
__ Signature & date is required.
__ Quantities stored are not clear and/or incorrect.
__ MSDS's are required.
__ Waste(s) must be indicated.
__ Annual waste throughput must be noted on the form.
__ Facility map needs more detail.
__ Type of tank (above or below ground) must be clarified.
__ Application is incomplete. Fill out and submit enclosed forms.
__ Business plan for emergency response needs more information.

_____

_____

___ A recent inspection by the Fire Department indicates chemicals stored in quantities greater than what was reported. The attached form, "Storage Facility Permit Quantity Limit" must be revised to reflect this, and additional fees paid if reported quantity ranges increase.

___ Additional backfees are owed in the amount of $_____, for the storage of hazardous materials during the _____ year.

___ Due to your lateness in filing, deliquent fees (double permit fees) of $_____ are now owed for the _____ year.

___ An error was found on your Facility Permit Fee Worksheet. _____ is still owed to complete your application.

X An error was found in your favor. You have a credit of $25.00 towards the 89 year.

_____

_____

Thank you for your cooperation in submitting this information to us. It will aid us directly in managing a hazardous materials incident at your facility and provide a greater degree of protection for your employees, neighbors, and first responders. Thanks Again!

CITY OF MOUNTAIN VIEW
FIRE DEPARTMENT

EMERGENCY RESPONSE PLAN
Section I: Evacuation Procedures

This emergency response plan describes the personnel, procedures, and equipment your facility has available to respond to a release or threatened release of the hazardous materials you store or use. This plan is for the protection of your and your employees. For small facilities, this plan may be sufficient to adequately address all your emergency response concerns. For larger or more complex facilities, supplemental and detailed emergency response information should be maintained on site and be available for review by the Fire Department.

1 *By which method(s) is the Emergency Coordinator (EC) at your facility notified that an emergency (i.e., an actual or threatened hazardous materials release) is taking place? (Check applicable items.)*

☐ Alarms: Name of Manufacturer _____
Last Test Date _____ Test Frequency _____

☐ Horns: Last Test Date _____ Test Frequency _____

☐ Emergency Phone Number: Number _____

☑ Shouting

☑ Other P. A SYSTEM

2. *Once the EC has been notified of an emergency situation, what outside agencies does he/she notify? (Check applicable items.)*

☑ Agency: *FIRE DEPARTMENT* Phone *9 1 1*

☑ Agency: *State Office of Emergency Services* Phone *1-800-852-7550*

☐ Agency: _____ Phone _____

☐ Agency: _____ Phone _____

3. *Indicate the extent of your evacuation pre-planning. (Check applicable items.)*

☑ Immediate area evacuation routes defined and procedures developed.

☑ Entire building evacuation procedures developed.

☑ Assembly areas pre-planned.

☑ Evacuation maps posted.

☐ Other: _____

4. *Should personnel be injured during the emergency, your facility must have a nearby clinic/hospital available for treatment:*

Medical Facility Name MOUNTAIN VIEW MEDICAL CLINIC

Medical Facility Address 280 HOPE STREET

Medical Facility Phone Number (24-hour) (415) 967-5701

Approximate Distance to Medical Facility 1.5 miles

EMERGENCY RESPONSE PLAN
Section II: Spill Control / Mitigation Equipment

INSTRUCTIONS: In the blank form provided describe the safety, spill reponse, and communication equipment you have in place at your facility for use in emergency situations. If practical, report the equipment according to individual job, shop, or work activity area within you facility. If applicable, include the elements listed in legend.

PERSONAL PROTECTIVE AND SAFETY EQUIPMENT

Aprons
Gloves
Coats
Chemical Suits
Boots
Safety Glasses
Faceshield
Hard Hats
Cartridge Respirators
Self Contained Breathing Apparatus (SCBA)
First Aid Kits
Exhaust Hood/Vapor Scrubbers
First Aid Stations
Chemical Antidotes
Eye Wash/Safety Shower

SPILL CONTROL/MONITORING EQUIPMENT

Fire Blankets
Fire Extinguishers (Type A, B, C, and D)
Fire Hoses
Chemical Vapor Monitoring Equipment (Type)
Spill Cart
Chemical Absorbents
Neutralizers
Sand
Leak Repair Kits (Chlorine)
Underground Tank Leak Detection Monitors
Overpak Drums
Plugging/Diking Materials
Pumps

COMMUNICATIONS EQUIPMENT

Pager
Telephones
Intercoms
Portable Radio(s)
Verbal

EMERGENCY RESPONSE PLAN

Section III: Emergency Response Training Program

1. PERSON RESPONSIBLE FOR EMERGENCY RESPONSE TRAINING PROGRAM:

Name RON GRANATH Title MFG MGR Phone (415)969-9100

2. TRAINING REQUIREMENTS (Check all applicable items.)

All employees are trained in the following procedures:

- [x] Notification of emergency response coordinator
- [x] Notification of external emergency response organizations (e.g. Fire Department)
- [ ] Location and content of emergency response plan
- [ ] Evacuation

Chemical handlers are additionally trained in the following:

- [x] Safe methods for handling and storage of hazardous materials
- [x] Proper use of personal protection equipment
- [x] Locations and proper use of fire and spill control equipment
- [x] Specific hazards of each chemical to which they may be exposed, including the pathways of exposure (i.e., skin absorption, inhalation, ingestion)

Emergency response team members are additionally trained in the following procedures:

- [x] Shutdown of operations
- [x] Use, maintenance, and replacement of emergency response equipment

- [x] ALL PERSONNEL RECEIVE APPROPRIATE EMERGENCY RESPONSE TRAINING WITHIN SIX MONTHS OF HIRING
- [x] REFRESHER TRAINING IS PROVIDED AT LEAST ANNUALLY

3. PERSONNEL TRAINING RECORDS

The following training records are maintained for each employee:

- [x] Type and amount of introductory and continuing training
- [x] Date that training was completed
- [x] Description of facility emergency reponse drills
- [x] Former employees' training records are retained for at least three years

Your Emergency Response Plan must be on-site and available for review by the Fire Department.

Dear Mr. Shippen and Llc:

Subject: Fuel Leak Site Case Closure - Shippen Property, 1175 Terra Bella, Mountain View, CA; Case No. 14-476; SCVWDID # 06S2W15M03f.

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, the Santa Clara Valley Water District is required to use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Residual petroleum hydrocarbons exist in soil and groundwater. However the levels appeared to have attenuated below regulatory concern.

If you have any questions, please call Michelle Martin at (408) 265-2607, extension 2768. Thank you.

Sincerely,

Dear Mr. Shippen and Llc:

Subject: Fuel Leak Site Case Closure - Shippen Property, 1175 Terra Bella, Mountain View, CA; Case No. 14-476; SCVWDID # 06S2W15M03f.

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25299.37 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.77 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code.

Please contact our office if you have any questions regarding this matter.

Sincerely,

ORIGINAL SIGNED BY

James S. Crowley, P.E.

Santa Clara Valley Water District

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

I. AGENCY INFORMATION

Date: July 12, 2001

Agency Name: Santa Clara Valley Water District	Address: 5750 Almaden Expressway
City/State/Zip: San Jose, CA 95118	Phone: (408) 265-2600
Responsible Staff person: Ms. Michelle Martin	Title: Assistant Engineer II

II. Case Information:

Site Facility Name: Shippen Property		
Site Facility Address: 1175, Terra Bella Avenue, Mountain View 94043		
RB LUSTIS Case No. ----	Local Case No.: 06S2W15M03f	LOP Case No.: 14-476
URF Filing Date: 9/23/1998	SWEEPS No.: -----	APN: 153-16-011
Responsible Parties	Addresses	Phone Numbers
Mr. Ben Shippen Ben Shippen Family Lmtd	270, South Main Street, Alpine UT 84004	(801) 756 5263
Bjs Vi Llc	984, Sunburst Lane, Alpine UT 84004	(801) 756 5263

Tank I.D. No.	Size in Gallons	Contents	Closed In Place/Removed	Date
1	500	Gasoline	Removed	August 13, 1998
Piping			Unknown	Unknown

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Numerous holes were observed on the 500-gallon gasoline tank during the tank removal.		
Site characterization complete? Yes	Date Approved by Oversight Agency: 7/12/01	
Monitoring wells installed? No	Number: -----	Proper screened interval? -----
Highest GW Depth Below Ground Surface:4.61 feet*	Lowest Depth:15.7 feet*	Flow Direction: North*
Most Sensitive Current Use: Potential drinking water supply		

* The information is based on the adjacent site. (Texaco 975, Shoreline Blvd, Mountain View, CA 94043)

Summary of Production Wells in Vicinity: A well search indicates that there are twenty abandoned water producing wells (06S02W15M001-M006,M008,M010-11,M013-M017,M019-M020, 06S02W15L003,L005,L008,06S02W15N003), four active water producing wells (06S02W15M012,06S02W15M009,06S02W15L007, 6S02W15N002) and two cathodic wells (06S02W15M027,06S02W15M026) within the ¼ miles radius of the site. Among the twenty abandoned wells, Geographical Information System (GIS) shows well (06S02W15M016) is located on the parcel. After the investigation, the well is located off site. Based upon the levels of contamination at the site, they are not likely to be affected by the reported release.

Are drinking water wells affected? No	Aquifer Name: Santa Clara Valley Water Basin
Is surface water affected? No	Nearest SW Name: Stevens Creek, ~2260 feet East from the site.
Off-Site Beneficial Use Impacts (Addresses/Locations): None	
Reports on file? Yes	Where are reports filed? Santa Clara Valley Water District

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal 2/Destination)	Date
Tank	1-steel	Removed with unknown destination	August 13, 1998
Piping	Unknown	Unknown	Unknown
Free Product	-------	-------	--------
Soil	20 cubic yards	Excavated and disposed by Fuller Excavation and Demolition, Inc	1998
Groundwater	-------	----------	----------
Barrels	-------	----------	----------

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS—BEFORE AND AFTER CLEANUP

OPTIONAL: (Please see Attachment ___ for additional information on contaminant locations and concentrations)

Contaminant	Soil (ppm)		Water (ppb)		Contaminant	Soil (ppm)		Water (ppb)

Description of Interim Remediation Activities: Tank excavation and soil excavation

NA= Not analyzed

1 = Soil sample (S-FILL) was collected from the former 500-gallons UST at the depth of 8 feet, 1998

2 = Soil sample (S-TP) was collected from the test pit at the depth of 2 feet, 1998

3 = Soil samples (DP1 to DP4) were collected around the former UST at the depth of 5 feet, 2000

4 = Groundwater sample (W-TPN-11) was collected from the excavation pit, 1998

5 = Groundwater sample (GP4) was collected around the former UST at the depth of 7 feet, 2000

6 = Groundwater sample (DP3) was collected around the former UST at the depth of 8 feet, 2000

7 = Groundwater sample (DP1) was collected around the former UST at the depth of 7 feet using EPA Method 8260, 2000

* = Di-Isopropyl Ether (DIPE), Ethyl tert-Butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME), tert-Butanol (TBA), 1,2-dibromoethane (EDA) were under the detection limit.

IV. CLOSURE

Does complete corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan/ Yes		
Does corrective action protect public health for current land Use? Santa Clara Valley Water District staff does not make specific determinations concerning public heath risk. However, it does not appear that the release would present a risk to human health.		
Site Management Requirements: None		
Should corrective action be reviewed if land use changes? No		
Monitoring Wells Decommissioned: -----	Number Decommissioned: -----	Number Retained: -----
List Enforcement Actions Taken: None		
List Enforcement Actions Rescinded: None		

V. ADDITIONAL COMMENTS, DATA, ETC.

Considerations and/or Variances:

1998:
A 500-gallon gasoline underground storage was removed from the site in August. During the removal of the tank, numerous holes were noticed in the tank. Soil samples were collected in the excavation tank pit and petroleum hydrocarbon odor was noticed on the soil samples collected. The maximum contamination in soil samples indicated 1900 parts per million (ppm) Total Petroleum Hydrocarbon as gasoline (TPH-g), 1.7 ppm Benzene, 13 ppm Toluene, 22 ppm Ethylbenzene, 120 ppm Xylenes with no detection of Methyl-Tert-Butyl-Ether. In September, one groundwater sample was collected from the excavation tank pit. The maximum contamination detected 42,000 parts per billion (ppb) TPH-g, 1400 ppb Benzene, 1900 ppb Toluene, 1300 ppb Ethylbenzene, 6600 ppb Xylenes with no detection of MTBE. Approximately 20 cubic yards of impacted soil was excavated from the tank pit.

2000:
In November, one boring (DP-3) was installed at the depth of 16 feet in the off-site area. Groundwater was encountered approximately 16 feet below ground surface (bgs). Soil and grab groundwater samples were collected. Additional three borings (DP-1, DP-2 and DP-4) were installed on the site. Each boring was drilled to depth approximately 11 feet bgs. Groundwater was encountered at the depth of 10 feet bgs. The maximum contamination detected in soil samples 0.011 ppm Toluene, 0.005 ppm Ethylbenzene, 0.018 ppm Xylenes with no detection of TPH-g, Benzene and MTBE. For the groundwater samples, the maximum contamination detected was 2600 ppb TPH-g, 1.8 ppb Benzene, 4.4 ppb Toluene, 26 ppb Ethylbenzene, 70 ppb Xylenes and 12 ppb MTBE.

Conclusions:
Based on the recent soil and groundwater sampling results, residual petroleum hydrocarbon contamination exists in soil (0.011ppm Toluene, 0.005 ppm Ethylbenzene, 0.018 ppm Xylenes), and in groundwater (2600ppb TPH-g, 1.8 ppb Benzene, 4.4 ppb Toluene, 26 ppb Ethylbenzene, 70 ppb Xylenes, 12 ppb MTBE).

Natural attenuation of this residual contamination is expected to continue and the plume is localized near the former tank pit. Therefore, the Santa Clara Valley Water District staff concludes that a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at the site and that Regional Water Quality Control Board objectives have not been compromised. The investigation was performed in accordance with state and local guidelines. District staff recommends closure for this case.

Prepared by: Ms. Michelle Martin	Title: Assistant Engineer
Signature: Michelle Martin	Date: 7/12/01
Approved by: James S. Crowley, P.E.	Title: Engineering Unit Manager
Signature: James S. Crowley	Date: 7/12/01

This closure approval is based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions.

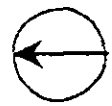
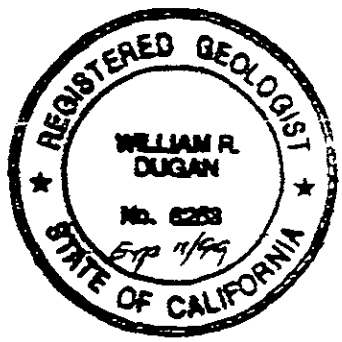
Rancho Cordova, CA 95742	Mountain View, CA 94042		



Dugan Associates specializes in the collection of subsurface environmental samples, and the preparation of certified sampling reports. This report summarizes sampling performed by Dugan Associates for soil profiling purposes BENEATH A FORMER 500-GALLON GASOLINE UST. Supporting documentation provided by an independent State-certified laboratory are attached. This sampling report, the chain of custody record, and laboratory data sheets comprise the formal documentation of subsurface sampling conducted during this phase of work at the site.



Sample Collection Method: A brass sleeve was driven directly into soil obtained approximately one foot beneath the former UST within native materials. The sample sleeve was retrieved, ends were covered with plastic end-caps, and sealed. The sample was placed in iced storage for transportation to the laboratory for analyses requested by the City of Mountain View Fire Department inspector [Chris Steck, R.E.A., Hazardous Materials Specialist]

Results: Results of laboratory analyses are presented in attached data sheets, and in the figure below. Numerous holes were observed in the tank. Product odor was noted within native soil under the former tank.

RECEIVED
JUL 30 2004
SANTA CLARA VALLEY WATER DISTRICT

July 26, 2004

Mr. Paul Supple
Atlantic Richfield Company
P.O. Box 6549
Moraga, CA 94570

Subject: Fuel Leak Site Case Closure; ARCO #6050, 790 Shoreline Blvd, Mountain View SCVWDID 06S2W16R01f

Dear Mr. Supple:

This letter transmits the enclosed underground storage tank (UST) case closure letter for the subject case in accordance with Chapter 6.75 (Section 25296.10 [g]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, all Local Oversight Programs (LOP) in the State are required to use this case closure letter for UST leak sites. The Santa Clara Valley Water District began transferring the LOP and all cases to the County of Santa Clara Department of Environmental Health on July 1, 2004. The County of Santa Clara is responsible for the issuance of the attached closure letter. The case closure summary is also enclosed. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

Please note the following conditions still remain at the site:

- There is a limited area of residual TPH and benzene in the shallow soils and groundwater at the northern extent of the site. These residuals occur on the site and extend beneath Middlefield Road at the location of BC-4 and E-1.

- On-Site: To protect against the feasibility of residential receptors or the potential vapor phase transport to an occupied basement, site use will be limited to commercial.

- Three land use control areas can serve as an institutional control to mitigate the residual risk. These controls are described within the Land Use Control and Implementation Program (LUCIP) included as an attachment to the Case Closure Summary Form.

  1. **Site Zone.** The "site zone" will monitor and track new construction and real estate transactions in order to monitor for land activities that are not consistent with the sites current use as a gas station or a commercial property.
  2. **Residual Zone.** The "residual management zone" will monitor the excavation service (USA North) in order to detect any excavations into the residual off-site or within the site boundary.
  3. **Regional Zone.** The "regional hydrogeologic" zone will detect new water wells, dry wells or construction dewatering through observing permitting activity at the Santa Clara Valley Water Agency.

Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. The

Board of Supervisors: Donald F. Gage, Blanca Alvarado, Pete McHugh, James T. Beall, Jr., Liz Kniss
County Executive: Peter Kutras, Jr.

County and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.

If you have any questions regarding the enclosed case closure form, please call Ms. Cris Tulloch of the Santa Clara Valley Water District at (408) 265-2607, extension 3758. Thank you.

Sincerely,

Ben Gale, Director

Subject: Fuel Leak Site Case Closure; ARCO #6050, 790 Shoreline Blvd, Mountain View SCVWDID 06S2W16R01f

Dear Mr. Supple:

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Ben Gale, Director

Board of Supervisors: Donald F. Gage, Blanca Alvarado, Pete McHugh, James T. Beall, Jr., Liz Kniss
County Executive: Peter Kutras, Jr.

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL TANK PROGRAM

I. AGENCY INFORMATION

Date: 12/29/2003

Agency Name. Santa Clara Valley Water District	**Address.** 5750 Almaden Expressway
City/State/Zip. San Jose/California/95118	**Phone:** (408) 265-2607 x 3758
Responsible Staff Person: Ms. Christine Tulloch	**Title:** Senior Water Quality Specialist

II. CASE INFORMATION

Site Facility Name: ARCO Service Station #6050		
Site Facility Address: 790 North Shoreline Boulevard, Mountain View, California 94043-3209		
RB LUSTIS Case No.: --	**SCVWDID No.:** 06S2W16R01f	**LOP Case No.:** 01-014
URF Filing Date: 7/22/1986 (Discovery)	**SWEEPs No.: --**	**APN:** 150-31-002

Responsible Parties	Addresses	Contact/Phone Number / Email
Atlantic Richfield Company	P O. Box 6549, Moraga, CA 94570	Mr. Paul Supple, (925) 299-8891 supplpv@bp com

Tank I.D. No.	Size in Gallons	Contents	Closed in Place/Removed	Date
Tank T1	6,000	Gasoline	Removed	May 1988
Tank T2	6,000	Gasoline	Removed	May 1988
Tank T3	6,000	Gasoline	Removed	May 1988
Tank T4	6,000	Gasoline	Removed	May 1988
Tank T5	12,000	Gasoline	Removed	May 1988
Tank T6	550	Waste Oil	Removed	May 1988
Oil / Water Separator	Unknown	Various	Removed	May 1992
Piping			Removed	May 1988 Nov 2002

Note: The site is an operating gas station. There are three 12,000-gallon gasoline USTs and one 550-gallon used oil UST, all are double-walled fiberglass USTs.

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: UST System		
Site characterization complete? Yes		**Date Approved by Oversight Agency:** November 11, 2003
Monitoring Wells Installed? Yes	**Number:** 6	**Proper Screened Interval:** Yes
Highest GW Depth Below Ground Surface: 8 feet	**Lowest Depth:** 18 feet	**Flow Direction:** North
Most Sensitive Groundwater Use: Potential drinking water supply		

Summary of Production Wells in Vicinity: Two active wells (N02 and N14) are located up-gradient at condominium complexes.
Three private wells (L04, M09 and M12) are located approximately north to northeast of the site. The respective well details are as follows:

Well Location	Distance	Use	Status
N02	500 feet South East	Domestic	Active
N14	925 feet South	Domestic	Active
L04	1,350 feet Northeast	Domestic	Active
M09	1,120 feet Northeast	Domestic	Active
M12	1,060 feet North to Northeast	Domestic	Active

The wells are not considered threatened from the release at this site.

There are many 'abandoned' wells within a ¼ mile. However, do to their location relative to the site, they will not act as vertical conduits for the release from this site.

Are drinking water wells affected? No	**Aquifer Name:** Santa Clara Valley Basin
Is surface water affected? No	**Nearest SW Name:** Stevens Creek
Off-Site Beneficial Use Impacts (Addresses/Location): None Reported	
Reports on File? Yes	**Where are reports filed?** Santa Clara Valley Water District

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal w/ Destination)	Date
Tank	5 gasoline , 1 used-oil UST and 1 oil/water separator	Removed and Disposed	May 1988 May 1992
Piping	Unknown	Unknown	May 1988 Nov 2002
Free Product	---	---	---
Soil	>1,030 cubic yards	Excavated, aerated and disposed. Waste oil contaminated soils were disposed without aeration.	June 1988
Groundwater	>35,000 gallons*	Removed and disposed offsite	11/02 to 12/02

* Groundwater was pumped out of the existing UST pit during line upgrade work and disposed offsite

HISTORIC AND CURRENT MAXIMUM CONTAMINANT CONCENTRATIONS
(Please see Attachments 4 and 5 for additional information on contaminant locations and concentrations)

	Soil (ppm)		Water (ppb)			Soil (ppm)		Water (ppb)	
Contaminant	Historic	Current	Historic	Current	Contaminant	Historic	Current	Historic	Current
TPH (EPA 8015)	7,800 [a]	7,800 [a]	47,000	3,800 [b]	Xylenes	1.6 [e]	1.6 [c]	1,140	220 [b]
Benzene	7.90 [c]	ND<0 0050	16,000[g]	600 [b]	MtBE	0.34 [d]	0.34 [d]	4700	ND<10
Toluene	21.00 [c]	ND<0.0050	810	48 [b]	TOG	8,600 [c]	ND<13	NA	NA
Ethyl benzene	15 00 [c]	ND<0.0050	437	66 [b]	TPH-diesel	140 [f]	140 [f]	NA	NA
Other (EPA 8240)	Tetrachloroethene 2.20 [c]	0.59 [e]	NA	NA					

Notes:

a Sample S-16-B2 collected at approximately 16 feet bgs (capillary fringe zone) from the western edge of the former UST excavation in April 1988.

b Well BC-4 sampled in August 2003.

c UST excavation sample S-7-T6 collected from approximately 7 feet on 05/17/88. The area with impacted soils was subsequently overexcavated to approximately at 15 feet bgs, at which depth groundwater was encountered.

d Dispenser sample D-4 collected at approximately 3 feet bgs in November 2002.

e Sample SB1-2 collected at approximately 2 feet below the bottom of the former oil-waster separator/clarifier on 05/13/92.
f Sample SB1-0 collected in native soil at the bottom of the former oil-water separator/clarifier sump on 05/13/92.
g Sample from well BC-4, 1989
NA Not analyzed
ND< Not detected at laboratory detection limits

Description of Interim Remediation Activities: Over excavation during removal of the former waste oil tank removed secondary sources of residual hydrocarbons. The excavation went to groundwater at approximately 11 feet BGS. Current remediation consists of monitored natural attenuation. In Nov 2002, approximately 35,000 gallons of groundwater were extracted from Well E-1 as part of tank removal activities.

IV. CLOSURE

"LOW" RISK SOIL AND GROUNDWATER EVALUATION SUPPORTING THE NFA REQUEST	
1. The leak has been stopped and ongoing source, including free produce, removed or remediated.	The primary source (USTs) have been removed and secondary sources (petroleum hydrocarbon impacted soils) have been excavated, remediated and disposed offsite.
2. The site has been adequately characterized and is stable.	The lateral and vertical extent of petroleum hydrocarbons in soils and groundwater have been defined, and over time has diminished and is localized to the following areas: Soil-former B2 boring location near the western edge of the former UST excavation at approximately 16 feet bgs; Groundwater- in the immediate vicinity of wells B-4 and E-1.
3. No surface water, deeper drinking water aquifers, or other sensitive receptors are likely to be impacted.	Due to the distance from the site to the closes surface water bodies (Stevens Creek), it is unlikely that the site could affect these water bodies. Further, due to the shallow depth of impacted water at the site, the presence of clay at the base of the shallow aquifer and that the site overlies a "confined" aquifer, it is unlikely that site groundwater has affected the underlying Santa Clara Basin.
4. The site presents no significant risk to human health.	There are no pathways to current potential receptors of the residual contamination with the exception of the construction worker that might excavate into the contamination. This exception can be protected against within the Site Management Plan.
5. The site presents no significant risk to the environment.	The contamination is limited in extent, laterally defined, and at low concentrations such that the site does not pose a risk to any known wetlands, sensitive habitats, or sensitive receptors. An exception is construction into the residual area where affected liquids and soils would require treatment or disposal. This exception can be protected against within the Site Management Plan.

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes.

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes.

Does corrective action protect public health for current land use? The current land use of the Site is as an operating gas station. The site is completely paved. As there is no pathway between a human receptor and the residual contamination in soil and groundwater, there is no public health risk posed to public at the site. Furthermore, for the "direct contact exposure pathway" the residual soil concentrations do not exceed the Preliminary Remediation Goals set by USEPA's Region 9 for the constituents of concern with a Commercial/Industrial scenario. Aside from the current use of Middlefield road for transportation, there are numerous utility conduits beneath the street. The site management plan's application of a land activity detection system would detect excavation activities within Middlefield Road and the adjacent Shoreline Boulevard. Once detected, an alert to the responsible party and excavation contractor can allow appropriate response including guidance on management of potentially contaminated soils and construction dewatering fluids.

The applicant understands that Santa Clara Valley Water District staff does not make specific determinations concerning public health risk.

Site Management Requirements: There is a limited area of residual TPH and benzene in the shallow soils and groundwater at the northern extent of the site. These residuals occur on the site and extend beneath Middlefield Road at the location of BC-4 and E-1.

- **On-Site.** To protect against the feasibility of residential receptors or the potential vapor phase transport to an occupied basement, site use will be limited to commercial.

- **Off-site, Middlefield Road Right of Way (ROW).** Middlefield Road is maintained under the jurisdiction of the City of Mountain View, CA. Land use is not expected to change from that of a roadway. However, there is the prospect that during an excavation into the roadway, construction workers may encounter residual contamination. This residual contamination could require proper handling and could require health and safety protection on behalf of the construction worker.

- **Regional Water Resources.** While the residual plume is stable, the stability is dependent upon no water resource development that could cause plume migration.

Three land use control areas will serve as an institutional control to mitigate the residual risk. These controls are described within the following Land Use Control and Implementation Program (LUCIP).

1. **Site Zone.** The "site zone" will monitor and track new construction and real estate transactions in order to monitor for land activities that are not consistent with the sites current use as a gas station or a commercial property.
2. **Off-site, Middlefield Road Right of Way (ROW).** The "residual management zone" will monitor the excavation service (USA North) in order to detect any excavations into the residual off-site or within the site boundary.
3. **Regional Water Resources.** The "regional hydrogeologic" zone will detect new water wells or dry wells through observing permitting activity at the Santa Clara Valley Water Agency.

Should corrective action be reviewed if land use changes? Yes, and is represented within Site Management Requirements (above)

Monitoring Wells Decommissioned: No	**Number Decommissioned:** None	**Number Retained:** 6*

List Enforcement Action Taken: None

List Enforcement Actions Rescinded: None

*With SCVWD's approval, the existing monitoring wells will be retained for future monitoring use or shall be properly destroyed before final closure letters will be issued.

V. SITE MANAGEMENT PLAN

LAND USE CONTROL IMPLEMENTATION PROGRAM (LUCIP)				
Zone Description*	Land Activity and Uses Monitored	Frequency of Land Use Monitoring	Controls / Obligation	Response Period after Receipt of Land Activity Data
1. Site Zone	☒ Real Estate ☒ Construction ☐ Excavation ☐ Water Resources ☐ Other ____	Monthly	Continue commercial landuse at site.	10 working days
2. Residual Groundwater Plume Area	☐ Real Estate ☐ Construction ☒ Excavation ☐ Water Resources ☐ Other _____	Daily	Transmit to excavator notification of presence of petroleum hydrocarbons for excavations greater than 5 feet.	5 working days
3. Regional Hydrogeologic Zone	☐ Real Estate ☐ Construction ☐ Excavation ☒ Water Resources ☐ Other _____	Monthly	Query the SCVWD for new water resources development and groundwater quality in production wells.	10 working days

VI. ADDITIONAL COMMENTS

Considerations and or variances:

- **Maintain Land Use Controls.** The responsible party shall maintain the land use controls and the monitoring of land activities consistent with LUCIP.
- **Transmit Notice to Agency of Exceptions in Site Management Plan.** If a land use control cannot be enforced or the plume is not stable within the response period noted within the LUCIP, then the responsible party shall send written notice to the regulatory agency.
- **Duration of NFA.** No active regulatory oversight is required unless an exception is transmitted to the agency. The NFA may be terminated upon written notice by either the agency or the responsible party.

Summary:

Soils beneath the site consist primarily of clays and silts to a depth of 9 to 14 feet below ground surface (bgs). To a depth of approximately 50 feet bgs, the soil is a mixture of silty sands, clayey sands and clayey gravel. The depth to water on site is at approximately 9 feet, and the groundwater flow has been in a northerly direction with a gradient of about 0.01 feet per foot (ft/ft).

Site investigation began in 1987 and several phases of investigation were conducted until 1991, which included the installation of six wells. Since 1996, the concentration of benzene has been gradually decreasing in all of the wells. Moreover, analytical results since 1999 show that in five wells (BC-1, BC-2, BC-3 BC-5 and E-1) benzene concentrations have been low to non-detect. However, in well BC-4 the benzene concentration during the third quarter 2003 was 600 ug/L. MtBE was first detected in BC-2 in 1996 at 4700 ug/l by USEPA method 8020.

In 1998, an MtBE investigation was conducted as part of a three-corner fuel leak investigation. No significant

MtBE was found in soil or groundwater from the four borings. Groundwater monitoring wells from the Chevron Station at 808 N. Shoreline provide adequate downgradient extent definition of contamination from the Arco site. MtBE in BC-2 decreased to less than 1000 ug/l within two quarters. MtBE was subsequently confirmed by method 8260 at 500 ug/l in August 1997. MtBE concentrations continued to quickly decline. MtBE has not been measured above 10 ug/l in BC-2 since May 2000.

On September 24, 2003, URS personnel performed a conduit study on a 42-inch diameter storm drain located along Middlefield Road, north of the site (Figure 2). The purpose of this investigation was to evaluate if the storm drain could be a potential horizontal conduit for impacted groundwater from the Arco site. Although concentrations have been decreasing, consistently high benzene concentrations have been observed in monitoring well BC-4, the most downgradient well at the site. During the investigation, field screening for hydrocarbons was conducted using visual and olfactory observations, and a portable photoionization detector (PID) to identify potential impacts to the above mentioned utility conduit. A total of four locations were field screened as part of this investigation. Based on the investigation and shallow nature of the under street utilities, it does not appear that any of the locations screened during the investigation have been impacted by the contamination on-site and the storm drain does not appear to be acting as a conduit for contamination from well BC-4.

Based on this information, it does not appear that contamination from the ARCO site, specifically the benzene observed in well BC-4, has migrated off-site and impacted the Chevron or Shell sites, located downgradient. In addition, the results of the conduit study/storm drain investigation do not show an impact to the downgradient utility conduits. It appears the contamination in BC-4 is localized along the northern property boundary, possibly isolated in one of the discontinuous lower silty and clayey sand and gravel horizons, and is attenuating under natural conditions.

Conclusion:

Residual contamination is expected to continually decline due to natural biodegradation processes. Furthermore, no sensitive receptors have been identified as being susceptible to impact from contamination associated with this fuel release given the current site conditions. The site management requirements presented herein are expected to protect to groundwater, human health, and the environment in the event of changes in exposure pathways. Therefore, Santa Clara Valley District staff has concluded that a continuing threat to groundwater, human health, and the environment from residual petroleum hydrocarbons does not exist at this site and that Regional Water Quality Control Board objectives have not been compromised.

Subject: Fuel Leak Site Case Closure, Chevron #9-6377, 808 Shoreline Boulevard, Mountain View, CA; SCVWDID No. 06S2W16J01f

Dear Mr. Lafferty:

This letter transmits the enclosed underground storage tank (UST) case closure letter for the subject case in accordance with Chapter 6.75 (Section 25296.10 [g]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, all Local Oversight Programs (LOP) in the State are required to use this case closure letter for UST leak sites. The Santa Clara Valley Water District began transferring the LOP and all cases to the County of Santa Clara Department of Environmental Health on July 1, 2004. The County of Santa Clara is responsible for the issuance of the attached closure letter. The case closure summary is also enclosed. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

Please note the following conditions still remain at the site: residual petroleum hydrocarbon contamination exists in soil (11,000 ppm TPHG, 71 ppm Benzene, and 7.8 ppm MTBE); residual groundwater contamination also remains (6,800 ppb TPHG, 47 ppb Benzene, and 64 ppb MTBE).

Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. The County and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.

Board of Supervisors: Donald F. Gage, Blanca Alvarado, Pete McHugh, James T. Beall, Jr., Liz Kniss
County Executive: Peter Kutras, Jr.

If you have any questions regarding the enclosed case closure form, please call Mr. Lane R. Davis of the Santa Clara Valley Water District at (408) 265-2607, extension 3756. Thank you.

Sincerely,

Ben Gale

Ben Gale, Director

Subject: Fuel Leak Site Case Closure, Chevron #9-6377, 808 Shoreline Boulevard, Mountain View, CA; SCVWDID No. 06S2W16J01f

Dear Mr. Lafferty:

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Ben Gale

Ben Gale, Director

Board of Supervisors: Donald F. Gage, Blanca Alvarado, Pete McHugh, James T. Beall, Jr., Liz Kniss

Santa Clara Valley Water District

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

I. AGENCY INFORMATION

Date: January 19, 2005

Agency Name: Santa Clara Valley Water District	Address: 5750 Almaden Expressway
City/State/Zip: San Jose, CA 95118	Phone: (408) 265-2600
Responsible Staff Person: Lane R. Davis	Title: Associate Engineer

II. CASE INFORMATION

Site Facility Name: Chevron #9-6377		
Site Facility Address: 808 Shoreline Boulevard, Mountain View, CA		
RB LUSTIS Case No.: ---	Local Case No.: 06S2W16J01f	LOP Case No: 03-073
URF Filing Date: 04-12-88	SWEEPS No.: ---	APN: 153-14-002

Responsible Parties	Addresses	Phone Number
ChevronTexaco c/o Mr. Mark Lafferty	P.O. Box 5004 San Ramon, CA 94583-0804	(925) 842-8953

Tank I.D. No	Size in Gallons	Contents	Closed In Place/Removed?	Date
1,2	5,000	Gasoline	Removed	4-6-88
3	2,000	Gasoline	Removed	4-6-88
4	550	Waste Oil	Removed	4-6-88
4,5,6	10,000	Gasoline	Existing	--
Piping			Existing	--

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Unknown		
Site characterization complete? Yes	Date Approved By Oversight Agency: January 19, 2005	
Monitoring wells installed? Yes	Number: 19	Proper screened interval? Yes
Highest GW Depth Below Ground Surface: 4.5'	Lowest Depth: 20'	Flow Direction: North
Most Sensitive Current Use: Potential drinking water		

Summary of Production Wells in Vicinity: There are 17 abandoned wells and 2 active domestic drinking water wells reported within ¼-mile of this site, the nearest (abandoned, 06S02W15M002) being approximately 200 feet crossgradient to this site. These wells are not considered to be likely receptors due to their location (distance, gradient) away from residual dissolved contamination.	
Are drinking water wells affected? No	Aquifer Name: Santa Clara Valley Groundwater Basin
Is surface water affected? No	Nearest SW Name: None within ¼-mile of this site.
Off-Site Beneficial Use Impacts (Addresses/Locations): None	
Reports on file? Yes	Where are reports filed? Santa Clara Valley Water District

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal w/Destination)	Date
Tank	4 Steel	Disposal; Destination not reported	1988
Piping	Not Reported	Disposal; Destination not reported	1988
Free Product	--	--	--
Soil	Not Reported	Disposal; Destination not reported	1988
Groundwater	14,300 gallons	Disposal; Disposal by contractor (IWM)	2001
Barrels	--	--	--

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONSCBEFORE AND AFTER CLEANUP
(Please see Attachment 2, 3 for additional information on contaminant locations and concentrations)

	Soil (ppm)		Water (ppb)			Soil (ppm)		Water (ppb)	
Contaminant	Before	After	Before	After	Contaminant	Before	After	Before	After

Other (8010)	ND	ND	Yes[2]	ND	MTBE	7.8	7.8	22,000[1]	64[3]

Description of Interim Remediation Activities: Batch extraction removed 14,300 gallons of (primarily) MTBE impacted groundwater from well MW-13.

ND- below detection limit

NA= No analysis for this compound

1- Groundwater grab sample concentration collected 1998, maximum dissolved concentration of contaminants in a monitoring well were: 120,000 ppb TPHG, 7,300 ppb Benzene and 3,100 ppb MTBE [in well MW-13 in the vicinity of the 22,000 ppb MTBE detection].

2- Volatile Organic Compounds detected: 35 ppb Bromodichloromethane (suspect, also found in travel blank), 0.6 ppb Tetrachloroethylene, 3.0 ppb 1,1-DCA, 93 ppb 1,2-DCA, 50 ppb 1,1,1-TCA, 10 ppb cis-1-1,2-DCE, 520 ppb Chloroform, 65 ppb Trichloroethylene, 3,200 ppb Acetone (believed to be laboratory contaminant).

3- via EPA Method 8260B.

V. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes		
Does corrective action protect public health for current land use? Santa Clara Valley Water District staff does not make specific determinations concerning public health risk. However, it does not appear that the release would present a risk to human health.		
Site Management Requirements: Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. Therefore, the impact of the disturbance of any residual contamination or the installation of a water well in the vicinity of the residual contamination shall be assessed and appropriate action taken so that there is no significant impact to human health, safety, or the environment. This could necessitate additional sampling, health risk assessment, and mitigation measures. The District and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.		
Should corrective action be reviewed if land use changes? Yes. This site is an active gas station.		
Monitoring Wells Commissioned: 19	Number Decommissioned: 0	Number Retained: 19*
List Enforcement Actions Taken: None		
List Enforcement Actions Rescinded: None		

*- To be properly destroyed prior to issuance of final closure letter.

V. ADDITIONAL COMMENTS, DATA, ETC.

Site Summary:

1985- In March, two monitoring wells were constructed named WT-1 and MW-9. The case file does not contain a record of this work. A later report refers to one monitoring well and two vadose wells present at the site in 1989, the discrepancies of the record have not been reconciled at this time.

1988- In April, four underground storage tanks (two 5,000-gallon and 2,000 gallon gasoline and one 550-gallon waste oil) were removed; the Unauthorized Release Form states free product was observed. A maximum 11,000 parts per million (ppm) Total Petroleum Hydrocarbons as Gasoline (TPHG) and 71 ppm Benzene were detected in soil. Limited overexcavation occurred under the location of the 2,000-gallon tank; however, the most impacted area was not overexcavated. Two vadose wells and one groundwater monitoring well was constructed

A soil gas survey was performed in November; 106,000 parts per million as vapor Volatile Hydrocarbons was detected.

1989- In January eight exploratory borings (B-1 to 8) were advanced; seven were converted to monitoring wells (MW-2 through 8). A maximum 4,000 ppm TPH (characterized as 'oil') was detected in soil; a composited sample from the same boring contained 670 ppm TPH characterized as 'oil/gas'. An existing groundwater monitoring well was 'renamed' MW-9.

In June, four borings(B-10 to 13) were constructed, three converted to monitoring wells (MW-10 to 12). A maximum 2,400 ppm TPHG and 1.1 ppm Benzene was detected in soil.

1998- In May, a geoprobe investigation encompassing three gas stations occupying the intersection of Shoreline Boulevard and Middlefield Road was performed. The borings associated with the Chevron site were GP-5 through 9, GP-16 and 17, GP-25 and 26, GP-28 and 29, and GP-33. A maximum 2,800 ppm TPHG, 0.16 ppm Benzene, and 7.8 ppm MTBE was detected in soil. Groundwater samplers collected contained a maximum

In November, MW-13 was constructed. A maximum 330 ppm TPHG and 0.074 ppm Methyl tert-Butyl Ether

(MTBE) was detected in soil.

1999- Two monitoring wells (MW-14 and 15) were constructed. A maximum 1.04 ppm TPHG was detected in soil.

2001- Batch extraction was performed as a pilot study to determine if pumping large volumes of water from well MW-13 would result in a significant decrease in dissolved contaminant concentrations.

A Risk-Based Corrective Action (RBCA) analysis was performed in February. Tier 2 RBCA analysis calculated health risk was less than commercial use reference risk level of 10^{-5}.

2004- In February, during the last round of groundwater sampling, the maximum dissolved concentrations in groundwater were 6,800 ppb TPHG, 47 ppb Benzene and 64 ppb MTBE, Tert Butyl Alcohol was not detected above the detection limit of 100 ppb.

Conclusions:
Based upon the results of soil samples and recent groundwater samples results, petroleum hydrocarbon contamination exists in soil (11,000 ppm TPHG, 71 ppm Benzene, and 7.8 ppm MTBE).
Residual groundwater contamination also remains (6,800 ppb TPHG, 47 ppb Benzene, and 64 ppb MTBE). Quarterly monitoring shows that dissolved concentrations steadily attenuating.

At this time, this is an operating fueling facility. See Site Management Requirements.

Based upon the residual concentration of petroleum hydrocarbons in soil and groundwater samples, Santa Clara Valley Water District staff has concluded that a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at this site and that Regional Water Quality Control Board objectives have not been compromised. The investigation was performed in accordance with state and local guidelines. District staff recommends closure for this case.

VI. LOCAL AGENCY REPRESENTATIVE DATA

Prepared by: Lane R. Davis	Title: Associate Engineer
Signature:	Date: 1-19-05
Approved by: James S. Crowley, P.E.	Title: Engineering Unit Manager
Signature:	Date: 1-19-05

This closure approval is based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions.

Re: **Quarterly Report – Third Quarter 2005**
Shell-branded Service Station
807 Shoreline Boulevard at Middlefield Road
Mountain View, California

Dear Mr. Jorvina:

The following report presents the results of the third quarter 2005 groundwater monitoring activities for the site referenced above. Shaw Environmental, Inc. (Shaw) has prepared and submitted this report on behalf of Equilon Enterprises LLC dba Shell Oil Products US (Shell).

PAST REMEDIAL ACTIVITIES

A groundwater extraction and treatment (GWET) system has been periodically operated since July 1992. At the request of Shell, the latest phase of GWET was initiated June 29, 1999 and was shut down in April 29, 2004. Please refer to Shaw's *Quarterly Report - Second Quarter 2004,* dated September 1, 2004, for a historical performance evaluation.

A soil vapor extraction and treatment (SVET) system was operated at the site from April through September 1994. The SVET system was shut down due to the lack of detectable total purgeable petroleum hydrocarbons calculated as gasoline (TPPH-g) and benzene in the influent. Please refer to Pacific Environmental Group, Inc.'s *Quarterly Report - First Quarter 1996,* dated April 29, 1996, for a historical description of the remedial system and performance evaluation. A soil vapor screening and extraction program was implemented at the site from April through December 2003. With concurrence from the Santa Clara Valley Water District, the soil vapor screening and extraction program was discontinued due to low methyl tert-butyl ether (MTBE) concentrations in the influent. Please refer to Shaw's *Quarterly Report - Fourth Quarter 2003,* dated March 2, 2004, for a historical performance evaluation.

QUARTERLY GROUNDWATER MONITORING ACTIVITIES

Under the direction of Shaw, Blaine Tech Services, Inc. (Blaine) performed the third quarter 2005 quarterly groundwater monitoring at the Shell-branded service station on August 3, 2005. Blaine's groundwater monitoring report, which includes a summary of historical and current groundwater elevation and analytical results, field data sheets, and the certified analytical report, is presented as Attachment A.

Groundwater elevation data collected on August 3 and 4, 2005, from the groundwater monitoring wells located at the nearby former Texaco service station (975 Shoreline Boulevard) are presented as Attachment B. Groundwater elevation contours for the site and surrounding area are presented on Figure 1.

Blaine submitted the groundwater samples to a state-certified laboratory for analysis of TPPH-g; benzene, toluene, ethylbenzene, and xylenes; and MTBE by U.S. Environmental Protection Agency (EPA) Method 8260B, and for analysis of total extractable petroleum hydrocarbons calculated as diesel (TEPH-d) by EPA Method 8015M. TPPH-g, benzene, TEPH-d, and MTBE concentrations detected in samples from groundwater monitoring wells at the site are presented on Figure 2.

CONCLUSIONS AND RECOMMENDATIONS

The above referenced site is currently undergoing the site closure process. Per e-mail correspondence from Mr. Lane Davis of Santa Clara Valley Water District, dated April 11, 2005, closure concurrence from the Regional Water Quality Control Board for the fuel leak release at the above-referenced site has been received. The final closure letter will be issued upon confirmation that the monitoring wells associated with the fuel leak investigation and monitoring are properly destroyed.

All existing monitoring wells are scheduled to be destroyed in fourth quarter 2005 pending approval of several access agreements from off-site property owners. Shaw recommends discontinuing groundwater monitoring and sampling activities in fourth quarter 2005.

Please do not hesitate to contact us with any questions or concerns at (408) 382-5800.

Sincerely,

Shaw Environmental, Inc.

Owen C. Chao
Project Engineer

Subject: Fuel Leak Site Case Closure Texaco, 975 Shoreline (Stierlin Rd.), Mountain View, CA; Case No. 20-017, SCVWDID No. 06S2W15M02f

Dear Mr. Frohnapple and Ms. Schlobohm:

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the Health and Safety Code.

Board of Supervisors: Mike Wasserman, George Shirakawa, Dave Cortese, Ken Yeager, Liz Kniss
County Executive: Jeffrey V. Smith

Please contact our office if you have any questions regarding this matter.

Sincerely,

Philip D. Smith
Director

Subject: Fuel Leak Site Case Closure Texaco, 975 Shoreline (Stierlin Rd.), Mountain View, CA; Case No. 20-017, SCVWDID No. 06S2W15M02f

Dear Mr. Frohnapple and Ms. Schlobohm:

This letter transmits the enclosed underground storage tank (UST) case closure letter for the subject case in accordance with Chapter 6.75 (Section 25296.10 [g]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, all Local Oversight Programs (LOP) in the State are required to use this case closure letter for UST leak sites. The Santa Clara Valley Water District began transferring the LOP and all cases to the County of Santa Clara Department of Environmental Health on July 1, 2004. The County of Santa Clara is responsible for the issuance of the attached closure letter. The case closure summary is also enclosed. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

Please note the following conditions still remain at the site: residual contamination remains in soil of 2,800 parts per million (ppm) Total Petroleum Hydrocarbons (TPH) as Gasoline (TPHg), 700 ppm Total Oil and Grease (TOG), 37 ppm Benzene, 52 ppm Toluene, 85 ppm Ethylbenzene, 205 ppm Xylenes, and 95 ppm Lead; and in groundwater of 7,700 parts per billion (ppb) TPHg, 3,300 ppb TPH as Diesel (TPHd), 58 ppb Benzene, 1 ppb Toluene, 8 ppb Ethylbenzene, 3 ppb Xylenes, 1 ppb Methyl tert Butyl Ether (MtBE), and 4.7 ppb Trichloroethene (TCE).

Residual contamination in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of

Board of Supervisors: Mike Wasserman, George Shirakawa, Dave Cortese, Ken Yeager, Liz Kniss
County Executive: Jeffrey V. Smith

water wells. The County and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.

If you have any questions regarding the enclosed case closure form, please call Ms. Lani Lee of the Local Oversight Program at (408) 918-1977. Thank you.

Sincerely,

Michael Balliet
Acting Program Manager
Hazardous Materials Compliance Division
Local Oversight Program

City/State/Zip: San Jose, CA 95112	Phone: (408) 918-3400
Responsible Staff Person: Lani Lee	Title: Hazardous Materials Specialist II

II. CASE INFORMATION

Site Facility Name: Texaco		
Site Facility Address: 975 Shoreline (Stierlin Rd.) Blvd., Mountain View 94043		
RB LUSTIS Case No: --	Local Case No: 06S2W15M02f	LOP Case No.: 20-017
URF Filing Date: 5/3/90; 4/9/91	SWEEPS No.: --	APN: 153-16-010
Responsible Parties	Address	Phone Number
Chevron Environmental Management Co. c/o Ian Robb	6001 Bollinger Canyon Road #K2216 San Ramon, CA 94583	--
Schlobohm Karin Trustee, Udt c/o Karin Schlobohm	1234 McIntosh Court Sunnyvale, CA 94087	--

Tank I.D. No.	Size in Gallons	Contents	Closed In Place/Removed?	Date
1	6,000	Gasoline	Removed	12/92
2,3	4,000	Gasoline	Removed	12/92
4,5	4,000	Diesel	Removed	12/92
6	550	Waste Oil	Removed	12/92
Piping			Removed	12/92

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: holes in the USTs		
Site characterization complete? Yes	Date Approved by Oversight Agency: 3/22/11	
Monitoring wells installed? Yes	Number: 15	Proper screened interval? Yes
Highest GW Depth Below Ground Surface: 4.01'	Lowest Depth: 15.75'	Flow Direction: north
Most Sensitive Current Use: Potential Drinking Water		
Summary of Production Wells in Vicinity: There are two inactive water supply wells located 370 to the northeast and 890 feet east and both are crossgradient of the site. Based on the flow of groundwater, it is unlikely that the release from this site has impacted these wells.		
Are drinking water wells affected? No	Aquifer Name: Santa Clara Valley Basin	
Is surface water affected? No	Nearest SW Name: Stevens Creek, ~2,511 ft east	
Off-site Beneficial Use Impacts (Addresses/Locations): None.		
Reports on file? Yes	Where are reports filed? County of Santa Clara, Dept. of Environmental Health

Notes:

1. Soil sample T3-S-14' collected at 14 feet below the ground surface (ft bgs) following tank removal on 12/8/92.
2. Soil sample S-14-T3S collected at 14 ft bgs following tank removal on 12/8/92. Heavy Metals concentration reported is for Lead. Confirmation soil samples were not analyzed for Lead.
3. Soil sample SS12-NW11.5' collected following over-excavation in August 1993 at 11.5 ft bgs.
4. Soil samples S-14-T4S and T3-S-S-14' collected at 14 ft bgs following tank removal on 12/8/92.
5. All soil samples analyzed for these constituents were not reported to have concentrations present above the laboratory reporting limits.
6. Soil sample S-14-T5S collected at 14 ft bgs following tank removal on 12/8/92.
7. Soil sample collected from 12.5-13 ft bgs in boring SB4 on 7/23/90.
8. Soil sample SS11-NW11.5' collected following over-excavation in August 1993.
9. All confirmation soil samples collected following over-excavation in August 1993 were not reported to have concentrations of TPHd present above the laboratory reporting limits.
10. Groundwater sample collected from well MW22E on 5/20/92.
11. Grab groundwater sample collected from boring B4 located near well MW22E, which was reported to contain 3,300 ppb TPHd, on 10/14/10.
12. Groundwater sample collected from well MW22E on 2/3/89, the first sampling event for this well.
13. Groundwater sample collected from well MW22E on 10/19/90; the only time wells were sampled for semi-volatile organic compounds. Reported concentration is for Trichloroethene (TCE).
14. Groundwater sample collected from well MW22D on 12/4/97; MtBE analysis by EPA Method No. 8021.
15. All groundwater samples collected from wells sampled on 2/21/07 when testing for TBA commenced.
16. Groundwater sample collected from well MW22E on 10/14/10; the last sampling event for this well.
17. Groundwater sample collected from well MW22O on 10/14/10; the last sampling event for this well.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes		
Does corrective action protect public health for current land use? Environmental Health Department staff does not make specific determinations concerning public health risk. However, it does not appear that the release would present a significant risk to human health.		
Site Management Requirements: The site is developed as a fast-food restaurant and the offsite properties impacted are developed commercially and/or zoned as light manufacturing (ML). Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. Therefore, the impact of the disturbance of any residual contamination or the installation of water well(s) in the vicinity of the residual contamination shall be assessed and appropriate action taken so that there is no significant impact to human health, safety, or the environment. This could necessitate additional sampling, health risk assessment, and mitigation measures. DEH and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.		
Should corrective action be reviewed if land use changes? Yes, See Site Management Requirements		
Number of Wells Commissioned: 15	Number of Wells Decommissioned: 3	Number of Wells Retained: 12*
List Enforcement Actions Taken: None.		
List Enforcement Actions Rescinded: None.		

* All wells will be destroyed prior to issuance of the closure letter and documents.

V. ADDITIONAL COMMENTS, DATA, ETC.

Site History:

1988 – In June, 3 groundwater monitoring wells (MW22A through MW22C) were installed at the site. This is prior to the opening of a fuel leak investigation case and a report of this work was not found in the file. No soil samples were collected for chemical analysis. Groundwater from well MW22A was reported to contain 5,800 parts per billion (ppb) Benzene, 2,100 ppb Toluene, 3,300 ppb Ethylbenzene, and 620 ppb Xylenes.

It is reported that "droplets of heavily weathered free product" was observed in well MW22A since June 1988. And that in December 1988, 5-inches of free product (FP) were measured in that well. During initial development of well MW22E, 0.25-inches of FP were observed; however it was not observed on subsequent visits.

Between November 1988 and January 1989, 3 soil borings (SB1 through SB3) were advanced and 3 wells (MW22D through MW22F) were installed on and offsite. 8 soil samples were collected and reported to contain maximum concentrations of 2,500 ppm TPHg, 16 ppm Toluene, 84 ppm Ethylbenzene, and 300 ppm Xylenes.

1989 – In October, a soil gas survey was conducted at the site. 10 soil gas samples (SG1 through SG10) were collected from depths of 5-10 feet below the ground surface (ft bgs) and reported to contain maximum concentrations of 190 parts per million (ppm) Total Petroleum Hydrocarbons (TPH), 86 ppm Benzene, 31 ppm Toluene and 1.1 ppm Xylenes.

In November, an offsite soil gas survey was conducted. 15 locations (S1 through S15) were selected for the collection of soil gas. Samples could not be obtained from S1 through S5 due to the presence of clayey soils. Low to non-detectable concentrations of the Constituents of Concern (COCs) were reported in the soil gas samples.

1990 – In May, a surface release was reported of 100 gallons of gasoline (51 gallons) and diesel (46 gallons) in preparation for a tank test. The release occurred while the USTs were being filled. Absorbent material and rags were used to cleanup the product. It is estimated that 5-10 gallons of product reached the storm drain. It is reported that the product was contained within the storm drain line and did not reach the discharge point.

In July, 12 soil borings were advanced onsite around the storage tanks, dispensers and waste oil tank. 22 soil samples were collected and reported to have maximum concentrations of 1,500 ppm TPHg, 21 ppm Benzene, 55 ppm Toluene, and 105 ppm Xylenes. The samples collected from boring SB4 (downgradient of the waste oil tank) were also analyzed for Halogenated Volatile Organic Compounds (HVOCs), which were not reported to be present above the laboratory reporting limit.

2 monitoring wells (MW22G and MW22H) were installed offsite and wells MW22A through MW22C were reconstructed. The reconstruction was done to deepen the wells which previously had 0-1.5 feet of standing groundwater. Groundwater samples collected from wells MW22A, MW22B, and MW22D were also analyzed for HVOCs. Well MW22A was reported to contain 8.1 ppb 1,2-dichloroethene (1,2-DCE), 1.5 ppb 1,1-dichloroethane (1,1-DCA), and 1.5 ppb 1,1,1-Trichloroethane (1,1,1-TCA). It should be noted that petroleum hydrocarbons have not been reported in this well prior to this time.

In October, groundwater from wells MW22B, MW22E, MW22F, and MW26S were again analyzed for HVOCs. The maximum concentrations reported were again for well MW22B. Well MW26S was not reported to have concentrations present above the laboratory reporting limits and this well is located on the upgradient side of the Teledyne/Spectra-Physics site with an ongoing investigation for a solvent release. It was concluded in the report that the solvents detected are not from the Teledyne/Spectra-Physics site and that they do not originate from onsite but rather some upgradient source.

1991 – In October, FP was observed in wells MW22A, MW22E, and MW22H at thicknesses ranging from 0.40-5.20 feet. Also at this time a soil vapor extraction (SVE) test was conducted and it was concluded that SVE would be a favorable remediation method.

1992 – In June, 3 soil borings (RB1 through RB3) and 7 groundwater monitoring wells (MW22K through MW22Q) were advanced. Well MW22Q was completed at 37.5 feet below the ground surface (ft bgs) in a deeper water bearing zone and was installed through conductor casing. 37 soil samples were collected and reported to have low to non-detectable concentrations of COCs, except for the sample collected from RB1 at 13 ft bgs. This sample was reported to contain 1,100 ppm TPHg 16 ppm Benzene, 2.6 ppm Toluene, 33 ppm Ethylbenzene, and 56 ppm Xylenes.

Groundwater monitoring ceased after the November sampling event.

In December, 5 fuel USTs were removed from the site. Holes were noted in a gasoline UST and a diesel UST. 10 soil samples were collected from beneath the USTs at approximately 14 ft bgs and were reported to contain maximum concentrations of 5,500 ppm TPHg, 2,800 ppm TPHd, 27 ppm Benzene, 280 ppm Toluene, 140 ppm Ethylbenzene, and 600 ppm Xylenes. Duplicate soil samples were collected and reported to have maximum concentrations of 6,300 ppm TPHg, 220 ppm TPHd, 34 ppm Benzene, 220 ppm Toluene, 600 ppm Ethylbenzene, and 100 ppm Xylenes.

Groundwater was not encountered in any of the excavations associated with the USTs removals.

The product lines and dispensers were also removed and 4 soil samples were collected from approximately 2 ft bgs under the lines. The samples were reported to contain maximum concentrations of 1,400 ppm TPHg, 2,000 ppb TPHd, 0.0074 ppm Benzene, 6.4 ppm Toluene, 11 ppm Ethylbenzene, and 86 ppm Xylenes.

1 waste oil UST was also removed. 1 soil sample (S-9-T6) was collected in the middle of the excavation at approximately 9 ft bgs and was not reported to have concentrations of the COCs above the laboratory reporting limits, except for a low detection of Methylene Chloride. The duplicate soil sample collected was reported to contain 70 ppm Total Recoverable Petroleum Hydrocarbons (TRPH).

2 hydraulic lifts were removed and soil samples were collected between 6-7 ft bgs. The soil samples were reported to only have 17 ppm TPH as Hydraulic Fluid (TPH-hf) in one sample. Total Oil and Grease (TOG) was not reported to be present in either sample above the laboratory reporting limits. The duplicate soil sample collected was reported to contain 47 ppm TRPH.

1993 – In March, additional excavation of soil was conducted onsite. Groundwater was encountered around 10 ft bgs during this phase of investigation. In the area of the fuel USTs, 9 soil samples were collected between 6-9.5 ft bgs and were reported to have maximum concentrations of 380 ppm TPHg, 66 ppm TPHd, and low concentrations of Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

In the excavation in the area of the product lines, 5 soil samples were collected between 5-9 ft bgs and reported to contain maximum concentrations of 1,100 ppm TPHg, 240 ppm TPHd, 0.023 ppm Benzene, 3.2 ppm Toluene, 23 ppm Ethylbenzene, and 130 ppm Xylenes.

In August, approximately 1,520 cubic yards of soil were removed from the site. The intent was to remove soil from the site with concentrations greater than 10 ppm TPHg. The excavation was approximately 14 feet deep and groundwater was encountered at 12 ft bgs. Maximum concentrations were reported in confirmation soil samples of 2,800 ppm TPHg, 37 ppm Benzene, 52 ppm Toluene, 85 ppm Ethylbenzene, and 205 ppm Xylenes. These maximum concentrations were reported in soil samples collected along the north wall of the excavation and further excavation in this direction could not be completed due to the proximity of the sidewalk.

A sheen was noted on the groundwater in the excavation. Approximately 1,000 gallons of groundwater and product was pumped out of the excavation. A grab groundwater sample was collected from the excavation for profiling purposes and was reported to contain 16,000 ppb TPHg and 870 ppb Benzene.

Soil vapor extraction (SVE) piping was laid within the excavation during backfilling. A 5-day SVE test was conducted. There was only a relatively small zone of influence, which was likely due to the large surface area of the vapor extraction trench upon which the vacuum was being applied. This test determined that SVE was a feasible remediation method and presented recommendations on system design.

1994 – In January, the SVE system was started and operated through the beginning of February. During this time approximately 14.04 pounds of TPH were reported to have been removed. The system was restarted 15 days later to see if the soil vapor concentrations had rebounded. No rebound was noted. The system was decommissioned and all piping was removed from the site in order to allow for site redevelopment.

1995 – In July, groundwater monitoring recommenced onsite. Prior to this date, 3 monitoring wells (MW22C, MW22K and MW22Q) were decommissioned due to their proximity to the excavation boundaries.

1998 – It is mentioned in a site summary report that ORC was placed in wells MW22A, MW22E, MW22G,

MW22H and MW22O. No further data was found on the use of ORC at the site.

2010 – In March, 1 boring (B1) was advanced to 10 ft bgs approximately 100 feet downgradient of monitoring well MW22H, which is the furthest downgradient well and historically been reported to have FP. 3 soil samples were collected and were not reported to have concentrations of COCs present above the laboratory reporting limits. A grab groundwater sample was collected and was not reported to have detectable concentrations of COCs present above the laboratory reporting limits.

In October, 3 soil borings (B2 through B4) were advanced on and offsite to 10 ft bgs. Soil samples were only collected from boring B4 and were reported to have maximum concentrations of 70 ppm TPHg, 10 ppm TPHd, 0.079 ppm Benzene, 0.071 ppm Toluene, 0.01 ppm Ethylbenzene, and 0.009 ppm Xylenes.

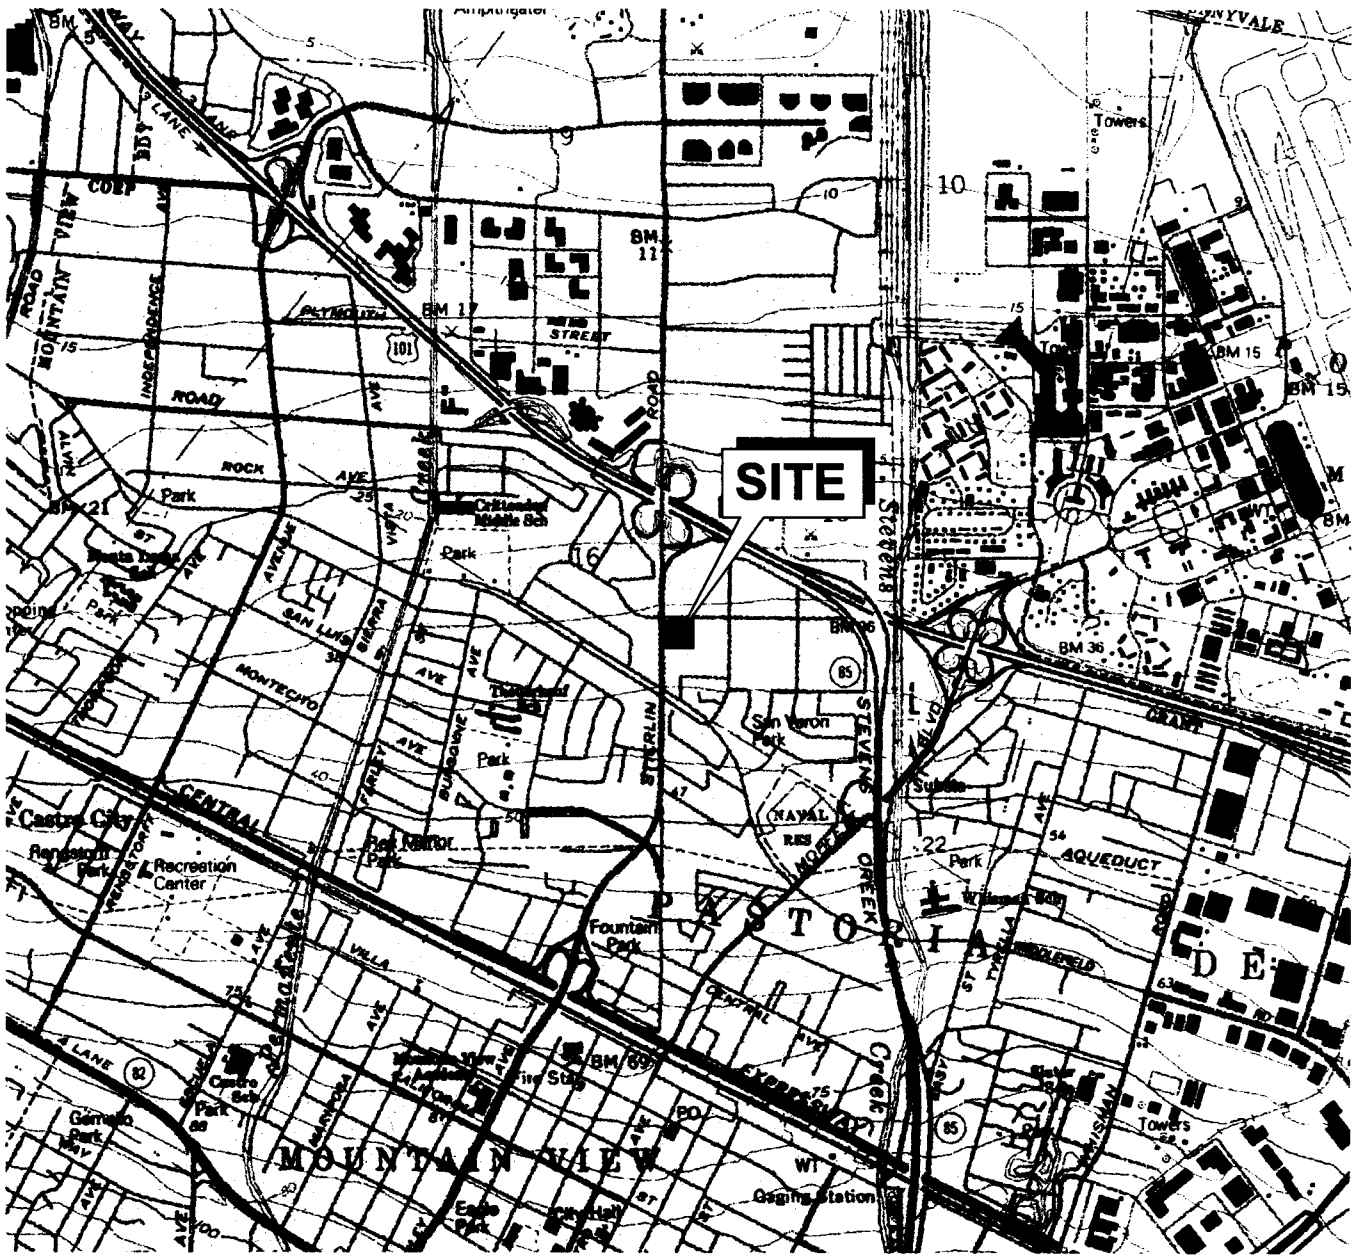
The borings were converted to temporary wells with screen intervals from 5-10 ft bgs for the collection of grab groundwater samples for comparison with adjacent monitoring wells. The comparison was conducted because the well screens in site wells are submerged due to groundwater rising across the site. Maximum concentrations were reported of 11,000 ppb TPHg, 9,900 ppb TPHd, 460 ppb Benzene, 13 ppb Toluene, 19 ppb Ethylbenzene, 25 ppb Xylenes, and 3 ppb MtBE in the sample collected from boring B4, which is adjacent to well MW22E. It was concluded that the data collected did not necessarily verify or refute that groundwater samples collected from submerged well screens are representative of dissolved-phase petroleum hydrocarbons concentrations. Differences between the borehole and groundwater monitoring well sample analytical results were both greater and less than their counterpart samples, depending on sample location.

Also at this time, air samples were collected from the crawl space beneath the vacant single-story building, within the vacant building and outside (ambient). The structure is residential in nature, but is zoned for light manufacturing (ML). This structure is located near well MW22E. The crawl space was described as having an earthen floor, posts and beams supporting the first floor, and approximately 2-foot high concrete sidewalls with vents on the north and south walls. The samples were reported to contain maximum concentrations of 1.5 micrograms per cubic meter ($\mu g/m^3$) Benzene, 7 $\mu g/m^3$ Toluene, 1.8 $\mu g/m^3$ Ethylbenzene, and 9.9 $\mu g/m^3$ Xylenes. Both Benzene and Ethylbenzene results for the indoor air sample exceed the Environmental Screening Levels (ESLs) for residential use of 0.084 $\mu g/m^3$ and 0.98 $\mu g/m^3$, respectively; however, the results for the indoor and outdoor samples were similar as well as the crawl space sample. Therefore, it is likely that the concentrations reported both indoors and in the crawl space are a result of ambient air.

Considerations and/or Variances:
The site is occupied by a fast food restaurant. Free product was historically reported to be present in wells MW22A, MW22E and MW22H. The maximum concentrations of contaminants in groundwater were 420,000 ppb TPHg, 9,900 ppb TPHd, 39,000 ppb Benzene, 40,000 ppb Toluene, 6,200 ppb Ethylbenzene, 67,000 ppb Xylenes in well MW22E located offsite near the vacant single family residence. These concentrations have reduced to 7,700 ppb TPHg, 3,300 ppb TPHd, 58 ppb Benzene, 1 ppb Toluene, 8 ppb Ethylbenzene, 3 ppb Xylenes and 1 ppb MtBE.

Residual contamination remains in soil of 2,800 ppm TPHg, 700 ppm Total Oil and Grease (TOG), 37 ppm Benzene, 52 ppm Toluene, 85 ppm Ethylbenzene, 205 ppm Xylenes, and 95 ppm Lead.

There are 2 inactive water supply wells located within 900 feet of the site in a crossgradient direction. Based on their location, it is unlikely that the release from this site has impacted or will impact these wells.



Site Management Requirements have been established for this site.

Conclusion:
The Department of Environmental Health believes that the residual soil and groundwater contamination at the site does not pose a continuing, significant threat to groundwater resources, human health, or the environment. Regional Water Quality Control Board objectives have not been compromised. The investigation was performed in accordance with state and local guidelines. The Department of Environmental Health recommends that this site be closed.

SIGNATURES

I understand and agree that all work associated with this permit is required to be done in accordance with Santa Clara Valley Water District (District) Well Ordinance 90-1, the District Well Standards, and conditions of this permit (see page 2). I certify that the information given in this permit is correct to the best of my knowledge and that the signature below, whether original, electronic, or photocopied, is authorized and valid, and is affixed with the intent to be enforceable. I also certify that a right of entry/encroachment agreement has been formalized between the well owner and property owner, if parties differ.

APPLICATION TO DRILL EXPLORATORY BORINGS

IMPORTANT: A minimum 24-hour notice must be given to Santa Clara Valley Water District Well Inspection Department prior to installing the annular seal. Call (408) 265-2607, ext. 2660. Please allow 10 working days to process permit application.

GENERAL CONDITIONS

A. **District** (telephone 408-630-2660) **must be notified a minimum of one working day before the exploratory boring is backfilled.** An authorized District representative must be on site to witness the sealing operation. This requirement may be waived by an authorized District representative. If the District waives the inspection requirement, the District may request the permittee(s) to furnish certification under penalty of perjury that the seal was constructed in accordance with the District Well Standards.

B. This permit is valid only for the purpose specified herein. Boring destruction methods authorized under this permit may not be changed except by written approval of an authorized District representative, and only if the District believes that such a change will result in equal or superior compliance with the District and State Well Standards (e.g., if the District representative finds that site conditions warrant such a change).

C. This permit is only valid for the Assessor's Parcel No. indicated on it.

D. This permit may be voided if it contains incorrect information.

E. Borings shall be sealed within 24 hours following completion of testing or sampling activities. Borings shall not be left in such a condition as to allow for the introduction of surface waters or foreign materials into them. Borings shall be secured such that they do not endanger public health.

F. If any work associated with this permit will take place on District property/easement, an encroachment or construction permit must be granted by the District's Community Projects Review Unit (telephone 408-630-2350, -2217, or -2253).

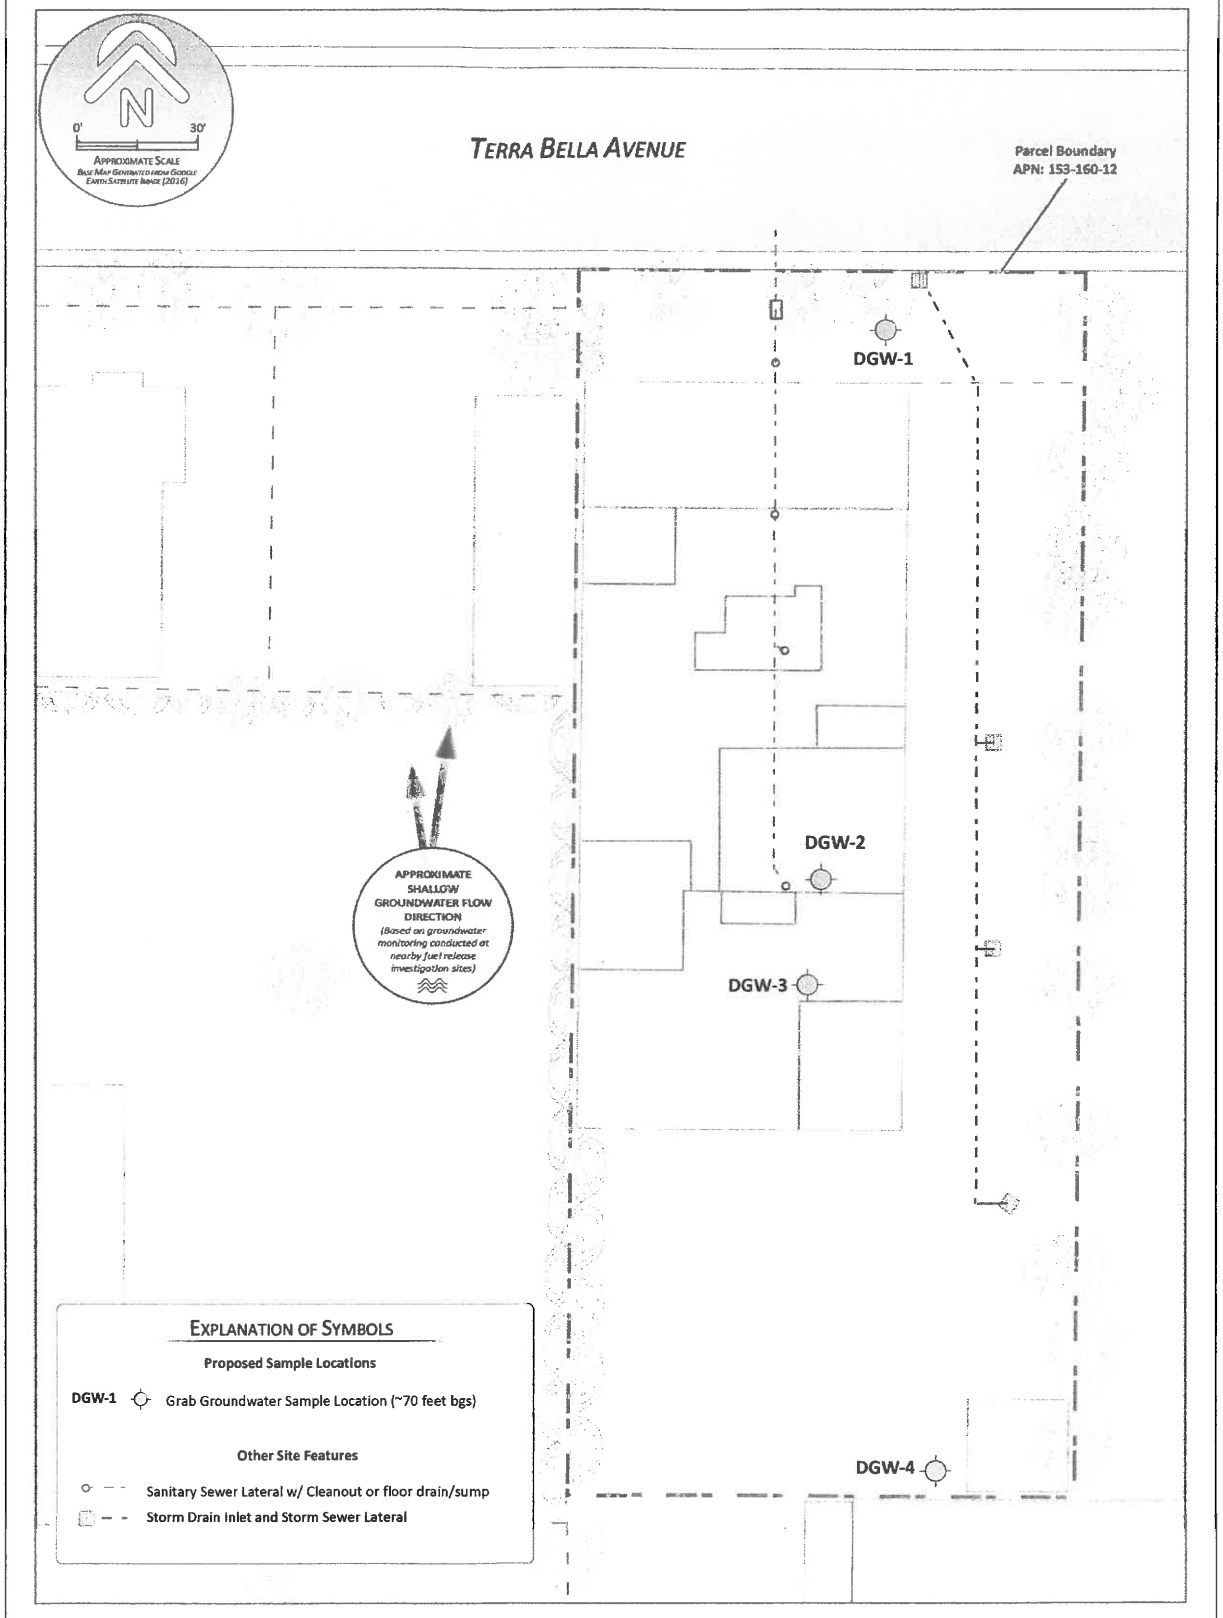
G. The permittee(s) shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend, and hold the District, its officers, agents, and employees, free and harmless from any and all expense, cost, and liability in connection with or resulting from the granting or exercise of this permit including, but not limited to, property damage, personal injury, and wrongful death.

