Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

NPL Status:	Not Listed
CTC:	221
Current Owner:	State Government
Future Prog:	Not reported
Description:	The 14.5-acre site is located 6 miles southwest of San Francisco in San Mateo County, California. The entire site has been closed to public use and the area is completely fenced. Multiple holes have been cut through the fence and the site is extensively used by the public.
Current Program:	Not reported
History:	In 1942, the U.S. government acquired 14.5 acres of land for the harbor defense of San Francisco and as a maneuver area. The only documented improvement was a communication cable used for military purposes. In 1943, the lease was terminated. The land was used by the State of California in the 1950s and 1960s until the area was rendered unusable by landslides. No potential hazards related to Department of Defense activities have been located at this site.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Local Lists of Registered Storage Tanks

SWEEPS UST: SWEEPS UST Listing

Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

Date of Government Version: 06/01/1994
Date Data Arrived at EDR: 07/07/2005

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Version Date:	2012
West Map:	5640630 SAN FRANCISCO SOUTH OE W, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

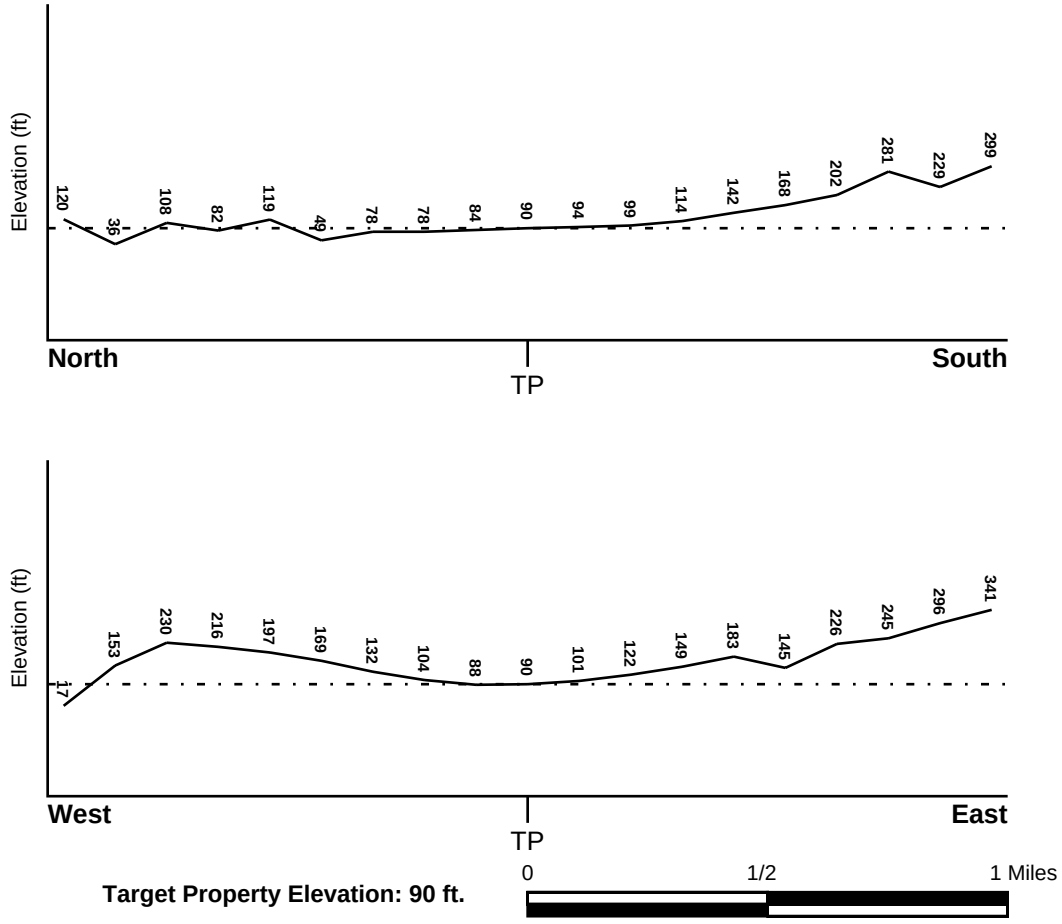
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 90 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06081C0030E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06081C0010E	FEMA FIRM Flood data
06081C0036E	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SAN FRANCISCO SOUTH	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
2	1/4 - 1/2 Mile SSW	S
A4	1/4 - 1/2 Mile NNW	SSW
9	1/4 - 1/2 Mile SW	E
15	1/2 - 1 Mile East	Varies

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches		Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:

Soil Map ID: 2

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information

1	0 inches	59 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

CA WELLS **3566**

Water System Information:

Prime Station Code:	03S/06W-02R03 M	User ID:	ENG
FRDS Number:	4110013003	County:	San Mateo
District Number:	04	Station Type:	WELL/AMBNT/MUN/INTAKE/SUPPLY
Water Type:	Well/Groundwater	Well Status:	Inactive Untreated
Source Lat/Long:	374200.0 1222800.0	Precision:	1 Mile (One Minute)
Source Name:	WELL 03 - INACTIVE		
System Number:	4110013		
System Name:	City of Daly City		
Organization That Operates System:			
	153 Lake Merced Blvd.		
	Daly City, CA 94015		
Pop Served:	92311	Connections:	21600
Area Served:	DALY CITY

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

APPENDIX B

Freedom of Information Act/Public Records Inquiries and Responses

February 8, 2017 9:44am

Gabe Matson called the North County Fire Department at (650)991-8138 to make a public records request. Gabe spoke with Erin who informed him that records requests could be made in person, without appointment Monday-Friday 7am-5pm at 10 Wembly Drive, Daly City CA.

From: Gabriel Matson
Sent: Tuesday, February 14, 2017 8:42 AM
To: 'envhealth@smcgov.org'
Subject: Public Records Request for Daly City Addresses

Hello,

I will be conducting a Phase I Environmental Site Assessment for the Westlake Shopping Center in Daly City, CA which includes following addresses:
239 Westlake Center
243 Westlake Center
213 Westlake Center
42 Park Plaza Dr, Suite 325
30 Park Plaza Dr
34 Park Plaza Dr
201 Westlake Center
36 Park Plaza Dr
321 S Mayfair Ave, Suite 227
42 Park Plaza Dr
215 Westlake Center
32 Park Plaza Dr
235 Westlake Center
247 Westlake Center
38 Park Plaza Dr
311 Lake Merced Blvd
341 S Mayfair Avenue
213 Westlake Center
311 Lake Merced Blvd
311 Lake Merced Blvd
44 Park Plaza Drive
34 Park Plaza Dr
201 Westlake Center
36 Park Plaza Dr
227 Westlake Center

We are interested in all the files available from this property for the entire history of the address.

If you have any questions feel free to call me.

Thank you,

Gabe Matson |Staff Geologist |Roux Associates, Inc.

Attachments: 213 Westlake Center.zip

Hi,

Tha records that I emailed last week were attached to the email. The additional files that for an additional request were too large to email. They were burned onto a CD and mailed to you last week.

I will send the emailed files again with this email. 213 Westage Center attached in pdf format. Thank you.

Subject: RE: 2 File Review requests

Hi Jean,

Thank you for the response. This is my first time requesting records from the San Mateo EHD, so just to clarify: how may I view these records?

Thank you,

Gabe

Subject: 2 File Review requests

Mr. Matson :

The records request **(SR0020021**) you submitted for properties in Daly City is complete. We have Hazardous Materials files for
213 Westlake Center, which are attached in pdf format.

If you have any questions regarding the records/ files contact the Hazardous Materials Inspector, Monica Banning at 650-207-8741/Jake Madden at 650-399-5959.

We have no Hazmat or Groundwater files for; 239, 243, 201 Westlake Center; 321 Mayfair Ave;
30, 34, 36, 42 Park Plaza Drive.

(SR0020022)
We have no Hazmat or Groundwater files for 227 Westlake Center, Daly City.

PERMIT CONDITIONS

2000 Alameda de las Pulgas, Ste. 100, San Mateo, CA 94403

Facility Identification Number: FA0035251

*In order to maintain the **Permit to Operate**, the permit holder must comply with the following provisions of related laws concerning management of hazardous materials. Any violation of the conditions may be cause for revocation of the **Permit to operate.***

a. **Hazardous Materials Business Plan Program:** California Health and Safety Code, Division 20, Chapter 6.95, Article 1 and Title 19 Calfornia Code of Regulations.
b. **California Accidental Release Prevention Program (Cal-ARP)**: California Health and Safety Code, Division 20, Chapter 6.95, Article 2 and Title 19, California Code of Regulations.
c. **Hazardous Waste Generator Program**: California Health and Safety Code, Division 20, Chapter 6.5, Articles 1-13, Section 25100 et seq., and Title 22, California Code of Regulations, Chapter 20
d. **Aboveground Petroleum ACT SPCC Plans**: California Health and Safety Code, Division 20, Chapter 6.67 and 40 CFR 112.
e. **Tiered Permit On-Site Hazardous Waste Treatment**: California Health and Safety Code, Division 20, Chapter 6.5 Article 9, and Title 22 California Code of Regulations, Chapter 20

The Permit to Operate is to be maintained on-site and is valid for a period of five (5) years.

NOTICE OF VIOLATION

Chipotle Mexican Grill, Inc.
1401 Wynkoop St., Suite 500
ATTN LICENSING
Denver, CO 80202

Subject Site: FA0035251, Chipotle Mexican Grill #1102 213 Westlake Ctr, Daly City

San Mateo County Environmental Health Services performed Hazardous Material inspections of the above-referenced facility on July 29, 2014 and September 15, 2016. During the inspections, the following violations were noted:

Hazardous Materials Business Plan (California Health & Safety Code, Division 20, Chapter 6.95 and California Code of Regulations, Title 19)

1. Failure to (1) provide initial training and annual training, including refresher courses, to all employees in safety procedures in the event of a release or threatened release of a hazardous material, including, but not limited to, the Emergency Response Plan, and (2) document electronically or by hard copy and make available for a minimum of three years. HSC 6.95 25505(a)(4)

   Violation Comments: resubmit detailed training plan and implement it.

2. Failure to notify property owner in writing that the business is subject to the business plan program and has complied with its provisions. HSC 6.95 25505.1

   Violation Comments: OBSERVATION: Failure to notify property owner in writing that the business is subject to the business plan program and has complied with its provisions. CORRECTIVE ACTION: Provide verification to the County within 30 days that the property owner has been properly notified.

3. Failure to (1) provide initial training and annual training, including refresher courses, to all employees in safety procedures in the event of a release or threatened release of a hazardous material, including, but not limited to, the Emergency Response Plan, and (2) document electronically or by hard copy and make available for a minimum of three years. HSC 6.95 25505(a)(4)

Violation Comments: Apprentice Lea stated she has not been trained in CO2 hazards. [INITIAL / ANNUAL] training documentation for all applicable employees was not available. CORRECTIVE ACTION: Submit documentation to the County within 30 days demonstrating that employees have received training on safe handling of hazardous materials and the Emergency Response Plan.

The above listed items are violations of the California Health and Safety Code and the California Code of Regulations. Your failure to submit documentation of compliance or request a reinspection of all the violations listed above within 15 days of the receipt of this notice will result in an Administrative Enforcement Order, or a referral for further enforcement action. **Re-inspection fee of $167.00 may apply for facilities failing to provide documentation of corrective action <15 days.**

Please Note: There are Civil and Criminal penalties for failure to comply with California Health and Safety Code and/or California Code of Regulations.

(A) Failure to comply with Hazardous Materials Business Plan requirements may result in a civil penalty not to exceed two thousand dollars ($2,000) for each day in which the violation occurs. Any business that knowingly violates the requirements, after notice of violation, may be assessed in an amount not to exceed five thousand dollars ($5,000) for each day in which the violation occurs.

If you have any questions about what you must do to correct the above violations, please contact me at (650) 207-8741 or MBANNING@SMCGOV.ORG.

Signed,

Monica Banning
Hazardous Materials Specialist

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**No**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month, or accumulate at any time, 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate or accumulate at any time more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	**No**
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

BUSINESS SITE CITY 104.		ZIP CODE 105.
Daly City	CA	94015

TYPE OF BUSINESS (e.g., Painting Contractor) A3.	INCIDENTAL OPERATIONS (e.g., Fleet Maintenance) A4.
Fast Casual Mexican Restaurant	

THIS PLAN COVERS CHEMICAL SPILLS, FIRES, AND EARTHQUAKES INVOLVING: (Check all that apply) A5.

☒ 1. HAZARDOUS MATERIALS; ☐ 2. HAZARDOUS WASTES

B. INTERNAL RESPONSE

INTERNAL FACILITY EMERGENCY RESPONSE WILL OCCUR VIA: (Check all that apply) B1.

☒ 1. CALLING PUBLIC EMERGENCY RESPONDERS (i.e., 9-1-1)
☐ 2. CALLING HAZARDOUS WASTE CONTRACTOR
☐ 3. ACTIVATING IN-HOUSE EMERGENCY RESPONSE TEAM

C. EMERGENCY COMMUNICATIONS, PHONE NUMBERS AND NOTIFICATIONS

Whenever there is an imminent or actual emergency situation such as an explosion, fire, or release, the Emergency Coordinator (or his/her designee when the Emergency Coordinator is on call) shall:

1. Activate internal facility alarms or communications systems, where applicable, to notify all facility personnel.
2. Notify appropriate local authorities (i.e., call 9-1-1).
3. Notify the California Emergency Management Agency at (800) 852-7550.

Before facility operations are resumed in areas of the facility affected by the incident, the emergency coordinator shall notify the California Department of Toxic Substances Control (DTSC), the local Unified Program Agency (UPA), and the local fire department's hazardous materials program that the facility is in compliance with requirements to:

1. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from an explosion, fire, or release at the facility; and
2. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

INTERNAL FACILITY EMERGENCY COMMUNICATIONS OR ALARM NOTIFICATION WILL OCCUR VIA: (Check all that apply) C1.

☒ 1. VERBAL WARNINGS;	☐ 2. PUBLIC ADDRESS OR INTERCOM SYSTEM;	☒ 3. TELEPHONE;
☐ 4. PAGERS;	☐ 5. ALARM SYSTEM;	☐ 6. PORTABLE RADIO

NOTIFICATIONS TO NEIGHBORING FACILITIES THAT MAY BE AFFECTED BY AN OFF-SITE RELEASE WILL OCCUR BY: (Check all that apply) C2.

☒ 1. VERBAL WARNINGS;	☐ 2. PUBLIC ADDRESS OR INTERCOM SYSTEM;	☒ 3. TELEPHONE;
☐ 4. PAGERS;	☐ 5. ALARM SYSTEM;	☐ 6. PORTABLE RADIO

EMERGENCY RESPONSE PHONE NUMBERS:

D. EMERGENCY CONTAINMENT AND CLEANUP PROCEDURES

SPILL PREVENTION, CONTAINMENT, AND CLEANUP PROCEDURES: (Check all boxes that apply to indicate your procedures for containing spills, releases, fires or explosions; and. preventing and mitigating associated harm to persons, property, and the environment.)

D1.

- [x] 1. MONITOR FOR LEAKS, RUPTURES, PRESSURE BUILD-UP, ETC.;
- [ ] 2. PROVIDE STRUCTURAL PHYSICAL BARRIERS (e.g., Portable spill containment walls);
- [ ] 3. PROVIDE ABSORBENT PHYSICAL BARRIERS (e.g., Pads, pigs, pillows);
- [ ] 4. COVER OR BLOCK FLOOR AND/ OR STORM DRAINS;
- [ ] 5. BUILT-IN BERM IN WORK / STORAGE AREA;
- [ ] 6. AUTOMATIC FIRE SUPPRESSION SYSTEM;
- [ ] 7. ELIMINATE SOURCES OF IGNITION FOR FLAMMABLE HAZARDS (e.g. Flammable liquids, Propane);
- [x] 8. STOP PROCESSES AND/OR OPERATIONS;
- [ ] 9. AUTOMATIC / ELECTRONIC EQUIPMENT SHUT-OFF SYSTEM;
- [x] 10. SHUT-OFF WATER, GAS, ELECTRICAL UTILITIES AS APPROPRIATE;
- [x] 11. CALL 9-1-1 FOR PUBLIC EMERGENCY RESPONDER ASSISTANCE / MEDICAL AID;
- [x] 12. NOTIFY AND EVACUATE PERSONS IN ALL THREATENED AREAS;
- [x] 13. ACCOUNT FOR EVACUATED PERSONS IMMEDIATELY AFTER EVACUATION CALL;
- [ ] 14. PROVIDE PROTECTIVE EQUIPMENT FOR ON-SITE RESPONSE TEAM;
- [ ] 15. REMOVE OR ISOLATE CONTAINERS / AREA AS APPROPRIATE;
- [ ] 16. HIRE LICENSED HAZARDOUS WASTE CONTRACTOR;
- [ ] 17. USE ABSORBENT MATERIAL FOR SPILLS WITH SUBSEQUENT PROPER LABELING, STORAGE, AND HAZARDOUS WASTE DISPOSAL AS APPROPRIATE;
- [ ] 18. SUCTION USING SHOP VACUUM WITH SUBSEQUENT PROPER LABELING, STORAGE, AND HAZARDOUS WASTE DISPOSAL AS APPROPRIATE;
- [ ] 19. WASH / DECONTAMINATE EQUIPMENT W/ CONTAINMENT and DISPOSAL OF EFFLUENT / RINSATE AS HAZARDOUS WASTE;
- [ ] 20. PROVIDE SAFE TEMPORARY STORAGE OF EMERGENCY-GENERATED WASTES;
- [ ] 21. OTHER (Specify):

D2.

E. FACILITY EVACUATION

THE FOLLOWING ALARM SIGNAL(S) WILL BE USED TO BEGIN EVACUATION OF THE FACILITY (CHECK ALL THAT APPLY): E1.

- [ ] 1. BELLS;
- [ ] 2. HORNS/SIRENS;
- [x] 3. VERBAL (I.E., SHOUTING);
- [ ] 4. OTHER (Specify):

E2.

THE FOLLOWING LOCATION(S) IS/ARE EVACUEE EMERGENCY ASSEMBLY AREA(S) (i.e., Front parking lot, specific street corner, etc.) E3.

front parking lot

Note: The Emergency Coordinator must account for all on site employees and/or site visitors after evacuation.

- [ ] EVACUATION ROUTE MAP(S) POSTED AS REQUIRED

E4.

Note: The map(s) must show primary and alternate evacuation routes, emergency exits, and primary and alternate staging areas, and must be prominently posted throughout the facility in locations where it will be visible to employees and visitors.

F. ARRANGEMENTS FOR EMERGENCY SERVICES

Explanation of Requirement: Advance arrangements with local fire and police departments, hospitals, and/or emergency services contractors should be made as appropriate for your facility. You may determine that such arrangements are not necessary.

ADVANCE ARRANGEMENTS FOR LOCAL EMERGENCY SERVICES (Check one of the following) F1.

- [x] 1. HAVE BEEN DETERMINED NOT NECESSARY; *or*
- [ ] 2. THE FOLLOWING ARRANGEMENTS HAVE BEEN MADE (Specify):

F2.

G. EMERGENCY EQUIPMENT

Check all boxes that apply to list emergency response equipment available at the facility and identify the location(s) where the equipment is kept and the equipment's capability, if applicable. [e.g., ☒ CHEMICAL PROTECTIVE GLOVES | Spill response kit | One time use, Oil & solvent resistant only.]

	35. ☐ OTHER	G70.	G71.

H. EARTHQUAKE VULNERABILITY

Identify areas of the facility that are vulnerable to hazardous materials releases / spills due to earthquake-related motion. These areas require immediate isolation and inspection.

VULNERABLE AREAS: (Check all that apply)	H1.	LOCATIONS (e.g., shop, outdoor shed, forensic lab)	
☒ 1. HAZARDOUS MATERIALS / WASTE STORAGE AREA		Co2 tank in south storage area	H2.
☐ 2. PROCESS LINES / PIPING			H3.
☐ 3. LABORATORY			H4.
☐ 4. WASTE TREATMENT AREA			H5.

Identify mechanical systems vulnerable to releases / spills due to earthquake-related motion. These systems require immediate isolation and inspection.

VULNERABLE SYSTEMS: (Check all that apply)	H6.	LOCATIONS	
☐ 1. SHELVES, CABINETS AND RACKS			H7.
☒ 2. TANKS (EMERGENCY SHUTOFF)		Co2 tank in south storage area	H8.
☐ 3. PORTABLE GAS CYLINDERS			H9.
☐ 4. EMERGENCY SHUTOFF AND/OR UTILITY VALVES			H10.
☐ 5. SPRINKLER SYSTEMS			H11.
☐ 6. STATIONARY PRESSURIZED CONTAINERS (e.g., Propane dispensing tank)			H12.

I. EMPLOYEE TRAINING

Explanation of Requirement: Employee training is required for all employees handling hazardous materials and hazardous wastes in day-to-day or clean-up operations including volunteers and/or contractors. Training must be:

- Provided within 6 months for new hires;
- Amended as necessary prior to change in process or work assignment;
- Given upon modification to the Emergency Response / Contingency Plan, and updated/refreshed annually for all employees.

Required content includes all of the following:

- Material Safety Data Sheets;
- Hazard communication related to health and safety;
- Methods for safe handling of hazardous substances;
- Fire hazards of materials / processes;
- Conditions likely to worsen emergencies;
- Coordination of emergency response;
- Notification procedures;
- Applicable laws and regulations;
- Communication and alarm systems;
- Personal protective equipment;
- Use of emergency response equipment (e.g. Fire extinguishers, respirators, etc.);
- Decontamination procedures;
- Evacuation procedures;
- Control and containment procedures;
- UST monitoring system equipment and procedures (if applicable).

INDICATE HOW EMPLOYEE TRAINING PROGRAM IS ADMINISTERED (Check all that apply) I1.

☐ 1. FORMAL CLASSROOM; ☐ 2. VIDEOS; ☐ 3. SAFETY / TAILGATE MEETINGS;

☒ 4. STUDY GUIDES / MANUALS (Specify): Chipotle creates safety manuals I2.

☒ 5. OTHER (Specify): Chipotle trains all employees I3.

☐ 6. NOT APPLICABLE BECAUSE FACILITY HAS NO EMPLOYEES

Large Quantity Generator (LQG) Training Records: Large quantity hazardous waste generators (i.e., who generate more than 270 gallons/1,000 kilograms of hazardous waste per month) must retain written documentation of employee hazardous waste management training sessions which includes:

- A written outline/agenda of the type and amount of both introductory and continuing training that will be given to persons filling each job position having responsibility for the management of hazardous waste (e.g., labeling, manifesting, compliance with accumulation time limits, etc.).
- The name, job title, and date of training for each hazardous waste management training session given to an employee filling such a job position; and
- A written job description for each of the above job positions that describes job duties and the skills, education, or other qualifications required of personnel assigned to the position.
- Current employee training records must be retained until closure of the facility.
- Former employee training records must be retained at least three years after termination of employment.

CARBON DIOXIDE (CO2)

Filed in Manager's office (and online on CERS website for CA locations only)

1. HAZARDOUS MATERIAL

Carbon Dioxide (CO2)

- Chemical Identification: CAS- No: 124-38-9
  Volume: >99%
  UN No.: 1013 (Gas) & UN2187 (Liquid)
  Chemical is stable

- Physical Description: Colorless, Odorless gas with a slight acidic taste
  Non-flammable and Non-reactive with many materials
  Weighs more than Oxygen, settles low in the air by the floor
  Contained under pressure; Cryogenic Liquid.

2. POTENTIAL HEALTH EFFECTS

- Inhalation: Simple asphyxiant. Can cause suffocation
  1,000,000 ppm of a gas = 100 % concentration of the gas. Therefore, 10,000 ppm of a gas in air is a 1% concentration.

EFFECT	CONCENTRATION
Breathing rate increases slightly.	1%
Breathing rate increases to 50% above normal level. Prolonged exposure can cause headache, tiredness.	2%
Breathing increases to twice normal rate and becomes labored. Weak narcotic effect. Impaired hearing, headache, increased blood pressure and pulse rate.	3%
Breathing increases to approximately four times normal rate, symptoms of intoxication become evident, and slight choking may be felt.	4 - 5%
Characteristic sharp odor noticeable. Very labored breathing, headache, visual impairment, and ringing in the ears. Judgment may be impaired, followed within minutes by loss of consciousness.	5 - 10%
Unconsciousness occurs more rapidly above 10% level. Prolonged exposure to high concentrations may eventually result in death from asphyxiation.	10 - 100%

- Contact: Contact with product may cause frostbite

3. FIRST AID

- Inhalation: PROMPT MEDICAL ATTENTION IS MANDATORY IN ALL CASES OF INHALATION OVEREXPOSURE. RESCUE PERSONNEL SHOULD BE EQUIPPED WITH SELF-CONTAINED BREATHING APPARATUS. Conscious inhalation victims should be assisted to an uncontaminated area and inhale fresh air. If breathing is difficult, administer oxygen. Unconscious persons should be moved to an uncontaminated area and, as necessary, given artificial resuscitation and supplemental oxygen. Treatment should be symptomatic and supportive.

- Contact: Eyes:
  If frost bite is suspected flush area with cool water for 15 minutes and obtain immediate medical attention.

  Skin:
  For dermal contact or suspected frostbite, remove contaminated clothing and flush affected areas with lukewarm water. DO NOT USE HOT WATER. A physician should see the patient promptly if contact with the product has resulted in blistering of the dermal surface or in deep tissue freezing.

CARBON DIOXIDE (CO_2)

4. HOW TO IDENTIFY A LEAK

- Listen for any unusual noise.
- Observe any frozen liquid around the storage container, piping and connections. Observe a vapor cloud similar to that produced by dry ice.
- Monitor alarm will sound (If your location has one installed)
- Bib motor running abnormally loud. Contact Coca-Cola as there could be minor leaking at the soda machine.
- If suspected, leave area immediately and evacuate the restaurant. Contact 9-1-1 and supplier for repairs.

5. EMERGENCY RESPONSE

- Call 911 if medical attention is needed due to contact or inhalation, if there is uncontainable fire within the restaurant or if you believe an earthquake (or other natural disaster) has damaged the CO_2 bulk tank.
- If there is a leak present, evacuate the restaurant immediately and ensure there is adequate ventilation.
- Do not re-enter the building without the proper safety equipment if the oxygen levels have reached a dangerous saturation of CO_2.
- Contact your supplier to notify them of the necessity of repairs.
- Reference the Business plan and notify the appropriate parties. (CA Only)

6. HANDLING AND STORAGE

Precautions to be taken in Handling:

- Avoid breathing gas and direct contact with liquid.
- Protect cylinders from damage.
- Never attempt to lift cylinder by its cap or insert items such as a wrench or screw driver, this may damage the valve.
- Open valve slowly, if difficult to do so, please stop what you are doing and contact your supplier.
- Keep cylinder upright when in use.
- Keep away from high temperature as this may damage the cylinder/tank.

Precautions to be taken in Storage:

- Store in an area with adequate ventilation as gas can cause suffocation.
- Keep storage area below 125°F (52°C).
- Firmly secure cylinders to the wall in an upright position.
- Use First-in, First-out inventory systems to prevent cylinders from being stored for extended periods of time.

7. BUSINESS PLAN (CALIFORNIA ONLY)

- Please review and become familiar with the previously supplied Business Plan.
- Review the site plans to become familiar with the location of all exits, evacuation staging area as well as emergency response equipment and shut-offs.

8. ECOLOGICAL INFORMATION

No adverse ecological effects expected. Carbon Dioxide does not contain any Class 1 or Class 2 ozone-depleting chemicals.

9. DISPOSAL

Do not attempt to dispose of any residual waste, please contact your supplier to remove.

10. FREQUENCY

Training must be performed once a year and to all new hires.

Subject: 247 Westlake Center, DC

Jake,

This email is to follow up from our discussion yesterday. As discussed, we are in the process of rebound testing at the former Westlake drycleaner (rebound testing started in July of 2016 and we have collected samples at four different sampling events). We have noted that in the last two sample events, PCE concentrations at the subslab probe TR-7 are trending upwards. Because of this we are planning on collecting one additional round of sampling at all monitoring points prior submittal of the Rebound Test Report. Axel will follow shortly up with a date to notify you of the schedule for the additional sampling event. Once we have completed the sampling and evaluated the data, we will let you know our recommendations regarding "closure recomendation" or "pulse" operation and then submit the Rebound Test Report with a summary of operations and our recommendations.

