North Rose Avenue is located immediately adjacent to the northwestern Site boundary. The area across North Rose Avenue from the Site is largely developed in residential land use except for the water production well and water storage tank facility owned and operated by the Vineyard Avenue Estates Water Mutual Company at the corner of North Rose Avenue and Corsicana Drive (Kadah 2020). The groundwater production well (OH Well # 14), owned and operated by the United Water Conservation District (UWCD), is located immediately adjacent to the southwest corner of the Site (Kadah 2020). Rio del Valle Middle School is located adjacent to southwest Site boundary. The areas northeast and southeast of the Site are being used for raspberry production by Reiter Affiliated Companies (Figure 2). The UWCD El Rio Spreading Grounds are located approximately 0.25 to 1.0 mile north of the Site on the northwest side of North Rose Avenue. Water is diverted from the Santa Clara River to the El Rio Spreading Grounds to recharge the underlying aquifers (refer to Section 3.3.1).

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING AND CONDITIONS

The Site is depicted on the Oxnard, California Quadrangle USGS 7.5-minute topographic series map (USGS 2018) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 14' 2.39" north, Longitude 119° 9' 10.61" west. The EDR report indicates that the Site elevation is approximately 97 feet amsl (EDR 2020).

3.1 REGIONAL GEOLOGY

The Site is located in Ventura County on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. This geomorphic province is distinguished by the prevailing east-west linear trend of its geologic structure and geomorphology in contrast to the predominant northwest-southeast trend of the geomorphic features within most other provinces of the state. The province is bounded by major faults, including the San Andreas Fault zone in the northeast, the Big Pine fault in the north and the Malibu Coast fault in the south. Most of the faults in Ventura County are reverse faults which dip north, including the Pine Mountain, Red Mountain, San Cayetano, Santa Susana, Simi, Ventura and Malibu Coast faults (Norris and Webb 1990).

The Ventura Basin is a large synclinal structure situated between the Santa Ynez Range and Topa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Department of Conservation, California Geologic Survey [CGS] 2002).

3.2 LOCAL GEOLOGY

Locally, the Site is situated in the Oxnard Plain sub-province. Lithologic units of sedimentary origin underlying the nearly flat Oxnard Plain are approximately 45,000 feet in thickness and consist of Upper Cretaceous, Tertiary, and Quaternary-age units which have been deposited on a pre-Upper Cretaceous base of igneous and/or metamorphic rock. Unconsolidated Holocene (last 11,000 years) sediments beneath the Site were deposited during the post-glacial period in marine, lagoonal, lacustrine, fluvial-flood plain, deltaic and eolian environments, including the pre-historic delta of the ancient Santa Clara River and Calleguas Creek and reach a depth of approximately 900 feet beneath the Oxnard Plain (Turner and Mukae 1975).

3.3 HYDROLOGY

3.3.1 Hydrogeology

The Site is situated at the eastern edge of the Oxnard Forebay Basin, a subbasin of the larger Santa Clara-Calleguas groundwater basin. The Oxnard Forebay Basin is an important groundwater recharge area for valuable resources of groundwater in aquifers underlying the Oxnard Plain. The unconsolidated sediments beneath the Oxnard Forebay Basin and the Site are composed of both continental and marine deposits of Tertiary and Quaternary age. They contain multiple aquifers of coarse grain sediments with intervening fine grain aquitards. Aquifers have been grouped into an Upper Aquifer System (UAS) and a Lower Aquifer System (LAS) based on changes in geologic structure and separated in many areas by regional layers of low permeability clay. The UAS sediments are relatively flat lying and extend to approximately 400 feet beneath the Site. The sediments in the LAS are more structurally complex, resulting from folding and faulting. In the Oxnard Forebay Basin, alluvial sediments in the subsurface are predominantly coarse

grain sands and gravels. Fine grain sediments, such as silts and clays, that can act as confining layers are generally absent or discontinuous. This condition allows for direct recharge of the UAS from the surface and some recharge of the LAS from the UAS in the subsurface (Fox Canyon Ground Water Management Agency 2017; Turner and Mukae 1975).

The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet below ground surface (bgs) to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

3.3.2 Flood Zoning

According to the U.S. Department of Homeland Security Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map No. 06111C0910E, the Site is not located in a flood hazard area (FEMA 2020).

3.3.3 Wetlands

The EDR report indicates that the Site area is covered in the National Wetlands Inventory prepared by the U.S. Fish and Wildlife Service (USFWS) (EDR 2020). The USFWS maintains the National Wetlands Inventory (NWI), a geographic information system (GIS)-based relational database of wetlands that have been mapped throughout the country. Based on the information provided in the EDR Report and review of the USFWS map for the area surrounding the Site, the nearest wetland is the UWCD El Rio Spreading Grounds, located 0.25 to 1 mile north of the Site (USFWS 2020).

3.3.4 Asbestos Containing Rocks

Tetra Tech has reviewed available topographic and geologic maps for the Site area and *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (CDMG 2000) for potential sources of naturally occurring asbestos (NOA) and believes the risk for NOA at the Site is low. The nearest sources of NOA are approximately 40 miles northwest of the Site in the Santa Ynez River Watershed located in Santa Barbara County.

4.0 PHASE II ESA ADDENDUM FIELD ASSESSMENT

4.1 RATIONALE

Tetra Tech implemented the field sampling in accordance with the *Preliminary Endangerment Guidance Manual* (DTSC January 1994, Revised October 2015) (PEA Guidance Manual). In the Phase II ESA (Tetra Tech 2020b), Tetra Tech recommended that the RSD enter the western 5-acre portion of the Site that was formerly to be developed for a maintenance, operations, and transportation (MOT) facility into the DTSC Voluntary Cleanup Program (VCP) and perform additional assessment to evaluate the lateral and vertical extent of TPHd, TPHc, and the OCD dieldrin at concentrations exceeding the screening levels. The additional assessment data was to be used to determine appropriate regulatory clearance prior to developing the Site as a MOT facility. For the remaining 5-acre portion of APN 144-0-110-225 to be developed as a K-12 school facility in the future, Tetra Tech recommended that a Preliminary Environmental Assessment (PEA) be performed under DTSC oversight to further evaluate the RECs posed by the areas of the Site that are significantly impacted by TPHd and TPHc. The Phase II Addendum for the Site was completed to gather additional data to define the vertical and lateral extent of OCP and TPHd and TPHc impacted soil and perform human health risk screening for the western 5-acre portion of the Site to be developed as the proposed MOT facility prior to entering the Site into the DTSC VCP. In addition, sampling was performed for the eastern 5-acre portion of the Site to assess the depth of the TPHd and TPHc impacted soil. The PEA for the 5-acre portion of the Site to be developed as a K-12 school facility was to be postponed for a later time.

The proposed use for the Site has changed since the Phase II ESA was completed. The RSD proposes to continue utilizing the Site for agriculture until future plans are determined. No utility expansion is proposed.

4.1.1 Former Proposed MOT Facility DTSC VCP

4.1.1.1 Assessment of OCPs (Dieldrin) in Soil

In the Phase II ESA, based on rationale recommended in the PEA Guidance Manual (DTSC 2015) and Agricultural Fields Guidance (DTSC 2008), 20 surface soil samples were collected (sample locations SS-1 through SS-20) in an equal-spaced grid pattern at depths of 0 to 0.5 feet bgs. The twenty discrete surface soil samples were collected and combined into five composite samples (samples Comp 1 through Comp 5) and one duplicate composite sample (sample Comp Dup). OCPs were detected in all five of the composite surface soil samples and the composite duplicate surface soil sample. The OCPs 4,4'-DDD (DDD), 4,4'-DDE (DDE), 4,4'-DDT (DDT) were detected at concentrations below their respective screening levels. Dieldrin was detected in sample Comp 2 at a concentration of 0.052 mg/kg, slightly above the screening level of 0.034 mg/kg. No other OCPs were identified in the composite surface soil sample results from the Site.

To further assess the location and extent of the dieldrin at a concentration above the screening level in sample Comp 2, discrete soil samples were collected at sample locations SS-5 through SS-8 for OCP analysis. At each location, a surface soil sample was collected at a depth of 0 to 0.5 feet bgs and a subsurface soil sample was collected at a depth of 2 to 2.5 feet bgs. Thirteen surface soil step out samples and 13 subsurface step out soil samples were collected at sample locations SS-22 through SS-31 around sample locations SS-5 through SS-8 to assess the lateral extent of OCPs at concentrations exceeding screening levels. Initially, only the surface soil samples from sample locations SS-5 through SS-8 were analyzed for OCPs. In the surface soil samples collected at sample locations SS-5 and SS-7, OCPs were detected at concentrations exceeding screening levels, and the corresponding subsurface samples and four step out

surface soil samples were analyzed to assess the vertical and lateral extent of OCPs at concentrations exceeding screening levels.

4.1.1.2 Assessment of TPHd and TPHc in Soil

In the Phase II ESA, potential impacts to surface soil from smudge pot fuel oil were assessed by collecting surface soil samples at a depth of 0 to 0.5 feet bgs at 10 locations across the Site within the OCP sampling grid. Ten discrete surface soil samples and one duplicate soil sample (11 soil samples total) were analyzed for semivolatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), (semivolatile organic compounds within the OCP sampling grid. SVOCs and PAHs were not detected at concentrations above their relevant screening levels. TPHd and TPHc were detected at concentrations that significantly exceeded their screening levels in nine discrete soil samples and one duplicate sample of the 11 soil samples analyzed.

To further assess the lateral and vertical extent of TPHd and TPHc at concentrations above their screening levels within the proposed MOT facility area, soil samples were collected at sample locations SS-1 through SS-8 (8 locations). Surface and subsurface soil samples were collected at a depths of 0 to 0.5 feet bgs and 2 to 2.5 feet bgs, respectively, at sample locations SS-2, SS-4, SS-6, and SS-8. Subsurface samples only were collected at sample locations SS-1, SS-3, SS-5, and SS-7. If TPHd and/or TPHc were detected at concentrations exceeding their screening level in the surface soil samples collected at locations SS-2, SS-4, SS-6, and SS-8, then the corresponding subsurface soil sample was to be analyzed for TPHd and/or TPHc to assess the depth of impacted soil. The samples were analyzed for TPHd and TPHc using EPA method 8015CC.

Extractable Petroleum Hydrocarbons (EPH) by Massachusetts Department of Environmental Protection Method. The surface soil samples collected from the former proposed MOT area were selected for analysis by extractable petroleum hydrocarbons (EPH) by Massachusetts Department of Environmental Protection (MDEP) method MADEP-EPH-04. This is in accordance with the recommendation in the PEA Guidance Manual (DTSC January 1994, Revised October 2015) for performing simplified risk exposure analysis for TPH. Surface soil sample SS-1-0, SS-2-0, SS-3-0, SS-4-0, SS-5-0, the duplicate sample for sample SS-5-0 (Dup-1), SS-6-0, SS-7-0, and SS-8-0 were analyzed for EHP by method MADEP-EPH-04.

4.1.2 Former Proposed K-12 School Site TPHd and TPHc Assessment

To further assess the vertical extent of TPHd and TPHc at concentrations above their screening levels within the former proposed K-12 school site area, subsurface soil samples (collected at a depth of 2 to 2.5 feet bgs) were collected at sample locations SS-9, SS-11, SS-13, SS-17, and SS-19 (five locations).

4.2 SITE HEALTH AND SAFETY

The Site-Specific Health and Safety Plan (SSHSP) prepared for the Phase II ESA was updated and used for the Phase II ESA Addendum. The SSHSP is required by law to perform work at sites where workers may be exposed to hazardous waste and/or materials. The SSHSP was prepared in accordance with Code of Federal Regulations (CFR) Section 1910.120, California Administrative Code (CAC), Title 8, and the Tetra Tech Corporate *Health and Safety Manual* (Tetra Tech 2011). The SSHSP included a Site location map and a map showing the most direct route to the nearest emergency care center, the identity of the Site Health and Safety Officer, lists of the chemicals, materials, equipment, physical conditions that pose a threat or hazard, and the level of protection that will provide for proper worker safety. Proof of valid and current Occupational Safety and Health Administration (OSHA) training certifications was required for all Site workers. The SSHSP also described the procedures and practices that were followed during field activities,

including safety monitoring and field decontamination. All fieldwork was performed in accordance with the SSHSP.

4.3 SOIL SAMPLE COLLECTION AND SAMPLE ANALYSIS

The soil sample analysis schedule is presented in Table 1 and the soil sample locations are shown on Figure 3. Tetra Tech collected soil samples using hand sampling techniques at 27 locations in the 10-acre Site to further assess pesticide and fuel oil in surface and subsurface soils. The soil sample analyses were performed by BC Laboratories, Inc. (BC), a California State Certified laboratory.

4.3.1 Former Proposed MOT Facility DTSC VCP

4.3.1.1 Additional Assessment of OCPs in Soil

To further assess OCPs in soil, Tetra Tech collected soil samples using hand auger sampling techniques at 21 locations (sample locations SS-1 through SS-8 and SS-22 through SS-34) in the 10-acre Site in an equal-spaced grid pattern (Figure 3 and Table 1). At each location, a surface soil sample was collected at a depth of 0 to 0.5 feet bgs and a subsurface soil sample was collected at a depth of 2 to 2.5 feet bgs. Thirteen surface soil step out samples and 13 subsurface step out soil samples were collected around sample locations SS-5 through SS-8 at sample locations SS-22 through SS-34 to assess the lateral extent of OCPs at concentrations exceeding screening levels. Initially, only the surface soil samples from sample locations SS-5 through SS-8 were analyzed for OCPs. OCPs were detected at concentrations exceeding screening levels in the surface soil samples from sample locations SS-5 and SS-7, so the corresponding subsurface samples were collected at sample locations SS-5 and SS-7. The four step out surface soil samples at each of the sample locations SS-5 and SS-7 (sample locations SS-22 through SS-25 and SS-28 through SS-31) were also analyzed to assess the lateral extent of OCPs at concentrations exceeding screening levels.

4.3.1.2 Additional Assessment TPHd and TPHc Soil

To further assess the lateral and vertical extent of TPHd and TPHc at concentrations above their screening levels within the former proposed MOT facility area, surface and subsurface soil samples were collected at a depths of 0 to 0.5 feet bgs and 2 to 2.5 feet bgs, respectively, at sample locations SS-2, SS-4, SS-6, and SS-8 (4 locations), and subsurface soil samples were collected at sample locations SS-1, SS-3, SS-5, and SS-7 (4 locations) (Figure 3 and Table 1). The surface soil samples collected at locations SS-2, SS-4, SS-6, and SS-8, and the subsurface soil samples collected at locations SS-1, SS-2, SS-3, SS-5, SS-6, SS-7, and SS-8 were analyzed for TPHd and TPHc using EPA methods 8015B and 8015CC.

4.3.1.3 Extractable Petroleum Hydrocarbons (EPH) by Massachusetts Department of Environmental Protection Method

The surface soil samples collected from the proposed MOT area at sample locations SS-1-0, SS-2-0, SS-3-0, SS-4-0, SS-5-0, the duplicate sample for sample SS-1-0 (Dup-1), SS-6-0, SS-7-0, and SS-8-0 were analyzed for EPH by method MADEP-EPH-04 (Figure 3 and Table 1).

4.3.2 Former Proposed K-12 School Site TPHd and TPHc Assessment

To further assess the vertical extent of TPHd and TPHc at concentrations above their screening levels within the former proposed K-12 school site area, subsurface soil samples (collected at a depth of 2 to 2.5 feet bgs) were collected at sample locations SS-9, SS-11, SS-13, SS-17, and SS-19 (Figure 3 and Table 1).

4.4 SOIL SAMPLE ANALYSIS RESULTS

4.4.1 Analytical Results for Organochlorine Pesticides

The OCP sample results for the samples collected for the Phase II ESA Addendum on December 9, 2020 are included in Appendix A. The sample results for the samples collected for the Phase II ESA Addendum on December 9, 2020 and the composite samples collected on October 9, 2020 for the Phase II ESA (Tetra Tech 2020b) are summarized in Table 2. Figure 4 presents a hits map that shows the dieldrin sample results at the sample locations. The dieldrin sample results from the Phase II ESA (Tetra Tech 2020b) are also included in Table 2 and shown on Figure 4. Low concentrations of OCPs were detected in all the samples analyzed for the Phase II ESA Addendum.

As stated earlier for the Phase II ESA, OCPs were detected in all five of the composite surface soil samples and the composite duplicate surface soil sample. The OCPs 4,4'-DDD (DDD), 4,4'-DDE (DDE), 4,4'-DDT (DDT) were detected at concentrations below their respective screening levels. Dieldrin was detected in sample Comp 2 at a concentration of 0.052 mg/kg, slightly above the screening level of 0.034 mg/kg. No other OCPs were identified in the composite surface soil sample results from the Site.

The OCPs 4,4'-DDD (DDD), 4,4'-DDE (DDE), 4,4'-DDT (DDT), and dieldrin were detected in all the surface soil samples collected for the Phase II ESA Addendum (samples SS-5-0, SS-6-0, Dup-2, SS-7-0, SS-8-0, Dup-3, SS-22-0, SS-23-0, SS-24-0, SS-25-0, SS-26-0, SS-27-0, SS-28-0, SS-29-0, SS-30-0, and SS-31-0) collected for the Phase II ESA Addendum. Only DDE was detected in subsurface sample SS-5-2.5, and DDE, DDT, and dieldrin were detected in subsurface sample SS-7-2.5. The samples results for OCP detected at concentrations above the laboratory method detection limit (MDL) are summarized below:

- DDD was detected at concentrations ranging from 0.0038 milligrams per kilogram (mg/kg) in sample SS-29-0 to 0.05 mg/kg in sample SS-5-0, and was not detected in subsurface samples SS-5-2.5 or SS-7-2.5;
- DDE was detected at concentrations ranging from 0.0016 mg/kg in sample SS-5-2.5 to 0.40 mg/kg in sample SS-5-0;
- DDT was detected at concentrations ranging from 0.0013 mg/kg in sample SS-7-2.5 to 0.069 mg/kg in sample SS-5-0, and was not detected in subsurface sample SS-5-2.5; and
- Dieldrin was detected at concentrations ranging from 0.0013 mg/kg in sample SS-7-2.5 to 0.056 mg/kg in sample SS-5-0, and was not detected in subsurface sample SS-5-2.5.

With the exception of dieldrin, none of the OCPs were detected at concentrations that exceeded their respective U.S. Environmental Protection Agency (U.S. EPA) Regional Screening Levels (RSLs) (U.S. EPA 2021) for residential soil (Table 2). The dieldrin concentrations in surface soil samples SS-5-0 (0.056 mg/kg), SS-7-0 (0.040 mg/kg), SS-22-0 (0.044 mg/kg), SS-23-0 (0.039 mg/kg), SS-25-0 (0.041 mg/kg), and SS-31-0 (0.034 mg/kg) equaled or exceeded the U.S. EPA RSL for dieldrin of 0.034 mg/kg.

4.4.2 Analytical Results for TPHd and TPHc

The TPHd and TPHc sample results sample results for the samples collected for Phase II ESA Addendum on December 9, 2020 are included in Appendix A. Figure 5 presents a hits map that shows the TPHd and TPHc sample results at the sample locations. The TPHd and TPHc sample results from the Phase II ESA (Tetra Tech 2020b) are also included in Table 3 and shown on Figure 5.

For the surface soil samples collected for the Phase II ESA on October 9, 2020, THPd and TPHc were detected in nine of the ten of the surface soil samples collected at Site and the two duplicate surface soil samples collected for TPHd and TPHc assessment. The samples results for TPHd and TPHc for samples collected on October 9, 2020 are summarized below:

- TPHd was detected in the surface soil samples collected on October 9, 2020 for the Phase II ESA (samples SS-1, SS-3, SS-5, Soil Dupe 1, SS-7, SS-9, SS-11, SS-13, SS-17, Soil Dupe 2, and SS-19) at concentrations ranging from 17 mg/kg (sample SS-19) to 870,000 mg/kg (sample Soil Dupe 2). TPHd was not detected at a concentration above the laboratory MDL in sample SS-15.

- TPHc was detected in the surface soil samples collected on October 9, 2020 for the Phase II ESA (samples SS-1, SS-3, SS-5, Soil Dupe 1, SS-7, SS-9, SS-11, SS-13, SS-17, Soil Dupe 2, and SS-19) at concentrations ranging from 15,000 mg/kg (sample SS-17) to 670,000 mg/kg (sample Soil Dupe 2, the duplicate sample for sample SS-17).

The samples results for TPHd and TPHc for samples collected on December 4, 2020 for the Phase II ESA Addendum are summarized below:

- TPHd was not detected at a concentration above the laboratory MDL in the surface or subsurface soil samples collected on December 4, 2020 for the Phase II ESA Addendum (surface soil samples SS-2-0, SS-4-0, SS-6-0, DUP-2, SS-8-0, and DUP-3, and subsurface soil samples SS-1-2.5, SS-2-2.5, SS-3-2.5, SS-5-2.5, SS-6-2.5, SS-7-2.5, SS-8-2.5, SS-9-2.5, Dup-4, SS-11-2.5, SS-13-2.5, SS-17-2.5, and SS-19-2.5).

- TPHc was detected in seven of the discrete surface soil samples and two of the duplicate samples collected on December 4, 2020 for the Phase II ESA Addendum (surface soil samples SS-2-0, SS-4-0, SS-6-0, DUP-2, SS-8-0, and DUP-3, and subsurface soil samples SS-7-2.5, SS-9-2.5, and SS-13-2.5) at concentrations ranging from 16 mg/kg (sample SS-9-2.5) to 56 mg/kg (sample SS-8-0).

TPHd was detected in samples SS-1, SS-3, SS-5, Soil Dup 1, SS-7, SS-9, SS-11, and SS-13 that were collected on October 9, 2020 for the Phase II ESA at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg by one order of magnitude. In samples SS-17 (170,000 mg/kg) and Soil Dup 2 (870,000 mg/kg) the TPHd concentrations exceeded the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg by three orders of magnitude (SFRWQCB 2019).

TPHc was detected in samples SS-1, SS-3, SS-5, Soil Dup 1, SS-7, SS-9, SS-11, SS-13, SS-17, Soil Dupe 2, and SS-19 that were collected on October 9, 2020 for the Phase II ESA at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg by one order of magnitude. In samples SS-17 (15,000 mg/kg) and Soil Dup 2 (670,000 mg/kg), the TPHc concentrations exceeded the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg by one and two orders of magnitude, respectively (SFRWQCB 2019).

TPHd and TPHc were not detected at concentrations that equaled or exceeded their respective SFRWQCB Tier 1 ESL for residential soil in any of the surface or subsurface samples collected on December 4, 2021 for the Phase II ESA Addendum.

4.4.3 Analytical Results for Extractable Petroleum Hydrocarbons (EPH) by Massachusetts Department of Environmental Protection Method

The EPH by method MADEP-EPH-04 sample results sample results for samples collected for the Phase II ESA Addendum are included in Appendix A and are summarized in Table 4. C19-C39 aliphatics were detected in sample SS-2-0 at a concentration of 13 mg/kg. No other EPH were detected at concentrations above the laboratory MDL. No EPH were detected at concentrations that exceeded their respective U.S. EPA RSLs (U.S. EPA 2021) for residential soil (Table 4).

5.0 HUMAN HEALTH SCREENING EVALUATION

5.1 INTRODUCTION

The Phase II ESA and ESA Addendum of the RSD ten-acre portion of APN 144-0-110-225 on North Rose Avenue were performed as part of the due diligence efforts required to support development of the Site by the RSD. School site expansion may be performed on the Site. Therefore, the human health risk screening evaluates the entire parcel for unrestricted land use and comparison with residential soil screening values, as well as risk screening for possible commercial/ industrial future use. Risk-based screening levels (RBSLs) for unrestricted and commercial/industrial land use followed DTSC HERO Note Number 3, DTSC-Modified Screening Levels (DTSC, 2020) and *HERO Note Number 4*, Guidance for Screening Level Human Health Risk Assessments (DTSC, 2019).

The Human Health Risk Screening Evaluation for human health effects consists of three steps: (1) identifying potentially complete exposure pathways based on a conceptual site model, (2) identifying chemicals of potential concern (COPCs), and (3) estimating potential cancer risks and noncancer hazards through comparison of risk-based screening levels (RBSLs) to site concentrations of COPCs. The findings of the human health screening evaluation are summarized in the risk characterization (Section 5.7).

5.2 EXPOSURE PATHWAYS AND CHEMICALS OF POTENTIAL CONCERN

This sections discusses the conceptual site model (CSM) for potential environmental release to soil of chemicals from historical and current agricultural operations, exposure pathways for receptors under proposed future school land use, and COPCs for the future school land use.

5.2.1 Conceptual Site Model

A CSM provides a description of the links between contaminant sources at a site, the chemicals detected at the Site, the mechanisms by which chemical transport or migration may occur in the environment, and the persons potentially exposed to environmental media at the Site. Furthermore, DTSC PEA Guidance (Cal/EPA DTSC, 2015) and HERO Memo #4 (Cal/EPA DTSC, 2019) indicate that developing a CSM is critical to ensuring that environmental investigations and screening level human health risk evaluations address appropriate receptors and exposure pathways. The CSM for the Site is described in the following text.

The Site is a 10-acre portion of APN 144-0-110-225, which is a 92.53-acre lot. The Site is bounded by North Rose Avenue on the west/northwest, land developed in berry cultivation on APN 144-0-110-225 on the northeast and southeast, and the RSD's Rio del Valle Middle School on the south/southeast. Currently, the Site is used for agricultural production of organic raspberries. Historical aerial photographs indicate that the Site was previously used for cultivation of row crops and orchards, and support long-term agricultural use of the parcel.

The Phase I ESA for the Site identified the following RECs for the Site with potential releases to surface and near surface soil. Therefore, a Phase II and Phase II Addendum ESAs for soil were conducted. REC 1 is for potential former agricultural pesticide application (specifically organochlorine pesticides [OCPs] and arsenic pesticides). REC 2 is for potential bunker oil releases from potential former smudge pot frost abatement practices. REC 3 is for PCB-containing transformers (three pole-mounted electrical transformers are located along the southwest Site boundary). All of these three RECs are associated with potential releases to soil. Soil samples were collected at the Site during the Phase II and Phase II Addendum ESAs,

and these were analyzed for OCPs, arsenic, SVOCs, PAHs, PCBs, TPH-(C10-C25 fraction), and TPH-(C25-C40 fraction).

While migration from soil to groundwater is a possibility, the Phase II ESA and Phase II ESA Addendum were focused on soil only and determined that chemical impacts were limited to the 0 – 0.5 ft soil interval. Therefore, the CSM is focused on potential exposure pathways with soil.

School children and staff are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. PEA guidance (Cal/EPA DTSC 2015) indicates that sites should be evaluated assuming unrestricted residential land use, regardless of current and future uses. Therefore, the unrestricted land use scenario (i.e., residential land use) was evaluated for this Site, which is protective of future school use since the exposure assumptions for a residential scenario are more conservative than those for a school scenario.

5.2.2 Potential Exposure Pathways for Receptors

Analytical data indicated that the environmental releases were limited to soil. Therefore, potential exposure pathways are for soil and for air pathways for chemicals that could be released from soil.

5.2.2.1 Soil Exposure Pathways

Currently, the Site is unpaved and bare soils may be contacted directly. Analytical data from Phase II ESA and Phase II Addendum ESA soil samples have shown chemical detections in soils at the Site. Therefore, the potential exists for humans to be exposed to COPCs through direct dermal contact with soil and by incidental soil ingestion. In the future, if school site expansion occurs on the parcel, it is likely buildings will be constructed at the Site. These buildings as well as supporting features such as sidewalks and parking areas will act to limit exposures to soils by onsite receptors. However, in accordance with PEA guidance, all soils at the Site were considered available for dermal contact, incidental ingestion, and the generation of dusts (Cal/EPA DTSC 2015).

5.2.2.2 Air Exposure Pathways

Nonvolatile chemicals may also sorb to soils. Wind erosion and dispersion of soil particulates could potentially result in exposure to these nonvolatile chemicals associated with airborne soil particulates (i.e., dusts). Therefore, it was assumed that receptors could potentially be exposed to COPCs by the inhalation of wind-generated airborne dusts.

5.3 CHEMICALS OF POTENTIAL CONCERN

Tables 5 and 6 present a data summary of chemical analyses for soil samples collected at the Site with comparison of maximum detections with RBSLs for the selection of COPCs. The following subsections discuss the types of chemicals that were analyzed for and detected by the specific EPA Methods, and identified the COPCs that were carried into the human health risk screening evaluation and on what basis they were included as COPCs or not.

5.3.1 Arsenic

Based on the historical agricultural land use, arsenic was the only metal analyzed for in soil. Historically, arsenical pesticides may have been used. To determine the presence of arsenic and ensure a health-protective assessment, soil samples were analyzed for arsenic using EPA Method 6010B.

Metals present at concentrations equivalent to (or lower than) background concentrations do not need to be considered in the screening evaluation (Cal/EPA DTSC, 2015). Arsenic was detected at a maximum concentration of 4.8 mg/kg, which is well below the DTSC screening level of 12 mg/kg. As indicated in the DTSC Interim Guidance for Sampling Agricultural Properties (Cal/EPA DTSC, 2008), if all arsenic data are equal to or less than 12 mg/kg, then arsenic does not need to be considered a COPC and this determination does not require collection and comparison to a background data set. Therefore, arsenic was not selected as a COPC and was not evaluated further in the risk screening evaluation.

5.3.2 Pesticides

To determine the presence of pesticides and ensure a health-protective assessment, soil samples collected at the Site were analyzed for OCPs using EPA Method 8081A. The following four organochlorine pesticides were detected in soils at the Site: DDD, DDE, DDT, and dieldrin. However, only dieldrin was detected at concentrations that exceed the residential soil RBSL (Table 5). It should be noted that all four of these OCPs were detected at concentrations that are below their commercial/industrial soil RBSLs (Table 6). All four of these OCPs were identified as COPCs for the health risk screening evaluation of unrestricted land use.

5.3.3 Semivolatile Organic Compounds (SVOCs)

To assess potential releases from possible historical smudge pots, soil samples were analyzed for SVOCs by EPA Method 8270C and for PAHs by EPA Method 8270 SIM. The only chemicals detected in soil samples by SVOC method analysis were bis(2-ethylhexyl)phthalate, DDD, DDE, DDT, and dieldrin. The pesticides were already identified as COPCs based on the results of the EPA Method 8081A analysis. Bis(2-ethylhexyl)phthalate was detected in only 1 of 12 samples, the detection is very low (0.036 mg/kg) when compared with the RBSL (39 mg/kg based on a 1×10^{-6} risk level), and it is considered a common laboratory contaminant. Based on these lines of evidence, bis(2-ethylhexyl)phthalate is not identified as a COPC for the screening risk evaluation.

5.3.4 Polycyclic Aromatic Hydrocarbons (PAHs)

Three noncarcinogenic PAHs were detected in the EPA Method 8270 SIM analysis (fluoranthene, phenanthrene, and pyrene), and their maximum detections were seven orders of magnitude lower than the respective noncancer RBSLs for these PAHs. Therefore, fluoranthene, phenanthrene, and pyrene were not selected as COPCs for the screening risk evaluation.

5.3.5 Total Petroleum Hydrocarbons (TPH)

The possible historical use of smudge pots when the parcel was used as an orchard is the basis of why soil samples were submitted for TPH analyses for diesel range (C10-C25) and crude oil range (C25-C40) carbon aliphatic chain fractions. The analytical method was EPA Method 8015M. While TPH analytical results exceeded the RBSLs for TPHd and TPHc oil, the chromatograms from the laboratory analyses did not match what would be expected for TPH-diesel and TPH-crude oil. In addition, EPH were not detected at concentrations that exceeded their respective U.S. EPA RSLs (U.S. EPA 2021) for residential soil. The current tenant, Reiter Affiliated Companies, grows certified-organic raspberries on the parcel and adjacent property, and uses environmentally safe mineral-based oils for miticide insect pest deterrent on a regular schedule. Based on the wide spread detection of TPHd and TPHc in Site soil, the chromatograms from the laboratory analyses not matching what would be expected for TPHd and TPHc, and the fact that environmentally safe mineral-based oils are used on the Site on a regular basis, it is likely that the wide spread detection of TPHd and TPHc in Site soil is from the environmentally safe mineral-based oils used

at the Site. Based on the information on likely low toxicity of the oils used for pest deterrent on these certified-organic raspberry cultures, TPH fractions C10-C25 and C25-C40 are not identified as COPCs for the screening risk evaluation.

5.3.6 Polychlorinated Biphenyls (PCBs)

REC 3 is a very localized area of a pole-mounted electrical transformer on the southwest corner of the Site. Duplicate soil samples were collected from a single sample location (SS-21), and analyzed by EPA Method 8082 for PCBs. Aroclor 1260 was the only detected PCB result. The detected result (0.0083 mg/kg; dup 0.007 mg/kg) is 30 times lower than the residential soil RBSL for PCBs. The associated cancer risk with the detected soil result is 3×10^{-8}, which is well below the de minimis risk level of 10^{-6}. As such, Aroclor 1260 is not selected as a COPC for the risk screening evaluation.

5.3.7 COPCs and Exposure Point Concentrations

The COPCs that were identified for the Site are the detected OCPs: DDD, DDE, DDT, and dieldrin. For the risk screening evaluation, the maximum detected concentrations were used as the exposure point concentration (EPC) for DDD, DDE, and DDT, which were detected at concentrations that are below their respective residential soil RBSLs. Table 5 presents the EPCs. The maximum detected concentrations were applied as EPCs in a more conservative risk screening evaluation, shown in Table 6. Because the maximum detected concentration of dieldrin exceeded the corresponding screening level, risks were also calculated based 95% upper confidence limit (95% UCL) of the arithmetic mean for dieldrin, while maintaining the maximum detected concentration EPCs for DDD, DDE, and DDT. The 95% UCL for dieldrin was calculated with EPA ProUCL software (USEPA, 2016), and the EPC dataset are from surface soil samples (0 – 0.5 ft bgs). The EPC dataset did not include samples from the 0.5 – 2 ft bgs interval because the deeper samples had lower concentrations (i.e., the OCPs were delineated in the surface soil). .

5.4 RISK-BASED SCREENING LEVELS

For COPCs in soil, potential residential receptors could be exposed via incidental ingestion, dermal contact, and inhalation of COPCs associated with airborne particulates. For this evaluation, soil screening levels were developed to be protective of potential exposures to COPCs in soil through these exposure pathways.

In accordance with the Human and Ecological Risk Office's (HERO's) Human Health Risk Assessment (HHRA) Note 3 (Cal/EPA DTSC 2020), DTSC-modified soil screening levels and USEPA RSLs for soil were used as screening levels protective of residential receptors potentially exposed via contact with soil. DTSC-modified screening levels would have been used if they had been available, but USEPA RSLs were available and were used in the human health risk screening.

5.4.1 Target Risk Levels

For this evaluation, target risk levels were determined according to USEPA and Cal/EPA guidance. USEPA's 1990 guidance indicates that a carcinogenic risk probability between 1 in 1,000,000 and 1 in 10,000 (1×10^{-6} to 1×10^{-4}) are generally acceptable. The lower end of the target risk range is typically applied to residential scenarios, whereas the higher range is typically considered appropriate for commercial/industrial situations. Thus, for this evaluation, carcinogenic soil screening levels were developed based on a target risk of 1×10^{-6} for the residential scenario. For potential non-carcinogenic effects, USEPA (1990) indicates that non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects. Therefore, for this evaluation, potential hazards for the residential scenario

are evaluated based on a target hazard index (HI) of 1. Individual chemical exposures that yield a HI of less than one is not expected to result in adverse non-cancer health effects (USEPA 1989).

5.4.2 Soil Risk-Based Screening Levels (RBSLs)

For this evaluation, DTSC-modified soil screening levels and USEPA soil RSLs protective of residential exposures were conservatively used to evaluate potential exposures to soil. The residential screening levels are conservative since they are based on exposure parameters that assume higher levels of exposure than would be associated with a school site. For example, the exposure frequency and exposure time in a residential scenario are 350 days per year and 24 hours per day, respectively. For a school scenario, the maximum exposure frequency and exposure time are 250 days per year and 10.3 hours per day, respectively.

5.5 RISK CHARACTERIZATION

Risks were characterized for potential residential receptors using the ratio of concentrations measured at the Site to the RBSLs identified for each environmental medium. This evaluation consisted of three steps: (1) specifying the target risk and hazard quotient to use in calculating the RBSLs; (2) estimating EPCs for each environmental medium; and (3) comparing the EPCs to the RBSLs to estimate risks and hazards for potential receptors. Each of these steps is described below.

5.5.1 Risk Estimation Procedures

The RBSLs were calculated for a specified target risk (i.e., a carcinogenic risk of 1×10^{-6} for residential receptors) and concentrations greater than the RBSLs represent carcinogenic risks proportionally greater than the target risk. Similarly, concentrations less than the RBSLs represent carcinogenic risks proportionally less than the target risk. Risks were calculated as follows, using the ratio of each COPC's EPC and its media-specific RBSL:

Cancer risk estimate for residential receptors:

$$\textbf{Theoretical Lifetime Cancer Risk} = (\text{EPC}/\text{carcinogenic RBSL}) \times 10^{-6}$$

Noncancer hazard quotient (HQ) for residential receptors:

$$\textbf{HQ} = (\text{EPC}/\text{noncarcinogenic RBSL})$$

In accordance with USEPA and DTSC guidance, the risk and hazard ratios for each chemical and potentially complete exposure pathway were summed to determine the multi-pathway cumulative carcinogenic risk estimates and noncarcinogenic HI for potential receptors.

5.5.2 Cancer Risk and Hazard Estimates for Soil

As shown in Table 6, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for the hypothetical residential scenario through exposure to COPCs in soil based on the residential soil RBSLs is 2×10^{-6}, which is at the low end of the USEPA target risk range of 10^{-4} to 10^{-6}) but just above the target risk level for residential receptors of 1×10^{-6} per DTSC guidance. The maximum estimated non-carcinogenic HI is 0.06, which is below the target HI of 1.

Dieldrin was detected in all surface soil samples with concentrations ranging from 0.013 mg/kg to 0.056 mg/kg, with 5 of 19 results exceeding its corresponding residential screening level of 0.034 mg/kg.

The estimated cancer risks summarized in Table 6 are conservative as they are based on the maximum detected concentrations for each chemical rather than a representative exposure concentration such as the 95% UCL of the arithmetic mean concentration.

Table 7 provides a risk estimate based on the 95% UCL for dieldrin (0.0335 mg/kg) and the maximum detected concentrations of the other pesticides detected in soil (i.e., DDD, DDE, and DDT). As shown in Table 7, the estimated cancer risk for potential school receptors exposed to COPCs in soil based on the 95% UCLs for dieldrin and residential soil RBSLs is 1×10^{-6}, which is at the low end of the USEPA target risk range of 10^{-6} to 10^{-4} and meets the DTSC target risk for residential receptors. The estimated non-carcinogenic based on the 95% UCLs for pesticides HI is 0.06, which is below the target HI of 1.

5.6 UNCERTAINTY ANALYSIS

This section presents an evaluation of several potential sources of uncertainty in the risk estimates presented in Section 5.5. Uncertainty may have been introduced into the risk calculations as a result of:

- Assumed exposure to maximum detected concentrations; and
- Assumed exposure to all soils at the Site.

5.6.1 Use of Maximum Detected Concentrations

For this evaluation, it was conservatively assumed that potential receptors were exposed to the maximum detected concentration of each chemical detected in soil gas and soil. This is considered conservative since receptors are assumed to move around the Site in such manner that they would likely be exposed to levels such as the average concentration for a site. For this reason, risk assessment guidance recommends using the reasonable maximum exposure (RME) point concentration represented by the 95% upper confidence limit on the mean concentration, which is usually significantly lower than the maximum detected concentration. For this reason, risk and hazard estimates based on the 95% UCL for dieldrin was also provided for the soil.

5.6.2 Use of Maximum Detected Concentrations

Future development at the Site will likely include constructing several buildings and paved areas. Buildings and paved areas will act to prevent exposure to the soils underneath them, thus reducing soil exposures at the Site. Reduced exposure to the soils at the Site would also result in lower risk estimates for any future receptors at the Site.

