RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: All
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 30

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 14
16<30 Years Bin: 14
16 to 70 Years Bin: 0

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
3rd Trimester to 16 years: ON
16 years to 70 years: ON

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.05
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: DBRs changed|FAH changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitCancerRisk.csv
Cancer risk total by receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitCancerRiskSumByRec.csv
Cancer risk total by receptor and source saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\CancerRiskSumByRec.csv
Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCChronicRiskSumByRec.csv
Chronic risk total by receptor and source saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCChronicRiskSumByRecBySrc.csv
Calculating acute risk
Acute risk breakdown by pollutant and receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCAcuteRisk.csv
Acute risk total by receptor saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCAcuteRiskSumByRec.csv
Acute risk total by receptor and source saved to: C:\Model QA\Mojave\PS_MMM_OPS_v3\hra\PS_MMM_OPS_MitNCAcuteRiskSumByRecBySrc.csv

2.0 INTRODUCTION 2-1

3.0 PROJECT DESCRIPTION 3-1
3.1 Scrap Storage and Handling 3-2
3.2 Raw Material Storage and Handling 3-2
3.3 EAF Melting and Refining Operations 3-3
3.4 Ladle Metallurgy Furnace 3-3
3.5 Ladle and Tundish Preheating 3-3
3.6 Casting Operations 3-4
3.7 Rolling Operations 3-4
3.8 Melt Shop Refractory Department 3-4
3.9 Slag and Mill Scale Handling and Crushing 3-4
3.10 Cooling Towers 3-5
3.11 Emergency Combustion Engines 3-5
3.12 On-site Mobile Equipment 3-5
3.13 Haul Roads 3-5
3.14 Fuel Storage Tanks 3-5

4.0 EMISSIONS ESTIMATES 4-1
4.1 Melt Shop Emission Sources and Emission Points – EP07, EP08, EP09, EP10 4-1
4.1.1 EAF Melting and Refining Operations 4-1
4.1.2 HAP Emissions from the EAF Melt Shop Baghouse 4-2
4.1.3 Natural Gas-Fired EAF Equipment 4-2
4.1.4 Ladle and Tundish Refractory Repair 4-2
4.1.5 Caster Emissions 4-3
4.2 Rolling Operations – EP11 4-3
4.3 Raw and Waste Material Storage and Handling – EP01, EP02, EP17, EP18 4-3
4.3.1 Material Handling 4-4
4.3.2 Pile Wind Erosion 4-4
4.3.3 Slag Screening and Crushing 4-6
4.4 Raw and Waste Material Storage and Handling in Silos – EP03, EP04, EP05 4-6
4.5 Scrap Cutting Torches – EP06 4-6
4.6 Cooling Towers – EP12 and EP13 4-6
4.7 Emergency Combustion Engines – EP14, EP15 and EP16 4-7

4.8 Haul Roads – EP19 and EP20 4-7
4.8.1 Paved Haul Roads 4-8
4.8.2 Unpaved Haul Roads 4-9
4.9 Fuel Storage Tanks – EP21 and EP22 4-10
4.10 HAPs 4-10

PANs	peroxyacetyl nitrates
PCBs	polychlorinated biphenyls
PE	Professional Engineer
PBL	Planetary Boundary Layers

Abbreviation	Term/Phrase/Name
PM	total particulate matter
PM_{10}	particulate matter less than 10 microns in diameter
$PM_{2.5}$	particulate matter less than 2.5 microns in diameter
ppb	parts per billion
ppm	parts per million
ppmvd	parts per million by volume, dry
PSD	Prevention of Significant Deterioration
PVMRM	Plume Volume Molar Ratio Method
RACT	Reasonably Available Control Technology
RAL	Risk Assessment Level
RBLC	RACT/BACT/LAER Clearinghouse
RICE	Reciprocating Internal Combustion Engine
RMP	risk management plan
scfm	standard cubic feet per minute
SCR	selective catalytic reduction
SDA	spray dryer absorption
SI	Spark ignited
SIC	Standard Industrial Classification
SNCR	selective non-catalytic reduction
SO_2	sulfur dioxide
SSM	start-up, shutdown and malfunction
tpy	tons per year

Abbreviation	Term/Phrase/Name
TRS	total reduced sulfur
TDS	total dissolved solids
UHP	ultra-high-power
USEPA	United States Environmental Protection Agency
USGS	U.S. Geological Survey
UTM	Universal Transverse Mercator
VSD	variable speed drive
VOC	volatile organic compounds
yd^3	cubic yard

1.0 EXECUTIVE SUMMARY

Pursuant to the requirements in the Florida Department of Environmental Protection (Florida DEP), Nucor Steel Florida, Inc. (Nucor) is submitting this Prevention of Significant Deterioration (PSD) construction permit application for the proposed construction of a new steel micro mill to be located in Frostproof, Highlands and Polk Counties, Florida (Project). The Project will include air emissions sources for the manufacture of steel products from scrap steel, home scrap and scrap substitutes. Iron ore will not be processed at the mill. The new Project will consist of electric arc furnace (EAF) melting and refining operations; ladle metallurgy furnace (LMF) operations; casting, rolling, and finishing operations; raw and product material handling; and other associated equipment to produce steel products. The steel micro mill will operate 24 hours per day and 7 days per week with a maximum annual steel production rate of 450,000 tons per year.

