Nucor will water and sweep the paved haul road as needed. To account for this control technique an efficiency was applied to the paved haul road equation using the methodology listed in the EPA Control of Open Fugitive Dust Sources (1988).

$$Control\ efficiency = 96 - 0.263 * V$$

Where:

V = number of vehicle passes since application

To determine the number of vehicle passes since application, the maximum number of vehicles per hour was multiplied by the time in hours between water applications.

4.8.2 Unpaved Haul Roads

Emissions from haul roads due to traffic were estimated using the unpaved surfaces at industrial sites emission calculation equation below:

$$E = k * (\frac{s}{12})^a * (\frac{W}{3})^b$$

Where:

s = surface material silt content (%) = 6%

W = mean vehicle weight (tons)

k = constant (AP-42 Table 13.2.2-2)

a = constant (AP-42 Table 13.2.2-2)

b = constant (AP-42 Table 13.2.2-2)

The silt content is based on typical silt content values for iron and steel production per AP-42, Table 13.2.2-1.

Nucor will water the unpaved haul road as needed. To account for this control technique an efficiency was applied to the unpaved haul road equation using the methodology listed in the Mojave Desert Air Quality Management District Antelope Valley Air Pollution Control District Emissions Inventory Guidance Mineral Handling and Processing Industries (2000). Watering is the most common control technique for unpaved roads and the equation used provides a control efficiency for a given water application rate.

$$Control\ efficiency = 100 - (0.0012 * \frac{A * D * T}{I})$$

Where:

A = Average annual class A pan evaporation in inches

D = Average hourly traffic rate in vehicles per hour

T = Time between water applications in hours

I = Water application intensity in gallons per square yard

4.9 Fuel Storage Tanks – EP21 and EP22

The Facility will have a 1,000-gallon gasoline storage tank and 3,000-gallon diesel fuel tank. A small amount of VOC emissions will occur as a result of tank breathing and working losses. VOC emissions were estimated using USEPA's TANKS Emissions Estimation Software, version 4.09d.

4.10 HAPs

The Project is an area source of HAPs (*i.e.*, less than 25 tons per year of total HAPs and less than 10 tons per year of any single HAP). HAP emission calculations and a summary of HAP emissions are included in Appendix D.

5.0 REGULATORY REVIEW

The Project is subject to various federal and state air regulations. This part of the application contains a discussion of the applicable federal regulations and FAC provisions. Where applicable, reference to general limitations is provided when there is no specific requirement that applies to an emission source.

In certain instances, there may be multiple applicable regulatory requirements which identify differing levels of emission limitations. For instance, where a BACT emission limitation is established for a specific pollutant and a NSPS regulation is also applicable, the BACT limitation may be more stringent than an applicable NSPS emission limitation for the same pollutant. In these situations, it is understood that compliance with the most restrictive requirement will be considered demonstration of compliance for other less-stringent requirements.

5.1 PSD Regulations

PSD review applies to the construction of a new major stationary source located in an area designated as attainment or unclassified whose potential to emit a regulated PSD pollutant exceeds the PSD significance level for that pollutant pursuant to 62-212.400, FAC. The PSD regulations defined in 40 CFR 52.21 require the following issues be addressed:

- Determination of BACT on a case-by-case basis, considering costs as well as energy, environmental, and economic impacts
- Demonstration that the increase in emissions will not cause or contribute to an exceedance of the NAAQS or PSD increment
- Analysis of the impairment, if any, to visibility, soils, vegetation, and growth

Three criteria were evaluated to determine PSD applicability to the Project (USEPA, 1990):

1. Whether the Project is sufficiently large (in terms of its emissions) to be a “major stationary source” or “major modification”
2. Whether the source is in a region designated as “attainment” or “unclassified”
3. Whether the pollutants emitted from a major stationary source exceed the significant emission levels defined by 40 CFR 52.21(b)(23)(i) and 62-210.200(256), FAC.

Steel mills are a listed source category pursuant to 40 CFR Part 51.166(b)(1) and 62-210.200(171)(b), FAC. The Project will be a new major stationary source as the potential to emit CO, PM and SO_2 will exceed the major source threshold of 100 tons per year.

Regulated PSD pollutants in Florida include NO_x, SO_2, CO, particulate matter, PM_{10}, $PM_{2.5}$, VOC, hydrogen sulfide (H_2S), total reduced sulfur (TRS), sulfuric acid mist (H_2SO_4), fluorides, mercury, and lead. The Project has the potential to emit several of these pollutants above their PSD significance levels; thus, meeting the third and final criteria for PSD applicability.

5.2 New Source Performance Standards

Per 40 CFR Part 60 (incorporated by reference in 62-204.800(8), FAC), the Project will be subject to NSPS. Relevant NSPS standards are listed below, along with a description of how the Project plans to meet the applicable standards.

5.2.1 NSPS 40 CFR Part 60, Subpart AAa

Subpart AAa applies to EAFs in the steel industry which are installed or modified after September 17, 1983. Discharges from EAF control device (baghouse) are limited to 0.0052 gr/dscf and 3 percent opacity. Melt shops containing affected facilities are limited to 6 percent opacity, and dust-handling systems are limited to 10 percent opacity. A continuous opacity monitor (COMS) is required on the baghouse unless the operator either conducts daily Method 9 visible emissions readings or installs bag leak detectors.

5.2.2 NSPS 40 CFR Part 60, Subpart JJJJ

Subpart JJJJ—Standards of Performance for Stationary Spark Ignition Internal Combustion Engines became effective March 18, 2008 and applies to the three natural gas-fired emergency engines (two 2,000-kW emergency generators and the one emergency fire pump).

The emergency generators and the emergency fire pump are subject to the NSPS Subpart JJJJ limits for emergency spark ignited natural gas engines greater than 130 hp manufactured after January 1, 2009 (Table 1 to Subpart JJJJ). The applicable limits are:

- 2.0 grams NO_x/horsepower-hour (g/hp-hr) (equivalent to 160 parts per million by volume, dry (ppmvd) at 15 percent oxygen(O_2))
- 4.0 g CO/hp-hr (540 ppmvd at 15 percent O_2)
- 1.0 g VOC/hp-hr (86 ppmvd at 15 percent O_2)

The emergency engines will satisfy these requirements based on certificates from the manufacturer.

5.3 National Emission Standards for Hazardous Air Pollutants and Maximum Achievable Control Technology

National Emission Standards for Hazardous Air Pollutants (NESHAPs) are contained in 40 CFR Part 63 (adopted by reference in 62-204.800(11), FAC). NESHAPs are emissions standards set by the USEPA for particular source categories. The NESHAPs for new sources require the maximum degree of emission reduction of certain HAP emissions the USEPA determines to be achievable, which is known as the Maximum Achievable Control Technology (MACT) standards. The Project will be considered an area source of HAP emissions for rule applicability.

5.3.1 NESHAP 40 CFR Part 63, Subpart ZZZZ

The Stationary Reciprocating Internal Combustion Engine (RICE) MACT is applicable to stationary RICE at major and area sources of HAP emissions.

The emergency generators and emergency fire pump will be affected sources under 40 CFR 63, Subpart ZZZZ. The engines will be subject only to the requirements of 40 CFR 60, Subpart JJJJ based on their classification as a new emergency stationary RICE located at an area source of HAP emissions pursuant to 40 CFR 63.6590(c)(1).

The emergency generators and emergency fire pump will comply with the applicable requirements of this rule based on certificates from the manufacturer.

5.3.2 NESHAP 40 CFR Part 63, Subpart YYYYY

The NESHAP for EAF Steelmaking Facilities affects EAFs at steel making facilities that are area sources of HAP emissions. The Project EAF will be subject to this subpart.

The facility will be required to follow a pollution prevention plan to inspect metallic scrap and remove chlorinated plastics, free organic materials, and lead. Alternatively, the facility can opt to not charge scrap from motor vehicle bodies, engine blocks, oil filters, oily turnings, machine shop borings, transformers or capacitors containing polychlorinated biphenyls (PCBs), lead-containing components, chlorinated plastics, or free organic liquids. A draft Pollution Prevention and Scrap Management Plan for the site is provided in Appendix C.

For scrap containing motor vehicle scrap, mercury switches must be removed from scrap before charging to the EAFs. The facility must include a requirement in its scrap specifications for removal of mercury switches from vehicle bodies used to make the scrap. The facility must prepare and operate according to a

plan demonstrating how the facility will implement this scrap specification. There are two alternatives to this:

- The facility can certify in its notification of compliance status it participates in a program for removal of mercury switches that has been approved by the USEPA, and it purchases motor vehicle scrap only from scrap providers who participate in this type of program.

- The facility can certify in its notification of compliance status the only materials from motor vehicles in the scrap are materials recovered for their specialty alloy (including, but not limited to, chromium, nickel, molybdenum, or other alloys) content (such as certain exhaust systems) and, based on the nature of the scrap and purchase specifications, the type of scrap is not reasonably expected to contain mercury switches.

For scrap that does not contain motor vehicle scrap, the facility must certify in its notification of compliance status and maintain records of documentation that this scrap does not contain motor vehicle scrap.

Nucor will have a maximum capacity greater than 150,000 tons of steel production per year; therefore, the EAF will be limited to no more than 0.0052 gr/dscf $PM_{10}/PM_{2.5}$. Opacity from the melt shop will be limited to 6 percent opacity. The BACT requirements for this emission source are more stringent than these area source MACT standards.

5.4 Florida Air Quality Standards and Regulations

This section describes the regulations which apply to the Project, according to the applicable FAC provisions.

5.4.1 62-4, FAC – Permits

This regulation defines the procedures and fees required to obtain environmental permits from the Florida DEP. This section also defines general conditions to be included in all permits issued by the Florida DEP. The appropriate processing fee for this project has been provided with this application, per 62-4.050(4)(a), FAC. The application has been sealed by a professional engineer registered in the State of Florida, as required by this regulation (62-4.050(3), FAC).

5.4.2 62-204, FAC – Air Pollution Control – General Provisions

This regulation addresses the designation of attainment, nonattainment, unclassifiable and maintenance areas per 40 CFR Part 81, Section 81.310. Highlands County is currently designated as an

attainment/unclassifiable area for all criteria pollutants in 40 CFR Part 81. Polk County is currently designated as an attainment/unclassifiable area for all criteria pollutants, except the 1-hour SO_2 standard. Polk County has been designated as partial non-attainment for the 1-hour SO_2 standard, but the Project will not be located in the Hillsborough-Polk non-attainment area. The Project is located in an attainment area for all criteria pollutants.

5.4.3 62-210, FAC – Stationary Sources – General Requirements

Terms that apply to the air quality regulations in the FAC are defined in 62-210.200, FAC. The significant emission rates listed in Table 3-1 are defined in 62-210.200(256), FAC.

Nucor is submitting herein an application for an air construction permit for the Facility as required by 62-210.300(1), FAC. When construction of the Facility is complete, Nucor will apply for an air operating permit as required by 62-210.300(2), FAC.

The Facility is not eligible to apply for an air general permit per 62-210.310, FAC.

Because the Facility is subject to PSD pre-construction review, there will be a 30-day public comment review period per 62-210.350(2), FAC. Nucor will publish the notice prepared by the Florida DEP at least 30 days prior to final agency action on the permit application. The Florida DEP will also send a copy of the notification to USEPA Region 4, any other state and local officials or agencies having cognizance over the Facility location, and any Federal Land Managers whose land may be impacted by emissions from the Facility. An opportunity for public hearing will be provided.

The facility will not be located within 100 km of a Federal Class I area, so the additional public notice requirements defined in 62-210.350(2)(h) will not apply.

The emission calculations presented in this application and in Part 4 of this report were prepared in accordance with the requirements of 62-210.370, FAC.

The Facility will not circumvent any air pollution control device or allow the emission of air pollutants without the applicable air pollution control device operating properly per 62-210.650, FAC.

Per 62-210.700, FAC, the Facility will not have excess emissions resulting from startup, shutdown or malfunction for more than two (2) hours in any 24-hour period. In case of excess emissions resulting from a malfunction, the Facility will notify the Florida DEP.

Nucor is not requesting any emission limits for transient modes of operation per 62-210.710, FAC.

The Application for Air Permit – Long Forms required under 62-210.900, FAC is provided in Appendix A. The regulations require four copies of the forms to be filed with the Florida DEP. However, in the May 11, 2018 pre-application meeting, Florida DEP advised no hardcopies are needed and a searchable PDF file provided by email is sufficient. Only the required signature pages and Professional Engineer (PE) certification seal are being provided in hardcopy.

5.4.4 62-212, FAC – Stationary Sources – Preconstruction Review

The Project potential air emissions indicate the PSD significance level will be exceeded for several pollutants, as shown in Table 3-1. Therefore, the Facility is subject to the PSD preconstruction review requirements defined in 62-212.400, FAC. Part 6 contains BACT analyses for pollutants that exceed their PSD significance level (state or federal). Part 7 contains air dispersion modeling analyses for each pollutant subject to PSD, and Part 8 contains additional impacts analyses for PSD pollutants. H_2S, TRS, lead, and H_2SO_4 mist were not above their respective significance levels for the Project.

5.4.5 62-213, FAC – Operating Permits for Major Sources of Air Pollution

Nucor will be required to obtain a Part 70 operating permit in accordance with Florida regulations. Nucor will make an application for a Part 70 operating permit for the Project within 180 days of commencing operation of the new units at the facility.

5.4.6 62-214, FAC – Requirements for Sources Subject to the Federal Acid Rain Program

The Facility will not be subject to the federal Acid Rain Program. Therefore, the provisions of this regulation do not apply.

5.4.7 62-243, FAC – Tampering with Motor Vehicle Air Pollution Control Equipment

This regulation applies only to motor vehicles and does not apply to the Facility.

5.4.8 62-252, FAC – Gasoline Vapor Control

This regulation applies only to gasoline dispensing facilities and does not apply to the Facility.

5.4.9 62-256, FAC – Open Burning

This regulation restricts the burning of waste materials by open burning. Nucor will comply with this regulation as necessary.

5.4.10 62-257, FAC – Asbestos Program

This regulation restricts the removal of asbestos-containing materials. Nucor will comply with this regulation.

5.4.11 62-285, FAC – Greenhouse Gas Emissions Reduction

This regulation establishes a clean diesel rebate program and does not apply to the Facility.

5.4.12 62-296, FAC – Stationary Sources – Emission Standards

5.4.12.1 Objectionable Odors

This regulation is intended to restrict offensive odors in the ambient air and the burning of refuse except under certain conditions and will apply to the facility. Nucor will comply with this regulation (62-296.320(2), FAC).

5.4.12.2 General PM Standard

Section 62-296.320(4)(a)2, FAC sets a PM standard based on the following process weight rate equation where the process weight rate is no more than 30 tons/hour:

$$E = 3.59(P)^{0.62}$$

Where:

E = Emission rate (pounds per hour, lbs/hr)

P = process weight rate (tons/hr)

Where the process weight rate is greater than 30 tons/hour, the PM standard is based on the following equation:

$$E = 17.31(P)^{0.16}$$

Where:

E = Emission rate (lbs/hr)

P = process weight rate (tons/hr)

5.4.12.3 General Visible Emissions Standard

Per Section 62-296.320(4)(b), FAC, visible emissions are limited to 20 percent opacity.

5.4.12.4 Best Available Retrofit Technology

The Facility will be constructed after August 7, 1977, so it is not subject to the Best Available Retrofit Technology (BART) requirements of 40 CFR Part 51, Subpart P or 62-296.340, FAC.

5.4.12.5 Reasonably Available Control Technology (RACT) – VOC and NOx

The Reasonably Available Control Technology (RACT) standards for NO_x and VOC set in 62-296.500 through 516, FAC do not apply to the Facility, as it will not be located in an ozone maintenance area. The Facility is also exempted from these rules as the Facility is subject to review pursuant to 40 CFR 52.21 and 62-212.400, FAC. The RACT limits for NO_x and VOC set under 62-296.570, FAC also do not apply as the Facility is exempted pursuant to 62-296.500(1)(b), FAC.

5.4.12.6 Reasonably Available Control Technology (RACT) – Lead

The Facility will qualify as a lead processing operation as it will be an EAF-equipped secondary steel manufacturing operation and will have the potential to emit more than 100 lbs/yr (0.05 tons/year, tpy) of lead per 62-210.200(158), FAC. However, the lead RACT standards set in 62-296.600, 601 and 604 do not apply to the Facility, as it will not be located in or near a lead maintenance or non-attainment area.

5.4.12.7 Reasonably Available Control Technology (RACT) – Particulate Matter

The particulate matter RACT standards set in 62-296.700 do not apply to the Facility, as it will not be located in or near a particulate matter maintenance area. It is also exempt from these rules as the Facility is subject to review pursuant to 40 CFR 52.21 and 62-212.400, FAC.

5.4.12.8 Electric Arc Furnaces

Section 62-296.707, FAC sets emission standards for EAFs. Under this regulation, the Facility EAF must meet a particulate matter emission limit of 0.010 gr/dscf or have no visible emissions (5 percent opacity) from the control device, except during charging and tapping. During charging periods, opacity is limited to 20 percent. During tapping periods, opacity is limited to 40 percent. Visible emissions shall be measured using USEPA Method 9 and PM emissions shall be measured using USEPA Method 5 or 5D.

The EAF will be subject to NSPS Subpart AAa, which sets more stringent PM and opacity limits for the EAF. The NSPS will take precedence over the requirements set by Section 62-296.707, FAC.

5.4.12.9 Material Handling Operations

The material handling operations at the facility will be subject to the RACT standards set in 62-296.711, FAC. This will include the handling and storage of scrap steel, alloys, slag and mill scale, which are stored in piles. The handling of carbon, flux and baghouse dust will also be subject to this rule, as these materials are stored in silos with capacities of 50 cubic yards (yd^3) or more.

No visible emissions from material handling operations are allowed (5 percent opacity limit). When a conveyor covering is moved, opacity must be no more than 10 percent as measured using USEPA Method 9.

For the silo bin vents, this rule limits PM emissions to 0.03 gr/dscf as measured by USEPA Method 5. This stack test is not required if there are no visible emissions (no more than 5 percent opacity as measured with USEPA Method 9).

5.4.12.10 Miscellaneous Manufacturing Process Operations

There will be no other manufacturing or process operations at the Facility that are subject to the PM RACT limits set in 62-296.712, FAC.

5.4.13 62-297, FAC – Stationary Sources – Emissions Monitoring

This regulation defines required emissions testing procedures. The Facility will comply with these rules for emission units and pollutants where emissions testing is required to demonstrate compliance.

5.5 NAAQS

As stated earlier, Part 7.0 of this permit application discusses the ambient air quality analysis and dispersion modeling performed for the Project. The Project is not expected to cause or contribute to a violation of the NAAQS. A full description of the NAAQS modeling analyses is included in Part 7.0 of this application.

5.6 Additional Impact Analysis

The impact of the Project on soils, vegetation, visibility, and growth was considered as part of the PSD process. The construction and operation of the Project is not expected to have a detrimental effect on plants, soils, or industrial, commercial, and residential growth. A full analysis of these impacts can be found in Part 8.0 of this application.

5.7 Chemical Accident Prevention

40 CFR Part 68, Accidental Release Prevention Provisions, under Clean Air Act Section 112(r), Prevention of Accidental Releases, establishes a general duty for owners and operators of stationary sources who produce, process, handle, or store any of a number of regulated substances, to prevent and mitigate accidental releases of these substances by preparing detailed risk assessments and implementing a number of safety procedures through the preparation of a Risk Management Plan (RMP).

The specific requirements of the RMP for affected facilities are established in 40 CFR Part 68, Accidental Release Prevention Provisions. Affected facilities are those stationary sources which produce, process, handle or store a regulated substance in amounts greater than the listed, applicable threshold quantity.

The facility will not produce, process, handle or store materials regulated by such rules or trigger regulatory threshold quantities, the RMP requirements will not apply to the Project. The Facility will implement general procedures and/or practices as deemed reasonable for materials utilized by and at the Facility.

6.0 BEST AVAILABLE CONTROL TECHNOLOGY ANALYSIS

Federal regulations specify that the owner of a facility subject to a PSD permit must perform a BACT analysis for the control of each PSD regulated pollutant emitted in significant quantities from a new stationary source located in an attainment area. As indicated in Part 3, this Project is subject to PSD review for NO_x, CO, PM, PM_{10}, $PM_{2.5}$, VOC, SO_2, fluorides, and greenhouse gases.

The USEPA has directed by policy that the BACT be determined using a process referred to as the "top-down" approach. The "top-down" process was outlined in a December 1, 1987, memorandum from the USEPA Assistant Administrator for Air and Radiation. As identified in USEPA's October 1990 draft of a New Source Review (NSR) Workshop Manual, the basic steps of the "top-down" BACT analysis used in this analysis are listed below:

- Step 1 – Identify all potential control technologies
- Step 2 – Identify technically feasible control technologies
- Step 3 – Rank the technically feasible control technologies
- Step 4 – Evaluate most effective controls and document results
- Step 5 – Propose BACT

Along with the potential annual emissions, a summary is provided of the proposed BACT emission limits and the associated control technologies for each piece of equipment. BACT is an emission limitation based on the maximum degree of reduction which the Florida DEP determines is achievable, on a case-by-case basis, taking into account energy, environmental, and economic impacts, and other costs.

An emission limit proposed in a permit application does not automatically mean that the limit has been "achieved in practice" on a similar unit. Many PSD and Lowest Achievable Emission Rate (LAER) permits have been issued over the years for projects that were never constructed and, therefore, never operated. As a result, those emission limits have never been "achieved in practice." There are also instances in which incorrect limits have been posted to the USEPA's RACT/BACT/LAER Clearinghouse (RBLC) database, or where the ultimate and final permit limits were subsequently modified prior to permit issuance. In some cases, an applicant may have proposed very stringent limits without a meaningful commercial guarantee, perhaps to avoid a more onerous requirement or an unacceptable air quality impact and was then unable to continuously achieve the limits in practice. It is also very important to note that an emission rate based on a BACT finding must be continuously met under all normal operating conditions, not just at one optimal design point. Therefore, there must a reasonable assurance

that each BACT limit evaluated is truly "demonstrated in practice" on a similar unit and can be continuously achieved under all expected operating conditions for the life of the unit.

The USEPA has interpreted the statutory and regulatory BACT definitions as containing two core requirements that must be met by any BACT determination. First, the BACT analysis must include consideration of the most effective control options that could be applied. Second, any decision to allow a less stringent emission rate must be justified by an objective analysis of "energy, environmental, and economic impacts" (USEPA, 1990). This is tempered, however, by the following statement from the NSR Workshop Manual:

> *Technologies which have not yet been applied to (or permitted for) full scale operations need not be considered available; an applicant should be able to purchase or construct a process or control device that has already been demonstrated in practice.* (Section IV.A.1. Demonstrated and Transferable Technologies, page B-11 from USEPA, 1990)

6.1 RACT/BACT/LAER Clearinghouse

The first step in the "top-down" BACT process is the identification of potentially available control technologies. One of the ways to identify available control technologies is to review previous BACT determinations for similar sources. USEPA's RBLC database was reviewed to identify recent BACT determinations for similar projects. This database is maintained on USEPA's Technology Transfer Network website (USEPA, 2018). Standard queries of the database were conducted to identify control technology determinations from January 2008 to June 2018.

To identify previous control technology determinations for comparable sources, a query of the RBLC database was run using the "standard search" with the following parameters:

- Final and draft determinations
- Standard Industrial Classification (SIC) code = 3312 - Steel Works, Blast Furnaces (including Coke Ovens), and Rolling Mills, or North American Industry Classification System (NAICS) = 331110 - Iron and Steel Mills and Ferroalloy Manufacturing or 331513 – Steel Foundries
- RBLC process type codes = 81.210 - Steel Production, Electric Arc Furnaces and 81.310 – Steel Foundry Processes, Electric Arc Furnaces
- Primary fuel = electric
- Case-by-case basis = BACT-PSD

Results were culled, removing any irrelevant entries.

The NAICS and SIC codes are the most appropriate codes in the standard search option of the RBLC. The SIC and NAICS are systems of source classification developed for the purpose of differentiating industrial types and are used in many USEPA documents. It is appropriate to use these codes as the match criteria in queries of the RBLC database since other facilities that use similar processes will likely have similar characteristics.

The RBLC search results are included in Appendix E of this application. Tables E-1 through E-5 list the RBLC search results for the EAF melt shop, cooling towers, natural gas engines, material handling and haul roads, respectively. A careful examination of the RBLC entries for particulate matter, specifically the equipment, type of particulate matter, and stack test methods, provides more information on which size of particulate matter is referred to and if back half (condensable) particulate is included (Tables E-6 and E-7). It is clear from these two tables that consistency is lacking in some RBLC entries, making comparison between entries difficult. For example, many limits do not specify if condensable particulate is included.

6.2 Steel Mill Types

For most of the last two centuries, steel production has required major investment in massive blast-furnaced operations which in turn were fed by ship-load quantities of iron ore and metallurgical coal or coke. As a result, steel mills were historically located on major waterways and at one time defined the economies of states like Wisconsin, Michigan, Ohio and Pennsylvania.[1] This traditional large integrated steel mill reduces metallic iron from ore (iron oxide) and makes it into pig iron and steel.

The next evolution of the steel mill was the mini mill. Mini mills depend solely on scrap for their product, which is melted in EAFs and then poured into products such as bars and rods.[2] Some mini mills, such as the Nucor Darlington facility, utilize a continuous casting and rolling process with a single uninterrupted billet strand from melting to finished product.[3]

Nucor Florida will be a micro mill, almost identical to the CMC Durant, Oklahoma micro mill. Both Florida and Durant are Danieli designs. Micro mills are a smaller-sized mini mill which use the ECS process. RBLC entries do not clearly differentiate between the different mill types. See Table 6-2.

With a conventional EAF and depending on the melt shop operating methods, about two-thirds of the total energy going into the system is electrical, and the balance is chemical energy from the oxidation of

[1] Anderson, James. *New Micro Steel Mill is Competitive Despite Low Steel Prices*. August 07, 2015.
[2] Chavez, Lydia. *The Rise of Mini-Steel Mills*. September 23, 1981.
[3] Commercial Metal Products. *About Us*. Available online at https://www.cmc.com/en/americas/our-businesses/mill-products/cmcsteel/aboutus

elements such as carbon, iron and silicon, and the combustion of natural gas with oxy-fuel burners. A little over 50 percent of the total energy leaves the furnace in the liquid steel, while the remainder is lost to the slag, waste gas, and cooling water. The 20 percent normally leaving the furnace in the waste gas represents about 130 kilowatt-hour/ton (kWh/ton) of steel produced. Using this gas to preheat the scrap being charged to the EAF can result in recovering some of this energy and offsetting some of the electrical energy required to melt steel scrap.[4] Therefore, a micro mill can require more energy since it does not have as much waste energy for scrap preheating.

The ECS process is different from a conventional EAF operation as it pertains to carbon injection and oxy-fuel burner use, which in turn can impact emissions. Table 6-1 displays the differences between the ECS and conventional EAFs.

Table 6-1: Conventional versus ECS EAF Comparison

Conventional EAF	ECS Charge EAF
Two-bucket charge	Scrap continuously fed
Power on ~73% of heat cycle time	Power on ~83% of heat cycle time
35% flat bath conditions	100% flat bath conditions
Carbon injection 35-40% of total power on time	Carbon injection 100% of total power on time
Various oxy-fuel burners on 55-85% of power on time	Oxy-fuel burners on 100% of power on time

There are only four facilities listed in the RBLC that are either ECS or are micro mills. Only two facilities are both ECS and a micro mill.

- Osceola Steel (GA-0142) – not ECS
- Gerdau Ameristeel Charlotte (NC-0116)
- CMC Oklahoma (OK-0173)
- Nucor Darlington (SC-0129) – Not a micro mill

It should be noted that the RBLC database contains separate BACT limits for the EAF and LMF at steel mills throughout the United States. In addition, other steel manufacturing facilities may use natural gas combustion as part of their LMF operations. In many cases, the exhaust from the EAF and LMF is combined into a single stream to achieve the highest levels of emission reductions. As a result, it is unclear in many cases whether the limits presented in the RBLC apply to the EAF and LMF individually,

[4] The EPRI Center for Materials Production, Commentary - Electric Arc Furnace Scrap Preheating, April 1997.

or to the combined exhaust stream. In addition, many of the facilities in the RBLC are listed with BACT limits on the EAF, but do not have corresponding BACT limits listed for the LMF.

In light of this uncertainty, in this application the Project compares the proposed BACT limits for the combined EAF and LMF exhaust streams with the EAF limits for facilities listed in the RBLC. This is a conservative approach, since BACT limits for the EAF alone are expected to be lower than the limits for the combined exhaust from the EAF and LMF. Also, please note, the Essar Steel Minnesota facility (MN-0085) was never constructed.

Table 6-2: Steel Mill Types in RBLC

RBLC IDs	Facility Name/Company	State	County	Comparison to Florida	Mill Type
AL-0309	Nucor Steel Decatur, LLC	AL	Morgan	EAF/sheet mill, no ECS - much larger in capacity and makes different grades of steel - two baghouses	Mini mill
*AL-0319, AL-0275, AL-0301	Nucor Steel Tuscaloosa, Inc.	AL	Tuscaloosa	EAF/plate mill - uses a twin shell furnace and charging buckets as opposed to ECS - two baghouses	Mini mill
*AL-0323	Outokumpu Stainless USA, LLC	AL	Mobile	EAF, no ECS	Mini mill
AR-0140	Big River Steel LLC	AR	Mississippi	EAF, no ECS	Mini mill
AR-0138	Nucor Corporation - Nucor Steel, Arkansas	AR	Mississippi	EAF/sheet mill, no ECS - much larger in capacity and makes different grades of steel	Mini mill
AR-0096	Nucor Yamato Steel	AR	Mississippi	EAF/beam mill, no ECS - much larger in capacity - multiple baghouses	Mini mill
CO-0066	ERMS Pueblo, CF & I Steel L.P. Dba EVRAZ Rocky Mountain Steel	CO	Pueblo	EAF, no ECS	Mini mill
GA-0142	Osceola Steel Co.	GA	Cook	EAF/bar mill, no ECS	Micro mill
GA-0137	Gerdau Ameristeel - Cartersville Steel Mill	GA	Bartow	EAF, no ECS	Mini mill
IN-0196	Nucor Steel	IN	Montgomery	EAF/sheet mill, no ECS - much larger in capacity and makes different grades of steel -multiple baghouses	Mini mill
LA-0309	Benteler Steel Tube Facility	LA	Caddo	EAF/pipe mill, no ECS	Mini mill
MI-0404, MI-0417	Gerdau Macsteel, Inc.	MI	Monroe	EAF, no ECS	Mini mill
MN-0085	Essar Steel Minnesota LLC	MN	Itasca	Never constructed	
NC-0116	Gerdau Ameristeel US, Inc Charlotte Steel Mill Division	NC	Mecklenburg	EAF/bar mill, ECS	Micro mill

RBLC IDs	Facility Name/Company	State	County	Comparison to Florida	Mill Type
NE-0055, *NE-0063, *NE-0062	Nucor Steel	NE	Stanton	EAF/bar mill, special bar quality mill - using a twin shell furnace and charging buckets as opposed to ECS - two baghouses	Mini mill
NY-0117	Nucor Steel Auburn Inc.	NY	Cayuga	EAF/bar mill, produces merchant bar - one baghouse	Mini mill
OH-0342, OH-0339	Timken Company, Faircrest Steel, Harrison Steel Plant	OH	Stark	EAF, no ECS	Integrated Mill
OH-0341	Nucor Steel Marion, Inc.	OH	Marion	EAF/bar mill, no ECS, produces merchant bar - one baghouse	Mini mill
OH-0350	Republic Steel	OH	Lorain	EAF, no ECS	Mini mill
OH-0328, OH-0316	V & M Star	OH	Mahoning	EAF, no ECS	Mini mill
OH-0331	AK Steel Corporation Mansfield Works	OH	Richland	EAF, no ECS	Mini mill
OK-0173	CMC Steel Oklahoma	OK	Bryan	Very similar, EAF, ECS	Micro mill
OK-0128	Mid-American Steel Rolling Mill	OK	Marshall	EAF/wire mill, no ECS	Mini mill
SC-0129	Nucor Steel Corporation (Darlington Plant)	SC	Darlington	EAF/bar mill, more merchant and special bar quality facility - uses ECS process, probably the most similar to Florida of the other Nucor facilities	Mini mill
SC-0112	Nucor Steel - Berkeley	SC	Berkeley	EAF/sheet mill, no ECS - much larger in capacity and makes different grades of steel - multiple baghouses	Mini mill
TX-0729	Arcelormittal Vinton LLC	TX	El Paso	EAF, no ECS	Mini mill
*TX-0651	Nucor Corporation	TX	Leon	No ECS process, but does produce rebar – one baghouse	Mini mill
TX-0705	Structural Metals Inc	TX	Guadalupe	EAF, no ECS	Mini mill
TX-0576	TPCO America Inc, Pipe Manufacturing Steel Mini Mill	TX	San Patricio	EAF/pipe mill, no ECS	Mini mill
VA-0314	Chapparal (Virginia) Inc.	VA	Dinwiddie	EAF, no ECS	Mini mill

6.3 BACT for the EAF, LMF, Caster, and Melt Shop

The predominant emissions from the melt shop are from the EAF. However, the emissions from the EAF are combined with the emissions from the LMF, caster, and from the melt shop, which are all vented through the melt shop baghouse. The BACT analysis will review controls and emissions for the EAF but will also need to include the emissions from the LMF and melt shop, which are also vented and controlled by the baghouse. RBLC limits for EAFs usually include any associated LMFs and other melt shop processes and no further emissions controls were identified for the EAF/LMF/melt shop combination. No further emission controls were identified for the LMF and melt shop.

The Project will be nearly identical to the micro mill recently permitted by Commercial Metals Company (CMC) in Durant, Bryan County, Oklahoma (January 15, 2016). As such, the CMC facility is both the most recent and the most relevant for BACT comparison.

6.3.1 BACT for NO_x for the EAF, LMF, Caster, and Melt Shop

NO_x emissions from the EAF are predominantly thermal NO_x, which is formed as a result of the high temperature arc used to melt the scrap steel. Temperatures in the EAF during the melting phase, which reach well over 3,000 °F, cause the nitrogen and oxygen present in the ambient air to form NO_x. Additional NO_x formation occurs during oxygen lancing, which introduces oxygen that can combine with nitrogen present in the molten steel to form NO_x.

6.3.1.1 Step 1: Identify All Potential Control Strategies for the EAF

Emissions from the molten steel are ducted through the fourth hole (at the top of the EAF) and into a water-cooled exhaust duct. At the juncture of the fourth hole and exhaust duct, an adjustable air gap introduces ambient air to cool the exhaust stream and provide oxygen to combust the CO into CO_2. This ducting system is also referred to as DEC. The only feasible control listed in the RBLC is DEC with oxy-fueled burners. Potentially applicable NO_x controls that were examined include:

- Direct evacuation control
- Low NO_x combustion controls
- Selective catalytic reduction (SCR)
- Selective non-catalytic reduction (SNCR)
- Non-selective catalytic reduction (NSCR)
- EM_x NO_x control.

6.3.1.2 Step 2: Identify Technically Feasible Control Technologies

The following sections discuss the technical feasibility of each identified control strategy.

6.3.1.2.1 Direct Evacuation Control

The EAF is comprised of bottom, sidewall, and roof sections. Each shell bottom is lined with refractory and is equipped with a sump burner for preheating the shell. The furnace bottom also contains the tap hole through which the molten steel will be drained into waiting ladles. This hole is typically plugged with free-flowing sand during the melting process. The roof section has a precast refractory section known as a delta ring that contains a hole for the electrode. Another hole in the roof, the fourth hole, connects the DEC system to the EAF. Furnace gases are evacuated to the emission control system through the fourth hole. The fourth hole extraction with a canopy is the current state-of-the-art technology for emissions control. This technology replaced "doghouses" as control options because the doghouses obstruct access to the EAF and are thus not closed during charging.[5]

A DEC with oxy-fuel burners is technically feasible and considered the baseline emissions control.

6.3.1.2.2 Low NO_x Combustion Controls

Low NO_x combustion controls consist of strategies to reduce the formation of NO_x either by cooling the flame temperature or limiting the amount of oxygen to form NO_x. These strategies include overfire air (OFA), low excess air (LEA), and flue gas recirculation (FGR). These methods of control are commonly used on boilers that have a steady-state exhaust flow, controllable fuel/air flows, and a generally consistent temperature range. Unlike boiler exhaust streams, the EAF exhaust flow rate and temperature fluctuate widely due to the intermittent, cyclical nature of the process. Additionally, these control strategies generally require somewhat precise control of the combustion process variables (e.g., fuel flow rate and fuel/air ratio) which is readily feasible on a boiler but would not be technically feasible on an EAF.

