CERS:
Name: GENON DELTA LLC
Address: 696 W 10TH ST
City,State,Zip: PITTSBURG, CA 94565-1806
Site ID: 398431
CERS ID: 10152487
CERS Description: Chemical Storage Facilities

Violations:
Site ID: 398431
Site Name: GenOn DELTA LLC
Violation Date: 06-12-2019
Citation: 22 CCR 15 66265.197 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.197
Violation Description: Failure of owner or operator to properly close a hazardous waste tank system ensuring the minimization of further maintenance and that the required requirements have been met.
Violation Notes: Returned to compliance on 06/12/2019. OBSERVATION: Owner/Operator failed to properly notify the CUPA prior to the initiation of closure of a hazardous waste tank system per 22 CCR - 67383. CORRECTIVE ACTION: Notification requirement is not resolvable. Facility will/has submit photos/documentation to the CUPA demonstrating the hazardous waste tank system has been closed in accordance with the requirements of 22 CCR 15 66265.197, and facility has complied with the requirements of 22 CCR 15 66265.111. and 66265.114.

Site ID: 398431
Site Name: GenOn DELTA LLC
Violation Date: 06-12-2019

NRG DELTA, LLC (Continued) **U001597931**

Citation:	HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description:	Failure to prepare an SPCC Plan that meets all applicable requirements.
Violation Notes:	Returned to compliance on 06/25/2019. OBSERVATION: Failure to prepare an SPCC Plan that meets all applicable requirements. The diesel fueling container is referred to as a permanently closed container in the SPCC Plan. However, it has not been properly permanently closed. CORRECTIVE ACTION: Complete or revise SPCC plan that meets all applicable requirements or properly permanently close the diesel container.
Violation Division:	Contra Costa County Health Services Department
Violation Program:	APSA
Violation Source:	CERS
Site ID:	398431
Site Name:	GenOn DELTA LLC
Violation Date:	06-12-2019
Citation:	HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Description:	"Failure to test or inspect each aboveground container for integrity based on industry standards as discussed in the SPCC Plan: 1. On a regular schedule. 2. After making material repairs. 3. Use non-destructive testing. 4. Inspect each containerG s supports, foundations, and outside for signs of deterioration, discharges, or accumulation of oil inside diked areas."
Violation Notes:	Returned to compliance on 07/12/2019. OBSERVATION: Failure to test or inspect each aboveground container for integrity based on industry standards. The SPCC Plan states that it is not possible to physically enter the fuel oil tanks and a comprehensive API 653 inspection is not possible. The plan does not provide environmental equivalence to meet the requirements. CORRECTIVE ACTION: State the reasons for non-conformance in your plan and describe in detail alternate methods and how you will achieve equivalent environmental protection. Or, test or inspect each aboveground container for integrity based on industry standards. Facility can update the SPCC Plan to do a risk based inspection in accordance with API standards. Maintain testing and inspection records.

Hazardous Waste Summary:

Waste Code:	D000
Waste Description:	Not Defined
Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D002
Waste Description:	CORROSIVE WASTE
Waste Code:	D003
Waste Description:	REACTIVE WASTE

PITTSBURG GENERATING STATION (Continued) **1015730702**

Waste Code: D004
Waste Description: ARSENIC

Waste Code: D005
Waste Description: BARIUM

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D009
Waste Description: MERCURY

Waste Code: D011
Waste Description: SILVER

Waste Code: D018
Waste Description: BENZENE

Waste Code: D022
Waste Description: CHLOROFORM

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F001
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS

PITTSBURG GENERATING STATION (Continued) **1015730702**

CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: U003
Waste Description: ACETONITRILE (I,T)

Waste Code: U044
Waste Description: CHLOROFORM (OR) METHANE, TRICHLORO-

Waste Code: U123
Waste Description: FORMIC ACID (C,T)

Waste Code: U239
Waste Description: BENZENE, DIMETHYL- (I,T) (OR) XYLENE (I)

Hazardous Waste Summary:
Waste Code: D000
Waste Description: Not Defined

Waste Code: D001
Waste Description: IGNITABLE WASTE

PITTSBURG GENERATING STATION (Continued) **1015730702**

Waste Code: D002
Waste Description: CORROSIVE WASTE

Waste Code: D003
Waste Description: REACTIVE WASTE

Waste Code: D004
Waste Description: ARSENIC

Waste Code: D005
Waste Description: BARIUM

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D009
Waste Description: MERCURY

Waste Code: D011
Waste Description: SILVER

Waste Code: D018
Waste Description: BENZENE

Waste Code: D022
Waste Description: CHLOROFORM

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F001
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

PITTSBURG GENERATING STATION (Continued) **1015730702**

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: U003
Waste Description: ACETONITRILE (I,T)

Waste Code: U044
Waste Description: CHLOROFORM (OR) METHANE, TRICHLORO-

Waste Code: U123
Waste Description: FORMIC ACID (C,T)

Waste Code: U239
Waste Description: BENZENE, DIMETHYL- (I,T) (OR) XYLENE (I)

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/30/2020

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/30/2020

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 04/03/2019

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 12/14/2020

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 12/14/2020

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

US INST CONTROLS: Institutional Controls Sites List

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities

Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

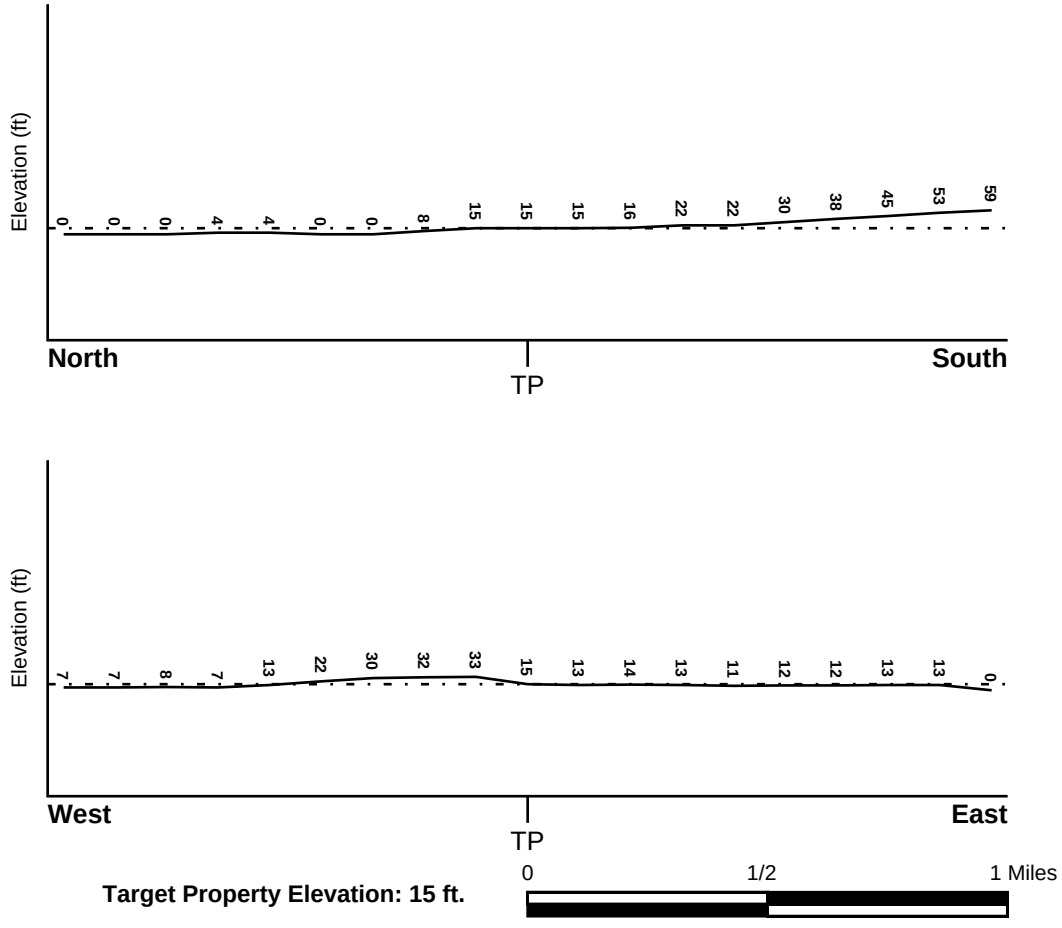
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06013C0119G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06013C0117G	FEMA FIRM Flood data
06013C0136G	FEMA FIRM Flood data
06013C0138G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
HONKER BAY	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
4	1/8 - 1/4 Mile SSW	Not Reported
104	1/2 - 1 Mile West	N
1G	1/2 - 1 Mile West	N
3G	1/8 - 1/4 Mile SSW	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: RINCON

Soil Surface Texture: clay loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
2	11 inches	29 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
3	29 inches	59 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: CLEAR LAKE

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	29 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.4 Min: 0.42	Max: 8.4 Min: 7.4
2	29 inches	59 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.4 Min: 0.42	Max: 8.4 Min: 7.4

Soil Map ID: 3

Soil Component Name: CAPAY

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

2	35 inches	51 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.4 Min: 0.42	Max: 8.4 Min: 6.6
3	51 inches	72 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 1.4 Min: 0.42	Max: 8.4 Min: 6.6

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by GSI Environmental were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by GSI Environmental were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

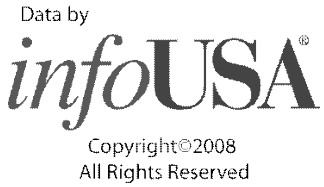
EXECUTIVE SUMMARY



DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

RESEARCH SUMMARY

1 INTRODUCTION

On behalf of Pittsburg River Park, LLC (PRPLLC), Arcadis U.S., Inc. (Arcadis) has prepared this Revised Five-Year Review Report ("Report") to confirm that the human health and the environment continue to be adequately protected by the remediation systems in place at the former Johns Manville Facility located at 420 East Third Street in Pittsburg, California (Figure 1). Investigation activities included evaluation of the engineered cap at the North Parcel and the engineered containment berm cap (Berm Parcel) located along the eastern portion of the former Johns Manville Plant Site (former Plant Site). This is the fourth Five-Year Review Report prepared for the North Parcel and the first for the Berm Parcel. The first Five-Year Review for the North Parcel was prepared by Harding ESE, Inc. (Harding [2001b]), the second report was prepared by Environmental Resources Management-West, Inc. (ERM [2006a]), and the third report was prepared by Arcadis (2012). This fourth Five-Year Review was performed in accordance with the Five-Year Review Work Plan (Work Plan; Arcadis 2015), submitted to the California Department of Toxic Substances Control (DTSC) on December 21, 2015, the comments received from the DTSC in its the *Comments on Five-Year Review Work Plan* correspondence dated February 25, 2016 (DTSC 2016a), and the comments received from the DTSC regarding the Five-Year Review Report in their letter dated October 12, 2016 (DTSC 2016b).

This Five-Year Review was implemented as required by and in accordance with the following documents:

- Operation and Maintenance (O&M) Agreement for the former Plant Site between PRPLLC and the DTSC, signed September 25, 2009 (DTSC 2009a); and
- O&M Agreement for the former Johns Manville Property (North Parcel) between PRPLLC and the DTSC, also signed September 25, 2009 (DTSC 2009b).

A modified schedule was approved to align the Five-Year Reviews for both the North Parcel and Berm Parcel into one event, which took place between March 29 and March 31, 2016.

2 BACKGROUND

The former Johns Manville Facility consists of two distinct parcels located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California. These properties are shown on Figure 1.

2.1 North Parcel

The North Parcel is an approximately 4.2-acre parcel located north of the former Plant Site between (and bounded by) New York Slough to the north and East Third Street to the south (Figures 1 and 2). The North Parcel is currently vacant land and the zoning for the North Parcel is industrial.

The North Parcel was reportedly used by Johns Manville for the storage of asbestos-containing products prior to shipment. As a result of this historical site use, asbestos-containing material (ACM) was deposited onto the ground. Johns Manville performed various investigations to assess the lateral and vertical extent of ACM at the North Parcel. The results of these investigations led to the development of a remedial approach that included placing an engineered cap over the parcel to prevent future direct exposure to ACM at the North Parcel. Under a Voluntary Cleanup Agreement (VCA), Johns Manville personnel

oversaw routine operation and maintenance inspections in accordance with the Final Operations and Maintenance Plan, Asbestos Soil Cap, Johns Manville Pittsburg Plant – North Parcel Site, Pittsburg, California (O&M Plan; Harding 2001a). PRPLLC purchased the property in October 2004 and entered into a VCA with the DTSC in 2005 (DTSC 2005). In 2006, ERM prepared a revised O&M Plan when they submitted to the DTSC the Final Operation and Maintenance Plan North Parcel, Former Johns Manville Plant, Pittsburg, California (Final O&M Plan; ERM 2006b), which has been followed to date. The Final O&M Plan for the North Parcel is included in the 2009 O&M Agreement between the DTSC and PRPLLC (DTSC 2009b).

2.1.1 Summary of Remedial Activities

In 1986, Harding Lawson Associates (HLA) prepared a Remedial Investigation/Feasibility Study (RI/FS) for the North Parcel (HLA 1986). The RI/FS indicated that ACM was present on approximately 3.6 acres of the 4.2-acre parcel in concentrations greater than 1 percent by weight. The DTSC classified ACM as a California-regulated hazardous waste if it is friable and contains 1 percent or more asbestos. Windblown dispersal of particulates was identified as the most significant potential exposure risk, and an engineered cap was chosen as the most appropriate solution to mitigate this exposure pathway. In the 1986 RI/FS additional remedial action alternatives were assessed, including soil removal and other cover alternatives; however, the soil cap was chosen based on effectiveness, economic factors, and because it was most consistent with Johns Manville's long-term land use plans (HLA 1986). In a letter dated December 11, 1986, the DTSC concurred that a soil cap would provide adequate protection from potential airborne asbestos exposure, providing the cap was installed properly.

The engineered cap construction was performed between December 1987 and March 1988. HLA oversaw the engineered cap construction by E.G. Alves Construction Company, Inc., and was present on site to observe construction activities and conduct field and laboratory testing to ensure that fill material and its placement were in compliance with the engineered cap design specifications.

2.1.2 Description of Engineered Cap

The construction plans and technical specifications for the engineered cap were prepared by HLA and documented in the Property Restoration Construction Observations report (HLA 1988), and included:

- Scarifying, moisture conditioning, and compacting of the existing ground surface;
- Placing a minimum 9-inch to greater than 24-inch-thick layer of engineered fill to form a continuous cover over the ACM, and grading the cover material to facilitate drainage;
- Installing an automated sprinkler system;
- Hydroseeding the engineered cap with a grass seed mixture appropriate to climatic and soil conditions; and
- Constructing a fence around the perimeter to prevent public access to the North Parcel.

According to the grading plan, the slope of the engineered cap ranges from 0.5 to 10 percent, which promotes general sheet flow of irrigation and/or storm water runoff to the east and west of the North Parcel.

A swale along the western edge of the North Parcel, running generally south to north, collects and directs surface runoff towards a catch basin. The remedial action meets the requirement of the Bay Area Air Quality Management District (BAAQMD) Regulation 11, Rule 2, Section 305.3 (BAAQMD 1998) and the Code of Federal Regulations (CFR) Title 40, Part 61, Subpart M, National Emission Standards for Hazardous Air Pollutants, Section 151 (CFR 1990). Both regulations require that inactive asbestos waste disposal sites are covered with a minimum of 6 inches of compacted, non-asbestos material with a vegetation cover, grown and maintained on the area to prevent asbestos exposure.

A permanent irrigation system was installed at the North Parcel at the time the engineered cap was completed to provide water for vegetation support and maintenance. The original irrigation system fell into disrepair and was replaced in July 2005. The current system consists of an aboveground polyvinyl chloride piping irrigation system, including four control stations and a total of 34 irrigation heads. The system includes four timer-activated, battery-operated valves so that the system can be operated at night to minimize evaporation. The system is configured such that routine mowing can be performed.

2.1.3 Operation and Maintenance

Initially, inspection of the engineered cap was performed periodically by Johns Manville, then changed to quarterly, pursuant to the 2001 O&M Plan (Harding 2001a). In 2004, inspections were changed to a semiannual inspection schedule conducted at the end of the second quarter (June) and fourth quarter (December) of each calendar year (ERM 2006b and DTSC 2009b). The objective of these inspections is to evaluate signs of erosion, settlement, cracking, poor and/or unusually discolored vegetation, and animal intrusion. Maintenance has consisted of mowing, fertilizing, and reseeding the vegetative cover as needed. Aside from minimal disturbance by burrowing animals (corrected and detailed in various semiannual monitoring reports), and a one-time cap repair following a utility truck leaving ruts in the engineered cap in 2006, which was described in the *Second Five-Year Review North Parcel Remedial Action Former Johns Manville North Parcel* (ERM 2006a), there has not been any other damage to the cap requiring corrective actions. The above-mentioned issues were promptly addressed by filling in the cap with clean fill and seeded to meet surrounding cap conditions.

In December 2007, the DTSC and PRPLLC entered into a *Land Use Covenant* (Contra Costa County Recorder Office 2007) for the North Parcel. The *Land Use Covenant* prohibits the use of the property for residential and other sensitive uses and requires that a *Soil Management Plan* and a *Health and Safety Plan* be submitted and approved by the DTSC prior to conducting any activities that will disturb the integrity of the engineered cap (such as excavation or trenching). In addition, the DTSC and PRPLLC entered into an *O&M Agreement* in September 2009 (DTSC 2009b). The O&M Agreement outlines the monitoring requirements, including conducting Five-Year Reviews of the North Parcel.

Five-Year Reviews have been performed at the North Parcel in 2001, 2006, and 2011 (Appendix A). In each review, field investigations included a site inspections, excavation of test pits, and air monitoring. The thickness of the engineered cap was visually examined in test pits, hand dug with shovels and/or hand augers, and found to range from 9 to 24 inches thick, which was consistent with the *Property Restoration Construction Observations* report (HLA 1988). Air monitoring was performed before, during, and occasionally after the test pits were properly backfilled and compacted using hand-tampers to quantify the presence of any airborne asbestos released from these activities. Airborne asbestos was not detected during any of the prior *Five-Year Review* events. Due to the field verified cap thicknesses, the lack of

airborne asbestos, and condition of the engineered cap, these Five-Year Reviews concluded that the engineered cap was in good condition, effectively protecting human and environmental health, and that there was no need to amend the approved *Final O&M Plan*.

Semiannual inspections of the cap have occurred continuously since the last Five-Year Review in 2011, and results of these inspections have been documented in semiannual O&M reports (Appendix A). No significant damage or issues has been identified during the 2016 inspection at the North Parcel since the previous Five-Year Review in 2011.

2.2 Former Plant Site and Berm Parcel

The former Plant Site, which contains the Berm Parcel, is located approximately 1,000 feet south of New York Slough (Figure 1). This 21-acre former Plant Site is bounded to the north by East Third Street, and a Tesoro petroleum coke facility; to the east by Harbor Street, several small light-industrial businesses, and USS-POSCO Industries; to the south by a City of Pittsburg park; and to the west by residential properties. The Johns Manville facility at this site was used for the manufacturing of commercial roofing materials until 2003, when it terminated operations.

2.2.1 Summary of Remedial Activities

A review of Johns Manville's historical operations, as well as site-wide investigation data, indicated that the areas of potential concern at the former Plant Site were a former evaporation pond and several additional areas of concern that were discovered while abatement and demolition activities were being conducted. ERM, on behalf of PRPLLC, assessed the remediation alternatives, documented in the *Final Remedial Action Plan* (ERM 2006c), and determined the most effective course of remedial action for the former Plant Site would be the construction of engineered containment berms along the eastern boundary of the former Plant Site. The details of the construction of the berms were summarized in the *Remedial Design and Implementation Plan* (RDIP; ERM 2006d), and in the Levine Fricke, Inc. (LFR; now Arcadis), *Addendum to the Remedial Design and Implementation Plan* (ARDIP; LFR 2007). During site remediation, heavy equipment was used to scrap all areas of the site found to have ACM and placed the ACM and soil into a trench along the eastern boundary of the former Plant Site. The placed ACM and soil was then capped by hydrocarbon-impacted soil, as approved by the DTSC in the ARDIP (LFR 2007). This provided a more significant cap for the asbestos-impacted soil, and allowed the hydrocarbon-impacted soil to be a greater distance from native soil, which it could potentially leach into. Clean low-permeability soil was then added to the top of the soil mound to create the capped, vegetated berms. The berms consist of two distinct segments referred to below as the "northern" and "southern" berms (Figure 3). Ongoing maintenance and monitoring has been continuously performed in accordance with the *Berm Parcel O&M Agreement* (DTSC 2009a).

2.2.2 Description of Engineered Cap

The various components and characteristics of the containment berms were detailed in the RDIP and ARDIP (ERM 2006d and LFR 2007, respectively) and are summarized in this section. Based on calculations completed by Winzler & Kelly, a licensed engineering company, approximately 64,400 cubic yards of ACM and total petroleum hydrocarbon (TPH)-containing soil were placed in the containment berms.

The construction plans and technical specifications for the berms, as described in the RDIP and the ARDIP (ERM 2006d and LFR 2007, respectively), included:

- Excavating a trench to approximately 10 feet below ground surface (bgs) beneath the entire length of the berm to accommodate the placement of ACM below grade;
- Backfilling the trench with ACM below grade, and TPH-affected material above grade;
- Capping the berm with a Tensar® product, a common engineered grid material used for the reinforcement of soil in construction and slope stability. In addition to providing additional structural integrity to the berm, the Tensar® product fabric also serves as a visual demarcation between affected soil and the 2-foot-thick clean soil cap;
- Constructing drainage swales adjacent to the berm and graded such that collected storm-water runoff drains towards catch basins;
- Installing an automated irrigation system;
- Installing low-maintenance landscaping in accordance with the City of Pittsburg requirements; and
- Constructing perimeter fencing to prevent public access to the former Plant Site.

Initially a 10-foot-deep trench was excavated in sections along the entire length of each berm. The trench was filled with ACM along the length of each berm section. To provide access directly from Harbor Street, a 58-foot-wide access roadway was constructed between the two berm sections. ACM was placed in the bottom of the trench up to a height even with the native grade elevations (ground surface). TPH-containing material was then placed above the native grade over the ACM to create the berm sections. As documented in Appendix B, the south berm is approximately 296 feet long, while the north berm is approximately 1,072 feet long. Both berms are approximately 85 feet wide at the base and extend approximately 10 feet above the elevation of the adjacent sidewalk area of the City of Pittsburg Harbor Street right of way (8 feet of waste material and 2 feet of clean cover). A minimum buffer distance of 1 to 3 feet exists between the limits of the berm and public rights of way or private streets or utilities. Access to the berms is restricted by a fence, with locking gates to provide controlled access for inspection and routine maintenance. The fence and all posted warning signs comply with the City of Pittsburg Municipal Code requirements.

In the ARDIP (LFR 2007), the construction plans and technical specifications for the berms were modified slightly to accommodate a larger volume of ACM encountered at the former Plant Site. Specifically, the ARDIP described plans for a western expansion of the berms by approximately 10 feet (LFR 2007). The height and northern, southern, and eastern dimensions of the berms were not modified. In addition, the indicator layer, to be placed between the affected soil and the 2-foot-thick clean soil cover, was changed to a Tensar® product (from a Mirafi™ product called for in the RAP and RDIP [ERM 2006c and ERM 2006d, respectively]). Treadwell & Rollo (the Geotechnical Engineer contracted by PRPLLC) recommended the substitution of the Tensar® product to increase contact/adhesion between the waste material and the clean cover material.

2.2.3 Operation and Maintenance

In 2009, the DTSC and PRPLLC entered into a *Land Use Covenant* (Contra Costa County Recorder Office 2009) for the Former Plant Site, which includes the Berm parcel. The *Land Use Covenant* prohibits the use of the property for residential and other sensitive uses and requires that a *Soil Management Plan* and a *Health and Safety Plan* be submitted and approved by the DTSC prior to conducting any activities that will disturb the integrity of the engineered cap (such as excavation or trenching). In addition, the DTSC and PRPLLC entered into an *O&M Agreement* in September 2009 (DTSC 2009a).

Since 2008, PRPLLC has retained professional landscaping contractors to conduct routine maintenance at the berm, to adjust and repair the irrigation system, maintain the fence, mow and maintain the berm cover (vegetation), and repair ground surface issues including areas of differential settlement and burrows created by rodents (gophers and ground squirrels).

From 2008 to 2012, the condition of the berms has been monitored (inspected), and reports documenting the condition of the berms have been prepared and submitted to DTSC on a quarterly basis in accordance with the *Berm Parcel O&M Agreement* (DTSC 2009a). In 2012, the reporting schedule was revised to a semiannual schedule as approved by the DTSC (DTSC 2012).

As anticipated, the most common maintenance issues have been associated with repairing burrows created by rodents. To date, observations made during the inspections and associated reports indicated that the rodents are burrowing into the clean 2-foot thick cover of imported soil. The Tensar® material, installed between the clean cover and the impacted fill material encapsulated within the berm has not been observed in the rodent burrows or burrow spoil piles during any of the inspections.

The DTSC requested and subsequently approved a *Rodent Mitigation Plan* (RMP; Arcadis 2013) on October 18, 2013 (DTSC 2013). The RMP was implemented to curb the number of burrowing rodents noted on the Berm Parcel. Poison bait stations were utilized to reduce ground squirrel populations and a Passive Exhaust Rodent Control method was used to exterminate gophers and any remaining ground squirrels. RMP inspections initially took place weekly and were reported in memoranda submitted the DTSC. In 2014, the RMP inspections were revised to quarterly and findings have been documented in the semiannual O&M reports (Appendix A).

Semiannual inspections of the cap have occurred continuously since the initiation of the Berm Parcel O&M Agreement (DTSC 2009a), and findings have been documented in Semiannual O&M Reports (Appendix A). No significant damage or issues have been identified at the Berm Parcel.

3 FIVE-YEAR REVIEW ACTIVITIES

The following activities were conducted to confirm that the human health and the environment continue to be adequately protected by the existing engineered caps at the North and the Berm Parcels. The activities were conducted in accordance with the approved *Health and Safety Plan* and the *Work Plan* (Arcadis 2015).

3.1 Site Inspection & Cap Thickness Evaluation

The site inspection conducted as part of the Five-Year Review consisted of a site-walk and visual examination of the engineered caps performed on March 29, 2016, consistent with the requirements outlined in the approved *Work Plan* (Arcadis 2015). Field notes, including a field-drawn sketch showing the approximate cap contours and test pit locations, are included as Appendix B. An additional inspection checklist was not required for this review because a full site-wide semiannual inspection was performed in December 2015, rodent inspections occur quarterly, and the site landscaping company, Blue Wagon, visits the site on approximately a monthly basis to perform a site inspection (Appendix A).

In addition to the March 29, 2016 site inspection, Arcadis excavated nine shallow test pits on the North Parcel and eight test pits on the Berm Parcel on March 30, 2016, for a total of 17 test locations. Table 1 summarizes the cap inspection results, and Figures 2 and 3 present the test pit locations at the North and Berm Parcels, respectively. The locations of the test pits were selected using a process that considered spatial planning and field observations. The parcels were initially subdivided into approximately equal parts to ensure the entire parcel was investigated. Each subdivided unit was evaluated based on field observations of areas that appear to have eroded or thinned within each unit, thereby giving the most conservative estimates of engineered cap integrity.

The *Conditional Approval Letter* (DTSC 2016a) recommended that consideration be given to the installation of permanent monuments to help measure engineered cap thickness at the same locations over time. However, due to concerns that the site rodent populations may burrow under permanent monument features as shelter, Arcadis recommended that each test pit location be surveyed using a global positioning system (GPS) to allow for each test pit location to be relocated during future inspection activities. The use of GPS was approved by the DTSC in a March 22, 2016 email (DTSC 2016c). The GPS coordinates for each location are provided in Table 1 and illustrated on Figures 2 and 3.

As performed during previous Five-Year Reviews, the engineered cap at the North Parcel was hand excavated to verify engineered cap thickness. The shallow test pits extended from the ground surface to the top of the waste-fill materials. The thickness of the engineered cap based on the original design standards described in the *Property Restoration Construction Observations* report (HLA 1988) was at a minimum of 9 inches when installed.

During previous site visits to the Berm Parcel, Arcadis identified that the upper sections of the sloped berms have been the areas most impacted by erosion and rodents. The flat portions of the site appear relatively unchanged, and the lower level of the berm slopes appear to receive soil that have been deposited from the upper berm areas. To verify that the engineered cap on the Berm Parcel is in compliance with the thickness specifications detailed in the ARDIP (LFR 2007), each test pit was dug to a maximum of 24 inches bgs, or until the Tensar® product was reached (Figure 3).

A hand auger was used to excavate the test pits to limit soil disturbance and dust generation. During excavation activities, water was sprayed down the hole and on the soil cuttings to limit dust generation. Photographs were taken to document each test pit's location and depth. Photographs of air monitoring locations are included as Appendix C-1, photographs of North Parcel test pit locations are included as Appendix C-2, and photographs of Berm Parcel test pit locations are included as Appendix C-3. After the field personnel identified and documented the thickness of the engineered cap, a hand shovel was used to

replace and re-compact the soil in 2- to 3-inch lifts. Any vegetation removed from the surface was replaced and watered.

3.2 Air Monitoring

During the engineered cap inspections and thickness evaluation activities, between March 29 and March 31, 2016, Arcadis conducted air monitoring at each parcel to confirm that the engineered cap remains effective in preventing the release of airborne asbestos fibers. Air monitoring sample results provide data regarding the presence of asbestos if released during the test pit excavation activities. The air monitoring was performed prior to the engineered cap thickness evaluation to establish a baseline data set (March 29, 2016), on the day of the cap thickness evaluation activities to quantify any generated asbestos (March 30, 2016), and the day after the cap thickness evaluation to ensure the cap was properly repaired (March 31, 2016).

Air monitoring samples were collected within the breathing zones at approximately 5 feet above ground surface and along the North Parcel and Berm Parcel perimeter fence lines. The sample locations were determined in the field based on the prevailing wind directions; one sample location placed upwind, and the remaining locations placed down and cross wind. Additionally, one duplicate air sample was collected on the downwind perimeter of the Berm Parcel. Photographs of all air monitoring locations are provided in Appendix C-1.

Samples were collected using air monitoring pumps fitted with 0.45-micron mixed cellulose ester cassettes consistent with *National Institute of Occupational Safety and Health* guidelines. The air monitoring samples were collected over an 8-hour period with the flow rate of the air monitoring pumps set at approximately 3 liters per minute. The samples were submitted to EMSL Analytical, Inc., an approved California-certified laboratory, for asbestos analysis using United States Environmental Protection Agency (EPA) Level II transmission electron microscopy (TEM) for asbestos.

3.3 Community Involvement

As outlined in the approved Work Plan (Arcadis 2015), the DTSC was responsible for producing the community involvement and notification documentation and distributing, as necessary, to local municipalities. Community involvement and notification documentation was not provided by the DTSC to PRPLLC; therefore, hard copies of any community involvement and notification documents were not provided by PRPLLC to the public local library, as discussed in the Work Plan (Arcadis 2015).

4 FIVE-YEAR REVIEW RESULTS

The following are the results for the engineered cap evaluations and the air monitoring performed before, during, and after the cap evaluation at the North and Berm Parcels. General site conditions observed at the North and Berm Parcels on March 29, 2016 are described in the *Semiannual Operation and Maintenance Report for the North Parcel and Former Plant Site* (Arcadis 2016; Appendix A), which was submitted to DTSC under separate cover on January 22, 2016.

4.1 North Parcel Site Inspection and Engineered Cap Thickness Evaluation Results

At the North Parcel, the engineered cap was found to be in good condition; there were no visible signs of surficial damage or thinning. The ground surface was in good condition with no visible signs of rutting or erosion. Vegetation throughout the site was also in good condition and regularly maintained.

In accordance with the *Work Plan* (Arcadis 2015), Arcadis field personnel oriented the nine test pit locations in a rough grid pattern to verify engineered cap thickness in all areas of the parcel. A hand auger was used to excavate each test pit. The excavated material was stockpiled next to each test pit. Soil descriptions were logged during excavation and photographs were taken of the spoils of the test pits (Appendix C-2). Once completed, soil from each pit was replaced in approximately 2- to 3-inch lifts and each excavation was individually compacted.

Each test pit was excavated to approximately 24 inches bgs, or until contact with native soil was reached, to verify that the engineered cap met the minimum stated thickness of 9 inches and the minimum cap thickness of 6 inches (CFR 1990 and BAAQMD 1998). Table 1 presents engineered cap thickness data from each test pit. Figure 2 is a map showing the locations of the test pits, as well as measured engineered cap thickness at each test pit location. The excavations were terminated at contact with native soil, which was indicated by an abrupt transition from a dark yellowish brown (Munsell Soil Color Chart classification system [Munsell] 10 YR 4/4) clay cap material to a very dark grayish brown (Munsell 10 YR 3/2) loam.

The measured engineered cap thickness ranged between approximately 11 and 23 inches bgs. Results from the observations made at each test pit indicated that the cap maintained a thickness of greater than 9 inches in all areas of the site except at Boring 7 (Figure 2). Boring 7 was advanced at the edge of the engineered cap and was terminated at approximately 8.5 inches bgs due to the presence of a hard, black resinous tar material. This material may be former paving along the tapered edge of the engineered cap. Boring 7 may have been advanced just outside the limits the engineered cap requirements, as it was along the eastern boundary of the engineered cap near the on-site road. Therefore, Boring 8 was advanced as a step-out 10 feet west of Boring 7, and the measured engineered cap thickness of 12 inches was consistent with that seen at the remainder of the test pit locations. Photographs taken during the North Parcel cap thickness evaluation are provided as Appendix C.

4.2 Berm Parcel Site Inspection and Engineered Cap Thickness Evaluation Results

In general, the engineered cap at the Berm Parcel appeared to be in good condition with few signs of surficial damage or thinning. Erosion tended to be localized in nature, and were limited to areas of high-grade slope, such as the upper portion of the berms. Vegetative cover throughout the site was observed to be in good condition.

In accordance with the Work Plan (Arcadis 2015), Arcadis field personnel oriented the entire berm parcel in a rough grid pattern of eight segments to verify engineered cap thickness in all areas of the parcel, and then focused each test pit in the area of each segment which visually appeared to be the thinnest or eroded. A hand auger was used to excavate each test pit. The excavated material was stockpiled next to

each pit. Soil descriptions were logged during excavation and photographs were taken of the spoils of the test pits (Appendix C-3). Once complete, soil from each pit was replaced in approximately 2- to 3-inch lifts, each individually compacted while water was added using a Hudson Sprayer to limit dust and increase compaction

Each test pit was excavated until contact with the fabric liner, or a minimum of 24-inches bgs. Table 1 presents engineered cap thickness data from each test pit. Figure 3 is a map showing the locations of the test pits which were focused in areas that visually appeared to be relatively thinner or showed signs of erosion. The measured cap thicknesses of the test pits performed within the extent of the erosional feature (as shown on Figure 3) as well as in typical areas of the cap all were found to exceed the cap thickness requirements of 6 inches (CFR 1990 and BAAQMD 1998). Measured engineered cap thickness at the north berm ranged between approximately 11.5 and 22-inches. Borings were advanced to a depth of approximately 24 inches at the south berm and the geotextile liner was not encountered, indicating full engineered cap design thickness has been maintained at this berm. The erosional features identified on the berms were limited to several feet in aerial extent and were not found to be a cause of concern to the cap integrity or to environmental and human health and safety. Future semiannual inspections will focus on these areas as well as the rest of the berm to identify changes to these apparent erosional features. Photographs taken during the thickness evaluation are provided as Appendix C-3.

4.3 Air Monitoring Results

Arcadis conducted 3 days of air monitoring during the inspection: the day prior to the engineered cap thickness evaluation, the day of the evaluation, and the day after the evaluation, per the guidance of the DTSC (DTSC 2016).

The air samples were submitted for asbestos analysis using EPA Level II TEM. Analytical results are provided in Table 2 and Appendix D. In 27 samples, asbestos fibers were not detected at or exceeding their laboratory reporting limit of 16 structures per square millimeter (S/mm^2) of air. Two samples (NP-E-032916 and NP-N-032916) collected during baseline sampling from the North Parcel on March 29, 2016, had asbestos detections at 16 and 62 S/mm^2 of air, respectively.

Arcadis requested that the laboratory further assess these two samples using the *National Institute of Occupational Safety and Health* test method 7402 in order for the results to be compared to the *California Occupational Safety and Health Administration* (Cal/OSHA) permissible exposure level (29 C.F.R., Toxic and Hazardous Substances, Standard 1910.1001 [Asbestos], Appendix C [1]). These two samples were reported by the laboratory as not containing fibers at or exceeding the reporting limit of 0.002 fiber per cubic centimeter of air. As a result, the air samples did not exceed the EPA's post-abatement clearance criterion of 70 S/mm^2 nor the Cal/OSHA permissible exposure level of 0.1 fiber per cubic centimeter of air (EPA 1989). Given these results, and the lack of asbestos detection during the advancement of test pits and the day following, these data conclude that asbestos fibers are not being released excess of the EPA or Cal/OSHA guidance values from the engineered cap at the North and Berm Parcels.

5 TECHNICAL ASSESSMENT AND RECOMMENDATIONS

The test pits excavated as part of the engineered cap thickness evaluation on both the North and Berm parcels confirmed that the engineered soil caps are in good condition and exceed the minimum cap

thickness of 6 inches (CFR 1990 and BAAQMD 1998). Based on the following evidence, modification of the existing *O&M Agreement* (DTSC 2009a) is not necessary and that the caps continue to function as designed and intended:

- No early indicators of potential remedy problems were identified.
- Visual examination and air monitoring data verifies that the engineered caps are providing adequate protection from the buried asbestos and digging into the engineered cap did not result in the exceedance of current EPA or Cal/OSHA published guidance values for airborne fibers.
- There have been no changes in the source mass, land use, exposure pathway or assumptions, toxicity data, or any other information that could affect the intended or actual protectiveness of the engineered caps (e.g., sea-level rise, meteorological conditions, earthquakes).
- There are no ongoing issues with the engineered caps at either parcel, and previous minor issues were all corrected expeditiously without environmental or public health exposure. Details can be found in the associated semiannual monitoring report for that time period included in Appendix A.
- There are no unresolved problems with any regulatory agencies, such as local government or tribes.

The current O&M procedures are expected to be continued for the next five-year period and will continue to include the following:

- Vegetation mowing/clearing;
- Site inspections covering site access, irrigation and vegetation coverage, erosion or settling issues, rodent monitoring and mitigation, and trash removal;
- Semiannual reports submitted to the DTSC presenting findings from quarterly site investigations; and
- An updated Five-Year Review Work Plan, which is anticipated to be submitted to DTSC in December 2020.

5.1 Protectiveness Statement

Based on the results of the activities conducted during this Five-Year Review, the engineered soil caps at the North and Berm Parcels continue to function as designed and are protective of human health and the environment. PRPLLC, as the responsible party for the future implementation of actions that will ensure protectiveness., and will continue to monitor the site and report findings to the DTSC as defined in the O&M Agreements (DTSC 2009a and 2009b).

INTERIM FENCE

EXISTING PROPERTY BOUNDARY

- MAUREL — 3/24/16
  - SITE IS NEARLY 100% VEGETATED
  - RECENTLY MOWED
  - SOME NEW GOPHER ACTIVITY — PRIMARILY IN THE AREA AROUND THE SWALE ON THE EAST SIDE OF THE BERMS
  - NO BURROWS (NEW OR OLD) OBSERVED
  - WATER TO SITE IS SHUT OFF — BUT VERIFIED VALVE BOXES/CONTROLS ARE STILL FUNCTIONING

- ENTRANCE GATE BENT AND PULLED OPEN ENOUGH FOR A PERSON TO PASS THROUGH
- NO GRAFFITI, AND NO SIGNIFICANT TRASH OBSERVED, HOWEVER

8' / 4' — Top edge of berm

⑤ 38.0299248
-121.8780645
Middle of section chosen. No Low areas.
= Approx average Cap Top.
22" to fabric

CONTROL FAULT FLASHING SCREEN

7x4' Eroded low area oval. At end of Irrg Line

② 38.0286105
-121.8785825
No low areas so top middle to get average
Fabric — soil change @ 21"
No Fabric to 24"

③ 38.0313336
-121.8781790
- Localized low area. (~7.5" lower than surroundings)
- No current erosion
- No burrows
- 2' from irrigation Line
- 10' from heads
- Fabric @ 11.5"

① 38.0316085
-121.8774299
Low area @ edge of berm top. ~~Current~~ Recent gopher mounds. Irrigation head 3' away. Pipe 1.5' away.
Fabric @ 18"

⑧ 38.0285715
-121.8786169
SE corner of flank top appears evenly thinned & lower flank appears thickened.
Soil color change @ 21"
No fabric to 24"

⑥ 38.0292528
-121.8782723
- Western flank
- Head scarp area & slump below (old)
- 17.5" to Fabric

④ 38.0318197
-121.8778077 / 8778302
- Localized ~3'x5' oval low area
- old burrows @ location
- 3' from irrigation line & 4' from head
- Fabric @ 18"

⑦ 38.0315700
-121.8773097
- similar as ①
- No recent mounds
- 6' from sprinkler head & 2' from pipe
- Fabric @ 19"

EXPLANATION:

- 6-FOOT GALVANIZED CHAIN-LINK FENCE
- PARCEL BOUNDARY
- 15 — FINAL GRADE CONTOURS
- CATCH BASIN
- AER MONITORING STATION
- BROKEN SPRINKLER HEAD
- M — OLD/ABANDONED GOPHER MOUND
- NM — NEW GOPHER MOUND
- IC — IRRIGATION CONTROL BOX

Test Report: Asbestos Analysis of Air Samples by Transmission Electron Microscopy via NIOSH Method 7402

Sample	Volume (Liters)	Non Asbestos Fibers	PCM F/cc	Asbestos Type(s)	Asbestos Fibers	Asbestos % of total	7402 Adjusted (TEM) F/cc	Notes
NP-N-032916 *041608428-0001*	1446	0	0.000	Chrysotile	1	100	**<0.002**	
NP-E-032916 *041608428-0002*	1440	0	0.000			0	**<0.002**	

NIOSH 7402 method only reports fibers > 5µm in length and > 0.25µm in width.
This method requires a minimum of 2 field blank analyses per set.The above results are not blank corrected
Average number of asbestos fibers on field blanks: n/a
Average number of non-asbestos fibers on field blanks: n/a

EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL is not responsible for data reported in fibers/cc, which is dependent on volume collected by non-laboratory personnel. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. The test results contained within this report meet the requirements of NELAP unless otherwise noted. Samples received in good condition unless otherwise noted. The analyses above were performed with a JOEL 100 CX II Transmission Electron Microscope (TEM) outfitted with a PGT/iXRF Energy Dispersive X-Ray Analysis (EDXA) System.

Samples analyzed by EMSL Analytical, Inc. Cinnaminson, NJ AIHA-LAP, LLC-IHLAP Lab 100194, NYS ELAP 10872, NJ DEP 03036, PA ID# 68-00367

Our ref:
EM009587.0016

Dear Ms. Indermill:

On behalf of Pittsburg River Park, LLC (PRPLLC), Arcadis U.S., Inc. (Arcadis) has prepared this notification memorandum reporting the results of the environmental due diligence investigation completed at the Former Johns Manville Plant Site located at 420 East Third Street in Pittsburg, California (the Site) which includes the Plant site, the North parcel, and the Access parcel. This memorandum summarizes the results of the soil gas, groundwater, and soil investigations performed by PES Environmental, Inc. (PES) on behalf of Making Waves Academy and Foundation (Making Waves). Investigation activities were performed by PES during the period of September 29 through October 11, 2017. The activities and results described below were provided by Making Waves/PES in a draft work plan and analytical results tables, respectively. Neither Arcadis nor any representative of PRPLLC participated in the due diligence investigation.

Soil-Gas Sampling

Based on field reports, PES performed a soil-gas investigation in accordance with the procedures outlined in the *Advisory for Active Soil Gas Investigations* published by DTSC, the California Regional Water Quality Control Board (RWQCB), Los Angeles region and the California RWQCB, San Francisco Bay

Region dated July 2015[1]. Seven temporary soil-gas probes at the North parcel, one soil-gas probe at the Access parcel, and 16 soil-gas probes at the Plant parcel were installed to evaluate soil-gas conditions. Soil-gas probe locations are shown on Attachment 1. The soil-gas samples were analyzed by an on-site mobile laboratory for volatile organic compounds (VOCs) and total petroleum hydrocarbons as gasoline (TPH-g) using U.S. Environmental Protection Agency (U.S. EPA) Test Method 8260B.

Results

All VOC and TPH-g soil-gas sample results were reported to be less than the RWQCB Tier 1 Soil Gas Environmental Screening Levels (ESLs)[2] (see Attachment 2). VOCs and TPH-g in soil gas are known Site constituents. The PES VOC and TPH soil gas sample results are consistent with the soil-gas sample results collected during the January 2008 post-remediation soil gas sampling activity[3].

Groundwater Sampling

Based on field reports, PES collected grab groundwater samples at five locations on the Plant parcel, one location on the North parcel (in the eastern access roadway), and one location on the Access parcel (see Attachment 1). The grab groundwater boreholes were advanced, using truck-mounted direct-push technology, to approximately 5- to 10-feet below first encountered groundwater. Once the desired depth was reached, a 0.75-inch diameter schedule 40 polyvinyl chloride (PVC) well casing fitted with a 5- to 10-foot section of factory-slotted PVC well screen was lowered into the outer casing. The outer casing was then retracted to expose the well screen to the saturated soil. The grab groundwater samples were then collected using a small-diameter, stainless-steel or Teflon™ bailer. The grab groundwater samples were immediately decanted from the bailer into appropriate laboratory-supplied sample bottles. The groundwater samples were analyzed for the following:

- TPHg by U.S. EPA Method 8015B;
- Total Petroleum Hydrocarbons as diesel/motor oil (TPHd/mo) by U.S. EPA Method 8015B, with and without silica gel cleanup;
- VOCs by U.S. EPA Method 8260B; and
- Semi-volatile Organic Compounds (SVOCs) by U.S. EPA Method 8270C.

Results

The results of PES' grab groundwater investigation generally are consistent with the results of historical site investigations. PES grab groundwater sample analysis indicated the presence of TPHd, SVOCs, and VOCs in groundwater with TPHd, tetrachloroethylene, diethyl phthalate, and 1,1-dichloroethene (1,1-

[1] DTSC, 2015. *Advisory - Active Soil Gas Investigations*. July
[2] 2016 Regional Water Quality Control Board, San Francisco Bay Region (SFRWQCB) Soil Gas Tier 1 Environmental Screening Levels (ESLs) (Rev. 3). February
[3] 2008 LFR. Remedial Action Completion Report. October.

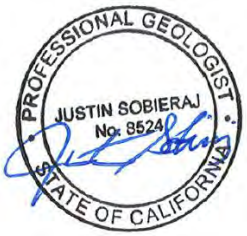
DCE) exceeding their Tier 1 ESL. Historically, site investigations reported that groundwater contained oil and grease, benzene, toluene, ethylbenzene, and other VOCs at varying concentrations. The single exceedance of PCE and 1,1-DCE was from an upgradient Plant site grab groundwater sample (GB7), and is likely associated with known off-site chlorinated VOC release sources not associated with the Johns Manville facility or operations. It should be noted that the Site is subject to a Land Use Covenant (LUC) which prohibits the use of groundwater across the entire Site. The PES grab groundwater sample results are consistent with the grab groundwater sample results collected during the January 2008 post-remediation grab groundwater sampling activity[4]. Comparisons of the January 2008 and recent PES grab groundwater VOCs and TPH analytical results indicate that natural attenuation has effectively reduced concentrations over time and will continue to do so in the future.

Asbestos Soil Sampling Activity

Based on field reports, soil samples were reportedly collected by PES for analysis of asbestos from 18 locations on the Plant parcel and three locations on the Access parcel (see Attachment 1). According to PES, the locations were selected in areas where no historical asbestos data existed. Each sample was collected using hand tools at approximately 6 inches below ground surface (bgs) and placed into a laboratory provided glass sample jar. The samples were analyzed for asbestos by fiber count by Polarized Light Microscopy (PLM; EPA/600/R-93/116) 1,200-point count. Sample results with detections were confirmed by Transmission Electron Microscopy (TEM; EPA/600/R-93/116).

Of the 21 samples analyzed the highest concentrations were reported at the Access Road sample SS3 (0.58%), and the Plant Site sample SS16 (0.25%; see Attachment 2).

Conclusions



The results of the PES investigation are consistent with historical investigation and remediation results at the Plant Site, and consistent with the comprehensive remedial action completed at the Plant Site in 2007. The Access Road was not incorporated into the historical remediation of the Plant Site or the North Parcel as there was no known hazardous materials use or stored on that parcel. The reported concentration is less than the 1% concentration that is the Cal/OSHA and Cal/EPA definition of a hazardous materials or waste.

If you have any questions or need more information regarding this notification and action plan , please call Mr. Justin Sobieraj of Arcadis at 415.858.8310 or Mr. Mike Singer of PRPLLC at 860.214.7195.

Explanation

- Assessor Parcel Boundary
- Grab Groundwater Sample Location
- Extent of North Parcel Engineered Soil Cap
- "Berm" Parcel Boundary

Explanation

Detections are shown in bold.
All compounds are reported in micrograms per liter (µg/L)
PCE = Tetrachloroethene
TCE = Trichloroethene
cis-1,2-DCE = cis-1,2-dichloroethene
trans-1,2-DCE = trans-1,2-dichloroethene
VC = Vinyl Chloride
1,1-DCE = 1,1-dichloroethene
DEP = Diethyl Phthalate
TPHd = Total petroleum hydrocarbons quantified as diesel
TPHmo = Total petroleum hydrocarbons quantified as motor oil
< 0.50 = Not detected at or above the specified laboratory reporting limit
92 (760 H) = Result with and without (in parenthesis) a silica gel clean-up
H = Sample was prepped or analyzed beyond the specified holding time
Shaded results are equal to or exceed the February 2016 (Rev 3) Regional Water Quality Control Board, San Francisco Bay Region (SFRWQCB) Groundwater Tier 1 Environmental Screening Levels (ESLs)

Dear Mrs. Indermill:

On behalf of Pittsburg River Park, LLC (PRPLLC), Arcadis U.S., Inc. (Arcadis) has prepared this letter report to provide the results of the Semi-Annual Operation and Maintenance (O&M) inspections of the North Parcel and Former Johns Manville Plant Site located at 420 East Third Street in Pittsburg, California (North Parcel "Site" and Former Plant Site; Figure 1). This report includes quarterly inspections associated with the Rodent Mitigation Plan (RMP).

All work was completed, in accordance with the California Department of Toxic Substances Control's (DTSC) March 5, 2012 approval of the semi-annual inspection and reporting schedule, and the RMP described in the Revised Semi-Annual O&M report dated September 29, 2014.

BACKGROUND

North Parcel

The North Parcel is approximately 4.2-acres and was formerly used by Johns Manville for storage of asbestos-containing products prior to shipment. As a result of the North Parcel Site use, asbestos-containing materials (ACMs) were deposited onto the ground. Under a Voluntary Cleanup Agreement (VCA), dated July 12, 2000 [Docket No. HAS-A000/01-004]), Johns Manville performed investigations that culminated in the placement of a soil cap to prevent direct exposure to ACMs at the North Parcel.

Johns Manville personnel oversaw routine O&M inspections until PRPLLC purchased the property in October 2004. Beginning in December 2004, contractors for PRPLLC have performed operation, maintenance and monitoring consistent with the protocols established in the "*Final Operations and Maintenance Plan, Asbestos Soil Cap, Johns Manville Pittsburg Plant – North Parcel Site, Pittsburg, California*", prepared by Harding, dated July 31, 2001. A revised VCA was established by the DTSC in 2005, to update the remedial actions allowing for the timely development of the Site for mixed-use redevelopment (Docket No. HSA-A 04/05-127). The "Final Operations and Maintenance Plan, North Parcel" was submitted by Environmental Resources Management (ERM), in 2006 to outline the revised operations and maintenance requirements of the engineered cap. The adherence to the revised O&M Plan is stipulated in the "*Operations and Maintenance Agreement for the Site located at East Third and Harbor Streets, Pittsburg, California*", dated September 25, 2009 ("North Parcel O&M Plan").

Former Plant Site

ERM, on behalf of PRPLLC, determined that the construction of an engineered containment berm would be the best remedial alternative for the Former Plant Site, as documented in the Final Remedial Action Plan, dated June 23, 2006. The construction details of the berms are described in *"Remedial Design and Implementation Plan, Harbor Park Development, Pittsburg, California*", dated June 22, 2006, also by ERM, as well as in the *"Addendum to the Remedial Design and Implementation Plan, Harbor Park Development (Former Johns Manville Facility), 420 East 3rd Street, Pittsburg, California,*" dated August 1, 2007, by LFR (now part of Arcadis). The containment berms are comprised of two distinct segments referred to as the "northern and southern" berms. Ongoing maintenance and monitoring was continuously performed in accordance with the "*Operation and Maintenance Plan for the Engineered Containment Berm on the Plant Site of the Former Johns Manville Facility, 420 East Third Street, Pittsburg, California*" (Plant Site O&M Plan*)*, dated October 1, 2008, by LFR*.*

RECENT ACTIVITIES

During the reporting period of July 1, 2017 through December 31, 2017, Blue Wagon Landscape and Design (Blue Wagon), the landscape and maintenance contractor for PRPLLC, performed maintenance activities, which consisted of mowing, sapling removal, testing and repairing the irrigation system, and filling any identified rodent mounds and burrows.

Following the December 5, 2017, semi-annual inspection performed by Arcadis (described below), Blue Wagon completed the repairs and site maintenance activities under the direction of Arcadis on December 20, 2017.

Semi-Annual Operation and Maintenance for the North Parcel and Plant Site

Arcadis performed the semi-annual inspection of the Former Plant Site and the North Parcel on December 5, 2017. The inspections were conducted in accordance with the Plant Site O&M Plan and the North Parcel O&M Plan, respectively. Photographs taken during the inspections documenting the current condition of the North Parcel and Plant Site are included as Attachment 1. Completed "Site Inspection

Checklists" are included as Attachment 2. Blue Wagon was informed of the inspection findings, and they promptly addressed each item, and example completion photos can be found in Attachment 1.

General Observations and Maintenance

North Parcel

The North Parcel was observed to be in good condition at the time of Arcadis' semi-annual inspection. The following specific observations were made, and a hand-drawn map of the North Parcel was completed and is included in Attachment 3. A photographic log of the Site is included as Attachment 1, which documents the conditions of the Site during the December 5, 2017 inspection (Attachment 1.1 and 1.2). A second photo log documenting the site conditions on December 20, 2017 after corrections and/or repairs by Blue Wagon is also attached (Attachment 1.3).

- The North Parcel exterior fencing was found to be in good condition.
- Trash was not observed within the North Parcel.
- The vegetation on the cap was composed of medium grasses and weeds. Following inspection of the Site, the grasses/weeds were mowed to discourage animal activity.
- The irrigation system was shut off for the rainy winter season by Arcadis. The irrigation lines were pressurized and leak-checked by Blue Wagon. Damaged sprinkler heads detected during the December 5th inspection were replaced by Blue Wagon on December 20, 2017.
- Active ground squirrel burrows were not observed.
- Nine gopher mounds were observed, primarily on the west side of the North Parcel.
    - Blue Wagon was notified of the gopher mound areas on December 12, 2017. On December 20, 2017, Blue Wagon mobilized to the site and the observed gopher mounds were filled in and the soil was compacted.
- Suspect ACM debris were not observed on the ground surface during Arcadis' inspection.

Former Plant Site

The Former Plant Site was also in good condition at the time of the inspection. The following specific observations were made, and a hand-drawn map of the Former Plant Site was completed and is included in Attachment 3. Attachment 1.4 through 1.6 document the conditions of the Site during the December 5, 2017 inspection, and Attachment 1.7 documents the corrections/fixes on December 20, 2017.

- The exterior fence was in good condition, but the main gate was found to be damaged. Blue wagon repaired the fence damage on December 20, 2017 (see Attachment 1.7).
- There were no signs of trespassing or graffiti.

- Vegetation on the Berm Parcels was medium height and in-process of being mowed. Grass was being mowed during December 5, 2017 inspection (Attachment 1.4), and finalized by December 20, 2017.
- The remainder of the Former Plant Site consisted of mixed low brown and green grasses and weeds.
- The irrigation system was shut off for the rainy winter season by Arcadis. The irrigation lines were pressurized and leak-checked by Blue Wagon, and any damaged sprinkler heads were replaced on December 20, 2017.
- Neither active or inactive ground squirrel burrows were observed. However, approximately 21 gopher burrows were identified on the North Berm, and approximately nine gopher burrows were identified on the south berm were identified on the Berm Parcel which falls within historic range. All identified gopher burrows were hand backfilled with clean, compacted soil on December 20, 2017.
- Ground squirrel bait stations were full and in working condition.
- Suspect ACM debris were not observed on the ground surface during Arcadis' inspection.
- Minor trash that was found on the site after the December 5, 2017 inspection was removed Blue Wagon on December 20, 2017 (Attachment 1.7).

Ongoing O&M Requirements

- Maintain the fences and irrigation systems.
- Maintain adequate landscaping irrigation.
- Continue quarterly rodent inspections and ground squirrel bait station replenishment.
- Continue the O&M schedule on a quarterly basis with the landscaping subcontractor, Blue Wagon.
- The next semi-annual O&M inspection will be conducted in June 2018.

RODENT MITIGATION PLAN INSPECTIONS – BERM PARCEL

Quarterly RMP inspections are conducted by Arcadis at the Berm Parcel as part of the approved scope submitted to the DTSC on September 27, 2013, to address the rodent population at the Site and maintain the integrity of the cap. Clark Pest Control (Clark) has maintained the bait stations and quarterly scheduled inspections have consistently found the bait stations to be in working condition and well-stocked since installation.

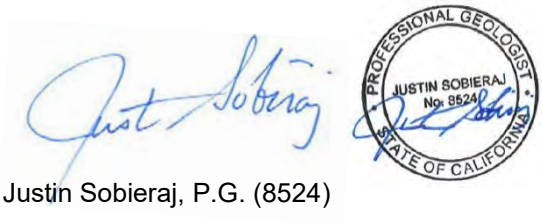
Rodent Mitigation Plan Implementation and Recommendations

The introduction of ground squirrel bait stations at the property has proven to be an effective and long-term mitigation strategy to limit the number of rodents and will continue. As outlined in previous semi-annual O&M inspection reports, the Berm Parcel is currently inspected on a quarterly basis to monitor rodent population. The third quarter 2017 monitoring inspection took place on September 18, 2017, and the fourth quarter 2017 monitoring inspection coincided with the North Parcel and Former Plant Site semi-annual inspection on December 5, 2017. A separate Site Inspection form for the September 18, 2017 RMP is included in Attachment 2 and a Site Map is included as Attachment 3. Active ground squirrel burrows were not identified during either quarterly inspection. Inactive burrows were filled with compacted soil.

To limit gopher populations, a Passive Exhaust Rodent Control (PERC) treatment was implemented in October 2014 and treated the approximately 100 gopher burrows identified on the Berm Parcel. During the inspections on September 18, 2017 and December 5, 2017, Arcadis identified approximately 25 and 30 gopher mounds on the Berm Parcel, respectively. Based on the most recent inspection, the October 2014 PERC treatment was effective and significantly reduced the gopher population.

The rodent inspections for the next monitoring period are scheduled to take place in March and June 2018, and results will be reported in the June 2018 Semi-Annual Operations and Maintenance Report.

CLOSURE



If you have any questions or need more information regarding the results of this inspection or the project in general, please call Mr. Justin Sobieraj of Arcadis at 415.858.8310, Mr. Rob Moniz of Arcadis at 925.409.3831, or Mr. Mike Singer of PRPLLC at 860.214.7195.

Sincerely,

Arcadis U.S., Inc.

Site Inspection Checklists

O&M CHECKLIST
PITTSBURG RIVER PARK LLC (Former JM Plant)
NORTH PARCEL

Inspector: Rob Moniz Date: 12/5/17 Time: 0900

Climatic Conditions: Clear, mild

Landscaping, Fencing, and Drainage Inspection

Please observe and document the following:

- Note and quantify eroded areas.
- Note and quantify cover soil conditions such as sloughing, sliding (presence of headscarps and/or toe bulging.
- Note and quantify cracks, fissures, or other features that may potentially allow surface water infiltration.
- Note and quantify areas subsidence, depressions, or topography where ponding may occur.
- Estimate of rodent or other burrowing animal populations
- Note and quantify burrowing animal intrusion drainage
- Document (locate) areas where cover deficiencies are observed.
- Inspect and record any ponding.
- Inspect for runoff inundation.
- Inspect fencing

LOCATION OF OBSERVATION (show on map)**:**

Sitewide: Grass green, tall, to be mowed

Sitewide: Water main and irrigation shut off for the winter.

West Side of Field: Gopher mounding activity.

OBSERVATION TYPE AND DETAILED DESCRIPTION:

-Tall grasses to be mowed to discourage animal activity

-Irrigation system turned off for winter—rainwater to be sufficient irrigation.

-Gopher mounding activity. Nine gopher mounds present.

ACTION(s) TO BE TAKEN (if necessary)***:**

-Mow tall grasses to be mowed to discourage burrowing animal activity.

-Continue to monitor grass health to ensure rainwater alone is sufficient irrigation for winter.

-Pack in gopher mounds to prevent erosion damage to cap and discourage gopher activity.

REMARKS:

Nothing further.

LANDSCAPE COVER

Please observe and document the following:

- Weed and fire control – Observe growth of plant materials and nuisance weeds in late winter. Determine if unsuitable plants pose a threat to the cover.
- Reseeding – Determine areas that require reseeding in summer.
- Rodent control – Evaluate visible signs of burrowing rodents during routine inspections around the site.
- Sprinkler system – Observe the condition of sprinkler heads and any potential leak from irrigation lines.

AREA LOCATION (show on map)	**GENERAL APPEARANCE & MOISTURE**	**MAINTENANCE REQUIRED**	**COMMENTS**
Sitewide Irrigation	Lines and heads intact. Good condition.	Inspect, fix, then turn-off irrigation system for winter.	Informed BW

Sitewide Vegetation	Grasses tall, weeds present.	Field to be mowed.	Informed BW
Gate Access	Secure and in good condition.	NA	
West side of site	Several gopher mounds present	Gopher mounds to be packed in	Informed BW

REPAIR RECORD

Inspector: Rob Moniz Date: 12/20/17 Time: 1300

Climatic Conditions: Sunny and mild

DEFICIENCY TYPE AND DETAILED DESCRIPTION:

Gopher mounds, irrigation system as detailed on the maps

LOCATION OF REPAIR ACTIVITY (show on map)**:**

See map

REPAIR ACTION TAKEN:

On December 20th, Blue Wagon compeleted the final activities at the site. The irrigation system was inspected, repaired, and turned off for the winter. All gopher mounds were packed in with soil.

REMARKS:

Activities were completed properly, ensure the caps are in good condition and will be protected for the next period.

- Document (locate) areas where cover deficiencies are observed.
- Inspect and record any ponding.
- Inspect for runoff inundation.
- Inspect fencing

LOCATION OF OBSERVATION (show on map)**:**

Sitewide: grass at variable heights. Short, recently mowed on top of berms, grass long on berm flanks and in field.

Sitewide: Water main and irrigation shut off for the winter.

Berms: Gopher mounding activity.

North Berm: Sapling growth.

Northern Corner of Site: Cut in gate.

OBSERVATION TYPE AND DETAILED DESCRIPTION:

-Tall grasses to be mowed to discourage animal activity

-Irrigation system turned off for winter—rainwater to be sufficient irrigation.

-Gopher mounding activity. 21 gopher mounds observed on North Berm, 9 gopher mounds observed on South Berm.

-Sapling Growth. 10 saplings observed near North Berm.

-Cut in gate. Gate cut large enough for person to enter site.

ACTION(s) TO BE TAKEN (if necessary)***:**

-Mow tall grasses to discourage burrowing animal activity.

-Continue to monitor grass health to ensure rainwater alone is sufficient irrigation for winter.

-Pack in gopher mounds to prevent erosion damage to cap and discourage gopher activity.

-Remove saplings to prevent root infiltration into cap.

-Repair cut gate.

REMARKS:

Nothing further.

COVENANT TO RESTRICT USE OF PROPERTY

ENVIRONMENTAL RESTRICTION

(Re: Former Johns Manville Plant Site, Contra Costa County, Assessor Parcel Number 073-050-001; Site Code 201318-11)

This Covenant and Agreement ("Covenant") is made by and between Pittsburg River Park LLC ("PRP" or the "Covenantor"), the current Owner of certain property situated in Pittsburg, County of Contra Costa, State of California, described and depicted in Exhibit "A" attached, (the "Property"), PRP's successors and assigns, and the California Department of Toxic Substances Control (the "Department"). Pursuant to Civil Code section 1471(c), the Department has determined that this Covenant is reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the land of hazardous materials as defined in Health and Safety Code section 25260. The Covenantor and the Department, collectively referred to as the "Parties," hereby agree, pursuant to Civil Code section 1471(c) and Health and Safety Code section 25355.5 that the use of the Property be restricted as set forth in this Covenant; and the Parties further agree that the Covenant shall conform with the requirements of California Code of Regulations, title 22, section 67391.1.

ARTICLE I
STATEMENT OF FACTS

1.01. The Former Johns Manville Plant site Property, totaling approximately 20.5 acres, is more particularly described and depicted in Exhibit "A." The Property is located in the area now generally bounded by the North Parcel, Third Street and a Tesoro coke facility to the north; by Harbor Street, several small light industrial businesses, and USS Posco Corporation to the east; and by the City of Pittsburg's Eighth Street Linear Park and residential properties to the south, and by residential properties to the west. This Property is more specifically described as Contra Costa County Assessor's Parcel Number: 073-050-001.

1.02. A portion of the Property is more particularly described and identified in Exhibit "B", which is attached hereto and incorporated herein by this reference ("Bermed Property") as defined below. The Bermed Property is approximately 3.2 acres and is located on the eastern side of the Property. The Bermed Property is distinguished by a chain link fence surrounding the property as further described in Exhibit "B" as Parcel D, as shown on that certain tentative parcel map entitled, "Harbor Park Development Project, Parcel Map MS 676-06, Pittsburg, California." APN: 073-050-001 (portion).

1.03. A portion of the Property is more particularly described and identified in Exhibit "C", which is attached hereto and incorporated herein by this reference ("Residential Property") as defined below. The Residential Property is approximately 17.30 acres and is located on the western and southern sides of the Property. The Residential Property is further described in Exhibit "C" as Parcels A, B and C as shown on that certain tentative parcel map entitled, "Harbor Park Development Project, Parcel Map MS 676-06, Pittsburg, California." APN: 073-050-001 (portion).

1.04. The subsurface soils on a portion of the Residential Property in the vicinity of the former evaporation pond formerly located in the southern portion of the Property are impacted with petroleum hydrocarbons and volatile organic compounds that are present below a depth of four feet National Geodetic Vertical Datum ("NGVD") and deeper, as more particularly described on Exhibit "D" ("Soil Management Area"). APN: 073-050-001 (portion).

1.05 In 2001, Harding Lawson Associates ("HLA") conducted a preliminary endangerment assessment to assess the presence and the extent of waste asbestos products and total petroleum hydrocarbons ("TPH") in the Property soils. The investigation confirmed the presence of asbestos fibers and asbestos products, TPH and volatile organic compounds ("VOC") including tetrachloroethylene ("PCE") and trichloroethylene ("TCE") at the Property. HLA presented the results of the site investigation in a report titled Preliminary Endangerment Assessment, Johns Manville – Plant Site, Pittsburg, California dated July 17, 2001 ("PEA"). In June 2006, ERM prepared a Remedial Action Plan ("RAP") for PRP. The RAP is developed in accordance with Health and Safety Code, division 20, chapter 6.8 under the oversight of the Department. Because hazardous substances, as defined in Health and Safety Code

section 25316, which are also hazardous materials as defined in Health and Safety Code section 25260, including asbestos, VOC and benzene remain in the Bermed property and in groundwater under the Property, the RAP provides that a Covenant be required as part of the site remediaton. The remedial activities selected in the RAP included consolidation of asbestos material in two berm trenches and aboveground consolidation of TPH-impacted soil from the Property, and installation of a protective barrier over the two consolidated berm areas of the Bermed Property. The berm-related remedial action includes: excavation and consolidation of TPH-and asbestos-impacted fill materials from the Property in two engineered berms; each with a subgrade storage cell and an aboveground storage cell; placing a two-foot-thick layer of clean soil as cover for the Bermed Property; installing an automatic sprinkler system; and, hydroseeding the cover soil with a grass seed mixture. The Department held a public meeting and circulated the RAP, an Initial Study and a Negative Declaration prepared pursuant to the California Environmental Quality Act, Public Resources Code section 21000 et seq., for public review and comment. The RAP and the Negative Declaration were approved by the Department on June 22, 2006. On August 25, 2006, the Department conditionally approved the Remedial Design and Implementation Plan ("RDIP") pending the approval of the final grading permit issued by the City of Pittsburg. The conditional approval of the RDIP allowed PRP's contractor to excavate the two trenches for the Bermed Property and to remove the contaminated soil from the Residential Property. On November 2, 2007, the Department approved an RDIP addendum ("ARDIP"), which allowed PRP's contractor to complete the construction of the two berms. The soil excavation and on-site and offsite disposal activities required in the RDIP were implemented from September 2006 to March 2008 to remove areas of soil contaminated with TPH and asbestos to achieve cleanup goals deemed safe for residential development of the Residential Property. Approximately 48,000 tons of soil contaminated with TPH and asbestos was excavated and disposed at the Forward Landfill and Hay Road Landfill. Approximately 103,000 tons of soil contaminated with asbestos and TPH was placed on the Bermed Property.

The Soil Management Area was initially excavated as deep as 11-feet NGVD or 22 feet below ground surface. In accordance with the ARDIP, the excavation of the former evaporation pond was extended to the north and west at an elevation of about 4 feet NGDV (observed groundwater table). About 4,400 cubic yards of stockpiled soil previously excavated from below the water table at a depth of 22 feet bgs was placed back to the excavation. The TPH-affected soil that was removed at or above the water table was placed on the Bermed Property. The results of the confirmation samples collected from the base of the excavation below the groundwater table in the Soil Management Area detected TPH from below laboratory analytical reporting limits to as high as 10,000 milligrams per kilogram ("mg/kg"). These concentrations exceed the cleanup level established by the RAP and the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels for residential development and protection of groundwater ("Residential ESLs"). Five grab groundwater samples collected in the Soil Management Area after the excavation was backfilled were above the ESL for groundwater not used as a source of drinking water and the detected TPH

concentrations ranged from 7.1 milligrams per liter ("mg/L") to 500 mg/L. Benzene was the only petroleum-related constituent detected above its Maximum Contaminant Level ("MCL") and was detected in only one groundwater sample collected under the Soil Management Area at a concentration of 1.3 micrograms per liter ("µg/L"), just slightly above the MCL of 1.0 µg/L. PCE and TCE were also detected at concentrations of 72 µg/L and 7.9 µg/L, respectively on the southwestern corner of the Property. These concentrations exceeded their respective MCLs. A soil-vapor investigation was also conducted to evaluate the potential hazard of vapor intrusion from groundwater for future residential development. Based on the results of a soil-vapor investigation and human health screening evaluation for the vapor intrusion pathway, estimated risks and hazards were below regulatory cancer and non-cancer targets associated with residential land use. The estimated cancer risk was determined using default building foundation assumptions, DTSC residential exposure assumptions, and site-specific soil parameters.

TPH in soil and groundwater at the Soil Management Area below the groundwater table exceeds the Residential soil ESL and the ESL for groundwater not used as a source of drinking water. Groundwater at the Property is also impacted with VOC. The contamination does not pose an unacceptable threat to public health in its current location. However, the contamination is present above Residential ESLs and MCLs. Therefore, it could pose a threat to public health if the contaminated soil is excavated or groundwater is extracted in areas with the potential for direct contact. The Bermed Property is intended to be used as a landscaped buffer for residential uses on the Property. The Department concluded that the Property, as remediated, and subject to the restrictions of this Covenant, does not present an unacceptable threat to human safety or the environment, if the Property is managed in accordance with the restrictions set forth in this Covenant.

1.06 The restrictions set forth in this Covenant are necessary to preclude present and future users' exposure to asbestos that will remain in Bermed Property soils and to preclude present and future users' exposure to petroleum hydrocarbons and volatile organic compounds that will remain in and below the Soil Management Area soils and in groundwater beneath the Residential Property.

ARTICLE II
DEFINITIONS

2.01. Department. "Department" means the California Department of Toxic Substances Control and includes its successor agencies, if any.

2.02. Environmental Restrictions. "Environmental Restrictions" means all protective provisions, covenants, restrictions, prohibitions, and terms and conditions as set forth in any section of this Covenant.

2.03. Improvements. "Improvements" includes, but is not limited to: buildings, structures, roads, driveways, improved parking areas, wells, pipelines, or other utilities.

2.04. Lease. "Lease" means lease, rental agreement, or any other document that creates a right to use or occupy any portion of the Property.

2.05. Occupant. "Occupant" means Owners and any person or entity entitled by ownership, leasehold, or other legal relationship to the right to occupy any portion of the Property.

2.06. Owner. "Owner" means the Covenantor, and all successors in interest including heirs and assigns, who at any time hold title to all or any portion of the Property.

ARTICLE III
GENERAL PROVISIONS

3.01. Restrictions to Run with the Land. This Covenant sets forth Environmental Restrictions that apply to and encumber the Property and every portion thereof no matter how it is improved, held, used, occupied, leased, sold, hypothecated, encumbered, or conveyed. This Covenant: (a) runs with the land pursuant to Health and Safety Code section 25355.5 and Civil Code section 1471; (b) inures to the benefit of and passes with each and every portion of the Property, (c) is for the benefit of, and is enforceable by the Department, and (d) is imposed upon the entire Property unless expressly stated as applicable only to a specific portion.

3.02. Binding upon all Owners/Occupants. Pursuant to the Health and Safety Code, this Covenant binds all Owners of the Property, their heirs, successors, and assignees, and the agents, employees, and lessees of the Owners, their heirs, successors, and assignees. Pursuant to Civil Code section 1471, all successive Owners of the Property, are expressly bound hereby for the benefit of the Department provided however, that Owners/Occupants are not responsible for any obligations and/or breaches of those obligations arising subsequent to their ownership/occupancy unless they caused or contributed to such a breach.

3.03. Incorporation into Deeds and Leases. This Covenant shall be incorporated by reference in each and every deed and lease for any portion of the Property.

3.04. Conveyance of Property. The Owner shall provide notice to the Department not later than thirty (30) days after any conveyance or other transfer of any ownership interest in the Property (excluding mortgages, liens, and other nonpossessory encumbrances) made by that Owner. The written notice shall include the name and mailing address of the new owner of the Property and shall reference the site name and site code as listed on page one of this Covenant. The notice shall also

include the APN noted on page one. If the new owner's property has been assigned a different APN, each such APN that covers the Property must be provided. The Department shall not, by reason of this Covenant, have authority to approve, disapprove, or otherwise affect a proposed conveyance or transfer, except as otherwise provided by law, or by administrative order.

3.05. Costs of Administering the Covenant to be Paid by Owner. The Department has already incurred and will in the future incur costs associated with the administration of this Covenant. Therefore the Owner hereby covenants for the Covenantor and for all subsequent Owners that, pursuant to Title 22 California Code of Regulations section 67391.1(h), the Owner agrees to pay the Department's cost in administering the Covenant.

ARTICLE IV
RESTRICTIONS

4.01. Prohibited Uses of the Bermed Property. The Bermed Property shall not be used for any of the following purposes:

(a) A residence, including any mobile home or factory built housing, constructed or installed for use as residential human habitation;

(b) A hospital for humans;

(c) A public or private school for persons under 21 years of age;

(d) A day care center for children;

(e) Raising of food (cattle, food crops);

4.02 Prohibited Activities on the Bermed Property. The following activities shall not be conducted at the Bermed Property:

(a) Drilling for water, oil, or gas, or extraction of groundwater without prior written approval by the Department.

(b) Activities that may disturb the Berms (e.g., excavation, grading, removal, trenching, filling, earth movement, or mining), except as authorized pursuant to the Operation and Maintenance Agreement for the Former Johns Manville Plant Site Bermed Property, as approved by the Department, or otherwise approved in writing by the Department.

4.03 Notice to the Department regarding Disturbance of the Bermed Property. The current Owner or Occupant shall notify the Department of each of the following on the Bermed Property: (a) the type, cause, location and date of any disturbance or damage to the lowest six inches in depth of the cover soil on the Berm and (b) the type and date of repair of such damage. Notification to the Department shall be made as provided below within ten (10) working days of (a) the discovery of any such disturbance and (b) the completion of any repairs. Timely and accurate notification by any Owner or Occupant shall satisfy this requirement on behalf of all other Owners and Occupants.

The Owner shall prepare a Soil Management Plan and a Health and Safety Plan for the Bermed Property, approved by the Department, prior to conducting activities that will disturb the integrity of the Berms. Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed in accordance with all applicable provisions of state and federal law. The Owner shall obtain the Department's written approval prior to removing any contaminated soils from the Bermed Property

4.04 Prohibited Activities on the Residential Property. The following activities shall not be conducted at the Residential Property:

(a) Extraction of groundwater for use as drinking water and for any other purposes other than groundwater monitoring or treatment or excavation or construction dewatering

(b) Installation and/or pumping of water producing wells, including but not limited to water supply, irrigation or private wells; or

(c) Removal and handling of groundwater for the purpose of excavation or construction dewatering shall be managed in accordance with all applicable provisions of state and federal law.

4.05 Prohibited Activities on the Soil Management Area. In addition to the prohibitions set forth in section 4.04, above, the following activities shall not be conducted at the Soil Management Area:

(a) Activities that will disturb the soil at or below four feet NGVD or which encounter groundwater if it occurs at a shallower depth (e.g., excavation, grading, removal, trenching, filling, earth movement, mining, or drilling) without a Soil Management Plan approved by the Department in advance. At the time remediation was completed, there was approximately five feet of clean soil above four feet NGVD.

(b) Any contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed in accordance with all applicable provisions of state and federal law.

4.06 Access for Department. The Department shall have reasonable right of entry and access to the Bermed Property and the Residential Property for inspection, monitoring, and other activities consistent with the purposes of this Covenant as deemed necessary by the Department in order to protect the public health or safety, or the environment.

4.07 Access for Implementing Operation and Maintenance. The entity or person responsible for implementing the operation and maintenance activities shall have reasonable rights of entry and access to the Bermed Property and the Residential Property for the purpose of implementing the operation and maintenance.

ARTICLE V
ENFORCEMENT

5.01. Enforcement. Failure of the Owner or Occupant to comply with this Covenant shall be grounds for the Department to require modification or removal, as appropriate, of any Improvements constructed or placed upon any portion of the Property in violation of this Covenant. Violation of this Covenant, including but not limited to, failure to submit, or the submission of any false statement, record or report to the Department, shall be grounds for the Department to pursue administrative, civil, or criminal actions, as provided by law.

ARTICLE VI
VARIANCE, TERMINATION, AND TERM

6.01. Variance. The Owner or any other aggrieved person may apply to the Department for a written variance from the provisions of this Covenant. Such application shall be made in accordance with Health and Safety Code section 25233.

6.02. Termination. The Owner or any other aggrieved person may apply to the Department for a termination of the Restrictions or other terms of this Covenant as they apply to all or any portion of the Bermed Property or the Residential Property. Such application shall be made in accordance with Health and Safety Code section 25234.

6.03. Term. Unless ended or modified in accordance with the paragraphs above, by law, or by the Department in the exercise of its discretion, this Covenant shall continue in effect in perpetuity.

ARTICLE VII
MISCELLANEOUS

7.01. No Dedication Intended. Nothing set forth in this Covenant shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Property, or any portion thereof to the general public or anyone else for any purpose whatsoever. Further, nothing set forth in this Covenant shall be construed to effect a taking under federal or state law.

7.02. Department References. All references to the Department include successor agencies/departments or other successor entity.

7.03. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in the County of Contra Costa within ten (10) days of the Covenantor's receipt of a fully executed original.

7.04. Notices. Whenever any person gives or serves any Notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (1) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (2) three (3) business days after deposit in the mail, if mailed by United States mail, postage paid, certified, return receipt requested:

To Owner: Pittsburg River Park LLC
36 Washington Street, Suite 390
Wellesley, MA 02481
Attention: Mr. John B. Hanselman

Or, at the Department's discretion to:

Paul Hastings Janofsky & Walker LLP
55 Second Street, 24th Floor
San Francisco, CA 94105
Attention: Mr. Gordon Hart

To DTSC: Barbara J. Cook, P.E., Performance Manager
Department of Toxic Substances Control
Brownfields and Environmental Restoration Program – Berkeley Office
700 Heinz Avenue
Berkeley, California 94710-2721

Any party may change its address or the individual to whose attention a Notice is to be sent by giving written Notice in compliance with this paragraph.

7.05. Partial Invalidity. If any portion of the Restrictions or other term set forth herein, or the application of it to any person or circumstance, is determined by a court of

competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect as if such portion found invalid had not been included herein.

7.06. Statutory References. All statutory references include successor provisions.

7.07. Annual Reporting Requirements for the Bermed Property. The Owner of the Bermed Property shall conduct an annual inspection of the Bermed Property verifying compliance with this Covenant, and shall submit an annual inspection report to the Department for its approval by January 15th of each year. The annual inspection report must include the dates, times, and names of those who conducted the inspection and reviewed the annual inspection report. It also shall describe how the observations were performed that were the basis for the statements and conclusions in the annual inspection report (e.g., drive by, fly over, walk in, etc.). If violations are noted, the annual inspection report must detail the steps taken to return to compliance. If the Owner identifies any violations of this Covenant during the annual inspections or at any other time, the Owner must within 10 days of identifying the violations: determine the identity of the party in violation, send a letter advising the party of the violation of the Covenant, and demand that the violations cease immediately. Additionally, copies of any correspondence related to the violation of this Covenant shall be sent to the Department within 10 days of its original transmission.

IN WITNESS WHEREOF, the Parties execute this Covenant.

Legal Description

All that certain real property situate in the City of Pittsburg, County of Contra Costa, State of California, being a portion of the lands of PITTSBURG RIVER PARK LLC described by deed recorded October 20, 2004 under Document Number 2004-0402164, Contra Costa County Records, being a portion of Parcel One, Parcel Two and Parcel Three as described in said deed, being shown on that certain map filed on March 20, 1935 in Book 3 of Land Survey Maps at Page 1, Contra Costa County Records, being within the Rancho Los Medanos, said portion of lands being more particularly described as follows:

Estimated extent of Petroleum Hydrocarbon Affected Soil

Commencing at a found standard City of Pittsburg street monument from which a found standard City of Pittsburg street monument bears North 73°15'00"West, 1269.91 feet as shown on that certain map filed on October 7, 2003 in Book 127 of Land Survey Maps at Page 11, Contra Costa County Records; thence South 16°45'00"West, 20.00 feet to a point on the northerly line of East Third Street; thence easterly along said line South 73°15'00"East, 191.24 feet to a point; thence leaving said line South 16°45'00"West, 50.00' to a point on the southerly line of East Third Street, being the northwest corner of said Parcel One, from which point a found ¾" iron pipe with no tag shown on said map filed March 20, 1935 in Book 3 of Land Survey Maps at Page 1, Contra Costa County Records bears South 16°36'02"West, 0.51 feet; thence southerly, along the westerly line of said lands South 16°36'02" West, 1257.75 feet; thence leaving said line South 73°15'00" East, 262.06 feet to the **Point of Beginning** of the herein described parcel; thence continuing on the same line South 73°15'00" East, 270.00 feet thence North 16°45'00" East, 400.00 feet; thence North 73°15'00" West, 270.00 feet; thence South 16°45'00" West, 400.00 feet to the **Point of Beginning**.

Containing 2.48 Acres, more or less.

In the matter of:	) Docket No. HSA-O&MEA 08/09-007
	)
Former Johns Manville Plant Site East Third & Harbor Streets Pittsburg, California	) OPERATION AND MAINTENANCE) AGREEMENT)
	)
Proponent:	)
	) Health and Safety Code
Pittsburg River Park LLC 36 Washington Street, Suite 390 Wellesley, MA 02481	) Section 25355.5 (a)(1)(C)))

The California Department of Toxic Substances Control (DTSC) and Pittsburg River Park LLC (Proponent) enter into this Operation and Maintenance Agreement (Agreement) for the site located at East Third and Harbor Streets, Pittsburg, California (Site) and agree as follows:

1. Jurisdiction. This Agreement is entered into by DTSC and Proponent pursuant to Health and Safety Code section 25355.5(a)(1)(C) which authorizes DTSC to enter into an enforceable agreement to oversee the investigation and/or remediation of a release or threatened release of any hazardous substance at or from the Site, and to oversee the operation and maintenance of any remediation system installed at the Site.

2. Remediation System. A DTSC-approved Remediation System has been installed at the Site for the remediation of the site soil. The Remediation System consists of consolidation of asbestos containing materials and the soil containing total petroleum hydrocarbons in a containment berm constructed along the eastern boundary of the Site. The Site is owned by Pittsburg River Park LLC. A site location map and the assessor's parcel map are attached as Exhibit A and Exhibit B. A site map or diagram showing the location(s) of the Remediation System is attached as Exhibit C.

3. Operation and Maintenance of Remediation System. Operation and maintenance of the Remediation System are required at the Site, and shall be left in place, operated and maintain by Proponent until and except to the extent that DTSC authorizes Proponent in writing to discontinue or modify part or all of the Remediation System.

4. Implementation of Operation and Maintenance Plan. Proponent has submitted an Operation and Maintenance Plan to DTSC for approval. Proponent shall fully implement the DTSC-approved Operation and Maintenance Plan dated October 1, 2008, attached as Exhibit D, including any requirements for inspections, monitoring, reporting and record keeping.

5. Modification or Discontinuation of Remediation System. Proponent shall submit a written request for DTSC's authorization for any modification or discontinuation

of the Remediation System or any part thereof at least 60 days, to the extent feasible, prior to the intended date of any proposed modification or discontinuation. Proponent may seek modification or discontinuation of the Remediation System or any part thereof if (a) Proponent has met the remediation objectives for the site; (b) the modification would better achieve the remediation objectives; (c) the Remediation System could not achieve the remediation objectives and other cleanup methods will be implemented; or (d) it has been demonstrated that the maximum achievable remediation has occurred. The written request to DTSC shall include the reasons for the request, a detailed description of any work to be done or modification to be made, and a map showing the exact location of the proposed work.

6. DTSC-Required Modification. DTSC may require modification, replacement, or additions to the Remediation System if the Remediation System or part of thereof is not achieving the remediation objectives or is not protecting human health or the environment. DTSC may require additional evaluations, designs and the construction and operation of facilities to achieve these objectives.

7. Five-Year Review. Proponent shall review and reevaluate the Remediation System after a period of five years from the completion of construction of the Remediation System and every 5 years thereafter. The review and reevaluation shall be conducted to determine if human health and the environment are being adequately protected by the Remediation System. Within 30 days before the end of each five-year period, Proponent shall submit a five-year review workplan to DTSC for review and approval. Within 60 days of DTSC's approval of the workplan, Proponent shall implement the workplan and submit a report of the results of the five-year review. The report shall describe the results of all sampling analyses, tests and other data generated or received by Proponent and evaluate the adequacy of the implemented remedy in protecting human health and the environment. As a result of any review work performed under this Agreement, DTSC may require Proponent to perform additional review work or modify the review work previously performed by Proponent.

8. Quality Control/Quality Assurance (QC/QA). All sampling and analysis conducted by Proponent under this Agreement shall be performed in accordance with the QC/QA procedures submitted by Proponent and approved by DTSC pursuant to this Agreement.

9. Financial Assurance. Proponent must assure that sufficient funds are available to implement all the requirements of this Agreement and to pay DTSC's costs as specified in Paragraph 10. Proponent shall propose a financial instrument as the financial assurance mechanism that meets DTSC's requirements pursuant to California Code of Regulations, title 22, section 66265.143.

10. Cost Recovery and Payment.

10.1. Proponent is liable for all of DTSC's costs incurred in implementing this Agreement, including costs of overseeing the work performed by Proponent, and in

responding to any contamination at the Site. Cost recovery may be pursued by DTSC pursuant to applicable state or federal laws or common law. DTSC will invoice Proponent for DTSC's costs on a quarterly basis. To the extent allowed by applicable law, Respondent reserves all rights to dispute such invoices and amounts and to seek administrative and/or judicial review of such Department costs.

10.2. All payments made by Proponent pursuant to this Agreement shall be by check payable to the "Department of Toxic Substances Control", and bearing on its face the project code for the Site (Site # 201318-11) and the docket number of this Agreement. Upon request by Proponent, DTSC may accept payments made by credit cards. Payments by check shall be sent to:

Department of Toxic Substances Control
Accounting Office
1001 I Street, 21st Floor
P.O. Box 806
Sacramento, California 95812-0806

A photocopy of the check shall be sent concurrently to DTSC's Project Manager.

10.3. DTSC shall retain all cost records associated with the work performed under this Agreement as may be required by state law. DTSC will make all documents that support DTSC's cost determination available for inspection upon request in accordance with the Public Records Act, Government Code section 6250 et seq.

11. Endangerment During Implementation.

11.1. Proponent shall notify DTSC's Project Manager immediately upon learning of any condition that may pose an immediate threat to public health or safety or the environment. Within seven days of the onset of such a condition, Proponent shall furnish a report to DTSC, signed by Proponent's Project Manager, setting forth the conditions and events that occurred and the measures taken in response thereto.

11.2. In the event DTSC determines that any activity (whether or not pursued in compliance with this Agreement) may pose an imminent or substantial endangerment to the health or safety of people on the Site or in the surrounding area or to the environment, DTSC may order Proponent to conduct additional activities or to stop further implementation of this Agreement for such period of time as may be needed to abate the endangerment. DTSC may request that Proponent implement interim measures to address any immediate threat or imminent or substantial endangerment.

12. Site Access. Proponent shall provide, and/or obtain access to the Site and take all reasonable efforts to obtain access to offsite areas to which access is necessary to implement the Agreement. Such access shall be provided to DTSC's employees, contractors, and consultants at all reasonable times. Such access shall also be

provided to any other proponent or Proponent who is in compliance with this Agreement for the purpose of conducting activities pursuant to this Agreement or for activities deemed necessary by DTSC to meet the objectives of this Agreement. Nothing in this paragraph is intended or shall be construed to limit in any way the right of entry or inspection that DTSC or any other agency may otherwise have by operation of law.

13. Sampling, Data and Document Availability. When requested by DTSC, Proponent shall make available for DTSC's inspection, and shall provide copies of, all data and information concerning contamination at or from the Site, including technical records and contractual documents, sampling and monitoring information and photographs and maps, whether or not such data and information was developed pursuant to this Agreement. For all final reports, Proponent shall submit one hard (paper) copy and one electronic copy with all applicable signatures and certification stamps as a text-readable Portable Document Formatted (pdf) file Adobe Acrobat or Microsoft Word formatted file.

14. Record Preservation. Proponent shall retain, during the implementation of this Agreement and for a minimum of six years after its termination, all data, reports, and other documents that relate to the performance of this Agreement. If DTSC requests that some or all of these documents be preserved for a longer period of time, Proponent shall either comply with the request, deliver the documents to DTSC, or permit DTSC to copy the documents at Proponent's expense prior to destruction.

15. Notification of Field Sampling. Proponent shall inform DTSC at least seven days in advance of all field sampling pursuant to this Agreement and shall allow DTSC and its authorized representatives to take duplicates of any samples collected by Proponent pursuant to this Agreement.

16. Project Managers. Within 14 days of the effective date of this Agreement, DTSC and Proponent shall each designate a Project Manager and shall notify each other in writing of the Project Manager selected. Each Project Manager shall be responsible for overseeing the implementation of this Agreement and for designating a person to act in his/her absence. All communications between DTSC and Proponent, and all notices, documents and correspondence concerning the activities performed pursuant to this Agreement shall be directed through the Project Managers. Each party may change its Project Manager with at least seven days prior written notice.

17. Proponent's Consultant and Contractor. All work performed pursuant to this Agreement shall be under the direction and supervision of a professional engineer or professional geologist, licensed in California, with expertise in hazardous substances site cleanup. Proponent's Project Manager, contractor or consultant shall have the technical expertise sufficient to fulfill his or her responsibilities. Within 14 days of the effective date of this Agreement, Proponent shall notify DTSC's Project Manager in writing of the name, title, and qualifications of the professional engineer or professional geologist and of any contractors or consultants and their personnel to be used in

carrying out the work under this Agreement in conformance with applicable state law, including but not limited to, Business and Professions Code sections 6735 and 7835.

18. DTSC Review and Approval. All work performed pursuant to this Agreement is subject to DTSC's review and approval. If DTSC determines that any report, plan, schedule or other document submitted for approval pursuant to this Agreement fails to comply with this Agreement or fails to protect public health or safety or the environment, DTSC may (a) return comments to Proponent with recommended changes and a date by which the Proponent must submit to DTSC a revised document incorporating or addressing the recommended changes; or (b) modify the document in consultation with Proponent and approve the document as modified. All DTSC approvals and decisions made regarding submittals and notifications will be communicated to Proponent in writing by DTSC's Performance Manager or his/her designee. No informal advice, guidance, suggestions or comments by DTSC regarding reports, plans, specifications, schedules or any other writings by the Proponent shall be construed to relieve Proponent of the obligation to obtain such written approvals.

19. Amendments. This Agreement, including the attached Operation and Maintenance Plan, may be amended in writing by mutual agreement of DTSC and Proponent. Such amendment shall be effective the third business day following the day the last party signing the amendment sends its notification of signing to the other party. The parties may agree to a different effective date.

20. Incorporation of Exhibits, Plans and Reports. All exhibits are incorporated into this Agreement by reference. All plans, schedules and reports that require DTSC's approval and are submitted by Proponent pursuant to this Agreement are incorporated in this Agreement upon DTSC's approval.

21. Reservation of Rights. DTSC reserves all of its statutory and regulatory powers, authorities, rights, and remedies under applicable laws to protect public health or the environment, including the right to recover its costs incurred therefore. Proponent reserves all of its statutory and regulatory rights, defenses and remedies available to Proponent under applicable laws..

22. Non-Admission of Liability. By entering into this Agreement, Proponent does not admit to any finding of fact or conclusion of law set forth in this Agreement or any fault or liability under applicable laws.

23. Proponent Liabilities. Nothing in this Agreement shall constitute or be considered a covenant not to sue, release or satisfaction from liability by DTSC for any condition or claim arising as a result of Proponent's past, current, or future operations or ownership of the Site.

24. Government Liabilities. The State of California or DTSC shall not be liable for any injuries or damages to persons or property resulting from acts or omissions by Proponent or by related parties in carrying out activities pursuant to this Agreement, nor

shall the State of California or DTSC be held as a party to any contract entered into by Proponent or its agents in carrying out the activities pursuant to this Agreement.

25. Third Party Actions. In the event that Proponent is a party to any suit or claim for damages or contribution relating to the Site to which DTSC is not a party, Proponent shall notify DTSC in writing within 10 days after service of the complaint in the third-party action. Proponent shall pay all costs incurred by DTSC relating to such third-party actions, including but not limited to responding to subpoenas.

26. California Law. This Agreement shall be governed, performed and interpreted under the laws of the State of California.

27. Severability. If any portion of this Agreement is ultimately determined not to be enforceable, that portion will be severed from the Agreement and the severability shall not affect the enforceability of the remaining provisions of the Agreement.

28. Parties Bound. This Agreement applies to and is binding, jointly and severally, upon Proponent and its agents, receivers, trustees, successors and assignees, and upon DTSC and any successor agency that may have responsibility for and jurisdiction over the subject matter of this Agreement. Proponent shall ensure that its contractors, subcontractors and agents receive a copy of this Agreement and comply with this Agreement.

29.. Effective Date. The effective date of this Agreement is the date of signature by DTSC's authorized representative after this Agreement is first signed by Proponent's authorized representative. Except as otherwise specified, "days" means calendar days.

30. Representative Authority. Each undersigned representative of the party to this Agreement certifies that she or he is fully authorized to enter into the terms and conditions of this Agreement and to execute and legally bind the party to this Agreement.

31. Counterparts. This Agreement may be executed and delivered in any number of counterparts, each of which when executed and delivered shall be deemed to be an original, but such counterparts shall together constitute one and the same document.

Attention: Mr. Mark Piros and Mr. Patrick Lee

Subject: Operation and Maintenance Plan for the Engineered Containment Berm Parcel on the Plant Site of the Former Johns Manville Facility, 420 East Third Street, Pittsburg, California

Dear Mr. Mark Piros and Mr. Patrick Lee:

On behalf of Pittsburg River Park LLC (PRPLLC), LFR Inc. (LFR) has prepared this Operation and Maintenance (O&M) Plan for the Berm Parcel (identified as Parcel D as shown on Minor Subdivision Map) of the Former Johns Manville Facility located at 420 East Third Street in Pittsburg, California ("the Site"; Figure 1). This document addresses the comments from the City of Pittsburg and Department of Toxic Substances Control (DTSC) sent in an email to Ron Goloubow from Patrick Lee on March 12 and September 23, 2008. The O&M Plan is to serve as the guide for operating, maintaining, and repairing the containment berm that has been built at the Site.

The O&M Plan includes a description of the following:

- General site overview and history;
- Physical features of the containment berm and soil cap;
- Routine and nonroutine monitoring and maintenance procedures and related schedules; and
- General restrictions on the containment berm.

This O&M Plan, once approved by the DTSC, will be periodically reviewed and updated in the event that site conditions change.

1.0 INTRODUCTION

LFR Inc. (LFR) on behalf of Pittsburg River Park LLC (PRPLLC) has prepared this Operation and Maintenance Plan ("O&M Plan") for the engineered containment berm on the Plant Site of the former Johns Manville (JM) Facility in Pittsburg, California ("the Site"; Figures 1 and 2). As illustrated on Figure 2, the containment berm is located along the eastern boundary of the Site and is comprised of two distinct segments. In order to provide access directly from Harbor Street, a 58-foot-wide access roadway was constructed between the two berm sections. For the purpose of this report the two distinct segments will be referred to as "the berm."

The construction of the on-site containment berm for asbestos-containing materials (ACM) and total petroleum hydrocarbon- (TPH-) affected soil was part of the remedial action that was selected for implementation as described in detail in the Final Remedial Action Plan (RAP; ERM 2006a). This O&M Plan serves as the guide for operating, maintaining, and repairing the containment berm that has been built at the Site. The O&M Plan will be reviewed and approved by the California Department of Toxic Substances Control (DTSC).

The O&M Plan includes a description of the following:

- General site overview and history;
- Physical features of the landscaped containment berm;
- Routine and nonroutine monitoring and maintenance procedures and related schedules; and
- General restrictions on the containment berm.

This O&M Plan, once approved by the DTSC, will be periodically reviewed and updated in the event that site conditions change. The responsibility for implementing the O&M Plan will remain with the owner of the property.

1.1 Site Description

The former JM Facility consists of two distinct properties located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California. These properties are shown on Figure 1.

The first parcel, known as the North Parcel, is an approximately 4.2-acre parcel located between (and bounded by) New York Slough to the north and the Plant Site to the south, and is situated just north of East Third Street. The North Parcel was formerly used for storage of asbestos-containing products prior to shipment. As a result of this practice, a significant amount of ACM was deposited onto the ground. To prevent future exposure to ACM a soil cap was constructed over the contaminated soil. The O&M plan for the North Parcel is provided in the "Operation and Maintenance

Plan, North Parcel Site, former Johns Manville Plant, Pittsburg, California" (ERM 2005). The O&M of the North Parcel has been conducted and reported on a semiannual basis (two times a year) since 2007 and prior to that the inspections were conducted quarterly.

The Plant Site, located approximately 1,000 feet south of New York Slough, is the subject of remedial actions addressed in this O&M plan. This 21-acre parcel is bounded to the north by the North Parcel, Third Street, and a Tesoro coke facility; to the east by Harbor Street, several small light-industrial businesses, and USS Posco Corporation; to the south by a City Park; and to the west by residential properties. Most recently, until the facility terminated operations in 2003, the facility was used for the manufacturing of commercial roofing materials.

A review of JM's historical operations, as well as site-wide investigation data, indicated that the areas of potential concern at the Site were the former evaporation pond and several additional locations found while conducting abatement and demolition activities at the Site. ERM, on behalf of PRPLLC assessed the remediation alternatives, documented in the RAP (ERM 2006a), and determined the most effective course of remedial action for the Site would be the construction of an engineered containment berm along the eastern boundary of the Site. The details of the construction of the berm is described in the "Remedial Design and Implementation Plan, Harbor Park Development, Pittsburg, California" (RDIP; ERM 2006b), and the "Addendum to the Remedial Design and Implementation Plan, Harbor Park Development (Former Johns Manville Facility), 420 East 3rd Street, Pittsburg, California" (ARDIP; LFR 2007).

1.2 Site History

The manufacturing plant was built sometime between 1925 and 1928. In 1957, a large warehouse was constructed south of the main manufacturing facility. Asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering were the primary products produced prior to the termination of asbestos-containing product manufacturing in 1980. A series of four asphalt stills, located along the southwestern margin of former Building 4, was used to convert heavy oil to asphalt. The stills were fueled by fuel oil and later with natural gas. In the process of converting heavy oil to asphalt, off-gas vapors were collected, condensed, and mixed with water to form an oil-water slurry that was transported via an underground pipe to the evaporation pond. The residual oil in the evaporation pond was reportedly burned approximately twice a year. Use of the evaporation pond began in 1946. It remained relatively constant in size until 1959, when discharge of effluent was discontinued, and the pond was subsequently filled with scrap and construction debris and capped with asphalt pavement (ERM 2006a/b). As a result of site operations the chemicals of concern at this Site were identified as ACM, TPH, and related compounds.

Subsequent to the cessation of ACM manufacturing operations at the Site, and until the plant was closed in approximately 2003, JM manufactured commercial roofing

materials using fiberglass mat, asphalt, sand, and limestone. Petroleum-based resins and solvents were also used on site.

In 2005 PRPLLC acquired the plant and retained Plant Reclamation to decommission and demolish the plant facilities. During demolition activities ACM was segregated and stored on site for placement into the containment berm. ACM was observed in many different forms including but not limited to concrete, wall board, roofing material, pipes, and debris. This material along with TPH-affected soil removed from the former evaporation pond has been placed into the berm during remedial activities.

In 2006 PRPLLC also retained Entact Environmental Services ("Entact") to implement the scope of the RAP. During the implementation of the RAP the ACM from the demolition of the on-site structures were placed into the containment berm along with other ACM or TPH-affected soil that was excavated from the subsurface.

2.0 CONTAINMENT BERM CONSTRUCTION

The berm has been constructed along the eastern boundary of the Site, and consists of two components: a north berm and a south berm (Figure 2). The various components and characteristics of the containment berm are detailed in the RDIP and ARDIP and summarized in this section. Based on calculations completed by Winzler & Kelly (W&K), a licensed engineering company located in San Francisco and Santa Rosa, California, approximately 64,400 cubic yards of ACM and TPH-affected soil have been transported and placed in the containment berm.

Project documents related to design, construction, and O&M of the berm are identified in the References section of this O&M Plan.

2.1 Construction Plans and Technical Specifications

The construction plans and technical specifications for the berm as described in the RDIP and the ARDIP include:

- Excavating a trench to approximately 10 feet below ground surface (bgs) beneath the entire length of the berm to accommodate the placement of ACM below grade;
- Backfilling the trench with affected material and constructing a berm above grade;
- Capping the berm with a Tensar product; this is commonly used for the reinforcement of soils in construction of structures such as embankments and 2 feet of clean cover soil. In addition to providing additional structural integrity to the berm, the Tensar product fabric will also serve as a visual demarcation liner between affected soils and the 2-foot-thick clean soil cap;
- Constructing perimeter fencing to prevent public access to the Site;

- Construction of drainage swales adjacent to the berm and grading such that collected storm-water runoff will drain towards catch basins;
- Installing an automated irrigation system; and
- Installing low maintenance landscaping in accordance with the City of Pittsburg requirements.

In the ARDIP completed by LFR, the construction plans and technical specifications for the berm were modified slightly to accommodate a larger volume of ACM waste material encountered at the Site. Specifically, the ARDIP described plans for a western expansion of the berm by approximately 10 feet. The height, northern, southern, and eastern dimensions of the berm were not modified. In addition, the indicator layer to be placed between the affected soil and the 2-foot-thick clean soil cover was changed to a Tensar product (from a Mirafi™ product called for in the RAP and RDIP). Treadwell & Rollo (our Geotechnical Engineer) recommended the substitution of the Tensar product to increase adhesion between the waste material and the clean cover material.

In general, the berm was constructed in accordance with the plans outlined in the RDIP and ARDIP. The berm constructed along the edge of the eastern boundary of the Site, is referred to as "south berm" and "north berm" (Figure 2). Initially a 10-foot-deep trench was excavated in sections along the entire length of the berm. The trench was filled with ACM along the length of both berm sections. In order to provide access directly from Harbor Street, a 58-foot-wide access roadway was constructed between the two berm sections. The TPH-affected material was placed in the berm above the ACM material, which was placed up to the native grade elevations. (i.e., TPH-affected soil was not placed in the subsurface portion of the berm.). The south berm is approximately 296 feet long, while the north berm is approximately 1,072 feet long. Both berms are approximately 85 feet wide at the base and extend approximately 10 feet above the elevation of the adjacent sidewalk area of the City's Harbor Street Right of Way (8 feet of waste material and 2 feet of clean cover). A minimum buffer distance of 1 to 3 feet exists between the affected soils and public rights of way or private streets or utilities (Figures 2 and 3).

Access to the berm is restricted by a fence, with gates to provide access for inspection and routine maintenance. The fence and all signs posted meet the City of Pittsburg Municipal Code (PMC) requirements.

2.2 Grading and Profile

The containment berm was constructed by Entact in accordance with the RDIP, ARDIP, and the grading permit issued by the City of Pittsburg. The City of Pittsburg periodically monitored grading operations to verify that field operations complied with the approved grading permit. W&K provided locations and final grade control during and after the berm construction.

2.3 Surface Drainage Control

The runoff from the berm is collected in swales that flow to catch basins connected to the city storm-water system. The swales were designed by W&K and were approved by the City of Pittsburg's engineering department. The remainder of the Site is currently undeveloped and in rough grade condition. All other storm-water utilities have been removed from the Site during plant decommissioning-demolition. During soil remediation activities, storm-water management was performed such that the adjacent off-site storm-water collection system was not affected by site activities.

2.4 Slope Protection and Drainage Control

The slope of the berm caps is approximately 2.0 feet horizontal to 1.0 foot vertical (2H: 1V). The side slopes and the associated landscaping were designed to prevent erosion and provide adequate drainage. The vegetation used was determined by a Qualified Landscape Contractor and was approved by the City of Pittsburg prior to construction. It is our understanding that the landscaping on the berm will be augmented as part of the future development plans for this Site.