Thanks and Best Regards,

Derrick

Subject: 247 Westlake Center Drycleaner, Daly City - notification of sewer line repair an start of rebound testing

Hi Jake,
As discussed, Kimco has scheduled a repair of the sewer line in the vicinity of the treatment system starting next Monday. The technology to repair the line consists of coating the inside of the line with plastic to form a water- and vapor-tight line inside the existing sewer line. A small excavation at each end of the line will be necessary as well as potholing at two locations for utility verification. Northgate will be on site to monitor for health and safety, and sample/characterize the excavated soil, which will be placed in a small roll-off bin, and subsequently profiled for proper disposal. Our oversight activities and soil disposal documentation will be included in our next progress report.

Northgate will shut down the system today prior to the sewer disposal work. We are planning on conducting sampling next week as part of our shut down/rebound testing program as documented in our progress report dated March 15, 2016.
Please don't hesitate to contact me if you have any questions or need any additional information.

Best Regards,
Derrick

Subject: Re: Soil vapor extraction well sampling notification - 247 Westlake Center Drycleaner, Daly City

Hi Derrick,

Looks like November 10th is actually a Tuesday. Just wanted to clarify thats what you meant. Thanks

>>> Derrick Willis <derrick.willis@ngem.com> 10/9/2015 3:26 PM >>>
Good afternoon Jake,
We will be conducting soil vapor sampling from the SVE system vapor extraction wells at the former drycleaner facility located at 247 Westlake Center in Daly City on Wednesday, November 10th. Gabriel Fuson from Northgate will be on site at 9 am to conduct the sampling. Please don't hesitate to contact me if you have any question or need any additional information.
Best Regards,
Derrick

1.0 INTRODUCTION AND BACKGROUND

1.1 INTRODUCTION

Kleinfelder Inc., (Kleinfelder), on behalf of Westlake Shopping Company, has prepared this Supplemental Phase II Environmental Investigation Report to document the two phases of environmental investigation performed at two dry cleaners: Westlake French and Southgate Dry Cleaning Facilities. The Westlake French and Southgate Dry Cleaners are located within the Westlake Shopping Center complex at 330 South Mayfair Drive and 183 Southgate Avenue, respectively, in Daly City, California (Plate 1). This Supplemental Investigation Report was prepared in accordance with the procedures and scope of work presented in *Preliminary Site Assessment Workplan*, prepared by Kleinfelder, dated May 17, 2002 and Kleinfelder's *Addendum to Work Plan*, dated July 19, 2002.

The purpose of the supplemental investigations was to collect and evaluate data during the due diligence period of the proposed property transaction. This report: 1) Describes investigative methods used to characterize subsurface conditions at the site; 2) Presents and interprets analytical results collected during this and the Phase II Environmental Investigation; and 3) Makes recommendations.

1.2 BACKGROUND

The facilities are located in the northeastern and southern sections of the Westlake Shopping Center (Plates 2 and 3). At the request of Citicorp Trust and Westlake Development Company, Kleinfelder was contracted to conduct limited subsurface investigations at both dry cleaners. The Westlake French Dry Cleaners has been present at the shopping center since 1978. The Southgate Dry Cleaners has been present at the site since that portion of the shopping center was developed in 1955. It is Kleinfelder's understanding that historically no site investigations have been performed prior to Kleinfelder's investigations, and no chemical releases have been reported at either facility.

Copyright 2002 Kleinfelder, Inc.

1.3 OBJECTIVE AND SCOPE OF WORK

These investigation activities were conducted to attempt to evaluate if the dry cleaning operations conducted at these two facilities have affected soil and/or groundwater beneath the sites. To meet this objective, Kleinfelder implemented the following scope of work:

- Conducted a site inspection of the two facilities;
- Performed private utility locating in areas of the planned borings;
- Advanced one deep boring to the maximum permitable depth of 120 feet bgs at each of the two facilities in an effort to collect groundwater samples;
- Evaluate date collected during this supplemental phase of investigation incorporating the original Phase II investigation data; and
- Prepared this Supplemental Phase II Environmental Investigation Report.

Copyright 2002 Kleinfelder, Inc.

2.0 SITE INVESTIGATION

2.1 SITE INSPECTION AND UTILITY SEARCH

During the original Phase II investigation, Kleinfelder conducted a brief site inspection of the two dry cleaners on May 13, 2002. The purpose of the inspection was to assess site access for drilling inside the facilities, to identify boring locations, and to meet a private utility locator. Kleinfelder did not observe any cracked concrete, stains on the concrete, or leaking waste storage containers when inspecting the two facilities.

Kleinfelder conducted a geophysical survey to locate and mark utilities at the proposed boring locations. Kleinfelder also contacted Underground Services Alert (USA) to arrange for utility marking within pertinent public rights of way and utility easements prior to each mobilization.

2.2 SAMPLING RATIONALE

The objectives of the original Phase II investigation were to:

- Conduct a preliminary assessment of potential Volatile Organic Compounds (VOCs) in the soil and, if possible, groundwater at the Cleaner facilities;
- Develop data to recommend further investigation, as appropriate.

On the basis of the site inspection/utility survey, three shallow soil borings were advanced at each dry cleaning facility to evaluate subsurface conditions. The borings were numbered sequentially as borings B-1 through B-3 at each facility.

2.3 SOIL BORING PROCEDURES

2.3.1 Shallow Soil Borings

A total of six (6) soil borings were advanced during the original Phase II investigation on June 5 and 6, 2002. Three borings were drilled inside of the Westlake French Dry Cleaners facility and three borings were drilled inside of the Southgate Dry Cleaners facility. The boring locations are presented on Plates 2 and 3. Groundwater was expected to be encountered within 20 ft below ground surface (bgs) at both facilities. Groundwater was not encountered within 20 ft bgs. One boring from each site was advanced to the depth limitation of the equipment (32 to 33 feet bgs)

Copyright 2002 Kleinfelder, Inc.

in an attempt to encounter groundwater. Groundwater was not encountered in any of the borings. Therefore, groundwater samples were not collected in the June drilling event.The borings were advanced inside of the facilities using a limited access drill rig equipped with direct push sampling equipment. Vironex, a drilling company with a valid State of California Drilling Contractor's License (C-57 License), was used. Prior to drilling, the 4-inch thick concrete slab floors were cored.

The down-hole equipment consisted of a hollow rod approximately 2 inches in outside diameter and an inner core barrel with sample liners to retrieve soil samples at the selected intervals. After the sampling was completed, each boring was backfilled through a Tremie pipe from bottom to top with neat cement grout (one 94-pound sack of Portland cement mixed with 5 to 6 gallons of clean water). No investigative derived wastes were generated during the field operations.

Soil samples were collected in butyrate plastic liners and inspected for signs of staining and chemical odors. Soil samples for potential chemical analyses were collected every 3 feet and screened for VOCs using a photoionization detector (PID) and visual/olfactory observations. Under the supervision of an experienced registered geologist (RG), Kleinfelder logged the samples for lithology in the field. Soils were logged continuously for lithologic logging purposes using the United Soil Classification System (USCS).

The PID and visual/olfactory screening of selected soil samples did not indicate any impacts in vadose zone soils to the depths explored in the six borings; therefore, samples for laboratory analysis were taken at the intervals shown on Table 1 below. The sampling intervals were selected to collect a diversified range of soil depths in the shallow soil beneath the dry cleaning equipment, waste storage containers and drains.

Copyright 2002 Kleinfelder, Inc.

TABLE 1 - SUMMARY OF INVESTIGATION

Westlake French Dry Cleaners	Boring Number		
	B-1	B-2	B-3
Boring Depth (ft bgs)	20	20	32
Location	Dry Cleaning Machine	Drain	Waste Storage Area
Sampling Depth for Analysis (ft bgs)	4.5 - 6.0	3 - 4.5	1 - 3
Southgate Dry Cleaners	**Boring Number**		
	B-1	B-2	B-3
Boring Depth (ft bgs)	33	22	20
Location	Dry Cleaning Machine	Waste Storage Area	Drain
Sampling Depth for Analysis (ft bgs)	4.5 - 6.0	1.5 - 3.0	0.0 - 1.5

In preparation for transport, the sample tubes were sealed on both ends with Teflon® sheets and plastic end caps, labeled with a unique identification number, entered on a chain-of-custody, placed in a Ziploc® bag, and stored in a cooler chilled with ice. Samples then were delivered to the analytical laboratory under chain-of-custody procedures.

2.3.2 Deeper Soil Borings

The shallow borings did not reach underlying groundwater. To provide additional due diligence information for prospective buyers, Westlake authorized Kleinfelder to proceed with this supplemental Phase II investigation and remobilize to the site and advance one deeper boring at each of the two dry cleaners.

On July 25 and 26, 2002 one deeper boring was advanced at each of the two facilities using a mobile B-51 hollow stem auger rig. Soil samples were collected every five feet for lithologic logging and screening via PID and olfactory/visual means.

The boring located near the Westlake French Dry Cleaners was advanced to a total depth of 89.5 feet. The boring located near the Southgate Cleaners was advanced to the total depth of 120 feet. The City of Daly City, which operates groundwater production wells to extract drinking water for domestic supply, would not allow the borings to be extended beyond the 120-foot depth as it could potentially effect a nearby municipal well.

Copyright 2002 Kleinfelder, Inc.

During drilling activities, neither PID or visual observation indicated the presence of VOCs in the soil profile. For chemical evaluation purposes, a soil sample was retained for analytical analysis at approximately the 60-foot depth and near the bottom of each boring.

Groundwater was encountered in the boring near the French Cleaners facility at approximately 84 feet bgs (Boring DB-1). A groundwater sample was collected from this boring by lowering a disposable bailer through the hollow stem auger. At the Southgate Cleaners facility, groundwater was not encountered at the maximum 120-foot depth (Boring DB-2). However, the soil sample collected at the maximum depth was moist, probably indicating that the boring may be within the capillary fringe just above the water table.

2.4 ANALYTICAL PROGRAM

The soil sample and groundwater sample from both investigations were submitted to McCampbell Analytical, Inc and analyzed for VOCs, including tetrachloroethene (PCE), by EPA Method 8021B (8010 target list). McCampbell Analytical, Inc. is a laboratory accredited by the California Environmental Protection Agency (Cal/EPA), Department of Health Services (DHS) Environmental Laboratory Accreditation Program (ELAP).

Copyright 2002 Kleinfelder, Inc.

3.0 RESULTS OF INVESTIGATION

3.1 FIELD OBSERVATIONS AND TOTAL DEPTH

Shallow borings B1, B2, and B3 from the Westlake French Dry Cleaners were drilled to total depths 20, 20 and 32 feet bgs, respectively. Shallow borings B1, B2, and B3 from the Southgate Dry Cleaners were drilled to total depths 33, 22 and 20 feet bgs, respectively. Deeper borings at each facility were extended to 89.5 to 120 feet bgs, respectively. Boring logs for the eight soil borings are presented in Appendix A. The shallow borings closest to the waste storage container and the dry cleaning machine were selected for extended drilling at the Westlake French Dry Cleaners and Southgate Dry Cleaners, respectively. The subsurface lithology at each boring location generally consisted of poorly graded sand to the maximum depth investigated.

3.2 ANALYTICAL RESULTS

The analytical results of soil and groundwater samples, including detection limits for VOC analyses, are summarized in Table 2. Certified laboratory data sheets are attached as Appendix B. No VOCs were detected in any of the soil samples or groundwater sample collected at Westlake French Dry Cleaners or Southgate Dry Cleaners.

Copyright 2002 Kleinfelder, Inc.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 CONCLUSIONS

VOCs, including PCE, are the main constituents of concern at typical dry cleaning facilities. Kleinfelder concludes that VOCs are not present above levels of regulatory concern at the French or Southgate Cleaners facilities based on soil and groundwater sampling results.

4.2 RECOMMENDATIONS

Shallow soil samples collected during this investigation were selected due to their proximity to the dry cleaning machine, sewer piping and waste storage areas. The samples were collected at depths below the possible source areas to evaluate if VOCs from these areas leached into the subsurface. No VOCs were detected at or above the laboratory detecting limit in any of the soil samples or groundwater sample collected during either the Phase II or Supplemental Phase II Investigation. In addition, no visual or olfactory observations or PID readings indicated VOC impacts. Based on the results of the two phases of subsurface investigation conducted, Kleinfelder does not recommend further investigations at Westlake French Dry Cleaners and Southgate Dry Cleaners.

5.0 LIMITATIONS

This report was prepared in general accordance with accepted standards of care that exist in Northern California at the time the work was completed. No warranty, expressed or implied, is made. It should be recognized that definition and evaluation of subsurface conditions are a difficult and inexact science. The scope of services described here is not intended to be inclusive, to identify all potential concerns, or to eliminate the possibility of environmental problems. With current technology, no level of assessment can show conclusively that a property or its structures are completely free of contaminated and/or hazardous substances. Therefore, Kleinfelder cannot offer a certification that the recommendations made in this report will clear any property of environmental liability.

The data points used during this investigation are necessarily limited due to economic and site constraints and should be viewed as generally, but not explicitly, representative of contamination likely to be associated with a site. Thus, Kleinfelder assumes no responsibility for the representation of the data as exact surface and/or subsurface conditions, but only for conditions at the sampling points. There is always the possibility that other contaminated areas exist in the materials and that they were simply not encountered during the limited soil sampling program.

This document may be used only by the Client, and only for the purposes stated, and within a reasonable time from its issuance. Land use, site conditions, or other factors may change over time, and additional work may be required with the passage of time.

Any party other than the Client who wishes to use this report is requested to notify Kleinfelder of such intended use. Based on the intended use, Kleinfelder may require that additional work be performed and that an updated document be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this document by any unauthorized party.

PHI	FRICTION ANGLE	FS	FREE SWELL (U.S.B.R.)

Notes: Blow counts represent the number of blows a 140-pound hammer falling 30 inches required to drive a sampler through the last 12 inches of an 18 inch penetration, unless otherwise noted.

The lines separating strata on the logs represent approximate boundaries only. The actual transition may be gradual. No warranty is provided as to the continuity of soil strata between borings. Logs represent the soil section observed at the boring location on the date of drilling only.

June 07, 2002

Dear Doug:

Enclosed are:

1). the results of **3** samples from your **16408 French Cleaners/Westgate Shopping Center project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

QC SUMMARY REPORT FOR SW8021B

BatchID: 2300 Matrix: S WorkOrder: 0206064

EPA Method: SW8021B Extraction: SW5030B Ext. Date: 6/05/02 Spiked Sample ID: N/A

Compound	Sample	Spiked	MS*	MSD*	MS-MSD*	LCS	LCSD	LCS-LCSD	Acceptance Criteria (%)	
	µg/Kg	µg/Kg	% Rec.	% Rec.	% RPD	% Rec.	% Rec.	% RPD	Low	High
Chlorobenzene	N/A	50	N/A	N/A	N/A	105	99.4	5.6	70	130
1,1-Dichloroethene	N/A	50	N/A	N/A	N/A	98.3	91.5	7.2	70	130
Trichloroethene	N/A	50	N/A	N/A	N/A	116	107	8.3	70	130
%SS	N/A	50	N/A	N/A	N/A	100	98.8	1.5	70	130

All target compounds in the Method Blank of this extraction batch were ND less than the method RL with the following exceptions:

NONE

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

N/A = not enough sample to perform matrix spike, or analyte concentration in sample exceeds spike amount.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS – MSD) / (MS + MSD) * 2.

* MS and / or MSD spike recoveries may not be near 100% or the RPDs near 0% if: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) if that specific sample matrix interferes with spike recovery.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

June 10, 2002

Dear Doug:

Enclosed are:

1). the results of **3** samples from your **#16408; Southgate Cleaners/Westgate Shopping Ctr. project,**

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits. If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Angela Rydelius, Lab Manager

Comments						

* water and vapor samples and all TCLP & SPLP extracts are reported in ug/L, soil and sludge samples in ug/kg, wipe samples in ug/wipe

Reporting limit for DF = 1; water/TCLP/SPLP extracts, ND<0.5ug/L; soils and sludges, ND<5ug/kg; wipes, ND<0.2ug/wipe

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis

(h) a lighter than water immiscible sheen/product is present; (i) liquid sample that contains greater than ~2 vol. % sediment; (j) sample diluted due to high organic content.

QC SUMMARY REPORT FOR SW8021B

BatchID: 2316 Matrix: S WorkOrder: 0206080

EPA Method: SW8021B Extraction: SW5030B Ext. Date: 6/06/02 Spiked Sample ID: N/A

Compound	Sample	Spiked	MS*	MSD*	MS-MSD*	LCS	LCSD	LCS-LCSD	Acceptance Criteria (%)	
	µg/Kg	µg/Kg	% Rec.	% Rec.	% RPD	% Rec.	% Rec.	% RPD	Low	High
Chlorobenzene	N/A	50	N/A	N/A	N/A	106	100	5.8	70	130
1,1-Dichloroethene	N/A	50	N/A	N/A	N/A	97	88.2	9.5	70	130
Trichloroethene	N/A	50	N/A	N/A	N/A	103	103	0.11	70	130
%SS	N/A	50	N/A	N/A	N/A	100	98.3	2.2	70	130

All target compounds in the Method Blank of this extraction batch were ND less than the method RL with the following exceptions:

NONE

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

N/A = not enough sample to perform matrix spike, or analyte concentration in sample exceeds spike amount.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS – MSD) / (MS + MSD) * 2.

* MS and / or MSD spike recoveries may not be near 100% or the RPDs near 0% if: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) if that specific sample matrix interferes with spike recovery.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

Subject: Public Records Request in Daly City, CA

Good Morning Melinda,

Hello,

I will be conducting a Phase I Environmental Site Assessment for the Westlake Shopping Center in Daly City, CA which includes following addresses:
239 Westlake Center
243 Westlake Center
213 Westlake Center
42 Park Plaza Dr, Suite 325
30 Park Plaza Dr
34 Park Plaza Dr
201 Westlake Center
36 Park Plaza Dr
321 S Mayfair Ave, Suite 227
42 Park Plaza Dr
215 Westlake Center
32 Park Plaza Dr
235 Westlake Center
247 Westlake Center
38 Park Plaza Dr
311 Lake Merced Blvd
341 S Mayfair Avenue
213 Westlake Center
311 Lake Merced Blvd
311 Lake Merced Blvd
44 Park Plaza Drive
34 Park Plaza Dr
201 Westlake Center
36 Park Plaza Dr
227 Westlake Center

We are interested in all the files available from this property for the entire history of the address.

If you have any questions feel free to call me.

Thank you,

Gabe Matson |Staff Geologist |Roux Associates, Inc.
555 12th Street, Suite 1725 | Oakland, California 94607
Tel: 415-967-6000 | Direct: 415-967-6026 | Cell: 925-768-6067 | Fax: 415-967-6001
Email: gmatson@rouxinc.com | Website: www.rouxinc.com

On 2/21/2017 at 10:14 am, Roux Associates personnel received a call from Melinda Wong of the San Francisco Bay Regional Water Quality Control Board (Water Board). Ms. Wong informed Roux Associates that the Water Board does not have records on file for the requested addresses.

Dear Mr. Matson:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control.

After a thorough review of our files we have found that no such records exist at this office pertaining to the sites/facilities referenced above.

We would like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. EnviroStor can be accessed at: http://www.envirostor.dtsc.ca.gov/public. Also, a computer is available in the Central Files of each DTSC Regional Office for use by community members to view EnviroStor.

If you have any questions, would like further information regarding your request or

Printed on Recycled Paper

would like an appointment to visit Sacramento's Central Files, please contact me at (916) 255-2796.

Sincerely,

Jan Papararo
Regional Records Coordinator

Questionnaire

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer	Observed During Site Walk	If "Yes" Please provide more details
1 Is the property used for an industrial use?	Yes **No** Unk	Yes No	
2 Is any adjoining property used for an industrial use?	Yes **No** Unk	Yes No	
3 Did you observe evidence or do you have any prior knowledge that the property has been used for an industrial use in the past?	Yes No **Unk**	Yes No	
4 Is the property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	Yes **No** Unk	Yes No	NOT CURRENTLY A DRY CLEANER BUT HISTORICALLY, YES
5 Is any adjoining property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	**Yes** No Unk	Yes No	
6 Did you observe evidence or do you have any prior knowledge that the property was used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	**Yes** No Unk	Yes No	
7 Did you observe evidence or do you have any prior knowledge that any adjoining property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	**Yes** No Unk	Yes No	
8 Are there currently any damaged or discarded automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers of >5 gal (19 L) in volume or 50 gal (190 L) in the aggregate, stored on or used at the property or at the facility?	Yes **No** Unk	Yes No	

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer	Observed During Site Walk	If "Yes" Please provide more details
9 Did you observe evidence or do you have any prior knowledge that there have been previously any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of >5 gal (19 L) in volume or 50 gal (190 L) in the aggregate, stored on or used at the property or at the facility?	Yes **No** Unk	Yes No	
10 Did you observe evidence or do you have any prior knowledge that there have been previously any industrial drums (typically 55 gal (208 L)) or sacks of chemicals located on the property or at the facility?	Yes **No** Unk	Yes No	

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer	Observed During Site Walk	If "Yes" Please provide more details
11 Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the property that originated from a contaminated site?	Yes **No** Unk	Yes No	
12 Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the property that is of an unknown origin?	Yes **No** Unk	Yes No	
13 Are there currently any pits, ponds, or lagoons located on the property in connection with waste treatment or waste disposal?	Yes **No** Unk	Yes No	
14 Did you observe evidence or do you have any prior knowledge that there have been previously, any pits, ponds, or lagoons located on the property in connection with waste treatment or waste disposal?	Yes **No** Unk	Yes No	
15 Is there currently any stained soil on the property?	Yes No **Unk**	Yes No	
16 Did you observe evidence or do you have any prior knowledge that there has been previously, any stained soil on the property?	Yes **No** Unk	Yes No	
17 Are there currently any registered or unregistered storage tanks (above or underground) located on the property?	Yes No **Unk**	Yes No	
18 Did you observe evidence or do you have any prior knowledge that there have been previously, any registered or unregistered storage tanks (above or underground) located on the property?	Yes **No** Unk	Yes No	
19 Are there currently any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property?	Yes No **Unk**	Yes No	

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer	Observed During Site Walk	If "Yes" Please provide more details
20 Did you observe evidence or do you have any prior knowledge that there have been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property?	Yes **No** Unk	Yes No	
21 Is there currently evidence of leaks, spills or staining by substances other than water, or foul odors, associated with any flooring, drains, walls, ceilings, or exposed grounds on the property?	Yes No **Unk**	Yes No	
22 Did you observe evidence or do you have any prior knowledge that there have been previously any leaks, spills, or staining by substances other than water, or foul odors, associated with any flooring drains, walls, ceilings or exposed grounds on the property ?	Yes **No** Unk	Yes No	
23 If the property is served by a private well or non-public water system, is there evidence or do you have prior knowledge that contaminants have been identified in the well or system that exceed guidelines applicable to the water system?	Yes **No** Unk	Yes No	
24 If the property is served by a private well or non-public water system, is there evidence or do you have prior knowledge that the well has been designated as contaminated by any government environmental/health agency?	Yes **No** Unk	Yes No	
25 Has the owner or occupant of the property been informed of the past existence of hazardous substances or petroleum products with respect to the property or any facility located on the property?	**Yes** No Unk	Yes No	REMEDIATION UNDERWAY FOR FORMER DRYCLEAN FACILITY.

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer			Observed During Site Walk		If "Yes" Please provide more details
26 Has the owner or occupant of the property been informed of the current existence of hazardous substances or petroleum products with respect to the property or any facility located on the property?	Yes	No	Unk	Yes	No	SEE ABOVE
27 Has the owner or occupant of the property been informed of the past existence of environmental violations with respect to the property or any facility located on the property?	Yes	No	Unk	Yes	No	SEE ABOVE
28 Has the owner or occupant of the property been informed of the current existence of environmental violations with respect to the property or any facility located on the property?	Yes	No	Unk	Yes	No	SEE ABOVE
29 Does the owner or occupant of the property have any knowledge of any environmental site assessment of the property or facility that indicated the presence of hazardous substances or petroleum products on, or contamination of, the property or recommended further assessment of the property?	Yes	No	Unk	Yes	No	SEE ABOVE
30 Does the owner or occupant of the property know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous substance or petroleum products involving the property by any owner or occupant of the property?	Yes	No	Unk	Yes	No	SEE ABOVE
31 Does the property discharge waste-water (not including sanitary waste or storm water) onto or adjacent to the property and/or into a storm water system?	Yes	No	Unk	Yes	No	
32 Does the property discharge waste water (not including sanitary waste or storm water) onto or adjacent to the property and/or into a sanitary sewer system?	Yes	No	Unk	Yes	No	

Phase I ESA Questionnaire
ASTM E1527-13

Question	Seller/Tenant/Buyer			Observed During Site Walk		If "Yes" Please provide more details
33 Did you observe evidence or do you have any prior knowledge that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been dumped above grade, buried and/or burned on the property ?	Yes	No	Unk	Yes	No	SEE ABOVES
34 Is there a transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs?	Yes	No	Unk	Yes	No	
35 Were there any previous environmental assessments done at the Property? If "Yes", please make the documents available.	Yes	No	Unk	Yes	No	

Completed By: MARIA TEOS

Title: PROPERTY MANAGER

Completed On: 2/14/17

The Following Questions are Required from the User per AAI Compliance

	Question	Owner			Observed During Site Walk		If "Yes" Please provide more details
1	Does the User, Owner or operator the property have any knowledge of environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the property or any facility located on the property?	Yes	No	Unk	Yes	No	
2	Did a search of recorded land title records or judicial records identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?	Yes	No	Unk	Yes	No	
3	Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?	Yes	No	Unk	Yes	No	
4	Have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?	Yes	No	Unk	Yes	No	
5	Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions that are indicative of releases or threatened releases? For example:	N/A					
	(a.) Do you know the past uses of the property?	Yes	No	Unk	Yes	No	
	(b.) Do you know of specific chemicals that are present or once were present at the property?	Yes	No	Unk	Yes	No	PERC FROM DRYCLEANERS
	(c.) Do you know of spills or other chemical releases that have taken place at the property?	Yes	No	Unk	Yes	No	
	(d.) Do you know of any environmental cleanups that have taken place at the property?	Yes	No	Unk	Yes	No	, ONGOING

The Following **Questions are Required from the User per AAI Compliance**							
	Question	**Owner**			**Observed During Site Walk**		**If "Yes" Please provide more details**
6	Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?	**Yes**	**No**	**Unk**	**Yes**	**No**

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Roux Associates Inc were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

1.0 INTRODUCTION

Northgate Environmental Management, Inc. (Northgate) has prepared this Soil Vapor Extraction (SVE) Performance Report on behalf of Kimco Westlake, L.P (Kimco), to summarize the results of sampling and analysis during the over six-months operation of the SVE treatment system at the Former Westlake French Dry Cleaners Site, located at 247 Westlake Center, Daly City, California (the Site, Figures 1 and 2), occurring between June 2014 and July 2014, and August 2015 to current (March 2015).

On September 20, 2012, the San Mateo County Department of Environmental Health Groundwater Protection Program (GPP) approved Northgate's *Soil Vapor Extraction Work Plan* (Work Plan; Northgate, 2012a) and *SVE Work Plan Addendum* (Northgate 2012b) for the installation, testing, and operation of an SVE system designed for removing tetrachloroethene (PCE) present in the subsurface at the Site. On August 13, 2015, Northgate submitted a *Soil Vapor Extraction Startup Report* (SVE Startup Report; Northgate, 2015) documenting installation and startup of the SVE system, and which recommended operating the SVE system for a six month duration. In its September 10, 2015 letter (GPP, 2015), the GPP concurred with the proposed schedule and requested submittal of this remedial progress report by March 15, 2016.

1.1 Scope and Objective of Soil Vapor Extraction (SVE)

The overall objective of the SVE program is to protect human health and the environment by achieving reduction of VOC subsurface concentrations that meet Remedial Action Objectives (RAOs) identified in the Work Plan (Northgate, 2012a), thereby minimizing risk of migration to indoor air of the overlying retail buildings or to groundwater.

To meet these objectives, the scope of the SVE system operation also includes implementation of an operation, maintenance, and monitoring (OM&M) program, which 1) ensures proper system operation and performance (Northgate, 2012a), and 2) evaluates extraction rates and beneficial shut-down of the system after six month of operation (GPP, 2015).. OM&M of the SVE system consists of periodic field inspections, taking field measurements of extracted air flowrates and volatile organic compound (VOC) concentrations, and collection of soil vapor samples for laboratory analysis to quantify VOC concentrations in and extracted from the subsurface. The planned duration for SVE system operation was six months.

1.2 Report Organization

Section 1 provides an introduction, purpose and scope of the SVE system operation. Section 2 provides a brief background on the Site. Section 3 provides a summary of the OM&M program for the last six months of SVE system operation. Section 4 describes conclusions based on monitoring results. Section 5 provides recommendations for shut-down of the system. References are cited in Section 6.