This permit application contains the following analyses/assessments regarding emissions of regulated pollutants associated with the construction and operation of the Project:

- Evaluation of ambient air quality in the area for each regulated pollutant for which the Project will result in a PSD significant net emissions increase
- Demonstration that emissions increases resulting from the Project will not cause or contribute to an increase in ambient concentrations of pollutants exceeding the remaining available PSD increment and the National Ambient Air Quality Standards (NAAQS)
- Assessment of any adverse impacts on soils, vegetation, visibility, and growth in the area
- A Best Available Control Technology (BACT) analysis for each PSD-regulated pollutant for which the Project will result in a significant net emissions increase

Potential emissions from the Project are reflected in Table 1-1. A full description of equipment associated with the Project is provided in Part 2 of this application.

1.1 HAP Emissions

The Project is an area source of Hazardous Air Pollutants (HAPs) (less than 25 tons per year of total HAPs and less than 10 tons per year of any single HAP).

1.2 BACT Analysis

A “top-down” BACT analysis was performed for each of the pollutants in Table 1-1 that were subject to PSD: nitrogen oxides (NO_x), carbon monoxide (CO), total particulate matter (PM), particulate matter less than 10 microns in diameter (PM_{10}), particulate matter less than 2.5 microns in diameter ($PM_{2.5}$), volatile

organic compounds (VOC), sulfur dioxide (SO_2), fluorides and carbon dioxide equivalents (CO_2e, greenhouse gases, GHGs). PM is no longer a NAAQS pollutant nor is it a PSD pollutant under 40 Code of Federal Regulations (CFR) Part 52.21; however, a BACT analysis for PM is required per 62-212.400(10), Florida Administrative Code (FAC).

Table 1-1. Project Potential Emissions and PSD Thresholds and Significance Levels

Pollutant	Preliminary Estimated Project Potential Emissions (Tons per Year)[a]	Major Stationary Source Threshold (Tons per Year)[b]	PSD Significance Levels (Tons per Year)[c]
NO_x	**93.1**	100	40
CO	**945**	100	100
PM	**66.0**	100	25
PM_{10}[d]	**87.0**	100	15
$PM_{2.5}$[d]	**78.5**	100	10
SO_2	**157.9**	100	40
VOC	**85.3**	100	40
H_2SO_4	0.03	100	7
Lead	0.06	100	0.6
Fluorides	**15.5**	100	3
H_2S	--	100	10
TRS	--	100	10
Mercury[e]	0.04	--	0.1
CO_2e	**144,895**	--	75,000

(a) Numbers in **bold** indicate its respective PSD significance level is exceeded.
(b) Steel mills are a listed source pursuant to 40 CFR Part 51.166(b)(1) and 62-210.200(171)(b), FAC.
(c) Per 40 CFR 52.21(b)(23)(i).
(d) Filterable plus condensable.
(e) Mercury is not a PSD pollutant. Florida DEP sets a significant emission rate for mercury in 62-210.200(256)(a)(2), FAC.

State-of-the-art pollution control equipment has been selected as BACT for the Project. Table 1-2 displays the BACT results for the Project emission sources.

Table 1-2. Summary of BACT Results

Equipment	Pollutant	BACT Rate	Control Device	Compliance Method and Averaging Period
EAF/LMF/caster/ meltshop	NO_x	0.3 lb/ton	Oxy-fired burners and good combustion and/or process operation / DEC	Stack test - 30-day rolling average
	CO	3.5 lb/ton	Good combustion practices / DEC	Stack test - 30-day rolling average
	PM - Filterable	0.0018 gr/dscf	Baghouse	Stack test - NSPS Subpart AAa - Method 5
	PM_{10} front and back half	0.0045 gr/dscf	Baghouse	Stack test - NSPS Subpart AAa
	$PM_{2.5}$ front and back half	0.0045 gr/dscf	Baghouse	Stack test - NSPS Subpart AAa
	SO_2	0.6 lb/ton	Low sulfur fuel, scrap management and good combustion practices	Stack test - 30 day rolling average
	VOC	0.3 lb/ton	Good combustion practices, scrap management	Stack test - 3-hour average
	GHG (CO_2e)	438 lb/ton	• Adjustable speed drives • Transformer efficiency, ultra-high-power transformers • Bottom stirring/stirring gas injection • Foamy slag practice • Oxy-fuel burners • Post combustion of the flue gases • Scrap preheating • Engineered refractories • Eccentric bottom tapping on furnace • Energy monitoring and management system	CO_2 stack test - 12 month rolling average
	Fluorides	0.059 lb/ton	Baghouse	Stack test, 3-hour average
Ladle and tundish preheaters, dryers and skull cutting	NO_x	0.1 lb/MMBtu	Good combustion practices	Vendor data and emission calculations
	CO	0.084 lb/MMBtu	Good combustion practices	Vendor data and emission calculations
	PM	0.0076 lb/MMBtu	Good combustion practices and fuel selection	Vendor data and emission calculations
	PM_{10}	0.0076 lb/MMBtu	Good combustion practices and fuel selection	Vendor data and emission calculations
	$PM_{2.5}$	0.0076 lb/MMBtu	Good combustion practices and fuel selection	Vendor data and emission calculations
	SO_2	0.0006 lb/MMBtu	Low sulfur fuel	Mass balance
	VOC	0.0055 lb/MMBtu	Good combustion practices	Vendor data and emission calculations
	CO_2e (GHG)	120 lb/MMBtu	Good combustion practices	Emission calculations
Cooling towers	PM	0.001%	Drift eliminators	Vendor data on drift efficiency
	PM_{10}	0.001%	Drift eliminators	Vendor data on drift efficiency
	$PM_{2.5}$	0.001%	Drift eliminators	Vendor data on drift efficiency

