CAUTION: External Email

Hello,

Attached please find the sample confirmation files for job 570-87328-1; Rohr Chula Vista-Parcel A/0127827-043

1. The container labels for the following sample did not match the information listed on the Chain-of-Custody (COC): NCB-021-B-050 (570-87328-19). The container labels list NCW-021-B-050, while the COC lists NCB-021-B-050 (collection date matches).

ACTION: Please provide clarification on the above sample ID.

Please feel free to contact me if you have any questions.

Thank you.

List Number: 1
Creator: Cortez Diaz, Antonio

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	IDs on containers do not match the COC. Logged in per COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Haley & Aldrich, Inc.
Project/Site: Rohr Chula Vista - Parcel A

Job ID: 570-87413-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
me	LCS Recovery is within Marginal Exdeedance (ME) control limit range (± 4 SD from the mean).

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative
570-87413-1

Comments
No additional comments.

Receipt
The samples were received on 3/9/2022 6:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.2º C.

Receipt Exception
A trip blank was submitted for analysis with these samples; however, it was not listed on the Chain of Custody (COC).

The client was contacted with the above sample receipt anomaly. The laboratory was provided written direction on how to proceed; please refer to the COC section of the report for further details.

GC/MS VOA
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with preparation batch 570-219962 and analytical batch 570-219837 were outside control limits: (570-87413-A-15-C MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8260B: Internal standard (ISTD) response for TBA-d9 for the following sample in analytical batch 570-219837 was outside acceptance criteria: DGA-013-10 (570-87413-3). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 570-219929 and analytical batch 570-219835 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) recoveries and precision were within acceptance limits.

Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 570-219929 and analytical batch 570-219835 recovered outside control limits for Acetone. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 570-220192 and analytical batch 570-220282 was outside control limits. Sample matrix interference is suspected.

Method 8260B: Sample dilution was required prior to analysis due to matrix interferences from sediment that precludes analysis by purge and trap for samples DGA-012-20-GW (570-87413-10) and DGA-020-20-GW (570-87413-24). The reporting limits (RLs) have been adjusted proportionately.

Method 8260B: The continuing calibration verification (CCV) associated with batch 570-221166 recovered above the upper control limit for Dichlorodifluoromethane. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 570-221166 recovered outside control limits for Dichlorodifluoromethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Haley & Aldrich, Inc.
Project/Site: Rohr Chula Vista - Parcel A

EXTERNAL EMAIL*

Hi Virendra,

Please go ahead and analyze the trip blank. Thank you,

Bob

Subject: <RESPONSE REQUESTED> Eurofins Calscience sample confirmation files from 570-87413-1 Rohr Chula Vista - Parcel A
Importance: High

CAUTION: External Email

Hello,

Attached please find the sample confirmation files for job 570-87413-1; Rohr Chula Vista - Parcel A

A trip blank was submitted for analysis with these samples; however, it was not listed on the Chain of Custody (COC).

ACTION -- please advise if this trip blank needs to be analyzed or not.

Please feel free to contact me if you have any questions.

Thank you.

Virendra Patel

Login Sample Receipt Checklist

Client: Haley & Aldrich, Inc.

Job Number: 570-87413-1

Login Number: 87413
List Number: 1
Creator: Lagunas, Jorge L

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received Trip Blank(s) not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Haley & Aldrich, Inc.
Project/Site: Rohr Chula Vista - Parcel A

Job ID: 570-87522-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*3	ISTD response or retention time outside acceptable limits.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
me	LCS Recovery is within Marginal Exdeedance (ME) control limit range (± 4 SD from the mean).

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 570-87522-1

Laboratory: Eurofins Calscience

Narrative

Job Narrative
570-87522-1

Comments
No additional comments.

Receipt
The samples were received on 3/10/2022 6:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 0.9º C.

GC/MS VOA
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for preparation batch 570-220539 and analytical batch 570-220591 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method 8260B: The following analyte recovered outside control limits for the LCS/LCSD associated with preparation batch 570-220539 and analytical batch 570-220591: 4-Methyl-2-pentanone. This is not indicative of a systematic control problem because this was a random marginal exceedance. Qualified results have been reported.

Method 8260B: Internal standard responses were outside of acceptance limits for the following matrix spike (MS): (570-87522-A-7-B MS). The sample shows evidence of matrix interference.

Method 8260B: Surrogate recovery was outside acceptance limits for the following matrix spike (MS) sample: (570-87522-A-7-B MS). The parent sample's surrogate recovery was within limits. The MS sample has been qualified and reported.

Method 8260B: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-221249 recovered outside control limits for Dichlorodifluoromethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The following analyte recovered outside control limits for the LCS and/or LCSD associated with analytical batch 570-221249: Bromoform. This is not indicative of a systematic control problem because this was a random marginal exceedance. Qualified results have been reported.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-221249. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-221559. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Client: Haley & Aldrich, Inc.

Job Number: 570-87522-1

Login Number: 87522
List Number: 1
Creator: Lagunas, Jorge L

List Source: Eurofins Calscience

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

APPENDIX H

Laboratory Analytical Reports – H&P Mobile Geochemistry

H&P Mobile Geochemistry Inc.

16 March 2022

Keith Foster
Haley & Aldrich, Inc.
5333 Mission Center Road, Suite 300
San Diego, CA 92108-1350

H&P Project: HAL030822-SB2
Client Project: 0127827-043 / 850 Lagoon Dr

Dear Keith Foster:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 3/8/2022 -3/10/2022 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Lisa Eminhizer
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC) for the fields of proficiency and analytes listed on those certificates. H& P is approved as an Environmental Testing Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs for the fields of proficiency and analytes included in the certification process and to the extent offered by the accreditation agency . Unless otherwise noted, accreditation certificate numbers, expiration of certificates, and scope of accreditation can be found at: www.handpmg.com/about/certifications. Fields of services and analytes contained in this report that are not listed on the certificates should be considered uncertified or unavailable for certification.

March 8 & 9, 2022 - Batches EC20811, EC20906

The percent recoveries for 2,2-Dichloropropane, Dibromochloromethane and Bromoform fell below the method criteria in the continuing calibration verifications associated with the batches referenced above. Any results for these analytes, for samples included in these batches, may be biased low.

March 10, 2022 - Batches EC21001

The percent recovery for 2,2-Dichloropropane fell below the method criteria in the CCV. Any result for this analyte, for samples included in this batche, may be biased low.

Notes and Definitions

S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
LCC	Leak Check Compound
ND	Analyte NOT DETECTED at or above the reporting limit
MDL	Method Detection Limit
%REC	Percent Recovery
RPD	Relative Percent Difference

All soil results are reported in wet weight.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs through PJLA, accreditation number 69070 for EPA Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743 & 2745.

H&P is approved by the State of Louisiana Department of Environmental Quality under the National Environmental Laboratory Accreditation Conference (NELAC) certification number 04138

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

Purge Volume Information
PV Amount:
PV Includes: ☐ Tubing ☑ Sand 40% ☑ Dry Bent 50%

Leak Check Compound
A cloth saturated with LCC is placed around tubing connections and probe seal. This is done for all samples unless otherwise noted.
☑ 1,1-DFA ☐ 1,1,1,2-TFA ☐ IPA ☐ Other:

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

SUMMARY OF SOIL ANALYTICAL RESULTS - VOLATILE ORGANIC COMPOUNDS
ROHR, INC. - NORTH CAMPUS, PARCEL A
CHULA VISTA, CALIFORNIA

Location					DGA-009			DGA-011		
Portion of Building 29					South			South		
Sample Name	Background [1]	GPL	Commercial/ Industrial DTSC SL [2]	TTLC	DGA-009-1	DGA-009-5	DGA-009-10	DGA-011-3.5	DGA-011-5	DGA-011-10
Sample Date					03/08/2022	03/08/2022	03/08/2022	03/08/2022	03/08/2022	03/08/2022
Sample Depth (bgs)					1 (ft)	5 (ft)	10 (ft)	3.5 (ft)	5 (ft)	10 (ft)
Volatile Organic Compounds (mg/kg)										
Trichlorofluoromethane (CFC-11)	-	-	5400 -	-	< 0.01	< 0.0098	< 0.01	< 0.0099	< 0.01	< 0.0099
Trifluorotrichloroethane (Freon 113)	-	6.4	28000 [3]	-	< 0.01	< 0.0098	< 0.01	< 0.0099	< 0.01	< 0.0099
Vinyl acetate	-	-	3800 [3]	-	< 0.01	< 0.0098	< 0.01	< 0.0099	< 0.01	< 0.0099
Vinyl chloride	-	13	0.15 -	10	< 0.001	< 0.00098	< 0.001	< 0.00099	< 0.001	< 0.00099

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

SUMMARY OF SOIL ANALYTICAL RESULTS - VOLATILE ORGANIC COMPOUNDS
ROHR, INC. - NORTH CAMPUS, PARCEL A
CHULA VISTA, CALIFORNIA

Location					DGA-021			DGA-022		
Portion of Building 29					North			North		
Sample Name	Background [1]	GPL	Commercial/ Industrial DTSC SL [2]	TTLC	DGA-021-1	DGA-021-5	DGA-021-10	DGA-022-1	DGA-022-5	DGA-022-10
Sample Date					03/09/2022	03/09/2022	03/09/2022	03/09/2022	03/09/2022	03/09/2022
Sample Depth (bgs)					1 (ft)	5 (ft)	10 (ft)	1 (ft)	5 (ft)	10 (ft)
Volatile Organic Compounds (mg/kg)										
Trichlorofluoromethane (CFC-11)	-	-	5400 -	-	< 0.0098	< 0.0099	< 0.0098	< 0.01	< 0.01	< 0.01
Trifluorotrichloroethane (Freon 113)	-	6.4	28000 [3]	-	< 0.0098	< 0.0099	< 0.0098	< 0.01	< 0.01	< 0.01
Vinyl acetate	-	-	3800 [3]	-	< 0.0098	< 0.0099	< 0.0098	< 0.01	< 0.01	< 0.01
Vinyl chloride	-	13	0.15 -	10	< 0.00098 F1	< 0.00099	< 0.00098	< 0.001	< 0.001	< 0.001

Notes:

1. Detected results were screened against the following criteria. Exceedances are shaded gray and flagged in [ ]:
   [A]: Result is greater than Groundwater Protection Level (GPL), (Haley & Aldrich 2014a, 2014b).
   [B]: Result is greater than Commercial/Industrial Department of Toxic Substances Control Screening Level, HHRA Note 3, June 2020 - Revised May 2022.
   [C]: Result is greater than Total Threshold Limit Concentration (TTLC), CCR Title 22 Section 66261.24.
2. Detected results for trichloroethene (TCE) were also compared to the Health-Based Remediation Goal (HBRG) of 1.5 mg/kg (Haley & Aldrich, 2021b). Results shown in this table do not exceed the HBRG for TCE.

Footnotes:

[1] Site background
[2] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[3] U.S. EPA Region 9 Remediation Screening Level

Abbreviations:

BOLD = concentration detected at or above reported detection limit.
< = analyte not detected above the indicated reporting limit.
F1 = MS and/or MSD recovery exceeds control limits.
F2 = MS/MSD RPD exceeds control limits
*+ = LCS and/or LCSD is outside acceptance limits, high biased.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.

Notes and Abbreviations:

1. Results in **bold** are detected.
2. <: Result is not detected above the indicated reporting limit.
3. Detected results were screened agaist Health-Based Remediation Goals (HBRGs; Haley & Aldrich, 2021b).
   Results detected above the HBRGs are shaded in gray.

µg/m^3 = micrograms per cubic meter

Dear Mr. Alo:

Please find enclosed for your review, a copy of the subject document dated December 20, 2022 that was prepared by Haley & Aldrich, Inc. for PW Wohl G Street LLC, the owner of Parcel B that is part of the larger Rohr, Inc., a Collins Aerospace Company (Rohr) site. This document is being submitted to meet the requirements for site demolition by the San Diego Regional Water Quality Control Board.

“I certify under penalty of law this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.”

If you have any questions, please contact Tyler Adkins at (619) 691-2020.

Best Regards,

Dear Mr. Alo:

Haley & Aldrich, Inc., is pleased to provide this Demolition and Soil Environmental Management Plan (DEMP) for the former Rohr, Inc. a Collins Aerospace Company (Rohr) Parcel A on behalf of the property owner, PSIP Wohl Bay Boulevard LLC, and Rohr. The DEMP will be implemented during the demolition of the northern 24,000 square feet of Building 29 where soil containing trichloroethene will be excavated and disposed at a permitted facility. It is anticipated that the DEMP will be implemented early next year. If you have any questions or comments on the DEMP, please contact us.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

Haley & Aldrich, Inc., prepared this Demolition and Environmental Management Plan (DEMP) on behalf of PSIP Bay Boulevard LLC (PSIP Wohl) for activities to be conducted on the former industrial property known as Parcel A, a portion of the former Rohr, Inc., a Collins Aersospace Company, (Rohr) North Campus facility located at 850 Lagoon Drive in Chula Vista, California ([the Site]; Figure 1). PSIP Wohl purchased Parcel A from Rohr in September 2020.

Parcel A includes the properties occupied by Buildings 29, 99, and 100 and the vacant properties located at 360, 364, and 368 Bay Boulevard (Figure 2). Rohr sold these properties to PSIP Wohl, who is redeveloping the properties for commercial/industrial use. PSIP Wohl will be constructing a new loading dock in the area currently occupied by the northern 24,000 square feet of Building 29. Construction will involve the removal of soil in this area to approximately 5 feet below ground surface (bgs). This DEMP is specific to this Project. It provides guidelines and procedures that the contractor shall follow for managing concrete, asphalt pavement, and soil generated during the Project. It also describes procedures for addressing new environmental conditions (NECs) that may be identified following demolition and impacted soil management during construction.

PSIP Wohl has also made improvements to the building that have included installing a new heating, ventilation, and air conditioning system and sealing and polishing the concrete floor. PSIP Wohl is required through the Purchase and Sale Agreement with Rohr to install a sub-slab depressurization system (SSDS) to address volatile organic compounds (VOCs) in soil gas that are present beneath the slab in Building 29. A separate Work Plan will be submitted that will describe the design, installation, and monitoring of the SSDS to address soil gas beneath the building slab. The SSDS will be installed during building renovation and prior to a tenant occupying the building.

A Risk Management Plan (RMP) will also be prepared and implemented to address potential future vapor intrusion risk to building occupants. The RMP will include:

- An SSDS post-installation monitoring and performance plan to evaluate the effectiveness of the SSDS in mitigating potential vapor intrusion. Indoor air sampling which is a requirement of the CAO will be included. The plan will be implemented before a tenant occupies the building.
- Restrictions on changes to the existing building slab;
- A Contingency Plan;
- A schedule for performing post-installation sub-slab and indoor air sampling and preparing SSDS performance monitoring reports, and a Post-Mitigation Completion Report; and
- The preparation and filing of a deed restriction containing restrictions on use and occupancy of Parcel A (the Grant Deed in favor of PSIP Wohl recorded in September 2020 contains such restrictions and satisfies such deed restriction requirement).

In addition to these documents, there are others that will be prepared for Parcel A specific to Cleanup and Abatement Order No. R9-2021-0042 (CAO). These include:

- Site Soil Cleanup Levels Report (Directive C.4.a), and
- Site Soil and Soil Gas Remedial Alternatives Report (Directive C.4.b)/Remedial Action Plan (RAP) (Directive C.5.a)

These documents will be submitted in accordance with the schedule specified in the CAO. It should be noted that the documents required by Directives C.4.b and C.5.a will be combined. Raytheon Technologies Corporation (Rohr's parent company) made this request in accordance with Provision L.1 of the CAO in a letter to the SDRWQCB dated August 25, 2021. The SDRWQCB granted this request.

This DEMP summarizes Site environmental conditions relevant to the contractor's health and safety planning, and describes guidelines and procedures to manage concrete, asphalt pavement, and soil within the construction Project footprint. Soil that will be excavated will be stockpiled and profiled for disposal. Confirmation sampling to document concentrations of chemicals of concern remaining in place will be conducted once the excavation of the Project footprint is complete. No groundwater is expected during construction since it is present at depths greater than 10 feet bgs. The DEMP also describes screening procedures during demolition to identify potential NECs and unknown subsurface features that have the potential to impact environmental conditions at the Site. It also describes how NECs and unknown subsurface features will be addressed during DEMP implementation. The DEMP does not address the removal of asbestos-containing materials, lead-based paint, and universal waste. These activities will be completed prior to initiating the demolition in accordance with federal, state, and local regulatory guidelines and permits.

1.1 DEMP APPLICABILITY

The DEMP was prepared to address activities that will occur during the demolition of existing structures, paving, select Site infrastructure, and soil removal activities that will occur within the Project. Demolition activities within the Project footprint will include removing:

- Existing aboveground Site structures and concrete and asphalt surface pavements;
- Certain subsurface utilities, depending on their potential for future use and burial depth; and .
- Soil up to an approximate depth of 5 feet bgs.

The soil containing trichloroethene (TCE) and other VOCs within the Project footprint will be segregated and profiled for disposal at a permitted facility.

The DEMP will be made available to all contractors involved in the above-mentioned activities by PSIP Wohl. All provisions of the DEMP, including, but not limited to, soil management, stormwater runoff controls, and management of unanticipated conditions will be followed as applicable.

1.2 DEMP OBJECTIVES

The objectives of the DEMP are to present Project guidelines and procedures for:

- Segregating, sampling, and evaluating on-Site reuse and off-Site disposal options for materials generated during demolition;
- Identifying, assessing, and remediating NECs during demolition activities, if necessary;
- Segregating, sampling, and evaluating off-Site disposal options or on-Site reuse for excavated soil;
- Controlling and tracking movement and disposition of demolition materials and excavated soil; and
- Protecting existing monitoring wells (NCW-021A,and NCW-021B) during construction activities.

As applicable, the DEMP is consistent with elements of the DEMP recently submitted by GSI Environmental Inc. (GSI) to the San Diego Regional Water Quality Control Board (SDRWQCB) for Parcel B (GSI, 2022). The Parcel B DEMP was approved by the SDRWQCB in a letter dated November 3, 2022.

1.3 REGULATORY STATUS AND REQUIREMENTS

The SDRWQCB is the lead regulatory agency for the Site. Ongoing investigation and remediation are being conducted under the CAO issued to Rohr on July 12, 2021. The CAO supersedes CAO No. 98-08. The DEMP is not a specific requirement of the CAO; however, it was prepared to provide guidance to contractors engaged in subsurface work at the Site and procedures for identifying potential NECs during subsurface intrusive activities.

1.3.1 Agency Notification of Demolition and Soil Removal Activities

The following notification requirements related to the activities under this DEMP are specified in the CAO:

- Demolition (Directive E) – the SDRWQCB shall be notified in writing no later than 90 calendar days prior to the start of demolition. Additionally, the SDRWQCB shall be notified in writing of the completion of demolition activities no later than 14 calendar days following completion.

Rohr provided the SDRWQCB a letter on April 22, 2022 notifying it of PSIP Wohl's demolition schedule to comply with the CAO. The schedule has been delayed, and PSIP Wohl has kept the SDRWQCB informed of these schedule changes during monthly project status calls. PSIP Wohl indicated during our monthly update call with the SDRWQCB on October 13, 2022, that demolition will tentatively begin in January 2023.

2. Site Background

This section summarizes background information for the Site, including pertinent Site history, location and layout, and a summary of known environmental conditions.

2.1 SITE DESCRIPTION

Parcel A consists of two areas that have been part of Rohr's manufacturing facility. Buildings 99 and 100 and the vacant properties are located north of G Street and Building 29 is located south of G Street. Industrial activities and historical chemical use on Parcel A were more limited compared to the main manufacturing portions of the facility located on Parcel B and the former South Campus. This section describes the history of the Building 29 Area, since the DEMP applies to this portion of Parcel A. . Site historical environmental features associated with Building 29 are shown on Figure 2.

Building 29 was constructed in phases beginning in about 1957 through 1962. This portion of Parcel A was owned by others and used for other purposes prior to Rohr's ownership (Adrian Brown, 1998; Woodward-Clyde Consultants, 1998; URS Corporation, 2013; Haley & Aldrich, 2016, 2018, 2020, 2021, 2022b). These other historical uses included agriculture, residential and a possible lumber yard. The agricultural use of the northern portion of Parcel A occupied by Building 29 appears to have taken place through the 1940s.

Building 29 was primarily used for tooling, machining, and office space for most of its history. At one time, the northernmost portion served as the Maintenance Department for the facility. Most recently, the building housed laboratories, kitting, an After-Market Spares Warehouse, Service Center, and FAI repairs, storage, tool calibration, product development, and office space.

2.2 SITE GEOLOGY AND HYDROGEOLOGY

The information regarding Site geology is excerpted from the Revised Conceptual Site Model for Parcel A prepared by Haley & Aldrich dated April 30, 2021 (Haley & Aldrich, 2021a).

Parcel A is situated at elevations ranging from approximately 13 feet above mean seal level (MSL) on the south and 28 feet above MSL on the north. Parcel A is underlain, in descending order, by limited fill material, the Bay Point Formation, a clay aquitard, and the San Diego Formation. Because Parcel A is more than 1,000 feet upland of the former shoreline, there are no bay deposits or extensive fill present on this portion of the North Campus facility. It is underlain by localized fill material and the Bay Point Formation.

The Bay Point Formation can also be referred to as Quaternary alluvium, as suggested by Wes Danskin, formerly with the United States Geological Survey (W. Danskin, personal communication). The thickness of the Quaternary sediment can be highly variable in the San Diego embayment, ranging from approximately 200 feet to possibly as much as 700 feet. The Bay Point is Pleistocene in age and was deposited in nearshore marine and onshore fluvial depositional environments.

The Bay Point Formation consists of an interbedded sequence of clay, silt, and silty sand to the total depth explored (approximately 30 feet). The strata are predominantly composed of reddish brown to yellowish brown clay and silt with some thin, discontinuous lenses of silty sand. The water table is present in the sandy lenses at depths greater than 10 feet bgs. A new well cluster (NCW-021A and -

021B) was installed on Parcel A immediately west of the portion of Building 29 as part of Haley & Aldrich's data gap investigation conducted in March 2022 (Figure 2, Haley & Aldrich, 2022b). NCW-021A is screened in Zone A from 10 to 20 feet bgs. NCW-021B is screened in Upper Zone B between 41 and 51 feet bgs).

2.3 SITE ENVIRONMENTAL CONDITIONS

2.3.1 Previous Investigations

Environmental investigations to evaluate chemical impacts to soil, soil gas, and groundwater as well as indoor air screening (Building 29) have been conducted at the Site and were described in the Revised Conceptual Site Model ([CSM]; Haley & Aldrich, 2021a) and the Updated Sitewide CSM (Haley & Aldrich, 2022a). Figure 3 is a sample location map for Building 29, and chemical impacts are described below. Details regarding investigation results are presented in the referenced reports.

Site assessment activities on Parcel A have been conducted since the 1990s (Adrian Brown, 1998, Haley & Aldrich, 2016). Haley & Aldrich conducted site investigations for soil, soil gas and groundwater in advance of the property sale (Haley & Aldrich, 2018, 2020). GSI conducted a Phase II screening investigation on Parcel A (excluding 360, 364, and 368 Bay Boulevard) in August 2020 on behalf of PSIP Wohl (GSI, 2020). A data gap investigation work plan was submitted to the SDRWQCB on November 5, 2021, to comply with Directive C.2.a of the CAO (Haley & Aldrich, 2021c). The SDRWQCB requested revisions, and a Revised Work Plan was approved by the SDRWQCB and resubmitted on January 22, 2022. The data gap investigation was conducted in March 2022. A report was submitted to the SDRWQCB on June 10, 2022 (Haley & Aldrich, 2022b). The SDRWQCB indicated in its letter dated November 3, 2022, that it had no further comments on the data gap investigation.

The results of the site investigations identified the following chemicals of potential concern (COPCs) in soil within the Project footprint: VOCs, Total Petroleum Hydrocarbons (TPH), semi-volatile organic compounds (SVOCs), PCBs and the organochlorine pesticide, DDT. Metals concentrations within the Project footprint fall within background ranges. Of the VOCs, trichloroethene (TCE) and tetrachloroethene (PCE) were the primary VOCs detected in soil in Project footprint and vicinity. The maximum concentrations of TCE and PCE were reported in boring B29-23 (37,800 µg/kg) and B29-28 (1,260 µg/kg), respectively. The maximum PCB (Aroclor 1260) concentration reported for soil in the Project footprint was 1,300 µg/kg in boring B29-05 (sample ID B29-05-2). This sample was also reported to contain low concentrations of TPH (in the oil carbon range [C32-C44]; 185 mg/kg), certain SVOCs (maximum concentration was for fluoranthene, 0.21 mg/kg) and DDT (0.021 mg/kg).

The maximum VOC soil gas concentrations reported within the vicinity of the Project footprint were:

- Chloroform: 39,000 µg/m^3;
- PCE: 11,000 µg/m^3; and
- TCE: 3,000,000 µg/m^3.

2.3.2 Human Health Risk Assessment

Haley & Aldrich submitted a baseline human health risk assessment (HHRA) to the SDRWQCB in 2021 in advance of the property sale (Haley & Aldrich, 2021b). The HHRA was updated following the data gap investigation earlier this year and submitted to the SDRWQCB on July 8, 2022 (Haley & Aldrich, 2022c).

The Office of Environmental Health and Hazard Assessment reviewed the Update to the HHRA and concurred with Haley & Aldrich's risk estimates and conclusions in a letter dated September 1, 2022.

A health-based remediation goal (HBRG) was derived for TCE in soil to reduce estimated human health risks for the on-Site construction worker during DEMP activities. The HBRG for TCE is 1,500 micrograms per kilogram (µg/kg). Figure 4 shows the locations where soil exceeds the TCE groundwater protection level (GPL) and HBRG. Soil was reported to contain TCE concentrations above its HBRG within the Project footprint in boring B29-23 at 1 foot bgs (37,800 micrograms per kilogram [µg/kg]) and boring B29-24 at 1 foot bgs (7,830 µg/kg). The TCE soil concentration in boring B29-23 is also greater than the GPL of 27,000 µg/kg.

Soil gas HBRGs were also derived for bromodichloromethane, chloroform, cis-1,2-dichloroethene (cis-1,2-DCE), tetrachloroethene (PCE), and TCE to reduce estimated health risks for the on-Site commercial/industrial worker for inhalation exposure to indoor air. The soil gas HBRGs for bromodichloromethane, chloroform, cis-1,2-DCE, PCE, and TCE are 70, 80, 100, 370, and 350 micrograms per cubic meter (µg/m^3), respectively.

The soil gas locations that exceed one or more of the HBRGs are shown on Figure 5. There were 12 soil gas probe locations in the vicinity of the Project footprint where soil gas exceeds one or more of the HBRGs as indicated below:

- PW-02
- B29-V03
- PW-03
- B29-V04
- PW-06
- PW-04
- PW-05
- B29-V07
- PW-07
- B29-V08
- DGA-021
- DGA-022

Groundwater is present beneath the Site at depths greater than 10 feet bgs and will not be encountered during construction activities. A composite TCE groundwater contour map is provided on Figure 6. The TCE groundwater plume is located beneath that portion of Building 29 that includes the Project footprint. The soil gas results for 10-foot probes sampled in the northern and southern portions of Building 29 suggest that groundwater VOCs are contributing to potential vapor intrusion risks for future building occupants. The SSDS installed by PSIP Wohl will address the potential future vapor intrusion risk to building occupants that may result from VOC off-gassing from groundwater.

3. Roles and Responsibilities

The table below presents the entities responsible for implementation of this DEMP, followed by a description of their general roles and responsibilities of each party.

Role	Entity	Contact Information
PSIP Wohl	PSIP Wohl	Emil Wohl emil@wohlproperty.com (619) 296-4113
Environmental Regulator	SDRWQCB	Tom Alo tom.Alo@waterboards.ca.gov (619) 521-3375
General Contractor	Dempsey Construction	Chad Layne clayne@dempseyconstruction.com (760) 918-6900 ext. 126
Environmental Consultant on behalf of PSIP Wohl	GSI	Gino Bianchi Mosquera gbianchi@gsienv.com (949) 242-8288
Rohr	Rohr	John Baron john.baron@rtx.com (207) 865-1022 Tyler Adkins tyler.adkins@collins.com (619) 691-2020
Environmental Consultant on behalf of Rohr and PSIP Wohl	Haley & Aldrich (program manager)	Bob Scott bscott@haleyaldrich.com (619) 888-0668
Environmental Consultant on behalf of Rohr	AECOM (groundwater)	Jerry Zimmerle jerome.zimmerle@aecom.com (714) 567-2758

3.1 PSIP WOHL

PSIP Wohl is responsible for the overall implementation of the DEMP, with responsibilities that include:

- Classifying materials for off-Site disposal or on-Site reuse that are generated during the demolition activities (e.g., subsurface pipelines);
- Approving the facility at which demolition waste will be disposed or recycled and signing associated manifests;
- Coordinating the signing of manifests with Rohr for any soil that is characterized as hazardous, including soil produced from both the demolition and DEMP activities;
- Preparing and implementing a Construction Storm Water Pollution Control Plan in accordance with City of Chula Vista Best Management Plan Design Manual (BMP Design Manual) to comply

with its Ordinance and the SDRWQCB's regional MS4 Permit since the Project area to be disturbed is less than 1 acre; and,

- Coordinating the protection and temporary cessation of groundwater monitoring related to cluster well NCW-021 and notification of the SDRWQCB of such activities.

3.2 ENVIRONMENTAL REGULATOR

As described in Section 1.3, the SDRWQCB has oversight responsibility under the CAO for the environmental activities at the Site presented in this DEMP.[1] In its role, the SDRWQCB will approve on-Site reuse of materials, if any is proposed, based on chemical data that indicates its reuse is consistent with approved Site-specific HBRGs and GPLs, and potential temporary cessation of groundwater monitoring as necessary to accommodate the demolition activities. If additional subsurface impacts are revealed during demolition activities, these additional impacts will be addressed by implementing the procedures described in this DEMP.

3.3 GENERAL CONTRACTOR

The General Contractor retained by PSIP Wohl has the overall responsibility for implementing this DEMP during demolition. In general, the General Contractor will be responsible for:

- Providing a copy of this DEMP to each contractor engaged in demolition of on-Site structures, surface pavements, select subsurface activities, and soil excavation activities, and confirming that each contractor has prepared a Health and Safety Plan (HASP) that is appropriate for the work it performs;
- Removing aboveground structures, surface pavements, and other subsurface features within the footprint and depth required to construct the new loading dock (approximately 5 feet bgs);
- Observing and mitigating fugitive dust during demolition activities, as needed, to comply with regulatory requirements;
- Handling and tracking the movement of building demolition materials, removed surface pavements, subsurface utilities, and soil as described in this DEMP;
- Handling and disposing of excess concrete, other demolition materials, and soil generated during demolition and soil excavation for the construction project;
- Implementing stormwater best management practices (BMPs), as required by the City Ordinance and the Regional MS4 Permit (Section 5.1);
- Protecting monitoring well cluster NCW-021 (Section 5.2); and
- Identifying import soil sources, if needed.

[1] Note that demolition and Site grading activities also require permitting and oversight from municipal and county agencies (City of Chula Vista and San Diego County, respectively). These requirements are beyond the scope of this DEMP.

3.4 ENVIRONMENTAL CONSULTANT (ON BEHALF OF PSIP WOHL)

The PSIP Wohl Environmental Consultant (Haley & Aldrich) will be responsible for:

- Observing soil beneath removed pavement surfaces and at subsurface utilities as described in this DEMP to identify potential NECs, and sampling soil for chemical testing, as needed, to evaluate additional areas of impacted soil for removal during DEMP implementation;
- Characterizing soil excavated for off-Site disposal and excess soil that may be generated during demolition activities for on-Site reuse or off-Site disposal;
- Overseeing DEMP implementation and conducting soil confirmation sampling to verify the completeness of soil removal activities;
- Observing the presence of fugitive dust during DEMP implementation and recommending additional dust control measures, as needed;
- Evaluating proposed import soil relative to approved screening criteria for Site placement; and,
- Documenting and reporting DEMP activities, including daily recording of field observations, soil screening results, sample collection (media type and location), and concrete and stockpile segregation and management.

3.5 ROHR

As the former operator of the Site and responsible party under the CAO, Rohr will coordinate with PSIP Wohl and its General Contractor to facilitate off-Site disposal of soil characterized as hazardous by providing its U.S. Environmental Protection Agency (EPA) ID number and signing manifests for hazardous soils removed from the Site and non-hazardous soil that contains chemical constituents above the Site HBRGs and GPLs for which it is deemed responsible. Additionally, as owner of the on-Site monitoring wells, Rohr will collaborate with PSIP Wohl should groundwater monitoring of well cluster NCW-021 need to cease temporarily during the construction project.

3.6 ENVIRONMENTAL CONSULTANTS (ON BEHALF OF ROHR)

Haley & Aldrich and AECOM will assist Rohr with its responsibilities listed above.

4. Health and Safety During Construction

As described in Section 2.3, soil, soil gas, and groundwater at the Site are chemically impacted. Each contractor and consultant engaged with field work is required to prepare and implement its own HASP relative to the work that is being conducted prior to DEMP field work.

The contractors will follow all applicable federal, state, and local regulations and codes relating to health and safety. The contractors will follow all sections of California Occupational Safety and Health Administration regulations contained in Title 8 of the California Code of Regulations (8 CCR) as they apply to the Site activities. Those contractors who will come in contact with soil or materials exposed to chemicals are required to be 40-hour hazardous waste operations and emergency response (HAZWOPER) trained, with a current 8-hour refresher course completed within the last 12 months prior to commencing work.

Site visitors who may not have the training described above will be escorted on the Site during active field work and will not be allowed access within identified exclusion zones.

4.1 SITE ACCESS

As with any site where construction activities occur, access to the Site should be limited only to those involved in conducting project activities. Access to areas where work is occurring, including where soil is stockpiled, should be limited via a fence, k-rail, or other appropriate means. Identified exclusion zones will be clearly marked with signage.

4.2 FUGITIVE DUST OBSERVATIONS DURING DEMOLITION ACTIVITIES

As per the San Diego Air Pollution Control District (APCD) Rule 55 titled, “Fugitive Dust Control,” no construction or demolition activity shall discharge visible dust emissions beyond the property line for a period or periods aggregating more than 3 minutes in any 60-minute period. Perimeter air monitoring will not be necessary during Project activities because there are no nearby sensitive receptors and the adjacent properties to the north and west are unoccupied. The nearest occupied residential property is east of the I-5 Freeway approximately 500 feet (1/4 mile) from the Project footprint.

Standard dust control procedures (e.g., wetting) will be adequate to mitigate dust that may be emitted to ambient air during DEMP activities. The PSIP Wohl Environmental Consultant will observe for the presence of visible dust during DEMP activities by periodic observations around the Site perimeter and specifically near and downwind of the work area(s). If visible dust is observed by the PSIP Wohl Environmental Consultant, additional dust suppression efforts will be requested and employed by the General Contractor.

5. Pre-Field Preparation

Prior to the start of activities under this DEMP, the following items will be addressed.

5.1 CONSTRUCTION STORMWATER POLLUTION CONTROL PLAN

The disturbed area of the Project will be less than one acre and as such the Project will not be subject to the National Pollutant Discharge Elimination System General Permit for Storm Water Discharges Associated with Construction Activity (2009-0009-DWQ, Construction General Permit). PSIP Wohl or its designee will prepare a Construction Storm Water Pollution Control Plan (CSWPCP) that addresses requirements appearing in the City's Ordinance and BMP Design Manual, and regional MS4 permit. The General Contractor will implement BMPs as specified in the CSWPCP during DEMP implementation.

5.2 GROUNDWATER MONITORING WELL PROTECTION

As described above and shown on Figure 2, one groundwater monitoring well cluster (NCW-021), located immediately west of the Project, is used for ongoing monitoring and evaluating chemical impacts to groundwater. Prior to demolition, PSIP Wohl's and Rohr's environmental consultant, Haley & Aldrich, will conduct a Site walk with the General Contractor to identify the location of the well cluster. If necessary to facilitate the DEMP activities, PSIP Wohl and Rohr will coordinate with Haley & Aldrich to reset the well head at a depth 2 to 3 feet bgs until the cessation of activities and rebuild the well to grade following completion. Well head restoration will be conducted in accordance with the County of San Diego Department of Environmental Health and Quality (DEHQ) requirements, as set forth in the DEHQ's Site Assessment and Mitigation (SAM) Manual.[2]

The well cluster will be marked in such a way that it is clearly visible to all workers to prevent accidental damage. K-rails or other methodologies will be employed to provide clear demarcation of the well cluster location to protect it during DEMP activities.

The PSIP Wohl Environmental Consultant will immediately notify Rohr and the SDRWQCB if the monitoring well cluster is damaged during DEMP activities. PSIP Wohl will be responsible for repairing or replacing the damaged well. Should it be necessary to replace the well, it shall first be destroyed and then replaced in kind in accordance with State well regulations and DEHQ requirements, including obtaining appropriate destruction and installation permits, as set forth in DEHQ's SAM Manual.

5.3 CONDITIONAL WAIVER OF WASTE DISCHARGE REQUIREMENTS

The California Water Code, Section 13260, requires that a Report of Waste Discharge be filed prior to discharging waste[3] that could affect the quality of the waters of the state for issuance of waste discharge requirements (WDRs) by the appropriate Regional Water Board. Under the California Water Code, the SDRWQCB has the authority to issue WDR waivers for discharges considered to be low threat.

[2] https://www.sandiegocounty.gov/content/sdc/deh/lwqd/sam_manual.html

[3] "Waste," as defined in Section 13050(d) of the California Water Code includes "sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal."

As described in Section 8.2, soil generated during demolition may be reused on Site pending chemical testing.

It is intended that soil generated when implementing the DEMP will be appropriately disposed at an off-Site facility. Because some soil at the Site is known to be contaminated, activities including temporary stockpiling during the DEMP and potential soil reuse require that a Notice of Intent be filed with the SDRWQCB under Conditional Waiver No. 9 - Discharges/Disposal to Land of Solid Wastes within 30 days of initial waste discharge to temporary stockpiles or intended soil reuse, and enrollment in the WDR waiver program be acknowledged by the SDRWQCB. Following completion of soil removal activities, the applicable project termination certifications will be filed with the SDRWQCB.

6. Environmental Monitoring and Material Management During Demolition

This section describes monitoring, material segregation, and sampling procedures that will be implemented during demolition activities associated with the Project.

6.1 MONITORING AND SAMPLING FOR SUBSURFACE CHEMICAL IMPACTS

Investigations at the Site have identified chemical impacts to soil, and an additional data gap investigation was completed earlier this year.[4] However, it is possible that additional subsurface impacts (NECs) may be observed following the removal of Site pavements, slabs and select utilities. The areas over which pavement, slabs, and utilities will be removed are shown in the civil demolition drawings included in Appendix A.

The PSIP Wohl Environmental Consultant will be on Site daily throughout the removal of subsurface structures, surface pavement, and subsurface utilities to monitor exposed soils for potential chemical impacts via observation (e.g., odor and discoloration) and field screening (e.g., photoionization detector [PID]) methodologies.[5]

Potential chemical impacts could be indicated by the following:

- PID measurements greater than 10 parts per million by volume (ppmv);
- Discolored soils;
- Olfactory observation;
- Wet or saturated soils; and
- The presence of other previously unknown subsurface features such as “wet” utilities, sumps, underground storage tanks, or other features indicative of past chemical use.

Field monitoring will be conducted continually during the surface and subsurface demolition activities. The General Contractor will provide access to the PSIP Wohl Environmental Consultant in the areas where the demolition is occurring, and will, as needed, temporarily halt demolition to facilitate observation.

Should a potential NEC be identified, its location will be referenced by way of a hand-held global positioning system equipment. As necessary, the PSIP Environmental Consultant will require the potential NEC to be cordoned off with cones, barricades, caution tape or other measures to minimize disturbance from demolition activities and access to demolition personnel. A soil sample will be collected approximately 3 to 6 inches below the observed impact for headspace analysis, as described in Section 6.1.1, and an additional sample will be collected for chemical testing. Since VOCs, namely TCE, are the chemicals that are present in soil at concentrations above its HBRG or GPL, testing will be conducted for VOCs using EPA Methods 5035/8260B. PCBs have been reported within the Project

[4] A Data Gap Investigation Work Plan was submitted by Haley & Aldrich to the SDRWQCB on January 21, 2022, in response to its letter dated January 7, 2022, which stated that it had no comments on our responses to its November 21, 2022, comments on the work plan. A Data Gap Investigation Report was submitted to the SDRWQCB on June 13, 2022. The SDRWQCB, responded in a letter dated November 3, 2022, that it had no further comments on the report.

[5] Observations during vertical demolition, including monitoring and segregating items such as asbestos-containing materials and universal waste, are outside the scope of this DEMP.

footprint at one location (boring B29-05) at a concentration above 1 milligram per kilogram and samples will therefore be analyzed for PCBs using EPA Method 8082.

If the location is a NEC, the process will follow the flow chart that is presented as Figure B-1 in Appendix B. Daily field reports will include the location of potential impacts, field screening results, and documentation of soil sampling, if any and requested analytes.

6.1.1 Headspace Screening Procedure

The following procedure appears in the Parcel B DEMP (GSI, 2022), and is applicable to the Project. Soil grab samples for headspace screening will be collected from at a depth of approximately 6 inches bgs to be representative of in-situ VOC conditions. Approximately 6 ounces of soil will be sealed inside a 1-pint sealable plastic bag or 1-pint glass jar and disaggregated to promote VOC volatilization, if any, into the head space. After allowing 2 minutes for VOCs to volatilize and equilibrate, the PID probe will be inserted into the headspace and the peak and steady PID reading recorded. To minimize variability, the PIDs will be calibrated daily per the manufacturer's specifications.

A headspace PID reading exceeding 10 ppmv above background will be considered indicative of a potential VOC impact to soil, and a soil sample will be collected for laboratory chemical testing to further evaluate the potential impact.

