears to be vacant and undeveloped land.

Included in Appendix F is an Environmental Data Resources Inc. Historical Topo Map Report, which reviewed the Escondido Quadrangle (15-minute series), dated 1893; the Escondido Quadrangle (15-minute series), dated 1901; the Escondido Quadrangle (15-minute series), dated 1947; the San Marcos (7.5-minute series), dated 1948; the San Marcos (7.5-minute series), dated 1949; the San Marcos Quadrangle (7.5-minute series), dated 1968; the San Marcos Quadrangle (7.5-minute series), dated 1983; the San Marcos Quadrangle (7.5-minute series), dated 1996; and the San Marcos Quadrangle (7.5-minute series), dated 2012 (Appendix F). The project site appears to be vacant land on all the topographic map sheets reviewed for this assessment. The 2012 topographic map sheet shows little detail other than streets in the vicinity (Appendix F).

Based on readily available historical information, the project site appears to have been vacant and undeveloped land from 1928 to 2005, used as a staging area for the construction of the CVS Pharmacy to the south, and has remained vacant since 2012. According to Google Earth images, the project site was used as an overflow parking lot for Palomar College in 2017 and 2018. Historically, the surrounding properties appear to have been vacant land from at least 1928 to at least 1953. Numerous structures and some vacant land can be observed from 1964 to 2005. Data gaps exist from 1901 to 1927, 1929 to 1939, 1940 to 1945, 1950 to 1952, 1954 to 1963, 1965 to 1966, 1971 to 1978, 1980 to 1982, 1984, 1986 to 1987, 1991 to 1995, and 1997 to 2004, due to the limited records that are reasonably ascertainable in the local area. However, according to Appendix F, additional historical information, if it were to become available, is likely insignificant and not likely to change the impact determination herein.

The surrounding properties appear to have a structure in 1893 and 1901 aerial photographs; railroad track, an unpaved road, and a structure in 1947 through 1949; multiple structures in 1968 and 1983; and in 1996 the remaining adjacent properties become developed. The 2012 maps show little detail other than streets in the vicinity (Appendix F).

Regulatory Database Review

As explained in Appendix F, Hillmann Consulting obtained and reviewed an environmental database report of the federal and state environmental records specified by international standard practice guidance (ASTM E 1527-13). The database report was provided by Environmental Data Resources Inc. of Shelton, Connecticut, and tracks the presence of underground storage tanks (USTs), hazardous waste generation, and hazardous waste generators, or other environmental concerns, such as spills, leaks, or aboveground tanks. Table 3.8-2, Environmental Database, shows that the project site was not listed on any of these regulatory databases and four site listings were present on adjacent sites.

Table 3.8-2. Environmental Database

Environmental Database	Minimum Search Distance (miles)	Site	Adjacent	Total Listed
Federal National Priorities List (NPL) and Proposed NPL	1.0	No	0	0
Delisted NPL	0.5	No	0	0
Federal Superfund Enterprise Management System (SEMS), including archived sites (formerly CERCLIS)	0.5	No	0	0
Federal SEMS-ARCHIVE (formally known as CERCLIS NFRAP)	0.5	No	0	3
Federal Resource Conservation and Recovery Act (RCRA), Corrective Action Sites (CORRACTS)	1.0	No	0	1
Federal RCRA, Treatment, Storage, and Disposal facilities (TSD) sites	0.5	No	0	1

Source: Appendix F.

National Priorities List

The National Priorities List (NPL) is the U.S. Environmental Protection Agency's (EPA) list of confirmed or proposed Superfund sites. The Phase I ESA reviewed the NPL list for confirmed or proposed Superfund sites, and for sites that have been delisted from the NPL, which occur within 1 mile of the project site. The project site does not appear on the NPL. There are no other facilities on the NPL within 1 mile of the project site.

Superfund Enterprise Management System

The Superfund Enterprise Management System (SEMS, formerly CERCLIS) is a compilation of sites that EPA has investigated or is currently investigating for a release or threatened release of hazardous substances. The Phase I ESA reviews current and archived SEMS sites within 0.5-mile distance of the project site.

The project site does not appear on the SEMS or SEMS-ARCHIVE list. There are three facilities on the SEMS-ARCHIVE list within 0.5 miles of the project site located at 217 N Las Posas Road (735 feet south of the project site) with no gradient due to a hydrologic barrier (Appendix F).

Due to the listings, distance, locations downgradient from the project site, and/or facility status as an archive facility (SEMS-ARCHIVE), these facilities are considered unlikely to represent an environmental concern to the project site.

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) compiles selective information on facilities that generate, transport, store, treat, and/or dispose of hazardous waste. RCRA facilities can be listed on one of the three databases:

- **Corrective Action Facilities** are facilities undergoing corrective action. A corrective action order is issued pursuant to RCRA Section 3008(h) when there has been a release of hazardous waste or constituents into the environment from a RCRA facility.
- **Treatment, Storage, and Disposal Facilities (TSD)** includes facilities that transport, store, or dispose of hazardous waste and are not listed on the RCRA Generators list. The TSD is searched for a 0.5-mile distance.
- **Generators List** identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Generators database is a compilation by EPA of reporting facilities that generate hazardous waste. The RCRA generators list is searched for the project site and adjacent properties.

The project site does not appear on the Corrective Action Facilities list. There is one facility on the list within 1 mile of the project site. The facility is Signet Armorlite, located at 1001 Armorlite Drive. The site has been listed on the federal CORRACTS list but has not had any violations listed. Therefore, this facility is considered unlikely to represent an environmental concern to the project site.

The project site does not appear on the RCRA TSD list. There is one facility on the list within 0.5 miles of the project site: Signet Armorlite, located at 1001 Armorlite Drive. The site has been listed on the RCRA-NonGEN/NLR lists but has not had any violations listed. Therefore, this facility is considered unlikely to represent an environmental concern to the project site.

The project site does not appear on the RCRA Generators list. There is one facility listed as a RCRA Generator within 0.25 miles of the project site. The facility is CVS Pharmacy, located at 1302 W Mission Road, which is adjacent and south-southeast of the project site and lower in elevation relative to the project site. The CERZ HAZ WASTE database listed administrative violations, but the facility has since achieved compliance. No other environmental databases identified violations from this facility and this facility is considered unlikely to represent an environmental concern to the project site.

Federal Institutional Control/Engineering Control Registries

EPA maintains institutional and engineering control databases or registries, which list sites with engineering or institutional controls in place. Institutional controls include administrative measures intended to prevent exposure to contaminants remaining on site. Engineering controls include various forms of caps, treatment methods, etc. The project site does not appear on the federal institutional control/engineering control registries.

Emergency Response Notification System

The Emergency Response Notification System is a national database used to collect information on reported releases of oil or hazardous substances. The project site does not appear on this list.

Solid Waste Fill/Landfill Database

The Solid Waste Fill/Landfill (SWF/LF) database includes information pertaining to closed and open solid waste facilities operating in the state of California. The SWF/LF database is searched for a 0.5-mile distance. The project site does not appear on the SWF/LF lists. There is one facility within 0.5 miles of the project site. The one facility is Benchmark Landscape Inc. located at 145 N Pacific Street is listed as being located 0.15 miles southwest of the project site at an elevation below the project site. Despite the facility having multiple administrative violations, the facility returned to compliance in 2014 and does not represent an environmental concern to the site.

Leaking Underground Storage Tanks List

The California Leaking Underground Storage Tanks (LUST) list is a compilation of petroleum storage tank sites that have reported a release. The LUST list is searched for a 0.5-mile distance. The project site does not appear on the LUST list. There are 20 facilities on the LUST list within 0.5 miles of the project site. Appendix F provides a detailed table with the facility name, address, location in relation to the project site, and the facility status. Due to their status listings and location, these facilities do not represent an environmental concern to the project site.

Underground Storage Tanks List

The California UST list is a compilation of petroleum storage tank sites that are registered with the state of California. The UST list is searched for the project site and adjacent properties. The project site did not appear on the UST list or historic UST list.

Dry Cleaners

Environmental Data Resources Inc. compiled and provided the dry cleaners list. The dry cleaner database is searched for a 0.25-mile distance. The project site does not appear on the dry cleaners list. There are no dry cleaner facilities listed within 0.25 miles of the project site.

Unmappable Facilities

Hillmann Consulting reviewed the list of “orphan” or unmappable facilities in the database report. There are no unmapped facilities in the report.

Vapor Encroachment Screening

The purpose of a vapor encroachment screen is to identify, to the extent feasible, if a vapor encroachment condition exists at the project site. According to Appendix F, a vapor encroachment condition is not likely to exist at the project site given that no recognized environmental conditions were identified.

Site Reconnaissance

A representative of Hillmann Consulting conducted a project site reconnaissance on June 8, 2021. The triangular-shaped project site currently comprises two parcels of land (Assessor's Parcel Numbers 219-121-15-00 and 219 121-16-00) and encompasses a total of approximately 7.6 acres. The project site can generally be accessed from either N Las Posas Road or W Mission Road. The project site is currently vacant and undeveloped land. No visual evidence of hazardous substances and wastes was observed during the project site reconnaissance. No visual indication of spills or leaks was observed. No other pungent or acrid odors were observed emanating from the project site.

Wildland Fire

The project site is not designated as a high fire severity zone (CAL FIRE 2022; City of San Marcos 2012). The San Marcos Fire Department (SMFD) prepared a Community Wildfire Protection Plan and Hazard Risk Assessment for the San Marcos community and unincorporated areas in the San Marcos Fire Protection District to reduce the risk of wildland fires (SMFD 2007). Fire protection services and wildfire risk for the project site are discussed in Section 3.13, Public Services, and Chapter 5, Environmental Effects Found Not to Be Significant.

3.8.2 Regulatory Setting

This section details the federal, state, and local regulations governing hazards and hazardous materials.

Federal

Chemical Accident Prevention Provision

Title 40 Part 68 of the Code of Federal Regulations sets forth a list of regulated substances and thresholds, the petition process for adding or deleting substances to the list of regulated substances, the requirements for owners or operators of stationary sources concerning the prevention of accident releases, and the state accidental release prevention programs approved under Section 112(r) of the Clean Air Act.

Federal Aviation Regulations—Notice of Proposed Construction or Alteration

The Federal Aviation Administration (FAA), which has primary responsibility for the safety of civil aviation, imposes height restrictions in order to prevent obstructions to navigable airspace to protect flights and surrounding structures. In certain cases, the FAA should be notified of proposed development pursuant to Section 77.11 of the Federal Aviation Regulations. The notification of proposed development enables the FAA to:

- Evaluate the effect of the construction or alteration on operational procedures and proposed operational procedures
- Determine the possible hazardous effect of the proposed construction or alteration of air navigation

- Provide recommendations for identifying the construction or alteration in accordance with current FAA Advisory Circular AC 70/7460-1K, Obstruction Marking and Lighting, dated August 1, 2000
- Determine other appropriate measures to be applied for continued safety of air navigation
- Provide charting and other notification to airmen of the construction or alteration

Certain jurisdictions can request an FAA evaluation of proposed development when certain features appear to be potentially hazardous.

Federal Disaster Mitigation Act of 2000

The Disaster Mitigation Act of 2000 provided a new set of mitigation plan requirements for state and local jurisdictions to coordinate disaster mitigation planning and implementation. States are encouraged to complete a "standard" or an "enhanced" natural mitigation plan. "Enhanced" plans demonstrate increased coordination of mitigation activities at the state level, and, if completed and approved, increase the amount of funding through the Hazard Mitigation Grant Program. California's updated State Hazard Mitigation Plan was adopted in October 2010 and approved by the Federal Emergency Management Agency Region IX. The City is one of the communities covered by the County of San Diego (County) Multi-Jurisdictional Hazard Mitigation Plan, described below, which is a Countywide plan that identifies risks posed by natural and human-made disasters.

Hazardous Materials Transport

The U.S. Department of Transportation regulates transportation of hazardous materials between states. State agencies with primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol and the California Department of Transportation. Together, these agencies determine container types used and license hazardous waste haulers for transportation of hazardous waste on public roads, including explosives that may be used for blasting.

International Fire Code

The International Fire Code (IFC), created by the International Code Council, is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The IFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The IFC and the International Building Code use a hazard classification system to determine what protective measures are required for fire and life safety. These measures may include construction standards, separations from property lines, and specialized equipment. To ensure that these safety measures are met, the IFC employs a permit system based on hazard classification. The IFC is updated every 3 years.

Resource Conservation and Recovery Act

RCRA gives EPA the authority to control hazardous waste during the generation, transportation, treatment, storage, and disposal of the waste. RCRA also sets forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances.

Hazardous and Solid Waste Amendments of 1984

The Hazardous and Solid Waste Amendments of 1984 amends the Solid Waste Disposal Act (as amended by the RCRA of 1976) to authorize appropriations for fiscal years 1985 through 1988 for:

1. General administration by the Administrator of EPA to carry out such act (including funds for resource recovery and conservation panels, hazardous waste management, and support for state, regional, local, and interstate agency solid waste plans
2. Grants to state hazardous waste programs
3. The hazardous waste site inventory
4. Development and implementation of plans by state, local, regional, and interstate authorities
5. Implementation of state, local, and intermunicipal programs for solid waste management, resource recovery, resource conservation, and hazardous waste management
6. Special communities assistance
7. Assistance to states for recycled oil programs
8. The Secretary of Commerce to carry out resource and recovery duties
9. Additional EPA officers or employees to conduct criminal investigations under such act and for support costs for such additional criminal investigators
10. UST regulation
11. Grants to states for state UST release detection, prevention, and correction programs
12. Small quantity generator waste education programs
13. State and other programs requiring compliance with open dumping/sanitary landfill criteria by solid waste management facilities within 36 months after enactment of this act
14. The National Ground Water Commission

In general, both the scope and requirements of the amendments, as amended by RCRA, were significantly expanded and reinforced.

State

The state regulations that govern hazardous materials are equal to or more stringent than federal regulations. California has been granted primary oversight responsibility by EPA to administer and enforce hazardous waste management programs. State regulations have detailed planning and management requirements to ensure that hazardous wastes are handled, stored, and disposed of properly to reduce risks to human health and the environment. Several key state laws pertaining to hazardous wastes are discussed below. In addition, the Department of Toxic Substances Control, the State Water Resources Control Board, and the Integrated Waste Management Act also regulate the generation of hazardous materials, as described below.

California Emergency Services Act

The California Emergency Services Act provides the basic authority for conducting emergency operations following a proclamation of emergency by the governor and/or appropriate local authorities. Local government and district emergency plans are considered to be extensions of the California Emergency Plan, established in accordance with the Emergency Services Act.

California Fire Code

The California Fire Code (CFC) is Chapter 9 of Title 24 of the California Code of Regulations. The California Code of Regulations is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The CFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The CFC and the California Building Code use a hazard classification system to determine what protective measures are required to ensure fire and life safety. These measures may include construction standards, separations from property lines, and specialized equipment. To ensure these safety measures are met, the CFC employs a permit system based on hazard classification. The CFC is updated every 3 years. SMFD has adopted the CFC by reference in its own fire code.

California Health and Safety Code—Hazardous Materials Release Response Plans and Inventory

Pursuant to California Health and Safety Code, Chapter 6.95, the California Department of Environmental Health implements the Hazardous Materials Business Plan (HMBP) program and the California Accidental Release Prevention Program (CalARP) in the County. The HMBP and CalARP programs provide threshold quantities for regulated hazardous substances. When the indicated quantities are exceeded, an HMBP or risk management plan is required pursuant to the regulation. Congress requires EPA Region 9 to make risk management plan information available to the public through EPA's Envirofacts Data Warehouse.

California Integrated Waste Management Act

This act requires the development and implementation of household hazardous waste disposal plans. The California Department of Resources Recycling and Recovery, formerly the California Integrated Waste Management Board, oversees compliance with this act and enforces operational plans for solid waste facilities.

Emergency Response to Hazardous Materials Incidents

California has developed an emergency response plan to coordinate emergency services provided by federal, state, and local governments and private agencies. Response to hazardous material incidents is one part of this plan. The plan is managed by the California Emergency Management Agency, which coordinates the responses of other agencies, including the California Environmental Protection Agency (CalEPA), California Highway Patrol, California Department of Fish and Wildlife, and Regional Water Quality Control Board.

Emergency Services Act

Under the Emergency Services Act (California Government Code Section 8850 et seq.), the state developed an emergency response plan to coordinate emergency services provided by federal, state, and local agencies. Quick response to incidents involving hazardous materials or hazardous waste is a key element of this plan. The Governor's Office of Emergency Services administers the plan, coordinating the responses of other agencies, including EPA, California Highway Patrol, Regional Water Quality Control Boards, air quality management districts, and county disaster response offices.

Government Code Section 65962.5 (Cortese List)

The provisions of Government Code Section 65962.5 are commonly referred to as the Cortese List. The Cortese List is a planning document used by the state and local agencies to provide information about hazardous materials release sites. Government Code Section 65962.5 requires CalEPA to develop an updated Cortese List annually, at

minimum. The Department of Toxic Substances Control is responsible for a portion of the information contained in the Cortese List. Other California state and local government agencies are required to provide additional hazardous material release information for the Cortese List.

Hazardous Waste Control Act

The Hazardous Waste Control Act is implemented by regulations contained in California Code of Regulations Title 26 that describe requirements for the proper management of hazardous wastes. The act created the state hazardous waste management program, which is similar to but more stringent than the federal RCRA program. The Hazardous Waste Control Act and Title 26 regulations list more than 800 potentially hazardous materials and establish criteria for identifying, packaging, transporting, and disposing of such wastes. Under these regulations, the generator of hazardous waste material must complete a manifest that accompanies the material from the point of generation to transportation to the ultimate disposal location, with copies of the manifest filed with the Department of Toxic Substances Control.

Unified Program

CalEPA delegates to qualifying local agencies oversight and permitting responsibility for certain state programs pertaining to hazardous waste and hazardous materials. This is achieved through the Unified Program, created by state legislation in 1993 to consolidate, coordinate, and make consistent the administrative requirements, permits, inspections, and enforcement activities for the following emergency and management programs:

- Hazardous materials release response plans and inventories (business plans)
- CalARP
- UST Program
- Aboveground Petroleum Storage Act Requirements for Spill Prevention, Control and Countermeasure plans
- Hazardous Waste Generator and On-site Hazardous Waste Treatment (tiered permitting) Programs
- CFC: Hazardous material management plans and hazardous material inventory statements

The County is the designated certified Unified Program agency for all local jurisdictions within the San Diego region, including San Marcos.

State Responsibility Area Fire Safe Regulations (California Code of Regulations, Title 14 Natural Resources, Department of Forestry Fire Protection)

These regulations constitute the basic wildland fire protection standards of the California Board of Forestry. They have been prepared and adopted for the purpose of establishing minimum wildfire protection standards in conjunction with building, construction, and development in State Responsibility Areas. Title 14 regulates that the future design and construction of structures, subdivisions, and developments in State Responsibility Areas shall provide for basic emergency access and perimeter wildfire protection measures.

Local

Airport Land Use Commission and Airport Land Use Compatibility Plans

Airport Land Use Commissions assist local agencies in ensuring compatible land uses in the vicinity of existing or proposed airports; coordinate planning at state, regional, and local levels; prepare and adopt airport land use

policies; review plans or regulations submitted by local agencies; and review and make recommendations regarding the land use, building heights, and other issues related to air navigation safety. The San Diego County Regional Airport Authority is the Airport Land Use Commission for the San Diego region.

The closest airport to the project site is the McClellan-Palomar Airport, which operates under its own Airport Land Use Compatibility Plan. The project site is not located within any of the McClellan-Palomar Airport Influence Areas (San Diego County Regional Airport Authority 2011).

County of San Diego Multi-Jurisdictional Hazard Mitigation Plan

To comply with the Disaster Mitigation Act of 2000, the County prepared the Multi-Jurisdictional Hazard Mitigation Plan. The plan serves as both a Countywide plan and a plan for local jurisdictions that identifies risks posed by natural and human-made disasters before a hazard event occurs. The plan includes overall goals and objectives shared by many jurisdictions, as well as specific goals, objectives, and mitigation action items for each of the participating jurisdictions to help minimize the effects of the specified hazards that could potentially affect their jurisdiction. Goals, objectives, and action items for the City are included in this plan (County of San Diego 2017).

San Marcos Fire Department Hazard Risk Analysis and Wildland Urban Interface Community Wildfire Protection Plan

The Community Wildfire Protection Plan, adopted in December 2007 (San Marcos Fire Department 2007), was developed by the SMFD with guidance from the County, California Department of Forestry and Fire Protection, and the U.S. Forest Service. The Community Wildfire Protection Plan supplements County Department of Planning and Land Use documents. The SMFD also published the Hazard Risk Analysis for internal City use, incorporating new and existing information relating to wildfire risk within the City to better quantify true risk and management needs. The Hazard Risk Analysis quantifies, clarifies, and manages the wildland urban interface responsibility and meets the requirements of the federal Healthy Forests Restoration Act of 2003 for community fire planning.

City of San Marcos, Ordinance 2003-1216

The City Ordinance 2003-1216 amends Chapter 17.64 of the San Marcos Municipal Code to adopt the most recent version of the CFC. This ordinance also requires all buildings or structures to provide and maintain an effective fuel modification zone of 150 feet.

City of San Marcos General Plan

Safety Element

The Safety Element of the San Marcos General Plan (City of San Marcos 2012) contains the following goals and policies pertaining to hazards and hazardous materials that apply to the project:

Goals S-3: Minimize injury, loss of life, and damage to property resulting from structure or wildland fire hazards.

> Policy S-3.1: Require development to be located, designed and constructed to provide adequate defensibility and reduce the risk of structural loss and life resulting from wildland fires. Development will consider hazards relative to terrain, topography, accessibility and proximity to vegetation. One such provision for development to minimize the risk of structural loss and life shall be the inclusion of overhead fire sprinklers.

Policy S-3.2: Provide sufficient level of fire protection service to reduce risk from urban and wildland fire. Advocate and support regional coordination among fire protection and emergency service providers.

Policy S-3.3: Require development to provide additional access roads when necessary to provide for safe access of emergency equipment and civilian evacuation concurrently.

Policy S-3.4: Coordinate with fire protection and emergency service providers to assess fire hazards before and after wildfire events to adjust fire prevention and suppression needs, as necessary, commensurate with both short- and long-term fire prevention needs.

Goal S-4: Protect life, structures, and the environment from the harmful effects of hazardous materials and waste.

Policy S-4.1: Promote and support the proper disposal, handling, transport, delivery, treatment, recovery, recycling, and storage of hazardous materials in accordance with applicable federal, State, and local regulations.

Policy S-4.2: Require areas of known or suspected contamination to be assessed prior to reuse or redevelopment. Plan for reuse of contaminated areas in a manner that is compatible with the nature of the contamination and subsequent remediation efforts.

Policy S-4.3: Require areas of known or suspected contamination to be assessed prior to reuse or redevelopment. Plan for reuse of contaminated areas in a manner that is compatible with the nature of the contamination and subsequent remediation efforts.

Policy S-4.4: Avoid locating sensitive uses near established hazardous materials users or industrial areas where incompatibilities would result, except in cases where appropriate safeguards have been developed and implemented.

Goal S-5: Establish and maintain an effective emergency response program to respond to disasters and maintain continuity-of-life support functions during an emergency.

Policy S-5.3: Develop, implement, and maintain an effective evacuation program for areas of risk in the event of a disaster.

Goal S-7: Comply with the McClellan-Palomar Airport Land Use Compatibility Plan.

Policy S-7.1: Record an overflight notification document in association with the approval of any new residential land use within the AIA [Airport Influence Area] overflight notification area consistent with the ALUCP.

3.8.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts related to hazards and hazardous materials are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hazards and hazardous material would occur if the project would:

- **Threshold No. 1:** Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

- **Threshold No. 2:** Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- **Threshold No. 3:** Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
- **Threshold No. 4:** Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
- **Threshold No. 5:** For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.
- **Threshold No. 6:** Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
- **Threshold No. 7:** Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

3.8.4 Project Impact Analysis

Impacts related to hazards and hazardous materials as a result of development of the project are analyzed below.

Threshold No. 1. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction of the project would entail transport, use, or disposal of potentially hazardous materials including, but not limited to, diesel fuel, gasoline, equipment fluids, concrete, cleaning solutions and solvents, lubricant oils, adhesives, human waste, and chemical toilets. Direct impacts to human health and biological resources from accidental spills of small amounts of hazardous materials from construction equipment could occur with the transport, use, or disposal of these materials. However, existing federal and state standards related to the handling, storage, and transport of these materials would be implemented during construction of the project. These regulations include the Federal Chemical Accident Prevention Provisions (Part 68 of the Code of Federal Regulations); California Highway Patrol and California Department of Transportation container and licensing requirements for transportation of hazardous waste on public roads; IFC; RCRA of 1976 as amended by the Hazardous and Solid Waste Amendments of 1984; California's Hazardous Waste Control Law; CFC; California Health and Safety Code Hazardous Materials Release Response Plans and Inventory; California Integrated Waste Management Act; regulations developed by California Occupations Safety and Health Administration; and the state Hazardous Waste Control Act.

During operation of the project, the only hazardous materials anticipated for transport, use, or disposal would be routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products, which are typical of residential uses. The use, handling, and disposal of these products is addressed by household hazardous waste programs that are part of the Integrated Waste Management Plan of the County. The Household Hazardous Waste Element of the Integrated Waste Management Plan specifies the means by which hazardous wastes generated by households shall be collected, recycled, treated, and disposed of safely (County of San Diego 2005).

The project's compliance with all standards required through federal, state, County, and municipal regulations, in addition to project-specific plans reviewed by the City, would ensure potential impacts to the public or the environment through routine transport, use, or disposal of hazardous materials would not be substantial. Therefore, impacts related to transport of hazardous materials would be **less than significant**.

Threshold No. 2. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

As discussed under Threshold No. 1, above, construction of the project would entail transport, use, or disposal of potentially hazardous materials including, but not limited to, diesel fuel, gasoline, equipment fluids, concrete, cleaning solutions and solvents, lubricant oils, adhesives, human waste, and chemical toilets. As described above, the project would be required to comply with all standards required through federal, state, County, and municipal regulations, in addition to project-specific plans review by the City, which would ensure potential impacts related to hazardous materials would not be significant.

The project would be limited to townhome residences, residential amenities, and some recreational uses, which are not typically characteristic of generating, releasing, or using large amounts of hazardous materials. During operations of the project, the only hazardous materials anticipated for transport, use, or disposal are routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products. The use, handling, and disposal of these products are addressed by household hazardous waste programs that are part of the Integrated Waste Management Plan of the County, and therefore the project is not expected to create a significant hazard to the public or environment through hazardous upsets or accidents. For these reasons, the project is not expected to result in potential upset and accident conditions involving release of hazardous materials in the environment; and impacts from a foreseeable upset would be **less than significant**.

Threshold No. 3: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

The project site is located within 0.25 miles of an existing or proposed school. The closest school to the project site is Palomar College, located approximately 0.2 miles east of the project site. However, the project is not expected to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste beyond routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products. Uses of these materials are typical of such residential land uses. Considering the project is surrounded by existing development, including industrial and commercial uses between the project site and Palomar College, project impacts related to exposing an existing or proposed school to hazardous materials would be **less than significant.**

Threshold No. 4. Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

As part of the Phase I ESA prepared for the project site (Appendix F), a database search report was completed, which documents various federal, state, and local regulatory database searches regarding properties with known or suspected releases of hazardous materials, chemical handlers, and/or polluters. As outlined above in Section 3.8.1, Existing Conditions, the project site is not located on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5. Therefore, this impact would be **less than significant**.

Threshold No. 5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

The closest airport to the project site is the McClellan-Palomar Airport, which is located approximately 5.5 miles west of the project site. The project site is located within Review Area 2 of the McClellan-Palomar Airport, which limits the height of structures in areas of high terrain. Given that that project site is not located within an area with high terrain, no height limit restrictions apply to the project within the Airport Influence Area (San Diego County Regional Airport Authority 2011). Therefore, this impact would be **less than significant**.

Threshold No. 6: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

According to the General Plan Safety Element, the San Marcos Emergency Operations Plan (EOP) governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012).

Additionally, the City is a participating jurisdiction in the County Operational Area EOP, which provides a planned response to disasters within the operational area. The project would conform with the standards set forth in the Operational Area EOP and would be required to abide by the standards set forth in the San Marcos EOP. Implementation of the project is not expected to impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As required under the CFC, the project would be required to present development plans that afford fire and emergency responders suitable fire access roads' dimensions and surfaces (Chapter 5, Sections 503.1 through 503.4 of the CFC), and an adequate number of emergency-rated entrances to the community (Appendix D, Section D106 of the CFC). The proposed points of entry and private driveways will be reviewed by SMFD and would be required to meet the qualifications for emergency access to and from the project site. Furthermore, as described in Chapter 3.13, Public Services, of this EIR, the Preliminary Fire Emergency Response Analysis prepared for the project (Appendix J to this EIR) determined that SMFD could provide emergency response to the project site within its internal 7-minute response time from Fire Station 1. Therefore, it is determined that impacts related to emergency response or emergency evacuation as a result of the project would be **less than significant**.

Threshold No. 7: Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

As described in Chapter 5 of this EIR, wildfire was an environmental topic area found not to be significant as it relates to the project site. The project site is not located in any fire hazard severity zones (CAL FIRE 2022). The project site is an undeveloped infill lot that is relatively flat and shows signs of previous disturbance. The project would not include associated infrastructure that may exacerbate fire risk. Additionally, the project would be required to comply with all applicable state and local fire codes, including compliance with the CFC and SMFD, which require a design that affords fire and emergency responders suitable fire access roads' dimensions and surfaces (Chapter 5, Sections 503.1 through 503.4 of the CFC), and an adequate number of emergency-rated entrances to the community (Appendix D, Section D106 of the CFC). Furthermore, as determined in the Fire Response Summary Letter prepared for the project (Appendix J to this EIR), SMFD's existing Station 1 would adequately serve the project site while maintaining SMFD's response goals.

For the reasons stated above and considering the project site is located in an urbanized area surrounded on all sides by existing development, implementation of the project would not expose people or structures to risk of loss, injury, or death involving wildfires, and impacts would be **less than significant**.

3.8.5 Cumulative Impact Analysis

Hazardous materials impacts are generally site specific and thus handled on a site-by-site basis. Identified cumulative projects are located more than 0.25 miles from the project site and thus would be unlikely to result in cumulative impacts to hazardous and hazardous materials together with the project. In addition, any cumulative project would be required to identify existing hazardous materials on site and comply with existing regulations related to use, transport, and disposal of hazardous materials. Similarly, all cumulative projects would be required to analyze and properly mitigate any impacts to the existing evacuation plan if impacts are identified.

With regard to wildfire hazards, any of the cumulative projects proposed within the wildland urban interface would be required to meet minimum fire fuel modification and/or clearing requirements in addition to meeting whatever standards of the various fire codes in effect at the time of building permit issuance. For projects within the City, these requirements are implemented through preparation of and compliance with a Fire Protection Plan, which is reviewed and approved by the Fire Marshal.

Therefore, the project's and cumulative projects' compliance with applicable regulations related to hazards and wildfire would ensure impacts related to hazards and hazardous materials would be **less than significant**.

3.8.6 Mitigation Measures

No impacts to hazards and hazardous materials were identified; thus, no mitigation measures are required.

3.8.7 Conclusion

As discussed above in Section 3.8.4, the project site is currently undeveloped and is not listed on any hazardous materials sites or databases. Construction and operation of the project is not expected to result in the transport, release, or disposal of any significant hazardous materials. Development of the project would not interfere with an adopted emergency response plan or emergency evacuation plan. Lastly, the project site is not designated as located within a high fire severity zone and proposed residential development on site would be constructed in accordance with all applicable fire codes and regulations. As such, project-level and cumulative-level impacts related to hazards and hazardous materials would be **less than significant**.

3.9 Hydrology and Water Quality

This section describes the existing hydrology and water quality of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

The analysis in this chapter relies on the following reports prepared for the project:

- Geotechnical Evaluation for the Proposed "Las Posas" Residential Development, prepared by LGC Geotechical Inc., July 15, 2021 (included as Appendix E to this environmental impact report [EIR]).
- Preliminary Drainage Study for Gran Vista, prepared by Hunsaker & Associates, May 20, 2022 (included as Appendix G to this EIR).
- Storm Water Quality Management Plan for Gran Vista, prepared by prepared by Hunsaker & Associates, May 20, 2022 (included as Appendix H to this EIR).

Table 3.9-1 summarizes the project- and cumulative-level hydrology and water quality impact analysis by threshold.

Table 3.9-1. Hydrology and Water Quality Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.	Less than Significant	Less than Significant	Less than Significant
No. 2: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	Less than Significant	Less than Significant	Less than Significant
No. 3: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site.	Less than Significant	Less than Significant	Less than Significant
No. 4: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite.	Less than Significant	Less than Significant	Less than Significant
No. 5: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.	Less than Significant	Less than Significant	Less than Significant
No. 6: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows	Less than Significant	Less than Significant	Less than Significant

Table 3.9-1. Hydrology and Water Quality Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 7: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.	Less than Significant	Less than Significant	Less than Significant
No. 8: Conflict with or obstruct implementation of water quality control plan or sustainable groundwater management plan?	Less than Significant	Less than Significant	Less than Significant

3.9.1 Existing Conditions

This section details the existing hydrology, water quality and groundwater conditions on the project site.

Hydrologic Setting

The project site is located at the northeastern corner of W Mission Road and N Las Posas Road in the City of San Marcos (City), San Diego County, California. The site is bounded to the southwest by W Mission Road and to the east by N Las Posas Road. The project site is primarily flat with two mass graded pads. Site surface conditions generally consist of rolling unimproved earthen terrain, with low-growing vegetation. Surface drainage is directed toward the southwestern corner of the property toward W Mission Road. Elevation on the project site is approximately 575 feet above mean sea level.

Water arrives on site via natural rainfall only. Rainfall runoff from the site typically only occurs during a significant wet weather event. Water that does accumulate on site generally drains in a southwestern direction to an existing 12-inch corrugated metal pipe riser to a 12-inch corrugated metal pipe to meet up with the commercial site to the south of the project site. Water is then conveyed west through a storm channel and eventually downstream to Las Posas Creek south. The project site is mostly located outside of the Federal Emergency Management Agency (FEMA) 100-year floodplain zone, with the exception of a small portion of the southwestern portion of the site, which is located in Zone X, and the northeastern edge of the project site, which is located in Zone AE, of the Flood Insurance Rate Map Panel 06073C0789H. Zone X is defined as areas determined to be outside the 0.2% chance of flooding each year and Zone AE is defined as having a 1% chance of flooding every year.

Water Quality

The project is located within the jurisdiction of the San Diego Regional Water Quality Control Board (RWQCB). The San Diego Region is divided into 11 hydrologic units. The project site is located in Richland Hydrologic Subarea (HSA) (HSA 904.52), within the San Marcos Hydrologic Area (HA) (HA 904.52) which is part of the Carlsbad Watershed Hydrologic Unit (HU) (HU 904.00) (RWQCB 2021a). The Carlsbad HU is a triangular area covering approximately 210 square miles (SWRCB 2002). This hydrologic unit is bordered by San Luis Rey HU to the north and San Dieguito HU to the east and south. The Carlsbad HU includes one small coastal lagoon (Loma Alta Slough) and four major coastal lagoons, including Buena Vista, Agua Hedionda, Batiquitos, and San Elijo (SWRCB 2002). The Carlsbad HU is separated into four primary subwatersheds based on topographical drainage areas to creek systems, including 904.1, San Luis Rey River; 904.3, Agua Hedionda Creek; 904.5, San Marcos Creek; and 904.6, Escondido Creek. Each of these subwatershed areas is further refined by eight creek system branches divided into hydrographic subareas (City of San Marcos 2012a).

The protection of watersheds and water quality is a prominent concern for the City since all of the major creeks and their tributaries (San Marcos, Agua Hedionda, and Escondido) are listed by the State Water Resources Control Board (SWRCB) as impaired for a variety of pollutants that ultimately affect the water quality of surface and groundwater supplies and biological resources. The City has partnered with other jurisdictions in the watersheds to implement water quality management plans for nutrients and bacteria in coordination with the San Diego RWQCB to protect the watersheds and address the water body impairments. The City is the lead agency for the nutrient management plan in the Upper San Marcos Creek Watershed (City of San Marcos 2012a).

The San Diego RWQCB has adopted the Water Quality Control Plan for the San Diego Basin (Basin Plan) (RWQCB 2021b) that outlines beneficial uses and water quality objectives that are protective of the beneficial uses for each of the HSAs in the City of San Marcos General Plan (General Plan) area. In addition, the San Diego RWQCB has adopted Order R9-2007-0001, Waste Discharge Requirements for Discharges of Urban Runoff From the Municipal Separate Storm Sewer Systems (MS4s) (RWQCB 2007). The City regionally and locally implements the requirements of Order R9-2007-0001. This includes best management practice (BMP) inspection programs for businesses, municipal facilities, and treatment control facilities; preventative programs such as street sweeping and storm drain facility cleaning; monitoring water quality within the City; and integrating site design, source control, low impact development (LID), treatment controls, and hydromodification design for City projects and private development and redevelopment to reduce the amount of polluted stormwater entering the City's storm drain system (City of San Marcos 2012a).

Due to the undeveloped condition of the project site and relatively flat terrain, the project site in current conditions does not contribute to water quality issues in the City.

Groundwater

As described in the Preliminary Geotechnical Evaluation prepared for the project (Appendix E), shallow groundwater was not encountered during drilling operations, which included excavations up to a depth of 15.5 feet below existing ground surfaces. Localized perched groundwater may be present but is also not anticipated to be a factor in site development, with the exception that seasonal water levels are likely to impact stormwater management.

The Basin Plan identifies beneficial uses for groundwater in the four primary subwatersheds as municipal, agricultural, and industrial uses. The City is located in the California Department of Water Resources (DWR) South Coast Hydrologic Region. DWR Bulletin 118 identifies the San Marcos Area as Basin 9-32 (DWR 2020). The DWR San Marcos Area is 2,129 acres. This groundwater basin is located entirely within San Marcos Creek HAS 904.52, which is designated as impaired and has a hydrologic connection to Lake San Marcos. Other minor groundwater basins and wells are located throughout the General Plan area outside of Basin 9-32; however, Basin 9-32 is the only groundwater basin formally designated in the General Plan area.

The implementation of watershed protection programs in the City to protection the beneficial uses identified in the Basin Plan is critical to protecting the City's ability to use these resources. Due to the undeveloped condition of the project site, the project site in current conditions does not contribute to groundwater contamination, nor is groundwater used in current conditions. The project would connect to existing City infrastructure for water use and would not use groundwater for construction or operation.

3.9.2 Regulatory Setting

This section details the applicable federal, state, and local regulations pertaining to hydrology and water quality.

Federal

Federal Emergency Management Agency

FEMA administers the National Flood Insurance Program to provide subsidized flood insurance to communities that comply with FEMA regulations limiting development in floodplains. FEMA also issues Flood Insurance Rate Maps that identify which land areas are subject to flooding. These maps provide flood information and identify flood hazard zones in the community. The standard for flood protection is established by FEMA, with the minimum level of flood protection for new development determined to be the 1% annual exceedance probability (i.e., the 100-year flood event). A small portion of the project site is located within a 100-year flood zone.

Federal Clean Water Act

The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters. The basis of the CWA, the Federal Water Pollution Control Act, was enacted in 1948; the act was significantly reorganized and expanded in 1972. The Clean Water Act became the act's common name with amendments in 1977.

Under the CWA, the U.S. Environmental Protection Agency (EPA) has implemented pollution control programs such as setting wastewater discharge standards for industry. The EPA has also set water quality standards for contaminants in surface waters. The CWA made it unlawful to discharge any pollutant from a point source into navigable waters unless a permit was obtained.

Under Section 303(d) of the CWA, states are required to develop lists of water bodies that would not attain water quality objectives after implementation of required levels of treatment by point-source dischargers (municipalities and industries). Section 303(d) requires that the state develop a TMDL for each of the listed pollutants. The TMDL is the amount of loading that the water body can receive and still be in compliance with water quality objectives. The TMDL can also act as a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. The TMDL prepared by the state must include an allocation of allowable loadings to point and nonpoint sources, with consideration of background loadings and a margin of safety. The TMDL must also include an analysis that shows the linkage between loading reductions and the attainment of water quality objectives. EPA must either approve a TMDL prepared by the state or, if it disapproves the state's TMDL, issue its own. National Pollutant Discharge Elimination System (NPDES) permit limits for listed pollutants must be consistent with the waste load allocation prescribed in the TMDLs. After implementation of a TMDL, it is anticipated that the problems that led to placement of a given pollutant on the Section 303(d) list would be remediated.

National Pollutant Discharge Elimination System

The NPDES permit system was established in the federal CWA to regulate municipal and industrial discharges to surface waters of the United States. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits. Section 307 of the CWA describes the factors that EPA must consider in setting effluent limits for priority pollutants.

Nonpoint sources are diffuse and originate from a wide area rather than from a definable point. Nonpoint pollution often enters receiving waters in the form of surface runoff, but is not conveyed by way of pipelines or discrete conveyances. As defined in the federal regulations, such nonpoint sources are generally exempt from federal NPDES permit program requirements. However, three types of nonpoint source discharges are controlled

by the NPDES program: nonpoint source discharge caused by general construction activities, the general quality of stormwater in municipal stormwater systems, and discharges associated with industrial operations. The 1987 amendments to the CWA directed EPA to implement the stormwater program in two phases. Phase I addressed discharges from large (population 250,000 or above) and medium (population 100,000 to 250,000) municipalities and certain industrial activities. Phase II addresses all other discharges defined by EPA that are not included in Phase I.

In accordance with NPDES regulations, in order to minimize the potential effects of construction runoff on receiving water quality, the state requires that any construction activity that disturbs 1 acre or more must obtain a General Construction Activity Stormwater Permit. Permit applicants are required to prepare a stormwater pollution prevention plan (SWPPP) and implement BMPs, such as erosion and sediment control and non-stormwater management measures, to reduce construction effects on receiving water quality.

Examples of typical BMPs implemented in SWPPPs include using temporary mulching, seeding, or other suitable stabilization measures to protect uncovered soils; storing materials and equipment to ensure that spills or leaks cannot enter the storm drain system or surface water; developing and implementing a spill prevention and cleanup plan; installing traps, filters, or other devices at drop inlets to prevent contaminants from entering storm drains; and using barriers, such as straw bales or plastic, to minimize the amount of uncontrolled runoff that could enter drains or surface water.

The project would be subject to permit requirements and would develop and implement a project-specific SWPPP to minimize construction activity impacts.

State

California Water Code Division 7 (Porter-Cologne Act)

The California Water Code contains provisions regulating water and its use. Division 7 establishes a program to protect water quality and beneficial uses of state water resources including groundwater and surface water. The SWRCB and RWQCB administer the program and are responsible for control and water quality. They establish waste discharge requirements, oversee water quality control planning and monitoring, enforce discharge permits, and establish groundwater and surface water quality objectives.

State Water Resources Control Board

In California, the SWRCB has broad authority over water-quality control issues for the state. The SWRCB is responsible for developing statewide water quality policy and exercises the powers delegated to the state by the federal government under the CWA. Other state agencies with jurisdiction over water quality regulation in California include California Department of Public Health (for drinking water regulations), the California Department of Pesticide Regulation, the California Department of Fish and Wildlife, and the Office of Environmental Health and Hazard Assessment.

Construction General Permit

Owners and operators of construction activities who disturb 1 or more acres of soil, or who disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under the SWRCB's Order 2009-0009-DWQ (as amended by 2010-0014-DWQ and 2012-0006-DWQ), the Construction General Permit. Construction and demolition activities subject to this permit include clearing, grading,

grubbing, and excavation or any other activity that results in a land disturbance equal to or greater than 1 acre. Applicants are required to submit a notice of intent to the SWRCB and prepare a SWPPP. The SWPPP must identify BMPs that are to be implemented to reduce construction impacts on receiving water quality based on potential pollutants. The SWPPP also must include descriptions of the BMPs to be implemented to reduce pollutants in stormwater discharges after construction phases are completed at a site (post-construction BMPs).

Regional Water Quality Control Board

The project site is situated within the jurisdiction of the San Diego RWQCB (Region 9). The San Diego RWQCB has the authority to implement water quality protection standards through the issuance of permits for discharges to waters at locations within its jurisdiction.

The project site is located in the Richland HSA within the San Marcos HA, which is part of the Carlsbad HU. The Basin Plan was prepared by the RWQCB in compliance with the federal CWA and the Porter-Cologne Act and establishes water quality objectives and implementation programs to meet stated objectives and to protect the beneficial uses of water bodies in the area. Because the City is located within the RWQCB's jurisdiction, all discharges to surface water or groundwater are subject to the Basin Plan requirements.

In May 2013, the San Diego RWQCB adopted Order R9-2013-0001, the new municipal NPDES permit for 39 municipal, county government, and special district entities located in southern Orange County, southwestern Riverside County, and San Diego County that own and operate large municipal separate storm sewer systems (MS4s) that discharge stormwater runoff and non-stormwater runoff to surface waters throughout the San Diego region. This permit requires development projects to minimize or eliminate the impacts of such development on water quality. The project is subject to the requirements of the MS4 Permit as it is implemented via the Carlsbad Watershed Urban Runoff Management Program. The specific requirements include the selection of appropriate BMPs to avoid, prevent, or reduce the pollutant loads entering the storm drain system and receiving waters. The permit was amended in February 2015 by Order R9-2015-0001 and in November 2015 by Order R9-2015-0100.

Provision D.1.a of Order R9-2013-0001 requires the San Diego Stormwater Co-Permittees to continue water monitoring programs established within previous orders and pursuant to the approved Hydromodification Management Plan (2011). The City is one of the co-permittees.

To comply with Order R9-2013-0001, as amended, the September 2020 Model BMP Design Manual – San Diego Region (BMP Design Manual) was developed to provide county-specific project design and post-construction stormwater requirements for development projects and to replace the prior San Diego Regional Model Standard Urban Stormwater Mitigation Plan (County of San Diego 2020). The BMP Design Manual was used to recommend BMPs and LID features for this project. LID is an approach to land development that uses multiple small-scale natural detention and filtration features to manage stormwater as close to its source as possible. LID employs principles such as preserving and re-creating natural landscape features, minimizing effective imperviousness to create functional and appealing site drainage that treats stormwater as a resource rather than a waste product.

Local

Carlsbad Watershed Management Area Water Quality Improvement Plan

On May 8, 2013, the San Diego RWQCB adopted Order R9-2013-0001, an NPDES MS4 Permit, regulating discharges from Phase I MS4s in the San Diego region (SWRCB 2015). Provision B of the permit requires Responsible Agencies in each of the region's Watershed Management Areas to develop water quality

improvement plans (WQIPs) that identify water quality conditions and strategies to improve water quality within the watershed. Through the WQIP approach, Highest Priority Water Quality Conditions within the Watershed Management Areas are identified and strategies are implemented through the Responsible Agencies' jurisdictional runoff management plan to progressively improve water quality. The plans contain an adaptive planning and management process and a public participation component. The Carlsbad Watershed Management Area WQIP was prepared in May 2018 for the Carlsbad Watershed Management Area Responsible Agencies, which include the Cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista and the County of San Diego (Carlsbad WMA Responsible Agencies 2016).

San Marcos Storm Water Standards

The City has adopted the use of the BMP Design Manual for the San Diego region as the City's Stormwater Standards Manual, and the project must comply with the standards and regulations contained therein (County of San Diego 2020).

City of San Marcos General Plan

Conservation and Open Space Element

The following are applicable goals and policies from the Conservation and Open Space Element of the General Plan related to hydrology and water quality (City of San Marcos 2012a):

Goal COS-6: Protect and restore appropriate surface water and groundwater beneficial uses through prioritizing the improvement of locally impaired water bodies within the City of San Marcos sub watersheds.

Policy COS-6.2: Promote watershed stewardship as the community norm.

Goal COS-7: Achieve sustainable watershed protection for surface and ground water quality that balances social, economical, and environmental needs.

Policy COS-8.4: Require new development and redevelopment to protect the quality of water bodies and natural drainage systems through site design, source controls, storm water treatment, runoff reduction measures, BMPs, LID, hydromodification strategies consistent with the Current San Diego RWQCB Municipal Stormwater NPDES Permit, and all future municipal stormwater permits.

Safety Element

The following goal and policy in the Safety Element of the General Plan are applicable to flooding and flood control (City of San Marcos 2012b):

Goal S-2: Minimize the risk to people, property, and the environment due to flooding hazards.

Policy S-2.2: Require existing private development to take responsibility for maintenance and repair of structures to resist flood damage.

Land Use and Community Design Element

The following goal and policies in the Land Use and Community Design Element of the General Plan are applicable to stormwater drainage facilities (City of San Marcos 2012c):

Goal LU-15: Flood control and storm water drainage facilities: ensure adequate flood control and storm water drainage is provided by the community.

Policy LU-15.1: Implement activities, practices, procedures, or facilities that avoid, prevent, or reduce pollution of the San Marcos Storm Water Conveyance System and receiving waters.

Policy LU-15.2: Improve inadequate or undersized drainage/flood control facilities to solve both small neighborhood and large regional drainage and flood control problems.

Policy LU-15.3: Avoid, to the extent possible, development in floodplain and flood prone areas.

Policy LU-15.4: Retain drainage courses in their natural condition, to the extent possible. Consider smaller-scale drainage improvements to protect the environment and avoid disturbing natural drainage courses; consider detention areas and raised building pads.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As detailed in Section 3.10, the project is consistent with the applicable goals and policies pertaining to hydrology and water quality.

City of San Marcos Ordinances

The Storm Water Management and Discharge Control Ordinance (San Marcos Municipal Code Chapter 14.15) requires that all new development and redevelopment activities comply with the stormwater pollution prevention requirements. These stormwater pollution prevention requirements, which are described in detail in Section 14.15.050 of the Municipal Code, Reduction of Pollutants in Storm Water, include construction, development and redevelopment, and residential BMPs.

3.9.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to hydrology and water quality are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hydrology and water quality would occur if the project would:

- **Threshold No. 1:** Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.
- **Threshold No. 2:** Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.
- **Threshold No. 3:** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site.

- **Threshold No. 4:** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite.
- **Threshold No. 5:** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
- **Threshold No. 6:** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows.
- **Threshold No. 7:** In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.
- **Threshold No. 8:** Conflict with or obstruct implementation of a water quality control or sustainable groundwater management plan.

3.9.4 Project Impact Analysis

This section considers the impacts to hydrology and water quality that would result from implementation of the project.

Threshold No. 1: Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Construction activities associated with the project could result in potential impacts to water quality. In addition to sediment erosion from ground-disturbing activities on the project site, fuels, oils, lubricants, and other hazardous substances used during construction could be released and potentially impact water quality.

The project would be required to comply with the SWRCB NPDES Construction General Permit Order No. 2009-0009-DWQ for stormwater discharges and general construction activities, and would incorporate standard BMPs, such as regular cleaning or sweeping of construction areas and impervious areas, as well as various stormwater BMPs, such as filtration media screens. In compliance with the Construction General Permit, a SWPPP will be prepared for the project that would specify BMPs that would be implemented during construction to minimize impacts to water quality. Lastly, project implementation of biofiltration, source control, and site design BMPs would effectively treat post-construction stormwater runoff prior to discharge from the site in compliance with the requirements of the BMP Design Manual and BMPs outlined in the Storm Water Quality Management Plan (SWQMP) (Appendix H).

The proposed biofiltration features on site would be subject to regular inspection and maintenance. The property owner is required, pursuant to San Marcos Municipal Code Section 14.15 and the BMP Design Manual, to enter into a stormwater management and discharge control maintenance agreement for the installation and maintenance of permanent BMPs prior to issuance of permits.

As described in Section 3.8, Hazards and Hazardous Materials, of this EIR, proposed residential uses do not typically generate, release, or use large amounts of hazardous materials. The only hazardous materials anticipated would be for transport, use, or disposal of routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products, typical of residential land uses. Operation of the project is not expected to include uses that would violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water or groundwater quality.

Furthermore, uses associated with construction and operation of the project would likely be less of a detriment to water quality than those uses associated with commercial uses, which is the current designated land use for the project site.

The implementation of biofiltration, source control, and site design BMPs and a SWPPP would effectively treat runoff prior to discharge from the site in compliance with the requirements of the BMP Design Manual and BMPs outlined in the SWQMP. Therefore, with implementation of all required BMPs as conditions of project approval, the project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water or groundwater quality. Impacts to water quality would be **less than significant**.

Threshold No. 2: Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

As discussed above, localized perched groundwater may be present on the project site; however, no static groundwater was encountered that would be indicative of an aquifer occurring below the site. As described in the response to Threshold No. 1, the project would treat stormwater runoff through the use of biofiltration basins. All stormwater would be adequately treated by the biofiltration basins prior to being discharged to natural/undisturbed areas that could allow the runoff to infiltrate into the ground and eventually reach groundwater. As the project would use biofiltration and BMPs that would effectively treat stormwater runoff, it is not expected that project implementation would have a potentially significant adverse impact on groundwater quality or cause or contribute to an exceedance of applicable groundwater water quality objectives or degradation of beneficial uses.

Further, as discussed in Section 3.17, Utilities and Service Systems, the project would receive water from the Vallecitos Water District, which receives its water from the Metropolitan Water District of Southern California. The Metropolitan Water District obtains water from local sources and the Colorado River, via the Colorado River Aqueduct, and the Sacramento-San Joaquin Delta, via the State Water Project (MWD 2016). No groundwater would be used for project construction. During operation, irrigation for the site would tie into the proposed looping water system on site. Irrigation of landscaping throughout the project site would be required to comply with the City's Water Efficient Landscape Ordinance and the City's Landscape Manual. No groundwater would be used for operation of the project, and implementation of the project would not interfere with infiltration and groundwater recharge. Additionally, implementation of the project would not decrease groundwater basins through increasing water demand on site or impede sustainable groundwater management of any groundwater basin. Therefore, impacts to groundwater supplies would be **less than significant**.

Threshold No. 3. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site?

There are no existing streams or rivers on site that would be substantially altered as a result of project implementation. As discussed above, the project site drainage is collected in a corrugated metal pipe riser that drains to a 12-inch corrugated metal pipe to meet up with the commercial site to the south of the project site. The remainder of the project site surface drains to the surrounding streets. The project site is currently a vacant lot and has no existing impervious areas. Project implementation would introduce new impervious areas and include on-site drainage systems that would alter the existing drainage pattern on the project site.

As described in response to Threshold No. 1, the project would be required to implement BMPs during construction and incorporate storm drain and biofiltration basins into development design. With implementation of the proposed biofiltration basins, the project would not generate runoff volumes that would significantly alter the overall drainage on site. Additionally, project-related runoff would be adequately treated prior to discharge into planned drainage systems via biofiltration and BMPs such that the project would not provide substantial additional sources of polluted runoff.

The project would be required to demonstrate adequate drainage on site and connections off site to existing facilities in project-specific plans to be reviewed and approved by the City. Further, implementation of BMPs and a SWPPP would ensure construction of the project would not result in substantial erosion or siltation on or off site. A SWQMP was prepared for the project and is included as Appendix H of this EIR. The SWQMP recommends storm drains, such as biofiltration basins, for the project site. Recommendations outlined in the SWQMP would be conditions of approval for the project. These components would properly handle runoff to meet regulatory requirements and to ensure post-development runoff quantities and rates that are similar to, or less than, pre-development conditions. Therefore, impacts to existing drainage on site would be **less than significant**.

Threshold No. 4. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Please refer to response to Threshold No. 3. Implementation of the project would increase the area of impervious surface on the project site, which could increase runoff flow rates and volumes. However, the project would include implementation of BMPs during construction and proposed storm drain and biofiltration basins during operation as recommended by the SWQMP (Appendix H). Drainage facilities such as curb inlets, storm drains, flow control, and detention vaults would assist in reducing runoff from the project site. This would ensure that the runoff quantities generated by the project do not significantly alter the existing drainage pattern of the site resulting in flooding. As concluded in the Drainage Study (Appendix G), development of the project would result in a 0.8% increase of peak discharge, which is considered negligible, and would not impact downstream properties or facilities. Impacts would be **less than significant**.

Threshold No. 5. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Please refer to response to Threshold No. 3 and Threshold No. 4. As described above, implementation of the project would increase impervious areas on-site. However, the project would include implementation of BMPs during construction and proposed storm drain and biofiltration basins during operation as recommended by the SWQMP (Appendix H). Drainage facilities such as curb inlets, storm drains, flow control, and detention vaults would assist in reducing runoff from the project site. These components would properly handle runoff to meet regulatory requirements and to ensure that post-development runoff would occur at rates that are similar to, or less than, pre-development conditions. Further, preparation and implementation of a SWPPP and implementation of project specific BMPs would ensure construction of the project would not result in substantial additional sources of polluted runoff. For these reasons, implementation of the project would not alter the course of a stream or river, and development of the project is not expected to exceed the capacity of existing or planned stormwater drainage systems or result in substantial sources of polluted runoff. Therefore, impacts related to stormwater drainage would be **less than significant**.

Threshold No. 6: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?

Please refer to the responses to Threshold Nos. 3, 4 and 5. The project would increase the impervious surface area on site in comparison to existing conditions, which could increase runoff flow rates or volumes. However, the project site and the immediate area are relatively flat and do not currently result in flooding during storms. As concluded in the Drainage Study (Appendix G), development of the project would result in a 0.8% increase of peak discharge, which is considered negligible, and would not impact downstream propertied or facilities. On-site drainage facilities and off-site drainage connections would be designed to collect and convey runoff from 100-year storm events. Implementation of the project is not expected to impede or redirect flood flows and impacts to stormwater drainage would be **less than significant**.

Threshold No. 7: In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

The project site is approximately 8.5 miles inland from the Pacific Ocean and would not be subject to inundation by tsunami. A small southwest portion of the site is located within a 100-year flood hazard area (Zone AE). Despite a small portion of the project site being located within a 100-year flood hazard area, the base flood elevation at the portion of the site that is within the 100-year flood hazard area would not reach to top of the slope. The project is not located in a tsunami or seiche zones. Given that the project site is not located near a large standing body of water, inundation by seiche (or standing wave) is considered negligible. The project site is generally flat with no steep slopes and does not contain slopes subject to mudflows; therefore, potential impacts related to inundation would be **less than significant**.

Threshold No. 8: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

The Carlsbad Watershed Management Area WQIP was updated in May 2018 for the Carlsbad Watershed Management Area Responsible Agencies, which include the Cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista and the County of San Diego. The purpose of the Carlsbad WQIP is to guide the Responsible Agencies' jurisdictional runoff management plans towards achieving improved water quality in MS4 discharges (or stormwater discharges) and receiving water bodies. The Responsible Agencies' jurisdictional runoff management plans contain the strategies, standards, and protocols by which each agency will implement their individual program in response to the priorities and goals established in the WQIP (Carlsbad WMA Responsible Agencies 2018).

The project is located within the San Marcos HA, which is the second largest within the Carlsbad Watershed Management Area. The Carlsbad Watershed Management Area Water WQIP outlines areas of priority water quality conditions and highest-priority water quality conditions. As discussed in Section 3.3, Biological Resources, no potential wetland or non-wetland water features are present within the project site. As such, the project would not conflict with or obstruct implementation of the Carlsbad Watershed Management Area Water WQIP or any other water quality plan. Further, the site is not located within a sustainable groundwater management plan area. Therefore, impacts relating to a conflict with a water quality control plan or sustainable groundwater management plan would be **less than significant**.

3.9.5 Cumulative Impact Analysis

The project and cumulative projects would result in an increase of impervious surfaces in the area. More specifically, other large development projects nearby would result in conversion of large pervious areas to impervious areas. This would potentially result in increased surface runoff, alteration of the regional drainage pattern, and flooding. However, like the project applicant, each individual project applicant would be required to hydrologically engineer the respective cumulative project sites to ensure that post-development surface runoff flows can be accommodated by the regional drainage system.

The project, in conjunction with cumulative projects that drain to the San Marcos HA, have the potential to increase the concentration of pollutants in surface runoff and downstream water quality. However, all cumulative projects would be subject to the same federal water quality standards and state waste discharge requirements as the project. This includes preparation of project-specific SWPPPs per the NPDES permit program and implementation of associated BMPs to prevent construction-related runoff from polluting receiving waters.

As discussed above, the project would incorporate biofiltration and BMPs into the project site design to limit the potential for water quality impacts to the greatest extent feasible. By incorporating these features into the project design, the project would not substantially contribute to a significant cumulative impact to water quality. Impacts would be **less than significant.**

3.9.6 Mitigation Measures

Based upon the analysis presented in Section 3.9.4 and 3.9.5, no impacts were identified, and no mitigation is required.

3.9.7 Conclusion

As described above, storm drainage components recommended by the Preliminary Drainage Study (Appendix G) would properly handle runoff to meet regulatory requirements and to ensure that post-development runoff would occur at rates that are similar to, or less than, pre-development conditions. Appropriate design of on- and off-site drainage facilities; implementation of a SWPPP, SWQMP, and BMPs; and implementation of all recommendations from the Preliminary Drainage Study and development-specific drainage plans would ensure the project would not substantially alter the drainage patterns on or off site or result in substantial polluted runoff. Therefore, impacts to hydrology and water quality as a result of the project would be less than significant.

INTENTIONALLY LEFT BLANK

3.10 Land Use and Planning

This section analyzes the potential for the proposed Gran Vista Specific Plan Project (project) to have impacts related to land use and planning. This section considers consistency with applicable land use plans and habitat conservation plans.

Table 3.10-1 summarizes the project- and cumulative-level land use impact analysis for the project.

Table 3.10-1. Land Use Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Physically divide an established community.	Less than Significant	Less than Significant	Less than Significant
No. 2: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	Less than Significant	Less than Significant	Less than Significant

3.10.1 Existing Conditions

This section describes the existing planning context for the project site, including the General Plan and Zoning designations that currently apply to the site.

Project Site

As shown in Figures 2-2 and 2-3, the project is located in north San Diego County within the northwestern portion of the City of San Marcos (City). The undeveloped project site is an approximately 7.6-acre site located at the northwest corner of N Las Posas Road and W Mission Road. The project site is located in an urban area of the City and surrounded by existing development, located in the College Area Neighborhood (City of San Marcos 2012a). The project site is undeveloped and reflects a history of disturbance.

Existing General Plan Designation

The City of San Marcos General Plan (General Plan) designates the 7.6-acre project site as Commercial (C) (City of San Marcos 2012a). Development allowed under this land use designation must be consistent with those uses outlined in the San Marcos Municipal Code and zoning ordinance, as well as the Commercial land use designation of the General Plan. The Commercial (C) designation generally allows for a wide range of retail activities, services, and offices. Please refer to Figure 2-4, Existing General Plan Land Use.

Existing Zoning Designation

Existing zoning of the project site is Commercial (C). The purpose of the Commercial land use designation is to "provide a business district for the full range of retail goods, services, and commercial centers that stabilize, maintain, and enhance the vitality of San Marcos in a supportive commercial setting adjacent to thoroughfares. Appropriate C Zone commercial uses will contribute to the range of service and destination retail, shopping centers, entertainment, and restaurant uses that generate a strong tax base" (City of San Marcos 2022). The Commercial zone is intended to implement and be consistent with the Commercial land use designation of the General Plan (City of San Marcos 2022). Please refer to Figure 2-6, Existing Zoning.

Surrounding Land Uses

The project site is immediately bordered by N Las Posas Road to the east and W Mission Road to the southwest. Beyond these adjacent roads, the project site is surrounded by residential uses to the north, west, and east; industrial uses to the south; and commercial uses to the south and east. A CVS Pharmacy is located directly south of the project site. Undeveloped lots are also located adjacent to the site to the west on W Mission Road and to the east across N Las Posas Road. Surrounding land uses outside of the immediately adjacent residential and commercial uses include designated industrial, commercial, single-family and multifamily residential, and schools/educational facilities. The closest freeway is State Route 78 located approximately 0.4 mile south of the project site.

3.10.2 Regulatory Setting

This section provides an overview of the regulatory setting related to planning and land use that applies to the project, including federal, state, regional, and local regulation and planning documents.

Federal

There are no federal codes, policies, or regulations regarding land use and planning that would apply to the proposed project.

State

California Planning and Zoning Law

The legal framework in which California cities and counties exercise local planning and land use functions is provided in the California Planning and Zoning Law, Government Code Sections 65000 et seq. Under state planning law, each city and county is required to adopt a general plan "for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning" (Section 65300). The general plan expresses the community's development goals and embodies public policy relative to the distribution of future land uses, both public and private. A general plan consists of several elements, including land use, circulation, housing, conservation, open space, noise, and safety; other elements may be included at the discretion of the jurisdiction that relate to the physical development of the county or city.