2.5 Irrigation System

An irrigation system has been installed to provide water for vegetation support and maintenance. The system consists of an aboveground PVC irrigation system. The system includes timer-activated, battery-operated valves so that the system can be operated at night to minimize evaporation. The system is configured such that routine landscape maintenance can be performed with minimal impact to the irrigation system. It is our understanding that the irrigation system on the berm will be upgraded as part of the future development plans for this Site.

3.0 MONITORING AND MAINTENANCE PROCEDURES AND SCHEDULES

This section provides the O&M program; identifies key personnel associated with the program; details monitoring, maintenance, and repair issues to be considered; and describes the reporting program.

3.1 O&M Monitoring Program

The objectives of the proposed O&M program are to:

- Minimize the threat to human health and the environment from ACM and TPH-affected soil contained within the berm;
- Preserve the function and integrity of the berm; and

- Control drainage and erosion on the berm.

O&M monitoring will include routine inspection of the irrigation system, fencing, drainage system, and soil cap. This inspection will also include an assessment of trash accumulation in the berm parcel. If appropriate, trash will be removed during the inspections and if necessary on a more frequent basis. With respect to the soil cap, emphasis will be placed on identifying signs of erosion, lack of vegetative cover, or damage due to burrowing animals or trespassers. Maintenance will include regular grass/weed abatement in accordance with Riverview Fire Prevention District requirements and to ensure that aesthetic issues do not arise with nearby residents. Fertilizing and pruning/trimming the vegetative cover will be conducted on an as-needed basis. The O&M monitoring program will include a quarterly (once every three months) inspection and reporting schedule for the first year and then semiannually (once every six months) assuming minimal disturbances are observed. A semiannual inspection schedule will allow for evaluating site conditions during the summer months (when the irrigation system is operational) and during the winter months (when erosion from seasonal precipitation is of most concern). These inspections will be conducted at the end of the Second Quarter (June) and Fourth Quarter (December) of each calendar year.

3.2 Monitoring Personnel

The site inspection will be conducted and the report written by the Site Inspector, a field engineer, or field geologist under the direct supervision of the Site Engineer, who will be a California professional civil or geotechnical engineer.

The primary responsibilities of the Site Inspector are:

- Perform inspections and evaluations
- Accurately record all inspection data
- Prepare the summary O&M Report
- Review and evaluate the O&M Plan and reference documents to ensure they are accurately reflected in the inspections and repairs performed

The primary responsibilities of the Site Engineer are:

- Review and evaluate data and reports prepared by the Site Inspector
- Report observations and inspection results to the property owner and DTSC
- Review and/or prepare repair plans and specifications
- Review and/or prepare instructions for contractor and Site Inspector for repair and inspection requirements and procedures

3.3 Monitoring and Maintenance Procedures

The inspection program for the containment berm and soil cap and drainage system will evaluate the following:

- Condition of the vegetative cover;
- Erosion from irrigation or storm-water runoff;
- Impacts from burrowing animals and/or trespassers;
- Condition of all drainage system components;
- Indication of settlement survey of the installed "settlement monuments" (see section 3.3.1)
- Condition of the irrigation system and fencing; and
- The need for slope failure repairs.

The site inspection will consist of a complete walk-through and visual examination of all the components addressed above. As appropriate, photographs will be taken to document site conditions. An O&M inspection checklist for use during site inspections is presented as Appendix A, and includes the following information:

- Inspector and date, time, and climatic conditions during inspection;
- Specific visual observations regarding the containment soil cap, fencing, and/or drainage system, and a diagram/map showing the location of the observations;
- Specific observations regarding the vegetative cover system to include an evaluation of weed and fire control issues, the need for re-seeding, rodent control, and the condition of the irrigation system;
- Detailed descriptions associated with observations, as appropriate;
- Short-term actions taken in response to observations, as appropriate; and
- Detailed record regarding any necessary repairs to include the nature/location of the deficiency, repair action taken, and any follow-up remarks or observations.

A map showing locations of specific observations and response/repair activities, and a photographic record of the inspection will be incorporated as part of the checklist for reporting purposes, as noted below.

All repairs determined to disturb the lowest 6 inches of the 2-foot-thick soil cover (1.5 feet below grade) or any repairs determined to be major (i.e., requiring engineering evaluation or cost analysis) will be scoped and completed under the supervision of the Site Engineer, with appropriate experience in caps and covers for waste containment facilities. The owner will be responsible to make these repairs so that the berm will return to its constructed condition. The DTSC will be informed via telephone, email, or written correspondence by the owner of the pending "major" repairs and it will be the DTSC's discretion to observe the repairs.

3.3.1 Differential Settlement

Per the recorded Grading Agreement, the settlement of the berm shall be monitored by a licensed geotechnical firm, selected by the City of Pittsburg and approved by the property owner. The observation period for the differential settlement is to be determined by the City of Pittsburg Engineer. As outlined in the grading agreement, the observation period is to be completed in accordance with the design and specifications of the wick drain report and as approved by the City of Pittsburg and City of Pittsburg geotechnical consultant. In general, the observation period is to last until it has been determined that 90% of the settlement has occurred. However, if at the end of the observation period, if 90% of the settlement has not occurred, then observation will continue.

3.3.2 Vegetation Monitoring, Maintenance, and Repairs

The entire above ground portion of the containment berm and soil cap will be visually inspected semiannually by the Site Inspector following the first year as described previously. The walk-through will focus on any indications of erosion, settlement, cracking, poor and/or unusually discolored vegetation, and animal intrusion on the containment berm and soil cap.

Vegetation on the containment berm soil cap will be maintained on a regular basis as described above to keep the area clear and visible to allow site inspections, and for fire control.

The inspection will also focus on areas of the cap that require re-vegetation. As necessary, limited areas requiring re-vegetation will be planted in a manner consistent with the rest of the berm growth and the City of Pittsburg's approved Landscaping Plan. A copy of the landscaping plan is included as Appendix B. Larger areas exhibiting dead or dying vegetation will be evaluated by the Site Engineer for potential replanting. Completing the landscaping repairs will be the responsibility of the site owner.

3.3.3 Erosion Control Monitoring, Maintenance, and Repairs

Surface erosion damage to the containment soil cap will be evaluated during each site inspection. Surface erosion damage includes areas eroded by storm water, wind, or excessive irrigation. Appropriate repairs will be evaluated and scheduled as soon as possible following identification of a defect. Repair work will be performed by appropriately trained personnel in accordance with a site-specific Health and Safety Plan (HASP) prepared prior to the commencement of work.

Implementation of repairs may require limited excavation prior to filling and grading. In all cases, care will be taken to ensure that excavation below the soil cap does not occur to the extent possible. Final grading and compaction will be performed so as to

match the surrounding topography and RDIP, ARDIP, and grading permit specifications.

3.3.4 Animal Intrusion Monitoring and Repairs

Burrowing animal intrusion will be evaluated during each site inspection. Along with evaluation of repairs necessary to fill the burrowed areas, consideration will be given to the possibility of removing burrowing animals from the Site if burrowing is extensive. Minimal filling of burrows will be conducted using commercially available soil as fill material for repair of vegetative cover as described above. Significant repairs, requiring the use of construction equipment or requiring the removal of burrowing animals, will be performed using appropriately trained personnel in accordance with a HASP prepared prior to the commencement of work.

3.3.5 Drainage System Monitoring, Maintenance, and Repairs

During each site inspection, the drainage swale and catch basins will be evaluated for obstructions, which will be removed on an as-needed basis using rakes or shovels, as appropriate. Signs of cracking, settling, excessive vegetative growth, and other maintenance and repair concerns will be evaluated.

In the event that the swale is damaged severely enough that re-grading is required, the affected section will be demolished and re-graded. The repair work will be designed and overseen by properly trained staff in accordance with a HASP prepared prior to the commencement of work.

3.3.6 Settlement Monitoring and Repairs

During each inspection, indications of settling will be evaluated. These indications include cracking, settling, or other deformations that may compromise the integrity of the containment berm and soil cap. Any such deformities will be repaired immediately using available fill materials that will be stored on site within the fenced area. More significant repairs involving construction equipment and the potential to breach the soil cap will be performed under the oversight of properly trained staff in accordance with a HASP prepared prior to the commencement of work.

3.3.7 Irrigation System Repair

The irrigation system will be evaluated during each inspection. During the growing season, when the irrigation system is generally operable, the inspection will include reviewing the condition of sprinkler heads and conveyance lines. Likewise, each station of the irrigation system will be manually started during the inspection to evaluate the degree to which the Site is being covered. Any damage to irrigation system components will be immediately repaired to ensure that system disruption does not result in damage to the vegetative cover.

During the winter months (i.e., rainy season), inspections will also include evaluation of system components. Any damage to these components will be noted and repaired at a convenient time prior to the following growing season. No efforts to manually start the irrigation system will be made during winter month inspections; however, repair needs will be noted if discovered and the necessary repairs will be made.

3.3.8 Fencing Monitoring and Repair

Because the fence and gates at the Site are the primary barriers between the containment soil cap and the public, it is essential that these components be maintained in good working order. Each inspection will include a perimeter walk along the fencing to evaluate the integrity of fence posts, structural bars, gates, and locks and to identify any evidence of vandalism or entry by humans or animals. Inspections would also include evaluating the condition of signage. Signage will include but not be limited to "no trespassing" signs and "do not enter" signs. The signs will be in English and Spanish and will be in accordance with the City of Pittsburg's requirements. Any required repairs will be conducted immediately to ensure the barrier between the Site and public remains intact.

3.3.9 Slope Failure Repairs

In the event that a localized or site-wide slope failure is identified during a site inspection, the condition will be documented photographically, and repairs will be implemented only after consulting with the Site Engineer and DTSC. If slope failure results in exposure of asbestos materials, that area will be temporarily covered with a tarp and sand bags to minimize potential threat to human health or the environment pending evaluation of appropriate repair actions by the Site Engineer and DTSC.

3.4 Nonroutine Monitoring and Maintenance Procedures and Schedules

A number of nonroutine events will require unscheduled (nonroutine) inspections. As soon as the Site is accessible, it will be inspected following any of the following events:

- Rainfall exceeding 2 inches in a 24-hour period;
- Earthquakes exceeding 5.0 magnitude within a 50-mile radius of the Site;
- Blockage or overflow of the drainage system;
- Vandalism;
- Fire;
- Explosion;
- Broken water mains;
- Misguided utility line repair;

- Vehicle collision with the berm; or
- Any other foreseeable impact which may result in a breach of the berm.

If the damage from one of these events presents an immediate hazard to human health and/or the environment, repairs or temporary controls will be initiated immediately subject to Site Engineer evaluation and approval. All repair work will be completed in accordance with the HASP that will be prepared prior to the commencement of the repair work and under the supervision of the Site Engineer or a registered professional civil engineer. DTSC will be notified if any major repairs are required.

3.5 Emergency Response Plan

As indicated in Section 4.1 of the RAP, none of the waste materials contained in the berm are acutely hazardous. As the primary exposure routes are incidental ingestion, dermal contact, or inhalation of fugitive dust there would be no immediate acute threat to human health or the environment if these materials should become suddenly exposed.

Personnel listed below can be called to contain the breach and the berm will be temporarily covered with a tarp and sand bags to minimize further threat to human health or the environment pending evaluation of appropriate repair actions by the Site Engineer and DTSC.

Contact Information Emergency Only:

- 911 – City of Pittsburg Police Department of Contra Costa County Fire Protection District

Contact Information for Routine and/or Emergencies:

- Pittsburg River Park LLC - 39 Washington Street, Suite 220 Wellesley, MA 02481, 781-431-8101- office
- Michael Singer, Project Director - 860-214-7195 - 24-hour cell phone
- John Hanselman, Managing Partner - 617-480-1667 - 24-hour cell phone
- Pete Pedersen, Managing Partner - 781-223-8157 - 24-hour cell phone
- LFR Inc. (24-Hour Emergency Response) - 510-652-4500 - office
- Ron Goloubow, Project Manager - 510-501-1789 - 24-hour cell phone

3.6 Operation and Maintenance Program Reporting

Upon completion of each inspection of the containment soil cap and drainage system, the responsible party will oversee preparation of a report describing conditions of the Site in accordance with the evaluation factors listed above. The responsible party shall

be the site owner, agent of owner, consultant or subcontractor of owner. Along with the inspection checklist and associated site diagram and photographic log, the inspection reports will include a written evaluation of the following:

- Integrity of the security fence;
- Condition of irrigation system;
- Condition of the vegetative cover;
- Erosion impacts from irrigation or storm-water runoff;
- Rodent or animal populations burrowing into the cap; and
- Condition of drainage system components.

Inspection reports will be maintained by the responsible party, and copies will be forwarded to DTSC within one month following completion of the inspection. In association with the Fourth Quarter submittal (to be submitted to DTSC by the end of January), an annual report will be prepared summarizing the results of semiannual monitoring and any noteworthy repair or maintenance activities.

In the event that slope failure is identified during a site inspection and repairs are required, the Site Engineer will oversee preparation of a report specific to slope failure issues. The report, which will be prepared by the Site Engineer, will document the problem, recommended repairs, procedures, and repair activities. That report will be submitted to DTSC and the appropriate department(s) of the City of Pittsburg within one month following completion of site repair activities.

4.0 TRAFFIC RESTRICTIONS ON THE CONTAINMENT SOIL CAP

The containment soil cap was constructed to allow limited vehicle access for the purpose of inspection, maintenance, and repair of the soil cap or its components. Vehicular traffic on the containment soil cap should be avoided unless absolutely necessary for inspections and repairs to ensure that disturbance of the cap is minimized at all times.

Under no circumstances will vehicular access be provided to anyone other than the responsible party or its subcontractors.

Operation and Maintenance Checklist

O&M CHECKLIST
PITTSBURG RIVER PARK LLC (Former JM Plant)
BERM PARCEL

Inspector: _____ Date: _____ Time: _____
Climatic Conditions: _____

Landscaping, Fencing, and Drainage Inspection

Please observe and document the following:

- Note and quantify eroded areas.
- Note and quantify cover soil conditions such as sloughing, sliding (presence of headscarps), and/or toe bulging.
- Note and quantify cracks, fissures, or other features that may potentially allow surface water infiltration.
- Note and quantify areas of subsidence, depressions, or topography where ponding may occur.
- Estimate rodent or other burrowing animal populations.
- Note and quantify burrowing animal intrusion drainage.
- Document (locate) areas where cover deficiencies are observed.
- Inspect and record any ponding.
- Inspect for runoff inundation.
- Inspect fencing.

LOCATION OF OBSERVATION (show on map): _____

FORMER JOHNS MANVILLE PLANT SITE AND NORTH PARCEL, EAST THIRD STREET AND HARBOR STREET, PITTSBURG, CALIFORNIA – CERTIFICATION OF REMEDIAL ACTIONS

Dear Mr. Singer:

The Department of Toxic Substances Control certified the completion of the remedial actions at the former Johns Manville Plant Site and North Parcel on November 12, 2009. Enclosed are copies of the certification documents for your records. We appreciate your effort and cooperation in completing the cleanup of these two properties. We also wish to acknowledge Jodi Smith from Paul, Hastings, Janofsky & Walker and Ron Goloubow from LFR for their efforts.

Please call me at (510) 540-3832 if you have any questions.

Sincerely,

Mark E. Piros

REMEDIAL ACTION CERTIFICATION
FORMER JOHNS MANVILLE NORTH PARCEL

---

1. Certification of Remedial Action:

I hereby certify that the following information is true and correct to the best of my knowledge.

Mark E. Piros — Project Manager, Cleanup Program — 11/12/2009 — Date

Mark E. Piros — Unit Chief, Cleanup Program — 11/12/2009 — Date

Barbara Cook — Performance Manager, Cleanup Program — 11/12/09 — Date

2. Certification Statement: Based upon the information which is currently and actually known to DTSC:

___ DTSC has determined that all appropriate response actions have been completed, that all acceptable engineering practices were implemented and that no further removal/remedial action is necessary.

___ DTSC has determined, based upon a remedial investigation or site characterization, that the site poses no significant threat to public health, welfare, or the environment and therefore implementation of removal/remedial measures is not necessary.

_X_ DTSC has determined that all appropriate removal/remedial actions have been completed and that all acceptable engineering practices were implemented: however, the site requires ongoing operation and maintenance (O&M) and monitoring efforts. The site will be deleted from the "active" site list following (1) a trial operation and maintenance period and (2) execution of a formal written settlement between DTSC and the responsible parties, if appropriate. However, the site will be placed on DTSC's list of sites undergoing O&M to ensure proper monitoring of long-term clean-up efforts.

Relationship to Site: Current Owner

Johns Manville
717 17th Street
Denver, Colorado 80202
Relationship to Site: Former Owner/Operator

5. **Brief Description and History of the Site:**

The 4.2-acre North Parcel was one of two properties near the intersection of East Third Street and Harbor Street which Johns Manville owned and where it operated a manufacturing facility that produced asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering from around 1926 to 1980. The second property is known as the Plant Site. The North Parcel was used for storage of bulk asbestos fiber used in product manufacturing and for storage and repair of wood pallets used in the shipping of asbestos-cement products. A significant amount of asbestos-containing materials (ACM) were deposited on the ground while the North Parcel was used for storage of bulk asbestos fiber. The North Parcel was also used as a parking area for cars and a tarping area for truck drivers.

In 1986, Harding Lawson Associates (HLA) conducted a remedial investigation / feasibility study (RI/FS) on behalf of Johns Manville to determine the extent of ACM impacts on the North Parcel and to identify a remedial alternative to

address the impacts. The results of the RI/FS were presented in HLA's September 26, 1986 Remedial Investigation/Feasibility Study Report. The remedial investigation showed that ACM was present on approximately 3.8-acres of the 4.2-acre North Parcel in concentrations greater than one percent. The feasibility study evaluated four cleanup alternatives, which included soil removal and three different cover alternatives. The recommended alternative was a soil cover, based on its ability to prevent airborne asbestos exposures and because it was the considered the most cost-effective of the alternatives. DTSC approved the recommended remedial alternative with a letter dated December 11, 1986.

Johns Manville entered into a Voluntary Cleanup Agreement (VCA) in July 2000 to conduct a five-year review for the North Parcel and Preliminary Endangerment Assessment for the Plant Site. DTSC approved the First Five-Year Review Report for the North Parcel in June 2001. In October 2004, Pittsburg River Park LLC (PRPLLC) acquired both the North Parcel and the Plant Site from Johns Manville. PRPLLC entered into a VCA with DTSC in March 2005 and continued investigation and cleanup activities under its VCA with DTSC. PRPLLC completed the second five-year review and DTSC approved the Second Five-Year Review Report on December 11, 2006. Both the first and second five-year reviews concluded that the soil cover was functioning as intended and continued to be protective of human health and the environment.

PRPLLC has been performing ongoing inspection, maintenance, and repair of the soil cover and will continue to do so under an Operation and Maintenance Agreement with DTSC that was executed in September 2009. PRPLLC also entered into a Land Use Covenant with DTSC in December 2007 which restricts the use of the North Parcel and place limitations on activities that would disturb the soil cover.

6. Type of Site:

Has the Site been identified in EnviroStor as an active DTSC site?

Yes _X_ No___

RCRA-Permitted Facility	___	Bond-funded	___
RCRA Facility Closure	___	RP-Funded	_X_
NPL	___	Federal Facility	___
Other (i.e. walk-in)	___	Explain Briefly:	

7. Size of the Site:

Small ___ Medium _X_ Large ___ Extra-Large ___

8. Dates of Remedial Action:

a. Initiated: December 1987 b. Completed: March 1988

9. Response Action Taken on Site: (check appropriate action)

___ Removal Action (satisfactory abatement of site)

_X_ Final Remedial Action

___ RCRA enforcement/closure action

___ No action, further investigation verified that no clean-up action at the site was need.

A. Type of Remedial or Removal Action: (e.g. excavation and disposal, on-site treatment, etc.)

The remedial action primarily consisted of the construction of a soil cover over the ACM-impacted soil. The soil cover was constructed by placing a minimum of 9-inches to over 24-inches of engineered fill and was graded to have a slope of 0.5 to 10 percent to facilitate drainage. An automatic sprinkler system was installed and the soil cover was hydroseeded with a grass seed mixture. A fence was constructed around the periphery of the North Parcel to prevent public access.

B. Estimated quantity of waste associated with the site (i.e., tons/gallons/cubic yards) which was:

___	treated	amount:
_X_	untreated (capped sites)	amount: 18,400 cubic yards
___	removed	amount:

10. Cleanup Levels/Standards:

a. What were the cleanup standards established by DTSC pursuant to the Final Remedial Action Plan (RAP) or workplan (if cleanup occurred as the result of removal action (RA) prior to development of a RAP)?

The soil cover was constructed over the 3.8-acre, ACM-impacted portion of the 4.2-acre North Parcel and numerical cleanup standards were not established.

b. **Were the specified cleanup standards met?** Yes __ No __
Not applicable – capped site

c. **If "no", why not:**

11. **DTSC Involvement in the Remedial Action:**

A. **Did DTSC order the Remedial Action?**

Yes ___ No_X_ Date of Order:_____

B. **Did DTSC review and approve the following plans/procedures? (indicate date of review/approval, if done):**

Sampling and Analysis Procedures	Date: Documentation of approval could not be located
Health and Safety Protections	Date: Documentation of approval could not be located
Cleanup Plan	Date: December 11, 1986

C. **If site was abated by responsible party, did DTSC receive a signed statement from a licensed professional on all phases of the Remedial Actions? (indicate date of statement)**

Cleanup Plan	Date: September 26, 1986
Design and Construction Specifications	Date: August 12, 1988
Post Construction	Date: August 12, 1988

D. **Did a registered engineer or geologist verify that acceptable engineering practices were implemented?**

Yes _X_ No ___ Name: William Frizzell, Civil 33013
Date: the dates are those identified under 9.C.

E. **Did DTSC confirm completion of all Remedial Actions?**

Yes _X_ No ___ Date:

F. **Did DTSC (directly or through a contractor) actually perform the Remedial Action?**

Yes __ No _X_ Name of Contractor:

G. **Was there a community relations plan in place?**

Yes _X_ No __ Community Profile, dated April 5, 2001

H. **Was a removal/remedial action plan developed for this site?**

Yes _X_ No __

I. **Did DTSC hold public meetings regarding the draft RAP?**

Yes ___ No_X_

J. **Were public comments addressed?**

Yes ___ No _X_

Dates of DTSC analyses/responses:

K. **Are all of the facts cited above adequately documented in the DTSC files?**

Yes _X_ No __

If no, identify areas where documentation is lacking:

12. **EPA Involvement in the Remedial Action;**

A. **Was EPA involved in the site cleanup?**

16. Problems Encountered Which Caused Major Delays: Difficulties were encountered in putting in place the required financial assurance mechanism.

17. Accomplishments Unique to this Project: There were no unique accomplishments for this project.

18. Final Use of Site: The current zoning for the North Parcel is industrial. The North Parcel is currently not being used and there are no definite plans for its future use.

REMEDIAL ACTION CERTIFICATION
FORMER JOHNS MANVILLE PLANT SITE

---

1. Certification of Remedial Action:

I hereby certify that the following information is true and correct to the best of my knowledge.

Mark E. Piros — Project Manager, Cleanup Program — 11/12/2009 — Date

Mark E. Piros — Unit Chief, Cleanup Program — 11/12/2009 — Date

Barbara Cook — Performance Manager, Cleanup Program — 11/12/09 — Date

2. Certification Statement: Based upon the information which is currently and actually known to DTSC:

___ DTSC has determined that all appropriate response actions have been completed, that all acceptable engineering practices were implemented and that no further removal/remedial action is necessary.

___ DTSC has determined, based upon a remedial investigation or site characterization, that the site poses no significant threat to public health, welfare, or the environment and therefore implementation of removal/remedial measures is not necessary.

_X_ DTSC has determined that all appropriate removal/remedial actions have been completed and that all acceptable engineering practices were implemented: however, the site requires ongoing operation and maintenance (O&M) and monitoring efforts. The site will be deleted from the "active" site list following (1) a trial operation and maintenance period and (2) execution of a formal written settlement between DTSC and the responsible parties, if appropriate. However, the site will be placed on DTSC's list of sites undergoing O&M to ensure proper monitoring of long-term clean-up efforts.

3. **Site Name and Location: (Street address, County, and City)**

Former Johns Manville Plant Site
East Third and Harbor Streets
Pittsburg, Contra Costa County, California

A. List any other names that have been used to identify this site:

Former Johns Manville Site - OU 1
Pittsburg River Park

B. Address of site if different from above: not applicable

C. **Assessor's Parcel Numbers:** 073-050-001

4. **Responsible Parties**:

Pittsburg River Park, LLC
36 Washington Street, Suite 220
Wellesley, Massachusetts 02481
Relationship to Site: Current Owner

Johns Manville
717 17th Street
Denver, Colorado 80202
Relationship to Site: Former Owner/Operator

5. Brief Description and History of the Site:

The 20.5-acre Plant Site was one of two properties near the intersection of East Third Street and Harbor Street in Pittsburg, which Johns Manville owned and where it operated a manufacturing facility. The second property is known as the North Parcel. The manufacturing facility was located on the Plant Site while the North Parcel was used for storage of bulk asbestos fiber used in product manufacturing and for storage and repair of wood pallets used in the shipping of asbestos-cement products. The manufacturing facility produced asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering from around 1926 to 1980. The facility then manufactured commercial roofing products using fiberglass mat, asphalt, sand, and limestone until the facility closed in 2003.

The former manufacturing facility on the Plant Site consisted of four buildings in the northern portion of the Site and a warehouse in the southwestern portion of the Site. An asbestos product storage area was located in the area north of the warehouse. A series of four asphalt stills were used in the manufacturing

operation to convert heavy oil to asphalt. Off-gas vapors from the stills were collected, condensed, and mixed with water to form an oil-water slurry that was discharged to an evaporation pond from approximately 1946 to 1959. The evaporation pond was subsequently filled with scrap and construction debris.

Johns Manville entered into a Voluntary Cleanup Agreement (VCA) with DTSC in July 2000 to conduct a five-year review for the North Parcel and Preliminary Endangerment Assessment for the Plant Site. In October 2004, Pittsburg River Park LLC (PRPLLC) acquired both the Plant Site and North Parcel from Johns Manville. PRPLLC entered into a VCA with DTSC in March 2005 and continued performing investigation and cleanup activities.

Investigations were conducted at the Plant Site from 1986 to 2004 by Johns Manville and then by PRPLLC. The primary chemical constituents that were found in soil/fill materials in the former evaporation pond area were extractable petroleum hydrocarbons (primarily total petroleum hydrocarbons [TPH] in the diesel and motor oil range) and asbestos. In the former asbestos product storage area that was located north of the warehouse and other areas identified during facility demolition activities, asbestos with minor amounts of heavier range TPH were found in soils at depths ranging from 6-inches to 10-feet below ground surface.

A treatability study was performed from June to August 2005 with 39 vapor extraction wells installed to a depth of 20 to 25 feet below ground surface in the evaporation pond area to remove non-aqueous phase liquids (NAPL). Approximately 14,120 gallons of impacted groundwater were removed and treated in granular activated carbon columns and approximately 201.7 gallons of NAPL and 104.3 gallons of NAPL through the dissolved phase were removed.

DTSC approved the Final Remedial Action Plan, the Remedial Design and Implementation Plan, and a Remedial Design Addendum for the Plant Site on June 22, 2006, August 25, 2006, and November 2, 2007, respectively. The implementation of the remedial activities is documented in the October 21, 2008 Remedial Action Completion Report prepared by LFR on behalf of PRPLLC.

PRPLLC entered into a Land Use Covenant with DTSC in September 2009 which restricts the use of the area where ACM and TPH-impacted soil are contained on-site and places limitations on activities that would disturb the soil cover that was constructed on it. The Land Use Covenant includes prohibitions on extraction of groundwater and installation of wells over the rest of the Plant Site and includes restrictions on activities that disturb the soil at or below an elevation of 4 feet elevation (relative to the National Geodetic Vertical Datum) in an area that is approximately where the evaporation pond was located and where residual TPH remains in groundwater.

PRPLLC will perform ongoing inspection, maintenance, and repair of soil covers that were constructed where the ACM and TPH-impacted soil are contained on-site under an Operation and Maintenance Agreement with DTSC that was executed in September 2009.

6. **Type of Site:**

Has the Site been identified in the EnviroStor database as an active DTSC site?

Yes _X_ No___

RCRA-Permitted Facility	___	Bond-funded	___
RCRA Facility Closure	___	RP-Funded	_X_
NPL	___	Federal Facility	___
Other (i.e. walk-in)	___	Explain Briefly:	

7. **Size of the Site:**

Small ___ Medium _X_ Large ___ Extra-Large ___

8. **Dates of Remedial Action:**

a. Initiated: June 2006 b. Completed: January 2008

9. **Response Action Taken on Site: (check appropriate action)**

___ Removal Action (satisfactory abatement of site)

_X_ Final Remedial Action

___ RCRA enforcement/closure action

___ No action, further investigation verified that no clean-up action at the site was need.

A. **Type of Remedial or Removal Action: (e.g. excavation and disposal, on-site treatment, etc.)**

The remedial actions primarily consisted of excavating ACM and TPH-impacted soil and consolidating the excavated ACM and soil in a containment berm along the eastern boundary of the Plant Site. Some soil was disposed off-site due to the volume of excavated soil exceeding the berm capacity. A total of 30,321 tons of excavated, TPH-impacted

soil was disposed at the Norcal Waste System, Inc. Hay Road Landfill. A total of 17,619 tons of ACM-impacted soil was disposed at the Forward Landfill. Approximately, 64,600 cubic yards of ACM and TPH-impacted soil were placed into the containment berm, which consists of two sections. The south and north berm sections are approximately 296 feet long and 1,072 feet long, respectively. Both berm sections are approximately 85 feet wide at the base and extend approximately 10 feet above the elevation of the adjacent sidewalk area. Access to the berm area is restricted by a fence. A two-foot-thick clean soil cover was constructed on the two berm sections using clean, imported soil that was also used for backfilling the excavation areas. Post-remediation grab groundwater sampling and soil vapor sampling were performed.

B. Estimated quantity of waste associated with the site (i.e., tons/gallons/cubic yards) which was:

X	treated	amount: 993,000 gallons of water pumped from excavations discharged to sanitation district
X	untreated (capped sites)	amount: 64,600 cubic yards ACM/soil
X	removed	amount: 47,940 tons ACM/soil

10. Cleanup Levels/Standards:

a. What were the cleanup standards established by DTSC pursuant to the Final Remedial Action Plan (RAP) or workplan (if cleanup occurred as the result of removal action (RA) prior to development of a RAP)?

The soil cleanup level for asbestos was established at the detection limit, using U.S. Environmental Protection Agency Method 600/R-93/116 or an equivalent analytical method

Table C-6 from the Final Remedial Action Plan lists the soil cleanup levels for the contaminants other than asbestos. A copy of this table is attached at the end of this certification.

The State maximum contaminant levels (MCLs) were established as the groundwater cleanup levels for benzene, toluene, ethylbenzene and xylenes (BTEX).

b. Were the specified cleanup standards met? Yes X No ___

All soil cleanup levels were met except in some confirmation soil samples that were collected from below the groundwater table in the former evaporation pond area, where there were some exceedences of the TPH cleanup levels.

The groundwater cleanup levels for BTEX were met, except in one post-remediation grab groundwater sample (sample location GGW-6), where there was a slight exceedence of the maximum contaminant level. Benzene was detected in this sample at a concentration of 1.3 micrograms per liter and State MCL for benzene is 1 microgram per liter.

c. **If "no", why not:** DTSC addressed the issue of the exceedences of the TPH cleanup levels in soil samples collected below the water table in the former evaporation pond area in a March 14, 2007 letter to the project proponent. A copy of this letter is attached at the end of this certification.

The exceedence of the State benzene MCL at sample location GGW-6 was not considered to be a significant concern because it was only a slight exceedence and a localized occurrence.

Chlorinated volatile organic compounds were detected in post-remediation grab groundwater samples at concentrations exceeding the State MCLs. However, groundwater cleanup levels for the detected compounds were not established in the Final Remedial Action Plan because a previous determination was made the origin of these contaminants was likely an off-site source.

11. DTSC Involvement in the Remedial Action:

A. Did DTSC order the Remedial Action?

Yes ___ No_X_ Date of Order: VCA, March 22, 2005

B. Did DTSC review and approve the following plans/procedures? (indicate date of review/approval, if done):

Sampling and Analysis Procedures	Date: August 25, 2006 November 2, 2007
Health and Safety Protections	Date: August 25, 2006
Remedial Action Plan	Date: June 22, 2006

C. **If the site was abated by responsible party, did DTSC receive a signed statement from a licensed professional on all phases of the Remedial Actions? (indicate date of statement)**

Remedial Action Plan	Date: June 2006
Design and Construction Specifications	Date: August 2006 August 1, 2007
Post-Remediation	Date: October 21, 2008

D. **Did a registered engineer or geologist verify that acceptable engineering practices were implemented?**

Yes _X_ No ___ Name: William Carson, California Civil Engineer #C60735
Date: October 23, 2008 (certification included in Remedial Action Completion Report)

E. **Did DTSC confirm completion of all Remedial Actions?**

Yes _X_ No ____ Date: November 6, 2008 (date of Remedial Action Completion Report approval)

F. **Did DTSC (directly or through a contractor) actually perform the Remedial Action?**

Yes __ No _X_ Name of Contractor:

G. **Was there a community relations plan in place?**

Yes _X_ No __

H. **Was a removal/remedial action plan developed for this site?**

Yes _X_ No __

I. **Did DTSC hold public meetings regarding the draft RAP?**

Yes _X_ No __

J. **Were public comments addressed?**

Yes _X_ No __

Date of DTSC responses to public comments: June 12, 2006

K. Are all of the facts cited above adequately documented in the DTSC files?

Yes X No __

If no, identify areas where documentation is lacking:

12. EPA Involvement in the Remedial Action;

A. Was EPA involved in the site cleanup?

Yes __ No X

B. If yes, did EPA concur with all remedial actions?

Yes __ No __

C. EPA comments

EPA staff involved in cleanup: (name, title, address, and phone number)

_____

13. Other Regulatory Agency Involvement in the Cleanup Action:

Agency:	Activity:
__ RWQCB	_____
__ ARB	_____
__ CHP	_____
__ Caltrans	_____
X Other	City of Pittsburg – Reviewed and commented on Remedial Action Plan and Remedial Design, issued grading permit for soil excavation and berm construction

Name of contact persons and agency: Chris Barton, City of Pittsburg Planning Department

14. Post Closure Activity:

A. Will there be post-closure activities at this site? (e.g. Operation and Maintenance)

Yes X No __

B. Have post-closure plans been prepared and approved by DTSC?

Yes X No __

C. What is the estimated duration of post-closure (including Operation and Maintenance) activities?

Indefinite duration

D. Are deed restrictions proposed or in place?

Yes X No __

If "yes", have deed restrictions been recorded with the County recorder?

Yes X No __

If "no", who is responsible for assuring that the deed restrictions are recorded? not applicable

Who is the Program contact? Mark Piros 510-540-3832
name/phone number

E. Has cost recovery been initiated?

Yes X No __
If "yes", amount received $263,883; 100% of DTSC costs.

F. Were local planning agencies notified of the cleanup action?

Yes X No ___

If "yes", the name and address of the agency:

City of Pittsburg Planning Department
65 Civic Avenue
Pittsburg, California 94565

15. **Expenditure of Funds and Sources: (Information to be supplied by Toxic Account Unit.) funding source and amount expended:**

___ HWCA $_____ ___ HSA $_____

___ HSCF $_____ ___ RCRA $_____

_X_ RP $ unknown ___ Other $_____

___ Federal Cooperation Agreement $_____

16. **Problems Encountered Which Caused Major Delays:** A substantially larger volume of ACM and TPH-impacted soil were encountered during the cleanup than was anticipated based on the estimates that were made based on investigation data. Difficulties were encountered in putting in place the financial assurance mechanism required by the Operation and Maintenance Agreement.

17. **Accomplishments Unique to this Project:** The City of Pittsburg, PRPLLC, and DTSC worked closely from the preparation of the Remedial Action Plan through implementation of the remedial actions to ensure that the cleanup was done in a manner that was compatible with future development plans on and adjacent to the Plant Site.

18. **Final Use of Site:** PRPLLC has developed conceptual development plans that include a mixed-use community of residences and commercial buildings. However, PRPLLC has not submitted a formal development application to the City of Pittsburg Planning Commission and the Plant Site is currently vacant. The containment berm constructed on the eastern side of the Plant Site provides both a visual and a sound barrier between the traffic on Harbor Street and the proposed future housing lots on the Plant Site.

	Xylenes	270	--	--	**270**

Notes:

1) USEPA Region 9, Preliminary Remediation Goals, October 2004, residential land use; these values do not factor in the indoor air emissions exposure pathway and additional evaluation of the protectiveness of these values may be warranted after emplacement of clean engineered backfill following remedial activities.

2) California EPA California Human Health Screening Levels, January 2005, residential land use

3) California Regional Water Quality Control Board Environmental Screening Levels, February 2005, residential land use; deep soil

(greater than 3 meters below ground surface, water is not a current or potential source of drinking water

4) As noted previously in this RAW, risks associated with site chemicals are outside the acceptable range when considered on a site-wide basis. However, if it is assumed that impacted soils within the former evaporation pond and asbestos storage areas are to be removed in association with site remedial actions, the resultant carcinogenic and noncarcinogenic (hazard index) risks are less than 10-6 and 1, respectively, which represent the acceptable range for residential reuse. For removal actions associated with the former evaporation pond and asbestos storage areas, the more stringent value of the PRG or CHHSL for a given constituent is to be used as the project-specific cleanup goal. It should be noted that CHHSLs have not been established for a number of the COCs.

For PCBs, the CHHSL does not differentiate between the different levels of risk posed by the various congeners. Therefore, for the "low risk" congeners, the proposed cleanup goal is the PRG established for this class of compounds.

In the case of TPH, for which neither PRGs nor CHHSLs have been established, the proposed cleanup goals are not risk based; these reflect standard practice. The risk-based cleanup goals for specific constituents of TPH mixtures (e.g., BTEX) will provide adequate risk protection associated with TPH in soil.

March 14, 2007

Ms. Susan Hollingshead
Renova Partners LLC
55 Hawthorne Street
San Francisco, California 94105

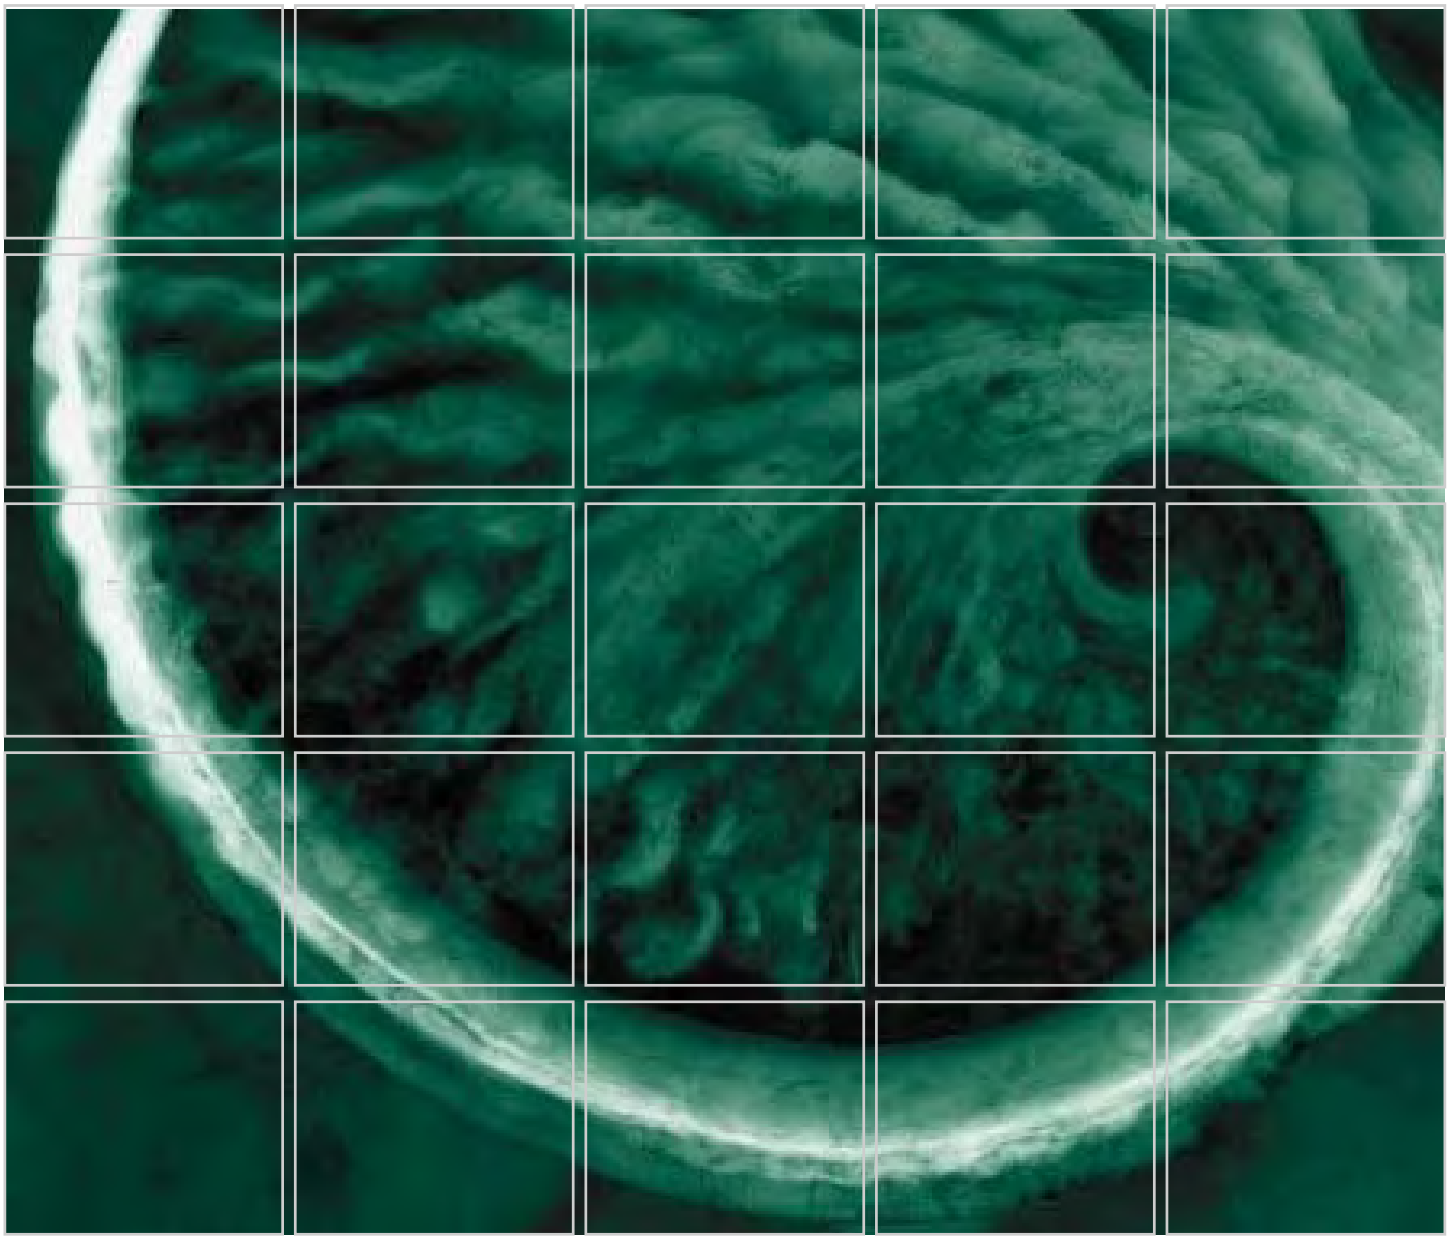
Dear Ms. Hollingshead:

At our February 1, 2007 meeting, we discussed the cleanup being performed by Renova Partners LLC at the Harbor Park Development (Site) in Pittsburg, California. The issues we discussed at this meeting included Renova's proposals to: 1) limit the extent of excavation of soil impacted by total petroleum hydrocarbons (TPH) in the former evaporation pond area to the groundwater table; and 2) place back into the former evaporation pond area excavation soil that was excavated from below the groundwater table and which is currently stockpiled adjacent to the excavation. In your February 12, 2007 e-mail, you requested that the Department of Toxic Substances Control (DTSC) provide written approval of these proposals.

As we discussed at our February 1, 2007 meeting, the TPH that occurs below the groundwater table in the former evaporation pond area is essentially a groundwater contamination problem. The soil below the groundwater table has been difficult to excavate because of the loose nature of the soil below the depth where groundwater has been encountered and we agree that addressing the TPH impacts below the groundwater table by soil excavation is impractical. Therefore, DTSC approves limiting the extent of excavation of TPH-impacted soil to the groundwater table. The weathered TPH that occurs in the former evaporation pond area does not pose a significant risk to human health and past investigations have shown the TPH impacts have remained localized in the former evaporation pond area. The existing data show a very limited occurrence of volatile organic compounds (VOCs) in association with TPH in groundwater in the former evaporation pond area. However, as we discussed at the February 1st meeting, soil gas sampling shall be performed after backfilling of the excavation is completed to ensure that there will not be a potential human health risk from subsurface vapor intrusion of VOCs into future buildings constructed on the Site.

Printed on Recycled Paper

In December 2006, about 5,200 cubic yards of soil was excavated from the former evaporation pond to depths ranging between four to eight feet below the groundwater table. The soil is now stockpiled on the west and north side of the excavation. The TPH concentrations in confirmation soil samples collected from that limits of the excavation and about 8 feet below the groundwater table ranged from 2.5 milligrams per kilogram (mg/kg) as gasoline to 11,000 mg/kg as motor oil. DTSC inspected the soil stockpile on February 27, 2006 and observed that the soil, in general, appears to be clayey and dark grey in color. Some patches of soil appear to be stained with TPH. It was also noted that the open excavation is filled with groundwater. However, no oily sheen or free product was observed in the open excavation. DTSC approves Renova's proposal to use the soil excavated from below the groundwater table to backfill the former evaporation pond area excavation once the open excavation is dewatered. However, if free oily product is encountered while handling the soil stockpile during backfilling, the soil contaminated with free oily product will be segregated and disposed offsite.



If you have any questions regarding this letter, you can contact Patrick Lee of my staff at (510) 540-3847.

Sincerely,

Barbara J. Cook, P.E.

EXECUTIVE SUMMARY

This Remedial Action Plan (RAP) was prepared by ERM-West, Inc. (ERM) for Pittsburg River Park LLC (PRPLLC) to address remedial options for the Harbor Park Development in Pittsburg, Contra Costa County, California. The proposed development is at the location of the former Johns Manville (JM) Plant Site. The remedies addressed in this RAP will integrate remedial actions at the site with proposed redevelopment as a mixed-use, single- and multi-family residential development. Specifically, the selected remedies are designed to minimize potential exposure by future site users to substances that could pose an unacceptable risk to human health and the environment, including any materials that may remain in place after the site is redeveloped. This RAP has been submitted to the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) for review and approval in association with site cleanup and redevelopment activities being performed by PRPLLC, and in accordance with a Voluntary Cleanup Agreement executed between PRPLLC and DTSC on 25 March 2005.

Subsurface investigations have evaluated soil and ground water conditions across the entire site. As part of the remedial investigation process for the site, historical records of site operations were reviewed and JM staffs were interviewed regarding waste disposal practices. Former operations were generally dry processes with minimal potential for chemical releases to the environment. The areas within the site where potential releases may have occurred are well known. As a result of the investigations and historical records review, the only areas of concern at the site are:

- Soil/fill materials impacted by site operations in the former evaporation pond, in the southeastern portion of the Plant Site and east of the warehouse (Figure 3);
- Surface soil impacted by site operations in the former asbestos product storage area north of the warehouse (Figure 3);
- Other locations of materials impacted with asbestos fill and/or petroleum hydrocarbon compounds found during demolition of the site including subsurface vaults, below railroad ballast, subsurface utilities, etc.; and
- Ground water found to contain chemical constituents associated with site operations, underlying the former evaporation pond.

This RAP addresses remedial alternatives for these media and areas of concern. Consistent with the relatively low and sporadic chemical detections elsewhere on the site, remediation is not warranted for any other portions of the site, thus remedial alternatives were not evaluated for any other portions of the site in this RAP.

This RAP summarizes site background and the results of historical soil and ground water investigations, presents information regarding potential human health and environmental effects from chemical constituents in soil/fill materials and/or ground water at the site, describes the development of Remedial Action Objectives (RAOs), describes and evaluates remedial alternatives for the site, and provides a comparative analysis of remedial alternatives. Based on the comparative analysis, the RAP presents the preferred remedial approaches for soil/fill materials and ground water that meet the stated RAOs.

Evaluation of the RAOs in the RAP included consideration of Applicable or Relevant and Appropriate Requirements (ARARs). Applicable requirements are promulgated at the federal and/or state level to specifically address a hazardous constituent, remedial action, location, or other circumstances at hazardous waste sites. Relevant and appropriate requirements, while not directly applicable to circumstances at a given hazardous waste site, address problems or situations similar to those encountered at the hazardous waste site. In addition to ARARs, the degree to which current natural and man-made conditions are achieving the RAOs was also evaluated.

The remedial alternatives developed for soil/fill materials ranged from a "no action" scenario to complete excavation and off-site removal of impacted soil and fill materials. Likewise, remedial alternatives for ground water impacted with petroleum hydrocarbons ranged from a "no action" scenario to a full-scale pump-and-treat system.

Conceptual designs for each alternative were developed, followed by an evaluation of each alternative based on criteria consistent with United States Environmental Protection Agency guidance for conducting remedial investigations and feasibility studies pursuant to the National Contingency Plan (NCP), the guidelines developed under the Comprehensive Environmental Response, Compensation, and Liability Act and adopted in Chapter 6.8 of the California Health and Safety Code. The nine evaluation criteria set forth in the NCP are categorized into two threshold criteria, five balancing criteria, and two modifying criteria. Threshold criteria are:

- Overall protection of human health and the environment; and
- Compliance with ARARs.

Balancing criteria represent the primary criteria upon which the detailed and comparative analyses are based. Balancing criteria are:

- Long-term effectiveness and permanence;
- Reduction in toxicity, mobility, or volume (TMV) through treatment;
- Short-term effectiveness;
- Implementability; and
- Cost.

The modifying criteria are:

- State acceptance; and
- Community acceptance.

A comparative analysis based on these criteria was performed to provide a basis for selecting the remedial alternatives appropriate to site conditions. Finally, recommendations for appropriate remedial actions were developed, based on comparative analysis of criteria for each alternative.

Based on comparisons of the rankings relative to the evaluation criteria, Alternative 4 (on-site consolidation in eastern boundary berm) emerged as the recommended remedial alternative for the impacted soil and fill materials at the site. Under this alternative, fill materials within the areas of concern would be excavated and consolidated on site in the construction of an engineered berm along the eastern boundary of the site. Appropriate deed restrictions and an Operation and Maintenance Agreement and Operation and Maintenance Plan would be put in place prior to certification of the site. The deed restriction would limit access to and the use of the bermed area. Selection of this alternative is based primarily on its demonstrated effectiveness, consistency with future land use, cost-effectiveness, and ease and speed of implementation.

Based on comparisons of the rankings relative to the evaluation criteria, Alternative 4 (natural attenuation with no ground water monitoring) is the recommended remedial alternative for impacted ground water at the site. Alternative 4 consists of natural subsurface concentration reduction processes and establishment of institutional controls prohibiting the use of ground water for purposes other than site remediation or construction

dewatering. These institutional controls would be in the form of homeowners' association covenants, conditions and restrictions (CC&Rs). Selection of this alternative is based primarily on demonstrated effectiveness, consistency with future land use, cost-effectiveness, and the ease and speed of implementation. This remedial alternative includes a post-removal action ground water investigation component to evaluate concentrations of potential constituents of concern in ground water. Should ground water concentrations be found to be below applicable cleanup objectives, an application for closure will be submitted to DTSC.

The proposed combination of remedies for soil/fill materials and ground water meets each of the established RAOs for the site. Additionally, by implementing the soil/fill materials removal alternative, the primary source of total petroleum hydrocarbons and low concentrations of volatile organic compounds is removed, providing further assurance against potential exposure to chemicals in ground water within the former evaporation pond and against further degradation of ground water from those chemicals.

1.0 INTRODUCTION

This Remedial Action Plan (RAP) was prepared by ERM-West, Inc. (ERM) for Pittsburg River Park LLC (PRPLLC) to address remedial options for the Harbor Park Development (former Johns Manville [JM] Plant Site; also referred to herein as "site"). The site is at the approximate intersection of East Third and Harbor Streets in Pittsburg, Contra Costa County, California (Figure 1). The remedies addressed in this RAP will integrate remedial actions at the site with proposed redevelopment as a mixed-use, single- and multi-family residential development. Specifically, the selected remedies are designed to minimize potential exposure by future site users to substances that could pose an unacceptable risk to human health and the environment, including any materials that may remain in place after the site is redeveloped. This RAP has been submitted to the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) for review and approval in association with site cleanup and redevelopment activities being performed by PRPLLC. As discussed in Section 2.2.1, historical site operations are well understood, subsurface conditions at the site have been adequately characterized, and impacts to the site from historical operations are limited to localized areas. The RAP focuses on these areas, and no further evaluation or consideration of remedial alternatives is warranted for other portions of the site.

This RAP is organized as follows:

- The remainder of Section 1 addresses the RAP process, including the regulatory basis for preparation of a RAP; the specific objectives of this RAP, and the scope of this RAP intended to meet the stated objectives.
- Section 2 presents the site background, including land use history and proposed redevelopment plan, and summarizes previous soil and ground water investigations for the site and immediate vicinity.
- Section 3 presents the findings of these historical site investigations, including the geologic and hydrogeologic site conditions, the nature and extent of chemical occurrence in impacted media, and the results of a treatability study for petroleum hydrocarbons in ground water performed under the direction of DTSC.
- Section 4 summarizes information regarding potential human health and environmental effects from exposure to the chemical constituents in soil/fill materials and/or ground water at the site, specifically asbestos-containing materials (ACMs) and petroleum hydrocarbons.

- Section 5 summarizes the development of Remedial Action Objectives (RAOs).
- Section 6 describes remedial alternatives developed for evaluation of their ability to meet the RAOs.
- Section 7 evaluates the remedial alternatives according to a number of remedial criteria including effectiveness, implementability, and cost.
- Section 8 provides a comparative analysis of the remedial alternatives.
- Section 9 presents the preferred remedial approach based on the comparative analysis of remedial alternatives.
- Section 10 presents a schedule for implementation of the preferred alternative, which is consistent with the proposed redevelopment schedule for the site.
- Section 11 describes the public involvement process associated with the development and approval of this RAP.
- Section 12 presents references cited or reviewed in preparation of the RAP.

The main text is followed by figures, tables, and appendices containing supporting information to the RAP process.

1.1 REGULATORY BASIS FOR THE REMEDIAL ACTION PLAN

The following discussion presents the regulatory basis for this RAP, both with respect to the California Health and Safety Code (Ca-HSC) and with respect to the Voluntary Cleanup Agreement (VCA) executed between DTSC and PRPLLC (DTSC, 2005). In addition, the objectives and scope of the RAP are addressed.

1.1.1 California Health and Safety Code

The RAP is DTSC's remedy selection document for hazardous substance release sites addressed pursuant to Ca-HSC Section 25356.1 (DTSC, 1995). A RAP must clearly and concisely reflect the remedial action decision reached by:

- Identifying the preferred alternative for a remedial action and explaining the reasons for the preference;
- Describing the other remedial alternatives considered; and

- Soliciting public review and comments on all the alternatives described.

The RAP contains a brief summary of all applicable remedial investigation and feasibility study findings and presents the key components of the conceptual plan for site remediation. Although RAPs do not contain the specific engineering design details of the proposed remedial actions, they must clearly set out specific remedial action objectives, including cleanup levels, and timeframes for completion of the remedial actions.

A detailed engineering plan for conducting the proposed remedial action will be prepared and submitted pursuant to the approval of this RAP in the form of a Remedial Design and Implementation Plan (RDIP). The RDIP will include specific engineering details and implementation procedures for the appropriate site remedy, including specific performance standards consistent with appropriate City standards and/or ordinances.

1.1.2 Voluntary Cleanup Agreement

In addition to statutory requirements for the RAP specified in the Ca-HSC, this RAP was prepared in accordance with the VCA between DTSC and Pittsburg River Park LLC, dated 25 March 2005 (Docket No. HAS-A 04/05-127), pursuant to Ca-HSC Section 25355.5(a)(1)(C). Specifically, Task 2 of *Exhibit C – Scope of Work* to the VCA requires that the RAP "…builds upon and modifies as appropriate the prior work conducted by JM including…":

- The VCA between DTSC and JM, dated 27 November 2000;
- The Preliminary Endangerment Assessment, Johns Manville – Plant Site, Pittsburg, California (Harding ESE, 2001b); and
- The Feasibility Study and Removal Action Workplan, Johns Manville – Plant Site, Pittsburg, California (Harding ESE, 2003)[1].

In accordance with DTSC's requirement above, applicable elements of these documents, as well as others addressing site background and investigation history, were considered in the preparation of this RAP.

---

[1] This FS/RAW is a draft document that was not finalized by Johns Manville due to the pending property sale, and has not been approved by DTSC.

1.1.3 Objectives of the Remedial Action Plan

Based on the results of previous investigations at the site, several areas of concern have been identified, as described in Section 2.1.2. This RAP has been prepared to summarize the remedial alternative evaluation process and identify the selected approach for addressing these areas of concern, and includes the following:

- A summary of overall site conditions and results of historical soil and ground water investigation activities, with a focus on the areas of concern;
- A summary of the evaluation that was performed to assess the potential for human exposure to site contaminants.
- RAOs developed for media-specific and area-specific protection of human health and the environment;
- Remedial action alternatives for the site;
- A discussion of the remedial alternative selected for the site; and
- A description of the remedial actions that will be implemented as part of the selected remedial alternative, including associated monitoring and reporting.

1.1.4 Scope of the Remedial Action Plan

This discussion identifies the scope of activities performed to meet the stated objectives for the RAP. To develop the summary of site conditions and historical soil and ground water investigations at the site, ERM reviewed reports and documents dating back to the mid-1980s, when investigation in the area of the site was initiated. A list of the reports and documents reviewed in preparation of this RAP are listed in Section 12. [*Note: These reports and documents are included in the Administrative Record List in the Appendix to the Executive Summary*.]

Evaluation of the RAOs in the RAP included consideration of Applicable or Relevant and Appropriate Requirements (ARARs). Applicable requirements are promulgated at the federal and/or state level to specifically address a hazardous constituent, remedial action, location, or other circumstances at hazardous waste sites. Relevant and appropriate requirements, while not directly applicable to circumstances at a given hazardous waste site, address problems or situations similar to those encountered at the hazardous waste site. In addition to ARARs, the degree to which current natural and man-made conditions are achieving the RAOs was also evaluated.

The remedial alternatives developed for fill materials in preparation of this analysis ranged from a "no action" scenario to complete excavation and off-site removal of impacted soil and fill materials buried at the site. Likewise, remedial alternatives for ground water impacted with petroleum hydrocarbons ranged from a "no action" scenario to a full-scale pump-and-treat system. Conceptual designs for each alternative were developed, followed by an evaluation of each alternative based on criteria consistent with United States Environmental Protection Agency (USEPA) guidance for conducting remedial investigations and feasibility studies pursuant to the NCP, as contained in the CERCLA and adopted in Chapter 6 of the Ca-HSC. A comparative analysis based on these criteria was performed to provide a basis for selecting the remedial action appropriate to site conditions. Finally, recommendations for appropriate remedial actions were developed, based on comparative analysis of criteria for each alternative.

The remedial alternatives considered in this evaluation are described in this RAP in sufficient detail such that they can be evaluated and compared as part of this process. After DTSC approval of the RAP, PRPLLC will submit a design document that includes a detailed description of the scope of work, including the specific portions of the Site to be addressed (lateral and vertical extent), confirmation sampling procedures, air monitoring and dust control measures, backfill requirements, and other pertinent details, as appropriate.

2.0 SITE BACKGROUND

This section describes the site and environmental conditions, including a summary of site history with respect to JM's former operations and previous environmental investigations. This summary takes into consideration significant efforts by JM associated with documenting site conditions through such documents as, among others, the *Preliminary Endangerment Assessment Report* (Harding ESE, 2001b) and the *Feasibility Study and Removal Action Workplan* (Harding ESE, 2003).

2.1 SITE DESCRIPTION

2.1.1 General Site Description

The former JM facility consists of two distinct properties located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California (Figure 2).

The first parcel, approximately 1,000 feet south of New York Slough and Suisun Bay, is referred to as the Plant Site, which is the primary subject of remedial actions addressed in this RAP (also referred to herein as "site"). This 21-acre parcel is bounded to the north by a Tesoro coke facility and Third Street; to the east by Harbor Street, several small light industrial businesses, and USS Posco Corporation; and to the south and west by residential properties. Most recently, until the facility terminated operations in 2003, the facility was used for the manufacture of commercial roofing materials. The Plant Site consists of Buildings 1 through 4 in the northern portion of the property, a warehouse in the southwestern portion of the site, and the former evaporation pond area, which is currently paved with asphalt. Railroad tracks bisect the central portion of the property. Demolition of these site features has been underway since mid-October 2005 and is nearing completion. A Site Detail Map showing physical site features, historical sampling locations, and related cross-section orientations is provided as Figure 3.

The North Parcel is an approximately 4.2-acre parcel located between (and bounded by) New York Slough to the north and the Plant Site to the south, north of East Third Street (Figure 2). This parcel is located approximately 400 feet north of the Plant Site, is covered by a separate VCA from the Plant Site, and is not the subject of this RAP. The North Parcel was formerly used for storage of asbestos-containing products prior

to shipment. As a result of this practice, a significant amount of ACMs was deposited onto the ground. Under a VCA established for the Plant Site, JM performed investigations that culminated in the emplacement of a soil cap to prevent future exposure to asbestos materials.

The land use and zoning for the Plant Site has recently been changed by the City of Pittsburg through a City Council-approved General Plan Amendment. The zoning for the plant site is now single family and multi family residential. Zoning for the North Parcel remains industrial.

2.1.2 Areas/Media of Concern

Subsurface investigations performed prior to PRPLLC's ownership of the site, as well as current environmental assessments undertaken at PRPLLC's request, have evaluated soil and ground water conditions across the entire site. As part of the remedial investigation process for the site, historical records of site operations were reviewed and JM staffs were interviewed regarding waste disposal practices. Former operations were generally dry processes with minimal potential for chemical releases to the environment. The areas within the site where potential releases may have occurred are well known. As a result of the investigations and historical records review, the areas of concern at the site are shown in Figure 3 and are identified as follows:

- Soil/fill materials impacted by site operations in the former evaporation pond, in the southeastern portion of the Plant Site and east of the warehouse;
- Surface soil impacted by site operations in the former asbestos product storage area north of the warehouse;
- Other locations of materials impacted with asbestos fill and/or petroleum hydrocarbon compounds found during demolition of the site including subsurface vaults, below railroad ballast, subsurface utilities, etc.; and
- Ground water found to contain chemical constituents associated with site operations, underlying the former evaporation pond.

This RAP addresses remedial alternatives for these media and areas of concern. PRPLLC has implemented contingency measures within the Site Management Plan (SMP; ERM, September 2005) to ensure that other impacted areas, if present, would be identified and addressed as appropriate during the development process. In addition, the implementation specifications document to be prepared pursuant to approval of this RAP will define procedures for 1) inspection of soils

beneath building foundations (following demolition) for staining or other evidence of impacts, and for the presence of underground storage tanks or sumps; and 2) sampling underlying soils and ground water, as appropriate, to determine the nature and extent of impacts, if any. If impacts warranting remediation are identified in this way, they will be addressed following the notification of, and in complete coordination with, DTSC.

The areas of concern known to exist on Site as listed above are described below.

Former Evaporation Pond. As described in more detail in Section 2.2.1, during site operations from approximately 1946 until 1959, an oil-water slurry was discharged to the former evaporation pond. The pond remained relatively constant in size during that period. In 1963, when the pond was no longer needed, it was filled with scrap and construction debris and was used from that point for parking and equipment storage.

Review of boring and test pit/pothole data generated during site investigations indicates that fill within the former evaporation pond consists of a variety of materials including fibrous ACMs, brick fragments, roofing shingles, roofing paper, wood fragments, and silty-sandy soil fill. In many of the borings and test pits, heavy, free-phase petroleum hydrocarbons and/or tarry materials were identified. The frequency at which these petroleum hydrocarbon materials were noted suggests that petroleum hydrocarbon impacts extend throughout the fill material within the former pond. This is the basis for the treatability study scope of work discussed later in this document.

Depth to ground water varies from about 6 to 8 feet below ground surface (bgs) within the evaporation pond and is likely the result of localized ponding of ground water (i.e., perched ground water).

The size of the pond at the time of closure was approximately 150 feet long by 75 feet wide with a maximum depth of 10 feet bgs. Based on information provided with the lines of section shown in Figure 3 and discussed below, the topographic low into which fill was emplaced at the time of pond closure generally extends to the warehouse on the west, and to the property lines on the southern and eastern margins. The approximate areal extent of the asbestos-impacted fill materials is 500 feet (north-south) by 300 feet (east-west). At the deepest point within the pond, fill materials are approximately 12-14 feet thick. The approximate areal extent of the asbestos-containing fill impacted with petroleum hydrocarbons is outlined on Figure 3.

Former Asbestos Product Storage Area. Interviews with former JM employees indicated that the area north of the warehouse was used for surficial storage of asbestos products. Surficial soils in this area are impacted by ACMs (an area approximately 300 by 300 feet, bounded by sample locations ERM-TP-6 through ERM-TP-9; Figure 3).

Other Locations Identified During Demolition Activities. Several additional areas of soil impacted with asbestos fill and/or petroleum hydrocarbon compounds were identified during the course of demolition at the site. These areas include subsurface vaults, below the railroad track ballast, impacted utility lines, etc. (Figure 3).

Ground Water. Ground water monitoring has been conducted at the site since approximately 1990. Ground water sampling locations are presented on Figure 3. Based on these sampling data, and consistent with the depth of soil impacts, ground water impacts from site operations have been observed in the immediate former evaporation pond vicinity. The sporadic and relatively low concentrations of chemicals detected in ground water elsewhere on site do not suggest the need for further evaluation.

2.2 LAND USE HISTORY

The following sections describe the historical land use of the JM Plant Site and the vicinity.

2.2.1 Site Land Use History

The primary manufacturing plant was built sometime between 1925 and 1928. In 1957, a large warehouse was constructed south of the main manufacturing facility. Asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering were the primary products produced prior to termination of asbestos-containing product manufacturing in 1980. A series of four asphalt stills, located along the southwestern margin of Building 4, was used to convert heavy oil to asphalt. The stills were fueled by fuel oil and later with natural gas. In the process of converting heavy oil to asphalt, off-gas vapors were collected, condensed, and mixed with water to form an oil-water slurry that was transported via an underground pipe to the evaporation pond. The residual oil in the evaporation pond was reportedly burned approximately twice a year. Use of the evaporation pond began in 1946. It remained relatively constant in size until 1959, when discharge of effluent was discontinued, and it was subsequently filled with scrap and

construction debris. The size of the pond at the time of closure was approximately 150 feet long by 75 feet wide with a maximum depth of 10 feet bgs (Figure 3).

Subsequently, and until the plant's closure in approximately 2003, JM manufactured commercial roofing materials using fiberglass mat, asphalt, sand, and limestone. Petroleum-based resins and solvents were also used on site.

Classes of chemicals associated with these historical site operations are primarily asbestos and total petroleum hydrocarbons (TPH). Additional related chemical classes are as follows:

- Metals (as constituents of TPH mixtures);
- Polychlorinated biphenyls (PCBs; as constituents of TPH mixtures);
- Semi-volatile organic compounds (SVOCs; as constituents of TPH mixtures and as TPH combustion products); and
- Volatile organic compounds (VOCs; as constituents of TPH mixtures).

2.2.2 *Surrounding Land Use History*

As noted above, the areas to the north and east of the Plant Site have historically been used for industrial or commercial purposes. To the south, west, and northwest are residential developments. Immediately west of the site is a residential area that was redeveloped in the mid-1990s. Prior to its redevelopment, this area, referred to in previous documentation as the Eastside Redevelopment Area (ENGEO, Inc. [ENGEO], 1991), was characterized by vacant lots, single-family residences and apartment units, vacant commercial buildings, a bakery, and Riverside Fire Station No. 84. Anecdotal information obtained by ERM suggests that some of the prior residences may have been historically used as illicit drug manufacturing laboratories, resulting in some of the minimal ground water impacts observed in the ENGEO report.

2.2.3 *Proposed Redevelopment*

The proposed development plan is designed to blend with the existing single-family residential neighborhood that abuts the Plant Site to the north and west, and provide a gradual transition to the Harbor Street transportation corridor and the more industrial uses east of the Plant Site. PRPLLC is currently considering redevelopment plans that envision the creation of a mixed community of single-family and multi-family

residences on the former Plant Site. Live/work commercial development is also being considered for a limited portion of the property along Third Street.

Open space will be designed into the development along Harbor Street. The wide green space will contain an earthen berm that will provide both a visual barrier and a sound barrier between the traffic on Harbor Street and the multi-family housing facing that street. The open space and earthen berm is also consistent with the City of Pittsburg's desire to create a strong "edge" within the city between residential and industrial development. One of the objectives of the proposed redevelopment plan is to integrate soil remediation requirements into the backbone infrastructure and the planned open spaces.

In association with site demolition activities implemented in October 2005, all existing buildings have been demolished and regulated building materials have been removed to the extent required by applicable regulations. Demolition of concrete pads and the asphalt cover associated with the former evaporation pond is currently underway and will be completed within the next two months. Uncontaminated concrete and brick from the existing site structures may be crushed for aggregate base and reused on site. All other building debris will be removed from the site.

DTSC understands that the development plan described herein for the Harbor Park Development is only conceptual. The conceptual development plan demonstrates how the property might be redeveloped in the future in accordance with the City's amended General Plan. PRPLLC has not submitted a formal development application, nor has the development been granted any approvals from the City of Pittsburg Planning Commission or City Council.

2.3 PREVIOUS INVESTIGATION HISTORY

2.3.1 Site Investigation History

The following sections summarize investigations conducted at the Plant Site by JM and, more recently, by PRPLLC. These investigations have taken place over a 19-year period (from 1986 to 2004), and have included more than 100 soil sampling locations and 28 ground water sampling locations throughout the approximately 21-acre site (Figure 3). Because later investigations targeted the known areas of concern (Section 2.1.2), sampling density in these areas is higher than elsewhere on site. The

scope and general findings of these investigations are summarized below. Interpreted subsurface conditions (i.e., hydrogeology, stratigraphy, and nature and extent of chemical occurrence) based on these results are presented in Section 3.

In July and August of 1986, HLA performed a site investigation that included a geophysical survey, collecting surface soil samples, drilling five shallow test borings to a maximum depth of 7 feet, drilling 15 probe borings, installing one piezometer and nine monitoring wells (MW-1 through MW-9), and excavating 14 test pits. No report was generated; however, the data were presented in HLA's 8 December 1986 *Data Transmittal Report* (HLA, 1986b).

Roux Associates, Inc. (Roux) conducted a historical review and subsurface investigation at the site between February and May 1991. Six additional ground water monitoring wells (MW-10 through MW-15) were installed, and ground water samples were collected from MW-2 through MW-15. MW-1 was abandoned or destroyed; no records of abandonment exist. Extractable petroleum hydrocarbons in the motor oil (TPH-mo), oil and grease (TPH-og), and TPH-d ranges were detected in six of 14 wells. Benzene, toluene, ethylbenzene, and xylenes (BTEX) and selected VOCs were detected in up to six wells, but at generally low concentrations. No organochlorine pesticides or PCBs were detected in ground water samples. Nonaqueous-phase liquid (NAPL) was present in MW-2 and MW-4.

In June 1991, Roux performed a Phase II investigation. The Phase II program was designed to further characterize the subsurface conditions, to develop remedial alternatives, and to evaluate the on-site sewer corridor as a possible conduit for horizontal migration of contaminants. Twenty soil borings (B-1 through B-20) were advanced in and around the former evaporation pond. Petroleum hydrocarbons were observed in 15 of 20 soil borings, and were found to be predominantly in the fill. Several remedial technologies were evaluated for the source (soil and NAPL) and dissolved-phase organic compounds. The ground water and NAPL remedial alternatives included: (1) an interceptor trench, (2) a series of interceptor recovery wells, and (3) containment with slurry wall. Remedial alternatives for soil included: (1) capping, (2) excavation, treatment and off-site disposal, (3) in-situ bioremediation, and (4) in-situ solidification/stabilization. The investigation of the sewer line as a potential conduit was inconclusive.

Roux conducted semiannual ground water monitoring between July 1992 and December 1994 using the monitoring wells along the east property

boundary (MW-8, MW-9, MW-15, MW-16 and MW-19). Ground water samples were analyzed for TPH-og and VOCs only. With the exception of low concentrations of selected VOCs, no other chemical compounds of concern were detected in ground water samples during the Roux monitoring programs.

Based on the results of the ground water monitoring program, concentrations of on-site chemical compounds appear to have decreased with time and there is no evidence of additional migration of chemical compounds in ground water. As a result, Roux recommended to JM that no further on-site monitoring be conducted (Roux, 1995).

Harding ESE completed a Preliminary Endangerment Assessment (PEA), addressing continued industrial/commercial use, to estimate the potential threat to public health and/or the environment from contaminated soil and ground water and to evaluate whether an expedited response action was required. A Human Health Screening Evaluation (HHSE) was completed as a part of the PEA to evaluate the potential for cancer risks and noncancer health effects from exposure to chemicals detected in soil and ground water. The results of the HHSE indicated that for on-site workers and off-site residents, exposure to chemicals in the air from volatilization from underlying ground water and soil at the site is not likely to result in adverse health effects. The results are presented in the *Preliminary Endangerment Assessment, Johns Manville – Plant Site, Pittsburg, California* (Harding ESE, 2001b).

Between January 2001 and February 2002, Harding ESE conducted additional field activities necessary to support the *Feasibility Study and Removal Action Workplan* (Harding ESE, 2003). These activities included the sampling of selected wells for asbestos and petroleum hydrocarbons, NAPL removal from MW-4, and the abandonment of MW-3. This document presents additional ground water data and discusses soil target excavation goals and ground water restoration goals. This document also evaluates remedial technologies capable of achieving the designated remedial goals, and recommends preferred remedies for soil and ground water. A No Action alternative with implementation of a Deed Restriction was recommended for soil, and enhanced monitored natural attenuation was the preferred ground water alternative. The study found that, in general, environmental conditions at the site do not pose unacceptable risk to human health or the environment under a commercial/industrial reuse scenario.

The document entitled, *Workplan, Treatability Study for ORC Injection, Johns Manville Plant Site, Pittsburg, California* was then submitted in August 2003

by MACTEC Engineering and Consulting, Inc. (MACTEC; formerly Harding ESE). The workplan presents the technical scope of work to determine if enhanced monitored natural attenuation by oxygen release compound (ORC®) injection is an effective technology for reducing TPH concentrations in site ground water. Although this specific treatability study approach was not implemented, PRPLLC has implemented a treatability study intended to address residual petroleum hydrocarbons in the immediate vicinity of the former evaporation pond. That study and associated results are addressed below.

In June and July 2004, ERM implemented a limited soil and ground water investigation in association with PRPLLC's environmental assessment activities. The objectives of the investigation, which were presented in the *Data Summary Report* (ERM, 2004) were to validate previous investigation results, to determine if there were any environmental conditions that could have rendered the then-pending transaction between PRPLLC and JM undesirable, and to define the scope and cost of site remediation issues so that they could be realistically factored into the transaction.

ERM performed a review of existing project documentation maintained by JM. This review included an evaluation of the risk analysis presented in Harding ESE's PEA to evaluate the degree to which current site conditions might impact a proposed residential reuse. ERM's conclusion from this analysis was that site conditions, as identified by historical soil and ground water investigations, are compatible with proposed residential reuse.

Finally, ERM performed a site review with JM to evaluate site conditions and scope additional invasive investigation activities, which were implemented in July 2004. One objective of that investigation was to perform an in-fill soil and ground water investigation to evaluate and confirm the potential presence of asbestos and free-phase liquid petroleum hydrocarbons within the former evaporation pond. ERM and PRPLLC also engaged in discussions with DTSC to identify site mitigation activities appropriate to a prospective residential reuse scenario.

Field activities were conducted on 14 and 15 July 2004 and included shallow potholing at six locations across the site, and excavating three deep trenches and drilling six soil borings/temporary well points in the vicinity of the former evaporation pond. During the field investigation, a certified asbestos consultant from Sensible Environmental Solutions (SES) was present to evaluate the excavated material and collect representative samples of asbestos material for analysis (ERM, September 2004).

During this 2004 investigation, one soil sample exhibiting the greatest visible impact from petroleum hydrocarbons was collected from each boring and submitted to a state-certified laboratory to be analyzed as follows:

- TPH as gasoline (TPH-g) and BTEX using USEPA Method 8015 (modified)/8021;
- TPH-d and TPH-mo using USEPA Method 8015 (modified);
- SVOCs using USEPA Method 8270 with Selective Ion Monitoring; and
- Percent asbestos content using polarized light microscopy.

Following completion of soil sampling activities, ERM installed temporary well points in the boreholes for the purpose of collecting ground water grab samples. Ground water samples were collected using a peristaltic pump and analyzed for the parameters referenced above. Upon completion of ground water sampling, ERM abandoned the borings in accordance with Contra Costa County Health Services Department, Environmental Health Division (Contra Costa County) requirements.

Pursuant to implementation of a Phase I Environmental Site Assessment in March 2005, Levine-Fricke identified an under-floor vault along the eastern wall of Building 1. Further inspection revealed that the vault contained a 10,000-gallon steel tank. Follow-up evaluation by ERM indicated that the tank formerly contained plating oil (similar in chemical composition to hydraulic fluid) used during the manufacturing of asbestos paper. During March and April 2005, ERM oversaw the removal of the tank's contents, along with standing water within the vault resulting from failure of the facility's fire suppression system, and the appropriate off-site removal and disposal of those materials. There is no indication that the tank had leaked any of its contents, nor did any of the standing water in the vault infiltrate into the subsurface. Nonetheless, as part of the inspections following demolition activities addressed above, ERM will evaluate this area for any potential impacts and, as necessary and appropriate, address any impacts consistent with the remedial alternative selected in this RAP. All appropriate notification and permitting requirements will be met during removal of the tank during site demolition activities.

As previously discussed, knowledge of historical site operations, findings from previous field investigations, and site demolition activities indicate that impacts from asbestos fill materials occur at numerous locations across the site. These areas are identified in Figure 3.

2.3.2 Surrounding Area Investigation History

ENGEO completed a soil and ground water investigation in 1991 for the Eastside Redevelopment Area (ENGEO, 1991) to the west and crossgradient of the JM Plant Site. The 28-acre Eastside Redevelopment Area is bordered by East Third Street to the north, Cumberland Street to the west, East Eighth Street to the south and the JM Plant Site to the east.

The site investigation included completion of five soil borings and collection and analysis of soil and ground water samples from these five borings. Samples were analyzed for SVOCs, VOCs, TPH, and asbestos. No asbestos fibers or TPH were detected in any of the samples. Low levels of aromatic and chlorinated VOCs were detected in selected saturated soil and ground water samples, but most sample concentration detections were below the potentially applicable regulatory action levels.

Four permanent ground water monitoring wells were installed on the property to monitor ground water impacts beneath the site. The report concluded that the results of the investigation would not impact the planned redevelopment, and recommended implementation of a quarterly ground water monitoring plan. VOCs exceeding potentially applicable regulatory standards, including carbon tetrachloride (in MW-1, at the southern end and generally upgradient boundary of the study area) and trichloroethene (in MW-2, immediately west and crossgradient of the JM site), were detected in one or more of the wells. The TCE concentration detected in MW-2 is approximately 10 times higher than that detected in on-site JM wells MW-12 and MW-13. These results suggest that VOC detections along the western boundary of the JM site may be related to off-site sources. Personal communication between ERM and JM indicated that JM had no recollection of ever having used TCE as a solvent during historical operations.

3.0 RESULTS OF SITE INVESTIGATIONS

The following sections describe the regional and local geologic and hydrogeologic conditions, and an evaluation of soil and ground water chemistry, based on the results of the historical site investigations summarized in Section 2.3.

3.1 GEOLOGY

Regionally, the JM Plant Site is within an area characterized by (1) alluvial sediment eroded from Tertiary and Cretaceous rocks of the Coast Range Physiographic Province, and (2) Pleistocene to recent fluvial deposits from the Sacramento River Delta consisting of clays, silts, and sands. Locally, the site is underlain by fill that was placed in and surrounding the former evaporation pond, which occupies approximately 4 acres and is located in the southeastern portion of the site (Figure 3). Underlying the fill are interbedded thin layers of silt and sand in clay. A sandy, channel-like deposit extends diagonally across the site from east to west. Cross-sectional representations of shallow conditions across the former evaporation pond are presented as Figures 4, 5, and 6; the lines of section are indicated in Figure 3.

Geology below the sediments is characterized by a series of Pliocene volcanic and sedimentary rocks to late Jurassic metamorphosed rock consisting of the Franciscan Assemblage.

3.2 HYDROGEOLOGY

The Plant Site and North Parcel are within the Pittsburg Plain Ground Water Basin of the San Francisco Bay Hydrologic Study Area. Depth to ground water at the Plant Site ranges between 5 to 19 feet bgs (Harding ESE, 2003). The ground water flow direction is east-northeast, toward the New York Slough, and is likely affected by tidal activity.

Shallow ground water is likely perched and discontinuous with deeper aquifers (approximately 125 feet deep). Based on investigations performed at the nearby Greif site (701 Willow Pass Road, approximately one-half mile from the JM site; also a project overseen by DTSC), shallow ground water has been shown not to be suitable for potable uses by virtue of low yield (i.e., less than 200 gallons per day). Given the overall

similarities in shallow hydrogeologic character between this site and the Greif site, it is concluded that shallow ground water at the JM site is likewise not suitable for potable use. During recent discussions regarding this issue, DTSC has agreed that this is generally an appropriate conclusion. Shallow aquifers are not used for public water supply in the site vicinity because of the discontinuous nature of the alluvial sediments. Salt-water intrusion problems have also limited the use of ground water in the area (Harding ESE, 2003).

3.3 SOIL AND GROUND WATER CHEMISTRY EVALUATION

Soil/fill and ground water investigations have been performed at the site since approximately 1986. These investigations have been documented in a number of reports, as indicated in Section 12, *References*. The following discussion identifies chemical constituents present in soil/fill materials and ground water, based on these studies. The analytical results for soil/fill and ground water samples associated with historical investigations are summarized in Tables 1 through 7.

3.3.1 Chemicals in Soil/Fill Materials

As previously noted, review of JM's historical operations and the findings from site-wide investigations and on-going site demolition activities indicate that the areas of potential concern at the site (Figure 3) are (1) the former evaporation pond, (2) the former asbestos product storage area, and (3) various locations where soil is impacted with asbestos fill and/or petroleum hydrocarbon compounds, as identified during the course of site demolition. For soil/fill materials in the former evaporation pond, the primary chemical constituents identified are:

- Extractable petroleum hydrocarbons, primarily in the TPH-mo and TPH-d ranges, which are the heavier TPH fractions; and
- Asbestos.

In the former asbestos product storage area north of the warehouse and other areas of impacts identified during demolition activities, asbestos (with minor amounts of heavier petroleum hydrocarbons) is present in soils at depths ranging from 6 inches to 10 feet.

The investigations also identified the following:

- *VOCs*. Aromatic VOCs including ethylbenzene, toluene, and total xylenes at concentrations near their respective method detection levels;

concentration ranges were less than 0.005 milligrams per kilogram (mg/kg) to 1.9 mg/kg in soil/fill material (maximum detection xylene). In addition, other chlorinated hydrocarbons were detected at low concentrations in one Plant Site soil sample (0.001 mg/kg 1,1-dichloroethane and 0.038 mg/kg TCE). All of these detections were below potentially applicable regulatory screening levels (i.e., USEPA Region IX Preliminary Remediation Goals (PRGs) and California Human Health Screening Levels [CHHSLs], established by the California Environmental Protection Agency.

- *SVOCs.* Twelve SVOCs (primarily polycyclic aromatic hydrocarbons [PAHs]) were detected at concentration ranges of less than 0.05 mg/kg to 85 mg/kg in soil/fill material (maximum detection phenanthrene). Of these, PRGs (no CHHSLs) have been established for eight of them. Two detections exceed these screening criteria (naphthalene and benzo(a)anthracene); these detections were in samples collected from the central portion of the former evaporation pond.
- *PCBs.* PCBs were detected in two samples from the same boring (one at 16.6 mg/kg at 5 feet deep and 1.0 mg/kg at 6.5 feet) and from 7 feet deep in one other boring (at 5.3 mg/kg). All of the detections exceeded the PCB CHHSL. Both borings were located within the central portion of the former evaporation pond.

These compounds do not appear to be widespread or to represent a significant contributor to risk at the site. In addition, proposed removal actions addressed in this RAP would remove the fill materials represented by these sampling data.

3.3.2 Chemicals in Ground Water

As summarized below, ground water samples collected from the site contained detectable concentrations of TPH, BTEX, chlorinated VOCs, SVOCs, PCBs, metals, and asbestos. These detections are summarized below.

TPH. Ground water shows evidence of petroleum impacts, primarily in the heavier fractions (TPH-d, TPH-mo, and TPH-og), with inconsistent detections in the gasoline range.

BTEX. BTEX compounds were historically detected in five of the monitoring wells in samples collected prior to 1992. Samples collected in

2004 produced BTEX concentrations ranging from <0.5 to 3.3 micrograms per liter (µg/L) (maximum concentration xylenes).[2]

VOCs. Chlorinated VOCs were detected in nine site monitoring wells between 1990 and 2000 (MW-2, MW-4, MW-5, MW-9, MW-11, MW-12, MW-13, MW-14, and MW-15; Table 5). These detections were generally at or near detection levels, except for wells MW-4, MW-9, MW-11, MW-14, and MW-15, where elevated detections of chlorinated VOCs were sporadically observed. In sampling conducted in August 2005 using existing monitoring wells MW-10 (upgradient) and MW-6 (downgradient), and treatability study wells SVE-36 (crossgradient) and SVE-20, no VOCs other than BTEX were detected, with the exception of methylene chloride, which was considered reflective of laboratory contamination. Review of the data in Table 5 and information regarding site layout and historical operations suggest the following:

- The pattern of VOC detections shows little correlation with historical site operations;
- There is no record that chlorinated VOCs were used in significant quantities as part of JM's routine operations; and
- In general, elevated concentrations of chlorinated VOCs are shown to decrease over time, suggesting that attenuation of these constituents is occurring naturally in site ground water.

SVOCs and PCBs. PAH and PCB compounds have been detected in site ground water; however, the concentrations have been low and not widespread. SVOCs were historically detected in five of the monitoring wells in samples collected prior to 1992. The most recent sampling event (July 2004 ground water grab sampling from temporary well points) showed SVOC concentrations in ground water ranging from <1.0 to 35 µg/L (phenanthrene). PCBs have only been detected historically in two samples: Aroclor-1248 was detected at 0.2 µg/L in MW-1 in 1986 and at 1.0 µg/L in MW-2 in 1990. Later samples collected from these wells were non-detect for PCB compounds. Detections of dissolved SVOCs (particularly PAHs) and PCBs in ground water are unusual and are likely associated with (1) suspended matter in the samples; or (2) the presence of

---

[2] An anomalous detection of 53 µg/L xylene was detected in a sample collected from monitoring well MW-2 in 1991, but was not replicated during subsequent sampling, is likely degraded, and is thus not considered representative of site conditions.

free product or a free product sheen. Therefore, these detections are not believed to represent actual ground water conditions.

Metals. The earliest wells installed at the site (MW-1 through MW-4, in the immediate vicinity of the former evaporation pond) indicate elevated levels of heavy metals (arsenic, barium, beryllium, cadmium, total chromium, copper, lead, mercury, nickel, silver, and/or zinc; Table 6). Comparable detections have not been noted in subsequently installed wells at various locations around the site (MW-5 through MW-21), suggesting that the observed metals may be related to the former evaporation pond operations, and that impacts to ground water are localized in that immediate area.

Asbestos. Asbestos was also detected in ground water samples collected during two sampling events (December 2000 and July 2004). Recognizing the anomalous nature of these detections, and being suspicious of matrix interference, in 2002, Harding ESE re-sampled certain wells that were sampled in 2000, using sampling methods designed to reduce collection of suspended sediment that could become agitated during the purging process. The 2000 samples did not contain detectable asbestos. Based on these findings, Harding ESE concluded that the "presence of asbestos fibers in groundwater is not an indication of a release of asbestos to the groundwater." The 2004 sampling event included sampling from temporary well points (within which suspended matter from the surrounding soils can often be incorporated), and did not undertake sediment minimization techniques. It is therefore likely that the 2004 samples (as well as the 2000 samples) reflect sediment from within the well casing as opposed to actual ground water conditions.

The data (Tables 4 and 6) show that concentrations of VOCs (including BTEX) and TPH in ground water have declined over time. As discussed subsequently in this report, this decline is believed to be due to geologic conditions at the site that promote natural attenuation.

3.4 TREATABILITY STUDY FOR PETROLEUM HYDROCARBONS

The following discussion presents the background, scope, and general findings associated with a treatability study implemented by ERM from June to September 2005. The treatability study was performed pursuant to ERM's 18 May 2005 *Final Treatability Study Workplan, Johns Manville Facility, Pittsburg, California* (Treatability Study Workplan). The Treatability Study Workplan, along with a report documenting the study, is presented as Appendix A.

3.4.1 Background for Treatability Study

As noted above, historical findings associated with site investigations (including ERM's more recent studies) indicate that fill materials and ground water within the former evaporation pond have been impacted with TPH-d and -mo. In some instances, TPH has been observed as NAPL, either on ground water (in monitoring wells such as MW-2 and MW-4) or as part of the fill matrix (as observed in selected ERM test pits and borings). Although the observed TPH fraction is generally heavy and nonvolatile, DTSC has expressed a concern that remedial alternatives for petroleum hydrocarbons in fill be evaluated. As a result, ERM prepared on behalf of PRPLLC the Treatability Study Workplan to propose a pilot study to evaluate a possible means of recovering NAPL from shallow fill and ground water.

The treatability study focused on removal of NAPL using vacuum enhanced recovery (VER) and enhancing the natural biodegradation of residual petroleum hydrocarbons. This process entails applying a vacuum through wells near the source of heavy petroleum hydrocarbons within the fill. The intended effect of this system is to:

- Enhance the mobility of petroleum hydrocarbons and to periodically remove accumulated NAPL from wells;
- Promote biodegradation of residual petroleum hydrocarbons in the soil through increased subsurface airflow; and
- Mobilize incidental volatile constituents of the petroleum hydrocarbons and treat them through granular activated carbon (GAC) before discharge to the atmosphere.

3.4.2 Scope of Treatability Study

The scope of the treatability study included pre-field activities, system installation, system operation and maintenance (O&M), performance monitoring, and reporting tasks. Pre-field tasks included:

- Obtaining permits to install soil vapor extraction (SVE) wells through Contra Costa County;
- Obtaining permits to construct and operate the SVE system through the Bay Area Air Quality Management District (BAAQMD); and
- Preparing a site-specific health and safety plan addressing potential physical and chemical hazards associated with implementing the study.

System installation (field) tasks included:

- Performing an underground utilities survey at the proposed well locations to ensure that underground utilities were not encountered during drilling activities;
- Installing 39 vapor extraction wells on 50-foot centers using hollow-stem-auger drilling techniques;
- Collecting soil samples from selected locations to supplement existing data, with analysis for TPH-mo and TPH-d by a state-licensed laboratory;
- Installing the VER equipment and system; and
- Surveying well casings, ground surface elevations, and selected physical locations across the site to augment existing map data.

System O&M tasks included:

- Performing weekly site visits to evaluate operational data and collect vapor samples to determine compliance with air permits, estimate mass removal rates, evaluate GAC loading, and to calibrate instrumentation;
- Performing liquid (ground water and NAPL) level monitoring;
- Overseeing evacuation of total fluids using a vacuum truck;
- Estimating, based on O&M data, system mass removal via biodegradation;
- Evaluating GAC breakthrough;
- Performing GAC and SVE system component changeouts, as needed; and
- Reporting results to BAAQMD, as required in the permits.

System performance monitoring included the following tasks:

- Evaluating the radius of influence based on system measurements;
- Estimating the rate of NAPL removal via free-phase produce recovery, volatilization, and biodegradation;
- Evaluating NAPL thickness and NAPL fractions in recovered total fluids; and
- Collecting periodic ground water samples from selected site wells to evaluate dissolved-phase concentrations of TPH and VOC constituents at upgradient, crossgradient, and downgradient locations.

Details regarding the scope and findings associated with the treatability study, including graphical representations of recovery data, are included in Appendix A.

3.4.3 Treatability Study Results

The treatability study was initiated with construction of the system in May 2005 in accordance with the DTSC-approved Treatability Study Workplan, and operated continually between June and August 2005. Since the treatability study was implemented, free product has been mobilized to and recovered from six wells within the central portion of the former evaporation pond. Approximately 300 gallons of free product have been recovered via total fluids removal and with a skimmer placed in selected wells. TPH reduction via biodegradation is also assumed, but can only be indirectly quantified.

Detailed results associated with the treatability study are presented in Appendix A. It is concluded that the overall treatability study was successful in removing the bulk of the recoverable free-phase petroleum hydrocarbons in fill materials within the former evaporation pond. Trace amounts of free phase-phase petroleum continue to accumulate at a few locations. However, due to the hydrostatic forces within the soil, product measured in a well can range from 5 to 10 times greater than the actual thickness of product within the surrounding formation (USEPA, 1992). Based on this and the data presented in Appendix A, it is further concluded that the operation of the system has reached a state of diminishing returns. Continued operation of the system would result in minimal amounts of incremental product recovery. As a result, further operation of the system or other removal actions associated with free-phase petroleum hydrocarbons are not warranted.

4.0 EXPOSURE EVALUATION SUMMARY

This section provides a general summary of the exposure evaluation performed in support of the RAP process, including identification of chemical classes included in the evaluation and consideration of the potential for exposure due to the impacted media (soil and ground water).

4.1 IDENTIFICATION OF SITE-RELATED CHEMICALS

As discussed in the previous sections, a number of chemicals were detected in the soil and ground water at the Plant Site. Those site-related chemicals were considered in the risk evaluation for the Plant Site that was performed as part of the RAP process, and are discussed in the subsections that follow:

Medium	**Chemical**
Soil	• Asbestos • TPH-mo • TPH-g • TPH-d • TPH-og • Ethylbenzene, toluene, and total xylenes • SVOCs • PCBs
Ground Water[3]	• TPH-mo • TPH-d • TPH-og • Heavy metals • BTEX and chlorinated VOCs • SVOCs

[3] As discussed in Section 3.2.2, asbestos was also detected in site ground water samples, but these detections are suspected to reflect the presence of residual suspended matter in the wells rather than actual ground water conditions.

4.1.1 Total Petroleum Hydrocarbons

TPH is a term used to describe a broad family of several hundred chemical compounds originating from crude oil. TPH is a mixture of chemicals and is most commonly classified as one of the following fractions: diesel, motor oil, gasoline or oil and grease. All four TPH fractions have been detected in site soil, with higher concentrations of TPH-mo and TPH-og. TPH-g-related compounds (i.e., ethylbenzene, toluene, and xylenes) and SVOCs (e.g., anthracene and pyrene) have been detected in Plant Site soil/fill material. In addition, all four TPH fractions and associated BTEX compounds have also been detected in Plant Site ground water. Individual SVOCs have also been detected in Plant Site ground water.

4.1.2 Volatile Organic Compounds

As noted above, BTEX compounds were routinely detected in Plant Site soil and ground water. In addition, other chlorinated hydrocarbons were sporadically detected in historical Plant Site soil and ground water samples. In sampling conducted in August 2005, no VOCs other than BTEX were detected, with the exception of methylene chloride, which was considered reflective of lab contamination. Therefore, this evaluation focuses on BTEX.

BTEX compounds are VOCs typically derived from petroleum products, such as gasoline and oil, and frequently co-occur at hazardous waste sites. Each of the chemicals in the mixture of concern is well absorbed, extensively metabolized, and does not persist in the body for long periods of time. All of the BTEX chemicals can produce neurological impairment. (Agency for Toxic Substances and Disease Registry [ATSDR], 2004).

When detected in soil and ground water, VOCs present a risk of migration upward into overlying structures and or trenches, where the concentrations in air may accumulate due to minimal dilution of air. Preliminary vapor intrusion pathway analysis for volatile constituents is addressed in Section 4.2).

4.1.3 Semi-Volatile Organic Compounds

Semi-volatile organic compounds (SVOCs) are organic compounds that have a boiling point higher than water and may vaporize when exposed to temperatures above room temperature. SVOCs include phenols and PAHs. PAHs are a class of SVOCs found naturally in petroleum products, including gasoline, diesel, and certain mineral spirits. Their presence in

site soils is likely due to this association or to combustion of TPH. No historical site uses of other PAH-containing materials have been identified. Phenols are a class of chemical compounds consisting of a hydroxyl functional group (-OH) attached to an aromatic hydrocarbon group. Phenols are weak acids that are widely used for their antiseptic and disinfectant properties. Phenols are often found in pesticides. No historical site uses of Phenol-containing materials have been identified.

The SVOCs detected in site soils include the following 12 PAHs:

Phenanthrene	Chrysene	Fluorene	Naphthalene
2-Methylnaphthalene	Acenaphthylene	Acenaphthene	Anthracene
Fluoranthene	Pyrene	Benzo(a)anthracene	2-Chloronaphthalene

The SVOCs detecting in site ground water include the following 9 PAHs and 10 phenols:

2-Methylnaphthalene	Fluorene	Phenanthrene	Anthracene
Benzo(a)anthracene	Chrysene	Fluoranthene	Naphthalene
Pyrene	1,3-Dichlorobenzene	1,2 and 1,4-Dichlorobenzene	Chlorobenzene
Phenol	2,4-Dimethylphenol	2-Methylphenol	4-Methyphenol
Hexachlorobenzene	2,4,6-Trichlorophenol	2,4-Dinitrotoluene	

SVOCs tend to adhere to soil particles and are effectively immobile. Potential exposures to volatile SVOCs[4] may result from airborne dust. As noted above for VOCs, when detected in soil and ground water, certain of the more volatile SVOCs (such as naphthalene, anthracene, and 1,3-dichlorobenzene) also present a risk of migration upward into overlying structures and or trenches, where the concentrations in air may accumulate due to minimal dilution air. Preliminary vapor intrusion pathway analysis for volatile constituents is addressed in Section 4.2.

---

4 Volatile chemicals are defined as presented within the United States Environmental Protection Agency [USEPA] October 2004 update to the *Preliminary Remediation Goals* (USEPA, 2004) (those chemicals having a Henry's Law Constant greater than 10^{-5} atmospheres-meter^3/mole and a vapor pressure greater than 0.001 millimeters of mercury).

4.1.4 Asbestos

Asbestos is a name given to a variety of naturally occurring minerals composed of hydrated, fibrous silicates, which are crystalline in structure. There are two groups of asbestos mineral. The first is the Serpentine group, commonly referred to as chrysotile. Chrysotile, which comprises approximately 93 percent of all asbestos in the United States, is characterized by long, soft and flexible strands that can be woven into a cloth. The second category occurs as a group of minerals called Amphiboles. Amphibole fibers are characterized as being strong, brittle and needle-like. The common names of the forms of minerals within this group are: crocidolite, amosite, tremolite, anthophyllite, and actinolite.

Asbestos is virtually indestructible, has good fiber bonding, is abrasion-resistant, and is extremely resistant to heat and chemicals. The variety of desirable properties exhibited by asbestos make it very popular for use in building materials and industry. The primary drawback with its use is the known association of severe health disorders and associated liabilities with exposure to the fibers.

Inhalation is the principal route of exposure to asbestos. Other routes are dermal contact and ingestion. Asbestos is also a cancer-producing agent (lung cancer and mesothelioma). Heavy exposure to dust containing asbestos can also cause skin irritation. Epidemiological studies have shown that lung cancer appears to be related to the degree of exposure, the type of asbestos and whether or not the individuals smoke cigarettes. Cigarette smoking greatly increases the risk of lung cancer in those who are exposed to asbestos. However, mesothelioma (a rare tumor of the chest cavity lining) appears to develop without regard to the amount of asbestos inhaled. There have been some studies regarding the risks of asbestos ingestion. However researchers and regulators have reviewed this information and have not been able to reach a consensus on the effects of ingested asbestos fibers. Dermal contact with asbestos can cause small warts or corns.

Most of the information on health effects comes from studies of workers exposed regularly to high levels of asbestos (chronic exposure). For individuals living in areas of naturally occurring asbestos, exposures to soil dust containing asbestos can occur under a variety of scenarios, including construction, landscaping and children playing in dirt. For homes built on asbestos outcroppings, asbestos may be tracked into the home and can also enter as fibers in outdoor air (Office of Environmental Health Hazard Assessment [OEHHA], 2003).

Asbestos results in soil/fill material samples are reported as a percentage (%), with concentrations ranging from <1% to 80%. The principal form of asbestos fiber detected at the site is chrysotile.

4.1.5 PCBs

PCBs are a group of 209 distinct molecules. In the U.S., PCB mixtures were principally sold under the trade name Aroclor. The various PCB mixtures sold were identified by their PCB content. PCBs have very low solubility in water, relatively low volatility in air, and tend to absorb to oils, fats, and carbon-rich materials, if available. In the environment, PCBs are relatively persistent, and are degraded only under certain conditions. PCBs are reported to pose a health risk to humans depending upon the route and duration of exposure and the dose received.

4.1.6 Metals

As noted in Section 2, site operations did not involve the use or production of metals-containing materials. However, there is a possibility that heavy metals could be present as constituents of the heavy oils present in the evaporation pond area. Due to the lack of historical metal usage, metals were not included in the suite of analyses performed on soil samples collected at the Plant Site. If present, they would be restricted to soil intervals containing heavy oils, and they would be addressed by the remedial alternatives selected for addressing those oils. A variety of metals were detected in ground water, including earth metals (e.g., calcium, iron, etc.). The observed metals appear to be related to the former evaporation pond operations; however, the extent to which some of the detections may reflect naturally-occurring conditions has not been determined.

Metals represent a large and toxicologically diverse group of chemicals that occur naturally in the environment. The toxicity of metals and metal compounds depends on their chemical form and is difficult to generalize. In addition to the carcinogenic potential of various metals found on site, many metals may also include a variety of noncarcinogenic adverse health effects, including effects on the liver, kidney, and nervous, cardiovascular, and respiratory systems at sufficient dosages.

4.2 POTENTIAL FOR EXPOSURE

The potential chemical exposure pathways and receptors for current/future use scenarios are summarized in Table 8 and discussed below.

This evaluation has determined that there are no complete exposure pathways under **current** site and land use conditions for the following reasons:

- The JM Plant Site ceased operations and closed its facilities in 2003. Site buildings remain, but the property is otherwise vacant. Commercial workers, except for the building demolition crew, are not currently present on site. The demolition workers are working in accordance with a health and safety plan that ensures their exposure is limited. In addition, perimeter fencing precludes access by trespassers. Therefore, potential on-site receptors are absent.
- The site is entirely paved, including the former evaporation pond. Because site soil is not exposed, direct exposure by on-site receptors (non-existent) and off-site transport of impacted dust/fibers by wind (and resultant inhalation by off-site receptors) are incomplete pathways.
- Ground water is not a potable drinking water source, and impacts are localized to the immediate evaporation pond vicinity. Because of this, exposures to off-site receptors (i.e., by ingestion or inhalation of vapors) are incomplete pathways. Direct contact by on-site receptors (non-existent) is also an incomplete pathway.

The redevelopment plan for the site consists of constructing residential buildings (multi-family) and single-family homes. As a result, intrusive activities performed at the site will generate fugitive dust potentially contaminated with various chemicals as well as create new potential pathways (e.g., vapor migration into overlying residential structures). Therefore, the exposure evaluation determined that the following exposure pathways are potentially complete under anticipated future land use:

- Inhalation of fugitive dusts from soil/fill materials;
- Inhalation of volatile emissions from soil/fill or ground water; and
- Direct contact (soil/fill and ground water).

These exposure pathways and the associated receptors are discussed below.

4.2.1 Soil/Fill Materials

The chemicals identified in site soil were detected primarily in the former evaporation pond area, with asbestos and TPH-mo being present at the highest concentrations. The other detected chemicals were VOCs (specifically, BTEX), other TPH fractions, PCBs, and SVOCs. Exposure pathways for these chemical classes are summarized below.

Inhalation of Fugitive Dusts/Fibers

SVOCs, TPH, PCBs, and VOCs are chemicals that may adhere to site soil and become airborne during intrusive site activities. In addition, asbestos fibers are intermixed with soil/fill material and may become airborne during intrusive activities. As a result, the primary receptors of concern are individuals with the highest likelihood of disturbing site soils (i.e., construction workers, utility workers, and landscapers). In addition, residents (adult and child) going about their daily routine and playing in the yard or in on-site park areas may be exposed to dust containing these chemicals or asbestos fibers.

Inhalation of Volatile Constituents

Ethylbenzene, toluene, total xylenes, and SVOCs are present in site soil. Because volatile constituents (VOCs and volatile SVOCs) may migrate upward into overlying residential structures, indoor air may become impacted, thereby exposing residents to these chemicals. In addition, construction and/or utility workers digging trenches and working within the trenches may be exposed to migrating vapors. The volatile constituents may accumulate in this "box" due to minimal air exchanges.

ERM performed a preliminary vapor intrusion pathway analysis for volatile constituents using the DTSC-modified Johnson and Ettinger *Screening Soil Gas Model* (January 2005). The evaluation was performed for two data sets based on historical sampling data performed by ERM and previous consultants to JM: 1) soil data collected across the entire site (including the former evaporation pond), and 2) soil data excluding samples collected within and around the former evaporation ponds. The latter evaluation takes into consideration that pond contents (i.e., asbestos fill containing petroleum hydrocarbons) will need to be remediated as part of proposed remedial actions. It follows that an evaluation of conditions excluding those materials will most accurately reflect future risks at the site.

First, the maximum detected soil concentration for each constituent was converted to equilibrium soil gas concentration using the equation developed by Dominic DiGiulio (USEPA, 1992). The risk associated resultant soil gas data was then determined using the default assumptions of the DTSC-modified Johnson and Ettinger *Screening Soil Gas Model* (January 2005), with the exception of soil type (a sandy clay matrix was assumed). Appendix B presents the risk models and summary tables.

The analysis estimates that hypothetical risks to future residents due to inhalation of volatile constituents emanating from soil as:

	Carcinogenic Risk	Noncarcinogenic Risk
Entire Data Set (including evaporation pond)	2.2×10^{-3}	52
Excluding Pond Data	0.00	0.054

It will be noted that carcinogenic risk excluding pond data does not exist because no carcinogenic compounds were detected in site soils outside the former evaporation pond (Table B-1; Appendix B).