2.0 BACKGROUND

2.1 Site Description

The Site is an approximately 3,280-square-foot tenant space within the Westlake retail shopping complex. The shopping center is bounded by offsite residential homes approximately 70 feet east of the former dry cleaners (along Park Plaza Drive) and by commercial tenant space and parking areas to the north, south, and west of the Site (Figure 2).

2.2 Site History

The space in which the former dry cleaning business operated from 1955 until June 2009 was 2,300 square feet. The space was then expanded in 2009 to 3,280 square feet and is currently occupied by a T-Mobile retail store.

Subsurface investigations conducted at the Site between 2002 and 2011, identified the presence of the dry cleaning solvent PCE in soil vapor at concentrations that exceeded Environmental Screening Levels (ESLs) established by the San Francisco Bay California Regional Water Quality Control Board (RWQCB) for commercial exposure (RWQCB, 2008). (ADR Environmental Group, Inc. [ADR], 2002a and 2002b; Kleinfelder, 2002; Treadwell and Rollo [T&R], 2009 and 2011) No VOCs, including PCE, have been detected in groundwater, encountered at a depth up to 78.6 feet below ground surface (bgs) at the Site, indicating that contamination is limited to the subsurface soil and soil vapor only (Kleinfelder, 2002; T&R, 2011).

Following installation and initial startup in June 2014, the SVE system ran for a total of 25 days until it was shut down on July 28, 2014 because of noise complaints by the commercial tenant whose wall abuts the treatment system enclosure area (Northgate, 2015). After protracted negotiations between property management and the tenant, the system was restarted in August 12, 2015 and has been operating continuously since that time.

3.0 OPERATION, MAINTENANCE, AND MONITORING SUMMARY

3.1 SVE System Description

In June 2014, an SVE system was installed at the Site in general conformance with the approved Work Plan (Northgate, 2012a) and as described in the SVE Startup Report (Northgate, 2015). The SVE system includes a treatment system, six vapor extraction wells (VEWs) and a network of soil vapor monitoring wells and probes. The treatment system consists of a positive displacement blower, a water knock-out drum, and two 1,000-pound vapor-phase carbon adsorption vessels. The VEWs are grouped into three nested well pairs, designated VEW-1A/1B, VEW-2A/2B, and VEW-3A/3B. Four nested vapor monitoring probes located at VMP-1 at depths of 10, 30, 50 and 60 feet bgs were installed between VEW-2A/2B and VEW-3A/3B to provide additional vacuum/concentration performance information. One previously installed subslab probe (TR-7) is located below the concrete floor of the former dry cleaning building. A site plan showing the locations of the extraction wells and monitoring wells and probes is included on Figure 3.

3.2 System Operations

The SVE system was restarted on August 12, 2015 after noise complaints were resolved, and was tested and operated on August 12, 19, 27, and 29 for a total of six hours. Following this testing, on the afternoon of September 3, 2015, the SVE system began continuous daily 24-hour operation for six months as originally recommended in the Work Plan (Northgate, 2012a). In accordance with the Work Plan, an OM&M program was implemented for the duration of system operation. The system ran continuously for a total of 167 days from September 3, 2015, to March 15, 2016. Extraction was conducted by operating a single well at a time. The SVE system dilution valve was closed at all times to induce maximum vacuum to each extraction well using full blower capacity and the valves to each of the operated extraction wells was 100% open allowing for maximum flow from each well. The extraction schedule and measured vapor flowrate for each well was as follows:

VEW-1A (147 to 221 CFM):

- August 12, 2015 and August 19, 2015
- September 3, 2015 to September 9, 2015
- September 16, 2015 to September 24, 2015
- September 30, 2015 to October 8, 2015
- October 23, 2015 to November 4, 2015
- November 12, 2015 to February 17, 2016

VEW-2A (196 CFM):

- August 27, 2015 and August 29, 2015
- September 3, 2015
- October 8, 2015 to October 15, 2015

VEW-3A (160 to 196 CFM):

- September 9, 2015 to September 16, 2015
- September 24, 2015 to September 30, 2015
- October 15, 2015 to October 23, 2015
- November 4, 2015 to November 12, 2015

Following SVE system restart, the treatment system influent and effluent were monitored at least once per month in compliance with the requirements of the Bay Area Air Quality Management District (BAAQMD) Permit to Operate (PTO). A MiniRAE 3000 photoionization detector (PID) was used to measure total VOC concentrations in parts per million by volume (ppm_v) at the influent, midpoint (between the two vessels), and effluent of the carbon adsorption vessels. The PID instrument was calibrated in accordance with manufacturer's recommendations using a 100-ppm_v concentration of isobutylene calibration gas.

The maximum VOC concentration in the carbon (system) influent samples was 2.7 ppm_v. The maximum carbon midpoint and effluent readings were 0.1 ppm_v at a flowrate of 196 CFM, indicating that the system was in compliance with the BAAQMD PTO effluent limitation of 3.77 pounds of PCE discharged to the atmosphere per year (average of 0.0103 pounds per day [lbs/day]) which corresponds to a maximum allowable 0.41 ppm_v at the above system flow rate.

A summary of the field measurements collected during system operation, including BAAQMD monitoring, are included on the SVE O&M forms in Appendix A.

OM&M of the SVE system included periodic field inspections, taking field measurements of extracted air flow rates and VOC concentrations, collecting soil vapor samples for laboratory analysis to quantify VOC concentrations in the subsurface and draining water collected in the knock-out drum. Inspection and field measurements were performed on a weekly basis for the first month to re-establish normal operating parameters, and then monthly thereafter for the duration of system operation.

Soil vapor samples were collected on monthly a basis from VEW-1A/B, VEW-2A/B, and VEW-3A/B, and once every three months from VMP-1-10/30/50/60 and TR-7. Soil vapor samples were collected by TEG Northern California, Inc. (TEG), a mobile laboratory, and analyzed onsite for VOCs by United States Environmental Protection Agency (EPA) Method 8260B. Soil vapor sampling has been and will continue to be performed pursuant to the

Advisory - Active Soil Gas Investigations (California Department of Toxic Substances Control [DTSC], 2015). The amount of vacuum applied to each well during operation was based on the expected corresponding extraction flow rate and the soil vapor VOC concentration, which together determine the VOC removal rate.

3.3 Soil Vapor Sampling and Analysis

In accordance with the schedule outlined in the Work Plan (Northgate, 2012a), Northgate initiated OM&M sampling on October 14, 2015, by temporarily shutting down the SVE system and collecting soil vapor samples from the vapor extraction wells VEW-1A/B, VEW-2A/B, and VEW-3A/B. Consistent with the Work Plan schedule, soil vapor samples were also collected on a monthly basis from the VEWs on November 12, 2015, December 10, 2015, January 26, 2016, and February 17, 2016. Soil vapor samples were also collected from soil vapor monitoring points VMP-1 (at 10, 30, 50, and 60 feet bgs), and from the subslab probe (TR-7) on November 12, 2015, and February 17, 2016.

OM&M vapor sampling and analysis was conducted by TEG for each VEW, the four probes comprising VMP-1, and subslab probe TR-7 on the dates listed above. Six primary and one duplicate soil vapor samples were collected on October 14, 2015, December 10, 2015, and January 26, 2016, from VEW-1A/B, VEW-2A/B, and VEW-3A/B. Eleven primary and one duplicate soil vapor samples were collected on November 12, 2015, and February 17, 2016, from wells or sampling points VEW-1A/1B, VEW-2A/2B, VEW-3A/3B, VMP-1-10/30/50/60, and TR-7. All samples were collected by TEG using DTSC protocols as described in the SVE Startup Report (Northgate, 2015).

Prior to sample collection, each VEW and monitoring point was purged three purge volumes according to DTSC protocols using the SVE system blower, vacuum pump, or syringe.

During sample collection, a leak-check gas was used to confirm that the sample conveyance was tight and leak free. Soil vapor was withdrawn from the inert tubing using a calibrated syringe connected via an on-off valve. Soil vapor samples were transferred directly to TEG's onsite mobile laboratory and immediately analyzed for VOCs by U.S. EPA Method 8260B. Equipment calibration and decontamination procedures were the same as described in the SVE Startup Report (Northgate, 2015).

Daily calibration was performed at the start of each day by injecting and analyzing a calibration standard appropriate for the target compounds. Depending on the compound, the calibration curve must agree within +/- 15% to 25% of the calibration standard compound.

The internal inert tubing and sampling syringes were flushed with large volumes of ambient air between samples or discarded and replaced with new tubing if any material or water was observed.

3.4 Soil Vapor Sampling Analytical Results

Analytical results for the OM&M sampling program are summarized in Table 1. Similar to the previous sampling prior to re-starting the SVE system, the primary chemical present in soil vapor is PCE during the last six-month operation; no other VOCs were detected above the laboratory detection limits.

In 2014 baseline PCE concentrations ranged from 1,400 micrograms per cubic meter (µg/m^3) (VMP-1-30) to 9,300 µg/m^3 (VEW-1B), except for sampling location TR-7, which is located at a depth of just 0.5 feet bgs beneath the floor slab. The PCE concentration at this location was 430 µg/m^3 (Northgate, 2015).

Current (February 2016) PCE concentrations are below the laboratory detection limit of 100 µg/m^3 for sampling location TR-7 and VMP-1-10, as well as for all VEWs except for VEW-1B and VEW-2B where PCE was detected at a concentration of 130 µg/m^3 and 330 µg/m^3, respectively. PCE concentrations for VMP-1-30 and VMP-1-60 are 940 µg/m^3 and 410 µg/m^3 respectively. Current PCE concentrations are summarized on Table 1 and shown on Figure 3. Concentrations versus time graphs are shown on Figures 4, 5, and 6. Copies of laboratory reports and chain of custody forms are included in Appendix B.

3.5 Quality Control Results and Quality Assurance Review

Northgate performed a review of the October 14, November 12, and December 10, 2015, and January 26 and February 17, 2016 quality control (QC) results for the soil vapor samples collected during the approximately six-month SVE system operation. The QC results include surrogate recoveries, syringe blanks, laboratory data and duplicate samples. All QC results were within laboratory control limits. The relative percent difference for each field duplicate sample was within an acceptable range per DTSC guidance (DTSC, 2015). Between October 14 and November 12, 2015, 1,1-difluoroethane was used as a leak detection compound. On December 10, 2015 and January 26 and February 17, 2016, isopropyl alcohol was used for leak detection testing. The above leak-detection compounds were not detected in any of the samples above the laboratory reporting limit. Based on the above QC results, the analytical results are acceptable (DTSC, 2015).

3.6 Estimated Soil Vapor and Mass Removal Rates

A summary of average system flow rates, total time of system operation, and the total volume of soil vapor extracted during the 2014 to 2016 operational period are presented in Table 2. As discussed in Section 3.2, the SVE system extracted vapors from three wells during its 167-day operation from September 3, 2015 to February 17, 2016: VEW-1A (131 days), VEW-2A (7 days), and VEW-3A (29 days). The total volume of soil vapor extracted from each well during the six-month SVE operational period is estimated below, based on the total number of days vapor extraction was conducted at each well and the average extraction flow rate as provided on the daily SVE Operations and Maintenance forms included in Appendix A:

- VEW-1A: The vapor extraction rate ranged from 172 to 221 CFM, with an average of approximately 197 CFM. This average flow rate yields over 241,700 standard cubic feet per day (SCF/day), or over 31.6 million cubic feet over the 131-day operational period;
- VEW-2A: The average vapor extraction rate was 196 CFM. This flow rate yields over 239.900 SCF/day, or almost 1.7 million SCF over the seven-day operational period; and
- VEW-3A: The vapor extraction rate ranged from 160 to 196 CFM, with an average of approximately 179 CFM. This average flow rate yields over 219.7 SCF/day, or almost 6.4 SCF over the 29-day operational period.

Based on the above individual flow contributions, the volume of soil vapor extracted during the SVE system six-month operational period following restart is over 39.5 million SCF. The total volume of soil vapor extracted since June, 2014 is estimated to be approximately 44.9 million SCF.

PCE mass removal rate was estimated from the baseline and OM&M analytical PCE concentrations and average flow rates. The analytical concentrations were averaged between sampling events at each well to provide a rough-order-of-magnitude estimates for PCE mass removal. The average concentration for the time period (as shown in Table 2) was multiplied by the average daily flow rate of the operating well, with appropriate conversion factors to calculate the estimated lbs/day removal rate of PCE. Flow rates are included on the SVE Operation and Maintenance field reports in Appendix A. The average flow rate and average PCE concentration for each operating VEW, as well as the resulting estimated rough-order-of-magnitude PCE mass removal rate for each well, are summarized in Table 2.

The SVE system has removed approximately 1.4 pounds of PCE over the 167-day operational period following restart in September 2015, yielding a mass removal rate of approximately 0.01 lbs/day. Based on individual mass removal rates, the total mass of PCE removed from the subsurface since the system was started in June, 2014 is approximately 3.7 lbs. Figure 7 shows the cumulative PCE mass removal versus time since the system initially started in June, 2014.

4.0 CONCLUSIONS

The following conclusions can be drawn from the six-month SVE system operation:

- VOC mass removal rates have stabilized at approximately 0.002 lbs/day for SVE operation focusing on well VEW-1A; and
- PCE concentrations in subslab and soil gas have reached asymptotic levels below ESLs.

Northgate evaluated the analytical results by comparing PCE concentration in samples collected during SVE operation to current ESLs. It should be noted that the RWQCB established combined ESLs for subslab and soil gas (Vapors ESLs[1]) on February 22, 2016. Current Vapors ESLs for subslab/soil gas include a residential exposure concentration of 240 µg/m^3 PCE, and a commercial exposure concentration of 2,100 µg/m^3 PCE. The above ESLs apply to PCE concentration below the building slab foundation and subsurface.

Analytical results for samples collected from extraction and monitoring points in the vicinity of the Site suggest that 1) PCE concentrations in soil vapor in the shallow subsurface (above 30 feet bgs including the subslab) have generally reached asymptotic levels below the Vapors ESLs for residential exposure and 2) PCE concentrations in soil vapor at the deeper subsurface (below 30 feet bgs) have generally reached asymptotic levels below the Vapors ESLs for commercial exposure. A comparison of analytical results and Vapor ESLs is provided on Table 1.

[1] ESLs for subslab vapor were not established until 2016. Previous reports compared PCE concentrations to calculated "Sub-Slab Screening Levels" that were based on residential and commercial Indoor Air ESLs.

5.0 RECOMMENDEDATIONS

Northgate recommends shut down of the SVE system for rebound testing in accordance with DTSC guidance (DTSC, 2010).

Rebound testing will be conducted to confirm whether PCE concentration reductions achieved by operation of the SVE system are sustainable and permanent. The proposed test consists of shutting down the SVE system operation for a two month period and monitoring the VOCs concentrations in soil vapor during that time in general accordance with the *Manual - Engineering and Design of Soil Vapor Extraction and Bioventing* (U.S. Army Corps of Engineers, 2002).

Soil vapor sampling will be performed immediately following shutdown and every month thereafter from existing vapor sampling points (VEW-1A/B; VEW-2A/B; VEW-3A/B; VMP-1-10,-30,-50, and -60; and TR-7). Soil vapor samples will be collected pursuant to the *Advisory - Active Soil Gas Investigations* (DTSC, 2015), placed in one-liter Summa™ canisters or syringe and analyzed at a fixed state-certified fixed laboratory using EPA Method TO-15 for VOCs or analyzed onsite for VOCs including PCE by a mobile lab using EPA Method 8260.

The data obtained under these conditions will be used to evaluate potential rebound effects. Following completion of the rebound testing, Northgate will prepare a Rebound Test Report and make recommendations regarding continued or completed SVE operation. If during rebound testing PCE is detected at or below ESLs at concentrations that are stable and not trending upwards beyond ESLs, then subsurface vapor concentrations likely will not rebound or increase in the future. The maximum practical remediation will have been achieved by the SVE and further operation will not reduce vapor concentrations in a meaningful way. At this point a permanent shutdown will be recommended.

The anticipated schedule for the rebound test is as follows:

- Week of April 18, 2016 – Shutdown of SVE system and collection of soil vapor samples;
- One month after shutdown – collection of soil vapor samples;
- Three months after shutdown – collection of soil vapor samples;
- Five months after shutdown (end of July 2016) – submit Rebound Test Report to GPP and make recommendations regarding continued or completed SVE operation.

SVE O&M FORMS

DAILY FIELD REPORT

northgate environmental management, inc.

Project No.: 1241.03 Date 10/14/15

Project Name: Former Westlake French Dry Cleaners Page 1 of 1

Field Personnel: Gabriel Fuson, Axel Rieke

Time Onsite: From: 0810 To: 2100 Task No(s): 05K

Weather partly cloudy (foggy in early evening)

PPE Level Used: traffic vest, safety glasses

Equipment Used: GCF 10/19/15

Other Personnel Onsite:

	Name	Purpose	Time Onsite	Time Offsite
1.	Stephanie	TEG	0745	2100
2.				
3.				

Time	Field Activities
0810	Arrived onsite, met Stephanie.
0830	Axel arrived onsite. Drained condensate tank, approximately 30 gallons of water. Need to replace lock on valve for 3B. Purge tests will be conducted per DTSC 2012 guidance.
1100	TEG analytical instrumentation still calibrating
1510	Collected 1x purge test sample @ VEW-1B.
1540	Collected 3x purge test sample @ VEW-1B.
1614	Collected 10x purge test sample @ VEW-1B. 3x purge sample showed highest PCE concentration - will use 3x purge volume amount for today's round of sampling.
1648	Collected sample @ VEW-1A.
1800	Collected sample @ VEW-3A.
1802	Collected sample @ VEW-3B.
1853	Collected sample @ VEW-2A.
2002	Collected sample @ VEW-2B.
2030	Demobilized, switched SVE system to pull from 3A, collected readings.
2100	Left site for return to Oakland office

GCF 10/14/15

0745	TEG on-site, prepping mobile lab
0815	Axel Rieke on-site
0830	Drain condensate from SVE system
0835	Collect IDW sample of condensate (3 VOAs)
0900	Purge VEW-3A and VEW-3B
	-Volume purged calculated based on July 2015
	DTSC guidance document (3 x's purge standard)
	-VEW-3A: 3 times purge volume using blower
	for 145 seconds (485 L)
	-VEW-3B: 3 times purge volume using blower
	for 210 seconds (675 L)
0915	Sample VEW-3A and VEW-3B
1000	Purge VMP-1 according to DTSC 3x purge volume
	-Volumes purged: VMP-1-10 = 10 L
	VMP-1-30 = 30 L
	VMP-1-50 = 50 L
	VMP-1-60 = 60 L
1010	Sample VMP-1-10, -30, -50, and -60
1210	Purge 3x volume and re-sample VEW-3B
1220	Purge 3x volume at VEW-2A and VEW-2B
	as per DTSC 2015 guidance
	-Volumes purged: VEW-2A = 485 L
	VEW-2B = 675 L
1230	Sample VEW-2A and VEW-2B
1315	Purge 3x volume at VEW-1A and -1B per DTSC guidance
	-Volumes purged: VEW-1A = 90 L
	VEW-1B = 185 L
1320	Sample VEW-1A

LABORATORY ANALYTICAL RESULTS

22 October 2015

Mr. Axel Rieke
Northgate Environmental Management, Inc.
428 13th Street, 4th Floor
Oakland, CA 95612

SUBJECT: DATA REPORT - Northgate Environmental Management, Inc. Project # 1241.03
Former Westlake French Dry Cleaners
247 Westlake Center, Daly City, California

TEG Project # 51014F

Mr. Rieke:

Please find enclosed a data report for the samples analyzed from the above referenced project for Northgate Environmental Management, Inc. The samples were analyzed on site in TEG's mobile laboratory. TEG conducted a total of 9 analyses on 9 soil vapor samples.

-- 9 analyses on soil vapors for volatile organic hydrocarbons by EPA method 8260B.

The results of the analyses are summarized in the enclosed tables. Applicable detection limits and calibration data are included in the tables.

TEG appreciates the opportunity to have provided analytical services to Northgate Environmental Management, Inc on this project. If you have any further questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Mark Jerpbak
Director, TEG-Northern California

SUBJECT: DATA REPORT - Northgate Environmental Management, Inc. Project # 1241.03
Former Westlake French Dry Cleaners
247 Westlake Center, Daly City, California

TEG Project # 51210E

Mr. Rieke:

Please find enclosed a data report for the samples analyzed from the above referenced project for Northgate Environmental Management, Inc. The samples were analyzed on site in TEG's mobile laboratory. TEG conducted a total of 7 analyses on 7 soil vapor samples.

-- 7 analyses on soil vapors for volatile organic hydrocarbons by EPA method 8260B.

The results of the analyses are summarized in the enclosed tables. Applicable detection limits and calibration data are included in the tables.

TEG appreciates the opportunity to have provided analytical services to Northgate Environmental Management, Inc on this project. If you have any further questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Mark Jerpbak
Director, TEG-Northern California

Subject: Sub-slab and Groundwater Sampling Results
Former Westlake French Dry Cleaners
247 Westlake Center
Daly City, California
GPP Site 229066

Dear Mr. Wactor:

Treadwell & Rollo, a Langan Company, submits its Sub-slab and Groundwater Sampling Results Report for the Former Westlake French Dry Cleaners at the Westlake Shopping Center in Daly City, California. In performing this investigation, we have endeavored to observe that degree of care and skill generally exercised by other consultants undertaking similar studies at the same time, under similar circumstances and conditions, and in the same geographical area.

We appreciate the opportunity to assist you with this project. If you have any questions, please contact us.

Sincerely yours,
Treadwell & Rollo, A Langan Company

SUB-SLAB AND GROUNDWATER SAMPLING RESULTS
FORMER WESTLAKE FRENCH DRY CLEANERS
Daly City, California

1.0 INTRODUCTION AND BACKGROUND

This report presents the results of Treadwell & Rollo, A Langan Company (T&R), sub-slab and groundwater sampling at the former Westlake French Dry Cleaners at 247 Westlake Center in Daly City, California (Site). The Site location is illustrated on Figure 1. The sampling was performed on behalf of Kimco Westlake LP (Kimco).

In response to a letter from the San Mateo County Health System's Groundwater Protection Program (GPP) dated 1 October 2009, T&R prepared and submitted a work plan to the GPP on 11 February 2010. This work plan provided a scope of work intended to respond to comments in GPP's letter dated 1 October 2009. On 13 July 2010, the GPP provided significant comments on the work plan. During a telephone call on 24 August 2010 with the GPP case worker to discuss the comments, the case worker suggested performing sub-slab sampling in lieu of soil vapor sampling to more directly evaluate vapor intrusion indoor air risks related to apparent releases from the former dry cleaners. Based on this conversation, T&R revised its work plan and submitted it to the GPP on 16 December 2010. The GPP provided minor comments in a letter dated 18 March 2011. T&R responded to those comments with a work plan addendum dated 30 March 2011. During a telephone call on 19 April 2011, the GPP case worker provided additional comments which were addressed in clarification letter dated 29 April 2011 from T&R to the GPP. The final scope of work was approved by the GPP in its letter dated 3 May 2011. References to this correspondence are provided in the references section.

1.1 Site Description and History

The Site is a 3,280 square foot commercial suite formerly occupied by a dry cleaner at the Westlake Shopping Center (Figure 2). The suite is part of parcel number 002-170-230. The Westlake Shopping Center is reportedly an approximately 560,000 square foot complex of multiple buildings occupied by over 150 tenants (ADR, 2002a). The shopping center is surfaced with asphalt and concrete parking lots and sidewalks interspersed with landscaped areas. The shopping center was first developed in the mid-1950s and expanded to its current configuration by the early to mid-1960s. Prior to the development of the

shopping the area was a mixture of agriculture land and riparian habitat and vegetated stream way (ADR, 2002b).

The former Westlake French Dry Cleaners was in operation from 1955 to June 2009 and at the time covered 2,300 square feet. The space was then expanded in 2009 to 3,280 square feet and is currently occupied by a T-Mobile retail store. The former dry cleaners operations used tetrachloroethene (PCE) in its daily operations. Operations equipment included the dry cleaning machine and a compressor. In addition, a drain was observed in the restroom space. These features are shown on Figure 2.

An interview with a former dry cleaners employee by ADR Environmental Group, Inc. (ADR) in 2002 revealed that at least between 1987 and 2002 PCE was used and stored in a base holding tank of the dry cleaning machine utilized at the Site. Reportedly, this dry cleaning machine was a dry-to-dry unit which was not connected to the sewer system and had secondary containment. PCE sludge generated at the site was stored in a 30-gallon drum adjoining the dry cleaning machine. This waste container did not have secondary containment. Minor staining of the concrete floor underlying this container was noted during a Phase I Environmental Site Assessment (ESA) performed by ADR in 2002 (ADR, 2002a). The nearest floor drain to the dry cleaning machine was located in an adjoining boiler room. No staining was observed around this drain by ADR in 2002. The Phase I ESA by ADR in 2002 further noted that a private disposal company, Safety Kleen, collected and removed approximately 15 gallons of PCE per month.

The shopping center is in a neighborhood of retail commercial and residential properties.

Adjacent properties include two story residential buildings approximately 100 feet east of the Site (along Park Plaza Drive), and commercial buildings and parking areas in the shopping center (shops, retails, and restaurants) to the north, south and west of the Site (Figure 2).

1.2 Summary of Previous Environmental Investigations

Several investigations have been performed at the Site since 2002 including Phase I and II ESAs by Kleinfelder and ADR in 2002, and more recent subsurface investigations by T&R in 2010 and 2011. Investigations by ADR and Kleinfelder were to evaluate the entire Westlake shopping center where the former Westlake French Dry Cleaners was located.

The Phase I ESA performed by Kleinfelder in 2002 noted the former Westlake French Dry Cleaners operations but did not identify it as a recognized environmental condition (Kleinfelder, 2002b). However a Phase II investigation was performed by Kleinfelder later that year (Kleinfelder, 2002a, 2002c). The Phase I ESA performed by ADR in 2002 noted the presence of the dry cleaner and included a review of Phase II investigation results performed by Kleinfelder and ADR. Those results are summarized below. No other environmental conditions related to the Dry Cleaner operations or potential release of PCE and its degradation daughter products were noted (ADR, 2002b).

To date (and including the recent investigation performed by T&R in 2011 and described in Section 3) Site investigations have included the following:

- Collection and analyses of 17 soil vapor samples from 9 locations;
- Collection and analysis of 2 groundwater samples from 2 locations;
- Collection and analysis of 7 soil samples from 5 locations; and
- Collection and analysis of 6 sub-slab vapor samples.

The locations for all samples are shown on Figure 3 and presented in Tables 1 through 4. The results of the sampling prior to the 2011 T&R sub-slab, soil, and groundwater sampling indicated the following:

- No volatile organic compounds (VOCs) were detected in any soil sample. Soil samples were collected inside the Site, in the immediate vicinity (within 5 feet) of the former dry cleaning equipment and restroom drains, along the sewer line, and at the upgradient deep boring location, DB-1 (Figure 3). Soil samples were collected to depths up to 15 feet on-Site and at 60 and 84 feet below ground surface (bgs) at boring DB-1 (Table 1). Soil sampling was performed in 2002 by Kleinfelder and ADR (Kleinfelder 2002a, 2002c; ADR, 2002a).

- PCE has been detected in soil vapor at concentrations exceeding both the residential and commercial Environmental Screening Levels (ESLs) of 410 and 1,400 micrograms per cubic meter ($\mu g/m^3$) (RWQCB, 2008) as shown in Table 2. The maximum PCE soil vapor concentrations were detected at 5 and 10 feet bgs from ADR boring B-3 at concentrations of 23,000 and 17,000 $\mu g/m^3$, respectively (Figure 3). Boring B-3 was advanced at a location adjacent to the Site and within 10 feet of the former dry cleaning

equipment, 5 feet from the restroom drain, and at the sewer line. Soil vapor concentrations were detected off-Site at concentrations ranging from below laboratory detection limits (from boring TR-4 located on the eastern site of Park Plaza drive) to 14,000 µg/m^3 (from boring TR-3 located just off-Site, Figure 3). Soil vapor sampling was performed by ADR in 2002 and T&R in 2010 (ADR, 2002a; T&R, 2009).

Other detected VOCs in soil vapor include TCE, chloroform, benzene, and 1,1,2,2-tetrachloroethane (1,1,2,2-PCA). TCE was only detected at one location, boring B-2 at 5 feet and may indicate some natural attenuation is occurring at this location. Acetone, 2-butanone (MEK), chloroform, benzene, and 1,1,2,2-PCA were all detected off-Site at locations along Park Plaza Drive. Of these VOCs only benzene and 1,1,2,2-PCA were found at concentrations exceeding their residential ESL. Benzene is a common constituent in gasoline and is commonly present in soil vapor below roadways. 1,1,2,2-PCA is a known refrigerant. The source of the 1,1,2,2-PCA is unknown but is unlikely to be attributed to the Site.

