Is the Data Valid? (circle) Yes / No	Preservation Temperature (if Known): 1.7 / 2.7 ºC

Antea®Group Lab Validation Sheet

Project/Client: BP

Project #: 00465EA191

Date of Validation: 2/27/2020

Completed By: Katelynn Smith **Signature:** Katelynn Smith

Analytical Lab Used and Report # (if any): 440-259635-1

	Circle or Highlight Yes/No below
1. Was the analysis the one requested?	Yes / No
2. Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes / No
3. Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes / No
4. Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes / No
5. Were Laboratory blanks performed, if so, were they below non-detect?	Yes / No
6. Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes / No
7. Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes / No
8. In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes / No
9. Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes / No
10. Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes / No
11. Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes / No

If any answer is no, explain why and what corrective action was taken:

The laboratory noted the following qualifier(s) in the lab report:

LM: MS and/or MSD above acceptance limits. See Blank Spike (LCS)

LR: LCS/LCSD recovery below method control limits

LN: MS and/or MSD below acceptance limits. See Blank Spike (LCS)

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the BPLAMP Technical Specifications, applicable federal, state, local regulations and certification requirements as well as the methodologies as described in laboratory SOPs reviewed by the BPLAMP. This Laboratory Report is confidential and is intended for the sole use of Eurofins TestAmerica and its client. This report shall not be reproduced, except in full, without written permission from TestAmerica. The signature on the cover page extends to the case narrative and all the data and forms in the package. The Chain of Custody is included and is an integral part of this report.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 1/24/2020 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 4.2º C and 4.8º C.

Receipt Exceptions
TB-465 was crossed off the COC however we received 12 TB voa vials unpreserved. TB-465 (440-259702-9)

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: Insufficient 8015-DRO sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-592379 and analytical batch 440-592483. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-592379/2-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-592379. Method 8015B

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Accreditation/Certification Summary

Client: Antea Group
Job ID: 440-259702-1
Project/Site: ARCO 0465, Daly City

Laboratory: Eurofins Calscience Irvine

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	2706	06-30-20

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8015B		Water	GRO (C6-C12)
8015B	3510C	Water	n-Octacosane
8015B	3510C	Water	Stod.Sol. RO [C9-C13]
8260B		Water	1,2-Dibromoethane (EDB)
8260B		Water	1,2-Dichloroethane
8260B		Water	Benzene
8260B		Water	Ethanol
8260B		Water	Ethylbenzene
8260B		Water	Ethyl-t-butyl ether (ETBE)
8260B		Water	Isopropyl Ether (DIPE)
8260B		Water	m,p-Xylene
8260B		Water	Methyl-t-Butyl Ether (MTBE)
8260B		Water	Naphthalene
8260B		Water	o-Xylene
8260B		Water	Tert-amyl-methyl ether (TAME)
8260B		Water	tert-Butyl alcohol (TBA)
8260B		Water	Toluene
8260B		Water	Xylenes, Total

Method Summary

Client: Antea Group
Project/Site: ARCO 0465, Daly City

Job ID: 440-259702-1

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL IRV
8015B	Gasoline Range Organics - (GC)	SW846	TAL IRV
8015B	Stoddard Solvent	SW846	TAL IRV
3510C	Liquid-Liquid Extraction (Separatory Funnel)	SW846	TAL IRV
5030B	Purge and Trap	SW846	TAL IRV

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Hi Tiffany,

Yes please run the trip blanks that were included in the cooler for both 8260 VOCs and 8015 GRO.

Thanks,
Hannah

3. Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes / No
4. Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes / No
5. Were Laboratory blanks performed, if so, were they below non-detect?	Yes / No
6. Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes / No
7. Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes / No
8. In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes / No
9. Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes / No
10. Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes / No
11. Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes / No

If any answer is no, explain why and what corrective action was taken:

The laboratory noted the following qualifier(s) in the lab report:

ANALYTICAL REPORT

Eurofins Calscience Irvine
17461 Derian Ave
Suite 100
Irvine, CA 92614-5817

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the BPLAMP Technical Specifications, applicable federal, state, local regulations and certification requirements as well as the methodologies as described in laboratory SOPs reviewed by the BPLAMP. This Laboratory Report is confidential and is intended for the sole use of Eurofins TestAmerica and its client. This report shall not be reproduced, except in full, without written permission from TestAmerica. The signature on the cover page extends to the case narrative and all the data and forms in the package. The Chain of Custody is included and is an integral part of this report.

Job ID: 440-259756-1

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 1/25/2020 10:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.3º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: Insufficient 8015-DRO sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-592379 and analytical batch 440-592483. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch: (LCS 440-592379/2-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-592379 and 440-592379. Method 8015B

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Antea Group
Project/Site: ARCO 0465, Daly City

Job ID: 440-259756-1

Accreditation/Certification Summary

Client: Antea Group
Job ID: 440-259756-1
Project/Site: ARCO 0465, Daly City

Laboratory: Eurofins Calscience Irvine

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
California	State	2706	06-30-20

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8015B		Water	GRO (C6-C12)
8015B	3510C	Water	n-Octacosane
8015B	3510C	Water	Stod.Sol. RO [C9-C13]
8260B		Water	1,2-Dibromoethane (EDB)
8260B		Water	1,2-Dichloroethane
8260B		Water	Benzene
8260B		Water	Ethanol
8260B		Water	Ethylbenzene
8260B		Water	Ethyl-t-butyl ether (ETBE)
8260B		Water	Isopropyl Ether (DIPE)
8260B		Water	m,p-Xylene
8260B		Water	Methyl-t-Butyl Ether (MTBE)
8260B		Water	Naphthalene
8260B		Water	o-Xylene
8260B		Water	Tert-amyl-methyl ether (TAME)
8260B		Water	tert-Butyl alcohol (TBA)
8260B		Water	Toluene
8260B		Water	Xylenes, Total

Login Number: 259756
List Number: 1
Creator: Dolidze, Lado

List Source: Eurofins Irvine

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Is the Data Valid? (circle) Yes / No	Preservation Temperature (if Known): 2.3 ºC

Antea®Group Lab Validation Sheet

Project/Client: BP
Project #: 00465EA191
Date of Validation: 2/6/2020
Completed By: Katelynn Smith **Signature:** Katelynn Smith
Analytical Lab Used and Report # (if any): J259702

	Circle or Highlight Yes/No below
1. Was the analysis the one requested?	Yes / No
2. Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes / No
3. Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes / No
4. Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes / No
5. Were Laboratory blanks performed, if so, were they below non-detect?	Yes / No
6. Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes / No
7. Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes / No
8. In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes / No
9. Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes / No
10. Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes / No
11. Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes / No

If any answer is no, explain why and what corrective action was taken:

The laboratory noted the following qualifier(s) in the lab report:

Subject: Closure Request
ARCO Service Station No. 465
151 Southgate Avenue
Daly City, California
San Mateo County Groundwater Protection Program (GPP), Case No. 220033
Global ID T10608100027

Dear Mr. Milano,

Antea®Group is pleased to present this Closure Request for ARCO #465 station located at 151 Southgate Avenue, Daly City, California (the Site). The GPP requested a Soil and Investigation Workplan be submitted by April 21, 2020; however, based on previous investigations and additional information provided herein, BP and Antea Group believe the Site conditions satisfy LTCP criteria and should be granted case closure by the GPP. If you have any questions regarding this report or need any additional information about this Site, please contact Mr. Wade Melton at (360) 594-7978.

Sincerely yours,

Wade Melton

Closure Request

ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California
San Mateo County Groundwater Protection Program No. 220033
San Francisco Bay Region Water Quality Control Board No. 41-0028

SECTION 1.0: INTRODUCTION

On behalf of BP Products North America, Inc. (BP), Antea®Group has prepared this *Closure Request* to document the remediation effort completed for active ARCO Service Station No. 465 located at 151 Southgate Avenue, San Mateo County, Daly City, California ("the Site"). The goal of this submittal is to obtain regulatory closure for San Mateo County Groundwater Protection Program (GPP) Case Number 220033. Please refer to **Figures 1 through 2a** for location and layout of the Site. **Sections 2.0 through 4.0** provide a summary of the recent regulatory interactions, current facility layout, past fuel storage system modifications, past assessment, and remedial activities, and regional and site-specific geologic and hydrogeologic conditions for the Site. The information presented in **Section 5.0** outlines available information on potential off-site sensitive receptors and **Section 6.0** provides information on the location of past on-site hydrocarbon release sources along with the current status of subsurface conditions following completion of remedial activities at the Site. **Sections 7.0 and 8.0** provide a summary the Conceptual Site Model (CSM) and an evaluation relative to the State Water Resources Control Board (SWRCB) Low-Threat Underground Storage Tank Case Closure Policy (LTCP) Resolution 2012-0016.

SECTION 2.0: REGULATORY STATUS

The GPP issued a letter on June 5, 2019 directing BP to immediately connect deep vapor extraction well V-14 to the soil vapor extraction (SVE) system unless the registered professional can demonstrate "that the residual mass of MTBE west and northwest of the subject site is insufficient to further impact regional groundwater and impact nearby well receptors".

On September 10, 2019, Antea Group submitted the *V-14 Soil Vapor Extraction Pilot Test Report* which outlined six days of testing that occurred in July and August 2019. The report recommended that the SVE system be shut down as soil vapor extraction in the deep zone, including extraction on V-14, was ineffective at removing methyl tert-butyl ether (MTBE).

The GPP issued a response letter to the aforementioned pilot test report on November 13, 2019 and approved the recommendation to shut down the SVE system; however, the GPP noted that "if the registered professional cannot demonstrate the MTBE in deep soils will not impact regional groundwater and nearby well receptors, then the responsible party will need to implement an alternative form of remediation or mitigate the impact if remediation is not possible."

The Closure Request herein addresses the GPP request to demonstrate that residual MTBE in soil at the Site is not likely to impact regional groundwater and that the Site, therefore, meets the requirements for low-threat closure.

Agency correspondence is included as **Appendix A.**

SECTION 3.0: BACKGROUND INFORMATION

This section includes a Site description, case background information, and regional and Site-specific geology and hydrogeology.

3.1: SITE DESCRIPTION

The Site is located on the west side of San Francisco Bay, approximately 1-mile east of the Pacific Ocean (**Figure 1**). It occupies the southwest corner at the intersection of Southgate Avenue and Lake Merced Boulevard in Daly City, California (**Figure 2**). The current property owner is the Kimco Realty Corporation, and the parcel number is 002201550. The Site is an active ARCO retail gasoline station with a station building and vehicle service area, six product dispensers, two blended gasoline underground storage tanks (USTs) and one waste oil UST.

Mixed commercial and residential properties surround the Site.

- North – An apartment complex
- Northeast – Westlake Shopping Center and a Home Depot store
- East – Burlington Coat Factory
- South – An apartment complex
- West – An active dry cleaner facility in the site cleanup program (183 Southgate Ave, Daly City, CA, GeoTracker ID SL0608188850) and a shopping mall

Site topography generally slopes toward the east and northeast. Ground surface elevations range from approximately 105 feet above the National Geodetic Vertical Datum of 1929 (NGVD 29) in the southwest corner of the Site to approximately 98 feet above NGVD 29 in the northeast corner of the Site, a difference of 7 feet in vertical elevation. Regionally, topography near the Site also slopes toward the east-northeast (**Figure 1**).

Site assessment activities began in 1992. The Site has 27 groundwater monitoring wells, 13 SVE wells, and one dual-nested soil vapor probe (**Table 1**). A remediation system exists in the southeastern portion of the Site that has been non-operational since November 2019. The Site layout and location of historical soil borings, existing wells, confirmation soil sample locations, and cross section lines are illustrated on **Figure 2, Figure 2a, Figure 2b, and Figure 2c**. A summary of previous Site assessment and remedial activities is provided in **Section 3.3 and Appendix B.**

3.2: PAST FUEL SYSTEM MODIFICATIONS

1997 Waste Oil UST Removal. On October 21, 1997, Gettler-Ryan, Inc. (Gettler-Ryan) removed a 520-gallon capacity waste oil UST, excavating the UST cavity to approximately 9 feet below ground surface (bgs).

1999 Product Line Removal. On March 4, 1999, Gettler-Ryan removed the product lines between the USTs and three fuel dispenser islands at the Site.

2000 UST Removal Action. Between August 28, 2000 and September 6, 2000, two 10,000-gallon capacity unleaded gasoline USTs, one 8,000-gallon capacity UST, and associated product lines and dispensers were removed from the Site.

3.3: ASSESSMENT AND REMEDIATION CHRONOLOGY

1992 Initial Subsurface Investigation. An initial subsurface investigation was performed at the Site in March 1992. Six SVE wells (V-1 through V-6) were installed around the former UST basin and near the former waste oil

UST. Groundwater monitoring wells MW-1 and MW-2 were installed at depths of approximately 70.5 feet and 61.5 feet bgs, respectively, to intercept a perched groundwater horizon[1]. Results of this investigation indicated that soil and groundwater near the gasoline and waste oil USTs had been impacted by petroleum hydrocarbons, including low boiling point hydrocarbons quantified as total petroleum hydrocarbons (TPH) as gasoline (TPHg; or gasoline range organics [GRO]), higher boiling point hydrocarbons quantified as TPH as diesel (TPHd; or diesel range organics [DRO]) and total recoverable petroleum hydrocarbons (TRPH). Low concentrations of semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs) were also reported in soil samples collected during the assessment.

In July 1992, SVE well V-7 was installed to a depth of 40 feet bgs, and an SVE pilot test was performed at the Site. In August 1992, deep groundwater monitoring well MW-3D was installed to a depth of approximately 220 feet bgs to intercept the upper portion of the regional groundwater aquifer[2]. The GPP noted in a letter dated July 5, 2001, that "MW-3D is screened from 202 bgs to 220 feet bgs (below an approximate 10-foot-thick clayey silt to silty clay zone) and may represent the deeper drinking water aquifer." Analytical data from soil samples collected during installation of vapor extraction and groundwater monitoring wells are presented in **Table 2a**. The soil vapor extraction well and monitoring well locations are presented in **Figure 3a.**

1993 Groundwater Sampling and Temporary SVE System Install. In January 1993, quarterly groundwater monitoring activities were initiated at the Site. Installation of vapor extraction and conveyance pipelines and construction of a vapor extraction and treatment system in the southwest corner of the Site were completed on March 30, 1993. On May 19, 1993, SVE well V-8 was installed to a depth of approximately 60.5 feet bgs. On May 20, 1993, groundwater monitoring well MW-4 was installed to a depth of approximately 61.5 feet bgs to further assess groundwater quality in the perched groundwater horizon. Analytical data from soil samples collected during installation of V-8 and MW-4 are presented in **Table 2a**. The monitoring well and SVE well locations are presented on **Figure 3b.** A temporary SVE system with an internal combustion engine began operation on July 13, 1993[3].

1994 – 1997 SVE System Operation and Shutdown. The SVE system was shut down due to noise issues on April 21, 1994. The internal combustion engine was removed from the Site on April 26, 1994. An Airex KATOX 100C55 catalytic oxidizer was installed at the Site in May 1995[4]. The SVE system operated full time from June 13, 1995 to October 10, 1995. The operation schedule of the SVE system was then modified to two months of operation followed by two months of non-operation. Operation of the SVE system continued with a two-month operation and two-month non-operation schedule until February 10, 1997. The SVE system was restarted on September 22, 1997 to perform a four-week system evaluation. On October 15, 1997, the SVE system was shut down with approval from the GPP[5].

1997 Waste Oil UST Removal. On October 21, 1997, Gettler-Ryan removed a 520-gallon capacity waste oil UST and excavated the UST cavity to approximately 9 feet bgs. A soil sample (WO-1-8) collected at 8 feet bgs (2 feet below the bottom of the tank) had reported concentrations of 2,700 milligrams per kilogram (mg/kg) GRO and 2,700 mg/kg DRO. On October 30, 1997, Gettler-Ryan over-excavated the former waste oil UST pit to a depth of

[1] SEACOR, 1992, *Technical Report, Phase 1 Site Investigation*. July 31.
[2] SEACOR, 1992, *Technical Report, Phase II Site Investigation.* December 9.
[3] SEACOR, 1993, *Project Status Report – Investigation and Remediation.* July 29.
[4] SEACOR, 1994, *Quarterly Groundwater Monitoring and Site Status Report, Second Quarter 1995.* July 27.
[5] SEACOR, 1997, *Revised Soil Vapor Extraction System Evaluation Report.* November 1997.

approximately 15 feet bgs. Stained soil was observed on the eastern wall of the pit approximately 4 feet bgs during over-excavation. With approval from the GPP, the over-excavation was extended in an easterly direction approximately 3 feet from the edge of the original excavation to a depth of 7 feet bgs. Three soil samples (WO-2-15, WO-3-7, and WO-4-4) were collected from the over-excavation areas and the results indicate mass was left in the subsurface. DRO concentrations ranged from 330 mg/kg to 4,000 mg/kg with the sample collected at 15 feet bgs reporting 3,100 mg/kg DRO, 2,900 mg/kg GRO, 16 mg/kg total xylenes, and 0.69 mg/kg MTBE (**Table 2a**). Approximately 60 cubic yards (yd^3) of soil excavated from the tank cavity was transported for offsite disposal by Dillard Trucking. A new waste oil UST and associated piping and vents were installed in the same tank cavity, the over-excavation was backfilled, and the surface asphalted on October 31, 1997[6]. Analytical data from soil samples collected during the waste oil UST removal and excavation are presented in **Table 2a**. The extent of the excavations and soil sample locations are presented on **Figure 3b**.

1998 Soil Investigation. In January 1998, six confirmation soil borings (CSB-1 through CSB-6) were advanced to determine if operation of the temporary SVE system had reduced the hydrocarbon concentration in soil to levels acceptable for regulatory case closure **(Figure 3b)**. The borings were advanced using hollow stem augers to depths ranging from 30.5 feet to 55.5 feet bgs. Soil samples were analyzed for GRO, benzene, toluene, ethylbenzene, xylenes (BTEX), and MTBE. Soil samples collected from CSB-6, located near the former waste oil UST, were also analyzed for DRO, TRPH, volatile organic compounds (VOCs), halogenated VOCs, PCBs, and total metals. Concentrations of GRO, DRO, and TRPH were present in soil samples collected from CSB-5 and CSB-6. Soil samples collected from CSB-6 were also reported to contain concentrations of heavy oil. Benzene was not detected in any of the soil samples collected. MTBE was reported in soil samples collected from boring CSB-3 at depths of 15 feet bgs and 21 feet bgs with concentrations of 0.66 mg/kg and 0.15 mg/kg, respectively. Concentrations of ethylbenzene, total xylenes, 2-methylnaphthalene, PCB Aroclor 1248, and total metals were detected in soil samples collected from CSB-6 at depths of 5 and 15 feet bgs. Analytical data from soil samples collected during the confirmation soil borings are presented in **Table 2a** and **Table 2b**. On July 6, 1998, the SVE unit was moved from the Site to another station[7].

1999 Product Line Removal. On March 5, 1999, Gettler-Ryan removed the product lines between the USTs and three fuel dispenser islands at the Site. The underlying soil in the trench between the central and northern two dispenser islands had gray staining and emitted a gasoline odor. Six trench floor soil samples (T-1 through T-6) and eight soil samples from beneath the dispensers (D-1 through D-8) were collected at 3 feet bgs and analyzed for GRO, BTEX, MTBE, and lead[8].

Due to concentrations of gasoline constituents in soil samples T-2, T-4, T-6, D-5, and D-8, soil was excavated to approximately 8 to 10 feet bgs and confirmation samples (T-2A, T-4A, T-6A, D-5A, and D-8A) were collected from the bottom of the over-excavated trenches on March 10, 1999. One of the five over excavation samples, T-2A located between the northern and middle dispenser island at 10 feet bgs contained 9,700 mg/kg GRO and 82 mg/kg benzene **(Table 2a)**. Analytical data from soil samples collected from the trench and beneath the dispenser islands are presented in **Table 2a**. The extent of excavations and soil sample locations are presented on **Figure 3c**. Approximately 127 tons of soil were removed from the Site after the excavation and transported by Dillard Trucking to a Browning Ferris Industries offsite disposal facility[5].

[7] SECOR, 1999, *Soil Sampling during Fuel Line Removal and Replacement.* June 25.
[8] SECOR, 1999, *Soil Sampling during Fuel Line Removal and Replacement.* June 25.

2000 UST Removal Action. SVE well V-3 was abandoned on August 29, 2000 in preparation for UST replacement activities. Between August 28, 2000 and September 6, 2000, two 10,000-gallon capacity unleaded gasoline USTs, one 8,000-gallon capacity unleaded gasoline UST, and associated product lines and dispensers were removed from the Site. Analytical data from soil samples collected from beneath the former USTs, over-excavated areas, new UST cavity, and product line and dispenser removal are presented in **Table 2a**. The extent of excavations and soil sample locations are presented on **Figure 3d.** Over-excavation of the UST area was confined to the expansion area intended for the new USTs[9]

During UST replacement activities performed in August and September 2000, Henderson Construction Company, the ARCO subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a gasoline and rinsate water mixture from one of the gasoline USTs. The spill occurred during the attempted removal of a UST with the rinsate water still inside. A portable dual-phase extraction (DPE) system was mobilized to the Site shortly thereafter and operated for a 10-day period to mitigate the effects of the reported release[10].

2001 Installation of MW-5 and MW-6 Monitoring Wells. In November 2001, SECOR International, Inc. (SECOR) installed two groundwater monitoring wells (MW-5 and MW-6) and advanced one soil boring (SB-1) (**Figure 3e**). Maximum concentrations of 21,000 mg/kg GRO and 470 mg/kg MTBE were reported in a sample collected from MW-6 at a depth of 15.5 feet bgs. The maximum benzene concentration (6.9 mg/kg) was reported in a sample collected from MW-5 at a depth of 20.5 feet bgs (**Table 2a**). Wells MW-5 and MW-6 were completed at a depth of 60 feet bgs. Groundwater samples have been obtained consistently from MW-6, but MW-5 has only had water seven times since it was installed[11]. Historical groundwater analytical data are presented in **Table 3**.

2003 Additional Characterization near MW-5. In April 2003, URS Corporation (URS) performed additional characterization in the vicinity of MW-5 to determine whether shallow groundwater was present at a depth greater than the 60-foot completion depth of MW-5, and to characterize the vertical extent of petroleum hydrocarbons and fuel oxygenates near the waste oil UST. Boring MW-5A was drilled adjacent to MW-5 and soil was sampled to a depth of 85 feet (**Figure 3f)**. After drilling through soil identified as sandy clayey silt and clayey silty sand from approximately 60 to 64 feet bgs, the augers were left open for observation at a depth of 66 feet bgs in moist silty sand for over one hour. No water accumulated in the borehole, so an additional well was not installed at this location. No GRO or benzene concentrations greater than the laboratory reporting limits (LRLs) were detected in soil samples collected from 60.5 to 85 feet bgs in the boring. However, MTBE was detected in soil samples collected from 60.5 to 85 feet bgs at concentrations ranging from 0.12 mg/kg to 1.0 mg/kg[12](**Table 2a**).

2005 Additional Soil Characterization. In September 2005, URS advanced nine soil borings (SB-1 renamed SB-1A, SB-2 through SB 5, and SB-7 through SB-10) to depths ranging from 50 to 81.5 feet bgs in order to further assess the vertical and lateral extent of petroleum hydrocarbons in the subsurface (**Figure 3f**). This work was summarized in URS' *Additional Soil and Groundwater Investigation Interim Report*, dated April 5, 2006.

[12] URS, 2003, *Soil and Water Investigation Report*, June 3.

Soil boring SB-6 was not advanced because no odor or photoionization detector (PID) readings were observed in boring SB-7. Benzene was not detected in onsite borings SB-1A, SB-2, and SB-3, while GRO, toluene, ethylbenzene, xylenes, and MTBE were detected. Soil samples collected from borings SB-2 and SB-3 were analyzed for the presence of additional VOCs. SB-3 had reported concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, n-butylbenzene, and n-propylbenzene above the LRL. Soil samples collected from boring SB-1A, advanced in the vicinity of the waste oil UST, were analyzed for the presence of DRO and Stoddard Solvent; these analytes were detected in the majority of samples collected to a depth of approximately 51.5 feet bgs (**Table 2a**). GRO, BTEX, and fuel oxygenates were not detected in the soil samples collected from offsite borings SB-4, SB-5, and SB-7 through SB-10 at concentrations above the LRLs.

Grab groundwater samples were collected from onsite boring SB-3, and offsite borings SB-4, SB-5, and SB-7 through SB-10. The grab groundwater sample collected from onsite boring SB-3 at approximately 60.5 feet bgs, contained concentrations of GRO, BTEX, MTBE, 1,2-4 trimethylbenzene, and 1,3,5 trimethylbenzene (**Table 4**). The grab groundwater samples collected from the offsite soil borings did not contain GRO, BTEX, and oxygenates at concentrations greater than the LRLs. Based upon the results of this investigation, URS recommended the installation of three additional offsite groundwater monitoring wells (MW-7 through MW-9) presented on **Figure 3g** to further delineate the lateral extent of dissolved petroleum hydrocarbons offsite[13].

2008 Installation of MW-7, MW-8, and MW-9. On August 28 and 29, 2008, wells MW-7 through MW-9 were installed (**Figure 3g**). Results of the investigation and an updated CSM were presented in the Stantec *Additional Site Assessment Report and SCM* dated June 14, 2010[14].

2010-2011 Additional Assessment and Remediation Feasibility Test. In a letter dated July 6, 2010, the GPP requested a workplan for remediation feasibility testing. The proposed feasibility testing scope of work was presented in Stantec's *Additional Assessment and Remediation Feasibility Test Workplan* (Workplan) dated October 29, 2010. The GPP issued a letter dated January 13, 2011, stating the information provided in the Workplan serves as a Remedial Action Plan (RAP), and thus required BP to forego SVE feasibility testing and move directly to active SVE remediation[15]. The GPP letter also directed submittal of an addendum to the Workplan. BP provided the revised assessment and remediation workplan to the GPP via email on March 1, 2011.

In June and July 2011, Stantec completed additional assessment and bench-scale feasibility testing. The work involved the installation of three additional onsite (MW-10) and off-site (MW-11 and MW-12) groundwater monitoring wells to further characterize petroleum hydrocarbons in soil and groundwater, the installation of two additional SVE wells (V-9 and V-10) for expansion of the existing offline SVE system, and the installation of one dual-nested soil vapor probe (SV-1S/SV-1D) near the western property line to evaluate vapor phase petroleum hydrocarbon intrusion risk toward nearby potential receptors west of the site from the former waste oil and gasoline UST source areas. Analytical data from soil samples collected during installation of monitoring and vapor extraction wells are presented in **Table 2a** and installed well locations are presented on **Figure 3h**. On December 21, 2011, Stantec collected soil vapor samples from vapor probes SV-1S and SV-1D. The tetrachloroethylene (PCE) concentrations reported in the vapor samples collected from SV-1S and SV-1D are

[13] URS, 2006, *Additional Soil and Groundwater Interim Report,* April 5.
[14] Stantec, 2010, *Additional Site Assessment Report and Site Conceptual Model*, June 14.
[15]Stantec, 2010, *Additional Assessment and Remediation Feasibility Test Workplan*, October 29.

likely derived from operations at the former Southgate Cleaners located west of the Site (**Table 5**). Details of the completed assessment and In-Situ Chemical Oxidation (ISCO) feasibility testing utilizing hydrogen peroxide (H2O2), and an updated CSM were presented in the Stantec's report dated February 14, 2012[16].

2011-2012 SVE System Installation. Phase 1 of the SVE system installation began in August 2011 and included connection of the new SVE wells V-9 and V-10 and connection of existing well V-4 to an expanded remediation system compound through lateral conveyance piping placed underground. While reviewing historical soil analytical data, it was noted that 1,200 mg/kg GRO was present in a soil sample collected at 46 feet bgs in soil boring SB-1A, located between MW-5 and newly installed well MW-10. Since the shallow SVE wells are screened from 15 to 35.5 feet bgs, Stantec connected groundwater monitoring wells MW-5 and MW-10 (screened from 40 to 60 feet bgs) to the SVE system to insure recovery of hydrocarbon mass present in soil at 46 feet bgs. The extraction piping was installed from V-5 to MW-5 and from V-10 to MW-10 and controlled with a ball valve. The ball valve allows extraction from V-5 or MW-5 and V-10 or MW-10.

Phase 2 of the SVE system installation was completed in February 2012 with installation of a thermal oxidizer. System startup and source testing was conducted in July 2012 upon completion of Pacific Gas & Electric (PG&E) utility connection and Bay Area Air Quality Management District (BAAQMD) air permitting[17]. Stantec's *Soil Vapor Extraction System Source Test Report* was submitted to the GPP on October 19, 2012, in accordance with their directive. The SVE system startup was completed on October 22, 2012[16].

2012 SVE Source Test. In a letter dated June 19, 2012, GPP issued a notice of violation (NOV) for the failure to begin operation of the SVE system. Although significant progress had been made, additional tasks that required completion before the new SVE system could be started included connection of power and natural gas services from PG&E and issuance of an Authority to Construct (ATC) permit from the BAAQMD. As communicated to the GPP in electronic correspondence dated June 12, 2012, the BAAQMD delayed issuance of the ATC permit due to concern about chlorinated solvents present in soil vapor beneath the Site and the potential for dioxin formation when operating the thermal oxidizer to treat chlorinated solvents present in the extracted soil vapor. In order to maintain compliance with ATC permit conditions, Stantec performed an SVE source test on July 2 and 3, 2012 using Granular Activated Carbon (GAC) vessels arranged in series. Following installation of the GAC vessels, Stantec worked with the SVE equipment manufacturer to modify the SVE system controls, bypass the thermal oxidizer, and re-route the extracted soil vapor through the GAC vessels for treatment[18]. As part of the source test, individual extraction well vapor samples were analyzed for contaminant concentrations. Stantec evaluated influent vapor analytical data to determine the total chlorinated atom mass and determine whether the dioxin health risk trigger level would be exceeded. The calculated dioxin trigger level was not exceeded, and the thermal oxidizer was placed back online[19].

2013 Additional Soil and Groundwater Assessment. Between March 18 and 27, 2013, Stantec supervised National Exploration, Wells, and Pumps (NEWP) during advancement of three soil borings (SB-11 through SB-13). Analytical data from soil samples collected during advancement of the soil borings are presented in **Table 2a** and soil boring

locations are presented on **Figure 3i**. Soil and groundwater samples were submitted to JAG Consulting Group for bench scale testing and analysis. The results, including an updated CSM, are summarized in Stantec's *Additional Assessment Report, Bench Scale Feasibility Test Report, and Site Conceptual Model* dated June 13, 2013. The GPP reviewed the report and responded in a letter dated March 18, 2014. The GPP requested a workplan for additional assessment and well replacement. Stantec submitted the requested workplan on June 19, 2014[20]. The workplan was conditionally approved by GPP in a letter dated August 18, 2014.

2014-2015 Additional Soil and Groundwater Assessment. Between December 2014 and February 2015, Stantec completed additional assessment that included the following scope of work:

- Advanced four soil borings (SB-14 through SB-17) to depths ranging from 130 to 180.5 feet bgs.
- Installed six groundwater monitoring wells (MW-1R, MW-13 through MW-17) to depths ranging from 32 to 62.5 feet bgs. The data was used to further assess the lateral and vertical extent of MTBE in soil and the lateral extent of MTBE present in the shallow perched groundwater zone underlying the site at approximately 44 feet bgs.
- Installed four groundwater monitoring wells (MW-4D through MW-7D) to depths ranging from 160 to 166 feet bgs to assess the shallow regional groundwater underlying the Site at approximately 150 feet bgs.
- Advanced three hand augers borings (HA-1 through HA-3) adjacent to the dispenser islands to further assess the extent of MTBE in soil at 5 feet bgs.

Analytical data from soil samples collected during soil boring advancement and well installations are presented in **Table 2a** and locations are presented on **Figure 3j** and **Figure 3k**. Based on the assessment results, the vertical extent of MTBE in soil was defined to a maximum depth of 110 feet bgs (**Table 6**) and the lateral extent was defined south and east of the Site. MTBE in perched groundwater was also defined to the south and east of the Site. MTBE was only reported in a deep, water sample collected from MW-4D at a concentration of 1.9 micrograms per liter (µg/L)[21].

October – November 2015 Additional Assessment – During October and November 2015, Stantec completed the following activities at the Site:

- To assess the lateral extent of MTBE in soil between the perched groundwater zone extending to approximately 55 to 64 feet bgs and the shallow regional groundwater zone extending to approximately 145 to 150 feet bgs, and to assess the lateral extent of hydrocarbons in the perched zone and shallow regional groundwater zone, soil borings were advanced to the west (SB-18) and west-northwest (SB-19) of the Site. Analytical results indicate that MTBE is present in soil at concentrations ranging from 0.006 to 0.11 mg/kg at depths between 100 and 120 feet bgs in SB-18. A sample collected at 130 feet bgs defines the vertical extent of MTBE in this area. Non-detect results from samples collected from SB-19 define the lateral extent of impacts to the west-northwest of the Site.
- Groundwater monitoring well MW-18 was installed to a total depth of 64.5 feet bgs to assess the perched groundwater zone west of the Site.
- Due to a potentially unsuitable screen interval, the GPP approved the destruction groundwater monitoring well MW-1 by over-drilling. The screen interval of MW-1 was only 4 to 5 feet above the depth to groundwater and screened 10 feet deeper than surrounding wells in the perched groundwater

[20] Stantec, 2014, *Workplan for Additional Assessment*, June 19.
[21] Stantec, 2015, *Additional Assessment Report and Site Conceptual Model*, February 25.

zone, potentially providing groundwater samples that were not representative of the top of the perched groundwater zone. Replacement well MW-1R was installed approximately 7 feet east of the MW-1 location at a total depth of 60 feet bgs in December 2014.

- To better assess groundwater conditions in the perched zone southwest of the Site, Stantec oversaw the installation of groundwater monitoring well MW-11R. Well MW-11 was over-drilled and deepened to 65 feet bgs for the installation of MW-11R. The original depth of MW-11 was 50 feet bgs.
- Vapor extraction wells V-12 and V-13 were installed to total depths of 90 feet bgs and screened from 70 feet bgs to 90 feet bgs to facilitate the remediation of deep MTBE concentrations in the northwest quadrant of the Site.
- To assess the extent of waste oil impacts to soil near the existing waste oil UST in the southwest corner of the Site, soil borings SB-21 and SB-22 were advanced to 40 and 35 feet bgs, respectively. Significant reductions in GRO, oil range organics (ORO), BTEX and MTBE concentrations were reported in samples collected from borings SB-21 and SB-22 when compared to historical data from borings CSB-6, MW-5A and well V-5[22] (**Table 2a, Figure 3l**).

May 2016 – Additional Assessment and Vapor Extraction Pilot Test – In order to assess the lateral extent of MTBE in soil between perched and regional groundwater, and to assess the lateral extent of hydrocarbons in soil in the perched groundwater zone to the north and northwest of the Site, Stantec oversaw the completion of the following work between May 9 and 20, 2016:

- Advanced soil boring SB-20D to the northwest of the Site. Soil boring SB-20D was advanced after refusal was encountered in attempted borings SB-20, SB-20B, and SB-20C in the Daly City Right-of-Way at approximately 23 feet bgs. Borings SB-20 and SB-20B were attempted in October 2015, and boring SB-20C was attempted in February 2016. Only MTBE concentrations were detected in soil samples collected from SB-20D at depths between 69.5 and 131 feet bgs. No other analytes were detected above the LRLs in soil samples collected from SB-20D.
- Installed monitoring well MW-19 northwest of the Site to assess the perched groundwater zone. MW-19 was installed to a total depth of 62.5 feet bgs with 10 feet of screen from 52.5 to 62.5 feet bgs. Soil analytical results from MW-19 did not have reported detections above the LRLs for any analyte.
- Advanced and installed offsite well V-14 to facilitate soil vapor extraction feasibility testing in the SVE wells screened from 70 to 90 feet bgs offsite. V-14 was installed to a total depth of 90 feet bgs with 20 feet of screen from 70 to 90 feet bgs. MTBE was detected in soil at concentrations ranging from 0.21 to 2.7 mg/kg at depths between 76 and 86 feet bgs. Tert-butyl alcohol (TBA) was present at a concentration of 1.2 mg/kg in the soil sample from 86 feet bgs. No other analytes were detected above the LRLs in soil samples collected from V-14 (**Table 2a, Figure 3m**).

Stantec performed pilot testing activities in the vicinity of V-14 on July 14 and 15, 2016. Pilot testing consisted of a step test, radius of influence (ROI) test, and sample collection to estimate potential MTBE mass removal rates. Step testing was performed by applying a vacuum of approximately 2, 4, 6, and 8 inches of mercury (inHg), measured at the system to extraction well V-11. A relatively linear relationship developed between the applied vacuum and the extracted flow rate, indicating that the system could operate at up to 8 inHg vacuum and not experience significant reduction in flow due to constriction of the well screen from lithology. ROI testing consisted of applying a vacuum between 8 and 9 inHg at the system, which resulted in 40 to 60 inches of water (inH_2O) at the wellhead. Vacuum influence measurements collected at V-12 and V-13, located 41 and 37 feet

[22] Stantec, 2015, *Additional Assessment Report*, November 16.

from the test well, respectively, were measured to be approximately 50% of the applied vacuum. The observed vacuum at V-14, located 89 feet from the extraction well, was measured to be approximately 25% of the applied vacuum. Based on these results, an estimated maximum deep well radius of effective air exchange of 96 feet was produced. To determine the concentration of MTBE in extracted soil vapor and allow for the estimation of MTBE mass removal rates during continuous operation, influent and effluent vapor samples were collected approximately halfway through the ROI test and submitted for laboratory analysis. Based on vapor concentrations obtained through laboratory analysis, the estimated MTBE mass removal rate from V-11 through the duration of the pilot test study was 1.69 pounds per day (lbs/day)[23].

July 2017 – Subsurface Investigation. To better delineate down gradient impacts located within the shallow regional groundwater zone at approximately 145 to 150 feet bgs., Antea Group oversaw Cascade Drilling, Inc. (Cascade) advance one soil boring to 162 feet bgs in a parking lot at the northeast corner of Southgate Avenue and Lake Merced Blvd between July 17 and 19, 2017 (**Figure 3m**). The boring was completed as deep monitoring well MW-9D, built at a total depth of 155 feet with 20 feet of screen from 135 to 155 feet bgs. A total of five soil samples were collected during this investigation and submitted for laboratory analysis. None of the five samples submitted had concentrations of petroleum hydrocarbon constituents that exceeded the LRLs[24] (**Table 2a**).

August 2017 – Radius of Influence Vacuum Test. On June 16, 2017, GPP staff directed BP to connect V-14 to the SVE system based on a belief that the need for dilution air to operate the SVE system was not effectively removing MTBE from the soil near V-14. On August 25, 2017 Antea Group conducted another test on deep zone wells V-11, V-12, V-13 and V-14 to determine the ROI of the SVE system while operating with dilution air. Well V-12 was isolated for the ROI test due to its proximity to well V-14 using the existing SVE system operated with dilution air. An applied vacuum of 78 inH_2O was maintained at well V-12 for one hour. Wells V-11, V-13 and V-14 located approximately 41, 47 and 67.5 feet from V-12, were observed to have induced vacuums of 44, 46 and 31 inH_2O, respectively. The Environmental Protection Agency (EPA) has determined a minimum vacuum of 0.1 inH_2O is required to adequately influence volatilization and extraction of vapors[25]. Based on the ROI test results, Antea Group conservatively estimated an ROI greater than 1.0 inH_2O at approximately 330 feet, sufficient to remediate MTBE impacts near V-14[26].

March 2018 – Waste Oil Investigation. Antea Group advanced seven soil borings around the waste oil tank (SB-23 through SB-29) in response to a GPP directive from January 26, 2018. Concentrations of benzene, ethylbenzene, naphthalene, and poly-aromatic hydrocarbons (PAHs) from this investigation are below the LTCP residential thresholds. Additionally, shallow soil sample results for GRO, DRO, and ORO did not exceed the 2019, Revision 2 Tier 1 San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs) of 100 mg/kg, 260 mg/kg, and 1,600 mg/kg, respectively. Additionally, benzene, ethylbenzene, and naphthalene levels in soil collected during the 2015 waste oil investigation (SB-21 and SB-22) meet the residential soil criteria for direct contact and outdoor air exposure in the LTCP[27].

---

[23] Stantec, 2016, *Additional Assessment and Vapor Extraction Pilot Test Report*, August 29.
[24] Antea Group, 2017, *Subsurface Investigation Report*, November 30.
[25] USEPA, 2004, How to Evaluate Alternative Cleanup Technologies for Underground Storage Tank Sites, May 2004.
[26] Antea Group, 2018, *Radius of Influence Vacuum Test Report*, March 1.
[27] Antea Group, 2018, *Waste Oil Area Investigation Report*, July 10.

May 2018 – Deep Soil Investigation. Antea Group advanced soil boring SB-30, near V-14 to 110 feet bgs to determine if deeper soil is being remediated near V-14 (**Figure 3n**). The investigation detected a maximum of 0.45 mg/kg TBA and 1.2 mg/kg of MTBE in soil between 81 and 91 feet bgs; however, MTBE and TBA in soil above and below those depths were non-detect (**Table 2a**). Unlike nearby well V-14, no concentrations were detected in the sample collected at 66 feet bgs in SB-30, which may indicate soil is being remediated in this area due to the high radius of influence from onsite wells. To further support this conclusion, soil collected at 86 feet bgs from SB-30 had a lower concentration of MTBE (0.45 mg/kg) than that previously recorded in V-14 (2.4 mg/kg); although, the result for the SB-30 sample is an estimated value[28].

October 2018 – Additional Waste Oil Investigation. Antea Group advanced two soil borings, SB-31 and SB-32, in the area of the former and current waste oil tank in response to a GPP directive issued September 20, 2018 (**Figure 3n**). Analytical results for soil collected during investigations in March and November 2018 in the waste oil tank area (SB-23 through SB-29, SB-31, and SB-32) meet the LTCP media-specific criteria for residential direct contact and outdoor air exposure. Analytical results for samples from SB-31 and SB-32 show decreasing Stoddard Solvent concentrations when compared to previously collected soil samples from MW-5. Soil samples from MW-5 at depths from 15.5-30.5 feet bgs had Stoddard Solvent detections ranging from 6,300 mg/kg to 47,000 mg/kg. Soil samples collected from SB-31 and SB-32 at depths from 15 to 35 feet bgs had a maximum Stoddard Solvent concentration of 1,500 mg/kg (**Table 2a**). Based on soil analytical data, Antea Group proposed that the implementation of a remedial action plan, as discussed in the November 2017 work plan, was unnecessary as the shallow soil near the waste oil tank meets the LTCP direct contact criteria for residential areas. The previously implemented shallow soil vapor extraction and removal of surface material during the soil vapor system installation and expansion appeared to have been effective in remediating the shallow soil near the waste oil tank[29].

March 2019 – Deep Soil and Groundwater Investigation

From February 19 through March 14, 2019 Antea Group oversaw the installation of monitoring wells MW-16D, MW-18D, and MW-19D by Cascade (**Figure 3o**). The December 2018 GPP letter stated that the vertical extent of MTBE in the vicinity of V-14 may not have been properly assessed during the advancement of SB-30, based on the termination depth of 110 feet bgs. Antea Group believes this has been accomplished with the advancement of MW-16D. Antea Group collected four soil samples between 120 feet bgs and the point of termination at 135 feet bgs. The samples did not have reported MTBE concentrations above the LRLs, which varied between 0.0035 mg/kg and 0.0041 mg/kg, or the ESL of 0.028 mg/kg (**Table 2a**).

Soil collected from MW-16D at 81 feet, 86 feet, and 91 feet bgs had MTBE concentrations of 0.97 mg/kg, 0.71 mg/kg, and 2.7 mg/kg, respectively; however, MTBE in groundwater was not detected above the LRL in that location, suggesting adsorbed impacts are not affecting the shallow regional aquifer. MTBE concentrations in the samples from both 81 feet bgs and 86 feet bgs were similar to those found in SB-30 at the same depths, and less than the concentrations in the soil samples collected from V-14 at the same depths (**Table 2a**). The MTBE concentration detected in soil from MW-16D at 91 feet bgs was higher than that detected in the sample collected from SB-30 at the same depth. This concentration is also higher than that collected from SB-16 at the same depth in 2016; however, of the five samples with MTBE detections above the ESL in SB-16, four confirmation samples from corresponding depths in MW-16D had lower MTBE concentrations. These analytical

[28] Antea Group, 2018, *Deep Soil Investigation Report*, September 21.
[29] Antea Group, 2018, *Additional Waste Oil Area Investigation Report*, December 12.

results, along with previously obtained ROI data, further support the conclusion that the soil in this area could be influenced by the onsite vapor extraction wells, which was initially presented in the *Deep Soil Investigation Report*, dated September 21, 2018[30]

June -August 2019 Pilot Testing. On July 10, 2019, BP connected V-14 to the SVE system with above ground piping to determine if extraction from V-14 would increase recovery of the residual MTBE mass in the area of MW-16D (SB-16, SB-30 and V-14). The SVE system and vapor extraction well V-12 were modified to enable isolation of and extraction from V-14. The subsequent testing on V-14 resulted in a maximum MTBE mass removal rate of 0.002 lbs/day. Additionally, the rapid depletion and slow recharge of oxygen in the deep zone demonstrated that the deep extraction wells are isolated from the perched zone and air being extracted via the SVE system is from the deep zone only and no short circuiting is occurring.