The analysis indicates that hypothetical risks to future residents due to inhalation of volatile constituents emanating from soil exceed the acceptable carcinogenic risk range ($1x10^{-4}$ to $1x10^{-6}$) and noncarcinogenic risk range (1) as defined by the USEPA for the entire site data. For the data set *excluding* the former evaporation pond data, the analysis indicates that hypothetical risks to future residents are acceptable under both USEPA and DTSC guidelines.

Direct Contact

Construction workers, utility workers, and landscapers will directly contact soil during their respective job activities, although they may be using some type of personal protective equipment (e.g., chemical resistant gloves). Residents (adult and children) may also contact soil during household activities. As a result, asbestos, TPH, VOCs, PCBs, and SVOCs in soil may present a dermal and ingestion risk.

4.2.2 *Ground Water*

Because ground water is not a potable drinking water source (see Section 3.2) this medium does not present a complete exposure pathway for ingestion and dermal contact associated with use of this water (e.g., showering, bathing). However, inhalation of VOCs and direct contact

present complete exposure pathways as summarized below. Exposure pathways for site-related chemical classes present in ground water (TPH, VOCs, PCBs, SVOCs, and metals) are described below.

Inhalation of Volatile Constituents

VOCs, most notably BTEX, and volatile SVOCs are present in site ground water. Because these volatile constituents may migrate upward from ground water into overlying residential structures, indoor air may be impacted, thereby exposing residents to these site-related chemicals. In addition, construction and/or utility workers digging trenches and working within the trenches may be exposed to migrating vapors from ground water. The volatile constituents may accumulate in this "box" due to minimal air exchanges.

ERM performed a preliminary vapor intrusion pathway analysis for volatile constituents in groundwater using the DTSC-modified Johnson and Ettinger *Screening Groundwater Model* (January 2005). The maximum detected value for each constituent from January 2000 through present was used in this evaluation. The risk associated with current groundwater was then determined using the default assumptions of the DTSC-modified Johnson and Ettinger *Screening Groundwater Model* (January 2005) with the exception of depth to groundwater where the site-specific value of 10 feet was used. Appendix B presents the risk models and summary tables. The preliminary vapor intrusion pathway analysis, which used a sandy clay default for soil type, found that hypothetical risks to future residents due to inhalation of volatile constituent emanating from site-wide ground water (including the evaporation pond) are within or lower than the USEPA defined acceptable carcinogenic risk range (value of 2.9×10^{-6}) and noncarcinogenic risk range (value of 0.033). The results are tabulated in Table B-2 of Appendix B.

It is noted that, with the exception of MW-9 (along the northeastern site margin), all the VOC and SVOC concentrations driving the cumulative carcinogenic risk value for indoor air (Table B-2) represent samples collected from within the former evaporation pond. Given that the cumulative risk is very near the 1.0×10^{-6} value recognized by DTSC as acceptable for residential reuse, and that some form of remedial action will be taken to address fill materials (both above and below ground water) within the pond, it follows that these remedial actions may very likely reduce the cumulative risk to below 1.0×10^{-6}.

Direct Contact

Construction workers and utility workers may directly contact ground water during their respective job activities, although they may be using some type of personal protective equipment (e.g., chemical resistant gloves). As a result, metals, TPH, VOCs, PCBs, and SVOCs in ground water may present a dermal and incidental ingestion risk.

5.0 REMEDIAL ACTION OBJECTIVES

This section provides the objectives for the remedial action and discusses how those objectives were formulated with respect to the site-specific exposure assessment, the ARARs, current and future beneficial uses for the site, and the remediation alternatives.

5.1 DEVELOPMENT PROCESS FOR REMEDIAL ACTION OBJECTIVES

RAOs consist of medium-specific goals that are protective of human health and the environment, which includes ground water. These objectives are based on present and anticipated future beneficial uses of study area resources. Typically, human health RAOs are chemical- and exposure-specific and are based on an assessment of potential exposure pathways. "Protection of ground water" RAOs are also chemical-specific objectives that govern allowable concentrations of chemical constituents in soils and ground water. These objectives are typically developed using ARARs and by applying specific chemical fate-and-transport assumptions to determine allowable concentrations of chemical constituents in soil/fill material and ground water that are protective of human health and of natural resources, such as ground water.

The process for developing RAOs consists of the following steps:

- Identify and evaluate regulatory standards that are ARARs;
- Identify current and anticipated future beneficial uses of study area resources and potential exposure scenarios associated with those uses;
- Develop health-risk-based remedial goals for soil/fill material and ground water that are protective of human health;
- Develop risk-based remedial goals for soil/fill material and ground water that are protective of the beneficial uses of ground water; and
- Develop RAOs that incorporate applicable ARARs and are protective of human health, the environment, and beneficial uses of ground water.

5.2 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

A requirement may be either (1) applicable or (2) relevant and appropriate, but not both. Applicable requirements are those remedial

standards, standards of control, or other environmental protection criteria or limitations that are promulgated under local, federal, or state law that specifically address hazardous substances, pollutants, contaminants, remedial actions, locations, or other circumstances at the site. Relevant and appropriate requirements are those that, while not applicable to the circumstances at the site, address problems or situations sufficiently similar to those encountered at sites such that their use is well suited to the target site of concern.

In addition to laws, regulations, and policies that are directly applicable, or relevant and appropriate, certain other items may have some reason warranting their consideration. Requirements "to be considered" (TBCs) include advisories or guidance documents issued by regulatory agencies that are not legally binding. TBCs may influence the selection of a remedy to allow the optimal remedy to be identified.

ARARs and TBCs were identified on a local, state, and federal level and evaluated in accordance with the physical, chemical, and toxicological characteristics of the chemical constituents, future use of the property, location of the property, and proposed remedial alternatives. Appendix C of this document presents the ARARs and TBCs identified for each of three categories: chemical-specific, action-specific, and location-specific.

5.2.1 Chemical-Specific ARARs

Chemical-specific ARARs are numerical standards set by various regulatory and government agencies that indicate the concentrations of certain compounds permitted in air, soil, ground water, surface water, and sediments.

ARARs and TBCs for chemical constituents present at the site, previously discussed in Section 4), are described in detail in Appendix C (Tables C-1 and C-2, respectively).

5.2.2 Action-Specific ARARs

Action-specific ARARs generally set performance, design, or other similar action-specific controls or restrictions on study area activities related to the management of hazardous substances. Action-specific ARARs will impact all activities that may be performed within the remediation area.

The types of activities under consideration for this RAP include:

- Release of dust or vapors from excavation activities;

- Transportation of excavated soil/fill materials within property boundaries;
- Transportation of excavated soil/fill materials to off-site locations;
- Ground water management during excavation activities; and
- Treatment, transportation and disposal of contaminated ground water.

Selected local ordinances and/or environmental protections governing proposed physical activities associated with the proposed remedies are TBCs, and include but are not limited to:

- Harbor Park General Plan Amendment (AP-05-223) and Mitigated Negative Declaration and Mitigation and Monitoring Plan (SCH#2005102062);
- City of Pittsburg Grading Ordinance, Title 15, Chapter 15.88;
- City of Pittsburg Standard Conditions of Development Details; and
- City of Pittsburg Landscaping Ordinance, Title 18, Chapter 18.84.

Action-specific ARARs and TBCs are presented in Appendix C (Tables C-3 and C-4, respectively).

5.2.3 Location-Specific ARARs

Location-specific ARARs are restrictions or requirements placed on the conduct of activities solely because they are in specific locations (e.g., activities performed in a flood plain or seismic standards for a specific location).

Location-specific ARARs are presented in Appendix C (Table C-5); no TBCs were identified.

5.3 BENEFICIAL USES SUMMARY

5.3.1 Current Beneficial Uses

As a non-operating industrial processing and manufacturing facility, there are currently no beneficial uses of this property. As noted above, shallow ground water (approximately 6-8 feet deep) is likely perched and discontinuous with deeper aquifers (approximately 125 feet deep). As discussed in Section 3.2, based on investigations performed at a site

approximately one-half mile from the JM site, shallow ground water has been shown not to be suitable for potable uses by virtue of low yield. Given the overall similarities in shallow hydrogeologic character between the two sites, it is concluded that shallow ground water at the JM site is likewise not suitable for potable use.

5.3.2 Anticipated Future Beneficial Uses

As discussed in Section 2.2.3, after completion of the planned development, this property will provide single and multi-family housing in the city of Pittsburg. Live/work commercial development is also being considered for a limited portion of the property along Third Street. As discussed above, there are no anticipated future beneficial uses for shallow ground water.

5.4 REMEDIAL ACTION OBJECTIVES

The RAOs are based on residential site usage and include the following:

- Prevent exposure (i.e., via incidental ingestion, dermal contact, inhalation of fugitive dust, and inhalation of volatile emissions) to soil/fill materials that are impacted with TPH at concentrations in excess of the cleanup goals established for the site (see Table C-6). (Note: These cleanup goals are not risk-based, because TPH includes varying mixtures of constituents and as such, the associated risks would also be variable. Risks associated with TPH are addressed by the cleanup goals established for specific TPH constituents [i.e., BTEX].) The proposed TPH cleanup goals for soil will be consistent with those commonly used by the Contra Costa County Environmental Health Division, Hazardous Materials Programs (County) in evaluating remedial actions for proposed residential sites. These cleanup objectives are based on California Regional Water Quality Control Board Environmental Screening Levels, and vary on a case-by-case basis.
- Ensure that asbestos is not present in soil/fill materials at detectable levels in any portions of the Plant Site in which residences are to be constructed (analysis will be transmission electron microscopy per USEPA Method 600/R-93/116 or equivalent).
- Prevent exposure (i.e., via incidental ingestion, dermal contact, inhalation of fugitive dust, and inhalation of volatile emissions) to soil/fill materials that are impacted with site-related chemicals at

concentrations in excess of health-risk-based cleanup goals established for the site (i.e., PCBs, SVOCs, and VOCs, see Table C-6).

- Prevent migration of constituents in soil/fill materials that would result in ground water contamination in excess of California Maximum Contaminant Levels or other applicable water quality standards. As described below in the section addressing potential remedial alternatives, we address a ground water sampling program to evaluate this issue.
- Prevent exposure (i.e., incidental ingestion, dermal contact, and inhalation of VOCs) to ground water within the footprint of the former evaporation pond; and
- Reduce the concentrations of TPH-related constituents in ground water (i.e., BTEX) to below their respective Maximum Contaminant Levels (MCLs).

6.0 REMEDIAL ACTION ALTERNATIVES

Remedial action alternatives potentially capable of meeting the RAOs for the remediation of impacted soil/fill materials and ground water have been developed. This section describes the development process for the remedial action alternatives, the methodology used to evaluate each alternative, and an evaluation of each alternative.

6.1 DEVELOPMENT OF REMEDIAL ALTERNATIVES

Various remedial technologies and process options were screened to identify those that have the potential to meet the RAOs for the chemical constituents identified at the site. The screenings of technology process options for soil and ground water are summarized in Tables 9 and 10, respectively. Based on the screening, those technology process options least suitable for addressing impacted media and achieving RAOs were eliminated. Those technology process options considered technically effective, implementable given current knowledge of the site, and cost-effective relative to competing options were retained and evaluated to develop remedial alternatives for impacted soil/fill materials and ground water.

6.2 REMEDIAL ALTERNATIVES – SOIL/FILL MATERIALS

Four remedial action alternatives for the remediation of impacted soil/fill materials have been developed:

- **Alternative 1** – No Action;
- **Alternative 2** – Fill Excavation with Off-Site Disposal;
- **Alternative 3** – Fill Consolidation on North Parcel; and
- **Alternative 4** – On-Site Consolidation in Eastern Boundary Berm.

The following subsections present a conceptual description of each alternative, in sufficient detail for evaluation and comparison of the alternatives later in this document. Detailed design, by way of an RDIP, will be performed for the selected remedial action alternative once the RAP is approved.

6.2.1 Alternative 1 – No Action

A No Action remedial alternative is included in the alternatives analysis to serve as a baseline against which to compare the other remedial alternatives. Because no remedial activities would be implemented, and no monitoring of ongoing natural subsurface processes would take place, long-term human health and environmental risks for the site would essentially be the same as those currently identified for the site.

6.2.2 Alternative 2 – Fill Excavation with Off-Site Disposal

Under this alternative, fill materials within the areas of concern (Figure 3) would be excavated and transported off site for disposal. Fill material generated from the excavation would be profiled through analytical testing. Soil/fill materials found not to contain evidence of ACM or petroleum hydrocarbons would be considered for use as backfill during construction at the site, as appropriate and practical. Soil/fill materials from within the former evaporation pond and other locations found with visible impact from either ACM or petroleum hydrocarbons will be transported off site for disposal.

Based on the known configuration of fill materials within the former evaporation pond and other locations found during demolition of the site, as described in Section 2.1.2 above, it is estimated that approximately 42,000 cubic yards (63,000 tons) of excavated fill materials (approximately 19,500 cubic yards from the former evaporation pond area, and 20,500 cubic yards from other locations found to contain ACM) would need to be transported off site for disposal. These volumetric estimates were arrived at by using computer assisted design functions in AutoCad, based on horizontal and vertical thickness data from various borings and/or test pits excavated within the pond and measurements taken from locations found during the demolition phase of work at the site. These data include horizontal and vertical thicknesses as indicated in cross-sections A-A', B-B', and C-C' presented as Figures 4, 5, and 6, respectively.

Once excavation is completed, confirmation sampling would be performed to ensure that all fill material and impacted soils have been removed. The sampling program will include sidewall confirmation sampling to define the lateral extent of soil removal. Sampling results will be compared against cleanup goals, as discussed previously, to determine that appropriate lateral and vertical excavation has been achieved. The details of the plan will be outlined in the Remedial Design and Implementation Plan (RDIP). Following confirmation sampling, the excavation area would be surveyed and backfilled using clean overburden

and replacement fill, after which the area would be compacted and regraded as needed. The site would then be restored to suitable conditions. The degree of compaction necessary and other geotechnical specifications for fill to be emplaced within the excavation will also be addressed in the RDIP.

Excavation, loading, and transporting of soil/fill materials impacted with ACM and petroleum hydrocarbons would be performed by state-certified contractors. Transportation of materials off-site to a licensed impoundment will be conducted only along designated truck routes approved by the City of Pittsburg Ordinance No. 05-1238, as contained in Section 10.36.080 of the Pittsburg Municipal Code.

6.2.3 Alternative 3 – Fill Consolidation on North Parcel

Under this alternative, fill materials within the areas of concern (Figure 3) would be excavated and consolidated on site at the North Parcel location (Figure 2). Fill materials generated from the excavation would be profiled through analytical testing. Soil/fill materials found not to contain evidence of ACM or petroleum hydrocarbons would be considered for use as backfill during construction at the site, as appropriate and practical. Soil/fill materials from within the former evaporation pond and former asbestos product storage area with visible impact from either ACM or petroleum hydrocarbons will be transported and consolidated with existing wastes landfilled at the North Parcel. Consistent with the program addressed in the previous alternative, confirmation sampling would be performed to define the lateral extent of soil removal; the sampling program would be addressed in the RDIP.

It is estimated that approximately 42,000 cubic yards (63,000 tons) of excavated fill materials would need to be transported to the North Parcel for disposal. Transported fill materials would be placed on the North Parcel in an area covering approximately 159,300 square feet. Clean fill would be placed on this area to act as a cover. The cover would be 2 feet thick and would require an estimated 11,800 cubic yards (17,700 tons) of clean fill, over which a vegetative cover would be re-established. Once excavation is completed, confirmation sampling would be performed to ensure that all impacted soils and fill material have been removed. Following confirmation sampling, the excavation area would be surveyed and backfilled using clean overburden and replacement fill, after which the area would be compacted and regraded as needed. The site would then be restored to suitable conditions.

Excavation, loading, and transporting of soil/fill materials impacted with ACM and petroleum hydrocarbons would be performed by state-certified contractors.

Implementation of this alternative would require establishing with DTSC a covenant to restrict the use of the property (i.e., deed restrictions) pursuant to Section 67391.1, Title 22, Division 4.5, Chapter 39, California Code of Regulations (CCR). Consistent with JM's prior agreement to restrict the use of the North Parcel, the applicable deed restrictions would be as follows, subject to final negotiations with DTSC:

- Prohibited Uses, including residences, hospitals for humans, public or private schools for persons under 21 years of age, and day-care centers for children;
- Soil Management Plan, addressing any activities that may disturb the capped property. Notification to, and approval by DTSC of any disturbances is would also be required;
- Prohibited Activities, including raising food (e.g., cattle, food crops, etc.), use of shallow (water table) ground water for purposes other than site remediation or construction dewatering, any earthwork that may disturb the cap (unless otherwise addressed in the Soil Management Plan), any uses or development on the capped property that does not preserve, or results in an alteration of, the cap's integrity;
- Timely and accurate notification to DTSC regarding type and date of any damage to the cap, and the type and date of any repair of such damage (10-working day notification);
- Provision of reasonable right of entry and access to DTSC for inspection, monitoring, and other activities consistent with the purpose of the covenant as deemed necessary by DTSC to protect public health or safety, or the environment; and
- Provision of reasonable access for implementing O&M activities to entities or persons responsible for that work.

Since all waste materials would be removed from the proposed residential portions within the redevelopment area, no deed restrictions beyond the prohibition on the use of ground water would be appropriate or necessary for these areas. Any further restrictions regarding reuse would be negotiated with DTSC as part of an O&M Agreement following implementation of the chosen remedy.

6.2.4 Alternative 4 – On-Site Consolidation in Eastern Boundary Berm

Under this alternative, fill materials within the areas of concern (Figure 3) would be excavated and consolidated on site in the construction of an engineered berm along the eastern boundary of the site. Fill materials generated from the excavation would be profiled through analytical testing. Soil/fill materials found not to contain evidence of ACMs or petroleum hydrocarbons would be considered for use as backfill during construction at the site, as appropriate and practical. Soil/fill materials from within the former evaporation pond and former asbestos product storage area with visible impact from either ACM or petroleum hydrocarbons would be used in the construction of the eastern boundary berm. It is estimated that approximately 42,000 cubic yards (63,000 tons) of fill materials and impacted soil would be excavated and consolidated in the berm. Consistent with the program addressed in the previous alternative, confirmation sampling would be performed to define the lateral extent of soil removal; the sampling program would be addressed in the RDIP.

The berm would be engineered to contain aboveground as well as subgrade storage cells. The aboveground storage cell, including clean fill cover, will be 10 feet high relative to the adjacent public right of way. The subgrade storage cell of the berm would be constructed by excavating a trench a maximum of 75 feet wide, 10 feet deep, and 1,400 feet long. Based on historical depths to ground water, as identified in selected ground water monitoring wells along the alignment of the proposed berm and with test pits and other borings along the eastern margin of the former evaporation pond, a separation between the bottom of the trench and ground water is not attainable. Soil excavated from the trench would be profiled to determine its suitability for reuse as site fill, or for offsite disposal, as appropriate. The profiling program will be detailed in the RDIP.

Cultural resources have not been identified during previous site activities. However, due to the location of the project in an area designated by the City of Pittsburg as sensitive for Native American resources, and the presence of an identified known historic Cultural Resource adjacent to the project site, the project proponent will be required to retain the services of a registered professional archaeologist (pre-historic and/or historical, as appropriate), or an individual meeting the qualifications established by the Secretary of the Interior's Standards and Guidelines for Professional Qualifications contained in 36 CRF Part 61. This individual will be required to be trained and certified in accordance with Federal Hazardous Waste Operations and Emergency Response requirements.

Prior to the commencement of site activities, the archaeologist will be responsible for conducting the following:

1. Preparing a Cultural Resource Protection Plan for review and approval by DTSC. The cultural resource protection plan shall be consistent with the requirements established in Public Resource Code (PRC) sections 21083.2, 21084.1 and CEQA Guidelines (CCR) section 15064.5. Earthmoving activities shall not commence prior to approval, by DTSC, of the Cultural Resource Protection Plan.
2. Consulting with Native American tribal representatives identified by the Native American Heritage Commission. Such consultation shall be in coordination with DTSC.
3. Consulting with the appropriate CHRIS Information Center. Such consultation shall be coordinated with DTSC.
4. Conducting orientation training for workers involved in excavation and construction activities associated with the remediation project. The orientation will explain the nature and importance of cultural resources potentially present and set forth a procedure for treatment of the cultural resources, if any are found.
5. Monitoring all ground-disturbing activities. If items of cultural resources or human remains are uncovered, the archaeologist shall direct that all work activities be stopped immediately to allow the archeologist to implement appropriate procedures for treatment and/or disposition of the cultural resources as established in the approved Cultural Resource Protection Plan, PRC section 21083.2, CCR section 15064.5, and H&SC section 7050.5.

As indicated above, the Site is located in an industrial area. No unique paleontological or geologic features have been identified during previous site investigations and/or disturbances. Proposed remediation activities involve excavation to a depth of five feet. Discovery of unique paleontological or geologic features is unlikely. In the event of an accidental discovery of geologic or paleontological resources, a qualified paleontological resource specialist or geologist will be contacted for immediate evaluation of the resources. If the resources are confirmed to be significant, the Office of Historic Preservation (OHP) within the Department of California State Parks will be contacted for further guidance relating to documentation and preservation of the resource.

A conceptual diagram showing berm detail in cross-section is presented as Figure 7. The aboveground storage cell with engineered slopes of the berm will be located directly above the trench. The aboveground storage

cell of the berm will extend the approximate width and length of the trench. Two feet of clean fill (6,200 cubic yards) will be placed on top and sides to act as a cover. The total height of the berm is anticipated to be approximately 10 feet, including clean fill, as measured from the adjacent right-of-way. A marker layer will be placed between the aboveground storage cell and the clean fill. This marker will serve as demarcation between the cover material and storage cell. In addition to the clean fill, thick vegetation such as grass and non-intrusive, drought-tolerant shrubs will be planted on the berm as erosion control for the cover material. The vegetative cover will be in conformance with the City's Landscape Ordinance (Pittsburg Municipal Code, Title 18, Chapter 18.84). The landscape details will be further addressed in the RDIP.

The original design capacity of the berm was assumed to be approximately 26,000 cubic yards. Based on the current understanding of the volume of asbestos-impacted fill materials present at the site, it may be necessary to increase the berm's capacity by over 50 percent (to more than 42,000 cubic yards). The proposed remedy will remove all impacted fill materials from the proposed residential areas and consolidate those materials within the berm. Under no circumstances will asbestos-impacted fill materials be left within the residential areas. The berm will be designed to have a minimum buffer distance of 1 foot (including an appropriate marker fabric or layer) between any waste materials in the berm and existing or future public rights-of-way or utilities corridors on either side of the berm, consistent with the proposed development plan.

As noted in Section 2.2.3 above, DTSC understands that the development plan details associated with the berm design are only conceptual. PRPLLC has not submitted a formal development application, nor has the development been granted any approvals from the City of Pittsburg Planning Commission or City Council.

Once excavation is completed, confirmation sampling would be performed to ensure that all impacted soils and fill material have been removed from beneath the proposed single- and multi-family residential areas. Following confirmation sampling, the excavation area would be surveyed and backfilled using clean overburden and replacement fill, after which the area would be compacted and regraded as needed. The site would then be restored to suitable conditions.

Excavation, loading, and transporting of soil/fill materials impacted with ACM and petroleum hydrocarbons will be performed by state-certified contractors.

As noted for implementation of Alternative 3, this alternative would also require establishing with DTSC a covenant to restrict the use of the bermed area (i.e., deed restrictions) pursuant to 22 CCR, Section 67391.1, Division 4.5, Chapter 39. Applicable deed restrictions would be consistent with those identified for Alternative 3 and an O&M Agreement with DTSC would be implemented and would include a requirement for demonstration of financial assurance for berm upkeep and oversight. The RDIP will specifically address potential impacts such as accidental breaches of the berm from broken water mains, misguided utility line repair, vehicle collision with the berm, or any other foreseeable long term impact which may result in a breach to the berm.

Since all waste materials would be removed from the proposed residential areas on the redevelopment area, no institutional controls beyond the prohibition on the use of ground water (if ground water contaminants exist above applicable cleanup levels, as described below) would be appropriate or necessary in these areas. As part of an O&M Agreement negotiated between PRPLLC and DTSC, an O&M Plan will be prepared in addition to the RDIP. The O&M Plan will include a contingency plan and emergency response plan, consistent with Paragraph 2.7 of DTSC's model O&M Agreement, which will identify policies and procedures for responding to accidental breaches to the berm. The O&M Plan will be implemented in accordance with an O&M Agreement, which will be an enforceable agreement executed between DTSC and PRPLLC pursuant to Health and Safety Code section 25355.5 (a)(1)(C).

6.3 REMEDIAL ALTERNATIVES – GROUND WATER

Three remedial action alternatives for the remediation of impacted ground water have been developed:

- **Alternative 1** – No Action;
- **Alternative 2** – Extraction/Treatment with Monitored Natural Attenuation (MNA);
- **Alternative 3** – Monitored Natural Attenuation; and
- **Alternative 4** – Natural Attenuation with Land Use Restriction.

The following subsections present a conceptual description of each alternative, in sufficient detail for evaluation and comparison of the alternatives later in this document. Detailed design will be performed (via RDIP) for the selected remedial action alternative once the RAP is approved.

6.3.1 Alternative 1 – No Action

A No Action remedial alternative is included in the alternatives analysis to serve as a baseline against which to compare the other remedial alternatives. Because no remedial activities would be implemented, long-term human health and environmental risks for the site would essentially be the same as those currently identified for the site.

6.3.2 Alternative 2 – Extraction/Treatment with MNA

Alternative 2 consists of ground water extraction and treatment with continued ground water monitoring to observe the results of natural subsurface concentration reduction processes. This alternative includes the following components:

- Installation of an extraction trench near the downgradient edge of the source area and an injection trench upgradient;
- Construction of the treatment system;
- Operation, maintenance, and monitoring of the system; and
- Implementation of a ground water monitoring program utilizing existing ground water monitoring wells, as appropriate and available, or with suitable replacement wells (Figure 3).

This alternative would monitor the potential progress of natural attenuation. Ground water samples would be collected annually for TPH analysis from existing (or suitable replacement) wells. In addition to monitoring for TPH, the four ground water monitoring wells would be sampled for dissolved oxygen concentration (DO), oxidation-reduction potential (ORP), pH, dissolved iron and manganese, nitrate (NO_3), sulfate (SO_4), carbon dioxide, methane, ethane, and ethene analyses. The four-well MNA system would be selected as follows: one upgradient (south) of the source area to establish background conditions; one in the source area to monitor the zone of highest concentration; one at mid-plume to monitor conditions at that location; and one at the downgradient extent of the former evaporation pond to monitor plume stability and any potential contaminant migration.

In accordance with 22 CCR Section 67391.1, Division 4.5, Chapter 39, a land use covenant prohibiting the use of ground water for purposes other than site remediation or construction dewatering would be part of the proposed remedy associated with Alternative 2. Ground water monitoring would be performed under an O&M Agreement with DTSC.

The following subsections describe the components of Alternative 2.

6.3.2.1 Extraction Trench and Injection Trench Installation

The extraction trench would be 100 feet long, 1 foot wide, and 20 feet deep to recover ground water from the zone of highest concentration immediately downgradient (north) of the former source area (i.e., the former evaporation pond; Figure 3). To reinject treated ground water back into the aquifer, an injection trench of similar size would be installed upgradient (south) of the source area. This combination would be designed to hydraulically contain and remediate the apparent source area of the contaminant plume.

6.3.2.2 Treatment System Construction

To extract ground water from the extraction trench, a sump pump would be sized for the appropriate ground water flux through the area of the trench. Via appropriate conveyance system, the extraction system would be plumbed to an aboveground treatment system. The anticipated treatment will be by GAC. The treated ground water from the GAC system would be returned to the aquifer via the injection trench.

6.3.2.3 System Operation, Maintenance, and Monitoring

The treatment system would be scheduled for 2 years of operation. During this time, periodic ground water influent and effluent monitoring would be performed to optimize mass removal rates and evaluate system performance and permit compliance. Principal components of the treatment system, including extraction pump, conveyance piping, and the GAC vessels, would require regular replacement and/or maintenance.

6.3.2.4 Ground Water Monitoring

A ground water monitoring program would analyze the performance of the remedial action as follows:

- Quarterly monitoring of on-site wells for TPH and aromatic VOCs (BTEX) until these constituents are shown to be at concentrations less than their respective MCLs. For purposes of costing, we assume that this will be accomplished within the first 5 years, and that the need for monitoring beyond 5 years will be evaluated at that time.
- Annual monitoring for MNA parameters. The MNA parameters include monitoring for VOCs by USEPA Method 8260, nitrate and sulfate by USEPA Method 300.0, total alkalinity by USEPA Method

310.1, dissolved iron and manganese by USEPA Method 6010, and dissolved methane and carbon dioxide by Microseeps-specific method AM20GAX.

6.3.3 Alternative 3 – Monitored Natural Attenuation

Alternative 3 consists of continued ground water monitoring to observe the results of natural subsurface concentration reduction processes. Previous site investigations have shown that natural attenuation is likely occurring in the subsurface; this alternative, as described in Alternative 2, would monitor that progress. The ground water monitoring program will utilize existing wells, as available (Figure 3) and would continue for 5 years. The monitoring schedule would analyze the performance of the remedial action as follows:

- Quarterly monitoring of on-site wells for TPH and aromatic VOCs (BTEX) until these constituents are shown to be at concentrations less than their respective MCLs. For purposes of costing, we assume that this will be accomplished within the first 5 years, and that the need for monitoring beyond 5 years will be evaluated at that time.
- Annual monitoring for MNA parameters, as described above.

In accordance with 22 CCR Section 67391.1, Division 4.5, Chapter 39, a land use covenant prohibiting the use of ground water for purposes other than site remediation or construction dewatering would be part of the proposed remedy associated with Alternative 2. Ground water monitoring would be performed under an O&M Agreement with DTSC.

This remedial alternative includes a post-removal action ground water investigation component, to include ground water grab sampling within the footprint of the former evaporation pond to evaluate concentrations of VOCs (i.e., BTEX) related to TPH in ground water. If the investigation, which will be performed following pond backfilling and compaction, demonstrates that VOCs concentrations in ground water do not exceed the applicable remedial objectives, as defined in Section 5 of this RAP, continued ground water monitoring pursuant to the approach described above will not be necessary. This will be evaluated with DTSC upon completion of the post-removal action investigation. If applicable ground water cleanup levels objectives for any constituents are not met (i.e., are exceeded), a formal ground water monitoring program (including natural attenuation parameters) will be required and will be negotiated with DTSC, as appropriate. The ground water monitoring program, if required, will include, at a minimum, annual reporting of ground water monitoring results to DTSC.

6.3.4 Alternative 4 – Natural Attenuation with no Ground Water Monitoring

Under Alternative 4, no remedial activities will be implemented. However, in accordance with 22 CCR Section 67391.1, Division 4.5, Chapter 39, an institutional control prohibiting the use of ground water for purposes other than site remediation or construction dewatering would be part of the proposed remedy associated with Alternative 2. This institutional control would be in the form of homeowners' association CC&Rs.

As described above for Alternative 3, this remedial alternative also includes a post-removal action ground water investigation component, to include ground water grab sampling within the footprint of the former evaporation pond to evaluate concentrations of VOCs and TPH constituents in ground water. If applicable ground water cleanup levels for any constituents are not met (i.e., are exceeded), a formal ground water monitoring program (including natural attenuation parameters) will be required and will be negotiated with DTSC, as appropriate. The ground water monitoring program, if required, will include, at a minimum, annual reporting of ground water monitoring results to DTSC. If the investigation demonstrates that VOCs and TPH concentrations in ground water do not exceed the applicable remedial objectives, as defined in Section 5 of this RAP, a ground water closure request will be prepared and submitted to DTSC. Pending DTSC approval of the request, no further activities associated with ground water issues will be performed for the site.

7.0 REMEDIAL ALTERNATIVES EVALUATION

This section provides a detailed and comparative analysis of the remedial alternatives developed in Section 6.

The detailed analysis of each alternative involves:

- An evaluation of each remedial alternative with respect to the nine federal evaluation criteria and six California state criteria. The six California criteria are not analyzed separately because the factors that the California criteria are intended to evaluate are fully considered in one or more of the nine federal criteria.
- An assessment of each remedial alternative with respect to its effectiveness in achieving RAOs.

The nine federal evaluation criteria as set forth in the NCP [Code of Federal Regulations, Part 300.430(e)(9)(iii)] are categorized into two threshold criteria, five balancing criteria, and two modifying criteria. Threshold criteria are:

- Overall protection of human health and the environment; and
- Compliance with ARARs.

Balancing criteria represent the primary criteria upon which the detailed and comparative analyses are based. Balancing criteria are:

- Long-term effectiveness and permanence;
- Reduction in TMV through treatment;
- Short-term effectiveness;
- Implementability; and
- Cost.

The modifying criteria are:

- State acceptance; and
- Community acceptance.

To streamline the detailed analysis, the two modifying criteria are evaluated together.

The components of the remedial alternatives are summarized in Table 11. The detailed analysis for each alternative is presented in Section 7.2 and summarized on Table 11. The comparative analysis is presented in Section 7.3 and summarized in Table 11.

7.1 REMEDIAL ALTERNATIVES EVALUATION CRITERIA

The nine federal evaluation criteria are described in the following subsections and are later used in the detailed alternatives analysis. The detailed and comparative analyses are based primarily on threshold and balancing criteria.

7.1.1 Federal Evaluation Criteria

7.1.1.1 Overall Protection of Human Health and the Environment

This criterion assesses whether an alternative provides adequate protection of human health, the environment, and the beneficial uses of ground water. It evaluates how site risks posed through each exposure pathway are eliminated, reduced, or controlled through treatment, engineering, or institutional controls. It also evaluates the degree to which the alternative satisfies RAOs.

7.1.1.2 Compliance with Applicable or Relevant and Appropriate Requirements

This evaluation criterion is used to determine whether each alternative will meet ARARs, as presented in Section 5. Each alternative will be evaluated to determine compliance with chemical-specific, action-specific, and location-specific ARARs. Additionally, compliance with other applicable criteria, advisories, and guidelines (TBCs) will be considered.

7.1.1.3 Long-Term Effectiveness and Permanence

The long-term effectiveness and permanence criterion evaluates the long-term reliability of the proposed equipment and process, and the permanence of the proposed alternative. This criterion evaluates the magnitude of residual risk posed by the presence of untreated waste or treatment residuals and the adequacy of institutional actions or containment measures needed to manage residual risk.

7.1.1.4 Reduction of Toxicity, Mobility, or Volume through Treatment

This criterion addresses the statutory preference for selecting remedial actions that employ treatment to permanently reduce TMV. It evaluates the amount of hazardous substances that will be destroyed, treated, or recycled and the degree to which the treatment is irreversible. The residual compounds that will remain following treatment and the degree to which treatment reduces the inherent hazards posed by principal threats at the site are considered. This criterion favors alternatives that utilize treatment to the maximum extent possible and generate little or no residual wastes.

7.1.1.5 Short-Term Effectiveness

The short-term effectiveness criterion measures the short-term risks to the community or remediation construction personnel that might occur during implementation of remediation. It also evaluates the time required to implement the proposed remediation. Finally, this criterion assesses the potential impact on the environment during remediation and the effectiveness of the proposed remedial measures.

7.1.1.6 Implementability

The implementability criterion evaluates technical and administrative feasibility of an alternative, and the availability of services and materials needed to implement the alternative. Evaluation of technical feasibility includes an assessment of the reliability of technologies and ease of undertaking additional remedial action, if necessary. This criterion favors proven technologies that are widely available and simple to implement or construct and operate.

7.1.1.7 Cost

The cost criterion assesses the financial burden associated with implementing the alternative. The factors addressed include capital costs, both direct and indirect, and O&M costs. Direct capital costs include construction costs or expenditures for labor, materials, equipment, and subcontractors associated with the remedial action. Indirect capital costs include expenditures for engineering, permitting, construction management, and other services necessary to carry out the remedial action. O&M costs include operational labor and maintenance materials associated with the extended O&M and reporting for each alternative. Costs are given as present worth costs.

7.1.1.8 State and Community Acceptance

The state and community acceptance criteria are addressed together. The state acceptance criterion evaluates the technical and administrative issues and concerns that the state may have regarding each alternative. State acceptance is implicit in regulatory approval of the RAP. The evaluation is preliminary and qualitative. State and community acceptance will be formally documented in the final RAP following public comment on the draft RAP.

7.2 REMEDIAL ALTERNATIVES EVALUATION – SOIL/FILL MATERIALS

In this section, each remedial action alternative for impacted soils is evaluated with respect to the previously identified criteria. The results of the detailed evaluation are discussed below. With the exception of the No Action alternative, each of the remedial action alternatives satisfies or nearly satisfies all of the requirements of the effectiveness and implementability criteria. The cost criterion is a significant distinguishing factor between the remaining alternatives.

A detailed cost estimate for each alternative is presented in Appendix D. Table 11 presents a summary of the alternative costs.

7.2.1 Alternative 1 – No Action

The detailed analysis of Alternative 1 against the nine federal evaluation criteria is presented below and summarized in Table 11.

Overall Protection of Human Health and the Environment. As no actions would be taken to address site RAOs, this alternative would provide no protection of human health and the environment.

Compliance with ARARs. This alternative does not meet ARARs identified for the site because no remedial actions would be taken.

Long-Term Effectiveness and Permanence. The No Action alternative provides no effectiveness in the long term. No actions would be taken at the site under this alternative, and therefore affected media would continue to pose a potential threat to human health and the environment.

Reduction of Toxicity, Mobility, or Volume through Treatment. The No Action alternative does not involve treatment to address site chemical

constituents, and therefore this alternative does not provide any reduction in TMV.

Short-Term Effectiveness. This alternative is considered to have moderate effectiveness in the short term. Because no action would be taken, there would be no short-term risk to the community or workers. No time would be required to complete this alternative, but protection from site risks would not be achieved.

Implementability. As no actions would be taken for this alternative, this alternative is highly implementable.

Cost. No costs are associated with this alternative, as no remedial actions would be conducted.

State and Community Acceptance. As no remedial actions would be taken, this alternative would likely not be acceptable to the state or community, given PRPLLC's plans to redevelop the site.

7.2.2 *Alternative 2 – Fill Excavation with Off-Site Disposal*

The detailed analysis of Alternative 2 against the nine federal evaluation criteria is presented below and summarized in Table 11.

Overall Protection of Human Health and the Environment. This alternative provides high overall protection of human health and environment. Under this alternative, fill material and residual soil contamination would be removed from the site and no longer would pose a potential threat to human health or the environment. Soil RAOs would be achieved, removing constituents exceeding health-based levels, preventing migration of constituents to ground water, and minimizing the need for long-term management.

Compliance with ARARs. This alternative meets ARARs identified for the site. Compliance with local regulations, such as those for permitting, zoning, and transport would be required.

Long-Term Effectiveness and Permanence. This alternative would be highly effective over the long term. The removal and off-site disposal of contaminated soil at the site would meet the RAO by eliminating the source of contamination and potential pathways. Residual risks would be permanently eliminated by removing the source. Excavation and disposal are proven and reliable technologies that would effectively remove the contaminated soil and thus permanently reduce the possibility of human

exposure to the materials. No long-term management would be needed, though confirmation sampling would be required to verify total removal.

Reduction of Toxicity, Mobility, or Volume through Treatment. The mobility of chemicals in on-site soil would be reduced through removal and disposal at a landfill.

Short-Term Effectiveness. Potential short-term risks for this alternative include generation of airborne contaminants from the excavation, including dust, volatile chemicals, and asbestos fibers. Risks would be present due to transportation of contaminated fill materials and soil to the landfill (as many as 1,800 truckloads) and physical hazards from the construction equipment.

Implementability. This alternative is highly implementable. Soil removal uses standard construction methods and the necessary labor, materials, and equipment are readily available. Traffic impacts are likely a significant concern.

Cost. The estimated cost for this alternative is $7,601,000 (Appendix D).

State and Community Acceptance. This alternative would likely be acceptable to the State and local community because it addresses site impacts through removal of impacted soil. Transportation of impacted soil and fill materials to the landfill could raise concerns within the community. Final determination of community acceptance would depend on comments received during the public comment period.

7.2.3 Alternative 3 – Fill Consolidation on North Parcel

The detailed analysis of Alternative 3 against the nine federal evaluation criteria is presented below and summarized in Table 11.

Overall Protection of Human Health and the Environment. This alternative also provides high overall protection of human health and environment. Under this alternative, impacted soil and fill materials would be removed from the area of the site that poses a potential threat to human health or the environment. Impacted soil and fill materials would be consolidated into a single area that would be classified for restricted use. Clean fill would be placed on top of the contaminated soil preventing exposure. The chemical constituents are not thought to be highly mobile and the threat of migration of constituents to ground water would be minimal.

Compliance with ARARs. This alternative meets ARARs identified for the site. Compliance with local regulations, such as those for permitting, zoning, and transport would be required.

Long-Term Effectiveness and Permanence. This alternative would be highly effective over the long term provided that there is ongoing inspection and maintenance of the waste consolidation area. The consolidation of contaminated soil at the site would meet the RAO by eliminating the source of contamination and potential pathways in the area of the site to be classified for unrestricted use. Limited access or deed restrictions would only apply to the consolidation area. The berm will be maintained and inspected in accordance with an Operation and Maintenance Agreement with DTSC to ensure the integrity of the berm. Residual risks to human health would be reduced by capping the consolidation area with clean fill. The residual risks to ground water would be minimal because the chemical constituents in soil are not thought to be highly mobile. Excavation and consolidation are proven and reliable technologies that would effectively remove the contaminated soil from unrestricted areas and thus permanently reduce the possibility of human exposure to the materials within the proposed residential development area of the site.

Reduction of Toxicity, Mobility, or Volume through Treatment. This alternative would not reduce the TMV of chemicals in on-site soil through treatment. The chemical constituents would be consolidated in one location (North Parcel), preventing potential exposure to on-site residents.

Short-Term Effectiveness. Potential short-term risks for this alternative include generation of airborne contaminants from the excavation, including dust, volatile chemicals, and asbestos fibers. There would be exposure risks from transportation of contaminated fill materials and soil to the North Parcel. Also, physical hazards from the construction equipment would be present.

Implementability. This alternative is highly implementable. Soil consolidation uses standard construction methods and the necessary labor, materials, and equipment are readily available.

Cost. The estimated cost for this alternative, including long-term O&M, is $2,358,000 (Appendix D).

State and Community Acceptance. This alternative would likely not be acceptable to the State and local community. Transportation of impacted soil and fill materials to the North Parcel would necessitate re-opening an impoundment (previously closed by DTSC) containing impacted fill

materials, which would likely not be approved by DTSC. Likewise, implementing this alternative within approximately 100 feet of the existing residential neighborhood to the west would likely raise concerns within the community. Final determination of community acceptance will depend on comments received during the public comment period.

7.2.4 Alternative 4 – On-Site Consolidation in Eastern Boundary Berm

The detailed analysis of Alternative 4 against the nine federal evaluation criteria is presented below and summarized in Table 11.

Overall Protection of Human Health and the Environment. This alternative also provides high overall protection of human health and environment. Under this alternative, impacted soil and fill materials would be largely removed from the area of the site that poses a potential threat to human health or the environment (to the extent that the berm can accommodate the fill materials). Excess impacted materials would be transported to and disposed at an appropriate off site landfill. Impacted soil and fill materials would be consolidated into a berm along the eastern boundary that would have a recorded land use covenant restricting its use. Clean fill would be placed on top of the contaminated soil, preventing exposure. Vegetation would be planted on the berm, reducing ground water infiltration to the impacted soil. The chemical constituents (namely asbestos and petroleum hydrocarbons in the diesel and motor oil ranges) are generally not mobile, therefore the threat of migration of constituents to ground water would be minimal. Continued ground water monitoring may be required to ensure that migration of the chemical constituents to ground water is not occurring.

Compliance with ARARs. This alternative meets ARARs identified for the site. Compliance with local regulations, such as those for permitting and zoning, would be required.

Long-Term Effectiveness and Permanence. This alternative would be highly effective over the long term provided that there is ongoing inspection and maintenance of the berm. The consolidation of contaminated soil at the site would meet the RAO by eliminating the source of contamination and potential pathways in the area of the site to be classified for unrestricted use. Limited access or deed restrictions would only apply to the consolidation area. Residual risks to human health would be reduced by capping the consolidation area with clean fill. The residual risks to ground water would be minimal because the chemical constituents in soil are generally not mobile. Additionally, vegetation would be placed on the berm. Excavation and consolidation are proven and reliable technologies

that would effectively remove the contaminated soil from unrestricted areas and thus permanently reduce the possibility of human exposure to the materials.

Reduction of Toxicity, Mobility, or Volume through Treatment. This alternative would not reduce the TMV of chemicals in on-site soil through treatment. Consolidation of contaminated soils to the eastern boundary berm would reduce the volume of contaminants in the proposed residential reuse area. The toxicity and volume of contaminants site-wide would not be reduced, but potential exposure to the chemical constituents would be reduced and the engineered controls of the berm would reduce the mobility of contaminants.

Short-Term Effectiveness. Potential short-term risks for this alternative include generation of airborne contaminants from the excavation, including dust, volatile chemicals, and asbestos fibers (these impacts can be mitigated with water misting and air monitoring during removal activities). Also, physical hazards from the construction equipment would be present.

Implementability. This alternative is highly implementable. Soil consolidation uses standard construction methods and the necessary labor, materials, and equipment are readily available.

Cost. The estimated cost for this alternative is $1,598,000 (Appendix D).

State and Community Acceptance. This alternative would likely be acceptable to the State and local community. This alternative has also been determined to be potentially acceptable to both the City of Pittsburg as well as the prospective multi-family residential developer. Final determination of community acceptance would depend on comments received during the public comment period.

7.3 REMEDIAL ALTERNATIVES EVALUATION – GROUND WATER

In this section, each remedial action alternative for contaminated ground water is evaluated with respect to the previously identified criteria. The results of the detailed evaluation are discussed below. With the exception of the No Action alternative, each of the remedial action alternatives satisfies or nearly satisfies all of the requirements of the effectiveness and implementability criteria. The cost criterion is a significant distinguishing factor between the remaining alternatives.

A detailed cost estimate for each alternative is presented in Appendix D. Table 12 presents a summary of the alternative costs.

7.3.1 Alternative 1 – No Action

The detailed analysis of Alternative 1 against the nine federal evaluation criteria is presented below and summarized in Table 12.

Overall Protection of Human Health and the Environment. This alternative would provide a moderate level of protection to human health and the environment, especially given the likely non-beneficial use of site ground water. Concentrations of TPH and VOCs in ground water may tend to decline over time due to natural attenuation. Petroleum hydrocarbons, and some VOCs, are well documented to be readily biodegradable in ground water systems (USEPA, 2004). Petroleum hydrocarbons and their constituents are generally biodegradable as long as indigenous microorganisms have an adequate supply of nutrients and electron acceptors, and biological activity is not inhibited by substances toxic to the organisms. In systems lacking a sufficient oxygen supply, anaerobic biodegradation will occur as long as an electron acceptor such as nitrate, iron (III), manganese (IV), and sulfate are present in adequate levels. As such, the biodegradation capacity of natural systems with is reported to be in the range of 7 to 70 mg/l (USEPA, 1996).

Compliance with ARARs. This alternative does not meet ARARs identified for the site because there are no controls to limit exposure to ground water.

Long-Term Effectiveness and Permanence. This alternative would provide moderate long-term effectiveness. Natural attenuation would reduce chemical concentrations in ground water to meet the RAOs. These concentration reductions would be permanent. However, this alternative does not provide monitoring to ensure that natural attenuation is sufficiently reducing chemical constituents.

Reduction of Toxicity, Mobility, or Volume through Treatment. The No Action alternative provides for reduction of TMV through natural attenuation.

Short-Term Effectiveness. This alternative is considered to have moderate to high effectiveness in the short term. Because no action would be taken, there would be no short-term risk to the community or workers. No time would be required to complete this alternative and ground water chemical concentrations will decrease due to natural attenuation.

Implementability. As no actions would be taken for this alternative, this alternative is highly implementable.

Cost. No costs are associated with this alternative, as no remedial actions would be conducted.

State and Community Acceptance. As no remedial actions would be taken, this alternative would likely not be acceptable to the State or community.

7.3.2 Alternative 2 – Extraction/Treatment with MNA

The detailed analysis of Alternative 2 against the nine federal evaluation criteria is presented below and summarized in Table 12.

Overall Protection of Human Health and the Environment. This alternative would provide a high level of protection to human health and the environment. Ground water chemical concentrations at the source area will be reduced through extraction and treatment. Continued ground water monitoring will confirm remedial progress or warn of unexpected developments.

Compliance with ARARs. This alternative would meet the ARARs by reducing the concentrations in the source area and verifying the stability and continued decrease in ground water concentrations with the implementation of the ground water monitoring program. Potential exposure to ground water would be limited by the implementation of a deed restriction.

Long-Term Effectiveness and Permanence. This alternative would provide high long-term effectiveness. Extraction and treatment may reduce chemical concentrations in ground water at the source area; however, the technical feasibility of such an approach is questionable due to the overall success of the treatability study (Appendix A). Natural attenuation, which is believed to be occurring due to the overall reductions in organic chemical concentrations site-wide, would decrease downgradient chemical constituents to concentrations that meet the RAOs. These concentration reductions would be permanent. Ground water monitoring would confirm remedial progress.

Reduction of Toxicity, Mobility, or Volume through Treatment. This alternative provides for reduction of TMV through extraction with treatment as well as natural attenuation.

Short-Term Effectiveness. Potential short-term risks to workers for this alternative include those associated with the installation of the extraction and injection trenches and treatment system and exposure to ground water during sampling events.

Implementability. This alternative is highly implementable. Extraction and treatment systems are readily available. Permits would be required for the treatment system as well as well installation. As noted above, this approach may not ultimately be technically feasible as a result of successful removal actions associated with the treatability study (Appendix A).

Cost. The estimated cost for this alternative is $413,000 (Appendix D).

State and Community Acceptance. This alternative would likely be acceptable to the State but possibly less desirable to the local community due to the proposed residential nature of the redevelopment. Final determination of community acceptance would depend on comments received during the public comment period.

7.3.3 Alternative 3 – Monitored Natural Attenuation

The detailed analysis of Alternative 3 against the nine federal evaluation criteria is presented below and summarized in Table 12.

Overall Protection of Human Health and the Environment. This alternative would provide a high level of protection to human health and the environment. It is believed that ground water chemical concentrations at the source area are declining due to natural attenuation, as described above. Continued ground water monitoring would confirm remedial progress.

Compliance with ARARs. This alternative would meet the ARARs by verifying the stability and continued decrease in ground water concentration with the implementation of the ground water monitoring program. Potential exposure to ground water would be limited by the implementation of a deed restriction.

Long-Term Effectiveness and Permanence. This alternative would provide high long-term effectiveness. Natural attenuation would reduce chemical concentrations in ground water to concentrations that meet the RAOs. These reductions would be permanent as long as further contamination does not occur. Ground water monitoring would confirm remedial progress or warn of unexpected developments.

Reduction of Toxicity, Mobility, or Volume through Treatment. This alternative provides for reduction of TMV not through treatment but through natural attenuation.

Short-Term Effectiveness. Potential short-term risks for this alternative include those associated with exposure to ground water during sampling events.

Implementability. This alternative is highly implementable. Existing wells could be utilized for the ground water monitoring program, to the extent that they do not interfere with the planned redevelopment.

Cost. The estimated cost for this alternative is $104,000 (Appendix D).

State and Community Acceptance. This alternative would likely be acceptable to the State and local community. Final determination of community acceptance would depend on comments received during the public comment period.

7.3.4 Alternative 4 – Natural Attenuation with Land Use Restriction

The detailed analysis of Alternative 4 against the nine federal evaluation criteria is presented below and summarized in Table 12.

Overall Protection of Human Health and the Environment. This alternative would provide a moderate level of protection to human health and the environment, especially given the likely non-beneficial use of site ground water. As described above, it is possible that ground water chemical concentrations will decline due to natural attenuation. A deed restriction would be placed on ground water for purposes other than site remediation or construction dewatering, eliminating potential exposure.

Compliance with ARARs. This alternative would meet ARARs identified for the site. Exposure to ground water would be limited only to construction or remediation activities as per the deed restriction. Natural attenuation will potentially decrease chemical concentrations in ground water.

Long-Term Effectiveness and Permanence. This alternative would provide moderate long-term effectiveness. Natural attenuation would potentially reduce chemical concentrations in ground water to meet the RAOs. These concentration reductions would be permanent.

Reduction of Toxicity, Mobility, or Volume through Treatment. This alternative provides for potential reduction of TMV through natural attenuation.

Short-Term Effectiveness. This alternative is considered to have moderate to high effectiveness in the short term. Because no remedial action would be taken, there would be no short-term risk to the community or workers. Time would be required to implement a deed restriction in place, although it would be relatively short.

Implementability. As no actions other than implementing a deed restriction would be taken for this alternative, this alternative is highly implementable.

Cost. The estimated cost for this alternative is $52,000 including long term O&M in the form of administrative oversight (Appendix D).

State and Community Acceptance. This alternative would likely be acceptable to the State and local community, although it does not provide monitoring to ensure that natural attenuation is sufficiently reducing chemical constituents. Final determination of community acceptance would depend on comments received during the public comment period.

8.0 COMPARATIVE ANALYSIS OF ALTERNATIVES AND RECOMMENDATIONS

In this section, the alternatives are evaluated relative to one another for each criterion. The comparative analysis identifies the relative advantages and disadvantages of each alternative.

8.1 COMPARATIVE ANALYSIS OF SOIL/FILL MATERIALS ALTERNATIVES

The following subsections evaluate the alternatives for remediation of impacted soil. Table 11 summarizes the results of the comparative analysis of soil/fill materials alternatives.

8.1.1 Overall Protection of Human Health and the Environment

Alternatives 2, 3, and 4 provide the greatest overall protection to human health and the environment. All of the alternatives except Alternative 1 (No Action) provide adequate protection of human health. Risk through direct contact with impacted soil and fill materials, and inhalation of volatile constituents and asbestos fibers are sufficiently reduced and consistent with proposed future land use.

Alternatives 2, 3, and 4 employ excavation to remove the impacted soils and fill materials from areas where proposed land use will be unrestricted. Alternative 2 disposes of the impacted soil in a landfill, minimizing the potential for future exposure to the chemical constituents. Risks do exist associated with potential future landfill leakage or failure, or from transport of the materials.

Alternatives 3 and 4 consolidate the impacted soils and fill materials on site in an area with restricted future use, as implemented through appropriate land use restrictions. Clean fill would be placed on the consolidated soils to eliminate exposure through direct contact or inhalation. The chemical constituents in soil are generally not mobile and infiltration of surface water through the consolidated soils should not cause chemical constituents to leach into ground water. Alternative 4 addresses this issue by placing a cover of vegetation such as grass and non-intrusive, drought-tolerant shrubs on top of the consolidated berm in order to reduce excessive surface water infiltration into impacted soils.

8.1.2 Compliance with ARARs

With the exception of Alternative 1 (No Action), all of the alternatives meet the ARARs for the areas of the site that are deeded for unrestricted use.

8.1.3 Long-Term Effectiveness and Permanence

Alternative 2 would provide the highest level of long-term effectiveness and permanence because the impacted soils and fill materials would be excavated and disposed of off site, thereby leaving no significant residual risks and removing the potential for exposure by future residents at the development to hazardous substances in soil.

Both Alternatives 3 and 4 would be adequate and reliable because they would result in the removal and consolidation of impacted soils and fill materials in areas on site with restricted future use. The potential for residual risks from chemical constituents leaching into the ground water is minimal for Alternatives 3 and 4 because the chemical constituents in soil are generally not mobile; however, protection of human health would be achieved by placing clean fill on top of the consolidated waste materials.

Alternative 4 addresses the concern of future mobility of contaminants into the ground water by creating sloped surfaces that promote runoff of precipitation and placing thick vegetation on the berm, reducing precipitation/irrigation water infiltration to the impacted soils and fill materials. No remedial action would be conducted under Alternative 1; therefore, Alternative 1 would provide no long-term effectiveness or permanence.

8.1.4 Reduction of Toxicity, Mobility, or Volume through Treatment

None of the alternatives reduce the TMV of contaminants through treatment. In Alternative 2, the TMV of chemicals in on-site soil would be reduced through removal. The impacted soil would be disposed of at a landfill where the mobility would be reduced. Alternatives 3 and 4 locally reduce the volume of contamination by consolidating these materials at another location on or near the site, which will limit potential exposure to future residents.

8.1.5 Short-Term Effectiveness

Because no action would be taken with Alternative 1, there would be no short-term risk to the community or workers. However, protection from site risks and the RAOs would not be achieved. Alternatives 2 through 4 pose a greater risk to the community or workers due to the potential for generation of fugitive dust emissions and potential risk associated with exposure to workers and the community. However, engineering controls such as dust suppression, air monitoring, and appropriate personal protective equipment would be implemented to mitigate these concerns. Alternatives 2 and 3 also require roadway transportation of impacted material, thus increasing the potential for community exposure to impacted materials during transport.

8.1.6 Implementability

All four alternatives are implementable since only standard construction equipment and techniques are required.

8.1.7 Cost

Appendix D contains detailed cost estimates of Alternatives 1 through 4. The total present worth of each alternative is as follows:

- Alternative 1 - $0;
- Alternative 2 - $7,601,000;
- Alternative 3 - $2,358,000; and
- Alternative 4 - $1,598,000.

8.1.8 State and Community Acceptance

Alternative 1 would not be acceptable to the State or community because it is not protective of human health or the environment under the proposed land use. The Harbor Bay community would be unlikely to accept Alternative 3 due to the perception of health risks associated with reopening a closed disposal cell in close proximity to existing, occupied housing.

Alternatives 2 and 4 would likely be acceptable to the State and local community. Alternatives 2 and 3 require roadway transportation of impacted soil and fill materials to either a landfill or the North Parcel and could raise concerns within the community. Final determination of

community acceptance would depend on comments received during the public comment period.

8.2 COMPARATIVE ANALYSIS OF GROUND WATER ALTERNATIVES

The following subsections evaluate the alternatives for remediation of impacted ground water. Table 12 summarizes the results of the comparative analysis of ground water alternatives.

8.2.1 Overall Protection of Human Health and the Environment

Alternative 2 provides the greatest potential protection to human health and the environment by reducing ground water chemical concentrations at the source area through extraction and treatment. Continued ground water monitoring would confirm remedial progress. Alternative 3 would also provide a high level of protection to human health and the environment, because concentrations of chemicals in ground water may decline as a result of natural attenuation. Continued ground water monitoring (Alternatives 2 and 3) would confirm remedial progress. Given the generally nonvolatile nature of ground water chemicals, Alternatives 1 and 4 would also provide a high level of protection to human health and the environment. However, these alternatives provide for no monitoring to confirm remedial progress or warn of unexpected developments. Alternatives 2, 3, and 4 also limit exposure by placing a deed restriction on ground water usage.

8.2.2 Compliance with ARARs

Alternative 1 does not meet ARARs identified for the site because no effort would be taken to limit exposure to chemicals in ground water. Alternatives 2, 3, and 4 comply with the site ARARs for ground water.

8.2.3 Long-Term Effectiveness and Permanence

All of the alternatives would provide permanent long-term effectiveness. Natural attenuation (Alternatives 1, 3, and 4) or extraction and treatment (Alternative 2) would reduce chemical concentrations in ground water to concentrations that meet RAOs. Alternatives 2 and 3 would employ ground water monitoring to ensure that chemical constituents are declining and not migrating. Alternatives 1 and 4 do not provide monitoring to ensure that natural attenuation is reducing chemical constituents.

8.2.4 Reduction of Toxicity, Mobility, or Volume through Treatment

All of the alternatives provide for reduction of TMV through treatment. Alternative 2 provides for reduction of TMV through extraction with treatment as well as natural attenuation. Alternatives 1, 3, and 4 provide for reduction of TMV through natural attenuation.

8.2.5 Short-Term Effectiveness

Alternatives 1 and 4 are considered to have high effectiveness in the short term. Because no remedial action would be taken, there would be no short-term risk to the community or workers and little time would be required to complete these alternatives.

Alternative 3 is considered to have moderate to high effectiveness in the short term. Potential short-term risks for this alternative include those associated with exposure to ground water during sampling events. Alternative 2 is considered to have moderate effectiveness in the short term. Potential short-term risks for this alternative include those associated with the installation of the extraction and injection trenches and the treatment system as well as exposure to ground water during sampling events.

8.2.6 Implementability

As no remedial actions would be taken for Alternatives 1 and 4, these alternatives are highly implementable. Alternative 2 is highly implementable. Extraction and treatment systems are readily available and easily designed. Permits would be required for the treatment system as well as trench installations. Alternative 3 is highly implementable. Existing wells would be utilized for the ground water monitoring program.

8.2.7 Cost

Appendix D contains detailed cost estimates of Ground Water Alternatives 1 through 3. The total present worth of each alternative is as follows:

- Alternative 1 - $0;
- Alternative 2 - $413,000;
- Alternative 3 - $104,000; and
- Alternative 4 - $52,000.

8.2.8 State and Community Acceptance

As no actions would be taken to limit exposure to chemicals in ground water within the footprint of the former evaporation pond, Alternative 1 would not be acceptable to the State or community. Alternatives 2, 3 and 4 would likely be acceptable to the State and local community because treatment and/or implementation of land use restrictions are part of the remedy. Final determination of community acceptance would depend on comments received during the public comment period.

9.0 RECOMMENDED REMEDIAL ALTERNATIVE

The purpose of the detailed and comparative analysis presented in Section 8 is to provide a basis for determining the most appropriate responses for protecting human health and the environment and managing long-term risk. This section summarizes the results of the detailed and comparative analysis in Section 8, and recommends a preferred alternative based on the comparative analysis.

9.1 RECOMMENDED REMEDIAL ALTERNATIVE FOR SOIL/FILL MATERIALS

Based on comparisons of the rankings relative to the evaluation criteria, Alternative 4 (on-site consolidation in eastern boundary berm) emerged as the recommended remedial alternative for the impacted soil and fill materials at the site. Under this alternative, fill materials within the areas of concern (former evaporation pond and other locations identified during the demolition phase of construction) would be excavated and consolidated on site in the construction of an engineered berm along the eastern boundary of the site. Appropriate land use restrictions limiting access to and the use of the bermed area would be negotiated with DTSC under a Land Use Covenant.

Selection of this alternative is based primarily on its protectiveness of human health and the environment, demonstrated effectiveness, consistency with future land use, cost-effectiveness, and ease and speed of implementation, as summarized below and in Table 11.

A comparison of the alternatives evaluation indicates the following:

- Alternatives 2, 3, and 4 satisfy the threshold criteria of overall protection of human health and the environment and compliance with ARARs.
- Alternatives 2, 3, and 4 provide a high level of long-term effectiveness and permanence. Alternative 2 ranks slightly higher than Alternatives 3 and 4 in terms of long-term effectiveness and permanence because all impacted soils and fill materials would be permanently removed from the site and the potential for exposure to future residents at the site would be reduced.
- None of the alternatives reduce TMV through treatment.

- Alternatives 2, 3, and 4 are similarly ranked in terms of implementability.
- Alternatives 2 and 3 require roadway transportation of contaminated soils and fill materials, increasing the risk of accidental exposure to the public and rank lower than Alternatives 1 and 4 in terms of short-term effectiveness.
- Alternative 4 ranked higher than Alternatives 2 and 3 in terms of State and community acceptance. Roadway transportation of fill materials would be required for Alternatives 2 and 3, resulting in increased road noise and contributing to traffic congestion. These issues would likely meet with significant community resistance. Additionally, the Harbor Bay and adjacent communities would be unlikely to accept Alternative 3 due to the perception of health risks associated with reopening a closed disposal cell in close proximity to existing, occupied housing.
- The cost of implementing Alternative 4 is much lower than the cost of implementing Alternatives 2 or 3.

Alternative 4 is the most suitable remediation remedy for impacted soil and fill materials at the site. While Alternative 2 was ranked higher in terms of long-term effectiveness, it was significantly lower in cost effectiveness and also ranked lower in terms of community acceptance and short-term effectiveness.

A detailed plan for implementing this alternative will be outlined in the RDIP and will include a comprehensive confirmation sampling program, and a strategy for air monitoring and dust suppression during the construction phase. In addition, the RDIP will contain a complete plan detailing the design and construction requirements of the berm as well as future land use restrictions and maintenance requirements. These restrictions will include:

- Specifically prohibited uses (e.g., residences, hospitals, day-care centers, etc.) and activities (e.g., raising food, ground water use, etc.);
- Implementation of a Soil Management Plan and O&M Plan addressing activities that may disturb the berm;
- Notification to and approval from DTSC for any activities that may impact the integrity of the berm; and
- Provision of access to DTSC for evaluation of the berm.

The O&M Plan will be implemented, and updated as necessary, by PRPLLC or other parties that subsequently assume responsibility for

maintenance of the berm, and will include a detailed description of the berm and related features (e.g., limits and grading profile, surface drainage control, survey monuments, and permanent irrigation system). Additionally, the O&M Plan will specify monitoring and maintenance procedures and schedules, and will specify the necessary training and qualifications for monitoring personnel. Monitoring and maintenance procedures (and repairs, as necessary) will address the following:

- Vegetation;
- Erosion control;
- Animal intrusion;
- Drainage system;
- Settlement;
- Permanent irrigation system;
- Fencing; and
- Slope failure.

9.2 RECOMMENDED REMEDIAL ALTERNATIVE FOR GROUND WATER

Based on comparisons of the rankings relative to the evaluation criteria, Alternative 4 (Natural Attenuation and Deed Restriction) is the recommended remedial alternative for impacted ground water at the site. Alternative 4 consists of natural subsurface concentration reduction processes and placing a deed restriction prohibiting the use of ground water for purposes other than site remediation or construction dewatering. Selection of this Alternative is based primarily on demonstrated effectiveness at numerous sites with comparable chemical constituents and hydrogeologic conditions (and based on overall reductions in organic chemical concentrations over time at this site), consistency with future land use, cost-effectiveness, and the ease and speed of implementation, as summarized below and in Table 12.

A comparison of the alternatives evaluation indicates the following:

- Alternatives 2, 3, and 4 satisfy the threshold criteria of overall protection of human health and the environment and compliance with ARARs.
- Alternatives 2, 3, and 4 are ranked similarly in terms of long-term effectiveness and permanence.

- Because no monitoring would be conducted, Alternative 4 ranks slightly lower than Alternatives 2 and 3 in terms State and community acceptance.
- Because physical treatment is used, Alternative 2 ranks slightly higher than Alternatives 3 and 4 in terms reduction of TMV through treatment.
- Because no additional equipment or conveyance piping is needed, Alternatives 3 and 4 rank higher than Alternative 2 in terms of short-term effectiveness and implementability.
- The cost of implementing Alternative 4 is significantly less than cost of implementing Alternatives 2 and 3.

Alternative 4 is the most suitable remediation remedy for impacted ground water at the site. Alternative 4 is the most cost-effective alternative that also meets all remediation goals. Given the localized nature of impacts to ground water, and the effectiveness of the treatability study in removing a significant volume of free product, this alternative is reasonable and appropriate.

As described in Section 6.3.3 of this document, a post-removal action ground water investigation component will be implemented to determine the appropriateness of this alternative. This investigation will include ground water grab sampling within the footprint of the former evaporation pond (following pond backfilling and compaction) to evaluate concentrations of VOCs related to TPH in ground water. If the investigation demonstrates that VOCs concentrations in ground water do not exceed the applicable remedial objectives, as defined in Section 5 of this document, Alternative 4 will be implemented in accordance with the program defined above. Alternatively, if VOCs concentrations are found to exceed one or more of the applicable remedial objectives, then Alternative 3 – *Monitored Natural Attenuation*, will be implemented in accordance with the program defined above.

9.3 DISCUSSION OF RECOMMENDED ALTERNATIVES

As indicated above, the recommended remedies for the site include (1) consolidating asbestos- and petroleum hydrocarbon-impacted soil/fill materials into an eastern boundary berm, and (2) implementing a land use restriction for ground water, prohibiting its use for anything other than remediation or construction dewatering activities, and allowing the residual chemicals to naturally attenuate. Each of the RAOs established

for the site are effectively met by implementing these remedies. Additionally, by implementing the soil/fill materials remedial alternative, the primary source of TPH and low concentrations of VOCs is removed, providing further assurance against potential exposure to chemicals in ground within the former evaporation pond and against further degradation of ground water from those chemicals. As described above, the necessity for ground water monitoring to demonstrate that natural attenuation is effectively reducing chemical constituents in ground water will be evaluated pursuant to implementation of a post-removal action ground water investigation.

10.0 IMPLEMENTATION SCHEDULE

A detailed schedule for implementation of the proposed remedy will be coordinated between PRPLLC and DTSC. A tentative schedule for implementation of the remedy following formal DTSC approval of this RAP, based on the schedule presented in the existing VCA, is summarized in the following table.

Activity	Tentative Start Date	Tentative Completion Date
Remedial Design and Implementation Plan Preparation	12/27/05	7/14/06
Permitting	6/01/06	7/14/06
Remedy Implementation	7/17/06	8/25/06
Implementation Report Preparation	8/28/06	9/8/06
Deed Restriction Development	8/1/06	9/15/06
Operation & Maintenance Agreement Development	8/01/06	9/15/06
DTSC Certification	9/15/06	10/01/06

11.0 PUBLIC INVOLVEMENT

The California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) held a 30-day comment period from February 2, 2006 to March 3, 2006 for the Draft RAP and for the proposed California Environmental Quality Act (CEQA) Negative Declaration and Initial Study for the Harbor Park Development. A public notice was placed in the Contra Costa Times and the Lel Mensojero on February 2, 2006. The notice announced the comment period, the date and time of a public meeting and the location of the information repositories. A fact sheet that discussed the Draft RAP, announced the public meeting and comment period was mailed on January 31, 2006 to the Site mailing list as well as the DTSC mandatory mailing list. The Site mailing list consists of approximately 1,100 addresses that include residents, key contacts, and businesses within a one half-mile radius of the site.

On February 16, 2006, DTSC held a public meeting on the Harbor Park Development Draft RAW. The purpose of the meeting was to provide information regarding the Draft RAP and proposed Negative Declaration and Initial and to provide the public with an opportunity to comment on these documents. DTSC addressed all the comments in Appendix E – Responsiveness Summary.

12.0 NON-BINDING PRELIMINARY ALLOCATION OF RESPONSIBILITY

DTSC has prepared a Nonbinding Allocation of Responsibilities for the site (NBAR). PRPLLC and Johns Manville are assigned to 100% of the liability (Appendix F).

Notes:

ft bgs = Feet below ground surface

< 0.1 Compound not detcted at or above stated Method Detection Limit

mg/kg Milligrams per kilogram (parts per million)

NA = Not analyzed

PCBs = Polychlorinated biphenyls

BTEX = Benzene, toluene, ethylbenzene, xylenes

* = Arochlor-1248

** = All "36" samples were collected by a Sensible Environmental Solutions (SES) representative onsite to collect representative samples of asbestos material. A summary of SES' findings is provided in Appendix A.

Volatile organic compounds were detected in only one sample, MW-02 on 3/25/1991 (1,1-Dichloroethane at 0.001 mg/kg and trichloroethylene at 0.038 mg/kg)

Table 2
PAHs Detected in Soil Samples

Notes:

* =	Aroclor-1248
** =	This sample contained 750,000 mg/kg TRPH and 100,000 mg/kg HBP Hydrocarbons
< 50	Constituent not detected at or aboave
NA =	Not Analyzed
ND =	Not detected at or above Method Detection Limit
NR =	Not Reported
PCBs =	Polychlorinated Biphinyls
CCL =	Carbon Tetrachloride
CF =	Chloroform
µg/L	Micrograms per liter (parts per billion)
>10 µm	Fibers greater than 10 micrometers
MLF	Million fibers per liter

Notes:

PAHs =	Polycyclic Aromatic Hydrocarbons
NA =	Not Analyzed
< 2.0	Compound not detected at or above stated Method Detection Limit
µg/L	Micrograms per liter (parts per billion)

Abbr	Chemical
2-MN =	2-Methylnaphthalene
NAP =	Naphthalene
1,3-DCB =	1,3 Dichlorobenzene
1,4 & 1,2 -DCB =	1,4 & 1,2 Dichlorobenzene
CB =	Chlorobenzene
2,4-DMP =	2,4 Dimethylphenol
2-MP =	2-Methylphenol
4-MP =	4-Methylphenol
2,4,6 TCP =	2,4,6 Trichlorophenol
2,4 DNT =	2,4 Dinitrotoluene
HCB =	Hexachlorobutadiene

ERM believes that the large concentrations of some metals and minerals detected during pre-1992 sampling events are anomolous or are indicative of unfiltered samples. These concentrations are also inconsistent with more recent sampling results for which we know the sampling pr and method.

Table 8
Site Conceptual Model
Johns Manville Exposure Pathway Analysis
Pittsburg, California

Primary Sources (Constituent Types)	Primary Release Mechanism	Secondary Sources	Secondary Release Mechanism	Tertiary Release Mechanism	Exposure Medium	Exposure Route	Potential Human Receptors				
							Current Site User[1]	Future Construction Worker/Utility Worker[2]	Future Commercial Worker (e.g., Building Maintenance Worker)	Future Landscape[3] Maintenance Worker	Future Resident[4]
Industrial Activities (Asbestos, VOCs, PAHs, PCBs, Total Petroleum Hydrocarbons, and Heavy Metals)	Ground Water		Volatile Emissions		Air	Inhalation (Indoor)	I	I	C	I	C
						Inhalation (Outdoor)	I	C	C	C	C
						Inhalation (Trench)	I	C	I	I	I
					Groundwater	Incidental Ingestion	I	C	I	I	I
						Dermal Contact	I	C	I	I	I
	Waste Disposal in evaporation pond and asbestos storage area	Soil/fill	Dust		Air	Inhalation	I	C	C	C	C
			Volatile Emissions		Air	Inhalation (Indoor)	I	I	C	I	C
						Inhalation (Outdoor)	I	C	C	C	C
						Inhalation (Trench)	I	C	I	I	I
						Ingestion	I	C	C	C	C
						Dermal Contact	I	C	C	C	C

Notes:
1 = All site buildings are vacant and security fencing/systems preclude trespassers.
2 = The ground water table is 8 ft bgs, presenting potential risks via inhalation, dermal, and incidental ingestion. However, ground water is not a potable drinking water source.
3 = Landscaping is typically performed 0-2 feet below grade and may generate airborne dust.
4 = Human activity will disrupt surface soil and potentially generate airborne dust. In addition, newly constructed homes may be impacted by volatile organic compounds migrating through the soil and into the overlying structures.
VOCs have been detected in Site soil and/or ground water.
C = Complete exposure pathway
I = Incomplete exposure pathway
NE = Not Evaluated; Off-site soil investigations have not been performed

Table 9
Soil and Fill Materials Remedial Technologies and Process Options
Pittsburg River Park LLC
Former Johns Manville Plant
Pittsburg, California

General Response Action	Remedial Technology	Process Option	Description	Effectiveness	Implementability	Cost	Summary of Screening
No Action	No Action	None	No institutional controls or treatment.	Not effective for protecting human health and environment.	Implementable but not acceptable to the general public or government agencies.	None	Required as a baseline for comparison by the National Contingency Plan. Retained
Institutional Controls / Limited Action	Institutional Control	Deed Notification /Restriction	Implement deed notification to inform future owners of the presence of potentially hazardous substances at the site and /or implement deed restriction to restrict future use of site.	Effectiveness for protection of human health would depend on enforcement of and compliance with deed restrictions	Technically implementable. Specific legal requirements and authority would need to be met.	Low capital	Not consistent with proposed future land use. Not retained.
	Access Control	Fencing /warning signage	Construct or maintain existing site fencing and signage to control site access by the general public thereby reducing potential exposure to contaminants	Effective for reducing exposure risk to the general public provided fencing and signage is maintained in the long term.	Technically implementable but not consistent with proposed future land use.	Low capital.	Not consistent with proposed future land use. Not retained.
In Situ Soil Treatment	Biological Treatment	Bioventing	Oxygen is supplied through direct low-flow air injection into residual contamination in soil.	Effective for petroleum hydrocarbons and non-halogenated VOCs. Generally ineffective for halogenated VOCs.	Technically implementable. Monitoring of off-gasses at ground surface may be required .	Low capital and O&M. Low cost relative to other in situ options.	Potentially applicable for VOC removal in soils. Does not address the fill material or ACM. Not retained.
		Enhanced Bioremediation	Stimulation of naturally occurring microbes by circulating water-based solutions through the contaminated soils to enhance in situ biological degradation of organic contaminants or immobilize inorganic contaminants.	Effective for VOCs, SVOCs, PAHs, and petroleum hydrocarbons.	Technically implementable. However, optimal distribution of water/nutrients in unsaturated zone may be difficult to achieve. Circulation of water/nutrients may encourage contaminant mobility and impact to groundwater.	High capital. Moderate O&M. High cost relative to other in situ options	High cost relative to competing technologies. Not retained.
		Natural Attenuation	Natural biotransformation processes such as volatilization, biodegradation, adsorption, and chemical reactions with soil materials can reduce contaminant concentrations to acceptable levels.	Generally not effective for reducing risk to human health and ongoing threats to groundwater	Technically implementable. Generally not perceived as an acceptable response by the local community or government agencies	Negligible capital. Low O&M. Low cost relative to other in situ options	Generally not acceptable to the State or local community. Not retained
		Phytoremediation	Process that uses plants to remove, transfer, stabilize, and destroy contaminants in soil.	Still in the demonstration phase. Potentially effective for metals, solvents, and petroleum hydrocarbons	Technically implementable, but inconsistent with proposed future land use. Emerging technology still in the demonstration stage and generally unfamiliar or unacceptable to governmental regulators.	Low capital and O&M. Low cost relative to other in situ options	Inconsistent with proposed future land use. Not retained.
	Physical/Chemical Treatment	Soil Flushing	The extraction of contaminants from soil with aqueous solution accomplished by passing fluid through in-place soils using an injection or infiltration process. Extraction fluids must be recovered from underlying aquifer.	Effective for VOCs and inorganic chemicals. Presence of fine grained soils limits effectiveness.	Technically implementable. However, there has been little commercial application. Regulatory concerns over potential to wash contaminants beyond fluid capture zones and introduction of surfactants in to the subsurface make permitting difficult.	High capital and O&M. High cost relative to other in situ options	High cost relative to competing technologies. Not retained.
		Soil Vapor Extraction	Vacuum is applied through extraction pipes to create a pressure/concentration gradient in impacted areas, which induces gas-phase volatiles to diffuse through soil to extraction wells. The process includes a system for treating off-gas. Air flow also induces aerobic bioremediation of petroleum hydrocarbons.	Effective for VOCs in granular soils. Presence of fine grained soils reduces effectiveness.	Technically implementable. Application of technology is well understood.	Low capital - systems already in place at source areas. Moderate O&M. Moderate cost relative to other in situ options	Potentially applicable for VOC removal in soils. Does not address the fill material or ACM. Not retained.
		In Situ Vitrification	Uses an electric current to melt soil at extremely high temperatures and thereby immobilize most inorganics and destroy organic pollutants by pyrolysis.	Effective for SVOCs and inorganic chemicals. Less effective for VOCs, and not effective for fuels.	Technically implementable. Resulting fused material in subsurface could interfere with redevelopment plans and future land use	Very high capital. Low O&M. High cost relative to other in situ options	Limited effectiveness for VOCs. High cost relative to competing technologies. Not retained.
		Thermally Enhanced Soil Vapor Extraction	Uses electrical resistance, electromagnetic, or hot-air/steam injection to increase the volatilization rate of semivolatiles and facilitate extraction.	Enhancement technology effective in soils with high moisture content. Effective for mobilizing SVOCs. Limited added benefit for VOCs	Technically implementable. However, implementation would require replacement of existing SVE wells with heat resistant wells.	High capital. Moderate O&M. High cost relative to other in situ options	High cost relative to competing technologies. Not retained.
Removal	Removal/Off-Site Disposal	Excavation	Excavation of impacted material with disposal at an off-site location	Effective for complete range of contaminant groups.	Technically implementable in some areas. Pretreatment of excavated material may be required to meet land disposal restrictions.	Moderate to high capital. Negligible O&M. High cost relative to competing technologies.	Potentially applicable. Retained.

Table 9
Soil and Fill Materials Remedial Technologies and Process Options
Pittsburg River Park LLC
Former Johns Manville Plant
Pittsburg, California

General Response Action	Remedial Technology	Process Option	Description	Effectiveness	Implementability	Cost	Summary of Screening
Off-site management	Land disposal	Landfill	Disposal of impacted material at a permitted, off-site landfill	Effective for complete range of contaminant groups.	Technically implementable. Impacted material must be profiled and meet land disposal restrictions. Pre-treatment may be required if material does not meet restrictions.	High capital depending on types of waste present. Negligible O&M	Potentially applicable disposal option for excavated materials. Retained.
On-site management	Consolidation	Landfill	Consolidation and capping of impacted fill material on site at the North Parcel.	Effective for complete range of contaminant groups in proposed unrestricted land use areas. Effective for preventing exposure. Less effective than land disposal for protection of groundwater	Technically implementable.	Moderate capital costs. Low O&M. Groundwater monitoring may be required to ensure contaminants are not impacting groundwater.	Potentially applicable disposal option for excavated materials. Retained.
		Landfill	Consolidation of impacted fill material on site in a berm consisting of engineered storage cells.	Effective for complete range of contaminant groups in proposed unrestricted land use areas. Effective for preventing exposure. Limits infiltration and leachate formation, but less effective than land disposal for protection of groundwater	Technically implementable.	Moderate capital costs. Low O&M. Groundwater monitoring may be required to ensure contaminants are not impacting groundwater.	Potentially applicable disposal option for excavated materials. Retained.
Ex Situ Soil Treatment	Biological Treatment	Biopiles	Excavated soils are mixed with soil amendments and placed on a treatment area that includes leachate collection systems and some form of aeration.	Solid-phase (soil) process is most effective for non-halogenated VOCs and fuel hydrocarbons. Not effective for some halogenated VOCs and SVOCs	Difficult to implement. Treatment area may require complete enclosure. Addition of amendment material results in volumetric increase in treated material. Leachate and off-gas may require treatment.	Moderate capital and O&M. Moderate cost relative to other ex situ biological technologies	Difficult to implement and high cost relative to other competing technologies. Does not address the fill material or ACM. Not retained
		Composting	Controlled biological process by which excavated soils are mixed with bulking agents and organic amendments to enhance microorganism conversion of organic contaminants to innocuous, stabilized byproducts.	Most effective for treatment of fuels and PAHs. Moderately effective for treatment of halogenated VOCs.	Difficult to implement. Treatment area may require complete enclosure. Addition of amendment material results in volumetric increase in treated material. Off-gas may require treatment.	Moderate capital and O&M. High cost relative to other ex situ biological technologies	Difficult to implement and high cost relative to other competing technologies. Does not address the fill material or ACM. Not retained
		Slurry Phase Biological Treatment	The controlled treatment of excavated soil in a bioreactor, where the contaminated soil is maintained in suspension with water and mixed with nutrients and oxygen.	Effective for treatment of non-halogenated VOCs and SVOCs. Treatment of halogenated compounds requires addition of specially adapted cometabolite organisms	Difficult to implement. Sizing (sorting) of heterogeneous materials prior to treatment, dewatering of fine grained material after treatment, and treatment of resulting wastewater can be difficult and expensive.	High capital and O&M. High cost relative to other ex situ biological technologies	Difficult to implement and high cost relative to competing technologies. Not retained
	Physical/Chemical Treatment	Chemical Reduction / Oxidation	Oxidizing/reducing agents are added to soils to convert hazardous contaminants to compounds that are less toxic, more stable, or inert. Dehalogenation processes rely on reagents and heating in a reactor to dechlorinate halogenated VOCs.	Most effective for inorganics. Less effective for non-halogenated organic chemicals. Effectiveness can be limited by incomplete dechlorination and breakdown of chlorinated compounds to daughter compounds with greater mobility and toxicity than parent compounds.	Technically implementable. Not recommended for waste with high contaminant concentrations because of the large amounts of oxidizing/reducing agent required	High capital. Low O&M. High cost relative to other ex situ physical/chemical technologies	High cost relative to competing technologies. Not retained
		Soil Washing	Wash soil with water-based surfactants, detergents, acids, etc., to remove chemicals from soil particles. Treat or dispose of high chemical concentration residuals fluids.	Most effective for inorganic chemicals, SVOCs and fuels. Less effective for VOCs. Removal of organics adsorbed to clay-sized particles may be difficult	Difficult to implement for complex waste mixtures. Complex mixtures of contaminants can make formulation of washing fluids difficult. Residuals may be difficult to extract from matrix and may require additional treatment/disposal.	High capital and O&M. High cost relative to other ex situ physical/chemical technologies	Difficult to implement. Difficult to formulate washing fluids for complex waste mixtures. Soils may remain toxic due to difficulty extracting residual fluids. High cost relative to competing technologies. Not retained.
		Incineration	High temperatures, 871-1,204 ^{o} C (1,600-2,200 ^{o} F), are used to combust (in the presence of oxygen) organic constituents in hazardous wastes.	Effective for removing/destroying chlorinated hydrocarbons. Not effective for inorganic chemicals.	Technically implementable. Incineration would be accomplished at a permitted off-site facility.	High capital and high O&M. High cost relative to other ex situ technologies	High cost relative to competing technologies. Not retained.
		Thermal Desorption	Wastes are heated within a continuous flow reactor to 320 to 560 ^{o} C to volatilize organic contaminants. A carrier gas or vacuum system transports volatilized organics to the gas treatment system.	Effective for VOCs, SVOCs and fuels. Fine grained soils increase treatment time as a result of binding of contaminants to soil.	Technically implementable. However, particles size screening, dewatering to achieve acceptable moisture content, and off-gas treatment may be required.	High capital. High O&M. Lower cost than incineration.	High cost relative to competing technologies. Extensive preparation for treatment will be required. Not retained.

Notes:
Shading indicates Process Option not retained
O&M = operation and maintenance
PAH = polycyclic aromatic hydrocarbon
SVE = Soil Vapor Extraction
SVOC = semivolatile organic compound
VOC = volatile organic compound

Table 10
Ground Water Remedial Technologies and Process Options
Pittsburg River Park LLC
Former Johns Manville Plant
Pittsburg, California

General Response Action	Remediation Technology	Process Option	Description	Effectiveness	Implementability	Cost	Summary of Screening
No Action	No Action	None	No institutional controls or treatment.	No way to determine the progress of natural attenuation.	Implementable but generally not acceptable to the general public or government agencies.	None	Required as a baseline for comparison by the National Contingency Plan. Retained
Institutional Controls / Limited Action	Institutional Control	Deed Notification /Restriction	Implement deed notification to inform future owners of the presence of potentially hazardous substances at the site and /or implement deed restriction to restrict future use of site.	Effectiveness for protection of human health would depend on enforcement of and compliance with deed restrictions	Technically implementable. Specific legal requirements and authority would need to be met.	Low capital	Potentially Applicable. Retained.
	Long term monitoring	Ground water monitoring	Long term gauging and sampling of monitoring well network to assess plume stability and contaminant concentration trends over time.	Effective for tracking plume migration over time.	Technically implementable. Monitoring well network already established at and surrounding the site.	Negligible capital. Moderate O&M.	Potentially applicable in combination with other technologies. Retained
Containment	Physical ground water barrier	Low Permeability Wall	Construction of a low-permeability vertical barrier to restrict ground water flow and contaminant migration in the downgradient direction. Long-term monitoring of containment structure required.	Effective for containing impacted ground water, diverting impacted ground water from drinking water intake, or providing a barrier for ground water treatment systems.	Technically implementable. Application of technology is well understood.	High capital. Negligible O&M.	High cost relative to competing technologies. Not retained
In Situ Ground Water Treatment	Monitored Natural Attenuation	Intrinsic Bioremediation	Reduction of dissolved concentrations through naturally occurring processes such as dilution, volatilization, biodegradation, or adsorption. Sampling and analysis of ground water sample for indicators of natural attenuation is generally included.	Effective for fuel hydrocarbons, and halogenated and non-halogenated VOCs. Previous studies indicate that natural attenuation is occurring at the site.	Technically implementable. Monitoring well network already established at site.	Negligible capital. Moderate O&M. Low overall cost relative to active remediation options.	Potentially applicable. Retained.
	Thermal Treatment	Steam Heating	Steam heating involves the installation of a series of steam injection wells within the ground water treatment area. Steam is generated in a boiler on site and injected at the wells, which gradually raises the temperature of the ground water and soil. This technology also uses an SVE system to control buildup of volatilized contaminants and non-condensable gases.	Effective for fuels and SVOCs and VOCs.	Technically implementable. SVE would be required to capture steam and vaporized contaminants. High temperatures will require destruction of existing ground water vapor and monitoring wells and installation of heat resistant wells.	High capital and O&M. High cost relative to other in situ options	High cost relative to competing technologies. Not retained
	Physical Treatment	In-well air stripping	In-well aerators perform air stripping of ground water within the well. Ground water is not removed from the well, but is circulated between an upper and lower screen in the well. Stripped volatile compounds enter the vapor phase and are recovered by vapor extraction.	Effective for halogenated and non halogenated VOCs, SVOCs and fuels. Cost effective in areas with deep water tables because impacted ground water does not have to be pumped to surface.	Technically implementable. However, based on experience with above ground air strippers, iron fouling may make stripping wells unusable within a brief timeframe. Pilot testing would be required to demonstrate implementability.	Moderate capital. Low O&M. Moderate cost enhancement option	Potentially applicable for impacted ground water in source areas. Pilot testing required to demonstrate effectiveness and implementability. Retained.
		Air Sparging	Air is injected into the saturated zone to induce mechanical stripping and volatilization of contaminants. Introduction of oxygen also enhances biodegradation. SVE is required to capture vapor phase contaminants	Effective for VOCs and fuels.	Technically implementable. The presence of the clay or tight formations inhibits vertical flow and limits recovery of stripped VOCs in some source areas.	Moderate capital. Low O&M. Moderate cost relative to other in situ treatment options	May be applicable in combination with installation of vent wells to penetrate clayey silt layer. Retained
In Situ Ground Water Treatment (continued)	Biological Treatment	Enhanced Aerobic Bioremediation	Injection of oxygen or oxygen-releasing material into or upgradient of the contaminated zone to enhance degradation of organic compounds through respiration.	Effective for non-halogenated VOCs, SVOCs, and fuels. More effective for dichloroethene and vinyl chloride. However, may not be effective because of high soil oxidant demand.	Technically implementable. Most case studies indicate application requires a dense injection grid. Consequently this option is difficult to implement in areas occupied by historical buildings and structures or off-site developed areas.	High capital. Low O&M. High cost relative to other in situ treatment options	May not be effective because of high soil oxidant demand. Higher cost than competing alternatives and difficult to implement in developed areas. Not retained

Table 10
Ground Water Remedial Technologies and Process Options
Pittsburg River Park LLC

Pittsburg, California

General Response Action	Remediation Technology	Process Option	Description	Effectiveness	Implementability	Cost	Summary of Screening
Collection/Ex Situ Treatment	Ground water pumping	Extraction wells or trenches	Ground water pumping using extraction wells or trenches. Objectives of ground water extraction include removal of dissolved contaminants from the subsurface and containment of contaminated ground water to prevent migration	Effective for plume containment and source area migration control.	Technically implementable. Groundwater must be treated prior to reinjection.	Moderate capital. Moderate O&M. Treatment of Groundwater is required as well as continued monitoring.	Potentially applicable for contaminant mass removal in source areas and South Plume migration control. Retained.
	Chemical/Physical Treatment	Air Stripping	Extracted water is passed downward against a stream of rising air. The countercurrent stream of air strips VOCs from the water. The resulting VOC laden air is treated following removal from the vessel, if required.	Effective for removal of VOCs from extracted ground water. Not effective for inorganic chemicals or organic compounds with low volatility	Technically implementable. Treatment of off-gas may be required.	High O&M. Moderate cost relative to other ex situ treatment options.	Applicable for treatment of VOCs dissolved in ground water but not suitable for compounds with low volatility. Not Retained.
		Liquid-phase carbon adsorption	Extracted water or vapor is passed through vessels containing granular activated carbon. Organic compounds with an affinity for carbon are transferred from the aqueous or vapor phase to the solid phase by sorption to the carbon.	Most effective for hydrocarbons and SVOCs. Less effective for halogenated VOCs	Technically implementable.	Moderate capital. High O&M.	Applicable for treatment of extracted ground water. Retained.
		UV Oxidation /reduction.	UV light and/or oxidizing chemicals (e.g., hydrogen peroxide) can be used to destroy organic constituents.	Effective for most organic compounds including petroleum hydrocarbons and halogenated VOCs.	Technically implementable.	High capital and moderate O&M. High cost relative to other ex situ treatment options	Higher cost than competing technologies. Not retained.
	Biological Treatment	Bioreactor contact Beds	Water is passed through a reactor vessel that contains a fixed bacterial film. Contaminants are aerobically degraded by the bacteria as the water passes through the reactor vessel.	Effective for fuel hydrocarbons and SVOCs. Treatment of halogenated compounds may require addition of specially adapted cometabolite organisms	Technically implementable. However, sustaining microbial populations can be difficult.	High capital and moderate O&M. High cost relative to other ex situ treatment options	Higher cost than competing technologies. Not retained.
Disposal	Off-site Disposal	Discharge to Publicly-Owned Treatment Works (POTW)	Discharge of extracted ground water to the sanitary sewer for conveyance to a local POTW for treatment and discharge.	Effective for disposal of extracted ground water.	Technically implementable. Requires sampling to ensure compliance with permit discharge standards. Treatment may be required prior to discharge.	Negligible capital. Low O&M.	Treatment would be required prior to disposal of extracted ground water. Not Retained.
	On-Site Disposal	Injection wells	Discharge of extracted ground water back into aquifer using injection wells	Effective for disposal of extracted ground water.	Technically implementable. Permits can be difficult to obtain.	Moderate capital. Low O&M.	More costly than POTW discharge. Not retained.

Notes:
Shading indicates Process Option not retained
O&M = operation and maintenance
POTW = Publically owned treatment works
SVE = Soil Vapor Extraction
SVOC = semivolatile organic compound
UV = ultra violet
VOC = volatile organic compound

Appendix A
Treatability Study Report

The following information describes activities associated with planning, implementing, maintaining, and documenting the effectiveness of the Vacuum Enhanced Extraction (VEE) Treatability Study (treatability study) for the fill materials within the former evaporation pond. This information is presented pursuant to the *Project Reporting* section of the DTSC-approved *Final Treatability Study Workplan*, prepared by ERM-West, Inc. (ERM) and dated 18 May 2005.

The treatability study for petroleum hydrocarbons found in fill materials and ground water within the former evaporation pond focused on removal of nonaqueous-phase liquid (NAPL) using VEE, while enhancing the natural biodegradation of residual petroleum hydrocarbons. This process entailed applying a vacuum through wells near what is understood to be the source of heavy petroleum hydrocarbons within fill materials in the central portion of the former evaporation pond. The intended effect of this system was to:

- Enhance the mobility of petroleum hydrocarbons and to periodically remove accumulated NAPL from wells;
- Promote biodegradation of residual petroleum hydrocarbons in the soil through increased subsurface airflow; and
- Mobilize incidental volatile constituents of the petroleum hydrocarbons and treat them through granular activated carbon (GAC) before discharge to the atmosphere.

The components of the completed VEE program include:

- Installation of 39 extraction wells, manifolded with suitable above-ground soil vapor extraction (SVE) piping network;
- Application of a low-level vacuum using a 1,000 cubic feet per minute (cfm) blower skid to enhance product collection/accumulation at the extraction wells;
- Weekly removal and off-site disposal of total fluids from each well (i.e., standing water and collected NAPL) using a vacuum truck;
- Operation and monitoring of the VEE system for permit compliance as well as biological degradation parameters; and
- Implementation of a NAPL skimmer pump in an effort to focus NAPL recovery from selected wells, which continued to yield limited quantities of free-phase hydrocarbons.

Details for the system are presented below. All work described herein was conducted under a site-specific Health and Safety Plan (HASP) prepared in accordance with Title 8, Section 5192, of the California Code of Regulations.

PRE-FIELD ACTIVITIES

Prior to implementing the treatability study pursuant to DTSC approval, ERM coordinated all permitting and site clearance activities. ERM applied for and received permits from Contra Costa County Health Services Department, Hazardous Materials Programs, to construct the vapor extraction wells. In addition, we applied for and received a permit to construct and operate the SVE system from the Bay Area Air Quality Management District.

ERM also coordinated and implemented the performance of a survey at the well locations by a licensed underground utilities location contractor. ERM prepared a site-specific HASP addressing physical and chemical hazards associated with the specific scope of work. All ERM employees, subcontractors, and other site visitors were required to review and comply with the HASP prior to entering the work zone. Additionally, ERM performed daily "tailgate" health and safety meetings to address planned activities prior to implementing daily site work.

SYSTEM INSTALLATION

ERM installed 39 vapor extraction wells on 50-foot centers and approximately 3,500 feet of conveyance piping. Based on the composition of fill materials and distribution of NAPL within the former evaporation pond, as presented in ERM's March 2005 *Data Summary Report*, ERM constructed the extraction well network so as to maximize potential recovery of separate-phase petroleum hydrocarbons. A cross section identifying typical well construction relative to fill thickness and extent of petroleum hydrocarbon impacts is presented in Figure A-1. A skid-mounted blower, knockout vessel, and the GAC vessels were located inside the warehouse to minimize site disruptions. A process flow diagram of the system is presented in Figure A-2. The final layout of the wells, piping, and equipment is shown in Figure A-3. During the initial startup, perimeter noise data emanating from the VEE blower was collected. To alleviate the potential noise nuisance to site neighbors, a sound enclosure was installed. Subsequently, noise data with the sound enclosure in place indicated that noise levels were reduced satisfactorily.

Maximum depth of extraction wells, dependent upon the factors described above, ranged from approximately 20 to 25 feet below ground surface (bgs), and each well was constructed with 4-inch PVC casing (Figure A-1). The wells were screened from the top of the petroleum-hydrocarbon-impacted zone (based on boring log data) to the bottom of the well (approximately 5 to 20 feet bgs). The wells were completed above the ground surface to facilitate the installation of piping materials. During well installation, ERM collected soil samples from selected depths (approximately every 5 feet) at each location to supplement existing information on the distribution of petroleum hydrocarbons in shallow soils. Samples were analyzed for total petroleum hydrocarbons in the diesel range (TPH-d) and TPH in the motor oil range (TPH-mo) using United States Environmental Protection Agency (USEPA) Method 8015-modified.

Following installation of the extraction wells, well casings and ground surface elevations of the wells were surveyed to the nearest 0.01 foot, and the x and y coordinates to the nearest 0.1 foot, by a licensed land surveyor. All site surveying was from a local datum referenced to mean sea level. The horizontal coordinate values were surveyed relative to the 1983 North American Datum (NAD83). Elevations were surveyed relative to the 1929 National Geodetic Vertical Datum (NGVD29).

A process flow diagram for the system is presented on Figure A-2 and consists of the following:

- An SVE blower skid with a blower rated for 1,000 cfm air-flow and approximately 80-inch water column vacuum and an interlocked moisture knockout pot;
- Vapor abatement using two parallel sets of 1,000-pound and 2,000-pound GAC canisters piped in series;
- The SVE blower was connected to extraction wells via 6-inch-diameter PVC conveyance piping placed on the ground surface approximately consistent with the location shown on Figure A-3;
- Each extraction well had a well-head valve arrangement to isolate the individual well from the SVE system during the weekly NAPL/liquids removal event;
- Each extraction well was also equipped with a sample port and a vacuum gauge to monitor well-head performance;
- Conveyance piping was connected to the SVE skid and GAC canisters with a suitable system of piping and hoses to facilitate spent GAC changeouts; and

- The system was energized with three-phase electrical power from a convenient on-site location.

SYSTEM OPERATION

The system was initially started on 15 June 2005, but operations were intermittent due to excessive water accumulation in the knockout vessel and only daytime system operation to alleviate potential noise nuisance to the neighboring community. Full-time operation of the system began on 24 June 2005, after optimizing system vacuum and subsequent to the construction of the noise enclosure. Since then, system operation parameters have been collected weekly and are summarized on Table A-1.

Based on the distribution of the NAPL, perimeter wells have been operated in "air induction mode." In this mode, they were left isolated with the caps off to allow ambient air to flow into the subsurface in the direction of NAPL-rich areas and to also enhance the biodegradation in the area of interest. Also, three wells (SVE-23, SVE-29, and SVE-30; Figure A-3) were isolated from the system due to the high water levels in each well, which were causing a higher rate of water accumulation in the knockout drum. No free-phase product was ever observed in wells SVE-23 and SVE-29; only a sheen was periodically noted in well SVE-30.

Weekly site visits were made to obtain operational data such as vapor concentrations at wells, bioremediation parameters (i.e., carbon dioxide, oxygen, and methane), and vacuum measurements. ERM used portable equipment such as a PID, an oxygen/carbon dioxide meter, and vacuum gages to collect field parameters. In addition, fluid level measurements were collected during the weekly site visits using an oil/water interface probe to evaluate the effectiveness of the system at removing NAPL in the ground water. The results of the weekly measurements are presented in Table A-2 for the six wells in which appreciable amounts of NAPL were measured consistently. The behavior of these wells during the course of the treatability study is discussed below.

- In general, water levels appear to have decreased in all wells over the course of the treatability study.
- Product thickness in SVE-20 started at 0.83 foot and dropped to 0.01 foot after the first mobile high-vacuum extraction (HVE) event. Since then, product thickness ranged from a sheen to 0.07 foot, and is currently at 0.01 foot.
- Product thickness in SVE-21 initially ranged from 0.90 foot to 5.59 feet. SVE-21 has consistently shown the highest NAPL accumulations likely due to being located at the lowest part of the fill area. To enhance

NAPL recovery at SVE-21, a skimmer was initially placed from 4 to 18 August. The NAPL skimmer operation was resumed in SVE-21 on 23 August to address the increase in NAPL thickness to 4.44 feet. Currently the measurable product thickness is 0.37 foot. Overall, approximately 19.2 gallons of free product have been removed from the well using the NAPL skimmer.

- Measurable product thickness in SVE-22 has ranged from a sheen to 0.90 foot. The skimmer operation was implemented at SVE-22 from 18 to 23 August, during which the product thickness decreased to 0.03 foot. Overall, approximately 0.02 gallon of free product was removed from SVE-22. Product thickness is currently 0.45 foot.
- Measurable product thickness in SVE-28 has typically ranged from a sheen to 0.93 foot, with a single outlier of a measurement of 2.43 feet. Disregarding the outlier, the average product thickness has been 0.47 foot. Currently, measurable product thickness is 0.76 foot.
- Measurable product thickness in SVE-30 has ranged from nondetect to 2.07 feet. Currently, measurable product thickness is 0.69 foot.
- Free product was not measured in SVE-38 until 28 July, at which time a sheen was detected. The product thickness has steadily increased to the current measurement of 1.50 feet.
- Generally, oxygen and carbon dioxide measurements in the extraction wells indicate that favorable conditions exist for the occurrence of petroleum hydrocarbon biodegradation in the subsurface, due to air delivery from the VEE.

Mobile HVE events were conducted weekly at all 18 of the interior wells. Ten extraction events were completed between 24 June and 26 August 2005. During these events, total fluids were removed from each extraction well by isolating the well from the system using the wellhead control valve and inserting a 2-inch stinger into the well. A vacuum of approximately 29 inches mercury was applied using a vacuum truck contracted through Evergreen Environmental Services. The vacuum was applied for approximately 5 minutes at each location and 10 minutes at the wells that contained measurable NAPL. In addition to recovering NAPL, ERM discovered that this total fluids removal approach generally dewatered the low-permeability fill materials and underlying native clay, enhancing flow of NAPL into individual wells. During each HVE event, the evacuated fluids were periodically passed through a knockout tank to estimate the fraction of NAPL in total liquids removed. The results of the HVE events are summarized on Table A-3 and are discussed below.

Overall, 14,120 gallons of total fluids have been removed, of which approximately 201.7 gallons are NAPL and approximately 104.3 gallons were removed in the dissolved phase.

GROUND WATER MONITORING

ERM also implemented a limited ground water monitoring program to evaluate reductions in dissolved-phase petroleum hydrocarbons in the immediate vicinity of the former evaporation pond. Near the beginning of the HVE events, ERM collected a sample from SVE-20 to aid in evaluating dissolved-phase removal of product. Existing monitoring wells MW-6 (downgradient and north of the pond) and MW-10 (upgradient and south of the pond, based on historical data), along with SVE-36 (cross-gradient and east of the pond), were later used as monitoring points to evaluate the reduction of dissolved-phase concentrations. Locations of these wells are shown in Figure A-3. Each well was purged and sampled in accordance with applicable California Well Standards.

Samples were analyzed by a California-certified analytical laboratory for TPH-mo and TPH-d using USEPA Method 8015-modified. Additionally, each sample was analyzed for chlorinated and aromatic volatile organic compounds (VOCs) using USEPA Method 8260B. The results of these samples are summarized in Table A-4 and discussed below.

Historically, MW-4 (last sampled in February 2002) reported TPH-mo and TPH-d ranges at concentrations of 10,000 and 51,000 micrograms per liter (µg/L), respectively. The most recent data for MW-10 (last sampled in December 2000) indicated nondetectable concentrations for TPH. The most recent data for MW-6 (last sampled in December 2000) indicate TPH-mo and TPH-d concentrations of 310 and 220 µg/L, respectively.

A sample was collected from SVE-20 on 11 July 2005. The results indicated a concentration of 6,200,000 µg/L of TPH-mo. This concentration was used to calculate the overall dissolved-phase product removal.

ERM performed sampling pursuant to the *Final Treatability Study Workplan* in July and August 2005. Samples collected from MW-6 and MW-10 indicate maximum TPH-mo concentrations of 1,500 and 970 µg/L, respectively. The elevated TPH detection in MW-10 suggests the potential for an off-site, upgradient source (Figure A-3). The sample collected from SVE-36 (located 50 feet west of MW-4) indicated a TPH-diesel concentration of 590,000 µg/L. VOC concentrations in MW-6 and MW-10

were nondetectable. However, benzene, toluene, and xylenes were detected in SVE-36 at concentrations of 2.1, 0.63, and 1.2 µg/L, respectively.