- Prior to the recent groundwater sampling, the only groundwater sample collected was from boring DB-1 at a depth of approximately 84 feet bgs (Table 3). No VOCs were detected in this sample, however this sample was collected from a location apparently upgradient of the Site (Kleinfelder, 2002c).

- An August 2002 video survey of the sanitary sewer lateral at the Site identified a crack in the sewer lateral approximately 23 feet from the dry cleaner facility restrooms (Figure 3, ADR, 2002a).

- T&R evaluated indoor air risks related to the vapor intrusion inhalation pathway in 2009. The results of the evaluation indicated an excess lifetime cancer risk for commercial use receptors on-Site of $1.1x10^{-6}$ and $1.1x10^{-7}$ for off-Site residential use receptors (T&R, 2009). The results of the evaluation estimated noncarcinogenic hazard quotients to be 0.015 on-Site and 0.0015 off-Site. Consistent with the National Contingency Plan (NCP), a risk range of 10^{-4} to 10^{-6} is considered to be a generally acceptable range for excess cancer risk levels associated with exposure to Chemicals of Potential Concern (COPCs), and risk-based concentrations equal to an excess lifetime cancer risk of 10^{-6} are used as a starting point for purposes of making remedial decisions. As noted in Section 4.2 of

the Water Board's ESL document, "Remediation is generally warranted at sites where the estimated cancer risk exceeds 10^{-4}. For sites where the estimated risk is between 10^{-4} and 10^{-6}, the need for active remediation is evaluated on a site specific basis (i.e., risks within this range are potentially acceptable, depending on site-specific considerations)" (Water Board, 2008). For cumulative risk for chemicals that are not carcinogens the point of departure is a noncancer HI of 1.[1] A departure point of 1 assumes that risks associated with all noncarcinogenic COPCs have been calculated.

- In its review letter dated 1 October 2009, the GPP raised the following specific concerns with the risk evaluation:
  - On-Site risks should be evaluated using residential receptors;
  - On-Site commercial risks should be evaluated using existing construction parameters, rather than conservative default parameters;
  - The soil temperature of 60°C seems high for Bay Area soils;
  - Bulk density estimates from samples collected using a 2-inch diameter sample sleeve represents a deviation from ASTM 6169 which recommends using 2.5-inch diameter samples or greater; and
  - Field laboratory calibration and quality control data was not provided in the report.

Based on the above comments and conversations with the GPP, the investigation approach to further evaluate indoor air inhalation risks via the vapor intrusion pathway the next phase of work was to focus on sub-slab vapor and grab-groundwater investigation. The results of which are provided in Section 3. In addition, while the soil temperature was mistakenly input as 60°C rather than 60°F, the model used is highly insensitive to soil temperature and the result is not changed whether 60°C is used as the input or 15.6°C (60°F) is used.

1.3 Geology and Hydrogeology

Soil lithology based on the borings advanced at the Site and surrounding areas indicate that the area is underlain primarily by coarse-grained silty sand and/or sand from the ground surface to the maximum

[1] The National Oil and Hazardous Substances Pollution Contingency Plan (NCP), (U.S. EPA, Code of Federal Regulations, Title 40, Part 300.430[e][2]).

explored depth of 89.5 feet bgs (boring DB-1, Kleinfelder 2002c). A cross section was developed as Figure 4 which illustrates vertical features at the Site.

Groundwater at the Site was previously measured at a depth of 84 feet bgs in boring DB-1 (Kleinfelder, 2002c). Groundwater flow direction is anticipated to be to the northeast, based on monitoring well data from properties 600 feet northwest and 3,700 feet south of the Site (CRA, 2011; Stantec, 2010). The Site is located within the San Mateo Subbasin of the Santa Clara Valley Groundwater Basin (DWR, 2004). The City of Daly City obtains 50% of its municipal water from groundwater located deeper than 260 feet bgs (Daly City, 2011; Brown, 2011). The nearest active groundwater well is approximately 0.33 miles southwest and upgradient from the Site (Brown, 2011). This well, known as the Westlake Well, is operated by the City of Daly City. Groundwater is pumped from this well at an approximate rate of 480 gallons per minute (gpm) while pumping and is screened from 340 to 650 feet bgs. The next closest well is 0.8 miles southeast and crossgradient from the Site. This well, known as Well #4, is also operated by the City of Daly City which pumps groundwater at rate of 600 gpm while pumping. The duration of the pumping for both of these wells fluctuates daily and annually and is based on consumption needs. This well is screened from 260 to 500 feet bgs. Currently there are three wells scheduled to be installed at a location approximately 0.4 miles southeast and crossgradient of the Site. These wells will be operated by the San Francisco Water District and at this time, details on their construction and schedule were unavailable (Brown, 2011). The locations of these water supply wells are shown on Figure 1.

2.0 OBJECTIVE AND SCOPE OF SERVICES

The objective of T&R's sub-slab vapor and grab-groundwater sampling was to 1) collect soil vapor data from directly below the building slab to evaluate vapor intrusion human health risk at the Site and; 2) to evaluate groundwater quality beneath the source area (near to the former equipment location and sewer line). The scope of services for this phase of work included:

- Obtaining drilling and encroachment permits from the City of Daly City to drill one boring;
- Preparing a site-specific health and safety plan;
- Collect for laboratory analysis, sub-slab soil vapor samples at six locations in general accordance with the sampling protocol outlines in the California Environmental Protection Agency's Department of Toxic Substances Control (DTSC) "Advisory – Active Soil Gas Investigation, Draft for Review" dated March 3, 2010 (DTSC, 2010); and the County of San Mateo Health

Department, Public Health and Environmental Protection Division (SMEHD) guidance in the Subsurface Vapor Sampling for Human Health Risk Evaluation January 2007 protocols (SMEHD, 2007);

- Collect for laboratory analysis, one groundwater sample from one boring;
- Evaluating potential vapor intrusion to indoor air risk;
- Revising the Site Conceptual Model; and
- Preparing this report.

3.0 FIELD INVESTIGATION

To meet the project objectives discussed in Section 2.0, we performed sub-slab vapor and grab-groundwater sampling at the Site. The field-sampling program included the following tasks:

- Contacting Underground Services Alert (USA) to help establish the approximate location of subsurface utilities within the area to be explored;
- Performing a subsurface utility survey by California Utility Surveys, an underground utility locator, to clear each boring location for underground utilities;
- Installing six (6) permanent sub-slab vapor points, conducting a purge volume test, sampling six (6) sub-slab vapor points and one duplicate sub-slab vapor sample for Quality Assurance/Quality Control (QA/QC) purposes and submitting them to an off-site analytical laboratory
- Installing one (1) angled boring and one (1) vertical boring, for the purpose of collecting grab groundwater samples for chemical analysis by an off-site analytical laboratory;
- Logging borings and classifying soils following the Unified Soil Classification System (USCS);
- Abandoning the soil/groundwater borings with Portland cement after sample collection.

3.1 Grab-Groundwater Sampling and Laboratory Analyses

On 2 June 2011, an angled boring (TR-3A) was advanced with an angle of 45° from a distance of approximately 45 feet from the source area, to collect a grab-groundwater sample from beneath the former dry cleaner space. Gregg Drilling and Testing of Martinez, CA, a California-licensed driller performed the drilling. A sonic drill rig with aqua-lock sampler was used to advance the angled boring.

Drill rig refusal was encountered at 78 feet (angled) bgs before reaching groundwater due to the increased friction from the pressure of the overlying soil. This angled depth of 78 feet equates to 55 feet bgs vertically and 55 feet horizontally based on a 45° drilling angle. It should be noted that angled borings encounter refusal at depths, where vertical boring would not, due to the increased friction from the pressure of the overlying soil. A second vertical boring, TR-3B, was then installed at the same location as TR-3A using a sonic drill rig. At the second location, drill rig refusal was encountered again at a vertical depth of approximately 55 feet bgs. On 3 June 2011, T&R returned to the Site with a tracked drill rig and continued drilling with hollow stem augers at boring location TR-3B. Groundwater was encountered at a depth of approximately 78 feet bgs and the boring was terminated at approximately 81.5 feet bgs. This sampling location is located approximately 50 feet downgradient of the back of the former dry cleaners space. During logging, no VOCs were detected using a PID in any of the boring attempts. Soil from TR-3A and TR-3B was logged at 5-foot intervals using the Unified Soil Classification System (USCS). The boring locations are illustrated on Figure 3. The boring logs are provided in Appendix A.

After advancing to the maximum depth, the drill rods were removed and a one-inch diameter slotted PVC casing was lowered into the open boring. A grab-groundwater sample, TR-3-GW, was then collected using a disposable bailer. The groundwater sample was contained in three laboratory-supplied 40-ml vials preserved with hydrochloric acid (HCl), labeled, and immediately placed in an iced cooler. The sample was submitted to Curtis and Tompkins Ltd (C&T), a California certified analytic laboratory under Chain of Custody (COC) protocols. The sample was analyzed for VOCs by EPA Method 8260B. After sample collection, the borings TR-3A and TR-3B were backfilled with neat cement grout under authorization from the City of Daly City, Department of Water and Wastewater Resources. All drilling and sampling equipment was washed with a detergent and/or steam-cleaned prior to each use. Soil cuttings and decontamination rinsate were contained in drums on-Site.

3.2 Sub-Slab Vapor Sampling and Analysis

On 6 and 7 June 2011, T&R supervised installation of reusable sub-slab vapor sampling ports at 6 locations (TR-5 through TR-10). A 5/16-inch diameter hole was drilled through the slab using a drill and spline bit. The thickness of the slab was noted to be approximately 5 inches at all locations. A 1/4-inch stainless steel tube with threaded fitting was inserted in the borehole such that the bottom of the tubing was even with the bottom of the slab. A threaded cap was placed on the threaded fitting of the steel

tube and the annular space was grouted. TEG Northern California Inc. (TEG) of Rancho Cordova, CA, a California-licensed driller provided the sub-slab vapor points installation. Figure 3 shows the sample locations. Figure 5 illustrates the sub-slab sampling setup. The following section presents details of the sampling and laboratory analytical procedures.

Sub-slab vapor samples were collected at least 48 hours after installation in general accordance with procedures established by the DTSC and SMEHD using helium shrouds that were assembled and supplied by C&T. The helium shroud is used in leak testing to create an external atmosphere with a known concentration of helium to compare to any detected leaks within the sample tubing. The helium shroud consists of a clear plastic box with a purge port and helium gas port, and a sampling train with a 3 port valve (*Purge, Sample* and *Off* positions). The sampling trains/shrouds used for the sub-slab vapor sampling were pre-set to a flow rate of approximately 50 milliliters per minute (ml/min) by C&T, as specified in the DTSC March 2010 guidance document.

To establish the optimum purge volume for collecting sub-slab vapor samples, a purge volume test was performed at sample location TR-7 on 9 June 2011. During the sub-slab vapor purging and sampling activities, the sub-slab vapor point was connected to the sampling train using ¼" Teflon tubing. A 1.4-liter summa canister was attached to the other end of the sampling train. A portable helium gauge was placed inside the shroud and the lid was tightly closed. Prior to purging or sampling activities, helium tracer gas was released into the enclosure beneath the shroud via a helium gas port. While the helium concentration was being established, the well purge train was assembled by placing a helium detector between the shroud and a new disposable hand-held 50-mL syringe. With the helium atmosphere established in the shroud at 20%, the sample train was purged. Samples were collected in the 1.4-liter sample canisters after withdrawing one, three and ten equivalent volumes of the sample tubing to evaluate which purge volume yielded the highest results. The 3 sample canisters were sent to C&T for VOC analysis using EPA Method TO-15 under COC protocol. Based on the results of the purge volume test at location TR-7, ten equivalent volumes of the sample tubing were purged prior to sampling at each of the other locations on 14 June 2011. For quality assurance / quality control purposes, one duplicate sample was collected at location TR-10. All samples were analyzed for VOCs by EPA Method TO-15. Copies of laboratory analytical reports are included in Appendix B. Following sample collection, each sub-slab vapor point was secured by fitting the threaded cap on to the threaded fitting of the stainless steel tube.

3.3 Grab-Groundwater Analytical Results

From boring TR-3B, at a sampling depth of 78.6 to 81.5 feet bgs, PCE and 1,2,4-Trimethylbenzene (1,2,4-TMB) were detected above laboratory reporting limits. PCE was detected at a concentration of 9.6 micrograms per liter (µg/L) which exceeds its drinking water maximum contaminant level (MCL) of 5 µg/L but is below its residential ESL for vapor intrusion of 120 µg/L. 1,2,4-TMB was detected at a concentration of 0.6 µg/L. There is no MCL or ESL established for 1,2,4-TMB.

3.4 Sub-Slab Vapor Sample Results

Sub-slab vapor samples were collected at 6 locations (TR-5 through TR-10) and analyzed for VOCs by EPA Method TO-15. The following compounds were detected above the laboratory reporting limits: PCE, TCE, Acetone, Methyl Ethyl Ketone (MEK), Carbon Disulfide, 1,2-Dichlorobenzene, Ethylbenzene, 4-Methyl-2-Pentanone, Propylene, Toluene and m,p-Xylenes. No other VOCs were detected above the laboratory reporting limits.

There is no Regional Water Quality Control Board ESL or DTSC California Human Health Screening Level (CHHSL) for sub-slab vapor concentrations. However the sub-slab screening level can be estimated by multiplying the compound's indoor air ESL by an assumed slab attenuation factor. In the absence of a Site-specific slab attenuation factor, the DTSC recommends using a conservative value of 0.01 as a default (DTSC, 2004). Using this default value, sub-slab screening levels were estimated for both residential and commercial receptors. The estimated screening levels are provided in Table 4.

PCE was detected above the laboratory reporting limit in all six subslab samples analyzed with concentrations ranging from 25 µg/m^3 to 7,100 µg/m^3. Of the six samples detected, five exceeded the estimated sub-slab screening levels for commercial use (69 µg/m^3) and residential use (41 µg/m^3) when the conservative, default slab attenuation factors are used. None of the other detected VOCs exceeded their corresponding estimated sub-slab vapor screening levels for commercial or residential use when the default slab attenuation factors are used (Table 4).

4.0 EVALUATION FOR VAPOR INTRUSION

As indicated in Section 3, sub-slab screening levels were based on a conservative value recommended by the DTSC of 0.01 (DTSC, 2004). However sub-slab to indoor air attenuation factors measured by others

have been estimated as low as $1x10^{-7}$ (McCafferty, 2008). Nevertheless, in the absence of a Site-specific attenuation factors, risks were evaluated based on sub-slab results and the recommended DTSC attenuation factor. Using a "ratio of proportions" method, the potential excess lifetime cancer risk attributable to modeled risk from measured sub-slab PCE concentrations from the recent sampling was estimated to range between $3.6x10^{-7}$ to $1.0x10^{-4}$ with an average potential risk of $2.1x10^{-5}$ for a commercial use scenario. For a residential use scenario, the potential excess lifetime cancer risk based default attenuation factor was estimated to range between $6.1x10^{-7}$ to $1.7x10^{-4}$ with an average potential risk of $3.5x10^{-5}$. Estimated risks using the lowest attenuation factors reported in the literature would be several orders of magnitude lower than $1x10^{-6}$ (potentially as low as 10^{-12} for both residential and commercial receptors). Therefore estimates based on the DTSC recommended value may result in conservatively high estimates of excess lifetime cancer risks that are higher than risks resulting from actual Site conditions.

For the sub-slab vapor sampling events, the barometric pressure was recorded daily between June 1 and 24, 2011. Data was collected from the Mussel Rock Daly City weather station located approximately 3 miles from the Site. For the 9 June 2011 sampling event, the average barometric pressure changed from 29.98 millimeters of mercury (mm Hg) on the day before sampling to 30.02 mm Hg on the day of sampling. This represents a net increase of 0.04 mm Hg. For the 14 June 2011 sampling event, the average barometric pressure changed from 29.99 mm Hg on the day before sampling to 29.99 mm Hg on the day of sampling. This represents a negligible change in barometric pressure. Between 1 and 24 June 2011, the average barometric pressure decreased from 30.09 mm Hg to 29.89 mm Hg. Barometric pressure changes can influence the rate of vapor intrusion into the indoor air space. Significantly decreasing barometric pressure changes can be expected to increase the rate of vapor intrusion while significantly increasing barometric pressure changes will have the reverse effect. The average changes during the sampling period (i.e. less 0.05 mm Hg) are expected to have a negligible effect.

5.0 CONCEPTUAL SITE MODEL

The following section provides a conceptual site model which includes an evaluation of potential contaminant sources, the distribution of contaminant impacts in the subsurface, potential contaminant sources, and an evaluation of existing data gaps. As discussed in Section 3, the only VOCs detected which exceed MCLs, ESLs, or estimated sub-slab screening levels are PCE, TCE, benzene, and 1,1,2,2-PCA. Of these compounds, only PCE and TCE have been detected on-Site and are known to be

associated with dry cleaner use (TCE as a daughter product to PCE). TCE has not been detected in sub-slab concentrations that exceed its estimated sub-slab screening level for residential or commercial use receptors. Therefore only the distribution of PCE will be discussed. Benzene and 1,1,2,2-PCA are assumed to be associated with a release mechanism separate from dry cleaner or other on-Site operations. Likely, benzene and 1,1,2,2-PCA are related to releases from the roadway under which they were detected.

5.1 Potential Contaminant Sources

5.1.1 Primary Potential Contaminant Sources.

Given the nature of the dry cleaner operations, likely potential contaminant sources are as follows:

- Spills and leaks at and around the dry cleaning equipment; and
- Discharges to the sewer laterals and releases to soil through the identified cracks in the sewer line.

The most likely primary source (or at least the primary source with the greatest impact) is likely from the historical disposal of spent PCE into the sewer lateral from the facility. The basis for this is as follows:

- The highest soil vapor concentrations are located near to the restroom drain and sewer line crack.
- PCE has not been detected in soil. Had a significant spill event been a primary release mechanism, PCE would have been expected to be detected in soil.
- No notable staining had been mentioned in previous Phase I ESAs at or around any equipment, storage containers, or outside of the former facility.
- Sub-slab vapor concentrations are greater northeast of the sewer line rather than west of the sewer line and dry cleaning equipment.

5.1.2 Secondary Potential Contaminant Sources.

Secondary contaminant sources include the media where the residual contaminant is located after the primary release has occurred. In relation to the exposure pathway of concern, indoor air inhalation via vapor intrusion, the only significant secondary contaminant source is soil vapor. This is due to the lack of detected PCE in soil at locations adjacent to and at the dry cleaning equipment and the primary

contaminant source (i.e. the sewer lateral), and the low detected groundwater concentration of PCE (which is significantly below the vapor intrusion residential ESL of 120 µg/L).

5.1.3 Fate and Transport.

Based on the data collected to date and the evaluations performed, the most likely mechanism of release of the PCE is via leaks from the sewer system prior to the time period when off-Site disposal of PCE began. This indicates that PCE releases to the subsurface may have begun in 1955 when operations began until as late as 1987. Therefore it is expected that releases occurred via cracks and other compromises in the sewer line. A known crack has been observed at length of 23 feet from the restroom drain. Once released from the sewer line, the PCE was dispersed as a constituent dissolved in wastewater where it redistributed within the vadose zone mostly into the vapor phase as a result of volatilization. Given the lack of impacts detected in groundwater, most of the PCE remained in the vadose zone in the vapor phase.

Given the minimal detection of PCE daughter products and relative coarse grained soils (silty sand and sand), anaerobic biodegrdation does not play a significant role in the attenuation of the PCE. However given the lack of NAPL in the subsurface (discussed in Section 5.2) and the fact that the dry cleaner no longer operates at the Site, PCE in soil vapor will be expected to slowly decrease in concentration as it diffuses away from the source area.

5.2 Lateral and Vertical Extent of Contamination.

PCE has been detected in soil vapor and groundwater but not in soil. The lateral sub-slab distribution and vertical sub-slab, groundwater, and soil vapor distribution of PCE is shown on Figures 3 and 4, respectively. The lateral soil vapor distribution is shown on Figure 6. The cross section location is shown on Figure 4. Soil vapor PCE concentrations have been detected up to 23,000 µg/m^3 near the former dry cleaner equipment, restroom drains, and sewer lines. The distribution of PCE in soil vapor at depths of 5 and 10 feet bgs are shown on Figure 6. Figure 6 illustrates that the greater soil vapor impacts (i.e. PCE concentrations greater than 10,000 µg/m^3) are likely constrained to the vicinity surrounding the former dry cleaning equipment and sewer lateral over a area of 11,000 square feet (ft^2) at a depth of 5 feet bgs and a 4,000 ft^2 area at 10 feet bgs (Figure 6).

PCE in groundwater has been detected at a concentration of 9.6 µg/L at first groundwater encountered (84 feet bgs from boring TR-3B) located approximately 50 feet east-northeast and approximately downgradient of the former dry cleaner. The lack of detected PCE from soil samples collected in the immediate vicinity (within 5 feet) of the former dry cleaning equipment, restroom drains, and along the sewer line indicate that no residual soil impacts are present at the Site. A concentration of PCE in groundwater of 9.6 µg/L collected within 50 feet of the former dry cleaner is significant evidence that non-aqueous phase liquid was not released at the Site. Had NAPL been present, concentrations at or greater than 1% of the PCE solubility (i.e. 1 % of 200,000 µg/L or a concentration greater than 2,000 µg/L) would have been expected in groundwater (USEPA, 2004).

5.3 Data Gap Evaluation

The following data gaps have been identified as a result of this evaluation:

- The actual attenuation of vapor concentrations through the slab to indoor air is unknown. Therefore, a relevant Site-specific sub-slab PCE vapor concentration equivalent to an excess lifetime cancer risk of $1x10^{-6}$ cannot be calculated.
- The seasonal fluctuation in sub-slab vapor concentration is unknown.
- The vertical distribution of PCE in soil vapor has not been fully evaluated. However given the depth to groundwater and minimal impacts in groundwater near the release area, there is not likely to be a significantly deep plume of PCE in soil vapor.
- The lateral distribution of PCE in sub-slab and soil vapor has not been clearly delineated north, west, and south of the source area.

6.0 CONCLUSIONS AND RECOMMENDATIONS

A sub-slab vapor and grab-groundwater sampling investigation was recently performed to evaluate the distribution of PCE and other VOCs in the subsurface and to evaluate potential risks to inhabitants of the commercial space overlying the PCE in soil vapor via the vapor intrusion pathway. PCE was the only compound likely to result from the former dry cleaner operations at the Site and thus was the focus of the investigation.

Groundwater was found to contain low levels of PCE, slightly above the MCL, and well below the vapor intrusion ESL. Groundwater was encountered at 78 feet bgs. A groundwater sample collected from first groundwater at 80 feet bgs, has a PCE concentration of 9.6 µg/L. While this concentration exceeds the MCL of 5.0 µg/L, there is no current use of groundwater as drinking water source from this location or depth. The nearest supply wells are all either upgradient or crossgradient and groundwater is extracted from a significantly greater depth from these wells (greater than 260 feet bgs). Since this concentration is significantly below the residential ESL of 120 µg/L, there is no risk related to groundwater impacts to downgradient residential receptors.

Soil samples were collected in the immediate vicinity (within 5 feet) of the former dry cleaning equipment and restroom drains, along the sewer line, and at the upgradient deep boring location, DB-1. No VOCs have been detected in any soil sample collected. Based on these data, soil is not an impacted media.

Soil vapor is the main plume of residual PCE at the Site. Sub-slab vapor PCE concentrations measured during the recent investigation ranged from 25 to 7,100 µg/m^3. PCE impacts in soil vapor have been reasonably characterized on the eastern portion of the Site to a depth of 10 feet bgs. The extent of soil vapor impacts have been inferred to the north, west, and south of the former dry cleaners and to depths greater than 10 feet bgs. While PCE concentrations in soil vapor have been detected up to 23,000 µg/m^3 and generally exceed commercial and residential use ESLs, earlier risk evaluations have indicated that detected PCE concentrations translate to low-level risks (i.e. between $1.1x10^{-6}$ for on-Site commercial and $1.1x10^{-7}$ for off-Site residential, T&R, 2010b). In contrast, estimates of risks from sub-slab PCE concentrations and use of conservative default model input factors predict risks ranging between $6.1x10^{-7}$ and $1.7x10^{-4}$ with an average potential risk of $2.1x10^{-5}$ for a commercial use scenario.

In order to refine our existing models for potential vapor intrusion risk, we recommend the following next steps:

- Indoor air sampling should be performed in concert with sub-slab vapor sampling at each current sub-slab vapor location, using protocols specified in the March 2010 DTSC guidance document.

- Collected samples should be analyzed for VOCs by EPA method TO-15 and for Radon-222 using an alpha scintillation counting method (USEPA, 1992). Radon results, as a conservative tracer to vapor intrusion from the subsurface, can be used to confirm indoor air VOC results. The estimated attenuation factors from Radon concentrations and VOC concentrations can be compared and if the results are similar, then VOC concentrations are likely to be due to vapor intrusion. However, if the VOC results indicate higher indoor air concentrations than predicted by the radon attenuation factor, the indoor air VOC concentrations are likely to be due to a source other than the subsurface (King et al, 2010).
- Indoor air and sub-slab samples should be collected semi-annually for one year to assess seasonal variations in PCE concentrations. Barometric air pressure should be recorded prior to, during, and after sampling events.
- A risk evaluation should be performed using site-specific slab attenuation factors.

The results of this proposed evaluation will provide a more site-specific estimate of risks based on both the indoor air conditions and the sub-slab environment using site-specific slab to indoor air attenuation factors. Using these results decisions can be made on whether remedial measures are necessary or if case close may be pursued.

$\mu g/m^3$ - micrograms per cubic meter
ft. bgs - Feet below ground surface
BOLD - Concentration detected at or above the reporting limit
NA - not analyzed
Ten vacuum purge volumes prior to sample collection for all samples
(1,3,7) & (1,3,10) - Three vacuum purge volumes tests prior to sample collection to select optimum purge volume
Except where noted all samples analyzed by EPA Method 8260
* - Sample analyzed using modified EPA Method TO-14A
Exceeds commercial and residential ESL.
Exceeds residential ESL only.
ESL (Res) = Residential Soil Gas Environmental Screening Level for Potential Indoor Air Vapor Intrusion (RWQCB, 2007), Table E-2
ESL (Com) = Commercial Soil Gas Environmental Screening Level for Potential Indoor Air Vapor Intrusion (RWQCB, 2007), Table E-2

Table 3
Grab Groundwater Sampling Analytical Results
Former French Dry Cleaners
Daly City California

Sample Location	Date	Sampling Depth	PCE	1,2,4-TMB	Other VOCs
		(ft bgs)	(µg/L)	(µg/L)	(µg/L)
DB-1	07/25/02	84	ND	ND	ND

Notes
PCE - Tetrachloroethene
TCE - Trichloroethene
MEK - 2-Butanone
1,2-DCB - 1,2-Dichlorobenzene
VOC - Volatile Organic Compound
µg/m^3 - micrograms per cubic meter
BOLD - Concentration detected at or above the reporting limit
ND - Not Detected
NA - Not Available
NC - Not Calculated
Dup - Duplicate Sample
Ten vacuum purge volumes prior to sample collection for all samples based on results from purge volume test at TR-7.
All samples analyzed by EPA Method TO-15
ESL - Environmental Screening Level for Vapor Intrusion Concerns
Com - ESL for commercial structures
Res - ESL for residential structures
ESLs taken from Table E, RWQCB, 2008. Screening for Environmental Concerns at Site with Contaminated Soil and Groundwater, Rev. May 2008.
Sub-slab screening level (SL) estimated by dividing indoor air ESL by an attenuation factor of 0.01.
Exceeds estimated sub-slab commercial and residential ESL.
Exceeds estimated sub-slab residential ESL only.

CASE NARRATIVE

Laboratory number:	**228625**
Client:	**Treadwell & Rollo**
Project:	**730487802**
Location:	**Westlake & Southgate Dry Cleaners**
Request Date:	**06/10/11**
Samples Received:	**06/10/11**

This data package contains sample and QC results for six air samples, requested for the above referenced project on 06/10/11. The samples were received intact.

Volatile Organics in Air by MS (EPA TO-15):
No analytical problems were encountered.

228625

Treadwell&Rollo
Environmental and Geotechnical Consultant

CASE NARRATIVE

Laboratory number:	**228783**
Client:	**Treadwell & Rollo**
Project:	**730487803**
Location:	**Westlake & Southgate Dry Cleaners**
Request Date:	**06/16/11**
Samples Received:	**06/16/11**

This data package contains sample and QC results for twelve air samples, requested for the above referenced project on 06/16/11. The samples were received intact at ambient temperature.