EAFs need a burner first to preheat solid scrap and a lance later to inject oxygen into the liquid bath. A surface combustion (low NO_x) burner cannot fulfill both and would not last very long since the force of the expanding gas from a surface burner configuration is not enough to keep the surface clear from splashing slag/steel. Further, the general concept that reduces NO_x in a low NO_x burner is to keep the flame below the peak NO_x formation temperature. In an EAF, the peak NO_x formation temperature is exceeded by the entire liquid bath near the end of the heat.

[5] http://eippcb.jrc.ec.europa.eu/reference/BREF/IS_Adopted_03_2012.pdf

Therefore, the use of low NO_x combustion controls is not technically feasible for the EAF.

6.3.1.2.3 Selective Catalytic Reduction

SCR involves the use of a catalyst bed and ammonia injection. As the exhaust passes through the catalyst bed, ammonia is introduced via an injection grid which disperses the ammonia uniformly throughout the bed. In-the presence of the catalyst, the NO_x reacts with ammonia and oxygen and is reduced to molecular nitrogen (N_2) and water. Many SCR systems utilize a "honeycomb" catalyst bed to increase the catalyst surface area available for reaction and to maximize the residence time to yield maximum NO_x conversion. The honeycomb structure contains thousands of small pores that can become clogged by heavy particulate laden gas streams, thereby drastically reducing available surface area for NO_x conversion. SCR systems require a relatively stable gas stream flow rate and relatively stable temperatures ranging from 500°F to 700°F to provide adequate NO_x reduction. SCR systems are generally designed based on a given NO_x concentration range or emission rate in the gas stream and provide optimal control of steady and consistent NO_x emissions. EAF exhaust stream flow rate, temperature, and NO_x concentrations vary substantially due to the cyclical nature of EAF operations (tap/charge/melt cycles), making effective SCR operation difficult. Additionally, SO_2 present in the EAF exhaust will react with the ammonia to form ammonium sulfate deposits that will foul the catalyst, rendering the catalyst ineffective. The catalyst in SCR systems (which can consist of various platinum, palladium, vanadium, or titanium compounds) is also susceptible to "poisoning" due to the presence of various iron, nickel, zinc, and chrome compounds in the EAF exhaust stream that can bind to the catalyst, rendering it ineffective. Heavy particulate loading in the exhaust stream would also tend to plug the catalyst pores, hampering performance. **For these reasons, use of an SCR system to control EAF NO_x emissions is not technically feasible.**

6.3.1.2.4 Selective Non-Catalytic Reduction

SNCR is another available NO_x reduction technology. SNCR utilizes ammonia injection at a gas temperature range of 1,400°F to 2,000°F which must be maintained to effectively reduce NO_x. SNCR does not employ a catalyst but instead relies on the use of ammonia maintained at the proper stoichiometric ratio to react with the exhaust stream NO_x. Therefore, the SNCR system has lower tolerance for fluctuations in NO_x concentrations in the gas stream. The highly variable NO_x concentrations in the EAF exhaust would make it difficult to maintain the proper stoichiometric NO_x / ammonia ratio. This would result in excess ammonia being released (ammonia slip) or too little ammonia being utilized, leading to ineffective NO_x reduction. The highly variable characteristics of the EAF exhaust also make it nearly impossible to maintain the required temperature range required for effective NO_x reduction using SNCR. **Therefore, the use of an SNCR system to control NO_x emissions is not technically feasible.**

6.3.1.2.5 Non-Selective Catalytic Reduction

NSCR employs a catalyst (typically platinum/rhodium) to reduce NO_x to nitrogen and water. NSCR has been effectively used on automobiles and reciprocating engines in fuel-rich mode with very low oxygen levels. Proper operation of NSCR requires that the fuel/air ratio be at or close to stoichiometric proportions. Research of the RBLC and other sources did not indicate any instances of a NSCR system being employed on an EAF. Due to the strict stoichiometric combustion requirements, exhaust temperature fluctuations and the heavy particulate loading in the EAF exhaust stream that would likely plug the catalyst, rendering it ineffective, the **use of NSCR is eliminated as a technically feasible control option for the EAF.**

6.3.1.2.6 EM_x NO_x Control

EmeraChem's EM_x NO_x control has been effectively employed on gas turbines for control of NO_x as well as other gaseous pollutants and particulate matter. However, gas turbines generally have steady-state exhaust flow with a consistent temperature range that allows for proper catalytic control. By contrast, the EAF exhaust stream characteristics are highly variable, and the temperature fluctuations would prevent the catalyst from effectively controlling emissions. Additionally, the highly dense particulate loading in an EAF exhaust stream is orders of magnitude greater than the particulate loading of a gas turbine exhaust stream, which would cause plugging and fouling of the catalyst. **EM_x is not a technically feasible option.**

6.3.1.3 Step 3: Rank the Technically Feasible Control Technologies

As determined in Step 2, no additional add-on NO_x controls are feasible for the EAF. DEC is therefore the only technically feasible control.

6.3.1.4 Step 4: Evaluate the Most Effective Control Technologies

No additional add-on NO_x controls are feasible for the EAF. DEC is therefore the most effective control.

6.3.1.5 Step 5: Propose NO_x BACT Determination

The emissions of the EAF are routed through the baghouses along with the LMF, caster, and other melt shop sources. The monitoring system for the EAF is after the baghouse and thus includes emissions from the LMF and the melt shop. Recently permitted NO_x BACT limits for EAFs range from 0.2159 to 0.90 pound per ton (lb/ton). Several RBLC listings show lower NO_x BACT limits (0.05-0.20 lb/ton) for continuous caster, LMFs, or melt shop fugitives (OK-0128, TX-0729, OH-0316, OH-0328, MI-0417, and MI-0404). These limits do not encompass the EAF, LMF, caster, and melt shop fugitives like the proposed 0.3 lb NO_x/ton and are not appropriate for comparison.

The RBLC listings for OK-0128 and IN-0196 are 0.01 pound per million British thermal units (lb/MMBtu) or 100 pounds per million cubic feet (lb/MMcf) and are obviously only for natural gas combustion since these values match the AP-42 rates for natural gas combustion in Chapter 1.4. The RBLC listings that are lower than the proposed BACT are for TX-0705, CO-0066, and NE-0055 and have limits of 0.2159, 0.28, and 0.28 lb/ton and annual capacities of 1.3, 1.35, and 1.35 million tons of steel per year, respectively. All three of these facilities are EAFs without an ECS process like at the Nucor Florida facility and are all much larger than the Nucor Florida facility, which has a capacity of 450,000 tons of steel per year. The CMC Durant BACT limit is the same as that proposed for the Nucor Florida facility.

In addition, NO_x emission rates can vary between facilities due to individual process characteristics and differences in the types of steel products produced at each facility. Product specifications at one facility may require greater use of oxygen lancing and longer melt times resulting in higher per ton NO_x emissions. Further, NO_x emissions can spike due to process variations. Therefore, a longer averaging period is necessary. The proposed NO_x BACT limit is 0.3 lb/ton with the DEC and baghouse controls. This limit includes all four sources: EAF, LMF, caster, and the melt shop. This limit is consistent with many of the other determinations made at similar facilities, as shown in the RBLC for all of these sources combined. As stated previously, due to the varying types of steel products and required processes to make the various products, this limit is consistent with the limits in the RBLC for other steel mills with the same level of control.

6.3.2 BACT for CO for the EAF, LMF, Caster, and Melt Shop

Similar to NO_x, the BACT analysis will concentrate on the EAF. Carbon monoxide emissions are generated mainly during the melting of the scrap metal in the EAF due to combustion of small amounts of greases and oils present in the scrap, the release of an electrode carbon during the melting process, and from the various forms of carbon added to the steel to achieve the desired carbon content of the steel product.

6.3.2.1 Step 1: Identify All Potentially Applicable Control Technologies

The use of an oxygen lance to introduce oxygen into the molten steel serves as an initial step to reduce CO emissions via oxidation. Emissions from the molten steel are ducted through the fourth hole (at the top of the EAF) and into a water-cooled exhaust duct. At the juncture of the fourth hole and exhaust duct, an adjustable air gap introduces ambient air to cool the exhaust stream and provide oxygen to combust the CO into CO_2. This ducting system is also referred to as a DEC and significantly reduces the amount of CO emissions.

Possible add-on control devices available to further reduce CO emissions (in addition to the reductions from the use of the oxygen lance and DEC) include catalytic oxidizers and thermal oxidizers.

The only feasible control listed in the RBLC is DEC with oxy-fueled burners. Potentially applicable CO controls that were examined include:

1. Direct evacuation control
2. Catalytic oxidizers
3. Thermal oxidizers

6.3.2.2 Step 2: Identify Technically Feasible Control Technologies

The following sections discuss the technical feasibility of each identified control strategy. The use of an oxygen lance to introduce oxygen into the molten steel serves as an initial step to reduce CO emissions via oxidation. The existing DEC significantly reduces the amount of CO emissions. Possible add-on control devices available to further reduce CO emissions (in addition to the reductions from the use of the oxygen lance and DEC) include catalytic oxidizers and thermal oxidizers.

6.3.2.2.1 Direct Evacuation Control

As described in the NO_x BACT evaluation, the DEC is technically feasible and considered the baseline emissions control for CO.

6.3.2.2.2 Catalytic Oxidizers

Catalytic oxidizers employ a catalyst bed through which the exhaust stream is vented. The catalyst in the bed facilitates oxidation to reduce CO emissions. However, catalytic oxidizers are precluded for use as a supplemental CO control device for the EAF since the extremely large amounts of particulate in the exhaust stream will coat and plug the catalyst bed, thereby drastically reducing the surface area available for oxidation reactions, rendering it ineffective in a short time. **Catalytic oxidizers are not a technically feasible option.**

6.3.2.2.3 Thermal Oxidizers

Thermal oxidizers utilize a high temperature chamber to combust or thermally break down pollutants. However, thermal oxidizers will also produce NO_x emissions due to the high temperatures involved (*i.e.*, thermal NO_x is formed) and will also create an additional emissions impact since combustion of fuel is necessary to maintain the high temperatures needed for proper operation. Additionally, thermal oxidizers are unlikely to provide significant reduction in the CO emissions beyond those already achieved by the air gap in the DEC, which provides a significant oxidation due to the high temperature of the EAF exhaust.

Various technical difficulties would be encountered in attempting to use a thermal oxidizer on the EAF. The large air flow from the EAF precludes routing air through the oxidizer tip. The heavy particulate loading in the EAF exhaust stream would cause excessive burner fouling and would most likely hinder proper combustion. Thermal cycling would necessitate substantial additional natural gas if the oxidizer were situated near the EAF and even greater amounts of natural gas if the unit were installed further downstream (e.g., after the baghouse). **A thermal oxidizer is not technically feasible as a CO control device for the EAF**.

6.3.2.3 Step 3: Rank the Technically Feasible Control Technologies

The only technically feasible option for CO emission control for the EAF is the use of DEC with an air gap. Additionally, effective use of a scrap management plan will serve to minimize the organic content present in the scrap steel, thereby helping to reduce CO emissions.

6.3.2.4 Step 4: Evaluate the Most Effective Control Technologies

Use of the DEC with an air gap and effective use of a scrap management plan will minimize CO emissions from the EAF and is the most effective control technology.

6.3.2.5 Step 5: Propose CO BACT Determination for the EAF

As stated previously, the BACT limit needs to consider the EAF, LMF, caster, and melt shop. Daily variations in the lb/ton CO emissions occur depending the type of steel produced and how much charge and injection carbon is added to the steel.

Because the ECS system starts with a flat bath and the charge is continuously fed by a conveyor, foamy slag is needed early in the heat, and carbon injection and oxy-fuel burners are operated 100 percent of the power on time, as compared to conventional EAF carbon injection about 40 percent of the power on time. While a conventional furnace practice may use 15 to 25 pounds of injection carbon per ton of steel, the ECS-charged furnace practice may require 40 to 50 pounds per ton. This results in significantly more CO generation with the ECS system. In a conventional EAF it is desirous to utilize post-combustion in the head space of the furnace by injecting oxygen to recover energy by the combustion of CO to CO_2 within the furnace. The hot CO gases laden exit the conventional furnace through the fourth hole DEC, where air is inspired by the negative draft at the gap and high CO destruction efficiency is provided by the high temperature and violent mixing of the gases and air. In the ECS, system it is desirous to carry the CO out of the furnace into the ECS energy recovery unit where air is introduced along the length of the recovery conveyor to transfer energy to the scrap.

Recently permitted CO BACT limits for EAFs range from 1.327 to 9.0 lb/ton. Several RBLC listings show lower CO BACT limits (0.02 – 2.0 lb/ton) for continuous caster, LMFs, or melt shop fugitives (AR-0140, AR-0138, OK-0128, TX-0651, MI-0417, MI-0404, IN-0196, and SC-0112). These limits do not encompass the EAF, LMF, caster, and melt shop fugitives like the proposed 3.5 lb CO/ton and are not appropriate for comparison.

The RBLC listings for OH-0331, OK-0128, OH-0342, and IN-0196 are 0.084 lb/MMBtu or 84 lb/MMcf and are obviously only for natural gas combustion since these values match the AP-42 rates for natural gas combustion in Chapter 1.4.

The RBLC listings that are lower than the proposed BACT are TX-0705, GA-0137, AR-0096, AR-0140, CO-0066, GA-0142, NE-0055, OH-0350, AL-0319, OH-0341, TX-0651, AL-0309, OK-0128, NE-0063, and OH-0342. However, none of these facilities have an ECS process like at the Nucor Florida facility. The ECS process, as explained above, increases the CO emissions.

A 3.5 lb CO/ton of steel expressed as a 30-day rolling average is proposed as BACT for CO from the EAF. These CO emissions account for emissions from the EAF, LMF, caster, and melt shop. The CMC Durant BACT limit is the same as that proposed for Florida.

6.3.3 BACT for PM/PM_{10}/$PM_{2.5}$ for the EAF, LMF, Caster, and Melt Shop

Particulate emissions are generated during the charging of scrap metal in the EAF, the melting of scrap via electric arc, and the pouring of the molten metal into the ladle. A majority of the particulate emissions are generated during the melting of the scrap. Emissions from the EAF are vented through the DEC system, which cools and transports the exhaust gases to additional ducting (dry duct) and eventually to the baghouse control device.

$PM_{2.5}$ emissions are a subset of PM_{10}. Table E-6 shows the RBLC limits for $PM_{2.5}$ emissions from EAF facilities equipped with baghouses. A significant portion of the $PM_{2.5}$ emissions will be comprised of condensable particulate matter, and this portion is likely to be highly variable.

PM normally only includes filterable particulate and does not include condensables and is therefore measured with Method 5. PM_{10} and $PM_{2.5}$, by definition, include condensables, but as shown in Table E-6, RBLC entries often break apart the PM_{10} and $PM_{2.5}$ filterable only portion or do not specify if condensables are included. Condensables are measured with Method 202.

A careful examination of the RBLC entries, specifically the equipment, type of particulate matter, and stack test methods, provides more information on which size of particulate matter is referred to and if back half (condensable) is included. See Table E-6 and Table E-7.

Condensable particulate forms primarily from sulfate compounds (produced by sulfur added to the steel) and combustion of VOCs present in the scrap steel during the melting phase. The amount of sulfur added will vary significantly due to the various grades of steel produced and the amount of grease and oil present in the EAF charge. For these reasons, the filterable/condensable ratio is highly unpredictable, subject to frequent change, and not consistent from one EAF to another, particularly with different product mixes. Due to the highly variable nature of particulate composition of the gas stream, it is not possible to reliably predict the condensable portion of the exhaust stream, and there is very little emissions data for condensable particulate available.

6.3.3.1 Step 1: Identify All Potentially Applicable Control Technologies

Particulate emissions are generated during the charging of scrap metal and scrap substitutes into the EAF, the melting of the scrap via electric arc, and the pouring of the molten metal into the ladle. The majority of the particulate emissions are generated during the melting of the scrap. Emissions from the EAF are vented through a DEC system which utilizes a water-cooled duct connected to the “fourth hole” in the roof of the EAF. The DEC cools and transports the exhaust gases to additional ducting (dry duct) and eventually to the baghouse control device. There is an air gap where the water-cooled duct meets the fourth hole that allows outside air to enter the duct and facilitate the combustion of carbon monoxide and to cool the exhaust stream prior to being sent to the baghouse. The EAF DEC emissions are ducted to a baghouse control device along with other emissions from the melt shop (collected via the melt shop canopy). Applicable options for the control of particulate emissions from the EAF include electrostatic precipitators, wet scrubbers, cyclones, and fabric filters (baghouses).

The following controls were identified as potentially applicable control technologies for $PM/PM_{10}/PM_{2.5}$ controls for EAF:

1. Fabric filter
2. Electrostatic Precipitator (ESP)
3. Wet gas scrubber
4. Incinerator
5. Cyclone

6.3.3.2 Step 2: Identify Technically Feasible Control Technologies

The following sections discuss the technical feasibility of each identified control strategy. None of the identified PM/PM_{10}/$PM_{2.5}$ control technologies for the EAF are deemed technically infeasible for control of the EAF.

6.3.3.2.1 Electrostatic Precipitators

ESPs utilize an electric field to electrically charge the exhaust particles which are then collected on an oppositely charged electric plate thereby removing the particles from the exhaust stream. The collection plates are periodically cleaned by mechanical rapping to dislodge the particles which are collected in a hopper. An ESP is not anticipated to achieve its optimal removal efficiency for the EAF due to the high metallic content of the EAF exhaust. Particulate emissions from the EAF contain significant amounts of iron oxide which, due to its magnetic properties, interferes with the mechanical removal of the particles from the plates, thereby reducing control efficiency. Additionally, electrostatic precipitators do not provide sufficient operational flexibility in handling the highly variable temperature, moisture content, and particle loading of the EAF exhaust stream. **ESPs are technically feasible but provide low control efficiency.**

6.3.3.2.2 Wet Scrubbers

Wet scrubbers remove particulate via inertial impact of the particles with water droplets. While wet scrubbers can have high removal efficiency for consistent, steady-state streams, the scrubbers require a high pressure drop (which entails high energy costs) in order to maintain high removal efficiencies. **A wet scrubber is considered technically feasible.**

6.3.3.2.3 Incinerators

Incinerators are used primarily for VOC control. Some particulate may be removed, depending on the composition of the particulate, the type of incinerator, and whether or not there are large quantities of VOC being treated in the incinerator. **Incinerators are considered technically feasible.**

6.3.3.2.4 Cyclones

Cyclones utilize centrifugal force and inertia to remove large- and medium-sized particles from a gas stream. The particle laden stream is introduced into the top of the cyclone in a tangential manner causing it to spiral down a tube. The larger particles are moved outward, impact the wall of the cyclone, and then slide down to a dust receiver for collection. When the gas stream reaches the bottom of the cyclone, it reverses direction, moving upward in a smaller, inner spiral that exits from the top as a cleaned gas stream. **Cyclones are considered technically feasible.**

6.3.3.2.5 Fabric Filters

Fabric filters, also known as "baghouses," remove particulate by passing the gas stream through porous fabric filters (bags) which trap the particles on the fabric. The particles collect on the fabric filters, forming a porous dust cake layer which results in a high collection efficiency, even for smaller particles. Baghouses are highly energy efficient and provide sufficient operational flexibility due to their tolerance of varying gas stream conditions inherent in EAF operations. **Baghouses have been employed as BACT particulate control for the vast majority of EAFs in existence and are a proven feasible control technology.**

6.3.3.3 Step 3: Rank the Technically Feasible Control Technologies

The third step in the BACT analysis is to rank the remaining control technologies in order of control effectiveness. Table 6-3 provides a listing of $PM/PM_{10}/PM_{2.5}$ control technologies by effectiveness.

The efficiency of the controls depends on the nature of the material being emitted. For an incinerator to achieve a reduction in particulate matter, the particulate matter must be combustible. (Running a metallic fume through a combustion unit would change metals into metal oxides, increasing emissions rather than decreasing them.) Electrostatic precipitators work best on high-resistivity particulate matter. Inertial separators such as cyclones and wet scrubbers work best on large-diameter particles but have only modest efficiencies on smaller (5 micron and below) particulate matter.

Table 6-3: Efficiency Ranking of Particulate Matter Control Technologies for EAF, LMF, Caster and Melt Shop

Control Technology	Approximate Control Efficiency (percent)	
	Range	Efficiency
Fabric filter	99-99.99[a]	99.5
Dry electrostatic precipitator	99-99.99[b]	99.5
Wet electrostatic precipitator	99-99.99[c]	99.5
Wet gas scrubber	70-99.9[d]	85
Incinerator	70-99[e]	84.5
Cyclone	50-99[f]	74.5

6.3.3.4 Step 4: Evaluate the Most Effective Control Technologies

In a review of the RBLC, fabric filters (also referred to as baghouses) are the only approved BACT methodology for PM/PM_{10}/$PM_{2.5}$ emissions from the EAF/LMF. The RBLC search results are included in Appendix E of this application. NSPS Subpart AAa requires a control device outlet grain loading of 0.0052 gr/dscf. Therefore, any proposed BACT must meet or better this emissions control level. Approved BACT levels for PM/PM_{10}/$PM_{2.5}$ found in the RBLC database range from 0.0008 gr/dscf to 0.008 gr/dscf. Of the most recently approved BACT levels included in the RBLC (from permit approval dates between 2010-2014), the average approved BACT level is 0.0043 gr/dscf. The lowest approved BACT rates appear to be based on filterable or "front-half" PM_{10} levels rather than total ("front-half" plus "back-half") emission levels. In addition, NSPS AAa states a maximum of 3 percent opacity at the exit from a control device as well as a limit of 6 percent opacity from a melt shop due solely to the operations of any affected EAF or argon oxygen decarburization (AOD) vessel.

A baghouse was identified as the control technology with the greatest control efficiency for the EAF and Nucor proposes to use a baghouse as BACT for particulate. Because a baghouse is the highest ranked technology, further analysis is not warranted. Recent permitted particulate BACT limits for EAFs, LMFs, casters and melt shops, as found in the RBLC, are shown in Appendix E.

6.3.3.5 Step 5: Propose EAF, LMF, Caster, and Melt Shop PM/PM_{10}/$PM_{2.5}$ BACT Determination

The PM_{10}/$PM_{2.5}$ rate should include both front and back half; therefore, RBLC entries for PM front half only are not appropriate for comparison for PM_{10} and $PM_{2.5}$.

Nucor proposes to install a baghouse to control PM/PM_{10}/$PM_{2.5}$ emissions from the combined exhaust from the EAF and LMF. NSPS Subpart AAa mandates control to at least 0.0052 gr/dscf. Nucor proposes an outlet grain loading for the combined EAF and LMF emissions of 0.0018 gr PM/dscf (filterable only), 0.0045 gr PM_{10}/dscf (filterable plus condensable), and 0.0045 gr $PM_{2.5}$/dscf (filterable plus condensable). Additionally, Nucor proposes an opacity limits of 3 percent measured at the baghouse exit and 6 percent opacity from the melt shop represents BACT for the proposed plant. This approach is also consistent with NSPS Subpart AAa.

As shown in Table E-7, EAF BACT limits range as follows for the various types of particulate, however since the RBLC listing is for "EAF" it is unknown if they limit includes emissions from the LMF, caster, and melt shop fugitives:

- PM (filterable only) 0.0008 to 0.0032 gr/dscf
- PM (filterable plus condensable) 0.0052 to 0.0054 gr/dscf
- PM_{10} (filterable only) 0.0018 gr/dscf
- PM_{10} (filterable plus condensable) 0.0052 to 0.0054 gr/dscf
- PM_{10} (unspecified) 0.0008 to 0.0052 gr/dscf
- $PM_{2.5}$ (filterable only) 0.0018 gr/dscf
- $PM_{2.5}$ (filterable plus condensable) 0.0049 to 0.0054 gr/dscf
- $PM_{2.5}$ (unspecified) 0.0008 to 0.0052 gr/dscf

RBLC listings show lower $PM/PM_{10}/PM_{2.5}$ BACT limits for continuous caster, LMFs, or melt shop fugitives (IN-0196, OK-0128, OH-0328, OH-0316, AR-0140, SC-0129, MI-0404, MI-0417, LA-0309). These limits do not encompass the EAF, LMF, caster, and melt shop fugitives like the proposed 0.0052 gr/dscf and are not appropriate for comparison.

The RBLC listings for OK-0128 and IN-0196 are obviously only for natural gas combustion since these values match the AP-42 rates for natural gas combustion in Chapter 1.4.

The remaining RBLC listings that are lower than the proposed BACT are not ECS processes like at Nucor Florida, except for CMC Durant (OK-0173). The Facility is requesting a limit higher than CMC Durant due to expected high variability in condensable emissions.

6.3.4 BACT for SO_2 for the EAF, LMF, Caster, and Melt Shop

SO_2 emissions are mainly associated with combustion of sulfur compounds charged in the EAF. SO_2 is attributable to the sulfur content of the scrap, carbon electrode, the sulfur in the raw material charged in the EAF and to a lesser extent, the sulfur content of the oil on the scrap steel, in addition to the sulfur-content in the available fuel. A main source of sulfur in the exhaust gases comes from the sulfur in the carbon source. The carbon source that Nucor proposes to use will be pet coke, which is waste from another facility. The sulfur content of the available pet coke in the area is in the range of 3 percent sulfur.

6.3.4.1 Step 1: Identify All Potentially Applicable Control Technologies

The first step in the BACT analysis is to identify all technologies available. The technologies identified for the control of SO_2 emissions are as follows:

- Wet gas scrubber
- Flue gas desulfurization (FGD)
- Low-sulfur carbon-based feed and charge material (charge substitution)
- Good combustion and/or process operation

6.3.4.2 Step 2: Identify Technically Feasible Control Technologies

The second step in the BACT analysis is to eliminate any technically infeasible control technologies. The following sections detail the technologies that have been deemed technically infeasible for the control of SO_2 emissions from the EAF and LMF.

6.3.4.2.1 Wet Gas Scrubber

Wet scrubbers are regenerative processes that are designed to maximize contact between the exhaust gas and an absorbing liquid. The exhaust gas is scrubbed with a 5 percent to 15 percent slurry, composed of lime (CaO) or limestone ($CaCO_3$) in suspension. The SO_2 in the exhaust gas reacts with the CaO or $CaCO_3$ to form calcium sulfite ($CaCO_3$) and calcium sulfate ($CaSO_4$). The scrubbing liquor is continuously recycled to the scrubbing tower after fresh CaO or $CaCO_3$ has been added.

The types of scrubbers that can adequately disperse the scrubbing liquid include packed towers, plate or tray towers, spray chambers, and venturi scrubbers. In addition to $CaCO_3$ or $CaSO_4$, numerous other absorbents are available including sodium solutions and ammonia-based solutions.

Packed bed scrubbers are comprised of a chamber with layers of packing material. The packing material is designed to provide a large surface area for contact between scrubbing liquid and exhaust gases. Scrubbing liquid is introduced above the packing and flows down through the bed. Water is the most common scrubbing fluid used for acid gas control, though a caustic solution may be used for enhanced SO_2 control. Exhaust gases are introduced into the scrubber, and SO_2 is absorbed as it makes contact with the scrubbing liquid that adheres to the packing material. The absorption rate of SO_2 depends on properties of the exhaust gases and scrubbing liquid. These properties are temperature dependent, and lower temperatures tend to favor higher absorption rates. Ideal temperatures for SO_2 removal range from 40°F to 100°F. Spray scrubbers are comprised of empty chambers in which spray nozzles release scrubbing liquid droplets. There are various configurations of spray nozzles that can be utilized to maximize contact with exhaust gases. Similar to packed bed scrubbers, exhaust gases are introduced into the scrubber, and SO_2 is absorbed as it makes contact with the scrubbing liquid droplets. The absorption rate of SO_2 depends on properties of the exhaust gases and scrubbing liquid. These properties are

temperature dependent, and lower temperatures tend to favor higher absorption rates. Ideal temperatures for SO_2 removal range from 40°F to 100°F.

Various operating problems are associated with the use of wet scrubbers to control SO_2 emissions from an EAF. Particulates can plug spray nozzles, packing plates, and trays. Wet scrubbers also require handling, treatment, and disposal of a sludge by-product. In this case, air emissions would be exchanged for a large-scale water treatment requirement. The volumetric exhaust gas flow rate from an EAF would range from approximately 285,000 to 599,000 dry standard cubic feet per minute (dscfm). When coupled with the relatively low SO_2 emission rate, a relatively small SO_2 concentration in the exhaust would result. The SO_2 concentration would also vary widely over the EAF cycle. This would preclude efficient application of wet scrubbing. Nucor is not aware of any wet scrubbing system used on an EAF due to the technical difficulties with this type of installation.

Impingement-plate scrubbers are comprised of a vertical chamber with horizontally mounted plates inside the hollow shell. A scrubbing liquid is introduced at the top of the scrubber and flows downward, coating the plates. Exhaust gases flow countercurrent to the scrubbing liquid through the scrubber. Contact between the scrubbing liquid and the exhaust gases occur on the plates. Similar to other wet scrubbers, SO_2 is absorbed as it makes contact with the scrubbing liquid. The absorption rate of SO_2 depends on properties of the exhaust gases and scrubbing liquid. These properties are temperature dependent, and lower temperatures tend to favor higher absorption rates. Ideal temperatures for SO_2 removal range from 40°F to 100°F. The temperature of the EAF and LMF exhaust is greater than the typical operating range of wet scrubbers. **Therefore, wet scrubbing technology is considered technically infeasible for the control of SO_2 emissions from the EAF and LMF.**

6.3.4.2.2 Flue Gas Desulfurization

FGD systems can include spray dryers, dry scrubbing, and wet scrubbing. FGDs differ from the wet scrubbing technology described above in that FGD technology is based on using an alkaline reagent to absorb and react with SO_2 to produce a solid compound, which is later removed with particulate controls. Therefore, FGD controls are used in conjunction with downstream particulate controls.

In spray dryer absorption (SDA), the gas-phase SO_2 is removed by intimate contact with the suitable absorbing media. Typically, this may be an aqueous solution of sodium carbonate ($NaCO_3$) or slaked lime [$Ca(OH)_2$]. In SDA systems the solution is pumped to atomizers, which create a spray of very fine droplets. The droplets mix with the incoming SO_2-laden EAF exhaust gas in a very large chamber, and subsequent absorption leads to the formation of sulfites and sulfates in the droplets. Almost

simultaneously, the sensible heat of the exhaust gas that enters the chamber evaporates the water in the droplets, forming a dry powder before the gas leaves the spray dryer. The temperature of the desulfurized gas stream leaving the spray dryer then approaches its dew point. For this application, the exhaust gas temperature would be approximately 150°F before entry to the baghouse. This temperature is too low for the effective operation of an SDA system.

The exhaust gas from the SDA system contains a particulate mixture that includes reacted products. Typically, baghouses employing Teflon-coated fiberglass bags (to minimize bag corrosion) are used to collect the precipitated particulates.

Although the SDA process would not have the wastewater treatment and disposal problems associated with the wet scrubbing systems, the SO_2 concentrations would be very low and would vary widely over the EAF cycle, precluding efficient application of SDA systems. Also, the temperature of the exhaust gas stream would be too low for effective operation. In view of the above limitations, the SDA dry scrubbing option is technically not feasible and is precluded from further consideration in this BACT analysis.

Dry sorbent injection (DSI) typically involves the injection of dry powders into either the furnace or post-furnace region of utility sized boilers. This process was developed as a lower-cost option to conventional FGD technology. Because the sorbent is injected directly into the exhaust gas stream, the mixing offered by the dry scrubber tower is not achieved. The maximum efficiency realized for this SO_2 control technology is estimated to be less than 50 percent.

As in SDA technology, DSI would not result in wastewater treatment and disposal problems associated with the wet scrubbing systems. However, because of the very low SO_2 emission concentrations in the exhaust gas and the fact that the SO_2 concentration will vary widely over the EAF cycle, it would not be feasible to design an efficient application of DSI systems. In view of the above limitations, the DSI option is technically not feasible and is precluded from further consideration in this BACT analysis.

Typically, the reagent used in an FGD is calcium or sodium based and is injected in the flue gas in a spray tower or directly into the duct. The SO_2 is absorbed, neutralized, and/or oxidized by the reagent into a solid compound, either calcium or sodium sulfate. The exhaust gas must be between 300°F to 1,830°F, depending on the type of system used (e.g., wet scrubber, spray dryer, or dry scrubber). The temperature of the EAF and LMF exhaust downstream of a particulate control device is less than 300°F, below the typical operating range of FGDs. **Therefore, FGD technology is considered technically infeasible for the control of SO_2 emissions from the EAF and LMF.**

6.3.4.2.3 Charge Substitution

SO_2 emissions are directly related to the amount of sulfur charged to the EAF. Types of material used in the charge that contain sulfur include scrap, directed reduced iron, pig iron, injection carbon, carbon charge, chipped, tires, coal, and petroleum coke. Scrap metal has inherently low sulfur content (0.003 to 0.07 percent), whereas injection coal, tires and petroleum which will be used by Nucor can have sulfur contents in the 2.5 to 3 percent range and potentially higher.

6.3.4.2.4 Chemical Additives

Adding CaO to the charge will not necessarily combine and react with sulfur compounds and be adsorbed into the slag layer of the melt when the slag is poured off and handled as solid material. However, Nucor will not use CaO in the process, which might have an unmeasurable effect on sulfur capture.

6.3.4.3 Step 3: Rank the Technically Feasible Control Technologies

The third step in the BACT analysis is to rank the remaining control technologies in order of control effectiveness. Since all of the remaining control technologies will be utilized at the Nucor facility, no ranking is required. The remaining technologies are:

- Use of natural gas fuel
- Low-sulfur carbon-based feed and charge material (charge substitution)
- Good combustion and/or process operation

6.3.4.4 Step 4: Evaluate the Most Effective Control Technologies

The fourth step in the BACT analysis is to evaluate the most effective control technologies not eliminated due to technical infeasibility. Since all of the remaining control technologies will be utilized at this facility, this evaluation is not required.

RBLC search results are included in Appendix E of this application. In a review of the RBLC, add-on SO_2 control technologies have not been demonstrated as BACT for EAF or LMF operations. Use of natural gas fuel, low-sulfur carbon-based feed and charge material, as well as good combustion and/or process operation, have been approved as BACT.

6.3.4.5 Step 5: Propose SO_2 BACT Determination

Nucor proposes the use of natural gas fuel, low-sulfur available carbon-based feed and charge material as well as good combustion and/or process operation as BACT for SO_2 control from the EAF and LMF.

Recently permitted SO_2 BACT limits for EAFs range from 0.15 to 0.50 lb/ton. Several RBLC listings show lower SO_2 BACT limits (0.05-0.33 lb/ton) for continuous caster, LMFs, or melt shop fugitives (OK-0128, AR-0138, AR-0140, MI-0417, MI-0404, SC-0112, OH-0328, and IN-0196). These limits do not encompass the EAF, LMF, caster, and melt shop fugitives like the proposed 0.6 lb SO_2/ton and are not appropriate for comparison.

The RBLC listings for OK-0128 and IN-0196 are 0.00006 lb/MMBtu or 0.6 lb/MMcf and are obviously only for natural gas combustion since these values match the AP-42 rates for natural gas combustion in Chapter 1.4.

The RBLC listings that are lower than the proposed BACT are for CO-0066, AR-0140, FA-0142, OH-0328, OK-0128, AL-0309, AL-0323, TX-0705, AL-0319, and OH-0341. However, none of these facilities have an ECS process like at the Nucor Florida facility, nor is the source of their carbon known.

Nucor is proposing the emission rate limit for the combined EAF/LMF exhaust of 0.6 pounds per ton of steel produced. This proposed emission rate is higher than the average emission rate but not the highest. If a scrap preheating process were not used at the Nucor Florida facility, the proposed emission rate would be at the low end of the emission rate range from the RBLC search results, but Nucor is anticipating that the slightly higher proposed SO_2 emission rate will be required due to oxidation of the scrap as it is preheated prior to entering the EAF and also due to the available carbon source in the area (pet coke). The CMC Durant BACT limit is the same as that proposed for the Nucor Florida facility.

6.3.5 BACT for VOC for the EAF, LMF, Caster, and Melt Shop

VOCs result from the melting stage of charge and depend on the degree of contamination of the charge with organic matter, paints and plastics.[6] Other VOC emission sources from EAF include scrap preparation with solvent degreasers, decarburization of scrap, charging of the furnace, pouring of the molten metal and slag, and mold drying. When molten steel is poured into molds, VOCs and organic compounds are emitted, not only when the steel first contacts the cores and molds, but also as the metal cools. Time and temperature may cause known organic compounds to be modified and recombined to form new previously unknown organic compounds, to be emitted into the steel foundry.[7]

[6] Iluţiu-Varvara, Dana-Adriana, et al. *An Assessment of Pollution with Volatile Organic Compounds in the Electric Arc Furnaces.* Procedia Technology Volume 22, 2016.
[7] U.S. Environmental Protection Agency. *Background Report AP-42, Section 12.13: Steel Foundries.*

6.3.5.1 Step 1: Identify All Potentially Applicable Control Technologies

The first step in the BACT analysis is to identify all technologies available. The technologies identified for the control of VOC emissions are as follows:

- Thermal Oxidizer
- Catalytic Oxidizer
- Carbon Adsorption
- Biofiltration
- Condenser
- Good Combustion and/or Process Control
- Scrap Management Plan

6.3.5.2 Step 2: Identify Technically Feasible Control Technologies

The second step in the BACT analysis is to eliminate any technically infeasible control technologies. The following sections detail the technologies that have been deemed technically infeasible for the control of VOC emissions from the EAF and LMF.