5.7 RISK SUMMARY

Risks associated with residential exposure to maximum detections of detected pesticides (dieldrin, DDD, DDE, and DDT) in surface soil of the Site are just above DTSC's target risk of 1×10^{-6} for residential receptors. However, when the 95% UCL concentration of dieldrin is applied as the EPC for the residential risk screening, the cumulative risk is 1×10^{-6} and meets the DTSC target risk and is at the low end of the U.S. EPA risk range of 10^{-6} to 10^{-4}. Therefore, future unrestricted use of the Site is supported on the basis of this human health risk screening evaluation.

6.0 CONCLUSIONS

6.1 GENERAL SITE CONDITIONS

The Site is owned by the RSD, is leased by Reiter Affiliated Companies, and is currently used for the production of organic raspberries. The grounds were clean and well-kept. No buildings currently exist on Site. Additionally, no chemical products, storage drums, aboveground storage tanks (ASTs) or underground storage tanks (USTs) exist on Site. Dirt roads line the southern and western sides of the Site and separate rows of raspberries. No utilities currently are connected to the Site. Utilities serving the Site area are electricity (Southern California Edison) and natural gas (the Southern California Gas Company). Water for crop irrigation at the Site is provided by five groundwater wells owned by KMS Industries, Inc. Solid waste disposal is performed by Harrison Industries. The Site is adjacent to other areas currently being used for organic raspberry production on the northeast and southeast sides. Three pole-mounted electrical transformers are adjacent to the Site's southwest corner. A groundwater production well operated by the UWCD is located adjacent to the southern corner of the Site. The Rio del Valle Middle School is located adjacent to the southwestern Site boundary. Two high volume water transmission pipelines (one operated by the City of Oxnard and one operated by the UWCD) are located 30 and 40 feet, respectively northwest of the Site beneath North Rose Avenue. A groundwater production and treatment facility operated by the Vineyard Avenue Estates Water Mutual Company is located northwest of the Site across North Rose. The Site is not located in an oil field. The nearest oil field is the Santa Clara Avenue Field, located approximately 0.5 to 1 mile southeast of the Site. There are no known active or abandoned oil wells on Site. The "McGrath-McCormick 1", located approximately 500 feet northeast of the Site, is the oil well closest to the Site. The "McGrath-McCormick 1" oil well is a dry (non-oil producing) well that was drilled and abandoned in 1959.

It is our understanding that the RSD proposes to continue utilizing the site for agricultural production until future plans are determined. No utility expansion at the Site is proposed at this time.

6.2 PHASE II ESA ADDENDUM RESULTS

The Phase II ESA Addendum was completed to gather additional data to define the vertical and lateral extent of OCP and TPHd and TPHc impacted soil at the Site and perform a human health risk screening evaluation.

In the soil samples collected for the Phase II Addendum, with the exception of dieldrin, none of the OCPs were detected at concentrations that exceeded their respective U.S. Environmental Protection Agency (U.S. EPA) Regional Screening Levels (RSLs) (U.S. EPA 2021) for residential soil (Table 2). The dieldrin concentrations in surface soil samples SS-5-0 (0.056 mg/kg), SS-7-0 (0.040 mg/kg), SS-22-0 (0.044 mg/kg), SS-23-0 (0.039 mg/kg), SS-25-0 (0.041 mg/kg), and SS-31-0 (0.034 mg/kg) equaled or exceeded the U.S. EPA RSL for dieldrin of 0.034 mg/kg. The soil sample results from the Phase II ESA and Phase II ESA Addendum and indicate that vertical extent of dieldrin at the Site at concentrations exceeding their respective U.S. EPA RSLs is confined to the surface soil zone extending from the ground surface to approximately 1.0 to 2.0 feet bgs at sample locations SS-5, SS-7, SS-23, and SS-31. The lateral extent of dieldrin at concentrations that equaled or exceeded their respective U.S. EPA RSLs appears to be confined to the areas adjacent to sample locations SS-5, SS-7, SS-23, and SS-31.

TPHd and TPHc were not detected at concentrations that equaled or exceeded their respective SFRWQCB Tier 1 ESL for residential soil in any of the surface or subsurface samples collected for the Phase II ESA Addendum. The soil sample results from the Phase II ESA and Phase II ESA Addendum and indicate that vertical extent of the TPHd and TPHc at the Site at concentrations exceeding their respective SFRWQCB

Tier 1 ESL for residential soil is confined to the surface soil zone extending from the ground surface to approximately 1.0 to 2.0 feet bgs at sample locations SS-1, SS-3,. SS-5, SS-7, SS-9, SS-11, SS-13, and SS-17, and to approximately 1.0 to 2.0 for TPHc at sample location SS-19. The lateral extent of TPHd and TPHc at concentrations that equaled or exceeded their respective SFRWQCB Tier 1 ESL appears to be confined to the areas adjacent to sample locations SS-1, SS-3,. SS-5, SS-7, SS-9, SS-11, SS-13, SS-17, and SS-19.

For the soil samples analyzed for EPH by method MADEP-EPH-04, C19-C39 aliphatics were detected in sample SS-2-0 at a concentration of 13 mg/kg. No other EPH were detected at concentrations above the laboratory MDL. No EPH were detected at concentrations that exceeded their respective U.S. EPA RSLs (U.S. EPA 2021) for residential soil (Table 4).

Based on review of the Phase II ESA and Phase II ESA Addendum soil sample results, the Site appears to have been slightly impacted by OCPs from past agricultural production activities and significantly impacted from TPHd and TPHc. However, based on review information provided by Reiter Affiliated Companies including pesticide application records for the Site from 2019 and 2020, the TPHd and TPHc detected in Site soils appears to be from organic mineral oil based miticides recently used at the Site.

6.3 HUMAN HEALTH SCREENING EVALUATION RESULTS

The COPCs that were identified for the Site are the detected four OCPs: DDD, DDE, DDT, and dieldrin. For the risk screening evaluation, the maximum detected concentrations were used as the EPC for DDD, DDE, and DDT, which were detected at concentrations that are below their respective residential soil RBSLs. TPHd and TPHc were not included in the COPCs for the Site because based on review information provided by Reiter Affiliated Companies including pesticide application records for the Site from 2019 and 2020, the TPHd and TPHc detected in Site soils appears to be from organic mineral oil based miticides recently used at the Site.

Risks associated with residential exposure to maximum detections of detected pesticides (dieldrin, DDD, DDE, and DDT) in surface soil of the Site are just above DTSC's target risk of 1 x 10-6 for residential receptors. However, when the 95% UCL concentration of dieldrin is applied as the EPC for the residential risk screening, the cumulative risk is 1 x 10-6 and meets the DTSC target risk and is at the low end of the U.S. EPA risk range of 10-6 to 10-4. Therefore, future unrestricted use of the Site is supported on the basis of the human health risk screening evaluation.

7.0 RECOMMENDATIONS

The findings of this Phase II ESA Addendum indicates that Site surface soils have been slightly impacted by OCPs. The results of the human health screening evaluation indicate that when the 95% UCL concentration of dieldrin is applied as the EPC for the residential risk screening, the cumulative risk is 1 x 10^{-6} and meets the DTSC target risk and is at the low end of the U.S. EPA risk range of 10^{-6} to 10^{-4}. Therefore, future unrestricted use of the Site is supported on the basis of the human health risk screening evaluation. No further action is recommended for the Site for as long as the Site is used for agricultural production.

If some portion or all of the Site is developed as a K-12 school facility at a future time, Tetra Tech recommends that the Phase I ESA report (Tetra Tech 2020a), Phase II ESA Report (Tetra Tech 2020b), and this Phase II ESA Addendum report be submitted to the DTSC as a PEA equivalent document. It is likely that the DTSC will require that a Phase I ESA Update be performed to evaluate the potential for additional RECs to have impacted the Site following the completion of these reports. Additional environmental assessment of the Site may be required by DTSC based on the results of the Phase I ESA Update report. In addition, a hazardous pipeline assessment should also be conducted in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (CDE 2007) as part of the PEA to evaluate potential hazards posed by the two high-volume water transmission pipelines beneath North Rose Avenue within 1,500 feet of the Site.

If some portion or all of the Site is developed by the RSD for other non K-12 school facility uses such as offices, Tetra Tech recommends that the RSD enter the Site into the DTSC Voluntary Cleanup Program (VCP) and submit the Phase I ESA report (Tetra Tech 2020a), Phase II ESA Report (Tetra Tech 2020b), and this Phase II ESA Addendum report to the DTSC for review. Again, it is likely that the DTSC will require that a Phase I ESA Update be performed to evaluate the potential for additional RECs to have impacted the Site following the completion of this report. Additional environmental assessment of the Site may be required by DTSC based on the results of the Phase I ESA Update report.

Notes:

a - Soil sample results are listed showing only the detected OCPs.

b - non carcinogenic

c - carcinogenic

d - SLs are the USEPA Region 9 Residential Soil Screening Level (USEPA 2021) as recommended by DTSC HHRA Note 3 (DTSC 2020).

e - The compound-specific MDLs and PQLs for analytes that were not detected are presented with the laboratory reports in Appendix A.

f - The detections and quantitation limits are raised due to sample dilution (see results in Appendix A).

g - Sample analyzed after holding time expired.

h - The detections and quantitation limits are raised due to matrix interferences (see results in Appendix A).

MDL - method detection limit

ND - not detected

OCP - Organochlorine Pesticide

PQL - practical quantitation limit

SL - Screening Level

The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.

The analyte concentrations in bold font exceed their relevant screening level.

Dieldrin	0.056	0.034	3.2	1.6E-06	0.018
	Estimated Cumulative Risk and Hazard Index[5]			2.E-06	0.06

Definitions:
mg/kg - milligrams per kilogram

Notes:
[1] Maximum detected concentration in surface soil samples (0-0.5 feet below ground surface). Sample list the listed concentration is maximum detected concentration.

[2] Listed screening levels are DTSC-Modified Soil Screening Levels, if available, or USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

[3] Estimated cancer risk = (soil concentration/cancer soil screening level) x 10^{-6}.

[4] Estimated hazard = (soil concentration/non-cancer soil screening level).

[5] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

Table 7
Estimated Risk for Potential Residential Exposures to Soil: Maximum Detections of COPCs Using 95% UCL for Dieldrin
Phase II ESA Addendum
3410 North Rose Avenue
Oxnard, California

Chemical	Maximum Detection (mg/kg)[1]	Residential Soil Screening Levels (mg/kg)[2]		Residential Risk Screen	
		Carcinogenic	Non-carcinogenic	Estimated Risk[3]	Estimated Hazard Quotient[4]
Pesticides					
4,4'-DDD (DDD)	0.05	2.3	1.9	2.2E-08	0.026
4,4'-DDE (DDE)	0.4	2.0	23	2.0E-07	0.017
4,4'-DDT (DDT)	0.069	1.9	37	3.6E-08	0.002
Dieldrin	0.0335	0.034	3.2	9.9E-07	0.010
	Estimated Cumulative Risk and Hazard Index[5]			1.E-06	0.06

Definitions:
mg/kg - milligrams per kilogram

Notes:
[1] Listed concentration for dieldrin is the 95% UCL calculated using USEPA's ProUCL software. For other COPCs, the listed concentration is maximum detected concentration.

[2] Listed screening levels are DTSC-Modified Soil Screening Levels, if available, or USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

[3] Estimated cancer risk = (soil concentration/cancer soil screening level) x 10^{-6}.

[4] Estimated hazard = (soil concentration/non-cancer soil screening level).

[5] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

A - LABORATORY REPORT

Date of Report: 01/18/2021

James R. Steele

Tetra Tech, Inc.- Santa Barbara
5383 Hollister, Suite 130
Santa Barbara, CA 93111

Client Project:	[none]
BCL Project:	Rio School District Rose Ave MOT Facility
BCL Work Order:	2035739
Invoice ID:	B402820, B404023

Enclosed are the results of analyses for samples received by the laboratory on 12/7/2020. If you have any questions concerning this report, please feel free to contact me.

Revised Report: This report supercedes Report ID 1001114170

Sincerely,

Molly Meyers

Case Narrative

Discussion

Client submitted a revised coc for running analysis on X3 samples, informed client past hold, ok to proceed. Revised coc attached under misc docs in report.
Client stated to run:

Please analyze samples SS-5-2.5, SS-7-2.5, SS-22-0, SS-23-0, SS-24-0, SS-25-0, SS-28-0, SS-29-0, SS-30-0, and SS-31-0 for OCPs using method EPA 8081.

Summary of Flags

A10	Detection and quantitation limits were raised due to matrix interference.
A17	Surrogate not reportable due to sample dilution.
A19	Surrogate is high due to matrix interference. Interferences verified through second extraction/analysis.
A20	Surrogate is low due to matrix interference. Interference verified through second extraction/analysis.
A52	Chromatogram not typical of diesel.
A55	Chromatogram not typical of crude oil.
Q03	Matrix spike recovery(s) was(were) not within the control limits.
S09	The surrogate recovery for this compound was not within the control limits.
S15	Client added sample after holding time expiration date.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Client: BC Laboratories
Project/Site: 2035739

Laboratory Job ID: 410-24428-1

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
·QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
·Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
·Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Definitions/Glossary

Client: BC Laboratories
Project/Site: 2035739

Job ID: 410-24428-1

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
S1-	Surrogate recovery exceeds control limits, low biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
1C	Result is from the primary column on a dual-column method.
2C	Result is from the confirmation column on a dual-column method.
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Job ID: 410-24428-1

Laboratory: Eurofins Lancaster Laboratories Env, LLC

Narrative

Job Narrative
410-24428-1

Receipt
The samples were received on 12/18/2020 3:19 PM; the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.8°C

Hydrocarbons
Method MAEPH: The following sample(s) was prepared outside of preparation holding time due to arriving on the last day of hold

Method MAEPH: The method blank for preparation batch 410-79385 and 410-79802 contained Pyrene above the method detection limit (MDL) but less than the reporting limit (RL). The following samples associated with this method blank contained the target compound: 2035739-01 (410-24428-1), 2035739-02 (410-24428-2), 2035739-04 (410-24428-3), 2035739-06 (410-24428-4), 2035739-08 (410-24428-5), 2035739-10 (410-24428-6), 2035739-12 (410-24428-7) and 2035739-17 (410-24428-9). The sample(s) were re-extracted and re-analyzed outside of holding time. Since both trials are past hold and Pyrene was not detected in the method blank of the re-extract batch, data is reported from the second trial.

Method MAEPH: Pyrene was detected above the method detection limit (MDL) but below the reporting limit (RL) in the method blank associated with preparation batch 410-79385 and 410-79802 and analytical batch 410-80634 as well as in the following sample: 2035739-15 (410-24428-8). All affected samples were re-extracted and re-analyzed outside of holding time. Both sets of data have been reported.

Method MAEPH: The following sample(s) was received with less than 2 days remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: 2035739-01 (410-24428-1), 2035739-02 (410-24428-2), 2035739-04 (410-24428-3), 2035739-06 (410-24428-4), 2035739-08 (410-24428-5), 2035739-10 (410-24428-6), 2035739-12 (410-24428-7), 2035739-15 (410-24428-8), 2035739-17 (410-24428-9), (410-24428-A-1-E MS) and (410-24428-A-1-F MSD).

Method MAEPH: The breakthrough for Naphthalene and 2-Methylnaphthalene in the LCS is <1%. The breakthrough for Naphthalene and 2-Methylnaphthalene in the LCSD is <1%. The method requirement for breakthrough is <5%.

Method MAEPH: 1-Chlorooctadecane (Surr) recovery for the method blank was outside the lower control limits. The samples were re-extracted outside of hold time and the method blank surrogate is again outside the control limits. Results are reported from the first trial. 2035739-01 (410-24428-1), 2035739-02 (410-24428-2), 2035739-04 (410-24428-3), 2035739-06 (410-24428-4), 2035739-08 (410-24428-5), 2035739-10 (410-24428-6), 2035739-12 (410-24428-7), 2035739-15 (410-24428-8), 2035739-17 (410-24428-9), (410-24428-A-1-C MS) and (410-24428-A-1-D MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

1.0 INTRODUCTION

1.1 BACKGROUND

This report presents the findings of a Phase II Environmental Site Assessment (ESA) prepared by Tetra Tech for the Rio School District (RSD) to evaluate a 11.1 acre portion of Assessor's Parcel No. (APN) 144-0-110-590 at 2600 North Rose Avenue in the Oxnard planning area of Ventura County, California (hereinafter referred to as the Site). Sage Realty (Sage) is coordinating this project for RSD. The Site location is shown on Figure 1.

The Phase II ESA was performed as part of the due diligence efforts required to support development of the Site by the RSD. The RSD proposes to acquire and develop the Site with new educational and support facilities as part of an expansion project for the Rio Del Valle Middle School that will result in an approximately 41.3 acre campus (Figure 1). The project site is generally surrounded by agricultural lands and residential to the north, agricultural to the east, commercial (car dealerships) to the south, and residential to the west.

The current owner of the Site is KMS Industries, Inc. The Site is leased by Reiter Affiliated Companies for berry production and is currently used for the production of berries. The Site is currently used as an organic berry farm and contains a single family residence, a farm yard area used for fuel and equipment storage, and areas formerly leased to a landscape maintenance company and for junk automobile storage.

Tetra Tech completed a Phase I ESA for the Site (Tetra Tech 2021). The Phase I ESA identified six recognized environmental conditions (RECs) for the Site. REC 1 is for potential former agricultural pesticide application (specifically organochlorine pesticides [OCPs] and arsenic pesticides). REC 2 is for potential bunker oil releases from potential former smudge pot frost abatement practices. REC 3 is for observed vehicle-related hydrocarbon and potentially toxic metals releases to surface and near surface soil at the Site from recent storage of junk automobiles and vehicle parking at the Site. REC 4 is for observed releases to surface and from near surface soil from two diesel and one gasoline above ground storage tanks (ASTs) at the Site used by the current tenant to fuel farm vehicles. The ASTs are owned by the MacValley Oil Company under lease from Reiter Affiliated Companies. One AST holds diesel fuel, one holds red diesel fuel, and one holds gasoline. The two diesel ASTs are approximately 300 gallons capacity and the gasoline AST is approximately 500 gallons capacity. The three ASTs were installed in 2016. Some evidence of potential leaks or spills was spotted at the base of the secondary containment bins. REC 5 is for potential polychlorinated biphenyl (PCB) releases to surface and from near surface soil at the Site from pole-mounted electrical transformers. REC 6 is for high volume water transmission pipelines that are located beneath North Rose Avenue and Collins Street within 1,500 feet of the Site. Tetra Tech recommended that a Phase II ESA be performed to evaluate RECs 1 through 5 as part of the pre-acquisition due diligence process. Because the Site will become part of a K-12 school in the future, the Phase II ESA field work sampling program was planned and performed in accordance with California Department of Toxic Substances Control (DTSC) guidelines. A hazardous pipeline assessment should be conducted in accordance with the California Department of Education (CDE) guidelines in *Guidance Protocol for School Site Pipeline Risk Analysis* (CDE 2007) to evaluate REC 6. The hazardous pipeline assessment is not required under ASTM Standard Practice E1527-13 (ASTM 2013) but will be required by the CDE when a portion of the Site is developed as a K-12 school. Tetra Tech recommends that the RSD wait until the Site is developed as a K-12 school to complete the hazardous pipeline assessment to address REC 6.

This Phase II ESA was completed to further assess RECs 1 through 5 that were identified in the Phase I ESA (Tetra Tech 2021).

1.2 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Messrs. James (Jim) Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. Steele, P.G., C.E.G., C.Hg.
Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-6302
Email: jim.steele@tetratech.com

Randy Westhaus, P.E.
Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 455-0603
Email: randy.westhaus@tetratech.com

The designated contact person for the RSD is Mr. Wael Saleh. Mr. Saleh is the Assistant Superintendent/Chief Business Official for the RSD. The contact information for Mr. Saleh is:

Mr. Wael Saleh, C.P.A., M.B.A.

2.0 SITE DESCRIPTION

2.1 SITE LOCATION/DESCRIPTION

The Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98 acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The geographic coordinates of the Site are approximately Latitude 34° 13' 50.75" North, Longitude 119° 9' 15.86" West (Google Earth 2021). Surface elevations at the Site are approximately 92 feet above mean sea level (EDR 2021).

The RSD proposes to acquire and develop the 11.1 acre Site with new educational and support facilities as part of the Rio Del Valle Expansion Project. The proposed development for the Site include a Transportation and Parking Facility in the western half of the Site (approximately 5.6 acres). The eastern half of the Site (approximately 5.4 acres) may be developed as part of the adjacent Rio Del Valle Middle School campus at a future point in time with recreation/athletic facilities including tennis courts and basketball courts. The Rio Del Valle Expansion Project will also include new developments on the adjacent existing Rio Del Valle campus and a 10.0 acre North Campus expansion area that will continue to be used for agricultural production (Figure 1).

The Site is owned by KMS Industries, Inc. and is leased by Reiter Affiliated Companies. At the time of the June 18, 2021 field sampling event, the Site comprised an approximate 11.1 acre area of the 21.98 acre parcel owned by KMS Industries, Inc. and was leased by Reiter Affiliated Companies (Figure 2). The Site currently contains (approximately) a 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farm Yard. The remaining 8.7 acres of the Site is occupied by areas of organic raspberry production with access roads. Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops and orchards. The agricultural section of the Site was planted in organic raspberries under shade structures when the sampling was performed. The Residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The Junk Vehicle Storage Area formerly contained approximately 30 junk cars. The Tenant Storage Yard contained a trailer, motor home, two storage containers, and utility truck that had been removed before the June 18, 2021 sampling event. The Farm Equipment Storage and Parking Area contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment. Three cylindrical steel ASTs with steel secondary containment bins that are owned and operated by Reiter Affiliated Companies were observed in the Farm Equipment Storage and Parking Area (Figure 2). The ASTs contained diesel fuel, red diesel fuel, and gasoline for farm equipment. The two diesel ASTs are approximately 300 gallons capacity and the gasoline AST is approximately 500 gallons capacity. The ASTs are within individual steel containment bins.

2.2 SITE VICINITY CHARACTERISTICS

The Site is located in an area developed primarily for residential and agricultural land use situated in the Rancho Santa Clara del Norte General Plan Area of Ventura County (Ventura County 2019). (Figures 1 and 2). The Site and the adjacent area to the southeast and east are zoned Agricultural Exclusive forty acre minimum lot (AE-40 ac). North Rose Avenue is adjacent to the northwest Site boundary. The area directly across North Rose Avenue from the Site is zoned Rural Exclusive 20,000 square feet minimum lot (RE 20,000 sq ft) and 10,000 square feet minimum lot (RE 10,000 sq ft). The Rio Del Valle Middle School, located adjacent to the northeast Site boundary, is zoned RE 10,000 sq ft. The Oxnard Auto Center located adjacent to the southwest Site boundary across Collins Street is zoned for Auto Sales and Service.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING AND CONDITIONS

The Site is depicted on the Oxnard, California Quadrangle USGS 7.5-minute topographic series map (USGS 2018) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 13' 50.75" North, Longitude 119° 9' 15.86" West (Google Earth 2021).). Surface elevations at the Site are approximately 92 feet above mean sea level (EDR 2021).

3.1 REGIONAL GEOLOGY

The Site is located in Ventura County on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. This geomorphic province is distinguished by the prevailing east-west linear trend of its geologic structure and geomorphology in contrast to the predominant northwest-southeast trend of the geomorphic features within most other provinces of the state. The province is bounded by major faults, including the San Andreas Fault zone in the northeast, the Big Pine fault in the north and the Malibu Coast fault in the south. Most of the faults in Ventura County are reverse faults which dip north, including the Pine Mountain, Red Mountain, San Cayetano, Santa Susana, Simi, Ventura and Malibu Coast faults (Norris and Webb 1990).

The Ventura Basin is a large synclinal structure situated between the Santa Ynez Range and Topa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Department of Conservation, California Geologic Survey [CGS] 2002).

3.2 LOCAL GEOLOGY

Locally, the Site is situated in the Oxnard Plain sub-province. Lithologic units of sedimentary origin underlying the nearly flat Oxnard Plain are approximately 45,000 feet in thickness and consist of Upper Cretaceous, Tertiary, and Quaternary-age units which have been deposited on a pre-Upper Cretaceous base of igneous and/or metamorphic rock. Unconsolidated Holocene (last 11,000 years) sediments beneath the Site were deposited during the post-glacial period in marine, lagoonal, lacustrine, fluvial-flood plain, deltaic and eolian environments, including the pre-historic delta of the ancient Santa Clara River and Calleguas Creek and reach a depth of approximately 900 feet beneath the Oxnard Plain (Turner and Mukae 1975).

3.3 HYDROLOGY

3.3.1 Hydrogeology

The Site is situated at the eastern edge of the Oxnard Forebay basin, a subbasin of the larger Santa Clara-Calleguas groundwater basin. The Oxnard Forebay is an important groundwater recharge area for valuable resources of groundwater in aquifers underlying the Oxnard Plain. The unconsolidated sediments beneath the Oxnard Forebay and the Site are composed of both continental and marine deposits of Tertiary and Quaternary age. They contain multiple aquifers of coarse grain sediments with intervening fine grain aquitards. Aquifers have been grouped into an Upper Aquifer System (UAS) and a Lower Aquifer System (LAS) based on changes in geologic structure and separated in many areas by regional layers of low permeability clay. The UAS sediments are relatively flat lying and extend to approximately 400 feet beneath the Site. The sediments in the LAS are more structurally complex, resulting from folding and faulting. In the Oxnard Forebay, alluvial sediments in the subsurface are predominantly coarse grain sands

and gravels. Fine grain sediments, such as silts and clays, that can act as confining layers are generally absent or discontinuous. This condition allows for direct recharge of the UAS from the surface and some recharge of the LAS from the UAS in the subsurface (Fox Canyon Ground Water Management Agency 2017; Turner and Mukae 1975).

The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet below ground surface (bgs) to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

3.3.2 Flood Zoning

According to the U.S. Department of Homeland Security Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map No. 06111C0910E, the Site is not located in a flood hazard area (FEMA 2010).

3.3.3 Wetlands

The EDR report indicates that the Site area is covered in the National Wetlands Inventory prepared by the U.S. Fish and Wildlife Service (USFWS) (EDR 2021) (Appendix D). The U.S. Fish and Wildlife Service maintains the National Wetlands Inventory (NWI), a geographic information system (GIS)-based relational database of wetlands that have been mapped throughout the country. Based on the information provided in the EDR Report and review of the USFWS map for the area surrounding the Site, the nearest wetland is the UWCD El Rio Spreading Grounds, located 0.5 to 1 mile north of the Site (USFWS 2020).

3.3.4 Asbestos Containing Rocks

Tetra Tech has reviewed available topographic and geologic maps for the Site area and *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (CDMG 2000) for potential sources of naturally occurring asbestos (NOA) and believes the risk for NOA at the Site is low. The nearest sources of NOA are approximately 40 miles northwest of the Site in the Santa Ynez River Watershed located in Santa Barbara County.

4.0 PHASE II ESA FIELD ASSESSMENT

4.1 RATIONALE

Tetra Tech implemented the field sampling in accordance with the following DTSC guidance documents:

- *Preliminary Endangerment Guidance Manual* (DTSC January 1994, Revised October 2015) (PEA Guidance Manual), and
- *Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008) (Agricultural Fields Guidance).

To assess the Site for potential former agricultural pesticide application impacts to the Site (REC 1) from agricultural row crop production performed between 1950 and 1974, the Agricultural Fields Guidance (DTSC 2008) recommends the assessment of surface soil for OCPs and arsenic through sample collection and laboratory analysis. Surface soil sample collection and laboratory analysis is also recommended to assess potential impacts from smudge pots containing fuel oil that were likely formerly used at the Site for frost abatement (REC 2). Therefore, surface soil sample collection and laboratory analysis was performed to assess the potential impacts to Site soils from former commercial pesticide application from OCPs and arsenic, and from fuel oil used in smudge pots for former frost abatement practices.

The potential impacts to the Site from the observed vehicle related hydrocarbon and potentially toxic metals releases to surface soil at the Site from recent storage of junk automobiles and vehicle parking at the Site (REC 3) and from observed releases to surface soil from diesel fuel and gasoline ASTs at the Site (REC 4) was also assessed through surface soil sample collection.

Surface soil sampling was also performed to assess the potential release of PCBs to Site soils from the two pole-mounted electrical transformers located in the central area of the Site and at the west Site boundary along North Rose Avenue (REC 5).

4.2 SITE HEALTH AND SAFETY

A Site-Specific Health and Safety Plan (SSHSP) was prepared for the Phase II ESA. The SSHSP is required by law to perform work at sites where workers may be exposed to hazardous waste and/or materials. The SSHSP was prepared in accordance with Code of Federal Regulations (CFR) Section 1910.120, California Administrative Code (CAC), Title 8, and the Tetra Tech Corporate *Health and Safety Manual* (Tetra Tech 2011, Revised August 2021). The SSHSP included a Site location map and a map showing the most direct route to the nearest emergency care center, the identity of the Site Health and Safety Officer, lists of the chemicals, materials, equipment, physical conditions that pose a threat or hazard, and the level of protection that will provide for proper worker safety. Proof of valid and current Occupational Safety and Health Administration (OSHA) training certifications is required for all Site workers. The SSHSP also described the procedures and practices that were followed during field activities, including safety monitoring and field decontamination. All fieldwork was performed in accordance with the SSHSP.

4.3 SOIL SAMPLE COLLECTION AND SAMPLE ANALYSIS SCHEDULE

The surface soil sample analysis schedule is presented in Table 1 and the surface soil sample locations are shown on Figure 3. Tetra Tech collected surface soil samples using hand sampling techniques at 20 locations in the 11.1 acre Site in an equal-spaced grid pattern to assess potential pesticide and fuel oil in surface soils. Surface soil samples were collected at seven locations to assess potential impacts from vehicle related hydrocarbon and potentially toxic metals releases to surface soil at the Site from recent storage of

junk automobiles and vehicle parking at the Site and from observed releases to surface soil from above ground diesel fuel ASTs at the Site. Surface soil samples were collected at three locations to assess potential PCBs in surface soils beneath pole-mounted transformer locations. The soil sample analyses were performed by BC Laboratories, Inc. (BC), a California State Certified laboratory.

4.3.1 Assessment of Potential Impacts to Soil from Past Agricultural Land Use

Assessment of Potential OCPs and Arsenic in Soil. Based on rationale recommended in the PEA Guidance Manual (DTSC 2015) and Agricultural Fields Guidance (DTSC 2008), Tetra Tech collected soil samples using hand sampling techniques at 20 locations (sample locations SS-1 through SS-20) in the 11.1 acre Site in an equal-spaced grid pattern (Figure 3 and Table 1). At each location, a surface soil sample was collected at depths of 0 to 0.5 feet bgs. The twenty discrete surface soil samples were collected and combined into five composite samples and one duplicate composite sample by the analytical laboratory for OCP analysis using United States Environmental Protection Agency (EPA) method 8081A (Tables 1 and 2). Surface soil samples SS-1 through SS-4 were combined into composite sample CS-1 and duplicate composite sample CS DUP1. Surface soil samples SS-5 through SS-8 were combined into composite sample CS-2. Surface soil samples SS-9 through SS-12 were combined into composite sample CS-3. Surface soil samples SS-13 through SS-16 were combined into composite sample CS-4. Surface soil samples SS-17 through SS-20 were combined into composite sample CS-5. As required by the Agricultural Fields Guidance document, five discrete surface soil samples (samples SS-1, SS-5, SS-9, SS-13, and SS-17) and one duplicate soil sample from sample SS-5 (6 soil samples total) were collected for arsenic analysis using EPA method 6010B within the OCP sampling grid (Table 3). In addition, discrete soil samples SS-23 through SS-29 and duplicate soil sample DUP3 were included in the arsenic sample set because they were analyzed for CAM 17 Metals using EPA method 6010B/7471A, which includes the arsenic analysis.

Assessment of Potential Smudge Pot Fuel Oil in Soil. To assess the Site for potential impacts to soil from smudge pot fuel oil, Tetra Tech collected surface soil samples using hand sampling techniques at depths of 0 to 0.5 feet bgs at 10 locations across the Site within the OCP sampling grid (Figure 3 and Table 1). Ten discrete surface soil samples (samples SS-1, SS-3, SS-5, SS-7, SS-10, SS-12, SS-13, SS-15, SS-17, and SS-19) and one duplicate soil sample at sample location SS-5 (11 soil samples total) were collected from the equal-spaced grid pattern used for the OCP samples and analyzed for semivolatile organic compounds (SVOCs) using EPA method 8270C, polyaromatic hydrocarbons (PAHs) using EPA method 8270C SIM, and diesel fuel total petroleum hydrocarbons (TPHd) and hydraulic oil/motor oil total petroleum hydrocarbons (TPHh/m) using EPA method 8015M (Tables 4, 5, and 6).

4.3.2 Assessment of Potential Hydrocarbon and Heavy Metal Impacts to Soil from Junk Automobile Storage and AST Diesel Fuel Releases

To assess the Site for potential impacts to soil from potential hydrocarbon and heavy metals releases from junk automobile storage and the diesel and gasoline ASTs, Tetra Tech collected surface soil samples using hand sampling techniques at depths of 0 to 0.5 feet bgs at seven locations (Figure 3 and Table 1). Seven discrete surface soil samples (samples SS-23 through SS-29) and one duplicate soil sample (Dup3) (8 soil samples total) were collected from areas of observed soil staining and analyzed for CAM 17 Metals using EPA method 6010B/7471A, SVOCs using EPA method 8270C, PAHs using EPA method 8270C SIM, total purgeable petroleum hydrocarbons (TPPH) using the LUFT gas chromatograph/mass spectrometer (GC/MS) method, TPHd and TPHh/m using EPA method 8015M, and volatile organic compounds (VOCs) using EPA method 8260B (Tables 3, 4, 5, 6, and 7). In addition, surface soil sample SS-10 is included in the sample set because it is within the former junk automobile storage area and was analyzed for TPHd and TPHh/m using EPA method 8015M.

4.3.3 Assessment of Potential PCB Impacts to Soil

To assess the Site for potential impacts to soil from PCBs that may have been released from the three pole-mounted electrical transformers, Tetra Tech collected surface soil samples at a three locations (sample locations SS-9, SS-21, and SS-22) using hand sampling techniques at depths of 0 to 0.5 feet bgs from beneath the power pole (Figure 3 and Table 1). Three discrete surface soil samples and one duplicate soil sample (DUP2) (four soil samples total) were collected and analyzed for PCBs using EPA method 8082.

4.4 SOIL SAMPLE ANALYSIS RESULTS

4.4.1 Analytical Results for Organochlorine Pesticides

The OCP sample results are included in Appendix A, summarized in Table 2, and the sample locations are shown on Figure 3. Low concentrations of OCPs were detected in all five surface soil composite samples and the composite duplicate sample. The OCPs 4,4'-DDD (DDD), 4,4'-DDE (DDE), and 4,4'-DDT (DDT) were detected in all the composite samples. For each OCPs detected at concentrations above the laboratory method detection limit (MDL), the maximum detected concentration occurred in the following samples:

- DDD was detected at a maximum concentration of 0.011 milligrams per kilogram (mg/kg) in composite sample CS-2;
- DDE was detected at a maximum concentration of 0.27 mg/kg in composite sample CS-5; and
- DDT was detected at a maximum concentration of 0.078 mg/kg in composite sample CS-3.

No other OCPs were detected at concentrations above the laboratory MDLs, which are less than their respective U.S. EPA RSLs (U.S. EPA 2020).

None of the OCPs were detected at concentrations that exceeded their respective U.S. Environmental Protection Agency (U.S. EPA) Regional Screening Levels (RSLs) (U.S. EPA 2021) for residential soil (Table 2).

4.4.2 Analytical Results for Arsenic and Total Metals

The arsenic and total metals sample results are included in Appendix A, summarized in Table 3, the sample locations are shown on Figure 3. Arsenic concentrations in the all of the surface soil samples ranged from 3.7 mg/kg in sample SS-17 to 2.2 mg/kg in samples SS-1 and SS-23. These sample results are below the DTSC arsenic screening value for soil at California School Sites (DTSC-ASL) of 12 mg/kg (DTSC 2008). Barium, beryllium, cadmium, total chromium, cobalt, copper, lead, molybdenum, nickel, vanadium, and zinc were detected in some or all of the 12 discrete and two duplicate soil samples. None of the remainder of the metals concentrations detected in the 12 discrete and two duplicate soil samples exceed the US EPA Region 9 RSLs.

4.4.3 Analytical Results for SVOCs

The SVOC sample results are included in Appendix A, summarized in Table 4, and the sample locations are shown on Figure 3. The SVOC DDE was detected in soil samples SS-1, SS-3, SS-5, SS-7, SS-12, SS-

13, SS-15, SS-17, SS-19, and SS-27 at concentrations ranging from 0.21 mg/kg in sample SS-7 to 0.030 mg/kg in sample SS-3, which is less than the U.S. EPA RSL for residential soil of 2.0 mg/kg.

No other SVOCs in the EPA Method 8270C list were detected at concentrations above their laboratory MDLs, which were less than less than their respective U.S. EPA RSLs (U.S. EPA 2021).

4.4.4 Analytical Results for PAHs

The PAH sample results are included in Appendix A, summarized in Table 5, and the sample locations are shown on Figure 3. PAHs were detected in the soil samples SS-10 and SS-23 at concentrations well below their respective U.S. EPA RSLs (U.S. EPA 2021). No other PAHs in the EPA 8270 Method SIM list were detected at concentrations above their laboratory MDLs, which were less than less than their respective U.S. EPA RSLs (U.S. EPA 2021).

4.4.5 Analytical Results for TPPH, TPHd, and TPHh/m

The TPPH, TPHd, and TPHh/m sample results are included in Appendix A, summarized in Table 6, and the sample locations are shown on Figure 3. Figure 4 presents a TPPH, TPHd, and TPHh/m hits map that shows the sample results at concentrations above at the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs) (SFRWQCB 2019) for residential soil. TPPH were detected in all seven of the surface soil samples and the duplicate sample collected at Site for TPPH analysis. THPd and TPHh/m were detected in seven of the 17 of the surface soil samples and the two duplicate surface soil samples collected at Site for TPHd and TPHh/m analysis. The TPPH, TPHd, and TPHh/m sample results are summarized below:

- TPPH was detected in samples SS-23 through SS-29 and DUP3 (duplicate sample for sample SS-23) at concentrations ranging from 310 mg/kg in sample SS-23 to 0.11 mg/kg in sample SS-27 as compared to the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Level (ESL) for residential soil of 100 mg/kg (SFRWQCB 2019);

- TPHd was detected in samples SS-1 at 20 mg/kg, DUP1 (duplicate sample for sample SS-5) at 48 mg/kg, SS-23 at 14,000 mg/kg, DUP3 (duplicate sample for sample SS-23) at 62 mg/kg, SS-24 at 25,000 mg/kg, SS-26 at 8,100 mg/kg, and SS-27 at 20 mg/kg as compared to the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg (SFRWQCB 2019); and

- TPHh/m was detected in samples SS-1 at 140 mg/kg, SS-5 at 140 mg/kg, DUP1 (duplicate sample for sample SS-5) at 220 mg/kg, SS-7 at 26 mg/kg, SS-10 at 2,800 mg/kg, SS-12 at 21 mg/kg, SS-13 at 19 mg/kg, SS-15 at 57 mg/kg, SS-17 at 20 mg/kg, SS-19 at 10 mg/kg, DUP 3 (duplicate sample for sample SS-23) at 280 mg/kg, SS-25 at 27,000 mg/kg, SS-26 at 33,000 mg/kg, SS-27 at 71 mg/kg, SS-28 at 74,000 mg/kg, and SS-29 at 25,000 mg/kg as compared to the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg (SFRWQCB 2019).

TPPH were detected in sample SS-23 at a concentration of 310 mg/kg, exceeding the SFRWQCB Tier 1 ESL for residential soil of 100 mg/kg. TPHd was detected in samples SS-23 (14,000 mg/kg), SS-24 (25,000 mg/kg), and SS-27 (8,100 mg/kg) at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg by one to two orders of magnitude. TPHh/m was detected in samples SS-10 (2,800 mg/kg), SS-25 (27,000 mg/kg), SS-26 (33,000 mg/kg), SS-28 (74,000 mg/kg), and SS-29 (25,000 mg/kg) at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg by zero to one order of magnitude (SFRWQCB 2019).