Table 1-2. Summary of BACT Results, continued

Equipment	Pollutant	BACT Rate	Control Device	Compliance Method and Averaging Period
Emergency engines	NO_x	2.0 g/hp-hr	Lean burn engines	Vender data
	CO	4.0 g/hp-hr	Lean burn engines	Vender data
	PM	0.048 g/hp-hr	Fuel selection	Vender data
	PM_{10}	0.048 g/hp-hr	Fuel selection	Vender data
	$PM_{2.5}$	0.048 g/hp-hr	Fuel selection	Vender data
	SO_2	Natural gas as fuel	Fuel selection	Mass balance
	VOC	1.0 g/hp-hr	Lean burn engines	Vendor data
	CO_2e (GHG)	117.1 lb/MMBtu	Fuel selection and efficient engines	Emissions calculations
Scrap cutting	NO_x	Natural gas as fuel	Fuel selection	Emissions calculations
	CO	Natural gas as fuel	Fuel selection	Emissions calculations
	PM	Natural gas as fuel	Fuel selection	Emissions calculations
	PM_{10}	Natural gas as fuel	Fuel selection	Emissions calculations
	$PM_{2.5}$	Natural gas as fuel	Fuel selection	Emissions calculations
	SO_2	Natural gas as fuel	Fuel selection	Emissions calculations
	VOC	Natural gas as fuel	Fuel selection	Emissions calculations
	CO_2e (GHG)	Natural gas as fuel	Fuel selection	Emissions calculations
Material handling	PM	See Section 6.8	Various controls (watering, partial enclosure, etc.)	Records of watering and monthly emission calculations
	PM_{10}	See Section 6.8	Various controls (watering, partial enclosure, etc.)	Records of watering and monthly emission calculations
	$PM_{2.5}$	See Section 6.8	Various controls (watering, partial enclosure, etc.)	Records of watering and monthly emission calculations
Storage silos	PM	0.005 gr/dscf	Fabric bin vent filters for storage silos	Vendor guarantee
	PM_{10}	0.005 gr/dscf	Fabric bin vent filters for storage silos	Vendor guarantee
	$PM_{2.5}$	0.005 gr/dscf	Fabric bin vent filters for storage silos	Vendor guarantee
Roads	PM	See Section 6.7	Fugitive Dust Control Plan	Records of monthly plan-required activities
	PM_{10}	See Section 6.7	Fugitive Dust Control Plan	Records of monthly plan-required activities
	$PM_{2.5}$	See Section 6.7	Fugitive Dust Control Plan	Records of monthly plan-required activities
Piles	PM	See Section 6.8	Minimize drop height	Records of throughput and monthly emissions
	PM_{10}	See Section 6.8	Minimize drop height	Records of throughput and monthly emissions
	$PM_{2.5}$	See Section 6.8	Minimize drop height	Records of throughput and monthly emissions

1.3 Air Quality Analysis

The existing air quality in Highlands County is designated as attainment or unclassifiable with regard to the NAAQS for all criteria pollutants. Polk County is designated as attainment or unclassifiable with regard to the NAAQS for all criteria pollutants, except the 1-hour SO_2 standard. Polk County has been designated as partial non-attainment for the 1-hour SO_2 standard, but the Project will not be located in the Hillsborough-Polk non-attainment area. The Project is located in an attainment area for all criteria pollutants.

Air dispersion modeling analyses were performed for the pollutants subject to PSD to assess potential ambient air quality impacts associated with the Project. The modeling was performed in accordance with approved Florida DEP and United States Environmental Protection Agency (USEPA) modeling guidance. The air dispersion modeling protocol was submitted to the Florida DEP on April 25, 2018. The modeling analysis (included in Part 7 of this application) demonstrates the Project will not cause or contribute to a violation of the NAAQS or PSD Class II Increment.

1.4 Additional Impacts Analysis

The potential impacts of the Project on visibility, soils, vegetation, and growth are discussed in Part 8 of this application. As indicated by the analysis, the Project will not have a significant impact on visibility, soils, growth, or vegetation in the surrounding area.

1.5 Proposed Emission Limits

Based on the regulatory review, BACT analyses and air dispersion modeling completed for this PSD permit application, the emission limits proposed for the Project emission units are summarized in Table 1-3. In general, proposed emission limits are requested on an annual basis. Compliance with such limitations will be demonstrated on a 12-month rolling basis. Compliance with fugitive PM, PM_{10} and $PM_{2.5}$ emissions from fugitive dust sources (*i.e.,* haul roads and material handling/storage) will be demonstrated through use of the facility's fugitive dust control plan.

Table 1-3. Proposed Emission Limits

Emission Unit ID Number	Description of Emissions Unit	Pollutant	Emission Limit	Compliance Demonstration Method
EU01	Melt Shop (EP07, EP08, EP09, EP10)	NO_x	67.5 tons/year	Maintain records of monthly steel production and emissions. Use good operating practices.
		CO	788 tons/year	
		PM	40.5 tons/year	
		PM_{10}	101 tons/year	
		$PM_{2.5}$	101 tons/year	
		SO_2	135 tons/year	
		VOC	67.5 tons/year	
		GHG (CO_2e)	98,550 tons/year	
		Fluorides	13.3 tons/year	
		Total HAPs	0.85 tons/year	

2.0 INTRODUCTION

Nucor is proposing to construct a steel micro mill at a greenfield site near Frostproof, Florida in Highlands and Polk Counties. The Project will include air emissions sources for the manufacture of steel products from scrap steel and scrap substitutes. Iron ore will not be processed at the mill. The steel micro mill will operate 24 hours per day and 7 days per week with a maximum annual steel production rate of 450,000 tons per year.