6.3.5.2.1 Thermal Oxidation

As described previously, thermal oxidation technology is considered technically infeasible due to the operation temperature. For the operation of most thermal oxidizers, the temperature of the exhaust gas must be between 1,100°F to 1,200°F. Below this temperature range, the reaction rate drops sharply and effective oxidation of VOC is no longer feasible. In order to prevent excess deterioration of controls due to the particulate loading of the exhaust stream from the EAF and LMF, thermal oxidation controls would need to be located downstream of a particulate emission control technology. The temperature of the EAF and LMF exhaust downstream of a particulate control device is less than 300°F, which is below the typical operating range of thermal oxidizers. **Therefore, thermal oxidation technology is considered technically infeasible for the control of VOC emissions from the EAF and LMF.**

6.3.5.2.2 Catalytic Oxidizer

As described previously, oxidation catalyst technology is considered technically infeasible due to the operation temperature. Prior to entering the catalyst bed where the oxidation reaction occurs, the temperature of the exhaust gas must be between 400°F to 800°F. Below this temperature range, the reaction rate drops sharply, and effective oxidation of VOC is no longer feasible. Above this temperature, conventional oxidation catalysts break down and are unable to perform their desired functions. In order to prevent fouling and deterioration of the catalyst due to the contaminants in the exhaust stream from the

EAF and LMF, catalytic oxidation controls would need to be located downstream of a particulate emission control technology. The temperature of the EAF and LMF exhaust downstream of a particulate control device is less than 300°F, which is below the typical operating range of catalytic oxidizers. **Therefore, catalytic oxidation technology is considered technically infeasible for the control of VOC emissions from the EAF and LMF.**

6.3.5.2.3 Carbon Adsorption

Adsorption technology utilizes a porous solid to selectively collect VOC from the gas stream. Adsorption collects VOC but does not destroy it. Activated carbon is a relatively low-cost adsorbent, with regard to initial costs. Activated carbon is affected by humidity in the stream; although it is generally insensitive to humidity less than 50 percent. Adsorption capacity is affected by the amount of organics in the stream. A carbon adsorption system is designed for streams of 1,000 parts per million (ppm) VOC or greater and may not achieve as great of efficiency on lower quantity streams. Carbon adsorption is a physical process; therefore, the capacity of adsorption decreases as temperature increases. Generally, temperature for physical adsorption is kept below 130°F. Aldehydes and other particulates in the exhaust stream can clog the adsorbent, decreasing the lifespan of the adsorption process. Streams with large quantities of particulate or polymerized. particulate, may make the VOC difficult to remove from the beds causing the beds to become saturated and requiring excessive replacement of adsorbent. The temperature of the exhaust stream from the EAF and LMF is much greater than 150°F. **Therefore, Nucor considers carbon adsorption to be technically infeasible for the control of VOC emissions from the EAF and LMF.**

6.3.5.2.4 Biofiltration

Biofiltration is an air pollution control technology in which exhaust gases containing biodegradable organic compounds are vented, under controlled temperature and humidity, through a biologically active material. The microorganisms contained in the bed of compost like material digest or biodegrade the organics to CO_2 and water. This technology has been successfully applied in full-scale applications to control odors, VOC, and air toxic emissions from a range of industrial and public-sector sources. However, biofilters are limited to organic concentrations of approximately 1,000 ppm or less. Biofiltration can provide significant economic advantages over other air pollution control technologies if applied to exhaust streams that contain readily biodegradable pollutants in low concentrations.

Biofiltration systems require a relatively large land area to house viable microbes (the size of the biofiltration unit increases with increasing volumes of gas to be treated). Particulate matter or grease in exhaust gases will clog the biofilter. This results in excessive media replacement and maintenance.

A limiting parameter of a biofilter is its operating temperature. The maximum operating temperature of biofilters is approximately 100°F due to the requirements of the microorganisms that comprise the biofilter. The temperature of the exhaust stream from the EAF and LMF is much greater than 100°F. **Therefore, biofiltration is considered technically infeasible for the control of VOC emissions from the EAF and LMF due to temperature considerations.**

6.3.5.2.5 Condenser

Condensers convert a gas or vapor stream to a liquid, allowing the organics within the stream to be recovered, refined, or reused and preventing the release of organic streams into the ambient air. Condensers are relatively inexpensive devices that typically use water or air to cool and condense the vapor stream. Condensers are typically used as pretreatment devices. Condensers are generally not capable of reaching temperatures below 100°F. High removal rates of gaseous pollutants are generally not possible unless the vapors will condense at high temperatures.

Condensers are designed for a specific throughput of fluid, although some overload is possible without causing damage. The economically feasible range of operation is 100,000 to 200,000 standard cubic feet per minute (scfm). In addition, condensers require regular maintenance and inspections, which may require shutdown of the condenser. Fouling of the condenser is commonly experienced and may require even more frequent maintenance. Large quantities of particulate in the exhaust stream will increase fouling leading to excessive maintenance requirements and decreased efficiency.

Furthermore, low concentrations of VOCs in the exhaust stream results in partial pressures of the VOCs that are too low for condensation to occur, resulting in low removal efficiencies and high energy usages.

The exhaust flowrate for the EAF and LMF will be significantly higher than 200,000 scfm, placing it above the economical range of operation for a condenser. In addition, the low VOC concentration in the exhaust stream reduces the effectiveness of condenser technology. **Therefore, Nucor considers condensers to be technically infeasible for the control of VOC emissions from the EAF and LMF.**

6.3.5.3 Step 3: Rank the Technically Feasible Control Technologies

The third step in the BACT analysis is to rank the remaining control technologies in order of control effectiveness. Since all of the remaining technologies will be implemented, no ranking is required. The remaining technologies are:

- Good Combustion and/or Process Control
- Scrap Management Plan

6.3.5.4 Step 4: Evaluate the Most Effective Control Technologies

The fourth step in the BACT analysis is to evaluate the most effective control technologies not eliminated due to technical infeasibility. Control technologies are evaluated for energy, environmental, and economic impacts prior to the selection of the BACT.

6.3.5.5 Step 5: Propose VOC BACT Determination

Recently permitted VOC BACT limits for EAFs range from 0.10 to 0.43 lb/ton. Several RBLC listings show lower VOC BACT limits (0.09-0.13 lb/ton) for continuous caster, LMFs, or melt shop fugitives (IN-0196, MI-0404, SC-0112, OK-0128, OH-0328). These limits do not encompass the EAF, LMF, caster, and melt shop fugitives like the proposed 0.3 lb VOC/ton and are not appropriate for comparison.

The RBLC listings for OK-0128, IN-0196, TX-0651, and AR-0410 are very close to the natural gas combustion values in AP-42 for natural gas combustion (Chapter 1.4), and are not appropriate for comparison.

The RBLC listings that are lower than the proposed BACT are for OH-0350, CO0066, AL-0309, OH-0341, AL-0319, AR0096, OH-0342, OH-0328, and TX-0705. However, none of these facilities have an ECS process like at the Nucor Florida facility.

Nucor proposes good combustion practice and process control along with a scrap management plan as BACT for VOC control from the EAF and LMF. Nucor is anticipating that higher than normal VOC emissions may be generated due to volatilization during the scrap preheating process. As a result, Nucor is proposing a VOC emission rate of 0.30 lb/ton as BACT which is within the range of approved BACT emission rate limits. This is somewhat higher than limitations shown on RBLC due to the preheating process. When hot gases from the furnace contacts residual organic material on the scrap being charged to the furnace, most of the residual organic material which is not oxidized would be evaporated. Higher VOC emissions are being traded for energy efficiency. The CMC Durant BACT limit is the same as that proposed for the Nucor Florida facility.

6.3.6 BACT for GHG for the EAF, LMF, Caster, and Melt Shop

As the hot waste gases leave the EAF, combustion air is typically introduced to the ductwork to convert the CO to CO_2, since CO is a regulated criteria pollutant. This practice, called post-combustion, is widely used throughout the industry as the best technology for CO control.

Emissions of CO_2 are also generated from the use of oxy-fuel burners by EAF. These burners increase the effective capacity of the EAF by increasing the speed of the melt and reducing the consumption of

electricity and electrode material, which reduces energy-related GHG emissions. Oxy-fuel burners also increase heat transfer while reducing heat losses and reduce tap-to-tap time. These burners are often designed to minimize the increase in NO_x emissions that is a known by-product of the technology by deliberately operating the burners at less than their maximum combustion efficiency; however, this practice increases CO emissions to some extent but in turn lowers CO_2 emissions.

6.3.6.1 Step 1: Identify All Potentially Applicable Control Technologies

The first step in the BACT analysis is to identify all technologies available. The technologies identified for the control of GHG emissions associated with EAF operations are as follows and summarized in Table 6-4:[8]

6.3.6.1.1 Potential GHG Reduction Technologies

1. **Improved Process Control (Neural Network):** Involves the use of a modem control and monitoring system which. integrates real-time monitoring of the process variables such as steel bath temperature, carbon levels along. With real-time control systems for graphite injection and lance oxygen practice.
2. **Adjustable Speed Drives:** As the flue gas flow rates vary from the EAF/LMF, there are opportunities to lower the speed of the dust collection fans by using adjustable speed drives to match the demand for these fans. Although there may be a slight reduction in total dust collection amounts, there is a significant power consumption savings to be had from the use of this technology.
3. **Transformer Efficiency-Ultra-High Power Transformers:** Ultra-high-power (UHP) transformers help to reduce energy loss and increase productivity through modem design.
4. **Bottom Stirring/Stirring Gas Injection:** Bottom stirring is accomplished by injecting an inert gas into the bottom of the EAF to increase the heat transfer in a melt.
5. **Foamy Slag Practice:** Foamy slag covers the arc and melt surface to reduce radiation heat losses. Foamy slag can be obtained by injecting carbonaceous material and oxygen or by lancing of oxygen only. Slag foaming increases the electric power efficiency by at least 20 percent in spite of a higher arc voltage. The use of the foamy slag process may also increase productivity through reduced tap-to-tap times.
6. **Oxy-Fuel Burners:** Oxy-fuel burners are used on most EAFs in the U.S. These burners increase the effective capacity of the furnace by increasing the speed of the melt and reducing the consumption of electricity and electrode material, both which reduce emissions of greenhouse gases. The use of oxy-fuels also increases heat transfer, reduces heat losses, reduces electrode consumption and reduces tap-

[8] U.S. Environmental Protection Agency. *Available and Emerging Technologies for Reducing Greenhouse Gas Emissions from the Iron and Steel Industry*. September 2012.

to-tap time. It also helps to remove different elements from the steel bath, like phosphorous, silicon and carbon.

7. **Post-Combustion of the Flue Gases:** Post-combustion is a process for. utilizing the chemical energy in the CO and hydrogen evolving from the steel bath to heat the steel in the EAF ladle or to preheat scrap. Post combustion helps to optimize the benefits of oxygen and fuel injection.
8. **DC Arc Furnace:** The DC Arc Furnace technology replaces the normal three electrodes (one for each phase) with one large electrode that uses direct current instead of alternating current for heating the scrap in the EAF. Based on the distinctive feature of using the heat and magnetic force generated by the current in melting, this arc furnace achieves an energy saving of approximately 5 percent in terms of power unit consumption in comparison to the 3-phase alternating current arc furnace.
9. **Scrap Preheating Using the ECS Process:** Preheating the scrap reduces power consumption to the EAF by using the waste heat of the EAF as the energy source for the preheat operation. The ECS process consists of a conveyer belt that transports the scrap through a tunnel to the EAF. In addition to energy savings, the ECS process can increase productivity by 33 percent, decrease electrode consumption by 40 percent and can reduce dust emissions.
10. **Scrap Preheating, Post-Combustion—Shaft Furnace:** A shaft furnace design can preheat the scrap prior to it being introduced into the EAF for melting. This design was developed as a method of reducing power consumption during the heating process. This potential option is discussed further in step two of the BACT evaluation. In addition to the options listed above, Nucor is proposing an additional measure for the reduction of GHGs from the facility through continuous billet rolling. The design of the Nucor facility incorporates the use of a rolling mill that will roll the steel billet to the final dimensions immediately after the casting process, which eliminates the need for a reheat furnace that would typically be found at a steel mill facility using scrap as the feedstock. This eliminates a significant source of greenhouse gases.
11. **Engineered Refractories:** Refractories in the EAF have to withstand extreme temperatures, oxidation, thermal shock, erosion, and corrosion. These conditions generally lead to an undesired wear of refractories. Through the use of controlled microstructure of the refractories, these factors can be controlled, which results in reduce ladle leakages and formation of slag during transfer operations.
12. **Airtight Operation:** During a heat cycle of the EAF, large quantities of air enter the EAF. This air is at ambient temperature and the air's nitrogen and non-reacted oxygen are heated in the furnace and exit with the fumes at high temperature (around 1,800°F) which results in significant thermal losses. Of the associated cost savings that can be attributed to this technology, 80 percent can be attributed to the reduction in the heat losses from the flue gases and 20 percent can be attributed to the reduced thermal losses due to reduced tap-to-tap time. This technology cannot be utilized 100 percent of the

time due to requirements to monitor the material within the EAF during the scrap charging process as well as balancing this requirement against the requirement to control emissions. It is typically necessary to find a balance between air tightness. Scrap density and access to the furnace for sampling the metal.

13. **CONTIARC® Furnace:** The CONTIARC® furnace is fed continuously with material in a ring between the CONTIARC shaft and the outer furnace vessel; where the charged material is continuously preheated by the rising process gas in a counter-current flow, while the material continuously moves down.
14. **Variable Speed Drives Monitoring and Control:** The use of variable speed drives (VSDs) can reduce energy usage of the flue gas fans, which in turn, reduces the losses in the flue gas. VSD control systems can help predict problems that occur in the EAF due to the variability in the scrap and also from energy fluctuations.
15. **Eccentric Bottom Tapping on Existing Furnace:** Eccentric bottom tapping leads to slag-free tapping, shorter tap-to-tap times, reduced refractory and electrode consumption, and improved ladle life.
16. **Twin-Shell Furnace with Scrap Heating (CONARC®):** A twin-shell furnace includes two EAF vessels with a common arc and power supply. In the two furnace shells, blowing lance and electrodes are used in turns. This makes it possible to process the charge materials of steel scrap, crude iron and direct-reduced iron (DRI) in various mixing ratios. This system increases productivity by decreasing tap-to-tap times, reducing refractory and electrode consumption and improved ladle life.

Table 6-4: Energy Efficiency Technologies and Measures Available for Electric Arc Furnace Steel Production in the U.S.

Option	Applicability and Feasibility Codes[a]	Payback Time (years)
1. Improved process control (neural network)	EX	0.5
2. Adjustable speed drives	EX	2–3
3. Transformer efficiency—ultra-high power transformers	C, EX	5.2
4. Bottom stirring/stirring gas injection	C, EE, N	0.2
5. Foamy slag practice	C, EX	4.2
6. Oxy-fuel burners	C, EX	0.9
7. Post-combustion of the flue gases	C, EX,	
8. DC arc furnace	C, N	
9. Scrap preheating—tunnel furnace (ECS)	C, EE, S	
10. Scrap preheating, post-combustion—shaft furnace (Fuchs)	C, EE, N, S	
11. Engineered refractories		
12. Airtight operation	P	
13. Contiarc furnace	C, N, S	
14. Variable speed drives monitoring and control	C, EX	4.3
15. Eccentric bottom tapping on existing furnace	C, N, S	6.8
16. DC twin-shell with scrap preheating	C, EE, N	3.5

Source: Available and Emerging Technologies for Reducing Greenhouse Gas Emissions from the Iron and Steel Industry, USEPA, September 2012 https://www.epa.gov/sites/production/files/2015-12/documents/ironsteel.pdf
(a) Applicability codes:
C = Site-specific variables may affect costs and/or practicality of use of the option at all facilities.
EE = Options that could improve energy efficiency and potentially lower GHG emissions but may increase other pollutants.
EX = Process already widely implemented at many existing facilities.
N = Only feasible for new units.
P = Immature process that is still in research and/or pilot stage as applied to Iron and Steel.
S = Specialized process only technically appropriate for some equipment configurations or types.

6.3.6.1.2 Add-On Technologies

Carbon Capture and Sequestration: In addition to the technologies discussed above, it is appropriate to consider add-on technologies as possible ways to capture GHG emissions that are emitted from the Nucor facility and to prevent them from entering the atmosphere. These emerging carbon capture and sequestration (CCS) technologies generally consist of processes that separate CO_2 from combustion process flue gas, compress, transport and then inject it into geologic formations such as oil and gas reservoirs, unmineable coal seams, and underground saline formations. Of the emerging CO_2 capture technologies that have been identified, only amine absorption is currently commercially used for state-of-

the art CO_2 separation processes. Amine absorption has been applied to processes in the petroleum refining and natural gas processing industries and for exhausts from gas-fired industrial boilers. Other potential absorption and membrane technologies are currently considered developmental.

If CO_2 capture can be achieved at a steel production facility, it would need to be routed to a geologic formation capable of long-term storage. The long-term storage potential for a formation is a function of the volumetric capacity of a geologic formation and CO_2 trapping mechanisms within the formation, including dissolution in brine, reactions with minerals to form solid carbonates, and/or adsorption in porous rock. The DOE-NETL is currently studying the geologic formations that could potentially serve as CO_2 storage sites. Potential types of reservoirs are being discovered but these areas may contain fluids that may include natural gas, oil, or saline water; any of which may impact CO_2 storage differently.

The technical feasibility of using add-on CCS technology will be further discussed in Step 2 below.

6.3.6.2 Step 2: Identify Technically Feasible Control Technologies

Of the options listed in Step 1 of the BACT process, the following are the options that cannot be utilized due to being technically infeasible for the Nucor facility:

- DC Arc Furnace: Although the use of a DC arc furnace would typically yield significant efficiency savings, when compared to the use of an older generation three-phase arc furnace, but when compared to modern three-phase designs, the performance can be considered equivalent for some EAF applications. Due to the additional mixing ability that is produced from the direct current electrode, this phenomenon makes the use of DC technology more applicable to larger EAF ladles that would require this capability. As per "The AIST 2015 Electric Arc Furnace Roundup" the typical DC electrode technology is utilized on larger EAFs that are at least 100 ton capacity. From this same reference, it is noted that there are several steel making facilities that utilize 3- phase electrodes on smaller EAFs (less than 100 tons) that can achieve similar efficiencies to the DC electrode technology. Since the EAF proposed for the proposed mill will be less than 100 tons, the 3-Phase electrode design is indicated and thus would render the DC electrode technology **not applicable**.
- CONTIARC® Furnace: In the USEPA reference document stated previously the CONTIARC® technology is a proprietary method for scrap preheating which uses a continuous vertical scrap feed. The use of the CONTIARC® design is typically employed at EAF facilities much larger than the Nucor facility (over 100-ton capacity) and cannot be scaled down to a size adequate for this installation. In addition, the CONTIARC® design does not have a method for removing slag

from the melted steel and thus limits its application to steel processes where slag removal is not required. For the proposed mill, slag removal is a key requirement and so the CONTIARC® design would not- be appropriate. For these reasons, the CONTIARC® technology is **not applicable**.

- Twin-Shell (CONARC®) Furnace with Scrap Heating: The Twin-Shell (CONARC®) furnace design is very effective at improving productivity and reducing the energy required for the melting process but it represents a significantly larger capital expenditure and would therefore be typically utilized for facilities that produce over 1 million tpy of steel. For this reason, since the Nucor facility will have a much smaller production rate, the use of the Twin-Shell (CONARC®) technology is **not applicable.**
- Shaft Furnace with Scrap Heating: The shaft furnace is a batch-type preheater that can be used with either AC or DC furnaces and is located on top of the EAF. In the shaft furnace, scrap is preheated by low-velocity off-gases and then dropped into the EAF. Although this design has the capability of reducing electrical consumption by up to 18 percent, there are some significant safety issues that have arisen that are associated with this technology. As an example, the Nucor steel plant located in Kingman, AZ originally installed a DC furnace with shaft preheating of the scrap, but this facility experienced exceedingly high CO emissions from the scrap preheating that were so severe that they experienced explosions in the scrap preheating shaft that endangered the operations personnel. This furnace has been mothballed as a result and now, this plant now only rolls steel and does not perform melting operations due to this safety concern. Several other steel plants that originally installed shaft furnaces have converted to other means of scrap preheating other than the shaft furnace technique. For this reason, the use of the shaft furnace technology is not applicable. For the reasons stated above, the DC Arc Furnace, CONTIARC® Furnace, Twin-Shell (CONARC®) Furnace and Shaft Furnace options are **not considered to be technically feasible** for the Nucor facility and so will not be further considered as the BACT evaluation continues.
- Amine absorption technology for CO_2 capture has been applied to processes in the petroleum refining and natural gas processing industries, so it may be technically feasible to apply that technology to the emissions of GHGs from steel production facilities; however, that technology has not been commercially available to steel production facilities, which have considerably lower volumes of GHG emissions and a broad range of CO_2 concentrations, depending on what step of the steel-making process is under consideration. In addition, there are the added factors of the intermittent nature of the steel production facility components under consideration, the necessity to remove significant amounts of particulate matter from the exhaust before treatment as well as

the high temperatures of the exhausts produced during the steel making process in that the temperature of the exhaust from the components under consideration is much hotter than any previous demonstration project and would require significant cooling in order to be treated using the amine process for CO_2 removal. In addition, there are no CO_2 sequestration facilities near the Nucor facility that are certified to store the captured, compressed and transported CO_2 for an indefinite period of time. For these reasons, Nucor proposes that CCS be considered as **not technically feasible** for the Nucor facility.

These remaining technologies are technically feasible:

- Adjustable speed drives
- Transformer efficiency-ultra-high power transformers
- Bottom stirring/stirring gas injection
- Foamy slag practice
- Oxy-fuel burners
- Post combustion of the flue gases
- Scrap preheating
- Engineered refractories
- Eccentric bottom tapping on furnace
- Energy monitoring and management system

6.3.6.3 Step 3: Rank the Technically Feasible Control Technologies

The third step in the BACT analysis is to rank the remaining control technologies in order of control effectiveness. Since all of the remaining technologies will be implemented, no ranking is required.

6.3.6.4 Step 4: Evaluate the Most Effective Control Technologies

The fourth step in the BACT analysis is to evaluate the most effective control technologies not eliminated due to technical infeasibility. Since all the technically feasible options under consideration will be utilized by Nucor, no evaluation of the effectiveness of the control measures is required.

6.3.6.5 Step 5: Propose GHG BACT Determination

Nucor proposes the following measures to be considered as BACT for the control of GHGs from the EAF and LMF:

- Adjustable speed drives
- Transformer efficiency-ultra-high power transformers

- Bottom stirring/stirring gas injection
- Foamy slag practice
- Oxy-fuel burners
- Post combustion of the flue gases
- Scrap preheating
- Engineered refractories
- Eccentric bottom tapping on furnace
- Energy monitoring and management system

Nucor proposes the above technologies and work practices as BACT for GHG emissions with an emission rate of 438 lb/ton.

6.3.7 BACT for Fluorides for the EAF, LMF, Caster, and Melt Shop

Some melt shops add fluorides to the process:

1. Fluorspar (calcium fluoride) is added to certain grades of steel at the LMF as a slag conditioner.
2. Mold powder, which contains calcium fluoride, is added to the process at the caster.

However, Nucor does not currently plan to add fluoride to its process at the Nucor Florida facility. Since fluoride is difficult to enumerate, Nucor has conservatively assumed that it will be present in the emissions. Based on the nature of EAF slag and the temperature of the melt shop exhaust stream, fluoride compounds are expected to be particulates incorporated in the slag dust from the EAF.

6.3.7.1 Step 1: Identify All Potential Control Strategies

Fluorides can be controlled with particulate matter emission controls on sources where fluorides are emitted as dust. Most fluorides emitted from an EAF, melt shop/LMF, or caster are very small in particulate size. Potential control technologies for fluoride emissions are:

- ESP
- Wet scrubber
- Centrifugal separator (cyclones)
- Fabric filter (baghouse)

The results of the RBLC query (Appendix E) showed two relevant facilities: Essar Steel Minnesota, LLC (formerly known as Minnesota Steel Industries, LLC) and Nucor Steel Division - Nebraska. The one entry for fluorides is from a 205 ton per hour EAF/melt shop controlled by a baghouse to a level of 0.6

lbs/hr with compliance demonstrated through a limit on fluorides in the raw materials (direct reduced iron) of 50 milligrams per kilogram (mg/kg). Nucor Nebraska, which is not a continuous feed facility, and which injects fluoride into its EAF has a limit of 0.059 pound per ton of steel produced.

The Essar Steel project has been suspended, when the company was unable to secure the additional funding needed to finish construction and commence production (Essar Steel 2016). Additionally, Essar Steel proposed using direct reduced iron (DRI) in the process, which will not be used at Nucor Florida. Finally, Essar Steel has not demonstrated compliance with the BACT limit for fluorides, since the process was not constructed. Therefore, this RBLC entry for Essar Steel has not been demonstrated in practice and should not be used in comparison to this Project.

The Nucor Norfolk Nebraska facility was issued a PSD permit for fluorides on July 7, 2017. This permit is entered as draft into the RBLC and Nucor Nebraska does not inject fluoride in the EAF.

6.3.7.2 Step 2: Identify Technically Feasible Control Technologies

Table 6-5 summarizes the feasibility of potential controls for fluorides from the EAF, melt shop/LMF, and caster.

6.3.7.3 Step 3: Rank the Technically Feasible Control Technologies

The technically feasible fluorides control technologies for the EAF, melt shop, and caster are ranked by control effectiveness in Table 6-6.

Table 6-5: Technical Feasibility of Fluorides Control Technologies for the EAF, Melt Shop/LMF, and Caster

Control Technology	Description	Technically Feasible?
ESP	ESPs utilize an electric field to electrically charge the exhaust particles which are then collected on an oppositely charged electric plate thereby removing the particles from the exhaust stream. The collection plates are periodically cleaned by mechanical rapping to dislodge the particles which are collected in a hopper. An ESP is not anticipated to achieve its optimal removal efficiency for the EAF, melt shop/LMF, and caster due to the high metallic content of the EAF, melt shop/LMF, and caster exhaust. Particulate emissions from the EAF, melt shop/LMF, and caster contain significant amounts of iron oxide which, due to its magnetic properties, interferes with the mechanical removal of the particles from the plates, thereby reducing control efficiency. Additionally, electrostatic precipitators do not provide sufficient operational flexibility in handling the highly variable temperature, moisture content, and particle loading of the EAF, melt shop/LMF, and caster exhaust stream. ESPs are technically feasible but provide low control efficiency.	Yes
Wet scrubber	Wet scrubbers remove particulate via inertial impact of the particles with water droplets. While wet scrubbers can have high removal efficiency for consistent, steady-state streams, the scrubbers require a high pressure drop (which entails high energy costs) in order to maintain high removal efficiencies. A wet scrubber is considered technically feasible.	Yes
Centrifugal separator (cyclone)	Cyclones utilize centrifugal force to remove large and medium sized particles from a gas stream. The particle laden stream is introduced into the top of the cyclone in a tangential manner causing it to spiral down a tube. The larger particles are moved outward, impact the wall of the cyclone, and then slide down to a dust receiver for collection. When the gas stream reaches the bottom of the cyclone, it reverses direction, moving upward in a smaller, inner spiral that exits from the top as a cleaned gas stream. Cyclones are considered technically feasible.	Yes
Fabric filter (baghouse)	Fabric filters, also known as “baghouses,” remove particulate by passing the gas stream through porous fabric filters (bags) which trap the particles on the fabric. The particles collect on the fabric filters, forming a porous dust cake layer which results in a high collection efficiency, even for smaller particles. Baghouses are highly energy efficient, and provide sufficient operational flexibility due to their tolerance of varying gas stream conditions inherent in EAF, melt shop/LMF, and caster operations. Baghouses have been employed as BACT particulate control for the vast majority of EAF, melt shop/LMF, and casters in existence, and are a proven feasible control technology.	Yes

Table 6-6: Ranking of Technically Feasible Fluorides Control Technologies for the Melt Shop

Rank	Control Technology	Potential to Control Fluorides Emissions	Available and Demonstrated Effective	In Service on Similar Systems	Reduction (%)
1	Fabric filter (baghouse)	Yes	Yes	Yes	98% - 99+%[a]
2	Wet scrubber	Yes	Yes	No	94% - 98%[a]
3	ESP	Yes	Yes	No	92-98%[a]
4	Centrifugal separator (cyclone)	Yes	Yes	No	20-99%[b]

(a) AP-42, Table 12.13-2
(b) Cyclones can control larger particles much more effectively than small particles. Air Pollution Control Technology Fact Sheet (EPA-452/F-03-005)

6.3.7.4 Step 4: Evaluate the Most Effective Control Technologies

A baghouse was identified as the control technology with the greatest control efficiency for the EAF, melt shop/LMF, and caster emissions. Thus, Nucor proposes to use a baghouse as BACT for fluorides. Because a baghouse is the highest ranked technology, further analysis is not warranted.

6.3.7.5 Step 5: Propose Fluorides BACT Determination

The use of a baghouse is selected as BACT. Nucor proposes a BACT rate of 0.059 lb/ton steel produced, as verified by stack testing. If stack testing shows that the emissions are low enough to not trigger PSD review, Nucor will petition Florida DEP to remove the fluoride BACT from the permit, since fluoride emissions are unknown from the steel process proposed for Nucor Florida.

6.3.8 BACT for Start-up, Shutdown, Malfunction for the EAF, LMF, Caster, and Melt Shop

The nature of the operation is that start-up, shutdown and malfunction (SSM) emissions will be lower than maximum normal operations, therefore, SSM need not be addressed separately. SSM are included as part of the proposed limits. These limits comply with all NAAQS and increments.

6.4 BACT for the Ladle and Tundish Preheaters, Dryers and Skull Cutting

The melt shop includes natural gas-fired sources such as ladle preheater, ladle dryer, ladle skull cutting, tundish preheater, tundish dryer, and tundish skull cutting. These units operate on an as-needed, intermittent basis. Emissions will be vented through the melt shop canopy and ultimately exit the baghouse stack.

6.4.1 BACT Analysis for NO_x for Ladle and Tundish Preheaters, Dryers and Skull Cutting

CO and NO_x emissions generally have an inverse relationship in a combustion source and are dependent on temperature and fuel/air ratio.

6.4.1.1 Step 1: Identify All Potentially Applicable Control Technologies

Potentially applicable add-on NO_x controls that were examined include low NO_x combustion controls, SCR, SNCR, NSCR, and EM_x NO_x control. Some equipment will burn natural gas as a fuel.

6.4.1.2 Step 2: Identify Technically Feasible Control Technologies

As previously described, emissions from these emission units are routed to the EAF baghouse. For the same reasons as described in the EAF BACT, all add-on control options are not technically feasible. Burning clean natural gas and using good combustion practices are technically feasible.

6.4.1.3 Step 3: Rank the Technically Feasible Control Technologies

Burning clean natural gas and using good combustion practices are the only technically feasible control and is thus the highest ranked. These emission units typically must be placed inside process vessels, which eliminates the ability to duct them to any type of control other than general exhaust to the melt shop.

6.4.1.4 Step 4: Evaluate Most Effective Controls and Document Results

Burning clean natural gas and using good combustion practices are the best control options.

6.4.1.5 Step 5: Propose BACT

The use of good combustion practices is determined to be BACT for NO_x for these emission units. As previously described, specific emission limits for NO_x emission other than natural gas combustion for these units are not practical. Therefore, emissions from these emission units are routed to the EAF baghouse and must be included with the 0.3 lb/ton NO_x limit on a 30-day rolling average. Since natural gas will be the only fuel, the NO_x BACT for natural gas combustion is proposed to be 0.1 lb/MMBtu.

6.4.2 BACT Analysis for CO for Ladle and Tundish Preheaters, Dryers and Skull Cutting

CO and NO_x emissions generally have an inverse relationship in a combustion source and are dependent on temperature and fuel/air ratio.

6.4.2.1 Step 1: Identify All Potentially Applicable Control Technologies

Possible add-on control devices available to further reduce CO emissions (in addition to the reductions from the use of the oxygen lance and DEC) include catalytic oxidizers and thermal oxidizers.

6.4.2.2 Step 2: Identify Technically Feasible Control Technologies

Emissions from these emission units are routed to the EAF baghouse. Due to the reasons described in the EAF BACT, both catalytic and thermal oxidation are not technically feasible.

6.4.2.3 Step 3: Rank the Technically Feasible Control Technologies

Burning clean natural gas and using good combustion practices are the only technically feasible controls and are thus the highest ranked.

6.4.2.4 Step 4: Evaluate Most Effective Controls and Document Results

Burning clean natural gas and using good combustion practices such as optimizing the fuel/air ratio through proper tuning and maintenance are the best control options.

6.4.2.5 Step 5: Propose BACT

The use of good combustion practices is determined to be BACT for CO for these emission units. As previously described, specific emission limits for these units are not practical. Therefore, emissions from these emission units are routed to the EAF baghouse and must be included with the 3.5 lb CO/ton of steel expressed as a 30-day rolling average. This limit is consistent with other determinations on RBLC. Since natural gas will be the only fuel, the CO BACT for natural gas combustion is proposed to be 0.084 lb/MMBtu.

6.4.3 BACT Analysis for PM/PM_{10}/$PM_{2.5}$ for Ladle and Tundish Preheaters, Dryers and Skull Cutting

For these natural gas combustion sources, PM equals PM_{10} which equals $PM_{2.5}$ since all PM from natural gas combustion is expected to be $PM_{2.5}$ or smaller. It is also expected that the majority of the particulate matter will be condensable emissions; however a breakdown of filterable versus condensable emissions is not widely known for these small sources, as shown by the emission factor rating in AP-42, Section 1.4 (natural gas combustion), Table 1.4-2 which shows a rating of D (with A being the best rating and E being the worst rating) for total and condensable emission factors.

6.4.3.1 Step 1: Identify All Potentially Applicable Control Technologies

Possible add-on control devices available to further reduce PM/PM_{10}/$PM_{2.5}$ emissions include baghouses, ESPs, wet gas scrubbers, incinerators, and cyclones. These technologies are discussed in detail in the EAF BACT.

6.4.3.2 Step 2: Identify Technically Feasible Control Technologies

All of the identified particulate matter control technologies are technically feasible technologies for natural gas-fired combustion units. However, none of these technologies have been required as BACT for new or modified natural gas-fired combustion units. This is because natural gas has almost no inert materials or ash, so that the "uncontrolled" particulate emissions from the combustion of these fuels are as low as the controlled particulate emissions from solid fuel combustion using state-of-the art air pollution control systems like fabric filter baghouses. As a result, for natural gas combustion, none of the control technologies are expected to achieve emission rates lower than the use of natural gas fuel and good combustion practices designed to minimize products of incomplete combustion.

6.4.3.3 Step 3: Rank the Technically Feasible Control Technologies

Natural gas fuel combined with good combustion practices consist of the only available control option.

6.4.3.4 Step 4: Evaluate Most Effective Controls and Document Results

Natural gas fuel combined with good combustion practices result in the most effective controls.

6.4.3.5 Step 5: Propose BACT

Information was obtained from the RBLC concerning recently permitted natural gas fired external combustion units. All of the limits are generally in the same range and all limits are specified as good combustion practices which reflects the infeasibility of add on $PM_{2.5}$ controls for natural gas fired external combustion units. Setting a numerical limit for particulate emissions specifically from these emission units is not feasible. The emissions from these emission units are combined with all the other emission units in the melt shop and are routed through the EAF baghouse. Instead of incorporating specific emission limitations for these emission units, the particulate emission limitations for the EAF baghouses must incorporate emissions from all the processes that occur in the melt shop. In addition to utilizing the EAF baghouse, Nucor will utilize good combustion practices for natural gas combustion units with a BACT emission rate of 0.0076 lb/MMBtu. This rate is proposed for PM, PM_{10} and $PM_{2.5}$, with compliance methods based on vendor data to confirm compliance with this emission limit.

6.4.4 BACT Analysis for SO_2 for Ladle and Tundish Preheaters, Dryers and Skull Cutting

The combustion units are sources of SO_2 due to sulfur present in the natural gas fuel.

6.4.4.1 Step 1: Identify All Potentially Applicable Control Technologies

SO_2 emissions from natural gas fired burners are due to sulfur content of the fuel. Potentially applicable SO_2 control technologies consist of wet scrubbing, spray dryer absorption, dry sorbent injection, and fuel sulfur removal prior to combustion.