It is notable that all of the samples with TPPH, TPHd, and TPHh/m detected at concentrations above their relevant screening levels were collected from the Junk Vehicle Storage Area, Tenant Storage Area, and Farm Equipment Storage and Vehicle Parking Area. With the exception of sample SS-10 (which is in the Junk Vehicle Storage Area), none of the samples collected within the equal-spaced grid pattern used to assess the potential impact from smudge pot fuel oil in the agricultural areas of the Site (samples SS-1, SS-3, SS-5, SS-7, SS-10, SS-12, SS-13, SS-15, SS-17, SS-19, and Dup 1), contained TPHd or TPHh/m at concentrations above their relevant screening levels.

4.4.6 Analytical Results for Sample MO-1 for TPHd and TPHh/m

Sample MO-1 was collected from a mineral oil miticide used at the Site, Omni Oil 6, and analyzed for TPHd and TPHh/m by EPA method 8015M. Sample MO-1 was collected from a mixture of Omni Oil 6 and tap water that is applied to the raspberry bushes to treat them for mites (1.5 gallons Omni Oil 6 to 100 gallons of water). The chromatogram from sample MO-1 was visually compared to the EPA method 8015M sample analysis chromatograms from samples SS-1, SS-3, SS-5, SS-7, SS-10, SS-12, SS-13, SS-15, SS-17, SS-19, SS-23 through SS-29, Dup 1, and Dup 3 and to the chromatograms for the laboratory standards used in the analysis. The chromatogram for sample MO-1 did not visually correlate with the chromatograms for samples SS-1, SS-3, SS-5, SS-7, SS-10, SS-12, SS-13, SS-15, SS-17, SS-19, SS-23 through SS-29, Dup 1, and Dup 3. In addition, none of the chromatograms for samples where TPHd and TPHh/m were detected correlated with the chromatograms for the TPHd and TPHh/m in the laboratory standards used for this analysis.

4.4.7 Analytical Results for VOCs

The VOC sample results are included in Appendix A, are summarized in Table 7, and the sample locations are shown on Figure 3. VOCs were detected in the soil samples SS-23, DUP3 (duplicate sample for sample SS-23), SS-24, SS-25, SS-27, SS-28, and SS-29 at concentrations well below their respective U.S. EPA RSLs (U.S. EPA 2021). No other VOCs in the EPA 8260B Method list were detected at concentrations above their laboratory MDLs, which were less than their respective U.S. EPA RSLs (U.S. EPA 2021).

4.4.8 Analytical Results for PCBs

The PCB sample results are included in Appendix A, are summarized in Table 8, and the sample locations are shown on Figure 3. No PCBs were detected at concentrations above their laboratory MDLs, which were less than their respective U.S. EPA RSLs (U.S. EPA 2021).

THIS PAGE INTENTIONALLY LEFT BLANK

5.0 CONCLUSIONS

5.1 GENERAL SITE CONDITIONS

The Site currently contains a 0.3-acre residential area, 0.6-acres in storage yard areas, a 1-acre farm equipment storage and parking area, a 0.26-acre farmyard, with the remainder of the Site being occupied by access roads and areas of organic raspberry agricultural production (Figure 2). Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops and orchards. The agricultural section of the Site was planted in organic raspberries under shade structures. The residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The storage yard formerly contained approximately 30 junk cars, a trailer, motor home, and utility truck. The farm yard and storage yard areas contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment.. Two 300 gallons capacity cylindrical steel ASTs (diesel fuel) and a 500 gallons capacity AST (gasoline) with secondary containment bins were present in the farm equipment storage and vehicle parking area. The ASTs contained diesel fuel, red diesel fuel, and gasoline (Figure 2).

5.2 PHASE II ESA RESULTS

This Phase II ESA was completed to further assess RECs 1 through 5 that were identified in the Phase I ESA (Tetra Tech 2021) as follows:

- REC 1, potential impacts to surface and near surface soil at the Site from former pesticide applications associated with former agricultural land use practices, specifically OCPs and arsenic;
- REC 2, potential bunker oil releases from potential former smudge pot frost abatement, specifically, SVOCs, PAHs, TPHd, and TPHh/m;
- REC 3, potential impacts to surface and near surface soil at the Site from hydrocarbons and heavy metals released from junk automobiles;
- REC 4, potential impacts to surface and near surface soil at the Site from hydrocarbons released from the two diesel and one gasoline ASTs; and
- REC 5, PCBs potentially released to surface soils beneath three pole-mounted electrical transformers.

Based on review of the Phase II ESA surface soil sample results the Site appears to have been impacted by TPPH, TPHd, and TPHh/m from releases from the junk vehicles previously stored at the Site and fuel storage ASTs (RECs 3 and 4) (Table 6 and Figure 4). The surface soil sample results for OCPs and arsenic (REC 1), SVOCs and PAHs (REC 2), VOCs (REC 4), and PCBs (REC 5) did not yield results with concentrations above relevant screening levels. The sample results TPPH, THPd, and TPHh/m are summarized below.

TPPH was detected in one sample, sample SS-23, at 310 mg/ kg, exceeding the SFRWQCB Tier 1 ESL for residential soil of 100 mg/kg. TPHd was detected in three surface soil samples, samples SS-23 at 14,000 mg/kg, SS-24 at 25,000 mg/kg, and SS-26 at 8,100 mg/kg, at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg by one to two orders of magnitude. TPHh/m was detected in five surface soil samples, samples SS-10 at 2,800 mg/kg, SS-25 at 27,000 mg/kg, SS-26 at 33,000 mg/kg, SS-28 at 74,000 mg/kg, and SS-29 at 25,000 mg/kg, at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg by zero to one order of magnitude.

The TPPH and TPHd detected in sample SS-23 and TPHd detected in sample SS-24 appear to be from accidental releases from the nearby fueling ASTs. The TPHd and TPHh/m detected in sample SS-26 appears to have been released from a vehicle or other equipment stored in the Tenant Storage Area. The TPHh/m detected in samples SS-10, SS-25, SS-28, and SS-29, appears to have been released from the junk vehicles formerly stored onsite.

6.0 RECOMMENDATIONS

The RSD proposes to acquire and develop the 11.1 acre Site with new educational and support facilities. The proposed development for the Site includes a Transportation and Parking Facility in the western half of the Site (approximately 5.6 acres). The eastern half of the Site (approximately 5.4 acres) may be developed as part of the adjacent Rio Del Valle Middle School campus at a future point in time with recreation/athletic facilities including tennis courts and basketball courts. The proposed Site development is shown on Figure 5.

Tetra Tech recommends that the RSD submit the Phase I ESA report and this Phase II ESA report to the DTSC and enter the Site into the DTSC Voluntary Cleanup Program (VCP). The Phase I ESA report and this Phase II ESA report should be used to support implementing potential remedies for the areas of shallow soil impacted with TPPH, TPHd and TPHh/m at concentrations exceeding the screening levels including either a Housekeeping Removal Action and/or the execution of land use covenants (LUCs).

A hazardous pipeline assessment should also be conducted in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (CDE 2007) to evaluate potential hazards posed by the two high-volume water transmission pipelines beneath North Rose Avenue and Collins Street within 1,500 feet of the Site prior to development of the K-12 school facilities on the eastern half of the Site.

	SS-21, Dup2									X	Analyze discrete sample for PCBs. Analyze discrete duplicate sample Dup2 for PCBs. Collect sample at base of power pole.
	SS-22									X	Analyze discrete sample for PCBs. Collect sample at base of power pole.
	SS-23, Dup3			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Analyze discrete duplicate sample Dup3 for haevy metals,,TPHd/mo, TPHg, VOCs, SVOCs and PAHs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas in front of fuel ASTs.
	SS-24			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis.
	SS-25			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas in front of fuel ASTs.
	SS-26			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas.
	SS-27			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas.
	SS-28			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas.
	SS-29			X	X	X	X	X	X		Analyze discrete sample for heavy metals, TPHd/mo, TPHg, VOCs, SVOCs and PNAs. Need 5035 kit for VOC and TPHg sample analysis. Collect sample in soil stained areas.
	MO-1				X						Analyze discrete aqueous sample for TPHd/mo. Collect sample of mineral oil miticide mixture.

Notes:

EPA - U.S. Environmental Protection Agency

OCPs - organochlorine pesticides

PAHs - polyaromatid hydrocarbons

PCBs - polychlorinated biphenyls

SVOCs - semivolatile organic compounds

TPHd - Diesel range total petroleum hydrocarbons

TPHh/m - Hydrualic oil/motor oil range total petroleum hydrocarbons

VOCs - volatile organic compounds

All other OCPs[d]			ND	ND	ND	ND	ND	ND

Notes:

a - All composite soil sample results are listed showing only the detected OCPs. Please refer to Appendix A for a complete list of the pesticides analyzed and their laboratory method detection limits.

b - non carcinogenic

c - carcinogenic.

d - The compound-specific MDLs and PQLs for analytes that were not detected are presented with the laboratory reports in Appendix A.

MDL - method detection limit

OCP - Organochlorine Pesticide

PQL - practical quantitation limit

RSL - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2021).

The detection limits and quantitation limits for all the samples are raised due to sample dilustion.

The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.

The analyte concentrations in bold font exceed their relevant screening level.

Table 5
Polyaromatic Hydrocarbons by EPA Method 8270 SIM
2600 North Rose Avenue
Oxnard, California
(milligrams per kilogram)

Notes:

a - Only the detected sample results are listed.

b - non carcinogenic

c - carcinogenic

d - The compound-specific MDLs and PQLs for analytes that were not detected are presented with the laboratory reports in Appendix A.

MDL - method detection limit

NA - not applicable

ND - Indicates constituent not detected at or above laboratory method detection limit. A complete list of the laboratory method detection limits is included in Appendix A.

ND<X - Indicates constituent(s) not detected at or above method detection limit.

PQL - practical quantitation limit

RSL - U. S. Environmental Protection Agency (EPA) Region 9 Regional Screening Level (RSL) for Residential and Industrial Soil, May 2021.

SVOC - Semivlotile Organic Compound

The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.

The analyte concentrations in bold font exceed their relevant screening level.

A - LABORATORY REPORT

Date of Report: 07/08/2021

James R. Steele

Tetra Tech, Inc.- Santa Barbara
5383 Hollister, Suite 130
Santa Barbara, CA 93111

Client Project:	19305
BCL Project:	Rio School District South Rose Avenue Project
BCL Work Order:	2119955
Invoice ID:	B421830

Enclosed are the results of analyses for samples received by the laboratory on 6/21/2021. If you have any questions concerning this report, please feel free to contact me.

Revised Report: This report supercedes Report ID 1001189026

Sincerely,

Contact Person: Robert Cortez
Client Service Rep

Stuart Buttram
Technical Director

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Discussion

Summary of Flags

A02	The difference between duplicate readings is less than the quantitation limit.
A10	Detection and quantitation limits were raised due to matrix interference.
A19	Surrogate is high due to matrix interference. Interferences verified through second extraction/analysis.
A20	Surrogate is low due to matrix interference. Interference verified through second extraction/analysis.
A52	Chromatogram not typical of diesel.
A57	Chromatogram not typical of motor oil.
L01	The Laboratory Control Sample Water (LCSW) recovery is not within laboratory established control limits.
Q01	Sample precision is not within the control limits.
Q03	Matrix spike recovery(s) was(were) not within the control limits.
S08	The internal standard on the sample was not within the control limits.
S09	The surrogate recovery for this compound was not within the control limits.
Z1	Sample was analysed twice and both times internal standard and surrogates were low.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected
PQL	Practical Quantitation Limit
A01	Detection and quantitation limits are raised due to sample dilution.
A02	The difference between duplicate readings is less than the quantitation limit.
A10	Detection and quantitation limits were raised due to matrix interference.
A19	Surrogate is high due to matrix interference. Interferences verified through second extraction/analysis.
A20	Surrogate is low due to matrix interference. Interference verified through second extraction/analysis.
A52	Chromatogram not typical of diesel.
A57	Chromatogram not typical of motor oil.
L01	The Laboratory Control Sample Water (LCSW) recovery is not within laboratory established control limits.
Q01	Sample precision is not within the control limits.
Q03	Matrix spike recovery(s) was(were) not within the control limits.
S08	The internal standard on the sample was not within the control limits.
S09	The surrogate recovery for this compound was not within the control limits.
Z1	Sample was analysed twice and both times internal standard and surrogates were low.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation, detachment or third party interpretation.

1.0 INTRODUCTION

This Technical Memorandum Supplemental Site Investigation Field Sampling Plan (SSIFSP) has been prepared by Tetra Tech and is being submitted to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Evaluation and Cleanup Branch on behalf of the Rio School District (RSD) for their Rio Del Valle Middle School Expansion Project South Campus Expansion Area (South Parcel) Supplemental Site Investigation (SSI). The scope of services for this SSI have been developed to assist the RSD in further assessing the nature and extent of total petroleum hydrocarbons (TPH) identified in Site surface soils at concentrations above Screening Levels that were identified in soil samples collected for the *Phase II Environmental Assessment Rio Del Valle Middle School Expansion Project 2600 North Rose Avenue, Oxnard California 93063* (Tetra Tech 2021b), potential organochlorine pesticides (OCPs) from former termiticide applications, and lead based paint (LPB) in soil around the existing residential structure, garage, and utility shed that were identified in the *Phase I Environmental Assessment, Rio Del Valle Middle School Expansion Project, 2600 North Rose Avenue, Oxnard, California 93036* (Tetra Tech 2021a). The SSIFSP is based on the scope of work agreed on by DTSC, Tetra Tech, RSD, and Sage Realty (Sage) at the SSI scoping telephone conference conducted on June 14, 2022.

The Rio Del Valle Middle School Expansion Project South Parcel site (hereinafter referred to as the Site) Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98 acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The RSD proposes to acquire and develop the 11.1-acre Site with new educational and support facilities as part of the Rio Del Valle Middle School Expansion Project. The proposed development for the Site includes a Transportation and Parking Facility in the western half of the Site (approximately 5.6 acres). The eastern half of the Site (approximately 5.4 acres) may be developed as part of the adjacent Rio Del Valle Middle School campus at a future point in time with recreation/athletic facilities including tennis courts and basketball courts.

This Technical Memorandum SSIFSP includes limited background and historical use information regarding the Site. A detailed summary of Site background and historical use information for the Site is presented in the *Phase I Environmental Assessment, Rio Del Valle Middle School Expansion Project, 2600 North Rose Avenue, Oxnard, California 93036.* (Tetra Tech 2021a). This Technical Memorandum is intended to provide details of the proposed SSI sampling and analytical work proposed for the Site in the SSI scoping telephone conference conducted on June 14, 2022. The scope of the SSI report will conform to the *PEA Guidance Manual* (DTSC 2015b) and will present findings from human health screening evaluations for the Site based upon the potential contaminants of concern identified through the field sampling program proposed here.

1.1 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Jim Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. (Jim) Steele, P.G., C.E.G., C.Hg.
Tetra Tech
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-6302

Randy Westhaus, P.E.
Tetra Tech
5383 Hollister Avenue, Suite 130

2.0 SITE DATA

2.1 SITE LOCATION AND DESCRIPTION

The Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98-acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The Site is owned by KMS Industries, Inc. and is leased by Reiter Affiliated Companies. At the time of the June 18, 2021 Phase II ESA field sampling event, the Site comprised an approximate 11.1-acre area of the 21.98-acre parcel owned by KMS Industries, Inc. and was leased by Reiter Affiliated Companies (Figure 2). In June 2021, the Site contained (approximately) a 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre vacant area that was formerly the Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farm Yard. The remaining 8.7 acres of the Site was occupied by areas of organic raspberry production with access roads. Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops and orchards. The agricultural section of the Site was planted in organic raspberries under shade structures when the Phase II ESA sampling was performed. The Residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The Junk Vehicle Storage Area formerly contained approximately 30 junk cars. The Tenant Storage Yard formerly contained a trailer, motor a home, two storage containers, and a utility truck. The vehicles in the former Junk Vehicle Storage Area and items in the Tenant Storage Yard had been removed before the June 18, 2021 sampling event. The Farm Equipment Storage and Parking Area contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment. Three cylindrical steel above ground storage tanks (ASTs) with steel secondary containment bins that are owned and operated by Reiter Affiliated Companies were observed in the Farm Equipment Storage and Parking Area (Figure 2). The ASTs contained diesel fuel, red diesel fuel, and gasoline for farm equipment. The two diesel ASTs are approximately 300 gallons capacity each and the gasoline AST is approximately 500 gallons capacity. The ASTs are within individual steel containment bins.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING AND CONDITIONS

The Site is depicted on the Oxnard, California Quadrangle U.S. Geological Survey (USGS) 7.5-minute topographic series map (USGS 2015) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 13' 50.75" North, Longitude 119° 9' 15.86" West (Google Earth 2021). Surface elevations at the Site range from approximately 94 feet above mean sea level (msl) in the northwest corner of the Site to 89 feet above msl in the southeast corner of the Site with a topographic gradient that is generally flat with a gentle slope to the southeast (EDR 2021).

3.1 REGIONAL GEOLOGY

The Site is located in Ventura County on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. This geomorphic province is distinguished by the prevailing east-west linear trend of its geologic structure and geomorphology in contrast to the predominant northwest-southeast trend of the geomorphic features within most other provinces of the state. The province is bounded by major faults, including the San Andreas Fault zone in the northeast, the Big Pine fault in the north and the Malibu Coast fault in the south. Most of the faults in Ventura County are reverse faults which dip north, including the Pine Mountain, Red Mountain, San Cayetano, Santa Susana, Simi, Ventura, and Malibu Coast faults (Norris and Webb 1990).

The Ventura Basin is a large synclinal structure situated between the Santa Ynez Range and Topa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Department of Conservation, California Geologic Survey [CGS] 2002).

3.2 LOCAL GEOLOGY

Locally, the Site is situated in the Oxnard Plain sub-province. Lithologic units of sedimentary origin underlying the nearly flat Oxnard Plain are approximately 45,000 feet in thickness and consist of Upper Cretaceous, Tertiary, and Quaternary-age units which have been deposited on a pre-Upper Cretaceous base of igneous and/or metamorphic rock. Unconsolidated Holocene (last 11,000 years) sediments beneath the Site were deposited during the post-glacial period in marine, lagoonal, lacustrine, fluvial-flood plain, deltaic and eolian environments, including the pre-historic delta of the ancient Santa Clara River and Calleguas Creek and reach a depth of approximately 900 feet beneath the Oxnard Plain (Clahan et al 2003; Turner and Mukae 1975).

3.3 HYDROLOGY

3.3.1 Hydrogeology

The Site is situated at the eastern edge of the Oxnard Forebay basin, a subbasin of the larger Santa Clara-Calleguas groundwater basin. The Oxnard Forebay is an important groundwater recharge area for valuable resources of groundwater in aquifers underlying the Oxnard Plain. The unconsolidated sediments beneath the Oxnard Forebay and the Site are composed of both continental and marine deposits of Tertiary and Quaternary age. They contain multiple aquifers of coarse grain sediments with intervening fine grain aquitards. Aquifers have been grouped into an Upper Aquifer System (UAS) and a Lower Aquifer System (LAS) based on changes in geologic structure and separated in many areas by

regional layers of low permeability clay. The UAS sediments are relatively flat lying and extend to approximately 400 feet beneath the Site. The sediments in the LAS are more structurally complex, resulting from folding and faulting. In the Oxnard Forebay, alluvial sediments in the subsurface are predominantly coarse grain sands and gravels. Fine grain sediments, such as silts and clays, that can act as confining layers are generally absent or discontinuous. This condition allows for direct recharge of the UAS from the surface and some recharge of the LAS from the UAS in the subsurface (Fox Canyon Ground Water Management Agency 2017; Turner and Mukae 1975).

The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet below ground surface (bgs) to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

4.0 PHASE I ESA

Tetra Tech completed a Phase I ESA for the Site in 2021 (Tetra Tech 2021a) The key information from the Phase I ESA is summarized in this section.

The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1927. The Site is currently being used for organic crop cultivation and has been over the last 10 years. Tetra Tech reviewed the Geologic Energy Management Division's (CalGEM, formerly DOGGR) online mapping application Well Finder (CalGEM 2020), Map 214 (California Department of Conservation, Division of Oil, Gas, and Geothermal Resources [DOGGR] 2000]), and associated well history documents to evaluate potential presence of oil fields and wells within the Site vicinity. Records indicate that the Site is not located in an oil field. The nearest oil field to the Site is the Santa Clara Avenue Field, located approximately 0.5 to 1 mile southeast of the Site. There are no known active or abandoned wells on Site. No oil production related pipelines or other facilities are located onsite or are known to have formerly been located onsite (Tetra Tech 2021a).

Tetra Tech reviewed online resources at the Cal EPA State Water Resources Control Board (SWRCB) GeoTracker database (SWRCB 2021) for any records pertaining to the Site and surrounding area. The GeoTracker database did not show any records for cases located on the Site. According to the GeoTracker database, four closed Leaking Underground Storage Tanks (LUSTs) are present approximately 0.2 miles southwest of the Site along Auto Center Drive. In addition, two closed LUSTs are present approximately 0.5 miles northeast of the Site on North Rose Avenue. These six sites do not pose a risk to the Site (Tetra Tech 2021a).

The following Recognized Environmental Conditions (RECs) were identified for the Site in the 2021 Phase I ESA:

- REC 1: Potential impacts from former agricultural pesticide application;
- REC 2: Potential bunker oil releases from potential former smudge pot frost abatement;
- REC 3: Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the Site;
- REC 4: Hydrocarbon releases to surface soil from the two-diesel fuel and one gasoline ASTs at the Site;
- REC 5: Three PCB-containing pole-mounted electrical transformers; and
- REC 6: Three high volume water transmission pipelines within 1,500 feet of the Site.

The following four *de minimis* conditions have been identified in the Phase I ESA.

- Potential that asbestos containing building materials (ACBMs) may be present in the building materials in the residence area structures.

- Potential that lead based paint (LBP) in the building materials in the residence area structures and LBP chips may be present in the surface soil surrounding the residence area structures.

- The residence is connected to a septic system. The location of the septic system appurtenances (leach field and septic tank) were not disclosed by the property owner to Tetra Tech.

- The minor housekeeping issues observed in the residence area included fertilizers, paint, and cleaning products found throughout the home and storage area, and the haphazardly stored items (old paint, fertilizer product, equipment, etc.) in the wood shed.

The Phase I ESA recommended that a Phase II ESA be performed to assess RECs 1 through 5 in accordance with DTSC guidelines for completing a Preliminary Environmental Assessment (PEA) including the *Preliminary Endangerment Guidance Manual* (DTSC January 1994, Revised October 2015b) (PEA Guidance Manual) and the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008) (Agricultural Fields Guidance). To evaluate the potential risks posed by REC 6, a hazardous pipeline assessment should be conducted in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (California Department of Education [CDE] 2007).

5.0 PHASE II ESA SUMMARY

On behalf of the RSD, Tetra Tech prepared the Phase II ESA report dated September 24, 2021 (Tetra Tech 2021b). The Phase II ESA field sampling program assessed RECs 1 through 5 as described below.

- REC 1, potential impacts from former agricultural pesticide application, was assessed by the collection of 20 discrete surface soil samples at depths of 0 to 0.5 feet bgs that were combined into five composite samples and one duplicate composite sample and analyzed for OCPs using United States Environmental Protection Agency (USEPA) method 8081A, and the collection of five discrete surface soil samples and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for total arsenic using United States EPA method 6010B.

- REC 2, potential bunker oil releases from potential former smudge pot frost abatement, was assessed by the collection of 10 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for semivolatile organic compounds (SVOCs) using EPA method 8270C, polyaromatic hydrocarbons (PAHs) using EPA method 8270C SIM, and diesel fuel total petroleum hydrocarbons (TPHd) and hydraulic oil/motor oil total petroleum hydrocarbons (TPHh/m) using EPA method 8015M.

- REC 3, Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the site and REC 4, Hydrocarbon releases to surface soil from the two diesel fuel and one gasoline ASTs, were assessed by the collection of 7 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for CAM 17 Metals using EPA method 6010B/7471A, SVOCs using EPA method 8270C, PAHs using EPA method 8270C SIM, gasoline range total petroleum hydrocarbons (TPHg) using the LUFT gas chromatograph/mass spectrometer (GC/MS) method, TPHd and TPHh/m using EPA method 8015M, and volatile organic compounds (VOCs) using EPA method 8260B.

- REC 5, Three pole-mounted electrical transformers, was assessed by the collection of 3 discrete surface soil samples at depths one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for PCBs using EPA method 8082.

The Phase II ESA surface soil sample analysis results did not yield OCPs and arsenic (REC 1), SVOCs and PAHs (REC 2), VOCs (REC 4), and PCBs (REC 5) at concentrations above relevant screening levels. The Phase II ESA surface soil sample results did indicate that TPHg, TPHd, and TPHh/m are present at the Site at concentrations above relevant screening levels due to releases from the junk vehicles previously stored at the Site and the fuel storage ASTs (RECs 3 and 4). The locations of the surface soil samples with TPHg, TPHd, and TPHh/m with concentrations above relevant screening levels is shown on Figure 3 and summarized in Table 1 for the Phase II ESA TPHg, TPHd, and TPHh/m sample results.

THIS PAGE INTENTIONALLY LEFT BLANK

6.0 PEA EQUIVALENT

On behalf of the RSD, Tetra Tech submitted the Phase I ESA (Tetra Tech 2021a) and Phase II ESA (Tetra Tech 2021b) to DTSC as a PEA Equivalent on March 30, 2022. In a letter dated May 10, 2022, the DTSC concurred with the adequacy of the PEA Equivalent pending review of public comments (DTSC 2022). DTSC's comments on the PEA Equivalent report were included as an attachment to the letter identifying discrepancies that required clarification and/or modification that should be addressed in the SSI. Potential impacts to the soils around the residential structures from OCPs in termiticides and LBP in soil were identified as items that should be further assessed in the SSI.

A SSI scoping telephone conference was conducted on June 14, 2022 between DTSC, Tetra Tech, RSD, and Sage. The discrepancies that required clarification and/or modification in the May 10, 2022 DTSC letter were discussed in the scoping meeting and resolved for the SSI. The proposed SSI work plan was discussed during the scoping telephone conference, and adjustments were made to the SSI work plan initially presented by Tetra Tech based on DTSC comments. The SSI scope of work presented below is based on the scope of work agreed on by DTSC, Tetra Tech, RSD, and Sage during the SSI scoping telephone conference.

THIS PAGE INTENTIONALLY LEFT BLANK

7.0 SSI FIELD SAMPLING PLAN

7.1 SAMPLING STRATEGY AND APPROACH

The field sampling assessment will consist of a subsurface soil sample collection program using direct push drill drilling and hand auger sampling methods with fixed laboratory sample analysis, and soil gas sample collection using direct push drilling methods and a mobile laboratory. The following subsections describe the rationale and scope of sampling. The Site ground surface is relatively flat and may be partially planted in crops during implementation of the SSI sampling program. The areas for the proposed SSI field work will not be in areas of the Site that will be planted in crops.

7.1.1 Rationale

The proposed SSI sample locations discussed below are shown on Figure 4. The SSI is being performed to further assess:

- The lateral and vertical extent of TPHg, TPHd, and TPHh/m at concentrations in soil at or above relevant screening levels at the seven locations where TPHg, TPHd, and TPHh/m were detected in surface soil samples at concentrations exceeding relevant screening levels (SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29);

- Potential TPHg and VOC soil gas at 5 and 10 feet bgs at concentrations at or above relevant screening levels at the seven locations where TPHg, TPHd, and TPHh/m were detected in surface soil samples at concentrations exceeding relevant screening levels (SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29) and in the vicinity of surface sample locations SS-1 and SS-22;

- Potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40; and

- Potential LBP at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40.

Relevant constituent screening levels are defined as those that were identified in the May 10, 2022 DTSC letter (DTSC 2022) per the DTSC's Toxicity Criteria Rule (https://dtsc.ca.gov/regs/toxicity-criteria-for-human-health-risk-assessment/). The screening levels provided in *Human Health Risk assessment (HHRA) Note Number 3 DTSC Modified Screening Levels (DTSC-SLs)* (DTSC 2020, Revised 2022) will be used in preference to U.S. Environmental Protection Agency (U.S. EPA) Regional Screening Levels (RSLs) (U.S. EPA 2022) when evaluating contaminants in environmental media at California sites and facilities. When screening levels for a chemical are not listed in HHRA Note Number 3, USEPA's RSL tables should be used. The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs) will be used for TPHg, TPHd, and TPHh/m (SFRWQCB 2019).

7.1.2 Field Coordination

Tetra Tech will coordinate Site access with the Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. The soil samples will be collected using sampling methods that will be executed in a manner that avoids damaging crops and Site infrastructure.

7.2 SAMPLING METHODS AND PROCEDURES

This section describes the methods and procedures that will be used to collect and analyze soil samples and soil gas samples.

7.2.1 Sample Site Location and Utility Clearance

The GPS coordinates of the seven soil sample locations where TPHg, TPHd, and TPHh/m were detected at concentrations exceeding relevant screening levels (sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29) and sample locations SS-1 and SS-22 were previously mapped in the field. These GPS sample location coordinates will be used to relocate these sample locations for the SSI using the ESRI Collector program system. The estimated new sample locations for samples SS-30 through SS-40 and the step out samples for sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29 will be entered into the ESRI Collector program prior to field work and corrected in the field as needed. Sample locations depths in feet bgs will be recorded using the ESRI Collector program and in our field notes. These data will be presented on figures and in tables in the SSI report. The utility clearance for these soil sample locations will be performed by meeting with Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. In addition, Tetra Tech will mark the proposed boring locations and contact Underground Service Alert (USA) to provide markout services. Tetra Tech will not be responsible for utilities encountered during drilling that have not been marked out by USA, or physically indicated in the field by RSD.

7.2.2 SSI Sampling Program

7.2.2.1 Soil Gas Survey

A soil gas survey will be conducted to assess potential gasoline range total petroleum hydrocarbons TPHg and VOC soil gas in accordance with the *Advisory – Active Soil Gas Investigations* (Advisory) (DTSC and LARWQCB 2015a). Soil gas samples will be collected from 9 monitoring point locations (SS-1, SS-10, SS-22 through SS-26, SS-28, and SS-29) (Figure 4 and Table 1). The soil vapor probes will be installed at each of the locations using a direct-push drilling rig. Two probes will be installed at each location in a nested configuration within each direct-push boring at depths of 5 and 10 feet bgs.

Soil Gas Monitoring Point Construction

The direct push rig will drive to the deep target sampling depth (10.0-10.5 feet bgs) using a 1.75-inch core sampler lined with acetate sleeves to recover soil for logging purposes. Temporary soil gas sampling probes will be constructed by attaching 0.25-inch diameter polyethylene tubing to a gas permeable sampling screen and lowering the screen to the deep target sampling depth (10 feet bgs). Clean sand will be poured into the borehole until it covers the sampling screen by at least 6 inches. Bentonite granular chips will then be poured into the borehole to fill the annular space to approximately 6 inches below the next target sampling depth. The bentonite chips will then be hydrated to seal the sampling probe. This process will be repeated to install the shallower sampling point at 5 feet bgs. The sampling points will be finished with approximately 1 to 2 feet of the sample tubing extending above the ground surface, and the

borehole sealed to ground surface with hydrated bentonite. No purging or sampling will be permitted for a minimum of 30 minutes after probe completion, so that the bentonite has time to form a seal between sample probes. The direct push drilling equipment will be decontaminated between each boring using a phosphate-free detergent wash and successive rinses with potable and deionized water.

Soil Gas Sample Collection Methods

Eighteen discrete soil gas samples will be collected from the 18 soil gas probes installed in the borings at sample locations SS-1, SS-10, SS-22 through SS-26, SS-28, and SS-29 per the Advisory (DTSC and LARWQCB 2015a) for on-site laboratory analysis. Two soil gas duplicate samples will be collected for quality control purposes (Table 1). Prior to purging or sampling, a shut-in test will be conducted to check for leaks in the above-ground sampling system in accordance with Section 4.2.1 of the Advisory (DTSC and LARWQCB 2015a).

Soil Gas Analysis Methods

Soil gas samples collected from the soil gas probes in the borings at sample locations SS-1, SS-10, SS-22 through SS-26, SS-28, and SS-29 will be analyzed by an onsite mobile laboratory for VOCs using EPA method 8260B and TPHg using the LUFT method (Tables 1 and 2).

The proposed method reporting limits and screening levels for soil gas analytical methods are provided in Table 2 (DTSC 2022; SFRWQCB 2019; U.S. EPA 2022).

7.2.2.2 TPHg, TPHd, and TPHh/m Impacted Soil Assessment

Soil Sample Collection

Soil samples will be collected to assess the lateral and vertical extent of the TPHg, TPHd, and TPHh/m impacted soil identified at the seven Phase II ESA sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 (Figure 4 and Table 1). Step out soil samples will be collected at 5 feet (sets A1, B1, C1, and D1) and 10 feet (sets A2, B2, C2, and D2) to the northeast, southeast, southwest, and northwest of each of the seven Phase II ESA sample locations identified above. Soil samples will be collected using direct push drilling continuous core sampling methods at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated initial step out sample locations, A1, B1, C1, and D1. Continuous core sampling to 5 feet bgs will be completed at each location. Surface soil samples will be collected from 0 to 0.5 feet bgs at the seven sets of A1, B1, C1, and D1 step out sample locations. Subsurface soil samples will be collected at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated step out sample locations, A1, B1, C1, and D1 at a minimum of 1.0 to 1.5 feet bgs or to as deep at 4.5 to 5.0 feet bgs if soil logging indicates that there is contaminated soil deeper than 1.5 feet bgs. Surface soil samples will be collected using hand sampling methods from 0.0 to 0.5 feet bgs at the A2, B2, C2, and D2 step out sample locations associated with sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29. The direct push drilling sampling equipment and hand sampling equipment will be decontaminated between each boring using a phosphate-free detergent wash and successive rinses with potable and deionized water.

After sample collection, the subsurface soil samples collected at sample locations soil SS-10, SS-23 through SS-26, SS-28, and SS-29 and the surface soil samples at their associated initial step out at sample locations, A1, B1, C1, and D1 will be submitted for laboratory analysis (Figure 4 and Table 3). If TPHg, TPHd, and TPHh/m are detected at concentrations exceeding their relevant screening levels in the surface soil samples from the associated initial step out at sample locations, A1, B1, C1, and D1, then the

associated subsurface soil sample and secondary step out surface soil sample (samples A2, B2, C2, and D2) will be submitted for laboratory analysis.

The total number of discrete soil samples that are analyzed for TPHg, TPHd, and TPHh/m will depend on the number of the tentative discrete surface and subsurface soils that require analysis. A minimum of 34 and a maximum of 88 discrete soil samples will be analyzed for TPHg, TPHd, and TPHh/m.

The total number of duplicate soil samples that are analyzed for TPHg, TPHd, and TPHh/m will depend on the number of the tentative discrete surface and subsurface soils that require analysis. A minimum of 4 and a maximum of 9 duplicate soil samples will be analyzed for TPHg, TPHd, and TPHh/m.

The borings will be logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 2017a) and D 2488-90 (ASTM 2017b). During sampling, a photoionization detector (PID) calibrated with isobutylene gas will be used to monitor the potential presence and concentrations of organic vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings will be recorded on field logs prepared by the field geologist/engineer during sampling activities. The drill cuttings and soil samples will be evaluated in the field for staining and odor. The labeled samples will be placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with chain-of-custody (COC) records. Instructions will be included on the COCs directing the laboratory on which discrete samples are to be grouped together for composite sample preparation and analysis.

The following sampling information will be recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 2017a, 2017b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

Soil Sample Analysis

The soil sample analysis schedule is presented in Table 1. The soil sample analyses will be performed by a California State Certified laboratory. The soil samples submitted for laboratory analysis to assess the lateral and vertical extent of the TPHg, TPHd, and TPHh/m impacted soil will be analyzed for TPHg, TPHd, and TPHh/m by USEPA method 8015M.

The laboratory proposed method reporting limits and screening levels for the soil sample analytical methods are provided in Table 3 (DTSC 2022; SFRWQCB 2019; U.S. EPA 2022).

7.2.2.3 Potential OCP and Lead in Soil Assessment

Soil Sample Collection

Soil samples will be collected to assess potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil, and lead at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40 (Figure 4 and Table 1). The sample collection and laboratory analysis will be performed in accordance with the *Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers* (DTSC 2006).

The surface and subsurface soil samples will be collected using hand auger methods with a hand driven split-spoon sampler. Subsurface soil will be directly transferred from the split-spoon sampler into pre-

cleaned glass sample containers provided by the analytical laboratory fitted with Teflon-lined screwcaps. The hand auger sampling equipment, including the split spoon sampler, will be decontaminated between the collection of each soil sample using a phosphate-free detergent wash and successive rinses with potable and deionized water.

Soil Sample Analysis

The soil sample analysis schedule is presented in Table 1. The soil sample analyses will be performed by a California State Certified laboratory. The soil samples submitted for laboratory to assess potential OCP-impacted soil will be analyzed for OCPs by USEPA method 8081A. The soil samples submitted for laboratory to assess potential lead impacted soil will be analyzed for total lead by USEPA method 6010B.

The proposed laboratory method reporting limits and screening levels for the soil sample analytical methods are provided in Table 3 (DTSC 2022; SFRWQCB 2019; U.S. EPA 2022).

THIS PAGE INTENTIONALLY LEFT BLANK

8.0 SSI TECHNICAL MEMORANDUM

Tetra Tech will prepare and submit a SSI Technical Memorandum (SSI TM) to DTSC. The SSI TM will be prepared in letter format and will provide background information about the Site, a description of field assessment activities including any deviations to the SSI TM sampling plan, tabulated analytical data, and maps showing sample locations. Site data will be compared to the relevant constituent screening levels as described in Section 7.1.1 and presented in Tables 2 and 3 in lieu of a Human Health Risk Assessment, and conclusions and recommendations for a Housekeeping Removal Action, Removal Action Work Plan (RAW), or Land Use Covenant will be considered for the TPHg, TPHd, and TPHh/m impacted soil at the Site and potential OCP and lead impacted soil around the residential structures.

A draft and final SSI TM will be prepared for this project and submitted to the DTSC for review and approval.

THIS PAGE INTENTIONALLY LEFT BLANK

9.0 SCHEDULE

Tetra Tech proposes to perform the field sampling (combined with the laboratory analysis) from June 21 through August 30, 2022. DTSC will be notified at least one week before any field work takes place and will be notified immediately of any schedule changes or revisions to the SSIFSP.

The proposed project schedule key milestones are as follows:

- Submit SSI Field Sampling Plan (Technical Memorandum) to DTSC: June 21, 2022
- DTSC Approval of Field Sampling Plan July 1, 2022
- Conduct SSI Field Work July 6-8, 2022
- Submit Draft SSI TM to DTSC August 3, 2022
- Receive DTSC Comments on Draft SSI TM August 16, 2022
- Submit Final SSI TM to DTSC August 23, 2022
- DTSC Approval of Final SSI TM August 30, 2022

Notes:

1 - The listed Residential Air Screening Levels are DTSC-Modified Air Screening Levels from Table 3 of *HERO Note Number 3., DTSC-modified Screening Levels (DTSC-SLs)* (DTSC 2018) (DTSC HHRA Note 3), if available, USEPA Region 9 Air Regional Screening Levels (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2020), or the Residential Air Screening Level and Soil Gas Screening Level are from Tier 1 Environmental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2019).

2 - The Residential Soil Gas Screening Levels for VOCs and hydrogen sulfide were derived by dividing the Residential Air Screening Levels by the future residential contaminant source attenuation factor of 0.001 from Table 2 of the *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (DTSC 2011).

3 - Residential Air Screening Level is the DTSC-Modified Air Screening Level from Table 3 of DTSC HHRA Note 3 (DTSC 2022).

4 - Residential Air Screening Level is the USEPA Region 9 Air RSLs (USEPA 2022) as recommended by DTSC HHRA Note 3 (DTSC 2022).

5 - Residential Air Screening Level and Soil Gas Screening Level are from Tier 1 Environmental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2019).

% - Percent by volume

EPA - U.S. Environmental Protection Agency

LUFT GCMS - California Regional Water Quality Control Board, Los Angeles Region Environmental Laboratory Accreditation Program certified method for analyzing TPHg in vapor samples.