H. Permittees are required to be in full compliance with Cal/OSHA California Labor Code Section 6300.

I. A current C-57 or C-61 Contractor's License is required for work associated with this permit.

J. Permittee, permittee's contractors, consultants, or agents shall be responsible to assure that all materials or waters generated during drilling, boring destruction, and/or other activities associated with this permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statues regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on- or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where the work is being completed.

K. The driller and consultants (if applicable) shall have an active copy of their Worker's Compensation Insurance on file with District.



L. This permit shall expire if not exercised within 180 calendar days of its approval, unless an extension of the permit expiration date is granted by an authorized District representative.

M. This permit shall be kept on site during all activities associated with it and shall immediately be presented to an authorized District representative upon request.

N. Permittee shall notify Underground Service Alert (USA) at 1-800-227-2600 or 811 prior to any digging.

Permit Approved by:	Date:
L B	9-7-16

Please allow 10 working days to process this application.

Client: **R.L. Collins Properties LLC**	Date: **July 21, 2016**
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☐ Drilling ☐ Sampling ☑ Other (see below):	Weather Conditions:
Pre-Drill Site Inspection & GPR Survey for Reported Underground Tank	Mostly Clear, Warming
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

0736 => Leave Santa Cruz area for Job site

0845 => Arrive onsite ; Meet w/ Frank
- Conduct site walk through.
- Locate area of suspect underground tank
  - Frank indicates tank was removed ~~prior to Telewave~~ taking ownership of building in 2006.
- Prior to Telewave, site was circuit board Manufacturing
- Locate floor drains (sinks) and cleanouts
- Will map / locate w/ transmitter.

0920 => JR Associates onsite (Jim)
- Attempt GPR survey in area of suspect tank location
  - Concrete re-inforced w/ wire mesh ; however GPR picks up rebar where tank was reportedly removed. There is a hair-line crack in concrete where rebar starts.
    - Difficult to locate at reported tank area due to shelving setting over a portion of this area.
    - Frank will move shelving prior to drill date.

JR Assoc. locates sewer lateral - one lateral running through approx center of building out to street.

→ Drain (floor drain - no cover) in "Metal working area" connected to lateral. Frank indicates chemicals / solutions from metal coating / aluminum coating were discharged to floor drain / sanitary sewer if pH was neutral - treated to neutralize as needed.

1220 => All exterior / interior boring locations cleared of utilities

Note : No other GPR anomalies in area around reported UST

1230 => USA perimeter of property → Demob.

LIMITATIONS: We can locate many, but not all, buried utilities in a given area. A buried utility must emit a signal, either a signal transmitted by us or a naturally occurring signal, to be detected by our equipment. The most common type of buried utilities not detected are nonmetal sewer lines and pipes made of PVC, concrete and other nonconducting materials. Other examples of utilities that might not be detected are metal pipelines that are electrically insulated between joints, pipes buried under or near other objects, and pipes buried in reinforced concrete. Often pipes buried close together will appear as a single pipe. Please call if you have any questions regarding the limitations of utility locating.

Client: **R.L. Collins Properties LLC**	Date: **August 9, 2016**
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below): **Phase II Soil & Groundwater Sampling**	Weather Conditions: Foggy + Cool
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

0600	=> Leave Santa Cruz area for site
0700	=> Arrive onsite • Frank (Telewave) onsite → open up facility for access. • Romero Concrete onsite. Commence coring all concrete locations (x 9 locations)
0710	=> Cascade Drilling onsite (Jose + helper) • GeoProbe 6620 LAR • Prep for drilling / go over work scope / tailgate meeting
0820	=> Stage rig at SV-1; commence 5.5 core and soil vapor sample installation.
0840	=> SV-1 probe installation complete.
0850	L> Stage rig at SV-2; commence coring/installation. Note: all SV's installed at 5' bgs, ceramic filter tip and Teflon tubing. See construction diagram and geologic log for details.
0900	=> SV-2 installation complete. Josh Hanneleck (WHA engineer) onsite to conduct soil vapor sampling.
0915	=> SV-3 installation complete. Note: Non native fill sand encountered to ~5' bgs; native silt below.
0925	=> Commence continuous core at DP/GW-4 for soil and groundwater sampling.
1000	=> Advanced DP-4 to 32' bgs. No significant water bearing zone observed. Wet soils observed from ~16-17.3' bgs (some dilatency) and thin (12-inches) gravelly lense around 21' bgs. → Will remove dual wall rods to 8' bgs and screen bottom 10' of borehole.
*	Note: Very strong solvent odors / moisture from ~28-32' bgs Retain samples @ 24, 27 and 31' for analysis. L> See log for details

Client: **R.L. Collins Properties LLC**			Date: **August 9, 2016**
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**			Study #: **2X620**
Field Tasks: ☑ Drilling	☑ Sampling	☐ Other (see below):	Weather Conditions: Part Sun, Warming
Phase II Soil & Groundwater Sampling			
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**			

TIME:

1045	=> Consult w/ Senior Geologist @ WHA (Pat Hoban) to augment drilling/sampling plan in light of deep contamination.
	• Eliminate DP-1 & 2 → Core DP-3/GW-3 to 32' Feet for deeper soil sampling and GW sampling.
	• Move GW-7 upgradient of old tank p.t (just outside building)
1110	=> Commence coring DP/GW-3
	(Note: Tagged water @ ~11' bgs in DP-4)
1200	=> DP-3/GW-3 advanced to 36' bgs. No obvious impacts observed.
	• Groundwater sampling:
	• DP-3: Screen from 16-36' bgs (dual wall rods pulled back to 10')
	• DP-4: " " 12-32' bgs (" " " " " " ")
	Depth to water:
	• GW-3: 8.5' bgs
	• GW-4: 6' bgs
1250	=> GW Sampling at GW-4 complete. => Apparent Solvent-like odor.
	2 x 1 Liter Ambers; 3 x 40 mL VOA's
	→ Seal borehole to surface w/ neat cement
	* All groundwater sampled via peristaltic pump and new poly tubing.
1310	=> GW Sampling at GW-3 complete. => Trace apparent solvent odor.
	→ Seal borehole to surface w/ neat cement.
1320	=> Stage rig at alternate GW-7 location. Hydropunch to 32' w/ expendable tip; then place 20' 0.010 slot screen from 12-32' bgs for groundwater sampling.
1340	=> GW-7 hydropunched to 32', 20' screen. Tag water @ ~7' bgs.
	- Purge/Sample (3 x 40 mL VOA's)
1400	=> GW-7 sampling complete → Seal borehole w/ neat cement.
	=> Begin hydropunching relocated GW-8; same construction as GW-7

*Note: groundwater samples contain $CaCO_3$ → effervessing w/ HCl in VOA's

Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below):	Weather Conditions: Sunny, Warm
Phase II Soil & Groundwater Sampling	
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

1420 => GW-8 construction complete. (Same as GW-7)
→ Tag water @ 7.5' bgs → Purge / Sample (3 x 40mL VOA's)

1430 => Sample collection at GW-8 complete.
→ Seal borehole w/ neat cement grout to surface.

=> Commence installation of GW-6 (hydropunch - same construction as GW-7, 8)

1455 => GW-6 installation complete.
- Tag water @ 8.5' bgs → Purge / Sample (3x40mL VOA's)

1515 => Sample Collection @ GW-6 complete.
→ Seal borehole w/ neat cement grout.

1550 => All boreholes properly sealed.
→ Secure site

Demob. / Will return tomorrow to complete sampling program.

Client: **R.L. Collins Properties LLC**	Date: **August 9, 2016**
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below):	Weather Conditions: Foggy + Cool
Phase II Soil & Groundwater Sampling	
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

0600	=> Leave Santa Cruz area for site
0650	=> Arrive onsite. Cascade Drilling onsite. Prep for drilling/sampling.
0710	=> Stage drill rig at DP/GW-5 (in front of long-standing storage shed)
	→ Core to 32' bgs for soil inspection and groundwater sampling.
0740	=> DP/GW-5 cored to 32' bgs. No evidence of soil impacts observed.
	Relatively thin zones of wetness observed at:
	• 11.5-12' ; • 15.5-17' ; 22-23'
	• Bore hole cased w/ 20' 0.010" slot screen (12-32')
	- Tag water @ 7.5' bgs ; Purge/sample w/ peristaltic pump
	and new poly tubing (3 x 40mL VOA's)
0755	=> GW-5 sample collection complete; Seal borehole to surface w/ neat cement grout.
0805	=> Stage rig at DP-4 location (where strong solvent odors were encountered
	below 28' bgs). Will advance a hydropunch to 20' bgs
	through existing SV-3 core (concrete precond) and screen
	borehole from 10-20' bgs for groundwater sampling. Want to
	compare deeper GW sampling that extended in to soil contamination
	w/ shallow sampling that does not extend into contamination.
	Also want to confirm thin, wet zone at 16-17.3 will
	produce. Sample ID = GW-4-d20
0820	=> GW-4-d20 - initially 21' water ; slow to enter borehole. Wait
0840	=> Commence hydropunch installation at GW-2; 32' deep, 20' 0.010 slotscreen.
0905	=> GW-2: Tag water at 8.2' bgs - Purge/Sample.
0920	=> GW-2 groundwater sampling complete; Seal borehole w/ neat cement.
	→ Advance/install GW-1, same construction as GW-2.
0945	=> GW-1: Tag water at 8' bgs → Purge/Sample (2x 1 Liter Ambers; 3 x 40ml VOA's)
1005	=> GW-1 Sample collection complete; Seal borehole w/ neat cement.
1010	=> Tag water level @ GW-4-d20 → Stabs @ 7.2' bgs → Purge/Sample
	(2 x 1 Liter Ambers; 3 x 40 mL VOA's)
1040	=> GW-4-d20 Sample collection complete (No obvious VOC odor).
	→ Seal borehole w/ neat cement.
1100	=> Begin site cleanup/prep for demob. Remove SV tubing at SV-1, 2, 3.
	→ All boreholes have been sealed. Patch all surface locations, flush.
	• Collect sample from soil drum and decon drum for disposal
	profiling. Drums will be left in front of facility for subsequent pick-up.
1120	=> BC Labs courier onsite. Relinquish samples under COC.
1250	=> All locations patch; Site secured.
	Drillers demob/Demob.

REPORTED LOCATION OF FORMER UNDERGROUND TANK

GPR survey detected rebar reinforced concrete at this location, rather than wire mesh reinforced concrete which was detected in all other areas surveyed. This information coupled with our observation of a linear crack in the concrete suggest that this reported underground tank location is probably accurate.

GW-7 (new location)

Client: **R.L. Collins Properties, LLC**	Date: 9/15/16
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below):	Weather Conditions:
Additional Phase II Drilling & Sampling	Foggy - Cool
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

0600 => Leave Santa Cruz area for job site.

0710 => Arrive onsite.
Meet w/ Frank Peek to obtain acess to site and building interior.

0720 => Coast Wide utility locaters (Sergio) and Romero concrete arrive onsite.
↳ Begin clearing all boring locations. DGW-1 through DGW-5
↓ Note: Concrete core DG-2, 3 + 4 (Also core alternate DGW-2 location inside building, beneath sky light, in case the Geoprobe 8040 drill rig can access (~13.5' high clearance). Otherwise, install DGW-2 just outside building.
↳ See attached site map for details.

0810 => Concrete Coring and utility clearance compete.

0830 => Cascade Drilling onsite (Fernando and Nerry).

0845 => Hold Tailgate meeting → go over work scope for today = One continuous core to ~ 60-70' +/-, and Two hydropunch Samples to similar depth.
→ Go over site health and safety - contaminants of Concern / PPE.
↳ Will stage rig at DGW-2 (outside building) => Overhead access too Low inside building.

0930 => Commence continuous core at DGW-2 => See geologic log for details.
↓
Contact SCVWD to schedule 11 am grout inspection per permit requirements. Liz (SCVWD) gives Okay to grout w/o inspector. today.

1100 => No recovery from 32'-36' (liner jammed)

1230 => Continuous core to 50' bgs
- Low permeability silty Clay encountered from ~29.5-39' (damp to moist)
- Saturated gravels to gravelly Sands encountered from 41.3-47.2' => Over

Client: **R.L. Collins Properties, LLC**	Date: 9/15/16
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below):	Weather Conditions:
Additional Phase II Drilling & Sampling	Cooler, Slightly Breezy - Fair
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

1230 => 47.2 - 50 encounter lower permeability material w/ sand interbed.
↳ See geologic log for details

1245 => Insert 10' 0.010 slot screen (3/4" PVC) to 50' bgs, with riser to ground surface.
→ Will ✓ retract rods to 42' bgs to expose screen from 42-50' bgs

1300 → Tag water level @: 8.2' bgs
→ Purge / sample groundwater via peristaltic pump and new poly tubing.

1320 => Grab groundwater sample collection @ DGW-2 complete.
Seal borehole w/ neat cement through rods — pull back rods as grouting advances in order to prevent potential cross contamination from upper water bearing zone to lower zone.

• Decon all rods.

1410 => Stage rig at DGW-5 location (up gradient)
→ Advance hydropunch rods to 50' ✓ bgs → then pull back 0.01 inch slot hydropunch screen (4' length) to 43' bgs

1436 => At target depth. Tag water level @: DRY

1453 => Still no water in borehole → pull back rods to 48' (pull up 2')
↳ Still DRY => Pull up to 39' (2 more feet)
Note: Will move on to DGW-1 and attempt 50' hydropunch.
→ Will let DGW-5 set for a while (possibly overnight if needed) to allow water to enter borehole from 39-50' bgs

1520 => Stage rig at DGW-1; advance closed tip rods to 50'; pull back to 40' (drop expendable tip) and insert ~~5~~ 10' of PVC screen.
1545 ↳ Tag borehole => Initially DRY
↓
Tag DGW-5 => Water @ ~29' bgs => Slowly entering borehole.
↳ Will cap rods @ surface to secure borehole → will purge/sample tomorrows morning

Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

1600	=> Tag depth to water @ DGW-1 => ~46' bgs ; Slowly entering bore hole.
	↳ Will cap casing & secure overnight → will purge/sample tomorrow morning.
	Note: Checked 8040 rig to see if it could fit inside building to install DGW. 3 + 4.
	↳ Rig just barely has enough overhead clearance (~1" to spare)
	↳ Will leave rig overnight, and continue drilling/sampling program tomorrow.
1610	Secure site; prep to demob.
1620	=> Demob.

Client: **R.L. Collins Properties, LLC**	Date: 9/16/16
Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☐ Other (see below):	Weather Conditions: Foggy & Cool
Additional Phase II Drilling & Sampling	
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

0600	=> Leave Santa Cruz Area for Site
0760	=> Arrive onSite
	Cascade onsite ; Prep for drilling / sampling => Continue from yesterday
0810	=> Tag DGW-5 (rods / screen left in place from yesterday afternoon).
	↳ At 7.6' bgs (considered Stabilized) => Prep to purge / sample
0725	=> Purge / Sample DGW-5 w/ peristaltic pump and new poly tubing.
0740	=> Sample collection complete.
	→ Seal borehole w/ neat cement by retraction grout method. Add grout through rods, then retract rods - adding grout as needed to top off.
	↳ Note: drop screen (4' Stainless) has knock-out plug that is removed prior to grouting.
0745	=> Contact SCVWD for scheduling / notification of borehole sealing.
	↳ Okay to grout w/out inspections today (via Chuck).
0750	=> Measure depth to water in DGW-1 (rods / screen left in place overnight). DTW = 33.9' bgs — very slow to enter borehole.
	↳ Will collect sample later this morning.
0800	=> Borehole DGW-5 completely sealed to surface. Decon drill Rods.
0830	=> Stage rig at DGW-4. Hydropunch for groundwater sampling only.
	→ Advance closed tip rods to 50' bgs → Insert 10' 0.010 slot screen (PVC - 40-50' bgs); then expose (pull back rods) from 40-50' bgs (expendable tip drops out at 50' when pulling back rods.).
0920	=> At target sample depth (DGW-3) screened and open from 40-50' bgs
	→ Purge / Sample → Tag water @: 9.1' bgs.
0940	=> DGW-3 sampling complete; seal borehole via retraction grout method
1000	=> DGW-3 borehole sealed to ground surface → Decon drill rods.

Site Location: **1155 Terra Bella Avenue, Mountain View, CA**	Study #: **2X620**
Field Tasks: ☑ Drilling ☑ Sampling ☑ Other (see below):	Weather Conditions:
Additional Phase II Drilling & Sampling	Becoming Sunny, Cool
Personnel / Company On-Site: **Jered Chaney (Weber, Hayes and Associates: WHA)**	

TIME:

1015	=> Collect groundwater sample at DGW-1
	Depth to water just prior to sampling = 32.5' bgs
1030	=> Sample collection complete. Seal borehole via retraction grouting.
1100	=> DGW-1 sealed to ground surface => Decon drill rods.
1120	=> Stage drill rig at DGW-4
1135	=> Commence continuous core to 50' bgs - Dual Wall sampler.
1245	=> At 50' bgs ; DGW-4.
	→ gravels to Sandy gravels encountered at 41.5 - 50' bgs
	↳ Fully saturated.
	↳ Shallow water bearing zone above ~30' not evident
	- Minor wet zone @ ~17.5 (a few inches thick)
	→ Another thin zone of saturation encountered in Sandy Material From ~34-37' bgs.
	No obvious impacts observed in DGW-4.
1250	=> Insert 10' 0.010 slot PVC screen From 40-50' bgs.
	→ Retract rods to 40' bgs.
	→ Tag water @ : 7.4' bgs
	↳ Prep to purge / sample.
	Note: Retained soil samples collected via 5035 field preservation methods (smart kits) from depths of: 8', 16', 24', 28', 32', 36' 40', and 48' for potential VOC analysis.
1330	=> Groundwater sample collection complete.
	→ Seal borehole via retraction grout method.
1400	=> DGW-4 completely sealed. All boring locations patched at surface w/ concrete.
	=> Clean up + Prep to Demob.
	• Generate One x 55-gallon drum of decon water → Label and place out Front. Add all soil cuttings to existing soil cutting drum.
1500	=> Secure Site => Mobilize to Log Gates to meet BC lab Courier for Sample Drop off.

INVOICE AGREEMENT

INVOICE #_____ DATE _____

This agreement is made between Coast Wide Utility Locators hereinafter referred to as C.W.U.L. and the undersigned Client.

REQUESTOR NAME:	JOB NAME:
Jared Chaney	Terra Bella
Company: Webber Haynes	Job Address: 195 Terra Bella
Billing Address: on file	Contact Person: Same
Phone: on file	Phone: Same
Service & Scope of Work: (6) Boring locations	PO/ Project: 2X620

C.W.U.L. agrees to perform the following scope of work for the above mentioned Client. In consideration of said scope of work the Client agrees to pay C.W.U.L. the amount of $ 135 / hour. Note that there is a minimum charge of 2 hours, and is incurred upon office departure to office return. In any event it is determined C.W.U.L. is liable for its actions, the liability shall be limited to the amount of its fee. Only the located and marked utilities are guaranteed. Clients should never assume that 100% of said utilities have been detected and marked. Some utilities are undetectable. For all excavations in accordance to California State Law, call USA 48 hours ahead, 1.800.227.2600. Payment is due upon receipt unless other arrangements have been made. Initials: _____

Date:	Start:	End:	Total Hrs:	Charges:
9/15/16	7:00	9:00	2	$270.00

Expense/Credit:	Total:
Authorizing Signature:	TOTAL FEE DUE: $270.00

Results: → Cleared (6) locations for Hot Electric (Power & Radio) & metal utilities.

Technician: Sergio

Make all checks payable to Coast Wide Utility Locators
Thank you for your business!

Geologic Symbols and Terms

	Major Divisions	Symbols	Descriptions
Coarse Grained Soils	Gravels (More than 1/2 of coarse fraction > no. 4 sieve size)	GW	Well Graded Gravels, little or no fines
		GP	Poorly Graded Gravels, little or no fines
		GM	Silty Gravels, gravel-silt mixtures
		GC	Clayey Gravels, gravel-clay mixtures
	Sands (More than 1/2 of coarse fraction < no. 4 sieve size)	SW	Well Graded Sand, little to no fines
		SP	Poorly Graded Sand
		SM	Silty Sand, sand-silt mixtures
		SC	Clayey Sand, sand-clay mixtures
Fine Grained Soils	Silts and Clays Liquid Limit < 50%	ML	Silt or Very Fine Sands, rock flour, with slight plasticity
		CL	Inorganic Clay with high plasticity, lean clay
	Silts and Clays Liquid Limit > 50%	MH	Inorganic Sandy Clay or Silt, elastic silts
		CH	Inorganic Sandy Clay or Silt, with high plasticity, fat clays

Symbols and Terms

- First encountered groundwater
- Stabilized groundwater
- Sample interval
- Soil sample sent to laboratory for targeted analysis
- Water sample sent to laboratory for targeted analysis

Trace = < 5%
Few = 5 - 10%
Little = 15 - 20%
Some = 30 - 45%
Dominantly = > 50%

SOIL DENSITY/CONSISTENCY			
SANDS & GRAVELS	BLOWS/FT.	SILTS & CLAYS	BLOWS/FT.
VERY LOOSE	0 - 4	VERY SOFT	0 - 2
LOOSE	4 - 10	SOFT	2 - 4
MED. DENSE	10 - 30	FIRM	4 - 8
DENSE	30 - 50	STIFF	8 - 16
VERY DENSE	> 50	VERY STIFF	16 - 32
		HARD	> 32

Blow count is the number of blows required to drive a 2-inch diameter California Modified Split-Spoon Sampler the last 12 inches of an 18 inch sample interval by a 140-pound hammer free-falling 30 inches.

Well Construction Details:

- Bentonite Seal
- Cement Seal
- Filter Pack
- Screened Interval

ags = above ground surface bgs = below ground surface
PID = Photo-Ionization Detector ppmv = parts per million by volume
USCS = Unified Soil Classification System

FIELD METHODOLOGY FOR:
HYDRAULIC DRIVEN PROBES

Using Macro-Core®, Large Bore® or Dual Tube® Hydraulic Driven Probes

Direct push exploratory borings are "drilled" with a Hydraulic Driven Probe drill rig, which hydraulically vibrates and drives steel probes into the soil. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval.

The soil cores are logged by an experienced geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. Relatively undisturbed soil samples are obtained for both lithologic logging and laboratory analysis. A portion of individual soil cores are stored in a sealed plastic bags for field screening of hydrocarbons and/or volatile organic compounds by an Photoionization Detector (PID). Vapor readings in parts per million (ppm) are recorded on the boring logs. The PID is also used during drilling for monitoring the work area for site safety.

All drilling equipment is decontaminated prior to arriving on-site to prevent possible transfer of contamination from another site. The sampling probe and all other soil sampling equipment are thoroughly cleaned between each borehole by washing in a Liqui-Nox or Alconox solution followed by a double rinsing with distilled water to prevent the transfer of contamination.

After drilling, all exploratory boreholes are grouted with continuous pour neat cement grout from the bottom of the borehole to the ground surface.

<u>Samples Targeted for Laboratory Analysis</u>:

Soil samples targeted for laboratory analysis are immediately cut from the acetate sample liner and protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, placed in a plastic ZipLock baggie, and immediately stored in an insulated container chilled to a temperature of 4 degree Celsius. Soil samples selected for Volatile Organic Compound (VOC) analysis may follow field preservation protocols according to EPA Method 5035, as described in DTSC's *Guidance Document for the Implementation of United States Environmental Protection Agency Method 5035:*

Methodologies for Collection, Preservation, Storage, and Preparation of Soils to be Analyzed for Volatile Organic Compounds, dated November 2004.

Groundwater samples are collected after temporary PVC casing is placed in the hole and at least one borehole volume is purged and groundwater is visually observed to be free of sediment. Relatively representative groundwater samples are either: 1) collected with a peristaltic pump and dedicated polyethylene tubing and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths of less than 27 feet bgs) or 2) collected by mechanically lifting groundwater through a clean stainless steel foot valve and dedicated polyethylene and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths greater than 27 feet bgs where a peristaltic pump cannot be used). Samples being analyzed for dissolved metals will be preserved and acidified by the testing laboratory following their receipt of samples. Once collected, groundwater sample containers are placed in ZipLock bags and are stored in an insulated container chilled to a temperature of 4 degree Celsius.

All samples are transported in chilled coolers to a State-certified laboratory under appropriate chain-of-custody documents. Soil samples that may be put on "hold" for potential future analysis will be stored in a dedicated sample freezer, be frozen, and stored under chain-of-custody documentation. Hold times will be confirmed with the testing laboratory to ensure that potential analysis of any "hold" samples will be analyzed within the laboratory hold times.

BC LABORATORIES INC. COOLER RECEIPT FORM Page 4 Of 4

Submission #: 16-22171

SHIPPING INFORMATION
Fed Ex ☐ UPS ☐ Ontrac ☐ Hand Delivery ☐
BC Lab Field Service ☒ Other ☐ (Specify)_____

SHIPPING CONTAINER
Ice Chest ☒ None ☐ Box ☐
Other ☐ (Specify)_____

FREE LIQUID
YES ☐ NO ☐
1→9 (W) / (S) 10→30

Refrigerant: Ice ☒ Blue Ice ☐ None ☐ Other ☐ Comments:

Custody Seals Ice Chest ☐ Intact? Yes ☐ No ☐ Containers ☐ Intact? Yes ☐ No ☐ None ☒ Comments:

All samples received? Yes ☒ No ☐ All samples containers intact? Yes ☒ No ☐ Description(s) match COC? Yes ☒ No ☐

COC Received ☒ YES ☐ NO

Emissivity: 0.9 Container: Amber Thermometer ID: 208

Temperature: (A) 4.0 °C / (C) 4.0 °C

Date/Time 8.10.16 2221

Analyst Init M

Notes And Definitions

J	Estimated Value (CLP Flag)
MDL	Method Detection Limit
ND	Analyte Not Detected
PQL	Practical Quantitation Limit
A01	Detection and quantitation limits are raised due to sample dilution.
A02	The difference between duplicate readings is less than the quantitation limit.
A07	Detection and quantitation limits were raised due to sample dilution caused by high analyte concentration or matrix interference.
A52	Chromatogram not typical of diesel.
Q02	Matrix spike precision is not within the control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Billing Email: _____ Billing Phone No. : (_____) _____

*Responsible Party as defined in Sections 25260 and 101480 of the Health and Safety Code. Typically, the RP is the entity requesting oversight.

Reason for Regulatory Oversight/Scope of Work *[New projects only]*

Discovery of a TCE/PCE release (documented in attached Phase I/II ESA). Owners wish to redevelop the property.
A perchloroethylene (PCE) release was discovered at the subject site during the completion of a recent Phase I/II Environmental Site Assessment. Laboratory tested samples indicate the primary source of the solvent release originated from a former underground chemical storage tank (UST) located within the southeast portion of the site building.

Do you anticipate using engineering controls to mitigate risk (soil capping, vapor barrier, etc.)? ◉ YES ○ NO

The undersigned hereby applies for regulatory oversight through the Voluntary Cleanup Program from the County of Santa Clara. I hereby certify that the submitted information is true, accurate, and complete. I understand that if engineering controls are used to mitigate risk, the Department requires a Deed Restriction/Environmental Covenant on the property. I understand that the Deed Restriction/Environmental Covenant may include a long-term operation and maintenance plan and/or long-term monitoring requirements. I understand that a new Voluntary Cleanup Agreement will be required if the property changes ownership or there is a change of Responsible Party. I understand that this is a fee for service program. Invoices for this project will be sent via email to the Responsible Party unless otherwise directed.

RE: Written notification pursuant to H&SC, Section 101480– Local cleanup oversight

This is a written notification as required by Health and Safety Code, Section 101487. All the required information is given below:

1. Name and address of the property owner and responsible party:
   Old Trace Partners, LLC
   c/o Sean Corrigan
   419 S San Antonio Rd., Suite 212
   Los Altos, CA 94022

2. Address and location of the site:
   1155 Terra Bella Ave., Mountain View, CA 94043
   APNs: 153-160-12

A commercial property occupied by a telecommunications company that utilized chlorinated solvents. It has been reported that the property had an underground storage tank containing trichloroethylene. Phase II site assessment activities reported significant levels of TCE in soil vapor, soil, and groundwater. The current property owners have expressed desire to remediate the property in preparation for a redevelopment.

The planned involvement by the County of Santa Clara is to oversee additional investigative activities, , direct remedial work, and assess the need for mitigation measures necessary to protect human health, and satisfy the redevelopment and land use requirements.

If you need any further information about this site, please contact the undersigned at (408) 918-1954.

Sincerely,

SUBJECT: REMEDIAL ACTION AGREEMENT
FORMER TELEWAVE PROPERTY
1155 TERRA BELLA AVE., MOUNTAIN VIEW, CA
APN: 153-160-12

Dear Mr. Corrigan:

The Department of Environmental Health (DEH) has received your application requesting regulatory oversight. At your request, DEH is assuming the role as the lead regulatory oversight agency for the remedial action as allowed by Section 101480 of the California Health and Safety Code. As indicated on your application for oversight, **OLD TRACE PARTNERS, LLC** has requested to be the Responsible Party[1] for the remedial action.

TERMS OF AGREEMENT

By entering into this Remedial Action Agreement (Agreement), you agree to the following terms and conditions:

- All subsequent written directives from DEH regarding testing, monitoring, and analysis to determine the nature, extent, and risk of contamination, potential remedial action or mitigation measures to be taken, and cleanup goals (including deadlines for required submittals), collectively referred to as Remedial Action, will be considered a part of this Agreement.

- The DEH will utilize the State of California GeoTracker database to store all documents related to this project. To be considered complete, all required submittals must be uploaded to GeoTracker. This includes all laboratory analytical reports in EDF format. Please note, DEH will not accept paper or email submittal of documents for review.

1 Responsible Party as defined in Health and Safety Code Sections 25260 and 101480.

Board of Supervisors: Cindy Chavez, Mike Wasserman, Dave Cortese, Ken Yeager, S. Joseph Simitian
County Executive: Jeffrey V. Smith

DocuSign Envelope ID: F98800EF-939D-466B-8400-540391EF7AAC

- DEH review of and response to all technical documents (work plans, site management plans, remedial action plans, completion reports, etc.) may take between 30 and 45 days after documents have been uploaded to GeoTracker. DEH will not expedite review of documents based on the Responsible Party's schedule.

- Regardless of the level of oversight from DEH, you are responsible for the timely reporting, investigation, and cleanup of soil and groundwater pollution such that the beneficial uses of waters of the State are protected, and in compliance with appropriate laws, regulations and policies. You are also responsible for compliance with any new laws or regulations that may be applicable during the term of this Agreement.

- If, at any time, the Responsible Party is not in compliance with directives from DEH that constitute a portion of this Agreement, DEH can, with adequate notice, terminate this Agreement. If the Agreement is terminated prior to adequate completion of the remedial action, the case may be referred to the Department of Toxic Substance Control (DTSC) or Regional Water Quality Control Board (RWQCB) for issuance of a State Corrective Action Order, Cleanup and Abatement Order, or other order or enforceable agreement, as appropriate, for further remedial action directives.

- If, upon further characterization, DEH determines that the release of waste that is the subject of this Agreement is sufficiently complex, may present such a significant potential hazard to human health or the environment, or may not be in the best interest of the DEH to continue as lead agency, the case may be referred to the DTSC or RWQCB for further action. In the event this case is referred to and accepted by the DTSC or RWQCB, this Agreement is terminated.

- Pursuant to Section 25262 of the Health and Safety Code, a Responsible Party may request the designation of an administering or lead agency other than DEH when required to conduct corrective action. Please contact DEH for further information about the State Site Designation Committee process.

- Remedial action must follow acceptable industry standards regarding testing, monitoring, and analyses to determine the type and extent of the contamination caused by the released waste, and the appropriate cleanup of the released waste to eliminate or mitigate the associated risk to human health or safety or the environment.

- After determining that the Responsible Party has completed the remedial action required by DEH to protect human health, safety, and the environment, and that a permanent remedy for the release of waste has been achieved, a case closure letter will be issued to the Responsible Party that certifies that no further action is required.

- As allowed by Section 101490 of the Health and Safety Code, DEH will invoice the Responsible Party to recover the reasonable and necessary costs for oversight of the identified release up to and including implementing this Agreement. DEH staff time will be invoiced quarterly at the rate specified in the County Fee Ordinance at the time the DEH work is performed. The current hourly charge rate is $191 per hour under the County's fee schedule and adopted by the Board of Supervisors.

DocuSign Envelope ID: F98800EF-939D-466B-8400-540391EF7AAC

- Failure to pay oversight invoices within 30 days may result in a 25% late charge and could result in assignment of the charges to the County's Department of Revenue for legal collections, and potential termination of this Agreement with subsequent referral to the DTSC or RWQCB. DEH response to technical documents and/or issuance of final closure may also be delayed.

RESPONSE REQUIRED

To execute this Agreement, please sign and date below where indicated. Upon receipt of the executed Agreement, a new project will be opened in the GeoTracker Database. DEH will utilize GeoTracker for the management and storage of all documents related to this project.

Should you have any questions, please contact the Site Mitigation Program coordinator, Mr. Aaron Costa at (408) 918-1954 or by email at aaron.costa@cep.sccgov.org.

Sincerely,

Re: Voluntary Cleanup Program: Former Telewave Property, 1155 Terra Bella Avenue, Mountain View, CA; Case No. 2018-23s

Dear Mr. Corrigan:

The purpose of this letter is to notify you that your application for regulatory oversight under the County of Santa Clara Department of Environmental Health (DEH), Voluntary Cleanup Program has been approved. The DEH has created a case file in the State Water Resources Control Board online GeoTracker database, which will be used to store and review relevant environmental documents related to the case. The GeoTracker case can be accessed online at http://geotracker.waterboards.ca.gov/ under the site address 1155 Terra Bella Avenue, Mountain View, CA, or the case name "Former Telewave Property," or GeoTracker Global ID No. T10000011881.

To evaluate potential environmental risk related to your project, the DEH requires a complete Conceptual Site Model (CSM) to adequately characterize the nature and extent of contamination in soil, groundwater, and soil vapor beneath the site. To begin our review of the CSM, please upload to GeoTracker all relevant environmental documents for review, such as Phase I and Phase II reports, and any other technical reports associated with the site.

As indicated in the Remedial Action Agreement, review and response to technical documents may take up to 45 days following submittal to GeoTracker. Once all relevant environmental documents have been uploaded to GeoTracker, please notify me via email.

I will be the DEH caseworker for this site, so please direct future correspondence to me. If you have any questions, please feel free to contact me at (408) 918-3486 or via email.

Sincerely,

1.0 EXECUTIVE SUMMARY

The following *Work Plan for Additional Site Assessment* (*Work Plan*) describes additional soil, soil vapor and groundwater investigation tasks designed to further characterize previously confirmed chemical impacts to the subsurface [i.e., chlorinated solvents - trichloroethylene (TCE) and associated degradation daughter products] that was discovered at the Former Telewave Property (1155 Terrabella Avenue, Mountain View, CA – see Figure 1) during a previously completed *Phase II Environmental Site Assessment*[1]. Two (2) separate parties that were interviewed during previous Phase I research had independently confirmed knowledge of an underground chemical storage tank (UST), that was removed from the site without permit sometime during the previous decade. Elevated concentrations of chlorinated solvents detected in soil and groundwater beneath the location of the reported chemical UST suggest that it is the likely source of the release.

Old Trace Partners, LLC (the current property owner and responsible party) have recently entered in to Santa Clara County Department of Environmental Health's (SCCDEH) Voluntary Cleanup Program (VCP), which allows the SCCDEH to assume lead regulatory oversight for site characterization and remediation activities and certify that site cleanup goals have been met. The owner, who purchased the property in late 2016, has plans to redevelop the site for residential use. The existing, on-site commercial building is currently vacant, and the owner has no plans to lease the space prior to redevelopment. We note that the building will need to be razed to facilitate the majority of investigation tasks described in this *Work Plan,* including subsequent primary source removal tasks, as proposed investigation locations situated within the building footprint cannot currently be accessed with the necessary drilling equipment.