Local

San Diego Association of Governments' San Diego Forward: The Regional Plan

The San Diego Association of Governments (SANDAG) is the federally designated metropolitan planning organization for the San Diego region. SANDAG serves as a forum for public decision making on regional issues such as growth, transportation, and land use in San Diego County and consists of representatives from each of the county's local jurisdictions. SANDAG builds consensus, develops strategic plans, obtains and allocates resources, and provides information on a broad range of topics pertinent to the region's quality of life.

The Regional Comprehensive Plan, adopted in 2004 by SANDAG, laid out key principles for managing the region's growth while preserving natural resources and limiting urban sprawl. The plan covered eight policy areas, including urban form, transportation, housing, healthy environment, economic prosperity, public facilities, our borders, and social equity (SANDAG 2004).

In 2011, SANDAG approved the 2050 Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS). This approval marked the first time SANDAG's RTP included an SCS, consistent with the Sustainable Communities and Climate Protection Act of 2008, also known as Senate Bill 375. This RTP/SCS provided a blueprint to improve mobility, preserve open space, and create communities, all with transportation choices to reduce greenhouse gas emissions and meet specific targets set by the California Air Resources Board as required by Senate Bill 375 (SANDAG 2011). In 2010, the California Air Resources Board established targets for each region in California governed by a metropolitan planning organization.

On December 10, 2021, the SANDAG Board of Directors adopted San Diego Forward: The Regional Plan (Regional Plan) (SANDAG 2021). The Regional Plan combines the two previously described existing regional planning documents: the Regional Comprehensive Plan and the RTP/SCS. The Regional Plan updates growth forecasts and is based on the most recent planning assumptions from currently adopted land use plans, including the City's General Plan and other factors from the cities in the region and the county. SANDAG's Regional Plan will change in response to the ongoing land use planning of the City and other jurisdictions. For example, the City's General Plan, and other local cities' general plans, may change based on General Plan Amendments (GPAs) initiated by jurisdictions or landowner applicants. The GPAs may result in increases in development densities due to amendments of the regional category designations or zoning classifications. Accordingly, SANDAG's RTP/SCS forecasts of future development in the San Diego region, including location, must be coordinated closely with each jurisdiction's ongoing land use planning because that planning is not static, as recognized by the need for updates to SANDAG's RTP/SCS every 4 years.

San Diego Association of Governments' North County Multiple Habitat Conservation Program

The North County Multiple Habitat Conservation Program (MHCP) is a comprehensive conservation planning process that addresses the needs of multiple plant and animal species in northwestern San Diego County (SANDAG 2003). The MHCP encompasses the Cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista. Its goal is to conserve approximately 19,000 acres of habitat, of which roughly 8,800 acres (46%) are already in public ownership and contribute toward the habitat preserve system for the protection of more than 80 rare, threatened, or endangered species.

The City began preparing the City of San Marcos Subarea Habitat Conservation Plan/Natural Community Conservation Plan (Draft San Marcos Subarea Plan) in May 2001. Although the Draft San Marcos Subarea Plan has not yet been approved by the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife, the plan is a component of the adopted MHCP and is currently being used as a guide for open space design and preservation within the City (SANDAG 2001). The intent of the Draft San Marcos Subarea Plan is to identify a citywide preserve system that meets local and regional biological goals while minimizing fiscal and economic impacts to the City and adverse impacts on private property owners. To help achieve this goal, Focused Planning Areas have been designated with parcel-level preserve goals that would contribute to achieving local and regional conservation goals while minimizing adverse effects on property rights and property values. The project site is located within the northern Focused Planning Area within the MHCP planning area.

San Diego County Regional Airport Authority Land Use Compatibility Plan

The nearest public airport is the McClellan-Palomar Airport, which is approximately 55 miles southwest of the project site. The McClellan-Palomar Airport Land Use Compatibility Plan contains policies to promote land use compatibility between the McClellan-Palomar Airport and adjacent and proximate land uses, to the extent these areas are not already developed with existing uses, and to protect the public health, safety, and welfare. Using airport-related

forecasts and background data approved by the California Department of Transportation, Division of Aeronautics, the plan reflects anticipated growth of the airport over a 20-year horizon. The plan includes land use compatibility criteria and identifies policies applicable to the airport and surrounding land uses. The project site is not located within any of the McClellan-Palomar Airport Influence Areas (San Diego County Regional Airport Authority 2011).

City of San Marcos General Plan

The General Plan consists of the following elements:

- **Land Use and Community Design Element** – Describes the desired future physical composition of the planning area in terms of location, type, and intensity of new development and open space to ensure balanced development that maximizes the long-term livability of the San Marcos community.
- **Mobility Element** – Describes the mobility strategy for the City, which identifies a network of options including streets, sidewalks, trails, and transit that connect people with the City.
- **Conservation and Open Space Element** – Recognizes the habitat and scenic value of natural and cultural open spaces within the City and lists goals and policies that ensure long-term stewardship of these resources. This element also addresses climate change, water conservation, energy conservation, air quality, watersheds, and water quality.
- **Parks, Recreation and Community Health Element** – Identifies the recreational amenities and community service programs offered within the City and outlines goals for increased access to parks, trails, recreational facilities, and community service programs for all community members.
- **Safety Element** – Establishes policies and programs to protect public health, safety, and welfare of all residents and property. This element identifies and describes plans for response to natural and human-caused safety issues, including geologic, seismic, flood, and fire hazards.
- **Noise Element** – Identifies problematic noise sources within the City and outlines strategies to reduce overall ambient noise levels. This element also includes measures to strategically distribute land uses throughout the City.
- **Housing Element** – Describes the strategy for developing a variety of housing opportunities to accommodate all residents and preserve the quality of existing housing in order to promote safe, decent, and affordable housing within the 2021–2029 planning period.
- **Environmental Justice Element** – Highlights existing policies contained in other General Plan elements as they relate to environmental justice. This element is designed to promote a more equitable, safe, and healthy lifestyle for all residents and support the long-term needs of the community's most vulnerable populations.

The following goals and policies from the City's Land Use and Community Design Element pertain to planning and are applicable to the project (City of San Marcos 2012a):

Goal LU-1: Achieve a balanced distribution and compatible mix of land uses to meet the present and future needs of all residents and the business community.

Policy LU-1.1: Ensure that adjacent land uses complement one another by considering compatibility of activities, development patterns and architectural character elements, and access to various mobility choices.

Policy LU-1.3: Diversify land uses by providing mixed use land uses in strategic locations within the City that place housing adjacent to employment.

Goal LU-2: Promote development standards and land use patterns that encourage long-term environmental sustainability.

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.2: Encourage new development to be sited to respond to climatic conditions, such as solar orientation, wind, and shading patterns.

Policy LU-2.3: Require the incorporation of green building practices, technologies, and strategies into development projects per code standards.

Policy LU-2.5: Promote landscaping (e.g., native, drought-tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the installation of trees to reduce the urban heat island effect and green infrastructure to reduce storm water runoff.

Goal LU-3: Develop land use patterns that are compatible with and support a variety of mobility opportunities and choices.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Policy LU-3.7: Require new development to prepare traffic demand management programs.

Policy LU-3.8: Require new development and discretionary actions to annex into a Congestion Management Community Facilities District.

Goal LU-5: Promote community design that produces a distinctive, high-quality built environment with forms and character that create memorable places and enrich community life.

Policy LU-5.3: Use public landscaping, banners, and signage along streets, sidewalks, property frontages, and in public spaces to strengthen the City's identity and create a unique sense of place.

Policy LU-5.4: Require building and site design that respects the natural topography and iconic ridgelines that serve as the visual backdrop for San Marcos.

Policy LU-5.5: Encourage development of public spaces and plazas within commercial, mixed-use, and residential projects that include fire and water features that can accommodate civic events and function as community gathering areas.

Policy LU-5.6: Require a specific plan for strategic areas/properties that require high-quality design, orientation and development due to their location or visibility within the community.

Policy LU-5.7: Architecture shall be enhanced with high-end building materials, varied roof lines, and decorative details.

Goal LU-7: Direct and sustain growth and expansion in areas of San Marcos that can support a concentration of a variety of uses and are particularly suitable for multimodal transportation and infrastructure expansion and improvements.

Policy LU-7.2: Coordinate pedestrian, transit and infrastructure upgrades with infill and redevelopment opportunities.

Goal LU-8: Ensure that existing and future development is adequately serviced by infrastructure and public services.

Policy LU-8.1: New development shall pay its fair share of required improvements to public facilities and services.

Policy LU-8.2: Promote development timing that is guided by the adequacy of existing and/or expandable infrastructure, services, and facilities.

Goal LU- 11.: Schools: Ensure all residents have access to high-quality education.

Policy LU 11.2: Work with San Marcos Unified School District and developers to ensure adequate school facilities are funded as required by State law and through developer mitigation agreements between the school district and the developer. The City shall require a "will serve" letter substantiating that the developer has paid fees to the satisfaction of the school district prior to issuance of building permits.

Goal LU-14: Wastewater: Ensure an adequate wastewater system for existing and future development.

Policy LU-14.2: Ensure development approval is directly tied to commitments for the construction or improvement of primary water, wastewater, and circulation systems.

Goal LU-17: Utilities and Communications: Encourage provision of power and communication systems that provide reliable, effective and efficient service for San Marcos.

Policy LU-17.2: Require all new development and redevelopment to provide the technology to support multiple telecommunications facilities and providers such as multi-media products, wireless technologies, and satellite communications.

Policy LU-17.4: Require utility location to be shown on all site development plans at the time of development/project application

The General Plan includes goals and policies applicable to other areas, such as mobility, safety, noise, and conservation. The project's consistency with applicable General Plan goals and policies is presented in Section 3.10.4.

San Marcos Municipal Code and Zoning Ordinance, Title 20

The provisions of Title 20 of the San Marcos Municipal Code are referred to as the Zoning Ordinance. The Zoning Ordinance is based on the official Zoning Map of the City of San Marcos. The purpose of this Zoning Ordinance is to protect and promote the public health, safety, comfort, convenience, and general welfare of the San Marcos community; to implement the policies of the General Plan; and to provide the physical, environmental, economic, and social advantages that result from the orderly planned use of land resources.

3.10.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to land use and planning are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to land use and planning would occur if the project would:

- **Threshold No. 1**: Physically divide an established community.
- **Threshold No. 2:** Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

3.10.4 Project Impact Analysis

This section considers the impacts to land use and planning that would result from the project.

Threshold No. 1: Would the project physically divide an established community?

The project site is currently undeveloped and surrounded by residential uses to the north, west, and east; industrial uses to the south; and commercial uses to the south and east. As described in Chapter 2, Project Description, of this EIR, the project proposes development of 120 townhomes on approximately 7.6 acres. The project would also include 92,645 square feet of common recreation area, landscaping, bio-retention areas, and circulation improvements. The project would have a density of approximately 15.8 dwelling units per acre.

The adjacent CVS parcel includes 99 existing spaces that would remain for the exclusive and ongoing use of CVS, which only requires 53 spaces to meet the City's Parking Ordinance for commercial uses. The project site currently contains an additional 38 existing parking spaces on the project site that would be shared between the project site and CVS. The City's Parking Ordinance requires the project to introduce an additional 20 guest spaces to meet the City's requirement for multifamily dwelling guest parking requirement of 1 space per 3 units. The project also includes 240 garage spaces, which would provide 2 garage spaces per unit, and therefore would comply with the City's Parking Ordinance.

Additionally, the project proposes a GPA and Rezone to change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA), to allow for the proposed townhome dwelling unit development and associated amenities.

Although development of the proposed residential land uses would be inconsistent with the neighboring commercial uses, the project site is located in an urban part of the City within close proximity to existing residential development. Because the project site is surrounded on all sides by existing infrastructure, the project would not divide an established community, and therefore this impact would be **less than significant**.

Threshold No. 2: Would the project cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

The project would conflict with the current General Plan and zoning designations for the site. However, as described above and in Chapter 2 of this EIR, the project proposes a GPA and Rezone to change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA) to allow for the proposed townhome

dwelling unit development and associated amenities. These requested project entitlements/discretionary actions by the City are further outlined below:

- **Specific Plan** - A Specific Plan would be required to provide a comprehensive plan to ensure the efficient development of a new residential community. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan.
- **General Plan Amendment** – A GPA would be required to re-designate the project site from Commercial to Specific Plan Area.
- **Rezone** - A Rezone would be required to re-designate parcels 219-121-15-00 and 219-121-16-00 from Commercial (C) to Specific Plan Area (SPA).
- **Tentative Map** – A Tentative Map will present specific lot configurations for the site.
- **Multifamily Site Development Plan** – A Site Development Plan will configure the site for townhome dwelling units, street configuration, infrastructure, and recreational open space.

Upon approval of the GPA/Rezone from Commercial (C) to Specific Plan Area (SPA), the project would be required to comply with the allowable residential uses outlined in the Specific Plan prepared for the project site (Appendix M).

Although the project would amend the land use designation, the concurrent process of amending the General Plan designation does not necessarily equate to consistency with the document. As such, a consistency analysis with the City's General Plan goals are included in Table 3.10-2 below.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Conservation and Open Space Element	
Goal COS-1: Identify, protect, and enhance significant ecological and biological resources within San Marcos and its adaptive Sphere of Influence.	**Consistent.** Implementation of the project would result in potentially significant impacts to biological resources. However, compliance with existing regulations and implementation of **MM-BIO-1** and **MM-BIO-2** outlined in Section 3.3, Biological Resources, would ensure that the project would not conflict with the MHCP or draft San Marcos Subarea Plan, or other applicable regulations related to biological resources.
Goal COS-2: The City is committed to conserving, protecting, and maintaining open space, agricultural, and limited resources for future generations. By working with property owners, local organizations, and state and federal agencies, the City can limit the conversion of resource lands to urban uses.	**Consistent**. The project site is currently vacant and zoned for Commercial uses. The project site is surrounded by existing development and infrastructure and would not be considered open space. Implementation of the project would not convert any designated open space or agricultural uses.
Goal COS-3: Protect natural topography to preserve and enhance the natural beauty of San Marcos.	**Consistent**. The project site is currently vacant and zoned for Commercial uses. The project site is surrounded by existing development and infrastructure. Development of the project site would not destroy the existing characteristics of the surrounding area as described in Section 3.1, Aesthetics, of this EIR.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal COS-4: Improve regional air quality and reduce greenhouse gas emissions that contribute to climate change.	**Consistent.** The project would result in fewer greenhouse gas emissions than the existing zoning, and the project would be required to implement all applicable checklist items within the City's 2020 Climate Action Plan.
Goal COS-6: Protect and restore appropriate surface water and groundwater beneficial uses through prioritizing the improvement of locally impaired water bodies within the City of San Marcos subwatersheds.	**Consistent.** The project would be required to comply with the NPDES State Water Resources Control Board Construction General Permit Order No. 2009-0009-DWQ for stormwater discharges and general construction activities, and would incorporate standard BMPs, such as regular cleaning or sweeping of construction areas and impervious areas, and various stormwater BMPs, such as filtration media screens. In compliance with the Construction General Permit, a SWPPP will be prepared for the project that would specify BMPs that would be implemented during construction to minimize impacts to water quality. Lastly, project implementation of biofiltration, source control, and site design BMPs would effectively treat post-construction stormwater runoff prior to discharge from the site in compliance with the requirements of the BMP Design Manual and BMPs outlined in the SWQMP.
Goal COS-7: Achieve sustainable watershed protection for surface and ground water quality that balances social, economical, and environmental needs.	**Consistent.** Please refer to the consistency response to Goal COS-6. Implementation of the project would not conflict with the goal to achieve sustainable watershed protection for surface and ground water quality.
Goal COS-8: Focus watershed protection, surface and groundwater quality management on sources and practices that the City has the ability to affect.	**Consistent.** Storm drainage components recommended by the Preliminary Drainage Study (Appendix G) would properly handle runoff from the project site to meet regulatory requirements and to ensure that post-development runoff would occur at rates that are similar to, or less than, pre-development conditions. Appropriate design of on- and off-site drainage facilities, implementation of a SWPPP, SWQMP, and BMPs, and implementation of all recommendations from the Preliminary Drainage Study and development-specific drainage plans would ensure the project would not substantially alter the drainage patterns on or off site or result in substantial polluted runoff.
Goal COS-11: Continue to identify and evaluate cultural, historic, archeological, paleontological, and architectural resources for protection from demolition and inappropriate actions.	**Consistent.** A Cultural Resources Report was prepared for the project site to ensure existing resources are protected (Appendix D). Implementation of the project would not impact any identified archaeological resources, historical resources, or any known human remains interred outside a formal cemetery. However, based upon the analysis presented in Section 3.4, Cultural Resources, the potential exists for impacts to unknown cultural resources resulting from project construction. These potentially significant impacts to archaeological resources and human remains would be mitigated to below

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
	a level of significance through implementation of **MM-CR-1** through **MM-CR-4**. Specifically, implementation of **MM-CR-1** through **MM-CR-4** provide for the presence of archaeological and Native American monitors during ground disturbing activities that would be able to identify any previously unidentified cultural resources and to prevent inadvertent disturbance of any intact cultural deposits that may be present. Should any resources be identified, implementation of **MM-CR-1** through **MM-CR-4** would ensure proper handling and treatment of such resources by providing for a proper evaluation to determine whether additional archaeological work is necessary.
Land Use and Community Design Element	
Goal LU-1: Achieve a balanced distribution and compatible mix of land uses to meet the present and future needs of all residents and the business community.	**Consistent.** The project is a previously graded and disturbed site surrounded by existing development. While the project land use designation would not mirror immediately adjacent industrial and commercial land uses to the south, it would be consistent with the residential uses located directly to the north of the project site. The project would include the development of townhomes, which would provide a transition between the high-density residential development south of the project site and the low-density single-family residences to the north. The project would be consistent with the goal to achieve a balanced distribution and compatible mix of land uses to meet the present and future needs of the City.
Goal LU-2: Promote development standards and land use patterns that encourage long-term environmental sustainability.	**Consistent.** Implementation of the project would implement the overarching goals of the City's General Plan, through various proposed features and components such as providing housing near transit and existing commercial and industrial uses; providing diverse and higher-density housing; designating opportunities for recreational and open space areas; and supporting vehicular, bicycle, and pedestrian modes of travel.
Goal LU-3: Develop land use patterns that are compatible with and support a variety of mobility opportunities and choices.	**Consistent.** NCTD operates the Palomar College SPRINTER Station located approximately 0.35 miles from the project's W Mission Road entrance. Additionally, multiple Breeze transit stations are located within close proximity to the project site; the closest is approximately 150 feet from the project entrance. The project would also be located within walking and biking distance from retail, school, park and other facilities. The project would therefore support a variety of mobility opportunities and would promote multimodal transportation, consistent with General Plan Land Use Element Goals LU-2, LU-3, and LU-7. The project would be designed to ensure aesthetic consistency with the surrounding area and compliance with General Plan Land Use Element Goal LU-5. Consistent with Goal LU-8, the project would be required to pay its fair share public facility

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
	fees and other development impact fees consistent with the City's Municipal Code (refer to Sections 3.13, 3.14, 3.15, and 3.17 for a discussion of potential impacts to public infrastructure and facilities and required development fees).
Goal LU-5: Promote community design that produces a distinctive, high-quality built environment with forms and character that create memorable places and enrich community life.	**Consistent**. All final project plans, including project elevations as shown in Figures 3.1-1A through 3.1-1D, would be reviewed by the City and would be expected to create a cohesive character with the surrounding environment. The project would follow the architectural and landscape design guidelines to create memorable places within the City.
Goal LU-6: Maintain a supportive business climate and a healthy, sustainable economy to retain and attract high quality businesses and create additional employment opportunities.	**Inconsistent.** The project would develop residential uses at a site that is currently undeveloped and zoned for commercial uses. The residential development as part of the project would take away the opportunity for commercial development in proximity to existing industrial and commercial development.
Goal LU-7: Direct and sustain growth and expansion in areas of San Marcos that can support a concentration of a variety of uses and are particularly suitable for multimodal transportation and infrastructure expansion and improvements.	**Consistent**. The project would promote sustainability through locating residential uses on an underutilized vacant site proximate to existing schools, markets, parks, transit, and shopping centers. Vehicle miles traveled would be reduced by sustainably locating residential uses in this vacant area. Infrastructure and services plans are provided with the Gran Vista Specific Plan (Appendix M). As discussed in Section 3.17 of this EIR, Public Utilities and Service Systems, impacts to utility and service systems were determined to be less than significant.
Goal LU-8: Ensure that existing and future development is adequately serviced by infrastructure and public services.	**Consistent.** As discussed in Section 3.13, Public Services, of this EIR, the project would be adequately served by San Marcos Fire Department, San Marcos Sheriff's Department, and SMUSD. Additionally, as discussed in Section 3.17, impacts to utility and service systems were determined to be less than significant.
Goal LU-11: Schools: Ensure all residents have access to high-quality education.	**Consistent.** As discussed in Section 3.13 of this EIR, the project would generate approximately 28 elementary school students, 12 middle school students, and 15 high school students. Prior to project approval, the project would be required to obtain will-serve letters from SMUSD or servicing schools to confirm such schools have adequate capacity. Furthermore, the project would be required to contribute development fees to SMUSD pursuant to California Education Code Section 17620 et. seq. and Government Code Sections 65995(h) and 65996(b), as well as the City's Municipal Code Section 17.52.050. As concluded in Section 3.13, the project would have less than significant impacts on schools.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal LU-14: Wastewater: Ensure an adequate wastewater system for existing and future development.	**Consistent**. Implementation of the project would require the construction of private on-site sewer lines connecting to the public system at two locations. The connections to the existing system will depend on on-site grading and utility design. The City requires that VWD provide a letter of Sewer Availability for proposed developments within VWD. Prior to issuing such a letter, VWD will conduct a sewer study for the project to determine whether the current infrastructure is sufficient to accommodate the development project, and/or to provide recommendations for capital improvements to provide service. A Water and Sewer Study was prepared in March 2022 (Appendix L) and is further discussed in Section 3.17. As concluded in Section 3.17, impacts to wastewater facilities would be less than significant.
Goal LU-17: Utilities and Communications: Encourage provision of power and communication systems that provide reliable, effective and efficient service for San Marcos.	**Consistent.** Communications systems for telephones, computers, and cable television are serviced by utility providers such as AT&T, Cox, Spectrum, and other independent cable companies. No specific systems upgrades are proposed.
Mobility Element	
Goal M-1: Provide a comprehensive multimodal circulation system that serves the City land uses and provides for the safe and effective movement of people and goods.	**Consistent.** The project would promote sustainability through locating residential uses on an underutilized vacant site proximate to existing schools, markets, parks, transit, and shopping centers. Vehicle miles traveled would be reduced by sustainably locating residential uses on a vacant site within this developed area. As discussed in Section 3.15, Transportation, roadways and intersection with the project study area would operate at LOS D or better. In addition, the project would be required to comply with Title 24 requirements and would include amenities such as electric vehicle charging stations, electric or solar water heaters, reduced landscaping water use, and trees.
Goal M-2: Protect neighborhoods by improving safety for all modes of travel and calming traffic where appropriate.	**Consistent**. The project would be required to provide a proposed circulation plan outlining safe movement within the project site, including emergency access, subject to review by the City and the San Marcos Fire Department. The conceptual site plan for the project is provided as Figure 2-1. All final project plans would be subject to review and approval by the City. Under existing conditions, on-street parking is prohibited on N Las Posas Road and W Mission Road. The internal circulation network for the project would not include any hazardous design features or incompatible uses. The project would include circulation amenities and improvements such as an interconnected mobility system for bicycles, pedestrians, and vehicles in order to provide residents with safe movement within the project site; connections to existing roadways within the within the vicinity of the project site; and access to regional arterial and highway networks and SPRINTER/Breeze transit services.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal M-3: Promote and encourage use of alternative transportation modes, including transit, bicycles, neighborhood electric vehicles (NEVs), and walking, within the City.	**Consistent.** NCTD provides public transportation within the City and the County of San Diego for Coaster rail service, SPRINTER light rail service, and Breeze bus service. The NCTD operates the Palomar College Station SPRINTER and Breeze transit station located approximately 0.3 miles from the project's W Mission Road entrance. The project would be required to comply with Title 24 requirements, would include amenities such as electric vehicle charging stations, and would implement a Transportation Demand Management Plan.
Parks, Recreation, and Community Health Element	
Goal PR-1: Plan for, acquire, develop, and maintain a system of local parks connected through an integrated network of trails and high quality recreational facilities.	**Consistent.** As shown in Figure 2-1, the project proposes 137,193 square feet of recreation area on site for residents, which would provide for private open space/passive recreational use for residents on site. Additionally, the project applicant/developer would be required to pay the City's Public Facilities Fees. Developer payment towards the City's Public Facilities Fees would go towards the acquisition and development of local and community park facilities throughout the City to offset the demand on public park space.
Safety Element	
Goal S-1: Reduce risks to the community from earthquakes by regulating new development and redevelopment to prevent the creation of new geologic and seismic hazards.	**Consistent.** There are no known active faults that run through the project site. The project would be designed in accordance with applicable California Building Code requirements, including for resistance to seismic shaking. Furthermore, the project would be constructed in accordance with other applicable regulations, the current seismic design specifications of the Structural Engineers Association of California, and all applicable requirements of the California Occupational Safety and Health Administration. These required seismic design considerations are used to minimize structural damage in the event of ground shaking. Additionally, the project would implement all recommendations per the Preliminary Geotechnical Evaluation (Appendix E), as well as any project-specific recommendations with any potential supplemental geotechnical evaluations, in compliance with Section 17.32.040(f) of the City's Municipal Code.
Goal S-2: Minimize the risk to people, property, and the environment due to flooding hazards.	**Consistent.** Despite a small portion of the project site being located in a 100-year flood hazard area, the base flood elevation at the portion of the site that is within the 100-year flood hazard area would not reach to the top of the slope. As determined in Section 3.9, Hydrology and Water Quality, risk related to flooding hazards would be less than significant.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal S-3: Minimize injury, loss of life, and damage to property results from structure or wildland fire hazards.	**Consistent.** The project site is not located in any fire hazard severity zone (CAL FIRE 2021, but the project is located approximately 0.25 miles from a VHFHSZ in a local responsibility area. The existing project site is an undeveloped lot that is relatively flat and shows signs of previous disturbance. The proposed redesignation of the project site from commercial uses to residential uses under the proposed Specific Plan would likely reduce the potential for wildfire hazards on site through the replacement of flammable vegetation currently on site with structures that are up to current fire code. The project would not include associated infrastructure that may exacerbate fire risk. Additionally, the project would be required to comply with all applicable state and local fire codes, including the California Fire Code and the San Marcos Fire Department, which require a design that affords fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Sections 503.1 through 503.4 of the California Fire Code), as well as an adequate number of emergency rated entrances to the community (Appendix D, Section D106 of the California Fire Code).
Goal S-4: Protect life, structures, and the environment from the harmful effects of hazardous materials and waste.	**Consistent.** Construction of the project would entail transport, use, or disposal of potentially hazardous materials including, but not limited to diesel fuel, gasoline, equipment fluids, concrete, cleaning solutions and solvents, lubricant oils, adhesives, human waste, and chemical toilets. The project would be required to comply with all standards required through federal, state, county, and municipal regulations, in addition to project-specific plan review by the City, which would ensure potential impacts related to hazardous materials would not be significant. Furthermore, hazards associated with development and operation of residential developments would likely be less than that associated with commercial development, which is the current designated land use for the project site. Proposed uses would be limited to multifamily residences and residential amenities, which do not typically generate, release, or use large amounts of hazardous materials. During operations of the project, the only hazardous materials anticipated for transport, use, or disposal are routinely used household products such as cleaners, paint, solvents, motor oil/automotive products, batteries, and garden maintenance products. The use, handling, and disposal of these products are addressed by household hazardous waste programs that are part of the Integrated Watershed Monitoring Program of the County of San Diego, and therefore the project is not expected to create a significant hazard to the public or environment through hazardous upsets or accidents.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal S-5: Establish and maintain an effective emergency response program to respond to disasters and maintain continuity-of-life support functions during an emergency.	**Consistent.** According to the General Plan Safety Element, the San Marcos Emergency Operations Plan governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012b). The project would be required to abide by standards as set forth in the San Marcos Emergency Operations Plan. The project would not impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
Goal S-6: Provide neighborhood safety through effective law enforcement.	**Consistent**. Implementation of the project would be expected to increase the frequency of emergency and non-emergency calls to the Sherriff's Department. However, over 100 deputies, volunteers, and professional staff serve the residents of the City. Law enforcement services include general patrol, criminal investigation, crime prevention, juvenile services, narcotics and gang investigations, communications and dispatch, and various management support services. Police units are continuously mobile and service calls are responded to by the nearest available mobile unit. At the San Marcos Station, patrol deputies are assigned to a geographical "beat" area, allowing deputies to become familiar with citizens and problems within their "beats" (SDCSD 2022). Accordingly, service ratios and response times are anticipated to remain adequate with development of the project. As such, the project is not expected to affect police protection such that new or physically altered governmental facilities are needed.
Goal S-7: Comply with the McClellan-Palomar Airport Land Use Compatibility Plan.	**Consistent.** The project site is not located within any of the McClellan-Palomar Airport Influence Areas and would not conflict with the McClellan-Palomar Airport Land Use Compatibility Plan.
Noise Element	
Goal N-1: Promote a pattern of land uses compatible with current and future noise levels.	**Consistent.** The project site is surrounded by commercial and industrial uses to the south and residential uses to the east and west. The project site is located in an urban setting and is surrounded by existing development. Surrounding land uses outside of the immediately adjacent industrial and commercial land uses include industrial uses, commercial uses, mixed-use development, single-family residential, and schools/educational facilities. Noise generated by the project would be similar to that of existing land uses in the vicinity.

Table 3.10-2. General Plan Consistency

Applicable General Plan Goals	Project Consistency with Policy
Goal N-2: Control transportation-related noise from traffic, rail, and aviation sources near noise sensitive land uses.	**Consistent.** As described in Section 3.11, Noise, of this EIR, the addition of traffic to the roadway network as a result of the project would result in a CNEL increase of less than 3 dB, which is below the discernible level of change for the average healthy human ear. Therefore, a less than significant impact would occur related to operational traffic noise. Furthermore, the project would meet the City's and California Building Code's requirement to reduce interior ambient noise levels to 45 dB CNEL within habitable rooms of new residential development. The project would not conflict with this City regulation or General Plan policy for purposes of evaluating the project's land use/planning impacts.
Goal N-3: Control non-transportation-related noise from commercial, industrial, construction, and other sources on noise sensitive land uses.	**Consistent.** Potential noise impacts during construction would be less than significant with implementation of recommended design features. Noise impacts due to operation of the project would be less than significant and no further mitigation is required. Further, the project would comply with the General Plan's 45 dBA interior noise standard.
Housing Element	
Goal H-1: Provide a broad range of housing opportunities with emphasis on providing housing which meets the special needs of the community.	**Consistent.** Implementation of the project would change the site's land use designation and zoning from Commercial to Specific Plan Area, allowing for development of the proposed 120 residential units and associated amenities on a vacant site with existing roads, alternative transportation and utilities in the immediate area. Additionally, the project proposes a townhome development, which is a housing type that is limited in proximity to the project site.
Goal H-2: Protect, encourage, and provide housing opportunities for persons of lower and moderate incomes.	**Consistent.** The project would change the land use and zoning designations at the project site to allow for townhome residential development under the proposed Specific Plan. Approval of the proposed GPA/Rezone could help the City address the substantial population growth within the City, and the need for housing. The project would provide above moderate income housing opportunities through project implementation. The project would not include any extremely low, very low, low, or moderate income households, but would pay the in-lieu fee that contributes to providing housing opportunities for target households in the City.

Note: MM = Mitigation Measure; MHCP = multiple habitat conservation program; EIR = environmental impact report; NPDES = National Pollution Discharge Elimination System; BMP = best management practice; SWPPP = stormwater pollution prevention plan; SWQMP = stormwater quality management plan; NCTD = North County Transit District; SMUSD = San Marcos Unified School District; VWD = Vallecitos Water District; LOS = level of service; VHFHSZ = very high fire hazard severity zone; CNEL = community noise equivalent level; dB = decibels; dBA = A-weighted decibels; GPA = General Plan Amendment.

As shown in Table 3.10-2, the project would not result in a significant environmental impact due to a conflict with the City's General Plan Land Use Element goals. Land Use Element goals not referenced above, including LU-4, LU-5, LU-6, LU-9 through LU-13, LU-15, and LU-16 are not relevant to this discussion as they do not apply to individual projects or mitigating environmental effects. Instead, these goals pertain to overall goals of the City related to education, business, and provision of community facilities and infrastructure. Project implementation would not impede the City's ability to achieve these goals.

2050 Regional Transportation Plan/Sustainable Communities Strategy

SANDAG's 2050 RTP/SCS outlines projects for rail and bus services, highways, local streets, bicycling and walking, movement of goods, and systems and demand management. The 2050 RTP/SCS presents a transportation system designed to maximize transit enhancements, integrate biking and walking elements, and promote programs to reduce demand and increase efficiency. As described in Section 3.15, Transportation, of this EIR, the project would provide for residential land uses in an area that is surrounded by existing development, taking advantage of the site's location near transit, retail, employment, schools, parks, and other uses. The project would be consistent with programs, plans, ordinances, and policies addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. However, for the CEQA transportation vehicle miles traveled (VMT) analysis, the SANDAG Series 14 Base Year 2016 regional travel demand model was used to calculate the project's VMT per resident. Based on the results, the project's VMT per resident is more than 85% of the regional average, at 90% of the regional average.

Although the project would not be consistent with the existing zoning and land use designations and the project would exceed the VMT threshold, the project would generate fewer greenhouse gas emissions at buildout than potential development permitted under the existing land use designation. Thus, the project would not increase land use intensities as provided in the RTP/SCS and would therefore not result in environmental impacts due to inconsistency with this plan.

North County Multiple Habitat Conservation Program

As described under Section 3.10.2, the MHCP is a comprehensive conservation planning process that addresses the needs of multiple plant and animal species in northwestern San Diego County (SANDAG 2003). The project site is generally located within the boundaries of the MHCP Plan (Appendix C), and specifically within the Draft San Marcos Subarea Plan area. The Draft San Marcos Subarea Plan has not been completed, approved, or adopted (SANDAG 2001). However, it is the City's General Plan policy to comply with the conservation policies identified in the MHCP through use of the Draft San Marcos Subarea Plan as an implementation tool.

As described throughout Section 3.3, Biological Resources, of this EIR, project implementation would result in potentially significant impacts to biological resources. However, compliance with existing regulations and implementation of **Mitigation Measure (MM) BIO-1** and **MM-BIO-2** outlined in Section 3.3.7 would ensure that the project would not conflict with the MHCP, draft San Marcos Subarea Plan, or other applicable regulations related to biological resources. Implementation of proposed mitigation and City review of development plans for the project site would ensure impacts to biological resources would be less than significant. Furthermore, the project would be consistent with the Conservation and Open Space Element goals of the City's General Plan.

San Marcos Municipal Code Zoning Ordinance, Title 20

As described above, a rezone would be required to re-designate the project site from Commercial (C) to Specific Plan Area (SPA). Approval of the proposed GPA/Rezone would allow for development of the project site with the proposed residential land uses and associated amenities and improvements. Although the project would amend the land use designation to Specific Plan Area (SPA), the concurrent process of amending the Zoning designation does not necessarily equate to consistency with the Zoning Ordinance. However, as shown in Table 3.10-2, the project would be consistent with majority of the City's General Plan goals that guide development within the City. Therefore, the proposed rezoning of the site would be consistent with the City's Zoning Ordinance.

Based on the considerations outlined above, the project would not conflict with an applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, project impacts related to land use and planning would be **less than significant**.

3.10.5 Cumulative Impact Analysis

As described in Section 3.10.4, while the project seeks approval of a GPA and Rezone of the project site, the project would be consistent with the overarching goals of the City's General Plan. In addition to the City's General Plan, the project would also be consistent with the City's Municipal Code, SANDAG's 2050 RTP/SCS, and applicable plans and policies described in the regulatory setting sections throughout Chapter 3. Furthermore, as analyzed throughout Chapter 3, implementation of the project would not result in any significant unavoidable impacts that could further impact land use.

All cumulative projects would be subject to similar criteria as the project, which would ensure compliance with existing applicable land use plans with jurisdiction over the project area. Any cumulative projects that propose amendments to the General Plan or Zoning Ordinance would be required to show that proposed uses would not result in significant environmental impacts due to a conflict with applicable policies in a similar way as the project. Since all current and future projects would be analyzed for compatibility and compliance with land use regulations prior to approval, cumulative impacts related to land use and planning would be **less than significant**.

3.10.6 Mitigation Measures

No mitigation specific to land use and planning would be required as a result of the project. However, the project would be required to incorporate mitigation measures proposed throughout Chapter 3 of this EIR to ensure project implementation would not result in significant land use impacts.

3.10.7 Conclusion

Based upon the analysis presented in Sections 3.10.4 and 3.10.5, development of the proposed 120 residential units, upon approval of the proposed GPA/Rezone of the project site from Commercial (C) to Specific Plan Area (SPA), would not result in significant impacts to land use and planning. The project would be required to incorporate technical report recommendations, design features, and mitigation measures identified throughout Chapter 3 of this EIR to ensure project implementation would not result in significant impacts or inconsistency with applicable land use plans and policies. The project would be consistent with the applicable goals and policies of the City's General Plan. As analyzed throughout Chapter 3 of this EIR, implementation of the project would not result in any significant unavoidable impacts, and all potentially significant impacts to biological resources, cultural resources, geology and soils, and tribal cultural resources would be reduced to a level of less-than-significant with mitigation incorporated. Furthermore, final project plans would be subject to City review and approval. For these reasons, impacts related to land use and planning would be less than significant.

3.11 Noise

This section discusses the existing noise and vibration setting of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the proposed project. This section is based on the Noise Technical Report prepared for the proposed project by Dudek in February 2023, which is included as Appendix I to this environmental impact report (EIR).

Table 3.11-1 summarizes the project- and cumulative-level noise impact analysis for the proposed project.

Table 3.11-1. Noise Summary of Impacts

Threshold of Significance	Project Direct Impact	Project Cumulative Impact	Significance Determination
No. 1: Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	Less Than Significant	Less than Significant	Less Than Significant
No. 2: Generation of excessive groundborne vibration or groundborne noise levels.	Less Than Significant	Less than Significant	Less Than Significant
No. 3: Exposure of people residing or working in the project area to excessive noise levels, for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.	Less Than Significant	Less Than Significant	Less Than Significant

3.11.1 Existing Conditions

This section provides background on noise characteristics and vibration fundamentals, as well as a description of the existing noise environment associated with the project site and the surrounding area.

Noise Characteristics

Sound is mechanical energy transmitted by pressure waves in a compressible medium, such as air. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired. Sound pressure level (SPL) has become the most common descriptor used to characterize the loudness of an ambient sound level. The unit of measurement of sound pressure is a decibel (dB). The average healthy ear can barely perceive noise level changes of 3 dB, a change of 5 dB is readily perceptible, and a change of 10 dB is perceived as twice or half as loud (Caltrans 2013). A doubling of sound energy results in a 3 dB increase in sound, which means that a doubling of sound energy (e.g., doubling the number of daily trips along a given road) would result in a barely perceptible change in sound level.

Sound may be described in terms of level or amplitude (measured in dB), frequency or pitch (measured in hertz or cycles per second), and duration (measured in seconds or minutes). Because the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale is used to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against low and very high frequencies in a manner approximating the sensitivity of the human ear.

Several descriptors of noise (i.e., noise metrics) exist to help predict average community reactions to the adverse effects of environmental noise, including traffic-generated noise. These descriptors include the equivalent noise level over a given period (L_{eq}), the day–night average noise level (L_{dn}), and the community noise equivalent level (CNEL). Each of these descriptors uses units of dBA.

L_{eq} is a decibel quantity that represents the constant or energy-averaged value equivalent to the amount of variable sound energy received by a receptor during a time interval. For example, a 1-hour L_{eq} measurement of 60 dBA would represent the average amount of energy contained in all the noise that occurred in that hour. L_{eq} is an effective noise descriptor because of its ability to assess the total time-varying effects of noise on sensitive receptors, which can then be compared to an established L_{eq} standard or threshold of the same duration. Another descriptor is maximum sound level, which is the greatest sound level measured during a designated time interval or event. The minimum sound level is often called the "floor" of a measurement period.

L_{dn} and CNEL descriptors represent 24-hour periods and differ from a 24-hour L_{eq} value because they apply a time-weighted factor designed to emphasize noise events that occur during the non-daytime hours (when speech and sleep disturbance is of more concern). "Time weighted" refers to the fact that L_{dn} and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m. to 7:00 p.m.) receives no penalty, but noise during the evening (7:00 p.m. to 10:00 p.m.) is penalized by adding 5 dB to the actual levels, and nighttime (10:00 p.m. to 7:00 a.m.) noise is penalized by adding 10 dB to the actual levels. L_{dn} differs from CNEL in that the daytime period is longer (defined instead as 7:00 a.m. to 10:00 p.m.), thus eliminating the dB adjustment for the evening period. L_{dn} and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5–1.0 dB and are often considered or actually defined as being essentially equivalent by many jurisdictions (Appendix I).

Vibration Fundamentals

Groundborne vibration is fluctuating or oscillatory motion transmitted through the ground mass (i.e., soils, clays, and rock strata). The strength of groundborne vibration attenuates rapidly over distance. Some soil types transmit vibration quite efficiently; other types (primarily sandy soils) do not. Several basic measurement units are commonly used to describe the intensity of ground vibration. The descriptors used by the Federal Transit Administration (FTA) are peak particle velocity (PPV), in units of inches per second (ips), and velocity decibel, which is based on the root-mean square of the vibration signal magnitude (Appendix I).

Existing Noise Environment

The project site is currently vacant and does not currently contain any sources of noise or vibration generation. However, the project site is located in an urbanized area surrounded by development, bordered by existing roadways and industrial and commercial uses. Sources of noise in the surrounding area primarily include traffic from the local roadways, including W Mission Road and N Las Posas Road.

SPL measurements were conducted near the project site on April 26, 2022, to quantify and characterize the existing outdoor ambient sound levels. Table 3.11-2 provides the location, date, and time period at which these baseline noise level measurements were performed by an attending Dudek field investigator using a Rion-branded Model NL-52 sound level meter equipped with a 0.5-inch, pre-polarized condenser microphone with pre-amplifier. The sound level meter meets the current American National Standards Institute standard for a Type 1 (Precision Grade) sound level meter. The accuracy of the sound level meter was verified using a field calibrator before and after the measurements, and the measurements were conducted with the microphone positioned approximately 5 feet above the ground.

Four short-term noise level measurement locations (ST1–ST4) that represent existing noise-sensitive receivers were selected on and near the project site. These locations are depicted as receivers ST1–ST4 on Figure 3.11-1, Noise Measurement Locations. The measured L_{eq} and maximum noise levels are provided in Table 3.11-2. The primary noise sources at the site consisted of traffic along adjacent roadways, the sounds of leaves rustling, and birdsong. As shown in Table 3.11-2, the measured SPL ranged from approximately 47.3 dBA L_{eq} at ST4 to 64.2 Dba L_{eq} at ST1. Detailed noise measurement data are included as part of Appendix I to this EIR.

Table 3.11-2. Measured Baseline Outdoor Ambient Noise Levels

Site	Location/Address	Date/Time	L^{eq}	L^{max}
ST1	Southwest in CVS parking lot	2022-04-26, 04:00 p.m. to 04:10 p.m.	64.2	73.6
ST2	Northern boundary of CVS parking lot	2022-04-26, 04:20 p.m. to 04:30 p.m.	63.5	74.5
ST3	In dirt lot west of project site at 1333 Granite Road, San Marcos CA, 92069, east of N Las Posas Road	2022-04-26, 04:40 p.m. to 04:50 p.m.	60.2	68.5
ST4	Front yard of 389 Palmac Street, San Marcos, CA 92069	2022-04-26, 05:00 p.m. to 05:10 p.m.	47.3	74.9

Source: Appendix A of Appendix I.
Notes: L_{eq} = equivalent continuous sound level (time-averaged sound level); L_{max} = maximum sound level during the measurement interval; dBA = A-weighted decibels.

Generally, the measured samples of daytime L_{eq} agree with expectations: ST1, ST2, and ST3 L_{eq} values are above 60 dBA, due largely to proximity to W Mission Boulevard and/or N Las Posas Road, which are major roadways; ST4 however, is behind residential walls west of the western boundary of the project site and more distant from these sources of roadway traffic noise, which results in a substantially lower sampled L_{eq} value.

Sensitive Receptors

Sensitive receptors are uses that are typically considered noise sensitive and include residences, schools, hospitals, parks, and wildlife habitats. The nearest sensitive receptors to the project site would be the residential uses located along Palmac Street located adjacent to the project site to the west and single-family residential uses located across from the site on the eastern side of N Las Posas Road.

3.11.2 Regulatory Setting

Federal

Federal Transit Administration

In its Transit Noise and Vibration Impact Assessment guidance manual, FTA recommends a daytime construction noise level threshold of 80 dBA L_{eq} over an 8-hour period (FTA 2018) when detailed construction noise assessments are performed to evaluate potential impacts to community residences surrounding a project. Although this FTA guidance is not a regulation, it can serve as a quantified standard in the absence of such limits at the state and local jurisdictional levels.

State

California Code of Regulations, Title 24

Title 24 of the California Code of Regulations sets standards that new development in California must meet. According to Title 24, interior noise levels are not to exceed 45 dBA CNEL in any habitable room, as demonstrated by a project-specific acoustical analysis.

California Department of Health Services Guidelines

The California Department of Health Services has developed guidelines of community noise acceptability for use by local agencies (OPR 2017). Selected relevant levels are listed here:

- **Below 60 dBA CNEL:** normally acceptable for low-density residential use
- **50 to 70 dBA:** conditionally acceptable for low-density residential use
- **Below 65 dBA CNEL:** normally acceptable for high-density residential use and transient lodging
- **60 to 70 dBA CNEL:** conditionally acceptable for high-density residential, transient lodging, places of worship, educational facilities, and medical facilities

California Department of Transportation

In its Transportation and Construction Vibration Guidance Manual (Caltrans 2020), the California Department of Transportation (Caltrans) recommends 0.5 ips PPV as a threshold for the avoidance of structural damage risk to typical newer residential buildings exposed to continuous or frequent intermittent sources of groundborne vibration. For transient vibration events, such as blasting, the damage risk threshold would be 1.0 ips PPV (Caltrans 2020) at the same type of newer residential structures. For older structures, these guidance thresholds would be more stringent: 0.3 ips PPV for continuous/intermittent vibration sources, and 0.5 ips PPV for transient vibration events. With respect to human annoyance, Caltrans guidance indicates that building occupants exposed to groundborne vibration of 0.2 ips PPV from continuous or frequently intermittent sources may find it "annoying" (Caltrans 2020) and on such basis this would be considered a significant groundborne vibration impact for purposes of this assessment. Although these Caltrans guidance thresholds are not regulations, they can serve as quantified standards in the absence of such limits at the local jurisdictional level.

Local

City of San Marcos Municipal Code

San Marcos Municipal Code Chapter 10.24.020.b.9 addresses construction activity, with exemption from chapter provisions between 7:00 a.m. and 6:00 p.m. Monday through Friday and on Saturdays from 8:00 a.m. to 5:00 p.m. The Municipal Codes does not set noise limits on construction activities; however, on occasion the City of San Marcos (City) has adopted the County of San Diego's Noise Ordinance noise limit of 75 dBA L_{eq} (8-hour average) attributed to construction activities as received by an occupied property.

Chapter 20.300, Site Planning and General Development Standards, of the Municipal Code includes noise regulations in the form of noise standards by zone (Section 20.300.070, Performance Standards). Municipal Code noise standards typically pertain to stationary (i.e., non-transportation-related) noise sources. The relevant portions of these noise standards are outlined in Table 3.11-3.

Table 3.11-3. Exterior Noise Standards by Zone

Zone	Allowable Noise Level (dBA L_{eq}) Measured from the Property Line
Single-Family Residential (A, R-1, R-2)[1,2]	
7:00 a.m. to 10:00 p.m. (daytime)	60
10:00 p.m. to 7:00 a.m. (overnight)	50
Multifamily Residential (R-3)[1,2]	
7:00 a.m. to 10:00 p.m. (daytime)	65
10:00 p.m. to 7:00 a.m. (overnight)	55
Commercial (C, O-P, SR)[3]	
7:00 a.m. to 10:00 p.m. (daytime)	65
10:00 p.m. to 7:00 a.m. (overnight)	55
Industrial	
7:00 a.m. to 10:00 p.m. (daytime)	65
10:00 p.m. to 7:00 a.m. (overnight)	60

Source: City of San Marcos 2017 (Table 20.300-4)
Notes: dBA = A-weighted decibels; L_{eq} = equivalent noise level over a given period.

1 For single-family detached dwelling units, the "exterior noise level" is defined as the noise level measured at an outdoor living area which adjoins and is on the same lot as the dwelling, and which contains at least the following minimum net lot area: (i) for lots less than 4,000 square feet in area, the exterior area shall include 400 square feet, (ii) for lots between 4,000 square feet to 10 acres in area, the exterior area shall include 10% of the lot area; (iii) for lots over 10 acres in area, the exterior area shall include 1 acre.

2 For all other residential land uses, "exterior noise level" is defined as noise measured at exterior areas which are provided for private or group usable open space purposes. "Private Usable Open Space" is defined as usable open space intended for use of occupants of one dwelling unit, normally including yards, decks, and balconies. When the noise limit for Private Usable Open Space cannot be met, then a Group Usable Open Space that meets the exterior noise level standard shall be provided. "Group Usable Open Space" is defined as usable open space intended for common use by occupants of a development, either privately owned and maintained or dedicated to a public agency, normally including swimming pools, recreation courts, patios, open landscaped areas, and greenbelts with pedestrian walkways and equestrian and bicycle trails, but not including off-street parking and loading areas or driveways.

3 For non-residential noise sensitive land uses, exterior noise level is defined as noise measured at the exterior area provided for public use.

With respect to vibration, Section 20.300.070 of the Performance Standards also indicates that “no person or use shall create, maintain, or cause ground vibration that is discernible without instruments to a person of normal sensitivity at any point on a property that is adjacent to the property of the vibration source. The ground vibration caused by moving vehicles, trains, aircraft, or temporary construction or demolition is exempted.” Due to these exemptions, vibration due to construction of the proposed project, or vibration from nearby roads and rail received by new buildings or its occupants associated with the proposed project, would be compatible with these City standards.

City of San Marcos General Plan

To control transportation-related noise sources such as arterial roads, freeways, airports, and railroads, the City has established guidelines for acceptable community noise levels in the Noise Element of the City of San Marcos General Plan (General Plan) (City of San Marcos 2012a). For noise sensitive rural and single-family residential uses, schools, libraries, parks, and recreational areas, the Noise Element requires exterior noise levels of less than 60 dBA CNEL for outdoor usable areas. For multifamily developments, the standard is 65 dBA CNEL, and a standard of 70 dBA CNEL is typically applied to commercial uses. The City has also established an interior noise limit of 45 dBA CNEL for all residential uses.

The following are applicable goals and policies from the General Plan Noise Element (City of San Marcos 2012a):

Goal N-1: Promote a pattern of land uses compatible with current and future noise levels.

Policy N-1.1: Address the potential for excessive noise levels when making land use planning decisions in accordance with Table 7-3 Land Use Compatibility Noise Standards.

Policy N-1.2: Ensure that acceptable noise levels are maintained near noise-sensitive uses.

Policy N-1.3: Incorporate design features into residential land use projects that can be used to shield residents from excessive noise. Design features may include, but are not limited to: berms, walls, and sound attenuating architectural design and construction methods.

Policy N-1.4: Require new development projects to provide barriers to reduce noise levels, or provide sufficient spatial buffers to separate excessive noise generating land uses and noise-sensitive land uses.

Policy N-1.5: Require an acoustical study for proposed developments in areas where the existing and projected noise level exceeds or would exceed the Normally Acceptable levels identified in Table 7-3.

Goal N-2: Control transportation-related noise from traffic, rail, and aviation sources near noise sensitive land uses.

Policy N-2.1: Encourage only noise-compatible land uses along existing and future roadways, highways, and freeways.

Policy N-2.2: Promote coordinated site planning and traffic control measures that reduce traffic noise on noise-sensitive land uses.

Policy N-2.3: Advocate the use of alternative transportation modes such as walking, bicycling, mass transit, and non-combustible engine vehicles to reduce traffic noise.

Goal N-3: Control non-transportation-related noise from commercial, industrial, construction, and other sources on noise sensitive land uses.

Policy N-3.1: When adjacent to noise sensitive receptors, require developers and contractors to employ noise reduction techniques during construction and maintenance operations.

Policy N-3.2: Limit the hours of construction and maintenance operations located adjacent to noise-sensitive land uses.

The following are applicable goals and policies from the General Plan Safety Element (City of San Marcos 2012b):

Goal S-7: Comply with the McClellan-Palomar Airport Land Use Compatibility Plan.

Policy S-7.1: Record an overflight notification document in association with the approval of any new residential land use within the AIA overflight notification area consistent with the ALUCP.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As detailed in Section 3.10.4, the project would be consistent with the applicable goals and policies.

3.11.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts related to noise are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to noise would occur if the project would:

- **Threshold No. 1:** Result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
- **Threshold No. 2:** Generation of excessive groundborne vibration or groundborne noise levels.
- **Threshold No. 3:** For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.

In light of the above significance criteria, this analysis uses the following standards to evaluate potential noise and vibration impacts.

- **Construction noise** – the City has adopted the County of San Diego threshold for construction equipment noise, which must not exceed an 8-hour L_{eq} value of 75 dBA L_{eq} when assessed at an occupied property. Construction shall only occur between the hours of 7:00 a.m. through 6:00 p.m., Monday through Friday, and 8:00 a.m. and 5:00 p.m. on Saturday.
- **Off-site project-attributed transportation noise** – For purposes for this analysis, a direct roadway noise impact would be considered significant if increases in roadway traffic noise levels attributed to the proposed project would be greater than 3 dBA CNEL at an existing noise-sensitive land use.
- **Off-site project-attributed stationary noise** – For purposes for this analysis, a noise impact would be considered significant if noise from typical operation of heating, ventilation, and air conditioning and other electro-mechanical systems associated with the proposed project would exceed the following:
  - 60 dBA hourly L_{eq} at the property line of an off-site single-family residence from 7:00 a.m. to 10:00 p.m., and 50 dBA hourly L_{eq} from 10:00 p.m. to 7:00 a.m.
  - 65 dBA hourly L_{eq} at the property line of an off-site commercial land use from 7:00 a.m. to 10:00 p.m., and 55 dBA hourly L_{eq} from 10:00 p.m. to 7:00 a.m.
- **Construction vibration** – Although exempted by the City, guidance from Caltrans indicates that a vibration velocity level of 0.2 ips PPV received at a structure would be considered annoying by occupants within (Caltrans 2020). As for the receiving structure itself, Caltrans guidance recommends that a vibration level of 0.3 ips PPV would represent the threshold for building damage risk.

Further, while the CEQA noise criteria listed above do not consider project consistency with exterior and interior noise standards, such an analysis is relevant to the assessment of the land use and planning impacts of the proposed project. This analysis therefore also evaluates compatibility of on-site traffic noise exposure levels with the City exterior and interior noise standards of 65 dBA CNEL and 45 dBA CNEL, respectively.

3.11.4 Project Impact Analysis

Threshold No. 1: Would the project result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Short-Term Construction Noise

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day depending on the equipment in use, the operations performed, and the distance between the source and receptor.

Equipment that would be in use during construction would include, in part, graders, backhoes, rubber-tired dozers, loaders, cranes, forklifts, pavers, rollers, and air compressors. The typical maximum noise levels at a distance of 50 feet from various pieces of construction equipment and activities anticipated for use on the project site are presented in Table 3.11-4. The equipment noise levels presented in Table 3.11-4 are maximum noise levels. Usually, construction equipment operates in alternating cycles of full power and low power, producing average noise levels over time that are less than the maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time.

Table 3.11-4. Typical Construction Equipment

Equipment Type	Typical Equipment (L_{max}, dBA at 50 Feet)
All Other Equipment Greater than 5 HP	85
Backhoe	78
Compressor (Air)	78
Concrete Saw	90
Crane	81
Dozer	82
Excavator	81
Flat Bed Truck	74
Front End Loader	79
Generator	72
Grader	85
Man Lift	75
Paver	77
Roller	80
Scraper	84
Welder/Torch	73

Source: DOT 2006.
Note: L_{max} = maximum sound level; dBA = A-weighted decibels; HP = horsepower

Aggregate noise emissions from proposed project construction activities, broken down by sequential phase, was predicted at two evaluation distances to the nearest existing noise-sensitive receptor: from the nearest position of the construction site boundary and from the geographic center of the construction site, which serves as the time-averaged location or geographic acoustical centroid of active construction equipment for the phase under study.

The intent of the former distance is to help evaluate anticipated construction noise from a limited quantity of equipment or vehicle activity expected to be at the boundary for some period of time, which would be most appropriate for phases such as site preparation, grading, and paving. The latter distance is used in a manner similar to the general assessment technique as described in the FTA guidance for construction noise assessment, when the location of individual equipment for a given construction phase is uncertain over some extent of (or the entirety of) the construction site area. In this studied scenario, because of the equipment location uncertainty, all the equipment for a construction phase is assumed to operate—on average—from the acoustical centroid position. Table 3.11-5 summarizes these two distances to the apparent closest noise-sensitive receptor for each of the seven sequential construction phases. At the site boundary, this analysis assumes that up to only one piece of equipment of each listed type per phase will be involved in the construction activity for a limited portion of the 8-hour period. In other words, at such proximity, the operating equipment cannot "stack" or crowd the vicinity and still operate. For the acoustical centroid case, which intends to be a geographic average position for all equipment during the indicated phase, this analysis assumes that the equipment may be operating up to all 8 hours per day.

Table 3.11-5. Estimated Distances between Construction Activities and the Nearest Noise-Sensitive Receptors

Construction Phase (and Equipment Types Involved)	Distance from Nearest Noise-Sensitive Receptor to Construction Site Boundary (Feet)	Distance from Nearest Noise-Sensitive Receptor to Geographic Center of Site (Feet)
Demolition (concrete saw, backhoe, dozer)	80	160
Site Preparation (grader, scraper, backhoe)	80	160
Grading (grader, dozer, backhoe)	80	160
Building construction (crane, man-lift, generator, backhoe, welder)	80	160
Paving (paver, roller, concrete mixer truck)	80	160
Architectural Coating (compressor)	80	160

Source: Appendix I.

A Microsoft Excel–based noise prediction model emulating and using reference data from the Federal Highway Administration Roadway Construction Noise Model (FHWA 2008) was used to estimate construction noise levels at the nearest occupied noise-sensitive land use. (Although the Roadway Construction Noise Model was funded and promulgated by the Federal Highway Administration, it is often used for non-roadway projects because the same types of construction equipment used for roadway projects are often used for other types of construction.) Input variables for the predictive modeling consist of the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of time within a specific time period when the equipment is expected to operate at full power or capacity and thus make noise at a level comparable to what is presented in Table 3.11-4), and the distance from the noise-sensitive receiver. The predictive model also considers how many hours that equipment may be on site and operating (or idling) within an established work shift. Conservatively, no topographical or structural shielding was assumed in the modeling. The Roadway Construction Noise Model has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical construction activity patterns. Those default duty-cycle values were used for this noise analysis, and the predicted results displayed in Table 3.11-6.

Table 3.11-6. Predicted Construction Noise Levels per Activity Phase

Construction Phase (and Equipment Types Involved)	8-Hour L_{eq} at Nearest Noise-Sensitive Receptor to Construction Site Boundary (dBA)	8-Hour L_{eq} at Nearest Noise-Sensitive Receptor to Geographic Center of Site (dBA)
Demolition (concrete saw, backhoe, dozer)	74.8	71.6
Site Preparation (grader, scraper, backhoe)	74.2	70.3
Grading (grader, dozer, backhoe)	73.5	70.0
Building construction (crane, man-lift, generator, backhoe, welder)	68.5	67.1
Paving (paver, roller, concrete mixer truck)	70.3	67.1
Architectural Coating (compressor)	62.6	59.1

Notes: L_{eq} = equivalent noise level; dBA = A-weighted decibels.

As presented in Table 3.11-6, the highest estimated construction noise levels are predicted to stay below 75 dBA Leq over an 8-hour period at the nearest existing residences (as close as 80 feet away) when demolition activities take place near the western project boundaries. These estimated noise levels at a source-to-receiver distance of 80 feet would only occur when noted pieces of heavy equipment would each operate for a cumulative period of up to 2 hours a day. For example, a grader might make multiple passes this close to a receiver, but for the remaining time during the day, the grader is performing work at a more distant location or simply not operating.

Should operation of construction equipment and processes be sufficiently proximate to the project's western boundary for greater than 2 hours a day, construction activity noise levels might exceed an 8-hour L_{eq} value of 75 dBA L_{eq} and thereby exceed the City's adopted daytime threshold for construction noise exposure at an occupied property. Therefore, the following suggested practices would be incorporated into the project's construction program as project design features:

- Administrative controls (e.g., reduce operating time of equipment and/or prohibit usage of equipment types within certain distances)
- Engineering controls (upgrade noise controls, such as install better engine exhaust mufflers)
- Install noise abatement on the site boundary fencing (or within the site, as practical and appropriate) in the form of sound blankets or comparable temporary barriers to occlude construction noise emissions between the site (or specific equipment operation as the situation may define) and off-site noise-sensitive receptors of concern
- At the outset of a project construction activity, an unattended noise level monitor might be deployed on site to measure and document that noise exposure levels attributed to project construction activity at adjacent off-site sensitive receptors are in conformance with the 75 dBA 8-hour L_{eq} threshold

The above design features would be implemented as site conditions may warrant. Proper application of temporary noise barriers or comparable sound abatement can feasibly reduce noise levels by at least 5 dB due to direct path occlusion between the noise source and receptor.

In summary, daytime construction noise would not exceed the City's 75 dBA threshold and, thus, temporary construction-related noise impacts would be considered **less than significant**.

Long-Term Operational Noise

Off-Site Traffic Noise Exposure

Implementation of the proposed project would generate additional vehicle trips on local arterial roadways (i.e., W Mission Boulevard and N Las Posas Road), which could result in increased traffic noise levels at adjacent offsite existing noise-sensitive land uses. Appendix K-2 to this EIR contains a spreadsheet with traffic volume data (average daily traffic) for surrounding arterial roadways. Implementation of the proposed project is estimated to add 960 average daily trips to adjacent street segments.

Potential noise effects from vehicular traffic were assessed using the Federal Highway Administration's Traffic Noise Model version 2.5 (FHWA 2004). Information used in the model included the roadway geometry, existing (year 2022), existing plus project, near-term (opening day) and near-term (opening day) plus project traffic volumes and posted traffic speeds. Noise levels were modeled at representative noise-sensitive receivers ST1 through ST4, as shown in Figure 3.11-1. The receivers were modeled to be 5 feet above the local ground elevation. The noise model results are summarized in Table 3.11-7.

Table 3.11-7. Roadway Traffic Noise Modeling Results

Modeled Receiver No.	Existing (2022) Noise Level (dBA CNEL)	Existing (2022) Plus Project Noise Level (dBA CNEL)	Near-Term (Opening Day) Noise Level (dBA CNEL)	Near-Term (Opening Day) Plus Project Noise Level (dBA CNEL)	Horizon Year (2050) Noise Level (dBA CNEL)	Horizon Year (2050) Plus Project Noise Level (dBA CNEL	Maximum Project-Related Noise Level Increase (dB)
ST1	68.3	68.3	68.6	68.6	69.4	69.4	0.0
ST2	69.0	69.6	69.6	69.8	70.2	70.4	0.2
ST3	66.5	66.7	67.1	67.2	67.7	67.9	0.2
ST4	52.7	51.2	53.2	51.7	53.9	52.4	< 0.0*

Notes: dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level; dB = decibel.
* Noise level change is negative.

Based on results of the model, implementation of the proposed project would not result in readily perceptible increases in traffic noise. Table 3.11-7 shows that at all four listed representative receivers, the addition of proposed project traffic to the roadway network would result in an increase in the CNEL of less than 3 dB, which is below the discernible level of change for the average healthy human ear. Therefore, a **less-than-significant impact** would occur related to operational traffic noise.