M - Modified

MDL - method detection limit

MS - mass spectrometry

µg/m³ - micrograms per cubic meter

NA - Not applicable

ppmV - parts per million by volume

RL - reporting limit

TPHg - Gasoline range total petroleum hydrocarbons (C_4-C_{12} carbon range)

VOC - volatile organic compound

1.0 INTRODUCTION

This Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan (RSSIFSP) has been prepared by Tetra Tech and is being submitted to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Evaluation and Cleanup Branch on behalf of the Rio School District (RSD) for their Rio Del Valle Middle School Expansion Project South Campus Expansion Area (South Parcel) Supplemental Site Investigation (SSI). The scope of services for this SSI have been developed to assist the RSD in further assessing the nature and extent of total petroleum hydrocarbons (TPH) identified in Site surface soils at concentrations above Screening Levels that were identified in soil samples collected for the *Phase II Environmental Assessment Rio Del Valle Middle School Expansion Project 2600 North Rose Avenue, Oxnard California 93063* (Tetra Tech 2021b), potential organochlorine pesticides (OCPs) from former termiticide applications, and lead based paint (LPB) in soil around the existing residential structure, garage, and utility shed that were identified in the *Phase I Environmental Assessment, Rio Del Valle Middle School Expansion Project, 2600 North Rose Avenue, Oxnard, California 93036* (Tetra Tech 2021a). The RSSIFSP is based on the scope of work agreed on by DTSC, Tetra Tech RSD, and Sage Realty (Sage) at the SSI scoping telephone conference conducted on June 14, 2022, and the revised scope of work agreed on by DTSC and Tetra Tech in a meeting between DTSC and Tetra Tech on behalf of the RSD on July 25, 2022.

Tetra Tech previously prepared the *Technical Memorandum Supplemental Site Investigation Field Sampling Plan, Rio Del Valle Middle School Expansion Project South Parcel 2600 South Rose Avenue, Oxnard, California 93036* (Tetra Tech 2022) (SSIFSP) to complete the SSI work scope that was agreed on by Tetra Tech, the RSD, and the California Environmental Protection Agency EPA (Cal/EPA) Department of Toxic Substances Control (DTSC) during the SSI scoping telephone conference conducted on June 14, 2022. Following review of the proposal to complete the work in the SSIFSP, the RSD requested that Tetra Tech renegotiate with DTSC and request that a land use covenant (LUC) be placed on the impacted areas of the Site because the estimated costs to complete the SSI were more than the RSD was willing to spend at this time. A Teams meeting was held between Tetra Tech and DTSC on July 25, 2022. In the July 25, 2022 meeting, it was determined that a LUC would not achieve the RSD's objectives for the Site. An alternative strategy was presented by Tetra Tech that eliminated the soil gas survey and direct push drilling. This strategy reduces the cost for completing the SSI significantly. This approach was accepted by DTSC during the July 25, 2022 meeting. This RSSIFSP is based on the revised scope of work agreed to by DTSC during the July 25, 2022 meeting.

The Rio Del Valle Middle School Expansion Project South Parcel site (hereinafter referred to as the Site) Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98 acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The RSD proposes to acquire and develop the 11.1-acre Site with new educational and support facilities as part of the Rio Del Valle Middle School Expansion Project. The proposed development for the Site includes a Transportation and Parking Facility in the western half of the Site (approximately 5.6 acres). The eastern half of the Site (approximately 5.4 acres) may be developed as part of the adjacent Rio Del Valle Middle School campus at a future point in time with recreation/athletic facilities including tennis courts and basketball courts.

This Technical Memorandum RSSIFSP includes limited background and historical use information regarding the Site. A detailed summary of Site background and historical use information for the Site is presented in the *Phase I Environmental Assessment, Rio Del Valle Middle School Expansion Project, 2600 North Rose Avenue, Oxnard, California 93036.* (Tetra Tech 2021a). This Technical Memorandum is intended to provide details of the proposed SSI sampling and analytical work proposed for the Site in the SSI scoping telephone conference conducted on June 14, 2022. The scope of the SSI report will

conform to the *PEA Guidance Manual* (DTSC 2015b) and will present findings from human health screening evaluations for the Site based upon the potential contaminants of concern identified through the field sampling program proposed here.

1.1 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Jim Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. (Jim) Steele, P.G., C.E.G., C.Hg.
Tetra Tech
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-6302

Randy Westhaus, P.E.
Tetra Tech
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 455-0603

The designated contact person for the RSD is Wael Saleh. Mr. Saleh is the Assistant Superintendent, Chief Business Official for the RSD. The contact information for Mr. Saleh is:

Wael Saleh
Assistant Superintendent, Chief Business Official
Rio School District
1800 Solar Drive
Oxnard, California 93030
Phone (805) 485-3111

2.0 SITE DATA

2.1 SITE LOCATION AND DESCRIPTION

The Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98-acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The Site is owned by KMS Industries, Inc. and is leased by Reiter Affiliated Companies. At the time of the June 18, 2021 Phase II ESA field sampling event, the Site comprised an approximate 11.1-acre area of the 21.98-acre parcel owned by KMS Industries, Inc. and was leased by Reiter Affiliated Companies (Figure 2). In June 2021, the Site contained (approximately) a 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre vacant area that was formerly the Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farm Yard. The remaining 8.7 acres of the Site was occupied by areas of organic raspberry production with access roads. Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops and orchards. The agricultural section of the Site was planted in organic raspberries under shade structures when the Phase II ESA sampling was performed. The Residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The Junk Vehicle Storage Area formerly contained approximately 30 junk cars. The Tenant Storage Yard formerly contained a trailer, motor a home, two storage containers, and a utility truck. The vehicles in the former Junk Vehicle Storage Area and items in the Tenant Storage Yard had been removed before the June 18, 2021 sampling event. The Farm Equipment Storage and Parking Area contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment. Three cylindrical steel above ground storage tanks (ASTs) with steel secondary containment bins that are owned and operated by Reiter Affiliated Companies were observed in the Farm Equipment Storage and Parking Area (Figure 2). The ASTs contained diesel fuel, red diesel fuel, and gasoline for farm equipment. The two diesel ASTs are approximately 300 gallons capacity each and the gasoline AST is approximately 500 gallons capacity. The ASTs are within individual steel containment bins.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING AND CONDITIONS

The Site is depicted on the Oxnard, California Quadrangle U.S. Geological Survey (USGS) 7.5-minute topographic series map (USGS 2015) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 13' 50.75" North, Longitude 119° 9' 15.86" West (Google Earth 2021). Surface elevations at the Site range from approximately 94 feet above mean sea level (msl) in the northwest corner of the Site to 89 feet above msl in the southeast corner of the Site with a topographic gradient that is generally flat with a gentle slope to the southeast (EDR 2021).

3.1 REGIONAL GEOLOGY

The Site is located in Ventura County on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. This geomorphic province is distinguished by the prevailing east-west linear trend of its geologic structure and geomorphology in contrast to the predominant northwest-southeast trend of the geomorphic features within most other provinces of the state. The province is bounded by major faults, including the San Andreas Fault zone in the northeast, the Big Pine fault in the north and the Malibu Coast fault in the south. Most of the faults in Ventura County are reverse faults which dip north, including the Pine Mountain, Red Mountain, San Cayetano, Santa Susana, Simi, Ventura, and Malibu Coast faults (Norris and Webb 1990).

The Ventura Basin is a large synclinal structure situated between the Santa Ynez Range and Topa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Department of Conservation, California Geologic Survey [CGS] 2002).

3.2 LOCAL GEOLOGY

Locally, the Site is situated in the Oxnard Plain sub-province. Lithologic units of sedimentary origin underlying the nearly flat Oxnard Plain are approximately 45,000 feet in thickness and consist of Upper Cretaceous, Tertiary, and Quaternary-age units which have been deposited on a pre-Upper Cretaceous base of igneous and/or metamorphic rock. Unconsolidated Holocene (last 11,000 years) sediments beneath the Site were deposited during the post-glacial period in marine, lagoonal, lacustrine, fluvial-flood plain, deltaic and eolian environments, including the pre-historic delta of the ancient Santa Clara River and Calleguas Creek and reach a depth of approximately 900 feet beneath the Oxnard Plain (Clahan et al 2003; Turner and Mukae 1975).

3.3 HYDROLOGY

3.3.1 Hydrogeology

The Site is situated at the eastern edge of the Oxnard Forebay basin, a subbasin of the larger Santa Clara-Calleguas groundwater basin. The Oxnard Forebay is an important groundwater recharge area for valuable resources of groundwater in aquifers underlying the Oxnard Plain. The unconsolidated sediments beneath the Oxnard Forebay and the Site are composed of both continental and marine deposits of Tertiary and Quaternary age. They contain multiple aquifers of coarse grain sediments with intervening fine grain aquitards. Aquifers have been grouped into an Upper Aquifer System (UAS) and a Lower Aquifer System (LAS) based on changes in geologic structure and separated in many areas by

regional layers of low permeability clay. The UAS sediments are relatively flat lying and extend to approximately 400 feet beneath the Site. The sediments in the LAS are more structurally complex, resulting from folding and faulting. In the Oxnard Forebay, alluvial sediments in the subsurface are predominantly coarse grain sands and gravels. Fine grain sediments, such as silts and clays, that can act as confining layers are generally absent or discontinuous. This condition allows for direct recharge of the UAS from the surface and some recharge of the LAS from the UAS in the subsurface (Fox Canyon Ground Water Management Agency 2017; Turner and Mukae 1975).

The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet below ground surface (bgs) to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

4.0 PHASE I ESA

Tetra Tech completed a Phase I ESA for the Site in 2021 (Tetra Tech 2021a). The key information from the Phase I ESA is summarized in this section.

The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1927. The Site is currently being used for organic crop cultivation and has been over the last 10 years. Tetra Tech reviewed the Geologic Energy Management Division's (CalGEM, formerly DOGGR) online mapping application Well Finder (CalGEM 2020), Map 214 (California Department of Conservation, Division of Oil, Gas, and Geothermal Resources [DOGGR] 2000]), and associated well history documents to evaluate potential presence of oil fields and wells within the Site vicinity. Records indicate that the Site is not located in an oil field. The nearest oil field to the Site is the Santa Clara Avenue Field, located approximately 0.5 to 1 mile southeast of the Site. There are no known active or abandoned wells on Site. No oil production related pipelines or other facilities are located onsite or are known to have formerly been located onsite (Tetra Tech 2021a).

Tetra Tech reviewed online resources at the Cal EPA State Water Resources Control Board (SWRCB) GeoTracker database (SWRCB 2021) for any records pertaining to the Site and surrounding area. The GeoTracker database did not show any records for cases located on the Site. According to the GeoTracker database, four closed Leaking Underground Storage Tanks (LUSTs) are present approximately 0.2 miles southwest of the Site along Auto Center Drive. In addition, two closed LUSTs are present approximately 0.5 miles northeast of the Site on North Rose Avenue. These six sites do not pose a risk to the Site (Tetra Tech 2021a).

The following Recognized Environmental Conditions (RECs) were identified for the Site in the 2021 Phase I ESA:

- REC 1: Potential impacts from former agricultural pesticide application;
- REC 2: Potential bunker oil releases from potential former smudge pot frost abatement;
- REC 3: Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the Site;
- REC 4: Hydrocarbon releases to surface soil from the two-diesel fuel and one gasoline ASTs at the Site;
- REC 5: Three PCB-containing pole-mounted electrical transformers; and
- REC 6: Three high volume water transmission pipelines within 1,500 feet of the Site.

The following four *de minimis* conditions have been identified in the Phase I ESA.

- Potential that asbestos containing building materials (ACBMs) may be present in the building materials in the residence area structures.

- Potential that lead based paint (LBP) in the building materials in the residence area structures and LBP chips may be present in the surface soil surrounding the residence area structures.

- The residence is connected to a septic system. The location of the septic system appurtenances (leach field and septic tank) were not disclosed by the property owner to Tetra Tech.

- The minor housekeeping issues observed in the residence area included fertilizers, paint, and cleaning products found throughout the home and storage area, and the haphazardly stored items (old paint, fertilizer product, equipment, etc.) in the wood shed.

The Phase I ESA recommended that a Phase II ESA be performed to assess RECs 1 through 5 in accordance with DTSC guidelines for completing a Preliminary Environmental Assessment (PEA) including the *Preliminary Endangerment Guidance Manual* (DTSC January 1994, Revised October 2015b) (PEA Guidance Manual) and the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008) (Agricultural Fields Guidance). To evaluate the potential risks posed by REC 6, a hazardous pipeline assessment should be conducted in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (California Department of Education [CDE] 2007).

5.0 PHASE II ESA SUMMARY

On behalf of the RSD, Tetra Tech prepared the Phase II ESA report dated September 24, 2021 (Tetra Tech 2021b). The Phase II ESA field sampling program assessed RECs 1 through 5 as described below.

- REC 1, potential impacts from former agricultural pesticide application, was assessed by the collection of 20 discrete surface soil samples at depths of 0 to 0.5 feet bgs that were combined into five composite samples and one duplicate composite sample and analyzed for OCPs using United States Environmental Protection Agency (USEPA) method 8081A, and the collection of five discrete surface soil samples and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for total arsenic using United States EPA method 6010B.

- REC 2, potential bunker oil releases from potential former smudge pot frost abatement, was assessed by the collection of 10 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for semivolatile organic compounds (SVOCs) using EPA method 8270C, polyaromatic hydrocarbons (PAHs) using EPA method 8270C SIM, and diesel fuel total petroleum hydrocarbons (TPHd) and hydraulic oil/motor oil total petroleum hydrocarbons (TPHh/m) using EPA method 8015M.

- REC 3, Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the site and REC 4, Hydrocarbon releases to surface soil from the two diesel fuel and one gasoline ASTs, were assessed by the collection of 7 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for CAM 17 Metals using EPA method 6010B/7471A, SVOCs using EPA method 8270C, PAHs using EPA method 8270C SIM, gasoline range total petroleum hydrocarbons (TPHg) using the LUFT gas chromatograph/mass spectrometer (GC/MS) method, TPHd and TPHh/m using EPA method 8015M, and volatile organic compounds (VOCs) using EPA method 8260B.

- REC 5, Three pole-mounted electrical transformers, was assessed by the collection of 3 discrete surface soil samples at depths one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for PCBs using EPA method 8082.

The Phase II ESA surface soil sample analysis results did not yield OCPs and arsenic (REC 1), SVOCs and PAHs (REC 2), VOCs (REC 4), and PCBs (REC 5) at concentrations above relevant screening levels. The Phase II ESA surface soil sample results did indicate that TPHg, TPHd, and TPHh/m are present at the Site at concentrations above relevant screening levels due to releases from the junk vehicles previously stored at the Site and the fuel storage ASTs (RECs 3 and 4). The locations of the surface soil samples with TPHg, TPHd, and TPHh/m with concentrations above relevant screening levels is shown on Figure 3 and summarized in Table 1 for the Phase II ESA TPHg, TPHd, and TPHh/m sample results.

THIS PAGE INTENTIONALLY LEFT BLANK

6.0 PEA EQUIVALENT

On behalf of the RSD, Tetra Tech submitted the Phase I ESA (Tetra Tech 2021a) and Phase II ESA (Tetra Tech 2021b) to DTSC as a PEA Equivalent on March 30, 2022. In a letter dated May 10, 2022, the DTSC concurred with the adequacy of the PEA Equivalent pending review of public comments (DTSC 2022a). DTSC's comments on the PEA Equivalent report were included as an attachment to the letter identifying discrepancies that required clarification and/or modification that should be addressed in the SSI. Potential impacts to the soils around the residential structures from OCPs in termiticides and LBP in soil were identified as items that should be further assessed in the SSI. The DTSC approved the PEA Equavalent in a letter dated August 8, 2022 (DTSC

A SSI scoping telephone conference was conducted on June 14, 2022 between DTSC, Tetra Tech, RSD, and Sage. The discrepancies that required clarification and/or modification in the May 10, 2022 DTSC letter were discussed in the scoping meeting and resolved for the SSI. The proposed SSI work plan was discussed during the scoping telephone conference, and adjustments were made to the SSI work plan initially presented by Tetra Tech based on DTSC comments. The scope of work presented in the SSIFSP (Tetra Tech 2022) was based on the scope of work agreed on by DTSC, Tetra Tech, RSD, and Sage during the June 14, 2022 SSI scoping telephone conference. As described in Section 1.0, at the request of the RSD, a Teams meeting was held between Tetra Tech and DTSC on July 25, 2022 in which an alternative strategy was presented by Tetra Tech that eliminated the soil gas survey and direct push drilling from the SSI field work. This strategy reduces the cost for completing the SSI significantly. This approach was accepted by DTSC during the July 25, 2022 meeting and is the basis for the work scope in the RSSIFSP.

THIS PAGE INTENTIONALLY LEFT BLANK

7.0 SSI FIELD SAMPLING PLAN

7.1 SAMPLING STRATEGY AND APPROACH

The field sampling assessment will consist of a subsurface soil sample collection program using hand auger sampling methods with fixed laboratory sample analysis. The following subsections describe the rationale and scope of sampling. The Site ground surface is relatively flat and may be partially planted in crops during implementation of the SSI sampling program. The areas for the proposed SSI field work will not be in areas of the Site that will be planted in crops.

7.1.1 Rationale

The proposed SSI sample locations discussed below are shown on Figure 4. The SSI is being performed to further assess:

- The lateral and vertical extent of TPHg, TPHd, and TPHh/m at concentrations in soil at or above relevant screening levels at the seven locations where TPHg, TPHd, and TPHh/m were detected in surface soil samples at concentrations exceeding relevant screening levels (SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29);

- Potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40; and

- Potential LBP at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40.

Relevant constituent screening levels are defined as those that were identified in the May 10, 2022 DTSC letter (DTSC 2022a) per the DTSC's Toxicity Criteria Rule (https://dtsc.ca.gov/regs/toxicity-criteria-for-human-health-risk-assessment/). The screening levels provided in *Human Health Risk assessment (HHRA) Note Number 3 DTSC Modified Screening Levels (DTSC-SLs)* (DTSC 2020, Revised 2022) will be used in preference to U.S. Environmental Protection Agency (U.S. EPA) Regional Screening Levels (RSLs) (U.S. EPA 2022) when evaluating contaminants in environmental media at California sites and facilities. When screening levels for a chemical are not listed in HHRA Note Number 3, USEPA's RSL tables should be used. The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs) will be used for TPHg, TPHd, and TPHh/m (SFRWQCB 2019).

7.1.2 Field Coordination

Tetra Tech will coordinate Site access with the Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. The soil samples will be collected using sampling methods that will be executed in a manner that avoids damaging crops and Site infrastructure.

7.2 SAMPLING METHODS AND PROCEDURES

This section describes the methods and procedures that will be used to collect and analyze soil samples and soil gas samples.

7.2.1 Sample Site Location and Utility Clearance

The GPS coordinates of the seven soil sample locations where TPHg, TPHd, and TPHh/m were detected at concentrations exceeding relevant screening levels (sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29) and sample locations SS-1 and SS-22 were previously mapped in the field. These GPS sample location coordinates will be used to relocate these sample locations for the SSI using the ESRI Collector program system. The estimated new sample locations for samples SS-30 through SS-40 and the step out samples for sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29 will be entered into the ESRI Collector program prior to field work and corrected in the field as needed. Sample locations depths in feet bgs will be recorded using the ESRI Collector program and in our field notes. These data will be presented on figures and in tables in the SSI report. The utility clearance for these soil sample locations will be performed by meeting with Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. In addition, Tetra Tech will mark the proposed boring locations and contact Underground Service Alert (USA) to provide markout services. Tetra Tech will not be responsible for utilities encountered during drilling that have not been marked out by USA, or physically indicated in the field by RSD.

7.2.2 SSI Sampling Program

7.2.2.1 TPHg, TPHd, and TPHh/m Impacted Soil Assessment

Soil Sample Collection

Soil samples will be collected to assess the lateral and vertical extent of the TPHg, TPHd, and TPHh/m impacted soil identified at the seven Phase II ESA sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 (Figure 4 and Table 1). Step out soil samples will be collected at 5 feet (sets A1, B1, C1, and D1) and 10 feet (sets A2, B2, C2, and D2) to the northeast, southeast, southwest, and northwest of each of the seven Phase II ESA sample locations identified above. Soil samples will be collected using hand auger sampling methods to 5 feet bgs at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated initial step out sample locations, A1, B1, C1, and D1. Surface soil samples will be collected from 0 to 0.5 feet bgs at the seven sets of A1, B1, C1, and D1 step out sample locations. Subsurface soil samples will be collected at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated step out sample locations, A1, B1, C1, and D1 at a minimum of 1.0 to 1.5 feet bgs or to as deep at 4.5 to 5.0 feet bgs if soil logging indicates that there is contaminated soil deeper than 1.5 feet bgs. Surface soil samples will be collected using hand sampling methods from 0.0 to 0.5 feet bgs at the A2, B2, C2, and D2 step out sample locations associated with sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29. The hand sampling equipment will be decontaminated between each boring using a phosphate-free detergent wash and successive rinses with potable and deionized water.

After sample collection, the subsurface soil samples collected at sample locations soil SS-10, SS-23 through SS-26, SS-28, and SS-29 and the surface soil samples at their associated initial step out at sample locations, A1, B1, C1, and D1 will be submitted for laboratory analysis (Figure 4 and Table 2). If TPHg, TPHd, and TPHh/m are detected at concentrations exceeding their relevant screening levels in the surface soil samples from the associated initial step out at sample locations, A1, B1, C1, and D1, then the associated subsurface soil sample and secondary step out surface soil sample (samples A2, B2, C2, and D2) will be submitted for laboratory analysis.

The total number of discrete soil samples that are analyzed for TPHg, TPHd, and TPHh/m will depend on the number of the tentative discrete surface and subsurface soils that require analysis. A minimum of 34 and a maximum of 88 discrete soil samples will be analyzed for TPHg, TPHd, and TPHh/m.

The total number of duplicate soil samples that are analyzed for TPHg, TPHd, and TPHh/m will depend on the number of the tentative discrete surface and subsurface soils that require analysis. A minimum of 4 and a maximum of 9 duplicate soil samples will be analyzed for TPHg, TPHd, and TPHh/m.

The borings will be logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 2017a) and D 2488-90 (ASTM 2017b). During sampling, a photoionization detector (PID) calibrated with isobutylene gas will be used to monitor the potential presence and concentrations of organic vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings will be recorded on field logs prepared by the field geologist/engineer during sampling activities. The drill cuttings and soil samples will be evaluated in the field for staining and odor. The labeled samples will be placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with chain-of-custody (COC) records. Instructions will be included on the COCs directing the laboratory on which discrete samples are to be grouped together for composite sample preparation and analysis.

The following sampling information will be recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 2017a, 2017b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

Soil Sample Analysis

The soil sample analysis schedule is presented in Table 1. The soil sample analyses will be performed by a California State Certified laboratory. The soil samples submitted for laboratory analysis to assess the lateral and vertical extent of the TPHg, TPHd, and TPHh/m impacted soil will be analyzed for TPHg, TPHd, and TPHh/m by USEPA method 8015M.

The laboratory proposed method reporting limits and screening levels for the soil sample analytical methods are provided in Table 2 (DTSC 2022a; SFRWQCB 2019; U.S. EPA 2022).

7.2.2.2 Potential OCP and Lead in Soil Assessment

Soil Sample Collection

Soil samples will be collected to assess potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil, and lead at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40 (Figure 4 and Table 1). The sample collection and laboratory analysis will be performed in accordance with the *Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers* (DTSC 2006).

The surface and subsurface soil samples will be collected using hand auger methods with a hand driven split-spoon sampler. Subsurface soil will be directly transferred from the split-spoon sampler into pre-cleaned glass sample containers provided by the analytical laboratory fitted with Teflon-lined screwcaps. The hand auger sampling equipment, including the split spoon sampler, will be decontaminated between the collection of each soil sample using a phosphate-free detergent wash and successive rinses with potable and deionized water.

Soil Sample Analysis

The soil sample analysis schedule is presented in Table 1. The soil sample analyses will be performed by a California State Certified laboratory. The soil samples submitted for laboratory to assess potential OCP-impacted soil will be analyzed for OCPs by USEPA method 8081A. The soil samples submitted for laboratory to assess potential lead impacted soil will be analyzed for total lead by USEPA method 6010B.

The proposed laboratory method reporting limits and screening levels for the soil sample analytical methods are provided in Table 2 (DTSC 2022a; SFRWQCB 2019; U.S. EPA 2022).

8.0 SSI TECHNICAL REPORT

Tetra Tech will prepare and submit a SSI Report (SSI Report) to DTSC. The SSI Report will be prepared in letter format and will provide background information about the Site, a description of field assessment activities including any deviations to the RSSIFSP, tabulated analytical data, and maps showing sample locations. Site data will be compared to the relevant constituent screening levels as described in Section 7.1.1 and presented in Table 2 in lieu of a Human Health Risk Assessment, and conclusions and recommendations for a Housekeeping Removal Action, Removal Action Work Plan (RAW), or Land Use Covenant will be considered for the TPHg, TPHd, and TPHh/m impacted soil at the Site and potential OCP and lead impacted soil around the residential structures.

A draft and final SSI Report will be prepared for this project and submitted to the DTSC for review and approval.

THIS PAGE INTENTIONALLY LEFT BLANK

9.0 SCHEDULE

Tetra Tech proposes to perform the field sampling (combined with the laboratory analysis) from August 15, 2022 through September 8, 2022. DTSC will be notified at least one week before any field work takes place and will be notified immediately of any schedule changes or revisions to the RSSIFSP.

The proposed project schedule key milestones are as follows:

- Submit RSSIFSP to DTSC: August 5, 2022
- DTSC Approval of RSSIFSP August 12, 2022
- Conduct SSI Field Work August 15-16, 2022
- Submit Draft SSI Report to DTSC September 9, 2022
- Receive DTSC Comments on Draft SSI Report September 23, 2022
- Submit Final SSI Report to DTSC September 30, 2022
- DTSC Approval of Final SSI Report October 14, 2022

Notes:

a - The total number of discrete soil samples that are analyzed for TPHh/m, TPHd, and TPHg will depend on the number of the tentative surface and subsurface soils that require analysis as described in the Notes column.

A minimum of 34 and a maximum of 88 discrete soil samples will be analyzed for TPHh/m, TPHd, and TPHg.

b - The total number of duplicate soil samples that are analyzed for TPHh/m, TPHd, and TPHg will depend on the number of the tentative surface and subsurface soils that require analysis as described in the Notes column.

A minimum of 4 and a maximum of 10 duplicate soil samples will be analyzed for TPHh/m, TPHd, and TPHg.

EPA - U.S. Environmental Protection Agency

OCPs - organochlorine pesticides

TPHd - Diesel range total petroleum hydrocarbons

TPHg - Gasoline range total petroleum hydrocarbons

TPHh/m - Hydraulic oil/motor oil range total petroleum hydrocarbons

1.0 INTRODUCTION

1.1 BACKGROUND

This Supplemental Site Investigation (SSI) Report was prepared by Tetra Tech for submittal to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Evaluation and Cleanup Branch on behalf of the Rio School District (RSD) for their Rio Del Valle Middle School Expansion Project South Parcel (hereinafter referred to as the Site) (Figure 1). The scope of services for this SSI have been developed to assist the RSD in further assessing the nature and extent of total petroleum hydrocarbons (TPH) identified in Site surface soils at concentrations above Screening Levels that were identified in soil samples collected for the *Phase II Environmental Assessment Rio Del Valle Middle School Expansion Project 2600 North Rose Avenue, Oxnard California 93063* (Tetra Tech 2021b) (Phase II ESA), potential organochlorine pesticides (OCPs) from former termiticide applications, and lead based paint (LPB) in soil around the existing residential structure, garage, and utility shed that were identified in the *Phase I Environmental Assessment, Rio Del Valle Middle School Expansion Project, 2600 North Rose Avenue, Oxnard, California 93036* (Tetra Tech 2021a) (Phase I ESA). The SSI is based on the scope of work in the *Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan, Rio Del Valle Middle School Expansion Project South Parcel 2600 South Rose Avenue, Oxnard, California 93036* (Tetra Tech 2022b) (RSSIFSP).

Tetra Tech previously prepared the *Technical Memorandum Supplemental Site Investigation Field Sampling Plan, Rio Del Valle Middle School Expansion Project South Parcel 2600 South Rose Avenue, Oxnard, California 93036* (Tetra Tech 2022a) (SSIFSP) to complete the SSI work scope that was agreed on by Tetra Tech, the RSD, and the DTSC during the SSI scoping telephone conference conducted on June 14, 2022. Following review of the proposal to complete the work in the SSIFSP, the RSD requested that Tetra Tech renegotiate with DTSC and request that a land use covenant (LUC) be placed on the impacted areas of the Site because the estimated costs to complete the SSI were more than the RSD was willing to spend at this time. A Teams meeting was held between Tetra Tech and DTSC on July 25, 2022. An alternative strategy was presented by Tetra Tech that eliminated the soil gas survey and direct push drilling. This strategy reduced the cost for completing the SSI significantly. This approach was accepted by DTSC during the July 25, 2022 meeting. The RSSIFSP and SSI are based on the revised scope of work agreed to by DTSC during the July 25, 2022 meeting.

This SSI Report includes limited background and historical use information regarding the Site. A detailed summary of Site background and historical use information for the Site is presented in the Phase I ESA (Tetra Tech 2021a) and the Phase II ESA (Tetra Tech 2021b). This SSI Report presents the details of the SSI sampling, analytical work, a human health screening evaluation, and conclusions and recommendations for the TPH-impacted soils, OCP-impacted soils, and LBP in soil at the Site based upon the contaminants of concern identified through SSI field sampling program and the results of the SSI Human Health Risk Evaluation.

1.2 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Jim Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. (Jim) Steele, P.G., C.E.G., C.Hg.
Tetra Tech
5383 Hollister Avenue, Suite 130

Santa Barbara, CA 93111
Phone (805) 681-6302

Randy Westhaus, P.E.
Tetra Tech
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 455-0603

The designated contact person for the RSD is Wael Saleh. Mr. Saleh is the Assistant Superintendent, Chief Business Official for the RSD. The contact information for Mr. Saleh is:

Wael Saleh
Assistant Superintendent, Chief Business Official
Rio School District
1800 Solar Drive
Oxnard, California 93030
Phone (805) 485-3111

2.0 SITE LOCATION AND DESCRIPTION

The Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98-acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). The Site is owned by KMS Industries, Inc. and is leased by Reiter Affiliated Companies. At the time of the June 18, 2021 Phase II ESA field sampling event, the Site comprised an approximate 11.1-acre area of the 21.98-acre parcel owned by KMS Industries, Inc. and was leased by Reiter Affiliated Companies (Figure 2). In August 2022, the Site contained (approximately) a 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre vacant area that was formerly the Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farm Yard. The remaining 8.7 acres of the Site was occupied by areas of row crop production with access roads. Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops and orchards. The Residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The Junk Vehicle Storage Area formerly contained approximately 30 junk cars. The Tenant Storage Yard formerly contained a trailer, motor a home, two storage containers, and a utility truck. The vehicles in the former Junk Vehicle Storage Area and items in the Tenant Storage Yard had been removed before the Phase II ESA June 18, 2021 sampling event. The Farm Equipment Storage and Parking Area contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment. Three cylindrical steel above ground storage tanks (ASTs) with steel secondary containment bins that are owned and operated by Reiter Affiliated Companies were observed in the Farm Equipment Storage and Parking Area (Figure 2). The ASTs contained diesel fuel, red diesel fuel, and gasoline for farm equipment. The two diesel ASTs are approximately 300 gallons capacity each and the gasoline AST is approximately 500 gallons capacity. The ASTs are within individual steel containment bins.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING, GEOLOGY, AND HYDROLOGY

3.1 PHYSICAL SETTING

The Site is depicted on the Oxnard, California Quadrangle U.S. Geological Survey (USGS) 7.5-minute topographic series map (USGS 2015) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 13' 50.75" North, Longitude 119° 9' 15.86" West (Google Earth 2021). Surface elevations at the Site range from approximately 94 feet above mean sea level (msl) in the northwest corner of the Site to 89 feet above msl in the southeast corner of the Site with a topographic gradient that is generally flat with a gentle slope to the southeast (Environmental Data Resources, Inc. [EDR] 2021).

3.2 REGIONAL GEOLOGY

The Site is located in Ventura County on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. This geomorphic province is distinguished by the prevailing east-west linear trend of its geologic structure and geomorphology in contrast to the predominant northwest-southeast trend of the geomorphic features within most other provinces of the state. The province is bounded by major faults, including the San Andreas Fault zone in the northeast, the Big Pine fault in the north and the Malibu Coast fault in the south. Most of the faults in Ventura County are reverse faults which dip north, including the Pine Mountain, Red Mountain, San Cayetano, Santa Susana, Simi, Ventura, and Malibu Coast faults (Norris and Webb 1990).

The Ventura Basin is a large synclinal structure situated between the Santa Ynez Range and Topa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Department of Conservation, California Geologic Survey [CGS] 2002).

3.3 LOCAL GEOLOGY

Locally, the Site is situated in the Oxnard Plain sub-province. Lithologic units of sedimentary origin underlying the nearly flat Oxnard Plain are approximately 45,000 feet in thickness and consist of Upper Cretaceous, Tertiary, and Quaternary-age units which have been deposited on a pre-Upper Cretaceous base of igneous and/or metamorphic rock. Unconsolidated Holocene (last 11,000 years) sediments beneath the Site were deposited during the post-glacial period in marine, lagoonal, lacustrine, fluvial-flood plain, deltaic and eolian environments, including the pre-historic delta of the ancient Santa Clara River and Calleguas Creek and reach a depth of approximately 900 feet beneath the Oxnard Plain (Clahan et al 2003; Turner and Mukae 1975).

3.4 HYDROLOGY

3.4.1 Hydrogeology

The Site is situated at the eastern edge of the Oxnard Forebay basin, a subbasin of the larger Santa Clara-Calleguas groundwater basin. The Oxnard Forebay is an important groundwater recharge area for valuable resources of groundwater in aquifers underlying the Oxnard Plain. The unconsolidated sediments

beneath the Oxnard Forebay and the Site are composed of both continental and marine deposits of Tertiary and Quaternary age. They contain multiple aquifers of coarse grain sediments with intervening fine grain aquitards. Aquifers have been grouped into an Upper Aquifer System (UAS) and a Lower Aquifer System (LAS) based on changes in geologic structure and separated in many areas by regional layers of low permeability clay. The UAS sediments are relatively flat lying and extend to approximately 400 feet beneath the Site. The sediments in the LAS are more structurally complex, resulting from folding and faulting. In the Oxnard Forebay, alluvial sediments in the subsurface are predominantly coarse grain sands and gravels. Fine grain sediments, such as silts and clays, which can act as confining layers are generally absent or discontinuous. This condition allows for direct recharge of the UAS from the surface and some recharge of the LAS from the UAS in the subsurface (Fox Canyon Ground Water Management Agency 2017; Turner and Mukae 1975).

The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet below ground surface (bgs) to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

3.4.2 Surface Water

No surface water was observed at the Site during the reconnaissance performed during August 2022 during the SSI field exploration. It is likely that during periods of moderate rainfall, free surface water that accumulates on the Site may flow south and southwest and possibly into gutters along Collins Street and North Rose Avenue (Figures 1 and 2). However, the U.S. Department of Agriculture, Soil Conservation Service report indicates that soil permeability at the Site is moderate to rapidly moderate and surface runoff is very slow, such that there is a low hazard of erosion by water (USDA 1970).

4.0 PHASE I ESA

Tetra Tech completed a Phase I ESA for the Site in 2021 (Tetra Tech 2021a). The key information from the Phase I ESA is summarized in this section.

The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1927. The Site is currently being used for organic crop cultivation and has been over the last 10 years. Tetra Tech reviewed the Geologic Energy Management Division's (CalGEM, formerly DOGGR) online mapping application Well Finder (CalGEM 2020), Map 214 (California Department of Conservation, Division of Oil, Gas, and Geothermal Resources [DOGGR] 2000]), and associated well history documents to evaluate potential presence of oil fields and wells within the Site vicinity. Records indicate that the Site is not located in an oil field. The nearest oil field to the Site is the Santa Clara Avenue Field, located approximately 0.5 to 1 mile southeast of the Site. There are no known active or abandoned wells on Site. No oil production related pipelines or other facilities are located onsite or are known to have formerly been located onsite (Tetra Tech 2021a).

Tetra Tech reviewed online resources at the Cal EPA State Water Resources Control Board (SWRCB) GeoTracker database (SWRCB 2021) for any records pertaining to the Site and surrounding area. The GeoTracker database did not show any records for cases located on the Site. According to the GeoTracker database, four closed Leaking Underground Storage Tanks (LUSTs) are present approximately 0.2 miles southwest of the Site along Auto Center Drive. In addition, two closed LUSTs are present approximately 0.5 miles northeast of the Site on North Rose Avenue. These six sites do not pose a risk to the Site (Tetra Tech 2021a).

The following Recognized Environmental Conditions (RECs) were identified for the Site in the 2021 Phase I ESA:

- REC 1: Potential impacts from former agricultural pesticide application;
- REC 2: Potential bunker oil releases from potential former smudge pot frost abatement;
- REC 3: Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the Site;
- REC 4: Hydrocarbon releases to surface soil from the two-diesel fuel and one gasoline ASTs at the Site;
- REC 5: Three PCB-containing pole-mounted electrical transformers; and
- REC 6: Three high-volume water transmission pipelines within 1,500 feet of the Site.

The following four *de minimis* conditions have been identified in the Phase I ESA.

- Potential that asbestos containing building materials (ACBMs) may be present in the building materials in the residence area structures.

- Potential that lead-based paint (LBP) in the building materials in the residence area structures and LBP chips may be present in the surface soil surrounding the residence area structures.

- The residence is connected to a septic system. The location of the septic system appurtenances (leach field and septic tank) was not disclosed by the property owner to Tetra Tech.

- The minor housekeeping issues observed in the residence area included fertilizers, paint, and cleaning products found throughout the home and storage area, and the haphazardly stored items (old paint, fertilizer product, equipment, etc.) in the woodshed.

The Phase I ESA recommended that a Phase II ESA be performed to assess RECs 1 through 5 in accordance with DTSC guidelines for completing a Preliminary Environmental Assessment (PEA) including the *Preliminary Endangerment Guidance Manual* (DTSC 2015b) (PEA Guidance Manual) and the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* (DTSC 2008) (Agricultural Fields Guidance). To evaluate the potential risks posed by REC 6, a hazardous pipeline assessment should be conducted in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (California Department of Education [CDE] 2007).

5.0 PHASE II ESA SUMMARY

On behalf of the RSD, Tetra Tech prepared the Phase II ESA report dated September 24, 2021 (Tetra Tech 2021b). The Phase II ESA field sampling program assessed RECs 1 through 5 as described below.

- REC 1, potential impacts from former agricultural pesticide application, was assessed by the collection of 20 discrete surface soil samples at depths of 0 to 0.5 feet bgs that were combined into five composite samples and one duplicate composite sample and analyzed for OCPs using United States Environmental Protection Agency (USEPA) method 8081A, and the collection of five discrete surface soil samples and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for total arsenic using EPA method 6010B.

- REC 2, potential bunker oil releases from potential former smudge pot frost abatement, was assessed by the collection of 10 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for semivolatile organic compounds (SVOCs) using EPA method 8270C, polyaromatic hydrocarbons (PAHs) using EPA method 8270C SIM, and diesel fuel total petroleum hydrocarbons (TPHd) and motor oil total petroleum hydrocarbons (TPHh/m) using EPA method 8015M.

- REC 3, Hydrocarbon and potentially toxic metals releases to surface soil from junk vehicles formerly stored at the site and REC 4, hydrocarbon releases to surface soil from the two diesel fuel and one gasoline ASTs, were assessed by the collection of 7 discrete surface soil samples at depths and one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for CAM 17 Metals using EPA method 6010B/7471A, SVOCs using EPA method 8270C, PAHs using EPA method 8270C SIM, gasoline range total petroleum hydrocarbons (TPHg) using the LUFT gas chromatograph/mass spectrometer (GC/MS) method, TPHd and TPHh/m using EPA method 8015M, and volatile organic compounds (VOCs) using EPA method 8260B.

- REC 5, Three pole-mounted electrical transformers, was assessed by the collection of 3 discrete surface soil samples at depths one duplicate soil sample at depths of 0 to 0.5 bgs that were analyzed for PCBs using EPA method 8082.