CONCLUSIONS

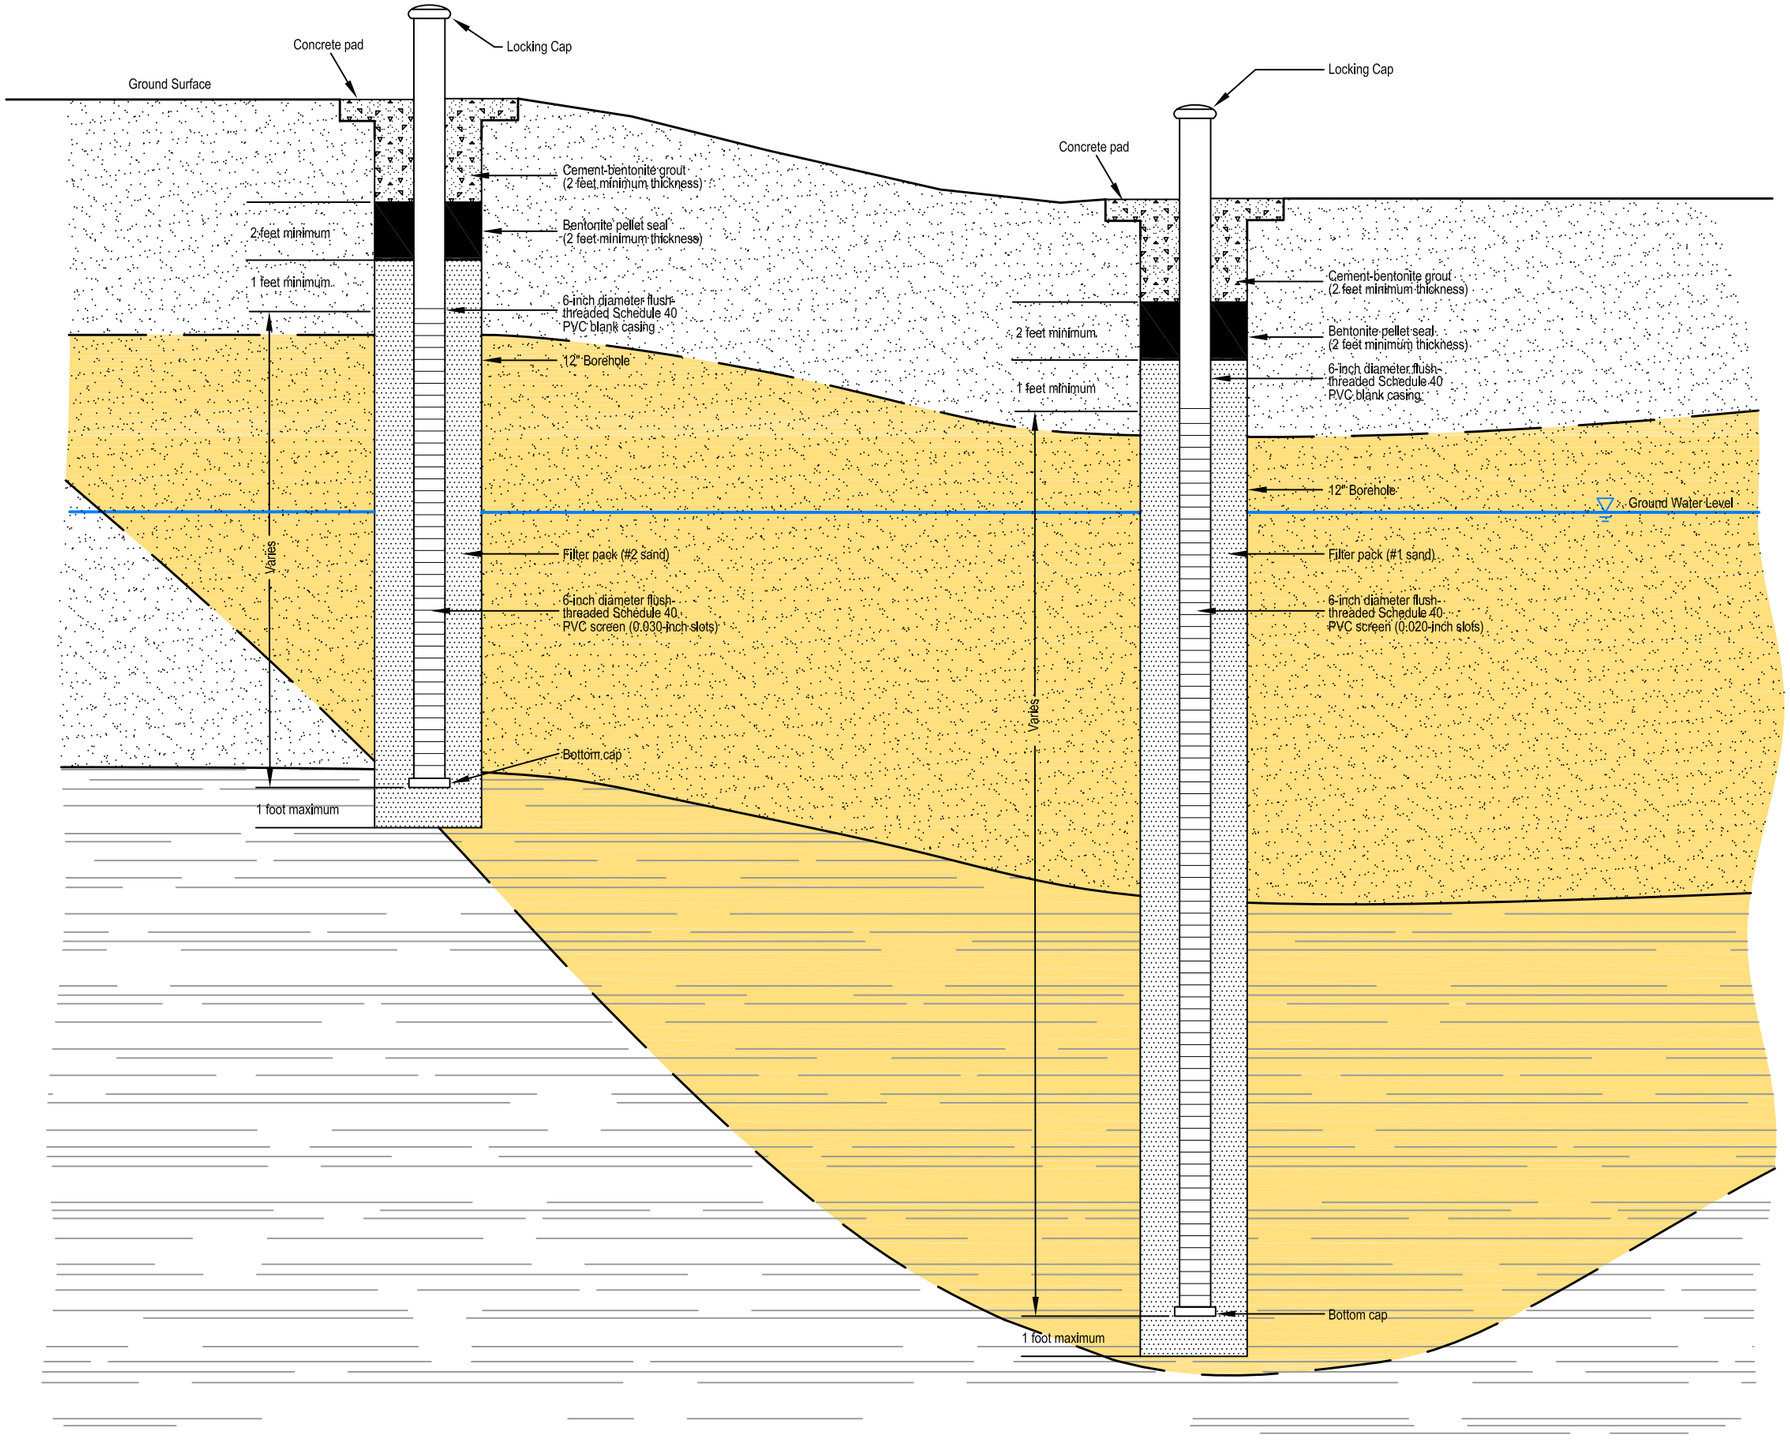
ERM has made the following conclusions regarding the VEE treatability study effectiveness:

- The VEE treatability study has removed in excess of 300 gallons of mobile petroleum hydrocarbons.
- Subsequent implementation of a NAPL skimmer at selected wells has aided in the removal of an additional 20 gallons of NAPL.
- The application of VEE has had a secondary benefit of causing aerobic biodegradation of residual petroleum hydrocarbons.
- Since VEE system installation, only six out of 39 SVE wells indicated measurable product (thickness in excess of a sheen), which could be cost-effectively addressed by implementing mobile HVE or a NAPL skimmer. NAPL occurrence has been localized generally near the deepest part of former evaporation pond centered around SVE-21.
- Measured NAPL thicknesses at six of the 39 SVE wells have significantly dropped since the implementation of VEE, with current thicknesses ranging from 0.01 to a maximum of 1.5 feet. The apparent product thickness is typically 5 to 10 times lower than measured values (Appendix A, EPA/600/R-98/128, September 1998). Thus, the range of apparent thickness of the mobile NAPL remaining at the site is between a sheen to 0.15 feet.
- Ground water monitoring results pursuant to implementation of the treatability study indicate that TPH constituents are not appreciably migrating away from the former evaporation pond area, and that an off-site, upgradient source of TPH may be present.
- At apparent NAPL thicknesses near 0.10 foot, continuation of mobile HVE in tandem with VEE operation for NAPL recovery is not cost-effective.

RECOMMENDATIONS

ERM recommends the following for the future operation of the VEE treatability study at the site:

- Discontinue implementation of mobile HVE for NAPL recovery at the site.



- Continue operation of VEE for 2 additional weeks with NAPL recovery using a skimmer that is rotated between selected wells centered around SVE-21, where NAPL accumulations have been historically highest.
- Shut down VEE operation after 2 weeks and continue with skimmer operation at selected wells to remove remaining quantities of accumulated NAPL.

PRODUCT VOLUME REMOVAL VIA SKIMMER PUMP IN SVE-21

Date	Cumulative Product Removed (gallons)
8/11/2005	5.9
8/15/2005	11.6
8/16/2005	13.4
8/16/2005	13.8
8/18/2005	14.0
8/25/2005	17.0
8/26/2005	19.2

Skimmer pump was placed in SVE-21 on 8-04-05, removed on 8-18-05, reinstalled on 8-23-05.

[1] Volume removal includes estimate of pure product and dissolved phase removal via direct extraction. Free product volume is estimated from the knockout drum collected during the extraction event.
Volume removal from dissolved phase estimated using (concentration in water ppm) * (gallons of water) * (8.34 lb/gal water density) / (density of product) = gallons of dissolved phase product removed.

Mass removal of VOCs (PID) in vapor stream is not considered due to extremely low concentrations

(Assumed density of product of 7.0 lb/gallon)

8-18-05 to 8-23-05 skimmer pump in SVE-22
8-23-05 skimmer pump in SVE-21
8-19-05 measurements are immediately following HVE extraction
Shaded wells are turned off from the system due to high water levels

1.0 INTRODUCTION

1.1 PURPOSE

This Remedial Design and Implementation Plan (RDIP) was prepared by ERM-West, Inc. (ERM) for Pittsburg River Park LLC (PRPLLC) to present a detailed engineering plan for implementing the chosen remedial alternatives for soil/fill materials and ground water at the Harbor Park Development (former Johns Manville [JM] Plant Site; also referred to herein as "site"). These remedial alternatives were described in detail in the *Final Remedial Action Plan* (RAP) (ERM, 2006). The site is at the approximate intersection of East Third and Harbor Streets in Pittsburg, Contra Costa County, California (Figure 1).

1.2 SITE DESCRIPTION AND LAND USE HISTORY

The following sections describe general site conditions and historical land use of the JM Plant Site and surrounding areas.

1.2.1 Site Description

The former JM facility consists of two distinct properties located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California.

The first parcel, approximately 1,000 feet south of New York Slough and Suisun Bay, is referred to as the "Plant Site" or "site," which is the primary subject of remedial actions addressed in this RDIP. This 21-acre parcel is bounded to the north by a Tesoro coke facility and Third Street; to the east by Harbor Street, several small light industrial businesses, and USS Posco Corporation; and to the south and west by residential properties. Most recently, until the facility terminated operations in 2003, it was used for the manufacture of commercial roofing materials. The Plant Site formerly consisted of Buildings 1 through 4 in the northern portion of the property, a warehouse in the southwestern portion of the site, and the former evaporation pond area, which is currently paved with asphalt. Railroad tracks bisect the central portion of the property. Currently, the site is undergoing complete demolition of all structures, improvements and subsurface features (utilities, vaults, tanks, rail tracks, etc). A Site Detail

Map showing historical physical site features and sampling locations is provided as Figure 2. Remedial actions described in this document address only the Plant Site.

The current land use and zoning for the Plant Site was changed from Marine Commercial to Downtown High Density Residential, Downtown Medium Density Residential, and Downtown Commercial through an entitlement process undertaken by Pittsburg River Park LLC. The entitlements, a General Plan Amendment approved by the Pittsburg City Council in December 2005, will allow for single-and multi-family residential reuse of the plant portion of the former JM site.

1.2.2 Land Use History of the Site and Surrounding Area

The primary manufacturing plant was built sometime between 1925 and 1928. In 1957, a large warehouse was constructed south of the main manufacturing facility. Asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering were the primary products produced prior to termination of asbestos-containing product manufacturing in 1980. A series of four asphalt stills, located along the southwestern margin of Building 4, was used to convert heavy oil to asphalt. The stills were fueled by fuel oil and later with natural gas. In the process of converting heavy oil to asphalt, off-gas vapors were collected, condensed, and mixed with water to form an oil-water slurry that was transported via an underground pipe to the evaporation pond. The residual oil in the evaporation pond was reportedly burned approximately twice a year. Use of the evaporation pond began in 1946. It remained relatively constant in size until 1959, when discharge of effluent was discontinued, and it was subsequently filled with scrap and construction debris. The size of the pond when it closed was approximately 150 feet long by 75 feet wide with a maximum depth of 10 feet below ground surface (bgs) (Figure 3).

From the 1980s until the plant's closure in approximately 2003, JM manufactured commercial roofing materials using fiberglass mat, asphalt, sand, and limestone. Petroleum-based resins and solvents were also used on site.

Classes of chemicals associated with historical site operations are primarily asbestos and total petroleum hydrocarbons (TPH). Additional related chemical classes, detected sporadically or infrequently at the site are as follows:

- Metals (as constituents of TPH mixtures);
- Polychlorinated biphenyls (PCBs; as constituents of TPH mixtures);
- Semivolatile organic compounds (SVOCs; as constituents of TPH mixtures and as TPH combustion products); and
- Volatile organic compounds (VOCs; as constituents of TPH mixtures).

As noted above, the areas to the north and east of the Plant Site have historically been used for industrial or commercial purposes. To the south, west, and northwest are residential developments. Immediately west of the site is a residential area that was redeveloped in the mid-1990s. Prior to its redevelopment, this area, referred to in previous documentation as the Eastside Redevelopment Area (ENGEO, Inc. [ENGEO], 1991), was characterized by vacant lots, single-family residences and apartment units, vacant commercial buildings, a bakery, and Riverside Fire Station No. 84. Anecdotal information obtained by ERM suggests that some of the prior residences may have been historically used as illicit drug manufacturing laboratories, resulting in some of the minimal ground water impacts observed in the ENGEO report. Based on concentrations of similar contaminants detected in ground water samples collected at the former JM site, upgradient of the former pond area, it is possible some of this contamination has migrated to the east onto the former JM property.

1.3 SUMMARY OF APPROVED REMEDIAL ACTION

The remedial action approved for impacted soil/fill materials at the site consists of consolidating impacted materials into an engineered berm along the eastern property boundary. Fill materials within the areas of concern will be excavated and consolidated on site in the construction of an engineered berm along the eastern site boundary. Appropriate deed restrictions and an Operation and Maintenance (O&M) Agreement will be implemented prior to certification of the site. The deed restriction will limit access to and use of the bermed area. Selection of this alternative is based primarily on its demonstrated effectiveness, consistency with future land use, cost-effectiveness, and ease and speed of implementation.

The remedial action approved for impacted ground water consists of natural attenuation of residual chemicals. Also, in accordance with 22 CCR Section 67391.1, Division 4.5, Chapter 39, an institutional control prohibiting the use of ground water for purposes other than site

remediation or construction dewatering will be included in the remedial action. This institutional control will be in the form of homeowners' association Codes, Covenants, and Restrictions (CCRs). Specific details associated with any other restrictions considered appropriate by DTSC will be addressed in a Final O&M Agreement following implementation of the remedy. Selection of this alternative is based primarily on demonstrated effectiveness, consistency with future land use, cost-effectiveness, and the ease and speed of implementation. This remedial alternative includes a post-removal action ground water investigation to evaluate concentrations of potential constituents of concern in ground water. Should samples of ground water demonstrate that the concentrations are below applicable cleanup objectives, an application for closure will be submitted to DTSC.

The approved remedial actions for soil/fill materials and ground water meet each of the established Remedial Action Objectives (RAOs) for the site.

1.4 REPORT ORGANIZATION

The remainder of this RDIP is organized as follows:

- Section 2 describes the overall RAOs and the location and extent of the areas undergoing remediation;
- Section 3 presents details of the remedial program, including the plans for soil excavation and berm construction and actions related to potential ground water issues;
- Section 4 describes the O&M Agreement and Plan;
- Section 5 presents a schedule and details of construction activities; and
- Section 6 presents references cited or reviewed in preparation of the RDIP.

The main text is followed by figures and appendices containing supporting information.

2.0 REMEDIAL ACTION OBJECTIVES

This section provides the objectives of the remedial action and describes the location and known extent of areas of concern as of 1 June 2006.

2.1 OVERALL OBJECTIVES OF THE REMEDIAL ACTION

The RAOs are based on residential site usage and include the following:

- Prevent exposure (i.e., via incidental ingestion, dermal contact, inhalation of fugitive dust, and inhalation of volatile emissions) to soil/fill materials that are impacted with TPH at concentrations in excess of the cleanup goals established for the site (see Table C-6 of the RAP). (Note: These cleanup goals are not risk-based, because TPH includes varying mixtures of constituents and, as such, the associated risks would also be variable. Risks associated with TPH are addressed by the cleanup goals established for specific TPH constituents [i.e., benzene, toluene, ethylbenzene, and xylenes (BTEX)]). The proposed TPH cleanup goals for soil will be consistent with those commonly used by the Contra Costa County Environmental Health Division, Hazardous Materials Programs (County) in evaluating remedial actions for proposed residential sites. These cleanup objectives are based on California Regional Water Quality Control Board (RWQCB) Environmental Screening Levels, and vary on a case-by-case basis.
- Ensure that asbestos is not present in soil/fill materials at detectable levels in any portions of the Plant Site (analysis will be Polarized Light Microscopy (PLM) per National Institute for Occupational Safety and Health (NIOSH) 9002, *Asbestos by Polarized Light Microscopy* or equivalent).
- Prevent exposure to soil/fill materials that are impacted with site-related chemicals at concentrations in excess of health-risk-based cleanup goals established for the site (i.e., PCBs, SVOCs, and VOCs, see Table C-6 of the RAP).
- Prevent migration of constituents in soil/fill materials that would result in ground water contamination in excess of California Maximum Contaminant Levels (MCLs) or other applicable water quality standards. As described below in section 3.4, we present a ground water sampling program to address this issue.

- Prevent exposure to ground water within the footprint of the former evaporation pond.
- Reduce the concentrations of TPH-related constituents in ground water (i.e., BTEX) to below their respective MCLs.

2.2 *LOCATION AND EXTENT OF AREAS OF CONCERN*

Figure 3 shows the location and extent of the known areas of contamination at the Plant Site as of 1 June 2006. These areas include the former evaporation pond and other locations found during the ongoing demolition phase of the project. Site demolition continued beyond 1 June 2006 and any additional Areas of Concern (AOCs) identified after that date will be addressed during the work described in Section 3. The full extent of all AOCs discovered during the performance of the work will be documented in the Remedial Action Certification Request.

3.0 DESCRIPTION OF THE REMEDIAL PROGRAM

This section defines the methodology and standard practices to control the quality of work performed at the site during remediation activities specified in this RDIP. Appendix A is the Site Management Plan (SMP), which was prepared prior to beginning the abatement and demolition phase of the project. The SMP includes several sections of construction-related requirements, which are also applicable to this phase of construction, including, but not limited to:

- Site Specific Health and Safety Plan;
- Air Monitoring Plan;
- Storm Water Pollution Prevention Plan (SWPPP);
- Dust Control – Section 4.3.1;
- Soil Excavation and Confirmation Sampling Protocol – Section 4.4; and
- Stockpile Management – Section 4.

3.1 EXCAVATING IMPACTED SOIL

3.1.1 Excavation Plan and Details

In accordance with Section 15.88 of the City of Pittsburg Municipal Code, the following requirements will be met by Entact, the selected remediation contractor (Contractor or Entact) during the execution of the excavation and stockpile work. In addition, Section 4 of the SMP shall be used as a reference during all site activities.

- It is anticipated that the contractor will use standard construction equipment (excavators, front-end loaders, dump trucks, etc.) to perform the work. All equipment must be in legal operating condition and all operators will be qualified to operate the equipment.
- All soil removed from the excavations will be segregated into stockpiles of like materials, i.e., not impacted, ACM, and TPH-impacted soils.
- During excavation work, unknown debris such as concrete, asphalt, and metal may be intermixed with the soil. Debris is defined as an object that does not serve a purpose and, if removed from the

subsurface, other objects, systems, and/or structures are not negatively impacted. The debris will be removed from the excavation areas and transported off site for disposal if deemed not geotechnically suitable for placement within the berm.

- During excavation and stockpile work, dust control will be implemented to mitigate visible dust. Should moisture limits associated with compaction requirements impair dust suppression, the contractor shall be prepared to amend water as needed (using surfactants, polymers, etc). Perimeter dust concentrations in air shall not exceed 0.18 milligram per cubic meter. PLM asbestos samples shall not exceed 0.01 structure per cubic centimeter.
- The contractor shall be prepared to erect moveable windscreens upwind and no further than 50 feet from any and all active excavation or compaction areas. Each windscreen will be a minimum of 6 feet high and 40 feet wide.
- All exposed contaminated materials shall be covered at the end of each workday. Covers shall be maintained at all times, except on active piles or excavation areas.
- Excavation work will be performed in compliance with all Occupational Safety and Health Administration (OSHA) rules and regulations. This includes following the requirements for sloping, benching, and shoring as presented in Title 29 of the Code of Federal Regulations, Part 1926, Subpart P – Excavations. The excavations shall be constructed to allow entrance and egress as needed for confirmation sampling.
- Excavation of the areas shown on Figure 3 (with the exception of the berm excavation) will be performed under the direction of the Construction Manager. The excavations will be performed in 1 foot lifts, and the Construction Manager will inspect each lift and either clear the excavation or require further excavation to remove any remaining contaminated materials. Details for the construction of the berm are described in the section below.

3.1.2 Excavation Dewatering and Water Management

3.1.2.1 Ground Water or Perched Water

Ground water or perched water will likely be encountered in the former evaporation pond area as well as in the excavation for the proposed berm. This water will be removed from the excavation with a dewatering

system. It is not anticipated that treatment of the water will be required to meet discharge requirements. However, if treatment is required, the water will be conveyed to a water treatment system located on site. If treatment is required, the water treatment system will consist of oil/water separator tanks, sediment tanks, filters and/or granular activated carbon units (or other similar equipment) as needed to achieve Publicly Owned Treatment Works (POTW) discharge limits, and ultimately be discharged to the Delta Diablo Sanitary District sewer system. Any recovered free-phase product will be removed and disposed at an approved off site facility. Any discharges to the sanitary sewer system will be under an approved Special Discharge Permit in accordance with Section 13.20 of the City of Pittsburg Municipal Code.

3.1.2.2 Storm Water

The site is currently undeveloped and in rough grade conditions. All storm water and sanitary sewer utilities have been removed from the site. During all soil remediation activities, storm water management will be performed such that the adjacent off-site storm water collection system is not adversely impacted by site activities. The storm water management requirements are detailed in the SWPPP attached as Appendix B of the SMP and are summarized below.

- All storm water management activities will be performed in accordance with Section 13.28 of the City of Pittsburg Municipal Code.
- All stockpile areas will be constructed and maintained to contain fluids that come in contact with the stockpiled material. The contractor is responsible for constructing the stockpile areas to achieve this requirement. Stockpiles with impacted soils will not be placed close to the edge of the property adjacent to either Harbor Street or Third Street. Until all stockpiles are removed, the contractor will prevent any flow of sediment and non-visible pollutants off site by covering the stockpiles with plastic sheeting. The sheeting will be securely fastened so wind does not blow it away and cause a nuisance.
- Other examples of storm water best management practices (BMPs) anticipated to be used around the stockpile areas are straw wattles, silt fencing, and straw bales.
- The catch basins adjacent to the property on Harbor and Third Streets will be protected with a BMP that prevents silt and sediment from entering the catch basin, such as a catch basin insert.

- The contractor will include in the health and safety tailgate meetings periodic training for employees addressing proper implementation of storm water BMPs.
- Storm water accumulated within contaminated excavation areas will be assumed contaminated until proven otherwise. Any water that cannot be proven clean will be pumped out of the excavation into the on site storage tanks.

3.1.3 Excavation Confirmation Sampling

Once impacted soil is removed in accordance with RDIP specifications, confirmation sampling will be performed at the excavation floors and sidewalls to verify that sufficient impacted soil has been removed to meet cleanup goals.

The bottoms and sidewalls of all excavations are to be sampled according to protocols set forth in American Society for Testing and Materials (ASTM) E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*, and ASTM D4700-91, *Standard Guide for Soil Sampling from the Vadose Zone*. These documents are attached as Appendices C and D of the SMP, respectively. The following sections summarize the protocols as they apply to the subject work.

3.1.3.1 Confirmation Sampling Frequency

For the excavations, soil confirmation samples will be collected from the excavation sidewalls and floors in evenly spaced locations. Frequency of samples and analytes evaluated are a function of the individual constituents of concern and the frequency they have been identified across the site (based on historical sampling results), as follows:

- ACM: 50-foot centers (approximately 300 samples, site-wide);
- TPH: 20 percent of the samples collected within the former evaporation pond (approximately 30 samples) plus approximately 10 samples site-wide;
- Metals: 10 percent of the samples collected within the former evaporation pond (approximately 15 samples) plus approximately 5 samples site-wide;
- SVOCs: 10 percent of the samples collected within the former evaporation pond (approximately 15 samples) plus approximately 5 samples site-wide; and

- VOCs: 10 percent of the samples collected within the former evaporation pond (approximately 15 samples) plus approximately 5 samples site-wide.

Samples to be analyzed for TPH, metals, SVOCs, and VOCs as indicated above will be selected based olfactory or other visual evidence of potential impacts from constituents of concern.

All soil sampling locations will be staked, documented, and their location marked on a site drawing. The sidewall samples will be collected at an approximate depth of 6 inches above the excavation floor or 6 inches above standing water within the excavation, whichever is higher

3.1.3.2 Confirmation Sampling Methods

Soil samples will be collected either by manually pushing pre-cleaned, brass or stainless-steel liners into the soil, or by using a steel core sampler with pre-cleaned, brass or stainless-steel liners attached to an extension rod with a slide hammer apparatus. Alternatively, a clean, stainless-steel trowel may be used for sample collection into 4-ounce glass jars if the aforementioned methods cannot be used in the event that refusal is encountered.

Each excavation confirmation sample will be assigned a unique sample identification number that will include the excavation designation and sample location. For example, EP-CONF-01 would be the evaporation pond area confirmation sample number 01. All sample locations will be documented on a site map and surveyed via global positioning system for future reference.

All field sampling equipment will be decontaminated before and after use. Wash water and other fluids generated during decontamination will be put into containers and disposed of properly.

3.1.3.3 Confirmation Sampling Analysis

The results of the post-excavation confirmation sampling will determine if further excavation or product removal is required (re-excavation, followed by additional confirmation sampling) or if excavation work can be terminated. At a minimum, each sample collected on 50-foot centers will be analyzed for ACM by PLM NIOSH 9002. Other samples will be analyzed according to the frequency described above for the following

constituents based upon their location and historical data, and upon physical evidence of potential impacts:

- TPH as diesel and motor oil by USEPA Method 8015;
- SVOCs by USEPA Method 8270;
- VOCs by USEPA Method 8020; and
- California Title 22 Metals by USEPA Methods 6010B and 7470 (for mercury).

The results of post-excavation confirmation sampling will determine if further excavation is required (re-excavation, followed by additional confirmation sampling) or if excavation work can be terminated. If confirmation sampling results exceed remedial objectives, as defined in Table C-6 of the RAP), additional soil will be excavated and resampled until remedial objectives are achieved.

3.1.4 Backfill and Restoration

All excavation areas will be backfilled and restored to rough grade conditions for future development. To the extent possible, backfill material will be clean soil existing on site either from building pad fill or clean soil excavated during the berm excavation. In some cases, available on-site crushed rock may be used where geotechnically suitable. The deepest excavations will be backfilled first. Backfilling will be completed using compaction techniques suitable for the intended future use, i.e., with excavator buckets and excavator mounted compactor wheels.

Additional clean material that may need to be imported to complete the backfilling of the excavations shall include a certification letter from the supplier and/or manufacturer. All imported materials shall be uncontaminated and geotechnically suitable as fill material for future construction.

3.1.5 Excavation Health and Safety and Air Monitoring

The Health and Safety Plan for this project is included as Appendix A in the SMP for reference. A third-party Industrial Hygiene contractor will perform on-site air monitoring. The Air Monitoring Plan is included as Appendix E of the SMP. Although these documents were written for the abatement and demolition phases of the project, the information, methods, and practices outlined therein are applicable to this remediation phase.

3.2 CONSTRUCTION OF ON-SITE EASTERN BOUNDARY BERM

3.2.1 Details of Eastern Boundary Berm

The Eastern Boundary Berm is designed to store impacted soil previously excavated from various locations around the site, including the former evaporation pond area. The berm consists of an excavated trench, backfilled and mounded contaminated soil, drainage features, and a clean fill cover layer with vegetation and irrigation.

3.2.2 Geotechnical Settlement Issues

According to the *Geotechnical Investigation Report* produced by Treadwell & Rollo (T&R) (T&R, 2006a) regarding geotechnical stability of the proposed berm, up to 21 inches of settlement may be expected. This report is included as Appendix B to this RDIP. T&R also submitted a *Supplemental Geotechnical Consultation Letter Report* (T&R, 2006b), which is included as Appendix C. To compensate for the predicted settlement, several sections of the berm will be constructed such that following settlement (approximately 10 years) the top surface alignment of the berm will be within the designed 10 feet above existing ground surface. Design contours shown on Figure 4 depict this compensation. A detailed geotechnical evaluation and contours have been submitted to the City of Pittsburg with the grading permit application.

3.2.3 Berm Construction Details

The final berm excavation depth will be approximately 10 feet below the existing ground surface. Based upon previous investigations and water levels measured from nearby monitoring wells, maintaining a separation between the bottom of the trench and ground water is not possible. To reduce the possibility of impacting ground water with hydrocarbon-impacted soil, the backfilled soils will be segregated so that ACM-impacted soils are placed at the bottom and soils containing petroleum hydrocarbons are placed near the top of the excavation.

The excavation area is outlined on Figure 4 and will be 75 feet wide and approximately 1,300 feet long. The excavated soils will be segregated into clean and impacted stockpiles. Stockpile management will be the same as that described in Section 3.1.1.

3.2.4 Berm Backfill and Completion Details

The previously stockpiled, contaminated soils will be placed in the trench and compacted in accordance with the methods described in Section 3.1.4. The Construction Manager shall direct the selection of the materials to be placed. A typical cross-section of the berm is shown in Figure 5. The impacted soils will be placed to a final thickness of 8 feet above existing ground surface at the center with a table of approximately 25.33 feet. The sides will be sloped at 2.25 feet horizontal to 1 foot vertical.

Following placement of the impacted soil, a layer of Mirafi 140NC filter fabric, or Engineer-approved like material, will be placed over the soil surface and vertically on the side walls to serve as a visual demarcation liner and prevent accidental exposure to the impacted materials contained below. A 2-foot-thick clean soil cover will then be placed over the entire berm to support landscaping features. The soil cover will consist of clean soil from the excavation stockpile amended as directed by a landscape architect to support the growth of the selected vegetation to be planted. Typical soil amendments might include 25 percent by volume washed sand and 30 percent by volume redwood and compost. The cover will extend to the edge of the proposed property line as shown on Figure 5.

Drainage swales will be constructed adjacent to the berm and will be graded such that collected storm water runoff will drain north towards a catch basin tied into the Third Street storm line. The design details of these swales are shown on Figure 5.

3.2.5 Berm Landscaping Features

Landscaping features for the berm cover will be non-inviting, low maintenance, drought-tolerant plants. In accordance with Section 18.84 Article 7 of the City of Pittsburg Municipal Code, a Landscaping and Irrigation Plan will be submitted to the City prior to installation. The plan will describe the plants, layout, and irrigation details.

3.2.6 Berm Secondary Structures and Aesthetic Details

A permanent fence will be installed along the proposed property line to deter future contact with the berm and its contents. The fence will be a sturdy decorative fence at least 6 feet tall, designed to discourage climbing and trespassing. Details of the fence construction are depicted on Figure 6. Vehicle access gates will be placed at one end of each berm section and two personnel gates will be installed along the western side of the northern

berm section. These gates will be locked at all times and only authorized maintenance personnel will be allowed access.

3.2.7 Construction Health and Safety and Air Monitoring

The Health and Safety Plan for this project is included as Appendix A of the SMP for reference. A third-party Industrial Hygiene contractor will perform on-site air monitoring. The Air Monitoring Plan is included as Appendix E of the SMP. Although these documents were written for the abatement and demolition phases of the project, the information, methods, and practices outlined therein are applicable to this remediation phase.

3.3 DISPOSAL OF SURPLUS IMPACTED SOIL

3.3.1 Destination of Waste Material

Should the amount of excavated waste exceed the capacity of the impoundment berm, the surplus material will require transportation off site for disposal. Some debris mixed in the soil, along with asphalt and concrete debris may have to be transported off site as well.

3.3.1.1 Debris

The surface of the former evaporation pond is currently capped with asphalt that will be removed to excavate the impacted soil in that area. As feasible, the contractor will segregate debris based on material type. All debris will be transported off site and either recycled or properly disposed of in a landfill. The contractor will select the off-site recycling facility and off-site landfill.

If the debris is transported to an off-site recycling facility, the facility will be legally authorized to recycle and process the debris. If the debris is not recycled, it will be transported to an off-site landfill that is legally authorized to receive the debris. Copies of the recycling facility or the landfill's permits to legally operate will be submitted to PRPLLC prior to beginning work. The contractor is responsible for supplying any waste-profiling analytical results and/or other information either to the recycler or landfill operator to facilitate recycling or disposal.

3.3.1.2 Soil

Due to the proposed volume of the berm, and the expected quantities of contaminated materials on site, it is not anticipated there will be surplus material to be disposed of off site. However, any surplus soil removed from the excavation areas that cannot be placed into the berm will be transported off site and disposed of in accordance with all applicable rules and regulations. The contractor will select the off-site landfill and provide PRPLLC with copies of the landfill's permits to operate.

The contractor will be responsible for coordinating with the landfill the sampling frequency necessary to characterize or profile the soil for disposal. The sampling frequency will include the number of samples per stockpiled volume of soil and the necessary laboratory analyses. The contractor will be responsible for verifying that all soil and wastes transported and disposed of off site meet landfill requirements.

3.3.2 Mode of Transportation

The debris and soil will be transported in dump trucks licensed to operate on public streets and highways, and to carry debris and hazardous waste loads as applicable. The trucks will be driven by appropriately qualified and licensed operators. The trucks will be operated on public or private roads and will follow all applicable state and federal laws.

3.3.3 Loading, Route, and Traffic Control

Debris and soil will be stockpiled on site in segregated piles. After the wastes are properly profiled and the off-site recycling facility or landfill has authorized acceptance of the material, the material will be loaded into the dump trucks. The dump trucks will be staged at the stockpile area, and the materials will be directly loaded into the trucks. The dump trucks will be tarped and then leave the site.

All truck traffic to and from the site will be conducted along Harbor Street, which is an approved City truck route. Truck traffic along other City streets will be prohibited.

3.3.4 Record-Keeping

The contractor will maintain a daily record of quantities of all debris, soil, and other wastes transported off site. The daily record will be maintained on site and available for review. The daily record will also include:

- The name of the trucking company for each truckload;
- Weigh ticket showing the weight of load;
- Volume ticket showing the volume of load; and
- Waste manifest for each load, as applicable.

Waste manifests for each truckload will be prepared by the contractor. The contractor will provide PRPLLC or its designated representative sufficient time to sign the manifests prior to off-site transportation.

The Construction Manager will maintain a daily activity log, a photo log, a record of sample locations, and provide an updated map of unexpected features encountered during the course of the work.

3.3.5 Contingency Plan

The contractor will verify that the trucking company has an emergency contingency program in place for all roadway shipments of materials. A summary of the general procedures for addressing accidental releases during truck shipments is presented below.

- In the event of an accident, the truck driver or other first responder will assess the potential for immediate threat to workers and people on or nearby the accident. The driver will take appropriate corrective steps to rectify the problem and notify local emergency agencies.
- After identifying the problem (approximate size of release, type of material, potential threat to human health or the environment), the first responder will notify PRPLLC as well as the truck hauler's responsible Person.
- For contaminated material spilled onto the ground surface along a transportation route, cleanup will consist of collection and disposal of the contaminated soil at a disposal facility. All cleanup work will be done in accordance with a site-specific Health and Safety Plan and in cooperation with appropriate state and local agencies.
- For accidental releases of contaminated material in or near a stream, river, or lake, the same general response procedures will apply, with particular emphasis on preventing the spilled waste from reaching the water body. In the event of an actual release of contaminated material into a body of water, all work will be coordinated with state and local agencies to select practical and appropriate cleanup methods based on specific circumstances of the release.

3.4 GROUND WATER ISSUES

3.4.1 Well Abandonment/Relocation (as needed)

Several on site wells have already been abandoned in accordance with Contra Costa County (County) regulations. The remainder of the wells will be abandoned during the remediation phase via excavation. Well abandonment permits will be acquired, as necessary, from the County prior to abandonment.

3.4.2 Post-Construction Ground Water Monitoring

As described in the RAP, this RDIP also includes a post-construction action ground water investigation to determine the need for further ground water monitoring.

The post-construction ground water monitoring program will take place following the excavation and subsequent backfill and rough grading of the contaminated materials. The sampling will include ground water grab samples, collected via direct push/hydropunch approach, at a minimum of five (5) locations within the footprint of the former evaporation pond and five (5) other locations across the site, based on historical ground water data. Ground water grab samples will be analyzed for TPH and VOCs in accordance with the methodologies described above for soil confirmation sampling.

If the applicable remedial objectives for any constituents are not met, a formal ground water monitoring program (including natural attenuation parameters) may be required and will be negotiated with DTSC, as appropriate.

3.4.3 Ground Water Monitoring Program Details (if needed)

No remedial activities for ground water will be implemented. However, in accordance with Title 22 of the California Code of Regulations, Section 67391.1, Division 4.5, Chapter 39, an institutional control prohibiting the use of ground water for purposes other than site remediation or construction dewatering will be part of the proposed remedy associated with this alternative. As mentioned in Section 1.3, this institutional control would be in the form of homeowners' association CC&Rs.

The ground water monitoring program, if required, will include, at a minimum, annual reporting of ground water monitoring results to DTSC.

A DTSC Operation and Maintenance (O&M) Agreement will be written following completion of the construction of the containment berm which will discuss the ground water monitoring program, if applicable. If the investigation demonstrates that constituents of concern concentrations in ground water do not exceed the applicable remedial objectives, as defined in Section 5 of the RAP, a ground water closure request will be prepared and submitted to DTSC. Pending DTSC approval of the request, no further activities associated with ground water issues will be performed for the site.

4.0 POST-CONSTRUCTION OPERATION AND MAINTENANCE

The following section summarizes the O&M approach, which will be detailed in a Post-Construction O&M Plan that will be prepared following the completion of the berm construction.

4.1 ACCESS CONTROL

Public access to the berm and its contents will be restricted. A security fence will be installed around the perimeter of the berm and access gates will be locked at all times. Gate locks will be tamper resistant. Only authorized personnel will be allowed entry within the fence for maintenance, inspection, or other approved activity. All applicable City of Pittsburg Municipal Code requirements will be followed in the installation of the fence.

4.2 MAINTENANCE

4.2.1 Regular Maintenance

Regular maintenance for cover integrity, landscaping, and irrigation will be discussed in detail in the Post-Construction O&M Plan.

4.2.2 Accidental Breaches and Exposure

Accidental breaches of the berm cover, with potential exposure to the public could occur as the result of several instances, such as broken irrigation lines, misguided utility line repairs, vehicle collision with the berm, burrowing animals, or trespassers. A contingency plan and an emergency response plan will be developed and included in the Post-Construction O&M Plan. A 24-hour contact number will be listed in the plan to facilitate emergency response.

Additionally, as indicated in Section 4.1 of the RAP, none of the waste materials that will be encapsulated in the berm are acutely hazardous, and the primary routes of exposure are via incidental ingestion, dermal contact, and inhalation of fugitive dust. As a result, there would be no immediate or acute threat to human health or the environment should

these materials become temporarily or suddenly exposed due to an accidental release or a breach of the berm cover.

5.0 CONSTRUCTION ACTIVITIES

5.1 SITE PREPARATION AND SECURITY MEASURES

Before starting remediation work, certain mobilization and site preparation activities will occur. Mobilization and site preparation is the act of establishing administrative procedures and bringing personnel, equipment, materials, and tools to support the remediation work. Mobilization will be performed in a phased approach by bringing equipment, materials, tools, and personnel to the site on an as-needed basis. Mobilization and site preparation include the following components:

- Procurement of remediation contractor and vendors (this has been completed);
- Obtaining permits and notifications (this is in process);
- Establishment of temporary facilities and site security;
- Utility and monitoring well demolition;
- Pre-Excavation survey;
- Implementation of worker health and safety; and
- Documentation and record-keeping of project activities.

5.1.1 Contractor and Vendor Procurement

Prior to performing on-site remediation work, procurement of a qualified remediation contractor will be performed. This will be accomplished by preparation of contract documents, and awarding the work to the successful contractor. The contract documents will include this RDIP, drawings, and any other site-related information. The contract documents will also detail the measurement and payment requirements for the contractor's compensation.

5.1.2 Permits and Notifications

The contractor will conduct all work in accordance with applicable local, state, and federal laws and regulations. With the exception of the grading and well destruction permits, the contractor will be responsible for

obtaining and maintaining all permits and notifications prior to executing the work. A grading permit will be obtained from the City and the appropriate well abandonment permits will be obtained from the County. The remaining anticipated permits and notifications are:

- Excavation permit from OSHA;
- Traffic control plan from the City (if required);
- Permits for off-site transportation and disposal (if required);
- Bay Area Air Quality Management District notification for the excavation, removal, and disposal of friable ACM;
- Discharge permit from the City or County (if required); and
- Encroachment permit from the City (as necessary).

Copies of these permits and any other permits and notifications necessary to execute the work will be maintained on site by the contractor during execution of the work.

5.1.3 Temporary Facilities and Site Security

Temporary facilities, project-control setup, and site access and security are necessary so each component of the soil remediation work can be performed. These include:

- A location established for a field office, equipment, storage bins, materials, and sanitary facilities. The contractor is responsible for any utility connections and disconnections that may be required.
- A parking area for workers' personal vehicles. The parking area will be at a location on site such that the work will not be hindered.
- Fencing and signs around specific work areas to prevent unauthorized entrance. An entry/exit point to the project site will be established. At the entry/exit point, signs will be placed to direct visitors and vendors to either a field office or designated area where they can check in with the site superintendent.
- The contractor shall be responsible for all site security, including perimeter fences and controlling all access.

5.1.4 Utility and Monitoring Well Demolition

The fieldwork location has been cleared of all known active utilities. In the event an unknown utility is encountered, the contractor shall stop

work and the site superintendent shall be notified. Upon verification of the utility construction material, the utility shall be removed and disposed of in accordance with all applicable rules and regulations.

As described in Section 3.4.1, existing monitoring wells and extraction wells in the former evaporation pond area may be encountered during the work. These shall be abandoned in accordance with County regulations for well abandonment.

5.1.5 Pre-Excavation Survey

The lateral excavation limits for the berm, as identified in Figure 4, will be staked out by a California Licensed Surveyor. When the excavation areas are delineated, the surveyor will tie the excavation areas with permanent features adjacent to the site such that post-excavation survey work can be performed and as-built drawings can be produced.

5.1.6 Implementation of Worker Health and Safety

A Health and Safety Plan has been prepared for the project (Appendix A of the SMP) to address worker health and safety, including:

- Physical and chemical hazards at the site and requirements for worker personal protective equipment (PPE);
- Criteria for upgrades in PPE;
- Minimum training requirements for site workers;
- Emergency information such as directions to the nearest hospital and emergency telephone numbers; and
- Specific administrative requirements such as documentation of training and daily health and safety tailgate meetings.

5.1.7 Documentation and Record-keeping

Prior to executing the project work, the contractor will establish a record-keeping system for project documentation of all soil remediation activities. The documentation and record-keeping will be maintained on site during the project and kept up to date. At the conclusion of the project, this information will be used to prepare a summary report of the soil remediation activities. At a minimum, the documentation and record-keeping system will include:

- Copies of current training and medical surveillance certificates for all on-site workers;
- Completed health and safety signature sheets;
- Completed daily tailgate health and safety forms;
- Copies of permits and notifications;
- On-site superintendent daily field log;
- As-built drawings of the final excavation limits and drainage utilities;
- On-site soil/stockpile material tracking log;
- Analytical results for soil confirmation sampling and analysis;
- Analytical results for soil profiling for off-site transportation and disposal;
- Waste manifests and weigh tickets for any soil and debris transported and disposed of off site;
- A certification letter from the off-site disposal facilities for all wastes showing that the off-site facility has approved receiving the waste; and
- Geotechnical testing for placement of backfill.

5.2 FIELD DOCUMENTATION

Daily field documentation of the on-site remediation activities will be performed by the Construction Manager and shall include contractor manpower, equipment used, work performed, soils removed, soil/stockpile management, and other site-related activities.

5.3 CONSTRUCTION SCHEDULE

The grading permit is expected to be issued by the City of Pittsburg no later than 1 August 2006. Excavation and backfill of the berm is expected to occur concurrently from 1 August 2006 to 4 September 2006. All work is anticipated to be completed by 22 September 2006.

5.4 CONSTRUCTION COMPLETION REPORT

Upon completion of the work a Construction Completion Report will be submitted PRPLLC. This report will consist of:

- Field documentation including the Construction Manager's field notes and pictures;
- As-built drawings showing the final excavation limits, locations of drainage structures, confirmation sample locations, etc.;
- Analytical results for all samples collected for profiling and confirmation purposes; and
- Waste manifests for off-site transportation and disposal.

The report will also be submitted to DTSC along with the following documents to ensure complete closure:

- O&M Agreement;
- O&M Plan; and
- Deed Restriction for Berm Parcel

Upon approval of the above listed report and associated documents, the DTSC should submit a Remedial Action Completion Certification letter to PRPLLC allowing for the intended use of the site.

1.0 INTRODUCTION

On behalf of Pittsburg River Park LLC (Owner), ERM-West, Inc. (ERM) has prepared this Site Management Plan (SMP) to mitigate potential risks associated with the Owner's upcoming abatement and demolition project. This project comprises the 21-acre site known as the Former Johns Manville Plant Site located in Pittsburg, California (hereafter "site" or "Plant Site"). A site location map is included as Figure 1. Specifically, this SMP addresses the complete abatement and demolition of the current site infrastructure to rough grade conditions in preparation for the future redevelopment of the site.

This SMP provides guidelines to ensure that the abatement and demolition of the site is conducted in a manner protective of the health and safety of site workers, future site residents, nearby residents and community, and the environment.

1.1 REPORT ORGANIZATION

This SMP is organized as follows:

- Section 1.0 presents site background information and describes the objectives, implementation, and oversight of the SMP;
- Section 2.0 briefly describes the pertinent environmental concerns at the site;
- Section 3.0 presents risk management measures to be implemented prior to site demolition, including abatement management;
- Section 4.0 presents risk management measures to be implemented during site demolition; and
- Section 5.0 lists references used to prepare this SMP.

Appendices to this SMP include:

- Appendix A – Health and Safety Plan
- Appendix B – Construction-Specific Storm Water Pollution Prevention Plan
- Appendix C – ASTM E1903-97: Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process

- Appendix D – ASTM Standard D4700-91: Guide for Soil Sampling From the Vadose Zone
- Appendix E – Air Monitoring Plan

1.2 BACKGROUND

The former JM Plant Site is located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California (Figure 2). The site is approximately 1,000 feet south of New York Slough and Suisun Bay. This 21-acre parcel is bounded to the north by a Tesoro coke facility and Third Street; to the east by Harbor Street, several small light industrial businesses, and USS Posco Corporation; and to the south and west by residential properties. Most recently, until the facility terminated operations in 2003, the facility was used for the manufacture of commercial roofing materials. The Plant Site consists of Buildings 1 through 4 in the northern portion of the property, a warehouse in the southwestern portion of the site, and a former evaporation pond area, which is currently paved with asphalt. Railroad tracks bisect the central portion of the property.

The current land use and zoning for the Plant Site is industrial. The Owner is currently in negotiations with the City of Pittsburg to re-entitle the Plant Site parcel for single-family residential, multi- family residential and commercial uses.

1.3 OBJECTIVES

The objective of this SMP is to document the following:

- Historical site activities and the nature and extent of materials and chemicals of concern (MCOCs) in site building materials, soils, and ground water;
- Mitigation efforts to be implemented to minimize exposure of human or environmental receptors to MCOCs that may be present at the site prior to, during, and following demolition; and
- Protocols for ensuring that work conducted at the site is performed in accordance with applicable state and federal environmental, health, and safety (EH&S) regulations.

1.4 IMPLEMENTATION AND OVERSIGHT

The risk mitigation efforts specified in this SMP are to be implemented by the entity (hereafter the "Contractor") selected by the Owner to perform abatement and demolition activities at the site. These activities will include abatement of all asbestos-containing materials (ACM) and lead-based paint (LBP), and demolition of the existing structures and utilities on the site. A licensed engineer, geologist, or other environmental professional familiar with environmental monitoring equipment will oversee implementation of the SMP, EH&S regulations and general industrial hygiene practices.

Oversight of ACM abatement at the site will be performed by a third-party Industrial Hygienist (hereafter the "IH") selected by the Owner.

ACM abatement at the site will be performed under the jurisdiction of the Bay Area Air Quality Management District (BAAQMD).

1.5 APPLICABLE INSTITUTIONAL CONTROLS, STATUTES, AND REGULATIONS

Following is a list of all institutional controls, and local, state, and federal laws and regulations that may apply to site abatement and demolition activities.

1.5.1 Federal Statutes and Regulations

National Environmental Policy Act (NEPA), 42 United States Code (USC) 4321 – Administered by the Council on Environmental Quality (CEQ) and the United States Environmental Protection Agency (USEPA), this act addresses projects that constitute major federal actions with the potential to significantly impact the environment.

The NEPA process often invokes one or several other federal statutes as described further in this section. In California, NEPA requirements are often addressed under the California Environmental Quality Act (CEQA), discussed below in Section 1.5.2.

Section 404, Clean Water Act, 33 USC 1344 – Administered by the U.S. Army Corps of Engineers, this act addresses discharges to navigable waters of the United States (including wetlands and streams that are

tributaries to navigable waters), and may apply to discharges of excavated soil or ground water generated by construction and dewatering.

Endangered Species Act, 16 USC 1536 – Administered by the U.S. Fish and Wildlife Service and the National Marine Fisheries Service, this act regulates activities affecting federally protected species. It also protects listed species from harm or "take," which is broadly defined as *"harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct."* The definition of "take" further includes unintentional or incidental take, which might be associated with construction or other activities.

Coastal Zone Management Act, 16 USC 1451 – Administered by the National Oceanic and Atmospheric Administration, this act regulates projects in the coastal zone.

Resource Conservation and Recovery Act of 1976 (RCRA), 42 USC 692 – Administered by the USEPA, this act manages hazardous wastes from "cradle to grave," governing the generation, storage, transportation, and disposal of hazardous waste. This includes excavated soil and/or ground water that exceeds threshold criteria. RCRA also governs underground storage tanks (USTs).

Toxic Substances Control Act of 1976 (TSCA), 15 USC 2601 et seq. – Administered by the USEPA, this act governs the introduction, manufacture, and importation/exportation of chemicals produced in the United States. Relevant to this SMP, TSCA also governs asbestos and lead-based paint hazards.

Emergency Planning and Community Right to Know Act of 1986 (EPCRA), 42 USC 11001 – Also known as Title III of SARA, this act is designed to help communities protect public health, safety, and the environment from chemical hazards. Through the Toxics Release Inventory, a list of all chemicals used and emitted by businesses small and large, it also gives individuals the right to obtain information regarding chemical hazards in their communities. It established the State Emergency Response Commission, responsible for the development of emergency action plans.

Occupational Safety and Health Administration (OSHA) Regulations, 29 Code of Federal Regulations (CFR) Sections 1910.120 and 1926.65 – These regulations govern the applicability and scope of training requirements for personnel involved in the handling of hazardous wastes.

1.5.2 State Statutes and Regulations

CEQA, California Public Resources Code 21000 et seq. and the CEQA Guidelines, 14 California Code of Regulations (CCR) 15000 et seq. – This act creates the state companion to the federal NEPA process, and is invoked by any nonexempt development project that requires public agency approval. This process can require, among other things, an Environmental Impact Report evaluating potentially significant environmental impacts related to the proposed project, as well as associated mitigation measures.

Porter-Cologne Water Quality Control Act of 1969, California Water Code, Division 7, Section 13000 et seq. – This act authorizes the Regional Water Quality Control Boards (RWQCBs) as the lead agencies in protecting the waters of the state. This is accomplished through implementation of the National Pollutant Discharge Elimination System (NPDES) permitting program for surface waters, and through issuing Waste Discharge Requirements for discharges potentially affecting ground water quality.

Safe Drinking Water and Toxic Enforcement Act of 1986, California Health and Safety Code (CHSC) Section 25249.6 et seq. (Proposition 65), 22 CCR 12000 et seq. – Proposition 65 is a voter ballot initiative passed in 1986 that requires the Governor to publish and update at least annually a list of chemicals known by the State of California to cause cancer or reproductive harm. The law prohibits businesses from discharging such chemicals into sources of drinking water and requires that warnings be given to potentially exposed individuals. Section 25249.6 of Proposition 65 requires "clear and reasonable warning" for specified potential chemical exposures.

Air Toxic Hot Spots Information and Assessment Act of 1987, AB 2588 – This requires the Air Resources Board to inventory sources of over 700 toxic air contaminants to assess the health risks of toxic air releases, and notify potentially exposed populations.

CHSC Section 39000 et seq. – The California Clean Air Act empowers regional air quality districts to enact rules and regulations that bring sources of air pollution into compliance with state and federal requirements. Section 41700 prohibits *"discharge from any source whatsoever of such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to…the public."*

California Endangered Species Act, Fish and Game Code, Sections 2050 et seq. – This act mirrors the Federal Endangered Species Act and is implemented by the California Department of Fish and Game. It is specific to the protection of state listed species; identified in the CESA and its implementing regulations.

Title 8 CCR – These regulations, implemented and enforced by the California Division of OSHA, complement the federal statutes governing worker health and safety in hazardous environments and in the presence of hazardous materials.

1.5.3 Local Statutes, Regulations, and Institutional Controls

BAAQMD Rules and Regulations – Local regulations regarding discharge of air contaminants in the BAAQMD, which includes the site. Particularly germane with respect to redevelopment of the site are BAAQMD Regulation 6, which addresses "Particulate Matter and Visible Emissions," and Regulation 8, Rule 40, which addresses "Aeration of Contaminated Soil."

City of Pittsburg Community Noise Ordinance – This ordinance affects the development project in that it restricts the hours of operation for heavy construction machinery.

2.0 ENVIRONMENTAL CONDITIONS

This section summarizes historical operations, site features, and the nature and extent of hazardous materials found on the site, in soils, and in ground water as determined during previous site investigations. Risk mitigation measures to be taken regarding these materials are outlined in Sections 3 and 4.

2.1 SITE-WIDE CONDITIONS

2.1.1 Asbestos-Containing Materials

Previous environmental investigations at the site have revealed the presence of ACMs. These materials include, but are not limited to, transite wall and roofing panels, transite piping, pipe insulation, roofing mastic, vinyl tile flooring, and various ACM debris.

These materials are located throughout the site within the buildings as well as under the concrete slab on the northern side of the warehouse structure on the eastern side of the site.

A description, as well as quantities, and locations of ACMs are reported in the Asbestos Survey Report prepared by Aurora Industrial Hygiene.

2.1.2 Lead-Based Paint Materials

Based upon the date of construction of the buildings on site, it is possible that LBP is present on site structures.

2.1.3 Total Petroleum Hydrocarbon Materials

Based upon the prior site use for manufacturing roofing shingles, the possibility exists of encountering residual total petroleum hydrocarbon (TPH) materials within storage tanks, distribution piping, equipment, and soil.

Previous investigation results at the site have revealed TPH detections in minor amounts, and should not be a concern during the demolition.

2.1.4 Hazardous Materials

Other hazardous materials that will be encountered on site include fluorescent light tubes, sodium-vapor lights, and fluorescent light ballasts.

3.0 RISK MANAGEMENT MEASURES TO BE IMPLEMENTED PRIOR TO DEMOLITION

The following sections include procedural guidelines to ensure that abatement and demolition activities at the site are conducted in accordance with applicable federal, state, and local EH&S regulations.

3.1 RISK COMMUNICATION

3.1.1 Employee Risk Communication

Prior to commencing work in the SMP Area, personnel employed in activities at the site shall be aware of the risks associated with materials present at the site. This communication shall contains at least the following information:

- A general description of historical site activities and the MCOCs associated with such activities;
- A list of known MCOCs present, including a description of the health risks, appearance, exposure symptoms, and means of field identification of these materials, if any; and
- Risk management protocols for the discovery of areas of unknown MCOCs or subsurface structures.

In addition, HSPs prepared for the facility shall include provisions for daily tailgate safety briefings, during which the above information shall be disseminated.

3.1.2 Community Risk Communication

Prior to and during site redevelopment activities, members of the public in neighboring communities shall be made aware of upcoming activities at the site. This public notification shall include quarterly postings in the local newspaper and at local community centers including Pittsburg City Hall. The newspaper and community postings shall contain the following information:

- A description of the site background;
- A schedule of major milestones and upcoming activities;

- The telephone numbers for the relevant regulatory agencies;
- The location(s) of the information repositories for documents associated with the site; and
- Information on how to obtain copies of relevant site documents.

3.2 WORKER HEALTH AND SAFETY

3.2.1 Site-Specific Health and Safety Plan

Site-specific Health and Safety Plans (HSPs) are designed to ensure that site construction activities are performed in a manner protective of the health and safety of site construction workers and interim site users in the vicinity of construction. This SMP is designed primarily to ensure the health and safety of current and future site users outside the immediate vicinity of construction; the development of a site-specific HSP is the responsibility of the Contractor and is beyond the scope of this SMP. ERM's HSP is included as Appendix A.

Following is a list of minimum requirements that any Contractor's site-specific HSP must meet for that Contractor to perform or oversee redevelopment:

- The HSP must be approved by the Site Engineer;
- A discussion of chemical hazards at the site, including acute and chronic health effects, and established occupational exposure limits of chemicals of potential concern identified at the site;
- A discussion of physical hazards known or reasonably expected to be present at the site based on proposed construction, including but not limited to hazards associated with equipment use, environmental hazards (heat stress, etc.), and noise;
- A discussion of engineering controls to be employed to minimize exposure of site workers to hazardous materials encountered during site activities;
- A discussion of required worker qualifications, including training requirements, medical surveillance, and record-keeping (also see Section 3.2.2, below);
- An exposure monitoring plan, including personal workspace monitoring and sampling protocols, appropriate action levels, and field monitoring logs;

- A discussion of general safe work procedures, including site control and security measures, illumination, required personal protective equipment, establishment of work zones and decontamination procedures, and documented daily tailgate safety meetings; and
- Emergency response procedures, including a map to the nearest hospital, an evacuation plan, first-aid procedures, fire protection and response procedures, spill containment procedures, and emergency references (key telephone numbers, addresses, etc.).

3.2.2 Health and Safety Training and Certification

Based on known environmental conditions at the site, the use of personnel trained and certified in EH&S procedures pursuant to OSHA 29 CFR 1910.120, HAZWOPER Training Requirements (OSHA-certified), is advisable on the entire site during abatement and intrusive construction activities. Intrusive construction activities include subgrade utility removal, excavating, trenching, and grading. OSHA-certified workers are required in the following areas if intrusive construction activities are to be performed:

- Previously identified underground transite utility piping; and
- The identified asbestos storage location north of the warehouse structure.

Intrusive construction at locations within the site other than those listed above may be performed by non-OSHA-certified employees. If unknown areas of contamination or subsurface structures are identified pursuant to Section 4.4.2, OSHA-certified employees must perform all remaining intrusive construction at the area in question.

3.3 ABATEMENT MANAGEMENT TO BE IMPLEMENTED DURING DEMOLITION

3.3.1 ACM Abatement

The Asbestos Survey Report conducted at the site by Aurora Industrial Hygiene has identified materials at the site that are both friable and nonfriable ACMs. ACM removal is regulated by the USEPA and BAAQMD pursuant to the National Emission Standards for Hazardous Air Pollutants (NESHAP) portion of the Clean Air Act and BAAQMD

regulations. The following Federal, State and local regulations apply to asbestos abatement:

- 29 CFR Sections 1910.12, 1910.20, 1910.134, 1910.145, and 1910.1001;
- 29 CFR Section 1926.1101;
- 34 CFR Section 231;
- 40 CFR Section 61, Subparts A and M;
- 8 CCR Sections 1529 and 5208;
- 8 CCR Article 2.5;
- 22 CCR Division 4; and
- San Francisco BAAQMD Regulation 11, Hazardous Pollutants Rule 2.

Removal of ACMs at the site must be performed in accordance with NESHAP requirements, BAAQMD regulations, and the Air Monitoring Plan (AMP), prepared by the IH. Collectively, these requirements include provisions for worker health and safety, prevention of releases to the environment, and materials handling and disposal.

A majority of the ACMs will be removed prior to the demolition phase of the project. However, since some of the materials are underground it will be more practical to remove those as they are encountered. An IH will be available at all times to assist in the proper management of all ACMs encountered during the project.

3.3.2 LBP Abatement

Because all buildings at the site were constructed prior to 1978, LBP is likely to be associated with site structures. Regulation 40 CFR 745.113 has relevance regarding LBP removal.

According to 8 CCR Section 1532.1 and 17 CCR Sections 35000-36100, loose and flaking LBP must be removed prior to demolition of impacted structures. Appropriate measures to control the generation of dust particles during building demolition must then be implemented prior to demolition. LBP abatement will be performed according to all applicable regulations and statutes. General dust control measures to be employed during demolition are discussed in Section 4.3.1.

3.3.3 Hazardous Materials Abatement

Fluorescent light tubes, sodium-vapor lights, and fluorescent light ballasts are considered hazardous materials and must be removed intact prior to demolition.

4.0 RISK MANAGEMENT MEASURES TO BE IMPLEMENTED DURING DEMOLITION

This section identifies appropriate risk management measures to be implemented at the site to minimize the potential for human or environmental exposure to materials encountered during demolition activities. Where applicable, the risk management activities address individual environmental media and provide risk mitigation efforts for each.

4.1 ACCESS CONTROL DURING DEMOLITION

The potential for unauthorized access to the construction site and the accompanying risk of exposure to hazardous materials shall be managed as follows:

- A 6-foot-high, chain-link fence exists around the site perimeter. Access to the site will be restricted by control points (i.e., gates) that will be monitored and locked during non-construction hours. The fence shall be examined daily and any necessary repairs made.
- "No Trespassing" signs in both English and Spanish shall be posted every 500 linear feet along the fence line.
- As mandated in Proposition 65, public notices shall be posted along the fence line alerting the public that materials with known adverse health effects are being recovered at the site.

4.2 IDENTIFICATION OF DEMOLITION ACTIVITIES THAT COULD IMPACT HUMAN AND/OR ENVIRONMENTAL HEALTH

Demolition of the site is likely to include various site activities that may create airborne dust. The following activities have the potential to impact human or environmental receptors:

- Unauthorized access to the SMP area during construction;
- Dust generation associated with demolition of buildings, intrusive construction, movement of demolition and transportation equipment, and winds traversing exposed soils or stockpiles;
- Off-site transport of sediment by surface runoff;

- Stockpiling and reuse of hazardous soil;
- Inadvertent off-site transport of soils on truck wheels or from unsecured truck beds; and
- Dewatering.

4.2.1 Subsurface Structure Demolition

Subsurface utilities and structures harboring hazardous materials may be brought to the surface during demolition activities. If the location of these structures is known and anticipated, then demolition will be conducted in accordance with the soil management guidelines presented in Section 4.4.1.

In the event that unknown subsurface structures are encountered, demolition activities will be conducted in accordance with the contingency protocols set forth in Section 4.4.2.

4.3 RISK MITIGATION EFFORTS TO ADDRESS MCOCS IN AIR

4.3.1 Dust Control

Contractors shall implement one or more of the following dust control measures during demolition to minimize dust generation, and to maintain compliance with the Air Monitoring Plan (AMP). Successful dust mitigation will accomplish the following goals:

- Reduce the potential for health impacts to construction workers;
- Prevent violations of ambient air quality standards;
- Minimize nuisance dust complaints from facility neighbors; and
- Minimize the migration of MCOCs adhered to fugitive dust particles outside the site.

4.3.1.1 Specific Dust Control Measures

Dust control measures to be implemented at the site during construction are identified below. These dust control measures were developed in accordance with BAAQMD particulate matter (PM_{10}) control measures outlined in the CEQA Guidelines. These dust control measures shall include the following:

- Water all active construction areas twice daily, or more frequently if needed, to prevent visible dust plumes from leaving the site;
- Mist or spray water while loading or unloading soil transportation vehicles as needed to prevent dust generation;
- Minimize drop heights when loading transportation vehicles carrying sand, soil, or other loose materials;
- Use tarpaulins or other effective covers for trucks carrying sand, soil, or other granular loose material, or maintain 2 feet of freeboard in all such trucks;
- Pave, apply water 3 times per day, or apply non-toxic soil binders on all unpaved access roads, parking areas, and staging areas at construction sites;
- Sweep all paved access routes, parking areas, and staging areas daily if soil is visible;
- Sweep public streets daily if visible soil material is carried into the street;
- Limit vehicular and equipment traffic speeds on all unpaved roads to 15 miles per hour;
- Line all boundaries between construction areas and public roadways with hay bales or silt fencing;
- Establish stationary downwind monitoring points and implement a monitoring program to determine whether fugitive dust levels leaving the property are below site-specific thresholds at all times;
- Apply non-toxic soil stabilizers to inactive, unvegetated construction areas where native soil was disturbed, if such areas have been inactive for 2 weeks;
- Enclose, cover, stabilize, or water any stockpiles in accordance with Section 4.4.1.3; and
- Implement erosion control measures to prevent soil from migrating off site in surface runoff in accordance with Section 4.5.1.

Should mitigation efforts prove inadequate to prevent visible dust plumes from leaving the site, one or more of the following additional dust control measures shall be implemented at the contractor's discretion:

- Wash all truck and equipment wheels and tracks prior to leaving the site;

- Install wind breakers at the windward sides of construction areas;
- Suspend excavation and grading activities when instantaneous wind gusts exceed 25 miles per hour; and/or
- Limit the area subject to excavation, grading, or other dust-generating activity to one area at a time.

Should these dust control measures prove inadequate to prevent visible dust plumes from leaving the site, excavation and grading activities shall be suspended until wind speeds have diminished.

To minimize the creation of additional exhaust emissions, the following protocols shall be followed:

- Construction equipment shall be stored at the facility, except when not in continuous use;
- Alternative-fueled vehicles and equipment shall be used as practicable;
- Idling times shall be minimized, and not more than 5 minutes;
- Equipment shall be tuned and maintained per manufacturer's instructions; and
- Heavy equipment usage shall be restricted from 7 AM to 7 PM from Monday through Friday, and from 8 AM to 5 PM on Saturday, as specified in the City of Pittsburg Community Noise Ordinance.

4.3.1.2 Documentation of Dust Control Measures

Contractors will be required to record all dust mitigation activities daily. Logs are to be maintained for 60 days following the completion of construction where dust mitigation was implemented.

4.3.2 Air Monitoring Plan

In addition to dust control measures, an AMP has been developed by Aurora Industrial Hygiene to ensure the health and safety of off-site residents during construction. The AMP uses downwind perimeter and constituent-specific air monitoring action levels to ensure that constituents migrating off site, including dust, do not exceed state or federal ambient air quality standards. The AMP is included as Appendix E.

4.4 RISK MITIGATION TO ADDRESS MCOCS IN SOIL

4.4.1 Soil Management Protocols during Site Demolition

All handling, movement, stockpiling, and reuse of soils within the site are subject to protocols delineated in this section. This section also specifies contingency protocols to manage risk in the event that unknown MCOCs or structures are discovered.

4.4.1.1 Soil Excavation and Confirmation Sampling

The bottoms and sidewalls of any excavations are to be sampled according to protocols set forth in American Society for Testing and Materials (ASTM) E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*, and ASTM D4700-91, *Standard Guide for Soil Sampling from the Vadose Zone*. These documents are attached as Appendices C and D, respectively.

At a minimum, one sample from the excavation bottom and one sample composited from the four excavation sidewalls (post-excavation samples) will be analyzed for the following:

- TPH as diesel and motor oil by USEPA Method 8010;
- Semivolatile organic compounds by USEPA Method 8270;
- Volatile organic compounds by USEPA Method 8020; and
- California Title 22 Metals by USEPA Methods 6010B and 7470 (for mercury).

Should an excavation wall exceed 100 feet in length, samples should be collected at a minimum of every 100 linear feet and composited. If the excavation exceeds 400 square feet in area, one bottom sample should be collected from each 400-square-foot section and composited to characterize post-excavation soil quality.

4.4.1.2 Soil Movement and Handling

Soil may be handled and moved from one portion of the site to another, as needed, within the limitations established in Section 4.4.1.7. Potential impacts associated with movement and handling are addressed in the AMP (see Section 4.3.2). Soil movement shall be conducted pursuant to the Traffic Management Plan prepared by the Contractor.

4.4.1.3 *Soil Stockpiles and Dust Generation*

Soils excavated from the site may require stockpiling prior to reuse or disposal. The risk management measures discussed below will address potential risks from wind transport, surface erosion, and unauthorized access.

All stockpiles shall be placed atop water-impermeable plastic sheeting within a soil berm, as per the Storm Water Pollution Prevention Plan (Appendix B). Several alternatives exist to minimize the generation of dust from soil stockpiles:

- Cover the stockpiles with anchored impermeable sheeting;
- Enclose the stockpiles in a covered structure;
- Hydroseed the stockpiles;
- Apply a non-toxic soil stabilizer to the surface of the stockpiles; or
- Regularly spray stockpiles with water to control dust.

One or more of these dust mitigation methods will be selected based on field conditions such as weather and the size of the stockpile(s). Selection of stabilization efforts shall be at the Contractor's discretion, provided compliance with the AMP and BAAQMD regulations are ensured.

Soils that are stockpiled for greater than 90 days must first be analyzed to determine whether they meet the criteria for a hazardous waste under federal or state regulations. Should the soils meet any of the hazardous waste criteria, they must be disposed of accordingly within 90 days of generation. This waste characterization shall be performed pursuant to the USEPA's Guidance Document SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (USEPA, 2001b).

4.4.1.4 *Soil Stockpiles and Erosion Management*

This section applies to the following types of stockpiles:

- Stockpiles left in place for more than 30 days;
- Stockpiles in active construction areas that exceed 4 acres in size;
- Any stockpile left in place during the rainy season (15 October through 1 April); and
- Stockpiles of soils saturated with free product.

The guidelines below will ensure that stockpiled soils do not erode and potentially impact off-site receptors. For stockpiles meeting any of the criteria listed above, erosion control measures shall be implemented and maintained, and shall include the following:

- Construction of a geotextile (filter) fence around the stockpile;
- Construction of a hay bale barrier around the stockpile;
- Use of a secured, impermeable stockpile cover;
- Use of drainage basin silt sacks in drainage basins within 250 feet of the stockpile; and
- Collection, containerization, waste characterization, and disposal in accordance with applicable regulations of any water that collects within the soil berm surrounding the stockpile.

4.4.1.5 Soil Stockpiles and Access Management

Provided that stockpiles will be located within active construction zones, the access restrictions set forth in Section 4.1 will be sufficient to control stockpile access. However, should the stockpile be located outside an active construction zone, access will be controlled using a chain-link fence with locked gates and appropriate warning signs in English and Spanish.

Stockpiles of the following types of soil shall be segregated from soils of different origin and surrounded by a 6-foot-high, locked, chain-link fence until determined to be nonhazardous or disposed of off-site within 90 days:

- Soils saturated with free product; and
- Soils suspected or shown to be hazardous.

4.4.1.6 Soil Stockpiles and Monitoring

Daily inspection of stockpiles shall be conducted for stockpiles of contaminated or uncharacterized materials, any stockpile located outside an active construction zone, any stockpile in place during a storm event lasting longer than 48 hours, and on the day following a storm event. Weekly inspection shall be conducted for 4 weeks after generation of any stockpile, and weekly for 4 weeks following the implementation of any erosion control device or observance of a failure thereof. Quarterly inspections shall be conducted in all other cases. Inspections of the integrity of the stockpile shall include an assessment of the following:

- The integrity of erosion control efforts;
- The effectiveness of access control measures; and
- The need for repairs to maintain erosion or access control.

Tears in a stockpile cover shall be repaired or the cover replaced, if the tears exceed 6 inches in length and one-eighth inch in width. Soil washouts are to be replaced and recovered.

To facilitate adherence to the SMP, a stockpile log shall be kept by the on-site environmental professional. The log shall include the following information:

- Date(s) of soil generation;
- Approximate location of excavation(s) generating stockpiled soils;
- Location of stockpile;
- Final destination of stockpiled soils;
- Log of any erosion control measures implemented or modifications made; and
- Stockpile inspection documentation.

4.4.1.7 Soil Reuse

It is the Owner's request that excavated soils be reused at the site to the extent possible. Soils described below are restricted from relocation and reuse at the site:

- Soils that are saturated with free-phase petroleum product; and
- Soils exhibiting other evidence of apparent MCOCs, prior to characterization of such soils proving them to be nonhazardous.

Contractors shall avoid commingling soils meeting any of the above-referenced criteria with soils excavated from other areas. Soils meeting any of the above criteria shall be stockpiled in accordance with Section 4.4.1.5. If shown to exceed either hazardous criteria or industrial Preliminary Remediation Goals following laboratory analysis, soils shall be disposed of according to the provisions of Section 4.4.1.8, below. Under no circumstances shall soils characterized as hazardous be reused at the site.

4.4.1.8 *Soil Disposal*

Excavated soils that are not reused at the site must be fully characterized for disposal and managed accordingly. If characterization determines that soils are hazardous under RCRA or California USEPA Hazardous Waste guidelines, they require appropriate handling and disposal at a licensed hazardous waste treatment, storage, and disposal facility.

4.4.1.9 *Soil Transportation*

Soils requiring off-site transportation must be fully characterized prior to removal from the site. If characterization determines the material is hazardous under RCRA or California EPA Hazardous Waste guidelines, the materials must be managed in accordance with RCRA and/or California EPA waste-tracking protocols. If characterization determines that the material is a designated waste, it will be managed and transported under Bill of Lading protocols.

4.4.2 ***Contingency Protocols for the Discovery and Management of Unknown MCOCs or Structures***

During excavation of subgrade utilities, it is reasonably anticipated that unknown MCOCs and/or structures may be encountered. If such unknown structures are encountered, risk mitigation measures should be implemented in these areas as described in the subsections below.

4.4.2.1 *Identification and Management of Unknown Areas of MCOCs*

Prior to commencement of construction at the site, the contractor shall review available data to identify any known areas of chemical presence, including chemical location, type, and concentration.

Contingency monitoring protocols will be triggered by the identification of any nonconforming soil or ground water conditions. Such conditions may be noted by visual or olfactory differences, or differences in physical composition from surrounding soils, and shall include, but not be limited to, the following:

- Oily or shiny soils;
- Soils saturated with a liquid other than water (i.e., free-phase liquids);
- Soils with an appreciable chemical or hydrocarbon odor;

- Soils with elevated organic vapor measurements (as measured with a photoionization detector [PID] or flame ionization detector [FID]); and
- Soil discoloration not related to lithologic facies changes.

If areas of previously unidentified apparent MCOCs are encountered, work shall cease in that area immediately. The on-site environmental professional shall be contacted immediately and their assistance requested in determining further sampling or mitigation. Further construction in the area shall not proceed until authorized by the on-site environmental professional. Materials that trigger these protocols shall be handled pursuant to Section 4.4.1 until proven nonhazardous.

To minimize down time, samples should be collected immediately and analyzed by a state-certified laboratory for any suspected MCOCs. Target analytes should be based on a review of field evidence, as well as existing analytical data from the area. Should the unidentified material prove to be contaminated, further actions shall be undertaken only by OSHA-certified personnel and under proper oversight.

4.4.2.2 Identification and Management of Unknown Structures

During intrusive construction activities at the site, it is possible that underground storage tanks (USTs), sumps, drainage structures, or other previously unidentified subsurface structures may be encountered.

CHSC Chapter 6.7 governs the removal and remediation of contamination associated with USTs. The RWQCB is responsible for oversight of UST removal and any associated remediation activities. In the event that a UST or associated vents or piping are discovered, the RWQCB shall be contacted and their assistance requested.

Other underground structures shall be assessed as follows:

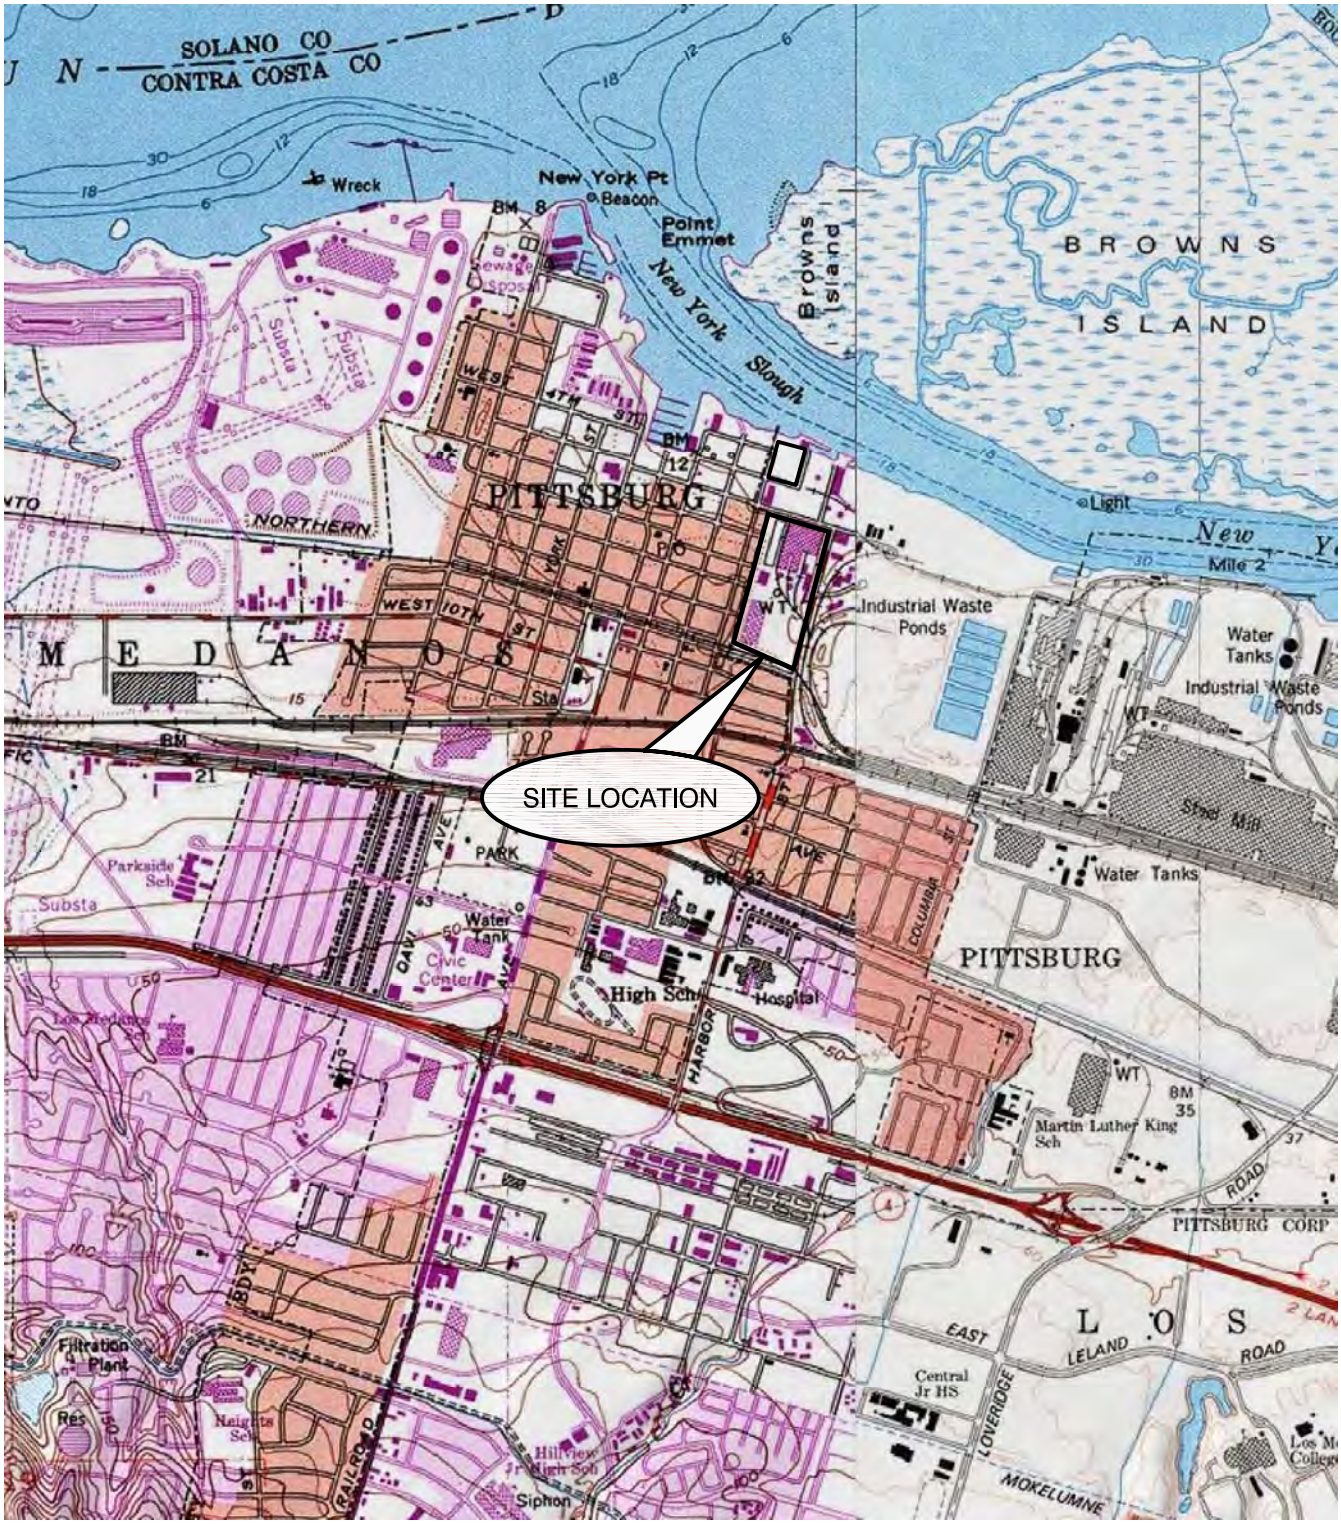
1. The structure shall be inspected to assess whether it contains any indication of chemical residuals or free-phase liquids other than water. This assessment shall be conducted by the Contractor's designated environmental professional, and shall be based on visual evidence and the results of vapor monitoring using a PID or FID. Under no circumstances shall any personnel enter an unknown subsurface structure at any time. If chemicals are not indicated within the structure by the above-referenced means, the Contractor may remove the structure in a safe manner.

2. If liquids are present in the structure, samples shall be collected and submitted to a state-certified laboratory for analysis. Liquids may be temporarily drummed or collected by vacuum truck while analysis is pending. Based on analytical results, the liquids shall be disposed of under the direction of the Contractor's environmental professional in accordance with all applicable environmental laws and disposal requirements.
3. If solids are present in the structure and MCOCs are suspected, they shall be sampled and managed as described above.
4. If contaminated liquid or solid media are present in the structure, the structure shall be inspected for physical integrity following removal of the contaminated media. The Contractor's environmental professional shall document the results of this inspection, including an estimation of the volume and former use of the structure. The structure shall then be excavated and disposed of at the direction of the environmental professional.
5. Once the structure is removed, soils adjacent to and beneath the structure shall be assessed for MCOCs through visual observation and organic vapor analysis and the results documented. If MCOCs are suspected, soils should be managed as discussed in Section 4.4.1.

4.5 RISK MITIGATION EFFORTS TO ADDRESS MCOCS IN SURFACE AND/OR GROUND WATER

4.5.1 Off-Site Runoff Control

To prevent the migration of soil from the site into adjacent areas by surface drainage, runoff control measures shall be implemented around the perimeter of the active construction site and shall include the following:



- Erection of a filter fabric fence around the entire active construction site;
- Construction of a hay bale barrier around the entire active construction site; and
- Placement of silt sacks in catch basins in the active construction area and public streets immediately adjacent to the active construction area.

Runoff controls shall be inspected daily during storm events of greater than 48 hours' duration, weekly during the rainy season (15 October

through 1 April) and quarterly during the remaining months. Any failures of the runoff control devices shall be immediately rectified. If visible soil runoff is observed leaving the site, runoff control measures will be amended immediately by the Contractor.

1.0 INTRODUCTION

This Health and Safety Plan (HSP) has been developed by ERM-West, Inc. (ERM) to establish the health and safety procedures required to minimize potential hazards to personnel involved in activities associated with the abatement and demolition activities at the Former Johns Manville Plant Site (hereafter the "site"). The site location is shown on Figure 1. The purpose of the current scope of work is the abatement of all on-site hazardous materials and demolition of the site structures to rough-grade conditions in preparation for the future redevelopment of the site.

Field activities generally include daily oversight of abatement and demolition activities, media sampling for characterization of unknown materials, and progress and recordkeeping of daily activities.

The provisions of this HSP directly apply to ERM personnel and contractors who will be potentially exposed to safety and/or health hazards related to this project. This HSP does not directly apply to client personnel, although ERM will advise the client on the safety and health aspects of the work based on the guidelines specified in this HSP.

This HSP has been written to comply with ERM's health and safety policies and requirements. The procedures in this HSP have been developed based on current knowledge regarding the specific chemical and physical hazards that are known or anticipated to be potentially associated with the site. All contractors who use this HSP must read and sign the "Disclaimers and Limitations on Use" included in Attachment A-1.

It is ERM's policy that activities covered by this HSP must be conducted in complete compliance with this HSP and with all applicable federal, state, and local health and safety regulations, including:

- California Occupational Health and Safety Administration (CAL-OSHA), Title 8 of the California Code of Regulations (CCR), Section 5192; and
- Federal Occupational Health and Safety Administration (FED-OSHA) Construction Industry Standards in Title 29 of the Code of Federal Regulations (CFR), Part 1926.

On-site personnel who cannot, or will not, comply with the policies and requirements incorporated into this HSP will be excluded from project activities. Prior to the commencement of field activities, all ERM and

subcontractor personnel covered by this HSP must review this document and sign and return the Health and Safety Signature Sheet to the Project Manager. A copy of this form is provided in Attachment A-1.

1.1 SITE DESCRIPTION AND HISTORY

This section provides information regarding the site location and proposed activities at the site. Site location and land use are described, hazardous chemicals associated with site activities and known releases are identified, and general site characteristics are presented below.

1.1.1 Site Location

The former JM Plant Site is located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California (Figure 2). The site is approximately 1,000 feet south of New York Slough and Suisun Bay. This 21-acre parcel is bounded to the north by a Tesoro coke facility and Third Street; to the east by Harbor Street, several small light industrial businesses, and USS Posco Corporation; and to the south and west by residential properties. The Plant Site consists of Buildings 1 through 4 in the northern portion of the property, a warehouse in the southwestern portion of the site, and a former evaporation pond area, which is currently paved with asphalt. Railroad tracks bisect the central portion of the property.

The current land use and zoning for the Plant Site is industrial. The Owner is currently in negotiations with the City of Pittsburg to re-entitle the Plant Site parcel for single-family residential, multi- family residential and commercial uses.

1.1.2 Operations History

The main manufacturing plant was constructed between 1925 and 1928. In 1957, a large warehouse was constructed south of the main manufacturing facility. The principal products produced at the site prior to 1980 (the year that manufacture of asbestos-containing product was terminated) included asbestos-cement products, asphalt roofing materials, and asbestos-containing pipe covering. A series of four asphalt stills were used to convert heavy oil to asphalt. The stills were fueled by fuel oil and later with natural gas. During the process of converting heavy oil to asphalt, off-gas vapors were collected, condensed, and mixed with water to form an oil-water slurry. The slurry was conveyed through an underground pipe to an evaporation pond on the site, where it was

burned approximately twice a year. The evaporation pond was in use in 1946 and remained relatively constant in size until 1959, when it was filled with scrap and construction debris.

Until its closure in 2003, the site manufactured roofing materials and blows asphalt, which involves the conversion of asphalt flux to blown asphalt. During the processes, petroleum-based resins and solvents are used. During the asphalt-blowing process, off-gas vapors are collected and transferred via condenser lines and mixed with water to form an oil-water slurry that is conveyed to a 8,000-gallon aboveground storage tank. The oily water is transferred to an oil-recycling facility as needed by an outside contractor.

1.2 CONSTITUENTS OF CONCERN

The following sections summarize constituents historically detected in soil and ground water at the site.

1.2.1 Semivolatile Organic Compounds Detected in Soil

The semivolatile organic compounds chrysene, diethylphthalate, 2-methylnaphthalene, naphthalene, and phenanthrene were detected at maximum concentrations of 0.27, 0.12, 0.26, 0.39, and 26 milligrams per kilogram (mg/kg) respectively.

1.2.2 Petroleum Hydrocarbons

According to analytical results, petroleum hydrocarbons have been identified in site soil. Investigations at the site detected concentrations of petroleum hydrocarbons ranging from 400 to 93,000 mg/kg.

Ground water analytical results from samples collected at the site have identified impacts of total petroleum hydrocarbons as diesel and motor oil (TPH-d and TPH-mo, respectively). Based on the results, detected concentrations of TPH-d ranged from 0.14 to 51.0 mg/kg, and detected concentrations of TPH-mo ranged from 0.31 mg/kg to 10.0 mg/kg.

1.2.3 Metals Concentrations Detected in Ground Water

Arsenic, antimony, barium, chromium, copper, molybdenum, nickel, thallium, and zinc were detected in soil samples at the site. Maximum concentrations of these metals are summarized as follows:

Metals	Maximum Concentration in Ground Water (mg/kg)
Arsenic	0.038
Antimony	0.12
Barium	0.68
Chromium	0.008
Copper	0.051
Molybdenum	0.073
Nickel	0.036
Thallium	0.023
Zinc	0.28

1.2.4 Volatile Organic Compounds

The volatile organic compounds (VOCs) toluene, ethylbenzene, and xylenes were detected in soil samples collected at the site at maximum concentrations of 0.11, 0.15, and 1.2 mg/kg respectively.

The VOCs methylene chloride, 1,1-dichloroethane, and 1,1-dichloroethene were detected in ground water samples collected at the site at maximum concentrations of 0.095, 0.028, and 0.0051 mg/kg respectively.

1.2.5 Asbestos-Containing Materials

Asbestos-containing materials (ACMs) are known to be present as building materials throughout the site. These materials include, but are not limited to, transite cement wall and roof panels, transite utility piping, pipe insulation, roofing mastic, vinyl tile flooring, and various ACM debris. These materials are documented in the *Asbestos Survey Report* prepared by Aurora Industrial Hygiene in September 2004.

ACM are known to be present within fill materials found in the former evaporation pond. Site investigation performed by Sensible Environmental Solutions (SES) under ERM's direction in July 2004 found various types of ACM in debris within the fill materials. Sampling performed by SES found concentrations of chrysotile ACM ranging from nondetectable to 80 percent.

1.3 PROPOSED SCOPE OF WORK

Work scheduled to be performed at the site may consist of, but is not limited to, the following activities:

- ACM abatement;
- Lead-based paint abatement;
- Demolition of building structures;
- Demolition of subgrade utilities and structures;
- Rough grading; and
- If necessary, confirmation soil sampling.

2.0 KEY PERSONNEL

The organization and responsibilities for implementing safe project activities, and more specifically, the requirements contained in this HSP, are discussed in this section. The key personnel for this project are listed in Table 1.

Table 1 Key Project Personnel

Title	ERM Personnel
Project Manager (PM)	Mike Quillin
Task Manager/Site Health & Safety Officer (TM/HSO)	Don Ludlam
Internal Health and Safety Coordinator (IHSC)	Robin Woolson
Certified Asbestos Consultant (CAC)	Independent Contractor
Principal-in-Charge (PIC)	Ben Leslie-Bole
Project Engineer	Kevin Mucha
Field Personnel	Josh Pfaff, Chris Gonzales, Rob Dyer, Jason Flattery

All contractors must have received FED-OSHA training per 29 CFR 1910.120, and must be certified to work on hazardous waste sites.

2.1 PROJECT MANAGER

ERM's PM is responsible for ensuring the overall health and safety of this project and for ensuring that the requirements described herein are understood and followed by key project personnel. The PM often serves in the role of TM/HSO and in such cases the PM is responsible for the tasks and responsibilities described in Section 2.2.

2.2 TASK MANAGER/SITE HEALTH AND SAFETY OFFICER

The ERM TM/HSO has primary responsibility for ensuring the overall health and safety of this project, including the primary responsibility for enforcing HSP requirements once work begins.

The TM/HSO has the authority to immediately correct all situations where HSP noncompliance is noted and to immediately stop work in cases where an immediate danger is perceived.

The TM/HSO's specific responsibilities include:

- Ensuring that all project personnel have received a copy of and have read this HSP, and have completed the Health and Safety Signature Sheet (Attachment A-1);
- Ensuring that all contractors who use this HSP read and sign the "Disclaimers and Limitations on Use" (Attachment A-1);
- Requiring the attendance of all site personnel to a Job Safety Briefing (also referred to as tailgate safety briefing) apprising them of the contents of this HSP and specific hazards identified to be present at the facility prior to performing work and if work locations or task(s) change during a day, and documenting this briefing on the Job Safety Briefing Form (included in Attachment A-1);
- Ensuring that sufficient personal protective equipment (PPE), as required by this HSP, is available during the project, and procuring and distributing the PPE and air monitoring instrumentation needed for the project;
- Verifying that all PPE and health and safety equipment is in good working order;
- Obtaining all subcontractor documentation of employee participation in a medical monitoring and training plan;
- Maintaining a high level of health and safety consciousness among employees at the facility;
- Maintaining communications with the IHSC, as referenced in the following section, in the event of any health and safety conflicts;
- Setting up and maintaining the personnel decontamination facility;
- Controlling site entry for unauthorized personnel;
- Supervising and monitoring the safety performance of all personnel to ensure that required health and safety procedures are followed and correcting any deficiencies;
- Conducting accident/incident investigations and preparing investigation reports (an Accident/Incident Investigation Form is included in Attachment A-1); and
- Initiating emergency response procedures.

2.3 INTERNAL HEALTH AND SAFETY COORDINATOR

ERM's IHSC is responsible for the preparation, interpretation, and modification of this HSP. Modifications to this HSP that may result in less stringent precautions cannot be undertaken by the TM/HSO without the approval of the IHSC.

Specific responsibilities of the IHSC include:

- Advising the TM/HSO on matters relating to health and safety on this project;
- Maintaining contact with the PIC in the case of injury, exposure, or other related issues;
- Recommending appropriate PPE and air monitoring instrumentation to protect personnel from potential hazards present on site;
- Performing field audits, when necessary, to monitor compliance with the HSP and its effectiveness;
- Conducting or directing personal exposure monitoring, where required and where deemed necessary, to determine the adequacy of protective measures and PPE specified by this HSP;
- Maintaining contact with the TM/HSO to regularly evaluate project conditions and new information that might require modification to this HSP;
- Working with the TM/HSO to ensure that sufficient PPE is available at the site; and
- Conducting briefing meetings, when necessary, to apprise personnel of the contents of this HSP and the project hazards.

2.4 CERTIFIED ASBESTOS CONSULTANT

All ACM abatement work will be performed under the direction of, and in consultation with, a California Certified Asbestos Consultant (CAC) working under an independent contract with the owner of the site. During site work, the CAC's role will be to visually observe all ACM abatement activities and ensure that those activities are performed in accordance with applicable asbestos regulations. The CAC will also conduct oversight for the appropriate dust abatement during those operations. The CAS will be available for consultation during site activities, as needed. Additionally, the CAC may collect samples of suspect ACMs identified during abatement and demolition activities.

If collected, those samples will be transferred to a certified asbestos laboratory where they will be analyzed by polarized light microscopy, consistent with the proposed scope of work for the abatement and demolition activities.

2.5 PRINCIPAL-IN-CHARGE

ERM's PIC is responsible for assisting the IHSC in case of injury, exposure, or with any other issues in which the IHSC may need guidance or technical support. The PIC may also serve in the role of IHSC, and in such cases, the PIC is responsible for ensuring the tasks as described in Section 2.3 are accomplished as necessary.

2.6 FIELD PERSONNEL

All field and subcontractor personnel are responsible for following HSP procedures and for performing their work in a safe and responsible manner. Specific requirements include:

- Obtaining a copy of this HSP and reading it, in its entirety, prior to the start of field activities;
- Signing the Health and Safety Signature Sheet (Attachment A-1), acknowledging receipt and understanding of this HSP;
- Bringing forth any questions or concerns regarding the content of the HSP to the TM/HSO or IHSC prior to the start of work;
- Reporting accidents/incidents and the presence of potentially hazardous working situations to the TM/HSO; and
- Complying with the requests of the TM/HSO.

3.0 PARTICIPANT QUALIFICATIONS

To participate in this project, employees must be trained, as well as involved with medical surveillance and recordkeeping programs. The details associated with these requirements are briefly described below.

3.1 TRAINING REQUIREMENTS

All ERM and subcontractor personnel working on the site will have completed an extensive training course and have previously worked at least 3 days at a hazardous waste site. The training course must be designed to meet the requirements of 29 CFR 1910.120. The training course must consist of a combination of 40 hours of classroom and field exercises, plus an annual 8-hour refresher.

All site participants will be required to show proof of current training (less than 1 year since initial or refresher training) prior to field activities. Intended participants without current training documentation will be barred from site activities.

Additionally, all personnel who are required to use respirators and other PPE must be trained in their proper selection, use, and limitations (see Section 6.1 - Personal Protection).

3.2 MEDICAL SURVEILLANCE

All on-site personnel, subcontractors, and visitors will be required to have a written statement from a licensed physician stating they have had a medical examination that meets the requirements of 29 CFR 1910.120. This examination must include pulmonary function testing, as well as certification by the physician of the employee's ability to wear a negative-pressure respirator and perform strenuous work. If a person sustains an injury or contracts an illness related to work on site that results in lost work time, he/she must obtain written approval from a physician to regain access to the site.

3.3 RECORDKEEPING

Air monitoring via industrial hygiene monitoring or direct reading instrumentation will become part of the written record. Both medical and air monitoring data will be retained for 30 years. Training records shall be maintained in project files and are available for inspection at any time. Subcontractor training and medical surveillance certification will also be maintained.

4.0 HAZARD EVALUATION

The following subsections summarize the potential chemical and physical hazards associated with site activities based on known conditions.

4.1 CHEMICAL HAZARDS

Based on existing analytical data for soil and ground water collected at the site, a discussion of the potential primary chemicals of concern at the site include (VOCs, polynuclear aromatic hydrocarbons [PAHs], TPH, and metals) is presented in the following subsections. Based on the site's operational history and the building materials present on site, asbestos is addressed as well.

4.1.1 Polynuclear Aromatic Hydrocarbons

PAHs constitute a class of materials of which benzo[a]pyrene (BaP) is one of the most common and also the most hazardous. In general, PAHs can be formed in any hydrocarbon combustion process and may be released from oil spills. The less efficient the combustion process, the higher the PAH emission factor is likely to be. The major sources are stationary sources, such as heat and power generation, and refuse burning; and industrial activity; such as coke ovens and coal refuse heaps. Because of the large number of sources, people are exposed to very low levels of PAHs every day.

Certain PAHs, such as the more common BaP, have been demonstrated to be carcinogenic at relatively high exposure levels in laboratory animals. BaP is a yellowish crystalline solid that consists of five benzene rings joined together. It is highly soluble in fat tissue and has been shown to produce tumors in the stomachs of laboratory mice. In addition, skin cancers have been induced in a variety of animals at very low levels and unspecified lengths of application.

It is important to recognize the PAHs ability to adhere to soil and other particulates. Therefore, good particulate emission controls and the use of air-purifying respirators with particulate filters are required for protection against airborne PAH hazards. The current CAL-OSHA permissible exposure limit (PEL) is listed as 0.2 milligrams per cubic meter (mg/M^3) for benzene-soluble coal tar pitch volatiles.

4.1.2 Total Petroleum Hydrocarbons

Exposure to petroleum hydrocarbons can produce narcotic effects such as dizziness, headaches, and giddiness similar to alcohol intoxication. Petroleum hydrocarbons are also an irritant to the mucous membranes and can irritate the eyes, throat, and skin.

4.1.2.1 Total Petroleum Hydrocarbons as Diesel

Diesel is a mix of hydrocarbons, chiefly of the methane series having 10 to 16 carbon atoms per molecule. It is a severe skin irritant with systemic effects by ingestion. Diesel is combustible when exposed to heat or flame and can react with oxidizing materials. The vapor is also moderately explosive when exposed to heat or flame.

4.1.2.2 Total Petroleum Hydrocarbons as Motor Oil

Heavy waste oils, including lubricants, grease, and used motor and hydraulic fluids, have been shown to cause skin cancer during prolonged dermal exposure in laboratory animals. Therefore, dermal protection must be provided when contact with used oil is suspected. Contaminated skin should be washed as soon as possible.

4.1.3 Metals

Specific metals of concern detected at the site and the respective exposure hazards for these metals are summarized below.

4.1.3.1 Antimony

Antimony is a silvery-gray, lustrous metal. It is an experimental poison and a questionable carcinogen with experimental carcinogenic data. It is a moderate fire and explosion hazard in the forms of dust and vapor when exposed to heat or flame. Antimony can react violently with acids, halogens, and oxidants. The current Cal-OSHA PEL is listed as 0.5 mg/M^3.

4.1.3.2 Arsenic

Arsenic is a naturally occurring, gray, metal-like, element, which is normally found in the environment combined with other elements such as oxygen, chlorine, and sulfur (inorganic arsenic). Organic forms of arsenic are usually less harmful than inorganic forms. Inorganic arsenic has no smell or taste. Health effects via ingestion include irritation of the stomach and intestines, pain, nausea, vomiting, and diarrhea. Blood cell

changes, blood vessel damage and impaired nerve function can also result from chronic arsenic ingestion. Other effects include skin changes, irritation of the throat, increased risk of cancer of the liver, bladder, kidney, and lung. The current Cal-OSHA PEL is listed as 10 micrograms per cubic meter ($\mu g/m^3$) for inorganic forms of arsenic.

4.1.3.3 Chromium

Chromic acid and its salts have a corrosive action on the skin and mucous membranes. The lesions are confined to the exposed parts, affecting chiefly the skin of the hands and forearms, and the mucous membranes of the nasal septum. Chromate salts are human and experimental carcinogens of the lungs, nasal cavity, and paranasal sinus, and are also experimental carcinogens of the stomach and larynx. Hexavalent compounds are more toxic than trivalent. The CAL-OSHA PELs for trivalent and metal chromium compounds are both 0.5 mg/M^3. The PELs for water-soluble hexavalent compounds and water-insoluble hexavalent compounds are 0.05 mg/M^3 and 0.01 mg/M^3, respectively.

4.1.3.4 Copper

In its elemental form, copper is a common metal with a distinct reddish color. Human systemic effects by ingestion include nausea and vomiting. In animals, inhalation of copper dust has caused hemolysis of the red blood cells, deposition of hemofuscin in the liver and pancreas, and injury to the lung cells. The current Cal-OSHA PEL for copper (as a dust) is listed as 1 mg/M^3.

4.1.3.5 Nickel

Nickel dust has been classified as a Class A carcinogen by the EPA. It has been shown to cause lung and nasal cancer upon prolonged exposures. It is a poison by ingestion. Ingestion of soluble nickel salts causes nausea, vomiting, and diarrhea. Hypersensitivity to nickel is common and can cause allergic contact dermatitis, pulmonary asthma, conjunctivitis, and inflammatory reactions around nickel-containing medical implants and prostheses. The current CAL-OSHA PEL for nickel is listed as 0.1 mg/M^3 for soluble compounds, and 1 mg/M^3 for insoluble compounds.

4.1.3.6 Zinc

Zinc is a bluish-white, lustrous metallic element. Human systemic effects by ingestion include cough, dyspnea, and sweating. It is a human skin irritant. Pure zinc powder, dust, and fume are relatively non-toxic to

humans by inhalation. However, the inhalation of zinc oxides may cause a sweet taste, throat dryness, cough, weakness, generalized aches, chills, nausea, and vomiting. Zinc dust is flammable when exposed to heat or flame and may ignite spontaneously in air when dry. Zinc dust is explosive when reacted with acids. The current CAL-OSHA PEL for zinc (as an oxide fume) is listed as 5 mg/M^3.

4.1.4 Volatile Organic Compounds

4.1.4.1 1,1-Dichloroethane (1,1-DCA)

1,1-DCA is moderately toxic by ingestion and is an experimental tumorigen and teratogen, as well as a suspect human carcinogen. The current Cal-OSHA PEL for 1,1-DCA is listed as 100 parts per million (ppm).

4.1.4.2 1,1-Dichloroethene (1,1-DCE)

1,1-DCE is an experimental carcinogen, tumorigen, and teratogen. It is a poison by inhalation and ingestion and can cause general anesthesia, liver and kidney changes, and reproductive effects. The current Cal-OSHA PEL is listed as 1 ppm due to its identification as a carcinogen by the National Institute for Occupational Safety and Health (NIOSH).

4.1.4.3 Ethylbenzene

Ethylbenzene is mildly toxic by inhalation and skin contact. Inhalation can cause eye, sleep, and pulmonary changes. It is an eye and skin irritant at levels as low as 0.1% (1,000 ppm) of the vapor in air. At higher concentrations, it is extremely irritating at first, and then can cause dizziness, irritation of the nose and throat, and a sense of constriction in the chest. The current Cal-OSHA PEL is listed as 100 ppm.