To confirm the results of the initial testing, BP again connected V-14 to the SVE system on August 6, 7 and 8, 2019, resulting in a maximum MTBE mass removal rate of 0.010 lbs/day. The results of the six days of pilot testing that occurred between July and August 2019 show that connecting V-14 to the existing SVE system will not add a notable increase in MTBE mass removal to what is currently being extracted and appears to even dilute the MTBE concentrations in the soil vapor being extracted from well V-12. Furthermore, optimizing the system to extract from only V-12, the configuration that resulted in the highest mass removal of the four configurations tested, would only remove 0.63 lbs/day of MTBE from the subsurface. Based on the results of the pilot testing, BP does not believe that SVE in any configuration would be effective in further remediating the MTBE present in the vicinity of V-14 and recommended ceasing operation of the SVE system[31]. The GPP concurred with the recommendation to shut down the SVE system in a letter dated November 13, 2019.

February 2020 – Shallow Soil Assessment. On February 18, 2020, two soil borings (HA-4 and HA-5) were advanced onsite near the fuel dispenser pumps to verify the concentrations of GRO, benzene, ethylbenzene, MTBE, and naphthalene on either side of historic soil samples T-2, T-2A, and D-4, which were collected during station upgrade activities on March 5 and March 10, 1999, near a product piping and dispenser excavation. Analyte concentrations for the samples collected during this investigation did not exceed laboratory reporting limits, and the laboratory reporting limits for benzene, ethyl benzene, and naphthalene are well below LTCP limits for direct contact and outdoor air exposure and utility workers[32].

3.4: REGIONAL GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

Geologic maps of San Mateo County[33][34] show and describe stratigraphy beneath the Site as comprised of (from youngest to oldest):

- **Artificial Fill** (Qaf) - Quaternary – "Loose to very well consolidated gravel, sand, silt, clay, rock fragments, organic matter, and manmade debris in various combinations. Thickness is variable and may exceed 30 m in places". The artificial fill is generally compacted and firm except for the fill made before 1965.

[30] Antea Group, 2019, *Deep Soil and Groundwater Investigation Report*, April 30.
[31] Antea Group, 2019, *V-14 Soil Vapor Extraction Pilot Test Report*, September 10.
[32] Antea Group, 2020, *Shallow Soil Assessment Report*, April 20.
[33] E. Brabb and E. Pampeyan, 1952, *Preliminary Geologic Map of San Mateo County, California*, United States Geologic Survey Miscellaneous Field Studies Map MF-328.
[34] E.E. Brabb, R. W. Graymer and D.L. Jones, 1998, *Geology of the Onshore Part of San Mateo County, California: A Digital Database*, United States Geologic Survey Open File 98-137.

- **Colma Formation** (Qc) - Pliestocene – "Yellowish-gray and gray to yellowish-orange and red-brown, friable to loose, fine- to medium-grained arkosic sand with subordinate amounts of gravel, silt, and clay". Helley et al (1979) describes the Colma Formation as pale, loose or friable well-sorted fine- to medium-grained sand with subordinate gravel, sandstone, siltstone, and claystone and a maximum thickness of about 200 feet[35]. Groundwater is unconfined in the Colma Formation but near Lake Merced, a confining layer is present[36]. Groundwater flow in the Colma Formation has previously been toward pumping wells south of Lake Merced[37].

  Merced Formation (QTm) - Lower Pleistocene and Upper Pliocene – "Medium-gray to yellowish gray and yellowish orange, medium- to very fine-grained, poorly indurated to friable sandstone, siltstone, and claystone, with some conglomerate lenses and a few friable beds of white volcanic ash. In many places, sandstone is silty, clayey, or conglomeratic. Some of the conglomerate, especially where fossiliferous, is well cemented". Extensive and thick clay layers are only found in the Merced Formation and are rare in the Colma Formation[38]. Hunter et al. (1984) estimated the thickness of the Merced Formation to be 2,000 meters in the Lake Merced area, and note that deposits of the uppermost layer of the Merced Formation and the bottom of the Colma Formation are similar in texture and structure, making the two formations difficult to distinguish from one another[39].

The Site lies within the boundaries of the Westside Groundwater Basin (the Basin)[34]. The primary water-bearing geologic units in the Basin are the Colma and Merced Formations. The Basin is divided into three aquifer zones identified as the Shallow, Primary Production, and Deep aquifers. A marker clay separating the Shallow and Primary Production aquifers in the Lake Merced area is referred to as the -100-foot Clay and based on the clay layer noted at 190 feet bgs on the boring log for well MW-3D it appears to be present beneath the Site area despite being absent in much of Daly City. According to the San Francisco Public Utilities Commission (SFPUC), production wells in the Primary Production aquifer are typically screened deeper than 200 feet bgs. The nearest surface water is Lake Merced, located approximately 4,200 feet to the north-northwest.

3.5: SITE GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

Based on the logs for borings drilled at the Site (**Appendix C**), the subsurface can be characterized by three stratigraphic units, as follows:

---

[39] Hunter, R.E., Clifton, H.E., Hall, N.T., Csaszar, G., Richmond, B.M., and Chin, J.L., 1984, *Pliocene and Pleistocene coastal and shelf deposits of the Merced Formation and associated beds, northwestern San Francisco Peninsula, California,* Society of Economic Paleontologists and Mineralogists Field Trip Guidebook 3. Midyear Meeting. pp. 1-29.

- **Sand Unit A** - Yellow brown to gray, loose, fine-grained sand to silty sand extending from ground surface to depths between 40 and 65 feet bgs. North and northeast of the Site (under and north of Southgate Avenue), Sand Unit A is interbedded with discontinuous lenses of yellow brown, olive brown, and black silt and clay as depicted on the boring logs for MW-15, MW-19, MW-19D, SB-20D, SB-5, SB-7, SB-10 and MW-9D. Perched water lies within Sand Unit A atop Fine-Grained Unit A described below. Shallow monitoring wells are screened in the perched water zone.
- **Fine-Grained Unit A** – Semi-continuous yellow brown, olive/dark brown, and black clayey sand to sandy clay and silt underlying Sand Unit A. Based on Site boring logs, Fine-Grained Unit A ranges in thickness from a minimum of 1-foot to a maximum of 15 feet but is most commonly 2.5 to 6 feet thick. To the northeast, Fine-Grained Unit A seems to thicken, and the color darkens to black (SB-7, MW-9, MW-9D). Fine-Grained Unit A is absent from the logs for borings SB-1A, SB-11 and SB-13, and wells MW-11R, V-12, V-13 and V-14, and is described as coarser on the logs for wells V-11, MW-10, MW-12, MW-14, and MW-15 located on the western and southern sides of the Site. Wells MW-5, MW-10, MW-11R, MW-12, MW-14, MW-15, V-11, V-12, V-13 are frequently dry or have insufficient water to collect a sample.
- **Sand Unit B** - Underlying Fine-Grained Unit A, is fine-grained sand to silty sand similar to Sand Unit A, except denser and darker in color (brown to dark brown). Groundwater has been encountered at depths between approximately 103 and 150 feet bgs within this unit, which comprises the regional Shallow aquifer[40]. The most consistent occurrence of groundwater is between 135 and 150 feet bgs (**Table 3**). The Shallow aquifer is continuous beneath the Site and surrounding area. The deep monitoring wells associated with the Site, except MW-3D, are screened within Sand Unit B.

The deepest monitoring well at the Site is MW-3D, screened from 202 to 220 feet bgs beneath a 10-foot thick clay layer logged from 190 to 200 feet bgs. Based on the rise in water level immediately following installation in 1992 and the difference in groundwater elevations compared to the closest deep wells constructed in Sand Unit B (MW-6D and MW-7D), well MW-3D may be constructed within the Primary Production aquifer. Since 2015, groundwater elevations in both MW-6D and MW-7D have ranged from 11 to 3 feet higher than the groundwater elevation in MW-3D. Comparatively, the difference in groundwater elevation between MW-6D and MW-7D over the same period has been a maximum of 1.19 feet.

Groundwater elevations in Site monitoring wells during First Quarter 2020 ranged from approximately 40.45 feet to 59.78 feet above NGVD29 in wells screened within Sand Unit A (Zone A wells), and from approximately -27.44 feet to -26.59 feet below NGVD29 for wells screened within Sand Unit B (Zone B wells) (the data for MW-19D collected on January 10, 2020 was erroneous). Groundwater elevation in the first Zone A monitoring wells installed at the Site (MW-1 and MW-2) ranged from approximately 43.90 feet to 44.02 feet above NGVD29 during Second Quarter 1992. Groundwater elevation in the first Zone B monitoring wells installed at the Site (MW-4D, MW-5D, MW-6D, and MW-7D) ranged from -45.62 feet to -44.43 feet below NGVD29 during First Quarter 2015. A review of the historical groundwater tables (**Table 3**) indicates groundwater elevation has been rising beneath the Site primarily in Zone B since 1992 resulting in an elevation change of approximately 23 feet with subsurface water rising from -44 feet to -27 feet below NGVD29. In MW-3D groundwater elevation has changed from approximately

[40] San Francisco Public Utilities Commission, 2018, *Annual Groundwater Monitoring Report Westside Basin, San Francisco and San Mateo Counties, California*, April.

-84 feet to -30 feet below NGVD29. During the First Quarter 2020 event the groundwater elevation in MW-3D was -30.44 feet (NGVD29).

SECTION 4.0: SUMMARY OF REMEDIATION ACTIVITIES

This section documents the remedial activities conducted at the Site along with the estimated amount of material removed from the subsurface. The following table provides a summary of the soil and vapor mass removed from the Site during past activities.

Activity	Soil (tons)	Vapor Mass (pounds)	Reference
1993 Temporary SVE System	NA	783	SEACOR, 1993. *Project Status Report – Investigation and Remediation.* July 29.
1993-1994 Internal Combustion Engine SVE System	NA	5,494	SECOR, 1997. *Soil Vapor Extraction System Evaluation Report*, September 4.
1995-1997 Catalytic Oxidizer SVE System	NA	11,608	SECOR, 1997, *Revised Soil Vapor Extraction System Evaluation Report*, November 24.
1997 Waste Oil UST Removal	60	NA	SECOR, 1998, *Waste Oil Tank Removal.* January 6.
1999 Product Line Removal	127	NA	SECOR, 1999, *Soil Sampling during Fuel Line Removal and Replacement.* June 25.
2000 UST Removal Action	1,403	4,333	SECOR, 2000, *Report of Interim Remedial Action*, November 21.
2012-2019 Thermal Oxidizer SVE System	NA	23,257	Stantec, 2017, *First Quarter 2017 Semi-Annual Groundwater Monitoring and Remediation Status Report*, May 12. Antea Group, 2019, *Fourth Quarter 2019 Quarterly Remediation Status Report*, February 15.

4.1: UNSATURATED ZONE REMEDY – SOIL EXCAVATION

Soil excavations associated with UST, piping, and dispenser removal have been conducted at the Site and have removed petroleum hydrocarbon impacted soil from the primary source areas. Excavated soil quantities are listed in the table above and excavation details are provided in **Sections 3.2 and 3.3**. Confirmation soil data is included in **Tables 2a and 2b**.

4.2: UNSATURATED ZONE REMEDY – SOIL VAPOR EXTRACTION

Various soil vapor extraction systems have operated on the Site since 1993, extracting hydrocarbons from the unsaturated zones above and below the perched groundwater zone.

4.2.1: SOIL VAPOR EXTRACTION 1993-1997

From March to May 1993, an internal combustion engine SVE system was installed and started at the Site. The system was operated from July 1993 through April 1994, when the internal combustion engine was removed. During this period of operation, an estimated 5,494 pounds (lbs) of GRO were removed from beneath the Site.[41]

In May 1995, a catalytic oxidizer unit was installed and the SVE system was restarted utilizing the same well array previously used in July 1993. Based on a decrease in extracted petroleum hydrocarbon vapor concentrations by the SVE system and consistently low to non-detectable concentrations in groundwater, the SVE system was shut down in October 1997, and Site closure was requested in November 1997. At that time, the Site and vicinity contained four groundwater monitoring wells (MW-1 through MW-4) and eight SVE wells (V-1 through V-8).

During the period of operation from June 1995 through October 1997, the maximum influent GRO concentration detected was 10,000 µg/L in June 1995. GRO decreased to 230 µg/L just prior to the SVE system shut down. Influent benzene vapor concentrations declined from 100 µg/L in June 1995 to 1.0 µg/L at the time of the final vapor sampling event. An estimated total of 11,563 lbs of GRO and 45.34 lbs of benzene were recovered during operation of the SVE system.[42]

4.2.2: SOIL VAPOR EXTRACTION SOURCE RECOVERY 2000

During UST replacement activities performed in August and September 2000, approximately 500 gallons of a gasoline and rinsate water mixture was released from one of the gasoline USTs. A portable DPE system was mobilized to the Site by Cal Clean, and operated for a 10-day period to mitigate the effects of the reported unauthorized release. Since down-hole stingers were not used and groundwater was not recovered during the test, the equipment was used as an SVE system that extracted soil vapor at 250 standard cubic feet per minute (scfm) with a system vacuum of 16 inHg. A source test was performed utilizing wells V-1, V-2, V-5, and V-8, and SVE was subsequently performed utilizing wells V-1, V-2, and V-5 as extraction wells, and wells V-4, V-6, V-7, and V-8 as observation wells. Individual extraction tests were completed using wells V-1, V-2, and V-5. Results of the system operation were summarized in SECOR's November 21, 2000, *Report of Interim Remedial Action*.[43]

Field observations and measurements recorded during the SVE event resulted in the calculation of a maximum vacuum effective ROI of 50 feet. The ROI was calculated using induced vacuum readings collected from wells V-4, V-6, V-7, and V-8 located 20 to 95 feet away from the extraction well V-2. The induced vacuum readings ranged from 2.3 to 5.5 inH_2O in response to a system vacuum of 16 inHg. During the 240-hour SVE event, approximately 4,333 lbs (713 gallons) of petroleum hydrocarbons were removed from the subsurface, a mass significantly greater than the reported release of approximately 500 gallons of gasoline and rinsate mixture. A review of the data collected during the extraction event indicated that SVE wells located in the vicinity of the former fuel UST cavity and the area of the waste oil UST yielded the highest soil vapor concentrations. Soil vapor concentrations from well V-5 continued on an increasing trend throughout the 10-day period. Well V-5, located adjacent to the waste oil UST cavity, reported soil vapor influent concentrations of 14,400 µg/L GRO, 244 µg/L benzene, and 5,150 µg/L MTBE on October 8, 2000. The soil vapor sample collected while extracting from V-5 was also analyzed for VOCs. Results indicated that BTEX compounds, 1,2,4-trimethylbenzene and

[41] SECOR, 1997, *Soil Vapor Extraction System Evaluation Report*, September 4.
[42] SECOR, 1997, *Revised Soil Vapor Extraction System Evaluation Report*, November 24.
[43] SECOR, 2000, *Report of Interim Remedial Action,* November 21.

1,3,5-trimethylbenzene were present in the sample. Other VOCs were reported as not detected above the specified LRLs.[44]

4.2.3: SOIL VAPOR EXTRACTION SOURCE RECOVERY 2012 – 2019

In 2011 and 2012, the SVE system was expanded and operated at the Site from July 2, 2012 through November 7, 2019. Due to BAAQMD's concern chlorinated solvents could be present in the recovered vapor stream as a result of the spill at the dry cleaner property west of the Site, Stantec conducted SVE using GAC vessels arranged in series from June through August 2012. Following installation of the GAC vessels, Stantec modified the SVE system controls, bypassed the thermal oxidizer, and re-routed the extracted soil vapor through the GAC vessels for treatment. Since August 2012, the major SVE system components include a 25-horsepower (hp) TECO positive displacement (PD) blower and 250 scfm Catalytic Combustion VGTO 250 natural gas fired thermal oxidizer. During the initial system operation, 13 wells (V-1, V-2, V-4 through V-10, MW-1, MW-2, MW-5 and MW-10) were connected to the SVE system via lateral conveyance lines placed underground. The PD blower was used to extract soil vapor from the subsurface through extraction conduits which are connected to the well casing within each well box. Treated soil vapor was discharged under BAAQMD Permit to Operate No. 20770. Soil vapor extraction in the shallow zone was last operated in January 2015. The system was restarted in December 2016, following reconfiguration for extraction from the deep zone wells (V-11, V-12, and V-13). During Fourth Quarter 2019, vacuum was applied only to deep extraction well V-12.

The GPP approved shut down the SVE system in a letter dated November 13, 2019 (**Appendix A**). The total operating hours, runtime, and petroleum hydrocarbon constituent removals are detailed in the table below for the shallow zone operating period, Deep zone operating period, and cumulative operation. Details regarding system operation from 2012 through 2019 are located in **Tables 7 through 10b.**

	Operating Hours	*Operational Uptime*	*GRO Removal*	*Benzene Removal*	*MTBE Removal*
Shallow Zone 6/2012 – 1/2015	14,645	74%	23,071 lbs	27 lbs	1,504 lbs
Deep Zone 12/2016 – 11/2019	11,041	38%	186 lbs	0.8 lbs	245 lbs
Cumulative 6/2012 – 11/2019	**25,718**	**42%**	**23,257 lbs**	**27.8 lbs**	**1,749 lbs**

SECTION 5.0: SENSITIVE RECEPTOR SURVEY

The following section provides information on sensitive receptors identified by Antea Group within a 1-mile radius of the Site. Environmental Data Resources, Inc. (EDR) provided information on potential sensitive receptors within the 1-mile radius that included Day Care Centers, Schools, Hospitals, and Federal Land (**Appendix D**). Antea Group conducted searches for nearby municipal wells using the GeoTracker Groundwater Ambient Monitoring and Assessment (GAMA) program database and through communication with the SFPUC, the City of Daly City Department of Water and Wastewater Resources, and the San Mateo County Office of Sustainability. The following section provides a summary of the EDR report and municipal well search results.

[44] Antea Group, 2019, *Fourth Quarter Quarterly Remediation Status Report*, February 15.

5.1: PUBLIC RECEPTORS

Within the 1-mile search radius, EDR reported a total of 64 sensitive public or environmental receptors, including 35 Day Care Centers, 7 Schools, 19 Hospitals, and 3 Federal Land Sites. Of these 64, only two are located within 1,000 feet of the Site and these are listed in the table below. Details regarding the public and environmental receptors identified are in the EDR report provided as **Appendix D.**

Facility Type	*Distance from Site*	*Direction from Site*	*Elevation Relative to Site*
Daycare	517 feet	ESE	Higher
AHA Hospitals	641 feet	ENE	Higher

5.2: WATER SUPPLY WELLS

Antea Group reviewed the online GAMA database to identify water supply wells within 1,000 feet of the Site and found two wells within the specified radius approximately 500 feet to the southwest. The two wells on GAMA are categorized as municipal wells and designated SF-03 and Westlake.

The July 2012 *South Westside Basin Groundwater Management Plan*, (the 2012 Plan)[45] references three Westlake wells [DC-1 (Westlake), Westlake 1, and Westlake 2]. Table C-1 in the 2012 Plan lists Westlake 1 and Westlake 2 as production wells installed in 1954 and 1955, respectively. The purpose and installation date for well DC-1 (Westlake) are not identified. In 2019, the City of Daly City provided Antea Group with a Department of Water Resources Well Completion Report for a Westlake Well installed in 1995. The construction specifications recorded correlate with those for well Westlake 1 on Table C-1 built in 1954; however, in a September 25, 2018 email, the City lists screen intervals for the existing Westlake well that do not directly correlate with those documented for the three Westlake wells identified in the 2012 Plan. The *2018 Annual Groundwater Monitoring Report Westside Basin San Francisco and San Mateo Counties, California* from the SFPUC, references two Westlake wells, DC-1 Westlake used for monitoring, and production well DC-2 Westlake. When searching for water supply wells within 1,000 feet of the Site, Antea Group spoke with representatives from GAMA, the San Mateo County Office of Sustainability, the SFPUC, and the City of Daly City Department of Water and Wastewater Resources. None of the agencies indicated the existence of more than one Westlake well. Antea Group considers it likely that the main Westlake well is the 1995 well, screened as shown on the Well Completion Report or as described in the 2018 email from Daly City. If a second well still exists as indicated by the SFPUC annual monitoring report, the top of the shallowest screen interval might be 190 feet bgs according to the construction specifications available for the three Westlake wells in the 2012 Plan[44]. The GAMA database includes groundwater analytical data for the Westlake well collected between 1997 and 2018. Benzene and MTBE are among the analytes tested, and neither has ever been detected in the well above the LRLs.

Well SF-03 is identified in the 2012 Plan as having been used in 2007 for the GAMA program study to evaluate risks to groundwater. The 2012 Plan does not provide construction details or describe the final disposition of the well, it is not mentioned in the SFPUC 2018 annual monitoring report, and the agency representatives

[45] Water Resources and Information Management Engineering, Inc., 2012, *South Westside Bain Groundwater Management Plan*, July.

contacted could not confirm its existence. The 2012 Plan also identifies a dedicated monitoring well designated DC-3, which appears on Figure 4.1 near DC-1 and was identified by previous sensitive receptor surveys performed for the Site. Similar to SF-03, the well is not mentioned in the SFPUC 2018 annual monitoring report, and the agency representatives contacted could not confirm its existence. Previous reports with sensitive receptor data also list a well designated Woodlawn No. 2 (1962), Antea Group found no other references to this well and the agency representative contacted could not confirm its existence. Antea Group believes this well was erroneously included in previous reports.

Below are the potential screen details for the Westlake well or wells located approximately 500 feet southwest of the Site. Please note that the screen details for DC-1 (Westlake), Westlake 1, and Westlake 2 from the 2012 Plan are only the top and bottom depths of a screen range, with no specified intervals.

DC-1 (Westlake)	*Westlake 1 (1954)*	*Westlake 2 (1955)*	*Westlake Well (1995) Well Completion Report*	*Westlake Well Daly City 2018 email*
190-370 ft. bgs	340 – 680 ft. bgs	255-369 ft. bgs	340 – 380 ft. bgs	--
			440 – 480 ft. bgs	423 to 561 ft. bgs
			600 – 680 ft. bgs	650 to 680 ft. bgs

SECTION 6.0: DISTRIBUTION OF CONSTITUENTS OF CONCERN

This section of the document provides a summary of the subsurface soil and water conditions leading up to the termination of the various remedial efforts implemented at the Site. Based on the LTCP criteria and the Site's history as a gasoline-dispensing service station, the primary constituents of concern (COCs) in soil are ethylbenzene, benzene, and naphthalene. The COCs relating to the Waste Oil Tank also include PAHs. For subsurface water, the primary COCs are benzene and MTBE. Additional constituents referenced in evaluation of Site conditions include GRO, DRO, and MTBE.

6.1: PRIMARY SOURCES

Based on available documentation, indications of a release were discovered in 1992 during a Phase II investigation. A second release was identified during waste oil tank replacement activities in 1997. During the 1999 product line replacement, additional contamination was identified in the trench between the central and northern two dispenser islands. In 2000, during UST and product line replacement activities, Henderson Construction Company, the ARCO subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a gasoline and rinsate water mixture from one of the gasoline USTs. Please refer to **Figure 2** for the location of the current and former facility footprint, and to **Sections 3.2 and 3.3** for the site history.

6.2: SECONDARY SOURCE MATERIAL

The LTCP defines secondary source as impacts at or below the primary release point. The maximum reported concentrations of the COCs in subsurface soil samples collected between 1992 and 2020 in the source areas are summarized in the following tables. A detailed summary of laboratory results is provided in **Tables 2a and 2b, Table 11,** and on **Figures 3a through 3o.**

Former/Current UST Location

COC	*Location ID*	*Sample Depth (feet)*	*Maximum Results (mg/Kg)*
GRO	S-13-TP1M	13	6,590
Benzene	S-18TP2SW	18	6.18
Ethylbenzene	V-8	21.5	71
Naphthalene	--	--	<0.005
MTBE	**S-13-TP1M**	**13**	**956**

Dispenser Islands

COC	*Location ID*	*Sample Depth (feet)*	*Maximum Results (mg/Kg)*
GRO	MW-6	15.5	21,000
Benzene	D-2	3	120
Ethylbenzene	T-2A	10	150
Naphthalene	--	--	<0.005
MTBE	T-2A	10	500

Waste Oil UST Location

COC	*Location ID*	*Sample Depth (ft)*	*Maximum Results (mg/Kg)*
GRO	SB-31	10	3,100
DRO	WO-4-4	4	4,000
Benzene	V-5	15	1.8
Ethylbenzene	V-5	15	2.8
Naphthalene	SB-32	30	6.1
MTBE	WO-4-4	4	7.8
PAHs	--	--	<0.25 - <2.1*

*Based on the seven carcinogenic PAHs as benzo(a)pyrene toxicity equivalent [BaPe]: benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene

6.3: EXTENT OF COC CONCENTRATIONS IN SOIL

Concentrations of the COCs within Sand Unit A have historically been detected above the LRLs and ESL clean-up objectives. The maximum lateral extent of these analytes is generally defined by SB-12 to the southwest, SB-18 to the west, SB-19 to the northwest, SB-5, SB-17 and SB-20D to the north, SB-7, SB-8, SB-10, and MW-7 to the northeast, SB-9 and MW-1R to the east, and SB-14 to the southeast. The highest concentrations detected in soil from 0 to 10 feet bgs were reported in trench excavations samples T-2 (3 feet), T-2A (10 feet), D-2 (3 feet), and D-4 (3 feet) collected in 1999.

Site assessment conducted within Fine-Grained Unit A and Sand Unit B has led to the detection of GRO, BTEX, naphthalene, and MTBE above the LRLs. The table below highlights the deepest detected concentration of these analytes.

Analyte	*GRO*	*Benzene*	*Toluene*	*Ethylbenzene*	*Xylenes*	*MTBE*	*Naphthalene*
Location	SB-2	V-8	MW-19D	SB-13, V-5	MW-5A	SB-15	MW-5
Concentration (mg/kg)	0.86	0.013	0.0022	0.0028, 0.005	0.056	0.0067	5.6
Feet bgs	66.5	70.5	131	60	60.5	160	35.5

MTBE has been detected above the ESL of 0.028 mg/kg in samples from 23 boring locations collected at depths of 55 to 135.5 ft bgs. These detections range in unsaturated soil from 0.028 mg/kg in SB-20D at 81 ft bgs to 99 mg/kg in SB-11 at 62 ft bgs (**Figure 2**). A summary of the MTBE detections above the ESL in soil samples collected from below 55 ft bgs is available as **Table 6**.

6.4: EXTENT OF COC CONCENTRATIONS IN GROUNDWATER

This section provides a summary of water quality and dissolved-phase plume extent and stability in the saturated zone. The impact on the saturated zone resulting from the release of fuel hydrocarbons is demonstrated by the laboratory results from subsurface water samples obtained from the monitoring wells both on- and offsite. Please refer to **Figure 2** for the location of the monitoring wells, **Table 3** for historical groundwater analytical results, and **Figure 4** for the First Quarter 2020 groundwater analytical results. The past maximum concentrations detected in groundwater collected from the Site monitoring wells are provided in **Table 12** as well as the following summary table.

COC	*Well ID*	*Maximum Results (µg/L)*
GRO	MW-5	370,000
Benzene	MW-1	5,300
MTBE	MW-5	510,000

6.4.1: VERTICAL EXTENT OF DISSOLVED-PHASE

Water level elevations in Sand Unit A monitoring wells ranged from approximately 40 to 60 feet above NGVD 29 in First Quarter 2020. Water level elevations in Sand Unit B monitoring wells ranged from approximately 25 to 35 feet below NGVD 29 during First Quarter 2020.

In First Quarter 2020, GRO, benzene, toluene, ethylbenzene, xylenes, and naphthalene concentrations in the Perched Zone wells set above Fine-Grained Unit A were below the LRLs. MTBE and TBA were detected in MW-6 at 67 µg/L and 240 µg/L, respectively. Well V-14 also had detections of MTBE and TBA, and well MW-3D had detections of MTBE in the first quarter 2020. In samples from wells set within Sand Unit B (Shallow aquifer) concentrations of GRO, BTEX, MTBE, and naphthalene were below the LRLs in First Quarter 2020. MTBE concentrations in MW-3D have remained below the corresponding ESL since May 1999, except for the anomalous detection in October 2005 of 220 µg/L. Please refer to **Figure 2** for monitoring well locations and to **Table 3** for historical groundwater gauging and analytical data.

6.4.2: LATERAL EXTENT OF DISSOLVED-PHASE

As of first quarter 2020, the following wells define the lateral extent of the dissolve-phase plume in the Perched Zone to the ESL water quality objectives: MW-12, MW-17 and V-8 define the plume to the southeast (downgradient), MW-7, MW-8 and MW-9 define the plume to the northeast (cross gradient), and MW-18 and MW-19 define the plume to the northwest (upgradient). Groundwater samples have not been collected from MW-11R and MW-14, located to the southwest (cross gradient) of source areas as there has been insufficient

water to sample throughout the life of the wells. Similarly, few samples have been collected from MW-5, also located to the southwest due to insufficient water in the well. The previous two MTBE concentrations in groundwater samples collected from MW-5 in February 2016 and September 2017 were below the corresponding ESL. Please refer to **Figure 2** for monitoring well locations and to **Table 3** for historical groundwater gauging and analytical data.

The lateral extent of dissolved MTBE in the Shallow aquifer has been defined to the ESL downgradient to the southeast by well MW-7D, cross gradient to the northeast by well MW-4D and to the southwest by well MW-6D, and upgradient to the northwest by wells MW-16D and MW-18D with concentrations in MW-19D dropping below the corresponding ESL in June 2019 and below the LRL in August 2019. Please refer to **Figure 2** for monitoring well locations and to **Table 3** for historical groundwater gauging and analytical data.
During the October 2005 groundwater sampling event, samples from MW-3D returned a MTBE concentration of 220 µg/L. Prior to this, the maximum MTBE concentration in MW-3D was 5 µg/L in May of 1999. The January 2005 and December 2005 sampling of MW-3D returned concentrations of MW-3D below the laboratory reporting limit of 0.50 µg/L. The maximum MTBE concentration detected in MW-3D following the October 2005 event was 3.7 µg/L in April of 2013 – as of the January 2020 sampling the MTBE concentration in MW-3D was 2.6 µg/L. Based on this information, it is Antea Group's determination that the October 2005 MTBE concentration of 220 µg/L was erroneous and caused by laboratory error or sample contamination during collection. Please refer to **Table 3** historical groundwater gauging and analytical data. As previously stated in **Section 3.5**, the deepest monitoring well at the Site is MW-3D, screened from 202 to 220 feet bgs beneath the -100-foot Clay. Three detections of MTBE were reported in MW-3D from July 2000 to February 2016, with one being the erroneous detection from the October 2005 sampling event. Groundwater analytical data from the Westlake Well show no detections of MTBE over the range of available data presented on the GAMA database, including over the same time range when detections were present in MW-3D.

Figure 4 shows the distribution of GRO, benzene, and MTBE during the First Quarter 2020 event. **Figure 5a and 5b** display the groundwater flow direction and gradient for both Zone A and Zone B as of First Quarter 2020, and **Appendix E** displays the historical groundwater flow directions.

6.4.3: TIME SERIES EVALUATION

Time Series Graphs showing groundwater elevation and GRO, benzene, and MTBE concentrations over time are provided as **Appendix F**. When results indicated concentrations were non-detect, the laboratory reporting limits were used to plot on the time series graphs. In some cases, fluctuations in concentrations on the graph may reflect changes in laboratory reporting limits. The data presented in the graphs indicates that the dissolved phase plume concentration trend for TPH-g/GRO, benzene, and MTBE is stable and/or reducing. Well MW-3D shows an increase in MTBE from third quarter 2019, but still remains below the ESL of 5.0 ug/L. Well MW-5 has a decreasing trend for TPH-g/GRO, and all other site wells with the exception of MW-10 indicate a stable trend. Wells MW-5 and MW-6 show decreasing trends for benzene, and all other site wells with the exception of MW-10 indicate a stable trend. Wells MW-4, MW-5, MW-6, MW-16, MW-19D, and V-14 show a decreasing trend for MTBE, and all other wells with the exception of MW-10 indicate a stable trend. MW-10 is an exception to the decreasing trends for TPH-G/GRO, benzene, and MTBE due to insufficient sample data; MW-10 has only been sampled twice. Concentrations of TPH-g/GRO, benzene, and MTBE in MW-10 decreased from initial highs of <1000 µg/L, <10 µg/L, and 11,000 µg/L, respectively in 2014 (reporting limits for GRO and benzene were elevated due to sample dilution), to lows of <50 µg/L, <0.5 µg/L, and 3.1 µg/L in 2016.

6.4.4: COC CONCENTRATION REDUCTION EVALUATION

Another method to evaluate the stability of dissolved-phase COC concentrations beneath the Site is comparison of maximum concentrations of GRO, benzene, and MTBE to the current or most recent concentrations in Site wells and calculating the percent reduction (**Table 12)**. Based on these comparisons, the site-wide reduction in concentrations of dissolved phase GRO, Benzene, and MTBE is estimated at 96, 88, and 90 percent, respectively.

6.5: SEVIEW EVALUATION OF COC MIGRATION

6.5.1: EVALUATION STATEMENT AND BACKGROUND

A question regarding the potential leaching of MTBE from soil and subsequent impact on groundwater and an idle municipal well (Westlake Well) was raised in correspondence from the GPP in letters dated June 19, 2017 and March 18, 2014. The substance of the correspondence concerned MTBE concentrations reported for soil samples collected above groundwater in the Shallow aquifer zone at well V-14 (2.7 mg/Kg at 86 feet bgs) and boring SB-11 (99 mg/Kg at 62 feet bgs), as reported by Antea Group[46]. The MTBE concentrations being evaluated were the highest reported for soil samples collected at each location. The MTBE concentration of 99 mg/Kg was detected at SB-11 in 2013, two years prior to the installation and operation of vapor extraction well V-12 located approximately ten feet to the northwest. V-12 is screened beginning at 70 feet bgs, below the 62-foot sample where the highest MTBE concentration was identified at SB-11 and, thus, the concentration of 99 mg/Kg was chosen as a worst-case scenario for modeling purposes. An aerial photograph showing the locations of soil borings V-14 and SB-11, as well as the Westlake Well, is included as Figure H-6 in **Appendix G.**

To assess the infiltration and impact of MTBE on the groundwater immediately below V-14 and SB-11, Antea Group prepared Conceptual Site Model (CSMs) using the SEVIEW software package. For the evaluation at soil boring V-14, the impact on the groundwater was also considered if the water table rose to 100 feet bgs from the approximately 130 feet bgs in the first quarter of 2020. Over the last several years, groundwater elevation has increased in the Shallow aquifer beginning in 2016 (**Table 3**). The SEVIEW CSMs for soil borings V-14 and SB-11 are included in **Appendix G** as Figures G-2 and G-3.

In addition to evaluating the impact of MTBE on groundwater immediately below each soil boring (V-14 and SB-11), the potential for migration of MTBE to the Westlake well was also evaluated. The Westlake production well is located approximately 560 feet south-southwest of the Site. As noted above in **Section 5.2**, the production well is screened within the Primary Production aquifer in the Merced Formation. Clay units, that would serve to impede the vertical migration of groundwater, are reported as overlying multiple screen intervals[47].

A summary and visual graphical representation of the SEVIEW simulations conducted for V-14 and SB-11 are included in **Appendix G**. This tabulation includes the key chemical and physical input parameters for MTBE, soil, and the aquifer. The tabulation also includes source area characterization parameters (soil layers, areal extent, and MTBE emplacement), as well as the predicted MTBE groundwater concentrations and timing at the sources and the Westlake Well.

6.5.2: EVALUATION APPROACH

The two aspects of evaluation – infiltration of MTBE from the vadose zone and subsequent migration in the groundwater – are ideally addressed by the SEVIEW[48] software package. SEVIEW is a contaminant fate and transport model that links the SESOIL[49] vadose zone model to the AT123D[50] groundwater transport model.

SESOIL is public-domain program developed in FORTRAN in the 1980s for the United States Environmental Protection Agency. SEVIEW was developed to facilitate the input of data to SESOIL and review the output. SESOIL allows up to 4 layers to be designated with variable hydrogeologic parameters, and each of the four layers may be subdivided into 10 sublayers. The hydrogeologic parameters of the sublayers cannot be changed but each can be assigned a concentration of the chemical being modeled for transport. A compilation of data required for SESOIL and AT123D is included in **Appendix G** as a series of data entry screens (Figures G-4 through G-12).

For ARCO 465 (Daly City, CA), the objective was to assess the impact on groundwater that may result from MTBE reported for soil samples collected at V-14 and SB-11. The hydrostratigraphy used in the model consisted of 62 feet (1890 cm) of sand, with a 3-foot to 5.5-foot fine-grained unit found at 62 feet. The fine-grained unit is then underlain by 65 feet of sand. The ambient water table was set at 130 feet bgs. Schematics of the hydrostratigraphy and MTBE source location for the simulations at V-14 and SB-11 are shown below and additional information is included in **Appendix G** (Figures G-2 and G-3):

		90/2743	
4	Sand		1189
	Water Table	130/3962	

Key input data for SESOIL and AT123D modules included:

SESOIL

1. Hydraulic conductivity (K) for Sand set at 3.5 * 10^{-3} cm/sec [intrinsic permeability (k) = 3.57 * 10^{-8} cm^2] – Based on determination at Site #11202 in Daly City, CA[51].
2. Hydraulic conductivity (K) for Fine-grained Unit set at 3.5 * 10^{-5} cm/sec [and intrinsic permeability (k) = 3.57 * 10^{-10} cm^2] – Based on determination at Site #11202 in Daly City, CA[48].
3. Fraction of organic carbon (f_{oc}) set at 0.2% as a typical value for sand, and also aligns well with data collected at Site #11202 in Daly City, CA[48].
4. The bulk density (1.65 g/cm^3), effective porosity (0.25), soil pore disconnectedness (3.8) and the Freundlich exponent (1.00) were set using default values for sand in SEVIEW.
5. Chemical parameters for MTBE are from the Massachusetts DEP, which are included in an extensive chemical database within SEVIEW.
6. The water table is assumed to be positioned immediately below the Fourth Soil Layer.

[51] Antea Group, 2017, *Remedial Action Plan: 76 (Former BP) Service Station No. 11202*, February 6.

7. Up to four layers may be specified in SESOIL and these were modeled for ARCO 465 for simulations based on the soil conditions reported at V-14 listed below:
    a. Upper Soil Layer (sand) – 1890 centimeters (62 feet)
    b. Second Soil Layer (fine-grained Unit) – 91 centimeters (3 feet)
    c. Third Soil Layer (sand) – 792 centimeters (26 feet)
    d. Fourth Soil Layer (sand) – 1189 centimeters (39 feet) [Ambient Conditions]
    e. Fourth Soil Layer (sand) – 275 centimeters (9 feet) [To simulate 30-foot rise in water table]
8. For simulations at V-14, 2.7 mg/Kg of MTBE was assigned to sublayer 10 of Layer 3 (2693.8 to 2773.0 centimeters bgs, or a thickness of 2.6 feet).
9. For the simulations at soil boring SB-11, the four layers had the following thicknesses:
    a. Upper Soil Layer (sand) – 1890 centimeters (62 feet)
    b. Second Soil Layer (fine-grained Unit) – 167 centimeters (5.5 feet)
    c. Third Soil Layer (sand) – 716 centimeters (22.5 feet)
    d. Fourth Soil Layer (sand) – 1189 centimeters (39 feet)
10. For simulations at SB-11, 99 mg/Kg of MTBE was assigned to sublayer 1 of Layer 2 (1890.0 to 1906.8 centimeters bgs, or a thickness of 5.5 feet).
11. For simulations that included degradation in the vadose zone, the Liquid Phase Biodegradation Rate was set at the most conservative rate of 0.006 /day based on studies and quantification of MTBE degradation in the vadose zone under limited oxygen conditions and no addition of nutrients[52].

AT123D

1. The potential receptor for MTBE transport in the groundwater was designated as the Westlake Well located 171 meters (560 feet) SSW of the assumed sources at V-14 and SB-11.
2. Hydraulic conductivity, bulk density, fraction of organic carbon, and effective porosity for AT123D are same as described for SESOIL previously.
3. The hydraulic gradient was set at 0.0015 (ft/ft) based on groundwater elevation contour maps developed for the Site.
4. Dispersivities (Longitudinal, Transverse, and Vertical) were calculated based on the method published by Xu and Eckstein (1995)[53] using an assumed plume length of 171 meters.
5. For simulations that included degradation of MTBE in the groundwater, the 1st Order Decay Coefficient was set at 0.00005 /hour based on field studies at sites comparable to ARCO Service Station No. 465 as reported by Parsons Engineering for the CFB Borden Site (Ontario, CA) and the USCG Fire Station Site (Elizabeth City, NC)[54].

The lateral extent of MTBE at V-14 is not well constrained by analytical results for soil samples collected nearby from a similar depth. The size of the source area at V-14 included three variants of 10 feet (3.05 m) by 10 feet,

[53] Xu, M. and Y. Eckstein, 1995, U*se of Weighted Least-Squares Method in Evaluation of the Relationship Between Dispersivity and Field Scale*, Ground Water Vol. 33 No. 3

[54] Parsons Engineering Science, 1999, *Methyl tert-Butyl Ether (MTBE): Its Movement and Fate in the Environment and Potential for Natural Attenuation*, Air Force Center for Environmental Excellence.

20 feet (6.1 m) by 20 feet, and 40 feet (12.2 m) by 40 feet. In addition, to simulate a potential rise in the water table of 30 feet (914 centimeters), the thickness of the Fourth Soil Layer was reduced from 1189 centimeters to 275 centimeters.

At the source area designated by SB-11, the extent of MTBE in vadose soil is constrained by soil samples collected and analyzed at SB-15 and V-12. The source area at SB-11 was maintained at 20 feet (6.1 m) by 20 feet for all simulations.

The output from SESOIL estimates the mass of MTBE from the initial source that volatilizes, is sorbed on soil, degrades from biological activity, and infiltrates to the water table. SESOIL predicts the concentration of MTBE in the leachate that exits the bottom of the soil column. The leachate concentration is then passed to AT123D for use in groundwater fate and transport predictions. To obtain an estimate of the MTBE concentration in groundwater at each source area, a point of compliance (designated as POC-10) was established immediately down-gradient of V-14 and SB-11. An additional point of compliance (POC-11) was established at the Westlake Well location to allow AT123D to predict the concentrations of MTBE in the Shallow aquifer zone (Colma Formation), as depicted in the 2004 Update on the Conceptualization of the Westside Ground-Water Basin – San Francisco and San Mateo Counties[55].

6.5.3: SEVIEW RESULTS

The SEVIEW model, both SESOIL and AT123D, were run with MTBE sources in the unsaturated zone based on soil samples collected while drilling V-14 and SB-11. As described above, the MTBE concentrations reported for soil samples from V-14 (2.7 mg/Kg at 86 feet bgs) and SB-11 (99 mg/Kg at 62 feet bgs) were the highest reported MTBE concentrations reported for the soil samples collected at each location.

Twelve simulations were run to evaluate the infiltration and migration of MTBE from the V-14 source area. The number of simulations is related to running SEVIEW with three, source area extents, and an ambient and higher water table. The initial six SEVIEW simulations evaluated the effect of the various source area extents, as well as a rise of the water table from 130 feet bgs to 100 feet bgs. The remaining six SEVIEW simulations at V-14 included unsaturated zone or saturated zone degradation, a higher water table, and two source area extents. All SEVIEW simulations for the V-14 source area were run for 50 years. Summaries of key input parameters and SEVIEW results for the V-14 source area are included in **Appendix G** (Figures G-13 and G-14).

Four simulations were run to evaluate infiltration and migration of MTBE from the SB-11 source area. Because the extent of MTBE was better constrained in the vicinity of SB-11, all SEVIEW simulations were run with a source area extent of 20 feet by 20 feet (6.1 meters by 6.1 meters). The initial simulation did not include degradation in the unsaturated or saturated zone, but subsequent simulations included one or the other, or both. All simulations for the SB-11 source area were run for 50 years. Summaries of key input parameters and SEVIEW results for the SB-11 source area are included in **Appendix G** (Figures G-15 and G-16).