The proposed additional soil, soil vapor and groundwater investigation tasks described in this *Work Plan* will be completed with the goal of generating a *Conceptual Site Model* that will be used to identify potential data gaps and evaluate remediation and/or mitigation approaches to move the site towards regulatory case closure for the proposed transition to residential use. Specifically, the proposed scope of work includes:

"Source Area" Soil Characterization (see Figure 6)

Investigate the area at, and around the immediate vicinity of the former chemical UST to determine the vertical and lateral extent of soil impacts. This proposed, two-part investigation will first involve advancing at least four (4) cone penetrometer test / membrane interface probe (CPT/MIP) borings to qualitatively gauge the point source location and extent of soil impacts, followed by the collection and laboratory analysis of discrete soil samples to quantify the magnitude and extent of soil impacts beneath the site. The goal of this investigation is to gauge potential soil source removal efforts and/or other potential soil remediation alternatives.

Preliminary Evaluation of Persistent Pesticides in Shallow Soil (see Figure 6)

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk if encountered; therefore, in order to facilitate the proposed residential land use transition and provide clearance for this *Recognized Environmental Condition* we propose to conduct a standard of care sampling and laboratory analysis of first encountered native soils beneath site to determine whether persistent pesticides are present at levels that may exceed risk based thresholds.

Soil Vapor Characterization (see Figure 7)

Obtain additional data on the extent of shallow soil vapor concentrations via the installation of three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent chemical UST source. One (1) soil vapor well is also proposed for installation at the southern property line, adjacent to a former off-site hazardous waste sump to provide data on the potential presence of an off-site solvent source.

Ambient Indoor Air Sampling (see Figure 7)

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (24-hour sampling period). We acknowledge that the samples may not be representative of indoor air quality for future buildings due to

[1] Weber, Hayes & Associates: *Phase I/II Environmental Site Assessment, Telewave Property*, dated November 15, 2016.

likely differences in building size, foundation construction and heating, ventilation and air conditioning (HVAC) configurations. However, it is our opinion that the data will be useful in providing some information as to whether the subsurface soil gas to indoor air pathway is complete.

Additional Groundwater Characterization (see Figure 8)

We propose a phased approach to further characterize impacts to groundwater which include:

1. Advancing a CPT sounding to depths of approximately 70 to 80 feet bgs (or deeper if possible and necessary) on the north side of Terra Bella Avenue (off-site, downgradient) to determine if a third water bearing zone (C-Zone) occurs at these deeper, unexplored depths, and if confirmed obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.

2. Advancing a transect of three (3) off-site, downgradient borings on the north side of Terra Bella Avenue for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of downgradient, off-site impacts in these water bearing zones.

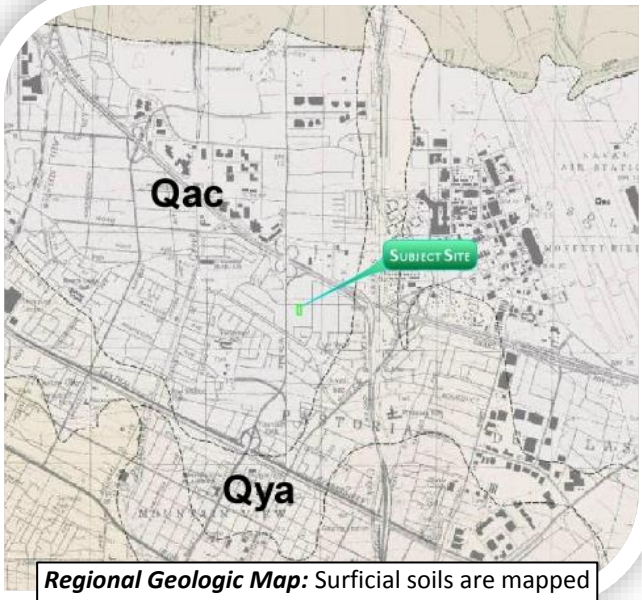
3. Install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A- and B-Zones. The proposed wells will be positioned near, and downgradient of the apparent chemical UST source. One (1) paired well is also proposed for installation at the southern property line, adjacent to an off-site, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. In addition to these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect described above, we will make appropriate recommendations to Santa Clara County Department of Environmental Health (SCCDEH) for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts.

We also propose completing a half mile radius well search to locate any nearby water supply wells that could potentially be impacted by the release.

2.0 SITE DESCRIPTION AND BACKGROUND

2.1 SITE SETTING & BACKGROUND

The approximate 0.85 acre subject property (the "site") consists of a single, parcel at 1155 Terra Bella Avenue, in Mountain View, California, and is situated in mixed commercial and residential area. The current Site layout has been the same since at least the mid-1960s.



- *Santa Clara County Assessor's Parcel Number (APN):* 153-160-12.
- The property spans a total area of approximately 36,810-ft^2.
- There is a large, commercial warehouse structure on-site along with a smaller storage shed.

The earliest available records (from aerial images dating back to 1939) show the subject Site was largely undeveloped through at least 1950. Agricultural land use (i.e., orchards) were first observed in 1956, and continued until sometime before 1968. The existing site structure and property layout was first observed in 1968, and the layout has remained unchanged thought the current day. The most recent manufacturing operations included the fabrication of radio equipment (Telewave) from the early 1980s through 2008, when operations were moved to a new facility in San Jose. Manufacturing operations included working of raw metals using acid etching, painting, assembly and shipping. Between 2008 and 2016, the site was used for storage and a portion of the building leased to a dog day-care business (Doggie-Ville). The property was acquired by the current owner in late 2016 and has remained unoccupied since that time. The current owner is planning to transition the site to residential.

The adjoining parcels are commercial-industrial, and the surrounding areas contain a mixture of commercial and residential land use (see *Vicinity Aerial Map,* Figure 2). Many of the industrial businesses that operate in this area of Mountain View are involved in the production of electronic and computer components, which often involves the bulk chemical storage and use.

2.2 GEOLOGICAL & HYDROGEOLOGICAL CONDITIONS

Regional geologic maps and reports indicate that surface soils underlying site and the vicinity area generally consist of Holocene-aged surficial sediments consisting of silty clay and organic clay ('Qac', see *regional geologic map*[2], right). This formation generally represents intra-fan areas. To the south and east of the site, there are other surficial sediment formations that consist of alluvial sand, fine-grained silt, and clay (Qya) and area typically associated with the outer edges of depositional fans.

Regional Geologic Map: Surficial soils are mapped as unconsolidated alluvial deposits (Qac) that consist primarily of silty clay, and clays.

Groundwater depth and flow data was gathered from a nearby monitoring network of twelve (12) wells. A quarterly groundwater monitoring report[3] for this nearby leaking underground storage tank site (a Texaco gas station on Shoreline Blvd) indicated shallow groundwater flows in a northernly direction and has a depth to groundwater of around 17 to 24 feet below ground surface (bgs).

As described in the subsection below, a Phase I/II Environmental Site Assessment (ESA) was complete for the site during the summer of 2016, which included the installation of a number of continuously cored soil borings to depths up to 50 feet below the ground surface (bgs). Geologic logs constructed for these borings are included as Appendix A for reference. Generalized observations of on-site subsurface lithology include:

- Lower permeability silts and silty clays are encountered below surface improvements to depths of approximately 11 to 12 feet bgs.

---

[2] *Geologic Map of Santa Clara County, California*, Dibble T.W., dated 2007.

[3] Stantec Consulting Corp, *1st quarter 2010 Semi-Annual Groundwater Monitoring Report, Former Texaco Service Station, dated April 30, 2010*

- Moderate permeability clayey sands to silty sands extend to depths of approximately 24 to 26 feet bgs.
    - **Shallow Groundwater (A-Zone):** Relatively thin water bearing zones (ranging from approximately 0.5 feet to 4.5 feet in thickness) are encountered between depths of approximately 12 and 26 feet bgs within localized sand or gravel lenses. Exception: one boring (DGW-4 encounter a saturated zone between approximately 34 to 37 feet bgs)
- Lithology below depths of approximately 26 feet bgs to depths of approximately 41 feet bgs is somewhat variable ranging from lower permeability silty clays to moderate permeability silty sands and clayey sands.
- **Deeper Groundwater (B-Zone):** a second, deeper water bearing zone was encountered within a well graded gravel deposit at depths below approximately 41 feet bgs, which extends to depths of at least 50 feet bgs.

2.3 PHASE I/II ENVIRONMENTAL SITE ASSESSMENT

A Phase I/II ESA was completed for the property in 2016[4]. The following subsections provide a brief synopsis of the investigation findings.

2.3.1.1 Summary of Phase I Research

A Site inspection, review of local, state and federal regulatory records, and communications with persons knowledgeable about the Site identified two (2) on-site, ***Recognized Environmental Conditions[5],*** which are summarized below.

- Reported Presence of Former Underground Chemical Storage Tank (UST): Interviews with two (2) separate parties have independently confirmed knowledge of an underground chemical storage tank (UST), that was removed sometime during the previous decade. It is likely that the

[4] Weber, Hayes & Associates: *Phase I/II Environmental Site Assessment, Telewave Property*, dated November 15, 2016.

[5] **'REC' - Recognized Environmental Condition:** the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

suspected underground chemical storage tank was used to store chemicals such as virgin/waste solvents, as suggested in a User Questionnaire. Should a leak have been the reason for its unpermitted removal, there is a strong potential for it to negatively impact the quality of soils and/or groundwater beneath the Site.

- Long-Term Manufacturing: The on-site facility maintained manufacturing operations for over 40 years that reportedly include the manufacture of radio equipment (Telewave) and some sort of computer chip/circuit board fabrication (Circo, Inc). Due to the lack of reviewable records regarding chemical use, storage and disposal, it is not clear how chemicals and wastes were maintained.

  In addition, **one (1) *de minimis* condition**[6] was also identified at the Site.

- Historical Agricultural Land Use (Orchards): Historic aerial photos indicate the property was used for agriculture purposes during the 1950s and early 1960s. Historical agricultural operations in California are documented to include the use of persistent pesticides, which can persist in the environment and create an unacceptable health risk for certain land use scenarios (e.g., residential). However, at the time the ESA was conducted, land use for the subject Site was intended to stay as commercial and encapsulated with paved surfaces, and the potential ingestion/inhalation impacts were considered a *de minimis* condition. **It was recommended that pesticides screening in shallow soils be completed should land use transition to residential.**

  Our review of local, state and federal regulatory records **identified one (1) Recognized Environmental Condition** near the Site, which is described below**.**

- Potential Offsite Contaminant Migration onto the Subject Site: Building records obtained from the City of Mountain View for an adjoining, upgradient property, showed that a manufacturing sump was removed from that property in 1986.[7] Due to the nature of the sump, two closure soil

[6] **De minimis Condition:** a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis conditions are not recognized environmental conditions nor controlled recognized environmental conditions.

[7]: Harris Corp, *Underground Tank Removal Permit Application*, 960 Linda Vista Drive, Mountain View, dated 4/1/1986.

samples were required and analyzed for metals and solvent compounds. The results contained detections of both PCE and TCE indicating some leakage into underlying-soils. However, no further actions were documented.

In addition, there are two other significant and well-defined chlorinated solvent releases (TCE and PCE) that are being actively remediated 2 blocks west of the subject Site (Teledyne and Spectra-Physics plumes). The subject Site is not situated within the lateral limits of the well-defined, groundwater plumes of those two releases. However, two closer properties (located northwest of the subject Site) detected soil vapor contaminants (TCE and PCE) that are attributed, in part, to the Teledyne solvent release, despite not being in direct path of that release plume.

Opinion: The upgradient release of solvents along the adjoining southern property line (upgradient), as documented in 1986 sump closure sampling documents, has the potential to migrate into shallow groundwater beneath the Site, and is considered a ***Recognized Environmental Condition.***

In addition, a *Vapor Encroachment Condition* (VEC) review, indicates there is some potential for vapor encroachment from both: 1) the documented release at the upgradient, property line sump; and 2) the vicinity solvent releases at the Teledyne/Spectra-Physics properties. This potential for vapor (soil gas) encroachment is considered ***Recognized Environmental Condition***.

2.3.1.2 Summary of Phase II Soil and Groundwater Sampling

A completed soil, soil vapor and groundwater sampling and laboratory-testing program was designed to address the *Recognized Environmental Conditions* identified as an outcome of the collected Phase I research described above. The soil, soil vapor and groundwater sampling program targeted areas of concern (infrastructure, chemical storage, etc.). Fieldwork and results are summarized below:

- **Shallow Groundwater Sampling (see Figure 3, Table 1):** On August 10, 2016, first encountered groundwater samples were collected from across the property as a preliminary gauge of site wide, environmental quality. Initially, first encountered groundwater samples were collected and laboratory-tested from eight (8) boring locations that extended to depths of 32 to 36 feet bgs, including three (3) upgradient soil core locations (GW-5, -7, and -8), three (3) mid-property locations (GW-3, -4, and -6), two (2) downgradient property line locations (GW-1, and -2).

All grab groundwater samples were submitted to a State-certified laboratory and analyzed for, *Volatile Organic Solvent Compounds* (VOCs, full list, by EPA Method 8260B) *and Fuel Fingerprint* (includes diesel, gasoline, motor oil), by LUFT/8015B for two locations (GW-1 & GW-4 only).

Results of groundwater analysis confirmed that there is a source of solvent (TCE) contamination centered beneath the suspected, historic chemical UST location. Specifically, a relatively high solvent concentration of TCE (6,600 µg/L, or parts per billion) was detected in first encountered groundwater beneath the tank (GW-4), while concentrations dropped off by two orders of magnitude within 80 feet from the source (GW-6 TCE @ 36 µg/L). An isocontour concentration map of the TCE in the shallow groundwater zone is presented as Figure 3.

- **Deeper Groundwater Sampling (see Figure 4, Table 1):** Due to the impacts in the shallow water bearing zone (discussed above), a follow-up drilling mobilization was completed on September 15 and 16, 2016 in order to evaluate potential impacts to the next (deeper) water-bearing zone, documented to be encountered at approximately depths of 40 feet bgs at nearby chemical release investigation sites[8]. Five (5), deeper groundwater sample (DGW) locations were positioned at upgradient, mid-property, and downgradient locations and grab groundwater samples were collected and submitted to a State-certified laboratory for VOC solvent analysis, specifically one (1) at the upgradient property line (DGW-5), three (3) exploratory borings at mid-property locations (DGW-4, DGW-3, and DGW-2), and one (1) borings at the downgradient property line (DGW-1).

  Results of deeper groundwater analysis confirm that concentrations of solvent VOCs significantly decrease with depth (see Figure 4 and Table 1). As shown on the isocontour map of TCE concentrations in the deeper water bearing zone (Figure 4):

  - The maximum TCE concentrations were again detected beneath the suspected UST source (360 µg/L, at DGW-3), which is more than an order of magnitude decrease in concentration relative to the max concentrations detected in the shallow zone (i.e., 6,600 µg/L in shallow grab sample GW-4; and

[8]: USEPA and Regional Water Quality Control Board, Solvent Release Case, Teledyne Semiconductor (SL721281224, 1300 Terra Bella Ave), and the Spectra Physics Lasers Property (SL721201221, 1250 West Middlefield Road), Mountain View:
- http://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL721281224

- The dissolved TCE plume appears limited laterally to approximately 110 feet from the suspected source location (the UST).
- However, cis-1,2-DCE, a degradation "daughter product" of TCE, was detected at elevated concentrations at the downgradient sample location (48 µg/L, DGW-1) that exceed its MCL of 6 µg/L. This elevated detection of cis-1,2-DCE suggests natural attenuation of the plume is occurring and the release is limited.

- **Soil Sampling (see Figure 5, Table 3):** Twelve (12) soil samples were collected from depths of approximately 4 to 32 feet bgs at continuously-cored borings DP-3 and DP-4 and submitted for laboratory analysis in order to vertically profile the soils in the vicinity of the former UST. In addition, and as per soil vapor sampling protocols, additional soil samples obtained from a depth of 5 feet bgs at two soil vapor sample locations (SV-1 and SV-2), where vapor sampling was not possible due to low-permeability soils (i.e., high vacuum conditions – see discussion below). The soil samples were submitted to a State-certified laboratory and analyzed for the following:
  - *Volatile Organic (solvent) Compounds* (VOCs) by EPA Method 8260B [all samples]
  - *Fuel Fingerprint* by LUFT/8015B (includes diesel, gasoline, motor oil) [DP-4 only at depths 24, 27 and 31 feet]
  - *Metals* by EPA Method 6010B [DP-4]

  The laboratory results confirmed field observations: elevated concentrations of TCE, and to a much lesser extent cis, 1-2 DCE, were limited to soils beneath the suspected source location (i.e., DP-4), where strong solvent odors were observed in the soil core at depths of 31 feet bgs. Contaminant solvent concentration in all other soil samples contained concentrations below risk-based agency thresholds (*Environmental Screening Levels,* ESLs)[9].

- http://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL721201221

[9]: **Environmental Screening Levels** (ESLs): from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (updated May 2016). The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted.

TPH was not detected in soil samples collected at boring DP-4, with the exception of a trace concentration of TPH-diesel detected at 24 feet bgs.

Vertical soil profiling during the second deeper coring mobilization included the collection of soil samples from continuously cored boring DGW-4, situated approximately 20 feet upgradient of the reported UST. Field observations did not note any obvious soil impacts in this boring which was confirmed by laboratory analysis that revealed a single, relatively low-level concentration of cis-1,2-DCE at 32 feet bgs (water bearing soil zone) that marginally exceeded its commercial ESL.

- **Soil Vapor Sampling (see Figure 6, Table 4):** Three (3) temporary, soil vapor-sampling points were installed at the suspected UST location (SV-3), and at two locations along the sanitary sewer lateral (SV-1 and SV-2) where facility process waters were historically discharged. SV-3 was installed in permeable backfill material at the reported UST location and a soil gas sample was easily obtainable. Native soils at the two other soil vapor points (SV-1 and SV-2) consisted of low-permeability silts and clays where *no flow conditions* were encountered during sampling (i.e., high vacuum in the low permeability silts/clays where "stripping" could potentially create a biased high result). As per State DTSC sampling protocols, since soil gas samples could not be obtained due to no flow conditions, a soil sample from the intended soil vapor sample depth (i.e., 5 feet bgs) was laboratory tested to evaluate for the potential presence of solvent VOCs in the low permeability soils.

  The UST backfill vapor sample SV-3, the only soil gas sample obtained due to native soil no-flow conditions, was submitted to a State-certified laboratory and analyzed for *Volatile Organic Compounds* (VOCs) by EPA Method TO-15. Results of laboratory analysis confirmed an elevated concentration **of TCE vapor in the preamble backfill material (25,000 µg/m^3) that exceeds its commercial ESL threshold of 3,000 µg/m^3. In addition, there is an elevated detection of TPH-gasoline but no detections of gasoline's volatile constituent compounds, which suggests "aged-gas".** This may suggest the former UST contained gasoline at one time.

- http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_Interim%20Final_22Feb16_Rev3_PDF.pdf >

The soil vapor sampling results, including the no flow conditions in native soils, suggests that soil vapor intrusion concerns could be limited to the tank backfill footprint.

3.0 SCOPE OF PROPOSED WORK

This *Work Plan for Additional Site Assessment* (*ASA*) describes additional soil, soil vapor and groundwater investigation tasks designed to further characterize previously confirmed chemical impacts to the subsurface with the goal of generating a *Conceptual Site Model* that will be used to identify potential data gaps and evaluate remediation and/or mitigation approaches to move the site towards regulatory case closure for the proposed transition to residential use. Specifically, the proposed scope of work includes:

"Source Area" Soil Characterization

Investigate the area at, and around the immediate vicinity of the former chemical UST and sanitary sewer lateral to determine the vertical and lateral extent of soil impacts. This proposed, two-part investigation will first involve advancing at least four (4) cone penetrometer test / membrane interface probe (CPT / MIP) borings to qualitatively gauge the extent of soil impacts followed by the collection and laboratory analysis of discrete soil samples to quantify the magnitude and extent of soil impacts beneath the site. The goal of this investigation is to gauge potential soil source removal efforts and/or other potential soil remediation alternatives.

Preliminary Evaluation of Persistent Pesticides in Shallow Soil

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk if encountered; therefore, in order to facilitate the proposed residential land use transition and provide clearance for this *Recognized Environmental Condition* we propose to conduct a standard of care sampling and laboratory analysis of first encountered native soils beneath site to determine whether persistent pesticides are present at levels that may exceed risk based thresholds.

Soil Vapor Characterization

Obtain additional data on the extent of shallow soil vapor concentrations via the installation of three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent

chemical UST source. One (1) soil vapor well is also proposed for installation at the southern property line, adjacent to a former hazardous waste sump to provide data on the potential presence of an off-site solvent source.

Ambient Indoor Air Sampling

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (24-hour sampling period) to provide an additional line of evidence on whether vapor intrusion may be risk.

Additional Groundwater Characterization

We propose a phased approach to further characterizing impacts to groundwater which include:

1. Advancing a CPT sounding to depths of approximately 70 to 80 feet bgs on the north side of Terra Bella Avenue (off-site, downgradient) to determine if a third water bearing zone (C-Zone) occurs at these deeper, unexplored depths, and if confirmed obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.
2. Advancing a transect of three (3) off-site, downgradient borings on the north side of Terra Bella Avenue for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of downgradient, off-site impacts in these water bearing zones.
3. Install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A- and B-Zones. The proposed wells will be positioned near, and downgradient of the apparent chemical UST source. One (1) paired well is also proposed for installation at the southern property line, adjacent to an off-site, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. In addition to these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect described above, we will make appropriate recommendations to Santa Clara County Department of Environmental Health (SCCDEH) for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts.

We also propose completing a half mile radius well search to locate any nearby water supply wells that could potentially be affected by the release.

Additional details on the proposed Scope of Work are presented below.

3.1 PRE-FIELDWORK TASKS

In order to access proposed soil boring investigation locations that are situated within the footprint of the existing, vacant building, the building must be razed. As the property owner/responsible party plans to redevelop the property and does not intend to lease the existing building in the interim, removal of the current site improvements is planned pending approval of demolition permits. Building demolition/removal will also be necessary for subsequent primary source removal efforts. A survey will be completed prior to building demolition in order to accurately preserve the location of key site features such as the former chemical UST and sanitary sewer lateral such that they can be subsequently located with accuracy.

Other tasks that will be completed prior to the investigation mobilization will include:

- Obtaining regulatory concurrence and approval of this *Work Plan* from the SCCDEH and providing at least five (5) days notification prior to the start of any fieldwork.
- Preparation of a Site Health & Safety Plan in accordance with State and Federal hazardous waste operations regulations (California Code of Regulations, Title 8, Section 5192 and 29 Code of Federal Regulations 1910.120) (included in Appendix B).
- Procuring a soil boring permit through the Santa Clara Valley Water District for borings that will extend deeper than 45 feet below the ground surface (bgs).
- Procuring monitoring well installation permits through the Santa Clara Valley Water District.
- Procuring encroachment permits through the City of Mountain View Public Works Department for the installation of borings and monitoring wells in the city right of way along Terra Bella Avenue.
- Retaining the appropriate contractors (i.e., drilling, down-hole screening, and traffic control) to complete the field investigation.
- Prior to drilling activities, Underground Service Alert (USA) will be contacted at least 48 hours in advance to identify the location of utilities that enter the property. All proposed boring locations will be clearly marked with white paint as required by USA. USA will contact all utility owners of record within the Site vicinity and notify them of the intent to drill. All utility owners

of record will be expected to clearly mark the position of their utilities on the ground surface throughout the designated area. In addition, a private utility locating firm will be retained to examine the Site with geophysical tools to locate on-Site, privately owned utilities.

3.2 "SOURCE AREA" SOIL CHARACTERIZATION

Soil analytical results from the previous investigation revealed an elevated concentration of TCE at a depth of 31 feet bgs immediately adjacent to the former chemical UST location (boring DP-4; see Figure 5 and Table 2), with only low-level concentrations detected at shallower depths (below residential screening thresholds). Soil borings installed approximately 15 feet north (DGW-4) and 30 feet southeast (DP-3) of boring DP-4 also did not reveal elevated concentrations of VOCs above residential screening thresholds, with the exception of cis-1,2 DCE detected slightly above the residential screening threshed at a depth of 32 feet bgs in boring DGW-4 (see Figure 5, Table 2). **Although near surface soil impacts were not identified during the previous Phase II Investigation, results of grab groundwater samples suggest that that the source of the TCE release originates at the former chemical UST or possibly the adjacent sanitary sewer lateral and associated former sink drain.** In order to locate the point source of the release and obtain data on the vertical and lateral extent of soil impacts we propose completing a two-part investigation that will include:

1. **Initial Mobilization:** Advancing at least four (4) cone penetrometer test / membrane interface probe borings (CPT/MIP-1 through -4; see Figure 6) to depths of approximately 40 feet bgs (i.e., to depths just above B-Zone groundwater) in an attempt to qualitatively identify the location of the point source release and the approximate vertical and lateral extent of soil impacts. The CPT takes measurements of cone bearing, sleeve friction and dynamic pore water pressure at 5-centimeter intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time. The MIP is a multipurpose, semi-qualitative tool for real-time mapping of subsurface soil and groundwater contamination, specifically volatile organic compounds (VOCs) such as halogenated solvents / chlorinated VOCs (cVOCs) and petroleum compounds. If review of the real time MIP data indicates that the installation of additional CPT/MIP borings would be beneficial to the investigation (i.e., step-out borings), additional borings may be advanced during the field mobilization.

2. **Follow-up Mobilization:** Based on the results and interpretation of the CPT/MIP screening investigation, we will propose the installation of soil borings for obtaining discrete soil samples

for laboratory analysis to quantitatively determine the magnitude and extent of soil impacts observed in the MIP data. These soil borings will be installed via conventional direct push drilling techniques. **Specific plans for this follow-up soil sampling scope will be communicated via email to SCCDEH staff for their concurrence and approval prior to mobilization.**

All soil borings will be advanced by a licensed C-57 driller under the direct supervision of experienced Weber, Hayes and Associates (WHA) personnel. The CPT and MIP soundings will be performed by an experienced contractor that specializes in this technology. Proposed boring locations are depicted on Figure 2. Fieldwork will follow our standard *Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening*, which is presented in Appendix C. Fieldwork for follow-up soil sampling will follow our standard *Field Methodology for Hydraulic Driven Probes*, which is also presented in Appendix C.

During follow-up soil sampling, the soil cores from each boring will be carefully examined by an experienced WHA field geologist to produce a boring log, using visual observations and a hand-held photoionization detector (PID) meter to screen for VOCs. Collected soil samples selected for laboratory analysis will be immediately preserved in the field by employing EPA Method 5035 field preservation techniques. The soil samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method 8260B

Analytical results will be compared with residential screening thresholds established in the San Francisco Bay Region - Regional Water Quality Control Board's Environmental Screening Levels (ESLs) and the State DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment "Note 3" screening values (DTSC Note 3)].

3.3 PRELIMINARY EVALUATION OF PERSISTENT PESTICIDES IN SHALLOW SOIL

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk for the proposed residential land use transition. In order to provide clearance for potential contaminants we propose completing standard of care sampling and laboratory analysis of first encounter native soils beneath site to determine whether persistent pesticides are

present at levels that may exceed risk-based thresholds. Specifically, the proposed sampling will follow the Department of Toxic Substances Control (DTSC) *Interim Guidance for Sampling Agricultural Properties (Third Revision)*, dated August 7, 2008, which provides an approach for evaluating former agricultural properties where pesticides may have been applied. The guidance recommends collecting and analyzing four (4) discrete samples across areas less than three (3) acres. The approximate site acreage is 0.85 acres. The guidance document recommends collecting surface samples (i.e., first encountered soil beneath extraneous materials such as vegetation or other site coverings such as pavement, imported fill, etc.). Recommended laboratory analysis includes the standard suite of organochlorine pesticides and arsenic.

Based on the guidance provided by DTSC, we propose collecting four (4) discrete shallow soil samples (SP-1 through SP-4) from approximate equidistant locations across the site to provide a relatively even distribution of coverage (see Figure 6). Soil samples will be collected from first encountered native soils (i.e., beneath extraneous material). Deeper, backup samples collected from a depth of 6-9 inches below first encountered native soils and placed on hold at the testing laboratory for potential analysis pending the results of the shallow counterpart sample. Soil sampling will be conducted by WHA personnel in accordance with our standard *Field Methodology for Shallow Soil Sampling*, which is presented in Appendix C. Samples will be submitted to a State-certified laboratory under chain of custody procedures for the following DTSC recommended suite of analysis:

- Organochlorine Pesticides by EPA Method 8081
- Arsenic by EPA Method 6010B

Analytical results will be compared with residential ESLs and DTSC Note 3 values. We note that arsenic has very low toxicological screening threshold, well below typical naturally occurring background concentrations. A 2011 study[10] confirms naturally background concentrations (99th percentile) of arsenic in the San Francisco Bay Region (which includes Santa Clara County in the study area) to be 11 mg/kg. Therefore, we propose evaluating the potential risk of any on-site detections of arsenic with respect to this established naturally occurring background concentration.

[10] Duvergé, 2011: Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region

If results for any sample exceed the established residential screening thresholds or background arsenic concentrations, then we will contact the lab to analysis the deeper counterpart sample and will subsequently provide a plan to SCCDEH to conduct "step-out" soil sampling to define the lateral and vertical extent of residual soil impacts.

3.4 ADDITIONAL SOIL VAPOR CHARACTERIZATION

During the 2016 Phase II ESA, three (3) shallow (5-foot deep) temporary soil vapor wells were installed at: 1) the former chemical UST location (SV-3; in the permeable backfill material), and 2) at two (2) locations along the sanitary sewer lateral (SV-1 and -2; see Figure 5). Results of laboratory analysis confirmed an elevated concentration of TCE vapor in the permeable UST backfill material (25,000 µg/m^3) which significantly exceeds the residential ESL/DTSC Note 3 threshold of 240 µg/m^3. Samples were not obtainable from temporary wells SV-1 and 2 due to no-flow conditions, which is attributed to the low permeability soil (i.e., silt to silty clay) encountered at the 5 foot sample depth.

In order to obtain additional data on the vertical and lateral distribution of shallow soil vapor concentrations, we propose to install three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent chemical UST source (V-2 through V-4). The dual depth wells (i.e., sample tubing & filter tip) will be installed within the same borehole. We note that low permeability soils were encountered to depths of approximately 11 feet bgs in all previous on-site borings and acknowledge that it may not be possible to obtain samples from the shallow, 5-foot sample depth. The deeper soil vapor well is intended to sample soil vapor within a more permeable soil encountered below approximately 11-12 feet bgs, but above first groundwater which was routinely encountered in a thin, saturated lens between approximately 12-15 feet bgs (see boring logs; Appendix A). The final depth of the deeper soil vapor well will be determined in the field based on soil core observations. The soil vapor wells are expected to provide reasonable coverage to assess the potential vapor intrusion pathway.

One (1) dual depth soil vapor well (V-1) is also proposed for installation at the southern property line, adjacent to a documented, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. Proposed soil vapor well locations are shown on Figure 7.

We will contract with a licensed C-57 driller to install the proposed permanent soil vapor wells. Installation and subsequent sampling will follow our *Field Methodology for Active Soil Gas Sampling*, which is in general accordance with protocols established in DTSC's 2015 *Advisory for Active Soil Gas*

Investigations, and is presented in Appendix C. Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method TO-15

Analytical results will be compared with residential ESLs and the DTSC Note 3 values.

3.5 AMBIENT INDOOR AIR EVALUATION

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (IA-1 and IA-2) to provide some insight as to whether vapor intrusion is currently occurring. We acknowledge that the samples may not be representative of indoor air quality for future buildings due to likely differences in building size, foundation construction and heating, ventilation and air conditioning (HVAC) configurations. However, it is our opinion that the data will be useful in providing some information as to whether the subsurface soil gas to indoor air pathway is complete.

The proposed sample locations will be placed at potential worst-case locations which include a former sink drain adjacent to the former chemical UST (IA-1) and a floor drain within a former wash room situated approximately 60 feet north of the former chemical UST (IA-2), and adjacent to the sewer lateral.

Sampling will follow our *Field Methodology for Ambient Air Sampling*, which is in general accordance with protocols established in DTSC's 2011 *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* and is presented in Appendix C. Per the DTSC guidance, we will complete a limited building survey to document conditions prior to sample collection and document any building inventory that may have the potential to skew the results (e.g., chemicals or materials that may contain VOCs). The DTSC guidance also recommends concurrently sampling outdoor ambient air to provide information regarding outside influences on indoor air quality. However, we do not propose collecting outdoor ambient air samples for two (2) reasons: 1) the building is currently non-operational (i.e., no active HVAC system exchanging indoor / outdoor air), and 2) we are specifically sampling for the presence TCE (and daughter products), which is not a common urban air pollutant.

Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method TO-15 Modified SIM (low level detection limits)

Analytical results will be compared with residential ESLs and the DTSC Note 3 values.

3.6 ADDITIONAL GROUNDWATER CHARACTERIZATION

Results of groundwater sampling and analysis completed during the 2016 Phase II ESA confirmed that there is a source of solvent (TCE) contamination centered beneath the suspected, former chemical UST location. Specifically, a relatively high solvent concentration of TCE (6,600 µg/L, or parts per billion) was detected in first encountered groundwater (i.e., A-Zone encountered between approximately 15-30 feet bgs) beneath the tank (GW-4), while concentrations dropped off by two (2) orders of magnitude within 80 feet from the suspected source (GW-6 TCE @ 36 µg/L), as shown on Figure 3.

Results of follow-up, deeper groundwater sampling and analysis (i.e., B-Zone encountered between approximately 40-50 feet bgs) confirm that concentrations of solvent VOCs significantly decrease with depth (see Figure 4 and Table 1). As shown on the isoconcentration map of TCE concentrations in the deeper water bearing zone (Figure 4), the maximum TCE concentrations were again detected beneath the suspected UST source (360 µg/L, at DGW-3), which is more than an order of magnitude decrease in concentration relative to the max concentrations detected in the shallow zone (i.e., 6,600 µg/L in shallow grab sample GW-4. The dissolved TCE plume appears limited laterally to approximately 110 feet from the suspected source location (the UST).

In order to further characterize groundwater impacts beneath the site, we propose the following phased investigation approach:

3.6.1.1 Initial Mobilization – Downgradient Grab Groundwater Sampling

In order to determine if significant solvent impacts have migrated to an even deeper water bearing zone (i.e., below the B-Zone) we propose advancing a CPT sounding (HP/CPT-2; see Figure 8) to depths of approximately 70 to 80 feet bgs (or deeper if necessary and possible) on the north side of Terra Bella Avenue (off-site, downgradient). If a third water bearing zone (C-Zone) is confirmed at these deeper, unexplored depths, then we will obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.

During the same mobilization we propose to advance a transect of three (3) off-site, downgradient borings (HP-1 through HP-3) on the north side of Terra Bella Avenue (including HP/CPT-2 described above) for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of

downgradient, off-site impacts in these water bearing zones. These proposed boring are shown on Figure 8.

We will contract with a licensed C-57 driller to install the proposed soil borings and CPT sounding. Fieldwork will follow our standard *Field Methodology for Cone Penetrometer Testing* and *Hydraulic Driven Probes*, which are presented in Appendix C.

We acknowledge that there is some limited risk in advancing CPT soundings through multiple water bearing zones do to the risk of cross-contaminating deeper water bearing zones once the tools is retracted from the subsurface and the borehole is left open for a brief period of time prior to borehole sealing. However, the proposed deeper CPT sounding (i.e., HP/CPT-2) is being installed at a downgradient location from the site where shallow groundwater impacts are expected to be much less significant based on previously collected on-site data. Furthermore, boring advancement into the deeper B-Zone and possible C-Zone water bearing zones (if encountered) will be conducted in separate boreholes using a disposable PVC "drop-screen" such that following grab groundwater sample collection, the screen section (5-foot length) will be abandoned at the base of the borehole and the borehole can be sealed from the bottom upwards by introducing grout through the drill rods as they are being retracted, thus eliminating vertical migration of groundwater. Additional protocols for sealing boreholes are included in the Appendix C *Field Methodologies*.

Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA 80260B

Analytical results will be compared with State Maximum Contaminant Levels (MCLs).

3.6.1.2 Subsequent Mobilization – Monitoring Well Installation, Development & Post Development Sampling

We propose to install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A-Zone and B-Zones (MW-1A/B through MW-2A/B; see Figure 8). The proposed wells will be positioned near, and downgradient of the apparent chemical UST source (MW-2A/B, and MW-3A/B and -4A/B, respectively; see Figure 8). One (1) paired well is also proposed for installation at the southern property line, adjacent to a former, off-site hazardous waste sump to provide data on the potential presence of an off-site solvent source (MW-1A/B). In addition to

these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect (i.e., HP-1 through HP-3), we will make appropriate recommendations to SCCDEH for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts. **Proposed plans for this additional, downgradient well will be communicated to SCCDEH via email for their review and approval prior to initiating the well installation mobilization.**

3.6.1.3 Proposed Groundwater Monitoring Well Design – A-Zone & B-Zone Wells

As discussed in previous sections of this *Work Plan*, shallow, A-Zone groundwater is generally encountered in relatively thin, saturated lenses between 15 and 30 feet bgs. Deeper, B-Zone groundwater is encountered in a gravelly zone between approximately 40 and 50 feet bgs. Based on these hydrogeologic conditions we proposed the following well construction design:

- Paired A/B-Zone wells will be situated within approximately 5 feet from one another and installed in sperate boreholes
- Total Depth: The total well depth will extend to:
    - A-Zone: 30 feet bgs
    - B-Zone: 50 feet bgs
- Well Material: The wells will be constructed of 2-inch diameter, threaded schedule 40 Polyvinyl Chloride (PVC)
- Wells Screens: The wells screens will consist of 0.01-inch factory slotted schedule 40 PVC installed at the base of the well borehole:
    - A-Zone: 15 to 30 feet bgs
    - B-Zone: 40 to 50 feet bgs
- Filter Pack: The filter pack will consist of #2/12 or #3 sand and extend from the base of the borehole to approximately 2 feet above the screened interval
- Annual Seal: The annular seal will consist of approximately 2 feet of hydrated bentonite above the sand filter pack followed by neat cement grout to approximately 6-inches bgs (i.e., 0.5 to 6 feet bgs).

- Surface Completion: Each well will be secured with an 8- or 12-inch diameter traffic rated monitoring well vault set in concrete. The top of well casing will be secured inside the well vault with a locking well cap.

3.6.1.4 Monitoring Well Installation

Monitoring wells will be installed by a licensed C-57 well drilling contractor with specific experience installing groundwater monitoring wells, in accordance with our *Field Methodology for Monitoring / Remediation Well Installation*, which is included in Appendix C. Well bores will be drilled via a hollow stem auger drill rig equipped with 8-inch diameter hollow stem augers. Wells will be constructed, as described above, through the hollow stem augers.