The following processes and emission units are proposed for the Project:

- Melt shop, including
  - EAF melting and refining operations
  - LMF
  - Natural gas combustion sources
  - Ladle and tundish refractory repairs
  - Casting operations
- Rolling operations
- Raw and waste material storage and handling
- Scrap cutting torches
- Contact and non-contact cooling towers
- Natural gas-fired emergency engines
- Haul roads
- Fuel storage tanks

The Project is a listed source per 40 CFR Part 52.21 and potential emissions indicate the Project will be a major source; as a result, the Project will be subject to PSD construction permit review. A PSD permit requires an assessment of ambient impacts for those pollutants subject to PSD review.

This construction permit application is divided into the following sections:

- Part 1 – Executive Summary
- Part 2 – Introduction
- Part 3 – Project Description
- Part 4 – Emissions Estimates (This section provides estimates of emissions associated with the Project.)

- Part 5 – Regulatory Review (This section identifies applicable State and Federal air quality regulations.)
- Part 6 – BACT Analysis
- Part 7 – Air Dispersion Modeling (This section provides model descriptions and data requirements for the air quality impact assessment, as well as interpretation, analysis, and comparison of the modeling results with applicable air quality regulations.)
- Part 8 – Additional Impacts Analysis (This section addresses other potential air quality-related impacts such as growth, soil, vegetation, and visibility.)
- Part 9 – Resources

Construction permit application forms required by the Florida DEP are included in Appendix A of this application.

3.0 PROJECT DESCRIPTION

The greenfield site proposed for the Project is located near Frostproof, Highlands and Polk Counties, Florida as shown in Figure B-1 (Appendix B). Highlands County is currently designated as an attainment/unclassifiable area for all criteria pollutants in 40 CFR Part 81. Polk County is currently designated as an attainment/unclassifiable area for all criteria pollutants, except the 1-hour SO_2 standard. Polk County has been designated as partial non-attainment for the 1-hour SO_2 standard, but the Project will not be located in the Hillsborough-Polk non-attainment area. The Project is located in an attainment area for all criteria pollutants.

The Project is a new listed source that exceeds the PSD major source thresholds; therefore, the Project will be a major source subject to PSD. The Project potential air emissions indicate that the PSD significance level will be exceeded for several pollutants, as reflected in Table 3-1.

Table 3-1: Total Preliminary Potential Emissions and PSD Major Source Thresholds

Pollutant	Preliminary Estimated Project Potential Emissions (Tons per Year)[a]	Major Stationary Source Threshold (Tons per Year)[b]	PSD Significance Levels (Tons per Year)[c]
NO_x	**93.1**	100	40
CO	**945**	100	100
PM	**66.0**	100	25
PM_{10}[d]	**87.0**	100	15
$PM_{2.5}$[d]	**78.5**	100	10
SO_2	**157.9**	100	40
VOC	**85.3**	100	40
H_2SO_4	0.03	100	7
Lead	0.06	100	0.6
Fluorides	**15.5**	100	3
H_2S	**--**	100	10
TRS	**--**	100	10
Mercury[e]	0.04	--	0.1
CO_2e	**144,895**	--	75,000

(a) Numbers in **bold** indicate its respective PSD significance level is exceeded.
(b) Steel mills are a listed source pursuant to 40 CFR Part 51.166(b)(1) and 62-210.200(171)(b), FAC.
(c) Per 40 CFR 52.21(b)(23)(i).
(d) Filterable plus condensable.
(e) Mercury is not a PSD pollutant. Florida DEP sets a significant emission rate for mercury in 62-210.200(256)(a)(2), FAC.

Based on the preliminary estimated potential emissions shown in Table 3-1, it is expected that NO_x, CO, SO_2, VOC, PM, PM_{10}, $PM_{2.5}$, fluorides and CO_2e (greenhouse gases) will be subject to PSD review.

The locations of the Project emission sources are shown on Figures B-2 and Figure B-3 in Appendix B. Process flow diagrams are included in Figures B-4 and B-5 in Appendix B. A description of the processes at the steel micro mill is provided in the following sections.

3.1 Scrap Storage and Handling

The majority of the raw material used to make the steel products will be recycled scrap iron and steel, home scrap, and scrap substitutes. The recycled material will be purchased and brought to the facility via truck and rail. The received scrap material may include automobiles, shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles intended for use at steel recycling facilities. This material will be stored in the scrap handling building or in outside storage piles.

Some scrap material is too large, so manual gas-fired torch cutting of a small portion of the scrap (mostly home scrap) will be necessary to break scrap pieces into manageable sizes. This will be done in the slag yard. The home scrap that has been cut to size in the slag yard will be hauled to the main scrap area.