6.5.3.1 Summary of Results for V-14 Source Area

The initial six SEVIEW simulations did not include degradation but did include variations in source area extent and depth to the water table. The higher water predicted a slight increase in the MTBE concentrations in the

[55] Luhdorff and Scalmanini Consulting Engineers, 2004*, Update on the Conceptualization of the Westside Ground-Water Basin – San Francisco and San Mateo Counties; prepared for the San Francisco Public Utilities Commission*, Geologic Cross Section F-F' for Westside Basin

groundwater at the source area and at the Westlake Well. All six SEVIEW simulations predicted detectable MTBE concentrations in the groundwater at the source area and at the Westlake Well. It should be noted that the predicted MTBE concentrations at the Westlake well are from the Shallow aquifer and do not factor in the influence of the confining clay recorded on the log for MW-3D and the 1995 Well Completion Report for the Westlake well.

The predicted MTBE concentrations in the groundwater at the source area ranged from 1,310 µg/L to 12,400 µg/L. The lower predicted MTBE concentrations are associated with simulations for the smallest source area (10 feet by 10 feet) and the lower water table, while the largest source area (40 feet by 40 feet) and higher water table produced the highest predicted MTBE concentrations.

	Source Area		Predicted Results				
RUN #	Lateral Extent		GW Impact near V-14 (POC-10)		GW Impact at SF-03 (POC-11)		
	X Direction (m)	Y Direction (m)	Maximum MTBE Concentration at Source (ug/L)	Year that Maximum Concentration Occurs at Source	Maximum MTBE Concentration at SF-03 (Westlake Well) (ug/L)	Year that Maximum Concentration Occurs at SF-03 (Westlake Well)	Notes
1	6.1	6.1	6040	6.5	32.60	38.92	
2	6.1	6.1	9170	1.5	34.10	33.83	Higher WT
3	12.2	12.2	9450	6.5	127.00	38.5	
4	12.2	12.2	12400	1.5	132.00	32.83	Higher WT
5	3.05	3.05	1310	6.5	8.04	39.58	
6	3.05	3.05	1820	1.5	8.42	34.25	Higher WT

Six SEVIEW simulations (7 – 12) included degradation in the unsaturated zone or saturated zone, as well as variations in source area extent and depth to the water table. The higher water predicted a slight increase in the MTBE concentrations in the groundwater at the source area and at the Westlake Well, most notably for the simulation with the larger source area and degradation in the unsaturated zone (Run #11). All six SEVIEW simulations predicted detectable MTBE concentrations in the groundwater at the source area, but only four simulations predicted detectable MTBE concentrations at the Westlake Well. It should be noted that the predicted MTBE concentrations at the Westlake Well are from the Shallow aquifer and the influence of the confining clay is not considered.

The predicted MTBE concentrations in the groundwater at the source area ranged from 136 µg/L to 11,600 µg/L. The lower predicted MTBE concentrations are associated with simulations for the smaller source area (20 feet by 20 feet) and the lower water table, while the larger source area (40 feet by 40 feet) and higher water table produced the highest predicted MTBE concentrations.

The inclusion of degradation in the unsaturated or saturated zone predicted lower MTBE concentrations at the source than those that did not include degradation. The predicted MTBE concentrations in the groundwater at the source were reduced by more than 95%. As depicted in the table below, the inclusion of degradation in the unsaturated zone produced lower initial groundwater concentrations at the source area that subsequently declined to non-detectable or slightly above detectable concentrations at the Westlake Well.

The effect of including degradation in the saturated zone produced predictions of MTBE concentrations in the groundwater at the source that ranged from 11% to 20% lower (depending on the source area extent) than simulations without degradation for comparable source areas. When only saturated zone degradation was active, detectable MTBE was predicted at the Westlake Well only for the simulation (Run #12) that included the larger source area and a higher water table.

	Unsaturated	Saturated	Source Area		Predicted Results				
			Lateral Extent		GW Impact at V-14 (POC-10)		GW Impact at SF-03 (POC-11)		
RUN #	Liquid Phase Biodegradation Rate (1/day)	1st Order Decay Coefficient (1/hour)	X Direction (m)	Y Direction (m)	Maximum MTBE Concentration at Source (ug/L)	Year that Maximum Concentration Occurs at Source	Maximum MTBE Concentration at SF-03 (ug/L)	Year that Maximum Concentration Occurs at SF-03	Notes

6.5.3.2 Summary of Results for SB-11 Source Area

Three of the four SEVIEW simulations for the SB-11 source area included unsaturated or saturated zone degradation, or both. Because the extent of MTBE in soil was better defined at the SB-11 location, the source area was maintained at 20 feet by 20 feet for all 4 simulations. Finally, all simulations for the SB-11 source area designated the water table at a depth of 130 feet bgs. A summary of the important variables and results for the SEVIEW simulations is tabulated below.

The simulation that did not include degradation (Run #1), predicted the MTBE groundwater concentration at the source area would be 39,800 µg/L and the concentration in the Shallow aquifer zone at the Westlake Well would be 250 µg/L after 44.25 years. The inclusion of unsaturated or saturated degradation reduced predictions of MTBE concentrations at the source area more than 99%, while inclusion of degradation in the saturated zone predicted a reduction in the MTBE concentration in the groundwater at the source of about 8%. The predicted marginally detectable MTBE concentrations occur at the Westlake Well after 27.67 or 41.42 years [Runs #2 (Unsaturated Zone Degradation) and #3 (Saturated Zone Degradation)]. The SEVIEW simulation that included both unsaturated and saturated zone degradation (Run #4) predicted no detectable MTBE concentrations at the

Westlake Well for the entire 50-year simulation period. As noted earlier, the predicted MTBE concentrations at the Westlake Well are in the surficial aquifer and do not represent MTBE concentrations below the confining clay.

	Unsaturated	Saturated	Source Area		Predicted Results				
			Lateral Extent		GW Impact at SB-11 (POC-10)		GW Impact at SF-03 (POC-11)		
RUN #	Liquid Phase Biodegradation Rate (1/day)	1st Order Decay Coefficient (1/hour)	X Direction (m)	Y Direction (m)	Maximum MTBE Concentration at Source (ug/L)	Year that Maximum Concentration Occurs at Source	Maximum MTBE Concentration at SF-03 (Westlake Well) (ug/L)	Year that Maximum Concentration Occurs at SF-03 (Westlake Well)	Notes

6.5.4: FINDINGS OF SEVIEW RESULTS

The SEVIEW model, which includes modules for migration and degradation in unsaturated (SESOIL) and saturated (AT123D) zones was used to evaluate the impact on the groundwater from MTBE reported in soil samples at two locations (soil borings V-14 and SB-11) near or at ARCO No. 465 (Daly City, CA). Simulations included variable source area extents and degradation, as well as a variable water table at the V-14 source area.

The conclusions to be drawn from the simulations described above are:

- Detectable MTBE is predicted at the respective source area in the groundwater under all simulation scenarios at V-14 or SB-11.
- Smaller source areas produce lower predicted MTBE concentrations in the groundwater near their respective source areas.
- The inclusion of degradation in the unsaturated zone reduces the predicted MTBE concentrations in the groundwater at the source by an order of magnitude or more (1000s vs. 100s of ug/L), or 97% to 99%.
- The inclusion of saturated zone degradation predicts somewhat lower (about 11% at V-14 and 8% to 9% at SB-11) MTBE concentrations in the groundwater at the source area (20-foot by 20-foot).
- For the V-14 source area, the predicted MTBE concentrations at the Westlake Well, with no active degradation, range from 8.04 µg/L to 132.0 µg/L after 32 to 39 years, with the higher water table producing slightly higher predicted MTBE concentrations.
- When degradation is active in the unsaturated or saturated zone for simulations of the V-14 source area and a higher water table is simulated, the highest predicted MTBE concentration in the surficial aquifer above the confining clay at the Westlake Well is 28.5 µg/L after more than 32 years.
- For simulations involving the SB-11 source area, non-detectable to marginally detectable MTBE concentrations are predicted in the surficial aquifer above the confining clay at the Westlake Well for all simulations that include unsaturated or saturated degradation (or both), while the simulation that did

not include degradation the predicted MTBE concentration in the surficial aquifer above the confining clay at the Westlake Well of 250 µg/L after 44.25 years.

6.6: CONCENTRATIONS IN SOIL GAS

On June 7, 2011, Stantec oversaw installation of dual-nested soil vapor probes SV-1S and SV-1D near the western property line to evaluate the risk of vapor intrusion to indoor air at the mixed commercial property to the west of the Site (**Figure 2**). Soil vapor probes SV-1S and SV-1D were constructed using ¼-inch tubing connected to 6-inch stainless steel probe tips centered in sand packs from 5.25 to 5.75 ft bgs and 9.25 to 9.75 ft bgs, respectively. On December 21, 2011, Stantec collected soil vapor samples from vapor probes SV-1S and SV-1D with SV-1D containing 610 µg/m^3 of PCE most likely derived from operations at the former Southgate Cleaners located approximately 100 feet west-southwest of the Site (**Table 5**).

Information acquired from GeoTracker indicates VOCs, specifically PCE, are present in soil vapor beneath the former Southgate Cleaners property (currently occupied by H&R Block) at concentrations that exceed both residential and commercial ESLs[56] due to historic dry-cleaning operations conducted from 1970 until 2007. In 2014, an SVE system was installed for the former dry-cleaner Site to reduce PCE concentrations. The SVE system consists of both extraction and treatment components including a blower, two vessels containing vapor phase GAC, and conveyance piping to three vapor extraction wells[57]. The SVE system started continuous operation on July 5, 2016 and ran on weekdays during business hours for a total of 127 days until it was shut down on December 28, 2016. A February 13, 2017 *Soil Vapor Extraction Performance Report*[57] recommended shut down of the SVE system for rebound testing. The proposed schedule included rebound activities (system operation and sampling) occurring through the end of May 2017. GPP concurred with the recommendation but requested a longer rebound testing period up to 12 months in duration.[58]

SECTION 7.0: CONCEPTUAL SITE MODEL

The following sections provide a narrative description of the amended CSM developed to support regulatory review of the Site for case closure. The CSM presented is a summary of the information outlined in other sections of this document.

7.1: SOURCE AREAS

Based on available documentation, onsite releases occurred prior to 1992 around the former USTs, in 1997 from the former waste oil UST located in the area of the current waste oil UST, in 1999 from the product lines, and in 2000 from the former USTs located in the area of the current USTs. Please refer to **Figure 2** for the location of the current and former facility footprint and **Sections 3.2 and 6.1** for available information on the release events that represent these areas of concern (AOCs) outlined above.

[57] Northgate Environmental Management, Inc., 2017. *Soil Vapor Extraction Performance Report* Former Southgate Dry Cleaners Site 183 Southgate Avenue, Daly City, California 94015. February 13.
[58] County of San Mateo Health System, Groundwater Protection Program, 2017. Letter to Ms Linda Larson of Kimco Realty Corporation and Mr. Gary Wong of Westlake Development Co. Inc. *Southgate Cleaners, 183 Southgate Avenue, Daly City, California*. March 16.

7.2: GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

Regional and Site-specific geologic and hydrogeologic conditions are summarized in **Sections 3.4** and **3.5**.

7.5: NATURE AND EXTENT OF IMPACTS

7.5.1: ADSORB PHASE IN SUBSURFACE SOIL

The nature and extent of subsurface soil contamination is discussed in **Section 6.3**. A summary of the MTBE detections above the ESL in soil samples collected from below 55 ft bgs is available in **Table 6**.

7.5.2: VERTICAL EXTENT OF DISSOLVED PHASE

The vertical extent of dissolved phase impacts is discussed in **Section 6.4.1**.

7.5.3: LATERAL EXTENT IN DISSOLVED PHASE

The lateral extent of dissolved phase impacts is discussed in **Section 6.4.2.**

7.6: HUMAN HEALTH RISK

A summary of potential sensitive receptors with a 1,000-foot to 1-mile radius of the site is provided in **Section 5.0** and the extent stability of the COCs in soil and groundwater is discussed in **Section 6.0**. Please refer to **Figure 2** and **Section 3.1** for the layout and facility information. **Table 11** presents soil analytical data from 0-10 feet bgs – reductions from the previous exceedances of the LTCP thresholds for benzene and ethylbenzene are confirmed and the 2020 samples analyzed for naphthalene were below LTCP thresholds, mitigating any direct contact and volatilization to outdoor air concerns. Based on the data presented in this report, the Site does not pose a significant human health risk.

7.7: ECOLOGICAL RISK

The facility is located in a developed urban area of Daly City, California. The nearest surface water is Lake Merced, located approximately 4,300 feet to the north. Based upon this information, there is no a significant ecological risk.

SECTION 8.0: LTC POLICY STATUS SUMMARY

The LTCP outlines general criteria a site must satisfy to qualify for closure along with media-specific criteria (MSC) for Groundwater (GW), Petroleum Vapor Intrusion to Indoor Air (PVI), and Direct Contact and Outdoor Air Exposure (DC&OAE). An evaluation of Site data against the criteria in the LTCP is provided in the following sections (**Appendix I**).

8.1: GENERAL CRITERIA

8.1.1: PUBLIC WATER SUPPLY

There is one public water supply well identified within 1,000 feet of the Site (**Section 5.2**). During telephone communication between Antea Group and the SFPUC, the agency indicated that this supply well is not in actively pumping and is currently used solely for monitoring purposes. The agency indicated that there were no plans to bring the well online in the near future, as part of the Regional Groundwater Storage and Recovery Project to store groundwater. The Site and surrounding area are on the municipal water system, managed by the SFPUC, whose Regional Water System draws from regional groundwater and local runoff, as well as runoff collected in Hetch Hetchy Reservoir in the Upper Tuolumne River Watershed[59].

[59] San Francisco Public Utilities Commission, 2018, *Annual Groundwater Monitoring Report Westside Basin, San Francisco and San Mateo Counties, California*, April.

8.1.2: UNAUTHORIZED RELEASE CONSISTS ONLY OF PETROLEUM HYDROCARBONS

The Site has been a retail automotive service station that has dispensed gasoline since at least the 1950's, according to aerial photos provided by EDR (**Appendix D**). Documentation available on GeoTracker for open case #220033 has only identified the gasoline, MTBE, TBA, and other fuel oxygenates as constituents of concern. Previous reports indicated PCBs were detected at the Site – however, concentrations were low, limited to the waste oil tank vicinity, and considered to be associated with the service station activities[6061].

8.1.3: UNAUTHORIZED RELEASE HAS BEEN STOPPED

As outlined in **Section 3.2**, BP has had the primary sources of the unauthorized releases (i.e. the USTs, product dispensers, and conveyance piping) removed and replaced.

8.1.4: FREE PRODUCT REMOVAL

No free product has been observed during the Site's 28-year remediation history. Please refer to **Table 3** for a summary of observations.

8.1.5: CONCEPTUAL SITE MODEL

The CSM for the Site (stratigraphy, hydrogeology, contaminant distribution, and the surrounding area) is described in **Section 7.0**. The soil borings and monitoring well details is provided in **Table 1.** Three cross sections are provided in **Appendix H** and the lateral extent of the dissolved phase plumes for the COCs GRO, benzene, and MTBE are provided **Figure 4.**

8.1.6: SECONDARY SOURCE REMOVAL

With the completion of the 1997, 1999, and 2000 tank and product line removals and soil excavation activities, as well as the intermittent soil vapor extraction system operation from 1993 to 2019 as described in **Section 4.0**, secondary source has been removed to the extent practicable in consideration of maintaining the existing infrastructure, preserving station operational status, and keeping remedial efforts effective and within economic feasibility.

8.1.7: MTBE IN SOIL AND GROUNDWATER

Both soil and groundwater have been tested for MTBE and the results reported in accordance with Health and Safety Code section 25296.15. Results of the soil and groundwater testing were reported in the associated site assessment reports and the periodic monitoring and sampling reports uploaded to the California State Water Resources Control Board GeoTracker database (**Tables 2a, 2b, and 6**).

8.1.8: NUISANCE DOES NOT EXIST AT THE SITE

A nuisance, as defined by Water Code Section 13050-13051 meets each of the following criteria:

- Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property;
- Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal;
- Occurs during, or as a result of, the treatment or disposal of wastes;

[60] SEACOR, 1992, *Technical Report Phase I Site Investigation*, July 31.
[61] SECOR, 1998, *Waste Oil Tank Removal and Replacement Report*, January 6.

No nuisance conditions exist at the Site.

8.2: MEDIA-SPECIFIC CRITERIA

The following provides a summary of the status of the three media specific LTCP criteria based on the information presented in previous sections of this document.

8.2.1: GROUNDWATER

Section 6.4 provides a detailed summary of the current status of the dissolved phase fuel hydrocarbon plume including dissolved phase benzene and MTBE. The five LTCP classes of the MSC for GW are summarized as follows:

(1) a. The contaminant plume that exceeds water quality objectives is less than 100 feet in length.
b. There is no free product.
c. The nearest existing water supply well or surface water body is greater than 250 feet from the defined plume boundary.

(2) a. The contaminant plume that exceeds water quality objectives is less than 250 feet in length.
b. There is no free product.
c. The nearest existing water supply well or surface water body is greater than 1,000 feet from the defined plume boundary.
d. The dissolved concentration of benzene is less than 3,000 micrograms per liter (µg/l), and the dissolved concentration of MTBE is less than 1,000 µg/l.

(3) a. The contaminant plume that exceeds water quality objectives is less than 250 feet in length.
b. Free product has been removed to the maximum extent practicable, may still be present below the site where the release originated, but does not extend off-site.
c. The plume has been stable or decreasing for a minimum of five years.
d. The nearest existing water supply well or surface water body is greater than 1,000 feet from the defined plume boundary.
e. The property owner is willing to accept a land use restriction if the regulatory agency requires a land use restriction as a condition of closure.

(4) a. The contaminant plume that exceeds water quality objectives is less than 1,000 feet in length.
b. There is no free product.
c. The nearest existing water supply well or surface water body is greater than 1,000 feet from the defined plume boundary.
d. The dissolved concentration of benzene is less than 1,000 µg/l, and the dissolved concentration of MTBE is less than 1,000 µg/l.

(5) a. The regulatory agency determines, based on an analysis of site specific conditions that under current and reasonably anticipated near-term future scenarios, the contaminant plume poses a low threat to human health and safety and to the environment and water quality objectives will be achieved within a reasonable time frame.

The application of Classes 1 through 4 do not apply since there is a municipal water production well within 1,000 feet of the Site. However, given the data and SEVIEW modeling presented in **Sections 6.0, 6.1, 6.2, 6.3, and 6.4** it is Antea Group's belief that the status of the Site should be considered under Class 5.

8.2.2: PETROLEUM VAPOR INTRUSION TO INDOOR AIR

The LTCP Vapor Intrusion MSC does not apply to the Site since it is an active commercial fuel dispensing facility. Please refer to **Figure 2** and **Section 3.1** for the layout and facility information.

8.2.3: DIRECT CONTACT AND OUTDOOR AIR EXPOSURE

The LTCP MSC for DC&OAE are based on the residual impact of benzene, ethylbenzene, and naphthalene in subsurface soil between the ground surface and 10 feet bgs. The following table lists the LTCP[62] thresholds for subsurface soil.

Concentrations of Petroleum Constituents in Soil That Will Have No Significant Risk of Adversely Affecting Human Health

Chemical	Residential		Commercial/ Industrial		Utility Worker
	0 to 5 feet bgs	Volatilization to outdoor air (5 to 10 feet bgs)	0 to 5 feet bgs	Volatilization to outdoor air (5 to 10 feet bgs)	0 to 10 feet bgs
	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg
Benzene	1.9	2.8	8.2	12	14
Ethylbenzene	21	32	89	134	314
Naphthalene	9.7	9.7	45	45	219
PAH[1]	0.063	NA	0.68	NA	4.5

Notes:
1. Based on the seven carcinogenic poly-aromatic hydrocarbons (PAHs) as benzo(a)pyrene toxicity equivalent [BaPe]. Sampling and analysis for PAH is only necessary where soil as affected by either waste oil or Bunker C fuel.
2. The area of impacted soil where a particular exposure occurs is 25 by 25 meters (approximately 82 by 82 feet) or less.
3. NA = not applicable
4. mg/kg = milligrams per kilogram

The following "bullets" describe the locations and concentrations above the LTCP MSC limits for DC&OAE under the Commercial Industrial and Utility Worker (CI&UW) receptor scenarios for the applicable COCs pre- and post-excavation and shallow SVE system operation:

- **Benzene**: Exceeded LTCP concentrations in the 3-foot sample collected from T-2 (18 mg/kg), the 10-foot sample collected from T-2A (82 mg/kg), the 3-foot sample collected from D-2 (120 mg/kg) and the 3-foot sample collected from D-4 (20 mg/kg). These detections occurred during the 1999 excavation and the sample locations were within the excavation footprint. Concentrations from 1999 sample T-1 at 3 feet bgs, 1999 sample T-6 at 3 feet bgs, 1999 sample T-6A at 4 feet bgs, and 2014 sample HA-2 at 3 feet bgs, all located in proximity to D-2, were below the LTCP limits. Concentrations from 2020 confirmation soil borings HA-4 and HA-5, located near T-2 and T-2A, were below the LRLs at both 5 and 10 feet bgs (**Figure 6**).

- **Ethylbenzene**: Exceeded LTCP threshold concentrations in the 3-foot sample collected from boring D-2 (100 mg/kg) in 1999. This location was excavated during the 1999 excavation, and concentrations from 2020 confirmation soil borings HA-4 and HA-5 were below LRLs at both 5 and 10 feet bgs (**Figure 6**).

- **Naphthalene**: No soil samples collected from 0-10 feet bgs at this Site have exceeded LTCP threshold concentrations outlined above.

[62] California State Water Resources Control Board, 2012, *Low-Threat Underground Storage Tank Case Closure Policy,* August 17.

All detections above the LTCP thresholds from samples collected between 0 and 10 feet bgs were within the 1999 excavation boundary. Confirmation soil borings advanced in February 2020 confirmed that concentrations at 5 and 10 feet bgs in previously unconfirmed locations were below the LRLs.

SECTION 9.0: CONCLUSIONS

In a letter dated February 2, 2015, the GPP stated that they could no longer recommend the UST Cleanup Fund reimburse the cost to operate the SVE system for remediating within and above the perched groundwater zone, as the hydrocarbon recovery had dropped to approximately 6 pounds/day and in a letter dated November 13, 2019, the GPP approved the recommendation to shut down the SVE system in the deep zone, as data indicated recovery of MTBE mass from SVE is negligible. BP and Antea Group believe that secondary source has been remediated to the maximum extent practicable within economic feasibility.

All detections above the LTCP thresholds from samples collected between 0 and 10 feet bgs were within the 1999 excavation boundary. Confirmation soil borings advanced in February 2020 confirmed that concentrations at 5 and 10 feet bgs in previously unconfirmed locations were below the LRLs.

SEVIEW modeling results presented in **Section 6.5** show that remaining MTBE mass in unsaturated soil at the Site is a low threat to impacting the nearby Westlake Well, resulting in eligibility for Class 5 of the media-specific criteria for groundwater. Due to the limitations of the SEVIEW modeling software, MTBE concentrations predicted at the Westlake Well are present at the depth of the shallow regional aquifer (Zone B). This conservative modeling result would still require the MTBE to migrate across the confining clay layer and travel approximately 200 vertical feet before reaching the top of the screened intervals of the Westlake Well.

Despite MTBE detections in MW-3D, MTBE has never been detected in in the Westlake Well in reported analytical data ranging from July 2000 to February 2016, regardless of if the well was pumping or not.

Based on the information presented in this document, Antea Group believes Site conditions satisfy LTCP criteria and should be granted case closure by the GPP.

SECTION 10.0: REMARKS

Any recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

Should you have any questions, or require additional information concerning this report, please contact Hannah Mishriki at (970) 292-1052 or hannah.mishriki@anteagroup.com

V-11	12/16/14	121.0	4	70.0	100.0	20.0	Bentonite 90 to 121 ft bgs, drilled from 12/14/14 - 12/16/14
V-12	10/15/15	90.0	4	70.0	90.0	20.0	Drilled from 10/7/15 - 10/15/15
V-13	10/13/15	90.0	4	70.0	90.0	20.0	Drilled from 10/8/15 - 10/13/15
V-14	05/09/16	91.5	4	70.0	90.0	20.0	Drilled from 5/9/16 - 5/12/16, bentonite from 90 to 91.5 ft bgs
Soil Vapor Probe							
SV-1S	06/07/11	5.5	0.75	5.25	5.75	0.5	Nested Soil Vapor Probe
SV-1D	06/07/11	10.0	0.75	9.25	9.75	0.5	Nested Soil Vapor Probe

Explanation

Wells are of poly-vinyl-chloride (PVC) construction

ft bgs = Feet Below ground surface

-- = Denotes unknown data or not applicable

Proposed soil boring SB-6 was not advanced per the April 5, 2006 Additional Soil and Groundwater Investigation Interim Report.

TABLE 2a
Historical Soil Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue
Daly City, CA

Sample I.D.	Date	Depth (ft bgs)	GRO (mg/kg)	DRO (mg/kg)	ORO (mg/kg)	Total TPH (mg/kg)	Benzene (mg/kg)	Toluene (mg/kg)	Ethylbenzene (mg/kg)	Xylene (Total) (mg/kg)	MTBE (SW8260B) (mg/kg)	DIPE (mg/kg)	ETBE (mg/kg)	TAME (mg/kg)	TBA (mg/kg)	1,2-DCA (mg/kg)	EDB (mg/kg)	Naphthalene (mg/kg)	Stoddard Solvent (mg/kg)	Oil and Grease (mg/kg)	Jet Fuel (mg/kg)

Notes:
ft bgs = feet below ground surface
mg/kg = milligrams/kilograms
-- = Not analyzed
< = Analyte was not detected above the specified reporting limit
-- = No Information Available
Results in **bold** exceed the reporting detection limit
GRO = Gasoline range organics
DRO = Diesel range organics
ORO = Oil range organics
TPH = Total recoverable petroleum hydrocarbons
MTBE = Methyl tertiary butly ether
DIPE = Diisopropyl ether
ETBE = Ethyl-tert-butyl ether
TAME = tert-Amylmethyl ether
TBA = tertiary-Butyl Alcohol
1,2-DCA = 1,2-Dichloroethane
EDB = 1,2-Dibromoethane
1) Soil analyzed by EPA Method 8260B was taken from unpreserved soil jars
2) Sample analyzed out of hold for EPA Method 8260B
LQ = LCS/LCSD recovery above method control lim
MTBE (CALUFT) and Ethanol not analyzed
BU = Samples analyzed after hold time expired.
EY = Result exceeds normal dynamic range; reported as a min. est.
GR = Internal Standard out of range
a = Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
b = Chromatogram Pattern: Gasoline C6-C10
c = Chromatogram Pattern: Unidentified Hydrocarbons C6-C10
d = The closing calibration was outside acceptance limits by -20%. This should be considered in evaluating the result. The average % difference for all analytes met the 15% requirement and the QC suggests that calibration linearily is not a factor.
^ = Confirmed by EPA Method 8260B measured 11/30/01 other values measured 11/29/01.
M1 = The Method Reporting Limit (MRL) was elevated due to matrix interferences.
A= The sample contained 13,000 mg/kg heavy oil
B=The sample contained 2,300 mg/kg heavy oil
C=The sample contained 380 mg/kg heavy oil
D=The sample contained 220 mg/kg heavy oil
E=The sample contained 430 mg/kg heavy oil
F=The sample contained 63 mg/kg heavy oil
G=Sample contains higher boiling point hydrocarbon mixture quantitated as gasoline. The chromatogram did not match the typical gasoline footprint.
H = MTBE analysis performed using EPA Method 8020

TABLE 2b
Soil SVOC Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue
Daly City, CA

Notes:
ft bgs = feet below ground surface
mg/kg = milligrams/kilograms
-- = Not analyzed
< = Analyte was not detected above the specified reporting limit
Bromobenzene, Bromodichloromethane, Bromoform, Bromomethane, sec-Butylbenzene, tert-Butylbenzene, n-Butylbenzene, Carbon tetrachloride, Chlorobenzene, Chloroethane, Chloroform, Chloromethane, 4-Chlorotoluene, 2-Chlorotoluene, 1,2-Bibromo-3-chloropropane, Dibromochloromethane, Dibromomethane, 1,2-Dichlorobenzene, Dichlorodifluoromethane, 1,1-Dichloroethane, 1,1-Dichloroethene, cis-1,2-Dichloroethene, cis-1,3-Dichloropropene, trans-1,2-Dichloroethene, trans-1,3-Dichloropropene, 1,2-Dichloropropane, 1,3-Dichloropropane, 2,2-Dichloropropane, 1,1-Dichloropropene, Isopropylbenzene, Methylene chloride, P-Isopropyltoluene, n-Propylbenzene, Styrene, 1,1,1,2-Tetrachloroethane, 1,1,2,2-Tetrachloroethane, Tetrachloroethene, 1,2,3-Trichlorobenzene, 1,1,1-Trichloroethane, 1,1,2-Trichloroethane, Trichloroethene, Trichlorofluoromethane, 1,2,3-Trichloropropane, 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, and Vinyl Chloride
were not analyzed in these samples
BU = Samples analyzed after hold time expired.
BH = Reporting limits rasied due to high level of non-target analytes.
LQ = LCS/LCSD recovery above method control lim
M1 = The Method Reporting Limit (MRL) was elevated due to matrix interferences.

TABLE 3
Historical Gauging and Analytical Data
ARCO Service Station No. 465
151 Southgate Avenue
Daly City, CA

Well I.D.	Date	GROUNDWATER ELEVATION DATA						GROUNDWATER ANALYTICAL DATA																
		TOC Elevation (ft)	Water Level Depth (ft)	LNAPL Depth (ft)	LNAPL Thickness (ft)	Water Level Elevation* (ft)	Qualifiers	GRO (ug/L)	DRO (ug/L)	Benzene (ug/L)	Toluene (ug/L)	Ethylbenzene (ug/L)	Xylene (Total) (ug/L)	MTBE (ug/L)	Naphthalene (ug/L)	Ethanol (ug/L)	TBA (ug/L)	DIPE (ug/L)	ETBE (ug/L)	TAME (ug/L)	1,2-DCA (ug/L)	EDB (ug/L)	Stoddard Solvent (ug/L)

Notes:
TOC = Top of Casing
ft = feet
NP = No Product
LNAPL = Light Non=Aqueous Phase Liquid
* = Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)
-- = No Information Available
Results in **bold** exceed the reporting detection limit
< = Not detected at or above indicated laboratory reporting limit
ug/L = micrograms per liter
GRO = Gasoline Range Organics
DRO = Diesel Range Organics
MTBE = Methyl tertiary butly ether
^ = TOC elevation changed to match August 24, 2017 survey data
a= Chomatogram Pattern: Weathered Gasoline C6-C12
b= Chromatogram Pattern: Gasolone C6-C12
c= The sample was diluted due to thie prescence of high levels of non-target analytes resulting in elevated reporting limits
d= Insufficient water in well to collect a sample
e= Hydrocarbon pattern is present in requested fuel quantitation range but does not resemble the pattern of the requested fuel for the Stoddard solvent
f= Discrete peak @ C6-C7 for GRO/TPH-g
g= This result was derived from a single point calibration with no MDL study for the Stoddard solvent
h= This sample was analyzed beyond the EPA recommended holding time. The results may still be useful for their intended purpose.
i= initial analysis indicated 10,000 ug/L, an estimated value above the calibration range of the instrument
j= Results for MTBE confirmed by EPA Methods 8260
k= Results of EPA Method 8240 METBE confirmation
l= Discrete peak at C5-C6
m= Hydrocarbon pattern is present in the requested fuel quantitation range byt does not resemble the pattern of the requested fuel
n= well is dry
o= well inaccessible
p= V-8 was sampled on Semptember 9,2000 because MW-1 was damaged
TBA = tertiary-Butyl Alcohol
DIPE = Diisopropyl ether
ETBE = Ethyl-tert-butyl ether
TAME = tert-Amylmethyl ether
1,2-DCA = 1,2-Dichloroethane
EDB = 1,2-Dibromoethane
IW = Inaccessible well
NG = Not Gauged
DNP = Did not purge prior to sampling
SV= Sample collected during SVE System Operation
VO = Vehicle obstruction
WD = Well Destroyed
WI = Well Inaccessible
NSP = Well not sampled this event, in accordance with groundwater sampling schedule
MD = Sampling & gauging performed over multiple days during this event
SU = Sample may be not be representative as they were collected within 48 hours of well development
VOL = Well not sampled due to insufficient volume of water in well
LQ = LCS/LCSD recovery above method control limits
N = Identity of contaminant uncertain (hydrocarbon pattern atypical of indicated analyte); see lab report

Beginning with the first quarter 2003 sampling event (3/26/03), TPH-g, BTEX and MTBE analyzed using EPA Method 8260B.

Beginning in the fourth quarter 2003, the laboratory modified the reported analyte list. Total petroleum hydrocarbons as gasoline (TPHg) has been changed resulting data may be impacted by the potential non-TPHg analytes within the requeted fuel range resulting in a higher concentation being reported

Beginning in the second quarater 2004, the carbon range fro GRO was changed from C6-C10 to C4-C12
Values for dissolved oxygen (DO) and pH were obstained through field measurements
Source: the data within this table collected prior to August 2002 was provided by URS by RM and their previous consultants. URS has not verified the accuracy of this information

Table 7
Soil Vapor Extraction System - Performance Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Notes:

a = System startup and shakedown in carbon abatement mode
b = PID used for influent, mid-influent, and effluent compliance readings
c = Field optimization following sample collection
d = Well V-10 turned off and well MW-10 turned on prior to departing site
e = Well MW-10 turned off and well V-10 turned on prior to departing site, pending receipt of analytical results.
f = System found shut down due to a triggered glass-covered emergency switch outside the compound
g = System found shut down due to tripped breakers for the enclosure exhaust fan. System was kept shut down in preparation for quarterly groundwater monitoring.
h = Liquid tight electrical conduit for oxidizer exhaust thermocouple was found needing replacement due to heat stress. System was shut down pending replacement.
i = Liquid tight electrical conduit and wiring for oxidizer exhaust thermocouple were replaced. The system was temporarily restarted, tested, and shut down.
j = System temporarily restarted to collect vapor samples and shut down.
k= System restarted based on vapor sample results.
l= System found down on arrival due to flame loss in oxidizer during a drive-by visit conducted on 2/10/14. Restarted w/o incident.
m = System emergency stop was triggered by unknown party following the 5/19/14 site visit. System was inspected for damage then restarted on 5/21/14.
n= System found down on arrival due to possible power failure. System restarted without incident. Effluent FIDs were inadvertently not collected during this visit.
o= System shutdown to accommodate drilling in vicinity of extraction wells. Operated for data collection and shutdown on departure.
p= System down to accommodate drilling in vicinity of extraction wells. Operated for compliance sample collection. System shutdown on departure for rebound testing purposes.
q= Operated on full dilution during visit for quarterly inspection and shut down on departure.
r= Deep extraction well feasibility test. System operated on deep screened extraction well V-11 only. SVE hourmeter reading at end of test.
s= Deep extraction well pilot test. System operated on deep screened extraction well V-11 only. SVE hourmeter reading at end of test.
t= Deep extraction well pilot test. System operated on deep screened extraction well V-11 only. SVE system hours at end of event inadvertently not recorded. Hours calculated based on runtime.
u = System startup following SVE extraction well network expansion. System operating on deep screened extraction wells only.
v = System down due to high level condition in the knock out tank.
w = System found down due to failure to maintain set point, low process air flow alarm PSL-701.
x = System restarted briefly for testing of the newly installed pressure transmitter and collection of monthly system samples. System shut down following sample collection for MTBE rebound monitoring.
y = Site walk with Antea technicians. Official Site transfer and SVE system O&M to Antea (from Stantec). No O&M conducted this day. Antea Group left SVE system off until their engineers could evaluate the sy
z = Air sample vacuum box was malfunctioning. Unable to collect samples for field and lab analysis.
aa = System down on arrival. Oxidizer panel system alarm "Power Failure". System restarted by technician.
ab = System down on arrival. Alarm reads "High Gas Pressure". System restarted by technician.
ac = System shutdown due to full knockout tank.
ad = System shutdown for two week on/off pulse cycle.
ae = System briefly turned on for performance readings. Shut down on departure because of permit compliance concerns.
af = Conflicting PID readings at different times. Suspected cross contamination with 743 system.
ag = No field notes taken during site visit on 10/23 when system was turned off - system hours at site visit determined by system hour reading prior to turning system on during 11/2 visit.
ah = No field notes taken during site visit on 12/4 to turn on system - system hours at site visit determined by system hour reading from previous site visit 11/19 when system was turned off
ai = System down on arrival. Alarm reads "Oxidizer externally disabled".
aj = System up and down during period between 1/24 and 3/25 site visits for repairs. No field notes (SVE hours, etc.) taken during repair work.
ak = System down on arrival. Alarm reads "Low Flow".
al = System shutdown for groundwater gauging and/or sampling activities.
am = Unable to start system due to continuous purge issue.
an = System shutdown May 30 to accommodate well development and groundwater sampling activities. No field notes taken at time of shutdown.
ao = System restarted. No field notes taken during start up activities.
ap = System emergency stop was triggered by unknown party. System was inspected for damage then restarted.
aq = System off due to an oxidizer air flow alarm. System restarted to collect compliance samples then shutdown to follow 30-day pulsing cycle

Table 7
Soil Vapor Extraction System - Performance Data
ARCO Service Station No. 465
151 Southgate Avenue, Daly City, California

Abbreviations:

"Hg	Inches of mercury
scfm	Standard cubic feet per minute
°F	Degree Fahrenheit
ppmv	Parts per million by volume as hexane
CARBON	Carbon abatement mode
lbs	Pounds
NC	Not collected/ not calculated
FID	Flame ionization detector
PID	Photoionization detector
--	Not calculated
bold	Current reporting period

BAAQMD Permit-to-Operate Requirements (Plant # 20770):

Permit-to-Operate expires July 1, 2020.

1. Influent flow rate shall not exceed 300 scfm.
2. Efficiency of the abatement device shall be maintained at the following levels:
   a) 98.5% for inlet concentrations ≥ 2000 ppmv
   b) 97% for inlet concentrations 200 ppmv - 2000 ppmv
   c) 90% for inlet concentrations <200 ppmv
   d) If effluent <10 ppm, destruction efficiency does not apply
3. While operating the Thermal Oxidizer, in no event shall total emissions to the atmosphere exceed the following limits:
   Benzene - 1.0E-02 lb/day
   Ethylbenzene - 1.1E-01 lb/day
4. When operating as a Thermal Oxidizer, the minimum operating temperature shall not be less than 1400 degrees F.
5. When operating as a Catayltic Oxidizer, the minimum operating temperature shall not be less than 600 degrees F.

Limits:			**≤ 350**	Thermal Abatement Emissions Limits (lbs/day):										NA	≤ 0.010	≤ 0.11	NA

Definitions:

Cum.	Cumulative	Avg.	Average
lbs	Pounds	--	Data not available
ppmv	Parts per million by volume	<	Less than stated laboratory method reporting limit
scfm	Standard cubic feet per minute	PCE	Tetrachloroethene
GRO	Gasoline Range Organics	NC	Not collected
PCE	Tetrachloroethene	VC	Vinyl chloride
MtBE	Methyl tertiary-butyl ether	NA	Not Applicable

Test America Molecular Weights

GRO	100.00
Benzene	78.11
Ethylbenzene	106.16
MTBE	88.15

Standard Molecular Weights

PCE	165.83

Calculations:

Removal Rates = [Concentration (average of two consecutive values){ppmv}]*[molecular Weight/24.45(Gas Constant)]*(28.32 L/ft3)*(0.0022 lb/g)*(0.000001 g/ug)*(SCFM (average of two consecutive values))*(1440 min/day) ==> lbs/day
Period Removal =[Removal Rate (lbs/day)]*[Hours Operational (hr)] / (24 hr/day)
Emission = [Concentration (average of two consecutive values){ppmv}]*[molecular Weight/24.45(Gas Constant)]*(28.32 L/ft3)*(0.0022 lb/g)*(0.000001 g/ug)*(SCFM (average of two consecutive values))*(1440 min/day) ==> lbs/day
Lab data provided in ug/m3 converted to ppmv according to the equation: ug/m^3 / 1000 x 24.1 / MW = ppmv

Notes

a = Total Influent PCE calculated using full detection limit when the compound is reported as less than the detection limit.
b = Effluent GRO less than 10 ppmv. Destruction efficiency does not apply.
c = Suspected interference from cross-contamination of air tubing on the sample vacuum box.
d = Analytical results pending
J = Trace amount between RL and MDL
bold = Current reporting period

Notes:

a PID used for vapor concentrations due to FID to flame out
b FID readings taken as methane and converted to hexane by instrument specific conversion factor
c Field optimization following sample collection
d Well V-10 turned off and well MW-10 turned on prior to departing site
e Well MW-10 turned off and well V-10 turned on prior to departing site
f Well V-10 turned off and well MW-10 turned on prior to departing site. Well V-10 data recorded in field notes for well MW-10 that was operating
g Well V-5 turned off and well MW-5 turned on prior to departing site
h Well MW-5 turned off after sampling and well V-5 turned on prior to departing site
i System restarted after extraction well network expansion. System operating on deep screened wells only (V-11, V-12 and V-13). All shallow wells closed.

"H_2O Inches of water
"Hg Inches of mercury
scfm standard cubic feet per minute
ppmv Parts per million by volume
FID Flame ionization detector
PID Photoionization detector
OFF Well only operated for short period of time to evaluate concentrations and flow and returned to closed position.
Wet Vapor flow in well too saturated with groundwater to measure
-- Not collected

TOTAL OPERATION HOURS:				**25,718**													

Notes:

a	Vapor concentrations measured by PID
b	Air sample vacuum box was malfunctioning. Unable to measure vapor concentrations
bold	Current reporting period
"H_2O	Inches of water
"Hg	Inches of mercury
1 "Hg =	13.6087 "H_2O
scfm	standard cubic feet per minute
ppmv	Parts per million by volume
FID	Flame ionization detector
PID	Photoionization detector
--	Not collected
Wet	Vapor flow in well too saturated with groundwater to measure

Table 11
Historical Soil Analytical Data 0-10 feet bgs
ARCO Service Station No. 465
151 Southgate Avenue
Daly City, CA

Notes:
GRO = Gasoline range organics
DRO = Diesel range organics
ORO = Oil range organics
TPH = Total recoverable petroleum hydrocarbons
ft bgs = feet below ground surface
mg/kg = milligrams/kilograms
-- = Not analyzed
< = Analyte was not detected above the specified reporting limit
1) Soil analyzed by EPA Method 8260B was taken from unpreserved soil jars
2) Sample analyzed out of hold for EPA Method 8260B
MTBE (CALUFT) and Ethanol not analyzed
BU = Samples analyzed after hold time expired.
EY = Result exceeds normal dynamic range; reported as a min. est.
GR = Internal Standard out of range
a = Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
b = Chromatogram Pattern: Gasoline C6-C10
c = Chromatogram Pattern: Unidentified Hydrocarbons C6-C10
d = The closing calibration was outside acceptance limits by -20%. This should be considered in evaluating the result. The average % difference for all analytes met the 15% requirement and the QC suggests that calibration linearily is not a factor.
^ = Confirmed by EPA Method 8260B measured 11/30/01 other values measured 11/29/01.
M1 = The Method Reporting Limit (MRL) was elevated due to matrix interferences.
A= The sample contained 13,000 mg/kg heavy oil
B=The sample contained 2,300 mg/kg heavy oil
C=The sample contained 380 mg/kg heavy oil
D=The sample contained 220 mg/kg heavy oil
E=The sample contained 430 mg/kg heavy oil
F=The sample contained 63 mg/kg heavy oil
G=Sample contains higher boiling point hydrocarbon mixture quantitated as gasoline. The chromatogram did not match the typical gasoline footprint.
LTCP Limit = 0-10 ft bgs benzene, ethylbenzene, and naphthalene contamination limits as defined by the California State Water Resources Control Board's 2012 *Low-Threat Underground Storage Tank Case Closure Policy.*

- EXCAVATION AREA (1997)

NOTES:
Dp = DEPTH BELOW GROUND SURFACE (FEET)
GRO = GASOLINE RANGE ORGANICS
DRO = DIESEL RANGE ORGANICS
B = BENZENE
T = TOLUENE
E = ETHYLBENZENE
X = TOTAL XYLENES
MTBE = METHYL TERTIARY BUTYL ETHER
N = NAPHTHALENE
<= LESS THAN LABORATORY METHOD DETECTION LIMITS
-- = NOT ANALYZED
A = THE SAMPLE CONTAINED 13,000 mg/kg HEAVY OIL
B = THE SAMPLE CONTAINED 2,300 mg/kg HEAVY OIL
C = THE SAMPLE CONTAINED 380 mg/kg HEAVY OIL
D = THE SAMPLE CONTAINED 220 mg/kg HEAVY OIL
E = THE SAMPLE CONTAINED 430 mg/kg HEAVY OIL
F = THE SAMPLE CONTAINED 63 mg/kg HEAVY OIL
G = THE SAMPLE CONTAINS HIGHER BOILING POINT HYDROCARBON MXTURE QUANTIFIED AS GASOLINE. THE CHROMATOGRAM DID NOT MATCH THE TYPICAL GASOLINE FOOTPRINT
M1 = THE METHOD REPORTING LIMIT (MRL) WAS ELEVATED DUE TO MATRIX INTERFERENCES.