On-Site Interior Noise Exposure

Aside from exposure to aviation traffic noise, current CEQA noise-related guidelines at the state level do not require an assessment of exterior-to-interior noise intrusion, environmental noise exposure to occupants of newly created project residences, or environmental noise exposure to exterior non-residential uses attributed to the development of the proposed project. Nevertheless, the City's General Plan and the California Building Code require that interior background noise levels not exceed a CNEL of 45 dB within habitable rooms. Hence, the following predictive analysis of traffic noise exposure at the exteriors of occupied residences and outdoor living areas is provided below.

In addition to the prediction results presented in Table 3.11-7, the Federal Highway Administration Traffic Noise Model software was also used to predict the Horizon-Year-Plus-Project scenario traffic noise levels at multiple on-site exterior areas, as listed in Table 3.11-8. These on-site modeled receptor locations, which appear in Figure 3.11-1, include representative positions for the exteriors of multiple floors and positions of six of the proposed project building facades. Predicted exterior sound levels presented in Table 3.11-8 that are higher than 65 dBA CNEL indicate locations where an exterior-to-interior noise analysis should be performed for the proximate occupied residential unit. Individual modeling locations are provided in Appendix I.

Table 3.11-8. Future Ambient Noise Levels at Residential Facades

Modeled Receptor	Noise Level (A-weighted CNEL)		
	1st Floor	2nd Floor	3rd Floor
M1–1	65	65	65
M1–2	64	64.0	64
M2–1	58	60	60
M2–2	62	63	63
M3–1	56	59	59
M3–2	58	60	61
M4–1	64	65	65
M5–1	61	62	62
M5–2	65	65	65
M6–1	68	69	68
M6–2	68	68	68
OS–1	65		
OS–2	65		

Note: CNEL = community noise equivalent level.

The prediction results from Table 3.11-8 indicate that future traffic noise levels would not exceed 69 dBA CNEL. With the 45 dBA CNEL interior background sound level limit, this means the minimum composite sound transmission class (STC) rating for the exterior shell separating the habitable interior space from the outdoor sound level should be at least 24. The composite STC rating for the portion of a building shell that separates an interior space from the outdoors is calculated from the area-dependent contributions of its elements: windows, wall assemblies, and doors.

Many of the residential units feature porches or balconies on the 1st or 2nd floor, for which access would likely be provided by single-panel, out-swing fiberglass French doors with hinges comparable to a Milgard Essence series model (or similar from another manufacturer). Alternately, they could be a sliding door type. For purposes of this analysis, either of these patio/balcony door design styles are assumed to feature a dual-pane glazing system similar to a standard residential window assembly (i.e., two 1/8-inch-thick glass panes separated by a 3/8-inch-wide airgap) in narrow-perimeter frames compatible with modern thermal insulation (and thus energy conserving) design. The analysis also assumes that these door products feature good seals and related hardware, so that when closed, the effective sound insulating performance is represented by the glass. Viracon data indicate that such glazing should demonstrate an STC rating of 31 (Viracon 2019; Appendix I).

The Noise Report prepared for this project assumes an exterior wall assembly that includes one layer of 5/8-inch gypsum wallboard on the interior-facing side, 2-inch × 4-inch wood studs, glass fiber batt insulation in the stud cavities, and a dual-layer of 5/8-inch gypsum wallboard on the exterior-facing side. Acoustical transmission loss

data are available on this representative assembly and are used as part of estimating the composite STC ratings reported herein (Appendix I). For purposes of this analysis, the dual-layer gypsum wallboard on the exterior surface approximates the mass and solidity of what may be other approved material options as determined by the project architect, such as cement fiber siding panels, brick masonry veneer, or cement plaster attached to layers of fiberglass mat sheathing and plywood sheathing.

Table 3.11-9 summarizes the calculated noise levels after applying the STC ratings for a set of studied occupied room facades that are anticipated to be exposed to predicted exterior noise levels greater than 65 dBA CNEL. Details of these calculations that account for the façade surface area and its composite areas of exterior wall assembly and windows are provided in Appendix I.

Table 3.11-9. Predicted Net Sound Transmission Class of Occupied Room façade

Occupied Room Facade	Predicted Net Sound Transmission Class for Proposed Project	
	Closed Windows and Door*	Open Windows and Closed Door*
1st floor living room w/porch, eastern facade	35	6
2nd floor living room w/balcony, eastern façade	35	6
3rd floor bedroom, eastern façade	38	15

Source: Appendix I.
Notes: n/a = not applicable
* Doors are only modeled for scenarios that contain the balcony door.

An open window or open door to an adjoining patio or balcony greatly compromises the sound insulation performance of the façade wall assembly, as presented for the sample units appearing in Table 3.11-9. However, when such windows and doors are closed, all facades are anticipated to exhibit a predicted STC rating of at least 35, and thus would provide sufficient exterior-to-interior sound insulation from outdoor traffic noise to yield interior background sound levels that are less than 45 dBA CNEL and compliant with the City and state standards. None of the predicted exterior traffic noise levels at the studied receptor locations exceeded 69 dBA CNEL; thus, the STC rating value (for closed windows and doors) subtracted from these exterior noise values would result in interior noise levels of less than 45 dBA CNEL (e.g., 69 − 35 = 34 dBA CNEL, which is less than 45). This apparent requirement for closed windows and doors means that the design of these habitable rooms should feature mechanical ventilation or an air-conditioning system to provide interior comfort for the occupants. Detailed transmission loss data are included in Appendix I. Thus, the City's threshold of 45 dB CNEL within habitable rooms would not be exceeded and the project would be expected to comply with this standard.

Where predicted exterior noise levels exceed 65 dBA CNEL near common useable outdoor space (as shown on Table 3.11-8) and such space would count towards the outdoor usable space associated with the project, according to the City's General Plan, feasible noise reduction techniques should be analyzed and incorporated to make outdoor activities acceptable at locations that are currently above the City's 65 dBA CNEL standard. With the implementation of Project Design Feature (PDF) NOI-1, the resultant exterior noise levels would meet the City's exterior noise standard of 65 dBA CNEL.

For proposed project residential units that feature patios or balconies as outdoor useable areas, predicted future traffic noise exposure levels presented in Table 3.11-8 suggest that up to 4 dBA of noise reduction would be needed to keep sound on such balconies at levels below the 65 dBA CNEL compatibility standard. With the implementation of PDF-NOI-2, the resultant exterior noise levels would meet the City's exterior noise standard of 65 dBA CNEL.

With implementation of PDF-NOI-1 and PDF-NOI-2, the City's thresholds would not be exceeded and on-site noise impacts would be **less than significant**.

PDF-NOI-1: Where exterior noise levels are predicted to exceed 65 A-weighted decibels community noise equivalent level at useable open space areas, the project shall install noise-reducing features external to or upon the useable open space areas (or within, as practical and appropriate) in the form of sound walls, fencing, landscape berms, or similarly performing barriers to occlude incoming roadway traffic noise.

PDF-NOI-2: Residential unit patios or balconies with roadway-facing building facades predicted to be exposed to external noise levels in excess of 65 A-weighted decibels community noise equivalent level shall feature railings or other partial-height barriers comprising sufficiently solid and dense materials (e.g., acrylic, glass, wood that exhibits a sound transmission class rating of at least 20) and of a 42-inch minimum height (from floor or deck of the balcony surface) that occludes direct sound path from the noise-producing roadway of concern and a seated patio or balcony occupant.

Stationary Operational Noise

The proposed project would add a variety of noise-producing mechanical equipment and other stationary sources, including facility unit heating, ventilation, and air conditioning equipment. The incorporation of new multifamily homes and a mix of open space uses attributed to development of the proposed project will add a variety of noise-producing electro-mechanical equipment. Most of these noise-producing equipment or sound sources would be considered stationary or limited in mobility to a defined area.

For purposes of this analysis, each of the new occupied residential units would be expected to feature a split-system type air-conditioning unit, with an air-cooled refrigeration (2-ton capacity) condenser unit in the patio area as currently depicted by the site plan (dated June 24, 2020). Assuming each condenser unit has an SPL of 68 dBA at 3 feet based on available data from a likely manufacturer (Carrier 2012), the site plan suggests that these condenser units would generally be installed near the patio (i.e., apparent "front porch"). Therefore, the closest existing noise-sensitive residential receptor to the west of the proposed project's westernmost unit would be as close as 90 horizontal feet to the nearest of these condenser units. However, due to the 6-foot-tall property line wall proposed along the western property boundary, the predicted sound emission level from the combination of all eight operating condenser units as received by this off-site single-family home would be 46 dBA L_{eq} and would thus be compliant with the City's nighttime threshold of 50 dBA hourly L_{eq}. The operation of residential air-conditioning units would result in a **less-than-significant** noise impact.

Threshold No. 2: Would the project result in the generation of excessive groundborne vibration or groundborne noise levels?

Construction activities may expose people to excessive groundborne vibration or groundborne noise. On-site construction that would cause the most groundborne vibration and noise is associated with equipment used for grading, specifically large bulldozers for earthmoving. Caltrans has collected groundborne vibration information related to construction activities (Caltrans 2020). Information from Caltrans indicates that continuous vibrations with a PPV of approximately 0.2 ips is considered "annoying."

Groundborne vibration attenuates rapidly—even over short distances. And when groundborne vibration encounters a building foundation, a coupling loss occurs depending on the mass and design. For typical wood-framed houses, like those near the proposed project, this coupling loss is 5 vibration velocity decibels according to FTA guidance

(FTA 2018). The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in FTA and Caltrans guidance. For a bulldozer operating on site as close as the western project boundary (80 feet from the nearest receiving sensitive land use), the estimated vibration velocity level would be 0.024 ips, less than the annoyance threshold recommended by Caltrans. Therefore, vibration-induced annoyance to occupants of nearby existing homes would be less than significant.

Construction vibration at sufficiently high levels can also present a building damage risk. However, anticipated construction vibration from conventional heavy equipment associated with this proposed project would not yield levels that surpass this risk. Per Caltrans, the recommended PPV threshold for newer residential structures is 0.5 ips and for older residential structures it is 0.3 ips—both of which are less stringent that the threshold to annoy occupants of such structures; thus, vibration damage risk to nearby structures is considered less than significant.

During project operation, the proposed project would feature mechanical systems like heating, ventilation, and air-conditioning units. These systems are designed and manufactured to feature rotating (fans, motors) and reciprocating (compressors) components that are well-balanced with isolated vibration within or external to the equipment casings. On this basis, vibration due to proposed project operation would be less than significant.

Overall, impacts related to generation of excessive groundborne vibration or groundborne noise levels as a result of project construction and operation would be **less than significant**.

Threshold No. 3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

There are no private airstrips within the vicinity of the project site. The closest airport to the project site is the McClellen Palomar Airport approximately 5 miles west southwest of the site. **No impact** would occur.

3.11.5 Cumulative Impact Analysis

Noise levels tend to diminish quickly with distance from a source. Therefore, the geographic scope of the analysis of cumulative impacts related to noise is limited to locations immediately surrounding and in close proximity to the project site. As described in Section 3.11.4, project implementation would result in less-than-significant noise impacts. No mitigation is required with implementation of the project design features.

Cumulative traffic noise impact could occur in combination with the project and cumulative projects during construction if traffic noise exceeded City standards. However, it is likely that any construction traffic, as related to export/import haul trucks associated with cumulative projects, would be distributed among different roadways based on the locations of cumulative projects. Similar to the proposed project, cumulative projects would include construction and operation noise reduction measures to reduce any potentially significant noise impacts to a level below significance, where feasible. Development plans for cumulative projects would be required to outline mitigation measures, design features, and required regulatory compliance. Implementation of project-specific mitigation and design features would ensure cumulative noise impacts would remain at a **less-than-significant** level.

3.11.6 Mitigation Measures

As analyzed in Section 3.11.4, potential noise impacts during construction and operation of the project would be less than significant. No mitigation is required.

3.11.7 Conclusion

As discussed above, potential noise impacts during construction would be less than significant. Noise impacts due to operation of the proposed project (including traffic noise) would be less than significant with implementation of PDF-NOI-1 and PDF-NOI-2. No further mitigation is required. Further, the proposed project would comply with the General Plan's 45 dBA interior noise standard. Proposed project impacts related to noise would be **less than significant.**

3.12 Population and Housing

This section describes the existing setting of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to population and housing resulting from the project. This section considers population and housing characteristics in the area and discusses project consistency with regional growth projections.

Table 3.12-1 provides a summary of the project- and cumulative-level population and housing impacts by threshold.

Table 3.12-1. Population and Housing Summary of Impacts

Threshold of Significance	Project Direct Impact	Project Cumulative Impact	Significance Determination
No. 1: Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).	Less than Significant	Less than Significant	Less than Significant
No. 2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.	No Impact	No Impact	No Impact

3.12.1 Existing Conditions

This section provides background information regarding population and housing forecasts for the City of San Marcos (City) based on demographic information from the San Diego Association of Governments (SANDAG) and the City of San Marcos General Plan (General Plan) Housing Element (2021–2029).

Currently, the project site is vacant and undeveloped and does not support residential uses as it is zoned for Commercial land use.

Population

According to the General Plan Housing Element, San Marcos has been one of the fastest growing cities in the San Diego region (City of San Marcos 2021). The City doubled its population in the 1980s and again between 1990 and 2010. The San Diego region grew by 8% from 2010 to 2020 and the City grew by 16% during this same timeframe (City of San Marcos 2021). As of 2020, the City had an estimated population of 96,302 (DOF 2021). Based on growth projections provided by the Series 13: 2050 Regional Growth Forecast prepared by SANDAG, it is estimated that the City's population will reach 109,095 people by 2035, and 113,015 people by 2050 (SANDAG 2013a).

The City's growth has outpaced countywide growth, and the City's population is anticipated to increase upon buildout of lands within the City limits, particularly in areas around transit facilities and near California State University San Marcos.

Housing

As of 2021, the City had 32,700 housing units. The housing stock is comprised of approximately 58.40% single-family detached and attached units and approximately 31.37% multifamily units (DOF 2021). Approximately 10.18% of the housing stock as of 2020 consisted of mobile homes (DOF 2021). Based on the Series 13: 2050 Regional Growth Forecast, the City is expected to have 35,795 housing units by 2035 and 37,337 housing units by 2050 (SANDAG 2013a).

The General Plan Housing Element identifies overcrowding and overpayment (cost burden) as two housing problems within the City (City of San Marcos 2021). Overcrowded households usually reflect the lack of affordable housing available and suitable for the size of those families, which may result in poor physical condition of the dwelling units. Of the total number of occupied units in the City in 2019, 1,959 (6.6%) housing units were overcrowded, which represents 2.6% of owner units and 13.2% of renter units. The average household size in the City was 3.17 persons in 2019, which is a slight increase from the average household size of 3.05 persons in 2010. The average household size was higher for renters (3.37 persons) than it was for owner households (3.05 persons) (City of San Marcos 2021).

Home sales in the City have generally trended upward, with median housing prices in the City rising from approximately $500,000 in 2015 to a high of $725,000 in March 2019. According to the 2015–2019 U.S. Census American Community Survey data, the median rent in the City was $1,704 per month in 2019 and very few rentals were available in December 2019. Median rents ranged from $1,449 for one-bedroom homes to $2,419–$3,067 for four-bedroom or larger homes (City of San Marcos 2021). Despite the trend of increasing housing prices, compared to the rest of the state, housing in San Marcos is considered relatively affordable. While San Marcos may be relatively affordable for some, housing is not affordable for all income levels, particularly very low- and low-income households, and many households in the City end up spending more than 30% of their income on housing, leading to overpayment (City of San Marcos 2021).

Actual or potential constraints on the provision of housing affect the development of new housing and the maintenance of existing units for all income levels. Governmental and non-governmental constraints in the City are similar to those in other jurisdictions in the region. One of the most significant and difficult constraints to housing in the City and elsewhere in the San Diego region is the high cost of land (City of San Marcos 2021).

The State of California mandated the preparation of a Regional Housing Needs Plan (RHNP) (Government Code, Section 65584) for regions to address housing issues and needs based on future growth projections for the area. SANDAG is responsible for the development of the RHNP for San Diego County and allocates a fair share of regional housing needs to individual cities and unincorporated county lands. The RHNP ensures that local jurisdictions address the needs of their jurisdiction and ensures that the needs for the entire region are fairly distributed to all communities. A major goal of the RHNP is to ensure that every community provides a mix of affordable housing to all economic segments of its population.

The City's 2021–2029 Housing Element addresses SANDAG's Regional Housing Need Allocation (RHNA) schedule for the 6th Cycle, from 2021 through 2029. The California Department of Housing and Community Development, in collaboration with SANDAG, allocated 171,685 housing units that the San Diego region must plan for between 2021 and 2029. The housing units are divided into four income categories, extremely low income, low income, moderate income, and above moderate income. The RHNA allocation for the City includes 3,116 new units, of which 364 must be extremely low income units, 364 very low, 530 low, 542 moderate, and 1,316 above moderate income units. The Housing Element has identified that 7 extremely low/very low/low, 5 low, 489 moderate, and 45 above

moderate income units have been constructed, are under construction, or have been issued permits since June 30, 2020. An additional 81 extremely low/very low income units, 50 low income units, 409 moderate income units, and 499 above moderate income units are approved/entitled within the City. The City has exceeded its Cycle 6th RHNA for the moderate income category between the units that have been constructed, are under construction, or have been issued permits since June 30, 2020, and those units that are approved, entitled, or in process; as such, the remaining units that must be accommodated for the 6th Cycle are those for extremely low/very low, low, and above moderate income households (City of San Marcos 2021).

3.12.2 Regulatory Setting

This section describes the regulatory setting as it relates to population and housing for the project.

Federal

There are no federal codes, policies, or regulations regarding population and housing that would apply to the proposed project.

State

California Planning and Zoning Law

The legal framework within which California counties and cities exercise local planning and land use functions is provided in the California Planning and Zoning Law (Sections 65000 through 66499.58 of the California Government Code). Under that law, each county and city must adopt a comprehensive, long-term general plan. The law gives counties and cities wide latitude in how a jurisdiction may create a general plan, but there are fundamental requirements that must be met. The requirements include seven mandatory elements described in the Government Code. Each element must contain text and descriptions setting forth objectives, principles, standards, policies, and plan proposals; diagrams and maps that incorporate data and analysis; and implementation measures.

Once the general plan of a county or city is adopted, it should be construed as a dynamic document, for which adaptability is a key component. Each jurisdiction should frequently review its general plan for consistency and to ensure it addresses growth-related issues in a comprehensive manner. State law allows up to four general plan amendments per general plan element per year, so each jurisdiction can make changes as justified.

California Building Standards Code

In 2001, California consolidated the Uniform Building, Plumbing, Electrical, and Mechanical codes into the California Building Standards Code, which is contained in Title 24 of the California Code of Regulations. The California Building Standards Code contains 11 parts: Electrical Code, Plumbing Code, Administrative Code, Mechanical Code, Energy Code, Residential Building Code, Historical Building Code, Fire Code, Existing Building Code, Green Building Standards Code, and the Reference Standards Code. These codes promote public health and safety and ensure that safe and decent housing is constructed in San Diego County's unincorporated areas.

Senate Bill 375

Senate Bill 375 (codified in the Government Code and California Public Resources Code) took effect in 2008 and provides a new planning process to coordinate land use planning, regional transportation plans, and funding priorities in order to help California meet the greenhouse gas reduction goals established in Assembly Bill 32.

Senate Bill 375 requires metropolitan planning organizations to incorporate Sustainable Communities Strategies (SCSs) in their Regional Transportation Plans (RTPs) that will achieve greenhouse gas emissions reduction targets by reducing vehicle miles traveled from light-duty vehicles through the development of more compact, complete, and efficient communities.

Regional Housing Needs Assessment

As discussed above, an RHNA is mandated by state housing law as part of the periodic process of updating local general plan housing elements. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods.

Communities use the RHNA in land use planning, prioritizing local resource allocation, and deciding how to address identified existing and future housing needs resulting from population, employment, and household growth. The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth, so that collectively the region and subregion can grow in ways that enhance quality of life, improve access to jobs, promote transportation mobility, and address social equity and fair share housing needs.

Local

San Diego Association of Governments

SANDAG is a public agency composed of 18 cities and the County of San Diego that builds strategic plans guiding the San Diego region in land use, growth, economics, and the environment. SANDAG also provides population and housing estimates for the region, which are based in part on local jurisdictional planning data and inform regional planning.

The SANDAG Regional Comprehensive Plan, adopted in 2004, provides a long-term planning framework for the San Diego region (SANDAG 2004). The Regional Comprehensive Plan identified smart growth and sustainable development as important strategies to direct the region's future growth toward compact, mixed-use development in urbanized communities that already have existing and planned infrastructure. The plan also emphasized connecting those communities with a variety of transportation choices.

In 2011, SANDAG approved the 2050 RTP/SCS (SANDAG 2011). This approval marked the first time SANDAG's RTP included an SCS, consistent with the Sustainable Communities and Climate Protection Act of 2008, also known as Senate Bill 375. This RTP/SCS provided a blueprint to improve mobility, preserve open space, and create communities, all with transportation choices to reduce greenhouse gas emissions and meet specific targets set by the California Air Resources Board (CARB) as required by Senate Bill 375. In 2010, CARB established targets for each region in California governed by a metropolitan planning organization. SANDAG is the metropolitan planning organization for the San Diego region.

The SANDAG target, as set by CARB, is to reduce the region's per capita emissions of greenhouse gas emissions from cars and light-duty trucks by 7% by 2020, compared with a 2005 baseline. By 2035, the target is a 13% per capita reduction. There is no target set beyond 2035. To achieve the 2020 and 2035 targets, SANDAG and other metropolitan planning organizations were required to develop SCSs as an element of their RTPs. The SANDAG SCS integrates land use and transportation plans to achieve reductions in greenhouse gas emissions and meet the CARB-required targets.

San Diego Forward: The Regional Plan

SANDAG is required by law to update its RTP every 4 years. In December 2021, SANDAG adopted the latest update to its RTP/SCS. SANDAG's 2021 RTP/SCS, known as San Diego Forward: The Regional Plan (Regional Plan), integrates the elements of the prior Regional Comprehensive Plan and combines those elements with the Regional Plan (SANDAG 2021).

The Regional Plan contains updated growth forecasts and is based on the most recent planning assumptions considering currently adopted land use plans, including the City's General Plan and other factors from the cities in the region and the County of San Diego. SANDAG's Regional Plan will change in response to the ongoing land use planning of the City and other jurisdictions. For example, the City's General Plan, as well as other local general plans, may change based on general plan amendments initiated by the jurisdiction or landowner applicants. The general plan amendments may result in increases in development densities due to amendments of the regional category designations or zoning classifications. Accordingly, the latest forecasts from the SANDAG RTP/SCS of future development in the San Diego region, including location, must be coordinated closely with each jurisdiction's ongoing land use planning because that planning is not static, as recognized by the need for updates to SANDAG's RTP/SCS every 4 years.

Regional Growth Forecast

SANDAG estimates future population, housing, land use, and economic growth throughout San Diego County and its comprising cities, including the City of San Marcos. On October 13, 2013, SANDAG accepted the Series 13: 2050 Regional Growth Forecast (SANDAG 2013a). This forecast serves as the foundation for the Regional Plan and other planning documents across the region. SANDAG growth projections for the region and for the City are outlined in Table 3.12-2. The City is expected to experience a higher growth rate for population, housing, and employment when compared to the entire region of San Diego. It should also be noted that the 2050 Regional Growth Forecast is not intended to be an exact formula to determine growth in the region and comprising jurisdictions; rather, it should be utilized as a starting point for regional planning.

Table 3.12-2. Forecasted Growth for the San Diego Region and the City of San Marcos

Jurisdiction	Year				Change 2012–2050	
	2012	2020	2035	2050	Numeric	Percent
Population						
San Diego Regional	3,143,429	3,435,713	3,853,698	4,068,759	925,330	29%
City of San Marcos	85,560	98,915	109,095	113,015	27,455	32%
Housing						
San Diego Regional	1,165,818	1,249,684	1,394,783	1,491,935	326,117	28%
City of San Marcos	28,539	32,625	35,795	37,337	8,798	31%
Employment						
San Diego Regional	1,450,913	1,624,124	1,769,938	1,911,405	460,492	32%
City of San Marcos	37,608	45,783	54,902	64,328	26,720	71%

Source: SANDAG 2013a, 2013b.

Regional Housing Needs Assessment

The Regional Housing Needs Assessment for the 6th Housing Element Cycle, 2021–2029, was approved on July 10, 2020 (SANDAG 2020). Based on a methodology that weighs several factors (i.e., projected population growth, employment, commute patterns, and available sites), SANDAG quantified needs for housing units in the region according to various income categories. In its final Regional Housing Needs Assessment figures, SANDAG allocated 3,116 housing units to the San Marcos area for the 2021–2029 Housing Element Cycle, including 1,258 housing units for very low and low income households (SANDAG 2020).

City of San Marcos General Plan

The City's Housing Element identifies goals and associated policies to provide a basis for housing and growth projections in the City for the 2021–2029 planning period. The following goals and policies from the Housing Element of the General Plan pertain to population and housing (City of San Marcos 2021):

Goal 1: Provide a broad range of housing opportunities with emphasis on providing housing which meets the special needs of the community.

Policy 1.1: Designate land for a variety of residential densities sufficient to meet the housing needs for a variety of household sizes and income levels, with higher densities being focused in the vicinity of transit stops and in proximity to significant concentrations of employment opportunities.

Goal 2: Protect, encourage, and provide housing opportunities for persons of lower and moderate incomes.

At the time of adoption of the City's Housing Element (July 2021), the City had achieved approximately half of its RHNA from the 6th cycle (or approximately 1,531 units) with housing units constructed, under construction, or approved, fulfilling its allocation of moderate income units. Based on a sites inventory assessment, the City has the ability to adequately accommodate the remaining RHNA requirements for all income levels within land that currently permits residential development (comprised of proposed applications, vacant residential sites, and vacant land in Specific Plan Areas). The project site is not identified within the City's Housing Element as a site that could contribute to the RHNA allocation (City of San Marcos 2021).

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning, of this environmental impact report (EIR). As detailed in Section 3.10.4, the project is consistent with the applicable goals and policies pertaining to population and housing.

3.12.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to population and housing are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact would occur if the project would:

- **Threshold No. 1:** Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).
- **Threshold No. 2:** Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

3.12.4 Project Impact Analysis

Threshold No. 1: Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

As described in Chapter 2, the project proposes development of 120 multifamily residential dwelling units on 7.6 acres for an approximate total density of 15.8 dwelling units per acre. The project would include a total of 260 parking spaces in addition to 37 existing spaces on site, approximately 92,645 square feet of common recreation area, and an average of 146 square feet of private open per unit. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the N Las Posas Road frontage. The proposed project also includes landscaping, bio-retention areas, and circulation improvements. The project would include two points of entry; the first entry point is located off N Las Posas Road and the second entry point is located off W Mission Road (please refer to Figure 2-1, Conceptual Site Plan).

The project would include a variety of floorplans for the proposed townhomes. Floorplans include two- and three-bedroom units that vary in size from approximately 1,200 square feet to 1,800 square feet and include differing garage configurations. All townhomes would be three stories high. The number of townhomes per building would vary from 4 to 10. Proposed residential units are designed as entry-level, market-rate housing with a range of unit sizes and price points in order to create opportunities for home ownership that would be attractive to varying income levels. The proposed townhomes would also provide for a transition between single-family homes to the north and high-density apartments to the south. All proposed buildings would be equipped with photovoltaic panels (solar panels) on the rooftops to provide solar energy to the proposed homes, in accordance with current building code.

The project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial and is within the City's General Plan Neighborhood College area. The project proposes a General Plan and Zoning Amendment to change the land use designation to Specific Plan Area (SPA) (refer to Figures 2-4 and 2-6). Design of the project would be required to follow the design guidelines outlined in the Gran Vista Specific Plan prepared for the project site (Appendix M). The design guidelines propose architectural styles for the project to be transitional in nature to allow the project to blend in with the surrounding neighborhood. Landscape screening would be provided along the top of the drainage channel slope to preserve the privacy of adjacent neighbors.

The project site is designated as a High Quality Transit Area due to its proximity to transit and other facilities and services that support alternatives to vehicle use. Palomar College, a public community college consisting of a 200-acre campus, is located east of the project site. Palomar College Transit Center, a North County Transit District hub, is located less than 0.25 miles from the project site. Palomar College Transit Center consists of a bus depot on the north side of W Mission Road, near the main entrance to Palomar College, and a train station on the south side of W Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the Transit Center provide local and regional connections to schools, employment, shopping, and entertainment options within the City, as well as San Diego and Riverside Counties. An existing bus turnout and stop are also located on W Mission Road in front of CVS. The Inland Rail Trail, a proposed 21-mile Class I bikeway, runs along the south side of W Mission Road and connects the Cities of Oceanside, Vista, San Marcos, and Escondido, as well us areas of unincorporated San Diego County.

As of 2021, the City has a person per household ratio of 3.08 (DOF 2021). Using this household ratio of 3.08, development of 120 residential dwelling units at the project site would house approximately 370 people. Although not all residents of the development would be new to the City, residential development on the project

site would still result in unplanned growth within the City because the project site is zoned for Commercial use and the project proposes a residential land use. The residential land use for the project site was not accounted for in the City's General Plan.

The project's generation of housing for approximately 370 people is not expected to substantially induce population growth in the area. This is because the area surrounding the project site is already developed. Further, because the project site is in an infill area with existing roads and utilities, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the project.

As discussed above, the City is forecasted to grow from 96,302 persons in 2020 to 109,095 persons in 2035, which is a population increase of 12,793 (SANDAG 2013a). Additionally, SANDAG allocated 3,116 housing units to the San Marcos area for the 2021–2029 Housing Element Cycle (SANDAG 2021). Approval of the project could help the City accommodate the substantial population growth projected to occur within the City and the need for housing.

The project would be subject to compliance with the City's General Plan Housing Element goals and policies, housing-related ordinances in the San Marcos Municipal Code, and applicable development fees.

The City's Growth Management Ordinance (Chapter 20.315 of the Municipal Code) was adopted to implement the General Plan and to manage the projected growth of residential, industrial, and commercial development. The ordinance requires that all new development bear the cost of providing the public facilities and services needed to effectively serve the new development. The Growth Management Ordinance does not limit density of development or cap the number of residential building permits that can be issued within the planning period. To the contrary, the ordinance will ensure that public facilities and services are, or will be, provided to serve future residential development anticipated by the RHNA.

The City's Inclusionary Housing Ordinance, established in May 2000, requires housing developers of one or more units to contribute to housing for extremely low, very low, low, and moderate income households as defined by the U.S. Department of Housing and Urban Development. Developers of for-sale single-family projects and rental projects of six or fewer units may pay an in-lieu fee in accordance with Section 20.310.050 of the Municipal Code. In-lieu fees are deposited into an interest-accruing account to provide housing opportunities for target households. The City has the discretion to accept an irrevocable dedication of land or other non-monetary contribution that is not less in value than the otherwise required in-lieu fee if the non-monetary alternative furthers the goals and policies of the Housing Element. The project would not include any designated affordable housing units and has opted to pay the in-lieu fee.

The City charges fees to process plans submitted for residential projects and to finance the provision of important services that are needed to accommodate housing and population growth. Fees and exactions are used to finance public facilities, roadways, water and sewer infrastructure, schools, and other community services. Nearly all of these fees are assessed through a pro rata share system, based on the magnitude of the project's impact or the extent of the benefit that will be derived. Failure to adequately plan for residential development is a key reason why jurisdictions are so financially constrained today. Furthermore, the City's fees have not been found to act as a constraint to the development of housing in San Marcos. For new residential projects, developers in San Marcos may be required to pay one or more of the following fees depending on the location, type, and size of the project: Planning, Building and Environmental Fees; City Impact Fees; and Regional Impact Fees (City of San Marcos 2023).

In summary, implementation of the project would change the site's land use designation and zoning from Commercial to Specific Plan Area in a manner that would accommodate development of 120 residential units and generate housing for approximately 370 people not previously accounted for by the City. However, because the

project area is already developed, the project is not expected to substantially induce unplanned population growth in the vicinity of the site. Further, because the project site is in an area with existing roads and utilities, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the project. City requirements for funding and pre-planning for implementation of housing projects would also ensure that project growth is adequately planned for prior to development. As the project would be required to comply with City regulations and applicable fees outlined above, impacts associated with unplanned population growth would be **less than significant**.

Threshold No. 2: Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The project site is currently vacant and undeveloped. Implementation of the project would not displace any existing housing or people or necessitate the construction of replacement housing elsewhere. Therefore, **no impact** would occur.

3.12.5 Cumulative Impact Analysis

Cumulative projects in addition to the project could result in both direct and indirect cumulative impacts to population and housing in the City. Projects outlined in Table 2-2 in Chapter 2, Project Description, of this EIR that include residential development could result in direct impacts to population growth in the City, and non-residential projects located on undeveloped land could result in indirect growth due to the need for new roads and/or utilities or expansion of existing infrastructure.

Cumulative projects outlined in Chapter 2 of this EIR include both residential and mixed-use development projects. The introduction of a new population is not, in and of itself, a significant impact. As with a project-level analysis, the significance of a cumulative population impact is determined by whether the population growth resulting from the combined cumulative projects would be considered to induce substantial unplanned population growth in the area. Similar to the City, the neighboring jurisdictions manage population growth and housing stock to meet their RHNA requirements. All cumulative projects would be required to prepare an environmental document addressing potential impacts to population and housing and would be required to comply with the City's General Plan Housing Element, City Ordinances related to housing, and applicable development fees. Compliance with City regulations and fees would ensure that cumulative impacts related to population and housing would be adequately addressed.

Further, the project and cumulative projects would not result in the removal of a barrier of growth that would reasonably result in the intensification or development of land or any cumulative utility or infrastructure expansion. Additionally, because the project is surrounded by existing development, approval of the project would not lead to substantial intensification of the land use in the area. Similar to the project, a CEQA analysis would be required for all cumulative projects to determine potential environmental impacts. Therefore, cumulative impacts would be **less than significant**.

3.12.6 Mitigation Measures

No significant impacts are identified; therefore, no mitigation measures are required.

3.12.7 Conclusion

Although the project would introduce a residential land use and an increase in population at the project site not previously accounted for by the City, because the surrounding project area is already developed, the project would not serve to induce substantial unplanned population growth in the vicinity of the site. Further, because the project site is in an area surrounded by development with existing roads and utilities, no indirect impacts associated with the extension or construction of roads or expansion of public utilities are expected to occur as a result of the project. As analyzed in Section 3.12.4, approval of the project could help the City accommodate the substantial population growth projected to occur within the City and the need for housing.

City requirements for funding and pre-planning for implementation of housing projects would also ensure that project growth is adequately planned for prior to development. The project would be required to comply with goals and policies outlined in the City's Housing Element and applicable City regulations and fees as outlined above. Approval of the proposed General Plan Amendment and Rezone of the project site from Commercial (C) to Specific Plan Area (SPA) and compliance with applicable City regulations would ensure project impacts related to the increase in population and housing would be less than significant.

Since the project site is located on undeveloped land, implementation of the project would not displace any existing housing or people in a manner that would necessitate the construction of replacement housing elsewhere.

Overall, impacts related to population and housing as a result of project implementation would be less than significant.

3.13 Public Services

This section describes the existing setting of the proposed Gran Vista Specific Plan Project (project) site, identifies associated regulatory requirements, and evaluates potential impacts related to public services, including fire protection services, police protection services, schools, parks, and libraries.

Table 3.13-1 summarizes the project- and cumulative-level public services analysis impact by thresholds of significance.

Table 3.13-1. Public Services Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:			
Fire protection services	Less than Significant	Less than Significant	Less than Significant
Police protection services	Less than Significant	Less than Significant	Less than Significant
Schools	Less than Significant	Less than Significant	Less than Significant
Parks	Less than Significant	Less than Significant	Less than Significant
Other public facilities	Less than Significant	Less than Significant	Less than Significant

3.13.1 Existing Conditions

This section details the existing service providers and resources related to fire protection, police protection, schools, parks, and libraries.

Fire Protection

The project site is located within the San Marcos Fire Protection District (SMFPD) boundary, which covers an area of 33 square miles and serves a population of approximately 95,000 residents (City of San Marcos 2022a). The San Marcos Fire Department (SMFD) would provide fire protection and emergency medical services to the project site.

The SMFD currently operates 4 fire stations, 4 paramedic assessment engine companies, 1 paramedic assessment truck company, 5 paramedic transport ambulances (24-hour units), 1 shift battalion chief, and 1 on-call duty chief. SMFD also cross-staffs three wildland fire engines and a State of California/Office of Emergency Services wildland fire engine (City of San Marcos 2022a). The SMFD Station 1, located at 180 W. Mission Road, San Marcos, California 92069, is the closest station to the project site and would likely serve the project site should fire response or emergency services be needed (City of San Marcos 2023a). SMFD Station 1 is located approximately 1.5 miles southwest of, or 4 minutes away from, the project site. SMFD Station 1 houses an engine, truck, brush engine, ambulance, and battalion chief.

Police Protection

According to the City of San Marcos (City) General Plan, Land Use and Community Design Element, the City contracts their law enforcement services from the San Diego County (County) Sheriff's Department (City of San Marcos 2012a). The project would be served by the Sheriff's San Marcos Station, located at 182 Santar Place in the northeast quadrant of the City (City of San Marcos 2012a). This sheriff station is located approximately 2.5 miles east of, or 8 minutes from, the project site.

The Sheriff's San Marcos Station provides law enforcement services to the City and unincorporated communities of Harmony Grove, Elfin Forest, Lake San Marcos, Hidden Meadows, Ivy Del, Del Dios, Lake Hodges, and the San Pasqual Valley (SDCSD 2022). Law enforcement services include general patrol, criminal investigation, crime prevention, juvenile services, narcotics and gang investigations, communications and dispatch, and various management support services (City of San Marcos 2012a). Services are available 24 hours a day, 7 days a week.

The San Marcos Station serves more than 111,000 residents and staffs more than 100 deputies, volunteers, and professional staff members (SDCSD 2022). Additionally, Community Oriented Police and Problem Solving teams are assigned to investigate community quality-of-life issues (SDCSD 2022). Lastly, the Sheriff's San Marcos Station has the only ASTREA (Sheriff's Aviation) helicopter landing pad in the County, which provides assistance to ground units and extends the range deputies can patrol (SDCSD 2022).

The County Sheriff's Department does not set response time goals. The Sheriff's Department does, however, prioritize different types of calls to better facilitate deputy dispatches. The Sheriff Department's priority categories are as follows: priority level 1 (lifesaving response calls), priority level 2 (expeditious response calls within confines of vehicle codes), priority level 3 (calls responded to as soon as possible), and priority level 4 (calls responses to when clear, still being alerted to violations that require immediate law enforcement action) (City of San Marcos 2012a).

Schools

According to the City's General Plan, Land Use and Community Design Element, primary education throughout the City is served by the San Marcos Unified School District (SMUSD) (City of San Marcos 2012a). The SMUSD is approximately 44 square miles and serves the City, portions of the City of Carlsbad, the City of Escondido, the City of Vista, and unincorporated areas of the County (SMUSD 2021). As of 2021, there were 10 elementary schools, 1 K–8 school, 1 K–8 International Baccalaureate World School, 3 middle schools, 2 comprehensive high schools, 1 continuation high school (which includes an adult transition program), and 1 independent high school program that are a part of the SMUSD. There are approximately 19,767 students enrolled in the SMUSD (SMUSD 2021).

Using the address of a business site immediately adjacent to the southeast of the project site, it was determined through SMUSD's school locator web application (SMUSD 2022a) that the project site falls within the following school boundaries (Appendix M, Gran Vista Specific Plan):

- Paloma Elementary School (serving grades K–5), located at 660 Camino Magnifico, San Marcos, California, 92069—approximately 1 mile north of the project site
- San Marcos Middle School (serving grades 6–8), located at 650 W Mission Road, San Marcos, California, 92069—approximately 1 mile east of the project site
- Mission Hills High School (serving grades 9–12), located at 1 Mission Hills Court, San Marcos, California, 92069—approximately 3 miles from the project site

Parks

The purpose of the City's Parks, Recreation, and Community Health Element of the General Plan is to provide recreational opportunities, which contribute to the health and well-being of the residents of San Marcos, and to provide goals and policies that outline the role recreational amenities plan in achieving the City's vision for the future (City of San Marcos 2012b).

There are 24 community parks, 13 neighborhood parks, and 3 recreation centers located throughout the City (City of San Marcos 2022b). The City residents in the project area are currently served by several nearby parks. Specifically, the closest park to the project site is Innovation Park located at 1151 Armorlite Drive, which is located 0.6 miles southeast of the project site. Innovation Park consists of a dog park, restrooms, picnic tables, play equipment, and pickleball courts (City of San Marcos 2022b). Other nearby parks include Mission Sports Park, located approximately 0.5 miles southeast of the project site, and Creek Park, located approximately 0.4 miles east of the project site.

Libraries

The City is served by the San Diego County Library, San Marcos Branch, which is located at 2 Civic Center Drive, approximately 2 miles east of the project site (City of San Marcos 2023b). The San Marcos Branch is 15,394 square feet (sf) (City of San Marcos 2012a), contains a MakerBot 3D printer and a 28-person capacity meeting room, is Americans with Disabilities Act accessible, and is open 7 days a week (prior to closures resulting from the 2020 COVID-19 pandemic) (San Diego County Library 2022).

3.13.2 Regulatory Setting

This section provides an overview of the applicable federal, state, and local regulations governing public services.

Federal

There are no federal codes, policies, or regulations regarding public services that would apply to the proposed project.

State

Quimby Act

Since the passage of the 1975 Quimby Act (California Government Code Section 66477), cities and counties have been authorized to pass ordinances requiring that developers set aside land, donate conservation easements, or pay fees for park improvements. Revenues generated by the Quimby Act cannot be used for the operation and maintenance of park facilities. The goal of the Quimby Act was to require developers to help mitigate the impacts of property improvements. The act gives authority for passage of land dedication ordinances only to cities and counties.

California Fire Code

The California Fire Code (CFC) and Office of the State Fire Marshal provide regulations and guidance for local agencies in the development and enforcement of fire safety standards. The CFC also establishes minimum requirements that would provide a reasonable degree of safety from fire, panic, and explosion.

Senate Bill 50—Leroy F. Greene Schools Facilities Act of 1998

Senate Bill (SB) 50, or the Leroy F. Greene School Facilities Act of 1998, restricts the ability of local agencies to deny project approvals on the basis that public school facilities (classrooms, auditoriums, etc.) are inadequate. School fees are also collected at the time when building permits are issued. Payment of school fees is required by SB 50 for all new residential development projects and is considered full and complete mitigation of any school impacts (Government Code Section 65996). As required by SB 50, school impact fees are payments to offset capital

cost impacts associated with new developments, which result primarily from costs of additional facilities, related furnishings and equipment, and projected capital maintenance requirements. As such, agencies cannot require additional mitigation for any school impacts. School impact fees and fees collected pursuant to SB 50 are collected at the time when building permits are issued.

Local

San Marcos Municipal Code Chapter 17.36—Park and Recreational Development Construction Unit Fee

San Marcos Municipal Code (SMMC) Chapter 17.36, Park and Recreational Development Construction Unit Fee, describes the need for developers of dwelling units within the City to pay applicable fees toward the City for the planning, acquisition, improvement, expansion, and operation of public parks, playgrounds, and recreational facilities to help mitigate the potential impacts on recreational facilities due to population increases (City of San Marcos 2022c). The payment of fees shall be collected prior to the issuance of building permit by the City.

San Marcos Municipal Code Chapter 17.44—Development Services and Public Facilities Exactions, Fees and/or Costs

SMMC Chapter 17.44, Development Services and Public Facilities Exactions, Fees and/or Costs, describes the payment of fees toward public services, facilities, and infrastructure in the City to mitigate increased demand on these facilities due to development of dwelling units (City of San Marcos 2022d). The developer of new dwelling units in the City would pay development service fees to the City alongside submission of an application for grading, construction, building, and/or development permit or entitlement by any person, or at the time of permit issuance, as specified by the City (City of San Marcos 2021b).

San Marcos Municipal Code Chapter 17.52—School Fees and Land Dedication

SMMC Chapter 17.52, School Fees and Land Dedication, describes the school facility fee dedications needed in the City to alleviate potential overcrowding in schools resulting from increased population from the development of dwelling units (City of San Marcos 2022e).

The City may require, as a condition to the approval of a residential development, the dedication of land, the payment of fees in lieu, or a combination of both, as determined by the decision-making body during the hearings and other proceedings, on specific residential development applications falling within their respective jurisdiction. Prior to imposition of the fees and/or dedications of land, it shall be necessary for the decision-making body acting on the application to make the following findings:

- The City's General Plan provides for the location of public schools.
- The land or fees, of both, transferred to a school district shall be used only for the purpose of providing interim elementary, junior high, or high school classroom and related facilities as defined by the governing body of the district.
- The location and amount of land to be dedicated or the amount of fees to be paid, or both, shall bear a reasonable relationship and would be limited to the needs of the community for interim elementary, junior high, or high school facilities and shall be reasonably related and limited to the need for schools caused by the development.
- The facilities to be constructed, purchased, leased, or rented from such fees or the land to be dedicated or both is consistent with the City's General Plan.

City of San Marcos General Plan

Land Use and Community Design Element

The following are applicable goals and policies from the City's General Plan, Land Use and Community Design Element, related to public services (City of San Marcos 2012a):

Goal LU-8: Ensure that existing and future development is adequately serviced by infrastructure and public services.

Policy LU-8.1: New development shall pay its fair share of required improvements to public facilities and services.

Policy LU-8.2: Promote development timing that is guided by the adequacy of existing and/or expandable infrastructure, services, and facilities.

Goal LU-10: Fire protection, emergency services, and law enforcement. Provide effective, high-quality and responsive services.

Policy LU-10.1: Provide demand-based fire-fighting and emergency medical services infrastructure, equipment, and personnel to provide a high level of fire, emergency medical, and law enforcement service in San Marcos to meet existing and future demands.

Policy LU-10.2: Work closely with the County of San Diego Sheriff's Department to determine and meet the community needs for adequate personnel, equipment and state-of-the-art technology to effectively combat crime, and meet existing and projected service demands.

Policy LU-10.3: Continue to conduct Public Outreach and education regarding fire safety and crime prevention within San Marcos.

Goal LU-11: Schools: Ensure all residents have access to high-quality education.

Policy LU-11.1: Collaborate with the local public school district (SMUSD), private schools, and institutions of higher learning to ensure a range of traditional and distance-learning educational opportunities are provided in superior, accessible facilities that complement the surrounding land uses.

Policy LU-11.2: Work with San Marcos Unified School District and developers to ensure adequate school facilities are funded as required by State law and through developer mitigation agreements between the school district and the developer. The City shall require a "will serve" letter substantiating that the developer has paid fees to the satisfaction of the school district prior to issuance of building permits.

Goal LU-12: Libraries. Provide library resources and services that meet the needs of the community.

Policy LU-12.1: Provide adequate library facilities and technological access that enhance San Marcos's quality of life and create a civic environment with vast opportunities for self-learning and academic enrichment.

Policy LU-12.2: Accommodate technology needs of the community and locate accessible technology in the library.

Safety Element

The following are applicable goals and policies from the City's Marcos General Plan, Safety Element related to public services, including fire protection, police protection, parks, and libraries (City of San Marcos 2012c):

Goal S-3: Minimize injury, loss of life, and damage to property resulting from structural or wildland fire hazards.

Policy S-3.1: Require development to be located, designed and constructed to provide adequate defensibility and reduce the risk of structural loss and life resulting from wildland fires. Development will consider hazards relative to terrain, topography, accessibility and proximity to vegetation. One such provision for development to minimize the risk of structural loss and life shall be the inclusion of overhead fire sprinklers.

Policy S-3.2: Provide sufficient level of fire protection service to reduce risk from urban and wildland fire. Advocate and support regional coordination among fire protection and emergency service providers.

Policy S-3.3: Require development to provide additional access roads when necessary to provide for safe access of emergency equipment and civilian evacuation concurrently.

Policy S-3.4: Coordinate with fire protection and emergency service providers to assess fire hazards before and after wildfire events to adjust fire prevention and suppression needs, as necessary, commensurate with both short- and long-term fire prevention needs.

Goal S-6: Provide neighborhood safety through effective law enforcement.

Policy S-6.1: Continue to maintain demand-based law enforcement service levels to reduce the risk of criminal activity.

Policy S-6.2: Continue public education efforts and community outreach programs to promote community involvement in crime and drug prevention.

Policy S-6.3: Use Crime Prevention through Environmental Design (CPTED) principles in the design or redevelopment of projects and buildings.

Parks, Recreation, and Community Health Element

The following are applicable goals and policies from the City's General Plan, Parks, Recreation and Community Health Element, related to parks (City of San Marcos 2012b):

Goal PR-1: Plan for, acquire, develop, and maintain a system of local parks connected through an integrated network of trails and high-quality recreational facilities.

Policy PR-1.1: Develop and maintain a complete system of public parks and recreational amenities that provide opportunities for passive and active recreation at a minimum standard of 5 acres per 1,000 residents. Parks, trails, and recreational facilities will enhance community livability, public health, and safety; should be equitably distributed throughout the City; and be responsive to the needs and interests of residents, employees, and visitors.

Policy PR-1.3: Ensure that the development of parks, trails, and recreation facilities and services keeps pace with development and growth within the City.

Policy PR-1.4: Promote increased access to parks and open spaces, pedestrian- and bike-oriented routes to parks and open space, greening of public rights-of-way, and a variety of active and passive uses of parks and open space.

Policy PR-1.5: Require new development to be designed and constructed in accordance with the approved Parks Master Plan to meet or exceed the City's parkland standard of 5 acres per 1,000 residents.

Policy PR-1.6: Require new infill development to provide plazas, mini parks, or other civic spaces as part of their parkland requirement.

Policy PR-1.7: Promote park and facility design that discourages vandalism, deters crime, provides natural surveillance, and creates a safe and comfortable environment.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning. As detailed in Section 3.13.4, Project Impact Analysis, the project is consistent with all applicable goals and policies pertaining to public services.

3.13.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to public services are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to public services would occur if the project would:

- **Threshold No. 1:** Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:
  - Fire protection
  - Police protection
  - Schools
  - Parks
  - Other public facilities

3.13.4 Project Impact Analysis

Threshold No. 1: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire Protection?

Residential uses were not considered at the project site in the City's General Plan, and the land use change from Commercial to Specific Plan Area to accommodate the proposed residential development could result in an increased demand on SMFD. As analyzed in Section 3.12 Population and Housing, the project would result in

development of 120 residential dwelling units, housing approximately 370 residents. The estimated generation of 370 residents is calculated based on an average of 3.08 occupants per household. The project would increase the demand on SMFD resources in comparison to development of a commercial use under the current allowed land use designation as a result of the increase of residents in the area. Although not all residents of the project would be new or additional to the City, the estimated additional numbers of residents at the project site would increase the need for fire protection services related to routine fire and emergency medical calls. The project would generate emergency calls, primarily medical, proportionally with its population. At build out, there may be as many as 44 calls per year generated by the on-site population. The addition of 1 call per 8 days to a station that is currently running approximately 17 to 18 calls per day is not considered a significant increase.

A Preliminary Fire Emergency Response Analysis prepared for the project (Appendix J to this EIR) included a response time analysis and call volume analysis. The Preliminary Fire Emergency Response Analysis (Appendix J) determined that SMFD could provide emergency response to the project site within its internal 7-minute response time from SMFD Station 1. Based on the conservative modeling in this analysis and the response times meeting the SMFD's internal response standards, there is no response time trigger for a new fire station to be provided in closer proximity to the project site. The existing Fire Station 1 would be able to adequately respond within the City's response time standard.

The project would be required to comply with SMFD and CFC requirements. In addition, the project would be required to comply with the City's Development Services Fees outlined in Section 17.44.030 of the SMMC. Payment of the Development Services Fees go toward City services. The project would be required to annex into the Community Facilities District (CFD 2001-01: Fire and Paramedic), which would help support the increased demand for services on existing public services and facilities. For the reasons stated above, potential impacts to fire response time as a result of the project would be **less than significant**.

Police Protection?

As discussed above under Fire Protection, the proposed residential development would develop 120 residential dwelling units, generating approximately 370 residents at the project site. Residential development at the project site would increase the demand on police protection services in comparison to the commercial uses allowed under the current land use designation because of the substantial increase in area residents. Although not all residents would be new/additional residents to the City, the project could increase the need for police protection services through routine police and emergency calls, and could increase the demand on the County Sheriff's Department San Marcos Station, which would serve the project site. The San Marcos Station is located approximately 2.5 miles east of the project site.

Implementation of the project would be expected to increase the frequency of emergency and non-emergency calls to the Sheriff's Department. However, as discussed in Section 3.13.1, Existing Conditions, more than 100 deputies, volunteers, and professional staff serve the residents of the City. Law enforcement services include general patrol, criminal investigation, crime prevention, juvenile services, narcotics and gang investigations, communications and dispatch, and various management support services. Unlike fire services, which respond solely to emergencies, law enforcement services consist of patrolling large areas 24 hours a day, 365 days a year. Police units are continuously mobile, and service calls are responded to by the nearest available mobile unit. At the San Marcos Station, patrol deputies are assigned to a geographical "beat" area, allowing deputies to become familiar with citizens and problems within their beats (SDCSD 2022). Accordingly, service ratios and response times are anticipated to remain adequate with implementation of the project. As such, the project is not expected to affect police protection such that new or physically altered governmental facilities are needed.

Additionally, the project would be required to comply with the City's Development Services Fees outlined in Section 17.44.030 of the SMMC. The project also would be required to annex into the Community Facilities District (CFD 98-01: Improvement Area No. 1 [Police Only]), which would provide funding to police services as the demand for services increases with new development. Payment of the Development Services Fees funds needed City services, which include the Sheriff's Department.

Therefore, while the project would place a slight increased demand on police protection services, it is not anticipated that the project would result in the need for construction or expansion of existing police facilities, and impacts to police response resulting from the project would be **less than significant**.

Schools?

As outlined above, the project would develop 120 residential dwelling units, generating approximately 370 residents, some of which are expected to be students. As described under Section 3.13.1, primary education throughout the City is served by the SMUSD. Paloma Elementary School (serving grades K–5), San Marcos Middle School (serving grades 6–8), and Mission Hills High School (serving grades 9–12), are the schools within the SMUSD that would be expected to serve grade-school residents at the project site. Using the SMUSD student generation rates as described in the City's General Plan, Land Use and Community Design Element (elementary students = 0.2297, middle school students = 0.0993, high school students = 0.1234), the project would generate approximately 28 elementary school students, 12 middle school students, and 15 high school students, respectively (City of San Marcos 2012a). This number of students generated by the project is not considered substantial.

Prior to project approval, the project would be required to obtain will-serve letters from the SMUSD or servicing schools to confirm such schools have adequate capacity. Furthermore, the project would be required to contribute development fees to SMUSD pursuant to California Education Code Section 17620 et seq. and Government Code Sections 65995(h) and 65996(b), as well as SMMC Section 17.52.050. The project developer/applicant would be required to pay the school mitigation fees that are in effect at the time of building permit issuance, unless a direct agreement otherwise has been made with the SMUSD. The current school fee for residential development required by SMUSD is $4.08 per square foot; however, this fee amount could change between the drafting of this EIR and the time of building permit issuance (SMUSD 2022b). Further, consistent with General Plan Policy LU-11.2, the project would be required to provide a letter from the school district(s) to the City prior to the issuance of building permits confirming these fees have been paid (City of San Marcos 2012a). SB 50 states that the fees imposed by school districts shall constitute the exclusive method of considering and mitigating impacts on school facilities caused by a development project. Such payment shall provide "full and complete mitigation of the impacts of any legislative or adjudicative act…on the provision of adequate school facilities" (Government Code Section 65995(h)). As such, with contribution of required development fees, impacts to schools as a result of the project would be **less than significant**.

Parks?

As previously described, the project would develop 120 residential dwelling units, generating approximately 370 residents. This increase in residents would increase demands for neighborhood and regional parks and other recreational facilities. Assuming 5 acres of park space per 1,000 residents (the minimum standard goal of the City's General Plan discussed in Section 3.13.2, Regulatory Setting), the addition of 370 residents at the project site equates to a demand of approximately 1.85 acres of public park space generated by the proposed residential development. Pursuant to the City's Multifamily Residential Development Design Guidelines, an area equal to 30% of livable ground floor area of all units shall be provided as common open space. For the project, this equates to 24,431 sf of common open space. As outlined in the Gran Vista Specific Plan (Appendix M), since the main living

areas proposed for all floor plans occur on the second floor, the common open space requirement has been calculated based upon the second floor's square footage. As calculated, the project would provide 92,645 sf of common open space area, which exceeds this requirement. Additionally, SMMC provides specific requirements for children's amenities on site for multifamily residential projects. The total required children's amenities for the project would be 2,720 sf, and the project proposes to include 5,811 sf, which exceeds the City's requirement. In addition to common open space, the project would provide an average of 146 sf of private open space per unit in the form of a deck or patio. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and landscaped pedestrian paths. The provided common and private open space areas would further offset demand on existing recreational facilities in the City, as required by the SMMC (Section 20.215.050).

The project would be required to pay the City's Public Facility Fees (PFFs), which are required of all projects that increase the demand for park and recreation needs in the City. The PFF would be used for developing public neighborhood and regional parks and recreational facilities, as outlined in the City's Parks Master Plan Update (City of San Marcos 2018). The provision of usable common open space, private open space, and payment of the PFF would maintain the City's service standard for parks within the City.

Therefore, impacts related to the use of park facilities would be **less than significant**. Further details regarding parks and recreation can be found in Section 3.14, Recreation.

Other Public Facilities?

The project would develop 120 units, generating approximately 370 residents at the project site. Although not all of these residents would be new residents to the City, the generation of residents at the project site would increase the demands on other public facilities, including library services and additional resources in comparison to the project site's current commercial land use designation. However, additional library services are available in the County through a cooperation of County libraries, independent city libraries, and the Imperial County Library, which collectively form the Serra Library System. This system enables County library cardholders to check out library materials from the other Serra member libraries (Serra Cooperative Library System 2016). In addition, community members can purchase a community borrower card to obtain borrowing privileges at the California State University San Marcos campus (California State University San Marcos 2023). Community members can also borrow materials at Palomar College with a valid picture ID and proof of current mailing address (Palomar College 2021). These additional library resources are located in the San Marcos community and provide more than 200,000 sf of additional library space. Therefore, impacts to other public facilities in the City as a result of the project would be **less than significant**.

3.13.5 Cumulative Impact Analysis

Fire Protection Services

The geographic area for the cumulative analysis of fire protection and emergency services consists of those areas that are serviced by the SMFPD. The cumulative projects that fall within this geographic area would add to the increased demand for fire protection and emergency services. The SMFPD provides service to the City and has existing automatic mutual aid fire agreements in place with the cities of Carlsbad, Vista, Escondido, Encinitas, and the Rancho Santa Fe Fire Protection District.

As discussed in Section 3.13.4 above, the project would increase the demand on SMFD resources in comparison to development of a commercial use under the current allowed land use because of the increase of residents in the area. The project in addition to cumulative projects could increase the need for fire protection services through routine fire and emergency medical calls, and would increase the demand on SMFD stations, specifically Station 1 which would serve the project site.

However, similar to the project, cumulative projects would be required to comply with SMFD and CFC requirements. Additionally, the developer/applicant of cumulative projects would be required to comply with the City's Development Services Fees outlined in Section 17.44.030 of the SMMC. Payment of the Development Services Fees fund City services, which include the Fire Protection District.

Furthermore, the Preliminary Fire Emergency Response Analysis prepared for the project (Appendix J to this EIR) determined that SMFD could provide emergency response to the project site within its internal 7-minute response time, and development at the project site would not trigger the need for a new fire station closer to the project site. Therefore, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered facilities. Cumulative projects are anticipated to prepare similar analyses and provide mitigation if the response time cannot be met. Therefore, cumulative impacts to fire protection as a result of the project would be **less than significant**.

Police Protection Services

The geographic area for the cumulative analysis of police protection is those areas that are serviced by the San Marcos Sheriff's Department. All cumulative projects would result in an increased demand for police protection services from the San Marcos Sheriff's Department. The project site would be served by the San Marcos Station, located approximately 4 miles from the project site. As discussed in Section 3.13.4, the project would not result in substantial adverse physical impacts associated with the provision of new or physically altered facilities. Therefore, cumulative impacts to police protection services would be **less than significant**.

For informational purposes, cumulative projects could result in additional demand for police protection services and the potential need for additional police protection resources. Similar to the project, all cumulative projects would be required to offset increased demand to police protection services through the payment of Development Services Fees, which go toward City services including the Sheriff's Department. These fees would provide for additional staff and equipment to assist in the provision of law enforcement services.

Schools

Cumulative projects that have a residential component would generate students that need to be accommodated by either the SMUSD or another school district in the area. As discussed in Section 3.13.4, the project would be required to contribute development fees to the SMUSD, pursuant to California Education Code Section 17620 et seq. and Government Code Sections 65995(h) and 65996(b), as well as SMMC Section 17.52.050. Furthermore, will-serve letters from the SMUSD or servicing schools would be required to confirm such schools have adequate capacity to serve grade-school students generated by residential development. This would apply to similar cumulative projects as well. SB 50 states that the fees imposed by school districts shall constitute the exclusive method of considering and mitigating impacts on school facilities caused by a development project. As such, with contribution of required development fees by the project and cumulative projects, cumulative impacts to schools would be **less than significant**.

Parks

The project and the cumulative projects in the City would add to the cumulative demand for park and recreation facilities in the City. All residential projects that increase the demand for park and recreation needs in the City are required to provide park space and/or pay park in lieu-fees. The environmental documentation prepared for each project would analyze impacts associated with the construction of any parks within each overall development footprint. As discussed in Section 3.13.4, the project developer/applicant would be required to pay the City's PFF, required of all projects that increase the demand for park and recreation needs in the City, and which is used for developing neighborhood and regional parks. It is expected that all cumulative projects that increase demand for parks and recreation needs would also be required to pay these fees. It is also anticipated that similar to the project, all cumulative residential projects would provide on-site open space and/or recreational amenities consistent with the requirements of the SMMC (Section 20.215.050). With payment into the City's PFF and incorporation of on-site recreation, cumulative impacts on recreational facilities in the City would be **less than significant**.

Libraries

Cumulative projects within the services area of the San Marcos Branch Library would potentially result in an increased demand for library services. Aside from the San Marcos Branch, additional library services are available in the County through the Serra Library System. In addition, community members can get borrowing privileges at the California State University San Marcos campus and Palomar College. These additional library resources provide more than 200,000 sf of additional library space. Therefore, cumulative impacts to library facilities in the City as a result of the project would be **less than significant**.

3.13.6 Mitigation Measures

No significant impacts to public services were identified; thus, no mitigation measures are required.

3.13.7 Conclusion

As analyzed above, the project would develop 120 residential units, generating approximately 370 residents at the project site. This would result in an increased demand for fire protection, emergency medical services, police protection, school services, and library facilities. However, the project and cumulative projects would be required to comply with applicable regulations and pay all applicable development fees discussed above, including payment of school mitigation fees pursuant to California Education Code Section 17620 et seq. and Government Code Sections 65995(h) and 65996(b), as well as SMMC Section 17.52.050; payment toward the City's Development Services Fees outlined in Section 17.44.030 of the SMMC, which goes toward City services that include the fire and police services; and payment of the City's PFF required of all projects that increase the demand for park and recreation needs in the City to avoid direct and cumulative impacts to schools and parks. With compliance with applicable regulations and payment of the applicable fees outlined above, direct and cumulative impacts to public services would be **less than significant**.

3.14 Recreation

This section describes the existing recreation setting of the project site, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the Proposed Gran Vista Specific Plan Project (project).

Table 3.14-1 summarizes the project- and cumulative-impact analysis by threshold for the project.

Table 3.14-1. Recreation Summary of Impacts

Threshold of Significance	Project Direct Impact	Project Cumulative Impact	Significance Determination
No. 1 – The project increases the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	Less than Significant	Less than Significant	Less than Significant
No. 2 – The project includes recreational facilities or requires the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	Less than Significant	Less than Significant	Less than Significant

3.14.1 Existing Conditions

This section describes existing parks, recreation facilities, and trails on the project site and in the project vicinity. The City of San Marcos has more than 290 acres of park land and 37 parks (City of San Marcos 2022). The City of San Marcos's Parks Master Plan classified parks into eight categories: Regional Park; Community Park; Neighborhood Park; Mini (Urban) Park; Special Use Facility; Historical, Monument, and Memorial; Recreation Center; and Aquatic Center (City of San Marcos 2018). Details on each of these park categories are details below.

Regional Parks

Regional Parks are defined as parks that are a minimum of 50 acres, with 75 or more acres being optimal (City of San Marcos 2018). The drive time to a Regional Park is approximately 1 hour or less, and offers a variety of terrain, scenic views, cultural amenities, and extensive natural areas with both passive and active opportunities.