A limited number of soil samples will be collected from the well bores at the discretion of an experienced WHA field geologist in order to confirm lithology and geologic contacts. Well boreholes will be logged by an experienced geologist using the Unified Soil Classification System (USCS) and be recorded in the field on geologic logs. No soils will be retained for laboratory analysis unless chemical impacts are observed, in which case soil samples will be selected for laboratory analysis to determine the vertical extent of soil impacts. Sample handling and preservation will be conducted in accordance with *Field Methodologies* presented in Appendix C, and samples will be laboratory analyzed for VOCs by EPA Method 8260B.

3.6.1.5 Monitoring Well Development & Post Development Sampling

Well development operations will occur no sooner than 48 hours following well installation in accordance with our *Field Methodology for Well Development and Post Development Sampling*, which is included in Appendix C. Well development will promote good hydraulic communication between the well filter pack and surrounding formation and will remove fines from the filter pack. Prior to development a depth to water measurement will be collected from each well to the nearest hundredth (0.01) of a foot with an electric sounder. After the depth to water is measured, each well will be checked for the presence of dense nonaqueous phase liquid (DNAPL) with an electronic oil/water interface probe. If DNAPL is present, the thickness of the layer will be recorded.

After measuring the depth-to-groundwater, a surge block will be used to physically swab the wells entire screened interval a minimum of 50 strokes in order to remove fines from the sand pack and promote gradation between the surrounding formation and the sand pack. Following well swabbing the well will

be purged with a low flow submersible electric pump until visually free of turbidity. It may be necessary to repeat the well swabbing and purging steps if the turbidity of the discharge water does not decrease during the well purge. During purging the physical parameters of temperature, conductivity, pH, dissolved oxygen (D.O.) concentration, and Oxidation-Reduction Potential (ORP) of the purge water will be monitored with a Flow-Through Cell equipped multi-meter to ensure that these parameters have stabilized. Purging will be determined to be complete (stabilized aquifer conditions reached) after the removal of at least three well casing volumes of water, when the discharge water is observed to be free of turbidity, and when the physical parameters have stabilized.

After purging, the water level in the well will be allowed to recover to approximately 80 percent of its original depth before a sample is collected. After water level recovery, a post-development groundwater sample will be collected from each well with a new, disposable bailer, and decanted into the appropriate laboratory-supplied sample container (i.e., 40 mL VOAs). All samples will be labeled in the field and transported in insulated containers cooled with blue ice to State-certified laboratory under proper chain of custody procedures for the following analysis:

Analytical results will be compared with State MCLs.

3.7 SURVEY

Prior to demolition of exiting site improvements, which will need to occur prior to the installation of borings / wells proposed within the foot print of the existing building, we will retain a California-Licensed Land Survey to complete a survey of key site features that will include the location of the former chemical UST and the sanitary sewer lateral. This survey data will be relied upon for accurately positioning the proposed borings following building demolition.

Following the installation of the proposed soil vapor and groundwater monitoring wells, horizontal and vertical locations (top of well casing elevation) will also be surveyed by California-Licensed Land Survey to satisfy State GeoTracker field point data documentation. The survey data will also be used to calculate groundwater elevations across the groundwater monitoring well network in order to accurately determine groundwater gradient and flow direction.

3.8 INVESTIGATIVE DERIVED WASTE

All investigative derived waste (IDW) generated during subsurface investigation activities, including soil cuttings, decontamination water and purged groundwater will be containerized on site in labeled 55-

gallon drums or other appropriate containers (e.g., soil roll-off bins) and will be subsequently properly disposed of by a licensed waste hauling contractor. Documentation of proper IDW disposal will be provided in the subsequent technical report documenting the related investigation activities.

3.9 HALF MILE RADIUS WELL SEARCH

We propose completing a record search through the Department of Water Resources to locate any potential active groundwater supply wells within a half mile radius of the Site to confirm whether there are any nearby drinking water supply wells that could potentially become impacted by the site release. Any wells identified within the radius search (with the exception of chemical release monitoring wells, cathodic protection wells and/or destroyed wells) will be plotted on a plan view location map and pertinent well construction information (i.e., installation date, total depth and screened interval), use details (i.e., domestic, municipal, irrigation) and distance from the site will be summarized in a spreadsheet which will be incorporated into the subsequent technical report documenting the related investigation activities. Pending the results, we will provide recommendations for sampling off-site wells if appropriate.

3.10 SUMMARY REPORTING

Following the completion of all proposed investigation tasks we will prepare a technical report presenting the investigative methods, figures depicting sample locations and analytical results, grologic cross sections, tabulated analytical results, laboratory analytical reports, a summary of our interpretation of the data, and recommendations for appropriate next steps based on the data. The report will be submitted to SCCDEH for their review and comment. All work will be conducted under the supervision of a California Registered Professional Geologist.

Concurrently, we will prepare a *Conceptual Site Model* (CSM) that will incorporate all investigative data obtained during the previous Phase II ESA and results of the currently proposed investigative tasks. The CSM is a progressive assemblage of information regarding the distribution of chemicals of concern and the hydrologic setting of the site. The CSM describes the regional and local geology and hydrogeology, surrounding land use, sensitive receptors, conduits, preferential pathways, and the likely distribution of chemicals of concern and any other factors relevant to the release. The CSM serves as the framework for the investigation, remediation and ultimately the closure of the chemical release site. The CSM is

dynamic and is continually updated as more information is gathered. Subsequent investigations provide data to accurately define the conditions at the site and close data gaps.

4.0 SCHEDULE

Following regulatory approval of this *Work Plan* we will begin procuring the necessary permits (i.e., soil borings and city encroachment). Following permit approval, we will contact SCCDEH with a proposed schedule. As described in this *Work Plan*, the site building will need to be razed prior to installing proposed boring as the necessary drilling equipment will not be able to access the locations within the footprint of the building. The time-frame for the property owner to obtain demolition permits and complete site demolition activities is uncertain. Therefore, some investigation activities will need to be scheduled with the SCCDEH following site demolition. However, prior to building demolition/removal the proposed ambient indoor air sampling will be completed and can be scheduled soon after *Work Plan* approval. The following provides a possible sequencing of the proposed assessment tasks:

Before Site Improvements are Removed

- Complete ambient indoor air sampling (proposed IA-1 & IA-2)
- Complete downgradient, off-site grab groundwater sampling (proposed HP-1, HP/CPT-2 & HP-3)

After Site Improvements are Removed (time-frame currently uncertain)

- Complete source zone investigation (proposed CPT/MIP-1 through -4) and subsequent direct push soil sampling based on results of the CPT/MIP investigationComplete shallow soil sampling for persistent pesticides clearance (proposed SP-1 through -4)
- Complete the installation and initial sampling of dual depth soil vapor monitoring wells (proposed V-1 through V-4) and paired A/B-Zone groundwater monitoring wells (proposed MW-1A/B through -4A/B, including the likely recommendation and approval of an additional off-site, downgradient well pair pending results of off-site grab groundwater samples collected from proposed HP-1 through HP-3).

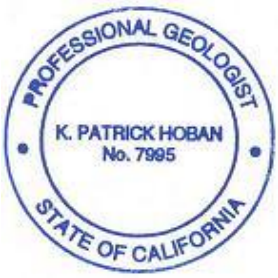
A technical report documenting all completed tasks will be prepared and submitted within sixty (60) days following the completion of all proposed investigative tasks and receipt of all laboratory analytical

results. A CSM will also be concurrently submitted under separate cover within this proposed time-frame.

5.0 LIMITATIONS

Our service consists of professional opinions and recommendations made in accordance with generally accepted geologic and engineering principles and practices. This warranty is in lieu of all others, either express or implied. The analysis and conclusions in this report are based on sampling and testing which are necessarily limited. Additional data from future work may lead to modification of the opinions expressed herein.

All work related to this investigation and remediation at this Site is done under the direct supervision of a Professional Geologist or Engineer, registered in California, and experienced in environmental assessment and remediation.



Thank you for the opportunity to participate in the assessment of this site. If you have any questions regarding this report, or any aspect of this project, please contact us at (831) 722-3580.

Sincerely yours,

WEBER, HAYES AND ASSOCIATES

A California Corporation

NOTES:

GW = Groundwater **DGW =** Deeper Groundwater Sample

1 = Water Quality Goals: Goals establised by the CRWQCB Central Coast Region based on State *Maximum Contaminant Levels* (Department of Health Services) or taste & odor threshold limits.

2 = Depths shown are not necessarily stabilized depth to groundwater. Boring logs show damp to moist, interbedded fine grained silts, clays and clayey sands to depths of 32 feet, with no saturated water bearing zones. Cased borings slowly porduce water.

3 = No MCL established for TPH as diesel or TPH as motor oil, instead, the ESL thresholds are listed in place of the MCLs.

BOLD = Indicates contaminant compound detected. **BOLD =** Indicates concentration exceeds Water Quality Goal.

J = Laboratory indicates a value between Method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative.

< # = Reporting limit elevated due to sample dilution and compound not detected at or above the Method Detection Limit (MDL),

ND = Not Detected **NE =** Not Established **bgs** = below ground surface

PCE = Tetrachloroethene **cis 1,2-DCE =** cis-1,2-Dichloroethene **1,1-DCE =** 1,1-Dichloroethene **1,1,1-TCA =** 1,1,1-Trichloroethane

TCE = Trichloroethene **trans 1,2-DCE =** trans 1,2-Dichloroethene **1,1-DCA =** 1,1-Dichloroethane

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (updated May 2016). <http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_Interim%20Final_22Feb16_Rev3_PDF.pdf > The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted. The ESLs used in this table were obtained from the above referenced document.

2= **CA DTSC Modified Soil Screening Levels:** From the California Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO), *Human Health Risk Assessment (HHRA) Note Number 3, Table 3* , Jan 2016 < https://www.dtsc.ca.gov/AssessingRisk/upload/HHRA-Note-3-2016-01.pdf >.

A = No established DTSC HERO Note 3 threshold value for the analyte. The Regional Screening Levels are referenced when no DTSC value is provided (see below for reference).
NOTE: The USEPA Regional Screening Levels (RSLs): from the *USEPA Region 9 RSL Tables* (updated November 2015) <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables-november-2015, revised Nov 2015>. The RSLs are risk-based screening levels used for screening sites, calculating risk factors and potentially as cleanup goals once a site has been characterized.

<X or ND = Analyte not detected at or above the laboratory Method Detection Limit (MDL), X.

NE = Not Established

J = Analyte Detected above Method Detection Limit (MDL) but below the PQL.

BOLD = Analytical result above Residential ESL or DTSC HERO Note 3 value.

BOLD = Analyte Detected

*= Soil sample collected and anlyzed due to low flow vapor condtions (refusal) at this location originally targeted for soil vapor sampling.

Table 3

Soil Sample Analytical Results - Metals

Former Telewave Property - 1155 Terra Bella Avenue, Mountain View

All soil results are in milligrams per Kilogram (mg/Kg, parts per million)

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (Final version, 2016). The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted.

2 = **Naturally Occuring Arsenic:** Note that Arsenic concentrations (and other metals) do occur naturally in the environment. Arsenic is a unique metal that can be present at naturally-occuring levels but still exceed the extremely low, agency thresholds for risk (threshold limit generated from toxicity studies). Naturally-occurring Arsenic concentrations in the Bay Area have been established at 11 mg/kg (Duvergé, 2011).

ND = Analyte not detected above the laboratory Method Detection Limit (MDL).

BOLD = Analytical result above Residential ESL.

- = Sample was not analyzed for this constituent

PCB = Polychlorinated biphenyl

MDL = Laboratory's mimimum detection level (lowest achievable concentration, based on high confidence level).

J = Laboratory reports that the detection value is between MDL and PQL, and should be considered to be an estimate with a high level of confidence.

Table 4

Soil Vapor Sample Analytical Results

Volatile Organic Compounds

Former Telewave Property - 1155 Terra Bella Ave, Mountain View

All soil vapor results are in microgram per cubic meter (ug/m ^{3})

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (Interim Final, Feb 2016) < **http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_PDF_Rev2.pdf** >. The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted. The ESLs used in this table were obtained from the above referenced document,"Tier 1 ESLs", based on shallow soils (<3m), groundwater is a current or potential source of drinking water.

2 = **US EPA Region 9 Indoor Air Regional Screening Levels (RSLs):** From *US EPA Regional Screening Levels for Indoor Air* (**https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables-november-2015,** revised Nov 2015) . The Indoor Air RSLs are divided by the US EPA's Recommended Vapor Attenuation Factor (from the US EPA's Recommended Vapor Attenuation Factor for Risk Based Screening of sub-slab soil gas [Table 6-1 in Final Guidance for Assessing and Mitigating the Vapor Intrusion Pathway From Subsurface Sources to Indoor Air, June 2015]) to calculate the Risk Level concentration appropriate for the specific sample collected (i.e., Sub-slab soil gas, "Near-source" exterior soil gas, Crawl space air, etc.).

3 = **CA DTSC Modified Air Screening Levels:** From the California Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO), *Human Health Risk Assessment (HHRA) Note Number 3, Table 3* , Jan 2016 < **https://www.dtsc.ca.gov/AssessingRisk/upload/HHRA-Note-3-2016-01.pdf** >. The Modified Air Screening Levels are divided by the DTSC's Recommended Vapor Attenuation Factor (0.05) to calculate the Risk Level concentration appropriate for the specific sample collected. Where Modified Air Screening Levels are not available, US EPA RSLs (see Note 2 above) are used with the DTSC attenuation factor.

ND = Analyte not detected above the laboratory Method Detection Limit (MDL).
PCE = Tetrachloroethene
cis- 1,2 DCE = cis-1,2 Dichloroethene
< # = Compound not detected at or above the elevated detection limit, X.
^ = PQL and MDL are elevated due to sample dilution
J = Value falls below the PQL and is therefore an estimated value

NE = Not Established
TCE = Trichloroethene
trans- 1,2 DCE = trans-1,2-Dichloroethene

-- = Sample was not analyzed for this constituent
TPH = Total Petroleum Hydrocarbons

BOLD = Analytical result above CA DTSC-Modified COMMERCIAL "Near Source" Threshold Limit.
BOLD = Analytical result above CA DTSC-Modified RESIDENTIAL "Near Source" Threshold Limit.

APPENDIX A

GEOLOGIC LOGS

Geologic Symbols and Terms

	Major Divisions	Symbols	Descriptions
Coarse Grained Soils	Gravels (More than 1/2 of coarse fraction > no. 4 sieve size)	GW	Well Graded Gravels, little or no fines
		GP	Poorly Graded Gravels, little or no fines
		GM	Silty Gravels, gravel-silt mixtures
		GC	Clayey Gravels, gravel-clay mixtures
	Sands (More than 1/2 of coarse fraction < no. 4 sieve size)	SW	Well Graded Sand, little to no fines
		SP	Poorly Graded Sand
		SM	Silty Sand, sand-silt mixtures
		SC	Clayey Sand, sand-clay mixtures
Fine Grained Soils	Silts and Clays Liquid Limit < 50%	ML	Silt or Very Fine Sands, rock flour, with slight plasticity
		CL	Inorganic Clay with high plasticity, lean clay
	Silts and Clays Liquid Limit > 50%	MH	Inorganic Sandy Clay or Silt, elastic silts
		CH	Inorganic Sandy Clay or Silt, with high plasticity, fat clays

Symbols and Terms

- First encountered groundwater
- Stabilized groundwater
- Sample interval
- Soil sample sent to laboratory for targeted analysis
- Water sample sent to laboratory for targeted analysis

Trace = < 5%
Few = 5 - 10%
Little = 15 - 20%
Some = 30 - 45%
Dominantly = > 50%

SOIL DENSITY/CONSISTENCY			
SANDS & GRAVELS	BLOWS/FT.	SILTS & CLAYS	BLOWS/FT.
VERY LOOSE	0 - 4	VERY SOFT	0 - 2
LOOSE	4 - 10	SOFT	2 - 4
MED. DENSE	10 - 30	FIRM	4 - 8
DENSE	30 - 50	STIFF	8 - 16
VERY DENSE	> 50	VERY STIFF	16 - 32
		HARD	> 32

Blow count is the number of blows required to drive a 2-inch diameter California Modified Split-Spoon Sampler the last 12 inches of an 18 inch sample interval by a 140-pound hammer free-falling 30 inches.

Well Construction Details:

- Bentonite Seal
- Cement Seal
- Filter Pack
- Screened Interval

ags = above ground surface bgs = below ground surface
PID = Photo-Ionization Detector ppmv = parts per million by volume
USCS = Unified Soil Classification System

APPENDIX B

SITE HEALTH & SAFETY PLAN

WEBER, HAYES & ASSOCIATES
Hydrogeology and Environmental Engineering
120 Westgate Drive, Watsonville, CA 95076
(831) 722-3580 // www.weber-hayes.com

SITE HEALTH & SAFETY PLAN (SSP)

Drilling, Well Installation & Sampling

This Site Health and Safety Plan has been prepared pursuant to the California Occupational Health and Safety Administration Title 8, Section 5192 *Hazardous Waste Operations and Emergency Response* and the U.S. Occupational Health and Safety Administration 29 CRF 1910.120, *Hazardous Waste Operations and Emergency Response*

Job Name and Job Number: Former Telewave Property – 2X834
Client: Sean Corrigan, Old Trace Partners, LLC
Site Location: 1155 Terra Bella Avenue, Mountain View, CA
Type of Facility/Current Usage of Property: Currently vacant – former radio equipment manufacturing & chip/circuit board manufacturer

Subcontractors On-Site

Driven Probe Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

_____

CPT/MIP Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

_____

Hollow Stem Auger Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

Regulatory Agencies

Lead Regulatory Agency
County of Santa Clara
Department of Environmental Health
Case Officer: Travis Flora
1555 Berger Drive, Suite 300
San Jose, CA 95112
Phone Number: (408) 918-3400

SCOPE OF WORK

Additional Site Assessment: Soil, Soil Vapor and Groundwater Sampling

- Advancing up to ten (14) direct push borings to depths of 40 to ~80 feet deep for soil and groundwater sampling.
- Installation and sampling of four (4) soil vapor wells to depths of approximately 14 feet bgs.
- Installation, development and sampling of approximately ten (10) groundwater monitoring wells to depths of approximately 30 and 50 feet bgs.
- Collect two (2) indoor ambient air samples.
- Collect four (4) shallow soil samples (surface and 1 foot bgs)

Key Field Personnel

(OSHA training for Hazardous Waste Operations is required on this job)

Jered Chaney – *Weber, Hayes and Associates*	Environmental Geologist & Site Safety Officer	Office: (831) 722-3580 Cell: (831) 254-1747
TBD Name:_____	Driven Probe Drilling Operator	Cell:_____
TBD Name:_____	CPT/MIP Drilling Operator	Cell:_____
TBD Name:_____	Hollow Stem Auger Drilling Operator	Cell:_____

Anticipated Physical Hazards

- **Noise**: Drill rig (hearing protection required over 85 dBA)
- **Heavy Equipment**: Drill Rigs & Support Trucks
- **Traffic**: Terra Bella right of way (traffic control required)
- **Overhead Hazards**: to be avoided
- **Excavation/Trenches**: none
- **Underground Hazards**: To be located by private utility locator / USA alert
- **Level Of Protection** - Is OSHA training for Hazardous Waste Operations required on this job? No ☒ Yes
- **Hazardous/Regulated Substances Anticipated?** ☐ No; ☒ Yes; (VOCs)

Anticipated Chemical Hazards:

Name (CAS # if applicable)	EXPECTED CONCENTRATION ☒ Soil ☒ Water ☐ Air	HEALTH EFFECTS
▸ Trichloroethylene (TCE) - CAS # 79-01-6 ▸ and breakdown halogenated VOC products (low-level)	▸ Up to 6,600 ppb in groundwater ▸ Up to 72 ppm or lower in soil ▸ Up to 25,000 ppt or lower in soil vapor	See attached NIOSH chemical information sheet

Medical Surveillance

Medical surveillance practices for all on-site employees will be maintained in accordance with Title 8 California Code of Regulations, Section 5192(c)(4)(B). **No personnel will be exposed to potential chemical hazards for more than 30 days at the project site, so no medical surveillance is required.**

Site Control Measures

- General public excluded from all work areas by establishing exclusion zones (i.e., cones and/or barricades with caution tape in work areas).
- Traffic control for work in roadway
- Containment of investigative waste.

Decontamination Procedures: Liquinox solution/ fresh water / D.I. water rinse. Containment of wastewater.

PERSONAL PROTECTIVE EQUIPMENT AND SITE MONITORING

Personal Protective Equipment

(see required Personal Protective Equipment below)

Based on the scope and nature of this field program the following aappropriate level of personal protective equipment is required A: ☐ B: ☐ C: ☐ D ☒

R = required, A = As needed

Hard Hat **A**	Eyewear (type) **A**
Safety Boots **A**	Respirator (type) **A** *(½-face minimum)*
Orange Vest **A**	Filter (type) **A** (organic vapor & particulate)
Hearing Protection **A**	Gloves (type) **A** nitrile
Tyvek Coveralls **A**	

Monitoring Equipment On Site (check those that apply)

Organic Vapor Analyzer HNu	PID with lamp of 10.2 ev X
LEL/Oxygen Meter	Draeger Tube

Confined Space Entry Procedures

Confined space entry is not a component of this field investigation.

PERSONELL TRAINING REQUIREMENTS

All personnel performing on-Site activities who may be exposed to chemical hazards are required to be trained in accordance with CCR, Title 8, Section 5192. As a minimum, all Site personnel will have completed 40-Hour Hazardous Waste Operations (HAZWOPER) training; 24 hours of supervised on the job training; have an eight-hour HAZWOPER refresher course if in initial HAZWOPER 40 hour training course was completed more than one year prior to the start date of Site operations.

Personnel who are only on-Site occasionally for a specific limited task (such as plan review, meetings, land surveying, geographic surveying, asphalt paving electrical work, etc.) and who are unlikely to be exposed over permissible and published exposure limits, shall be informed of the Site hazards in a tail gate safety meeting.

Tailgate Meetings

The Field Superintendent will conduct an initial Tailgate Safety Meeting prior to commencing work at the Site. In addition, the following information will be provided to all Site personnel involved with the project, as applicable:

- Name of personnel and alternate responsible for Site safety and health
- Safety, health, and other hazards present at the Site
- Hospital directions
- General safety procedures and practices to minimize risks from hazards at the Site
- Task specific procedures and practices
- Instructions for safe use of equipment
- Instructions for safe use of personnel protective equipment
- Recognition of symptoms and signs, which might indicate overexposure to hazards
- Site control measures
- Emergency/Contingency procedures

EMERGENCY RESPONSE

In the event of minor physical injury, appropriate first aid will be administered and worker transport to the urgent care/emergency room, if necessary. In the event of significant physical injury beyond the level of first aid response, emergency response personnel will be contacted immediately by calling 911 from the nearest land-line or via cell phone.

Hospital/Clinic: Kaiser Permanente
Santa Clara Medical Center
700 Lawrence Expressway
Santa Clara, CA 95051
Emergency Phone: (408) 851-1000

Fire Department Phone Number: 911

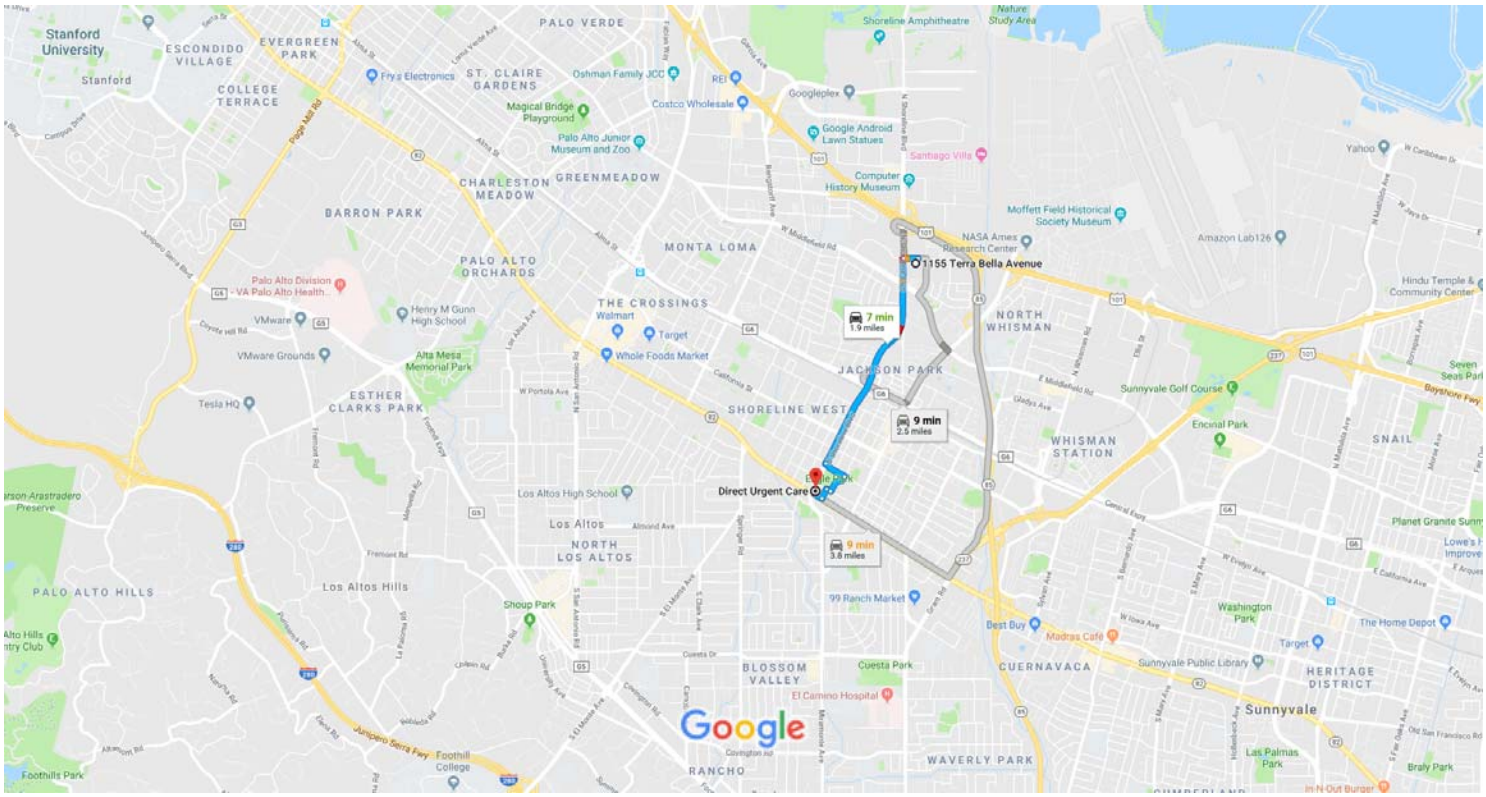
Paramedic Phone Number: 911
Police Department Phone Number: 911

Hospital Directions: See attached directions and accompanying map

Emergency/Contingency Plans and Procedures: Mobile Phone contact with emergency personnel. (831)254-1747

DISCLAIMER AND SIGNATURES

Site Hazard Information Provided By: *Jered Chaney – Site Safety Officer*



Date: September 17, 2018

Jered Chaney, Site Safety Officer

Note: All contractors and authorized visitors to the site are responsible for maintaining their safety using standard of care construction site safety procedures. This site safety plan is designed to provide worker right to know information on site contaminants of concern and a generic due diligence overview of safety issues. Neither the professional activities of Weber, Hayes and Associates, nor the presence of Weber, Hayes and Associates employees and subcontractors, shall be construed to imply Weber, Hayes and Associates has any responsibility for methods of work performance, superintendence, sequencing of construction, or safety in on or about the job site.

Combustible Liquid, but burns with difficulty.

Incompatibilities & Reactivities Strong caustics & alkalis; chemically-active metals (such as barium, lithium, sodium, magnesium, titanium & beryllium)

Exposure Routes inhalation, skin absorption, ingestion, skin and/or eye contact

Symptoms irritation eyes, skin; headache, visual disturbance, lassitude (weakness, exhaustion), dizziness, tremor, drowsiness, nausea, vomiting; dermatitis; cardiac arrhythmias, paresthesia; liver injury; [potential occupational carcinogen]

Target Organs Eyes, skin, respiratory system, heart, liver, kidneys, central nervous system

Cancer Site [in animals: liver & kidney cancer]

Personal Protection/Sanitation (See protection codes (protect.html))
Skin: Prevent skin contact
Eyes: Prevent eye contact
Wash skin: When contaminated
Remove: When wet or contaminated
Change: No recommendation
Provide: Eyewash, Quick drench

First Aid (See procedures (firstaid.html))
Eye: Irrigate immediately
Skin: Soap wash promptly
Breathing: Respiratory support
Swallow: Medical attention immediately

Respirator Recommendations

NIOSH

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:
(APF = 10,000) Any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode
(APF = 10,000) Any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus

Escape:
(APF = 50) Any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister
Any appropriate escape-type, self-contained breathing apparatus

Important additional information about respirator selection (pgintrod.html#mustread)

APPENDIX C

FIELD METHODOLOGIES

- *Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening*
- *Field Methodology for Hydraulic Driven Probe Sampling*
- *Field Methodology for Shallow Soil Sampling*
- *Field Methodology for Active Soil Gas Sampling*
- *Field Methodology for Indoor and Outdoor Air Sampling*
- *Field Methodology for Monitoring / Remediation Well Installation & Well Development and Post Development Sampling*

Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening

Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening

This Appendix describes field methodologies for conducting soil and/or groundwater screening using cone penetrometer testing (CPT) and membrane interface probe techniques. For the purpose of this investigation we will be conducting both CPT and MIP screening simultaneously at each prescribed screening investigation location described in this *Work Plan*. The CPT/MIP can be deployed from any type of hydraulic driven direct push drill rig (ranging from all-terrain track rigs to confined-space dolly mounts). The CPT/MIP tool is threaded onto the lead drill rod of the drill rig and is advanced via the drill rig at the rate of approximately 2 feet per minute.

This Appendix includes the following procedures/references for conducting CPT/MIP screening that will be employed during this field sampling program:

1. Cone Penetration Testing Procedure
2. Cone Penetration Test Data and Interpretation
3. Pore Pressure Dissipation Tests
4. Membrane Interface Probe Procedures
5. GeoProbe® Membrane Interface Probe (MIP) Standard Operating Procedure

Following borehole screening, the CPT/MIP instruments are retracted from the borehole and the subsequent borehole is completely sealed with neat cement grout from the bottom of the borehole upward via a tremi-pipe to ensure no voids or bridging of the sealing material. If the borehole remains open to within 2 feet of the total exploration depth following retraction of the CPT/MIP instruments, then a PVC tremi-pipe will be inserted to the total borehole depth and neat cement grout will be added through the tremi-pipe as it is slowly retracted from the borehole. If the borehole collapses to depths greater than 2 feet above the base of the total borehole depth following retraction of the CPT/MIP tooling, then a hollow drill pipe equipped with an expendable “knock-out” point will be advanced to the original borehole depth and neat cement grout will be added through the drill pipe as it is slowly retracted from the borehole.

Cone Penetration Testing Procedure

(CPT)

Gregg Drilling & Testing, Inc. carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, Figure CPT. The soundings are conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.80.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and dynamic pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2002) ASTM standards (D 5778-95).

The cone also contains a porous filter element located directly behind the cone tip (u_2), Figure CPT. It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain dynamic pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (PPDT's) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with silicon oil under vacuum pressure to ensure accurate and fast dissipation.

When the soundings are complete, the test holes are grouted using a Gregg Drilling support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug to the termination depth of the test hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

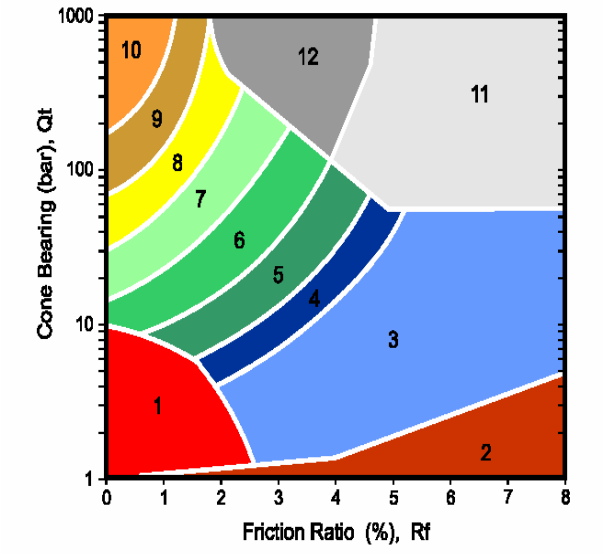
Cone Penetration Test Data & Interpretation



The Cone Penetration Test (CPT) data collected from your site are presented in graphical form in the attached report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings extending greater than 50 feet, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg InSitu and Gregg Drilling & Testing Inc. do not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and do not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals measured hydrostatic water pressures and determined the approximate depth of the ground water table. A PPDT is conducted when the cone is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded by a computer system.
Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until such time as there is no variation in pore pressure with time, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1991.

Water Table Calculation

$$D_{water} = D_{cone} - H_{water}$$

where $H_{water} = U_e$ (depth units)

Useful Conversion Factors: 1psi = 0.704m = 2.31 feet (water)
1tsf = 0.958 bar = 13.9 psi
1m = 3.28 feet

Field Methodology for Membrane Interface Probes (MIP)

Using Hydraulic Driven Direct Push Drilling Techniques

THE INFORMATION PROVIDED IN THIS FIELD METHODOLOGY HAS BEEN GLEANED IN PART FROM THE MANUFACTURER OF THE MIP, GEOPROBE ®

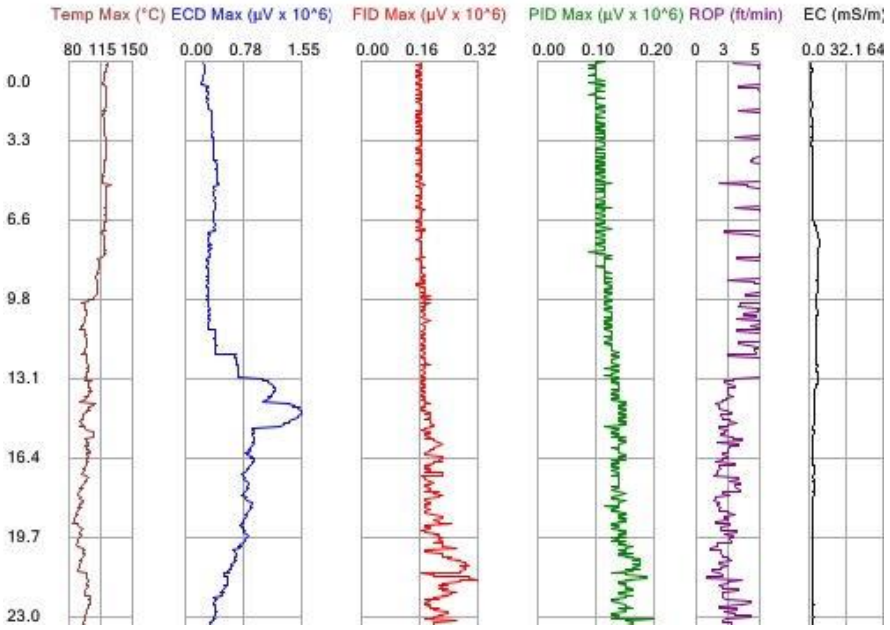
The Membrane Interface Probe (MIP) is a multipurpose tool for mapping soil and groundwater contamination, specifically volatile organic compounds (VOCs) such as halogenated solvents / chlorinated VOCs (cVOCs) and petroleum compounds. The MIP can be deployed from any type of hydraulic driven direct push drill rig (ranging from all-terrain track rigs to confined-space dolly mounts). The MIP tool is threaded onto the lead drill rod of the drill rig and the heating element and gas carrier and return line are run through the center of the hollow drill rods to the surface (trunkline system) where they are connected to the sensor detection system. The MIP is advanced via the drill rig at the rate of approximately 2 feet per minute and can collect approximately 20 sample readings per foot.

The MIP Principle of Operation. The downhole, permeable membrane serves as an interface to a detector at the surface. Volatiles in the subsurface diffuse across the membrane and partition into a stream of carrier gas where they can be swept to the detector. The membrane is heated so that travel by VOCs across this thin film is almost instantaneous. MIP acquisition software logs detector signal with depth.

The MIP is a screening tool with semi-quantitative capabilities acting as an interface between the contaminants in the subsurface and gas phase detectors at the surface (see Figure at right). The membrane is semi-permeable and is comprised of a thin film polymer impregnated into a stainless steel screen for support. The membrane is approximately 6.35mm. The membrane is placed in a heated block attached to the probe. This block is heated to approximately 100-120 degrees Celsius and is raised at the leading edge to protect the membrane. Heating the block helps accelerate diffusion of the contaminant through the membrane.

Diffusion occurs because of a concentration gradient between the contaminated soil/groundwater and the clean carrier gas behind the membrane. The VOC mass is extracted across a semi-permeable membrane and carried to the surface by an inert purge gas at a constant flow of 35-45 milliliters per minute (mL/min) via small diameter inert tubing which carries the contaminants to the gas phase detectors at the surface. Travel time from the membrane interface to the detector(s) is approximately 30-45 seconds (depending on the length of trunkline and flow rate). Once the compounds reach the surface they are analyzed by a suite of three laboratory grade detectors.

The sensor detection system includes:



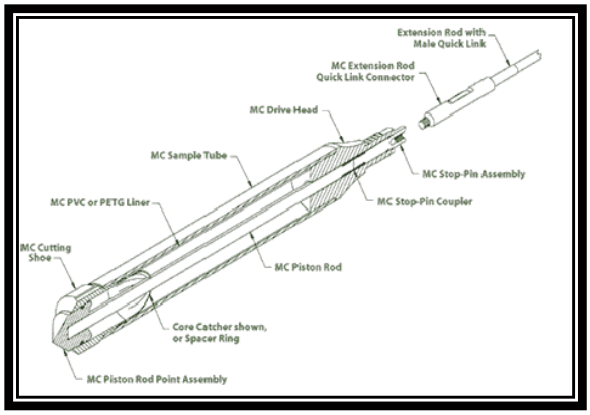
- Photo Ionization Detector (PID)
- Flame Ionization Detector (FID)
- Electron Capture Detector (ECD)

Together, these three detectors offer a range of sensitivities and a means of discriminating different classes of compounds – anything from chlorinated solvents to gasoline hydrocarbons to methane soil gas. The use of multiple detectors is important for separating different types of contamination such as petroleum (e.g., retail gasoline station) from chlorinated solvents (e.g., dry cleaner facility). The ECD is used for chlorinated (e.g., TCE, PCE) contaminant detection, PID is best used for the detection of aromatic hydrocarbons (e.g., BTEX compounds), and the FID is best used for straight chained hydrocarbons (e.g., methane, butane). These detectors may be used in series with the least destructive detector being first and the most destructive detector coming last. The MIP system can process four detector signals at one time. The complementary range of performance of the different detectors enables the system to function from low contaminant levels to near NAPL levels. The detectors have a minimum detection resolution of approximately 0.1 milligram per kilogram (mg/kg) or 100 micrograms per liter (µg/L) for VOCs in soil and groundwater, respectively.