CONCENTRATIONS IN MILLIGRAMS PER KILOGRAM (mg/kg).

- LIGHT POLE
- ELECTRIC MANHOLE
- SANITARY SEWER MANHOLE
- STORM SEWER MANHOLE

This figure is based on a survey by Stratus Environmental dated 10/7/08, a Utility Map by Stantec dated 6/14/08 and a Detailed Site Plan by Stantec dated 8/12/16.

SUBJECT: FORMER ARCO SERVICE STATION #465 AT 151 SOUTHGATE AVENUE, DALY CITY, CALIFORNIA

Dear Mr. Melton:

Antea Group uploaded to the State GeoTracker database (GeoTracker) a soil and groundwater investigation report dated April 30, 2019, and a groundwater monitoring and soil vapor extraction (SVE) system operations and maintenance (O&M) report dated May 14, 2019. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these reports and the project file.

Soil and Groundwater Assessment Report

The GeoWell file for the gauging of MW-16D, MW-18D, and MW-19D on March 14 and 15, 2019, was not uploaded to GeoTracker. Please upload this file to complete the well installation task (the April 30, 2019, completion deadline remains in-effect).

The report indicates grab groundwater samples were collected from wells MW-16D, MW-18D, and MW-19D on April 4, 2019. Please ensure future versions of Table 5 footnote these samples as grab samples. Please also ensure future tables listing the laboratory results from the analysis of soil samples for semi-volatile organic compounds (SVOCs) only list SVOC compounds (many volatile organic compounds were also listed on Tables 2B and 3B). Please also consider reformatting future versions of Tables 3A and 3B so the data tables are not 90 and 592 pages long, respectively. It is acceptable to use Table 3 in the December 2018 report omitting the columns for DIPE, ETBE, TAME, and ethanol (results that can be handled by a footnote given the historical non-detect results) and to use Table 4 in the December 2018 report omitting columns for analytes that never have been detected, but adding a note indicating the listed samples were analyzed by EPA Method 8270 and unlisted compounds were not detected. Please also ensure future versions of Table 3B omit the erroneous 1998 sampling results for V-5 as was done for Table 3A.

The report concludes the vertical extent of MTBE-affected soil near SB-30 was assessed by the soil sampling results from MW-16D. GPP staff concur with this conclusion providing the elevated temperatures in the soil spilt-spoon samples did not result in significant loss of MTBE and the MTBE in the soil above regional groundwater is not vertically migrating. We further agree the laboratory results from the analysis of groundwater samples from MW-16D suggests regional groundwater at MW-16D has not been impacted at this time by the MTBE in the overlying soil. However, the registered professional has not demonstrated the MTBE in this overlying soil is stable. Continued vertical migration of this MTBE is suggested by comparing the MTBE concentrations reported in the May 2016 and May 2018 soil samples from V-14 and SB-30 to those collected in the March 2019 soil samples from MW-16D. This comparison also suggests the SVE vacuum in MW-16D (Section 4.0 of May 2019 report) either does not exist within the impacted interval of 70 to 100 fbg (the vacuum originated from >129 fbg [the top of the screened interval of MW-16D]) or if it does, the vacuum from onsite SVE may not be sufficient to remediate the MTBE near MW-16D. The 11,000 ug/l of MTBE reported in the groundwater sample collected from V-14 in February 2018 also is a concern. Therefore, please **immediately** act to connect V-14 to the SVE system unless the registered professional can demonstrate by **September 10, 2019**, that the residual mass of MTBE west and northwest of the subject site is insufficient to further impact regional groundwater and impact nearby well receptors.

The report recommends quarterly gauging and sampling of all deep monitoring wells. GPP staff can only support semi-annual monitoring of MW-16D, MW-18D, MW-19D, and V-14 because MTBE was only reported in the groundwater sample from MW-19D, was reported at a low concentration, and we would not expect rapid migration of MTBE to regional groundwater given the depth to regional groundwater and the identified soil impacts. The other wells should remain on an annual sampling schedule.

Groundwater Monitoring and SVE System O&M Report

The report indicates wells MW-15, MW-16D, MW-18D, and MW-19D were inaccessible on the planned groundwater sampling date. Please ensure representatives of ARCO/BP implement all reasonable actions to complete sampling on the scheduled monitoring date (e.g. arrange temporary no parking with the City). We also considered it the responsibility of ARCO/BP to ensure their station operator does not block required access to monitoring wells.

Section 2.3.4 states the MTBE concentration reported in the groundwater samples were below the 3,000 ug/l criteria listed in the State Low-Threat UST Case Closure Policy (LTCP). This represents improper application of the LTCP and we have previously informed Antea Group of this on other LUFT cases in San Mateo County. Please note, the LTCP limit for MTBE is 1,000 ug/l and this only applies to plumes satisfying LTCP groundwater-specific Classes 2 or 4, and these two Classes don't apply because water supply wells are <1,000 feet from the edge of the petroleum plume. **Continued misapplication of the LTCP may result in referral of the registered professional to the Board for Professional Engineers, Land Surveyors, and Geologists.**

Section 2.3.5 discusses Mann-Kendall analysis of the groundwater sampling results. GPP staff cannot accept the results of this analysis because the registered professional did not demonstrate the limitations of this analysis were not applicable. That said, we do not consider such analysis necessary because visual inspection of the monitoring data suggests the petroleum plume is stable to shrinking in areas where a sufficient number of groundwater samples have been collected.

The well purging forms in Appendix C indicate the stagnant groundwater within the blank casing above the top of the screened interval in MW-3D, MW-5D, MW-6D, MW-7D, and MW-9D is not being removed prior to purging groundwater from the screened interval. Removal of this groundwater from MW-3D may not be possible, but does appear feasible for MW-5D, MW-6D, MW-7D, and MW-9D if suitable pumping rate is used. Please ensure this is addressed during future groundwater monitoring events.

Some of the benzene/GRO ratios listed on Table 6 appear based on non-detect laboratory reporting limits. GPP staff do not consider such calculations useful. We also consider MTBE as the analyte of concern inhibiting case closure. The graphs in Appendix D also no longer appear necessary if the petroleum plume is stable.

Section 3.1.1 indicates the SVE system vapor influent is treated by a thermal oxidizer. **GPP staff cannot recommend the UST Cleanup Fund reimburse the costs for thermal oxidizer treatment** because of the very low hydrocarbon concentrations reported in the influent vapor samples and because we have previously informed ARCO/BP of this issue on other ARCO/BP LUFT sites in San Mateo County.

The SVE system portion of the report only summarizes SVE system monitoring and maintenance data. GPP staff expect remediation system reports to discuss how the O&M data demonstrates the system is optimized for site conditions and satisfying the remedial objective(s) and to provide and justify conclusions and recommendations on system operation (e.g. whether to bring wells on- or off-line, install and connect new wells to the system, modify system operation, etc.). A data dump of monitoring and maintenance data is not acceptable and will be considered incomplete reporting. The registered professional must also demonstrate the system is appropriate for site conditions and properly designed, optimized, and maintained before we will consider conclusions that contaminants have been removed to the extent practical.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org on Monday through Thursday (excluding holidays) if you have any questions.

SUBJECT: FORMER ARCO SERVICE STATION #465 AT 151 SOUTHGATE AVENUE, DALY CITY, CALIFORNIA

Dear Mr. Melton:

Antea Group uploaded to the State GeoTracker database (GeoTracker) a soil vapor extraction (SVE) system operations and maintenance (O&M) report dated August 14, 2019, and an unsolicited SVE pilot testing report dated September 10, 2019. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these reports and the project file.

SVE System O&M Report

GPP staff denied electronic data file (EDF) #8554101049 because it listed incorrect field point names (FPNs). Please **immediately** correct this file to complete the associated task.

The report did not discuss how the O&M data demonstrates the system is optimized for site conditions and satisfying the remedial objective(s) as required on page 3 of our June 2019 letter. However, GPP staff will defer this requirement until the Third Quarter SVE system O&M report given SVE pilot testing was performed in July and August 2019.

SVE Pilot Testing Report

GPP staff denied the EDFs for the July and August 2019 pilot testing events because they listed incorrect FPNs. Please **immediately** correct these files to complete the associated task.

It appears the two vacuum columns in Table 2 represent wellhead vacuum when extracting from a single well and system vacuum when simultaneously extracting from multiple wells. If this is correct, then the inches-Hg column does not list the correct values. In addition, some of the field sheets in Appendix C list incorrect measurement units. Please ensure this is corrected or explained if these tables and field notes will be used in future documents.

Section 1.0 of the report states the additional SVE testing was proposed in the Second Quarter 2019 SVE system O&M report. This is incorrect. This testing was performed before the Second Quarter 2019 O&M report was issued.

Section 3.3 attributes the lower flow and higher vacuum response in V-14 to finer-grained soils near V-14. Comparison of the boring logs for V-11 through V-14 does not support this conclusion. Nevertheless, the pilot testing results and those from operation of the SVE system over the past year indicate recovery of MTBE mass from SVE is negligible. Therefore, GPP staff approve the recommendation to shut-down the SVE system. Please note, however, if the registered professional cannot demonstrate the MTBE in deep soils will not impact regional groundwater and nearby well receptors, then the responsible party will need to implement an alternative form of remediation or mitigate the impact if remediation is not possible (perhaps focused SVE on V-12 if that would provide sufficient mitigation).

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org on Monday through Thursday (excluding holidays) if you have any questions.

Appendix B

Site Assessment and Remediation Summary

ARCO FACILITY NO. 465 - 151 SOUTHGATE AVENUE, DALY CITY, CALIFORNIA

SITE ASSESSMENT AND REMEDIATION SUMMARY

1992 Initial Subsurface Investigation. An initial subsurface investigation was performed at the Site in March 1992. Six SVE wells (V-1 through V-6) were installed around the former UST basin and near the former waste oil UST. Groundwater monitoring wells MW-1 and MW-2 were installed at depths of approximately 70.5 feet and 61.5 feet bgs, respectively, to intercept a perched groundwater horizon[1]. Results of this investigation indicated that soil and groundwater near the gasoline and waste oil USTs had been impacted by petroleum hydrocarbons, including low boiling point hydrocarbons quantified as total petroleum hydrocarbons (TPH) as gasoline (TPHg; or gasoline range organics [GRO]), higher boiling point hydrocarbons quantified as TPH as diesel (TPHd; or diesel range organics [DRO]) and total recoverable petroleum hydrocarbons (TRPH). Low concentrations of semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs) were also reported in soil samples collected during the assessment.

In July 1992, SVE well V-7 was installed to a depth of 40 feet bgs, and an SVE pilot test was performed at the Site. In August 1992, deep groundwater monitoring well MW-3D was installed to a depth of approximately 220 feet bgs to intercept the upper portion of the regional groundwater aquifer[2]. The GPP noted in a letter dated July 5, 2001, that "MW-3D is screened from 202 bgs to 220 feet bgs (below an approximate 10-foot-thick clayey silt to silty clay zone) and may represent the deeper drinking water aquifer."

1993 Groundwater Sampling and Temporary SVE System Install. In January 1993, quarterly groundwater monitoring activities were initiated at the Site. Installation of vapor extraction and conveyance pipelines and construction of a vapor extraction and treatment system in the southwest corner of the Site were completed on March 30, 1993. On May 19, 1993, SVE well V-8 was installed to a depth of approximately 60.5 feet bgs. On May 20, 1993, groundwater monitoring well MW-4 was installed to a depth of approximately 61.5 feet bgs to further assess groundwater quality in the perched groundwater horizon. A temporary SVE system with an internal combustion engine began operation on July 13, 1993[3].

1994 – 1997 SVE System Operation and Shutdown. The SVE system was shut down due to noise issues on April 21, 1994. The internal combustion engine was removed from the Site on April 26, 1994. An Airex KATOX 100C55 catalytic oxidizer was installed at the Site in May 1995[4]. The SVE system operated full time from June 13, 1995 to October 10, 1995. The operation schedule of the SVE system was then modified to two months of operation followed by two months of non-operation. Operation of the SVE system continued with a two-month operation and two-month non-operation schedule until February 10, 1997. The SVE system was restarted on September 22, 1997 to perform a four-week system evaluation. On October 15, 1997, the SVE system was shut down with approval from the GPP[5].

1997 Waste Oil UST Removal. On October 21, 1997, Gettler-Ryan removed a 520-gallon capacity waste oil UST and excavated the UST cavity to approximately 9 feet bgs. A soil sample (WO-1-8) collected at 8 feet bgs (2 feet below the bottom of the tank) had reported concentrations of 2,700 milligrams per kilogram (mg/kg) GRO and 2,700 mg/kg DRO. On October 30, 1997, Gettler-Ryan over-excavated the former waste oil UST pit to a depth of approximately 15 feet bgs. Stained soil was observed on the eastern wall of the pit approximately 4 feet bgs during over-excavation. With approval from the GPP, the over-excavation was extended in an easterly direction approximately 3 feet from the edge of the original excavation to a depth of 7 feet bgs. Three soil samples (WO-2-15, WO-3-7, and WO-4-4) were collected from the over-excavation areas and the results indicate mass was left in the subsurface. DRO

[4] SEACOR, 1994, *Quarterly Groundwater Monitoring and Site Status Report, Second Quarter 1995.* July 27.
[5] SEACOR, 1997, *Revised Soil Vapor Extraction System Evaluation Report.* November 1997.

concentrations ranged from 330 mg/kg to 4,000 mg/kg with the sample collected at 15 feet bgs reporting 3,100 mg/kg DRO, 2,900 mg/kg GRO, 16 mg/kg total xylenes, and 0.69 mg/kg MTBE. Approximately 60 cubic yards (yd^3) of soil excavated from the tank cavity was transported for offsite disposal by Dillard Trucking. A new waste oil UST and associated piping and vents were installed in the same tank cavity, the over-excavation was backfilled, and the surface asphalted on October 31, 1997[6].

1998 Soil Investigation. In January 1998, six confirmation soil borings (CSB-1 through CSB-6) were advanced to determine if operation of the temporary SVE system had reduced the hydrocarbon concentration in soil to levels acceptable for regulatory case closure**.** The borings were advanced using hollow stem augers to depths ranging from 30.5 feet to 55.5 feet bgs. Soil samples were analyzed for GRO, benzene, toluene, ethylbenzene, xylenes (BTEX), and MTBE. Soil samples collected from CSB-6, located near the former waste oil UST, were also analyzed for DRO, TRPH, volatile organic compounds (VOCs), halogenated VOCs, PCBs, and total metals. Concentrations of GRO, DRO, and TRPH were present in soil samples collected from CSB-5 and CSB-6. Soil samples collected from CSB-6 were also reported to contain concentrations of heavy oil. Benzene was not detected in any of the soil samples collected. MTBE was reported in soil samples collected from boring CSB-3 at depths of 15 feet bgs and 21 feet bgs with concentrations of 0.66 mg/kg and 0.15 mg/kg, respectively. Concentrations of ethylbenzene, total xylenes, 2-methylnaphthalene, PCB Aroclor 1248, and total metals were detected in soil samples collected from CSB-6 at depths of 5 and 15 feet bgs. On July 6, 1998, the SVE unit was moved from the Site to another station[7].

1999 Product Line Removal. On March 5, 1999, Gettler-Ryan removed the product lines between the USTs and three fuel dispenser islands at the Site. The underlying soil in the trench between the central and northern two dispenser islands had gray staining and emitted a gasoline odor. Six trench floor soil samples (T-1 through T-6) and eight soil samples from beneath the dispensers (D-1 through D-8) were collected at 3 feet bgs and analyzed for GRO, BTEX, MTBE, and lead[8].

Due to concentrations of gasoline constituents in soil samples T-2, T-4, T-6, D-5, and D-8, soil was excavated to approximately 8 to 10 feet bgs and confirmation samples (T-2A, T-4A, T-6A, D-5A, and D-8A) were collected from the bottom of the over-excavated trenches on March 10, 1999. One of the five over excavation samples, T-2A located between the northern and middle dispenser island at 10 feet bgs contained 9,700 mg/kg GRO and 82 mg/kg benzene**.** Approximately 127 tons of soil were removed from the Site after the excavation and transported by Dillard Trucking to a Browning Ferris Industries offsite disposal facility[5].

2000 UST Removal Action. SVE well V-3 was abandoned on August 29, 2000 in preparation for UST replacement activities. Between August 28, 2000 and September 6, 2000, two 10,000-gallon capacity unleaded gasoline USTs, one 8,000-gallon capacity unleaded gasoline UST, and associated product lines and dispensers were removed from the Site. Over-excavation of the UST area was confined to the expansion area intended for the new USTs[9]-

During UST replacement activities performed in August and September 2000, Henderson Construction Company, the ARCO subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a gasoline and rinsate water mixture from one of the gasoline USTs. The spill occurred during the attempted removal of a UST with the rinsate water still inside. A portable dual-phase extraction (DPE) system was mobilized to the Site shortly thereafter and operated for a 10-day period to mitigate the effects of the reported release[10].

2001 Installation of MW-5 and MW-6 Monitoring Wells. In November 2001, SECOR International, Inc. (SECOR)

[10] SECOR, 2000, *Report of Interim Remedial Action*, November 21.

installed two groundwater monitoring wells (MW-5 and MW-6) and advanced one soil boring (SB-1). Maximum concentrations of 21,000 mg/kg GRO and 470 mg/kg MTBE were reported in a sample collected from MW-6 at a depth of 15.5 feet bgs. The maximum benzene concentration (6.9 mg/kg) was reported in a sample collected from MW-5 at a depth of 20.5 feet bgs. Wells MW-5 and MW-6 were completed at a depth of 60 feet bgs. Groundwater samples have been obtained consistently from MW-6, but MW-5 has only had water seven times since it was installed[11].

2003 Additional Characterization near MW-5. In April 2003, URS Corporation (URS) performed additional characterization in the vicinity of MW-5 to determine whether shallow groundwater was present at a depth greater than the 60-foot completion depth of MW-5, and to characterize the vertical extent of petroleum hydrocarbons and fuel oxygenates near the waste oil UST. Boring MW-5A was drilled adjacent to MW-5 and soil was sampled to a depth of 85 feet. After drilling through soil identified as sandy clayey silt and clayey silty sand from approximately 60 to 64 feet bgs, the augers were left open for observation at a depth of 66 feet bgs in moist silty sand for over one hour. No water accumulated in the borehole, so an additional well was not installed at this location. No GRO or benzene concentrations greater than the laboratory reporting limits (LRLs) were detected in soil samples collected from 60.5 to 85 feet bgs in the boring. However, MTBE was detected in soil samples collected from 60.5 to 85 feet bgs at concentrations ranging from 0.12 mg/kg to 1.0 mg/kg[12].

2005 Additional Soil Characterization. In September 2005, URS advanced nine soil borings (SB-1 renamed SB-1A, SB-2 through SB 5, and SB-7 through SB-10) to depths ranging from 50 to 81.5 feet bgs in order to further assess the vertical and lateral extent of petroleum hydrocarbons in the subsurface. This work was summarized in URS' *Additional Soil and Groundwater Investigation Interim Report*, dated April 5, 2006.

Soil boring SB-6 was not advanced because no odor or photoionization detector (PID) readings were observed in boring SB-7. Benzene was not detected in onsite borings SB-1A, SB-2, and SB-3, while GRO, toluene, ethylbenzene, xylenes, and MTBE were detected. Soil samples collected from borings SB-2 and SB-3 were analyzed for the presence of additional VOCs. SB-3 had reported concentrations of 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, n-butylbenzene, and n-propylbenzene above the LRL. Soil samples collected from boring SB-1A, advanced in the vicinity of the waste oil UST, were analyzed for the presence of DRO and Stoddard Solvent; these analytes were detected in the majority of samples collected to a depth of approximately 51.5 feet bgs. GRO, BTEX, and fuel oxygenates were not detected in the soil samples collected from offsite borings SB-4, SB-5, and SB-7 through SB-10 at concentrations above the LRLs.

Grab groundwater samples were collected from onsite boring SB-3, and offsite borings SB-4, SB-5, and SB-7 through SB-10. The grab groundwater sample collected from onsite boring SB-3 at approximately 60.5 feet bgs, contained concentrations of GRO, BTEX, MTBE, 1,2-4 trimethylbenzene, and 1,3,5 trimethylbenzene. The grab groundwater samples collected from the offsite soil borings did not contain GRO, BTEX, and oxygenates at concentrations greater than the LRLs. Based upon the results of this investigation, URS recommended the installation of three additional offsite groundwater monitoring wells (MW-7 through MW-9) to further delineate the lateral extent of dissolved petroleum hydrocarbons offsite[13].

2008 Installation of MW-7, MW-8, and MW-9. On August 28 and 29, 2008, wells MW-7 through MW-9 were installed. Results of the investigation and an updated CSM were presented in the Stantec *Additional Site Assessment Report and SCM* dated June 14, 2010[14].

2010-2011 Additional Assessment and Remediation Feasibility Test. In a letter dated July 6, 2010, the GPP requested a workplan for remediation feasibility testing. The proposed feasibility testing scope of work was

[11] SECOR, 2002, *Additional Site Assessment*, May 23.
[12] URS, 2003, *Soil and Water Investigation Report*, June 3.
[13] URS, 2006, *Additional Soil and Groundwater Interim Report,* April 5.
[14] Stantec, 2010, *Additional Site Assessment Report and Site Conceptual Model*, June 14.

presented in Stantec's *Additional Assessment and Remediation Feasibility Test Workplan* (Workplan) dated October 29, 2010. The GPP issued a letter dated January 13, 2011, stating the information provided in the Workplan serves as a Remedial Action Plan (RAP), and thus required BP to forego SVE feasibility testing and move directly to active SVE remediation[15]. The GPP letter also directed submittal of an addendum to the Workplan. BP provided the revised assessment and remediation workplan to the GPP via email on March 1, 2011.

In June and July 2011, Stantec completed additional assessment and bench-scale feasibility testing. The work involved the installation of three additional onsite (MW-10) and off-site (MW-11 and MW-12) groundwater monitoring wells to further characterize petroleum hydrocarbons in soil and groundwater, the installation of two additional SVE wells (V-9 and V-10) for expansion of the existing offline SVE system, and the installation of one dual-nested soil vapor probe (SV-1S/SV-1D) near the western property line to evaluate vapor phase petroleum hydrocarbon intrusion risk toward nearby potential receptors west of the site from the former waste oil and gasoline UST source areas. On December 21, 2011, Stantec collected soil vapor samples from vapor probes SV-1S and SV-1D. The tetrachloroethylene (PCE) concentrations reported in the vapor samples collected from SV-1S and SV-1D are likely derived from operations at the former Southgate Cleaners located west of the Site. Details of the completed assessment and In-Situ Chemical Oxidation (ISCO) feasibility testing utilizing hydrogen peroxide (H2O2), and an updated CSM were presented in the Stantec's report dated February 14, 2012[16].

2011-2012 SVE System Installation. Phase 1 of the SVE system installation began in August 2011 and included connection of the new SVE wells V-9 and V-10 and connection of existing well V-4 to an expanded remediation system compound through lateral conveyance piping placed underground. While reviewing historical soil analytical data, it was noted that 1,200 mg/kg GRO was present in a soil sample collected at 46 feet bgs in soil boring SB-1A, located between MW-5 and newly installed well MW-10. Since the shallow SVE wells are screened from 15 to 35.5 feet bgs, Stantec connected groundwater monitoring wells MW-5 and MW-10 (screened from 40 to 60 feet bgs) to the SVE system to insure recovery of hydrocarbon mass present in soil at 46 feet bgs. The extraction piping was installed from V-5 to MW-5 and from V-10 to MW-10 and controlled with a ball valve. The ball valve allows extraction from V-5 or MW-5 and V-10 or MW-10.

Phase 2 of the SVE system installation was completed in February 2012 with installation of a thermal oxidizer. System startup and source testing was conducted in July 2012 upon completion of Pacific Gas & Electric (PG&E) utility connection and Bay Area Air Quality Management District (BAAQMD) air permitting[17]. Stantec's *Soil Vapor Extraction System Source Test Report* was submitted to the GPP on October 19, 2012, in accordance with their directive. The SVE system startup was completed on October 22, 2012[16].

2012 SVE Source Test. In a letter dated June 19, 2012, GPP issued a notice of violation (NOV) for the failure to begin operation of the SVE system. Although significant progress had been made, additional tasks that required completion before the new SVE system could be started included connection of power and natural gas services from PG&E and issuance of an Authority to Construct (ATC) permit from the BAAQMD. As communicated to the GPP in electronic correspondence dated June 12, 2012, the BAAQMD delayed issuance of the ATC permit due to concern about chlorinated solvents present in soil vapor beneath the Site and the potential for dioxin formation when operating the thermal oxidizer to treat chlorinated solvents present in the extracted soil vapor. In order to maintain compliance with ATC permit conditions, Stantec performed an SVE source test on July 2 and 3, 2012 using Granular Activated Carbon (GAC) vessels arranged in series. Following installation of the GAC vessels, Stantec worked with the SVE equipment manufacturer to modify the SVE system controls, bypass the thermal oxidizer, and re-route the extracted soil vapor through the GAC vessels for treatment[18]. As part of the source test, individual extraction well vapor samples were analyzed for contaminant concentrations. Stantec evaluated influent vapor analytical data to

[15]Stantec, 2010, *Additional Assessment and Remediation Feasibility Test Workplan*, October 29.
[16]Stantec, 2012, *Additional Assessment Report of Findings, Bench Scale Feasibility Test Report, and Site Conceptual Model*, February 14.

[18] Stantec, 2012, *Soil Vapor Extraction System Source Test Report*, October 19.

determine the total chlorinated atom mass and determine whether the dioxin health risk trigger level would be exceeded. The calculated dioxin trigger level was not exceeded, and the thermal oxidizer was placed back online[19].

2013 Additional Soil and Groundwater Assessment. Between March 18 and 27, 2013, Stantec supervised National Exploration, Wells, and Pumps (NEWP) during advancement of three soil borings (SB-11 through SB-13). Soil and groundwater samples were submitted to JAG Consulting Group for bench scale testing and analysis. The results, including an updated CSM, are summarized in Stantec's *Additional Assessment Report, Bench Scale Feasibility Test Report, and Site Conceptual Model* dated June 13, 2013. The GPP reviewed the report and responded in a letter dated March 18, 2014. The GPP requested a workplan for additional assessment and well replacement. Stantec submitted the requested workplan on June 19, 2014[20]. The workplan was conditionally approved by GPP in a letter dated August 18, 2014.

2014-2015 Additional Soil and Groundwater Assessment. Between December 2014 and February 2015, Stantec completed additional assessment that included the following scope of work:

- Advanced four soil borings (SB-14 through SB-17) to depths ranging from 130 to 180.5 feet bgs.
- Installed six groundwater monitoring wells (MW-1R, MW-13 through MW-17) to depths ranging from 32 to 62.5 feet bgs. The data was used to further assess the lateral and vertical extent of MTBE in soil and the lateral extent of MTBE present in the shallow perched groundwater zone underlying the site at approximately 44 feet bgs.
- Installed four groundwater monitoring wells (MW-4D through MW-7D) to depths ranging from 160 to 166 feet bgs to assess the shallow regional groundwater underlying the Site at approximately 150 feet bgs.
- Advanced three hand augers borings (HA-1 through HA-3) adjacent to the dispenser islands to further assess the extent of MTBE in soil at 5 feet bgs.

Based on the assessment results, the vertical extent of MTBE in soil was defined to a maximum depth of 110 feet bgs and the lateral extent was defined south and east of the Site. MTBE in perched groundwater was also defined to the south and east of the Site. MTBE was only reported in a deep, water sample collected from MW-4D at a concentration of 1.9 micrograms per liter (µg/L)[21].

October – November 2015 Additional Assessment – During October and November 2015, Stantec completed the following activities at the Site:

- To assess the lateral extent of MTBE in soil between the perched groundwater zone extending to approximately 55 to 64 feet bgs and the shallow regional groundwater zone extending to approximately 145 to 150 feet bgs, and to assess the lateral extent of hydrocarbons in the perched zone and shallow regional groundwater zone, soil borings were advanced to the west (SB-18) and west-northwest (SB-19) of the Site. Analytical results indicate that MTBE is present in soil at concentrations ranging from 0.006 to 0.11 mg/kg at depths between 100 and 120 feet bgs in SB-18. A sample collected at 130 feet bgs defines the vertical extent of MTBE in this area. Non-detect results from samples collected from SB-19 define the lateral extent of impacts to the west-northwest of the Site.
- Groundwater monitoring well MW-18 was installed to a total depth of 64.5 feet bgs to assess the perched groundwater zone west of the Site.
- Due to a potentially unsuitable screen interval, the GPP approved the destruction groundwater monitoring well MW-1 by over-drilling. The screen interval of MW-1 was only 4 to 5 feet above the depth to groundwater and screened 10 feet deeper than surrounding wells in the perched groundwater zone, potentially providing groundwater samples that were not representative of the top of the perched

[19]USEPA, 2004, How to Evaluate Alternative Cleanup Technologies for Underground Storage Tank Sites, May 2004
[20] Stantec, 2014, *Workplan for Additional Assessment*, June 19.
[21] Stantec, 2015, *Additional Assessment Report and Site Conceptual Model*, February 25.

groundwater zone. Replacement well MW-1R was installed approximately 7 feet east of the MW-1 location at a total depth of 60 feet bgs in December 2014.

- To better assess groundwater conditions in the perched zone southwest of the Site, Stantec oversaw the installation of groundwater monitoring well MW-11R. Well MW-11 was over-drilled and deepened to 65 feet bgs for the installation of MW-11R. The original depth of MW-11 was 50 feet bgs.
- Vapor extraction wells V-12 and V-13 were installed to total depths of 90 feet bgs and screened from 70 feet bgs to 90 feet bgs to facilitate the remediation of deep MTBE concentrations in the northwest quadrant of the Site.
- To assess the extent of waste oil impacts to soil near the existing waste oil UST in the southwest corner of the Site, soil borings SB-21 and SB-22 were advanced to 40 and 35 feet bgs, respectively. Significant reductions in GRO, oil range organics (ORO), BTEX and MTBE concentrations were reported in samples collected from borings SB-21 and SB-22 when compared to historical data from borings CSB-6, MW-5A and well V-5[22].

May 2016 – Additional Assessment and Vapor Extraction Pilot Test – In order to assess the lateral extent of MTBE in soil between perched and regional groundwater, and to assess the lateral extent of hydrocarbons in soil in the perched groundwater zone to the north and northwest of the Site, Stantec oversaw the completion of the following work between May 9 and 20, 2016:

- Advanced soil boring SB-20D to the northwest of the Site. Soil boring SB-20D was advanced after refusal was encountered in attempted borings SB-20, SB-20B, and SB-20C in the Daly City Right-of-Way at approximately 23 feet bgs. Borings SB-20 and SB-20B were attempted in October 2015, and boring SB-20C was attempted in February 2016. Only MTBE concentrations were detected in soil samples collected from SB-20D at depths between 69.5 and 131 feet bgs. No other analytes were detected above the LRLs in soil samples collected from SB-20D.
- Installed monitoring well MW-19 northwest of the Site to assess the perched groundwater zone. MW-19 was installed to a total depth of 62.5 feet bgs with 10 feet of screen from 52.5 to 62.5 feet bgs. Soil analytical results from MW-19 did not have reported detections above the LRLs for any analyte.
- Advanced and installed offsite well V-14 to facilitate soil vapor extraction feasibility testing in the SVE wells screened from 70 to 90 feet bgs offsite. V-14 was installed to a total depth of 90 feet bgs with 20 feet of screen from 70 to 90 feet bgs. MTBE was detected in soil at concentrations ranging from 0.21 to 2.7 mg/kg at depths between 76 and 86 feet bgs. Tert-butyl alcohol (TBA) was present at a concentration of 1.2 mg/kg in the soil sample from 86 feet bgs. No other analytes were detected above the LRLs in soil samples collected from V-14.

Stantec performed pilot testing activities in the vicinity of V-14 on July 14 and 15, 2016. Pilot testing consisted of a step test, radius of influence (ROI) test, and sample collection to estimate potential MTBE mass removal rates. Step testing was performed by applying a vacuum of approximately 2, 4, 6, and 8 inches of mercury (inHg), measured at the system to extraction well V-11. A relatively linear relationship developed between the applied vacuum and the extracted flow rate, indicating that the system could operate at up to 8 inHg vacuum and not experience significant reduction in flow due to constriction of the well screen from lithology. ROI testing consisted of applying a vacuum between 8 and 9 inHg at the system, which resulted in 40 to 60 inches of water (inH_2O) at the wellhead. Vacuum influence measurements collected at V-12 and V-13, located 41 and 37 feet from the test well, respectively, were measured to be approximately 50% of the applied vacuum. The observed vacuum at V-14, located 89 feet from the extraction well, was measured to be approximately 25% of the applied vacuum. Based on these results, an estimated maximum deep well radius of effective air exchange of 96 feet was produced. To determine the concentration of MTBE in extracted soil vapor and allow for the estimation of MTBE mass removal rates during continuous operation, influent and effluent vapor samples were collected approximately halfway through the ROI test and submitted for

[22] Stantec, 2015, *Additional Assessment Report*, November 16.

laboratory analysis. Based on vapor concentrations obtained through laboratory analysis, the estimated MTBE mass removal rate from V-11 through the duration of the pilot test study was 1.69 pounds per day (lbs/day)[23].

July 2017 – Subsurface Investigation. To better delineate down gradient impacts located within the shallow regional groundwater zone at approximately 145 to 150 feet bgs., Antea Group oversaw Cascade Drilling, Inc. (Cascade) advance one soil boring to 162 feet bgs in a parking lot at the northeast corner of Southgate Avenue and Lake Merced Blvd between July 17 and 19, 2017. The boring was completed as deep monitoring well MW-9D, built at a total depth of 155 feet with 20 feet of screen from 135 to 155 feet bgs. A total of five soil samples were collected during this investigation and submitted for laboratory analysis. None of the five samples submitted had concentrations of petroleum hydrocarbon constituents that exceeded the LRLs[24].

August 2017 – Radius of Influence Vacuum Test. On June 16, 2017, GPP staff directed BP to connect V-14 to the SVE system based on a belief that the need for dilution air to operate the SVE system was not effectively removing MTBE from the soil near V-14. On August 25, 2017 Antea Group conducted another test on deep zone wells V-11, V-12, V-13 and V-14 to determine the ROI of the SVE system while operating with dilution air. Well V-12 was isolated for the ROI test due to its proximity to well V-14 using the existing SVE system operated with dilution air. An applied vacuum of 78 inH_2O was maintained at well V-12 for one hour. Wells V-11, V-13 and V-14 located approximately 41, 47 and 67.5 feet from V-12, were observed to have induced vacuums of 44, 46 and 31 inH_2O, respectively. The Environmental Protection Agency (EPA) has determined a minimum vacuum of 0.1 inH_2O is required to adequately influence volatilization and extraction of vapors[25]. Based on the ROI test results, Antea Group conservatively estimated an ROI greater than 1.0 inH_2O at approximately 330 feet, sufficient to remediate MTBE impacts near V-14[26].

March 2018 – Waste Oil Investigation. Antea Group advanced seven soil borings around the waste oil tank (SB-23 through SB-29) in response to a GPP directive from January 26, 2018. Concentrations of benzene, ethylbenzene, naphthalene, and poly-aromatic hydrocarbons (PAHs) from this investigation are below the LTCP residential thresholds. Additionally, shallow soil sample results for GRO, DRO, and ORO did not exceed the 2019, Revision 2 Tier 1 San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs) of 100 mg/kg, 260 mg/kg, and 1,600 mg/kg, respectively. Additionally, benzene, ethylbenzene, and naphthalene levels in soil collected during the 2015 waste oil investigation (SB-21 and SB-22) meet the residential soil criteria for direct contact and outdoor air exposure in the LTCP[27].

May 2018 – Deep Soil Investigation. Antea Group advanced soil boring SB-30, near V-14 to 110 feet bgs to determine if deeper soil is being remediated near V-14. The investigation detected a maximum of 0.45 mg/kg TBA and 1.2 mg/kg of MTBE in soil between 81 and 91 feet bgs; however, MTBE and TBA in soil above and below those depths were non-detect. Unlike nearby well V-14, no concentrations were detected in the sample collected at 66 feet bgs in SB-30, which may indicate soil is being remediated in this area due to the high radius of influence from onsite wells. To further support this conclusion, soil collected at 86 feet bgs from SB-30 had a lower concentration of MTBE (0.45 mg/kg) than that previously recorded in V-14 (2.4 mg/kg); although, the result for the SB-30 sample is an estimated value[28].

October 2018 – Additional Waste Oil Investigation. Antea Group advanced two soil borings, SB-31 and SB-32, in the area of the former and current waste oil tank in response to a GPP directive issued September 20, 2018. Analytical results for soil collected during investigations in March and November 2018 in the waste oil tank area (SB-23 through SB-29, SB-31, and SB-32) meet the LTCP media-specific criteria for residential direct contact and outdoor air

exposure. Analytical results for samples from SB-31 and SB-32 show decreasing Stoddard Solvent concentrations when compared to previously collected soil samples from MW-5. Soil samples from MW-5 at depths from 15.5-30.5 feet bgs had Stoddard Solvent detections ranging from 6,300 mg/kg to 47,000 mg/kg. Soil samples collected from SB-31 and SB-32 at depths from 15 to 35 feet bgs had a maximum Stoddard Solvent concentration of 1,500 mg/kg. Based on soil analytical data, Antea Group proposed that the implementation of a remedial action plan, as discussed in the November 2017 work plan, was unnecessary as the shallow soil near the waste oil tank meets the LTCP direct contact criteria for residential areas. The previously implemented shallow soil vapor extraction and removal of surface material during the soil vapor system installation and expansion appeared to have been effective in remediating the shallow soil near the waste oil tank[29].

March 2019 – Deep Soil and Groundwater Investigation
From February 19 through March 14, 2019 Antea Group oversaw the installation of monitoring wells MW-16D, MW-18D, and MW-19D by Cascade. The December 2018 GPP letter stated that the vertical extent of MTBE in the vicinity of V-14 may not have been properly assessed during the advancement of SB-30, based on the termination depth of 110 feet bgs. Antea Group believes this has been accomplished with the advancement of MW-16D. Antea Group collected four soil samples between 120 feet bgs and the point of termination at 135 feet bgs. The samples did not have reported MTBE concentrations above the LRLs, which varied between 0.0035 mg/kg and 0.0041 mg/kg, or the ESL of 0.028 mg/kg.

Soil collected from MW-16D at 81 feet, 86 feet, and 91 feet bgs had MTBE concentrations of 0.97 mg/kg, 0.71 mg/kg, and 2.7 mg/kg, respectively; however, MTBE in groundwater was not detected above the LRL in that location, suggesting adsorbed impacts are not affecting the shallow regional aquifer. MTBE concentrations in the samples from both 81 feet bgs and 86 feet bgs were similar to those found in SB-30 at the same depths, and less than the concentrations in the soil samples collected from V-14 at the same depths. The MTBE concentration detected in soil from MW-16D at 91 feet bgs was higher than that detected in the sample collected from SB-30 at the same depth. This concentration is also higher than that collected from SB-16 at the same depth in 2016; however, of the five samples with MTBE detections above the ESL in SB-16, four confirmation samples from corresponding depths in MW-16D had lower MTBE concentrations. These analytical results, along with previously-obtained ROI data, further support the conclusion that the soil in this area could be influenced by the onsite vapor extraction wells, which was initially presented in the *Deep Soil Investigation Report*, dated September 21, 2018[30]

June -August 2019 Pilot Testing. On July 10, 2019, BP connected V-14 to the SVE system with above ground piping to determine if extraction from V-14 would increase recovery of the residual MTBE mass in the area of MW-16D (SB-16, SB-30 and V-14). The SVE system and vapor extraction well V-12 were modified to enable isolation of and extraction from V-14. The subsequent testing on V-14 resulted in a maximum MTBE mass removal rate of 0.002 lbs/day. Additionally, the rapid depletion and slow recharge of oxygen in the deep zone demonstrated that the deep extraction wells are isolated from the perched zone and air being extracted via the SVE system is from the deep zone only and no short circuiting is occurring.

To confirm the results of the initial testing, BP again connected V-14 to the SVE system on August 6, 7 and 8, 2019, resulting in a maximum MTBE mass removal rate of 0.010 lbs/day. The results of the six days of pilot testing that occurred between July and August 2019 show that connecting V-14 to the existing SVE system will not add a notable increase in MTBE mass removal to what is currently being extracted and appears to even dilute the MTBE concentrations in the soil vapor being extracted from well V-12. Furthermore, optimizing the system to extract from only V-12, the configuration that resulted in the highest mass removal of the four configurations tested, would only remove 0.63 lbs/day of MTBE from the subsurface. Based on the results of the pilot testing, BP does not believe that SVE in any configuration would be effective in further remediating the MTBE present in the vicinity of V-14 and recommended ceasing operation of the SVE system[31]. The GPP concurred with the recommendation to shut down

the SVE system in a letter dated November 13, 2019.

February 2020 – Shallow Soil Assessment. On February 18, 2020, two soil borings (HA-4 and HA-5) were advanced onsite near the fuel dispenser pumps to verify the concentrations of GRO, benzene, ethylbenzene, MTBE, and naphthalene on either side of historic soil samples T-2, T-2A, and D-4, which were collected during station upgrade activities on March 5 and March 10, 1999, near a product piping and dispenser excavation. Analyte concentrations for the samples collected during this investigation did not exceed laboratory reporting limits, and the laboratory reporting limits for benzene, ethyl benzene, and naphthalene are well below LTCP limits for direct contact and outdoor air exposure and utility workers[32].

NOTES:
Boring advanced to a depth of 68 feet below ground surface on 5/20/93.
Borehole backfilled with cement/bentonite grout to 61.5 feet.
Monitoring well installed on 5/20/93 as follows:
4-inch Schedule 40 PVC with 0.02-inch slots and end cap 61.5 - 31.5 feet.
4-inch Schedule 40 PVC blank casing 31.5 feet to surface.
#2/16 Monterey Sand 61.5 - 29.5 feet.
Bentonite Pellets 29.5 -27.5 feet.
Cement/bentonite grout 27.5 feet to surface.
Christy Box at surface.

170			Hand augered to 6.5 feet then air-knifed on 12/10/15 Sonic rig advanced a 10-inch diameter steel conductor and set it at 67.0 feet bgs. An 8-inch diameter sonic drive casing was then advanced to total depth and the well was constructed as shown. The sonic rig collected a 6-inch diameter continuous core soil sample from the boring from 6.5 feet bgs to total depth. Borehole terminated at 167.5 feet.						170

The substrata descriptions above are generalized representations and based upon visual/manual classification of cuttings and/or samples obtained during drilling. Predominant material types shown on the log may contain different materials and the change from one predominant material type to another could be different than indicated. Descriptions on this log apply only at the specific location at the time of drilling and may not be representative of subsurface conditions at other locations or times.

Boring Abandonment/ Well Construction Details

NOTES:

Boring completed to a depth of 90 feet below ground surface on 3/18/92.
Borehole backfilled to 38 feet with cement-sand slurry.
Vapor extraction well installed on 3/19/92 as follows:
4-inch Schedule 40 PVC with 0.02-inch slots and end cap 35.5 - 15 feet.
4-inch Schedule 40 PVC blank casing 15 feet to surface.
#2/16 sand 38 - 13 feet.
Bentonite pellets 13 - 11 feet.
Grout 11 feet to surface.
Morrison traffic box at surface.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

A search of available records was conducted by Environmental Data Resources, Inc. (EDR). The EDR Offsite Receptor Report provides information which may be used to comply with the Clean Air Act Risk Management Program 112-R. *"The rule requires that you estimate in the RMP residential populations within the circle defined by the endpoint for your worst-case and alternative release scenarios (i.e., the center of the circle is the point of release and the radius is the distance to the endpoint). In addition, you must report in the RMP whether certain types of public receptors and environmental receptors are within the circles."*

The address of the subject property, for which the search was intended, is:

ARCO 465
151 SOUTHGATE AVENUE
DALY CITY, CA 94015

Distance Searched: 1.000 miles from subject property

RECEPTOR SUMMARY
An X indicates the presence of the receptor within the search radius.

Residential Population
Estimated population within search radius: 31550 persons.