Community Parks

Community Parks are defined as parks that are a minimum of 10 acres and up to 100 acres (City of San Marcos 2018). Community Parks serve two or more neighborhoods with a service area of 0.5 to 3 miles. There are five Community Parks in the City of San Marcos: Bradley Park, Woodland Park, Walnut Grove Park, Discovery/Lakeview Park, and Double Peak Park. Bradley Park, Walnut Grove Park, Discovery/Lakeview Park, and Double Peak Park would serve the project site because the project site is within the service area of these four parks. Bradley Park is the closest to the project site and is approximately 1 mile southwest of the project site.

Neighborhood Parks

Neighborhood Parks are defined as parks that are generally 5 acres, although 7 to 10 acres is optimal (City of San Marcos 2018). Neighborhood Parks have a service area of 0.25 to 0.5 miles and should be accessible by arterial roads. There are 14 Neighborhood Parks in San Marcos: Buelow Park, Connors Park, Hollandia Park, Innovation Park, Knob Hill Park, Jacks Pond Park, Cerros de Las Posas Park, Mission Sports Park, Montiel Park, Mulberry Park, Richmar Park, San Elijo Park, Simmons Family Park, and Sunset Park.

Mini (Urban) Parks

Mini (Urban) Parks are defined as parks that are 2,500 square feet to 1 acre in size, although a park area of less than 5 acres could be considered a Mini Park (City of San Marcos 2018). A Mini Park's service area is 0.25 miles or less and is in a residential setting. There are 18 Mini (Urban) Parks in San Marcos: Alder Glen Park, Amigo Park, Bougher Park, Children's Park, Civic Center Park, Creek View Park, Discovery Meadows, Foothill Park, The Laurels Park, Optimist Park, Pebblestone Park, Quail Valley Park, Questhaven Park, Regency Hills Park, Ridgeline Trailhead, Santa Fe Hills Park, Summer Hill Park, and Valley View Park.

Special Use Facility

A Special Use Facility includes three categories of facilities (City of San Marcos 2018):

- Historic/Cultural/Social Sites – A unique local resource offering historical, educational, and cultural opportunities. Examples include historic downtown areas, performing arts parks, arboretums, display gardens, performing arts facilities, indoor theaters, churches, public buildings, and amphitheaters.
- Recreation Facilities – A specialized or single-purpose facility. Examples include community centers, senior centers, community theaters, hockey arenas, marinas, golf courses, and aquatic parks.
- Outdoor Recreation Facilities – Examples include tennis centers, softball complexes, sports stadiums, skateboard parks, and bark parks.

The size and service area of a Special Use Facility varies greatly.

Historical, Monuments, and Memorials

Historical, Monuments, and Memorials parks preserve monuments and memorials, provides programmed historical interpretation, attracts tourists, and offers passive recreation opportunities (such as trails) (City of San Marcos 2018). The size and service area varies.

Recreation Centers

Recreation Centers are intended to provide indoor leisure facilities and programs at a reasonable cost. Recreation centers also serve as meeting facilities for local social gatherings and public events, and are designed to be a hub of recreation activity (City of San Marcos 2018). The size and service area varies.

Aquatic Centers

Aquatic Centers are swimming facilities that provide active recreation for resident. The size of these facilities varies. The service area is a minimum population of 25,000, and the recommended level of service is one Aquatic Center site per 40,000 persons in San Marcos (City of San Marcos 2018).

Trails

The City of San Marcos (City) currently owns and manages 63 miles of completed trails, with plans to expand the trail network to 72 miles (City of San Marcos 2018). The goal of the trail system is two-fold: to serve as a recreational amenity, and to provide an alternative means of circulation for non-motorized travelers through an inter-linked citywide system of trails connecting residential neighborhoods to parks, schools, colleges, stores, restaurants, movie theaters, other important destinations within San Marcos, and the wider regional trails system.

3.14.2 Regulatory Setting

This section describes the federal, state, and local laws and regulations that are applicable to recreation and the project.

Federal

There are no federal codes, policies, or regulations regarding recreation that would apply to the proposed project.

State

Quimby Act

Since the passage of the 1975 Quimby Act (California Government Code Section 66477), cities and counties have been authorized to pass ordinances requiring that developers set aside land, donate conservation easements, or pay fees for park improvements. Revenues generated by the Quimby Act cannot be used for the operation and maintenance of park facilities. The goal of the Quimby Act was to require developers to help mitigate the impacts of property improvements. The act gives authority for passage of land dedication ordinances only to cities and counties.

Landscape and Lighting Act of 1972

The Landscape and Lighting Act of 1972 enables cities, counties, and special districts to landscape and light public areas for parks, recreation facilities, and open space. A local government may also use the assessments to pay for improvements and maintenance in these areas.

Mello-Roos Community Facilities Act

The Mello-Roos Community Facilities Act (Government Code Section 53311 et seq.) is a tax-based financing method available to cities, counties, and special districts. It authorizes local governments to establish community facilities districts within which they may levy special taxes and issue bonds to finance open space acquisition, maintenance, and other programs. Approval of the special tax and any related bond issue requires approval by two-thirds of the district electorate.

Local

San Marcos Municipal Code Chapter 17.36 – Park and Recreational Development Construction Fee

As described in Chapter 17.36, Park and Recreational Development Construction Unit Fee, of the San Marcos Municipal Code (SMMC), the continued increase in the development of dwelling units and population within San Marcos has created the need for planning, acquisition, improvement, expansion, and operation of public

parks, playgrounds, and recreational facilities, and thus the need for additional revenue with which to finance such facilities. This chapter of the SMMC requires that each builder of each dwelling unit to be constructed within San Marcos must, prior to the construction, pay a fee, as adopted by Resolution by the City Council.

San Marcos Municipal Code Chapter 17.44 – Development Services and Public Facilities, Exaction, Fees, and/or Costs

The City recognizes that the continued development of property within the City's jurisdictional boundaries has resulted in an increased demand on existing public services, facilities, and infrastructure; the need for expansion of public services, facilities, and infrastructure; and/or the need for the installation of new public services, facilities, and infrastructure. It is the intent of the City that each applicant for a grading, construction, building, and/or development permit or entitlement must, prior to the issuance of such permit or entitlement, pay a Public Facilities Fee. The funds generated by the payment of fees described Chapter 17.44 are deposited into separate accounts established for the purposes of maintaining, expanding, and installing public infrastructure. Such public infrastructure includes active and passive open space and parks.

City of San Marcos General Plan

Parks, Recreation, and Community Health Element

The following are applicable goals and policies from the City of San Marcos General Plan, Parks, Recreation, and Community Health Element (City of San Marcos 2012):

Goal PR-1: Plan for, acquire, develop, and maintain a system of local parks connected through an integrated network of trails and high-quality recreational facilities.

Policy PR-1.1: Develop and maintain a complete system of public parks and recreational amenities that provide opportunities for passive and active recreation at a minimum standard of 5 acres per 1,000 residents. Parks, trails, and recreational facilities will enhance community livability, public health, and safety; should be equitably distributed throughout the City; and be responsive to the needs and interests of residents, employees, and visitors.

Policy PR-1.3: Ensure that the development of parks, trails, and recreation facilities and services keeps pace with development and growth within the City.

Policy PR-1.4: Promote increased access to parks and open spaces, pedestrian- and bike-oriented routes to parks and open space, greening of public rights-of-way, and a variety of active and passive uses of parks and open space.

Policy PR-1.5: Require new development to be designed and constructed in accordance with the approved Parks Master Plan to meet or exceed the City's parkland standard of 5 acres per 1,000 residents.

Policy PR-1.6: Require new infill development to provide plazas, mini parks, or other civic spaces as part of their parkland requirement.

Policy PR-1.7: Promote park and facility design that discourages vandalism, deters crime, provides natural surveillance, and creates a safe and comfortable environment.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning, of this environmental impact report (EIR). As detailed in Section 3.10.4, the project is consistent with the applicable goals and policies pertaining to recreation.

Parks Master Plan

The City adopted its first Parks Master Plan in 1990, which presented a vision of parks and recreation facilities for the City. Since that time, the City has changed significantly, so a Master Plan Update was adopted in 2018. The goal of the Parks Master Plan Update is to identify potential improvements to the park system and, as funding becomes available, suggest additional amenities for new parks and improvements to existing park facilities (City of San Marcos 2018).

Master Trails Plan

The City's Master Trails Plan, adopted in 1991, details a trails implementation strategy and description of each proposed trail segment. The plan envisions a system of connectivity through trail corridors networked across San Marcos. To meet this goal, the Master Trails Plan recommends the creation of 72 miles of trails that will provide an alternative means of circulation and recreational opportunities to San Marcos residents and visitors. These trails will include 21 miles of urban trails, 36 miles of multiuse trails, and 15 miles of soft-surface trails that connect neighborhoods to parks, schools, and workplaces, as well as to the trails systems of neighboring cities and the County of San Diego (City of San Marcos 1991).

3.14.3 Thresholds of Significance

The significance criteria used to evaluate project impacts to recreation are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to recreation would occur if the project would:

- **Threshold 1:** Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.
- **Threshold 2:** Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

3.14.4 Project Impact Analysis

Threshold 1: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

According to the State of California Department of Finance, there are approximately 3.08 persons per housing unit in San Marcos (DOF 2021). The project proposes development of 120 residential dwelling units, which is estimated to generate approximately 370 residents using the California Department of Finance's 3.08 persons per household unit estimate (see Section 3.12, Population and Housing, of this EIR). This increase in residents would increase demands for neighborhood and regional parks and other recreational facilities. Assuming 5 acres of park space per 1,000 residents (the minimum standard goal of the City's General Plan, discussed in Section 3.14.2, Regulatory Setting), the addition of project residents equates to a demand of approximately 1.85 acres of public park space generated by residents of the project site.

As described in Section 3.12 of this EIR, pursuant to the City's Multifamily Residential Development Design Guidelines, an area equal to 30% of livable ground floor area of all units must be provided as common open space. For the proposed project, this equates to 24,431 square feet of common open space. As outlined in the Gran Vista Specific Plan (Appendix M), because the main living areas proposed for all floor plans occur on the second floor, the common open space requirement has been calculated based on the second floor's square footage. As calculated, the project would provide 92,645 square feet of common open space area, which exceeds the requirements of the Design Guidelines. Additionally, the SMMC provides specific requirements for children's amenities on site for multifamily residential projects. The total required children's amenities for the project would be 2,720 square feet, and the project proposes to provide 5,811 square feet, which exceeds the City's requirement. In addition to common open space, the project would provide an average of 146 square feet of private open space per unit in the form of a deck or patio. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and landscaped pedestrian paths. These provided common and private open space areas would further off-set demand on existing recreational facilities in San Marcos, as required by SMMC Section 20.215.050.

In total, the project would provide 2.12 acres of useable common open space area with grades of less than 10%, as outlined in Figure 2.2, Distribution of Allowable Uses, in the Gran Vista Specific Plan (Appendix M).

In addition to the proposed open space and amenities on site, the project would be required to pay the City's Public Facility Fees (PFFs), as applicable, required of all projects that increase the demand for park and recreation needs in the City. PFFs go toward the acquisition and development of local and community park facilities throughout San Marcos to offset the demand on public park space, as described in SMMC Chapters 17.36 and 17.44. Payment of the PFF would be made prior to City issuance of the first building permit for the project. Therefore, payment, which would ultimately contribute to development of new parks and recreational facilities, would offset the increase in demand of parks and recreational facilities generated by residential development at the project site, such that existing facilities would not substantially deteriorate. Therefore, project impacts to existing neighborhood and regional parks would be **less than significant**.

Threshold 2: Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

As stated under Threshold 1, the project would provide 2.12 acres of useable common open space area with amenities on site that include tot lots and recreational areas, a dog park, a community garden, and landscaped pedestrian paths. The project's proposed open space amenities are analyzed as part of this EIR. Furthermore, the project developer would be required to pay the City's PFF, which would go toward the acquisition and development of local and community park facilities throughout San Marcos to offset the demand on public park space. Therefore, impacts related to the construction or expansion of recreational facilities would be **less than significant**.

3.14.5 Cumulative Impact Analysis

The project, in addition to cumulative projects, would increase the demand for park and recreation facilities in San Marcos. Similar to the proposed project, all cumulative projects that increase the demand for park and recreation needs would be required to provide park space and/or pay the City's PFF. Furthermore, any substantial expansion or development of new recreational facilities would be subject to the appropriate CEQA environmental review, which would identify and address any site-specific impacts. Therefore, with payment of the City's PFF and project-specific environmental review, cumulative impacts to recreational facilities would be **less than significant**.

3.14.6 Mitigation Measures

No significant impacts to recreation were identified; thus, no mitigation is required.

3.14.7 Conclusion

As analyzed in Section 3.14.4, Project Impact Analysis, the project is required to present site plans outlining proposed open space and recreational amenities on site, and the project applicant/developer would be required to pay the City's PFF. Payment would be determined by the City based on the presented plans for the site. As described above, developer payment of the PFF would go toward the acquisition and development of local and community park facilities throughout San Marcos to offset the demand on public park space. With payment of the PFF and provision of the proposed on-site open space, impacts related to recreation would be **less than significant**.

INTENTIONALLY LEFT BLANK

3.15 Transportation

This section describes the transportation impact analysis for the proposed Gran Vista Specific Plan Project (project). It includes a description of existing traffic conditions, trip generation for the project, traffic modeling, and identification of mitigation measures. This section is based on the Local Transportation Analysis (LTA), and Vehicle Miles Traveled (VMT) Analysis Technical Memorandum prepared by CR Associates in February 2023. These reports are included as Appendix K-1 and K-2 to this environmental impact report (EIR), respectively.

Table 3.15-1 summarizes the project- and cumulative-level impact analyses by threshold.

Table 3.15-1. Transportation Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.	Less than Significant	Less than Significant	Less than Significant
No. 2: Conflict or be inconsistent with CEQA Guideline section 15064.3, subdivision (b).	Potentially Significant	Significant and Unavoidable	Significant and Unavoidable
No. 3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	Less than Significant	Less than Significant	Less than Significant
No. 4: Result in inadequate emergency access.	Less than Significant	Less than Significant	Less than Significant

3.15.1 Existing Conditions

This section describes the existing circulation and transportation system in the project area and the methodology used to prepare the transportation analysis.

Project Location

The approximately 7.6-acre project site is surrounded by existing development located in the northwestern portion of the City of San Marcos (City), at the northwest corner of N Las Posas Road and W Mission Road. The project site is bounded by N Las Posas Road along the eastern boundary, W Mission Road along the southwest boundary, an existing CVS store to the south, and existing single-family residential development to the north and west, as well as to the east across N Las Posas Road. Nearby land uses in the vicinity of the project site include industrial and commercial uses to the south and east, the Santa Fe Hills residential community to the north, and Palomar College approximately 0.2 miles to the east. The closest freeway is State Route 78 located approximately 0.4 miles south of the project site.

The project site is currently zoned for Commercial (C) use with an existing General Plan designation of “Commercial” and is within the City’s General Plan Neighborhood College area. The project proposes a General Plan Amendment and Rezone to change the land use designation to Specific Plan Area (SPA).

The project site is designated as a High Quality Transit Area due to its proximity to transit and other facilities and services that support alternatives to vehicle use. Palomar College, a public community college consisting of a 200-acre campus, is located east of the project site. Palomar College Transit Center, a North County Transit District (NCTD) hub, is located less than 0.25 miles from the project site. Palomar College Transit Center consists of a bus depot on the north side of W Mission Road, near the main entrance to Palomar College, and a train station on the south side of W Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the Transit Center provide local and regional connections to schools, employment, shopping, and entertainment options within the City, as well as San Diego and Riverside Counties. An existing bus turnout and stop are also located on W Mission Road in front of CVS. The Inland Rail Trail, a proposed 21-mile Class I bikeway, runs along the south side of W Mission Road and connects the Cities of Oceanside, Vista, San Marcos, and Escondido, as well us areas of unincorporated San Diego County.

Methodology

Transportation Impact Analysis Approach and Methodology

As part of the TIA prepared for the project, the vehicle miles traveled (VMT) analysis was prepared to satisfy the requirements of the California Environmental Quality Act (CEQA). The level of service (LOS) analysis conducted as a part of the LTA was used to evaluate the effects of the proposed project on the circulation network. Per the City of San Marcos Transportation Impact Analysis Guidelines, the City strives to maintain intersection and roadway segment operations based on LOS standards outlined in the City of San Marcos General Plan (General Plan) Mobility Element (City of San Marcos 2020). Improvements should be identified for any study facilities that do not meet City LOS standards to increase performance to acceptable or pre-project conditions.

A discussion of LOS is included to support the Local Transportation Analysis (LTA) and consider consistency with programs addressing the circulation system for informational purposes only. Under CEQA, LOS or other measures of vehicle capacity or traffic congestion are no longer considered to be a significant impact on the environment. The effect of the project on traffic delay is not a significant impact under CEQA. For informational purposes, trip generation rates and distribution information are provided from the TIA. However, the potential CEQA environmental impact of the project in terms of vehicle trips is analyzed in terms of VMT below.

VMT Metrics

Consistent with the City's Transportation Impact Analysis Guidelines (City of San Marcos 2020), the proposed project shall be analyzed by the following VMT metric:

> VMT/Capita which includes, for all San Diego County residents, all vehicle-based resident travel grouped and summed to the home location of the individual. It includes all resident vehicle travel: home-based and non-home-based. The VMT for each individual is then summed for all individuals residing in a particular census tract and divided by the population of that census tract to arrive at Resident VMT/Capita. A significant impact will occur if the project generates VMT per resident greater than 85 percent of the regional average.

The City's Transportation Impact Analysis Guidelines provide screening criteria to screen out VMT based on project size, location, provision of affordable housing, and transit availability. The City uses screening thresholds to quickly identify when a project should be expected to cause a less-than-significant impact without conducting a detailed VMT study. Relevant screening criteria for the proposed project is described below:

- Screening Threshold for Small Projects – Absent substantial evidence indicating that a project would generate a potentially significant level of VMT, or inconsistency with the City General Plan, projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less-than-significant transportation impact.
- Map-Based Screening for Residential and Office Projects – Residential and office projects located in areas that generate VMT below adopted City threshold can be presumed to have a less-than-significant transportation impact. This determination must be made by SANDAG's [the San Diego Association of Governments'] online residential and employment VMT maps for existing year or model baselines year VMT (whichever is available at the time analysis is being conducted), which show census tracts in the city where the VMT is below the regional average.
- Presumption of Less Than Significant Impact for Affordable Residential Development – Residential projects with 100 percent deed restricted affordable housing can be presumed to have a less-than-significant transportation impact. Projects can only be screened out if they are located in parts of the city that have been identified by SANDAG and the City as Smart Growth Opportunity Areas.
- Presumption of Less Than Significant Impact Near Transit Stations – Projects located within one-half mile walkshed of a high-quality transit area can be presumed to have a less than significant transportation impact. However, this presumption does not apply if the project:
  - Has a floor area ratio (FAR) of less than 0.75;
  - Includes more parking for use by residents, customers, or employees of the project than required by the City;
  - Is inconsistent with the City's current General Plan, as determined by the City; or,
  - Replaces affordable residential units with a smaller number of moderate- or high-income residential units

If a project would result in significant impacts, CEQA requires mitigation measures to be implemented to reduce or mitigate an impact. VMT is reduced by implementing strategies that reduce the number of automobile trips generated by the project, shift more trips from automobile to non-automobile modes, and/or reduce the distances that people drive. Generally, these reductions can be achieved by the implementation of transportation demand management (TDM) strategies. TDM measures focus on understanding how people make their transportation decisions and helping people use the infrastructure in place for transit, ridesharing, walking, biking, and teleworking. The following are examples of TDM measures:

- Transit pass subsidies
- Carpool program
- Flexible work schedules
- Telework
- Showers, changing rooms, and secure bike parking to help employees bike to work

Projects for which VMT impacts are determined to be significant are required to propose a list of VMT reduction measures and document the associated percent reduction in VMT. Mitigated project VMT is calculated by applying the percent reduction. Project VMT is then compared to the threshold of significance to determine if the project's VMT impact has been mitigated.

Study scenarios used for traffic impact analysis are outlined below:

- **Existing Conditions** are utilized to establish the existing baseline of traffic operations within the study area.
- **Near-Term (Interim Year 2024) Conditions** are based on the SANDAG pre-established interim year scenario closest to the project's anticipated opening year.
- **Near-Term (Interim Year 2024) Plus Project Conditions** include project-generated traffic added to interim year volumes.
- **Horizon Year Conditions** are based on the Regional Transportation Plan year, currently 2050.
- **Horizon Year Plus Project Conditions** include project-generated traffic added to horizon year traffic volumes.

Existing Street Network

Figure 5.1 of Appendix K-1 to this EIR depicts existing conditions within the transportation study area, including signalized intersections and lane configurations. The transportation study area evaluated for the project includes the following intersections and street segments, based on the anticipated distribution traffic to/from the project site:

Intersections:

1. N Las Posas Road and Project Driveway No. 1/Palm Road (Signal)
2. W Mission Road and Project Driveway No. 2 (Side-Street Stop-Controlled)
3. N Las Posas Road and W Mission Road (Signal)

Segments:

1. N Las Posas Road, between Palm Road and W Mission Road
2. N Las Posas Road, between W Mission Road and Armorlite Drive
3. W Mission Road, between Pacific Street and N Las Posas Road
4. W Mission Road, between N Las Posas Road and Palomar College Driveway

The principal roadways in the transportation study area are described briefly below. Roadway classification was determined from a review of the General Plan Mobility Element and information gathered from field observations.

N Las Posas Road is currently constructed as a 6-lane divided roadway between the State Route 78 westbound ramps and Avenida Azul, a 4-lane divided roadway between Avenida Azul and Avenida Arana, and a 3-lane undivided roadway between Avenida Arana and Avenida Leon. The posted speed limit is 45 mph. On-street parking is prohibited. Class II bike lanes are provided. N Las Posas Road is classified as a 6-Lane Arterial between State Route 78 westbound ramps and Avenida Azul.

W Mission Road is constructed as a 4-lane undivided roadway with a two-way left-turn lane between Comet Circle and N Las Posas Road. The posted speed limit is 40 mph. On-street parking is prohibited. Class I (eastbound) and Class II (westbound) bike lanes are provided along the roadway. W Mission Road is classified as a 4-Lane Arterial between W San Marcos Boulevard and Las Flores Drive.

Existing Traffic Volumes

Both signalized and unsignalized intersections, in addition to street segments, were analyzed as part of the local transportation analysis. These terms are described below:

Signalized intersections: Signalized intersections were analyzed under AM and PM peak hour conditions. Average vehicle delay was determined utilizing the methodology found in Chapter 19 of the Highway Capacity Manual 6th Edition (TRB 2016), with the assistance of the Synchro Version 11 computer software. The delay values (represented in seconds) were qualified with a corresponding intersection LOS.

Unsignalized intersections: Unsignalized intersections were analyzed under AM and PM peak hour conditions. Average vehicle delay and LOS was determined based upon the procedures found in Chapter 20 and Chapter 21 of the Highway Capacity Manual 6th Edition (TRB 2016) with the assistance of the Synchro Version 11 computer software.

Street Segments: Street segment analysis is based upon the comparison of average daily traffic (ADT) volumes to the City's Roadway Classification, Level of Service, and ADT Table (City of San Marcos 2012b). This table provides segment capacities for different street classifications based on traffic volumes and roadway characteristics.

Intersections

Table 3.15-2 summarizes the peak hour intersection operations under existing conditions. As seen in Table 3.15-2, all study intersections operate at LOS D or better. As explained above, LOS information is provided as part of the LTA, not in support of the CEQA analysis. LOS and other measures of vehicle capacity or traffic congestion are no longer considered to be a significant impact on the environment. For informational purposes, trip generation rates and distribution information are provided from the TIA. The potential CEQA environmental impact of the project in terms of vehicle trips is analyzed in terms of VMT.

Table 3.15-2. Existing Intersection Operations

Intersection	Control Type	Peak Hour	Existing	
			Delay	LOS
N Las Posas Road/Project Driveway No. 1/Palm Road	Signal	AM	17.7	B
		PM	16.3	B
Project Driveway No. 2 and W Mission Road	SSSC	AM	10.2	B
		PM	11.1	B
N Las Posas Road and W Mission Road	Signal	AM	39.6	D
		PM	41.2	D

Source: Appendix K-1.
Notes: LOS = level of service; SSSC =Side-Street Stop Controlled.
For SSSC intersections, the delay shown is the worst delay experienced by any of the movements.

SIGNALIZED DELAY/LOS THRESHOLDS		UNSIGNALIZED DELAY/LOS THRESHOLDS	
Delay	LOS	Delay	LOS
0.0 ⩽ 10.0	A	0.0 ⩽ 10.0	A
10.1 to 20.0	B	10.1 to 15.0	B
20.1 to 35.0	C	15.1 to 25.0	C
35.1 to 55.0	D	25.1 to 35.0	D
55.1 to 80.0	E	35.1 to 50.0	E
⩾ 80.1	F	⩾ 50.1	F

Street Segments

Table 3.15-3 summarizes the segment operations under existing conditions and the available ADT volumes from counts conducted on June 15, 2021. Counts at the study intersections, including bicycle and pedestrian counts, were conducted on June 15, 2021, between 7:00 a.m. and 9:00 a.m. and 4:00 p.m. and 6:00 p.m. As described in the LTA prepared for the project (Appendix K-1), current traffic volume counts may remain artificially depressed due to restrictions and limitations on business, school, and other activities associated with the coronavirus (COVID-19) pandemic. Therefore, current counts were compared to traffic data collected prior to 2020. All existing segments outlined below currently operate at LOS B or better under Existing Conditions.

Table 3.15-3. Existing Street Segment Operations

Street Segment	Classification	ADT	LOS Threshold (LOS E)	LOS	V/C
North Las Posas Road					
Palm Road to West Mission Road	6-Lane Major Arterial	17,900	50,000	A	0.358
West Mission Road to Armorlite Drive	6-Lane Major Arterial	22,000	50,000	B	0.440
West Mission Road					
Pacific Street and North Las Posas Road	4-Lane Major Arterial	17,800	40,000	B	0.445
North Las Posas Road to Palomar College Driveway	4-Lane Major Arterial	17,800	40,000	B	0.445

Source: Appendix K-1.
Note: ADT = average daily traffic; LOS = level of service; V/C = Volume/Capacity

Existing Transit Conditions

NCTD provides public transportation within the City and the County of San Diego for Coaster rail service, SPRINTER light rail service, and Breeze bus service. SPRINTER service operates between Escondido and Oceanside, with connections to Interstate 5 and the Coaster rail service operating out of the City of Oceanside. The NCTD operates the Palomar College Station SPRINTER and Breeze transit station located approximately 0.3 miles from the project's W Mission Road entrance. Transit service is provided to the project area via NCTD bus routes 304, 305, 347, and 445 and the SPRINTER.

Route 304 provides bus service along W Mission Road, with stops within the transportation study area along W Mission Road and Rancho Santa Fe Road. This route connects the Palomar College Transit Center to the Encinitas Train Station. This route provides a direct connection to Palomar College Station with transfers to SPRINTER, Route 305, Route 347, and Route 445 bus service. The route operates in 30-minute intervals between the hours of 4:53 a.m. and 8:23 p.m., Monday through Friday, and in 60-minute intervals between 6:53 a.m. and 9:05 p.m. on Saturday.

Route 305 provides bus service between Vista and Escondido, with stops within the transportation study area along W Mission Road. This route provides a direct connection to Palomar College Station with transfers to SPRINTER, Route 304, Route 347, and Route 445 bus service. The route operates in 30-minute intervals between the hours of 4:37 a.m. and 11:30 p.m., Monday through Friday, and in 60-minute intervals between 5:34 a.m. and 11:31 p.m. on Saturday.

Route 347 provides bus service between California State University, San Marcos, SPRINTER Station and Palomar College, with stops within the transportation study area along N Las Posas Road. This route provides a direct connection to Palomar College Station with transfers to SPRINTER, Route 304, Route 305, and Route 445 bus service. The route operates in 30-minute intervals between the hours of 5:31 a.m. and 7:21 p.m., Monday through Friday, and in 60-minute intervals between 7:22 a.m. and 7:08 p.m. on Saturday.

Route 445 provides bus service between Palomar College and Carlsbad Poinsettia Station with stops within the transportation study area along N Las Posas Road. This route provides a direct connection to Palomar College Station with transfers to SPRINTER, Route 304, Route 305, and Route 347 bus service, and to Poinsettia Station with transfers to Coaster service. The route operates in 30-minute intervals between the hours of 6:34 a.m. and 7:19 p.m., Monday through Friday. This route is not in operation during the weekends.

SPRINTER provides light rail service between Oceanside Transit Center and Escondido Transit Center. This route provides a direct connection to Palomar College Station with transfers to Route 304, Route 305, Route 347, and Route 445 bus service. The route operates in 30-minute intervals between the hours of 4:03 a.m. and 9:26 p.m., Monday through Friday, and between 4:46 a.m. and 12:26 a.m. on Saturday.

The project site is located within 0.25-miles (walking distance) of two bus stops serving Route 304, Route 305, Route 347, and Route 445 located along N Las Posas Road and W Mission Road. The closest bus stops to the project site are located near the intersection of N Las Posas Road and W Mission Road and the intersection of W Mission Road and Pacific Street. The project site is also approximately 0.3 miles walking or biking distance from Palomar College Station.

At the intersection of N Las Posas Road and W Mission Road, the bus stop in the westbound direction provides route signage, route designations, seating with shade, and a trash receptacle. In the southbound direction the stop provides route signage only. At intersection of W Mission Road and Pacific Street, the bus stop in the westbound direction provides route signage, route designation, seating with shade, and a trash receptacle. In the eastbound direction it provides route signage only.

Existing Bicycle Network

Currently, Class II bike lanes are provided on the following study street segments:

- N Las Posas Road (both sides)
- W Mission Road (north side)

Currently, Class I bike lanes are provided on the following study street segments:

- W Mission Road (south side)

No other bicycle facilities are currently constructed within the transportation study area.

Existing Pedestrian Conditions

Pedestrian sidewalks are provided throughout the transportation study area along N Las Posas Road and W Mission Road.

3.15.2 Regulatory Setting

The following provides a general description of the applicable regulatory requirements and guidelines for the project area.

Federal

There are no federal codes, policies, or regulations regarding transportation that would apply to the proposed project.

State

California Department of Transportation

The California Department of Transportation (Caltrans) is the primary state agency responsible for transportation issues. One of its duties is the construction and maintenance of the state highway system. Caltrans has established standards for roadway traffic flow and has developed procedures to determine if intersections require improvements. For projects that may physically affect facilities under its administration, Caltrans requires encroachment permits before any construction work may be undertaken. For projects that would not physically affect facilities, but may influence traffic flow and levels of services at such facilities, Caltrans may recommend measures to mitigate the traffic impacts of such projects.

Assembly Bill 1358 – California Complete Streets Act of 2008

The California Complete Streets Act of 2008 (Assembly Bill 1358) requires circulation elements as of January 1, 2011, to accommodate the transportation system from a multimodal perspective, including public transit, walking, and biking.

Senate Bill 743, CEQA Guidelines Update

In December 2018, the California Natural Resources Agency certified and adopted the CEQA Guidelines update package, including Guidelines Section 15063.4, which implements Senate Bill (SB) 743. SB 743 required new metrics for analyzing transportation impacts under CEQA to provide an alternative to LOS. Measurements of transportation impacts may include VMT,[1] VMT per capita, automobile trip generation rates, or automobile trips generated. SB 743 further directed that unless otherwise provided, a project's effect on automobile delay shall no longer be considered a significant environmental impact under CEQA.[2] Under CEQA Guidelines Section 15064.3, VMT was determined to be the most appropriate measure of transportation impacts.

The justification for this paradigm shift is that when significant impacts are identified under a LOS and delay-based analysis, the mitigation is often to provide road improvements, which increase roadway capacity, which inherently accommodates more vehicular traffic resulting in additional greenhouse gas emissions. In contrast, under a VMT-based analysis, mitigation typically takes the form of strategies intended to reduce vehicle traffic, rather than accommodate such traffic, thereby reducing vehicle traffic and associated emissions.

Lead agencies were tasked to transition to the new guidelines and establish thresholds for transportation impacts no later than July 1, 2020. The City adopted its VMT thresholds for CEQA purposes in November 2020 as part of the City's Transportation Impact Analysis Guidelines (November 2020), which provides that a significant impact

1 VMT refers to the amount and distance of automobile travel attributable to a project.
2 California Public Resources Code, Section 21099(b). SB 743 also amends congestion management law to allow cities and counties to opt out of LOS standards within certain infill areas (OPR 2023).

would occur if a project proposing a residential land use would generate VMT per resident exceeding a level of 15% below the existing countywide average. The City's Transportation Impact Analysis Guidelines also provide VMT thresholds for other land use types including employment projects (office and industrial), retail uses, mixed-use projects, and redevelopment projects.

Local

The San Diego Association of Governments' San Diego Forward: The Regional Plan

The SANDAG's San Diego Forward: The Regional Plan combines the region's two most important existing planning documents—the Regional Comprehensive Plan and the Regional Transportation Plan and its Sustainable Communities Strategy (SANDAG 2015). The Regional Comprehensive Plan, adopted in 2004, laid out key principles for managing the region's growth while preserving natural resources and limiting urban sprawl. The plan covered eight policy areas, including urban form, transportation, housing, healthy environment, economic prosperity, public facilities, our borders, and social equity. These policy areas were addressed in the 2050 Regional Transportation Plan/Sustainable Communities Strategy and are now fully integrated into the regional plan.

The SANDAG Board of Directors adopted the 2021 Regional Plan on December 10, 2021. The 2021 Regional Plan is a 30-year plan that considers growth, movement, and residential location around the region (SANDAG 2021). The 2021 Regional Plan combines the Regional Transportation Plan, Sustainable Communities Strategy, and Regional Comprehensive Plan. As such, the 2021 Regional Plan must comply with specific state and feral mandates. These include a Sustainable Communities Strategy, per California SB 375, that achieves greenhouse gas emissions reduction targets set by the California Air Resources Board, compliance with federal civil rights requirements (Title VI), environmental justice considerations, air quality conformity, and public participation (SANDAG 2021).

Congestion Management Program

The 2008 Congestion Management Program for San Diego County was developed to meet the requirements of Section 65089 of the California Government Code. Since that time, the local agencies within San Diego County elected to opt out of the Congestion Management Program requirements, as allowed within the Government Code. As such, there are no Congestion Management Program-specific requirements associated with this project. However, to ensure the region's continued compliance with the federal congestion management process, SANDAG prepared San Diego Forward: The Regional Plan in compliance with Title 23 Code of Federal Regulations Section 450.320 (SANDAG 2015). The regional plan incorporates performance monitoring and measurement of the regional transportation system, multimodal alternatives to single-occupancy vehicles, land use impact analysis, congestion management tools, and integration with the Regional Transportation Improvement Program process.

City of San Marcos Bikeway Master Plan

The 2016 Bikeway Master Plan is an update to the City's original master plan adopted in 2001. Goals of the master plan were to obtain State Bicycle Transportation Account grant funds and improve bicycle facilities throughout the City for safer routes to school, connections to adjacent cities and incorporate an environmental inventory analysis. One of the goals of the master plan was to connect the City's trails to bicycle facilities to complete a safe and enjoyable trail and bikeway system.

City of San Marcos General Plan

Land Use and Community Design Element

The Land Use and Community Design Element of the General Plan identifies specific policies related to congestion management. Those that are applicable to the project are identified below (City of San Marcos 2012a).

Policy LU-3.7: Require new development to prepare traffic demand management programs.

Policy LU-3.8: Require new development and discretionary actions to annex into a Congestion Management Community Facilities District.

Mobility Element

The Mobility Element of the General Plan identifies specific goals and policies related to an efficient circulation system, traffic calming and safety, and alternative modes of travel. Those that are applicable to the project are identified below (City of San Marcos 2012b).

Goal M-1: Provide a comprehensive multimodal circulation system that serves the City land uses and provides for the safe and effective movement of people and goods.

Policy M-1.1: Safely and efficiently accommodate traffic generated by development and redevelopment associated with implementation of the General Plan Land Use Policy Map.

Policy M-1.2: Require new development to finance and construct internal adjacent roadway circulation and City-wide improvements as necessary to mitigate project impacts, including roadway, transit, pedestrian and bicycle facilities.

Policy M-1.3: Require new developments to prepare and implement Transportation Demand Management (TDM) programs to minimize vehicle trip generation and promote alternative modes of travel within the City.

Policy M-1.4: Utilize multi-modal LOS techniques to evaluate transportation facilities. For identified prioritized modes (based on facility typology), provide the following minimum LOS as shown in Table 3-4 of the Mobility Element:

- LOS D or better for Vehicles as a prioritized mode
  - Generally, provides facilities that have minimum vehicle congestion during peak periods. Most motorists are delayed less than 55 seconds at a signal (or less than one signalized cycle).
- The City shall allow for flexible LOS where warranted (e.g., accepting a lower LOS than identified above).

Policy M-1.6: Work to improve connectivity within the City by closing gaps in the existing bicycle, pedestrian, trail, transit, and roadway network. Work with new development to provide connectivity and redundancy in the mobility network.

Policy M-1.7: Strive to ensure that streets within San Marcos shall be complete streets where feasible; thereby providing accessibility, safety, connectivity, and comfort for all modes and users of the system. Appropriate new local streets and Main Streets will prioritize pedestrian and bicycle users through the corridor.

Goal M-2: Protect neighborhoods by improving safety for all modes of travel and calming traffic where appropriate.

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network.

Policy M-2.3: Consider roundabouts, as appropriate, as an intersection control device with demonstrated air quality, traffic efficiency, and safety benefits.

Goal M-3: Promote and encourage use of alternative transportation modes, including transit, bicycles, neighborhood electric vehicles (NEVs), and walking, within the City.

Policy M-3.1: Develop an integrated, multimodal circulation system that accommodates transit, bicycles, pedestrians, and vehicles; provides opportunities to reduce air pollution and greenhouse gas emissions; and reinforces the role of the street as a public space that unites the City.

Policy M-3.2: Improve safety conditions, efficiency, and comfort for bicyclists and pedestrians through design, maintenance and law enforcement. Install wider sidewalks and curb extensions at pedestrian crossings (bulb outs) where appropriate.

Policy M-3.3: Provide a pedestrian and bicycle network in existing and new neighborhoods that facilitates convenient and continuous pedestrian and bicycle travel free of major impediments and obstacles.

Policy M-3.5: Ensure that streets in areas with high levels of pedestrian activity (such as employment centers, residential areas, mixed use areas, and schools) support safe pedestrian travel by providing detached sidewalks, bulb-outs, enhanced pedestrian crossings, pedestrian bridges, and medians.

Policy M-3.9: Create a pleasant walking environment for roadway typologies where pedestrian travel is prioritized. This includes providing shade trees, landscaping, benches, pedestrian-scale lighting, way finding signage, transit shelters, and other appropriate amenities.

3.15.3 Thresholds of Significance

Appendix G of the CEQA Guidelines provides thresholds for determining significant environmental impacts. A project may be deemed to have a significant impact on transportation/traffic if it would:

- **Threshold No. 1:** Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
- **Threshold No. 2:** Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).
- **Threshold No. 3:** Substantially increase hazards due to a geometric design feature (e.g., sharp curves, or dangerous intersections) or incompatible uses (e.g., farm equipment).
- **Threshold No. 4:** Result in inadequate emergency access.

3.15.4 Project Impact Analysis

The following discussion summarizes the findings of the LTA (Appendix K-1) and VMT analysis (Appendix K-2) as it relates to project trip generation, project trip distribution and assignment, Near-Term (Year 2024) scenarios with and without the proposed project, and Horizon Year (Year 2050) scenarios with and without the proposed project. The discussion herein supports the findings of the project impact analysis.

Project Trip Generation

As described in Chapter 2, Project Description, of this EIR, the project proposes development of 120 residential dwelling units under the proposed Specific Plan Area designation. To determine the traffic generation of the project, SANDAG's (Not So) Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region (SANDAG 2002) rates were applied to the project. The trip generation rate for Multifamily (6–20 dwelling units/acre) was used based on the project density of approximately 15.8 dwelling units/acre.

SANDAG provides for a 5% daily trip reduction for land uses with transit access or near transit stations accessible within 0.25 miles. The site is located adjacent to transit service with stops located near project driveway no. 2. To provide a conservative analysis, however, no transit trip reduction was applied to the trip generation for this analysis.

Table 3.15-4 tabulates the total project traffic generation. The project is estimated to generate a total of 960 ADT with 77 AM peak hour trips (15 inbound/62 outbound) and 96 PM peak hour trips (67 inbound/29 outbound).

Table 3.15-4. Project Trip Generation

Land Use	Size	Daily Trip Ends (ADTs)		AM Peak Hour					PM Peak Hour				
						Volume					Volume		
		Rate	ADT	%	In: Out Split	In	Out	Total	%	In: Out Split	In	Out	Total
Multi-Family 6–20 du/acre)	120 du	8/du	960	8%	2:8	15	62	77	10%	7:3	67	29	96

Source: Appendix K-1; SANDAG 2002.
Notes: ADT = average daily traffic; DU = Dwelling Unit.

Project Trip Distribution/Assignment

Trip distribution is the process of determining traffic percentage splits on the regional and local roadway network. Trip distribution is determined based on the characteristics of the project and upon the general location of other land uses at which project trips would originate or terminate, such as employment, housing, schools, recreation, and shopping.

The traffic generated by the project was distributed and assigned based on anticipated traffic patterns to and from the site, as well as the project site's proximity to state highways and arterials. The project would be served by two driveways, one located on N Las Posas Road and one located on W Mission Road. Full turning movements would be provided at the N Las Posas Road driveway. W Mission Road driveway would include a left-turn in and right-in/right-out traffic movements.

Figure 3.1 in the LTA (Appendix K-1) shows the traffic distribution, including the project driveway traffic distribution to provide additional clarity on the local distribution of trips on the streets immediately adjacent to the project site, and Figure 6.4 in the LTA shows the Near-Term Plus Project traffic volumes. Additionally, Table 6.5, Near-Term Intersection Operations and Table 6.4, Near-Term Street Segment Operations, in Appendix K-1 show intersection and street segment operations both with and without the project.

Near-Term (Interim Year 2024) Conditions

This section describes Near-Term (Interim Year 2024) roadway network and traffic volume conditions. Year 2024 was selected based on SANDAG's pre-established interim year scenarios as the closest to the opening year of the project. The existing street system as illustrated in Figure 5.1 of the LTA (Appendix K-1) is assumed for Near-Term Conditions with no notable improvements within the transportation study area. To forecast future traffic volumes for Near-Term (Interim Year 2024) Conditions, the SANDAG Series 14 Model was utilized. The forecasted ADT volumes were then used to calculate peak hour volumes based partially on the existing relationship between ADT and peak hour volumes. As outlined in Section 6.42 of the LTA (Appendix K-1), all transportation study area roadway segments are projected to operate at acceptable LOS B under Near-Term Conditions. Additionally, all transportation study area intersections are projected to operate at acceptable LOS D or better under Near-Term Conditions.

Near-Term (Interim Year 2024) Plus Project Conditions

Intersection geometrics under the Near-Term Plus Project Conditions were assumed to be identical to the Near-Term Conditions. As outlined in Section 6.6 of the LTA (Appendix K-1), all transportation study area roadway segments are projected to operate at acceptable LOS B under Near-Term Plus Project Conditions. Therefore, no transportation study area roadway segments are anticipated to degrade in LOS to unacceptable levels with implementation of the project and no improvements would be required.

Peak hour intersection volumes for the Near-Term Plus Project Conditions were derived by combining the proposed project trips with the Near-Term base traffic volumes. As outlined in Appendix K-1, all transportation study area intersections are projected to operate at acceptable LOS D or better under Near-Term Plus Project Conditions. No study intersections are anticipated to degrade in LOS to unacceptable levels with implementation of the proposed project and no improvements would be required.

Horizon Year 2050 Conditions

Intersection geometrics under Horizon Year 2050 Conditions were assumed to be identical to the Existing Conditions. Horizon Year 2050 ADT forecasts were obtained from the SANDAG Series 14 ABM2+/2021 RP forecast year 2050 model (scenario ID no. 459). Any transportation study area roadway with Near-Term ADT found to be greater than forecasted Transportation Forecast Information Center ADT were adjusted using growth rates observed between existing and forecasted Transportation Forecast Information Center ADT for adjacent segments. Intersection turning movement volumes were developed utilizing the roadway volumes analyzed for the roadway segment analysis. Growth was applied per approach based on existing and forecasted Horizon Year 2050 ADT, distributed based on existing travel patterns, and balanced utilizing engineering judgement.

As outlined in Appendix K-1, all transportation study area roadway segments are projected to operate at acceptable LOS C or better under Horizon Year 2050 conditions. Similarly, all transportation study area intersections are projected to operate at acceptable LOS D or better under Horizon Year 2050 Conditions.

Horizon Year 2050 Plus Project Conditions

Intersection geometrics under the Horizon Year 2050 Plus Project Conditions were assumed to be identical to the Horizon Year 2050 Conditions geometrics. Peak hour intersection volumes for the Horizon Year 2050 Plus Project Conditions were derived by combining the proposed project trips with the Horizon Year 2050 traffic volumes. As outlined in Appendix K-1, all transportation study area roadway segments are projected to operate at acceptable LOS C or better under Horizon Year 2050 Plus Project Conditions. Therefore, no transportation study area roadway segments are anticipated to degrade in LOS to unacceptable levels with implementation of the proposed project and no improvements would be required. Similarly, all transportation study area intersections are projected to operate at acceptable LOS D or better under Horizon Year 2050 with Project Conditions. Therefore, no study intersections are anticipated to degrade in LOS to unacceptable levels with implementation of the proposed project and no improvements would be required.

Threshold No. 1. Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

The proposed project seeks to construct 120 multifamily dwelling units on a vacant property approximately 250 feet northwest of the W Mission Road and N Las Posas Road intersection in the City of San Marcos. The property is bordered by N Las Posas Road on the northeast side, W Mission Road on the southwest side, single-family dwelling units on the northwest side, and a CVS pharmacy to the south. Per the City's General Plan, the site is designated as a Commercial (C) land use.

The proposed project would share two existing driveways with the adjacent CVS Pharmacy, with one located off N Las Posas Road and the other off W Mission Road. The access off N Las Posas Road is via a signalized intersection at N Las Posas Road and Palm Road (driveway no. 1), and the access off W Mission Road is via a side-street (the CVS driveway) stop-controlled intersection that does not allow left-turn out movements (driveway no. 2).

The project site is located in an area surrounded by development with numerous bicycle, pedestrian, and transit facilities, as discussed in Section 3.15.1, Existing Conditions. Class II bike lanes are provided on N Las Posas Road and W Mission Road. Additionally, a Class I multi-use path exists along the south side of W Mission Road. This Class I multi-use path is identified as the Inland Rail Trail, which consists of 21 miles of proposed facilities that will eventually connect the Cities of Oceanside and Escondido while passing through the Cities of San Marcos and Vista and unincorporated areas of the San Diego County. Pedestrian sidewalks are provided throughout the area, with pedestrian crossings located at intersections surrounding the project site. As described previously, the project site is designated as a High Quality Transit Area due to its proximity to transit and other facilities and services that support alternatives to vehicle use. Palomar College, a public community college consisting of a 200-acre campus, is located east of the project site. Palomar College Transit Center, an NCTD hub, is located less than 0.25 miles from the project site. Palomar College Transit Center consists of a bus depot on the north side of W Mission Road, near the main entrance to Palomar College, and a train station on the south side of W Mission Road that serves the SPRINTER hybrid rail train. Rail service and bus transit service offered at the Transit Center provide local and regional connections to schools, employment, shopping, and entertainment options within the City, as well as San Diego and Riverside Counties. An existing bus turnout and stop are also located on W Mission Road in front of CVS.

As concluded in the TIA, the proposed project would not conflict with any existing or planned transit facilities and would not result in any impacts to transit facilities. Similarly, the proposed project would not conflict with existing bicycle facilities and would not result in any impacts to bicyclist safety and accessibility.

Sidewalks are proposed along the project frontage along N Las Posas Road and W Mission Road. Sidewalks are also proposed throughout the internal roadways providing direct access to the proposed residential units and on-site amenities. As outlined in the LTA (Appendix K-1), it is recommended that curb ramps at the project driveways be constructed, if needed, with detectable surface warning tactiles, and meeting all Americans with Disabilities Act (ADA) requirements. With project implementation of LTA recommendations, the overall pedestrian environment would be enhanced for both walkability and safety and would not result in any impacts to pedestrian facilities.

The project would be required to provide adequate on-site circulation for passenger vehicles, heavy vehicles, bicyclists, and pedestrians. Internal circulation within the project site is shown in site plans subject to City review and would be designed to comply with the following recommendations of the TIA, as required by conditions of approval:

1. Driveways would be constructed in accordance with City standards
2. Stop sign (R1-1) would be installed at project driveway no. 2
3. High visibility pedestrian crossings where crossing is allowed would be installed at project driveway no. 1
4. Existing traffic detection camera would be modified at traffic signal serving driveway no. 1 to accommodate queuing vehicles exiting through this driveway
5. Appropriate signage would be posted to warn drivers of pedestrian foot traffic
6. Installation of speed cushions/bumps along internal roadways would be considered to calm traffic

The adjacent CVS parcel includes 99 existing spaces that would remain for the exclusive and ongoing use of CVS, which only requires 53 spaces to meet the City's Parking Ordinance for commercial uses. The project site currently contains an additional 38 existing parking spaces on the project site that would be shared between the project site and CVS. The project would introduce an additional 20 guest spaces to meet the City's requirement for multifamily dwelling guest parking of 1 space per 3 units (120 units/3 = 40 spaces total). As required, 2 of the 20 additional guest parking spaces would be electric vehicle charging stations. The project also includes 240 garage spaces, which would provide two garage spaces per unit and therefore would comply with the City's Parking Ordinance. The project is consistent with SANDAG's San Diego Forward: The Regional Plan policies and strategies to manage congestion, as it would develop in an area surrounded by existing development in a manner that would reduce VMT in comparison to development under the existing land use and zoning designation of Commercial (C). The project would incorporate safe access to/from the project site and surrounding roadways and would not preclude the development of any specific improvement projects identified in the Regional Plan to reduce regional congestion. Therefore, impacts would be **less than significant.**

Threshold No. 2: Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

As discussed above, CEQA Guidelines Section 15064.3 replaces LOS with VMT as the appropriate metric to be used in assessing a project's transportation related impacts. Under CEQA Guidelines Section 15063.4(b)(1), VMT exceeding an applicable threshold of significance may indicate a significant impact. However, development projects within 0.5 miles of a major transit stop are presumed to cause a less-than-significant transportation impact (under California Public Resource Code, Section 21064.3, a "Major transit stop means a site containing an existing rail station"). Despite the project being located within 0.5 miles of a major transit stop (Palomar Station), the project would not be screened out to be less than significant because the project is inconsistent with the current General Plan. Because the project site is inconsistent with the current General Plan, a quantitative VMT analysis has been prepared for the project.

Vehicle Miles Traveled Analysis

As described under Section 3.15.1, for new land use development that does not meet any of the screening criteria, the VMT metrics and thresholds outlined in the City's Transportation Impact Analysis Guidelines, VMT Impact Thresholds by Land Use Type, are used to determine a significant transportation impact (City of San Marcos 2020). The project does not meet any of the screening criteria. Therefore, a detailed VMT analysis is required. Since the project proposes residential land uses, this EIR evaluates whether the project VMT per resident would exceed a significance threshold of 15% below the existing countywide average. The project is estimated to generate 960 ADT.

The SANDAG Series 14 model (also known as ABM 2+) is the latest available model and was used to determine the regional average VMT. VMT data should only be compared with regional averages within the same model version. Table 3.15-5 shows the project VMT analysis. Based on the model outputs, the project VMT per resident is 17.10, above the significance threshold of 15% below the regionwide average, or 14.9 VMT per resident.

Because the project's VMT per resident is more than 15% above the regionwide average, impacts would be potentially significant and mitigation is required **(Impact TRA-1).**

Table 3.15-5. VMT Impact Analysis

Metric	Regional Average[1]	Significance Threshold (15% below Average)[2]	Project[1]	Transportation Impact? (Over Threshold)
VMT per Resident	18.90	16.07	17.10	**Yes**

Source: Appendix K-2
Notes:
1 SANDAG Series 14 ABM2+/2021 RP Year 2016 Base Model
2 Regional Average x 85%

The proposed project's VMT per resident is not anticipated to fall under the significance threshold as the project site is located in a suburban area that includes single-family homes with higher automobile ownership as compared to the region. However, while the proposed project is located on an infill site and is consistent with Climate Action Plan and SANDAG's Regional Plan, impacts related to VMT per resident would not be reduced to 85% of the regional average. This impact is primarily a result of the geographic location of the proposed project in a suburban neighborhood, as trip characteristics of the surrounding residential land uses are used as a surrogate to estimate proposed project trip characteristics, regardless of the inherent differences between the land uses.

The proposed project would have a significant VMT impact and mitigation measures are required to reduce the VMT per resident. The proposed project's total VMT per resident is 17.1 miles. To mitigate the proposed project's VMT to less-than-significant levels, mitigation measures would need to reduce the total VMT per resident by 6.02% from 17.1 miles to 16.07 miles.

To reduce the average VMT per resident, it is recommended that the proposed project implement a TDM Program. A TDM program would facilitate increased opportunities for walking and bicycling, as well as provide the resources, means, and incentives for ridesharing and carpooling. The SANDAG Mobility Management Guidebook/VMT Reduction Tool was taken into consideration initially; however, this tool does not provide strategies that are applicable to project. Therefore, the methods and strategies contained in the California Air Pollution Control Officers Association Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity were considered (CAPCOA 2022).

Mitigation Measure (MM) TRA-1 through **MM-TRA-3** are proposed for the project, as outlined in Section 3.15.6. As described in Appendix K-2, based on the VMT reduction results, implementation of the TDM program is anticipated to reduce the VMT per capita generated by 0.10%. Thus, with implementation of the TDM program, the proposed project is anticipated to generate 17.08 VMT per resident (17.1 VMT per resident × (1−0.001)). The resulting 17.08 miles per resident exceeds the 16.07 miles threshold. Therefore, since the mitigation measures would not reduce the VMT per resident to less-than-significant levels, the impact is only partially mitigated, and the proposed project would have a significant and partially mitigated impact. Therefore, despite the implementation of **MM-TRA-1** through **MM-TRA-3**, impacts would be **significant and unavoidable**.

Threshold No. 3: Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves, or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The project site is located in an area surrounded by development and is bounded by N Las Posas Road and W Mission Road. The project would be served by two driveways located on N Las Posas Road and W Mission Road. Internal roadways on the project site allow for two-way flow of vehicle traffic. Dead-end aisles between buildings would provide direct access to garages for each dwelling unit. The internal circulation network for the project would not include any hazardous design features or incompatible uses. The project would include connections to existing roadways within the vicinity of the project site and access to regional arterial and highway networks and SPRINTER/Breeze transit services. All final project plans and the LTA prepared for the project (Appendix K-1) are subject to review and approval by the City and the San Marcos Fire Department. Proposed circulation improvements per the LTA would be designed in accordance with the City's roadway design standards to ensure proper safety requirements are met (Appendix K-1). All uses on site, including vehicle, pedestrian, and bicycle circulation, would be typical of a residential land use, and no incompatible uses or equipment is proposed. Furthermore, the project is designed to comply with the recommendations of the TIA, outlined under response to Threshold No. 1, which are required conditions of approval for the project. As such, impacts would be **less than significant.**

Threshold No. 4: Would the project result in inadequate emergency access?

The project would be served by two driveways located on N Las Posas Road and W Mission Road. Driveway no. 1 would provide for full turning movements while driveway no. 2 would be limited to right-out only. Both would be designed to meet the design requirements codified in the California Fire Code.

According to the General Plan Safety Element, the San Marcos Emergency Operations Plan governs the operations of the City during a disaster. This plan addresses response to moderate evacuation scenarios, including the identification of evacuation points and general routes (City of San Marcos 2012c). The project would be required to abide by standards as set forth in the San Marcos Emergency Operations Plan. Implementation of the project would not impact any roadway or staging areas that are identified in any emergency planning documents and would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Additionally, as described in Chapter 3.13, Public Services, of this EIR, the Preliminary Fire Emergency Response Analysis prepared for the project (Appendix J to this EIR) determined that San Marcos Fire Department could provide emergency response to the project site within its internal 7-minute response time from San Marcos Fire Department Station 1 to the project site.

Furthermore, the California Fire Code, along with the San Marcos Fire Department, administers the rules and regulations on fire access design. Final site plans will be required to show fire and emergency responders suitable fire access roads dimensions and surfaces (Chapter 5, Sections 503.1–503.4, of the California Fire Code) and an adequate number of emergency rated entrances to the community (Appendix D, Section D106, of the California Fire

Code). All final project plans and the LTA prepared for the project (Appendix K-1) are subject to review and approval by the City and the San Marcos Fire Department. Proposed circulation improvements would be designed in accordance with the City's roadway design standards to ensure proper safety requirements are met (City of San Marcos 2022). Therefore, for the reasons outlined above, impacts related to emergency access would be **less than significant.**

3.15.5 Cumulative Impact Analysis

The project, in addition to cumulative projects in the transportation study area, could result in cumulative impacts related to transportation and circulation. Table 6.1 in the LTA (Appendix K-1) displays the projected trip generation for the cumulative projects considered for the traffic analysis. Cumulative project traffic was assigned to the transportation study area as identified within their respective traffic studies provided by the City. Cumulative project traffic without completed traffic studies were assigned to the transportation study area utilizing the same methodology used for the proposed project, consistent with the City's Transportation Impact Analysis Guidelines. As shown in Table 6.1 in Appendix K-1, the cumulative projects are anticipated to generate 6,756 daily trips, including 536 trips during AM peak hour and 623 trips during the PM peak hour, that would be dispersed throughout the City and beyond the transportation study area.

It is expected that TIAs would be prepared for cumulative projects, consistent with City guidelines, to fully analyze project-specific impacts on site and in the transportation study area and provide mitigation measures, design features, or improvements recommendations to address any potentially significant impacts. Furthermore, all cumulative projects would be required to comply with applicable City regulations related to transportation and circulation, as the project does. As analyzed in Section 3.15.4, implementation of the project would result in a significant VMT impact in the transportation study area. For this reason, it is determined that cumulative impacts to transportation as a result of project implementation would similarly be **significant and unavoidable**.

3.15.6 Mitigation Measures

MM-TRA-1 through **MM-TRA-3** outlined below would reduce impacts related to the VMT per resident. However, even with implementation of these mitigation measures, project VMT would remain significant.

MM-TRA-1 Provide subsidized transit passes (10%) for 100% of all residents (CAPCOA T-9: Implement Subsidized or Discounted Transit Program = 0.10% VMT reduction)

MM-TRA-2 Creation and distribution of a "new resident" information packet addressing alternative modes of transportation (CAPCOA T-7: Implement Commute Trip Reduction Marketing).

MM-TRA-3 Provide on-site bike parking (CAPCOA T-10: Provide End-of-Trip Bicycle Facilities).

In addition to MM-TRA-1 through MM-TRA-3, the following improvement recommendation proposed by the LTA (Appendix K-1) would be incorporated as a condition of approval, which has the potential to further reduce VMT; however, it is not considered a mitigation measure as it does not meet CAPCOA's minimum requirements:

- Install electric vehicle charging stations at each electric vehicle guest parking space (CAPCOA T-14: Provide Electric Vehicle Charging Infrastructure).

3.15.7 Conclusion

The project would provide for residential land uses in an infill area, taking advantage of the site's location near transit, retail, employment, schools, parks, and other uses. The project would be consistent with programs, plans, ordinances, and policies addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. Implementation of the project would not conflict with any applicable plans or policies addressing circulation, would not increase hazards, and would not result in inadequate emergency access. Impacts related to Threshold Nos. 1, 3, and 4 were determined to be less than significant.

As described in response to Threshold No. 2, based on the VMT reduction results, implementation of the TDM program is anticipated to reduce the VMT per capita generated by 0.10%. Thus, with implementation of the TDM program, the proposed project is anticipated to generate 17.08 VMT per resident (17.1 VMT per resident × (1−0.001)). The resulting 17.08 miles per resident exceeds the 16.07 miles threshold. Therefore, since the mitigation measures would not reduce the VMT per resident to less-than-significant levels, the impact is only partially mitigated, and the proposed project would have a significant and partially mitigated impact. Therefore, even with implementation of **MM-TRA-1** through **MM-TRA-3**, impacts related to VMT would be significant and unavoidable. As such, cumulative impacts related to traffic would similarly be considered significant and unavoidable.

INTENTIONALLY LEFT BLANK

3.16 Tribal Cultural Resources

This section describes the existing tribal cultural resources (TCRs) of the proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project. As defined by California Public Resources Code (PRC), Section 21074, a TCR is a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe. A TCR is either on or eligible for the California Register of Historic Resources (CRHR) or a local historic register or determined by the City of San Marcos (City) at its discretion to treat the resources as a TCR (PRC Section 5024.1). Cultural resources are further analyzed in Section 3.4, Cultural Resources, of this environmental impact report (EIR).

The analysis in this section relies on the Archaeological Resource Inventory – Negative Findings Report for the Gran Vista Project prepared by Dudek in February 2023 (Appendix D to this EIR). The cultural resources report included a record search, literature review, correspondence with Native American contacts, and a field survey. The analysis also considers the California Environmental Quality Act (CEQA) Guidelines Appendix G and applicable state and local regulations, including the City of San Marcos General Plan (General Plan). Table 3.16-1 summarizes the TCRs project- and cumulative-level impacts by threshold.

Table 3.16-1. Tribal Cultural Resources Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	Potentially Significant	Less than Significant	Less than Significant with **MM-CR-1** through **MM-CR-4**

3.16.1 Existing Conditions

The project site is undeveloped and reflects a history of disturbance. Vegetation is disturbed by an abundance of invasive and weedy plant species (Appendix C, Biological Resources Technical Report).

The project area of potential effect (APE), as analyzed in the cultural resources report, includes the entire 7.6-acre project site. The project APE is located at the northwest corner of N Las Posas Road and W Mission Road and is surrounded by commercial, residential, and light industrial uses.

The information herein describes the existing archeological context of the project site. It also provides information on the outreach and consultation efforts with local tribes, as required by existing regulations.

Methodology

South Coastal Information Center Records Search

Dudek previously completed a cultural resources constraints analysis for the project (DeCarlo et al. 2021). The purpose of the records search is to identify any previously recorded cultural resources that may be located within the property. In addition to a review of previously prepared EIRs, permit application packages, site records, and reports, the records search also reviewed historical maps of the project APE and vicinity, ethnographies, the National Register of Historic Places (NRHP), CRHR, Built Environment Resources Directory, and the lists of California State Historical Landmarks, California Points of Historical Interest, and Archaeological Determinations of Eligibility. Dudek received the results of the records search on June 17, 2021 (Appendix D).

Dudek reviewed the Built Environment Resources Directory on June 16, 2021. No previously recorded built environment resources are located on the project APE or along the blocks of N Las Posas Road and W Mission Road that border the project APE.

The South Coastal Information Center records search results identified 40 cultural resources within 1 mile of the project APE, none of which intersect the current project APE. One resource, P-37-005584/CA-SDI-5584, was identified immediately adjacent to the project APE and is discussed below. Table 1 in Appendix D summarizes the cultural resources within 1 mile of the project APE.

P-37-005584/CA-SDI-5584

This site was originally recorded by Randy Franklin in 1977 as a single grinding slick in a boulder outcrop on a small knoll. Franklin (1977) stated that there was no midden but lithic flakes, core fragments, and a hammerstone were present near the adjacent road, and suggested that they may have been intrusive. This resource was located immediately east of the project APE within the current path of N Las Posas Road. This resource was destroyed during the road's construction in 1986 and its expansion by 1990.

The records search also identified 55 previous studies that have been performed within 1 mile of the project APE. Four of these studies have addressed at least a portion of the project APE, one of which (SD-18210) addressed the entire project APE. SD-18210, however, was a constraints study and did not include a full pedestrian survey. The findings of SD-18210 are similar to the findings of this inventory; therefore, they will not be summarized here. These previous 55 studies were conducted between 1974 and 2020. No survey of the project APE has been conducted within the past 6 years. A complete list of the previous studies conducted within 1 mile of the project APE is included in Appendix D.