Cranes and material handling equipment will transfer the scrap material from the storage piles and from within the building to a conveyor that will continuously feed the EAF (described below). Particulate matter emissions will be generated during indoor and outdoor scrap handling and storage, from the scrap storage piles and sweepings, and from vehicular traffic on the paved and unpaved facility roads. A small amount of particulate matter and combustion emissions will also be formed from the torch cutting of larger pieces of scrap. A scrap material management program will be put in place to facilitate removal of mercury switches and other mercury containing materials from the raw material before processing. A preliminary scrap management plan is provided in Appendix C.

3.2 Raw Material Storage and Handling

The facility will utilize various raw materials in the steelmaking process, including carbon as a steel-reducing agent, lime or dolomite as a fluxing agent, and various alloys for metallurgical refining. The carbon and fluxing agents will be transported by truck or rail to the facility, moved via blower system, and will be held in storage silos controlled with bin vents. The carbon and fluxing agents will be pneumatically transferred from the silos to the EAF and LMF for refining as needed. The alloys will be transported to the facility by truck and will be stored in outdoor storage piles. The alloys will be transferred with material handling loaders from the storage piles to the EAF and LMF as needed via an Endless Charging System (ECS). Particulate emissions will be generated during the storage and handling of carbon, fluxing agents, and alloy aggregates. The carbon and flux silo vents will be controlled with bin vent dust collectors.

3.3 EAF Melting and Refining Operations

The steelmaking process is initiated by loading the EAF material feed conveyor with scrap. After the EAF is filled with scrap material, the furnace electrodes will be lowered and energized. The scrap will be melted using electrical energy from the electrodes, to achieve a liquid steel temperature of approximately 3,000 degrees Fahrenheit (°F). Once the first batch "heat" of scrap has been melted, the conveyor will feed scrap to the EAF for subsequent batches. Oxygen, carbon, and fluxing agents will be injected into the molten steel in the EAF, resulting in slag formation. Once the desired properties are reached, the molten steel will be poured into a transport vessel lined with refractory material known as a ladle.

A direct evacuation control (DEC) system will capture the EAF emissions and vent the emissions through a large duct to the melt shop baghouse. Emissions created when the EAF pivots to fill a ladle (called "pouring") will be vented by the canopy hood to the melt shop baghouse. The baghouse will operate at two flow rates: a higher flow rate during charging and pouring in the EAF, and a lower flow rate during charging and melting in the EAF. Dust that is collected by the melt shop baghouse will be transferred to a dust storage silo, whose vent will be controlled by a bin vent filter. The baghouse dust will then be loaded into trucks or railcars for transport off-site.

3.4 Ladle Metallurgy Furnace

Ladles will be filled with molten steel from the EAF and transported to the LMF via an overhead crane. Steel in the ladles at the LMF will be heated with additional electrical energy to maintain its molten state during further processing. The molten steel in the ladles will be refined by adding raw materials such as fluxing and reducing agents and alloys. Emissions from the LMF will be captured by the LMF roof and connected ladle duct. These captured emissions will be vented through the canopy hood to the melt shop baghouse. The emissions not captured by the ladle duct will vent to the melt shop and be captured by the canopy hood, caster vent, or may escape through building openings.

3.5 Ladle and Tundish Preheating

The ladles and tundishes will be lined with refractory material which must be preheated to remain dry and to prevent heat loss in the molten steel during transfers. Natural gas-fired heaters in the melt shop will be used for preheating the ladles and tundishes. Emissions from the preheating operations will be released directly to the melt shop. During high baghouse flow, the emissions will be captured by the canopy hood and vented to the baghouse. During low baghouse flow, the emissions will be vented through the caster vent. In both scenarios, a small amount of emissions may escape through openings in the melt shop.

3.6 Casting Operations

After the molten steel in the ladle has achieved its desired properties, the ladle will be transported from the LMF to the caster via overhead crane. At the caster, the molten steel in the ladle will be poured from a slide gate in the bottom of the ladle into a vessel called a tundish. The tundish is a refractory-lined vessel with holes in the bottom that meter the liquid steel into the mold. The molds form and cool the molten steel into a square cross-sectional product called a billet. The billets continue to be cooled in a water spray chamber below the caster. The billet will then feed directly into the rolling mill for further processing. The emissions from the caster cooling chamber will be vented to the caster spray stack.

3.7 Rolling Operations

Billets from the casting operations will be directly charged in the rolling mill. Induction coils will be used when necessary to maintain a billet temperature of approximately 2,100 °F. The billets will pass through a series of high pressure rolling mills for straightening, elongating, and forming. The rolling stands will spray contact cooling water, which may have oil and grease contamination from the machinery, on the billets. Particulate emissions in the form of water droplets will be created from the water spraying, as well as VOCs and HAPs from the oil and grease contamination of the contact water. Rolling mill emissions will vent through the roll mill vent. The finished product will be cut to size by a shear cutter and cooled on a natural convection cooling bed. After the rolled steel has cooled, the steel will be packaged and stored. The finished product will be shipped to customers via rail and truck.

3.8 Melt Shop Refractory Department

The refractory lining of the EAF, ladles, and tundish will be regularly repaired or rebuilt. Emissions from the ladle and tundish repair area will be released directly to the melt shop. During high baghouse flow, the emissions will be captured by the canopy hood and vented to the baghouse. During low baghouse flow the emissions will be vented through the caster vent. In both scenarios, a small amount of emissions may escape through openings in the melt shop.