6.2 JOINT COMPOUND MANAGEMENT

Chemical testing of flexible compounds (joint compound) that existed between former building slabs and pavement at some locations on Rohr's South Campus property indicated the presence of various metals and PCBs within the material (Haley & Aldrich, 2013). The concrete slab in most of the Project footprint in Building 29 is not original. The slab was removed in approximately 2000 to install the below grade infrastructure for the test labs that occupied this area.

On October 21, 2022, Haley & Aldrich observed the concrete slab in the Project footprint where the new loading dock will be constructed. Based on Haley & Aldrich's observations, no joint compound was identified between the joints in the floor slab within the Project footprint. It is anticipated that there will be no joint compound that will require managing during construction of the new loading dock.

6.3 CONCRETE MANAGEMENT

It is planned that demolished concrete will be transported off Site for recycling or disposal and chemical testing will be conducted by PSIP Wohl's Environmental Consultant according to the requirements of the receiving facility. The General Contractor will coordinate the chemical testing frequency, sample type (discrete or composite), and analytical parameters with the receiving facility.

Concrete stockpiles will be managed using BMPs as described in the CSWPCP. Copies of laboratory data reports, waste manifests, or other transportation documentation will be retained by the General Contractor and/or PSIP Wohl's Environmental Consultant for inclusion in a Demolition Completion Report that documents the disposition of concrete.

6.4 ASPHALT PAVEMENT

Asphalt pavement is primarily located within designated parking areas of the Site and within internal Site roadways. Asphalt removed during demolition will be transported to an asphalt recycling facility. The receiving facility and its requirements will be documented and analytical testing results, if any testing is required, will be documented in a DEMP Completion Report.

7. Soil Excavation and Confirmation Sampling Procedures

7.1 SOIL EXCAVATION PROCEDURES

The General Contractor will excavate soil in the Project footprint using a backhoe or similar excavation equipment. Following the surface sampling associated with the possible NECs, the General Contractor will excavate VOC-containing soil around known impacts first. This will include the two locations where soil TCE concentrations exceed the HBRG and/or GPL (borings B29-23 and B29-24). The soil will be excavated based on field observations and ppbRAE measurements as described in Section 6.1.1. The soil at each location will be excavated 10 feet radially in each direction, as feasible. The extent will be restricted by the wall of the vault that is present in this area. Soil will be monitored as described in Section 6.1.1 above and stockpiled separately at the designated location as described in Section 8.1. Soil will be excavated initially to a depth of approximately 3 feet. Further excavation will be conducted as required, based on PID readings. NECs will also be addressed in this manner. Once excavation is completed at the TCE HBRG exceedance locations and NECs, soil confirmation samples will be collected from the sidewalls and bottom of the excavation to confirm that soil exceeding the TCE HBRG, and GPL has been removed. Soil excavation will then proceed to complete the entire Project footprint.

7.2 SOIL CONFIRMATION SAMPLING PROCEDURES

One sample will be collected for at least every 200 square feet of sidewall surface area for each excavation sidewall, and one sample for every 400 square feet of excavation bottom surface area. A minimum of one sample will be collected at mid depth from each sidewall in the initial and successive excavations (should the depth of the excavation need to be extended below 3 feet). This sampling procedure will also be used for NECs that may be identified and excavated once the concrete slab is removed.

Final confirmation sampling will be conducted from the sidewalls and floor once the excavation for the Project footprint is completed to document soil VOC and PCB concentrations remaining in place. We estimate that up to 8 samples will be collected from the floor, 4 samples each from the north and south sidewalls and two samples each from the east and west sidewalls. Approximately 20 samples will be collected and analyzed from the floor and sidewalls of the Project footprint. The samples will be analyzed for VOCs by EPA Methods 5035/8260 and polychlorinated biphenyls (PCBs) by EPA Method 8082.

Soil samples will be collected using Terracores™ and extracted in the field in accordance with EPA Method 5035. Samples for other analyses will be collected using a trowel or similar tool and placed in laboratory provided glass jars, placed in a cooler with ice, and transported under standard chain of custody to a laboratory. Sampling personnel will use disposable gloves during sampling and will change gloves between sampling locations. Sampling tools will be decontaminated before each sample is collected. Analytical results will be compared to the soil TCE HBRG and GPL to confirm that soil containing concentrations exceeding these criteria have been excavated.

Quality assurance/quality control procedures will be performed during each sampling event, including a review of the laboratory method blanks, sample holding times, and sample collection and preservation as described in Appendix C.

8. Soil Management Procedures

Soil management procedures to be followed during DEMP implementation are described in this section. A flow chart that generally illustrates the process described above is presented as Figure B-2 in Appendix B. Stockpiling and evaluating excavated soil for reuse or off-Site disposal and importing soil will be conducted as specified below to the extent practical.

8.1 STOCKPILE SAMPLING

Excavated soil may be either stockpiled and covered or placed in roll-off bins. Stockpile areas will be prepared with BMPs to minimize surface water run on and runoff, and to prevent transport of soil by surface water runoff. Stockpiles will be covered as necessary to prevent rainwater infiltration and control fugitive dust. The method of covering will be determined based on the anticipated time that the stockpiles will be in place, weather conditions, regulatory requirements, and other practical factors such as the size of the stockpiles. Soil excavated as part of the DEMP activities will also be placed on plastic sheeting with a minimum thickness of 10 mils to segregate it from the underlying ground surface.

In consultation with the PSIP Wohl Environmental Consultant, the General Contractor will segregate excavated soil into separate stockpiles based on field observations, PID readings, and soil analytical results. Each stockpile will be chemically tested to evaluate its disposition. Note that the disposition of stockpiled soil generated during DEMP activities will be evaluated based on chemical characterization, as described below.

Stockpiles generated during DEMP will be limited to less than 500 cubic yards. The purpose of limiting a stockpile size is to minimize the possibility of disposing of large volumes of materials as hazardous waste when only a smaller volume of soil contains chemicals above hazardous waste criteria.

8.2 ON SITE REUSE OF SOIL

PSIP Wohl does not plan soil reuse for this Project; however, in the instance that soil is reused on Site, the following procedures will be implemented. Soil removed during demolition activities may be reused on Site only if chemical testing does not indicate the presence of chemicals above Site cleanup goals. Only discrete soil samples will be used to assess the appropriateness of on-Site reuse. Analytical testing results for soil will be compared to Site-specific HBRGs approved by the SDRWQCB and GPLs.

Discrete soil samples will be collected by the PSIP Wohl Environmental Consultant at the frequency set forth in the DEHQ SAM Manual as follows:

- Stockpiles less than 10 cubic yards: a minimum of two discrete samples will be collected, one from a randomly selected location from each half of the stockpile;
- Stockpiles from 10 to 20 cubic yards: a minimum of three discrete samples will be collected, one from a randomly selected location from each third of the stockpile;
- Stockpiles from 20 to 100 cubic yards: a minimum of four discrete samples will be collected, one from a randomly selected location from each quarter of the stockpile;
- Stockpiles from 100 to 500 cubic yards: a minimum of one sample for each 25 cubic yards or portion will be collected (e.g., a 130-cubic-yard stockpile would require 6 samples). The

stockpile will be sectioned into 25-cubic-yard portions to obtain a minimum of one sample from a randomly selected location from each portion; and,

- For stockpiles over 500 cubic yards, the number of samples collected will be in accordance with SW-846 guidance, as ascertained by the PSIP Wohl Environmental Consultant (note that this DEMP recommends soil stockpiles be less than 500 cubic yards).

The analysis of discrete soil samples for reuse will include the following:

- VOCs using USEPA Methods 5035/8260B;
- PCBs using USEPA Method 8082; and
- Title 22 metals by USEPA Methods 6010/7471.

Data will be evaluated and reported to the SDRWQCB for its approval to reuse the soil on Site.

Soil designated for reuse will also meet the project specifications that may be related, but not limited, to physical properties and landscaping considerations.

8.3 OFF-SITE SOIL DISPOSAL

Soil excavated during DEMP implementation will be disposed of off Site at a permitted facility. The soil will be profiled through analytical testing. It is anticipated that analytical tests for soil samples will include

- VOCs by USEPA 8260;
- PCBs by USEPA Method 8082; and
- Title 22 metals by USEPA Methods 6010/7471

Based on existing analytical data, it is unlikely that the soil will be profiled as Resource Conservation and Recovery Act (RCRA)[i] or non-RCRA California hazardous waste. However, if it is found otherwise, additional methods and analyses will be performed as specified by the receiving landfill facility. Specifically, leachability testing may be required as follows:

- RCRA hazardous waste criteria: the toxicity characteristic leaching procedure (TCLP) is conducted for soil samples with a total constituent concentration that is 20 times its respective TCLP regulatory limit appearing in Code of Federal Regulation (CFR) Title 40, Part 261, Subpart C, Section 261.24.
- Non-RCRA California hazardous waste criteria: the Waste Extraction Test methodology is conducted for soil samples with a TTLC that is 10 times its respective Soluble Threshold Limit Concentration appearing in California Code of Regulations (CCR), Title 22, Division 4.5, Chapter 11, Sections 66261.24.

Other tests to ascertain other potential hazardous characteristics may also be required. A flow chart that generally illustrates the process described above is presented as Figure B-3 in Appendix B. The frequency of sampling and the sample types (i.e., discrete or composite) will be designated by the receiving facility. Typically, the sample frequency is at least one (composite or discrete) sample per every 250 cubic yards to 1,000 cubic yards. Note that the facility to which soil will be disposed must be pre-approved in advance of its shipping.

The disposal facility for soil that is classified as non-RCRA California hazardous waste or RCRA hazardous waste will be selected by Rohr. Manifest for soil classified as hazardous waste will be signed by Rohr using Rohr's EPA ID number. Waste manifests for non-hazardous soil that contains chemical constituents above their respective HBRGs will also be signed by Rohr or its designee.

8.4 IMPORT SOIL

Imported soil brought on to the Site, if any will meet the minimum requirements for soil sampling and analysis designated by the California Department of Toxic Substances Control (DTSC) in the guidance document "*Information Advisory Clean Imported Fill Material*" ([Advisory]; DTSC, 2001) to avoid the placement of chemically impacted soil on-Site. The DTSC Advisory is included as Appendix D. The specific chemicals to be tested and the frequency of testing will be evaluated on a case-by-case basis, as determined by the PSIP Wohl Environmental Consultant. For example, soil whose origin is a quarry or a commercial horticulture entity may not require testing. The General Contractor will provide source soil documentation for the PSIP Wohl Environmental Consultant's review prior to its acceptance and placement.

Environmental Consultant shall oversee all sampling and analytical testing and evaluate whether the soil meets reuse criteria. No import soil may be used on Site without the written consent of the Owner. Supporting documentation regarding the import soil will be provided to the SDRWQCB in progress and completion reports, as described in Section 11.3. A flow chart that generally illustrates the approval process for import soil is presented as Figure B-4 in Appendix B.

8.5 DECONTAMINATION OF OFF-HAUL VEHICLES AND EQUIPMENT CLEANING

Track out of soil or other materials from the Site is prohibited, and the General Contractor will designate controlled ingress and egress locations. Soil or other materials adhered to vehicles will be removed via track-out plates or washing before exiting the Site.

Water from the cleaning processes will be collected and contained on Site. Sampling may be needed prior to disposal to comply with a sewer discharge permit. The PSIP Wohl Environmental Consultant will assist the General Contractor with sampling; compliance with a sewer discharge permit will be the responsibility of the General Contractor.

9. Dust Control

During DEMP activities, dust control measures will be implemented to comply with the Rule 55 Fugitive Dust Rule established by the APCD and the dust action level (Section 4.3.1), respectively. The General Contractor will be responsible for dust mitigation during DEMP activities. If visible dust is observed at the perimeter of the Site boundaries, the Contractor will enhance mitigation measures to eliminate visible dust at the Site boundary. In general, dust control measures and recommended practices include:

- Applying water as needed to maintain soil moisture and minimize dust generation daily;
- Covering the soil or maintaining at least 2 feet of freeboard for trucks hauling affected soil within the Site;
- Sweeping all paved access roads, parking areas, and staging areas, as needed;
- Sweeping streets if soil is carried onto adjacent public streets;
- Restricting non-essential traffic to compacted and paved roadways;
- Limiting vehicle speeds to 5 miles per hour on the Site;
- Minimizing drop heights while loading transportation vehicles; and
- Covering exposed soil or stockpiles and securing the Site at the end of each day by locking the gates.

10. Water Management

Groundwater is present beneath the Project footprint at a depth greater than 10 feet. Since the excavation depth for the Project is expected to be no more than 5 feet, the water table will not be encountered during construction and no dewatering will be necessary. However, it is possible that rain water may accumulate in the excavation depending on the timing and weather conditions during construction. If accumulated water requires management during DEMP activities, a permit from the City of Chula Vista will be obtained to discharge the water to the sanitary sewer. Volume and chemical discharge limits are specified for the Industrial User Permit in City of Chula Vista Municipal Code (MC) 13.10. Alternatively, if only limited water management is needed, it may be placed in containers and profiled for off-Site treatment/disposal. The General Contractor will be responsible for complying with all applicable ordinances and permitting requirements regarding water collection, storage, management, and sampling prior to discharge. Water will not be used for dust control across the Site or over stockpiles.

11. Unanticipated Subsurface Conditions

It is unlikely but it is possible that unknown historical subsurface features and structures (such as underground storage tanks and concrete vaults) may be encountered in the construction footprint during DEMP activities. Whenever unanticipated conditions are encountered, the General Contractor will stop work, secure the work area, and notify PSIP Wohl and the PSIP Wohl Environmental Consultant of the unanticipated condition before any further action is taken. Further action may include removal or in-place abandonment of subsurface structures or characterization and appropriate handling of soil potentially affected by chemicals. The General Contractor will take no action regarding the unanticipated condition unless expressly authorized by PSIP Wohl. Work can proceed in the area upon authorization from PSIP Wohl.

PSIP Wohl or its designee will notify Rohr and the SDRWQCB of an any unanticipated condition, and activities related to the unanticipated condition will be conducted with their concurrence. In the case of an underground storage tank, PSIP Wohl will notify Rohr and DEHQ, and its removal will proceed in accordance with the permitting and procedures outlined in the SAM Manual.

12. Data Management and Reporting

12.1 QUALITY ASSURANCE/QUALITY CONTROL

Quality Assurance/Quality Control (QA/QC) measures will be employed throughout the sampling and analytical testing associated with the activities described in this DEMP so that representative and reliable data are generated to facilitate decision-making. Specific QA/QC measures are presented in Appendix C.

12.2 FIELD RECORDS

Daily field records will be maintained by the PSIP Wohl Environmental Consultant describing the activities conducted, visual and olfactory observations and field measurements, location and type of samples collected, if any, and daily calibration of field equipment. Where field observations indicate soil staining or an unanticipated condition, it will be documented on a Site map.

Sample labeling will include an identifier that designates its origin. For instance, NECs, confirmation samples and stockpile samples may be labeled according to the following conventions:

NEC-001: NECs will be numbered sequentially.

CS-001-005: Confirmation samples will be numbered sequentially, followed by the sample depth. In the example, "005" is a sample collected at a depth of 0.5 feet.

C-SP1-XX: Concrete will be designated by a "C", followed by the stockpile number (if appropriate), followed by the sample number. The samples will be numbered sequentially.

Sample identifiers will be coordinated among the PSIP Wohl Environmental Consultant project manager and field staff prior to demolition and field activities.

12.3 REPORTING

A report will be prepared upon completion of DEMP activities. The DEMP Completion Report will include: a description of demolition activities, including a map showing the location of NECs, documentation of the disposition of concrete and soil, copies of analytical reports, chain-of-custody forms, and bills of lading/waste manifests. The DEMP Completion Report will be submitted within 90 days of the last scheduled DEMP activity.

13. Management of DEMP

This section discusses responsibilities for managing this DEMP and the circumstances under which this DEMP may be modified.

13.1 RESPONSIBILITIES

PSIP Wohl will make a copy of the DEMP available to its General Contractor, who will be responsible for providing this DEMP to its subcontractors engaged in subsurface work activities for the Project. The General Contractor and its subcontractors will be responsible for following the requirements appearing in this DEMP, project specifications, and job and Site safety. Each contractor engaging in the Project on Site will be required to sign a letter of acknowledgment documenting receipt and agreement to the responsibilities and requirements set forth in this DEMP (Appendix E). Copies will be maintained in the General Contractor's files for its respective subcontractors and available to PSIP Wohl upon request.

13.2 MODIFICATIONS TO DEMP

This DEMP was developed based on Haley & Aldrich's understanding of current conditions at the Site and applicable regulations. The DEMP may be updated if conditions are different than we currently understand.

14. Scope Representations, and Limitations

This DEMP was developed exclusively to address activities for the construction of a new loading dock within the northern portion of Building 29, relative to Haley & Aldrich's understanding of Site environmental conditions, as reported in the documents included in the references section of this DEMP. This DEMP does not address issues related to other chemicals or media that may be encountered during this construction Project other than that described herein. Contractors and workers are responsible for complying with all applicable laws pertaining to the handling and disposal of these materials.

In preparing this DEMP, Haley & Aldrich has relied upon certain information and documents prepared by others. To the extent that recommendations are based in whole or in part on such information, those conclusions are contingent on its accuracy and validity. Haley & Aldrich assumes no responsibility for any consequences arising from any information or condition that was concealed, withheld, misrepresented, or otherwise not fully disclosed or available to Haley & Aldrich.

This DEMP is based on current known Site conditions and current laws, policies, and regulations. No representation is made to any present or future developer or property owner of the Site or portions of the Site with respect to future Site conditions, other than those specifically identified within this DEMP.

Haley & Aldrich disclaims any responsibility for any unintended or unauthorized use of this DEMP. Haley & Aldrich has not made any commitment to, or assumed any obligation or liability to, any present or future developer, property owner, tenant, engineer, agent, contractor, user, or other party owning or visiting the Site or portion of the Site based upon or arising out of implementation of this DEMP. It is expressly understood that while this DEMP is intended to provide guidance and establish a framework for the management of residual chemicals in soil, soil vapor, and groundwater to protect human health and the environment, this DEMP shall not create any warranties or obligations to Haley & Aldrich as to implementation, adequacy, or success of protective measures under this DEMP.

APPENDIX A
Civil Drawings – Demolition Plans

795 H STREET

GRADING AND IMPROVEMENT PLANS

IN THE CITY OF CHULA VISTA, CALIFORNIA

A. GRADING NOTES:

1. ALL WORK SHALL BE DONE IN ACCORDANCE WITH THESE APPROVED PLANS AND APPROVED REVISIONS. ANY CHANGES OR REVISIONS THEREFROM SHALL BE APPROVED BY THE CITY ENGINEER AND MITIGATION MONITOR PRIOR TO ANY REQUEST FOR INSPECTION.

2. ALL GRADING SHALL BE INSPECTED AND TESTED BY OR UNDER THE DIRECTION OF A QUALIFIED SOILS ENGINEER. THE SOILS ENGINEER SHALL INSPECT THE EXCAVATION, AND SHALL OBSERVE AND TEST THE PLACEMENT, AND COMPACTION OF FILL AND BACKFILL AND COMPACTION OF TRENCHES; SUBMIT GEOTECHNICAL OR SOILS REPORTS AS REQUIRED AND DETERMINE THE SUITABILITY OF ANY FILL MATERIAL UPON COMPLETION OF GRADING OPERATIONS. THE SOILS ENGINEER SHALL STATE THAT OBSERVATIONS AND TESTS WERE MADE BY, OR UNDER DIRECTION OF THE SOILS ENGINEER, AND THAT EMBANKMENTS AND EXCAVATIONS WERE CONSTRUCTED IN ACCORDANCE WITH THE GEOTECHNICAL ASPECTS OF THE APPROVED GRADING PLANS, ANY APPROVED REVISIONS THERETO, SUBJECT LAND DEVELOPMENT PERMIT AND ORDINANCE NO. 1797 AS AMENDED, AND THAT ALL EMBANKMENTS AND EXCAVATIONS ARE ACCEPTABLE FOR THEIR INTENDED USE.

3. THE CONTRACTOR SHALL PROPERLY GRADE ALL EXCAVATED SURFACES TO PROVIDE POSITIVE DRAINAGE AND PREVENT PONDING OF WATER. CONTRACTOR SHALL CONTROL SURFACE WATER TO AVOID DAMAGE TO ADJOINING PROPERTIES OR TO FINISHED WORK ON THE SITE, AND SHALL TAKE REMEDIAL MEASURES TO PREVENT EROSION OF FRESHLY GRADED AREAS UNTIL SUCH TIME AS PERMANENT DRAINAGE AND EROSION CONTROL MEASURES HAVE BEEN INSTALLED TO THE SATISFACTION OF THE CITY ENGINEER AND THE MITIGATION MONITOR.

4. ALL AREAS TO BE FILLED SHALL BE PREPARED PRIOR TO FILLING, AND FILL SHALL BE PLACED IN ACCORDANCE WITH STANDARD SPECIFICATIONS AND THE RECOMMENDATIONS AND SPECIFICATIONS CONTAINED IN THE SOILS REPORT. ALL VEGETABLE MATTER AND OTHER OBJECTIONABLE MATERIALS SHALL BE REMOVED, BY THE CONTRACTOR, FROM THE SURFACE UPON WHICH THE FILL IS TO BE PLACED. LOOSE FILL AND UNSUITABLE SOILS SHALL BE REMOVED TO SUITABLE FIRM NATURAL GROUND. THE EXPOSED SOILS SHALL BE SCARIFIED IN ACCORDANCE WITH THE GEOTECHNICAL REPORT AND THEN COMPACTED TO A MINIMUM OF 90% OF ASTM-D1557. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO PLACE, SPREAD, WATER AND COMPACT THE FILL IN STRICT ACCORDANCE WITH THE SPECIFICATIONS.

5. CUT AND FILL SLOPES SHALL BE CUT AND TRIMMED TO THE FINISHED GRADE TO PRODUCE SMOOTH SURFACES AND UNIFORM CROSS SECTIONS. THE SLOPES OF EXCAVATIONS AND EMBANKMENTS SHALL BE SHAPED, TRIMMED, AND PLANTED IN ACCORDANCE WITH THE PLANTING NOTES AND AS DIRECTED BY THE ENGINEER OF WORK, AND LEFT IN A NEAT AND ORDERLY CONDITION. ALL STONES, ROOTS AND OTHER WASTE MATERIALS EXPOSED ON THE EXCAVATION OR EMBANKMENT SLOPES WHICH ARE LIABLE TO BECOME LOOSENED, SHALL BE REMOVED AND DISPOSED OF. THE TOE AND TOP OF ALL SLOPES SHALL BE ROUNDED IN ACCORDANCE WITH ORDINANCE NO. 1797, THESE GRADING PLANS, AND THE STANDARD DRAWINGS GRD-01 AND GRD-02. SLOPE SETBACKS AND GRADES SHALL CONFORM TO GRD-06.

6. IF THERE ARE EROSION SCARS ON EXISTING SLOPES WHICH OTHERWISE WOULD NOT BE ELIMINATED BY THE PROPOSED GRADING, THESE SCARS ARE TO BE ELIMINATED BY TRIMMING, FINE GRADING AND PLANTING. IF THE SCARS ARE IN AREAS OF NATIVE VEGETATION, THE REPAIRS SHOULD BE PERFORMED WITH AN EFFORT TO AVOID OR MINIMIZE IMPACTS TO NATIVE VEGETATION. ALL SUCH REPAIRS IN AREAS OF NATIVE VEGETATION SHALL BE REVIEWED AND APPROVED BY THE CITY'S MITIGATION MONITORING COORDINATOR PRIOR TO THE BEGINNING OF THE REPAIR WORK.

7. ALL TREES, BRUSH, GRASS, AND OTHER OBJECTIONABLE MATERIAL SHALL BE COLLECTED, PILED OR OTHERWISE DISPOSED OF OFF THE SITE BY THE CONTRACTOR SO AS TO LEAVE THE AREAS THAT HAVE BEEN CLEARED WITH A NEAT AND FINISHED APPEARANCE FREE FROM UNSIGHTLY DEBRIS. APPROVAL OF LOCATIONS FOR DEBRIS FILL SHALL BE OBTAINED FROM THE SOILS ENGINEER PRIOR TO THE DISPOSAL OF ANY SUCH MATERIAL.

8. SUBDRAIN LOCATIONS SHOWN ARE APPROXIMATE AND ARE RECOMMENDED FOR ALL SIGNIFICANT FILL CANYONS. THE ACTUAL LOCATION AND EXTENT OF SUBDRAINS SHALL BE DETERMINED BY THE GEOTECHNICAL CONSULTANT AT THE TIME OF CONSTRUCTION.

9. BY REFERENCE, HERE, THE GEOTECHNICAL ENGINEERING REPORT PREPARED BY GEOCON INCORPORATED, ON OCTOBER 12, 2020 IS INCLUDED AS A PART OF THESE PLANS.

10. CONTRACTOR SHALL VERIFY LOCATIONS OF ALL EXISTING UNDERGROUND UTILITIES. LOCATIONS SHOWN ON THESE PLANS ARE APPROXIMATE AND SHOWN FOR GENERAL INFORMATION ONLY.

11. WHERE GRADING DOES NOT OCCUR, ALL EXISTING PLANT MATERIAL IS TO BE PROTECTED IN PLACE. NO CONSTRUCTION EQUIPMENT WILL BE ALLOWED TO TRAVEL THROUGH AND DAMAGE ANY OF THESE AREAS. ALL AREAS TO BE RETAINED IN A NATURAL CONDITION SHALL BE FENCED UNDER THE DIRECTION OF THE PROJECT BIOLOGIST. CONTRACTOR WILL BE RESPONSIBLE TO REPAIR ANY AND ALL DAMAGE/IMPACTS TO THESE AREAS.

12. THE CONTRACTOR SHALL FURNISH TO THE ENGINEER OF WORK AS-BUILT PLANS FOR ALL NEW IMPROVEMENTS AND GRADING SHOWN ON THESE PLANS FOR SUBMITTAL TO THE CITY ENGINEER FOR APPROVAL IN ACCORDANCE WITH SECTION 15.04.140 OF THE CHULA VISTA MUNICIPAL CODE.

13. IN THE CASE OF CONFLICTS, THE REQUIREMENTS OF THE EARTHWORK, SPECIFICATIONS PREPARED FOR THE PROJECT BY THE SOILS ENGINEER SHALL GOVERN THE REQUIREMENTS OF THIS PLAN AND THESE NOTES AND THESE PLANS SHALL BE REVISED ACCORDINGLY.

B. DIG ALERT NOTICE

IMPORTANT NOTICE
SECTION 4215/4217 OF THE GOVERNMENT CODE REQUIRES THAT A DIG ALERT IDENTIFICATION NUMBER BE ISSUED BEFORE A "PERMIT TO EXCAVATE" WILL BE VALID. PER YOUR DIG ALERT I.D. NUMBER CALL UNDERGROUND SERVICE ALERT TOLL FREE 1-800-422-4133 TWO WORKING DAYS BEFORE YOU DIG.

ALL FIRE HYDRANTS AND HARD SURFACE ACCESS MUST BE IN PLACE BEFORE COMBUSTIBLE MATERIALS ARE DELIVERED TO THE SITE.

UNDERGROUND SERVICE ALERT

CALL: TOLL FREE
(800)422-4133

TWO WORKING DAYS BEFORE YOU DIG

"CAUTION": REMEMBER THAT THE USA CENTER NOTIFIES ONLY THOSE UTILITIES BELONGING TO THE CENTER. THERE COULD BE OTHER UTILITIES PRESENT AT THE WORK SITE. THE CENTER WILL INFORM YOU OF WHOM THEY WILL NOTIFY.

UTILITY NOTE

ALL EXISTING UTILITIES SHOWN ON THESE PLANS ARE PLOTTED FROM RECORD DATA AT THEIR APPROXIMATE LOCATIONS. UNDERGROUND FACILITIES MAY EXIST WHICH HAVE NOT BEEN REPORTED OR ARE NOT OF RECORD. CONTRACTOR SHALL VERIFY THE LOCATION OF ALL PERTINENT UTILITIES IN THE FIELD PRIOR TO THE START OF CONSTRUCTION.

C. GENERAL NOTES:

9. THE SOILS REPORT TITLED GEOTECHNICAL ENGINEERING REPORT PREPARED BY GEOCON INCORPORATED, ON OCTOBER 12, 2020 SHALL BE CONSIDERED TO BE PART OF THIS GRADING PLAN. ALL GRADING SHALL BE DONE IN ACCORDANCE WITH THE RECOMMENDATIONS AND SPECIFICATIONS CONTAINED IN SAID REPORT.

10. STORM DRAINS ARE SHOWN FOR INFORMATIONAL PURPOSES ONLY. APPROVAL OF THIS PLAN DOES NOT CONSTITUTE APPROVAL OF SIZES, LOCATIONS, AND TYPE OF SEWER AND DRAINAGE FACILITIES, OR ANY SURFACE IMPROVEMENTS WITHIN FUTURE STREET RIGHTS-OF-WAY SHOWN ON THESE PLANS. SEPARATE APPROVALS AND PERMITS FOR THESE SHALL BE REQUIRED IN CONJUNCTION WITH IMPROVEMENT PLANS.

11. WRITTEN PERMISSION SHALL BE OBTAINED FOR ANY OFF-SITE GRADING.

12. CONTRACTOR SHALL TAKE ALL NECESSARY PRECAUTIONS REQUIRED TO PROTECT ADJACENT PROPERTIES DURING GRADING OPERATIONS. ANYTHING DAMAGED OR DESTROYED SHALL BE REPLACED OR REPAIRED TO CONDITION EXISTING PRIOR TO GRADING.

13. THE CONTRACTOR SHALL BE RESPONSIBLE THAT ANY MONUMENT OR BENCH MARK WHICH IS DISTURBED OR DESTROYED SHALL BE RE-ESTABLISHED AND REPLACED BY A REGISTERED CIVIL ENGINEER WHO IS ALLOWED TO PRACTICE SURVEYING OR A LICENSED LAND SURVEYOR AND A CORNER RECORD, RECORD OF SURVEY, OR CERTIFICATE OF CORRECTION FILED AS REQUIRED BY THE LAND SURVEYOR'S ACT.

14. THE CONTRACTOR SHALL DESIGN, CONSTRUCT, AND MAINTAIN ALL SAFETY DEVICES, INCLUDING SHORING, AND SHALL BE RESPONSIBLE FOR CONFORMING TO ALL LOCAL, STATE, AND FEDERAL SAFETY AND HEALTH STANDARDS, LAWS, AND REGULATIONS.

15. ALL FLOWS SHOWN ARE FOR 50 -YEAR STORM, EXCEPT AS NOTED.

16. ALL SEDIMENTATION BASINS, OUTLET PIPES AND DITCHES ARE PRIVATE UNLESS OTHERWISE NOTED AND HAVE NOT BEEN REVIEWED FOR ADEQUACY BY THE CITY ENGINEERING DEPARTMENT.

17. THE OWNER MUST OBTAIN AN EXCAVATION PERMIT FROM THE DIVISION OF OCCUPATIONAL SAFETY AND HEALTH (D.O.S.H.) FOR CONSTRUCTION OF TRENCHES OR EXCAVATIONS WHICH ARE FIVE FEET OR DEEPER INTO WHICH A PERSON IS REQUIRED TO DESCEND. SAID PERMIT IS REQUIRED PRIOR TO ISSUANCE OF A GRADING PERMIT BY THE CITY OF CHULA VISTA.

18. GRADING EQUIPMENT SHALL NOT USE OR BLOCK TRAFFIC LANES DURING GRADING ACTIVITY, TRUCK OPERATIONS IN AND OUT OF CONSTRUCTION AND STAGING AREAS SHALL BE CONTROLLED AS REQUIRED BY THE CITY. TRUCK AND EQUIPMENT ROUTES IN AND OUT OF THE SITE, SHALL BE APPROVED BY THE CITY PRIOR TO START OF WORK. AT THE END OF THE WORKING DAY, STREETS SHALL BE CLEANED OF DIRT AND CONSTRUCTION DEBRIS TO THE SATISFACTION OF THE CITY INSPECTOR AND THE MITIGATION MONITOR.

19. DUST GENERATED BY CONSTRUCTION ACTIVITIES SHALL COMPLY WITH LOCAL DUST CONTROL, ANY REQUIREMENTS OF ANY MITIGATION MONITORING PROGRAMS, AND UNIFORM BUILDING CODE (UBC) REQUIREMENTS, WHICH INCLUDE DUST CONTROL MEASURES FOR CONSTRUCTION SITES. DUST REDUCING MEASURES SHALL INCLUDE, BUT NOT LIMITED TO, REGULAR WATERING OF GRADED SURFACES AND RESTRICTION OF ALL CONSTRUCTION VEHICLES AND EQUIPMENT TO TRAVEL ALONG ESTABLISHED AND REGULARLY WATERED ROADWAYS AT SPECIFIED SPEEDS.

D. PRECONSTRUCTION CONFERENCE:

THE CONTRACTOR SHALL NOT BEGIN ANY WORK ON THIS PROJECT UNTIL A PRECONSTRUCTION CONFERENCE IS HELD WITH THE ENGINEER OF WORK, THE SOILS ENGINEER, DEVELOPER, CONTRACTOR, OTAY WATER DISTRICT INSPECTOR, AND CITY ENGINEER.

E. SHEET INDEX:

G. OWNER'S CERTIFICATE:

IT IS AGREED THAT FIELD CONDITIONS MAY REQUIRE CHANGES TO THESE PLANS. IT IS FURTHER AGREED THAT THE OWNER (DEVELOPER) SHALL HAVE THE ENGINEER OF WORK MAKE SUCH CHANGES, ALTERATIONS OR ADDITIONS TO THESE PLANS WHICH THE ENGINEER OF WORK DETERMINES ARE NECESSARY AND DESIRABLE FOR THE PROPER COMPLETION OF THE IMPROVEMENTS. ALL PLAN CHANGES SHALL BE APPROVED BY THE CITY ENGINEER PRIOR TO CONSTRUCTION.

I FURTHER AGREE TO COMMENCE WORK ON ANY IMPROVEMENTS SHOWN ON THESE PLANS WITHIN EXISTING CITY RIGHT-OF-WAY WITHIN 60 DAYS AFTER ISSUANCE OF THE CONSTRUCTION PERMIT AND TO PURSUE SUCH WORK ACTIVELY ON EVERY NORMAL WORKING DAY UNTIL COMPLETED, IRRESPECTIVE AND INDEPENDENT OF ANY OTHER WORK ASSOCIATED WITH THIS PROJECT OR UNDER MY CONTROL.

P. WORK TO BE DONE:

THE WORK TO BE DONE CONSISTS OF THE ITEMS INDICATED UNDER THE "LEGEND" SHOWN BELOW, AND IS TO BE DONE IN ACCORDANCE WITH THESE PLANS AND THE FOLLOWING LIST OR PRINTED MATERIALS AS CURRENTLY ADOPTED BY THE CITY OF CHULA VISTA CITY COUNCIL INCLUDING THE FOLLOWING:

1. 2012 STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION ("GREENBOOK") AND 2012 REGIONAL SUPPLEMENT AMENDMENTS (TO THE GREENBOOK).
2. 2012 SAN DIEGO AREA REGIONAL STANDARD DRAWINGS..
3. 2015 CITY OF CHULA VISTA STANDARD SPECIAL PROVISIONS (TO THE GREENBOOK).
4. 2017 DESIGN AND CONSTRUCTION STANDARDS OF THE CITY OF CHULA VISTA.
5. PORTION OF THE STATE STANDARD SPECIFICATIONS, STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, DATED JULA 2010 AND ALL SUBSEQUENT ADDITIONS AND REVISIONS.
6. PORTION OF THE STATE STANDARD PLANS, STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, DATED JULY 2010 AND ALL SUBSEQUENT ADDITIONS AND REVISIONS.
7. 2014 CALIFORNIA MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES ("CA-MUTCD") AND ALL SUBSEQUENT ADDITIONS AND REVISIONS.
8. WATER AGENCIES STANDARDS SPECIFICATIONS FOR WATER, RECYCLED WATER AND SEWER FACILITIES, LATEST EDITION.
9. PUBLIC WATER SYSTEM IMPROVEMENTS SHALL BE INSTALLED IN ACCORDANCE WITH THE SWEETWATER AUTHORITY'S DESIGN STANDARDS AND STANDARD SPECIFICATIONS FOR CONSTRUCTION OF WATER FACILITIES.

ALL REFERENCES ARE TO BE MADE PART OF THESE PLANS. ANY CHANGES OR REVISIONS THEREFROM, SHALL BE APPROVED BY THE CITY ENGINEER, OR HIS DESIGNEE, PRIOR TO ANY REQUEST FOR INSPECTION.

R. TOPOGRAPHICAL SOURCE:

KIMLEY HORN ON 06/09/2020.

S. EARTHWORK QUANTITIES:

MAXIMUM CUT: 5.11 FEET
MAXIMUM FILL: 5.84 FEET
TOTAL CUT/FILL: 2,579 CY CUT 1,114 CY FILL
TOTAL EXPORT: 1,464 CY

AREA TO BE GRADED: 3.82 ACRES

IMPORT:
GRADING QUANTITIES ARE ESTIMATED FOR BONDING PURPOSES ONLY AND ARE NOT BE USED FOR FINAL PAYMENT QUANTITIES

THE EARTHWORK QUANTITIES ABOVE ARE FOR PERMIT PURPOSES ONLY. THE CONTRACTOR IS NOT AUTHORIZED TO USE THE ESTIMATES HEREIN FOR BIDDING AND CONSTRUCTION PURPOSES WITHOUT THE EXPLICIT WRITTEN PERMISSION OF THE ENGINEER OF RECORD. NO REPRESENTATIONS OF SUCH QUANTITIES OR A BALANCED SITE CONDITION ARE MADE BY THE ENGINEER OF RECORD.

UNLESS EXPLICITLY STATED OTHERWISE HEREIN, THE ABOVE QUANTITIES ARE APPROXIMATE, IN PLACE VOLUMES CALCULATED FROM THE EXISTING GROUND TO THE PROPOSED FINISHED GRADE. EXISTING GROUND IS DEFINED BY THE CONTOURS AND SPOT GRADES ON THE BASE SURVEY. PROPOSED FINISHED GRADE IS DEFINED AS THE FINAL GRADE AS INDICATED ON THE GRADING PLAN(S) AS FINISHED GROUND, FINISHED SURFACE, AND FINISHED FLOOR ELEVATIONS.

UNLESS EXPLICITLY STATED OTHERWISE HEREIN, THE ABOVE GRADING QUANTITIES HAVE NOT BEEN FACTORED TO ACCOUNT FOR CHANGES IN VOLUME DUE TO BULKING, CLEARING AND GRUBBING, SHRINKAGE, SUBSIDENCE, OVER-EXCAVATION AND RE-COMPACTION, AND CONSTRUCTION METHODS. NOR DO THEY ACCOUNT FOR THE THICKNESS OF PAVEMENT SECTIONS, STORMWATER QUALITY MEDIA SECTIONS, UTILITY PIPES, TRENCHING AND BEDDING MATERIALS, BUILDING OR WALL FOOTINGS, BUILDING SLAB THICKNESSES AND UNDERLYING BASE OR SAND LAYERS, REUSE OF PULVERIZED MATERIALS THAT WILL UNDERLIE NEW PAVEMENTS, ETC.

ANY OVEREXCAVATION AND RECOMPACTION DEPTHS AND VOLUMES, SHRINKAGE FACTORS, PAVEMENT SECTIONS, BUILDING PAD SECTIONS, AND BULKING FACTORS ARE BASED ON A SEPARATE GEOTECHNICAL REPORT. ANY BUILDING SLAB THICKNESSES ARE BASED ON THE SEPARATE BUILDING STRUCTURAL ENGINEERING PLANS. ANY UTILITY, STORMWATER MITIGATION, AND FOOTING SPOILS ARE BASED ON ESTIMATES PROVIDED BY THE OWNER OR CONTRACTOR.

T. NOTIFICATIONS:

1. THE EXISTENCE AND LOCATION OF UNDERGROUND UTILITY PIPES AND STRUCTURES SHOWN ON THESE PLANS WERE OBTAINED BY A SEARCH OF AVAILABLE RECORD, TO THE BEST OF OUR KNOWLEDGE, THERE ARE NO EXISTING UTILITIES EXCEPT AS SHOWN HEREON, HOWEVER, THE CONTRACTOR IS REQUIRED TO TAKE DUE PRECAUTIONARY MEASURES TO PROTECT ANY EXISTING UTILITIES OR STRUCTURES LOCATED AT THE WORK SITE. IT IS THE CONTRACTOR'S RESPONSIBILITY TO CONTACT UNDERGROUND SERVICE ALERT (PHONE 1-800-422-4133) TWO (2) WORKING DAYS IN ADVANCE OF ANY EXCAVATION FOR THE MARK OUT OF THE LOCATION OF UTILITIES AND NOTIFICATION OF COMMENCEMENT OF WORK.

FOR ANY QUESTIONS REGARDING THE MARK OUT OF UNDERGROUND UTILITIES, THE CONTRACTOR SHOULD CONTACT THE RESPECTIVE UTILITY COMPANY:

STREET LIGHT OR SIGNAL LIGHT CONDUIT CITY OF CHULA VISTA (619) 397-6163
SEWER OR STORM DRAIN CITY OF CHULA VISTA
VERIFICATION (619) 691-5024

2. CONTRACTOR SHALL NOTIFY THE CITY ENGINEER'S OFFICE (PHONE 619- 585-5737) AND THE MITIGATION MONITOR AT THE PLANNING DIVISION (PHONE 619- 691-5101) 48 HOURS (2 WORKING DAYS) PRIOR TO BEGINNING ANY WORK ON THIS PROJECT.