Archival Research

The previous constraints analysis included a review of historic topographic maps and aerial photographs of the project APE and the general vicinity, to help determine the possible development and land use of the project APE in the past. The historic aerial imagery available from Nationwide Environmental Title Research LLC includes historic

photographs available since 1953 (NETR 2021). The 1953 aerial photograph shows that the property was undeveloped but still bordered W Mission Road to the south. The knoll and rock outcrop on which archaeological resource P-37-005584 was located is vaguely visible on the 1953 aerial photograph. By 1964, a natural drainage that was located west of the project APE was channelized and demarcates the western boundary of the current project APE. The project APE itself was still undisturbed but a residential development was constructed to the northeast. By 1978, the project APE and the adjacent P-37-005584 knoll were undisturbed, though a new residential development was constructed west of the project boundary. The 1984 aerial photograph shows that the southeastern corner of the project APE was graded but the rest of the project APE and the adjacent P-37-005584 knoll was undisturbed. The 1986 aerial photograph shows the grading of the current N Las Posas Road alignment. This grading disturbed the eastern border of the project APE and destroyed part of the adjacent P-37-005584 knoll. By 1989, the grading of the eastern project APE boundary was expanded and substantial earth movement was required to support the current alignment of the six-lane N Las Posas Road. This expansion destroyed the P-37-005584 knoll adjacent to the project APE. By 1991, the entire project APE had been graded. By 2009, the entire project APE was graded again leaving the property with a northern terrace that overlooked the southern 75% of the project APE. The current commercial building and parking lot that bound the southern portion of the project APE were also constructed by 2009. The historic aerial photographs show that the project APE has been undeveloped but completely disturbed.

Intensive Pedestrian Survey

A Dudek archaeologist conducted a survey of the proposed project APE on April 22, 2022. Native American Monitor Logovii Sialoi from Saving Sacred Sites Inc., a Luiseño owned company, participated in the pedestrian survey. The project consists of a vacant lot bordering existing residential and commercial developments. The project APE has been previously disturbed, as evidenced by graded terraces. There was an elevation difference of approximately 10 feet between the northern and the southern half of the parcel, showing complete disturbance of the natural landscape. Ground visibility was low throughout the project APE due to heavy vegetation with some modern trash and debris scattered throughout the area. Though currently undeveloped, the project APE is immediately adjacent to residential and commercial development and has been subjected to illicit dumping activities. Pedestrian survey was conducted utilizing formal transects at 15-meter intervals. Deviations from transects also occurred to inspect animal burrows and other locations of exposed sediments and boulders. No remnants of adjacent resource P-37-005584 or other cultural resources were identified within the project APE (Appendix D).

Native American Heritage Commission and Native American outreach letters

Dudek requested a Native American Heritage Commission (NAHC) search of the Sacred Lands File on April 15, 2022, for the project APE and a 1-mile buffer. The Sacred Lands File consists of a database of known Native American resources. These resources may not be included in South Coastal Information Center database. The NAHC replied on May 19, 2022, and reported that the Sacred Lands File did not identify any known Native American cultural resources within the project APE or the surrounding 1-mile buffer (Appendix D). The NAHC additionally provided a list of Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area.

Outreach letters were mailed on May 27, 2022, to all Native American group representatives included on the NAHC contact list (Appendix D). These letters attempted to solicit additional information relating to Native American resources that may be impacted by the project. Native American representatives were requested to define a general area where known resources intersect the project APE. To date, Dudek has received responses to these outreach letters from three tribal representatives. On June 17, 2022, San Pasqual Band of Mission Indians responded to the

letter stating that the project APE is within the boundary of the tribe's Traditional Use Area. San Pasqual stated that they would like to engage in "formal government to government consultation." On June 21, 2022, Pechanga Band of Luiseño Mission Indians stated that the project APE is within their Ancestral Territory and that they are interested in participating in the project area. Pechanga added that the project APE is within 1.75 miles of two Ancestral Placenames and nine other previously recorded sites within 0.5 miles, one of which is within the project APE. Unfortunately, no other information about the intersecting resource was included but Pechanga is likely referring to the destroyed adjacent P-37-005584 knoll. On June 28, 2022, Rincon Band of Luiseño Indians responded to the outreach letter and stated that the project APE was within the band's specific Area of Historic Interest. Rincon added that they were concerned that the project may impact Tribal Cultural Resources, Traditional Cultural Landscapes, or potential Traditional Cultural Properties. Rincon recommended an archaeological/cultural resources inventory and that a tribal monitor from the Rincon Band should accompany the survey staff. On July 12, 2022, Dudek archaeologist Matthew DeCarlo met Cheryl Madrigal, the tribal historic preservation officer for Rincon Band, at the project APE for a site visit. They discussed the previous disturbance of the area and visited the location of former prehistoric bedrock milling site P-37-005584. Ms. Madrigal stated that she would contact the City about her concerns after she had some time to research the project area. On September 8, 2022, Rincon sent a letter to the City critiquing an earlier version of this report. Rincon requested an ethno-historic research and further analysis of adjacent sites P-37-005584 and P-37-005633.

In compliance with Assembly Bill 52 and Senate Bill 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. Rincon Band responded to City outreach for Senate Bill 18 and Assembly Bill 52 on February 16 and April 13 requesting consultation on the Project. The City had a consultation meeting with representatives of Rincon Band on August 16, 2022.

3.16.2 Regulatory Setting

Federal

National Historic Preservation Act

The National Historic Preservation Act established the NRHP program under the Secretary of the Interior. The act authorized funding for state programs with provision for pass-through funding and participation by local governments, created an Advisory Council on Historic Preservation, and established the Section 106 review process for protecting historic resources. The goal of the Section 106 review process is to offer protection to sites that are determined eligible for listing in the NRHP. The National Historic Preservation Act provides the legal framework for most state and local preservation laws.

Traditional Cultural Properties (Native American Heritage Values)

Federal and state laws mandate that consideration be given to the concerns of contemporary Native Americans with regard to potentially ancestral human remains, associated funerary objects, and items of cultural patrimony. Consequently, an important element in assessing the significance of the study site has been to evaluate the likelihood that these classes of items are present in areas that would be affected by the proposed project. Also, potentially relevant to prehistoric archaeological sites is the category termed Traditional Cultural Properties in discussions of cultural resource management performed under federal auspices. According to Parker and King (1998), "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices.

State

California Register of Historical Resources (California Public Resources Code Section 5020 et. seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1[j]). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following NRHP criteria (PRC Section 5024.1[c]):

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (14 CCR Section 4852[d][2]).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

Native American Historical Cultural Sites (California Public Resources Code Section 5097 et. seq.)

State law addresses the following:

- The disposition of Native American burials in archaeological sites and the protection of such remains from disturbance, vandalism, or inadvertent destruction.
- The procedures to be implemented if Native American skeletal remains are discovered during construction of a project.
- The establishment of the NAHC to resolve disputes regarding the disposition of such remains.

In addition, the Native American Historic Resource Protection Act states that defacing or destroying Native American historic or cultural sites that are listed (or may be eligible for listing) in the CRHR is a misdemeanor punishable by up to 1 year in jail.

California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological and historic resources:

1. PRC Section 21083.2(g): Defines "unique archaeological resource."
2. PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a): Define historical resources. In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.
3. PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
4. PRC Sections 21083.2(b)–(c) and CEQA Guidelines Section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; 14 CCR 15064.5[b]). If a site is either listed or eligible for listing in the CRHR, if it is included in a local register of historic resources, or is identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1[q]), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; 14 CCR 15064.5[a]). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; 14 CCR 15064.5[a]).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5[b][1]; PRC Section 5020.1[q]). In turn, the significance of a historical resource is materially impaired when a project does the following:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA

California Health and Safety Code, Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code, Section 7050.5, requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (Section 7050.5b). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Section 7050.5c). The NAHC will notify the most likely descendant. With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 24 hours of notification of the most likely descendant by the NAHC. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Senate Bill 18

Senate Bill 18 amended Section 65351 of the Government Code and dictates the following:

> During the preparation or amendment of the general plan, the planning agency shall provide opportunities for the involvement of citizens California Native American Indian tribes, public agencies, public utility companies, and civic, education, and other community groups, through public hearings and any other means the city or county deems appropriate.

Assembly Bill 52

California AB 52, which took effect July 1, 2015, establishes a consultation process between California Native American tribes and lead agencies in order to address tribal concerns regarding project impacts and mitigation to TCRs. PRC Section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. Listed or eligible for listing in the CRHR or a local register of historical resources
2. Determined by a lead agency to be a TCR

Traditional Cultural Properties/Native American Heritage Values

Federal and state laws mandate that consideration be given to the concerns of contemporary Native Americans with regard to potentially ancestral human remains associated funerary objects and items of cultural patrimony. Consequently, an important element in assessing the significance of the project site has been to evaluate the likelihood that these classes of items are present in areas that would be affected by the proposed project.

The category termed "Traditional Cultural Properties" in discussions of cultural resource management performed under federal auspices is also potentially relevant to prehistoric archaeological sites. According to Patricia L. Parker and Thomas F. King (1998), "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include the following:

1. A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world
2. A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents

3. An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices
4. A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice
5. A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity

Native American Historic Resource Protection Act

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act (PRC Section 5097 et seq.) makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy a Native American historic or cultural site that is listed or may be eligible for listing in the CRHR.

California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act) (25 USC Chapter 32), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

Local

City of San Marcos General Plan

The Conservation and Open Space Element of the City's General Plan contains several policies pertaining to the protection of archaeological and historic resources. The following goals and policies apply to the project (City of San Marcos 2012):

> Policy COS-2.5: Continue to review future development proposals to ensure that cultural resources (including prehistoric, historic, paleontological, and SB 18 Tribal resources) are analyzed and conserved in compliance with CEQA requirements.

Goal COS-11: Continue to identify and evaluate cultural, historic, archaeological, paleontological and architectural resources for protection from demolition and inappropriate actions.

> Policy COS-11.1: Identify and protect historic and cultural resources including individual properties, districts and sites (e.g., archaeological sites) in compliance with CEQA.

> Policy COS-11.2: Prohibit the demolition or removal of a historic structure without evaluation of the condition of the structure, the cost of rehabilitation, and the feasibility of alternatives to preservation in place including but not limited to relocation, or reconstruction off-site, and/or photo-preservation.

The project's consistency with applicable General Plan goals and policies is discussed in Section 3.10, Land Use and Planning, of this EIR.

3.16.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to TCRs are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to TCRs would occur if the project would:

- **Threshold No. 1:** Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
  a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
  b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

3.16.4 Project Impact Analysis

Impacts to TCRs that may result from ground disturbing activities associated with the project are analyzed below.

Threshold No. 1: Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Under California's AB 52, TCRs are defined as archaeological resources that are eligible for or listed in the CRHR or resources that the lead agency determines to be a TCR with a substantial burden of evidence. Based on information on TCRs received by the City to date, no TCRs have been identified that would be impacted by project implementation.

As described above, outreach letters were mailed on May 27, 2022, to all Native American group representatives included on the NAHC contact list (Appendix D). These letters attempted to solicit additional information relating to Native American resources that may be impacted by the project. Native American representatives were requested to define a general area where known resources intersect the project APE. To date, Dudek has received responses to these outreach letters from three tribal representatives. On June 17, 2022, San Pasqual Band of Mission Indians responded to the letter stating that the project APE is within the boundary of the tribe's Traditional Use Area. San Pasqual stated that they would like to engage in "formal government to government consultation." On June 21, 2022, Pechanga Band of Luiseño Mission Indians stated that the project APE is within their Ancestral Territory and that they are interested in participating in the project area. Pechanga added that the project APE is

within 1.75 miles of two Ancestral Placenames and nine other previously recorded sites within 0.5 miles, one of which is within the project APE. Unfortunately, no other information about the intersecting resource was included but Pechanga is likely referring to the destroyed adjacent P-37-005584 knoll. On June 28, 2022, Rincon Band of Luiseño Indians responded to the outreach letter and stated that the project APE was within the band's specific Area of Historic Interest. Rincon added that they were concerned that the project may impact Tribal Cultural Resources, Traditional Cultural Landscapes, or potential Traditional Cultural Properties. Rincon recommended an archaeological/cultural resources inventory and that a tribal monitor from the Rincon Band should accompany the survey staff. On July 12, 2022, Dudek archaeologist Matthew DeCarlo met Cheryl Madrigal, the tribal historic preservation officer for rincon band, at the project APE for a site visit. They discussed the previous disturbance of the area and visited the location of former prehistoric bedrock milling site P-37-005584. Ms. Madrigal stated that she would contact the City about her concerns after she had some time to research the project area. On September 8, 2022, Rincon sent a letter to the City critiquing an earlier version of this report. Rincon requested an ethno-historic research and further analysis of adjacent sites P-37-005584 and P-37-005633.

In compliance with Assembly Bill 52 and Senate Bill 18, the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. Rincon Band responded to City outreach for Senate Bill 18 and Assembly Bill 52 on February 16 and April 13 requesting consultation on the project. The City had a consultation meeting with representatives of Rincon Band on August 16, 2022.

While considered unlikely based on the South Coastal Information Center records search, the current disturbed state of the project site, and other information received by the City to date; there remains the potential for the project to encounter previously unknown and unanticipated TCRs during construction of the project (**Impact TCR-1**).

Implementation of previously identified mitigation in Section 3.4 of this EIR (**Mitigation Measure [MM] CR-1** through **MM-CR-4**) would ensure potential impacts to TCRs as a result of ground-disturbing activities on the project site would remain **less than significant with mitigation incorporated.**

3.16.5 Cumulative Impact Analysis

Each cumulative project subject to AB 52 would require tribal consultation on a case-by-case basis to identify any potential TCRs affected by each cumulative project. It is anticipated that each cumulative project would require mitigation similar to that required of the project to reduce potentially significant impacts to TCRs to a level below significance. With implementation of project-specific mitigation and compliance with applicable regulations related to TCRs, cumulative impacts would be **less than significant**.

3.16.6 Mitigation Measures

Implementation of **MM-CR-1** through **MM-CR-4** outlined in EIR Section 3.4 would be required to ensure any potential impacts to unknown and unanticipated TCRs would remain less than significant.

3.16.7 Conclusion

Implementation of **MM-CR-1** through **MM-CR-4** outlined in Section 3.4 of this EIR would ensure any potentially significant impacts to TCRs (**Impact TCR-1**) remain less than significant.

3.17 Utilities and Service Systems

This section describes the existing utilities setting of proposed Gran Vista Specific Plan Project (project), identifies associated regulatory requirements, and evaluates potential impacts related to water supply, water infrastructure, wastewater treatment capacity, wastewater infrastructure, and solid waste. Stormwater drainage and facilities are also analyzed in Section 3.9, Hydrology and Water Quality, of this environmental impact report (EIR). Energy consumption and conservation are addressed in Section 3.5, Energy, of this EIR.

The analysis herein relies on the following technical studies and supporting documentation:

- Preliminary Drainage Study for Gran Vista, prepared by Hunsaker & Associates, May 20, 2022 (included as Appendix G)
- Las Posas Meritage Homes Water and Sewer Study Final Technical Memorandum, prepared by Vallecitos Water District, March 23, 2022 (included as Appendix L)

Table 3.17-1 summarizes the utilities and service system analysis by threshold.

Table 3.17-1. Utilities and Service Systems Summary of Impacts

Threshold of Significance	Project-Level Impact	Cumulative-Level Impact	Significance Determination
No. 1: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.	Less than Significant	Less than Significant	Less than Significant
No. 2: Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.	Less than Significant	Less than Significant	Less than Significant
No. 3: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.	Less than Significant	Less than Significant	Less than Significant
No. 4: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.	Less than Significant	Less than Significant	Less than Significant
No. 5: Comply with federal, state, or local management and reduction statutes and regulations related to solid waste.	Less than Significant	Less than Significant	Less than Significant

3.17.1 Existing Conditions

This section provides background information about the water, wastewater, and solid waste service providers that currently serve the project area and that would serve the project.

Water

The project site is located within the Vallecitos Water District (VWD) for water services (Appendix L). According to the City of San Marcos General Plan (General Plan), the VWD receives its water from the Metropolitan Water District of Southern California (MWD), which imports water from the Colorado River and Northern California (City of San Marcos 2012a).

MWD was formed in 1928 to develop, store, and distribute supplemental water to Southern California for domestic and municipal purposes. MWD consists of 26 member agencies and has a service area covering six counties, 5,200 square miles, and approximately 19 million people. MWD obtains water from local sources, as well as the Colorado River, via the Colorado River Aqueduct, and the Sacramento–San Joaquin Delta, via the State Water Project. MWD's Urban Water Management Plan (UWMP) documents the availability of these supplies to meet future demands. With a projected annual water demand of 4,925,000 acre-feet per year for 2025, the MWD UWMP concludes that, with implementation of required conservation measures, MWD has supply capabilities sufficient to meet expected demands through 2045 under normal, single dry, and multiple dry water years (MWD 2021).

The MWD water demands through normal, single dry year, and multiple dry years are shown below in Table 3.17-2.

Table 3.17-2. MWD Total Water Demands (AFY)

Year	2025	2030	2035	2040	2045
Average Year	4,925,000	5,032,000	5,156,000	5,261,000	5,374,000
Single Dry Year	4,929,000	5,037,000	5,160,000	5,265,000	5,378,000
Multiple Dry Years	4,877,000	5,064,000	5,182,000	5,299,000	5,410,000

Source: MWD 2021.
Note: MWD = Metropolitan Water District of Southern California; AFY = acre-feet per year.

San Diego County Water Authority (SDCWA) is the largest member agency of MWD. SDCWA's 2020 UWMP was approved on May 27, 2021. SDCWA's mission is to provide a safe and reliable supply of water to its 24 member agencies serving the San Diego region, which includes VWD. SDCWA is San Diego County's predominant source of water, supplying from 75% to 95% of the region's water needs (SDCWA 2021). The population within the SDCWA's service area was approximately 3.3 million people in 2020 and is projected to increase to roughly 3.8 million people by 2045. The County of San Diego is expected to develop an additional 130,000 acres between 2020 and 2050, with the majority (125,000 acres) of development dedicated to residential land uses. These regional growth projections are based on the San Diego Association of Governments Series 14 Regional Growth Forecast, developed for its 2019 Federal Regional Transportation Plan adopted by San Diego Association of Governments' Board of Directors on October 25, 2019. In fiscal year 2020, total water demand in the SDCWA's service area was 463,128 acre-feet, of which 92% was for municipal and industrial use and 8% was for agricultural water use. By 2045, the SDCWA's annual water demands are projected to reach 630,771 acre-feet. This projection accounts for planned future water conservation savings (SDCWA 2021).

The project site is entirely within the 855 zone. Water storage within this zone is located within the 920 zone and 1028 Twin Oaks pressure zones.

Wastewater

The project site is located within the VWD for sewer services (Appendix L). The VWD currently has a wastewater system that has a total liquids treatment capacity of 12.67 million gallons per day (MGD) and has an estimated daily flow of approximately 7.5 MGD (Appendix L). VWD's award-winning Meadowlark Water Reclamation Facility (MRF) is capable of recycling up to 74% of the wastewater generated in VWD's service area. Built in 1961, MRF is located within the southwestern portion of VWD's service area in Carlsbad. The MRF treats wastewater to meet the stringent standards of California Code of Regulations Title 22 and Waste Discharge Permit R9-2007-0018 issued by the Regional Water Quality Control Board Region 9. The MRF has a capacity of 5 MGD, with a wet weather treatment capacity of 8 MGD. Recycled water from MRF travels through a 24-inch pipeline and is sold to the Carlsbad Municipal Water District and Olivenhain Municipal Water District. The Carlsbad Municipal Water District is contracted to annually purchase 3 MGD, while Olivenhain Municipal Water District is contracted to annually purchase up to 1.5 MGD (VWD 2018).

Surplus water from the MRF is stored in the 54-million-gallon Mahr Reservoir. Of the total 54 million gallons within the reservoir, 32 million gallons are allocated to Carlsbad Municipal Water District, and 16 million gallons are allocated to Olivenhain Municipal Water District, leaving 6 million gallons for VWD to use in wastewater flow management. From here, water can be transported to the Encina Water Pollution Control Facility for disposal via a 3 MGD capacity failsafe pipeline. Under dry weather conditions, up to 1 MGD is conveyed for disposal. Under wet weather conditions, VWD would manage flow via the Mahr Reservoir to ensure flows to the Encina Water Pollution Control Facility would not exceed 2.5 MGD.[1] According to VWD's Master Plan, when the pipeline is at capacity, Carlsbad Municipal Water District has agreed to permit VWD to dispose of additional flow into their recycled water distribution system, subject to availability. In January 2010 through June 2014, VWD conveyed approximately 3.65 MGD of wastewater flow to the MRF for treatment and disposal (VWD 2018).

There are existing gravity sewer lines on the southwestern and northeastern sides of the project site. There is a 15-inch sewer line in N Las Posas Road and an 8-inch line in W Mission Road. These gravity sewers all convey flow to N Las Posas Road where they are conveyed south to San Marcos Boulevard and eventually to District Lift Station No. 1.

Solid Waste

Solid waste disposal in the City of San Marcos (City) is provided by a private franchise hauler, EDCO Waste and Recycling (EDCO), a private waste collection and recycling company that handles all residential, commercial, and industrial collections within the City (City of San Marcos 2012a). Waste collected by EDCO is hauled to the Escondido Resource Recovery Transfer Station. Waste is then transported to the Sycamore Sanitary Landfill in Santee, while recyclable materials are processed at the Escondido Resource Recovery Transfer Station (City of San Marcos 2012a). The project site would be serviced by EDCO.

The Escondido Resource Recovery Transfer Station has a permitted daily maximum capacity of 2,500 tons. Solid waste is consolidated here and trucked to a landfill for disposal. The transfer station is permitted to operate 7 days per week, 24 hours per day (County of San Diego 2008). The Sycamore Sanitary Landfill has a daily permitted throughput of 5,000 tons of solid waste, a remaining capacity of approximately 113,972,637 cubic yards, and an anticipated closure date of 2042 (CalRecycle 2019a).

[1] Despite a total capacity of 3 MGD in the failsafe pipeline, permitted wastewater flows are determined by acceptable depth-to-diameter ratios to ensure infrastructure longevity and functioning systems. This means that maximum flows to the Encina Water Pollution Control Facility will be less than 3 MGD.

Electrical and Gas

Electricity and natural gas would be provided by San Diego Gas & Electric (SDG&E) (City of San Marcos 2012a). SDG&E provides energy service to an estimated 3.3 million consumers through 1.3 million electric meters and approximately 800,000 natural gas meters in San Diego County and southern Orange County (City of San Marcos 2012a). Electrical facilities throughout the City include a combination of aboveground and belowground electrical distribution lines and utilities structures. The City's fiber-optic network is facilitated by a 72-strand fiber-optic line that runs on various streets throughout the City. All major arterials in the City have implemented fiber optics. Proposed development on site would require constructing private utility lines to connect to existing electrical lines within N Posas Road and natural gas lines within N Las Posas Road and W Mission Road.

Telecommunications

Telecommunications services to the project site may be provided by various distributors. Existing AT&T and Cox telecommunication lines surround the project site.

3.17.2 Regulatory Setting

Existing federal, state, and local regulations related to water supply, wastewater, and solid waste that are applicable to the project are summarized below.

Federal

Clean Water Act

The federal Clean Water Act establishes regulatory requirements for potable water supplies including raw and treated water quality criteria. The City is required to monitor water quality and conform to regulatory requirements of the Clean Water Act.

Resource Recovery and Conservation Act

The Resource Recovery and Conservation Act, Subtitle D, focuses on state and local governments as the primary planning, regulating, and implementing entities for the management of non-hazardous solid waste, such as household solid waste and nonhazardous industrial solid waste. Subtitle D provides regulations for the generation, transportation, and treatment, storage, or disposal of hazardous wastes.

State

Urban Water Management Plans

Urban water purveyors are required to prepare and update a UWMP every 5 years. The UWMPs address water supply, treatment, reclamation, and water conservation and contain a water shortage contingency plan. Local UWMPs and those of other water districts are supplemental to the regional plans prepared by MWD. The Water Conservation Bill of 2009 (Senate Bill [S] X7-7) requires each urban retail water supplier to develop an urban water use target and an interim urban water use target. Notably, SB X7-7 authorizes urban retail water suppliers to determine and report progress toward achieving these targets on an individual agency basis or pursuant to a regional alliance as provided in California Water Code Section 10608.28(a). As described above, water service to

the site is provided by MWD. In accordance with this regulation, MWD prepared and their Board of Directors adopted its 2020 UWMP in 2021. MWD's UWMP includes estimated future water demands until 2040, using updated population projections and a conservative assumption that, in the absence of mandatory water conservation measures, per-capita consumption could rebound to its 2020 target value (MWD 2021). Demands provided in MWD UWMP have been coordinated with SDWCA, MWD's wholesale supplier.

California Green Building Standards Code

In 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24 of the California Code of Regulations) is commonly referred to as CALGreen and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The CALGreen 2022 building standards code became effective on January 1, 2023. The mandatory standards require the following measures that relate to utilities and service systems (24 CCR Part 11):

- Mandatory reduction in indoor water use through compliance with specified flow rates for plumbing fixtures and fittings
- Mandatory reduction in outdoor water use through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' Model Water Efficient Landscape Ordinance
- 65% of construction and demolition waste must be diverted from landfills
- Mandatory inspections of energy systems to ensure optimal working efficiency
- Inclusion of electric vehicle charging stations or designated spaces capable of supporting future charging stations

The CALGreen standards also include voluntary efficiency measures that are provided at two separate tiers and implemented at the discretion of local agencies and applicants. CALGreen's Tier 1 standards call for a 15% improvement in energy requirements, stricter water conservation, 65% diversion of construction and demolition waste, 10% recycled content in building materials, 20% permeable paving, 20% cement reduction, and cool/solar-reflective roofs. CALGreen's more rigorous Tier 2 standards call for a 30% improvement in energy requirements, stricter water conservation, 75% diversion of construction and demolition waste, 15% recycled content in building materials, 30% permeable paving, 25% cement reduction, and cool/solar-reflective roofs.

Senate Bill 221

Signed into law on October 8, 2001, SB 221 established a process whereby sufficient water supply must be identified and available for new development for any residential development of 500 homes or more or, in the case wherein a water supplier has fewer than 5,000 service connections or the proposed development would increase the number of connections by at least 10%, unless there is proof of adequate water over at least the next 20 years, including long periods of drought. Because the project is fewer than 500 homes, a water supply assessment and verification report pursuant to SB 221 and SB 610, described below, are not required.

Senate Bill 610

Signed into law October 9, 2001, SB 610 resulted in amendments to the California Public Resources Code and the California Water Code. Revising provisions established by SB 901, SB 610 requires that the planning agency determine whether a project subject to the California Environmental Quality Act (CEQA) meets any of the thresholds for requiring preparation of a water supply assessment. Specifically, if a project proposes development of more than 500 dwelling units, the planning agency must then request that the urban water supplier prepare a water supply assessment. The assessment would include the identification of existing water entitlements, water rights, or water service contracts relevant to the water supply identified for the project, as well as the amount of water received pursuant to such entitlements, rights, or contracts. Because the project is fewer than 500 homes, a water supply assessment pursuant to SB 610 is not required.

Assembly Bills 939 and 341

In 1989, Assembly Bill (AB) 939, known as the Integrated Waste Management Act (California Public Resources Code, Section 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020 and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle has conducted multiple workshops and published documents that identify priority strategies that CalRecycle believes would assist the state in reaching the 75% goal by 2020.

Local

San Diego County Integrated Waste Management Plan

Pursuant to the Integrated Waste Management Act, the Countywide Integrated Waste Management Plan for San Diego County describes the goals, policies, and objectives of the county for coordinating efforts to divert, market, and dispose of solid waste during the planning period through the year 2022 (County of San Diego 2005). Countywide policies for reducing waste and implementing the programs are identified in the individual jurisdiction Source Reduction and Recycling Elements and Household Hazardous Waste Elements and are intended to reduce costs, streamline administration of programs, and encourage a coordinated and planned approach to integrated waste management.

To avoid duplication of effort, all of the jurisdictions in the county participate in the San Diego County Integrated Waste Management Local Task Force. The Local Task Force coordinates mandated planning, oversees implementation of new or countywide integrated waste management programs, and carries out an active legislative program. Regulatory reform, changes to state diversion requirements, and reduction of the costs of compliance are considered by the Local Task Force, as well as other solid waste issues of regional or countywide concerns.

City of San Marcos Municipal Code

Title 8, Health and Sanitation

San Marcos Municipal Code (SMMC) Title 8 contains regulations and provisions on sewers and sewage disposal plants, sewer connections, septic tanks, waste matter, garbage and refuse collection, and other matters concerning sanitation.

Title 14, Streets, Sidewalks, and Underground Utility Facilities

SMMC Title 14, Chapter 14.15, contains regulations concerning stormwater management and discharge control. Chapter 14.24 contains regulations concerning underground utility facilities.

Title 19, Subdivisions

SMMC Title 19 regulates subdivision requirements, including the installation of utility facilities and connections and payment or fees for such installations.

Title 20, Chapter 20.330 Water Efficient Landscaping Ordinance

The provisions of Title 20 of the SMMC are referred to as the Zoning Ordinance. SMMC Title 20, Section 20.330, details the City's Water Efficient Landscaping Ordinance. In accordance with state law, SMMC Chapter 20.330 establishes specific standards for landscape and irrigation design and installation to ensure beneficial, efficient, and responsible use of water resources within the City.

City of San Marcos General Plan

The General Plan Conservation and Open Space Element includes two goals and one policy that are applicable to the project (City of San Marcos 2012b):

Goal COS-5: Reduce water consumption and ensure reliable water supply through water efficiency, conservation, capture, and reuse.

Goal COS-10: Establish and maintain an innovative, sustainable solid waste collection, recycling, and disposal delivery system for present and future generations.

Policy COS-10.1: Promote the curbside recycling program to divert residential refuse from the landfills.

The General Plan Land Use and Community Design Element identifies the following goals and policies regarding utilities and services systems that are applicable to the project (City of San Marcos 2012a):

Goal LU-8: Ensure that existing and future development is adequately serviced by infrastructure and public services.

Policy LU-8.1: New development shall pay its fair share of required improvements to public facilities and services.

Policy LU-8.2: Promote development timing that is guided by the adequacy of existing and/or expandable infrastructure, services, and facilities.

Goal LU-13: Water Service and Supply: Manage and conserve domestic water resources by reducing water usage and waste on a per capita basis, to ensure an adequate water supply for existing and future residents.

Policy LU-13.1: Work closely with local and regional water providers to ensure high quality water supplies are available for the community.

Policy LU-13.2: Actively promote water conservation programs aimed at reducing demand.

Policy LU-13.3: Encourage exploration and use of deep underground wells to reduce reliance on treatable water.

Goal LU-14: Wastewater: Ensure a wastewater system for existing and future development.

Policy LU-14.1: Work closely with local service providers to ensure an adequate wastewater system for existing and future development is in place.

Policy LU-14.2: Ensure development approval is directly tied to commitments for the construction or improvement of primary water, wastewater, and circulation systems.

Goal LU-16: Solid Waste: Reduce the amount of waste material entering regional landfills with an efficient and innovative waste management program.

Policy LU-16.1: Work closely with local service providers to ensure adequate solid waste disposal, collection, and recycling services.

Policy LU-16.2: Increase recycling, composting, source reduction, and education efforts throughout the city to reduce the amount of solid waste requiring disposal at landfills.

Goal LU-17: Utilities and Communications: Encourage provision of power and communication systems that provide reliable, effective and efficient service for San Marcos.

Policy LU-17.2: Require all new development and redevelopment to provide the technology to support multiple telecommunications facilities and providers such as multi-media products, wireless technologies, and satellite communications.

Policy LU-17.3: The City shall prohibit above ground utility equipment within any of the pedestrian pathway and street frontage areas. All above ground utilities shall be placed either within; “wet closets” within the buildings, underground vaults, or behind buildings where they are not visible. The developer shall be responsible to contact the applicable utility agencies in advance to coordinate utilities prior to approval of the final street improvement plans for both public and private street frontages and prior to submittal of building permits.

Policy LU-17.4: Require utility location to be shown on all site development plans at the time of development/ project application.

3.17.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to utilities and service systems are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to utilities and service systems would occur if the project would:

- **Threshold No. 1:** Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.
- **Threshold No. 2:** Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.
- **Threshold No. 3:** Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.
- **Threshold No. 4:** Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
- **Threshold No. 5:** Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

3.17.4 Project Impact Analysis

Threshold No. 1: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

Water

The project development would be served by VWD. Townhome residential sites in the VWD are typically served by on-site private water systems, which consist of separate fire and domestic systems on site. Private fire systems typically supply on-site fire hydrants and building fire sprinkler systems and require a backflow preventer at the connection to the public water system.

The distribution of potable water to each home would be provided by a series of 8-inch public pipes and related infrastructure. The proposed water system would connect to an existing 8-inch pipe in N Las Posas Road. Pipes would be located within private drives and private drive aisles to create a loop system that serves the entire project site. Individual services to homes would be provided by a lateral from the main pipe to the water meter for each home.

A dedicated fire main would provide fire service to a series of new and existing fire hydrants, as well as to the individual units, for firefighting purposes. There are two existing fire hydrants on the project site that are already in service and would remain in place.

In accordance with current California Building Code, all buildings would be equipped with fire sprinklers and water conservation features such as water efficient faucets and shower heads and high-performance toilets. Homes would be Water Sense Certified to meet U.S. Environmental Protection Agency standards.

Irrigation for the site will tie into the proposed loop system. Irrigation of landscaping throughout the project site would be required to comply with the City's Water Efficient Landscaping Ordinance and the City's Landscape Manual.

The domestic system for the project would consist of a single connection to the public water system with an on-site looping system. A water meter and backflow preventer would be required at the connection to the public water system. The project would connect to the existing 855 Zone water facilities within N Las Posas Road. Landscaped areas associated with the project would require a separate irrigation service and meter. A water and sewer study was prepared by VWD for the project and is included as Appendix L to this EIR. Prior to project construction, VWD will confirm capacity fees to be paid by the project applicant. Therefore, due to the location of the project site in an urbanized area that is currently served by existing facilities, the project is not expected to require or result in the relocation or construction of new water facilities and impacts to water services would be **less than significant**.

Wastewater

As described above, the project would develop 120 townhomes, which would increase the intensity of uses on the project site and result in increased wastewater generation. The Water and Sewer Memorandum prepared for the project estimated that buildout of the project would generate approximately 24,882 gallons of wastewater per day (Appendix L).

There are existing gravity sewer lines on the southwestern and northeastern sides of the project site, including an 8-inch sewer lines in W Mission Road and a 15-inch line in N Las Posas Road. These gravity sewers all convey flow to N Las Posas Road where they are conveyed south to San Marcos Boulevard and eventually to District Lift Station No. 1. Sewer service to the project site would consist of constructing private on-site sewer lines and connecting to the public system. A wastewater system would be incorporated into the project site design, which would include an 8-inch PVC sewer main to adequately service individual homes and community areas discharging wastewater. Pipes would be located underneath internal private drives and private drive aisles. The on-site system would collect wastewater and direct flows into an existing 15-inch pipe in N Las Posas Road.

Wastewater generated by the project would be treated by the MRF. MRF has a capacity of 5 MGD, with a wet weather treatment capacity of 8 MGD, and treats wastewater at 0.25 MGD. It is expected that the MRF would be able to adequately treat wastewater flows from the project, and therefore new wastewater treatment facilities would not be needed.

The City requires that VWD provide a letter of Sewer Availability for proposed developments within VWD. VWD conducted a sewer study for the proposed development to determine whether the current infrastructure is sufficient to accommodate the development project and/or to provide recommendations for capital improvements to provide service. As discussed in the Water and Sewer Memorandum (Appendix L), the applicant would be required to pay all applicable Wastewater Capital Facility fees in effect at the time service is committed in accordance with VWD rules and regulations. Acceptance by VWD of all wastewater facilities required to be constructed to service the project would also be required. With implementation of City and VWD requirements for sewer service, and considering the scope of existing and proposed infrastructure, the project is not anticipated to exceed current capacities or significantly impact existing wastewater treatment systems. Further, to the extent the project will require or result in the relocation or construction of sewer facilities, the construction of such infrastructure has been considered throughout this EIR (e.g., within the project description and construction assumptions) and would not cause significant environmental effects. Therefore, impacts to wastewater services would be **less than significant**.

Stormwater Drainage

Development of the project would increase the impervious area on site and increase stormwater runoff in comparison to existing conditions. However, as described in Section 3.9 of this EIR, storm drainage components recommended by the Preliminary Drainage Study (Appendix G) would properly handle runoff to meet regulatory requirements and to ensure that post-development runoff quantifies rates would be similar to or less than pre-development conditions.

Stormwater arrives on site via natural rainfall only. Rainfall runoff from the site typically only occurs during a significant wet weather event. Stormwater that does accumulate on site generally drains in a southwestern direction to an existing 12-inch corrugated metal pipe riser to a 12-inch corrugated metal pipe to meet up with the commercial site to the south of the project site and is then conveyed west through a storm channel and eventually downstream to the Las Posas Creek south. Per municipal separate storm sewer system requirements, stormwater flows on site would be conveyed to biofiltration systems through storm drains throughout the project site, where water would be treated prior to being discharged. Storm drainage components would properly handle runoff to meet regulatory requirements and to ensure that post-development runoff quantifies rates are similar to or less than pre-development conditions. The project would incorporate appropriate design of on- and off-site drainage facilities and would prepare and implement a stormwater pollution prevention plan, stormwater quality management plan, and best management practices.

Implementation of all recommendations from the Preliminary Drainage Study and development-specific drainage plans would ensure the project would not substantially exceed stormwater drainage capacity or result in substantial polluted runoff. The construction of such improvements has been considered throughout this EIR (e.g., within the project description and construction assumptions) and has not been identified to cause significant environmental effects. Therefore, impacts would be **less than significant**. Please refer to Section 3.9 for additional discussion related to drainage.

Electric Power

As discussed in Section 3.5 of this EIR, implementation of the project would not result in inefficient, wasteful, or unnecessary electricity use. Temporary electric power for as-necessary lighting and electronic equipment (such as computers inside temporary construction trailers and heating, ventilation, and air conditioning) would be provided by SDG&E. The amount of electricity used during construction of the project would be minimal because typical demand stems from the use of electronic equipment in addition to electrically powered hand tools. The majority of the energy used during construction would be from petroleum. The electricity used for construction activities would be considered temporary and minimal.

Project operation would require electricity for multiple purposes, including cooling, lighting, appliances, and various equipment. Additionally, the supply, conveyance, treatment, and distribution of water would indirectly result in electricity usage. The project is estimated to have a total electrical demand of approximately 0.7 million kilowatt-hours of electricity per year. Additionally, the project would be required to implement, as applicable, the City's Climate Action Plan Consistency Checklist measures that would reduce operational electricity consumption.

The project would be required to include various on-site features and measures to reduce the project's energy consumption, which includes electric vehicle charging stations, electric or solar water heaters, solar panels, a transportation demand management plan, reduced landscaping water use, and trees. The project would be built under the 2019 Title 24 standards or newer standards. 2019 Title 24 homes would use about 53% less energy than those under the 2016 Title 24 standards.

Electricity and natural gas would be provided by SDG&E. Electrical facilities throughout the City include a combination of aboveground and belowground electrical distribution lines and utilities structures. The City fiber-optic network is facilitated by a 72-strand fiber-optic line that runs on various streets throughout the City. All major arterials in the City have implemented fiber optics. The project would require constructing private utility lines to connect to existing electrical lines within N Las Posas Road.

In summary, although electricity consumption would increase at the project site over current, vacant conditions, project would be required to comply with the Title 24 and the City's Climate Action Plan Consistency Checklist by implementing energy-efficiency measures that would further reduce electricity usage. Residential development on site is not expected to exceed existing capacity of servicing infrastructure. Therefore, implementation of the project would not require or result in the relocation or construction of expanded electric power facilities and impacts would be **less than significant**.

Natural Gas

As discussed in Section 3.5, natural gas is not anticipated to be required during construction of the project. The proposed residential land use/ zoning change is estimated to use approximately 247 million kBTU of natural gas per year, equivalent to 24,672 therms of natural gas per year. Further, the project would be required to implement project design features and comply with green building standards to reduce energy consumption.

As described above, natural gas would be provided by SDG&E. The project would require construction of private utility lines to connect to an existing natural gas pipeline within N Las Posas Road and W Mission Road. SDG&E maintains a 4-inch gas distribution system within N Las Posas Road and a 3-inch distribution system within W Mission Road. The gas lines would be extended to and through the project site through the same joint trench alignment as electric and telecommunication facilities. Use of gas for the project would be limited to gas cooktops and gas dryers.

Due to existing SDG&E infrastructure in the project area, the project is expected to be adequately served by SDG&E. However, a will-serve letter from SDG&E would be required to ensure service needs are met. For these reasons, implementation of the project would not require or result in the relocation or construction of new or expanded natural gas facilities, and impacts would be **less than significant**.

Telecommunications

Communications systems for telephones, computers, and cable television are serviced by utility providers such as AT&T, Cox, and other independent cable companies. No specific systems upgrades are proposed or anticipated for the project. Due to the existing infrastructure served in the surrounding project area, the project would not result in impacts associated with the construction or expansion of telecommunications, and impacts would be **less than significant**.

Threshold No. 2: Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

As discussed in response to Threshold No. 1, the project would be served by VWD. Per the Water and Sewer Memorandum (Appendix L), the project is anticipated to use an estimated 37,700 gallons per day. This equates to approximately 42.26 acre-feet per year.

As discussed above, MWD's UWMP shows water supplies will be available to meet current and future demands of the region. With a projected annual water demand of 4,925,000 acre-feet per year in 2025, the MWD UWMP demonstrates that, with implementation of required conservation measures, MWD has supply capabilities sufficient to meet expected demands through 2040 under normal, single dry, and multiple dry water years (MWD 2021). The 42.26 acre-feet per year generated by the project would present an insignificant increase in water demand relative to the annual water demand projected by the MWD's UWMP.

Further, the project site would be developed in compliance with CALGreen, which implements water efficiency standards for appliances and fixtures. Compliance with CALGreen would further reduce project water usage in combination with VWD and MWD's ongoing water conservation practices. VWD requires a development-specific evaluation of water use to determine its ability to service any development and capacity fees to be paid. A Water Availability letter will be required for processing the project (VWD 2021). Compliance with these regulations and conservation measures will ensure sufficient water supplies are available to service the project. Impacts to water services would be **less than significant**.

Threshold No. 3: Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

As discussed under Threshold No. 1, wastewater generated by the project would be treated by the MRF. MRF has a capacity of 5 MGD, with a wet weather treatment capacity of 8 MGD, and treats wastewater at 0.25 MGD. The project is estimated to generate 24,882 gallons per day, or approximately 0.49% of the facility's 5 MDG capacity. It is expected that the MRF would be able to adequately treat wastewater flows from the project.

As described above, sewer facilities to serve the project would require the construction of private on-site sewer lines connecting to the public system within N Las Posas Road. As discussed in the Water and Sewer Memorandum (Appendix L), the applicant of the project would be required to pay all applicable Wastewater Capital Facility fees in effect at the time service is committed in accordance with VWD rules and regulations. Acceptance by VWD of all wastewater facilities required to be constructed to service the project would also be required. With implementation of City and VWD requirements for sewer service, and considering the scope of existing and proposed infrastructure, the project is not anticipated to exceed current capacities or significantly impact existing wastewater treatment systems. Further, to the extent the project will require or result in the relocation or construction of sewer facilities, the construction of such infrastructure has been considered throughout this EIR (e.g., within the project description and construction assumptions) and would not cause significant environmental effects. Therefore, impacts to wastewater services would be **less than significant**.

Threshold No. 4: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Construction of the project would result in the generation of solid waste such as scrap lumber, concrete, residual wastes, packing materials, and plastics. Operation of the project would represent an increase in intensity of uses and generation of solid waste on the project site compared to existing conditions. Solid waste generated by the project would be serviced by EDCO, and solid waste would then be transferred to Sycamore Landfill. According to CalRecycle, the facility has a daily permitted capacity of 5,000 tons per day for solid waste. As of December 2016, the remaining capacity of Sycamore Sanitary Landfill is 113,972,673 cubic yards, with an anticipated closure date of 2042. Further, three other landfills in the County of San Diego accept municipal solid waste, including Borrego Landfill, Miramar Landfill, and Otay Landfill.

The anticipated operational solid waste generation from the project was estimated using CalRecycle's Estimated Solid Waste Generation Rates (CalRecycle 2019b). It is estimated that the project (120 units) would generate approximately 1,467.6 pounds of solid waste per day (12.23 pounds per household). This does not consider any waste diversion through recycling. According to CalRecycle, the City has a disposal rate target of 8.9 pounds per person per day. If the City meets this target, the City is considered in compliance with the 50% diversion requirement of AB 939. The most recent data from CalRecycle identify the annual per capital disposal rate as 4.9 pounds per person per day (CalRecycle 2020). Thus, the City is exceeding their target for diversion.

The project would be required to comply with applicable state and local regulations related to solid waste, waste diversion, and recycling at the time of development. Implementation of the project is not expected to generate solid waste in excess of state or local standards or in excess of the capacity of local infrastructure, or to otherwise impair the attainment of solid waste reduction goals. Impacts related to solid waste would be **less than significant**.

Threshold No. 5: Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

As described in response to Threshold No. 4, the project would be required to comply with all federal, state, and local statutes and regulations related to solid waste, diversion of waste, and recycling. All solid waste facilities, including landfills, require solid waste facility permits to operate. In San Diego County, California Public Resources Code, Sections 44001–44018, and California Code of Regulations Title 27, Division 2, Subdivision 1, Chapter 4, Section 21440 et seq., authorize the County Department of Environmental Health, Local Enforcement Agency to issue solid waste facility permits. Sycamore Sanitary Landfill is a permitted facility and EDCO is a licensed hauler. For these reasons, and the reasons stated above, impacts related to solid waste as a result of project implementation would be **less than significant**.

3.17.5 Cumulative Impact Analysis

Water

Some of the cumulative projects are within VWD service area for potable water service and would contribute to the cumulative demand for water supply. However, MWD anticipates the demand of future development through their master planning process. According to MWD's UWMP, no water shortages are anticipated within MWD service area in single or multiple dry years through 2045. Not all cumulative projects fall into the VWD's service area; those that do not would be served by neighboring districts.

As described in Section 3.17.4, the project would result in less-than-significant impacts to water supply services. As discussed in Section 3.17.1, MWD has determined that with supplies provided by SDCWA and compliance with the Water Conservation Bill of 2009, no water shortages would occur in a normal year through 2045 (MWD 2021). Other cumulative projects that are consistent with the land use assumptions made in MWD's UWMP would have already been accounted for in demand projections. Projects that are inconsistent with the land use assumptions made in MWD's UWMP would also be subject to CEQA and required to include water supply assessments to demonstrate adequate supply for development. Further, related projects would be required to show that adequate infrastructure exists to serve the related projects and mitigate any potential impacts to water infrastructure caused by the project. All projects would be required to pay applicable Capital Facility fees to the SDCWA and VWD, which are required to go towards infrastructure improvements. Thus, cumulative impacts to water services would be **less than significant**.

Wastewater

Some of the cumulative projects are within VWD's service area for wastewater service and would contribute to the cumulative demand for wastewater treatment. VWD anticipates the demand for future development through their master planning process. Cumulative projects that are consistent with the land use assumptions made in VWD's Master Plan would have already had their demand accounted for. Lastly, not all cumulative projects fall into the VWD's service area; those that do not would be served by neighboring districts.

As discussed in Section 3.17.4, VWD has sufficient capacity to account for the project's estimated wastewater generation rate. Thus, with payment of all applicable Wastewater Capital Facility fees to VWD, impacts to wastewater treatment facilities would be less than significant. Cumulative projects that result in an increase in density or development over what was accounted for in VWD's Master Plan would further exacerbate wastewater deficiencies. However, these projects would also be subject to CEQA and required to mitigate any potential impacts to water supply services caused by the project. As such, cumulative impacts to wastewater facilities would be **less than significant**.

Electrical Power

Potential cumulative impacts on energy would result if the project, in combination with past, present, and future projects, would result in the wasteful or inefficient use of energy. This could result from development that would not incorporate sufficient building energy efficiency features, would not achieve building energy efficiency standards, or would result in the unnecessary use of energy during construction and/or operation. The cumulative projects within the areas serviced by the energy service providers would be applicable to this analysis; this includes existing aging structures that are energy inefficient. Projects that include development of large buildings or other structures that would have the potential to consume energy in an inefficient manner would have the potential to contribute to a cumulative impact. Projects that would mostly include construction, such as transportation infrastructure, could also contribute to a cumulative impact; however, the impact of these projects would be limited because they would typically not involve substantial ongoing energy use.

As described previously in Section 3.5, the project would not result in significant environmental impacts due to wasteful, inefficient, or unnecessary use of energy due to various design features, including installing electric vehicle charging stations, installing electric or solar water heaters, implementing a Transportation Demand Management plan, reducing landscaping water use, and planting trees, that would be required of the project. Like the project, cumulative projects would be subject to CALGreen, which provides energy efficiency standards for commercial and residential buildings. Over time, CALGreen would implement increasingly stringent energy efficiency standards that would require the project and the cumulative projects to minimize the wasteful and inefficient use of energy. In addition, cumulative projects would be required to meet or exceed the Title 24 building standards, further reducing the inefficient use of energy.

Cumulative projects are also required to comply with the state's energy efficiency standards and local regulations. Cumulative projects are therefore unlikely to result in significant effects related to requiring or resulting in the relocation or construction of new or expanded electric power facilities. As such, cumulative impacts related to electrical power would be **less than significant**.

Solid Waste

Cumulative development projects would generate solid waste to be disposed of at the Sycamore Sanitary Landfill. According to CalRecycle, the facility has a daily permitted capacity of 5,000 tons per day for solid waste. As of February 2021, the remaining capacity of Sycamore Sanitary Landfill is 113,972,673 cubic yards, or approximately 40 million tons, with an anticipated closure date of 2042. Further, three other landfills in the County of San Diego accept municipal solid waste (County of San Diego 2022). This includes Borrego Landfill, with a remaining capacity of 88,750 cubic yards in January 2020; Otay Landfill, with a remaining capacity of 11.1 million cubic yards in February 2021; and Miramar Landfill, with a remaining capacity of 11.0 million cubic yards in January 2020 (County of San Diego 2022). Therefore, it is determined there is adequate capacity throughout the County of San Diego to serve future development projects, including those identified on the cumulative project list. Cumulative impacts related to solid waste would be **less than significant**.

3.17.6 Mitigation Measures

Impacts to utilities and service systems would be less than significant, and no mitigation is required.

3.17.7 Conclusion

Project implementation would result in an increase in the need for water, wastewater, stormwater, electrical power, and solid waste services. However, as outlined in the project impact analysis in Section 3.17.4, there would be adequate existing facilities to service the project; impacts to/from such utilities and service systems would be less than significant.

4 Alternatives

4.1 Introduction

Section 15126.6 of the California Environmental Quality Act (CEQA) Guidelines states that the environmental impact report (EIR) shall "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives." The comparative merits of the alternatives evaluated, including the No Project Alternative, shall also be discussed.

The range of alternatives evaluated in an EIR is governed by the "rule of reason," which requires the EIR set forth alternatives adequate to permit a reasoned choice by decisionmakers and limited to alternatives that "would avoid or substantially lessen any of the significant effects of the project." An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative (14 CCR 15126.6[a]).

Other than the No Project Alternative, the EIR needs to examine only those alternatives that could feasibly obtain most of the basic objectives of the proposed project even if the alternative would impede to some degree the attainment of project objectives.

Factors that may influence feasibility of an alternative also include "site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent)" (14 CCR 15126.6[f][1]). The ultimate determination as to whether an alternative is feasible or infeasible is made by the lead agency's decision-making body, the San Marcos City Council (California Public Resources Code, Section 21081[a][3]).

This section presents several alternatives to the proposed Gran Vista Specific Plan Project (project) that were considered pursuant to CEQA and evaluated for their ability to meet the basic objectives of the project, while reducing or avoiding the environmental impacts of the project identified throughout Chapter 3, Environmental Analysis, of the EIR. The alternatives proposed herein include the No Project Alternative (Section 4.4.3), the Existing Land Use Designation Alternative (Section 4.4.4), and the Reduced Density Alternative (Section 4.4.5). Other alternatives were considered but rejected, as summarized in Section 4.3.

4.2 Project Objectives

The following objectives of the proposed project describe the underlying purpose of the project and provide a basis for identification of a range of reasonable alternatives evaluated in this EIR:

1. Maximize residential densities, to the extent feasible, within proximity to major transit, education facilities, commercial uses, and trails to reduce reliance on automobiles and potentially minimize greenhouse gas (GHG) emissions.
2. Create a highly connected and efficient system of sidewalks and pathways supported by pedestrian friendly architecture and landscaping to promote walkability and connect people to surrounding transit and destinations.

3. Design a vehicular circulation system that adequately accommodates traffic and minimizes traffic impacts in and around the project site.
4. Support the housing needs of the City of San Marcos (City) and the region by developing high-quality workforce housing that balances density with price-points and long-term maintenance costs, such that new homes remain financially attainable to entry-level home buyers.
5. Establish development standards and design guidelines that ensure distinctive architecture, landscaping, and recreational amenities that complement and enhance the existing surrounding neighborhood while providing a desirable living environment.
6. Identify a program for the long-term maintenance of the community to ensure all facilities are adequately maintained to City standards.
7. Finance or contribute a fair share of funding to all community services and infrastructure needed to support development proposed by the project to promote economic stability.

4.3 Alternatives Considered But Rejected

The CEQA Guidelines state that an EIR should identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process, and should briefly explain the reasons underlying the lead agency's determination. Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are: failure to meet most of the basic project objectives, infeasibility, or inability to avoid significant environmental impacts. Factors that may be taken into account when evaluating an alternative's feasibility include, among other things, site suitability, economic viability, availability of infrastructure, general plan consistency, consistency with other plans, regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent). The following describes concepts that were considered as alternatives to the proposed project by the City but were rejected from further evaluation in this EIR, and a brief description of the reasons for their rejection.

4.3.1 Alternative Location

Pursuant to Section 15126.6(f)(2) of the CEQA Guidelines, the City considered the potential for alternative locations to develop the proposed project. There are sites within the City that are already zoned for residential use under the City of San Marcos General Plan (General Plan) that could be developed or redeveloped with a residential project. However, the project applicant does not control another site within the City of comparable land area that is surrounded by existing infrastructure and near existing transit. One of the factors for feasibility of an alternative is "whether the proponent can reasonably acquire, control or otherwise have access to the alternative site." Because the City is highly urbanized and is largely built out, obtaining another site of a similar size in a similar location is not considered feasible. The project site is surrounded on all sides by development and considered an infill site in an urban area. As such, an alternative location was ultimately rejected from further analysis in the EIR.

4.4 Project Alternatives Considered in this EIR

4.4.1 Description of Alternatives

The following alternatives are under consideration for this project:

- No Project Alternative (Section 4.4.3)
- Existing Land Use Designation Alternative (Section 4.4.4)
- Reduced Density Alternative (Section 4.4.5)

Alternatives considered and removed from further consideration are summarized in Section 4.3.

4.4.2 Summary of Project Impacts

Project- and cumulative-level impacts associated with implementation of the proposed project are evaluated throughout Chapter 3 of this EIR. As identified in Table 1-1, in Chapter 1, Executive Summary, construction and/or operation of the proposed project would cause the following significant but mitigable environmental impacts:

- **Impact BIO-1:** There is potential for project activities to cause disturbances that would result in impacts to adjacent habitat.
- **Impact BIO-2:** There is potential for construction activities could result in indirect impacts to nesting birds.
- **Impact CR-1:** Unknown archaeological resources may occur on the project site, and the proposed project has the potential to disturb such unidentified resources during project grading.
- **Impact CR-2:** There is a potential for project construction activities to disturb previously unidentified human remains on the project site.
- **Impact TCR-1:** There is potential for project construction to adversely affect previously unidentified tribal cultural resources.

The following impacts are significant and unavoidable:

- **Impact TRA-1:** The project vehicle miles traveled (VMT) per resident would exceed 16.07 VMT per resident, which exceeds the 15% below regional average threshold.

4.4.3 No Project Alternative

Under the No Project Alternative, the proposed project would not be implemented and the project site would remain undeveloped in its existing condition. This alternative would eliminate all the significant impacts identified for the proposed project. Since the No Project Alternative would not provide any development, overall impacts would be reduced compared to the proposed project. However, certain benefits would not be realized under this alternative, including the provision of housing units as identified in the General Plan in an infill and transit area.

4.4.3.1 Comparison of the Effects of the No Project Alternative to the Proposed Project

Aesthetics

Under the No Project Alternative, the site would remain in its current condition and the visual character of the site would not change. Existing vegetation would remain on site, and no grading or landform modification would occur under this alternative. This alternative would result in no impacts related to scenic vistas, scenic highways, visual character or quality, or lighting and glare. No new sources of light, glare, or shading would be introduced. However, as discussed in Section 3.1, Aesthetics, of this EIR, the proposed project would similarly not result in significant impacts to aesthetics and no mitigation would be required. Further, leaving the site condition unchanged in an infill area would be inconsistent with, and not enhance, the character of the surrounding area. However, when compared to the proposed project, this alternative would reduce impacts, as no new development or construction would occur.

Air Quality

Under the No Project Alternative, air pollutant emissions associated with construction, including emissions associated with grading, site preparation, site finishing and building finishing, would not occur. This alternative would avoid any potential impacts related to construction volatile organic compound emissions, because no construction air pollutant emissions would occur. Implementation of this alternative would not introduce any uses that would generate operational air pollutant emissions. Although the proposed project would result in less-than-significant impacts related to air quality, the No Project Alternative would reduce air quality impacts overall, because no development would occur.

Biological Resources

The No Project Alternative would not require any ground-disturbing activities. As such, this alternative would not result in direct impacts to biological resources. Because impacts to biological resources would be avoided under the No Project Alternative, **Mitigation Measure (MM) BIO-1** and **MM-BIO-2** proposed for the project would not be implemented or required for this alternative. Thus, compared to the proposed project, this alternative would result in a reduced level of direct impacts to biological resources.

Cultural Resources

The No Project Alternative would not require any ground-disturbing activities. Therefore, there would be no potential to impact unknown archaeological resources potentially located within the project site. Further, there would be no potential to disturb previously unidentified human remains that may be present on the project site. As such, **MM-CR-1** through **MM-CR-4** proposed for the project would not be implemented or required for this alternative. Although there may be a reduced level of direct impact to cultural resources, any previously undiscovered on-site resources could be subject to continued degradation due to lack of preservation of the undeveloped site. Nonetheless, compared to the proposed project, this alternative would result in a reduced level of impact to cultural resources as no ground disturbance would occur.

Energy

Under the No Project Alternative, energy use associated with construction or operation of the proposed development, including from electricity use and natural gas use, would not occur. No construction would occur; therefore, no construction-related energy impacts associated with the construction equipment and worker and vendor vehicles would occur as they would with the proposed project. This alternative would not introduce any people or uses that would generate energy use, and, in comparison to the proposed project, this alternative would reduce energy use. As described in Section 3.5, Energy, of this EIR, the proposed project's impacts related to energy emissions would be less than significant. Therefore, compared to the proposed project's less-than-significant impact to energy, the No Project Alternative would have reduced impacts.

Geology and Soils

Under the No Project Alternative, the project site would remain in its current state. Existing topography and on-site soils would not be disturbed by any development. Although the project site would still be subject to potential seismic hazards such as seismic ground shaking, under this alternative, no structures would be present on site. Additionally, paleontological resources would be avoided as no grading or construction would occur. Thus, the risk of loss, injury, or death involving seismic hazards or other geologic conditions would be reduced compared to development of the proposed project.

Greenhouse Gas Emissions

Under the No Project Alternative, GHG emissions associated with construction or operation of future residences at the site, including from electricity use, natural gas use, water use, and solid waste handling, would not occur. No construction would occur; therefore, no construction related GHG impacts associated with the operation of construction equipment and worker and vendor vehicles would occur like they would under the proposed project. This alternative would not introduce any people or uses that would generate GHG emissions. GHG emissions associated with vehicular trips would not occur. In comparison to the proposed project, this alternative would reduce GHG emissions. As described in Section 3.7, Greenhouse Gas Emissions, of this EIR, the proposed project's impacts related to GHG emissions would be less than significant. Therefore, compared to the proposed project's less-than-significant impact to GHGs, the No Project Alternative would have reduced impacts.

Hazards and Hazardous Materials

Under the No Project Alternative, no land uses would be introduced that could result in the use or generation of hazardous materials. In comparison to the proposed project, this alternative would not have the potential for transport, accidental release, or spill of hazardous materials during construction and would not expose people or structures to the potential of wildland fires, as the site would remain undeveloped. As described in Section 3.8, Hazards and Hazardous Materials, of this EIR, the proposed project's impacts related to hazards and hazardous materials would be less than significant. Therefore, compared to the proposed project's less-than-significant impact to hazards/hazardous materials, this alternative would have reduced impacts.

Hydrology and Water Quality

Under No Project Alternative, no development would occur and no impervious surfaces would be created. The existing on-site hydrologic conditions, drainage patterns, and drainage volumes would remain unaltered. Water quality would also remain unchanged. However, no best management practices would be implemented and

stormwater runoff would continue to leave the project site untreated. Additionally, as described in Section 3.9, Hydrology and Water Quality, of this EIR, the proposed project's impacts to hydrology and water quality would be less than significant. Therefore, compared to the proposed project's less-than-significant impacts to hydrology and water quality, this alternative would have reduced impacts.

Land Use and Planning

Under this alternative, the project site would remain undeveloped and none of the discretionary approvals identified for the project would be required. The proposed General Plan Amendment (GPA) and Rezone of the site from Commercial (C) to Specific Plan Area (SPA) would not be required. However, this alternative would not meet many of the overall goals of the City's General Plan, including accommodating growth in areas that can sustain a concentration of a variety of uses and constructing residential uses in areas suitable for multimodal transportation. Nonetheless, because discretionary approvals would not be required to change the existing land use and zoning designations under this alternative to allow for intended development (i.e., potential conflict regarding consistency with applicable regulations), impacts to land use and planning would be reduced compared to the proposed project.

Noise

The project site is currently vacant and does not generate any noise. Under the No Project Alternative, the project site would remain undeveloped and would not create any new sources of construction or operational noise. Additionally, this alternative would not generate any groundborne vibration. As described in Section 3.11, Noise, of this EIR, the proposed project's impacts related to noise would be less than significant. Therefore, compared to the proposed project's less-than-significant impact to noise, this alternative would have reduced impacts.

Population and Housing

The project site is currently undeveloped. The No Project Alternative would not induce population growth in the area, as no development would occur. However, this alternative would also not contribute to meeting regional housing demands. Similar to the proposed project, this alternative would not displace any housing or people. As described in Section 3.12, Population and Housing, of this EIR, the proposed project's impacts related to population and housing would be less than significant. However, because this alternative would not induce unplanned population growth, overall impacts would be reduced.

Public Services

The No Project Alternative would not result in an increase in demand for public services since no development would occur. Specifically, the No Project Alternative would not increase the demand for police and fire protection services, nor would this alternative increase the demand on parks, schools, and library services. As stated in Section 3.13, Public Services, of this EIR, the proposed project would result in less-than-significant impacts to public services. Therefore, compared to the proposed project's less-than-significant impact to public services, this alternative would have reduced impacts.

Recreation

Under the No Project Alternative, there would not be an increased demand for park and recreational facilities. As such, payment of the City's Public Facility Fees by the applicant would not be required. However, under this alternative, recreation and open space amenities proposed as part of the project would also not be developed. As

stated in Section 3.14, Recreation, of this EIR, the proposed project would result in less-than-significant impacts to recreation. Because this alternative would not result in increased demands to parks and recreation, impacts would be reduced compared to the proposed project.

Transportation

Under the No Project Alternative, no development would occur. Therefore, this alternative would have no direct impact on VMT, would not result in hazards due to design features, and would not alter emergency access; no impact would occur. However, compared to the proposed project, this alternative would not promote sustainability by focusing housing development in an infill area identified as having low VMT due to proximity to existing employment, entertainment, schools, markets, parks, transit, and shopping centers. Additionally, other improvements, such as circulation and pedestrian improvements, would not occur under this alternative. As outlined in Section 3.15, Transportation, of this EIR, because the project's VMT per resident is more than 15% above the regionwide average, impacts would be significant; despite the implementation of **MM-TRA-1** through **MM-TRA-3**, impacts would remain significant and unavoidable. Under the No Project Alternative, no mitigation would be required as no development would occur. Therefore, compared to the proposed project, the No Project Alternative would result in reduced impacts related to transportation.

Tribal Cultural Resources

The No Project Alternative would not require any ground-disturbing or other construction/development activities. Therefore, there would be no potential to impact unknown tribal cultural resources potentially located within the project site. However, although there may be a reduced level of direct impact to tribal cultural resources, any previously undiscovered on-site resources could be subject to continued degradation due to lack of preservation with the undeveloped site.