3.9 Slag and Mill Scale Handling and Crushing

Slag, a product of the steelmaking process, is produced when fluxing agents are added to molten steel to remove impurities. Most of the slag at the facility will be produced in the EAF, and a smaller amount will be formed in the LMF. The EAF slag will be emptied into a slag pit below the furnace to cool. The LMF slag will be formed when further refining is performed in the ladle. Once cooled, the ladle slag will be transferred to the slag processing area via mobile equipment. Mill scale, another product of the steelmaking process, is an iron oxide material that is formed when hot steel is oxidized by the air. Mill scale is generated at the caster spray chamber and along the rolling mills, and will also be present in

contact cooling water. Activities in the slag processing area/slag yard include slag and mill scale handling, crushing, sorting, and storage. Finished slag aggregate and mill scale will be shipped to customers by truck or rail.

3.10 Cooling Towers

Two (2) two-celled cooling towers will be used to remove the heat absorbed by the cooling water system throughout the plant. The makeup water supplied to the cooling tower will contain trace amounts of dissolved minerals from on-site process wells. Contact cooling water, with water that has been used to cool steel through direct contact, may have increased levels of dissolved solids. Upon evaporation and possible drift of the moist air due to evaporative cooling and wind, the entrained solids may be emitted as $PM/PM_{10}/PM_{2.5}$ when the water droplets evaporate.

3.11 Emergency Combustion Engines

The Project will include emergency combustion equipment for start-up or cool down processes. The site will include two 2,000-kilowatt (kW) emergency natural gas-fired generators and one emergency natural gas-fired 500 horsepower (hp) fire pump. Only one emergency generator will be used at a time.

3.12 On-site Mobile Equipment

The Nucor facility will have on-site mobile equipment which will include front-end loaders, large heavy-duty haul trucks, and other maintenance vehicles. Particulate emissions will be generated from the use of these vehicles during loading or unloading of material.

3.13 Haul Roads

Materials hauled on- and off-site will be transported via truck on paved and unpaved roads. This traffic will generate particulate emissions.

3.14 Fuel Storage Tanks

The Facility will have a 1,000-gallon gasoline storage tank and a 3,000-gallon diesel fuel tank. A negligible amount of VOC emissions will occur as a result of tank breathing and working losses.

4.0 EMISSIONS ESTIMATES

Emissions from the Project will originate from the steelmaking processes, associated material handling systems, auxiliary combustion equipment, cooling towers, haul roads, and fuel storage tanks. Each emission point's control device descriptions, control efficiencies, and procedures for estimating emissions is discussed in detail in the sections below. Tables summarizing the emissions estimates are included in Appendix D.

4.1 Melt Shop Emission Sources and Emission Points – EP07, EP08, EP09, EP10

The majority of non-particulate emissions from the facility will be generated by the EAF and its related processes in the melt shop. The emission sources within the melt shop include the following:

- EAF
- LMF
- Natural gas combustion sources:
  - EAF gas modules
  - Ladle and tundish preheaters and dryers
  - Ladle and tundish skull cutting
  - Caster torches
- Ladle and tundish refractory repairs
- Ladle and tundish dumping
- Slag dump
- Casting operations

4.1.1 EAF Melting and Refining Operations

The EAF will vent to the melt shop baghouse via the DEC or the melt shop canopy hood, which capture emissions generated in the melt shop. Emissions for PM/PM_{10}/$PM_{2.5}$, NO_x, CO, SO_2, VOC, CO_2e and fluorides were calculated based on BACT emission rates and baghouse flow rates. Table 4-1 reflects the BACT rates for the melt shop baghouse and EAF.

Table 4-1: Melt Shop Baghouse EAF BACT Rates

Pollutant	Emission Factor
PM	0.0018 gr/dscf
$PM_{10}/PM_{2.5}$	0.0045 gr/dscf
NO_x	0.3 lb/ton
CO	3.5 lb/ton
SO_2	0.6 lb/ton
VOC	0.3 lb/ton
CO_2e	438 lb/ton
Fluoride	0.059 lb/ton

4.1.2 HAP Emissions from the EAF Melt Shop Baghouse

Nucor Corporation conducted EAF baghouse dust analyses from 2009 to 2011 for the Nucor Berkeley facility in South Carolina. The composition of HAPs in the baghouse dust was conservatively estimated to be the average over the three-year period plus two standard deviations. The metals analysis of the baghouse dust was used to calculate the HAPs emissions from the melt shop baghouse.

4.1.3 Natural Gas-Fired EAF Equipment

The EAF will be equipped with several natural gas-fired burners to assist with the heating of scrap between charges. Natural gas usage includes EAF injector modules as well as service cutting torches for the slag door area and eccentric bottom tapping (EBT) area. Natural gas-fired burners will be used to heat the refractory material of the ladles and tundish in order to keep the refractory material dry and to prevent major losses of heat in the molten steel during transfers. Natural gas-fired burners will also be used to dry the refractory material of the EAF, ladles, and tundish after being repaired or rebuilt. Torches used in the caster as well as for tundish and ladle skull cutting will also use natural gas. Emission estimates for these natural gas users were calculated using AP-42, Section 1.4 emission factors for natural gas combustion. The greenhouse gas emission factors are from the USEPA Mandatory Greenhouse Gas Reporting Rule (40 CFR Part 98).