Volatile Organics in Air by MS (EPA TO-15):
No analytical problems were encountered.

228783

Treadwell&Rollo
Environmental and Geotechnical Consultant

1. Did cooler come with a shipping slip (airbill, etc)_____ YES (NO)
   Shipping info_____

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☒ NO
   How many _____ Name_____ Date_____
2B. Were custody seals intact upon arrival? _____ YES NO (N/A)
3. Were custody papers dry and intact when received? _____ (YES) NO
4. Were custody papers filled out properly (ink, signed, etc)? _____ (YES) NO
5. Is the project identifiable from custody papers? (If so fill out top of form) (YES) NO
6. Indicate the packing in cooler: (if other, describe)_____

☐ Bubble Wrap ☐ Foam blocks ☐ Bags ☐ None
☐ Cloth material ☒ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☐ Wet ☐ Blue/Gel ☒ None Temp(°C)_____

☐ Samples Received on ice & cold without a temperature blank

☐ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present? _____ YES (NO)
   If YES, what time were they transferred to freezer?_____
9. Did all bottles arrive unbroken/unopened? _____ (YES) NO
10. Are samples in the appropriate containers for indicated tests? _____ (YES) NO
11. Are sample labels present, in good condition and complete? _____ (YES) NO
12. Do the sample labels agree with custody papers? _____ (YES) NO
13. Was sufficient amount of sample sent for tests requested? _____ (YES) NO
14. Are the samples appropriately preserved? _____ YES NO (N/A)
15. Did you check preservatives for all bottles for each sample? _____ YES NO (N/A)
16. Did you document your preservative check? _____ YES NO (N/A)
17. Did you change the hold time in LIMS for unpreserved VOAs? _____ YES NO (N/A)
18. Are bubbles > 6mm absent in VOA samples? _____ YES NO (N/A)
19. Was the client contacted concerning this sample delivery? _____ YES (NO)
   If YES, Who was called?_____ By_____ Date:_____

1.0 INTRODUCTION

On behalf of Atlantic Richfield Company (ARC), a BP affiliated company, Stantec Consulting Services Inc. (Stantec) has prepared this *Additional Assessment and Vapor Extraction Pilot Test Report* for ARCO Service Station No. 465, located at 151 Southgate Avenue in Daly City, California (Figures 1 through 3). This report was prepared in accordance with a San Mateo County Groundwater Protection Program (GPP) letter dated March 7, 2016 (Attachment A). The purpose of the completed scope of work described herein was to further characterize and define the lateral and vertical extent of petroleum hydrocarbon impacts to soil and groundwater, and to document results of a vapor extraction pilot test conducted at the site. Results of recent assessment activities are presented below following discussion of the site background and site geology/hydrogeology.

2.0 SITE BACKGROUND

2.1 SITE LOCATION AND FACILITY DESCRIPTION

The site is located at the southern corner of the intersection of Southgate Avenue and Lake Merced Boulevard in Daly City, California (Figures 1 and 2). The site is an active retail fuel dispensing facility with a station building and service area, six dispensers, two blended gasoline underground storage tanks (USTs) and one waste oil UST. Prior to the assessment discussed in this report, the site had 22 groundwater monitoring wells, 12 soil vapor extraction (SVE) wells, and one dual nested soil vapor probe. An existing remediation equipment compound is located in the southern portion of the site. The site layout and location of historical soil borings and existing wells are illustrated in Figures 2 and 3.

Mixed commercial and residential properties surround the site. Burlington Coat Factory is located to the east of the site; two apartment complexes are located south and north of the site, a former dry cleaner facility and a shopping mall are located west of the site. Site topography slopes to the east or northeast, at an approximate elevation of 100 feet above mean sea level (MSL). Regionally, topography near the site slopes toward the east-northeast (Figure 1).

According to the California State GeoTracker database, former Southgate Cleaners is located at 183 Southgate Avenue, Daly City, approximately 100 feet west-southwest of the site. A review of available information indicates that a leak of volatile organic compounds (VOCs) including tetrachloroethene (PCE) has occurred on the Southgate Cleaners property from the former dry cleaning operations. Results of assessment activities for Southgate Cleaners were presented in the *Sub-slab and Groundwater Sampling Results* (Report) by Treadwell & Rollo (Treadwell & Rollo) dated August 8, 2011. The Treadwell & Rollo Report includes a figure showing PCE Soil Vapor Concentration Contours (Treadwell & Rollo Figure 7) and a 500 microgram per cubic meter (µg/m^3) concentration contour that extends from the former Southgate Cleaners site onto the ARCO station property. The Treadwell & Rollo Report also includes grab groundwater analytical data for direct push soil boring SG-10. Groundwater was collected from boring SG-10 with a screen interval of 101.2 to 104.2 feet below ground surface (bgs). The groundwater sample was reported to contain methyl tert-butyl ether (MtBE) at a concentration of 4.8 micrograms per liter (µg/L). PCE was not detected at a concentration above the laboratory method reporting limit of 0.5 µg/L in the groundwater sample collected from boring SG-10.

2.2 SITE BACKGROUND AND PREVIOUS INVESTIGATIONS

Site assessment activities were first conducted at the site in 1992 when hydrocarbon impacted soil was detected in the vicinity of the gasoline and waste oil USTs. Prior to the assessment discussed in this report, the site had a total of 22 groundwater monitoring wells (MW-1R, MW-2, MW-3D, MW-4, MW-4D, MW-5, MW-5D, MW-6, MW-6D, MW-7, MW-7D, and MW-8 through MW-18) and 12 SVE wells (V-1, V-2, and V-4 through V-13), and one dual-nested soil vapor probe (SV-1S/SV-1D). A total of 32 soil borings (CSB-1 through CSB-6, SB-1, SB-1A, SB-2 through SB-5, SB-7 through SB-19, SB-20, SB-20B, SB-20C, MW-5A, and HA-1 through HA-3), had also been advanced at the site. Soil borings, soil sample locations, soil vapor probe, SVE wells and groundwater monitoring well locations are depicted on Figures 2 and 3. Soil boring and well construction details are summarized in Table 1 and soil boring logs are presented as Attachment B. Soil analytical data is summarized in Tables 2 through 6. Groundwater monitoring and analytical data are summarized in Tables 7 through 10, and data from the most recent groundwater monitoring and sampling event are illustrated in Figures 4 through 8. Soil vapor analytical data are summarized in Table 11. Groundwater PCE and trichloroethene (TCE) analytical data is presented in Table 12.

An initial subsurface investigation was performed at the site in March 1992. Results of this investigation indicated that soil and groundwater in the vicinity of the gasoline UST complex had been impacted by petroleum hydrocarbons. Soil in the vicinity of the waste oil UST was also found to be impacted by both low boiling point hydrocarbons which were quantified as total petroleum hydrocarbons as gasoline (TPHg; also referred to as gasoline range organics [GRO]) and higher boiling point hydrocarbons which were quantified as TPH as diesel (TPHd; also referred to as diesel range organics [DRO]) and total recoverable petroleum hydrocarbons (TRPH). Low concentrations of semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs) were also reported in soil samples collected during the assessment. Groundwater monitoring wells MW-1 and MW-2 were installed at depths of approximately 70.5 feet and 61.5 feet bgs, respectively, to intercept a perched groundwater horizon (SEACOR, 1992a).

In July 1992, SVE well V-7 was installed to a depth of 85 feet bgs, and a SVE pilot test was performed at the site. In August 1992, deep groundwater monitoring well MW-3D was installed to a depth of approximately 220 feet bgs to intercept the upper portion of the regional groundwater aquifer (SEACOR, 1992b). The GPP noted in a letter dated July 5, 2001, that because "*MW-3D is screened from 202 bgs to 220 feet bgs (below an approximate 10-foot-thick clayey silt to silty clay zone) ... (MW-3D) may represent the deeper drinking water aquifer.*" In January 1993, quarterly groundwater monitoring activities were initiated at the site. Groundwater monitoring well MW-4 and vapor extraction well V-8, were installed in May 1993. Groundwater monitoring well MW-4 was installed to a depth of approximately 68 feet bgs to further assess groundwater quality in the perched groundwater horizon. A temporary SVE system was installed and pilot testing was performed during this phase of work (SEACOR, 1993).

On October 21, 1997, Gettler-Ryan removed a 520-gallon capacity waste oil UST located on the southwest side of the site and excavated the UST cavity to approximately nine feet bgs. On October 30, 1997, Gettler-Ryan further excavated the former waste oil UST pit to a depth of approximately 15 feet bgs, and in an easterly direction, to a depth of approximately 3 feet from the edge of the original excavation. Approximately 60 cubic yards (yd^3) of soil excavated from the pit was transported for offsite disposal by Dillard Trucking. The new waste oil UST and associated piping and vents were installed, the excavation was backfilled, and the surface asphalted on October 31, 1997 (SECOR 1997a).

In January 1998, six confirmation soil borings (CSB-1 through CSB-6) were advanced to determine if operation of the temporary SVE system had reduced the hydrocarbon concentration in soil to levels acceptable for regulatory case closure. The borings were advanced to depths ranging from 30.5 feet to 55.5 feet bgs using a drill rig equipped with 8-inch diameter hollow stem augers. Soil samples collected during this assessment were analyzed for GRO, benzene, toluene, ethylbenzene, xylenes (collectively BTEX), and MtBE. Soil samples collected from CSB-6, located near the former waste oil UST, were also analyzed for DRO, TRPH, Halogenated VOCs, VOCs, PCBs, and total metals. Results of the investigation indicated that concentrations of GRO, DRO, and TRPH were present in soil samples collected from CSB-5 and CSB-6. Soil samples collected from CSB-6 were also reported to contain concentrations of heavy oil. Benzene was not detected in any of the soil samples collected. MtBE was reported in soil samples collected from the boring of CSB-3 at depths of 15 and 21 feet bgs at concentrations of 0.66 milligrams per kilogram (mg/kg) and 0.15 mg/kg, respectively. Concentrations of ethylbenzene, total xylenes, 2-methylnaphthalene, PCB Aroclor 1248, and total metals were detected in soil samples collected from CSB-6 at depths of 5 and 15 feet bgs.

On March 4, 1999, Gettler-Ryan removed the product lines which carried fuel from the USTs to the three fuel dispenser islands at the site. The soil underlying the fuel line trenches was observed to be stained and exhibited a gasoline odor. As the excavation continued, gasoline odor and gray staining of the soil were observed in the trench between the central and northern two dispenser islands. Six trench floor soil samples (T-1 through T-6) and eight soil samples from beneath the dispensers (D-1 through D-8) were collected and analyzed for GRO, BTEX, MtBE, and lead (SECOR, 1999).

Due to concentrations of gasoline constituents in soil samples T-2, T-4, T-6, D-5, and D-8, soil was excavated to approximately 8 to 10 feet bgs and confirmation samples (T-2A, T-4A, T-6A, D-5A, and D-8A) were collected from the bottom of the over-excavated trenches. One of the five over excavation samples, T-2A located between the northern and middle dispenser island at 10 feet bgs contained 9,700 mg/kg GRO and 82 mg/kg benzene. Approximately 127 tons of soil were removed from the site after the excavation, and transported by Dillard Trucking to a Browning Ferris Industries offsite disposal facility for proper disposal (SECOR, 1999).

Between August 28, 2000 and September 6, 2000, two 10,000-gallon unleaded gasoline USTs, one 8,000-gallon UST, and associated product lines and dispensers were removed from the site. SVE

well V-3 was also destroyed during this time. Soil samples collected from beneath the USTs contained maximum concentrations of 6,590 mg/kg GRO (S-13-TP1M), 0.00560 mg/kg benzene (S-11-TP3N), and 956 mg/kg MtBE (S-13-TP1M) at depths ranging from 11 to 13 feet bgs. Over-excavation of the UST area was confined to the expansion area intended for the new USTs. Samples collected at a depth of 18 feet bgs in the over-excavated area contained maximum hydrocarbon concentrations at 3,440 mg/kg GRO (S-18-TP2SE), 6.18 mg/kg benzene (S-18-TP2SW), and 140 mg/kg MtBE (S-18-TP2SE). Maximum concentrations reported in confirmation samples collected after over-excavating the dispenser areas to depths of 5 to 6 feet bgs were 2,040 mg/kg GRO and 4.61 mg/kg MtBE in sample S-6-D2E (SECOR, 2001).

During UST replacement activities performed in August and September 2000, Henderson Construction Company, the ARC subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a mixture of gasoline and rinsate water from one of the gasoline USTs. The spill was apparently caused by attempting to remove the UST with the rinsate water still inside the UST. A portable dual-phase extraction (DPE) system was mobilized to the site shortly thereafter, and operated for a 10-day period to mitigate the effects of the reported release (SECOR, 2000).

In November 2001, SECOR International, Inc. (SECOR) installed two groundwater monitoring wells (MW-5 and MW-6) and one soil boring (SB-1). Maximum concentrations of GRO and MtBE were reported at 21,000 mg/kg and 470 mg/kg in a sample collected from MW-6 at a depth of 15.5 feet bgs, respectively. The maximum benzene concentration (6.9 mg/kg) was reported in a sample collected from MW-5 at a depth of 20.5 feet bgs. Wells MW-5 and MW-6 were completed at a depth of 60 feet bgs. Groundwater samples have been obtained from MW-6, but MW-5 has been generally dry since the well was installed. Groundwater samples collected from MW-5 in April 2010 reported concentrations of 4,300 µg/L GRO, 55,000 µg/L MtBE, and 89,000 µg/L tert-butyl alcohol (TBA) (Table 8). The soil boring of well MW-5 was advanced approximately 2.5 feet into a silt and clay layer, and the well was installed at 60 feet bgs to avoid penetrating a clay layer that was encountered at 57.5 feet bgs (SECOR, 2002).

In April 2003, URS performed additional characterization in the vicinity of MW-5 to determine whether shallow groundwater was present at a depth greater than the 60-foot completion depth of MW-5, and to characterize the vertical extent of petroleum hydrocarbons and fuel oxygenates at this location, near the waste oil UST. Boring MW-5A was drilled adjacent to MW-5 and soil was sampled to a depth of 85 feet bgs. After drilling through a sandy clayey silt and clayey silty sand from approximately 60 to 64 feet bgs, the augers were left open for observation for over one hour at a depth of 66 feet bgs in moist silty sand. No water accumulated in the borehole, so an additional well was not installed at this location. No GRO or benzene concentrations greater than the laboratory reporting limits (LRL) were detected in soil samples collected from 60.5 to 85 feet in the boring. However, MtBE was detected in soil samples collected from 60.5 to 85 feet bgs at concentrations ranging from 0.12 to 1.0 mg/kg (URS, 2003).

In September 2005, URS advanced nine soil borings (SB-1 renamed SB-1A, SB-2 through SB-5, and SB-7 through SB-10) to depths ranging from 50 to 81 feet bgs in order to further assess the vertical and lateral extent of dissolved hydrocarbons in the subsurface. This work was summarized in the URS *Additional Soil and Groundwater Investigation Interim Report* dated April 5, 2006. Soil boring SB-6 was not advanced due to refusal at approximately 5 feet bgs. In soil samples collected from onsite borings SB-1A, SB-2, and SB-3, GRO and MtBE were reported at maximum concentrations of 2,700 mg/kg (SB-1A at 16.5 feet bgs) and 120 mg/kg (SB-1A at 21.5 feet bgs), respectively. Benzene was not detected in the onsite borings, and GRO, BTEX, and fuel oxygenates were not detected in the soil samples collected from the offsite borings SB-4, SB-5, and SB-7 through SB-10 at concentrations above LRLs. Soil samples collected from borings SB-2 and SB-3 were analyzed for the presence of additional VOCs. Aside from the gasoline related compounds 1,2,4-trimethylbenzene, 1,3,5 trimethylbenzene, n-butylbenzene, and n-propylbenzene, soil samples collected from borings SB-2 and SB-3 did not contain VOCs at concentrations above the LRLs. Soil samples collected from boring SB-1A, advanced in the vicinity of the waste oil UST, were analyzed for the presence of DRO and Stoddard Solvent; these analytes were detected in the majority of samples collected to a depth of approximately 51.5 feet bgs. Maximum concentrations of DRO (790 mg/kg) and Stoddard Solvent (1,200 mg/kg) were reported in the sample collect from SB-1A at 16.5 feet bgs. Grab groundwater samples were collected from onsite boring SB-3, offsite borings SB-4, SB-5, and SB-7 through SB-10. The grab groundwater sample collected from onsite boring SB-3 at approximately 60.5 feet bgs contained concentrations of 59,000 µg/L GRO, 670 µg/L benzene, and 49,000 µg/L MtBE. No VOCs other than the gasoline range components of 1,2-4 trimethylbenzene (930 µg/L), and 1,3,5 trimethylbenzene (380 µg/L) were present in the grab groundwater sample collected from SB-3. The grab groundwater samples collected from the offsite soil borings did not contain GRO, BTEX, and oxygenates at concentrations greater than the LRLs. Based upon the results of this investigation, URS recommended the installation of three additional offsite groundwater monitoring wells (MW-7 through MW-9) to further delineate the lateral extent of dissolved petroleum hydrocarbons offsite (URS, 2006).

On August 28 and 29, 2008, the installation of wells MW-7 through MW-9 was performed. Results of the investigation and an updated site conceptual model (SCM) were presented in the Stantec *Additional Site Assessment Report and SCM* dated June 14, 2010.

In a letter dated July 6, 2010, the GPP requested a workplan for remediation feasibility testing. The proposed feasibility testing scope of work was presented in the Stantec *Additional Assessment and Remediation Feasibility Test Workplan* (*Workplan*) dated October 29, 2010. GPP issued a letter dated January 13, 2011, stating the information provided in the *Workplan* serves as a Remedial Action Plan (RAP) which required ARC to forego SVE feasibility testing and move directly into active SVE remediation. The GPP letter also directed submittal of an addendum to the *Workplan*. The revised assessment and remediation plan was submitted to GPP on March 1, 2011.

In June and July 2011, Stantec completed an additional assessment and bench-scale feasibility testing. The work involved the installation of three additional onsite (MW-10) and off-site (MW-11 and MW-12) groundwater monitoring wells to further characterize petroleum hydrocarbons in soil and groundwater, the installation of two additional SVE wells (V-9 and V-10) for expansion of the existing offline SVE system, and one dual-nested soil vapor probe (SV-1S/SV-1D) to evaluate vapor phase petroleum hydrocarbons near the western property line. On December 21, 2011, Stantec collected soil vapor samples from vapor probes SV-1S and SV-1D. Soil vapor analytical data summarized in Table 10 documents the primary soil vapor constituents of concern along the western property line are MtBE and PCE. The PCE concentrations reported in the vapor samples collected from SV-1S and SV-1D are likely derived from operations at the former Southgate Cleaners located west of the site. Details of the completed assessment and In-Situ Chemical Oxidation (ISCO) feasibility testing utilizing hydrogen peroxide (H_2O_2), and an updated SCM were presented in the Stantec *Additional Assessment Report of Findings, Bench Scale Feasibility Test Report,* and *Site Conceptual Model* dated February 14, 2012 (Stantec, 2012).

In a letter dated June 19, 2012, GPP issued a notice of violation (NOV) for the failure to implement the operation of the SVE system. Although significant progress had been made, additional tasks that required completion before the new SVE system could be started included connection of power and natural gas services from Pacific Gas & Electric (PG&E) and issuance of a permit from the Bay Area Air Quality Management District (BAAQMD) for Authority to Construct (ATC) the system. As communicated to GPP in electronic correspondence dated June 12, 2012, the BAAQMD delayed issuance of the ATC permit due to concern about chlorinated solvents that are present in soil vapor beneath the site and the potential for dioxin formation when operating the thermal oxidizer to treat chlorinated solvents present in the extracted soil vapor. In order to maintain compliance with ATC permit conditions, Stantec performed an SVE source test using Granular Activated Carbon (GAC) vessels arranged in series on July 2 and 3, 2012. Following installation of the GAC vessels, Stantec worked with the SVE equipment manufacturer to modify the SVE system controls, bypass the thermal oxidizer, and re-route the extracted soil vapor through the GAC vessels for treatment. As part of the source test, individual extraction well vapor samples were analyzed for contaminant concentrations. Stantec evaluated influent vapor analytical data to determine the total chlorinated atom mass and determine whether the dioxin health risk trigger level will be exceeded. The calculated dioxin trigger level was not exceeded, and the thermal oxidizer was placed back online (Stantec, 2013).

Phase 1 of the SVE system installation began in August 2011 and included connection of the new SVE wells V-9 and V-10 and connection of existing well V-4 to an expanded remediation system compound through lateral conveyance piping placed underground. While reviewing historical soil analytical data, it was noted that 1,200 mg/kg GRO was present in a soil sample collected at 46 feet bgs in soil boring SB-1A, located between MW-5 and newly installed well MW-10. Since the shallow SVE wells are screened from 15 to 35 feet bgs, Stantec connected groundwater monitoring wells MW-5 and MW-10 (screened from 40 to 60 feet bgs) to the SVE system to insure

recovery of hydrocarbon mass present in soil at 46 feet bgs. The extraction piping was installed from V-5 to MW-5 and from V-10 to MW-10 and controlled with a ball valve. The ball valve allows extraction from V-5 or MW-5 and V-10 or MW-10. Phase 2 of the SVE system installation was completed in February 2012 with installation of a thermal oxidizer. System startup and source testing was conducted in July 2012 upon completion of PG&E utility connection and BAAQMD air permitting (Stantec, 2013). Stantec's *Soil Vapor Extraction System Source Test Report* dated October 19, 2012 was also submitted to the GPP, in accordance to their directive. The SVE system startup was completed on October 22, 2012.

Between March 18 and 27, 2013, Stantec supervised National Exploration, Wells, and Pumps (NEWP) during advancement of three soil borings (SB-11 through SB-13). Soil and groundwater samples were submitted to JAG Consulting Group for bench scale testing and analysis. The results, including an updated SCM, are summarized in Stantec's *Additional Assessment Report, Bench Scale Feasibility Test Report, and Site Conceptual Model* dated June 13, 2013. GPP reviewed the report and responded in a letter dated March 18, 2014. GPP requested a workplan be submitted for additional assessment and well replacement. Stantec submitted a *Workplan for Additional Assessment* dated June 19, 2014. The workplan was conditionally approved by GPP in a letter dated August 18, 2014.

Between December 2014 and February 2015, Stantec completed an additional assessment that included the following scope of work:

- Advanced four soil borings (SB-14 through SB-17) to depths ranging from 130 to 160 feet bgs and installed five groundwater monitoring wells (MW-13 through MW-17) to depths ranging from 32 to 62 feet bgs. The data was used to further assess the lateral and vertical extent of MtBE in soil and the lateral extent of MtBE present in the shallow perched zone.

- Installed four groundwater monitoring wells (MW-4D through MW-7D) to assess the regional groundwater underlying the site at approximately 150 feet bgs.

- Advanced three hand augers borings (HA-1 through HA-3) adjacent to the dispenser islands to further assess the extent of MtBE in soil at 5 feet bgs.

Based on the assessment results the vertical extent of MtBE in soil was generally defined and lateral extent of MtBE in soil and shallow perched groundwater zone was not defined to the north and northwest of the site. MtBE was only reported in the water sample collected from MW-4D at a concentration of 1.6 parts per billion, so the bulk of the MtBE mass present in the source areas at the site has not reached the regional water. In addition, operation of the SVE system appears to have removed the bulk of the MtBE mass present in soil above the shallow perch water zone. The assessment results are summarized in Stantec's *Additional Assessment Report and Site Conceptual Model* Dated February 25, 2015.

During October and November 2015, Stantec completed the following activities at the site:

- To assess the lateral extent of MtBE in soil between the perched and regional groundwater zones, and to assess the lateral extent of hydrocarbons in the main perched groundwater zones, soil borings were advanced to the west (SB-18) and west-northwest (SB-19) of the site. Analytical results indicate that MtBE is present at concentrations ranging from 0.006 to 0.11 mg/kg at depths between 100 and 120 feet bgs. A sample collected at 130 feet defines the vertical extent of MtBE in this area. Non-detect results from samples collected from SB-19 define the lateral extent of impacts to the west-northwest of the site.

- Groundwater monitoring well MW-18 was installed to a total depth of 64.5 feet bgs west of the site to assess the perched groundwater zone to the west of the site.

- Due to low dissolved-phase hydrocarbon concentrations, and with approval from the GPP, groundwater monitoring well MW-1 was properly destroyed by over-drilling. Replacement well MW-1R was installed approximately seven feet east of the original location of MW-1. MW-1R was installed with a total depth of 60 feet bgs, the total depth of original well MW-1 was 70.5 feet bgs.

- To assess the groundwater conditions in the perched zone to the southwest of the Site, Stantec oversaw the installation of replacement of groundwater monitoring well MW-11R. MW-11R was advanced by over-drilling and deepening well MW-11 to a total depth of 65 feet bgs. Original depth of MW-11 was 50 feet bgs.

- Vapor extraction wells V-12 and V-13 were installed to total depths of 90 feet bgs and screen from 70 to 90 feet bgs to facilitate the remediation of deep MtBE concentrations in the northwest quadrant of the site.

- To assess the extent of waste oil impacts to soil in the vicinity of the current waste oil UST in the southwest corner of the site, soil borings SB-21 and SB-22 were advanced to 40 and 35 feet bgs, respectively. Significant reductions of GRO, ORO, BTEX and MtBE concentrations were reported in samples collected from borings SB-21 and SB-22 when compared to historical data from borings CSB-6, MW-5A and well V-5 (see Table 2).

2.3 IDENTIFICATION OF CONTAMINATION SOURCES

Based on results of historical site assessment activities, the following source areas of contamination have been identified at the site.

2.3.1 Former Gasoline USTs

The area of the former USTs on the east side of the site is considered a source of gasoline contamination at the site. In 2000, GRO, BTEX, and MtBE were reported in soil samples collected during the removal of the former gasoline USTs and excavation of a new UST pit. Concentrations of GRO and MtBE were detected in the 12-foot samples collected from the southern sidewalls of

the central and easternmost gasoline USTs (samples S-12-TP2S and S-12-TP1S respectively), and in the 13 foot sample collected in the center of the eastern-most gasoline UST at the base of the excavation (S-13-TP1M). Over-excavation of the original UST area was conducted to approximately 13 feet bgs and expanded to accommodate installation of the new USTs. The presence of GRO, benzene, and MtBE concentrations in soil samples (S-18-TP2SE and S-18-TP2SW), collected at 18 feet bgs during excavation of the new UST pit, indicate the presence of gasoline in the soil north of the former UST pit. Historical soil analytical data is presented in tables 2 through 6.

2.3.2 Former Waste Oil UST

The area of the former waste oil UST located in the southwestern corner of the site is considered a source of GRO, BTEX, MtBE, DRO, Stoddard Solvent, and motor oil range organics (MRO) contamination at the site. GRO concentrations were also detected in close proximity to the former waste oil UST prior to its excavation, as indicated by concentrations reported in soil samples collected from boring V-5 in 1992. The area of the former UST pit was excavated vertically to a depth of 15 feet bgs and laterally to the east to a depth of 7 feet bgs. Additional assessment conducted east of the former waste oil UST excavation in 1998 (boring CSB-6), 2001 (boring MW-5), 2003 (boring MW-5A), and in 2005 (boring SB-1A) document the presence of GRO and DRO concentrations similar in magnitude to the initial UST pit excavation samples. With the exception of samples from boring CSB-6, the highest concentrations of GRO, DRO, MRO, Stoddard Solvent, oil and grease, benzene, and MtBE were detected in samples collected from depths ranging from 15.5 feet to 30.5 feet bgs. Additional analysis of VOCs have indicated the presence of other benzene derivatives, naphthalene, Stoddard Solvent, waste oil, and p-isopropyltoluene in several samples collected from boring MW-5 to a depth of 35.5 feet bgs. Historical soil analytical data is presented in Tables 2 through 6.

2.3.3 Former Fuel Dispenser Islands

Elevated concentrations of GRO, BTEX, and MtBE reported in soil samples collected during removal and replacement of the former fuel dispensers and product lines in 1999 document soil underlying the dispenser islands and fuel lines are a source area for gasoline impacts in shallow soil. Hydrocarbon impacted soil was excavated beneath the northernmost (D-8), central (D-4), and southernmost dispenser islands (D-2). Soil excavation was also conducted in product line trenches near the former and current USTs (T-2 and T-4) and southernmost fuel dispenser (T-6). Additional samples collected following excavation of hydrocarbon impacted soil beneath sampling points T-2, T-4, T-6, D-5, and D-8 to a maximum depth of 10 feet bgs were reported to contain low to non-detectable levels of GRO, BTEX, and MtBE, with the exception of the 10-foot sample collected from the base of the trench excavation at location T-2A. Soil sample T-2A contained the highest concentrations of GRO, BTEX, and MtBE during this phase of investigation. Shallow soil samples were collected from two additional hand auger borings, HA-1 and HA-2, in December 2014 to further assess impacted soil adjacent to the dispenser islands. Historical soil analytical data is presented in Tables 2 through 6.