Nevertheless, because the site would not be disturbed under this alternative, **MM-CR-1** through **MM-CR-4** proposed for the project would not be implemented or required under this alternative. Compared to the proposed project, this alternative would result in a reduced level of impact to tribal cultural resources.

Utilities and Service Systems

No development would occur under the No Project Alternative. As such, the increase in demand for water service, wastewater service, and solid waste handling services would not occur. As discussed in Section 3.17 of this EIR, impacts to utilities and service systems were determined to be less than significant under the proposed project. Nonetheless, because no development would occur under this alternative, the demand for utilities would be eliminated. Therefore, impacts to utilities and service systems would be reduced under this alternative compared to the proposed project and no impacts on utilities and service systems would occur.

Summary and Relation to Project Objectives

Since the No Project Alternative would not provide any development, overall impacts would be reduced compared to the proposed project. However, certain benefits would not be realized under this alternative, including the provision of housing units in an infill area identified in the General Plan and enhanced uses and connectivity in the surrounding area.

As the No Project Alternative would not develop the site or allow for housing, this alternative would not fulfill any of the project objectives.

4.4.4 Existing Land Use Designation Alternative

Under the Existing Land Use Designation Alternative, the project site would be developed per the City's General Plan as a Commercial (C) land use. The project site would be developed as previously processed with the existing CVS Conditional Use Permit. The Existing Land Use Designation Alternative would include 69,000 square feet (sf) of grocery store and gas station uses and 23,000 sf of office space. This alternative would include 276 parking spaces. This alternative could be processed with a Conditional Use Permit and Site Development Plan and would not require a GPA or Rezone of the site.

Other improvements, such as circulation, landscaping, and utility connections would occur as required. Off-site improvements beyond those required by mitigation measures would not occur under this alternative. No open space uses would occur on site.

4.4.4.1 Comparison of the Effects of the Existing Land Use Designation Alternative to the Proposed Project

Aesthetics

The Existing Land Use Designation Alternative would develop commercial uses on the currently undeveloped site. This alternative would consist of 69,000 sf of grocery store and gas station uses, 23,000 sf of office space, and 276 parking spaces. This alternative would result in similar less-than-significant impacts or no impacts related to scenic vistas, scenic highways, visual character or quality, or lighting and glare compared to the proposed project. The visual character of the site would change from vacant to commercial, which is consistent with the existing land use designation and immediately adjacent uses to the south/southeast. New sources of lighting would be introduced, but, similar to the project, they would be required to comply with the City's Light and Glare Standards. Therefore, aesthetic impacts of the Existing Land Use Designation Alternative would be comparable to those of the proposed project.

Air Quality

Under the Existing Land Use Designation Alternative, air pollutant emissions associated with project construction, including emissions associated with grading, site preparation, site finishing and building finishing, would occur, which would be similar to the proposed project.

Under the Existing Land Use Designation Alternative, mobile source operational emissions from vehicle trips are expected to be greater than those of the proposed project, based on the alternative land use of a grocery store, gas station, and office space. Commercial development would likely result in greater stationary source operational air pollutant emissions compared to the proposed project's residential use of the site. Commercial uses generally use more energy than residential land uses, which translates to increased air pollutant emissions related to energy generation and energy transmission. Diesel particulate matter emissions from heavy-duty equipment operations and heavy-duty truck trips associated with the gas station and grocery store may also generate significant operational emissions, which could potentially result in associated health impacts to nearby sensitive receptors. Unlike operation of a residential development, development of the Existing Land Use Designation Alternative could result in significant long-term toxic air contaminant emissions, including diesel particulate matter. Commercial development of the site may also result in adverse impacts from odors associated with the gas station. As such, this alternative would likely result in greater impacts to air quality compared to the proposed project.

Biological Resources

The development footprint of the Existing Land Use Designation Alternative would result in a similar or greater ground disturbance area on the project site. Development of this alternative would result in a similar potential to impact existing biological resources on site, including loss of vegetation communities and potential impacts to special-status species, sensitive natural communities, and nesting birds. Under this alternative, designated open space areas would not be required and the site would be developed with more impervious area than the proposed project. Like the project, this alternative would likely require mitigation measures similar to MM-BIO-1 and MM-BIO-2 in order to reduce impacts to biological resources. With implementation of mitigation measures similar to those proposed for the project, this alternative would result in similar impacts to biological resources compared to the project.

Cultural Resources

The development footprint of the Existing Land Use Designation Alternative would be slightly greater than the proposed project since no open space area would be required. Development could result in similar or greater ground-disturbance compared to the proposed project. Therefore, the potential to impact unknown archaeological resources located within the project site, as well as unidentified human remains, would still occur. As with the proposed project, implementation of MM-CR-1 through MM-CR-4 would be required to reduce potential impacts to unknown/unidentified cultural resources. Compared to the proposed project, this alternative would result in a similar level of impact to cultural resources.

Energy

Development of the Existing Land Use Designation Alternative would result in construction and operational energy use. Energy use during construction would be similar to the proposed project and primarily be associated with construction equipment, as-necessary lighting, and electronic equipment such as computers inside temporary construction trailers and heating, ventilation, and air conditioning. The operation of this alternative would require electricity for multiple purposes, including proposed daily uses associated with the industrial land use, cooling, lighting, and various equipment. Additionally, the supply, conveyance, treatment, and distribution of water would indirectly result in electricity usage.

As described above, commercial uses generally use more energy than residential land uses, which translates to increased air pollutant emissions related to energy generation and energy transmission. As such, demand for energy would be greater under the Existing Land Use Designation Alternative than under the proposed project.

Similar to the proposed project, this alternative would be required to comply with building requirements (including Title 24 California Code of Regulations standards) designed to ensure efficient energy use, reduce energy demand, and comply with state and local renewable energy and energy efficiency requirements. Petroleum use during operation of the Existing Land Use Designation Alternative is expected to be increased compared to the proposed project as a result of grocery store and gas station land use activities and vehicles. As such, demand for energy would be greater under this alternative than under the proposed project.

Geology and Soils

Under the Existing Land Use Designation Alternative, although the project site would be developed with different land uses, ground-disturbance areas would be similar. Development under this alternative would be subject to the same potential seismic hazards such as seismic ground shaking. This alternative would also require abiding by geological recommendations, such as the ones identified in the geotechnical evaluation for the proposed project.

Similar to the proposed project, paleontological resources would be avoided because the potential for paleontological resources to be located on the project site is considered low. Compared to the proposed project, this alternative would result in similar level of impacts to geology and soils.

Greenhouse Gas Emissions

Construction and operation of the Existing Land Use Designation Alternative would result in construction GHG emissions that are primarily associated with use of off-road construction equipment, on-road vehicles, vendor trucks, daily operations, and worker vehicles. The GHG emissions associated with this alternative are expected to be greater due to typical daily operations associated with the commercial land uses, specifically transportation trucks associated with the gas station and grocery store. Additionally, the City's zoning does not have an open space requirement for commercial uses, as it does for the project's residential land use.

Although this alternative is not expected to conflict with an applicable GHG related plan, policy, or regulation due to consistency with the existing General Plan land use and zoning designation, the Existing Land Use Designation Alternative is expected to result in greater emissions compared to the project due to operational uses typical of such commercial projects. As such, impacts to GHG emissions under the Existing Land Use Designation Alternative would be greater in comparison to the proposed project.

Hazards and Hazardous Materials

Similar to the proposed project, there is the potential for the Existing Land Use Designation Alternative to generate hazardous materials during construction; however, existing federal and state standards are in place for the handling, storage, and transport of these materials. Because the Existing Land Use Designation Alternative would result in development of commercial uses on site, including a gas station, operation of this alternative would likely result in increased use of hazardous materials on site compared to the household products that would be utilized under the project's proposed residential uses. Therefore, compared to the proposed project, this alternative would result in greater impacts related to hazards and hazardous materials.

Hydrology and Water Quality

As described above, the Existing Land Use Designation Alternative would result in a similar or greater disturbance area on the project site. Due to uses associated with commercial development and associated parking, it is assumed that this alternative would introduce more impervious surfaces to the site compared to the proposed project, as the proposed project would be required to incorporate open space and landscaped areas for residents under the San Marcos Municipal Code. Development of both the proposed project and this alternative would alter the existing on-site hydrologic conditions, drainage patterns, and drainage volumes in comparison to existing vacant conditions. It is expected that this alternative, like the proposed project, would also incorporate all required and applicable best management practices to avoid any violations of water quality standards and to avoid otherwise modifying or adversely affecting surface and groundwater quality or increasing runoff rate or volume from the site. Therefore, as compared to the proposed project, this alternative would result in similar, less-than-significant impacts.

Land Use and Planning

Because development of this alternative would be consistent with land uses identified in the City's General Plan, a GPA and Rezone would not be required. Development of commercial uses on the project site would also be consistent with adjacent land uses to the south/southeast. By contrast, the proposed project would introduce population growth in an area of the City that has not been accounted for in the City's General Plan. Therefore,

because this alternative would avoid a GPA/Rezone, which would be required for the proposed project, no impacts would occur under this alternative, and impacts would be reduced compared to the proposed project.

Noise

The Existing Land Use Designation Alternative would result in similar ground-disturbance on site in comparison to the proposed project. As analyzed in Section 3.11 of this EIR, proposed project noise impacts were determined to be less than significant. Construction noise of this alternative is expected to be similar to that of the proposed project. Operationally, this alternative may result in greater noise generation during commercial operating hours, particularly with components such as the grocery store and gas station. While it is likely that such commercial uses would generate more noise than a residential development, it would be expected that the uses would comply with the City's noise ordinance regarding generation of noise at the property line, and that appropriate mitigation would be implemented as needed to reduce potential impacts to less than significant. Therefore, compared to the proposed project, this alternative would result in similar impacts.

Population and Housing

The Existing Land Use Designation Alternative would not induce substantial unplanned population growth in the area, either directly or indirectly. This alternative would propose new businesses consistent with the General Plan and provide for infrastructure only as needed to serve the alternative. The proposed project seeks to change the land use designation of the project site to allow for development of residential land uses that have not been accounted for in the City's General Plan; however, the proposed new homes and associated estimate of 370 residents is not expected to substantially induce unplanned population growth in this infill area. Like the proposed project, the Existing Land Use Designation Alternative would have no impact related to displacing substantial numbers of people or housing. Overall, impacts related to population and housing for this alternative would be reduced compared to the proposed project's less-than-significant impact.

Public Services

Similar to the proposed project, the Existing Land Use Designation Alternative would result in an increase in demand for public services due to the development of a currently vacant site. However, commercial development under this alternative would likely result in less of a demand on public services (especially parks, schools, and libraries) compared to the residential development proposed by the project. Therefore, impacts to public services under this alternative would be reduced compared to the proposed project, but would remain less than significant.

Recreation

Unlike the proposed project, the Existing Land Use Designation Alternative would not result in an increase in demand for parks and recreation services over existing conditions, as no residents or substantial population generation would be associated with development of commercial uses on site. Additionally, this alternative would not require usable open space on site. This alternative would result in reduced impacts to recreational facilities compared to the proposed project's less-than-significant impacts.

Transportation

The Existing Land Use Designation Alternative is assumed to be served by a larger volume of large trucks and machinery during both construction and operation. However, traffic signals and entries to the site were designed

and built to accommodate anticipated heavy commercial traffic during processing of the CVS development. It is anticipated that this alternative would be required to provide adequate emergency access, similar to the project.

VMT for the Existing Land Use Designation Alternative is expected to be greater in comparison to the proposed project as a result of operational uses typical of such commercial uses, including daily transport and volume of large trucks. The estimated daily vehicle trips for this alternative is approximately 10,672 average daily trips, in comparison to the proposed project's calculated 960 average daily trips. Further, this alternative would not promote sustainability by focusing housing development in an infill area identified as a High Quality Transit Area due to proximity to existing employment, entertainment, schools, markets, parks, transit, and shopping centers.

This alternative would likely result in a larger volume of large trucks during operation. However, such uses would be compatible with surrounding commercial uses to the south/southwest and are unlikely to result in hazards due to design features or incompatible uses. Compared to the proposed project, the Existing Land Use Designation Alternative is expected to result in similar or greater impacts related to transportation.

Tribal Cultural Resources

This alternative would result in new commercial development within a slightly greater footprint than the proposed project on a currently vacant site. As such, this alternative would have similar potential to affect unknown tribal cultural resources compared to the proposed project. It is expected that this alternative would require implementation of mitigation measures similar to **MM-CR-1** through **MM-CR-4** proposed for the project. Thus, with the implementation of mitigation, impacts to tribal cultural resources are expected to be similar to the proposed project.

Utilities and Service Systems

The Existing Land Use Designation Alternative demand for water service, energy, and solid waste is expected to be greater than that required to serve a 120-unit residential project (approximately 370 residents). As described under the air quality analysis above, commercial uses including the grocery store and gas station proposed under this alternative generally use more energy and water than residential land uses. As such, the Existing Land Use Designation Alternative's demand for utilities and service systems is likely to be greater than the demand under the proposed project.

Summary and Relation to Project Objectives

Under the Existing Land Use Designation Alternative, the project site would be developed per the City's General Plan land use designation with Commercial (C) land uses. As described above, this alternative would develop 69,000 sf of grocery store and gas station uses, 23,000 sf of office space, and 276 parking spaces. This alternative could be processed with a Site Development Plan and would not require a GPA or Rezone of the site.

Because development of the Existing Land Use Designation Alternative would include grading and development of the same site, construction-related impacts would be similar to the proposed project and would require similar mitigation for impacts to biological resources, cultural resources, geology and soils, tribal cultural resources, and traffic. However, the commercial use of the site would be expected to result in greater impacts to air quality, energy, GHG emissions, hazards and hazardous materials, transportation, and utilities, in comparison to the impacts resulting from the proposed project's residential use, and additional mitigation may be required.

This alternative would promote infill development on site; however, it would not fulfill any of the basic project objectives and would also not aid the City in achieving its Regional Housing Needs Assessment allocation. Furthermore, the project site has been designated for commercial development under the existing and previous General Plans but has remained vacant, evidencing that it is not marketable or feasible for commercial uses.

Although this alternative would be consistent with the existing designated land use and zoning for the site and adjacent land uses to the south, this alternative would not reduce or avoid significant environmental impacts and would not meet any project objectives.

4.4.5 Reduced Density Alternative

The Reduced Density Alternative would reduce the density on site in comparison to the project by changing the General Plan land use designation to Low Density Residential (LDR) and changing the zoning to Residential 1 (R-1-7.5), which "provides for low-density, single family detached homes that are suitable in massing and character or inclusion in single-family detached neighborhoods," as outlined in the Municipal Code. Under this alternative, the site would accommodate approximately 33 single-family homes for a total residential density of 4.34 dwelling units per acre. The Reduced Density Alternative would not incorporate private useable open space area within the residential community since each single-family home would have a backyard. The access points and internal streets would be configured to fit the 33 single-family home layout. This alternative would utilize the entire 7.6-acre site.

4.4.5.1 Comparison of the Effects of the Reduced Density Alternative to the Proposed Project

Aesthetics

The Reduced Density Alternative would reduce the density on site with the development of 33 single-family homes instead of 120 townhomes. The visual character of the site would change from vacant to residential in an urbanized and developed area. Compared to the proposed project, the Reduced Density Alternative would decrease impacts related to visual character and consistency for the land uses to the north and west of the project due to the more similar single-family housing. New sources of lighting would be introduced but, similar to the project, they would be required to comply with the City's Light and Glare Standards. Therefore, aesthetic impacts of the Reduced Density Alternative would be comparable to the proposed project, resulting in less-than-significant impacts.

Air Quality

Under the Reduced Density Alternative, air pollutant emissions associated with project construction, including emissions associated with grading, site preparation, site finishing, and building finishing, would be similar compared to the proposed project.

Under the Reduced Density Alternative, mobile source operational emissions from light vehicle trips would be reduced compared to the proposed project, since the unit count would decrease to 33 single-family homes. As such, this alternative would likely result in overall reduced impacts to operational air quality compared to the proposed project.

Biological Resources

The Reduced Density Alternative would result in similar ground disturbance area on the project site and would result in similar impacts as the proposed project to existing biological resources on site. Similar to the proposed project, this alternative would require mitigation similar to **MM-BIO-1** and **MM-BIO-2**, proposed for the project.

With implementation of mitigation measures similar to those proposed for the project, this alternative would result in similar less-than-significant impacts to biological resources compared to the project.

Cultural Resources

The Reduced Density Alternative would result in similar ground-disturbance compared to the proposed project and would result in similar impacts to unknown archaeological resources located within the project site, as well as unidentified human remains. As with the proposed project, implementation of mitigation measures similar to **MM-CR-1** through **MM-CR-4** would be required to reduce potential impacts to unknown/unidentified cultural resources. With implementation of mitigation measures similar to those proposed within the project, this alternative is expected to result in similar less-than-significant impacts to cultural resources compared to the project.

Energy

Under the Reduced Density Alternative, development would result in construction and operational energy use. Energy use during construction would primarily be associated with construction equipment, as-necessary lighting, and electronic equipment, such as computers inside temporary construction trailers and heating, ventilation, and air conditioning, similar to the proposed project. Natural gas is not anticipated to be used during construction, similar to the proposed project, and would be temporary and negligible if used. Petroleum would be used throughout construction of the alternative and would be similar to the proposed project. Ultimately, like the proposed project, the petroleum consumed related to construction would be typical of construction projects of similar types and sizes and would not be wasteful or inefficient.

The operation of this alternative would also require electricity for multiple purposes, similar to the proposed project. The Reduced Density Alternative demand for energy use is expected to be similar or slightly reduced to that required to serve the proposed project. Similar to the proposed project, this alternative would be required to comply with building requirements (including Title 24 California Code of Regulations standards) designed to ensure efficient energy use, reduce energy demand, and comply with state and local renewable energy and energy efficiency requirements. Like the proposed project, the operation of residential units would require natural gas for space heating and to power appliances, but compliance with Title 24 would ensure its efficient use. As such, demand for energy under this alternative would be comparable to demand under the proposed project, or would be slightly reduced. Similar, less-than-significant impacts to energy would occur under this alternative.

Geology and Soils

Under the Reduced Density Alternative, ground-disturbance areas would be similar. Development under this alternative would be subject to the same potential seismic hazards, such as seismic ground shaking. This alternative would also require abiding by geological recommendations, such as the ones identified in the geotechnical evaluation for the proposed project. Similar to the proposed project, paleontological resources would be avoided because the potential for paleontological resources to be located on the project site is considered low. Compared to the proposed project, this alternative would result in similar less-than-significant impacts to geology and soils.

Greenhouse Gas Emissions

Construction of the Reduced Density Alternative would result in construction GHG emissions that are primarily associated with use of off-road construction equipment, on-road vehicles, vendor trucks, and worker vehicles, similar to the proposed project. Construction GHG emissions under this alternative may be slightly reduced as a result of the decreased unit count.

Estimated annual operational GHG emissions from this alternative would be similar or slightly reduced compared to the proposed project as the unit count would be reduced to 33 single-family homes. Thus, this alternative would result in overall similar GHG emissions compared to the proposed project and impacts would remain less than significant.

Hazards and Hazardous Materials

Similar to the proposed project, there is the potential for the Reduced Density Alternative to generate hazardous materials during construction; however, existing federal and state standards are in place for the handling, storage, and transport of these materials. Because the Reduced Density Alternative would result in similar development of residential units on site, operation of this alternative would result in similar use of hazardous materials on site, such as household products, that would be utilized under the proposed project. Therefore, compared to the proposed project, this alternative would result in similar impacts related to hazards and hazardous materials.

Hydrology and Water Quality

As described above, the Reduced Density Alternative would result in similar ground disturbance area on the project site. Due to the similar development footprint under this alternative, impervious surfaces would be similar to those of the proposed project or would slightly increase since no communal useable open space area would be incorporated on site. Development of both the proposed project and this alternative would alter the existing on-site hydrologic conditions, drainage patterns, and drainage volumes in comparison to existing vacant conditions. It is expected that this alternative, like the proposed project, would also incorporate all required and applicable best management practices to avoid any violations of water quality standards and to avoid otherwise modifying or adversely affecting surface and groundwater quality or increasing runoff rate or volume from the site. Therefore, as compared to the proposed project, this alternative would result in similar, less-than-significant impacts to hydrology and water quality.

Land Use and Planning

Similar to the proposed project, the Reduced Density Alternative would introduce housing on site and a GPA and Rezone would be required. Similar to the proposed project, this alternative would introduce population growth in an area of the City that has not been accounted for in the City's General Plan. Therefore, because this alternative would also require a GPA/Rezone but would not conflict with applicable plans, policies, and regulations, impacts under this alternative would result in similar impacts to land use to those of the proposed project.

Noise

The Reduced Density Alternative could potentially result in reduced noise levels as a result of the reduction in unit count from 120 townhomes to 33 single-family homes. As analyzed in Section 3.11 of this EIR, noise impacts

associated with the proposed project were determined to be less than significant. Construction noise of this alternative is expected to be similar to that of the proposed project. Operationally, this alternative would result in similar or slightly reduced noise generation to that of the proposed project due to the layout. Development of this alternative would be expected to comply with the City's noise ordinance regarding generation of noise at the property line. Therefore, as compared to the proposed project, this alternative may result in slightly reduced noise, but would still result in similar, less-than-significant impacts.

Population and Housing

The Reduced Density Alternative would similarly introduce unplanned population growth in the area with the development of 33 single-family housing units on the currently vacant site. As of 2021, the City has a person per household ratio of 3.08 (DOF 2021). Using this household ratio of 3.08, development of 33 single-family residential dwelling units at the project site would generate approximately 102 people, in comparison to the proposed project's estimated generation of 370 people. The proposed project seeks to change the land use designation of the project site to allow for development of residential land uses that have not been accounted for in the City's General Plan. Development of this alternative would also require a GPA/Rezone. However, similar to the project, the new homes under this alternative would not be considered to substantially induce unplanned population growth as the project site is an infill site surrounding by existing roadways, utilities, and development. Like the proposed project, this alternative would have no impact related to displacing substantial numbers of people or housing. Therefore, impacts related to population and housing for this alternative would be similar to the proposed project's less-than-significant impacts.

Public Services

Similar to the proposed project, the Reduced Density Alternative would result in an increase in demand for public services due to the development of a currently vacant site. Because the unit count would be reduced under this alternative, impacts to public services would be slightly less than the proposed project, but still result in similar less-than-significant impacts.

Recreation

Similar to the proposed project, the Reduced Density Alternative would result in an increased demand on existing park and recreational facilities within the City with the introduction of 33 single-family housing units. However, similar to the proposed project, this alternative would be required to incorporate private open space on site and would be required to pay into applicable developer and park impact fees. Therefore, impacts related to recreation for this alternative would be similar to the proposed project's less-than-significant impacts.

Transportation

The Reduced Density Alternative would be served by similar vehicle traffic during construction compared to the proposed project. Construction traffic impacts under this alternative are expected to be less than significant, as with the proposed project.

During operation, project access points for this alternative would be designed to fit the 33 single-family unit layout. It is anticipated that this alternative would be required to provide adequate emergency access, similar to the project.

Due to the project site being located in an urban setting and the limited options available to mitigate VMT impacts for residential projects, the Reduced Density Alternative would still result in a significant and unavoidable transportation impact due to VMT. Therefore, compared to the proposed project, this alternative would result in similar significant and unavoidable impacts related to transportation.

Tribal Cultural Resources

This alternative would result in development within the same footprint as the proposed project on the project site. As such, this alternative would result in a similar potential to affect unknown tribal cultural resources compared to the proposed project. It is expected that this alternative would require implementation of mitigation measures similar to **MM-CR-1** through **MM-CR-4** proposed for the project. Thus, with the implementation of mitigation, impacts to tribal cultural resources would be similar to the proposed project and would be less than significant.

Utilities and Service Systems

The Reduced Density Alternative demand for water service, energy, and solid waste is expected to be similar to that required to serve the proposed project. Therefore, the demand for utilities and service systems is determined to be similar to that of the proposed project under this alternative, and result in a less-than-significant impact.

Summary and Relation to Project Objectives

The Reduced Density Alternative would reduce the total unit and population density on site, but retain the same development footprint as the proposed project. The Reduced Density Alternative would develop 33 single-family homes on the 7.6-acre site. Development of single-family homes would be more consistent with the adjacent single-family homes to the west. However, the 33 single-family homes under this alternative would not be consistent with the urban setting of the area and other adjacent land uses, and would not maximize development of the site near transit, schools, and commercial uses.

While this alternative would develop infill housing on an urbanized site and rezone the site to residential to assist the City to implement its housing goals, it would less efficiently promote infill development and would not enhance connectivity. Due to the site configuration and single-family units, communal recreational amenities would not be incorporated into this alternative. Furthermore, due to the project site being located in an urban setting and the limited options available to mitigate VMT impacts for residential projects, the Reduced Density Alternative would still result in a significant and unavoidable transportation impact due to VMT.

However, the Reduced Density Alternative would potentially provide a slightly reduced level of impact in some environmental analysis areas including aesthetics, air quality, energy, GHG, and noise. As described above, mitigation measures would still be required to mitigate impacts to biological resources, cultural resources, geology and soils, and tribal cultural resources. This alternative would not meet most of the project objectives.

4.5 Environmentally Superior Alternative

Table 4-1 provides a qualitative comparison of the impacts for each Alternative compared to the proposed project. As shown in Table 4-1, the No Project Alternative would eliminate all of the significant impacts identified for the project. However, the No Project Alternative would not meet any of the project objectives. CEQA Guidelines Section 15126.6(e)(2) states that if the No Project Alternative is identified as the environmentally superior alternative, then an environmentally superior alternative should be identified among the other alternatives.

Among the other alternatives, not including the proposed project, the Reduced Density Alternative would be considered the environmentally superior alternative because it would potentially provide a reduced level of impact in some environmental analysis areas including air quality, GHG, and noise. However, such impacts under this alternative would still remain as less than significant, similar to the proposed project. The Reduced Density Alternative would cover the same development footprint as the proposed project but would result in decreased unit count and population count on site. Because the Reduced Density Alternative would cover the same development footprint as the project, impacts to biological resources, cultural resources, geology and soils, and tribal cultural resources would remain the same as the proposed project and mitigation measures would still be required to mitigate impacts to these environmental resources. The Reduced Density Alternative would not meet project objectives 1, 2, and 4. Furthermore, due to the project site being located in an urban setting and the limited options available to mitigate VMT impacts for residential projects, the Reduced Density Alternative would still result in a significant and unavoidable transportation impact due to VMT.

For the Existing Land Use Designation Alternative, although this alternative would be consistent with the existing land use and zoning designation for the site and would promote infill development on site, it would not fulfill any of the project objectives, would not reduce or avoid significant environmental impacts, would not aid the City in achieving its Regional Housing Needs Assessment allocation. Additionally, it may result in new or more severe impacts related to air quality, GHG emissions, and hazards.

Table 4-1. Comparison of Impacts of Proposed Project and Alternatives

Environmental Topic	Proposed Project	No Project Alternative	Existing Land Use Designation Alternative	Reduced Density Alternative
Aesthetics	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same/Reduced)
Air Quality	LTS	No Impact (Reduced)	LTS (Greater)	LTS (Same/Reduced)
Biological Resources	LTSM	No Impact (Reduced)	LTSM (Same/Greater)	LTSM (Same)
Cultural Resources	LTSM	No Impact (Reduced)	LTSM (Same/Greater)	LTSM (Same)
Energy	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same/Reduced)
Geology and Soils	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same)
Greenhouse Gas Emissions	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same/Reduced)
Hazards and Hazardous Materials	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same)
Hydrology and Water Quality	LTS	No Impact (Reduced)	LTS (Same)	LTS (Same)
Land Use	LTS	No Impact (Reduced)	LTS (Reduced)	LTS (Same)
Noise	LTSM	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same/Reduced)
Population and Housing	LTS	No Impact (Reduced)	LTS (Reduced)	LTS (Same/Reduced)
Public Services	LTS	No Impact (Reduced)	LTS (Reduced)	LTS (Same/Reduced)
Recreation	LTS	No Impact (Reduced)	LTS (Reduced)	LTS (Same)
Transportation	LTS	No Impact (Reduced)	LTSM (Same/Greater)	LTSM (Same)
Tribal Cultural Resources	LTSM	No Impact (Reduced)	LTSM (Same/Greater)	LTSM (Same)
Utilities and Service Systems	LTS	No Impact (Reduced)	LTS (Same/Greater)	LTS (Same)

Note: LTS = Less Than Significant Impact; LTSM = Less Than Significant with Mitigation; SU = Significant and Unavoidable.

5 Environmental Effects Found Not To Be Significant

As required by Section 15128 of the California Environmental Quality Act Guidelines, the following is a discussion of the environmental effects that were considered as part of this environmental impact report (EIR) but were determined to have no impact and therefore are not discussed in detail in Chapter 3, Environmental Analysis, of this EIR. Agriculture and forestry resources, mineral resources, and wildfire were the only environmental issue areas eliminated from Chapter 3 and are briefly discussed below.

As discussed in Chapter 2, Project Description, of this EIR, the proposed Gran Vista Specific Plan Project (project) proposes development of 120 townhomes and associated amenities on a 7.6-acre project site. The project proposes a General Plan Amendment and Rezone from Commercial (C) to Specific Plan Area (SPA).

5.1 Agriculture and Forestry Resources

The project site is designated as Urban and Built-Up Land by the California Department of Conservation Farmland Mapping and Monitoring Program (DOC 2016). As a result, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses.

Furthermore, the project site is not zoned for agricultural use or designated as land under the Williamson Act, nor is the project site zoned for forest land or timberland production (DOC 2014). Therefore, implementation of the proposed project would not result in the loss or conversion of forest land. No impact would occur regarding conflicts with existing zoning for agricultural use or forest land.

Designated farmland does not exist within the vicinity of the project site. The proposed project would not result in substantial changes that could result in the conversion of farmland to non-agricultural use. The project site is surrounded entirely by developed land, with the exception of two small vacant lots adjacent to the east and west portion of the site. This vacant lots are designated Commercial by the City of San Marcos (City). Other existing development adjacent to the project site include Commercial, Specific Plan Amendment, and Low Density Residential (City of San Marcos 2022). Given the extent of development surrounding the project site, the proposed project would not result in the conversion of any existing farmland, and **no impact** would occur.

5.2 Mineral Resources

According to the City of San Marcos General Plan Conservation and Open Space Element, the City has land classified in all four Mineral Resource Zones (MRZs) (City of San Marcos 2012). The different MRZs are defined as follows:

- **MRZ-1:** Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.
- **MRZ-2:** Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.
- **MRZ-3:** Areas containing mineral deposits the significance of which cannot be evaluated from available data.
- **MRZ-4:** Areas where available information is inadequate for assignment to any other MRZ zone.

California does not require that local governments protect land designated as MRZ-1, MRZ-3, or MRZ-4. However, the City is responsible for recognizing lands designated as MRZ-2 and protecting these areas from premature development incompatible with mining. City lands designated as MRZ-2 include small portions between Double Peak, Mt. Whitney, and Franks Peak and small portions in the northern Sphere of Influence within Twin Oaks Valley Neighborhood (City of San Marcos 2012). These locations do not overlap with the proposed project site and the project site is located in MRZ-4 (DOC 2017); therefore, no loss of known mineral resources would occur.

Furthermore, the project site is not designated as a locally important mineral resource recovery site on any local general plan, specific plan, or other land use plan (City of San Marcos 2012). Therefore, due to the location and nature of the proposed project, there would be **no impact** to mineral resources.

5.3 Wildfire

The project site is not located in any fire hazard severity zones (CAL FIRE 2022). Nor is the project site located near any local responsibility areas, state responsibility areas, or lands classified as very high fire hazards severity zones (CAL FIRE 2022). The existing project site is a vacant lot. Implementation of the proposed project would likely reduce the potential for wildfire hazards on site. Proposed development would not include infrastructure that would exacerbate fire risk. Additionally, the proposed project would be required to comply with all applicable state and local fire codes. Furthermore, as determined in the Fire Response Summary Letter prepared for the project (Appendix J to this EIR), the San Marcos Fire Department's existing Station 1 would adequately serve future development at the project site while maintaining their response goals. For these reasons, the proposed project is not expected to result in significant impacts related to wildfire. **No impact** would occur.

6 Other CEQA Considerations

6.1 Significant Unavoidable Impacts

California Environmental Quality Act (CEQA) Guidelines Section 15126.2(b) requires that an environmental impact report (EIR) describe any significant impacts that cannot be avoided, including those impacts that can be mitigated but not reduced to a less-than-significant level. Chapter 3, Environmental Analysis, of this EIR describes the potential environmental impacts of the proposed Gran Vista Specific Plan Project (project) and recommends mitigation measures to reduce impacts, where feasible.

As discussed in this EIR, all potentially significant impacts would be reduced to a less-than-significant level with mitigation incorporated, with the exception of traffic impacts, which would remain significant and unavoidable after incorporation of proposed mitigation.

6.2 Growth Inducement

Section 15126.2(d) of the CEQA Guidelines mandates that the growth-inducing nature of a proposed project be discussed. The CEQA Guideline state the growth-inducing analysis is intended to address the potential for the proposed project to "foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." Further, the CEQA Appendix G Checklist (Population and Housing) also mandates that a CEQA document speak to the proposed project's likelihood to induce substantial population growth in an area, either directly (e.g., by proposing new homes or businesses) or indirectly (e.g., through extension of roads or other infrastructure).

A project may be distinguished as either facilitating planned growth or inducing unplanned growth. Facilitating growth is related to the establishment of direct employment, population, or housing growth that would occur within a project site. Inducing growth is related to lowering or removing barriers to growth or creating an amenity or facility that attracts new population/economic activity. For purposes of this EIR analysis, a significant growth inducement impact would occur if the proposed project, as well as associated infrastructure improvements, directly or indirectly removes obstacles to growth such that the induced growth would significantly burden existing community services or the environment or cause a demand for General Plan Amendments. This section contains a discussion of the growth inducing factors related to the proposed project as defined under CEQA Guidelines Section 15126.2(d). A project is defined as growth inducing when it directly or indirectly:

1. Fosters population growth
2. Includes the construction of additional housing in the surrounding environment
3. Removes obstacles to population growth
4. Taxes existing community service facilities, requiring construction of new facilities that could cause significant environmental effects
5. Encourages or facilitates other activities that could significantly affect the environments, either individually or cumulatively

It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.

The project proposes development of 120 multifamily residential dwelling units on 7.6 acres for an approximate total density of 15.8 dwelling units per acre. The project would include a total of 260 new parking spaces in addition to 37 existing spaces on site, approximately 92,645 square feet of common recreation area, and an average of 146 square feet of private open per unit. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the N Las Posas Road frontage. The proposed project also includes landscaping, bio-retention areas, and circulation improvements. The project would include two points of entry, the first entry point is located off N Las Posas Road and the second entry point is located off W Mission Road.

The project proposes a General Plan Amendment, Rezone, Specific Plan, Tentative Map, and Site Development Plan. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA). The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the City of San Marcos General Plan (General Plan) (the Specific Plan is included as Appendix M to this EIR). The Tentative Map presents specific lot configurations for the site. The Site Development Plan will configure the site for townhome dwelling units, street configuration, infrastructure, recreational open space, and private open space.

As described in Section 3.12, Population and Housing, it is anticipated that the proposed residential development at the project site could generate a population increase of up to approximately 370 people. Although the proposed project would accommodate some planned growth within the City of San Marcos (City) and not all potential future residents of the project are expected to be new to the City, the project could still result in unplanned growth for the City because residential land uses for the project site were not accounted for in the City's General Plan.

As described in Section 3.12 of this EIR, the City is forecast to grow from 96,302 persons in 2020 to 109,095 persons in 2035, which is a population increase of 12,793 (SANDAG 2013). Additionally, San Diego Association of Governments allocated 3,116 housing units to the San Marcos area for the 2021–2029 Housing Element Cycle (SANDAG 2020). Approval of the proposed project to residential land use could help the City accommodate this substantial population growth and its need for housing. The proposed project would be subject to compliance with the City's General Plan Housing Element goals and policies, compliance with housing-related ordinances in the San Marcos Municipal Code, and applicable development fees as outlined in Section 3.12 of this EIR. Compliance with these policies, ordinances, and fee provisions would ensure any growth at the site is adequately planned for in terms of ensuring the provision of community service facilities, including utilities, public services, recreation, emergency access, and roadways.

There is no hardline number or percentage available to determine whether or not the estimated introduction of approximately 370 people would be considered a substantial increase in population. However, the San Diego Association of Governments 2050 Regional Growth Forecast is intended to be used as a starting point for regional planning, as opposed to a prescribed growth pattern. While the City has determined that there are adequate sites available with appropriate designations/zoning to accommodate the remaining Regional Housing Needs Assessment allocation for the current General Plan Housing Element planning period (2013 to 2021), and has tentatively determined the same for the 2021–2029 Draft Housing Element Update (City of San Marcos 2021), the City has the discretion to adjust allocated housing units/sites as necessary to balance proposed plans for residential development with approved/constructed residential development. It is likely the site would act to accommodate some of the planned population growth in the City.

Potential indirect growth inducing impacts are unlikely to result from the proposed project. No extension of infrastructure is anticipated to be needed for the proposed project, as the site is located in an urbanized, infill area. In addition, the proposed project would be required to evaluate project-specific requirements, which would ensure the development does not overtax existing infrastructure or community service facilities, consistent with the guidelines, standards, design features, and mitigation measures provided in this EIR.

Therefore, while the proposed project would induce growth beyond current estimates and forecasts, it would not remove obstacles to further growth, expand infrastructure, or overtax existing community facilities. The proposed project would therefore not be considered substantially growth inducing.

6.3 Significant Irreversible Environmental Changes

CEQA Guidelines Section 15126.2(c) requires that an EIR identify any significant irreversible environmental changes associated with the proposed project. Such changes include, for example, the intensification of land use or irreversible damage from environmental accidents associated with the proposed project.

The project proposes development of 120 multifamily residential dwelling units on 7.6 acres for an approximate total density of 15.8 dwelling units per acre. The project would include a total of 260 new parking spaces in addition to 37 existing spaces on site, approximately 92,645 square feet of common recreation area, and an average of 146 square feet of private open per unit. The project proposes a General Plan Amendment, Rezone, Specific Plan, Tentative Map, and Site Development Plan. The General Plan Amendment and Rezone would change the General Plan designation and Zoning from Commercial (C) to Specific Plan Area (SPA).

The proposed project's change in land use would not be an intensification of land use over the existing commercial designation. As analyzed in Chapter 4, Alternatives, of this EIR, commercial development under the existing land use and zoning designation would result in additional and more severe environmental impacts in comparison to the development under the proposed project designations. Nevertheless, as analyzed throughout Chapter 3 of this EIR, the proposed project may result in significant impacts to biological resources, cultural resources, tribal cultural resources, and traffic (see Tables 1-1 and 1-2 in Chapter 1, Executive Summary, of this EIR). All potential impacts as a result of the proposed project would be mitigated to a less-than-significant level with the exception of impacts related to traffic. Such impacts would be considered irreversible.

Further, construction and/or operation of the proposed project would require the use of resources that include, but are not limited to, soils, gravel, concrete, and asphalt, lumber and other related forest products, petrochemical construction materials, steel, copper, and other metals, water, fuels, and energy. As such, the proposed project would result in the short-term and long-term use of fossil fuels and other nonrenewable resources.

Scoping Letter, NOP and NOP Comments

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT (EIR) AND SCOPING MEETING/PUBLIC WORKSHOP

Project Title:	Gran Vista Specific Plan
Project Number:	Specific Plan (SP21-0003), General Plan Amendment (GP21-0007), Rezone (R21-0003), Multi-Family Site Development Plan (MFSDP21-0001), and Tentative Subdivision Map (TSM21-0003).
Applicant:	Meritage Homes- MLC Holdings, Inc.
NOP Comment Period:	April 20, 2022 to May 20, 2022
Meeting Date/Time:	May 12, 2022 at 6 P.M.

PURPOSE FOR NOTICE: This Notice of Preparation (NOP) is being issued by the City of San Marcos for the proposed Gran Vista condominium project located in the City of San Marcos. The City is the lead agency for the project and will prepare an Environmental Impact Report (EIR) in accordance with the requirements of the California Environmental Quality Act (CEQA) and the CEQA implementation guidelines. This NOP is being circulated pursuant to California Resources Code Section 211153(a) and CEQA Guidelines Section 15082.

The City is requesting written feedback from the public, interested organizations, and responsible trustee agencies about the scope and content of the environmental information that will be addressed in the EIR.

Project Location: West of the intersection of Las Posas Road and Palm Road. Assessor's Parcel Number: 219-121-15-00 & 219-121-16-00.

Project Description: Request for a Specific Plan, Multi-Family Site Development Plan, and Tentative Subdivision Map for a 120-unit residential condominium development on 7.6 acres. Project includes a General Plan Amendment and Rezone to change the land use and zone of the property from Commercial (C) to Specific Plan Area (SPA). The project site is bounded by Las Posas Road and Mission Road to the east and south, respectively, and an existing CVS store is located to the south and a single-family residential subdivision to the west. Nearby land uses in the vicinity of the project site include industrial and commercial uses to the south and west, the Santa Fe Hills residential community to the north, and single-family residential and Palomar College to the east.

The project consists of 120 townhomes consisting of 2 and 3-bedroom units. The project includes approximately 148,297 square feet of recreation area and landscaping on-site and approximately 144 square feet of private open space per unit. Amenities on site include tot lots and exercise equipment, bbq and seating areas, dog park, and community garden. The project would use the existing driveway entries on Las Posas Road and Mission Road that currently provide access to the adjacent CVS store.

Potential Environmental Effects: Pursuant to CEQA Section 15060(d) of the CEQA Guidelines, the project may result in significant impacts related to: Aesthetics, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, and Utilities and Service Systems. An EIR will be prepared to evaluate the proposed project's potential impacts on the environment, outline mitigation measures, and analyze potential project alternatives. Responses received on this NOP may modify or add to the preliminary assessment of potential issues addressed in the EIR.

Scoping Meeting/Public Workshop: A joint Scoping Meeting/Public Workshop for the project will be held on **May 12, 2022 at 6 PM** at the San Marcos City Hall in the Valley of Discovery Room (next to City Council Chambers) located at 1 Civic Center Drive, San Marcos, CA 92069. The intent of the Scoping Meeting/Public Workshop is to obtain information and solicit comments from the public about the issues and content of the EIR. During the meeting, the project applicant will provide an overview of the project, will explain the environmental review process, and will be available to hear your comments and questions. Attendance of the scoping meeting is not required in order to submit written comments.

NOP Comments: All written comments must be submitted within 30 days of this notice and received no later than close of business on **May 20, 2022**. Written comments can be submitted via letter or email to the following address, and should include your name and contact information or the name of a contact person in your organization or agency, if applicable.

Subject: The 120 Condos Proposed at Las Posas and Mission, against

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Good Morning,

I am against this proposal.

With the 274-Homes going in already which were against public approval . We do not yet know the traffic congestion as it worsens for morning and evening commutes. Its already a big traffic jam as one approaches Ranch Santa Fe on M-F afternoons.

The morning there are already "ghost crosswalk" delays at the multiple lights and traffic alread. This is without all the vehicles and commutes of the 274 new homes.

It is not a good time to approve another 120 Condos , without seeing how traffic will actually be once these 274 new homes get populated.

Please listen to the community, instead of just adding ever more dwellings and worsening the life of current residents. I would like to be added to all future communication on this proposal. Thank You.

Comments on project next to CVS in San Marcos
To: Norm Pedersen

Comments regarding the proposed project: Grand Vista-SP21-0003,GPA21-0007,R21-0003,MFS21-0001,TSM21-0003

I am opposed to this project located on the north west corner of Las Posas and Mission with the current plan in place. This site was originally planned for retail and now has been "rezoned" for residential. I don't think this project in taking into consideration the residents that already live in the area (Santa Fe Hills). There are roughly 300 homes being built behind Santa Fe Hills which would add to the 120 townhomes planned in this community. Additionally, another 450 units are planned for the area across from the shopping center on Las Posas. The amount of traffic (2 cars per unit/home = ~1600-1800 additional automobiles) would be extremely difficult to handle on Las Posas and the surrounding roads. It can take an additional 15-20 minutes just to get through Santa Fe/San Marcos Blvd when the high school is in session. Second, there is no store/retail for the community to walk/bike to safely. Walking to the Grand Plaza shopping center (further down Las Posas) is extremely dangerous with several streets to cross and the noise level is high. San Marcos is consistently pushing environmentally friendly ways to commute yet there are no solutions or new ideas. Homes/condos are being build at an alarming rate in San Marcos with no way of commuting except with the use of a car. We need to have some type of retail/store/coffee shop within this site to enhance and create a gathering spot for our community. Yes, I understand housing is an issue but what about what the current residents want and need. The area was planned for retail so why isn't there a compromise...have both.

Thank you,
Marie Marcinko

Subject: No new condos on Las Posas at Mission

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hello Ms. Mayor and City Planners: I am writing to ask that you do not approve the proposed development of over 100 condominiums on Las Posas near Mission next to the CVS store. Traffic is my main concern as it already backs up on Las Posas, and it's not just occurring during workday commuting hours. Secondly is that elementary school near Borden and Las Posas cannot accommodate more children. Finally, our Sheriff Department is stretched thin and adding high density housing which will include low income residents (because a significant percentage must be affordable housing) is an invitation to more trouble that Law Enforcement won't be able to handle. Crime will increase in the Santa Fe Hills neighborhood.

So, in summary, we current residents in Santa Fe Hills do not want our City Leaders to increase traffic, crime, and school overcrowding.

Thank you for taking my feedback seriously. Jillcene Bachman, resident home owner in San Marcos. You may contact me to discuss my thoughts on developing San Marcos at (858)761-5981.

Subject: Gran Vista Specific Plan, Meritage Homes Proposed Location

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear Norm Pedersen,

I am writing to officially express my concern and opposition towards the proposed Meritage homes development at Las Posas and Palm Road.
I live in Santa Fe Hills and our neighborhood already experiences high volumes of traffic, along with the accompanying noise, automotive pollution, and additional parking requirements. There is, as I am sure you are aware, currently an expansion of homes being constructed at the end of Las Posas, which will add many more cars to our busy local roads. Very few people (none that I've met) that actually live here want that development; it has erased natural habitat for animals, vegetation, and recreational areas in which humans previously enjoyed the above-mentioned nature and whose presence had a lot to do with many people choosing to move here. The last thing the people of this neighborhood want is even more development at the proposed Meritage home site, which would further bookend our already impacted neighborhood with even more traffic, noise, and pollution. At some point the traffic becomes untenable, and gainfully employed citizens will move to less congested areas to avoid commuting traffic.
None of this has even touched on the proposed rezoning from commercial to residential, as is proposed for the Las Posas and Palm Rd site. Commercial is what is needed in the area, to service the already existing residents. What the area does not need, for a healthy developmental balance and quality of life, is more residential forced into an area previously designated for commercial use.
There is already detrimental development occurring in this area. I speak for my household, and many others I've spoken with in this community when I say that this proposed Meritage homes development is Not what the people in the affected area want. Choosing to allow this proposed development does not represent sound developmental policy, but rather a further betrayal of your constituents wishes and a substantial reduction to their quality of life. Long term impacts of such bad decisions may likely include an exodus of residents who can afford to leave, causing great damage to this city.

Very Sincerely,

Andrew Post

Subject: Objection to high-density condo plan Gran Vista at Las Posas and Mission Roads

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear Mr. Pedersen, Mr, Musgrove and Ms. Jones: I have sent a letter to all of you, but write this to provide some added comment. I object to the Gran Vista proposal.

1- The Santa Fe Hills development has over 1500 homes, with more approved. They all rely on Las Posas Road to get to the 78 freeway and most of the rest of San Marcos. The condo plan would clog traffic further.

The Las Posas and Mission Road intersection is already a mess during weekday rush hour periods for work and school. Adding up to 264 more cars right at that problem intersection means longer back-ups, longer idling, more exhaust, and likely resentment from Santa Fe Hills voters.

2- How schools will be affected by the proposed residents of 330 new bedrooms is not something I have had time to examine, nor my business, since our child is grown. But the parents of Santa Fe Hills ought to be afforded time to consult with the Principals and Board members of their childrens' schools, so they can make informed comments on this issue.

Yet City Planning has set the only Public Workshop on this condo plan for May 12th, and had set the comment period from April 20th to May 20th - leaving working parents just eight days to try to speak to Principals and School Boards before the City cuts off comments. Whether that would be found legal if challenged is beside the point, right now. It does not pass a common-sense test for honest hearing of public comments.

Why not extend the comment period to June 20th to allow intelligent gathering of facts by Santa Fe Hills parents?

3- What about water - not just this one new development - but do we not have responsibility in our region to be water stewards along with the rest of South California? We appear to be in a regional megadrought, both in California and the Colorado River Basin that supplies a large portion of our water.

Historical evidence of droughts, using a tree-ring measurement data recently published, have demonstrated natural cycles of drought visited here in the past. Some have lasted lasting as long as 30 years. We are 22 years into the current megadrought. When will we return to the wet years of the 1900's ? We truly do not know when - or even if we will. We need to face facts today - not just the Vallecitos Water District - but collectively in South California.

Piecemeal approval of new developments seems akin to piecemeal spending by legislators: "A billion here, a billion there and pretty soon you are talking about real money."

Restating this criticism: " A new development here, a new development there, and pretty soon you will have to compel existing water customers (not just new ones) to pay for a second desalination plant at the coast."

Voters might determine they want to do that for the sake of temporary construction jobs - or they might not. That expensive decision ought not to be forced on them by piecemeal development decisions.

4- The parcel at Las Posas and Mission is zoned for commercial use in the general plan. There are still good reasons to retain that designation. Santa Fe Hills citizens could use an economical food market like at least an Aldi or a Walmart Neighborhood Market for groceries. Palomar College has large student body and significant sized staff who would likely welcome breakfast and lunch sources. There not yet any close gathering spots for neighbors to talk over coffee or other fare. Perhaps the general plan got the zoning right.

Thank you for the opportunity to comment. Dale Armitage, 438 Palm Road, San Marcos

Subject: Opposition to multi dwelling project behind CVS

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Mr. Petersen,

Please let me know what I need to do to express concern and opposition over the proposed planning to build a large complex behind the CVS on Mission at Las Posas Road.

I am a homeowner and live less than a mile from the proposed site. I do not feel this neighborhood can support this project. Our roads are congested and our schools are already overcrowded.

Please confirm if I need to complete anything more formal to express concern and opposition to these plans.

I'd also like to be informed of future meetings or community forums on the proposed project.

Thank you,
Ellen Kaplan

Re: 2022040440, Gran Vista Specific Plan Project, San Diego County

Dear Mr. Pedersen:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).

2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.

3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).

4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:

- **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
- **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:

- **a.** If part or all of the APE has been previously surveyed for cultural resources.
- **b.** If any known cultural resources have already been recorded on or adjacent to the APE.
- **c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
- **d.** If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.

- **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
- **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Re: Gran Vista Specific Plan

Dear Mr. Pedersen:

Thank you for the opportunity to review the Gran Vista Specific Plan, based on the notice of preparation received on April 14, 2022. This project is located west of the intersection of Las Posas Road and Palm Road.

Upon review of the notice received by the North County Transit District (NCTD), NCTD has determined that there is a bus stop on the project site (Stop ID: 24848 "Mission Rd & Las Posas Rd"). This stop is already equipped with a shelter and trash can, so no further improvements are requested at this time.

Detours Required:

The construction may take place in the right-of-way of NCTD BREEZE Routes 304 and 305. NCTD requests that you or the developer's contractor provide notice two (2) weeks prior to starting work so that we may send a supervisor to meet with the construction crew to determine if the traffic control methods affect NCTD's stops. Notice should be provided via e-mail to detours@nctd.org.

TOD/Pedestrian:

NCTD highly recommends that the project site design allow for sufficient ADA paths for connecting pedestrians from within your future development to access nearby bus stops, sidewalks, and crosswalks. To make your development pedestrian and bike friendly, NCTD highly encourages you to provide shading from trees or structures, lighting, bike racks, and seating.

As described in NCTD's Bus Stop Development Handbook (2018), new developments should be designed to provide clear and direct access to bus stops (existing or new), and should emphasize pedestrian access, activity, and safety.

Gated or walled developments should provide openings through walls to minimize the walking distance and provide a more direct route to bus stops. Developments with parking lots should be designed with clear pedestrian walkways. Distinct walkway networks should be provided where bus stops and/or transit centers can be linked with building entrances. Entrances to buildings should face the street with pedestrian access located close to the nearest bus stop.

Below is a sample of Guidelines for design supported by NCTD, as found in our Bus Stop Development Handbook (2018).

Key Transit Supportive Design and Development Guidelines Supported by NCTD
Orient developments towards the street, with parking located to the rear of buildings rather than along the street frontage.
Building design and circulation plans should minimize the need for parking and increase the opportunity for transit and active transportation.
Bus stop and station elements should be incorporated into the design, in addition to other public spaces like walkways, bicycle paths, and street furniture.
Emphasize compatible and compact land uses that enable convenient access to and from bus routes, and that are designed to provide connections to a variety of uses (i.e. residential, employment, educational, and commercial).
Minimize walk distances through developments to bus stops, especially those with walls or gates, so that transit is accessible to most patrons or residents.

Supporting transit elements is essential for the City of San Marcos to meet its goals and objectives described in the City's Climate Action Plan. This aligns with Policy LU-2.1: "*Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use*" for the city goal to "*Promote development standards and land use patterns that encourage long-term environmental sustainability*" (pg. 1-8). Other supported goals include increasing transit ridership, reducing greenhouse gas emissions (GHG), and decrease Vehicle Miles Travelled (VMT) (pg. 1-8, 3-9).

Thank you again for allowing NCTD to review and comment on this project. Should you have any questions related to this review, feel free to contact me via e-mail at kpersons@nctd.org or by phone at (760) 966-6683.

Sincerely,

Katie Persons
Director of Service Planning

Subject: Las Posas Condo Project

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

To Whom it May Concern,

I was made aware of this proposed condo subdivision at Las Posas and Mission Rd., behind the CVS, and you are taking public comments. First of all, terrible idea to allow this to move forward, and as a San Marcos resident- we live in Santa Fe Hills, pay property taxes as owners. The traffic already is horrendous at that intersection, and the homes at the end of Las Posas are not even close to being completed. Imagine the traffic that new neighborhood will create. The stress to our utilities, and water bill increases, and not to mention the overcrowding of the middle school and high school. Interesting you only have to inform homes within 500 feet of the development, kinda sneaky isn't it? We would only know by paying attention and expressing our views, which is NO! No thank you! Please reply to this email confirming receipt.

SIP	State Implementation Plan
SO_x	sulfur oxides
SR-	State Route
TAC	toxic air contaminant
VOC	volatile organic compound
ZEV	Zero Emissions Vehicle
ZNE	zero net energy

Executive Summary

The Gran Vista Project (project) involves construction of up to 120 townhomes on a 7.6-acre site situated at the City of San Marcos' (City's) southeastern limits. The project site is located within the San Diego Air Basin (SDAB) and is subject to the guidelines and regulations of the San Diego Air Pollution Control District (SDAPCD).

Air Quality

The air quality impact analysis provides an evaluation of the potential for significant adverse impacts to the ambient air quality due to construction and operational emissions resulting from the project. Construction of the project would result in a temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. The analysis concludes that the daily and annual construction emissions would not exceed SDAPCD's significance thresholds for criteria pollutants and thus would result in a less than significant impact.

Operational emissions for the project were also found to be below SDAPCD's significance thresholds; therefore, impacts during project operation would be less than significant. Additionally, impacts to sensitive receptors during temporary construction activities and operation of the project were determined to be less than significant. Lastly, project operation would not generate odors at levels that would cause a nuisance; therefore, impacts would be less than significant.

Greenhouse Gas Emissions

The project's potential effect on global climate change was evaluated, and emissions of greenhouse gas (GHG) were estimated based on the use of construction equipment and vehicle trips associated with construction activities, as well as operational emissions once construction phases are complete. First, the annual project-generated GHG emissions were estimated to result in approximately 627 metric tons of carbon dioxide equivalent (MT CO_2e) per year as a result of project operations and amortized construction emissions. With a service population of 408, the project would result in 1.5 MT CO_2e per person per year, which is less than the significance threshold of 2.1 MT CO_2e per person per year anticipated in the City's Climate Action Plan (CAP). As such, the project was also deemed consistent with the City's CAP.

Third, the project would be consistent with and would not conflict with the applicable GHG-reducing strategies of the state that implicate the project's construction and operational components. The project did not have a cumulative impact on the environment when evaluated with the City's CAP. Therefore, GHG impacts would be less than significant.

INTENTIONALLY LEFT BLANK

1 Introduction

1.1 Report Purpose and Scope

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with construction and operation of the Gran Vista Project (project). This analysis uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and the emissions-based significance thresholds recommended by the San Diego Air Pollution Control District (SDAPCD) and other applicable thresholds of significance.

This introductory section provides a description of the project and the project location. Section 2, Air Quality, describes the air quality–related environmental setting, regulatory setting, existing air quality conditions, and thresholds of significance and analysis methodology, and presents an air quality impact analysis per Appendix G of the CEQA Guidelines. Section 3, Greenhouse Gas Emissions, follows the same format as Section 2 and similarly describes the GHG emissions-related environmental setting, regulatory setting, existing climate change conditions, and thresholds of significance and analysis methodology, and presents a GHG emissions impact analysis per Appendix G of the CEQA Guidelines. Section 4, References Cited, includes a list of the references cited in this technical report. Section 5, List of Preparers, includes a list of those who prepared this technical report.

1.2 Regional and Local Setting

The site is located in the land use jurisdictions of both the City of San Marcos (City) and the County of San Diego (County); however, it is proposed to be annexed into the City of San Marcos. The site is located at the southeastern portion of the City of San Marcos, bordering the City of Escondido to the east and unincorporated County of San Diego lands to the south.

The City is located within the San Diego Air Basin (SDAB) and is under the jurisdiction of the SDAPCD. The project site is bounded by Las Posas Road along the eastern boundary, W. Mission Road along the southwest boundary, an existing CVS store to the south, and existing single-family residential development to the west/northwest. Nearby land uses in the vicinity of the project site include industrial and commercial uses to the west on the other side of W. Mission Road, the Santa Fe Hills residential community to the north, and Palomar College approximately half a mile to the east. The project site is comprised of Assessor's Parcel Numbers (APNs) 219-121-1500 and 219-121-1600.

1.3 Project Description

The residential component of the Project consists of 120 townhomes, a mix of 2- and 3-bedroom units. The project includes approximately 148,297 square feet of recreation area on-site and up to 198 square feet of private open space per unit. Amenities on site would include tot lots and recreational areas, a dog park, a community garden, and a landscaped pedestrian path along the Las Posas Road frontage. The project would include two points of entry: one off N. Las Posas Road, and the other off of W. Mission Road. A total of 264 parking spaces would be provided for the total residential dwelling units, including 20 guest spaces. The project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial

and is within the City's General Plan Neighborhood College area. The project proposes a General Plan and Zoning Amendment to change the land use designation to Specific Plan Area (SPA).

2 Air Quality

2.1 Environmental Setting

2.1.1 Climate and Topography

The weather of the San Diego region, as in most of Southern California, is influenced by the Pacific Ocean and its semi-permanent high-pressure systems that result in dry, warm summers and mild, occasionally wet winters. The average summertime high temperature in the region is approximately 74°F, with highs approaching 76°F in August on average. The average wintertime low temperature is approximately 49°F, although record lows have approached 48°F in January. Average precipitation in the local area is approximately 10 inches per year, with the bulk of precipitation falling between December and March (WRCC 2017).

The topography in the San Diego region varies greatly, from beaches on the west to mountains and desert on the east; along with local meteorology, topography influences the dispersal and movement of pollutants in the air basin. The mountains to the east prevent dispersal of pollutants in that direction and help trap them in inversion layers.

The interaction of ocean, land, and the Pacific High Pressure Zone maintains clear skies for much of the year and influences the direction of prevailing winds (westerly to northwesterly). Local terrain is often the dominant factor inland, and winds in inland mountainous areas tend to blow through the valleys during the day and down the hills and valleys at night.

2.1.2 Air Pollution Climatology

The SDAB is one of 15 air basins that geographically divide the State of California. The SDAB is currently classified as a federal nonattainment area for ozone (O_3) and a state nonattainment area for particulate matter less than or equal to 10 microns (coarse particulate matter (PM_{10})), particulate matter less than or equal to 2.5 microns (fine particulate matter ($PM_{2.5}$)), and O_3.

The SDAB lies in the southwest corner of California and comprises the entire San Diego region, covering 4,260 square miles, and it is an area of high air pollution potential. The SDAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds.

The SDAB experiences frequent temperature inversions. Subsidence inversions occur during the warmer months as descending air associated with the Pacific High Pressure Zone meets cool marine air. The boundary between the two layers of air creates a temperature inversion that traps pollutants. Another type of inversion, a radiation inversion, develops on winter nights when air near the ground cools by heat radiation and the air aloft remains warm. The shallow inversion layer formed between these two air masses also can trap pollutants. As the pollutants become more concentrated in the atmosphere, photochemical reactions occur that produce O_3, commonly known as smog (CARB 2014a).

Light daytime winds, predominantly from the west, further aggravate the condition by driving air pollutants inland, toward the mountains. During the fall and winter, air quality problems are created due to carbon monoxide (CO)

and oxides of nitrogen (NO_x) emissions. CO concentrations are generally higher in the morning and late evening. In the morning, CO levels are elevated due to cold temperatures and the large number of motor vehicles traveling. Higher CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO is produced almost entirely from automobiles, the highest CO concentrations in the SDAB are associated with heavy traffic. Nitrogen dioxide (NO_2) levels are also generally higher during fall and winter days.

Under certain conditions, atmospheric oscillation results in the offshore transport of air from the Los Angeles region to San Diego County. This often produces high O_3 concentrations, as measured at air pollutant monitoring stations within the County. The transport of air pollutants from Los Angeles to San Diego has also occurred within the stable layer of the elevated subsidence inversion, where high levels of O_3 are transported.

2.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by the California Air Resources Board (CARB), include children, the elderly, and people with cardiovascular and chronic respiratory diseases. Sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes. The closest existing sensitive receptors include single-family residents bordering the western boundary of the project site.

2.1.4 Pollutants and Effects

2.1.4.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, NO_2, CO, SO_2, PM_{10}, $PM_{2.5}$, and lead. These pollutants, as well as toxic air contaminants (TACs), are discussed in the following text.[1] In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants.

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors, such as hydrocarbons and NO_x. These precursors are mainly NO_x and volatile organic compounds (VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere ozone layer (stratospheric ozone) as well as at the Earth's surface in the troposphere (ozone). O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in

[1] The descriptions of health effects for each of the criteria air pollutants associated with project construction and operations are based on the U.S. Environmental Protection Agency's (EPA's) "Criteria Air Pollutants" (EPA 2016a) and CARB's "Glossary of Air Pollution Terms" (CARB 2014a).

breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. These health problems are particularly acute in sensitive receptors such as the sick, the elderly, and young children.

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections.

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil, fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas such as the project location, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions; primarily, wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent. In terms of adverse health effects, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can include dizziness, fatigue, and impairment of central nervous system functions.

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs and can cause acute respiratory symptoms and diminished lung function in children. When combined with particulate matter, SO_2 can injure lung tissue and reduce visibility and the level of sunlight. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles, which can include smoke, soot, dust, salts, acids, and metals, floating in the air. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. $PM_{2.5}$ (fine particulate matter) is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs. PM_{10} (respirable particulate matter, or coarse particulate matter), is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle, as well as producing haze and reducing regional visibility.

People with influenza, people with chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death as a result of breathing particulate matter. People with bronchitis can expect aggravated symptoms from breathing in particulate matter. Children may experience a decline in lung function due to breathing in PM_{10} and $PM_{2.5}$. Other groups considered sensitive are smokers, people who cannot breathe well through their noses, and exercising athletes (because many breathe through their mouths).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient (IQ) performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon, and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs. Combustion engine exhaust, oil refineries, and fossil-fueled power plants are sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry-cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

2.1.4.2 Non-Criteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic noncancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the State of California, TACs are identified through a two-

step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and noncarcinogenic effects. Noncarcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

The California Air Resources Board (CARB) classified "particulate emissions from diesel-fueled engines" (i.e., diesel particulate matter (DPM)) as a TAC in August 1998. DPM is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. DPM is emitted from a broad range of diesel engines: on-road diesel engines of trucks, buses, and cars and off-road diesel engines including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with diesel particulate matter, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000).