4.1.4 Ladle and Tundish Refractory Repair

Particulate emissions will be generated from the removal and relining of refractory material in the ladles and tundishes. Emission factors from AP-42, Section 12.5, *Uncontrolled PM Emission Factors for Open Dust Sources at Iron and Steel Mills*, Table 12.5-4 were used (batch drop, front end loader, low silt slag) to estimate $PM/PM_{10}/PM_{2.5}$ emissions. There is a low concentration of VOCs in the resin of the refractory material that will be volatilized during the drying of the refractory lining. An emission factor for VOC

emissions from the drying of refractory resin was developed based on test data from the Nucor Steel Berkeley facility.

4.1.5 Caster Emissions

Particulate emissions from the caster will be generated during the process of pouring steel from the ladle into the tundish and the subsequent flow of steel from the tundish through the caster. Emission factors for particulate matter from the caster were developed using emissions data from the Nucor Steel Berkeley facility.

Emissions from the water spraying of steel exiting the caster will be captured by a caster enclosure and vented through the caster spray stack. Stack tests performed on the caster spray stack at Nucor's mini mill in Huger, South Carolina on November 29, 2012 were used to develop emission factors for $PM/PM_{10}/PM_{2.5}$, NO_x, CO, SO_2, and VOC.

4.2 Rolling Operations – EP11

Particulate emissions in the form of water droplets will be created from the water spraying of steel billets, as well as minor amounts of VOCs and HAPs from oil and grease contamination of the contact water. The emissions will be vented through a natural ventilation ridge ventilator on the roof. To estimate emissions, Nucor performed stack testing of rolling mill vents at several Nucor mini mills to establish emission factors for total PM, PM_{10}, $PM_{2.5}$, VOC, and HAPs. The USEPA published "*Volatilized Lubricant Emissions from Steel Rolling Operation*s" was also referenced for emission factors.

4.3 Raw and Waste Material Storage and Handling – EP01, EP02, EP17, EP18

Emissions of $PM/PM_{10}/PM_{2.5}$ will result from the transfer and handling raw materials on site. These materials include:

- Scrap steel operations (two piles – active and inactive)
- Alloys (one pile)
- Slag/mill scale (one pile)

Each of these materials include emissions from material unloading and loading, transfers, pile wind erosion and the screening and crushing of slag in the slag yard. The calculation methodologies used for these materials are described further below.

4.3.1 Material Handling

Emissions from some material handling processes were estimated using the aggregate transfer equation, often referred to as the drop equation, found in AP-42, Section 13.2.4, *Aggregate Handling and Storage Piles* (11/06). The equation used is as follows:

$$E = k(0.0032) \frac{\left(\frac{U}{5}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}} \text{ (pound [lb]/ton)}$$

Where:

E = emission factor

k = particle size multiplier (dimensionless)

U = mean wind speed (miles per hour [mph])

M = material moisture content (percent)

The moisture content (M) for each material is as follows:

- 2 percent for scrap steel
- 5.4 percent for alloy
- 2 percent for mill scale
- 2.81 percent for slag

A mean windspeed of 8 miles per hour (mph) was used from the National Climatic Data Center's (NCDC's) Climactic Wind Data for the United States for Tampa, Florida.

4.3.2 Pile Wind Erosion

Fugitive emissions from wind erosion of the storage piles were estimated using AP-42, Section 13.2.5, *Industrial Wind Erosion* (11/06). The particulate matter emissions due to wind erosion were calculated based on the following equation:

$$E = k \sum P_i$$

Where: E = emissions from the pile in grams per square meter per year ($g/m^2/yr$)

k = particle size multiplier (1.0 for PM, 0.5 for PM_{10}, and 0.075 for $PM_{2.5}$)

P_i = erosion potential corresponding to observed (or probable) fastest mile of wind for the ith period between disturbances (g/m^2)

A conservative approach was used for determining wind erosion emissions from the piles. To calculate the overall emission from a pile, it was assumed once the wind speed criteria for erosion was met for one part of the pile it was assumed to have been met for the entire pile.

The erosion potential can further be expanded as follows:

$$P = 58 \cdot \left(u^* - u_t^*\right)^2 + 25 \cdot \left(u^* - u_t^*\right)$$

Where: u^* = friction velocity (m/s)

u_t^* = threshold friction velocity (m/s)

Table 13.2.5-2 in AP-42 lists suggested values for the threshold friction velocity (u_t^*). A threshold friction velocity value of 1.12 was used for the alloy pile (similar to an uncrusted coal pile). The scrap piles and slag pile used threshold friction velocities of 1.33 (a higher value because these materials are not granular).

Once u_t^* is determined, the values of u^* must be calculated. Section 13.2.5 in AP-42 gives the following equation:

$$u^* = 0.053 \cdot u_{10}^+$$

Where: u_{10}^+ = fastest mile of reference anemometer for periods between disturbances (m/s)

To use this equation, a representative fastest mile of wind speeds for the site must be known. Meteorological data was obtained from the NCDC website for the Tampa, Florida meteorological station. The worst-case peak gusts were provided by month for any year from 1930 to 1996, and the worst-case for any year was selected. This gives an overly conservative estimate of erosion potential for any disturbance, as most wind speeds will not reach the one fastest recorded mile for the history of a particular meteorological station.

Additionally, height and base area of the piles must be known in order to determine which wind profile is appropriate. If the height-to-base ratio is greater than 0.2, then winds can be expected to erode different areas of the pile at different rates. However, for all Project storage piles, the height-to-base ratios were below 0.2 and were assumed to be relatively flat piles. The total surface area of all the piles was calculated and then the erosion potentials were determined.