6.4.4.2 Step 2: Identify Technically Feasible Control Technologies

Emissions from these emission units are routed to the EAF baghouse. Due to the reasons described in the EAF BACT, wet scrubbing, spray dryer absorption, and DSI are not technically feasible. Pretreatment of natural gas to remove sulfur is not technically feasible due to the negligible level of sulfur present in the gas (<0.5 grains per dry standard cubic foot).

6.4.4.3 Step 3: Rank the Technically Feasible Control Technologies

Due to natural gas pipeline requirements and tariffs, the sulfur content in modem pipeline quality natural gas is nearly negligible. AP-42, Section 1.4 contains an emission factor of 0.6 lbs SO_2 for every million standard cubic feet (MMscf) of natural gas combusted. There are no technically feasible add-on control technologies.

6.4.4.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for SO_2 for the ladle and tundish preheaters, dryers and scull cutting.

6.4.4.5 Step 5: Propose BACT

The SO_2 BACT for these burners is proposed to be the use of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical. Therefore, emissions from these emission units are routed to the EAF baghouse and must be included with the SO_2 limit of 0.6 lb/ton of steel produced. Isolated natural gas emissions will be limited to 0.0006 lb/MMBtu.

6.4.5 BACT Analysis for VOC for Ladle and Tundish Preheaters, Dryers and Skull Cutting

The combustion units are sources of VOC as a byproduct of natural gas combustion.

6.4.5.1 Step 1: Identify All Potentially Applicable Control Technologies

Potentially applicable VOC add-on control technologies consist of thermal oxidation, catalytic oxidation, carbon adsorption, biofiltration, and condenser. Good combustion practices is another potential VOC control.

6.4.5.2 Step 2: Identify Technically Feasible Control Technologies

Emissions from these emission units are routed to the EAF baghouse. Due to the reasons described in the EAF BACT, thermal oxidation, catalytic oxidation, carbon adsorption, biofiltration, and condenser are not technically feasible. Good combustion practices are technically feasible.

6.4.5.3 Step 3: Rank the Technically Feasible Control Technologies

Good combustion practices is the only technically feasible control technologies.

6.4.5.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for VOC for the ladle and tundish preheaters, dryers and skull cutting other than good combustion practices.

6.4.5.5 Step 5: Propose BACT

The VOC BACT for these burners is proposed to be good combustion practices and using of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical. Therefore, emissions from these emission units are routed to the EAF baghouse and must be included with the VOC limit of 0.3 lb/ton of steel produced. Isolated natural gas emissions will be limited to 0.0055 lb/MMBtu.

6.4.6 BACT Analysis for GHG for Ladle and Tundish Preheaters, Dryers and Skull Cutting

The combustion units are sources of GHG as a byproduct of natural gas combustion.

6.4.6.1 Step 1: Identify All Potentially Applicable Control Technologies

Potentially applicable GHG control technologies are the same as discussed in the EAF BACT. Good combustion practices is another potential GHG control.

6.4.6.2 Step 2: Identify Technically Feasible Control Technologies

Emissions from these emission units are routed to the EAF baghouse. Due to the reasons described in the EAF BACT, add-on control technologies and CCS are not technically feasible. Good combustion practices is a technically feasible.

6.4.6.3 Step 3: Rank the Technically Feasible Control Technologies

Good combustion practices is the only technically feasible control technologies applicable to natural gas combustion.

6.4.6.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for GHG for the ladle and tundish preheaters, dryers and skull cutting other than good combustion practices.

6.4.6.5 Step 5: Propose BACT

The GHG BACT for these burners is proposed to be good combustion practices of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical. Therefore, emissions from these emission units are routed to the EAF baghouse and must be included with the GHG limit of 438 lb/ton of steel produced. Isolated natural gas emissions will be limited to 120 lb/MMBtu CO_2e emissions.

6.5 BACT for Particulate Matter ($PM_{10}/PM_{2.5}$) – Cooling Towers

In every cooling tower there is a loss of water to the environment due to the evaporative cooling process. This evaporation is usually in the form of pure water vapor. Drift, however, is the undesirable loss of liquid water to the environment via small droplets that become entrained in the leaving air stream. These water droplets carry with them chemicals and minerals, thus creating particulate emissions.

6.5.1 Step 1: Identify All Potential Control Strategies

Particulate emissions occur from the cooling towers as a result of the total solids (suspended and dissolved metals and minerals) in the water droplets entrained in the air stream leaving the cooling tower. These droplets of water (containing particulate) are known as drift. While the majority of the suspended water and particulate are deposited in or near the tower, some of the drift can exit through the top of the tower and enter the air as $PM/PM_{10}/PM_{2.5}$.

The particulate emissions from the cooling towers can be controlled by minimizing the amount of water drift that occurs and/or minimizing the amount of dissolved solids in the water. This can be accomplished by using high efficiency drift eliminators, fewer cycles of circulating water concentration, or a combination of both. The number of cycles of water concentration is limited by the amount of water available for use, since lower levels of concentration require increased cooling tower blowdown and more water intake to offset the blowdown.

Review of the federal RBLC database for cooling towers at similar steel mills indicates that high efficiency drift eliminators and limits on total dissolved solids (TDS) concentration in the circulating water are the techniques which set the basis for cooling tower BACT emission limits. The efficiency of drift eliminator designs is characterized by the percentage of the circulating water flow rate that is lost to drift. The drift eliminators to be used on the proposed cooling tower will be designed such that the drift rate is less than a specified percentage of the circulating water. Typical geometries for the drift eliminators include chevron blade, honeycomb, or wave form patterns, which attempt to optimize droplet impingement with minimal pressure drop.

Recent BACT determinations for utility-scale mechanical draft cooling towers are summarized in Appendix E. The commercially available techniques listed to limit drift PM/PM_{10}/$PM_{2.5}$ releases from utility scale cooling towers include:

- Use of dry cooling (no water circulation) heat exchanger units
- High-efficiency drift eliminators
- Limitations on TDS concentrations in the circulating water
- Combinations of drift eliminator efficiency rating and TDS limit
- Installation of drift eliminators (no efficiency specified)

The use of high-efficiency drift eliminating media to de-entrain aerosol droplets from the air flow exiting the wetted-media tower is commercially proven technique to reduce PM/PM_{10}/$PM_{2.5}$ emissions. Compared to “conventional” drift eliminators, advanced drift eliminators reduce the PM/PM_{10}/$PM_{2.5}$ emission rate by more than 90 percent.

In addition to the use of high efficiency drift eliminators, management of the tower water balance to control the concentration of dissolved solids in the cooling water can also reduce particulate emissions. Dissolved solids accumulate in the cooling water due to increasing concentration of dissolved solids in the make-up water as the circulating water evaporates, and, secondarily, the addition of anti-corrosion, anti-biocide additives. However, to maintain reliable operation of the tower without the environmental impact of frequent acid wash cleanings, the water balance must be considered. The proposed cooling tower design is based on an engineering judgment that cooling water is estimated not to exceed a TDS concentration of 5,000 ppm.

Lastly, the substitution of a dry cooling tower is a commercially available option that has been adopted by utility-scale combined-cycle plants in arid climates, usually because of concerns other than air emissions, such as the unavailability of water. This option involves use of a very large, finned-tube water-to-air heat

exchanger through which one or more large fans force a stream of ambient dry air to remove heat from the circulating water in the tube-side of the exchanger.

6.5.2 Step 2: Identify Technically Feasible Control Technologies

6.5.2.1 High Efficiency Drift Eliminators

Development of increasingly effective de-entrainment structures has resulted in equipment vendors claims that a cooling tower may be specified to achieve drift release no higher than 0.0005 percent of the circulating water rate. This is the most stringent BACT for cooling towers in current permits for steel mills. This level of drift elimination is found on larger cooling towers than will be installed at the Facility.

Even incremental improvement in drift control involves substantial changes in the tower design. First, the velocity of the draft air that is drawn through the tower media must be reduced compared to "conventional" specifications. This is necessary to use drift eliminator media with smaller passages (to improve droplet capture) without encountering unacceptably high pressure drop. Since reducing the air velocity also reduces the heat transfer coefficient of the tower, it is likely that a proportional increase in the overall size of the media will be needed. For example, an 8-cell tower may need to be expanded to 10 cells in order to accommodate higher drift eliminator efficiency for the same heat rejection duty. These changes will also result in an energy penalty in the form of larger and higher-powered fans to accommodate the improved droplet capture. More importantly, there is a substantial increase in both tower operating costs and capital costs that deliver relatively few tons of PM/PM_{10}/$PM_{2.5}$ abatement.

Adopting a TDS limit for the circulating water is usually viewed as a measure that benefits air quality by reducing the dissolved salts that can be precipitated from drift aerosols. To reduce TDS the facility must introduce a higher volume flow of make-up water to the tower. This has the potential environmental disadvantage of increasing the overall plant water requirements.

Drift eliminators are considered **technically feasible** for this Project.

6.5.2.2 Non-Evaporative Cooling Tower

One measure that has been adopted in arid, low precipitation climates is the use of a dry, *i.e.*, non-evaporative cooling tower for heat rejection from combined-cycle power plants. Where it has been adopted, this measure is usually a means to reduce the water consumption of the plant, rather than as BACT for PM/PM_{10}/$PM_{2.5}$ emissions. There is a very substantial capital cost penalty in adopting this technology, in addition to the process changes (e.g., operating pressures) necessary to condense water at the ambient dry bulb temperature, rather than at ambient wet bulb temperature. Because of the process

design changes involved in the use of a dry cooling tower, this option is **considered to be technically infeasible** for this Project.

6.5.2.3 Summary of Technically Feasible $PM_{10}/PM_{2.5}$ Controls for Cooling Tower

The technical feasibility of the control options for the cooling towers is summarized in Table 6-7. The expected performance has been determined considering the design requirements for the cooling tower.

Table 6-7. Summary of Technically Feasible $PM/PM_{10}/PM_{2.5}$ Technologies for Cooling Towers

Control System		Technical Feasibility	Comments
Drift Eliminators	0.001% Drift Efficiency	Feasible	0.001% is the lowest drift efficiency available on this size cooling tower for the steel industry with low water flow and few cells

6.5.3 Step 3: Rank the Technically Feasible Control Technologies

Because all of the commercially available options that could form the basis for a BACT emission limit for $PM/PM_{10}/PM_{2.5}$ from the cooling tower are also technically feasible, this section will rank these options. The technically feasible option of high-efficiency drift eliminators can be implemented at different levels of stringency. Development of increasingly effective de-entrainment structures now allows a cooling tower to be specified to achieve drift release no higher than 0.001 percent of the circulating water rate. As seen in Appendix E (RBLC tables) there is one facility that does not appear to be a steel mill comparable to Nucor Florida that has a limit of 0.0005 percent drift eliminators. CMC Oklahoma, which has an almost identical process and output as Nucor Florida, supports a limit of 0.001 percent as BACT for cooling towers of this size. There are no significant costs or environmental factors which favor implementation of a less-stringent drift eliminator option. Table 6-8 displays the rankings of the controls for the cooling tower.

Table 6-8. Ranking of $PM_{10}/PM_{2.5}$ Control for Cooling Towers

Control System		Expected Performance % Reduction
Drift Eliminators	0.001% Drift Efficiency	99.9990%

6.5.4 Steps 4 and 5: Evaluate the Most Effective Control Technologies and Propose BACT for PM/PM_{10}/$PM_{2.5}$

Drift eliminators to control drift emissions to 0.001 percent of the water flow through the cooling towers are proposed as BACT for particulate matter control on the cooling towers. This represents the highest option for BACT, and in accordance with USEPA guidance, no further control techniques were considered. This BACT rate will serve to limit PM, PM_{10}, and $PM_{2.5}$ emissions.

6.6 BACT Analysis for Natural Gas-Fired Emergency Engines

Subpart JJJJ—Standards of Performance for Stationary Spark Ignition Internal Combustion Engines became effective March 18, 2008. The RICE engines are subject to the NSPS Subpart JJJJ limits for non-emergency spark ignited (SI) natural gas engines greater than 500 hp manufactured after July 1, 2010. The applicable emission limitations for emergency engines greater than 130 hp are:

- NO_x 2.0 g/hp-hr
- CO 4.0 g/hp-hr
- VOC 1.0 g/hp-hr

BACT emission limitations must be at least as stringent as the applicable NSPS.

6.6.1 BACT Analysis for NO_x for Natural Gas-Fired Emergency Engines

NO_x is primarily formed in combustion processes in three ways: 1) the combination of elemental nitrogen with oxygen in the combustion air within the high temperature environment of the combustor (thermal NO_x); 2) reactions of nitrogen with hydrocarbon radicals from the fuel (prompt NO_x); and 3) the oxidation of nitrogen contained in the fuel (fuel NO_x). Natural gas contains negligible amounts of fuel-bound nitrogen, although some molecular nitrogen is present. Therefore, it is assumed that essentially all NO_x emissions from the engines originate as thermal NO_x. The rate of formation of thermal NO_x is a function of residence time and free oxygen and is exponential with peak flame temperature. NO_x control techniques are aimed at controlling one or more of these variables during combustion. Controlling the air-to-fuel ratio can reduce the amount of NO_x.

6.6.1.1 Step 1: Identify All Potentially Applicable Control Technologies

The RICE for the Project will be lean-burn, 4-stroke engines, which can also be characterized as clean-burn engines. The term “clean-burn” technology refers to engines designed to reduce NO_x by operating at high air-to-fuel ratios. The RICE will be equipped with turbo chargers which increase the volume of air in

the combustion chamber. Lean-burn engines typically have lower oxides of nitrogen (NO_x) emissions than rich-burn engines.

Other control methods utilize add-on equipment to remove NO_x from the exhaust gas stream after its formation. The most common control techniques involve the injection of ammonia or urea into the gas stream to reduce the NO_x to molecular nitrogen and water. Ammonia is either injected into the engine combustion chamber (NSCR) or injected with the use of a catalyst (SCR). NSCR may be used for rich-burn engines but is not feasible on lean-burn engines.

6.6.1.2 Step 2: Identify Technically Feasible Control Technologies

Emergency engines are normally operated once a month or once a week for 30-60 minutes testing purposes. Sustained operation would only occur in an actual emergency. All three engines will be limited to 100 hours per year for testing and maintenance purposes.

6.6.1.2.1 Non-Selective Catalytic Reduction

NSCR uses the residual hydrocarbons and CO in the rich-burn engine exhaust as a reducing agent for NO_x. In an NSCR, hydrocarbons and CO are oxidized by O_2 and NO_x. The excess hydrocarbons, CO, and NO_x pass over a catalyst that reduces NO_x to N_2.

The NSCR technique is effectively limited to engines with normal exhaust oxygen levels of 4 percent or less. This includes four-stroke rich-burn naturally-aspirated engines and some four-stroke rich- burn turbo-charged engines. Engines operating with NSCR require tight air-to-fuel control to maintain high reduction effectiveness without high hydrocarbon emissions. To achieve effective NO_x reduction performance, the engine may need to be run with a richer fuel adjustment than normal. This exhaust excess oxygen level is usually closer to 1 percent.

Lean-burn engines cannot be retrofitted with NSCR control because of the reduced exhaust temperatures. **Because lean-burn engines cannot be fitted with NSCR, NSCR is not technically feasible for application to the RICE.**

6.6.1.2.2 Selective Catalytic Reduction

SCR is a post-combustion technology that employs ammonia in the presence of a catalyst to convert NO_x to nitrogen and water. The function of the catalyst is to lower the activation energy of the NO_x decomposition reaction. Technical factors related to this technology include the catalyst reactor design, optimum operating temperature, sulfur content of the fuel, deactivation due to aging, ammonia slip

(ammonia that is left unreacted and exits out the stack) emissions, and the design of the ammonia injection system.

SCR represents state-of-the-art controls for lean-burn four-stroke engine NO_x removal. This technology is also commonly used on natural gas-fired non-emergency engines.

The temperature of the exhaust in an SCR dictates the type of catalyst that will be used and its efficiency. When operated as an emergency engine, the RICE will not get hot enough for SCR operation. **SCR is not technically feasible for application to the RICE.**

6.6.1.2.3 Lean-Burn Combustion

The Project's RICE will be lean-burn, four-stroke engines. Lean-burn engines may operate up to the lean flame extinction limit, with exhaust oxygen levels of 12 percent or greater. The air-to-fuel ratios of lean-burn engines range from 20:1 to 50:1 and are typically higher than 24:1. The Project's RICE lean-burn engines are also characterized as clean-burn engines. Engines operating at high air-to-fuel ratios (greater than 30:1) may require combustion modification to promote stable combustion with the high excess air. The RICE are designed with a turbo charger which is used to force more air than non-turbo charged engines into the combustion chamber. Lean-burn engines typically have lower NO_x emissions than rich-burn engines.

Steady-state controlled NO_x emissions using no control or only lean-burn combustion range from 0.19 to 20.2 g/bhp-hr according to the RBLC database (Table E-3). The NO_x emissions are highly variable depending on the specific RICE and its use. Each vendor that offers RICE has different NO_x emission levels, even though they all may use lean-burn technology.

Because lean-burn combustion with clean-burn technology is standard on engines like those to be used for the Project, it is a technically feasible option for the RICE.

6.6.1.2.4 Summary of the Technically Feasible Control Options

The technical feasibility of the NO_x control options for the engines is summarized in Table 6-9. The expected performance (steady state) has been determined considering the vendor guarantees.

Table 6-9: Summary of Technically Feasible NO_x Control Technologies for the RICE

Control System		Technical Feasibility	Comments
Combustion controls	Lean-burn combustion	Feasible	Standard
Post combustion controls	Non-selective catalytic reduction	Not Feasible	Only used on rich-burn engines
	Selective catalytic reduction	Not Feasible	Catalyst will not reach operating temperature during testing/maintenance operation

6.6.1.3 Step 3: Rank the Technically Feasible Control Technologies

Add-on controls are not a technically feasible option on the Project's RICE. The RICE will come as lean-burn engines as part of the standard packages. Therefore, lean-burn combustion is the only technically feasible control option.

6.6.1.4 Step 4: Evaluate Most Effective Controls and Document Results

Energy Impacts

Lean-burn combustion and clean-burn technology are usually accompanied by an efficiency penalty (typically 2 to 3 percent) and an increase in power output (typically 5 to 6 percent). The increase in power output results from the increase in mass flow required to maintain engine inlet temperature at manufacturer's specifications. Because there is a power increase, no energy impacts are associated with lean-burn combustion and clean-burn technology.

Environmental Impacts

Lean-burn combustion may increase CO and VOC emissions. However, this increase does not outweigh the advantage of decreased NO_x emissions because NO_x emissions are considered to be more detrimental to the environment and human health.

Economic Impacts

The RICE vendors under consideration currently install lean-burn combustion with clean-burn technology as standard on the engines. Because lean-burn combustion is standard equipment on the engines, there is no calculated annualized cost of the control for the economic impacts evaluation.

The maximum technically feasible control applied to RICE is lean-burn combustion. **Because this is the highest level of control for engines of this size, BACT for control of NO_x emissions from the RICE is lean-burn combustion with clean-burn technology.**

6.6.1.5 Step 5: Propose BACT

BACT determinations shown in the RBLC (Table E-3) for engines that are in a similar size range located in attainment areas were in the range of 0.45 to 2.0 g/hp-hr using lean-burn combustion for natural gas-fired engines.

The BACT emission limitation for NO_x is proposed to be 2.0 g/hp-hr for intermittent operation of these emergency engines.

6.6.2 BACT Analysis for CO for Natural Gas-Fired Emergency Engines

CO results from incomplete combustion. Control of CO is typically accomplished by providing adequate fuel residence time and a high temperature in the combustion zone to ensure complete combustion. CO emissions may indicate early quenching of combustion gases on cylinder walls or valve surfaces. Lean burn engines typically have higher CO emissions and lower NO_x emissions due to the air-to-fuel ratios at which they both operate.

6.6.2.1 Step 1: Identify All Potentially Applicable Control Technologies

CO emissions from engines are a function of oxygen availability (excess air), flame temperature, residence time at flame temperature, combustion zone design, and turbulence. Front-end control involves controlling the combustion process to suppress CO formation. Post-combustion control involves the use of catalytic oxidation.

The technologies identified for reducing CO emissions from the engines are an oxidation catalyst (also referred to as a CO catalyst) and combustion controls. The standard technology for reducing CO emissions is to maintain “good combustion” through proper control and monitoring of the combustion process through the air-to-fuel ratio. A survey of the RBLC database (Table E-3) indicates that combustion controls is the most prevalent BACT control, with several oxidation catalysts listed as BACT.

6.6.2.2 Step 2: Identify Technically Feasible Control Technologies

6.6.2.2.1 Oxidation Catalyst

Oxidation catalysts are a post-combustion technology which does not rely on the introduction of additional chemicals, such as ammonia or urea with SCR, for a reaction to occur. The oxidation of CO to

CO_2 utilizes excess air present in the engine exhaust; the activation energy required for the reaction to proceed is lowered in the presence of a catalyst. Products of combustion are introduced into a catalytic bed, with the optimum temperature range for these systems being between 700°F and 1,100°F. At higher temperatures, catalyst sintering may occur, potentially causing permanent damage to the catalyst. The addition of a catalyst bed onto the engine exhaust will create a pressure drop, resulting in back pressure to the engine. This has the effect of reducing the efficiency of the engine and the power generating capabilities.

When operated as an emergency engine, the RICE will not get hot enough for oxidation catalyst operation. **The use of oxidation catalysts is not technically feasible method for controlling CO emissions from the RICE.**

6.6.2.2.2 Combustion Control

"Good combustion practices" include operational and incinerator design elements to control the amount and distribution of excess air in the flue gas to ensure that there is enough oxygen present for complete combustion (controlling the air-to-fuel ratio).

Good combustion practices are a technically feasible method of controlling CO emissions from the RICE.

6.6.2.3 Step 3: Rank the Technically Feasible Control Technologies

Using good combustion practices is the only technically feasible control and is thus the highest ranked.

6.6.2.4 Step 4: Evaluate Most Effective Controls and Document Results

Using good combustion practices such as optimizing the fuel/air ratio through proper tuning and maintenance is the best control option.

6.6.2.5 Step 5: Propose BACT

BACT determinations shown in the RBLC (Table E-3) for engines that are in a similar size range located in attainment areas were in the range of 4.0 g/hp-hr using lean-burn combustion for natural gas-fired emergency engines. The use of good combustion practices is determined to be BACT for CO for these emission units.

6.6.3 BACT Analysis for PM/PM_{10}/$PM_{2.5}$ for Natural Gas-Fired Emergency Engines

PM/PM_{10}/$PM_{2.5}$ emissions from natural gas combustion sources consist of several components: a) inert contaminants in natural gas; b) sulfates from fuel sulfur or mercaptans used as odorants, c) dust drawn in from the ambient air, and d) particulate of carbon and hydrocarbons resulting from incomplete combustion. Therefore, units firing fuels with low ash content and high combustion efficiency exhibit correspondingly low particulate emissions.

6.6.3.1 Step 1: Identify All Potentially Applicable Control Technologies

Because of their extremely low particulate concentrations and resulting large costs per ton of particulate matter removed, post-combustion controls, such as ESPs or baghouses, have not been applied to commercial gas-fired engines. In addition, no vendors of the RICE to be used for the Project have identified any similar engines that have particulate control devices. Therefore, the use of ESPs and baghouse filters are both technically infeasible and do not represent an available control technology.

In the absence of add-on controls, the most effective control method demonstrated for gas engines is the use of low ash fuel, such as natural gas, and combustion controls. This was confirmed by a survey of the RBLC database (Table E-3) which disclosed no add-on PM/PM_{10}/$PM_{2.5}$ control technologies for the RICE to be used for this Project. **Because proper combustion control and the firing of fuels with negligible or zero ash content (such as natural gas) are the only control methods, they are BACT for the RICE. Further control technology is not necessary or appropriate.**

6.6.3.2 Step 2: Identify Technically Feasible Control Technologies

No add-on technology has been required as BACT for new or modified natural gas-fired combustion units. This is because natural gas has almost no inert materials or ash, so that the "uncontrolled" particulate emissions from the combustion of these fuels are as low as the controlled particulate emissions from solid fuel combustion using state-of-the-art air pollution control systems like fabric filter baghouses. As a result, the use of natural gas fuel and good combustion practices designed to minimize products of incomplete combustion are the only technically feasible options.

6.6.3.3 Step 3: Rank the Technically Feasible Control Technologies

Natural gas fuel combined with good combustion practices consist of the only available control option.

6.6.3.4 Step 4: Evaluate Most Effective Controls and Document Results

Natural gas fuel combined with good combustion practices result in the most effective controls.

6.6.3.5 Step 5: Propose BACT

BACT determinations shown in the RBLC (Table E-3) for engines that are in a similar size range located in attainment areas were in the range of 3.4 g/hp-hr (PM) using lean-burn combustion for natural gas-fired engines. The use of good combustion practices is determined to be BACT for $PM/PM_{10}/PM_{2.5}$ for these emergency engines. The $PM/PM_{10}/PM_{2.5}$ BACT for natural gas combustion is proposed to be 0.048 g/hp-hr.

As with the BACT analysis for the other natural gas-fired emission units discussed in Section 6.4.3 of this BACT analysis, it is very difficult to determine filterable versus condensable portions of $PM/PM_{10}/PM_{2.5}$ from small natural gas combustion sources, therefore the proposed BACT analysis is the same for all particulate sizes.

6.6.4 BACT Analysis for SO_2 for Natural Gas-Fired Emergency Engines

The combustion units are sources of SO_2 due to sulfur present in the natural gas fuel.

6.6.4.1 Step 1: Identify All Potentially Applicable Control Technologies

SO_2 emissions from natural gas fired burners are due to sulfur content of the fuel. Potentially applicable SO_2 control technologies consist burning low sulfur fuel. No add-on controls are potentially applicable.

6.6.4.2 Step 2: Identify Technically Feasible Control Technologies

The use of low sulfur fuels is technically feasible (<0.5 grains per dry standard cubic foot).

6.6.4.3 Step 3: Rank the Technically Feasible Control Technologies

The use of low sulfur fuels is the only technically feasible control.

6.6.4.4 Step 4: Evaluate Most Effective Controls and Document Results

The use of low sulfur fuels is the most effective control.

6.6.4.5 Step 5: Propose BACT

The SO_2 BACT for these engines is proposed to be the use of pipeline quality natural gas. BACT determinations shown in the RBLC (Appendix E) for engines that are in a similar size range located in attainment areas were 0.015 grams/kilowatt-hour (g/kw-hr) using pipeline quality natural gas. The SO_2 BACT for natural gas combustion is proposed to be the use of natural gas fuel.

6.6.5 BACT Analysis for VOC for Natural Gas-Fired Emergency Engines

VOC results from incomplete combustion. VOC emissions occur when some gas remains unburned or is only partially burned during the combustion process. With natural gas, some organics are unreacted trace constituents of the gas, while others may be products of the heavier hydrocarbon constituents. Partially burned hydrocarbons result from inadequate air-to-fuel mixing before or during combustion or inefficient air-to-fuel ratios in the cylinder during combustion due to maladjustment of the engine fuel system. Lean-burn engines typically have higher VOC emissions than rich-burn engines due to the respective air-to-fuel ratios at which they operate.

6.6.5.1 Step 1: Identify All Potentially Applicable Control Technologies

VOC emissions from engines are a function of oxygen availability (excess air), flame temperature, residence time at flame temperature, and combustion zone design. Front-end control involves controlling the combustion process to suppress unburned VOC. Post-combustion control involves the use of catalytic oxidation.

The technologies identified for reducing VOC emissions from the RICE being considered are the same as those identified for CO control: an oxidation catalyst (also referred to as a CO catalyst) and combustion controls. The standard technology for reducing VOC emissions is to maintain “good combustion” through proper control and monitoring of the combustion process through the air-to-fuel ratio. A survey of the RBLC database (Appendix E) indicates that combustion controls is the most prevalent BACT control listed as BACT for VOC.

6.6.5.2 Step 2: Identify Technically Feasible Control Technologies

For the reasons stated in the CO BACT for the natural gas-fired engines, an oxidation catalyst is not technically feasible. Good combustion practices are the only technically feasible control.

6.6.5.3 Step 3: Rank the Technically Feasible Control Technologies

Good combustion practices are the only technically feasible control.

6.6.5.4 Step 4: Evaluate Most Effective Controls and Document Results

Good combustion practices is the most effective control.

6.6.5.5 Step 5: Propose BACT

The VOC BACT for these engines is proposed to be the use of good combustion practices. BACT determinations shown in the RBLC (Table E-3) for engines that are in a similar size range without

oxidation catalysts located in attainment areas were 0.9 g/kw-hr. The VOC BACT for natural gas combustion is proposed to be 1.0 g/hp-hr.

6.6.6 BACT Analysis for GHG for Natural Gas-Fired Emergency Engines

The combustion units are sources of GHG as a byproduct of natural gas combustion.

6.6.6.1 Step 1: Identify All Potentially Applicable Control Technologies

Unlike other regulated air pollutants, which can be reduced by controlling the combustion process or through addition of add-on controls, there is at this time no corresponding way to reduce the amount of CO_2 generated during combustion, as CO_2 is an inherent product of the chemical reaction between the fuel and oxygen in which it burns. As such, the only way to reduce the amount of CO_2 generated by a fuel-burning power plant is to design and operate it through the use of the most efficient generating technologies for the anticipated load requirement.

Emissions of CO_2 during fossil fueled combustion are strongly correlated to the amount of carbon in the fuel stream. In comparison to all other potential fuels, natural gas will achieve the lowest emissions of CO_2 and other GHGs.

6.6.6.2 Step 2: Identify Technically Feasible Control Technologies

Due to the reasons described in the EAF BACT, CCS is not technically feasible. Burning natural gas and good combustion practices is the only technically feasible option.

6.6.6.3 Step 3: Rank the Technically Feasible Control Technologies

Burning natural gas and good combustion practices are the only technically feasible control technologies applicable to the emergency engines.

6.6.6.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for GHG for the emergency engines other than burning natural gas and good combustion practices.

6.6.6.5 Step 5: Propose BACT

The GHG BACT for these engines is proposed to be good combustion practices of pipeline quality natural gas at an emission rate of 117.1 lb/MMBtu for CO_2e.

6.7 BACT for Scrap Cutting

Scrap cutting is a natural gas combustion process that will be done in the slag yard with manual torches. Scrap cutting is similar to the ladle and tundish preheating, drying and skull cutting evaluated in Section 6.4, but emissions from the scrap cutting will not be controlled by the EAF baghouse. Natural gas will be the only fuel burned for scrap cutting.

6.7.1 BACT Analysis for NO_x for Scrap Cutting

CO and NO_x emissions generally have an inverse relationship in a combustion source and are dependent on temperature and fuel/air ratio.

6.7.1.1 Step 1: Identify All Potentially Applicable Control Technologies

As with the ladle and tundish preheaters, dryers and skull cutting, potentially applicable add-on NO_x controls that were examined include low NO_x combustion controls, SCR, SNCR, NSCR and EM_x NO_x control. The equipment will burn natural gas as a fuel.

6.7.1.2 Step 2: Identify Technically Feasible Control Technologies

There are no add-on control devices available to further reduce NO_x emissions from the manually-operated scrap cutting units.

6.7.1.3 Step 3: Rank the Technically Feasible Control Technologies

Burning clean natural gas and using good combustion practices are the only technically feasible control and is thus the highest ranked. These emission units will be manually operated outside, which eliminates the ability to duct them to any type of control.

6.7.1.4 Step 4: Evaluate Most Effective Controls and Document Results

Burning clean natural gas and using good combustion practices are the best control options.

6.7.1.5 Step 5: Propose BACT

The use of good combustion practices is determined to be BACT for NO_x for scrap cutting. As the scrap cutting is a manual process that will be done outside, specific emission limits for these units are not practical.

6.7.2 BACT Analysis for CO for Scrap Cutting

CO and NO_x emissions generally have an inverse relationship in a combustion source and are dependent on temperature and fuel/air ratio.

6.7.2.1 Step 1: Identify All Potentially Applicable Control Technologies

There are no add-on control devices available to further reduce CO emissions from the manually-operated scrap cutting units.

6.7.2.2 Step 2: Identify Technically Feasible Control Technologies

As with the ladle and tundish preheaters, dryers and skull cutting, both catalytic and thermal oxidation are not technically feasible.

6.7.2.3 Step 3: Rank the Technically Feasible Control Technologies

Burning clean natural gas and using good combustion practices are the only technically feasible controls and are thus the highest ranked.

6.7.2.4 Step 4: Evaluate Most Effective Controls and Document Results

Burning clean natural gas and using good combustion practices are the best control options.

6.7.2.5 Step 5: Propose BACT

The use of good combustion practices is determined to be BACT for CO for the scarp cutting. As the scrap cutting is a manual process that will be done outside, specific emission limits for these units are not practical.

6.7.3 BACT Analysis for PM/PM_{10}/$PM_{2.5}$ for Scrap Cutting

For these natural gas combustion sources, PM equals PM_{10} which equals $PM_{2.5}$ since all PM from natural gas combustion is expected to be $PM_{2.5}$ or smaller. It is also expected that the majority of the particulate matter will be condensable emissions, however a breakdown of filterable versus condensable emissions is not widely known for these small sources, as shown by the emission factor rating in AP-42, Section 1.4 (natural gas combustion), Table 1.4-2 which shows a rating of D (with A being the best rating and E being the worst rating) for total and condensable emission factors.

6.7.3.1 Step 1: Identify All Potentially Applicable Control Technologies

Possible add-on control devices available to further reduce PM/PM_{10}/$PM_{2.5}$ emissions include baghouses, ESPs, wet gas scrubbers, incinerators, and cyclones. These technologies are discussed in detail in the EAF BACT.

6.7.3.2 Step 2: Identify Technically Feasible Control Technologies

There are no add-on control devices available to further reduce PM/PM_{10}/$PM_{2.5}$ emissions from the manually-operated scrap cutting units.

6.7.3.3 Step 3: Rank the Technically Feasible Control Technologies

Natural gas fuel combined with good combustion practices consist of the only available control option.

6.7.3.4 Step 4: Evaluate Most Effective Controls and Document Results

Natural gas fuel combined with good combustion practices result in the most effective controls.

6.7.3.5 Step 5: Propose BACT

The use of good combustion practices is determined to be BACT for $PM/PM_{10}/PM_{2.5}$ for the scrap cutting. As the scrap cutting is a manual process that will be done outside, specific emission limits for these units are not practical.

6.7.4 BACT Analysis for SO_2 for Scrap Cutting

The combustion units are sources of SO_2 due to sulfur present in the natural gas fuel.

6.7.4.1 Step 1: Identify All Potentially Applicable Control Technologies

SO_2 emissions from natural gas fired burners are due to sulfur content of the fuel. Potentially applicable SO_2 control technologies consist of wet scrubbing, spray dryer absorption, dry sorbent injection, and fuel sulfur removal prior to combustion.

6.7.4.2 Step 2: Identify Technically Feasible Control Technologies

As with the ladle and tundish preheaters, dryers and skull cutting, wet scrubbing, spray dryer absorption, and DSI are not technically feasible. Pretreatment of natural gas to remove sulfur is not technically feasible due to the negligible level of sulfur present in the gas (<0.5 grains per dry standard cubic foot).

6.7.4.3 Step 3: Rank the Technically Feasible Control Technologies

Due to natural gas pipeline requirements and tariffs, the sulfur content in modem pipeline quality natural gas is nearly negligible. AP-42, Section 1.4 contains an emission factor of 0.6 lbs SO_2/MMscf of natural gas combusted. There are no technically feasible add-on control technologies.

6.7.4.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for SO_2 for the scrap cutting.

6.7.4.5 Step 5: Propose BACT

The SO_2 BACT for the scrap cutting is proposed to be the use of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical.

6.7.5 BACT Analysis for VOC for Scrap Cutting

The combustion units are sources of VOC as a byproduct of natural gas combustion.

6.7.5.1 Step 1: Identify All Potentially Applicable Control Technologies

Potentially applicable VOC add-on control technologies consist of thermal oxidation, catalytic oxidation, carbon adsorption, biofiltration, and condenser. Good combustion practices is another potential VOC control.

6.7.5.2 Step 2: Identify Technically Feasible Control Technologies

As with the ladle and tundish preheaters, dryers and skull cutting, thermal oxidation, catalytic oxidation, carbon adsorption, biofiltration, and condenser are not technically feasible. Good combustion practices are technically feasible.

6.7.5.3 Step 3: Rank the Technically Feasible Control Technologies

Good combustion practices are the only technically feasible control technologies.

6.7.5.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for VOC for the scrap cutting other than good combustion practices.

6.7.5.5 Step 5: Propose BACT

The VOC BACT for scrap cutting is proposed to be good combustion practices and using of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical.