The Phase II ESA surface soil sample analysis results did not yield OCPs and arsenic (REC 1), SVOCs and PAHs (REC 2), VOCs (REC 4), and PCBs (REC 5) at concentrations above relevant screening levels. The Phase II ESA surface soil sample results did indicate that TPHg, TPHd, and TPHh/m were present at the Site at concentrations above relevant screening levels due to releases from the junk vehicles previously stored at the Site and the fuel storage ASTs (RECs 3 and 4). The locations of the surface soil samples with TPHg, TPHd, and TPHh/m with concentrations above relevant screening levels are shown on Figure 3 and summarized in Table 1 for the Phase II ESA TPHg, TPHd, and TPHh/m sample results.

THIS PAGE INTENTIONALLY LEFT BLANK

6.0 PEA EQUIVALENT AND SSI SCOPE OF WORK DEVELOPMENT

On behalf of the RSD, Tetra Tech submitted the Phase I ESA (Tetra Tech 2021a) and Phase II ESA (Tetra Tech 2021b) to DTSC as a PEA Equivalent on March 30, 2022. In a letter dated May 10, 2022, the DTSC concurred with the adequacy of the PEA Equivalent pending review of public comments (DTSC 2022c). DTSC's comments on the PEA Equivalent report were included as an attachment to the letter identifying discrepancies that required clarification and/or modification that should be addressed in the SSI. Potential impacts to the soils around the residential structures from OCPs in termiticides and LBP in soil were identified as items that should be further assessed in the SSI. The DTSC approved the PEA Equivalent in a letter dated August 8, 2022 (DTSC 2022e).

A SSI scoping telephone conference was conducted on June 14, 2022 between DTSC, Tetra Tech, RSD, and Sage. The discrepancies that required clarification and/or modification in the May 10, 2022 DTSC letter were discussed in the scoping meeting and resolved for the SSI. The proposed SSI work plan was discussed during the scoping telephone conference, and adjustments were made to the SSI work plan initially presented by Tetra Tech based on DTSC comments. The scope of work presented in the SSIFSP (Tetra Tech 2022a) was based on the scope of work agreed on by DTSC, Tetra Tech, RSD, and Sage during the June 14, 2022 SSI scoping telephone conference. The DTSC approved the SSIFSP in a letter dated July 5 2022 (DTSC 2022d). As described in Section 1.0, at the request of the RSD, a Teams meeting was held between Tetra Tech and DTSC on July 25, 2022 in which an alternative strategy was presented by Tetra Tech that eliminated the soil gas survey and direct push drilling from the SSI field work included in the SSIFSP. This strategy reduced the cost for completing the SSI significantly. This approach was accepted by DTSC during the July 25, 2022, meeting and is the basis for the work scope in the RSSIFSP (Tetra Tech 2022b). The DTSC approved the RSSIFSP in a letter dated August 12, 2022 (DTSC 2022f) which is included in Appendix A.

7.0 SSI FIELD WORK

7.1 SAMPLING STRATEGY AND APPROACH

The field sampling assessment consists of a subsurface soil sample collection program using hand auger sampling methods with fixed laboratory sample analysis. The following subsections describe the rationale and scope of sampling. The Site ground surface is relatively flat and was partially planted in crops during implementation of the SSI sampling program. The areas for the proposed SSI field work will not be in areas of the Site that will be planted in crops.

7.1.1 Rationale

The SSI sample locations discussed below are shown on Figure 4. The SSI is being performed to further assess:

- The lateral and vertical extent of TPHg, TPHd, and motor oil total petroleum hydrocarbons (TPHm) (equivalent to TPHh/m) at concentrations in soil at or above relevant screening levels at the seven locations where TPHg, TPHd, TPHm were detected in surface soil samples at concentrations exceeding relevant screening levels (SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29);

- Potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40; and

- Potential LBP at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) in the soil within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40.

Relevant constituent screening levels are defined as those that were identified in the May 10, 2022 DTSC letter (DTSC 2022c) per the DTSC's Toxicity Criteria Rule (https://dtsc.ca.gov/regs/toxicity-criteria-for-human-health-risk-assessment/). The screening levels provided in *Human Health Risk Assessment (HHRA) Note Number 3 DTSC Modified Screening Levels (DTSC-SLs)* (HHRA Note 3) (DTSC 2022b) were used in preference to U.S. EPA Regional Screening Levels (RSLs) (U.S. EPA 2022a) when evaluating contaminants in environmental media at California sites and facilities. When screening levels for a chemical are not listed in HHRA Note Number 3, USEPA's RSL tables were used. The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Environmental Screening Levels (ESLs), Tier 1 ESLs were used for TPHg, TPHd, and TPHm (SFRWQCB 2019).

7.1.2 Field Coordination

Tetra Tech coordinated Site access with the Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. The soil samples were collected using sampling methods that were executed in a manner that avoided damaging crops and Site infrastructure.

7.2 SAMPLING METHODS AND PROCEDURES

Tetra Tech completed the SSI field soil sample collection on August 15 and 16, 2022. This section describes the methods and procedures that were used to collect and analyze soil samples.

7.2.1 Sample Site Location and Utility Clearance

The GPS coordinates of the seven soil sample locations where TPHg, TPHd, and TPHm were detected at concentrations exceeding relevant screening levels (sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29) and sample locations SS-1 and SS-22 were previously mapped in the field. These GPS sample location coordinates were used to relocate these sample locations for the SSI using the ESRI Collector program system. The estimated new sample locations for samples SS-30 through SS-40 and the step out samples for sample locations SS-10, SS-23, SS-24, SS-25, SS-26, SS-28, and SS-29 were entered into the ESRI Collector program prior to field work and corrected in the field as needed. Sample location depths in feet bgs were recorded using the ESRI Collector program and in our field notes. These data are presented on figures and in tables in this SSI report. The utility clearance for these soil sample locations was performed by meeting with Site owner, KMS Industries, Inc. and tenant, Reiter Affiliated Companies prior to performing the SSI field sampling. In addition, Tetra Tech marked the proposed boring locations and contacted Dig Alert to provide markout services.

7.2.2 SSI Sampling Program

7.2.2.1 TPHg, TPHd, and TPHm Impacted Soil Assessment

Soil Sample Collection

Soil samples were collected to assess the lateral and vertical extent of the TPHg, TPHd, and TPHm impacted soil identified at the seven Phase II ESA sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 (Figure 4 and Table 1). Step out soil samples were collected at 5 feet (sets A1, B1, C1, and D1) and 10 feet (sets A2, B2, C2, and D2) to the northeast, southeast, southwest, and northwest of each of the seven Phase II ESA sample locations identified above. Surface soil samples were collected from 0 to 0.5 feet bgs at the seven sets of A1, B1, C1, and D1 step out sample locations. Subsurface soil samples were also collected at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated step out sample locations, A1, B1, C1, and D1 at 1.0 to 1.5 feet bgs. Surface soil samples were collected using hand sampling methods from 0.0 to 0.5 feet bgs at the A2, B2, C2, and D2 step out sample locations associated with sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29. The hand sampling equipment was decontaminated between each boring using a phosphate-free detergent wash and successive rinses with potable and deionized water.

After sample collection, the subsurface soil samples collected at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and the surface soil samples at their associated initial step out at sample locations, A1, B1, C1, and D1 were submitted for laboratory analysis (Figure 4 and Table 2). If TPHg, TPHd, and TPHm were detected at concentrations exceeding their relevant screening levels in the surface soil samples from the associated initial step out at sample locations A1, B1, C1, and D1, then the associated subsurface soil sample and secondary step out surface soil sample (samples A2, B2, C2, and D2) were submitted for laboratory analysis.

Following the sample analysis strategy described in the previous paragraph, the subsurface soil samples collected at sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 and the surface soil samples at their associated initial step out at sample locations A1, B1, C1, and D1 were submitted for laboratory analysis. Because TPHd was detected at a concentration exceeding the relevant screening level in the surface soil sample from SS-23-D1-0.0, subsurface soil sample from SS-23-D1-1.0 and surface soil sample from SS-23-D2-0.0, these samples were analyzed for TPHg, TPHd, and TPHm. Because TPHd was detected at a concentration exceeding the relevant screening level in the surface soil sample from samples SS-26-B1-0.0, subsurface soil sample from SS-26-B1-1.0 and surface soil sample from SS-26-

B2-0.0, these samples were analyzed for TPHg, TPHd, and TPHm. A total of 27 discrete and two duplicate surface soil samples were analyzed for TPHg, TPHd, and TPHm using EPA method 8015B. A total of 7 discrete and two duplicate subsurface soil samples were analyzed for TPHg, TPHd, and TPHm using EPA method 8015B.

The borings were logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 2017a) and D 2488-90 (ASTM 2017b). During sampling, a photoionization detector (PID) calibrated with isobutylene gas was used to monitor the potential presence and concentrations of organic vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings were recorded on field logs prepared by the field geologist/engineer during sampling activities. The drill cuttings and soil samples were evaluated in the field for staining and odor. The labeled samples were placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with chain-of-custody (COC) records. Instructions were included on the COCs.

The following sampling information was recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 2017a, 2017b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

7.2.2.2 Potential OCP and Lead in Soil Assessment

Soil Sample Collection

Soil samples were collected to assess potential OCPs at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) and subsurface soil (2.5-3.0 feet bgs) in the soil, and lead at concentrations at or above relevant screening levels in surface soil (0.0-0.5 feet bgs) within 2 feet of the residential structures at proposed sample locations SS-30 through SS-40 (Figure 4 and Table 2). The sample collection and laboratory analysis were performed in accordance with the *Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers* (DTSC 2006).

The surface and subsurface soil samples were collected using hand auger methods with a hand driven split-spoon sampler. Subsurface soil was directly transferred from the split-spoon sampler into pre-cleaned glass sample containers provided by the analytical laboratory fitted with Teflon-lined screwcaps. The hand auger sampling equipment, including the split spoon sampler, were decontaminated between the collection of each soil sample using a phosphate-free detergent wash and successive rinses with potable and deionized water.

A total of 11 discrete surface, 11 discrete subsurface, and three duplicate soil samples were collected and submitted for laboratory analysis for OCPs using EPA method 8081A. A total of 11 discrete surface and 2 duplicate soil samples were collected and submitted for laboratory analysis for total lead using EPA method 6010B.

THIS PAGE INTENTIONALLY LEFT BLANK

8.0 SSI FIELD ASSESSMENT RESULTS

8.1 EARTH MATERIALS

The Site geology and soil types are described in Sections 3.2 through 3.4.2. Thirty five soil borings (borings SS-10, SS-23 through SS-26, SS-28, and SS-29 and their associated initial step outs at sample locations, A1, B1, C1, and D1) were completed to 1.5 feet bgs and 11 soil borings (borings SS-30 through SS-40) were completed to 2.5 feet bgs for the SSI at the locations shown on Figure 4. Twenty-eight surface soil samples were collected from approximately 0.0 to 0.5 feet bgs at the A2, B2, C2, and D2 secondary step outs at sample locations for borings SS-10, SS-23 through SS-26, SS-28, and SS-29.

The boring logs are included in Appendix B. The general subsurface profile observed in the borings consisted of silt, silty sand, and sand at the ground surface extending to the total depth of each boring at 2.5 feet bgs. Diesel fuel soil staining was noted in samples SS-23-1.0 and SS-23-D1-0.0 and a PID soil vapor reading of 4.4 parts per million by volume (ppmv) was recorded for soil sample SS-23-1.0 and 0.4 ppmv for soil sample SS-23-D1-0.0. No VOC vapors, soil staining, or odors indicative of contamination were noted in the soils logged for the remainder of the borings completed and soil samples collected for the SSI.

8.2 GROUNDWATER

The Site area hydrogeology is described in Section 3.4.1. No groundwater was encountered in the borings completed to 0.5, 1.5, and 2.5 feet bgs for the SSI. The first encountered groundwater beneath the Site is in the UAS. Review of potentiometric maps for the UAS from 1972 through 2016 indicate that the depth to groundwater ranged from approximately 33 feet bgs to 133 feet bgs during that time period (Fox Canyon Groundwater Management Agency 2015). The most recent groundwater elevation data for Fall 2016 indicates that the first encountered groundwater in the Site area was at approximately -36 feet below mean sea level (msl) or approximately 133 feet bgs (Fox Canyon Groundwater Management Agency 2019). The depth to the highest known historical groundwater level in the Site area is approximately 20 feet bgs (CGS 2002).

8.3 SOIL SAMPLE ANALYSIS RESULTS

The soil sample analysis schedule is presented in Table 2 and their locations are shown on Figure 4. The soil sample analyses were performed by Eurofins/Calscience, a California State Certified laboratory.

The laboratory reporting limits and soil sample screening levels for subsurface soil samples are provided in Table 3. The SFRWQCB Tier 1 ESLs were used for evaluating TPHg, TPHd, and TPHm soil concentrations (SFRWQCB 2019). The soil samples analyzed for OCPs and total lead were compared to the screening levels provided in HHRA Note 3 (DTSC 2022b) and were used in preference to U.S. EPA RSLs (U.S. EPA 2022a) when evaluating contaminants in environmental media at California sites and facilities. When screening levels for a chemical are not listed in HHRA Note Number 3, USEPA's RSL tables were used.

8.3.1 TPHg, TPHd, and TPHm Impacted Soil Assessment

Select soil samples collected for the SSI were submitted for laboratory analysis to assess the lateral and vertical extent of the TPHg, TPHd, and TPHm impacted soil. These soil samples were analyzed for TPHg, TPHd, and TPHm by EPA method 8015B. As described in Section 7.2.2.1, a total of 27 discrete and two duplicate surface soil samples were analyzed for TPHg, TPHd, and TPHm using EPA method

8015B for the SSI. A total of 7 discrete and two duplicate subsurface soil samples were analyzed for TPHg, TPHd, and TPHm using EPA method 8015B for the SSI. The TPHg, TPHd, and TPHm soil sample analysis results are summarized in Table 4 and the laboratory reports are included in Appendix C. The soil sample locations are shown on Figure 4.

Figure 5 presents a hits map that shows the soil sample results at concentrations above or at the SFRWQCB Tier 1 ESLs (SFRWQCB 2019) for residential soil. This figure shows the soil sample analytical results at concentrations exceeding relevant screening levels for soil samples collected for the 2021 Phase II ESA (Tetra Tech 2021b) and for the 2022 SSI.

As shown in Table 1 and Figure 5, the surface soil sample laboratory analytical results from the 2021 Phase II ESA (Tetra Tech 2021b) at seven locations contained TPHg as total purgeable petroleum hydrocarbons (TPPH), TPHd, or TPHm as hydraulic oil\motor oil (TPHm/h) at concentrations greater than their relevant screening levels as follows:

- TPPH were detected in sample SS-23 at a concentration of 310 mg/kg, exceeding the SFRWQCB Tier 1 ESL for residential soil of 100 mg/kg;

- TPHd was detected in samples SS-23 (14,000 mg/kg), SS-24 (25,000 mg/kg), and SS-26 (8,100 mg/kg) at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg by one to two orders of magnitude; and

- TPHh was detected in samples SS-10 (2,800 mg/kg), SS-25 (27,000 mg/kg), SS-26 (33,000 mg/kg), SS-28 (74,000 mg/kg), and SS-29 (25,000 mg/kg) at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 1,600 mg/kg by one order of magnitude (SFRWQCB 2019).

As shown in Table 4 and Figure 5, the surface soil samples at three locations contain TPHd at concentrations exceeding the SFRWQCB Tier 1 ESL for residential soil of 260 mg/kg as follows:

- TPHd was detected in sample SS-23-D1-0.0 at 920 mg/kg;

- TPHd was detected in sample SS-23-D2-0.0 at 1,600 mg/kg; and

- TPHd was detected in sample SS-26-B1-0.0 at 380 mg/kg.

None of the other surface or subsurface soil samples analyzed for the SSI contained TPHg, TPHd, or TPHm at concentrations above their relevant screening levels.

8.3.2 OCP and Total Lead Soil Assessment

As described in Section 7.2.2.2, a total of 11 discrete surface, 11 discrete subsurface, and three duplicate soil samples were collected and submitted for laboratory analysis for OCPs using EPA method 8081A. A total of 11 discrete surface and 2 duplicate soil samples were collected and submitted for laboratory analysis for total lead using EPA method 6010B. The OCP soil sample analysis results are summarized in Table 5, the total lead sample analysis results are summarized in Table 6, and the laboratory reports are included in Appendix C. The soil sample locations are shown on Figure 4.

As shown in Table 5 and Figure 5, OCPs were detected in the following surface soil samples at concentrations exceeding their Residential Soil Screening Level is the DTSC-Modified Soil Screening Levels (DTSC RSLs) in HHRA Note 3 (DTSC 2022b):

- 4,4'-DDT (DDT) was detected at concentrations exceeding the DTSC RSL of 1,900 micrograms per kilogram (µg/kg) in surface soil samples SS-35-0.0 (3,600 µg/kg) and DUP 6 (2,400 µg/kg);

- Chlordane (Technical) was detected at concentrations exceeding the DTSC RSL of 1,700 µg/kg in surface soil samples SS-30-0.0 (1,800 µg/kg), DUP 5 (2,100 µg/kg), and SS-32-0.0 (3,400 µg/kg);

- Dieldrin was detected at concentrations exceeding the DTSC RSL of 34 µg/kg in surface soil samples SS-31-0.0 (210 µg/kg), SS-35-0.0 (240 µg/kg), DUP 6 (180 µg/kg), SS-36-0.0 (35 µg/kg), SS-39-0.0 (150 µg/kg), and DUP 7 (190 µg/kg), and subsurface soil samples SS-31-2.0 (42 µg/kg), and SS-35-2.0 (340 µg/kg); and

- Toxaphene was detected at concentrations exceeding the DTSC RSL of 450 µg/kg in surface soil samples SS-35-0.0 (2,220 µg/kg), DUP 6 (1,800 µg/kg), SS-39-0.0 (780 µg/kg), and DUP 7 (1,100 µg/kg).

None of the other surface or subsurface soil samples analyzed for the SSI contained OCPs at concentrations above their relevant screening levels.

As shown in Table 6, Total Lead was not detected at concentrations above the DTSC RSL of 80 mg/kg (DTSC 2022b).

8.3.3 Estimated Extent of Total Petroleum Hydrocarbons in Soil at Concentrations Above Relevant Screening Levels

The estimated lateral and vertical extent of TPHg, TPHd, and TPHm at concentrations above screening levels was estimated using the soil sample data from the Phase II ESA (Tetra Tech 2021b) (Table 1) and this SSI (Table 4). The estimated lateral extent of TPHg, TPHd, and TPHm at concentrations above screening levels is shown on Figure 6 and the estimated lateral extent, depth, and volume of TPHg, TPHd, and TPHm at concentrations above screening levels is listed in Table 7.

As shown in Tables 1 and 4 , at sample locations SS-10, SS-24, SS-25, SS-28, and SS-29, TPHg, TPHd, and TPHm were not detected at concentrations exceeding the relevant screening levels in the samples collected at 1 foot bgs beneath the initial sample locations (SS-10, SS-24, SS-25, SS-28, and SS-29) or in any of the associate primary step out samples (A1, B1, C1, and D1). Therefore, the estimated maximum lateral extent of TPHg, TPHd, or TPHm at concentrations exceeding screening levels was set at a circle with a 5-foot radius with its center at each initial sample location. The estimated depth of TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels was set at 1-foot bgs. Therefore, the estimated lateral extent of TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels at each of the five locations is 78.5 square feet (ft^2) and the estimated volume is 2.9 cubic yards (CY).

At sample location SS-23, TPHg, TPHd, and TPHm were not detected at concentrations exceeding the relevant screening levels in the sample collected at 1-foot bgs beneath the initial sample location (SS-23), or in the associate primary step out samples A1, B1, and C1. TPHg, TPHd, and TPHm were detected at concentrations exceeding the relevant screening levels in the surface soil step out samples D1 and D2.

The estimated area of TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels was extended out to approximately 12.5 feet from the initial sample location, SS-23 resulting in an estimated area of 111.2 ft^2 and a volume of 4.1 CY with TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels. Although the estimated extent of TPHd at concentrations exceeding the relevant screening levels was not defined to the south of sample location SS-23-D2 by soil sample data, based on field observations of soil conditions, it is estimated not to extend more than approximately 3 feet further to the south of sample location SS-23-D2.

At sample location SS-26, TPHg, TPHd, and TPHm were not detected at concentrations exceeding the relevant screening levels in the sample collected at 1-foot bgs beneath the initial sample location (SS-26), or in the associated primary step out samples A1, C1, and D1. TPHg, TPHd, and TPHm were detected at concentrations exceeding the relevant screening levels in the surface soil step out sample D1 but not in step out sample D2. The estimated area of TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels was extended out to approximately 7.5 feet from the initial sample location, SS-26 resulting in an estimated area of 88.3 ft^2 and volume of 3.3 CY with TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels.

The total estimated volume of soil with TPHg, TPHd, and TPHm at concentrations exceeding the relevant screening levels at the Site is 21.89 CY (Table 7).

8.3.4 Estimated Extent of Organochlorine Pesticides in Soil at Concentrations Above Relevant Screening Levels

Step out soil samples would need to be collected to assess the extent of OCPs in soil at concentrations above relevant screening levels.

9.0 HUMAN HEALTH RISK EVALUATION

9.1 INTRODUCTION

The SSI Human Health Risk Evaluation (HHRE) has been conducted for hypothetical residential exposures to the chemicals of potential concern (COPCs) identified in soils at the Rio Del Valle Middle School Expansion Project's South Parcel through sample data collected during the Phase II ESA investigation and the SSI.

The SSI HHRE conservatively includes only a hypothetical residential scenario (for unrestricted land use) and assesses cumulative cancer risk and noncancer hazard estimates for both maximum detected COPC concentrations and 95% upper confidence limit (95% UCL) of the arithmetic mean concentrations.

The HHRE consists of four steps: (1) identifying potentially complete exposure pathways based on the conceptual site model, (2) identifying COPCs, (3) estimating exposures to the COPCs and the associated potential health risks, and (4) calculating estimated cumulative cancer risks and noncancer hazards from all COPCs. The findings of the HHRE are summarized in the Risk Characterization (Section 9.5).

9.2 EXPOSURE PATHWAYS AND MEDIA OF CONCERN

9.2.1 Conceptual Site Model

A conceptual site model (CSM) provides a description of the links between contaminant sources at a site, the chemicals detected at the Site, the mechanisms by which chemical transport or migration may occur in the environment, and the persons potentially exposed to environmental media at the Site. The CSM (Figure 7) identifies the potential sources, mechanisms of transport, environmental media of concern, and exposure routes for current and future human receptors at this Site.

As discussed in Section 2.0, the Site is located on a 11.1 acre rectangular-shaped portion of APN 144-0-110-590 at 2600 North Rose Avenue, a 21.98-acre parcel in the Oxnard planning area of Ventura County, California (Figures 1 and 2). In August 2022, the Site contained (approximately) a 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre vacant area that was formerly the Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farm Yard. The remaining 8.7 acres of the Site was occupied by areas of row crop production with access roads. The Residence contains an unmaintained swimming pool, yard, parking area and garage, and tool shed. The Junk Vehicle Storage Area formerly contained approximately 30 junk cars. The Tenant Storage Yard formerly contained a trailer, motor a home, two storage containers, and a utility truck. The vehicles in the former Junk Vehicle Storage Area and items in the Tenant Storage Yard had been removed before the Phase II ESA June 18, 2021 sampling event. The Farm Equipment Storage and Parking Area contained agricultural equipment such as fertilizer tanks, shade structures, tarps, wood, and motorized equipment. Three cylindrical steel above ground storage tanks (ASTs) with steel secondary containment bins that are owned and operated by Reiter Affiliated Companies were observed in the Farm Equipment Storage and Parking Area (Figure 2). The ASTs contained diesel fuel, red diesel fuel, and gasoline for farm equipment. The two diesel ASTs are approximately 300 gallons capacity each and the gasoline AST is approximately 500 gallons capacity. The ASTs are within individual steel containment bins.

As explained in Section 4, the Phase II ESA field sampling program assessed five RECs, and only TPHg, TPHd, and TPHm were present from surface soil samples collected at the Site at concentrations above relevant screening levels. The sources of TPH were associated with junk vehicles previously stored at the Site and the fuel storage ASTs (RECs 3 and 4, as described in Section 4). The locations of the Phase II

ESA surface soil samples with TPHg, TPHd, and TPHm with concentrations above relevant screening levels are shown on Figure 3 and summarized in Table 1 for the Phase II ESA TPHg, TPHd, and TPHm sample results.

DTSC review of the Phase II ESA included recommendations for delineating TPH concentrations around the locations of exceedances of screening values, and that additional soil sampling be conducted around the residential structures and analyzed for OCPs (from possible use of termiticides) and lead (potentially from LBP). Therefore, the SSI was conducted to collect these additional soil data. Table 3 presents the sample IDs and analytical methods for specific samples. Tables 4, 5, and 6 provide the analytical results for the SSI for TPH, OCPs, and lead, respectively.

Middle school children and staff are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. PEA guidance (DTSC 2015b) indicates that sites should be evaluated assuming unrestricted residential land use, regardless of current and future uses. Therefore, the unrestricted land use scenario (i.e., residential land use) was evaluated for this Site, which is protective of future school use since the exposure assumptions for a residential scenario are more conservative than those for a school scenario.

9.2.2 Soil Exposure Pathways

Currently, the Site has areas of bare soils that may be contacted directly. Chemicals of potential concern (COPCs) have been detected in soils at the Site. Therefore, the potential exists for humans to be exposed to COPCs through direct dermal contact with soil and by incidental soil ingestion. In the future, it is likely buildings will be constructed at the Site. These buildings will act to limit exposures to soils by onsite receptors. However, in accordance with PEA guidance, all soils at the Site were considered available for dermal contact, incidental ingestion, and the generation of dusts (DTSC 2015b).

9.2.3 Air Exposure Pathways

The Phase II ESA included analyses for VOCs, and none were detected at concentrations exceeding screening levels. Therefore, inhalation of volatiles from soil is not considered a complete exposure pathway for on-Site receptors. Nonvolatile chemicals may be sorb to soils. Wind erosion and dispersion of soil particulates could potentially result in exposure to these nonvolatile chemicals associated with airborne soil particulates (i.e., dusts). Therefore, it was assumed that receptors could potentially be exposed to COPCs by the inhalation of airborne dusts.

9.2.4 Summary of Selected Exposure Pathways

Although the Site is planned for middle school use, for the purpose of this screening evaluation, a residential/unrestricted land use scenario was assumed. Receptors were assumed to be potentially exposed to chemicals at the Site by direct dermal contact with soils, incidental ingestion of soils, and the inhalation of wind-generated airborne dusts. These potentially complete exposure pathways are shown in the CSM for planned future Site conditions (Figure 7).

9.3 CHEMICALS AND EXPOSURE POINT CONCENTRATIONS

Table 8 presents the maximum detected concentrations and upper bound estimates of the mean concentrations for soil COPCs. The following sections briefly discuss the TPH, OCPs, and lead samples and results that were incorporated into the HHRE.

9.3.1 Metals

Consistent with the Tetra Tech SSI Sampling Plan (Tetra Tech 2022b), only lead was analyzed for in soil from near structures in the SSI, and for assessing the potential for LBP release of lead to soil. The analytical method was EPA method 6010B. The lead results range from 16.7 – 39.2 mg/kg (the maximum is the average of sample SS-35-0.0 and its duplicate – 35.9 mg/kg and 42.5 mg/kg). These results are lower than the DTSC residential soil lead screening level of 80 mg/kg (DTSC. 2022a) and indicate that no significant release of lead has occurred to soil near the on-Site structures. Therefore, lead is not selected as a COPC and was not evaluated further in the risk evaluation.

9.3.2 Pesticides

The OCP soil sample results are summarized in Table 5 for the 22 surface soil samples collected during the SSI. Soil samples were collected near structures in case OCP-containing termiticides may have been used and potentially released to soil.

To determine the presence of pesticides and ensure a health-protective assessment, soil samples collected at the Site were analyzed for OCPs using EPA method 8081A. The following 18 organochlorine pesticides were detected in soils at the Site:

- DDD;
- DDE;
- DDT;
- Chlordane (alpha);
- Chlordane (gamma);
- Chlordane (technical);
- Dieldrin;
- Endosulfan I;
- Endosulfan II;
- Endosulfan sulfate;
- Endrin;
- Endrin ketone;
- Heptachlor;
- Heptachlor epoxide;
- Hexachlorocyclohexane – alpha (also known as alpha-BHC);

- Hexachlorocyclohexane – beta (also known as beta-BHC);
- Hexachlorocyclohexane – delta (also known as delta-BHC); and
- Toxaphene.

All of the detected pesticides were selected as COPCs and evaluated. For chlordane, only the chlordane (technical) results were evaluated since these results included mixtures of chlordane isomers, and therefore would also include alpha-chlordane and gamma-chlordane. This was done so that chlordane isomers were not double counted in the risk evaluation.

9.3.3 Chemicals of Potential Concern Summary

All of the detected organic chemicals at the Site associated with the Phase II ESA and the SSI were selected as COPCs and are evaluated in this HHRE. Soil COPCs were identified at the Site as follows:

Soil

- **TPHg, TPHd, and TPHm**; and
- **Sixteen Organochlorine Pesticides** (DDD, DDE, DDT, chlordane (technical), dieldrin, endosulfan I, endosulfan II, endosulfan sulfate, endrin, endrin ketone, heptachlor, heptachlor epoxide, three hexachlorocyclohexane isomers [known as alpha-BHC, beta-BHC, and delta-BHC], and toxaphene.)

All 19 of the COPCs were included in the HHRE.

9.3.4 Exposure Point Concentrations

For this evaluation, the maximum detected concentration was used as the exposure point concentration (EPC) for a Maximum Estimated Risk Evaluation, which is in accordance with DTSC's PEA guidance (DTSC 2015b). A Reasonable Maximum Exposure (RME) Estimated Risk Evaluation was also conducted, and for these cancer risks and noncancer hazards for the hypothetical residential scenario were based on upper estimates of the mean concentrations. These were primarily either the 95% UCLs of the mean concentration, or if there were too few data to calculate meaningful statistics, the maximum detections. USEPA's ProUCL program, version 5.2 (U.S. EPA 2022b) was used to calculate 95% UCLs. In one case, ProUCL provided a 95% UCL calculation for the toxaphene dataset (0.4275 mg/kg) that was not applied as the RME EPC because the uncertainty in this statistic given that there were only three detections of 21 samples. Most of the detection limits of the toxaphene non-detects were quite low (i.e., 0.025 mg/kg), while the three detections were in a similar range (0.940, 1.0, and 2.0 mg/kg). Based on professional judgment, the average of the three detected results (1.313 mg/kg) was applied as the EPC for the RME Estimated Risk Evaluation.

Table 8 presents the Exposure Point Concentrations for both the Maximum Estimated Risk Evaluation and the RME Estimated Risk Evaluation. The ProUCL input and output files are provided in Appendix D.

9.4 RISK-BASED SCREENING LEVELS

For COPCs in soil, potential residential and school-based receptors could be exposed via ingestion, dermal contact, and inhalation of dusts. For this evaluation, soil screening levels were developed to be protective of potential exposures to COPCS in soil through these exposure pathways.

In accordance with the Human and Ecological Risk Office's (HERO's) HHRA Note 3 (DTSC 2022b), DTSC-modified soil screening levels and U.S. EPA RSLs for soil were used as the basis for developing soil screening levels protective of residential receptors potentially exposed via contact with soil. Chemical-specific residential soil screening values for the cancer endpoint or noncancer endpoint from Table 1 of DTSC (2022b) were applied as the Risk-Based Screening Levels (RBSLs) in the Maximum and RME Estimated Risk Evaluations for the organochlorine pesticide COPCs. These RBSLs represent first DTSC-modified screening levels if available, and otherwise U.S. EPA RSLs.

For TPH, the SFRWQCB ESLs for petroleum – gasoline, petroleum – diesel, and petroleum – motor oil was selected as the RBSLs for TPHg, TPHd, and TPHm, respectively (SFRWQCB 2019). While the SSI data for TPH were initially screened against the most conservative Tier 1 ESLs (100 mg/kg for TPHg, 260 mg/kg for TPHd, and 1,600 mg/kg for TPHm), only the Tier 1 ESL for TPHd is based on health risk and equivalent to the Soil Direct Exposure Human Health Risk Screening Level for petroleum – diesel (Table S-1 of SFRWQCB 2019). Therefore, 260 mg/kg was selected as the RBSL for TPHd.

The Tier 1 ESL for TPHg is based on a nuisance/odor endpoint, whereas the most conservative Soil Direct Exposure Human Health Risk Screening Level for petroleum – gasoline (that is, TPHg) is 430 mg/kg (Table S-1 of SFRWQCB 2019). Therefore, 430 mg/kg was selected as the RBSL for TPHg.

The Tier 1 ESL for TPHm is based on ecological receptor protection (soil terrestrial habitat screening level for protecting plants and soil organisms). The human health risk-based ESL for TPHm direct exposure is 12,000 mg/kg. However, this risk-based concentration exceeds the TPHm soil saturation limit of 5,100 mg/kg. In consistency with the ESL User Guide and Table S-4 of SFRWQCB 2019, the soil saturation limit (5,100 mg/kg) was selected as the RBSL for TPHm.

Target Risk Levels

For this evaluation, target risk levels were determined according to U.S. EPA and Cal/EPA guidance. U.S. EPA's 1990 guidance indicates that a carcinogenic risk probability between 1 in 1,000,000 and 1 in 10,000 (1×10^{-6} to 1×10^{-4}) are generally acceptable (U.S. EPA 1990). The lower end of the target risk range is typically applied to residential scenarios, whereas the higher range is typically considered appropriate for commercial/industrial situations. Thus, for this evaluation, soil screening levels were developed based on a target risk of 1×10^{-6} for residential receptors. For potential non-carcinogenic effects, indicates that non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects. Therefore, for this evaluation, potential hazards for the hypothetical residential scenario receptors are evaluated based on a target hazard index (HI) of 1 summed for all COPCs with noncancer RBSLs. Individual chemical exposures that yield HIs of less than 1 is not expected to result in adverse non-cancer health effects (U.S. EPA 1989).

Soil RBSLs

For this evaluation, DTSC-modified soil screening levels (DTSC 2022b), U.S. EPA soil RSLs (U.S. EPA 2022a), or (for TPH) SFRWQCB risk-based ESLs (SFRWQCB 2019) protective of residential exposures were conservatively used to evaluate potential residential exposures to soil. The residential screening levels are conservative since they are based on exposure parameters that assume higher levels of exposure

than would be associated with a school site. For example, the exposure frequency and exposure time in a residential scenario are 350 days per year and 24 hours per day, respectively. For a school scenario, these factors are lower: the maximum exposure frequency and exposure time are 250 days per year and 10.3 hours per day, respectively.

9.5 RISK CHARACTERIZATION

Risks were characterized for potential residential and school-based student receptors using the ratio of concentrations measured at the Site to the RBSLs identified for soil. This evaluation consisted of three steps: (1) specifying the target risk and hazard quotient to use in calculating the RBSLs; (2) estimating EPCs for each environmental medium (i.e., the maximum detected concentration or the 95% upper confidence limit (95% UCL) of the arithmetic mean concentration; and (3) comparing the EPCs to the RBSLs to estimate risks and hazards for potential receptors, and (4) calculating estimated cumulative cancer risks and noncancer hazards from all COPCs. Each of these steps is described below.

9.5.1 Risk Estimation Procedures

The RBSLs were calculated for a specified target risk (i.e., a carcinogenic risk of 1 x 10^{-6} for residential receptors) and concentrations greater than the RBSLs represent carcinogenic risks proportionally greater than the target risk. Similarly, concentrations less than the RBSLs represent carcinogenic risks proportionally less than the target risk. Risks were calculated as follows, using the ratio of each COPC's EPC and its media specific RBSL:

Risk for hypothetical residential receptors:

$$Risk = \frac{\text{EPC}}{\text{carcinogenic RBSL}} \times 10^{-6}$$

Hazard quotient (HQ) for residential and school-based receptors:

$$HQ = \frac{\text{EPC}}{\text{non - cancer RBSL}}$$

In accordance with U.S. EPA and DTSC guidance, the risk and hazard ratios for each chemical and potentially complete exposure pathway were summed to determine the multi-pathway cumulative carcinogenic risk estimates and noncarcinogenic HI for potential receptors.

9.5.2 Cancer Risk and Hazard Estimates for Soil

Hypothetical Residential Scenario

Table 9 presents the Maximum Estimate Risk Evaluation based on the maximum detected results for COPCs detected in soil. The estimated cumulative cancer risk for hypothetical residential receptors exposed to maximum detections of COPCs in soil based on the residential soil RBSLs is 2 x 10^{-5}, which is within the middle of the U.S. EPA target risk range of 10^{-6} to 10^{-4} but exceeds the target risk level for residential receptors (1 x 10^{-6}). The maximum estimated non-carcinogenic HI is greater than 100, which is well above the target HI of 1.

Dieldrin and toxaphene contribute the greatest proportions to cumulative risk for the Maximum Estimate Risk Evaluation (1×10^{-5} and 4.4×10^{-6}, respectively). DDT and chlordane estimated risks also exceed the 10^{-6} risk target for maximum detections.

For the maximum estimated cumulative noncancer hazard, the overwhelming contributions are from the maximum detections of TPHd and TPHm (25,000 mg/kg and 74,000 mg/kg, respectively). The dataset for TPHd has seven of 54 samples that exceed the RBSL of 260 mg/kg. Three of these are exceptionally high (SS-24, SS-23, and SS-26 at 25,000 mg/kg, 14,000 mg/kg, and 8,100 mg/kg, respectively). The dataset for TPHm has four of 54 sample results that exceed the RBSL of 5,100 mg/kg. These are SS-28, SS-26, SS-25, and SS-29 with TPHm results of 74,000 mg/kg, 33,000 mg/kg, 27,000 mg/kg, and 25,000 mg/kg, respectively). All of these samples with elevated TPHd and TPHm are from the Phase II ESA and were the basis of recommendation for TPH delineation in the SSI.

Table 10 presents the RME Estimate Risk Evaluation, which is based on an upperbound estimate of the mean EPC. The estimated cumulative cancer risk for potential residential receptors exposed to maximum detections of COPCs in soil based on the residential soil RBSLs is 7×10^{-6}, which is on the lower end of the U.S. EPA target risk range of 10^{-6} to 10^{-4} but exceeds the target risk level for residential receptors (1×10^{-6}). The RME Estimated Risk Evaluation cumulative noncancer HI is 9, which still exceeds the target HI of 1.

The primary contributors to the RME estimated risk for residential receptors exposed to soil are toxaphene (41% for the RME Estimate Risk Evaluation at 2.9×10^{-6} risk contribution) and dieldrin (35% for the RME Risk Evaluation at 2.5×10^{-6} risk contribution), with similar 10^{-7} risk contributions of DDE, DDT, and chlordane. Toxaphene was detected in only 3 of 21 soil samples, and these results each exceeded the corresponding residential screening level of 0.45 mg/kg. Dieldrin was detected in 11 of 22 samples, with five results from three sampling locations (results ranging from 0.042 to 0.340 mg/kg) that exceeded the corresponding residential screening level of 0.034 mg/kg based on a 10^{-6} cancer risk.

As with the Maximum Estimated Risk Evaluation, TPHd and TPHm contribute most significantly to the RME Estimated Risk Evaluation cumulative HI (with HIs of 7 and 1, respectively).

9.5.3 Risk Characterization Summary

Middle school children and staff are the receptor groups most likely to be exposed to any chemicals potentially present at the Site, the South Parcel that is evaluated in the HHRE. The human health risk was evaluated assuming unrestricted residential land use (residential scenario), regardless of current and future uses.

The results of the risk characterization for the hypothetical residential scenario based on the maximum detected concentrations yielded cumulative estimated cancer risk of 2×10^{-5}, which is in the middle of the U.S. EPA risk range of 10^{-6} to 10^{-4} (Table 9). COPC-specific estimated risks for toxaphene, dieldrin, DDT, and chlordane levels detected in soil result in an estimated risk that exceed the residential target risk level (1×10^{-6}). The estimated cumulative risk for the RME Estimated Risk Evaluation is 7×10^{-6}, within the U.S. EPA risk range (Table 10). Only toxaphene and dieldrin exceed the residential target risk level of 1×10^{-6} (estimated risk 2.9×10^{-6} and 2.5×10^{-6} for toxaphene and dieldrin, respectively). It should be noted that actual exposure risks for students and teachers will be lower than those estimated by the hypothetical residential scenario.

10.0 DATA VALIDATION RESULTS

The data validation memorandum for the SSI is provided in Appendix E.