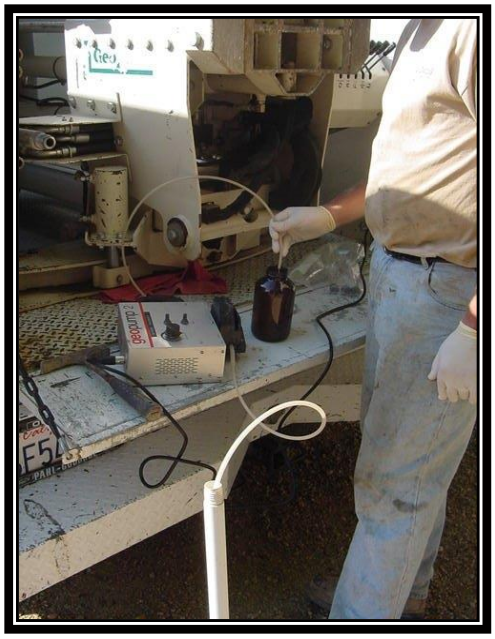
The MIP also includes an integrated Electrical Conductivity (EC) probe to provide indication of general soil particle size which can help determine zones of sands, silts, and clays. The EC logs

can help define zones of lower conductivity (i.e., higher permeability), which may correlate with movement and distribution of contaminants into the subsurface.

The detector information and the electrical conductivity of the soil are graphed via GeoProbe ® FC4000 field instrument (see example graph at right). This instrument allows the operator to determine the location of the contaminant, the relative concentration of the contaminant and the soil/groundwater zone in which the contaminant is located. The MIP log can be used to help determine contaminant "hot spot" zones in the subsurface and generally characterize the vertical and lateral distribution of contaminants in the subsurface.



Field Methodology for Hydraulic Driven Probe Sampling



Field Methodology for Hydraulic Driven Probes

Using Macro-Core®, Large Bore® or Dual Tube® Hydraulic Driven Probes

Direct push exploratory borings are "drilled" with a Hydraulic Driven Probe drill rig, which hydraulically vibrates and drives steel probes into the soil. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval.

The soil cores are logged by an experienced geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. Relatively undisturbed soil samples are obtained for both lithologic logging and laboratory analysis. A portion of individual soil cores are stored in sealed plastic bags for field screening of hydrocarbons and/or volatile organic compounds by a Photoionization Detector (PID). Vapor readings in parts per million (ppm) are recorded on the boring logs. The PID is also used during drilling for monitoring the work area for site safety.

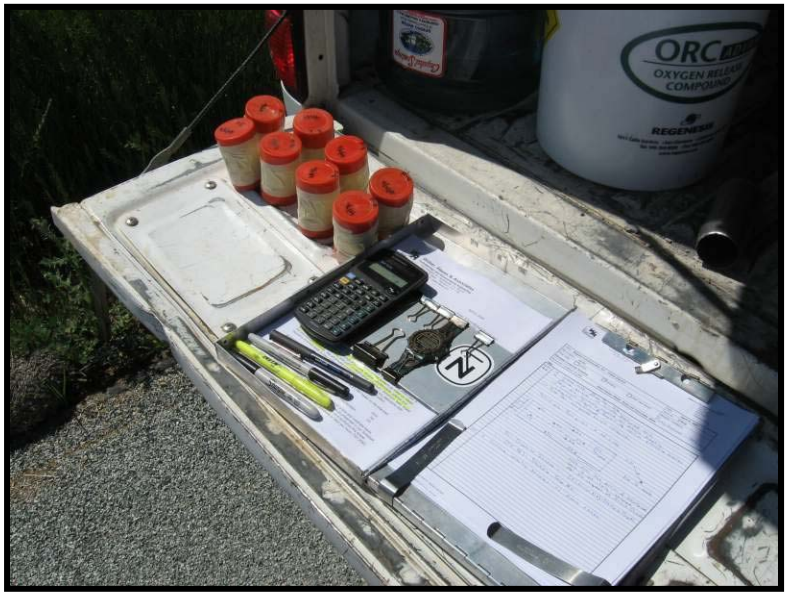
All drilling equipment is decontaminated prior to arriving on-site to prevent possible transfer of contamination from another site. The sampling probe and all other soil sampling equipment are thoroughly cleaned between each borehole by washing in a Liqui-Nox or Alconox solution followed by a double rinsing with distilled water to prevent the transfer of contamination.

Following sample collection the borehole borehole is completely sealed with neat cement grout from the bottom of the borehole upward via a tremi-pipe to ensure no voids or bridging of the sealing material. If the borehole remains open to within 2 feet of the total exploration depth following retraction of the sample barrel, then a PVC tremi-pipe will be inserted to the total borehole depth and neat cement grout will be added through the tremi-pipe as it is slowly

retracted from the borehole. If the borehole collapses to depths greater than 2 feet above the base of the total borehole depth following retraction of the sample barrel, then a hollow drill pipe equipped with an expendable "knock-out" point will be advanced to the original borehole depth and neat cement grout will be added through the drill pipe as it is slowly retracted from the borehole.

Samples Targeted for Laboratory Analysis:

Soil samples targeted for laboratory analysis are immediately cut from the acetate sample liner and protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, placed in a plastic Ziploc baggie, and immediately stored in an insulated container chilled to a temperature of 4 degree Celsius. Soil samples selected for Volatile Organic Compound (VOC) analysis will follow field preservation protocols according to EPA Method 5035, as described in DTSC's *Guidance Document for the Implementation of United States Environmental Protection Agency Method 5035: Methodologies for Collection, Preservation, Storage, and Preparation of Soils to be Analyzed for Volatile Organic Compounds*, dated November 2004.



Discrete groundwater samples are collected after temporary PVC casing is placed in the hole and at least one borehole volume of groundwater in the PVC casing is purged and groundwater is visually observed to be free of sediment. Relatively representative groundwater samples are either: 1) collected with a peristaltic pump and dedicated polyethylene tubing and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths of less than 27 feet bgs) or 2) collected by mechanically lifting groundwater through a clean stainless steel foot valve and dedicated polyethylene and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths greater than 27 feet bgs where a peristaltic pump cannot be used). Samples being analyzed for dissolved metals will be preserved and acidified by the testing laboratory following their receipt of samples. Once collected, groundwater sample containers are placed in Ziploc bags and are stored in an insulated container chilled to a temperature of 4 degree Celsius.

All samples are transported in chilled coolers to a State-certified laboratory under appropriate chain-of-custody documents. Soil samples that may be put on "hold" for potential future analysis will be stored in a dedicated sample freezer, be frozen, and stored under chain-of-custody documentation. Hold times will be confirmed with the testing laboratory to ensure that potential analysis of any "hold" samples will be analyzed within the laboratory hold times.

Field Methodology for Shallow Soil Sampling

Field Methodology for Shallow Soil Sampling

This following provides detailed descriptions of methods used during shallow soil sampling investigations. Included are specifications for shallow soil sampling with a slide hammer, and decontamination procedures.

Shallow Soil Sampling Procedures: A backhoe, two person power auger, or a hand auger is used to get to a point immediately above the sampling depth.

Once at the desired sampling depth, a slide hammer is used to drive a clean stainless steel liner encased in the slide hammer sampling shoe to obtain a relatively undisturbed sample. The slide hammer consists of a metal rod with one end containing a threaded sampling shoe containing a beveled cutting head. A pre-cleaned brass or stainless steel sample liner is installed within the sampling shoe prior to sampling. The slide hammer consists of a weighted sliding handle which slides up and down a connecting rod, and which is used to drive the sampling shoe into undisturbed, native soils. The handle is manually slid up and down the slide rod which in turn forces the sampling shoe (with liner) into native soils.

Materials retrieved from the sampler is be logged on an as-needed basis by the experienced field geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. The liner and relatively undisturbed soils is then be removed from the sampling shoe, protected at both ends with Teflon tape, sealed with non-reactive caps, taped, and immediately stored in an insulated container cooled with blue ice at a temperature of 4 degree Celsius or less. Samples targeted for analysis are transported under appropriate chain-of-custody documentation to a State-certified laboratory performing the targeted analysis.

Upon completion of sampling at the designated location, the location will be backfilled and compacted with the materials that were removed prior to sampling, supplemented by clean imported fill as necessary.

Soil samples selected for Volatile Organic Compound (VOC) analysis will follow field preservation protocols according to EPA Method 5035, as described in DTSC's *Guidance Document for the Implementation of United States Environmental Protection Agency Method 5035: Methodologies for Collection, Preservation, Storage, and Preparation of Soils to be Analyzed for Volatile Organic Compounds*, dated November 2004.

Equipment Decontamination and Containerization Procedures: All sampling equipment is cleaned prior to arriving on site to prevent possible transfer of contamination from another site. In areas suspected of having contamination, sampling equipment is thoroughly cleaned between each sampling runs with Alconox ® solution (or equivalent) followed by a double rinsing with distilled water to prevent the vertical transfer of contamination, and/or contamination from location to location onsite. Accordingly, all sampling equipment will be cleaned following sampling operations to prevent the possible transfer of contamination. All cleaning rinsate, and wash water produced during the shallow soil sampling and decontamination process will be containerized on site in pails or approved DOT drums until profiling determines appropriate disposal options.

Field Methodology for Active Soil Gas Sampling

Field Methodology for Active Soil Gas Sampling

The active soil gas / soil vapor (we use the terms interchangeably) sampling field methodology is conducted in general accordance with the procedures outlined in the CalEPA's/DTSC/LARWQCB/SFRWQCB *Advisory – Active Soil Gas Investigations* (July 2015), and the DTSC/CalEPA's final *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (October 2011). We use the terms soil gas and soil vapor interchangeably. The field methodology for soil vapor sampling entails:

- Constructing Soil Vapor Sample Points and Purge Test Points (if necessary);
- Purge volume testing at the Purge Test Point(s);
- Setting up the sampling and leak testing equipment; and
- Soil Vapor Sampling

Constructing & Decommissioning Soil Vapor Sample and Purge Test Probes

Soil vapor sample probes can be either semi-permanent or temporary. A semi-permanent sample probe is constructed with a secure surface completion consisting of bolt-down flush-mounted well vault so it can be reused. A field geologist or engineer logs the soils encountered using the Unified Soil Classification System (USCS), unless the site is already well characterized geologically.

Shallow soil vapor probe installation via GeoProbe drill rig

Shallow Soil Vapor Probe: The soil vapor/gas probe is installed to the target sampling depth via a Geo-Probe drill rig, which hydraulically drives and vibrates steel probes into the soil. The soil is cored out using a 4-foot long nickel-plated sampling barrel fitted with a clear acetate liner. During coring operations, the sample barrel remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. Alternatively, the soil gas probe borehole can be created via a hollow stem auger or hand auger. Shallow soil gas / soil vapor sample depths will be no less than 5 feet deep (if possible) in order to avoid breakthrough of ambient air from the surface. Shallow and deeper soil gas probes are constructed in a similar manner. Once the probe hole is cored to the desired sample depth, a length of 3/16–inch inner diameter Teflon or Nylaflo tubing having a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted through a 1-inch diameter tremi-pipe that runs the entire length of the borehole. This sample tubing is placed approximately 6-inches above the base of the

borehole. A minimum of a one-foot sand pack is emplaced at the base of the borehole (the grain size of the sand pack is larger than the grain size of the adjacent formation), followed by at least one foot of dry granular bentonite. The probe tip is emplaced midway within the sand pack. The tremi-pipe is used to insert the sand pack and granular bentonite to ensure that no bridging occurs. The remainder of the borehole is sealed to the ground surface with hydrated bentonite gel for temporary probes or neat cement mixed with 1% – 5% bentonite, which are both pre-mixed at the ground surface; this ensures a sound surface seal and/or seal between multi-depth nested probe sample intervals.

Decommissioning Shallow Soil Vapor Probes: Following sample collection the vapor probe is properly decommissioned by one of the following regulatory approved techniques:

- The sample tubing is completely removed from the ground surface (if possible) allowing the bentonite gel slurry to flow into the small vertical void thereby sealing the borehole. Subsequently, approximately 6-inches of bentonite slurry is removed below the ground surface and the surface is patched to match the existing grade.
- The sample tubing is properly destroyed by injecting neat cement grout into the tubing via a syringe. The volume of grout injected into the tubing is monitored to ensure that the entire tubing is completely sealed. Subsequently, the tubing is cut off approximately 6-inches below the ground surface and the surface is patched to match the existing grade.
- The vapor probe is properly destroyed by over-drilling the sample tubing and annular seal material. Once the material has been removed, the subsequent borehole is filled with neat cement grout to within about 6-inches of the ground surface and the surface is patched to match the existing grade.

Sub-Slab Soil Vapor Probe: The emplacement of the sub-slab soil vapor sampling probe is conducted by coring a 1 to 1-1/4-inch diameter hole via an electric hand rotary hammer drill through the slab foundation. The sub-slab borehole is advanced approximately 3 to 4-inches below the base of the slab and into the sub-slab material. Once the probe hole is cored to the desired sample depth a length of 3/16–inch inner diameter Teflon or Nylaflo or inert, cleaned metal tubing with a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted into the borehole. The probe tip is emplaced 1 to 2-inches above the base of the bore hole. A minimum of 2 to 4-inches of sand pack is emplaced at the base of the borehole followed by at least 1 to 2-inches of dry granular bentonite to above the base of the slab. The probe tip is emplaced midway within the sand pack. The remainder of the borehole is sealed to the ground surface with hydrated bentonite for temporary probes or hydrated bentonite followed by neat cement for permanent probes to ensure a sound surface seal. Permanent probes have a flush-mount inert metal fitting for providing a good seal when

connecting the above-ground sample tubing and for plugging between sampling events. Following sample collection from a temporary probe the sample tubing is removed and the subsequent void is sealed with hydrated bentonite and the surface is patched with concrete.

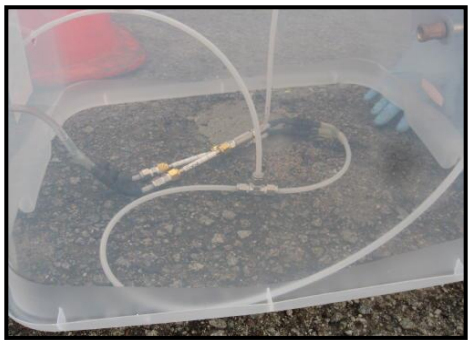
Purging

Prior to soil gas sample collection, a purge volume or "dead space volume" will be calculated in order to purge ambient or stagnant air from the sampling system to ensure that collected samples are representative.

Per the procedures outlined in the CalEPA's Advisory, a default of three purge volumes will be extracted prior to sampling. The purge volume consists of approximately three system volumes (i.e. tubing and annular space) of soil gas, while capturing the purge effluent. One system volume is calculated by summing the inner diameter (id) tubing volume (i.e., id area times the length of tubing) and the annular pore space volume (i.e., area of the borehole times the length of sand pack and granular bentonite surrounding the ceramic filter stone tip times an estimated sand-pack pore space volume of 33.8%). The purge rate will be conducted at the same rate soil gas is sampled (approximately 200-mL/min flow). We note that Cal-EPA guidance recommends purging or sampling at rates between 100 to 200-mL/min for soil vapor probes at all depths, including sub-slab vapor probes, to limit air stripping and to prevent ambient air form diluting the sample. After the specific pre-determined purge volume is removed, a soil vapor/gas sample is collected for laboratory analyses for the site specific target compounds as discussed below.

Sample Collection

Before purging the appropriate "dead space volume" from the soil vapor/gas probe, the probe seal is allowed to cure and the subsurface is allowed to equilibrate for the appropriate amount of time per the procedures outlined in the CalEPA's Advisory. We note that an equilibration time of 2-hours is required for soil vapor/gas probes installed via a direct push drill rig and 48-hours for soil vapor/gas probes installed via a hollow stem auger drill rig, hand-auger, or an electric hand rotary hammer drill. Once the appropriate "dead space volume" has been purged, the sample tubing will be attached to a laboratory prepared soil vapor manifold and 1 or 6-liter Summa canister or sorbent sampling media depending on required laboratory analysis. We note that the choice between using a 1-L or 6-L canister is typically dependent on the purpose of the site investigation. However, for soil vapor/gas samples collected at a depth less than 5-feet, including sub-slab vapor probes, a 1-L canister should be used to avoid excessive air removal and to prevent ambient air from entering the sub-surface and sample. When sampling for ambient indoor air, a 6-L canister is nearly always required because of the extremely low detection limits required to meet Indoor Air ESLs. For soil vapor collection, a 1-L



canister may be all that is necessary if the site is known to contain high concentrations of contaminants of interest that make achieving low detection limits a secondary concern. In those cases, only a small volume of the 1-L collected is necessary for analysis of both the TO-15 and the TO-3 compounds. However, if a site does not have historical data indicating that it is significantly contaminated, or if multiple analytical runs become necessary to achieve reporting limit/CHHSL/ESL goals, it becomes critical to have a larger initial volume of collected sample. A 6-L volume allows the laboratory to provide the lowest possible detection for the compounds of interest for full list TO-15 while providing enough volume for the additional analysis of individual compounds that may require dilution to bring them within the instrument calibration range. The 6-L volume will provide enough residual sample to analyze for additional contaminants (e.g., EPA Method TO-3) and/or fixed Gases (ASTM D1946) including Helium, which may be used as a tracer or leak check compound in the investigation. A consultation with the selected testing laboratory will be conducted for each investigation to ensure that appropriate sample volumes are obtained.

Sample collection with Summa canisters

The following sample collection procedures are followed for each sample collection media:

- The Summa canisters will be supplied by the analytical laboratory with a vacuum of approximately 30-inches of mercury and outfitted with a 200-mL/min flow control valve. The tubing will be connected to the soil vapor manifold and Summa canister using airtight stainless-steel or brass fittings. The flow control valve will then be opened slowly to draw the vapor sample from the target depth.

Sample collection with sorbent tube

- Laboratory sorbent media and canister with a vacuum of approximately 30-inches of mercury and outfitted with a 200- mL/min flow control valve or sampling pump (10 to 200 mL/min) will be supplied by the analytical laboratory. The tubing will be connected to the sorbent media sample tube, upstream of the vacuum canister/sample pump/syringe using airtight stainless-steel or brass fittings. The sample vacuum canister/ pump/syringe will then be activated to draw approximately 1 to 3-L of sample volume for TO-17 analysis from the target depth at a flow rate of 200- mL/min or less per sorbent media sample tube manufacturer and/or laboratory guidelines.

Schematic diagrams of sample configurations for the different sampling media (i.e., Summa canister and sorbent media) and probe construction (i.e., shallow soil and sub-slab) are included as attachments 1, 2, and 3 of this field methodology.

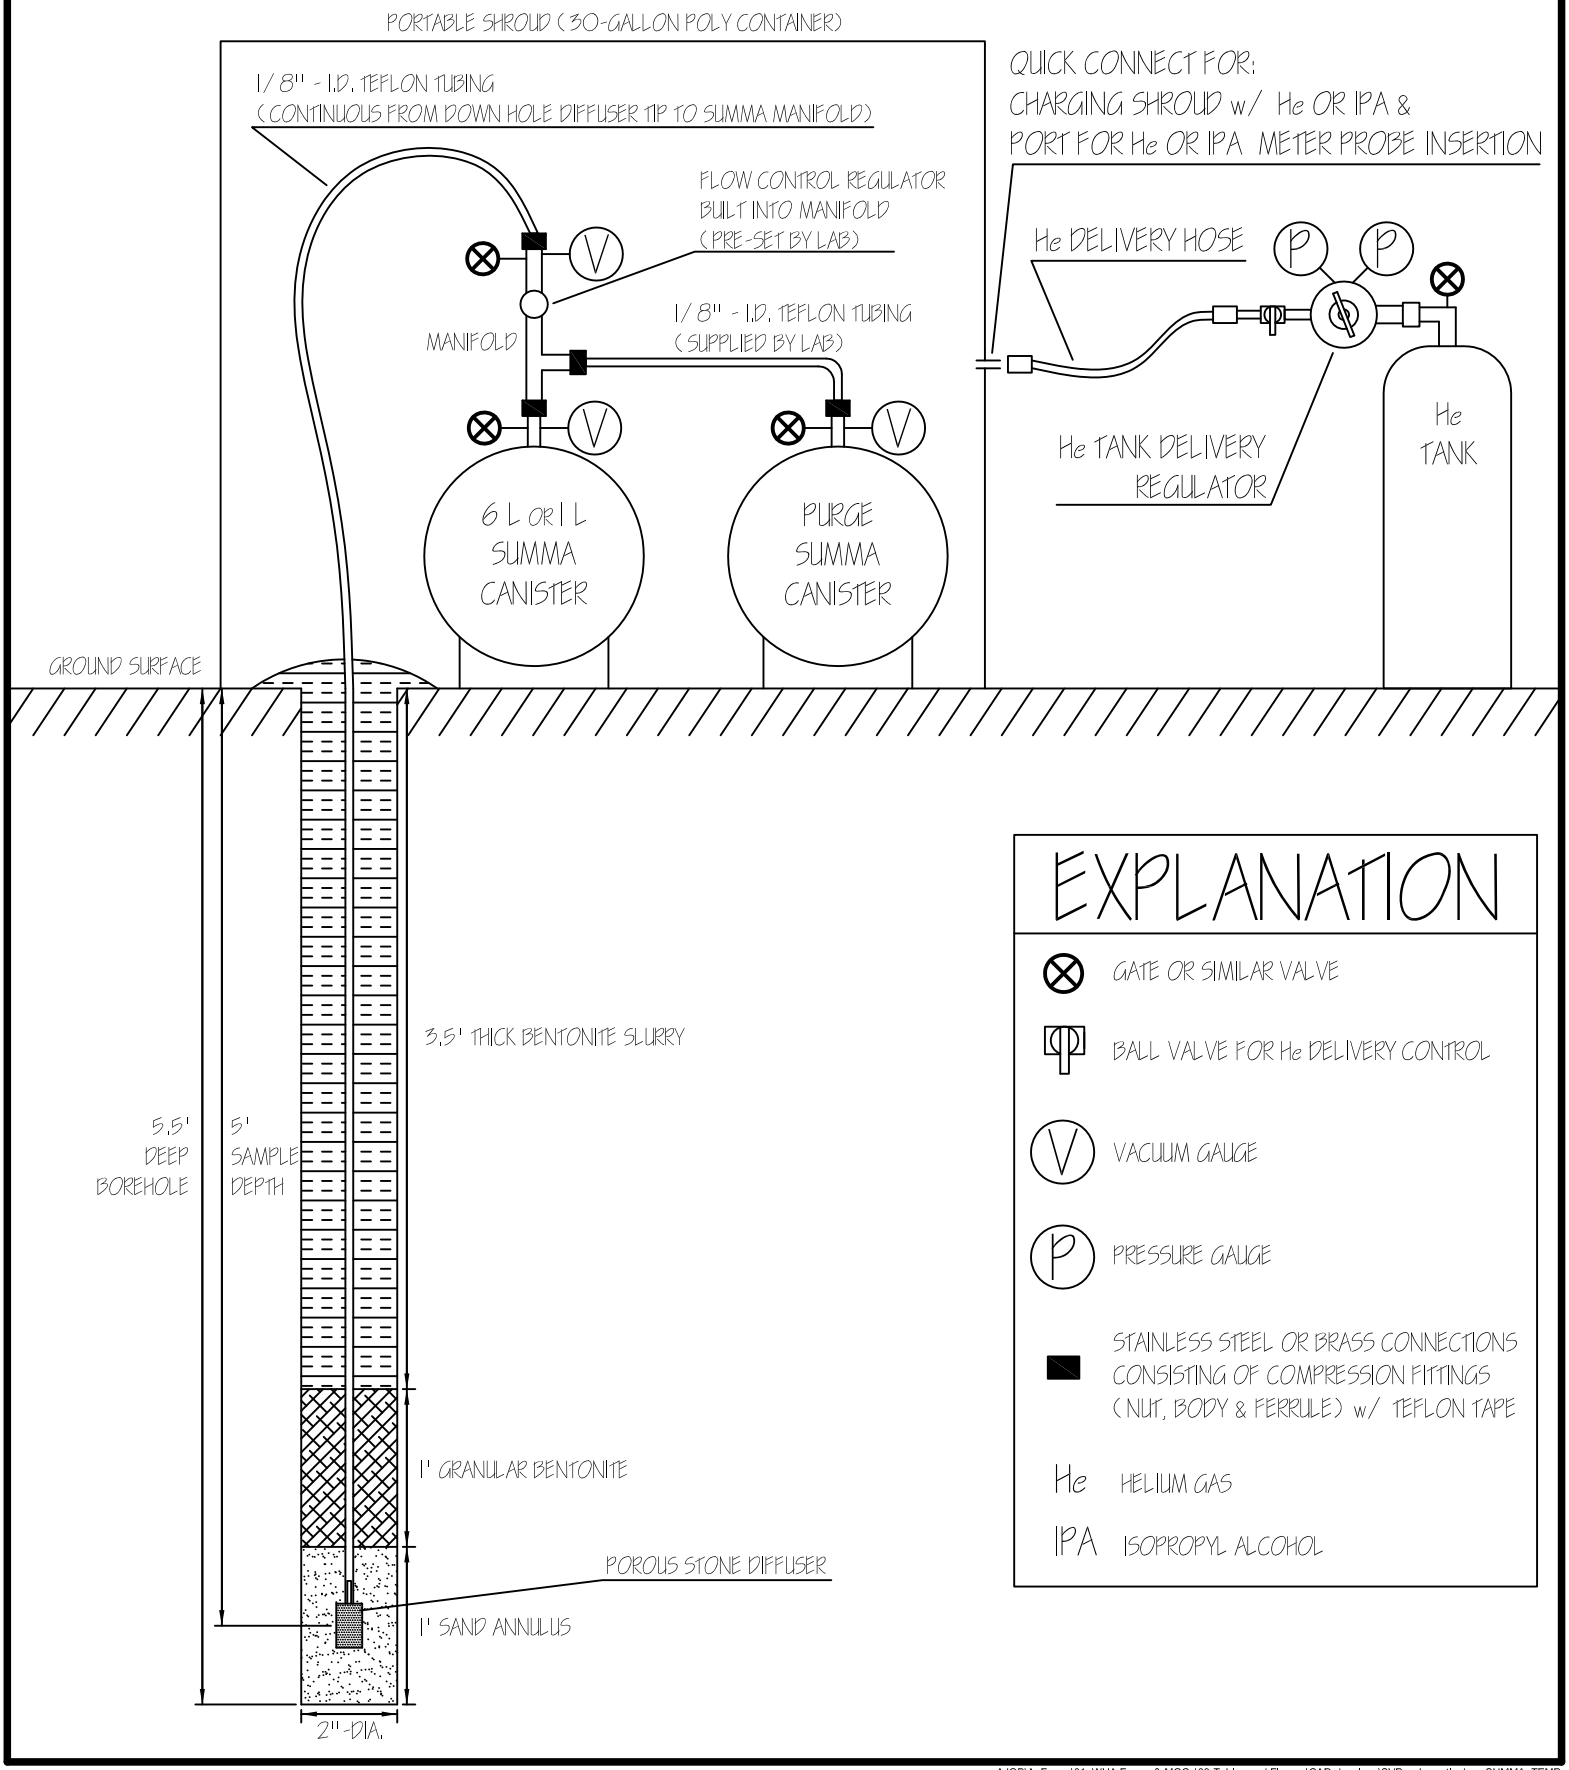
Leak Detection Monitoring

Monitoring leak check compound within shroud during sample collection

Leak detection monitoring will be conducted during soil gas sampling by applying a tracer compound (i.e., isopropyl alcohol [isopropanol, IPA] or helium) to the sample system connections and bentonite seal. Specifically, a shroud will be used to encapsulate the entire system (i.e., the sample canister and surface bentonite seal) so as to trap the applied tracer compound. The leak detection monitoring configuration is graphically depicted on attachments 1, 2, and 3 of this field methodology. The concentration of the leak check compound within the shroud will be monitored periodically throughout the sample collection period with a PID calibrated to the specific tracer gas compound and these values will be recorded into the field notes. The tracer compound (i.e., IPA or helium) is maintained within the shroud at a concentration of approximately two (2) orders of magnitude higher than the detection limit of the field meter used throughout the duration of sample collection. The testing laboratory will screen for this compound in all analyzed air samples when IPA is used. If helium is used the laboratory can screen for this compound if collected in Summa canisters, or the sample effluent after passing through the sorbent media will be field screened for the presence of the helium.

Prior to purging and sample collection, a “shut-in test” is performed to check the above-ground sample system connections downstream from the top of the soil vapor/gas probe, including the laboratory provided sample manifold (“sample train”). The “shut-in test” is completed in the field by closing off all valves to the laboratory provided soil vapor manifold and the soil vapor/gas probe tubing, and subsequently opening the valve to the connected “purge” Summa canister to increase the vacuum in the sample train to a minimum of 100-inches of water, at which point the purge canister is closed. Then the vacuum gauge on the sample train is observed for at least 1-minute to confirm it remains stable.

Low Flow Sampling Conditions



A low flow sampling condition is characterized as a condition where the sample probe cannot sustain a flow rate of 100-mL/min for more than three minutes while maintaining an applied vacuum of less than 100-inches of water (or 7.4-inches of mercury). The vacuum applied to the

sample probe will be measured and monitored via a vacuum gauge installed between the sample probe and the sample collection flow regulator. If the vacuum measured within the sample probe exceeds 100-inches of water during dead space volume purging, then one of the following sample collection procedures will be employed:

- If the lithology observed during sample probe installation indicates potential for low permeability / low flow conditions a representative soil sample at the soil vapor sample depth will be collected and put on ice for possible laboratory analysis.
- If extreme low flow conditions are observed during purging, specifically excessive time will be required to purge and collect a sample, we will contact the regulating agency to confirm collecting a purge volume approximating one dead space volume (i.e., volume of the sample tube plus the volume of the sand pack pore space and granular bentonite pore space surrounding the probe tip) will be evacuated prior to sample collection. Sample collection will proceed until the sample probe vacuum equals 100-inches of water. The sample system will then be closed off to allow the probe to relax and equilibrate. Over time the vacuum will eventually dissipate, the rate of which can be monitored via an in-line vacuum gauge installed as described above. Once the vacuum in the sample probe has dissipated, sampling will resume as described above. This process will be repeated until an adequate sample volume has been obtained for the required laboratory analysis.
- If during low flow sampling as stated above, the sample system when closed off to allow the probe to relax and equilibrate the probe vacuum does not reduce by 13.5 inches of water (1 inch of mercury) in 3-minutes, soil vapor sampling will cease and the previously collected soil sample will be submitted to the laboratory for potential analysis for site specific constituents.

Sample Storage and Transport

Once collected, the soil gas samples are then transported to a State-certified laboratory under appropriate chain-of-custody documentation. Sorbent media are wrapped in foil and placed in individual zip-lock type bags and immediately placed in a chilled cooler (chilled to 4 degrees Celsius) for storage and transport to the testing laboratory. Summa canisters are placed in laboratory provided cardboard boxes and stored at ambient temperature for transport to the testing laboratory.

Temporary Soil Vapor Probe Construction Details

Figure B

Field Methodology for Indoor and Outdoor Air Sampling

Field Methodology for Indoor and Outdoor Air Sampling

This indoor and outdoor air sampling field methodology was designed in general accordance with the procedures outlined in the DTSC/CalEPA's final *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (October 2011 and 2012a).

1.0 SCOPE AND APPLICATION

This field methodology describes the method for collecting indoor, outdoor, and crawl space air samples for volatile organic compounds (VOCs) of target *chemicals of concern*. Reporting limits for these samples are typically very low and extremely prone to positive bias from interfering, aboveground VOC sources. A Building Survey will be performed before sample collection. The methods presented here are based on "clean" sampling techniques. The requirements of clean sampling dictate that sampling and sample handling are done by trained personnel and are designed to satisfy applicable regulatory standards.

2.0 GENERAL GUIDELINES

If other media sampling (i.e., soil, groundwater, soil vapor) are included for the site-specific assessment, typically this sampling will be collected concurrently with the indoor and outdoor air sampling (i.e., soil and groundwater sampling are not generally collected on the same day but are collected on the same phase of work mobilization in order to assess all media samples within a reasonable timeframe).

Indoor Air Sampling: Sampling for indoor air is generally conducted based on conservative (worst case) conditions and/or potential variation in seasonal results. Initial sampling for conservative conditions typically includes closed windows and doors and limiting drafts due to entering/exiting. Heating, ventilation, and air condition (HVAC) systems should be operated normally for the season and time of day. If testing during the cold season, the heating system should be run for at least 24 hours prior to sampling and the temperature should be maintained at, or above, 65ºF to address the potential of enhanced vapor intrusion conditions.

Multiple lines of evidence sampling assessment should be used to evaluate the need for seasonal evaluation of potential vapor intrusion. Lines of evidence can include soil & groundwater results, known contaminant sources, and initial subgrade vapor and indoor air results. Ideally, a minimum of two sampling events should be completed to address the potential for seasonal variation (i.e., a late summer/early autumn and a later winter/early spring). However, number of sampling events can be revised to be more or less based on site-specific conditions.

Outdoor Air Sampling: The collection of outdoor air samples, if deemed necessary to satisfy project goals to assess anthropogenic conditions that may impact indoor air conditions should be collected concurrently with indoor air sampling. The site-specific *Workplan* should define whether outdoor air sampling is to be conducted based on potential target chemical(s) contribution from surrounding area activities/processes. If outdoor air is appropriate, then three outdoor air samples will be collected during each indoor air sampling event.

3.0 SAMPLE LOCATION SELECTION & SETUP

Selection of sample locations: The selection of indoor, outdoor, and crawl space air sample locations will be based on a survey of building conditions, and in consultation with the building owner/occupant and local agency oversight staff. A *Building Survey for Indoor Air Sampling & Vapor Intrusion Investigation* form (copy attached) outlines the procedures/guidelines for performing a pre-sampling building survey (Following *DTSC Vapor Intrusion Guidance,* 2011 Appendix L). The

sample locations will be selected to meet the project-specific data quality objectives and will identify potential entry points of contaminated soil gas into the structure. The building survey observations will better inform appropriate indoor/ambient air sampling locations. Guidelines for selecting indoor, outdoor, and crawl space air sample locations are as follows:

- ***Indoor Air Sample Locations*:**
  - Indoor air samples are typically collected from segregated (walled off) compartments or HVAC zones within a building.
  - Indoor air samples are to be located in the areas of the building that are generally occupied most frequently and by the most amounts of people (i.e., for residential – primary living area; and for commercial – in the primary working zones) and/or at locations having the highest potential vapor intrusion (i.e., residential – bathroom and kitchen; and for commercial – near sumps, elevator shafts, floor drains, etc.).
  - Typically, indoor air samples will be collected on the lowest floor of the building at breathing zone height (approximately 3 to 5 feet) toward the center of the building away from windows and doors.
    - Site-specific considerations will be given to those situations where a different sampling height may also be appropriate to evaluate a unique setting or population (i.e., a daycare facility).
  - If there is more than one floor within a structure, additional indoor air samples will be considered in consultation with the overseeing agency staff, to address the potential for variable risk exposures and/or to distinguish contaminant contribution from background sources. The location and position of the indoor air sampling container will vary depending on the floor layout and facility infrastructure.
  - If there is a basement, any indoor air sample locations will be positioned to investigate worst-case situations within a structure (i.e., sumps or major cracks in the foundation).
- ***Outdoor Air Sample Locations*:**
  - Typically, outdoor air samples are collected upwind of subsurface contaminant plumes, upwind and/or downwind of the building or site being investigated, and at HVAC intakes. Outdoor air samples should be collected at breathing zone height (approximately 6 feet).
  - An effort will be made to place the canister away from obvious potential outdoor VOC sources (i.e., busy roads, gas stations, chemical storage, dry cleaners, etc.) in order to avoid biasing the sample results.
  - Outdoor air samples are collected on the upwind side of the building should be placed at a distance equal to twice the height of the building. However, the outdoor air canister may be placed near the outdoor air intake for the HVAC system for the building.
  - An effort will be made to secure outdoor air sample canisters to an immovable structure to ensure security and prevent tampering in public areas. If the canister is not in a secured location, the canister will be labeled as an environmental sample with warnings not to tamper, and will include contact information. A bicycle lock or piece of chain and padlock will be used.
  - Sampling should be conducted at least 10 feet beyond a tree's drip line. Placing canisters on

or near to a tree should be avoided as studies have suggested tree evapotranspiration processes can potentially capture and release VOCs from groundwater plumes.

- ***Crawl Space Air Sample Locations*:**
  - Crawl Space air samples are typically collected in locations selected to achieve adequate spatial coverage of the building's crawl space. However, the selected sample location may be limited by accessibility.
  - Crawl Space air sample inlets should be located several feet from the opening or access point to avoid dilution by outdoor air. In cases where the crawl space is most conveniently sampled by access through crawl space vents, a sampling probe (sample delivery line made of Teflon® or stainless steel) of sufficient length is attached to the inlet of the flow controller.

Selection of Sample Duration: Generally, 6-liter canisters are used for air sampling. An initial indoor air sample should be collected over a 24-hour sample period for a worst case scenario. If the initial sample indicates there is NO presence of VOCs, and additional lines of evidence indicate there is no significant source of source material capable of creating significant off-gassing (i.e., no significance source of residual soil contamination or elevated dissolved concentrations in a contaminant plume), then a second round of follow-up samples may not be necessary.

After initial samples are collected, follow-up sampling may be warranted based on any significant detections and any additionally collected multiple lines of evidence. Follow-up sampling durations are usually selected to mimic the building occupants daily exposure period. Residential air sampling durations are typically 24 hours and commercial/industrial durations are typically 8-hours (note: depending on schedule shifts, the duration may be adjusted).

Sample collection can be integrated over time by adjusting the flow controller. Project-specific sample periods as short as 10 minutes to as long as 24 hours can be achieved based on the size of canister used and the sampling rate selected (see Table below).

Typical Air Sampling Rates:

Canister Size	Sample Duration	Sampling Flow Rate (mL/min)
6-Liter	1-hour	90
6-Liter	8-hours	11.25
6-Liter	24-hours	3.75
1-Liter	5-minutes	180
1-Liter	1-hour	15
850-mL	5-minutes	150
850-mL	1-hour	12

Selection of Sampling Schedule: Sample collection that is less than 24-hous should ideally occur during typical operating conditions (i.e., when workers occupy the building). However, building owners/occupants may request that sampling take place when the building is not in use. In the case

of commercial operations, the HVAC system is set to typical operating conditions and an additional sampling event may be required to further refine assessment of conditions when the HVAC system is off. If additional sampling is warranted, the schedule and location will be selected only after conferencing with agency staff.