Valley Fever. Coccidioidomycosis, more commonly known as "Valley Fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. When fungal spores are present, any activity that disturbs the soil, such as digging, grading, or other earth-moving operations, can cause the spores to become airborne and thereby increase the risk of exposure. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline sandy soils.

Valley Fever is not considered highly endemic to San Diego. Per the San Diego County Health and Human Services Agency, the 10-year average (2008–2017) for Coccidioidomycosis cases in the County of San Diego is 4.5 cases per 100,000 people per year. The project area is wholly contained within the 92069 zip code. For the 92069 zip code, there were 16 cases of Coccidioidomycosis between 2008 and 2017, which is equivalent to a rate of 3.4 cases per 100,000 people (Nelson 2018). Statewide incidences in 2016 were 13.7 per 100,000 people (CDPH 2017).

Even if present at a site, earth-moving activities may not result in increased incidence of Valley Fever. Propagation of *Coccidioides immitis* is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. *Coccidioides immitis* spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing Valley Fever. Moreover, exposure to *Coccidioides immitis* does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

2.2 Regulatory Setting

2.2.1 Federal

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The U.S. Environmental Protection Agency (EPA) is responsible for implementing most aspects of the Clean Air Act, including setting National ambient air quality standards (NAAQS) for major air pollutants, setting hazardous air pollutant standards, approving state attainment plans, setting motor vehicle emission standards, issuing stationary source emission standards and permits, and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the criteria pollutants O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the U.S. Environmental Protection Agency (EPA) to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the standards within mandated time frames.

2.2.2 State

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established California ambient air quality standards (CAAQS), which are generally more restrictive than the NAAQS. The CAAQS describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard. Air quality is considered “in attainment” if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. The NAAQS and CAAQS are presented in Table 1.

Table 1. Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS[a]	NAAQS[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as primary standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as primary standard
	Annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None

Source: CARB 2016a.

Notes: CAAQS = California Ambient Air Quality Standards; NAAQS = National Ambient Air Quality Standards; O_3 = ozone; ppm = parts per million by volume; µg/m³ = micrograms per cubic meter; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter—PM_{10}, $PM_{2.5}$, and visibility-reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth-highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National primary standards: the levels of air quality necessary, with an adequate margin of safety to protect the public health.

[e] National secondary standards: the levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the primary and secondary NAAQS for O_3 were lowered from 0.075 ppm to 0.070 ppm.

[g] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

2.2.3 Local

San Diego Air Pollution Control District

Although CARB is responsible for the regulation of mobile emission sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. The project is located within the SDAB and is subject to SDAPCD guidelines and regulations. In San Diego County, O_3 and particulate matter are the pollutants of main concern, because exceedances of the CAAQS for those pollutants are experienced here in most years. For this reason, the SDAB has been designated as a nonattainment area for the state PM_{10}, $PM_{2.5}$, and O_3 (1-hour and 8-hour) standards. The SDAB is also designated as a federal O_3 marginal nonattainment area for the 2008 8-hour NAAQS for O_3.

SDAPCD and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB. The Regional Air Quality Strategy (RAQS) for the SDAB was initially adopted in 1991, and is updated every 3 years (most recently in 2016). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS relies on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in San Diego County and the cities in the County, to project future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based

on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans.

The 8-Hour Ozone Attainment Plan for San Diego County indicates that local controls and state programs would allow the region to reach attainment of the federal 8-hour O_3 standard by 2018 (SDAPCD 2016). In this plan, SDAPCD relies on the RAQS to demonstrate how the region will comply with the federal O_3 standard. The RAQS details how the region will manage and reduce O_3 precursors (NO_x and VOCs) by identifying measures and regulations intended to reduce these contaminants. The control measures identified in the RAQS generally focus on stationary sources; however, the emissions inventories and projections in the RAQS address all potential sources, including those under the authority of CARB and EPA. Incentive programs for reduction of emissions from heavy-duty diesel vehicles, off-road equipment, and school buses are also established in the RAQS. In response to court decisions, some elements in the 8-hour Ozone Attainment Plan for San Diego County required updates. CARB staff prepared the 2018 Updates to the California State Implementation Plan to update SIP elements for nonattainment areas throughout the state as needed. The applicable attainment date for San Diego County is in 2032.

In December 2005, SDAPCD prepared a report titled "Measures to Reduce Particulate Matter in San Diego County" to address implementation of Senate Bill (SB) 656 in San Diego County (SB 656 required additional controls to reduce ambient concentrations of PM_{10} and $PM_{2.5}$). In the report, SDAPCD evaluates the implementation of source-control measures that would reduce particulate matter emissions associated with residential wood combustion.

As stated previously, SDAPCD is responsible for planning, implementing, and enforcing federal and state ambient standards in the SDAB. The following rules and regulations would apply to the project:

- **SDAPCD Regulation II: Permits; Rule 20.2: New Source Review Non-Major Stationary Sources.** Requires new or modified stationary source units (that are not major stationary sources) with the potential to emit 10 pounds per day or more of VOC, NO_x, SO_x, or PM_{10} to be equipped with best available control technology (BACT). For those units with a potential to emit above Air Quality Impact Assessments Trigger Levels, the units must demonstrate that such emissions would not violate or interfere with the attainment of any national air quality standard (SDAPCD 1998).
- **SDAPCD Regulation IV: Prohibitions; Rule 50: Visible Emissions.** Prohibits discharge into the atmosphere from any single source of emissions whatsoever any air contaminant for a period or periods aggregating more than 3 minutes in any period of 60 consecutive minutes that is darker in shade than that designated as Number 1 on the Ringelmann Chart, as published by the United States Bureau of Mines, or of such opacity as to obscure an observer's view to a degree greater than does smoke of a shade designated as Number 1 on the Ringelmann Chart (SDAPCD 1997).
- **SDAPCD Regulation IV: Prohibitions; Rule 51: Nuisance.** Prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, annoyance to people and/or the public, or damage to any business or property (SDAPCD 1976).
- **SDAPCD Regulation IV: Prohibitions; Rule 55: Fugitive Dust.** Regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project site (SDAPCD 2009).

- **SDAPCD Regulation IV: Prohibitions; Rule 67.0.1: Architectural Coatings.** Requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015.

City of San Marcos

The City's General Plan (City of San Marcos 2013a) includes various policies related to reducing Air Quality and GHG emissions. Applicable policies include the following:

Land Use and Community Design Element

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-2.1: Work with new development to design roadways that minimize traffic volumes and/or speed, as appropriate within residential neighborhoods; while maintaining the City's desire to provide connectivity on the roadway network (City of San Marcos 2013a).

2.3 Regional and Local Air Quality

2.3.1 San Diego Air Basin Attainment Designation

Pursuant to the 1990 Clean Air Act amendments, EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. As previously discussed, these standards are set by EPA or CARB for the maximum level of a given air pollutant that can exist in the outdoor air without unacceptable effects on human health or the public welfare. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved maintenance plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, calls for the designation of areas as "attainment" or "nonattainment," but based on the CAAQS rather than the NAAQS. The attainment classifications for the criteria pollutants are outlined in Table 2.

Table 2. San Diego Air Basin Attainment Classification

Pollutant	Federal Designation	State Designation
O_3 (1-hour)	Attainment[a]	**Nonattainment**
O_3 (8-hour – 1997) (8-hour – 2008)	Attainment (maintenance) **Nonattainment (moderate)**	**Nonattainment**
NO_2	Unclassifiable/attainment	Attainment
CO	Attainment (maintenance)	Attainment
SO_2	Not designated[b]	Attainment
PM_{10}	Unclassifiable/attainment	**Nonattainment**
$PM_{2.5}$	Unclassifiable/attainment	**Nonattainment**
Lead	Unclassifiable/attainment	Attainment
Sulfates	No federal standard	Attainment
Hydrogen sulfide	No federal standard	Unclassified
Visibility-reducing particles	No federal standard	Unclassified
Vinyl chloride	No federal standard	No designation

Sources: EPA 2022b (federal); CARB 2022a (state).
Notes: O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
Attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.

[a] The federal 1-hour standard of 0.12 ppm was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in State Implementation Plans (SIPs).

[b] Federal designations for SO_2 are on hold by EPA; EPA expects to make the designations by December 2017 (EPA 2016c).

In summary, the SDAB is designated as a nonattainment area for the 2008 8-hour O_3 NAAQS. The SDAB is designated as a nonattainment area for O_3, PM_{10}, and $PM_{2.5}$ CAAQS. The portion of the SDAB where the project site is located is designated as attainment or unclassifiable/unclassified for all other criteria pollutants under the NAAQS and CAAQS.

2.3.2 Local Ambient Air Quality

As mentioned above, the SDAPCD operates a network of ambient air monitoring stations throughout San Diego County that measure ambient concentrations of pollutants and determine whether the ambient air quality meets the CAAQS and the NAAQS. The SDAPCD monitors air quality conditions at 11 locations throughout the SDAB. Camp Pendleton monitoring station is the closest to the project site for O_3 and NO_2. The Escondido – East Valley Parkway monitoring station ceased to collect data post-2015; thus, due to proximity to the site and similar geographic and climactic characteristics, the San Diego – 11403 Rancho Carmel Drive monitoring station concentrations are considered most representative for the project site. Data at this station also was available for CO. The El Cajon – 609 S 1st Street monitoring station was used for SO_2, PM_{10}, and $PM_{2.5}$. Ambient concentrations of pollutants from 2018 through 2020 are presented in Table 3. Air quality within the project region was in compliance with the CAAQS and NAAQS for NO_2, CO, SO_2, and PM_{10} (NAAQS only) during this monitoring period.

Table 3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2018	2019	2020	2018	2019	2020
Ozone (O_3) – Camp Pendleton									
Maximum 1-hour concentration	ppm	State	0.12	0.084	0.075	0.094	0	0	0
Maximum 8-hour concentration	ppm	State	0.070	0.069	0.065	0.074	0	0	3
		Federal	0.070	0.068	0.064	0.074	0	0	3
Nitrogen Dioxide (NO_2) – Camp Pendleton									
Maximum 1-hour concentration	ppm	State	0.18	0.048	0.053	0.058	0	0	0
		Federal	0.100	0.048	0.053	0.058	0	0	0
Annual concentration	ppm	State	0.030	—	0.005	0.006	—	—	—
		Federal	0.053	0.006	0.005	0.006	—	—	—
Carbon Monoxide (CO) – San Diego – 11403 Rancho Carmel Drive									
Maximum 1-hour concentration	ppm	State	20	1.9	4.1	3.3	0	0	0
		Federal	35	1.9	4.1	3.3	0	0	0
Maximum 8-hour concentration	ppm	State	9.0	1.4	2.5	1.7	0	0	0
		Federal	9	1.4	2.5	1.7	0	0	0
Sulfur Dioxide (SO_2) – El Cajon – Lexington Elementary School									
Maximum 1-hour concentration	ppm	Federal	0.075	0.003	0.0008	0.002	0	0	0
Maximum 24-hour concentration	ppm	Federal	0.14	0.0004	0.0003	0.0004	0	0	0
Annual concentration	ppm	Federal	0.030	0.0001	0.0001	0.0001	—	—	—
Coarse Particulate Matter (PM_{10})[a] – El Cajon – Lexington Elementary School									
Maximum 24-hour concentration	µg/m³	State	50	44.7	37.4	55.0	0.0 (0)	0.0 (0)	0.0 (0)
		Federal	150	43.0	38.7	55.0	0.0 (0)	0.0 (0)	0.0 (0)
Annual concentration	µg/m³	State	20	ND	ND	ND	—	—	—
Fine Particulate Matter ($PM_{2.5}$)[a] – El Cajon – Lexington Elementary School									
Maximum 24-hour concentration	µg/m³	Federal	35	36.2	23.8	38.2	—	—	—
Annual concentration	µg/m³	State	12	9.6	8.6	10.3	—	—	—
		Federal	12.0	9.6	8.6	10.3	—	—	—

Sources: CARB 2022b; EPA 2022b.

Notes: ppm = parts per million by volume; ND = insufficient data available to determine the value; — = not available; µg/m³ = micrograms per cubic meter.

Data taken from CARB iADAM (http://www.CARB.ca.gov/adam) and EPA AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour ozone, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.
The Camp Pendleton monitoring station is located at 21441 W B Street, Camp Pendleton, California.
The San Diego – 11403 Rancho Carmel Drive monitoring station is located at 11403 Rancho Carmel Drive, San Diego, California.
The El Cajon-Lexington Elementary School monitoring station is located at 533 First Street, El Cajon, California.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

2.4 Significance Criteria and Methodology

2.4.1 Thresholds of Significance

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) provides guidance for evaluating whether a development project may result in significant impacts. Based on Appendix G of the CEQA Guidelines, the project would have a significant impact on air quality if the project would:

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or pollution control district may be relied upon to determine whether the project would have a significant impact on air quality. For purposes of this EIR, reference has been made to thresholds established by SDAPCD in Rule 20.2 for permitted stationary sources. SDAPCD sets forth quantitative emission thresholds in Rule 20.2 below which a stationary source would not have a significant impact on ambient air quality. While the proposed project is a land use development project (and not a stationary source project), the Rule 20.2 thresholds provide a representative and relevant proxy for purposes of assessing project impacts. Therefore, project-related air quality impacts assessed in this EIR would be considered significant if any of the applicable significance thresholds developed by SDAPCD for Rule 20.2, as presented in Table 4, are exceeded. Emissions below the screening-level thresholds would not cause a significant impact. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 4, a project could have the potential to result in a cumulatively considerable net increase in these pollutants and thus could have a significant impact on the ambient air quality.

Table 4. San Diego Air Pollution Control District Air Quality Significance Thresholds

Construction Emissions	
Pollutant	**Total Emissions (Pounds per Day)**
Respirable particulate matter (PM_{10})	100
Fine particulate matter ($PM_{2.5}$)	55
Oxides of nitrogen (NO_x)	250
Sulfur oxides (SO_x)	250

Table 4. San Diego Air Pollution Control District Air Quality Significance Thresholds

Construction Emissions			
Pollutant	Total Emissions (Pounds per Day)		
Carbon monoxide (CO)	550		
Volatile organic compounds (VOC)	137[a]		
Operational Emissions			
	Total Emissions		
Pollutant	Pounds per Hour	Pounds per Day	Tons per Year
Respirable particulate matter (PM_{10})	—	100	15
Fine particulate matter ($PM_{2.5}$)	—	55	10
Oxides of nitrogen (NO_x)	25	250	40
Sulfur oxides (SO_x)	25	250	40
Carbon monoxide (CO)	100	550	100
Lead and lead compounds	—	3.2	0.6
Volatile organic compounds (VOC)	—	137[a]	13.7

Source: SDAPCD Rules 1501 and 20.2(d)(2).

[a] VOC threshold based on South Coast Air Quality Management District (SCAQMD) levels per the SCAQMD and the Monterey Bay Air Pollution Control District, which have similar federal and state attainment status to San Diego.

2.4.2 Approach and Methodology

2.4.2.1 Construction

Emissions from construction of the project were estimated using the California Emissions Estimator Model (CalEEMod)[2] Version 2020.4.0.

For purposes of estimating project emissions, and based on information provided by the applicant and CalEEMod default values, it was estimated that construction of the project would commence in December 2023 and would last approximately 16 months, ending in March 2025. The analysis contained herein is based on the following parameters (duration of phases is approximate):

- Site preparation – 6 days (December 2023)
- Grading – 24 days (December 2023 – January 2024)
- Paving – 20 days (January 2024 – February 2024)
- Building construction – 262 days (February 2024 – February 2025)
- Architectural coating – 20 days (February 2025 – March 2025)

The construction equipment mix used for estimating the construction emissions of the project is based on CalEEMod default data and is shown in Table 5. For this analysis, it was estimated that heavy construction equipment would operate 5 days a week during project construction.

[2] CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria air pollutant and GHG emissions from a variety of land use projects.

Table 5. Construction Scenario Parameters

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Site preparation	12	4	0	Rubber Tired Loaders	1	8
				Tractors/Loaders/ Backhoes	3	8
Grading	16	4	0	Graders	1	8
				Rubber Tired Dozers	1	8
				Scrapers	4	8
				Tractors/Loaders/ Backhoes	1	8
Paving	16	4	0	Pavers	2	8
				Paving Equipment	2	8
				Rollers	3	8
Building Construction	192	54	0	Welders	1	8
				Air Compressors	2	8
				Cranes	1	4
				Forklifts	2	8
				Generator Sets	1	8
				Skid Steer Loaders	1	4
				Tractors/Loaders/ Backhoes	1	4
Architectural coating	38	4	0	Air Compressors	1	6

Note: See Appendix A for details.

The equipment used in each phase as shown in Table 5 was based on the CalEEMod default equipment mix for each phase of construction. Construction-worker and vendor estimates by construction phase were generated by CalEEMod. Based on the project's grading plans, the project would be balanced on site. The applicant has committed to using offroad construction equipment with EPA Tier 4 Interim certification or better for equipment over 50 horsepower and electric equipment less than 50 horsepower[3].

Health Risk Assessment

As a precautionary measure, a health risk assessment (HRA) was performed to assess the impact of construction on sensitive receptors proximate to the project. This report includes an HRA associated with emissions from construction of the project based on the methodologies prescribed in the Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of*

[3] In the case that a piece of equipment is not available in Tier 4 Interim, the applicant may upgrade another piece of equipment to better than Tier 4 Interim (i.e. Tier 4 Final) to compensate for the piece of equipment with a lower tier.

Health Risk Assessments (OEHHA 2015). To implement the OEHHA Guidelines based on Project information, the SDAPCD has developed a three-tiered approach where each successive tier is progressively more refined, with fewer conservative assumptions. The SDAPCD *Supplemental Guidelines for Submission of Air Toxics "Hot Spots" Program Health Risk Assessments* provides guidance with which to perform HRAs within the SDAB (SDAPCD 2022).

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends a carcinogenic (cancer) risk threshold of 10 in a million. Additionally, some TACs increase non-cancer health risk due to long-term (chronic) exposures. The Chronic Hazard Index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. The SDAPCD recommends a Chronic Hazard Index significance threshold of 1.0 (project increment). The exhaust from diesel engines is a complex mixture of gases, vapors, and particles, many of which are known human carcinogens. DPM has established cancer risk factors and relative exposure values for long-term chronic health hazard impacts. No short-term, acute relative exposure level has been established for DPM; therefore, acute impacts of DPM are not addressed in this assessment. This HRA evaluated the risk to future residents from diesel emissions from exhaust from onsite construction equipment and diesel haul and vendor trucks.

The dispersion modeling of DPM was performed using the American Meteorological Society/EPA Regulatory Model (AERMOD), which is the model SDAPCD requires for atmospheric dispersion of emissions. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain (EPA 2015). For the Project, AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the "X/Q" values. X/Q is a dispersion factor that is the average effluent concentration normalized by source strength and is used as a way to simplify the representation of emissions from many sources. The X/Q values of ground-level concentrations were determined for construction emissions using AERMOD and the maximum concentrations determined for the 1-hour and Period averaging periods. Principal parameters of this modeling are presented in Table 6.

Table 6. AERMOD Principal Parameters

Parameter	Details
Meteorological Data	The latest 3-year meteorological data (2010–2012) for the Escondido Station (Station ID 3177) from SDAPCD were downloaded and then input to AERMOD. For cancer or chronic noncancer risk assessments, the average cancer risk of all years modeled was used.
Urban versus Rural Option	Urban areas typically have more surface roughness, as well as structures and low-albedo surfaces that absorb more sunlight—and thus more heat—relative to rural areas. However, based on the SDAPCD guidelines, the rural dispersion option was selected due to the Project's proximity to the ocean.
Terrain Characteristics	The terrain in the vicinity of the modeled Project site is generally flat. The elevation of the modeled site is about 575 feet above sea level. Digital elevation model files were imported into AERMOD so that complex terrain features were evaluated as appropriate.
Elevation Data	Digital elevation data were imported into AERMOD, and elevations were assigned to the emission sources and receptors. Digital elevation data were obtained through AERMOD View in the United States Geological Survey's National Elevation Dataset format with a 10-meter resolution.
Emission Sources and Release	Air dispersion modeling of DPM from construction equipment was conducted using emissions estimated using the CalEEMod, assuming emissions would occur 8

Table 6. AERMOD Principal Parameters

Parameter	Details
Parameters	hours per day, 5 days per week. The Project area was modeled as a series of volume sources.
Source Release Characterizations	Based on EPA methodology, the modeled line volume sources would result in a release height of 3.4 meters, a plume height of 6.8 meters, and a plume width of 8.6 meters for off-road equipment and diesel trucks (EPA 2015).
Discrete Receptors	A uniform Cartesian grid overlaying residential receptors in close proximity to the project with 20-meter resolution was placed. Additional discrete receptors were placed over residences not within the uniform Cartesian grid.

Note: See Appendix B.

Dispersion model plotfiles from AERMOD were then imported into CARB's Hotspots Analysis and Reporting Program Version 2 to determine health risk, which requires peak 1-hour emission rates and annual-averaged emission rates for all pollutants for each modeling source. For the residential health risk, the HRA assumes exposure would start in the third trimester of pregnancy. The results of the HRA are provided in Section 2.5, and detailed results and methodology are provided in Appendix B.

2.4.2.2 Operation

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text.

Area Sources

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2021). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of residential buildings and on the default factor of pounds of VOC per building square foot per day. The CalEEMod default values for consumer products were modeled.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings, such as in paints and primers used during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and SDAPCD's Rule 67.0.1 (Architectural Coatings) governs the VOC content for interior and exterior coatings (SDAPCD 2015). The model default reapplication rate of 10% of area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2021). Consistent with the architectural coatings used during the construction phase, the applicant will use architectural coatings with a VOC content of 50 grams per liter (g/L) for internal reapplication, and exterior architectural coatings would have a VOC content of 100 g/L for any reapplication during operation.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of nonresidential building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. Emissions associated with potential landscape maintenance equipment were included to conservatively capture potential project operational emission sources. As a project design feature, the project would not include wood burning stoves or fireplaces.

Energy Sources

As represented in CalEEMod, energy sources would include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, since criteria pollutant emissions occur at the site of the power plant, which is typically off site.

Operational criteria air pollutant emissions from energy sources include natural gas combustion for appliances and space and water heating. The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. CalEEMod defaults were assumed for electricity and natural gas. The project is also designed to include energy star appliances.

Mobile Sources

The project would generate air quality emissions from mobile sources (vehicular traffic) as a result of the residents of the project. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix A). The trip generation rates for the project residential land use were adjusted in CalEEMod to match the overall weekday daily trip rate and trip length based on the Traffic Impact Analysis (CR Associates 2022). CalEEMod default data, trip modes, fleet mix, and emissions factors were used for the model inputs. CalEEMod default vehicle emission factors and vehicle fleet mix for 2025, as based on the CARB EMFAC2017 model, were used to estimate emissions associated with vehicular sources. In accordance with 2019 CalGreen requirements, the project would install a listed raceway to accommodate a dedicated 208/240-volt branch circuit in each residential garage for future installation of an electric vehicle (EV) charger. No quantitative credit was taken for this requirement. The 2019 CalGreen Section 4.106.4.2.1 requires the installation of at least one EV space in common use parking. As such, the project is assume to install two EV charging stations in the common use parking.

Due to the projects location and design, the following reduction measures were estimated using a spreadsheet based model (see Appendix A for calculation details):

- CAPCOA Final Handbook: Increase Residential Density (T-1;
- CAPCOA Final Handbook: T-18 Provide Pedestrian Network Improvement;
- City of San Marcos CAP: Measure T-2 Require Electric Vehicle Charging Stations in New Development; and
- City of San Marcos CAP: Measure E-1 Require New Residential Developments to Install Alternatively-Fueled Water Heaters.

2.5 Impact Analysis

Threshold 1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

As mentioned in Section 2.2, Regulatory Setting, the SDAPCD is responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the SDAB—specifically, the SIP and RAQS.[4] SANDAG is responsible for developing forecasts and data that are used by the SDAPCD in preparing the SIP and RAQS. The federal O_3 maintenance plan, which is part of the SIP, was adopted in 2012. The SIP includes a demonstration that current strategies and tactics will maintain acceptable air quality in the basin based on the NAAQS. The RAQS was initially adopted in 1991 and is updated every 3 years (most recently in 2020). The RAQS outlines SDAPCD's plans and control measures designed to attain the state air quality standards for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County as a whole and the cities in San Diego County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of development of their general plans.

Although the SDAPCD and City do not provide guidance regarding the analysis of impacts associated with air quality plan conformance, the County's Guidelines for Determining Significance and Report and Format and Content Requirements – Air Quality does discuss conformance with the RAQS (County of San Diego 2007). The guidance indicates that, if the project, in conjunction with other projects, contributes to growth projections that would not exceed SANDAG's growth projections for a city, the project would not be in conflict with the RAQS. If a project includes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might be in conflict with the SIP and RAQS and may contribute to a potentially significant cumulative impact on air quality (County of San Diego 2007).

The project site is currently zoned for Commercial (C) use with an existing General Plan designation of Commercial and is within the City's General Plan Neighborhood College area. The project proposes a General Plan and Zoning Amendment to change the land use designation to Specific Plan Area (SPA). The City projects an increase of 3,170 housing units between 2020 and 2035 (SANDAG 2013), and the project would only account for 3.8% of the projected housing units to increase in the City between 2020 and 2035 in the SANDAG Series 13 forecast. The project's proposed GPA/Rezone would be within the growth projections for the City; thus, the project would result in regional growth that is accounted for within the RAQS. Furthermore, at a regional level, the growth is consistent with the underlying growth forecasts in the SIP and RAQS. Therefore, implementation of the proposed project would not conflict with the RAQS or SIP, and potential future development would be consistent with the growth in the region. Impacts would be **less than significant.**

[4] For the purpose of this discussion, the relevant federal air quality plan is the Ozone Maintenance Plan (SDAPCD 2020). The RAQS is the applicable plan for purposes of state air quality planning. Both plans reflect growth projections in the SDAB.

Threshold 2: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

In analyzing cumulative impacts from a project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the air basin is designated as nonattainment for the CAAQS and NAAQS. If a project does not exceed thresholds and is determined to have less-than-significant project-specific impacts, it may still contribute to a significant cumulative impact on air quality if the emissions from the project, in combination with the emissions from other proposed or reasonably foreseeable future projects, are in excess of established thresholds. However, a project would only be considered to have a significant cumulative impact if the project's contribution accounts for a significant proportion of the cumulative total emissions (i.e., it represents a "cumulatively considerable contribution" to the cumulative air quality impact).

Additionally, for the SDAB, the RAQS serves as the long-term regional air quality planning document for the purpose of assessing cumulative operational emissions to ensure that the SDAB continues to make progress toward NAAQS and CAAQS attainment status. As such, cumulative projects located in the San Diego region would have the potential to result in a cumulative impact to air quality if, in combination, they would conflict with or obstruct implementation of the RAQS. Similarly, individual projects that are inconsistent with the regional planning documents upon which the RAQS is based would have the potential to result in cumulative operational impacts if they represent development and population increases beyond regional projections.

The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. PM_{10} and $PM_{2.5}$ emissions associated with construction generally result in "near-field" impacts. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SDAB. As discussed previously, the emissions of all criteria pollutants would be below the significance levels. Construction would be short term and temporary, and once construction is completed, construction-related emissions would cease. Operational emissions generated by the project would not exceed the significance thresholds for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$, and would not cause a significant impact. As such, the project would result in less-than-significant impacts to air quality relative to operational emissions.

Construction of the project would result in the temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts. Fugitive dust (PM_{10} and $PM_{2.5}$) emissions would primarily result from grading and site preparation activities. NO_x and CO emissions would primarily result from the use of construction equipment and motor vehicles.

Construction emissions were calculated using CalEEMod for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2023 through 2025). Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the applicant and is intended to represent a reasonable scenario based on the best information available. A detailed depiction of the construction schedule—including information regarding phasing, equipment used during each phase, haul trucks, vendor trucks, and worker vehicles—is included in Section 2.4.2.1, Construction, of this report. The information contained in Appendix A (CalEEMod Output Files) was used for the CalEEMod inputs.

Implementation of the project would generate temporary air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The project is subject to SDAPCD Rule 55, Fugitive Dust Control. This rule requires that the project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) that may be generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the active sites would be watered at least two times daily, resulting in an approximately 55% reduction of PM. Compliance with Rule 55 would be required as a standard condition of project approval or for issuance of a grading permit.

Exhaust from internal combustion engines used by construction equipment, hauling trucks (dump trucks), vendor trucks (delivery trucks), and worker vehicles would result in temporary emissions of NO_x, VOC, CO, SO_x, PM_{10}, and $PM_{2.5}$. Application of architectural coatings, such as exterior/interior paint and other finishes, would also produce VOC emissions; however, the contractor is required to procure architectural coatings from a supplier in compliance with the requirements of SDAPCD Rule 67.0.1, Architectural Coatings. This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015). The project would comply with SDAPCD Rule 67.0.1 through the incorporation of low-VOC architectural coatings. The VOC content assumed for the analysis was 50 g/L for interior coatings and 100 g/L for exterior coatings.

Table 7 shows the estimated maximum daily construction emissions associated with the construction of the project. Details of the emissions calculations are provided in Appendix A of this document.

Table 7. Estimated Maximum Daily Construction Emissions

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
2023	1.36	21.59	43.15	0.08	5.39	1.92
2024	1.36	21.59	43.12	0.08	5.39	1.92
2025	48.50	11.21	19.58	0.05	2.02	0.08
Maximum daily emissions	**48.50**	**21.59**	**43.15**	**0.08**	**5.39**	**1.92**
Emission threshold	*75*	*250*	*550*	*250*	*100*	*55*
Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix A for output files and modeling details.
The values shown are the maximum summer or winter daily emissions results from CalEEMod and provided in Appendix A. The maximum emissions assumes compliance with SDAPCD Rule 67.0.1, Architectural Coatings, and SDAPCD Rule 55, Fugitive Dust Control.

As shown in Table 7, daily construction emissions would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Following the completion of construction activities, the project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic generated by residents of the project; area sources, including the use of landscaping equipment and consumer products; and from architectural coatings.

Table 8 presents the maximum daily emissions associated with the operation of the project after all construction has been completed. The values shown for motor vehicles and area sources are the maximum summer or winter daily emissions results from CalEEMod.

Table 8. Estimated Project Maximum Daily Operational Emissions

Emission Source	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	pounds per day					
Area	3.17	0.11	9.89	0.00	0.06	0.06
Energy	0.03	0.22	0.09	0.00	0.02	0.02
Mobile	2.03	1.77	15.18	0.03	3.02	0.82
Total	**5.23**	**2.10**	**25.16**	**0.03**	**3.10**	**0.90**
Emission threshold	*55*	*250*	*550*	*250*	*100*	*55*
Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix A for output files and modeling details.

As shown in Table 8, the daily operational emissions from the project would not exceed the significance thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Regarding long-term cumulative operational emissions in relation to consistency with local air quality plans, the SIP and RAQS serve as the primary air quality planning documents for the state and SDAB, respectively. The SIP and RAQS rely on SANDAG growth projections based on population, vehicle trends, and land use plans developed by the cities and the County as part of the development of their general plans. Development that is consistent with the growth anticipated by local plans would be consistent with the SIP and RAQS and would result in emissions that are accounted for. Projects that conform to the permitted land use, or result in a less emissions-intensive use, and are therefore accounted for in the SIP and RAQS, would not be considered to result in cumulatively considerable impacts from operational emissions. As stated previously, the project would result in fewer emissions than buildout of the existing permitted land use that was anticipated by the RAQS and therefore would not result in significant regional emissions that are not accounted for within the RAQS. As a result, the project would not result in a cumulatively considerable contribution to regional O_3 concentrations or other criteria pollutant emissions. Therefore, the project's cumulative impacts would be **less than significant**.

Threshold 3: Would the project expose sensitive receptors to substantial pollutant concentrations?

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts upon those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution,

as identified by CARB, include children, the elderly, athletes, and people with cardiovascular and chronic respiratory diseases; however, for the purposes of this analysis, residents are also considered sensitive receptors. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes.

Health Impacts of Toxic Air Contaminants

In addition to impacts from criteria pollutants, project impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants. State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal hazardous air pollutants, and is adopting appropriate control measures for sources of these TACs. The greatest potential for TAC emissions during construction would be diesel particulate emissions from heavy-duty equipment operations and heavy-duty trucks, and the associated health impacts to sensitive receptors. The following measures are required by state law to reduce diesel particulate emissions:

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-use Off-road Diesel Vehicles (Title 13 California Code of Regulations, Chapter 9, Section 2449), the purpose of which is to reduce DPM and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading shall be limited to 5 minutes; electric auxiliary power units should be used whenever possible.

The greatest potential for TAC emissions during construction would be DPM emissions from heavy-duty equipment operations and heavy-duty trucks during construction of the project and the associated health impacts to sensitive receptors.

However, as a precautionary measure, an HRA was performed to evaluate the risk from diesel exhaust emissions on existing sensitive receptors and future onsite receptors from construction activities. The HRA methodology was described in Section 2.4.2.1, and the detailed assessment is provided in Appendix B. Table 9 summarizes the results of the HRA for proposed project construction.

Table 9. Construction Activity Health Risk Assessment Results

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Cancer Risk	Per Million	5.9	10.0	Less than Significant
HIC	Not Applicable	0.005	1.0	Less than Significant

Source: Appendix B.
Notes: CEQA = California Environmental Quality Act; HIC = Chronic Hazard Index.

The results of the HRA demonstrate that the TAC exposure from construction diesel exhaust emissions would result in cancer risk on site below the 10 in 1 million threshold, as well as Chronic Hazard Index less than 1.0. Therefore, TAC emissions from construction of the proposed project would not expose sensitive receptors to substantial pollutant concentrations and would result in a **less than significant** impact. Upon completion of construction, the project would not generate substantial TAC emissions. As such, impacts would be **less than significant** during operation.

Health Impacts of Carbon Monoxide

Exposure to high concentrations of CO can result in dizziness, fatigue, chest pain, headaches, and impairment of central nervous system functions. Mobile-source impacts, including those related to CO, occur on two scales. Regionally, project-related construction travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, construction traffic would be added to the roadway system in the vicinity of the project site. Although the SDAB is currently an attainment area for CO, there is a potential for the formation of microscale CO "hotspots" to occur immediately around points of congested traffic. Hotspots can form if such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles cold-started and operating at pollution-inefficient speeds, and/or is operating on roadways already crowded with non-project traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing. The SDAB is a CO maintenance area (western and central part of the SDAB only).

The Governor's Office of Planning and Research and the California Natural Resources Agency have issued new CEQA Guidelines for analyzing transportation impacts. By July 1, 2020, all CEQA lead agencies must analyze a project's transportation impacts using vehicle-miles traveled. Vehicle-miles traveled measures the distances vehicles will travel to and from a project, rather than congestion levels at intersections (LOS, graded on a scale of A–F). To account for this shift from LOS to vehicle-miles traveled – such that vehicle congestion is no longer modeled and available – but to nonetheless evaluate the potential for CO hotspots for the hypothetical development scenario, this SCEA utilizes CO modeling analyses performed by the South Coast Air Quality Management District (SCAQMD) relative to 1-hour and 8-hour concentrations as follows.

The SCAQMD conducted CO modeling for the 2003 Air Quality Management Plan (Appendix V of SCAQMD 2003) for the four worst-case intersections in the South Coast Air Basin: (1) Wilshire Boulevard and Veteran Avenue, (2) Sunset Boulevard and Highland Avenue, (3) La Cienega Boulevard and Century Boulevard, and (4) Long Beach Boulevard and Imperial Highway. At the time the 2003 Air Quality Management Plan was prepared, the intersection of Wilshire Boulevard and Veteran Avenue was the most congested intersection in Los Angeles County, with an average daily traffic volume of about 100,000 vehicles per day. Using CO emission factors for 2002, the peak modeled CO 1-hour concentration was estimated to be 4.6 ppm at the intersection of Wilshire Boulevard and Veteran Avenue.

A daily traffic volume of 100,000 vehicles (as considered in the SCAQMD modeling) as a result of the proposed project, would be at least double the traffic volumes of nearby intersections (CR Associates 2022). However, if "peak" modeled 1-hour concentration from SCAQMD's analysis of 100,000 vehicle traffic volumes of the 4.6 ppm were added to the maximum 1-hour CO concentration from 2018 through 2020 at the San Diego – 11403 Rancho Carmel Drive monitoring station (see Table 3, Local Ambient Air Quality Data) of 4.1 ppm (in 2019), the 1-hour CO concentration in the project area would total 8.7 ppm. This "worst case scenario" – modeling at least double the traffic compared to that experienced in the proposed project area – would still result in 1-hour CO concentrations well below the CAAQS 1-hour CO threshold of 20 ppm.

Concerning 8-hour concentrations, SCAQMD modeled future year 8-hour CO concentrations at the Central Los Angeles monitoring site of 4.6 ppm in 2020. Adding the 4.6 ppm to the maximum 8-hour CO concentration from 2018 through 2020 at the San Diego – 11403 Rancho Carmel Drive monitoring station of 2.5 ppm (in 2019) would result in a total 8-hour CO concentration of 7.1 ppm. Again, this "worst case scenario" 8-hour CO

concentration assuming traffic counts far above that experienced in the proposed project area would still be well below the CAAQS 8-hour threshold of 9.0 ppm.

Said another way, CO concentrations at congested intersections would not exceed the 1-hour or 8-hour CO CAAQS unless projected daily traffic would cause area traffic volumes to exceed 100,000 vehicles per day. The proposed project would not increase daily traffic volumes at any study intersection to more than 100,000 vehicles per day (CR Associates 2022). Therefore, the proposed project is not anticipated to create a CO hotspot. As such, impacts to sensitive receptors with regard to potential CO hotspots resulting from the project and hypothetical development scenario's contribution to cumulative traffic-related air quality impacts would be less than significant.

Health Impacts of Criteria Air Pollutants

Construction and operation of the project would not result in emissions that exceed the SDAPCD significance thresholds for any criteria air pollutants including VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Regarding VOCs, some VOCs would be associated with motor vehicles and construction equipment, while others are associated with architectural coatings, the emissions of which would not result in the exceedances of the SDAPCD significance thresholds as shown in Table 3, Local Ambient Air Quality Data. Generally, the VOCs in architectural coatings are of relatively low toxicity. Additionally, the project would use low-VOC architectural coatings that would comply with SDAPCD Rule 67.0.1, which restricts the VOC content of coatings for both construction and operational applications (SDAPCD 2015).

In addition, VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS (the SDAB is designated by the EPA as an attainment area for the 1-hour O_3 NAAQS standard). The health effects associated with O_3, as discussed in Section 2.2, are generally associated with reduced lung function. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 ambient air quality standards tend to occur between April and October when solar radiation is highest.

The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of quantitative methods to assess this impact. Nonetheless, the VOC and NO_x emissions associated with project construction could minimally contribute to regional O_3 concentrations and the associated health impacts. Due to the minimal contribution during construction and operation health impacts would be considered less than significant.

Similar to O_3, construction of the project would not exceed the SDAPCD significance thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter. Due to the minimal contribution of particulate matter during construction and operation, health impacts would be considered less than significant.

Regarding nitrogen dioxide, according to the construction emissions analysis, construction of the project would not contribute to exceedances of the NAAQS and CAAQS for NO_2. As described in Section 2.2, NO_2 and NO_x health impacts are associated with respiratory irritation, which may be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. Off-road construction equipment would be operating

at various portions of the site and would not be concentrated in one portion of the site at any one time. Construction of the project would not require any stationary emission sources that would create substantial, localized NO_x impacts. Therefore, health impacts would be considered less than significant.

In summary, construction and operation of the project would not result in exceedances SDAPCD significance thresholds for criteria pollutants. The VOC and NO_x emissions, as described previously, would minimally contribute to regional O_3 concentrations and the associated health effects. In addition to O_3, NO_x emissions would not contribute to potential exceedances of the NAAQS and CAAQS for NO_2. As shown in Table 3, the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Thus, the project's operational NO_x emissions are not expected to result in exceedances of the NO_2 standards or contribute to the associated health effects. PM_{10} and $PM_{2.5}$ would not contribute to potential exceedances of the NAAQS and CAAQS and would not obstruct the SDAB from coming into attainment for these pollutants and would not contribute to significant health effects associated with particulates. Therefore, health impacts associated with criteria air pollutants would be considered **less than significant**.

Valley Fever Exposure

As discussed in Section 2.1.4, Pollutants and Effects, Valley Fever is not highly endemic to San Diego County, and within San Diego County, the incidence rate in the project area is below the County average and the statewide average. Construction of the project would comply with SDAPCD Rule 55, which limits the amount of fugitive dust generated during construction. Strategies the Project would implement to comply with SDAPCD Rule 55 and control dust include watering two times per day and limiting speed on unpaved roads to 15 miles per hour.

Based on the low incidence rate of Coccidioidomycosis in San Diego County, and the project's implementation of dust control strategies, it is not anticipated that earth-moving activities during project construction would result in exposure of nearby sensitive receptors to Valley Fever. Therefore, the project would have a **less than significant** impact with respect to Valley Fever exposure for sensitive receptors.

Threshold 4: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment and architectural coatings. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered **less than significant**.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (CARB 2005). The project would not engage in any of these activities. Moreover, typical odors generated from operation of the project would primarily include vehicle exhaust generated by residents, as well as through the periodic use of landscaping or maintenance equipment. Therefore, the project would result in an odor impact that is considered to be **less than significant**.

2.6 Mitigation Measures

The project would not result in significant impacts; therefore, no mitigation is required.

3 Greenhouse Gas Emissions

3.1 Environmental Setting

3.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017a).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process as follows: Short-wave radiation emitted by the Sun is absorbed by the Earth; the Earth emits a portion of this energy in the form of long-wave radiation; and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and is the most significant driver of observed climate change (IPCC 2013; EPA 2017a). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 3.1.5, Potential Effects of Climate Change.

3.1.2 Greenhouse Gases and other Climate Forcing Substances

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. GHGs include, but are not limited to, carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), O_3, water vapor, hydrofluorocarbons (HFCs), hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and sulfur

hexafluoride (SF_6).[5] Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted to the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as HFCs, HCFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. A summary of the most common GHGs and their sources is included in the following text.[6] Also included is a discussion of other climate forcing substances.

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are from the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. Methane is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (such as in rockets, racecars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are powerful synthetic GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric ozone-depleting substances (e.g., CFCs, HCFCs, and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to ozone-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the ozone depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.

[5] California Health and Safety Code, Section 38505, identifies seven GHGs that CARB is responsible for monitoring and regulating to reduce emissions: CO_2, CH_4, N_2O, SF_6, HFCs, PFCs, and nitrogen trifluoride (NF_3).

[6] The descriptions of GHGs are summarized from IPCC Second Assessment Report (IPCC 1995), IPCC Fourth Assessment Report (IPCC 2007), CARB's Glossary of Terms Used in GHG Inventories (CARB 2015a), and EPA's Glossary of Climate Change Terms (EPA 2016d).

- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** Nitrogen trifluoride (NF_3) is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere) and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds, whose structure is very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify the global warming potential. DPM emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health. In relation to declining DPM from CARB's regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014b).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects

atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2017b). The Intergovernmental Panel on Climate Change (IPCC) developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in MT CO_2e.

The CalEEMod (Version 2020.4.0) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007).

3.1.4 Sources of Greenhouse Gas Emissions

Anthropogenic GHG emissions worldwide in 2019 (the most recent year for which data is available) totaled approximately 52.4 million metric tons (MMT) of CO_2e, excluding land use change and forestry (PBL 2020). Six countries—China, the United States, the Russian Federation, India, Japan, and Brazil—and the European community accounted for approximately 62% of the total global emissions, or approximately 32.5 MMT CO_2e (PBL 2020).

Per the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2019, total United States GHG emissions were approximately 6,558.3 MMT CO_2e in 2019 (EPA 2021). Overall, from 1990 to 2019, total emissions of CO2 increased by 142.4 MMT CO_2e (2.8%), while total emissions of CH_4 decreased by 117.2 MMT CO_2e (15.1%) and emissions of N_2O increased by 4.5 MMT CO_2e (1.0%). During the same period, aggregate weighted emissions of hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3) rose by 86.0 MMT CO_2e (86.3%). From 1990 to 2019, HFCs increased by 128.1 MMT CO_2e (275.4%), PFCs decreased by 19.8 MMT CO_2e (81.5%), SF_6 decreased by 22.9 MMT CO_2e (79.5%), and NF_3 increased by 0.6 MMT CO_2e (1,162.7%).

According to California's 2000–2019 GHG emissions inventory (2021 edition), California emitted 418.2 MMT CO_2e in 2019, including emissions resulting from out-of-state electrical generation (CARB 2021). The sources of GHG emissions in California include transportation, industrial uses, electric power production from both in-state and out-of-state sources, commercial and residential uses, agriculture, high-GWP substances, and recycling and waste. The California GHG emission source categories and their relative contributions in 2019 are shown in Table 10.

Table 10. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Transportation	166.1	40%
Industrial uses	88.2	21%
Electricity generation[b]	58.8	14%
Residential and commercial uses	43.8	10%
Agriculture	31.8	8%
High global warming potential substances	20.6	5%
Recycling and waste	8.9	2%
Totals	**418.2**	**100%**

Source: CARB 2021.

Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent per year.
Emissions reflect 2019 California GHG inventory.
[a] Percentage of total has been rounded and total may not sum due to rounding.
[b] Includes emissions associated with imported electricity, which account for 21.7 MMT CO_2e.

The City prepared a GHG emissions inventory for year 2012 in the 2020 CAP. The emissions by source category are shown in Table 11.

Table 11. Greenhouse Gas Emissions Sources in San Marcos

Source Category	Annual GHG Emissions (MT CO_2e)	Percent of Total[a]
On-Road Transportation	322,000	54%
Electricity	162,000	27%
Natural Gas	75,000	12%
Solid Waste	15,000	3%
Off-Road Transportation	14,000	2%
Water	9,000	1%
Wastewater	3,000	1%
Totals	**599,000**	**100%**

Source: City of San Marcos 2013b.
Notes: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent per year.
Emissions reflect the City's 2012 GHG inventory.
[a] Percentage of total has been rounded and total may not sum due to rounding.

3.1.5 Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 IPCC Synthesis Report indicated that warming of the climate system is unequivocal, and many of the observed changes since the 1950s are unprecedented. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice have, and rising sea levels (IPCC 2014).

In California, climate change impacts have the potential to affect sea level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply (CCCC 2006). The primary effect of global climate change has been a 0.2°C (0.36°F) rise in average global tropospheric temperature per decade, determined from meteorological measurements worldwide between 1990 and 2005. Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. A warming of about 0.2°C (0.36°F) per decade is projected, and there are identifiable signs that global warming could be taking place.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The average temperatures in California have increased, leading to more extreme hot days and fewer cold nights; shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year; sea levels have risen; and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CAT 2010).

An increase in annual average temperature is a reasonably foreseeable effect of climate change. Observed changes over the last several decades across the western United States reveal clear signals of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011, and warming has been greatest in the Sierra Nevada (CCCC 2012). By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase by 4.1°F to 8.6°F, depending on emissions levels. Springtime warming—a critical influence on snowmelt—will be particularly pronounced. Summer temperatures will rise more than winter temperatures, and the increases will be greater in inland California, compared to the coast. Heat waves will be more frequent, hotter, and longer. There will be fewer extremely cold nights (CCCC 2012). A decline of Sierra Nevada snowpack, which accounts for approximately half of the surface water storage in California, by 30% to as much as 90% is predicted over the next 100 years (CAT 2006).

Model projections for precipitation over California continue to show the Mediterranean pattern of wet winters and dry summers with seasonal, year-to-year, and decade-to-decade variability. For the first time, however, several of the improved climate models shift toward drier conditions by the mid-to-late twenty-first century in Central California, and most notably, in Southern California. By the late century, all projections show drying, and half of them suggest 30-year average precipitation will decline by over 10% below the historical average (CCCC 2012).

3.2 Regulatory Setting

3.2.1 Federal

Infrastructure Investment and Jobs Act. On November 6, 2021, Congress passed the Bipartisan Infrastructure Deal (Infrastructure Investment and Jobs Act), a once-in-a-generation investment in our nation's infrastructure and competitiveness. This Bipartisan Infrastructure Deal will rebuild America's roads, bridges and rails, expand access to clean drinking water, ensure every American has access to high-speed internet, tackle the climate crisis, advance environmental justice, and invest in communities that have too often been left behind. The legislation will help ease inflationary pressures and strengthen supply chains by making long overdue improvements for our nation's ports, airports, rail, and roads. It will drive the creation of good-paying union jobs and grow the economy sustainably and equitably so that everyone gets ahead for decades to come. Combined with the President's Build Back Framework, it will add on average 1.5 million jobs per year for the next 10 years. It will improve transportation options for millions of Americans to reduce energy use and GHG emissions. It will increase investment in electric vehicle chargers and renewable energy production.

Executive Order on Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability. President Biden will sign an executive order that demonstrates how the United States will leverage its scale and procurement power to lead by example in tackling the climate crisis. The executive order will reduce emissions across federal operations, invest in American clean energy industries and manufacturing, and create clean, healthy, and resilient communities. The President's executive order directs the federal government to use its scale and procurement power to achieve five ambitious goals:

- 100 percent carbon pollution-free electricity (CFE) by 2030, at least half of which will be locally supplied clean energy to meet 24/7 demand;

- 100 percent zero-emission vehicle (ZEV) acquisitions by 2035, including 100 percent zero-emission light-duty vehicle acquisitions by 2027;
- Net-zero emissions from federal procurement no later than 2050, including a Buy Clean policy to promote use of construction materials with lower embodied emissions;
- A net-zero emissions building portfolio by 2045, including a 50 percent emissions reduction by 2032; and
- Net-zero emissions from overall federal operations by 2050, including a 65 percent emissions reduction by 2030.

Massachusetts v. EPA. In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal Clean Air Act:

- The Administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The Administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

Energy Independence and Security Act. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions:

1. Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
2. Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
3. Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards.

In August 2016, EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018–2027 for certain trailers, and model years 2021–2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by

approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

On September 27, 2019, EPA and NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310), which became effective November 26, 2019. The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. The Part One Rule also impacted some of the underlying assumptions in the CARB EMFAC2014 and EMFAC2017 models for criteria air pollutant emissions from gasoline light-duty vehicles, which CARB released off-model adjustment factors for EMFAC's criteria air pollutants estimation on November 20, 2019, primarily for use in federal Clean Air Act conformity demonstration analyses. CARB expects Part Two of these regulations to be adopted by the EPA and NHTSA later in the fall of 2019. However, because CARB does not know the full impacts of these rules until Part Two is released, no off-model adjustments factors are available for GHG emissions at this time. In addition, the EMFAC off-model adjustments have not yet been incorporated into CalEEMod. This issue is evolving as California and 22 other states, as well as the District of Columbia and two cities, filed suit against the EPA over the vehicle waiver revocation on November 15, 2019 and a petition for reconsideration of the rule was filed on November 26, 2019 by California and 22 other states, the District of Columbia, and four cities. On April 22, 2021, NHTSA issued a notice of proposed rulemaking that would repeal those portions of SAFE 1 (including the regulatory text and interpretive statements in the preamble) that found California's GHG and ZEV mandates preempted by EPCA. One day after NHTSA issued its notice, EPA announced its parallel action on SAFE 1. On December 21, 2021, after reviewing all the public comments submitted on NHTSA's April 2021 Notice of Proposed Rulemaking, NHTSA finalizes the CAFE Preemption rulemaking to withdraw its portions of the so-called SAFE I Rule.

3.2.2 State

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes executive orders, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

Executive Order S-3-05. Executive Order (EO) S-3-05 (June 2005) established the following statewide goals: GHG emissions should be reduced to 2000 levels by 2010, GHG emissions should be reduced to 1990 levels by 2020, and GHG emissions should be reduced to 80% below 1990 levels by 2050.

Assembly Bill 32. In furtherance of the goals established in EO S-3-05, the legislature enacted AB 32 (Núñez and Pavley). The bill is referred to as the California Global Warming Solutions Act of 2006 (September 27, 2006). AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020 and initiate the transformations required to achieve the state's long-range climate objectives.

Executive Order B-55-18. EO B-55-18 (September 2018) establishes a statewide policy for the state to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. The goal is an addition to the existing statewide targets of reducing the state's GHG emissions. CARB will work with

relevant state agencies to ensure that future scoping plans identify and recommend measures to achieve the carbon neutrality goal.

California Air Resources Board's Climate Change Scoping Plan. One specific requirement of AB 32 was for CARB to prepare a scoping plan for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (Health and Safety Code Section 38561[a]), and to update the plan at least once every 5 years. In 2008, CARB approved the first scoping plan. The Climate Change Scoping Plan: A Framework for Change (Scoping Plan) included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emissions limit and initiate the transformations needed to achieve the state's long-range climate objectives. The key elements of the Scoping Plan include the following (CARB 2008):

1. Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
2. Achieving a statewide renewable energy mix of 33%.
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions.
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets.
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (17 CCR 95480 et seq.).
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations, and for community emissions to reduce GHGs by approximately 15% from then levels (2008) by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years, and laid the groundwork to start the transition to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012. The First Update concluded that California is on track to meet the 2020 target but recommended a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the state's 1990 emissions level, using more recent GWPs identified by the IPCC, from 427 MMT CO_2e to 431 MMT CO_2e (CARB 2014).

In 2015, as directed by EO B-30-15 (discussed below), CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in EO S-3-05. The governor called on California to pursue a new and ambitious set of strategies, in line with the five climate change pillars from his inaugural address, to reduce GHG emissions and prepare for the unavoidable impacts of climate change. In the summer of 2016, the legislature affirmed the importance of addressing climate change through passage of SB 32.

In December 2017, CARB adopted California's 2017 Climate Change Scoping Plan (2017 Scoping Plan) for public review and comment (CARB 2017b). The 2017 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update while identifying new, technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target as established by SB 32 and define the state's climate change priorities to 2030 and beyond. The strategies' commitments include implementing renewable energy and energy efficiency strategies (including the mandates of SB 350), increasing stringency of the Low Carbon Fuel Standard, implementing measures identified in the Mobile Source and Freight Strategies, implementing measures identified in the proposed Short-Lived Climate Pollutant Reduction Strategy, and increasing stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, it recommends continuing the Cap-and-Trade Program.

For local governments, the 2017 Scoping Plan replaced the initial Scoping Plan's 15% reduction goal with a recommendation to aim for a community-wide goal of no more than 6 MT CO_2e per capita by 2030, and no more than 2 MT CO_2e per capita by 2050, which are consistent with the state's long-term goals. These goals are also consistent with the Under 2 Memorandum of Understanding (Under 2 2016) and the Paris Agreement, which are developed around the scientifically based levels necessary to limit global warming to below 2°C. The 2017 Scoping Plan recognized the benefits of local government GHG planning (e.g., through CAPs) and provided more information regarding tools CARB is working on to support those efforts. It also recognized the CEQA streamlining provisions for project-level review where there is a legally adequate CAP.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the executive orders, and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and executive orders if it meets the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and does not impede attainment of those goals. A project would be consistent if it will further the objectives and not obstruct their attainment.

CARB presently is preparing the *2022 Scoping Plan Update*, which will assess progress towards achievement of the state's 2030 reduction target and lay out a path for the state's achievement of carbon neutrality by 2045. CARB has held a number of public workshops to provide information on the plan update and solicit feedback from stakeholders. A draft plan has not yet been released for public review and comment.

Executive Order B-30-15. EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 specifically set an interim target goal of reducing statewide GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing statewide GHG emissions to 80% below 1990 levels by 2050, as set forth in EO S-3-05. To facilitate achievement of this goal, EO B-30-15 called for an update to CARB's Scoping Plan to express the 2030 target in terms of MMT CO_2e. The executive order also called for state agencies to continue

to develop and implement GHG emissions reduction programs in support of the reduction targets. Sector-specific agencies in transportation, energy, water, and forestry were required to prepare GHG reduction plans by September 2015, followed by a report on action taken in relation to these plans in June 2016. EO B-30-15 did not require local agencies to take any action to meet the new interim GHG reduction target.

Senate Bill 32 and Assembly Bill 197. SB 32 and AB 197 (enacted in 2016) are companion bills that set a new statewide GHG reduction targets, made changes to CARB's membership and increased legislative oversight of CARB's climate change-based activities, and expanded dissemination of GHG and other air-quality-related emissions data to enhance transparency and accountability. More specifically, SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

Senate Bill 605 and Senate Bill 1383. SB 605 (2014) required CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants in the state, and SB 1383 (2016) required CARB to approve and implement that strategy by January 1, 2018. SB 1383 also established specific targets for the reduction of short-lived climate pollutants (40% below 2013 levels by 2030 for CH_4 and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provided direction for reductions from dairy and livestock operations and landfills. The Short-Lived Climate Pollutants Reduction Strategy was approved by CARB in March 2017, and lays out a range of options to reduce short-lived climate pollutant emissions in California, including regulations, incentives, and other market-supporting activities.

Building Energy

Title 24, Part 6. Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Although not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and CEC, and revised if necessary (California Public Resources Code [PRC] Section 25402[b][1]). The regulations receive input from members of industry and the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (PRC Section 25402[d]) and cost effectiveness (PRC Sections 25402[b][2] and [b][3]). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

The 2019 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2020. The 2019 Title 24 Building Energy Efficiency Standards will further reduce energy used and associated GHG emissions compared to prior standards. In general, single-family residences built to the 2019 standards are anticipated to use approximately 7% less energy due to energy efficiency measures than those built to the 2016 standards; once rooftop solar electricity generation is factored in, single-family residences built under the 2019 standards will use approximately 53% less energy than those under the 2016 standards (CEC 2018). Nonresidential buildings built

to the 2019 standards are anticipated to use an estimated 30% less energy than those built to the 2016 standards (CEC 2018). The project is subject to the nonresidential standards due to the number of stories. The project's apartments and affordable flats are subject to the nonresidential standards while the rowhomes and villas are subject to the residential standards.

On August 11, 2021, the CEC adopted the 2022 Energy Code. In December 2021, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

Title 24, Part 11. In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as California's Green Building Standards (CALGreen), and establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings, schools, and hospitals. The CALGreen 2019 standards, which are the current standards, became effective January 1, 2020.

Title 20. Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. Performance of appliances must be certified through the CEC to demonstrate compliance with standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing for each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance, and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

Assembly Bill 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general-purpose lighting to reduce electricity consumption by 50% for indoor residential lighting and by 25% for indoor commercial lighting.

SB 1. SB 1 (Murray) (August 2006) established a $3 billion rebate program to support the goal of the state to install rooftop solar energy systems with a generation capacity of 3,000 megawatts through 2016. SB 1 added sections to the Public Resources Code, including Chapter 8.8 (California Solar Initiative), that require building projects applying for ratepayer-funded incentives for photovoltaic systems to meet minimum energy efficiency levels and performance requirements. Section 25780 established that it is a goal of the state to establish a self-sufficient solar industry. The goals included establishing solar energy systems as a viable mainstream option for homes and businesses within 10 years of adoption, and placing solar energy systems on 50% of new

homes within 13 years of adoption. SB 1, also termed "Go Solar California," was previously titled "Million Solar Roofs."

California AB 1470 (Solar Water Heating). This bill established the Solar Water Heating and Efficiency Act of 2007. AB 1470 makes findings and declarations of the Legislature relating to the promotion of solar water heating systems and other technologies that reduce natural gas demand. AB 1470 defines several terms for purposes of the act. The bill required a commission to evaluate the data available from a specified pilot program, and to design and implement a program of incentives for the installation of 200,000 solar water heating systems in homes and businesses throughout the state by 2017.

Renewable Energy and Energy Procurement. SB 1078 (2002) established the Renewables Portfolio Standard (RPS) program, which requires an annual increase in renewable generation by the utilities. Initially, the RPS required utilities to obtain 20% of their power from renewable sources by 2010. SB X1-2 (2011) subsequently expanded the RPS by establishing that 33% of the total electricity sold to retail customers in California per year by December 31, 2020, and in subsequent years, be secured from qualifying renewable energy sources. SB 350 (2015) further expanded the RPS by establishing that 50% of the total electricity sold to retail customers in California per year by December 31, 2030, be secured from qualifying renewable energy sources. And SB 100 (2018) further accelerated the RPS, requiring achievement of a 50% RPS by December 31, 2026, and a 60% RPS by December 31, 2030. SB 100 also established a new state policy goal that calls for eligible renewable energy resources and zero-carbon resources to supply 100% of electricity retail sales and 100% of electricity procured to serve all state agencies by December 31, 2045.

Under the program, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation of 30 megawatts or less, digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location.

Mobile Sources

CARB's Mobile Source Strategy. On May 16, 2016, CARB released the 2016 Mobile Source Strategy that demonstrates how the state can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The actions contained in the 2016 Mobile Source Strategy will deliver broad environmental and public health benefits, as well as support much needed efforts to modernize and upgrade transportation infrastructure, enhance system-wide efficiency and mobility options, and promote clean economic growth in the mobile sector. The 2016 Mobile Source Strategy would also result in a 45 percent reduction in GHG emissions, and a 50 percent reduction in the consumption of petroleum-based fuels (CARB 2016).

On October 28, 2021, CARB received and heard the 2020 Mobile Source Strategy, which continues and builds upon the foundation established by the 2016 Mobile Source Strategy. The 2020 Mobile Source Strategy, if implemented, would achieve a 76 percent reduction in GHG emissions from 2020 levels from mobile sources by 2045, as largely attributable to transitioning towards a zero-emissions fleet. Moving forward, CARB anticipates that the programs and concepts in the 2020 Mobile Source Strategy will be incorporated into other aspects of CARB's regulatory and planning frameworks.

State Vehicle Standards. AB 1493 (July 2002) was enacted in response to the transportation sector accounting for more than one-half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for

passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. AB 1493 required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004.

As explained under the "Federal Vehicle Standards" description above, the EPA and NHTSA approved the SAFE Vehicles Rule Part One and Two, which revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. Because the EPA rule is the subject of pending legal challenges, and because President Biden issued an executive order to review Part One and Part Two, this analysis used the best available information at this time, as set forth in EMFAC and assumed in CalEEMod.

The Advanced Clean Cars program (January 2012) is an emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that by 2025, cars will emit 75% less smog-forming pollution than the average new car sold in 2012. To reduce GHG emissions, CARB, in conjunction with the EPA and NHTSA, adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The zero-emissions vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years.

Executive Order S-1-07. Issued on January 18, 2007, EO S-1-07 sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The initial target of the Low Carbon Fuel Standard was to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The Low Carbon Fuel Standard was subsequently amended in 2018 to require a 20% reduction in carbon intensity by 2030. This new requirement aligns with the California's overall 2030 target of reducing climate changing emissions to 40% below 1990 levels by 2030, set by SB 32. CARB has adopted implementing regulations for both the 10% and 20% carbon intensity reduction targets.

Senate Bill 375. SB 375 (2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 required CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035. Regional metropolitan planning organizations are then responsible for preparing a Sustainable Communities Strategy (SCS) within their Regional Transportation Plan (RTP). The goal of the SCS is to establish a forecasted development pattern for the region that, after considering transportation measures and policies, will achieve, if feasible, the GHG reduction targets. If an SCS is unable to achieve the GHG reduction target, a metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to California Government Code Section 65080(b)(2)(K), an SCS does not regulate the use of land; supersede the land use authority of cities and counties; or require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets adopted for SANDAG in 2010 are a 7% reduction in per-capita passenger-vehicle GHG emissions by 2020 and a 13% reduction by 2035, measured relative to 2005 GHG emissions. In 2018, CARB adopted the second round of SB 375 reduction targets, and increased SANDAG's 2020 target to a 15% reduction in per-capita passenger-vehicle GHG emissions, and the 2035 target to a 19% reduction using the same 2005 baseline.

Senate Bill 350. In 2015, SB 350 – the Clean Energy and Pollution Reduction Act – was enacted into law. As one of its elements, SB 350 establishes a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see California Public Utilities Code, Section 740.12).

AB 1236. AB 1236 (October 2015) (Chiu) required a city, county, or city and county to approve an application for the installation of electric vehicle charging stations, as defined, through the issuance of specified permits unless the city or county makes specified written findings based on substantial evidence in the record that the proposed installation would have a specific, adverse impact upon the public health or safety, and there is no feasible method to satisfactorily mitigate or avoid the specific, adverse impact. AB 1236 provided for appeal of that decision to the planning commission, as specified. The bill provided that the implementation of consistent statewide standards to achieve the timely and cost-effective installation of electric vehicle charging stations is a matter of statewide concern. The bill required electric vehicle charging stations to meet specified standards. AB 1236 required a city, county, or city and county with a population of 200,000 or more residents to adopt an ordinance, by September 30, 2016, that created an expedited and streamlined permitting process for electric vehicle charging stations. The bill also required a city, county, or city and county with a population of fewer than 200,000 residents to adopt this ordinance by September 30, 2017.