3. THE CONTRACTOR SHALL GIVE 24 HOURS (ONE WORKING DAY) NOTICE ON CALLS FOR INSPECTION. PHONE: (619) 397-6128.

4. ALL WORK PERFORMED WITHOUT BENEFIT OF INSPECTION SHALL BE SUBJECT TO REJECTION AND REMOVAL AT CONTRACTOR'S EXPENSE.

U. NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) STATEMENT:

DEVELOPMENT OF THIS PROJECT SHALL COMPLY WITH ALL REQUIREMENTS OF STATE WATER RESOURCES CONTROL BOARD (SWRCB) WQ ORDER NO. 2012-006-DWQ, WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION ACTIVITY. IN ACCORDANCE WITH SAID PERMIT, A STORM WATER POLLUTION PREVENTION PLAN (SWPPP) AND A MONITORING PROGRAM PLAN SHALL BE DEVELOPED AND IMPLEMENTED CONCURRENT WITH THE COMMENCEMENT OF GRADING ACTIVITIES. THE SWPPP SHALL SPECIFY BOTH CONSTRUCTION AND POST-CONSTRUCTION STRUCTURAL AND NON-STRUCTURAL POLLUTION PREVENTION MEASURES. THE SWPPP SHALL ALSO ADDRESS OPERATION AND MAINTENANCE OF POST-CONSTRUCTION POLLUTION PREVENTIONS MEASURES, INCLUDING SHORT-TERM AND LONG-TERM FUNDING SOURCES AND THE PARTY OR PARTIES THAT WILL BE RESPONSIBLE FOR THE IMPLEMENTATION OF SAID MEASURES.

A COMPLETE AND ACCURATE NOTICE-OF-INTENT (NOI) WILL BE FILLED WITH THE SWRCB, A COPY OF THE ACKNOWLEDGMENT FROM THE SWRCB THAT A NOI HAS BEEN RECEIVED FOR THIS PROJECT SHALL BE FILED WITH THE CITY OF CHULA VISTA WHEN RECEIVED; FURTHER, A COPY OF THE COMPLETED NOI FROM THE SWRCB SHOWING THE PERMIT NUMBER FOR THIS PROJECT BE FILED WITH THE CITY OF CHULA VISTA WHEN RECEIVED.

IN ADDITION, THE UNDERSIGNED AND SUBSEQUENT OWNER(S) OF ANY PORTION OF THE PROPERTY COVERED BY THIS GRADING PERMIT NO. XXXXX AND XXXXX SHALL COMPLY WITH SPECIAL PROVISIONS REGARDING THE REVOCATION OR CANCELLATION OF NPDES GENERAL PERMIT COVERAGE, AS SET FORTH IN SWRCB ORDER NO. CAS000002, AND ANY SUBSEQUENT AMENDMENTS THERETO AND REISSUANCES THEREOF.

RESPONSIBLE PARTY: EMIL WOHL - PSIP WOHL BAY BOULEVARD, LLC

SIGNATURE OF LAND OWNER, CORPORATE OFFICE,
GENERAL PARTNER OR PROPRIETOR: _____

DATE: _____

TITLE: OWNER

PERMIT IDENTIFICATION NUMBER: WDID# X XXXXXXXX

V. LANDSCAPE NOTES:

1. ALL SLOPES 3 FEET IN VERTICAL HEIGHT AND GREATER SHALL BE PLANTED AND IRRIGATED IN ACCORDANCE WITH LANDSCAPE IMPROVEMENT PLANS CONFORMING TO THE CITY OF CHULA VISTA LANDSCAPE MANUAL (MOST RECENT EDITION), GRADING ORDINANCE NO. 1797, THE WATER CONSERVATION ORDINANCE, AND THE SAN DIEGO COUNTY HANDBOOK FOR PUBLIC WORKS CONSTRUCTION. WHENEVER SPECIAL REQUIREMENTS CONFLICT ON ANY MATTER, THE DIRECTOR OF DEVELOPMENT SERVICES OR DESIGNEE SHALL DETERMINE WHICH SPECIAL CONDITION OR CODE SHALL GOVERN. PLANS SHALL BE APPROVED BY THE DIRECTOR OF DEVELOPMENT SERVICES OR DESIGNEE PRIOR TO ISSUANCE OF APPLICABLE CONSTRUCTION AND BUILDING PERMITS.

2. FINISH GRADING AND PLANTING SHALL BE ACCOMPLISHED ON ALL SLOPES PRIOR TO OCTOBER 1 OR IMMEDIATELY UPON COMPLETION OF ANY SLOPES GRADED BETWEEN OCTOBER 1 AND APRIL 1, AS DIRECTED BY THE CITY'S DIRECTOR OF DEVELOPMENT SERVICES.

3. PRIOR TO GRADING, CONTRACTOR SHALL FIELD VERIFY EXISTING IRRIGATION SYSTEMS TO DETERMINE WHICH ARE OPERABLE. UNLESS OTHERWISE NOTED ON THESE PLANS, ALL EXISTING IRRIGATION SYSTEMS ARE TO BE PROTECTED IN PLACE AND REMAIN OPERABLE. CONTACT THE PUBLIC WORKS DEPARTMENT TWO (2) WORKING DAYS IN ADVANCE OF ANY WORK.
CITY LANDSCAPING COORDINATION CONTACTS:
PUBLIC RIGHT-OF-WAY AND OPEN SPACE – DAVE DEFACCI, SR. LANDSCAPE INSPECTOR (619-409-5432)
PARKS – HUGO MARTINEZ, PARKS MANAGER, (619-397-6145).

W. RCP STORM DRAIN BEVELING NOTES:

1. WHERE RADIUS=90 FEET TO 45 FEET, USE 8-FOOT LENGTH OF PIPE BEVELED ONE END.

2. WHERE RADIUS CURVE= 45 FEET TO 22 ½ FEET, USE 8- FOOT LENGTH OF PIPE BEVELED BOTH ENDS.

3. WHERE RADIUS CURVE=22 ½ FEET, USE 4-FOOT LENGTH OF PIPE BEVELED BOTH ENDS.

4.CONTRACTOR SHALL PROVIDE LAYOUT SHEET OF BEVELED PIPE PRIOR TO BEGINNING INSTALLATION.

X. SPECIAL NOTES:

1. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE QUANTITIES SHOWN HEREON AND BALANCING THE EARTHWORK ONSITE. IF DISCREPANCIES ARISE, THE ENGINEER OF WORK SHALL PROVIDE AREAS OF ADJUSTMENT TO THE CONTRACTOR. WHERE TRENCHES ARE WITHIN EASEMENTS, STREETS, OR 10' OF ANY BUILDING, SOILS REPORTS SHALL BE SUBMITTED TO THE ENGINEER OF WORK BY A QUALIFIED SOILS ENGINEER WHICH INDICATE THAT THE TRENCH BACKFILL WAS COMPACTED UNDER THE OBSERVATION OF THE SOILS ENGINEER AND IN ACCORDANCE WITH THE EARTHWORK SPECIFICATIONS.

2. THE CONTRACTOR SHALL BE RESPONSIBLE OT INSURE THAT ALL SLOPES ARE BUILT IN ACCORDANCE WITH THESE PLANS. IF THERE IS ANY QUESTION REGARDING THESE PLANS OR FIELD STAKES, THE CONTRACTOR SHALL REQUEST AN INTERPRETATION BEFORE DOING ANY WORK BY CALLING THE ENGINEER AT (619) 234-9411.

3. THE PALEONTOLOGICAL MONITOR SHALL BE PRESENT DURING THE GRADING OF THE PLIOCENE SAN DIEGO FORMATION (TSD) ON THE SITE. THE MONITOR SHALL HAVE THE AUTHORITY TO TEMPORARY DIRECT, DIVERT, OR HALT GRADING TO ALLOW RECOVERY OF FOSSIL REMAINS.

4. THE CONTRACTOR SHALL UNCOVER ALL UTILITIES THAT MAYBE JOINED, CROSSED, OR PARALLELED TO VERIFY BOTH HORIZONTAL AND VERTICAL LOCATION PRIOR TO ANY CONSTRUCTION. ANY CONFLICT OR DISCREPANCY SHALL BE BROUGHT TO THE ENGINEER'S ATTENTION PRIOR TO CONSTRUCTION, OTHERWISE THE CONTRACTOR ACCEPTS FULL RESPONSIBILITY FOR ANY ADDITIONAL CONSTRUCTION OR RELOCATION COSTS.

5. ALL FILL AREAS, WHICH ARE FENCED, SHALL REMAIN FENCED. TEMPORARY AND/OR FINAL FENCING SHALL BE PROVIDED AS SHOWN ON THE PLANS.

6. ALL APPROVED GEOTEXTILE ENGINEERING FABRIC SHALL BE INSTALLED PER MANUFACTURERS SPECIFICATIONS.

7. A 6" MINIMUM THICKNESS BEDDING BLANKET UNDERDRAIN BY A LAYER OF GEOTEXTILE (MIRAFI 700X OR EQUIVALENT) SHALL BE CONSTRUCTED BENEATH ALL RIP RAP. THE BEDDING BLANKET SHALL MEET THE FOLLOWING SPECIFICATIONS:

   a) FRACTION PASSING THE NO. 3/8 IN. STANDARD SIEVE SHALL BE 100% BY WEIGHT.

   b) ANY SOURCE OF ON-SITE MATERIAL DEEMED SUITABLE BY THE SOILS ENGINEER.

8. THE CONTRACTOR SHALL BE RESPONSIBLE FOR LOCATING, MAINTAINING, RELOCATING, AND OR REMOVAL OF EXISTING UTILITIES.

9. THE CONTRACTOR SHALL REPLACE ALL DESTROYED OR DAMAGED SURFACE IMPROVEMENTS WITH IMPROVEMENTS EQUAL OR SUPERIOR.

10. ALL CONTOURS AND ELEVATIONS SHOW HEREON REPRESENT FINISH GRADE. CONTRACTOR SHALL MAKE THE APPROPRIATE ALLOWANCES FOR PAVEMENT SUBGRADE, PAD UNDERCUT, AND UTILITY TRENCHING.

11. THE ENGINEER PREPARING THESE PLANS WILL NOT BE RESPONSIBLE FOR UNAUTHORIZED CHANGES TO OR USES OF THESE PLANS. ALL PROPOSED CHANGES TO THE PLANS MUST BE WRITING AND MUST BE APPROVED BY THE PREPARER OF THESE PLANS AND THE CITY OF CHULA VISTA.

Y. EROSION CONTROL NOTES:

1. THE EROSION CONTROL CONTRACTOR SHALL BE RESPONSIBLE FOR THE INSPECTION AND MODIFICATION OF THE EROSION CONTROL DEVICES DURING THE RAINY SEASON. THE CONTRACTOR, PERMITTEE OR OWNER SHALL BE RESPONSIBLE FOR THE CONTINUAL MAINTENANCE OF THE EROSION CONTROL DEVICES DURING THE RAINY SEASON. IN THE EVENT O FAILURE OR REFUSAL TO PROPERLY MAINTAIN SAID DEVICES, THE CITY ENGINEER OR MITIGATION MONITOR MAY CAUSE EMERGENCY MAINTENANCE WORK TO BE DONE TO PROTECT ADJACENT PRIVATE AND PUBLIC PROPERTY, THE COST (INCLUDING AN INITIAL MOBILIZATION AMOUNT) OF WHICH SHALL BE CHARGED TO THE OWNER.

2. SEDIMENTATION BASINS MAY NOT BE REMOVED OR MADE INOPERATIVE WITHOUT PRIOR WRITTEN APPROVAL OF THE CITY ENGINEER AND MITIGATION MONITOR.

3. TEMPORARY EROSION CONTROL DEVICES, WHICH INTERFERE WITH THE WORK, SHALL BE RELOCATED OR MODIFIED AS THE WORK PROGRESSES, AS RECOMMENDED BY THE ENGINEER OF WORK AND AS APPROVED BY THE CITY ENGINEER AND MITIGATION MONITOR.

4. ALL REMOVABLE PROTECTION DEVICES SHOWN SHALL BE IN PLACE AT THE END OF EACH WORKING DAY WHEN THE 5-DAY RAIN PROBABILITY FORECAST EXCEEDS 40 PERCENT. AFTER EACH RAINSTORM EXCEEDING 1/4 INCH IN A 12-HOUR PERIOD, SILT AND DEBRIS SHALL BE REMOVED FROM CHECK DAMS AND DESILTING BASINS AND BASINS SHALL BE PUMPED DRY AS DEEMED NECESSARY BY THE CITY ENGINEER AND MITIGATION MONITOR.

5. EFFECTIVE PLANTING SHALL BE INSTALLED, FULLY GERMINATED, AND SHALL EFFECTIVELY COVER THE REQUIRED SLOPES PRIOR TO FINAL APPROVAL. THE PLANTING MIX SHALL BE APPROVED, BY THE DIRECTOR OF DEVELOPMENT SERVICES OR DESIGNEE, PRIOR TO INSTALLATION. SPRINKLER SYSTEMS ARE REQUIRED ON ALL SLOPES THREE FEET IN VERTICAL HEIGHT OR GREATER.

6. A 12 INCH HIGH BY 3 FEET WIDE BERM SHALL BE MAINTAINED ALONG THE TOP OF THE SLOPE OF THOSE FILLS ON WHICH GRADING IS NOT IN PROGRESS. CONCENTRATED WATER SHALL NOT BE CARRIED CLOSER THAN 10 FEET FROM THE TOP OF SLOPES.

7. SILT BASINS, TRAPS,, OR SANDBAGS SHALL BE PROVIDED AT EVERY STORM DRAIN INLET TO PREVENT SEDIMENT FROM ENTERING THE STORM DRAIN SYSTEM.

8. FOR INLETS LOCATED AT SUMPS ADJACENT TO TOP OF SLOPE, THE CONTRACTOR SHALL INSURE THAT WATER DRAINING TO THE SUMPS IS DIRECTED INTO THE INLET, AND THAT A MINIMUM OF 1.00' FREEBOARD EXISTS AND IS MAINTAINED ABOVE THE TOP OF THE INLET. IF FREEBOARD IS NOT . PROVIDED BY GRADING SHOWN ON THESE PLANS, THE CONTRACTOR SHALL PROVIDE IT VIA TEMPORARY MEASURES, I.E. SANDBAGS OR DIKES.

9. THE GRADING CONTRACTOR SHALL BE RESPONSIBLE FOR CLEANUP OF SILT AND MUD ON ADJACENT STREETS DUE TO CONSTRUCTION ACTIVITY.

10. THE CONTRACTOR SHALL CHECK AND MAINTAIN LINED AND UNLINED DITCHES AFTER EACH RAINFALL.

11. **HYDROSEED NOTES** (APPLICABLE ONLY IF THERE WILL BE SLOPES THREE FEET IN VERTICAL HEIGHT OR GREATER)

   A. ALL SLOPES 3 FEET IN VERTICAL HEIGHT OR GREATER AND PADS STEEPER THAN 2% SHALL BE HYDROSEEDED WITH THE FOLLOWING IRRIGATED SEED MIX, MULCH AND BINDING AGENT:

      HYDROSEED NOT APPLICABLE TO THIS PROJECT.

   B. IRRIGATION METHODS ARE REQUIRED FOR ALL AREAS HYDROSEEDED BETWEEN MARCH 1ST AND NOVEMBER 1ST AS NEEDED. IMMEDIATELY FOLLOWING HYDROSEED APPLICATION, AND FOR A PERIOD OF TIME OF NO LESS THAN 90 DAYS, ADEQUATE SOIL MOISTURE SHALL BE MAINTAINED IN THE UPPER ONE-HALF INCH OF SOIL TO ASSURE MAXIMUM RATES OF SEED GERMINATION AND PLANT ESTABLISHMENT. IRRIGATION SHALL BE MAINTAINED BEYOND THE 90 DAYS WHEN DEEMED NECESSARY BY THE CITY OF CHULA VISTA PUBLIC WORKS OPERATIONS, OPEN SPACE SECTION.

   C. IRRIGATION SYSTEMS ARE NOT REQUIRED FOR AREAS HYDROSEEDED ON (OR WITHIN ONE WEEK OF) NOVEMBER 1ST; HOWEVER, TEMPORARY WATERING (BY HAND OR TRUCK) IS REQUIRED UNTIL PLANTING IS ESTABLISHED IF RAINFALL IS NOT PRESENT.

AS BUILT	UTILITY NOTE
_____ DATE _____ SIGNATURE _____ P.E. No. _____ Printed Name My Registration Expires _____ Discipline _____	ALL EXISTING UTILITIES SHOWN ON THESE PLANS ARE PLOTTED FROM RECORD DATA AT THEIR APPROXIMATE LOCATIONS. UNDERGROUND FACILITIES MAY EXIST WHICH HAVE NOT BEEN REPORTED OR ARE NOT OF RECORD. CONTRACTOR SHALL VERIFY THE LOCATION OF ALL PERTINENT UTILITIES IN THE FIELD PRIOR TO THE START OF CONSTRUCTION.

INSTALLATION NOTES

1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURERS CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE TO VERIFY PROJECT ENGINEERS RECOMMENDED BASE SPECIFICATIONS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL PIPES SHALL BE SEALED WATER TIGHT PER MANUFACTURERS STANDARD CONNECTION DETAIL.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. VEGETATION SUPPLIED AND INSTALLED BY OTHERS. ALL UNITS WITH VEGETATION MUST HAVE DRIP OR SPRAY IRRIGATION SUPPLIED AND INSTALLED BY OTHERS.
7. CONTRACTOR RESPONSIBLE FOR CONTACTING BIO CLEAN FOR ACTIVATION OF UNIT. MANUFACTURERS WARRANTY IS VOID WITH OUT PROPER ACTIVATION BY A BIO CLEAN REPRESENTATIVE.

GENERAL NOTES

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT BIO CLEAN.

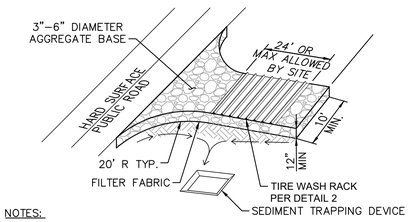
NOTES:

1. GRAVEL BAG MATERIAL: POLYPROPYLENE, POLYETHYLENE OR POLYMIDE WOVEN FABRIC, MINIMUM UNIT WEIGHT 4 OUNCES PER SQUARE YARD, MULLEN BURST STRENGTH EXCEEDING 300 PSI AND ULTRAVIOLET STABILITY EXCEEDING 70%
2. GRAVEL BAG SHALL BE FILLED WITH 3/4" ROCK OR 1/4" PEA GRAVEL.
3. PLACE SEVERAL LAYERS OF SAND BAGS (12" MINIMUM HIGH) OVERLAPPING THE BAGS AND PACKING THEM TIGHTLY TOGETHER.
4. LEAVE GAP OF ONE BAG ON THE TOP ROW TO SERVE AS A SPILLWAY.
5. PLACE WIRE MESH OVER AND 1' (MINIMUM) BEYOND THE INLET STRUCTURE.
6. PLACE FILTER FABRIC OVER WIRE MESH. FILTER FABRIC SHALL BE MANUFACTURED FROM UV RESISTANT POLYPROPYLENE, NYLON, POLYESTER, OR ETHYLENE FABRIC WITH AN EQUIVALENT OPENING SIZE NOT GREATER THAN 20 SIEVE AND WITH A MINIMUM FLOW RATE OF 40 GALLONS/MINUTE/SQ. FT.
7. INSPECT BARRIERS AND REMOVE SEDIMENT AFTER EACH STORM EVENT.

1 STORM DRAIN INLET PROTECTION - CASQA SE-10

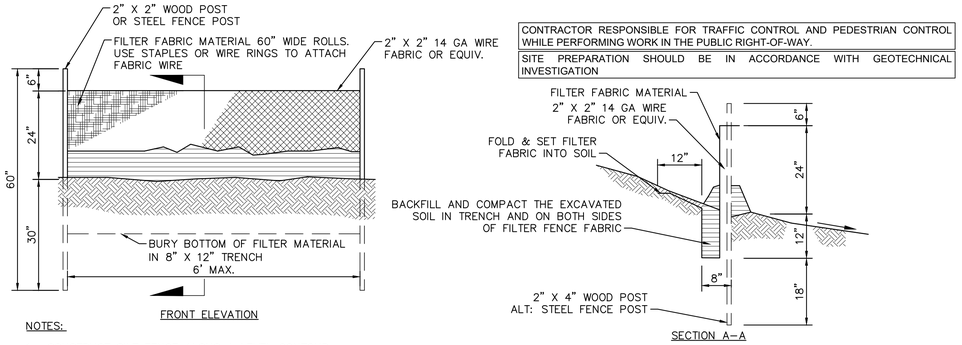
NOT TO SCALE



NOTES:

1. THE ENTRANCE SHALL BE MAINTAINED IN A CONDITION THAT WILL PREVENT TRACKING OR FLOWING OF SEDIMENT ONTO PUBLIC RIGHTS–OF–WAY. THIS MAY REQUIRE TOP DRESSING, REPAIR AND/OR CLEANOUT OF ANY MEASURES USED TO TRAP SEDIMENT.
2. WHEN NECESSARY, WHEELS SHALL BE CLEANED PRIOR TO ENTRANCE ONTO PUBLIC RIGHT–OF–WAY.
3. WHEN WASHING IS REQUIRED, IT SHALL BE DONE ON AN AREA STABILIZED WITH CRUSHED STONE THAT DRAINS INTO AN APPROVED SEDIMENT TRAP OR SEDIMENT BASIN.

2 CONSTRUCTION ENTRANCE - CASQA TC-1



NOTES:

1. CONSTRUCT SILT FENCE ALONG A LEVEL CONTOUR.
2. WHEN STANDARD STRENGTH FILTER FABRIC IS USED A WIRE MESH SUPPORT FENCE SHALL BE FASTENED TO THE UPSLOPE SIDE OF THE POSTS USING HEAVY– DUTY WIRE STAPLES AR LEAST 1" LONG TIE WIRES OR HOG RINGS. THE WIRE SHALL EXTEND INTO THE TRENCH A MINIMUM OF 4".
3. STANDARD STRENGTH FILTER FABRIC SHALL BE STAPLED OR WIRED TO THE FENCE AND 40" OF THE FABRIC SHALL EXTEND INTO THE TRENCH. WHEN EXTRA–STRENGTH FILTER FABRIC AND CLOSER POST SPACING ARE USED THE WIRE MESH SUPPORT FENCE MAY BE ELIMINATED AND THE FILTER FABRIC STAPLED OR WIRED DIRECTLY TO THE POSTS.
4. FILTER FABRIC SHALL BE PURCHASED IN A CONTINUOUS ROLL THEN CUT TO THE LENGTH OF THE BARRIER. WHEN JOINTS ARE NECESSARY FILTER CLOTH SHALL BE SPICED TOGETHER ONLY TO A SUPPORT POST WITH A MINIMUM 6" OVERLAP AND BOTH AND SECURELY FASTENED TO THE POST.
5. THE TRENCH SHALL BE BACKFILLED WITH IMPACTED NATIVE MATERIAL.
6. IF 85% OR MORE OF A SOIL BY WEIGHT PASSES THROUGH THE OPENINGS IN A NO. 200 SIEVE (U.S. STANDARD) FILTER FABRIC SHALL NOT BE USED.
7. FILTER FABRIC MATERIAL SHALL CONTAIN ULTRAVIOLET RAY INHIBITORS AND STABILIZERS TO PROVIDE A MINIMUM OF 6 MONTHS OF EXPECTED USABLE CONSTRUCTION LIFE AT A TEMPERATURE RANGE OF 0 DEGREES FAHRENHEIT TO 120 DEGREES FAHRENHEIT.
8. SILT FENCES SHALL REMAIN IN PLACE UNTIL THE SLOPED AREA IS PERMANENTLY STABILIZED.
9. LEAVE AN UNDISTURBED OR STABILIZED AREA IMMEDIATELY DOWNSLOPE FROM THE FENCE.

3 TEMPORARY SILT FENCE - CASQA SE-1

NOT TO SCALE

APPENDIX C
Quality Assurance/Quality Control

Appendix C

Quality Assurance/Quality Control Procedures
Parcel A, North Campus
850 Lagoon Drive
Chula Vista, California

During DEMP activities at Parcel A, soil and concrete samples will be collected for chemical testing. This appendix outlines quality assurance/quality control (QA/QC) procedures applicable to sample collection.

FIELD QUALITY CONTROL MEASURES

The following field quality control measures apply to concrete, soil, and groundwater sample collection.

DUPLICATE SAMPLES - CONCRETE AND SOIL

Duplicate samples are not typically collected for soil due to heterogeneity within the soil matrix that can yield differences in analytical results even within a sample core. For this program, duplicate samples for both concrete and soil will be generated by collecting two primary samples which will be homogenized into a single sample, and then split into two unique samples for analysis. Duplicate samples will be collected at a frequency of 1 sample for every 20 primary samples for both concrete and soil.

FIELD EQUIPMENT BLANKS

Field equipment blanks will be prepared by pouring deionized or distilled water onto clean sampling equipment; the rinsate will be collected and analyzed for the same analytes associated with the samples that are being collected. Field equipment blanks will be collected at a frequency of one sample per day on which sampling is occurring for soil and concrete.

TRIP BLANKS

Trip blanks will be supplied by the analytical laboratory and will accompany the samples in the cooler during transport to the analytical laboratory. The trip blank will be analyzed only in cases where there may be concern about the analytical results.

Appendix C

FIELD QUALITY ASSURANCE MEASURES

The following field quality assurance measures apply to soil and concrete collected during DEMP activities, as applicable.

SAMPLE CONTAINERS, PRESERVATION, AND PACKAGING

Sample containers will be supplied by the state-certified analytical laboratory that is conducting the chemical analysis of the specific sample media. Sample containers will be clearly labeled with sample designation, date, and time of collection, and requested analysis(es), packaged in plastic bags, and placed in a cooled ice chest for sample transport to the analytical laboratory.

Table C-1 indicates U.S. Environmental Protection Agency (USEPA) methods for analysis of classes of chemicals and includes information regarding preservation requirements and holding times for soil. Note that sample collection and containers for soil samples that will be analyzed for volatile organic compounds depends on the use of the data that will be generated. For soil samples that are collected to represent in-situ Site conditions, samples will be preserved following the requirements of USEPA Method 5035 to minimize disturbance and volatilization, as noted on Table C-1.

SAMPLE CUSTODY

Samples will be accompanied for transport with a chain-of-custody form that lists each sample by its designation, date and time of collection, media (soil or concrete), required analysis(es), and requested turnaround time. Sample information on the chain-of-custody form will match that on the sample label. The chain-of-custody form will accompany the samples through their delivery to the analytical laboratory and will be signed by the sampling personnel relinquishing the samples to the laboratory or courier service and signed by each party accepting the samples. The chain-of- custody shall be part of, and integral to, the project QC documentation.

EQUIPMENT MAINTENANCE AND CALIBRATION

All non-dedicated equipment will be decontaminated with deionized or distilled water with a non-phosphate detergent (Alconox™ or equivalent), followed by a distilled water rinse, immediately prior and subsequent to its use. Field equipment, including photoionization detectors (PIDs), global positioning system (GPS) equipment, and dust monitors will be calibrated daily according to the manufacturer's instructions. Calibration of such equipment will be recorded on daily field records.

LABORATORY MANAGEMENT AND QA/QC REPORTING

Prior to the initiation of field activities, the Environmental Consultant will communicate with the selected state-certified laboratory to assure that laboratory reporting limits (RLs) or method detection limits (MDLs) are adequate to compare data to human health risk-based remediation goals and groundwater protection limits (GPLs) established for the project. Should RLs or MDLs be insufficient to meet project goals, project personnel will seek another state-certified laboratory to conduct the analysis(es) or, in the case that detection limits cannot be achieved, discuss the data limitations with the SDRWQCB.

Appendix C

Analytical laboratory reports will document:

- Sample preservation and verification that analytical testing was conducted within the holding times required by the USEPA test method employed;
- Chemical testing results, including RLs and MDLs for each reported analyte;
- Surrogate recoveries;
- Laboratory control samples and matrix spike/matrix spike duplicate recoveries; and,
- Laboratory data qualifiers.
- Laboratory data reports will be provided as electronic copies (pdf files) and in electronic data deliverable (EDD) format.

Attachment:

Table C-1 - Soil Sample Preservation and Analytical Holding Times – Soil

\\haleyaldrich.com\share\CF\Projects\0206064\Deliverables\Appendix C\2022_12_HAI_AppdxC_Text_F.docx

TABLE C-1
SOIL SAMPLE PRESERVATION AND ANALYTICAL HOLDING TIMES - SOIL
PARCEL A - NORTH CAMPUS
CHULA VISTA, CALIFORNIA

Chemical Class or Chemical	Analytical Method[1]	Maximum Holding Time[2]	Minimum Mass	Sample Containers[3]	Preservation
Volatile Organic Compounds (disposal)[4]	8260B	14 days	10 grams	4-ounce jar with Teflon lid	Iced, 0 to 6° Celsius
Volatile Organic Compounds (in-situ)[5]	8260B	Terra Core™ sampler – 14 days En Core® sampler - 48 hours for extraction; 14 days for analysis	5 grams	Hermetically-sealed vials – see USEPA Method 5035. (e.g., En Core®/Terra Core™ Soil Samplers)	Bisulfate or methanol; iced, 0 to 6° Celsius. Unpreserved or deionized water; iced, 0 to 6° Celsius
Polychlorinated Biphenyls	8082	14 days for extraction; 40 days after extraction for analysis	20 grams	4-oz glass jar with Teflon lid	Iced, 0 to 6° Celsius
Metals	6010B	180 days	200 grams	4-oz glass jar with Teflon lid	None
Mercury	7471A	28 days	200 grams	4-oz glass jar with Teflon lid	Iced, 0 to 6° Celsius

Notes:

1. All analytical methods are U.S. Environmental Protection Agency (USEPA) methods unless shown otherwise.
2. The technical holding times are based on time elapsed from sample collection.
3. Multiple analyses for a soil sample may not require additional containers for each parameter; confirm volume requirements with the laboratory.
4. Confirm the sample collection methodology and container with the disposal facility.
5. Samples for soil that will be left on Site are to utilize methods that minimize sample disturbance and volatilization.

APPENDIX D
Information Advisory Clean Imported Fill Material

DTSC Information Advisory Clean Imported Fill Material Fact Sheet

October 2001

Executive Summary

This fact sheet has been prepared to ensure that inappropriate fill material is not introduced onto sensitive land use properties under the oversight of the DTSC or applicable regulatory authorities. Sensitive land use properties include those that contain facilities such as hospitals, homes, day care centers, and schools. This document only focuses on human health concerns and ecological issues are not addressed.

It identifies those types of land use activities that may be appropriate when determining whether a site may be used as a fill material source area. It also provides guidelines for the appropriate types of analyses that should be performed relative to the former land use, and for the number of samples that should be collected and analyzed based on the estimated volume of fill material that will need to be used.

The information provided in this fact sheet is not regulatory in nature, rather is to be used as a guide, and in most situations the final decision as to the acceptability of fill material for a sensitive land use property is made on a case-by-case basis by the appropriate regulatory agency.

Introduction

The use of imported fill material has recently come under scrutiny because of the instances where contaminated soil has been brought onto an otherwise clean site. However, there are currently no established standards in the statutes or regulations that address environmental requirements for imported fill material. Therefore, the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) has prepared this fact sheet to identify procedures that can be used to minimize the possibility of introducing contaminated soil onto a site that requires imported fill material. Such sites include those that are undergoing site remediation, corrective action, and closure activities overseen by DTSC or the appropriate regulatory agency. These procedures may also apply to construction projects that will result in sensitive land uses.

The intent of this fact sheet is to protect people who live on or otherwise use a sensitive land use property. By using this fact sheet as a guide, the reader will minimize the chance of introducing fill material that may result in potential risk to human health or the environment at some future time.

Overview

Both natural and man-made fill materials are used for a variety of purposes. Fill material properties are commonly controlled to meet the necessary site specific engineering specifications. Because most sites requiring fill material are located in or near urban areas, the fill materials are often obtained from construction projects that generate an excess of soil, and from demolition debris (asphalt, broken concrete, etc.). However, materials from those types of sites may or may not be appropriate, depending on the proposed use of the fill, and the quality of the assessment and/or mitigation measures, if necessary. Therefore, unless material from construction projects can be demonstrated to be free of contamination and/or appropriate for the proposed use, the use of that material as fill should be avoided.

Selecting Fill Material

In general, the fill source area should be located in nonindustrial areas, and not from sites undergoing an environmental cleanup. Nonindustrial sites include those that were previously undeveloped, or used solely for residential or agricultural purposes. If the source is from an agricultural area, care should be taken to insure that the fill does not include former agricultural waste process byproducts such as manure or other decomposed organic material. Undesirable sources of fill material include industrial and/or commercial sites where hazardous materials were used, handled or stored as part of the business operations, or unpaved parking areas where petroleum hydrocarbons could have been spilled or leaked into the soil.

Undesirable commercial sites include:

- Former gasoline service stations
- Retail strip malls that contained dry cleaners or photographic processing facilities
- Paint stores
- Auto repair and/or painting facilities

Undesirable industrial facilities include:

- Metal processing shops
- Manufacturing facilities
- Aerospace facilities
- Oil refineries
- Waste treatment plants, etc.

Alternatives to using fill from construction sites include the use of fill material obtained from a commercial supplier of fill material or from soil pits in rural or suburban areas. However, care should be taken to ensure that those materials are also uncontaminated.

Recommended Fill Material Sampling Schedule

Area of Individual Borrow Area	Sampling Requirements
2 acres or less	Minimum of 4 samples
2 to 4 acres	Minimum of 1 sample every 1/2 acre
4 to 10 acres	Minimum of 8 samples
Greater than 10 acres	Minimum of 8 locations with 4 subsamples per location

Volume of Borrow Area Stockpile	Samples per Volume
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

Documentation and Analysis

In order to minimize the potential of introducing contaminated fill material onto a site, it is necessary to verify through documentation that the fill source is appropriate and/or to have the fill material analyzed for potential contaminants based on the location and history of the source area. Fill documentation should include detailed information on the previous use of the land from where the fill is taken, whether an environmental site assessment was performed and its findings, and the results of any testing performed. It is recommended that any such documentation should be signed by

an appropriately licensed (CA-registered) individual. If such documentation is not available or is inadequate, samples of the fill material should be chemically analyzed. Analysis of the fill material should be based on the source of the fill and knowledge of the prior land use.

Detectable amounts of compounds of concern within the fill material should be evaluated for risk in accordance with the DTSC Preliminary Endangerment Assessment (PEA) Guidance Manual. If metal analyses are performed, only those metals (CAM 17 / Title 22) to which risk levels have been assigned need to be evaluated.

At present, the DTSC is working to establish California Screening Levels (CSL) to determine whether some compounds of concern pose a risk. Until such time as these CSL values are established, DTSC recommends that the DTSC PEA Guidance Manual or an equivalent process be referenced. This guidance may include the Regional Water Quality Control Board's (RWQCB) guidelines for reuse of non-hazardous petroleum hydrocarbon contaminated soil as applied to Total Petroleum Hydrocarbons (TPH) only. The RWQCB guidelines should not be used for volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCS). In addition, a standard laboratory data package, including a summary of the QA/QC (Quality Assurance/Quality Control) sample results should also accompany all analytical reports.

When possible, representative samples should be collected at the borrow area while the potential fill material is still in place, and analyzed prior to removal from the borrow area. In addition to performing the appropriate analyses of the fill material, an appropriate number of samples should also be determined based on the approximate volume or area of soil to be used as fill material. The table above can be used as a guide to determine the number of samples needed to adequately characterize the fill material when sampled at the borrow site.

Alternative Sampling

A Phase I or PEA may be conducted prior to sampling to determine whether the borrow area may have been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with DTSC or appropriate regulatory agency. However, if it is not possible to analyze the fill material at the borrow area or determine that it is appropriate for use via a Phase I or PEA, it is recommended that one (1) sample per truckload be collected and analyzed for all compounds of concern to ensure that the imported soil is uncontaminated and acceptable. (See chart on Potential Contaminants Based on the Fill Source Area for appropriate analyses).

This sampling frequency may be modified upon consultation with the DTSC or appropriate regulatory agency if all of the fill material is derived from a common borrow area. However, fill material that is not characterized at the borrow area will need to be stockpiled either on or off-site until the analyses have been completed. In addition, should contaminants exceeding acceptance criteria be identified in the stockpiled fill
material, that material will be deemed unacceptable and new fill material will need to be obtained, sampled and analyzed. Therefore, the DTSC recommends that all sampling and analyses should be completed prior to delivery to the site to ensure the soil is free of contamination, and to eliminate unnecessary transportation charges for unacceptable fill material.

Composite sampling for fill material characterization may or may not be appropriate, depending on quality and homogeneity of source/borrow area, and compounds of concern. Compositing samples for volatile and semivolatile constituents is not acceptable. Composite sampling for heavy metals, pesticides, herbicides or PAH's from unanalyzed stockpiled soil is also unacceptable, unless it is stockpiled at the borrow area and originates from the same source area. In addition, if samples are composited, they should be from the same soil layer, and not from different soil layers.

When very large volumes of fill material are anticipated, or when larger areas are being considered as borrow areas, the DTSC recommends that a Phase I or PEA be conducted on the area to ensure that the borrow area has not been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with the DTSC.

For further information, call Shahir Haddad, P.E. at (714) 484-5368.

San Diego, California 92108-2700

Attention: Mr. Tom Alo

Subject: Document Submittals Under Cleanup and Abatement Order No. R9-2021-0042 Rohr, Inc. - North Campus, Parcel A
Chula Vista, California
Global ID No. T0000011095

Dear Mr. Alo:

Haley & Aldrich, Inc., is providing this letter on behalf of Rohr, Inc. a Collins Aerospace Company, (Rohr) for Parcel A at its former North Campus facility located in Chula Vista, California (Site). The letter is in response to our discussion during an on-Site meeting on July 7, 2022, and a subsequent conference call on July 14, 2022, regarding the Site remediation approach and document submittals required under Cleanup and Abatement Order No. R9-2021-0042 (CAO).

Rohr sold Parcels A and B, which will be redeveloped by new owners. Parcel A was sold to PSIP Wohl Bay Boulevard LLC (PSIP Wohl) in September 2020. PSIP Wohl intends to demolish the northern 24,000 square feet of Building 29 to construct a new loading dock once it obtains permit approval from the City of Chula Vista (City) sometime later this year.

The San Diego Regional Water Quality Control Board (SDRWQCB) issued a new CAO to Rohr on July 12, 2021. Provision L.1 of the CAO required Rohr to notify the SDRQCB within 45 days of its intent to submit optional documents to meet the Directives of the CAO. On August 25, 2021, Raytheon Technologies Corporation (Raytheon), the parent company of Rohr, submitted a request to provide separate submittals for each parcel (Parcels A, B, and C) since they are on different redevelopment schedules and Rohr will continue to own and continue its operations on Parcel C. Raytheon also requested that the Site's Soil and Soil Gas Remedial Alternatives Report (Directive C.4.b) be combined with the Site's Soil and Soil Gas Remedial Action Plan (C.5.a) for each parcel.

Rohr recently completed a Data Gap Investigation and Report for Parcel A to meet the requirements of CAO Directive C.2. The Data Gap investigation Report was submitted to the SDRWQCB on June 13, 2022. The Baseline Human Health Risk Assessment (HHRA), submitted to the SDRWQCB on May 4, 2021, was updated to include the results of the data gap investigation. An Updated HHRA was submitted to the SDRWQCB on July 8, 2022, to meet CAO Directive C.3. It is our understanding that it is currently being

reviewed by the SDRWQCB and the Office of Environmental Health Hazard Assessment and that the reviews will be completed in a few weeks.

During our Site walk and conference call, we discussed the path forward for addressing Parcel A soil and soil gas (Directives C.4 and C.5) with the pending City approval of the permit to demolish the northern portion of Building 29. A summary of our discussion for each media is provided below:

Soil: The areas where trichloroethene is present in soil above its health-based remediation goal (HBRG) and groundwater protection level are located beneath that portion of Building 29 that will be demolished. As such, we intend to remediate soil through removal and disposal under a Demolition and Environmental Monitoring Plan (DEMP). Once completed, a DEMP Completion Report will be submitted to the SDRWQCB. It is our understanding that based on the results and review of the DEMP Completion Report, the SDRWQCB will provide a letter to Rohr that no further action is needed for Parcel A soil.

Soil Gas: Volatile organic compounds (VOCs) in soil gas in the northern portion of Building 29 that are above HBRGs appearing in the Update to the Revised HHRA will be addressed by implementing the DEMP and removing the VOC-impacted soil beneath that portion of the building that will be demolished. However, there are other localized areas of soil gas HBRG exceedances beneath the central and southern portions of Building 29 attributed to VOCs in groundwater. These areas will be addressed by installing and operating a sub-slab depressurization system (SSDS) to protect future building occupants from vapor intrusion risks, if any. Rohr's Purchase and Sale Agreement requires PSIP Wohl to install an SSDS for Building 29 prior to any occupancy. As discussed, a work plan will be prepared that summarizes testing data that supports and includes the proposed design for the SSDS that will be installed beneath the building.

A Risk Management Plan (RMP) will also be prepared and implemented to address potential future vapor intrusion risks to building occupants. The RMP will include:

- An SSDS post-installation monitoring and performance plan to evaluate the effectiveness of the SSDS in mitigating potential vapor intrusion. Indoor air sampling, as required by the CAO, will be included. The plan will be implemented before a tenant occupies the building.
- Restrictions on changes to the existing building slab;
- A Contingency Plan;
- A schedule for performing post-installation sub-slab and indoor air sampling and preparing SSDS performance monitoring reports, and a Post-Mitigation Completion Report; and
- The preparation and filing of a deed restriction containing restrictions on use and occupancy of Parcel A (the Grant Deed in favor of PSIP Wohl recorded in September 2020 contains such restrictions and satisfies such deed restriction requirement).

While not directly included in our discussions, groundwater impacts will be addressed sitewide including Parcels A, B and C as described in Raytheon's letter to the SDRWQCB on Optional Document Submittals dated August 25, 2021.