10.1 INTRODUCTION

A typical SSI validation effort consists of a review of 10% of the analytical data; however, due to the limited number of analytical batches associated with the subject investigation, 100% of the data were reviewed. The validation guidance used in evaluating the data is presented in *USEPA National Functional Guidelines for Inorganic Data Review* (U.S. EPA 2014a) and *USEPA National Functional Guidelines for Organic Data Review* (U.S. EPA 2014b). The data review consisted of an evaluation of all applicable Quality Control (QC) sample results as they relate to the field data under review. Raw data were not reviewed. The review determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

The Eurofins/Calscience data were contained in two Sample Delivery Groups (SDGs) associated with the soil sampling at Rio Del Valle Middle School in 2022. The 2022 SDGs were 570-106769-1 and 570-106860-1.

The total data set consisted of environmental and QC samples analyses. This data set contained the following parameters and analytical methods:

- Organic Chlorinated Pesticides (OCPs) by EPA 8081A;
- Metals by EPA 6010B;
- TPHg by EPA 8015M;
- TPHd by EPA 8015M; and
- TPH by EPA 8015B, 8015B M with carbon ranges.

The samples were logged into the laboratory under compliant COC documentation with no unresolved exceptions noted. The samples were analyzed in one or two preparation batch per analytical method per SDG. All QC samples were reviewed and if the QC result caused the data to be qualified the reason for the qualification was identified.

The data showed the laboratory analyzed all samples in accordance with method guidelines. All data not qualified are of known precision and accuracy and can be used as stated. All data for this Rio Del Valle Middle School sampling event were usable for their intended purpose.

10.2 EVALUATION CRITERIA

The data were evaluated by results from the following quality control (QC) entities:

- Method/field blanks;
- Sample preservation;
- Laboratory control samples;
- Holding times;

- Surrogate recovery (organic methods);
- Spiked and field duplicate compliance;
- Compound identification;
- Analytical method compliance; and
- Case narrative review.

COC forms were reviewed, and no unresolved discrepancies were noted.

10.3 EVALUATION OF PRECISION, ACCURACY, REPRESENTATIVENESS, COMPARABILITY, AND COMPLETENESS (PARCC)

Precision is established by calculating the RPD values for matrix spike/matrix spike duplicate (MS/MSD) pairs and/or field duplicates. The RPD values calculated for the Rio Del Valle Middle School project show that greater than 95% of the RPD calculated were within control limits. Therefore, the precision for the projects meets the DQOs.

Accuracy is established by reviewing spiked sample analysis. A blank spike (LCS) measures the accuracy of the instrument and the LCS results for this data set were found to be within control limits for greater than 95% of the LCS results. Therefore, accuracy for the Rio Del Valle Middle School project meets the DQOs.

Representativeness is established by using standard field sampling techniques. Because the field sampling was conducted under approved work plans and by following established SOPs, the sampling is judged to have adequate representativeness. The DQOs were met.

Comparability of the data is preserved if the analytical analyses are conducted under approved and vetted EPA analytical methods. Because the EPA methods are constructed with comparability built into the methods, by using these approved analytical methods for the project, the data is comparable. The DQOs were met.

Completeness is measured by determining the amount of valid data produced by the laboratory as compared to the total possible data from the chain. This data set had rejected data and all samples were analyzed as per the chains. Therefore, the data completeness is 95% which is above the 90% criterion. The DQOs were met.

10.4 VALIDATION QUALIFIERS AND COMMENT DESCRIPTORS DEFINITIONS

Validation Qualifier	Definition
J-	Estimated. The associated numerical value is an estimated quantity with a negative bias. The analyte was detected but the reported value may not be accurate or precise. The data are usable as estimated values.
J+	Estimated. The associated numerical value is an estimated quantity with a positive bias. The analyte was detected but the reported value may not be accurate or precise. The data are usable as estimated values.

Validation Qualifier	Definition
J	Estimated. The associated numerical value is an estimated quantity. It is not possible to assess the direction of the potential bias. The analyte was detected but the reported value may not be accurate or precise. The "J" qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data. The data are usable as estimated values.
R	Rejected. The data is unusable (the compound or analyte may or may not be present). Use of the "R" qualifier indicates a significant variance from functional guideline acceptance criteria. Either resampling or reanalysis is necessary to determine the presence or absence of the rejected analyte.
U	Not detected. Analyses were performed for the compound or analyte, but it was not detected. The "U" designation is also applied to suspected blank contamination. The "U" flag is used to qualify any result that is detected in an environmental sample and associated blank at less than the PQL. However, the data result is not censored by using the default PQL level.
UJ	Estimated/Not detected. Analyses were performed for the compound or analyte, but it was not detected, and the sample quantitation or detection limit is an estimated quantity due to poor accuracy or precision. This qualification is also used to flag possible false negative results in the case where low bias in the analytical system is indicated by low calibration response, surrogate, or other spike recovery.

Comment Descriptor	Definition
a	The analyte was found in the method blank.
b	The surrogate spike recovery was outside control limits.
c	The Matrix Spike and/or Matrix Spike Duplicate recoveries were outside control limits.
d	The Laboratory Control Sample (LCS) recovery was outside control limits.
e	A holding time violation occurred.
f	The duplicate samples Relative Percent Difference (RPD) was outside the control limit.
h	The method requires a confirmation result, but none was performed.
k	The analyte was found in a field blank.
l	The second column confirmation result indicates the analyte was not confirmed.
p	The result was qualified based on professional judgment.
q	The analyte detection was below the Practical Quantitation Limit (PQL).
r	The result is above the instrument's calibration range.
t	The sample temperature was outside acceptance criteria.
n	The laboratory case narrative indicated a QC problem.

All data qualified are presented below under the QC entity where qualification occurred. Unless listed below, all other data may be used as stated. Data qualified for only being detected below the reporting level are excluded from being listed below.

10.5 SURROGATE RECOVERY

Surrogate recovery below 10% in sample SS-36-0.0 caused the OCP data result not detected to be rejected (R). The data are not usable for their intended purpose.

10.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

The Matrix spike recovery below control limits qualified Endrin in sample SS-36-0.0 as rejected (R). The data are not usable.

10.7 CONCLUSIONS

All the Rio Del Valle Middle School data results not qualified were of known precision and accuracy and may be used as stated. The data that were qualified are usable as estimated or not detected values. Any rejected data are not usable.

The laboratory data packages were reviewed to determine if the project plan requirements were being followed. The laboratory applicable QC criteria stated were applied to the analytical methods used for the project. All QC protocols were being followed as prescribed.

Because the data met the DQOs and the PARCC indicators for the project the usability of the data meet the criteria for this project. All data are usable.

11.0 HEALTH AND SAFETY PLAN IMPLEMENTATION

Tetra Tech prepared a site-specific Health and Safety Plan (HASP) pursuant to Health and Safety Code 1910.120. The HASP is included in Appendix B of the Draft PEA (Tetra Tech 2018d). The plan:

- Identified and described potentially hazardous substances that may be encountered during field operations;
- Specified PPE and clothing for Site activities; and
- Outlined measures to be implemented in the event of an emergency.

Tetra Tech field personnel reviewed the HASP prior to commencing field work. Prior to initiation of field activities each day, a site safety briefing was conducted to identify potential physical and chemical hazards and outline measures to be taken in event of an emergency. All onsite personnel were required to sign the site safety briefing form.

During field activities, appropriate Level D PPE was worn by all personnel within the exclusion zone. Operator breathing zone PID readings were obtained on a regular basis as required by the HASP. All PID readings in the operator breathing zone during field activities were 0.0 ppm. Based on these measurements, an upgrade to Level C PPE was not required.

Potential hazards to public health and safety were minimal due to the nature of the sampling activities and the absence of detectable vapors in the exclusion zone. No incidents or emergency actions occurred during the field program.

THIS PAGE INTENTIONALLY LEFT BLANK

12.0 FIELD VARIANCES

The soil samples at locations SS-24-D1 and SS-24-D2 were not collected because they were located in an asphalt paved driveway.

There were no other field variances during the implementation of the RSSIFSP (Tetra Tech 2022b).

THIS PAGE INTENTIONALLY LEFT BLANK

13.0 PUBLIC PARTICIPATION

California Education Code (CEC) 17210.1(b) requires that residents in line-of-sight of the Site be notified, in writing, of the proposed field sampling. The residents nearest to the Site are located along west side of North Rose Avenue to the west of the Site. (Figure 1). The SSI sample locations are located approximately 400 feet east of residences on North Rose Avenue. A covered six-foot-high chain link fence surrounds the Site and prevents the visual examination of the Site by the residents in the neighborhoods surrounding the Site. Given the distance from the surrounding residential properties to the SSI sample locations, and that the Site is not within the line-of-site of the surrounding residential properties, public notification was not necessary for these residences and was not performed.

THIS PAGE INTENTIONALLY LEFT BLANK

14.0 CONCLUSIONS AND RECOMMENDATIONS

The lateral and vertical extent of TPHs in soils at the Site at concentrations exceeding Screening Levels was largely defined in the SSI sampling event and comprises approximately 592 ft^2 distributed between seven separate locations centered on sample locations SS-10, SS-23 through SS-26, SS-28, and SS-29 (Figure 6 and Table 7). The soil with TPH with at concentrations exceeding Screening Levels does not appear to extend to depths greater than 1.0-foot bgs, and collectively comprises a volume of approximately 22 CY (Table 7). Although the estimated extent of TPHd at concentrations exceeding the relevant screening levels was not defined to the south of sample location SS-23-D2 by soil sample data, based on field observations of soil conditions, it is estimated not to extend more than approximately 3 feet further to the south of sample location SS-23-D2.

The following OCPs were detected in the soils around the residential structures at concentrations exceeding their relevant screening levels in the SSI sampling event (Figure 5 and Table 5):

- 4,4'-DDT (DDT) was detected at concentrations exceeding the DTSC RSL of 1,900 micrograms per kilogram (µg/kg) in surface soil samples SS-35-0.0 (3,600 µg/kg) and DUP 6 (2,400 µg/kg);

- Chlordane (Technical) was detected at concentrations exceeding the DTSC RSL of 1,700 µg/kg in surface soil samples SS-30-0.0 (1,800 µg/kg), DUP 5 (2,100 µg/kg), and SS-32-0.0 (3,400 µg/kg);

- Dieldrin was detected at concentrations exceeding the DTSC RSL of 34 µg/kg in surface soil samples SS-31-0.0 (210 µg/kg), SS-35-0.0 (240 µg/kg), DUP 6 (180 µg/kg), SS-36-0.0 (35 µg/kg), SS-39-0.0 (150 µg/kg), and DUP 7 (190 µg/kg), and subsurface soil samples SS-31-2.0 (42 µg/kg), and SS-35-2.0 (340 µg/kg); and

- Toxaphene was detected at concentrations exceeding the DTSC RSL of 450 µg/kg in surface soil samples SS-35-0.0 (2,220 µg/kg), DUP 6 (1,800 µg/kg), SS-39-0.0 (780 µg/kg), and DUP 7 (1,100 µg/kg).

None of the other surface or subsurface soil samples analyzed for the SSI contained OCPs at concentrations above their relevant screening levels.

Step out soil samples would need to be collected to assess the extent of OCPs in soil at concentrations above relevant screening levels.

Lead was not detected at concentrations above the DTSC RSL of 80 mg/kg (Table 6) (DTSC 2020, Revised May 2022).

The results of the Phase II ESA and SSI risk characterization for the residential scenario based on the Maximum and RME Estimated Risk Evaluations indicate that toxaphene and dieldrin levels detected in soil result in estimated risk that exceeds the residential target risk level (1×10^{-6}). For the noncancer hazard assessment, both the Maximum and RME Estimated Risk Evaluations show cumulative HIs that exceed the target HI of 1. A small number of elevated TPHd and TPHm results from the Phase II ESA are the greatest contributors to the cumulative noncancer HIs.

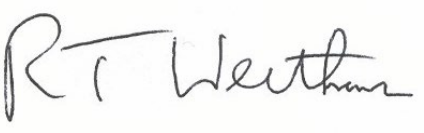
Based on the results of the SSI HHRE, Tetra Tech recommends that additional step out sampling be performed to assess the lateral extent of OCPs in surface soil at concentrations above relevant screening levels be performed at sample locations SS-30, SS-31, SS-32, SS-35, SS-36, and SS-39, and the vertical

extent of dieldrin in subsurface soil at concentrations above relevant screening levels be performed at sample location SS-35.

Once the extent of OCPs at concentrations above relevant screening levels in soil is defined, a focused housekeeping soil removal action for the small areas of elevated OCPs and TPHd and TPHm should be performed based on meeting acceptable risk and noncancer hazard index targets with a revised RME Estimated Risk Evaluation for the South Parcel of Rio Del Valle Middle School Expansion Project.

15.0 CERTIFICATION

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature but shall be a representation of findings of fact from records examined.



Respectfully submitted,

Notes:

The analytical results in **black bold face font** are detected at a concentration exceeding their laboratory MDL but are less than their ESL.

The analytical results in **red bold face font** are detected at a concentration equal to or greater than their ESL.

a - All sample results are listed.

b - Chromatogram not typical of diesel.

bgs - below ground surface

c - Chromatogram not typical of motor oil.

d - Detection and quantitation limits raised due to sample dilution.

ESL - Tier 1 Environmental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2019).

J - Results is less than the laboratory PQL but greater than or equal to the MDL and the concentration is an approximate value.

MDL- Laboratory method detection limit.

NA - not analyzed

ND<X - Indicates constituent(s) not detected at or above method detection limit (X).

PQL - Laboratory practical quantitation limit.

TPHd- Diesel Range (C12-C24 Carbon Range) Total Petroleum Hydrocarbons.by EPA Method 8015M.

TPHh/m - Hydraulic Oil/Motor Oil (C25-C32 Carbon Range) Total Petroleum Hydrocarbons by EPA Method 8015M.

TPPH - Total Purgeable Petroleum Hydrocarbons (C4-C14 Carbon Range) by LUFT Gas Chromatograph/Mass Spectrometer (GC/MS) Method.

Table 2
Soil Sampling Schedule
Supplemental Site Investigation
Rio School District Rio Del Valle Middle School Expansion Project
2600 North Rose Avenue, Ventura County, California

Notes:

- Yellow highlighted samples (Sample Set 1) were submitted for analysis immediately on arrival a the laboratory. Unhighlighted samples (Sample Set 2) were held by the laboratory pending analytical results of the Sample Set 1.

a - The total number of discrete soil samples that are analyzed for TPHg and TPHd/m will depend on the number of the tentative surface and subsurface soils that require analysis as described in the Notes column.

A minimum of 34 and a maximum of 88 discrete soil samples will be analyzed for TPHg and TPHd/m.

b - The total number of duplicate soil samples that are analyzed for TPHg and TPHd/m will depend on the number of the tentative surface and subsurface soils that require analysis as described in the Notes column.

A minimum of 4 and a maximum of 10 duplicate soil samples will be analyzed for TPHg and TPHd/m.

EPA - U.S. Environmental Protection Agency

OCPs - organochlorine pesticides

TPHg - Gasoline range total petroleum hydrocarbons C4-C12.

TPHd/m - Diesel range total petroleum hydrocarbons/motor oil range total petroleum hydrocarbons C10-C28/C17-C44.

Notes:

1 - Residential Soil Screening Levels are from Tier 1 Environmental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2019

2 - Residential Soil Screening Level is the U.S. EPA Soil RSLs (U.S.EPA 2022a) as recommended by DTSC HHRA Note 3 (DTSC 2022b).

3 - Residential Soil Screening Level is the DTSC-Modified Soil Screening Level from Table 1 of DTSC HHRA Note 3 (DTSC 2022b).

EPA - U.S. Environmental Protection Agency

DL - detection limit

LOQ - limit of quantitation

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

NA - not applicable

Notes:

The analytical results in **black bold face font** are detected at a concentration exceeding their laboratory LOQ or DL but are less than their ESL.

The analytical results in **red bold face font** are detected at a concentration equal to or greater than their ESL.

bgs - below ground surface

DL - laboratory detection limit

ESL - Tier 1 Environmental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2019).

J - Results is less than the laboratory LOQ but greater than or equal to the DL and the concentration is an approximate value.

LOQ - laboratory limit of quantification

mg/kg - milligrams per kilogram

ND<X - Indicates constituent was not detected at a concentration or above laboratory LOQ or DL (X).

TPHg - Gasoline Range Total Petroleum Hydrocarbons (C4-C12 Carbon Range) by EPA Method 8015M.

TPHd- Diesel Range (C10-C28 Carbon Range) Total Petroleum Hydrocarbons.by EPA Method 8015M.

TPHm - Motor Oil (C17-C44 Carbon Range) Total Petroleum Hydrocarbons by EPA Method 8015M.

Notes:

The analytical results in **black bold face font** are detected at a concentration exceeding their laboratory LOQ or DL but are less than their RSL.

The analytical results in **red bold face font** are detected at a concentration equal to or greater than their RSL.

bgs - below ground surface

1 - Residential Soil Screening Level is the U.S. EPA Soil RSLs (U.S. EPA 2022b) as recommended by DTSC HHRA Note 3 (DTSC 2022b).

2 - Residential Soil Screening Level is the DTSC-Modified Soil Screening Level from Table 1 of DTSC HHRA Note 3 (DTSC 2022b).

a - All soil sample results are listed showing only the detected OCPs. Please refer to Appendix A for a complete list of the pesticides analyzed and their laboratory LOQs or DLs.

b - The compound-specific LOQs and DLs for analytes that were not detected are presented with the laboratory reports in Appendix A.

bgs - below ground surface

DL - laboratory detection limit

LOQ - laboratory limit of quantification

µg/kg - micrograms per kilogram

ND<X - Indicates constituent was not detected at a concentration or above laboratory DL (X).

OCP - Organochlorine Pesticide

P - The relative percent difference between the primary and confirmation column detector >40%. The lower value has been reported.

RSL - Residential Soil Screening Level.

NA - Not applicable

[1] ProUCL (U.S. EPA, 2022b). Version 5.2

[2] Exposure Point Concentration (EPC) is EPA Recommended Upper Confidence Limit (UCL) from ProUCL output or maximum detection if number of detections in dataset was too small for calculating statistics.

[3] Maximum detection is the average of SS-35-0.0 and Dup06.

[4] Kaplan-Meier (KM) Mean

[5] Dataset only had one detection; therefore, it is used as the EPC

[6] Maximum detection selected as EPC because 95% UCL exceeds maximum.

[7] Maximum detection is the average of SS-39-0.0 and Dup07.

[8] While ProUCL did calculate a 95% UCL of 0.4275 mg/kg, it was based on only detections out of 21 samples and was noted as not enough detections for computing reliable statistics. Therefore, based on professional judgment, the average of the three detections (0.940, 1.0, and 2.0 mg/kg) was selected as a conservative estimate of the dataset mean.

Rio School District
1800 Solar Drive
Oxnard, California 93030
wsaleh@rioschools.org

CONDITIONAL APPROVAL OF TECHNICAL MEMORANDUM, SUPPLEMENTAL SITE INVESTIGATION FIELD SAMPLING, RIO DEL VALLE MIDDLE SCHOOL EXPANSION PROJECT, 2600 NORTH ROSE AVENUE (SITE CODE: 304685)

Dear Mr. Saleh:

The Department of Toxic Substances Control (DTSC) reviewed the "Revised Technical Memorandum, Supplemental Site Investigation Field Sampling" (TM) (Tetra Tech, August 5, 2022) received on August 11, 2022, for the Rio Del Valle Middle School Expansion Project South Parcel site (Site). The TM was prepared in response to DTSC comments on the draft version forwarded in a letter dated July 5, 2022. The TM includes Site background and supplemental site investigation scope of work at the Site.

According to the TM, the Site is comprised of a 11.1 acre rectangular-shaped portion of a 21.98- acre parcel. The Site currently contains (approximately) a 0.3-acre residence, 0.25-acre tenant storage yard, a 0.45-acre junk vehicle storage area, a 1.1-acre farm equipment storage and parking area, and a 0.3-acre farmyard. The remaining 8.7 acres of the Site is occupied by areas of organic raspberry production with access roads. The Site is bounded to the northwest by North Rose Avenue, to the northeast by The Rio Del Valle Middle School, to the east and southeast by agricultural land, and to the south and southwest by The Oxnard Auto Center. Two pole-mounted electrical transformers are within the Site boundary, and one pole-mounted transformer exists on the Site's northeastern side along North Rose Avenue. The Site was previously used for cultivation of row crops and orchards for citrus fruit production for most of the time

between at least 1947 through 1978. The Site is a proposed school expansion site for Rio Del Valle Middle School. Surrounding land use is a mix of agricultural and commercial use. Recognized environmental conditions identified at the Site are lead from lead-based paint, organochlorine pesticides and arsenic from historic agricultural use, and total petroleum hydrocarbons from junk automobiles and vehicle parking at the Site and from observed releases to surface soil from diesel fuel and gasoline above ground storage tanks.

DTSC hereby approves the TM provided the enclosed comments are addressed during the future fieldwork and/or reports. Revisions to the TM are no longer necessary. Please notify DTSC a minimum of one week in advance of future fieldwork or schedule changes.

If you have any questions regarding this project, please contact Johnson Abraham, Project Manager, at (714) 484-5380 or by e-mail at Johnson.Abraham@dtsc.ca.gov or contact me at (714) 484-5368 or by e-mail at Shahir.Haddad@dtsc.ca.gov.

Sincerely,

Shahir Haddad, P.E.

DTSC COMMENTS
REVISED TECHNICAL MEMORANDUM
SUPPLEMENTAL SITE INVESTIGATION FIELD SAMPLING
RIO DEL VALLE MIDDLE SCHOOL EXPANSION PROJECT
OXNARD

The following DTSC staff reviewed and provided comments herein to the Revised Technical Memorandum (TM), Supplemental Site Investigation Field Sampling, for the Rio Del Valle Middle School Expansion Project South Parcel site (Site). Please contact the Project Manager if you have any questions on the comments. Original comments are available for review in the DTSC project files.

Johnson P. Abraham
Project Manager
Brownfields and Environmental Restoration Program

GENERAL COMMENTS:

1. This General Comment has not been addressed in the Revised TM. *"Health and Safety Plan (HSP): The HSP is not mentioned in the TM. You should have an HSP along with the COVI-19 protocols. A health and safety plan should be in place, and all site activities should be in compliance with the California Occupational Safety and Health Administration (CAL-OSHA) requirements."*

SPECIFIC COMMENTS:

1. Section 8.0, SSI Technical Memorandum: As indicated in Section 1.0, Introduction, DTSC concurs that execution of Land Use Covenant (LUC) based on the proposed development may be appropriate remedy for the Site. If impact to soil is de minimis based on SSI sampling results, then soil gas sampling and LUC may not be warranted. However, if impact to soil is significant, then LUC may be appropriate remedy for the Site.

2. Section 8.0, SSI Technical Memorandum: Section 1.0, Introduction of the TM further states, "A Teams meeting was held between Tetra Tech and DTSC on July 25, 2022. In the July 25, 2022 meeting, it was determined that a LUC would not achieve the RSD's objectives for the Site." This statement is inaccurate. Based on discussion with Rio School District (RSD), LUC would achieve objectives for the Site. Furthermore, long term operation and maintenance will be required if a LUC is executed for the Site.

Dr. Sandipan Datta, Ph.D.
Staff Toxicologist (Specialist)
DTSC/Human and Ecological Risk Office

At the request of the Cleanup Program, the Human and Ecological Risk Office (HERO) reviewed documents titled " Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan Rio Del Valle Middle School Expansion Project South Parcel 2600 North Rose Avenue Oxnard, California". The report was prepared for Rio School District (RSD), by Tetra Tech, and is dated August 5, 2022.

BACKGROUND:

The current 11.1-acre site under review is located at 2600 North Rose Avenue in the Oxnard planning area of Ventura County and is being assessed as a part of expansion of adjacent Rio Del Valle Middle School campus at a future point in time. The site is earmarked for development into a Transportation and Parking Facility (western half of the Site, approximately 5.6 acres) and recreation/athletic facilities including tennis courts and basketball courts (eastern half of the Site, approximately 5.4 acres). Historically this site has been used for agricultural purposes including row crops and orchards. The site contains an approximately 0.3-acre Residence, 0.25-acre Tenant Storage Yard, a 0.45-acre Junk Vehicle Storage Area, a 1.1-acre Farm Equipment Storage and Parking Area, and a 0.3-acre Farmyard. The remaining 8.7 acres of the Site is occupied by areas of organic raspberry production with access roads

According to the Phase I ESA, six recognized environmental concerns (RECs) were identified. The RECs include 1) potential release of organochlorine pesticides (OCPs); 2) release of bunker oil from potential former smudge pot frost abatement practices; 3) vehicle-related hydrocarbon and potentially toxic metals releases to surface and near surface soil at the Site from recent storage of junk automobiles and vehicle parking at the Site; 4) releases to surface and near surface soil of contents from two diesel and one gasoline above ground storage tanks (ASTs) at the Site used by the current tenant to fuel farm vehicles; 5) potential polychlorinated biphenyl (PCB) releases to surface and from near surface soil at the Site from pole-mounted electrical transformers; and 6) high volume water transmission pipelines that are located beneath North Rose Avenue and Collins Street within 1,500 feet of the site.

According to the report, twenty shallow (0 – 0.5 ft below ground surface, bgs) soil samples were collected by hand auger sampling and combined to form five composite samples and a duplicate composite sample for commercial organochlorine pesticides (OCPs) analysis using United States Environmental Protection Agency (USEPA) method 8081A. Fourteen discrete soil samples (SS1, SS5, SS9, SS13, SS17, SS23

through 29, duplicate sample from SS5 and Dup3) were analyzed for arsenic using EPA method 6010B. Three samples were collected and analyzed for polychlorinated biphenyls using USEPA method 8082.

Seven discrete surface soil samples (samples SS-23 through SS-29) and one duplicate soil sample (Dup3) (8 soil samples total) were collected from areas of observed soil staining and analyzed for CAM 17 metals using USEPA method 6010B/7471A, semi-volatile organic compounds (SVOCs) using USEPA method 8270C, polycyclic aromatic hydrocarbons (PAHs) using USEPA method 8270C SIM, total purgeable petroleum hydrocarbons (TPPH) using the LUFT gas chromatograph/mass spectrometer (GC/MS) method, TPHd and TPHh/m using EPA method 8015M, and volatile organic compounds (VOCs) using EPA method 8260B. In addition, surface soil sample SS-10 was included in the sample set because it is within the former junk automobile storage area and was analyzed for TPHd and TPHh/m using EPA method 8015M.

The concentrations of total purgeable petroleum hydrocarbons (TPPH) meant to capture gasoline range TPHs, diesel fuel total petroleum hydrocarbons (TPHd) and hydraulic oil/motor oil total petroleum hydrocarbons (TPHh/m aka TPHmo) were significantly higher (in the samples from the area around AST and junk yard storage (SS23 through 29)) than the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Level (ESL). TPHg concentration of SS23 was 310 mg/kg, which is above the SFRWQCB ESL of 100 mg/kg. TPHd concentration in SS23, SS24, and SS26 was 14,000, 25,000 and 8,100 mg/kg which is above the SFRWQCB ESL of 260 mg/kg. TPHmo concentration ranged 2800 – 74,000 mg/kg in the SS10, SS25, SS26, SS28, and SS29 which is above the SFRWQCB ESL of 1,600 mg/kg. The other contaminants such as OCPs, metals and PAH were found to be below the USEPA's Regional Screening Levels (RSL). Arsenic was below the southern California upper bound ambient level of 12 mg/kg.

Following the DTSC comments (Letter dated April 19, 2022) on the Phase I and Phase II ESA, and a scoping meeting on June 14, 2022, a Supplemental Site Investigation Workplan was submitted for DTSC review on June 21, 2022. DTSC provided comments via email on June 30, 2022, requesting minor modifications to the workplan. In response to the previous comments the revised workplan was submitted for review and DTSC approval.

SCOPE OF REVIEW:

The report was reviewed for major scientific and technical deficiencies only, with focus on those aspects of the report that may influence human health. Minor editorial,

stylistic, and/or grammatical issues are not noted. Comments on this document are described below.

GENERAL COMMENTS:

Based on a review of the Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan, HERO recommends addressing the concerns mentioned below.

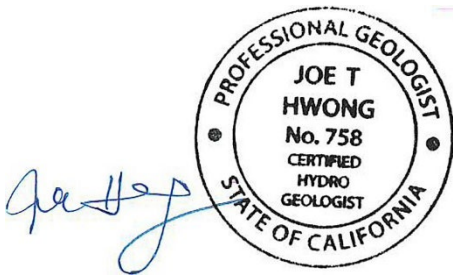
1. **Soil vapor sampling and Land use covenant (LUC):** As per the Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan, the Rio School District (RSD) requested a reduction in proposed expenditure for the supplemental site investigation and as per an agreement between the DTSC and the responsible party, soil vapor sampling and analysis was eliminated. It is HERO's understanding that the current proposed development of the site consists of transportation and parking facility, and outdoor sports facility (Basketball and Tennis courts), in which case the vapor intrusion pathway is unlikely to be of concern. However, if plans change and buildings are placed in this area without appropriate remediation measures, vapor intrusion may be of concern and as such soil vapor sampling may be warranted in this area. An LUC may be considered since the soil vapor analysis is currently being omitted in the supplemental site investigation. Please note that the appropriate personal protective equipment (PPE) should be used by workers handling the TPH contaminated soils.

2. **Sampling methodology:** HERO defers to Geological Services Unit and DTSC management to determine whether the sampling locations, and methodology are adequate to delineate the contaminants vertically and laterally.

3. **Human Health Risk Assessment (HHRA):** Once the vertical and lateral delineation is completed, HERO recommends that a HHRA is performed for the receptors on the site to facilitate risk-based decision making for the site. Alternatively, if the site is completely paved and there is no contact between contaminated soil and the receptors on the site, the maintenance of pavement integrity should be ensured at all times through appropriate Operation and Maintenance (O&M) Plans.

RECOMMENDATIONS AND CONCLUSIONS:

HERO recommends the following based on the review of Revised Technical Memorandum Supplemental Site Investigation Field Sampling Plan:



1. HERO defers to DTSC's management to determine whether an execution of LUC is required to maintain the current proposed development, as the omission of soil gas analysis is a significant data gap with respect to evaluating the vapor intrusion if a building is built in the future on the contaminated soil.

2. Please perform an HHRA after complete delineation of the soil contaminants.

HERO notes that the decisions made in this document are site-specific and should not be construed as a policy decision applicable to other sites.

Joe Hwong, P.G., C.HG.
Senior Engineering Geologist
DTSC/Brownfields Restoration and School Evaluation Branch

DTSC received the revised Table 1 and Workplan from Tetra Tech on August 11, 2022. After reviewed the revised Workplan and Table 1, DTSC concurs with the Workplan sampling strategies and have no comments to it.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Tetra Tech, Inc. Job ID: 570-106769-1
Project/Site: Rio Del Valle MS Expansion / 112G-SBA-T4

Qualifiers

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-106769-1

Narrative

Job Narrative
570-106769-1

Comments
No additional comments.

Receipt
The samples were received on 8/17/2022 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.5º C, 3.7º C and 4.1º C.

GC VOA
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-257714.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-260059. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8081A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-257791 and analytical batch 570-258208 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8081A: The following sample was diluted due to the nature of the sample matrix: SS-31-2.0 (570-106769-22). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: Tetra Tech, Inc. Job ID: 570-106769-1
Project/Site: Rio Del Valle MS Expansion / 112G-SBA-T4

Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	3082	07-31-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8081A	3546	Solid	alpha-Chlordane
8081A	3546	Solid	gamma-Chlordane

Method Summary

Client: Tetra Tech, Inc.
Job ID: 570-106769-1
Project/Site: Rio Del Valle MS Expansion / 112G-SBA-T4

Method	Method Description	Protocol	Laboratory
8015B	Gasoline Range Organics - (GC)	SW846	EET CAL 4
8015B	Diesel Range Organics (DRO) (GC)	SW846	EET CAL 4

Subject: RE: Preliminary Eurofins Calscience report and EDD files from 570-106769-1 Rio Del Valle MS Expansion / 112G-SBA-T4
Attachments: COC Excerpt from J106860-1 UDS Level 2 Report Prelim Report (Watermarked).pdf; COC Excerpt from J106769-1 UDS Level 2 Report Prelim Report (Watermarked).pdf

Hello Vic.

I have reviewed the TPHg, TPHd, and TPHm soil sample results in the preliminary laboratory reports sent to me today, Eurofins laboratory reports 570-106860-1 and 570-106869-1.

Please analyze the following soil samples for TPHg, TPHd, and TPHm via method 8015B as indicated on the attached marked COC pages from the laboratory reports:

- Eurofins laboratory report 570-106860-1, samples DUP 3, SS-26-B1-1.0, and SS-26-B2-0.0.
- Eurofins laboratory report 570-106869-1, samples DUP 2, SS-23-D1-1.0, and SS-23-D2-0.0.

Please start the sample analysis before the sample holding time expires.

Please let me know that you have received this email and can perform these analyses.

Thanks,

Jim

106769

Client: Tetra Tech, Inc.

Job Number: 570-106769-1

Login Number: 106769
List Number: 1
Creator: Patel, Jayesh

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Tetra Tech, Inc. Job ID: 570-106860-1
Project/Site: Rio Del Valle MS Expansion / 112G-SBA-T4

Qualifiers

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-106860-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative

Comments
No additional comments.

Receipt
The samples were received on 8/18/2022 9:45 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.5º C, 1.8º C and 2.7º C.

GC VOA
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-258048. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-258052. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-258056. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-260059. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: The surrogate recovery for the blank associated with preparation batch 570-258046 and analytical batch 570-258980 was outside the upper control limits.

Method 8015B: The matrix spike (MS) recoveries for preparation batch 570-258046 and analytical batch 570-258980 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Hello Vic.

You are correct. DUP 2 was submitted with the batch covered in laboratory report 570-106760-1 (Please see the attached sheet). Please analyze it.

Thanks,

Jim

Hi Jim - We should be able to accommodate your request, but sample DUP 2 was not submitted on laboratory report 570-106769-1. Please confirm.

Thank you,

Vikas Patel
Project Manager

Subject: RE: Preliminary Eurofins Calscience report and EDD files from 570-106769-1 Rio Del Valle MS Expansion / 112G-SBA-T4

Hello Vic.

I have reviewed the TPHg, TPHd, and TPHm soil sample results in the preliminary laboratory reports sent to me today, Eurofins laboratory reports 570-106860-1 and 570-106869-1.

Please analyze the following soil samples for TPHg, TPHd, and TPHm via method 8015B as indicated on the attached marked COC pages from the laboratory reports:

- Eurofins laboratory report 570-106860-1, samples DUP 3, SS-26-B1-1.0, and SS-26-B2-0.0.
- Eurofins laboratory report 570-106869-1, samples DUP 2, SS-23-D1-1.0, and SS-23-D2-0.0.

Please start the sample analysis before the sample holding time expires.

Please let me know that you have received this email and can perform these analyses.

Thanks,

Jim

106860

List Number: 1
Creator: Patel, Jayesh

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Detected Data Not Gamma Distributed at 5% Significance Level		

Gamma Statistics on Detected Data Only			
k hat (MLE)	0.18	k star (bias corrected MLE)	0.185
Theta hat (MLE)	74.09	Theta star (bias corrected MLE)	71.97
nu hat (MLE)	8.635	nu star (bias corrected)	8.889
Mean (detects)	13.33		

Gamma ROS Statistics using Imputed Non-Detects

53	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
54	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
55	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
56	This is especially true when the sample size is small.											
57	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates											
58					Minimum	0.01				Mean	7.274	
59					Maximum	310				Median	0.0685	
60					SD	46.71				CV	6.421

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.2 9/16/2022 4:11:31 PM
From File	WorkSheet.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

4,4'-DDD

General Statistics

Total Number of Observations	21	Number of Distinct Observations	13
Number of Detects	10	Number of Non-Detects	11
Number of Distinct Detects	10	Number of Distinct Non-Detects	3
Minimum Detect	1.5	Minimum Non-Detect	4.9
Maximum Detect	190	Maximum Non-Detect	250
Variance Detects	3208	Percent Non-Detects	52.38%
Mean Detects	32.61	SD Detects	56.64
Median Detects	13.48	CV Detects	1.737
Skewness Detects	2.899	Kurtosis Detects	8.739
Mean of Logged Detects	2.58	SD of Logged Detects	1.394

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.559	**Shapiro Wilk GOF Test**
1% Shapiro Wilk Critical Value	0.781	Detected Data Not Normal at 1% Significance Level
Lilliefors Test Statistic	0.369	**Lilliefors GOF Test**
1% Lilliefors Critical Value	0.304	Detected Data Not Normal at 1% Significance Level

Detected Data Not Normal at 1% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

KM Mean	18.13	KM Standard Error of Mean	10.13
90KM SD	41.86	95% KM (BCA) UCL	37.29
95% KM (t) UCL	35.6	95% KM (Percentile Bootstrap) UCL	36.58
95% KM (z) UCL	34.79	95% KM Bootstrap t UCL	83.25
90% KM Chebyshev UCL	48.51	95% KM Chebyshev UCL	62.27
97.5% KM Chebyshev UCL	81.37	99% KM Chebyshev UCL	118.9

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	0.501	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.763	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.204	**Kolmogorov-Smirnov GOF**
5% K-S Critical Value	0.277	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	0.672	k star (bias corrected MLE)	0.537
Theta hat (MLE)	48.49	Theta star (bias corrected MLE)	60.68
nu hat (MLE)	13.45	nu star (bias corrected)	10.75
Mean (detects)	32.61		

Gamma ROS Statistics using Imputed Non-Detects

53	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
54	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
55	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
56	This is especially true when the sample size is small.											
57	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates											
58					Minimum	0.01			Mean	16.05		
59					Maximum	190			Median	1.5

E - DATA VALIDATION MEMORANDUM

TETRA TECH

Memo

To:	Jim Steele, Project Manager
Cc:	
From:	Mike Wilson, Senior Chemist
Date:	July 26, 2022
Subject:	One Hundred Percent Data Validation Review for the Rio Del Valle Middle School Expansion Project

Introduction

This report summarizes the findings from data validation efforts conducted on one hundred percent of the sample data results for the Rio Del Valle project. The validation guidance used in evaluating the data is presented in the current versions of USEPA National Functional Guidelines for Inorganic Data Review and USEPA National Functional Guidelines for Organic Data Review. The data were audited at a Stage 2A effort. The Stage 2A effort requires review of all applicable quality control (QC) sample results as it relates to the field data under review. The Stage 2A effort also determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

The Eurofins data for the project were contained in two Sample Delivery Groups (SDGs) and are associated with the soil sampling at Rio Del Valle in 2022. 2022 SDGs were 570-106769-1 and 570-106860-1.

The total data set consisted of environmental and QC samples analyses. This data set contained the following parameters and analytical methods.

- Organic Chlorinated Pesticides (OCPs) by EPA 8081A;
- Metals by EPA 6010B;
- TPHg by EPA 8015M;
- TPHd by EPA 8015M;
- TPH by 8015B, 8015B M with carbon ranges

The samples were logged into the lab under compliant Chain of Custody documentation with no unresolved exceptions noted. The samples were analyzed in one or two preparation batch per analytical method per SDG. All QC samples were reviewed and if the QC result caused the data to be qualified the reason for the qualification was identified.

The data showed the laboratory analyzed all samples in accordance with method guidelines. All data not qualified are of known precision and accuracy and can be used as stated. All data for this Rio Del Valle sampling event were usable for their intended purpose.

Evaluation Criteria

The data were evaluated by results from the following quality control (QC) entities.

- Method/field blanks
- Sample preservation

Tetra Tech, Inc.
301 E. Vanderbilt Way, Suite 450 | San Bernardino, CA 92408
Tel +1.909.381.1674 **Fax** +1.909.889.1391 | tetratech.com

- Laboratory control samples
- Holding times
- Surrogate recovery (organic methods)
- Spiked and field duplicate compliance
- Compound identification
- Analytical method compliance
- Case narrative review

Chain-of-custody (COC) forms were reviewed and no unresolved discrepancies were noted.

Evaluation of Precision, Accuracy, Representativeness, Comparability, and Completeness (PARCC)

Precision is established by calculating the RPD values for matrix spike/matrix spike duplicate (MS/MSD) pairs and/or field duplicates. The RPD values calculated for the Rio Del Valle project show that greater than 95% of the RPD calculated were within control limits. Therefore, the precision for the projects meets the DQO.