Executive Order B-16-12. EO B-16-12 (2012) directs state entities under the Governor's direction and control to support and facilitate development and distribution ZEVs. On a statewide basis, EO B-16-12 also establishes a GHG emissions reduction target from the transportation sector equaling 80% less than 1990 levels by 2050. In furtherance of this executive order, the Governor convened an Interagency Working Group on ZEVs that has published multiple reports regarding the progress. It ordered CARB, CEC, the California Public Utilities Commission, and other relevant agencies to work with the Plug-In Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve goals by 2015, 2020, and 2025. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

Executive Order N-79-20. EO N-79-20 (2020) sets the goal for the State that 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035. EO-N-79-20 also sets goals for transition to 100 percent zero emission all medium- and heavy-duty vehicles by 2045, zero emission drayage trucks by 2035, and zero emission off-road vehicles and equipment by 2035, where feasible. Among other directives to further this executive order, for passenger cars and trucks, the Governor directed CARB to develop and propose regulations requiring increasing volumes of new zero-emission vehicles sold in the State towards the target of 100 percent of in-state sales by 2035. The Governor also directed the Governor's Office of Business and Economic Development to develop a Zero-Emissions Vehicle Market Development Strategy, which was completed in February 2021[7]. The executive order also directs updates and assessments to ensure zero-emission vehicle infrastructure is in place to support the levels of electric vehicle adoption required by the order.

Small Offroad Engines

The CARB approved a measure on December 9, 2021 that will require most newly manufactured small off-road engines such as those found in leaf blowers, lawn mowers and other equipment be zero emission starting in 2024. Portable generators, including those in recreational vehicles, would be required to meet more stringent standards in 2024 and meet zero-emission standards starting in 2028.

Solid Waste

AB 939 and AB 341. In 1989, AB 939, known as the Integrated Waste Management Act (PRC Sections 40000 et seq.), was passed because of the increase in waste stream and decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed of where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (Chapter 476, Statutes of 2011 [Chesbro]) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle conducted several general stakeholder workshops and several focused workshops, and in August 2015 published a discussion document titled AB 341 Report to the Legislature, which identified five priority strategies that CalRecycle believed would assist the state in reaching the 75% goal by 2020, legislative and regulatory recommendations, and an evaluation of program effectiveness (CalRecycle 2012).

SB 1383. Beginning in 2022, SB 1383 requires every jurisdiction to provide organic waste collection services to all residents and businesses. Jurisdictions can select from a variety of organic waste collection services to match their unique communities and local infrastructure, while producing clean streams of organic feedstock that can be recycled into high-quality, marketable recycled products, including compost, renewable natural gas, electricity, and paper. Jurisdictions will educate all residents and businesses about collection requirements, including what materials to put in curbside bins. Education to residents and businesses may vary by jurisdiction and educational content may be provided electronically, through hard copy materials, or through direct outreach.

Water

Executive Order B-29-15. In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the executive order extended through February 28, 2016, although many of the directives have since become permanent water-efficiency standards and requirements. The executive order includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increased the requirements for landscape water use efficiency and broadened its applicability to include new development projects with smaller landscape areas.

EO B-37-16. Issued May 2016, EO B-37-16 directed the State Water Resources Control Board to adjust emergency water conservation regulations through the end of January 2017 to reflect differing water supply

conditions across the state. The State Water Resources Control Board also developed a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The State Water Resources Control Board and Department of Water Resources will develop new, permanent water use targets that build on the existing state law requirements that the state achieve 20% reduction in urban water usage by 2020. EO B-37-16 also specifies that the State Water Resources Control Board permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in fountains and other decorative water features; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.

Other State Regulations and Goals

SB 97. SB 97 (Dutton) (August 2007) directed the Governor's Office of Planning and Research to develop guidelines under CEQA for the mitigation of GHG emissions. The California Natural Resources Agency (CNRA) then adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010. The CEQA Guidelines were subsequently amended in 2018, which changes became effective on December 28, 2018.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines provide that a lead agency should also consider the extent to which a project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features; off-site measures, including offsets that are not otherwise required; measures in an existing plan or mitigation program; measures that sequester GHGs; etc. (14 CRR 15126.4[c]). The adopted amendments do not establish a GHG emissions threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts (14 CCR 15064.7). The CEQA Guidelines also permit using environmental standards – i.e., an applicable and relevant quantitative, qualitative or performance requirement found in an ordinance, resolution, rule, regulation, order, plan or other environmental requirement that has been adopted for the purpose of environmental protection – as a threshold of significance to promote consistency in significance determinations (14 CCR 15064.7 [d]).

With respect to GHG emissions, the CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either quantifying the emissions resulting from a project or by relying on "qualitative analysis or other performance-based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should focus on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. The analysis should consider a timeframe appropriate for the project, and must reasonably reflect evolving scientific knowledge and state regulatory schemes (14 CCR 15064.4[b]).

Section 15183.5 of the CEQA Guidelines allows agencies to tier from qualified GHG reduction plans developed in accordance with subsection (b). Specifically, the GHG reduction plan must quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area; establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions

from activities covered by the plan would not be cumulatively considerable; identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area; specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level; establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and be adopted in a public process following environmental review.

Executive Order S-13-08. EO Order S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the executive order directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009 (CNRA 2009b), an update, Safeguarding California: Reducing Climate Risk, followed in July 2014 (CNRA 2014) as well as in 2018, Safeguarding California Plan: 2018 Update California's Climate Adaptation Strategy (CNRA 2018). The draft 2021 California Climate Adaptation Strategy was released for public comment on October 18, 2021 and closed on November 17, 2021. To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, transportation, and water.

3.2.3 Local

SANDAG RTP/SCS

SANDAG completed and adopted its 2050 RTP/SCS in October 2011. In November 2011, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

In October 2015, SANDAG adopted San Diego Forward: The Regional Plan (SANDAG 2015). Like the 2050 RTP/SCS, San Diego Forward: Regional Plan meets CARB's 2020 and 2035 reduction targets for the region (SANDAG 2015). In December 2015, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

The 2021 Regional Plan, adopted by SANDAG on December 10, 2021, provides a long-term blueprint for the San Diego region that seeks to meet regulatory requirements, address traffic congestion, and create equal access to jobs, education, healthcare, and other community resources (SANDAG 2021). The plan is the result of years of planning, data analysis, and community engagement to reimagine the San Diego region with a transformative transportation system, a sustainable pattern of growth and development, and innovative demand and management strategies.

The 2021 Regional Plan includes a Sustainable Communities Strategy (SCS), as required by California Senate Bill 375 (Steinberg, 2008) (SB 375), for the San Diego region. This SCS describes coordinated transportation and land use planning that exceeds the state's target for reducing per capita GHG emissions set by CARB. The state-mandated target is a 19% reduction—compared with 2005—in per capita GHG emissions from cars and light-duty trucks by 2035. The 2021 Regional Plan achieves a 20% reduction by then.

The 2021 Regional Plan also puts forth a forecasted development pattern that is driven by regional goals for sustainability, mobility, housing affordability, and economic prosperity.

City of San Marcos Climate Action Plan. The City adopted its currently applicable CAP on December 8, 2020 (City of San Marcos 2020b). The CAP acts as a roadmap to address challenges of climate change within the City. The CAP builds on the efforts and strategies identified in the City's 2013 CAP and establishes GHG emission reduction targets and identifies achievable, locally based actions to reduce GHG emissions from municipal and community activities. The CAP includes a baseline GHG emissions inventory for 2012, GHG emissions forecasts for 2020 and 2030, local GHG emissions reduction strategies and measures to help the City achieve the 2030 target, climate adaptation measures for the City, and implementation and monitoring mechanisms to ensure the City's measures and targets are achieved. The CAP establishes GHG emissions reduction goals of 4% below 2012 levels by 2020 and 42% below 2012 levels by 2030 (City of San Marcos 2020b).

The CAP was prepared in accordance with the requirements within CEQA Guidelines Section 15183.5, and the CAP Consistency Checklist is used in this analysis to evaluate the proposed project's significance with respect to GHG emissions. As provided in the Checklist, projects that are consistent with the CAP "may rely on the CAP for the cumulative impact analysis of GHG emissions" and "may be determined not to be cumulatively considerable" (City of San Marcos 2020b)

City of San Marcos General Plan. The City's General Plan (City of San Marcos 2012) includes various policies related to reducing GHG emissions. Applicable policies include the following:

Land Use and Community Design Element

Goal LU-1: Achieve a balanced distribution and compatible mix of land uses to meet the present and future needs of all residents and the business community.

Policy LU-1.1: Ensure that adjacent land uses complement one another by considering compatibility of activities, development patterns and architectural character elements and access to various mobility choices.

Goal LU-2 Promote development standards and land use patterns that encourage long-term environmental sustainability.

Policy LU-2.1: Promote compact development patterns that reduce air pollution and automobile dependence and facilitate walking, bicycling, and transit use.

Policy LU-2.3: Require the incorporation of green building practices, technologies, and strategies into development projects per code standards

Policy LU-2.5: Promote landscaping (e.g., native, drought tolerant plants) that minimizes demands on water supply.

Policy LU-2.7: Promote the instillation of trees to reduce the urban heat-island effect and green infrastructure to reduce storm water runoff.

Policy LU-3.1: Require that new development and redevelopment incorporate connections and reduce barriers between neighborhoods, transit corridors, and activity centers within the City.

Mobility Element

Policy M-1.3: Require new developments to prepare and implement Transportation Demand Management (TDM) programs to minimize vehicle trip generation and promote alternative modes of travel within the City.

Goal M-3: Promote and encourage use of alternative transportation modes, including transit, bicycles, neighborhood electric vehicles (NEVs), and walking, within the City.

Policy M-3.1: Develop an integrated, multimodal circulation system that accommodates transit, bicycles, pedestrians, and vehicles; provides opportunities to reduce air pollution and GHG emissions; and reinforces the role of the street as a public space that unites the City.

Conservation and Open Space Element

Goal COS-4: Improve regional air quality and reduce greenhouse gas emissions that contribute to climate change.

Policy COS-4.5: Encourage energy conservation and the use of alternative energy sources within the community.

Policy COS-4.6: Promote efficient use of energy and conservation of available resources in the design, construction, maintenance and operation of public and private facilities, infrastructure and equipment.

As detailed in response to Threshold #2 below, the project would be consistent with the applicable goals and policies pertaining to greenhouse gasses.

3.3 Significance Criteria and Methodology

3.3.1 Thresholds of Significance

The State of California has developed guidelines to address the significance of greenhouse gas emissions impacts that are contained in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). Appendix G provides that a project would have a significant environmental impact if it would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Neither the State of California nor the SDAPCD has adopted emission-based thresholds of significance for GHG emissions under CEQA.

The CEQA Guidelines provide that in determining the significance of impacts from GHG emissions, an agency may consider the extent to which the project complies with a local plan for the reduction or mitigation of GHG emissions. (See CEQA Guidelines Sections 15064.4(b)(3), 15183.5.). As indicated above, the City has adopted such a plan. Accordingly, for purposes of GHG Threshold 1, the project's GHG emissions are assessed by evaluating the project's consistency with the CAP, which is discussed below in detail.

For purposes of GHG Threshold 2, the project is assessed based on its potential to conflict with the City's CAP, SANDAG's Regional Plan, and CARB's Scoping Plan. The Regional Plan and Scoping Plan goals and measures are analyzed against the project as part of the consistency analysis. The potential for the project to conflict with these plans is addressed in detail below.

City of San Marcos Climate Action Plan Significance Criteria

The City adopted an updated CAP on December 8, 2020. The CAP outlines strategies and measures that the City will undertake to achieve its proportional share of State GHG emissions reduction targets. The CAP is a plan for the reduction of GHG emissions in accordance with California Environmental Quality Act (CEQA) Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of the CAP. The City has also developed a CAP Consistency Checklist (Checklist), in conjunction with the CAP, to provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to CEQA. A GHG screening threshold of 500 MT CO_2e per year is established for new development projects in order to determine if a project would need to demonstrate consistency with the CAP through the Checklist. Projects that are projected to emit fewer than 500 MT CO_2e annually would not make a considerable contribution to the cumulative impact of climate change and would not need to provide additional analysis to demonstrate consistency with the CAP. For proposed projects at or above the screening threshold of 500 MT CO_2e, applicants are required to complete the CAP Consistency Checklist, which is meant to provide a streamlined review process for proposed new development projects that are subject to discretionary review and require environmental review pursuant to CEQA. A properly completed Checklist documents how a proposed project complies with the CAP, and in so doing, demonstrates that the project's contribution to climate change impacts is not cumulatively considerable. The City also developed a service population threshold for the CAP to show that projects are consistent with GHG reduction measures. The City determined that a GHG threshold of 2.1 MT CO_2e per service population per year (SP/yr) would be consistent with GHG emissions within the CAP.

3.3.2 Approach and Methodology

3.3.2.1 Construction

CalEEMod Version 2020.4.0 was used to estimate potential project-generated GHG emissions during construction. Construction of the project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 2.4.2, Approach and Methodology (including Section 2.4.2.1, Construction), are also applicable for the estimation of construction-related GHG emissions. As such, see Section 2.4.2.1 for a discussion of project-generated construction emissions calculation methodology and assumptions.

Existing Land Use Designation

To compare the GHG emissions intensity of the proposed project and the land use built under the existing land use designation, the following section summarizes the construction methodology for the existing land use designation. Construction assumptions, including timing, phasing, equipment type and quantity, and worker and

vendor truck trips, were based on the maximum allowed buildout of the existing land use designation for the site. For the Commercial (C) zoning, consistent with existing land use alternative, it would include a 69,000 square feet of grocery store and gas station uses, as well as 23,000 square feet of office space. This alternative would include 276 parking spaces. An assumption of 10 fueling positions (5 pumps) was made for calculation purposes.

Default values provided by CalEEMod were used where zoning information was not available. For purposes of estimating GHG emissions, it was assumed that construction of the land use built under the existing land use designation would commence in December 2023[8] and would end in December 2024. Construction of the land use built under the existing land use designation is anticipated to occur in five phases. Accordingly, five phases consisting of site preparation, grading, building construction, paving, and architectural coating were assumed. The analysis contained herein is based on the following assumptions (the duration of phases is approximate):

- Site Preparation: 1 week (December 2023)
- Grading: 1 week (December 2023)
- Building Construction: 11 months (December 2023 – November 2024)
- Paving: 1 month (November 2024)
- Architectural Coating: 1 month (December 2024)

The construction equipment mix used for estimating the construction emissions of the existing land use designation is based on CalEEMod defaults and is shown in Table 12, Construction Scenario Assumptions – Existing Land Use Designation. For worker and vendor truck trips, the default CalEEMod assumptions for one-way trips were rounded up to the nearest even number to account for whole round trips. For this analysis, it was generally assumed that heavy construction equipment would operate 5 days a week (22 days per month) during project construction. Grading activities were anticipated to be minimal for the land use built under the existing land use designation; therefore, no haul trucks would be required to import or export material.

Table 12. Construction Scenario Assumptions – Existing Land Use Designation

Construction Phase	One-Way Trips			Equipment	Quantity	Hours Per Day
	Daily Workers	Daily Vendor Trucks	Total Haul Trucks			
Site Preparation	18	0	0	Rubber Tired Dozers	3	8
				Tractors/Loaders/Backhoes	4	8
Grading	16	0	0	Excavators	1	8
				Graders	1	8
				Rubber Tired Dozers	1	8
				Tractors/Loaders/Backhoes	3	8
Building Construction	76	34	0	Cranes	1	7
				Forklifts	3	8

[8] The analysis assumes a construction start date of June 2023, which represents the earliest date construction would initiate (although unlikely). Assuming the earliest start date for construction represents the worst-case scenario for emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 12. Construction Scenario Assumptions – Existing Land Use Designation

Construction Phase	One-Way Trips			Equipment	Quantity	Hours Per Day
	Daily Workers	Daily Vendor Trucks	Total Haul Trucks			
				Generator Sets	1	8
				Tractors/Loaders/Backhoes	3	7
				Welders	1	8
Paving	20	0	0	Cement and Mortar Mixers	2	6
				Pavers	1	8
				Paving Equipment	2	6
				Rollers	2	6
				Tractors/Loaders/Backhoes	1	8
Architectural Coating	16	0	0	Air Compressors	1	6

Note: See Appendix A.

3.3.2.2 Operation

Existing Land Use Designation

Similar to construction, emissions from the operational phase of the existing land use designation and project were estimated using CalEEMod. Operational year 2030 was assumed consistent with Appendix D of the City's CAP (City of San Marcos 2020).

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating were calculated in the building energy use module of CalEEMod, as described in the following text.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated with landscape equipment use were estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. Based on CalEEMod defaults for the County, the average annual number of summer days is estimated at 180 days (CAPCOA 2021).

Energy Sources

CalEEMod default values for electricity use and natural gas consumption for each land use type (industrial park) were applied for the existing land use designation. The energy use from commercial and industrial land uses is calculated in CalEEMod based on the Commercial End-Use Survey (CAPCOA 2021). Energy use in buildings (both natural gas and electricity) is divided by CalEEMod into end-use categories subject to Title 24 requirements (end uses associated with the building envelope, such as the HVAC system, water heating system, and integrated

lighting) and those not subject to Title 24 requirements (such as appliances, electronics, and miscellaneous "plug-in" uses).

Operational GHG emissions from energy sources include natural gas combustion for appliances and space and water heating. The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. The current version of CalEEMod assumes compliance with the 2019 Title 24 Building Energy Efficiency Standards (CAPCOA 2021).

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt hour) for SDG&E were based on the value for SDG&E's energy mix in 2021. As explained in Section 3.2.2, SB X1-2 established a target of 33% from renewable energy sources for all electricity providers in California by 2020, and SB 350 calls for further development of renewable energy, with a target of 50% by 2030. SB 100 revised this target to 60% by 2030. Consistent with the City's CAP, the GHG intensity for 2030 was assumed to be 44 pounds per megawatt-hour for SDG&E (City of San Marcos 2020). In accordance with the City's CAP Measure E-2, the existing land use designation was assumed to install 2 watts of solar photovoltaics for every square food of gross floor area. This resulted in 184 kilowatts of solar. The production of the solar photovoltaic system was estimated using the National Renewable Energy Laboratories (NREL)'s PVWatts calculator (NREL 2022).

Mobile Sources

The land use built under the existing land use designation would generate GHG emissions from mobile sources (vehicular traffic) as a result of trucks, customers, and employee vehicles. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix A). CalEEMod default data, including trip rates, trip modes, trip lengths, fleet mix, and emissions factors, were used for the model inputs. CalEEMod default vehicle emission factors and vehicle fleet mix for 2030, as based on CARB's EMFAC2017 model, were used to estimate emissions associated with vehicular sources. Consistent with Measure T-2 of the City's CAP, 5% of the proposed parking spaces (14) were assumed to be EV charging stations.

Solid Waste

The land use built under the existing land use designation would generate solid waste and therefore would result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values were used to estimate GHG emissions associated with solid waste.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the land use built under the existing land use designation require the use of electricity, which result in associated indirect GHG emissions. Similarly, wastewater generated by the land use built under the existing land use designation requires the use of electricity for conveyance and treatment, along with GHG emissions generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use relied on CalEEMod default assumptions.

Proposed Project

CalEEMod Version 2020.4.0 was used to estimate potential project-generated operational GHG emissions from vehicular sources, area sources (natural gas combustion and landscape maintenance), electrical generation (including electrical generation associated with water supply and wastewater treatment), and solid waste.

Emissions from each category—area sources, energy sources, mobile sources, solid waste, and water supply and wastewater treatment—are discussed in the following text with respect to the project. For additional details, see Section 2.4.2.2, Operation, for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (natural gas), and mobile sources. Consistent with Appendix D of the City's CAP, Operational Year 2030 was assumed consistent with the CAP horizon year (City of San Marcos 2013b).

Area Sources

CalEEMod was used to estimate GHG emissions from the project's area sources, which include operation of gasoline-powered landscape maintenance equipment, which produce minimal GHG emissions. See Section 2.4.2.2 for a discussion of landscaping equipment emissions calculations. Consumer product use and architectural coatings result in VOC emissions, which are analyzed in air quality analysis only, and little to no GHG emissions. No wood hearths or stoves would be included in the project design; therefore, they were not included in the CalEEMod analysis. It should be noted that CalEEMod 2020.4.0 does not account for the recent SORE regulations and thus is considered conservative.

Energy Sources

Operational GHG emissions from energy sources would include natural gas combustion for appliances and space heating. The current Title 24, Part 6 standards, referred to as the 2019 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2020. The current version of CalEEMod assumes compliance with the 2019 Title 24 Building Energy Efficiency Standards (CAPCOA 2021). This is conservative and does not reflect the building standards in 2030 as building standards decrease energy use over time.

CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kilowatt hour) for SDG&E are based on the value for SDG&E's energy mix in 2021. As explained in Section 3.2.2, SB X1-2 established a target of 33% from renewable energy sources for all electricity providers in California by 2020, and SB 350 calls for further development of renewable energy, with a target of 50% by 2030. SB 100 updated this goal with a 60% renewable energy target by 2030. Consistent with the City's CAP, the GHG intensity for 2030 was assumed to be 44 pounds per megawatt-hour for SDG&E (City of San Marcos 2020).

As discussed in Section 2.4.2.2, the project would include alternatively fueled water heaters in accordance with the City's CAP Measure E-1. When using the CAP's GHG reduction methodology as shown in Appendix A, the net GHG reduction (emissions avoided from natural gas minus emissions from electricity) would be 84 MT CO_2e per year. However, this exceeds the total GHG emissions from natural gas from the project as estimated in CalEEMod. Therefore, using the Energy Information Administration's estimate of 46% of residential natural gas use being attributed to water heating, this amount was applied to the CalEEMod GHG estimate to account for the reduction from alternatively fueled water heaters (EIA 2015).

Mobile Sources (Motor Vehicles)

CalEEMod was used to estimate mobile source emissions from the project. See Section 2.4.2.2 for a discussion of mobile source emissions calculations. The operational year was adjusted to 2030 consistent with the City's CAP Guidance Appendix D (City of San Marcos 2020).

Solid Waste

The project would generate solid waste and therefore would result in CO_2e emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste.

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the project requires the use of electricity for conveyance and treatment, along with GHG emissions generated during wastewater treatment. Water consumption estimates for both indoor and outdoor water use and associated electricity consumption from water use and wastewater generation were estimated using CalEEMod default values. The project is designed to include low-flow fixtures and water-efficient irrigation systems consistent with CAP measure W-1.

3.4 Impact Analysis

This section evaluates the GHG emissions impacts associated with the project. The significance criteria described in Section 3.3.1, Thresholds of Significance, were used to evaluate impacts associated with the construction and operation of the project.

Threshold 1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold 2: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

City of San Marcos' Climate Action Plan Consistency

This section first presents a comparison of the existing land use designation GHG emissions and compares them to the projects. This section then evaluates the proposed project's impacts to GHG in accordance with the City's 2020 CAP Consistency Checklist. As discussed in Section 3.3.1, the City's numerical GHG threshold of 2.1 MT/SP/yr is used to evaluate the projects consistency with the City's CAP and determine its impact with respect to GHG emissions. The projects construction and operational GHG emissions are quantified below in accordance with the methodology presented in Section 3.3.2 and compared to the City's threshold.

Existing Land Use Designation

Construction Emissions

Construction of the existing land use designation would result in GHG emissions that are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. CalEEMod was used to calculate the GHG emissions based on the construction scenario described in Section 3.3.2.1, Construction, and Appendix A. Construction of the existing land use designation is anticipated to commence in December 2023, lasting a total of approximately 11 months. On-site sources of GHG emissions include off-road equipment and off-

site sources include on-road vehicles (haul trucks, vendor trucks, and worker vehicles). Table 13 presents construction emissions for the existing land use designation from on-site and off-site emission sources.

Table 13. Estimated Annual Construction GHG Emissions – Existing Land Use Designation

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2023	33.41	0.01	0.00	33.76
2024	402.57	0.07	0.01	407.95
			Total	441.71
			Emissions amortized over 30 years	14.72

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for complete results.

As shown in Table 13, the estimated total GHG emissions during construction of the existing land use designation would be approximately 442 MT CO_2e. Construction GHG emissions of the existing land use designation amortized over 30 years would be 15 MT CO_2e per year. Amortized construction emissions are added to operational emissions to be compared to the proposed project for this assessment.

Operational Emissions

Operation of the existing land use designation would generate GHG emissions through area sources; motor vehicle trips to and from the project site; energy use (natural gas and generation of electricity consumed by the existing land use designation); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. CalEEMod was used to calculate the annual GHG emissions based on the operational assumptions described in Section 3.3.2.2, Operation. The estimated operational emissions of the existing land use designation are presented in Table 14.

Table 14. Estimated Annual Operational GHG Emissions – Existing Land Use Designation

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
Area	0.01	0.00	0.00	0.01
Energy	167.08	0.00	0.00	167.78
Mobile[1]	3,181.44	0.31	0.19	3,245.70
Waste	84.43	4.99	0.00	209.18
Water	6.47	0.33	0.01	17.10
			Total	3,639.77
			Amortized construction emissions	14.72
			Total with amortized construction emissions	3,654.49

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
[1] Mobile emissions include reductions from EV charging stations.
See Appendix A for complete results.

As shown in Table 14, estimated annual GHG emissions from the existing land use designation would be approximately 3,640 MT CO_2e per year. With amortized construction emissions, the annual operational emissions would be 3,655 MT CO_2e per year.

Proposed Project

Construction Emissions

Construction of the proposed project would result in GHG emissions that are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. Table 15 presents construction emissions for the proposed project from construction-related sources.

Table 15. Estimated Annual Construction GHG Emissions – Proposed Project

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2023	57.99	0.02	0.00	58.49
2024	549.96	0.06	0.02	558.00
2025	66.17	0.01	0.00	67.14
			Total	683.63
			Emissions amortized over 30 years	22.79

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for complete results.

As shown in Table 15, the estimated total GHG emissions during construction of the proposed project would be approximately 684 MT CO_2e. Construction GHG emissions amortized over 30 years would be 23 MT CO_2e per year. Amortized construction emissions are added to operational emissions to be compared to the City's threshold.

Operational Emissions

Operation of the proposed project would generate GHG emissions through area sources; motor vehicle trips to and from the project site; energy use (natural gas and generation of electricity consumed by the project); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. The estimated operational emissions of the proposed project are presented in Table 16.

Table 16. Estimated Annual Operational GHG Emissions – Proposed Project

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
Area	1.46	0.00	0.00	1.49
Energy	36.62	0.00	0.00	36.77
Mobile[1]	517.81	0.04	0.03	526.46
Waste	11.26	0.67	0.00	27.91
Water	5.48	0.20	0.00	12.01

Table 16. Estimated Annual Operational GHG Emissions – Proposed Project

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
Total				604.64
Amortized construction emissions				22.79
Total with amortized construction emissions				627.43

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for complete results.
[1] Includes reduction from EV chargers as discussed in Section 2.4.2.2.

As shown in Table 16, estimated annual GHG emissions from the proposed project would be approximately 605 MT CO_2e per year. With amortized construction emissions, the annual operational emissions would be 627 MT CO_2e per year. This would be less than the existing designated land use estimate of 3,655 MT CO_2e per year.

Service Population

Using the land use by Master Geographic Reference Area (MGRA) file obtained from the SANDAG activity based reginal travel demand model, the number of multi-family households and corresponding household population within the City of San Marcos was reviewed. The values for the base year (2016) of the 2021 Regional Plan and the Series 14 land use forecast were used. It was found that the average household size for multi-family households in San Marcos is approximately 3.4 (SANDAG 2022). Using this household ratio of 3.4, development of 120 residential dwelling units at the project site would generate approximately 408 people.

Summary

As outlined above, the proposed project would result in an estimated 627 MT CO_2e per year, including amortized construction GHG emissions. With an estimated service population of 408 persons, the project would result in 1.5 MT CO_2e/SP/yr. The project would result in GHG emissions that would not exceed the City's significance threshold of 2.1 MT CO_2e/SP/yr. Therefore, implementation of the proposed project would be consistent with the City's 2020 CAP and impacts to GHG emissions would be **less than significant**.

Consistency with Statewide Greenhouse Gas Reduction Strategies

The project's consistency with statewide GHG reduction strategies is summarized in detail in Table 17 through consideration of the project's various construction and operational components and their relationship to specified laws and regulations designed to reduce GHG emissions from such components.

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
Building Components/Facility Operations		
Roofs/Ceilings/Insulation	CALGreen Code (Title 24, Part 11)	The proposed project must comply with efficiency standards regarding roofing, ceilings, and insulation. For

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
	California Energy Code (Title 24, Part 6)	example: Roofs/Ceilings: New construction must reduce roof heat island effects per CALGreen Code Section 106.11.2, which requires use of roofing materials having a minimum aged solar reflectance, thermal emittance complying with Section A5.106.11.2.2 and A5.106.11.2.3 or a minimum aged Solar Reflectance Index as specified in Tables A5.106.11.2.2, or A5.106.11.2.3. Roofing materials must also meet solar reflectance and thermal emittance standards contained in Title 20 Standards. Roof/Ceiling Insulation: There are also requirements for the installation of roofing and ceiling insulation. (See Title 24, Part 6 Compliance Manual at Section 3.2.2.)
Flooring	CALGreen Code	The proposed project must comply with efficiency standards regarding flooring materials. For example, for 80% of floor area receiving "resilient flooring," the flooring must meet applicable installation and material requirements contained in CALGreen Code Section 5.504.4.6.
Window and Doors (Fenestration)	California Energy Code	The proposed project must comply with fenestration efficiency requirements. For example, the choice of windows, glazed doors, and any skylights for the project must conform to energy consumption requirements affecting size, orientation, and types of fenestration products used. (See Title 24, Part 6 Compliance Manual, Section 3.3.)
Building Walls/Insulation	CALGreen Code California Energy Code	The proposed project must comply with efficiency requirements for building walls and insulation. Exterior Walls: Must meet requirements in current edition of California Energy Code, and comply with Sections A5.106.7.1 or A5.106.7.2 of CALGreen Code for wall surfaces, as well as Section 5.407.1, which required weather-resistant exterior wall and foundation envelope as required by California Building Code Section 1403.2. Construction must also meet requirements contained in Title 24, Part 6, which vary by material of the exterior walls. (See Title 24, Part 6 Compliance Manual, Part 3.2.3.) Demising (Interior) Walls: Mandatory insulation requirements for demising walls (which separate conditioned from non-conditions space) differ by the type of wall material used. (*Id*. at 3.2.4.) Door Insulation: There are mandatory requirements for air infiltration rates to improve insulation efficiency; they

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		differ according to the type of door. (*Id*. at 3.2.5.) Flooring Insulation: There are mandatory requirements for insulation that depend on the material and location of the flooring. (*Id*. at 3.2.6.)
Finish Materials	CALGreen Code	The proposed project must comply with pollutant control requirements for finish materials. For example, materials including adhesives, sealants, caulks, paints and coatings, carpet systems, and composite wood products must meet requirements in CALGreen Code to ensure pollutant control. (CALGreen Code Section 5.504.4.)
Wet Appliances (Toilets/Faucets/Urinals, Dishwasher/Clothes Washer, Spa and Pool/Water Heater)	CALGreen Code California Energy Code Appliance Efficiency Regulations (Title 20 Standards)	Wet appliances associated with the proposed project must meet various efficiency requirements. For example: Spa and Pool: Use associated with the project is subject to appliance efficiency requirements for service water heating systems and equipment, spa and pool heating systems and equipment. (Title 24, Part 6, Sections 110.3, 110.4, 110.5; Title 20 Standards, Sections 1605.1(g), 1605.3(g); see also California Energy Code.) Toilets/Faucets/Urinals: Use associated with the project is subject to new maximum rates for toilets, urinals, and faucets effective January 1, 2016: ▪ Showerheads maximum flow rate 2.5 gpm at 80 psi ▪ Wash fountains 2.2 x (rim space in inches/20) gpm at 60 psi ▪ Metering faucets 0.25 gallons/cycle ▪ Lavatory faucets and aerators 1.2 gpm at 60 psi ▪ Kitchen faucets and aerators 1.8 gpm with optional temporary flow of 2.2 gpm at 60 psi ▪ Public lavatory faucets 0.5 gpm at 60 psi ▪ Trough-type urinals 16 inches length ▪ Wall mounted urinals 0.125 gallons per flush ▪ Other urinals 0.5 gallons per flush (Title 20 Standards, Sections 1605.1(h),(i) 1065.3(h),(i).) Water Heaters: Use associated with the project is subject to appliance efficiency requirements for water heaters. (Title 20 Standards, Sections 1605.1(f), 1605.3(f).) Dishwasher/Clothes Washer: Use associated with the project is subject to appliance efficiency requirements for dishwashers and clothes washers. (Title 20 Standards, Sections 1605.1(o),(p),(q), 1605.3(o),(p),(q).)
Dry Appliances (Refrigerator/Freezer, Heater/ Air Conditioner, Clothes Dryer)	Title 20 Standards CALGreen Code	Dry appliances associated with the proposed project must meet various efficiency requirements. For example: Refrigerator/Freezer: Use associated with the proposed

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		project is subject to appliance efficiency requirements for refrigerators and freezers. (Title 20 Standards, Sections 1605.1(a), 1605.3(a).) Heater/Air Conditioner: Use associated with the proposed project is subject to appliance efficiency requirements for heaters and air conditioners. (Title 20 Standards, Sections 1605.1(b),(c),(d),(e), 1605.3(b),(c),(d),(e) as applicable.) Clothes Dryer: Use associated with the proposed project is subject to appliance efficiency requirements for clothes dryers. (Title 20 Standards, Section 1605.1(q).)
	CALGreen Code	Installations of HVAC, refrigeration and fire suppression equipment must comply with CALGreen Code Sections 5.508.1.1 and 508.1.2, which prohibits CFCs, halons, and certain HCFCs and HFCs.
Lighting	Title 20 Standards	Lighting associated with the proposed project will be subject to energy efficiency requirements contained in Title 20 Standards. General Lighting: Indoor and outdoor lighting associated with the proposed project must comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1(j),(k),(n), 1605.3(j),(k),(n).) Emergency lighting and self-contained lighting: the proposes project must also comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1(l), 1605.3(l).) Traffic Signal Lighting: For any necessary proposed project improvements involving traffic lighting, traffic signal modules and traffic signal lamps will need to comply with applicable appliance efficiency regulations (Title 20 Standards, Sections 1605.1(m), 1605.3(m).)
	California Energy Code	Lighting associated with a use implementing the proposed project will also be subject to energy efficiency requirements contained in Title 24, Part 6, which contains energy standards for non-residential indoor lighting and outdoor lighting. (See Title 24 Part 6 Compliance Manual, at Sections 5, 6.) Mandatory lighting controls for indoor lighting include, for example, regulations for automatic shut-off, automatic daytime controls, demand responsive controls, and certificates of installation. (Id. at Section 5.) Regulations for outdoor lighting include, for example, creation of lighting zones, lighting power requirements, a hardscape lighting power allowance, requirements for outdoor

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		incandescent and luminaire lighting, and lighting control functionality. (Id. at Section 6.)
	AB 1109	Lighting associated with implementing the proposed project will be subject to energy efficiency requirements adopted pursuant to AB 1109. Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general purpose lighting, to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.
Bicycle and Vehicle Parking	CALGreen Code	A use implementing the proposed project will be required to provide compliant bicycle parking, fuel-efficient vehicle parking, and electric vehicle charging spaces (CALGreen Code Sections 5.106.4, 5.106.5.1, 5.106.5.3)
	California Energy Code	The proposed project is also subject to parking requirements contained in Title 24, Party 6. For example, parking capacity is to meet but not exceed minimum local zoning requirements, and the project should employ approved strategies to reduce parking capacity (Title 24, Part 6, section 106.6)
Landscaping	CALGreen Code	The CALGreen Code requires and has further voluntary provisions for: ▪ -A water budget for landscape irrigation use; ▪ For new water service, separate meters or submeters must be installed for indoor and outdoor potable water use for landscaped areas of 1,000-5,000 square feet; ▪ -Provide water-efficient landscape design that reduces use of potable water beyond initial requirements for plant installation and establishment
	Model Water Efficient Landscaping Ordinance	The model ordinance promotes efficient landscaping in new developments and establishes an outdoor water budget for new and renovated landscaped areas that are 500 square feet or larger. (CCR, Title 23, Division 2, Chapter 2.7.)
	Cap-and-Trade Program	Transportation fuels used in landscape maintenance equipment (e.g., gasoline) would be subject to the Cap-and-Trade Program. Fuel refineries and suppliers are subject to the Cap-and-Trade requirements. (See “Energy Use,” below.)
Refrigerants	CARB Management of High GWP	Any refrigerants associated with the project will be subject to CARB standards. CARB’s Regulation for the Management of High GWP Refrigerants for Stationary Sources 1) reduces

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
	Refrigerants for Stationary Sources	emissions of high-GWP refrigerants from leaky stationary, non-residential refrigeration equipment; 2) reduces emissions resulting from the installation and servicing of stationary refrigeration and air conditioning appliances using high-GWP refrigerants; and 3) requires verification GHG emission reductions. (CCR, Title 17, Division 3, Chapter 1, Subchapter 10, Article 4, Subarticle 5.1, Section 95380 et seq.)
Consumer Products	CARB High GWP GHGs in Consumer Products	All consumer products associated with the project will be subject to CARB standards. CARB's consumer products regulations set VOC limits for numerous categories of consumer products, and limits the reactivity of the ingredients used in numerous categories of aerosol coating products (CCR, Title 17, Division 3, Chapter 1, Subchapter 8.5.)
Construction		
Use of Off-Road Diesel Engines, Vehicles, and Equipment	CARB In-Use Off-Road Diesel Vehicle Regulation	Any relevant vehicle or machine use associated with the project will be subject to CARB standards. The CARB In-Use-Off-Road Diesel Vehicle Regulation applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulation: 1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; 2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; 3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and 4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits). The requirements and compliance dates of the Off-Road regulation vary by fleet size, as defined by the regulation.
	Cap-and-Trade Program	Transportation fuels (e.g., gasoline) used in equipment operation would be subject to the Cap-and-Trade Program. Fuel refineries and suppliers are subject to the Cap-and-Trade requirements. (See "Energy Use," below.)
Greening New Construction	CALGreen Code	All new construction must comply with CALGreen Code, as discussed in more detail throughout this table. Adoption of the mandatory CALGreen Code standards for construction has been essential for improving the overall environmental performance of new buildings; it also sets voluntary targets for builders to exceed the mandatory requirements.
Construction Waste	CALGreen Code	The proposed project will be subject to CALGreen Code requirements for construction waste reduction, disposal,

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		and recycling, such as a requirement to recycle and/or salvage for reuse a minimum of 50% of the non-hazardous construction waste in accordance with Section 5.408.1.1, 5.408.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent.
Solid Waste		
Solid Waste Management	Landfill Methane Control Measure	Waste associated with a use implementing the proposed project will be disposed per state requirements for landfills, material recovery facilities, and transfer stations. Per the statewide GHG emissions inventory, the largest emissions from waste management sectors come from landfills, and are in the form of CH_4. In 2010, CARB adopted a regulation that reduces emissions from methane in landfills, primarily by requiring owners and operators of certain uncontrolled municipal solid waste landfills to install gas collection and control systems, and requires existing and newly installed gas and control systems to operate in an optimal manner. The regulation allows local air districts to voluntarily enter into a memorandum of understanding with CARB to implement and enforce the regulation and to assess fees to cover costs of implementation.
	Mandatory Commercial Recycling (AB 341)	AB 341 will require a use implementing the proposed project, if it generates four cubic yards or more of commercial solid waste per week, to arrange for recycling services, using one of the following: self-haul; subscribe to a hauler(s); arranging for pickup of recyclable materials; subscribing to a recycling service that may include mixed waste processing that yields diversion results comparable to source separation. The project will also be subject to local commercial solid waste recycling program required to be implemented by each jurisdiction under AB 341.
	CALGreen Code	The proposed project will be subject to CALGreen Code requirement to provide areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling (CALGreen Code Section 5.410.1)
Energy Use		
Electricity/Natural Gas Generation	Cap-and-Trade Program	Electricity and natural gas generated and/or imported into the state which may be used for the proposed project will be subject to the Cap-and-Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants.

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade Program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, reformulated gasoline blendstock for oxygenate blending (RBOB), distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 metric tons or more of CO_2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.
Renewable Energy	California RPS (SB X1-2, SB 350, and SB 100)	Energy providers to the proposed project will be required to comply with RPS set by SB X1 2, SB 350, and SB 100. SB X1 2 requires investor-owned utilities, publicly-owned utilities, and electric service providers to increase purchases of renewable energy such that at least 33% of retail sales are procured from renewable energy resources by December 31, 2020. In the interim, each entity was required to procure an average of 20% of renewable energy for the period of January 1, 2011 through December 31, 2013; and will be required to procure an average of 25% by December 31, 2016, and 33% by 2020. SB 350 requires retail sellers and publicly owned utilities to procure 50% of their electricity from eligible renewable energy resources by 2030. SB 100 increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California by 2045.
	Million Solar Roofs Program (SB 1)	The project will participate in California's energy market by pre-wiring roofs for future installation of solar, which is affected by implementation of the Million Solar Roofs Program. As part of Governor Schwarzenegger's Million Solar Roofs

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		Program, California has set a goal to install 3,000 megawatts of new, solar capacity through 2016. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time.
	California Solar Initiative- Thermal Program	The proposed project will derive energy from California's energy market, which is affected by implementation of the California Solar Initiative -Thermal Program. The program offers cash rebates of up to $4,366 on solar water heating systems for single-family residential customers. Multifamily and Commercial properties qualify for rebates of up to $800,000 on solar water heating systems and eligible solar pool heating systems qualify for rebates of up to $500,000. Funding for the California Solar Initiative-Thermal program comes from ratepayers of Pacific Gas & Electric, SCE, Southern California Gas Company, and San Diego Gas & Electric. The rebate program is overseen by the CPUC as part of the California Solar Initiative.
	Waste Heat and Carbon Emissions Reduction Act (AB 1613, AB 2791)	The proposed project will derive energy from California's energy market, which is affected by implementation of the Waste Heat and Carbon Emissions Reduction Act. Originally enacted in 2007 and amended in 2008, this act directed the CEC, CPUC, and CARB to implement a program that would encourage the development of new combined heat and power systems in California with a generating capacity of not more than 20 megawatts, to increase combined heat and power use by 30,000 gigawatt-hour. The CPUC publicly owned electric utilities, and CEC duly established policies and procedures for the purchase of electricity from eligible combined heat and power systems. CEC guidelines require combined heat and power systems to be designed to reduce waste energy; have a minimum efficiency of 60%; have NO_x emissions of no more than 0.07 pounds per megawatt-hour; be sized to meet eligible customer generation thermal load; operate continuously in a manner that meets expected thermal load and optimizes efficient use of waste heat; and be cost effective, technologically feasible, and environmentally beneficial.
Vehicular/Mobile Sources		
General	SB 375 and SANDAG RTP/SCS	The proposed project complies with, and is subject to, the SANDAG adopted RTP/SCS, which CARB approved as meeting its regional GHG targets in 2016. The most recent plan was adopted in December 2021, but CARB

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		has not accepted it as of this writing. See discussion below.
Fuel	Low Carbon Fuel Standard (LCFS)/ EO S-01-07	Auto trips associated with the proposed project will be subject to LCFS (EO S-01-07), which requires a 20% or greater reduction in the average fuel carbon intensity by 2030 with a 2010 baseline for transportation fuels in California regulated by CARB. The program establishes a strong framework to promote the low carbon fuel adoption necessary to achieve statewide GHG reduction goals.
	Cap-and-Trade Program	Gasoline used for proposed project implementation will be subject to the Cap-and-Trade Program. The rules came into effect on January 1, 2013, applying to large electric power plants and large industrial plants. In 2015, importers and distributors of fossil fuels were added to the Cap-and-Trade Program in the second phase. Specifically, on January 1, 2015, cap-and-trade compliance obligations were phased in for suppliers of natural gas, RBOB, distillate fuel oils, and liquefied petroleum gas that meet or exceed specified emissions thresholds. The threshold that triggers a cap-and-trade compliance obligation for a fuel supplier is 25,000 MT or more of CO_2e annually from the GHG emissions that would result from full combustion or oxidation of quantities of fuels (including natural gas, RBOB, distillate fuel oil, liquefied petroleum gas, and blended fuels that contain these fuels) imported and/or delivered to California.
Light-Duty Vehicles	AB 1493 (or the Pavley Standard)	Cars that drive to and from the proposed project will be subject to AB 1493, which directed CARB to adopt a regulation requiring the maximum feasible and cost-effective reduction of GHG emissions from new passenger vehicles. Pursuant to AB 1493, CARB adopted regulations that establish a declining fleet average standard for CO_2, CH_4, N_2O, and HFCs (air conditioner refrigerants) in new passenger vehicles and light-duty trucks beginning with the 2009 model year and phased-in through the 2016 model year. These standards are divided into those applicable to lighter and those applicable to heavier portions of the passenger vehicle fleet. The regulations will reduce “upstream” smog-forming emissions from refining, marketing, and distribution of fuel.

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
	Advanced Clean Car and ZEV Programs	Cars that drive to and from the proposed project will be subject to the Advanced Clean Car and ZEV Programs. In January 2012, CARB approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards called Advanced Clean Cars. By 2025, new automobiles will emit 34% fewer global warming gases and 75% fewer smog-forming emissions. The ZEV program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018-2025 model years.
	Tire Inflation Regulation	Cars that drive to and from the proposed project will be subject to the CARB Tire Inflation Regulation, which took effect on September 1, 2010, and applies to vehicles with a gross vehicle weight rating of 10,000 pounds or less. Under this regulation, automotive service providers must, inter alia, check and inflate each vehicle's tires to the recommended tire pressure rating, with air or nitrogen, as appropriate, at the time of performing any automotive maintenance or repair service, and to keep a copy of the service invoice for a minimum of three years, and make the vehicle service invoice available to the CARB, or its authorized representative upon request.
	EPA and NHTSA GHG and CAFE Standards	Mobile sources that travel to and from the proposed project would be subject to EPA and NHTSA GHG and CAFE standards for passenger cars, light-duty trucks, and medium-duty passenger vehicles. (75 FR 25324–25728 and 77 FR 62624–63200.)
Water Use		
Water Use Efficiency	Emergency State Water Board Regulations	Water use associated with the proposed project will be subject to emergency regulations. On May 18, 2016, partially in response to EO B-27-16, the State Water Board adopted emergency water use regulations (CCR, title 23, Section 864.5 and amended and re-adopted Sections 863, 864, 865, and 866). The regulation directs the State Water Board, Department of Water Resources, and CPUC to implement rates and pricing structures to incentivize water conservation, and calls upon

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
		water suppliers, homeowners' associations, California businesses, landlords and tenants, and wholesale water agencies to take stronger conservation measures.
	EO B-37-16	Water use associated with the proposed project will be subject to Emergency EO B-37-16, issued May 9, 2016, which directs the State Water Resources Control Board to adjust emergency water conservation regulations through the end of January, 2017 to reflect differing water supply conditions across the state. The Water Board must also develop a proposal to achieve a mandatory reduction of potable urban water usage that builds off the mandatory 25% reduction called for in EO B-29-15. The Water Board and Department of Water Resources will develop new, permanent water use targets to which the project will be subject. The Water Board will permanently prohibit water-wasting practices such as hosing off sidewalks, driveways, and other hardscapes; washing automobiles with hoses not equipped with a shut-off nozzle; using non-recirculated water in a fountain or other decorative water feature; watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation; and irrigating ornamental turf on public street medians.
	EO B-40-17	EO B-40-17 lifted the drought emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne. It also rescinds EO B-29-15, but expressly states that EO B-37-16 remains in effect and directs the State Water Resources Control Board to continue development of permanent prohibitions on wasteful water use to which the proposed project will be subject.
	SB X7-7	Water provided to the proposed project will be affected by SB X7-7's requirements for water suppliers. SB X7-7, or the Water Conservation Act of 2009, requires all water suppliers to increase water use efficiency. It also requires, among other things, that the Department of Water Resources, in consultation with other state agencies, develop a single standardized water use reporting form, which would be used by both urban and agricultural water agencies.
	CALGreen Code	The proposed project is subject to CALGreen Code's water efficiency standards, including a required 20% mandatory reduction in indoor water use. (CALGreen Code, Division 4.3.)
	California Water	Development and approval of the proposed project

Table 17. Relevant Greenhouse Gas-Related Laws and Regulations

Project Component	Applicable Laws/ Regulations	GHG Reduction Measures Required for Project
	Code, Division 6, Part 2.10, Sections 10910–10915.	would require the development of a project-specific Water Supply Assessment assessing the projects water demand and its inclusion within the City's urban water management plan.
	Cap-and-Trade Program	Electricity usage associated with water and wastewater supply, treatment and distribution would be subject to the Cap-and-Trade Program.
	California RPS (SB X1-2, SB 350, SB 100)	Electricity usage associated with water and wastewater supply, treatment and distribution associated with the project will be required to comply with RPS set by SB X1-2, SB 350, and SB 100.

Notes: AB = Assembly Bill; CARB = California Air Resources Board; CEC = California Energy Commission; CFC = chlorofluorocarbon; CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; CPUC = California Public Utilities Commission; EO = Executive Order; EPA = Environmental Protection Agency; GHG = greenhouse gas; GWP = global warming potential; HCFC = hydrochlorofluorocarbon; HFC = hydrofluorocarbon; gpm = gallons per minute; MT = metric tons; N_2O = nitrous oxide; NHTSA = National Highway Traffic Safety Administration; PM = particulate matter; RPS = Renewable Portfolio Standard; RTP/SCS = Regional Transportation Plan/Sustainable Communities Strategy; SB = Senate Bill; SANDAG = San Diego Association of Governments; VOC = volatile organic compound; ZEV = zero emission vehicle

As shown, the project would be consistent with and would not conflict with the applicable GHG-reducing strategies of the state that implicate the project's construction and operational components.

In addition, CARB notes in the First Update that "California is on track to meet the near-term 2020 GHG limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). The project would help support achievement of the near-term 2020 goal (as codified in AB 32), the interim 2030 goal (as codified in SB 32) and the long-term, carbon neutrality 2045 goal (as set forth in EO B-55-18) by being infill development with access to multi-modal transportation options and incorporating design features such as electric vehicle charging stations, bicycle infrastructure, transportation demand management, electric water heaters, smart landscaping irrigation, and an urban tree canopy.

Consistency with SANDAG's RTP/SCS

At the regional level, SANDAG's RTP/SCS has been adopted for the purpose of reducing GHG emissions attributable to passenger vehicles in the San Diego region. In December 2021, SANDAG adopted its RTP/SCS (The 2021 Regional Plan), which shows the San Diego region reduced per capita CO_2 emissions by 17.9% in 2020 compared to 2005 baseline, which exceeds the 2020 target set for SANDAG of 15% reduction. Implementation of the RTP/SCS is estimated to result in a 20% CO_2 emissions reduction for cars and light-duty trucks by 2035, exceeding the 19% target from 2005 levels set by CARB. The RTP/SCS does not regulate land use or supersede the exercise of land use authority by SANDAG's member jurisdictions, but it is a relevant regional reference document for purposes of evaluating the intersection of land use and transportation patterns and the corresponding GHG emissions.

For purposes of the RTP/SCS consistency evaluation, the proposed project would increase access to transit because it is located approximately 0.3 mile from the Palomar College Sprinter station, and two bus stops are

located in front of the project site off Mission Road.[9] The project site's proximity to State Route 78 further allows for easy regional connectivity to employment centers, shopping areas, and recreation opportunities. Furthermore, the project would be consistent with the City's CAP. These measures would further reduce the project's GHG emissions from vehicle trips, increase access to transit, and encourage alternative modes of transportation. The proposed density, land use type, and location are consistent with the SANDAG's RTP/SCS, which increases access to transit and promotes regional connectivity to employment centers, shopping areas, and recreation opportunities. The features mentioned above would help facilitate alternative transit usage and reduce the overall vehicle trips, thereby reducing the project's regional GHG emissions.

Based on the considerations outlined above, the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and potential impacts would be **less than significant** and no mitigation measure is required.

3.5 Mitigation Measures

The project would not result in significant impacts; therefore, no mitigation is required.

[9] The City uses the North County Transit District (NCTD) for Coaster rail service, Sprinter light rail service, and Breeze bus service for connections throughout the County of San Diego. Sprinter service operates between Escondido and Oceanside with connections to Interstate 5 and the Coaster rail service operating out of the City of Oceanside. The NCTD operates the Palomar College Sprinter, which is within a short walk from the project area. In addition, a bus stop is located in front of the project site. Connections to Orange County can be made via the Metrolink in the City of Oceanside. Similarly, connections to Riverside Transit Authority buses can be made via the transit station in Oceanside and Escondido. Both the Metrolink connection in Oceanside and the Riverside Transit Authority Bus connection in Oceanside and Escondido are accessible through Sprinter light rail service. These public transit options will offer residents of the project area quick access to a variety of alternative modes of transportation.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	2.14	Acre	2.14	93,218.40	0
Parking Lot	20.00	Space	0.18	8,000.00	0
City Park	3.40	Acre	3.40	148,104.00	0
Condo/Townhouse High Rise	120.00	Dwelling Unit	1.88	120,000.00	343

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	40
Climate Zone	13			**Operational Year**	2025
Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	539.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Based on site plan for project.

Construction Phase - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Trips and VMT - Based on applicant provided information.

Gran Vista Specific Plan - San Diego County APCD Air District, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

On-road Fugitive Dust - CalEEmod defaults.

Grading - CalEEmod defaults.

Architectural Coating - Low-VOC content coatings to be used onsite.

Vehicle Trips - Based on traffic assessment for project.

Road Dust - CalEEmod defaults.

Woodstoves - No wood or natural gas.

Consumer Products - CalEEmod defaults.

Area Coating - Low-VOC coatings to be used.

Landscape Equipment - CalEEmod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEmod defaults.

Solid Waste - CalEEmod defaults.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55. Applicant has committed to Tier 4 Interim equipment over 50 horsepower, electric under 50 horsepower.

Mobile Land Use Mitigation -

Area Mitigation - Low-VOC architectural coatings and no hearths.

Energy Mitigation - Energy star appliances

Water Mitigation - low-flow fixtures and water-efficient irrigation

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	2.14	Acre	2.14	93,218.40	0
Parking Lot	20.00	Space	0.18	8,000.00	0
City Park	3.40	Acre	3.40	148,104.00	0
Condo/Townhouse High Rise	120.00	Dwelling Unit	1.88	120,000.00	343

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	40
Climate Zone	13			**Operational Year**	2025
Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	539.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Based on site plan for project.

Construction Phase - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Trips and VMT - Based on applicant provided information.

Gran Vista Specific Plan - San Diego County APCD Air District, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

On-road Fugitive Dust - CalEEmod defaults.

Grading - CalEEmod defaults.

Architectural Coating - Low-VOC content coatings to be used onsite.

Vehicle Trips - Based on traffic assessment for project.

Road Dust - CalEEmod defaults.

Woodstoves - No wood or natural gas.

Consumer Products - CalEEmod defaults.

Area Coating - Low-VOC coatings to be used.

Landscape Equipment - CalEEmod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEmod defaults.

Solid Waste - CalEEmod defaults.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55. Applicant has committed to Tier 4 Interim equipment over 50 horsepower, electric under 50 horsepower.

Mobile Land Use Mitigation -

Area Mitigation - Low-VOC architectural coatings and no hearths.

Energy Mitigation - Energy star appliances

Water Mitigation - low-flow fixtures and water-efficient irrigation

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	1.99	Acre	1.99	86,684.40	0
Parking Lot	20.00	Space	0.18	8,000.00	0
City Park	3.55	Acre	3.55	154,638.00	0
Condo/Townhouse High Rise	120.00	Dwelling Unit	1.88	120,000.00	343

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	40
Climate Zone	13			**Operational Year**	2030
Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	44	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor based on 2030 projection in City of San Marcos CAP.

Land Use - Based on site plan for project.

Construction Phase - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Off-road Equipment - Based on applicant provided information.

Trips and VMT - Based on applicant provided information.

Gran Vista Specific Plan - 2030 CAP Buildout - San Diego County APCD Air District, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

On-road Fugitive Dust - CalEEmod defaults.

Grading - CalEEmod defaults.

Architectural Coating - Low-VOC content coatings to be used onsite.

Vehicle Trips - Based on traffic assessment for project and measures T-1 and T-18 from CAPCOA GHG Reduction Handbook.

Road Dust - CalEEmod defaults.

Woodstoves - No wood or natural gas.

Consumer Products - CalEEmod defaults.

Area Coating - Low-VOC coatings to be used.

Landscape Equipment - CalEEmod defaults.

Energy Use - Natural gas reduced by 46% to account for alternatively fueled water heaters. Electricity use for water heaters added.

Water And Wastewater - CalEEmod defaults.

Solid Waste - CalEEmod defaults.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55. Applicant has committed to Tier 4 Interim equipment over 50 horsepower, electric under 50 horsepower.

Mobile Land Use Mitigation -

Area Mitigation - Low-VOC architectural coatings and no hearths.

Energy Mitigation - Energy star appliances

Water Mitigation - low-flow fixtures and water-efficient irrigation

Stationary Sources - User Defined - Reductions based on CAP assumptions within Tables 25 of Appendix B to the City of San Marcos' CAP.

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Gran Vista Specific Plan - 2030 CAP Buildout - San Diego County APCD Air District, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

11.0 Vegetation

CAPCOA Final Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity, December 2021

T-1 Increase Residential Density

GHG Reduction Formula

$$A = \frac{B - C}{C} \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project VMT in study area	0–30.0	%	calculated
User Inputs				
B	Residential density of project development	[ ]	du/acre	user input
Constants, Assumptions, and Available Defaults				
C	Residential density of typical development	9.1	du/acre	Ewing et al. 2007
D	Elasticity of VMT with respect to residential density	-0.22	unitless	Stevens 2016

B = 120 units / 7.6 acres = 15.78947
A = -16.2%

T-18 Provide Pedestrian Network Improvement

GHG Reduction Formula

$$A = \left(\frac{C}{B} - 1\right) \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from household vehicle travel in plan/community	0–6.4	%	calculated
User Inputs				
B	Existing sidewalk length in study area	[ ]	miles	user input
C	Sidewalk length in study area with measure	[ ]	miles	user input
Constants, Assumptions, and Available Defaults				
D	Elasticity of household VMT with respect to the ratio of sidewalks-to-streets	-0.05	unitless	Frank et al. 2011

B 1.2
C 1.64

A = -1.8%

City of San Marcos CAP GHG Reductions

Table 25 of Appendix B to the City of San Marcos CAP

New Development Type	Projected Number of EVCSs in 2030	Annual San Marcos EV Miles due to the EVCSs in 2030 (miles per year)	2030 Emissions Reduction (MT CO2e)	2030 Emissions Reductions per EVCS[1] (MT CO2e)
Multi-Family	220	1519489	363	1.65
Commercial	234	8924491	2,130	9.10
		Total	2,493	

Note: [1] Emissions reductions per EVCS were calculated by dividing the 2030 Emissions Reductions by the Projected Number of EVCSs in 2030.

Project = 2 EVCS
GHG Reduction = 1.65 MT CO2e per EVCS
Project GHG Reduction = **3.3 MT CO2e**

Table 48 of Appendix B to the City of San Marcos CAP

Year	New Residential Water Heaters Added Annually	Total New Alternatively Fueld Water Heaters after 2022	Natural Gas Savings Per Alternatively-Fueled Water Heater (Therms/year)	Total Natual Gas Savings (Therms/year)	Natural Gas Emission Factor (MT CO2e/Therm)	Emission Reductions from Natural Gas Savings (MT CO2e)	Emission Reductions from Natural Gas Savings per Water Heater (MT CO2e)
2030	250	1800	133	239400	0.0054	1303	0.72

Note: [1] Emissions reductions per water heater were calculated by dividing the Emission Reductiosn from Natural Gas Savings by the New Residential Water Heaters Added Annually.

Project = 120 units
GHG Reduction = 0.72 MT CO2e per water heater
Project GHG Reduction = **86.4 MT CO2e**

Table 49 of Appendix B to the City of San Marcos CAP

Year	New Residential Water Heaters Added Annually	Total New Alternatively Fueld Water Heaters after 2022	Electricity Added Per Alternatively-Fueled Water Heater (kWh/year)	Total Electricity Use (kWh/year)	Electricity Emission Factor (lbs CO2e/MWh)	Emissions from Additional Electricity Use (MT CO2e)	Emissions from Additional Electricity Use per Water Heater (MT CO2e)
2030	250	1800	766	1378800	44	28	0.02

Project = 120 units
GHG Reduction = 0.02 MT CO2e per water heater
Project GHG Addition = **2.4 MT CO2e**

Project Net GHG Reduction = **84 MT CO2e**

Existing Land Use Designation

Table 25 of Appendix B to the City of San Marcos CAP

New Development Type	Projected Number of EVCSs in 2030	Annual San Marcos EV Miles due to the EVCSs in 2030 (miles per year)	2030 Emissions Reduction (MT CO2e)	2030 Emissions Reductions per EVCS[1] (MT CO2e)
Multi-Family	220	1519489	363	1.65
Commercial	234	8924491	2,130	9.10
		Total	2,493	

Note: [1] Emissions reductions per EVCS were calculated by dividing the 2030 Emissions Reductions by the Projected Number of EVCSs in 2030.

Existing Land Use Designation = 14 EVCS
GHG Reduction = 1.65 MT CO2e per EVCS
Total GHG Reduction = **23.1 MT CO2e**

NREL
NATIONAL RENEWABLE ENERGY LABORATORY

Caution: Photovoltaic system performance predictions calculated by PVWatts® include many inherent assumptions and uncertainties and do not reflect variations between PV technologies nor site-specific characteristics except as represented by PVWatts® inputs. For example, PV modules with better performance are not differentiated within PVWatts® from lesser performing modules. Both NREL and private companies provide more sophisticated PV modeling tools (such as the System Advisor Model at https://sam.nrel.gov) that allow for more precise and complex modeling of PV systems.

The expected range is based on 30 years of actual weather data at the given location and is intended to provide an indication of the variation you might see. For more information, please refer to this NREL report: The Error Report.

Disclaimer: The PVWatts® Model ("Model") is provided by the National Renewable Energy Laboratory ("NREL"), which is operated by the Alliance for Sustainable Energy, LLC ("Alliance") for the U.S. Department Of Energy ("DOE") and may be used for any purpose whatsoever.

The names DOE/NREL/ALLIANCE shall not be used in any representation, advertising, publicity or other manner whatsoever to endorse or promote any entity that adopts or uses the Model. DOE/NREL/ALLIANCE shall not provide any support, consulting, training or assistance of any kind with regard to the use of the Model or any updates, revisions or new versions of the Model.

YOU AGREE TO INDEMNIFY DOE/NREL/ALLIANCE, AND ITS AFFILIATES, OFFICERS, AGENTS, AND EMPLOYEES AGAINST ANY CLAIM OR DEMAND, INCLUDING REASONABLE ATTORNEYS' FEES, RELATED TO YOUR USE, RELIANCE, OR ADOPTION OF THE MODEL FOR ANY PURPOSE WHATSOEVER. THE MODEL IS PROVIDED BY DOE/NREL/ALLIANCE 'AS IS' AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE EXPRESSLY DISCLAIMED. IN NO EVENT SHALL DOE/NREL/ALLIANCE BE LIABLE FOR ANY SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER, INCLUDING BUT NOT LIMITED TO CLAIMS ASSOCIATED WITH THE LOSS OF DATA OR PROFITS, WHICH MAY RESULT FROM ANY ACTION IN CONTRACT, NEGLIGENCE OR OTHER TORTIOUS CLAIM THAT ARISES OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THE MODEL.

The energy output range is based on analysis of 30 years of historical weather data, and is intended to provide an indication of the possible interannual variability in generation for a Fixed (open rack) PV system at this location.

RESULTS

308,503 kWh/Year*

System output may range from 296,533 to 310,447 kWh per year near this location.

- - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.
```

```
 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

 **Other Options Specified:
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    188 Source(s);       1 Source Group(s); and    2996
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    188 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    60.96 ;  Decay
```

Coef. =   0.000   ; Rot. Angle =   0.0
                  Emission Units = GRAMS/SEC   ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =   4.0 MB of RAM.

 **Input Runstream File: aermod.inp

 **Output Print File: aermod.out

 **Detailed Error/Message File: Gran Vista.err

 **File for Summary of Results: Gran Vista.sum