The CAO is written sequentially such that following approval of the HHRA (Directive C.3), it requires that the following documents be prepared, implemented, and submitted in this order:

- Site Soil Cleanup Levels Report (Directive C.4.a),
- Site Soil and Soil Gas Remedial Alternatives Report (Directive C.4.b),
- Site Soil and Soil Gas Remedial Action Plan ([RAP]; Directive C.5.a),
- Soil and Soil Gas RAP Implementation (Directive C.5.b);
- Site Soil and Soil Gas RAP Progress Reports (Directive C.5.c); and
- Soil and Soil Gas RAP Completion Report (Directive C.5.d).

As discussed, the approach described above for Parcel A includes submitting the DEMP, a DEMP Completion Report, an SSDS Work Plan and RMP documents would replace the documents in the list above required by Directive C.4 – Site Soil and Soil Gas Feasibility Study and Directive C.5 – Site Soil and Soil Gas Remedial Actions. Please provide a letter that indicates the SDRWQCB concurs with this proposed approach for Parcel A and the list of documents listed above for Directives C.4 and C.5 will not be needed to comply with the CAO. Please contact us if you have any questions.

Sincerely yours,
HALEY & ALDRICH, INC.

Attention: Mr. Tom Alo

Subject: Revised Conceptual Site Model
Rohr, Inc. – North Campus, Parcel A
850 Lagoon Drive
Chula Vista, California
GeoTracker ID No. T10000011095

Dear Mr. Alo:

Haley & Aldrich, Inc., is submitting this Revised Conceptual Site Model (CSM) to the San Diego Regional Water Quality Control Board (SDRWQCB) on behalf of Rohr, Inc., a Collins Aerospace Company, for Parcel A of its North Campus facility at 850 Lagoon Drive, in Chula Vista, California. The Parcel A CSM was revised in response to the SDRWQCB's letter dated April 13, 2021. A response to comments matrix (Table 1) is attached to this letter with our responses. Please contact the undersigned if you have any additional comments or questions regarding this Revised Parcel A CSM.

Sincerely yours,
HALEY & ALDRICH, INC.

COMMENT NO.	CSM SECTION	DECEMBER 8, 2020 LETTER		FEBRUARY 25, 2021 LETTER		APRIL 13, 2021 LETTER	
		SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD COMMENT	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE
A						This section should include details on the recognized environmental condition (REC) and a discussion whether a data gap exists. The REC should be included in Table 1 and discussed in Section 6 accordingly.	Based on clarification provided during a telephone call on April 19, 2021, the SDRWQCB was referencing the following statement appearing in the Partner Phase I: "Additional sampling is proposed for the adjacent parcels to the north." While the statement is unclear, Partner is referencing the three additional vacant parcels north of those that are subject to the Phase I and property sale: 340 Bay Boulevard and the two additional parcels to the north at 798 F Street. These parcels are part of Parcel C and will be described in the sitewide CSM.
1	Section 2.1 Site Geology	This section indicates that the geology beneath Parcel A is different than the geology beneath the former South Campus Site and other portions of the North Campus Site (i.e., Parcels B and C) in terms of the composition of the fill material. Parcel A is more than 1,000 feet upland of the former shoreline and, as such, there is no bay mud or extensive fill present. Based on these differences, evaluate whether the soil background cleanup levels and the groundwater protection levels (GPLs) developed for the former South Campus Site are applicable to Parcel A. Include this evaluation in the feasibility study for Parcel A.	Comment noted. While the geologic units may be different on Parcel A compared to the former South Campus and Parcel B on the North Campus, the soil types are the same based on review of boring logs for these areas. The soil for each of the areas is generally fine-grained. The GPLs are soil matrix dependent and protect groundwater to concentrations equal to the Maximum Contaminant Level (MCL). Each GPL for the South Campus Property was~~-~~selected using one **of** two methodologies: 1) based on leachate results obtained from soil samples collected across the South Campus property, or 2) calculated from a soil partition equation. As noted above, the soil matrix of the vadose zone soil on both the South Campus Property and the North Campus Property is similar. Therefore, the leachability of chemicals from soil on either property would be similar as would the GPL derived based on soil leachability. As for the GPLs selected using a partition equation calculation, the soil type in the equation was conservatively assumed to be sand, a more coarse-grained matrix that would result in less chemical adsorption and a lower GPL than if a more fine-grained matrix were assumed.~~-~~Therefore the GPLs derived using either methodology would be applicable at both the South Campus Property and the North Campus Property. An evaluation will be included in the Feasibility Study for Parcel A, that will be presented in the Soil Remedial Action Plan.	Clarify whether the following text in your response should be “of” and not “or” (highlighted and underlined): “Each GPL for the South Campus Property was selected using one or two methodologies: 1) based on leachate results obtained from soil samples collected across the South Campus property, or 2) calculated from a soil partition equation. As noted above, the soil matrix of the vadose zone soil on both the South Campus Property and the North Campus Property is similar.”	The "or" should be "of," and has been revised (bold text in the original response in the Rohr response column to the left).		
2	Section 3 Environmental Features	The environmental features listed in Table 1 are difficult to identify on Figure 2. Revise Figure 2 to make each environmental feature easily identifiable.	Figure 2 has been revised to make the environmental features easily identifiable. Table 1 has been revised to include the corresponding Map ID in the first, rather than third column, followed by the name of the feature. Non-numbered features are shown on the figures with text and/or shading and this is noted in Table 1. As we discussed on December 9, 2020 the sample locations appear on a separate figure (now Figure 3) to simplify Figure 2 and show environmental features only.	No additional comments.			

TABLE 1
RESPONSE TO COMMENTS MATRIX
SDRWQCB LETTERS DATED DECEMBER 8, 2020, FEBRUARY 25, 2021, AND APRIL 13, 2021
ROHR - NORTH CAMPUS CONCEPTUAL SITE MODEL (PARCEL A ONLY)
CHULA VISTA, CALIFORNIA

COMMENT NO.	CSM SECTION	DECEMBER 8, 2020 LETTER		FEBRUARY 25, 2021 LETTER		APRIL 13, 2021 LETTER	
		SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD COMMENT	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE
3	Section 4.1 Extent of Chemicals in Vadose Zone Soil	The soil background cleanup levels and GPLs developed for the former South Campus Site may or may not be applicable for Parcel A as described in comment 1. If these screening levels cannot be used, soil background cleanup levels and GPLs must be developed for Parcel A and, at a minimum, this section of the CSM report must be revised.	Similar to the GPLs, soil background thresholds are dependent on soil type, in addition to geology, and location. Soil background thresholds are typically derived from on-site soil or soil in proximity to a site that has similar soil properties and generally of similar geologic origin. Due to the similar soil types on both the South Campus Property and the North Campus Property and their proximity to one another, the soil background thresholds derived for the South Campus Property are considered to be relevant at the North Campus Property.	Include an evaluation in the Feasibility Study for the soil background levels similar to the proposed evaluation for GPLs described in your response to Comment 1 above.	Comment noted. An evaluation will be included in the soil Feasibility Study.	No additional comments.	
4	Section 4.1 Extent of Chemicals in Vadose Zone Soil	The following figures should be included in the CSM report. These figures will provide a more focused view of the vadose-zone soil samples collected and analyzed per chemical class and per environmental feature, which will help to identify data gaps. These figures should also be referenced and discussed in Section 6 of the CSM report. a. Chemical Class Figures. Separate figures, similar to Figures 4 through 8 in the North Campus report titled "Phase II Environmental Site Assessment – Project Springsteen, Parcel B" (January 2018), showing (1) the vadose-zone samples collected at Parcel A for each chemical class: Title 22 metals, hexavalent chromium, pesticides, volatile organic compounds (VOCs), semi-VOCs, total petroleum hydrocarbons, and polychlorinated biphenyls; and (2) the vadose-zone samples that exceed soil screening criteria. b. Environmental Feature Figures. Separate figures with callout boxes, similar to Figures 6 through 61 in the South Campus report titled "Soil Cleanup and Abatement Completion Report – North of Exchange Parcel" (July 2020), showing the vadose-zone soil samples collected at Parcel A that are used to assess the subsurface conditions in the vicinity of each environmental feature. These figures should be consistent with Figure 2 and the information provided in Table 1.	Chemical Class Figures for vadose zone soil are included (Figures 7A through 7F) for the COPCs on Parcel A. The figures are referenced in the text as requested. Environmental Feature Figures are provided as Figures 4A through 4D. As we discussed on December 9, 2020, we agreed that a figure for each environmental feature was not necessary. The site has been split into four areas from north to south with a smaller map scale so that the sample locations associated with an environmental feature can be identified more easily. These figures are consistent with Figure 2, Figure 3 and Table 1.	Confirm that all soil borings listed in the column titled "Previous Soil Assessment Summary" of Table 1 are shown on Figures 3, 4A-4D, and 7A-7F. Some of the borings are missing from these figures, such as the 2013 UT borings. Also, confirm that all soil vapor probes are shown on Figures 3 and 9.	Figures 3, 4A-4D and 7A-7F have been reviewed and revised to include borings indicated in the noted column in Table 1.	No additional comments.	
				Include the boring ID numbers on Figure 7A.	Figure 7A has been revised to include the boring IDs.	No additional comments.	
				In Table 1, the soil borings and vapor probes listed for aboveground storage tank (AST) Nos. 201 and 202 are reversed and should be switched.	Table 1 has been corrected.	No additional comments.	
				Underground storage tank (UST) No. 3-09598 is identified as a historical environmental feature with total petroleum hydrocarbons (TPH) and metals as chemicals of potential concern (COPCs). Borings B29-33 (A, B, and C) and UT-22 are used to assess the soil conditions in the vicinity of this UST. Explain how the COPCs in soil near this UST are adequately characterized given that the soil samples collected at borings B-29-33 (A, B, and C) were not analyzed for TPH and metals as shown on Figures 7B and 7F, respectively. Additionally, boring UT-22 is missing from Figures 3, 4A-4D, and 7A-7F. Include boring UT-22 on these figures.	This UST was granted closure by the San Diego Department of Environmental Health since petroleum hydrocarbons were not present in soil and required no further investigation. Borings B29-33 (A,B.C) were advanced to investigate a former lathe. The additional borings were advanced to investigate whether PCBs or VOCs might be associated with the former lathe. The figures have been updated to include the location of boring UT-22. Soil from this boring was analyzed for VOCs, since VOCs may be COPCs associated with this feature.	Metals were originally listed as one of the potential chemicals associated with this UST. Explain why metals were removed and replaced with VOCs.	The URS Phase I (URS, 2013) identifies VOCs as the only COPCs other than TRPH for this feature. Metals are not COPCs for this feature. Table 1 will remain as is for this feature. Subsequent sub-slab vapor sampling indicated that certain VOCs were reported at levels above screening criteria and step-out soil samples were collected and analyzed during the Haley & Aldrich Data Gap Assessment (borings B29-35A, -35B and -35C; Haley & Aldrich, 2020).
				AST No. 203 is identified as a historical environmental feature with TPH and metals as COPCs. Boring UT-19 is the only boring used to assess the soil conditions in the vicinity of this AST. Explain how the COPCs in soil near this AST are adequately characterized given that boring UT-19 is approximately 90 feet to the west. Additionally, boring UT-19 is missing in the TPH and metals figures (Figures 7B and 7F, respectively). Include boring UT-19 on these figures.	UT-19 has been added to Figures 7B and 7F. No vapor sample could be obtained from vapor probe PW-10 due to tight soil conditions. While no impacts to groundwater were observed downgradient of this feature in UT-19, we believe that the absence of soil data is not a data gap based on the explanation provided in Table 1.		

COMMENT NO.	CSM SECTION	DECEMBER 8, 2020 LETTER		FEBRUARY 25, 2021 LETTER		APRIL 13, 2021 LETTER	
		SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD COMMENT	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE	SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD RESPONSE	ROHR, INC., A COLLINS AEROSPACE COMPANY RESPONSE
4	Section 4.1 Extent of Chemicals in Vadose Zone Soil			AST No. 161 is identified as a historical environmental feature with volatile organic compounds (VOCs) and metals as COPCs. Borings (UT-25, B29-10, and B29-15) and vapor probes (B29-V13, B29-V16, and PW-11) are used to assess the soil and soil vapor conditions near this AST. Boring B29-15 and vapor probe B29-V16 should not be used because they are greater than 300 feet south of this AST as shown on Figure 3.	Feature No. 161 was a former paint booth that was present at two different locations as noted in the comments in Table 1 and as shown on Figure 3, B29-15, and B29-V16 investigated the second (southern) location of that the paint booth in Building 29.		
				Degreaser No. 300 is identified as a historical environmental feature with VOCs as COPCs. Table 1 indicates that trichloroethene (TCE) is the only chemical exceeding the GPLs and/or the Department of Toxic Substances Control (DTSC) screening levels based on the soil borings advanced near this degreaser. Confirm that no other chemicals exceed these criteria.	There are no other chemicals that exceed GPLs and/or DTSC-SLs in soil associated with this degreaser. There are however several COPCs that exceed their respective screening criteria for soil vapor, which has been noted in the comments associated with this feature in Table 1.	Soil associated with this degreaser is not characterized. Therefore, Table 1 and Section 6 should indicate that a data gap exists.	Table 1 and Section 6 have been revised to indicate that there is a data gap at Degreaser No. 300.
				The mills and lathes (No. 304) are identified as a historical environmental feature with VOCs and polychlorinated biphenyls (PCBs) as COPCs. Borings (B29-21 and B29-32 through B29-35) and vapor probes (B29-V17 and PW-14) are used to assess the soil and soil vapor conditions near this environmental feature. Boring B29-32 should not be used because it is located on the opposite end of Building 29 as shown on Figure 3. Vapor probes B29-V19 and PW-15 should be included for assessing the soil vapor conditions because they are located in the vicinity of this environmental feature. Note that these vapor probes exceed the soil vapor screening criteria for TCE.	Comment noted. The mills and lathes were at four different locations and are not described individually in Table 1. The vapor probes noted have been added to the description associated with these environmental features. It has been noted in the comments that there were Vapor ESL exceedances at these locations.	The soil samples associated with each mill/lathe should be listed separately in Table 1, similar to the Former Paint Booth (two locations).	Table 1 has been revised to describe each mill/lathe independently. These features are depicted as feature nos. 304A, 304B, 304C and 304D on the site maps.
				The former maintenance department is identified as a historical environmental feature with TPH and VOCs as COPCs. Table 1 indicates that TCE is the only chemical exceeding the GPLs and/or DTSC screening levels based on the soil borings advanced in the former maintenance department. Confirm that no other chemicals exceed these criteria.	There are no other chemicals that exceed GPLs and/or DTSC-SLs in soil in the former Maintenance Department. There are however several COPCs that exceed their respective screening criteria for soil vapor. Vapor ESL exceedances are noted in the comments associated with the former Maintenance Department.	Soil associated with the former maintenance department is not characterized. Therefore, Table 1 and Section 6 should indicate that a data gap exists.	Table 1 and Section 6 have been revised to indicate that there is a data gap at the former maintenance department.
				The former lumber yard is identified as a historical environmental feature with phenols as a COPC. Borings (UT-25 and B29-8 through B29-11) and vapor probes (B29-V11 and B29-V13) are used to assess the soil and soil vapor conditions near the former lumber yard. Boring UT-25 should be not used because the soil samples were not analyzed for semi-volatile organic compounds (SVOCs) as shown on Figure 7C. Vapor probes PW-11 and PW-12 should be included for assessing the soil vapor conditions because they are located within the footprint of the former lumber yard. Note that these vapor probes exceed soil vapor screening criteria for specific VOCs as shown on Figure 9.	The vapor probes were used to investigate the former Maintenance Department not the lumber yard and have been removed from the description of this historical environmental feature in Table 1. The vapor exceedances associated with these vapor probes are noted under the comments for the former Maintenance Department.	Per our original recommendation, vapor probes PW-11 and PW-12 should be included in Table 1 for assessing the soil vapor conditions within the former lumber yard. Table 1 and Section 6 should also indicate that a data gap exists because vapor probes PW-11 and PW-12 exceed the soil vapor screening criteria for specific VOCs shown on Figure 9.	Table 1 has been updated as requested; however, the source of the soil vapor is related to an unspecified source that is coincident with the footprint of the former lumberyard. Based on the PW-11 and PW-12 soil vapor screening criteria exceedances, the area has been identified as a data gap since the soil vapor concentrations exceed screening criteria.

4	Section 4.1 Extent of Chemicals in Vadose Zone Soil			The former agricultural property is identified as a historical environmental feature with metals (specifically arsenic) and organochlorine pesticides (OCPs) as COPCs. Borings B99-01 through B99-04 and borings B29-01 through B29-20 are used to assess the soil conditions near this environmental feature. Borings B29-08 through B29-20 should not be used because they are not within the footprint of this environmental feature as shown on Figure 3.	Table 1 has been revised to not include borings B29-08 through B29-20 since these borings lie outside the area historically used for agricultural purposes.	No additional comments.	
		The San Diego Water Board will consult with the California Office of Environmental Health Hazard Assessment to discuss the exposure pathways shown on Figure 13. Written comments will be provided to Rohr during the development of the Human Health Risk Assessment for Parcel A.	Comment noted.				
6	Section 6 Data Gap Assessment	Data gaps exist for soil at the former Maintenance Department located in Building 29. The San Diego Water Board agrees with Rohr's proposal to further delineate soil exceeding screening levels during the construction of the new loading dock and the implementation of the soil Remedial Action Plan for Parcel A.	Comment noted.				
7		Data gaps exist for indoor air at Building 29. The San Diego Water Board agrees with Rohr's proposal to conduct indoor air sampling after Building 29 improvements are completed. The improvements include the construction of the new loading dock (which will include further delineation and excavation of trichloroethene-impacted soil) and installation of a sub-slab depressurization system (SSD). Rohr is installing an SSD to address the potential for vapor intrusion due to the elevated soil vapor concentrations present beneath Building 29. Indoor air sampling will be conducted after the completion of these improvements to verify vapor intrusion is a not concern.	Comment noted.				
8		Revise this section, as necessary, based on the chemical class figures and environmental feature figures recommended in Comment 4.	No revisions were necessary to Section 6 based on the chemical class and environmental features figures recommended in Comment No. 4.

Haley & Aldrich, Inc.

Executive Summary

Haley & Aldrich, Inc., prepared this Revised Conceptual Site Model (CSM) on behalf of Rohr, Inc., a Collins Aerospace Company, (Rohr) for Parcel A of its North Campus facility located at 850 Lagoon Drive, in Chula Vista, California (Site). Rohr has decommissioned and is in the process of selling portions of its facility that occupies approximately 82 acres. The Site has been divided into three parts: Parcels A, B, and C. In September 2020, Rohr sold the property that includes Buildings 29, 99, and 100 on Parcel A to PSIP Wohl Bay Boulevard LLC (Owner). The Owner is also purchasing the vacant parcels at 360, 364, and 368 Bay Boulevard, formerly included on Parcel C, and is negotiating the purchase of 350 Bay Boulevard. These parcels are also included in this Revised CSM. With these added parcels, Parcel A occupies approximately 15.3 acres. Parcel B is in the process of being sold, and Parcel C will be retained and continue to be owned and operated by Rohr. The Owner intends to raze the northern portion of Building 29 to build a loading dock and may raze Buildings 99 and 100 to redevelop this parcel and the adjoining vacant properties to the north.

Rohr's industrial activities on the North Campus included the manufacture and assembly of aerospace parts, primarily engine parts and covers (nacelles). Parcel A consists of two areas: Buildings 99 and 100 and the adjacent vacant properties north of G Street, and Building 29 south of G Street. Industrial activities and historical chemical use on Parcel A were more limited compared to the main manufacturing portions of the facility located on Parcel B and the former South Campus. Building 29 was primarily used for tooling, machining, and office space. At one time, the northernmost portion of Building 29 served as the Maintenance Department. Rohr purchased Buildings 99 and 100 in 1986 and primarily used them for administrative purposes. Rohr acquired the vacant Bay Boulevard properties to the north of Buildings 99 and 100, including 350, 360, 364, and 368 Bay Boulevard in 1999 from the City of Chula Vista (City) as part of the 1999 Relocation Agreement. Rohr has not conducted any activities on the vacant Bay Boulevard properties since they acquired them from the City. Prior to Rohr's ownership, Parcel A had other uses.

Phase I Environmental Site Assessments have identified historical environmental features that could be potential sources of chemicals beneath Parcel A. These features included aboveground storage tanks, underground storage tanks, paint booths, and vapor degreasers. Previous investigations on Parcel A have included extensive soil, soil vapor, and groundwater sampling. Indoor air screening has been performed in Building 29. The available soil, soil vapor, and indoor air screening data have been compared to relevant screening criteria.

Soil samples have been analyzed for the following chemicals of potential concern (COPCs): total recoverable petroleum hydrocarbons, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs; including phenols and polynuclear aromatic hydrocarbons), polychlorinated biphenyls (PCBs), organochlorine pesticides (OCPs), and Title 22 Metals. The analyses performed were specific to the historical environmental features identified on Parcel A. There were five COPCs reported in soil at concentrations above their respective Total Threshold Limit Concentration (TTLC), Groundwater Protection Level (GPL), and/or commercial/industrial California Department of Toxic Substances Control Screening Level (DTSC-SL) on Parcel A: trichloroethene (TCE), PCBs, DDE, dibenz(a,h)anthracene, and arsenic. The five COPCs that exceed a GPL or commercial/industrial DTSC-SL have been reported at five locations in the Building 29 Area (B29-23, B29-24, B29-05, B29-07A, and B29-12). Arsenic was compared to the background concentration established for the former South Campus. Seven locations exceeded background (B29-02, B29-03,

B29-03A, B29-03B, B29-07, B29-07A, and B29-07B). There were no soil exceedances in the Buildings 99 and 100 Area or on the vacant parcels to the north except for BB-23, where DDE was reported at the TTLC of 1 milligram per kilogram (mg/kg) and below the commercial/industrial DTSC-SL of 9.3 mg/kg.

Five locations adjacent to Parcel A along the drainage swale in the railroad right-of-way (ROW) reported DTSC-SL exceedances for PCBs (UT-02), benzo(a)pyrene, and dibenz(a,h)anthracene (UT-18, UT-21, and UT-66). Arsenic was reported above Site-specific background in UT-03. The railroad ROW is not owned by Rohr and is not part of Parcel A.

Sub-slab and deeper soil vapor samples were compared to the San Francisco Bay Regional Water Quality Control Board's commercial/industrial sub-slab/soil gas Vapor Environmental Screening Levels (Vapor ESLs). The following VOCs were reported in soil vapor at concentrations above the Vapor ESLs: TCE, tetrachloroethene, chloroform, benzene, bromodichloromethane and ethylbenzene. The exceedances were reported at the locations of historical environmental features in Building 29. There were no environmental concerns related to soil vapor in Buildings 99 and 100. The TCE indoor air screening data were compared to the U.S. Environmental Protection Agency Region 9 Interim TCE Indoor Air Response Levels (RLs). The RL exceedances during the February 2019 screening event were in the former Maintenance Department, where VOCs have been detected in soil, soil vapor, and groundwater. As an immediate interim action, Rohr increased air circulation by keeping the fans operating and the doors opened as well as sealing the cracks and joints in the slab in the northern portion of the building.

This Revised CSM was developed based on the Site history, location, and geology. Parcel A is situated at elevations ranging from approximately 13 to 28 feet above mean sea level datum. Unlike Parcel B, Parcel C, and the Former South Campus, located to the west at lower elevations and adjacent to the former shoreline of San Diego Bay, the geology beneath Parcel A is relatively simple. It is underlain, in descending order, by limited fill material, the Bay Point Formation, a clay aquitard, and the San Diego Formation. Because Parcel A is more than 1,000 feet upland of the former shoreline, there are no bay deposits or extensive fill present on this portion of the North Campus facility. However, a comparison of boring logs for Parcel A, Parcel B, and the South Campus suggest that the soil types are similar and fine-grained. While it is believed that background and GPLs for soil derived for the Former South Campus are relevant, an evaluation will be included in the Feasibility Study for Parcel A that will be presented in the Soil Remedial Action Plan.

Historical environmental features on Parcel A have been investigated for their specific COPCs in soil, soil vapor, indoor air, and shallow groundwater. Historical chemical sources are coincident with former Site areas associated with long-term chemical usage. VOC releases have migrated through the soil to groundwater, resulting in a groundwater plume that extends westward below Parcel B. Soil vapor has the potential to migrate through the building slab and into indoor air. Potential receptors to soil and soil vapor include an on-Site commercial/industrial worker, a landscaper/utility worker, and a construction worker. Exposure pathways and receptors will be evaluated during the Human Health Risk Assessment (HHRA).

Based on our assessments, it is our opinion that the existing soil and soil vapor data support the Revised CSM and are adequate to proceed with an HHRA and a Soil Feasibility Study/Soil Remedial Action Plan (Soil FS/RAP). The COPCs analyzed, sample locations, and sample depths have been reviewed specific to each environmental feature to evaluate whether it has been adequately characterized.

There are no soil data gaps for TPH, SVOCs, PCBs, OCPs, and Title 22 Metals. There are soil data gaps for VOCs in the former Maintenance Department, including the small degreaser (Historical Environmental Feature No. 300). If additional sampling is needed to delineate soil that may require remediation, it can be conducted during the Soil FS/RAP once the building slab has been removed and the soil is being excavated to construct the loading dock.

The soil vapor surveys identified locations beneath Building 29 where VOCs are present at concentrations that exceed the Vapor ESLs. The locations of the exceedances are coincident with historical environmental features and VOCs in soil and groundwater. The Owner will be installing a sub-slab depressurization system (SSDS), and other remedies will be considered in the Soil FS/RAP for addressing vapor intrusion. The historical features that were associated with VOCs have been adequately investigated; however, there is a data gap associated with soil vapor at PW-11 and PW-12, where VOCs were reported above Vapor ESLs.

Indoor air screening was conducted based on the findings of the soil gas surveys and addressed cracks and other penetrations to the slab in Building 29. No indoor air sampling was necessary in Buildings 99 and 100. As previously noted, the Soil FS/RAP will address soil during construction of the loading dock. The SSDS will also address potential vapor intrusion into the building. While indoor air sampling is a data gap, the data will only be relevant if the data are collected post-redevelopment prior to building occupancy. It is recommended that indoor air sampling be conducted at that time to address potential vapor intrusion concerns.

1. Site Background

1.1 SITE SETTING

Haley & Aldrich, Inc., (Haley & Aldrich) prepared this Revised Conceptual Site Model (CSM) on behalf of Rohr, Inc., a Collins Aerospace Company, (Rohr) for Parcel A of its North Campus facility located at 850 Lagoon Drive, in the City of Chula Vista, California (Site). Rohr has decommissioned and is in the process of selling portions of its facility that occupies approximately 82 acres. The Site has been divided into three parts: Parcels A, B, and C. In September 2020, Rohr sold the property that includes Buildings 29, 99, and 100 (APN 567-022-30 and the eastern portion of 571-330-29) on Parcel A to PSIP Wohl Bay Boulevard LLC (Owner). The Owner is also planning to purchase the vacant parcels at 360, 364, and 368 Bay Boulevard (APNs 567-022-28, 567-022-31 and 567-022-33) and is negotiating purchase of 350 Bay Boulevard (APN 567-022-17). These parcels, formerly included in Parcel C, are also included in this Revised CSM. With these added parcels, Parcel A occupies approximately 15.3 acres. The Owner intends to raze the northern portion of Building 29 to build a loading dock and may raze Buildings 99 and 100 to redevelop this parcel and the adjoining vacant properties to the north. Parcel B is in the process of being sold; and Parcel C will be retained and continue to be owned and operated by Rohr.

Haley & Aldrich prepared and submitted a CSM for the North Campus to the San Diego Regional Water Quality Control Board (SDRWQCB) on May 19, 2020 (Haley & Aldrich, 2020b). The SDRWQCB issued a letter on October 27, 2020, (SDRWQCB, 2020) commenting on the North Campus CSM. Haley & Aldrich responded to the SDRWQCB's comments in a letter dated November 19, 2020.

As discussed on our conference call with the SDRWQCB on November 4, 2020, the Owner's consultant, GSI Environmental Inc., (GSI) and Haley & Aldrich, the Owner plans to make some improvements to Building 29 for a tenant that will occupy the building in early 2022. The SDRWQCB has agreed that Rohr can submit a separate CSM specific to Parcel A for soil and soil vapor. This document is the CSM specific to Parcel A. A subsequent CSM will be submitted to address soil and soil vapor for Parcels B and C as well as groundwater for the entire Site (Sitewide CSM). The SDRWQCB is also in the process of finalizing a new Cleanup and Abatement Order (CAO) for the North Campus (CAO No. R9-2020-0099) that will supersede CAO No. 98-08 (the 1998 CAO).

The Site's location is shown on Figure 1; the Site's boundaries and Assessor's Parcel Numbers are shown on Figure 2. Parcel A includes the properties occupied by Buildings 29, 99, and 100 and the vacant properties north of Buildings 99 and 100 at 350, 360, 364, and 368 Bay Boulevard. Parcel A is bounded on the east by Bay Boulevard, on the west by the San Diego and Arizona Eastern Railroad right-of-way (ROW) and Parcels B and C, on the north by the remainder of Rohr's vacant Bay Boulevard properties that are part of Parcel C, and on the south by H Street and Rohr's former South Campus. The former South Campus is owned by the San Diego Unified Port District.

Parcel A is approximately 1,000 feet upland of the former San Diego Bay shoreline. Ground surface elevations range from approximately 13 to 28 feet above mean sea level (MSL). There are no surface water features on the Site. The storm water conveyance system (SWCS) in the Building 29 Area is simple and includes the drain lines shown on Figure 2 that discharge to an asphalt-lined drainage swale. Surface water in the swale flows south toward H Street (Rick Engineering, 1998). Surface water sheet flows across the vacant properties to an unlined drainage swale on the west where it infiltrates or flows south and joins sheet flow from the Building 99 and 100 Area that flows west along the north side of G

Street into the SWCS between Parcels B and C. The SWCS discharges to a tidal inlet to San Diego Bay west of Building 61 on Parcel C.

1.2 SITE HISTORY

The history of Parcel A is primarily derived from information appearing in the following documents:

- Phase I Environmental Site Assessment (Phase I) prepared by Adrian Brown Consultants ([Adrian Brown], 1998);
- Data Compilation and Evaluation Report prepared by Woodward-Clyde Consultants ([Woodward-Clyde], 1998);
- Phase I prepared by URS Corporation (URS) when United Technologies Corporation acquired Goodrich Aerostructures Group (URS, 2013);
- Phase I prepared by Haley & Aldrich for Buildings 29, 99, and 100 on Parcel A (Haley & Aldrich, 2016a); and
- Phase I prepared by Haley & Aldrich for the Vacant Bay Boulevard Properties (Haley & Aldrich, 2016b).

The Owner recently had a Phase I ESA performed by Partner Engineering and Science, Inc. (Partner) for the parcels at 350, 360, 364 and 368 Bay Boulevard (Partner, 2020).

Rohr's industrial activities on the North Campus included the manufacture and assembly of aerospace parts, primarily engine parts and covers (nacelles). These manufacturing operations included metal cutting, punching, bending, stretching, forming, anodizing, alodining, milling, etching, and painting as well as chemical handling and storage, wastewater treatment, and material recycling. Chlorinated solvents, acids, caustics, cutting oils, petroleum fuel products, and metals were historically used at the North Campus. Other activities conducted at the facility included manufacturing and assembling light rail cars, buses, large array antennas, and missiles, among others (Bodhi, 2013).

Parcel A consists of two areas that have been part of the Rohr manufacturing facility. Buildings 99 and 100 and the vacant properties are located north of G Street, and Building 29 is located south of G Street. Industrial activities and historical chemical use on Parcel A were more limited compared to the main manufacturing portions of the facility located on Parcel B and the former South Campus. Rohr acquired the vacant Bay Boulevard properties from the City of Chula Vista (City) as part of the 1999 Relocation Agreement. Rohr has conducted no activities on these properties since acquiring them from the City.

Prior to Rohr's ownership, the parcels at 350, 360, 364, and 368 Bay Boulevard were developed agriculturally as a citrus grove from as early as 1929 to approximately 1944. The parcels were used for row crop cultivation from that time until at least 1953. The properties were then developed with mixed commercial/industrial and residential use as summarized in the following table.

Street Address	Occupants/Businesses
350 Bay Boulevard	Casey Const. Co. (1956) B & H Metal Co., metal goods (1964) Jackson's Auto Wrecking/Import Auto (1970-1985) Campbell Enterprise (1981)
360 Bay Boulevard	B & H Metal Co. (1956-1964) A & R Used Auto Parts (1964-1985)
364 Bay Boulevard	So. Bay Veterinary Hospital (1956-1964) Post Aircraft Co./For Mac Co., aircraft parts rear (1960-1964)
368, 368½ Bay Boulevard	Mansell Marine Inc./So. Bay Marine & Boat (1956-1964) San Diego Pump & Compressor (1964-1985) Residential (1976-1985)

Businesses that occupied these parcels included aircraft parts manufacturing, refrigeration unit repair, storage, junkyards, and a veterinary hospital (Haley & Aldrich, 2016b). 350 and 360 Bay Boulevard were formerly used for auto maintenance and repair, auto dismantling, and salvaging that included a gold ore extraction/recovery operation. By the mid-1980s, many of the properties were acquired by the City and business operations ceased. Rohr considered purchasing the vacant Bay Boulevard properties in the late 1980s to construct its corporate headquarters but purchased the property west of the railroad ROW instead. Rohr has never used or conducted any operations on the vacant Bay Boulevard properties.

Rohr purchased Buildings 99 and 100 in 1986 and primarily used them for administrative purposes. Test laboratories were housed in Building 100. Building 29 was constructed in phases beginning in about 1957 through 1962. Both areas of Parcel A were owned by others and used for other purposes prior to Rohr's ownership. (Adrian Brown, 1998; Woodward-Clyde, 1998; URS, 2013; Haley & Aldrich, 2016a, 2016b, 2018a). These other historical uses included agriculture, a trailer park, employee parking, truck engine repair, and a possible lumber yard. Based on historical aerial photographs, the area occupied by Buildings 99 and 100 were citrus groves as early as the 1920s, and the northern portion of the Building 29 Area was also used for agriculture. The agricultural use of portions of Parcel A appears to have taken place through the 1940s.

Building 29 was primarily used for tooling, machining, and office space for most of its history. At one time, the northernmost portion served as the Maintenance Department for the facility. Most recently the building housed laboratories, kitting, an After-Market Spares Warehouse, Service Center and FAI repairs, storage, tool calibration, product development, and office space.

Another former building (Building 28) was built on the southern portion of Parcel A in the mid-1940s and served as offices, including finance and payroll. The building was located south of Building 29 and was demolished around 2000. The area is now occupied by a parking lot.

1.3 SITE ASSESSMENT AND REMEDIATION

Historical environmental features on Parcel A are listed in Table 1 and shown on Figure 2. Site assessment activities were initiated in the late 1980s when Rohr considered purchasing the vacant properties for constructing its corporate office complex (Building 107).

Several investigations and soil remediation activities were conducted specific to 350-360 Bay Boulevard under the regulatory oversight of the San Diego County Department of Environmental Health (DEH) Voluntary Assistance Program (VAP) and the City received a No Further Action (NFA) Letter contingent on continued commercial/industrial property use.

Adrian Brown completed a Phase I in 1998 (Adrian Brown, 1998) to comply with the directives appearing in the 1998 CAO issued to Rohr by the SDRWQCB (SDRWQCB, 1998a, 1998b). The Adrian Brown Phase I predates Rohr's acquisition of the vacant Bay Boulevard properties from the City in 1999. The Phase I identified historical environmental features that could be potential sources of chemicals in soil on the North Campus and included aboveground storage tanks (ASTs), underground storage tanks (USTs), paint booths, and vapor degreasers. Woodward-Clyde also prepared a compilation and evaluation of existing Site and adjacent property data as another directive under the 1998 CAO (Woodward-Clyde, 1998). This document includes information on the vacant Bay Boulevard property site assessment activities that was available at that time. In 2013, URS completed a Phase I as part of due diligence during the sale of Rohr to United Technologies Corporation (URS, 2013). In addition, Haley & Aldrich completed two Phase Is in 2016: one for Buildings 29, 99, and 100 and the other for the vacant Bay Boulevard properties in anticipation of a property sale (Haley & Aldrich, 2016a, 2016b).

Previous investigations on Parcel A have included soil, soil vapor, and groundwater sampling. Indoor air screening has been performed in Building 29. Analytical results for soil and soil vapor samples are provided in Tables 2 through 4. The sample locations are shown on Figure 3. Figures 4A though 4E provide detail maps at smaller scale from north to south so that the environmental features and their associated boring locations can be seen more clearly. Indoor air screening results for Building 29 are summarized in Tables 5 and 6.

Site assessment activities on Parcel A, conducted under SDRWQCB oversight, have included the following:

<u>350, 360, 364, and 368 Bay Boulevard</u>

- Eleven direct-push and Hydropunch borings; and
- Twenty-two soil and two groundwater sample analyses.

Previous assessment and remediation activities conducted at 350 and 360 Bay Boulevard under DEH oversight are described in Section 1.3.2 below. Information related to these investigations is limited to that appearing the Woodward-Clyde "Data Compilation and Evaluation Report" (Woodward-Clyde, 1998) and some documentation in the DEH's electronic library database.

<u>Buildings 99 and 100</u>

- Six direct-push and Hydropunch borings;
- Nine sub-slab vapor probes and one deeper vapor probe; and
- Ten soil, nine sub-slab soil vapor, one deeper soil vapor, and one groundwater sample analyses.

Building 29

- Sixty-six direct-push and Hydropunch borings;
- Seventeen temporary sub-slab soil vapor probes;
- Twenty-one temporary deeper soil vapor probes; and
- One-hundred twenty-six soil, seventeen sub-slab soil vapor, twenty-three deeper soil vapor, and nineteen groundwater sample analyses.

Several borings (seven; borings UT-02, -03, -18, -19, -20, -21 and -66) were advanced and fourteen samples analyzed during URS' 2013 supplemental remedial investigation on the adjacent parcel occupied by the railroad ROW. While these data are described and included in this Revised CSM, they are not located on Parcel A.

A chronology of the Site assessment activities on Parcel A is provided in the following sections.

1.3.1 Fuel UST Closures

In 1986, four fuel USTs in the Building 99 and 100 Area were removed and closed under permit with the DEH. McLaren Environmental Engineering conducted a subsurface investigation prior to Rohr's purchase of the property formerly occupied by Valley Detroit Diesel. Four groundwater monitoring wells (MW-A through MW-D) were installed on the perimeter of the Building 99 and 100 Area. Total recoverable petroleum hydrocarbon (TRPH) and volatile organic compound (VOC) concentrations in soil and groundwater were relatively low or not detected (Woodward-Clyde, 1998). In June 1996, the DEH provided Rohr with approval to destroy the wells.

1.3.2 350 and 360 Bay Boulevard Site Assessment

The following summary is primarily based on information appearing in the "Data Compilation and Evaluation Report" prepared by Woodward-Clyde in 1998 (Woodward-Clyde, 1998) and limited information in the DEH electronic library database. In October 1987, Woodward-Clyde conducted soil excavation, disposal, sampling, and analysis for the City related to petroleum hydrocarbons. Soil with petroleum hydrocarbon concentrations greater than 1,000 milligrams per kilogram ([mg/kg]; 85 cubic yards) was excavated and properly disposed. Lead (greater than 200 mg/kg) was detected in surface soil at 350 Bay Boulevard, around the area believed to have been formerly used for gold ore extraction. A sample contained Soluble Threshold Limit Concentration (STLC) lead at a concentration of 20 milligrams per liter (mg/L), which was above the regulatory limit of 5 mg/L.

In 1988, when Rohr obtained an option to purchase these parcels, Woodward-Clyde collected 25 surface soil samples at random locations and installed and sampled three groundwater monitoring wells (MW-1B, MW-2B and MW-3B). Soil lead concentrations ranged from 75.2 to 16,400 mg/kg and STLC lead concentrations ranged from 1.0 to 538 mg/L. The lead concentration in groundwater in well MW-1B was below the Maximum Contaminant Level (MCL) of 0.050 mg/L. Trichloroethene (TCE) was also reported in well MW-2B at a concentration of 14 micrograms per liter (µg/L).

In 1991, TorStan destroyed well MW-3B and characterized surface soil on the property for the City. Soil sample were analyzed for total and STLC lead (44 samples), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), and dioxin and furans. Total lead concentrations in the samples

analyzed ranged from 13.3 to 3,490 mg/kg. Three samples contained lead above the Total Threshold Limit Concentration (TTLC) of 1,000 mg/kg. STLC lead ranged from not detected (<0.275 mg/L) to 84.6 mg/L, and 24 samples contained STLC lead above the regulatory limit of 5 mg/L. The upper 80 percent confidence interval concentrations for TTLC and STLC lead were 399 mg/kg and 12.0 mg/L, respectively. OCPs were detected in the 12 samples analyzed, and included DDE and DDT at concentrations ranging from approximately 0.0075 to 0.0361 mg/kg, below the TTLC regulatory limit of 1.0 mg/kg for each compound. PCBs (as Aroclor 1254) were also present in 10 of the 12 soil samples at concentrations ranging from 0.063 to 2.585 mg/kg.

Four additional soil samples were analyzed for PCBs, and dioxin and furans. Two of the samples contained PCBs (Aroclor 1254 and 1260) at concentrations of 0.055 and 7.438 mg/kg. Dioxins and furans were detected in two of the four samples analyzed. Compounds detected included hexa, hepta and octa isomers; concentrations ranged from 3.2 to 1883.7 nanograms per kilogram (ng/kg). TorStan concluded that the concentrations of the isomers detected were below the TTLC for tetradioxins (10,000 ng/kg). Soil containing PCBs was excavated and properly disposed off-site under DEH oversight.

TorStan conducted quarterly groundwater monitoring of wells MW-1B and MW-2B in 1991 and 1992. No OCPs were detected in groundwater samples when analyzed during the first quarter 1991. TCE concentrations in well MW-2B were above the MCL of 5 µg/L during each monitoring event. According to DEH records, MW-2B was destroyed, but MW-1B could not be located. It is unclear if this well remains on the property.