Accuracy is established by reviewing spiked sample analysis. A blank spike (LCS) measures the accuracy of the instrument and the LCS results for this data set were found to be within control limits for greater than 95% of the LCS results. Therefore, accuracy for the Rio Del Valle project meets the Data Quality Objectives (DQO).

Representativeness is established by using standard field sampling techniques. Because the field sampling was conducted under approved work plans and by following established SOPs, the sampling is judged to have adequate representativeness. The DQO was met.

Comparability of the data is preserved if the analytical analyses are conducted under approved and vetted EPA analytical methods. Because the EPA methods are constructed with comparability built into the methods, by using these approved analytical methods for the project, the data is comparable. The DQO was met.

Completeness is measured by determining the amount of valid data produced by the laboratory as compared to the total possible data from the chain. This data set had rejected data and all samples were analyzed as per the chains. Therefore, the data completeness is 95% which is above the 90% criterion. The DQO was met.

Validation Qualifiers and Comment Descriptors Definitions

Validation Qualifier	Definition
J-	Estimated. The associated numerical value is an estimated quantity with a negative bias. The analyte was detected but the reported value may not be accurate or precise. The data are usable as estimated values.
J+	Estimated. The associated numerical value is an estimated quantity with a positive bias. The analyte was detected but the reported value may not be accurate or precise. The data are usable as estimated values.

J	Estimated. The associated numerical value is an estimated quantity. It is not possible to assess the direction of the potential bias. The analyte was detected but the reported value may not be accurate or precise. The "J" qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data. The data are usable as estimated values.
R	Rejected. The data is unusable (the compound or analyte may or may not be present). Use of the "R" qualifier indicates a significant variance from functional guideline acceptance criteria. Either resampling or reanalysis is necessary to determine the presence or absence of the rejected analyte.
U	Not detected. Analyses were performed for the compound or analyte, but it was not detected. The "U" designation is also applied to suspected blank contamination. The "U" flag is used to qualify any result that is detected in an environmental sample and associated blank at less than the PQL. However, the data result is not censored by using the default PQL level.
UJ	Estimated/Not detected. Analyses were performed for the compound or analyte, but it was not detected, and the sample quantitation or detection limit is an estimated quantity due to poor accuracy or precision. This qualification is also used to flag possible false negative results in the case where low bias in the analytical system is indicated by low calibration response, surrogate, or other spike recovery.

Comment Descriptor	Definition
a	The analyte was found in the method blank.
b	The surrogate spike recovery was outside control limits.
c	The Matrix Spike and/or Matrix Spike Duplicate recoveries were outside control limits.
d	The Laboratory Control Sample (LCS) recovery was outside control limits.
e	A holding time violation occurred.
f	The duplicate samples Relative Percent Difference (RPD) was outside the control limit.
h	The method requires a confirmation result, but none was performed.
k	The analyte was found in a field blank.
l	The second column confirmation result indicates the analyte was not confirmed.
p	The result was qualified based on professional judgment.
q	The analyte detection was below the Practical Quantitation Limit (PQL).
r	The result is above the instrument's calibration range.
t	The sample temperature was outside acceptance criteria.
n	The laboratory case narrative indicated a QC problem.

All data qualified are presented below under the QC entity where qualification occurred. Unless listed below, all other data may be used as stated. Data qualified for only being detected below the reporting level are excluded from being listed below.

Surrogate Recovery

Surrogate recovery below 10% in sample SS-36-0.0 caused the OCP data result not detected to be rejected (R). The data are not usable for their intended purpose.

Matrix Spike/Matrix Spike Duplicate

The Matrix spike recovery below control limits qualified Endrin in sample SS-36-0.0 as rejected (R). The data are not usable.

Conclusions

All the Rio Del Valle data results not qualified were of known precision and accuracy and may be used as stated. The data that were qualified are usable as estimated or not detected values. Any rejected data are not usable.

The laboratory data packages were reviewed to determine if the project plan requirements were being followed. The laboratory applicable QC criteria stated were applied to the analytical methods used for the project. All QC protocols were being followed as prescribed.

Because the data met the DQOs and the PARCC indicators for the project the usability of the data meet the criteria for this project. All data are usable.

City of Oxnard
Tai Chau
214 S C St.
Oxnard, CA 93030

Subject: Rio Del Valle Middle School Expansion—Preliminary Hydrology

Dear Tai,

Rio School District (RSD) plans to expand Rio Del Valle Middle School by 11.1 acres to the south of the existing campus. The expansion will provide additional onsite parking, new classrooms, a library and media center, maintenance offices, a lunch play field, four sand volleyball courts, a jogging path, and a stormwater infiltration/detention basin. The site is currently developed with hoop houses and one residence. RSD plans to convert the residence into offices for maintenance staff. This letter addresses MS4 stormwater compliance as well as onsite detention requirements.

Drainage Patterns

Currently, the site slopes in a southeasterly direction. Runoff discharges from the site via surface flow and discharges to a City of Oxnard reinforced concrete box in Auto Center Drive, approximately 0.25 mile from the project site.

In the developed condition, the 11.1-acre site will be 44 percent impervious. Stormwater runoff will be collected in an onsite storm drain system which will carry it to a combined infiltration/detention basin (see the attached Preliminary Drainage Exhibit for location). The outlet from the basin will connect to a proposed storm drain in Collins Street. The proposed storm drain will run east in Collins Street and will discharge to existing City of Oxnard storm drain facilities at Collins Street and Auto Center Drive.

Drainage Area H on the attached Preliminary Drainage Exhibit will not be captured in the onsite storm drain system prior to discharging from the site. This area is composed of 2.6 acres of pervious area and 0.2 acres of impervious area (2 percent of the 11.1-acre site). The impervious area is included in the 5 percent allowable effective impervious area for stormwater treatment. However, runoff from Drainage Area H is still included with the allowable site discharge rates.

Stormwater Flows

Stormwater flows in the developed condition were calculated using VCRat. To be conservative, a time of concentration of five minutes was assumed. VCRat results were used to create hydrographs for the site and determine the volume of runoff to analyze the detention system. Peak flowrates from the project were calculated to be Q_{10}=19.3 cfs and Q_{100}=29.3 cfs.

MS4 Requirments

This project is subject to compliance with the 2021 Ventura County MS4 Permit (Order R4-2021-0105). The detention basin is designed to also accommodate the Stormwater Quality Design Volume (SQDV) for infiltration. Since this is a combined system, the basin outlet is set at the SQDV water surface elevation to provide sufficient storage to meet MS4 requirements.

Low flows must be pre-treated prior to discharging to the basin. For preliminary design purposes, it is assumed a hydrodynamic separator (such as the Downstream Defender manufactured by Hydro International) will be used.

The preliminary SQDV for the site was calculated using "Method 3: 0.75-Inch Design Storm Approach" defined in the Ventura County Technical Guidance Manual (TGM). To size the basin to accommodate the preliminary SQDV, the Ventura County Design Worksheet INF-1: Infiltration Basin was used (found in Appendix E of the TGM). Since percolation test results are not currently available, the minimum allowable infiltration rate of 0.5 in/hr was assumed. Preliminary calculations are attached for reference. The table below shows that the available infiltration storage volume exceeds the SQDV, and the available infiltrating surface area surpasses the minimum required area.

Infiltration Design Summary

	Infiltration Volume (cf)	Infiltrating Surface Area (sf)
Required	5,256	12,713
Proposed	5,877	14,500

Detention Requirements

The City of Oxnard requires that stormwater runoff from this area does not exceed 1.1 cfs/acre during storm events up to a 100-year storm. Therefore, for this 11.1-acre site, 12.2 cfs may be released.

Detention will be provided in a combined infiltration/detention basin. A diversion structure will be installed to allow mid-level flows to bypass the basin and directly discharge from the site, while low flows are infiltrated and high flows are detained in the basin. Due to diversion structure hydraulics, bypassed flows are not consistent across storm events. To correctly model bypassed and detained flows, each storm event was analyzed separately.

Hydraflow Hydrographs was used to model detention in the basin and calculate the resulting outflows. A weir structure will control discharge from the basin. The table below compares

allowable post-construction runoff to the proposed peak flowrates, and routing calculations are attached for reference.

Allowable vs. Proposed Site Runoff

	Q10 (cfs)	Q100 (cfs)
Allowed	12.2	12.2
Proposed	9.7	12.0

Hydraflow Hydrographs also analyzes the required storage volumes and water surface elevations in the proposed basin given the inflow hydrograph and defined outflow structure. To show that the basin is sufficiently sized, the following table compares the required storage volume and basin depth calculated by the program for a 100-year storm to those provided. As demonstrated in the table, 1.8 feet of freeboard is available.

Required vs. Proposed Infiltration/Detention Basin Storage

	Storage Volume (cf)	Basin Depth (ft)
Required	18,300	1.2
Proposed	47,900	3.0

Conclusion

This preliminary analysis for proposed improvements indicates that the development can meet Ventura County MS4 and City of Oxnard detention requirements. Finished floor elevations will be protected against the Q100 water surface elevation, and overflow points will be provided onsite.

Sincerely,
Jensen Design & Survey, Inc.

Designer:	Jensen Design & Survey, Inc
Project Proponent:	Rio School District
Date:	7/7/2022
Project:	RIO 6207 - Rio Del Valle Middle School Expansion
Location:	Oxnard

Type of Vegetation: (Check type used or describe "Other"

_____ Native Grass
_____ Irrigated Turf Grass
_____ Other

Step 2: Determine the design percolation rate

2-1	Enter measured soil percolation rate (in/hr) 0.5 in/hr minimum. $P_{measured}$	$P_{measured}$=	0.5	in/hr
2-2	Determine percolation rate correction factor, S_A based on suitability assessment (see Section 6 INF-1, Table 6-2)	S_A =	2.25	
2-3	Determine percolation rate correction factor, S_B based on design (see Section 6 INF-1)	S_B =	2.75	
2-4	Calculate Combine safety factor, $S = S_A * S_B$	S =	6.1875	
2-5	Calculate the design percolation rate (in/hr) $P_{design} = P_{measured}/S$	P_{design} =	0.081	in/hr

Step 3: Calculate the surface area

3-1	Enter required drain time (hours, 72 hours max, t	t =	72	hr
3-2	Calculate max. depth of runoff that can be infiltrated within the t (ft), d_{max} = $P_{design}*t/12$	d_{max} =	0.485	ft
3-3	For Basins, Select ponding depth dp such that $d_p <= d_{max}$	d_p =	0.4	ft
3-6	Enter the time to fill infiltration basin with water (sue 2 hours for most designs), T	T =	2	hrs
3-7	Calculate Infiltrating surface area for infiltration basin $A_b = SQDV/(TP_{design}/12+d_p)$	A_b =	12713.0	sf

1.0 PROJECT BACKGROUND

1.1 PROJECT DESCRIPTION & LOCATION

Rio School District (RSD) proposes to expand the Rio Del Valle Middle School campus on Rose Avenue by 11.1 acres southerly toward Collins Street. The expansion will include a library and media center, multi-purposed building, new classrooms, maintenance offices, a school bus drop off, additional onsite parking, a bus wash, a lunch play field, four sand volleyball courts, and onsite landscaping.

The property is currently developed with hoop houses and an existing residence. RSD plans to repurpose the residence as offices for maintenance staff.

The project site is currently outside the City of Oxnard's Sphere of Influence, since Collins Street delineates the northerly boundary of the City's service areas (see City of Oxnard Jurisdictional Boundary Map, Appendix 5.1). As part of the project, the expansion area would be annexed into the City of Oxnard and be served by the existing City of Oxnard sewer infrastructure.

1.2 EXISTING & PROPOSED SEWER SYSTEM LAYOUT

Although the existing Rio Del Valle Middle School campus is connected to City sewer, the campus expansion site is currently served by a septic system. The nearest City line is an 8-inch VCP line in Collins Street, adjacent to the southerly boundary of the site. The line runs east in Collins Street and south in Via Estrada before discharging to a 15-inch VCP trunk line in Auto Center Drive at a manhole in the intersection (see City of Oxnard Sewer Atlas Sheet R-14, Appendix 5.2).

Sewer for the project site will be served by the City of Oxnard. A new sewer connection will be made to the 8-inch line in Collins Street, as shown in the attached Preliminary Grading Plan (Appendix 5.5).

1.3 REPORT OBJECTIVE

This study will assess existing and proposed sewer loading associated with the Rio Del Valle Middle School expansion. It will also demonstrate that the proposed development meets City of Oxnard design standards and capacity criteria.

2.0 EXISTING & PROPOSED SEWER GENERATION

2.1 EXISTING SEWER FLOW RATES

The existing residence on the 11.1-acre expansion area is served by a septic system and does not contribute to the City of Oxnard sewer collection system.

2.2 PROPOSED SEWER FLOW RATES

Proposed average sewer generation is estimated as a factor of the site's water demand. Water demand was calculated in the Proposed Rio Del Valle School Expansion Domestic Water Demand and Allocations Technical Memorandum prepared by Jensen Design & Survey, Inc. and dated August 2, 2022.Table 1 below shows the expected water demands for the site's wastewater-producing sources.

Per the City's Wastewater Rate Sheet effective September 1, 2021 (Appendix 5.3), schools are charged assuming an 85 percent rate of water return. Therefore, we estimate that wastewater flows generated by domestic metered project site areas will be 85 percent of their water demands.

A bus wash is proposed as part of the campus expansion. Although RSD will be required to recycle wash water, some wastewater is expected from maintenance activities such as back flushing filters. It is estimated that 25 percent of bus wash water demand will discharge to the City's sewer system.

Based on the assumptions described, proposed sewer generation is summarized in Table 1.

Table 1. Projected Sewer Generation

	Water Demand	Rate of Return	Wastewater Production
	(AFY)	(%)	(AFY)
Buildings (Full Build-Out)	4.873	85%	4.142
Bus Wash	4.787	25%	1.197
Total	**9.660**		**5.339**
			4,766 gpd

3.0 SEWER CAPACITY

3.1 EVALUATION CRITERIA

Design criteria is from the City of Oxnard's Wastewater Master Plan Update (2008). Section 4.3.1 indicates the following design criteria for gravity mains:

Manning's n	0.0135
Peak Wet Weather Flow, Max depth/diameter ratio, d/D (pipes 10" and smaller)	0.5
Peak Wet Weather Flow, Max depth/diameter ratio, d/D (pipes over 10")	0.67

To convert the average flow from Table 1 above to peak wet weather flow, a duty factor from Table 4-2 of the Wastewater Master Plan Update was applied (600 gpad for schools). For the 11.1-acre site, an additional 6,660 gpd shall be considered, resulting in a peak wet weather flow (Qpww) of 11,426 gpd (0.018 cfs).

3.2 SEWER FLOW IMPACT

According to the City of Oxnard Wastewater Master Plan Update, the 15-inch line in Auto Center Drive has sufficient capacity to meet hydraulic requirements for its projected ultimate demand. The 8-inch main upstream in Via Estrada and Collins Street was not evaluated as part of the study. Additionally, the project site falls outside of the Master Plan Update Study Area and therefore was not considered a potential contributor to the City's wastewater system.

The increase in sewer flow due to the proposed campus expansion was analyzed to show its impact on existing infrastructure. It was assumed that the sewer main is at the maximum acceptable depth/diameter ratio for peak flows in the existing condition. The increase in sewer flow created by the proposed expansion was compared to the assumed existing condition flowrate. Pipe capacity analysis results are included in Appendix 5.4, and Table 2 below summarizes the results.

Table 2. Impact of Improvements on Peak Wet Weather Flows

Sewer Main Size	Max Flow Depth, Qpww	Qpww	Additional Qpww	Increase in Qpww	Proposed Max Flow Depth, Qpww
(in)	(in)	(cfs)	(cfs)	(%)	(in)
8	4.0	0.343	0.018	5.0	4.0
15	10.0	1.911	0.018	0.9	10.0

The increased flows do not produce a measurable increase in maximum flow depth. Therefore, the d/D ratio will not increase during peak wet weather flows, even if the existing condition is already at the maximum d/D ratio.

4.0 CONCLUSION

The existing 8-inch sewer line that the proposed site will connect to, as well as the 15-inch trunk line immediately downstream, meet City of Oxnard standards and capacity criteria. They are sufficiently sized to accommodate the needs of the Rio Del Valle Middle School expansion.

Jurisdictional Boundaries

Formal planning and jurisdiction boundaries described below define geographic aspects of the 2030 General Plan.

Oxnard Planning Area/Oxnard Area of Interest
Established by the City of Oxnard, the Planning Area includes unincorporated areas surrounding the City that have a relation to the City's existing and future development. It is the same area as used in the 2020 General Plan and the same as the Area of Interest, with the addition of the Point Mugu Naval Air Station area.

Area of Interest
Areas of Interest were adopted by the Ventura County Local Agency Formation Commission (LAFCO) to define major geographic areas where only one incorporated city is permitted. Significant development proposals in the unincorporated areas of the Oxnard Area of Interest are referred by Ventura County to the City of Oxnard for review.

Oxnard Sphere of Influence
The Oxnard Sphere of Influence (SOI) was determined by the Ventura LAFCO on June 8, 1983 (amended June 2000) as the probable future physical boundaries and service areas of the City. The SOI is 29.9 square miles. The SOI may be amended with the approval of LAFCO.

City Urban Restriction Boundary (CURB) and City Buffer Boundary (CBB)
In 1998, the voters of the City of Oxnard adopted the SOAR (Save Open Space and Agricultural Resources) initiative establishing the City Urban Restriction Boundary (CURB) and re-designating as "Agriculture (AG)" all land previously designated "Agricultural Planning Reserve (AG/PR)." CURB defines the urban development boundary for the City of Oxnard until December 31, 2020. The SOAR initiative also established a City Buffer Boundary (CBB) which lies outside of the CURB line and is coterminous with the Oxnard Area of Interest. Change to the CURB line or an agricultural land use designation within the CBB generally requires majority approval of Oxnard voters, with certain exceptions, including but not limited to an exception to allow up to 20 acres per year to be brought into the CURB for affordable housing needed to meet the City's Regional Housing Needs Assessment (RHNA) target production.

TECHNICAL MEMORANDUM

RE: Proposed Rio Del Valle School Expansion Domestic Water Demand and Allocations

To Whom It May concern,

The Rio Del Valle Middle School Expansion Project includes expanding the campus to the north and south. The Rio School District (RSD) has acquired 10 acres to the north and is in the process of acquiring 11.1 acres to the south of the existing Rio Del Valle Campus. The northern expansion area will serve as farm land for an agricultural learning program. The southern expansion area will include additional buildings, landscaping, bus parking and a bus wash. This technical memorandum presents the analysis of projected water demand for the project and required water allocations.

Rio School District Fox Canyon Groundwater History

Historically, the domestic water supply for Rio School District facilities has been provided by a combination of three active ground water wells and domestic water connections with the City of Oxnard and United Water Conservation District. The three wells are located at Rio Real School, Rio Del Valle School, and the El Rio Elementary School. After the Fox Canyon Groundwater Management Agency (FCGMA) adopted Ordinance E, water allocations for these three wells were reduced to a total of 52.074 AFY.

Additionally, the El Rio Elementary School site was sold to a developer and is to be replaced by the Rio Urbana residential community. The Rio Urbana project included the annexation of the site into the City of Oxnard, and the transfer of 40.399 AFY of groundwater pumping allocation for the on-site well. Following this transfer, the Rio School District has 11.675 AFY water allocations remaining for the two wells located at Rio Real School and Rio Del Valle School.

54.6 AFY of FCGMA water allocations are to be transferred to RSD with the newly acquired land to expand the Rio De Valle School campus. The water transfer amount will need to be finalized in a formal written agreement with the sellers of both parcels. With this transfer, Rio School District will have a total of 66.275 AFY of FCGMA water allocations.

Rio Del Valle and Rio Real Historical Groundwater Usage

Three sources supply water to the existing Rio Del Valle (RDV) school: the on-site well (subject to FCGMA requirements), United Water, and the City of Oxnard. The City of Oxnard supplies water for the gymnasium, United Water supplies for the existing campus buildings, and the on-site RDV well supplies irrigation water for landscaping and water of play fields. The Rio Real school well supplies water for on-site landscaping as well.

Under the FCGMA "Ordinance to Establish a New Pumping Allocation System for the Oxnard and Pleasant Valley Basins," effective October 1, 2020, initial extraction allocations were set based on the average annual extractions per well during the 2005 through 2014 base period. Table 1 summarizes the historical well extractions for RSD.

Table 1 – Average Annual Well Extractions (2005 – 2014)

Rio Del Valle School	27.33 AFY
Rio Real School	14.26 AFY
SUM	**41.59 AFY**

Following the Rio Urbana and new farm land water allocation transfers, the Rio School District will have a surplus of 24.685 AFY (66.275 AFY – 41.59 AFY = 24.685 AFY) water allocations to supply for the two existing schools before the Rio De Valle expansion discussed below.

Proposed Rio Del Valle Water Demand

The Rio Del Valle Expansion will increase the school's water demands. The new 10-acre farm to the north will require irrigation water for crops. Using the FCGMA Crop Year Irrigation Allowance Table, and assuming the crops are avocados with 20-70% ground shading, typical precipitation, the farm will require 2.0 acre-feet/acre. Given the farm is 10 acres, this results in 20 AFY demand for the new farm.

The southern campus expansion will increase the number of classrooms and add a bus wash. Additionally, the campus proposes to replace all existing and new sports fields with zero scape, resulting in a net decrease in landscaping water demand. A ratio between the existing and proposed areas was used to calculate the projected water demand. Table 2 below summarizes the projected water demand for the campus expansion.

Table 2 – Project Expansion Water Demand based on Area

	Existing Area	Proposed Area	Final Build-out Area	% Change	Existing Water Usage	Final Build-out Water Usage
Buildings (Classrooms, Bathrooms, Library etc.)	1.58 acres	0.96 acres	2.54 acres	+61%	3.027 AFY[1]	4.873 AFY
Landscaping[2] (Planters, etc.)	10.97 acres	1.868 acres	1.868 acres	-83%	27.33 AFY[3]	4.654 AFY

The projected bus wash demand can be found in Table 3.

[1] Value based on the maximum monthly usage (112 HCF) from United Water Bills

[2] Excludes farm land/agricultural learning irrigation & excludes zero scape sports fields

[3] Average annual well extraction, see Table 1

Table 3 – Projected Bus Wash Demand

Quantity	Units	Source
24	buses	# of proposed bus parking spaces
1	wash/bus/week	assumption
250	GPM	4-Brush-Hybrid-WRS-specs-PLC-1.pdf (interclean.com)
5	minutes/wash	Assumption
4.787	**AFY**	

Table 4 below summarizes the total water demand and the FCGMA water allocations for Rio School District.

Table 4 – Water Demand and Allocations

RSD Water Demands			
Water Demand	**Quantity**	**Water Source**	**Reference**
Rio Real School (Landscaping)	14.26 AFY	FCGMA	See Table 1
Rio Del Valle – Full Build-out, Buildings	4.873 AFY	United Water	See Table 2
Rio Del Valle – Full Build-out, Landscaping	4.654 AFY	FCGMA	See Table 2
Rio Del Valle – Farm/Agricultural Learning	20 AFY	FCGMA	FCGMA Crop Irrigation Table
Rio Del Valle – Bus Wash	4.787 AFY	FCGMA	See Table 3
Total RSD Water Demand	**48.574 AFY**		
FCGMA Water Allocations			
RSD Existing FCGMA Allocations	11.675 AFY		
Water Allocations Acquired from Expansion Areas	54.6 AFY		
Total FCGMA Water Allocations	**66.275 AFY**		

The Rio School District will have a net surplus of 17.701 AFY water allocations with the Rio Del Valle Campus Expansion.

Please contact us if you have any questions.

INTRODUCTION

Stantec has prepared the following draft traffic and circulation study for the Rio Del Valle Middle School Project. The traffic and circulation study provides an assessment of the existing and future traffic conditions within the study area, determines the trip generation and trip distribution for the proposed development, evaluates the potential traffic impacts to the vicinity roadways and intersections, and provides feasible improvements where applicable. A discussion of the site access and circulation plan and parking is also provided. A vehicle miles traveled (VMT) analysis is provided in a separate document.

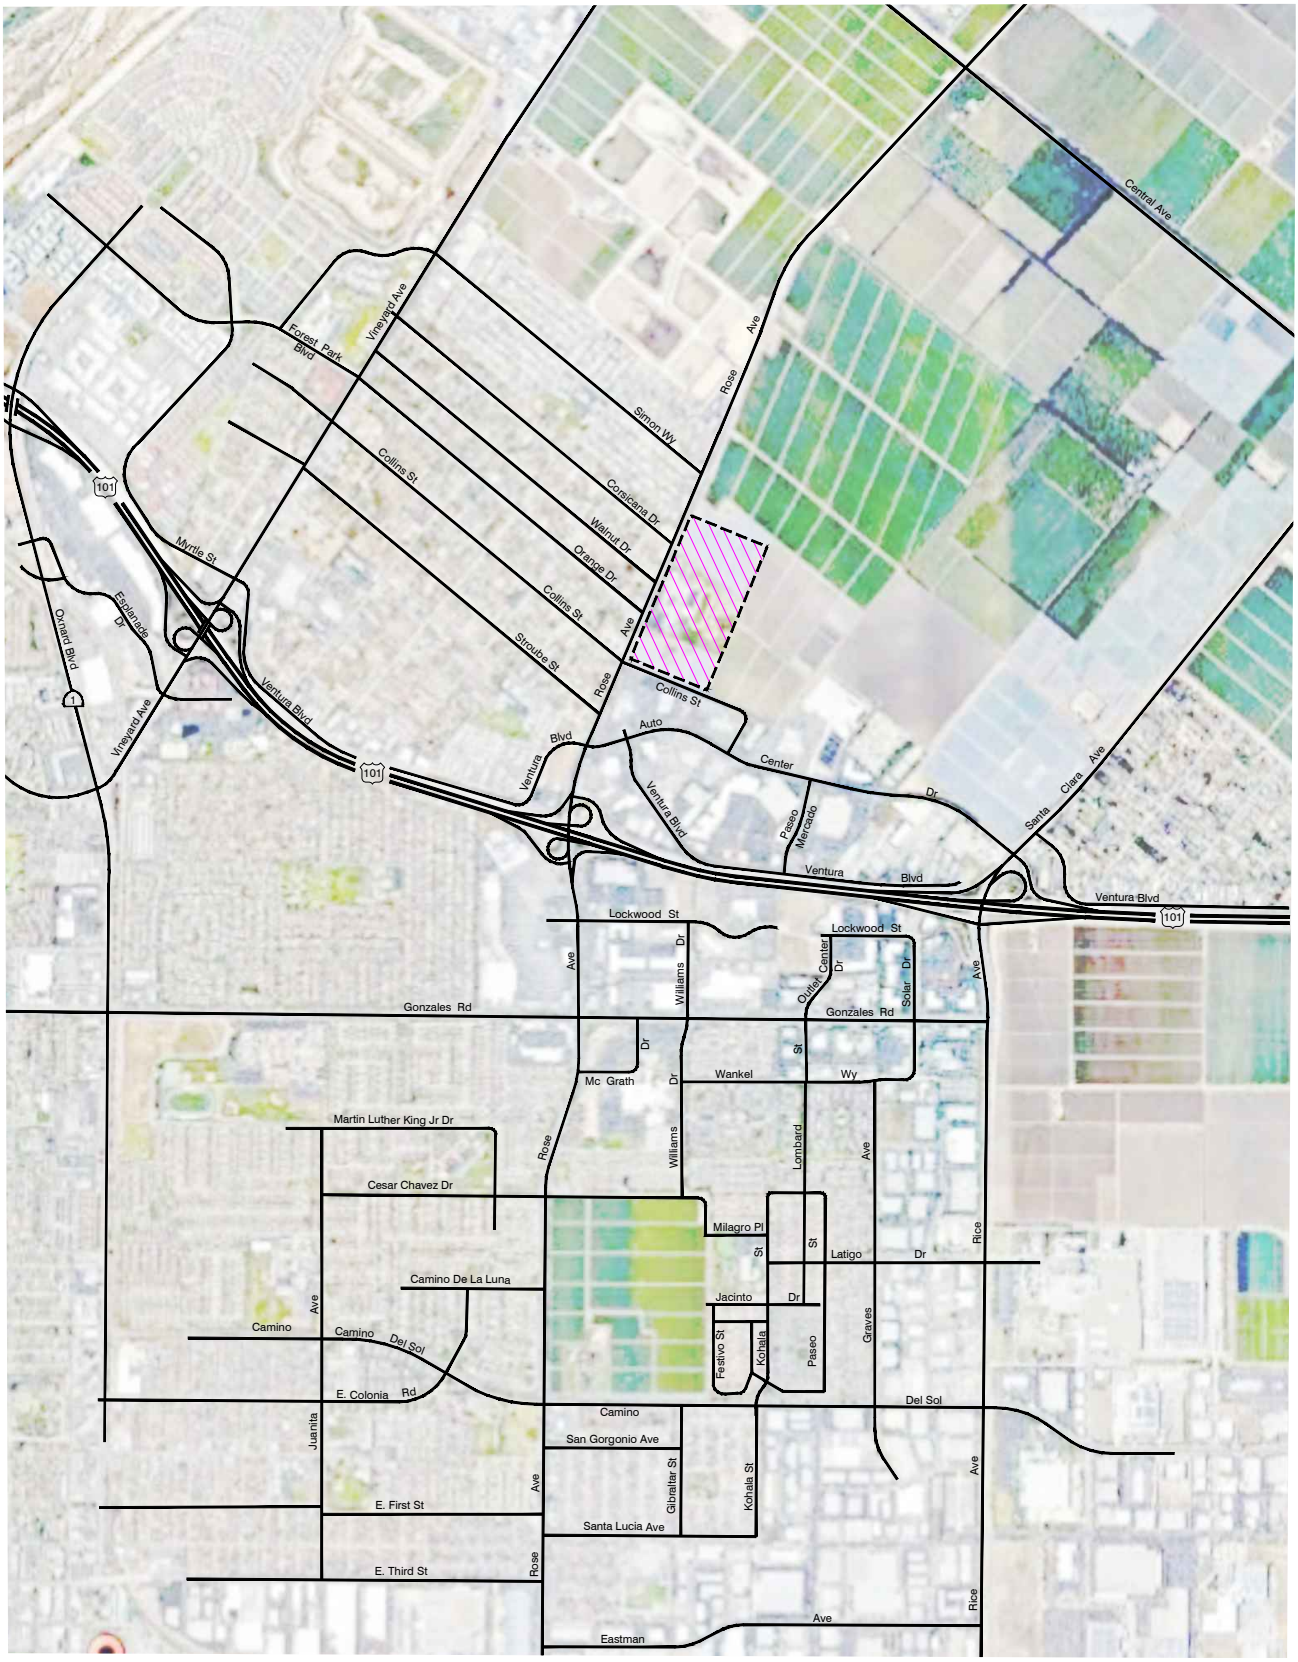
PROJECT DESCRIPTION

The proposed project includes the expansion of the Rio Del Valle Middle School campus located at 3100 Rose Avenue in unincorporated County of Ventura. Exhibit 1 shows the location of the project site and Exhibit 2 illustrates the proposed improvements. The existing campus is approximately 30.2 acres including the 20.2-acre main campus (APN 144-0-110-445) and 10-acres of active agricultural lands (a portion of 144-0-110-225) to the north of the main campus buildings. The proposed project would add approximately 11.1-acres to the south (a portion of 144-0-110-590) that the District proposes to acquire and develop with new educational and support facilities resulting in an approximately 41.3-acre campus (project site). This could result in a potential enrollment increase of 250 students over a five-year period commencing at the earliest in the 2024/25 school year. In addition, the District proposes to transfer the existing school bus parking and workroom facilities (District Transportation and Parking Facility) from the current location on E. Vineyard Avenue at Sycamore Street to the project site. A conceptual site plan illustrating the proposed project is attached for reference.

Existing access to the school site is provided via one ingress driveway and two egress driveways. The ingress driveway is located on the east side of Rose Avenue opposite Orange Drive. The northerly egress driveway connects to the signalized Rose Ave/Walnut Dr intersection as the east leg, and the southerly right-turn only egress driveway is located south of the Rose Ave/Orange Dr intersection. A gated maintenance driveway is located at the north portion of the school site. The proposed project will add a full-access driveway on Collins Street. The District Transportation and Parking Facility will have primary access from Collins Street to the south of the facility via this driveway connection.

.

STUDY METHODOLOGY



Traffic Analysis Scenarios

Pursuant to County of Ventura and City of Oxnard traffic study requirements, the traffic analysis includes the following traffic scenarios:

- Existing Conditions
- Existing plus Project Conditions
- Cumulative Conditions
- Cumulative plus Project Conditions

Level of Service Criteria

A level of service (LOS) ranking scale is used to identify the operating condition on roadways and at intersections. This scale compares traffic volumes to intersection capacity and assigns a letter value to this relationship. The letter scale ranges from A to F with LOS A representing free flow conditions and LOS F representing congested conditions. The level of service criteria are summarized in Table 1.

PROJECT SITE PLAN

Table 1 - Intersection Level of Service Criteria

LOS	Signalized Intersections (V/C Ratio)	Signalized Intersections (Sec. of Delay)	Unsignalized Intersections (Sec. of Delay)	Definition
A	< 0.60	≤ 10	≤ 10	Conditions of free unobstructed flow, no delays and all signal phases sufficient in duration to clear all approaching vehicles.
B	0.61 – 0.70	> 10 and ≤ 20	> 10 and ≤ 15	Conditions of stable flow, very little delay, a few phases are unable to handle all approaching vehicles.
C	0.71- 0.80	> 20 and ≤ 35	> 15 and ≤ 25	Conditions of stable flow, delays are low to moderate, full use of peak direction signal phases is experienced.
D	0.81 – 0.90	> 35 and ≤ 55	> 25 and ≤ 35	Conditions approaching unstable flow, delays are moderate to heavy, significant signal time deficiencies are experienced for short durations during the peak traffic period.
E	0.91 – 1.00	> 55 and ≤ 80	> 35 and ≤ 50	Conditions of unstable flow, delays are significant, signal phase timing is generally insufficient, congestion exists for extended duration throughout the peak period.
F	> 1.00	> 80	> 50	Conditions of forced flow, travel speeds are low and volumes are well above capacity. This condition is often caused when vehicles released by an upstream signal are unable to proceed because of back-ups from a downstream signal

Source: Highway Capacity Manual, 6th Edition.

Traffic Analysis Methodology

The analysis for roadway segments and intersections located in Ventura County is completed conform to the *Ventura County Initial Study Assessment Guidelines Section 27a(1). Transportation & Circulation – Roadways and Highways – Level of Service (LOS).*

Roadway levels of service are calculated by comparing the average daily traffic (ADT) to the roadway segment's design capacity. The levels of service for signalized intersections are based on the Intersection Capacity Utilization (ICU) method and the service flow rates adopted by the County from the Ventura County Transportation Commission (VCTC) for the Congestion Management Plan (CMP). the CMP level of service criteria are included in the Technical Appendix. Unsignalized intersection are analyzed pursuant the methodologies outlined in the Highway Capacity Manual (HCM 6th Edition)[1], and intersection levels of service are reported based on seconds of delay on the stopped intersection approaches.

Levels of service for intersections are calculated for the peak hour within the 7AM – 9AM commute period and the 4PM – 6PM commute period. K-8 schools generate traffic in the AM period from 7:30AM to 8:30PM, with virtually no traffic generated outside that peak hour. Previous counts collected along Rose Avenue indicate that the PM peak hour occurs from 4:30PM to 5:30PM, which falls within the 4PM – 6PM commute count period.

[1] Highway Capacity Manual, 6th Edition: A Guide for Multi-Modal Mobility Analysis, Transportation Research Board, 2016.

EXISTING CONDITIONS

Roadway Network

The roadway system in the study area is comprised of a network of freeways, arterials and collectors. The study-area roadway network is shown in Exhibit 3 and a brief description of the major components is provided below.

U.S. Highway 101 (U.S. 101) extends along the Pacific Coast between Los Angeles and San Francisco. Within the City of Oxnard, the six to eight-lane freeway is the principal route between Oxnard and the cities of Ventura and Santa Barbara to the north, and the cities of Camarillo, Thousand Oaks and Los Angeles to the south. Regional access from U.S. 101 to the project site is provided via the interchange with Rose Avenue.

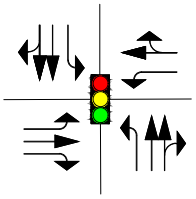
Rose Avenue is a north-south secondary arterial roadway that extends from Pleasant Valley Road south of Oxnard to Los Angeles Avenue (SR 118) in the County of Ventura. North of Ventura Boulevard the roadway contains four travel lanes with a raised or painted median and left-turn lanes at intersections. The speed limit adjacent to the school is 45 MPH. The roadway provides direct access to the project site via its intersections with Orange Avenue and Walnut Drive. The intersections with Auto Center Drive, Collins Street, Walnut Drive, Simon Way and Central Avenue are signalized.

Vineyard Avenue (S.R. 232) is a north-south four- to six-lane arterial roadway that extends from Oxnard Boulevard to Los Angeles Avenue (SR 118) in Ventura County.

Auto Center Drive is an east-west four-lane roadway with a raised median and left-turn lanes at intersections. The posted speed limit on Auto Center Drive is 40 MPH and on-street parking is prohibited. Auto Center Drive terminates on the east at Santa Clara Avenue and on the west at Rose Avenue.

Alternative Transportation

Bus service in the project area is provided by Gold Coast Transit Route 15, which provides a connection between the Riverpark Specific Plan Area and St. John's Regional Medical Center, but does not have a bus stop in the vicinity of the project site. School bus service routes throughout the El Rio neighborhood is provided by the El Rio School District.



Existing Roadway and Intersection Operations

One roadway segment and nine intersections were selected for analysis in consultation with County and City staff. New traffic counts were collected on January 26 and March 1, 2022. The lane geometry and control for the intersections within the study area are shown in Exhibit 3 and the traffic volumes are illustrated in Exhibit 4. Levels of service were calculated the level of service methodology outlined previously. The technical calculation worksheets are included in the Technical Appendix, and the existing roadway and intersection levels of service are summarized in Tables 2 and 3.

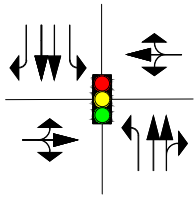


Table 2 – Existing Roadway Levels of Service

7. Rose Ave/Ventura Blvd-Auto Center Dr	Oxnard	Signal	0.50/LOS A	0.63/LOS B
8. Auto Center Dr/Collins St [1]	Oxnard	One-way stop	13.8 sec/LOS B	*28.4 sec/LOS D*
9. Santa Clara Ave/Ventura Blvd	Oxnard	Signal	0.31/LOS A	0.34/LOS A

[1] Unsignalized intersection: level of service based on seconds of delay on minor street.

Table 2 indicates that the four-lane segment of Rose Avenue between Walnut Drive and Central Avenue operates in the LOS A range. Table 3 indicates that the study-area intersections operate in the LOS A-C range except the Auto Center Dr/Collins St intersection, which operates at LOS D, which is below the City of Oxnard LOS C standard.

PROJECT SPECIFIC CONDITIONS

Traffic Impact Thresholds

Pursuant California Environmental Quality Act (CEQA) guidelines, a vehicle miles traveled (VMT) analysis and an evaluation of consistency with the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) was prepared in support of the Project's environmental documentation. The VMT analysis is provided in a separate document. Because project-specific impacts are not evaluated anymore using vehicle delay (V/C increase or seconds of delay), the traffic impact analysis focusses on consistency with local plans, ordinances or policies establishing measures of effectiveness for the performance of the circulation system.

County of Ventura. The County of Ventura considers LOS C the minimum level of service for local roads and LOS D the minimum level of service for County thoroughfares, with the less stringent minimum level of service applied to intersections between local roads and thoroughfares.

Table 4 - Minimum Acceptable Level of Service (LOS) for Roadway Segments and Intersections

Minimum LOS	County of Ventura - Description
C	All County maintained local roads.
D	All County thoroughfares and state highways within the unincorporated area of the County, except as provided below.
E	a. State Route 33 between the end of the Ojai freeway and the City of Ojai. b. State Route 118 between Santa Clara Avenue and the City of Moorpark. c. State Route 34 (Somis Road) north of the City of Camarillo. d. Santa Rosa Road between Camarillo city limit line and Thousand Oaks city limit line. e. Moorpark Road north of Santa Rosa Road to Moorpark city limits line.
Varies	The LOS prescribed by the applicable city for all State highways, city thoroughfares, and city maintained local roads located within that city, if the city has formally adopted General Plan policies, ordinances, or a reciprocal agreement with the County, pertaining to development in the city that would individually or cumulatively affect the LOS of State highways, County thoroughfares and County-maintained local roads in the unincorporated area of the County.
	County LOS standards are applicable for any city that has not adopted its own standards or has not executed a reciprocal agreement with the County pertaining to impacts to County roads.
At any intersection between two roads, each of which has a prescribed minimum acceptable LOS, the less stringent LOS of the two shall be the minimum acceptable LOS of that intersection.	