Pleasant Hill, CA 94523
Contact: Jonathan Fillingame

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

Year	Scale	Details	Source
2012	1"=500'	Flight Year: 2012	USDA/NAIP

RECORDS SEARCHED/DATA CURRENCY TRACKING

Census

Source: U.S. Census Bureau
Telephone: 301-763-4636
2010 U.S. Census data was used to estimate residential population following these EPA guidelines:
"Census data are presented by Census tract. If your circle covers only a portion of the tract, you should develop an estimate for that portion...Determine the population density per square mile (total population of the Census tract divided by the number of square miles in the tract) and apply that density figure to the number of square miles within your circle."

FED_LAND: Federal Lands

Source: USGS
Telephone: 888-275-8747
Federal lands data. Includes data from several Federal land management agencies, including Fish and Wildlife Service, Bureau of Land Management, National Park Service, and Forest Service. Includes National Parks, Forests, Monuments; . Wildlife Sanctuaries, Preserves, Refuges; Federal Wilderness Areas.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Colleges - Integrated Postsecondary Education Data

Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on integrated postsecondary education in the United States.

Arenas

Source: Dunhill International
EDR indicates the location of buildings and facilities - arenas - where individuals who are public receptors are likely to be located.

Prisons: Bureau of Prisons Facilities

Source: Federal Bureau of Prisons
Telephone: 202-307-3198
List of facilities operated by the Federal Bureau of Prisons.

Contact: Jonathan Fillingame

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

Appendix I

Low Threat Closure Policy Checklist

Site Name: Arco #465
Site Address: 151 Southgate Avenue Daly City, CA 94015

Site meets the criteria of the Low-Threat Underground Storage Tank (UST) Case Closure Policy as described below.[1]

General Criteria General criteria that must be satisfied by all candidate sites: **Is the unauthorized release located within the service area of a public water system?**	☒Yes ☐No
Does the unauthorized release consist only of petroleum?	☒Yes ☐No
Has the unauthorized ("primary") release from the UST system been stopped?	☒Yes ☐No
Has free product been removed to the maximum extent practicable?	☒Yes ☐No ☐NA
Has a conceptual site model that assesses the nature, extent, and mobility of the release been developed?	☒Yes ☐No
Has secondary source been removed to the extent practicable?	☒Yes ☐No
Has soil or groundwater been tested for MTBE and results reported in accordance with Health and Safety Code Section 25296.15?	☒Yes ☐No
Does nuisance as defined by Water Code section 13050 exist at the site?	☐Yes ☒No
Are there unique site attributes or site-specific conditions that demonstrably increase the risk associated with residual petroleum constituents?	☐Yes ☒No
Media-Specific Criteria Candidate sites must satisfy all three of these media-specific criteria: **1. Groundwater:** To satisfy the media-specific criteria for groundwater, the contaminant plume that exceeds water quality objectives must be stable or decreasing in areal extent, and meet all of the additional characteristics of one of the five classes of sites: **Is the contaminant plume that exceeds water quality objectives stable or decreasing in areal extent?**	☒Yes ☐No ☐NA
Does the contaminant plume that exceeds water quality objectives meet all of the additional characteristics of one of the five classes of sites? If YES, check applicable class: ☐**1** ☐**2** ☐**3** ☐**4** ☒**5**	☒Yes ☐No ☐NA

[1] Refer to the Low-Threat Underground Storage Tank Case Closure Policy for closure criteria for low-threat petroleum UST sites.

Site Name: Arco #465
Site Address: 151 Southgate Avenue Daly City, CA 94015

For sites with releases that have not affected groundwater, do mobile constituents (leachate, vapors, or light non-aqueous phase liquids) contain sufficient mobile constituents to cause groundwater to exceed the groundwater criteria?	☐Yes ☐No ☒NA
2. Petroleum Vapor Intrusion to Indoor Air: The site is considered low-threat for vapor intrusion to indoor air if site-specific conditions satisfy all of the characteristics of one of the three classes of sites (a through c) or if the exception for active commercial fueling facilities applies. **Is the site an active commercial petroleum fueling facility?** Exception: Satisfaction of the media-specific criteria for petroleum vapor intrusion to indoor air is not required at active commercial petroleum fueling facilities, except in cases where release characteristics can be reasonably believed to pose an unacceptable health risk. **a. Do site-specific conditions at the release site satisfy all of the applicable characteristics and criteria of scenarios 1 through 3 or all of the applicable characteristics and criteria of scenario 4?** If YES, check applicable scenarios: ☐**1** ☐**2** ☐**3** ☐**4** **b. Has a site-specific risk assessment for the vapor intrusion pathway been conducted and demonstrates that human health is protected to the satisfaction of the regulatory agency?** **c. As a result of controlling exposure through the use of mitigation measures or through the use of institutional or engineering controls, has the regulatory agency determined that petroleum vapors migrating from soil or groundwater will have no significant risk of adversely affecting human health**?	☒Yes ☐No ☐Yes ☐No ☒NA ☐Yes ☐No ☒NA ☐Yes ☐No ☒NA
3. Direct Contact and Outdoor Air Exposure: The site is considered low-threat for direct contact and outdoor air exposure if site-specific conditions satisfy one of the three classes of sites (a through c). **a. Are maximum concentrations of petroleum constituents in soil less than or equal to those listed in Table 1 for the specified depth below ground surface (bgs)?** **b. Are maximum concentrations of petroleum constituents in soilless than levels that a site specific risk assessment demonstrates will have no significant risk of adversely affecting human health?** **c. As a result of controlling exposure through the use of mitigation measures or through the use of institutional or engineering controls, has the regulatory agency determined that the concentrations of petroleum constituents in soil will have no significant risk of adversely affecting human health?**	☒Yes ☐No ☐NA ☐Yes ☐No ☒NA ☐Yes ☐No ☒NA

SUBJECT: ARCO STATION #465 AT 151 SOUTHGATE AVENUE, DALY CITY, CALIFORNIA

Dear Mr. Melton:

Antea Group uploaded to the State GeoTracker database (GeoTracker) a remediation status report dated February 12, 2020; a groundwater monitoring report dated April 20, 2020; unsolicited shallow soil assessment report dated April 20, 2020; and an unsolicited case closure request dated April 21, 2020. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these documents and the project file.

Remediation Status Report

GPP staff concur operation of the soil vapor extraction (SVE) system on the wells screened below the perched groundwater zone system does not currently appear cost-effective. This conclusion is based on the low mass recovery reported and the current limited impact to regional groundwater.

Groundwater Monitoring Report

The report discusses the groundwater monitoring and gauging work performed in November 2019 and January 2020. Page 2 of our June 2019 letter only supported semi-annual gauging and sampling of MW-16D, MW-18D, MW-19D, and V-14 during the first quarter and annual gauging and sampling of most of the other wells during the first quarter. The findings of the November 2019 monitoring event did not change our understanding of site conditions. Therefore, **GPP staff cannot recommend the UST Cleanup Fund reimburse the costs associated with the November 2019 groundwater monitoring event. We also cannot recommend the Cleanup Fund reimburse the costs of the well gauging event planned during the second quarter of 2020 (Section 1.2).** Please reduce the groundwater gauging and sampling frequency of all wells to annual during the first quarter.

The report indicates MW-17 was not sampled because a piece of tubing was stuck in the well. Please note, it is the well owner's responsibility to maintain their monitoring wells for the intended purpose. Please ensure the obstruction is removed prior to the next monitoring event.

Comment 2 below Table B on page 3 of the report implies the purging of groundwater from the blank portions of the well casing prior to sampling could not be addressed during the November 2019 and January 2020 monitoring events because these events occurred before our January 2020 letter was issued. Please note, GPP staff previously requested the registered professional to address the stagnant water issue on page 3 of our June 2019 letter.

Table 3 doesn't indicate the April 2019 groundwater samples collected from MW-16D, MW-18D, and MW-19D were grab samples as required on page 1 of our June 2019 letter. The table also does not indicate the November 2019 and January 2020 groundwater samples from V-14 were grab samples. Please ensure future versions of this table convey this information.

Unsolicited Soil Sampling Report

The report does not contain a figure showing the location of soil samples T-2, T-2A, and D-4 (the soil samples that resulted in the decision to drill Borings HA-4 and HA-5). Please ensure future documents contain sufficient data to evaluate findings and proposed work (e.g. Figure 2 in the reports dated June 25, 1999, and January 12, 2001).

Sections 2.1 and 4.0 of the report state HA-4 and HA-5 were drilled to assess the elevated benzene concentrations in soil samples T-2, T2-A, and D-4. GPP staff do not consider the objective satisfied because it appears the soil samples from these borings were collected from soils used to backfill the 1999 excavations. The gravel logged in HA-4 and HA-5 from grade to approximately 10 feet below grade (fbg) was not logged in any of the 29 monitoring wells installed for the subject site. Moreover, HA-4 and HA-5 were adjacent to the 1999 excavations which were excavated to depths of 10 fbg according to Section 3.3 of the April 2020 case closure request. Field personnel should have moved HA-4 and HA-5 to areas outside the 1999 excavation when logging indicated the borings were likely within the 1999 excavation. In addition, the representativeness of soil samples collected from gravel cuttings in a hand-auger barrel is a concern and no soil samples were collected from native soil at approximately 3 fbg (the depth of greatest petroleum impact identified in shallow soil). Please ensure future versions of Table 3 footnote the soil sampling results from these borings to identify these QA/QC concerns. Table 3 should also footnote that September 2000 soil samples D1B, D1E, D1N, D1S, D1W, D2S, D3S, D2E, D5, D7, D8 to indicate they also appear to have been collected from soil used to backfill the 1999 excavations, and therefore, should not be used to assess the extent of the contamination reported in the 1999 soil samples.

It appears sampling of soil north of D-4 and outside the 1999 excavation is necessary to assess the extent of residual soil contamination ≤10 fbg. This conclusion is based on the following findings: 1) soil impact ≤10 fbg and east of the dispensing facilities was likely removed by the UST excavations; 2) the laboratory results from the analysis of soil samples T-3, D-3, HA-2, MW-13, and MW-14 appear to assess the lateral extent of the elevated benzene concentrations reported at D-4 and T-2 given the reported excavation depth; 3) the laboratory results from the analysis of soil samples T-1, D-1, T-6, T-6A, MW-14, HA-2, SB-29, and V-6 appear to adequately assess the lateral extent of the

elevated benzene concentrations at D-2; and 4) no significant benzene impact was reported in shallow soil near the northernmost dispenser island. Therefore, please upload to GeoTracker the work plan required on page 2 of out January 2020 letter for soil confirmation sampling north of D-4 and the soil confirmation sampling required near D-2, SB-1A, SB-3, south of SB-11, and south of V-13. It only appears necessary to assess unsaturated zone soil above the perched groundwater table. Assessment of soil within and below the perched groundwater zone does not appear necessary based on the laboratory results of groundwater samples collected from the perched water zone and the recency of vertical assessment below the perched groundwater zone. Please ensure the work plan proposes to analyze soil samples collected from depths where significant petroleum impact was previously reported, on the top of lower permeability strata, and where sample screening indicates residual impact may be present. The April 21, 2020, completion deadline remains in-effect because the registered professional did not object to this work plan requirement within 30 days of our January 2020 letter.

Table 2 lists footnotes for groundwater sampling on the groundwater gauging table such as when a grab groundwater sample was collected. Please ensure future versions of this table and Table 3 in future groundwater monitoring reports indicate via footnote that the April 2019 groundwater samples collected from wells MW-16D, MW-18D, and MW-19D were grab samples as required on page 1 of our June 2019 letter. It would also be beneficial if future tables listing soil sampling results identified sample field point names instead of Sample ID so the nomenclature agrees with GeoMap files.

Unsolicited Case Closure Request

GPP staff do not consider it necessary or cost-effective to prepare a comprehensive case closure report when we previously identified only two impediments to case closure: 1) demonstrating MTBE will not impact regional groundwater (page 2 of our June and November 2019 letters) and 2) collecting soil confirmation samples to evaluate the residual concentrations of benzene and MTBE in soil and leaching potential to groundwater (page 2 of our January 2020 letter). **Therefore, the UST Cleanup Fund may not fully reimburse the cost to prepare the entire case closure request**.

The document concludes case closure is appropriate because the April 2020 soil sampling results from HA-4 and HA-5 assessed the lateral extent of petroleum in soil between grade and 10 fbg and because groundwater conditions satisfy Class 5 of the State Low-Threat UST Case Closure Policy (LTCP). GPP staff do not concur with these conclusions for the following reasons:

- As discussed in the previous section of this letter, it appears Borings HA-4 and HA-5 sampled soils used to backfill the 1999 excavations rather than pre-existing soils that were impacted by the petroleum release. Therefore, extent of residual petroleum impact in shallow soil has not been adequately assessed. The previous section of this letter outlined a path forward to resolve this impediment;

- MTBE concentrations exceeding the Regional Water Quality Control Board Environmental Screening Level (ESL) for leaching to groundwater have been reported in soil to the depth of regional groundwater. This ESL was exceeded in 23 boring locations according to Section 6.3 of the closure request between depths of 55 to 135.5 fbg and some of the depths in this range represented the bottom of the boring – a vertically unassessed condition (e.g. V-14);

- The Westlake municipal water supply well (DC-2) is only approximately 500 feet southwest of the site (adjacent DC-1 is a former production well now used as a monitoring well). Moreover, two new SFPUC production wells were recently installed approximately 1,100 to 1,300 feet downgradient of the site (GSR-BFW and GSR-PPW);

- Ten of the 12 soil leaching and groundwater transport simulations for well V-14 and 3 of the 4 simulations for Boring SB-11 predicted detectable concentrations of MTBE will enter the Westlake well - 8 of the 16 simulations predicting exceedance of the MCL. Moreover, 12 of the 16 simulations predicted regional groundwater beneath the site will contain >1,000 ug/l of MTBE, the threshold for Class 2 of the LTCP - the groundwater media-specific class GPP staff would compare the site against if the municipal supply well were not within 1,000 feet of the site;

- The modeling assumptions may not be conservative. For example, the model assumed the MTBE was only present in soil between approximately 87.5 and 90 fbg in V-14 and between 61.5 and 62 fbg in SB-11 and within an area between 100 and 1,600 ft2 (limited areal extent). It did not consider the occurrence of MTBE in soil that are present at other depths below the perched groundwater zone and over a much larger area (e.g. 9.1 mg/kg at 70 fbg and 2.9 mg/kg at 80 fbg in SB-15; 0.19 mg/kg at 85 fbg in MW-5A [bottom of the boring]; 0.45 mg/kg at 86 fbg in SB-30; 13 mg/kg at 80 fbg and 0.33 mg/kg at 90 fbg in MW-15 [bottom of boring], 1.1 mg/kg of MTBE at 80 fbg in V-11; and 0.22 mg/kg at 90 fbg in V-13 [bottom of boring]). The model also did not evaluate the effect of the MTBE concentrations reported in soil samples collected below the assumed and the current depth to regional groundwater (e.g. Borings SB-11, SB-15, SB-17, SB-18, SB-20D, V-11). Furthermore, it did not justify the values of the parameters and assigned a fine-grained sediment layer at 62 fbg in the SB-11 simulation when the boring log describes this depth interval as silty sand (35% silt); and

- MTBE was reported in the groundwater samples from MW-3D in each of the last 2 groundwater monitoring events (no detections had been reported during the previous 7 monitoring events). MW-3D is screened within the primary production aquifer according to Section 1.3 of the April 2020 soil sampling report. Moreover, these detections of MTBE suggest the clay units above the screened interval of MW-3D may not prevent the vertical migration of MTBE into the main production aquifer as implied in Sections 6.5.1, 6.5.3.1, 6.5.3.2, and 9.0 of the closure request.

Therefore, GPP staff do not consider case closure warranted at this time. GPP staff can only support the destruction of the wells installed to monitor and remediate the area within and above the perched groundwater interval and only if the results of the required soil confirmation sampling are favorable. The deeper monitoring and SVE wells must remain and groundwater in the deeper wells must be annually monitored during the first quarter to verify regional groundwater will not be adversely impacted. GPP staff will require additional remedial action if the MTBE concentrations in regional groundwater significantly increase or if MTBE is detected in the municipal well and the MTBE appears to have originated from the subject site.

GPP staff denied GeoMap #3006731152 because Figure 2b does not accurately show and identify the 1999 and 2000 soil samples (refer to Figure 2 in reports dated June 25, 1999, and January 12, 2001). Please upload a correct version of this file to GeoTracker.

Closing Comment

Our decision to deny case closure is subject to appeal to the State Water Resources Control Board (SWRCB), pursuant to Section 25296.40(a)(1) of the Health and Safety Code (Thompson-Richter Underground Storage Tank Reform Act - Senate Bill 562). Please contact the SWRCB Underground Storage Tank Program at (916) 341-5752 for information regarding the appeal process if you desire to appeal our decision.

We appreciate your cooperation. Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org on Monday through Thursday (excluding holidays) if you have any questions.

Mr. Deno Milano
San Mateo County Groundwater Protection Program
2000 Alameda de las Pulgas, Suite 100
San Mateo, California 94403

Subject: ARCO Service Station #465 at 151 Southgate Avenue, Daly City, California

Dear Mr. Milano,

BP Products North America, Inc. (BP) and Antea®Group have reviewed the San Mateo County Groundwater Protection Program (GPP) letter dated June 4, 2020, and have the following comments:

GPP Comment: Ten of the 12 soil leaching and groundwater transport simulations for well V-14 and 3 of the 4 simulations for Boring SB-11 predicted detectable concentrations of MTBE will enter the Westlake well - 8 of the 16 simulations predicting exceedance of the MCL. Moreover, 12 of the 16 simulations predicted regional groundwater beneath the site will contain >1,000 ug/l of MTBE, the threshold for Class 2 of the LTCP - the groundwater media-specific class GPP staff would compare the site against if the municipal supply well were not within 1,000 feet of the site.

Response:

- The SEVIEW model runs reported in the Closure Request predicted MTBE could potentially migrate laterally to the location of the Westlake Well in the Shallow Aquifer, not that it would enter the Westlake Well. The shallowest screen interval of the Westlake Well is reported from 340 to 380 feet below ground surface (bgs), which would place the top of the uppermost screen section approximately 150 feet below the top of the clay unit that is located approximately 190 feet bgs, as shown in the well log for MW-3D and the log for the Westlake Well, and approximately 200 feet below the vertical depth MTBE is predicted using the SEVIEW model. [*The Westlake well is screened in the Primary Production Aquifer below the 100-foot clay layer underlying the Shallow Aquifer. The 100-foot clay layer is not part of the CSM used for the model*.] Furthermore, the Westlake Well is not located downgradient of the Site; however, the model assumes the Westlake Well is directly downgradient from the point source of MTBE. This was done to simulate the worst-case-scenario if pumping resumed in the Westlake Well without any other production wells in the area affecting gradient, including the two new SFPUC production wells that were recently installed downgradient of the Site, at a distance greater than 1,000 feet. The Westlake Well is property of The City of Daly City and BP was unable to obtain authorization from The City of Daly City to include the well log with this letter. The log can be made available to the GPP for review by contacting The City of Daly City Department of Water and Wastewater Resources.

- As mentioned in the June 2020 GPP letter, the -100 foot clay unit may not completely prevent the vertical migration of MTBE into the Primary Production Aquifer; however, the clay will significantly impede vertical migration, allowing time for additional natural attenuation and biodegradation of the MTBE.

- The highest MTBE concentrations predicted below the Site are reported for the simulations with the larger source area, no unsaturated zone degradation, and the simulated higher water table. The SEVIEW results that predicted the highest MTBE concentration at the point source simulate an overly conservative situation for the 40' x 40' source area centered at V-14. If these conservative assumptions accurately represented the conditions of the Site, it is likely that MTBE concentrations in excess of 1,000 ug/L would have been observed in the regional groundwater beneath the Site in the 20+ years since the initial spill occurred. The only instance of MTBE in the shallow aquifer in excess of 1,000 ug/L is from the groundwater sample collected from V-14 in February 2018. However, this sample was not representative of aquifer conditions as the sample was collected from stagnent water within the well casing and no purging occurred prior to sampling. During all groundwater monitoring events after February 2018, stagnant groundwater was removed from the V-14 well casing to allow water from the formation to enter the well prior to collecting a sample. All MTBE concentrations from January 2019 through the present remain below 1,000 ug/L.

GPP Comment: The modeling assumptions may not be conservative. For example, the model assumed the MTBE was only present in soil between approximately 87.5 and 90 fbg in V-14 and between 61.5 and 62 fbg in SB-11 and within an area between 100 and 1,600 ft2 (limited areal extent). It did not consider the occurrence of MTBE in soil that are present at other depths below the perched groundwater zone and over a much larger area (e.g. 9.1 mg/kg at 70 fbg and 2.9 mg/kg at 80 fbg in SB-15; 0.19 mg/kg at 85 fbg in MW-5A [bottom of the boring]; 0.45 mg/kg at 86 fbg in SB-30; 13 mg/kg at 80 fbg and 0.33 mg/kg at 90 fbg in MW-15 [bottom of boring], 1.1 mg/kg of MTBE at 80 fbg in V-11; and 0.22 mg/kg at 90 fbg in V-13 [bottom of boring]). The model also did not evaluate the effect of the MTBE concentrations reported in soil samples collected below the assumed and the current depth to regional groundwater (e.g. Borings SB-11, SB-15, SB-17, SB-18, SB-20D, V-11). Furthermore, it did not justify the values of the parameters and assigned a fine-grained sediment layer at 62 fbg in the SB-11 simulation when the boring log describes this depth interval as silty sand (35% silt).

Response:

- Not all occurrences of MTBE in soil were modeled. The concentrations at V-14 and SB-11 were cited as a concern because of the proximity to the perched groundwater table and shallow aquifer, respectively. Therefore, it is the opinion of the registered professional that the SEVIEW simulations for single MTBE occurrences at V-14 and SB-11 adequately evaluate the potential, though unlikely, impact of MTBE in the shallow aquifer above the Westlake Well.

- The precise extent of MTBE at borings V-14 and SB-11, as based on a soil samples collected from each boring, is not known. However, the estimated source area was based on the soil-sampling results from nearby soil borings. Soil samples collected from MW-16D, located in proximity to V-14, show MTBE decreasing and remaining below the ESL at 96 feet bgs. The source areas simulated at V-14 ranged from 100 ft^2 to 1,600 ft^2, which provides a conservative range of source area extents. At SB-11 the availability of nearby soil boring results indicated an area of 400 ft^2 was a reasonable and conservative representation of the source area.

- The parameters assigned to the fine-grained sediment layer at 62 feet bgs include thickness and intrinsic permeability. The thickness was obtained from the soil boring log for SB-11 that reported a silty (fine-grained) sand from 62 to 67.5 feet bgs. The intrinsic permeability ($3.57 * 10^{-10}$ cm^2) is the value for a Silt Loam, as contained in a SEVIEW internal database.

GPP Comment: Sections 2.1 and 4.0 of the report state HA-4 and HA-5 were drilled to assess the elevated benzene concentrations in soil samples T-2, T2-A, and D-4. GPP staff do not consider the objective satisfied because it appears the soil samples from these borings were collected from soils used to backfill the 1999 excavations. The gravel logged in HA-4 and HA-5 from grade to approximately 10 feet below grade (fbg) was not logged in any of the 29 monitoring wells installed for the subject site. Moreover, HA-4 and HA-5 were

adjacent to the 1999 excavations which were excavated to depths of 10 fbg according to Section 3.3 of the April 2020 case closure request. Field personnel should have moved HA-4 and HA-5 to areas outside the 1999 excavation when logging indicated the borings were likely within the 1999 excavation. In addition, the representativeness of soil samples collected from gravel cuttings in a hand-auger barrel is a concern and no soil samples were collected from native soil at approximately 3 fbg (the depth of greatest petroleum impact identified in shallow soil). Please ensure future versions of Table 3 footnote the soil sampling results from these borings to identify these QA/QC concerns. Table 3 should also footnote that September 2000 soil samples D1B, D1E, D1N, D1S, D1W, D2S, D3S, D2E, D5, D7, D8 to indicate they also appear to have been collected from soil used to backfill the 1999 excavations, and therefore, should not be used to assess the extent of the contamination reported in the 1999 soil samples.

Response:

- The location of HA-4 was chosen based on the distance to the dispensers and existing product lines. Advancing an additional shallow soil boring to the south of HA-4 and closer to D-4 is not possible as the product lines are running to the north of D-4 and the product line trench is roughly 5-6 feet in diameter. Relocating HA-4 further to the west places it approximately 8 feet away from both MW-6, advanced in 2001, and MW-13, advanced in 2015. A sample collected from MW-6 at 5.5 feet bgs showed all contaminants of concern (COCs) were below the Low Threat Closure Policy Concentrations of Petroleum Constituents in Soil That Will Have No Significant Risk of Adversely Affecting Human Health. Similarly, a sample collected from MW-13 at 10 feet bgs showed all COCs were below the laboratory detection limits.

- As noted by the GPP, no soil sample was collected from HA-4, MW-6, or MW-13 at a depth of 3 feet bgs. However, soil samples collected from approximately 5 feet bgs in both HA-4 and MW-6 did not contain concentrations in excess of the Low Threat Closure Policy Low Threat Closure Policy Concentrations of Petroleum Constituents in Soil That Will Have No Significant Risk of Adversely Affecting Human Health. If impacts remained in the vicinity of T-2/T-2A, it is likely concentrations would have been detected in samples collected at the 5-foot interval, accounting for vertical migration over the 20 years since the initial sampling was performed.

- The concentrations of all COCs analyzed were higher at a depth of 10 feet bgs in T-2A than they were in the sample collected from T-2 at 3 feet bgs. Samples collected from HA-4, MW-6, and MW-13 at approximately 10 feet bgs confirm the concentrations previously identified in the T-2A sample are not present to the west of T-2/T-2A and the north of D-4.

GPP Comment: Therefore, please upload to GeoTracker the work plan required on page 2 of out January 2020 letter for soil confirmation sampling north of D-4 and the soil confirmation sampling required near D-2, SB-1A, SB-3, south of SB-11, and south of V-13. It only appears necessary to assess unsaturated zone soil above the perched groundwater table. Assessment of soil within and below the perched groundwater zone does not appear necessary based on the laboratory results of groundwater samples collected from the perched water zone and the recency of vertical assessment below the perched groundwater zone.

Response:

As per conversations with the GPP, it is our intention to wait until the Closure Request has been reviewed by California Regional Water Quality Control Board before proposing any additional actions at the site. In the meantime, we will maintain the annual sampling schedule required by GPP in the letter dated June 4, 2020.

If you have any questions regarding this report or need any additional information about this Site, please contact Mr. Wade Melton at (360) 594-7978.

Sincerely yours,

Wade Melton

SUBJECT: ARCO STATION #465 AT 151 SOUTHGATE AVENUE, DALY CITY, CALIFORNIA

Dear Mr. Melton:

Thank you for your letter dated July 1, 2020, responding to the San Mateo County Groundwater Protection Program (GPP) staff letter dated June 4, 2020. The following comments are based on our review of your letter and the project file.

Responses Concerning the Groundwater Modeling Portion of the April 2020 Closure Request

Sections 6.5.3.1 and 6.5.3.2 of the April 2020 closure request concluded the groundwater modeling predicted regional groundwater could be impacted with MTBE concentrations as great as 39,800 ug/l and MTBE-impacted groundwater could migrate to the Westlake municipal well if this well was downgradient of the site. The response speculates MTBE impact to the Westlake well is unlikely. However, some of the data cited for this inference is not firmly supported by the soil and groundwater sampling data. For example, borehole logging for well MW-3D suggests the 100-foot-thick clay layer cited in the response may only be 10-feet thick. This clay layer may not be an effective barrier to the vertical migration of MTBE to the screened interval of the Westlake well because MW-3D is screened below this clay layer and MTBE has been reported in groundwater samples collected from MW-3D. Only sand was logged below this clay (200 fbg to a total depth of 220 fbg) which is only 120 feet above the top of the screened interval of the Westlake well. Moreover, no data was provided to demonstrate pumping of the Westlake well would not draw the MTBE-affected groundwater at this depth to the screened interval of the Westlake well. In addition, no information was provided that the MTBE reported in soil below the perched groundwater zone is stable (refer to page 2 in our letter dated June 5, 2019 letter) or that our concerns in our June 2020 letter regarding the distribution of MTBE in soil have no merit (refer to Bullet #4 on page 4 of our June 2020 letter). Therefore, given the Westlake municipal well is only approximately 500 feet from the subject site, GPP staff still consider it reasonable to require ongoing annual monitoring of the deep monitoring wells to verify the worse-case MTBE impacts predicted by the groundwater modeling do not materialize and the

MTBE concentrations in regional groundwater will not significantly exceed the 1,000 groundwater media-specific criterion in the State Low-Threat UST Case Closure Policy (page 5 of our June 2020 letter). The bottom of page 3 of the response suggests ARCO concurs with this annual monitoring.

Response Concerning Soil Samples HA-4 and HA-5

While the soil sampling results from MW-6 are useful to assess the lateral extent of impact reported at 10 fbg in T-2A, no samples were collected from this well to assess the significant impact reported at 3 fbg in D-2 and T-2 and no data was submitted to demonstrate the soils at 3 fbg would not favor lateral migration of contaminants. Therefore, GPP staff still consider it necessary to sample native soil at 3 fbg immediately west of HA-4. Please note, we do not consider it appropriate to use the soil sampling results from HA-4 for decision making (paragraph 3 on page 3 of the response) because no information was provided to demonstrate the soil samples from this boring were not collected from the fill soils used to backfill the 1999 soil excavation.

Work Plan Required for Soil Confirmation Sampling

The response states it is ARCO's intention to wait until State Water Resources Control Board staff review the GPP staff closure denial per ARCO's conversations with GPP staff. GPP staff concur providing this review occurs during 2020 because the objective of the work is to confirm previous soil vapor extraction significantly reduced the residual petroleum concentrations previously reported in the vadose zone.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org on Monday through Thursday (excluding holidays) if you have any questions.

RE: Source Area Characterization Work Plan
Former Westlake French Dry Cleaners Site, 247 Westlake Center
Daly City, California 94015
Project# 1241.03
SMCo Case# 229066

Dear Ms. Jurek:

Northgate Environmental Management, Inc. (Northgate) is submitting this Source Area Characterization Work Plan (the Work Plan), on behalf of Kimco Westlake, L.P. (Kimco), for your review and approval. The Work Plan describes planned soil vapor sampling activities to be conducted at the Former Westlake French Dry Cleaners Site, located at 247 Westlake Center, Daly City, California (the Site; Figures 1, 2 and 3), and adjacent commercial tenant spaces located in Daly City, California.

BACKGROUND

Soil gas investigations conducted at the Site from 2002 to 2011 indicated the presence of the dry cleaning solvent tetrachloroethene (PCE) in soil vapor at concentrations that exceeded Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB)[1] (Figures 4a and 4b). In accordance with Northgate's Soil Vapor Extraction (SVE) Work Plan (Northgate Environmental Management, Inc. [Northgate], 2012a)[2] and SVE Work Plan Addendum (Northgate, 2012b)[3], a SVE system including three

nested vapor extraction well pairs (VEWs) and four monitoring probes (VMPs) was installed in 2014. One previously installed sub-slab probe (TR-7) is located below the concrete floor of the former dry cleaning tenant space currently occupied by a T-Mobile retail store. A Site Plan showing the locations of the extraction wells, the monitoring probes, and the sub-slab probe is included on Figure 3. The SVE system was operated until July 14, 2016, when the system was shut down for rebound testing in accordance with the Northgate's Performance Report (Northgate, 2016)[4] recommendations.

Between July 7, 2016, and May 15, 2017, Northgate performed a rebound test at the Site by discontinuing SVE system operations for a an approximately 10-month period and monitoring the PCE concentrations in soil vapor in the extraction wells and monitoring probes during that time in accordance with regulatory guidance. Northgate evaluated the rebound test results by comparing PCE concentration in samples collected during rebound testing to current RWQCB *Vapor ESLs for Subslab and Soil Gas (Table SG-1)* (RWQCB, 2016a)[5]. On August 30, 2017, Northgate submitted a Rebound Test Report (Northgate, 2017)[6] summarizing the results of rebound testing performed during the 10-month shutdown and recommended SVE be discontinued and the SVE system be decommissioned.

In its September 29, 2017 letter[7] response to the Rebound Test Report, the San Mateo County Groundwater Protection Program [GPP]) requested continued rebound test sampling of the sub-slab soil vapor probe TR-7 inside the T-Mobile tenant space on a semi-annual basis until PCE concentrations reach stable equilibrium. In addition to continued rebound testing, the GPP requested submittal of a work plan to collect indoor air samples and to evaluate soil vapor intrusion (VI) at the Site over time. Northgate prepared an Indoor Air Sampling Work Plan[8] outlining an indoor air (IA) sampling program in accordance with the GPP letter request, the California Department of Toxic Substances Control (or DTSC) *Vapor Intrusion Guidance* (Vapor Intrusion Guidance) (DTSC, 2011)[9] and the RWQCB *Draft Interim Framework for Assessment of Vapor Intrusion at TCE-Contaminated Sites in the San Francisco Bay Region*

(FAVI) (RWQCB, 2014)[10]. In its February 28, 2018 letter the GPP provided comments on the IA Sampling Work Plan requesting 1) seasonal evaluation IA as well as Heating Ventilation, and Air Conditions (HVAC) system on/off conditions; 2) IA concurrent sub-slab vapor sampling to establish building-specific attenuation; and 3) evaluation of cross slab pressure differentials indicating building dynamics potentially influencing VI.[11]

On July 13, 2018, Northgate submitted an email update for the first half of 2018 rebound testing and recommended restarting the SVE System for a short operation or "pulse" followed by rebound testing and IA work plan implementation. In its July 18, 2017[12] email comments on the rebound test update, the GPP requested a work plan for a source area characterization to optimize the SVE program. The GPP noted that some rebound test results exceeding pre and post-SVE concentrations potentially suggesting the need to expand or modify the existing system to target specific impacted source areas or depth intervals. The new source area characterization results will provide the basis for potential SVE program modifications or path to completion recommendations.

The following Work Plan describing collection of additional soil vapor and sub-slab soil vapor samples was prepared as requested by the GPP to further characterize the current nature and extent of the potential PCE source area in the subsurface at the Site.

PURPOSE

The purpose of the source area characterization program, requested by the GPP, is to provide data regarding current concentrations of PCE in soil vapor at the Site. These results will primarily be used to 1) evaluate the current nature and extent of PCE impacts in the subsurface, 2) evaluate the potential need to further optimize remediation activities at the Site by modifying operation of the SVE system, and 3) provide data to establish a building-specific attenuation factor (AF) in conjunction with implementation of a revised IA Sampling Work Plan. A building-specific AF will be used to develop Site-specific sub-slab and soil gas screening levels (Vapor SL) for PCE and evaluate VI at the Site. Sampling results will be compared to the above Site-specific Vapor SL to evaluate the potential for VI at the Site and if PCE in soil vapor presents a significant potential risk to human health. Favorable findings of the program will be used in re-evaluating the rebound testing program potentially justifying a closure path for the remediation recently completed at the Site. Less favorable findings may be used to modify

[10] RWQCB, 2014. D*raft Interim Framework for Assessment of Vapor Intrusion at TCE-Contaminated Sites in the San Francisco Bay Region*. October.
[11] Northgate plans to revise the IA Sampling Work Plan per the GPP comments and the recommendation included in this work plan.
[12] GPP, 2018. Email. July 18.

operation of the SVE system to target specific impacted intervals in order to optimize effectiveness of the SVE system.

SOURCE AREA CHARACTERIZATION PLAN

The source area characterization sampling will be performed in general accordance with the DTSC Advisory Active Soil Gas Investigations (DTSC, 2012)[13]. As shown on Figure 6, Northgate proposes collecting 16 primary soil vapor (SV) samples: 12 SV samples from four new locations (VMP-2 thru VMP-5) and four SV samples from one existing multi-depth probe (VMP-1). Additionally, six primary sub-slab vapor (SSV) samples will be collected: one sample from one existing probe (TR-7) and five samples from five new locations (SSV-1 thru SSV-5) that are generally consistent with locations of SSV sampling performed by Treadwell and Rollo in 2011[14]. As described further below, results will be compared to Site-specific commercial vapor SLs for PCE in SV and SSV calculated by dividing the current RWQCB *Vapor ESL for Indoor Air, Direct Exposure Human Health Risk Levels for Commercial/Industrial Exposure (Table IA-1)* (RWQCB, 2016b)[15] by a building-specific AF.

Building Survey and Inventory

In preparation for collecting samples and as part of the previously proposed IA evaluation, Northgate will tour the building and grounds to observe building construction and confirm that the sample locations presented on Figure 6 are accessible and appropriate places to collect samples. A floor diagram will be generated to illustrate floor layout and include chemical storage and use areas, doorways, stairways, hoods, sinks, sumps, electrical rooms, restrooms, fire risers, HVAC systems inlets and outlets, etc. The general construction of the building will be observed and locations where foundation–wall joints, foundation cracks, concrete control joints, plumbing and electrical conduits, other equipment penetrations to the slab exist will be noted.

A hand-held organic vapor analyzer equipped with a photoionization detector (PID) capable of sub parts-per-million readings will be used to identify cracks, joints and other penetrations where PCE may enter the buildings. The PID will also be used to identify VOC products that may be in the investigation area that may impact the investigation. PID readings will be recorded on the floor diagram and on a separate form.

During the building survey, the SSV sample locations presented on Figure 6 will be confirmed or adjusted according to observations of subsurface penetrations in the floor slab penetrations (e.g.

[13] DTSC, 2012. *Advisory – Active Soil Gas Investigations.* April.
[14] Treadwell and Rollo, 2011. *Sub-slab and Groundwater Sampling Results*, Former Westlake French Dry Cleaners, 247 Westlake Center, Daly City, California. August 8.
[15] RWQCB, 2016b. Vapor ESLs for Indoor Air. February.

restrooms, electrical rooms, lunch rooms, fire risers, etc.), as well as office areas, and common areas. The locations of doors, windows, and ventilation systems will be considered in sample location confirmation, and SSV locations will be co-located with sample locations for IA.

New Sub-Slab Vapor Probes Installation

Pending GPP approval, we plan on installing VaporPin™ reusable sub-slab vapor sampling probes at five locations (SSV-1 thru SSV-5) shown on Figure 6. To install the probes, a 5/8-inch diameter hole will be drilled through the slab using a hammer drill. The anticipated slab thickness is approximately five inches. A stainless steel Vapor Pin™ will be inserted in the drilled hole with the bottom of the probe even with the bottom of the slab. VaporPin™ installation and extraction standard operating procedures are described in the manufacturer manual enclosed in this work plan.

New Vapor Monitoring Probes Installation

We propose to install multi-depth vapor monitoring probes at four locations (VMP-2 thru VMP-5) to collect samples from three specific depth intervals at 10, 20, and 30 feet below ground surface (bgs). Northgate will conduct a Site visit to mark the drilling locations on the ground at the Site and conduct underground utility clearances by notifying Underground Services Alert at least 48 hours prior to drilling and employing the services of a private, subcontracted utility locator. The Site visit will also be used to identify any conditions that might limit access to drilling locations with drilling equipment. The soil vapor probes will be installed in soil borings advanced using a direct-push drill rig. Continuous soil cores will be retrieved and screened every 2 to 2.5 feet for VOCs using a photoionization detector (PID). Borings will be advanced to a depth of approximately 30.5 feet bgs and the co-located vapor probes will be installed at depths of 10, 20, and 30 feet bgs.

The vapor probes will be installed and constructed in accordance with DTSC guidance. The probe will consist of a 6-inch long stainless steel implant (screen) installed at the desired probe depth. Teflon tubing (¼ inch diameter) will be connected from the implant to the ground surface, and terminated above the existing ground surface. The borehole annulus around each implant and tubing will be filled through the drill rods with: (a) sand of depth 1.5 feet in the borehole around each implant, (b) 1 foot of dry bentonite above the sand, and (c) hydrated bentonite above the dry bentonite to the depth of sand pack for the next probe or near ground surface. A gas-tight protective cap will be placed on the surface ends of the Teflon tubing.

All reusable drilling equipment will be steam-cleaned or washed and rinsed prior to use at each boring location, and probe construction details will be recorded in field notes.

Data Quality Objectives

The Data Quality Objectives (DQOs) are the qualitative statements developed to specify the quality and quantity of data necessary to support decisions regarding conditions at the Site. The U.S. EPA seven-step process was used to develop the sampling design and data quality objectives for this investigation (U.S. EPA, 2006). Table 1 depicts the DQOs for the Site.

Number and Type of SV Samples

A total of 17 SV samples (including one duplicate samples) will be collected in accordance with the DTSC Advisory Active Soil Gas Investigations [DTSC, 2012][16] procedures) from four new probes VMP-2 thru VMP-5 and the existing probe VMP-1 shown on Figure 6. In accordance with the Vapor Intrusion Guidance, soil vapor samples will be collected at least two hours after the new probe installation is completed. A purge volume test will be conducted at the first sampling location using Tedlar bags and a PID. Soil vapor samples will be collected at each location using ¼-inch Teflon tubing and laboratory batch certified 1-liter summa canisters for VOC analysis using EPA Method TO-15. A leak test will completed during collection of each soil vapor sample using a shroud and isopropanol alcohol as the leak detection compound.

Number and Type of SSV Samples

A total of seven SSV samples (including one duplicate sample) will be collected in accordance with the DTSC Advisory Active Soil Gas Investigations [DTSC, 2012][17] procedures) from the new probes SSV-1 thru SSV-5 and the existing probe TR-7 shown on Figure 6. In accordance with the Vapor Intrusion Guidance, soil vapor samples will be collected at least two hours after the new probe installation is completed. A purge volume test will be conducted at the first sampling location using Tedlar bags and a PID. SSV samples will be collected at each location using ¼-inch Teflon tubing and laboratory batch certified 1-liter summa canisters for VOC analysis using EPA Method TO-15. A leak test will completed during collection of each SSV sample using a shroud and isopropanol alcohol as the leak detection compound.

Rationale for Sampling Locations

The SV and SSV samples will be collected from the Former Westlake French Dry Cleaners tenant space, adjacent tenant spaces, and adjacent hallways as shown on Figure 6. Pre-SVE PCE sub-slab and soil gas iso-concentration plots for the Site vicinity are shown on Figure 4a and 4b, respectively. Post-SVE PCE sub-slab and soil vapor concentrations for the Site vicinity are

[16] DTSC 2012. *Advisory Active Soil Gas Investigations*, April.

[17] DTSC 2012. *Advisory Active Soil Gas Investigations*, April.

shown on Figure 5. The pre-SVE data, as shown on Figure 4a was used to support selection of sampling locations within the adjacent tenant spaces for SSV sampling for potential VI assessment. SSV samples proposed in this Work Plan will be approximately co-located with corresponding IA samples documented in the IA Sampling Work Plan (Northgate 2018) in order to allow for determination of a building-specific AF. Given the small tenant spaces, and the existence of a continuous slab in the building, it is proposed that only the indoor air samples co-located with the sub-slab samples described above be sampled coincident with this workplan implementation. Additionally, SV and SSV sampling locations were determined to support further evaluation of the current nature and extent of PCE impacts in the subsurface. In particular, SV samples will be collected from specific depth intervals in order to evaluate the current vertical extent of PCE impacts across the Site. SSV sampling locations were also selected to be generally consistent with the locations of sub-slab samples collected prior to SVE operation in 2011 to evaluate changes in subsurface conditions.

Laboratory Analytical Methods and Detection Limits

The Summa canisters will be labeled and transported to a certified laboratory following chain-of-custody procedures. Based upon historical soil vapor data only PCE will be considered as a chemical of potential concern for chemical analysis. The SV and SSV samples will be analyzed for PCE using EPA Method TO-15. The laboratory reporting limit for PCE using TO-15 is typically 3.4 micrograms per cubic meter ($\mu g/m^3$), which is well below the current soil gas Vapor ESL for a commercial exposure of 2,100 $\mu g/m^3$ for PCE and below the proposed commercial ESL of 70 $\mu g/m^3$ expected to be published in late 2018.

Procedures for Evaluation of Analytical Results

The SV and SSV sampling results will be used to evaluate the current nature and extent of PCE in the subsurface and to calculate a building-specific sub-slab to indoor air AF (AF_{SSV}) and soil vapor to indoor air AF (AF_{SV}) by dividing the sample average concentration for SSV or SV collected from 10 feet bgs, respectively, by the IA sample average PCE concentration (DTSC 2011)[18]. Site-specific commercial Vapor SLs for PCE in SV and in SSV will be developed by dividing the commercial indoor air ESL for PCE (2.1 $\mu g/m^3$) by the building-specific AF_{SV} and AF_{SSV}, respectively. The SV and SSV sampling results will be compared to the Site-specific Vapor SLs to determine if PCE in the subsurface indicates the need for further evaluation or remediation, or if operation of the SVE system is no longer necessary and rebound testing can be completed. If warranted based on the results, operation of the SVE system may be modified to target specific impacted intervals where significant PCE impacts were observed in soil vapor.

[18] DTSC 2011. Vapor Intrusion Guidance. October.