4.0 SAMPLING EQUIPMENT & MATERIALS

Indoor and outdoor air samples are typically collected in stainless steel, polished, certified clean canisters that have been evacuated to a vacuum of approximately 30 inch of mercury. Laboratory provided flow controllers are also certified clean and set at the desired sampling rate by the laboratory. Laboratory sampling equipment/hardware is typically shipped in containers suitable for protection during transit with general package shipping companies (i.e., FedEx or UPS).

Vacuum gauges used to check canister vacuum should be oil-free and clean (gauges are typically provided by the laboratory). The laboratory may either provide one vacuum gauge to be used with all of the canisters, or a vacuum gauge for each canister to be left on during sample collection. Sometimes the canisters are fitted with built-in vacuum gauges that are not removable. These gauges are for field use only, and are an approximate measure of the actual vacuum. Regularly calibrated – and less rugged – vacuum gauges are used at the laboratory to measure vacuum before shipment and again after sample receipt. All tools (i.e., wrenches and screwdrivers) used for connecting fittings and making adjustment to the flow controller should be clean and free of contaminants.

For crawl space samples, typical sample probe material may include new Teflon®, Nylaflo® or stainless steel tubing, fitted with compression fittings.

A sampling desiccant filter or similar device may be used for outdoor air sampling to prevent water from entering canister during sampling.

SAMPLE COLLECTION PROCEDURES

Clean sampling protocols must be followed when handling and collecting air samples, including:

- Care in the shipping, storage, and use of sampling equipment.
- Cleanliness of personnel who come in contact with the sampling equipment is also important:
  - NO smoking, eating, drinking, perfumes, deodorants, dry cleaned clothing, etc.
- Canisters should not be transported in vehicles with gas-powered equipment or fuel cans.
- Sharpie®- type markers should not be used for labeling or note-taking during sampling.

As noted above, a building survey to evaluate vapor intrusion should be completed prior to taking air samples, (see *Building Survey for Indoor Air Sampling & Vapor Intrusion Investigation* form). The form should be referenced and any changes in building conditions since the building survey was completed should be noted (i.e., changes in chemical storage location/quantities).

The canister should be carefully inspected for damage (canisters having visible damage should not be used). The canister's initial vacuum should be recorded and sufficient vacuum should be available for sampling. Canister having less vacuums than registered by the certified laboratory (~29 to 30 inches Hg) are a potential indication of leakage which could affect the accuracy of analytical results. The initial canister vacuum will be measured using an external vacuum gauge, as described below:

- Remove protective cap from the canister (make sure the canister valve is closed before doing

this.

- If there is not a vacuum gauge already attached to the canister, attach an external vacuum gauge to the canister and open the valve. If the vacuum gauge has two openings, make sure that the other opening is closed; the canister cap can be used for this. After taking the reading, record the initial vacuum, close the canister valve and remove the gauge.
- Measure the initial canister vacuum using a vacuum gauge with 0.25% accuracy at the -30 to 0 inches Hg range and NIST-traceable calibration for vacuum measurements.
- Do not sample using a canister without sufficient initial vacuum. Sampling data may be flagged or rejected for canisters having low initial vacuum (less than 28 inches Hg) as low initial vacuum can create a low bias in analytical results due to air leakage. While there is also a smaller risk that air leakage could introduce contaminants into the canister, the primary concern is the low bias to analytical results; this bias is within the range of analytical variability allowed with the EPA Method TO-15 (±30%) for initial vacuums >24 inches Hg. The table presented in below identifies the field person's response based on the initial vacuum reading for a canister. In addition, this table also identifies the potential bias to results at different initial canister vacuums. Use the following table to determine when to use canisters based on initial vacuum readings:

Initial Vacuum Reading (inches of Hg)	Potential Percent Error in Analytical Results (from vacuum leakage)	Recommended Course of Action
>30 to 28	Up to -10%	Use canister for sampling – no limitations on use.
>26 to 28	Up to -21%	Use canister for sampling if necessary; replace canister with a spare if spares are available.
>24 to 26	Up to -30%	Sampling with canister is not advisable. Contact project manager and obtain direction before sampling with this canister. (Lab qualifiers may be applied to analytical results sampled with canisters with vacuums less than 26 inches Hg).
<24	> -30%	Do not use (analytical results will be rejected).

Flow controllers should come pre-set by the laboratory to sample at a pre-determined rate based on specific project requirements (see Table on page 4, under *Selection of Sample Duration* for the most common options). In some cases (i.e., project-specific quality assurance [QA]), the flow rate will need to be verified in the field prior to use. This is accomplished with a bubble meter, vacuum source, and instructions supplied by the laboratory.

5.0 SAMPLE EQUIPMENT SETUP, SAMPLE COLLECTION & BREAKDOWN

- Connect the flow controller to the sample canister.
- For outdoor samples, be sure that the inlet to the flow controller is protected from precipitation. Place the canister and flow controller under a shelter/enclosure, use a sampling desiccant filter provided by the laboratory, or use a clean piece of aluminum foil to build a tent over the flow controller inlet.
- If crawl spaces are being sampled remotely through a crawl space vent, adjust the length of the

sampling probe to achieve the desired sampling location and place an inert spacer/support (wire clothes hanger) near the end of the probe to keep the probe tip opening suspended ~3 inches above the ground level. Then connect the sampling probe to the inlet of the flow controller.

- Remove all work articles from the sampling area.
- BEGIN SAMPLING by slowly opening the canister valve one full turn. For canisters with built-in or assigned vacuum gauges, monitor the vacuum change several times during the course of the selected sample period to ensure the canister is filling at the desired rate.
- AT THE END OF THE SAMPLE PERIOD, record the final canister vacuum and close the canister valve finger tight.
- Remove the flow controller and replace the protective cap on the canister valve fitting.
- If necessary, measure the final canister vacuum with a separate vacuum gauge. Open the canister valve and record the final vacuum. Close the valve, remove the gauge, and replace and tighten the cap on the canister.
    - Appropriate final vacuum in the canister is between 2 and 10 inches Hg. More than 10 inches Hg indicates that a smaller than expected sample volume has been collected, which can increase laboratory reporting limits.
- Canisters with no vacuum left (i.e., 0 inches Hg) should not be analyzed as sample bias could occur. It may be possible to have the lab verify if there is vacuum (i.e., the tank gauge is faulty). If the laboratory vacuum gauge indicates vacuum remains in the canister, then the sample is still considered acceptable and may be analyzed. The analytical laboratory will be directed to not analyze any sample showing a final vacuum of 0 inches Hg (as measured by the laboratory).
- If the flow controller is going to be used for more than one sample collection, a purge volume should run through the apparatus. To do this, attach the flow controller to a vacuum source and draw clean air or gas (ultra-high purity) through it for several minutes before attaching it to the canister.

6.0 QUALITY ASSURANCE/QUALITY CONTROL

One duplicate sample will be collected for each sampling event, and for each laboratory used, if more than on laboratory is needed. Trip blanks are considered unnecessary when passivated steel canisters are used for sample collection. Collected samples will be delivered to the analyzing laboratory as soon as possible and will be analyzed within the recommended holding times (30 days for passivated steel canisters).

7.0 SAMPLE STORAGE AND TRANSPORT

Once collected, the air samples are then transported to a State-certified laboratory under appropriate chain-of-custody documentation. Sticky labels should NOT be affixed to the sample canisters. Summa canisters are placed in cardboard boxes and stored at ambient temperature for transport to the testing laboratory.

8.0 ALTITUDE CORRECTION

Air pressure decreases with elevation. Therefore, a canister evacuated at a laboratory located at sea level will show a lower vacuum measurement at a higher altitude. Generally, a 1,000 foot rise in

elevation corresponds to a 1 inch Hg drop in pressure OR a 1 inch Hg decrease in measured vacuum. For example, a canister evacuated to 30 inches at sea level and used at 3,000 feet would show an initial vacuum of 27 inches Hg.

For samples collected at altitude, the laboratory will be informed ahead of time so they adjust the flow controllers accordingly. If sampling is being conducted at higher elevations, verify the elevation difference between the analytical laboratory and field location and determine the associated decrease in measured vacuum using the following formula:

- Calculate the pressure difference between the laboratory and field location as follows:
  - Difference from Sea Level (field) – Difference from Sea Level (laboratory). Use the Altitude Correction Table attached.
- Subtract the pressure difference determined directly above from allowable initial vacuum levels (pre-sample collection) and final vacuum levels (post-sample collection) to determine appropriate initial and final vacuum levels.

SECTION 5. CURRENT ATMOSPHERIC AND SITE CONDITIONS

What is the temperature relative to outside?	
Were windows and doors kept open?	
Is ventilation system in use?	
Are intake and exhaust fans being used?	
Ventilation hoods in operation?	
Do any portions of indoor air appear to be stagnant?	
Do any portions of indoor air exhibit strong or unusual odors?	

SECTION 6. MISCELLANEOUS FACTORS

Are attached garages or storage structures present?	☐ Yes	☐ No	
Does smoking occur in the building?	☐ Yes	☐ No	
New carpet or furniture recently installed?	☐ Yes	☐ No	
Have any fabrics been dry cleaned recently?	☐ Yes	☐ No	
Has any portion of the interior been painted or stained within the last 6 months?	☐ Yes	☐ No	

Any documented internal fires, recently or historically?	☐ Yes	☐ No	
Has the building been remodeled recently?	☐ Yes	☐ No	
Are aboveground or underground fuel/oil storage tanks present near the facility?	☐ Yes	☐ No	
Is there a hobby or craft area in the building?	☐ Yes	☐ No	
Is gun cleaner stored in the building?	☐ Yes	☐ No	
Do any building occupants use solvents at work?	☐ Yes	☐ No	
Are manufactured products / materials stored that may be off-gassing VOCs from the manufacturing process?	☐ Yes	☐ No	
Has the building been fumigated within the last 3 months?	☐ Yes	☐ No	
Do any current building occupants use solvents or volatile chemicals for any purpose?	☐ Yes	☐ No	
Is a septic system connected to the facility? Proximity? Active?	☐ Yes	☐ No	
Are ponds or pools adjacent to the facility?	☐ Yes	☐ No	

SECTION 7. LIST ANY KNOWN VOLATILE HAZARDOUS MATERIALS OR CLEANING PRODUCTS PREVIOUSLY STORED

SECTION 8. LIST ANY VOLATILE HAZARDOUS MATERIALS OR CLEANING PRODUCTS CURRENTLY STORED

SECTION 9. BUILDING SKETCH

Provide a sketch of facility that details the location of heating and cooling systems/intakes, locations of doors and windows, hazardous materials and petroleum products storage locations and general orientation.

Field Methodology for Monitoring / Remediation Well Installation & Well Development and Post Development Sampling

Field Methodology for Monitoring / Remediation Well Installation
and
Well Development & Post Development Sampling

This appendix describes the methods employed in hollow stem auger drilling for soil and groundwater investigations and/or monitoring and/or remediation well installations. Included are specifications for borehole drilling and soil sampling procedures, and the conversion of boreholes into monitoring wells, piezometers, sparge wells, vapor monitoring, and /or vapor extraction wells. Fieldwork tasks and well construction generally follow the guidelines outlined in the California EPA's *Guidance Manual for Groundwater Investigations – Monitoring Well Design and Construction for Hydrogeologic Investigations,* dated July 1995.

Borehole Drilling and Soil Sampling Procedures: Exploratory borehole(s) locations are determined based on data from previous investigation(s), local and regional groundwater flow direction, surface topography, underground utilities, overhead utilities and obstructions, property lines, and structures.

The exploratory boreholes are drilled using a truck-mounted drill rig equipped with eight-inch or twelve-inch diameter hollow-stem augers. Soil samples are obtained for lithologic logging of native materials and laboratory analysis. The retrieved soil is logged by an experienced geologist using the Unified Soil Classification System (USCS). A Photoionization Detector (PID) is used during drilling operations for site safety purposes and for on-site interpretation of potential "hot-spots". Vapor readings in parts per million (ppm) are recorded on the boring logs.

The samples are collected by advancing the boring to a point immediately above the sampling depth and driving a modified-California split-spoon sampler into relatively undisturbed soil through the center of the drill augers. The sampler contains three separate six-inch brass or stainless steel sleeves that are driven into undisturbed soils by a standard 140-pound hammer that is repeatedly dropped from a height of 30 inches. The number of blows required to drive the sampler each successive 6-inches is recorded on geologic logs to evaluate the relative consistency of the soil. When driving the split-spoon sampler is complete, the driller advances the auger flight over the split-spoon sampler, thus freeing the sampler to be retrieved. Drilling cuttings are continuously observed and materials retrieved from the sampler are logged by the field geologist. Three brass sleeves are retained from the modified-California split-spoon sampler at project specific sampling intervals. The soil sleeves are retained for the following purposes:

- One sleeve is protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, and immediately stored in an insulated container cooled chilled to a temperature of 4 degree Celsius. Selected samples (generally at least one per borehole,

though soil samples may not be analyzed from borings for remediation wells at well characterized sites) are transported under appropriate chain-of-custody documentation to a State Certified laboratory for analysis specific to the investigation.

- The second sample is extracted from its sleeve and stored in a sealed plastic bag so that it may be screened by the portable PID for hydrocarbon odors and/or volatile organic compounds.
- The third sample is also extracted from its sleeve and used to describe the subsurface lithology at the specific sampling depth. The retrieved soil is logged by an experienced geologist using the USCS criteria for soil description.

Alternatively, some hollow stem auger drill rigs are equipped with pneumatic samplers rather than the aforementioned free falling hammer sampling technique. The pneumatic sampler vibrates and drives steel probes into the soil. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. Soil samples targeted for laboratory analysis are immediately cut from the acetate sample liner and protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, placed in a plastic ZipLock baggie, and immediately stored in an insulated container chilled to a temperature of 4 degree Celsius for transportation under to a State Certified laboratory for analysis specific to the investigation appropriate chain-of-custody documentation.

Soil cuttings are either (1) stockpiled on, and covered with, plastic sheeting to eliminate aeration of potentially contaminated soil, or (2) containerized in 55-gallon steel drums. Soil cuttings from drilling operations are disposed of under proper hazardous waste manifest(s) in landfills capable of accepting the appropriate waste type and contaminant concentration.

Conversion of Borehole(s) into Well(s): The boreholes are converted into groundwater monitoring wells, piezometers, sparge wells, vapor monitoring, and /or vapor extraction wells by installing threaded schedule 40 PVC well casing of the appropriate diameter (dependant upon well type). A predetermined portion of the well casing is constructed of machine-slotted sections, which allow for the flow of groundwater and/or soil vapor/air into and out of the well casing. The size of the machined slots (measured in 100ths of inches) is determined by the grain size of the native materials encountered during drilling and by the well's intended use. For groundwater monitoring wells the screened section is generally no more than 10 feet long. The well casing is lowered into the borehole through the hollow stem augers and the annular space adjacent to the screened interval is slowly backfilled with sand (sand size is determined by the slot size noted above). The annular space between the well casing and the borehole wall will be a minimum of 2.5 inches and no more than 5-inches. A weighted measuring tape with the

appropriate graduations (feet and 10ths of feet) is used to prevent bridging of the annular material and to insure that the well is constructed according to the predetermined construction specifications. The annular sand (or filter pack) is extended one to two feet above the top of the screened interval. A two-foot thick hydrated bentonite seal is placed above the sand and the remaining annular space is back filled with cement slurry to prevent the inflow of surface water. The wellhead is fitted with a locking watertight plug and is encased in a traffic-rated bolt-down vault to protect against damage and unauthorized access.

Well Development and Groundwater Sample Collection: Weber, Hayes and Associates' groundwater monitoring field methodology is generally based guidelines outlined in California EPA's *Guidance Manual for Groundwater Investigations – Monitoring Well Design and Construction for Hydrogeologic Investigations,* dated July 1995. Well development operations will occur no sooner than 48 hours following well installation. The first step in groundwater well development is for Weber, Hayes and Associates field personnel to measure the depth-to-groundwater to the nearest hundredth (0.01) of a foot with an electric sounder. If the well appears to be pressurized, or the groundwater level is fluctuating, measurements are made until the groundwater levels stabilize, and a final depth-to-groundwater measurement is taken and recorded. After the depth-to-groundwater is measured, the well is then checked for the presence of free product with an oil/water interface probe. If free product is present, the thickness of the layer is recorded, and the product is removed. All field data (depth-to-groundwater, well purge volume, physical parameters, and sampling method) is recorded on field data sheets. Because removing free product may skew the data, wells that contain free product are generally not used in groundwater elevation and gradient calculations.

After measuring the depth-to-groundwater, a surge block is used to physically swab the wells entire screened interval a minimum of 50 strokes in order to remove fines for the sand pack and promote gradation between the surrounding formation and the sand pack. Following well swabbing the well is purged with a low flow submersible electric pump until visually free of turbidity. It may be necessary to repeat the well swabbing and purging steps if the turbidity of the discharge water does not decrease during the well purge. During purging the physical parameters of temperature, conductivity, pH, dissolved oxygen (D.O.) concentration, and Oxidation-Reduction Potential (ORP) of the purge water are monitored with a YSI ProPlus Flow Through Cell equipped meter to ensure that these parameters have stabilized. The YSI ProPlus meter is calibrated on site prior to each sampling event. Purging is determined to be complete (stabilized aquifer conditions reached) after the removal of at least one well casing volume of water and when the physical parameters have stabilized as follows:

Parameter	Stabilization Criteria
Temperature	+/- 3% of the reading (minimum of +/- 0.2° C)
pH	+/- 0.1
Electrical Conductance (EC)	+/- 3%
Oxidation-reduction Potential	+/- 10 millivolts
Dissolved Oxygen	+/- 0.3 milligrams per liter

The stabilization criteria should hold for at least three consecutive readings at a recording interval of approximately 1 reading per minute.

All purge water is stored on site in DOT-approved, 55-gallon drums for disposal by a state-licensed contractor pending laboratory analysis for fuel hydrocarbons.

After purging, the water level in the well is allowed to recover to 80 percent of its original depth before a sample is collected. After water level recovery, a post-development groundwater sample is collected from each well with a new, disposable bailer, and decanted into the appropriate laboratory-supplied sample container(s). All samples are labeled in the field and transported in insulated containers cooled with blue ice to state-certified laboratories under proper chain of custody procedures.

All field and sampling equipment is decontaminated before, between, and after measurements or sampling by washing in a Liqui-Nox and tap water solution, rinsing with tap water, and rinsing with distilled water.

Equipment Decontamination and Decontamination Fluid Containerization Procedures: All drilling equipment is steam cleaned prior to arriving on-site to prevent the transfer of contamination from another site. Accordingly, all drilling equipment is steam cleaned between boreholes (if applicable) and at the end of drilling operations to prevent the transfer of contamination to another site. The drill augers, all soil sampling equipment, and groundwater sampling and/or measurement equipment is thoroughly cleaned between each sampling run with a Liqui-Nox® or Alconox® solution followed by a double rinsing with distilled water to prevent transferring contamination vertically.

All cleaning rinsate, wash water, and other fluids or solids produced during the drilling process are containerized on-site in 55-gallon steel drum(s), and/or are disposed of under proper hazardous waste manifest(s) to an appropriate recycling facility with the capacity to accept the type and concentration of contaminant(s).

Re: Voluntary Cleanup Program: Former Telewave Property, 1155 Terra Bella Avenue, Mountain View, CA; Case No. 2018-23s

Dear Mr. Corrigan:

The Department of Environmental Health (DEH) has reviewed the *Work Plan for Additional Site Assessment* (Work Plan) prepared by Weber, Hayes & Associates (WHA) and dated September 18, 2018 (submitted to GeoTracker October 22, 2018). The Work Plan proposes multiple tasks to conduct additional soil, soil vapor, and groundwater assessment. DEH approves the Work Plan with the following conditions and additional requirements.

TECHNICAL COMMENTS

- As stated in the work plan, DEH understands that the property owner has plans to redevelop the site for residential use; therefore, DEH will screen all site data and evaluate the extent of contamination using RWQCB residential ESLs. Currently, the vertical and lateral extent contamination in soil, soil vapor, and groundwater are not fully defined.

- The Work Plan proposes a phased or stepwise approach to conduct site assessment activities. If results of the proposed assessment to do not define the vertical and lateral extent of contamination in soil, soil vapor, and groundwater, additional assessment will be required.

- The work plan proposes four near-surface soil samples to evaluate persistent pesticides (ex., organochlorine pesticides [OCPs]) and arsenic. Due to the unpredictable nature of the distribution of OCPs, additional near-surface soil samples are required to evaluate the site. Please mirror the distribution of the four proposed near-surface soil sample locations for a total of eight samples evenly distributed across the site.

- The *Phase I/II Environmental Site Assessment* report for this site, dated November 15, 2016, notes that historical Telewave manufacturing operations included working of raw metals using acid etching, painting, assembly and shipping. Therefore, in addition to OCPs and arsenic, near-surface soil samples shall also be analyzed for CAM-17 metals.

Board of Supervisors: Cindy Chavez, Mike Wasserman, Dave Cortese, Ken Yeager, S. Joseph Simitian
County Executive: Jeffrey V. Smith

- Soil samples shall be collected and analyzed for volatile organic compounds (VOCs) at regular intervals from all boreholes advanced during installation of groundwater monitoring wells and soil vapor wells, according to the field methodologies described in Appendix C of the Work Plan.

- DEH notes that the proposed indoor air sample data can only be used to evaluate potential vapor intrusion to the current building and cannot be used to evaluate potential future buildings.

- DEH recognizes that demolition/removal of the on-site building will provide better access to conduct the proposed site assessment activities in some areas of the site; however, the City of Mountain View is the sole agency responsible for approving a demolition permit.

    - If a demolition permit is approved, care should be taken to not disturb subsurface soil or groundwater until the site is adequately assessed and the extent of contamination is better understood so that a site management plan can be prepared to mitigate potential risks associated with the contamination.

    - If a demolition permit is not obtained within 6 months of the date of this letter, a revised schedule or a revised work plan shall be submitted proposing alternate assessment methods to obtain the necessary site assessment data. The revised schedule should have City of Mountain View concurrence if dependent upon a City permit.

- Please submit milestone progress reports for each completed phase of work until all proposed assessment activities are complete, then submit one comprehensive site assessment report and conceptual site model. In the milestone progress reports, please include any recommendations to modify the remaining scope of work, as appropriate.

- Please note, DEH does not review or provide feedback for the health and safety plan (HASP) included in Appendix B of the Work Plan. HASPs are outside the scope of DEH oversight and are the responsibility of each company to prepare and implement for their workers, as required.

TECHNICAL REPORT REQUEST

Please submit the following technical reports to the DEH (attention: Mr. Travis Flora) via GeoTracker by the following dates:

Milestone Progress Reports – Due within 30 days of completion of each phase, but no later than April 26, 2019

Revised Schedule or Revised Work Plan (if demolition permit is not received by April 26, 2019) – Due by May 31, 2019

Site Assessment Report and Conceptual Site Model – Due within 60 days of completion of all site assessment activities, but no later than June 28, 2019

Technical reports are requested pursuant to our authority under Section 101480 of the California Health and Safety Code. Each report shall include conclusions and recommendations for the next phases of work required to protect water resources, human health and safety, and the environment at the site. We require that all work be performed in a prompt and timely manner. Revisions to the schedule shall be requested at least two (2) weeks prior to the due date in writing with appropriate justification for the anticipated delays and a proposed revised schedule.

The California Business and Professions Code (Sections 6735, 7835, and 7835.1) require that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments must be performed under the direction of an appropriately registered or certified professional.

PERJURY STATEMENT

All proposals and reports submitted to DEH must be accompanied by a cover letter from the responsible party which states, at a minimum, the following:

> "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached proposal or report is true and correct to the best of my knowledge."

This letter must be signed by an officer or legally authorized representative of your company.

If you have any questions, please feel free to contact me at (408) 918-3486 or by email.

Sincerely,

Digitally signed

Dear Mr. Shippen and Llc:

Subject: Fuel Leak Site Case Closure - Shippen Property, 1175 Terra Bella, Mountain View, CA; Case No. 14-476; SCVWDID # 06S2W15M03f.

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, the Santa Clara Valley Water District is required to use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Residual petroleum hydrocarbons exist in soil and groundwater. However the levels appeared to have attenuated below regulatory concern.

If you have any questions, please call Michelle Martin at (408) 265-2607, extension 2768. Thank you.

Sincerely,

Dear Mr. Shippen and Llc:

Subject: Fuel Leak Site Case Closure - Shippen Property, 1175 Terra Bella, Mountain View, CA; Case No. 14-476; SCVWDID # 06S2W15M03f.

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25299.37 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.77 of the Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code.

Please contact our office if you have any questions regarding this matter.

Sincerely,

CASE CLOSURE SUMMARY
LEAKING UNDERGROUND FUEL STORAGE TANK PROGRAM

I. AGENCY INFORMATION

Date: July 12, 2001

Agency Name: Santa Clara Valley Water District	Address: 5750 Almaden Expressway
City/State/Zip: San Jose, CA 95118	Phone: (408) 265-2600
Responsible Staff person: Ms. Michelle Martin	Title: Assistant Engineer II

II. Case Information:

Site Facility Name: Shippen Property		
Site Facility Address: 1175, Terra Bella Avenue, Mountain View 94043		
RB LUSTIS Case No. ----	Local Case No.: 06S2W15M03f	LOP Case No.: 14-476
URF Filing Date: 9/23/1998	SWEEPS No.: -----	APN: 153-16-011
Responsible Parties	Addresses	Phone Numbers
Mr. Ben Shippen Ben Shippen Family Lmtd	270, South Main Street, Alpine UT 84004	(801) 756 5263
Bjs Vi Llc	984, Sunburst Lane, Alpine UT 84004	(801) 756 5263

Tank I.D. No.	Size in Gallons	Contents	Closed In Place/Removed	Date
1	500	Gasoline	Removed	August 13, 1998
Piping			Unknown	Unknown

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Numerous holes were observed on the 500-gallon gasoline tank during the tank removal.		
Site characterization complete? Yes	Date Approved by Oversight Agency: 7/12/01	
Monitoring wells installed? No	Number: -----	Proper screened interval? -----
Highest GW Depth Below Ground Surface:4.61 feet*	Lowest Depth:15.7 feet*	Flow Direction: North*
Most Sensitive Current Use: Potential drinking water supply		

* The information is based on the adjacent site. (Texaco 975, Shoreline Blvd, Mountain View, CA 94043)

Summary of Production Wells in Vicinity: A well search indicates that there are twenty abandoned water producing wells (06S02W15M001-M006,M008,M010-11,M013-M017,M019-M020, 06S02W15L003,L005,L008,06S02W15N003), four active water producing wells (06S02W15M012,06S02W15M009,06S02W15L007, 6S02W15N002) and two cathodic wells (06S02W15M027,06S02W15M026) within the ¼ miles radius of the site. Among the twenty abandoned wells, Geographical Information System (GIS) shows well (06S02W15M016) is located on the parcel. After the investigation, the well is located off site. Based upon the levels of contamination at the site, they are not likely to be affected by the reported release.

Are drinking water wells affected? No	Aquifer Name: Santa Clara Valley Water Basin
Is surface water affected? No	Nearest SW Name: Stevens Creek, ~2260 feet East from the site.
Off-Site Beneficial Use Impacts (Addresses/Locations): None	
Reports on file? Yes	Where are reports filed? Santa Clara Valley Water District

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal 2/Destination)	Date
Tank	1-steel	Removed with unknown destination	August 13, 1998

Description of Interim Remediation Activities: Tank excavation and soil excavation

NA= Not analyzed

1 = Soil sample (S-FILL) was collected from the former 500-gallons UST at the depth of 8 feet, 1998
2 = Soil sample (S-TP) was collected from the test pit at the depth of 2 feet, 1998
3 = Soil samples (DP1 to DP4) were collected around the former UST at the depth of 5 feet, 2000
4 = Groundwater sample (W-TPN-11) was collected from the excavation pit, 1998
5 = Groundwater sample (GP4) was collected around the former UST at the depth of 7 feet, 2000
6 = Groundwater sample (DP3) was collected around the former UST at the depth of 8 feet, 2000
7 = Groundwater sample (DP1) was collected around the former UST at the depth of 7 feet using EPA Method 8260, 2000
* = Di-Isopropyl Ether (DIPE), Ethyl tert-Butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME), tert-Butanol (TBA), 1,2-dibromoethane (EDA) were under the detection limit.

IV. CLOSURE

Does complete corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan/ Yes		
Does corrective action protect public health for current land Use? Santa Clara Valley Water District staff does not make specific determinations concerning public heath risk. However, it does not appear that the release would present a risk to human health.		
Site Management Requirements: None		
Should corrective action be reviewed if land use changes? No		
Monitoring Wells Decommissioned: -----	Number Decommissioned: -----	Number Retained: -----
List Enforcement Actions Taken: None		
List Enforcement Actions Rescinded: None		

V. ADDITIONAL COMMENTS, DATA, ETC.

Considerations and/or Variances:

1998:
A 500-gallon gasoline underground storage was removed from the site in August. During the removal of the tank, numerous holes were noticed in the tank. Soil samples were collected in the excavation tank pit and petroleum hydrocarbon odor was noticed on the soil samples collected. The maximum contamination in soil samples indicated 1900 parts per million (ppm) Total Petroleum Hydrocarbon as gasoline (TPH-g), 1.7 ppm Benzene, 13 ppm Toluene, 22 ppm Ethylbenzene, 120 ppm Xylenes with no detection of Methyl-Tert-Butyl-Ether. In September, one groundwater sample was collected from the excavation tank pit. The maximum contamination detected 42,000 parts per billion (ppb) TPH-g, 1400 ppb Benzene, 1900 ppb Toluene, 1300 ppb Ethylbenzene, 6600 ppb Xylenes with no detection of MTBE. Approximately 20 cubic yards of impacted soil was excavated from the tank pit.

2000:
In November, one boring (DP-3) was installed at the depth of 16 feet in the off-site area. Groundwater was encountered approximately 16 feet below ground surface (bgs). Soil and grab groundwater samples were collected. Additional three borings (DP-1, DP-2 and DP-4) were installed on the site. Each boring was drilled to depth approximately 11 feet bgs. Groundwater was encountered at the depth of 10 feet bgs. The maximum contamination detected in soil samples 0.011 ppm Toluene, 0.005 ppm Ethylbenzene, 0.018 ppm Xylenes with no detection of TPH-g, Benzene and MTBE. For the groundwater samples, the maximum contamination detected was 2600 ppb TPH-g, 1.8 ppb Benzene, 4.4 ppb Toluene, 26 ppb Ethylbenzene, 70 ppb Xylenes and 12 ppb MTBE.

Conclusions:
Based on the recent soil and groundwater sampling results, residual petroleum hydrocarbon contamination exists in soil (0.011ppm Toluene, 0.005 ppm Ethylbenzene, 0.018 ppm Xylenes), and in groundwater (2600ppb TPH-g, 1.8 ppb Benzene, 4.4 ppb Toluene, 26 ppb Ethylbenzene, 70 ppb Xylenes, 12 ppb MTBE).

Natural attenuation of this residual contamination is expected to continue and the plume is localized near the former tank pit. Therefore, the Santa Clara Valley Water District staff concludes that a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at the site and that Regional Water Quality Control Board objectives have not been compromised. The investigation was performed in accordance with state and local guidelines. District staff recommends closure for this case.

Prepared by: Ms. Michelle Martin	Title: Assistant Engineer
Signature: Michelle Martin	Date: 7/12/01
Approved by: James S. Crowley, P.E.	Title: Engineering Unit Manager
Signature: James S Crowley	Date: 7/12/01

This closure approval is based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions.

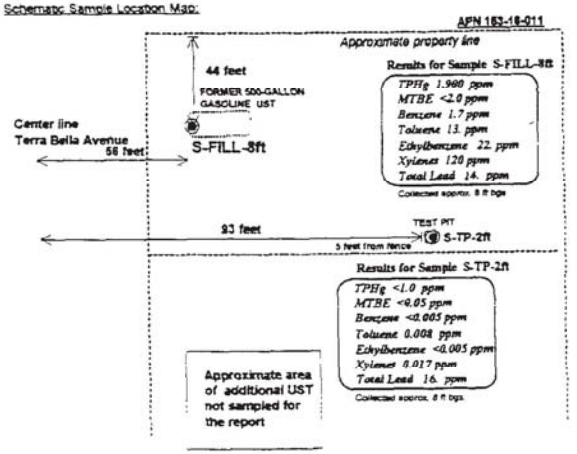
Underground Gasoline Storage Tank Removal Soil Sampling Report

Lic. RG # 6253



Client:	Site:	Report Date:	August 22, 1998
Fuller Excavation/Demolition	Shippen Property	Report#:	1-98Q3.503
3283 Luyund Drive	1175 Terra Bella Avenue	Date Sampled:	August 13, 1998
Rancho Cordova, CA 95742	Mountain View, CA 94042		

Dugan Associates specializes in the collection of subsurface environmental samples, and the preparation of certified sampling reports. This report summarizes sampling performed by Dugan Associates for soil profiling purposes BENEATH A FORMER 500-GALLON GASOLINE UST. Supporting documentation provided by an independent State-certified laboratory are attached. This sampling report, the chain of custody record, and laboratory data sheets comprise the formal documentation of subsurface sampling conducted during this phase of work at the site.

Sample Collection Method: A brass sleeve was driven directly into soil obtained approximately one foot beneath the former UST within native materials. The sample sleeve was retrieved, ends were covered with plastic end-caps, and sealed. The sample was placed in iced storage for transportation to the laboratory for analyses requested by the City of Mountain View Fire Department inspector [Chris Steck, R.E.A., Hazardous Materials Specialist]

Results: Results of laboratory analyses are presented in attached data sheets, and in the figure below. Numerous holes were observed in the tank. Product odor was noted within native soil under the former tank.

Project / Client: Trace Partners LLC	Project # : 21115
Site Location: 1185 Terra Bella	Date: 4-15-21
Field tasks: Soil/SV Sampling 1185	Weather: Sunny
Personnel / Company On-Site: RN, OA, HH (WHA) ; Sergio ; Trinity (Heavy	
Attachments: Site Map____ Data Sheets____ Geologic Logs____ Photos____ COC____ Chargeable Materials____	

Time:	Notes:
0800	- Arrived onsite. Site Safety meeting with full squad. Talking about hazards onsite, COVID-19 safety, drill rig safety, and today's scope of work.
0830	- Preparing sampling equipment and geologic logs.
0845	- Starting drilling at B-1/SV-1
0945	- Constructing SV-1 probe at 6' bgs. Clay (thick) from 0-8' (end of borehole). GW is around @ 10' bgs (based on neighboring site). Extending sand pack area from standard 4.5-5.5' to 4.5-6.5' to increase likelyhood of soil vapor yielding.
	↳ Taking a back-up soil sample at 5.0' bgs and putting on hold to run for VOCs (Full List) as a back-up for soil vapor samples (if they do not yield).
1000	- Starting B-4/SV-4.
1033	- Starting B-5/SV-5.
1057	- Starting B-6/SV-6. Dry / low plasticity (due to dryness) clay from 0 to ~ 4' bgs. Moving sampling to this dry area (more spaces between grains (potentially better flow). Constructing soil vapor well with 1' of sand (4.5' to 3.5' bgs) and 1' dry bentonite (3.5-2.5'). and saturated bentonite at bottom (4.5' to 5.0') and ~~dry slurry bentonite~~ slurry from 5.0-6.5' bgs.
1138	- Starting B-3/SV-3
1200	- Starting B-2/SV-2 Probe set at 1220.
1230	- Finishing up sampling and preparing samples for shipping
1245	- Calling Jered (Project Manager) with update. Getting no flow on SV samples.
1305	- Packing up equipment
1350	- Got ice for samples. headed to FedEx

Job Name: 1185 Terra Bella Phase II	Date: 4/15/21
Site Location: 1185 Terra Bella Mtn. View	Study #: 2T115
Field Tasks: [ ] Drilling [X] Sampling [ ] Other (see below): Soil Vapor Sampling	Weather Conditions: Sunny - No clouds
Personnel / Company On-Site: Harrison Hucks (WHA), Oliver Abbitt (WHA), Sergio (CWUC)	

TIME:

0730	Arrive on-site and meet w/ Coast Side Utility Locators (Sergio)
	- Goal: Provide utility clearance at 6 locations for borings
	+ Drill 6 soil vapor probes, construct temp. vapor probes, and attempt
	to collect vapor samples
	+ Collect shallow soil data for Phase II ESA investigation.
	Complete sample lay-out → Sergio begins utility clearance.
	- Sergio will provide passive sweep @ former UST locations.
0830	Trinity Drilling (Dave + Henry) arrives on-site
	- utility clearance complete.
	- Discuss site Health and Safety and goal of mobilization w/ drillers
	- Drillers get setup at B-1/SV-1.
0845	Sergio departs
	Ryan Nyberg (WHA) on-site to complete geologic logging. See attached
	logging notes for additional detail.
	Trinity Drilling breaks boring barrel at B-1 → re-tool and re-drill.
	- Due to tight grain (clay) + moisture conditions (see logs) → soil
	vapor samples will be challenging to achieve from 0-8' bgs. Discuss w/ P.M. Jared Cheney.
	- Modify probe construction to capture (potentially) larger area in formation
	• Specifically: 0-3.5' = hydrated bentonite
	• 3.5'-4.5' = Dry bentonite
	• 4.5'-6.5' = Sand
	• Probe tip set @ 6'
	- B-1/SV-1 set at 0955. Probes will be allowed to equilibrate for
	2 hours prior to purge + sample.

Job Name: 1185 Terra Bella Phase II	Date: 4/15/21
Site Location: 1185 Terra Bella Ave, Mtn. View	Study #: 2T115
Field Tasks: [ ] Drilling [X] Sampling [ ] Other (see below): Soil Vapor Sampling	Weather Conditions: Sunny - Warm
Personnel / Company On-Site: Harrison Hucks, Ryan Nyberg, other Abbitt (WHA), Trinity Drilling	

TIME:

	Probe Name/#	Set time
	SV-1	0955
	SV-2	1220
	SV-3	1155
	SV-4	1025
	SV-5	1050
	SV-6	1135
	Ryan continues drilling at SV-2 to SV-6 following same probe construction details. Assist w/soil sample collection until probes equilibrated.	
	Moisture change + lithology change @ B-6. Adjust probe construction:	
	- 0'-3' = Hydrated bentonite	
	- 3'-3.5' = Dry Bentonite	
	- 3.5'-4.5' = Sand	
1155	Mobilize. to B-1/SV-1 and prepare to complete soil vapor sampling	
	- See attached field sheets for additional detail.	
	- No flow conditions @ SV-1 → No sample collected.	
1225	Mob. to SV-4 and prepare to purge	
	- No flow conditions @ SV-4 → No sample collected.	
1310	Trinity Drilling completes installation of packer equipment & demobs.	
	- Ryan Nyberg demobs. to drop soil samples w/lab courier under chain of custody.