6.7.6 BACT Analysis for GHG for Scrap Cutting

The combustion units are sources of GHG as a byproduct of natural gas combustion.

6.7.6.1 Step 1: Identify All Potentially Applicable Control Technologies

Potentially applicable GHG control technologies are the same as discussed in the BACT for the ladle and tundish preheaters, dryers and skull cutting. Good combustion practices is another potential GHG control.

6.7.6.2 Step 2: Identify Technically Feasible Control Technologies

As with the ladle and tundish preheaters, dryers and skull cutting, add-on control technologies and CCS are not technically feasible. Good combustion practices are a technically feasible.

6.7.6.3 Step 3: Rank the Technically Feasible Control Technologies

Good combustion practices is the only technically feasible control technologies applicable to natural gas combustion.

6.7.6.4 Step 4: Evaluate Most Effective Controls and Document Results

There are no available control options for GHG for the scrap cutting other than good combustion practices.

6.7.6.5 Step 5: Propose BACT

The GHG BACT for the scrap cutting is proposed to be good combustion practices of pipeline quality natural gas. As previously described, specific emission limits for these units is not practical.

6.8 BACT Analysis for Particulate Matter (PM/PM_{10}/$PM_{2.5}$) – Haul Roads

Haul roads will be located on site. Truck traffic will travel on paved and unpaved roads; some loaders and other equipment will travel on unpaved roads as well. Emissions of particulate matter will be filterable only and speciated into PM, PM_{10}, and $PM_{2.5}$. However, control technologies will control all sizes of particulate.

6.8.1 Step 1: Identify All Potentially Applicable Control Technologies

In a review of the RBLC, the following control technologies for particulate emissions from roads were identified:

1. Chemical dust suppression and surfactant application,
2. Watering, sweeping and vacuuming,
3. Reducing silt content, and
4. Traffic and speed restrictions

6.8.2 Step 2: Identify Technically Feasible Control Technologies

All of the options listed as potentially applicable control technologies are considered technically feasible for the Nucor facility.

6.8.3 Step 3: Rank the Technically Feasible Control Technologies

The third step in the BACT analysis is to rank the remaining control technologies in order of control effectiveness. Table 6-10 provides a listing of PM/PM_{10}/$PM_{2.5}$ control technologies by effectiveness.

Table 6-10: Efficiency Ranking of Particulate Control Technologies for Haul Roads

Control Technology	Approximate Control Efficiency (percent)
Watering, sweeping/vacuuming of paved roads	< 98
Paving, gravel, or asphalt	95
Water	90
Speed/traffic restrictions	--

6.8.4 Step 4: Evaluate the Most Effective Control Technology

The fourth step in the BACT analysis is to evaluate the most effective control technology based on energy, environmental, and economic impacts. Based on a review of the RBLC, the implementation of a Fugitive Dust Control Plan (FDCP), including watering, vacuuming/sweeping paved roads, and speed reduction, is considered a control method accepted as BACT for particulate emissions from roads at similar facilities. No specific BACT emission limits associated with the previously mentioned control methods were obtained from the RBLC.

6.8.5 Step 5: Propose Roads PM/PM_{10}/$PM_{2.5}$ BACT Determination

Nucor proposes to develop, maintain, and implement a FDCP as BACT for the roads.

6.9 BACT Analysis for Particulate Matter (PM/PM_{10}/$PM_{2.5}$) – Material Handling

PM/PM_{10}/$PM_{2.5}$ emissions will be generated from the handling and storage of raw materials and steelmaking byproducts. The processes that will result in the emission of particulate include storage silos, storage piles, and other material handling.

6.9.1 BACT Analysis for PM/PM_{10}/$PM_{2.5}$ – Storage Silos

Injection carbon, fluxing agents such as lime and dolomite, and EAF baghouse dust will be stored in storage silos.

6.9.1.1 Step 1: Identify All Potentially Applicable Control Technologies

In a review of the RLBC, the following control technologies were identified for the control of particulate emissions from storage silos:

1. Fabric filter baghouse
2. Bin vent filters
3. Mechanical collector (cyclone)

4. Venturi wet scrubber
5. Wet dust suppression

6.9.1.2 Step 2: Identify Technically Feasible Control Technologies

All of the above listed control technologies are technically feasible for the control of particulate emissions from storage silos.

6.9.1.3 Step 3: Rank the Technically Feasible Control Technologies

All of the above listed control technologies are technically feasible for the control of particulate emissions from storage silos. Table 6-11 ranks the storage silos control technology efficiencies.

Table 6-11: Efficiency Ranking of Particulate Control Technologies for Storage Silos

Control Technology	Approximate Control Efficiency
Enclosed with bin vent or fabric filter	0.005 gr/dscf
Enclosed with wet dust suppression/surfactant spray/ reduced drop height	> 95%
Cyclones and Venturi Scrubbers	> 90%

6.9.1.4 Step 4: Evaluate the Most Effective Control Technology

The top ranked control technology for storage silo particulate emissions is a bin vent or fabric filter controlling particulate emissions to 0.005 gr/dscf.

6.9.1.5 Step 5: Propose Storage Silos PM/PM_{10}/$PM_{2.5}$ BACT Determination

Nucor proposes the use of bin vents or fabric filters on enclosed storage silos, controlling particulate emissions to 0.005 gr/dscf as BACT. All particulate exiting the baghouse will be less than 2.5 microns in diameter. This BACT applies to the dust silo, flux silos/hopper, and carbon silo/hopper. The limit applies to PM_{10}, $PM_{2.5}$ and PM as all emissions are assumed to be filterable particulate matter.

6.9.2 BACT Analysis for PM/PM_{10}/$PM_{2.5}$ – Material Handling Piles and Drop Points

Material handling sources include the scrap, slag, alloy, and mill scale storage, which will occur both inside and outside and include both wind erosion from the piles and drop and transfer points at the piles.

6.9.2.1 Step 1: Identify All Potentially Feasible Control Technologies

In a review of the RLBC, the following control technologies were identified for the control of particulate emissions from storage piles, material handling, and fugitives:

1. Wetting piles
2. Partial enclosure
3. Minimizing drop height

6.9.2.2 Step 2: Identify Technically Feasible Control Technologies

Minimizing drop height and using covered conveyors are both technically feasible control technologies for all material handling. Wetting piles or chemical dust suppressant is technically infeasible for raw scrap piles, fluxing agents, carbon, and alloys, because if water contacts molten steel in the EAF a violent and unsafe reaction will occur. If wetting were used to control dust, more energy and combustion would be needed to dry out the material before entering the EAF. Wetting is feasible for the mill scale pile. See Table 6-12.

Table 6-12: Technical Feasibility of Particulate Control Technologies for Material Handling

Material Handling Source	Wetting/Moisture	Partial Enclosure	Minimizing Drop Height
Scrap yard	Not Feasible	Not Feasible	Feasible
Scrap building	Not Feasible	Feasible	Feasible
Alloy pile	Not Feasible	Feasible	Feasible
Mill scale pile	Feasible	Not Feasible	Feasible
Slag yard	Feasible	Not Feasible	Feasible
Dust loadout	Not Feasible	Not Feasible	Feasible
Conveyor transfer points	Not Feasible	Feasible	Feasible

6.9.2.3 Step 3: Rank the Technically Feasible Control Technologies

The above listed control technologies do not all have numeric control efficiencies. Table 6-13 shows the approximate control efficiencies of some of the control technologies.

Table 6-13: Efficiency Ranking of Particulate Control Technologies for Material Handling

Control Technology	Approximate Control Efficiency (%)
Partial enclosure	85
Watering	70
Material moisture content	50
Minimize drop height	--

6.9.2.4 Step 4: Evaluate the Most Effective Control Technology

The most effective control varies by material handling source. All technically feasible controls will be implemented as appropriate for each source; therefore, no ranking is needed.

6.9.2.5 Step 5: Propose Storage Piles PM/PM_{10}/$PM_{2.5}$ BACT Determination

BACT for the material handling is proposed as shown in Table 6-14.

Table 6-14: Proposed BACT for Particulate Control of Material Handling

Material Handling Source	Proposed BACT
Scrap yard	Minimizing drop height
Scrap building	Partial enclosure, minimizing drop height
Alloy pile	Partial enclosure, minimizing drop height
Mill scale pile	Wetting, minimizing drop height
Slag yard	Wetting, minimizing drop height
Dust loadout	Minimizing drop height
Conveyor transfer points	Partial enclosure, minimizing drop height

7.0 AIR DISPERSION MODELING

Since the Project is subject to PSD review, an air dispersion modeling analysis is required for each regulated NSR pollutant that exceeds its PSD significance level. According to the emission calculations for this Project, NO_x, CO, SO_2, PM_{10}, $PM_{2.5}$, VOC, and CO_2e are subject to PSD review; as a result, an air quality analysis was performed for NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$ using the EPA-approved American Meteorological Society (AMS)/EPA Regulatory Model (AERMOD). Consistent with Florida DEP and EPA guidance, modeling of VOC and CO_2e were not conducted, since there are no modeling thresholds for these pollutants.

A pre-project meeting was held with the Florida DEP to discuss the modeling methodology that would be used for this Project. The air dispersion modeling protocol is presented in Appendix F of this application.

A summary of the models, the modeling techniques, and modeling results for the Project are discussed in the following sections.

7.1 Air Dispersion Model

Air dispersion modeling was performed using the latest version of the AERMOD model (Version 18081). The AERMOD model is an EPA-approved, steady-state Gaussian air dispersion model that is designed to estimate downwind ground-level concentrations from single or multiple sources using detailed meteorological data. AERMOD is a model currently approved for industrial sources and PSD permits.

The Florida DEP requested that Nucor demonstrate regulatory compliance through AERMOD. Major features of the AERMOD model are as follows:

- Plume rise, in stable conditions, is calculated using Briggs equations that consider wind and temperature gradients at stack top and half the distance to plume rise. In unstable conditions, plume rise is superimposed on the displacements by random convective velocities, accounting for updrafts and downdrafts due to momentum and buoyancy as a function of downwind distance for stack emissions.
- Plume dispersion receives Gaussian treatment in horizontal and vertical directions for stable conditions and non-Gaussian probability density function in vertical direction for unstable conditions.
- AERMOD creates profiles of wind, temperature, and turbulence, using all available measurement levels and accounts for meteorological data throughout the plume depth.

- Surface characteristics, such as Bowen ratio, albedo, and surface roughness length, may be specified to better simulate the modeling domain.
- Planetary Boundary Layers (PBL) such as friction velocity, Monin-Obukhov length, convective velocity scale, mechanical and convective height, and sensible heat flux may be specified.
- AERMOD uses a convective (based on hourly accumulation of sensible heat flux) and a mechanical mixed layer height.
- AERMOD's terrain pre-processor (AERMAP) provides information for the advanced critical dividing streamline height algorithms and uses the National Elevation Dataset (NED) to obtain elevations.
- AERMOD uses vertical and horizontal turbulence-based plume growth (from measurements and/or PBL theory) that varies with height and uses continuous growth functions.
- AERMOD uses convective updrafts and downdrafts in a probability density function to predict plume interaction with the mixing lid in convective conditions while using a mechanically mixed layer near the ground.
- Plume reflection above the lid is considered.
- AERMOD models impacts that occur within the cavity regions of building downwash via the use of the plume rise model enhancements (PRIME) algorithm, and then uses the standard AERMOD algorithms for areas without downwash.

Details of the modeling algorithms contained in the AERMOD model may be found in the User's Guide for AERMOD (EPA, 2018b). The regulatory default option was selected for this analysis since it met the EPA guideline requirements and Florida DEP modeling guidance requirements.

The following default model options, which were discussed in the air dispersion modeling protocol, were used:

- Elevated terrain algorithms
- Stack-tip downwash
- Gradual plume rise
- Buoyancy-induced dispersion
- Calms and missing data processing routine
- Calculate wind profiles
- Default vertical potential temperature gradient
- Rural dispersion

7.2 Model Parameters

Modeling runs were conducted to confirm that operation of the Project will not result in impacts greater than the NAAQS and PSD Class II Increments. The expected hourly emission rates are shown in Appendix D. These emission rates represent projected worst-case ambient conditions and the annual emissions are based on worst-case annual emissions.

7.2.1 1-hour Modeling for NO_2 and SO_2

To be conservative, the 1-hour NO_2 and SO_2 models include values for the melt shop baghouse (EP08) that could be seen in a 1-hour period. Very little data exists on operation of micro mills that use the ECS process, therefore, it is unknown if the 1-hour averages might result in occasional spikes due to scrap variability and the melting process. As such, the maximum hourly emission rates (lb/hr) used in these very short-term averaging periods were increased by an extremely conservative amount and modeled to show that even with the potential for spikes, the ambient air would still be protected. The maximum 1-hour lb/hr value modeled for NO_2 is 370 lb/hr and the maximum 1-hour value modeled for SO_2 is 340 lb/hr.

7.2.2 Haul Roads

Volume sources were used to represent the emissions of truck traffic on haul roads. These roads were laid out using the guidance from the March 2, 2012, EPA memo on the Haul Road Workgroup Final Report. The following parameters were used:

- Vehicle height = 12.0 feet or 3.66 meters
- Road width = 30.0 feet or 9.14 meters
- Top of plume height = 1.7 x vehicle height = 20.4 feet or 6.22 meters
- Volume source release height = 0.5 x top of plume height = 10.2 feet or 3.11 meters
- Width of plume = road width + 6 meters for two lane roadways = 49.7 feet or 15.14 meters
- Initial sigma z = top of plume / 2.15 = 9.5 feet or 2.89 meters
- Initial sigma y = width of plume / 2.15 = 23.1 feet or 7.04 meters
- Adjacent volume source spacing = sigma y x 2.15 = 49.7 feet or 15.14 meters

Calculated road emissions are included in Appendix D of this submittal.

7.2.3 Storage Piles

Where applicable, emissions from storage piles were modeled using four different components: storage pile load-in, storage pile load-out, wind erosion, and pile maintenance vehicle activity.

The storage pile load-in and load-out source parameters were modeled. If a front-end loader is used in the load-in or load-out process it was modeled as a volume source. If a conveyor is used to feed the storage pile or unload from the storage pile, it was also classified as a volume source.

Wind erosion from the piles were modeled as area sources. For the area sources, the dimensions of each pile will approximate the area that each of the piles cover. The average height of the pile was used to represent the release height of the pile. Wind erosion from storage piles was only considered at wind speeds above 12 miles per hour and was modeled using the STAR/WSPEED emission rate factor to simulate the lack of emissions below 12 miles per hour. The initial vertical dimension was listed as zero as there is limited amount of growth from a storage pile plume release.

Vehicle maintenance activity around a storage pile is classified as a haul road and was modeled as a volume source.

Calculated storage pile emissions are included in Appendix D of this submittal.

7.3 Modeling Methodology

The modeling methodology used for this analysis is summarized in the sections below.

7.3.1 Intermittent Emissions

Per Florida DEP guidance, Nucor proposes to only model continuous operation for the 1-hour standard. Emission units that do not have a set operating schedule, operate for short periods of time during the year, and do not contribute to the normal operation of the facility were not included in the 1-hour modeling analysis. The two-emergency natural gas-fired generators and one emergency natural gas-fired fire pump will operate less than 100 hours annually and are considered intermittent sources; as such, these sources are not included in the 1-hour NO_2 and SO_2 modeling analysis.

7.3.2 Emission Factors

Emissions factor (EMISFACT) modeling options in AERMOD allow a user to model emissions only when certain criteria are met. Wind erosion from storage piles were modeled as area sources using the STAR/WSPEED emission rate factor to simulate the lack of emissions below 12 miles per hour. EMISFACT was not used for any other sources in the model.

7.3.3 Rain Caps and Horizontal Stacks

If horizontal stacks or rain caps are present at the site, the restriction of vertical flow is accounted for through the use of the POINTCAP or POINTHOR keywords within the AERMOD input file. The caster spray stack (EP10) is a horizontal stack and modeled with the POINTHOR keyword.

7.3.4 Good Engineering Practice Stack Height

Sources are subject to Good Engineering Practice (GEP) stack height requirements outlined in 40 CFR Part 51, Sections 51.100 and 51.118. As defined by the regulations, GEP height is calculated as the greater of 65 meters (measured from the ground level elevation at the base of the stack) or the height resulting from the following formula:

$$GEP = H + 1.5L$$

Where,

H = the building height; and

L = the lesser of the building height or the greatest crosswind distance of the building, also known as maximum projected width.

To meet stack height requirements, the point sources were evaluated in terms of their proximity to nearby structures. The purpose of this evaluation is to determine if the discharge from each stack will become caught in the turbulent wake of a building or other structure, resulting in downwash of the plume. Downwash of the plume can result in elevated ground-level concentrations. In EPA's 1985 *Guideline for Determination of Good Engineering Practice Stack Height*, EPA provides guidance for determining whether building downwash will occur. The downwash analysis was performed consistent with the methods prescribed in this guidance document.

Calculations for determining the direction-specific downwash parameters were performed using the most current version of the EPA's Building Profile Input Program – Plume Rise Model Enhancements, otherwise referred to as the BPIP-PRIME downwash algorithm (Version 04274). BPIP-PRIME files are included in the electronic file transfer to the Florida DEP. After running the BPIP-PRIME model, it was determined that the GEP stack heights do not exceed the greater of 65 meters or the calculated GEP stack height.

7.3.5 Receptor Grid

The overall purpose of the modeling analysis is to demonstrate that operation of the Project will not result in, or contribute to, concentrations above the NAAQS or PSD Class II Increments. Modeling runs were conducted using the AERMOD model in simple and complex terrain mode within a 20- by 20-kilometer

Cartesian grid to determine the significant impact area for each pollutant (Figure G-1, Appendix G). Based on guidance from Florida DEP, the grid incorporated the receptor spacing specified in Table 7-1. Receptors were also placed along the fence line boundary at a spacing of 25 meters.

Table 7-1: Receptor Spacing from Fence Line Boundary

Distance from Fence Line (kilometers)	Receptor Spacing (meters)
0 – 0.1	50
0.1 – 2	100
2 – 5	250
5 – 10	1,000

Terrain elevations were incorporated into the model. Therefore, the appropriate U.S. Geological Survey (USGS) NED was used to obtain the necessary receptor elevations. North American Datum of 1983 (NAD 83) was used to develop the Universal Transverse Mercator (UTM) coordinates for this Project.

AERMOD has a terrain preprocessor (AERMAP) which uses gridded terrain data for the modeling domain to calculate not only a XYZ coordinate, but also a representative terrain-influenced height associated with each receptor location selected. This terrain-influenced height is called the height scale and is separate for each individual receptor. AERMAP (Version 18081) utilized the electronic NED data to populate the model with receptor elevations.

7.3.6 Meteorological Data

AERMOD requires a preprocessor called AERMET to process meteorological data for 5 years from offsite locations to estimate the boundary layer parameters for the dispersion calculations. AERMET requires the input of surface roughness length, albedo, and Bowen ratio to define land surface characteristics for its calculations. Florida DEP provides AERMOD-ready processed meteorological data sets; therefore, the site characteristics (Bowen ratio, albedo, surface roughness) were completed by Florida DEP.

Surface air meteorological data from Winter Haven Municipal Airport near Auburndale, Florida (WBAN ID 12876) was used in the analysis. The Winter Haven Municipal Airport is approximately 32 miles northwest of the Project site and like the Project site, is located in inland Florida. Upper air data from Tampa International Airport in Tampa, Florida (WBAN ID 12842) was used in the analysis. The Tampa International Airport is approximately 67 miles from the Project site and is the closest upper air station available. The most recent 5-year data set available covers the period of 2013 to 2017. A profile base

elevation of 44.5 meters was used in the model. The meteorological data used to develop these data sets has been analyzed by Florida DEP for data completeness, and these data sets have good data quality.

7.3.7 Land Use Parameters

USGS land cover data was used to determine the rural and urban land use percentages for a 3-kilometer area surrounding the Project site (Figure G-2, Appendix G). Land use categories I1, I2, C1, R2, and R3 were classified as urban land use categories (EPA, 2017). Less than 7 percent of the area surrounding the Project site is classified as urban. Since the 3-kilometer area surrounding the Project is more than 50 percent rural, the rural dispersion coefficients option in the AERMOD model were selected.

7.3.8 Modeling Thresholds

The NAAQS, modeling/monitoring significance levels, and PSD Class II Increment thresholds for the modeled pollutants are shown in Table 7-2.

Table 7-2: NAAQS, Modeling and Monitoring Significance Levels, and PSD Class II Increment

Pollutant	Averaging Period	Monitoring Significance Level[1]	Modeling Significance Level[2]	PSD Class II Increment[3]	NAAQS[4]
	micrograms per cubic meter (µg/m^3)				
NO_x	Annual	14	1	25	100
	1-hour	--	7.55	--	188
CO	8-hour	575	500	--	10,000
	1-hour	--	2,000	--	40,000
PM_{10}	Annual	--	1	17	--
	24-hour	10	5	30	150
$PM_{2.5}$	Annual	--	0.2[5]	4	12
	24-hour	4[a]	1.2[5]	9	35
SO_2	Annual	--	1	20	80
	24-hour	13	5	91	365
	3-hour	--	25	512	1,300
	1-hour	--	7.86	--	196
Fluorides	24-hour	0.25	--	--	--

(4) Title 40 CFR Part 50.
(5) EPA Memorandum, 2018a, "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program."
(a) The $PM_{2.5}$ 24-hour significant monitoring concentration vacated by the United States Court of Appeals for the District of Columbia Circuit on January 22, 2013, is not considered valid in Florida. However, representative local monitoring data is available for use.

The modeled values were modeled using the appropriate form of the standard for each pollutant and averaging period. For significance modeling, all short-term and annual averaging periods were modeled using the highs shown in Table 7-3. For PSD Class II Increment, the short-term averaging periods were compared to the high second highest impacts, and the annual standards were compared to the first highest impacts. The NAAQS thresholds were modeled using the highs shown in Table 7-3 for each averaging period.

Table 7-3: Modeled Highs

Pollutant	Averaging Period	Significant Impact Level High[1]	NAAQS Modeled High[2]
NO_2	Annual	1st highest	1st highest
	1-hour	5-year average 1st high hour day	5-year average 8th high hour day
CO	8-hour	1st highest	High 2nd highest
	1-hour	1st highest	High 2nd highest
PM_{10}	Annual	1st highest	--
	24-hour	1st highest	6th highest in 5 years
$PM_{2.5}$	Annual	5-year average year	5-year average year
	24-hour	5-year average 1st high day	5-year average 8th high day
SO_2	Annual	1st highest	1st highest
	24-hour	1st highest	High 2nd highest
	3-hour	1st highest	High 2nd highest
	1-hour	5-year average 1st high hour day	5-year average 4th high hour-day

7.3.9 Ambient Monitoring

The modeling analysis for emission sources for the Project will also address the pre-construction monitoring provision of the PSD regulations (EPA, 1987). The regulations specify monitoring *de minimis* levels for each PSD pollutant that, if exceeded, trigger the requirement to perform 1 year of pre-construction ambient air monitoring. If any predicted concentrations reach or exceed the monitoring *de*

minimis levels, the owner will consult with Florida DEP to determine if pre-construction ambient air monitoring will be required. If modeled values exceed their respective monitoring *de minimis* values, the owner will request a waiver to use local ambient monitoring data to fulfill the pre-construction monitoring provisions of the PSD regulations or develop an acceptable monitoring plan at that time. For any impacts predicted to be below the monitoring *de minimis* levels, the owner will request an exemption from pre-construction ambient air monitoring, given that representative monitors in the area may be used for appropriate background concentrations.

7.3.10 Background Air Quality

As stated previously, if any pollutant exceeds its respective PSD significance level, a refined analysis (cumulative analysis) will be performed for that pollutant and averaging period. The analysis will be used to determine compliance with the PSD Class II Increments and the NAAQS. The NAAQS are set up to protect the air quality for all sensitive populations, and attainment is determined by the comparison to the NAAQS thresholds. As such, existing concentrations of each criteria pollutant that are present in ambient air must be included in an analysis to account for items, such as mobile source emissions, not already accounted for in the model. Monitored ambient emission levels will be added to the modeled ground level impacts to account for these sources. Modeling indicates that refined modeling will be required for NO_2, PM_{10}, $PM_{2.5}$, and SO_2. Therefore, background values for these pollutants were determined for the refined modeling analysis.

The EPA and the Florida DEP collect ambient air quality pollutant concentrations from monitors that are placed throughout the State (as do other state agencies, in their respective states). The data that is collected by the monitors is available on the EPA website (http://www.epa.gov/airdata/). Background values for NO_2, PM_{10}, $PM_{2.5}$, and SO_2 were identified from the monitors in the area. The monitored background levels will be added to the modeled impacts, as previously discussed.

In accordance with EPA documentation (EPA, 1987), there are three criteria that should be considered when selecting a representative existing ambient air monitor to represent ambient air concentrations for a Project. These three criteria are:

- Monitor location
- Data quality
- Currentness of data

Further discussion on these three criteria is presented below.

7.3.10.1 Monitor Location and Currentness of Data

The selected monitors for the Project are located in Florida, as noted in Figure G-3, Appendix G. For each pollutant, the most representative monitor was selected. Land use was considered in the selection of representative monitors for the proposed Project. Monitored concentrations should represent the land use within the immediate vicinity of the site, as much as is practicable. The land use surrounding the Project and each of the selected monitors are shown in Figures G-2, G-4, G-5, and G-6 in Appendix G. As demonstrated in the figures, the land use surrounding the selected monitors is predominantly low intensity and medium intensity developed land, while the Project site is mostly cultivated cropland, developed open space, and low intensity developed land. Therefore, the selected monitors are expected to be a conservative estimate of concentrations. Currentness of data was also considered in the selection of representative monitors for the proposed Project. The monitors selected had data available for monitoring years 2015 through 2017, the most recent three-year period.

7.3.10.2 Data Quality

Data quality was a factor in the selection of the proposed monitors. The selected monitors were reviewed for completeness, and it was determined that all data years for each pollutant are more than 80 percent complete. Therefore, the monitors meet the requirement for 80 percent completeness per EPA documentation (EPA, 1987).

7.3.10.3 Winter Park: Winter Park, Florida (Monitor 12-095-2002)

The most representative inland NO_2 monitor is the Winter Park monitor (AIRS No. 12-095-2002) located in Winter Park, Florida, as shown in Figure G-3, Appendix G. This monitor is located approximately 106 kilometers northeast of the Project site. Figure G-4, Appendix G displays the land use near the monitor. The land use surrounding the monitor is predominantly low-intensity and medium-intensity developed land. The Project site is mostly cultivated cropland, developed open space, and low-intensity developed land. This monitor is the inland NO_2 monitor closest to the Project site and is more representative than monitors located in coastal areas. Because this monitor is in an urban area, the monitored NO_2 concentrations are expected to be a conservative estimate of NO_2 concentrations in a less-developed area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of the Project area. The regional background concentrations that will be used for the NO_2 averaging periods are listed in Table 7-4.

7.3.10.4 Baptist Children's Home: Lakeland, Florida (Monitor 12-105-6006)

The most representative monitor for the $PM_{2.5}$ and PM_{10} background concentrations is the Baptist Children's Home monitor (AIRS No. 12-105-6006) located in Lakeland, Florida, shown in Figure G-3,

Appendix G. This is the closest operating $PM_{2.5}$ and PM_{10} monitor that is representative of the Project site. This monitor is located approximately 61 kilometers northwest from the Project site. Figure G-5, Appendix G displays the land use near the monitor. The land use surrounding the monitor is predominantly low-intensity and medium-intensity developed land. The Project site is mostly cultivated cropland, developed open space, and low intensity developed land. This monitor is the inland monitor closest to the Project site and will be more representative than a monitor located in a coastal area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of the Project area. The regional background concentrations that will be used for the $PM_{2.5}$ and PM_{10} averaging periods are listed in Table 7-4.

7.3.10.5 Sikes Elementary School: Lakeland, Florida (Monitor 12-105-6005)

The most representative monitor for the SO_2 background concentrations is the Sikes Elementary School monitor (AIRS No. 12-105-6005) located in Lakeland, Florida, shown in Figure G-3, Appendix G. This is the closest operating SO_2 monitor that is representative of the Project site. This monitor is located approximately 57 kilometers northwest from the Project site. Figure G-6, Appendix G displays the land use near the monitor. The land use surrounding the monitor is predominantly developed open space and medium-intensity developed land. The Project site is mostly cultivated cropland, developed open space, and low intensity developed land. This monitor is the inland monitor closest to the Project site and will be more representative than a monitor located in a coastal area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of the Project area. The regional background concentrations that will be used for the SO_2 averaging periods are listed in Table 7-4.

Table 7-4: Background Concentrations

Pollutant	Averaging Period	Background Concentration ($\mu g/m^3$)[1,a]	Form of the Standard	Air Quality System Monitor ID
NO_2	Annual	7.71	Maximum arithmetic mean for years 2015 to 2017	Winter Park (12-095-2002)
	1-hour	52.64	98th percentile of daily maximum 1-hour value averaged over years 2015 to 2017	
PM_{10}	24-hour	41.33	98th percentile averaged over years 2015 to 2017	Baptist Children's Home (12-105-6006)
$PM_{2.5}$	Annual	6.53	Maximum arithmetic mean for years 2015 to 2017	Baptist Children's Home (12-105-6006)
	24-hour	20.67	98th percentile of daily maximum 1-hour value averaged over years 2015 to 2017	
SO_2	Annual	3.20	Maximum arithmetic mean for years 2015 to 2017	Sikes Elementary School (12-105-6005)
	24-hour	11.27	Maximum highest second high for years 2015 to 2017	
	3-hour	71.53	Maximum highest second high for years 2015 to 2017	
	1-hour	55.89	99th percentile of daily maximum 1-hour value averaged over years 2015 to 2017

(a) $\mu g/m^3$ = micrograms per cubic meter.

7.3.11 NAAQS and PSD Class II Increment

When the maximum impacts exceed the significant impact level for any pollutant and averaging time, then a refined modeling analysis is required. The inventories of sources were developed in accordance with applicable EPA guidance and input from Florida DEP. For the NAAQS and PSD Class II Increment analysis, all stationary sources identified by Florida DEP that emit pollutants subject to this analysis and are located within the radius of impact were addressed.

Background air quality concentrations (as described in Section 7.3.10) were added to model-predicted concentrations for comparison to the NAAQS. If the refined analysis does not result in any concentrations above the NAAQS or PSD Class II Increments, no further modeling will be conducted.

7.3.12 NO_2 Modeling – Multi-Tiered Screening Approach

The AERMOD model gives the emission results for all pollutants, including NO_x. However, impacts of nitrogen dioxide (NO_2) must be examined for comparison to the NAAQS, PSD Class II Increments, and significance values. The EPA has a three-tier approach to modeling NO_2 concentrations:

- Tier I – total conversion, or all $NO_x = NO_2$
- Tier II – use a default NO_2/NO_x ratio
- Tier III – case-by-case detailed screening methods, such as the Ozone Limiting Method (OLM) or Plume Volume Molar Ratio Method (PVMRM)

Tier II of the ARM2 uses a minimum and maximum ratio that varies based on the modeled level of NO_x. For the 1-hour and annual modeled results, the default minimum and maximum ratios of 0.5 and 0.9, respectively, were applied to determine the predicted ground-level concentration of NO_2.

7.4 Significance Model Results

Significance modeling was performed for NO_2, CO, PM_{10}, $PM_{2.5}$, fluorides, and SO_2 for the appropriate emission sources. The modeled impacts are shown in Table 7-5 below.

Table 7-5: Maximum Modeled Concentrations for Significance Modeling

Pollutant	Averaging Period	UTM Coordinates[a]		Year	Predicted Concentration	Modeling Significance Level[1]	Monitoring De Minimis Level[2]
		Easting (meters)	Northing (meters)		micrograms per cubic meter (µg/m³)		
NO_2	Annual	448,454.0	3,058,141.2	2016	1.1	1	14
	1-hour	449,249.0	3,058,391.6	5 years	178.7	7.55	--
CO	8-hour	449,254.9	3,059,258.7	2016	216.6	500	575
	1-hour	449,253.2	3,059,010.9	2015	494.9	2,000	--
PM_{10}	Annual	448,429.7	3,058,141.4	2016	2.9	1	--
	24-hour	449,252.0	3,058,837.5	2014	30.3	5	10
$PM_{2.5}$	Annual	448,429.7	3,058,141.4	5 years	0.9	0.2[3]	--
	24-hour	449,252.0	3,058,837.5	5 years	8.0	1.2[3]	4[b]
SO_2	Annual	448,429.7	3,058,141.4	2016	0.4	1	--
	24-hour	449,249.5	3,058,465.9	2016	5.9	5	13
	3-hour	449,252.2	3,058,862.3	2017	18.9	25	--
	1-hour	449,249.0	3,058,391.6	5 years	163.9	7.86	--
Fluorides	24-hour	449,249.5	3,058,465.9	2016	0.6	--	0.25

(b) The $PM_{2.5}$ 24-hour significant monitoring concentration vacated by the United States Court of Appeals for the District of Columbia Circuit on January 22, 2013, is not considered valid in Florida. However, representative local monitoring data is available for use.

7.4.1 NO_2 Significance Results

After examining the modeling results, it was determined that exceedances of the annual and 1-hour NO_2 modeling significance level occurred, and that refined modeling would be required.

The annual predicted impacts were lower than the ambient air monitoring *de minimis* level and therefore no pre-construction ambient monitoring is proposed for NO_2.

7.4.2 CO Significance Results

After examining the modeling results, it was determined that no exceedances of the 8-hour or 1-hour CO modeling significance level occurred, and that refined modeling would be not required. The 8-hour predicted impacts were lower than the ambient air monitoring *de minimis* level and therefore no pre-construction ambient monitoring is proposed for CO.

7.4.3 $PM_{10}/PM_{2.5}$ Significance Results

After examining the modeling results, it was determined that exceedances of the annual and 24-hour PM_{10} and $PM_{2.5}$ modeling significance level occurred, and that refined modeling would be required.

The 24-hour predicted impacts were greater than the PM_{10} and $PM_{2.5}$ ambient air monitoring *de minimis* levels and therefore pre-construction ambient monitoring must be considered for PM_{10} and $PM_{2.5}$. Nucor requests that existing monitoring data from the Baptist Children's Home monitor located in Lakeland, Florida (monitor number 12-105-6006) be used for existing ambient levels of PM_{10} and $PM_{2.5}$ in the area. Section 7.3.10.4 outlines how this monitor is representative of the Project area based on land use surrounding the Project site and the inland monitor location.

7.4.4 SO_2 Significance Results

After examining the modeling results, it was determined that no exceedances of the annual and 3-hour SO_2 modeling significance level occurred, and that refined modeling would not be required. The 24-hour predicted SO_2 impacts were lower than the ambient air monitoring *de minimis* level and therefore no pre-construction ambient monitoring is proposed for SO_2.

The model predicted that impacts greater than the 24-hour and 1-hour SO_2 modeling significance level occurred, and refined modeling would be required.

7.4.5 Fluorides Monitoring Results

Upon review of the EPA's RACT/BACT/LAER clearinghouse, there are very few steel mills that have fluoride BACT rates and very little is known about fluoride emissions from steel micro mills. Some mills add fluoride to their processes; however, Nucor does not currently plan to add fluoride to its process. Since fluoride emissions are difficult to quantify, Nucor has conservatively assumed that it will be present in the emissions. Based on the nature of EAF slag and the temperature of the melt shop exhaust stream, fluoride compounds are expected to be particulates incorporated in the slag dust from the EAF.

Using this conservative estimate for fluoride emissions from the melt shop baghouse, the 24-hour predicted impacts of fluoride emissions exceeds the fluorides ambient air monitoring *de minimis* level.

Currently, no fluoride monitors exist in Florida. Nucor is requesting that pre-construction monitoring be waived. Further, once the facility is operational, stack testing will be used to determine actual fluoride emissions from the process. If the fluoride measurements show that emissions of fluorides are predicted to be well below the PSD significant emission rate, then no further action would be necessary, except to potentially modify the permit to remove fluorides as a PSD pollutant and corresponding compliance

requirements. If the fluoride rate is realistically above the PSD significant emission rate, then Nucor will discuss options with Florida DEP regarding the need for monitoring.

7.5 PSD Class II Increment Modeling

Refined modeling was performed for PM_{10}, $PM_{2.5}$, and SO_2 24-hour averaging periods and NO_2, PM_{10}, and $PM_{2.5}$ annual averaging period to demonstrate compliance with the PSD Class II Increments.

All Project emission sources and all inventory sources (provided by Florida DEP) were included in the modeling analysis.

There were no modeled PSD Class II Increment exceedances for NO_2, PM_{10}, $PM_{2.5}$, and SO_2 as shown in Table 7-6. Therefore, the Project will be in compliance with the Class II PSD Increment.