In February 2001, the lead-containing soil was excavated across the property to a depth of 2 feet, and 800 cubic yards of lead-containing soil was removed and consolidated with burn ash from the Shinohara Burn Site on Otay Valley Road. The materials were used as part of the foundation of the cap for the former Otay Class I Landfill operated by San Diego County. This landfill was permitted to accept hazardous waste. Confirmation soil samples were collected from the perimeter and the floor of the excavation at random locations. The mean total lead concentration of the confirmation samples was 54 mg/kg, and the upper 95% confidence interval was 71 mg/kg. An NFA letter was provided to the City by the DEH VAP on September 17, 2001.

1.3.3 1998 Phase I Environmental Site Assessment

Adrian Brown was retained to conduct a Phase I of the Rohr facility in 1998 (Adrian Brown, 1998) in compliance with the 1998 CAO issued by the SDRWQCB. In this Phase I, Adrian Brown identified possible Site environmental features potentially containing hazardous substances and petroleum products such as process lines, sewers, sumps, drains, storm sewers, tanks, storage vessels, equipment vaults, degreasers, waste treatment storage areas, and chemical use areas. The historical environmental features identified by Adrian Brown are included on Figure 2.

1.3.4 San Diego Formation Aquifer Testing

In 1998 and 1999, URS Greiner Woodward-Clyde (URSGWC) conducted a drilling program to assess subsurface geology and hydrogeology of the San Diego Formation at the Rohr Site (URSGWC, 1999). These data were collected to support the redesignation of the groundwater basin uses from beneficial to non-beneficial for the area west of Interstate 5. The drilling program identified subsurface geology to a depth of approximately 550 feet and evaluated the vertical hydraulic connection between shallow groundwater and a deeper, coarse-grained gravel zone identified at 180 to 200 feet below ground

surface (bgs) by conducting aquifer testing. In addition to the five wells installed (DB-2, DB-4, DB-5, OW-3, and OW-4), two pressure transducers (OW-1 and OW-2) were installed in separate grouted boreholes to monitor changes in pressure within the aquitard during aquifer testing. Three wells (DB-2, DB-4, and DB-5) and the two transducers (OW-1 and OW-2) were recently destroyed under permit with the DEH. Wells OW-3 and OW-4, screened in Upper Zone B and Lower Zone B, respectively, remain for monitoring purposes. Groundwater use remains beneficial west of Interstate 5.

1.3.5 Blanchard Grinder UST Closure

The former Blanchard Grinder UST (Rohr Tank No. 3-09598) was in the tooling area in the southern portion of Building 29 (see Table 1 and Figure 2). The machine sat on a metal plate above a concrete sump that served as a reservoir for coolant that was used to circulate through the unit while operating. URSGWC drilled soil borings in 1999 adjacent to this UST and analyzed samples for TRPH. None were detected. Based on the results, the DEH approved the in-place closure of this former sump.

1.3.6 2013 URS Supplemental Remedial Investigation

Following completion of a Phase I, URS conducted a Site investigation in 2013 when United Technologies Corporation acquired Goodrich Corporation (URS, 2015). During this investigation, 62 direct-push and four hand-auger borings were advanced to depths ranging from approximately 1 to 22 feet bgs on the Rohr facility. The investigation included soil and shallow groundwater sampling to identify potential sources of chemicals of potential concern (COPCs) at the facility. There were four borings drilled on Parcel A (UT-22, UT-23, UT-24, and UT-25) and seven other borings were advanced adjacent to the drainage swale west of Parcel A on the railroad ROW (UT-02, UT-03, UT-18 through UT-21 and UT-66). The borings were advanced hydraulically downgradient (west) and outside of buildings, except for UT-22. The results of the investigation were compared to industrial/commercial screening criteria consistent with the Site's commercial/industrial use. Soil samples from the borings were analyzed for VOCs, total petroleum hydrocarbons-extended range (TPH), semi-volatile organic compounds (SVOCs, specifically polynuclear aromatic hydrocarbons [PAHs}, PCBs, PAHs, Title 22 Metals, and hexavalent chromium depending on location and Site history. None of the soil samples from the borings on Parcel A contained COPCs at concentrations above their respective Groundwater Protection Level (GPL), commercial/industrial California Department of Toxic Substances Control (DTSC) Screening Level (DTSC-SL) or TTLC. However, there were some soil samples from the drainage swale that contained one or more COPCs above their respective screening criteria. Soil in UT-02 contained the PCB, Aroclor 1254 at a concentration of 770 micrograms per kilogram (µg/kg), exceeding its commercial/industrial DTSC-SL of 590 µg/kg. The PAHs, benzo(a)pyrene and dibenz(a,h)anthracene were reported in soil from borings UT-18, UT-21 and UT-66 exceeding their respective commercial/industrial DTSC-SLs of 1,300 and 310 µg/kg. The presence of these compounds is attributed to railroad operations unrelated to the Rohr facility.

1.3.7 2016 Haley & Aldrich Phase I and IIs

Following completion of Phase Is, Haley & Aldrich conducted supplemental Phase II Environmental Site Assessments (Phase IIs) in 2016 to investigate soil and groundwater on the Building 99 and 100 and Building 29 Areas (Haley & Aldrich, 2018a) and the vacant Bay Boulevard properties (including 350, 360, 364, and 368 Bay Boulevard [Haley & Aldrich, 2018b]). The locations of the borings advanced during the Phase IIs are shown on Figure 3. The results of the Phase II and Rohr's plans to sell Parcel A were

discussed with the SDRWQCB in late 2017. The SDRWQCB opened a GeoTracker ID for these areas to track investigation and remediation activities for these areas separately from the rest of the North Campus (Eastern Parcels, Global ID no. T10000011095). Subsequently, Rohr notified the SDRWQCB that it planned to retain the vacant Bay Boulevard properties to be included in Parcel C. A summary of the findings for each Phase II conducted by Haley & Aldrich is described below.

1.3.7.1 Buildings 29, 99, and 100

Haley & Aldrich advanced 25 soil borings and analyzed samples for the following COPCs: TPH, VOCs, SVOCs (phenols and PAHs), OCPs, PCBs, and Title 22 Metals. None of the soil samples analyzed for TPH, VOCs, SVOCs (phenols), or OCPs contained an analyte at a concentration above its respective commercial/industrial DTSC-SL except for one sample (B29-05-02) collected at 2 feet bgs that contained the PCB Aroclor 1260 (1,300 µg/kg) above its commercial/industrial DTSC-SL of 580 µg/kg. None of the samples contained any COPCs at a concentration above its GPL or TTLC.

Arsenic was reported in soil at three locations (B29-02, B29-03, and B29-07) on the northern portion of the Building 29 Area at concentrations greater than the Site-specific background threshold of 8 mg/kg (established for the Former South Campus), but below the Site-specific GPL of 24.3 mg/kg. None of the other Title 22 Metals were present in soil at concentrations exceeding screening criteria described in Section 4. No environmental concerns were identified in soil or groundwater in the Building 99 and 100 Area.

1.3.7.2 Vacant Bay Boulevard Properties

Haley & Aldrich advanced 27 soil borings and analyzed 49 soil and 9 groundwater samples for COPCs. Of the borings advanced and samples analyzed, 11 borings and 22 samples were specific to 350, 360, 364, and 368 Bay Boulevard. COPCs included TPH, VOCs, PAHs, OCPs, and Title 22 Metals. None of the soil samples analyzed were reported to exceed a GPL, commercial/industrial DTSC-SL or TTLC for the COPCs identified. One sample collected from BB-23 was reported to contain DDE at its TTLC of 1 mg/kg. Two in-situ groundwater samples from BB-17 and BB-23 were reported to contain arsenic slightly above the MCL of 0.010 mg/L (0.0149 and 0.0122 mg/L, respectively). The presence of low levels of arsenic in groundwater is likely naturally occurring and attributed to background.

1.3.8 2018 Sub-Slab Soil Vapor and Focused Deeper Soil Vapor Survey

In May 2018, and in preparation for the property sale, a soil vapor survey was conducted in Buildings 29, 99, and 100 in accordance with the California Environmental Protection Agency's "Advisory Active Soil Gas Investigations" dated July 2015 (Haley & Aldrich, 2018c). Sub-slab soil vapor sample locations were selected considering past Site use and previous subsurface VOC soil and groundwater concentrations. The soil vapor samples were analyzed by a mobile laboratory using U.S. Environmental Protection Agency (EPA) Method TO-15. The temporary vapor probe locations are shown on Figure 3.

Analytical results for sub-slab soil vapor samples are summarized in Table 3. VOCs were identified in sub-slab soil vapor samples collected beneath the slab of Building 29 and in the deeper soil vapor samples. Samples were collected at a depth of 1 foot below the slab. TCE was detected in 10 of the 17 sub-slab soil vapor sample locations beneath Building 29 at concentrations ranging from 42 to 920,000 micrograms per cubic meter (µg/m^3). The highest TCE concentration in the sub-slab soil vapor samples was detected at probe B29-V03.

Deeper soil vapor data are summarized in Table 4. The deeper soil vapor samples were collected at depths of 5 and 10 feet below the slab in the former Maintenance Department since groundwater beneath this area contains VOCs. TCE was detected in each of the deeper samples collected beneath and in proximity to Building 29 except for samples from probe B29-V05. TCE concentrations ranged from 100 to 3,000,000 µg/m^3 in the 5-foot samples, with the highest concentration detected in probe B29-V03. TCE was detected in three of the four soil vapor samples collected at 10 feet (just above the level of groundwater) at lower concentrations, ranging from 64 to 3,400 µg/m^3. This suggested that TCE in soil vapor was related to a shallow soil source. Based on these findings, Haley & Aldrich recommended supplemental indoor air and potential preferential pathway screening in the building. The SDRWQCB concurred with our recommendations.

Relatively low concentrations of some VOCs were reported in soil vapor samples collected beneath Buildings 99 and 100. None of the VOC concentrations exceeded screening criteria and as such, are not considered an environmental concern.

1.3.9 2018 - 2019 Indoor Air Screening

In September 2018, Haley & Aldrich conducted indoor air screening in Building 29 to evaluate whether total VOCs and TCE may be present in indoor air (Haley & Aldrich, 2018d). The screening was based on locations where TCE had been detected in soil, shallow groundwater, sub-slab soil vapor, and near slab penetrations that could serve as preferential subsurface vapor migration pathways. Air grab samples were screened using a photoionization detector and Hapsite gas chromatograph. It should be noted that the measurements represent a moment in time rather than a time-weighted average concentration over an 8- or 10-hour workday. The results were only used for screening purposes and to determine if interim mitigation measures were warranted prior to implementing building improvements (beyond sealing potential preferential pathways for vapor intrusion). The results of the indoor air screening indicated no immediate interim measures appeared to be required for Building 29.

TCE screening results for September 2018 are summarized in Tables 5 and 6 for the breathing zone and preferential pathways, respectively. The TCE screening results ranged from 0.012 µg/m^3 to 2 µg/m^3, except for two locations where 4.2 µg/m^3 and 5.5 µg/m^3 were measured in the breathing zone near utility trenches in proximity to a floor slab crack, suggesting that potential preferential pathways may be contributing to TCE screening results observed in indoor air. None of the results were greater than the EPA Region 9 Indoor Air Response Action Level of 8 µg/m^3 for TCE, also identified by DTSC as the commercial/industrial worker accelerated response action level assuming an 8-hour workday. No immediate interim measure was required in the building. However, there were several samples in the building where the TCE screening results were greater than the lower end of the health protective risk range for the 8-hour workday for a commercial/industrial worker (3 µg/m^3). This concentration is based on a 1 x 10^{-6} risk threshold assuming chronic long-term exposure.

Indoor air screening was conducted again in February 2019 at the same locations based on DTSC guidance (Haley & Aldrich, 2019). Doors and windows that are typically open were closed in February. TCE screening results for the February 2019 event for the breathing zone and preferential pathways are summarized in Tables 5 and 6, respectively. There were six locations in the northern portion of Building 29 where TCE screening results in the breathing zone were greater than the accelerated response action level for the commercial/industrial 8-hour workday (8 µg/m^3). TCE screening results at six additional locations in the northern half of Building 29 were greater than the lower end of the health protective risk range for the 8-hour workday for a commercial/industrial worker (3 µg/m^3). As an immediate

interim measure, Rohr increased air circulation by keeping fans operating and doors opened. In September 2019, Haley & Aldrich sealed cracks and joints in the slab in the former Maintenance Department.

1.3.10 2020 Data Gap Assessment

A data gap assessment was conducted in January 2020 to further characterize the nature and extent of VOCs in soil and groundwater and conduct some step-out sampling in areas where arsenic and PCBs had been detected above screening levels during the Phase II (Haley & Aldrich, 2018a; 2020a). Arsenic was detected in soil at a concentration slightly greater than the GPL of 24.3 mg/kg in step-out boring B29-07A (24.6 mg/kg). The other analyzed step-out samples contained arsenic concentrations less than the GPL. PCBs were not detected at concentrations greater than the commercial/industrial DTSC-SL in soil samples collected from the step-out borings for boring B29-05.

Several borings were advanced in the former Maintenance Department to identify the potential source of TCE in soil gas and groundwater beneath this area. Soil samples B29-24-010 and B29-23-010 were collected at 1 foot bgs beneath the former Maintenance Department. The samples contained TCE at concentrations greater than the EPA Region 9 commercial/industrial Regional Screening Level ([RSL]; there is no DTSC-SL) of 6 mg/kg (7.83 and 37.8 mg/kg, respectively). TCE in soil sample B29-23-010 also exceeded the GPL of 27 mg/kg. Groundwater analytical results indicated that TCE was present at up to 1,490 µg/L in boring B29-23 beneath the former Maintenance Department. It is our understanding that a relatively small degreaser, once located in this area, appears to have been the source of TCE and other VOCs detected in soil, soil vapor, and groundwater in this area. None of the soil samples contained a COPC concentration above its respective TTLC.

Step-out borings were also conducted around the former mill and lathe locations. None of the COPCs in soil were reported at concentrations above GPLs, commercial/industrial DTSC-SLs, or TTLCs.

1.3.11 2020 GSI Phase II Screening Investigation

GSI conducted a Phase II screening investigation on Parcel A (excluding 350, 360, 364, and 368 Bay Boulevard) in August 2020 on behalf of the Owner (GSI, 2020). The investigation included additional soil and soil vapor sampling and analyses.

The soil analytical results are included in Table 2. Tetrachloroethene (PCE) was detected in PW-12 in soil at a concentration of 4.7 µg/kg at 1.5 feet bgs, and TCE was detected in PW-07 at a concentration of 23 µg/kg at 1.5 feet bgs. PCE and TCE were not detected above laboratory reporting limits in other soil samples. PCBs (Aroclor-1260) were only detected in PW-11, at a concentration of 180 µg/kg and below the screening criteria. PCBs in other samples analyzed were not detected above the reporting limits. No analytes were detected in soil samples at concentrations exceeding GPLs, commercial/industrial DTSC-SLs, TTLCs, or background soil concentrations for arsenic.

Seventeen soil vapor samples (including two duplicate samples) were collected at 15 locations from depths between approximately 3 and 5 feet bgs and analyzed for VOCs. Soil vapor analytical results are included in Table 4. TCE was the constituent detected at the highest concentrations in both the GSI and Haley & Aldrich soil vapor assessments. GSI concluded that the soil analytical results did not indicate a need for additional assessment on Parcel A, and the soil vapor results were generally consistent with the data collected by Haley & Aldrich in 2018.

1.3.12 2020 Partner Phase I for 350, 360, 364, and 368 Bay Boulevard

Partner conducted a Phase I for the property buyer in late 2020 (Partner, 2020). Partner concluded that the parcels had a recognized environmental condition, since they are part of the ongoing larger Eastern Parcels (Parcel A, Case Number T10000011095) investigation under the oversight of the SDRWQCB.

2. Site Description

2.1 SITE GEOLOGY

Parcel A is situated at elevations ranging from approximately 13 feet above MSL on the south and 28 feet above MSL on the north. Parcel A is underlain, in descending order, by limited fill material, the Bay Point Formation, a clay aquitard, and the San Diego Formation. Because Parcel A is more than 1,000 feet upland of the former shoreline, there are no bay muds or extensive fill present on this portion of the North Campus facility. Geologic cross sections A-A' (north-south) and B-B' (east-west in the Former Maintenance Department) are provided as Figures 5 and 6, respectively.

2.1.1 Artificial Fill

Artificial fill generally consisted of yellow to brown, silty fine to medium sand with degraded asphalt and sub-angular fine gravel were observed during the Phase II and the data gap assessment (Haley & Aldrich, 2018a and 2020a). The maximum thickness of fill encountered was approximately 5 feet, in boring B29-33A.

2.1.2 Bay Point Formation

The Bay Point Formation can also be referred to as Quaternary alluvium, as suggested by Wes Danskin formerly with the United States Geological Survey (W. Danskin, pers. comm.). The thickness of the Quaternary sediment can be highly variable in the San Diego embayment, ranging from approximately 200 feet to possibly as much as 700 feet. The Bay Point is Pleistocene in age and was deposited in nearshore marine and onshore fluvial depositional environments.

The Bay Point Formation consists of an interbedded sequence of clay, silt, and silty sand to the total depth explored (approximately 30 feet). The strata are predominantly composed of reddish brown to yellowish brown clay and silt with some thin, discontinuous lenses of silty sand. The coarser-grained lenses are typically saturated below a depth of approximately 12 feet bgs.

2.1.3 Clay Aquitard

A blue-gray estuarine clay, designated as a "clay aquitard" occurs below the sandy interval at about 125 to 150 feet bgs (Huntley, 2000). The clay aquitard was identified during URSGWC's San Diego Formation aquifer testing program. The clay aquitard varies in thickness from 20 feet to almost 40 feet. A blue-gray clay layer has also been encountered beneath the North Campus at a depth of approximately 125 to 150 feet bgs with a thickness of 20 to 65 feet. Although the aquitard materials encountered may differ in color at various locations throughout the North Campus and Former South Campus, the materials are characterized as clay with a low hydraulic conductivity.

2.1.4 San Diego Formation

There is a 20-foot-plus thick interval of coarse sands, gravels, and cobbles beneath the clay aquitard that is attributed to the San Diego Formation (Huntley, 2000). These strata were investigated during a drilling and aquifer testing program that Rohr conducted in 1998 and 1999 on behalf of the Sweetwater Authority to characterize the hydrogeology beneath the North Campus (URSGWC, 1999). These coarser-grained sediments were referred to as the Upper Gravel Unit in the URSGWC study and, based on

geophysical logs and borehole flowmeter logging, Huntley suggested that the Upper Gravel Unit is the most productive zone investigated during this study (Huntley, 2000). The Upper Gravel Unit is underlain by a series of discontinuous lenses of fine to medium sands, silty sands, clayey sands, and silts and clays to a depth of at least 400 feet bgs (Huntley, 2000).

The San Diego Formation consists of two portions: the upper and lower members. The upper member of the San Diego Formation is present on the land surface in the vicinity of downtown San Diego and Chollas Creek but does not seem to be present or exposed in the South Bay, where the Site is located. The upper member was deposited in a higher energy environment, closer to the continent; the lower member was deposited in a lower energy environment, typical of a deeper marine environment. The thickest section of the San Diego Formation is located adjacent to the southeastern edge of San Diego Bay, south of the Site.

The age of the San Diego Formation is less well defined but considered to be of the Plio-Pleistocene age. Like the Quaternary sediment, the San Diego Formation was deposited in nearshore marine and onshore fluvial depositional environments. The contact with the overlying Quaternary alluvium is erosional and very difficult to distinguish in the subsurface and in geophysical logs. The term "San Diego Formation" has historically been used quite liberally, and in some instances, probably inaccurately. For example, marine mollusks present in the clay aquitard during URSGWC's study were found to be Pleistocene age and part of the Quaternary sediments (Bay Point Formation).

Recent work by the United States Geological Survey indicates that San Diego Formation groundwater near the Sweetwater and Otay Rivers is isotopically enriched, reflecting the process of seawater intrusion (Anders et al, 2013). Furthermore, chloride concentrations decline within the saline section of the San Diego Formation at depths of about 500 to 820 feet bgs, indicating that the greatest quantity of regional groundwater recharge (originating in higher elevations to the east), may flow through the coastal aquifer at these depths.

2.2 SITE HYDROGEOLOGY

Because this Revised CSM focuses on soil and soil gas on Parcel A, the discussion of Site hydrogeology is limited to depth and flow direction in the uppermost water-bearing zone (Zone A). Groundwater is present in the Bay Point Formation ranging in depth from approximately 10 to 20 feet bgs, based on observations during drilling and water levels in the wells that are north of Building 99. Boring logs for the direct-push borings and the monitoring wells are provided in Appendix A. The locations of the borings and the existing and former monitoring wells are shown on Figure 3. The thickness of the vadose zone on Parcel A ranges from approximately 10 to 20 feet based on this information. The direction of groundwater flow is generally to the west. Wells present on Parcel A have been limited to those installed for the San Diego Formation aquifer testing program (URSGWC, 1999). Two monitoring wells remain north of Building 99 and serve as upgradient wells. OW-3 is screened in Upper Zone B at 10 to 30 feet bgs, and OW-4 is screened in Lower Zone B at 60 to 80 feet bgs.

3. Environmental Features

Historical environmental features on Parcel A are described in Table 1. The table first describes Rohr operational features, followed by pre-Rohr operational features. The information has been compiled from numerous historical sources and the results of Site assessment activities. References are also noted and listed on the last page of the table. As previously described, soil remediation activities on Parcel A have been limited to 350-360 Bay Boulevard and occurred prior to Rohr's acquisition of the property from the City. The City obtained an NFA letter for soil remediation performed on these two parcels. Rohr has not conducted any activities on the vacant Bay Boulevard properties.

Figure 2 shows former operational features, including buildings, ASTs, USTs, underground vessels, vaults, paint booths, degreasers, hydraulic equipment, and maintenance and storage areas. Rohr Tank IDs are noted in Table 1 and on Figure 2, where appropriate. The numbering of these features on Figure 2 corresponds to that appearing in Table 1. The numbering of the features in the table and on Figure 2 is consistent with the Adrian Brown Phase I (Adrian Brown, 1998), the URS Phase I (URS, 2013) and the Haley & Aldrich Data Gap Assessment (Haley & Aldrich, 2020a).

4. Distribution of Chemicals at the Site

The distribution of chemicals in vadose zone soil, soil vapor, and indoor air (based on screening) are described in the following sections. As previously described, no discussion of saturated soil is included in this Revised CSM as requested in the SDRWQCB letter dated October 27, 2020, since fill is not present in the saturated zone on Parcel A as noted on geologic cross-sections provided as Figures 5 and 6 and on the boring logs provided in Appendix A.

4.1 EXTENT OF CHEMICALS IN VADOSE ZONE SOIL

The Site soil data have been compared to the GPLs developed for the Former South Campus (Haley & Aldrich, 2014a, 2014b), the DTSC-SLs for commercial/industrial use (where no DTSC-SL is established, the EPA Region 9 commercial/industrial RSL was used, for example for TCE), and the TTLCs appearing in California Code of Regulations (CCR) Title 22 Section 66261.24 – Characteristic of Toxicity. In the case of arsenic, Site-specific background for the Former South Campus is greater than the commercial/industrial DTSC-SL (0.36 mg/kg). Therefore, soil arsenic concentrations were compared to background established for the South Campus (8 mg/kg; Haley & Aldrich, 2014a, 2014b).

The GPLs and background concentrations for the Former South Campus should be relevant for the North Campus since the operations were the same as the South Campus (they were the same facility) and the hydrogeology and soil types are very similar. The justification for applying these values will be described and evaluated in the Soil Feasibility Study/Soil Remedial Action Plan (Soil FS/RAP) that will be prepared for the North Campus. GPLs for vadose zone soil are summarized in Table 10 of the "Revised Soil Remedial Action Plan" (Soil RAP) for the northern portion of the South Campus (Haley & Aldrich, 2018b). A copy of this table is provided in Appendix B. The GPL for total PCBs is 130 mg/kg. The PCB concentrations in soil have been compared to the commercial/industrial DTSC-SL and TTLC in lieu of the GPL. The commercial/industrial DTSC-SL for total PCBs in 580 µg/kg and the TTLC is 50 mg/kg.

Soil samples on Parcel A have been analyzed for the following COPCs: VOCs, TPH, SVOCs (phenols and PAHs), PCBs, OCPs, and Title 22 Metals. Figures 7A through 7F summarize the assessment results by chemical class: Figure 7A – VOCs, Figure 7B – TPH, Figure 7C – SVOCs (including phenol and PAHs), Figure 7D - PCBs, Figure 7E – OCPs and Figure 7F – Title 22 Metals. Locations where samples were analyzed and did not contain a COPC for a particular chemical class above a screening criterion are shown in yellow. Locations where samples were not analyzed for that chemical class on the Site are shown in black. Locations where a sample exceeds a GPL are shown in blue, locations where soil exceeds a commercial/industrial DTSC-SL or RSL are shown in yellow and locations that exceed a TTLC are shown in orange. Locations that exceed the Site-specific background for arsenic are also shown in yellow. The COPC, sample depth and its concentration are noted on the figures for screening exceedances.

The analyses performed were specific to the historical environmental features noted in Table 1, and in many instances, none of the COPCs were detected at concentrations that warranted further investigation (see Figures 2 and 7A through 7F).

The locations and COPCs where exceedances of these criteria have been identified are shown in Table 7 and on Figures 7A for VOCs, Figure 7D for PCBs, Figure 7E for OCPs, and Figure 7F for Title 22 Metals (arsenic). The exceedances are described by chemical suite below:

4.1.1 VOCs

TCE was reported at a concentration above the GPL of 27 mg/kg at B29-23 in the former Maintenance Department in Building 29, where a small former degreaser was once located. The concentration reported was well below the TTLC of 2,040 mg/kg. B29-23 and B29-24 (also in Building 29) both reported soil TCE concentrations above the EPA Region 9 commercial/industrial RSL of 6 mg/kg. Both locations are approximately 3 feet south of a subterranean vault that runs along the northern portion of Building 29.

The extent of TCE (and VOCs) in soil on Parcel A is shown on the isoconcentration contour map provided as Figure 8. TCE in soil is primarily limited to the northern portion of Building 29 and a location in the southern portion of the building near the former Blanchard Grinder. As shown on cross sections provided as Figures 5 and 6, the vertical extent of TCE appears to be limited as well.

B29-23 and B29-24 lie within the footprint of the proposed loading dock where soil will be excavated during construction proposed by the new Owner. The area is currently underlain by thick reinforced concrete, since this area was used to test large and heavy equipment. There is also a complex network of subsurface utilities that supported the test laboratory. The extent of TCE in the former Maintenance Department can be conducted as needed prior to constructing the loading dock in this area.

4.1.2 TPH

None of the samples analyzed on Parcel A were reported to contain concentrations that exceeded their respective GPLs and DTSC-SLs for certain TPH carbon ranges.

4.1.3 SVOCs

Phenols were not detected in the samples analyzed in the vicinity of the former lumber yard that was formerly located on a portion of the Site. The PAH dibenz(a,h)anthracene was reported in soil at B29-12 above its commercial/industrial DTSC-SL of 0.31 mg/kg. While not on Rohr property, soil at three locations (UT-18, UT-21, and UT-66) in the adjacent railroad ROW contained benzo(a)pyrene and dibenz(a,h)anthracene above their commercial/industrial DTSC-SLs of 1.3 and 0.31 mg/kg, respectively. The PAHs are often associated with rail lines, and the presence of these compounds in the railroad ROW is attributed to railroad operations, not the Rohr facility.

4.1.4 PCBs

The PCB Aroclor 1260 was reported in B29-05 above its commercial/industrial DTSC-SL of 580 µg/kg and well below the TTLC of 50 mg/kg. Soil in step-out borings (B29-05A, -05B and -05C) was reported to contain PCBs at concentrations less than its TTLC and commercial/industrial DTSC-SL. Step-out sampling has delineated the extent of PCBs that are present in soil above its commercial/industrial DTSC-SL on Parcel A. While not on Rohr property, one location adjacent to Parcel A along the drainage swale in the railroad ROW reported a commercial/industrial DTSC-SL exceedance for PCBs (UT-02).

4.1.5 OCPs

A surface soil sample from BB-23 on 368 Bay Boulevard was reported to contain DDE at a concentration equal to its TTLC of 1 mg/kg. The concentration reported was below its commercial/industrial DTSC-SL of 6.2 mg/kg.

4.1.6 Title 22 Metals

Arsenic was compared to the background concentration established for the former South Campus. Arsenic in soil was reported above background and below the GPL of 24.3 mg/kg in the Building 29 Area that was historically used for agriculture. Seven locations exceeded Site-specific background (B29-02, B29-03, B29-03A, B29-03B, B29-07, B29-07A, and B29-07B). While not on Rohr property, one location adjacent to Parcel A along the drainage swale in the railroad ROW reported an arsenic concentration above background (UT-03).

Arsenic was reported in step-out boring B29-07A for B29-07 at a concentration of 24.6 mg/kg, slightly above the GPL, and well below the TTLC of 500 mg/kg. The boring is immediately adjacent to an underground utility bank. Based on the step-out sampling and the location of the utility bank, arsenic in soil exceeding the GPL is limited and has been delineated. The sample is located beneath pavement in an area that will undergo improvements by the Owner.

A Human Health Risk Assessment (HHRA) for Parcel A is in progress and has been submitted to the SDRWQCB. An evaluation of the relevance of soil background and GPLs developed for the Former South Campus to Parcel A will be included in the Feasibility Study for Parcel A that will be presented in the Soil RAP.

4.2 EXTENT OF CHEMICALS IN SOIL VAPOR

The soil vapor VOC data have been compared to the San Francisco Bay Regional Water Quality Control Board's commercial/industrial sub-slab/soil gas Vapor Environmental Screening Levels (Vapor ESLs). Tables 3 and 4 summarize sub-slab and deeper soil vapor results, respectively. Vapor ESL exceedances are listed in Table 8 and shown on Figure 9. There are no environmental concerns related to soil vapor in the Building 99 and 100 Area.

The following VOCs exceed their Vapor ESLs in sub-slab vapor samples in the following locations:

- TCE: B29-V03, B29-V04, B29-V07, B29-V08, B29-V09, B29-V10, B29-V16, and B29-V19;
- PCE: B29-V03, B29-V04, B29-V05, B29-V07, B29-V08, B29-V09, and B29-V16;
- Chloroform: B29-V03, B29-V07; and B29-V09; and
- Benzene: B29-V03, and B29-V05.

The following VOCs exceeded their Vapor ESLs in deeper soil vapor at the following locations:

- TCE: B29-V01, B29-V02, B29-V03, B29-V06, B29-V07, B29-V08, PW-01B, PW-02, PW-03, PW-04, PW-05, PW-06, PW-07, PW-09, PW-14, and PW-15;
- PCE: B29-V01, B29-V02, B29-V04, B29-V07, B29-V08, PW-05, PW-07, and PW-12;

- Chloroform: B29-V01, B29-V03, B29-V07, PW-02, PW-03, PW-04, PW-05, PW-06, PW-07, PW-08, PW-11, and PW-12;
- Benzene: B29-V01, B29-V02, B29-V05, B29-V06, and B29-V07; PW-04, PW-08, and PW-12;
- Bromodichloromethane: PW-09, PW-11, and PW-12; and
- Ethylbenzene: PW-09.

The TCE soil vapor concentrations on Parcel A are shown on the isoconcentration contour map provided as Figure 10. The distribution of soil vapor is consistent with the soil and groundwater VOC concentrations detected in the Building 29 Area as shown on the TCE isoconcentration contour maps for soil and groundwater provided as Figures 8 and 11, respectively. The Site data are sufficient to conduct the HHRA and develop HBRGs for soil vapor beneath Building 29. An HHRA for Parcel A is in progress. HBRGs are being developed for Parcel A, and this section of the Revised CSM will be updated based on the results of the HHRA.

4.3 INDOOR AIR SCREENING

The TCE indoor air screening data for the breathing zone appearing in Table 5 were compared to the EPA Region 9 Interim TCE Indoor Air Response Levels (RLs). The locations where measurements in the breathing zone exceeded the TCE indoor air RL are shown on Figures 12 and 13 for September 2018 and February 2019, respectively. The six exceedances during the February 2019 screening event were in the former Maintenance Department, where VOCs have been detected in soil, soil vapor, and groundwater as shown on Figures 8, 10 and 11, respectively. TCE screening results at six additional screening locations in the northern half of Building 29 were greater than the lower end of the health protective risk range for the 8-hour workday for a commercial/industrial worker (3 $\mu g/m^3$). As an immediate interim measure, Rohr increased air circulation by keeping fans operating and doors opened and sealed cracks and joints in the slab in the northern portion of the building. There are currently no occupants in the building.

5. Conceptual Site Model

As previously noted, historical chemical sources are coincident with former Site areas associated with long-term chemical usage. A summary of historical environmental features and status of their investigation are provided in Table 1. The Revised CSM for Parcel A is provided on Figure 14. Figure 15 shows the Site human health exposure pathways and depicts historical chemical sources, primary release mechanisms, primary impacted media, transport mechanisms, secondary impacted media, exposure routes, and potentially exposed receptors for Parcel A. Exposure pathways considered to be potentially complete will be quantified in the HHRAs. Those pathways considered to be insignificant will not be quantified.

6. Data Gap Assessment

Historical environmental features on Parcel A have been investigated for their specific COPCs in soil, soil vapor, and shallow groundwater. The detailed maps provided as Figures 4A through 4D show the locations of samples with respect to the historical environmental features on Parcel A from north to south. Figures 7A through 7F show the locations of samples with respect to the historical environmental features based on chemical class supporting the discussion in Section 6.1. Based on our assessments, it is our opinion that the existing soil and soil vapor data support the Revised CSM and are adequate to proceed with an HHRA and a Soil FS/RAP. The COPCs analyzed, sample locations, and sample depths have been reviewed specific to each environmental feature to evaluate whether it has been adequately characterized. Our assessment is provided in Table 1. The following data gaps are described for soil, soil vapor, and indoor air in the sections below. Groundwater data gaps on Parcel A will be described in the Sitewide CSM.

6.1 SOIL

6.1.1 VOCs

VOCs are COPCs for the Site, and extensive sampling has been conducted associated with its historical environmental features as shown on Figure 7A. There are data gaps for soil in the Former Maintenance Department, including the former location of a small degreaser (Historical Environmental Feature No. 300; B29-23 and B29-24). Additional sampling to delineate the extent of soil that may require remediation can be conducted when implementing the Soil FS/RAP following the removal of the building slab and excavation to construct the loading dock.

6.1.2 TPH

Extensive sampling for TPH was conducted for historical features that were known to use materials containing petroleum hydrocarbons (oils) as shown on Figure 7B. TPH was reported primarily in the oil carbon ranges (C17-C32) at concentrations below the GPL of 7,300 mg/kg and the commercial/industrial DTSC-SL of 18,000 mg/kg. Based on the number of samples analyzed and the locations and depths sampled, there are no data gaps associated with TPH at the Site.

6.1.3 SVOCs

Phenols were considered a COPC for a portion of the Building 29 Area that may have been occupied by a lumberyard as shown on Figure 7C. PAHs were also analyzed in the Building 29 Area. An assessment of this area for phenols indicated that none were reported at detectable concentrations, some PAHs were reported in soil, and dibenz(a,h) anthracene was detected at a concentration above its commercial/industrial DTSC-SL in B29-12. Based on the analytical results and the locations and depths sampled, there are no data gaps related to SVOCs, including phenols, and PAHs in Site soil.

6.1.4 PCBs

Extensive sampling for PCBs has been conducted beneath Building 29 as shown on Figure 7D. Building 29 was primarily used as a machine shop for tooling. There is one location where PCBs were detected above the commercial/ industrial DTSC-SL (B29-05). Step-out sampling indicated that the exceedance

was limited in extent. Based on sample results and the locations and depths sampled, there are no data gaps associated with PCBs in soil at the Site at this time.

6.1.5 OCPs

Soil has been analyzed in the Building 29 and Buildings 99 and 100 Areas, and 350, 360, 364 and 368 Bay Boulevard that were historically used for agriculture (see Figure 7E). Only one sample analyzed was reported with DDE concentrations at its TTLC, but the reported concentration was below its commercial/industrial DTSC-SL (BB-23). Based on the number of samples analyzed and the locations and depths sampled, there are no data gaps associated with OCPs at the Site.

6.1.6 Title 22 Metals

Extensive sampling for metals has been conducted on Parcel A as shown on Figure 7F. Of the metals, only arsenic has been detected above its GPL at one location (B29-07A) in the northern portion of Building 29 Area that was historically used for agriculture. The area is paved and immediately adjacent to a subsurface utility bank. If it is found that this area is disturbed during construction of the tenant improvements to Building 29, the limited volume of soil can be addressed at that time, if necessary. There are no data gaps with respect to metals (including arsenic) on Parcel A.

6.2 SOIL VAPOR

The soil vapor surveys identified locations beneath Building 29 where VOCs are present at concentrations that exceed the Vapor ESLs. The locations of the exceedances are coincident with historical environmental features, and impacted soil and groundwater as shown on the TCE concentration contour maps provided as Figures 8 and 11, respectively. The historical features that were associated with VOCs have been adequately investigated. However, there are two locations (PW-11 and PW-12) in Building 29 in the area that was once occupied by a lumber yard where VOCs were reported above Vapor ESLs and are considered data gaps. The Site data are sufficient to conduct the HHRA and develop HBRGs for soil vapor beneath Building 29. The Owner will be installing a sub-slab depressurization system (SSDS) to address soil vapor intrusion. Other remedies will also be considered in the Soil FS/RAP to address vapor intrusion.

6.3 INDOOR AIR

Indoor air screening was conducted based on the findings of the soil gas surveys and addressed cracks and other penetrations to the slab in Building 29. No indoor air sampling was necessary based on the soil vapor survey results in Buildings 99 and 100. The results of the September 2018 screening in Building 29 indicated that none of the results in the breathing zone were greater than the EPA Region 9 Interim TCE Indoor Air RL of 8 µg/m^3 for TCE. However, during the February 2019 screening, there were locations that were above the RL in the former Maintenance Department. Rohr implemented immediate interim actions to increase air circulation and sealed cracks and penetrations in the building slab in the former Maintenance Department. It should be noted that the measurements represent a moment in time rather than a time-weighted average concentration over an 8- or 10-hour workday. The results were only used for screening purposes and to determine if interim mitigation measures were warranted prior to implementing building improvements (beyond sealing potential preferential pathways for vapor intrusion). The results of the indoor air screening indicated no immediate interim measures appeared to be required for Building 29.

As previously noted, the Owner will be making improvements to Building 29 that include constructing a loading dock in the portion once occupied by the former Maintenance Department. In addition, the Owner will be removing TCE-containing soil as part of loading dock construction and installing an SSDS to address vapor intrusion. While indoor air sampling is a data gap, the data will only be relevant if the data are collected post-redevelopment prior to building occupancy by the tenant. It is recommended that indoor air sampling be conducted at that time to address potential vapor intrusion concerns.