City of Oxnard. The City has adopted level of service C as the threshold of significance for intersections during environmental review.

Traffic studies shall include a list of intersections where the project will worsen the Intersection Capacity Utilization (ICU) numeric value of Level of Service (LOS) by V/C 0.02 or more. This ICU list shall include intersections projected to be at LOS C with background traffic (existing plus approved plus pending projects) and LOS D, E, or F with background traffic plus project generated traffic.

Project Trip Generation

Middle School. The existing school has a student enrollment of 819 students. The project could potentially result in a 250 – student increase. Trip generation estimates for the school were calculated based on rates contained in the Institute of Transportation Engineers (ITE) *Trip Generation Manual (11th Edition)* for *Land Use #522 – Middle School/Junior High School*.

District Transportation and Parking Facility. The project also includes the relocation of the District Transportation and Parking Facility from E. Vineyard Avenue to N. Rose Avenue. While the relocation would not add traffic to the regional roadway network, it would divert bus and employee trips to the immediate vicinity of the school site and its driveways. The District Transportation and Parking Facility operational statistics provided by the district are as follows:

- 17 school busses in service. All busses will be parked at the facility.
- Bus traffic consists of 13 AM bus routes, 4 midday bus routes and 13 PM bus routes, for a total 30 busses per school day.
- Total of 10 office/maintenance employees, work times 6:30 AM to 3:30 PM.

The existing school is served by 6 school busses which currently enter the site and leave to the existing facility on E. Vineyard Ave after dropping off students. In the future, these 6 busses will leave the site to start student pick-up routes and remain on the site after returning to drop off students.

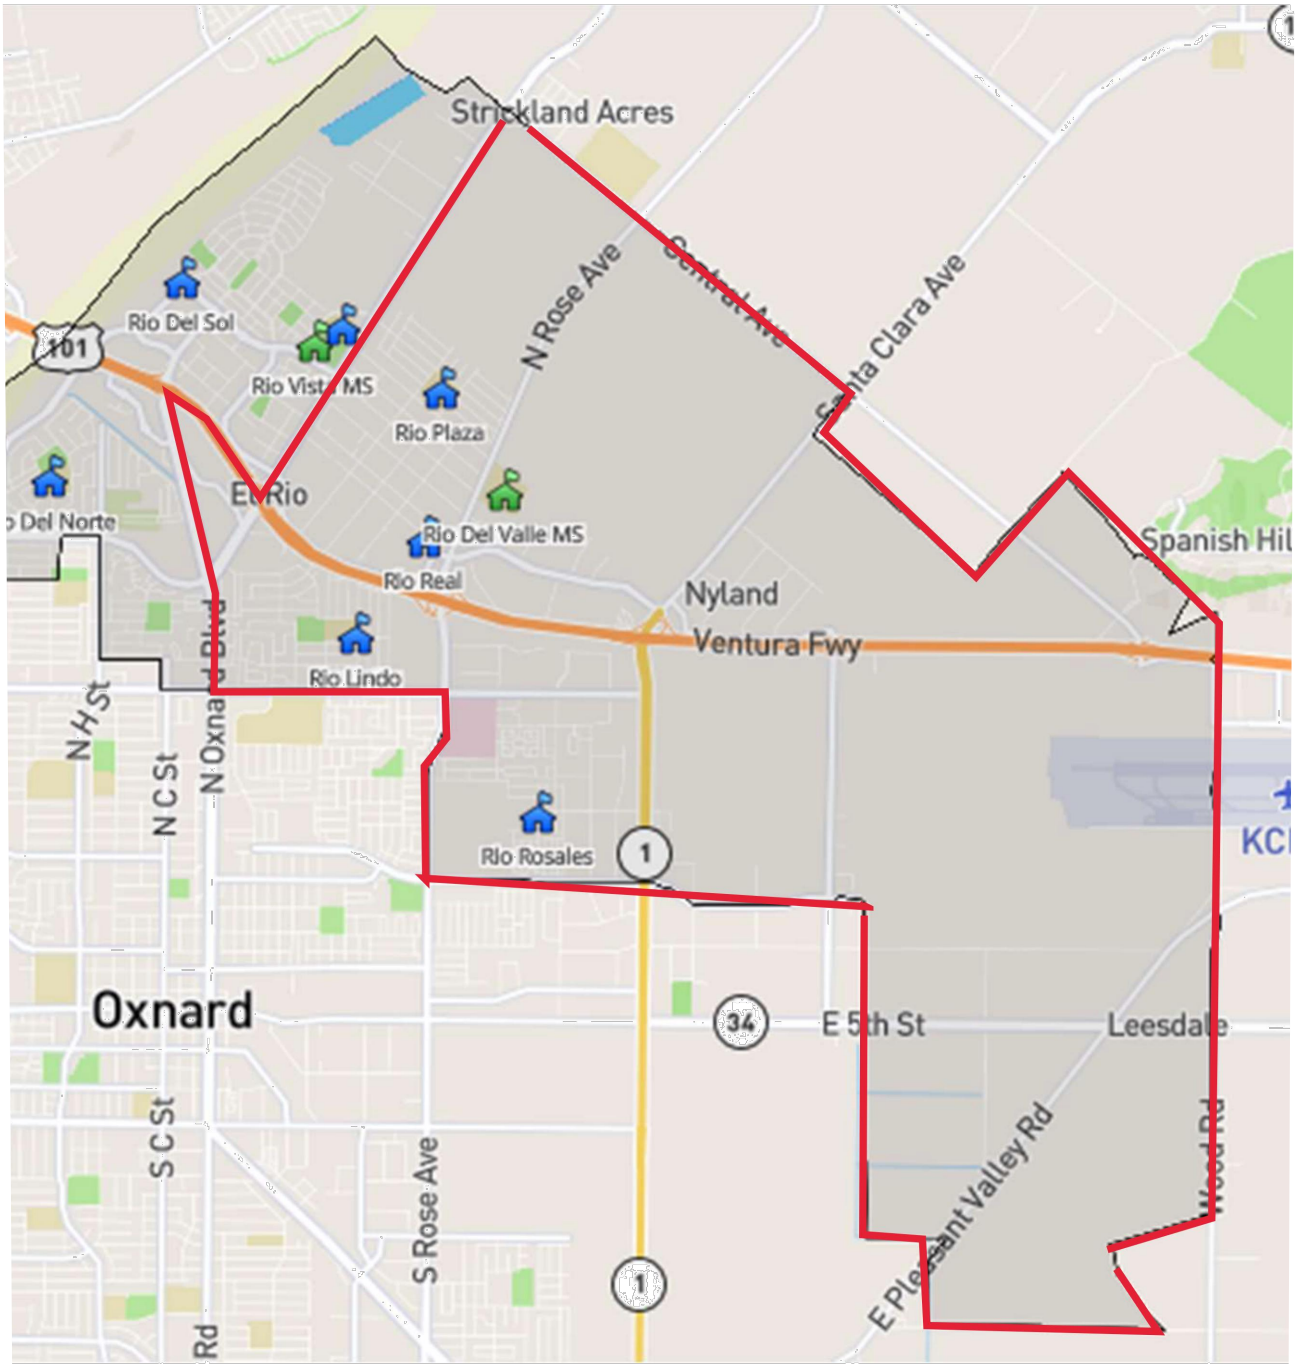
Table 5 - Project Trip Generation

Land Use	Size/Variable	ADT	AM			PM		
			In	Out	Total	In	Out	Total
Middle School	rate/student	2.10	0.36	0.31	0.67	0.072	0.078	0.15
	250 students	*525*	*90*	*78*	*168*	*18*	*20*	*38*
District Transportation and Parking Facility	Ex. Site Count	*267*	*26*	*4*	*30*	*4*	*6*	*10*
Total		**792**	**116**	**82**	**198**	**22**	**26**	**48**

Bell schedule for a normal school day is 8:21 AM to 2:53 PM.
Transportation Facility ADT assumes half of counted vehicles is bus/heavy vehicle (178 ADT x 1.5 = 267 ADT).
Transportation Facility AM and PM PHT assumes 100% of counted vehicles is bus/heavy vehicle (15 AM PHT x 2.0 = 30 AM PHT, 5 PM PHT x 2.0 = 10 PM PHT).

As shown in Table 1, the project is expected to generate 792 ADT, with 198 trips occurring in the AM peak hour and 48 trips occurring in the PM peak hour.

Project Trip Distribution



The project trip distribution for new students is based on the school's attendance boundary illustrated in Exhibit 5, with a smaller percentage of trips generated from outside the attendance boundary by new school employees. There is no indication that existing bus routes are subject to change, thus the regional distribution of District Transportation and Parking Facility trips would not change except in the immediate vicinity of the school site. The distribution percentages are shown in Exhibit 6. The site access changes (addition of full-access driveway on Collings Street) would result in changes to existing school traffic patterns, where traffic from and to the south now have the option to use the new driveway on Collins Street instead of the existing driveways on Rose Avenue. Exhibit 7 shows the anticipated existing diverted traffic volumes, and Exhibit 8 shows the project-added traffic volumes. Exhibit A in the Technical Appendix shows the separate middle school trips and District maintenance/bus trips.

Existing plus Project Roadway and Intersection Operations

Project generated traffic was added to the existing peak hour traffic volumes and levels of service were recalculated for existing plus project conditions. The existing plus project traffic volumes are illustrated in Exhibit 9. Tables 6 and 7 summarize the level of service calculations for project-specific conditions.

Table 6 – Existing + Project Roadway Levels of Service

Roadway Segment	Classification	Number of Lanes	Existing + Project ADT	LOS C Threshold	Existing LOS
Rose Ave n/o Simon Way	Class I	4 lanes	12,863 ADT	38,000 ADT	LOS A
Rose Ave n/o Walnut Dr	Class I	4 lanes	15,587 ADT	38,000 ADT	LOS A

9. Santa Clara Ave/Ventura Blvd	Oxnard	Signal	0.32/LOS A	0.34/LOS A

[1] Unsignalized intersection: level of service based on seconds of delay on minor street.

Tables 6 and 7 indicate that the four-lane segment of Rose Avenue between Walnut Drive and Central Avenue would continue to operate in the LOS A range, and that the study-area intersections would continue to operate in the LOS A-C range except the Auto Center Dr/Collins St intersection, which operates at LOS D. The project would contribute to the delays experienced on the stopped approach (Collins Street).

CUMULATIVE CONDITIONS

Cumulative Projects Trip Generation and Distribution

The cumulative (existing plus approved and pending projects) conditions serves as a near future baseline to assess potential impacts generated by the project. Cumulative traffic volumes were developed based on approved and pending projects information provided by City of Oxnard and County of Ventura staff.

A list of approved and pending development projects in the City of Oxnard was provided by City staff[2]. The location map and *Development Project List* information for the approved and pending projects is included in the Technical Appendix. The County's Resource Management Agency (RMA) staff provided a parcel map with approved and pending projects within a five-mile radius of the project site. The parcel map information was compared with the project information contained in the County's Approved Projects list and the Pending Project list [3].

Trip generation estimates for the approved and pending projects were developed based on rates contained in the ITE Trip Generation Manual and trips were distributed based on the location of each project, project distribution data contained in traffic studies completed for several approved and pending projects, and existing traffic patterns in the study area. The cumulative-added volumes are illustrated in Exhibit B in the Technical Appendix and the cumulative (existing plus approved and pending) traffic volumes are illustrated in Exhibit 10.

[2] Planning Division Quarterly Project List, City of Oxnard, April 2022.
[3] County of Ventura, RMA Planning Division, Approved Projects list and Pending Projects list, June 8, 2022.

Short-Term Future Improvement Projects

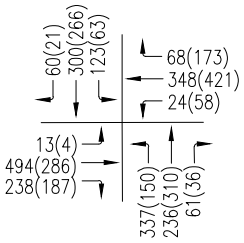
The County's short-term improvements (2023-2027 Capital Improvement Program, or CIP) include the following projects:

- El Rio Sidewalk Improvements: Construction of sidewalks and intersection improvements on various roads within the El Rio area. This project is associated with the Rio Del Valle Safe Routes to School (SRTS) program.
- Rose Avenue Bike Lanes (Collins-Simon): Construction of Class II bike lanes on Rose Avenue from Collins Street to Simon Way. This will include pavement overlay and bike lane striping improvements on Rose Avenue from south of Collins Street to North of Simon Way, installation of speed feedback signs and other signing additions.

Cumulative plus Project Roadway and Intersection Operations

The cumulative plus project traffic volumes are illustrated in Exhibit 11. Intersection levels of service were recalculated assuming cumulative and cumulative plus project conditions. Tables 8 and 9 summarize the cumulative and cumulative plus project level of service calculations.

Table 8 – Cumulative + Project Roadway Levels of Service



Roadway Segment	Classification	Cumulative ADT	Cumulative + Project ADT	LOS C Threshold	Existing LOS

EXHIBIT 11
CUMULATIVE + PROJECT TRAFFIC VOLUMES

Tables 8 and 9 indicate that the four-lane segment of Rose Avenue between Walnut Drive and Central Avenue would continue to operate in the LOS A range under cumulative and cumulative plus project conditions. The intersections located in the County are forecast to operate in LOS A-B range, except the Rose Ave/Orange Dr intersection, which would operate at LOS D in the AM peak hour. LOS D is acceptable along throughfares. The intersections located in the City of Oxnard are forecast to operate in the LOS A-C range, except the Auto Center Dr/Collins St intersection, which would operate at LOS D.

SITE ACCESS AND CIRCULATION

As illustrated in Exhibit 2, Existing access to the school site is provided via one ingress driveway and two egress driveways. The ingress driveway is located on the east side of Rose Avenue opposite Orange Drive and provides access to the internal drop-off loop system and the parking areas. The northerly egress driveway connects to the signalized Rose Ave/Walnut Dr intersection as the east leg and provides exit from the internal drop-off loop system. A southerly right-turn only egress driveway is located south of the Rose Ave/Orange Dr intersection. A gated maintenance driveway is located at the north portion of the school site. The proposed project will add a full-access driveway on Collins Street. The District Transportation and Parking Facility will have primary access from Collins Street via this driveway connection. An existing right-turn only driveway currently providing access to agricultural land north of the middle school will provide access to the new Parking Lot C

Field review of school traffic during the morning commute period indicated that the existing drop-off loop system with ingress from the Rose Ave/Orange Dr intersection backs up during brief periods, and student drop-offs occur along the northbound shoulder of Rose Avenue south of the existing school boundary. Congestion occurs during the period prior to start of bell schedule and is associated with peak drop-off traffic and arrival of school busses, which use the same drop-off area.

The construction of a full-access driveway on Collins Street, a separate school bus drop-off area and additional parking areas will improve access and on-site circulation. School busses will now enter and exit via Collins Street with minimal delay or conflict with school drop-off vehicles. The signalized Rose Ave/Collins St intersection provides sufficient capacity to accommodate school bus traffic. The driveway on Collins Street will also provide additional access for drop-off/pick-up traffic. The diversion of school bus traffic to Collins Street and provision of additional access points for drop-off/pick-up traffic on Collins Street and Parking Lot C will significantly improve operations at the existing school loop drop-off loop system.

It is recommended that the District develop a school traffic management plan (TMP) to document and implement measures to promote travel mode shifts, optimize on-site circulation and provide safety for students, parents and staff (education, traffic control, physical measures such as speed humps).

A continuous sidewalk is provided along the east side of Rose Avenue from Auto Center Drive to the middle school that connects to the school's internal pedestrian facilities. Crosswalks are provided at the signalized intersections at Collins Street and Walnut Dr. As discussed, the County's 2023-2027 CIP includes several projects in de El Rio neighborhood that will improve pedestrian and bicycle access to the middle school. The Rio Del Valle SRTS assessment identified locations for construction of (infill) sidewalks, intersection curb extensions and traffic calming measures along students walking corridors to promote walking to school. A new sidewalk will be constructed along the north side of Collins Street that connects to an ADA pedestrian sidewalk system on the school site.

The Rose Avenue Bike Lanes project will provide Class II (on-street striped) bike lanes on Rose Avenue from Collins Street to Simon Way. The project will provide a continuous bike lane from Ventura Boulevard to Simon Way in the northbound direction and from Simon Way to Collins Street in the southbound

direction. The SRTS improvement exhibit and Rose Avenue Bike Lanes project exhibits are included in the Technical Appendix.

Rose Avenue/Walnut Drive Intersection

The intersection is controlled by a traffic signal with permissive phasing (green ball) on all approaches, and detection (loops) on the east and west approaches.. The northbound approach on Rose Avenue contains a separate left-turn lane and two through lanes, the southbound approach contains a through lane and a shared through/right-turn lane, the eastbound approach (Walnut Drive) has one shared left/right-turn lane and the westbound approach is the middle school exit driveway with one shared left-turn/through/right-turn lane. School crosswalks are provided on the west and north side of the intersection (ladder crosswalks) and on the east side (basic stripe). Advanced school speed limit signage with speed feedback sign and overhead flashing beacons are provided on Rose Avenue in both directions.

Review of the intersection recent five-year collision history (2017 – 2021) shows a total of nine ((9) collisions with several correctable accidents: three broadsides, three rear-ends and an improper turn. One pedestrian right-of-way violation was reported in 2021 (eastbound right-turn vs. southbound pedestrian in crosswalk).

The County's Local Roadway Safety Plan provides several general countermeasures focused on making the path of travel clearer, including installation of retroreflective backplates and a yellow-change and all-red clearance interval update, and painting directional arrows on the eastbound approach (Walnut Drive). As discussed previously, the Rose Avenue Bike Lanes (Collins-Simon) project will install Class II bike lanes on Rose Avenue, which would improve bicycle traffic conditions.

Additional traffic signal improvements may include provision of a protected left-turn signal head for the northbound left-turn movement, which will require a longer mast arm, and replacing the green ball of the signal face for the no.1 southbound through lane with a green directional arrow to emphasize the through-only movement. Additional improvements may include the realignment of the crosswalk on the north side of the intersection to provide for shorter crossing times. This may require modifications to the to the northeast corner (ADA improvements, installation of pedestrian push button post).

IMPROVEMENT MEASURES

The project-specific analysis found that the project would contribute to the delays experienced the Auto Center Dr/Collins St intersection, which operates at LOS D in the PM peak hour. The low side street volumes (76 peak hour trips in the PM peak hour) and delays would not satisfy any traffic signal warrants. The southbound approach is controlled by a stop sign and contains a shared left-right-turn lane. Prohibiting parking along the west curb extending 60 feet from the intersection and restripe of the southbound approach to provide separate turn lanes will improve operations. The intersection would operate in the LOS C range as a whole, however the southbound approach would continue to operate at LOS D. This would affect 52 vehicles in the PM peak hour in the southbound left-turn lane. Table 10 shows the mitigated intersection levels of service.

It is recommended that the District develop a school traffic management plan (TMP) to document and implement measures to promote travel mode shifts, optimize on-site circulation and provide safety for students, parents and staff (education, traffic control, physical measures such as speed humps).

Several general countermeasures have been identified by the County for the Rose Avenue/Walnut Drive intersections, including installation of retroreflective backplates and a yellow-change and all-red clearance interval update, and painting directional arrows on the eastbound approach (Walnut Drive). Additional

traffic signal improvements may include provision of a protected left-turn signal head for the northbound left-turn movement and replacing the green ball of the signal face for the no.1 southbound through lane with a green directional arrow to emphasize the through-only movement. Additional improvements may include the realignment of the crosswalk on the north side of the intersection to provide for shorter crossing times, including ADA improvements and installation of pedestrian push button post) on the northeast corner.

The cumulative analysis indicated that the Rose Ave/Orange Dr intersection would operate at LOS D in the AM peak hour, which is acceptable along throughfares. The Auto Center Dr/Collins St intersection would operate at LOS D without and with project traffic. Similarly existing plus project conditions, the southbound approach would continue to operate at LOS D after the restripe to separate turning lanes. This would affect 52 vehicles in the PM peak hour in the southbound left-turn lane. The intersection would not satisfy traffic signal warrants under cumulative plus project conditions. Table 10 shows the mitigated intersection levels of service

Table 10 - Auto Center Dr/Collins St Intersection
Mitigated AM and PM Peak Hour Levels of Service

	AM Peak Hour		PM Peak Hour	
Scenario	**Delay - LOS**	**Mitigated V/C - LOS**	**Delay - LOS**	**Mitigated V/C - LOS**
Existing + Project Conditions	14.9 sec/LOS B	14.7 sec/LOS B	31.6 sec/LOS D	29.3 sec/LOS D
Cumulative + Project Conditions	15.1 sec/LOS C	14.9 sec/LOS B	31.8 sec/LOS D	29.4 sec/LOS D

Unsignalized intersection: level of service based on seconds of delay on minor street.

Ventura County Initial Study Assessment Guidelines

2. Typical Content of Traffic Impact Studies (TIS):
3.c.2. The LOS for signalized intersections shall be based on the Intersection Capacity Utilization (ICU) method and the service flow rates adopted by the Ventura County Transportation Commission for the Congestion Management Plan.

Exhibit 14
Guidance for Calculating Level of Service (LOS)

Level of Service (LOS) for signalized intersections on the CMP network shall be calculated using the Intersection Capacity Utilization (ICU) method. LOS on freeway and select road segments will be measured using methods described in the Highway Capacity Manual.

The ICU method includes a number of variables which, depending on the value assigned to each, can have a dramatic effect on LOS. For CMP monitoring purposes, the following guidelines are to be used to calculate LOS using the ICU method:

Phasing/split phasing: Shared left/through lanes will be treated as split phased.

Right-turn overlap: The overlapping left-turn volume will be subtracted from the right-turn volume and then compared to the opposing through volume to determine the critical move.

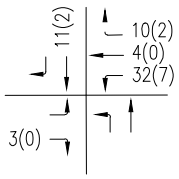
Right-turn on Red: An average of 40% right-turns on red should be used for LOS calculations. If a separate right-turn lane is provided, the through lane should be used as the critical movement even if the right-turn volume is higher. Where a right-turn overlap phase is provided, the overlapping left-turn volume should be subtracted from the right-turn volume and then the remaining right-turn volume would be compared to the through volume per lane to determine the critical movement.

Lane Distribution: It should be assumed that traffic is evenly distributed among all the lanes.

Split Phasing: When an intersection approach has a shared left/through lane, it should be treated as having split phasing for the purpose of calculating LOS.

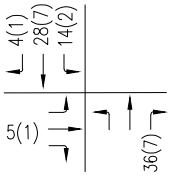
LOS threshold: LOS will be calculated to 2 decimal points.

Intersection proximity: Each intersection will be analyzed separately.



Multiple left-turn lanes: Assume uniform lane distribution.

Saturation flow rate: 1,850 vehicles per lane per hour with an adjustment factor of 14%-15% (the adjustment factor represents a combination of start-up delay, unequal lane distribution, and lost time during clearance. Application of this factor effectively reduces the saturation flow rate to approximately 1,600 vehicles per lane per hour).



ICU	LOS
0 to 60%	A
>60% to 70%	B
>70% to 80%	C
>80% to 90%	D
>90% to 100%	E
>100% to 110%	F
>110% to 120%	G
>120%	H

SIGNING AND STRIPING GENERAL NOTES:

1. INSTALLATION OF ALL SIGNING, STRIPING AND PAVEMENT MARKERS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.
2. ALL SIGNING AND STRIPING SHALL CONFORM TO 2015 CALTRANS STANDARD PLANS AND SPECIFICATIONS AND THE CALIFORNIA MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (CAMUTCD).
3. NOTIFY COUNTY TRAFFIC ENGINEER AT (805) 654-2063 FOR APPROVAL OF MARK-OUT. A MINIMUM OF 48 HOURS PRIOR NOTICE IS REQUIRED.
4. THE CONTRACTOR SHALL REMOVE ALL CONFLICTING STRIPING, PAVEMENT MARKINGS AND LEGENDS BY SANDBLASTING AND/OR GRINDING. ANY DEBRIS SHALL BE PROMPTLY REMOVED BY THE CONTRACTOR.
5. SIGN POSTS SHALL BE INSTALLED WITH SQUARE PERFORATED STEEL TUBING WITH A BREAKAWAY BASE PER COUNTY OF VENTURA ROAD STANDARDS SIGN POST INSTALLATION PLATE F-3.
6. ALL SIGNS SHOWN ON THE SIGNING AND STRIPING PLANS SHALL BE NEW SIGNS PROVIDED AND INSTALLED BY THE CONTRACTOR, EXCEPT FOR EXISTING SIGNS SPECIFICALLY INDICATED TO BE RELOCATED OR REMAIN.
7. NEW STRIPING AND PAVEMENT MARKINGS SHALL BE THERMOPLASTIC.

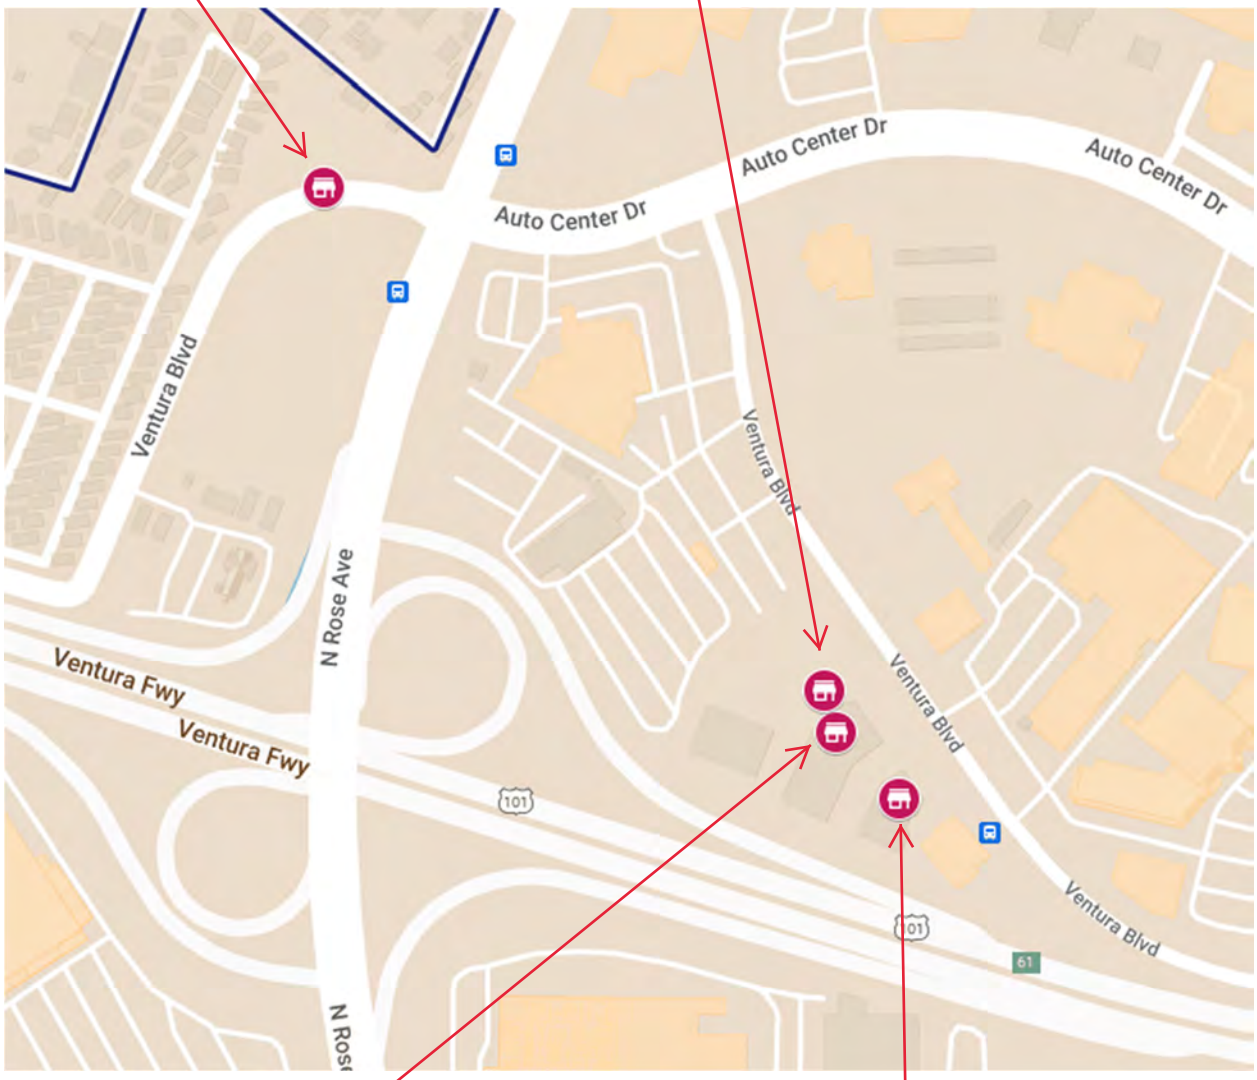
DESCRIPTION

New rental office, auto carwash, and lot for 40+ rental vehicles. Located NW Rose Ave & Ventura Blvd Oxnard CA

SQF (Net)



1600

DESCRIPTION

Construction of a wireless communications facility designed as a 40 foot tall faux eucalyptus tree with associated ground mounted equipment. APN: 144-0-134-065

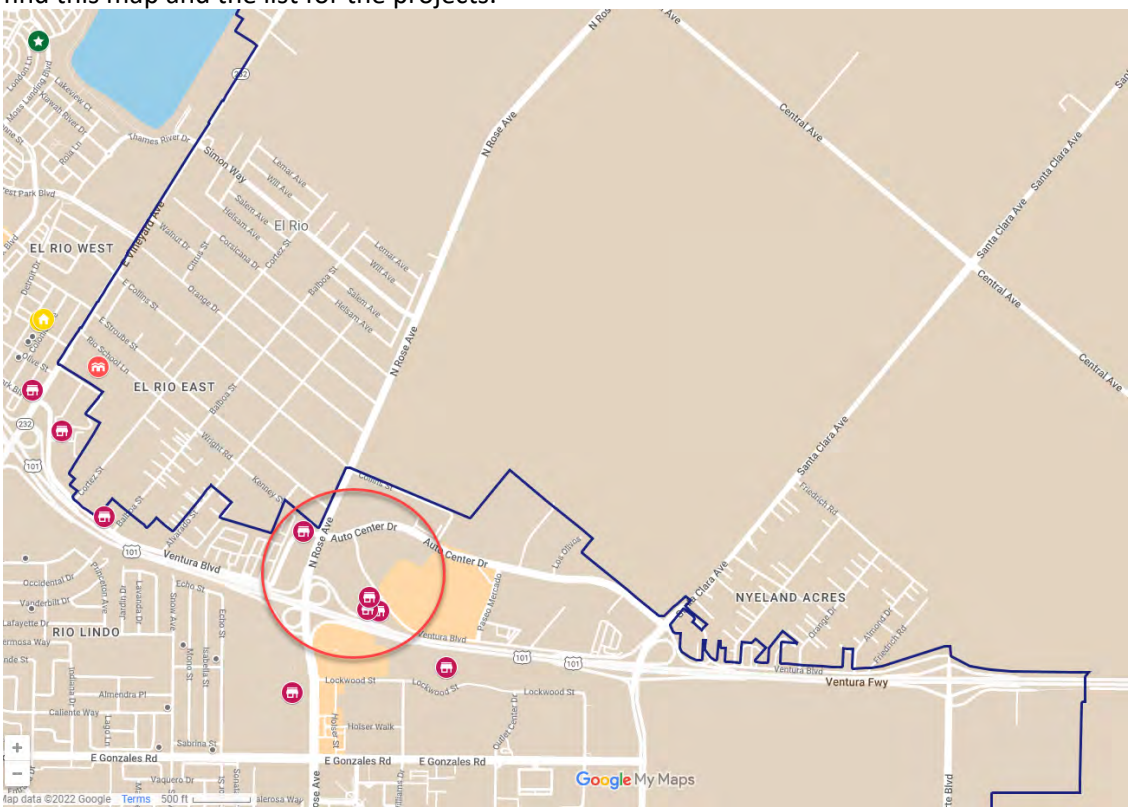
SQF (Net)

540

DESCRIPTION

Demolition of existing 18,000 square foot commercial structure and site improvements to construct a new 3,885 square foot, In-N-Out Burger drive-thru restaurant with 23 car stacking lane and 74 parking spaces on a 1.47 acre lot in the Rose-Santa Clara Specific Plan area.

DESCRIPTION



Demolition of existing 7,080 square foot commercial structure and construct a new 1,800 square foot Starbucks Coffee with drive-thru and 15 car stacking lane and 27 parking spaces on an 0.85 acre lot in the Rose-Santa Clara Specific Plan area.

Stantec

Memo

To:	Gianfranco Laurie Ventura County Public Works Agency, Roads & Transportation Department	From:	Daryl Zerfass and Maria Morris Stantec
File:	2042625101	Date:	April 27, 2022

Reference: Rio Del Valle Middle School Project, Rio School District – Preliminary VMT Analysis

Stantec has prepared a vehicle miles of travel (VMT) analysis for the proposed expansion of the Rio Del Valle Middle School campus (Project) located at 3100 Rose Avenue in unincorporated County of Ventura. The purpose of this memo is to document the findings of a VMT analysis prepared in support of the Project's environmental documentation and complies with the updated California Environmental Quality Act (CEQA) guidelines that incorporate the requirements of Senate Bill 743 (SB 743).

Project Description

The Project expands the existing campus and results in a potential enrollment increase of 250 students over a five-year period commencing at the earliest in the 2024/25 school year. In addition, the School District proposes to transfer the existing school bus parking and workroom facilities (District Transportation and Parking Facility) from the current location on E. Vineyard Avenue at Sycamore Street to the Project site. A conceptual site plan illustrating the proposed Project is attached for reference (**Figure 1**). The Rio Del Valle Middle School campus is part of the Rio School District.

Methodology

The Governor's Office of Planning and Research (OPR) Technical Advisory[1] recommends local agencies adopt guidelines appropriate for their jurisdiction. The County of Ventura has developed the Initial Study Assessment Guidelines[2] (referred to here as County Guidelines) that is consistent with the CEQA requirements and includes analysis methodology and significance thresholds for projects in unincorporated County areas. Since the County Guidelines do not include a screening criteria, guidance from OPR's Technical Advisory and other local agencies are utilized here for the screening process.

First, a screening process is conducted to identify if the Project can be presumed to have a less than significant impact. If the Project does not meet any of the screening criteria, a full VMT analysis is prepared. For purposes of this analysis, the Project is evaluated as a mixed-use consisting of the school portion and the District Transportation and Parking Facility (DTPF) portion. County Guidelines cite OPR's guidance that "suggests applying the threshold of one (or more) of the land uses"[3] for mixed use projects. OPR's Technical Advisory also suggests "a lead agency may consider only the project's dominant use"[4]. In this instance the school portion of the project is the dominant use since the estimated average daily trips generated by the

school expansion (525 ADT) make up approximately two thirds of the Project's daily trip generation (792 ADT)[5].

Project Screening

OPR's Technical Advisory advises that lead agencies conduct a screening process "to quickly identify when a project should be expected to cause a less than significant impact."[6] As shown in **Table 1**, the screening process considers the project size, low VMT areas, transit availability, affordable housing, and local serving development. If the Project meets one of the criteria, it is presumed to have a less than significant impact.

Table 1 Project Screening Criteria

Category	Criteria/Screening	Threshold	Does Project Meet Screening Criteria?	
			School	DTPF
Small Project	Small projects are presumed to have a less than significant impact	If the Project generates less than 110 net trips per day	No	Yes
Map-based screening	Projects that located in areas with low VMT are presumed to have a less than significant impact	If the Project is in a low VMT area, defined as 15% below the regional average.	No	No
Proximity to transit	Projects in a transit priority area are presumed to have a less than significant impact	If the Project is within ½ mile of a major or high-quality transit stop/corridor	No	No
Affordable residential development	Affordable housing in infill locations are presumed to have a less than significant impact	If the Project is comprised 100% of affordable units	N/A	N/A
Locally serving retail and other local serving uses	Retail projects that are local serving are presumed to have a less than significant impact Other local serving uses approved by the local agency.	Retail that is less than 50,000 square feet Uses approved by local agencies such as a public school.	Yes	Yes

As shown in **Table 1**, the Project meets the locally serving use criteria. The following is a qualitative assessment on how the Project meets the criteria of a local serving use and meets the intent and goals of SB 743.

Local agencies may elect to classify certain uses as local serving if the use is expected to draw users from a relatively small geographic area, leading to short-distance trips, and trips that are linked to other destinations. A neighborhood school primarily draws students from a relatively small geographic area in the vicinity of the school site, which results in short-distance trips. The furthest distance to the school within the attendance boundary is approximately three miles[7] (See attendance boundaries in **Figure 2**). If enrollment at the Rio Del Valle Middle School is at capacity, a student may need to attend the Rio Vista Middle School, which is approximately 1.3 miles from the Project site and 4 to 5 miles from the furthest point of the attendance boundary. Driving to a further school can result in a longer trip length of one to two miles and an increase in VMT. Other agencies in California, such as the County of Sacramento, County of San Diego, City of Irvine,

[5] 250 students = 525 ADT; DTPF = 267 ADT; Source: Rio Del Valle Middle School Project Traffic Impact Study

[7] Measured from Kohala Street/Camino Del Sol intersection to Rio Del Valle Middle School

and City of Pomona have adopted a public school use as a local serving use as it meets the intent of SB 743. Therefore, based on the locally serving use screening criteria, the VMT generated by the school expansion is less than significant.

The DTPF portion makes up only a third of the Project's trip generation, is not the dominant use, and it meets the small project screening criteria since the facility is being relocated and would have less than 110 net new daily trips. In addition, the DTPF is relocating only a short distance from its current site at the E. Vineyard Avenue at Sycamore Street intersection to the Project site (approximately 1.25 miles), resulting in a nominal change in VMT overall. Importantly, school buses result in an overall reduction in VMT citywide by reducing private vehicle use. Therefore, based on the small project screening criteria and the locally serving use screening criteria, the DTPF portion of the project is less than significant.

Based on the analysis provided above, the Project would have a less than significant impact at the project level.

Cumulative Impact Analysis

Per the OPR Technical Advisory, "a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa"[8]. Therefore, since the Project has a less than significant impact at the project level, the Project has less than significant cumulative impact.

Consistency with the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

The purpose of the RTP/SCS is to evaluate regional land use patterns and transportation systems to achieve the State's target GHG emissions reduction goals. Ventura County is within the SCAG region and the Project's consistency with the SCAG 2020-2045 RTP/SCS, also known as Connect SoCal, is required. The Project's land uses are consistent with the County's General Plan, specifically with the El Rio/Del Norte Area Plan that designates the site as Institutional and Agricultural, which allows for the proposed uses. Therefore, since the Project is consistent with the County's General Plan, the Project would be consistent with the RTP/SCS.

Active Transportation and Transit

There are existing Class II bike lanes on Rose Avenue and Auto Center Drive. The Project will not block, remove, or restrict existing or future pedestrian and bicycle facilities.

The Project site is accessible by bus transit. There are approximately 9 bus stops around the Project site, serviced by Gold Coast Transit, public transit services in Western Ventura County. The stops provide service to routes 15 (Esplanade – El Rio – St. John's Medical Center) 18G (School Trippers – Local Community and Area High Schools), and 17 (Esplanade – St. John's – Oxnard College). The Project will not block, remove, or restrict existing transit.

Conclusion

A VMT analysis was conducted for the Project. The school portion of the Project is the dominant use and meets the locally serving screening criteria; therefore, the Project is presumed to have a less than significant impact at the project level. Furthermore, the DTPF portion of the project would also be less than significant on a stand-alone basis based on both the small project screening criteria and the locally serving screening criteria. Since the Project would have a less than significant impact at the project level, the Project would have a less than significant impact at the cumulative level per OPR's Technical Advisory. The Project was also determined to be consistent with regional plans and to not impact active transportation or transit use.

Sincerely,