4.1.4.4 Methylene Chloride

Methylene chloride is an experimental carcinogen and tumorigen. Human systemic effects upon inhalation include: altered sleep time, convulsions, euphoria, and change in cardiac rate. It is an eye and severe skin irritant. Data in humans suggest it may be a mutagen. Methylene chloride also exhibits the unique effect of elevating the blood carboxyhemoglobin levels, similar to the effect of exposure to carbon monoxide (CO). In fact, evidence suggests that methylene chloride can convert to CO in the body. The current Cal-OSHA PEL is listed as 25 ppm.

4.1.4.5 Toluene

Human systemic effects of exposure to toluene include: hallucinations or distorted perceptions, changes in motor activity and bone marrow, or psychophysiological alterations. It is a severe eye irritant and an experimental teratogen. The current Cal-OSHA PEL for toluene is listed as 50 ppm.

4.1.4.6 Xylene

Xylene exhibits the general chlorinated hydrocarbon central nervous system effects and olfactory (smell) changes, eye irritation, and pulmonary changes. It is a severe skin irritant. Irritation can start at 200 ppm. The current Cal-OSHA PEL is listed as 100 ppm for all three isomers (ortho, meta, and para).

4.1.5 Asbestos

Asbestos is a name given to a variety of naturally occurring minerals composed of hydrated, fibrous silicates that are crystalline in structure. The word asbestos is derived from the Greek work similarly spelled, meaning "inextinguishable." There are two groups of asbestos mineral. The first is the Serpentine group, commonly referred to as chrysotile. Chrysotile, which comprises approximately 93% of all asbestos in use in the United States, is characterized by long, soft and flexible strands that can be woven into a cloth. The second category occurs as a group of minerals called Amphiboles. Amphiboles fibers are characterized as being strong, brittle, and needle-like. The common names of the forms of the minerals within this group are: crocidolite, amosite, tremolite, anthophyllite, and actinolite.

Asbestos is virtually indestructible, has good fiber bonding, is abrasion-resistant, and is extremely resistant to heat and chemicals. The variety of desirable properties exhibited by asbestos make it very popular for use in building materials and industry. The primary drawback with its use is the known association of severe health disorders and associated liabilities with exposure to the fibers.

Exposure to asbestos can produce a lung fibrosis called asbestosis. The onset of asbestosis is usually gradual, developing over a period of 10 to 30 years of exposure to significant concentrations of asbestos. It is characterized by development of a thickening of the lung pleura (lining).

Asbestos is also a cancer-producing agent (lung cancer and mesothelioma). Heavy exposure to dust containing asbestos can also cause skin irritation. Epidemiological studies have shown that lung cancer appears to be related to the degree of exposure, the type of asbestos, and whether or not the individuals smoke cigarettes. It is significant that cigarette smoking greatly increases the risk of lung cancer in those who are exposed to asbestos. However, mesothelioma (a rare tumor of the chest cavity lining) appears to develop without regard to the amount of asbestos inhaled.

The Cal-OSHA PEL for asbestos is 0.1 fiber per cubic centimeter.

4.2 PHYSICAL HAZARDS

Physical hazards associated with site activities include slips, trips, falls, contact- and crushing-type injuries, eye abrasions, contusions, lacerations, flammability, and heat-stress concerns. The potential for such hazards necessitates the use of gloves and safety boots that meet American National Standards Institute (ANSI) Z41.1, eye protection that meets ANSI Z87.1, and hard hats that meet ANSI Z89.1. Personnel engaged in strenuous physical labor shall wear sturdy work gloves.

Additionally, previous experience indicates the noise level during use of heavy equipment may exceed the CAL-OSHA action level of 85 dBA (decibels on A-weighted scale). Therefore, all personnel working in the exclusion zone during use of this equipment shall wear hearing protection in the form of plugs and/or earmuffs.

See Table 2 for a list of potential physical hazards that may be present and the procedures that will be utilized to minimize these potential hazards.

4.2.1 Use of Equipment

Any equipment, including earth-moving equipment, drill rigs, cranes, or other heavy machinery will be operated in strict compliance with the manufacturer's instructions, specifications, and limitations, as well as any applicable regulations.

Any equipment or machinery that cannot be operated safely will be tagged and will not be operated until the unsafe condition has been removed or repaired. All repaired equipment will remain out of service until a designated qualified person has tested and inspected the equipment.

The contractor of heavy equipment operator will clearly designate the zone(s) associated with each piece of heavy equipment where the potential for injuring workers exists. No site personnel will be permitted to enter or access this zone without prior approval from the operator.

Table 2 ***Potential Physical Hazards***

Potential Hazard	Source of Hazard	Procedures to Be Used to Minimize Hazard
Struck by heavy equipment	Drill rigs, backhoes, and other heavy equipment.	Maintain eye contact with equipment operators. Use proper PPE (i.e., hard hats, steel-toed boots, reflective vests, etc.).
Puncture of utility line	Electrical, gas, water, or sewer line underground.	Locate existing utilities prior to start of operations.
Slip, trips, or falls due to refuse and debris	Construction refuse and materials, trash, or excavated materials.	Maintain clean work areas and dispose of refuse promptly.
Fire/electrical hazard	Spark or heat producing equipment in the vicinity of combustibles.	Operate equipment away from combustibles such as vegetation. Maintain portable fire extinguishers nearby.
Heat stress	Personnel working in environments with high ambient temperatures may be subject to adverse temperature-related effects.	Employ the buddy system. Each worker will be responsible to monitor his/her buddy for signs of heat stress (loss of concentration, profuse sweating, dizziness, etc.). The TM/HSO will also monitor working conditions via use of an ambient monitor when conditions warrant. Work/rest regimens may be followed (Table 3).
Dust	Automobiles/trucks/walking	Vehicles should be driven slowly and water shall be used to moisten soil if necessary.
Struck by vehicular traffic in public right-of-way	Automobiles/trucks	Utilize traffic control plan (prepared by subcontractor) and traffic control devices and maintain physical barrier between work zone and active traffic.

All heavy equipment provided or leased on site shall be equipped with audible backup warning devices. The operator is responsible for inspecting the equipment daily to ensure that it is functioning properly and safely. This inspection will include all pins, pulleys, and connections subject to faster than normal wear and all lubrication points.

When equipment with moving booms, arms, or masts are operated in the vicinity of overhead hazards, the operator, with assistance from the designated signaling person, will ensure that the moving parts of the equipment maintain safe clearance from the hazards. Equipment will be kept away from energized electrical lines by at least 25 feet. Drill rigs and other equipment not specifically designed to move with the boom, mast, or arm elevated will be returned to traveling position and condition before being moved.

All portable equipment and tools will be inspected prior to each day's use and as often as necessary to ensure safety. Defective equipment and tools will be removed from service immediately. Examples of defective tools include:

- Hooks and chains stretched beyond allowable deformations;
- Cables and ropes with more than the allowable number of broken strands;
- Missing grounding prongs on power tools;
- Defective on/off switches;
- Mushroomed heads of impact tools;
- Sprung wrench jaws;
- Missing or broken handles or guards; and
- Wooden handles that are cracked, splintered, or loose.

All equipment and tools will be used within their rated capacities and capabilities.

The location of all underground pipes, electrical conductors, fuel, water and sewer lines must be determined prior to any drilling work. All lines must be de-energized, locked-out, or blinded off where feasible.

4.2.2 Flammability Hazards

The nature of this project and the operations to be performed may increase volatilization and cause a flammability hazard. Certain solvents

can be extremely flammable. Oxidation products from burning can be extremely deadly.

All electrical equipment used during this project will be inspected to ensure that it is in good repair and has no frayed or loose connections before it may be used on site. Only approved, listed equipment and components will be used. All connections will be made in accordance with National Electric Code practices. All equipment and devices so designed will be properly grounded or bonded to an adequate grounding mechanism. Although explosive limits are not expected, only equipment listed as explosion-proof will be used in areas where explosivity is sustained at or above 5 percent of the lower explosive limit.

4.2.3 Temperature-Stress Concerns

Temperature stress includes heat stress, as well as cold injury. It should be noted that both types of temperature stress could occur simultaneously. The ambient air temperature, wind velocity, humidity, and activity level of the worker, as well as the type of protective equipment employed, are all factors that play a role in producing temperature stresses. Workers will be trained on the signs and symptoms of these forms of temperature stresses and will be encouraged to monitor themselves and others.

The human body has a regulator mechanism that maintains the body's core temperature at 98.6 degrees Fahrenheit. The body's energy is devoted to keeping the temperature within a fairly narrow range. When the body overheats, heat loss occurs primarily through evaporation via sweating and by radiant heat loss by dilation of blood vessels in the skin. When body temperature drops, involuntary shivering produces heat while constriction of the blood vessels in the skin reduces radiant heat loss.

Protective clothing designed to protect against chemicals interferes with the evaporative cooling mechanism. As a result, heat stress can develop rapidly in non-acclimated individuals. Cold stress can occur when the heat produced by intense activity is reduced by the stoppage of work. Chemical-protective clothing offers no insulation and little protection against the cold; it does not retain body heat well. The water-saturated atmosphere that can occur within protective clothing loses heat more rapidly than ambient air; thus, heat loss can occur rapidly. During episodes of heavy work, it is possible for a worker to suffer symptoms of heat stress, only to experience cold stress when activity levels decrease or the work stops.

4.2.3.1 Heat Stress

There are varying symptoms of heat stress, depending on its severity. Many heat-related problems occur in workers who are unaccustomed to heavy workloads and heat, or who are in poor physical condition. Obesity, alcohol or drug use, age, and the presence of other complicating factors, such as disease, also affect an individual's response to hot environments. In heat conditions, the work/rest regimen shown on Table 3 should be followed. Heat stress is a general term used to describe one or more of the following heat-related disabilities and illnesses:

Heat Cramps are a condition characterized by painful, intermittent spasms of the voluntary muscles following hard physical work in a hot environment. Cramps usually occur after heavy sweating and often begin at the end of a work shift.

Heat Exhaustion is a condition characterized by profuse sweating, weakness, rapid pulse, dizziness, nausea, and headache. The skin is cool and sometimes pale and clammy with sweat. Body temperature is normal or subnormal. Nausea, vomiting, and unconsciousness may occur.

Heat Stroke is a condition in which sweating is diminished or absent. The skin is hot, dry, and flushed. Increased body temperature, if uncontrolled, may lead to delirium, convulsions, coma, and even death. **Medical attention is needed immediately.**

When selecting chemical-protective clothing and equipment, each item's benefit should be carefully evaluated for its potential to increase the risk of heat stress. For example, if a lighter, less insulating suit can be worn without a sacrifice of protection, then the lighter suit should be worn.

Workers will be trained on the signs and symptoms of the forms of heat stress and will be encouraged to monitor themselves and others. In addition, experience has shown that the following work/rest regimen (Table 3) is appropriate for field workers performing various degrees of work while wearing Level D protection. When upgrading the level of personal protection is deemed necessary, heat-stress conditions should be taken into consideration.

Table 3 Work/Rest Regimen in Level D Protection

Temperature °Fahrenheit (F)/°Celsius (C)	**Water Intake (Quarts per hour)**	**Work/Rest Cycle (Minutes)**
82 – 85 (28 - 29)	At least 0.5	50/10
85 – 88 (29 – 31)	At least 1	45/15
88 - 90 (31 – 32)	At least 1.5	30/30
90 and above (above 32)	More than 2	20/40

The workload classes are defined in The American Conference of Governmental Industrial Hygienists' booklet, *Threshold Limit Values and Biological Exposure Indices for 1998*.

5.0 EXPOSURE MONITORING PLAN

To identify and prevent the exposure of workers, an exposure monitoring plan will be followed. The following subsections summarize the details of the general area monitoring program, as well as the action levels that will be used to determine mitigating actions necessary.

5.1 GENERAL AREA AND PERSONAL MONITORING

Air monitoring may be conducted to determine the presence of on-site hazardous conditions and will help determine the level of personal protection required for personnel. Environmental monitoring equipment includes a photoionization detector (PID) or a flame ionization detector (FID). In addition, a Miniature real-time aerosol monitor (Mini-RAM) dust monitor will be used during demolition activities if conditions warrant its use. Characterization with these instruments will determine airborne contaminants present and the respective concentrations in the workplace, and will help assess worker safety.

The intent of general area monitoring is to utilize generic field instruments and action levels to assess the continuous exposure to field personnel during site activities, and upgrade or downgrade PPE as appropriate. The general monitoring shall consist of daily breathing zone monitoring every 30 minutes using the PID or FID (and Mini-RAM if necessary) during site activities. Daily calibration and maintenance of the PID or FID will also be recorded and performed according to the manufacturer's recommendations (see Attachment A-1 for calibration documentation sheet). The Mini-RAM will be zeroed out during each day of use. All breathing zone readings will be recorded on ERM's Air Monitoring Form (provided in Attachment A-1).

5.2 ACTION LEVELS

The TM/HSO will establish daily background total organic vapor (TOV) or dust levels prior to initiating site activities. Under most circumstances, these levels can be determined by taking multiple readings at representative locations along the perimeter of the site, and averaging the results of sustained measurements.

Decisions to upgrade personal protection will be based on sustained breathing zone TOV or total dust that exceeds background. Breathing zone refers to the area from the top of the shoulders to the top of the head. Specific criteria for upgrading personal protection based on TOV and dust levels are presented in Table 4.

The CAC has provided objective data that demonstrate that asbestos is not capable of being released in airborne concentrations at or above the PEL under the expected conditions at the site. Exposure monitoring for asbestos will be instituted when there has been a change in the work practices that may result in new exposures above the PEL.

Table 4 Criteria for Upgrading Respiratory Protection

Sustained Breathing Zone TOV and Dust	**Level of Respiratory Protection**
Background + 5 ppm or Background + 0.5 mg/M^3	Level D (no respiratory protection)
5 to 20 ppm or 0.5 mg/M^3 to 2 mg/M^3	Level C (half-face, air-purifying respirators, equipped with organic vapor/high-efficiency particulate air [HEPA] cartridges)
20 to 50 ppm or 2 mg/M^3 to 5 mg/M^3	Level C (full-face, air-purifying respirators equipped with organic vapor/HEPA cartridges)
Above 50 ppm or 5 mg/M^3	Cease activities, evacuate the exclusion zone.

6.0 GENERAL SAFE WORK PROCEDURES

Personal protection, work zone and decontamination procedures, and general safety rules are described in the following subsections.

6.1 PERSONAL PROTECTION

Initial protection will include the Level D requirements for PPE, and will be upgraded based on sustained PID/FID readings, or Mini-Ram readings (if conditions warrant its use), compared to the action levels listed in Table 4. Levels of PPE are described below.

6.1.1 Level D Protection

Level D protection consisting of the following items is required for sustained PID/FID readings of less than 5 ppm above background, or for Mini-Ram readings of less than 0.5 mg/M^3 above background:

- Long-sleeve shirt and long pants;
- Outer nitrile gloves for material handling (inner latex or similar surgical gloves are recommended when practical);
- Steel-toed safety boots;
- Safety glasses;
- Hard hat; and
- Orange reflective vest.

Other personal protection readily available for use, if necessary, includes the following:

- Chemical-resistant gloves; and
- Hearing protection.

6.1.2 Level C Protection

Level C protection is required for sustained PID/FID readings of 5 to 20 ppm above background, or Mini-Ram readings of 0.5 mg/M^3 to 2 mg/M^3 above background. Level C protection consists of Level D protection, plus the following:

- Half-face air-purifying pespirator (APR) equipped with combination organic vapor/HEPA filter cartridges;
- Chemical-resistant clothing (i.e., Tyvek, polycoated Tyvek, or Saranex), consisting of one-piece suits with attached hoods, booties, and elastic wrist bands;
- Outer nitrile gloves and inner latex surgical gloves; and
- Steel-toed safety boots with rubber overboots.

During work activities, sustained PID/FID readings of 20 to 50 ppm above background, or Mini-Ram readings of 2 to 5 mg/M^3, require Level C protection, with the substitution of a full-face APR equipped with organic vapor/HEPA filter cartridges, in place of half-face APR and safety glasses.

Sustained PID/FID readings over 50 ppm above background, or Mini-Ram readings above or 5 mg/M^3, require an immediate cessation of activities, and an evacuation of personnel from the exclusion zone. Questions regarding personal protection and related issues should be addressed to the TM/HSO.

6.2 WORK ZONES AND DECONTAMINATION PROCEDURES

Work zones and decontamination procedures will be established in accordance with guidance provided in Chapters 9 and 10 of the *Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities*, published by NIOSH, FED-OSHA, and the United States Environmental Protection Agency. An exclusion zone will be established as determined by the TM/HSO based on the type of work to be performed and the anticipated TOV and dust levels in the work area. Exclusion zones will be marked with yellow caution tape. The location of the zones may be modified to fit applicable field conditions; however, proposed modifications must be approved by the TM/HSO.

A minimum of one basin wash/rinse station will be placed in the contamination/reduction zone to facilitate cleaning and removal of PPE.

The wash/rinse station will be used by workers to clean and rinse nondisposable boots and gloves. The ground beneath these basins will be covered with plastic to ensure the ground is not contaminated with basin rinse water. A drum or another type of container will be designated to dispose of PPE that will not be reused.

All personnel must follow the appropriate order for cleansing and removal during decontamination:

1. Boots;
2. Outer gloves;
3. Coveralls or protective suit;
4. Respirators; and
5. Inner gloves.

Direct contact with contaminated protective equipment can be avoided by following the proper decontamination sequence. To avoid a potential inhalation hazard during decontamination, respirators, if used, must not be removed before leaving the contaminated area.

Water, soap, and paper towels will be available for cleaning of hands and face before breaks, eating, drinking, or smoking. On-site toilet facilities or an easily accessible toilet facility will also be available.

6.3 GENERAL SAFETY RULES

In addition to the specific requirements of this site-specific HSP, common sense should prevail at all times. The following general safety rules and practices will be in effect at the site:

- The site will be suitably marked or barricaded as necessary to prevent unauthorized visitors, but will not hinder emergency services, if needed.
- All open holes, excavations, trenches, and obstacles will be properly barricaded in accordance with local site needs. These needs will be determined by proximity to traffic ways, both pedestrian and vehicular, and site of the hole, trench, or obstacle. If holes are required to be left open during nonworking hours, they will be adequately decked over or barricaded and sufficiently lighted.
- Prior to conducting any digging or boring operations, underground utility locations will be identified. The site representative and local

utility authorities, as well as Underground Service Alert will be contacted to provide locations of underground utility lines and product piping. In addition, a private utility locating service will be contracted to identify any underground utilities. All boring, excavation, and other site work will be planned and performed with consideration for underground lines.

- Smoking and ignition sources in the vicinity of flammable or contaminated material are prohibited. Designated smoking areas will be delineated.
- Dust suppression shall be utilized during all site activities. A light water mist will be necessary and required during demolition activities to keep dust migration to an absolute minimum.
- No demolition activities will be allowed on excessively windy days. For purposes of this HSP, excessive wind will be defined as wind with sufficient velocity to render dust suppression techniques at the site inadequate. The designated TM/HSO will make this determination by visual observation. If dust is observed blowing from the work area off site, work activities will cease. Personnel should keep themselves upwind from impacted areas during windy days.
- Stockpiled soils shall be covered with plastic while not being loaded. The TM/HSO must inspect the stockpiled soil periodically to ensure that the plastic sheeting remains in place.
- Drilling, boring, movement and use of cranes and drilling rigs, erection of towers, movement of vehicles, and equipment as well as other activities will be planned and performed with consideration for the location, height, and relative position of aboveground utilities and fixtures, including signs, lights, canopies, buildings, other structures, and construction as well as natural features such as trees, boulders, bodies of water, and terrain.
- When working in areas where flammable vapors may be present, particular care must be exercised with tools and equipment that may be sources of ignition. All tools and equipment so provided must be properly bonded and/or grounded.
- Beards that interfere with respirator fit are not allowed within the site boundaries. This is necessary because all site personnel may be called upon to use respirator protection in some situations, and beards do not allow for proper respirator fit.
- No smoking, eating, or drinking will be allowed in the contaminated areas.

- Tools and hands must be kept away from the face.
- Personnel must shower at the end of the shift or as soon as possible after leaving the site.
- Each sample must be treated and handled as though it was extremely toxic.
- Do not touch obviously contaminated materials. Avoiding contact with these materials will facilitate decontamination.
- Persons with long hair and/or loose-fitting clothing that could become entangled in power equipment are not permitted in the work area.
- Employees shall be suitably dressed to perform their duties safely and in a manner that will not interfere with their vision, hearing, or free use of their hands or feet. Only waist-length shirts with sleeves and trousers that cover the entire leg are to be worn.
- Horseplay is prohibited in the work area. The TM/HSO has the authority to discharge site personnel for horseplay.
- Work while under the influence of intoxicants, narcotics, or controlled substances is prohibited.

7.0 EMERGENCY RESPONSE/ACCIDENT INVESTIGATION

The telephone numbers of the police and fire departments, ambulance services, local hospital, and ERM representatives are provided in the reference sheet in Section 8.0 of this HSP. Directions to the nearest hospital are also provided on the sheet. (A map to the hospital is provided on Figure 3). The reference sheet will be maintained at the work site by the TM/HSO.

Any accident/incident resulting in an OSHA-recordable injury or illness, treatment at a hospital or physician's office, property damage, or a near-miss accident requires that an Accident/Incident Investigation Report be completed and submitted to the ERM IHSC. A copy of this form is provided in Attachment A-1. The investigation will be initiated as soon as emergency conditions are under control. The purpose of this investigation is not to attribute blame, but to determine the pertinent facts so that repeat or similar occurrences can be avoided.

7.1 PLANNING

Prior to facility entrance, the TM/HSO shall plan emergency actions and discuss them with personnel conducting project work. Initial planning includes establishing the best means for evacuation from the area in case of a catastrophe.

7.2 EMERGENCY SERVICES

A tested system must exist for rapid and clear distress communications, preferably voice, from all personnel to the TM/HSO. The TM/HSO shall ensure that all personnel working at the facility know how to communicate with the appropriate local emergency response units as well as provide adequate and clear directions between work locations and the locations of support personnel, prior to commencing any facility investigation or operations. Emergency response contacts and telephone numbers are included in the emergency reference sheet provided in Section 8.0. A copy of this information must be posted in a visible location at the project site before operations commence.

7.3 GENERAL EVACUATION PLAN

In case of fire, explosion, or toxic vapor release and the TM/HSO orders a site evacuation, the following steps shall be performed:

1. Announce the evacuation via radio/horn. Three blasts of a car or truck air horn will be used to signal emergencies that require evacuation.
2. Evaluate the immediate situation and downwind direction. All personnel will evacuate in the upwind direction.
3. Assemble all personnel in an upwind area when the situation permits.
4. Account for all personnel.
5. Determine the extent of the problem.
6. Dispatch response teams in protective clothing and self-contained breathing apparatus on site to evaluate any missing personnel.
7. Correct the problem.

7.4 EVACUATION/MEETING POINT

In the case of an emergency, utilize the following locations as evacuation/meeting points, and provide this information to emergency personnel:

1. Site entrance on Harbor Street.
2. The intersection of Harbor and Third Streets.

The TM/HSO shall meet emergency personnel and guide them to the incident scene.

7.5 FIRST AID

Qualified personnel on site shall give first aid and stabilize any worker needing assistance. Life support techniques such as cardiopulmonary resuscitation and treatment of life-threatening problems such as bleeding, airway maintenance, and shock shall be given top priority. Professional medical assistance shall be obtained at the earliest possible opportunity. If assistance beyond first aid is required, **dial 911, and request emergency medical assistance**.

A first aid kit and emergency eyewash shall be maintained readily accessible to all workers. First aid kits must be maintained in all self-propelled equipment. The portable eyewash shall be supplemented by at least two, 5-gallon carboys full of potable water, which will substitute as the continuous-flowing eyewash facility. Emergency first aid for exposure, inhalation, or exposure to organic compounds is summarized in the following paragraphs.

7.5.1 Eyes

Flush eyes immediately with fresh water for at least 15 minutes while holding the eyelids open. If injury occurs or irritation persists, transport person to emergency room as soon as possible.

7.5.2 Skin

Wash skin thoroughly with soap and water. See a doctor if any unusual signs or symptoms or if any skin irritation occurs. Launder chemically impacted clothing.

7.5.3 Inhalation

Move exposed person to fresh air. If breathing has stopped, apply artificial respiration. **Dial 911 immediately**.

7.5.4 Ingestion

If swallowed, DO NOT induce vomiting. **Call Poison Control Center immediately at 1-800-876-4766**.

7.5.5 Heat Stress

Persons exhibiting any of the signs of heat stress should be immediately moved to a cooler environment, such as an air-conditioned trailer or vehicle. First aid for the specific types of heat stress include:

Heat Stroke. Dial 911, begin cooling the individual by soaking their clothes in cool water and fanning.

Heat Exhaustion. Replenish fluids by having the individual drink an electrolyte solution (such as Gatorade® or other sports drink). If vomiting or loss of consciousness occurs, dial 911.

Heat Cramps. Replenish salt balance by having the individual drink an electrolyte solution (see above). If cramps persist, person may need medical attention.

7.6 FIRE PROTECTION AND RESPONSE

To ensure that fire and explosion hazards are minimized, plans and procedures must be coordinated with the local Fire Department. A permit may be required before gasoline or other flammable liquids may be removed. **Dial 911 in the event of any fire at a work location**. In the event of a fire or explosion at a work location, general evacuation plan described above in Section 7.3.

At least one fire extinguisher, with a minimum class rating of 20BC, shall be provided within 50 feet of the site activities. A fire extinguisher must be kept in each piece of self-propelled equipment. Site personnel must not attempt to extinguish large fires, but rather dial 911 immediately.

8.0 EMERGENCY REFERENCES

The following subsections provide emergency telephone numbers, information regarding the nearest hospital, and directions to the site.

8.1 KEY TELEPHONE NUMBERS

AMBULANCE: 911
POLICE: 911
FIRE: 911
HOSPITAL: 911
SUTTER DELTA MEDICAL CENTER: 1-925-779-7273
NATIONAL RESPONSE CENTER: 1-800-424-8802
POISON CONTROL CENTER: 1-800-876-4766
TOXLINE: 1-301-496-1131
CHEMTREC: 1-800-424-9300
ERM HEALTH AND SAFETY COORDINATOR (R. WOOLSON): 1-714-430-1476
ERM PRINCIPAL-IN-CHARGE (MIKE QUILLIN): 1-925-946-0455
ERM TASK MANAGER (DON LUDLAM): 1-925-818-0314

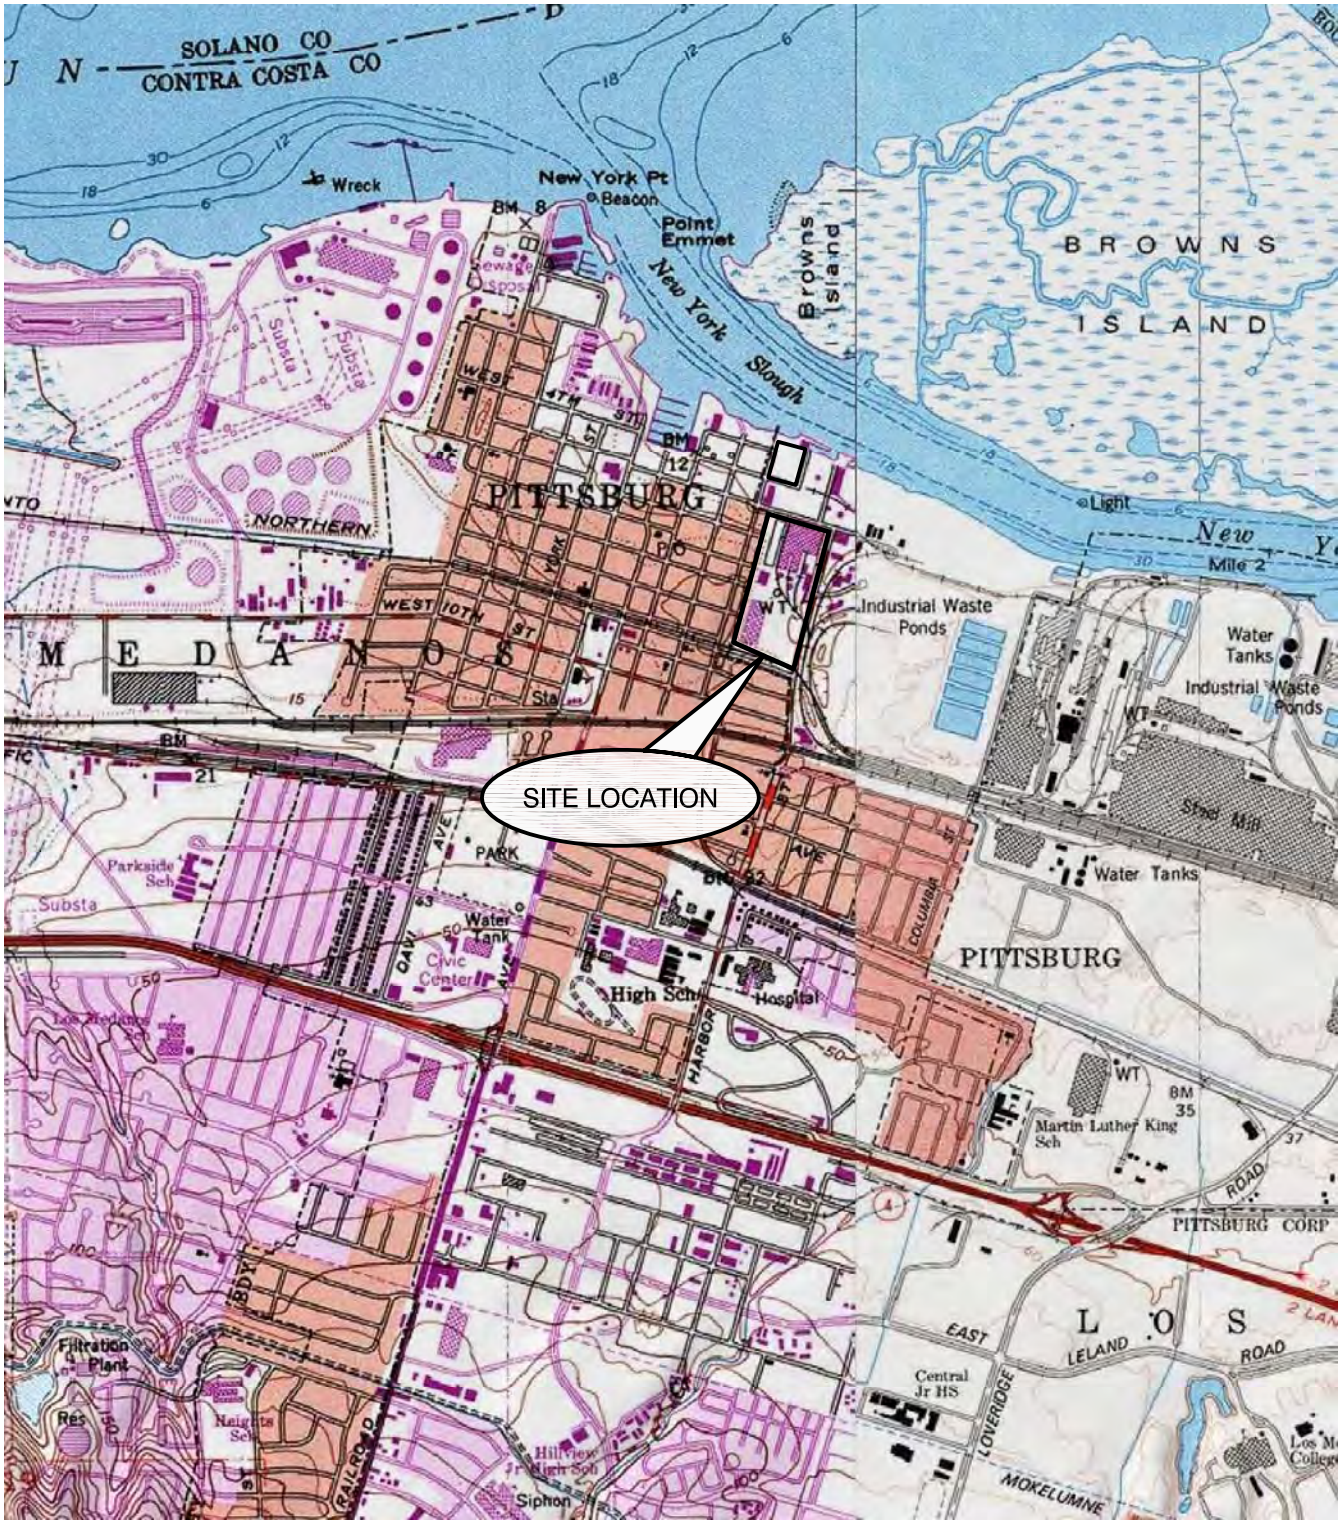
8.2 NEAREST HOSPITAL

Sutter Delta Medical Center 1-925-779-7273
3901 Lone Tree Way
Antioch, California

8.2.1 Directions to Hospital

- Exit the site, proceed LEFT (WEST) on 3rd STREET.
- Turn LEFT (SOUTH) onto RAILROAD AVENUE.
- Take HIGHWAY 4 (EAST) toward Antioch.
- Exit at LONE TREE WAY.
- Proceed SOUTH on LONE TREE WAY to Hospital (on left immediately before Ridgerock Drive.

8.2.2 Directions to the Site



The site is located south of Highway 4 in Pittsburg, California.

Follow Highway 4 east from Concord toward Pittsburg. Take the Railroad Avenue exit in Pittsburg. Proceed south on Railroad Avenue.

Turn right turn onto Third Street. The site is on the right side of Third Street at the corner of Harbor Street.

DISCLAIMERS AND LIMITATIONS ON USE

ERM-West, Inc. ("ERM") developed this site-specific Health and Safety Plan ("HSP") for use by ERM personnel and by ERM subcontractors (individually, an "ERM Contractor" and collectively, "ERM Contractors") in connection with the field activities (the "Project") being performed by ERM for RENOVA (the "Client") at the Johns Manville Plant between East Third and Harbor Streets, Pittsburg, California (the "Site"). ERM personnel must adhere to the practices and procedures specified in this HSP.

Each ERM Contractor must review this HSP and agree to accept and abide by this HSP, subject to any modifications to this HSP (to address the ERM Contractor's more stringent practices and procedures) agreed upon in writing by ERM and the ERM Contractor. The ERM Contractor shall indicate such acceptance by executing a copy of this notice of disclaimers and limitations on use as indicated below and returning it to ERM's project manager for the Project prior to its commencing work at the Site. However, if any ERM Contractor commences work at the Site, the ERM Contractor shall be deemed to have accepted this HSP and the terms hereof and the failure to execute and return to ERM a copy of this notice shall not be relevant to such interpretation.

If a contractor or a person other than the Client, ERM employees and ERM Contractors (individually, a "Third Party" and collectively, "Third Parties") receives a copy of this HSP, such Third Party should not assume that this HSP is appropriate for the activities being conducted by the Third Party. **NO THIRD PARTY HAS THE RIGHT TO RELY ON THIS HSP. EACH THIRD PARTY SHOULD ABIDE BY ITS OWN SITE-SPECIFIC HEALTH AND SAFETY PLAN IN ACCORDANCE WITH ITS OWN PROFESSIONAL JUDGMENT AND ESTABLISHED PRACTICES.**

ERM shall not be responsible for the implementation of any Third Party's safety program(s), except to the extent otherwise expressly agreed upon by ERM and a Third Party in writing. The services performed by ERM for the Client and any right of the Client and/or an ERM Contractor to rely on this HSP shall in no way inure to the benefit of any Third Party, including, but not limited to, employees, agents, or consultants and subcontractors of ERM Contractors, so as to give rise to any cause of action by such Third Party against ERM.

This HSP generated by ERM in connection with the Project is for use on a specific site and in connection with a specific project. ERM makes no representation or warranty as to the suitability of this HSP for reuse on another site or as to the suitability of this HSP for reuse on another project or for modifications made by the Client or a Third Party to this HSP.

1.0 INTRODUCTION

On behalf of Pittsburg River Park LLC, ERM-West, Inc. (ERM) has prepared this Storm Water Pollution Prevention Plan and Monitoring Plan (SWPPP) for construction activities associated with the abatement and demolition at the Former Johns Manville Plant Site (hereafter "site" or "Plant Site"). This SWPPP is included as Appendix B of the Site Management Plan (SMP), which provides guidance for construction activities at the site. This site has been given a waste discharger's identification number 2 07C336983 by the State Water Resources Control Board (SWRCB).

The SWPPP is a requirement of the State of California's General Permit to discharge storm water associated with construction activity. The amendments made to the Clean Water Act (CWA) in 1987 require National Pollutant Discharge Elimination System (NPDES) permits for storm water dischargers associated with industrial and certain construction activities. The United States Environmental Protection Agency (USEPA) also issued regulations in 1990 that established permit application requirements for storm water discharges associated with construction activity. These regulations are contained in Parts 122, 123, and 124 of Title 40 of the Code of Federal Regulations. The CWA allows states to request USEPA authorization to administer the NPDES program instead of the USEPA. California's SWRCB has received authorization to issue the permit and to administer the NPDES program for construction sites greater than 1 acre.

This SWPPP has been prepared to comply with the SWRCB, Order No. 99–08–DWQ, NPDES General Permit No. CAS000002, *Waste Discharge Requirements (WDRs) for Discharges of Storm Water Runoff Associated with Construction Activity* (General Permit).

This SWPPP has been prepared for activities at the site including, but not limited to, the following:

- Abatement of hazardous materials;
- Demolition of all buildings and subgrade utilities;
- Soil and debris stockpiling;

- Soil and debris loading into trucks for off-site transportation and disposal; and
- Backfill and rough site grading.

Storm water Best Management Practices (BMPs) will be implemented to ensure that storm water runoff with pollutants does not leave the site. The *Caltrans Construction Site Best Management Practices (BMPs) Manual* (Caltrans, March 2003) has been used as a guide to establish the BMPs for this SWPPP. Establishing and maintaining a monitoring program to document the effectiveness of the BMPs and by modifying any deficiencies will ensure compliance with the SWPPP and the General Permit. If site conditions change beyond what is presented in this SWPPP, the SWPPP will be revised as necessary.

1.1 PURPOSE AND OBJECTIVES

The purpose of this SWPPP is to provide guidance for storm water and non-storm water management protocol during demolition activities. The Contractor and Subcontractors will be required to adhere to the guidelines established by this SWPPP. By following this SWPPP, the discharge of pollutants associated with these site activities to surface waters will be minimized. The objectives of this SWPPP are to:

- Identify sources of sediment and pollutants that may affect the quality of storm water discharges from the site;
- Identify non-storm water discharges;
- Identify, construct, implement, and maintain BMPs to reduce or eliminate pollutants in storm water discharges and authorized non-storm water discharges from the site; and
- Develop a monitoring program for BMPs installed during site activities to verify that impacted storm water does not run off from the site.

2.0 GENERAL SITE DESCRIPTION

The former JM Plant Site is located at the approximate intersection of East Third Street and Harbor Street in Pittsburg, California (Appendix B-1). The site is approximately 1,000 feet south of New York Slough and Suisun Bay. This 21-acre parcel is bounded to the north by a Tesoro coke facility and Third Street; to the east by Harbor Street, several small light industrial businesses, and USS Posco Corporation; and to the south and west by residential properties. Most recently, until the facility terminated operations in 2003, the facility was used for the manufacture of commercial roofing materials. The Plant Site consists of Buildings 1 through 4 in the northern portion of the property, a warehouse in the southwestern portion of the site, and the former evaporation pond area, which is currently paved with asphalt. Railroad tracks bisect the central portion of the property.

The current land use and zoning for the Plant Site is industrial. The Owner is currently in negotiations with the City of Pittsburg to re-entitle the Plant Site parcel for single-and multi-family residential reuse.

Under current site conditions (i.e., site is relatively impervious with asphaltic concrete and concrete surfaces), storm water runoff is generally directed towards storm drain inlets located approximately in the center of the site. This water is then collected into the City of Pittsburg storm water collection system with final discharge into New York Slough.

Demolition of the site will consist of abatement of the hazardous materials, knocking down the buildings, demolition of subgrade structures and utilities, and off-site transportation and disposal of construction debris. The type of construction activity associated with these activities requires the guidance provided in this SWPPP. The remaining SWPPP sections detail the following items:

- Description of construction activities that may negatively impact the site's storm water;
- The BMPs that will be implemented during construction to alleviate the potential for impacts to site storm water;
- The post-construction BMPs that will be implemented following construction; and

- The monitoring program that will be implemented during construction to verify compliance with the SWPPP and the General Permit.

3.0 PROJECT INFORMATION – SUMMARY OF ACTIVITIES

This section provides project information regarding the remedial activities as it pertains to storm water pollution prevention.

3.1 SITE ACTIVITIES

Site activities will include numerous activities requiring storm water BMPs. These activities include, but are not limited to:

- Demolition of all buildings and subgrade structures and utilities;
- Soil and debris stockpiling;
- Soil and debris loading into trucks for off-site transportation and disposal; and
- Backfill and rough site grading.

3.2 PROJECT CONTACTS AND RESPONSIBLE PERSONNEL

The following persons shall be responsible for ensuring adherence to the SWPPP during site construction activities:

Owner: Pittsburg River Park LLC

Mr. Chris Nelson
Renova Partners LLC
55 Hawthorne Street, Suite 555
San Francisco, California 94105
(415) 243-8162

Contractor: Plant Reclamation

Fred Glueck
Plant Reclamation
912 Harbour Way So.
Richmond, California 94804
(510) 233-6552

The Contractor performing site activities will be responsible for providing all labor, equipment, and materials necessary to adhere to the SWPPP and for installing BMPs. Mr. Glueck will maintain this SWPPP and ensure that installation of BMPs meets the minimum requirements contained in this SWPPP. Additional qualified and trained personnel, under the direction of Mr. Glueck, may perform many of the SWPPP's actions and provisions, including performance of the monitoring program presented in this SWPPP.

4.0 *IDENTIFICATION OF STORM WATER AND NON-STORM WATER POLLUTANT SOURCES AND BMP SELECTION*

The purpose of this section is to present project-specific activities and individual BMPs that will be implemented during the project. Attachment B-2 presents storm water BMPs obtained from the *Caltrans Construction Site Best Management Practices (BMPs) Manual* (Caltrans, March 2003) that may be utilized during this project. In summary, the applicable BMPs include:

Caltrans Number	BMP Title	Caltrans Number	BMP Title
SC-1	Silt Fence	NS-8	Vehicle and Equipment Cleaning
SC-5	Fiber Rolls	NS-9	Vehicle and Equipment Fueling
SC-7	Street Sweeping/Vacuuming	NS-10	Vehicle and Equipment Maintenance
SC-10	Storm Drain Inlet Protection	WM-1	Material Delivery and Storage
TC-1	Stabilized Construction Entrance/Exit	WM-2	Material Use
TC-2	Stabilized Construction Roadway	WM-3	Stockpile Management
TC-3	Entrance/Outlet Tire Wash	WM-4	Spill Prevention Control
WE-1	Wind Erosion Control	WM-5	Solid Waste Management
SS-7	Geotextiles, Plastic Covers, & Erosion Control Blankets/Mats	WM-6	Hazardous Waste Management
NS-1	Water Conservation Practices	WM-7	Contaminated Soil Management
NS-2	Dewatering Operations	WM-8	Concrete Waste Management
NS-7	Potable Water/Irrigation	WM-9	Sanitary/Septic Waste Management
		WM-10	Liquid Waste Management

For the above-listed BMPs and those detailed in Attachment B-2, many of the design features may not be applicable to the demolition project. During demolition at the site, the BMP may be implemented with some field modifications due to changes in site conditions. The sequence of implementation of BMPs will depend on the phasing of the project work. For example, BMPs associated with the site trailer and site entrance/exit will be implemented at the start of the project and remain in effect throughout the project. However, excavation BMPs will only be implemented when active excavation occurs.

For the construction activities that will occur during this project, both storm water sources and non-storm water sources for potential pollutants are present. For each construction activity and/or pollutant source, the appropriate BMPs are presented that will be implemented.

4.1 DEMOLITION

Demolition of surface buildings and structures as well as subgrade structures and utilities will be performed. In general the demolition work will involve removal of all buildings and structures, concrete foundations, concrete curbs, concrete pavements, subgrade utilities, and vegetation. The demolition work will generate asphaltic concrete, concrete, metal, and wood debris. The debris will be segregated and transported off site for disposal and/or recycling. Concrete debris will be crushed and left on site for reuse. During demolition work, dust suppression will be performed such that applicable rules and regulations of the Bay Area Air Quality Management District are followed. The dust suppression techniques may involve water spray of demolition work, placement of plastic over dusty debris, and performing work in non-windy conditions.

Demolition of the buildings and structures will be completed such that surrounding site surface drainage is not affected. During demolition work, if storm water enters an uncompleted excavation (i.e., utility trench that has not been backfilled), the water will be pumped out and discharged into the storm system. Fiber rolls and/or silt fencing (along with sidewall benching) may be implemented such that excessive erosion and sedimentation along trench sidewalls do not occur. All demolition will be completed in a safe manner such that excessive runoff during storm events does not occur. In addition, excavation work will not occur during periods of extensive forecasted rainfall.

4.1.1 Best Management Practices for Demolition Activities

During demolition work, storm water may be protected with one or more of the following BMPs:

- Placement of fiber rolls around debris piles and uncompleted excavations;
- Placement of straw bales around debris piles;
- Installation of geotextiles/filter fabric over debris piles; and
- Ensuring that excessive amounts of dust suppressing water are not applied to demolition work such that a water runoff problem is created.

4.2 SOIL AND DEBRIS HANDLING

This project will include the following soil and debris-handling processes:

- Soil and debris stockpiling;
- Soil and debris loading into trucks for off-site transportation and disposal; and
- Backfill and rough site grading.

4.2.1 Best Management Practices for Soil and Debris Handling

For each handling process certain BMPs will be implemented.

Soil and Debris Stockpiling

Soil and debris that are generated from demolition work will be placed in the stockpile area defined in the contractor's demolition plan. This soil and debris will be put inside a containment system constructed from straw bales, fiber rolls, and geotextiles such that the soil and debris are contained. The containment system will prevent excessive silt and debris from flowing into the storm water system. The stockpile containment system will be checked daily for proper function. Any deficiencies will be immediately repaired.

Backfill and Grading

When demolition excavations are complete, the excavations will be backfilled in accordance with the SMP. The backfill material will consist of existing onsite material. Placement of the backfill material will be performed such that excessive soil is not tracked off the site. The final grading of the site will be performed such that the site has positive drainage. Because the on-site storm water collection system will ultimately be removed, attention will be paid to areas where drainage towards off-site storm water inlets may occur. To the extent possible, final grading will be performed such that runoff from soil areas into inlets is minimized. A combination of silt fencing, fiber rolls, and drainage swales may be implemented to prevent discharge from final graded areas into nearby storm drain inlets.

Soil Handling Activities

During this project, the following BMPs will be implemented during soil handling activities:

- Stabilized construction roads. This includes all roads internal to the project as well as the entrance/exit roads. Preparation of the entrance/exits shall prevent unnecessary tracking of soil onto public streets.
- Maintenance of existing fencing to prevent unauthorized visitors to protect construction BMPs.
- Decontamination of equipment. To the extent possible, dry decontamination of equipment shall occur to prevent generation of wastewater. The project will also have a decontamination pad for equipment.
- No washing of on-site streets will be performed. Regular street sweeping will be performed to remove soil and dust.
- Regular maintenance of construction equipment will be performed to prevented unwarranted leaks of petroleum products from the equipment onto the site. Equipment servicing will be performed on site in one designated area away from stormwater and sanitary drain inlets and will be performed in a clean and professional manner. Bulk storage of fuels and oils will likely not occur during this project. If such storage is necessary, appropriate measures will be taken to ensure that potential releases of fuels and oils do not impact the storm water

system. Typically a service truck will be utilized to service construction equipment. If any spillage of petroleum products greater than 25 gallons occurs during this project, ERM's Task Manager/Health & Safety Officer (TM/HSO) will be notified and appropriate cleanup and disposal will occur.

5.0 MONITORING PROGRAM

The purpose of the monitoring program is to serve as a self-check to ensure that the BMPs presented in this SWPPP are performing adequately during active construction to protect storm water runoff quality. This monitoring program consists of the following requirements:

- Training;
- Compliance; and
- Inspection and Monitoring.

Records of all training, inspections, compliance certifications, and noncompliance reporting will be retained for a period of 3 years from the date generated. With the exception of noncompliance reporting, submittal of these records to the California Regional Water Quality Control Board (RWQCB) is not required unless specifically requested.

5.1 TRAINING REQUIREMENT

A requirement of the General Permit is that the SWPPP and the monitoring program must be prepared and managed by a person adequately trained in storm water management. To promote storm water management awareness specific to this project, job-site personnel will be periodically trained on the subject of storm water management at daily health and safety tailgate meetings. Plant Reclamation personnel who are trained in storm water management will be responsible for providing this information at safety tailgate meetings. The minimum documentation of the tailgate meeting will be a job safety briefing form showing the site-specific storm water topics covered, with the signatures of those who attended the tailgate meeting. Records of tailgate meetings that include discussion of SWPPP topics will be retained in Attachment B-3 to ensure compliance with this training requirement.

5.2 COMPLIANCE REQUIREMENT

The General Permit requires that the permit holder complete annual certification that construction activities are in compliance with the

requirements of the General Permit and the SWPPP. This certification is contingent upon site inspections and monitoring that are performed routinely based upon the procedures outlined in this monitoring program. The certification must be completed by 1 July of each year, and is not required for submittal to the RWQCB unless specifically requested. Yearly compliance certification, as well as site inspection checklists, will be included at the end of the SWPPP to serve as a record for complying with the General Permit and the SWPPP.

Section B.3 of the NPDES General Permit requires that if site inspections and monitoring identify a noncompliance incident, the RWQCB shall be notified by telephone at (510) 622-2300 as soon as possible, but no later than 48 hours after the incident has been discovered. This notification shall be followed by a report within 14 days. The noncompliance notification will include the following items:

- Identify the noncompliance event (including an initial assessment of any impact caused by the event);
- Describe the actions necessary to achieve compliance; and
- Include a time schedule subject to modifications by the RWQCB indicating when compliance will be achieved.

A sample annual certification is included in Attachment B-4, and all completed annual compliance certifications will also be retained in Attachment B-4.

5.3 INSPECTION AND MONITORING

This SWPPP identifies storm water and non-storm water pollutant sources associated with demolition activities at the site. Based upon these pollutant sources and the activities that will take place, appropriate BMPs have been identified and selected. Site inspections and monitoring will serve as the primary resource to verify that the BMPs are performing as required. The monitoring is based on visual inspection of runoff and adequacy of the installed BMPs.

Qualified personnel shall conduct inspections and monitoring of the BMPs prior to anticipated storm events, during extended storm events, and after actual storm events to identify areas contributing to a discharge of storm water associated with construction activity. During extended storm events (a storm event is defined as 0.5 inch of rainfall within a 24-hour

period, as measured by an on-site rain gauge or local weather report), inspections will be required each 24-hour period. If a storm event is not predicted, an inspection and monitoring event of the BMPs will be performed twice a month to ensure adequacy of the BMPs, or as otherwise already stated in this SWPPP. Any adjustments in the BMPs will be noted in the site inspection report. Attachment B-5 of this SWPPP contains a blank Inspection and Monitoring Checklist that will be completed for each inspection and monitoring event. Each completed inspection and monitoring checklist will be retained in Attachment B-6, and will support the annual compliance requirement.

5.3.1 Sampling and Analysis Contingency Plan

In addition to the visual monitoring program, the General Permit requires a sampling and analysis plan for off-site discharges resulting from construction activity. The purpose of this sampling is to determine whether the BMPs employed on a construction site are effective in controlling potential construction site pollutants from leaving the site with the storm water runoff. The sampling plan must be implemented under the following conditions:

- Sediment in storm water from the site is discharged directly into waters listed as impaired from sediment, silt, or turbidity on the SWRCB's 303(d) list; or
- Pollutants that are known, but that cannot be visually observed, are discharged from the site, causing or contributing to exceedances of water quality objectives in the receiving waters.

Storm water at this site that enters storm drain inlets is discharged to the New York Slough. The New York Slough is listed as impaired on the SWRCB's 303(d) list. Therefore, this sampling contingency plan only covers sampling for discharges of pollutants that are known, but cannot be visually observed. Sampling for nonvisible pollutants is required if storm water comes into contact with soil amendments, other exposed materials, or site contamination, and if visual inspections indicate that there has been a breach or malfunction of a BMP that could result in the discharge of pollutants to storm drain inlets. If a leakage or spill is observed during inspections, and appropriate measures are taken to fully contain and clean up the leakage or spill, then the potential for discharge of pollutants off-site no longer exists and sampling is not required.

Potential nonvisible, storm water pollutants existing at the site include possibly impacted soil, lubricants, fuel, and oil associated with on-site

equipment servicing. If any of these materials are not properly contained on site and are exposed to storm water runoff, ERM personnel will perform the sampling. Potentially impacted storm water will be sampled at locations where a BMP failure or breach has occurred that can be safely accessed. At least one background sample will be collected in a location that is not affected by the BMP breach. The samples of potentially impacted storm water and the background sample will be analyzed for the suspected contaminant of concern (i.e., if diesel tank on a truck leaks near a storm drain, then diesel will be the suspected contaminant of concern). The background sample will be used as a comparison against the samples of potentially impacted storm water.

If portable field instruments or analytical laboratory test results indicate that the storm water sample concentrations of the material in question significantly exceeds the background sample concentrations, the existing BMPs will be evaluated. The deficient BMPs shall be repaired or alternative BMPs shall be implemented. Additional BMPs may also be added. Records of all inspections, field measurements, laboratory analyses, and other documentation relating to sampling and analysis shall be kept with the project's SWPPP.

5.3.2 Identified BMPs for Construction Activities

Section 4 of the SWPPP identified the necessary BMPs required for site development activities. If properly installed and maintained, the selected BMPs will protect the storm water quality during site construction activities. During site inspection and monitoring, each BMP will be evaluated for adequacy and proper implementation, and whether additional BMPs are required. This will be accomplished by completing an Inspection and Monitoring Checklist for each inspection and monitoring event.

5.3.3 Inspection and Monitoring Checklist

Attachment B-5 contains blank Inspection and Monitoring Checklists and Attachment B-6 will retain the completed checklists. The Inspection and Monitoring Checklist contains the following information:

- Inspector information;
- Type of inspection;
- Weather information;
- List of inadequate BMPs; and

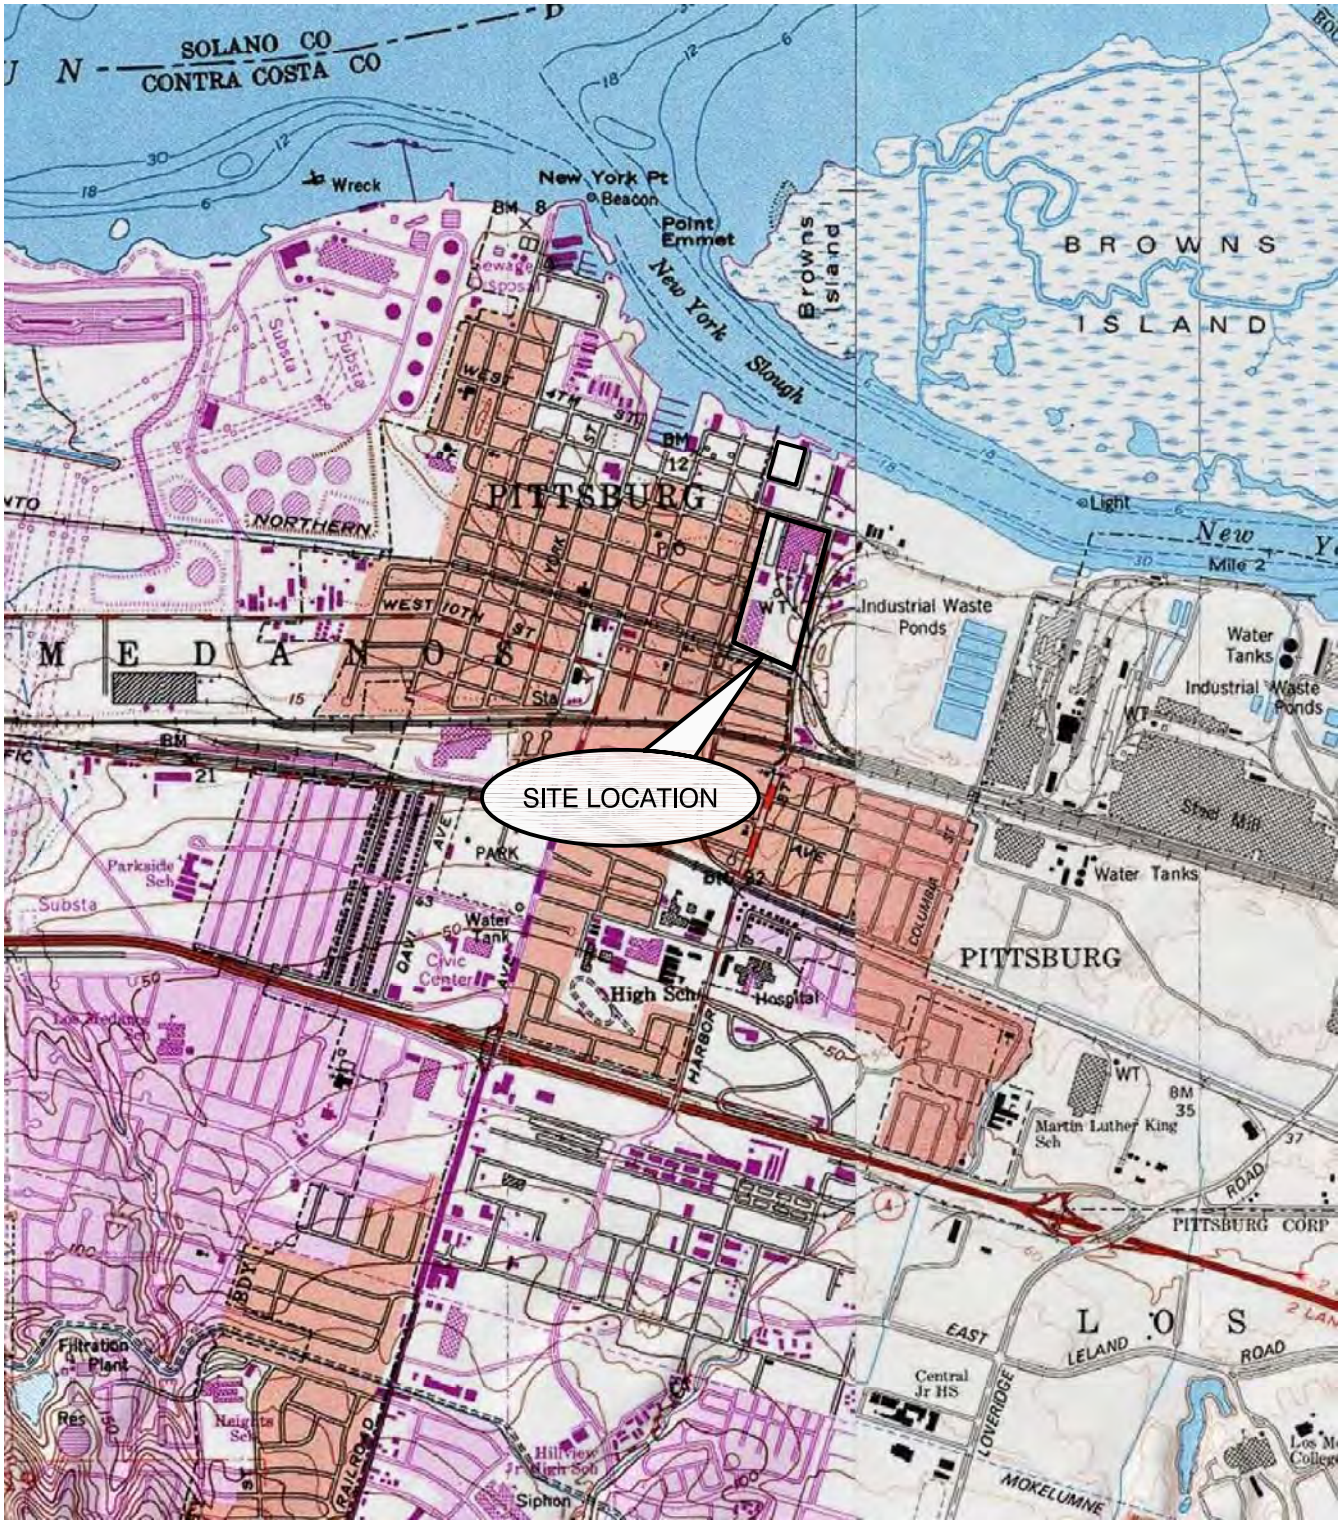
- List of corrective actions taken.

For each inspection and monitoring event, a person adequately trained and qualified in storm water management for construction sites will complete an Inspection and Monitoring Checklist.

5.4 POST-CONSTRUCTION BMPS

After construction is complete at the site, post-construction BMPs will be implemented by the Contractor. The post-construction BMPs may include the following:

- Final grading of exposed soil will be performed such that positive drainage occurs. Grading will be performed such that drainage into sanitary and storm water drain inlets does not occur.
- Fiber rolls and silt fencing will be installed at strategic places where exposed soil may be subject to erosion and sedimentation.
- Final site demobilization will include completely cleaning the site to remove debris and Contractor-generated wastes. No water will be used that would rinse soil or debris down drain inlets.
- Off-site drain inlets will be protected by one and/or a combination of the following BMPs: drop inlet filter fabrics, sand bags filled with gravel, straw bales, and fiber rolls.



After the Contractor has demobilized from the site and the post-construction BMPs are in place, ERM will be responsible for inspection, monitoring, and improvements of these BMPs.

5.5 ADDITIONS TO THE SWPPP

This SWPPP has been prepared based on knowledge of the site and the anticipated construction activities. The purpose of this SWPPP is to provide guidance for storm water and non-storm water management protocol during such activities. By following this SWPPP, the discharge of pollutants associated with construction activities will be minimized. If unforeseen activities require additions or reductions in BMPs, appropriate action will be taken to modify the BMPs and make the necessary amendments to the SWPPP.

Silt Fence

SC-1

Standard Symbol

BMP Objectives

- o Soil Stabilization
- ● Sediment Control
- o Tracking Control
- o Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

A silt fence is a temporary linear sediment barrier of permeable fabric designed to intercept and slow the flow of sediment-laden sheet flow runoff. Silt fences allow sediment to settle from runoff before water leaves the construction site.

Appropriate Applications

Silt fences are placed:

- Below the toe of exposed and erodible slopes.
- Down-slope of exposed soil areas.
- Around temporary stockpiles.
- Along streams and channels.
- Along the perimeter of a project.

Limitations

- Not effective unless trenched and keyed in.
- Not intended for use as mid-slope protection on slopes greater than 1:4 (V:H).
- Must be maintained.
- Must be removed and disposed of.
- Don't use below slopes subject to creep, slumping, or landslides.
- Don't use in streams, channels, drain inlets, or anywhere flow is concentrated.
- Don't use silt fences to divert flow.

Standards and Specifications

Design and Layout

- The maximum length of slope draining to any point along the silt fence shall be 61 m (200 ft) or less.
- Slope of area draining to silt fence shall be less than 1:1 (V:H).
- Limit to locations suitable for temporary ponding or deposition of sediment.
- Fabric life span generally limited to between five and eight months. Longer periods may require fabric replacement.
- Silt fences shall not be used in concentrated flow areas.
- Lay out in accordance with Pages 5 and 6 of this BMP.
- For slopes steeper than 1:2 (V:H) and that contain a high number of rocks or large dirt clods that tend to dislodge, it may be necessary to install additional protection immediately adjacent to the bottom of the slope, prior to installing silt fence. Additional protection may be a chain link fence or a cable fence.
- For slopes adjacent to water bodies or Environmentally Sensitive Areas (ESAs), additional temporary soil stabilization BMPs shall be used.

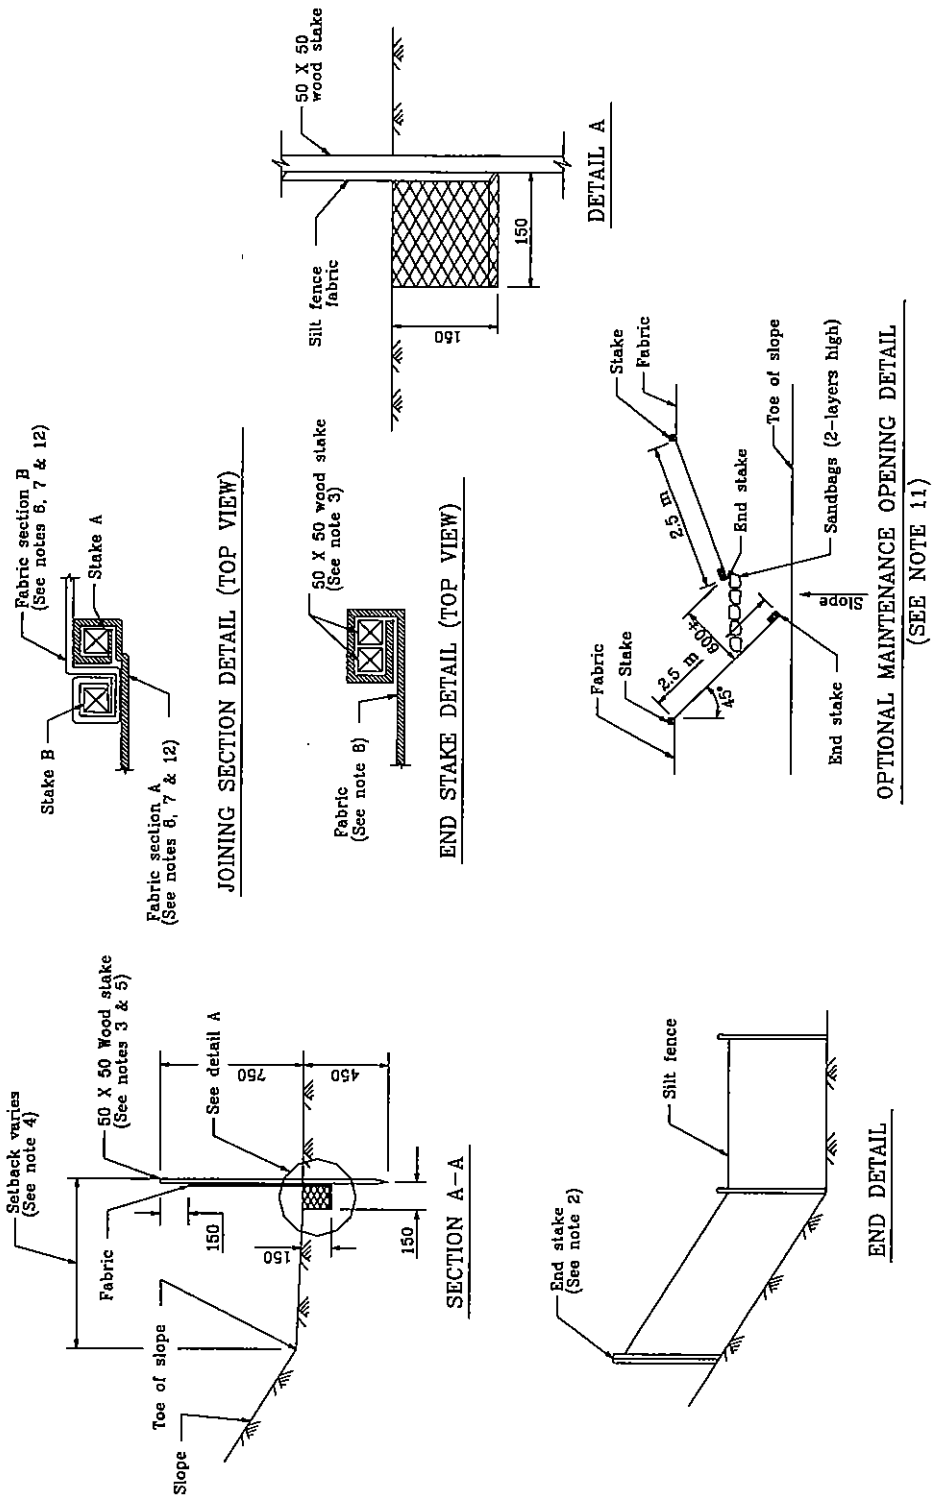
Materials

- Silt fence fabric shall be woven polypropylene with a minimum width of 900 mm (36 inches) and a minimum tensile strength of 0.45-kN. The fabric shall conform to the requirements in ASTM designation D4632 and shall have an integral reinforcement layer. The reinforcement layer shall be a polypropylene, or equivalent, net provided by the manufacturer. The permittivity of the fabric shall be between 0.1 sec^{-1} and 0.15 sec^{-1} in conformance with the requirements in ASTM designation D4491. Contractor must submit certificate of compliance in accordance with Standard Specifications Section 6-1.07.
- Wood stakes shall be commercial quality lumber of the size and shape shown on the plans. Each stake shall be free from decay, splits or cracks longer than the thickness of the stake or other defects that would weaken the stakes and cause the stakes to be structurally unsuitable.
- Bar reinforcement may be used, and its size shall be equal to a number four (4) or greater. End protection shall be provided for any exposed bar reinforcement.
- Staples used to fasten the fence fabric to the stakes shall be not less than 45 mm (1.75 inches) long and shall be fabricated from 1.57 mm (0.06 inch) or heavier wire. The wire used to fasten the tops of the stakes together when

joining two sections of fence shall be 3.05 mm (0.12 inch) or heavier wire. Galvanizing of the fastening wire is not required.

Installation

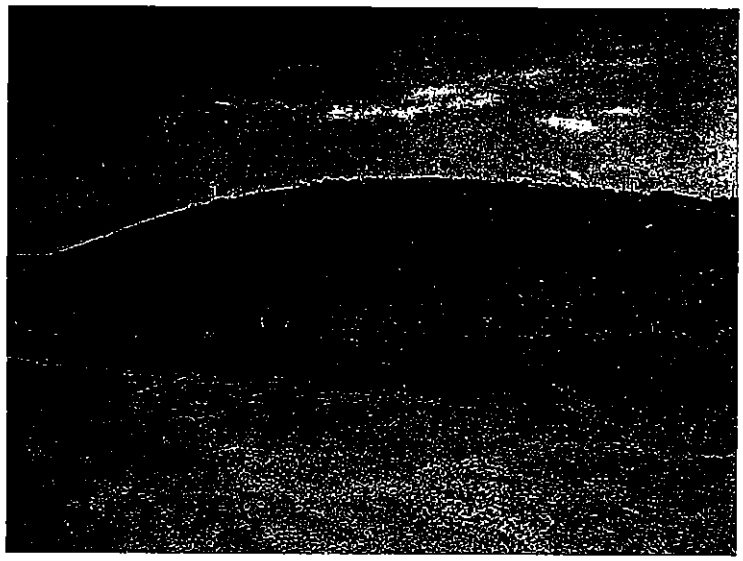
- Generally, silt fences shall be used in conjunction with soil stabilization source controls up slope to provide effective erosion and sediment control.
- Bottom of the silt fence shall be keyed-in a minimum of 150 mm (12 inches).
- Trenches shall not be excavated wider and deeper than necessary for proper installation of the temporary linear sediment barriers.
- Excavation of the trenches shall be performed immediately before installation of the temporary linear sediment barriers.
- Construct silt fences with a set-back of at least 1m (3 ft) from the toe of a slope. Where a silt fence is determined to be not practical due to specific site conditions, the silt fence may be constructed at the toe of the slope, but shall be constructed as far from the toe of the slope as practical.
- Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/3 the height of the barrier; in no case shall the reach exceed 150 meters (490 ft).
- Cross barriers shall be a minimum of 1/3 and a maximum of 1/2 the height of the linear barrier.
- Install in accordance with Pages 5 and 6 of this BMP.



Maintenance and Inspection

- Repair undercut silt fences.
- Repair or replace split, torn, slumping, or weathered fabric.
- Inspect silt fence when rain is forecast. Perform necessary maintenance, or maintenance required by the Resident Engineer (RE).
- Inspect silt fence following rainfall events. Perform maintenance as necessary, or as required by the RE.
- Maintain silt fences to provide an adequate sediment holding capacity. Sediment shall be removed when the sediment accumulation reaches one-third (1/3) of the barrier height. Removed sediment shall be incorporated in the project at locations designated by the RE or disposed of outside the right-of-way in conformance with the Standard Specifications.
- Silt fences that are damaged and become unsuitable for the intended purpose, as determined by the RE, shall be removed from the site of work, disposed of outside the highway right-of-way in conformance with the Standard Specifications, and replaced with new silt fence barriers.

- Holes, depressions or other ground disturbance caused by the removal of the temporary silt fences shall be backfilled and repaired in conformance with the Standard Specifications.



- Remove silt fence when no longer needed or as required by the RE. Fill and compact post holes and anchorage trench, remove sediment accumulation, and grade fence alignment to blend with adjacent ground.

TEMPORARY LINEAR SEDIMENT BARRIER (TYPE SILT FENCE)
NOTES
1. Construct the length of each reach so that the change in base elevation along the reach does not exceed 1/3 the height of the linear barrier, in no case shall the reach length exceed 150m.
2. The last 2.5 m of fence shall be turned up slope.
3. Stake dimensions are nominal.
4. Dimension may vary to fit field condition.
5. Stakes shall be spaced at 2.5 m maximum and shall be positioned on downstream side of fence.
6. Stakes to overlap and fence fabric to fold around each stake one full turn. Secure fabric to stake with 4 staples.
7. Stakes shall be driven tightly together to prevent potential flow-through of sediment at joint. The tops of the stakes shall be secured with wire.
8. For end stake, fence fabric shall be folded around two stakes one full turn and secured with 4 staples.
9. Minimum 4 staples per stake. Dimensions shown are typical.
10. Cross barriers shall be a minimum of 1/3 and a maximum of 1/2 the height of the linear barrier.
11. Maintenance openings shall be constructed in a manner to ensure sediment remains behind silt fence.
12. Joining sections shall not be placed at sump locations.
13. Sandbag rows and layers shall be offset to eliminate gaps.

Fiber Rolls

SC-5

Standard Symbol

BMP Objectives

- ● Soil Stabilization
- ● Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ○ Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

A fiber roll consists of wood excelsior, rice or wheat straw, or coconut fibers that is rolled or bound into a tight tubular roll and placed on the toe and face of slopes to intercept runoff, reduce its flow velocity, release the runoff as sheet flow and provide removal of sediment from the runoff. Fiber rolls may also be used for inlet protection and as check dams under certain situations.

Appropriate Applications

- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- Below the toe of exposed and erodible slopes.
- Fiber rolls may be used as check dams in unlined ditches if approved by the Resident Engineer (RE) or the District Construction Storm Water Coordinator (refer to SC-4 "Check Dams").
- Fiber rolls may be used for drain inlet protection if approved by the RE or the District Construction Storm Water Coordinator (refer to SC-10 "Storm Drain Inlet Protection").
- Down-slope of exposed soil areas.
- Around temporary stockpiles.
- Along the perimeter of a project.

Limitations

- Runoff and erosion may occur if fiber roll is not adequately trenched in.
- Fiber rolls at the toe of slopes greater than 1:5 may require the use of 500 mm (20" diameter) or installations achieving the same protection (i.e., stacked smaller diameter fiber rolls, etc.).
- Fiber rolls may be used for drainage inlet protection if they can be properly anchored.
- Difficult to move once saturated.
- Fiber rolls could be transported by high flows if not properly staked and trenched in.
- Fiber rolls have limited sediment capture zone.
- Do not use fiber rolls on slopes subject to creep, slumping, or landslide.

Standards and Specifications

Fiber Roll Materials

- Fiber rolls shall be either:

  (1) Prefabricated rolls.

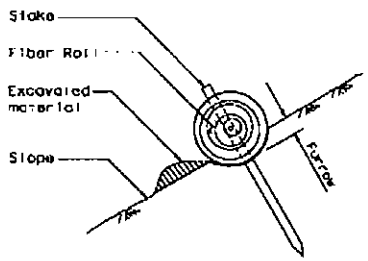
  (2) Rolled tubes of erosion control blanket.

Assembly of Field Rolled Fiber Roll

- Roll length of erosion control blanket into a tube of minimum 200 mm (8 in) diameter.
- Bind roll at each end and every 1.2 m (4 ft) along length of roll with jute-type twine.

Installation

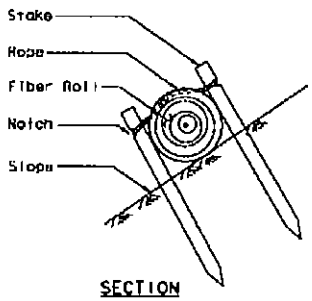
- Slope inclination of 1:4 or flatter: fiber rolls shall be placed on slopes 6.0 m apart.
- Slope inclination of 1:4 to 1:2: fiber rolls shall be placed on slopes 4.5 m apart.
- Slope inclination 1:2 or greater: fiber rolls shall be placed on slopes 3.0 m apart.
- Stake fiber rolls into a 50 to 100 mm (2 to 4 in) trench.



- Drive stakes at the end of each fiber roll and spaced 600 mm (2 ft) apart if Type 2 installation is used (refer to Page 4). Otherwise, space stakes 1.2 m (4 ft) maximum on center if installed as shown on Pages 5 and 6.
- Use wood stakes with a nominal classification of 19 by 19 mm (3/4 by 3/4 in), and minimum length of 600 mm (24 in).
- If more than one fiber roll is placed in a row, the rolls shall be overlapped; not abutted.

Removal

- Fiber rolls are typically left in place.
- If fiber rolls are removed, collect and dispose of sediment accumulation, and fill and compact holes, trenches, depressions or any other ground disturbance to blend with adjacent ground.



Maintenance and Inspection

- Repair or replace split, torn, unraveling, or slumping fiber rolls.
- Inspect fiber rolls when rain is forecast. Perform maintenance as needed or as required by the RE.
- Inspect fiber rolls following rainfall events and a least daily during prolonged rainfall. Perform maintenance as needed or as required by the RE.
- Maintain fiber rolls to provide an adequate sediment holding capacity. Sediment shall be removed when the sediment accumulation reaches three quarters (3/4) of the barrier height. Removed sediment shall be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications.

- ● Tracking Control
- o Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Practices to remove tracked sediment to prevent the sediment from entering a storm drain or watercourse.

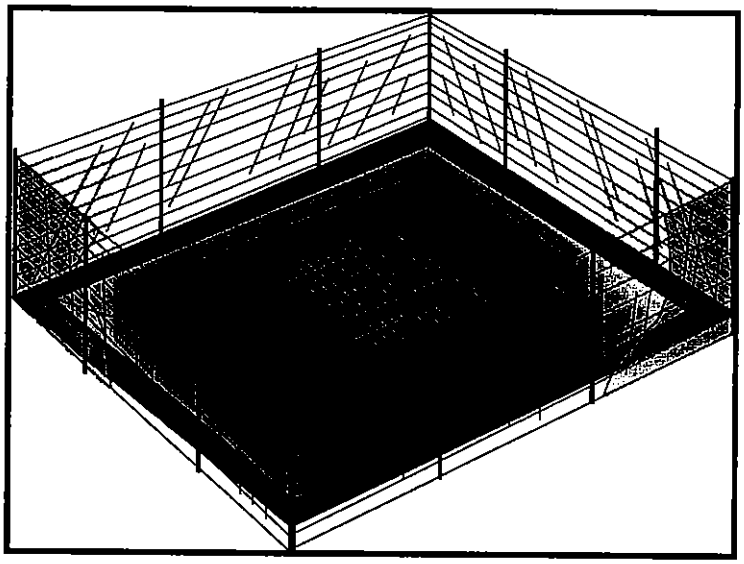
Appropriate Applications

These practices are implemented anywhere sediment is tracked from the project site onto public or private paved roads, typically at points of ingress/egress.

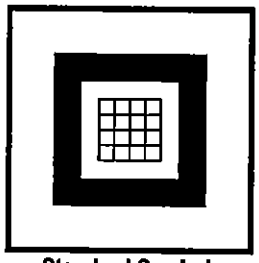
Limitations

Sweeping and vacuuming may not be effective when soil is wet or muddy.

Standards and Specifications



- Kick brooms or sweeper attachments shall not be used.
- Inspect potential sediment tracking locations daily.
- Visible sediment tracking shall be swept and/or vacuumed daily.
- If not mixed with debris or trash, consider incorporating the removed sediment back into the project.



Maintenance and Inspection

- Inspect ingress/egress access points daily and sweep tracked sediment as needed, or as required by the Resident Engineer (RE).
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- Adjust brooms frequently; maximize efficiency of sweeping operations.
- After sweeping is finished, properly dispose of sweeper wastes at an approved dumpsite in conformance with the provisions in Standard Specifications Section 7-1.13 .

Storm Drain Inlet Protection

SC-10

Standard Symbol

BMP Objectives

- o Soil Stabilization
- ● Sediment Control
- o Tracking Control
- o Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Devices used at storm drain inlets that are subject to runoff from construction activities to detain and/or to filter sediment-laden runoff to allow sediment to settle and/or to filter sediment prior to discharge into storm drainage systems or watercourses.

Appropriate Applications

- Where ponding will not encroach into highway traffic.
- Where sediment laden surface runoff may enter an inlet.
- Where disturbed drainage areas have not yet been permanently stabilized.
- Where the drainage area is 0.4 ha (1 ac) or less.
- Appropriate during wet and snow-melt seasons.

Limitations

- Requires an adequate area for water to pond without encroaching upon traveled way and should not present itself to be an obstacle to oncoming traffic.
- May require other methods of temporary protection to prevent sediment-laden storm water and non-storm water discharges from entering the storm drain system.
- Sediment removal may be difficult in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use other on-site sediment trapping techniques (e.g. check dams) in conjunction with inlet protection.
- Frequent maintenance is required.
- For drainage areas larger than 0.4 ha (1 ac), runoff shall be routed to a sediment trapping device designed for larger flows. See BMPs SC-2, "Sediment/Desilting Basin," and SC-3 "Sediment Trap."

- Filter fabric fence inlet protection is appropriate in open areas that are subject to sheet flow and for flows not exceeding 0.014 m3/s (0.5 cfs).
- Gravel bag barriers for inlet protection are applicable when sheet flows or concentrated flows exceed 0.014 m3/s (0.5 cfs), and it is necessary to allow for overtopping to prevent flooding.
- Fiber rolls and foam barriers are not appropriate for locations where they cannot be properly anchored to the surface.
- Excavated drop inlet sediment traps are appropriate where relatively heavy flows are expected and overflow capability is needed.

Standards and Specifications

Identify existing and/or planned storm drain inlets that have the potential to receive sediment-laden surface runoff. Determine if storm drain inlet protection is needed, and which method to use.

Methods and Installation

- ***DI Protection Type 1 - Filter Fabric Fence*** - The filter fabric fence (Type 1) protection is illustrated on Page 5. Similar to constructing a silt fence. See BMP SC-1, "Silt Fence." Do not place filter fabric underneath the inlet grate since the collected sediment may fall into the drain inlet when the fabric is removed or replaced.
- ***DI Protection Type 2 - Excavated Drop Inlet Sediment Trap*** - The excavated drop inlet sediment trap (Type 2) is illustrated in Page 6. Similar to constructing a temporary silt fence, See BMP SC-1, "Silt Fence." Size excavated trap to provide a minimum storage capacity calculated at the rate of 130 m3/ha (67 yd3/ac) of drainage area.
- ***DI Protection Type 3 – Gravel bag*** - The gravel bag barrier (Type 3) is illustrated in Page 7. Flow from a severe storm shall not overtop the curb. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Construct gravel bags in accordance with BMP SC-6, "Gravel Bag Berm." Gravel bags shall be used due to their high permeability.
- ***DI Protection Type 4 – Foam Barriers and Fiber Rolls*** – Foam barrier or fiber roll (Type 4) is placed around the inlet and keyed and anchored to the surface. Foam barriers and fiber rolls are intended for use as inlet protection where the area around the inlet is unpaved and the foam barrier or fiber roll can be secured to the surface. RE or Construction Storm Water Coordinator approval is required.

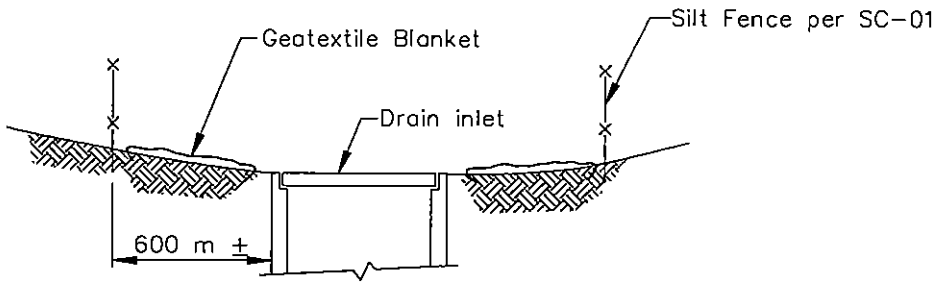
Maintenance and Inspection

General

- Inspect all inlet protection devices before and after every rainfall event, and weekly during the rest of the rainy season. During extended rainfall events, inspect inlet protection devices at least once every 24 hours.

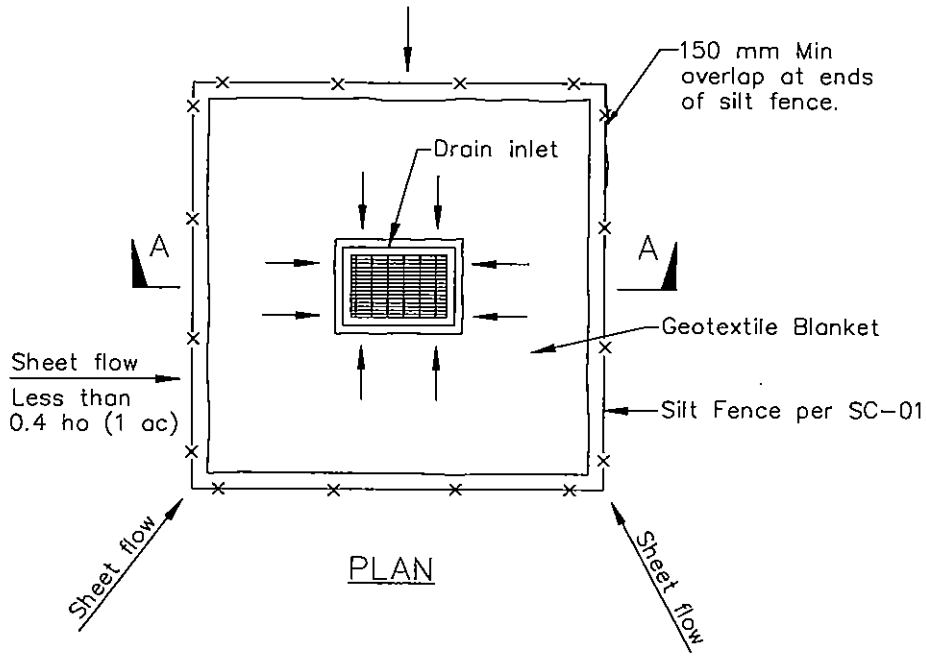
- Inspect the storm drain inlet after severe storms in the rainy season to check for bypassed material.
- Remove all inlet protection devices within thirty days after the site is stabilized, or when the inlet protection is no longer needed.
  - Bring the disturbed area to final grade and smooth and compact it. Appropriately stabilize all bare areas around the inlet.
  - Clean and re-grade area around the inlet and clean the inside of the storm drain inlet as it must be free of sediment and debris at the time of final inspection.

Requirements by Method



- ***Type 1 - Filter Fabric Fence***
  - This method shall be used for drain inlets requiring protection in areas where finished grade is established and erosion control seeding has been applied or is pending.
  - Make sure the stakes are securely driven in the ground and are structurally sound (i.e., not bent, cracked, or splintered, and are reasonably perpendicular to the ground). Replace damaged stakes.
  - Replace or clean the fabric when the fabric becomes clogged with sediment. Make sure the fabric does not have any holes or tears. Repair or replace fabric as needed or as directed by the RE.
  - At a minimum, remove the sediment behind the fabric fence when accumulation reaches one-third the height of the fence or barrier height. Removed sediment shall be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications Section 7-1.13.
- ***Type 2 – Excavated Drop Inlet Sediment Trap***
  - This method may be used for drain inlets requiring protection in areas that have been cleared and grubbed, and where exposed soil areas are subject to grading.
  - Remove sediment from basin when the volume of the basin has been reduced by one-half.
- ***Type 3 - Gravel Bag Barrier***
  - This method may be used for drain inlets surrounded by AC or paved surfaces.
  - Inspect bags for holes, gashes, and snags.

- Check gravel bags for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier. Removed sediment shall be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications Section 7-1.13.

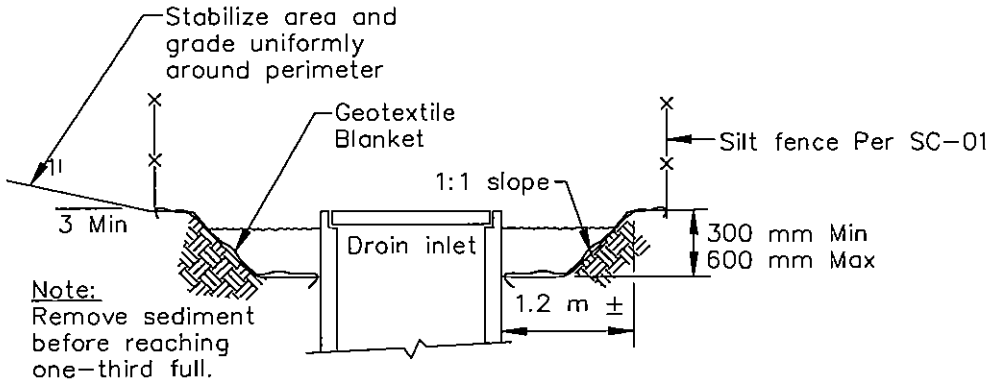


- ***Type 4 Foam Barriers and Fiber Rolls***

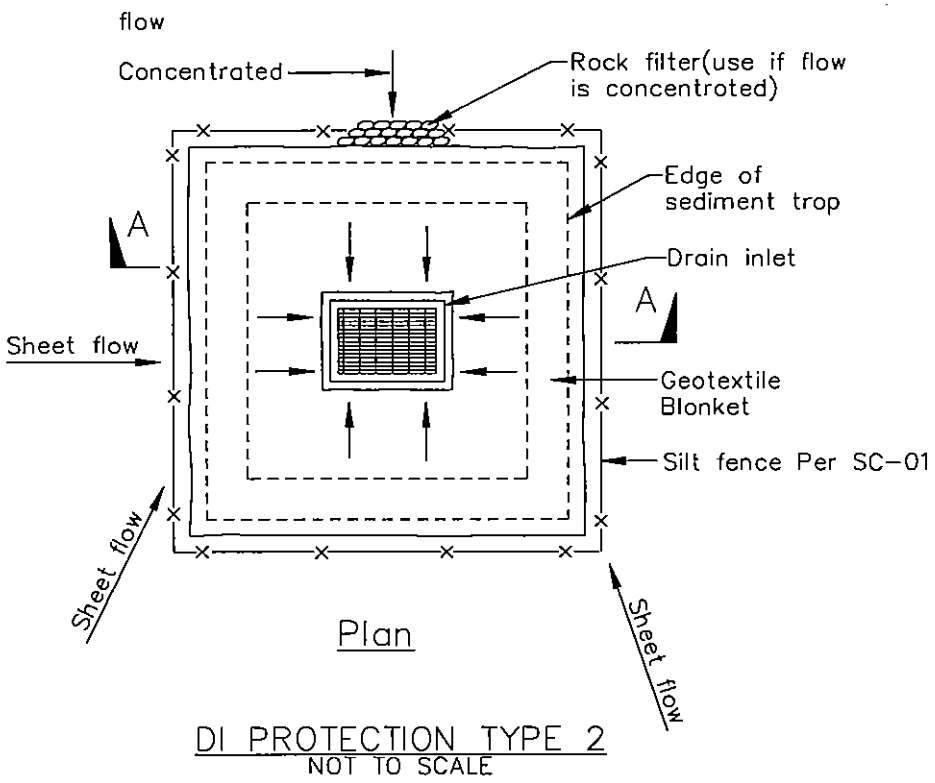
  - This method may be used for drain inlets requiring protection in areas that have been cleared and grubbed, and where exposed soil areas subject to grading. RE or Construction Storm Coordinator approval is required.

  - Check foam barrier or fiber roll for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier. Removed sediment shall be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications.

SECTION A–A



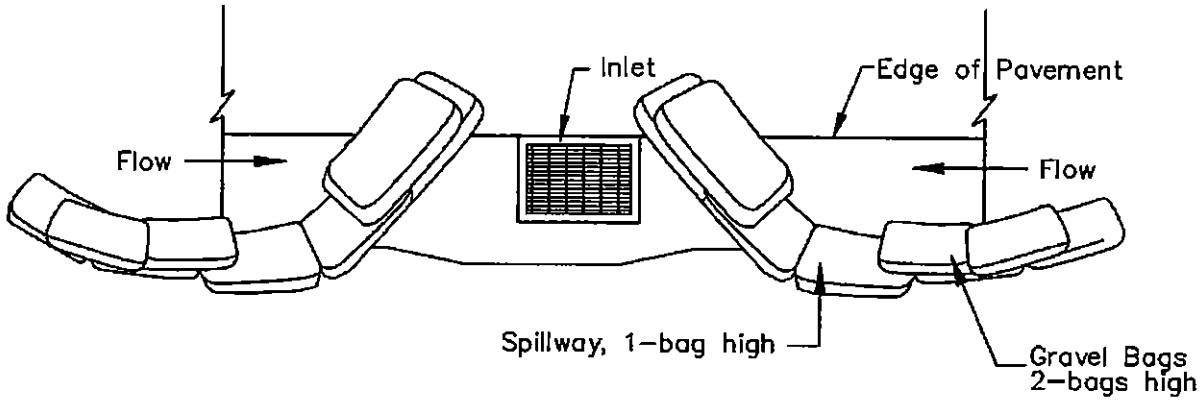
PLAN



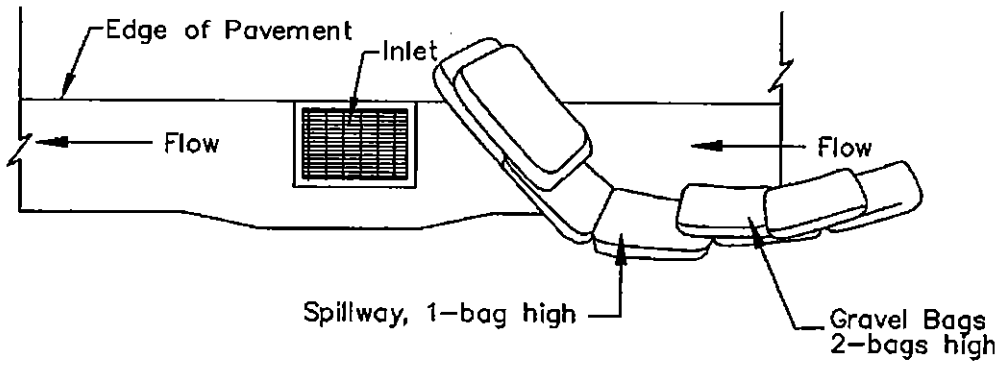
DI PROTECTION TYPE 1
NOT TO SCALE

NOTES:

1. For use in areas where grading has been completed and final soil stabilization and seeding are pending.
2. Not applicable in paved areas.
3. Not applicable with concentrated flows.



Section A–A

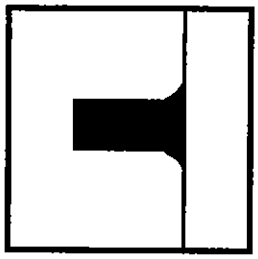


Plan

DI PROTECTION TYPE 2
NOT TO SCALE

Notes
1. For use in cleared and grubbed and in graded areas.
2. Shape basin so that longest inflow area faces longest length of trap.
3. For concentrated flows, shape basin in 2:1 ratio with length oriented towards direction of flow.

TYPICAL PROTECTION FOR INLET WITH OPPOSING FLOW DIRECTIONS



TYPICAL PROTECTION FOR INLET WITH SINGLE FLOW DIRECTION

NOTES:

1. Intended for short–term use.
2. Use to inhibit non–storm water flow.
3. Allow for proper maintenance and cleanup.
4. Bags must be removed after adjacent operation is completed
5. Not applicable in areas with high silts and clays without filter fabric.

Stabilized Construction Entrance/Exit TC-1

Standard Symbol

BMP Objectives
- ● Soil Stabilization
- ○ Sediment Control
- ● Tracking Control
- ● Wind Erosion Control
- ○ Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

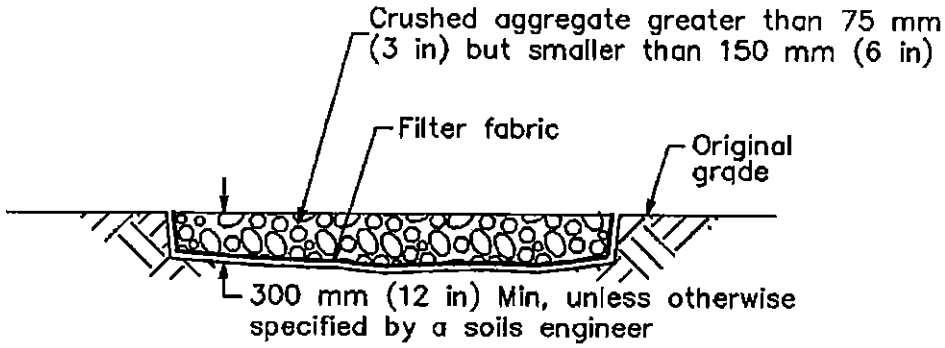
Appropriate Applications

- Use at construction sites:
  - Where dirt or mud can be tracked onto public roads.
  - Adjacent to water bodies.
  - Where poor soils are encountered.
  - Where dust is a problem during dry weather conditions.
- This BMP may be implemented on a project-by-project basis in addition to other BMPs when determined necessary and feasible by the Resident Engineer (RE).

Limitations

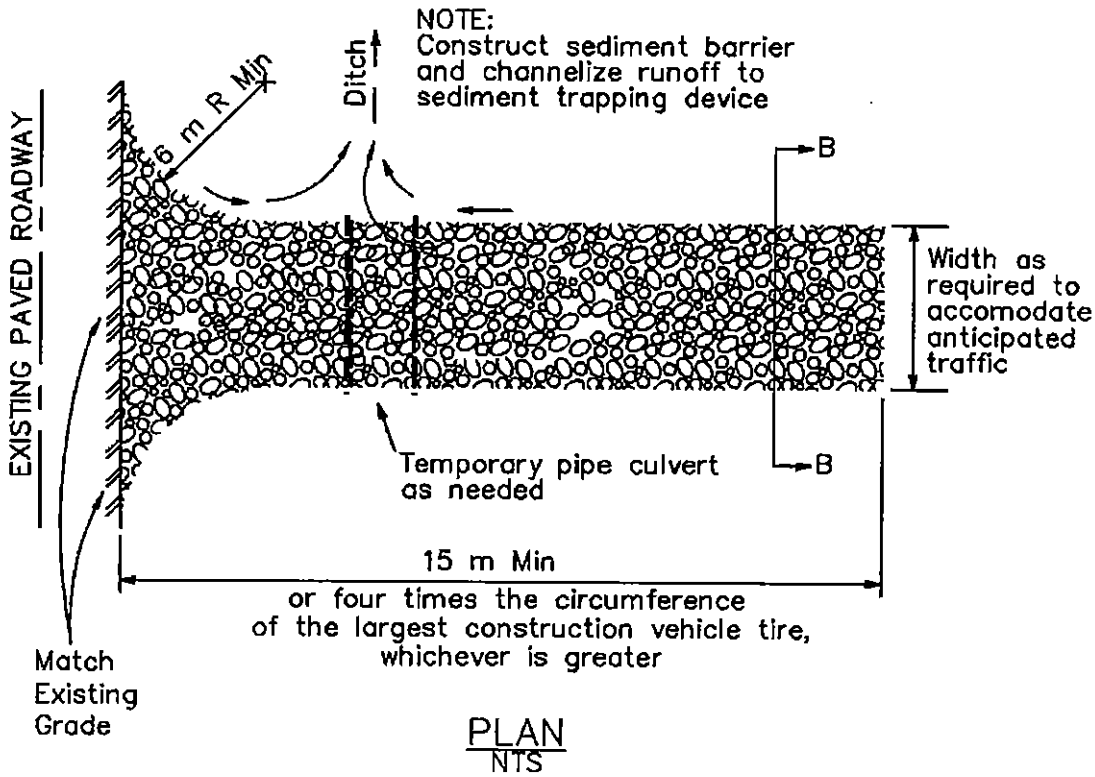
- Site conditions will dictate design and need.

Standards and Specifications



- Limit the points of entrance/exit to the construction site.
- Limit speed of vehicles to control dust.
- Properly grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment-trapping device before discharge.
- Design stabilized entrance/exit to support the heaviest vehicles and equipment that will use it.

Stabilized Construction Entrance/Exit TC-1



- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. The use of asphalt concrete (AC) grindings for stabilized construction access/roadway is not allowed.
- Use of constructed/manufactured steel plates with ribs for entrance/exit access is allowed with written approval from the RE.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 300 mm (12 in) depth, or place aggregate to a depth recommended by the RE. Crushed aggregate greater than 75 mm (3 inches) and smaller than 150 mm (6 inches) shall be used.
- Designate combination or single purpose entrances and exits to the construction site.
- Implement BMP SC-7, "Street Sweeping and Vacuuming" as needed and as required.
- Require all employees, subcontractors, and suppliers to utilize the stabilized construction access.
- All exit locations intended to be used continuously and for a period of time shall have stabilized construction entrance/exit BMPs (TC-1 "Stabilized Construction Entrance/Exit" or TC-3 "Entrance/Outlet Tire Wash").

Maintenance and Inspection

- Inspect routinely for damage and assess effectiveness of the BMP. Remove aggregate, separate and dispose of sediment if construction entrance/exit is clogged with sediment or as directed by the RE.
- Keep all temporary roadway ditches clear.
- Inspect for damage and repair as needed.

Stabilized Construction Roadway

TC-2

Standard Symbol

BMP Objectives
- ● Soil Stabilization
- o Sediment Control
- ● Tracking Control
- ● Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

A stabilized construction roadway is a temporary access road. It is designed for the control of dust and erosion created by vehicular tracking.

Appropriate Applications

- Construction roadways and short-term detour roads:
  - Where mud tracking is a problem during wet weather.
  - Where dust is a problem during dry weather.
  - Adjacent to water bodies.
  - Where poor soils are encountered.
  - Where there are steep grades and additional traction is needed.
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the Resident Engineer (RE).

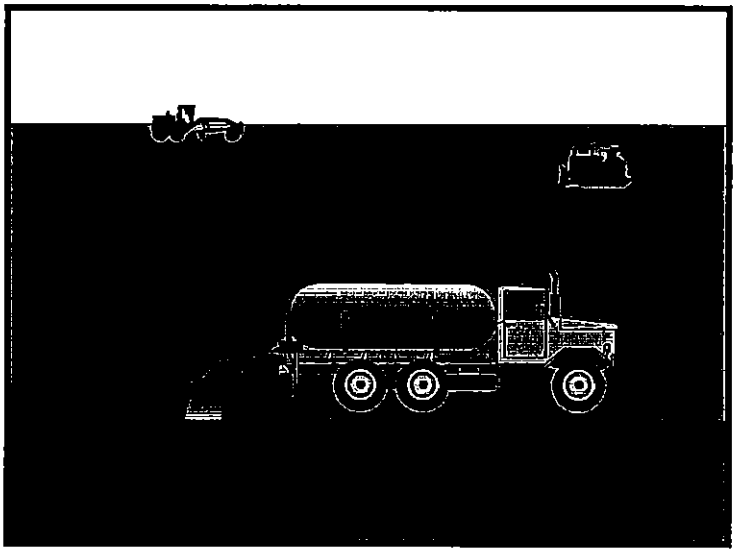
Limitations

- Materials will likely need to be removed prior to final project grading and stabilization.
- Site conditions will dictate design and need.
- May not be applicable to very short duration projects.
- Limit speed of vehicles to control dust.

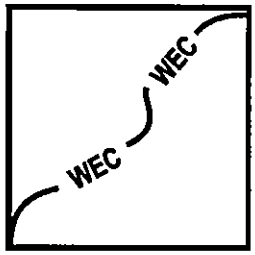
Stabilized Construction Roadway

TC-2

Standards and Specifications



- Properly grade roadway to prevent runoff from leaving the construction site.
- Design stabilized access to support the heaviest vehicles and equipment that will use it.
- Stabilize roadway using aggregate, asphalt concrete, or concrete based on longevity, required performance, and site conditions. The use of cold mix asphalt or asphalt concrete (AC) grindings for stabilized construction roadway is not allowed.
- Coordinate materials with those used for stabilized construction entrance/exit points.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 300 mm (12 in) depth, or place aggregate to a depth recommended by the RE or Construction Storm Water Coordinator. Crushed aggregate greater than 75 mm (3 inches) and smaller than 150 mm (6 inches) shall be used.



Maintenance and Inspection

- Inspect routinely for damage and repair as needed, or as directed by the RE.
- Keep all temporary roadway ditches clear.
- When no longer required, remove stabilized construction roadway and re-grade and repair slopes.

Wind Erosion Control

WE-1

Standard Symbol

BMP Objectives

- ● Soil Stabilization
- ● Sediment Control
- o Tracking Control
- ● Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Wind erosion control consists of applying water and/or other dust palliatives as necessary to prevent or alleviate erosion by the forces of wind. Dust control shall be applied in accordance with Caltrans standard practices. Covering of small stockpiles or areas is an alternative to applying water or other dust palliatives.

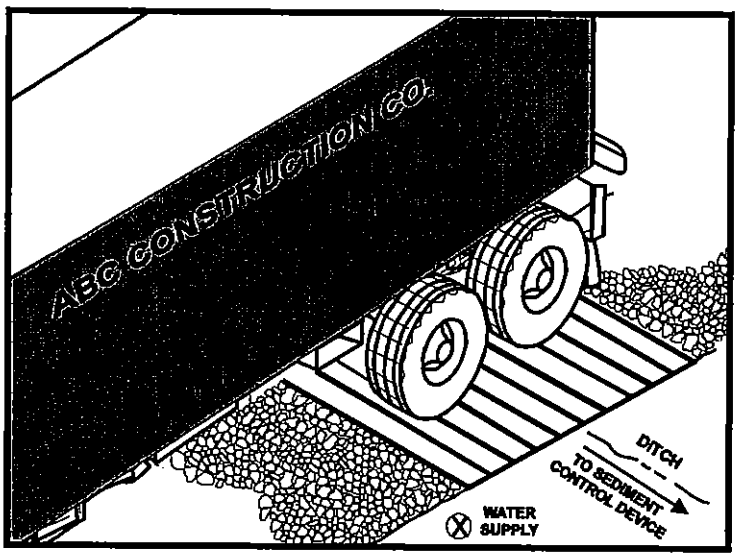
Appropriate Applications

- This practice is implemented on all exposed soils subject to wind erosion.