3.0 GEOLOGY/HYDROLOGY

The site is located on the west side of the San Francisco Peninsula of California, approximately one mile east of the Pacific Ocean (Figure 1). Shallow subsurface deposits in the site vicinity are part of the Colma Formation, which consists of pale colored, loose or friable, well sorted, fine to medium grained sand with subordinate gravel, sandy silt, and clay. The Colma Formation has a maximum thickness of about 200 feet, and is underlain by the Merced Formation bedrock (Helley et al. 1979). The nearest surface water is Lake Merced, located approximately 4,200 feet to the north-northwest.

According to the California Regional Water Quality Control Board, San Francisco Bay Region Water Quality Control Plan, groundwater underneath the site is located in the Westside Groundwater Basin. The Westside Groundwater Basin has existing uses as a municipal, domestic, and agricultural water supply.

Based on borings advanced at the site, the area is underlain primarily by fine-grained silty sand and sand from the ground surface to the maximum depth explored of 220 feet bgs. Soil boring logs are presented in Attachment B. As shown in the boring logs, fine grained beds of silt and/or clay were encountered from approximately 58 to 64 feet bgs in most borings advanced onsite. Another fine-grained interval was encountered from 190 to 200 feet bgs in MW-3D. The shallow low permeability fine grained layers appear to partially limit vertical migration of groundwater, allowing shallow groundwater to accumulate on it. Based on results from recent and historical boring logs, the upper surface and thickness of the low permeability layer that allows perched groundwater to exist has significant lateral variability. The variability is shown in MW-5, where the groundwater surface elevation is at or slightly lower than the top of the fine grained competent layer. The lower permeability silt and clay layer is encountered much lower in former well MW-1. Referring to the boring log for well MW-9, the lower permeability lithology is encountered at a higher elevation, allowing perched groundwater to exist at an elevation above that present onsite. The variability of the thickness and elevation of the lower permeability layers may be controlled by following factors: 1) differences in field soil descriptions, 2) under or over estimating the bed thickness based on samples collected on 5 foot intervals, 3) deposition as well as erosion of the finer grained layers prior to deposition of the overlying higher permeability sand, and 4) possible variation in cementation within the formation.

3.1 GROUNDWATER FLOW AND GRADIENT

Depth to groundwater within the deep groundwater monitoring well located onsite (MW-3D) has historically ranged from 149.67 feet below top of casing (BTOC) (2nd quarter 2011) to 182.48 feet BTOC (3rd quarter 1997). Historic groundwater monitoring and analytical data are presented in Table 8. The depth to water gradually decreased between 2001 and 2011, and has gradually increased since 2011. Referring to the soil boring log for MW-3D included in Attachment B, a 10-foot thick moist silt to clay layer was logged from 190 to 200 feet bgs. The clay layer is overlain

by dry medium grained sand and underlain by wet to moist sand. Following completion with screen set from 205 to 220 feet bgs the static groundwater was measured at 180 feet bgs, 20 feet above the base of the clay layer. Based on the recently completed assessments, regional groundwater is approximately 145 to 150 feet bgs. Consequently the clay layer logged in MW-3D does not appear to act as a confining layer of the regional groundwater underlying the site.

From 2002 to 2014, the depth to groundwater in shallow aquifer site well MW-1 had varied just under two-feet from 53.81 to 55.71 feet BTOC (Table 9). The predominant shallow groundwater flow direction beneath the site has historically been to the northeast at an average gradient of 0.012 foot of vertical drop per foot of lateral distance (ft/ft) as summarized in Table 9 and illustrated on Figure 4A. As discussed above, the actual groundwater flow direction in the shallow perched zone is difficult to determine due to the lateral and vertical variability of the lower permeability fine grained layer encountered from 55 to 64 feet bgs. During the most recent groundwater monitoring event conducted during the first quarter 2016, perched groundwater beneath the site was measured in the shallow wells at depths between 46.17 (MW-9) and 62.15 (MW-18) feet BTOC, and the depth to groundwater in deep wells MW-3D through MW-7D was measured between 144.45 (MW-7D) and 155.98 (MW-3D) feet BTOC. The subsurface groundwater flow directions were calculated to the west-northwest at a hydraulic gradient of 0.005 feet per foot (ft/ft) for perched groundwater on the eastern portion of the site and surrounding vicinity, and to the east at a hydraulic gradient of 0.006 ft/ft on the western portion of the site and vicinity. Per the GPP letter dated August 16, 2016, future groundwater elevation contour maps will include a full discussion for all groundwater elevation data that is posted but not used in contouring the groundwater surface.

For wells screened within the deeper aquifer, the subsurface flow direction since February 2015 has been toward the northeast to east-northeast with an average hydraulic gradient of 0.014 ft/ft (Figure 4B and Table 10).

During the February 2016 monitoring event, the groundwater elevation in MW-3D was -53.49 feet above MSL and -45.16 feet above MSL in well MW-7D, or approximately eight feet lower than the stabilized water level in MW-7D.

4.0 COMPLETED SCOPE OF WORK

Between May 9, 2016 and May 20, 2016, Stantec field personnel supervised NEWP of Richmond, California perform the advancement of soil boring SB-20D, installation of monitoring well MW-19 and installation of deep SVE well V-14 at the site. Field notes documenting work at the site are presented in Attachment C.

4.1 ASSESSMENT DATA OBJECTIVES

To assess the lateral extent of MtBE in soil between perched and regional groundwater and to assess the lateral extent of hydrocarbons in the main perched groundwater zone to the northwest and north of the site, Stantec oversaw the completion of the following work:

- Advancement of SB-20D to the west of the Site.

To assess the perched groundwater zone to the north of the site, Stantec oversaw the completion of the following work:

- Installation of MW-19 to the west of the site.

To facilitate soil vapor extraction feasibility testing in the SVE wells screened from 70 to 90 feet bgs onsite, Stantec oversaw the completion of the following work:

- Advancement and installation of offsite well V-14.

Soil boring SB-20D was advanced after refusal was encountered during the attempted borings of SB-20, SB-20B, and SB-20C in the City of Right-of-Way at approximately 23 feet bgs. Borings SB-20 and SB-20B were attempted in October 2015, and boring SB-20C was attempted in February 2016.

4.2 PRE-FIELD ACTIVITIES

4.2.1 Health and Safety

A site-specific health and safety plan (HASP) was prepared in accordance with the requirements outlined in the Occupational Safety and Health Administration (OSHA) Standard "Hazardous Waste Operations and Emergency Response" guidelines (29 CFR 1910.120). The document was reviewed and signed by all onsite consulting personnel and subcontractors prior to performing work at the site.

4.2.2 Permitting and Utility Clearance

Prior to conducting work at the site, subsurface drilling and encroachment permits were obtained from the City of Daly City. An encroachment permit from the City of Daly City was obtained in order to setup traffic control along Southgate Avenue. Under an existing access agreement with Kimco realty corporation

Underground Service Alert (USA) was contacted to delineate subsurface utilities near the proposed boring locations with surface markings, and a private utility locator was contracted to clear the area. GPP was notified of the assessment schedule prior to the start of field activities. Permits for field activities are presented as Attachment D.

4.3 SOIL BORING ADVANCEMENT

Stantec oversaw NEWP execute the assessment work at the site in May 2016. Soil boring and well completion details are summarized in Table 1 and locations of completed soil borings are shown on Figures 2 and 3.

Prior to advancing the borehole for soil sampling, soil boring SB-20D was cleared of utilities using a combination of hand auger and air-knife to a depth of 6.5 feet bgs and 110% of the boring diameter.

Soil samples were collected for lithologic description and analysis using a spilt-spoon sampler lined with 2-inch diameter by 6-inch long stainless-steel sleeves in hollow stem auger borings. Soil sample analytical data is provided in Table 2.

Soil boring SB-20C was initially advanced using HSA drilling equipment in the City-Right-of-Way on February 23, 2016. During drilling refusal was encounter at approximately 23.5 feet bgs. As described in previous communications with GPP, Stantec reported the refusal to the City of Daly who indicated a storm drain line is present in the street that lines up with borings SB-20, SB-20B, and SB-20C. Stantec selected a new drilling location on private property located north of the Southgate Avenue and the new boring location was designated SB-20D. Soil boring SB-20D was advanced using hollow stem auger drilling equipment to an approximate depth of 131 feet bgs. Sampling was conducted using a California Modified split-spoon sampler fitted with 2-inch diameter by 6-inch long stainless-steel sleeves Down hole drilling equipment was cleaned before advancing each borehole and sampling equipment was cleaned between each sampling interval. Each soil sample was screened for hydrocarbon vapors using a portable photoionization detector (PID). Soil encountered during drilling activities was either logged continuously, or at approximately 5 foot intervals by Stantec field personnel using the Unified Soil Classification System (USCS), and working under the supervision of a licensed California Professional Geologist.

Soil samples were retained and submitted for laboratory analysis as presented in Table 2. Soil samples selected for laboratory analysis were sealed with Teflon® sheets and plastic caps, then labeled and placed on ice in an insulated container for delivery under proper chain-of-custody (COC) documentation to TestAmerica Laboratories Inc. (TestAmerica), a California-licensed laboratory.

After soil samples were collected and the boring was advanced to total depth, the borehole was tremie-grouted to the surface using a ratio of 94 pounds of cement per 6 gallons of water, and patched with concrete to match the surrounding grade.

4.3.1 Soil Boring Soil Sample Analysis

Soil samples collected from SB-20D were analyzed for GRO by Environmental Protection Agency (EPA) Method 8015M; BTEX, MtBE, TBA, DIPE, ETBE, TAME, 1,2-DCA, and EDB, by EPA Method 8260B. Certified laboratory analytical reports are presented as Attachment E.

4.4 GROUNDWATER MONITORING WELL INSTALLATION

4.4.1 Perched Groundwater Monitoring Well

Stantec oversaw NEWP during the installation of well MW-19, in order to assess the perched groundwater zone to the north of the Site. Well MW-19 was installed with a screen interval of 52.5 to 62.5 feet bgs at the location shown in Figures 2 and 3. Soil boring and well construction details are summarized in Table 1 and a soil boring log is presented in Attachment B. Prior to advancing the borehole for soil sampling and well installation, well MW-19 was cleared of utilities using a combination of hand auger and air-knife to a depth of 6.5 feet bgs, and 110% of the boring diameter.

MW-19 was advanced using a drilling rig equipped with 8-inch diameter hollow stem augers. Lithology observed during the advancement and sampling of SB-20D was used to determine the well construction details, and due to the proximity of SB-20D, no soil samples were collected from ground surface to 61.5 feet bgs. A soil sample for lithologic verification and analyses was collected from 62 feet bgs.

MW-19 was constructed using 4-inch diameter schedule 40 polyvinyl chloride (PVC) casing with 0.020" slotted screen set between 52.5 to 62.5 feet bgs. A sand filter pack was placed within the annulus of the well from the bottom of the boring to approximately two feet above the top of the well screen. The annulus of the well was sealed with 3 feet of hydrated bentonite on top of the sand and neat cement grout to surface. The surface was completed with a traffic rated well box to match the surrounding grade.

4.4.1.1 Groundwater Monitoring Well Soil Sample Analysis

The soil sample collected from MW-19 was analyzed for GRO by EPA Method 8015M; BTEX, MtBE, TBA, DIPE, ETBE, TAME, 1,2-DCA, and EDB by EPA Method 8260B. Certified laboratory analytical reports are presented as Attachment E.

4.4.2 Vapor Extraction Well Installation

Stantec oversaw NEWP during the installation of one additional SVE well V-14 to facilitate soil vapor extraction radius of influence feasibility testing in the onsite deep SVE wells screened from 70 to 90 feet bgs (Figures 2 and 3). Soil boring and well construction details are summarized in Table 1 and a soil boring log is presented in Attachment B. Prior to advancing the borehole for soil sampling and well installation, well V-14 was cleared of utilities using a combination of hand auger and air-knife to a depth of 6.5 feet bgs, and 110% of the boring diameter.

V-14 was advanced using a drilling rig equipped with 10-inch diameter hollow stem augers to a depth of 91.5 feet bgs. Soil samples were collected using a California Modified split-spoon sampler fitted with stainless steel sleeves at 10 foot intervals from 10 to 60 feet bgs and at 5 foot intervals from 65 to 90 feet bgs. Soil samples at 66, 76 and 86 feet bgs were retained for laboratory analysis to complement the existing soil sample data from the adjacent borings SB-16 and SB-18. All other samples were collected from V-14 were used for lithologic description and field screening.

Well V-14 was constructed with 4-inch diameter schedule 40 PVC casing, with 0.020" slotted screen set between 70 and 90 feet bgs. A sand filter pack was placed within the annulus of the wells from the bottom of the borings to approximately two feet above the screened interval. The annulus was sealed with 3 feet of hydrated bentonite on top of the sand and neat cement grout to surface. The surface was completed with a traffic rated well box to match the surrounding grade. Following completion of the well on May 12, 2016 (prior to well development), the static water level was measured at 88.68 feet below top of casing.

4.4.2.1 Vapor Extraction Well Soil Sample Analysis

Soil samples from V-14 were analyzed for GRO by EPA Method 8015M; BTEX, MtBE, TBA, DIPE, ETBE, TAME, 1,2-DCA, EDB, Tetrachloroethene (PCE), Trichloroethene (TCE), by EPA Method 8260B. Certified laboratory analytical reports are presented as Attachment E.

4.4.3 Well Development and Sampling

Following installation, wells MW-19 and V-14 were developed on May 20, 2016, by surging the wells over the lengths of the screen intervals and bailing using a surge block and bailer to remove fine-grained sediments for the wells and sand pack. Prior to development, the bentonite seal and neat cement grout were allowed to cure for a period of at least 48 hours. Periodic measurements of pH, conductivity, and temperature were made during development

to establish values for groundwater. A bailer was used recover water and remove sediment from the wells.

During development of V-14, water was logged at 88.68 feet below top of casing and depth to bottom was tagged at 90.30 feet below top of casing. After development, the depth to water in well V-14 was monitored at 90.00 feet below top of casing, leaving 0.3 feet of water in the well. Due to the limited amount of water in well V-14 and low recharge rates, only 4.5 gallons of water was recovered over a 3 hour period and the pH, conductivity, and temperature readings did not stabilize.

During development of MW-19, water was logged at 52.29 feet below top of casing and depth to bottom was tagged at 62.10 feet below top of casing. After development, the depth to water in well MW-19 was monitored at 61.50 feet below top of casing, leaving 0.6 feet of water in the well. Due to the low recharge rates, only 4.0 gallons of water was recovered over a 1.25 hour period.

Well MW-19 and V-14 will be monitored and well MW-19 will be sampled as part of the third quarter 2016 semi-annual monitoring and sampling event. Well development field notes are included in Attachment C.

4.4.4 Well Surveying

Stantec surveyed soil boring SB-20D, groundwater monitoring well MW-19, and vapor extraction well V-14 on May 25, 2016, using NAD 83 (1986) datum to establish geographical location. In addition, wells V-14 and MW-19 were surveyed using NGVD 29 datum for elevation. The survey tied into previous surveys performed at the site, and used at least two existing site features as references. Survey data is presented as Attachment F.

4.5 WASTE HANDLING AND STORAGE

During drilling operations, drilling equipment, sample tubes, sampling tools, and downhole equipment were cleaned prior to use. All rinsate water, purge water, and soil cuttings generated during the drilling operations were placed into properly labeled Department-of-Transportation (DOT) approved 55-gallon drums on site pending characterization and transportation for proper offsite disposal. Drums were picked up by Belshire Environmental Services, Inc. (Belshire) and transported to an approved off-site waste disposal facility. Waste disposal documentation is included in Attachment G.

Waste disposal documentation for the investigation derived waste generated during the assessment activities performed at the site between October 7 and November 6, 2015 is also included in Attachment G.

5.0 RESULTS

5.1 SOIL ANALYTICAL DATA

Soil analytical results from soil boring SB-20D document MtBE is present with concentrations ranging from 0.0075 to 0.036 mg/kg at depths between 69.5 to 131 feet bgs (Table 2). No other analytes were detected above the LRLs in soil samples collected from boring SB-20D. Soil samples were not analyzed from boring SB-20C, due to refusal encountered during attempts at advancement beyond 23 feet bgs.

Soil analytical results from MW-19 did not show any detections above the LRLs in the soil sample collected from 62 feet bgs, which is consistent with the soil data from SB-20D, this includes PCE and TCE (Table 3).

Soil analytical results from the vapor extraction well V-14 document MtBE is present with concentrations ranging from 0.21 to 2.7 mg/kg at depths between 76 and 86 feet bgs (Table 2). TBA was present at a concentration of 1.2 mg/kg in the soil sample from 86 feet bgs. No other analytes were detected above the LRLs in soil samples collected from well V-14.

Soil analytical data is presented in Table 2, and certified laboratory analytical reports are presented as Attachment E.

6.0 DISCUSSION OF FINDINGS

6.1 HYDROCARBON CONCENTRATIONS IN SHALLOW SOIL

As previously reported in Stantec's *Additional Assessment Report and Site Conceptual Model* dated February 25, 2015, results from hand auger borings HA-1 through HA-3 and shallow soil samples collected during the advancement of soil borings and monitoring wells indicate that hydrocarbons are generally non-detect above depths of 10 feet bgs, in shallow soil. All soil samples collected above 10 feet bgs during early 2015 assessment activities were either non-detect or below California Regional Water Quality Control Board - Residential Environmental Screening Levels (ESLs) for shallow soil. These results indicate that the area of the former fuel dispensers and product lines complies with the direct contact criteria of the Low Threat Closure Policy (LTCP) for BTEX, GRO, and MtBE.

Recent assessment work in the area of the used oil tank identified elevated concentrations of GRO and Oil Range Organics (ORO) between three and five feet bgs. The concentration of benzene, ethylbenzene, and naphthalene in the shallow soil samples collected from SB-21 and SB-22 located adjacent to the used oil tank are below the LRLs and below the LTCP Soil Screening Levels for commercial/industrial receptors (Tables 2 and 3).

6.2 DISTRIBUTION OF MTBE IN SOIL

6.2.1 Lateral Distribution of MtBE in Soil

The lateral distribution of MtBE in soil is illustrated on three isoconcentration maps:

- Figure 9, MtBE in soil from 50 to 60 feet bgs (at or above the perched water zone. With the new soil data from SB-20D, the northern extent of MtBE in soil from 50 to 60 feet bgs is now defined.

- Figure 10, MtBE in soil from 70 to 89 feet bgs (below the shallow perched water zone). Only the northern extent of MtBE in soil from 70 to 89 feet bgs is not defined. The MtBE appears to have migrated north of the site and attenuated laterally as evidenced by the lower MtBE concentrations report in SB-20C verses the concentrations reported in SB-17. Higher concentrations of MtBE were reported in onsite boring SB-15 and SB-16 located offsite.

- Figure 11, MtBE in soil from 90 to 110 feet bgs (below the shallow perched water zone). The northern and west-northwest extent of MtBE in soil from 90 to 110 feet bgs is not defined. Based on the presence of MtBE in boring SB-16 at 100 feet bgs, the MtBE appears to have migrated west-northwest as it moved downwards. The MtBE concentrations attenuate both laterally and vertically as they migrate from the source

area. The concentration of MtBE in boring SB-16 declined from 13 mg/kg at 71 feet bgs to 1.3 mg/kg at 90 feet bgs. The concentration of MtBE in the soil sample collected from SB-16 at 130 feet was below the LRL.

TBA is generally encountered in the same intervals as MtBE, and appears to evidence that MtBE is being degraded via aerobic biodegradation. The highest concentration of MtBE reported in soil samples collected since December 2014 of 49 mg/kg, was reported in the soil sample collected from V-11 in moist clayey sand at 63 feet bgs. Under the western portion of the site, MtBE remains in the lower permeability silty sand and clayey sand at approximately 60 feet bgs (Figure 10).

Based on comparison of the 2015 MtBE soil data with the pre-remediation soil data, it appears that operation of the SVE remediation system has recovered a large portion of the MtBE mass from 10 to 60 feet bgs. Specifically, comparison of the MtBE soil data from MW-10, which was installed in 2011 (prior to SVE system startup), with the soil data from SB-15, shows the MtBE concentrations present in MW-10 between 10 to 50 feet bgs were non-detect for MtBE between 10 and 50 feet bgs. Similar results were achieved when comparing SB-2 and MW-15, which are approximately 5 feet apart. The table below demonstrates the comparison between MtBE soil data collected before and after SVE remediation was implemented. The reduction of MtBE soil concentrations are also illustrated by comparison of the pre-remediation MtBE concentration map (Figure 12) with the current MtBE soil isoconcentration maps are presented in Figures 9, 10, and 11.

MW-10 (6/30/11)		**SB-2** (7/18/05)		**MW-15** (12/17/14)		**SB-15** (12/9/14)		**V-11** (12/12/14)	
Depth (ft bgs)	MtBE (mg/kg)	Depth (ft bgs)	MtBE (mg/kg)	Depth (ft bgs)	MtBE (mg/kg)	Depth (ft bgs)	MtBE (mg/kg)	Depth (ft bgs)	MtBE (mg/kg)
10	**0.14**	10.5	<0.099	10	<0.0050	10	<0.0050	10	<0.0049
20	**5.3**	20.5	<0.097	20	<0.0050	20	<0.0050	20	<0.0050
30	**31**	30.5	**3.1**	30	<0.0050	30	**0.0090**	30	<0.0048
40	**12**	40.5	**5.0**	40	<0.0050	40	<0.0049	40	<0.0050
50	**76**	50.5	**3.9**	50	**0.065**	50	**0.015**	50	<0.0047

6.2.2 Vertical Distribution of MtBE in Soil

Referring to Figure 12, soil sample results from SB-15, SB-16, and SB-18 document the vertical limit of MtBE in soil at the site. The 0.0067 mg/kg MtBE reported in the soil sample collected from SB-15 was collected at 160 feet bgs, below the regional groundwater surface. Soil samples collected from SB-11, SB-17, and SB-20D at depths ranging from 120 and 131 feet bgs contain concentrations of MtBE slightly above the LRLs. The concentration of MtBE in borings SB-11 and SB-17 attenuates with depth by 2 to 3 orders of magnitude.

6.3 DISTRIBUTION OF MTBE IN GROUNDWATER

6.3.1 Shallow Perched Water Zone

As shown on the First Quarter 2016 Dissolved MtBE Isoconcentration Map presented as Figure 8, the lateral extent of MtBE dissolved in groundwater in the shallow perched water zone is now defined to the west, northeast, east, southeast, and south of the dispenser island source areas.

Since groundwater is not present in MW-11 or in MW-11R, Stantec cannot strictly say the lateral extent MtBE dissolved in groundwater within the shallow perched water zone is defined. Although the maximum MtBE concentration reported in the soil sample collected from MW-11 in 2001 was 0.17 mg/kg, operation of the shallow SVE system is expected to be effective in recovery of MtBE mass in the soil. It should also be noted that soil samples collected from MW-10 contained 76 mg/kg MtBE at 50 feet bgs, documenting lateral attenuation of MtBE in soil toward the southwest.

Due to the 790 µg/L MtBE reported in the grab groundwater sample collected from SB-17, the northern extent of MtBE dissolved in groundwater is not defined. Well MW-19 was sampled as part of the third quarter 2016 groundwater sampling event on July 25, 2016. The data, not yet reported, documents MtBE is present in well MW-19 at a concentration of 0.51 ug/L. The data will be presented in the forthcoming semi-annual groundwater monitoring report. With the exception of well MW-4, the concentration of MtBE present in the shallow perched water zone continues to decline (Figure 8, Table 8,). It should be noted the concentration of MtBE reported in well MW-4 prior to running the SVE system was as high as 15,000 µg/L in October 2011.

6.3.2 Regional Groundwater

The regional groundwater aquifer is unconfined and present at approximately 145 to 150 feet bgs. Referring to Table 8, groundwater samples collected from well MW-4D after installation were initially reported with a concentration of 1.9 µg/L. However, subsequent sampling indicates the concentrations of all analyzed constituents are below the LRLs.

6.4 ASSESSMENT DATA GAPS AND CONCLUSIONS

Based on the foregoing data, the following data gaps exist at the site:

- The lateral extent of MtBE in soil north of SB-20D at concentrations ranging from 0.036 to 0.0075 mg/kg from 67 to 131 feet bgs (Figure 10).
- The lateral extent of MtBE in soil west-northwest of SB-18 at concentrations ranging from 0.36 to 0.0060 mg/kg from 100 to 120 feet bgs.
- MtBE in soil has been vertically delineated at depths of 120 to 130 feet bgs at concentrations of <0.0050 mg/kg in borings SB-15, SB-16, SB-18 at 130 feet bgs, and SB-19.

Low MtBE concentrations are present at depths of 120 to131 feet bgs in SB-11 at 0.0091 mg/kg, SB-17 at 0.0050 mg/kg, SB-20D at 0.0075 mg/kg, and in V-11 at 0.018 mg/kg.

Although the lateral extent of MtBE west-northwest of SB-18 and SB-20D is not defined, additional assessment is not recommended for the following reasons:

- The concentration of MtBE in soil attenuates as it migrates laterally toward the north-northwest. The maximum concentration of MtBE present in SB-18 is 0.36 mg/kg at 100 feet bgs, an order of magnitude less than the maximum MtBE concentration of 2.3 mg/kg reported in SB-16 located 60 feet away.

- The concentration of MtBE reported in groundwater samples collected from wells MW-4D, MW-5D, MW-6D, and MW-7D, completed in the reginal groundwater at 145 feet bgs, are below the LRL.

- Operating the SVE system using the newly installed SVE wells completed from 70 to 90 feet bgs will recover MtBE from the formation underlying the shallow perched water zone. Additional details related to soil vapor extraction test are presented in Section 7.0 of this report.

7.0 DEEP REMEDIATION WELL PILOT TESTING

Deep vapor extraction well pilot testing was conducted on July 14 and 15, 2016. Pilot testing consisted of a step test, a radius of influence (ROI) test, and sample collection to estimate potential MtBE mass removal rates. Tabulated results, ROI plots, field data sheets, and laboratory reports are provided as Attachment H.

7.1 SYSTEM DESCRIPTION

A 25 horsepower TECO positive displacement blower is used to extract soil vapor from the subsurface via 13 onsite shallow screened vapor extraction wells (V-1, V-2, V-4 through V-10, MW-1, MW-2, MW-5, and MW-10) and three onsite deep screened vapor extraction wells (V-11 V-12, and V-13). The vapors are abated with a 250 standard cubic feet per minute (scfm) Catalytic Combustion VGTO 250 natural gas fired thermal/catalytic oxidizer. The oxidizer operates in accordance with permit to operate number 20770 issued by the Bay Area Air Quality Management District (BAAQMD) on June 8, 2016.

7.2 DEEP VAPOR EXTRACTION WELL INSTALLATION

Deep vapor extraction wells V-11 through V-14 were installed on December 14, 2014, October 15, 2015, October 13, 2015, and May 9, 2016, respectively (Figure 3). All deep vapor extraction wells are screened from 70 to 90 feet bgs.

Onsite deep vapor extraction wells V-11 through V-13 were connected to the SVE system between April 11 and 14, 2016. Offsite well V-14 was installed for use as an SVE test observation well for horizontal ROI testing and is not connected to the SVE system. Prior to the starting the test

7.3 DEEP VAPOR EXTRACTION WELL TESTS

7.3.1 Feasibility Test – April 17, 2015

A feasibility test was performed using deep extraction well V-11 on April 17, 2015 to determine if extraction from the deep zone was technically possible and to estimate the MtBE mass removal rate that could be expected during full scale operation. Test results indicated that removal of MtBE impacts in the deep zone could be achieved via SVE at a rate of approximately 10.1 lbs/day. Consequently two additional deep screened vapor extraction wells (V-12 and V-13) were installed at the site.

7.3.2 Initial Pilot Test – October 27, 2015

A pilot test was conducted on October 27, 2015 following the installation of deep extraction wells V-12 and V-13. Deep extraction well V-11 was connected to the SVE system via two-inch diameter above ground tubing and used as an extraction well for pilot testing purposes. All other extraction wells were closed off to the system so that soil vapors were extracted exclusively from well V-11. Applied vacuums, flow rates, and FID measurements were taken periodically during the three and a half hour long test to monitor system performance. Influent vapor samples were collected and submitted for laboratory analysis for confirmation of MtBE recovery. Deep extraction wells V-12 and V-13 were used as observation wells for horizontal ROI testing.