Table 7-6: Maximum Modeled Concentrations for Increment Modeling

Pollutant	Averaging Period	UTM Coordinates[a]		Year	Predicted Concentration	PSD Class II Increment[1]
		Easting (meters)	Northing (meters)		micrograms per cubic meter (µg/m³)	
NO_2	Annual	448,454.0	3,058,141.2	2016	1.4	25
PM_{10}	Annual	448,429.7	3,058,141.4	2016	3.0	17
	24-hour	449,252.0	3,058,837.5	2015	24.1	30
$PM_{2.5}$	Annual	448,429.7	3,058,141.4	2016	1.5	4
	24-hour	449,252.0	3,058,837.5	2015	8.5	9
SO_2	24-hour	452,000.0	3,050,000.0	2015	9.1	91

7.6 NAAQS Modeling

Refined modeling was performed for annual and 1-hour NO_2, 24-hour PM_{10}, annual and 24-hour $PM_{2.5}$, and 24- and 1-hour SO_2 for all Project emission sources and all inventory sources (provided by Florida DEP).

The modeling results showed that the Project is not contributing to any NAAQS exceedance for the pollutants and averaging periods modeled. Therefore, the Project will be in compliance with the NAAQS. The NAAQS analysis modeling results are shown in Table 7-7.

Table 7-7: Maximum Modeled Concentrations for NAAQS Modeling

Pollutant and Averaging Period		UTM Coordinates[a]		Year	Predicted Concentration	Background Concentration	Total Concentration	NAAQS[1]
		Easting (meters)	Northing (meters)		micrograms per cubic meter (µg/m³)			
NO_2	Annual	448,454.0	3,058,141.2	2016	1.45	7.71	9.2	100
	1-hour	449,250.0	3,058,400.0	5 years	132.42	52.64	185.1	188
PM_{10}	24-hour	449,252.0	3,058,837.5	2016	22.79	41.33	64.1	150
$PM_{2.5}$	Annual	448,429.7	3,058,141.4	5 years	0.94	6.53	7.5	12
	24-hour	449,250.9	3,058,664.1	5 years	4.95	20.67	25.6	35

7.7 PSD Class I Increment Analysis

Under the PSD program, Class I areas are protected more stringently than under the NAAQS. Class I areas include national parks, wilderness areas, and other areas of special national and cultural significance.

Three Class I areas are within 350 kilometers of the Project, with only two areas within 300 kilometers:

- Chassahowitzka Wilderness Area (152 kilometers)
- Everglades National Park (201 kilometers)
- Okefenokee Wilderness Area (339 kilometers)

The locations of the Project and the Class I areas are shown in Figure G-7, Appendix G.

An assessment of air quality impacts at Class I areas was performed to demonstrate that the operation of the Project will not result in, or contribute to, concentrations above the PSD Class I Increment threshold. A screening analysis to determine if further analysis is required was performed for Everglades National Park and Chassahowitzka Wilderness Class I areas. Due to the distance from the Project (greater than 300 km), an analysis for Okefenokee Wilderness was not performed. Modeled impacts at receptors placed in a ring at a distance of 50-kilometers from the Project site at one-degree intervals were compared to the Class I significant impact level using AERMOD. A model was run for each Class I area using the elevation of the nearest Class I receptor as shown in Table 7-8.

Table 7-8: Class I Receptor Elevation

Class I Area	Closest Class I Elevation/Hill Height (meters)
Chassahowitzka Wilderness Area	3 / 3
Everglades National Park	1 / 1

The AERMOD modeled impacts in comparison to the Class I significance thresholds are shown in Table 7-9. Based on the analysis, it was determined that the impacts from the Project will not significantly impact the PSD Class I Increment at the surrounding Class I areas and does not require further analysis.

A letter report summarizing the Class I Increment analysis will be sent to the appropriate Federal Land Managers (FLMs) and Florida DEP modeling team for concurrence.

Table 7-9: Class I Modeled Impacts and Class I Significant Impact Level

Pollutant	Averaging Time	Maximum Modeled Concentration at 50-kilometer Receptors		Class I Significant Impact Level[1]
		Chassahowitzka Wilderness Area	Everglades National Park	
		micrograms per cubic meter (µg/m^3)		
NO_2[a]	Annual	0.02	0.02	0.1
PM_{10}	24-hour	0.27	0.27	0.3
	Annual	0.03	0.03	0.2
$PM_{2.5}$	24-hour	0.12	0.12	0.27[2]
	Annual	0.01	0.03	0.05[2]
SO_2	Annual	0.02	0.02	0.1
	24-hour	0.19[b]	0.19[b]	0.2
	3-hour	0.70	0.69	1.0

Sources:
(1) EPA. Prevention of Significant Deterioration (PSD) and Nonattainment New Source Review (NSR) Proposed Rulemaking, July 23, 1996. (61 FR 38249).
(2) EPA Memorandum, 2018a, "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program."
(a) Modeled as NO_x.
(b) The AERMOD model showed potential exceedances (up to a maximum of 0.27 µg/m^3) on the ring of receptors in the 199 to 215 degrees sector of the modeled receptors. The reported value is the maximum that is not within this sector and is the maximum of the remaining receptors.

While there are modeled potential SO_2 24-hour exceedances of the PSD Class I significance levels, the exceedances are not in the direction of either Class I area and only occur for 6 temporal periods (time/day occurrences) in 2016. The location of the exceedances ranges from 199 degrees to 215 degrees, which is not in the direction of either Class I area. Everglades is located south of the Project in the 155- to 180-degree direction, while Chassahowitzka is located northwest of the Project in the 310 to 320-degree direction. When considering all other receptors, excluding the 199- to 215-degree receptors in the Class I model, the

modeled impacts are well below the SO_2 24-hour PSD Class I significance levels with a maximum at any receptor of 0.19 µg/m^3.

7.8 Secondary Formation Analysis

The Project is estimated to be significant for NO_x, SO_2, and VOC; therefore, an analysis of the impact of secondary formation of ozone (NO_x and VOC) and $PM_{2.5}$ (NO_x and SO_2) was performed.

The NAAQS and modeling significance level threshold for ozone and $PM_{2.5}$ are shown in Table 7-9.

Table 7-10: NAAQS and Modeling Significance Levels

Pollutant	Averaging Period	Modeling Significance Level[1,a]	NAAQS[2,a]
Ozone	8-hour	1.0 ppb	0.07 ppm
$PM_{2.5}$	Annual	0.2 µg/m^3	12 µg/m^3
	24-hour	1.2 µg/m^3	35 µg/m^3

Source:
(1) EPA Memorandum, 2018a, "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program."
(2) Title 40 CFR Part 50.
(a) ppb = parts per billion; ppm = parts per million; micrograms per cubic meter = µg/m^3.

In December 2016, the EPA provided *Guidance on the Development of Modeled Emission Rates for Precursors (MERPS) as a Tier I Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program* (the Guidance) for consideration, review, and comment to local and state air agencies. While this guidance is not final, the MERPS methodology was used to satisfy the compliance demonstration requirements for both ozone and secondary $PM_{2.5}$ for PSD purposes. The Tier 1 assessment in the Guidance uses existing empirical relationships between precursors and secondary impacts based on modeling performed by the EPA. MERPs were used to describe an emission rate of a precursor that is expected to result in a change in ambient ozone or $PM_{2.5}$ that would be less than a specific air quality concentration threshold for ozone or $PM_{2.5}$ to determine whether an impact causes or contributes to a violation of the NAAQS for ozone or $PM_{2.5}$.

7.8.1 Ozone Analysis

The NO_x and VOC emissions from the Project sources (93.1 tpy and 85.3 tpy, respectively) are below the eastern United States ozone MERP value, shown in Table 7-1 of the Guidance. Therefore, air quality impacts of ozone from the Project would be expected to be below the critical air quality threshold (CAQT), and no impacts to ozone are expected.

However, the NO_x and VOC precursor contributions to the 8-hour daily maximum O_3 need to be considered together to determine if the Project's air quality impact would exceed the CAQT. The additive secondary impacts on 8-hour daily maximum ozone is calculated as follows:

$$\left(\frac{93.1\ tpy\ NOx}{107\ tpy\ NOx\ 8hr\ daily\ max\ O3\ MERP}\right)+\left(\frac{85.3\ tpy\ VOC}{814\ tpy\ VOC\ 8hr\ daily\ max\ O3\ MERP}\right)=0.87+0.10=0.97*100=97\%$$

A value less than 100 percent indicates that the CAQT will not be exceeded when considering the combined impacts of these precursors on 8-hour daily maximum O_3.

7.8.2 $PM_{2.5}$ Analysis

The NO_x and SO_2 emissions from the Project sources (93.1 tpy and 157.9 tpy, respectively), are well below the eastern $PM_{2.5}$ MERP value for the daily and annual NAAQS, shown in Table 7-1 in the Guidance. In this case, air quality impacts of $PM_{2.5}$ from the Project are expected to be below the CAQT, and no significant impacts to $PM_{2.5}$ are expected.

However, the NO_x and SO_2 precursor contributions to both daily and annual average $PM_{2.5}$ need to be considered together along with primary $PM_{2.5}$ impacts to determine if the Project's air quality impact of $PM_{2.5}$ would exceed the CAQT.

7.8.2.1 Daily $PM_{2.5}$ (percentage of the NAAQS)

The primary impacts are above the significant impact level; therefore, primary modeled impacts were calculated as a percentage of the NAAQS and is calculated as follows:

$$\left(\frac{5.0\ \ \mu g/m3\ \ NAAQS\ 24-hour\ impact}{35\ \mu g/m3\ daily\ PM2.5\ SIL}\right)=0.14=0.14*100=14.3\%$$

For conservativeness, the total modeled impact (Project impacts plus inventory) is used to calculate the primary impacts for each exercise (NAAQS and PSD Class II Increment).

The daily $PM_{2.5}$ MERPS for NO_x and SO_2 from Table 7-1 in the Guidance were converted into equivalent daily NAAQS tpy values by taking a ratio of the 24-hour $PM_{2.5}$ NAAQS to the 24-hour $PM_{2.5}$ significant impact level:

$$2{,}467\ tpy\ NOx\ daily\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3}*\left(\frac{35\ \frac{\mu g}{m3}}{1.2\ \frac{\mu g}{m3}}\right)=71{,}954.2\ tpy$$

$$675\ tpy\ SO2\ daily\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{35\ \frac{\mu g}{m3}}{1.2\ \frac{\mu g}{m3}}\right) = 19{,}687.5\ tpy$$

The secondary $PM_{2.5}$ impacts were calculated using these equivalent tpy values:

$$\left(\frac{93.1\ tpy\ NOx}{71{,}954.2\ tpy\ NOx\ daily\ PM2.5\ MERP}\right) + \left(\frac{157.9\ tpy\ SO2}{19{,}687.5\ tpy\ SO2\ annual\ PM2.5\ MERP}\right) = 0.0013 + 0.008 = 0.009 * 100 = 0.9\%$$

The total daily $PM_{2.5}$ impact is calculated as follows:

$$14.3\%\ (primary\ PM2.5\ impact) + 0.9\%\ (secondary\ PM2.5\ impact) = 15.2\%\ of\ CAQT$$

7.8.2.2 Daily $PM_{2.5}$ (percentage of the PSD Class II Increment)

The primary impacts are above the significant impact level; therefore, primary modeled impacts were calculated as a percentage of the PSD Class II Increment and is calculated as follows:

$$\left(\frac{8.5\ \ \mu g/m3\ PSD\ Class\ II\ 24-hour\ impact}{9\ \mu g/m3\ daily\ PM2.5\ SIL}\right) = 0.94 = 0.94 * 100 = 94.4\%$$

The daily $PM_{2.5}$ MERPS for NO_x and SO_2 from Table 7-1 in the Guidance were converted into equivalent daily PSD Class II Increment tpy values by taking a ratio of the 24-hour $PM_{2.5}$ PSD Class II Increment to the 24-hour $PM_{2.5}$ significant impact level:

$$2{,}467\ tpy\ NOx\ daily\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{9\ \frac{\mu g}{m3}}{1.2\ \frac{\mu g}{m3}}\right) = 18{,}502.5\ tpy$$

$$675\ tpy\ SO2\ daily\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{9\ \frac{\mu g}{m3}}{1.2\ \frac{\mu g}{m3}}\right) = 5{,}062.5\ tpy$$

The secondary $PM_{2.5}$ impacts were calculated using these equivalent tpy values:

$$\left(\frac{93.1\ tpy\ NOx}{18{,}503\ tpy\ NOx\ daily\ PM2.5\ MERP}\right) + \left(\frac{157.9\ tpy\ SO2}{5{,}063\ tpy\ SO2\ annual\ PM2.5\ MERP}\right) = 0.005 + 0.031 = 0.036 * 100 = 3.6\%$$

The total daily $PM_{2.5}$ impact is calculated as follows:

$$94.4\%\ (primary\ PM2.5\ impact) + 3.6\%\ (secondary\ PM2.5\ impact) = 98.1\%\ of\ CAQT$$

A value less than 100 percent indicates that the daily $PM_{2.5}$ CAQT will not be exceeded when considering the combined impacts of daily primary and secondary $PM_{2.5}$.

7.8.2.3 Annual $PM_{2.5}$ (percentage of the NAAQS)

The primary impacts are above the significant impact level; therefore, annual primary modeled impacts were calculated as a percentage of the NAAQS and is calculated as follows:

$$\left(\frac{0.9\ \mu g/m3\ \ NAAQS\ annual\ impact}{12\ \mu g/m3\ annual\ PM2.5\ SIL}\right) = 0.075 = 0.075 * 100 = 7.5\%$$

The annual $PM_{2.5}$ MERPS for NO_x and SO_2 from Table 7-1 in the Guidance were converted into equivalent annual NAAQS tpy values by taking a ratio of the annual $PM_{2.5}$ NAAQS to the annual $PM_{2.5}$ significant impact level:

$$10{,}037\ tpy\ NOx\ annual\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{12\ \frac{\mu g}{m3}}{0.2\ \frac{\mu g}{m3}}\right) = 602{,}220\ tpy$$

$$4{,}013\ tpy\ SO2\ annual\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{12\ \frac{\mu g}{m3}}{0.2\ \frac{\mu g}{m3}}\right) = 240{,}780\ tpy$$

The secondary $PM_{2.5}$ impacts were calculated using these equivalent tpy values:

$$\left(\frac{93.1\ tpy\ NOx}{\substack{602{,}220\ tpy\ NOx\ annual \\ PM2.5\ MERP}}\right) + \left(\frac{157.9\ tpy\ SO2}{\substack{240{,}780\ tpy\ SO2\ annual \\ PM2.5\ MERP}}\right) = (0.0002 + 0.001) * 100 = 0.08\%$$

The total annual $PM_{2.5}$ impact is calculated as follows:

$$7.5\%\ (primary\ PM2.5\ impact) + 0.08\%\ (secondary\ PM2.5\ impact) = 7.6\%\ of\ CAQT$$

7.8.2.4 Annual $PM_{2.5}$ (percentage of the PSD Class II Increment)

The primary impacts are above the significant impact level; therefore, primary modeled impacts were calculated as a percentage of the PSD Class II Increment and is calculated as follows:

$$\left(\frac{1.5\ \mu g/m3\ PSD\ Class\ II\ annual\ impact}{4\ \mu g/m3\ annual\ PM2.5\ SIL}\right) = 0.375 = 0.375 * 100 = 37.5\%$$

The annual $PM_{2.5}$ MERPS for NO_x and SO_2 from Table 7-1 in the Guidance were converted into equivalent annual Class II Increment tpy values by taking a ratio of the annual $PM_{2.5}$ PSD Class II Increment to the annual $PM_{2.5}$ significant impact level:

$$10{,}037\ tpy\ NOx\ annual\ PM2.5\ MERP\ for\ CAQT\ of\ 1.2\ \frac{\mu g}{m3} * \left(\frac{4\ \frac{\mu g}{m3}}{0.2\ \frac{\mu g}{m3}}\right) = 200{,}740\ tpy$$

$$4{,}013\ tpy\ SO2\ daily\ PM2.5\ MERP\ for\ CAQT\ of\ 0.2\ \frac{\mu g}{m3} * \left(\frac{4\ \frac{\mu g}{m3}}{0.2\ \frac{\mu g}{m3}}\right) = 80{,}260\ tpy$$

The secondary $PM_{2.5}$ impacts were calculated using these equivalent tpy values:

$$\left(\frac{93.1\ tpy\ NOx}{200{,}740\ tpy\ NOx\ annual\ PM2.5\ MERP}\right) + \left(\frac{157.9\ tpy\ SO2}{80{,}260\ tpy\ SO2\ annual\ PM2.5\ MERP}\right) = (0.0005 + 0.002) * 100 = 0.25\%$$

The total daily $PM_{2.5}$ impact is calculated as follows:

$$37.5\%\ (primary\ PM2.5\ impact) + 0.25\%\ (secondary\ PM2.5\ impact) = 37.75\%\ of\ CAQT$$

A value less than 100 percent indicates that the CAQT will not be exceeded when considering the combined impacts of these precursors on annual $PM_{2.5}$.

7.9 Conclusion

The modeling results shown in Table 7-5, demonstrate that no exceedances of the 1- and 8-hour CO and annual and 3-hour SO_2 modeling significance levels are predicted; consequently, no further modeling is required. A refined modeling analysis was conducted to demonstrate compliance with the PSD Class II Increment for NO_2 (annual), PM_{10} (24-hour and annual), $PM_{2.5}$ (24-hour and annual), and SO_2 (24-hour) and with the NAAQS for NO_2 (1-hour and annual), PM_{10} (24-hour), $PM_{2.5}$ (24-hour and annual), and SO_2 (24-hour and 1-hour). The Project will not cause or contribute to any modeled Class II PSD Increment or NAAQS exceedances.

Based on the Class I analysis, it was determined that the impacts from the Project will not significantly impact the three Class I areas that are within 350 kilometers of the Project and does not require further analysis.

The operation of the Project will not cause or contribute to a significant degradation of ambient air quality. After examining the results of the models, it has been determined that the modeling requirements for all pollutants have been fulfilled, and no further modeling is required. All model input and output files are provided in the electronic file transfer to the Florida DEP.

8.0 ADDITIONAL IMPACTS ANALYSIS

The additional impacts analysis requirement under PSD includes the ambient air quality impact analysis, soils and vegetation impacts, visibility impairment, and growth analysis for the Project.

8.1 Construction Impacts

Construction for the Project has the potential for short-term adverse effects on air quality in the immediate area around the site and will not affect the attainment status for Highlands County and Polk County, Florida. Diesel fumes from construction vehicles and dust from site preparation and construction vehicle operation can affect local air quality during certain meteorological conditions. However, these instances are limited in time and area of effect.

Low sulfur fuel will be used for construction vehicles that use diesel fuel. Operation of these vehicles is not expected to significantly affect ambient air quality. During prolonged periods without rainfall, fugitive construction-related dust may need to be minimized through the application of water to onsite roads used by construction equipment.

8.2 Vegetation Impacts

The following sections briefly describe the potential effects of CO, CO_2, NO_2, $PM_{10}/PM_{2.5}$, SO_2, H_2SO_4 mist, and synergistic effects of pollutants produced by the installation of the Project on the nearby vegetation. The potential effects of the air emissions to vegetation within the immediate vicinity of the Project will be compared to scientific research examining the effects of pollution on vegetation. Damage to vegetation often results from acute exposure to pollution but may also occur after prolonged or chronic exposures. Acute exposures are typically manifested by internal physical damage to leaf tissues, while chronic exposures are more associated with the inhibition of physiological processes such as photosynthesis, carbon allocation, and stomatal functioning (Hill and Littlefield, 1969; Hallgren, 1984; Mansfield and Freer-Smith, 1984).

8.2.1 Carbon Monoxide

CO is not known to injure plants, nor has it been shown to be taken up by plants. Consequently, no adverse impacts to vegetation at or near the Project are expected from CO stack emissions from the Project.

8.2.2 Carbon Dioxide

CO_2 is not known to injure plants. Long-term exposure to elevated CO_2 levels has shown to improve the efficiency of nutrient, water, and photosynthesis in some plants (Drake, et al., 1997; Leakey et al., 2009).

However, the improved efficiencies that result from elevated CO_2 levels may not necessarily result in greater yields for crop plants (Morgan et al., 2005). No adverse impacts to vegetation at or near the Project are expected from CO_2 stack emissions from the Project.

8.2.3 Sulfur Dioxide

Short- and long-term exposure to sulfur dioxide has been shown to have detrimental effects on many plant species (Heath, 1980; Kozlowski and Constantinidou, 1986; Darrall, 1989). Numerous studies have been conducted on the effects of SO_2 on vegetation including crop plants, trees and shrubs, and herbaceous plants (Guderian and Stratman [1968] cited in Kozlowski and Constantinidou, 1986; Huang et al., 1976; Reinert et al., 1975; Tingey et al., 1971; Thompson et al., 1983; Darrall, 1989; Linzon, 1986; Winner and Mooney, 1980; Westman et. al., 1985). Symptoms of SO_2 injury in leaves are manifested as interveinal necrotic blotches in angiosperms (plants having seeds enclosed within an ovary or flowering plants) and red-brown banding in gymnosperms (plants having seeds not enclosed in an ovary or flowering plants) (Kozlowski and Constantinidou, 1986). A number of the plant species studied may be found in Florida. These include eastern red cedar (*Juniperus virginiana*), white oak (*Quercus alba*), sumac (*Rhus* spp.), white ash (*Fraxinus americana*), blackberry (*Rubus* spp.), American elm (*Ulmus americana*), red maple (*Acer rubrum*), soybean (*Glycine max*), corn (*Zea mays*), tobacco (*Nicotiana tabacum*), black willow (*Salix nigra*), and bracken fern (*Pteridium aquilinum*). Injury threshold concentrations varied by species and dose (131-5,240 micrograms per cubic meter ($\mu g/m^3$) for 8-hours, 393-3,930 $\mu g/m^3$ for 2-hours, and 1,310 $\mu g/m^3$ for 4-hours).

In another study, three varieties of rice produced commercially were fumigated with SO_2 at 0.05, 0.10, 0.15, and 0.20 ppm concentrations for 104 hours/week. The effects of the SO_2 exposure, which were variable among the three varieties of rice and SO_2 exposure concentrations, resulted in reduced growth and yield (Thompson et. al., 1983). These concentrations are higher than those expected to result from the Project. The maximum 3-hour SO_2 impact from the Project is predicted to be 18.9 $\mu g/m^3$. Even lichens and bryophytes, which are pollution bio-indicators due to their well-documented sensitivity to air pollution, would not be expected to be affected by long-term exposure to SO_2 emissions from the Project. They do not experience injury, decreased abundance, or lowered CO_2 uptake until annual SO_2 concentrations respectively reach 5 to 40 $\mu g/m^3$ SO_2, 13 to 26 $\mu g/m^3$ SO_2, and 400 $\mu g/m^3$ SO_2 (Will-Wolf, 1980; Holopainen, 1984; McCune, 1988; Treshow and Anderson, 1989; LeBlanc and Rao, 1975; Wetmore, 1988; Hart et al., 1988). The modeled maximum annual SO_2 concentration due to emissions from the Project is predicted to be 0.4 $\mu g/m^3$.

8.2.4 Nitrogen Oxides

During fuel combustion, atmospheric and fuel-bound nitrogen is oxidized to nitrogen oxide (NO) and small amounts of NO_2 (Chang, 1981). The NO is photochemically oxidized to NO_2, which is then subsequently consumed during the production of ozone and peroxyacetyl nitrates (PANs). NO_2 has been shown to deleteriously impact vegetation (Taylor et al., 1975; Heath, 1980; Kozlowski and Constantinidou, 1986; Darrall, 1989). Different plant species exhibit different levels of sensitivity to nitrogen oxides; however, sensitivities to nitrogen oxides generally decrease as water becomes less available in the soil. Typical leaf injury responses include interveinal necrotic blotches for angiosperms and red-brown distal necrosis in gymnosperms (Kozlowski and Constantinidou, 1986). The blotches on the leaves and along the leaf margins are the result of cell damage and dehydration of leaf tissues. Injury threshold concentrations vary by species and dose.

In general, short-term, high concentrations of NO_2 are required for deleterious impacts on plants (Prinz and Brandt, 1985). A 1-hour NO_2 concentration of 7,520 $\mu g/m^3$ will result in a 5 percent foliar injury for the most susceptible plant species (U.S. Environmental Protection Agency, 1993). For the most NO_2 sensitive plant species, the minimum concentrations at which adverse growth effects or tissue injury occurred have been reported at 1,200 $\mu g/m^3$ (1 hour), 3,760 $\mu g/m^3$ (4 hour averaging time), 500 $\mu g/m^3$ (24 hour), 564 $\mu g/m^3$ (1 month averaging time), and 94 $\mu g/m^3$ (1 year averaging time) (Dvorak et al .,1978; U.S. Environmental Protection Agency, 1993). The injury threshold concentration for plants that are grown and occur naturally in Highlands County and Polk County, Florida, is 7,380 $\mu g/m^3$ for tomato (*Solanum lycopersicum*) and annual sunflower (*Helianthus annuus*). Lamb's quarters (*Chenopodium album*) a common, weedy plant found in disturbed areas in Florida was not injured for two hours at concentrations of 1.9 $\mu g/m^3$ NO_2. Furthermore, short-term fumigations of approximately 1-hour, 20-hours, and 48-hours at NO_2 concentrations of 940 to 38,000 $\mu g/m^3$, 470 $\mu g/m^3$, and 3,000 to 5,000 $\mu g/m^3$, respectively, have been shown to impair photosynthesis in a number of herbaceous [tomato, oats (*Avena sativa*), alfalfa (*Medicago* spp.) and woody plants (Hill and Bennett, 1970; Capron and Mansfield, 1976; Smith, 1981). Moreover, Taylor and McLean (1970), in their review of NO_2 effects on vegetation, noted that long-term exposures of phytotoxic doses of NO_2 ranged from 280 to 560 $\mu g/m^3$.

The maximum annual modeled value for the Project is 1.1 $\mu g/m^3$ and the maximum 1-hour NO_2 modeled value for the Project is 178.7 $\mu g/m^3$. These levels are low, so it is highly unlikely that NO_2 emissions will impact vegetation adjacent to or surrounding the Project.

8.2.5 Particulate Matter

Particulates have been shown to be detrimental to vegetation typically within the immediate vicinity of the source. The phytotoxic response of a given plant species to particulate deposition on leaves varies depending on the concentration and composition of the airborne particulates. Experimental evidence indicates that the deposition of most common particulate materials on leaf surfaces result in less direct harm to plants than phytotoxic gases, which are absorbed and assimilated more rapidly and cause greater direct injury to plant tissues (Guderian, 1986). The most obvious effect of particle deposition on vegetation is a physical smothering of the leaf surface. This will reduce light transmission to the plant and cause a decrease in photosynthesis. The maximum PM_{10} 24-hour modeled value for the Project is 30.3 $\mu g/m^3$ and the maximum $PM_{2.5}$ 24-hour modeled values for the Project is 8.0 $\mu g/m^3$. These levels are low, so it is highly unlikely that PM_{10} and $PM_{2.5}$ emissions will impact vegetation adjacent to the Project.

8.2.6 Synergistic Effects of Pollutants

Air pollutants are known to act in concert to cause injury to or decrease the functioning of plants (Reinert et al., 1975; Omrod, 1982). Synergistic refers to the combined effects of pollutants when they are greater than is expected from the additive effect of the pollutants or concern. The inhibitory effects of SO_2 and NO_2, NO_2 and NO, NO_2 and ozone (O_3), and O_3 and SO_2 have been reported in various short-term studies for crop plants (e.g., alfalfa, soybean, broad bean (*Vicia faba*), annual sunflower, and tomato) and various tree species, including several that grow in Florida [e.g., eastern white pine (*Pinus strobus*), eastern cottonwood (*Populus deltoides*), sugar maple (*Acer saccharum*), white ash, black oak (*Quercus velutina*)] (White et al., 1974; Wright et al., 1986; Capron and Mansfield, 1976; Furakawa et al., 1984; Okana et al., 1985; Costonis, 1970, Carlson, 1979; Jensen, 1981; Omrod et al., 1981). The concentrations of pollutants (80 to 981 $\mu g/m^3$) in these studies are higher than the concentrations predicted to occur near the Project. Consequently, no synergistic effects of the air pollutants are expected to inhibit vegetation at or near the Project.

8.2.7 Sulfuric Acid Mist

Sulfuric acid mist impacts vegetation in much the same way as acid rain, causing foliar damage and necrosis. In a study that examined the effects of acidic mist on crops and trees in London, the sulfuric acid mist concentrations in polluted regions were insufficient to produce acute injury to vegetation except in close vicinity of intense emission sources. Generally, in experimental studies, the concentrations of acidic aerosol required to produce measurable reductions in growth and noticeable injury to plants vary between 10 to 100 milligrams per cubic meter (mg/m^3) (Jacobson and Troiano, 1983). Short time exposures of 4-16 hours at rates of 100-200 (mg/m^3) have been shown to cause injury to plants (Lange, 1979). Kohno

and Kobayashi analyzed the effect of simulated acid rain on soybean growth in Japan and found that visible injury to the young, trifoliate leaves occurred only when the pH was below 3.0 (Kohno and Kobayashi, 1989). In the area around the Project, the average sulfate concentration in acid rain is projected to be approximately 0.25 to 0.75 milligrams per liter (mg/L) with a pH ranging from 5.0 to 5.2 (National Atmospheric Deposition Program (NRSP-3), 2018a and 2018b). These concentrations and levels of acidity are not likely to cause foliar damage, as described in the Kohno and Kobayashi study, because the pH is not low enough.

8.2.8 Volatile Organic Compounds

VOCs are formed from the products of incomplete combustion of natural gas. Currently VOCs are not one of the six criteria pollutants for which the EPA has set NAAQS (EPA, n.d.). Ozone is a gas created by a chemical reaction between NO_x and VOCs in the presence of sunlight. Vegetation may be impacted by ozone, commonly referred to as "ground-level ozone" where it forms in potential harmful concentrations and becomes a primary constituent of smog. Similar to particulate matter and lead, ozone's primary impact on vegetation is a physically smothering of the leaf surface, typically resulting in mottled markings, yellowing leaves, or a bronzed appearance. As a result, this smothering interferes with the ability of sensitive plants to produce and store food, making them more susceptible to diseases, insects, other pollutants, and harsh weather.

Chronic exposures to ozone concentrations of greater than or equal to 196 $\mu g/m^3$ can cause negative impacts to vegetation (Heath, 1975). Reductions in growth and photosynthesis of trees can occur at ozone levels of less than 200 $\mu g/m^3$ (Pye, 1988). Short-term exposures to ozone concentrations of 40 ppb, 100 ppb, and 160 ppb (80 $\mu g/m^3$, 200 $\mu g/m^3$, and 320 $\mu g/m^3$, respectively) results in O_3 accumulation in the intercellular spaces of lemon (*Citrus limon*), mandarin (*Citrus reticulata*), and orange (*Citrus sinensis*) leaves and decreases in the stomatal conductance of O_3, which can cause negative impacts to vegetation (Fares, et al., 2010). Soybeans, corn, wheat, annual sunflower, and white clover showed decreases in photosynthetic rates with short-term (200 $\mu g/m^3$ to 1399 $\mu g/m^3$ for 1 to 4 hours) and long-term (70 to 270 $\mu g/m^3$ for 147 to 180 hours in 3 weeks) exposures to ozone (Hill and Littlefield, 1969; Bennett and Hill, 1973; Furukawa et al., 1984; Reich and Amundson, 1985).

It is difficult to determine the contribution the Project would have on local or regional ambient ozone levels. Photoreactive modeling runs would be required to estimate the ozone impacts resulting from the emissions of NO_x and VOC. Due to the transport effects of ozone, it is unlikely that concentrations in the vicinity of the Project would exceed NAAQS.

8.2.9 Fluorides

Fluoride is an accumulative poison in plant foliage that strongly inhibits photosynthesis and other processes as accumulation builds up in the plan tissue over time (Pscheidt, 2016). Gaseous uptake of fluorides by leaves is rapid due to fluoride's high solubility. Generally, leaves are most sensitive, especially when they are young and still developing. Typical leaf injury responses to exposure to gaseous fluorides include necrosis of part or even the whole of the leaf. In most plant species, the initial symptom is the development of chlorosis, a yellowing of the leaf at the tips and along the leaf margins. In corn, sorghum (*Sorghum* spp.), and some other grasses, the symptoms of exposure to fluorides begin as scattered yellow (chlorotic) flecks at the tips and upper margins of the leaves. At high fluoride concentrations, there is less yellow (chlorotic) flecking and a greater tendency for the leaf tips and leaf margins to exhibit necrosis or a transverse necrotic band at the arch of the leaf. For alfalfa, fumigations over 14 days for approximately 10 hours at average hydrogen fluoride concentrations of 630 parts per billion (ppb) and maximum hydrogen fluoride concentrations of 1,020 ppb resulted in a destruction of 1 percent of leaf area (Thomas and Alther, 1966).

Plants exhibit different uptake and accumulation rates of fluorides. For example, two varieties of gladioli exposed to the same concentrations showed different uptake rates. Leaves of the Shirley Temple variety of gladiolus accumulated 138 parts per million (ppm) of fluorine in the leaf tissue with 54 percent of the leaf surface injured, while leaves of the Algonquin variety of gladiolus accumulated 611 ppm of fluorine in the leaf tissue with only seven percent of leaf surface injured (Greenwood, 1956).

8.3 Soil Impacts

A soil inventory was completed by obtaining soil survey data within the 3-kilometer radius study area surrounding the Project. The soil survey data was obtained from the Natural Resource Conservation Service's Web Soil Survey (Natural Resources Conservation Service, 2018). The different soil types that were found to be in excess of one percent of the total land area of the 3-kilometer study area are listed below. The most abundant soil type in the vicinity of the Project was Astatula sand, 0 to 5 percent slopes at 18.6 percent in Polk County and 13.0 percent in Highland County.

Soils of Highland County, Florida include the following:

- Tavares sand, 0 to 5 percent slopes
- Placid fine sand, frequently ponded, 0 to 1 percent slopes
- Immokalee sand, 0 to 2 percent slopes
- Astatula sand, 0 to 5 percent slopes

- Basinger fine sand, 0 to 2 percent slopes

Soils of Polk County, Florida include the following:

- Samsula muck, frequently ponded, 0 to 1 percent slopes
- Tavares fine sand, 0 to 5 percent slope
- Pompano fine sand
- Hontoon muck, frequently ponded, 0 to 1 percent slopes
- Basinger mucky fine sand, depressional
- St. Johns sand
- Astatula sand, 0 to 5 percent slopes
- Zolfo fine sand, 0 to 2 percent slopes
- Duette fine sand
- Millhopper fine sand, 0 to 5 percent slopes
- Satellite sand, 0 to 2 percent slopes
- Basinger fine sand

Nitrates caused by NO_x deposition onto the soil can be either beneficial or detrimental to soil depending on its composition. However, the proposed NO_x emission rates and consequently the impacts generated by the Project are not expected to have an adverse impact upon soils in the immediate vicinity since they are below the NAAQS.

Soils uptake of carbon monoxide from the atmosphere occurs fairly quickly through biological mechanisms (Inman et al., 1971). Soils that are constantly exposed to high CO concentrations are more active in CO uptake than those soils with low exposure to CO (Ingersoll et al., 1974). The rate of CO uptake by nearby soils should not be weakened with the increase in CO emitted by the Project. The Project is not expected to have an adverse impact upon soils in the immediate vicinity since the CO emitted by the Project is below the NAAQS.

8.4 Industrial, Residential, and Commercial Growth Impacts

The purpose of the growth impact analysis is to quantify growth resulting from the construction and operation of the Project and assess air quality impacts that would result from that growth. Impacts associated with construction of the Project will be minor.

Construction work may temporarily increase the number of people residing in the area for the construction phase. In the immediate vicinity of the facility, because of the Project, increased vehicular

traffic is expected; however, these activities are not expected to significantly impact air quality. The Project is adding a new facility; therefore, some secondary growth effects due to operation of the Project is anticipated.

8.5 Visibility and Deposition Analysis

The visibility impairment analysis is part of the additional impacts analysis requirement under PSD.

8.5.1 Class I Area Analysis

Under the PSD program, Class I areas are protected more stringently than under the NAAQS. Class I areas include national parks, wilderness areas, and other areas of special national and cultural significance.

Three Class I areas are within 350 kilometers of the Project, with only two within 300 kilometers:

- Chassahowitzka Wilderness Area (152 kilometers)
- Everglades National Park (201 kilometers)
- Okefenokee Wilderness Area (339 kilometers)

The locations of the Project and the Class I areas are shown in Figure G-7, Appendix G.

Following the most recent Federal Land Managers' Air Quality Related Values Work Group (FLAG) Workshop procedures (USFS, NPS, and USFWS, 2010), the Screening Procedure (Q/D) was used to determine if the Project could opt (screen) out of an air quality related value (AQRV) assessment for visibility and deposition with CALPUFF. Following the screening procedures in FLAG, using the maximum 24-hour emission rates, the emissions of NO_x, SO_2, $PM_{10}/PM_{2.5}$, and H_2SO_4 mist were summed and divided by the distance to the respective Class I area. The screening analysis is summarized for each of the Class I areas located within 350 kilometers of the Project as presented in Table 8-1.