Other Operations/Equipment											
304A	Defiance Boring Mill (Col. F17)	29	NA	removed	VOCs, PCBs	B29-V06, B29-32A, -32B, -32C	N	Y	Y	H&A reported in the Phase I that photographs of the mills and lathes in the tooling area showed fluid on the floor surface.	H&A Phase I, H&A Phase II, H&A Vapor Survey, H&A Data Gap Assessment, GSI Phase II
304B	Froriep Vertical Turret Lathe (Col. L4)	29	NA	removed	VOCs, PCBs	PW-14, B29-33A, -33B, -33C	N	Y	Y	H&A reported in the Phase I that photographs of the mills and lathes in the tooling area showed fluid on the floor surface. VOCs in soil vapor exceed Vapor ESLs in PW-14.	H&A Phase I, H&A Phase II, H&A Vapor Survey, H&A Data Gap Assessment, GSI Phase II
304C	King Vertical Turret Lathe (Col. I4)	29	NA	removed	VOCs, PCBs	B29-V17, B29-34A, -34B, -34C	N	Y	Y	H&A reported in the Phase I that photographs of the mills and lathes in the tooling area showed fluid on the floor surface.	H&A Phase I, H&A Phase II, H&A Vapor Survey, H&A Data Gap Assessment, GSI Phase II
304D	Herbert Devleig Jig Mill, Moore Vertical Jig Borer, Oerlikon Jig Boring and Pratt & Whitney Jig Boring (Col. L3)	29	NA	removed	VOCs, PCBs	B29-V19, B29-35A, -35B and -35C	N	Y	Y	H&A reported in the Phase I that photographs of the mills and lathes in the tooling area showed fluid on the floor surface. VOCs in soil vapor exceed Vapor ESLs in B29-V19.	H&A Phase I, H&A Phase II, H&A Vapor Survey, H&A Data Gap Assessment, GSI Phase II
See Map Label	Former Maintenance Department	29	NA	NA	TPH, VOCs	Downgradient (UT-23, UT-24), B29-V03 through -V08 and -V10, B29-22 through -29, PW-02 through-07	TCE	N	Y	H&A Phase I reported that oils and potentially solvents were histroically used in a portion of Building 29. Certain VOCs in soil vapor exceed their respective Vapor ESLs. The former Maintenance Department is a data gap. Further delineation can be conducted as needed when the new Owner excavates soil to construct a new loading dock.	H&A Phase I, URS Phase II, H&A Vapor Survey, H&A Data Gap Assessment, GSI Phase II

TABLE 1
HISTORICAL ENVIRONMENTAL FEATURES
ROHR, INC. - PARCEL A
CHULA VISTA, CALIFORNIA

Map ID (see Figure 2)	Areas or Features of Potential Environmental Concern	Location/ Building No.	Size (gallons unless otherwise specified)	Status	Potential Chemicals Associated with Feature/Area	Previous Soil Assessment Summary	COPCs Above GPLs and/or Comm/Ind DTSC-SLs in Soil	Soil Characterized?	Proper COPCs And Depths Analyzed?	Comments	References
Pre-Rohr Features											
See Map Label	Lead- and Petroleum Hydrocarbon-containing Soil	350-360 Bay Boulevard	NA	NA	TPH, Pb	DEH-related Assessment and Remediation, BB-14, -15 and -16	Y	Y	Y	TPH- and lead-containing soil investigated and remediated under DEH VAP oversight. See report text for additional details. DEH VAP issued and NFA letter in 2001.	WCC Data Compilation Report, H&A Phase I, H&A Phase II, Partner Phase I
145	Unleaded Gasoline UST	99/100	10,000	closed	TPHg, BTEX	B99-01, B100-V01	N	Y	Y	URS reported this feature as closed prior to Rohr ownership. No VOCs present in soil vapor above their respective Vapor ESLs.	ABC Plate 9, URS Phase I, H&A Phase I, H&A Phase II, H&A Vapor Survey
146	Diesel Fuel UST	99/100	10,000	closed	TPHd	B99-01, B100-V01	N	Y	Y	URS reported this feature as closed prior to Rohr ownership. No VOCs present in soil vapor above their respective Vapor ESLs.	ABC Plate 9, URS Phase I, H&A Phase I, H&A Phase II, H&A Vapor Survey
147	Waste Oil UST	99/100	1,000	closed	TPH, Metals	B99-01, B100-V01	N	Y	Y	URS reported this feature as closed prior to Rohr ownership. No VOCs present in soil vapor above their respective Vapor ESLs.	ABC Plate 9, URS Phase I, H&A Phase I, H&A Phase II, H&A Vapor Survey
148	Waste Solvent UST	99/100	100	closed	VOCs, TPH	B99-01, B100-V01	N	Y	Y	URS reported this feature as closed prior to Rohr ownership. No VOCs present in soil vapor above their respective Vapor ESLs.	ABC Plate 9, URS Phase I, H&A Phase I, H&A Phase II, H&A Vapor Survey
See Map Label, Gray Shading	Possible Former Lumber Yard	29	NA	NA	Phenols	B29-08 through -11, PW-11, PW-12 B29-V11, B29-V13	N	Y	Y	H&A reported in the Phase I that historical documents and photos suggested a lumber yard occupied a portion of the Building 29 Area in the late 1940s and may have engaged in wood treating prior to Rohr's ownership. No phenols detected. VOCs exceed soil vapor ESLs in PW-11 and PW-12. This is a data gap for soil vapor.	H&A Phase I, H&A Phase II
See Map Stippling and Label	Former Shallow Swale	29	NA	NA	VOCs	B15, UT-23, UT-24, B29-01, -03, -05, -07, B29-V06, -V08 & V10, PW-07	N	Y	Y	H&A reported in the Phase I that 1948 aerial photograph showed a shallow depression filled with debris on the southern and western perimeter of the northern quarter of the Building 29 Area that may be current location of storm drain. Investigated through data gap assessment in former Maintenance Department.	H&A Phase I, H&A Phase II, H&A Data Gap Assessment

TABLE 1
HISTORICAL ENVIRONMENTAL FEATURES
ROHR, INC. - PARCEL A
CHULA VISTA, CALIFORNIA

Map ID (see Figure 2)	Areas or Features of Potential Environmental Concern	Location/ Building No.	Size (gallons unless otherwise specified)	Status	Potential Chemicals Associated with Feature/Area	Previous Soil Assessment Summary	COPCs Above GPLs and/or Comm/Ind DTSC-SLs in Soil	Soil Characterized? Other Operations/Equipment											
See Map Label	Former Truck Engine Repair with potential hydraulic lifts	100	NA	NA	TPH, VOCs	UT-03, B99-02, B100-V01, -V02, -V03, PW-01B	N	Y	Y	H&A reported in the Phase I that Building 100 contained three bays. The bays were used for truck repair. URS indicated that there was a 30-inch deep work pit in the bays. No VOCs in soil vapor exceeded their respective Vapor ESLs.	URS Phase I and IIs, H&A Phase I and IIs, H&A Vapor Survey, GSI Phase II
See Map Label	Western Drainage Swale	29, 99, and 100	NA	NA	Metals, VOCs, PCBs, PAHs	UT-03, UT-18, UT-19, UT-20, UT-21, UT-66	N	Y	Y	Certain PAHs exceeded commercial/industrial screening criteria in soil associated with railroad right-of-way. This is not Rohr property.	URS Phase I and IIs
See Map Label, Tan Shading	Former Agricultural Property Use	350, 360, 364 and 368 Bay Boulevard, 29, 99, and 100	NA	NA	Metals, OCPs	BB-14 through -24, B99-01 through -04, and B29-01 through -07 with associated step-out borings	As	Y	Y	H&A reported vacant land was previously used for agricultural purposes for citrus and row crops prior to 1950s and identified agricultural property use as a REC. H&A evaluated OCPs and arsenic in surface soil during Phase IIs. Only arsenic present above site-specific background at Building 29. Partner identified the ongoing investigation under SDRWQCB oversight as a REC for vacant parcels (350, 360, 364 and 368 Bay Boulevard) , but did not specifically identify former agricultural property use as a REC.	URS Phase I and IIs, H&A Phase I and IIs, H&A Data Gap Assessment Partner Phase I

Notes and Abbreviations:

UST - Underground storage tank
AST - Aboveground storage tank
UV - Underground vessel
Y - Yes
N - No
NA - Not applicable
U - Unknown
µg/kg - micrograms per kilogram
µg/L - micrograms per liter
bgs - below ground surface
DEH - San Diego County Department of Environmental Health
SDRWQCB - San Diego Regional Water Quality Control Board
VOCs - volatile organic compounds
Metals -Title 22 metals
TCE - trichloroethene
OCPs - organochlorine pesticides
TPH - total petroleum hydrocarbons
PAHs - Polynuclear Aromatic Hydrocarbons
TPHd - TPH diesel range organics
TPHg - TPH gasoline range organics
PCBs - Polychlorinated biphenyls
BTEX - Benzene, toluene, ethylbenzene and xylenes
As - Arsenic

Map ID is the Rohr tank number or number assigned by Adrian Brown Consultants (1998) or URS Corporation (2013) or Haley & Aldrich (2020). The Map IDs are noted on Figure 2.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Xylene (total)	6	-	-	-	-	-	-	-	-	-	-	-	-

Notes and Abbreviations:

BOLD = concentration detected at or above reported detection limit.

No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).

< = analyte not detected above the indicated reporting limit.

B = compound detected in the associated blank

J = estimated concentration.

- = not analyzed or not applicable.

mg/kg = milligrams per kilogram.

bgs = below ground surface.

GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)

DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.

TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24

[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[2] Site background

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:

BOLD = concentration detected at or above reported detection limit.

No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).

< = analyte not detected above the indicated reporting limit.

B = compound detected in the associated blank

J = estimated concentration.

- = not analyzed or not applicable.

mg/kg = milligrams per kilogram.

bgs = below ground surface.

GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)

DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.

TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24

[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

[2] Site background

[3] U.S. EPA Region 9 Remediation Screening Level

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[2] Site background
[3] U.S. EPA Region 9 Remediation Screening Level

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[2] Site background
[3] U.S. EPA Region 9 Remediation Screening Level

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.
[2] Site background
[3] U.S. EPA Region 9 Remediation Screening Level

Notes and Abbreviations:
BOLD = concentration detected at or above
reported detection limit.
No COPC in soil exceeded its Total Threshold Limit Concentration (TTLC).
< = analyte not detected above the indicated
reporting limit.
B = compound detected in the associated blank
J = estimated concentration.
- = not analyzed or not applicable.
mg/kg = milligrams per kilogram.
bgs = below ground surface.
GPL: Groundwater Protection Level (Haley & Aldrich 2014a, 2014b)
DTSC-SL: Commercial/Industrial Department of Toxic Substances Control-Screening Level, HHRA Note 3, June 2020.
TTLC: Total Threshold Limit Concentration, CCR Title 22 Section 66261.24
[1] Cancer Endpoint. If there is no Cancer Endpoint, the Noncancer Endpoint is noted.

Notes:
Volatile Organic Compounds (VOCs) analyzed by EPA Method TO-15.
BOLD = concentration detected at or above reported detection limit,
2019 San Francisco Bay Regional Water Quality Control Board Vapor ESLs
Cells shaded gray = concentration detected at or above the Vapor ESL

Abbreviations:
< = analyte not detected above the indicated reporting limit.
- = not analyzed or not applicable.
ESL = Environmental Screening Level
µg/m^3 = micrograms per cubic meter.

Notes:
Volatile Organic Compounds (VOCs) analyzed by EPA Method TO-15.
BOLD = concentration detected at or above reported detection limit,
2019 San Francisco Bay Regional Water Quality Control Board Vapor ESLs
Cells shaded gray = concentration detected at or above the Vapor ESL

Abbreviations:
< = analyte not detected above the indicated reporting limit.
- = not analyzed or not applicable.
ESL = Environmental Screening Level
µg/m^3 = micrograms per cubic meter.

TABLE 5

INDOOR AIR SCREENING RESULTS - BREATHING ZONE IN BUILDING 29

ROHR, INC. - PARCEL A

CHULA VISTA, CALIFORNIA

Screening Location	Location Description	February 2019		September 2018		Comments
		TVOC[1] (ppbv)	TCE[2] (µg/m^3)	TVOC[1] (ppbv)	TCE[2] (µg/m^3)	
V03	Occupied northern portion of building, Column 18/19	50-500	**114**	50-500	4.2	Utility trench nearby, adjacent to crack in slab (sealed prior to February), flammables storage cabinets nearby, organic odors, vaulted floor along northern wall. Rollup door open in September and closed in February. In February, TCE was remeasured two days later (121 µg/m^3).
V03-020	Occupied northern portion of building, Column 18/19	500-5,000	--	50-500	--	Crack next to flammables cabinet
V03-021	Dock, Column 19	10-50	--	50-500	--	
V04	Occupied northern portion of building, Column 18/19	50-500	**40**	50-500	5.5	Utility trench nearby, wall fans operating, vaulted floor along northern wall. Rollup door open in September and closed in February. In February, TCE was remeasured two days later (31 µg/m^3).
NDT1	Occupied northern portion of building, Column 16/17	50-500	4.7	50-500	0.16	Passive roof wind turbine, flammables storage cabinet nearby.
V05-027	Machine Shop, Column 17	50-500	--	50-500	--	
V05-028	Outside hallway to women's restroom, Column 15	50-500	--	50-500	--	
V05-029	Hallway outside men's restroom, Column 15	500-5,000	2.8	500-5,000	0.25	Stuffy, drop ceiling, slight organic odor. Exhaust fans on in men's restroom. Near metallurgy lab and utility room.

B29-OUT03	Ambient outdoor air, near Door 29-19	50-500	0.50	--	--	

Notes:

µg/m^3 = micrograms per cubic meter

ppbv = parts per billion by volume

[1]TVOC = total volatile organic compounds measured using ppbRAE Photoionization Detector

[2]TCE = trichloroethene measured using HAPSITE Mass Spectrometer/Gas Chromatograph

Bold and gray shading indicates that the TCE concentration is greater than or equal to the US EPA Region 9 Interim TCE Indoor Air Response Level

TCE concentrations less than 0.54 µg/m^3 or greater than 107 µg/m^3 are outside the instrument's calibration range and should be considered estimated.

BB-23			DDE
UT-02*		PCBs	
UT-03*		As	
UT-18*		BaP, DahA	
UT-21*		BaP, DahA	
UT-66*		BaP, DahA	
Total No. of Locations Above Screening Criterion	**2**	**15**	**1**

Notes:

No other VOCs, SVOCs, OCPs, or metals were above their respective screening criteria.
GPL = Groundwater Protection Level
DTSC-SL = Department of Toxic Substances Control Screening Level
TTLC = Total Threshold Limit Concentration
As = Arsenic
BaP = Benzo(a)pyrene
DahA = Dibenz(a,h)anthracene
DDE = 4,4'-DDE
TCE = Trichloroethene
PCBs = Total Polychorinated Biphenyls

[1] Arsenic is compared to background established for the Former South Campus (8 mg/kg).

* Boring not located on Rohr property (adjacent railroad right-of-way).

TABLE 8

LEGEND

- ● Complete: Exposure pathway currently exists for that receptor.
- ◑ Potentially Complete: Exposure pathway may exist for future receptor.
- ⊗ Insignificant: All criteria exist for a complete pathway, but data suggest low concentrations, low exposure frequency, potential insignificant risk, or significant pathway in comparison to other pathways.
- ○ Incomplete: One or more criteria for a complete pathway do not exist.

COLUMN DESCRIPTIONS

1	**Depth:**	Distance (in feet) below the ground surface.
2	**Elevation:**	Approximate elevation (in feet) referenced from the ground surface.*
3	**Sample Type:**	Type of soil sample collected at depth interval depicted; symbols explained above.
4	**Sample Number:**	Sample identification number.
5	**Sample Blows/foot:**	Number of blows required to advance driven sampler 1 foot, or distance indicated, using a 140-lb hammer (or as otherwise indicated) with a 30-inch drop. "**" indicates blow count for initial 6-inch seating interval of sampling only.
6	***Graphic Log:***	*Graphic depiction of subsurface material encountered; symbology explained* on Sheet 2 of Key.
7	**Material Description:**	Description of subsurface material encountered, including USCS soil designation.
8	***Well Completion Log:***	*Graphic depiction of well construction; symbology explained on Sheet 2 of Key.*
9	**Headspace:**	Photoionization detector (PID) field headspace reading (in parts per million). ND indicates that no organic vapors were detected.
10	***Remarks:***	*Comments or observations regarding drilling/sampling made by driller* or Woodward-Clyde's field personnel

GENERAL NOTES

1. Soil classifications are based on the Unified Soil Classification System (USCS) or recorded and include consistency/relative density (where standard blow count correlation is possible), moisture, and color.
2. Descriptions on these boring logs apply only to the specific boring locations at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or for other times.

ATD = At time of drilling
ND = Organic vapors not detected
NR = Negligible to no recovery

*Based on available topographic plan

1	**Depth:**	Distance (in feet) below the ground surface.
2	**Elevation:**	Approximate elevation (in feet) referenced from the ground surface.*
3	**Sample Type:**	Type of soil sample collected at depth interval depicted; symbols explained above.
4	**Sample Number:**	Sample identification number.
5	**Sample Blows/foot:**	Number of blows required to advance driven sampler 1 foot, or distance indicated, using a 140-lb hammer (or as otherwise indicated) with a 30-inch drop. "*" indicates blow count for initial 6-inch seating interval of sampling only.
6	**Graphic Log:**	Graphic depiction of subsurface material encountered; symbology explained on Sheet 2 of Key.
7	**Material Description:**	Description of subsurface material encountered, including USCS soil designation.
8	**Well Completion Log:**	Graphic depiction of well construction; symbology explained on Sheet 2 of Key.
9	**Headspace:**	Photoionization detector (PID) field headspace reading (in parts per million). ND indicates that no organic vapors were detected.
10	**Remarks:**	Comments or observations regarding drilling/sampling made by driller or URSGWC's field personnel

GENERAL NOTES

1. Soil classifications are based on the Unified Soil Classification System (USCS) or recorded and include consistency/relative density (where standard blow count correlation is possible), moisture, and color.
2. Descriptions on these boring logs apply only to the specific boring locations at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or for other times.

NR - No Recovery
*Based on available topographic plan

Rohr, Inc., Chula Vista, CA Facility
Cleanup and Abatement Order No. R9-2021-0042

Dear Mr. Gibson:

By this correspondence, Raytheon Technologies Corporation on behalf of Rohr, Inc. (Rohr) is providing the San Diego Regional Water Quality Control Board (SDRWQCB) written notification that Rohr Inc. sold the portion of Parcel A occupied by Buildings 29, 99 and 100 to PSIP Wohl Bay Boulevard LLC, a Delaware limited liability company on September 25, 2020. In accordance with Section M(2) of Cleanup and Abatement Order No. R9-2021-0042 (CAO) Rohr is also providing notification that the portion of Parcel A at 360, 364 and 368 Bay Boulevard was also purchased by PSIP Bay Boulevard LLC. The sale closed on September 28, 2021. The properties sold are shown on Figure 2 of the CAO.

Please do not hesitate to contact me at 207-865-1022 or Bob Scott of Haley & Aldrich at 619-285-7141 if you have any questions or require further information.

Dear Mr. Alo:

Please find enclosed for your review, a copy of the subject document dated July 8, 2022 that was prepared by Haley & Aldrich, Inc. for Rohr, Inc., a Collins Aerospace Company (Rohr) for Parcel A at the site. This document is being submitted in response to Directive C.3 of Cleanup and Abatement Order No. R9-2021-0042, issued to Rohr on July 12, 2021 by the San Diego Regional Water Quality Control Board.

"I certify under penalty of law this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

If you have any questions, please contact Tyler Adkins at (619) 691-2020.

Sincerely,

Attention: Mr. Tom Alo

Subject: Update to the Revised Baseline Human Health Risk Assessment
Rohr, Inc. - North Campus, Parcel A
850 Lagoon Drive
Chula Vista, California
GeoTracker Global ID T0000011095

Dear Mr. Alo:

Haley & Aldrich, Inc., is pleased to provide the San Diego Regional Water Quality Control Board (SDRWQCB) this Update to the Revised Baseline Human Health Risk Assessment (HHRA) for Parcel A of the Rohr, Inc., a Collins Aerospace Company North Campus facility located in Chula Vista, California. This HHRA was prepared to meet the requirements of Directive C.3 in the Cleanup and Abatement Order (CAO) No. R9-2021-0042 dated July 12, 2021.

The Revised Baseline Human Health Risk Assessment dated May 4, 2021, was prepared in response to comments provided by the Office of Environmental Health Hazard Assessment (OEHHA) in a memorandum to the SDRWQCB dated March 8, 2021, and following further discussion and clarification during a conference call on March 18, 2021. OEHHA concurred with the findings of the Revised Baseline HHRA in a June 30, 2021, letter.

This HHRA has been updated to add the soil and soil vapor data collected as part of the data gap assessment conducted in March 2022. Please note that data for the parcel at 350 Bay Boulevard was removed, since Rohr did not sell it to the new owner of Parcel A. Please contact us if you have questions or require additional information.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

Haley & Aldrich, Inc., (Haley & Aldrich) prepared this Update to the Revised Baseline Human Health Risk Assessment report (HHRA) on behalf of Rohr, Inc., a Collins Aerospace Company, (Rohr) for Parcel A on the North Campus property in Chula Vista, California (Site). Parcel A comprises Buildings 29, 99, and 100 and Parcel A is bound by Bay Boulevard on the east, a railroad right-of way on the west, H Street on the South, and vacant properties owned by Rohr to the north (Figures 1 and 2). This HHRA was prepared in accordance with, and to meet the requirements of Directive C.3 in the Cleanup and Abatement Order (CAO) No. R9-2021-0042 dated July 12, 2021. The Revised Baseline Human Health Risk Assessment dated May 4, 2021, was prepared in response to comments provided by the Office of Environmental Health Hazard Assessment (OEHHA) in a memorandum to the San Diego Regional Water Quality Control Board (SDRWQCB) dated March 8, 2021, and following further discussion and clarification during a conference call on March 18, 2021. OEHHA concurred with the findings of the Revised Baseline Human Health Risk Assessment in a letter dated June 30, 2021. This HHRA has been updated with soil and soil vapor data collected as part of the data gap assessment conducted in March 2022. This HHRA does not include the vacant lot at 350 Bay Boulevard, since the new owner of Parcel A has not purchased this parcel from Rohr.

Rohr is in the process of selling portions of its facility that occupied approximately 82 acres. The Site has been divided into three parts: Parcels A, B, and C. In September 2020, Rohr sold Parcel A that includes Buildings 29, 99, and 100 (assessor parcel number [APN] 567-022-30 and the eastern portion of APN 571-330-29) to PSIP Wohl Bay Boulevard LLC (Owner). The Owner has also purchased the vacant parcels at 360, 364, and 368 Bay Boulevard (APNs 567-022-28, 567-022-31, and 567-022-33). These parcels, formerly included in Parcel C, are also included in this Update to the Revised HHRA. With these added parcels, Parcel A occupies approximately 14.7 acres.

The Owner intends to raze the northern portion of Building 29 to build a loading dock and may raze Buildings 99 and 100 to redevelop this parcel and the adjoining vacant properties to the north for surface parking. This Update to the Revised HHRA considers two scenarios, one with Buildings 99 and 100 remaining in place and the other assuming these buildings have been demolished. Buildings may be constructed in the future at undetermined locations on that portion of Parcel A.

1.1 SITE LOCATION

The Site consists of two APNs that are part of Rohr's manufacturing facility, including APN 567-022-30-00 and the eastern portion of APN 571-330-29-00, as well as three APNs that were not part of Rohr manufacturing facility that include APNs 567-022-28-00, 567-022-31-00, and 567-022-33-00. The following table summarizes the APNs, historical street addresses, and names that have been used for these properties.

APN	Address	Property Name/Building
567-022-28	360 Bay Boulevard	B & H Metal Co. (1956-1964) A & R Used Auto Parts (1964-1985)
567-022-31	364 Bay Boulevard	So. Bay Veterinary Hospital (1956-1964) Post Aircraft Co./For Mac Co., aircraft parts rear (1960-1964)

APN	Address	Property Name/Building
567-022-33	368, 368½ Bay Boulevard	Mansell Marine Inc./So. Bay Marine & Boat (1956-1964) San Diego Pump & Compressor (1964-1985) Residential (1976-1985)
567-022-30	390 Bay Boulevard	Valley Detroit Diesel/Buildings 99 and 100
571-330-29*	850 Lagoon Drive	Building 29

Note: * Portion of the APN east of the railroad right-of-way

1.2 SITE DESCRIPTION AND HISTORY

APN 567-022-30-00 and the eastern portion of APN 571-330-29-00 are part of Rohr's manufacturing facility that is primarily located west of the Site and has occupied the Chula Vista Bayfront since 1941 (Adrian Brown Consultants [Adrian Brown], 1998; URS Corporation [URS], 2013). The parcels at 360, 364, and 368 Bay Boulevard (APNs 567-022-28, 567-022-31 and 567-022-33) were not part of Rohr's manufacturing facility. Rohr primarily manufactured structural and engine components for aircraft (nacelles). The facility's Standard Industrial Classification Code is 3728. The Site is divided by G Street; the areas north and south of G Street are therefore described separately.

1.2.1 Building 99 and Building 100 Area (North of G Street)

For the purpose of this Revised HHRA, the Building 99 and 100 Area includes the following properties north of G Street: Buildings 99 and 100 (APN 567-022-30) and three vacant properties to the north at 360, 364, and 368 Bay Boulevard (APNs 567-022-28, 567-022-31, and 567-022-33). Rohr will retain the properties at 798 F Street and 340 and 350 Bay Boulevard. These four Rohr parcels (APNs 567-022-01, 567-022-17, 567-022-36, and 567-022-35) remain part of Parcel C.

The property between Lagoon Drive (formerly F Street) and G Street, which includes the Building 99 and 100 Area, was developed agriculturally as a citrus grove from as early as 1929 through at least 1945 and continued to be used for row crop cultivation until at least 1953. By 1957, the Building 99 and 100 property was a parking lot and a trailer park with two possible residences. Harbor Trailer Park (388 Bay Boulevard) was located on this property from 1956 through 1976 (Haley & Aldrich, 2016a), at which time Buildings 99 and 100 were constructed on the property. Valley Detroit Diesel repaired semi-truck engines at this location starting in 1978. Rohr purchased Buildings 99 and 100 in 1986 from Valley Detroit Diesel. Rohr used the buildings primarily for administrative purposes (URS, 2013; Haley & Aldrich, 2016a). Test laboratories were housed in Building 100 until last year.

After 1953, the properties at 360, 364, and 368 Bay Boulevard were developed with mixed commercial/industrial and residential use. Businesses that occupied these parcels included aircraft parts manufacturing, refrigeration unit repair, storage, junkyards, and a veterinary hospital (Haley & Aldrich, 2016b). 360 Bay Boulevard was formerly used for auto maintenance and repair, auto dismantling, and salvaging that included a gold ore extraction/recovery operation. By the mid-1980s, the properties were acquired by the City of Chula Vista (City) and business operations ceased. Rohr has never used or conducted any operations on the three vacant Bay Boulevard properties (360, 364, and 368).

1.2.2 Building 29 Area (South of G Street)

Building 29 was constructed in phases beginning in about 1957 through 1962 (URS, 2013; Haley & Aldrich, 2016a). The building was primarily used for tooling and machining and office space for most of its history. At one time, the northernmost portion served as the Maintenance Department for the facility. Most recently, the building housed laboratories, kitting, an Aftermarket Spares Warehouse, Service Center and FAI repairs, storage, tool calibration, product development, and office space.

Prior to Rohr's ownership, the Building 29 area had a variety of other historical uses, including agriculture, a possible lumber yard, and residential. A former building (Building 28) was also built on the southern portion of Parcel A in the mid-1940s and served as a cafeteria and a warehouse. The building was located south of Building 29 and was demolished around 2000. The area is now occupied by a parking lot.

1.3 SITE FUTURE USE

Rohr sold the Building 99/100 and Building 29 portions of Parcel A to the Owner in September 2020. The Owner purchased three adjoining vacant Bay Boulevard parcels in 2021. The Owner will be demolishing the northern portion of Building 29 to construct a loading dock to improve truck access. Up to approximately 5 feet of soil will be excavated to construct the loading dock. The remainder of Building 29 will be used by the Owner for commercial/industrial purposes. The Owner is also contemplating demolishing Buildings 99 and 100 and redeveloping this portion of the Site as well as the three adjoining vacant parcels to the north for surface parking. However, it is possible the buildings will be used for commercial/industrial use.

1.4 HHRA ORGANIZATION

The HHRA report sections are as follows:

- Section 1 – Introduction: provides a description of the Site location and general conditions;
- Section 2 – Site Geology and Hydrogeology: provides an overview of the characteristics of the regional and local geology and hydrogeology;
- Section 3 – Previous Investigations: provides a summary of the previous Site assessments and investigations conducted by various environmental consultants;
- Section 4 – Human Health Risk Assessment: presents a summary of the methodology and the results and uncertainties associated with the HHRA; and
- Section 5 – Health-based Remediation Goals: includes the methodology used to derive health protective remedial goals for the Site.

2. Site Geology and Hydrogeology

This section summarizes the geology and hydrogeology that appears in the "Revised Conceptual Site Model, Rohr, Inc. – North Campus, Parcel A" (Parcel A CSM) submitted to the SDRWQCB on April 30, 2021, (Haley & Aldrich, 2021) and the "Revised Updated Sitewide Conceptual Site Model, Rohr, Inc. – North Campus" submitted to the SDRWQCB on February 25, 2022 (Haley & Aldrich, 2022b).

2.1 SITE GEOLOGY

Parcel A is situated at elevations ranging from approximately 13 feet above mean sea level on the south and 28 feet above mean sea level on the north. Parcel A is underlain, in descending order, by limited fill material, the Bay Point Formation, a clay aquitard, and the San Diego Formation. Because Parcel A is more than 1,000 feet upland of the former shoreline, there are no bay muds or extensive fill present on this portion of the North Campus facility. Geologic cross sections A-A' (north-south) and B-B' (east-west in the Former Maintenance Department) are provided as Figures 3 and 4.

2.1.1 Artificial Fill

Artificial fill generally consisting of yellow to brown, silty fine to medium sand with degraded asphalt and sub-angular fine gravel were observed during the Phase II Environmental Site Assessment (Phase II) and the data gap assessment (Haley & Aldrich, 2018a and 2020a). The maximum thickness of fill encountered was approximately 5 feet, in boring B29-33A.

2.1.2 Bay Point Formation

The Bay Point Formation can also be referred to as Quaternary alluvium, as suggested by Wes Danskin formerly with the United States Geological Survey (W. Danskin, pers. comm.). The thickness of the Quaternary sediment can be highly variable in the San Diego embayment, ranging from approximately 200 feet to possibly as much as 700 feet. The Bay Point is Pleistocene in age and was deposited in nearshore marine and onshore fluvial depositional environments.

The Bay Point Formation consists of an interbedded sequence of clay, silt, and silty sand to the total depth explored (approximately 30 feet). The strata are predominantly composed of reddish brown to yellowish brown clay and silt with some thin, discontinuous lenses of silty sand. The coarser-grained lenses are typically saturated below a depth of approximately 12 feet below ground surface (bgs).

2.1.3 Clay Aquitard

A blue-gray estuarine clay, designated as a "clay aquitard" occurs below the sandy interval at about 125 to 150 feet bgs (Huntley, 2000). The clay aquitard was identified during URS Greiner Woodward-Clyde's(URSGWC) San Diego Formation aquifer testing program (URSGWC, 1999). The clay aquitard varies in thickness from 20 feet to almost 40 feet. A blue-gray clay layer has also been encountered beneath the North Campus at a depth of approximately 125 to 150 feet bgs with a thickness of 20 to 65 feet. Although the aquitard materials encountered may differ in color at various locations throughout the North Campus and Former South Campus, the materials are characterized as clay with a low hydraulic conductivity.

2.1.4 San Diego Formation

There is a 20-foot-plus thick interval of coarse sands, gravels, and cobbles beneath the clay aquitard that is attributed to the San Diego Formation (Huntley, 2000). These strata were investigated during a drilling and aquifer testing program that Rohr conducted in 1998 and 1999 on behalf of the Sweetwater Authority to characterize the hydrogeology beneath the North Campus (URSGWC, 1999). These coarser-grained sediments were referred to as the Upper Gravel Unit in the URSGWC study and, based on geophysical logs and borehole flowmeter logging, Huntley suggested that the Upper Gravel Unit is the most productive zone investigated during this study (Huntley, 2000). The Upper Gravel Unit is underlain by a series of discontinuous lenses of fine to medium sands, silty sands, clayey sands, and silts and clays to a depth of at least 400 feet bgs (Huntley, 2000).

The San Diego Formation consists of two portions: the upper and lower members. The upper member of the San Diego Formation is present on the land surface in the vicinity of downtown San Diego and Chollas Creek but does not seem to be present or exposed in the South Bay, where the Site is located. The upper member was deposited in a higher energy environment, closer to the continent; the lower member was deposited in a lower energy environment, typical of a deeper marine environment. The thickest section of the San Diego Formation is located adjacent to the southeastern edge of San Diego Bay, south of the Site.

The age of the San Diego Formation is less well defined but considered to be of the Plio-Pleistocene age. Like the Quaternary sediment, the San Diego Formation was deposited in nearshore marine and onshore fluvial depositional environments. The contact with the overlying Quaternary alluvium is erosional and very difficult to distinguish in the subsurface and in geophysical logs. The term “San Diego Formation” has historically been used quite liberally, and in some instances, probably inaccurately. For example, marine mollusks present in the clay aquitard during URSGWC’s study were found to be Pleistocene age and part of the Quaternary sediments (Bay Point Formation).

Recent work by the United States Geological Survey indicates that San Diego Formation groundwater near the Sweetwater and Otay Rivers is isotopically enriched, reflecting the process of seawater intrusion (Anders et al, 2013). Furthermore, chloride concentrations decline within the saline section of the San Diego Formation at depths of about 500 to 820 feet bgs, indicating that the greatest quantity of regional groundwater recharge (originating in higher elevations to the east) may flow through the coastal aquifer at these depths.

2.2 SITE HYDROGEOLOGY

Because this HHRA focuses on soil and soil vapor on Parcel A, the discussion of Site hydrogeology is limited to depth and flow direction in the uppermost water-bearing zone (Zone A). Groundwater is present in the Bay Point Formation ranging in depth from approximately 10 to 20 feet bgs, based on observations during drilling and water levels in the wells that are north of Building 99. Boring logs for the direct-push borings and the monitoring wells are provided in the Revised Parcel A CSM. The locations of the borings and the existing and former monitoring wells are shown on Figure 5. The thickness of the vadose zone on Parcel A ranges from approximately 10 to 20 feet based on this information. The direction of groundwater flow is generally to the west. Wells present on Parcel A include the remaining wells installed for the San Diego Formation aquifer testing program that serve as upgradient wells (URSGWC, 1999). The two monitoring wells are north of Building 99. OW-3 is screened in Upper Zone B at 10 to 30 feet bgs, and OW-4 is screened in Lower Zone B at 60 to 80 feet bgs. A well cluster consisting of two wells (NCW-021A and NCW-021B) was installed during the Parcel A data gap investigation. The wells were recently sampled, and the analytical results will be included in AECOM’s next annual groundwater monitoring report.

3. Previous Investigations

Previous investigations at the Site that have included soil, soil vapor, and groundwater sampling are summarized in this section. Tables summarizing the analytical results for soil, sub-slab and deeper soil vapor, and groundwater samples are provided in Appendix A. Sample locations and historical environmental site features are shown on Figures 5 and 6, respectively.

3.1 FUEL UNDERGROUND STORAGE TANKS CLOSURES

In 1986, four fuel underground storage tanks (USTs) in the Building 99 and 100 Area were removed and closed under permit with the San Diego Department of Environmental Health (DEH). McLaren Environmental Engineering conducted a subsurface investigation prior to Rohr's purchase of the property formerly occupied by Valley Detroit Diesel. Four groundwater monitoring wells (MW-A through MW-D) were installed on the perimeter of the Building 99 and 100 Area. Total recoverable petroleum hydrocarbon (TRPH) and volatile organic compound (VOC) concentrations in soil and groundwater were relatively low or not detected (Woodward-Clyde, 1998). In June 1996, the DEH provided Rohr with approval to destroy the wells.

3.2 350-360 BAY BOULEVARD SITE ASSESSMENT

The following summary is based primarily on information appearing in the "Data Compilation and Evaluation Report" prepared by Woodward-Clyde Consultants in 1998 ([WCC], 1998) and limited information in the DEH electronic library database. In October 1987, WCC conducted soil excavation, disposal, sampling, and analysis for the City related to petroleum hydrocarbons. Soil with petroleum hydrocarbon concentrations greater than 1,000 milligrams per kilogram ([mg/kg]; 85 cubic yards) was excavated and properly disposed of off-Site. Lead (greater than 200 mg/kg) was detected in surface soil at 350 Bay Boulevard, around the area believed to have been formerly used for gold ore extraction. A sample contained Soluble Threshold Limit Concentration (STLC) lead at a concentration of 20 milligrams per liter (mg/L), which was above the regulatory limit of 5 mg/L.

In 1988, when Rohr obtained an option to purchase these parcels, WCC collected 25 surface soil samples at random locations and installed and sampled three groundwater monitoring wells (MW-1B, -2B and MW-3B). Soil lead concentrations ranged from 75.2 to 16,400 mg/kg and STLC lead concentrations ranged from 1.0 to 538 mg/L. The lead concentration in groundwater in well MW-1B was below the Maximum Contaminant Level (MCL) of 0.050 mg/L. Trichloroethene (TCE) was also detected in well MW-2B at 14 micrograms per liter (µg/L).

In 1991, TorStan destroyed well MW-3B and characterized surface soil on the property for the City. Soil samples were analyzed for total and STLC lead (44 samples), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), and dioxin and furans. Total lead concentrations in the samples analyzed ranged from 13.3 to 3,490 mg/kg. Three samples contained lead above the Total Threshold Limit Concentration (TTLC) of 1,000 mg/kg. STLC lead ranged from not detected (<0.275 mg/L) to 84.6 mg/L, and 24 samples contained STLC lead above the regulatory limit of 5 mg/L. The upper 80 percent confidence interval concentrations for TTLC and STLC lead were 399 mg/kg and 12.0 mg/L, respectively. OCPs were detected in the 12 samples analyzed and included DDE and DDT at concentrations ranging from approximately 0.0075 to 0.0361 mg/kg, below the TTLC regulatory limit of 1.0 mg/kg for each compound. PCBs (as Aroclor 1254) were also present in 10 of the 12 soil samples at concentrations ranging from 0.063 to 2.585 mg/kg.

Four additional soil samples were analyzed for PCBs, and dioxin and furans. Two of the samples contained PCBs (Aroclor 1254 and 1260) at concentrations of 0.055 and 7.438 mg/kg. Dioxins and furans were detected in two of the four samples analyzed. Compounds detected included hexa, hepta and octa isomers; concentrations ranged from 3.2 to 1883.7 nanograms per kilogram (ng/kg). TorStan concluded that the concentrations of the isomers detected were below the TTLC for tetradioxins (10,000 ng/kg). Soil containing PCBs was excavated and properly disposed of off-Site under DEH oversight.

TorStan conducted quarterly groundwater monitoring of wells MW-1B and MW- 2B in 1991 and 1992. No OCPs were detected in groundwater samples when analyzed during the first quarter 1991. TCE concentrations in well MW-2B were above the MCL of 5 µg/L during each monitoring event. According to DEH records, MW-2B was destroyed, but MW-1B could not be located. It is unclear if this well remains on the property.

In February 2001, the lead-containing soil was excavated across the property to a depth of 2 feet and 800 cubic yards of lead-containing soil was removed and consolidated with burn ash from the Shinohara Burn Site on Otay Valley Road. The materials were used as part of the foundation of the cap for the former Otay Class I Landfill operated by San Diego County. This landfill was permitted to accept hazardous waste. Confirmation soil samples were collected from the perimeter and the floor of the excavation at random locations. The mean total lead concentration of the confirmation samples was 54 mg/kg, and the upper 95% confidence interval was 71 mg/kg. A No Further Action (NFA) letter was provided to the City by the DEH Voluntary Assistance Program on September 17, 2001.

3.3 1998 PHASE I ENVIRONMENTAL SITE ASSESSMENT

Adrian Brown was retained to conduct a Phase I of the Rohr facility in 1998 (Adrian Brown, 1998) in compliance with the 1998 CAO issued by the SDRWQCB. In this Phase I, Adrian Brown identified possible Site environmental features potentially containing hazardous substances and petroleum products such as process lines, sewers, sumps, drains, storm sewers, tanks, storage vessels, equipment vaults, degreasers, waste treatment storage areas, and chemical use areas. The historical environmental features identified by Adrian Brown are included on Figure 6.

3.4 SAN DIEGO FORMATION AQUIFER TESTING

In 1998 and 1999, URSGWC conducted a drilling program to assess subsurface geology and hydrogeology of the San Diego Formation at the Rohr Site (URSGWC, 1999). These data were collected to support the redesignation of the groundwater basin uses from beneficial to non-beneficial for the area west of Interstate 5. The drilling program identified subsurface geology to a depth of approximately 550 feet and evaluated the vertical hydraulic connection between shallow groundwater and a deeper, coarse-grained gravel zone identified at 180 to 200 feet bgs by conducting aquifer testing. In addition to the five wells installed (DB-2, DB-4, DB-5, OW-3, and OW-4), two pressure transducers (OW-1 and OW-2) were installed in separate grouted boreholes to monitor changes in pressure within the aquitard during aquifer testing. Three wells (DB-2, DB-4 and DB-5) and the two transducers (OW-1 and OW-2) were destroyed under permit with the DEH in late 2020. Wells OW-3 and OW-4, screened in Upper Zone B and Lower Zone B, respectively, remain for monitoring purposes. Groundwater use remains beneficial west of Interstate 5.

3.5 BLANCHARD GRINDER UNDERGROUND STORAGE TANK CLOSURE

The former Blanchard Grinder UST (Rohr Tank No.3-09598) was in the tooling area in the southern portion of Building 29. The machine sat on a metal plate above a concrete sump that served as a reservoir for coolant that was used to circulate through the unit while operating. URSGWC drilled soil borings in 1999 adjacent to the structure and analyzed the samples for TRPH. None were detected. Based on the results, the DEH approved in place closure of this former sump.

3.6 2013 URS SUPPLEMENTAL REMEDIAL INVESTIGATION

URS conducted a Site investigation as part of environmental due diligence associated with United Technologies Corporation's purchase of Goodrich Corporation (URS, 2015). The results of the investigations were compared to industrial/commercial screening criteria consistent with the Site's commercial/industrial use. One boring was drilled in the vicinity of the former Blanchard Grinder (boring UT-22) to collect soil and groundwater samples for VOC analysis, since the feature formerly used coolant. No VOCs were detected in soil samples from boring UT-22. The reported groundwater TCE concentration was 42 µg/L.

No VOCs or PCBs were detected in soil samples from the other borings drilled on the Building 29 portion of Parcel A. Polycyclic aromatic hydrocarbons (PAHs) were present in boring UT-18 in the railroad right-of-way drainage swale. The PAHs were detected in the drainage swale east of the railroad tracks in surface soil samples collected from 0.5 to 1 foot bgs; however, this is not part of the Site.

TCE was reported in groundwater in borings UT-22, UT-23, and UT-24 at concentrations of 42, 520 and 4.7 µg/L, respectively. No PCBs or PAHs were detected in groundwater at concentrations greater than a State of California MCL, except for boring UT-18, located in the drainage swale adjacent to the railroad line in the Building 29 area that is not part of the Site. Total petroleum hydrocarbons (TPH) were detected in borings UT-19 and UT-21 at concentrations of 860 and 1,300 µg/L, respectively. No Title 22 Metals (except for thallium) or hexavalent chromium were detected in groundwater above their respective MCLs on the Building 29 portion of Parcel A.

3.7 2016 HALEY & ALDRICH PHASE I AND IIs

Following completion of Phase I Environmental Site Assessments (Phase I), Haley & Aldrich conducted supplemental Phase II) in 2016 to investigate soil and groundwater on the Building 99 and 100 and Building 29 Areas (Haley & Aldrich, 2018a) and the vacant Bay Boulevard properties that were described as Parcel A [Haley & Aldrich, 2018b]). The locations of the borings advanced during the Phase IIs are shown on Figure 5. A summary of the findings for each of the Phase IIs conducted by Haley & Aldrich are described below.