MtBE was recovered during the pilot test supporting the findings from the feasibility test, however mass removal rates observed during the pilot test decreased to 0.8 lbs/day. Due to the nearly equidistant spacing of deep observation wells V-12 and V-13 from extraction well V-11, an effective ROI could not be confidently determined. Consequently, an additional deep observation well (V-14) was installed offsite at approximately double the distance to V-11.

7.3.3 Additional Pilot Test – July 14 and 15, 2016

7.3.3.1 Step Testing

A step test was conducted on July 14, 2016 to evaluate the relationship between applied vacuum and extracted vapor flow rate.

A vacuum of approximately two inches of Mercury (inHg), measured at the system, was applied to extraction well V-11. After the vacuum at the wellhead stabilized, flow rates at the system were measured at 10 minute intervals for one hour. The applied vacuum was then stepped up by approximately two inHg and the process repeated. Step test results are presented in Attachment H.

In total four steps consisting of an applied vacuum of two, four, six, and eight inHg were conducted. As shown on the V-11 Step Test Plot (Attachment H), a relatively linear relationship exists between the applied vacuum and the extracted flow rate, indicating that the system could operate at up to eight inHg vacuum and not experience significant reduction in flow due to constriction of the well screen from lithology. Eight inHg appears to be an upper limit for this linear relationship and so was used as the starting point for the subsequent ROI test because it generated the greatest flow.

7.3.3.2 Radius of Influence Testing

A deep well ROI test was conducted on July 15, 2016 to estimate the effectiveness of the SVE system in the deep extraction wells. The ROI test utilized V-11 as the extraction well and wells V-12, V-13, and V-14 as observation wells. Well V-12, V-13, and V-14 are spaced approximately 41 feet, 37 feet, and 89 feet from extraction well V-11, respectively.

Test Setup

All extraction wells were isolated from the system at the manifold with the exception of extraction well V-11. The wellheads of the extraction well and each observation well were fit with sampling ports to allow for the collection of applied vacuum and induced vacuum, respectively. Background vacuums were measured within each observation well prior to initiating the test. Redundant induced vacuum measurements were collected for confirmation purposes via data logging transducers installed within each observation well. A fourth pressure transducer was left at the surface to record changes in atmospheric pressure during the test.

System Operation

The deep well ROI test was conducted between 9:00 AM and 5:00 PM. The system shut down for unknown reasons at 9:41 AM and was restarted at 10:21 AM. The system shut down again at 10:24 AM and was restarted at 10:45 AM; there were no other interruptions to system operation during the remainder of the test.

Test Results

An applied vacuum of between eight and nine inHg, measured at the system, was used to conduct the test. This resulted in an applied vacuum of approximately 40 to 60 inches of water (inH_2O) at the extraction wellhead. As shown on the vacuum vs time plots (Attachment H), induced vacuums in the observation wells were observed to steadily and continuously increase over the test period.

At the end of the test, induced vacuums in observation wells V-12 and V-13 (located 41 and 37 feet from the extraction well, respectively) were measured to be approximately 50% of the applied vacuum; the induced vacuum in observation well V-14 (located 89 feet from the extraction well) was measured to be approximately 25% of the applied vacuum.

ROI Determination

The USEPA suggests that 0.1 inH_2O induced vacuum is the minimum vacuum necessary to adequately enhance volatilization and extraction of impacts to soil (USEPA, 2004). The US Army Core of Engineers further states that 0.1 inH_2O induced vacuum is 'the value often adopted by ROI practitioners as indicative of significant vacuum' (USACE, 2002). For ROI determination during this pilot test, a conservative induced vacuum value of 1.0 inH_2O was used to estimate the deep well ROI.

To observe the change in ROI over time, a trend line was fit to a plot of vacuums vs distance at approximately 100 minute intervals. To determine the final ROI, a trend line was fit to a plot of vacuum vs distance for the vacuum measurements obtained at the end of the test. This trend line was used to interpolate the radial distance an induced vacuum corresponding to 1.0 inH_2O would be measured. Using this method, an estimated maximum deep well ROI of 265 feet was produced. ROI plots are provided in Attachment H.

Effective ROI

Although the maximum horizontal ROI is estimated to be approximately 265 feet, this does not represent the radius of effective air exchange. The USEPA suggest that one pore volume of soil vapor should be extracted per day for effective remedial progress (USEPA, 2004). Based on the step test and historic system operation, the minimum vapor extraction flow rate during continuous operation is anticipated to be approximately 100 scfm. At this extraction rate and with a ROI of 265 feet, one pore volume exchange would take place every 7.66 days.

Using one pore volume exchange per day as a guideline, the radius of effective air exchange is approximately 96 feet.

Well ID	Height	Radius	V - Total Volume	*e* - Porosity	*e*V - Pore Volume	Q - Flow Rate		E - Pore Volume Exchange Time				
	(ft)	(ft)	(CF)	(%)	(CF)	(SCFM)	CF/year	(Mins)	(Hrs)	(Days)	PV/Day	PV/Year
V-11	20.0	265.0	4,412,367	25%	1,103,092	100.0	52,560,000	11,031	183.8	7.66	0.13	48
V-11	20.0	96.0	579,058	25%	144,765	100.0	52,560,000	1,448	24.1	1.01	0.99	363

$$E = \frac{eV}{Q}$$

E = Pore Volume exchange time
V = Volume of soil to be treated (cubic feet [CF])
e = soil porosity (25% for sand)
Q = Total vapor extraction flowrate (scfm)

The ROI of 265 feet represents the greatest distance from the extraction well that an induced vacuum of 1.0 inH_2O would be present. The radius of effective air exchange of 96 feet represents the greatest distance from the extraction well that soil vapor (and contaminants) can be removed during a single day of operation. The 96 foot radius of effective air exchange is the effective ROI for remediation purposes.

7.3.3.3 MtBE Mass Removal Estimation

To determine the concentration of MtBE in extracted soil vapor and allow for the estimation of MTBE mass removal rates during continuous operation, influent and effluent vapor samples were collected approximately halfway through the ROI test and submitted for laboratory analysis. Samples were analyzed for the presence of GRO by EPA method TO-3M and BTEX, MTBE, and (influent) PCE by EPA method TO-15M. BTEX and PCE were reported as non-detect in the influent sample. The results of the MTBE analysis are summarized below.

V-11 Applied Vacuum at Manifold	V-11 Applied Vacuum at Wellhead	V-11 Flow Rate at Manifold	V-11 FID at Manifold	Laboratory Reported Influent Concentration of MtBE	Estimated MTBE Mass Removal Rate from V-11
8.63 inHg	3.87 inHg	129 CFM (92.1 SCFM)	47 ppm	52 ppmv	1.69 lbs/day

InHg = inches of mercury
ppm= parts per million
lbs/day = pounds per day
(S)CFM = (standard) cubic feet per minute
MTBE = Methyl tertiary butyl ether
ppmv = parts per million by volume

7.4 PILOT TEST CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the additional pilot test conducted on July 15th and 16th on deep screened vapor extraction well V-11 the following conclusions can be made:

- A relatively linear relationship exists between applied vacuum and resultant extraction flow rate over the range of applied vacuums tested (two to eight inHg) with eight inHg appearing to be the limit for this relationship.
- An applied vacuum of approximately 8.23 inHg resulted in an extraction flow rate of approximately 127.5 cfm (93.3 scfm).
- The estimated maximum ROI for V-11 is approximately 265 feet. This is based on induced vacuum interpolation and is the greatest distance from the extraction well that an induced vacuum of 1.0 inH_2O would be measured.
- The estimated maximum radius of effective air exchange for V-11 is approximately 96 feet. This is based on one pore volume exchange per day per well.
- Assuming an effective radius of 96 feet for all deep extraction wells, the combined ROI of V-11 through V-13 will reach SB-18 to the west, SB-4 to the north, MW-7 and MW-17 to the east, and past MW-6D to the south (Figure 13A).
- The inclusion of additional deep screened vapor wells or the connection of V-14 to the system does not appear necessary at this time (Figure 13B).
- MtBE was recovered during the feasibility test and during both pilot tests. Operation of the SVE system on the deep screened wells will result in MtBE mass removal from soils between 70 and 90 feet bgs.
- PCE was not detected in the influent vapor stream.

- The SVE system should be restarted for continuous operation on deep screened extraction wells V-11 through V-13.

- During operation of the SVE system, Stantec recommends collecting induced vacuum readings from the four deep groundwater monitoring wells MW-4D, MW-5D, MW-6D, and MW-7D. Well MW-5D is located approximately 20 to 30 feet way from the deep extraction wells and MW-4D is located approximately 55 to 75 feet away from the deep extraction wells. The deep monitoring wells are screen from 140 to 160 feet bgs and groundwater is present in the wells at an approximate depth of 145 feet bgs. If induced vacuum readings are reported in the deep wells that result in 1% of the applied vacuum, the existing SVE wells screen from 70-90 feet bgs may be able to recover MtBE mass present from 90 to 140 feet bgs at the site.

- Until the SVE vertical vacuum influence test can be completed using the deep groundwater monitoring wells, inclusion of additional deep screened vapor wells or the connection of V-14 to the remediation system does not appear necessary at this time (Figure 13B).

8.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the updated assessment data, the following data gaps exist at the site:

- The lateral extent of MtBE in soil north of SB-20D at concentrations ranging from 0.036 to 0.0075 mg/kg from 67 to 131 feet bgs (Figure 10).
- The lateral extent of MtBE in soil west-northwest of SB-18 at concentrations ranging from 0.36 to 0.0060 mg/kg from 100 to 120 feet bgs.
- MtBE in soil has been vertically delineated at depths of 120 to 130 feet bgs at concentrations of <0.0050 mg/kg in borings SB-15, SB-16, SB-18 at 130 feet bgs, and SB-19. Low MtBE concentrations are present at depths of 120 to131 feet bgs in SB-11 at 0.0091 mg/kg, SB-17 at 0.0050 mg/kg, SB-20D at 0.0075 mg/kg, and in V-11 at 0.018 mg/kg.

Although the lateral extent of MtBE west-northwest of SB-18 and SB-20D is not defined, additional assessment is not recommended for the following reasons:

- The concentration of MtBE in soil attenuates as it migrates laterally toward the north-northwest. The maximum concentration of MtBE present in SB-18 is 0.36 mg/kg at 100 feet bgs, an order of magnitude less than the maximum MtBE concentration of 2.3 mg/kg reported in SB-16 located 60 feet away.
- The concentration of MtBE reported in groundwater samples collected from wells MW-4D, MW-5D, MW-6D, and MW-7D, completed in the reginal groundwater at 145 feet bgs, are below the LRLs.
- Operating the SVE system using the newly installed SVE wells completed from 70 to 90 feet bgs will recover MtBE from the formation underlying the shallow perched water zone.

Based on the results of the additional pilot test conducted on July 15th and 16th, 2016 on deep screened vapor extraction well V-11 the following conclusions can be made:

- The estimated maximum radius of effective air exchange for V-11 is approximately 96 feet. This is based on one pore volume exchange per day per well.
- Assuming an effective radius of 96 feet for all deep extraction wells, the combined ROI of V-11 through V-13 will reach SB-18 to the west, SB-20D/MW-19 to the north, MW-7 and MW-17 to the east, and past MW-6D to the south (Figure 13A and Figure 10).

- MtBE was recovered during the feasibility test and during both pilot tests. Operation of the SVE system on the deep screened wells will result in MtBE mass removal from soil between 70 and 90 feet bgs.

- The SVE system should be restarted for continuous operation on deep screened extraction wells V-11 through V-13.

- During operation of the SVE system, Stantec recommends collecting induced vacuum readings from the four deep groundwater monitoring wells MW-4D, MW-5D, MW-6D, and MW-7D. The deep monitoring wells are screen from 140 to 160 feet bgs and groundwater is present in the wells at an approximate depth of 145 feet bgs. If induced vacuum readings are reported in the deep wells that result in 1% of the applied vacuum, the existing SVE wells screen from 70-90 feet bgs may be able to recover MtBE mass present from 90 to 140 feet bgs at the site.

- Until the SVE vertical vacuum influence test can be completed using the deep groundwater monitoring wells, inclusion of additional deep screened vapor wells or the connection of V-14 to the remediation system does not appear necessary at this time (Figure 13B).

9.0 LIMITATIONS AND CERTIFICATION

This report was prepared in accordance with the scope of work outlined in Stantec's contract and with generally accepted professional engineering and environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of Atlantic Richfield Company, a BP affiliated company, for the express purpose stated above. Explanation

Wells are of poly-vinyl-chloride (PVC) construction

ft bgs = Feet Below ground surface

-- = Denotes unknown data or not applicable

Notes

mg/kg = milligrams per kilogram or parts per million (ppm)
-- = Not analyzed
GRO = Gasoline range organics
B = Benzene
T = Toluene
E = Ethylbenzene
X = Total xylenes
MTBE = Methyl tert-butyl ether (by DHS-LUFT / by EPA Method 8260B)
TBA = Tert-butyl alcohol
DIPE = Di-isopropyl ether
ETBE = Ethyl tert-butyl ether
TAME = Tert-amyl methyl ether
1,2-DCA = 1,2 Dichloroethane
EDB = 1,2-Dibromoethane

Lab Notes: CSB-6 1 = D5, 1 - The sample contained 13,000 ppm heavy oil.
2 = D5, 2 - The sample contained 2,300 ppm heavy oil.
3 = D5, 3 - The sample contained 380 ppm heavy oil.
4 = D5, 4 - The sample contained 220 ppm heavy oil.
5 = D5, 5 - The sample contained 430 ppm heavy oil.
6 = D5, 6 - The sample contained 63 ppm heavy oil.

Explanation
SVOC = Semi-Volatile Organic Compounds by EPA Method 8270
feet bgs = feet below ground surface
UST = Underground Storage Tank
mg/kg = milligrams per kilogram
Well V-5 originally named MW-5 (See Table 1)
-- = not analyzed
Lab Note: Soil, MW-5 / 14.5-15 - "No Additional peaks >0.25 mg/kg were identified by the Mass Spectral Library."
Lab Note: Soil, MW-5 / 29.5-30 - "No Additional peaks >0.25 mg/kg were identified by the Mass Spectral Library."
Lab Note: Soil, MW-5 / 89.5-90 - "No Additional peaks >0.25 mg/kg were identified by the Mass Spectral Library."

Explanation:
DRO = Diesel range organics
ORO = Oil range organics
TPH-o = Total petroleum hydrocarbons as oil
ft bgs = feet below ground surface
mg/kg = milligrams per kilogram or parts per million (ppm)
-- = Not analyzed
< = Analyte was not detected above the specified reporting limit
f = Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel

Explanation:
ug/L = micrograms per liter
GRO = gasoline range organics by EPA Method 8260B, modified
BTEX = benzene, toluene, ethylbenzene, and xylenes by EPA Method 8260B
Stoddard Solvent (C9 to C13) analyzed by EPA Method 8015B with silica gel cleanup
Fuel Oxygenates = ethanol, tert-butyl alcohol (TBA), methyl tert-butyl ether (MtBE), di-isopropyl ether (DIPE), ethyl tert-butyl ether (ETBE), tert-amyl methyl ether (TAME), 1,2-dicholoroethane (1,2-DCA), and 1,2-dibromoethane (EDB) analyzed using EPA Method 8260B

Lab Notes:
BZ - Sample preserved improperly (23.0^{o}C at time of sample receiving)
BU - Sample analyzed after hold time expired.
IY - The analyte concentration is derived from a single calibration point.

Table 8
Historical Groundwater Monitoring & Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Notes:

GRO = Gasoline range organics
DRO = Diesel range organics
B = Benzene
T = Toluene
E = Ethylbenzene
X = Total xylenes
MTBE = Methyl tert-butyl ether
TBA = Tert-butyl alcohol
DIPE = Di-isopropyl ether
ETBE = Ethyl tert-butyl ether
TAME = Tert-amyl methyl ether
1,2-DCA = 1,2 Dichloroethane
EDB = 1,2-Dibromoethane
D.O. = Dissolved Oxygen; rounded to the nearest tenth
SPH = Separate phase hydrocarbons
TOC = Top of casing (surveyed); elevations reference NGVD 29
Calc. GW Elev. = Calculated groundwater elevation = TOC - Depth to Water + 0.75*(Measured SPH Thickness); assuming a specific gravity of 0.75 for SPH
µg/L = Micrograms per liter
< = Analyte was not detected above the specified method reporting limit
- = Not measured or analyzed
‡ = Sample collected during SVE System Operation
DRY = Well dry during gauging; not sampled
INA = Well inaccessible; not sampled
MD = Sampling & gauging performed over multiple days during this event
N = Identity of contaminant uncertain (hydrocarbon pattern atypical of indicated analyte); see lab report
NP = Well not purged prior to sampling
NS = Well not sampled
NSP = Well not sampled this event, in accordance with groundwater sampling schedule
VOL = Well not sampled due to insufficient volume of water in well
SS = Stoddard Solvent
* = Insufficient groundwater in well for purging
** = Insufficient groundwater in well for purging. Groundwater elevation considered anomalous
*** = Depth to water > Depth of well. Data Invalid; gauging measurement for MW-9 is erroneous.

Additional Notes:

Refer to the reports in which data was first presented for more information on historical data.
Beginning with the first quarter 2003 sampling event (3/28/03), TPH-g, benzene, toluene, ethylbenzene, total xylenes, and MTBE analyzed using EPA Method 8260B.
Beginning in the fourth quarter 2003, the laboratory modified the reported analyte list. TPH-g was changed to GRO. The resulting data may be impacted by the potential of non-TPH-g analytes within the requested fuel range resulting in a higher concentration being reported.
Beginning in the second quarter 2004, the carbon range for GRO was changed from C6-C10 to C4-C12.
The data within this table collected prior to July 2006 was provided to Stantec by RM and their previous consultants. Stantec has not verified the accuracy of this information.
Beginning in the second quarter 2008, the carbon range for GRO was changed from C4-C12 to C6-C12.
SVE system started for continuous operation on October 24,2012; therefore groundwater samples collected after this date affects the interpretation of the data.
Groundwater samples from wells MW-4D and MW-16 sampled on 2/12/15 and 2/13/15, respectively, were collected less than 48 hours after well development and may not be representative.

TABLE 11
Soil SVOC Analytical Data
ARCO Service Station No. 0465
151 Southgate Avenue, Daly City, California

Well No.	Date	GRO ($\mu g/m^3$)	Benzene ($\mu g/m^3$)	Toluene ($\mu g/m^3$)	Ethyl-benzene ($\mu g/m^3$)	Xylenes ($\mu g/m^3$)	MtBE ($\mu g/m^3$)	Acetone ($\mu g/m^3$)	PCE ($\mu g/m^3$)	Carbon Dioxide (% v)	Oxygen + Argon (% v)	Methane (% v)	Helium (% v)
SV-1S	12/21/11	<3,800	<1.6	<1.9	<2.2	<8.7	**37**	<4.8	**260**	**4.83**	**17.8**	<0.500	<0.0100
SV-1D	12/21/11	<3,800	<1.6	<1.9	<2.2	<8.7	**85**	**4.8**	**610**	**11.5**	**10.8**	<0.500	<0.0100
ESL	Nov-07	**10,000**	84	63,000	210,000	21,000	9,400	NA	NA	NA	NA	NA	NA

Notes:

GRO = Gasoline range organics

MTBE = Methyl tert-butyl ether

PCE = Tetrachloroethene

$\mu g/m^3$ = micrograms per cubic meter

% v/v = Percent volume by volume

NA = Not applicable

10,000 = Environmental screening level exceeded

< = Concentration below the method reporting limit

a = Leak detection compound 1,2-Difluoroethane reported in sample

b = Anomalous % oxygen result

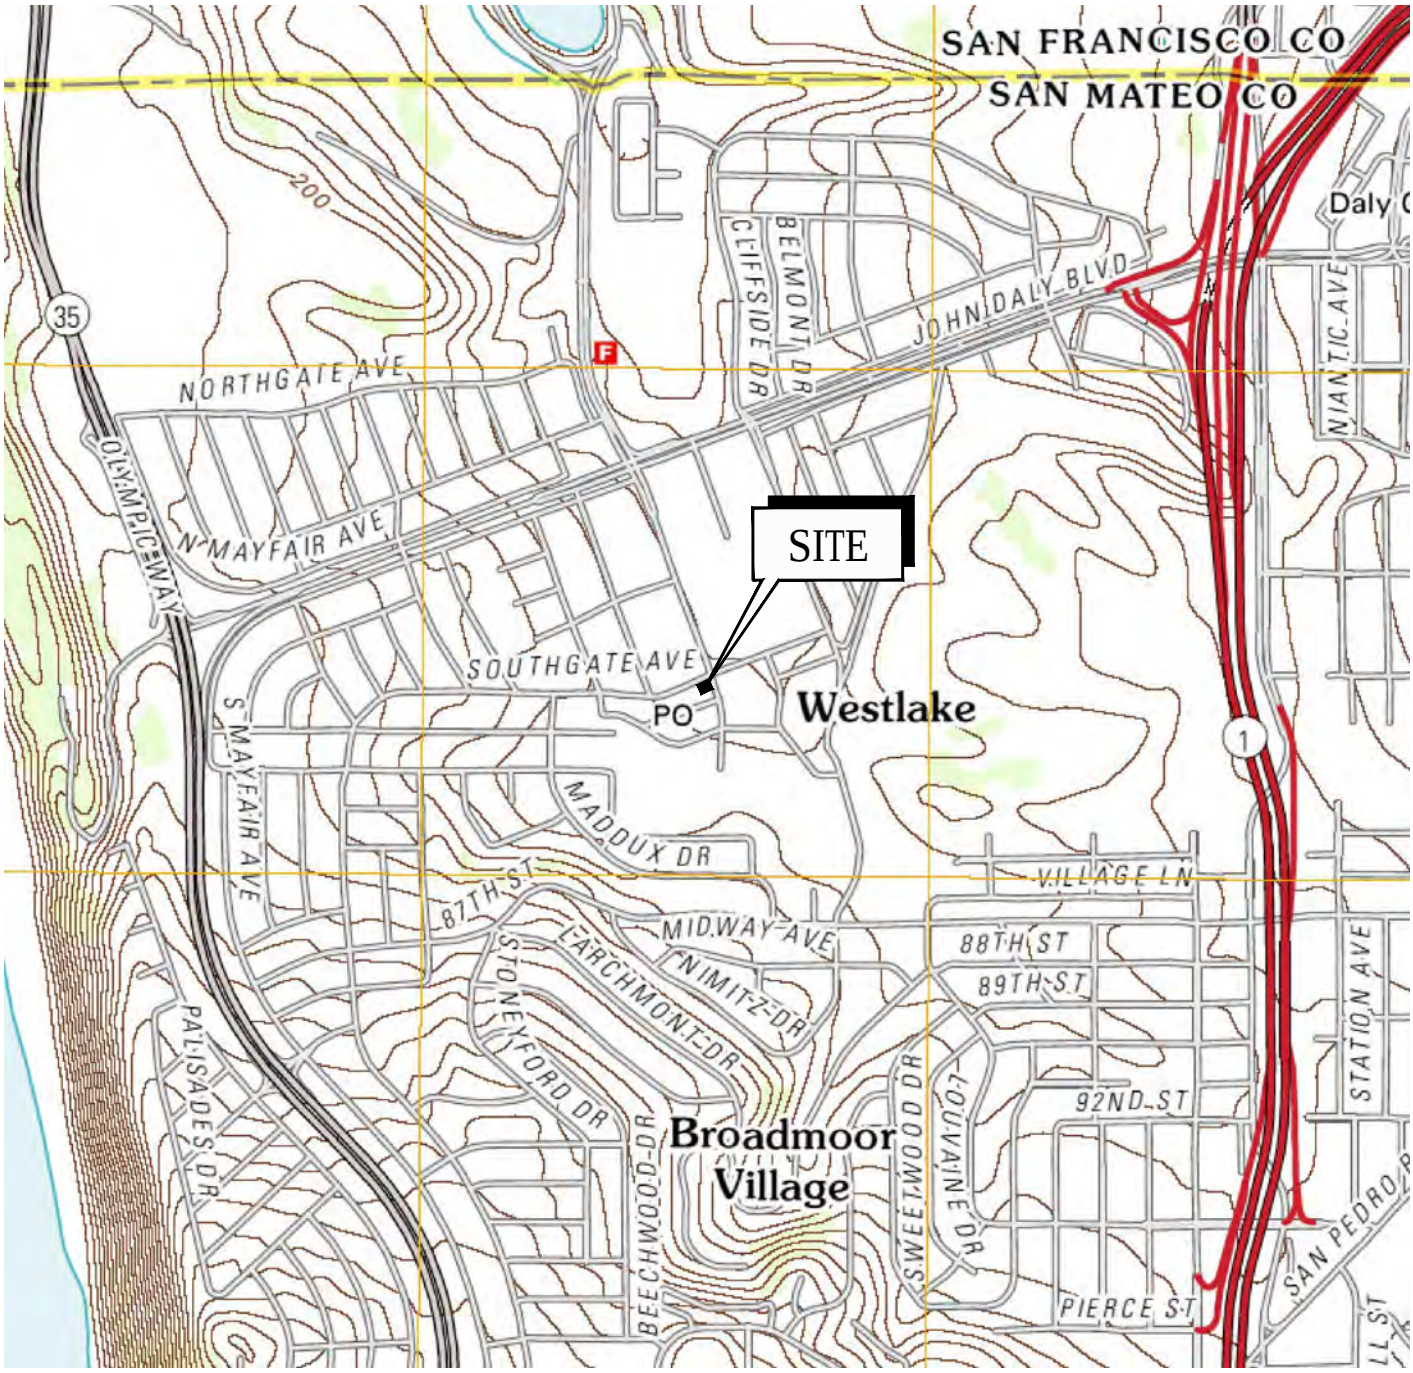
ESL = November 2007 California Regional Water Quality Control Board Environmental Screening Level for residential shallow soils where groundwater IS a potential source of drinking water (most conservative).

TABLE 12
2Groundwater PCE and TCE Analytical Data
ARCO Service Station No. 0465
151 Southgate Avenue, Daly City, Calfornia

Well No.	Date	PCE (µg/L)	TCE (µg/L)	Comments
MW-1	07/27/09	<0.50	<0.50	
MW-2	07/27/09	<10	<10	
MW-4	07/27/09	<25	<25	
MW-7	07/27/09	<0.50	<0.50	
MW-8	07/27/09	<0.50	<0.50	
MW-9	07/27/09	<0.50	<0.50	
V-8	07/27/09	<1.0	<1.0	

Notes:

PCE = Tetrachloroethene



TCE = Trichloroethene

µg/L = Micrograms per liter

< = Analyte was not detected above the specified method reporting limit

- = Not measured or analyzed

- EXCAVATION AREA CONDUCTED MARCH 1999
- EXCAVATION AREA CONDUCTED OCTOBER 1997
- EXISTING UNDERGROUND SYSTEM CONVEYANCE PIPING AND TRENCHING
- (-53.49) GROUNDWATER ELEVATION (FEET ABOVE MEAN SEA LEVEL)
- GROUNDWATER ELEVATION CONTOUR; DASHED WHERE INFERRED (FEET ABOVE MEAN SEA LEVEL)
- * NOT USED IN CONTOUR DETERMINATION
- APPROXIMATE DIRECTION OF GROUNDWATER FLOW IN FEET PER FOOT (ft/ft).

NOTE:

GROUNDWATER CONTOURS WERE CREATED USING SURFER VERSION 11.6

REFERENCE : THIS FIGURE IS BASED ON PRELIMINARY IMPROVEMENT PLANS PROVIDED BY BKF ENGINEERS DATED JULY 26, 2007. UTILITY LAYOUT AND ORIENTATION ARE BASED ON VARIOUS COUNTY DRAWINGS AS WELL AS FIELD VERIFICATION AND ARE APPROXIMATE. SELECTIVE SAMPLE SURVEY CONDUCTED BY STANTEC PERSONNEL ON OCTOBER 27, 2011, FEBRUARY 2015, AND NOVEMBER 2, 2015.