Public Outreach Activities

Pursuant to the DTSC *Vapor Intrusion Public Participation Advisory* (DTSC, 2012)[19], Northgate will conduct public outreach activities prior to SSV sampling and following analysis.

Prior to collecting SSV samples, a Northgate scientist will meet with the occupants of the above tenant spaces to inform them of the upcoming sampling event and discuss access to the target sampling locations. The IA Sampling Plan including a contingency plan and the anticipated method and timing for the communication of sampling results will be discussed with the occupants. The contingency plan will be discussed with the occupants so that they understand actions to be taken based upon the pre-established responses to ESL exceedances.

Report of Findings

The source area characterization report will summarize the sampling event including SV and SSV sample collection procedures, a tabular summary of the analytical data and present appropriate conclusions and recommendations for closure or further remediation as warranted.

[19] DTSC 2012. *Vapor Intrusion Public Participation Adv*isory – *Final*, March.

Schedule

The revision of the IA Work Plan and installation of the SSVs and VMPs is planned for the fourth quarter of 2018. Following installation, the SSVs and VMPs will used to collect SV samples in the first quarter of 2019. The source area characterization report will be submitted to the GPP in the second quarter of 2019.

Should you have any questions or require additional information, please do not hesitate to call us.

Sincerely,

Northgate Environmental Management, Inc.

Axel Rieke, P.E.

Derrick Willis

TABLES

TABLE 1
Generation of Data Quality Objectives using the EPA Seven-Step Process

Step 1	Step 2	Step 3	Step 4	Step 5	Step 6	Step 7
State the Problem	**Identify the Goals of the Study**	**Identify Information Inputs**	**Define the Boundaries of the Study**	**Develop the Analytic Approach**	**Specify Performance or Acceptance Criteria**	**Develop the Plan for Obtaining Data**
PCE has been detected in soil vapor at the Site. A SVE system has been operated at the Site to mitigate intrusion of PCE in soil vapor to indoor air (IA). SVE system operations at the Site have reduced PCE concentrations in soil vapor to levels below Environmental Screening Levels (ESLs) established for a commercial exposure scenario by the San Francisco Bay Regional Water Quality Control Board (RWQCB). Data will be collected to 1) evaluate the current nature and extent of PCE impacts in the subsurface, 2) evaluate the potential need to further optimize remediation activites at the Site by modifying operation of the SVE system, and 3) in conjunction with the previously proposed indoor air sampling, provide data to establish a building-specific attenuation factor (AF).	Determine if PCE concentrations in SSV and SV are at acceptable levels such that operation of the SVE system is no longer necessary and rebound testing can be completed, or alternatively if it may be necessary to further optimize operation of the SVE system.	Sampling to determine concentrations of PCE in SSV and SV is required. One round of concurrent SSV and IA sampling with conservative HVAC setting will be conducted at the site and adjacent in tenant spaces. Conservative HVAC settings (off/on) will be determined by a building dynamics evaluation through measuring cross-slab pressure and indoor/outdoor pressure differentials in each tenant space. Depth specific SV samples will be collected to further evaluate the current nature and extent of PCE impacts at the Site.	The spatial boundary of the investigation will include tenant space at 12 to 40 Park Plaza Drive, and at 235 and 239 Westlake Center Drive within the Westlake Shopping Center. The temporal boundaries of the study will be a normal 8-hour day during commercial operations. The SSV/IA sampling event will be conducted in the Fall of 2018 or Winter of 2019. SSV samples will be collected concurrently with the HVAC off IA sampling. The action level will be the site-specific subslab/soil vapor screening level for PCE.	Compare SSV and SV results against the IA sampling results and calculate a building specific factor for SSV to IA attenuation and for SV to IA attenuation. Compare cross-slab and indoor/outdoor pressure differentials to qualitatively assess vapor and air flow. Compare SSV and SV sampling results against the site-specific subslab/soil gas vapor screening level. EPA Compendium Method TO-15 and TO-15 SIM have detection limits below the applicable ESLs.	Appropriate QA/QC procedures will be implemented during sample collection and analysis to obtain data of known and acceptable quality.	Up to 7 sub-slab samples and up to 17 soil vapor samples will be collected from the Site and adjacent tenant spaces. The SV and SSV samples will be analyzed for PCE using standard TO-15, respectively.

Acronyms:

Standard Operating Procedure Installation and Extraction of the Vapor Pin™

Updated April 3, 2015

Scope:

This standard operating procedure describes the installation and extraction of the Vapor Pin™ for use in sub-slab soil-gas sampling.

Purpose:

The purpose of this procedure is to assure good quality control in field operations and uniformity between field personnel in the use of the Vapor Pin™ for the collection of sub-slab soil-gas samples or pressure readings.

Equipment Needed:

- Assembled Vapor Pin™ [Vapor Pin™ and silicone sleeve(Figure 1)]; Because of sharp edges, gloves are recommended for sleeve installation;
- Hammer drill;
- 5/8-inch (16mm) diameter hammer bit (hole **must** be 5/8-inch (16mm) diameter to ensure seal. It is recommended that you use the drill guide). (Hilti™ TE-YX 5/8" x 22" (400 mm) #00206514 or equivalent);
- 1½-inch (38mm) diameter hammer bit (Hilti™ TE-YX 1½" x 23" #00293032 or equivalent) for flush mount applications;
- ¾-inch (19mm) diameter bottle brush;
- Wet/Dry vacuum with HEPA filter (optional);
- Vapor Pin™ installation/extraction tool;
- Dead blow hammer;
- Vapor Pin™ flush mount cover, if desired;
- Vapor Pin™ drilling guide, if desired;
- Vapor Pin™ protective cap; and
- VOC-free hole patching material (hydraulic cement) and putty knife or trowel for repairing the hole following the extraction of the Vapor Pin™.

Figure 1. Assembled Vapor Pin™

Installation Procedure:

1) Check for buried obstacles (pipes, electrical lines, etc.) prior to proceeding.

2) Set up wet/dry vacuum to collect drill cuttings.

3) If a flush mount installation is required, drill a 1½-inch (38mm) diameter hole at least 1¾-inches (45mm) into the slab. Use of a Vapor Pin™ drilling guide is recommended.

4) Drill a 5/8-inch (16mm) diameter hole through the slab and approximately 1-inch (25mm) into the underlying soil to form a void. Hole **must** be 5/8-inch (16mm) in diameter to ensure seal. It is recommended that you use the drill guide.

Vapor Pin™ protected under US Patent # 8,220,347 B2

5) Remove the drill bit, brush the hole with the bottle brush, and remove the loose cuttings with the vacuum.

6) Place the lower end of Vapor Pin™ assembly into the drilled hole. Place the small hole located in the handle of the installation/extraction tool over the Vapor Pin™ to protect the barb fitting, and tap the Vapor Pin™ into place using a dead blow hammer (Figure 2). Make sure the installation/extraction tool is aligned parallel to the Vapor Pin™ to avoid damaging the barb fitting.

Figure 2. Installing the Vapor Pin™.

During installation, the silicone sleeve will form a slight bulge between the slab and the Vapor Pin™ shoulder. Place the protective cap on Vapor Pin™ to prevent vapor loss prior to sampling (Figure 3).

Figure 3. Installed Vapor Pin™

7) For flush mount installations, cover the Vapor Pin™ with a flush mount cover, using either the plastic cover or the optional stainless-steel Secure Cover (Figure 4).

Figure 4. Secure Cover Installed

8) Allow 20 minutes or more (consult applicable guidance for your situation) for the sub-slab soil-gas conditions to re-equilibrate prior to sampling.

9) Remove protective cap and connect sample tubing to the barb fitting of the Vapor Pin™. This connection can be made using a short piece of Tygon™ tubing to join the Vapor Pin™ with the Nylaflow

tubing (Figure 5). Put the Nylaflow tubing as close to the Vapor Pin as possible to minimize contact between soil gas and Tygon™ tubing.

Figure 5. Vapor Pin™ sample connection.

10) Conduct leak tests in accordance with applicable guidance. If the method of leak testing is not specified, an alternative can be the use of a water dam and vacuum pump, as described in SOP Leak Testing the Vapor Pin™ via Mechanical Means (Figure 6). For flush-mount installations, distilled water can be poured directly into the 1 1/2 inch (38mm) hole.

Figure 6. Water dam used for leak detection

11) Collect sub-slab soil gas sample or pressure reading. When finished, replace the protective cap and flush mount cover until the next event. If the sampling is complete, extract the Vapor Pin™.

Extraction Procedure:

1) Remove the protective cap, and thread the installation/extraction tool onto the barrel of the Vapor Pin™ (Figure 7). Continue turning the tool clockwise to pull the Vapor Pin™ from the hole into the installation/extraction tool.

2) Fill the void with hydraulic cement and smooth with a trowel or putty knife.

Figure 7. Removing the Vapor Pin™.

3) Prior to reuse, remove the silicone sleeve and protective cap and discard. Decontaminate the Vapor Pin™ in a hot water and Alconox® wash, then heat in an oven to a temperature of 265° F (130° C) for 15 to 30 minutes.

The Vapor Pin™ to designed be used repeatedly, however, replacement parts and supplies will be required periodically. These parts are available on-line at VaporPin.CoxColvin.com.

Vapor Pin™ protected under US Patent # 8,220,347 B2

RE: 2018 Annual Rebound Test Report
Former Westlake French Dry Cleaners Site, 247 Westlake Center
Daly City, California 94015
Project# 1241.03
SMCo Case# 229066

Dear Ms. Jurek:

Northgate Environmental Management, Inc. (Northgate) has prepared this letter report to document the results of rebound testing performed between February and December 2018, at the Former Westlake French Dry Cleaners Site, located at 247 Westlake Center, Daly City, California (the Site; Figures 1,2 and 3). The results for initially testing between February and June 2018, were provided to the San Mateo County Groundwater Protection Program (GPP) in an email dated July 13, 2018 (Northgate, 2018)[1]. Per the GPP November 27, 2018 letter request (GPP, 2018)[2], Northgate prepared this report to summarize the test results. In addition, this report presents results of continued semi-annual rebound testing performed in December 2018.

BACKGROUND

Soil gas investigations conducted at the Site from 2002 to 2011 indicated the presence of the dry cleaning solvent tetrachloroethene (PCE) in soil vapor at concentrations that exceeded Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water

[1] Northgate Environmental Management, Inc. (Northgate), 2018. *Westlake First Half 2018 Rebound Test Status Update Email*, Former Westlake French Dry Cleaners Site, 247 Westlake Center, Daly City, California. July 13.

[2] San Mateo County Groundwater Protection Program (GPP), 2018. *Comments on the Source Area Characterization Work Plan*, Former Westlake French Dry Cleaners Site, 247 Westlake Center, Daly City, California. November 27.

Quality Control Board (RWQCB, 2007)[3]. In accordance with Northgate's *Soil Vapor Extraction (SVE) Work Plan* (Northgate, 2012a)[4] and *SVE Work Plan Addendum* (Northgate, 2012b)[5], a SVE system including three nested vapor extraction well pairs (VEWs) and four monitoring probes (VMPs) was installed in 2014. In addition, the monitoring network at the Site included one previously installed sub-slab probe (TR-7) located below the concrete floor of the former dry cleaning tenant space currently occupied by a T-Mobile retail store. A Site Plan showing the locations of the extraction wells, the monitoring probes, and the sub-slab probe is included on Figure 3. The SVE system was operated from 2015 until July 11, 2016, when the system was shut down for rebound testing in accordance with Northgate's *SVE Performance Report* (Northgate 2016)[6] recommendations.

Between July 7, 2016, and May 15, 2017, Northgate performed rebound testing at the Site by discontinuing SVE system operations for an approximately 10-month period and monitoring the PCE concentrations in soil vapor in the extraction wells and monitoring probes. Northgate evaluated the rebound test results by comparing PCE concentration to RWQCB *Vapor ESLs for Subslab and Soil Gas (Table SG-1)* (RWQCB, 2016)[7]. On August 30, 2017, Northgate submitted a *Rebound Test Report* (Northgate, 2017)[8] summarizing the results of rebound testing performed during the 10-month shutdown and recommended SVE be discontinued and the SVE system be decommissioned.

In its September 29, 2017 letter[9] response to the *Rebound Test Report*, the GPP requested continued rebound test sampling of the sub-slab soil vapor probe TR-7 inside the T-Mobile tenant space on a semi-annual basis until PCE concentrations reach stable equilibrium. On March 14, 2018, Northgate submitted the *Second Half 2017 Rebound Test Report* (Northgate, 2018)[10] summarizing the results of rebound testing performed during the continued three-month shutdown between December 2017 and February 2018. The report recommended continued

rebound test sampling of the sub-slab soil vapor probe TR-7 inside the T-Mobile tenant space on a semi-annual basis until PCE concentrations reach stable equilibrium.

This report presents the laboratory analytical results of additional samples collected at TR-7 on June 20, 2018, and December 12, 2018, in accordance with the *SVE Work Plan* and the above GPP request.

SAMPLING AND ANALYSIS

Each sample was collected in a one-liter Summa™ laboratory batch certified canister and transported under chain-of custody protocol for chemical analysis at McCampbell Analytical, Inc. in Pittsburg, California, a fixed state-certified laboratory using U.S. Environmental Protection Agency (EPA) Method TO-15 for volatile organic compounds (VOCs). The daily field report and forms are included in Attachment A. Laboratory results for samples collected on June 20, 2018, and December 12, 2018, are summarized in Table 1 which shows a summary of PCE concentrations for soil vapor samples collected at TR-7 since the start of the rebound testing program in July 2016. A summary of soil vapor sample analytical results for other VOCs is provided on Table 2. The laboratory analytical report is included in Attachment B (older laboratory reports are included in Northgate's *Rebound Test Report* [2017] and the *Second Half 2017 Rebound Test Report* [2018a]. A site plan including locations of monitoring points is shown on Figure 3. PCE concentrations over time, in the sub-slab probe TR-7, are shown on Figure 4.

REBOUND TEST RESULTS

In accordance with the California Department of Toxic Substances Control (DTSC) *Advisory - Active Soil Gas Investigations* (DTSC, 2015)[11], Northgate collected one primary and one field duplicate soil vapor sample (TR-7 and TR-7-DUP) from the sub-slab soil vapor probe TR-7 inside the T-Mobile tenant space on June 20, 2018. On December 12, 2018, Northgate collected one primary and one field replicate soil vapor sample (TR-7 and TR-7-REP). The analytical laboratory reported a tetrachloroethylene (PCE) concentration of 2,100 micrograms per cubic meter (µg/m^3) for samples TR-7 and TR-7-DUP collected on June 20, 2018. Subsequently, PCE was detected at concentrations of 1,500 and 1,700 µg/m^3 in samples TR-7 and TR-7-REP, respectively, collected on December 12, 2018. Other VOCs were not detected above their corresponding laboratory detection limits.

[11] California Department of Toxic Substances Control (DTSC), 2015. *Advisory - Active Soil Gas Investigations.* July.

All analytical results are within the range outlined by the DTSC guidance and laboratory quality control criteria, except for the Relative Percent Deviation (RPD) of 1,3-butadiene in the Laboratory Controls Sample (LCS) for the batch collected on December 12, 2018. The RPD is outside the laboratory limit suggesting low reproducibility of the LCS result for 1,3-butadiene, a chemical of no concern for the Site. Results for PCE are not impacted by the above laboratory quality control qualifier. The leak check compound, isopropyl alcohol, was not detected above laboratory reporting limits in any of the samples collected, indicating that the soil vapor samples collected during this rebound test period are unlikely to have been diluted with ambient air. Laboratory results for all four samples are summarized in Tables 1 and 2. Laboratory analytical reports are included in Attachment B.

Following initial rebound testing, PCE concentrations increased from less than 100 µg/m^3 in July 2016 to 2,100 µg/m^3 in June 2018; however, current PCE concentrations from samples collected from the sub-slab probe TR-7 have decreased in the last six months to 1,700 µg/m^3 in December 2018 (Tables 1; and Figures 3 and 4).

Northgate evaluated this study periods' rebound test results by comparing detected concentrations of PCE and other VOCs to their corresponding previous 2016 ESLs, recently revised 2019 Vapor ESLs, and new Subslab/Soil Gas Level Short-Term Action Levels (Vapor STALs) established for the PCE degradation compound trichloroethene (TCE) (RWQCB, 2019)[12,13]. Current Vapor ESLs for subslab/soil gas include a residential exposure concentration of 15 µg/m^3 (previously 240 µg/m^3) for PCE, and a commercial exposure concentration of 67 µg/m^3 (previously 2,100 µg/m^3) for PCE. The new commercial Vapor STAL for TCE triggering expedited indoor air sampling is 270 µg/m^3.

All detected PCE subslab/soil gas results at the conclusion of this study period were below the 2016 commercial ESLs applicable at the time of sample collection. However, PCE rebound test results exceed the new 2019 commercial ESLs. No other VOCs exceed the 2019 residential ESLs. The new Vapor STALs apply to TCE concentrations below the building slab foundation and subsurface (RWQCB, 2019). TCE was not detected above the above the laboratory

[12] RWQCB, 2019. *Environmental Screening Levels (ESLs).* January 24.

[13] On January 24, 2019 the RWQCB published revised Vapor Intrusion ESLs for subslab soil gas and exterior soil gas vapor intrusion (Table SG-1) based on USEPA's 2015 recommended attenuation factors (AF) rather than the Johnson and Ettinger Model. Table SG-1 presents an AF of 0.03 (previously 0.001 and 0.002) lowering the residential and commercial ESLs by over a magnitude to 15 and 67 µg/m^3 (previously 240 and 2,100 µg/m^3), respectively. In addition, the RWQCB established Vapor and Indoor Air (IA) STALs for TCE. The commercial Vapor STAL triggering a Response Action (RA) is 270 µg/m^3 for TCE. The commercial IA STALs triggering an Accelerated RA (within weeks) and Urgent RA (within days) are 8 and 24 µg/m^3 for TCE, respectively. A subslab/soil gas related RA prompts expedited indoor air sampling. A commercial indoor air related Accelerated RA and Urgent RA prompt mitigation such as increasing use of HVAC (e.g., increasing outdoor air intake, increasing building pressurization), sealing potential conduits, or treating indoor air.

detection limit of up to 5.5 µg/m^3 (the commercial Vapor STAL is 270 µg/m^3) during this study period.

CONCLUSIONS AND RECOMMENDATIONS

Results do not indicate that sub-slab PCE concentrations are near or at equilibrium at this time. At the current time, in accordance with GPPs request, Northgate is in the process of implementing the GPP conditionally approved *Source Area Characterization Work Plan* (Northgate, 2018; GPP, 2018) to evaluate the current nature and extent of PCE impacts in the subsurface and evaluate the potential need to further optimize remediation activities at the Site by modifying operation of the SVE system.

CLOSING

Should you have any questions or require additional information, please do not hesitate to call Derrick Willis at (949) 716-0050 ext. 101.

Sincerely,

Northgate Environmental Management, Inc.

TABLE 1
Comparison of Rebound Test Analytical Results for PCE and Vapor ESLs

Notes:

1. Start up of the Soil Vapor Extraction (SVE) system on June 16, 2014. The SVE system ran for a total of 25 days until it was shut down on July 28, 2014 because of noise complaints. The system was restarted in August 12, 2015. Rebound testing activities were initiated on July 11, 2016, following shut down the SVE system on July 7, 2016, after 10 months of continuous operation between August 12, 2015 and July 7, 2016.
2. Samples collected on May 15, 2017, December 20, 2017, February 14, 2018, June 20, 2018, and December 12, 2018, were analyzed by USEPA Method TO-15. All other samples were analyzed by USEPA Method 8260.
3. Environmental Screening Levels (ESLs) published by SFBRWQCB Region 2 February 2016), Table SG-1 (Subslab/Soil Gas Vapor Intrusion Human Health Risk Screening Levels based on commerial and residential Attenuation Factor Soil Gas to Indoor Air of 0.001 and 0.002, respectively)
4. Environmental Screening Levels (ESLs) published by SFBRWQCB Region 2 January 2019), Table SG-1 (Subslab Soil Gas and Exterior Soil Gas Vapor Intrusion Human Health Risk Screening Level based on Attenuation Factor Soil Gas to Indoor Air of 0.03)

< = not detected above the indicated detection limit

fbgs: feet below the ground surface

$\mu g/m^3$: Micrograms per cubic meter

PCE : tetrachloroethene

TR = Subslab Monitoring Probe

(#,###): 2016 ESL superseded by 2019 ESL

bold: analyte detected above its corresponding 2019 commerical ESL

Shaded areas represent rebound test results for the study period (February through December 2018) of this report.

TABLE 2
Summary of Soil Vapor Sample Analytical Results for Other VOCs

Sample Identification	Well Screen Interval (fbgs)	Date Sampled	Analyte Concentrations (µg/m^3)		Comment[2]

Note: Purge volumes were established in accordance with the July 2015 Department of Toxic Substances Control (DTSC) VI Active Soil Guidance Advisory (DTSC 2015):
"A default of three purge volumes should be used. Purge volume testing is no longer recommended. One purge volume includes the following:
- The internal volume of The tubing and probe tip.
- The void space of the sand pack around the probe tip.
- The voic space of the dry bentonite in the annular space."

Glossary of Terms & Qualifier Definitions

Client: Northgate Environmental Mngmnt, Inc.
Project: 1241.03; Westlake
WorkOrder: 1806C28

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

Case Narrative

Client: Northgate Environmental Mngmnt, Inc. **Work Order:** 1806C28
Project: 1241.03; Westlake June 29, 2018

TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Active Soil Gas Advisory of July 2015.

Glossary of Terms & Qualifier Definitions

Client: Northgate Environmental Mngmnt, Inc.
Project: 1241.03; Westlak e
WorkOrder: 1812C45 A

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

j1:

TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Active Soil Gas Advisory of July 2015.

No hazardous waste shipments

ITEM	SECTION #	WASTE DETERMINATION	IN COMPLIANCE
16	22-66262.11	Hazardous waste determination made for all waste..... No waste	(N/A) (Yes) (No)
		EMERGENCY PREPAREDNESS/CONTINGENCY PLAN	
17	22-66265.31	Facility operated to minimize possibility of fire, explosion, or any unplanned release of hazardous waste to air, soil, or surface water, which could threaten human health or the environment.....	(N/A) (Yes) (No)
18	22-66265.32	Facility has adequate emergency response equipment, internal communication, fire extinguishers and spill control material.....	(N/A) (Yes) (No)
19	22-66265.33/.34	Emergency equipment is adequately maintained and accessible.....	(N/A) (Yes) (No)
20	22-66265.35	Aisle space is adequately maintained for emergency response.....	(N/A) (Yes) (No)
21	22-66265.51/.53	Facility has a Hazardous Waste Contingency Plan on site..... (1)	(N/A) (Yes) (No)
		HAZARDOUS WASTE STORAGE	
22	HSC 25189.5(a)(d) HSC 25201(a)	Generator does not accept, treat, or dispose of hazardous waste on-site without a permit.....	(N/A) (Yes) (No)
23	22-66262.34(a)	Generator does not accumulate hazardous waste on-site for longer than 90 days without a permit.....	(N/A) (Yes) (No)
24	22.66262.34(d)	Generator does not accumulate hazardous waste on site for longer than 180 days or longer than 270 days if transport of waste to a TSD facility is over 200 miles.....	(N/A) (Yes) (No)
25	22-66262.34(e)(1)	Generator uses "Satellite Accumulation" exemption for storage.....	(N/A) (Yes) (No)
26	22-66262.34(f)(3) (A)(B)(C)	Each container is labeled with: "Hazardous Waste", waste composition, hazardous properties and generator information.....	(N/A) (Yes) (No)
27	22-66262.34(f)(1)	Accumulation start date clearly marked and visible for inspection on each container..... No waste	(N/A) (Yes) (No)
		CONTAINER USE AND MANAGEMENT	
28	22-66265.171	Hazardous waste containers in good condition.....	(N/A) (Yes) (No)
29	22-66265.172	Hazardous waste compatible with holding containers.....	(N/A) (Yes) (No)
30	22-66265.173	Hazardous waste containers closed when not in use.....	(N/A) (Yes) (No)
31	22-66265.174	Hazardous waste storage area inspected weekly.....	(N/A) (Yes) (No)
32	22-66265.177(a)	No mixing of incompatible wastes.....	(N/A) (Yes) (No)
33	22-66265.177(c)	Storage of incompatible hazardous waste is in a secure area which minimizes the possibility of spills, mixing, and escape of materials from the area.....	(N/A) (Yes) (No)
34	22-66261.7(e) 22.66261.7(f)	Empty containers are managed properly.....	(N/A) (Yes) (No)

ITEM	SECTION #	UNIVERSAL WASTE	IN COMPLIANCE
35	22-66261.9(a)	Universal waste managed according with the standards of chapter 23.....	(N/A) (Yes) (No)
		TANK MANAGEMENT	
36	22-66265.190-199	Waste stored in tank(s) is in compliance with Article 10.....	(N/A) (Yes) (No)

WASTE GENERATED: **QUANTITY / MONTH**

CORRECTIVE ACTIONS:

1. Faculty needs to have a hazardous waste contingency plan.

Correct violation within 30 days.

Facility Representative: Your signature acknowledges receipt of this report and does not imply agreement with the findings.

PERMIT CONDITIONS

2000 Alameda de las Pulgas, Ste. 100, San Mateo, CA 94403

Facility Identification Number: FA0057880

*In order to maintain the **Permit to Operate**, the permit holder must comply with the following provisions of related laws concerning management of hazardous materials. Any violation of the conditions may be cause for revocation of the **Permit to operate.***

a. **Hazardous Materials Business Plan Program:** California Health and Safety Code, Division 20, Chapter 6.95, Article 1 and Title 19 Calfornia Code of Regulations.
b. **California Accidental Release Prevention Program (Cal-ARP)**: California Health and Safety Code, Division 20, Chapter 6.95, Article 2 and Title 19, California Code of Regulations.
c. **Hazardous Waste Generator Program**: California Health and Safety Code, Division 20, Chapter 6.5, Articles 1-13, Section 25100 et seq., and Title 22, California Code of Regulations, Chapter 20
d. **Aboveground Petroleum ACT SPCC Plans**: California Health and Safety Code, Division 20, Chapter 6.67 and 40 CFR 112.
e. **Tiered Permit On-Site Hazardous Waste Treatment**: California Health and Safety Code, Division 20, Chapter 6.5 Article 9, and Title 22 California Code of Regulations, Chapter 20

The Permit to Operate is to be maintained on-site and is valid for a period of five (5) years.

Please print or type. (Form designed for use on elite (12-pitch) typewriter.)

Land Disposal Restriction Notification

Generator Name: Burlington #182 **EPA Number:** CAL000403215

Generator Address: 99 Southgate Avenue Daly City, CA

Manifest Tracking Number: 010058679FLE

Instructions

Column 1: List the Manifest Line number or Manifest Line item.
Column 2: Identify all U.S. EPA hazardous Waste Codes that apply to this shipment.
Column 3: Choose the appropriate treatability group: Non-Wastewater (NWW) or Wastewater (WW).
Column 4: Enter the appropriate Subcategory (per 40 CFR 268.40), if applicable, and also enter "Contaminated Soil" or "Debris" if the waste will be treated using one of the alternative treatment technologies provided by 268.49 (c)-soil, or 268.45- debris.
Column 5: Enter the letter of the appropriate paragraph from below(see Appendix 1 for other options if needed)
Column 6: For F001-F005, please enter the Reference Number(s) located below for the constituents in your waste stream subject to treatment.
Column 7: For F039, D001-D043, Debris& Contaminated Soil: please list the Reference Numbers listed in Appendix 2 for any Underlying Hazardous Constituents.

Manifest Line Number or Manifest Line Item	U.S. EPA Hazardous Waste Codes	Check One		Sub-Category	How Must This Waste Be Managed?	Regulated Constituents For F001-F005	Underlying Hazardous Constituents for D001-D043, Debris or Soil
		NWW	WW				
1 - 103306	D001,D002	Yes		High TOC Ignitable Liquid	A		
2 - 103294	D001	Yes		High TOC Ignitable Liquid	A		

Column 5 Waste Management Codes

A	THIS RESTRICTED WASTE REQUIRES TREATMENT TO THE APPLICABLE STANDARD. This waste must be treated to the applicable performance based treatment standard set forth in 40CFR Part 268 Subpart C, 268.32, Subpart D, 268.40 or RCRA Section 3004(d) prior to land disposal.

Column 6 F001-F005 Reference Numbers

Column 7 D001-D043 Reference Numbers

I hereby certify that all information subscribed at this and all associated documents is complete and accurate to the best of my knowledge and information.

Land Disposal Restriction Notification

Generator Name: Burlington #182 **EPA Number:** CAL000403215

Generator Address: 99 Southgate Avenue Daly City, CA

Manifest Tracking Number: 008628741FLE

Instructions

Column 1: List the Manifest Line number or Manifest Line item.
Column 2: Identify all U.S. EPA hazardous Waste Codes that apply to this shipment.
Column 3: Choose the appropriate treatability group: Non-Wastewater (NWW) or Wastewater (WW).
Column 4: Enter the appropriate Subcategory (per 40 CFR 268.40), if applicable, and also enter "Contaminated Soil" or "Debris" if the waste will be treated using one of the alternative treatment technologies provided by 268.49 (c)-soil, or 268.45- debris.
Column 5: Enter the letter of the appropriate paragraph from below(see Appendix 1 for other options if needed)
Column 6: For F001-F005, please enter the Reference Number(s) located below for the constituents in your waste stream subject to treatment.
Column 7: For F039, D001-D043, Debris& Contaminated Soil: please list the Reference Numbers listed in Appendix 2 for any Underlying Hazardous Constituents.

Manifest Line Number or Manifest Line Item	U.S. EPA Hazardous Waste Codes	Check One		Sub-Category	How Must This Waste Be Managed?	Regulated Constituents For F001-F005	Underlying Hazardous Constituents for D001-D043, Debris or Soil
		NWW	WW				
1 - 103306	D001,D002	Yes		Ignitable Charecteristic Waste	A		
2 - 103294	D001	Yes		High TOC Ignitable Liquid	A		

Column 5 Waste Management Codes

A	THIS RESTRICTED WASTE REQUIRES TREATMENT TO THE APPLICABLE STANDARD. This waste must be treated to the applicable performance based treatment standard set forth in 40CFR Part 268 Subpart C, 268.32, Subpart D, 268.40 or RCRA Section 3004(d) prior to land disposal.

Column 6 F001-F005 Reference Numbers

Land Disposal Restriction Notification

Generator Name: Burlington #182 EPA Number: CAL000403215

Generator Address: 99 Southgate Avenue Daly City, CA

Manifest Tracking Number: 008465576FLE

Instructions

Column 1: List the Manifest Line number or Manifest Line item
Column 2: Identify all U.S. EPA hazardous Waste Codes that apply to this shipment
Column 3: Choose the appropriate treatability group: Non-Wastewater (NWW) or Wastewater (WW)
Column 4: Enter the appropriate Subcategory (per 40 CFR 268.40), if applicable, and also enter "Contaminated Soil" or "Debris" if the waste will be treated using one of the alternative treatment technologies provided by 268.49 (c) soil, or 268.45- debris
Column 5: Enter the letter of the appropriate paragraph from below (see Appendix 1 for other options if needed)
Column 6: For F001-F005, please enter the Reference Number(s) located below for the constituents in your waste stream subject to treatment
Column 7: For F039, D001-D043, Debris& Contaminated Soil, please list the Reference Numbers listed in Appendix 2 for any Underlying Hazardous Constituents

Manifest Line Number or Manifest Line Item	U.S. EPA Hazardous Waste Codes	Check One: NWW	Check One: WW	Sub-Category	How Must This Waste Be Managed?	Regulated Constituents For F001-F005	Underlying Hazardous Constituents for D001-D043 Debris or Soil
1 - 103306	D001 D002	Yes		Ignitable Characteristic Waste	A		
2 - 103294	D001	Yes		High TOC Ignitable Liquid	A		

Column 5 Waste Management Codes

A — THIS RESTRICTED WASTE REQUIRES TREATMENT TO THE APPLICABLE STANDARD. This waste must be treated to the applicable performance based treatment standard set forth in 40CFR Part 268 Subpart C, 268.32, Subpart D, 268.40 or RCRA Section 3004(d) prior to land disposal.

Land Disposal Restriction Notification

Generator Name: Safeway Inc Dist #1490 **EPA Number:** CALD[illegible]

Generator Address: 2300 - 16th Street San Francisco, CA

Manifest Tracking Number: 008428264FLE

Instructions

Column 1: List the Manifest Line number or Manifest Line Item
Column 2: Identify all U.S. EPA hazardous Waste Codes that apply to this shipment
Column 3: Choose the appropriate treatability group: Non-Wastewater (NWW) or Wastewater (WW)
Column 4: Enter the appropriate Subcategory (per 40 CFR 268.40) if applicable, and also enter "Contaminated Soil" or "Debris" if the waste will be treated using one of the alternative treatment technologies provided by 268.45 (soil) or 268.45 debris
Column 5: Enter the letter of the appropriate paragraph from below (see Appendix 1 for other options if needed)
Column 6: For F001-F005, please enter the Reference Number(s) located below for the constituents in your waste stream subject to treatment
Column 7: For F039, D001-D043, Debris & Contaminated Soil, please list the Reference Numbers listed in Appendix 7 for any Underlying Hazardous Constituents

Check One

Manifest Line Number or Manifest Line Item	U.S. EPA Hazardous Waste Codes	NWW	WW	Sub-Category	How Must This Waste Be Managed?	Regulated Constituents For F001-F005	Underlying Hazardous Constituents for D001-D043, Debris or Soil
1 - 4690	D001	Yes		ignitable Characteristic Waste	A		
2 - 101445	F001	Yes			A		
3 - 4692	D002	Yes			A		

Column 5 Waste Management Codes

A THIS RESTRICTED WASTE REQUIRES TREATMENT TO THE APPLICABLE STANDARD. This waste must be treated to the applicable performance based treatment standard set forth in 40CFR Part 268 Subpart C, 268.32, Subpart D, 268.40 or RCRA Section 3004(m) prior to land disposal

Column 6 F001-F005 Reference Numbers

Column 7 D001-D043 Reference Numbers

I hereby certify that all information submitted in this and all associated documents is complete and accurate to the best of my knowledge and information.

Re: Inspection Report Dated June 1, 2017, Burlington Stores #182, Daly City
Documentation of Return to Compliance / Corrective Action

Dear Ms. Banning:

We write in response to the Notice of Violation ("Notice") that you issued to Burlington Store #182, 99 Southgate Avenue, Daly City, California (the "Store") on June 1, 2017, following an inspection on April 14, 2017. In all respects, the Store has taken corrective action and returned to compliance. We confirmed that the appropriate Store employees had received training as required by our program and the applicable regulations. We have also required the Store Manager, Assistant Store Managers, and all employees involved in handling regulated or hazardous waste at the Store to undertake a re-training with a focus on the specific elements identified in the Notice.

Turning to the particulars of the Notice and the corrective action we have taken:

1. **Proper labeling** under 22 CCR 12.662.34(f) – all bins in the accumulation area now have proper labels that are completely filled out including the accumulation start date. Attached are two pictures confirming the same. Where the Store knew the date that the first item was placed in the bin, we used that date. Where the Store did not know, per the suggestion in your Notice, we have used a date near the time of the last pickup. Going forward, the Store will use the date that the first item is placed in the bin. The retraining of the Store employees has emphasized these points.
2. **Manifests** under 22 CCR 12.662.40(a) –signed off copies of the manifest from the destination facility for the manifest numbers referenced in the Notice are now in the binder of all manifests maintained at the Store. They are attached for your reference. Store personnel have been reminded of the need to maintain these manifests in the binder and also reminded about how they can access all copies of manifests in the event that one is not received or is missing.
3. **Determination of waste** under 22 CCR 12.662.11 and 662.40(c) – we have confirmed that candles should be placed in the toxics bin and this was emphasized in the retraining. We have also reminded the Store that they can seek guidance from corporate headquarters if they ever have a question about where an item should go. With respect to watches, it is sometimes very

difficult for watch batteries to be removed effectively and safely. We will therefore place these in the Universal Waste bin going forward.

4. **Segregating waste** under 22 CCR 12.6626.34(d)(2) – the Store has reviewed the entire contents of the bins identified in the Notice. Together with our certified hazardous waste vendor, Stericycle, we have reviewed with the Store employees where each of the items in those bins should go. All wastes are now segregated into their appropriate bins and are no longer co-mingled. The retraining has emphasized the importance of not co-mingling wastes.
5. **Training** under 22 CCR 12.66262.34(d)(2) – as reflected above, we have confirmed that all personnel at the Store responsible for our Hazardous Waste Program had taken the Company's required training. They all re-took the training again on June 13, 2017 to serve as a refresher. We also discussed with Store Management and the Regional Operations Manager the importance to adhere to all required training.

I hereby certify that I am authorized to make these statements on behalf of Burlington Stores, Inc., that the statements above are true and correct to the best of my knowledge, and that I am aware that there can be penalties for knowingly false statements.

Burlington Stores is committed to compliance with all applicable regulations and with its own Hazardous Waste Program. If you have any questions about this response, please feel free to contact me directly at Jami.Franceschi@burlingtonstores.com or 609-387-7800 Ext. 73696

Sincerely,

Jami Franceschi

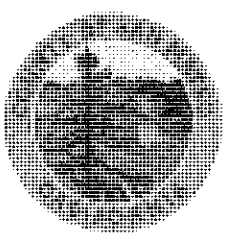
NOTICE OF VIOLATION

Burlington Stores
1830 Route 130 North
Burlington, NJ 08016

Subject Site: FA0057880, Burlington Store #182 99 Southgate Ave, Daly City

San Mateo County Environmental Health Services performed a Hazardous Waste inspection of the above-referenced facility on April 14, 2017. During the inspection, the following violations were noted:

Hazardous Waste Regulations (California Health and Safety Code, Division 20, Chapter 6.5 (HSC) and California Code of Regulations, Title 22)



1. Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date. 22 CCR 12 66262.34(f)

   Violation Comments: Two bins of toxic and state regulated waste, one bin of universal waste, two bins of aerosols/flammables/combustibles, one bin of oxidizers, and two bins of corrosive bases did not have their labels filled out (all of the hazardous waste containers). All hazardous waste containers must be properly labeled. Immediately label all hazardous waste containers and submit documentation (photos) to the inspector within the comply by date. When filing out labels, use the date from around the time of the last pickup.

2. Failure to maintain uniform hazardous waste manifest, consolidated manifest, or bills of lading copies for three years. 22 CCR 12 66262.40(a)

   Violation Comments: OBSERVATION: Manifest numbers 008517451FLE and 008517703FLE were found without signed off copies from the destination facility. Hazardous waste generators shall retain copies of all manifests signed off by the destination facility on site for three years and have them readily available for review. Submit to the inspector within the comply by date copies of the signed off manifests.

3. Failure to determine if the waste generated is a hazardous waste and to maintain analysis results for three years. 22 CCR 12 66262.11, 66262.40(c)

Violation Comments: Candles were found in both state regulated waste/toxics and flammable bin. Make a waste determination for the candles and submit documentation to the inspector within the comply by date. Please advise also why batteries are not removed from watches before being placed in the state regulated waste/toxics bin.

4. Failure to ensure incompatible waste and/or materials are not placed or stored in the same container or nearby or into an unwashed container, which previously contained incompatible waste and/or materials, so that it does not potentially result in the following:
1) Generate extreme heat or pressure, fire or explosion, or violent reaction;
2) Produce uncontrolled toxic mists, fumes, dusts, or gases in sufficient quantities to threaten human health or the environment;
3) Produce uncontrolled flammable fumes or gases in sufficient quantities to pose a risk of fire or explosions;
4) Damage the structural integrity of the device or facility containing the waste; or
5) Through other like means threaten human health or the environment. 22 CCR 12 66262.34(d)(2); 40 CFR 1 265.17(b), 265.177

   Violation Comments: Oxidizers bin contains state regulated waste/toxics. Flammables were in both state regulated waste/toxics and oxidizers bin. State regulated waste/toxics were placed in flammable bin. OBSERVATION: No determination was made as to the compatibility of the wastes stored together. CORRECTIVE ACTION: Immediately transfer or separate incompatible wastes to other containers and submit documentation to the inspector within the comply by date that wastes are properly sorted and segregated.

5. Failure to ensure employees are familiar with the handling and compliance of hazardous waste regulations and emergency response. 22 CCR 12 66262.34(d)(2); 40 CFR 1 262.34(d)(5)(iii)

   Violation Comments: OBSERVATION: At the time of inspection, it could not be demonstrated that employees who handle hazardous waste were properly trained. The generator must ensure that all employees who handle hazardous waste are thoroughly familiar with proper waste handling and emergency procedures. CORRECTIVE ACTION: Immediately provide training to all employees who handle hazardous waste and submit a copy of the training records to the inspector within the comply by date.

The above listed items are violations of the California Health and Safety Code and the California Code of Regulations. Your failure to submit documentation of compliance or request a reinspection of all the violations listed above within 15 days of the receipt of this notice will result in an Administrative Enforcement Order, or a referral for further enforcement action. **Re-inspection fee of $167.00 may apply for facilities failing to provide documentation of corrective action <15 days.**

Please Note: There are Civil and Criminal penalties for failure to comply with California Health and Safety Code and/or California Code of Regulations.

(A) Failure to comply with Hazardous Waste Regulations may result in civil penalties not to exceed twenty five thousand dollars ($25,000) for each violation. Failure to comply with Hazardous Waste Regulations may result in civil penalties not to exceed twenty five thousand dollars ($25,000) for each violation.

If you have any questions about what you must do to correct the above violations, please contact me at (650) 207-8741 or MBANNING@SMCGOV.ORG.

Signed,

Monica Banning
Hazardous Materials Specialist

SUBJECT: Burlington Coat Factory Store # 182
To Whom It May Concern,

In response to your corrective actions taken and return to compliance documentation for violations that were noted at Store #182 in Daly City, CA San Mateo County EH has reviewed your documentation and found it to be sufficient to resolve these violations and there is no further actions required at this time. We appreciate your efforts to train staff on hazardous waste issues at the facility and maintain in compliance with applicable regulations.

Thank you for your cooperation on this matter. At this time, your inspector is Monica Banning. She can be reached at (650) 650-207-8741 or mbanning@smcgov.org . Feel free to contact Monica or myself if you have any questions or concerns.

Sincerely,

Dan Rompf

Safe Food Donations: San Mateo County Environmental Health encourages all food facilities to participate in our Safe Surplus Food Donation Program. This is a statewide effort to get edible food out of the trash and to the families that are in need. Your business is protected by the Bill Emerson Good Samaritan Act and the California Retail Food Code 114433 that states any person, gleaner, or food facility that donates food as permitted by Section 114432 shall not be subject to civil or criminal liability. The county appreciates your business and contribution to the local community and environment. For more information regarding Safe Surplus Food Donations, please visit our website at <https://www.smchealth.org/fooddonation> or by phone at 650-692-6200.

Please note: Health permits are non-transferrable. In the event of a change of ownership, the new owner must apply for a new health permit. The placard is the property of San Mateo County Environmental Health Services. The placard shall remain posted as designated by the representative of San Mateo County. If removed the facility will be subject to a fine of $500 per incident.

Submittal was ***Accepted***; Processed on 3/27/2020 by *Sabrina Mih* for San Mateo County Environmental Health

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**No**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**Yes**
Does your facility treat hazardous waste on-site?	**No**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**No**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**No**
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	**No**
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

Waste is generated as a result of damaged or off specification retail product. No waste is generated or accumulated in amounts greater than the listed threshold in question 1.

PRELIMINARY REPORT

In response to the above referenced application for a policy of title insurance, this company hereby reports that it is prepared to issue, or cause to be issued, as of the date hereof, a Policy or Policies of Title Insurance describing the land and the estate or interest therein hereinafter set forth, insuring against loss which may be sustained by reason of any defect, lien or encumbrance not shown or referred to as an Exception below or not excluded from coverage pursuant to the printed Schedules, Conditions and Stipulations of said Policy forms.

The printed Exceptions and Exclusions from the coverage and Limitations on Covered Risks of said policy or policies are set forth in Exhibit A attached. *The policy to be issued may contain an arbitration clause. When the Amount of Insurance is less than that set forth in the arbitration clause, all arbitrable matters shall be arbitrated at the option of either the Company or the Insured as the exclusive remedy of the parties.* Limitations on Covered Risks applicable to the CLTA and ALTA Homeowner's Policies of Title Insurance which establish a Deductible Amount and a Maximum Dollar Limit of Liability for certain coverages are also set forth in Exhibit A. Copies of the policy forms should be read. They are available from the office which issued this report.

Please read the exceptions shown or referred to below and the exceptions and exclusions set forth in Exhibit A of this report carefully. The exceptions and exclusions are meant to provide you with notice of matters which are not covered under the terms of the title insurance policy and should be carefully considered.

It is important to note that this preliminary report is not a written representation as to the condition of title and may not list all liens, defects, and encumbrances affecting title to the land.