Table 8-1: Q/D Analyses

Class I Area	Q[a] (tpy)[b]	D (Kilometers)	Q/D
Chassahowitzka Wilderness Area	467.0	152	3.1
Everglades National Park	467.0	201	2.3
Okefenokee Wilderness Area	467.0	339	1.4

(a) Q=sum(NO_x+$PM_{10/2.5}$+SO_2+H_2SO_4)
(b) tpy = tons per year

In accordance with the FLAG Guidance, if Q/D is less than 10, then no AQRV analysis is required. Based on the ratio of Q/D, all the areas listed in the table above do not require further analysis of AQRV. Thus, no CALPUFF analysis is anticipated for impacts to AQRVs. A notification letter will be submitted to the FLMs for concurrence with the above assessment.

8.5.2 Class II Area Analysis

The Project is located in a Class II area. With respect to visibility conditions around the facility, no known Class II screening visibility criteria have been recommended at this time. Per the May 11, 2018 kickoff meeting with Florida DEP, no Class II visibility analysis is required since the application includes a complete, complex dispersion analysis.

8.6 Conclusion

As shown by the results presented in this section of the application and additional supplemental information, the Project will not have a significant adverse impact on the air quality, soils, vegetation, visibility and or growth in the surrounding area.

APPENDIX A – FLORIDA DEP FORMS

Department of
Environmental Protection
Division of Air Resource Management

APPLICATION FOR AIR PERMIT - LONG FORM
DEP FORM No. 62-210.900(1) and INSTRUCTIONS

I. APPLICATION INFORMATION

Air Construction Permit – Use this form to apply for an air construction permit:

- For any required purpose at a facility operating under a federally enforceable state air operation permit (FESOP) or Title V air operation permit;
- For a proposed project subject to prevention of significant deterioration (PSD) review, nonattainment new source review, or maximum achievable control technology (MACT);
- To assume a restriction on the potential emissions of one or more pollutants to escape a requirement such as PSD review, nonattainment new source review, MACT, or Title V; or
- To establish, revise, or renew a plantwide applicability limit (PAL).

Air Operation Permit – Use this form to apply for:

- An initial federally enforceable state air operation permit (FESOP); or
- An initial, revised, or renewal Title V air operation permit.

Identification of Facility

1. **Facility Owner/Company Name**: Nucor Steel Florida, Inc.	
2. **Site Name**: Nucor Steel Florida, Inc.	
3. **Facility Identification Number**: _____ ☒Unknown	
4. **Facility Location** Street Address or Other Locator: City: Frostproof County: Highlands and Polk Counties Zip Code:	
5. **Relocatable Facility?** ☐Yes ☒ No	6. **Existing Title V Permitted Facility?** ☐Yes ☒No

Application Contact

1. Application Contact Name: Eric Larmore_____ Title: Environmental Manager_____
2. **Application Contact Mailing Address** Organization/Firm: Nucor Steel Florida, Inc. Street Address: P.O. Box 8 City: Frostproof State: FL Zip Code: 33843
3. **Application Contact Telephone Numbers** Telephone: (205) 393-7749 ext._____ Fax: (____) ____- _____
4. **Application Contact E-mail Address**: Eric.Larmore@nucor.com

Application Processing Information (DEP Use Only)

1. Date of Receipt of Application:	3. PSD Number (if applicable):
2. Project Number(s):	4. Siting Number (if applicable):

I. APPLICATION INFORMATION

Purpose of Application

This application for air permit is being submitted to obtain: (Check one)

Air Construction Permit

☒ Air construction permit.

☐ Air construction permit to establish, revise, or renew a plantwide applicability limit (PAL).

☐ Air construction permit to establish, revise, or renew a plantwide applicability limit (PAL), and separate air construction permit to authorize construction or modification of one or more emissions units covered by the PAL.

Air Operation Permit

☐ Initial Title V air operation permit.

☐ Title V air operation permit revision.

☐ Title V air operation permit renewal.

☐ Initial federally enforceable state air operation permit (FESOP) where professional engineer (PE) certification is required.

☐ Initial federally enforceable state air operation permit (FESOP) where professional engineer (PE) certification is not required.

Air Construction Permit and Revised/Renewal Title V Air Operation Permit (Concurrent Processing)

☐ Air construction permit and Title V permit revision, incorporating the proposed project.

☐ Air construction permit and Title V permit renewal, incorporating the proposed project.

Note: By checking one of the above two boxes, you, the applicant, are requesting concurrent processing pursuant to Rule 62-213.405, F.A.C. In such case, you must also check the following box:

☐ I hereby request that the department waive the processing time requirements of the air construction permit to accommodate the processing time frames of the Title V air operation permit.

Application Comment

I. APPLICATION INFORMATION

Scope of Application

Emissions Unit ID Number	Description of Emissions Unit	Air Permit Type	Air Permit Processing Fee
EU01	Meltshop (EP07, EP08, EP09, EP10)	AC1A	$7,500
EU02	Rolling Mill (EP11)	AC1A	$0
EU03	Scrap Storage and Handling (EP01, EP02, EP06)	AC1A	$0
EU04	Alloy Storage (EP17)	AC1A	$0
EU05	Silos (EP03, EP04, EP05)	AC1A	$0
EU06	Slag Yard (EP18)	AC1A	$0
EU07	Cooling Towers (EP12, EP13)	AC1A	$0
EU08	Emergency Equipment (EP14, EP15, EP16)	AC1A	$0
EU09	Roads (EP19, EP20)	AC1A	$0
EU10	Tanks (EP21, EP22)	AC1A	$0
	Note: “EP” refers to the modeled emission points.		

Application Processing Fee

Check one: ☒Attached - Amount: $_7,500_____ ☐ Not Applicable

I. APPLICATION INFORMATION

Owner/Authorized Representative Statement

Complete if applying for an air construction permit or an initial FESOP.

1. **Owner/Authorized Representative**
   Name: Drew Wilcox Title: Vice President and General Manager, Nucor Steel Florida, Inc.
2. **Owner/Authorized Representative Mailing Address**
   Organization/Firm: Nucor Steel Florida, Inc.
   Street Address: P.O. Box 8
   City: Frostproof State: FL Zip Code: 33843
3. **Owner/Authorized Representative Telephone Numbers**
   Telephone: (863) 546 - 5800 ext. _____ Fax: (____) ____ - _____
4. **Owner/Authorized Representative E-mail Address**: Drew.Wilcox@nucor.com
5. **Owner/Authorized Representative Statement**:

   I, the undersigned, am the owner or authorized representative of the facility addressed in this air permit application. I hereby certify, based on information and belief formed after reasonable inquiry, that the statements made in this application are true, accurate and complete, and that, to the best of my knowledge, any estimates of emissions reported in this application are based upon reasonable techniques for calculating emissions. The air pollutant emissions units and air pollution control equipment described in this application will be operated and maintained so as to comply with all applicable standards for control of air pollutant emissions found in the statutes of the State of Florida and rules of the Department of Environmental Protection (Department) and revisions thereof. I understand that a permit, if granted by the Department, cannot be transferred without authorization from the Department, and I will promptly notify the Department upon sale or legal transfer of any permitted emissions unit.*

   Signature _____ Date 8-1-18

* Attach letter of authorization if not currently on file.

I. APPLICATION INFORMATION

Application Responsible Official Certification *Not Applicable*

Complete if applying for an initial, revised, or renewal Title V air operation permit or concurrent processing of an air construction permit and revised or renewal Title V air operation permit. If there are multiple responsible officials, the "application responsible official" need not be the "primary responsible official."

1. **Application Responsible Official**
   Name: _____ Title: _____

2. **Application Responsible Official Qualification** (Check one or more of the following options, as applicable):
   ☐ For a corporation, the president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit under Chapter 62-213, F.A.C.
   ☐ For a partnership or sole proprietorship, a general partner or the proprietor, respectively.
   ☐ For a municipality, county, state, federal, or other public agency, either a principal executive officer or ranking elected official.
   ☐ The designated representative at an Acid Rain source or CAIR source.

3. **Application Responsible Official Mailing Address**
   Organization/Firm:
   Street Address:
   City: State: Zip Code:

4. **Application Responsible Official Telephone Numbers**
   Telephone: ( ) – ext. _____ Fax: (____) ____- _____

5. **Application Responsible Official E-mail Address**: eric.larmore@nucor.com

6. **Application Responsible Official Certification**:
   I, the undersigned, am a responsible official of the Title V source addressed in this air permit application. I hereby certify, based on information and belief formed after reasonable inquiry, that the statements made in this application are true, accurate and complete and that, to the best of my knowledge, any estimates of emissions reported in this application are based upon reasonable techniques for calculating emissions. The air pollutant emissions units and air pollution control equipment described in this application will be operated and maintained so as to comply with all applicable standards for control of air pollutant emissions found in the statutes of the State of Florida and rules of the Department of Environmental Protection and revisions thereof and all other applicable requirements identified in this application to which the Title V source is subject. I understand that a permit, if granted by the department, cannot be transferred without authorization from the department, and I will promptly notify the department upon sale or legal transfer of the facility or any permitted emissions unit. Finally, I certify that the facility and each emissions unit are in compliance with all applicable requirements to which they are subject, except as identified in compliance plan(s) submitted with this application.
   Signature_____ Date _____

I. APPLICATION INFORMATION

Professional Engineer Certification

1. **Professional Engineer Name**: Robynn Andracsek
   Florida License Number: 68919
2. **Professional Engineer Mailing Address**
   Organization/Firm: Burns & McDonnell Engineering Company, Inc.
   Street Address: 9400 Ward Parkway
   City: Kansas City State: MO Zip Code: 64114
3. **Professional Engineer Telephone Numbers**
   Telephone: (816) 822-3596 ext. N/A Fax: (816) 822- 4299
4. **Professional Engineer E-mail Address**: RAndracsek@burnsmcd.com
5. Professional Engineer Statement:

I, the undersigned, hereby certify, except as particularly noted herein, that:*

To the best of my knowledge, there is reasonable assurance that the air pollutant emissions unit(s) and the air pollution control equipment described in this application for air permit, when properly operated and maintained, will comply with all applicable standards for control of air pollutant emissions found in the Florida Statutes and rules of the Department of Environmental Protection; and

To the best of my knowledge, any emission estimates reported or relied on in this application are true, accurate, and complete and are either based upon reasonable techniques available for calculating emissions or, for emission estimates of hazardous air pollutants not regulated for an emissions unit addressed in this application, based solely upon the materials, information and calculations submitted with this application.

If the purpose of this application is to obtain a Title V air operation permit (check here ☐, if so), I further certify that each emissions unit described in this application for air permit, when properly operated and maintained, will comply with the applicable requirements identified in this application to which the unit is subject, except those emissions units for which a compliance plan and schedule is submitted with this application.

If the purpose of this application is to obtain an air construction permit (check here ☐, if so) or concurrently process and obtain an air construction permit and a Title V air operation permit revision or renewal for one or more proposed new or modified emissions units (check here ☐, if so), I further certify that the engineering features of each such emissions unit described in this application have been designed or examined by me or individuals under my direct supervision and found to be in conformity with sound engineering principles applicable to the control of emissions of the air pollutants characterized in this application.

If the purpose of this application is to obtain an initial air operation permit or operation permit revision or renewal for one or more newly constructed or modified emissions units (check here ☐, if so), I further certify that, with the exception of any changes detailed as part of this application, each such emissions unit has been constructed or modified in substantial accordance with the information given in the corresponding application for air construction permit and with all provisions contained in such permit.

_____ _____

Signature Date

(seal)

* Attach any exception to certification statement.

II. FACILITY INFORMATION

Potential Greenhouse Gas Emissions (For PSD applications only.)

1. List the potential emissions, in tons per year, of the following greenhouse gases:

Greenhouse Gas	Tons/year	2. x GWP =	CO2e (Tons/year)
carbon dioxide	144,563	1	144,563
nitrous oxide	0.54	298	160
methane	6.90	25	172
sulfur hexafluoride	0	22,800	0
hydrofluorocarbons	0		0
perfluorocarbons	0		0
3. Total carbon dioxide equivalents			144,895

4. Greenhouse Gases Comments:

II. FACILITY INFORMATION

List of Pollutants Emitted by Facility

1. **Pollutant Emitted**	2. **Pollutant Classification**	3. **Emissions Cap [Y or N]?**
NOX	A	N
CO	A	N
PM	A	N
PM10	A	N
PM2.5	A	N
SO2	A	N
VOC	A	N

See emission calculations in Appendix D		

II. FACILITY INFORMATION

B. EMISSIONS CAPS

Facility-Wide or Multi-Unit Emissions Caps *Not Applicable*

1. Pollutant Subject to Emissions Cap	2. Facility-Wide Cap [Y or N]? (all units)	3. Emissions Unit ID's Under Cap (if not all units)	4. Hourly Cap (lbs/hr)	5. Annual Cap (tons/yr)	6. Basis for Emissions Cap

7. Facility-Wide or Multi-Unit Emissions Cap Comment:

II. FACILITY INFORMATION

C. FACILITY ADDITIONAL INFORMATION

Additional Requirements for All Applications, Except as Otherwise Stated

1. **Facility Plot Plan**: (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)
   ☒ Attached, Document ID: Appendix B ☐ Previously Submitted, Date:_____
2. **Process Flow Diagram(s)**: (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)
   ☒ Attached, Document ID: Appendix B ☐ Previously Submitted, Date:_____
3. **Precautions to Prevent Emissions of Unconfined Particulate Matter**: (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)
   ☒ Attached, Document ID: Report Section 6.0 ☐ Previously Submitted, Date:_____

Additional Requirements for Air Construction Permit Applications

1. **Area Map Showing Facility Location**
   ☒ Attached, Document ID: Appendix B ☐ Not Applicable (existing permitted facility)
2. **Description of Proposed Construction, Modification, or Plantwide Applicability Limit (PAL)**
   ☒ Attached, Document ID: Report Section 3.0
3. **Rule Applicability Analysis**
   ☒ Attached, Document ID: Report Section 5.0
4. **List of Exempt Emissions Units**
   ☐ Attached, Document ID:_____ ☒ Not Applicable (no exempt units at facility)
5. **Fugitive Emissions Identification**
   ☒ Attached, Document ID: Appendix D ☐ Not Applicable
6. **Air Quality Analysis** (Rule 62-212.400(7), F.A.C.)
   ☒ Attached, Document ID: Report Section 7.0, Appendix F and G ☐ Not Applicable
7. **Source Impact Analysis** (Rule 62-212.400(5), F.A.C.)
   ☒ Attached, Document ID: Report Section 7.0, Appendix F and G ☐ Not Applicable
8. **Air Quality Impact since 1977** (Rule 62-212.400(4)(e), F.A.C.)
   ☒ Attached, Document ID: Report Section 7.0, Appendix F and G ☐ Not Applicable
9. **Additional Impact Analyses** (Rules 62-212.400(8) and 62-212.500(4)(e), F.A.C.)
   ☒ Attached, Document ID: Report Section 8.0 ☐ Not Applicable
10. **Alternative Analysis Requirement** (Rule 62-212.500(4)(g), F.A.C.)
    ☐ Attached, Document ID:_____ ☒ Not Applicable

II. FACILITY INFORMATION

C. FACILITY ADDITIONAL INFORMATION (CONTINUED)

Additional Requirement for FESOP Applications *Not Applicable*

List of Exempt Emissions Units

☐ Attached, Document ID:_____ ☐ Not Applicable (no exempt units at facility)

Additional Requirements for Title V Air Operation Permit Applications *Not Applicable*

1. **List of Insignificant Activities** (Required for initial/renewal applications only)
   ☐ Attached, Document ID:_____ ☐ Not Applicable (revision application)

2. **Identification of Applicable Requirements** (Required for initial/renewal applications, and for revision applications if this information would be changed as a result of the revision being sought. For federal regulations where applicability is dependent on the specific type of facility, provide the level of detail required to determine which specific set of regulations apply.)
   ☐ Attached, Document ID:_____
   ☐ Not Applicable (revision application with no change in applicable requirements)

3. **Compliance Report and Plan** (Required for all initial/revision/renewal applications)
   ☐ Attached, Document ID:_____
   Note: A compliance plan must be submitted for each emissions unit that is not in compliance with all applicable requirements at the time of application and/or at any time during application processing. The department must be notified of any changes in compliance status during application processing.

4. **List of Equipment/Activities Regulated under Title VI** (If applicable, required for initial/renewal applications only)
   ☐ Attached, Document ID: _____
   ☐ Equipment/Activities Onsite but Not Required to be Individually Listed
   ☐ Not Applicable

5. **Verification of Risk Management Plan Submission to EPA** (If applicable, required for initial/renewal applications only)
   ☐ Attached, Document ID:_____ ☐ Not Applicable

6. **Requested Changes to Current Title V Air Operation Permit**
   ☐ Attached, Document ID:_____ ☐ Not Applicable

II. FACILITY INFORMATION

C. FACILITY ADDITIONAL INFORMATION (CONTINUED)

Additional Requirements for Facilities Subject to Acid Rain or CAIR Program

Not Applicable

1. **Acid Rain Program Forms**:

   Acid Rain Part Application (DEP Form No. 62-210.900(1)(a))

   ☐ Attached, Document ID:_____ ☐ Previously Submitted, Date:_____

   ☐ Not Applicable (not an Acid Rain source)

   Phase II NO_X Averaging Plan (DEP Form No. 62-210.900(1)(a)1.)

   ☐ Attached, Document ID:_____ ☐ Previously Submitted, Date:_____

   ☐ Not Applicable

   New Unit Exemption (DEP Form No. 62-210.900(1)(a)2.)

   ☐ Attached, Document ID:_____ ☐ Previously Submitted, Date:_____

   ☐ Not Applicable

2. **CAIR Part** (DEP Form No. 62-210.900(1)(b)):

   ☐ Attached, Document ID:_____ ☐ Previously Submitted, Date:_____

   ☐ Not Applicable (not a CAIR source)

Additional Requirements Comment *Not Applicable*

III. EMISSIONS UNIT INFORMATION

Title V Air Operation Permit Application - For Title V air operation permitting only, emissions units are classified as regulated, unregulated, or insignificant. If this is an application for an initial, revised or renewal Title V air operation permit, a separate Emissions Unit Information Section (including subsections A through I as required) must be completed for each regulated and unregulated emissions unit addressed in this application. Some of the subsections comprising the Emissions Unit Information Section of the form are optional for unregulated emissions units. Each such subsection is appropriately marked. Insignificant emissions units are required to be listed at Section II, Subsection C.

Air Construction Permit or FESOP Application - For air construction permitting or federally enforceable state air operation permitting, emissions units are classified as either subject to air permitting or exempt from air permitting. The concept of an "unregulated emissions unit" does not apply. If this is an application for an air construction permit or FESOP, a separate Emissions Unit Information Section (including subsections A through I as required) must be completed for each emissions unit subject to air permitting addressed in this application for air permit. Emissions units exempt from air permitting are required to be listed at Section II, Subsection C.

Air Construction Permit and Revised/Renewal Title V Air Operation Permit Application – Where this application is used to apply for both an air construction permit and a revised or renewal Title V air operation permit, each emissions unit is classified as either subject to air permitting or exempt from air permitting for air construction permitting purposes, and as regulated, unregulated, or insignificant for Title V air operation permitting purposes. A separate Emissions Unit Information Section (including subsections A through I as required) must be completed for each emissions unit addressed in this application that is subject to air construction permitting and for each such emissions unit that is a regulated or unregulated unit for purposes of Title V permitting. (An emissions unit may be exempt from air construction permitting but still be classified as an unregulated unit for Title V purposes.) Emissions units classified as insignificant for Title V purposes are required to be listed at Section II, Subsection C.

If submitting the application form in hard copy, the number of this Emissions Unit Information Section and the total number of Emissions Unit Information Sections submitted as part of this application must be indicated in the space provided at the top of each page.

EMISSIONS UNIT INFORMATION
Section [] of [] *See attached Table III.A for the information below*

A. GENERAL EMISSIONS UNIT INFORMATION

Title V Air Operation Permit Emissions Unit Classification

Regulated or Unregulated Emissions Unit? (Check one, if applying for an initial, revised or renewal Title V air operation permit. Skip this item if applying for an air construction permit or FESOP only.) *Not Applicable*

☐ The emissions unit addressed in this Emissions Unit Information Section is a regulated emissions unit.

☐ The emissions unit addressed in this Emissions Unit Information Section is an unregulated emissions unit.

Emissions Unit Description and Status *See attached Table III.A for the information below*

1. **Type of Emissions Unit Addressed in this Section** (Check one)

☐ This Emissions Unit Information Section addresses, as a single emissions unit, a single process or production unit, or activity, which produces one or more air pollutants and which has at least one definable emission point (stack or vent).

☐ This Emissions Unit Information Section addresses, as a single emissions unit, a group of process or production units and activities which has at least one definable emission point (stack or vent) but may also produce fugitive emissions.

☐ This Emissions Unit Information Section addresses, as a single emissions unit, one or more process or production units and activities which produce fugitive emissions only.

2. **Description of Emissions Unit Addressed in this Section**:

3. **Emissions Unit Identification Number**:

4. **Emissions Unit Status Code**:	5. **Commence Construction Date**:	6. **Initial Startup Date**:	7. **Emissions Unit Major Group SIC Code**:

8. **NAICS Code**:

9. **Federal Program Applicability**: (Check all that apply)

☐ Acid Rain Unit

☐ CAIR Unit

10. **Package Unit Manufacturer**: **Model Number**:

11. **Generator Nameplate Rating**:

12. **Emissions Unit Comment**:

EMISSIONS UNIT INFORMATION
Section [] of [] *See attached Table III.A for the information below*

Emissions Unit Control Equipment/Method: Control __ of ____

1. **Control Equipment/Method Description**:
2. **Control Device or Method Code**:

Emissions Unit Control Equipment/Method: Control __ of ____

1. **Control Equipment/Method Description**:
2. **Control Device or Method Code**:

Emissions Unit Control Equipment/Method: Control __ of ____

1. **Control Equipment/Method Description**:
2. **Control Device or Method Code**:

Emissions Unit Control Equipment/Method: Control __ of ____

1. **Control Equipment/Method Description**:
2. **Control Device or Method Code**:

 See attached Table III.B for the information below

B. EMISSIONS UNIT CAPACITY INFORMATION
(Optional for unregulated emissions units.)

Emissions Unit Operating Capacity and Schedule

1. **Maximum Process or Throughput Rate**:
2. **Maximum Production Rate**:
3. **Maximum Heat Input Rate**: _____mmBtu/hr
4. **Maximum Incineration Rate**: _____lbs/hr _____tons/day
5. **Requested Maximum Operating Schedule** hours/day: days/week: weeks/year: hours/year:
6. **Operating Capacity/Schedule Comment**:

C. EMISSION POINT (STACK/VENT) INFORMATION

(Optional for unregulated emissions units.)

Emission Point Description and Type

1. **Identification of Point on Plot Plan or Flow Diagram**:		2. **Emission Point Type Code**:
3. **Descriptions of Emission Points Comprising this Emissions Unit for VE Tracking**:		
4. **ID Numbers or Descriptions of Emission Units with this Emission Point in Common**:		
5. **Discharge Type Code**:	6. **Stack Height** (feet):	7. **Exit Diameter** (feet):
8. **Exit Temperature** (°F):	9. **Actual Volumetric Flow Rate** (acfm):	10. **Water Vapor (%)**:
11. **Maximum Dry Standard Flow Rate** (dscfm):		12. **Nonstack Emission Point Height** (feet):
13. **Emission Point UTM Coordinates** Zone: East (km): North (km):		14. **Emission Point Latitude/Longitude** Latitude (DD/MM/SS): Longitude (DD/MM/SS):
15. **Emission Point Comment**:		

D. SEGMENT (PROCESS/FUEL) INFORMATION

Segment Description and Rate: Segment __ of __

1. **Segment Description (Process/Fuel Type)**:		
2. **Source Classification Code (SCC)**:	3. **SCC Units**:	
4. **Maximum Hourly Rate**:	5. **Maximum Annual Rate**:	6. **Estimated Annual Activity Factor**:
7. **Maximum % Sulfur**:	8. **Maximum % Ash**:	9. **Million Btu per SCC Unit**:
10. Segment Comment:		

Segment Description and Rate: Segment __ of __

1. **Segment Description (Process/Fuel Type)**:		
2. **Source Classification Code (SCC)**:	3. **SCC Units**:	
4. **Maximum Hourly Rate**:	5. **Maximum Annual Rate**:	6. **Estimated Annual Activity Factor**:
7. **Maximum % Sulfur**:	8. **Maximum % Ash**:	9. **Million Btu per SCC Unit**:
10. **Segment Comment**:		

D. SEGMENT (PROCESS/FUEL) INFORMATION (CONTINUED)

Segment Description and Rate: Segment __ of __

1. **Segment Description (Process/Fuel Type)**:		
2. **Source Classification Code (SCC)**:	3. **SCC Units**:	
4. **Maximum Hourly Rate**:	5. **Maximum Annual Rate**:	6. **Estimated Annual Activity Factor**:
7. **Maximum % Sulfur**:	8. **Maximum % Ash**:	9. **Million Btu per SCC Unit**:
10. **Segment Comment**:		

Segment Description and Rate: Segment __ of __

1. **Segment Description (Process/Fuel Type)**:		
2. **Source Classification Code (SCC)**:	3. **SCC Units**:	
4. **Maximum Hourly Rate**:	5. **Maximum Annual Rate**:	6. **Estimated Annual Activity Factor**:
7. **Maximum % Sulfur**:	8. **Maximum % Ash**:	9. **Million Btu per SCC Unit**:
10. **Segment Comment**:		

E. EMISSIONS UNIT POLLUTANTS

List of Pollutants Emitted by Emissions Unit

1. Pollutant Emitted	2. Primary Control Device Code	3. Secondary Control Device Code	4. Pollutant Regulatory Code
See Appendix D for the Emission Unit Pollutants			

F1. EMISSIONS UNIT POLLUTANT DETAIL INFORMATION – POTENTIAL, FUGITIVE, AND ACTUAL EMISSIONS

(Optional for unregulated emissions units.)

Complete a Subsection F1 for each pollutant identified in Subsection E if applying for an air construction permit or concurrent processing of an air construction permit and a revised or renewal Title V operation permit. Complete for each emissions-limited pollutant identified in Subsection E if applying for an air operation permit.

Potential, Estimated Fugitive, and Baseline & Projected Actual Emissions

1. **Pollutant Emitted**: *See Report Section 4.0 and Appendix D for the information requested in this section.*	2. **Total Percent Efficiency of Control**:
3. **Potential Emissions** lbs/hour tons/year	4. **Synthetically-Limited?** ☐ Yes ☐ No
5. **Range of Estimated Fugitive Emissions (as applicable)**: _____ to _____ tons/year	
6. **Emission Factor**: **Reference**:	7. **Emissions Method Code**:
8.a. **Baseline Actual Emissions (if required)**: tons/year	8.b. **Baseline 24-month Period**: From: To:
9.a. **Projected Actual Emissions (if required)**: tons/year	9.b. **Projected Monitoring Period**: ☐ 5 years ☐ 10 years
10. **Calculation of Emissions**:	
11. **Potential, Fugitive, and Actual Emissions Comment**:	

F2. EMISSIONS UNIT POLLUTANT DETAIL INFORMATION - ALLOWABLE EMISSIONS

Complete Subsection F2 if the pollutant identified in Subsection F1 is or would be subject to a numerical emissions limitation.

Allowable Emissions Numerical Emissions Limitation ___of ___

1. **Basis for Numerical Emissions Limitation Code**: *See Report Section 1.0 for the information requested in this section*	2. **Future Effective Date of Numerical Emissions Limitation**:
3. **Numerical Emissions Limitation and Units**:	4. **Equivalent Allowable Emissions**: lbs/hour tons/year
5. **Method of Compliance**:	
6. **Allowable Emissions Comment** (Description of Operating Method):	

Allowable Emissions Numerical Emissions Limitation ___of ___

1. **Basis for Numerical Emissions Limitation Code**:	2. **Future Effective Date of Numerical Emissions Limitation**:
3. **Numerical Emissions Limitation and Units**:	4. **Equivalent Allowable Emissions**: lbs/hour tons/year
5. **Method of Compliance**:	
6. **Allowable Emissions Comment (Description of Operating Method)**:	

Allowable Emissions Numerical Emissions Limitation ___of ___

1. **Basis for Numerical Emissions Limitation Code**:	2. **Future Effective Date of Numerical Emissions Limitation**:
3. **Numerical Emissions Limitation and Units**:	4. **Equivalent Allowable Emissions**: lbs/hour tons/year
5. **Method of Compliance**:	
6. **Allowable Emissions Comment** (Description of Operating Method):	

G. VISIBLE EMISSIONS INFORMATION

Complete Subsection G if this emissions unit is or would be subject to a unit-specific visible emissions limitation.

Visible Emissions Limitation: Visible Emissions Limitation ___ of ____

1. **Visible Emissions Subtype**:	2. **Basis for Opacity Limit**: ☐ Rule ☐ Other
3. **Opacity Limit** Normal Conditions: % Exceptional Conditions: % Maximum Period of Excess Opacity Allowed: min/hour	
4. **Method of Compliance**:	
5. **Visible Emissions Comment**:	

Visible Emissions Limitation: Visible Emissions Limitation ___ of ____

1. **Visible Emissions Subtype**:	2. **Basis for Opacity Limit**: ☐ Rule ☐ Other
3. **Opacity Limit** Normal Conditions: % Exceptional Conditions: % Maximum Period of Excess Opacity Allowed: min/hour	
4. **Method of Compliance**:	
5. **Visible Emissions Comment**:	

H. CONTINUOUS MONITOR INFORMATION

Complete Subsection H if this emissions unit is or would be subject to continuous monitoring.

Continuous Monitoring System: Continuous Monitor ___ of ___

1. **Parameter Code**:	2. **Pollutant(s)**:
3. **CMS Requirement**:	
4. **Monitor Manufacturer**: **Model Number**: **Serial Number**:	
5. **Installation Date**:	6. **Performance Specification Test Date**:
7. **Continuous Monitor Comment**:	

Continuous Monitoring System: Continuous Monitor ___ of ___

1. **Parameter Code**:	2. **Pollutant(s)**:
3. **CMS Requirement**:	
4. **Monitor Manufacturer**: **Model Number**: **Serial Number**:	
5. **Installation Date**:	6. **Performance Specification Test Date**:
7. **Continuous Monitor Comment**:	

H. CONTINUOUS MONITOR INFORMATION (CONTINUED)

Continuous Monitoring System: Continuous Monitor ___ of ___

1. **Parameter Code**:	2. **Pollutant(s)**:
3. **CMS Requirement**:	
4. **Monitor Manufacturer**: **Model Number**: **Serial Number**:	
5. **Installation Date**:	6. **Performance Specification Test Date**:
7. **Continuous Monitor Comment**:	

Continuous Monitoring System: Continuous Monitor ___ of ___

1. **Parameter Code**:	2. **Pollutant(s)**:
3. **CMS Requirement**:	
4. **Monitor Manufacturer**: **Model Number**: **Serial Number**:	
5. **Installation Date**:	6. **Performance Specification Test Date**:
7. **Continuous Monitor Comment**:	

I. EMISSIONS UNIT ADDITIONAL INFORMATION

Additional Requirements for All Applications, Except as Otherwise Stated

1. **Process Flow Diagram** (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)

   ☒ Attached, Document ID: Appendix B ☐ Previously Submitted, Date _____

2. **Fuel Analysis or Specification** (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)

   ☒ Attached, Document ID: natural gas, coal and coke ☐ Previously Submitted, Date ___

3. **Detailed Description of Control Equipment** (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)

   ☒ Attached, Document ID: Report Section 6.0 ☐ Previously Submitted, Date _____

4. **Procedures for Startup and Shutdown** (Required for all operation permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)

   ☐ Attached, Document ID: _____ ☐ Previously Submitted, Date _____

   ☒ Not Applicable (construction application)

5. **Operation and Maintenance Plan** (Required for all permit applications, except Title V air operation permit revision applications if this information was submitted to the department within the previous five years and would not be altered as a result of the revision being sought)

   ☐ Attached, Document ID: _____ ☐ Previously Submitted, Date _____

   ☒ Not Applicable

6. **Compliance Demonstration Reports/Records**

   ☐ Attached, Document ID: _____

   Test Date(s)/Pollutant(s) Tested: _____

   _____

   ☐ Previously Submitted, Date: _____

   Test Date(s)/Pollutant(s) Tested: _____

   _____

   ☐ To be Submitted, Date (if known):_____

   Test Date(s)/Pollutant(s) Tested: _____

   ☒ Not Applicable

   Note: For FESOP applications, all required compliance demonstration records/reports must be submitted at the time of application. For Title V air operation permit applications, all required compliance demonstration reports/records must be submitted at the time of application, or a compliance plan must be submitted at the time of application.

7. **Other Information Required by Rule or Statute**

   ☐ Attached, Document ID: _____ ☒ Not Applicable

I. EMISSIONS UNIT ADDITIONAL INFORMATION (CONTINUED)

Additional Requirements for Air Construction Permit Applications

1. **Control Technology Review and Analysis** (Rules 62-212.400(10) and 62-212.500(7), F.A.C.; 40 CFR 63.43(d) and (e)) ☒ Attached, Document ID: Report Section 6.0 ☐ Not Applicable
2. **Good Engineering Practice Stack Height Analysis** (Rules 62-212.400(4)(d) and 62-212.500(4)(f), F.A.C.) ☒ Attached, Document ID: Report Section 7.0 ☐ Not Applicable
3. **Description of Stack Sampling Facilities** (Required for proposed new stack sampling facilities only) ☒ Attached, Document ID: Report Section 6.0 ☐ Not Applicable

Additional Requirements for Title V Air Operation Permit Applications *Not Applicable*

1. **Identification of Applicable Requirements** (For federal regulations where applicability is dependent on the specific type of emissions unit and/or emissions unit subgroup, provide the level of detail required to determine which specific set of regulations apply.): ☐ Attached, Document ID: _____
2. **Compliance Assurance Monitoring** ☐ Attached, Document ID: _____ ☐ Not Applicable
3. **Alternative Methods of Operation** ☐ Attached, Document ID: _____ ☐ Not Applicable
4. **Alternative Modes of Operation (Emissions Trading)** ☐ Attached, Document ID: _____ ☐ Not Applicable

APPENDIX C – PRELIMINARY SCRAP MANANGEMENT PLAN

NUCOR

Pollution Prevention and Scrap Management Plan

Nucor Steel Florida, Inc.

Pollution Prevention/Scrap Management Plan for the Control of Contaminants in Scrap Under the Area Source Rule for Electric Arc Furnace (EAF) Steelmaking Facilities

Contaminants such as chlorinated plastics, free organic liquids, lead (except for leaded steel) and mercury are not appropriate or desired for the production of steel in EAF facilities. However, these contaminants are occasionally found in the scrap metal that is the basic feedstock for the production of new steel.

EPA has identified EAF facilities as potential sources of HAP emissions and, on December 28, 2007, promulgated final regulations (codified at 40 CFR Part YYYYY) intended to control or minimize such emissions.

The regulations require EAF facilities, among other things, to restrict the use of certain scrap or follow a Pollution Prevention Plan (PPP) for scrap purchased as production feedstock to minimize the amount of specified contaminants in such scrap.

Nucor Steel Florida, Inc. (“Nucor”) is committed to complying with the requirements of the EAF Area Source Rule and to the goal of removing at least 80% of mercury convenience-light switches from motor vehicle scrap.

Accordingly, Nucor has adopted and will comply with the provisions of this PPP designed to control the presence of such contaminants in scrap that is consumed in the EAF by adopting:

1. A specification for scrap that addresses contaminants identified by EPA.
2. Procedures for verifying compliance with the specification.
3. Procedures for taking corrective action against vendors who do not comply with the specification.
4. Documentation sufficient to demonstrate how Nucor will appropriately implement its responsibilities under the EPA-approved National Vehicle Mercury Switch Recovery Program (NVMSRP) or other EPA-approved program.

This PPP must be approved by USEPA or a delegated authority. Any deficiencies identified by the permitting authority must be addressed within 60 days of disapproval of the PPP. A copy of the plan and supportive documentation must remain onsite.

The terms used in this PPP shall have the same definitions as those enumerated in EPA's Final Area Source Rule found at 40 CFR Part 63 Subpart YYYYY. As outlined in the final rule, the term "mercury switch" denotes only mercury switches that are part of a convenience light switch mechanism installed in a vehicle.

General Scrap Specifications:

The following restrictions apply to all scrap steel purchased or used by Nucor in its EAF steelmaking process:

- Scrap materials must be depleted to the extent practicable of undrained used oil filters, chlorinated plastics, and free organic liquids at the time of charging to the furnace.