OFFICE: 844 275 2208

INVOICE AGREEMENT

INVOICE #_____ DATE _____

This agreement is made between Coast Wide Utility Locators, LLC hereinafter referred to as C.W.U.L. and the undersigned Client.

REQUESTOR NAME:	JOB NAME:
Harrison Hucks	
Company: Webcor, Hayes	Job Address: 185 Terra Bella Ave MT View
Billing Address: on file	Contact Person: Same
Phone: on file	Phone: Same
Service & Scope of Work: (6) locations	PO/ Project: 3T115

C.W.U.L. agrees to perform the following scope of work for the above mentioned Client. In consideration of said scope of work the Client agrees to pay C.W.U.L. the amount of $ 175 / hour. Note that there is a minimum charge of 2 hours, and is incurred upon office departure to office return. In any event it is determined C.W.U.L. is liable for its actions, the liability shall be limited to the amount of its fee. Only the located and marked utilities are guaranteed. Clients should never assume that 100% of said utilities have been detected and marked. Some utilities are undetectable. For all excavations in accordance to California State Law, call USA 1.800.227.2600. Payment is due upon receipt unless other arrangements have been made. Initials:_____

Date:	Start:	End:	Total Hrs:	Charges:

Geologic Symbols and Terms

	Major Divisions	Symbols	Descriptions
Coarse Grained Soils	Gravels (More than 1/2 of coarse fraction > no. 4 sieve size)	GW	Well Graded Gravels, little or no fines
		GP	Poorly Graded Gravels, little or no fines
		GM	Silty Gravels, gravel-silt mixtures
		GC	Clayey Gravels, gravel-clay mixtures
	Sands (More than 1/2 of coarse fraction < no. 4 sieve size)	SW	Well Graded Sand, little to no fines
		SP	Poorly Graded Sand
		SM	Silty Sand, sand-silt mixtures
		SC	Clayey Sand, sand-clay mixtures
Fine Grained Soils	Silts and Clays Liquid Limit < 50%	ML	Silt or Very Fine Sands, rock flour, with slight plasticity
		CL	Inorganic Clay with high plasticity, lean clay
	Silts and Clays Liquid Limit > 50%	MH	Inorganic Sandy Clay or Silt, elastic silts
		CH	Inorganic Sandy Clay or Silt, with high plasticity, fat clays

Symbols and Terms

- First encountered groundwater
- Stabilized groundwater
- Sample interval
- Soil sample sent to laboratory for targeted analysis
- Water sample sent to laboratory for targeted analysis

Trace = < 5%
Few = 5 - 10%
Little = 15 - 20%
Some = 30 - 45%
Dominantly = > 50%

SOIL DENSITY/CONSISTENCY			
SANDS & GRAVELS	BLOWS/FT.	SILTS & CLAYS	BLOWS/FT.
VERY LOOSE	0 - 4	VERY SOFT	0 - 2
LOOSE	4 - 10	SOFT	2 - 4
MED. DENSE	10 - 30	FIRM	4 - 8
DENSE	30 - 50	STIFF	8 - 16
VERY DENSE	> 50	VERY STIFF	16 - 32
		HARD	> 32

Blow count is the number of blows required to drive a 2-inch diameter California Modified Split-Spoon Sampler the last 12 inches of an 18 inch sample interval by a 140-pound hammer free-falling 30 inches.

Well Construction Details:

- Bentonite Seal
- Cement Seal
- Filter Pack
- Screened Interval

ags = above ground surface bgs = below ground surface
PID = Photo-Ionization Detector ppmv = parts per million by volume

Standard Field Methodology for Hydraulic Driven Probes
Using Macro-Core®, Large Bore® or Dual Tube® Hydraulic Driven Probes

Direct push exploratory borings are "drilled" Geo-Probe rig, which hydraulically drives and vibrates steel probes into the soil. No drill cuttings are produced. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. After drilling, all exploratory boreholes are grouted according to county regulations.

The soil cores are logged by an experienced geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. Relatively undisturbed soil samples are obtained for both lithologic logging and laboratory analysis. A portion of individual soil cores are stored in a sealed plastic bags for field screening of hydrocarbons and/or volatile organic compounds by an Organic Vapor Analyzer (Photoionization Detector, PID). Vapor readings in parts per million (ppm) are recorded on the boring logs. The PID is also used during drilling for monitoring the work area for site safety.

All drilling equipment is steam cleaned prior to arriving on-site to prevent possible transfer of contamination from another site. The sampling probe and all other soil sampling equipment are thoroughly cleaned between each sampling event by washing in a Liqui-Nox or Alconox solution followed by a double rinsing with distilled water to prevent the transfer of contamination.

Samples Targeted for Laboratory Analysis: Soil samples targeted for laboratory analysis are immediately protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, and immediately stored in an insulated container cooled with blue ice. A portion of the

soil is placed in a ZipLock Bag and the soil gas is measured using the PID. Groundwater samples are collected after temporary casing is placed in the hole and at least one borehole volume are purged. Relatively representative groundwater samples are collected with individual disposable acrylic bailers, peristaltic pump and dedicated tubing, or ball and check valve with dedicated tubing and dispensed directly into containers specifically prepared for the analyses. Once collected, groundwater samples are immediately placed in ice chests cooled with blue ice. Soil and groundwater samples are then transported to a State-certified laboratory under appropriate chain-of-custody documents.

Field Methodology for Active Soil Gas Sampling

Active soil gas / soil vapor (we use the terms interchangeably) sampling is conducted in general accordance with the procedures outlined in the CalEPA's/DTSC/LARWQCB/SFRWQCB *Advisory – Active Soil Gas Investigations* (July 2015)[1], and the DTSC/CalEPA's final *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (October 2011). We use the terms soil gas and soil vapor interchangeably. The field methodology for active soil gas/vapor sampling entails:

- Constructing Soil Gas Sample Points/Probes
- Setting up the sampling and leak testing equipment; and
- Soil Vapor Sampling

Constructing & Decommissioning Soil Vapor Sample Points/Probes

Soil vapor sample points can be either semi-permanent or temporary. A semi-permanent sample probe is constructed with a secure surface completion consisting of bolt-down flush-mounted well vault so it can be reused. A field geologist or engineer logs the soils encountered using the Unified Soil Classification System (USCS), unless the site is already well characterized geologically.

Shallow soil vapor probe installation via GeoProbe drill rig

Shallow Soil Vapor Probe: The soil vapor/gas probe is installed to the target sampling depth via a Geo-Probe drill rig, which hydraulically drives and vibrates steel probes into the soil. The soil is cored out using a 4-foot long nickel-plated sampling barrel fitted with a clear acetate liner. During coring operations, the sample barrel remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. Alternatively, the soil gas probe borehole can be created via a hollow stem auger or hand auger. Shallow soil gas / soil vapor sample depths will be no less than 5 feet deep (if possible) in order to avoid breakthrough of ambient air from the surface. Shallow and deeper soil gas points are constructed in a similar manner. Once the probe hole is cored to the desired sample depth, a length of 3/16–inch inner diameter Teflon or Nylaflo tubing (Teflon is preferred, especially if testing for naphthalene) having a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted through a

[1]: https://www.dtsc.ca.gov/SiteCleanup/upload/VI_ActiveSoilGasAdvisory_FINAL.pdf

1-inch diameter tremie-pipe that is extended down to 6-inches above the base of the borehole. The sample tubing end with the ceramic filter stone is also placed approximately 6-inches above the base of the borehole. A minimum of a one-foot sand pack is emplaced at the base of the borehole (the grain size of the sand pack is larger than the grain size of the adjacent formation), followed by at least one foot of dry granular bentonite. The probe tip is emplaced midway within the sand pack. While the sand pack and granular bentonite is slowly added to the borehole, the tremie-pipe is correspondingly pulled out of the boring (with the bottom of the tremie pipe periodically "tapping" the top surface of sand pack and granular bentonite to ensure that no bridging occurs). The remainder of the borehole is sealed to the ground surface with hydrated bentonite gel for temporary points or neat cement mixed with 1% – 5% bentonite, which are both pre-mixed at the ground surface; this ensures a sound surface seal and/or seal between multi-depth nested probe sample intervals.

Decommissioning Shallow Soil Vapor Points: Following sample collection the vapor probe is properly decommissioned by one of the following regulatory approved techniques:

- The sample tubing is completely removed from the ground surface (if possible) allowing the bentonite gel slurry to flow into the small vertical void thereby sealing the borehole. Subsequently, approximately 6-inches of bentonite slurry is removed below the ground surface and the surface is patched to match the existing grade.
- The sample tubing is properly destroyed by injecting neat cement grout into the tubing via a syringe. The volume of grout injected into the tubing is monitored to ensure that the entire tubing is completely sealed. Subsequently, the tubing is cut off approximately 6-inches below the ground surface and the surface is patched to match the existing grade.
- The vapor probe is properly destroyed by over-drilling the sample tubing and annular seal material. Once the material has been removed, the subsequent borehole is filled with neat cement grout to within about 6-inches of the ground surface and the surface is patched to match the existing grade.

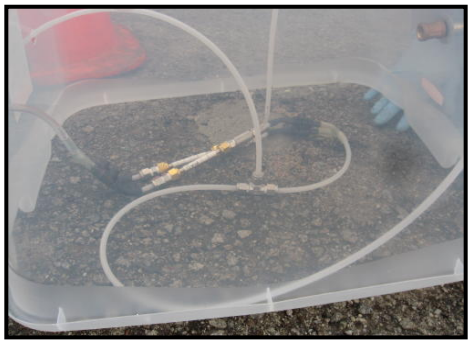
Sub-Slab Soil Vapor Probe: The emplacement of the sub-slab soil vapor sampling probe is conducted by coring a 1 to 1-1/4-inch diameter hole via an electric hand rotary hammer drill through the slab foundation. The sub-slab borehole is advanced approximately 3 to 4-inches below the base of the slab and into the sub-slab material. Once the probe hole is cored to the desired sample depth a length of 3/16–inch inner diameter Teflon or Nylaflo or inert, cleaned metal tubing with a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted into the borehole. The probe tip is emplaced 1 to 2-inches above the base of the bore hole. A minimum of 2 to 4-inches of sand pack is emplaced at the base of the borehole followed by at least 1 to 2-inches of dry granular bentonite to above the base of the

slab. The probe tip is emplaced midway within the sand pack. The remainder of the borehole is sealed to the ground surface with hydrated bentonite for temporary points or hydrated bentonite followed by neat cement for permanent points to ensure a sound surface seal. Permanent points have a flush-mount inert metal fitting for providing a good seal when connecting the above-ground sample tubing and for plugging between sampling events. Following sample collection from a temporary probe the sample tubing is removed and the subsequent void is sealed with hydrated bentonite and the surface is patched with concrete.

Purging

Prior to soil gas sample collection, a purge volume or "dead space volume" will be calculated in order to purge ambient or stagnant air from the sampling system to ensure that collected samples are representative.

Per the procedures outlined in the CalEPA's Advisory, a default of three purge volumes will be extracted prior to sampling. The purge volume consists of approximately three system volumes (i.e. tubing and annular space) of soil gas, while capturing the purge effluent. One system volume is calculated by summing the inner diameter (id) tubing volume (i.e., id area times the length of tubing) and the annular pore space volume (i.e., area of the borehole times the length of sand pack and granular bentonite surrounding the ceramic filter stone tip times an estimated sand-pack pore space volume of 33.8%). The purge rate will be conducted at the same rate soil gas is sampled (approximately 200-mL/min flow). We note that Cal-EPA guidance recommends purging or sampling at rates between 100 to 200-mL/min for soil vapor points at all depths, including sub-slab vapor points, to limit air stripping and to prevent ambient air form diluting the sample. After the specific pre-determined purge volume is removed, a soil vapor/gas sample is collected for laboratory analyses for the site-specific target compounds as discussed below.



Sample Collection

Before purging the appropriate "dead space volume" from the soil vapor/gas probe, the probe seal is allowed to cure and the subsurface is allowed to equilibrate for the appropriate amount of time per the procedures outlined in the CalEPA's Advisory. We note that an equilibration time of 2-hours is required for soil vapor/gas points installed via a direct push drill rig and 48-hours for soil vapor/gas points installed via a hollow stem auger drill rig, hand-auger, or an electric hand rotary hammer drill. Once the appropriate "dead space volume" has been purged, the sample tubing will be attached to a laboratory prepared soil vapor manifold and 1 or 6-liter Summa canister or sorbent sampling media depending on required laboratory analysis. We note that the choice between using a 1-L or 6-L canister is typically dependent on the purpose of the site investigation. However, for soil vapor/gas samples collected at a depth

less than 5-feet, including sub-slab vapor points, a 1-L canister should be used to avoid excessive air removal and to prevent ambient air from entering the sub-surface and sample. When sampling for ambient indoor air, a 6-L canister is nearly always required because of the extremely low detection limits required to meet Indoor Air ESLs. For soil vapor collection, a 1-L canister may be all that is necessary if the site is known to contain high concentrations of contaminants of interest that make achieving low detection limits a secondary concern. In those cases, only a small volume of the 1-L collected is necessary for analysis of both the TO-15 and the TO-3 compounds. However, if a site does not have historical data indicating that it is significantly contaminated, or if multiple analytical runs become necessary to achieve reporting limit/CHHSL/ESL goals, it becomes critical to have a larger initial volume of collected sample. A 6-L volume allows the laboratory to provide the lowest possible detection for the compounds of interest for full list TO-15 while providing enough volume for the additional analysis of individual compounds that may require dilution to bring them within the instrument calibration range. The 6-L volume will provide enough residual sample to analyze for additional contaminants (e.g., EPA Method TO-3) and/or fixed Gases (ASTM D1946) including Helium, which may be used as a tracer or leak check compound in the investigation. A consultation with the selected testing laboratory will be conducted for each investigation to ensure that appropriate sample volumes are obtained.

Sample collection with Summa canisters

Sample collection with sorbent tube

The following sample collection procedures are followed for each sample collection media:

- The Summa canisters will be supplied by the analytical laboratory with a vacuum of approximately 30-inches of mercury and outfitted with a 200-mL/min flow control valve. The tubing will be connected to the soil vapor manifold and Summa canister using airtight stainless-steel or brass fittings. The flow control valve will then be opened slowly to draw the vapor sample from the target depth.
- Laboratory sorbent media and canister with a vacuum of approximately 30-inches of mercury and outfitted with a 200- mL/min flow control valve or sampling pump (10 to 200 mL/min) will be supplied by the analytical laboratory. The tubing will be connected to the sorbent media sample tube, upstream of the vacuum canister/sample pump/syringe using airtight stainless-steel or brass fittings. The sample

vacuum canister/ pump/syringe will then be activated to draw approximately 1 to 3-L of sample volume for TO-17 analysis from the target depth at a flow rate of 200- mL/min or less per sorbent media sample tube manufacturer and/or laboratory guidelines.

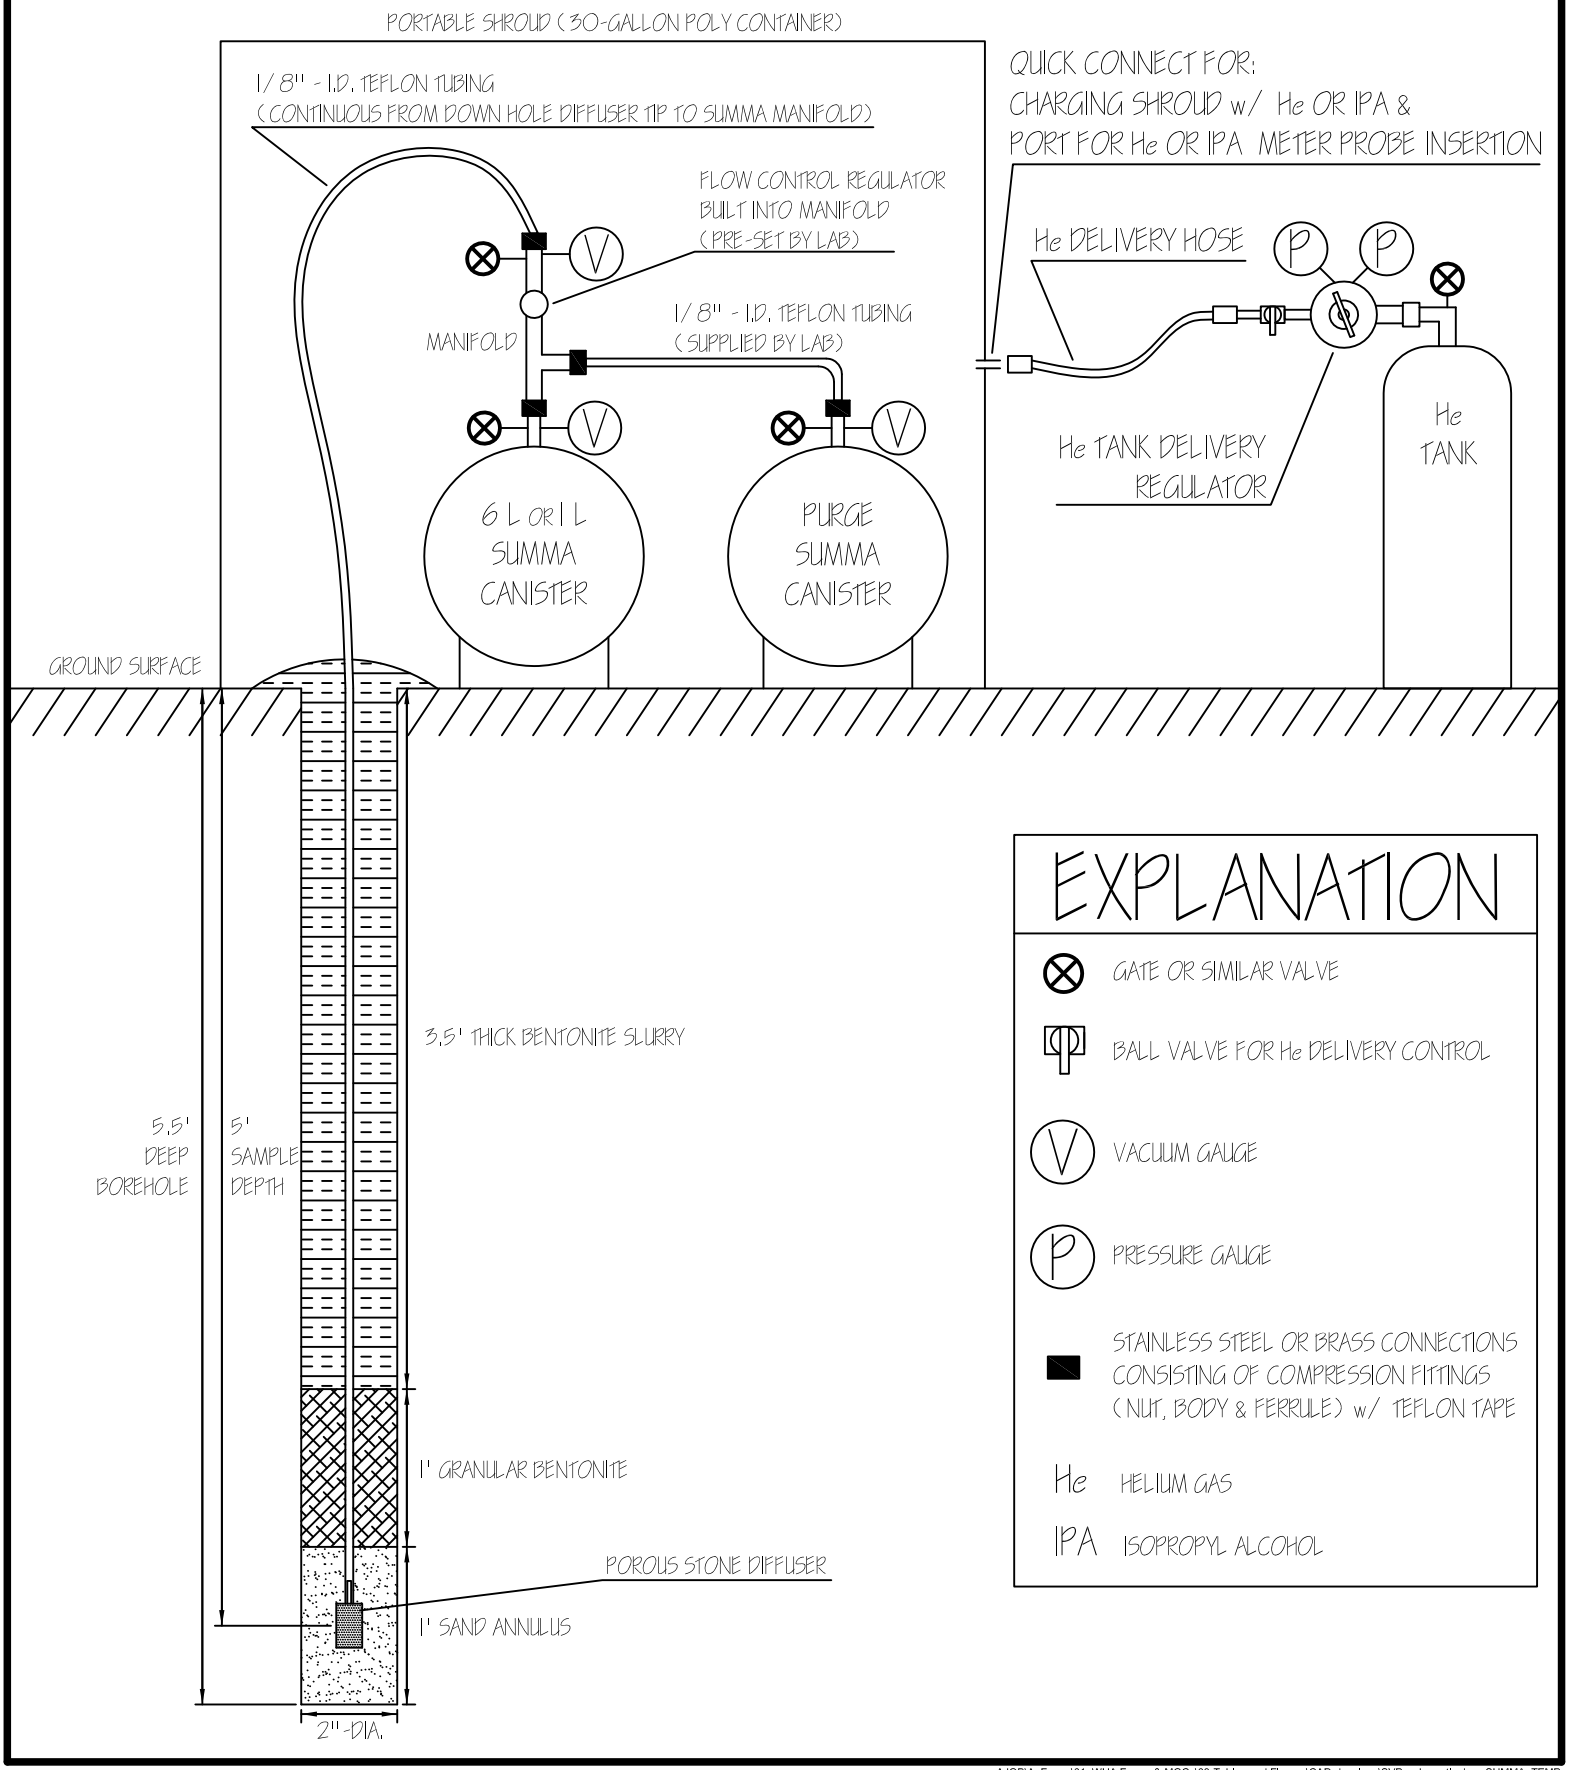
Schematic diagrams of sample configurations for the different sampling media (i.e., Summa canister and sorbent media) and probe construction (i.e., shallow soil and sub-slab) are included as attachments 1, 2, and 3 of this field methodology.

Leak Detection Monitoring

Monitoring leak check compound within shroud during sample collection

Leak detection monitoring will be conducted during soil gas sampling by applying a tracer compound (i.e., isopropyl alcohol [isopropanol, IPA] or helium) to the sample system connections and bentonite seal. Specifically, a shroud will be used to encapsulate the entire system (i.e., the sample canister and surface bentonite seal) so as to trap the applied tracer compound. The leak detection monitoring configuration is graphically depicted on attachments 1, 2, and 3 of this field methodology. The concentration of the leak check compound within the shroud will be monitored periodically throughout the sample collection period with a PID calibrated to the specific tracer gas compound and these values will be recorded into the field notes. The tracer compound (i.e., IPA or helium) is maintained within the shroud at a concentration of approximately two (2) orders of magnitude higher than the detection limit of the field meter used throughout the duration of sample collection. The testing laboratory will screen for this compound in all analyzed air samples when IPA is used. If helium is used the laboratory can screen for this compound if collected in Summa canisters, or the sample effluent after passing through the sorbent media will be field screened for the presence of the helium.

Prior to purging and sample collection, a “shut-in test” is performed to check the above-ground sample system connections downstream from the top of the soil vapor/gas probe, including the laboratory provided sample manifold (“sample train”). The “shut-in test” is completed in the field by closing off all valves to the laboratory provided soil vapor manifold and the soil vapor/gas probe tubing, and subsequently opening the valve to the connected “purge” Summa canister to increase the vacuum in the sample train to a minimum of 30-inches of mercury, at which point the purge canister is closed. Then the vacuum gauge on the sample train is observed for at least 1-minute to confirm it remains stable.



Low Flow Sampling Conditions

A low flow sampling condition is characterized as a condition where the sample probe cannot sustain a flow rate of 100-mL/min for more than three minutes while maintaining an applied vacuum of less than 100-inches of water (or 7.4-inches of mercury). The vacuum applied to the sample probe will be measured and monitored via a vacuum gauge installed between the sample probe and the sample collection flow regulator. If the vacuum measured within the sample probe exceeds 100-inches of water during dead space volume purging, then one of the following sample collection procedures will be employed:

- If the lithology observed during sample probe installation indicates potential for low permeability / low flow conditions a representative soil sample at the soil vapor sample depth will be collected and put on ice for possible laboratory analysis.
- If extreme low flow conditions are observed during purging, excessive time will be required to purge and collect a sample. We will contact the regulating agency to confirm collecting a purge volume approximating one dead space volume (i.e., volume of the sample tube plus the volume of the sand pack pore space and granular bentonite pore space surrounding the probe tip) will be evacuated prior to sample collection. Sample collection will proceed until the sample probe vacuum equals 100-inches of water. The sample system will then be closed off to allow the probe to relax and equilibrate. Over time the vacuum will eventually dissipate, the rate of which can be monitored via an in-line vacuum gauge installed as described above. Once the vacuum in the sample probe has dissipated, sampling will resume as described above. This process will be repeated until an adequate sample volume has been obtained for the required laboratory analysis.
- If during low flow sampling as stated above, the sample system when closed off to allow the probe to relax and equilibrate the probe vacuum does not reduce by 13.5 inches of water (1 inch of mercury) in 3-minutes, soil vapor sampling will cease and the previously collected soil sample will be submitted to the laboratory for potential analysis for site specific constituents.

Sample Storage and Transport

Once collected, the soil gas samples are then transported to a State-certified laboratory under appropriate chain-of-custody documentation. Sorbent media are wrapped in foil and placed in individual zip-lock type bags and immediately placed in a chilled cooler (chilled to 4 degrees Celsius) for storage and transport to the testing laboratory. Summa canisters are placed in laboratory provided cardboard boxes and stored at ambient temperature for transport to the testing laboratory.

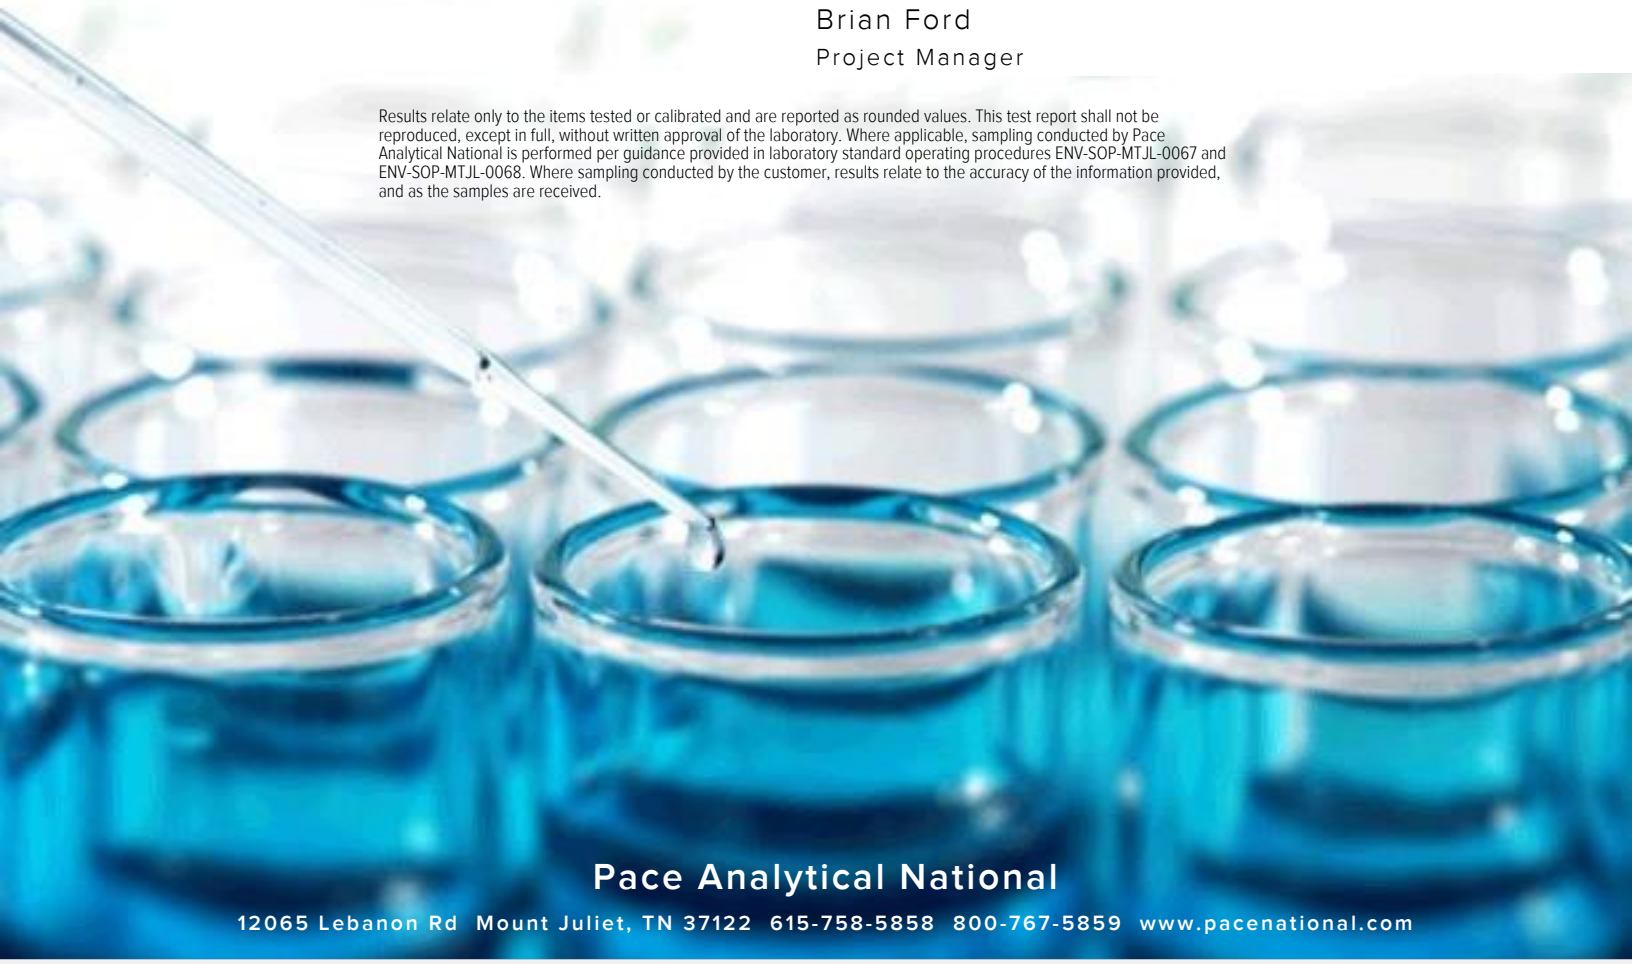
ANALYTICAL REPORT

April 28, 2021

Weber, Hayes & Associates - CA



Sample Delivery Group:	L1340301
Samples Received:	04/17/2021
Project Number:	2t115
Description:	Terra Bella ESA

Report To: Ryan Nyberg
120 Westgate Drive
Watsonville, CA 95076

Entire Report Reviewed By:

Brian Ford
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
P	RPD between the primary and confirmatory analysis exceeded 40%.

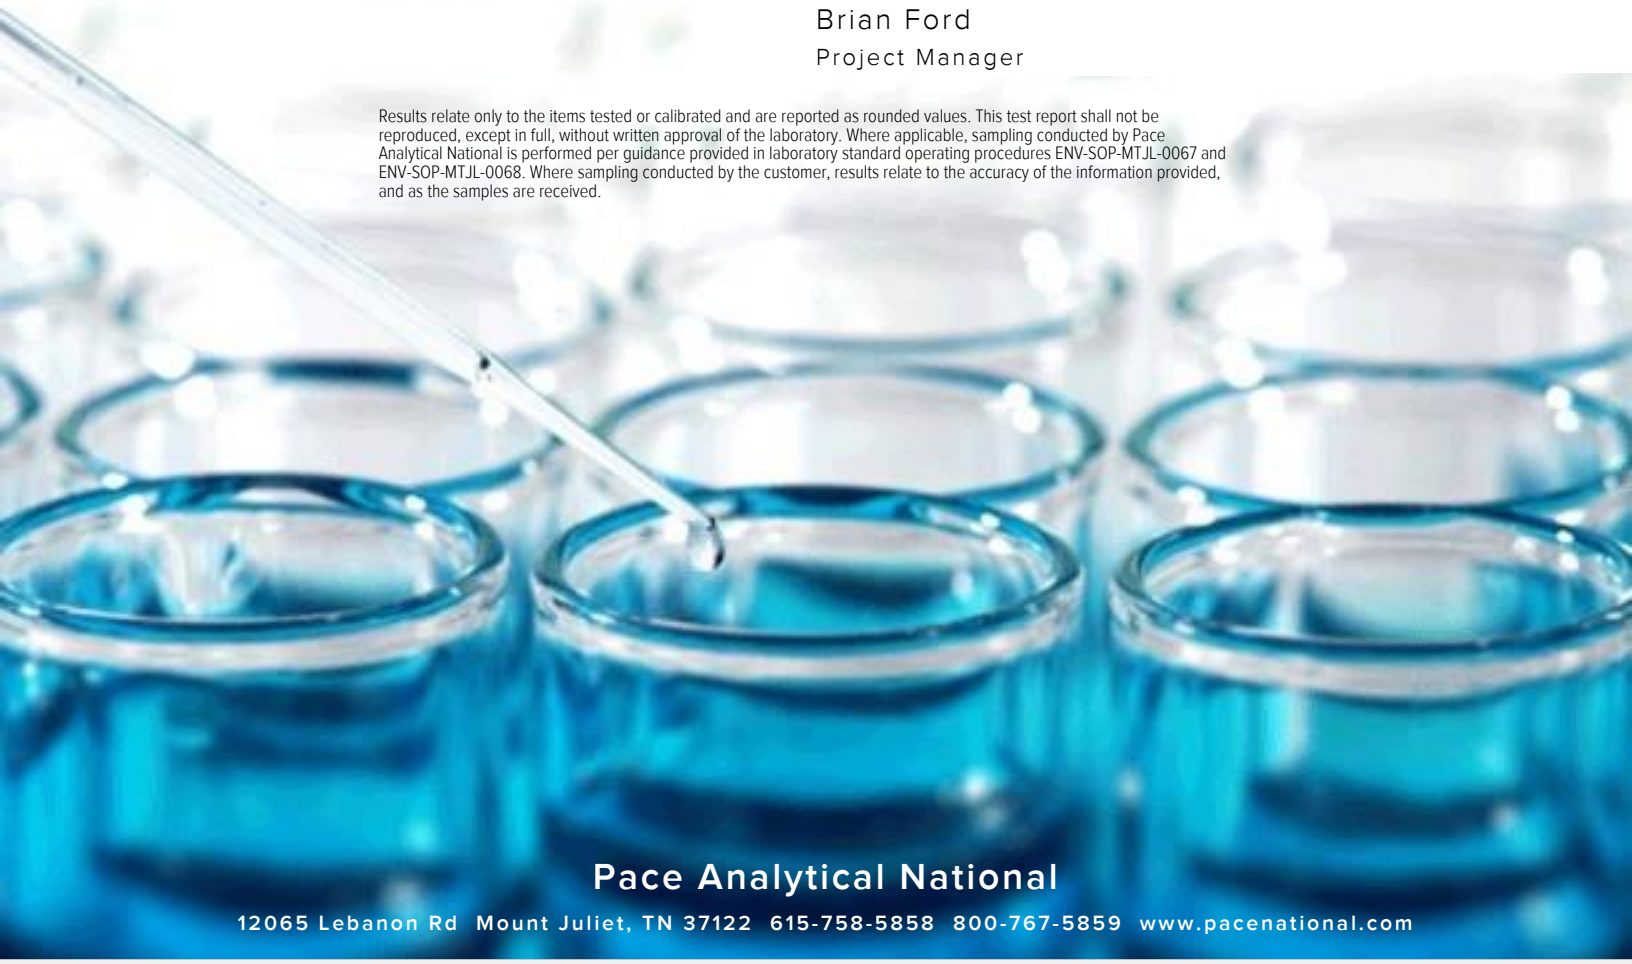
ANALYTICAL REPORT

May 03, 2021

Weber, Hayes & Associates - CA



Sample Delivery Group:	L1345524
Samples Received:	04/16/2021
Project Number:	2t115
Description:	Terra Bella ESA

Report To: Ryan Nyberg
120 Westgate Drive
Watsonville, CA 95076

Entire Report Reviewed By:

Brian Ford
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Brian Ford

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
	The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.