Table 1
Current Groundwater Monitoring & Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Notes:

GRO = Gasoline range organics
B = Benzene
T = Toluene
E = Ethylbenzene
X = Total xylenes
MTBE = Methyl tert-butyl ether
TBA = Tert-butyl alcohol
DIPE = Di-isopropyl ether
ETBE = Ethyl tert-butyl ether
TAME = Tert-amyl methyl ether
1,2-DCA = 1,2-Dichloroethane
EDB = 1,2-Dibromoethane
D.O. = Dissolved Oxygen; rounded to the nearest tenth
SPH = Separate-phase hydrocarbons
TOC = Top of casing (surveyed)
Calc. GW Elev. = Calculated groundwater elevation = TOC - Depth to Water + 0.75*(Measured SPH Thickness); assuming a specific gravity of 0.75 for SPH
ft-MSL = feet above mean sea level
mg/L = Milligrams per liter
µg/L = Micrograms per liter
< = Analyte was not detected above the specified method reporting limit
- = Not measured or analyzed
DRY = Well dry during gauging; not sampled
MD = Sampling & gauging performed over multiple days during this event
NP = Well not purged prior to sampling
VOL = Well not sampled due to insufficient volume of water in well

Table 2
Historical Groundwater Monitoring & Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Notes:

GRO = Gasoline range organics
DRO = Diesel range organics
B = Benzene
T = Toluene
E = Ethylbenzene
X = Total xylenes
MTBE = Methyl tert-butyl ether
TBA = Tert-butyl alcohol
DIPE = Di-isopropyl ether
ETBE = Ethyl tert-butyl ether
TAME = Tert-amyl methyl ether
1,2-DCA = 1,2 Dichloroethane
EDB = 1,2-Dibromoethane
D.O. = Dissolved Oxygen; rounded to the nearest tenth
SPH = Separate phase hydrocarbons
TOC = Top of casing (surveyed)
Calc. GW Elev. = Calculated groundwater elevation = TOC - Depth to Water + 0.75*(Measured SPH Thickness); assuming a specific gravity of 0.75 for SPH
ft-MSL = feet above mean sea level
mg/L = Milligrams per liter
µg/L = Micrograms per liter
< = Analyte was not detected above the specified method reporting limit
- = Not measured or analyzed
‡ = Sample collected during SVE System Operation
DRY = Well dry during gauging; not sampled
INA = Well inaccessible; not sampled
MD = Sampling & gauging performed over multiple days during this event
N = Identity of contaminant uncertain (hydrocarbon pattern atypical of indicated analyte); see lab report
NP = Well not purged prior to sampling
NS = Well not sampled
NSP = Well not sampled this event, in accordance with groundwater sampling schedule
VOL = Well not sampled due to insufficient volume of water in well
SS = Stoddard Solvent
* = Insufficient groundwater in well for purging
** = Insufficient groundwater in well for purging. Groundwater elevation considered anomalous
*** = Depth to water > Depth of well. Data Invalid; gauging measurement for MW-9 is erroneous.

Additional Notes:

Refer to the reports in which data was first presented for more information on historical data.
Beginning with the first quarter 2003 sampling event (3/28/03), TPH-g, benzene, toluene, ethylbenzene, total xylenes, and MTBE analyzed using EPA Method 8260B.
Beginning in the fourth quarter 2003, the laboratory modified the reported analyte list. TPH-g was changed to GRO. The resulting data may be impacted by the potential of non-TPH-g analytes within the requested fuel range resulting in a higher concentration being reported.
Beginning in the second quarter 2004, the carbon range for GRO was changed from C6-C10 to C4-C12.
The data within this table collected prior to July 2006 was provided to Stantec by RM and their previous consultants. Stantec has not verified the accuracy of this information.
Beginning in the second quarter 2008, the carbon range for GRO was changed from C4-C12 to C6-C12.
SVE system started for continuous operation on October 24,2012; therefore groundwater samples collected after this date affects the interpretation of the data.
Groundwater samples from wells MW-4D and MW-16 sampled on 2/12/15 and 2/13/15, respectively, were collected less than 48 hours after well development and may not be representative.
Stoddard Solvent data for wells MW-3D, MW-6D, MW-7, and MW-9 sampled on February 2015 is invalid, likely laboratory cross contamination.

Table 5
Soil Vapor Extraction System - Performance Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Notes:

a = System startup and shakedown in carbon abatement mode

b = PID used for influent, mid-influent, and effluent compliance readings

c = Field optimization following sample collection

d = Well V-10 turned off and well MW-10 turned on prior to departing site

e = Well MW-10 turned off and well V-10 turned on prior to departing site, pending receipt of analytical results.

f = System found shut down due to a triggered glass-covered emergency switch outside the compound

g = System found shut down due to tripped breakers for the enclosure exhaust fan. System was kept shut down in preparation for quarterly groundwater monitoring.

h = Liquid tight electrical conduit for oxidizer exhaust thermocouple was found needing replacement due to heat stress. System was shut down pending replacement.

i = Liquid tight electrical conduit and wiring for oxidizer exhaust thermocouple were replaced. The system was temporarily restarted, tested, and shut down.

j = System temporarily restarted to collect vapor samples and shut down.

k= System restarted based on vapor sample results.

l= System found down on arrival due to flame loss in oxidizer during a drive-by visit conducted on 2/10/14. Restarted w/o incident.

m = System emergency stop was triggered by unknown party following the 5/19/14 site visit. System was inspected for damage then restarted on 5/21/14.

n= System found down on arrival due to possible power failure. System restarted without incident. Effluent FIDs were inadvertently not collected during this visit.

o= System shutdown to accommodate drilling in vicinity of extraction wells. Operated for data collection and shutdown on departure.

p= System down to accommodate drilling in vicinity of extraction wells. Operated for compliance sample collection. System shutdown on departure for rebound testing purposes.

q= Operated on full dilution during visit for quarterly inspection and shut down on departure.

Abbreviations:

"Hg	Inches of mercury
scfm	Standard cubic feet per minute
^{o}F	Degree Fahrenheit
ppmv	Parts per million by volume as hexane
CARBON	Carbon abatement mode
lbs	Pounds
NC	Not collected/ not calculated
FID	Flame ionization detector
PID	Photoionization detector
--	Not calculated

Table 6
Soil Vapor Extraction System - Analytical Data and Mass Recovery
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Vapor System Influent Analytical and Recovery

(In order to show best estimate, recovery calculations assume half of the detection limit when the compound is reported as less than the detection limit.)

Limits:			**≤ 350**					Thermal Abatement Emissions Limits (lbs/day):						**≤ 0.010**	**≤ 0.11**	**NA**

Definitions:

Cum.	Cumulative
lbs	Pounds
ppmv	Parts per million by volume
scfm	Standard cubic feet per minute
GRO	Gasoline Range Organics
PCE	Tetrachloroethene
MtBE	Methyl tertiary-butyl ether
Avg.	Average
--	Data not available
<	Less than stated laboratory method reporting limit
PCE	Tetrachloroethene
NC	Not collected
VC	Vinyl chloride

Test America Molecular Weights

GRO	100.00
Benzene	78.11
Ethylbenzene	106.16
MTBE	88.15

Standard Molecular Weights

PCE	165.83

Calculations:

Removal Rates = [Concentration (average of two consecutive values){ppmv}]*[molecular Weight/24.45(Gas Constant)]*(1 m^3/35.315 CF)*(1 pound/453592 milligrams)*(SCFM (average of two consecutive values))*(60min/hour)*Hours) ==> lbs
Emission = [Concentration(average of two consecutive values){ppmv}]*[molecular Weight/24.45(Gas Constant)]*(1 m^3/35.315 CF)*(1 pound/453592 milligrams)*(SCFM)*(60min/hour)*Hours) ==> lbs
Lab data provided in ug/m3 converted to ppmv according to the equation: ug/m^3 / 1000 x 24.1 / MW = ppmv

Notes

a = Total Influent PCE calculated using full detection limit when the compound is reported as less than the detection limit.

1 INTRODUCTION

ADR Environmental Group, Inc. (ADR) is pleased to present this report describing the results of a subsurface investigation performed at the Westlake Shopping Center (subject Property) located at Lake Merced Boulevard and Southgate Avenue, Daly City, California (Figure 1). Specifically, the portions of the subject Property investigated included the Westlake French Dry Cleaners located at 330 South Mayfair Avenue, the Southgate Dry Cleaners located at 183 Southgate Avenue, and the Burlington Coat Factory located at 99 Southgate Avenue (Figure 2).

Given the potential environmental concerns associated with these property uses, a subsurface investigation was conducted to determine whether the dry cleaners and staining around a storm drain located near the Burlington Coat Factory had environmentally impacted the subject Property. As part of this investigation, ADR advanced nine soil borings in areas that would likely be impacted by hazardous waste if releases had occurred. Field work was conducted on August 28, 2002.

This report summarizes the results of ADR's soil boring investigation, including soil and soil vapor sample collection and analyses. The soil borings advanced as part of this investigation were intended to assess the presence or absence of volatile organic compounds (VOCs) at selected locations in shallow soil and soil vapor outside the dry cleaning facility tenant spaces and petroleum hydrocarbons and selected metals in soil adjacent to the west side of Burlington Coat Factory building. Fieldwork for the subsurface investigation was conducted under the supervision of California Registered Geologist Larry A. Flora of ADR. The project was conducted under the general direction of ADR Environmental Project Manager Kevin F. Gallagher.

2 BACKGROUND

2.1 Site Description

The subject Property consists of an approximate 560,000 square foot, multi-building shopping center, housing approximately 150 tenants. The Westlake Shopping Center is occupied by a variety of retail, restaurant, governmental, and financial businesses, including the Westlake French Dry Cleaners, the Southgate Dry Cleaners, and the Burlington Coat Factory. The site consist of numerous strip malls around the intersection of Southgate Avenue and Lake Merced Boulevard (Figure 2). The remaining portion of the subject Property consists of asphalt paved parking areas, concrete walkways, and landscaped areas. The site is located in a mixed commercial and residential setting. The overall topography of the subject Property is generally flat.

2.2 Previous Work

In July 2002, a Phase I Environmental Site Assessment (ESA) was performed by Kleinfelder Inc. (Kleinfelder) at the Westlake Shopping Center. From a review of available historical information, Kleinfelder concluded that the shopping center was first developed in the mid-1950s and expanded to its current configuration by the early to mid-1960s. The Westlake Development Company bought the property in the 1970s and still owns the property today. The specific facilities under investigation are located in the northeastern and southern sections of the shopping center. According to Kleinfelder the Westlake French Dry Cleaners and Southgate Dry Cleaners occupied their present tenant spaces in 1978 and 1955, respectively. ADR's research, however, indicates that the Westlake French Dry Cleaners occupied its present location in 1955 and that the Southgate Dry Cleaners has occupied its tenant space since at least 1970. The building presently leased by the Burlington Coat Factory was constructed in the early to mid-1960s.

As part of Kleinfelder's ESA, the following recognized environmental condition was identified in connection with the Burlington Coat Factory.

- Numerous oily discolorations of concrete and a storm drain that was filled with oil in the parking lot to the west of the Burlington Coat Factory. There are no apparent activities by the Burlington Coat Factory which involved the use of oil. As such the release of the oil may be the result of informal, unauthorized use of the parking lot by others for vehicle maintenance activities.

In June 2002, Kleinfelder, on behalf of Westlake Shopping Center, conducted a Phase II subsurface investigation at the Westlake French and the Southgate Dry Cleaning facilities. The investigation was conducted to evaluate if the dry cleaning operations conducted at these two facilities have affected soil or, if encountered, groundwater beneath the sites. A total of three borings were advanced inside of each of the dry cleaning tenant spaces. Groundwater was not encountered during the drilling operations. The results of the soil samples collected at the dry cleaning facilities indicated that volatile organic compounds (VOCs), including Tetrachloroethene (PCE), were not present at or above laboratory detection limits in the shallow soil beneath the dry cleaning sites.

In July 2002, also on behalf of Westlake Shopping Center, Kleinfelder implemented a supplemental Phase II investigation to further characterize the subsurface soils and collect groundwater samples from the underlying aquifer. One soil boring, located south of the

Southgate Dry Cleaners, was advanced to a total depth of 120 feet below ground surface (bgs). Another soil boring, located northwest of the Westlake French Dry Cleaners, was drilled to a total depth of 89.5 feet bgs. Groundwater (likely perched) was encountered in the boring near the Westlake French Dry Cleaners facility at approximately 84 feet bgs. At the Southgate Dry Cleaners, groundwater was not encountered at the maximum depth drilled of 120 feet bgs. Based on soil and groundwater sample analyses, Kleinfelder concluded that VOCs, including PCE, were not present at or above laboratory detection limits.

2.3 Geologic Setting

The subject Property lies within the Coast Range Geologic Province of California. This province is characterized by northwest trending mountain ranges and intervening valleys, which are a reflection of the dominant northwest structural trend in bedrock of the region. The basement rock in the northwest portion of this province is dominantly highly deformed sedimentary, metamorphic, and volcanic rock of the Franciscan Complex of Upper Jurassic to Cretaceous Age. In the site vicinity, these rocks have been unconformably overlain by Tertiary age, continental and marine sedimentary and volcanic rocks. Younger alluvial, colluvial, and landslide deposits have locally overlain these rocks.

2.4 Groundwater Conditions

In March 1992, perched groundwater (measured from monitoring wells) beneath an onsite ARCO gasoline station was reported by SECOR International Inc. to be at 55 feet bgs. In December 2001, the calculated groundwater flow direction of the perched water was to the southeast. Based on groundwater data collected from a monitoring well located approximately 1,200 feet north of the subject Property, the Daly City Department of Water and Wastewater Resources reported that regional groundwater is approximately 125 to 160 feet bgs.

3 SCOPE OF WORK

Based on the results of Kleinfelder's Phase I and Phase II investigations, ADR was authorized to advance soil borings and collect soil and/or soil vapor samples to assess the presence or absence of contamination in shallow soil at selected exterior locations around the Westlake and Southgate Dry Cleaning facilities and the Burlington Coat Factory. This work included the following:

Burlington Coat Factory:

- Public utility clearance. Clearance of soil boring locations by private on-site utility locator.
- Advancement of one soil boring by hydraulic percussion hammer to a depth of 15 feet bgs at the location shown in Figure 3, adjacent to a storm drain on the west side of the building.
- Collection of soil samples at approximately 5 foot vertical intervals. Field screening of collected soil samples for the presence of organic vapors using a PID.
- Laboratory analysis of a soil sample collected at five feet bgs for total petroleum hydrocarbons as gasoline (TPHg), diesel (TPHd), and oil (TPHo) by EPA Method 8015 modified, benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Method 8020, and selected metals cadmium, chromium, lead, nickel, and zinc by EPA Method 6010B.

Westlake and Southgate Dry Cleaners:

- Public utility clearance. Clearance of soil boring locations by private on-site utility locator.
- Performing video inspections of the sanitary sewer lines and junctions in the areas of the investigation using a subcontractor.
- Advancement of four soil borings per site by hydraulic percussion hammer to an average depth of 15 feet bgs at the locations shown in Figures 4 and 5.
- Collection of soil samples at approximately 5 foot intervals during advancement of each boring. Field screening of collected soil samples for the presence of organic vapors using a photoionization detector (PID).
- Collection of vapor and soil samples and analysis of selected samples from each boring for VOCs using EPA Method 8260B.

After receipt of analytical results, preparation of this report summarizing the findings of the subsurface investigations at each site.

4 FIELD WORK AND OBSERVATIONS

4.1 Underground Utility Clearance

Prior to implementing the subsurface investigation, each proposed soil boring was cleared of underground utilities by Norcal Underground Locating, a private locating firm, and locators representing various local utilities.

4.2 Sanitary Sewer Video Inspections

In August 2002, a video camera inspection of the sanitary sewer lines was conducted in the vicinity of the Westlake French and Southgate dry cleaning tenant spaces. RotoRooter® performed the inspection utilizing a remote control camera equipped with a locating device. Access to the sanitary sewer laterals was through the restrooms of the tenant spaces. Because of numerous turns in the sewer line beneath the Westlake French Dry Cleaners the direction that the sewer lateral drained was uncertain, but was assumed to run parallel to the enclosed walkway, located behind the cleaners, and connect to the sewer clean outs situated near the walkways entrance (Figure 4). The video inspection also revealed a crack in the sewer lateral at approximately 23 feet from the sewer access insertion point within the Westlake French Dry Cleaners restroom. The video inspection at the Southgate Dry Cleaners indicated that the direction of the sewer lateral from the tenant space was to the southeast towards a sewer main located beneath North Coronado Street. No cracks or breaks in the sewer line were detected in the video inspection.

4.3 Soil Borings

On August 28, 2002, soil borings B-1 through B-9 were advanced at the selected locations as shown in Figures 3, 4, and 5. The soil borings were drilled to total depths of 15 feet bgs or refusal with a direct push truck-mounted drill rig equipped with a hydraulic percussion hammer, owned and operated by Kehoe Testing & Engineering, Inc., a licensed well driller from Pleasanton, California. Soil boring B-1 was advanced next to a parking lot storm drain on the west side of the Burlington Coat Factory building. Soil borings B-2 through B-5 were situated behind the Westlake Dry Cleaners, within an enclosed walkway and storage area, along the facilities assumed sanitary sewer lateral. Soil borings B-6 through B-9 were located in back of the Southgate Dry Cleaners also adjacent to the sites sanitary sewer lateral.

Soil samples were collected from the boreholes at vertical intervals of approximately 5 feet by driving a "large bore" sampler containing an acrylic tubing liner 12 inches into the undisturbed soil. After retrieval of the sampling assembly, the acrylic tubing was removed from the sampler and a portion of the liner was immediately capped, labeled, and placed on ice awaiting transportation to the laboratory. Other portions of the soil sample were used for soil classification (in accordance with the guidelines of ASTM D-2487-85) and field PID screening.

Discrete soil vapor samples were collected at depths of 5 and 15 feet bgs from soil borings B-2 through B-9 in 1-liter Tedlar air sampling bags. The soil vapor sampling process involved driving a stainless steel soil gas sampler to the desired depths of 5 and 15 feet bgs. Once at the desired depth, the sampler is then retracted slightly, leaving behind the drop-off tip and allowing soil gas to flow into the sampling assembly. A ¼-inch-diameter soil gas line, connected to the sampling tip, is then attached to the Tedlar bag located in the

gas collection area at the surface. Once connected, the Tedlar bag is placed into an air-tight gas sampling box. An air sample pump is then connected to the vacuum outlet port of the sampling box and the air from inside the box is evacuated. The Tedlar bag spontaneously inflates in response to the resulting interior drop in pressure in the sample box. The soil vapor sample enters the bag directly without passing through the pump thus eliminating the risk of contaminating the pump or air sample.

Soils encountered in soil borings B-1 through B-9, to a depth of 15 feet, are generally similar in character beneath the asphalt or concrete surfaces consisting of homogeneous brown, loose, poorly graded sand. Groundwater was not encountered in any of the exploratory borings. Soil boring logs describing soil types encountered are contained in Appendix B.

Subjective field observations of soil samples did not indicate the presence of staining or odors in the recovered soil samples. Screening of the samples with the PID did not detect concentrations of organic vapors in any of the samples.

After the total depth of each soil boring was reached and after soil and/or vapor samples were collected, the boreholes was abandoned by filling completely with a neat cement slurry and patched to match the existing surface cover.

5 RESULTS OF LABORATORY ANALYSES

Soil and soil vapor samples collected by ADR were submitted for chemical analysis to California Health Services certified Excelchem Environmental Laboratory (certification number 2119), located in Roseville, California. Copies of certified laboratory analytical reports and chain-of-custody documentation are contained in Appendix C.

Burlington Coat Factory:

A single soil sample collected at 5 feet bgs was analyzed for TPHg, TPHd, and TPHo by EPA Method 8015 modified, BTEX by EPA Method 8020, and selected metals – cadmium, chromium, lead, nickel and zinc by EPA Method 6010B. Soil sample analytical results are compiled in Tables 1 and 2.

Table 1
Soil Sample Analytical Results, Petroleum Constituents
Westlake Shopping Center
Burlington Coat Factory Building
99 Southgate Avenue, Daly City, California
Concentrations in milligrams per Kilogram (mg/Kg)

Soil Sample	Soil Sample Depth (feet below grade)	TPHg[1]	TPHd[2]	TPHo[3]	Benzene	Toluene	Ethyl-benzene	Total Xylenes
B-1-1	5	<1.0[4]	<1.0	<10.0	<0.005	<0.005	<0.005	<0.005

TPHg[1] = Total Petroleum Hydrocarbons as Gasoline.
TPHd[2] = Total Petroleum Hydrocarbons as Diesel.
TPHo[3] = Total Petroleum Hydrocarbons as Oil.
<1.0[4] = Compound not detected at the indicated detection limit.

Table 2
Soil Sample Analytical Results, Selected Metals
Westlake Shopping Center
Burlington Coat Factory Building
99 Southgate Avenue, Daly City, California
Concentrations in milligrams per Kilogram (mg/Kg)

Soil Sample	Soil Sample Depth (feet below grade)	Cadmium	Chromium	Lead	Nickel	Zinc
B-1-1	5	**0.67**	**34**	**1.9**	**33**	**19**

Results of the soil sample submitted for laboratory analysis from the Burlington Coat Factory area did not detect the presence of petroleum hydrocarbons. Of the selected metals analyzed, cadmium, chromium, lead, nickel, and zinc were detected at concentrations within expected ambient ranges for these metals.

Westlake French Dry Cleaners:

Four soil vapor samples (one from each soil boring), collected at 5 feet bgs, were initially analyzed for VOCs by EPA Method 8260B. Upon receipt of analysis of the samples collected, indicating the presence of PCE and/or Trichloroethane (TCE) in each sample, ADR was authorized to submit soil samples collected at 5 and 15 feet bgs and the soil vapor sample collected at 15 feet bgs from soil boring B-3 (the boring showing the highest PCE vapor concentration at 5 feet bgs) for additional VOC laboratory analysis by EPA Method 8260B. Soil sample and soil vapor sample analytical results are compiled in Tables 3 and 4, respectively.

trans-1,2-DCE[1] = trans-1,2-Dicholorethene
cis-1,2-DCE[2] = cis-1,2-Dichloroethene
PCE[3] = Tetrachloroethene
TCE[4] = Trichloroethene
VOCs[5] = Volatile Organic Compounds; refer to Appendix C for a List of Compounds Included in USEPA Method 8260.
<0.1[6] = Compound not detected at the indicated detection limit.
ND[7] = Not Detected; Refer to Appendix C for Compound Detection Limits.

As shown in Table 3, VOCs were not detected in either soil sample analyzed. Analysis of soil vapor samples (Table 4) indicated the presence of detectable concentrations of PCE and/or lesser concentrations of TCE in each sample tested. The highest concentrations of PCE (23 and 17 milligrams per cubic meter (mg/m^3)) were reported in the vapor samples collected from soil boring B-3 at 5 and 15 feet bgs, respectively. No other VOCs were detected above laboratory detection limits from any of the soil vapor samples analyzed.

Southgate Dry Cleaners:

A total of four soil vapor samples (one from each soil boring), collected at 5 feet bgs, were initially submitted for analysis of VOCs by EPA Method 8260B. After receipt of the vapor analyses, indicating PCE contamination in each sample, ADR was authorized to submit the soil samples collected at 5 and 15 feet bgs and the soil vapor sample obtained at 15 feet bgs from soil boring B-9 (the boring with the highest PCE vapor concentration at 5 feet bgs) for additional analysis by EPA Method 8260B. Soil and soil vapor samples are compiled in Tables 5 and 6, respectively.

trans-1,2-DCE[1] = trans-1,2-Dicholorethene
cis-1,2-DCE[2] = cis-1,2-Dichloroethene
PCE[3] = Tetrachloroethene
TCE[4] = Trichloroethene
VOCs[5] = Volatile Organic Compounds; refer to Appendix C for a List of Compounds Included in USEPA Method 8260.
<0.1[6] = Compound not detected at the indicated detection limit.
ND[7] = Not Detected; Refer to Appendix C for Compound Detection Limits.

As illustrated in Table 5, VOCs were not detected in either soil sample analyzed. Analysis of soil vapor samples (Table 6) indicated the presence of reportable concentrations of PCE in each sample tested. The highest concentrations of PCE (11 and 8.5 mg/m^3) were detected in the vapor samples collected at 5 and 15 feet bgs from soil boring B-9, respectively. No other VOCs were reported above laboratory detection limits from any of the soil vapor samples analyzed.

6 CONCLUSIONS

Soils encountered in the borings advanced at the Burlington Coat Factory, the Westlake French Dry Cleaners, and the Southgate Dry Cleaners from the surface to 15 feet below grade consisted of a homogeneous stratum of brown, fine-grained, poorly graded sand. Regional groundwater, reportedly exceeding a depth of 125 bgs, was not encountered in any of the soil borings.

Burlington Coat Factory

Neither staining, odors, nor PID organic vapors were noted during subjective field screening in any of the soil samples recovered from the Burlington Coat Factory. Soil sample analysis did not detect gasoline, diesel or motor oil hydrocarbons above laboratory detection limits in the soil sample collected and submitted for laboratory analysis from soil boring B-1 at 5 feet bgs. Of the selected metals analyzed, cadmium, chromium, lead, nickel, and zinc were reported at concentrations consistent with naturally-occurring levels in soil. As such, it is ADR's opinion that additional investigation or remediation of soil in this area of Burlington Coat Factory is not warranted at this time.

Westlake French Dry Cleaners:

Video camera inspection of the sanitary sewer line revealed a crack approximately 23 feet from the insertion point located in the facilities restroom. Neither staining, odors, nor PID organic vapors were noted by the subjective field screening in any of the soil samples recovered at this dry cleaning facility. Laboratory analysis of soil boring vapor samples collected from borings B-2, B-3, B-4, and B-5 (located north and south parallel to the assumed sewer lateral) indicated that VOCs, including PCE and/or TCE, were present in each of the vapor samples tested. PCE concentrations ranged from 5.9 mg/m^3 in soil boring B-2 at 5 feet bgs to 23 mg/m^3 in soil boring B-3 at 5 feet bgs. Analytical results of soil samples collected from soil boring B-3 at 5 and 15 feet bgs did not detect the presence of any VOC contamination. The relatively low concentrations of VOCs detected in soil vapor samples collected from the soil borings and the lack of detected VOCs in the soil samples collected from boring B-3 indicate that significant impact from dry cleaning solvents to the subsurface in the vicinity of the Westlake French Cleaners is unlikely. Additionally, since the assumed sanitary sewer line is located beneath both a covered structure and a concrete pad and the depth to groundwater exceeds 125 feet bgs, it is unlikely that the soil would come into contact with any surface water that would percolate to the groundwater table. Based on the data presented in this report, ADR believes that the VOC concentrations detected in the soil vapor samples represents ambient levels typically found around dry cleaning facilities. As such, ADR does not believe that additional assessment or remediation of the Westlake French Dry Cleaning facility is warranted at this time.

Southgate Dry Cleaners:

Video camera inspection of the sanitary sewer line indicates that the existing sewer line leading from the tenant space restroom is not cracked or broken anywhere along its path toward the sewer main in North Coronado Street, south of the dry cleaners. Neither staining, odors nor PID organic vapors were observed in any of the soil samples recovered from any of the soil borings advanced at the site. Laboratory analysis of soil vapor samples collected from soil borings B-6, B-7, B-8, and B-9, located north and south parallel to the facilities sanitary sewer lateral, detected the presence of PCE vapors in each boring at concentrations ranging from 0.6 mg/m^3 in soil boring B-6 at 5 feet bgs to 11 mg/m^3 in soil

boring B-9 at 5 feet bgs. Laboratory analysis of selected soil samples collected from soil boring B-9 did not detect the presence of VOCs at detectable concentrations in any of the samples analyzed. Since the levels of PCE identified in the soil vapor samples are considered low, the soil sample analytical results did not detect VOCs at reportable concentrations, the area around the dry cleaners is paved with asphalt, and the depth to groundwater exceeds 125 feet bgs, it is unlikely that the groundwater table has been impact by the site activities. Based on the soil boring and soil vapor sample analytical results presented in this report, ADR does not believe that additional assessment or remediation of the Southgate Cleaners exterior area is warranted at this time.

7 LIMITATIONS

The conclusions presented in this report are professional opinions based solely upon the Scope of Services described in this report. They are intended exclusively for the use of Kimco Realty Corporation (Kimco) or agents specified by Kimco. The Scope of Services performed in the execution of this investigation may not be appropriate to satisfy the needs of other users, and any re-use of this document or the findings, conclusions, or recommendations presented herein is at the sole risk of said user. It should be recognized that his study was not intended to be a definitive investigation of potential contamination at the subject Property. Given that the Scope of Services for this investigation was limited, it is possible that currently unrecognized contamination might exist at the site.

Services performed by ADR were conducted in a manner consistent with that of the same care and skill ordinarily exercised by members of the same profession currently practicing in the same locality under the same conditions. It is important to recognize that even the most comprehensive scope of services may fail to detect environmental liabilities on a particular site. Therefore, ADR cannot act as insurers and cannot "certify" that a site is free of environmental contamination. No expressed or implied representation or warranty is included or intended in our reports except that our services were performed, within the limits prescribed by our client, with the customary thoroughness and competence of our profession.

8 SIGNATURE PAGE

This Report was prepared in accordance with generally accepted environmental practices and procedures, employing the degree of care and skill ordinarily exercised under similar circumstances by reputable environmental professionals practicing in this area, as of the date of this Report.