This report (and any supplements or amendments hereto) is issued solely for the purpose of facilitating the issuance of a policy of title insurance and no liability is assumed hereby. If it is desired that liability be assumed prior to the issuance of a policy of title insurance, a Binder or Commitment should be requested.

Dated as of July 08, 2020 at 7:30 A.M.

The form of Policy of title insurance contemplated by this report is:

To Be Determined

A specific request should be made if another form or additional coverage is desired.

Title to said estate or interest at the date hereof is vested in:

Kimco Westlake L.P., a California limited partnership

The estate or interest in the land hereinafter described or referred to covered by this Report is:

Fee Simple as to Parcel 1, 2, 3, 4, 5, 8 through 13, an easement as to Parcel 6 and 7.

The Land referred to herein is described as follows:

(See attached Legal Description)

At the date hereof exceptions to coverage in addition to the printed Exceptions and Exclusions in said policy form would be as follows:

1. General and special taxes and assessments for the fiscal year 2019-2020, a lien not yet due or payable.

2. The lien of supplemental taxes, if any, assessed pursuant to Chapter 3.5 commencing with Section 75 of the California Revenue and Taxation Code.

3. An easement for sewer and incidental purposes, recorded July 17, 1933 as Book 602, Page 105 of Official Records.
   In Favor of: County of San Mateo
   Affects: as described therein

   The location of the easement cannot be determined from record information.

4. An easement for roadway and slope and incidental purposes, recorded January 31, 1935 as Book 639, Page 454 of Official Records.
   In Favor of: State of California
   Affects: as described therein

   (Affects Parcels 8 through 13)

   The interest of the State of California passed to the City of Daly City in the Relinquishment recorded August 2, 1971 as Book 5990, Page 607 of Official Records.

Roadway slope easement was purportedly vacated by the City of Daly City in Resolution No. 08-2 recorded February 28, 2008 as Instrument No. 2008-021279 of Official Records.

5. An easement for water pipelines and incidental purposes, recorded August 15, 1947 as Book 1374, Page 244 of Official Records.
In Favor of: Henry Doelger Builder, Inc.
Affects: as described therein

The location of the easement cannot be determined from record information.

(Affects Parcels 8 through 13)

6. An easement for sewer pipeline and ingress and egress and incidental purposes, recorded March 27, 1950 as Book 1825, Page 47 of Official Records.
In Favor of: County of San Mateo, California
Affects: as described therein

(Affects Parcels 5, 8 through 12)

7. An easement shown or dedicated on the map of Westlake Subdivision No. 3 recorded April 7, 1950 and on file in Book 31, Page 17, 18 and 19, of Tract Maps.
For: colma sewer maintenance district easement and san francisco water department pipeline easement and incidental purposes.

(Affects Parcels 8 through 13)

8. Covenants, conditions, restrictions and easements in the document recorded August 14, 1950 as Book 1917, Page 461 of Official Records, which provide that a violation thereof shall not defeat or render invalid the lien of any first mortgage or deed of trust made in good faith and for value, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes or Section 12955 of the California Government Code. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

9. An easement for underground gas mains and/or pipelines and incidental purposes, recorded March 20, 1951 as Book 2041, Page 204 as Instrument No. 24922J of Official Records.
In Favor of: Pacific Gas and Electric Company
Affects: as described therein

(Affects Parcels 8 through 12)

Quitclaim of a portion thereof, recorded November 30, 1954, in Book 2696, Page 748 as Instrument No. 6139M, Official Records.

10. A lease dated May 1, 1953, executed by Henry Doelger Builder, Inc., a California corporation as lessor and J. C. Penney Company, a Delaware corporation as lessee, recorded September 8, 1953 as Book 2469, Page 189 of Official Records.

Defects, liens, encumbrances or other matters affecting the leasehold estate, whether or not shown by the public records are not shown herein.

(Affects Parcels 8 through 12)

Document(s) declaring modifications thereof recorded November 26, 1974 as Instrument No. 3672AI in Book 6743, Page 50 of Official Records.

Document(s) declaring modifications thereof recorded November 12, 1976 as Instrument No. 45709AK in Book 7296, Page 22 of Official Records.

Document(s) declaring modifications thereof recorded April 27, 1981 as Instrument No. 38482AS of Official Records.

Document(s) declaring modifications thereof recorded July 13, 1983 as Instrument No. 83071625 of Official Records.

11. The terms and provisions contained in the document entitled "Agreement" recorded February 10, 1954 as Book 2536, Page 73 of Official Records.

(Affects Parcels 8 through 13)

Document(s) declaring modifications thereof recorded March 1, 1963 as Book 4402, Page 312 of Official Records.

12. Any and all existing easements for public utility purposes, pipelines and/or sewers, with incidents thereto, over that portion of the property described herein, lying within that portion of Southgate Avenue abandoned by Order No. 2102 of the City of Daly City, a certified copy of which recorded January 4, 1955, in Book 2719, Page 291, as Instrument No. 15239M, Official Records.

(Affects Parcel 1)

13. An easement for gas pipeline and incidental purposes, recorded February 4, 1955 as Book 2737, Page 562 of Official Records.

In Favor of:	Pacific Gas and Electric Company, a California corporation

15. According to the public records, there has been no conveyance of the land within a period of twenty-four months prior to the date of this report, except as follows:

None

16. This preliminary report/commitment was prepared based upon an application for a policy of title insurance that identified land by street address or assessor's parcel number only. It is the responsibility of the applicant to determine whether the land referred to herein is in fact the land that is to be described in the policy or policies to be issued.

17. Should this report be used to facilitate your transaction, we must be provided with the following prior to the issuance of the policy:

A. WITH RESPECT TO A CORPORATION:
   1. A certificate of good standing of recent date issued by the Secretary of State of the corporation's state of domicile.
   2. A certificate copy of a resolution of the Board of Directors authorizing the contemplated transaction and designating which corporate officers shall have the power to execute on behalf of the corporation.
   3. A certificate of revivor and a certificate of relief from contract voidability issued by the Franchise Tax Board of the State of California.
   4. Requirements which the Company may impose following its review of the above material and other information which the Company may require.

B. WITH RESPECT TO A CALIFORNIA LIMITED PARTNERSHIP:
   1. A certified copy of the certificate of limited partnership (form LP-1) and any amendments thereto (form LP-2) to be recorded in the public records;
   2. A full copy of the partnership agreement and any amendments;
   3. Satisfactory evidence of the consent of a majority in interest of the limited partners to the contemplated transaction;
   4. A certificate of revivor and a certificate of relief from contract voidability issued by the Franchise Tax Board of the State of California.

5. Requirements which the Company may impose following its review of the above material and other information which the Company may require.

C. WITH RESPECT TO A FOREIGN LIMITED PARTNERSHIP:

1. A certified copy of the application for registration, foreign limited partnership (form LP-5) and any amendments thereto (form LP-6) to be recorded in the public records;
2. A full copy of the partnership agreement and any amendment;
3. Satisfactory evidence of the consent of a majority in interest of the limited partners to the contemplated transaction;
4. A certificate of revivor and a certificate of relief from contract voidability issued by the Franchise Tax Board of the State of California.
5. Requirements which the Company may impose following its review of the above material and other information which the Company may require.

D. WITH RESPECT TO A GENERAL PARTNERSHIP:

1. A certified copy of a statement of partnership authority pursuant to Section 16303 of the California Corporation Code (form GP-I), executed by at least two partners, and a certified copy of any amendments to such statement (form GP-7), to be recorded in the public records;
2. A full copy of the partnership agreement and any amendments;
3. Requirements which the Company may impose following its review of the above material required herein and other information which the Company may require.

E. WITH RESPECT TO A LIMITED LIABILITY COMPANY:

1. A copy of its operating agreement and any amendments thereto;
2. If it is a California limited liability company, a certified copy of its articles of organization (LLC-1) and any certificate of correction (LLC-11), certificate of amendment (LLC-2), or restatement of articles of organization (LLC-10) to be recorded in the public records;
3. If it is a foreign limited liability company, a certified copy of its application for registration (LLC-5) to be recorded in the public records;
4. With respect to any deed, deed of trust, lease, subordination agreement or other document or instrument executed by such limited liability company and presented for recordation by the Company or upon which the Company is asked to rely, such document or instrument must be executed in accordance with one of the following, as appropriate:
   (i) If the limited liability company properly operates through officers appointed or elected pursuant to the terms of a written operating agreement, such documents must be executed by at least two duly elected or appointed officers, as follows: the chairman of the board, the president or any vice president, and any secretary, assistant secretary, the chief financial officer or any assistant treasurer;
   (ii) If the limited liability company properly operates through a manager or managers identified in the articles of organization and/or duly elected pursuant to the terms of a written operating agreement, such document must be executed by at least two such managers or by one manager if the limited liability company properly operates with the existence of only one manager.
5. A certificate of revivor and a certificate of relief from contract voidability issued by the Franchise Tax Board of the State of California.
6. Requirements which the Company may impose following its review of the above material and other information which the Company may require.

F. WITH RESPECT TO A TRUST:

1. A certification pursuant to Section 18100.5 of the California Probate Code in a form satisfactory to the Company.
2. Copies of those excerpts from the original trust documents and amendments thereto which designate the trustee and confer upon the trustee the power to act in the pending transaction.
3. Other requirements which the Company may impose following its review of the material require herein and other information which the Company may require.

G. WITH RESPECT TO INDIVIDUALS:

1. A statement of information.

The map attached, if any, may or may not be a survey of the land depicted hereon. First American Title Insurance Company expressly disclaims any liability for loss or damage which may result from reliance on this map except to the extent coverage for such loss or damage is expressly provided by the terms and provisions of the title insurance policy, if any, to which this map is attached.

NOTICE I

Section 12413.1 of the California Insurance Code, effective January 1, 1990, requires that any title insurance company, underwritten title company, or controlled escrow company handling funds in an escrow or sub-escrow capacity, wait a specified number of days after depositing funds, before recording any documents in connection with the transaction or disbursing funds. This statute allows for funds deposited by wire transfer to be disbursed the same day as deposit. In the case of cashier's checks or certified checks, funds may be disbursed the next day after deposit. In order to avoid unnecessary delays of three to seven days, or more, please use wire transfer, cashier's checks, or certified checks whenever possible.

If you have any questions about the effect of this new law, please contact your local First American Office for more details.

NOTICE II

As of January 1, 1991, if the transaction which is the subject of this report will be a sale, you as a party to the transaction, may have certain tax reporting and withholding obligations pursuant to the state law referred to below:

In accordance with Sections 18662 and 18668 of the Revenue and Taxation Code, a buyer may be required to withhold an amount equal to three and one-third percent of the sales price in the case of the disposition of California real property interest by either:

1. A seller who is an individual with a last known street address outside of California or when the disbursement instructions authorize the proceeds be sent to a financial intermediary of the seller, OR
2. A corporate seller which has no permanent place of business in California.

The buyer may become subject to penalty for failure to withhold an amount equal to the greater of 10 percent of the amount required to be withheld or five hundred dollars ($500).

However, notwithstanding any other provision included in the California statutes referenced above, no buyer will be required to withhold any amount or be subject to penalty for failure to withhold if:

1. The sales price of the California real property conveyed does not exceed one hundred thousand dollars ($100,000), OR
2. The seller executes a written certificate, under the penalty of perjury, certifying that the seller is a resident of California, or if a corporation, has a permanent place of business in California, OR
3. The seller, who is an individual, executes a written certificate, under the penalty of perjury, that the California real property being conveyed is the seller's principal residence (as defined in Section 1034 of the Internal Revenue Code).

The seller is subject to penalty for knowingly filing a fraudulent certificate for the purpose of avoiding the withholding requirement.

The California statutes referenced above include provisions which authorize the Franchise Tax Board to grant reduced withholding and waivers from withholding on a case-by-case basis.

The parties to this transaction should seek an attorney's, accountant's, or other tax specialist's opinion concerning the effect of this law on this transaction and should not act on any statements made or omitted by the escrow or closing officer.

The Seller May Request a Waiver by Contacting:
Franchise Tax Board
Withhold at Source Unit

Privacy Policy

We Are Committed to Safeguarding Customer Information

In order to better serve your needs now and in the future, we may ask you to provide us with certain information. We understand that you may be concerned about what we will do with such information - particularly any personal or financial information. We agree that you have a right to know how we will utilize the personal information you provide to us. Therefore, together with our parent company, The First American Corporation, we have adopted this Privacy Policy to govern the use and handling of your personal information.

Applicability

This Privacy Policy governs our use of the information which you provide to us. It does not govern the manner in which we may use information we have obtained from any other source, such as information obtained from a public record or from another person or entity. First American has also adopted broader guidelines that govern our use of personal information regardless of its source. First American calls these guidelines its *Fair Information Values*, a copy of which can be found on our website at www.firstam.com.

Types of Information

Depending upon which of our services you are utilizing, the types of nonpublic personal information that we may collect include:

- Information we receive from you on applications, forms and in other communications to us, whether in writing, in person, by telephone or any other means;
- Information about your transactions with us, our affiliated companies, or others; and
- Information we receive from a consumer reporting agency.

Use of Information

We request information from you for our own legitimate business purposes and not for the benefit of any nonaffiliated party. Therefore, we will not release your information to nonaffiliated parties except: (1) as necessary for us to provide the product or service you have requested of us; or (2) as permitted by law. We may, however, store such information indefinitely, including the period after which any customer relationship has ceased. Such information may be used for any internal purpose, such as quality control efforts or customer analysis. We may also provide all of the types of nonpublic personal information listed above to one or more of our affiliated companies. Such affiliated companies include financial service providers, such as title insurers, property and casualty insurers, and trust and investment advisory companies, or companies involved in real estate services, such as appraisal companies, home warranty companies, and escrow companies. Furthermore, we may also provide all the information we collect, as described above, to companies that perform marketing services on our behalf, on behalf of our affiliated companies, or to other financial institutions with whom we or our affiliated companies have joint marketing agreements.

Former Customers

Even if you are no longer our customer, our Privacy Policy will continue to apply to you.

Confidentiality and Security

We will use our best efforts to ensure that no unauthorized parties have access to any of your information. We restrict access to nonpublic personal information about you to those individuals and entities who need to know that information to provide products or services to you. We will use our best efforts to train and oversee our employees and agents to ensure that your information will be handled responsibly and in accordance with this Privacy Policy and First American's *Fair Information Values*. We currently maintain physical, electronic, and procedural safeguards that comply with federal regulations to guard your nonpublic personal information.

CLTA/ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE (02-03-10)
EXCLUSIONS

In addition to the Exceptions in Schedule B, You are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of those portions of any law or government regulation concerning:
   (a) building; (d) improvements on the Land;
   (b) zoning; (e) land division; and
   (c) land use; (f) environmental protection.
   This Exclusion does not limit the coverage described in Covered Risk 8.a., 14, 15, 16, 18, 19, 20, 23 or 27.
2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not limit the coverage described in Covered Risk 14 or 15.
3. The right to take the Land by condemning it. This Exclusion does not limit the coverage described in Covered Risk 17.
4. Risks:
   (a) that are created, allowed, or agreed to by You, whether or not they are recorded in the Public Records;
   (b) that are Known to You at the Policy Date, but not to Us, unless they are recorded in the Public Records at the Policy Date;
   (c) that result in no loss to You; or
   (d) that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.e., 25, 26, 27 or 28.
5. Failure to pay value for Your Title.
6. Lack of a right:
   (a) to any land outside the area specifically described and referred to in paragraph 3 of Schedule A; and
   (b) in streets, alleys, or waterways that touch the Land.
   This Exclusion does not limit the coverage described in Covered Risk 11 or 21.
7. The transfer of the Title to You is invalid as a preferential transfer or as a fraudulent transfer or conveyance under federal bankruptcy, state insolvency, or similar creditors' rights laws.

LIMITATIONS ON COVERED RISKS

Your insurance for the following Covered Risks is limited on the Owner's Coverage Statement as follows: For Covered Risk 16, 18, 19, and 21 Your Deductible Amount and Our Maximum Dollar Limit of Liability shown in Schedule A.

	Your Deductible Amount	Our Maximum Dollar Limit of Liability
Covered Risk 16:	1% of Policy Amount or $2,500.00 (whichever is less)	$10,000.00
Covered Risk 18:	1% of Policy Amount or $5,000.00 (whichever is less)	$25,000.00
Covered Risk 19:	1% of Policy Amount or $5,000.00 (whichever is less)	$25,000.00
Covered Risk 21:	1% of Policy Amount or $2,500.00 (whichever is less)	$5,000.00

ALTA RESIDENTIAL TITLE INSURANCE POLICY (6-1-87)
EXCLUSIONS

In addition to the Exceptions in Schedule B, you are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of any law or government regulation. This includes building and zoning ordinances and also laws and regulations concerning:
   (a) and use
   (b) improvements on the land
   (c) and division
   (d) environmental protection
   This exclusion does not apply to violations or the enforcement of these matters which appear in the public records at Policy Date.
   This exclusion does not limit the zoning coverage described in Items 12 and 13 of Covered Title Risks.
2. The right to take the land by condemning it, unless:
   (a) a notice of exercising the right appears in the public records on the Policy Date
   (b) the taking happened prior to the Policy Date and is binding on you if you bought the land without knowing of the taking
3. Title Risks:
   (a) that are created, allowed, or agreed to by you
   (b) that are known to you, but not to us, on the Policy Date -- unless they appeared in the public records
   (c) that result in no loss to you
   (d) that first affect your title after the Policy Date -- this does not limit the labor and material lien coverage in Item 8 of Covered Title Risks
4. Failure to pay value for your title.

5. Lack of a right:
   (a) to any land outside the area specifically described and referred to in Item 3 of Schedule A OR
   (b) in streets, alleys, or waterways that touch your land
   This exclusion does not limit the access coverage in Item 5 of Covered Title Risks.

2006 ALTA LOAN POLICY (06-17-06)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
      i. the occupancy, use, or enjoyment of the Land;
      ii. the character, dimensions, or location of any improvement erected on the Land;
      iii. the subdivision of land; or
      iv. environmental protection;

      or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.
   b. Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   a. created, suffered, assumed, or agreed to by the Insured Claimant;
   b. not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   c. resulting in no loss or damage to the Insured Claimant;
   d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or
   e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   a. a fraudulent conveyance or fraudulent transfer, or
   b. a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

2006 ALTA OWNER'S POLICY (06-17-06)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   i. the occupancy, use, or enjoyment of the Land;
   ii. the character, dimensions, or location of any improvement erected on the Land;
   iii. the subdivision of land; or
   iv. environmental protection;

   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

   b.Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   a. created, suffered, assumed, or agreed to by the Insured Claimant;
   b. not Known to the Company, not recorded in the Public Records at Date of Policy, but known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   c. resulting in no loss or damage to the Insured Claimant;
   d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or
   e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   a. a fraudulent conveyance or fraudulent transfer, or
   b. a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

ALTA EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (07-26-10)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   i. the occupancy, use, or enjoyment of the Land;
   ii. the character, dimensions, or location of any improvement erected on the Land;
   iii. the subdivision of land; or
   iv. environmental protection;

   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.

   b. Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters

   a. created, suffered, assumed, or agreed to by the Insured Claimant;
   b. not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   c. resulting in no loss or damage to the Insured Claimant;
   d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 16, 17, 18, 19, 20, 21, 22, 23, 24, 27 or 28); or
   e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law. This Exclusion does not modify or limit the coverage provided in Covered Risk 26.
6. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to Advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching subsequent to Date of Policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11(b) or 25.
8. The failure of the residential structure, or any portion of it, to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This Exclusion does not modify or limit the coverage provided in Covered Risk 5 or 6.
9. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   a. a fraudulent conveyance or fraudulent transfer, or
   b. a preferential transfer for any reason not stated in Covered Risk 27(b) of this policy.

PROJECT DESCRIPTION

KIMCO SEEKS PRELIMINARY COMMENT FROM THE CITY STAFF OF DALY CITY ON A PROPOSED MIXED-USE REDEVELOPMENT TO DEMOLISH AND REPLACE THE VACANT BURLINGTON RETAIL STORE (55,000 SF) LOCATED AT 99 SOUTHGATE AVENUE (1.93-ACRE SITE) WITHIN THE WESTLAKE SHOPPING CENTER. THE NEW WESTLAKE SOUTH DEVELOPMENT WOULD BE A SEVEN-STORY, 214-UNIT MIXED-USE PROJECT WITH A FIVE-STORY RESIDENTIAL WOOD-FRAME (TYPE IIIA) SUPERSTRUCTURE ATOP A TWO-STORY ENCLOSED CONCRETE PODIUM (TYPE IA) WITH 251 PARKING SPACES AND 10,800 SF OF HIGH-QUALITY PEDESTRIAN ORIENTED RETAIL FRONTING SOUTHGATE AVENUE. AT 355,000 GSF, THE PROJECT WOULD CONTAIN A MIX OF RENTAL HOUSING INCLUDING STUDIOS, IBR, 2BR, AND 3 BR APARTMENTS (WITH 10% INCLUSIONARY UNITS SET ASIDE FOR LOW-INCOME HOUSEHOLDS ONSITE) ALONG WITH AMENITIES SUCH AS A TWO-STORY LOBBY, FULL-SERVICE PROPERTY MANAGEMENT, FITNESS CENTER, RESIDENTS' CLUB HOUSE, REMOTE WORKING SPACE, PANORAMIC SKY LOUNGE, LANDSCAPED OUTDOOR ACTIVITY SPACES, AND DOG WASH FACILITIES. RESIDENTIAL UNITS WILL OFFER PREMIUM FINISHES THROUGHOUT AND HAVE THE OPTION OF BALCONIES/PATIOS. THIS DEVELOPMENT FURTHER SUPPORTS KIMCO'S LONG-TERM DESIRE TO MAINTAIN WESTLAKE SHOPPING CENTER AS A VIBRANT SHOPPING DESTINATION THROUGH IMPROVEMENT OF EXISTING RETAIL AND OFFICE SPACES WHILE ADDING MUCH NEEDED AND COMPLEMENTARY HOUSING DIRECTLY ADJACENT. THIS PROPOSAL WOULD BE STAND ALONE AND IN ADDITION TO KIMCO'S 179-UNIT RESIDENTIAL MIXED USE PROJECT ENTITLED IN 2018 THROUGH THE ADOPTION OF ORDINANCE 1422 (PD-60A ZONING DISTRICT) AT THE NORTHEAST CORNER OF THE SHOPPING CENTER NEAR THE CORNER OF JOHN DALY BOULEVARD AND PARK PLAZA DRIVE.

PROJECT SUMMARY	
ADDRESS	99 SOUTHGATE AVE, DALY CITY, CA 94015
APN	2201570
SITE AREA	1.93 ACRE
BUILDING GROSS SF	355,580 SQ.FT.
RESIDENTIAL PARKING	251 SPACES
LAND USES	EXISTING: 55,000 SF COMMERCIAL
	PROPOSED: 10,800 SF COMMERCIAL AND 214 RESIDENTIAL UNITS WITH 10% OR 22 INCLUSIONARY UNITS FOR LOW INCOME HOUSEHOLDS (70% AMI)

PD-60A COMMERCIAL PARKING COMPLIANCE
REQUIREMENT: 3.29 PARKING PAKING SPACES PER 1,000 SQUARE FEET OF LEASABLE BUILDING AREA
CURRENT PD-60A
CURRENT TOTAL BUILDING AREA IN PD-60A PLANNED DEVELOPMENT ZONING DISTRICT: **629,880 SF**
TOTAL PARKING STALLS IN PD-60A PLANNED DEVELOPMENT ZONING DISTRICT: **2158** STALLS
CURRENT PARKING RATIO IN PD-60A: **3.43**/1000
PROPOSED AMENDMENTS TO PD-60A
PROPOSED TOTAL BUILDING AREA IN PD-60A PLANNED DEVELOPMENT ZONING DISTRICT: **585,680 SF** [629,880-55,000+10,800]
PROPOSED PARKING RATIO IN PD-60A: **3.57**/1000

EXECUTIVE SUMMARY

Roux Associates, Inc. (Roux Associates) performed a Phase I Environmental Site Assessment (ESA) of the Westlake Center "Work Area", California ("Property"). The location of the Property is shown on Figure 1. This Phase I ESA was performed on behalf of Kimco Westlake L.P.

The Property is located in the northeastern corner of the Westlake Shopping Center bounded to the north by John Daly Boulevard and to the east by Park Plaza Drive. The southern and western extents of the Property are defined by the Work Area displayed in Figure 2.

The current Property is occupied by two retail/commercial use buildings (both constructed in 1951, identified herein as Building M and Building L) and an asphalt paved parking lot. Details as follows:

- Building M is a 22,168-square foot, single-story retail use building with tenants including Nations Giant Hamburgers, Chipotle Mexican Grill, Supercuts, Redwing Boots, UPS Store, Bank of the West, T-Mobile, Broaster Chicken, Accuquest, and Elite Hair Salon.

- Building L is a 27,659-square foot, three-story retail and commercial building. The building consists of street level retail with office space (mostly medical and dental) on the upper floors. Tenants include: Tani's Kitchen, Magic Touch, Pulido's Tailor, Westlake Art Center, Westlake Shoe Repair, Structure Hair Design, Cigarettes Are Cheaper, Spring Wireless, and Westlake Center Medical-Dental Building.

This Phase I ESA was performed to identify recognized environmental conditions (RECs) at the Property, indicating past, current, or material threats of the release of hazardous materials or petroleum hydrocarbons to the buildings, soil, groundwater, or surface water at the Property. The Phase I ESA was conducted by investigating past Property uses, reviewing the results of a search of environmental databases, reviewing records at relevant government agencies, and performing a reconnaissance of the Property and surrounding area.

Based on the data reviewed and Roux Associates' observations and understanding of the Property's use and conditions, one non-action REC was identified at the Property:

1. Available records indicate that a former drycleaner was located at 247 Westlake Center (formerly 330 South Mayfair Avenue before street reconfiguration). Subsurface investigations were conducted between 2002 and 2011 under the oversight of the San Mateo County Environmental Health Department (SMCEHD). The results indicated the soil vapor beneath Building L was impacted with tetrachloroethene (PCE) with PCE concentrations exceeding commercial Environmental Screening Limits (ESLs). A soil vapor extraction (SVE) system was installed and operated between June 2014 and April

2016. The SVE system is currently shutdown and rebound testing will be completed in March 2017. Roux Associates considers this listing to be a non-action REC because the source of the PCE has been addressed.

There were no data gaps identified as part of the site reconnaissance. Based on the buildings' age, asbestos containing materials (ACM) and lead based pain (LBP) are likely to be present in building materials; however, identification of these issues is out of scope for this Phase 1 ESA.

1.0 INTRODUCTION

At the request of Kimco Westlake L.P. (Client), Roux Associates, Inc. (Roux Associates) performed a Phase I Environmental Site Assessment (Phase I ESA) of Westlake Shopping Center "Work Area" in Daly City, California ("Property"). The location of the Property is shown in Figure 1. The Phase I ESA was conducted in accordance with the scope of work presented in Roux Associates' proposal dated February 2, 2017, in general accordance with the ASTM International Standard Practice E1527-13 (Standard Practice for Environmental Site Assessments), and was consistent with the United States Environmental Protection Agency (USEPA) Standards and Practices for All Appropriate Inquiries (AAI) Rule (40 CFR Part 312, Standards and Practices for All Appropriate Inquiries; Final Rule[1]). The preamble for the AAI Rule refers ASTM E1527-05 and states:

> *In today's final rule, EPA is referencing the standards and practices developed by ASTM International and known as Standard E1527-05 (entitled "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process") and recognizing the E1527-05 standard as consistent with today's final rule. The Agency determined that this voluntary consensus standard is consistent with today's final rule and is compliant with the statutory criteria for all appropriate inquiries. Persons conducting all appropriate inquiries may use the procedures included in the ASTM E1527-05 standard to comply with today's final rule.*[2]

This AAI Rule was subsequently amended in 2013, as indicated in the following "Background":

> *With today's action, EPA is establishing that parties seeking liability relief under CERCLA's landowner liability protections, as well as recipients of brownfields grants for conducting site assessments, will be considered to have met the standards and practices for all appropriate inquiries, as set forth in the Brownfields Amendments to CERCLA and 40 CFR Part 312, if such parties follow the procedures provided in the ASTM E1527-13 "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." EPA made this determination based upon the Agency's finding that the ASTM E1527-13 standard is compliant with the All Appropriate Inquiries Rule. Therefore, parties conducting all appropriate inquiries may use the procedures in the newly issued ASTM E1527-13 standard when conducting all appropriate inquiries.*[3]

---

[1] Final Rule and information available at www.epa.gov/swerosps/bf/regneg.htm#final_rule, and https://federalregister.gov/a/2013-31112.
[2] Federal Register: November 1, 2005 (Volume 70, Number 210), page 66081.
[3] Federal Register: December 30, 2013 (Volume 78, Number 250).

The purpose of the Phase I ESA was to identify, to the extent feasible, Recognized Environmental Conditions (RECs) in connection with the Property. ASTM Standard Practice E1527-13 defines RECs as:

> *…the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.*

ASTM Standard Practice E1527-13 provides that identified RECs can be evaluated and classified into Controlled Recognized Environmental Conditions (CRECs) or Historical Recognized Environmental Conditions (HRECs) based on the following definitions. A CREC is defined as:

> *…a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*

A HREC is defined as:

> *…a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*

In order to assess the potential for RECs associated with the Property, Roux Associates utilized a variety of information sources to perform the Phase I ESA, including a radial information search from federal, state, and local regulatory agency databases; Freedom of Information Act (FOIA)/public records request responses from federal, state, and local regulatory agencies; an interview with the Property owner; on-site walk through of the Property; and readily available information from the following sources: historical aerial photographs, historical topographic maps,

historical Sanborn fire insurance maps, and city directories. The historical research and interviews were conducted in order to develop an understanding of the following:

- Current and past uses of the Property;
- Current and past uses of hazardous substances and/or petroleum at the Property, if any;
- Waste management and disposal practices that might have potentially caused releases or threatened releases of hazardous substances and/or petroleum products at the Property;
- Current and past corrective actions and response activities undertaken to address past and ongoing releases of hazardous substances and/or petroleum products at the Property, if any;
- The existence of any engineering and/or institutional controls recorded for the Property; and
- Current and past uses of adjoining properties that could have resulted in releases or threatened releases of hazardous substances and/or petroleum products to the Property.

Roux Associates' Principal Engineer Angela Liang Cutting, Ph.D., P.E., Principal Geologist, Richard Maxwell, and Staff Geologist Gabe Matson served as the Environmental Professionals who conducted the Phase I ESA. Ms. Cutting possesses sufficient specific education, training, and experience to exercise professional judgment to develop opinions and conclusions regarding conditions indicative of releases or threatened releases, as defined in 40 CFR §312.1(c) on, at, in, or to a Property, sufficient to meet the objectives and performance factors in 40 CFR §312.20(e) and (f).

2.0 METHODS OF INVESTIGATION

The methods of investigation used to conduct this Phase I ESA are outlined in the following sections.

2.1 General

The activities performed in conjunction with the Phase I ESA of the Property include:

- Review of federal, state, and local environmental regulatory agency databases provided by Environmental Data Resources, Inc. of Milford, Connecticut (EDR), indicating locations of environmental concern within specified radii from the Site (Appendix A);
- Submission of FOIA requests/public requests and inquiries to federal, state, and local regulatory agencies (Appendix B);
- Reconnaissance of the Property and surrounding area; and
- Questionnaire with key Property manager (Appendix C).

2.2 Review of Readily Available Information

The resources compiled and reviewed by Roux Associates to date include the following:

- EDR Radius Map with GeoCheck, dated December 19, 2016 (Appendix A);
- Public records from the agencies listed below (Appendix B);

Agency	Status
North County Fire Authority	Response received February 16, 2017. Documents were reviewed in person and described in Section 5.1.
San Mateo County Environmental Health Department	Response received February 17, 2017. Files were available for 247 & 213 Westlake Center. Documents are described in Section 5.1.
San Francisco Bay Area Regional Water Quality Control Board, including online GeoTracker files	Response received February 21, 2017; no additional records were available for review besides what is available on GeoTracker.
Department of Toxic Substances Control (DTSC)	Responses received February 17, 2017; no records were available for review.

- Aerial photographs dated 1943, 1946, 1956, 1963, 1968, 1974, 1982, 1993, 1998, 2005, 2009, 2010 and 2012 (Appendix D);
- United States Geological Survey (USGS) Historical Topographic Maps, San Mateo Quadrangle, dated 1896, 1899, 1915, 1939, (Appendix E);

- USGS Historical Topographic Maps, San Francisco South Quadrangle, dated 1947, 1950, 1956, 1968, 1973, 1980, 1995, 1996, and 2012 (Appendix E);
- USGS Historical Topographic Maps, San Francisco OE W Quadrangle, dated 2012 (Appendix E);
- Certified Sanborn Map Report, Dated February 12, 2017 (Appendix F); and
- EDR City Directory Abstract, dated February 14, 2017 (Appendix G).

2.3 Property and Surrounding Area Reconnaissance

Pursuant to ASTM Standard Practice E1527-13, Roux Associates conducted a reconnaissance of the Property and surrounding area on February 16, 2017, to identify, investigate, and assess potential RECs and other potential environmental concerns. The reconnaissance included observation of the Property, including all structures, buildings, and surrounding areas to determine the current use and condition of the Property, indications of past uses of the Property, and current uses of adjoining properties and the surrounding area. During the reconnaissance, Roux Associates placed particular emphasis on identifying the following features, if present, in accordance with ASTM E1527-13:

- Hazardous substances and petroleum products in connection with identified uses;
- Storage tanks;
- Odors;
- Pools of liquid;
- Drums;
- Hazardous substances and petroleum products containers;
- Unidentified substance containers;
- Polychlorinated biphenyls (PCBs);
- Heating and cooling systems;
- Stains or corrosion;
- Drains and sumps;
- Pits, ponds, or lagoons;
- Stained soil or pavement;
- Stressed vegetation;
- Solid waste;

- Waste water;
- Wells; and
- Septic systems.

In addition, observation of the general topographic setting of the Property was made, and inquiry was made into the source of potable water for the Property and other utilities, as presented in Section 6. Roux Associates did not conduct a visual inspection for asbestos containing materials (ACM) or lead based paints (LBP) in the building(s) at the Property because this environmental area is considered "out-of-scope" under ASTM E1527-13. Based on the ages of the buildings, it is likely that ACM and LBP are present in building materials. Photographs from the reconnaissance are presented in Appendix H.

2.4 Interview with Site Manager

On February 16, 2017, in conjunction with the site reconnaissance, Roux Associates Principal Geologist Richard Maxwell and Staff Geologist Gabe Matson interviewed Ms. Maria Teos of Kimco, the Property Manager. During the interview, Ms. Teos described the current and historical use and conditions of the Property and surrounding area and answered questions regarding observations made by Roux Associates during the reconnaissance.

2.5 Reviewed Documents

Roux Associates personnel reviewed documents provided by the Client, through FOIA/public records requests, and San Francisco Bay Area Regional Water Quality Control Board (RWQCB).

FOIA/Public Record Requested Documents (Appendix B)

The following documents were supplied by the San Mateo County Environmental Health Department (SMCEHD) for the addresses listed:

- Chipotle Mexican Grill, 213 Westlake Center: Chipotle Mexican Grill is registered with the Hazardous Materials Business Plan (HMBP) program through the SMCEHD. Documents include registration forms, inspection forms, corrective action forms, and correspondence related to the HMBP program.

- Former Westlake French Cleaners, 247 Westlake Center: The SMCEHD oversees environmental investigation and ongoing remediation at the site of the former drycleaners since 2002. Documents include fiscal paperwork, correspondence between environmental consultants and the SMCEHD, and reports provided to the SMCEHD

Roux Associates reviewed the documents and included those that are referenced herein.

RWQCB GeoTracker Documents (Appendix I)

The RWQCB maintains the environmental database GeoTracker which includes sites within cleanup programs. The Property's former Westlake French Cleaners is listed in this database. GeoTracker gives access to environmental reports including: subsurface investigation work plans/reports, soil vapor extraction work plans/reports, correspondence between the SMCEHD and the Client's environmental consultants, and regulatory letters from the SMCEHD to the Client. Only reports referenced herein are included as attachments. All available documents may be accessed through GeoTracker's website[4]

Client Provided Documents (Appendix J)

The Client provided environmental related documents concerning the Property's former Westlake French Cleaners. Documents include previously conducted Phase I ESAs, subsurface investigation work plans/reports, soil vapor extraction work plans/reports. Roux Associates reviewed the documents and included those that are referenced herein.

3.0 PROPERTY DESCRIPTION

Descriptions of the Property and surrounding properties are included in the following sections. Figure 1 presents the location of the Property in the general context of the City of Daly City, California.

3.1 Property Location and Description

The Property is located in the northeastern corner of the Westlake Shopping Center bounded to the north by John Daly Boulevard and to the east by Park Plaza Drive. The southern and western extents of the Property are defined by the Work Area displayed in Figure 2.

Currently, the Property is occupied by two retail/commercial use buildings (both constructed in 1951, identified herein as Building M and Building L) and an asphalt paved parking lot. Details as follows:

- Building M is a 22,168-square foot, single-story retail use building. Tenants include Nations Giant Hamburgers, Chipotle Mexican Grill, Supercuts, Redwing Boots, UPS Store, Bank of the West, T-Mobile, Broaster Chicken, Accuquest, and Elite Hair Salon.

- Building L is a 27,659-square foot, three-story retail and commercial building. The building consists of street level retail with office space (mostly medical and dental) on the upper floors. Tenants include: Tani's Kitchen, Magic Touch, Pulido's Tailor, Westlake Art Center, Westlake Shoe Repair, Structure Hair Design, Cigarettes Are Cheaper, Spring Wireless, and Westlake Center Medical-Dental Building. There is an elevator within Building L to provide access to upper levels. The floor of the elevator pit is stained; however, without cracking on the slab, this is not considered a REC.

- Passageway: A covered passageway sits between Building M and Building L. A soil vapor extraction (SVE) system is located in the passage way, which is used to address soil vapor impacts from a former dry cleaner at the Property

There is an elevator in Building L that provides access to the upper floors. The elevator pit was observed along with the buildings and surrounding area during the site reconnaissance. The findings of the site reconnaissance are summarized in Section 6.0.

3.2 Current Surrounding Property Usage

Daly City, California is located on the San Francisco Peninsula, approximately 10 miles south of San Francisco. The Property is located at the corner of John Daly Boulevard and Park Plaza Drive. Surrounding properties include retail, commercial, food service, and residential uses.

Table 1. Surrounding Property Uses

North	John Daly Boulevard, beyond which are residential and commercial use buildings, a sports field and the Daly City Water & Wastewater Facility.
South	Retail use buildings associated with the Westlake Shopping Center
East	Park Plaza Drive, beyond which are multi-unit residential use buildings
West	Retail use buildings associated with the Westlake Shopping Center

3.3 Topographic and Hydrogeologic Setting

The historical topographic maps place the Property at roughly 100 feet above mean sea level (MSL), which is confirmed by the EDR Radius Map Report (Appendix A). For the surrounding area, the topographic gradient is to the north towards Lake Merced (Appendix A; Appendix E). Previous investigation completed by Treadwell & Rollo as part of a Sub-slab Groundwater Sampling effort for the Westlake French Cleaners located at the Property determined that the Property is underlain by coarse-grained silty sand, with groundwater at a depth of approximately 78 feet below ground surface (bgs) (Appendix I). Groundwater flow is inferred to be to the northeast based on monitoring well information within a mile of the Site (Appendix I).

4.0 PROPERTY HISTORY

The land-use history of the Property was developed by searching aerial photos, city directories, historical topographic maps, and Sanborn maps. Aerial photographs dated 1943, 1946, 1956, 1963, 1968, 1974, 1982, 1993, 1998, 2005, 2009, 2010 and 2012 were reviewed. Roux Associates also reviewed historical city directories as part of this ESA. Historical Sanborn Maps date 1960 and 1969 were also reviewed. Historical research documentation is provided in Appendices D through G. Based on the available sources, the following chronology of the Property was developed (Table 2).

Table 2. Property History

Source	Year	Status
Aerial Photo	1943	The 1943 aerial photo shows the Property and surrounding area to be rural land. Alemany Boulevard exits to the northeast of the Property
Aerial Photo	1946	The 1946 aerial photo shows no change in land use at the Property or surrounding area.
Aerial Photo	1956	The 1956 aerial photo shows completed development of a shopping center at the Property, which includes two buildings (Buildings M & L). The surrounding Westlake Shopping Center is also developed, but not identical to its 2017 extent. There is a parking lot to the southeast of the property and Park Plaza Drive sits to the northeast. The area surrounding the Westlake Shopping Center is occupied to by residences, as well as a sports field to the northwest across Alemany Boulevard.
Sanborn Map	1960	According to the 1960 Sanborn Map, the Property was used as a shopping center, which includes a post office and furniture store.
Aerial Photo	1963	The 1963 aerial photo shows no change in land use at the Property; however additional buildings were added in the Westlake Shopping Center outside the Property boundary to the southwest.
Aerial Photo	1968	The 1968 aerial photo shows no change in land use at the Property or surrounding areas.
Sanborn Map	1969	According to the 1969 Sanborn Map, the Property was used as a shopping center, which includes a paint store, a library, and furniture store.
City Directory	1970	According to the 1970 city directory, the Property was occupied by retail tenants including: Westlake French, Westlake Paint & Wallpaper, Kelly's Shoe Service, The San Mateo Times, Westlake Barbershop, Westlake Medical Pharmacy, etc.

Source	Year	Status
Aerial Photo	1974	The 1974 aerial photo shows no change in land use at the Property or surrounding area.
City Directory	1980	According to the 1980 city directory, the Property was occupied by retail tenants including: Westlake French Cleaners, Park Plaza Berber, Westlake Medical Pharmacy, Westlake Paint & Wallpaper, Westlake Laundry, etc.
Aerial Photo	1982	The 1982 aerial photo shows no change in land use at the Property or surrounding area.
City Directory	1992	According to the 1992 city directory, the Property was occupied by retail tenants including: Westlake Drapery Cleaner (listed at same address as Westlake French Cleaners), Moto Photo, Danco Real Estate, Westlake Shoe Repair, medical/dental offices, etc.
Aerial Photo	1993	The 1993 aerial photo shows no change in land use at the Property.
Aerial Photo	1998	The 1998 aerial photo shows no change in land use at the Property or surrounding area.
City Directory	2003	According to the 2003 city directory, the Property was occupied by retail tenants including: Westlake French Cleaners, Nations Giant Hamburgers, Danco Real Estate, Hong Kong Designer Hair & Nail, Tanis Kitchen, medical/dental offices, etc.
Aerial Photo	2005	The 2005 aerial photo the development of S Mayfair Avenue into a parking lot along the northwestern boundary of the Property.
Aerial Photo	2009	The 2009 aerial photo shows no change in land use at the Property; however, the adjacent building to the southwest was replaced by a parking lot and the parking lot to the southeast was developed into an additional shopping center building.
City Directory	2008	According to the 2008 city directory, the Property was occupied by retail tenants including: Radioshack, Bank of the West, Elite Hair Salon, medical/dental offices, Baskin Robins, etc.
Aerial Photo	2010	The 2010 aerial photo shows no change in land use at the Property.
Aerial Photo	2012	The 2012 aerial photo shows no change in land use at the Property or surrounding area.
Historical Topo Map	2012	The 2012 historical topo map shows that former Alemany Boulevard is now called John Daly Boulevard.
City Directory	2013	According to the 2013 city directory, the Property was occupied by retail tenants including: Elite Hair Salon, Tanis Kitchen, Pulidos Tailor, Westlake Art & Framing Center, Cigarettes Are Cheaper, medical/dental offices, Chipotle Mexican Grill, T Mobile, Bank of the West, etc.

5.0 RECORDS REVIEW

Roux Associates used a computerized environmental database and radius map report prepared by EDR to conduct a government records database search of sites of potential environmental concern within a maximum of one mile radius of the Property. Appendix A contains a complete copy of the EDR Radius Map Report with GeoCheck. Tables 3 and 4 show the search results for all the pertinent databases that indicated potential environmental concerns. A description of the databases can be found in the EDR Report (Appendix A). There were no Federal National Priorities List (NPL) facilities located within a mile of the Property.

There are differences between addresses provided in the EDR Report and addresses found at the Property during the site reconnaissance. The addresses found at the Property are assumed to be correct, and a given Property listing from EDR will be reassigned a corrected address based on site reconnaissance.

Table 3. Properties of Potential Environmental Concern

Database	Target Property	<1/8 mile	1/8-1/4 mile	1/4-1/2 mile	1/2-1 mile	>1 mile	Total
NPL	0	0	0	0	0	NR	**0**

*NR refers to "not requested" at search distance.							