4.3.3 Slag Screening and Crushing

The screening and crushing of slag, mill scale, and other debris at the slag yard will produce particulate emissions. Emission factors from AP-42, Section 11.19.2 *Crushed Stone Processing and Pulverized Mineral Processing* (08/04) were used to determine PM/PM_{10}/$PM_{2.5}$ emissions from screening and crushing of materials in the slag yard. The emissions were calculated based on a conservative estimate of screening and crushing throughput based on experiences at other Nucor facilities.

4.4 Raw and Waste Material Storage and Handling in Silos – EP03, EP04, EP05

Particulate emissions from the transport and unloading of raw materials to storage silos will be generated at the facility. One carbon silo, two flux silos and one baghouse dust silo will be constructed at the facility. Bin vent filters will control particulate emissions from the pneumatic transfer of carbon and flux from trucks into the storage silos, as well as from the pneumatic transfer of dust from the baghouse to the dust silo. All bin vent filters will achieve an exhaust grain loading of 0.005 grains per dry standard cubic feet (gr/dscf) based on the BACT analysis.

Particulate emissions will also result from the loadout of baghouse dust to trucks or railcars at the dust building. AP-42, Section 12.5 *Iron and Steel Production* Table 12.5-4 High Silt Batch Drop emission factors were used to calculate particulate emissions from railcar/truck dust loading.

4.5 Scrap Cutting Torches – EP06

Natural gas-fired torches will be used to cut scrap that is too large for the EAF. Emission estimates from the torches were calculated using AP-42, Section 1.4 emission factors for natural gas combustion. The greenhouse gas emission factors are from the USEPA Mandatory Greenhouse Gas Reporting Rule (40 CFR Part 98).

4.6 Cooling Towers – EP12 and EP13

Two two-celled cooling towers will be used to remove the heat absorbed by the cooling water system throughout the plant. High efficiency drift eliminators will control drift to 0.001 percent, based on the BACT analysis.

PM_{10} and $PM_{2.5}$ emissions were estimated based on the method detailed in the paper “Calculating Realistic PM_{10} Emissions from Cooling Towers” by Reisman and Frisbie (2004), often referred to as the “Frisbie Method.”

The cooling tower calculation methodology presented in AP-42 (below) can be used to estimate PM and PM_{10} emissions; however, this assumes that all TDS emitted in "drift" particles (liquid water entrained in the air stream and carried out of the tower through the induced draft fan stack) are PM emissions.

PM = Water Circulation Rate * Drift Rate * TDS

AP-42 states that this calculation estimates a "conservatively high" PM_{10} emission rate. For wet cooling towers with medium to high TDS levels, this methodology over-predicts PM_{10} emissions, even for towers equipped with very high efficiency drift eliminators (e.g., 0.0006 percent drift rate). The method described by Reisman & Frisbie uses a representative drift droplet size distribution (based on drift eliminator test data) and the TDS concentration in the water to calculate the solid mass in each drop size. Using this drift droplet size distribution, the percentage of drift mass containing particles small enough to produce PM_{10} can be calculated. This fraction can then be applied to the PM emission rate to determine the PM_{10} emission rate. The calculations for this analysis assume PM_{10} equals $PM_{2.5}$.

4.7 Emergency Combustion Engines – EP14, EP15 and EP16

Two 2000-kW natural gas generators will be installed for emergency power use at the facility, and one 500-hp natural gas-fired fire water pump will be installed for the emergency fire system. Emissions from these emergency generators were estimated assuming 100 hours/year for performance testing and maintenance. New Source Performance Standards (NSPS) Subpart JJJJ limits as well as AP-42, Section 3.3 and Section 3.2 were used to determine emissions from the emergency engines.

4.8 Haul Roads – EP19 and EP20

The roads used for hauling materials on-site will be a combination of paved and unpaved roads; therefore, emissions from the haul roads were estimated using equations taken from AP-42, Section 13.2.1, Paved Roads (1/11) and Section 13.2.2, Unpaved Roads (11/06).

The maximum hourly and annual amount hauled depends on the type of material being hauled, the availability of loading/unloading facilities, annual throughput, and the capacity of the trucks.

There are several haul roads that will be used for bringing material on-site or hauling materials off-site. These haul road segments are designated as follows to coincide with specific materials:

- Scrap
- Fluxing agents
- Alloy
- Carbon
- Finished product
- Slag
- Mill scale
- Baghouse dust

- Spent refractory
- Miscellaneous vehicles

Nucor will use best management practices for the haul roads. All haul road calculations are listed in Appendix D.

4.8.1 Paved Haul Roads

Emissions from haul roads due to traffic were estimated using the paved roads, size-specific emission calculation equation below:

$$E = k * (sL)^{0.91} 0.91 * (W)^{1.02}$$

Where:

sL = silt loading grams per square meter (g/m^2)

W = mean vehicle weight (tons)

k = constant (AP-42, Table 13.2-1.1)

The mean vehicle weight is calculated by averaging the loaded and unloaded vehicle weights. The "ubiquitous baseline" of 0.6 g/m^2 was selected from the less than 500 average daily traffic category in AP-42, Table 13.2.1-2.

For paved roads, VMT is calculated as follows:

$$VMT = length\ of\ path\ haul\ road\ vehicle\ travels * maximum\ trips\ (hourly\ or\ annual)$$

Whether a vehicle travels the haul road twice (back and forth) or once (when traveling in a loop) was accounted when calculating the miles traveled for each haul road routes.