3.7.1 Buildings 29, 99, and 100

Haley & Aldrich advanced 25 soil borings and analyzed samples for the following chemicals of potential concern (COPCs): TPH, VOCs, semi-volatile organic compounds (SVOCs [phenols and polynuclear aromatic hydrocarbons]), OCPs, PCBs, and Title 22 Metals. None of the soil samples analyzed for TPH, VOCs, SVOCs, or OCPs contained an analyte at a concentration above its respective commercial/industrial Department of Toxic Substances Control (DTSC) screening level (DTSC-SL) except for one sample (B29-05-02) collected at 2 feet bgs that contained the PCB Aroclor 1260 (1,300 micrograms per kilogram [µg/kg]) above its commercial/industrial DTSC-SL of 580 µg/kg. None of the samples contained any COPCs at a concentration above its groundwater protection level (GPL) or TTLC.

Arsenic was reported in soil at three locations (B29-02, B29-03, and B29-07) on the northern portion of the Building 29 Area at concentrations greater than the Site-specific background threshold of 8 mg/kg (established for the Former South Campus), but below the Site-specific GPL of 24.3 mg/kg. None of the other Title 22 Metals were present in soil at concentrations exceeding screening criteria described in Section 4. No environmental concerns were identified in soil or groundwater in the Building 99 and 100 Area.

3.7.2 Vacant Bay Boulevard Properties

Haley & Aldrich advanced 27 soil borings and analyzed 49 soil and nine groundwater samples for COPCs. Of the borings advanced and samples analyzed, there were 11 borings advanced, and 22 samples analyzed specific to 350, 360, 364, and 368 Bay Boulevard. COPCs included TPH, VOCs, PAHs, OCPs, and Title 22 Metals. None of the soil samples analyzed was reported to exceed a GPL, commercial/industrial DTSC-SL, or TTLC for the COPCs identified. One sample collected from BB-23 was reported to contain DDE at its TTLC of 1 mg/kg. Two in-situ groundwater samples from BB-17 and BB-23 were reported to contain arsenic slightly above the MCL of 0.010 mg/L (0.0149 and 0.0122 mg/L, respectively). The presence of low levels of arsenic in groundwater is likely naturally occurring and attributed to background.

3.8 2018 SUB-SLAB AND FOCUSED SOIL VAPOR SURVEY

In May 2018, and in preparation for the property sale, a soil vapor survey was conducted in Buildings 29, 99, and 100 in accordance with the California Environmental Protection Agency's "Advisory Active Soil Gas Investigations" dated July 2015 (Haley & Aldrich 2018c). Sub-slab sample locations were selected considering past Site use and previous subsurface VOC soil and groundwater concentrations. The soil vapor samples were analyzed by a mobile laboratory using U.S. Environmental Protection Agency (EPA) Method TO-15. The temporary vapor probe locations are shown on Figure 5.

Analytical results for sub-slab soil vapor samples are summarized in Appendix A. VOCs were identified in sub-slab soil vapor samples collected beneath the slab of Building 29 and in the deeper soil vapor samples. Samples were collected at a depth of 1 foot below the slab. TCE was detected in 10 of the 17 sub-slab soil vapor sample locations beneath Building 29 at concentrations ranging from 42 to 920,000 micrograms per cubic meter ($\mu g/m^3$). The highest TCE concentration in the sub-slab soil vapor samples was detected at probe B29-V03.

Deeper soil vapor data are summarized in Appendix A. The deeper soil vapor samples were collected at depths of 5 and 10 feet below the slab in the former Maintenance Department, since groundwater beneath this area contains VOCs. TCE was detected in each of the deeper samples collected beneath and in proximity to Building 29 except for samples from probe B29-V05. TCE concentrations ranged from 100 to 3,000,000 $\mu g/m^3$ in the 5-foot samples, with the highest concentration detected in probe B29-V03. TCE was detected in three of the four soil vapor samples collected at 10 feet (just above the level of groundwater) at lower concentrations, ranging from 64 to 3,400 $\mu g/m^3$. This suggested that TCE in soil vapor was related to a shallow soil source. Based on these findings, Haley & Aldrich recommended supplemental indoor air and potential preferential pathway screening in the building. The SDRWQCB concurred with our recommendations.

Relatively low concentrations of some VOCs were reported in soil vapor samples collected beneath Buildings 99 and 100. None of the VOC concentrations exceeded screening criteria and as such, are not considered to pose an immediate potential health concern.

3.9 2018-2019 INDOOR AIR SCREENING

In September 2018, Haley & Aldrich conducted indoor air screening in Building 29 to evaluate whether total VOCs and TCE may be present in indoor air (Haley & Aldrich 2018d). The screening was based on locations where TCE had been detected in soil, shallow groundwater, sub-slab soil vapor, and near slab penetrations that could serve as preferential subsurface vapor migration pathways. Air grab samples were screened using a photoionization detector and Hapsite gas chromatograph. It should be noted that the measurements represent a moment in time rather than a time-weighted average concentration over an 8- or 10-hour workday. The results were only used for screening purposes and to determine if interim mitigation measures were warranted prior to implementing building improvements (beyond sealing potential preferential pathways for vapor intrusion). The results of the indoor air screening indicated no immediate interim measures appeared to be required for Building 29.

TCE screening results for September 2018 are summarized in the Revised Parcel A CSM for the breathing zone and preferential pathways, respectively. The TCE screening results ranged from 0.012 µg/m^3 to 2 µg/m^3, except for two locations where 4.2 µg/m^3 and 5.5 µg/m^3 were measured in the breathing zone near utility trenches in proximity to a floor slab crack, suggesting that potential preferential pathways may be contributing to TCE screening results observed in indoor air. None of the results were greater than the EPA Region 9 Indoor Air Response Action Level of 8 µg/m^3 for TCE, also identified by DTSC as the commercial/industrial worker accelerated response action level assuming an 8-hour workday. No immediate interim measure was required in the building. However, there were several samples in the building where the TCE screening results were greater than the lower end of the health protective risk range for the 8-hour workday for a commercial/industrial worker (3 µg/m^3). This concentration is based on a 1 x 10^{-6} risk threshold assuming chronic long-term exposure.

Indoor air screening was conducted again in February 2019 at the same locations based on DTSC guidance (Haley & Aldrich, 2019). Doors and windows that are typically open were closed in February. There were six locations in the northern portion of Building 29 where TCE screening results in the breathing zone were greater than the accelerated response action level for the commercial/industrial 8-hour workday 8 µg/m^3). TCE screening results at six additional screening locations in the northern half of Building 29 were greater than the lower end of the health protective risk range for the 8-hour workday for a commercial/industrial worker (3 µg/m^3). As an immediate action, Rohr increased air circulation by keeping fans operating and doors opened. In September 2019, Haley & Aldrich sealed cracks and joints in the slab in the former Maintenance Department.

3.10 2020 DATA GAP ASSESSMENT

A data gap assessment was conducted in January 2020 to further characterize the nature and extent of VOCs in soil and groundwater and conduct some step-out sampling in areas where arsenic and PCBs had been detected above screening levels during the Phase II (Haley & Aldrich, 2018a; 2020a). Arsenic was detected in soil at concentrations slightly greater than the GPL of 24.3 mg/kg in step-out boring B29-07A (24.6 mg/kg). The other step-out samples analyzed contained arsenic concentrations less than the GPL. PCBs were not detected in soil at concentrations greater than the commercial/industrial DTSC-SLs in soil samples collected from the step-out borings for boring B29-05.

Several borings were advanced in the former Maintenance Department to identify the potential source of TCE in soil vapor and groundwater beneath this area. Soil samples B29-24-010 and B29-23-010 were collected at 1 foot bgs beneath the former Maintenance Department. The samples contained TCE at concentrations greater than the EPA Region 9 commercial/industrial Regional Screening Level (there is no DTSC-SL) of 6 mg/kg (7.83 and 37.8 mg/kg, respectively). TCE in soil sample B29-23-010 also

exceeded the GPL of 27 mg/kg. Groundwater analytical results indicated that TCE was present at up to 1,490 µg/L in boring B29-23 beneath the former Maintenance Department. It is our understanding that a relatively small degreaser, once located in this area, appears to have been the source of TCE and other VOCs detected in soil, soil vapor, and groundwater in this area. None of the soil samples contained a concentration of a COPC (as identified in Section 4 of this HHRA) above its respective TTLC.

Step-out borings were also conducted around the former mill and lathe locations. None of the COPCs in soil (as identified in Section 4 of the HHRA) were reported at concentrations above GPLs, commercial/industrial DTSC-SLs, or TTLCs.

3.11 2020 GSI PHASE II SCREENING INVESTIGATION

GSI Environmental, Inc., (GSI) conducted a Phase II screening investigation on Parcel A (excluding 350, 360, 364, and 368 Bay Boulevard) in August 2020 on behalf of the new Owner (GSI, 2020). The investigation included additional soil and soil vapor sampling and analyses.

Tetrachloroethene (PCE) was detected in PW-12 in soil at a concentration of 4.7 µg/kg at 1.5 feet bgs, and TCE was detected in PW-07 at a concentration of 23 µg/kg at 1.5 feet bgs. PCE and TCE were not detected above laboratory reporting limits in other soil samples. PCBs (Aroclor-1260) were only detected in PW-11, at a concentration of 180 µg/kg. PCBs in other samples analyzed were not detected at concentrations greater than the reporting limits. No analytes were detected in soil samples at concentrations exceeding GPLs, commercial/industrial DTSC-SLs, TTLCs, or background soil concentrations for arsenic.

Seventeen soil vapor samples (including two duplicate samples) were collected at 15 locations from depths between approximately 3 and 5 feet bgs and analyzed for VOCs. TCE was the constituent detected at the highest concentrations in both GSI and Haley & Aldrich soil vapor assessments. GSI concluded that the soil analytical results did not indicate a need for additional assessment on Parcel A, and the soil vapor results were generally consistent with the data collected by Haley & Aldrich in 2018.

The samples collected in 2020 were not co-located with the samples collected in 2018. These two sampling events represent the distribution of impacts beneath and in proximity to Building 29. Contaminant releases to the subsurface beneath Building 29 are historical, occurring decades ago; there are no ongoing contaminant releases associated with current on-Site operations at Building 29. The apparent differences in concentrations beneath portions of Building 29 may be associated with the distribution of subsurface impacts at the various identified environmental features and seasonal differences such as temperature, soil moisture and barometric pressure.

3.12 2020 PARTNER PHASE I FOR 350, 360, 364 AND 368 BAY BOULEVARD

Partner Engineering and Science, Inc. (Partner) conducted a Phase I for the property buyer in late 2020 (Partner, 2020). Partner concluded that the parcels had a recognized environmental condition, since they are part of the ongoing larger Eastern Parcels (Parcel A, Case Number T10000011095) investigation under the oversight of the SDRWQCB. It should be noted that the Eastern Parcels initially included the vacant Bay Boulevard Properties; because Rohr had decided that it would retain them. With the new Owner's plan to purchase 360, 364 and 368 Bay Boulevard, it was requested that the SDRWQCB include these parcels in Parcel A once again.

3.13 2022 DATA GAP INVESTIGATION

Haley & Aldrich submitted a Data Gap Investigation Work Plan (Work Plan) for Building 29 to the SDRWQCB on November 5, 2021, to meet Directive C.2.a of the CAO. The Work Plan was subsequently revised (Revised Work Plan) at the request of the SDRWQCB and resubmitted on January 21, 2022 (Haley & Aldrich, 2022a). Haley & Aldrich implemented the Revised Work Plan in March 2022 and submitted a report to the SDRWQCB dated June 10, 2022. The results of the data gap investigation indicated the following:

Soil: TCE exceeding the heath-based remediation goal (HBRG) in the former Maintenance Department in the northern portion of Building 29 has been delineated. None of the samples collected from the step-out borings (DGA-024, DGA-025, and DGA-026) were reported to contain TCE or other VOCs at concentrations above its respective HBRG, commercial/industrial DTSC-SL, GPL, or TTLC. Based on the data for the former Maintenance Department, the area with soil impacts is limited to depths less than 4 feet bgs. VOC concentrations beneath the central and southern portions of Building 29 were either not detected in soil, or the concentrations were relatively low, supporting that soil is not a significant VOC source contributing to those present in soil vapor.

Soil Vapor: Based on the Owner's intent to construct the new loading dock and manage TCE-containing soil by implementing a Demolition and Environmental Monitoring Plan and manage VOCs in soil vapor through installing a sub-slab depressurization system (SSDS) and implementing a Risk Management Plan (RMP), Haley & Aldrich recommended that no further soil vapor investigation be conducted at this time.

Groundwater: The VOCs in groundwater detected at the four locations sampled during the data gap investigation were relatively low, delineating groundwater impacts beneath Building 29 in the former Maintenance Department where there are TCE soil and soil vapor impacts, and the central and southwestern portion of the building where there are lesser groundwater and soil vapor impacts. Based on these and previous groundwater analytical results, groundwater off-gassing appears to contribute to the VOCs reported in soil vapor beneath the northern and southwestern portions of Building 29. The potential for future vapor intrusion risk to building occupants will be addressed by installing the SSDS and implementing the RMP previously described.

Groundwater monitoring was recently conducted in well cluster NCW-021 by AECOM in accordance with the Revised Work Plan. Analytical results for the parameters indicated in the Revised Work Plan will be included in the next annual groundwater monitoring report.

4. Human Health Risk Assessment

Potential human health risks were estimated for on-Site human receptors, assuming the Site will be used for commercial/industrial purposes. As stated earlier, the Owner will be demolishing approximately 24,000 square feet of the northern portion of Building 29 to construct a loading dock to improve truck access. Up to approximately 5 feet of soil will be excavated to construct the loading dock. The remainder of Building 29 will continue to be used for commercial/industrial use. Buildings 99 and 100 may be used for commercial/industrial purposes or may be razed and the area redeveloped for surface parking. Both scenarios have been evaluated in this HHRA.

The overall approach used in the HHRA was based on current EPA (EPA 1988; 1989; 1990; 1991a,b,c; 1992a,b,c,d; 1996; 1997; 2001; 2002a,b; 2009; 2014; 2019) and DTSC (DTSC 1993, 2011, 2015, 2019a,b, and 2020b) guidance documents.

The methodology and assumptions used in the HHRA calculations presented herein are consistent with those presented in the revised April 20, 2018, "Human Health Risk Assessment Update" (HHRA Update) prepared for the Rohr Former South Campus property adjacent south of the Site (Haley & Aldrich, 2018b). The HHRA Update was submitted to California Office of Health Hazard Assessment (OEHHA) and SDRWQCB. The methodology presented in the HHRA Update was used to obtain NFA determinations on that property in a letter dated May 4, 2022. The methodology was also used in the "H Street Extension Cleanup and Abatement Completion Report, Former South Campus" prepared by Haley & Aldrich and dated March 23, 2015 (Haley & Aldrich, 2015b) and the "Final Cleanup and Abatement Completion Report Soil Remediation, Exchange Parcel - Former South Campus Facility" prepared by Haley & Aldrich and dated February 4, 2015 (Haley & Aldrich, 2015a). On March 12, 2015, and December 15, 2015, the SDRWQCB issued letters of NFA for the Exchange Parcel and H Street vadose zone soils, respectively (SDRWQCB, 2015a and 2015b). This HHRA was conducted following similar methodology with the following exceptions. More recent default exposure parameters and toxicity values published by the EPA and DTSC were used in this HHRA. In addition, the vapor intrusion evaluation in this HHRA was conducted following the "Human Health Risk Assessment (HHRA) Note 4, Human and Ecological Risk Office (HERO) Guidance for Screening Level Human Health Risk Assessments," (HERO Note 4) prepared by the DTSC dated March 29, 2022 (DTSC, 2022).

An HHRA is conducted in four steps: 1) hazard identification; 2) exposure assessment; 3) toxicity assessment; and 4) risk characterization. A description of these steps is provided below.

- Hazard Identification includes an evaluation of the adequacy of the data to identify COPCs at the Site and identifies the COPCs and data used in the HHRA.
- Exposure Assessment includes a review of the most sensitive receptors at the Site and their possible exposure pathways (i.e., how receptors may come into contact with the COPCs at the Site). This assessment is summarized in a Conceptual Site Model (exposure pathway evaluation). The exposure assessment also includes an estimate of the chemical concentrations to which each receptor may be exposed.
- Toxicity Assessment identifies the relevant toxicity values for the COPCs.
- Risk Characterization summarizes of the estimated human health risk results for each receptor and exposure area and the associated risk uncertainties.

4.1 HAZARD IDENTIFICATION

The objective of the hazard identification step is to evaluate available data to characterize the Site and identify COPCs. Soil, sub-slab soil vapor, soil vapor, and groundwater samples have been collected from the Site at and in proximity to historical operations where chemicals were used and stored. The samples were collected over multiple Site investigation events and analyzed for chemicals associated with the historical on-Site operations to assess the nature and extent of impacts.

The EPA and the DTSC have published guidance on selecting COPCs for risk assessment purposes. Key regulatory documents that include this guidance are, but not limited to, the following:

- EPA, 1989. "Risk Assessment Guidance for Superfund, Volume I, Human Health Evaluation Manual (Part A), Interim Final. December 1989" (RAGs Part A; EPA, 1989); and
- DTSC, 2015. "Preliminary Endangerment Assessment Guidance Manual (A guidance for evaluating hazardous substance release sites)," January 1994, Revised October 2015 ([PEA Manual]; DTSC, 2015).

These documents provide guidance for selecting COPCs at hazardous substance release sites for evaluation, more specifically, those site-related chemicals to be evaluated in the HHRA process. Section 2.4.5.7 of the PEA Manual indicates that "all chemicals that are not eliminated by previously described evaluations should be considered COPCs for the site and should be evaluated further through the PEA screening evaluation." The evaluations noted as "previously described" in the PEA Manual primarily include the background evaluation. The intent of the background evaluation is to distinguish site-related contamination from naturally occurring or anthropogenic contamination. Anthropogenic contamination is described as contamination that "may arise when an off-site source has contributed to the on-site contamination, the site is part of a regional contamination problem, or the site-related contaminants are the same as certain ubiquitous, manmade chemicals." The PEA Manual provides a process for eliminating chemicals as COPCs that are within "background" and are therefore not considered to be "site-related." RAGs Part A describes an optional process that may be followed for further reducing the number of COPCs based on a low frequency of detection and low toxicity compared to other site-related chemicals.

The HHRA prepared for Parcel A used a conservative approach for selecting COPCs. This approach was inclusive, as opposed to exclusive. The only chemicals eliminated as COPCs were those metals with maximum or 95% Upper Confidence Limit (95% UCL) concentrations less than the SDRWQCB-approved site-specific background threshold. No other background sources were used to exclude COPCs. Although the PEA Manual indicates that anthropogenic contamination (from off-site sources or ubiquitous man-made chemicals) may be eliminated from consideration, chemicals that may be present due to activities unrelated to on-site industrial operations were nonetheless included as COPCs. In addition, no chemicals were eliminated due to a low frequency of detection or low toxicity. Organic chemicals detected in at least one sample were included as COPCs for the media in which that chemical was detected. COPCs were identified for soil and soil vapor.

In general, and similar to the South Campus HHRAs, the Site-related COPCs evaluated in this HHRA include detected organic chemicals in soil, sub-slab soil vapor, and soil vapor as well as metals (inorganic chemicals) detected at concentrations greater than Site-specific background threshold in soil. COPCs were selected for each exposure area evaluated.

As indicated in Section 4.2, vadose zone soil sample results within the upper 10 feet bgs were used to assess direct exposure pathways. Soil vapor sample results were used to assess exposure based on the vapor intrusion into buildings. Sub-slab soil vapor samples were collected beneath the foundation of each building. COPCs were therefore identified for sub-slab soil vapor samples (within and adjacent to the building footprints) as opposed to the deeper soil vapor samples collected beneath or adjacent to the buildings. COPCs were also identified by the soil vapor samples collected by GSI (within and adjacent to the building footprints), since they did not collect co-located sub-slab soil vapor samples. Locations B29-V03, PW-02, and PW-03 were not considered for selecting COPCs. These sample locations were in the area of Building 29 that will be excavated for construction of a loading dock, and other samples collected either within or closer to the portion of Building 29 that will remain were considered more representative for selecting COPCs.

For the purposes of this HHRA, it was assumed that potential dermal contact or ingestion of groundwater beneath the Site is not complete since groundwater is encountered deeper than 10 feet bgs at the Site and will therefore unlikely be encountered by the on-Site receptors. In addition, groundwater beneath the Site has relatively high total dissolved solids, sodium, and chloride concentrations. Any occupants of the Site will be provided drinking water for consumption and other uses via municipal water supply by the Sweetwater Authority. Potential exposure from the use of groundwater for municipal purpose (e.g., drinking water) was not evaluated in this HHRA, nor was it evaluated in the previous HHRA for the former South Campus property referenced in this HHRA.

4.1.1 Organic Chemicals of Potential Concern

Organic chemicals detected at concentration greater than laboratory detection limits in one or more vadose zone soil (within the upper 10 feet bgs), sub-slab soil vapor samples, and/or the GSI soil vapor samples (herein collectively referred to as soil vapor) are considered COPCs. COPCs were identified separately for soil and soil vapor. A list of the organic chemicals identified as COPCs in on-Site vadose zone soil (within the upper 10 feet bgs) and soil vapor samples is presented in Table 1.

4.1.2 Inorganic Chemicals of Potential Concern

Inorganic compounds that were reported at concentrations greater than SDRWQCB-approved Site-specific background thresholds were considered COPCs. The Site-specific background thresholds for metals in soil were presented in the following documents:

- "Human Health Risk Assessment, South Campus Facility, Chula Vista, California," prepared by Haley & Aldrich, and dated July 2007, revised 26 April 2012; and
- "Hexavalent Chromium Soil Background Evaluation, South Campus Property, Chula Vista, California," prepared by Haley & Aldrich, and dated 8 August 2013.

Prior to the sale of the Former South Campus to the San Diego Unified Port District by Rohr in 1999, the North and South Campuses were part of a single manufacturing facility. The soil characteristics and geology are similar both north and south of H Street on the North and South Campuses, respectively. Both sites are underlain by undocumented and dredged fill and Bay Deposits on the west and the Bay Point Formation east of the former shoreline in landside areas. In general, the native materials that consist of Bay Deposits or the Bay Point Formation beneath the North and South Campuses have similar characteristics. Both lithologies are fine grained, composed primarily of silt and clay as described in the boring logs provided in Appendix A of the Revised Parcel A CSM (Haley & Aldrich, 2021). For these reasons, the soil background evaluation conducted for the Former South Campus is relevant and applicable to the North Campus. Thus, these soil background threshold concentrations were used in the

HHRA to assess which metals on the North Campus are present at concentrations greater than background and were considered COPCs that were further evaluated in the HHRA. Background metals concentrations for soil are summarized in Table 2. A list of the inorganic chemicals identified as COPCs in on-Site vadose zone soil (within the upper 10 feet bgs) is presented in Table 1.

4.2 EXPOSURE ASSESSMENT

The objective of the exposure assessment is to estimate the magnitude, frequency, duration, and routes of reasonably anticipated human exposure to COPCs to anticipated future use of the Site. The exposure assessment is based on anticipated potential on-Site receptors and associated potentially complete exposure pathways that define the conditions of potential exposure to Site-related COPCs. The receptors and assessment of potentially complete exposure pathways are shown on Figure 7. Human health risks were estimated for significant potentially complete exposure pathways. An exposure pathway is considered potentially complete for a receptor if it has the following elements:

- A contaminant source;
- A retention medium and transport mechanism;
- A point of potential human contact with the contaminated medium; and
- An exposure route at the exposure point.

If any of the required elements are absent, the exposure pathway is considered incomplete (i.e., no exposure will occur) and has no associated health risks (i.e., health risks will be zero for that exposure pathway). An exposure pathway may also be considered insignificant, if based on professional judgment, the magnitude of exposure is low, the probability of the exposure occurring is low, and risks associated with the occurrence are not high (EPA, 1989). These criteria render an exposure pathway insignificant, and it is concluded that the associated human health risks for that exposure pathway would not significantly contribute to the overall health risks. Estimated human health risks are not quantified in an HHRA for insignificant exposure pathways.

Potentially complete exposure pathways are discussed below in Section 4.2.1. Once the potentially complete exposure pathways have been identified, the quantification of chemical intake for each receptor requires an estimate of:

- Each COPC concentration the receptor may be exposed to (also referred to as an exposure point concentration [EPC]);
- The absorption of each COPC into the human body once exposed via the complete and potentially complete exposure pathways;
- The frequency and duration of contact for the complete and potentially complete exposure pathways; and
- The biological characteristics of the receptor.

4.2.1 Conceptual Site Model

Figure 7 identifies the potential chemical exposure pathways (i.e., ways that people could potentially be exposed to the COPCs in soil and soil vapor) at the Site. The Site was evaluated as two separate exposure areas, referred to as the Building 99/100 exposure area and the Building 29 exposure area, since these two areas are separated by G Street.

The Building 29 exposure area, located south of G Street, is approximately 9.5 acres and, as stated previously, will continue to be used for commercial/industrial uses. As stated previously the Owner will be demolishing approximately 24,000 square feet of the northern portion of Building 29 and up to approximately 5 feet of soil will be excavated for the construction of a loading dock adjacent to the building. The remainder of Building 29 will continue to be used for commercial/industrial use.

The Building 99/100 exposure area is approximately 5.2 acres north of G Street and includes the vacant properties at 360, 364, and 368 Bay Boulevard. These properties have been combined into a single exposure area since they will be developed as one property. The Owner may be demolishing Buildings 99 and 100 and may be redeveloping this portion of the Site as well as the three vacant parcels for surface parking, which is also considered to be a commercial/industrial land use. An exposure-area-specific HHRA was performed for each of these two exposure areas.

Worst-case human receptors (i.e., receptors with the highest potential exposures to on-Site chemical impacts) for each of the two on-Site exposure areas are identified as follows:

- On-Site construction worker, within the planned excavation area to construct a loading dock at the northern portion of Building 29 (approximately 24,000 square feet) and within the Buildings 99/100 exposure area;
- On-Site landscaper (including utility worker); and
- On-Site commercial/industrial worker.

These three receptors are relevant for the current and planned future use of the property and were also evaluated in the HHRAs for South Campus. The exposure characteristics of each receptor are presented in Table 3. A description of each of the on-Site receptors is provided below.

4.2.1.1 On-Site Construction Worker

The future on-Site construction worker is assumed to work outside during on-Site redevelopment activities (as discussed above) that occur after removing on-Site paving and structures when surface soils are exposed and/or on-Site grading is being conducted. It is assumed that the on-Site construction worker is present on-Site in each of the two exposure areas for 8 hours each day, 5 days per week for 50 weeks over one year and may be exposed to vadose zone soil.

The potentially complete exposure pathways identified for the on-Site construction worker are:

- Incidental ingestion of vadose zone soil;
- Dermal contact with vadose zone soil;
- Inhalation of fugitive dust generated from windborne vadose zone soil; and
- Inhalation of vapors emanating into ambient air from vadose zone soil.

4.2.1.2 On-Site Landscaper (Including Utility Worker)

The Site will not be redeveloped (other than the future loading dock and the possible demolition of Buildings 99 and 100 for surface parking noted above) but will retain the remaining portion of the existing Building 29 and possibly existing Buildings 99 and 100 and limited landscaped areas. The only portions of the Site that are unpaved are those limited landscape areas located on the eastern portion of the Site adjacent to Bay Boulevard, and those adjacent to the north and south side of G Street.

Receptors that may have direct contact with this soil will be on-Site landscape workers. Soil underlying the paved areas may also be contacted during subsurface utility maintenance activities. It is assumed that the on-Site landscaper and utility worker only work outside and will not work within the on-Site buildings. It is further assumed that both the on-Site landscaper and the on-Site utility worker will work in each of the two identified exposure areas and that they may potentially be exposed to soil across each of those exposure areas.

The on-Site landscaper has a higher potential exposure than an on-Site utility worker, whose potential exposure is likely over fewer days per year and over fewer years than the on-Site landscaper. The estimated health risk to an on-Site landscaper would therefore be higher than the estimated health risk to an on-Site utility worker. Chemical concentrations protective for the on-Site landscaper would therefore also be protective for the on-Site utility worker, so estimated human health risks were only quantified for the on-Site landscaper.

The potentially complete exposure pathways for the on-Site landscaper (and on-Site utility worker) include:

- Incidental ingestion of vadose zone soil;
- Dermal contact with vadose zone soil;
- Inhalation of fugitive dust generated from windborne vadose zone soil; and
- Inhalation of vapors emanating into ambient air from vadose zone soil.

It is assumed that an on-Site landscaper will work at the Site for 8 hours each day, 2 days per week for 50 weeks over 25 years.

4.2.1.3 On-Site Commercial/Industrial Worker

It is conservatively assumed that the on-Site commercial/industrial workers may work inside the commercial/industrial buildings and would have insignificant exposure to soil within the landscape areas. The only potentially complete exposure pathway evaluated in this HHRA for the commercial/industrial worker is VOC inhalation in indoor air, based on the subsurface vapor intrusion pathway. It is assumed that the on-Site commercial/industrial worker is present on-Site for 8 hours each day, 5 days per week for 50 weeks each year for 25 years.

4.2.2 Exposure Point Concentrations

Deriving estimates of chemical concentrations at points of potential human exposure is necessary to derive chemical intakes for potentially exposed individuals (i.e., human receptors). These chemical concentrations at the locations where potential exposure may occur are referred to as EPCs. It was assumed for this HHRA that exposures to on-Site vadose zone soil occur within 10 feet bgs.

4.2.2.1 Overview of Data Selection for Derivation of EPCs

Developing long-term EPCs from the investigation data includes an underlying assumption about the representativeness of the data, both temporally and spatially. EPCs were calculated under the assumption that environmental concentrations would remain constant at the levels detected during the investigation activities for an indefinite period. It was therefore assumed that the data considered representative of current Site conditions simulates current and future exposure conditions for a receptor having potential exposure to impacted media at the Site. Organic chemicals naturally degrade

in the environment, which results in the reduction of concentrations over time. However, it is conservatively assumed that no degradation mechanisms will occur. This assumption of steady-state concentrations for each COPC will result in a conservative estimation of long-term exposure concentrations.

To simulate a receptor's spatially and temporally integrated exposure, EPA (1992, 1997, 2002b) defines the EPC used to estimate the reasonable maximum exposure (RME) as the 95% UCL, or the maximum observed concentration, whichever is lower. The arithmetic mean reflects the assumption that exposure by the receptor is averaged as they traverse an area over time. The intent of the RME scenario is to focus the assessment on a conservative exposure within the range of exposures. The 95% UCL concentrations in soil samples were calculated using EPA ProUCL version 5.1.002 software. The results of these calculations presented in the software output, including the EPA recommended 95% UCL concentrations, are presented in Appendix B.

4.2.2.1.1. Soil

For each COPC in soil, its EPC was initially conservatively assumed to be its maximum detected concentration reported in that exposure area. After evaluating the contribution of each chemical to the cumulative risk, the EPC for each COPC that contributed significantly to human health risk was revised to its maximum concentration or 95% UCL, whichever was lower, provided there were sufficient data available to calculate a 95% UCL. If that COPC was a metal, the 95% UCL concentration was compared to the Site-specific background threshold. If the 95% UCL concentration was equal to or less than the Site-specific background concentration threshold, the metal concentration was considered to be within background and was not further evaluated in that exposure-area-specific HHRA.

The EPCs for soil on the Building 99/100 exposure area are summarized in Table 4. Maximum COPC concentrations in soil across the Building 99/100 exposure area (that includes the vacant properties at 360, 364, and 368 Bay Boulevard) were used to estimate human health risks for the on-Site construction worker and the on-Site landscaper.

The EPCs for soil in the Building 29 exposure area and the portion of Building 29 where excavation will be conducted to construct the loading dock are summarized in Tables 5 and 6, respectively. The EPCs for the on-Site construction worker were derived using only COPCs in soil within the planned loading dock excavation area (Table 6). The EPCs for the on-Site landscaper were derived using COPCs in soil across the entire exposure area.

4.2.2.1.2. Soil Vapor

For each COPC in soil vapor, indoor air EPCs were either derived at each soil vapor sample location or using maximum concentrations beneath each building.

Building 99/100 exposure area - Buildings 99 and 100 may be used for commercial/industrial purposes or may be razed and the area redeveloped for surface parking. Both scenarios were evaluated in this HHRA using the following methods:

- Maximum detected soil vapor concentrations beneath each building assuming the buildings remain in place; and
- A point-by-point basis that allowed for estimating future vapor intrusion risks at each location with soil vapor data since future building locations in this exposure area are not known.

Building 29 exposure area – For Building 29, an estimated COPC concentration in indoor air was derived from its detected VOC concentration at each soil vapor sample location. The approach was conducted for Building 29 given the size of the building, as it is unlikely that vapors migrating into the building will be completely mixed as is assumed in the derivation of 95% UCL concentrations.

It was assumed that VOC concentrations in indoor air can be estimated from on-Site soil vapor data as described above. A summary of EPCs in soil vapor is provided in Table 7 (Building 99/100 exposure area) and Table 8 (Building 29 exposure area).

4.2.2.2 Derivation of EPCs

For incidental ingestion and dermal contact with soil within each exposure area, the maximum COPC concentrations or the 95% UCL within the upper 10 feet of vadose zone soil were used as the EPCs. Ambient air EPCs from generated fugitive dust and VOCs emanating into ambient air were also derived from COPC concentrations within the upper 10 feet of vadose zone soil. Indoor air EPCs from vapor intrusion into indoor air were derived using COPC concentrations in soil vapor. The calculations used to estimate the EPCs in ambient and indoor air are described below.

4.2.2.3 Fugitive Dust in Ambient Air

COPCs that are relatively nonvolatile compounds can adhere to soil and become airborne because of wind erosion or mechanical disturbance such as soil grading operations. Once airborne, these soil particulates generate fugitive dust that can be inhaled. The fugitive dust EPC is estimated by multiplying the COPC EPC in soil by the inverse of the particulate emission factor (PEF) relevant to the fugitive dust generating activities.

During intrusive activities associated with activities conducted by the future on-Site construction worker, fugitive dust may be generated by various activities, including not only wind erosion, but also by vehicles driven on unpaved roads, trucks dumping excavated soil, dozing, grading, tilling, or similar operations, as noted in the 2002 EPA document (EPA, 2002a). To account for these activities, the PEF during these activities was assumed to be the DTSC-recommended default PEF identified for the construction scenario in the 9 April 2019 DTSC document entitled "Human Health Risk Assessment (HHRA) Note Number 1, Recommended DTSC Default Exposure Factors for Use in Risk Assessment at California Hazardous Waste Sites and Permitted Facilities" (HHRA Note 1, [DTSC, 2019a]). This PEF value is 1.0 x 10^6 cubic meters per kilogram (m^3/kg).

For the on-Site landscaper, fugitive dust may be generated from wind erosion of exposed surface soil. The fugitive dust EPC was estimated by dividing the COPC EPC in vadose zone soil by the PEF calculated for wind erosion for the general geographic area containing the Site. This PEF was estimated using the following equation presented in the EPA document entitled "Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites" (EPA, 2002a) using parameters for the Los Angeles, California, area. Los Angeles is the closest weather metering station to San Diego County that measures air dispersion modeling parameters.

$$PEF = \frac{Q}{C} \times \left[\frac{3600}{RPF \times (1-V) \times \left(\frac{U_m}{U_t} \right)^3 \times F_x} \right] \qquad \text{(Equation 1)}$$

$$\frac{Q}{C} = A \times \exp[\frac{(\ln A_{site} - B)^2}{C}] \qquad \text{(Equation 2)}$$

where:

PEF	=	Particulate emission factor of annual average respirable fraction (PM_{10}) of impacted fugitive dust (m^3/kg)
PM_{10}	=	Respirable fraction, particles less than 10 micrometers (μm) in diameter
Q/C	=	Dispersion emission component, $(g/m^2/s)/(kg/m^3)$, as Q/C_{sc} *or* Q/C_{vol} (EPA, 2002a)
A,B,C	=	Constants based on air dispersion modeling for Los Angeles, California, A=11.9110, B=18.4385, C=209.7845 (EPA, 2002a)
A_{site}	=	Areal extent of exposure area contamination in acres (5.2 acres for the Building 99/100 exposure area, 9.5 acres for the Building 29 exposure area)
RPF	=	Respirable fraction of particulate ($g/m^2/h$), default, 0.036 $g/m^2/h$, (EPA, 2002a)
Um	=	Mean annual wind speed (meters per second [m/s]), (4.69 m/s) (EPA, 2002a)
Ut	=	Equivalent threshold value of wind speed at 7 meters, (11.32 m/s) (EPA, 2002a)
F_x	=	Function describing U_t/U_m (unitless) derived using Cowherd et al. 1985 (0.194) (EPA, 2002a)

4.2.2.4 VOCs in Ambient Air Due to Volatilization from Soil

VOCs may volatize from VOC-impacted soil into the ambient air. The ambient air concentrations from subsurface impacts were estimated using the most recent EPA and DTSC guidance (see equations below). These are the same equations used to estimate ambient air concentrations in the derivation of the May 2022 EPA Regional Screening Levels (EPA, 2022) and the "Human and Ecological Risk Office (HERO) HHRA Note Number: 3, DTSC-modified Screening Levels (DTSC-SLs)" prepared by the DTSC dated June 2020 - revised May 2022 (HHRA Note 3; DTSC, 2020b). The ambient air VOC concentration was estimated by dividing the lower of the COPC EPC in vadose zone soil and the soil saturation limit concentration for the COPC by the volatilization factor (VF) calculated using default DTSC soil properties for sand presented in the Johnson & Ettinger Model ([J&E Model]; DTSC, 2014). Our estimates were based on the total matrix concentrations in samples collected within the entire vadose zone (depths to 10 feet below ground surface). The total matrix concentration includes concentrations present in the entire soil matrix, including concentrations adhered to the soil and organic particles and within the soil's water- and air-filled porosity.

The use of the equations conservatively assumes that VOCs volatilize directly from soil into ambient air. The Site surface is not bare ground as assumed in these equations. Instead, there is a paved surface or building covering the majority of the entire Site which acts as a barrier that impedes the migration of VOCs from the subsurface directly into ambient air. Assuming this barrier is not present, as was done in this HHRA, overestimates actual ambient concentrations.

The soil saturation limit concentration was estimated following Equation 4-9 presented in the EPA document entitled "Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites" (EPA, 2002a):

$$sat = \frac{S}{\rho_b} \times \left(K_d \rho_b + \Theta_w + H'\Theta_a\right) \qquad \text{(Equation 3)}$$

where:

sat	=	Soil saturation concentration (mg/kg)
S	=	Solubility in water (milligrams per liter-water, chemical-specific) (EPA, 2022)
ρ_b	=	Dry soil bulk density (grams per cubic centimeter [g/cm^3], default property for sand in the J&E Model)
K_d	=	Soil-water partition coefficient (cubic centimeter per gram [cm^3/g]) = Koc x foc
f_{oc}	=	Soil organic carbon-water partition coefficient (cm^3/g, chemical-specific; EPA, 2022)
foc	=	Fraction organic carbon in soil (gram per gram [g/g], default, 0.006; EPA, 2002a)
Θ_w	=	Water-filled soil porosity (l water/l soil, default property for sand in the J&E Model)
Θ_a	=	Air-filled soil porosity (l air/l soil, default property for sand in the J&E Model)
H'	=	Dimensionless Henry's Law constant (chemical-specific; EPA, 2022)

The soil VF for the construction scenario was calculated using the following subchronic volatilization factor equation, Equation 5-14 as specified by EPA (2002a):

$$VF_{sc} = \left[\frac{(3.14 \times D_A \times T)^{1/2}}{2 \times \rho_b \times D_A}\right] \times 10^{-4} m^2/cm^2 \times Q/C_{sa} \times \frac{1}{F_D} \qquad \text{(Equation 4)}$$

where:

VF	=	Volatilization factor (m^3/kg)
D_A	=	Apparent diffusivity (centimeters squared per second [cm^2/s], see Equation 5)
T	=	Total time over which construction occurs (s, receptor-specific, e.g., 31,536,000 s = 1 year for the future on-Site construction worker)
ρ_b	=	Dry soil bulk density (g/cm^3, Site-specific, same as used in the J&E Model)
Q/C	=	Dispersion emission component, ([g/m^2/s]/[kg/m^3], see Equation 6)
F_D	=	Dispersion correlation factor (unitless, 0.185, EPA 2002a)

and where:

$$D_A = \frac{\left[\left(\Theta_a^{10/3} D_i H' + \Theta_w^{10/3} D_w\right)/n^2\right]}{\rho_b K_d + \Theta_w + \Theta_w H'} \qquad \text{(Equation 5)}$$

where:

D_A	=	Apparent diffusivity (cm^2/s, chemical-specific)
ρ_b	=	Dry soil bulk density (g/cm^3, default property for sand in the J&E Model)
Θ_A	=	Air-filled soil porosity (l air/l soil, default property for sand in the J&E Model)
n	=	Total soil porosity (l pore/l soil, default property for sand in the J&E Model)
Θ_w	=	Water-filled soil porosity (l water/l soil, default property for sand in the J&E Model)
D_i	=	Diffusivity in air (cm^2/s, chemical-specific; EPA, 2022)
H'	=	Dimensionless Henry's Law constant (unitless, chemical-specific; EPA, 2022)
D_w	=	Diffusivity in water (cm^2/s, chemical-specific; EPA, 2022)
K_d	=	Soil-water partition coefficient (cm^3/g) = Koc x foc

K_{oc} = Soil organic carbon-water partition coefficient (cm^3/g, chemical-specific; EPA, 2022)

f_{oc} = Fraction organic carbon in soil (g/g, 0.006 = default; EPA, 2002a)

$$Q/C_{sa} = A \times \exp\left[\frac{(\ln A_c - B)^2}{C}\right] \quad \text{(Equation 6)}$$

where:

Q/C = Dispersion emission component, ($[g/m^2/s]/[kg/m^3]$)

A = Unitless constant (11.911 = default for Los Angeles for on-Site landscaper (post development receptors; 2.4538 default for future on-Site construction worker, EPA, 2002a)

A_c = Areal extent of Site soil contamination (acres, exposure area specific)

B = Unitless constant (18.439 = default for Los Angeles for post development receptors; 17.566 = default for construction worker, EPA, 2002a)

C = Unitless constant (209.7845 = default for Los Angeles for post development receptors; 189.0426 = default for construction worker, EPA 2002a)

The soil VF for the on-Site landscaper was calculated using the following equations presented by EPA (2002a) as Equation 4-8:

$$VF = \frac{Q/C_{vol} \times (3.14 \times D_A \times T)^{1/2} \times 10^{-4} (m^2/cm^2)}{(2 \times \rho_b \times D_A)} \quad \text{(Equation 7)}$$

where:

VF = Volatilization factor (m^3/kg)

D_A = Apparent diffusivity (cm^2/s, see Equation 5)

T = Total time (s, receptor specific, e.g., 788,400,000 s = 25 years for occupational receptors)

ρ_b = Dry soil bulk density (g/cm^3, default property for sand in the J&E Model)

Q/C = Dispersion emission component, ($[g/m^2/s]/[kg/m^3]$, see Equation 6)

Each COPC concentration in ambient air was calculated using the following equation:

$$Ca = \frac{C_s}{VF} \quad \text{(Equation 8)}$$

where:

C_a = Ambient air concentration (milligram per cubic meter [mg/m^3])

C_s = Soil concentration (mg/kg)

VF = Volatilization factor (m^3/kg, see Equation 4 above)

4.2.2.5 VOCs in Indoor Air Due to Subsurface Vapor Intrusion

VOCs may volatize from VOC-impacted soil or groundwater and enter indoor air from upward migration of vapor through cracks and seams in the building foundation. The COPC concentrations in soil vapor samples collected beneath and adjacent to the future building footprints within each on-Site exposure area were used to calculate EPCs in indoor air at each of those soil vapor sample locations.