The remainder of the discussion concerning review of environmental databases has been restricted to those properties located within 1/4 of a mile from the Property. Table 4 presents sites of potential environmental concern within 1/4 of a mile from the Property. Roux Associates made the determination to review sites within a 1/4 mile radius of the Property based upon the following factors: (1) the former historical commercial uses of the Property and residential and commercial immediately surrounding district, as documented by review of historical aerial photographs, Certified Sanborn Maps, and city directories (Section 4.0) and (2) the lack of supporting evidence for historical environmental regulatory cases in the general Property vicinity, other than the known soil vapor impacts in the vicinity of a former drycleaner, which is discussed in Section 5.2.1. For each listing, EDR reports whether a property is located topographically higher or lower in elevation relative to the Property.

Table 4. Properties of Potential Environmental Concern <1/4 Mile from Target Property

*Databases are defined in EDR Radius Report (Appendix A)						

Although Westlake French Cleaners, Sprint, and Moto Photo are listed as being outside the property by EDR, based on the city directory search and known documentation about the site, these businesses will be considered to be located within the Property from this point forward.

5.1 FOIA/Public Records Request Responses

FOIA/public records requests for the Property, and surrounding sites, were submitted to federal, state, and local regulatory agencies (Section 2.2, Appendix B).

Information obtained from all agency correspondence is included in Appendix B and is summarized below.

North County Fire Authority

Roux Associates personnel visited the North County Fire Authority (Fire Authority) administrative facility on 10 Wembley Road, Daly City, California on February 16, 2017 to access available public records for the addresses at the Property. Searchable records included occupancy inspections, fire inspections, and new business inspections for the Property, but did not present any environmental concern. Marie Antonis, office administrator for the Fire Authority, informed Roux Associates personnel that records prior to 2009 have been purged, thus are not searchable.

San Mateo County Environmental Health Department

On February 17, 2017, Roux Associates received a response from the San Mateo County Environmental Health Department (SMCEHD) that there were documents available for review for 213 Westlake Center and 247 Westlake Center. No documents are available for review for the other addresses at the Property. Available documents include fiscal notices (such as business address changes), administrative documents, and compliance for storage of hazardous material (such as carbon dioxide or waste oil). These do not provide evidence for environmental concern. In addition to these documents, the SMCEHD provided correspondence and reports relevant to the former Westlake French Cleaners. These documents overlap with those available on GeoTracker and those provided by the Client; however, several of the correspondences are unique. These documents were used to complete Section 5.2.1 below.

RWQCB

Ms. Melinda Wong of the Water Board informed Roux Associates on February 21, 2017 via a phone call that no records were found for the Property (besides what exists on GeoTracker). The Water Board searched the following databases as part of its records review:

- California GeoTracker Database;
- California Integrated Water Quality Systems (CIWQ's) Database; and
- California Storm Water Multiple Applications and Report Tracking System (Smarts).

Department of Toxic Substances Control (DTSC)

DTSC notified Roux Associates on February 17, 2017 that there were no documents to review for the Property. In addition, there were no available documents on Envirostor.

5.2 Records Review Summary

Based on the EDR report and the file reviews discussed above, the following information for the Property and sites that are immediately adjacent or hydraulically upgradient, is provided in the sections below.

5 2.1 Records Review Summary for Property

Westlake French Cleaners: According to the EDR Radius Report, Westlake French Cleaners is listed under its former address: 330 S Mayfair Ave. The space is now designated with the address of 247 Westlake Center. The Westlake French Cleaners operated from 1955 to 2009. The space was originally 2,300 square feet; however, in 2009, the space was combined with 251 Westlake Center to occupy 3,280 square feet.

The presence of tetrachloroethene (PCE) was identified at the Westlake French Cleaners by means of subsurface investigations in 2002. The concentrations of PCE in soil vapor exceeded RWQCB Environmental Screening Levels (ESLs) for commercial exposure. In August 2011, PCE was detected in groundwater, located 78 feet bgs, at a concentration of 9.6 µg/L, which is above the maximum contaminant level (MCL) for drinking water. As the groundwater below the Property is not a source of drinking water and the concentration is below the RWQCB residential environmental screening limit (ESL), this impact does not pose a risk to downgradient residential properties. Northgate Environmental Management, Inc. (Northgate) installed and operated a soil vapor extraction (SVE) system in June 2014. After running for one month, in July 2014 there was a hiatus in SVE system operation for approximately one year due to noise complaints. The SVE system resumed operation in August 2015. Following the collection of soil vapor samples with concentrations of PCE below the commercial ESL in April 2016, the system was shut down for rebound testing. . The relevant documents associated with this site are included in Appendix I & J

Northgate reported that rebound testing performed in July 2016 indicated that PCE concentrations increased and additional rebound testing will occur in March 2017.

Chipotle Mexican Grill: According to the EDR Radius Report, Chipotle Mexican Grill, located at 345 S Mayfair Avenue, now 213 Westlake Center, stored less than 1,200 gallons of an undisclosed hazardous material. No records of spills or releases are associated with this database entry.

Additionally, Chipotle Mexican Grill is registered with the SMCEHD's Hazardous Materials Business Plan program for containing carbon dioxide and waste oil. Chipotle Mexican Grill was cited for violations in 2014 and 2016 regarding a lack of employee training for dealing with carbon dioxide; however, these violations were corrected in 2014 and 2017, respectively. As such, thus Chipotle Mexican grill is not considered a REC.

Sprint: According to the EDR Radius Report, Sprint located at 345 S Mayfair Avenue, now 335 Westlake Center, stored less than 1,200 gallons of an undisclosed hazardous material. No records of spills or releases are associated with this database entry, thus Sprint is not considered a REC.

Moto Photo: According to the EDR Radius Report, Moto Photo formerly located at 311 S Mayfair Avenue generates and recycles waste oil/solvents and stores less than 1,200 gallons of hazardous materials. No records of spills or releases are associated with this database entry, thus Moto Photo is not considered a REC.

5.2.2 Records Review Summary for Surrounding Sites

Leaking Underground Storage Tanks

According to Tables 3 & 4 there are 5 LUST listings within 1/4 mile from the Property (excluding the listing at Westlake French Cleaners), of which four are cross gradient/up gradient from the Property. Contaminants of concern that leaked from these 5 listings include:

- Two involving diesel,
- Three involving gasoline, and
- One undisclosed UST

Based on the inferred northeasterly groundwater flow, four of the LUST listings (Chevron Station, Daly City Wastewater, North San Mateo County Sanitation District WWTP, and Daly City Fire Station) are down or cross gradient from the Property and have all been closed; therefore, they not considered RECs in connection with the Property.

The LUST listing associated with the Arco Station at 151 Southgate Avenue is located upgradient from the Property and has not been closed. The identified contamination sources include former gasoline and waste oil underground storage tanks (USTs), and former fuel dispenser islands.

According to the Additional Assessment and Vapor Extraction Pilot Test Report (August 2016), concentrations of MtBE in shallow perched groundwater (approximately 55 feet bgs) are as high as 790 µg/L along the northern edge of the Arco Station, however concentrations are declining (Appendix I). Regional groundwater below the Arco Station is located at approximately 150 feet bgs. Sampling in February 2016 showed concentrations of constituents below laboratory reporting limits in the deep regional groundwater. Gasoline range organics (GRO) impact is localized to the area of the waste oil tank in shallow groundwater (15 to 35-feet bgs). BTEX and GRO are not present in the perched groundwater zone at 60 feet bgs at the LUST facility. As MtBE, BTEX, and GRO were not detected at the Property above laboratory reporting limits, the LUST at the Arco Station does not represent a REC for the Property.

Underground Storage Tank (UST) and Above Ground Storage Tank (AST)

According to Table 4, there are 16 USTs and 2 ASTs listings within 1/4 mile of the Property. These UST listings include the UST, SWEEPS UST, HIST UST, and CA FID UST database entries (defined in Appendix A). Five of the USTs listed in the EDR database were associated with the previously mentioned LUST listings. One of the UST listings corresponds to a LUST listing that is still open; however, as described above, this does not indicated a REC for the Property. As the other UST listings that have spilled and/or leaked received closure, they are not considered RECs.

Allied Waste Solutions and PG&E each own an AST within 1/4 mile of the Property. These ASTs contain up to 1,320 gallons of an undisclosed material (Appendix A). No spills or releases are associated with these ASTs, thus they do not pose RECs for the Property.

Automotive

According to Table 4 there are three listings associated with automotive repair facilities within 1/4 mile from the Property. Automobile garages typically use chlorinated solvents, petroleum hydrocarbons, organic solvents, heavy metals, antifreeze, refrigerants, and batteries. Two of the EDR Hist Auto database listings were also associated with LUST listings. These include the following addresses: 892 John Daly Boulevard and 151 Southgate Avenue. The LUST at 892 John Daly Boulevard has been closed by the SMCEHD; however, the LUST at 151 Southgate

Avenue is still open and described above. Thus, neither of these automotive facilities represent a REC for the Property.

Databases presented in Tables 3 and 4 whose listings are not described in Section 5.2.2 include do not provide information that would indicate an environmental concern.

6.0 SITE RECONNAISSANCE

Roux Associates conducted a reconnaissance of the Property on February 16, 2017, assisted by Property Manager Maria Teos of Kimco Realty. The current Property buildings, which were constructed in 1951, consists of a one-story commercial and retail building and a three story commercial, retail, and office building. At the time of the Site reconnaissance, the Property was occupied by multiple tenants.

The objective of the reconnaissance was to check for visual evidence of past or present use or storage of hazardous materials that could potentially affect the soil and groundwater quality at the Property. Ms. Maria Teos provided access to the Property. Photographs taken during the site reconnaissance are attached (Appendix H) and described below.

Roux Associates observed the buildings adjacent and nearby to the Property. The buildings surrounding the Property are primarily used for residential, commercial, and retail uses

During the site reconnaissance, Roux Associates entered all available tenant spaces to observe the operations and conditions of the space. Accuquest, Supercuts, Magic Touch Salon, and several dental offices were not accessible due to the manager not being present or store closure. Roux Associates does not consider these data gaps due to the nature of the businesses present.

6.1 Utilities

Electrical utilities and natural gas are provided to the Property by PG&E.

6.2 Hazardous Substances

No hazardous materials storage or disposal was observed at the site.

6.3 Polychlorinated Biphenyls

No transformers were observed at the site.

6.4 Staining and Stressed Vegetation

Staining is present within the elevator shaft and outer room. An unlabeled drum sits in the elevator shaft and stores hydraulic oil for the elevators. The staining is minimal and no observed

pathway to the subsurface is present in the bottom of the elevator shaft; as such, this is not considered a REC.

6.5 Drains and Sumps

Drainage was observed throughout the Property including the parking lot, the passageway between Buildings M and L, and restaurant spaces. Grease traps are present within restaurants. Used cooking oil from Broaster Chicken is stored in two 55-gallon drums behind the restaurant in the covered passageway.

6.6 Solid Waste

Solid waste is disposed of at the facility by Republic Services. Additionally, twelve 55-gallon drums containing soil were observed in the northeastern corner of the Property. According to Northgate, the soil was removed during excavation related to sewer line repairs.

6.7 Wastewater

The City of Daly City provides the Property's sewage services and potable water service.

6.8 Wells

There were two monitoring wells observed along the eastern boundary of the Property.

6.9 Soil Vapor Extraction System

The SVE system installed in the passageway east of the former Westlake French Cleaners (247 Westlake Center) was observed at the Property. A blower, two containers of granular activated carbon (GAC) and two SVE wells sat within the passageway. Additionally PVC pipe extends the east of the property to four additional SVE wells that are installed along Park Plaza Avenue.

6.10 Out-of-Scope Services

No out-of-scope services were provided. An assessment for LBP and ACM was not performed as part of this assessment. Based on the age of the building, LBP and ACMs may be present.

7.0 INTERVIEWS AND USER PROVIDED INFORMATION

Roux Associates incorporated an interview with key site managers and completed questionnaires provided by the Owner Kimco Westlake L.P. at the Property in this Phase I ESA. Information obtained from these sources was detailed throughout this report in various sections, as appropriate. Pertinent findings from these sources are summarized in Sections 7.1 and 7.2. The completed Questionnaire is provided in Appendix C.

7.1 Interviews

Roux Associates conducted interviews in person with the Ms. Maria Teos of Kimco, the current Property Owner on February 16, 2017. The interviews were completed concurrent with the site reconnaissance.

7.2 Owner Questionnaire

Roux Associates provided questionnaires to the property owner and received results on February 14, 2017. The Owner answered the following, to the best of her knowledge:

- No environmental cleanup liens exist in connection with the Property;
- No activity and land use limitations are in place at the Property;
- No specialized, personal knowledge or experience is related to the Property or nearby properties, other than information contained in the environmental reports provided to Roux Associates (Section 2.5);
- The purchase price of the Property fairly reflects the fair market value of the Property;
- No commonly known or reasonably ascertainable information is known about the Property, other than information contained in the environmental reports provided to Roux Associates (Section 2.5); and
- No knowledge of obvious indicators suggests the presence of contamination at the Property, other than information contained in the environmental reports provided to Roux Associates (Section 2.5).

This information is in agreement with the findings documented in other components of the Phase I ESA.

8.0 SUMMARY AND CONCLUSIONS

Roux Associates performed a Phase I ESA for the Property on behalf of Kimco Westlake L.P.

The Property is located in the northeastern corner of the Westlake Shopping Center bounded to the north by John Daly Boulevard and to the east by Park Plaza Drive. The southern and western extents of the Property are defined by the Work Area displayed in Figure 2. The Property comprises two buildings that total 49,827-square feet of commercial, retail, and medical/dental space.

This ESA was performed to identify RECs associated with the Property, indicating past, current, or material threats of the release of hazardous materials or petroleum hydrocarbons to the buildings, soil, groundwater, or surface water at the Property. The ESA was conducted by investigating past Property uses, reviewing the results of a search of environmental databases, reviewing records at relevant government agencies, and performing a reconnaissance of the Property and surrounding area.

This Phase I ESA is intended to define the historical uses of the Property and identify any potential RECs for the Property, as defined by ASTM International Standard Practice E1527-13. After review of the variety of information sources used to conduct the Phase I ESA, review of the EDR City Directory, Certified Sanborn Fire Insurance maps, and Aerial Photos (Section 4.0) indicate that the Property has been improved with the current retail and commercial buildings since its development in 1951.

Based on the data reviewed and Roux Associates' observations and understanding of the Property's use and conditions, one non-action REC was identified at the Property:

1. Available records indicate that a former drycleaners was located at 247 Westlake Center (formerly 330 South Mayfair Avenue before street reconfiguration). Subsurface investigations were conducted began in 2002 under the oversight of the San Mateo County Environmental Health Department (SMCEHD). The results indicated the soil vapor beneath Building L was impacted with tetrachloroethene (PCE) with PCE concentrations exceeding commercial Environmental Screening Limits (ESLs). A soil vapor extraction (SVE) system was installed and operated between June 2014 and April 2016. The SVE

system was currently shutdown and rebound testing will be completed in March 2017. Roux Associates considers this listing to be a non-action REC because the source of the PCE has been addressed.

There were no data gaps identified as part of the site reconnaissance. Based on the buildings' age, ACM and LBP are likely to be present in building materials; however, identification of these issues is out of scope for this Phase 1 Environmental Site Assessment.

9.0 REPORT ASSUMPTIONS AND LIMITATIONS

The Phase I ESA described herein was conducted by Roux Associates in accordance with ASTM Standard Practice E1527-13, which is consistent with the regulatory requirements for conducting all appropriate inquiries (40 CFR Part 312, Standards and Practices for All Appropriate Inquiries; Final Rule[5]). The preamble for the AAI Rule refers to ASTM E1527-05 and states:

> *In today's final rule, EPA is referencing the standards and practices developed by ASTM International and known as Standard E1527-05 (entitled "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process") and recognizing the E1527-05 standard as consistent with today's final rule. The Agency determined that this voluntary consensus standard is consistent with today's final rule and is compliant with the statutory criteria for all appropriate inquiries. Persons conducting all appropriate inquiries may use the procedures included in the ASTM E1527-05 standard to comply with today's final rule.*[6]

This AAI Rule was subsequently amended in 2013, as indicated in the following "Background":

> *With today's action, EPA is establishing that parties seeking liability relief under CERCLA's landowner liability protections, as well as recipients of brownfields grants for conducting site assessments, will be considered to have met the standards and practices for all appropriate inquiries, as set forth in the Brownfields Amendments to CERCLA and 40 CFR Part 312, if such parties follow the procedures provided in the ASTM E1527-13 "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." EPA made this determination based upon the Agency's finding that the ASTM E1527-13 standard is compliant with the All Appropriate Inquiries Rule. Therefore, parties conducting all appropriate inquiries may use the procedures in the newly issued ASTM E1527-13 standard when conducting all appropriate inquiries.*[7]

It is Roux Associates' understanding that this Phase I ESA was requested by Pellarin Enterprises so that Pellarin Enterprises may qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on liability under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). One of the requirements that a person acquiring real property must meet in order to qualify for one of these limitations on liability under CERCLA is to perform all appropriate inquiries in conformance with the AAI Rule (or the ASTM

---

[5] Final Rule and information available at www.epa.gov/swerosps/bf/regneg.htm#final_rule, and https://federalregister.gov/a/2013-31112.
[6] Federal Register: November 1, 2005 (Volume 70, Number 210), page 66081.
[7] Federal Register: December 30, 2013 (Volume 78, Number 250).

Standard Practice E1527-13) prior to acquisition of the property. Pellarin Enterprises has acknowledged that, under the AAI Rule, Roux Associates' performance of the Phase I ESA described herein will not alone result in Pellarin Enterprises satisfying all of the requirements of the AAI Rule and provide a defense to CERCLA liability. Further, Pellarin Enterprises has acknowledged that the AAI Rule requires that certain additional inquiries be undertaken to satisfy the CERCLA AAI requirements. **ACCORDINGLY, ROUX ASSOCIATES MAKES NO GUARANTEES OR WARRANTIES, EXPRESSED OR IMPLIED, REGARDING THIS PHASE I ESA, INCLUDING WITHOUT LIMITATION, ANY WARRANTY THAT THIS PHASE I ESA WILL IN FACT QUALIFY CLIENT FOR A DEFENSE TO CERCLA LIABILITY.**

Roux Associates has performed this Phase I ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. Professional judgments expressed herein are based on the facts currently available to Roux Associates.

The AAI Rule requires and the conclusions stated herein represent the application of a variety of engineering and technical disciplines to material facts and conditions associated with the Property. As such, these conclusions are based on subjective interpretations and the exercise of discretion. Many of these facts and conditions are subject to change over time. Accordingly, the conclusions must be considered within this context.

Pellarin Enterprises has agreed that Roux Associates shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time the Phase I ESA was performed. To the extent practicable, Roux Associates has identified data gaps, and has evaluated the potential significance of such data gaps.

This Phase I ESA Report should not be considered a legal interpretation of existing environmental laws and regulations. The Phase I ESA was conducted with a reasonable degree of inquiry to identify RECs, but uncertainty is not eliminated. No Phase I ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. The Phase I ESA process is intended to reduce, but not eliminate, the uncertainty involved with identifying RECs.

This Phase I ESA Report is not an appraisal or value judgment of the Property. Pellarin Enterprises has agreed that Roux Associates shall not be liable for any use of the Phase I ESA Report as an appraisal or value judgment of the Property.

The Phase I ESA Report has been prepared for the exclusive use of Pellarin Enterprises for specific application to the Property. Pellarin Enterprises has agreed that any third-party use of this Phase I ESA Report is Pellarin Enterprises sole responsibility and at Pellarin Enterprises' sole liability.

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312; and

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the appropriate inquiries in conformance with the standards and practices set forth in 40 CFR 312.

Respectfully submitted,

ROUX ASSOCIATES, INC.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/12/2016 has revealed that there are 4

RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 09/12/2016 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/31/2016 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there is 1 UST site within

approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History: Extracted from CRA's SEPTEMBER 2, 2009 SUBSURFACE INVESTIGATION AND WELL DESTRUCTION REPORT, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site

CHEVRON (Continued) **S100858432**

is an active Chevron service station located on the north side of John Daly Boulevard, approximately 100 feet east of Lake Merced Boulevard in Daly City, California (Figure 1). Existing station facilities include a store, car wash, and two gasoline underground storage tanks (USTs) connected to six dispenser islands by underground product line piping. 1998 Facility Replacement and Remedial Excavation: In July and August 1998, Armer/Norman Associates (ANA) of Walnut Creek, California removed the two hoists, dispensers, product lines, and five underground storage tanks (USTs) including three 10,000-gallon gasoline, one 10,000-gallon diesel, and one 1,000-gallon used-oil tanks. ANA transported approximately 250 cubic yards of excavated soil to an approved disposal facility, and new fuel USTs were installed in a new location. Touchstone Developments (Touchstone) collected soil samples from beneath the fuel USTs, used-oil UST, and product lines. One sample (TX1) collected from beneath the fuel USTs contained 283 milligrams per kilogram (mg/kg) total petroleum hydrocarbons as diesel (TPHd). No other hydrocarbons were detected in any of the other seven soil samples collected from beneath the fuel USTs. Hydrocarbon concentrations as high as 1,570 mg/kg TPHd and 4,900 mg/kg total petroleum hydrocarbons as gasoline (TPHg) were detected in soil collected from beneath the product lines at 5 feet below grade (fbg). Following over-excavation of soil to approximately 7 fbg in three locations with the highest hydrocarbon concentrations, concentrations beneath the product lines were reduced to 175 mg/kg TPHd and 395 mg/kg TPHg. No hydrocarbons were detected in soil beneath the used-oil UST. 2000 Soil Borings: Based on Touchstones sampling results, San Mateo County Health Services Department (SMCHD) requested that Chevron investigate the groundwater impacts beneath the site in an August 2, 1999 letter. In August 2000, Cambria Environmental Technology, Inc. (Cambria) advanced soil borings B-1 through B-4 to approximately 30.5 fbg. Boring B-3 contained the highest hydrocarbon concentrations of 69 mg/kg TPHd and 55 mg/kg TPHd at 15 fbg. Benzene was detected in soil at 30 fbg from B-1 at 0.20 mg/kg and B-3 at 0.031 mg/kg. Groundwater was first encountered at approximately 28 fbg. Hydrocarbons were detected in groundwater at soil borings B-1, B-2, and B-3, located between the former fuel USTs and dispenser islands at maximum concentrations of 22,000 micrograms per liter (gg/L) TPHd, 57,000 gg/L TPHg, and 1,000 gg/L benzene. No hydrocarbons were detected in B-4, defining the western extent of hydrocarbons in soil and groundwater. 2002 Well Receptor Survey: Cambria completed a well receptor survey to identify all municipal groundwater wells within a 2,000-foot radius of the site, and all domestic groundwater wells within a 400-foot radius of the site. In August and September 2001, Cambria mailed a one-page questionnaire to all property owners within a 400-foot radius and contacted the City of Daly City Water and Wastewater and SMCHD for record of any wells within 2,000 feet of the property. The search identified one drinking water well, two irrigation wells, 20 monitoring wells, an unknown well, four improperly destroyed wells, and five properly destroyed wells within a 2,000-foot radius of the site. A monitoring well owned by the City of Daly City is located approximately 500 feet north (downgradient) of the site. The nearest drinking water well is located approximately 2,100 feet south (upgradient) of the site near the intersection of Lake Merced Boulevard and Coronado Avenue (near the ARCO station). 2004 Well Installation: In April 2004, Cambria installed monitoring wells MW-2 through MW-4. The boring for MW-1 was not completed as a well to

CHEVRON (Continued) **S100858432**

protect an underlying aquitard at a depth of approximately 30 fbg. Monitoring wells MW-2 through MW-4 were completed as 4-inch diameter wells. No hydrocarbons were detected in soil from MW-2 and MW-3 and only low concentrations were detected in soil from MW-1 and MW-4. 2005 CTP Investigation: In December 2005, Cambria advanced Cone Penetration Test (CPT) borings CPT-1 through CPT-5. No petroleum hydrocarbons were detected in soil samples collected from borings CPT-3, CPT-4, and CPT-5. The only TPHg detected in soil was 3.8 mg/kg in CPT-2 at 45.5 fbg. The only benzene and MTBE detected in soil were 0.005 mg/kg benzene and 0.003 mg/kg MTBE in CPT-1 at 30.5 fbg. The highest hydrocarbon concentrations detected in grab-groundwater samples were 4,600 gg/L TPHg, 860 gg/L benzene, and 46 gg/L MTBE detected in CPT-2, located north of the former USTs. The highest TPHd concentration in groundwater was 8,100 %g/L in CPT-3, located west of the former USTs and north of the former dispenser islands. 2006 Well Installation: In October 2006, Cambria installed monitoring well MW-5 to 35 fbg, and deepened wells MW-2 to 60 fbg and MW-3 to 50 fbg. No TPHd was detected in any of the soil samples collected. The highest hydrocarbon concentrations in soil and groundwater were detected in MW-2, located north of the existing gasoline USTs. CRA installed groundwater monitoring wells MW-3R and MW-6 on May 7 and 8, 2009 and destroyed MW-3 by pressure grouting on May 8, 2009.

Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from RRM's February 8, 2010 Case Closure Summary, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is located at the City of Daly City Wastewater Treatment Plant located at the northeast corner of John Daly Avenue and Lake Merced Boulevard. The UST site is located in the southeast corner of the site, between two L-shaped buildings. The UST site is located east of the southerly L-shaped building. The existing USTs are overlain by a concrete slab, with two fuel dispensers located immediately west of the existing USTs. There are two southeast to northwest trending 33 diameter sanitary sewer lines immediately east/northeast of the UST excavation. In addition, a storm drain catch basin and storm drain pipe are also located northeast of the USTs. Four fuel USTs were formerly located at the WWTP near the vehicle maintenance operations for the Waste Water and Clean Water Department for Daly City. Two 10,000-gallon USTs were used to provide diesel fuel to an emergency generator and two 2,000 gallon unleaded gasoline USTs were used to fuel gasoline powered WWTP maintenance vehicles. A diesel pump pit, which connected the underground piping from the diesel tanks to the generators entered the building via an underground piping valve vault, was located near the northeast corner of the building. All of the old tanks and piping were replaced in 1998. The replacement included the installation of shoring around the existing tank excavation, and installation of new USTs at the same location as the old. During removal of the USTs, gasoline diesel contamination was found in soil in the area of the old fuel tank location. December 1989 to January 1990: A pressurized diesel fuel line connected from the adjacent building to a fuel pump in the diesel pump pit ruptured and leaked diesel into the soil. Samples collected by Applied Consultants in January 1990 indicated diesel contamination in the soils at the diesel pump pit. The underground piping and subsurface vault were removed. The diesel fuel line that connected the UST to the generator was replaced with steel piping. The piping was also relocated into a subsurface utility tunnel where visual inspection can be performed over the entire length of the piping. Soil samples P-1 through P-6 were collected

NORTH SAN MATEO COUNTY SANITATION DISTRICT WWTP (Continued) **S101438168**

from the excavation in the area of the diesel fuel release. The soil was excavated to a maximum depth of approximately 6 feet below grade surface (bgs). Approximately 86 cubic yards of soil were excavated and transported offsite for disposal. The excavation was not continued laterally and vertically due to the close proximity to the structure. The above information was obtained from the report, Soil Sampling Daly City Waste Water Treatment Plant, Applied Consultants, February 9, 1990. September 1991: Six soil borings were drilled north and south of the diesel pump pit. These borings, originally named B-1 through B-6, will be referred to in this report as HB-1 through HB-6 (Harding) to alleviate confusion with borings B-1 through B-5 drilled by EMC. HB-1 was located inside the limits of the diesel pump pit excavation. HB-2 was located north of the diesel pump pit, just south of the existing sanitary sewer lines. These borings were drilled to 20 and 25 feet bgs, respectively. The remaining four borings were drilled to 15 feet in depth, with HB-3 located southeast of the diesel pump pit and HB-4 and HB-5 located to the north of the existing 33 sanitary sewer lines. Diesel was detected in HB-1 at the former diesel pump pit excavation at the 10 and 15 feet depth intervals. Diesel was also detected in HB-6 9.5, just west of the storm drain inlet. Deeper samples from HB-6 at 15 and 20 feet were non detect for diesel. Diesel was also detected at the five foot depth interval of HB-3, which is southeast of the diesel pump pit. Diesel was not detected at any depth in HB-2, HB-3, HB-4, or HB-5. April 1997: Additional soil borings were installed as part of a pre-tank removal investigation in 1997. Three of the borings (B-1 through B-3) surrounded the UST excavation. Boring B-5 was located between the UST excavation and diesel pump pit excavation. The fifth boring, B-4, was drilled in the diesel pump pit excavation. B-1 through B-3, the borings surrounding the UST excavation, were drilled to approximately 20 feet in depth. B-4, drilled through the diesel pump pit excavation, was extended to 35 feet in depth. Boring B-5, located between the diesel pump pit and UST excavation, was only advanced to 8 feet in depth due to auger refusal. An imported loose gravel backfill was encountered in borings B-1 through B-4 to depths of up to 14 feet bgs (boring B-1). Soils beneath the gravel generally consisted of interbedded sand, silty sand, and sandy silt. A silty clay was encountered in boring B-1 from 19 feet bgs to the total depth of the boring (21.5 feet bgs). Diesel was detected in all three borings (B-1 to B-3) surrounding the UST excavation, at both the 15 and 20 feet sampling interval. Gasoline was also reported in B-1 and B-2 but was not detected in B-3. At the diesel pump pit excavation, diesel was detected in boring B-4 at depths ranging from 6 to 26 feet in depth. Diesel was not detected in a deeper sample collected at 30 feet. During this phase of investigation, soil samples were analyzed for MTBE and lead. MTBE was not detected in any of the soil samples. Lead was detected at concentrations ranging from 1 to 11 mg/kg. None of the reported lead concentrations are above regulatory levels. December 1998: The four existing USTs were removed and replaced in essentially the same location. The removal of the USTs required the installation of shoring. During the tank replacement effort, 1,010 cubic yards of diesel impacted soils were removed from the limits of the shoring and disposed off site. After installation of the new tanks, clean backfill was placed in the excavation. Soil samples SS-1 through SS-18 were collected from below the removed USTs and from the limits of the excavation to depths up to 18 feet below ground surface. The results of the sampling indicated gasoline and diesel in

NORTH SAN MATEO COUNTY SANITATION DISTRICT WWTP (Continued) **S101438168**

SS-1 through SS-6, collected below the former USTs. In addition, diesel was also detected at the 15 or 18 feet depth interval in samples collected along the western (SS-10 and SS-12) and northern (SS-13 and SS-14) limits of the excavation. Soil samples collected below the gasoline tanks (SS-5 and SS-6) were also analyzed for lead. Lead was detected in both samples at 3 mg/kg, well below any regulatory level. All 28 soil samples during this phase were also analyzed for MTBE. MTBE was detected in SS-13 15 at a concentration of 0.584 mg/kg. MTBE was not detected in any of the remaining 27 samples.

Title:	SEL 10/05/2015 for North San Mateo County Sanitation District
Description:	Unauthorized release occurred between December 11 and

NORTH SAN MATEO COUNTY SANITATION DISTRICT WWTP (Continued) **S101438168**

December 12, 2014 (Violation ID#985190) due to effluent pump malfunction during significant rain events. More than 22,000 gallons of secondary treated but undisinfected effluent overflew into the storm drain and the Pacific Ocean. We followed it up in the 2015 Compliance Evaluation Inspection which, among other things, required NSMCSD to submit a comprehensive discussion of corrective actions taken or planned to improve their wastewater collection and treatment practices. NSMCSD responded on November 19, 2015, in part, by revising and resubmitting its December 2014 SMR to address the issue. See attachments.

Title:	NOV 11/22/2013 for North San Mateo County Sanitation District
Description:	On December 13, 2012, the District discharged 1.31 million gallons of partially disinfected effluent into the Pacific Ocean. The incident occurred after 100 gallons of sodium bisulfite was accidentally pumped into the tank storing sodium hypochlorite, neutralizing its chemical strength. For two periods, totaling 3 hours and 42 minutes, the District allowed the plant discharge to proceed without evidence that adequate chlorine was present in the contact basin. The District did not report the incident discussed above to the Regional Water Board, the California Emergency Management Agency, or local health officers.

Title:	Oral Com 09/23/2013 for North San Mateo County Sanitation District
Description:	Overflow of 125 gallons sewage from Headwork#2 to a stormdrain. WB staff determined oral com was appropriate becasue: (1) the incident was relatively minor (2) the corrective actions the Discharger implemented were adequate, and (3) no similiar incident occured recently (the last release occurred in August 1995).

NORTH SAN MATEO COUNTY SANITATION DISTRICT WWTP (Continued) **S101438168**

Title:	Oral Com 08/01/2013 for North San Mateo County Sanitation District
Description:	During the first week of this month the scheduled weekly final effluent Enterococcus sample was not collected. WB staff concurred with Discharger's corrective measures (Discharger's staff has reviewed sampling schedules and procedures. The Lab supervisor has been directed to review all scheduled sampling requirements collected for the week and on Thursdays he is required to verify all have been collected and sent out or analyzed on site. Furthermore, he is to review and prepare a report advising staff that sampling for the prior week is or is not complete and state what the upcoming weeks sampling schedule will be.)

Title:	Oral Com 11/30/2012 for North San Mateo County Sanitation District
Description:	For the month of November 2012 there was only one ammonia nitrogen sample collected; the second sample was scheduled but inadvertently not collected. The WB staff concurred with Discharger's proposed corrective measure, covering both Violation ID # 942716 and # 940928. (The corrective measure going forward is the Ammonia Nitrogen sample will be collected weekly up to 4 times per month.)

Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline, MTBE / TBA / Other Fuel Oxygenates
Site History:	Extracted from Stantec's June 14, 2010 Additional Site Assessment Report and Site Conceptual Model, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is located at the southern corner of the intersection of Southgate Avenue and Lake Merced Boulevard in Daly City, California. The site is an active retail fuel dispensing facility with a station building and service area, six dispensers, two blended gasoline underground storage tanks (USTs) and one waste-oil UST. Currently the site has six groundwater monitoring wells (MW-1 through MW-6) and eight soil vapor extraction (SVE) wells (V-1 through V-8), one of which is used for groundwater monitoring (V-8). During the most recent assessment, wells MW-7, MW-8, and MW-9 were installed. A remediation equipment compound is located in the southern corner of the site. Mixed commercial and residential properties surround the site. Burlington Coat Factory is located to the east of the site; two apartment complexes are located south and north of the site, a dry cleaner facility and a shopping mall are located west of the site. Site topography slopes to the northwest, at an approximate elevation of 100 feet above mean sea level (MSL). Regionally, topography near the site slopes toward the east northeast. According to the California State GeoTracker database, former Southgate Cleaners is located at 183 Southgate Avenue, Daly City, approximately 100 feet west-southwest of the site. A review of available site information indicates that a leak of tetrachloroethylene (PCE) has occurred on the property from former dry cleaning operations. Based on the information presented Treadwell & Rollos February 11, 2110 Work Plan for Additional Site Investigation, it appears dry cleaning solvent vapor is present in the shallow soil at adjacent to the western property line of the subject site. Additional assessment adjacent to the subject site has been proposed by Treadwell & Rollo. An initial subsurface investigation was performed at the site in March 1992. The results of this investigation indicated that soil and groundwater in the vicinity of the gasoline UST complex had been impacted by petroleum hydrocarbons. Soil in the vicinity of the waste oil UST was also found to be impacted by both low boiling point hydrocarbons which were quantified as total petroleum hydrocarbons as gasoline

ARCO #0465 (Continued) **S101303078**

(TPHg) and higher boiling point hydrocarbons which were quantified as TPH as diesel (TPHd) and total recoverable petroleum hydrocarbons (TRPH). Low concentrations of semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs) were also reported in soil samples collected during the assessment. Groundwater monitoring wells MW-1 and MW-2 were installed at depths of approximately 70.5 feet and 61.5 feet below ground surface (bgs), respectively, to intercept a perched groundwater horizon. In October and November 1992, following additional subsurface investigation activities, deep groundwater monitoring well MW-3D was installed to a depth of approximately 220 feet bgs to intercept the upper portion of the regional groundwater aquifer. The GPP noted in a letter dated July 5, 2001, that because MW-3D is screened from 202 bgs to 220 feet bgs (below an approximate 10-foot-thick clayey silt to silty clay zone) ... (MW-3D) may represent the deeper drinking water aquifer." In January 1993, quarterly groundwater monitoring activities were initiated at the site. In June 1993, groundwater monitoring well MW-4 was installed to a depth of approximately 63 feet bgs to further assess groundwater quality in the perched groundwater horizon. In March through May 1993, an internal combustion engine SVE system was installed and started at the site. The system, which initially utilized wells V-1, V-2, V-3, V-6, V-7, V-8, MW-1, and MW-2 was operated through April 1994, when the internal combustion engine was removed. During this period of operation, an estimated 5,494 pounds of TPHg were removed from beneath the site. In June 1995, a catalytic oxidizer unit was installed and the SVE system was restarted utilizing the same well array used in July 1993. Based on a decrease in extracted petroleum hydrocarbon vapor concentrations by the SVE system and consistently low to non-detectable concentrations in groundwater, the SVE system was shut down in October 1997, and site closure was requested in November 1997. At that time, the site and vicinity contained four groundwater monitoring wells and eight SVE extraction wells (V-1 through V-8). An estimated total of 11,563 pounds of TPHg and 45.34 pounds of benzene were recovered during operation of the SVE system. On October 21, 1997, Gettler-Ryan removed a 520-gallon capacity waste oil UST and excavated the UST cavity to approximately nine feet bgs. On October 30, 1997, Gettler-Ryan further excavated the pit to a depth of approximately 15 feet bgs, and in an easterly direction, to a depth of approximately 3 feet from the edge of the original excavation. Approximately 60 cubic yards of soil excavated from the pit was transported for offsite disposal by Dillard Trucking. The new waste oil UST and associated piping and vents were replaced, the excavation was backfilled, and the surface asphalted on October 31, 1997. In January 1998, six confirmation soil borings (CSB-1 through CSB-6) were advanced to determine if operation of the temporary soil vapor extraction system had reduced the gasoline concentration in soil to levels acceptable for regulatory case closure. The borings were advanced to depths ranging from 30.5 feet to 55.5 feet bgs using a drill rig equipped with 8-inch diameter hollow stem augers. Results of the investigation indicated that concentrations of TPHg, TPHd, and TRPH were present in soil samples collected from CSB-5 and CSB-6. Soil samples collected from CSB-6 were also reported to contain concentrations of heavy oil. Benzene was not detected in any of the soil samples collected. MtBE was reported in soil samples collected from the boring of CSB-3 at depths of 15 and 21 feet bgs. Concentrations of ethylbenzene, total xylenes, 2-methylnaphthalene, PCB aroclor 1248, and total metals were detected in soil samples

ARCO #0465 (Continued) **S101303078**

collected from CSB-6 at depths of 5 and 15 feet bgs. On March 4, 1999, Gettler-Ryan removed the product lines which carried fuel from the USTs to the three fuel pump islands at the site. The soil underlying the fuel line trenches was observed to be stained and exhibited a gasoline odor. As the excavation continued, product odor and gray staining of the soil were observed in the trench between the central and northern two pump islands. Six trench floor soil samples (T-1 through T-6) and eight soil samples from beneath the dispensers (D-1 through D-8) were collected and analyzed for TPHg, BTEX, MtBE, and lead. Due to elevated concentrations of gasoline in soil samples T-2, T-4, T-6, D-5, and D-8, soil was excavated to approximately 8 to 10 feet bgs and confirmation samples (T-2A, T-4A, T-6A, D-5A, and D-8A) were collected from the bottom of the over-excavated trenches. Approximately 127 tons of soil were removed from the site after the excavation, and transported by Dillard Trucking to a Browning Ferris Industries offsite disposal facility for proper disposal. Between August 28, 2000 and September 6, 2000, two 10,000-gallon unleaded gasoline USTs, one 8,000-gallon UST, and associated product lines and dispensers were removed from the site. Over-excavation of the UST area was confined to the expansion area intended for the new USTs. During UST replacement activities performed in August and September 2000, Henderson Construction Company, the ARC subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a mixture of gasoline and rinsate water from one of the gasoline USTs. The spill was apparently caused by attempting to remove the UST with the rinsate water still inside the UST. A portable dual-phase extraction (DPE) system was mobilized to the site shortly thereafter, and operated for a 10-day period to mitigate the effects of the reported release. As previously noted, during UST replacement activities performed in August and September 2000, Henderson Construction Company, the ARC subcontractor performing the replacement, reported an unauthorized release of approximately 500 gallons of a mixture of gasoline and rinsate water from one of the gasoline USTs. The spill was apparently caused by attempting to remove the UST with the rinsate water still inside the UST. A portable dual phase extraction (DPE) system was subsequently mobilized to the site by Cal Clean, and operated for a 10-day period to mitigate the effects of the reported release. Since downhole stingers were not used and groundwater was not recovered during the test, the equipment was used as soil vapor extraction system that extracted soil vapor at 250 standard cubic feet per minute (scfm) with a system vacuum of 16-inches of mercury. A source test was performed utilizing wells V-1, V-2, V-5, and V-8, and SVE was subsequently performed utilizing wells V-1, V-2, and V-5 as extraction wells, and wells V-4, V-6, V-7, and V-8 as observation wells. Individual extraction test were completed using wells V-1, V-2, and V-5. Field observations and measurements recorded during the SVE event resulted in calculation of a maximum effective radius of influence (ROI) of 50 feet in groundwater. The ROI was calculated using induced vacuum readings collected from wells V-4, V-6, V-7, and V-8 that were located from 20 to 95 feet away from the extraction well V-2. The induced vacuum readings ranged from 2.3 to 5.5-inchs of water in response to a system vacuum of 16-inches of mercury. During the 240-hour SVE event, approximately 4,333 pounds (713 gallons) of petroleum hydrocarbons were removed from the subsurface, a mass significantly greater than the reported release of approximately 500 gallons of a gasoline and rinsate mixture. A review of the data

ARCO #0465 (Continued) **S101303078**

collected during the extraction event indicated that SVE wells located in the vicinity of the former fuel UST cavity and the area of the waste oil UST yielded the highest soil vapor concentrations. Soil vapor concentrations from well V-5 yielded concentrations that continued on an increasing trend throughout the 10-day period. The increase of petroleum hydrocarbons in soil vapor samples collected from V-5 at the conclusion of the interim event indicated that petroleum hydrocarbon mass remains in soil in the area of the former waste oil UST. Based on the past performance of the SVE remediation efforts, SECOR concluded that soil vapor extraction is a viable technology for removing petroleum hydrocarbon mass from the unsaturated soil beneath the site. In November 2001, SECOR installed two wells (MW-5 and MW-6) and advanced one soil boring (SB-1). Wells MW-5 and MW-6 were completed at a depth of 60 feet bgs. Groundwater samples have been obtained from MW-6, but MW-5 has been generally dry since the well was installed. Recent groundwater samples collected from MW-5 in July 2008 indicated elevated concentrations of gasoline range organics (GRO), MtBE, and tert-butyl alcohol (TBA). The soil boring of well MW-5 was advanced approximately 2.5 feet into a silty clay layer, and the well was installed at 60 feet bgs to avoid penetrating a clay layer that was encountered at 57.5 feet bgs. In April 2003, URS performed additional characterization in the vicinity of MW-5 to determine whether shallow groundwater was present at a depth greater than the 60-foot completion depth of MW-5, and to characterize the vertical extent of petroleum hydrocarbons and fuel oxygenates at this location, near the waste oil UST. Boring MW-5A was drilled adjacent to MW-5 and soil was sampled to a depth of 85 feet. After drilling through a sandy clayeysilt and clayey silty sand from approximately 60 to 64 feet bgs, the augers were left open for observation for over one hour at a depth of 66 feet bgs in a moist silty sand. No water accumulated in the borehole, so an additional well was not installed at this location. GRO and BTEX with concentration greater than the laboratory reporting limits were detected in soil samples collected from 60.5 to 85 feet in the boring. However MtBE with concentrations ranging from 0.12 to 1.0 mg/kg were reported in the soil samples collected from 60.5 to 85 feet bgs. In September 2005, URS advanced nine soil borings (SB-1 renamed SB-1A, SB-2 through SB-5, and SB-7 through SB-10) to depths ranging from 50 to 81 feet bgs in order to further assess the vertical and lateral extent of dissolved hydrocarbons in the subsurface. Soil boring SB-6 was not advanced due to refusal at approximately 5 feet bgs. Grab groundwater samples were collected from onsite boring SB-3, offsite borings SB-4, SB-5, and SB-7 through SB-10. Based upon the results of this investigation, URS recommended the installation of three additional offsite groundwater monitoring wells (MW-7 through MW-9) to further delineate the lateral extent of dissolved petroleum hydrocarbons offsite. In a letter dated October 11, 2007, the GPP approved the scope of work previously proposed by URS. After access was granted to the offsite property located northeast of the site for the installation of well MW-9, the installation of wells MW-7 through MW-9 was performed on August 28 and 29, 2008.