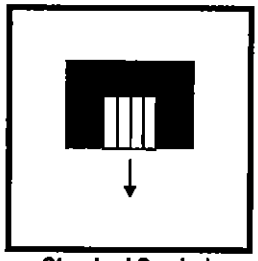
Limitations

- Effectiveness depends on soil, temperature, humidity and wind velocity.

Standards and Specifications



- Water shall be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment shall be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit shall be available at all times to apply water or dust palliative to the project.
- If reclaimed water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality Control Board requirements. Non-potable water shall not be conveyed in tanks or drain pipes that will be used to convey potable water and there shall be no connection between potable and non-potable supplies. Non-potable tanks, pipes and other conveyances shall be marked "NON-POTABLE WATER - DO NOT DRINK."
- Materials applied as temporary soil stabilizers and soil binders will also provide wind erosion control benefits.



Maintenance and Inspection

- Check areas that have been protected to ensure coverage.

Entrance/Outlet Tire Wash

TC-3

Standard Symbol

BMP Objectives
- ● Soil Stabilization
- ● Sediment Control
- ● Tracking Control
- ○ Wind Erosion Control
- ○ Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

A tire wash is an area located at stabilized construction access points to remove sediment from tires and undercarriages, and to prevent sediment from being transported onto public roadways.

Appropriate Applications

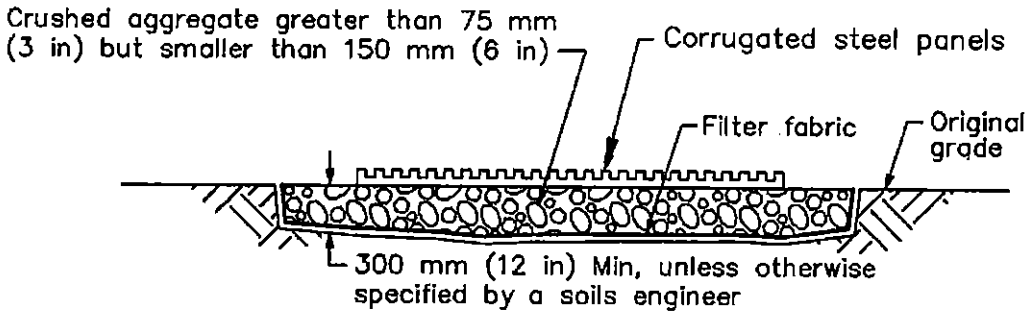
- Tire washes may be used on construction sites where dirt and mud tracking onto public roads by construction vehicles may occur.
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the Resident Engineer (RE).

Limitations

- Requires a supply of wash water.
- Requires a turnout or doublewide exit to avoid having entering vehicles drive through the wash area.

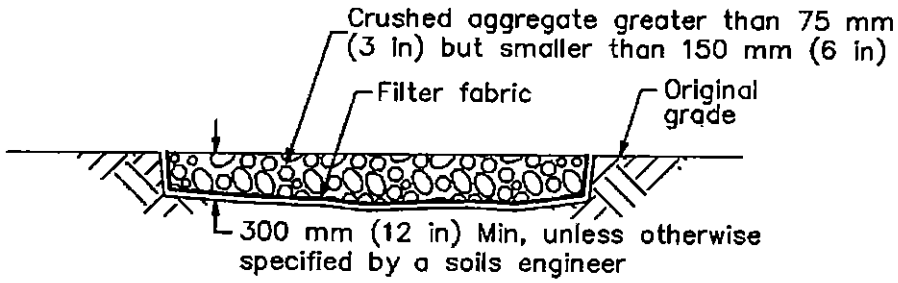
Standards and Specifications

- Incorporate with a stabilized construction entrance/exit. See BMP TC-1, "Stabilized Construction Entrance/Exit."
- Construct on level ground when possible, on a pad of coarse aggregate, greater than 75 mm (3 inches) and smaller than 150 mm (6 inches). A geotextile fabric shall be placed below the aggregate.
- Wash rack shall be designed and constructed/manufactured for anticipated traffic loads.
- Provide a drainage ditch that will convey the runoff from the wash area to a sediment trapping device. The drainage ditch shall be of sufficient grade, width, and depth to carry the wash runoff.



- Require all employees, subcontractors, and others that leave the site with mud-caked tires and/or undercarriages to use the wash facility.
- Implement BMP SC-7, "Street Sweeping and Vacuuming" as needed.
- Use of constructed or prefabricated steel plate with ribs for entrance/exit access is allowed with written approval of RE.

Maintenance and Inspection



- Remove accumulated sediment in wash rack and/or sediment trap to maintain system performance.
- Inspect routinely for damage and repair as needed.

Vehicle and Equipment Cleaning

NS-8

Standard Symbol

BMP Objectives

- o Soil Stabilization
- o Sediment Control
- o Tracking Control
- o Wind Erosion Control
- ● Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Vehicle and equipment cleaning procedures and practices are used to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning operations to storm drain system or to watercourses.

Appropriate Applications

These procedures are applied on all construction sites where vehicle and equipment cleaning is performed.

Limitations

- None.

Standards and Specifications

- On-site vehicle and equipment washing is discouraged.
- Cleaning of vehicles and equipment with soap, solvents or steam shall not occur on the project site unless the Resident Engineer (RE) has been notified in advance and the resulting wastes are fully contained and disposed of outside the highway right-of-way in conformance with the provisions in the Standard Specifications Section 7-1.13. Resulting wastes and by-products shall not be discharged or buried within the highway right-of-way, and must be captured and recycled or disposed according to the requirements of WM-10, "Liquid Waste Management" or WM-6, "Hazardous Waste Management," depending on the waste characteristics. Minimize use of solvents. The use of diesel for vehicle and equipment cleaning is prohibited.
- Vehicle and equipment wash water shall be contained for percolation or evaporative drying away from storm drain inlets or watercourses and shall not be discharged within the highway right-of-way. Apply sediment control BMPs if applicable.
- All vehicles/equipment that regularly enter and leave the construction site must be cleaned off-site.
- When vehicle/equipment washing/cleaning must occur onsite, and the

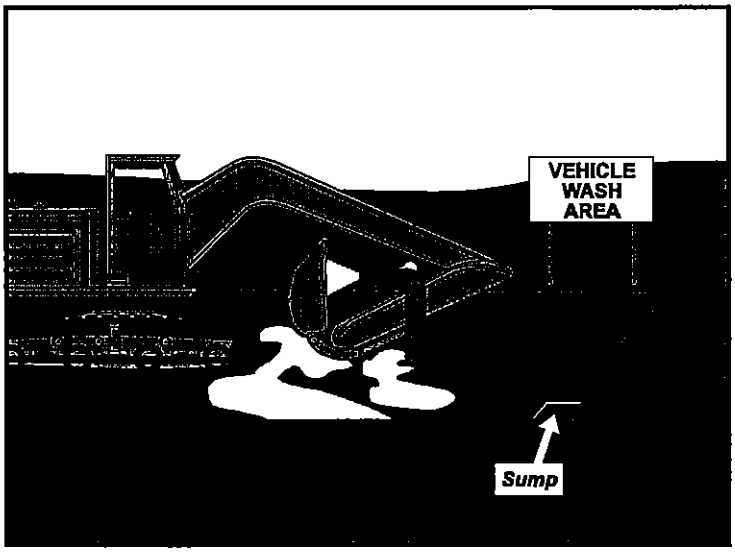
operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area shall have the following characteristics, and shall be arranged with the construction storm water coordinator:

- Located away from storm drain inlets, drainage facilities, or watercourses.
- Paved with concrete or asphalt and bermed to contain wash waters and to prevent run-on and runoff.
- Configured with a sump to allow collection and disposal of wash water.
- Wash waters shall not be discharged to storm drains or watercourses.
- Used only when necessary.

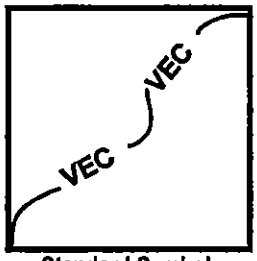
■ When cleaning vehicles/equipment with water:

- Use as little water as possible. High pressure sprayers may use less water than a hose, and shall be considered.
- Use positive shutoff valve to minimize water usage.
- Facility wash racks shall discharge to a sanitary sewer, recycle system or other approved discharge system and shall not discharge to the storm drainage system or watercourses.

Maintenance and Inspection



■ The control measure shall be inspected at a minimum of once a week.



■ Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.

■ Inspect sump regularly and remove liquids and sediment as needed or as directed by the RE.

Vehicle and Equipment Cleaning

NS-8

Vehicle and Equipment Fueling

NS-9

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

Vehicle and equipment fueling procedures and practices are designed to minimize or eliminate the discharge of fuel spills and leaks into storm drain systems or to watercourses.

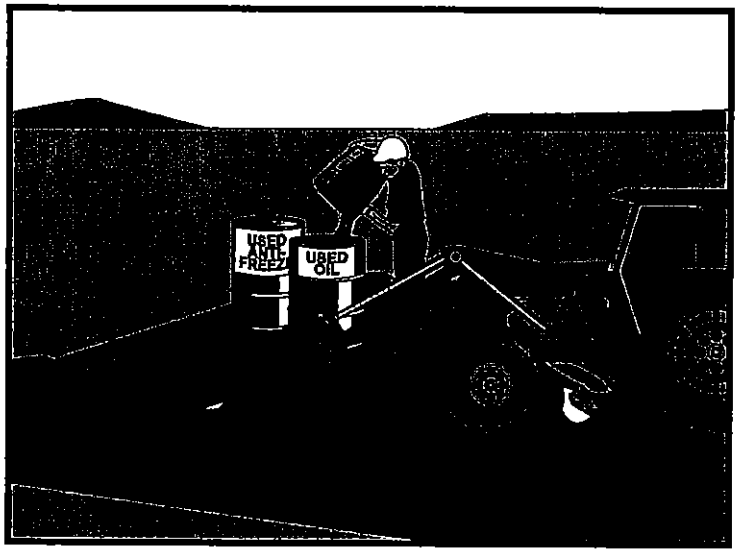
Appropriate Applications

These procedures are applied on all construction sites where vehicle and equipment fueling takes place.

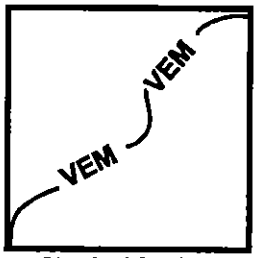
Limitations

- Onsite vehicle and equipment fueling shall only be used where it's impractical to send vehicles and equipment off-site for fueling.

Standards and Specifications



- When fueling must occur onsite, the contractor shall select and designate an area to be used, subject to approval of the Resident Engineer (RE).
- Absorbent spill clean-up materials and spill kits shall be available in fueling areas and on fueling trucks and shall be disposed of properly after use.
- Drip pans or absorbent pads shall be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Dedicated fueling areas shall be protected from storm water run-on and runoff, and shall be located at least 15 m (50 ft) from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Nozzles used in vehicle and equipment fueling shall be equipped with an automatic shut-off to control drips. Fueling operations shall not be left unattended.
- Protect fueling areas with berms and/or dikes to prevent run-on, runoff, and to contain spills.



- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD). Ensure the nozzle is secured upright when not in use.
- Fuel tanks shall not be "topped-off."
- Vehicles and equipment shall be inspected on each day of use for leaks. Leaks shall be repaired immediately or problem vehicles or equipment shall be removed from the project site.
- Absorbent spill clean-up materials shall be available in fueling and maintenance areas and used on small spills instead of hosing down or burying techniques. The spent absorbent material shall be removed promptly and disposed of properly.
- Federal, state, and local requirements shall be observed for any stationary above ground storage tanks. Refer to WM-1, "Material Delivery and Storage."
- Mobile fueling of construction equipment throughout the site shall be minimized. Whenever practical, equipment shall be transported to the designated fueling area.

Maintenance and Inspection

- Fueling areas and storage tanks shall be inspected regularly.
- Keep an ample supply of spill cleanup material on the site.
- Immediately cleanup spills and properly dispose of contaminated soil and cleanup materials.

Vehicle and Equipment Maintenance NS-10

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

Procedures and practices to minimize or eliminate the discharge of pollutants to the storm drain systems or to watercourses from vehicle and equipment maintenance procedures.

Appropriate Applications

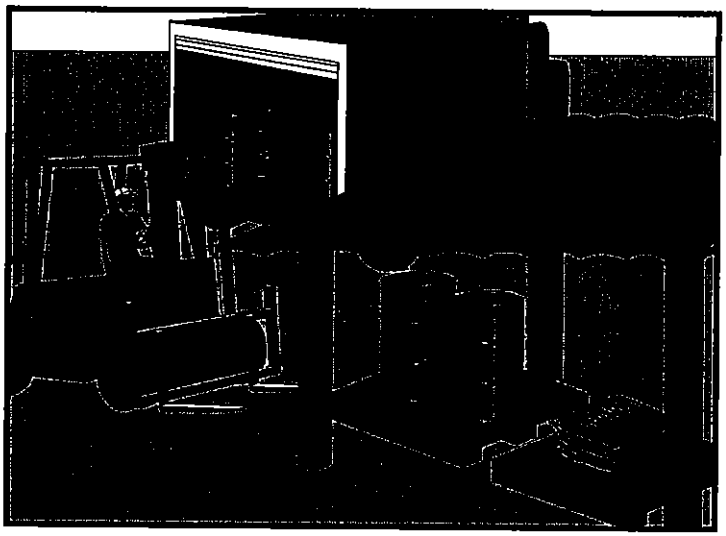
These procedures are applied on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

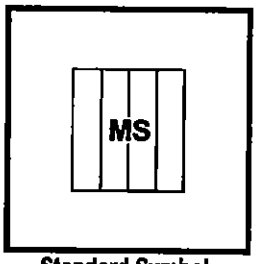
- None identified.

Standards and Specifications

- Drip pans or absorbent pads shall be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- All maintenance areas are required to have spill kits and/or use other spill protection devices.
- Dedicated maintenance areas shall be protected from storm water run-on and runoff, and shall be located at least 15 m (50 ft) from downstream drainage facilities and watercourses.
- Drip Pans or plastic sheeting shall be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than one hour.
- Absorbent spill clean-up materials shall be available in maintenance areas and shall be disposed of properly after use. Substances used to coat asphalt transport trucks and asphalt-spreading equipment shall be non-toxic.
- Use off-site maintenance facilities whenever practical.



- For long-term projects, consider constructing roofs or using portable tents over maintenance areas.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not dump fuels and lubricants onto the ground.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose or recycle used batteries.
- Do not bury used tires.
- Repair of fluid and oil leaks immediately.
- Provide spill containment dikes or secondary containment around stored oil and chemical drums.



Maintenance and Inspection

- Maintain waste fluid containers in leak proof condition.
- Vehicle and equipment maintenance areas shall be inspected regularly.
- Vehicles and equipment shall be inspected on each day of use. Leaks shall be repaired immediately or the problem vehicle(s) or equipment shall be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

Material Delivery and Storage

WM-1

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

Procedures and practices for the proper handling and storage of materials in a manner that minimizes or eliminates the discharge of these materials to the storm drain system or to watercourses.

Appropriate Applications

These procedures are implemented at all construction sites with delivery and storage of the following:

- Hazardous chemicals such as:
  - Acids,
  - lime,
  - glues,
  - adhesives,
  - paints,
  - solvents, and
  - curing compounds.
- Soil stabilizers and binders.
- Fertilizers.
- Detergents.
- Plaster.
- Petroleum products such as fuel, oil, and grease.
- Asphalt and concrete components.
- Pesticides and herbicides.

- Other materials that may be detrimental if released to the environment.

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds must meet building & fire code requirements.

Standards and Specifications

General

- Train employees and subcontractors on the proper material delivery and storage practices.
- Temporary storage area shall be located away from vehicular traffic.
- Material Safety Data Sheets (MSDS) shall be supplied to the Resident Engineer (RE) for all materials stored.

Material Storage Areas and Practices

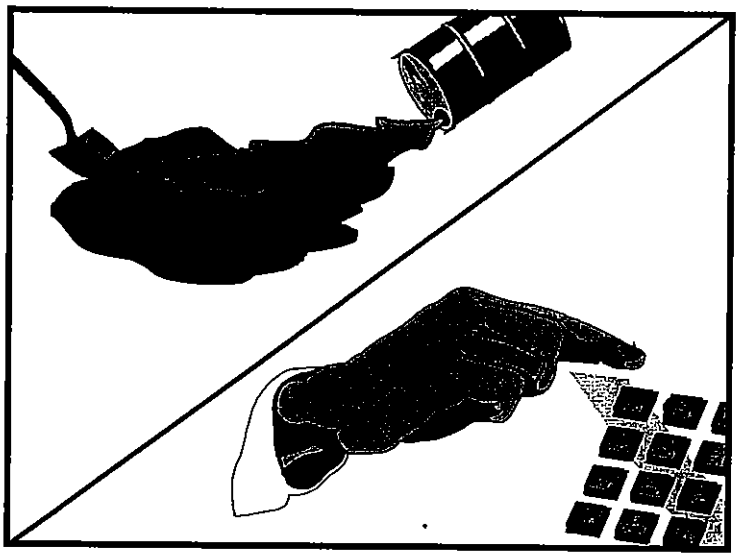
- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 shall be stored in approved containers and drums and shall be placed in temporary containment facilities for storage.
- Throughout the rainy season, each temporary containment facility shall have a permanent cover and side wind protection or be covered during non-working days and prior to and during rain events.
- A temporary containment facility shall provide for a spill containment volume able to contain precipitation from a 24-hour, 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility shall be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility shall be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills shall be collected and placed into drums. These liquids shall be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids shall be sent to an approved disposal site.
- Sufficient separation shall be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, shall not be stored in the same temporary containment facility.
- Materials shall be stored in their original containers and the original product labels shall be maintained in place in a legible condition. Damaged or otherwise illegible labels shall be replaced immediately.

-
- Bagged and boxed materials shall be stored on pallets and shall not be allowed to accumulate on the ground. To provide protection from wind and rain, throughout the rainy season, bagged and boxed materials shall be covered during non-working days and prior to rain events.
- Stockpiles shall be protected in accordance with BMP WM-3, "Stockpile Management."
- Minimize the material inventory stored on-site (e.g., only a few days supply).
- Have proper storage instructions posted at all times in an open and conspicuous location.
- Do not store hazardous chemicals, drums, or bagged materials directly on the ground. Place these items on a pallet and when possible, under cover in secondary containment.
- Keep hazardous chemicals well labeled and in their original containers.
- Keep ample supply of appropriate spill clean up material near storage areas.
- Also see BMP WM-6, "Hazardous Waste Management", for storing of hazardous materials.

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored on-site.
- Employees trained in emergency spill clean-up procedures shall be present when dangerous materials or liquid chemicals are unloaded.

Spill Clean-up



- Contain and clean up any spill immediately.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose any hazardous materials or contaminated soil.
- See BMP WM-4, "Spill Prevention and Control", for spills of chemicals and/or hazardous materials.

Maintenance and Inspection

- Storage areas shall be kept clean, well organized, and equipped with ample clean-up supplies as appropriate for the materials being stored.
- Perimeter controls, containment structures, covers, and liners shall be repaired or replaced as needed to maintain proper function.
- Inspect storage areas before and after rainfall events, and at least weekly during other times. Collect and place into drums any spills or accumulated rainwater.

Spill Prevention and Control

WM-4

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

These procedures and practices are implemented to prevent and control spills in a manner that minimizes or prevents the discharge of spilled material to the drainage system or watercourses.

Appropriate Application

This best management practice (BMP) applies to all construction projects. Spill control procedures are implemented anytime chemicals and/or hazardous substances are stored. Substances may include, but are not limited to:

- Soil stabilizers/binders.
- Dust Palliatives.
- Herbicides.
- Growth inhibitors.
- Fertilizers.
- Deicing/anti-icing chemicals.
- Fuels.
- Lubricants.
- Other petroleum distillates.

To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110, 117, and 302, and sanitary and septic wastes shall be contained and cleaned up immediately.

Limitations

- This BMP only applies to spills caused by the contractor.
- Procedures and practices presented in this BMP are general. Contractor shall identify appropriate practices for the specific materials used or stored on-site.

Standards and Specifications

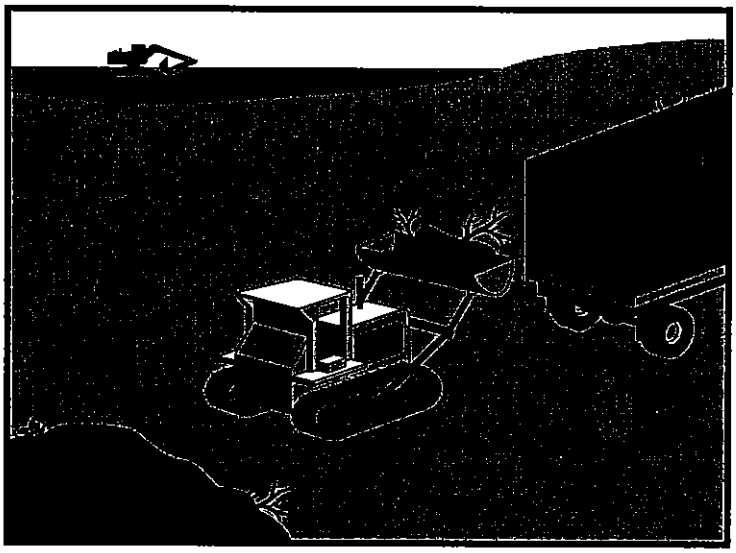
- To the extent that it doesn't compromise clean up activities, spills shall be covered and protected from storm water run-on during rainfall.
- Spills shall not be buried or washed with water.
- Used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose shall be stored and disposed of in conformance with the special provisions.
- Water used for cleaning and decontamination shall not be allowed to enter storm drains or watercourses and shall be collected and disposed of in accordance with BMP WM-10, "Liquid Waste Management."
- Water overflow or minor water spillage shall be contained and shall not be allowed to discharge into drainage facilities or watercourses.
- Proper storage, clean-up and spill reporting instruction for hazardous materials stored or used on the project site shall be posted at all times in an open, conspicuous and accessible location.
- Waste storage areas shall be kept clean, well organized and equipped with ample clean-up supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers and liners shall be repaired or replaced as needed to maintain proper function.

Education

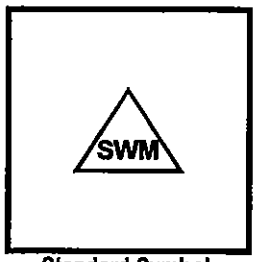
- Educate employees and subcontractors on what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- The Contractor's Water Pollution Control Manager (WPCM) shall oversee and enforce proper spill prevention and control measures.

Cleanup and Storage Procedures

- Minor Spills
  - Minor spills typically involve small quantities of oil, gasoline, paint, etc., which can be controlled by the first responder at the discovery of the spill.
  - Use absorbent materials on small spills rather than hosing down or burying the spill.
  - Remove the absorbent materials promptly and dispose of properly.
  - The practice commonly followed for a minor spill is:
    - Contain the spread of the spill.
    - Recover spilled materials.
    - Clean the contaminated area and/or properly dispose of contaminated materials.
- Semi-Significant Spills
  - Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.
  - Clean up spills immediately:
    - Notify the project foreman immediately. The foreman shall notify the Resident Engineer (RE).
    - Contain spread of the spill.
    - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
    - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
    - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.



- Significant/Hazardous Spills
  - For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps shall be taken:
    - Notify the RE immediately and follow up with a written report.
    - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
    - Notify the Governor's Office of Emergency Services Warning Center, (805) 852-7550.
    - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor shall notify the National Response Center at (800) 424-8802.
    - Notification shall first be made by telephone and followed up with a written report.
    - The services of a spills contractor or a Haz-Mat team shall be obtained immediately. Construction personnel shall not attempt to clean up the spill until the appropriate and qualified staff have arrived at the job site.
    - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, RWQCB, etc.



Maintenance and Inspection

- Verify weekly that spill control clean up materials are located near material storage, unloading, and use areas.
- Update spill prevention and control plans and stock appropriate clean-up materials whenever changes occur in the types of chemicals used or stored onsite.

Solid Waste Management

WM-5

Standard Symbol

BMP Objectives

- o Soil Stabilization
- o Sediment Control
- o Tracking Control
- o Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

Solid waste management procedures and practices are designed to minimize or eliminate the discharge of pollutants to the drainage system or to watercourses as a result of the creation, stockpiling, or removal of construction site wastes.

Appropriate Applications

Solid waste management procedures and practices are implemented on all construction projects that generate solid wastes.

Solid wastes include but are not limited to:

- Construction wastes including brick, mortar, timber, steel and metal scraps, sawdust, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials.
- Highway planting wastes, including vegetative material, plant containers, and packaging materials.
- Litter, including food containers, beverage cans, coffee cups, paper bags, plastic wrappers, and smoking materials, including litter generated by the public.

Limitations

- Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

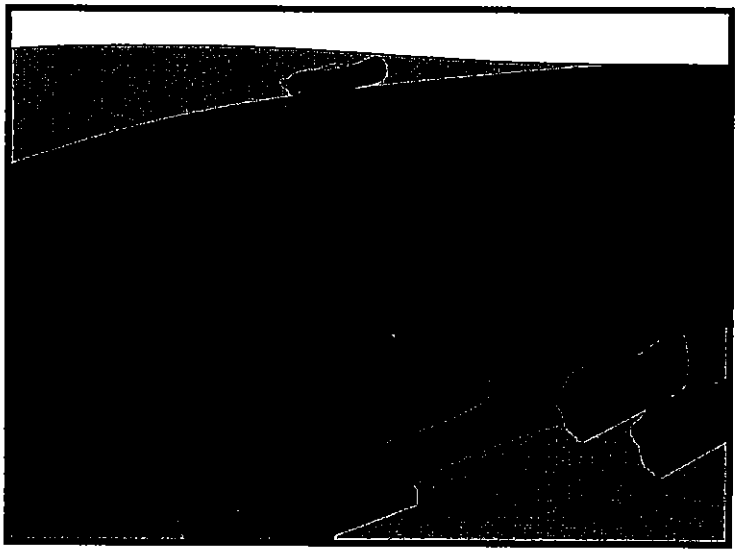
Standards and Specifications

Education

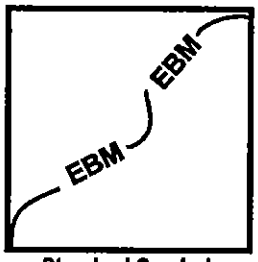
- The Contractor's Water Pollution Control Manager (WPCM) shall oversee and enforce proper solid waste procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Wherever possible, minimize production of solid waste materials.

Collection, Storage, and Disposal

- Dumpsters of sufficient size and number shall be provided to contain the solid waste generated by the project and properly serviced.
- Littering on the project site shall be prohibited.
- To prevent clogging of the storm drainage system litter and debris removal from drainage grates, trash racks, and ditch lines shall be a priority.
- Trash receptacles shall be provided in the Contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Construction debris and litter from work areas within the construction limits of the project site shall be collected and placed in watertight dumpsters at least weekly regardless of whether the litter was generated by the Contractor, the public, or others. Collected litter and debris shall not be placed in or next to drain inlets, storm water drainage systems or watercourses.
- Full dumpsters shall be removed from the project site and the contents shall be disposed of outside the highway right-of-way in conformance with the provisions in the Standard Specifications Section 7-1.13.
- Litter stored in collection areas and containers shall be handled and disposed of by trash hauling contractors.
- Construction debris and waste shall be removed from the site every two weeks or as directed by the RE.



- Construction material visible to the public shall be stored or stacked in an orderly manner to the satisfaction of the RE.
- Storm water run-on shall be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas shall be located at least 15 m (50 ft) from drainage facilities and watercourses and shall not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters shall be securely covered from wind and rain by covering the waste with tarps or plastic sheeting or protected in conformance with the applicable Disturbed Soil Area protection section.
- Dumpster washout on the project site is not allowed.
- Notify trash hauling contractors that only watertight dumpsters are acceptable for use on-site.
- Plan for additional containers during the demolition phase of construction.
- Plan for more frequent pickup during the demolition phase of construction.
- Construction waste shall be stored in a designated area approved by the RE.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Keep the site clean of litter debris.
- Make sure that toxic liquid wastes (e.g., used oils, solvents, and paints) and chemicals (e.g., acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Dispose of non-hazardous waste in accordance with Standard Specification 7-1.13, Disposal of Material Outside the Highway Right of Way.
- For disposal of hazardous waste, see BMP WM-6, "Hazardous Waste Management." Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
- Salvage or recycle useful vegetation debris, packaging and/or surplus building materials when practical. For example, trees and shrubs from land clearing can be converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.



Maintenance and Inspection

- The WPCM shall monitor onsite solid waste storage and disposal procedures.
- Police site for litter and debris.

Geotextiles, Mats, Plastic Covers and Erosion Control Blankets

SS-7

Standard Symbol

BMP Objectives

- ● Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ● Wind Erosion Control
- ○ Non-Storm Water Management
- ○ Materials and Waste Management

Definition and Purpose

This Best Management Practice (BMP) involves the placement of geotextiles, mats, plastic covers, or erosion control blankets to stabilize disturbed soil areas and protect soils from erosion by wind or water. This is one of five temporary soil stabilization alternatives to consider.

Appropriate Applications

These measures are used when disturbed soils may be particularly difficult to stabilize, including the following situations:

- Steep slopes, generally steeper than 1:3 (V:H).
- Slopes where the erosion potential is high.
- Slopes and disturbed soils where mulch must be anchored.
- Disturbed areas where plants are slow to develop.
- Channels with flows exceeding 1.0 m/s (3.3 ft/s).
- Channels to be vegetated.
- Stockpiles.
- Slopes adjacent to water bodies of Environmentally Sensitive Areas (ESAs).

Geotextiles, Mats, Plastic Covers and Erosion Control Blankets

SS-7

Limitations

- Blankets and mats are more expensive than other erosion control measures, due to labor and material costs. This usually limits their application to areas inaccessible to hydraulic equipment, or where other measures are not applicable, such as channels.
- Blankets and mats are generally not suitable for excessively rocky sites, or areas where the final vegetation will be mowed (since staples and netting can catch in mowers).
- Blankets and mats must be removed and disposed of prior to application of permanent soil stabilization measures.
- Plastic sheeting is easily vandalized, easily torn, photodegradable, and must be disposed of at a landfill.
- Plastic results in 100% runoff, which may cause serious erosion problems in the areas receiving the increased flow.
- The use of plastic shall be limited to covering stockpiles, or very small graded areas for short periods of time (such as through one imminent storm event), until alternative measures, such as seeding and mulching, may be installed.
- Geotextiles, mats, plastic covers, and erosion control covers have maximum flow rate limitations; consult the manufacturer for proper selection.

Standards and Specifications

Material Selection

There are many types of erosion control blankets and mats, and selection of the appropriate type shall be based on the specific type of application and site conditions. Selection(s) made by the Contractor must be approved by the Resident Engineer (RE); certification of compliance shall be in accordance with Standard Specifications Section 6-1.07.

Geotextiles

- Material shall be a woven polypropylene fabric with minimum thickness of 1.5 mm (0.06 inch), minimum width of 3.7 m (12 ft) and shall have minimum tensile strength of 0.67 kN (warp) 0.36 kN (fill) in conformance with the requirements in ASTM Designation: D 4632. The permittivity of the fabric shall be approximately 0.07 sec –1 in conformance with the requirements in ASTM Designation: D4491. The fabric shall have an ultraviolet (UV) stability of 70 percent in conformance with the requirements in ASTM designation: D4355. Geotextile blankets shall be secured in place with wire staples or sandbags and by keying into tops of slopes and edges to prevent infiltration of surface waters under Geotextile. Staples shall be made of 3.05-mm (0.12-inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.
- Geotextiles may be reused if, in the opinion of the RE, they are suitable for the use intended.

Plastic Covers

- Plastic sheeting shall have a minimum thickness of 6 mil, and shall be keyed in at the top of slope and firmly held in place with sandbags or other weights placed no more than 3 m (10 ft) apart. Seams are typically taped or weighted down their entire length, and there shall be at least a 300 mm to 600 mm (12 to 24 inches) overlap of all seams. Edges shall be embedded a minimum of 150 mm (6 inches) in soil.

- All sheeting shall be inspected periodically after installation and after significant rainstorms to check for erosion, undermining, and anchorage failure. Any failures shall be repaired immediately. If washout or breakages occurs, the material shall be re-installed after repairing the damage to the slope.

Erosion Control Blankets/Mats

- Biodegradable rolled erosion control products (RECPs) are typically composed of jute fibers, curled wood fibers, straw, coconut fiber, or a combination of these materials. For an RECP to be considered 100% biodegradable, the netting, sewing or adhesive system that holds the biodegradable mulch fibers together must also be biodegradable.

  - **Jute** is a natural fiber that is made into a yarn, which is loosely woven into a biodegradable mesh. It is designed to be used in conjunction with vegetation and has longevity of approximately one year. The material is supplied in rolled strips, which shall be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.

  - **Excelsior (curled wood fiber)** blanket material shall consist of machine produced mats of curled wood excelsior with 80 percent of the fiber 150 mm (6 inches) or longer. The excelsior blanket shall be of consistent thickness. The wood fiber shall be evenly distributed over the entire area of the blanket. The top surface of the blanket shall be covered with a photodegradable extruded plastic mesh. The blanket shall be smolder resistant without the use of chemical additives and shall be non-toxic and non-injurious to plant and animal life. Excelsior blanket shall be furnished in rolled strips, a minimum of 1220 mm (48 inches) wide, and shall have an average weight of 0.5 kg/m^2 (12 lb/ft^2), ±10 percent, at the time of manufacture. Excelsior blankets shall be secured in place with wire staples. Staples shall be made of 3.05-mm (0.12 inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.

- **Straw blanket** shall be machine-produced mats of straw with a lightweight biodegradable netting top layer. The straw shall be attached to the netting with biodegradable thread or glue strips. The straw blanket shall be of consistent thickness. The straw shall be evenly distributed over the entire area of the blanket. Straw blanket shall be furnished in rolled strips a minimum of 2 m (6.5 ft) wide, a minimum of 25 m (80 ft) long and a minimum of 0.27 kg/m2 (6.4 lb/ft2). Straw blankets shall be secured in place with wire staples. Staples shall be made of 3.05-mm (0.12 inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.

- **Wood fiber blanket** is composed of biodegradable fiber mulch with extruded plastic netting held together with adhesives. The material is designed to enhance revegetation. The material is furnished in rolled strips, which shall be secured to the ground with U-shaped staples or stakes in accordance with manufacturers' recommendations.

- **Coconut fiber blanket** shall be machine-produced mats of 100% coconut fiber with biodegradable netting on the top and bottom. The coconut fiber shall be attached to the netting with biodegradable thread or glue strips. The coconut fiber blanket shall be of consistent thickness. The coconut fiber shall be evenly distributed over the entire area of the blanket. Coconut fiber blanket shall be furnished in rolled strips with a minimum of 2 m (6.5 ft) wide, a minimum of 25 m (80 ft) long and a minimum of 0.27-kg/m2 (6.4 lb/ft2). Coconut fiber blankets shall be secured in place with wire staples. Staples shall be made of 3.05-mm (0.12 inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.

- **Coconut fiber mesh** is a thin permeable membrane made from coconut or corn fiber that is spun into a yarn and woven into a biodegradable mat. It is designed to be used in conjunction with vegetation and typically has longevity of several years. The material is supplied in rolled strips, which shall be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.

- **Straw coconut fiber blanket** shall be machine-produced mats of 70% straw and 30% coconut fiber with a biodegradable netting top layer and a biodegradable bottom net. The straw and coconut fiber shall be attached to the netting with biodegradable thread or glue strips. The straw coconut fiber blanket shall be of consistent thickness. The straw and coconut fiber shall be evenly distributed over the entire area of the blanket. Straw coconut fiber blanket shall be furnished in rolled strips a minimum of 2 m (6.5 ft) wide, a minimum of 25 m (80 ft) long and a minimum of 0.27 kg/m2 (6.4 lb/ft2). Straw coconut fiber blankets shall be secured in place with wire staples. Staples shall be made of 3.05-mm (0.12-inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.

- Non-biodegradable RECPs are typically composed of polypropylene, polyethylene, nylon or other synthetic fibers. In some cases, a combination of biodegradable and synthetic fibers is used to construct the RECP. Netting used to hold these fibers together is typically non-biodegradable as well.

  - **Plastic netting** is a lightweight biaxially-oriented netting designed for securing loose mulches like straw to soil surfaces to establish vegetation. The netting is photodegradable. The netting is supplied in rolled strips, which shall be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

  - **Plastic mesh** is an open-weave geotextile that is composed of an extruded synthetic fiber woven into a mesh with an opening size of less than 0.5 cm (0.2 inch). It is used with revegetation or may be used to secure loose fiber such as straw to the ground. The material is supplied in rolled strips, which shall be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.

  - **Synthetic fiber with netting** is a mat that is composed of durable synthetic fibers treated to resist chemicals and ultraviolet light. The mat is a dense, three-dimensional mesh of synthetic (typically polyolefin) fibers stitched between two polypropylene nets. The mats are designed to be revegetated and provide a permanent composite system of soil, roots, and geomatrix. The material is furnished in rolled strips, which shall be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

  - **Bonded synthetic fibers** consist of a three-dimensional geomatrix nylon (or other synthetic) matting. Typically it has more than 90% open area, which facilitates root growth. Its tough root-reinforcing system anchors vegetation and protects against hydraulic lift and shear forces created by high volume discharges. It can be installed over prepared soil, followed by seeding into the mat. Once vegetated, it becomes an invisible composite system of soil, roots, and geomatrix. The material is furnished in rolled strips that shall be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

  - **Combination synthetic and biodegradable RECPs** consist of biodegradable fibers, such as wood fiber or coconut fiber, with a heavy polypropylene net stitched to the top and a high-strength continuous-filament geomatrix or net stitched to the bottom. The material is designed to enhance revegetation. The material is furnished in rolled strips, which shall be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

Site Preparation

- Proper site preparation is essential to ensure complete contact of the blanket or matting with the soil.
- Grade and shape the area of installation.
- Remove all rocks, clods, vegetation or other obstructions so that the installed blankets or mats will have complete, direct contact with the soil.
- Prepare seedbed by loosening 50 mm (2 in) to 75 mm (3 in) of topsoil.

Seeding

Seed the area before blanket installation for erosion control and revegetation. Seeding after mat installation is often specified for turf reinforcement application. When seeding prior to blanket installation, all check slots and other areas disturbed during installation must be re-seeded. Where soil filling is specified, seed the matting and the entire disturbed area after installation and prior to filling the mat with soil.

Anchoring

- U-shaped wire staples, metal geotextile stake pins or triangular wooden stakes can be used to anchor mats and blankets to the ground surface.
- Staples shall be made of 3.05 mm (0.12 inch) steel wire and shall be U-shaped with 200-mm (8-inch) legs and 50-mm (2-inch) crown.
- Metal stake pins shall be 5 mm (0.188 in) diameter steel with a 40 mm (1.5 in) steel washer at the head of the pin.
- Wire staples and metal stakes shall be driven flush to the soil surface.
- All anchors shall be 150 mm (6 in) to 450 mm (18 in) long and have sufficient ground penetration to resist pullout. Longer anchors may be required for loose soils.

Installation on Slopes

Installation shall be in accordance with the manufacturer's recommendations. In general, these will be as follows:

- Begin at the top of the slope and anchor the blanket in a 150 mm (6 in) deep by 150 mm (6 in) wide trench. Backfill trench and tamp earth firmly.
- Unroll blanket downslope in the direction of water flow.

- Overlap the edges of adjacent parallel rolls 50 mm (2 in) to 75 mm (3 in) and staple every 1 m (3 ft).
- When blankets must be spliced, place blankets end over end (shingle style) with 150 mm (6 in) overlap. Staple through overlapped area, approximately 300 mm (12 in) apart.
- Lay blankets loosely and maintain direct contact with the soil. Do not stretch.
- Staple blankets sufficiently to anchor blanket and maintain contact with the soil. Staples shall be placed down the center and staggered with the staples placed along the edges. Steep slopes, 1:1 (V:H) to 1:2 (V:H), require a minimum of 2 staples/m2 (2 staples/yd2). Moderate slopes, 1:2 (V:H) to 1:3 (V:H), require a minimum of 1½ staples/m2 (1 ½ staples/yd2), placing 1 staple/m (1 staple/yd) on centers. Gentle slopes require a minimum of 1 staple/m2 (1 staple/yd2).

Installation in Channels

Installation shall be in accordance with the manufacturer's recommendations. In general, these will be as follows:

- Dig initial anchor trench 300 mm (12 in) deep and 150 mm (6 in) wide across the channel at the lower end of the project area.
- Excavate intermittent check slots, 150 mm (6 in) deep and 150 mm (6 in) wide across the channel at 8 m to 10 m (25 ft to 30 ft) intervals along the channels.
- Cut longitudinal channel anchor slots 100 mm (4 in) deep and 100 mm (4 in) wide along each side of the installation to bury edges of matting, whenever possible extend matting 50 mm (2 in) to 75 mm (3 in) above the crest of the channel side slopes.
- Beginning at the downstream end and in the center of the channel, place the initial end of the first roll in the anchor trench and secure with fastening devices at 300 mm (12 in) intervals. Note: matting will initially be upside down in anchor trench.
- In the same manner, position adjacent rolls in anchor trench, overlapping the preceding roll a minimum of 75 mm (3 in).
- Secure these initial ends of mats with anchors at 300 mm (12 in) intervals, backfill and compact soil.
- Unroll center strip of matting upstream. Stop at next check slot or terminal anchor trench. Unroll adjacent mats upstream in similar fashion, maintaining a 75 mm (3 in) overlap.

- Fold and secure all rolls of matting snugly into all transverse check slots. Lay mat in the bottom of the slot then fold back against itself. Anchor through both layers of mat at 300 mm (12 in) intervals, then backfill and compact soil. Continue rolling all mat widths upstream to the next check slot or terminal anchor trench.
- Alternate method for non-critical installations: Place two rows of anchors on 150 mm (6 in) centers at 8 m (25 ft) to 10 m (30 ft) intervals in lieu of excavated check slots.
- Shingle-lap spliced ends by a minimum of 300 mm (12 in) apart on 300 mm (12 in) intervals.
- Place edges of outside mats in previously excavated longitudinal slots, anchor using prescribed staple pattern, backfill and compact soil.
- Anchor, fill and compact upstream end of mat in a 300 mm (12 in) by 150 mm (6 in) terminal trench.
- Secure mat to ground surface using U-shaped wire staples, geotextile pins, or wooden stakes.
- Seed and fill turf reinforcement matting with soil, if specified.

Soil Filling (if specified for turf reinforcement)

- Always consult the manufacturer's recommendations for installation.
- Do not drive tracked or heavy equipment over mat.
- Avoid any traffic over matting if loose or wet soil conditions exist.
- Use shovels, rakes or brooms for fine grading and touch up.
- Smooth out soil filling, just exposing top netting of mat.

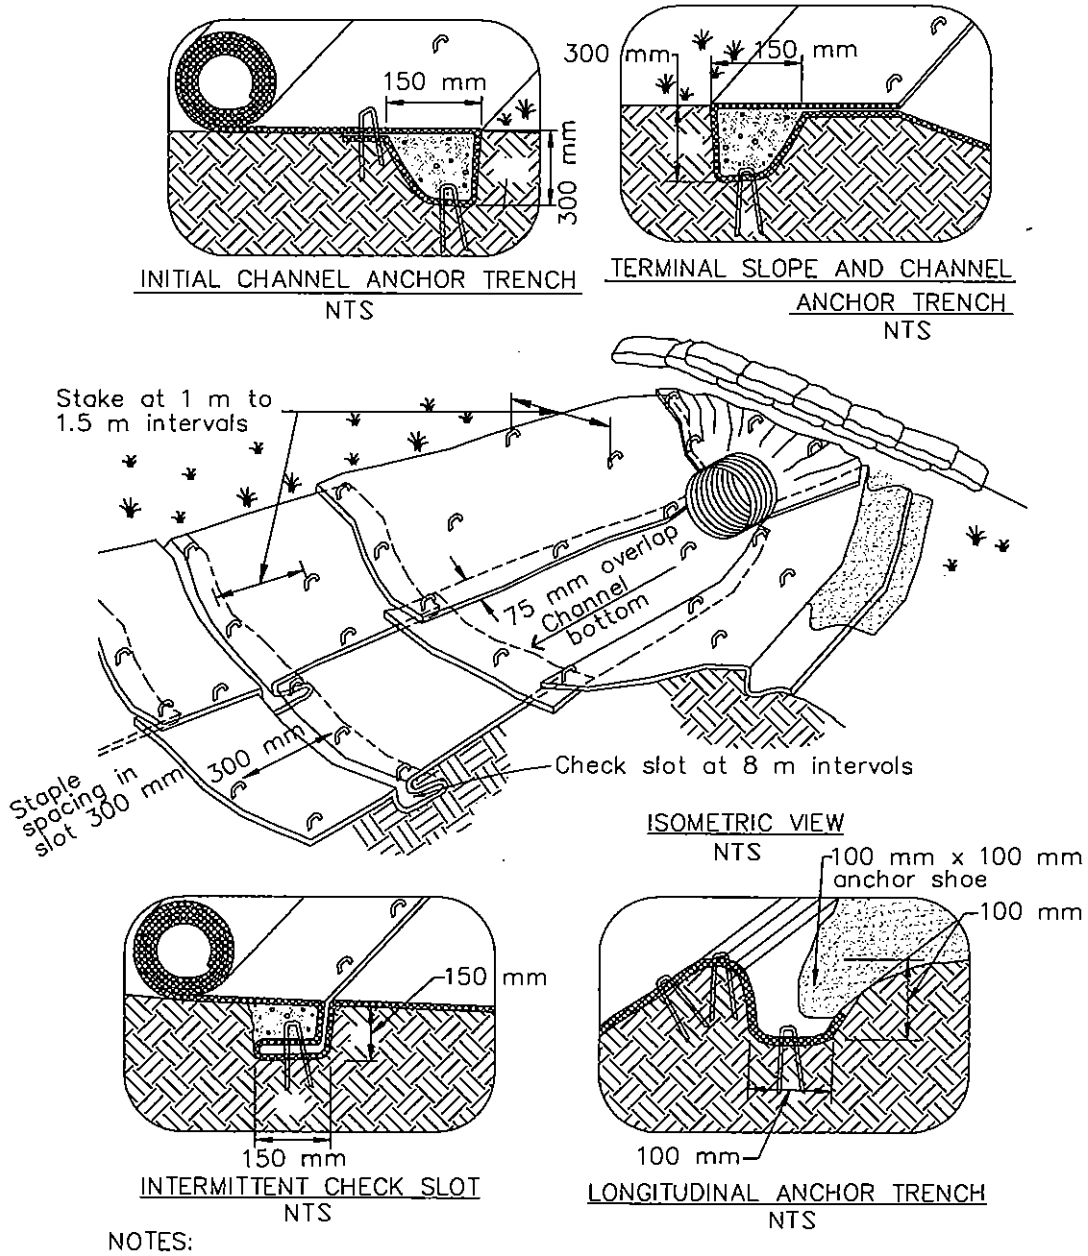
Temporary Soil Stabilization Removal

- When no longer required for the work, temporary soil stabilization shall become the property of the Contractor. Temporary soil stabilization removed from the site of the work shall be disposed of outside the highway right-of-way in conformance with the provisions in Standard Specifications Section 7-1.13. If approved by the RE, the contractor may leave the temporary soil stabilizer in place.

Geotextiles, Mats, Plastic Covers and Erosion Control Blankets

SS-7

Maintenance and Inspection



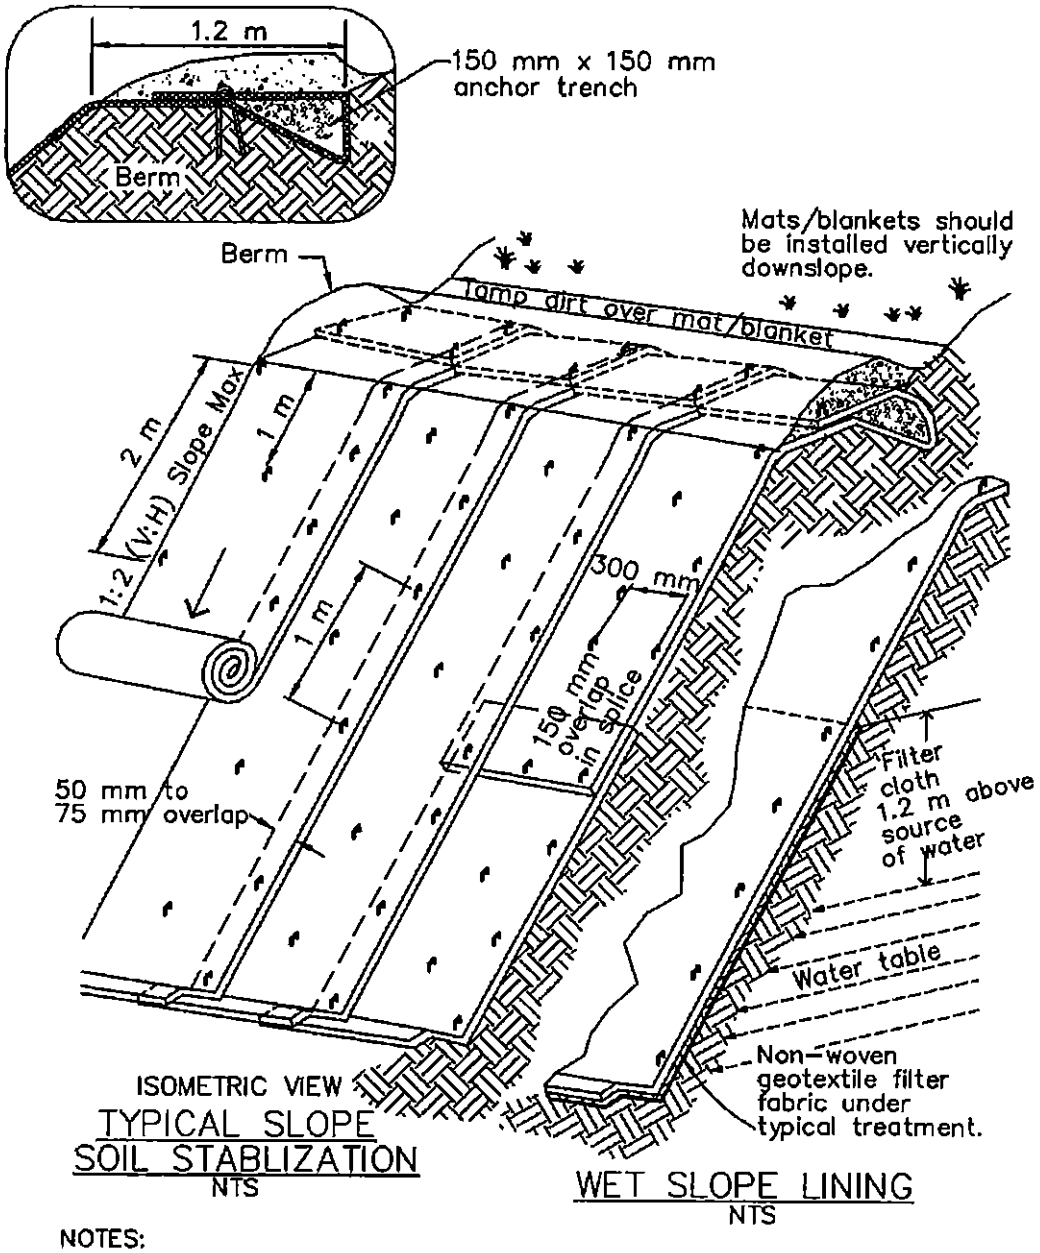
Areas treated with temporary soil stabilization shall be inspected as specified in the special provisions. Areas treated with temporary soil stabilization shall be maintained to provide adequate erosion control. Temporary soil stabilization shall be reapplied or replaced on exposed soils when area becomes exposed or exhibits visible erosion.

- All blankets and mats shall be inspected periodically after installation.
- Installation shall be inspected after significant rain storms to check for erosion and undermining. Any failures shall be repaired immediately.
- If washout or breakage occurs, re-install the material after repairing the damage to the slope or channel.

Geotextiles, Mats, Plastic Covers and Erosion Control Blankets

SS-7

Typical Installation Detail



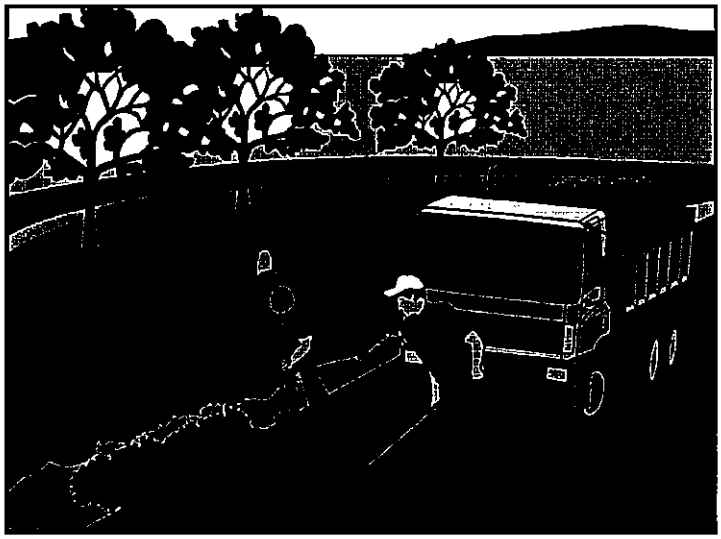
NOTES:

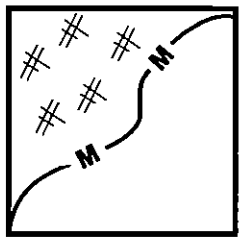
1. Check slots to be constructed per manufacturers specifications.
2. Staking or stopling layout per manufacturers specifications.
3. Install per manufacturer's recommendations

Geotextiles, Mats, Plastic Covers and Erosion Control Blankets

SS-7

Typical Installation Detail





NOTES:

1. Slope surface shall be free of rocks, clods, sticks and grass. Mats/blankets shall have good soil contact.
2. Lay blankets loosely and stake or staple to maintain direct contact with the soil. Do not stretch.
3. Install per manufacturer's recommendations

Wood Mulching

SS-8

Standard Symbol

BMP Objectives

- ● Soil Stabilization
- o Sediment Control
- o Tracking Control
- ● Wind Erosion Control
- o Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Wood mulching consist of applying a mixture of shredded wood mulch, bark or compost. Wood mulch is mostly applicable to landscape projects.

The primary function of wood mulching is to reduce erosion by protecting bare soil from rainfall impact, increasing infiltration, and reducing runoff.

Appropriate Applications

Wood mulching is considered a temporary soil stabilization (erosion control) alternative in the following situations:

- As a stand-alone temporary surface cover on disturbed areas until soils can be prepared for revegetation and permanent vegetative cover can be established.
- As short term, non-vegetative ground cover on slopes to reduce rainfall impact, decrease the velocity of sheet flow, settle out sediment and reduce wind erosion.

Limitations

- Wood mulch may introduce unwanted species.
- Shredded wood does not withstand concentrated flows and is prone to sheet erosion.
- Green material has the potential for the presence of unwanted weeds and other plant materials. Delivery system is primarily by manual labor, although pneumatic application equipment is available.

Water Conservation Practices

NS-1

Standard Symbol

BMP Objectives

- o Soil Stabilization
- o Sediment Control
- o Tracking Control
- o Wind Erosion Control
- ● Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and/or the transport of pollutants off site.

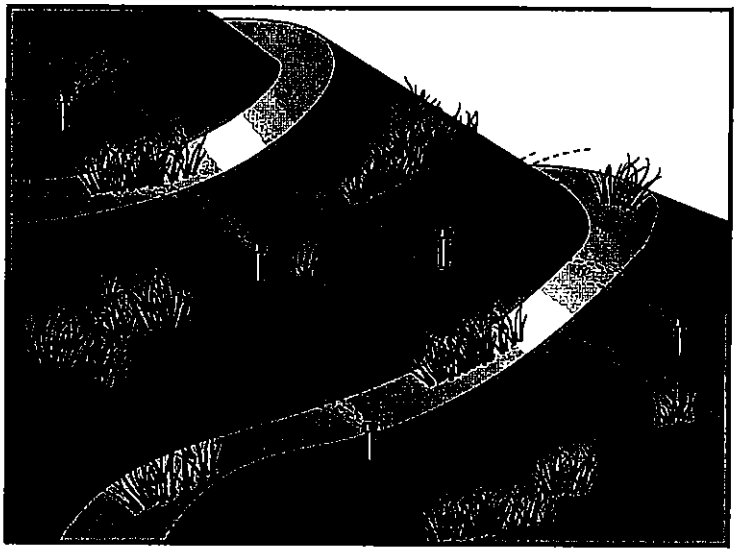
Appropriate Applications

- Water conservation practices are implemented on all construction sites and wherever water is used.
- Applies to all construction projects.

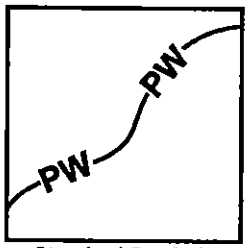
Limitations

- None identified.

Standards and Specifications



- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Vehicles and equipment washing on the construction site is discouraged.
- Avoid using water to clean construction areas. Do not use water to clean pavement. Paved areas shall be swept and vacuumed.
- Direct construction water runoff to areas where it can infiltrate into the ground.
- Apply water for dust control in accordance with the Standard Specifications Section 10, and WE-1, "Wind Erosion Control."
- Report discharges to RE immediately.



Maintenance and Inspection

- Inspect water equipment at least weekly.
- Repair water equipment as needed.

Potable Water/Irrigation

NS-7

Standard Symbol

BMP Objectives

- o Soil Stabilization
- o Sediment Control
- o Tracking Control
- o Wind Erosion Control
- ● Non-Storm Water Management
- o Materials and Waste Management

Definition and Purpose

Potable Water/Irrigation management consists of practices and procedures to manage the discharge of potential pollutants generated during discharges from irrigation water lines, landscape irrigation, lawn or garden watering, planned and unplanned discharges from potable water sources, water line flushing, and hydrant flushing.

Appropriate Applications

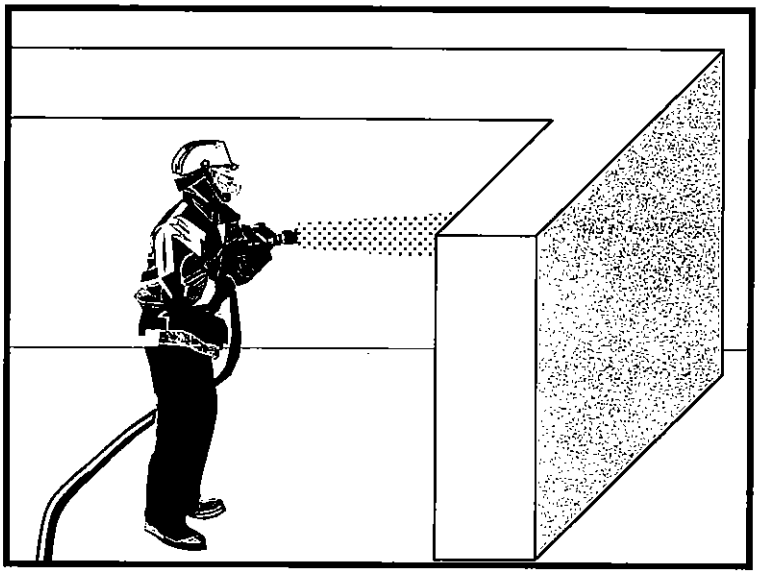
Implement this BMP whenever the above activities or discharges occur at or enter a construction site.

Limitations

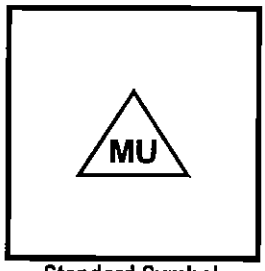
- None identified.

Standards and Specifications

- Inspect irrigated areas within the construction limits for excess watering. Adjust watering times and schedules to ensure that the appropriate amount of water is being used and to minimize runoff. Consider factors such as soil structure, grade, time of year, and type of plant material in determining the proper amounts of water for a specific area.
- RE approval is required prior to commencing any washing activities that could discharge to the storm drain or receiving waterbody.
- Where possible, direct water from off-site sources around or through a construction site in a way that minimizes contact with the construction site.
- When possible, discharges from water line flushing shall be reused for landscaping purposes.
- Shut off the water source to broken lines, sprinklers, or valves as soon as possible to prevent excess water flow.



- Protect downstream storm water drainage systems and watercourses from water pumped or bailed from trenches excavated to repair water lines.



Maintenance and Inspection

- Repair broken water lines as soon as possible or as directed by the RE.
- Inspect irrigated areas regularly for signs of erosion and/or discharge.

Material Use

WM-2

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

These are procedures and practices for use of construction material in a manner that minimizes or eliminates the discharge of these materials to the storm drain system or to watercourses.

Appropriate Applications

This BMP applies to all construction projects. These procedures apply when the following materials are used or prepared on site:

- Hazardous chemicals such as:

  Acids,
  lime,
  glues,
  adhesives,
  paints,
  solvents, and
  curing compounds.

- Soil stabilizers and binders.
- Fertilizers.
- Detergents.
- Plaster.
- Petroleum products such as fuel, oil, and grease.
- Asphalt and concrete components.
- Pesticides and herbicides.
- Other materials that may be detrimental if released to the environment.

Stockpile Management

WM-3

Standard Symbol

BMP Objectives

- ● Soil Stabilization
- ● Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ○ Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and storm water pollution from stockpiles of soil, and paving materials such as portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate subbase or pre-mixed aggregate, asphalt binder (so called "cold mix" asphalt) and pressure treated wood.

Appropriate Applications

Implemented in all projects that stockpile soil and other materials.

Limitations

- None identified

Standards and Specifications

- Protection of stockpiles is a year-round requirement.
- Locate stockpiles a minimum of 15 m (50 ft)away from concentrated flows of storm water, drainage courses, and inlets.
- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information see BMP WE-1, "Wind Erosion Control."
- Stockpiles of contaminated soil shall be managed in accordance with BMP WM-7, "Contaminated Soil Management."
- Bagged materials should be placed on pallets and under cover.

Protection of Non-Active Stockpiles

Non-active stockpiles of the identified materials shall be protected further as follows:

- ***Soil stockpiles:***

  - During the rainy seasons, soil stockpiles shall be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times.

  - During the non-rainy season, soil stockpiles shall be covered and protected with a temporary perimeter sediment barrier prior to the onset of precipitation.

- ***Stockpiles of portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate subbase:***

  - During the rainy season, the stockpiles shall be covered or protected with a temporary perimeter sediment barrier at all times.

  - During the non-rainy season, the stockpiles shall be covered or protected with a temporary perimeter sediment barrier prior to the onset of precipitation.

- ***Stockpiles of "cold mix":***

  - During the rainy season, cold mix stockpiles shall be placed on and covered with plastic or comparable material at all times.

  - During the non-rainy season, cold mix stockpiles shall be placed on and covered with plastic or comparable material prior to the onset of precipitation.

- ***Stockpiles/Storage of pressure treated wood with copper, chromium, and arsenic or ammonical, copper, zinc, and arsenate:***

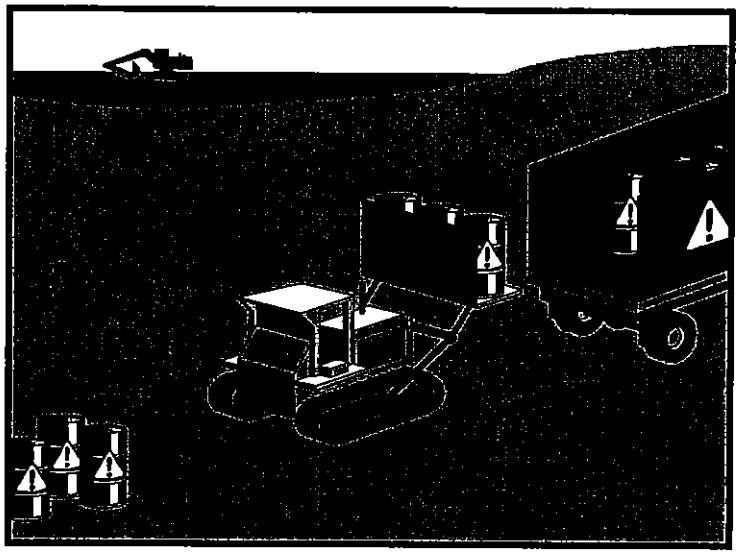
  - During the rainy season, treated wood shall be covered with plastic or comparable material at all times.

  - During the non-rainy season, treated wood shall be covered with plastic or comparable material and shall be placed on pallets prior to the onset of precipitation.

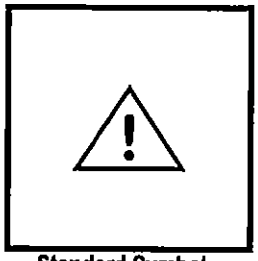
Protection of Active Stockpiles

Active stockpiles of the identified materials shall be protected further as follows:

- All stockpiles shall be covered, stabilized, or protected with a temporary linear sediment barrier prior to the onset of precipitation.



- Stockpiles of "cold mix" shall be placed on and covered with plastic or comparable material prior to the onset of precipitation.



Maintenance and Inspections

- Repair and/or replace perimeter controls and covers as needed, or as directed by the RE, to keep them functioning properly. Sediment shall be removed when sediment accumulation reaches one-third (1/3) of the barrier height.

Hazardous Waste Management

WM-6

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

These are procedures and practices to minimize or eliminate the discharge of pollutants from construction site hazardous waste to the storm drain systems or to watercourses.

Appropriate Applications

- This best management practice (BMP) applies to all construction projects.
- Hazardous waste management practices are implemented on construction projects that generate waste from the use of:
  - Petroleum Products,
  - Asphalt Products,
  - Concrete Curing Compounds,
  - Pesticides,
  - Acids,
  - Paints,
  - Stains,
  - Solvents,
  - Wood Preservatives,
  - Roofing Tar, or
  - Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302.

Limitations

- Nothing in this BMP relieves the Contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
- This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to BMP WM-7, "Contaminated Soil Management," and the project special provisions.

Standards and Specifications

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings).
- The Contractor's Water Pollution Control Manager (WPCM) shall oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.

Storage Procedures

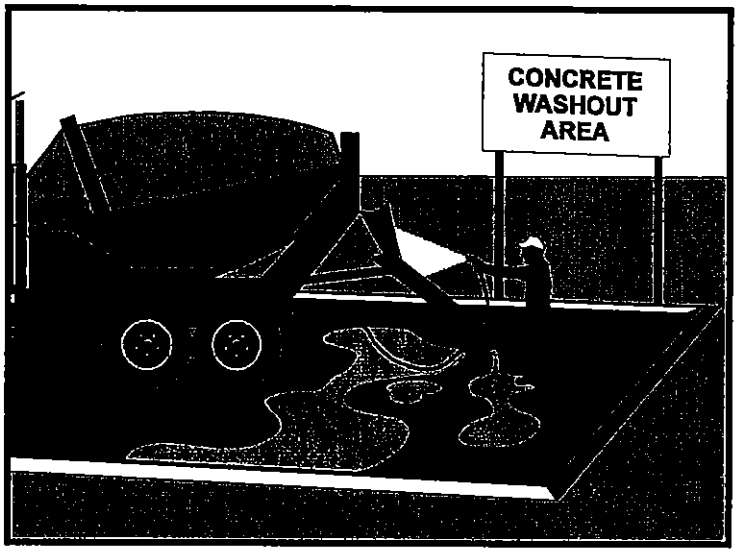
- Wastes shall be stored in sealed containers constructed of a suitable material and shall be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172,173, 178, and 179.
- All hazardous waste shall be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.
- Waste containers shall be stored in temporary containment facilities that shall comply with the following requirements:
  - Temporary containment facility shall provide for a spill containment volume able to contain precipitation from a 24-hour, 25 year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest tank within its boundary, whichever is greater.

- Temporary containment facility shall be impervious to the materials stored there for a minimum contact time of 72 hours.
- Temporary containment facilities shall be maintained free of accumulated rainwater and spills. In the event of spills or leaks accumulated rainwater and spills shall be placed into drums after each rainfall. These liquids shall be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids shall be sent to an approved disposal site.
- Sufficient separation shall be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, shall not be stored in the same temporary containment facility.
- Throughout the rainy season, temporary containment facilities shall be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs. A storage facility having a solid cover and sides is preferred to a temporary tarp. Storage facilities shall be equipped with adequate ventilation.

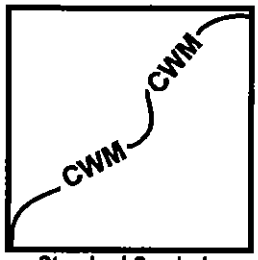
- Drums shall not be overfilled and wastes shall not be mixed.
- Unless watertight, containers of dry waste shall be stored on pallets.
- Paint brushes and equipment for water and oil based paints shall be cleaned within a contained area and shall not be allowed to contaminate site soils, watercourses or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused shall be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths shall be disposed of as solid waste.
- Ensure that adequate hazardous waste storage volume is available.
- Ensure that hazardous waste collection containers are conveniently located.
- Designate hazardous waste storage areas on site away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.
- Minimize production or generation of hazardous materials and hazardous waste on the job site.
- Use containment berms in fueling and maintenance areas and where the potential for spills is high.

- Segregate potentially hazardous waste from non-hazardous construction site debris.
- Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.
- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.

Disposal Procedures



- Waste shall be disposed of outside the highway right-of-way within 90 days of being generated, or as directed by the Resident Engineer (RE). In no case shall hazardous waste storage exceed requirements in Title 22 CCR, Section 66262.34.
- Waste shall be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- A Department of Health Services (DHS) certified laboratory shall sample waste and classify it to determine the appropriate disposal facility.
- Make sure that toxic liquid wastes (e.g., used oils, solvents, and paints) and chemicals (e.g., acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for solid waste construction debris.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Recycle any useful material such as used oil or water-based paint when practical.
- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.



Maintenance and Inspection

- A foreman and/or construction supervisor shall monitor on-site hazardous waste storage and disposal procedures.
- Waste storage areas shall be kept clean, well organized, and equipped with ample clean-up supplies as appropriate for the materials being stored.
- Storage areas shall be inspected in conformance with the provisions in the contract documents.
- Perimeter controls, containment structures, covers, and liners shall be repaired or replaced as needed to maintain proper function.
- Hazardous spills shall be cleaned up and reported in conformance with the applicable Material Safety Data Sheet (MSDS) and the instructions posted at the project site.
- The National Response Center, at (800) 424-8802, shall be notified of spills of Federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302.
- Copy of the hazardous waste manifests shall be provided to the RE.

Concrete Waste Management

WM-8

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

These are procedures and practices that are designed to minimize or eliminate the discharge of concrete waste materials to the storm drain systems or watercourses.

Appropriate Applications

- Concrete waste management procedures and practices are implemented on construction projects where concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Where slurries containing portland cement concrete (PCC) or asphalt concrete (AC) are generated, such as from sawcutting, coring, grinding, grooving, and hydro-concrete demolition.
- Where concrete trucks and other concrete-coated equipment are washed on site, when approved by the Resident Engineer (RE). See also NS-8, "Vehicle and Equipment Cleaning."
- Where mortar-mixing stations exist.

Limitations

- None identified.

Standards and Specifications

Education

- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.
- The Contractor's Water Pollution Control Manager (WPCM) shall oversee and enforce concrete waste management procedures.

Concrete Slurry Wastes

- PCC and AC waste shall not be allowed to enter storm drains or watercourses.

- PCC and AC waste shall be collected and properly disposed of outside the highway right-of-way in conformance with Standard Specifications Section 7-1.13 or placed in a temporary concrete washout facility as shown in the figures on Pages 5 and 6.
- Disposal of hardened PCC and AC waste shall be in conformance with Standard Specifications Section 15-3.02.
- A sign shall be installed adjacent to each temporary concrete washout facility to inform concrete equipment operators to utilize the proper facilities as shown on Page 6.
- A foreman and/or construction supervisor shall monitor onsite concrete working tasks, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Do not allow saw-cut PCC slurry to enter storm drains or watercourses. See also BMP NS-3, "Paving and Grinding Operations;" and BMP WM-10, "Liquid Waste Management." Residue from grinding operations shall be picked up by means of a vacuum attachment to the grinding machine. Saw cutting residue shall not be allowed to flow across the pavement, and shall not be left on the surface of the pavement.
- Vacuum slurry residue and dispose in a temporary facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below) and allow slurry to dry. Dispose of dry slurry residue in accordance with BMP WM-5, "Solid Waste Management", or, for on-site disposal, in accordance with Standard Specification 15-3.02, Removal Methods.
- Collect and dispose of residue from grooving and grinding operations in accordance with Standard Specifications Section 42-1.02 and 42-2.02.

Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures

- Temporary concrete washout facilities shall be located a minimum of 15 m (50 ft) from storm drain inlets, open drainage facilities, and watercourses, unless determined infeasible by the RE. Each facility shall be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign shall be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities. The sign shall be installed as shown on the plans and in conformance with the provisions in Standard Specifications Section 56-2, Roadside Signs.

- Temporary concrete washout facilities shall be constructed above grade or below grade at the option of the Contractor. Temporary concrete washout facilities shall be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.
- Temporary washout facilities shall have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Perform washout of concrete mixer trucks in designated areas only.
- Wash concrete only from mixer truck chutes into approved concrete washout facility. Washout may be collected in an impermeable bag for disposal.
- Pump excess concrete in concrete pump bin back into concrete mixer truck.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete shall be broken up, removed, and disposed of per BMP WM-5, "Solid Waste Management", and in conformance with the provisions in Standard Specifications Section 15-3.02, "Removal Methods."

Temporary Concrete Washout Facility Type "Above Grade"

- Temporary concrete washout facility Type "Above Grade" shall be constructed as shown on Page 5 or 6, with a recommended minimum length and minimum width of 3 m (10 ft), but with sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations. The length and width of a facility may be increased, at the Contractor's expense, upon approval from the RE.
- Straw bales, wood stakes, and sandbag materials shall conform to the provisions in BMP SC-9, "Straw Bale Barrier."
- Plastic lining material shall be a minimum of 10-mil polyethylene sheeting and shall be free of holes, tears or other defects that compromise the impermeability of the material.
- Portable delineators shall conform to the provisions in Standard Specifications Section 12-3.04, "Portable Delineators.". The delineator bases shall be cemented to the pavement in the same manner as provided for cementing pavement markers to pavement in Standard Specifications Section 85-1.06, "Placement." Portable delineators shall be applied only to a clean, dry surface.

Temporary Concrete Washout Facility (Type Below Grade)

- Temporary concrete washout facility Type "Below Grade" shall be constructed as shown on page 6, with a recommended minimum length and minimum width of 3m (10 ft). The quantity and volume shall be sufficient to contain all liquid and concrete waste generated by washout operations. The length and width of a facility may be increased, at the Contractor's expense, upon approval of the RE. Lath and flagging shall be commercial type.

- Plastic lining material shall be a minimum of 10-mil polyethylene sheeting and shall be free of holes, tears or other defects that compromise the impermeability of the material.

- The soil base shall be prepared free of rocks or other debris that may cause tears or holes in the plastic lining material.

Removal of Temporary Concrete Washout Facilities

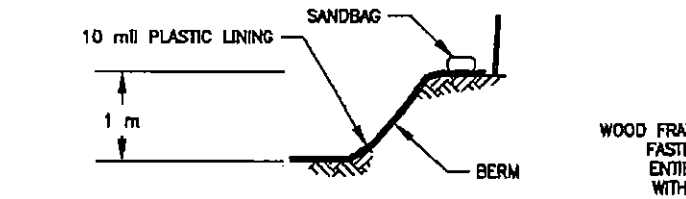
- When temporary concrete washout facilities are no longer required for the work, as determined by the RE, the hardened concrete shall be removed and disposed of in conformance with the provisions in Standard Specifications Section 15-3.02. Disposal of PCC slurries or liquid waste shall be disposed of outside the highway right-of-way in conformance with provisions of Standard Specifications Section 7-1-13. Materials used to construct temporary concrete washout facilities shall become the property of the Contractor, shall be removed from the site of the work, and shall be disposed of outside the highway right-of-way in conformance with the provisions of the Standard Specifications, Section 7-1.13.

- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities shall be backfilled and repaired in conformance with the provisions in Standard Specifications Section 15-1.02, "Preservation of Property."

Maintenance and Inspection

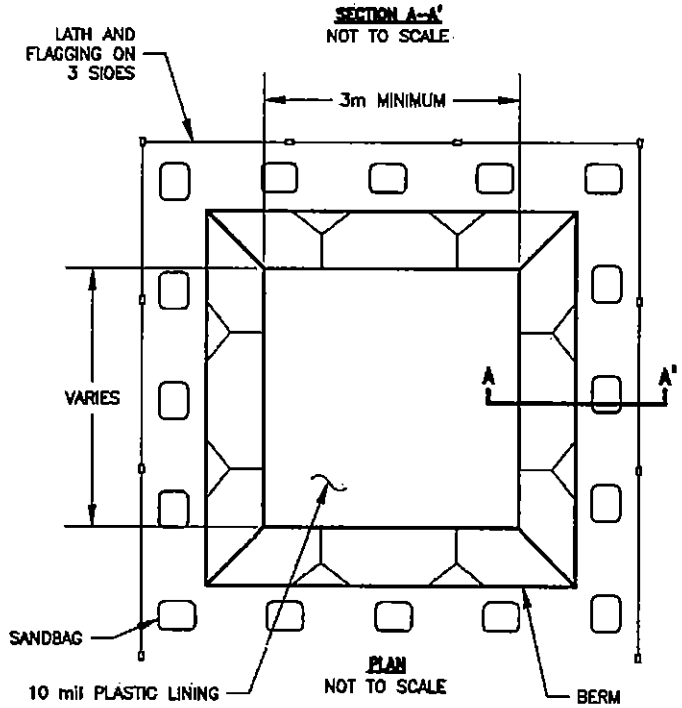
- The Contractor's Water Pollution Control Manager (WPCM) shall monitor on site concrete waste storage and disposal procedures at least weekly or as directed by the RE.

- The WPCM shall monitor concrete working tasks, such as saw cutting, coring, grinding and grooving daily to ensure proper methods are employed or as directed by the RE.



- Temporary concrete washout facilities shall be maintained to provide adequate holding capacity with a minimum freeboard of 100 mm (4 inches) for above grade facilities and 300 mm (12 inches) for below grade facilities. Maintaining temporary concrete washout facilities shall include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials shall be removed and disposed of in conformance with the provisions in Standard Specifications Section 15-3.02, "Removal Methods."

- Existing facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.



- Temporary concrete washout facilities shall be inspected for damage (i.e. tears in PVC liner, missing sand bags, etc.). Damaged facilities shall be repaired.

Sanitary/Septic Waste Management

WM-9

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

Procedures and practices to minimize or eliminate the discharge of construction site sanitary/septic waste materials to the storm drain system or to watercourses.

Appropriate Applications

Sanitary/septic waste management practices are implemented on all construction sites that use temporary or portable sanitary/septic waste systems.

Limitations

- None identified.

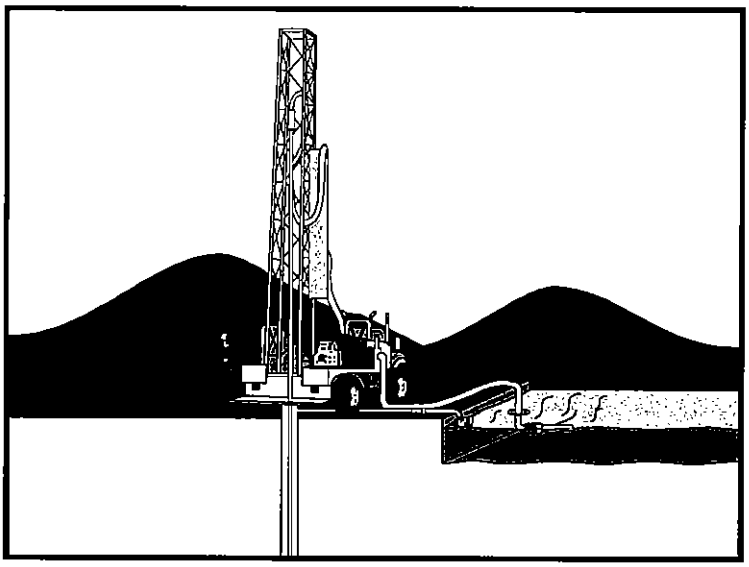
Standards and Specifications

Education

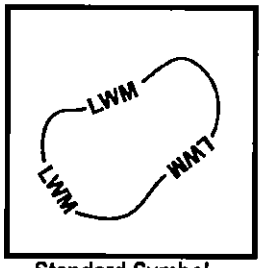
- Educate employees, subcontractors, and suppliers on sanitary/septic waste storage and disposal procedures.
- Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary/septic wastes.
- Instruct employees, subcontractors, and suppliers in identification of sanitary/septic waste.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

Storage and Disposal Procedures

- Temporary sanitary facilities shall be located away from drainage facilities, watercourses, and from traffic circulation. When subjected to high winds or risk.



- Wastewater shall not be discharged or buried within the highway right-of-way.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, shall comply with the local health agency, city, county, and sewer district requirements.
- If using an on site disposal system, such as a septic system, comply with local health agency requirements.
- Properly connect temporary sanitary facilities that discharge to the sanitary sewer system to avoid illicit discharges.
- Ensure that sanitary/septic facilities are maintained in good working order by a licensed service.
- Use only reputable, licensed sanitary/septic waste haulers.



Maintenance and Inspection

- The Contractor's Water Pollution Control Manager (WPCM) shall monitor onsite sanitary/septic waste storage and disposal procedures at least weekly.

Liquid Waste Management

WM-10

Standard Symbol

BMP Objectives

- ○ Soil Stabilization
- ○ Sediment Control
- ○ Tracking Control
- ○ Wind Erosion Control
- ● Non-Storm Water Management
- ● Materials and Waste Management

Definition and Purpose

Procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Appropriate Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous byproducts, residuals, or wastes:

- Drilling slurries and drilling fluids.
- Grease-free and oil-free wastewater and rinse water.
- Dredgings.
- Other non-storm water liquid discharges not permitted by separate permits.

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations, or to requirements of other permits secured for the construction project (e.g., National Pollutant Discharge Elimination System [NPDES] permits, Army Corps permits, Coastal Commission permits, etc.).
- Does not apply to dewatering operations (see BMP NS-2, "Dewatering Operations"), solid waste management (see BMP WM-5, "Solid Waste Management"), hazardous wastes (see BMP WM-6, "Hazardous Waste Management"), or concrete slurry residue (see BMP WM-8, "Concrete Waste Management").
- Does not apply to non-stormwater discharges permitted by any NPDES permit held by the pertinent Caltrans District, unless the discharge is determined by Caltrans to be a source of pollutants. Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground

water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and, discharges or flows from emergency fire fighting activities.

Standards and Specifications

General Practices

- The Contractor's Water Pollution Control Manager (WPCM) shall oversee and enforce proper liquid waste management procedures and practices.
- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage structure, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities, and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Verify which non-stormwater discharges are permitted by the Caltrans Statewide NPDES permit; different regions might have different requirements not outlined in this permit. Some listed discharges may be prohibited if Caltrans determines the discharge to be a source of pollutants.
- Apply the NS-8, "Vehicle and Equipment Cleaning" BMP for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids shall not be allowed to enter storm drains and watercourses and shall be disposed of outside the highway right-of-way in conformance with the provisions in Standard Specifications Section 7-1.13.
- If an appropriate location is available, as determined by the Resident Engineer (RE), drilling residue and drilling fluids that are exempt under California Code of Regulations (CCR) Title 23 §2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the provisions concerning the Temporary Concrete Washout Facilities detailed in BMP WM-08, "Concrete Waste Management."
- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, shall be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.

- Contain liquid wastes in a controlled area, such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.
- Take precautions to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in BMP WM-4, "Spill Prevention and Control."
- Do not locate containment areas or devices where accidental release of the contained liquid can threaten health or safety, or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes running off a surface, which has the potential to affect the storm drainage system, such as wash water and rinse water from cleaning walls or pavement.
- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.
- If the liquid waste is sediment laden, use a sediment trap (see BMP SC-3, "Sediment Trap") for capturing and treating the liquid waste stream, or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- Typical method is to dewater the contained liquid waste, using procedures such as described in BMP NS-2, "Dewatering Operations", and BMP SC-2, "Sediment/Desilting Basin"; and dispose of resulting solids per BMP WM-5, "Solid Waste Management", or per Standard Specifications Section 7-1.13, "Disposal of Material Outside the Highway Right of Way", for off-site disposal.
- Method of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 Water Quality Certifications or 404 permits, local agency discharge permits, etc., and may be defined elsewhere in the special provisions.
- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.

- For disposal of hazardous waste, see BMP WM-6, "Hazardous Waste Management."
- If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.

Maintenance and Inspection

- Spot check employees and subcontractors at least monthly throughout the job to ensure appropriate practices are being employed.
- Remove deposited solids in containment areas and capturing devices as needed, and at the completion of the task. Dispose of any solids as described in BMP WM-5, "Solid Waste Management."
- Inspect containment areas and capturing devices frequently for damage, and repair as needed.

CONSTRUCTION SITE SELF-INSPECTION CHECKLIST

Inspected By: _____

Project: _____

Contractor: _____

Date: _____

Check "Yes" or "No" or "N/A" if not applicable.

YES	NO	N/A	
_____	_____	_____	1. Has there been an absence of rain since the last inspection?
_____	_____	_____	2. Are all sediment barriers (e.g., sandbags, straw bales, and silt fences) in place in accordance with the Local SWPPP or WWECP and are they functioning properly?
_____	_____	_____	3. If present, are all exposed slopes protected from erosion through the implementation of acceptable soil stabilization practices?
_____	_____	_____	4. If present, are all sediment traps/basins installed and functioning properly (if applicable)?
_____	_____	_____	5. Are all material handling and storage areas reasonably clean and free of spills, leaks, or other deleterious materials?
_____	_____	_____	6. Are all equipment storage and maintenance areas reasonably clean and free of spills, leaks, or any other deleterious materials?
_____	_____	_____	7. Are all materials and equipment properly covered?

YES	NO	N/A	
_____	_____	_____	8. Are all external discharge points (i.e., outfalls) reasonably free of any noticeable pollutant discharges?
_____	_____	_____	9. Are all internal discharge points (i.e., storm drain inlets) provided with inlet protection?
_____	_____	_____	10. Are all external discharge points reasonably free of any significant erosion or sediment transport?
_____	_____	_____	11. Are all BMPs identified on the Plan installed in the proper location and according to the specifications for the plan?
_____	_____	_____	12. Are all structural control practices in good repair and maintained in functional order?
_____	_____	_____	13. Are all on-site traffic routes, parking, and storage of equipment and supplies restricted to areas designated in the Plan for those uses?
_____	_____	_____	14. Are all locations of temporary soil stockpiles or construction materials in approved areas?
_____	_____	_____	15. Are all seeded or landscaped areas properly maintained?
_____	_____	_____	16. Are sediment treatment controls in place at discharge points from the site?
_____	_____	_____	17. Are slopes free of significant erosion?
_____	_____	_____	18. Are all points of ingress and egress from the site provided with stabilized construction entrances?
_____	_____	_____	19. Is sediment, debris, or mud being cleaned from public roads at intersections with site access roads?

YES	NO	N/A	
_____	_____	_____	20. Does the Plan reflect current site conditions?

If you answered "no" to any of the questions on the previous page except Number 1, describe any corrective action(s) that must be taken to remedy the problem and when the corrective action is to be completed:

Attachment B-6
Record of Completed Inspection and Monitoring Checklists

Appendix C
ASTM E-1903-97: Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process

Designation: E 1903 – 97

Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process[1]

This standard is issued under the fixed designation E 1903; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide[2] covers a framework for employing good commercial and customary practices in conducting a Phase II environmental site assessment (ESA) of a parcel of commercial property with respect to the potential presence of a range of contaminants which are within the scope of CERCLA as well as petroleum products.

1.1.1 This guide is intended to provide practical procedural guidance for the continuation of an assessment conducted in accordance with the most recent edition of Practice E 1527 or E 1528, or both. Practice E 1527 is the practice for conducting Phase I ESAs for a parcel of commercial property and Practice E 1528 is the transaction screen practice. Both practices define a process that is intended to constitute "all appropriate inquiry into the previous ownership and uses of a property" to determine whether hazardous substances or petroleum products have been disposed or released there in order to satisfy one element of the innocent purchaser defense to CERCLA liability.

1.1.2 Because this guide for conducting Phase II ESAs describes a process for further evaluating a parcel of commercial property with recognized environmental conditions, as defined in Practices E 1527 and E 1528, users of this guide should understand the requirements and limitations of those practices. It is strongly recommended that the user refer to and apply the guide in concert with Practices E 1527 and E 1528.

1.1.3 This guide has multiple purposes. It is intended to provide assistance to users in satisfying the appropriate inquiry element of CERCLA's innocent purchaser defense, as defined in 42 U.S.C. § 9601(35)(B), where a previous assessment satisfying that element identified recognized environmental conditions. This guide also is intended to assist a user in gathering reliable information about a property's environmental conditions to guide the user's business decisions. However, this guide does not purport to include the level of specificity required of technical standards that govern full characterization of a site's environmental conditions.

1.2 *Objectives*—The primary objectives of conducting a Phase II ESA are to evaluate the recognized environmental conditions identified in the Phase I ESA or transaction screen process for the purpose of providing sufficient information regarding the nature and extent of contamination to assist in making informed business decisions about the property; and where applicable, providing the level of knowledge necessary to satisfy the innocent purchaser defense under CERCLA.

1.2.1 To achieve these objectives, it may be appropriate to perform more than a single iteration of assessment. The guide fosters an iterative approach to Phase II assessments and allows the user to terminate the Phase II ESA at the point where sufficient data have been generated to meet the user's objectives.

1.2.2 At the completion of a Phase II ESA, the environmental professional should be able to conclude, at a minimum, that either *(a)* the ESA has provided sufficient information to render a professional opinion that there is no reasonable basis to suspect the presence of hazardous substances or petroleum products at the property associated with the recognized environmental conditions under assessment, or *(b)* the ESA has confirmed the presence of hazardous substances or petroleum products at the property under conditions that indicate disposal or release. If the information developed in the ESA is insufficient for the environmental professional to reach either of these conclusions, the environmental professional may recommend additional iterations of assessment if warranted to meet the objectives of the user. If the environmental professional reasonably suspects that unconfirmed hazardous substance or petroleum releases remain but concludes that further reasonable assessment is not expected to provide additional information of significant value, he may recommend that further assessment is not warranted. In such circumstances, the recommendation for no further assessment should be accompanied by an explanation why a reasonable suspicion of releases remains and why further reasonable assessment is not warranted. Depending upon the work scope, the environmental professional may also be able to provide guidance on the nature and extent of contamination in order to assist the user in making business decisions regarding the property.

---

[1] This guide is under the jurisdiction of ASTM Committee E-50 on Environmental Assessment and is the direct responsibility of Subcommittee E50.02 on Commercial Real Estate Transactions.

Current edition approved Dec. 10, 1997. Published February 1998.

[2] As used herein, a "Standard" is a document that has been developed and established within the consensus principles of the Society and that meets the approval requirements of ASTM procedures and regulations. A "Guide" is a compendium of information or a series of options that does not recommend a specific course of action. A guide increases the awareness of information and approaches in a given subject area. A "Practice," in contrast, is a definitive set of instructions for performing one or more specific operations that does not produce a test result. See Form and Style for ASTM Standards, 10th ed., 1996.

1.2.3 This guide is intended to provide guidance for assessing recognized environmental conditions and developing technically sound data. It is not intended to satisfy the level of inquiry that may be necessary to support remedial solutions for a site. For further discussion of the use of this guide, refer to Section 4 on Significance and Use.

1.3 *Needs of the User*—Establishing the innocent purchaser defense may not be a realistic objective in some instances. Accordingly, the extent of assessment is based on the business objectives of the user as well as the degree of uncertainty acceptable to the user. In either case, the primary purpose of a Phase II ESA conducted in accordance with this guide is to assess and evaluate the recognized environmental conditions identified in the Phase I ESA or Transaction Screen Process.

1.3.1 The mere confirmation of contamination or the preliminary indication of the extent and magnitude of contamination may be sufficient for the purposes of many users. If a user desires a more complete characterization of the environmental condition of the property, further assessment may be undertaken. However, this guide should not be construed to require multiple iterations of assessments in all cases, either to establish the innocent purchaser defense or to meet other objectives. Many Phase II ESAs may in fact be restricted to only a single round of assessment, whatever the extent of contamination, if any, that might be revealed.

1.4 *Limitations*—The use of this guide is related to the scope as set forth in Section 1. For information purposes, Section 12 of this guide contains a non-exhaustive list of certain environmental conditions that are beyond the scope of this guide but that may warrant consideration by parties to a commercial property transaction. This guide provides an approach that may be employed to assess the environmental conditions listed in Section 12. Reference also should be made to 4.1.

1.5 *Organization of This Guide*—This guide has twelve sections and one appendix. Section 1 is the Scope section. Section 2 is Referenced Documents. Section 3, Terminology, contains definitions of terms and acronyms used in this guide. Section 4 is Significance and Use of this guide. Section 5 is Contracting Considerations. Sections 6-11 constitute the main body of the Phase II Environmental Site Assessment guide and include objectives (see Section 6), developing the scope of work (see Section 7), assessment activities (see Section 8), evaluation of data (see Section 9), interpretation of results (see Section 10) and recommended report preparation (see Section 11). Section 12 provides additional information regarding non-scope considerations. Appendix X1 provides a sample table of contents and report format for a written Phase II Environmental Site Assessment Report.

2. Referenced Documents

2.1 The references in this Section are for informational purposes. Although Phase II ESAs should utilize government- and industry-accepted practices and methods, this guide does not recommend the use of specific practices in the implementation of a Phase II ESA.

2.2 *ASTM Standards:*

D 5730 Guide to Site Characteristics for Environmental Purposes With Emphasis on Soil, Rock, The Vadose Zone and Ground Water[3,4]

D 653 Terminology Relating to Soil, Rock and Cont. Fluids[3]

D 4750 Test Method for Determining Subsurface Liquid Levels in a Borehole or Monitoring Well. (Observation Well)[3]

E 1527 Practice for Environmental Site Assessments: Phase I[5]

E 1528 Practice for Environmental Site Assessments: Transaction Screen Process[3]

3. Terminology

3.1 *Definitions:*

3.1.1 *aquifer*—as defined in Terminology D 653, a geologic formation that is capable of providing a significant quantity of water.

3.1.2 *ARARs*—an acronym for "applicable or relevant and appropriate requirements," a term used in CERCLA and interpreted by EPA regulations. Applicable requirements mean "those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site", 40 C.F.R. § 300. Relevant and appropriate requirements means "those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal, environmental or state environmental or facility siting l... th... while not 'applicable' to a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site" 40 C.F.R. § 300.5.

3.1.3 *business decision*—a decision based on various business risk management considerations relating to a specific property, such as a transfer of title or change in financing. Such considerations may also include the potential financial exposure associated with environmental risks, the value of the property compared with the cost of environmental assessment and the participation and motivations of specific parties to the transaction (that is, owner, seller, buyer, lender, etc.).

3.1.4 *CERCLA*—the acronym for the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C.§ 9601, *et seq.*, the primary federal statute that governs the imposition of liability for environmental cleanups.

3.1.5 *C.F.R.*—Code of Federal Regulations.

3.1.6 *chain of custody*—a written or printed form which is used to document sample possession, condition and responsibility. This custody can include the time from sample conta... acquisition through transportation, sample collection and la... ratory analysis.

3.1.7 *chemical phases*—the physical state of the chemi... (that is; solid, liquid, vapor/gaseous). A chemical'... hys...

[3] *Annual Book of ASTM Standards*, Vol 04.08.

[4] Guide D 5730 covers the selection of the various ASTM Standards th... available for the investigation of soil, rock, the vadose zone, ground water, and media where investigations have an environmental purpose.

[5] *Annual Book of ASTM Standards*, Vol 11.04.

state can change from the one phase to another based on its physical environment.

3.1.8 *common law*—as distinguished from law created by the enactment of legislatures, the common law comprises the body of those principles and rules of action, relating to the government and security of persons and property, which derive their authority solely from usages and customs of immemorial antiquity, or from the judgments and decrees of the courts recognizing, affirming and enforcing such usages and customs; and, in this sense, particularly the ancient unwritten law of England.[6]

3.1.9 *cuttings*—soil, rock chips, fragments or other material that is brought to the surface by drilling or sampling, or both.

3.1.10 *disposal*—as defined by CERCLA and interpreted by EPA regulations, the discharge, deposit, injection, dumping, spilling, leaking, or placing of any solid waste or hazardous waste into or on any land or water so that such solid waste or hazardous waste or any constituent thereof may enter the environment or be emitted into the air or discharged into any waters, including ground waters. By judicial construction, the term also may include hazardous substances in repose in the environment, with the result that hazardous substances that have migrated to a site from an off-site source may nonetheless be considered to have been disposed at the site. See, for example, *United States v. Waste Industries*, 734 F.2d 159 (4th Cir. 1984). This construction is not universally accepted. See, for example, *United States v. Petersen Sand and Gravel, Inc.*, 806 F. Supp. 1346 (D.Ill. 1992).

3.1.11 *downgradient*—with respect to a given reference point, it is all points through which ground water originating at the reference point flows until reaching a surface discharge point or a distance or depth that ceases to be a matter of potential environmental concern; the direction of decreasing hydrostatic head.

3.1.12 *environmental media*—soil, rock, water, air, sediment.

3.1.13 *environmental professional*—a person or group of persons possessing sufficient training and experience necessary to prepare and implement a Phase II environmental site assessment in accordance with this guide, and from the information generated by such activities, having the ability to develop sound opinions and conclusions regarding recognized environmental conditions in connection with the property in question. An individual's status as an environmental professional may be limited to the type of assessment to be performed or to specific segments of the assessment for which the professional is responsible. The person may be an independent contractor or an employee of the user.

3.1.13.1 *Discussion*—Some jurisdictions may have licensing requirements for individuals who perform certain activities included in a Phase II ESA.

3.1.14 *EPA*—the United States Environmental Protection Agency.

3.1.15 *ESA*—environmental site assessment.

3.1.16 *fate and transport characteristics*—natural consequences that can be predicted based on the distinguishing characteristics of a substance and the media which carry the substance.

3.1.17 *ground water*—as defined by Terminology D 653, the part of the subsurface that is in the saturated zone. Loosely, all subsurface water as distinct from surface water.

3.1.18 *ground water flow*—as defined by Terminology D 653, the movement of water in the zone of saturation.

3.1.19 *ground water flow direction*—the compass bearing of the movement of water in the zone of saturation (vertical and horizontal components of ground water flow).

3.1.20 *hazardous substance*—a substance defined as a hazardous substance pursuant to CERCLA, 42 U.S.C. § 9601(14), as interpreted by EPA regulations and the courts. The term includes any substance designated pursuant to section 311(b)(2)(A) of the Clean Water Act, 33 U.S.C.§ 1321(b)(2)(A); any element, compound, mixture, solution or substance designated pursuant to section 102 of CERCLA, 42 U.S.C. § 9602; any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act, 42 U.S.C. § 6921, (but not including any waste the regulation of which under the Solid Waste Disposal Act, 42 U.S.C.§ 6901 *et seq.*, has been suspended by Act of Congress); any toxic pollutant listed under section 307(a) of the Clean Water Act, 33 U.S.C. § 1317(a); any hazardous air pollutant listed under section 112 of the Clean Air Act, 42 U.S.C. § 7412; and any imminently hazardous chemical substance or mixture with respect to which the EPA administrator has taken action pursuant to section 7 of the Toxic Substances Control Act, 15 U.S.C. § 2606. The term does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance by EPA and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas). Hazardous substances designated by EPA are listed in 40 C.F.R. § 302.4.

3.1.21 *petroleum products*—those substances included within the petroleum exclusion to CERCLA, 42 U.S.C. § 9601(14), as interpreted by the courts and EPA; that is, petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under Subparagraphs (A) through (F) of 42 U.S.C. § 9601(14), natural gas, natural gas liquids, liquefied natural gas, and synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas). (The word fraction refers to certain distillates of crude oil, including gasoline, kerosene, diesel oil, jet fuels, and fuel oil, pursuant to Standard Definitions of Petroleum Statistics).[7]

3.1.22 *Phase I environmental site assessments (ESAs)*—the process described in Practice E 1527.

3.1.23 *Phase II environmental site assessments (ESAs)*—the process described in this guide.

3.1.24 *property*—the property that is the subject of the ESA described in this guide. The term includes buildings and other fixtures and improvements located on the property and affixed to the land.

[6] *Black's Law Dictionary 250-251*, 5th ed., 1979.

[7] *Standard Definitions of Petroleum Statistics*, American Petroleum Institute, Fourth Edition 1988.

3.1.25 *purged ground water*—water that is removed from a monitoring well prior to collecting a representative sample of the aquifer, including water generated during well installation and well development.

3.1.26 *quality assurance/quality control (QA/QC)*—the use of standards and procedures to provide reasonable assurance that samples collected and data generated are reliable, reproducible and verifiable.

3.1.27 *recognized environmental condition (REC)*—the presence or likely presence of any hazardous substances or petroleum products on property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

3.1.28 *release*—as defined by § 101(22) of CERCLA, 42 U.S.C. § 9601(22), "any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing any hazardous substance or pollutant or contaminant), but exclud[ing] (A) any release which results in exposure to persons solely within a workplace, with respect to a claim which such persons may assert against the employer of such persons, (B) emissions from the engine exhaust of a motor vehicle, rolling stock, aircraft, vessel, or pipeline pumping station engine, (C) release of source, byproduct, or special nuclear material from a nuclear incident, as those terms are defined in the Atomic Energy Act of 1954 [42 U.S.C. § 2011 *et seq.*], if such release is subject to requirements with respect to financial protection established by the Nuclear Regulatory Commission under section 170 of such Act [42 U.S.C. § 2210], or, for the purposes of section 104 of CERCLA or any other response action, any release of source, byproduct, or special nuclear material from any processing site designated under section 102(a)(1) or 302(a) of the Uranium Mill Tailings Radiation Control Act of 1978; [42 U.S.C. § 7912(a)(1) or 7942(a)], and (D) the normal application of fertilizer."

3.1.29 *sample medium*—the particular matrix that is sampled for laboratory analysis. Examples of commonly encountered matrices include: soil, rock, sludge, sediment, air, wastes, pure or mixtures of chemicals, ground water, drinking water, surface water, etc.

3.1.30 *self-evaluation privilege*—a privilege invoked to protect from disclosure confidential information resulting from a critical self-analysis undertaken by the party seeking to invoke the privilege.

3.1.31 *Superfund*—the common name for the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C. § 9601, *et seq.*, as amended by the Superfund Amendments and Reauthorization Act of 1986 ("SARA"), the primary federal statute that governs the imposition of liability for environmental cleanups.

3.1.32 *surface water*—water above the surface of the ground, including but not limited to lakes, ponds, reservoirs, artificial impoundments, streams, rivers, springs, seeps and wetlands.

3.1.33 *target analyte*—a chemical substance or class of chemicals that is selected for laboratory analysis or field analysis.

3.1.34 *Transaction Screen Process*—the process described in Practice E 1528.

3.1.35 *U.S.C.*—United States Code.

3.1.36 *user*—the party seeking to use this guide to guide performance of an ESA of the property. A user may include, without limitation, a purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager.

3.1.37 *water table*—as defined in Test Method D 4750, the surface of a ground water body at which the water pressure equals atmospheric pressure. Earth material below the ground water table is saturated with water.

4. Significance and Use

4.1 *Uses:*

4.1.1 This guide is intended for use on a voluntary basis by parties who wish to assess the recognized environmental conditions ("RECs") identified in a Phase I ESA or transa[illegible] screen process for the purpose of establishing the inno[illegible] purchaser defense, where applicable, or to support business decisions about the property. The level of assessment can, and most likely will, vary depending on the needs of the user and the business situation driving the assessment, as described in 1.3. No implication is intended that a person must use this guide in order to be deemed to have conducted inquiry in a commercially prudent or reasonable manner in any particular transaction. Nevertheless, this guide is intended to reflect good commercial and customary practice for appropriate inquiry sufficient to satisfy the innocent purchaser defense.

4.1.1.1 CERCLA provides that a purchaser of real property qualifies for the innocent purchaser defense if the purchaser acquires a contaminated site after the disposal or placement of hazardous substances at the site, and the purchaser neither knew nor had reason to know that any hazardous substance which is the subject of the release was disposed at the site. 42 U.S.C. § 9601(35)(A)(i). To establish that a purchaser had no reason to know of the disposal or release of any hazardous substance at the site, CERCLA requires the purchaser to show that at the time of acquisition the purchaser undertook all appropriate inquiry into the previous ownership and uses of a property consistent with "good commercial or customary practice". 42 U.S.C.§ 9601(35)(B). To determine whether a purchaser made "all appropriate inquiry", the courts are directed by statute to consider any specialized knowled[illegible] experience on the part of the purchaser, the relationship o[illegible] purchase price to the value of the property, if uncontaminated, commonly known or ascertainable information about the property, the obviousness of the presence or likely presence of contamination at the property, and the ability to detect such contamination by appropriate inspection.

4.1.1.2 This guide is intended to meet the business community's need for a written, practical reference describing procedures that constitute" all appropriate inquiry" once recognized environmental conditions are identified. This guide is intended to be a practical reference document which can be used to assess whether good commercial or customary practice (that is, appropriate procedure) has been followed in a particular environmental assessment.

4.1.1.3 This guide does not address the business judgments that follow from the interpretation of data collected through the Phase II process. Assessment of the business risks reflected by such data is dependent upon numerous site- and transaction-specific variables which cannot be adequately anticipated in this guide. Proper analysis of the legal, business and environmental risks associated with a particular site and business transaction is best conducted on a case-by-case basis by legal, business and environmental professionals assessing the known data relating to the particular site and transaction.

4.1.1.4 Likewise, this guide does not assess the legal risks associated with a transaction involving property where hazardous substances or petroleum products are present at levels above those occurring naturally but below those generally considered to be of regulatory concern, that is, *de minimis* levels. What constitutes a *de minimis* level of contamination is an evolving regulatory concept which may vary from jurisdiction to jurisdiction and may turn on site-specific factors.

4.1.1.5 If a Phase II ESA conducted in accordance with this guide provides sufficient information from which the environmental professional can render a professional opinion that there is no reasonable basis for suspecting the disposal or release of hazardous substances at the site, then further assessment is not warranted to establish the innocent purchaser defense. If the Phase II ESA confirms the presence of *de minimis* quantities of hazardous substances on the site under circumstances that suggest these hazardous substances have been released or disposed, the availability of the innocent purchaser defense is not assured as a matter of law. A review of reported case law as of January 1996 revealed no judicial decision concerning the availability of the innocent purchaser defense when *de minimis* quantities of hazardous substances are present on a site. This guide, therefore, does not address the availability of the innocent purchaser defense in those circumstances. Because petroleum products are excluded from the hazardous substances subject to CERCLA, the innocent purchaser defense is inapplicable to petroleum product releases.