The building-specific vapor intrusion evaluation for Buildings 29, 99, and 100 were conducted following the guidance presented in the EPA Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air (EPA, 2015), the DTSC Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (DTSC, 2011), and HERO Note 4 (DTSC, 2022). For each selected VOC concentration in soil vapor, the potential indoor air concentration was estimated by multiplying its detected concentration by a default attenuation factor. The EPA default attenuation factor of 0.03 was used to estimate indoor air concentrations. This attenuation factor was conservatively used instead of the DTSC recommended commercial building attenuation factors identified in Table 2 of the DTSC Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (DTSC, 2011). The DTSC recommended commercial building attenuation factors are 0.001 for an existing building contaminant source, 0.05 for an existing building sub-slab, and 0.0005 for a future building contaminant source.

4.2.3 Estimation of Chemical Intakes

EPA risk assessment guidelines recommend that intake doses be calculated in a manner that produces risk estimates of the RME scenario (EPA, 1989). The RME considers the upper bound case described by using the 50th or 95th percentile of the actual distribution of most input parameters, including receptor characteristics used to estimate intake doses. The intent of the RME scenario is to focus the risk assessment on conservative exposures within the range of possible exposures. Since the RME scenario uses a mixture of upper bound and central tendency assumptions and data, the associated estimated COPC intake is not an average COPC intake but is intended to be an estimate of the plausible upper-end intake. These conservative assumptions add another level of conservativeness that further overestimates potential exposures. These assumptions are presented in Table 3.

The exposure values for the identified receptors are generally consistent with the HHRA Update, and were updated with more current values obtained from the:

- 2019 DTSC guidance entitled “Human Health Risk Assessment (HHRA) Note Number 1, Recommended DTSC Default Exposure Factors for Use in Risk Assessment at California Hazardous Waste Sites and Permitted Facilities” (DTSC, 2019a),
- 2002 EPA guidance entitled “Supplemental Guidance for Developing Screening Levels for Superfund Sites” (EPA 2002a),
- 2014 EPA document entitled “Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors” (EPA, 2014), and
- 2009 EPA document entitled “Risk Assessment Guidance for Superfund, Volume I, Human Health Evaluation Manual, Part F, Supplemental Guidance for Inhalation Risk Assessment),” (EPA, 2009).

4.2.3.1 Soil Ingestion and Dermal Contact with Soil

For noncarcinogenic effects, intake for soil ingestion and dermal exposure to soil is averaged over the period of exposure and referred to as the average daily intake (ADI). For carcinogenic effects, the intake is averaged over a lifetime and referred to as the lifetime average daily intake (LADI). The following general equation was applied to estimate COPC intake for soil ingestion and dermal exposure to soil exposure pathways considered in the HHRA:

$$Intake = \frac{C \times IR \times EF \times ED \times RAF}{BW \times AT} \quad \text{(Equation 9)}$$

where:

Intake	=	ADI (mg/kg-day) for noncarcinogens LADI (mg/kg-day) for carcinogens
C	=	EPC of COPC in environmental medium (e.g., mg/kg for soil)
IR	=	Intake rate (e.g., mg soil/day)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
RAF	=	Relative absorption factor (i.e., the ratio of bioavailability in the exposure scenario to bioavailability in the exposure situation from which the toxicity criteria are based)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

4.2.3.1.1. Incidental Ingestion of Soil

The equation used to estimate COPC intake due to incidental ingestion of soil is presented below:

$$Intake = \frac{CS \times IR \times CF \times EF \times ED \times RAF}{BW \times AT} \quad \text{(Equation 10)}$$

where:

CS	=	EPC of COPC in soil (mg/kg)
IR	=	Ingestion rate of soil (mg/day)
CF	=	Conversion factor (1×10^{-6} kg/mg)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
RAF	=	Relative absorption factor (unitless)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

4.2.3.1.2. Dermal Contact with Soil

The equation used to estimate COPC intake due to dermal contact with soil is presented below:

$$Intake = \frac{CS \times AF \times SA \times CF \times EF_1 \times EF_2 \times ED \times ABS_d}{BW \times AT} \quad \text{(Equation 11)}$$

where:

CS	=	EPC of COPC in soil (mg/kg)
AF	=	Soil adherence factor (mg/cm^2-event)
SA	=	Surface area of exposed skin (cm^2)
CF	=	Conversion factor (1 x 10^{-6} kg/mg)
EF_1	=	Exposure frequency (days/ year)
EF_2	=	Contact rate (event/day)
ED	=	Exposure duration (years)
ABS_d	=	Dermal absorption fraction (unitless)
BW	=	Body weight (kg)
AT	=	Averaging time (days)

4.2.3.2 Inhalation Exposure

For the inhalation pathway, intake of COPCs in air is a time-weighted average concentration, referred to as the exposure concentration (EC), derived from measured or modeled concentrations in air and adjusted based on characteristics of the exposure scenario and receptor being evaluated (e.g., exposure time, exposure frequency, etc.). The following general equation was applied to estimate ECs for the inhalation exposure pathways considered in the HHRA:

$$EC = \frac{CA \times ET \times EF \times ED}{AT} \qquad \text{(Equation 12)}$$

where:

EC	=	Exposure concentration (µg/m^3)
CA	=	EPC of COPC in air (µg/m^3 in air, either measured or modeled)
ET	=	Exposure time (hours/day)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
AT	=	Averaging time (hour over a lifetime for cancer risk, hours over exposure period for hazard index)

4.3 TOXICITY ASSESSMENT

The toxicity assessment characterizes the relationship between the magnitude of exposure to a COPC and the nature and magnitude of adverse health effects that may result from each exposure. Adverse health effects are generally classified into two broad categories: noncarcinogens and carcinogens. Toxicity values are typically developed based on the threshold approach for noncarcinogenic effects and the non-threshold approach for carcinogenic effects. Toxicity values may be based on epidemiological studies, short-term human studies, or subchronic or chronic animal data. Toxicity values to estimate adverse noncarcinogenic health effects as hazard quotients (HQs) are derived using reference doses (RfDs) and reference concentrations (RfCs); toxicity values to estimate incremental lifetime cancer risks ([ILCRs], also typically referred to as excess lifetime cancer risks), are derived using cancer slope factors (SFs) and unit risk factors (URFs).

4.3.1 Adverse Noncarcinogenic Health Effects

It is widely accepted that adverse noncarcinogenic health effects from chemical substances occur only after a threshold dose or intake is reached. To establish a toxicity value for an adverse noncarcinogenic health effect, a threshold dose is usually estimated from the no-observed-adverse-effect-level (NOAEL), or the lowest-observed-adverse-effect-level (LOAEL) determined from chronic or subchronic animal studies. The NOAEL is the highest dose at which no adverse effects are observed; the LOAEL is the lowest dose at which adverse effects are observed.

Safety factors (up to 1,000-fold) are applied to the NOAEL or LOAEL observed in animal studies or human epidemiological studies to establish conservative RfDs or RfCs. An RfD is an estimate of a dose level not expected to result in adverse health effects in humans, even among the most sensitive members of the population (EPA, 1989). RfDs are expressed as acceptable daily doses in milligrams of chemical per kilogram of body weight per day (mg/kg-day) and are used to derive estimated risk from exposure to noncarcinogens via ingestion and dermal contact.

An RfC is an estimate of a continuous inhalation exposure to the human population (including sensitive subgroups) likely to be without appreciable risk of deleterious effects during a lifetime (EPA, 2009). RfCs are expressed in $\mu g/m^3$ and are used to estimate risks from exposure to noncarcinogens via inhalation.

4.3.2 Carcinogenic Health Effects

Regulatory agencies have generally assumed that carcinogenic agents do not have toxicological thresholds. The dose-response curve used to regulate carcinogens only predicts zero risk when there is zero dose (i.e., for doses greater than zero, some risk is assumed to be present). Cancer risks from potential human exposures to carcinogenic chemicals are modeled mathematically using either animal or human data.

Cancer risks for exposure to carcinogens are defined in terms of upper bounds on probabilities. The probabilities identify the likelihood of a carcinogenic response in an individual who receives a given dose of a particular chemical (based on mathematical modeling of the animal or human data). Potential carcinogenic effects are expressed as the probability that an individual will develop cancer from a lifetime exposure. This probability is based on projected intakes and chemical-specific dose-response data called SFs and URFs.

The SF defines the cancer risk due to average lifetime exposure to one unit of carcinogen (in units of risk per mg/kg-day written as the inverse of mg/kg-day $(mg/kg\text{-}day)^{-1}$) and is used to derive estimated risk from exposure to carcinogens via ingestion and dermal contact. To derive SFs, the EPA generally uses the linearized multistage model for low-dose extrapolation. The model is considered one of the most conservative models applied and has been recognized by EPA to overpredict ILCRs. Using this model, SFs are derived by calculating the 95% UCL on the slope of the linearized portion of the dose-response curve obtained from the multistage cancer model. Use of the 95% UCL of the slope means that there is only a 5 percent chance that the probability of a response could be greater than the estimated value of the experimental data used.

The inhalation URF (IURF) is the upper bound excess lifetime cancer risk estimated to result from continuous exposure to an agent at a concentration of 1 $\mu g/m^3$ in air (EPA, 2009). IURFs are expressed in $(\mu g/m^3)^{-1}$ and are used to derive estimated risk from exposure to carcinogens via inhalation.

4.3.3 Chemical-specific Toxicity Values

Chronic toxicity values for adverse cancer and noncancer effects are conservatively used to evaluate both chronic and subchronic exposures for each COPC. Each exposure evaluated herein is considered to be chronic exposure. Toxicity criteria were selected using the methodology described in the DTSC February 25, 2019 "Human Health Risk Assessment (HHRA) Note, Human and Ecological Risk Office (HERO) HHRA Note Number: 10, Toxicity Criteria." The selected toxicity values for the COPCs are presented in Table 9.

4.4 RISK CHARACTERIZATION

Risk characterization is the fourth step in the risk assessment process. Risk characterization includes the integration of the toxicity and exposure assessments to provide quantitative and qualitative expressions of risk.

4.4.1 Calculation of Adverse Noncarcinogenic Health Effects for Exposure to Soil – Other Than Lead

The RfD and RfC are used in the risk characterization to estimate the potential for adverse noncarcinogenic health effects. The estimated ADI divided by the RfD or RfC for inhalation exposures is referred to as an HQ. An HQ value greater than 1 indicates a chemical dose above the RfD for that pathway, and thus a potential for adverse noncarcinogenic health effects. A total hazard index (HI) is a sum of the HQs for more than one chemical with similar toxicological endpoints. A total HI greater than 1 indicates a potential for an adverse noncarcinogenic health effect from exposure to that chemical or chemicals. Additional risk evaluation is typically undertaken only when this threshold is exceeded. Additional information regarding the derivation and interpretation of HQs and total HI is presented below.

The HQ compares a receptor's exposure or intake level to the RfD or RfC of that COPC, as appropriate for the defined complete pathway (EPA, 1989). To calculate an HQ, the ADI for non-inhalation exposures or EC for inhalation exposures (e.g., upper bound intake averaged over the exposure period) for each COPC is divided by the chemical-specific RfD or RfC, respectively, as shown in the following equation:

$$HQ_{pathway1} = \begin{cases} ADI/RfD \\ or \\ EC/RfC \end{cases} \qquad \text{(Equation 13)}$$

where:

$HQ_{pathway1}$	=	HQ of particular pathway for COPC (unitless)
ADI	=	Average daily intake of COPC (mg/kg-day)
EC	=	Exposure concentration (µg/m^3)
RfD	=	Reference dose of COPC (mg/kg-day)
RfC	=	Reference concentration of COPC (µg/m^3)

When using the above equation to estimate the potential for adverse noncancer health effects, both the intake and the RfD or the exposure concentration and the RfC must refer to exposures of equivalent duration (e.g., chronic).

For each receptor, the HQ of each pathway for the COPC is then summed to calculate the total HQ for that COPC as shown in the following equation:

$$Total\ HQ = HQ_{pathway1} + HQ_{pathway2} + \ldots + HQ_{pathway\ n} \quad \text{(Equation 14)}$$

where:

Total HQ	=	Summed HQs for COPC (unitless)
$HQ_{pathway1}$	=	HQ for particular pathway for COPC (unitless)

As a first-tier analysis, the HQs (e.g., for all COPCs, regardless of target organ) for each receptor can be summed as the basis for conservatively estimating a preliminary total HI for that receptor. In this case, it is assumed that each COPC acts by the same mechanism and induces the same effects (EPA, 1989). For simultaneous exposures to a receptor by several COPCs, a total HI is calculated as the sum of the HQs for each COPC by:

$$Total\ HI = HQ_{COPC_1} + HQ_{COPC_2} + \ldots + HQ_{COPC_n} \quad \text{(Equation 15)}$$

where:

Total HI	=	Total Hazard Index
$Total\ HQ_{COPC_n}$	=	Sum of HQs for that COPC

If the total HI exceeds a value of 1, then acceptable target organ-specific total HIs can be calculated for the receptor based on target organs as recommended by EPA (1989). For the purpose of this HHRA, target organ-specific total HIs were not derived. Instead, the preliminary total HI was used to assess the magnitude of non-cancer health risk.

4.4.2 Calculation of Adverse Noncarcinogenic Health Effects for Lead

Potential human health effects from exposure to lead are typically inferred from blood lead levels and, as such, are not amenable to the HQ/HI approach described above. Health risk from exposure to lead in soil was conservatively evaluated based on information presented in the HERO Note 3 (DTSC, 2020b).

The blood lead concentration identified as acceptable, for both children and adults, is 1 microgram per deciliter (OEHHA, 2009) and will be applied to high end (i.e., RME) exposure estimates. While the LeadSpread 9 Model (DTSC, 2020a) calculates estimated 90th, 95th, 98th and 99th percentile blood lead concentrations, OEHHA identifies the 90th percentile blood lead as a "point of departure" (e.g., remedial actions are not warranted when predicted blood lead levels are at or less than 1 microgram per deciliter). The commercial/industrial DTSC-SL derived from the LeadSpread Model is 500 mg/kg, which was used to assess potential exposures to lead at the Site.

4.4.3 Calculation of Cumulative Incremental Lifetime Cancer Risk from Exposure to Soil

The cancer SF or URF is used in the risk characterization to estimate the cancer risk. The SF multiplied by the LADI or the URF for inhalation exposures multiplied by EC is referred to as an ILCR:

$$ILCR = LADI \times SF$$

Or

$$EC \times IURF \quad \text{(Equation 16)}$$

where:

ILCR	=	Incremental lifetime cancer risk for COPC, also referred to as excess lifetime cancer risk (unitless)
LADI	=	Lifetime average daily intake of COPC (mg/kg-day)
EC	=	Exposure concentration ($\mu g/m^3$)
SF	=	Slope factor of COPC $(mg/kg\text{-}day)^{-1}$
IURF	=	Inhalation URF $(\mu g/m^3)^{-1}$

For each COPC identified as a potential human carcinogen, the theoretical upper bound ILCR for a particular receptor is the sum of the calculated ILCRs for each COPC.

For each receptor, the ILCR of each pathway for the COPC is then summed to calculate the ILCR for that COPC as shown in the following equation:

$$ILCR_{COPC} = ILCR_{pathway1} + ILCR_{pathway2} + \ldots + ILCR_{pathwayn} \quad \text{(Equation 17)}$$

where:

$ILCR_{COPC}$	=	Summed ILCR for COPC (unitless)
$ILCR_{pathway1}$	=	ILCR for particular pathway for COPC (unitless)

If a receptor is exposed to several carcinogens, the following equation is used to sum cancer risks:

$$Cumulative\ ILCR = ILCR_{COPC1} + ILCR_{COPC2} + \ldots + ILCR_{COPCn} \quad \text{(Equation 18)}$$

where:

Cumulative ILCR	=	Total risk of cancer incidence for all COPCs
$ILCR_{COPC_n}$	=	Individual COPC ILCR

4.4.4 Calculation of Incremental Lifetime Cancer Risk and Hazard Index from Inhalation of Vapors in Indoor Air

Potential human health risks to an on-Site commercial/industrial worker that may occupy the on-Site buildings were estimated assuming inhalation of the estimated VOC concentrations in indoor air. To estimate these human health risks, commercial/industrial ambient air screening levels based on a cancer risk level of 1×10^{-6} and noncancer HQ of 1 were selected from the HERO Note 3 (DTSC, 2020b). These screening levels assume that the commercial/industrial worker would be present within a building 8 hours each day for 250 days per year for 25 years. Each estimated COPC concentration in indoor air (derived by dividing the sub-slab soil vapor concentration by the default attenuation factor of 0.03) was divided by its corresponding available cancer and/or non-cancer ambient air DTSC-SL. The ratios based on the cancer ambient air DTSC-SLs were each multiplied by their corresponding risk threshold, 1×10^{-6}, and the ratios (also referred to as HQs) based on the non-cancer ambient air DTSC-SL were each multiplied by their corresponding risk threshold, 1. The resulting cumulative cancer risks were summed to estimate cumulative ILCR, and the resulting HQs were summed to estimate a total HI. For human health risks due to inhalation of indoor air that were estimated on a point-by-point basis, an ILCR and HI was presented for each soil vapor sample location. These calculations and the results are presented in Appendix C.

4.4.5 Acceptable Risk Thresholds

Estimates of the total HI and cumulative ILCR are compared to acceptable target levels by risk managers. There is some variability in acceptable cumulative ILCRs established by various regulatory agencies, although the acceptable target level for HIs is generally less than or equal to 1 and most target cumulative ILCRs considered acceptable lie within the risk range of 10^{-6} to $10^{-4.}$

4.4.5.1 Total Noncancer Hazard Index

The HI evaluation process typically occurs in two steps. First, the HQs for all COPCs are added and compared to an acceptable target total HI. If the calculated value is greater than the acceptable target level, then only total HQs for those compounds considered to have additive adverse noncarcinogenic health effects are summed in the second step to refine the HI estimate.

An HI of less than 1 indicates that it is unlikely that adverse human health effects will occur during a lifetime in an exposed population, including sensitive subpopulations (EPA, 1989). Most environmental programs employ an HI of unity (i.e., 1) as an acceptable target for risk decisions. The most explicit directive comes from the Federal Superfund Program (EPA, 1990), which is also California/EPA policy. This directive specifies an HI of 1 as the acceptable target for risk management decisions, as well as the acceptable target risk to be achieved in designing remedial responses. This noncancer risk threshold was used in this HHRA for each receptor as the acceptable total HI to assess whether exposure to COPCs at the Site may pose an adverse noncarcinogenic effect.

4.4.5.2 Cumulative Incremental Lifetime Cancer Risk

A total incremental lifetime risk of 10^{-6} and 10^{-4} corresponds to theoretical probability of 1 chance in 1 million to 1 chance in ten thousand, which is in addition to or excess of the background cancer risk. The conservatism of such risk increments is enhanced by the fact that risk is typically expressed as an upper bound ILCR. That is, true risk is anticipated to lie somewhere between zero and the upper bound risk estimated in the risk characterization (EPA, 1989). Potential risk estimates between 10^{-6} and 10^{-4} require risk management decisions based on Site-specific land use/exposure scenarios and may or may not require remediation or mitigation (EPA, 1990). It is generally accepted in the regulatory community that risk estimates equal to or less than 10^{-6} do not require remediation or mitigation measures. Risk estimates greater than 10^{-4} generally require remediation or mitigation to reduce potential exposures, and site remediation based on cumulative ILCRs between 10^{-6} and 10^{-4} is made on a case-by-case basis.

California Proposition 65 (1986, Safe Drinking Water and Toxic Enforcement Act of 1986, Proposition 65, Health and Safety Code Section 25249.5 et seq.) requires specific notification and warning for exposure to carcinogens above the "no significant risk level," which is based on a 10^{-5} excess lifetime cancer risk. In addition, the EPA, under the Resource Conservation and Recovery Act Corrective Action Environmental Indicators (EI) program, indicates that "For the purposes of making Current Human Exposure under Control EI determinations with respect to vapor intrusion, EPA generally recommends the use of 10^{-5} levels for carcinogens (incremental individual lifetime cancer risk), and a HQ of 1 for noncancer risk." Within this range of acceptable risk values, the California/EPA and EPA typically default to an acceptable cumulative ILCR threshold of 10^{-5} in risk management decision making for occupational receptors (e.g., on-Site landscaper) and 10^{-6} in risk management decision making for residential receptors. Therefore, the cumulative ILCR threshold of 10^{-5} for the on-Site construction worker, the on-Site landscaper, and the on-Site commercial/industrial worker was used in this HHRA as the acceptable cumulative ILCR to assess whether exposure to COPCs at the Site may pose an unacceptable cancer risk.

4.4.6 Summary of Risk Characterization Results

The exposure area-specific risk characterization results for each exposure area are summarized below. A summary of the exposure-area-specific HHRA risk results is presented in Table 10. The associated risk calculations are presented in Appendices D and E. As noted previously, the vacant properties at 360, 364, and 368 Bay Boulevard are included in the Building 99/100 exposure area.

4.4.6.1 Building 99/100 Exposure Area

On-Site Construction Worker: Based on the results of the HHRA for the on-Site construction worker, the cumulative ILCR is 1×10^{-7}, and the total HI is 0.3. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is less than the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 500 mg/kg. Remediation or mitigation is therefore not necessary to protect the on-Site construction worker.

On-Site Landscaper: Based on the results of the HHRA for the on-Site landscaper, the cumulative ILCR is 2×10^{-7}, and the total HI is 0.04. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is less than the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 500 mg/kg. Remediation or mitigation is therefore not necessary to protect the on-Site landscaper.

On-Site Commercial/Industrial Worker (Building 99): Based on the results of the HHRA for the on-Site commercial/industrial worker using sub-slab soil vapor data, the ILCR is 3×10^{-7}, and the total HI is 0.1. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is less than the acceptable total HI of 1. Remediation or mitigation is therefore not necessary to protect the commercial/industrial worker.

On-Site Commercial/Industrial Worker (Building 100): Based on the results of the HHRA for the on-Site commercial/industrial worker using sub-slab soil vapor data, the ILCR is 3×10^{-7}, and the total HI is 0.1. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is less than the acceptable total HI of 1. Remediation or mitigation is therefore not necessary to protect the commercial/industrial worker.

On-Site Commercial/Industrial Worker (Future Building): Based on the results of the HHRA for the on-Site commercial/industrial worker using sub-slab soil vapor data, the maximum ILCR is 3×10^{-7}, and the maximum total HI is 0.1. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is less than the acceptable total HI of 1. Remediation or mitigation is therefore not necessary to protect the commercial/industrial worker.

4.4.6.2 Building 29 Exposure Area

On-Site Construction Worker: Based on the results of the HHRA for the on-Site construction worker, the cumulative ILCR is 1×10^{-6}, and the total HI is 6. The cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is greater than the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 500 mg/kg. Remediation or mitigation is therefore warranted to protect the on-Site construction worker.

TCE is driving the risk. A HBRG (see Section 6) was derived for TCE in soil to reduce estimated human health risks for the on-Site construction worker from exposure soil within the planned excavation area within the Building 29 exposure area.

On-Site Landscaper: Based on the results of the HHRA for the on-Site landscaper, the cumulative ILCR is 1×10^{-5}, and the total HI is 1. The cumulative ILCR is equal to the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is equal to the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 320 mg/kg. Remediation or mitigation is therefore not necessary to protect the on-Site landscaper.

On-Site Commercial/Industrial Worker: Based on the results of the HHRA for the on-Site commercial/industrial worker using sub-slab soil vapor data, the maximum ILCR is 2×10^{-3}, and the maximum total HI is 500. The cumulative ILCR is greater than the acceptable cumulative ILCR threshold of 1×10^{-5} and the total HI is greater than the acceptable total HI of 1. Remediation or mitigation is therefore warranted to protect the on-Site commercial/industrial worker.

Bromodichloromethane, chloroform, cis-1,2-dichloroethene (cis-1,2-DCE), PCE, and TCE are driving the risk. HBRGs (see Section 6) were derived for these COPCs in soil vapor to reduce estimated health risks for the on-Site commercial/industrial worker from exposure to inhalation of indoor air for Building 29.

The Owner will be installing a sub-slab depressurization system beneath Building 29 as a vapor intrusion mitigation measure.

4.4.7 Uncertainty Analysis

It should be noted that the above risk estimates are conservative estimates of potential health risks. The EPA and DTSC guidance documents for risk assessment provide a systematic means for organizing, analyzing, and presenting information on the nature and magnitude of risk to public health posed by chemical exposures. Despite the advanced state of current risk assessment methodology, uncertainties and limitations are inherent in the risk assessment process. To minimize the consequences of uncertainty, regulatory guidance typically relies on the use of conservative estimates of adverse health effects in the absence of strong scientific data. Because multiple conservative assumptions are used, the overall risk characterization results are much more likely to overestimate the potential risk rather than to underestimate it.

The risk estimates presented herein are likely overestimates of risk for the following reasons:

- Use of the maximum concentrations for EPCs assumes that a person would be exposed to a maximum concentration during their entire exposure duration, which is unlikely. It is more realistic to assume that a person may be exposed to representative average concentrations. Thus, the use of maximum concentrations overestimates risk. The assumption that each maximum concentration is co-located within the exposure area further contributes to an overestimate of risks.
- It is also assumed that COPC concentrations would remain constant over time. It is more likely that given the natural degradation processes, organic COPC concentrations would decrease over time. Thus, estimated organic COPC intakes would decrease over time, which would result in lower risk estimates than presented herein.
- Conservative assumptions regarding exposure duration were assumed in the HHRA. For instance, it was conservatively assumed that an on-Site landscaper would be at the Site for a period of 100 days a year for 25 years, when it is more realistic that the longest any one particular landscaper would be on Site is significantly less. The shorter the exposure duration the lower the estimated risks.

- This HHRA includes assumptions about general characteristics and potential patterns of human exposure. RME exposures were calculated to provide some measure of the range and uncertainty in potential exposures. The RME case is developed to provide an upper bound on exposure. Because RME estimates are based on a combination of conservative assumptions, the estimates likely overpredict exposures that would generally be encountered. Both the EPA and DTSC publish conservative default exposure assumptions. EPA's default soil adherence factor for the industrial worker (including a utility worker) as identified in the HHRA Note 1 is less conservative then the DTSC soil adherence factor used in this HHRA. The DTSC default industrial worker soil adherence factor is 0.2, while the EPA default adherence factor is 0.12. Using the DTSC value as assumed in this HHRA results in nearly twice the estimated risk than if the EPA default soil adherence factor were used.
- Toxicity values used in risk assessments present overestimates of the potential toxicity of these chemicals to humans. Assumptions used to develop toxicity values include the addition of safety factors to account for uncertainties associated with extrapolating high doses to low doses where chronic environmental exposures would occur and to account for uncertainties associated with the use of laboratory animal studies to assess potential toxicity to human receptors.
- The EPA default sub-slab soil vapor to indoor air attenuation factor was used to estimate indoor air concentrations. EPA based this attenuation factor on the 95th percentile of the attenuation factors derived from indoor air and sub-slab data pairs included in their vapor intrusion database, "EPA's Vapor Intrusion Database: Evaluation and Characterization of Attenuation Factors for Chlorinated Volatile Organic Compounds and Residential Buildings." The data pairs used were solely for chlorinated hydrocarbons in residential settings with more than 75 percent collected within basements where indoor air concentrations would likely be higher than the rest of the home, where there is typically more ventilation. Using this EPA default attenuation likely overestimates indoor air concentrations and estimated risks associated with this pathway for the commercial/industrial worker.

5. Development of Health-Based Remediation Goals

The HBRGs were derived based on the results of the exposure-area-specific HHRAs. Of the two exposure areas at the Site, only the Building 29 exposure area required development of heath-based remediation goals. No HBRGs were required for the Building 99/100 exposure area that includes 360, 364, and 368 Bay Boulevard, because no remediation or mitigation is necessary to protect on-Site receptors regardless of whether or not Buildings 99 and 100 remain.

Health–based remediation goals were derived for soil vapor beneath and adjacent to Building 29 and for soil within the planned loading dock excavation area in the Building 29 exposure area. The calculations presenting the derivation of the HBRGs are presented in the Appendix E.

The COPCs with EPCs that contributed the most to the risk threshold exceedances, referred to as risk drivers, were identified. HBRGs were derived for the chemical risk drivers by lowering the concentrations of these risk drivers for each of the soil vapor samples or soil samples that exceeded risk thresholds until the risk thresholds were met for the receptor. These lowered health protective EPC concentrations for soil vapor and soil, identified as the HBRGs, are listed in Table 11.

The soil vapor locations that exceed the HBRGs are highlighted on Figure 8 and identified below:

- B29-V04/PW-06
- B29-V07
- PW-07
- B29-V09/PW-09
- PW-12
- B29-V16
- PW-14
- B29-V19
- PW-15
- DGA-004
- DGA-007
- DGA-008
- DGA-009
- DGA-011
- DGA-016
- DGA-017
- DGA-019
- DGA-021
- DGA-022

Table 12 summarizes the estimated ILCR and HI for the on-Site commercial/industrial worker at each of these soil vapor locations after the HBRGs have been met.

The soil samples that exceed the HBRG are highlighted on Figure 9 and are identified below:

- B29-23; and
- B29-24.

Table 12 summarizes the estimated ILCR and HI for the on-Site construction worker after the HBRGs have been met.

6. Conclusions and Recommendations

Haley & Aldrich performed this HHRA for Parcel A that includes an evaluation of two exposure areas. One exposure area, the Building 99/100 exposure area is north of G Street and includes Buildings 99/100 and three vacant properties to the north at 360, 364, and 368 Bay Boulevard. Two scenarios are considered for this exposure area: Buildings 99 and 100 remain with continued commercial/industrial use, or Buildings 99 and 100 are razed and along with the vacant properties at 360, 364 and 368 Bay Boulevard are redeveloped as surface parking. The second exposure area, the Building 29 exposure area, is south of G Street and includes Building 29. The northern portion of Building 29 will be demolished and up to approximately 5 feet of soil will be excavated to construct a loading dock adjacent to the building.

The HHRA has been performed in accordance with regulatory guidance and considers the following receptors for each exposure area: on-Site construction worker, landscaper, and commercial/industrial worker. The conclusions for each exposure area are provided below.

6.1 BUILDINGS 99/100 EXPOSURE AREA

The cumulative ILCR for each on-Site receptor for the Buildings 99/100 exposure area, regardless of whether Buildings 99 and 100 remain, is less than the acceptable cumulative ILCR threshold of 1×10^{-5} and the total HI is less than the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 500 mg/kg. Based on the results of the HHRA, no remediation or mitigation is necessary to protect the on-Site receptors. Therefore, based on these results, it is requested that the SDRWQCB provide concurrence that no further action is warranted at this time and Rohr has met the requirements of the CAO for this exposure area (that includes 360, 364 and 368 Bay Boulevard).

6.2 BUILDING 29 EXPOSURE AREA

For the on-Site landscaper, the cumulative ILCR is equal to the acceptable cumulative ILCR threshold of 1×10^{-5}, and the total HI is equal to the acceptable total HI of 1. The lead EPC is less than the commercial/industrial DTSC-SL of 500 mg/kg. Remediation or mitigation is therefore not necessary to protect the on-Site landscaper.

Based on sub-slab soil vapor data for the on-Site commercial/industrial worker, the cumulative ILCR is greater than the acceptable cumulative ILCR threshold of 1×10^{-5} and the total HI is greater than the acceptable total HI of 1 for the on-Site commercial/industrial worker. Bromodichloromethane, chloroform, cis-1,2-DCE, PCE, and TCE are driving the risk. HBRGs were derived for these COPCs in soil vapor to reduce estimated health risks for the on-Site commercial/industrial worker from exposure to inhalation of indoor air for Building 29. The soil vapor HBRGs for bromodichloromethane, chloroform, cis-1,2-DCE, PCE, and TCE are 70, 80, 100, 370, and 350 $\mu g/m^3$, respectively. The Owner will be installing a SSDS beneath Building 29 as a vapor intrusion mitigation measure and implementing an RMP.

For the on-Site construction worker, the cumulative ILCR is less than the acceptable cumulative ILCR threshold of 1×10^{-5} and the lead EPC is less that the commercial/industrial DTSC-SL of 500 mg/kg. However, the total HI is greater than the acceptable total HI of 1. Remediation or mitigation is therefore warranted to protect the on-Site construction worker. TCE is driving the risk. A HBRG was derived for TCE in soil to reduce estimated human health risks for the on-Site construction worker during excavation to construct the new loading dock on the north end of Building 29. The HBRG for TCE in this area is 1.5 mg/kg.

TABLE 3
RECEPTOR EXPOSURE ASSUMPTIONS
ROHR INC. - PARCEL A
CHULA VISTA, CALIFORNIA

RECEPTOR: FUTURE ON-SITE CONSTRUCTION WORKER

Potentially Complete Pathways:

- Incidental ingestion of vadose zone soil
- Dermal contact with vadose zone soil
- Inhalation of fugitive dust generated from windborne vadose zone soil
- Inhalation of vapors emanating into ambient air from vadose zone soil

PARAMETER	REASONABLE MAXIMUM EXPOSURE (RME)
General Parameters:	
Body Weight (BW)	Value: 80 kg Rationale: Default value; DTSC, 2019
Exposure Frequency (EF)	Value: 8 hrs./day, 250 days/year Rationale: Default value; DTSC, 2019
Exposure Duration (ED)	Value: 1 year Rationale: Default value; DTSC, 2019
Averaging Time (AT)	Value: Carcinogenic Effects: 70 years (25,550 days) Noncarcinogenic Effects: AT = Exposure duration Rationale: Default value; DTSC, 2019; EPA 1997, 2002, 2014
Inhalation of Particulates/VOCs:	
Exposure Time (ET)	Value: 8 hours/day Rationale: Default value; DTSC, 2019; EPA, 2014
Dermal Contact with Soil:	
Soil Adherence Factor (AF)	Value: 0.8 mg/cm^2 Rationale: Default value; DTSC, 2019
Event Frequency (EV)	Value: 1 event/day Rationale: EPA, 2004
Skin Surface Area (SA)	Value: 3,527 cm^2 Rationale: Weighted average of mean values for head, hands, and forearms (male and female, 21+years); EPA, 2014

PARAMETER	REASONABLE MAXIMUM EXPOSURE (RME)
Dermal Absorption Fraction (ABS_d)	Value: Chemical-specific: 0.15 for PAHs; 0.15 for PCBs; 0 for VOCs; 0.1 for other organics; 0.03 for As; 0.001 for Cd; 0.01 for other metals; 0.05 for pesticides. Rationale: Default values; DTSC, 2015, 2019
Incidental Soil Ingestion:	
Ingestion Rate (IR_{soil})	Value: 330 mg/day Rationale: Default value; DTSC, 2019
Relative Absorption Factor (RAF)	Value: 1.0 Rationale: Assumed total dose is absorbed

RECEPTOR: FUTURE ON-SITE LANDSCAPER (INCLUDING UTILITY WORKER)

Potentially Complete Pathways:

- Incidental ingestion of vadose zone soil
- Dermal contact with vadose zone soil
- Inhalation of fugitive dust generated from windborne vadose zone soil
- Inhalation of vapors emanating into ambient air from vadose zone soil

PARAMETER	REASONABLE MAXIMUM EXPOSURE (RME)
General Parameters:	
Body Weight (BW)	Value: 80 kg Rationale: Default value; DTSC, 2019
Exposure Frequency (EF)	Value: 8 hrs./day, 100 days/year (2 days per week for 50 weeks) Rationale: Reasonable assumption for landscapers in southern California
Exposure Duration (ED)	Value: 25 years Rationale: Default value; DTSC, 2019; EPA, 1997, 2002, 2004, 2014
Averaging Time (AT)	Value: Carcinogenic Effects: 70 years (25,550 days) Noncarcinogenic Effects: AT = Exposure duration Rationale: Default value; DTSC, 2019; EPA 1997, 2002, 2014
Inhalation of Particulates/VOCs:	
Exposure Time (ET)	Value: 8 hours/day Rationale: Default value; DTSC, 2019; EPA, 2014

RECEPTOR EXPOSURE ASSUMPTIONS
ROHR INC. - PARCEL A
CHULA VISTA, CALIFORNIA

PARAMETER	REASONABLE MAXIMUM EXPOSURE (RME)
Dermal Contact with Soil:	
Soil Adherence Factor (AF)	Value: 0.2 mg/cm^2 * Rationale: Default value; DTSC, 2019; EPA, 2004, 2011, 2014
Event Frequency (EV)	Value: 1 event/day Rationale: EPA, 2004
Skin Surface Area (SA)	Value: 3,527 cm^2 Rationale: Weighted average of mean values for head, hands, and forearms (male and female, 21+years); EPA, 2014
Dermal Absorption Fraction (ABS_d)	Value: Chemical-specific: 0.15 for PAHs; 0.15 for PCBs; 0 for VOCs; 0.1 for other organics; 0.03 for As; 0.001 for Cd; 0.01 for other metals; 0.05 for pesticides. Rationale: Default values; DTSC, 2015, 2019
Incidental Soil Ingestion:	
Ingestion Rate (IR_{soil})	Value: 100 mg/day Rationale: Recommended screening-level value for outdoor workers during landscaping or other soil disturbing activities; EPA, 2002, 2004; DTSC, 2019
Relative Absorption Factor (RAF)	Value: 1.0 Rationale: Assumed total dose is absorbed

* The 0.2 mg/cm^2 soil adherence factor used for the landscaper (including utility worker) is identified in the DTSC Note 1, "2019 DTSC HHRA Note 1, "Recommended DTSC Default Exposure Factors for Use in Risk Assessments at California Hazardous Waste Sites and Permitted Facilities" for an industrial scenario. Additional background regarding this value is provided by the EPA in their July 2004 "Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment)" where they indicate on page 3-17 that "Given that there were data available for a wide variety of activities that a commercial/industrial adult worker may engage in, a high-end soil contact activity was selected and the central tendency weighted AF (50th percentile) derived for that activity. In so doing, the recommended weighted AF for a commercial/industrial adult worker is 0.2 mg/cm^2 and is based on the 50th percentile weighted AF for utility workers (the activity determined to represent a high-end contact activity). The bases for this recommendation are as follows: (1) although no single activity would be representative of activities a commercial/industrial adult worker engages in, a comparison of the utility worker 50th percentile weighted AF with other commercial/industrial-type activities (Exhibit 3-3) shows that the utility worker represents a high-end soil contact activity (i.e., grounds keepers, landscaper/rockery, irrigation installers, gardeners, construction workers); (2) a combination of common sense and data on the weighted AFs supports the assumption that utility worker activities represent a high-end soil contact activity, whereas, determining which of other measured activities might represent a reasonable, central tendency (i.e., typical) soil contact activity would be difficult; and (3) selecting the central tendency weighted AF (i.e., 50th percentile) of a high-end soil contact activity is consistent with a RME for contact rates." It should also be noted that the February 2014 EPA Memorandum, "Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors", the EPA indicates that the previous default soil adherence factor for an outdoor worker is 0.2 mg/cm^2 but the updated default soil adherence factor of an outdoor worker is 0.12 mg/cm^2 . The updated soil adherence factor is reportedly based on the arithmetic mean of weighted average body part-specific mean adherence factors of hands, forearms, and face for adult commercial/industrial activities. The updated factor is lower than the factor proposed for this HHRA. Therefore, based on the above information, the soil adherence factor of 0.2 mg/cm^2 appears to be adequately conservative for the on-Site landscaper (including utility worker) for this HHRA.

RECEPTOR EXPOSURE ASSUMPTIONS
ROHR INC. - PARCEL A
CHULA VISTA, CALIFORNIA

RECEPTOR: FUTURE ON-SITE COMMERCIAL/INDUSTRIAL WORKER
Potentially Complete Pathways:

- Inhalation of vapors emanating into indoor air from vadose zone soil and groundwater

PARAMETER	REASONABLE MAXIMUM EXPOSURE (RME)
General Parameters:	
Exposure Frequency (EF)	Value: 250 days/yr (5 days per week for 50 weeks) Rationale: Default value; DTSC, 2019; EPA 1997, 2002, 2014
Exposure Duration (ED)	Value: 25 years Rationale: Default value; DTSC 2019; EPA 1997, 2002, 2004, 2014
Averaging Time (AT)	Value: Carcinogenic Effects: 70 years (25,550 days) Noncarcinogenic Effects: AT = Exposure duration Rationale: Default value; DTSC 2019; EPA 1997, 2002, 2014
Inhalation of VOCs:	
Exposure Time:	Value: 8 hours/day Rationale: Default value; DTSC, 2019; EPA, 2014