4.1.2 *Use Not Limited to CERCLA*—This guide is designed to assist a user in developing information about the environmental condition of the property and has utility for a wide range of users including those who may have no actual or potential CERCLA concerns.

4.1.2.1 Where fewer than all recognized environmental conditions identified in a Phase I ESA or transaction screen are assessed in the Phase II ESA, the conclusion that no further inquiry is warranted applies only to the recognized environmental conditions assessed. However, this guide should not be construed to require Phase II assessment of all recognized environmental conditions identified in a Phase I ESA or a transaction screen. Where the user's objectives may be otherwise satisfied (for example, establishing the innocent purchaser defense is not the user's objective), a recognized environmental condition identified in a Phase I ESA or transaction screen may be eliminated from further assessment in the Phase II ESA.

4.1.3 *Site- and Transaction-Specific*—A Phase II ESA is site-specific in that it relates to assessing recognized environmental conditions as identified in a Phase I ESA or transaction screen. A Phase II ESA is also transaction-specific. This guide is intended to set forth a level of diligence that will satisfy the innocent purchaser defense where it is sought. The level of diligence set forth in this guide is also intended to generate information of sufficient quality to satisfy different or additional objectives of the user.

4.1.4 *Use by Other Parties*—Transaction-specific assumptions and limitations, based on the user's objectives, will be built into the implementation of this guide for any specific site to the extent the user's objectives go beyond establishing the innocent purchaser defense. Any person who seeks to rely on a Phase II ESA conducted for someone else is cautioned to understand these assumptions and objectives prior to review and use of the findings of the Phase II ESA.

4.2 *Principles*—The following principles are an integral part of this guide and are intended to be referred to in resolving any ambiguity or exercising such discretion as is accorded the user or environmental professional.

4.2.1 *Elimination of Uncertainty*—No ESA can eliminate all uncertainty. Furthermore, any sample, either surface or subsurface, taken for chemical analysis may or may not be representative of a larger population. Professional judgment and interpretation are inherent in the process and uncertainty is inevitable. Additional assessment may be able to reduce the uncertainty.

4.2.1.1 *Failure to Detect*—Even when Phase II work is executed with an appropriate site-specific standard of care certain conditions present especially difficult detection problems. Such conditions may include, but are not limited to complex geological settings, the fate and transport characteristics of certain hazardous substances and petroleum products the distribution of existing contamination, physical limitations imposed by the location of utilities and other man-made objects, and the limitations of assessment technologies.

4.2.1.2 *Inadequate Phase I ESA or Transaction Screen*—If Phase II work is based on an inadequate Phase I ESA or an inadequate transaction screen (for example, one that fails to identify all recognized environmental conditions) there will be an increased risk that the disposal or release of hazardous substances or petroleum products on the property may go undetected and jeopardize the availability of the innocent purchaser defense and the quality of data on which judgments are made. A Phase I ESA or transaction screen, or both conducted in accordance with the latest edition of Practice E 1527 and Practice E 1528 should provide an adequate basis for a Phase II ESA.

4.2.1.3 *Chemical Analysis Error*—Chemical testing methods have inherent uncertainties and limitations. The environmental professional should build quality control and quality assurance tests into the work description, as outlined in 7.

The environmental professional should require the laboratory to report any potential or actual problems experienced, or non-routine events which may have occurred during the testing, so that such problems can be considered in evaluating the data. The environmental professional should subsequently identify such problems in any requested reports or documentation provided to the user.

4.2.2 *Level of Assessment*—Phase II ESAs do not generally require an exhaustive assessment of environmental conditions on property. There is a point at which the cost of information obtained and the time required to obtain it outweigh the usefulness of the information and, in fact, may be a material detriment to the orderly completion of transactions. If hazardous substance or petroleum releases are confirmed on a parcel of property, the extent of further assessment is related to the degree of uncertainty that is acceptable to the user with respect to the real estate transaction.

4.2.3 *Comparison With Subsequent Inquiry*—For purposes of the innocent purchaser defense, Phase II ESAs should be evaluated based on the reasonableness of judgments made at the time and under the circumstances in which they were made.

4.2.4 *Data Usability*—Measurements and sampling data only represent the site conditions at the time of data collection. Therefore, the usability of data collected as part of a Phase II ESA may have a finite lifetime depending on the application and use being made of the data. An environmental professional should evaluate whether previously generated data are appropriate for any subsequent use beyond the original purpose for which it was collected.

5. Contracting Considerations

5.1 *Contracts*—The content and form of the contractual relationship between an environmental professional and user are outside the scope of this guide. The outcome of a Phase II ESA may be adversely affected if the environmental professional and the user do not adequately define their relationship. This guide identifies some of the issues that should be resolved prior to initiation of a Phase II ESA. This guide does not purport to identify all issues that may arise in the course of implementing a Phase II ESA. Nor does it specify how these issues should be resolved. Where the user utilizes the services of an in-house environmental professional, contracting considerations may or may not arise.

5.1.1 *Reporting Obligations*—A requirement to report observations from a Phase II ESA to a governmental entity or third party may be imposed by various authorities, including statutes, regulations, common law, and professional standards. In most cases, statutory, regulatory and common law requirements impose reporting obligations only on the owner, operator, or person in charge or control of the facility or property being assessed. In some circumstances, however, reporting obligations may be legally or voluntarily imposed upon a broader group, including the environmental professional. To avoid disagreement, misunderstanding, or unexpected reporting, the contract between the user and the environmental professional should clearly define the obligations of and protocol for both the user and environmental professional to report to governmental entities or third parties.

5.1.2 *Production of Written Reports and Documentation*—The production of written documentation reflecting the findings of a Phase II ESA raises issues of concern to the user and the environmental professional. The user may be concerned, for example, about the potential for disclosure of sensitive information to the government or third parties and the conflicting interest of ensuring documentation to support an innocent landowner claim. The environmental professional may be concerned that the assessment is well documented to minimize misinterpretation, document uncertainty, and clearly present findings to the user. As a result, the agreement between the user and environmental professional should address the type and scope of written documentation that will be developed to reflect the findings of the Phase II ESA. In this regard, consideration should be given to issues such as the attorney-client, work product and self-evaluation privileges, whether recommendations should be provided separately from the Phase II report, whether the report should be written or oral, and the extent to which the user wants to review a report prior to its becoming "final". An example format is attached in Appendix X1.

5.1.3 *Confidentiality*—Agreements for confidential treatment of the Phase II ESA, if any, should be included in the contract. This agreement should include any subcontractors used in performance of the assessment.

5.1.4 *Work Performed by Others*—During the implementation of the Phase II assessment, the environmental professional may employ others (for example, drillers, laboratories) to carry out portions of the work. The contract between the environmental professional and the user may specify whether the environmental professional or the user is to be responsible for selecting subcontractors. The contract also may specify that only qualified subcontractors with current and appropriate certifications and licenses may be employed. The contract also may specify the qualifications required of subcontractors.

5.1.5 *Limitation on Scope of Work, Data, Information, or Time*—Any limitations on the information, data collected or the work to be performed during the Phase II ESA, including time allowed for completing the work, and their effect on the results of the assessment, should be clearly understood by the environmental professional and user. Such limitations may be made part of the contract.

5.1.6 *Third Party Reliance On Reports and Other Documentation*—Responsibility for the use of Phase II ESAs by third parties may be governed by the contractual relationship between the user and environmental professional.

5.1.7 *Generation of Waste*—Wastes may be generatsd during the assessment implemented as part of the Phase II ESA (for example, drill cuttings and purged ground water). The contract between the environmental professional and the user should clearly address the manner in which such wastes are to be handled and disposed. Techniques that minimize the generation of waste should be utilized to the extent feasible, consistent with the information and data quality objectives of the planned assessment and applicable regulatory requirements.

5.1.8 *Damages Caused by Explorations*—Exploration activities risk damaging structures such as utility lines and underground storage tanks when such are present. Intrusive

explorations may also create additional pathways for pollutant migration. Responsibility for identification of subsurface structures may be governed by the contractual relationship between the user and environmental professional. Where the user is not the owner of the property, the owner should be consulted about the location of such structures.

5.1.9 Many states have statutory obligations for contacting utilities through "one-call" programs. Coordination with utility companies or locator services should also be addressed in the contract documents.

5.2 *Responsibility of User*—The following list of responsibilities of the user is not intended to be exhaustive:

5.2.1 The user should provide access to appropriate areas of the site for the environmental professional. The user should provide the environmental professional a site contact name and phone number.

5.2.2 The user should provide to the environmental professional all pertinent documentation and information regarding the site that is reasonably and practicably available, including but not limited to: previously prepared ESAs, other environmental studies, reports, or permits; property appraisals; site plans that identify site features, including buildings and other above ground structures, property boundaries, and underground structures and buried utilities (for example, sanitary and storm sewers, water, gas, telephone, and electric systems, underground storage tanks, oil/water separators, sumps and drywells); site specific health and safety information; and known or suspected environmental conditions.

5.3 *Responsibility of Environmental Professional*—The following list of responsibilities of the environmental professional is not intended to be exhaustive.

5.3.1 The environmental professional should conform to the precepts of this guide and accepted industry practice. The environmental professional should document and explain significant deviations.

5.3.2 The environmental professional should provide the user prompt notice of environmental conditions observed.

5.3.3 The environmental professional should communicate to the user limitations resulting from any time and cost constraints imposed by the user.

5.3.4 The environmental professional should verify with the user, prior to implementation, any substantive deviations from the original scope of work.

5.3.5 The environmental professional should ascertain and observe all site health and safety considerations and regulations applicable to the activities of the environmental professional.

5.3.6 The environmental professional should provide the user a written statement of qualifications, including the qualifications of the individual environmental professional(s) responsible for the Phase II ESA on request.

5.3.7 The environmental professional should not undertake any activity that he or she is not qualified or licensed (where applicable) to perform.

6. Phase II ESA

6.1 *Objective and Purpose*—The objective of conducting a Phase II ESA is to evaluate the recognized environmental conditions identified in the Phase I ESA or transaction screen process. The purpose of conducting a Phase II ESA depends on the objective(s) of the user. Typically, the purposes of a Phase II ESA are to:

6.1.1 Develop sufficient information from which the environmental professional reasonably can render a professional opinion that, with respect to the recognized environmental conditions assessed, hazardous substances have not been disposed or released at the property, thereby satisfying the innocent purchaser defense under CERCLA as to those recognized environmental conditions; or

6.1.2 Develop sufficient information about the presence of a recognized environmental condition at a site to meet the business objectives of the user and to provide sufficient data to assist the user in making informed business decisions, or both.

6.1.3 The Phase II work scope may consist of several iterations and may be terminated at any point, once the objectives of the user have been satisfied.

6.2 *Components*—The components of a Phase II ESA are as follows:

6.2.1 Developing the scope of work,

6.2.2 Assessment activities,

6.2.3 Evaluation and presentation of data, and

6.2.4 Presentation of findings and conclusions.

7. Developing the Scope of Work

7.1 A description of the work to be performed should be developed by the environmental professional to establish the methods and work tasks that achieve the user's Phase II objectives. The description should provide the rationale for planned sampling locations and testing parameters along with identification of selected methodologies and appropriate QA/QC measures. The description may provide for minor field modifications where appropriate. The description should be organized to facilitate the orderly, objective-focused implementation of the plan in the field. A formal written description may not be required or appropriate in all circumstances and may be substituted by another document that contains the same elements, such as proposal or scope of work. Likewise, the sampling, health and safety and chemical testing programs need not be formal, stand-alone documents. In general, there are seven main tasks in developing a description of the work, as described in 7.2 through 7.8

7.2 *Site Limitations*—The environmental professional is responsible for anticipating foreseeable physical and logistical impediments which interfere with, or limit the ability to conduct explorations, analyses and sampling, for example, low ceilings, narrow alleyways, soft ground, steep slopes, known subsurface structures, such as utilities, etc.

7.3 *Review Existing Information*—Readily available existing information should be reviewed to identify or establish those characteristics of the site and its vicinity which:

7.3.1 Constitute the recognized environmental condition(s) being assessed in the Phase II;

7.3.2 Affect the potential distribution and mobility of hazardous substances or petroleum products in structures, on the ground, in ground water, in soils, or in surface water and environs at the site; and

7.3.3 Affect the manner in which the presence of hazardous substances or petroleum products may be assessed.

7.3.4 The review of readily available existing information

should serve as the basis for evaluating the likely distribution of hazardous substances or petroleum products at the site, identifying appropriate sampling locations, and selecting appropriate sampling and analytical methodologies. Readily available information may be gained in review of Phase I ESAs conducted in accordance with Practice E 1527 and transaction screens conducted in accordance with Practice E 1528. Other ESAs or reports may be used where the information, in the judgment of the environmental professional, can be reasonably relied upon.

7.3.5 The environmental professional may review additional sources of information as is appropriate to the property, or as required by the judgment of the environmental professional. Information developed at this stage of the assessment may eliminate recognized environmental conditions identified in a Phase I ESA or transaction screen from further Phase II assessment where, in the judgment of the environmental professional, the additional information adequately demonstrates that hazardous substances or petroleum products associated with a previously identified recognized environmental condition are unlikely to be present at the property. See 10.1.

7.4 *Potential Distributions of Contaminants*—The environmental professional should consider the likely distribution of potential contaminants. This requires that the environmental professional consider the properties, behaviors, and fate and transport characteristics of the contaminant in a setting like that being assessed.

7.5 *Sampling*—A sampling program should be designed to provide collection of potentially contaminated environmental media, if they occur, at locations and depths where the highest concentrations are likely to occur, as determined pursuant to the provisions of this section.

7.6 *Health and Safety*—The work description should include personnel health and safety precautions to be followed in accordance with applicable federal law or state or local equivalents and any requirements imposed by the owner or occupant of the property or by the user.

7.7 *Chemical Testing*—The chemical testing program should be designed to detect the contaminants suspected to be present in the samples collected in implementing 7.5 above. The chemical tests should be appropriate for detecting the indicator constituents of the hazardous substances and petroleum products identified in the review performed under 7.3 above (for example, target analytes), consistent with 7.4 above. The chemical testing program should include tests which provide quality assurance (QA) and techniques that provide quality control (QC) over the chemical analyses. QA/QC, including detection limits of the chemical testing plan, should be consistent with the intended use of the data. The chemical testing program may include both field analytical and laboratory analytical techniques.

7.7.1 The environmental professional should specify in advance the analytical methods to be used as well as the requirements for data deliverables (for example, tabulated results, individual analysis sheets, chromatograms, spike recoveries, instrument calibration data, etc.) and quality control information (that is, project-specific or only laboratory batch-specific QC sample analysis).

7.7.2 An extensive body of methods is available for the analysis of environmental samples gathered in the course of a Phase II ESA. Several distinct compilations of methods for the analysis of environmental samples have been developed, principally by EPA and ASTM, for different purposes, primarily for hazardous waste management, industrial and municipal wastewater monitoring, assessment and cleanup of potential Superfund sites, and monitoring of the public water supply. An example is the compilation titled *Test Methods for Evaluating Solid Waste* (SW-846) prepared by EPA.

7.7.3 For each specific medium and target analyte, a variety of methods may be appropriate, depending upon the particular circumstances. The environmental professional should select methods for the analysis of samples giving consideration to the intended end-use of the resulting data, the user's data quality objectives, the statutory, regulatory, or policy framework applicable to the sample in question, and any limitations or allowances associated with the level of effort as understood by the environmental professional and user. The selected analytical method should be appropriate for the sample medium, target analyte, and detection limits. The choice of analytical methods will influence conclusions regarding recognized environmental conditions.

7.8 *Quality Assurance/Quality Control Procedures*:

7.8.1 Appropriate quality assurance/quality control (QA/QC) procedures should be included in the Phase II ESA to allow for assessment of the quality of the data collected. The QA/QC measures may include, for example, written field sampling protocol, decontamination procedures, instrument calibration, the preparation and analysis of trip blanks, equipment blanks, duplicate samples, and holding times for sample analysis. The data quality objectives of the user will influence the decision whether to include QA/QC samples and the selection of particular QA/QC procedures.

7.8.2 Any analytical laboratory used in the course of the Phase II ESA should have an established QA/QC program sufficient to allow assessment of the precision and accuracy of the data it generates. The environmental professional should verify the certification or licensing of the analytical laboratory where applicable, or otherwise evaluate the appropriateness of the QA/QC program of the analytical laboratory prior to engaging its services. Environmental professionals should use laboratories that hold appropriate licenses and certifications for the analyses to be performed.

8. Assessment Activities

8.1 The assessment activities to be conducted under the Phase II ESA may range from field screening methods to intrusive multi-media sampling and laboratory analysis. This section references an overview of recognized intrusive and non-intrusive site assessment methodologies and common field screening activities and analytical protocols. The selection of one or a combination of these methods will be based on the stated objectives of the user and the judgment of the environmental professional. Appropriate QA/QC measures should be implemented according to the work plan.

8.2 *Field Screening and Field Analytical Techniques*:

8.2.1 Field methods may be used for the purpose of characterizing certain physical attributes of a site and for the

assessment of the presence and distribution of a specific chemical or chemical classes at a sampling location. Field screening and field analytical techniques include methods of data gathering which may result in real-time acquisition of data. Field screening and field analytical techniques generally allow rapid, multiple measurements at relatively low cost. Because the accuracy and reliability of data produced by field instruments varies, the selection of particular field instruments and methods is influenced by the data quality objectives of the assessment. The quality of the data generated should be consistent with the intent of the assessment.

8.2.1.1 Some common field screening instruments, such as portable flame and photoionization detectors, have higher detection limits and lower precision and accuracy compared to field or laboratory analytical instruments and are most suited to general qualitative analyses and health and safety monitoring.

8.2.1.2 Field analytical methods include all chemical analysis methods capable of providing chemical-specific quantitative data in the field or non-laboratory setting. More reliable data than obtained through field screening may be obtained in the field or laboratory through the use of portable gas chromatographs or mobile field laboratories. The highest degree of data accuracy can generally be obtained by use of EPA and ASTM analytical methods.

8.2.2 Field screening and field analytical techniques may be used in Phase II ESAs for: qualitative and quantitative confirmation of the presence of contaminants constituting a recognized environmental condition, preliminary mapping of the areal and vertical distribution of contaminants, guiding the collection of samples for more rigorous analysis, and guiding the placement of monitoring wells. The environmental professional should establish standard procedures and protocols prior to the implementation of field screening and field analytical efforts.

8.2.3 Common field methods may assess soil, soil gas, surface water and ground water. Field screening and field analytical methods include use of ion-selective electrodes, detection of volatile compounds using field gas chromatographs, and detection of inorganic constituents and semi-volatile organic chemicals using colorimetric wet chemistry methods, including enzyme immunoassay tests. Section 5.1.5 and Section 12 in Guide D 5730, further address the use of field screening and field analytical methods (see 2.1).

8.3 *Environmental Media Sampling*:

8.3.1 Phase II ESAs generally require environmental sampling and field or laboratory analysis, or both, to determine whether hazardous substances or petroleum products are present on a property. The selection of sampling locations and analytical parameters should be consistent with the work description developed at the onset of the project. Deviations from the description of work to be performed should be noted and justified in the final report. Sampling locations should be documented to allow the sampling event to be reproduced later. The need for surveyed locations is subject to the agreement between the user and the environmental professional.

8.3.2 The Phase II sampling activities should be conducted to avoid the introduction of contaminants into the sample from the sampling equipment, and from environmental factors and to avoid, if feasible, and minimize the spread of contaminants in the environment.

8.3.3 Sampling methods should be selected based on requirements of the local jurisdiction, where applicable. Sampling methods that may be employed during a Phase II site assessment are among the standards identified in Guide D 5730. See 2.1. New technologies are frequently introduced.

8.4 *Sampling Handling*:

8.4.1 Sample handling includes sample collection and containerization, filtration, and preservation. Sample handling procedures should be selected based on requirements of local jurisdictions, where applicable. Sample containerization and preservation techniques are among the standards identified in Guide D 5730. See 2.1. Sample handling methods approved or recommended in the applicable analytical protocol should be used.

8.4.2 A completed chain of custody record should accompany each shipment of samples to the analytical laboratory, and should be included in the written report of the assessment. Chain of custody records provide written documentation regarding sample collection and handling and identify the persons involved in the chain of sample possession. Chain of custody records also provide a written record of requested analytical parameters.

8.4.3 The environmental professional should take appropriate measures to deliver the samples such that the analysis can be completed within the appropriate sample holding times.

9. Evaluation of Data

9.1 The implementation of the work that was planned under Section 7 will generate information and data on environmental conditions at the property that must be evaluated. To complete the Phase II ESA, this information and data must be analyzed to qualify the adequacy of the work performed, and evaluate whether a release or disposal of hazardous substances or petroleum products has occurred.

9.2 *Verification of Assumptions*[8]—The first step in analysis of data is to consider whether the assumptions upon which the work description was based were valid. That is, one asks whether samples were collected of the appropriate media (for example, soil, ground water) at the right location and depth (that is, where the highest concentrations of contaminant should be, if the potential release had actually occurred).

9.2.1 A work description is typically based upon assumptions as to subsurface physical conditions, for example, relative soil or aquifer permeabilities, depth to the water table, ground water flow direction and characteristics of potential contaminants. Actual information on these conditions is usually gained through the explorations, sampling, and observations completed under the work description (at least for those studies where subsurface conditions are of concern). The environmental professional should evaluate whether the assumptions were valid, in light of the actual conditions encountered. If an assumption was not valid, then the work performed may not

[8] In some jurisdictions, the evaluation and analysis of the subsurface conditions may require a licensed individual (for example, registered geologist, professional engineer).

have verified the recognized environmental conditions and additional iterations may be appropriate.

9.2.2 For example, the work description may have called for the installation of a number of observation wells, some of which were intended to be downgradient of areas where releases may have occurred. However, the water levels measured in the wells might have indicated that ground water flowed in a different direction than that inferred for development of the description of work to be performed. Hence the wells were not downgradient of the potential release areas and their purpose was not met. This would indicate that additional site work would have to be done to successfully complete the Phase II ESA. On the other hand, water levels may have confirmed that the wells were downgradient, as intended. They are then qualified as meeting their purpose, and the analysis and interpretation of data relating to them can proceed.

9.3 *Verification of Data*—The second step is to evaluate whether any target analytes detected in the samples are in fact attributable to the site. This requires the environmental professional to determine whether the analytical results should be questioned based on the QA/QC procedures described in 7.8. When data quality is determined to be acceptable, test results should be interpreted.

10. Interpretation of Results

10.1 The results of the Phase II explorations, sampling and testing should be interpreted to determine the significance of the data as they relate to the user's objectives. The data should also be evaluated to determine if other sources of contamination or more highly contaminated media may exist at the site but were not assessed in accordance with this guide. If chemicals that occur in nature are detected, the data must be interpreted to determine whether they are naturally occurring or are present as a result of human activity. For example, lead occurs naturally in soils and waters, at a range of concentrations. Mere detection of lead does not necessarily reflect lead disposal or release. The environmental professional must judge the likelihood that the lead level detected exceeded the naturally occurring lead level in the site vicinity and must evaluate potential sources (for example, fill materials present on the property in an area where use of mine tailings as fill was prevalent) to determine whether disposal or a release has occurred.

10.2 *Elimination of Recognized Environmental Conditions*—If hazardous substances or petroleum products were not detected, and the Phase II ESA information and data has been evaluated and found by the environmental professional to provide sufficient information from which the environmental professional can render a professional opinion that there is no reasonable basis for suspecting the disposal or release of hazardous substances at the site, then no further work is necessary to satisfy the "all appropriate inquiry" element of the innocent purchaser provision of CERCLA with respect to the recognized environmental conditions assessed.

10.2.1 Where fewer than all recognized environmental conditions identified in a Phase I ESA or transaction screen are assessed in the Phase II ESA, the conclusion that no further inquiry is warranted applies only to the recognized environmental conditions assessed. However, this guide should not be construed to require Phase II assessment of all recognized environmental conditions identified in a Phase I ESA or transaction screen. Where the user's objectives may be otherwise satisfied (for example, establishing the innocent purchaser defense is not the user's objective), a recognized environmental condition identified in a Phase I ESA or Transaction Screen may be eliminated from further assessment in the Phase II ESA.

10.2.2 A recognized environmental condition identified in a Phase I ESA or transaction screen may also be eliminated from the full scope of Phase II ESA procedures by developing further information not included in the Phase I or transaction screen. For example, the user may obtain a tank closure report not included in the Phase I report that confirms there were no releases from the tank that was identified as a recognized environmental condition in the Phase I or transaction screen. This new information may eliminate the need for additional Phase II tasks with respect to that recognized environmental condition. Similarly, a recognized environmental condition identified in the Phase I or transaction screen due to off-site conditions (for example, a nearby CERCLIS or LUST site) may be eliminated from a Phase II ESA if the records associated with such sites confirm that hazardous substances or petroleum products have not migrated or are not likely to migrate onto the property.

10.3 *Confirmation of Recognized Environmental Conditions*—If the Phase II ESA was conducted in accordance with this guide and the presence of hazardous substances or petroleum products at the property is confirmed under conditions that indicate disposal or a release, then the innocent purchaser defense may not be supportable with respect to these confirmed substances. See 4.1.1. If hazardous substances or petroleum products were detected, and if requested by the user, the Phase II information and data may be interpreted to determine what further work is required or desirable to assess the nature and extent of the release. This guide should not be construed to require additional assessment.

10.3.1 Additional assessment may be requested by the user if further information is desired. The objectives of the user will determine the scope of additional assessment, if any.

10.3.2 In order to guide the decision whether to conduct an additional assessment and to form the objectives of that assessment, data which confirms the presence of hazardous substances or petroleum products may be compared to applicable or relevant and appropriate requirements ("ARARs") to determine whether such standards are exceeded. The identification and interpretation of ARARs may be assisted by consultation with legal counsel having environmental expertise and other environmental professionals.[9]

10.3.3 This guide does not address the multitude of factors, in addition to environmental data, that may be considered by a user in determining whether additional assessment is warranted where the presence of hazardous substances or petroleum products under conditions that indicate disposal or relea

[9] *ASTM Book Reference No. DS 64* is a compilation of cleanup criteria for contaminated soil and ground water in the fifty states and in selected countries outside the United States. Because such criteria continue to evolve, care should be taken to determine the current status of such criteria.

been confirmed. This guide should not be construed to elevate the consideration of environmental data above economic or other business considerations in business decisions. Such considerations and their impact on transactional decisions are properly within the purview of the parties to the transaction and are beyond the scope of this guide.

11. Phase II ESA Report Preparation

11.1 *Purpose*—The purpose of a written report, when one is prepared, is to describe the work performed and provide documentation of the data and evaluation that *(a)* constitutes the factual findings, *(b)* supports the conclusions of the environmental professional, *(c)* facilitates decisions about the transaction, and *(d)* documents the basis for the decision whether further assessment is warranted. Although generally prepared, a written report is not required of all Phase II ESAs and is subject to the agreement between the user and the environmental professional (see 5.1.2).

11.2 *Characteristics*—A written Phase II ESA report generally has three characteristics: the components of a scientific report, good technical writing, and clear and accurate presentation of the results and conclusions, and, if requested, recommendations to the user. Scientific reports generally contain the following sections: an introduction, a summary of background information, a description of site conditions, a description of work performed and methods used, data presentation and evaluation, and findings and conclusions. The report is typically supported by appropriate tables, figures and appendices. Good technical writing is consistent, accurate, concise, clear and complete. The whole report needs to stand on its own.

11.3 *Format of Report*—An example report format for a written Phase II ESA report is presented in Appendix X1.

11.4 *Content of Report*:

11.4.1 *Introductory Components*—The introductory components of a Phase II ESA usually include a transmittal letter, executive summary, cover page, and table of contents.

11.4.1.1 *Signatures*—The environmental professional(s) responsible for the Phase II ESA should sign the report. Signatures, along with typed names and titles may appear in the transmittal letter, on the cover page, or on a signature page at the end of the main text of the report. Where required by the local jurisdiction, professional seals, license type and license number, as applicable, should be affixed.

11.4.1.2 *Transmittal Letter*—A transmittal letter documents the date of a report's delivery and identifies the intended recipients of the report. It also may contain other important information including a description of the report as draft or final and a designation that the report is confidential or subject to attorney-client privilege, or both. The transmittal letter also may identify the staff responsible for the work.

11.4.1.3 *Cover Page*—The cover or title page identifies the following items: the subject property name and address, the preparer of the report, the person for whom the report was prepared and the date of the report. It may also include a statement of confidentiality. If appropriate, it also may include a statement identifying the document as subject to certain legal privileges, such as attorney-work product and attorney/client privileges.

11.4.1.4 *Table of Contents*—The table of contents refers the reader to the location of the major sections of the report and to the figures, tables and appendices. All section, figure, table and appendix titles should match those of the text. See Appendix X1 for a sample table of contents.

11.4.1.5 *Executive Summary*—An executive summary provides a concise overview of the findings of the ESA and is considered optional. As a summary, it should generally be brief and should not discuss material not included in the text of the report.

11.5 *Main Text*—The main text of the report generally contains an introduction, a discussion of background information, a description of work performed during the Phase II ESA and methods used, data presentation and evaluation, and a discussion of findings and conclusions.

11.5.1 *Introduction*—The introduction should generally include: the purpose and scope of the Phase II ESA; any special terms, conditions, or limitations; the date of authorization of the project and any changes. The introduction also should identify items not included within the scope of the Phase II ESA that might have been expected to be included, for example, recognized environmental conditions not included and the reasons for eliminating them.

11.5.1.1 The introduction also references the guiding standards including contracts/service agreements, regulatory requirements, and the description of work to be performed. The introduction generally identifies the specific tasks comprising the work performed in the order in which they will be described later.

11.5.2 *Background Information*—This section should include a description of the site and its features, a description of the physical site setting, a brief discussion of the site's history and use and the use of adjacent properties, and a summary of previous environmental site assessments. Reference to existing ESA reports may convey this information.

11.5.2.1 This section should identify the data and conclusions that led to the performance of the Phase II ESA. If the Phase II ESA is based on earlier environmental site assessments, the earlier ESAs should be precisely identified (for example, by reference to report title, project number, author and date of any report). Where appropriate, prior ESAs may be included in an appendix. If recommendations for further work were included in a referenced prior ESA but were not followed in the Phase II ESA, an explanation in this section is appropriate.

11.5.3 *Phase II ESA Activities*—This section should summarize the work conducted. This section should describe what was done, identify the methods that were used, identify the location of the Phase II ESA activities and pertinent site conditions. This section also should explain the rationale for the work performed, including the review of supplemental records and the selection of sampling locations, analytical parameters and methodologies. Deviations from the work description and deviations from standard methodologies also should be explained.

11.5.3.1 Methods used should be identified by reference to a specific published standard or method such as ASTM, state protocols, or EPA methodologies. Other methods used (for

example, standard operating procedures for a particular company) should be described in detail. Where appropriate, the details of methods and procedures used can be included in an appendix.

11.5.4 *Evaluation and Presentation of Results*—Results of the Phase II ESA should be presented in a logical order and should be summarized to allow the reader to more readily follow the discussion of findings and conclusions which appears in the next section of the report. Results may be presented in text, in tables, and/or in figures. Reference to the location of data in the appendices is appropriate. Results should be presented consistently and accurately.

11.5.4.1 *Evaluation*—Evaluation of data involves verifying assumptions underlying the scope of work as they relate to meeting objectives and determining whether chemical constituents detected in samples were attributable to site conditions or to QA/QC failures. See Section 9 for a detailed discussion of data evaluation.

11.5.4.2 *Presentation*—The presentation of results should be organized to assist the reader's understanding of the interpretation of the chemical analysis data that follows in the next section of the report. Organizational divisions may be by media (for example, soil data presented separately from ground water data), contaminant type (for example, organic vs. inorganic contaminants), source (for example, contamination from leaking underground storage tank versus contamination from drum storage area), or other factors.

11.5.4.3 The specific information presented will depend on the activities performed. Although Phase II ESAs can involve the full range of environmental media, they most typically involve sampling and chemical analysis or screening of soil, vapors and/or ground water.

11.5.5 For purposes of illustration, the following information should generally be presented for the referenced activities:

11.5.5.1 *Soil Sampling*—The locations of sampling points in relation to potential sources; the depths of sampling; the depth to pertinent horizons, such as the water table and the fill/natural soil contact; the sampling and analytical methods used; and the results of chemical analyses.

11.5.5.2 *Soil Gas Sampling*—The locations of sampling points in relation to potential sources; the depths of sampling; the depth to pertinent horizons, such as the water table and the fill/natural soil contact; the sampling and analytical methods used; and the results of chemical analyses.

11.5.5.3 *Ground Water Sampling*—The locations of sampling points in relation to potential sources; water level data (for example, depth to water or water table elevation, screened interval elevation, filtered interval elevation); the sampling and analytical methods used; and the results of chemical analyses.

11.5.6 *Discussion of Findings and Conclusions*—Where a written report of a Phase II ESA is prepared, it should have a findings and conclusions section that includes:

11.5.6.1 A statement that the Phase II ESA was conducted in substantive accordance with the guidance contained in this guide and in accordance with the description of work to be performed, and a description of any deviations from the assessment activities that were planned;

11.5.6.2 A summary description of: the nature of the recognized environmental conditions identified in previous work, the assessments performed to evaluate the identified recognized environmental conditions, the data generated from the assessments, the geologic and hydrogeologic conditions encountered, and any limitations of the data produced and their impact on conclusions;

11.5.6.3 The environmental professional's interpretation of the significance of the data as they relate to the user's objectives. Appropriate citations and references to standards, guidelines and sources for background concentrations should be included. See Section 10 for a detailed discussion of interpretation of results;

11.5.6.4 A statement whether, in the judgment of the environmental professional, the data provides sufficient information to support a professional opinion that there is no reasonable basis for suspecting the disposal or release of hazardous substances or petroleum products at the site with respect to the recognized environmental conditions assessed, and that no further assessment is necessary; or that with respect to the recognized environmental conditions assessed, hazardous substances or petroleum products have been released or disposed at the property; and

11.5.6.5 Where applicable, a specific explanation of data insufficiencies that prevent a conclusion that hazardous substances or petroleum products were or were not released or disposed at the property.

11.5.7 *Recommendations*—Recommendations for further work may be included at the option of the user.

11.5.8 *Concluding Components*—The report should contain tables, figures and appendices as necessary or appropriate to explain and support the main text of the report.

11.5.8.1 *Tables and Figures*—Tables and figures may be used as a summary presentation of data. Guidelines for data presentation in 11.5.4 apply to tables and figures as well as to text.

11.5.8.2 Figures that show potential sources of contamination, sampling points, locations of other activities and surface and subsurface structures can significantly aid the understanding of the reader. Figures should be dated and should include a north arrow, a scale as appropriate to the level of accuracy of the drawing (or notation that the figure is not to scale), a legend, a title, and other appropriate identification. If figures are based on the work of others, the source and its date should be referenced.

11.5.8.3 *Appendices*—The following is a non-exhaustive list of materials that may be appropriate for inclusion in appendices to a Phase II ESA report: photographs, subsurface exploration logs, laboratory reports, with quality control information, chain of custody forms, identification of specific methods, and reports of previous environmental site assessments.

11.6 *Additional Services*—Any additional services including a broader scope of assessment, more detailed conclusions liability/risk evaluations, recommendations for additional Phase II assessment, remediation techniques, etc., are beyond the scope of this guide, and should only be included in the report if so agreed by the user and the environmental professional.

12. Non-Scope Considerations

12.1 *General*:

12.1.1 *Additional Issues*—There may be environmental issues or conditions at a property that parties may wish to assess in connection with commercial property transactions that are outside the scope of this guide (the non-scope considerations). As noted by the legal analysis in Appendix X1 of Practices E 1527 and E 1528, some substances may be present on property in quantities and under conditions that may lead to contamination of the property or of nearby properties but are not included in CERCLA's definition of hazardous substances (42 U.S.C. § 9601(14)) or do not otherwise present potential CERCLA liability. In any case, they are beyond the scope of this guide.

12.1.2 *Outside Standard Guide*—Whether or not a user elects to inquire into non-scope considerations in connection with an ESA implemented in accordance with this guide or any other ESA, no assessment of such non-scope considerations is required for appropriate inquiry as described by this guide.

12.1.3 *Other Standards*—There may be standards or protocols for assessment of potential hazards and conditions associated with non-scope conditions developed by governmental entities, professional organizations, or other private entities, including ASTM.

12.1.4 *List of Additional Issues*—Several considerations that may be important in property transactions but that are outside the scope of this guide include asbestos-containing materials, radon, lead-based paint, lead in drinking water, and wetlands. No implication is intended as to the relative importance of such considerations, nor is this list intended to be all-inclusive.

APPENDIX

(Nonmandatory Information)

X1. EXAMPLE TABLE OF CONTENTS AND REPORT FORMAT

Where a written report is desired by the user, a Phase II ESA report that includes the sections described below, is suggested:

Transmittal Letter
Cover Page
Table of Contents

X1.1 Executive Summary

X1.2 Introduction
- X1.2.1 Purpose
- X1.2.2 Special Terms and Conditions
- X1.2.3 Limitations and Exceptions of Assessment
- X1.2.4 Limiting Conditions and Methodology Used

X1.3 Background (may be by reference to prior environmental reports):
- X1.3.1 Site Description and Features
- X1.3.2 Physical Setting
- X1.3.3 Site History and Land Use
- X1.3.4 Adjacent Property Land Use
- X1.3.5 Summary of Previous Assessments

X1.4 Phase II Activities
- X1.4.1 Scope of Assessment:
  - X1.4.1.1 Supplemental Record Review
  - X1.4.1.2 Conceptual Site Model and Sampling Plan
  - X1.4.1.3 Chemical Testing Plan
  - X1.4.1.4 Deviations from the Work Plan
- X1.4.2 Field Explorations and Methods
  - X1.4.2.1 Test Pits
  - X1.4.2.2 Test Borings
  - X1.4.2.3 Monitoring Well Installations
    - 1) Ground water elevation measurement
    - 2) Ground water flow direction
  - X1.4.2.4 Other
- X1.4.3 Sampling and Chemical Analyses and Methods
  - X1.4.3.1 Soil
  - X1.4.3.2 Ground water
  - X1.4.3.3 Other

X1.5 Evaluation and Presentation of Results
- X1.5.1 Subsurface Conditions
  - X1.5.1.1 Geologic Setting

X1.5.1.2 Hydrogeologic Conditions
X1.5.1.3 Verification of Conceptual Site Model
X1.5.2 Analytical Data
X1.5.2.1 Soil
X1.5.2.2 Ground water
X1.5.2.3 Other

X1.6 Discussion of Findings and Conclusions
X1.6.1 Recognized Environmental Conditions
X1.6.2 Affected Media
X1.6.3 Evaluation of Media Quality
X1.6.4 Other Concerns (for example, adequacy of assessment)

X1.7 Recommendations (if desired by user)

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 100 Barr Harbor Drive, West Conshohocken, PA 19428.

Appendix D
ASTM Standard D4700-91:
Guide for Soil Sampling from the Vadose Zone

Designation: D 4700 – 91

Standard Guide for Soil Sampling from the Vadose Zone[1]

This standard is issued under the fixed designation D 4700; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide addresses procedures that may be used for obtaining soil samples from the vadose zone (unsaturated zone). Samples can be collected for a variety of reasons including the following:

1.1.1 Stratigraphic description,
1.1.2 Hydraulic conductivity testing,
1.1.3 Moisture content measurement,
1.1.4 Moisture release curve construction,
1.1.5 Geotechnical testing,
1.1.6 Soil gas analyses,
1.1.7 Microorganism extraction, or
1.1.8 Pore liquid and soils chemical analyses.

1.2 This guide focuses on methods that provide soil samples for chemical analyses of the soil or contained liquids or contaminants. However, comments on how methods may be modified for other objectives are included.

1.3 This guide does not describe sampling methods for lithified deposits and rocks (for example, sandstone, shale, tuff, granite).

1.4 In general, it is prudent to perform all field work with at least two people present. This increases safety and facilitates efficient data collection.

1.5 The values stated in inch-pound units are to be regarded as the standard. The SI units given in parentheses are for information only.

1.6 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 *ASTM Standards:*

D 420 Practice for Investigating and Sampling Soil and Rock for Engineering Purposes[2]

D 1587 Method for Thin-Walled Tube Sampling of Soils[2]
D 2488 Practice for Description and Identification of Soils (Visual-Manual Procedure)[2]
D 2607 Classification of Peats, Mosses, Humus, and Related Products[2]
D 3550 Method for Ring-Lined Barrel Sampling of Soils[2]
D 4083 Practice for Description of Frozen Soils (Visual-Manual Procedure)[2]
D 4220 Practice for Preserving and Transporting Soil Samples[2]

3. Terminology

3.1 *Definitions:*

3.1.1 Except where noted, all terms and symbols in this guide are in accordance with the following publications. In order of consideration they are:

3.1.1.1 Terminology D 653.

3.1.1.2 *Compilation of ASTM Standard Terminology*,[3] and

3.1.1.3 *Webster's New Collegiate Dictionary*.[4]

3.1.2 For definitions and classifications of soil related terms used, refer to Practice D 2488 and Terminology D 653. Additional terms that require clarification are defined in 3.2.

3.2 *Descriptions of Terms Specific to This Standard:*

3.2.1 *cascading water*—perched ground water that enters a well casing via cracks or uncovered perforations, trickling, or pouring down the inside of the casing.

3.2.2 *sludge*—a water charged sedimentary deposit.

3.2.2.1 *Discussion*—The water-formed sedimentary deposit may include all suspended solids carried by the water and trace elements that were in solution in the water. Sludge usually does not cohere sufficiently to retain its physical shape when mechanical means are used to remove it from the surface on which it deposits, but it may be baked in place and be adherent.

4. Summary of Guide

4.1 Sampling vadose zone soil involves inserting into the ground a device that retains and recovers a sample. Devices and systems for vadose zone sampling are divided into two general groups, namely the following: samplers used in conjunction with hand operated devices; and samplers used

---

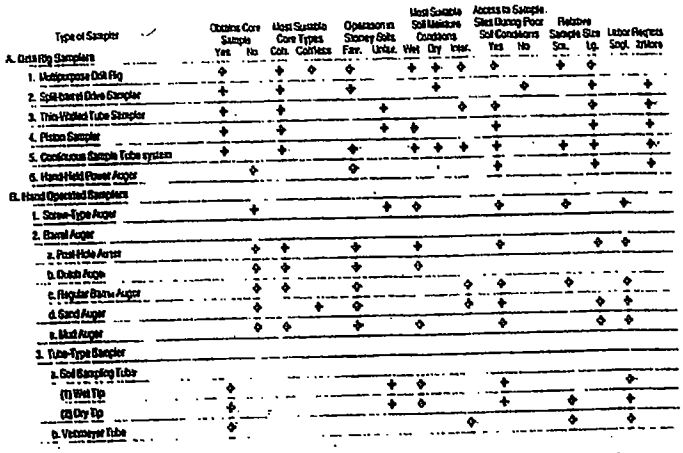

FIG. 1 Criteria for Selecting Soil Sampling Equipment

in conjunction with multipurpose or auger drill rigs. This guide discusses these groups and their associated practices.

4.2 The discussion of each device is organized into three sections, describing the device, describing sampling methods, and limitations and advantages of its use.

4.3 This guide identifies and describes a number of sampling methods and samplers. It is advisable to consult available site-specific geological and hydrological data to assist in determining the sampling method and sampler best suited for a specific project. It is also advisable to contact a local firm providing the services required as not all sampling and drilling methods described in this guide are available nationwide.

5. Significance and Use

5.1 Chemical analyses of liquids, solids, and gases from the vadose zone can provide information on the presence, possible source, migration route, and physical-chemical behavior of contaminants. Remedial or mitigating measures can be formulated based on this information. This guide describes devices and procedures that can be used to obtain vadose zone soil samples.

5.2 Soil sampling is useful for the reasons presented in Section 1. However, it should be recognized that the general method is destructive, and that resampling at an exact location is not possible. Therefore, if a long term monitoring program is being designed, other methods for obtaining samples should be considered.

6. Criteria for Selecting Soil Samplers

6.1 Important criteria to consider when selecting devices for vadose zone soil sampling include the following:

6.1.1 Type of sample: An encased core sample, an uncased core sample, a depth-specific representative sample, or a sample according to requirements of the analyses,

6.1.2 Sample size requirements,

6.1.3 Suitability for sampling various soil types,

6.1.4 Maximum sampling depth,

6.1.5 Suitability for sampling soils under various moisture conditions,

6.1.6 Ability to minimize cross contamination,

6.1.7 Accessibility to the sampling site, and

6.1.8 Personnel requirements.

6.2 The sampling devices described in this guide have been evaluated for these criteria. The results are summarized in Fig. 1.

7. Sampling with Hand Operated Devices

7.1 These devices, that have mostly been developed for agricultural purposes, include:

7.1.1 Screw-type augers,

7.1.2 Barrel augers,

7.1.3 Tube-type samplers,

7.1.4 Hand held power augers, and

7.1.5 Trench sampling with shovels in conjunction with machine excavations.

7.2 The advantages of using hand operated devices over drill rigs are the ease of equipment transport to locations with poor vehicle access, and the lower costs of setup and decontamination. However, a major disadvantage is that these devices are limited to shallower depths than drill rigs.

7.3 *Screw-Type Augers:*

7.3.1 *Description*—The screw or ship auger is essentially a small diameter (for example, 1.5 in. (3.81 cm)) wood auger from which the cutting side flanges and tip have been removed (1)[5] (see Fig. 2(*a*)). According to the Soil Survey Staff (1), the spiral part of the auger should be about 7 in. (18 cm) long, with the distances between flights about the same as the diameter (for example, 1.5 in.) of the auger. This facilitates measuring the depth of penetration of the tool. Variations on this design include the closed spiral auger and the Jamaica open spiral auger (2) (see Fig. 2(*b*) and 1(*c*)). The

[5] The boldface numbers in parentheses refer to the list of references at the end of the text.

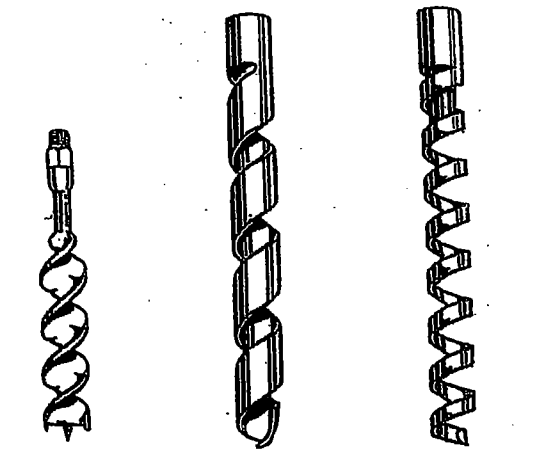

FIG. 2 Screw Type Augers

auger is welded onto a length of solid or tubular rod. The upper end of this rod is threaded, to accept a handle or extension rods. As many extensions are used as are required to reach the target sampling depth. The rod and the extensions are marked in even increments (for example, in 6-in. (15.24-cm) increments) above the base of the auger to aid in determining drilling depth. A wooden or metal handle fits into a tee-type coupling, screwed into the uppermost extension rod.

7.3.2 *Sampling Method*—For drilling, the auger is rotated manually. The operator may have to apply downward pressure to start and embed the auger; afterwards, the auger screws itself into the soil. The auger is advanced to its full length, and then pulled up and removed. Soil from the deepest interval penetrated by the auger is retained on the auger flights. A sample can be collected from the flights using a spatula. A foot pump operated hydraulic system has been developed to advance augers up to 4.5 in. (11.43 cm) in diameter. This larger diameter allows insertion of other sampling devices into the drill hole, once the auger is removed, if desired (3).[6]

7.3.3 *Comments*—Samples obtained with screw-type samplers are disturbed and are not truly core samples. Therefore, the samples are not suitable for tests requiring undisturbed samples, such as hydraulic conductivity tests. In addition, soil structures are disrupted and small scale lithologic features cannot be examined. Nevertheless, screw-type samplers are still suitable for use in collecting samples for the purpose of detecting contaminants. However, it is difficult to avoid transporting shallow soils downward when reentering a drill hole. When representative samples are desired from a discrete interval, the borehole must be made large enough to insert a sampler and extend it to the bottom of the borehole without touching the sides of the borehole. It is suggested that a larger diameter auger be used to advance and clear the borehole, then a smaller diameter auger sampler be used to obtain the sample. Screw-type augers work better in wet, cohesive soils than in dry, loose soils. Sampling in very dry (for example, powdery) soils may not be possible with these augers as soils will not be retained on the auger flights. Also, if the soil contains gravel or rock fragments larger than about one tenth of the hole diameter, drilling may not be possible (4).

7.4 *Barrel Augers:*

7.4.1 *Description*—The barrel auger consists of a bit with cutting edges welded to a short tube or barrel within which the soil sample is retained, welded in turn to shanks. The shanks are welded to a threaded rod at the other end. Extension rods are attached as required to reach the target sampling depth. Extensions are marked in increments above the base of the tool. The uppermost extension rod contains a tee-type coupling for a handle. The auger is available in carbon steel and stainless steel with hardened steel cutting edges (5, 6).

7.4.2 *Sampling Method*—The auger is rotated to advance the barrel into the ground. The operator may have to apply downward pressure to keep the auger advancing. When the barrel is filled, the unit is withdrawn from the soil cavity and a sample may be collected from the barrel.

[6] This reference is manufacturer's literature, and it has not been subjected to technical review.

7.4.3 *Comments*—Barrel augers generally provide larger samples than screw-type augers. The augers can penetrate shallow clays, silts, and fine grained sands (7).[6] The augers do not work well in gravelly soils, caliche, or semi-lithified deposits. Samples obtained with barrel augers are disturbed and are not core samples. Therefore, the samples are not suitable for tests requiring undisturbed samples, such as hydraulic conductivity tests. Nevertheless, the samplers are still suitable for use in collecting samples for the purpose of detecting contaminants. Because the sample is retained inside the barrel, there is less of a chance of mixing it with soil from a shallower interval during insertion or withdrawal of the sampler. The following are five common barrel augers:

7.4.3.1 Post-hole augers (also called Iwan-type augers),

7.4.3.2 Dutch-type augers,

7.4.3.3 Regular or general purpose barrel augers,

7.4.3.4 Sand augers, and

7.4.3.5 Mud augers.

7.4.4 *Post-Hole Augers*—The most readily available barrel auger is the post-hole auger (also called the Iwan-type auger) (8). As shown in Fig. 3, the barrel consists of two-part cylindrical leaves rather than a complete cylinder and is slightly tapered toward the cutting bit. The taper and the cupped bit help to retain soils within the barrel. The barrel is available with a 3 to 12-in. (7.62 to 30.48-cm) diameter. There are two types of drilling systems, one has a single rod and handle, and the other has two handles. In stable, cohesive soils, the auger can be advanced up to 25 ft (7.62 m) (8).

7.4.5 *Dutch-Type Augers*—The Dutch-type auger (commercially developed by Eijkelkamp) is a smaller variation of the post-hole auger design. As shown in Fig. 4, the pointed bit is continuous with two, narrow part-cylindrical barrel segments, welded onto the shanks. The barrel generally has a 3 in. (7.62 cm) outside diameter. This tool is best suited for sampling wet, clayey soils.

7.4.6 *Regular or General Purpose Barrel Augers*—A version of the barrel auger commonly used by soil scientists and county agricultural agents is depicted in Fig. 5(*a*) and (*b*). As shown, the barrel is a complete cylinder. As with the post-hole auger, the cutting blades are cupped so that soil is loosened and forced into the barrel as the unit is rotated and pushed into the ground. Each filling of the barrel corresponds to a depth of penetration of 3 to 5 in. (7.62 to 12.70 cm) (1). The most popular barrel diameter is 3.5 in. (8.89 cm), but sizes ranging from 1.5 to 7 in. (3.81 to 17.78 cm) are available (6).[6] Plastic, stainless steel, PTFE (polytetrafluoroethylene) or aluminum liners can also be used (6).[6] Extension rods are available in 4 ft (1.22 m) lengths. The rods can be made from standard black pipe, from lightweight conduit or from seamless steel tubing. The extensions have evenly spaced marks to facilitate determining sample depth. The regular barrel auger is suitable for use in loam type soils.

7.4.7 *Sand Augers*—For dry, sandy soils it may be necessary to use a variation of the regular barrel auger that includes a specially-formed bit to retain the sample in the barrel (see Fig. 5(*c*)). Sand augers with 2, 3, or 4-in. (5.08, 7.62, or 10.16-cm) diameters are available (5).[6]

7.4.8 *Mud Augers*—Another variation on the regular barrel auger design is available for sampling wet, clayey soils. As shown in Fig. 5(*d*), the barrel is designed with open sides to facilitate extraction of samples. The bits are the same as those used on the regular barrel auger (6).[6] Mud augers with 2, 3, or 4-in. (5.08, 7.62, or 10.16-cm) diameters are available (5).[6]

7.5 *Tube-Type Samplers:*

7.5.1 Tube-type samplers generally have proportionally smaller diameters and greater body lengths than those of barrel augers.

7.5.2 For sampling, these units are perched into the soil causing the tube to fill with material from the interval penetrated. The assembly is then pulled to the surface and a sample can be collected from the tube. Since the device is not

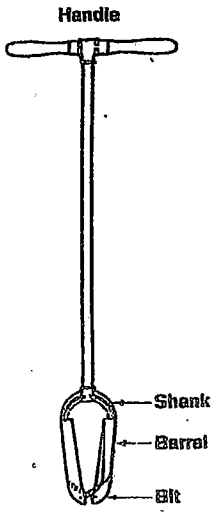

FIG. 3 Post-Hole Type Barrel Auger

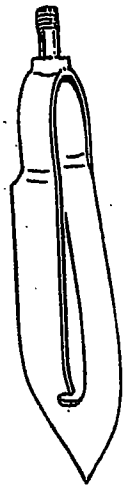

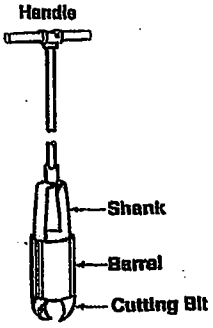

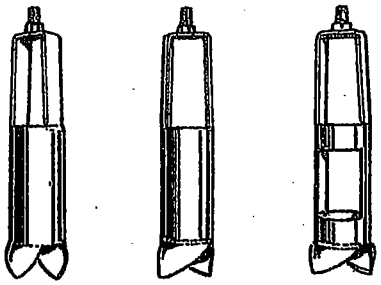

FIG. 4 Dutch Type Auger

(a) Regular Barrel Auger

(b) Regular Barrel Auger (c) Sand Auger (d) Mud Auger

FIG. 5 Barrel Auger Variations and Soil Moisture

rotated, a nearly undisturbed sample can be obtained. Commercial units are available with foot lever attachments, a hydraulic apparatus, or drop-hammers to aid in driving the sampler into the ground (5)[6]. Vibratory heads have also been developed to advance tube-type samplers (9).[6]

7.5.3 These units are not as suitable for sampling in compacted, gravelly soils as are the barrel augers. They are preferred if an undisturbed sample is required. Commonly used varieties of the tube type samplers include:

7.5.3.1 Soil sampling tubes (also called Lord samplers),

7.5.3.2 Veihmeyer tubes (also called King tubes),

7.5.3.3 Thin-walled tube samplers (also called Shelby tubes),

7.5.3.4 Ring-lined barrel samplers, and

7.5.3.5 Piston samplers.

7.5.4 *Soil Sampling Tubes:*

7.5.4.1 *Description*—As depicted in Fig. 6, the soil sampling tube consists of a hardened cutting tip, a cut-away barrel, and an uppermost threaded segment. The cut-away barrel allows textural examination and easy removal of soil samples. Generally, the tube is constructed from high strength alloy steel (10).[6] The samplers are available with 6, 12, 15, 18, and 24-in. (15.24, 30.48, 38.10, 45.72, 60.96-cm) lengths (5, 6). The tubes are available with 1.13 or 0.88-in. (2.87 or 2.22-cm) outside diameter. Two modified versions of the tip are available, for sampling in wet or dry soils. The

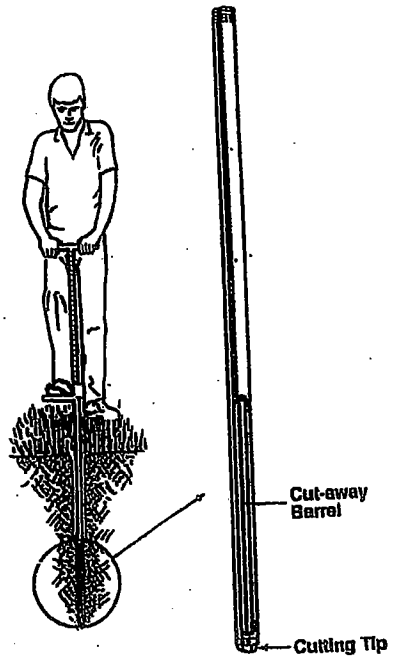

FIG. 6 Soil Sampling Tube

sampling tube is attached to extension rods to attain the target sampling depth. A cross-handle is attached to the uppermost rod. Extension rods are made of lightweight, durable metal. They are available in a variety of lengths depending on the manufacturer. Markings on the extensions and the sampler facilitate determining sample depths.

7.5.4.2 *Sampling Method*—The sampler is pushed into the ground by leaning on the unit's handle. Once the sampler has reached the bottom of the sampling interval, it is twisted to break soil continuity at the tip. Depending on the type of cutting edge, the tube sampler may obtain samples varying in diameter from 0.69 to 0.75 in. (1.75 to 1.91 cm).

7.5.4.3 *Comments*—The soil sampling tube works best in soft, clayey, cohesive soils. If the soil contains cobbles or rock fragments larger than about one-half the cutting tip diameter, satisfactory sampling may not be possible. If the soil is cohesionless, it will not be retained in the tube. With time, the cutting tip will be damaged and worn dull. Most units are designed so that this part can be replaced.

7.5.5 *Veihmeyer Tubes:*

7.5.5.1 *Description*—The Veihmeyer tube is a long, complete cylinder. As shown in Fig. 6, this unit consists of a bevelled tip, that is threaded into the lower end of the tube, and a drive head threaded onto the upper end of the tube. The sampler is constructed of hardened steel. The tube is generally marked in even increments (for example, 1 ft or 0.30 m). These samplers are available in 4 to 16-ft (1.22 to 4.88-m) lengths with a 0.75-in. (1.91-cm) inside diameter.

7.5.5.2 *Sampling Method*—The lower guide rod of the drop hammer is slipped into the upper tube, through the drive head (see Fig. 7). The hammer is used to pound the sampler into the ground. The sampler is then retrieved by pulling or jerking up on the hammer to force the sampler out of the soil cavity. Samples are extruded by forcing a rod through the tube.

7.5.5.3 *Comments*—Prior to sampling, the inside of the tube is sometimes coated with a lubricant to facilitate extrusion. However, the types of analyses to be performed on the samples should be considered to determine if the presence of lubricant will cause interference. Because the Veihmeyer sampler is a solid-walled tube and is fitted with a drop hammer, it can generally be used in more resistant soils than the soil sampling tube.

7.5.6 *Thin-Walled Tube Samplers:*

7.5.6.1 *Description*—Thin-walled tube (Shelby Tube) samplers are readily available with 2, 3, and 5-in. (5.08, 7.62, and 12.70-cm) outside diameters and are commonly 30 in. (76.20 cm) long. The 3 by 30-in. (7.62 by 76.20-cm) outside diameter long sampler is most common. The advancing end of the sampler is rolled inwardly and has a cutting edge with a smaller diameter than the tube inside diameter. The cutting edge inside diameter reduction, defined as a "clearance ratio," is usually in the range of 0.0050 to 0.0150 or 0.50 to 1.50 % (Refer to Practice D 1587). The sampler tube is usually connected with set screws to a sampler head that in turn is threaded to connect with extension rods. Plastic and PTFE sealing caps for use after sampling are readily available for the 2, 3, and 5-in. (5.08, 7.62, and 12.70-cm) diameter tubes (refer to Practice D 4220). Shelby tubes are common available in carbon steel but can be manufactured from other metal (see Fig. 8).

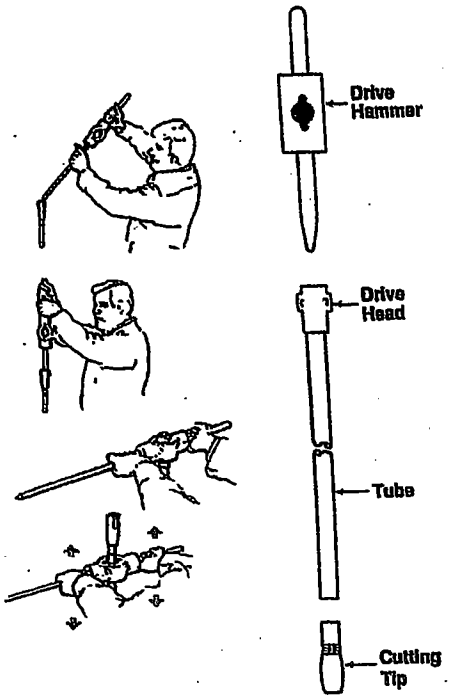

FIG. 7 Veihmeyer Tube

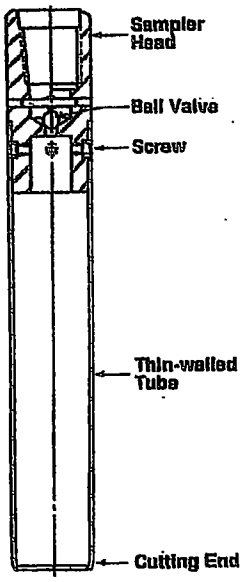

FIG. 8 Thin-Walled Tube Sampler

7.5.6.2 *Sampling Method*—The Shelby tube is pushed into soil by hand, with a jack-like system or with a hydraulic piston. The sample recovered is often less than the distance pushed, that is, the recovery ratio is less than 1.0. The recovery ratio is less than 1.0 because of soil compaction during sampling, and because friction between soil and the inner tube walls becomes greater than the shear strength of the soil in front of the tube. Consequently, soil in front of the advancing end of the tube is displaced laterally rather than entering the tube (11). In general, shorter tubes provide less-disturbed samples than longer tubes. Samples are extruded from the Shelby tube with a hydraulic ram. As with all sampling devices, the most disturbed portion of the sample in contact with the tube is considered unrepresentative. Wilson et al. (12) developed a paring device to remove this outer layer of the core during extrusion.

7.5.6.3 *Comments*—Shelby tubes are best used in clays, silts, and fine-grained sands. If the soils are cohesionless, they may not be retained in the tube. If firm to very hard soils are encountered, driving (hammering) the sampler may be required. However, this should be avoided as the tube may buckle under the drive stress.

7.5.7 *Ring-Lined Barrel Samplers:*

7.5.7.1 *Description*—As described in Practice D 3550, the ring-lined barrel sampler consists of a one piece barrel or two split barrel halves, a drive shoe, rings, and a sampler head (see Fig. 9). The rings, that are usually brass, fit snugly inside the barrel and are designed to be directly inserted into geotechnical testing apparatuses when removed from the barrel. Most samplers are designed to hold at least two rings. The barrel is commonly 3.5 in. (8.89 cm) inside diameter and 3.94 to 5.91 in. (10 to 15 cm) long (5).[6] With these lengths, the barrel can be fitted with a variety of liners ranging in length from 1 to 2.36 in. (2.54 to 6 cm).

7.5.7.2 *Sampling Method*—The ring-lined barrel sampler can be driven or pushed into soil. Once retrieved, the sampler is disassembled, and the sample-filled rings are removed. The rings are usually removed as one unit and placed into a capped container. Alternately, the individual soil-filled rings can be capped with plastic or PTFE and then sealed with wax or adhesive tape (refer to Practice D 4220).

7.5.7.3 *Comments*—Because barrel samplers are more rigid than thin-walled tubes, they can be driven into hard soils and soils containing sands and gravels that might damage thin-walled tubes. The sampler provides samples in rings which can be handled without further disturbance of the soil. Because of this, these devices are most often used when geotechnical or chemical analyses are to be performed.

7.5.8 *Piston Samplers:*

7.5.8.1 *Description*—Locally saturated (for example, by perched ground water), or cohesionless soils, and very soft soils or sludges may not be retained in most samplers, even when fitted with retainer baskets or flap valves. Piston samplers can be used in these situations. The sampler consists of a sampling tube, extension pipe attached to the tube, an internal piston, and rods connected to the piston and running through the extension pipe (see Fig. 10). These samplers are often built, as needed, out of common PVC (for use in sludge) or steel pipe fittings. The sampling tube commonly has a 0.75 to 3-in. (1.91 to 7.62-cm) inside diameter and is 8 in. to 9 ft (20.32 cm to 2.74 m) long (13). A variation designed for sampling peat has a cone shaped piston (8).

7.5.8.2 *Sampling Method*—The sampler can be pushed into the ground with the handle or driven into the ground with a drop hammer (13). As the tube is advanced, the piston is held stationary or pulled upward with the attached rods. Once the tube has been advanced through the sampling interval, it is rotated to break suction that might have developed between the soil and the outside wall of the tube. The sampler is then pulled to the surface keeping the piston rod fixed with respect to the extension pipe. The sample is retained because of suction that develops between the piston and the sample. Upon retrieval, the sample is extruded by

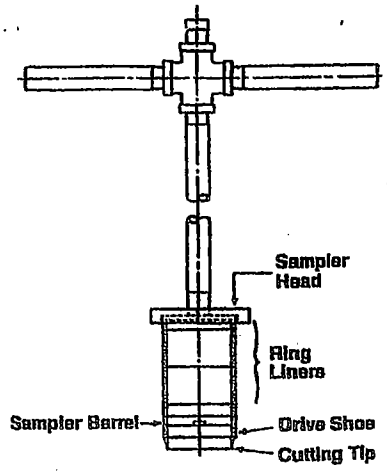

FIG. 9 Hand Operated Ring-Lined Barrel Sampler

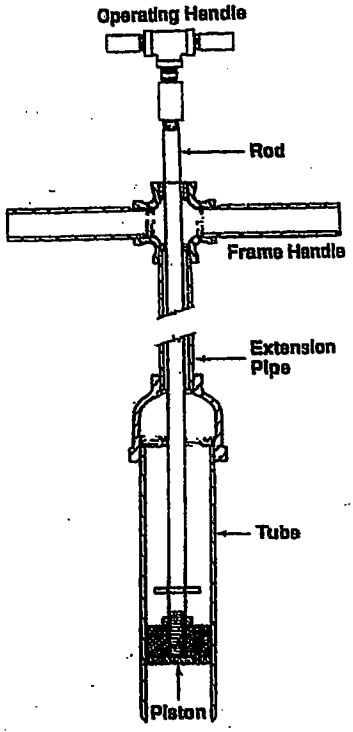

FIG. 10 Hand Operated Piston Sampler

using the piston to force the sample out of the tube. Sharma and De Dalta (14) described a cylindrical sampler for use in puddled soils that would flow back out of most samplers. The design includes a basal shutter that retains the sample while the sampler is withdrawn from the soil.

7.5.8.3 *Comments*—Because the sampler depends on development of suction between the sample and the piston, it may not work in unsaturated, coarse-grained sands and gravels. This is due to the high air permeability of such material that prevents the creation of high suction.

7.6 *Hand Held Power Augers:*

7.6.1 *Description*—A very simple, commercially available auger consists of a solid flight auger attached to and driven by a small air-cooled engine (see Fig. 11). Two handles on the head assembly allow two operators to guide the auger into the soil. Throttle and clutch controls are integrated into grips on the handles. Augers are available with diameters ranging from 2 to 16 in. (5.08 to 40.64 cm). The auger sections are commonly 3 ft (0.91 m) long.

7.6.2 *Sampling Method*—As the auger rotates into soil, cuttings advance up the flights and are discharged at the surface. Soil samples can be collected from the surface discharge, or from the auger flights after pulling the auger out of the ground. Alternatively, samples can be collected with other samplers (for example, a thin-walled tube) after auger removal.

7.6.3 *Comments*—As discussed in 7.3, if samples are collected from surface discharge or from the flights, they are disturbed and are not suitable for some uses. In addition, if samples are collected from surface discharge, it is difficult to

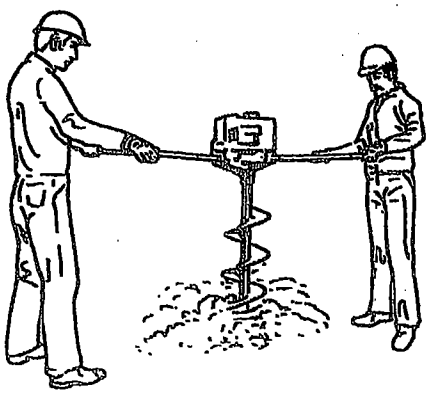

FIG. 11 Hand Held Power Auger

determine the depth from which the soil came and uncontrolled mixing of soil from different depth intervals can occur. The auger operates well in most soils. However, if the soil is cohesionless, it may not be retained on the flights and sampling in that fashion may not be possible. If the soil contains cobbles or boulders, drilling may not be possible. If the auger "hangs up" on an obstruction, the machine will start to rotate at the surface. Otherwise, the operator should not attempt to stop rotation of the machine by grabbing the handles. An alternate design that transfers the torque to a separate engine prevents this problem (15).[6] As previously stated, it is prudent to perform the field work with at least two people present.

7.7 *Trench Sampling:*

7.7.1 *Description*—Soils may be sampled from a trench or pit excavated for that purpose. Excavation is usually performed by a backhoe, and samples are collected with knives, trowels, or shovels. Occasionally, samples are collected from the sides or the bottom of the trench or pit with hand augers or tube-type samplers.

7.7.2 *Sampling Method*—Excavation is performed under the guidance of the sampling technician. Sampling is performed only after the backhoe has moved away from the trench or pit. When the trench or pit is in unstable material or is more than a few feet deep, the sampling technician should only enter the trench or pit after it has been shored up or the sidewalls have been cut back to within the angle of repose (see Occupational Safety and Health Administration regulations). Otherwise, samples are more commonly collected at the surface from the bucket of the backhoe as excavation occurs.

7.7.3 *Comments*—The maximum sampling depth for the trench or pit method is dictated by the reach of the backhoe, the soil type and the moisture content of the soil. Maximum depths of up to 20 ft (6.10 m) can be obtained in moist clays. Maximum depths of less than 10 ft (3.05 m) are common in dry sands. Samples collected from the backhoe bucket should be taken from the center of the material to prevent collecting soil contaminated by the bucket surface, and to prevent inclusion of materials that may have fallen from above the desired sampling interval. However, when this is done, it is difficult to accurately estimate the depth from which the sample was obtained. Trenches are useful for obtaining lithologic information since cross sections of the vadose zone can be studied and photographed. Trench or pit sampling is often used in areas with difficult access since backhoes are designed to travel on rough terrain. However, because the process involves excavating a much larger hole than drilling methods, chances of encountering underground utilities are increased, and proper backfilling and compaction of the trench is often very difficult.

8. Multipurpose and Auger Drill Rigs

8.1 Vadose zone samplers used in conjunction with drill rigs are identical to those used to sample below the water table. However, commonly used drill rigs such as cable tool and rotary units are not recommended as they generally require the introduction of drilling fluids to the soils to be sampled. Air rotary drilling is also undesirable for obtaining samples for pore liquid or gas extraction. In most cases, hollow-stem augers with some type of cylindrical sampler provide the greatest level of assurance that soil sampled within the vadose zone was not carried downward by the drilling or sampling process. For some situations, such as sampling firm to very hard ground, using multipurpose auger-core-rotary drill rigs will be necessary. For some geologic circumstances the use of solid stem augers will provide an adequate drilling method.

8.2 *Multipurpose Auger-Core-Rotary Drill Rigs:*

8.2.1 Multipurpose auger-core-rotary drill rigs are generally equipped with rotary power and vertical feed control to advance both hollow-stem augers and continuous flight (solid stem) augers to depths greater than 100 ft (30.48 m). These same drills have secondary capability for rotary and core drilling. The larger of these drills are typically mounted on 20 000 to 30 000-lb (9070 to 13605-kg) GVW trucks. The same multipurpose drill rigs are available on both rubber tired and track-driven all-terrain carriers. The smaller of the multipurpose drills are typically mounted on trailers or one-ton, 4 by 4 trucks.

8.2.2 When equipped with augers, the sampling process is identical to that for auger drill rigs. When multipurpose auger-core-rotary drill rigs or auger drill rigs are used, the speed of drilling and sampling is much greater than with hand operated equipment. Therefore it is useful to have a larger crew to efficiently handle, log, identify, and preserve the samples.

8.3 *Auger Drill Rigs*—Auger drill rigs are similar to multipurpose auger-core-rotary drill rigs. They are manufactured specifically for efficient auger drilling but do not have the pumps and hoists that are required for efficient core or rotary drilling. The rigs can be equipped with either solid stem or hollow stem augers. There are relatively few auger drills available in comparison to multipurpose auger-core-rotary drills.

9. Auger Drilling and Sampling

9.1 *Solid Stem Auger Drilling and Sampling:*

9.1.1 *Description*—The tools used for solid-stem auger drilling include: auger sections, the drive cap, and the cutter head (see Fig. 12). Auger sections are typically 5 ft (1.52 m) long and are interchangeable for assembly in an articulated but continuously flighted column. Augers are available in diameters up to 24 in. (60.96 cm). The cutter head is attached to the lowermost or leading flight of the auger column. It is about 0.5 in. (1.25 cm) larger in diameter than the flights. Head types include fish tail or drag bits for use in

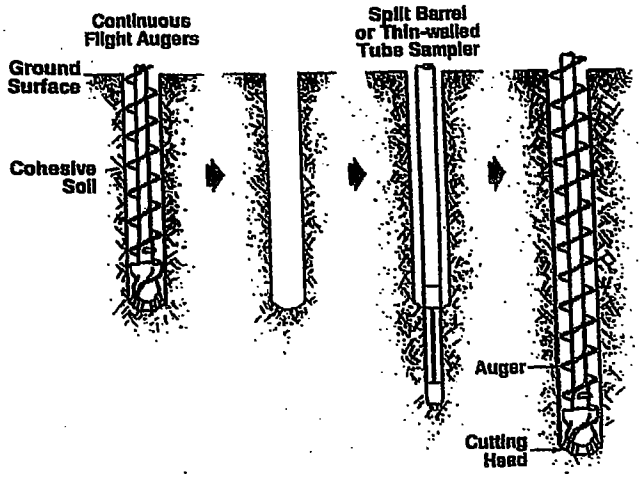

FIG. 12 Solid Stem Auger Sampling

cohesionless materials, and clay or stinger bits for use in more consolidated material (16).

9.1.2 *Sampling Method*—As the auger column is rotated into soil, cuttings are retained on the flights. The augers are then removed from the hole and samples are taken from the retained soil. Samples obtained with solid stem augers are disturbed and are not core samples. Therefore, the samples are not suitable for analyses requiring undisturbed samples, such as hydraulic conductivity tests. This sampling method can provide an adequately clean borehole in some clayey and silty soils. However, when using the method in caving or squeezing ground, the quality and the origin of the recovered samples are questionable because soils from different intervals may have mixed. Therefore, when representative samples from discrete depths are desired, the borehole should be made large enough to insert a smaller diameter auger or another sampler (for example, a thin-walled tube) to the bottom of the borehole, without touching the sides of the borehole (see Fig. 11), to collect a discrete sample from the interval ahead.

9.1.3 *Comments*—Typical drilling depths with solid stem augers range from 50 to 120 ft (15.24 to 36.58 m). The greater drilling depths are attained in firm, silty and clayey soils. However, the depth to which the hole will remain open for sampling once the auger column has been removed is usually less than the maximum drilling depth. If cascading water or cohesionless soils are encountered, it can be expected that the hole will cave at that depth. The sample depth measurement, as taken from its location on an auger, is not precise. This is because soil may move up the flights in an uneven fashion as the auger column is advanced. As with hollow-stem augers, solid stem augers are often painted by the driller or manufacturer. It is prudent to remove this paint before drilling. The majority of the paint can be removed by drilling through sandy soils or by sand blasting. As with all sampling devices, decontamination (for example, steam cleaning) should be performed between holes when chemical analyses are to be performed on the samples. This is especially important with the solid stem auger as it doubles as the drilling and sampling tool.

9.2 *Bucket Auger Drilling and Sampling:*

9.2.1 *Description*—The bucket auger is a large diameter cylindrical bucket with auger-type cutting blades on the bottom. The bucket can have a diameter ranging from 12 in. (30.48 cm) up to 6 ft (1.83 m) with lengths varying from 24 to 48 in. (60.96 to 121.92 cm) (17). The bottom is hinged to allow cuttings to be emptied out (see Fig. 13).

9.2.2 *Sampling Method*—The bucket is rotated to depth in the vadose zone until the bucket is full. Therefore, depending on the bucket length, sampling intervals can range from 24 to 48 in. (60.96 to 121.92 cm). Sampling consists of extracting small diameter core samples from the interior of the bucket after lowering the full bucket to the ground (see Section 7). This approach minimizes problems with undiscrete mixing of discrete portions to be sampled.

9.2.3 *Comments*—The bucket auger is best suited for sampling from relatively stable clays as the caving problems discussed in 9.1.3 are amplified by the larger hole diameter. Boulders can impede drilling and may have to be individually removed from the hole before sampling can continue (15)[6]. Generally, boulders up to one-third or one-fourth the bucket diameter can be picked up by the bucket. Common sampling depths are less than 50 ft (15.24 m) but holes up to 250 ft (76.20 m) deep have been drilled (16, 17).

9.3 *Hollow Stem Auger Drilling and Sampling:*

9.3.1 *Description*—Outer components of the hollow stem auger system include: hollow auger sections, the hollow auger head, and the drive cap. Inner components include: the pilot assembly, the center rod column, and the rod-to-cap adaptor (see Fig. 14). The auger head contains replaceable carbide teeth that pulverize the formation during flight

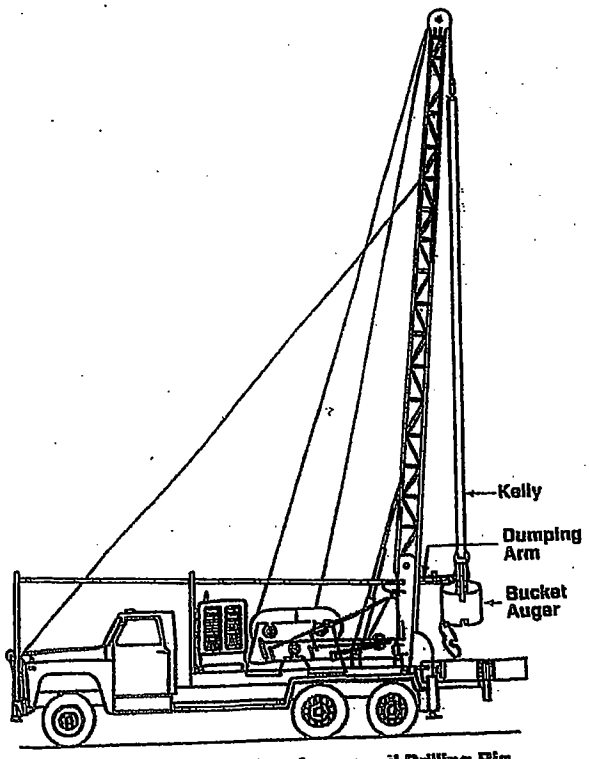

FIG. 13 Bucket Auger and Drilling Rig

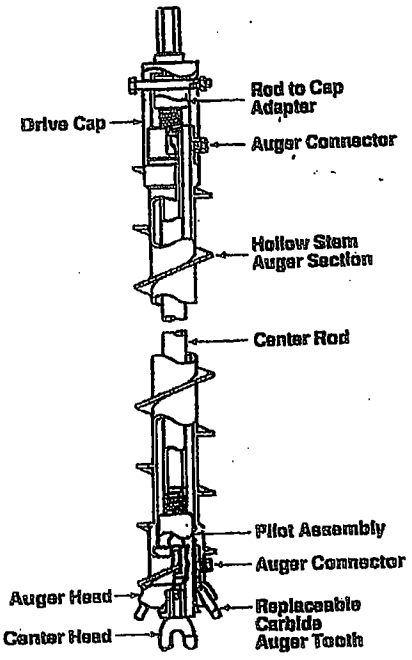

FIG. 14 Hollow-Stem Auger Components

column rotation. The cutting diameter is somewhat greater than the flighting diameter because of the protruding teeth. Auger sections are typically 5 ft (1.52 m) long and are interchangeable for assembly in an articulated but continuously flighted column. Drilling progresses in 5 ft (1.52 m) or shorter increments and sampling can be accomplished at any depth within that increment. Upon advancement of a 5 ft (1.52 m) increment, another 5 ft (1.52 m) section hollow-stem auger and center rod is added. Hollow-stem augers are readily available with 2.25, 2.75, 3.25, 3.75, 4.25, 6.25, and 8.25-in. (5.72, 6.99, 8.26, 9.53, 10.80, 15.88, and 20.96-cm) inside diameters.

9.3.2 *Sampling Method*—The auger column and pilot assembly are advanced to the top of the desired sampling interval. Sampling is accomplished by removing the pilot assembly and center rod, if they are used, and inserting the sampler through the hollow stem of the auger column (see Fig. 15). The sampler may be lowered to the sampling depth by attaching it to center rods or by using a wireline assembly (12). When the sampler is attached to center rods, a sample is collected by pushing or driving the sampler into undisturbed soil with the rig hydraulic system or with a drop hammer. When a wireline is used, the sampler is locked into place ahead of the lower-most auger and advanced into the sampling interval by rotating the auger column (18).[6] Hollow stem augers with a 6.25-in. (15.88-cm) inside diameter allow the use of 5-in. (12.70-cm) outside diameter Shelby tubes and 4.5-in. (11.43-cm) outside diameter split barrel samplers (see 9.4).

9.3.3 *Comments*—The purpose of the center head (pilot) assembly is to prevent soils from entering the auger column as it is advanced (19). Driscoll (17) suggests that the assembly may be omitted when drilling through hard, silty and clayey soils as these materials will usually form a 2 to 4 in. (5.08 to 10.16 cm) long plug at the auger opening. However, Hackett (19) recommends that the pilot assembly be used when detailed samples are required. When perched water is encountered, "heaving sands" that move up into the auger column upon pilot assembly removal during sampling, may be a concern. Various one-way plugs that allow sampling, but that prevent sand from moving into the auger column, are described in Hackett (19). The important capability of being able to obtain samples that do not contain mixed material from shallow sources in the hole is enhanced by using the hollow-stem auger method. However, because the sections are hollow, decontamination of the auger interiors between holes to prevent cross contamination is difficult. High pressure steam cleaners are usually necessary to remove caked-on soils and contaminants. Hollow stem augers may advance rapidly through unconsolidated materials.

9.4 *Sampling Devices:*

9.4.1 Sampling devices used in conjunction with hollow stem augers and occasionally in holes advanced by solid stem augers include:

9.4.1.1 Thin-walled tube samplers (also called Shelby tubes),

9.4.1.2 Split-barrel drive samplers (also called Split spoons),

9.4.1.3 Ring-lined barrel samplers,

9.4.1.4 Continuous sample tube systems, and

9.4.1.5 Piston samplers.

9.4.2 These samplers are either pushed or driven in sequence with an increment of drilling or advanced simultaneously with the advance of a hollow stem auger column.

9.4.3 *Thin-Walled Tube Samplers:*

9.4.3.1 *Description*—The thin-walled tube sampler consists of a tube connected to a head with screws. The head is threaded to connect with standard drill rods. The head contains a ball check valve. Thin-walled tube (Shelby tube) samplers are readily available with 2, 3, and 5-in. (5.08, 7.62, and 12.70-cm) outside diameter and are commonly 30 in. (76.20 cm) long. The 3 by 30 in. (7.62 by 76.20 cm) outside diameter long sampler is most common. The advancing end of the sampler is constructed with an inward lip, machined to a cutting edge, that has a smaller diameter than the tube inside diameter. The cutting edge inside diameter reduction, defined as a "clearance ratio," is usually in the range of 0.0050 to 0.0150 or 0.50 to 1.50 % (refer to Practice D 1587). PTFE or plastic sealing caps and other sealing devices for use after sampling are readily available for the 2, 3, and 5-in. (5.08, 7.62 and 12.70-cm) diameter tubes (refer to Practice D 4220). Shelby tubes are commonly available in carbon steel but can be manufactured from other metal (see Fig. 8).

9.4.3.2 *Sampling Methods*—When a Shelby tube is pushed into soil, the length of the sample recovered is often less than the distance pushed, that is, the recovery ratio is less than 1.0 (see 7.5.6.2). In addition, a portion of the sample frequently remains in the borehole after retrieval of the sampler. This is due to suction that develops at the sampler-soil interface. This suction may be broken by twisting the

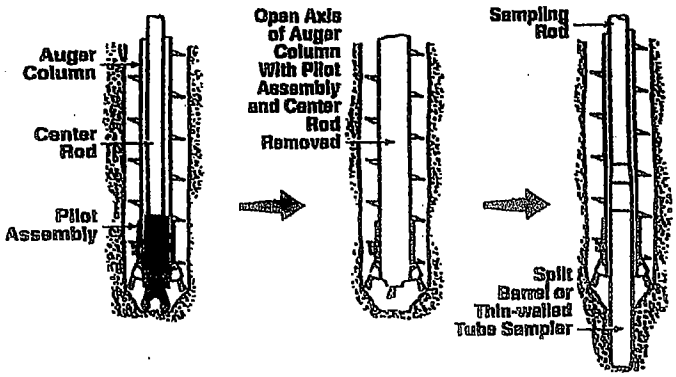

FIG. 15 Hollow-Stem Auger Sampling

sampler prior to retrieval or by advancing the auger column below the base of the sampler before retrieval (20). Samples are extruded from the Shelby tube with a hydraulic ram. As with all sampling devices, the portion of the sample in contact with the tube is considered disturbed and unrepresentative. Wilson et al. (12) developed a paring device to remove this outer layer of the core during extrusion.

9.4.3.3 *Comments*—The ball check valve was originally intended to provide a vent for drilling fluids when pushing the tube into soil, and also to prevent the column of fluid within the drill stem from forcing the sample out of the tube during retrieval. Since drilling fluids are not used when sampling in the vadose zone, these considerations are not important. However, the valve does provide a vent for air displaced as the sampler is pushed into soil. Shelby tubes are best used in clays, silts, and fine grained sands. They can be pushed with the hydraulic system of most drill rigs in fine grained sands that are loose to moderately consolidated or in clays and silts that are soft to firm. If the soils are cohesionless, they may not be retained in the tube. If consolidated or hard soils are encountered, driving the sampler may be required. However, some tubes may buckle under the drive stress. A spring-loaded barrel has been developed to protect the Shelby tube from buckling when sampling these soils (21).[6]

9.4.4 *Split-Barrel Drive Samplers:*

9.4.4.1 *Description*—The split-barrel drive sampler consists of two split-barrel halves, a drive shoe, and a sampler head containing a ball check valve, all of which are threaded together (see Fig. 15). The most common size has a 2-in. (5.08-cm) outside diameter and a 1.5-in. (3.81-cm) inside diameter split barrel with a 1.375-in. (3.49-cm) inside diameter drive shoe. This sampler is used extensively in geotechnical exploration (Refer to Method D 1586). When fitted with a 16 gage liner for encased cores, the sampler has a 1.375-in. (3.49-cm) inside diameter throughout. A 3-in. (7.62-cm) outside diameter by 2.5-in. (6.35-cm) inside diameter split-barrel sampler with a 2.375-in. (6.03-cm) inside diameter drive shoe is also available (22).[6] Other split-barrel samplers in the size range of 2.5-in. (6.35-cm) to 4.5-in. (11.43-cm) outside diameter are manufactured but are less common. A plastic or metal retainer basket, or a flap valve is often fitted into the drive shoe to prevent samples from falling out during retrieval.

9.4.4.2 *Sampling Method*—As described in Method D 1586 the sampler is threaded onto drilling rods and is lowered to the bottom of the boring. The sampler is then driven into the soil with blows from a drop hammer attached to the drill rig. The hammer usually weighs 140 lb [illegible]s operated by the driller. The sampler is extracted from t[illegible]oil in a manner that will ensure maximum sample recovery. A

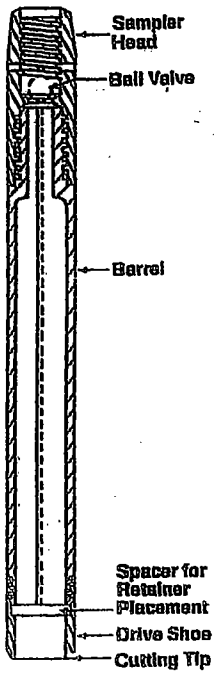

FIG. 16 Split-Barrel Drive Sampler

sample is obtained by disassembling the drive shoe and head, and splitting the barrel to expose the core of soil. Material disturbed by contact with the barrel can be scraped away, or a less disturbed interior portion collected with a spatula.

9.4.4.3 *Comments*—Split barrel drive samplers can be used in all soil types if the larger grain sizes can enter through the opening of the drive shoe. Because the sampler can be fitted with a retainer basket, it is typically used in place of thin-walled tubes when cohesionless soils are to be sampled.

9.4.5 *Ring-Lined Barrel Samplers:*

9.4.5.1 *Description*—As described in Practice D 3550, the ring-lined barrel sampler consists of a one piece barrel or two split-barrel halves, a drive shoe, rings, a waste barrel and a sampler head containing a ball check valve (see Fig. 17). The rings fit snugly inside the barrel and are designed to be directly inserted into geotechnical testing apparatus when removed from the barrel. Most samplers are designed to hold at least six rings. The waste barrel provides a space above the rings into which disturbed soil, originally at the bottom of the hole, can move. The samplers are commonly available with 2, 3, and 4-in. (5.08, 7.62, and 10.16-cm) outside diameter.

9.4.5.2 *Sampling Method*—The ring-lined barrel sampler can be driven or pushed into soil. It is important to insert the sampler deep enough to allow all disturbed soil to move through the rings and into the waste barrel. Once retrieved, the sampler is disassembled, and the sample filled rings are carefully removed. The rings are usually removed as one unit and placed into a capped container. Alternately, the individual soil filled rings can be capped with plastic or PTFE and even sealed with wax or adhesive tape (refer to Practice D 4220).

9.4.5.3 *Comments*—Because ring-lined barrel samplers are more rigid than thin-walled tubes, they can be driven into soils containing sands and gravels that might damage thin-walled tubes. The sampler provides samples in rings that can be handled without further disturbance of the soil. Because of this, these devices are most often used when geotechnical or chemical analyses are to be performed.

9.4.6 *Continuous Sample Tube System:*

9.4.6.1 *Description*—Continuous sample tube systems that fit within a hollow-stem auger column are readily available in North America. The barrel is typically 5 ft (1.52 m) long, and fits within the lead auger of the hollow auger column. The sampler is prevented from rotating as the auger column is turned (20). For many conditions the sampler provides continuous, 5-ft (1.52-m) samples (see Fig. 18). The assembly can be split- or solid-barrel and can be used with or without liners of various metallic and nonmetallic materials (20). Two clear, plastic, 30 in. (76.20 cm) long liners are often used. The sampler may also be fitted with a plastic or metal retainer basket, or a falp valve to prevent cohesionless soils from falling out of the sampler during retrieval (20).

9.4.6.2 *Sampling Method*—The sampler is locked in place inside the auger column with its open end protruding a short distance beyond the end of the column. While advancing the column, soil enters the non-rotating sampling barrel. After a 5-ft (1.52-m) advance, the sampler is withdrawn, and the liner (if used) is removed and capped.

9.4.6.3 *Comments*—The continuous sample tube system replaces the pilot head assembly in the hollow-stem auger column. Because of this, sampling speed is greatly increased since the pilot assembly does not have to be removed before taking a sample. The continuous sample tube system is best used in clays, silts, and in fine grained sands. It can be used to sample soils that are much more consolidated or harder than can be sampled with Shelby tubes.

9.4.7 *Piston Samplers:*

9.4.7.1 *Description*—Locally saturated (for example, perched ground water), or cohesionless soils, and very soft soils or sludges may not be retained in most samplers, even when they have been fitted with retainer baskets or flap valves. Piston samplers are often used under these conditions. The sampler consists of a sampling tube, an internal piston, and a drive head. The piston fits snugly inside the tube. The piston is attached to a rod assembly or a cable that leads to the surface. Tubes made of steel are available in 5.5 and 30-in. (13.97 and 76.20-cm) and 5-ft (1.5-m) lengths with 0.75, 2, 3, 4, and 5-in. (1.91, 5.08, 7.62, 10.16, and 12.70-cm) inside diameter (22, 23). When equipped with a hardened steel drive shoe, the tube can be fitted with a liner made of aluminum clear PVC, or another material (see Fig. 19) (24). A version of the sampler designed for peat sampling has a cone shaped piston (8).

9.4.7.2 *Sampling Method*—Prior to sampling, the piston is placed at the base (advancing end) of the tube. The sampler is then attached to drill rods and lowered down the borehole or hollow-stem auger column to the bottom of the hole (top of the sampling interval). The sampler is then pushed or driven into the sampling interval. As the tube

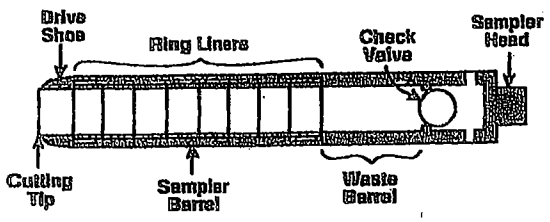

FIG. 17 Ring-Lined Barrel Sampler

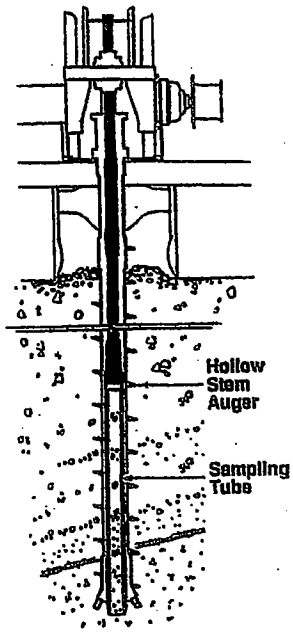

FIG. 18 Continuous Sample Tube System

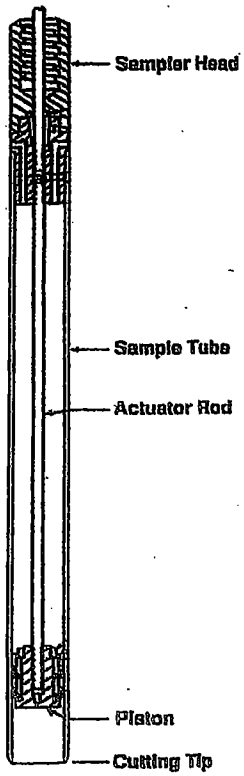

FIG. 19 Piston Sampler

moves downward, the piston remains stationary and in contact with the top of the soil sample. When the sampler is withdrawn, soil is retained because of suction that develops between the piston and the soil core within the sampler. This suction is stronger than the suction at the bottom of the sampler that would tend to extract soil from the sampler. Even so, it is often useful to twist the sampler with the drill and ensure that the sample will not be pulled out of the sampler.

9.4.7.3 *Comments*—Average recovery ratios greater than 0.9 can be attained with this sampling tool (24, 25). However, because the sampler depends on development of suction between the sample and the piston, it may not work in unsaturated, coarse grained sands and gravels. This is due

creation of suction with the sampler. Samples collected with piston samplers are relatively undisturbed. Zapico et al. (24) described techniques for extracting fluid samples directly from liners, and for converting liners into permeameters.

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 1916 Race St., Philadelphia, PA 19103.

Appendix E
Aurora Industrial Hygiene Scope of Work and Air Monitoring Plan

AURORA INDUSTRIAL HYGIENE, INC. SCOPE OF WORK

1.0 OBJECTIVE

The objective of this scope of work is to provide practices and procedures that ensure the following:

- A minimization of community exposures to potential hazards from site activities and/or releases that may migrate off site.
- Asbestos abatement oversight

All monitoring system design and frequency shall be approved by Pittsburg River Park LLC.

2.0 RESPONSIBILITIES

2.1 CIH RESPONSIBILITIES

- The CIH shall evaluate the potential chemical constituents of concern that may migrate off the site based on previous and current environmental assessment information and previous site usage.

- The CIH is responsible for designing both the periodic and continuous air monitoring plan for all analytes. This shall include frequency and type of air monitoring, sampling techniques and instrumentation, and calibration methods. Action limits for perimeter monitoring will be determined and measures that will be taken to reduce airborne concentrations to below the action levels in the event that an action limit is exceeded will be included. Table 1 provides a minimum air monitoring sampling schedule for each phase of work. The actual number of samples taken will depend upon site conditions, work activities and weather, and OSHA and BAAQMD regulations.

- The air monitoring plan shall include samples taken during asbestos abatement and site perimeter monitoring during all phases of work, including background, asbestos abatement, demolition, and soil excavation.

- The CIH shall be certified by the American Board of Industrial Hygiene for Comprehensive Practice, and shall also be certified by the State of California as a Certified Asbestos Consultant and a Department of Health Services Lead Inspector/Risk Assessor and Lead Monitor with a minimum of 15 years

experience in Health and Safety. CIH responsibilities will not be passed to subcontractors.

2.2 PM RESPONSIBILITIES

- The Aurora Industrial Hygiene project manager (PM) is responsible for recognizing potential hazards that may be encountered at the site and acting as the liaison for all team members.
- The PM shall hold the designations Certified Asbestos Consultant, Certified Lead Monitor and Certified Lead Inspector/Risk Assessor.
- The PM shall have a minimum of 10 years experience as an Industrial Hygienist.

2.3 PROJECT FIELD STAFF RESPONSIBILITIES

- The Aurora project field staff is responsible for ensuring that all data acquisition is performed in accordance with the work plan, and that deviations from the plans are based upon field conditions encountered and are well documented in the field notes.

- All Aurora project field staff will have completed 40 hours of comprehensive health and safety training and have current medical surveillance that meets the requirements of Title 29 Code of Federal Regulations Part 1910.120 (29 CFR 1910.120).

- Field Staff shall hold the designation Certified Site Surveillance Technician (CSST), and be DHS Lead Certified.

- Field staff shall have the authority to monitor and correct health and safety problems as they arise on Site.

- All contractors not hired by Aurora Industrial Hygiene are responsible for the health and safety of their own onsite personnel. Aurora does not accept responsibility for the health and safety of contractors, but if Field Staff note items of concern they will report concerns to the client.

2.4 CONTRACTOR RESPONSIBILITIES

All Site contractor and subcontractor employers are responsible for their own health and safety program and the health and safety of their own employees. This requirement is based on Occupational Safety and Health Administration (OSHA) regulations that recognize the employer-to-employee responsibility for health and safety.

3.0 AIR MONITORING PLAN (AMP)

This section describes the general concepts of an air monitoring program and specifies the activities that will take place during the Johns Manville Demolition Project.

The purpose of air monitoring is to identify and quantify airborne contaminants in order to verify and determine the level of worker protection and evaluate potential community exposures. Two principal approaches are available for identifying and/or quantifying airborne contaminants to include the use of on-site direct-reading chemical monitoring instruments and laboratory analysis of air samples obtained on collection media.

It is the responsibility of each contractor to determine the personnel exposure for their employees. Each contractor is expected to perform initial monitoring of their employees who are or may reasonably be expected to be exposed to airborne concentrations at or above the action levels. After the initial determinations have been made, sampling shall be of such frequency and pattern as to represent with reasonable accuracy the levels of exposure of their employees. Personal monitoring for contractors not hired by Aurora is NOT within Aurora Industrial Hygiene's scope of work.

Table 1: Sample Collection Estimates

Baseline (1 week)			
Type	Estimated Number	Location	Time Line
Asbestos	12-24	Upwind and downwind along site perimeter	Minimum 3 days of sampling, prior to construction start, during daytime (0700-1600)
Lead – Air	12-24		
Particulates	12-24		
Asbestos Abatement (5 weeks)			
Type	Estimated Number	Location	Time Line
Asbestos (TEM)	80-100 (10/week)	Upwind, downwind, South and West perimeter	Daily
Asbestos (PCM)	50-100/week	3 samples, minimum outside each containment work area	Daily
Demolition (14 weeks)			
Type	Estimated Number	Location	Time Line
Asbestos	280 (15-20/week)	Upwind, downwind, south and west along site perimeter.	Daily
Lead (GF)	280(15-20/week)	Upwind, downwind south and west along site perimeter,	Daily
Lead (AA)	280 (15-20/week)	Active work site samples as needed.	Daily

Particulates	280 (15-20/week)	Active work site samples as needed	Daily
Soil Remediation (10 weeks)			
Asbestos (TEM)	200 (15-20/week)	Upwind, downwind, south and west along site perimeter.	Daily
Asbestos (PCM)	50-100/week	Active work site samples as needed	Daily
Particulates	200(15-20/week)	Active work site samples as needed	Daily

3.1 BASELINE

Baseline (background) monitoring will be accomplished by Aurora by conducting both downwind and upwind sampling, and collecting site perimeter measurements/samples. Perimeter locations will include upwind and downwind locations. If the downwind direction cannot be determined, or if the wind varies throughout the day, as least two sample collection locations shall be established. These shall be along the south and west perimeters of the project site. All instrument results will be documented. A summary sheet will be provided on a weekly basis or as requested by the client. The following are minimum numbers; additional sampling may be added depending upon site conditions:

3.1.1 AIRBORNE ASBESTOS

- TEM, EPA Level II samples will be collected upwind, downwind, and along the south and west perimeter of the site. Samples will be collected for a minimum of three days during work hours. Depending upon wind and weather conditions, additional samples may be collected to ensure adequate comparison data. Baseline asbestos TEM samples will be archived for analysis if needed to compare with samples taken during subsequent phases.
- Phase Contrast Microscopy samples will be collected within buildings where asbestos work is scheduled, prior to the start of work in each area. The number of background samples will be dependent upon the parameters of each work area, and the type of asbestos which will be removed.

3.1.2 PARTICULATE (PM10)

- A minimum of three particulate monitors will be set up along the perimeter of the site, two along the south and west perimeters. Readings will be taken every 10-15 minutes/for a minimum of 3-5 days. Readings will be recorded on a 24 hour basis and a permanent record generated. A handheld unit may also be used as needed along specific building perimeters.

3.1.3 WIND DIRECTION/WIND SPEED/TEMPERATURE

- Readings will be taken using a solar powered Davis Instrument Weather station. The weather station will be on site for the duration of the project. All readings will be recorded on a 24hr basis and a permanent record generated.

- Readings from the onsite weather station will be correlated with local weather information from the nearest airport meteorological station.

3.1.4 AIRBORNE LEAD (FLAME ATOMIC ABSORPTION AND GRAPHITE FURNACE).

- A minimum of three days of lead air samples shall be collected during work hours for comparison with both EPA and OSHA standards and with samples collected during subsequent phases. Samples will be archived for analysis if needed to compare with samples taken during subsequent phases.

3.2 MONITORING DURING ACTIVE WORK

3.2.1 PHASES

3.2.1.1 During Asbestos Abatement

- Aurora's Field Staff will conduct site surveillance during all asbestos removal. A minimum of 3 air samples will be collected outside each work area to provide the client with information regarding the integrity of each containment area. Oversight services, including documentation of contractor submittals, checklists, and daily notes will be provided along with a final report for each area. Clearance samples will be taken within each work area upon completion of the remediation.
- Continuous monitoring for particulates, wind speed/direction and perimeter monitoring for asbestos will be conducted simultaneously.

3.2.1.2 During Demolition

- Continuous monitoring for particulates, wind speed/direction and daily perimeter monitoring for lead and asbestos will be conducted by Aurora's on site representative.
- It will be the responsibility of Aurora's CIH along with the field staff on site to determine, based upon construction activities, the location, number of, and type of samples which will be taken.

3.2.1.3 Soil Excavation

- During activities which may involve handling of soil contaminated with asbestos debris, area monitoring for asbestos will be conducted along with continued perimeter monitoring for particulates.
- Aurora will provide asbestos abatement oversite during transite pipe removal.
- Monitoring for wind speed and direction will be continued.

3.2.2 ACTIONS LEVELS/RESPONSES

3.2.2.1 Active Work Areas

During all phases of active work, real time monitoring and indirect monitoring will be performed by Aurora under the direction of the CIH and PM in each active work area as deemed necessary. Any concentration above the action levels will be reported to the Site safety and health officer and action taken. As a minimum real time measurements will be taken every 30 minutes, or when task or exposure conditions change (whichever frequency is less). All indirect sampling media will be analyzed by an AIHA (American Industrial Hygiene Association) accredited laboratory.

Table 2 — Active Work Area Air Monitoring

Test Method/ Equipment	Exposure Limits*		Action Level	Action Plan
	OSHA PEL	ACGIH TLV		
Inorganic Lead Compounds				
NIOSH Method 7300; with air monitoring pumps and filters	0.05 mg/m3	0.05 mg/m3	a. <0.03 mg/m3 b. 0.03 < and > 0.3 mg/m3 c. > 0.3 mg/m3	a. Continue Work and Monitoring b. Upgrade to Level C and continue to monitor c. Suspend work; evaluate source and mitigation measures.
Nuisance Dust				
a. Direct-reading b. NIOSH Method 500; with air monitoring pumps and filters	Total 10 mg/m3 Respirable 5.0 mg/m3	Inhalable 10 mg/m3 Respirable 3.0 mg/m3	a. <1.0 mg/m3 b. >1.0 mg/m3	a. Continue Work and Monitoring b. Suspend work; evaluate source and mitigation measures.
Asbestos				
b. NIOSH Method 7400; with air monitoring pumps and filters	0.1 fb/cc (1910.1001) 0.1 fb/cc	0.1 fb/cc	a. <0.01 fb/cc b. >0.1 fb/cc	a. Continue Work and Monitoring b. evaluate source and mitigation measures.

Exposure limits established by the Occupational Safety and Health Administration (OSHA) and Threshold Limit Values published by the American Conference of Governmental Industrial Hygienist.

3.2.2.2 Perimeter Monitoring

During all Site activities, the perimeter of the work zone will be monitored by Aurora according to the following list of initial and/or ongoing monitoring for community

exposure assessment. At a minimum, three site perimeter locations will be monitored as part of the perimeter monitoring program. Perimeter locations will include upwind and downwind locations. If the downwind direction cannot be determined, or if the wind varies throughout the day, as least two sample collection locations shall be established. These shall be along the south and west perimeters of the project site. See Diagram 1 for perimeter sampling locations.

DIAGRAM 1

Table 3 — Perimeter Air Monitoring

Test Method/Equipment	Action Level	Action Plan
	Inorganic Lead Compounds	
NIOSH Method 7082; with air monitoring pumps and filters	a. At or below background b. Above background	a. Continue Work and Monitoring b. Suspend work; evaluate source and mitigation measures.
	Nuisance Dust

Davis Weather Station III with solar panel	a. <20 mph b. >20 mph	a. Continue Work and Monitoring b. Inform contractors of high winds condition. Monitor dust levels

4.0 CALIBRATION OF MONITORING EQUIPMENT

It is essential that each piece of site monitoring equipment be calibrated on a routine basis. This assures that a given monitoring instrument is both working and working with a reasonable degree of accuracy. This procedure outlines required calibration frequencies and techniques. The manufacturers' instruction manual should always be available for specific calibration procedures and other information. It is the responsibility of Aurora's on site staff to complete calibration in accordance with manufacturer's instructions.

4.1 FREQUENCY OF CALIBRATION

The following instruments must be calibrated before each use:

- Air Sampling Pumps (various flow rates)
- Aerosol/Particulate Monitor

4.2 CALIBRATION TECHNIQUES

Air Sampling Pumps

The flow rate of air sampling pumps must be calibrated within a range depending upon the chemical of concern and the collection medium for the sample. Calibration is achieved by connecting the hose assembly with collection medium attached, to a calibrator (e.g., MiniBuck) and observing the flow rate. A set screw or knob is then turned until the flow rate is within the desired range.

Refer to the NIOSH Manual of Analytical Methods for the prescribed flow rates and sampling media for the targeted concern, if needed.

Aerosol/Particulate Monitors

Some particulate monitors must be factory recalibrated, however they should be zeroed daily.

Periodic Instrument Response Checks

It is important that each piece of monitoring equipment be checked occasionally during its use to determine that it is responding to contaminants.

These "response checks" are key to providing confidence to the user that the instrument is at least functioning and responding to contaminants.

5.0 ASBESTOS ABATEMENT OVERSITE

Aurora will provide specific asbestos abatement services during set-up, project duration, and containment teardowns. Project management services are provided by a CAC, oversite activities will be provided by a Certified Site Surveillance Technician (CSST) or a CAC. These services are in addition to the background and perimeter sampling schedules provided in Section 3. All oversight work shall be conducted as per regulations and requirements set forth by the Bay Area Air Quality Management District.

5.1 CERTIFIED ASBESTOS CONSULTANT SERVICES:

- Review Contractor submittals, including permits, notifications, work plans, and disposal plans, employee training, medical and respiratory fit testing prior to the start of work.

- Attend pre-construction and planning meetings to provide guidance to the client regarding regulatory compliance issues regarding asbestos.
- Monitor quality control, review daily field notes and air monitoring data to ensure continuing compliance with regulatory standards.
- Upon completion of the project a final report documenting that the areas requiring asbestos abatement have been abated in conformance with all applicable laws and regulations upon successful completion of the project including submittals, daily notes, air monitoring results will be written by a CAC who is also a Certified Industrial Hygienist (CIH).

5.2 CERTIFIED ASBESTOS SITE SURVEILLANCE TECHNICIAN SERVICES (CSST)

- Pre-abatement air monitoring to determine background concentrations of particulates.
- Inspection of the contractor's construction of containment areas prior to startup and on a regular basis at least two times daily.
- Review of asbestos air monitoring results, document submittals such as respirator fit tests, medicals, and training, pressure differential reports, etc., as required to ensure regulatory and specification compliance.
- Daily air monitoring outside the containment areas to ensure that the containment system is operating correctly and that there is no contamination of the outside environment.
- Analysis of up to 10 area samples per shift using phase contrast microscopy (PCM), in accordance with NIOSH Method 7400 per shift at no extra charge. Sample results will be provided within 24 hours. Clearance sample results will be provided ASAP.
- Clearance inspections and air sampling will be conducted in each work area prior to releasing the asbestos abatement work areas.

6.0 DOCUMENTATION

6.1 DAILY SUBMITTALS

A daily log of monitoring results will be maintained by Aurora. The log shall be provided to the Client's representative as requested or on a weekly basis. The log shall contain, minimally:

- A diagram indicating project boundaries, the areas where active work was completed, and the perimeter sample collection locations.
- Direct reading equipment used including equipment make and model, serial number, factory calibration date, and time, method, and results of daily field calibration.

- A list of sampling pumps used which indicated pump manufacturer, pump ID number calibrator type, and time and flow rate for pre- and post – daily pump calibration.
- A sample collection record for sampled sent for laboratory analysis which will include sample ID number, pump number, sample location, analytes, sample time, sample flow rate, and total sample volume.
- A table of direct reading sample results which will include collection time, collection location, and results.
- Weather observations which include time, wind direction, wind speed, and temperature.
- Any other condition or circumstances that may have influenced the readings

6.2 CLOSE-OUT DOCUMENTS

A close-out document will be provided by Aurora for each phase of the project. The close-out document shall include all daily notes as described in Section 6.1 and the following:

- All laboratory chain of custody and laboratory analysis data
- A time line and summary of contractor activities
- Contractor submittals
- Complete datalogged information from all direct readings, including particulate counts and weather station information.
- Certifications

7.0 SAMPLE HANDLING

7.1 AMERISCI LABORATORIES

Amerisci Laboratories, located at 24416 South Main Street, Suite 308, Carson, CA., is one of two laboratories which will be used for asbestos and lead analysis. The following are their protocols for sample handling.

7.1.1 SAMPLE STORAGE

Client samples are either returned or temporarily stored at the laboratory for 60 days before disposal unless other conditions are specified. Samples that are retained for storage are placed in double bags or other appropriate containers and filed by the laboratory job number. The sealed container is placed in a storage box with other similar samples. An identification code is recorded on the outside of the storage box. The sealed storage box of individually bagged jobs is then placed in a secured storage area. Different analysis types (ie., air filters, bulk samples) are stored separately, thereby minimizing any potential cross contamination.

7.1.2 SAMPLE RETURN

Samples designated for return to the client are kept in the original shipping container if appropriate. Upon completion of processing and/or analysis the samples and their container are returned to the Sample Coordinator for retention in the Return Holding Area. After the appropriate time (approximately 60 days) samples held in the Return holding area are returned to the client by a traceable shipping method. All samples leaving the laboratory are accompanied by a Chain of Custody (COC). In the event of being returned to the original owner, they will be accompanied by a copy of the original chain of custody. Portions of the samples may be retained for QA purposes.

7.1.3 SAMPLE DISPOSAL

After the appropriate time (60 days, unless otherwise requested and agreed upon in writing) samples held in temporary storage are disposed of by a licensed contractor following federal, state and local regulations. The COC copy is retained in the appropriate job file. Portions of the samples may be retained for QA purposes.

7.2 EMS LABORATORIES

Asbestos, lead and particulate samples may be sent to EMS Laboratories, located at 117 West Bellevue Drive, Pasadena, California. The following are EMS Laboratories policies regarding storage and disposal of samples.

7.2.1 STORAGE

All chemistry samples are kept for 90 – 120 days from the data of analysis or as required by the customer before they are treated as waste. Samples are returned to the client upon request or if they require special storage. It is documented with EMS' chain-of-custody. The results of the analysis are used as a guide to determine whether the sample should be considered normal or hazardous waste. All samples are sealed in individual containers compatible with their contents.

7.2.2 DISPOSAL

After 90-120 days, unless otherwise requested and agreed upon in writing) samples held in temporary storage are disposed of by a licensed contractor following federal, state and local regulations. It is documented with EMS' chain-of-custody.

7.3 AURORA INDUSTRIAL HYGIENE, INC.

Phase Contrast Microscopy samples are immediately returned to their original sampling train housing. Samples are then placed into a secondary box. Each sample is identified

by a label, listing time, location, air volume, date and unique sample identification numbers. Boxes are sealed, with project information placed on the box. All PCM samples are then stored by Aurora Industrial Hygiene, Inc. for a period of time not less than three years or returned to the client along with the chain-of-custody.

Subject: Geotechnical Investigation
Harbor Park Development
Pittsburg, California

Dear Mr. Nelson:

Treadwell & Rollo, Inc. is pleased to present our updated geotechnical investigation report for the Harbor Park development. The project site encompasses about 21 acres, and is southwest of the intersection between 3rd Street and Harbor Street in Pittsburg, California.

The site was previously occupied by the Johns Manville manufacturing facility. The proposed development for Harbor Park includes the construction of 2- to 3-story, wood-framed single- and multi-family residences and live-work lofts. We do not anticipate that the site grades will change significantly as part of the proposed development.

A preliminary geotechnical investigation was performed to collect data regarding the subsurface conditions by drilling four test borings and performing 13 cone penetration tests and the results were presented in our report titled *Preliminary Geotechnical Investigation Proposed Harbor Bay development, Pittsburg California*, dated 17 October 2005. The results of the preliminary investigation indicated that the project site was underlain by various types of soil including localized potentially liquefiable soil, and highly compressible clay deposits with varying thickness and compressibility characteristics.

This geotechnical investigation was performed to better define the lateral extents and depths of the various types of soil and geotechnical constraints, to provide more detailed geotechnical recommendations for the development of the site. The results of our subsurface investigations indicate the site is covered with heterogeneous fill ranging in thicknesses from 2 to 15 feet. The thickest fill deposit is in the area of a previously filled former evaporation pond. Beneath the western portion, the fill is underlain by stiff to hard clay and dense sand and gravel. Beneath the southeastern portion of the site, the fill is underlain by soft to medium stiff compressible clay. The compressible deposit is underlain by alluvium (stiff to hard clay with varying sand and gravel content and medium dense to very dense silty and clayey sand and gravel) to the maximum depth explored (51.5 feet). Groundwater was encountered at depths of 4 to 30 feet below ground surface in the borings and CPT holes.

Liquefiable deposits were encountered throughout the site, although it appears the liquefiable deposits are relatively thin, contain a high silt content, and are discontinuous.

Based on the results of our analyses, we conclude the primary geotechnical concerns affecting the proposed development are the presence of compressible clay and liquefiable zones. We conclude the proposed buildings can be supported on reinforced concrete mats, interconnect continuous footings, post-tensioned slabs or deep foundations.

This report contains information regarding subsurface conditions, grading, and foundation design criteria. The information presented herein should be used for preliminary design and project pricing. We recommend the project team have discussions regarding cost and constructability issues related to the alternatives presented in this report before the final designs for site development are prepared.

We appreciate the opportunity to work with you on this project. If you have any questions, please call.

Sincerely yours,
TREADWELL & ROLLO, INC.

GEOTECHNICAL INVESTIGATION
PROPOSED HARBOR PARK DEVELOPMENT
Pittsburg, California

1.0 INTRODUCTION

This report presents the results of the geotechnical investigation performed by Treadwell & Rollo, Inc. (T&R) for the proposed Harbor Park residential development in Pittsburg, California. The Harbor Park development encompasses approximately 21 acres and is southwest[1] of the intersection of East 3rd and Harbor Streets as shown on the Site Location Map (Figure 1).

2.0 BACKGROUND

The project site is bound by East 3rd Street to the north, Harbor Street to the east, a park and 8th Street to the south, and a residential development to the west. The residential development to the west is atop an approximately 1.5:1 (horizontal to vertical) slope that ranges from approximately 0 to 20 feet in height. The site was previously occupied by the Johns Manville Pittsburg Manufacturing Facility. At the time of this report, the structures associated with the manufacturing facility had been demolished and the majority of the building footings had been excavated and removed. The approximate locations of the former buildings associated with the Johns Manville facility are shown on the Site Plan, Figure 2. We understand some of the building footings were encountered at depths greater that five feet below the existing ground surface (bgs). After the footings were removed, the resulting excavations were backfilled with loose soil.

Site development plans include environmental remediation of on-site soil. ERM is the environmental consultant for the project. Currently, ERM is in the process of assessing the environmental quality of the soil and groundwater at the site and evaluating disposal and/or remediation options. Environmental remediation of contaminated soil at the site had not started

[1] All direction references are based on the project north arrow presented on the Site Location Map, Figure 1 of this report.

at the time this report was completed. However, some of the environmental remediation work will have geotechnical aspects associated with them, such as excavation and refilling of a former evaporation pond at the southeastern corner of the site (see Figure 2) after contaminated soil has been removed, and constructing a large earthen embankment within the "open space" area along the eastern edge of the site (Harbor Street), as indicated on Figure 3.

3.0 PROJECT DESCRIPTION

The proposed development includes the following:

- Downtown Medium Density Residential (DMDR); this portion of the development will consist of 2- and 3-story, single-family, detached and attached homes, constructed at a density of 12 to 18 units per acre

- Downtown High Density Residential (DHDR); this portion of the development will consist of 3-story, multi-family structures and live/work lofts, constructed at a density of 18 to 30 units per acre

- Open Space (OS) area; this portion of the development will include a relatively large earthen embankment along the eastern edge of the site along Harbor Street.

A conceptual development plan for the proposed Harbor Park site is shown on Figure 3. Proposed site improvements will also include underground utilities, landscaping, and new pavements. Preliminary design loads, proposed grading, and/or new underground utility locations were not available at the time of this report was prepared.

4.0 PREVIOUS GEOTECHNICAL INVESTIGATION

T&R previously performed a preliminary geotechnical investigation of the project site and the results were presented in a report titled *Preliminary Geotechnical Investigation, Proposed Harbor Bay Development, Pittsburg, California*, dated 17 October 2005. The preliminary investigation identified several geotechnical issues that could impact the proposed development.

These issues include deposits of soft compressible clay and isolated deposits of potentially liquefiable granular soil. The results of the previous geotechnical investigation dated 17 October 2005 have been incorporated into this report, where applicable.

5.0 SCOPE OF SERVICES

Our scope of services for this geotechnical investigation was outlined in our proposal dated 9 December 2005. Our services included researching historical documents, drilling borings, performing cone penetration tests (CPTs), testing soil samples, and performing engineering analyses. Based on the results of our investigation, we prepared conclusions and recommendations regarding the following:

- soil and groundwater conditions
- geotechnical characteristics of the on-site soil, especially with respect to identifying potentially expansive, compressible, and liquefiable soils and their approximate limits within the site
- the most appropriate foundation types for the proposed buildings and dwellings
- design criteria for the recommended foundation types, including vertical and lateral capacities
- building settlement, including total and differential settlement
- site seismicity and seismic hazards, including the approximate location of known active faults and the potential for on-site soil to liquefy during a large earthquake on one of the nearby active faults
- stability of the existing slope along the property line at the western edge of the site
- site preparation and grading, including criteria for fill quality, moisture-conditioning and compaction

- utility trench backfill requirements
- surface and lot drainage
- flexible pavement design
- 2001 California Building Code soil profile type and near source factors
- construction considerations.

Although the site is not located in a seismic hazard zone as defined by the California Geologic Survey (CGS), we have addressed potential seismic conditions that could relate to proposed developments.

6.0 FIELD INVESTIGATION AND LABORATORY TESTING

The subsurface conditions at the site were explored using a combination of test borings and CPTs. Nine test borings (designated as B-5 through B-13) and 48 CPTs (designated as CPT-14 through CPT-61) were performed as part of this investigation. Subsurface conditions were previously explored during our preliminary geotechnical investigation by drilling four borings (designated as B-1 through B-4) and performing 13 CPTs (designated CPT-1 through CPT-13). The approximate locations of all of the test borings and CPTs are shown on Figure 2.

6.1 Borings

The borings were drilled by Gregg Drilling, Inc. of Martinez, California (Gregg Drilling) and Ofiaro Building Engineering and Construction of Richmond, California. On 18 and 19 August 2005, 20 and 21 December 2005, and 2 through 7 February 2006, we drilled a total of 13 test borings using:

- a truck-mounted drill rig equipped with rotary-wash equipment
- a truck-mounted drill rig equipped with hollow-stem augers

- a portable drill rig equipped with solid-stem flight augers for drilling boring B-9 at the top of the slope along the western edge of the site.

The borings were drilled to depths ranging from approximately 20 to 50 feet bgs. During drilling, our field engineer logged the soil encountered and obtained samples for visual classification and laboratory testing. Logs of the borings are presented on Figures A-1 through A-14 in Appendix A. The materials encountered during drilling were classified according to the soil classification system described on Figure A-15.

Soil samples were obtained using the following samplers:

- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.5-inch inside diameter (without liners)
- Sprague and Henwood (S&H) split-barrel sampler with a 3.0-inch outside diameter and 2.5-inch inside diameter (with 2.43-inch-inside-diameter brass liners)
- Dames and Moore (D&M) sampler with a 2.5-inch-outside-diameter, thin-walled tube.

The SPT and S&H samplers were driven with a 140-pound automatic hammer falling approximately 30 inches per drop, except for boring B-9, where the samplers were driven using a tripod-mounted “rope and cathead” system. The blow counts required to drive the S&H sampler the final 12 inches of an 18-inch drive were converted to approximate SPT N-values using a conversion factor of 0.6 or 0.7 depending upon the type of hammer used, as indicated on the boring logs. The approximate SPT N-values are also shown on the boring logs. Where the SPT sampler was used, the actual blow counts are presented on the boring logs.

Upon completion of drilling, the borings were backfilled with cement grout in accordance with the requirements of the Contra Costa County Environmental Health Department. The soil cuttings and drilling fluids from the borings were placed in 55-gallon drums and stored at a central on-site location as directed by the environmental consultant, ERM. Analytical tests were subsequently performed on composite samples of the drilling fluid and soil cuttings generated

during our field investigation. The laboratory test results were provided to Renova for disposal of the drummed material. Results of the analytical tests are presented in Appendix D.

6.2 Cone Penetration Tests

Sixty-one CPTs were performed by Gregg Drilling on 19 through 22 August 2005, 15 through 21 December 2005, and 2, 10, and 24 February 2006. The CPTs were performed by hydraulically pushing a 1.4-inch-diameter, cone-tipped probe with a projected area of 15 square centimeters into the ground. The cone-tipped probe measures tip resistance, and the friction sleeve behind the cone tip measures frictional resistance. Load cells within the cone continuously measure soil parameters for the entire depth advanced. Soil data, including tip resistance and frictional resistance, were recorded while the test was conducted. Accumulated data were processed by computer to provide engineering information such as the approximate type and strength characteristics of the soil at the site. The CPTs were advanced to depths of 30 to 50 feet bgs. CPT logs, showing tip resistance and friction ratio by depth, as well as interpreted SPT N-values and soil type, are presented in Appendix B.

6.3 Laboratory Testing

Soil samples were re-examined in our office to confirm field classifications, and representative samples were selected for testing. Laboratory tests were performed on selected soil samples to measure soil gradation and fines content (percentage of particles passing the No. 200 sieve), Atterberg limits, moisture content, dry density, consolidation characteristics, shear strength, and corrosion characteristics. The geotechnical laboratory test results are presented in Appendix C. Analytical tests were performed on composite samples of the drilling fluid and soil cuttings generated during our field investigation to assist with the disposal of the drummed material. The chemical test results are presented in Appendix D.

7.0 SITE CONDITIONS

The Harbor Park site is bordered by East 3rd Street to the north, a park and East 8th Street to the south, an existing residential development to the west, and Harbor Street to the east, as shown on

Figure 2. The existing ground surface ranges in elevation from approximately 12 feet above mean sea level (MSL) near the intersection of East 3rd and Harbor Streets to approximately 32 feet MSL at the top of the existing slope at the southwest corner of the site. An ALTA Land Title survey performed by Renner Group, dated 20 May 2005, indicates that the site grades at these two locations correspond to about Elevation 100 feet[2] at the intersection of East 3rd Street and 120 at the top of the existing slope at the southwest corner of the site, which correspond to 12 and 32 feet MSL respectively.

In general, the ground surface at the site gently slopes toward the north from approximately Elevation 110 feet (22 feet MSL) along the southern edge of the site to about Elevation 100 (12 feet MSL) feet near the intersection of East 3rd and Harbor Streets, except for the existing slope along the western edge of the property, as shown on Figure 2. This slope is up to 20 feet in height and the ground surface slopes down toward the east at an inclination of approximately 1.5:1 or steeper. Existing 3- to 4-foot-high wood retaining walls were observed along the toe of the slope. A large deposit of loose sand is present at the southwest corner of the site near the top of the slope; the depth of the sand deposit is unknown at this time. An existing relatively new residential development is at the top of the slope and borders the western edge of the site. It is our understanding that the residential development is approximately 15 years old.

During our investigation, the existing structures and improvements associated with the Johns Manville manufacturing facility, including former manufacturing buildings, four rail spurs, asphalt cement pavements, fences, and underground utilities (see Figure 2), were being demolished and either removed from the site or incorporated as part of the new development. According to the documents reviewed for this project (see the References section), a former evaporation pond in the southeast corner of the project site was previously filled in; Figure 2 shows the approximate location of the former pond. Environmental boring logs previously prepared by others indicate the fill and soil in the area of the old evaporation pond contain some

[2] All elevations described in this report are based on the vertical datum as described on the ALTA Land Title survey prepared by Renner Group, dated 20 May 2005, unless otherwise noted.

debris and contaminates that are most likely associated with the previous industrial activities at the project site.

8.0 SUBSURFACE CONDITIONS

The results of our investigation indicate the ground surface at the site is underlain by about 2 to 15 feet of fill. The fill is highly variable in soil type and strength. The estimated thickness of fill at each individual boring and CPT location is shown in the "soil data boxes" presented on Figure 4. The specific soil types and engineering characteristics are presented on the boring and CPT logs and laboratory test results in Appendices A, B, and C. The fill generally consists of loose to medium dense sand and gravel with varying silt and clay content, and medium stiff to very stiff clay with varying sand and gravel content. The near-surface clayey fill encountered at the site generally has a low to moderate expansion potential.

Based on the results of the borings, CPTs, and laboratory tests, we conclude the fill at the southeastern portion of the site and at isolated areas at the northwestern portion of the site are underlain by deposits of compressible soft to medium stiff clay. The lateral extent of compressible deposits at the southeastern portion of the site is approximately shown on Figure 4. The compressible deposits vary between approximately 3 and 43 feet in thickness. The estimated thickness of compressible deposits at each individual boring and CPT is shown in the "soil data boxes" presented on Figure 4. A description of the soil, as well as, specific soil types, depths to compressible soil layers, and engineering characteristics are presented on the boring and CPTs logs and laboratory test results presented in Appendices A, B, and C. The results of our study indicate that the compressible deposits primarily consist of clay with varying amounts of silt and sand.

Beneath the fill at the western portion of the site and beneath the compressible clay deposits at the southeastern part of the site, we generally encountered medium stiff to stiff sandy silt and clay, medium dense to very dense sand with varying amounts of silt and clay, and dense to very dense gravelly sand/sandy gravel.

Groundwater was encountered at depths of 4 to 30 feet bgs in the borings and CPTs during or immediately following drilling or CPT advancement, respectively. Approximate depth to groundwater was also estimated at some CPT locations by using the results of pore pressure dissipation tests. The groundwater depths are summarized in Table 1. These depths to groundwater correspond to elevations between 92.5 and 97.5 feet (corresponding to 4.5 and 9.5 feet MSL respectively). The groundwater level has been previously measured and reported in the environmental reports by others at elevations between approximately 91 to 93 feet (corresponding to 3 and 5 feet MSL respectively). However, due to the close proximity of the project site to the Sacramento-San Joaquin River Delta (i.e., New York Slough), we conclude the groundwater elevation will likely fluctuate with changes in the water level of the slough.

TABLE 1

Depth to Groundwater Observed during the Subsurface Investigation[3]

Location	Approximate Depth to Ground Water
B-1	9 feet bgs (5 feet MSL)
B-2	13-1/2 feet bgs (6-1/2 feet MSL)
B-4	9 feet (5 feet MSL)
B-9	25 to 30 feet bgs (9 to 4 feet MSL)
B-10a	6-1/2 feet bgs (9-1/2 feet MSL)
B-12	9 feet bgs (5 feet MSL)
CPT-1	10 feet bgs (18 feet MSL)
CPT-14	8 feet bgs (8 feet MSL)
CPT-21	11-1/2 feet bgs (6-1/2 feet MSL)
CPT-22	15-1/2 feet bgs (10-1/2 feet MSL)
CPT-38	6 feet bgs (8 feet MSL)
CPT-41	7-1/2 feet (6-1/2 feet MSL)
CPT-43	4 feet bgs (10 feet MSL)

[3] Refer to the boring and CPT logs in Appendices A and B for dates in which the subsurface explorations were performed.

Location	Approximate Depth to Ground Water
CPT-45	4-1/2 feet bgs (11-1/2 feet MSL)
CPT-50	7 feet bgs (9 feet MSL)
CPT-51	6 feet bgs (10 feet MSL)
CPT-53	6 feet bgs (10 feet MSL)
CPT-54	5 feet bgs (11 feet MSL)
CPT-56	6 feet bgs (10 feet MSL)
CPT-59	8 feet bgs (6 feet MSL)
CPT-61	8 feet bgs (6 feet MSL)

9.0 REGIONAL SEISMICITY

The major active faults in the area are the Great Valley Faults, Concord/Green Valley, Greenville, Mount Diablo, and Calaveras Faults. These and other faults of the region are shown on Figure 5. For each of the active faults, the distance from the site and estimated mean Moment magnitude[4] [Working Group on California Earthquake Probabilities (WGCEP) (Cao, et al., 2003)] are summarized in Table 2.

[4] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

TABLE 2

Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Maximum Magnitude
Great Valley 6	7.9	East	6.70
Great Valley 5	13	East	6.50
Concord/Green Valley	15	West	6.71
Greenville	18	Southwest	6.94
Mt. Diablo	23	Southwest	6.65
Total Calaveras	27	Southwest	6.93
Great Valley 4	29	North	6.60
West Napa	34	West	6.50
North Hayward	37	West	6.49
Total Hayward	37	West	6.91
Total Hayward-Rogers Creek	37	West	7.26
South Hayward	37	Southwest	6.67
Great Valley 7	46	Southeast	6.70
Rogers Creek	48	West	6.98
Hunting Creek-Berryessa	54	Northwest	6.9
Hayward-South East Extension	64	South	6.40
San Andreas 1906 Rupture	66	West	7.90
San Andreas- Peninsula	66	West	7.15

Figure 5 also shows the earthquake epicenters for events with magnitude greater than 5.0 from January 1800 through January 1996. Since 1800, four major earthquakes have been recorded on the San Andreas Fault. In 1836, an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale (Figure 6) occurred east of Monterey Bay on the San Andreas Fault (Toppozada and Borchardt 1998). The estimated Moment magnitude, $M_{w,}$ for this earthquake is about 6-1/4. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to a M_w of about 7-1/2. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and

property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista approximately 430 kilometers in length. It had a maximum intensity of XI (MM), a M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The most recent earthquake to affect the Bay Area was the Loma Prieta Earthquake of 17 October 1989 with a M_w of 6.9. The epicenter of the earthquake was in the Santa Cruz Mountains approximately 111 km from the site.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward Fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably a $M_{w\ of}$ about 6.5) was reported on the Calaveras Fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake (M_w = 6.2).

The Coast Ranges-Central Valley Fault (Great Valley) system is characterized by a poorly-defined series of thrust faults and blind thrust faults. The fault system is defined by diffuse seismicity, distinct geomorphic expression of mountain-front faulting, and seismic reflection profiles. The thrust system trends northwest-southeast and is believed to extend 640 kilometers, forming the western boundary of the Sacramento and San Joaquin Valleys. In general, the fault system dips westward. An earthquake on the Coast Ranges-Central Valley Fault system could cause strong seismic shaking at the project site. A number of large historic earthquakes have occurred on this fault system, including the 1892 Vacaville (M_w = 6.8), 1889 Antioch (M_w = 6.3), and the 1983 Coalinga (M_w = 6.5) earthquakes. Geologists have estimated a slip rate ranging from 0.2 to 3 mm/yr. Estimated moment magnitudes of earthquakes along the thrust fault system are between 6.0 and 6.7.

The Concord-Green Valley faults, including some significant active secondary traces such as the Cordelia fault, consist of a highly complex zone with a potential for either one major event or two smaller events to the northwest and southeast of Suisun Bay. A single event model involving a rupture along the Concord and Green Valley faults is estimated to be capable of producing an M_w 6.9 event every 180 years. An alternate model involves independent Concord

and Green Valley fault ruptures that would produce a M_w 6.5 event every 110 years and a M_w 6.7 event every 150 years, respectively (USGS, 2000).

The Mount Diablo blind thrust underlying the Livermore and Sycamore Valleys is the source of major fold structures, including Mount Diablo and the Mount Diablo and Tassajara anticlines (Unruh and Sawyer, 1997). The folds, and the underlying fault, are assumed to be active because they deform late Pleistocene and early Holocene sediments. The geometry and slip rate on the thrust are inferred largely from structural modeling, although the existence of the thrust is consistent with seismic reflection data from the southeastern Tassajara Hills (Unruh, 2000). Unruh and Sawyer hypothesize that this system has formed in a left-stepping transpressional step-over between the right lateral Greenville and Concord-Green Valley faults, and propose a kinematic model in which slip on the Greenville fault is transferred via the Mount Diablo thrust to the Concord Fault. Present modeling results constrain estimates for the minimum slip rate on the Mount Diablo thrust to a range of 1.3 to 2.4 mm/yr.

In 2003, the Working Group on California Earthquake Probabilities (WGCEP 2003) at the U.S. Geologic Survey (USGS) predicted a 70 percent probability of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area by the year 2031. More specific estimates of the probabilities for different faults in the Bay Area are presented in Table 3.

TABLE 3

WGCEP (2003) Estimates of 30-Year Probability (2002 to 2031) of a Magnitude 6.7 or Greater Earthquake

Fault	Probability (percent)
Hayward-Rodgers Creek	27
San Andreas	21
Calaveras	11
San Gregorio	10
Concord-Green Valley	4
Greenville	3

10.0 DISCUSSIONS AND CONCLUSIONS

From a geotechnical standpoint, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical issues to be addressed during site development are:

- seismic hazard, including soil liquefaction and associated hazards
- consolidation-related settlement of soft to medium stiff clay deposits under the weight of new fill and building loads, including the weight of the proposed earthen embankment along the eastern edge of the site
- presence of undocumented fill associated with past site uses and current demolition activities, including fill previously placed in the former evaporation pond area
- relatively shallow groundwater beneath the site
- stability of the existing slope along the western edge of the site
- strong ground shaking due to a seismic event on one of the nearby faults
- foundation design criteria
- construction considerations.

These and other geotechnical issues as they pertain to the proposed development are discussed in following sections.

10.1 Seismic Hazards

The site is not within a state-designated seismic hazard zone. However, during a major earthquake on a segment of one of the nearby faults, strong to very strong shaking is expected to occur at the project site. Strong shaking during an earthquake can result in ground failures such

as those associated with soil liquefaction,[5] lateral spreading,[6] and cyclic densification.[7] We used the results of our field investigations to evaluate the potential of these phenomena occurring at the project site. The results of our evaluation are presented below.

10.1.1 Ground Shaking

The seismicity of the site is governed by the activity of the Great Valley Faults and the Concord/ Green Valley fault. However, strong ground shaking from future earthquakes on any of the nearby faults will be felt at the site. The intensity of earthquake ground motions at the site will depend upon the characteristics of the generating fault, distance to the earthquake epicenter, magnitude and duration of the earthquake, and specific subsurface conditions. We judge ground shaking at the site during a large earthquake on one of the nearby active faults will be strong to very strong.

10.1.2 Soil Liquefaction and Associated Hazards

When saturated, cohesionless soil liquefies, it experiences a temporary loss of shear strength due to a transient rise in excess pore pressure generated by strong ground motion. Flow failure, lateral spreading, differential settlement, loss of bearing strength, ground fissures and sand boils are evidence of excess pore pressure generation and liquefaction. We evaluated the potential for soil liquefaction at the site in accordance with the California Geologic Survey's Special Publication 117 (SP 117) (CGS, 1997), as described in the following sections.

To estimate the peak ground acceleration (PGA) for use in our liquefaction analysis, we selected a Simple Prescribed Parameter Value (SPPV), as described in SP 117. Specifically, we

---

[5] Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits.

[6] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[7] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground-surface settlement.

classified the site according to the procedures and soil profile types defined in Chapter 16 of the 2001 California Building Code (CBC). The site is 7.9 kilometers from the northern portion of the Great Valley 6 fault, which is a Type B fault according to the publication titled *Maps of Known Active Fault Near-Source Zones in California and Adjacent Portions of Nevada* (CDMG, 1998). The 2001 CBC near-source factors for the site are 1.0 and 1.1 for N_a and N_v, respectively. We assumed a soil profile type of S_D for our liquefaction analysis. Based on our classification of the site, we estimate the PGA will be approximately 0.44 times N_a which corresponds to 0.44 times gravity (0.44g). Also, we assumed an earthquake magnitude of 6.7, which is the estimated maximum Moment magnitude for the Green Valley 6 Fault (Table 1).

Liquefaction analyses were performed in accordance with the methodology presented in the publication titled *Liquefaction Resistance of Soils: Summary Report from the 1996 NCEER and 1998 NCFEA/NSF Workshop on Evaluation of Liquefaction Resistance on Soil* (Youd et al, 2001). The methodology is applicable to both the SPT and CPT results. This methodology consists of converting the CPT tip resistance data (q_C) to corrected $(q_{C1N})_{CS}$ values[8] or field blow count data to SPT N-values for determination of the cyclic resistance ratio (CRR), which is used to evaluate liquefaction resistance of the site under seismic loading. In general, the uncorrected field data were converted to overburden-corrected values using the correction factor C_N, where C_N is equal to the ratio $(1/\sigma_v')^n$, where σ_v' is the effective overburden pressure in tons per square foot (tsf), and "n" is an exponent that varies from 0.5 to 1.0 for the CPT analysis and is 0.5 for the test boring analysis, as recommended in the NCEER proceedings. Additional correction values, such as sampler size, hammer efficiency, and rod length, are required for the test boring analysis method.

The susceptibility of the sands to liquefy under seismic loading was evaluated in general accordance with the procedure presented by NCEER which is based on the methodology developed by Seed and Idriss (1982). The equivalent uniform cyclic stress ratio (CSR_{eq}) was estimated for each depth using a magnitude dependent stress reduction factor (r_d) formulation

[8] These values have been corrected to account for the effects of the overburden soil and fines content as recommended by the NCEER procedure.

presented in the NCEER proceedings. The equivalent uniform stress ratio required to trigger liquefaction for a magnitude 7.5 event ($CRR_{7.5}$) was determined from relationships between $CRR_{7.5}$ and $(q_{C1N})_{CS}$, as suggested by NCEER. The factor of safety against liquefaction was defined as $CRR_{7.5}/CSR_{eq}$. Liquefaction is unlikely to occur if any of the following conditions are encountered for a particular soil layer:

- $(q_{C1N})_{CS}$ is greater than 160 tsf
- the soil is determined to be too "fines rich" to liquefy
- the factor of safety against liquefaction is greater than or equal to 1.3.

The results of our investigation indicate that thin layers of medium dense silty and clayey sand and medium stiff to stiff sandy silt were encountered in many of the borings and CPTs at the site. The results of our analyses indicate that soil liquefaction will occur at most of the boring and CPT locations across the site. In general, the potentially liquefiable soil layers are typically less than three feet thick, contain a high silt content, and are laterally discontinuous. Potential hazards associated with these relatively thin, discontinuous layers include total and differential settlement, loss of bearing strength, and ground fissures and sand boils. These and other potential seismic hazards are discussed in the following sections.

10.1.2.1 Liquefaction-Induced Ground Settlement

We used the procedure outlined in the 1997 NCEER report to estimate liquefaction-induced settlement based on CPT data. We also used the method developed by Tokimatsu and Seed (1987) to estimate the amount of settlement that can occur based on the blow count data as presented on the boring logs. By using these analytical methods, we estimate that a maximum of 4 to 5 inches of total liquefaction-induced settlement may occur at the site in the vicinity of boring B-2 and CPT-18. However, the average liquefaction-induced settlement for the site is limited to about 1 to 1.5 inches of total settlement with differential settlement of about 0.5 to 0.75 inches across a 25-foot distance. Estimates of liquefaction-induced settlement at each boring and CPT location are shown in the "settlement data boxes" presented on Figure 7.

Specific areas that may experience greater than three inches of liquefaction-induced settlement during and immediately after a large earthquake on a nearby active fault are listed in Table 4 and Figure 7.

TABLE 4

Estimated Seismically-Induced Settlements Greater Than Three Inches

Location	Depth to Top of Potentially Liquefiable Layer (feet)	Estimated Total Settlement (inches)
B-2	17	4-2/3
B-7	28-1/2	3-3/4
CPT-18	17	3-3/4
CPT-28	11	3-1/4
CPT-29	14	3-2/3
CPT-34	20	3-1/4
CPT-56	8-1/2	3-1/2

10.1.2.2 Liquefaction-Induced Ground Failures

The potential for liquefaction-induced ground failures depends on the thickness of the liquefiable soil layer relative to the thickness of the overlying non-liquefiable material. Ishihara (1985) developed an empirical relationship that provides criteria that can be used to evaluate whether liquefaction-induced ground failure would be expected to occur under a given level of shaking. The behavior of low plasticity (PI less than 12) material with a high fines content (greater than 35 percent passing a standard No. 200 sieve) during dynamic loading is currently an area of ongoing professional research and discussion. Academics and professionals agree that these materials do have a potential to lose strength during dynamic loading; however, the geotechnical community is not agreed in whether these materials will be fluid and mobile resulting in liquefaction-induced ground failures, such as surface ruptures and sand boils, or whether these materials will simply soften under earthquake loading conditions. Based on the CPT and

laboratory test results, we conclude the majority of the near-surface (less than 10 feet bgs) potentially liquefiable soil layers identified by our analysis have fines contents in excess of 35 percent, and silty soil has plasticity indices ranging from 0 to 13. In addition, these near surface potentially liquefiable soil layers are relatively thin (less than 2 feet thick), and are laterally discontinuous. Specific locations where the potential for ground failure is greatest are near CPT-16, CPT-17, CPT-18, CPT-21 and CPT-28. Refer to the boring and CPT logs, and laboratory test results in Appendices A, B, and C for specific subsurface conditions. On the basis of our engineering analysis and professional experience, it is our opinion that the potential for liquefaction-induced ground rupture at the site is generally low, primarily due to the high silt content of the potentially liquefiable soil. We believe that occasional ground surface ruptures may occur near CPT-16, CPT-17, CPT-18, CPT-21 and CPT-28 during a large earthquake; however, the underlying soil has a very high silt content and will have limited mobility to manifest itself at the ground surface (e.g., sand boils). Overexcavation of the potentially liquefiable layers is not considered feasible since the potentially liquefiable soil layers are below the groundwater, generally thin, discontinuous, and extend to the maximum depths explored by our borings and CPTs, which correspond to depths of about 50 feet bgs. Consequently, the proposed buildings to be constructed within areas susceptible to liquefaction-induced ground failures should be supported on stiffened foundations that rest on a layer of well-compacted fill or a deep foundation system that gains support below the potentially liquefiable soil layers. It is our opinion that these types of foundation systems can be used to safely support the proposed residential structures within areas that are potentially susceptible to liquefaction-induced ground failures.

10.1.2.3 Lateral Spreading

Lateral spreading occurs when a continuous layer of soil liquefies at depth and the soil layers above move toward an unsupported face, such as an open slope cut or in the direction of a regional slope or gradient. We evaluated the potential for liquefaction-induced lateral spreading at the site using the method developed by Bartlett and Youd (1995). Based on the results of our analyses, we conclude the underlying layers of saturated sand and silt are sufficiently dense

and/or laterally discontinuous; therefore, we conclude the potential for lateral spreading at the site is low.

10.1.3 Cyclic Densification

Seismically induced compaction or cyclic densification of non-saturated sand (i.e., sand above the groundwater table) due to earthquake vibrations may cause differential settlement. We used the procedure recommended by Tokimatsu and Seed (1984) to estimate the magnitude of settlement associated with cyclic densification. In general, a majority of the non-saturated soil at the site contains sufficient clay content to resist cyclic densification. However, occasional layers of loose, non-saturated sand and silt that are potentially susceptible to cyclic densification were encountered at the site in isolated areas. The amount of settlement associated with cyclic densification at the individual borings and CPT locations across the site are presented in the "settlement data boxes" on Figure 7. Based on our evaluation, we conclude non-saturated soil at the site could settle up to 1/2 inch as a result of cyclic densification following a large earthquake; this amount of settlement is considered relatively low in the greater San Francisco Bay Area.

10.1.4 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure is very low. We therefore conclude the risk of fault offset at the site from a known active fault is low.

10.2 Consolidation-Related Settlement

Based on the results of our subsurface investigation, we conclude the southeastern portion of the site, as well as, isolated areas at the northwestern portion of the site are underlain by deposits of compressible soft to medium stiff clay. The estimated lateral extent of compressible soil

deposits at the southeastern portion of the site is shown on Figure 4. The estimated thickness of compressible deposits at individual boring and CPT locations is shown in the "soil data boxes" presented on Figure 4. Neither the thickness nor the compressibility characteristics of the clay is uniform across the site.

Based on the results of our study, we conclude the underlying layers of soft to medium stiff clay will consolidate and settle under the weight of new fill and building loads, including the weight of the proposed earthen embankment along the eastern edge of the site. The weight of new fill and building loads will begin a new cycle of consolidation settlement in the compressible clay deposits. The amount and rate of consolidation settlement depends upon: 1) the weight of new fill and buildings, 2) the thickness of the existing fill, 3) the thickness and consolidation characteristics of the compressible soil deposits, 4) the degree of desiccation within the upper portion of the compressible deposits, and 5) the presence of sand layers within the compressible deposits. Because these factors vary significantly across the site, the amount of total and differential settlement expected beneath the proposed buildings and improvements are difficult to estimate. However, in general, our calculations indicate that for every foot of new fill placed, we anticipate total settlement of about 1/2 inch due to the consolidation of the underlying compressible deposits. Once the final grading plans and structural loads become available, we should review the plans to verify our assumptions and perform additional analyses to evaluate the settlement behavior of the buildings at the site, if necessary.

10.3 Settlement of the Proposed Earthen Embankment

As part of the environmental remediation of the site, we understand on-site soil impacted with chemical contaminants will be used as fill within the proposed earthen embankment along Harbor Street. Due to the estimated quantity of impacted soil, we understand a below-grade excavation will be created, the chemically impacted soil will be placed beneath and within the proposed earthen embankment, and the embankment will be covered by a layer of clean soil. The approximate location of the earthen embankment is shown on the conceptual development plan (Figure 3) as an elongated "open space" area. Based on our recent discussions with the environmental consultant, ERM, we understand the earthen embankment will have:

- an above-grade portion that is approximately 10 feet high and 69 feet wide at the base (between the toe of the side slopes); 3-foot-wide drainage swales are planned along the eastern and western edges of the embankment
- a below-grade portion that is approximately 10 feet deep and 75 feet wide; the lower portion of the fill will extend below the existing groundwater level during certain times of the year
- side slopes at inclinations of approximately 2.25:1.

Based on our understanding of subsurface conditions across the site, and the proposed configuration and alignment of the earthen embankment, we conclude the southern portion of the proposed earthen embankment will be underlain by variable thicknesses of compressible soil deposits. We performed settlement computations along the length of the earthen embankment; the estimated magnitudes of consolidation-related settlement are presented in Table 5. Our settlement analysis considered cross-sections at approximate boring and CPT locations along the embankment alignment. The subsurface conditions are based on our interpolation and/or extrapolation of soil and groundwater conditions in the vicinity of each cross-section. The earthen embankment fill material was assumed to be incompressible and approximately the same weight as the native soil that will be removed from the below-grade portion of the embankment excavation.

TABLE 5

Estimated Consolidation-Related Settlement of Proposed Embankment

Approximate Cross-Section Location	Estimated Consolidation Settlement Along the Length of the Embankment (inches)
CPT-11	4-1/4 to 9
B-8/CPT-21	4 to 8-1/2
CPT-12	1/2 to 1
CPT-33	<1/4
CPT-36	10-1/4 to 21-1/2
CPT-13	8-1/2 to 18
B-11	2-1/2 to 5-1/4
CPT-40/ B-12/ CPT-41	3/4 to 1-2/3

Due to the subsurface soil conditions and the relatively large footprint of the earthen embankment, we conclude the weight of the proposed earthen embankment will cause settlement of the surrounding area (away from the earthen embankment alignment). To estimate the lateral influence of the earthen embankment, we performed consolidation settlement analyses at various distances away from the earthen embankment centerline to estimate the distance in which one inch of settlement would occur due to the weight and configuration of the proposed earthen embankment. Our results are presented on Table 6 and they are based on engineering analyses, and our interpolation and/or extrapolation of subsurface soil and groundwater conditions from borings and CPTs in the vicinity of each cross-section. The results of our analyses indicate the placement of the proposed earthen embankment material can significantly influence the settlement of the ground surface at distances of more than 70 feet away from earthen embankment centerline.

TABLE 6

Estimated Distance from the Embankment Centerline for One Inch of Settlement

Approximate Cross-Section Location	Estimated Horizontal Distance from Embankment Centerline for One Inch of Settlement (feet)
CPT-11	35 to 45
B-8/CPT-21	30 to 40
CPT-12	24 to 40
CPT-33	0
CPT-36	55 to 70
B-11	24 to 40
CPT-40/ B-12/ CPT-41	0 to 25

The consolidation of soft to medium stiff clay deposits under the weight of new fill and building loads will occur slowly over time. The rate of settlement is dependant upon the permeability and consolidation characteristics of the soil, the stress history, and the water level beneath the earthen embankment. Our estimates of the time needed to achieve 50 and 90 percent of the total consolidation-related settlement are presented on Table 7. In general, we estimate that portions of the proposed earthen embankment will continue to settle for approximately 12 to 24 years after the earthen embankment is constructed. Therefore, periodic maintenance of the earthen embankment and surrounding area should be expected.

TABLE 7

Estimated Time Rate of Consolidation of the Proposed Embankment Fill

Approximate Cross-Section Location	Time Needed to Reach 50% Consolidation (Years)	Time Needed to Reach 90% Consolidation (Years)
CPT-11	1-1/2 to 3-1/2	7 to 14
B-8/CPT-21	1-1/2 to 3	6 to 12
CPT-12	< 1/2	< 1/2 to 1
CPT-33	2 to 4	8 to 16
CPT-36	2-1/2 to 5-1/2	12 to 24-1/2
CPT-13	3 to 6	11 to 22-1/2
B-11	1 to 2	4 to 8-1/2
CPT-40/ B-12/ CPT-41/B-4	< 1/2	1-1/2

10.4 Foundations and Settlement

A plan showing the proposed Harbor Park development is presented on Figure 3. We understand the proposed residential structures within the DMDR and DHDR areas will consist of 2- and 3-story, wood-framed structures, respectively. Building loads for these structures were not available at the time this report was being prepared; however, based on our experience with similar types of structures, we estimate the 2-story building will have wall and column loads of about 2 kips per linear foot (klf) and about 100 kips per column, respectively. We estimate the 3-story structure will have wall and column loads of about 3 klf and about 150 kips per column, respectively. In general, these proposed buildings are relatively light. However, the subsurface conditions at the proposed building sites are highly variable, and in their existing condition, we conclude the proposed structures can not be supported on conventional shallow foundations. Instead, we conclude the proposed buildings should be supported on either stiffened shallow foundations bearing on a layer of well-compacted fill or on deep foundations. These foundation systems are discussed in subsequent sections of this report.

To better understand the magnitudes and types of settlement that could impact the proposed residential structures, we summarized our settlement estimates on Figure 7. In general, the proposed building sites are susceptible to the following potential sources of settlement:

- liquefaction-induced settlement
- settlement associated with the cyclic densification of non-saturated granular soil
- consolidation-related settlement associated with the placement of new fill; for our settlement analyses, we assumed that site grades would remain the same and no new fill will be added to the site; therefore, settlements associated with new area fills are not included in the settlement estimates presented on Figure 7
- consolidation-related settlement associated with the weight of the proposed buildings
- consolidation-related settlement with significant lateral influences resulting from the weight and configuration of the proposed earthen embankment
- erratic ground settlement associated with the presence of undocumented fills; settlements associated with undocumented fills are not included in the settlement estimates presented on Figure 7; however, we believe that performing a comprehensive site preparation and grading program will expose areas of loose or weak fill; subsequently, the weak soil subgrade can be repaired prior to the placement of new fill and the construction of the proposed buildings.

Based on our evaluation of various foundations options, we conclude the primary geotechnical issue that affects the selection of the foundation type for each structure is the presence of compressible clay deposits in the southeastern portion of the site (Figure 4) that are subjected to new fill and building loads, including earthen embankment loads. The proposed fill and building loads will cause the compressible clay deposits to settle as indicated on Figure 7, which could potentially damage shallow foundation systems. Therefore, at locations where the proposed building sites are underlain by compressible soil deposits (Figure 4) and are subjected to new fill

and building loads, we conclude these proposed structures should be supported on deep foundations, such as driven piles or drilled cast-in-place concrete piers that gain support in competent soil below the compressible soil deposits. The approximate locations of the proposed residential units that should be supported on deep foundations are shown on Figure 8. As indicated on Figure 8, deep foundations are recommended for the southeastern portion of the DHDR development area. This area is underlain by compressible clay and subject to additional settlement from consolidation caused by the weight of the proposed earthen embankment. Because of the characteristics of the underlying deposits we estimate settlements will occur slowly over time. Although the southeastern portion of the DMDR development area is underlain by compressible clay deposits, we feel that deep foundations are not necessary in this area because the estimated amount of consolidation-related settlement is than two inches and these settlements are expected to occur in less than one year.

At all other locations, we conclude the quality and consistency of the native soil and fill at the site is variable. If new structures are designed to gain support on shallow foundations bearing on undocumented fills in their existing condition, we estimate the new buildings may experience erratic total and differential settlements of up to 6.5 inches and three inches across a horizontal distance of 25 feet, respectively. Total and differential settlements can be estimated by summing the settlement values presented on Figure 7. For example the total settlement for the area near CPT-15 is approximately 4-1/4 inches (sum of the estimated settlement due to building loads, cyclic densification, and liquefaction). The estimated differential settlement between CPT-15 and CPT-58 is approximately 2-2/3 inches over a distance of approximately 70 feet (difference of total settlements divided by the distance between points) or approximately 1-inch over a distance of 25 feet. Differential settlement can cause cracks to develop in building foundations and can potentially damage new structures. To reduce the potential for foundation settlement and subsequent building damage, we conclude the proposed buildings should be supported on stiffened shallow foundations, such as post-tensioned slabs (P-T slabs), reinforced mats, or interconnected footings that gain support on at least a 3-foot-thick layer of compacted fill. We estimate that buildings supported on stiffened shallow foundations bearing on at least a

3-foot-thick layer of compacted fill will experience less than 1-1/2 inches of differential settlement across a 25-foot distance.

Alternatively, the proposed structures may be supported on deep foundations that gain support in competent soil below the highly compressible clay deposits. Deep foundations will prevent excessive differential and total settlement of the structures, although the utilities and surrounding improvements (pavements, and landscaping) may continue settle over time. We estimate new buildings that gain support on deep foundations will experience less than 0.5 inch of differential settlement across a 25-foot distance. Deep foundations would also need to be designed to resist downdrag loads induced by the settling soil. Recommendations for the design of building foundations are provided in Section 11.

10.5 Undocumented Fill

Based on the boring and CPT data, the site appears to be blanketed by undocumented fill that ranges in thickness from approximately 3 to 10 feet thick, except in the area of the backfilled former evaporation pond and the loose sand deposit at the southwest corner of the site, which may extend deeper than 10 feet. The depths of undocumented fill encountered at each of the boring and CPT locations are shown on Figure 4. Undocumented fill associated with the existing underground utility trench backfill is also anticipated to be encountered during grading. Considerations regarding the treatment of existing underground utilities are discussed below in Section 10.11. The existing fill generally appears to be poorly to moderately compacted, and consists of various types of soil (sand, silt, and clay). It is our understanding that the existing fill in the area of the backfilled former evaporation pond will be removed and replaced with clean, engineered fill as part of the proposed improvements. Deeper deposits of undocumented fill may be encountered during grading operations. In general, undocumented fill below new foundations and other proposed settlement-sensitive structures should be removed to expose competent material and backfilled with engineered fill in accordance with the recommendations in Section 11.1.

10.6 Expansive Soil Considerations

The existing near-surface soil, specifically in the western portion of the site, consists of low to moderately expansive sand and clay. However, we anticipate the soil along the eastern portion of the site may consist of moderately to highly expansive clay. Moisture fluctuations in the expansive soil could cause the soil to expand or contract resulting in movement and potential damage to foundations, slabs, and pavements. Potential causes of moisture fluctuations include seasonal changes, drying during construction, and subsequent wetting from rain, capillary rise, and landscape irrigation. To limit the amount of differential movement of the expansive soil due to changes in moisture content, proposed slab-on-grade floors, exterior slabs, and pavements should be underlain by a layer of non-expansive, select fill or chemically treated on-site soil. Mat foundations or post-tensioned (P-T) slabs should be checked to ensure they can resist movements associated with seasonal moisture changes, but it is not necessary to place select fill beneath mats or P-T slabs.

10.7 Demolition of Existing Structures

It is our understanding that currently, all of the buildings, building foundations, and most of the other above-grade improvements associated with the Johns Manville Manufacturing Facility have been demolished and removed from the site. We did not observe the demolition of the buildings and are not familiar with the depth, locations, or lateral extent of disturbed material. However, we understand some of the footings that supported the former manufacturing buildings may have extended deeper than five feet bgs. These footing excavations may have been backfilled with loose soil; therefore, we conclude there is a potential for encountering localized areas of soft subgrade during site grading activities. Our recommendations for site preparation and grading are presented in Section 11.1.

Existing concrete from the foundations, asphalt concrete from pavement areas, and ballast rock beneath railroad spurs encountered during grading activities can be crushed and incorporated as engineered fill (including aggregate base material) and/or used as granular fill, if it meets the project specifications and is approved for re-use by the environmental consultant.

10.8 Slope Stability

The existing residential development on the western edge of the project site is on top of an approximately 1.5:1 slope. The slope is up to 20 feet in height and we believe the slope was originally cut during the development of the Johns Manville Manufacturing Facility. We performed a slope stability analysis by incorporating the subsurface data and laboratory test results from borings B-9 and B-13. In general, the slope is primarily composed of silt and clay with some sandy soil exposed on the face of the slope. Based on the results of our analysis, we conclude the existing slope has a factor of safety of at least 1.5 and 1.15 against deep rotational failure with respect to static and seismic loading conditions, respectively. However, during our field activities, we observed localized surficial erosion and shallow soil slumps. Also, we observed portions of the existing retaining walls that showed evidence of rotation due to lateral earth pressures. At the time of our field activities, most of the slope face was covered with dense vegetation and was not visible for inspection.

Based on observations, we conclude the sandy material that is exposed on the face of the 1.5:1 slope is marginally unstable and will tend to erode and/or continue to experience shallow soil slumps unless the slope is flattened to a more stable configuration. Recommendations for stabilizing and retaining the slope along the western edge of the site are presented in Sections 11.2 and 11.8, respectively.

10.9 Groundwater

As discussed in Section 8.0, groundwater was encountered during our investigation between Elevation 92.5 and 97.5 feet (4.5 and 9.5 feet MSL respectively). Groundwater levels were reported by others between about Elevation 91 and 93 feet (3 and 5 feet MSL respectively). For project design purposes, we conclude a groundwater level at Elevation 93 feet (5 feet MSL) should be used for the site. At this elevation, we believe the lower portion of the proposed earthen embankment will extend below the groundwater table; therefore, temporary dewatering of the excavation may be required.

10.10 Corrosion Potential

The corrosion potential of the on-site subsurface soil was evaluated near boring B-5 as part of this geotechnical investigation. The results of the corrosion testing are presented in Appendix C, and they indicate the near-surface soil in the vicinity of boring B-5 has a minimum resistivity of 1882 ohm-cm, a chloride concentration of 4 mg/kg, a chloride concentration less than 0.0005 percent by dry weight, and a pH of 8.8. These results indicate the near surface soil near boring B-5 has a high corrosion potential for buried metals, and low corrosion potential for concrete. We conclude that more corrosion tests should be performed on the final soil subgrade throughout the site once the grading plans become available.

10.11 Construction Considerations

Existing underground utilities at the site may require removal and/or abandonment. Some of the existing utilities may extend below the groundwater table, and removal and subsequent backfilling of the excavations may be difficult due to the presence of high groundwater. In that case, abandonment by filling with grout would be acceptable. Any loose, weak existing utility trench backfill material that may be encountered during future site grading should be removed and replaced with properly compacted fill.

We anticipate that planned excavations may extend below the existing groundwater level. Soil removed from the excavations may be wet and may require significant moisture-conditioning (drying) prior to re-use as compacted fill. Also, if site grading is performed during wet weather, the exposed soil subgrade may become wet and difficult to compact. The grading contractor should be prepared to repair the weak and wet subgrade, if required.

10.12 Temporary Slopes and Shoring for Construction of the Proposed Earthen Embankment

Construction of the proposed earthen embankment will require an approximately 10-foot-deep excavation. Our analysis indicate temporary cut slopes with inclinations no steeper than 1.5:1 may be used to temporarily support the sidewalls of the excavation. If temporary cut slopes are

not feasible for the proposed earthen embankment excavation, temporary shoring may be used. Due to the relatively shallow groundwater at the site, an active or passive dewatering system may be required. From our discussions with the design team, we understand a passive dewatering system is preferred. A sheet pile shoring system that extends through granular layers below the bottom of the excavation could be used to cut-off the lateral flow of groundwater and help reduce the amount of water that flows into the excavation. Also, the temporary shoring system can be used to reduce the potential for bottom heave in situations where the bottom of the excavation exposes weak compressible soil.

11.0 RECOMMENDATIONS

Recommendations for grading, and preliminary recommendations for foundation design, retaining walls, slabs-on-grade, and other geotechnical aspects for Harbor Park Development are presented in the following sections.

11.1 Site Preparation and Grading

Demolition in areas to be developed should include removal of existing pavement and underground obstructions, including foundations of existing structures. Any vegetation and organic topsoil should be stripped in areas to receive new site improvements. Stripped organic soil can be stockpiled for later use in landscaped areas, if approved by the owner and architect; organic topsoil should not be used as compacted fill.

Demolished asphalt and concrete at the site may be crushed to provide recycled construction materials, including sand, free-draining crushed rock, and Class 2 aggregate base (AB). Where crushed rock will be used beneath vapor retarders and in other applications where free-draining materials are required, it should have no greater than six percent of material passing the 3/8-inch sieve and meet the other requirements presented in Section 11.7. Where recycled Class 2 AB will be used beneath pavements, it should meet requirements of the Caltrans Standard Specifications. Recycled Class 2 AB that does not meet the Caltrans specifications should not be used beneath City streets, but it is acceptable for use as select fill within building pads and

beneath concrete flatwork, provided it meets the requirements for select fill as presented in a subsequent section of this report.

Existing underground utilities beneath areas to receive new improvements should be removed or abandoned in-place by filling them with grout. The procedure for in-place abandonment of utilities should be evaluated on a case-by-case basis, and will depend on location of utilities relative to new improvements. However, in general, existing utilities within four feet of final grades should be excavated and removed, and the resulting excavation should be properly backfilled.

After clearing and grubbing are completed, the proposed building areas should be excavated to accommodate at least a three-foot thick layer of compacted fill beneath the planned building foundations and slab-on-grade floors. For example, if a grid foundation system is used, the 3-foot-thick layer of compacted soil should extend beneath the bottoms of the proposed footings. If a mat or P-T slab is selected, the 3-foot-thick layer of compacted soil should extend beneath the moisture barrier system that lies below the mat or slab. The proposed excavations should extend a lateral distance of at least five feet beyond the planned building footprints. Alternatively, if a deep foundation option is selected, the proposed building sites need only be cut to the proposed final subgrade elevations.

The subgrade exposed at the bottom of the proposed building pad excavations, as well as other portions of the site that will receive new fill or site improvements, should be scarified to a depth of at least eight inches, moisture-conditioned to at least three percent above the optimum moisture content, and compacted to at least 90 percent relative compaction[9] where the exposed material consists of moderately expansive soil. Where lean clay or sandy soil are encountered during grading, the scarified surface should be moisture-conditioned to above the optimum moisture content and compacted to at least 90 percent relative compaction. An exception to this general procedure occurs within the proposed pavement areas, where the upper six inches of the

[9] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557-00 laboratory compaction procedure.

pavement subgrade should be compacted to at least 95 percent relative compaction. If areas of weak soil are encountered during subgrade preparation, we recommend the proposed building pads and pavement areas be repaired by using one of the subgrade repair options presented in a subsequent section of this report. The soil subgrade should be kept moist during construction to prevent desiccation cracks.

Any select fill placed during grading should meet the following criteria:

- be non-hazardous
- be free of organic matter
- contain no rocks or lumps larger than three inches in greatest dimension
- have a low expansion potential (defined by a liquid limit of less than 40 and plasticity index lower than 12)
- have a low corrosion potential[10]
- be approved by the geotechnical engineer.

All select fill should be moisture-conditioned to above optimum moisture content, placed in horizontal lifts not exceeding eight inches in loose thickness, and compacted to at least 90 percent relative compaction, except if the fill is placed within the proposed pavement areas. In this situation, the upper six inches of the soil subgrade and all AB materials should be compacted to at least 95 percent relative compaction. Where used, sand containing less than 10 percent fines (particles passing the No. 200 sieve) should be compacted to at least 95 percent relative compaction.

[10] Low corrosion potential is defined as a minimum resistivity of 2,000 ohms-cm and maximum sulfate and chloride concentrations of 250 parts per million.

Samples of on-site and proposed import fill materials should be submitted to the geotechnical engineer for approval at least three business days prior to use at the site. The grading subcontractor should also provide analytical test results or other suitable environmental documentation to ERM for approval prior to importing fill to the site.

Excavations extending below the groundwater are anticipated. For example, one area of planned excavation is at the former evaporation pond area, as shown on Figure 2. We estimate the maximum depth of excavations will be about 10 to 15 feet bgs; however, the actual depth is not certain and will need to be determined in the field. If soft subgrade and/or ponded water are encountered at the bottom of proposed excavations in areas where soil compaction is required, we recommend the following procedure:

- temporarily pumping the water from the excavation
- placing a layer of geotextile tensile fabric (Mirafi 500X or equivalent) over the sides and bottom of the excavation
- placing an 18- to 24-inch-thick layer of gravel or crushed rock (1/2- to 3/4-inch gradation) over the geotextile tensile fabric and track-rolling the granular material
- installing a temporary sump and pump within the gravel layer to facilitate the dewatering of the excavation
- place a layer of filter fabric (Mirafi 140N or equivalent) over the surface of the gravel
- place fill over the filter fabric material and compact the fill in horizontal lifts as previously discussed in this section.

If weak soft subgrade is encountered during grading (at locations other than pond areas), it should be repaired using one of the following options:

Subgrade Repair Option 1 – Moisture-Conditioning and Compaction

Scarifying the exposed subgrade to a depth of 8 to 12 inches, moisture-conditioning (wetting or drying) the soil to near the optimum moisture content, and compacting the soil to at least 90 percent relative compaction. Typically, this option is the least expensive to implement, but it requires several days to weeks of dry, warm weather to facilitate the moisture-conditioning process.

Subgrade Repair Option 2 – Lime or Cement Admixture

Thoroughly mixing a lime- or Portland-cement-based admixture into the subgrade at a concentration of 4 to 5 percent of the dry weight of the soil being treated; allowing the admixture to react with the wet soil for at least 12 hours, re-mixing and moisture-conditioning the soil to above the optimum moisture content, and compacting the lime- or cement-treated material to at least 90 percent relative compaction.

Subgrade Repair Option 3 – Overexcavation and Filling

Weak wet soil can be excavated and removed to expose firm subgrade or excavated to a depth of 18 to 24 inches bgs (or as recommended by our field engineer). A layer of geotextile tensile fabric (Mirafi 500X or equivalent) can then be placed over the sides and bottom of the excavation and the excavation backfilled with Caltrans Class 2 AB that has been compacted to at least 95 percent relative compaction. Alternatively, the excavation can be backfilled with Controlled Density Fill (CDF), sand-cement slurry, or lean cement with a 28-day unconfined compressive strength of at least 50 pounds per square inch (psi).

The most appropriate subgrade repair option will depend on the time of year site grading commences and the time available to allow drying of the soil. We will provide recommendations for subgrade stabilization on a case-by-case basis. We recommend a non-vibratory roller be used to compact weak and/or wet subgrade soil and fill placed over wet subgrades.

11.2 Permanent and Temporary Slopes and Shoring

For a permanent slope, such as along the western edge of the site, we recommend a maximum slope inclination of approximately 2:1. The slope should be graded so that surface water drains away from the top of slope, and the face of slope should be planted with appropriate deep-rooted vegetation to reduce the potential for surface erosion.

If temporary cut slopes are required to facilitate new excavations at the site, we recommend using slope inclinations no steeper than 1-1/2:1. Where sloped excavations are not feasible, then a temporary cantilever sheet pile wall may be used. Figure 9 present our recommended lateral earth pressures for design of a cantilever sheet pile wall. The lateral earth pressures of soft clay are dependant upon the length of time that the excavation will remain open. For this project, we recommend using the lateral earth pressures presented in Figure 9. If vehicular traffic will be within 10 feet horizontally from the top of the shoring an additional uniform load of 100 psf should be applied to the upper 10 feet of the shoring. Construction equipment and soil stockpiles should not be allowed within a horizontal distance of 10 feet of the shoring, unless additional loading is considered in the design of the shoring system.

For a 10-foot-deep excavation measured from the existing ground surface, we recommend that sheet piles extend a minimum of five feet below the bottom of the planned excavation. The sheet pile will help cut-off the lateral flow of water into the excavation and help prevent heaving of the bottom of the excavation. If a deeper excavation is required, T&R should be contacted to revise our recommendations, as necessary.

11.3 Temporary Dewatering

The groundwater level at the site will fluctuate due to seasonal conditions and will vary with the tide level in the nearby Sacramento-San Joaquin River Delta. Dewatering of the excavations is anticipated. We recommend the groundwater within proposed excavations be drawn down below the bottom of the excavation until sufficient fill has been placed and compacted to raise the working surface above the groundwater table.

Either active or passive dewatering systems can be used at the site. During conversations with the project design team, we understand a passive dewatering system is the preferred option. The dewatering system should be designed and implemented by an experienced dewatering contractor. We should have the opportunity to check the dewatering system design proposed by the contractor prior to installation.

11.4 Foundations

The following sections present preliminary foundation recommendations for the Harbor Park development. As discussed in Section 10.4 and shown on Figures 4 and 8, the proposed building sites that are underlain by compressible, soft to medium stiff, clay deposits and subjected to new fill and building loads, should be supported on deep foundations that gain support in competent soil below the compressible clay deposits. At all other locations, we recommend the proposed 2- to 3-story buildings be supported on stiffened shallow foundations that rest on at least a 3-foot-thick layer of compacted fill.

11.4.1 Stiffened Shallow Foundations

Stiffened shallow foundation systems should bear on at least a 3-foot-thick layer of compacted fill. A stiffened shallow foundation system may consist of either interconnected, continuous spread-type footings, a reinforced concrete mat, or a P-T slab. Foundation recommendations are presented in the following sections.

11.4.1.1 Interconnected Continuous Footings and Mats

Interconnected continuous footings and mats that bear on at least a 3-foot-thick layer of compacted fill may be designed using an allowable bearing pressure of 1,000 pounds per square foot (psf) for dead plus live loads. This value contains a factor of safety of at least 2.0 and may be increased by one-third for total loads, including wind or seismic forces. The maximum allowable bearing pressures will likely occur only in the vicinity of columns and walls. To evaluate the pressure distribution beneath the continuous footings or mat, we recommend using a modulus of vertical subgrade reaction of 10 pounds per cubic inch (pci). In addition, we

recommend the stiffened shallow foundation system be designed to span an unsupported area of 10 feet in diameter at any location within the building interior, and cantilever a distance of three feet along the edges and five feet at the corners. If continuous spread footings are used, they should be at least 18 inches wide and should extend at least 18 inches below the lowest adjacent grade. If a mat is selected, the edges of the mat should be thickened, such that the foundation edge is bottomed at least 12 inches below the adjacent exterior grade or six inches below the bottom of the capillary moisture break and vapor retarder system, whichever is lower, as indicated on Figure 10.

Lateral loads can be resisted by a combination of passive pressures on the embedded vertical faces of the footings or mat, and friction along the base of the foundation elements. Passive resistance may be computed using an equivalent fluid weight of 300 pounds per cubic foot (pcf) in the compacted fill; the upper foot of soil should be ignored unless confined by slabs or pavement. Frictional resistance should be computed using a base friction coefficient of 0.30 for footings and mats bearing on soil subgrade. A base friction value of 0.15 should be used for mats bearing on waterproofing or a vapor retarder. The passive resistance and friction values include a factor of safety of about 1.5 and may be used in combination without reduction.

The foundation subgrade should be kept in a moist condition until covered. We should observe the mat or footing excavations prior to placement of reinforcing steel. If the subgrade consists of clayey soil and is allowed to dry during construction, it will be necessary to scarify the upper 8 to 12 inches of the foundation subgrade, moisture-condition the soil to above the optimum moisture content, and compact the soil in accordance with the recommendations presented in Section 11.1. The foundation excavations should be free of standing water, debris, and disturbed materials prior to placing concrete.

11.4.1.2 Post-Tensioned (PT) Slab-on-Grade Foundations

P-T slabs can be used in lieu of a grid or mat foundation where stiffened shallow foundations are required. The edges of the mats should be thickened such that the foundation edge is bottomed at least 12 inches below the adjacent exterior grade or six inches below the bottom of the

capillary moisture break (if used) or vapor retarder, whichever is lower. A conceptual foundation edge detail showing the embedment of P-T slab is shown on Figure 10. P-T slabs should be designed using the maximum allowable bearing pressures presented previously in Section 11.4.1.1.

Also, we recommend using P-T slab design parameters based on the California Building Code Chapter 18. For general design of the P-T slabs in highly expansive soil conditions, we recommend using the parameters presented in Table 8.

TABLE 8

P-T Slab Design Parameters

Parameter	Value
Edge moisture variation distance edge lift center lift	 5.0 feet 5.5 feet
Constant soil suction	3.5 pF
Soil differential movement edge lift center lift	 1.5 inches 3.5 inches

The soil differential movement is likely controlled by the amount of differential settlement expected rather than the potential for seasonal differential movement. In addition, we recommend the P-T slab foundation system be designed to span an unsupported area of 10 feet in diameter at any location within the building interior, and cantilever a distance of three feet along the edges and five feet at the corners.

Recommendations regarding resistance to lateral loads and subgrade preparation are the same as those presented for interconnected continuous footings and mat foundations in Section 11.4.1.1.

The recommendations presented above assume the as-graded near-surface soil will be highly expansive; however, as site grading processes, we recommend that additional laboratory testing

and engineering analyses be performed to verify our assumptions and potentially revise our recommendations, if necessary.

11.4.2 Deep Foundations

Deep foundations should gain support through skin friction in competent soil below weak compressible clay deposits. For the preliminary foundation design purposes, we selected drilled piers as the most appropriate deep foundation system for the proposed project. However, there are several other acceptable foundation systems that can be used for the support of new buildings at the project site.

Drilled piers installed in a group should be spaced at least three diameters apart, center to center spacing. To compute the axial compressive and uplift capacity of drilled piers, we recommend using an allowable skin friction of 1,000 psf for dead and live loads. This skin friction value should be applied to the portion of the piers that extends below the bottom of the compressible clay deposits, as indicated on the boring and CPT logs presented in Appendices A and B, and as can be determined from Figure 4. For total loads, including wind or seismic loads, the skin friction value can be increased by one-third. Axial support from the compressible soft to medium stiff clay deposit should be ignored. If new area fills are added to the site, we recommend the deep foundations be designed for a negative skin friction load (down-drag) of 400 psf, applied to the portion of the piers that extend above the bottom of the compressible clay deposits. The drilled pier holes should be free of debris and water, and inspected by the geotechnical engineer before placing reinforcing steel and concrete.

Lateral loads can be resisted through a combination of passive pressure acting against the embedded vertical faces of pier caps and from the structural rigidity of the piers. Passive resistance against the vertical faces of pier caps may be computed using an equivalent fluid weight (triangular distribution) of 300 pcf; the upper foot of soil should be ignored unless it is confined by a slab or pavement. Lateral resistance of piers will depend on the pier diameter, pier head condition (restrained or unrestrained), allowable deflection of the pier top, and the bending moment resistance of the piers. We have performed lateral load analyses for isolated, 18- and

24-inch-diameter piers for pier head deflections of 0.5 inch. The results of our analyses are presented in Table 9.

TABLE 9

Results of Lateral Load Analyses for 0.5-inch Deflection at Pier Top

Pier Diameter (inches)	Pier Top Condition	Computed Lateral Load at 0.5-inch Deflection (kips)	Computed Maximum Bending Moment (kip-feet)	Depth to Maximum Bending Moment (feet)
18	Restrained	13.7	88	0.0
18	Unrestrained	5.5	30	9.3
24	Restrained	21.7	176	0.0
24	Unrestrained	8.8	61	12.7

The lateral resistances tabulated in Table 9 are for isolated piers or piers in a group spaced at least six pier diameters apart. If two piers are installed in a row with a center to center spacing of three diameters apart, we recommend reducing the lateral capacities by 20 percent. The design bending moments should not be reduced and should remain the same as those presented in Table 9. If larger pier groups are needed for support of the buildings, we should evaluate each group and provide reduction factors on a case by case basis.

11.5 Underground Utilities

Excavations for utility trenches can be readily made with a backhoe. Despite careful site preparation, unexpected obstructions may make some of the trenching operations difficult. All trenches should conform to the current CAL-OSHA requirements.

The thickness and type of bedding material required for utility conduits will depend on the soil conditions at the utility trench bottom. As a minimum, bedding should have a thickness of at least D/4 (with D equal to the outside pipe diameter) below the bottom of the pipe, and a minimum thickness of at least four inches. Clean sand, rod mill, or pea gravel bedding material are adequate for use as bedding materials in shallow trenches above the groundwater level.

Where the utility trenches extend below the groundwater level at Elevation 93 feet, we recommend using at least 12 inches of crushed rock bedding. Bedding should be placed in lifts not exceeding 12 inches in loose thickness and then mechanically tamped. Where utility trench excavations are bottomed in weak compressible clay soil below the water table, it may be necessary to place geotextile tensile fabric (Mirafi 500X or equivalent) across the base of the excavation and extending a few feet up the excavation sides; this determination will be made by the geotechnical engineer in the field based on the conditions encountered. If soil fill is placed above crushed rock bedding, the crushed rock should be covered by filter fabric (Mirafi 140N or equivalent) prior to placement of soil fill to reduce the potential for piping of the soil fill into voids between rock particles. Trench backfill beneath buildings, sidewalks, and courtyards should be covered with at least six inches of select fill to reduce effects of expansive soil.

Soil backfill for utility trenches should be compacted according to the recommendations presented in Section 11.1. In streets to be dedicated to the City of Pittsburg, the upper three feet of utility trench backfill (measured below the top of pavement) should be compacted to at least 95 percent relative compaction. Jetting and flooding of trench backfill should not be allowed. If sand containing less than 10 percent fines is used for backfill, it should be compacted to at least 95 percent relative compaction. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the pavement section.

Where utility trenches enter the building pad, an impermeable plug consisting of lean concrete at least three feet in length, should be installed where the trenches enter the building footprint. Furthermore, where sand- or gravel-backfilled trenches cross planter areas and pass below asphalt or concrete pavements, a similar plug should be placed at the edge of the pavement. The purpose of these recommendations is to reduce the potential for water to become trapped in trenches beneath the buildings or pavements. This trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements.

As previously discussed, the subsurface conditions vary significantly across the project site, and the potential for total and differential settlements (consolidation, liquefactions, and cyclic

densification) varies as well. New utilities should be design to tolerate the estimated settlements, as presented on Figure 7. At the time this report was being prepared, utility layout plans were not available for review; therefore, we were unable to estimate settlements along the proposed utility pipe alignments.

11.6 Drainage and Landscaping

Positive surface drainage should be provided around the buildings to direct surface water away from the foundations. To reduce the potential for water ponding adjacent to the buildings, we recommend the ground surface within a horizontal distance of five feet from the buildings be designed to slope down and away from the buildings with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundations. These preliminary gradients should be checked once final grading plans and anticipated cut/fill thicknesses are known. Areas requiring significant fill may require a steeper gradient to account for future settlement to the underlying soft clay.

The use of water-intensive landscaping around the perimeter of the buildings should be avoided to reduce the amount of water introduced to the expansive clay subgrade. In addition, irrigation of landscaping around the building should be limited to drip or bubbler-type systems. The purpose of these recommendations is to avoid large differential moisture changes adjacent to the foundations, which have been known to cause large differential movement over short horizontal distances in expansive soil, resulting in cracking of slabs and architectural damage.

To reduce the potential for irrigation water entering the pavement section, vertical curbs adjacent to landscaped areas should extend at least four inches into the underlying clay. Where heavily watered areas, such as lawns, are adjacent to vertical curbs, it may also be necessary to install a subdrain behind the curb to intercept excess irrigation water.

11.7 Concrete Floors

The soil subgrade beneath slab-on-grade floors should be prepared and covered with a select fill layer (if required) as described in Section 11.1. The concrete mats or P-T slabs should be supported on properly compacted and moisture-conditioned soil. The subgrade should not be allowed to dry during construction. If the previously compacted soil subgrade is disturbed during foundation and utility excavation, the subgrade should be scarified, moisture-conditioned, and rerolled to provide a firm, unyielding surface prior to placement of the capillary break material.

To reduce water moisture transmission through the floor slab, we recommend installing a capillary moisture break and a Class C water vapor retarder beneath the floor. A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. A capillary moisture break and water vapor retarder are generally not required beneath garage slabs. We recommend garage slabs be underlain by six inches of AB compacted to at least 95 percent relative compaction if a capillary break and vapor retarder are not used below the slabs. AB is not required beneath garage parking areas located over a mat foundation.

The vapor retarder should be placed in general accordance with the requirements of ASTM E1643-98. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The vapor retarder should be covered with two inches of sand to aid in curing the concrete and to protect the vapor retarder during slab construction. The particle size of the gravel/crushed rock and sand should meet the gradation requirements presented in Table 10.

TABLE 10

Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
Gravel or Crushed Rock	
1 inch	90-100
3/4 inch	30-100
1/2 inch	5–25
3/8 inch	0-6
Sand	
No. 4	100
No. 200	0-5

The sand overlying the membrane should be moist at the time concrete is placed; however, it should not contain free water. Excess water trapped in the sand could eventually be transmitted as vapor through the slab. If the sand becomes wet, concrete should not be placed until the sand has been dried or replaced.

The current standard-of-practice in the San Francisco Bay Area does not include placing a gravel capillary break beneath P-T slab foundations. Although we believe this practice increases the risk of unacceptable levels of water vapor transmission through the slab, it is our understanding it has been used successfully for at least 10 years. Accordingly, we recommend P-T slabs-on-grade be underlain by a vapor retarder meeting the requirements for Class B vapor retarders stated in ASTM E1745-97 (15-mil Stego Wrap or equivalent). The vapor retarder should be placed in accordance with the requirements of ASTM E1643-98. The vapor retarder should be covered with two inches of sand with less than five percent fines to protect the vapor retarder during slab construction. In some cases, it is cost effective to remove both the sand and gravel from the capillary break and vapor retarder system used beneath mats or P-T slabs. If it is desired to remove these materials from the under slab system, we recommend a Class A vapor retarder be used in lieu of a Class B or C vapor retarder. Class A vapor retarders have a lower

inherent permanence rating and are less prone to accidental puncture. An examples of Class A vapor retarders are Moiststop Ultra A polyolefin sheeting, although any equivalent system can be used.

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the floor slab should have a low w/c ratio - less than 0.50. If approved by the project structural engineer, the sand can be eliminated beneath the slabs-on-grade and the concrete can be placed directly over the vapor retarder, provided the w/c ratio of the concrete does not exceed 0.45 and water is not added in the field. If necessary, workability should be increased by adding plasticizers. In addition, the slab should be properly cured.

Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

11.8 Retaining Walls

Cantilever (unrestrained) walls that have backdrains should be designed to resist the appropriate lateral earth pressures as presented in Table 11. The maximum applicable height for sloping and level backfill conditions is 6 and 12 feet respectively. If taller walls are planned as part of the site development, revised recommendations should be provided once more detailed development plans become available.

TABLE 11

Drained Cantilever Retaining Wall Lateral Earth Pressures

Earth Pressure Condition	Equivalent Fluid Weights	
	Level Backfill	Inclined at 2:1
Active	45 pcf	70 pcf
At-Rest	65 pcf	100 pcf

Walls that are restrained from rotation at the top should be designed using the at-rest pressures. Walls should be checked to resist active pressures plus lateral earth pressures imposed by seismic shaking. We recommend using a uniform seismic increment of 12H psf, where H is the wall height in feet. Where traffic is expected within a distance equal to the height of the walls, they should be designed to resist an additional uniform lateral pressure of 100 psf acting over the entire height of the wall or 10 feet, whichever is less. These lateral earth pressures assume that the walls will be retaining soil similar to the near-surface clayey soil that currently exists on-site. If the walls will be backfilled with highly expansive or non-plastic granular material, the lateral earth pressure values may need to be revised accordingly.

Retaining walls designed using the values presented above should be backdrained to prevent the buildup of hydrostatic pressure. One acceptable method for backdraining the wall is to place a prefabricated drainage panel (Miradrain 6000 or equivalent) against the back of the wall. The drainage panel should extend down to a four-inch-diameter perforated PVC collector pipe at the base of the walls. The pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material (see Caltrans Standard Specifications Section 68-1.025) or clean drain rock wrapped in filter fabric (Mirafi 140N or equivalent). AdvanEDGE pipe (or equivalent) may be used in lieu of the PVC pipe surrounded by crushed rock. The pipe should be sloped to drain into a sump or other suitable outlet, where it can be discharged into the storm drain system. We should check the manufacturer's specifications for the proposed prefabricated drainage panel and drain pipe material to verify it is appropriate for its intended use.

Footings supporting retaining walls should be designed using the same allowable bearing pressure and lateral resistance criteria presented for stiffened shallow foundations as presented in Section 11.4.

11.9 Flexible (Asphalt Concrete) Pavement

The State of California flexible pavement design method was used to develop the recommended asphalt concrete pavement sections. We expect the final soil subgrade in asphalt-paved areas will generally consist of sandy/silty clay. Based on our professional experience with similar

projects and soil type, we selected an R-value of 15 for design. If the existing subgrade will be raised beneath the paved areas, the fill material should have the same or higher R-value than the native soil. Therefore, additional testing should be performed on the existing near-surface soil and/or the as-graded subgrade soil and proposed fill to measure its R-value. Depending on the results of the tests, the pavement design may need to be revised.

We have analyzed pavement sections required for traffic indices (TIs) of 4.5 to 6.0. We recommend TIs of 4.5 be used for automobile parking areas with occasional trucks, and 6.0 be used for interior driveways and truck-use areas. These recommended design TIs should be confirmed by the project civil engineer. Table 12 presents our recommendations for asphalt pavement sections. It may be feasible to reduce the pavement sections presented in Table 12 by utilizing a lime-treated subgrade (LTS) layer as subbase beneath the AB. However, additional laboratory testing would be required to design the LTS section, which can be performed if desired.

TABLE 12

Pavement Section Design

TI	Asphalt Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	3.0	7.0
5.0	3.0	8.0
5.5	3.5	9.0
6.0	3.5	11.0

Pavement components should conform to the current Caltrans Standard Specifications. The upper six inches of the soil subgrade and AB in pavement areas should be moisture-conditioned to above optimum moisture content, compacted to at least 95 percent relative compaction, and rolled to provide a smooth non-yielding surface. The soil subgrades should be kept moist until covered. To reduce the potential for irrigation water to enter the pavement section, curbs

adjacent to landscaped areas should extend through the AB and at least four inches into the underlying clay.

11.10 Rigid (Portland Cement) Concrete Pavement

Concrete pavement design is based on a maximum single-axle load of 20,000 pounds and a maximum tandem axle of 32,000 pounds. The recommended rigid pavement section for these axle loads is seven inches of Portland cement concrete over six inches of AB. For parking garages that will be subjected to passenger vehicle traffic, the pavement may consist of five inches of Portland cement over six inches of AB.

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at 15-foot spacing. Where the outer edge of a concrete pavement meets asphalt pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. For loading docks, we recommend the slab be reinforced with a minimum of No. 4 bars at 16-inch spacing in both directions. Recommendations for subgrade preparation and AB compaction for concrete pavement are the same as those we have described for asphalt pavement.

11.11 Exterior Concrete Slabs

Exterior concrete slabs, such as sidewalks, courtyards, and patios, should be underlain by at least six inches of select fill extending at least 12 inches beyond slabs laterally. Class 2 AB, aggregate subbase (ASB), or lime-treated existing fill may be used as select fill. The subgrade and select fill should be compacted to at least 90 percent relative compaction and provide a smooth, non-yielding surface.

City of Pittsburg sidewalks should be underlain by at least four inches of Class 2 AB and compacted to at least 90 percent relative compaction and/or in accordance with the City of Pittsburg Standard Specifications And Details.

11.12 Seismic Design

The proposed buildings should be designed to the appropriate seismic codes. Since the thickness of the compressible soft to medium stiff clay is not uniform across the site, two sets of seismic design parameters are considered appropriate. For simplicity of design, the structural engineer may determine which of the two sets of design parameters is the most conservative. For design in accordance with the 2001 California Building Code (CBC) seismic code, we recommend the following:

Areas with less than 10 feet of soft to medium stiff clay:

- Seismic Zone Factor 4
- Soil Profile S_D
- Near Source Factors N_a and N_v of 1.0 and 1.1, respectively.

Areas with 10 feet or more of soft to medium stiff clay

- Seismic Zone Factor 4
- Soil Profile S_E
- Near Source Factors N_a and N_v of 1.0 and 1.1, respectively.

It is our opinion that a Site Profile S_F is not appropriate for this site since the liquefiable layers are relatively thin and discontinuous; therefore, we conclude the potentially liquefiable layers will not have a significant effect on the site response to seismic shaking. For this reason, we recommend using the soil profiles of S_D and S_E, as described above for this site.

12.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

We should review the final plans and specifications to check that they are in general conformance with the intent of our recommendations. During construction, we should observe site preparation, abandonment of existing underground utilities, and grading. We should check footing bottoms, deep foundation installations, mat subgrades, P-T subgrades, and vapor

retarders before they are covered. We should observe placement of any fill and perform field density tests to check that adequate compaction has been achieved. These observations will allow us to compare actual with anticipated soil conditions, and to check that the contractor's work conforms with the geotechnical aspects of the plans and specifications.

13.0 LIMITATIONS

The conclusions and recommendations presented in this report result from limited engineering studies based on our interpretation of the existing geotechnical conditions and available subsurface data. Actual subsurface conditions may vary. More detailed information concerning the proposed structures and site development is required to further refine design and foundation recommendations. If any variations or unforeseen conditions are encountered during construction, or if the proposed construction will differ from that which is described in this report, Treadwell & Rollo should be notified so that supplemental recommendations can be made.

MAP OF MAJOR FAULTS AND EARTHQUAKE EPICENTERS IN THE SAN FRANCISCO BAY AREA

Date: 04/17/06	Project No. 4245.02	Figure: 5

I **Not felt by people, except under especially favorable circumstances. However, dizziness or nausea may be experienced.**
Sometimes birds and animals are uneasy or disturbed. Trees, structures, liquids, bodies of water may sway gently, and doors may swing very slowly.

II **Felt indoors by a few people, especially on upper floors of multi-story buildings, and by sensitive or nervous persons.**
As in Grade I, birds and animals are disturbed, and trees, structures, liquids and bodies of water may sway. Hanging objects swing, especially if they are delicately suspended.

III **Felt indoors by several people, usually as a rapid vibration that may not be recognized as an earthquake at first. Vibration is similar to that of a light, or lightly loaded trucks, or heavy trucks some distance away. Duration may be estimated in some cases.**
Movements may be appreciable on upper levels of tall structures. Standing motor cars may rock slightly.

IV **Felt indoors by many, outdoors by a few. Awakens a few individuals, particularly light sleepers, but frightens no one except those apprehensive from previous experience. Vibration like that due to passing of heavy, or heavily loaded trucks. Sensation like a heavy body striking building, or the falling of heavy objects inside.**
Dishes, windows and doors rattle; glassware and crockery clink and clash. Walls and house frames creak, especially if intensity is in the upper range of this grade. Hanging objects often swing. Liquids in open vessels are disturbed slightly. Stationary automobiles rock noticeably.

V **Felt indoors by practically everyone, outdoors by most people. Direction can often be estimated by those outdoors. Awakens many, or most sleepers. Frightens a few people, with slight excitement; some persons run outdoors.**
Buildings tremble throughout. Dishes and glassware break to some extent. Windows crack in some cases, but not generally. Vases and small or unstable objects overturn in many instances, and a few fall. Hanging objects and doors swing generally or considerably. Pictures knock against walls, or swing out of place. Doors and shutters open or close abruptly. Pendulum clocks stop, or run fast or slow. Small objects move, and furnishings may shift to a slight extent. Small amounts of liquids spill from well-filled open containers. Trees and bushes shake slightly.

VI **Felt by everyone, indoors and outdoors. Awakens all sleepers. Frightens many people; general excitement, and some persons run outdoors.**
Persons move unsteadily. Trees and bushes shake slightly to moderately. Liquids are set in strong motion. Small bells in churches and schools ring. Poorly built buildings may be damaged. Plaster falls in small amounts. Other plaster cracks somewhat. Many dishes and glasses, and a few windows break. Knickknacks, books and pictures fall. Furniture overturns in many instances. Heavy furnishings move.

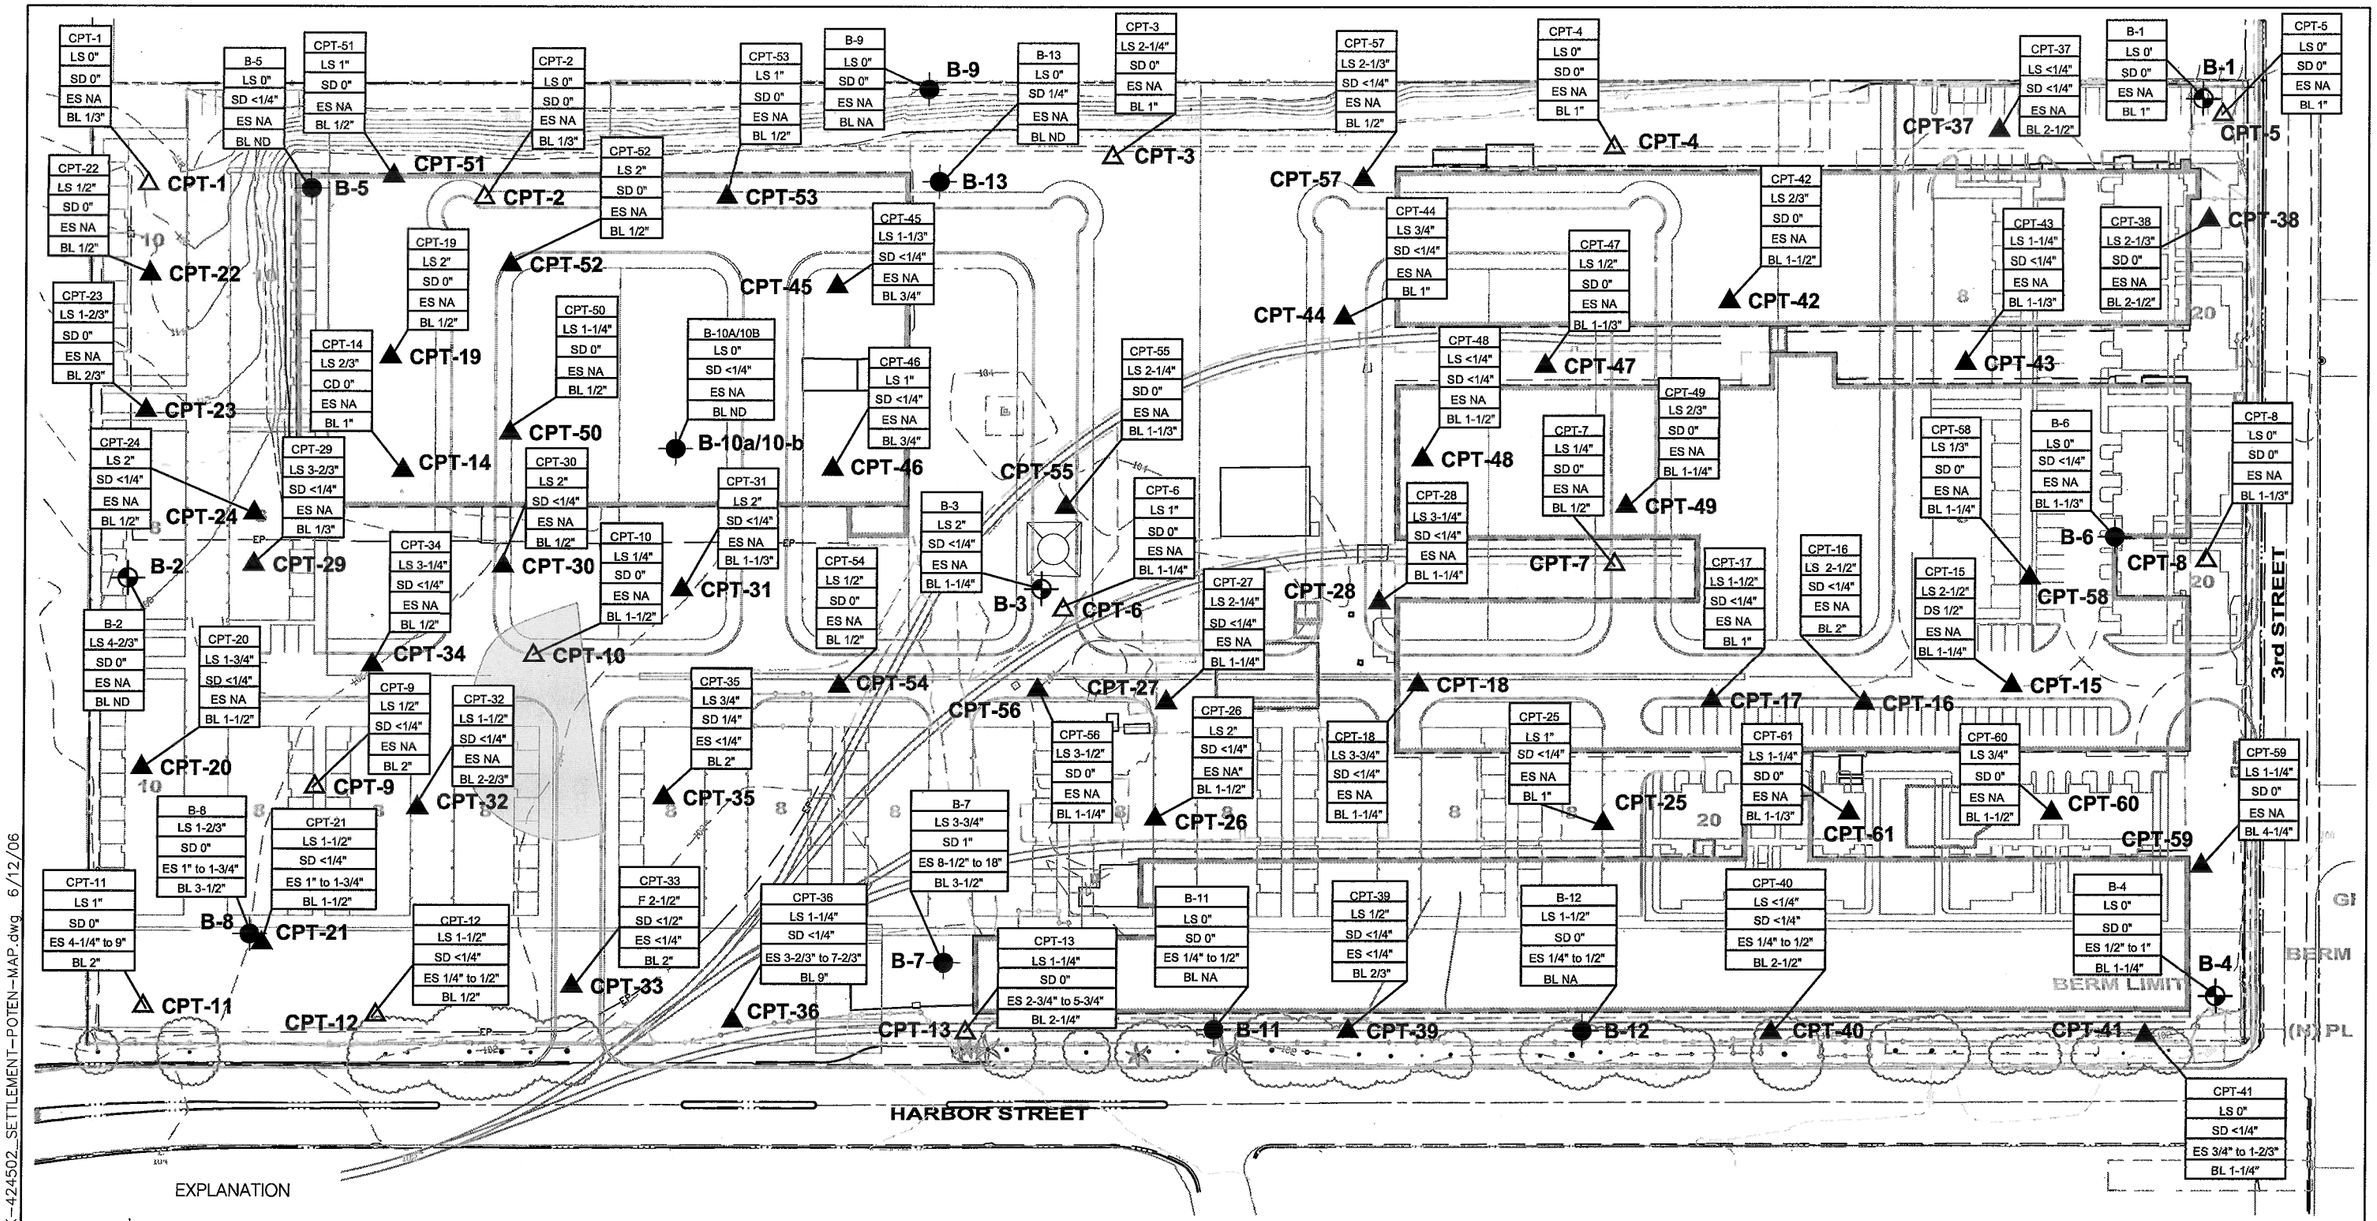
VII **Frightens everyone. General alarm, and everyone runs outdoors.**
People find it difficult to stand. Persons driving cars notice shaking. Trees and bushes shake moderately to strongly. Waves form on ponds, lakes and streams. Water is muddied. Gravel or sand stream banks cave in. Large church bells ring. Suspended objects quiver. Damage is negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in poorly built or badly designed buildings, adobe houses, old walls (especially where laid up without mortar), spires, etc. Plaster and some stucco fall. Many windows and some furniture break. Loosened brickwork and tiles shake down. Weak chimneys break at the roofline. Cornices fall from towers and high buildings. Bricks and stones are dislodged. Heavy furniture overturns. Concrete irrigation ditches are considerably damaged.

VIII **General fright, and alarm approaches panic.**
Persons driving cars are disturbed. Trees shake strongly, and branches and trunks break off (especially palm trees). Sand and mud erupts in small amounts. Flow of springs and wells is temporarily and sometimes permanently changed. Dry wells renew flow. Temperatures of spring and well waters varies. Damage slight in brick structures built especially to withstand earthquakes; considerable in ordinary substantial buildings, with some partial collapse; heavy in some wooden houses, with some tumbling down. Panel walls break away in frame structures. Decayed pilings break off. Walls fall. Solid stone walls crack and break seriously. Wet grounds and steep slopes crack to some extent. Chimneys, columns, monuments and factory stacks and towers twist and fall. Very heavy furniture moves conspicuously or overturns.

IX **Panic is general.**
Ground cracks conspicuously. Damage is considerable in masonry structures built especially to withstand earthquakes; great in other masonry buildings - some collapse in large part. Some wood frame houses built especially to withstand earthquakes are thrown out of plumb, others are shifted wholly off foundations. Reservoirs are seriously damaged and underground pipes sometimes break.

X **Panic is general.**
Ground, especially when loose and wet, cracks up to widths of several inches; fissures up to a yard in width run parallel to canal and stream banks. Landsliding is considerable from river banks and steep coasts. Sand and mud shifts horizontally on beaches and flat land. Water level changes in wells. Water is thrown on banks of canals, lakes, rivers, etc. Dams, dikes, embankments are seriously damaged. Well-built wooden structures and bridges are severely damaged, and some collapse. Dangerous cracks develop in excellent brick walls. Most masonry and frame structures, and their foundations are destroyed. Railroad rails bend slightly. Pipe lines buried in earth tear apart or are crushed endwise. Open cracks and broad wavy folds open in cement pavements and asphalt road surfaces.

XI **Panic is general.**
Disturbances in ground are many and widespread, varying with the ground material. Broad fissures, earth slumps, and land slips develop in soft, wet ground. Water charged with sand and mud is ejected in large amounts. Sea waves of significant magnitude may develop. Damage is severe to wood frame structures, especially near shock centers, great to dams, dikes and embankments, even at long distances. Few if any masonry structures remain standing. Supporting piers or pillars of large, well-built bridges are wrecked. Wooden bridges that "give" are less affected. Railroad rails bend greatly and some thrust endwise. Pipe lines buried in earth are put completely out of service.



XII **Panic is general.**
Damage is total, and practically all works of construction are damaged greatly or destroyed. Disturbances in the ground are great and varied, and numerous shearing cracks develop. Landslides, rock falls, and slumps in river banks are numerous and extensive. Large rock masses are wrenched loose and torn off. Fault slips develop in firm rock, and horizontal and vertical offset displacements are notable. Water channels, both surface and underground, are disturbed and modified greatly. Lakes are dammed, new waterfalls are produced, rivers are deflected, etc. Surface waves are seen on ground surfaces. Lines of sight and level are distorted. Objects are thrown upward into the air.

EXPLANATION

- Approximate location of boring performed by Treadwell & Rollo, Inc., in December 2005 and February 2006
- Approximate location of cone penetration test (CPT) performed by Treadwell & Rollo, Inc., in December 2005 and February 2006
- B-1 Approximate location of boring performed by Treadwell & Rollo, Inc., in August 2005
- CPT-1 Approximate location of cone penetration test (CPT) performed by Treadwell & Rollo, Inc., in August 2005
- Former building outlines
- Filled in evaporation pond
- LS Estimated settlement due to liquefaction (inches)
- SD Estimated settlement due to cyclic densification (inches)
- ES Estimated settlement due to proposed embankment (inches)
- BL Estimated settlement due to proposed building loads (inches)
- ND Not determined
- NA Not applicable

APPENDIX A
Boring Logs

PROJECT: **HARBOR PARK**
Pittsburg, California

Log of Boring B-1

Boring location: See Site Plan, Figure 2 | Logged by: M. Zinsley

Date started: 8/18/05 | Date finished: 8/18/05

Drilling method: Rotary wash

Hammer weight/drop: 140 lbs./30 inches | Hammer type: Automatic hammer

Sampler: Sprague & Henwood (S&H), Standard Penetration Test (SPT)

DEPTH (feet)	SAMPLES: Sampler Type	SAMPLES: Sample	SAMPLES: SPT N-Value[1]	LITHOLOGY	MATERIAL DESCRIPTION (Ground Surface Elevation: 102 feet[2])	LABORATORY TEST DATA: Type of Strength Test	Confining Pressure Lbs/Sq Ft	Shear Strength Lbs/Sq Ft	Fines %	Natural Moisture Content, %	Dry Density Lbs/Cu Ft
1	S&H		8	ML	Asphalt concrete SILT with SAND (ML) gray-brown, medium stiff to stiff, moist						
2					FILL						
3	S&H		9	CL	CLAY (CL) gray-brown, stiff, moist LL = 34, PI = 16; see Figure C-7					19.4	107
4				CL	CLAY with SAND (CL) yellow-brown, medium stiff, moist						
5					Consolidation Test, see Figure C-1						
6	S&H		8							23.6	103
7				CL	SANDY CLAY (CL) yellow-brown, stiff, moist

Boring terminated at a depth of 51.5 feet bgs.
Boring backfilled with cement grout.
Groundwater not measured due to drilling mud.

[1] S&H blow counts converted to SPT N-value using a correction factor of 0.7
[2] Elevation based on ALTA LAND Title Survey performed by Renner Group dated 20 May 2005

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

GRAIN SIZE CHART

Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel	3" to No. 4	76.2 to 4.76
coarse	3" to 3/4"	76.2 to 19.1
fine	3/4" to No. 4	19.1 to 4.76
Sand	No. 4 to No. 200	4.76 to 0.074
coarse	No. 4 to No. 10	4.76 to 2.00
medium	No. 10 to No. 40	2.00 to 0.420
fine	No. 40 to No. 200	0.420 to 0.074
Silt and Clay	Below No. 200	Below 0.074

Unstabilized groundwater level

Stabilized groundwater level

SAMPLE DESIGNATIONS/SYMBOLS

Sample taken with split-barrel sampler other than Standard Penetration Test sampler. Darkened area indicates soil recovered

Classification sample taken with Standard Penetration Test sampler

Undisturbed sample taken with thin-walled tube

Disturbed sample

Sampling attempted with no recovery

Core sample

Analytical laboratory sample

Sample taken with Direct Push sampler

SAMPLER TYPE

C Core barrel

CA California split-barrel sampler with 2.5-inch outside diameter and a 1.93-inch inside diameter

D&M Dames & Moore piston sampler using 2.5-inch outside diameter, thin-walled tube

O Osterberg piston sampler using 3.0-inch outside diameter, thin-walled Shelby tube

PT Pitcher tube sampler using 3.0-inch outside diameter, thin-walled Shelby tube

S&H Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter

SPT Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.5-inch inside diameter

ST Shelby Tube (3.0-inch outside diameter, thin-walled tube) advanced with hydraulic pressure

HARBOR PARK
Pittsburg, California

CASE NARRATIVE

Laboratory number:	185059
Client:	Treadwell & Rollo
Location:	Harbor Bay, Pittsburg
Request Date:	02/21/06
Samples Received:	02/21/06

This hardcopy data package contains sample and QC results for two three-point soil composites and one two-point soil composite, requested for the above referenced project on 02/21/06. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
Low recoveries were observed for gasoline C7-C12 in the MS/MSD for batch 110641; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits. 185059-009, 185059-010, and 185059-011 were received outside of hold time; affected data were qualified with "b". No other analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
Low recoveries were observed for diesel C10-C24 in the MS/MSD for batch 110713; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits. 185059-009, 185059-010, and 185059-011 were received outside of hold time; affected data was qualified with "b". No other analytical problems were encountered.

Metals (EPA 6010B):
High recovery was observed for chromium in the MSD for batch 110682; the parent sample was not a project sample, and the BS/BSD were within limits. High RPD was also observed for chromium in the MS/MSD for batch 110682; the RPD was acceptable in the BS/BSD. No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 165059 Date Received: 2-21-96 Number of Coolers: 1
Client: Treadwell & Rollo Project: 4245.01

A. Preliminary Examination Phase
Date Opened: 2-21-96 By (print): Troy Windsor (sign) Troy Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... (YES) NO
Type of ice: wet Temperature: Cold - no temp blank

B. Login Phase
Date Logged In: 2-21-96 By (print): Troy Windsor (sign) Troy Windsor

1. Describe type of packing in cooler: In ziploc type bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
If YES, give details below.
Who was called? _____ By whom? _____ Date: _____