- Lead-containing components of scrap, such as batteries, battery cables, and wheel weights, must be removed, to the extent practicable, prior to charging in the furnace unless the scrap is used to produce leaded steel.

- Motor vehicle scrap must be purchased from providers that have minimized the presence of mercury in scrap through participation in the NVMSRP or another EPA-approved program.

Verification of Compliance with Specifications:

Free Organic Liquids, Chlorinated Plastics, Lead and Lead-Containing Components:

Visual Inspection: Nucor conducts a visual inspection of incoming scrap loads to confirm the scrap meets existing quality and/or purchase order specifications. Scrap inspection will be required also to determine whether there is an obvious presence of free organic liquids, chlorinated plastics, or lead-containing components. Records of scrap inspections will be maintained on site for one year. Scrap inspection records shall include the identity of the scrap provider for any load that fails visual inspection. Foreign materials will be removed to the extent practicable prior to charging to the furnace, and the scrap supplier will be subject to corrective action.

Unrestricted Scrap: Certain types of scrap, including "factory bundles," "demolition debris," "home scrap," "return scrap", "rail," and "flashings," as defined by common industry practice, as well as similar uncontaminated scrap, are not expected to contain free organic liquids, chlorinated plastics, or lead and will be presumed to be free of these contaminants. This scrap is not subject to the inspection and verification requirements of this plan.

Baghouse Bags, Internal Process and Maintenance Materials: Baghouse bags and baghouse maintenance materials that are routinely recycled by charging to the electric arc furnace, including personal protective equipment (PPE) and baghouse dust, are exempt from this PPP and not subject to the inspection and certification requirements of this plan.

Mercury

Nucor shall confirm motor vehicle scrap providers are participating in the NVMSRP or other EPA-approved program.

Corrective Action:

Lead, Chlorinated Plastics, Free Organic Liquids

If during an inspection of scrap pursuant to Part II(A) above, Nucor determines that the scrap provider has not met the specifications in part I, the scrap provider will be subject to corrective action, including suspension of the scrap provider.

Mercury

If Nucor reasonably believes, either as a result of inspection, site visits to a scrap yard, or review of the End of Life Vehicle Solutions (ELVS) database or by other means, that a scrap supplier is not taking appropriate steps to minimize the presence of mercury switches in scrap from end-of-life vehicles, the facility will be subject to corrective action, including suspension of the scrap provider.

APPENDIX D – EMISSIONS CALCULATIONS

Nucor Steel Florida LLC
Scrap Pile 1 Calculations

Scrap Pile - EP01

	Surface Area	
	86,377	ft2
	8,025	m2
Height	20	ft
Base Length	178	ft
Height to base ratio	0.11	<0.2, do not need to divide into subareas - assume relatively flat pile

Threshold Friction Velocity = 1.33 Table 13.2.5-2 Used a higher threshold velocity (scoria) since scrap steel is not a granular material

Nucor Steel Florida LLC
Scrap Transfer Points Calculations

Scrap Drop Points at EP01 and EP02

General Information	Value	Units	Basis
Operating Hours	8,760	hr/yr	
Annual Feedrate	481,500	ton/yr	
Moisture Content, M	2.0	%	Site-specific
Control Efficiency	0	%	No controls
Emission Factor Information			
PM Particle Size Multiplier, k	0.74		AP-42, Section 13.2.4: Aggregate Handling and Storage Piles (11/2006)
PM_{10} Particle Size Multiplier, k	0.35		AP-42, Section 13.2.4: Aggregate Handling and Storage Piles (11/2006)
$PM_{2.5}$ Particle Size Multiplier, k	0.053		AP-42, Section 13.2.4: Aggregate Handling and Storage Piles (11/2006)
Annual Outdoor Wind Speed, U	8	mph	Average mean wind speed from https://www.ncdc.noaa.gov/sites/default/files/attachments/wind1996.pdf for Tampa, FL

Emissions Summary	Emissions lb/hr	Total (ton/yr)
PM	0.240	1.05
PM_{10}	0.113	0.50
$PM_{2.5}$	0.017	0.08

Throughput

Emission/ Drop ID	Percent of Feedrate	Drop Throughput (ton/yr)
EP02 - Scrap Building		
Scrap Building Drop 1	16.7%	80,250
Scrap Building Drop 2	16.7%	80,250
Scrap Building Drop 3	16.7%	80,250
EP01 - Scrap Yard		
Scrap Pile 1 Unloading to Pile	25.0%	120,375
Scrap Pile 1 Loadout	25.0%	120,375

PM Emissions

Emission/ Drop ID	PM Emission Factor (lb/ton)	PM Emissions (lb/hr)	PM Emissions (ton/year)
EP02 - Scrap Building			
Scrap Building Transfer Point 1	4.4E-03	3.996E-02	0.175
Scrap Building Transfer Point 2	4.4E-03	3.996E-02	0.175
Scrap Building Transfer Point 3	4.4E-03	3.996E-02	0.175
EP01- Scrap Yard			
Scrap Pile 1 Unloading to Pile	4.4E-03	0.060	0.263
Scrap Pile 1 Loadout	4.4E-03	0.060	0.263
	Total	**0.240**	**1.050**

Nucor Steel Florida LLC
Scrap Transfer Points Calculations

Scrap Drop Points at EP01 and EP02

PM10 Emissions

Emission/ Drop ID	PM10 Emission Factor (lb/ton)	PM10 Emissions (lb/hr)	PM10 Emissions (ton/year)
EP02 - Scrap Building			
Scrap Building Transfer Point 1	2.1E-03	1.89E-02	0.083
Scrap Building Transfer Point 2	2.1E-03	1.89E-02	0.083
Scrap Building Transfer Point 3	2.1E-03	1.89E-02	0.083
EP01- Scrap Yard			
Scrap Pile 1 Unloading to Pile	2.1E-03	0.028	0.124
Scrap Pile 1 Loadout	2.1E-03	0.028	0.124
	Total	**0.113**	**0.497**

PM25 Emissions

Emission/ Drop ID	PM25 Emission Factor (lb/ton)	PM25 Emissions (lb/hr)	PM25 Emissions (ton/year)
EP02 - Scrap Building			
Scrap Building Transfer Point 1	3.125E-04	2.862E-03	0.013
Scrap Building Transfer Point 2	3.125E-04	2.862E-03	0.013
Scrap Building Transfer Point 3	3.125E-04	2.862E-03	0.013
EP01- Scrap Yard			
Scrap Pile 1 Unloading to Pile	3.125E-04	4.29E-03	0.019
Scrap Pile 1 Loadout	3.125E-04	4.29E-03	0.019
	Total	**0.017**	**0.075**

Notes
Calculated per AP-42, Section 13.2.4: Aggregate Handling and Storage Piles, Equation 1
Emission Calculations
Emission Factor = Particle Size Multiplier * 0.0032 * [Mean Wind Speed (mph) / 5] $^{1.3}$ / [Moisture Content (%) /2] $^{1.4}$
Emissions = Emission Factor (lb/ton dropped) * Drop Throughput (ton/yr) * (1-Baghouse Control Efficiency (if applicable))

Emissions Calculations

Throughput of screenings conservatively estimated based on experience with screening operations at other Nucor mini mills

Average Annual Particulate (PM) Emissions from Screening

Screen Name	Average Throughput	Emission Factor	Emission Rate	Annual Emission Rate [3]
	(tons/hr)	(lb/ton)	(lb/hr)	(tpy)
5' x 12' Screen (2)	96	2.20E-03	0.21	0.93
D.D. Screen	181	2.20E-03	0.40	1.74
Fe Screen	12	2.20E-03	0.03	0.12
T.D Screen	145	2.20E-03	0.32	1.39
TOTAL			**0.96**	**4.18**

Average Annual Particulate (PM_{10}) Emissions from Screening

Screen Name	Average Throughput	Emission Factor	Emission Rate	Annual Emission Rate
	(tons/hr)	(lb/ton)	(lb/hr)	(tpy)
5' x 12' Screen (2)	96	7.40E-04	0.07	0.31
D.D. Screen	181	7.40E-04	0.13	0.59
Fe Screen	12	7.40E-04	0.01	0.04
T.D Screen	145	7.40E-04	0.11	0.47
TOTAL			**0.32**	**1.41**

Average Annual Particulate ($PM_{2.5}$) Emissions from Screening

Screen Name	Average Throughput	Emission Factor	Emission Rate	Annual Emission Rate [3]
	(tons/hr)	(lb/ton)	(lb/hr)	(tpy)
5' x 12' Screen (2)	96	5.00E-05	4.82E-03	0.02
D.D. Screen	181	5.00E-05	0.01	0.04
Fe Screen	12	5.00E-05	6.03E-04	2.64E-03
T.D Screen	145	5.00E-05	0.01	0.03
TOTAL			**0.02**	**0.10**

Notes:

1. Emission factors from AP-42 Table 11.19.2-2 for controlled screening.

Nucor Steel Florida LLC
Slag & Mill Scale Transfer Calculations

Debris/Mill Scale/Slag Processing - Conveyor Transfer - EP18

Inputs

Description	Value	Units
Annual Operating Hours	8,760	hrs/yr
Average Throughput	Varies	tons/hr

Emissions Summary

Pollutant	Average Emission Rate (lb/hr_{avg})	Annual Emission Rate (tpy)
PM	0.04	0.19
PM_{10}	0.01	0.06
$PM_{2.5}$	4.1E-03	0.02

Calculation Basis

Calculation methodology derived from AP-42 Section 11.19.2 *Crushed Stone*

Emission Factor (lb / ton)

Source	PM	PM_{10}	$PM_{2.5}$
Conveyor Transfer [1]	0.00014	0.000046	0.000013

Emissions Calculations

Throughput of screenings conservatively estimated based on experience at other Nucor mini mills

Notes:

1. Emission factors from AP-42 Table 11.19.2-2 for controlled conveyor transfer.

Nucor Steel Florida LLC
Haul Road Calculations

Paved Haul Road Emissions - EP19

$E = k * (sL)^{0.91} * (W)^{1.02}$ Equation 1 from AP 42 Section 13.2.1.3.

where E is the particulate emission factor having the units matching k

Parameter	Value	Description of parameter
sL	0.6	Ubiquitous Silt Loading Default Value, g/m^2
W	see below	Mean vehicle weight [(loaded truck weight + unloaded truck weight)/2], tons
VMT	see below	Vehicle miles traveled (length traveled round trip)
VMT/hr	see below	Vehicle miles traveled per hour = VMT*maximum trips per hour
VMT/yr	see below	Vehicle miles traveled per year = VMT*maximum trips per year

	k (lb/VMT)
PM2.5	0.00054
PM10	0.0022
PM30 (TSP)	0.011

Notes: Constant k, lb/VMT is from AP 42 Table 13.2.1-1

EPA Control of Open Fugitive Dust Sources
Table 2-4: Measured Efficiency Values for Paved Road Controls

Water flushing followed by sweeping = 96 - 0.263 * V

Paved Entrance Road	Paved Roads	
36	108	V = number of vehicle passes since application
9	9	= Number of vehicle passes per hour- based on realistic maximum w/o causing traffic jam
4	12	= Time between water applications in hours
87%	68%	

Unpaved (Gravel) Roads - EP20

$E = k * (s/12)^{a} * (W/3)^{b}$ Equation 1b from AP 42 Section 13.2.2.2.

where E is the size specific emission factor, lb/VMT

Parameter	Value	Description of parameter
s	6	Surface material silt content, % (Plant road - Iron & steel production)
W	see below	Mean vehicle weight [(loaded truck weight + unloaded truck weight)/2], tons
VMT	see below	Vehicle miles traveled (length traveled round trip)
VMT/hr	see below	Vehicle miles traveled per hour = VMT*maximum trips per hour
VMT/yr	see below	Vehicle miles traveled per year = VMT*maximum trips per year

	k	a	b
PM2.5	0.15	0.9	0.45
PM10	1.5	0.9	0.45
PM30 (TSP)	4.9	0.7	0.45

Notes: Constants k, a, and b are from AP 42 Table 13.2.2-2

Mojave Desert Air Quality Management District Antelope Valley Air Pollution Control District
Emissions Inventory Guidance Mineral Handling and Processing Industries (April 10, 2000)
K, Dust Entrainment from Unpaved Roads

$$C_f = 100 - \left(0.0012 \times \frac{A \times D \times T}{I}\right)$$

Cf = Control efficiency of watering application in percent
37.06 A = Average annual class A pan evaporation in inches
4 D = Average hourly traffic rate in vehicles per hour
4 T = Time between water applications in hours
0.11 I = Water application intensity in gallons per square yard
94% Control efficiency of watering application in percent

Diesel Tank Calculations

Diesel Fuel Storage Tank - EP21

TANKS 4.0.9d Inputs

Description	Value	Units
Tank Type	Horizontal	
Location (meteorological data)	Orlando, FL	
Tank Contents	Distillate Fuel Oil #2	
Shell Length	20	ft
Diameter	5	ft
Volume	3000	gal
Turnovers	17.30	
Throughput	51,906	gal
Tank heated (y/n)	n	
Tank underground (y/n)	n	
Shell Color/Shade	White	
Shell Condition	Good	
Vacuum Settings (psig)	-0.03	
Pressure Settings (psig)	0.03	
Working Loss	1.66	lb/yr
Breathing Loss	0.79	lb/yr
Total Emissions	**1.23E-03**	**tpy**
	2.45	**lb/yr**

1.0 INTRODUCTION

Nucor Corporation – Nucor Steel Division (Nucor) is proposing to construct a steel micro mill, to be named Nucor Steel Florida LLC (Project), at a greenfield site northeast of the city limits of Avon Park, Florida. The site will be located in two counties: Polk and Highlands. The location of the Project site is shown in Figure A-1 in Appendix A. The Project will include air emissions sources for the manufacture of steel products from scrap steel. Iron ore will not be processed at the mill.

The following processes and emission units are preliminary proposed for the Project:

- Scrap and other material storage and handling
- Electric Arc Furnace (EAF) melting and refining operations
- Ladle Metallurgy Station (LMS) refining operations
- Ladle preheating and ladle repair/rebuilding
- Casting operations
- Rolling operations
- Finishing process
- Slag handling and crushing
- Cooling towers
- Emergency combustion engines
- Haul roads
- Car shredder
- Roller mill

The Project is a listed source and potential emissions indicate that the Project will be a major source; as a result, the Project will be subject to Prevention of Significant Deterioration (PSD) construction permit review. A PSD permit requires an assessment of ambient impacts for those pollutants subject to PSD review.

This air dispersion modeling protocol has been drafted in accordance with the U.S. Environmental Protection Agency (EPA) (EPA, 2017). Submittal of this protocol will allow the Florida Department of Environmental Protection (FDEP) to review and comment on the methodology to be employed in the modeling analysis.

2.0 PROJECT DESCRIPTION

The Project is a listed source that exceeds the major source threshold; therefore, the Project will be a major source subject to PSD. The Project potential emissions have not been finalized; however, preliminary estimated air emissions indicate that the PSD significance level will be exceeded for several modeled pollutants, as shown in Table 2-1. Based on the preliminary estimated potential emissions shown in Table 2-1, it is expected that nitrogen oxides (NO_x), carbon monoxide (CO), sulfur dioxide (SO_2), volatile organic compounds (VOC), particulate matter less than 10 microns and 2.5 microns in diameter (PM_{10} and $PM_{2.5}$), fluorides, and sulfuric acid (H_2SO_4) mist will be subject to PSD review and therefore require air dispersion modeling.

Maximum hours of operation for each emission source will be listed in detail in the air permit application.

Table 2-1: Preliminary Estimated Potential Emissions and PSD Significance Levels for the Project

Pollutant[a]	Preliminary Estimated Potential Emissions (Tons per Year)[b]	PSD Significance Level (Tons per Year)
NO_x	**93**	40

Fluorides	**16**	3

Source: 40 CFR 52.21(b)(23)(i)

Polk and Highlands County are currently designated as an attainment/unclassified area for all criteria pollutants in 40 Code of Federal Regulations (CFR) Part 81.

3.0 PROPOSED MODEL AND MODELING METHODOLOGY

Nucor is proposing to use the most current version of the AMS/EPA Regulatory Model (AERMOD) for the air quality analysis (Version 18081r). The AERMOD model is an EPA-approved, steady-state Gaussian plume model capable of modeling multiple sources in simple and complex terrain.

The following model options will be used:

- Elevated Terrain Algorithms
- Stack-tip Downwash
- Gradual Plume Rise
- Buoyancy-induced Dispersion
- Calms and Missing Data Processing Routine
- Calculate Wind Profiles
- Default Vertical Potential Temperature Gradient
- Rural Dispersion

Details of the modeling algorithms contained in AERMOD may be found in the User's Guide for AERMOD (EPA, 2016b). The regulatory default option will be selected for this analysis.

3.1 Modeling Parameters

It is expected that NO_x, CO, SO_2, VOC, PM_{10}, $PM_{2.5}$, fluorides, and H_2SO_4 mist will be subject to PSD review, and air dispersion modeling will be performed for all PSD pollutants subject to review. Modeling of VOC will not be performed because there are no modeling thresholds for this pollutant.

3.2 Emission Source Parameters

To confirm that operation of the Project will not exceed the required air dispersion modeling thresholds, modeling runs will be conducted at the maximum allowable operating conditions. All modeling inputs, including stack parameters, will be included in the air permit application submittal.

In addition to point sources, fugitive sources, such as haul roads and storage piles, will also be modeled. Volume sources will be used to represent the emissions from haul roads and any open conveyor drop points. Area sources will be used to represent fugitive emissions from storage piles and wind erosion.

Haul roads will be laid out using the guidance from the March 2, 2012, EPA memo on the *Haul Road Workgroup Final Report*. The following volume source configuration will be used for the haul roads:

- Top of plume height = 1.7 x vehicle height
- Volume source release height = 0.5 x top of plume height
- Width of plume = vehicle width + 6 meters for single lane road ways / road width + 6 meters for two lane roadways
- Initial sigma z = top of plume / 2.15
- Initial sigma y = width of plume / 2.15
- Adjacent volume source spacing = sigma y x 2.15

3.3 Intermittent Emissions

Per EPA guidance, Nucor proposes to only model continuous operation for the 1-hour standard. Emission units that do not have a set operating schedule, operate for short periods of time during the year, and do not contribute to the normal operation of the facility will not be included in the 1-hour modeling analysis. Therefore, emergency equipment (generator and fire pump) will be considered intermittent sources for the modeling analysis. The final list of sources considered intermittent and not modeled for the 1-hour standard will be listed in the air permit application submittal.

3.4 Emission Factors

Emissions factor (EMISFACT) modeling options in AERMOD allow a user to model emissions only when certain criteria are met. Fugitive emissions from storage pile wind erosion will be modeled as area sources and will be modeled using the STAR/WSPEED emission rate factor to simulate the lack of emissions below 12 miles per hour. EMISFACT will also be used to model the appropriate hourly restrictions on any equipment activities that only occur over a certain number of hours per day or seasons per year. If this hourly restriction option is utilized, a more detailed breakdown of operation times will be presented with the final modeling analysis. Nucor understands that the EMISFACT restrictions in the modeling will likely result in corresponding permit limitations.

3.5 Rain Caps and Horizontal Stacks

If horizontal stacks or rain caps are present at the site, the restriction of vertical flow will be accounted for through the use of the POINTCAP or POINTHOR keywords within the AERMOD input file. Any stack that is equipped with a rain cap or vents horizontally will be identified in the air permit application submittal.

3.6 Good Engineering Practice Stack Height

Sources are subject to Good Engineering Practice (GEP) stack height requirements outlined in 40 CFR Part 51, Sections 51.100 and 51.118. As defined by the regulations, GEP height is calculated as the

greater of 65 meters (measured from the ground level elevation at the base of the stack) or the height resulting from the following formula:

$$GEP = H + 1.5L$$

Where,

H = the building height; and

L = the lesser of the building height or the greatest crosswind distance of the building, also known as maximum projected width.

To meet stack height requirements, the proposed point sources will be evaluated in terms of their proximity to nearby structures. The purpose of this evaluation is to determine if the discharge from each stack will become caught in the turbulent wake of a building or other structure, resulting in downwash of the plume. Downwash of the plume can result in elevated ground-level concentrations. In EPA's 1985 *Guideline for Determination of Good Engineering Practice Stack Height*, EPA provides guidance for determining whether building downwash will occur. The downwash analysis will be performed consistent with the methods prescribed in this guidance document.

Calculations for determining the direction-specific downwash parameters will be performed using the most current version of the EPA's Building Profile Input Program – Plume Rise Model Enhancements, otherwise referred to as the BPIP-PRIME downwash algorithm (Version 04274). The BPIP-PRIME files will be submitted to FDEP as part of the modeling analysis. Modeled stack heights will not exceed the greater of 65 meters or the calculated GEP stack height, and the lesser of actual height or GEP stack height will be used.

3.7 Receptor Grid

The overall purpose of the modeling analysis is to demonstrate that operation of the Project will not result in, or contribute to, concentrations above the National Ambient Air Quality Standards (NAAQS) or PSD Class II Increments. Modeling runs will be conducted using the AERMOD model in simple and complex terrain mode within a 10- by 10-kilometer Cartesian grid to determine the significant impact area for each pollutant. Based on guidance from FDEP, the grid will incorporate the receptor spacing specified in Table 3-1. Receptors will also be placed along the fence line boundary at a spacing of 25 meters.

Table 3-1: Receptor Spacing from Fence Line Boundary

Distance from Fence Line (kilometers)	Receptor Spacing (meters)
0 – 0.1	50
0.1 – 2	100
2 – 5	250
5 – 10	1,000

Terrain elevations will be incorporated into the model. Therefore, the appropriate U.S. Geological Survey (USGS) National Elevation Dataset (NED) will be used to obtain the necessary receptor elevations. North American Datum of 1983 (NAD 83) will be used to develop the Universal Transverse Mercator (UTM) coordinates for this Project.

AERMOD has a terrain preprocessor (AERMAP) which uses gridded terrain data for the modeling domain to calculate not only a XYZ coordinate, but also a representative terrain-influenced height associated with each receptor location selected. This terrain-influenced height is called the height scale and is separate for each individual receptor. AERMAP (Version 18081) will utilize the electronic NED data to populate the model with receptor elevations.

3.8 Meteorological Data

AERMOD requires a preprocessor called AERMET to process meteorological data for 5 years from offsite locations to estimate the boundary layer parameters for the dispersion calculations. AERMET requires the input of surface roughness length, albedo, and Bowen ratio to define land surface characteristics for its calculations. FDEP provides AERMOD-ready processed meteorological data sets; therefore, the site characteristics (Bowen ratio, albedo, surface roughness) were completed by FDEP.

Surface air meteorological data from Winter Haven Municipal Airport near Auburndale, Florida (WBAN ID 12876). The Winter Haven Municipal Airport is approximately 32 miles northwest of the Project site and like the Project site, is located in inland Florida. Upper air data from Tampa International Airport in Tampa, Florida (WBAN ID 12842) will be used in the analysis. The Tampa International Airport is approximately 67 miles from the Project site and is the closest upper air station available. The most recent 5-year data set covers the period of 2013 to 2017. A profile base elevation of 44.5 meters will be used in the model. The meteorological data used to develop these data sets has been analyzed by FDEP for data completeness, and these meteorological data sets have good data quality.

3.9 Land Use Parameters

USGS land cover data was used to determine the rural and urban land use percentages for a 3-kilometer area surrounding the Project site (Figure A-2, Appendix A). Land use categories I1, I2, C1, R2, and R3 were classified as urban land use categories (EPA, 2017). Approximately 7 percent of the area surrounding the Project site is classified as urban. Since the 3-kilometer area surrounding the Project is more than 50 percent rural, the rural dispersion coefficients option in the AERMOD model were selected.

3.10 Modeling Thresholds

The NAAQS, modeling/monitoring significance levels, and PSD Class II Increment thresholds for the modeled pollutants are shown in Table 3-2.

Table 3-2: NAAQS, Modeling and Monitoring Significance Levels, and PSD Class II Increment

Pollutant	Averaging Period	Monitoring Significance Level[1]	Modeling Significance Level[2]	PSD Class II Increment[3]	NAAQS[4]
	micrograms per cubic meter (µg/m^3)				
NO_x	Annual	14	1	25	100
	1-hour	--	7.55	--	188
CO	8-hour	575	500	--	10,000
	1-hour	--	2,000	--	40,000
PM_{10}	Annual	--	1	17	--
	24-hour	10	5	30	150
$PM_{2.5}$	Annual	--	0.2[5]	4	12
	24-hour	4[a]	1.2[5]	9	35
SO_2	Annual	--	1	20	80
	24-hour	13	5	91	365
	3-hour	--	25	512	1,300
	1-hour	--	7.86	--	196

(4) Title 40 CFR Part 50
(5) EPA Memorandum, April 17, 2018, "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program."
(a) The $PM_{2.5}$ 24-hour significant monitoring concentration vacated by the United States Court of Appeals for the District of Columbia Circuit on January 22, 2013, is not considered valid in Florida. However, representative local monitoring data is available for use.

The modeled values will be modeled using the appropriate form of the standard for each pollutant and averaging period. For significance modeling, all short-term and annual averaging periods will be modeled with the impact shown in Table 3-3. For PSD Class II Increment, the short-term averaging periods will be compared to the high second highest impacts, and the annual standards will be compared to the first highest impacts. The NAAQS thresholds will be modeled using the highs shown in Table 3-3 for each averaging period.

Table 3-3: Modeled Highs

Pollutant	Averaging Period	Significant Impact Level High[1]	NAAQS Modeled High[2]
NO_2	Annual	1st highest	1st highest
	1-hour	5-year average 1st high hour day	5-year average 8th high hour day
CO	8-hour	1st highest	High 2nd highest
	1-hour	1st highest	High 2nd highest
PM_{10}	Annual	1st highest	--
	24-hour	1st highest	6th highest in 5 years
$PM_{2.5}$	Annual	5-year average year	5-year average year
	24-hour	5-year average 1st high day	5-year average 8th high day

(2) Title 40 CFR Part 50

3.11 Ambient Monitoring

The modeling analysis for emission sources for the Project will also address the pre-construction monitoring provision of the PSD regulations (EPA, 1987). The regulations specify monitoring *de minimis* levels for each PSD pollutant that, if exceeded, trigger the requirement to perform 1 year of pre-construction ambient air monitoring. If any predicted concentrations reach or exceed the monitoring *de minimis* levels, the owner will consult with FDEP to determine if pre-construction ambient air monitoring will be required. If modeled values exceed their respective monitoring *de minimis* values, the owner will request a waiver to use local ambient monitoring data to fulfill the pre-construction monitoring provisions of the PSD regulations or develop an acceptable monitoring plan at that time. For any impacts predicted to be below the monitoring *de minimis* levels, the owner will request an exemption from pre-construction

ambient air monitoring, given that representative monitors in the area may be used for appropriate background concentrations.

3.12 NAAQS and PSD Class II Increment Analysis

When the maximum impacts exceed the significant impact level for any pollutant and averaging time, then a refined modeling analysis is required. The inventories of sources will be developed in accordance with applicable EPA guidance and input from FDEP. For the NAAQS and PSD Class II Increment analysis, stationary sources identified by FDEP that emit pollutants subject to this analysis and are located within the radius of impact will be addressed.

Background air quality concentrations (as described in Section 3.13) will be added to model-predicted concentrations for comparison to the NAAQS. If the refined analysis does not result in any concentrations above the NAAQS or PSD Class II Increments, no further modeling will be conducted.

3.13 Background Air Quality

As stated previously, if any pollutant exceeds its respective PSD significance level, a refined analysis (cumulative analysis) will be performed for that pollutant and averaging period. The analysis will be used to determine compliance with the PSD Class II Increments and the NAAQS. The NAAQS are set up to protect the air quality for all sensitive populations, and attainment is determined by the comparison to the NAAQS thresholds. As such, existing concentrations of each criteria pollutant that are present in ambient air must be included in an analysis to account for items, such as mobile source emissions, not already accounted for in the model. Monitored ambient emission levels will be added to the modeled ground level impacts to account for these sources. Preliminary modeling indicates that refined modeling will be required for NO_2, PM_{10}, $PM_{2.5}$ and SO_2. Therefore, background values for these pollutants were determined for the refined modeling analysis.

The EPA and the FDEP collect ambient air quality pollutant concentrations from monitors that are placed throughout the State (as do other state agencies, in their respective states). The data that is collected by the monitors is available on the EPA website (https://www.epa.gov/outdoor-air-quality-data). Background values for NO_2, PM_{10}, $PM_{2.5}$ and SO_2 were identified from the monitors in the area. The monitored background levels will be added to the modeled impacts, as previously discussed.

In accordance with EPA documentation (EPA, 1987), there are three criteria that should be considered when selecting a representative existing ambient air monitor to represent ambient air concentrations for a Project. These three criteria are:

- Monitor location
- Data quality
- Currentness of data

Further discussion on these three criteria is presented below.

3.13.1 Monitor Location and Currentness of Data

The selected monitors for the Project are located in Florida, as noted in Figure A-3, Appendix A. For each pollutant, the most representative monitor was selected. Land use was considered in the selection of representative monitors for the proposed Project. Monitored concentrations should represent the land use within the immediate vicinity of the site, as much as is practicable. The land use surrounding the Project and each of the selected monitors are shown in Figures A-2, A-4, A-5, and A-6 in Appendix A. As demonstrated in the figures, the land use surrounding the selected monitors is predominantly low intensity and medium intensity developed land, while the Project site is mostly cultivated cropland, developed open space, and low intensity developed land. Therefore, the selected monitors are expected to be a conservative estimate of concentrations. Currentness of data was also considered in the selection of representative monitors for the proposed Project. The monitors selected had data available for monitoring years 2015 through 2017, the most recent three-year period.

3.13.2 Data Quality

Data quality was a factor in the selection of the proposed monitors. The selected monitors were reviewed for completeness, and it was determined that all data years for each pollutant are more than 80 percent complete. Therefore, the monitors meet the requirement for 80 percent completeness per EPA documentation (EPA, 1987).

3.13.3 Winter Park: Winter Park, Florida (Monitor 12-095-2002)

The most representative inland NO_2 monitor is the Winter Park monitor (AIRS No. 12-095-2002) located in Winter Park, Florida, as shown in Figure A-3. This monitor is located approximately 106 kilometers northeast of the Project site. Figure A-4 displays the land-use near the monitor. The land use surrounding the monitor is predominantly low intensity and medium intensity developed land, while the Project site is mostly cultivated cropland, developed open space, and low intensity developed land. This is also the closest inland NO_2 monitor to the Project site and is more representative than monitors located coastal areas. Because this monitor is an urban area, the monitored NO_2 concentrations are expected to be a conservative estimate of NO_2 concentrations in a less-developed area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of

the Project area. The regional background concentrations that will be used for the NO_2 averaging periods are listed in Table 3-4.

3.13.4 Baptist Children's Home: Lakeland, Florida (Monitor 12-105-6006)

The most representative monitor for the $PM_{2.5}$ and PM_{10} background concentrations is the Baptist Children's Home monitor (AIRS No. 12-105-6006) located in Lakeland, Florida, shown in Figure A-3. This is the closest operating $PM_{2.5}$ and PM_{10} monitor that is representative of the Project site. This monitor is located approximately 61 kilometers northwest from the Project site. Figure A-5 displays the land-use near the monitor. The land use surrounding the monitor is predominantly low intensity and medium intensity developed land, while the Project site is mostly cultivated cropland, developed open space, and low intensity developed land. This is also the closest inland monitor to the Project site and will be more representative than a monitor located in a coastal area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of the Project area. The regional background concentrations that will be used for the $PM_{2.5}$ and PM_{10} averaging periods are listed in Table 3-4.

3.13.5 Sikes Elementary School: Lakeland, Florida (Monitor 12-105-6005)

The most representative monitor for the SO_2 background concentrations is the Sikes Elementary School monitor (AIRS No. 12-105-6005) located in Lakeland, Florida, shown in Figure A-3. This is the closest operating SO_2 monitor that is representative of the Project site. This monitor is located approximately 57 kilometers northwest from the Project site. Figure A-6 displays the land-use near the monitor. The land use surrounding the monitor is predominantly developed open space and medium intensity developed land, while the Project site is mostly cultivated cropland, developed open space, and low intensity developed land. This is also the closest inland monitor to the Project site and will be more representative than a monitor located in a coastal area. Based on the land use surrounding the Project site and the inland monitor location, the monitored values are expected to be representative of the Project area. The regional background concentrations that will be used for the SO_2 averaging periods are listed in Table 3-4.

Table 3-4: Background Concentrations

Pollutant	Averaging Period	Background Concentration (µg/m³)	Form of the Standard	Air Quality System Monitor ID
NO_2	Annual	7.71	Maximum arithmetic mean for years 2015 to 2017	Winter Park (12-095-2002)
	1-hour	52.64	98th percentile of daily maximum 1-hour value averaged over years 2015 to 2017	
PM_{10}	24-hour	41.33	98th percentile averaged over years 2015 to 2017	Baptist Children's Home (12-105-6006)
$PM_{2.5}$	Annual	6.53	Maximum arithmetic mean for years 2015 to 2017	Baptist Children's Home (12-105-6006)
	24-hour	20.67	98th percentile of daily maximum 1-hour value averaged over years 2015 to 2017	
SO_2	Annual	3.20	Maximum arithmetic mean for years 2015 to 2017	Sikes Elementary School (12-105-6005)
	24-hour	11.27	Maximum highest second high for years 2015 to 2017	
	3-hour	71.53	Maximum highest second high for years 2015 to 2017	
	1-hour	55.89	99th percentile of daily maximum 1-hour value averaged over years 2015 to 2017

(a) µg/m³ = micrograms per cubic meter

3.14 NO_2 Modeling – Multi-Tiered Screening Approach

The AERMOD model gives the emission results for all pollutants, including NO_x. However, impacts of nitrogen dioxide (NO_2) must be examined for comparison to the NAAQS, PSD Class II Increments, and significance values. The EPA has a three-tier approach to modeling NO_2 concentrations:

- Tier I – total conversion, or all $NO_x = NO_2$
- Tier II – use a default NO_2/NO_x ratio
- Tier III – case-by-case detailed screening methods, such as the Ozone Limiting Method (OLM) or Plume Volume Molar Ratio Method (PVMRM)

At this time, it is unknown which approach will be used for the analysis. Tier II of the Ambient Ratio Method (ARM2) uses a minimum and maximum ratio that varies based on the modeled level of NO_x. If Tier II is used, the default minimum and maximum ratios of 0.5 and 0.9, respectively, will be applied to determine the predicted ground-level concentration of NO_2. If Tier III is used, the FDEP will be consulted for concurrence on the methodologies.

4.0 CLASS I AREA IMPACTS

Under the PSD program, Class I areas are protected more stringently than under the NAAQS. Class I areas include national parks, wilderness areas, and other areas of special national and cultural significance.

Three Class I areas are within 350 kilometers of the Project:

- Chassahowitzka Wilderness Area (152 kilometers)
- Everglades National Park (201 kilometers)
- Okefenokee Wilderness Area (339 kilometers)

The locations of the Project and the Class I areas are shown in Figure A-7, Appendix A.

As the Project develops, the appropriate Federal Land Managers (FLMs) and FDEP modeling team will be contacted to establish the Class I analyses required for this Project.

4.1 Visibility and Deposition

Following the most recent Federal Land Managers' Air Quality Related Values Work Group (FLAG) Workshop procedures (USFS, NPS, and USFWS, 2010), the Screening Procedure (Q/D) was used to determine if the Project could opt (screen) out of an Air Quality Related Value (AQRV) assessment for visibility and deposition with CALPUFF. Following the screening procedures in FLAG, using the preliminary maximum 24-hour emission rates, the emissions of NO_x, SO_2, $PM_{10}/PM_{2.5}$, and H_2SO_4 mist were summed and divided by the distance to the respective Class I area. The screening analysis is summarized for each of the Class I areas located within 350 kilometers of the Project as presented in Table 4-1.

Table 4-1: Q/D Analyses

Class I Area	Q[a] (Tons per Year)[b]	D (Kilometers)	Q/D
Chassahowitzka Wilderness Area	513.0	152	3.4
Everglades National Park	513.0	201	2.6
Okefenokee Wilderness Area	513.0	339	1.5

(a) $Q=sum(NO_x+PM_{10/2.5}+SO_2+H_2SO_4)$

In accordance with the FLAG Guidance, if Q/D is less than 10, then no AQRV analysis is required. Based on the ratio of Q/D, all the areas listed in the table above do not require further analysis of AQRV. Thus,

no CALPUFF analysis is anticipated for impacts to AQRVs. A notification letter will be submitted to the FLMs for concurrence with the above assessment.

4.2 PSD Class I Increment

An assessment of air quality impacts at Class I areas will be performed to demonstrate that the operation of the Project will not result in, or contribute to, concentrations above the PSD Class I Increment threshold. A screening analysis to determine if further analysis is required will be performed for each of the three Class I areas. Modeled impacts at a receptor placed 50 kilometers in the direction of each Class I area will be compared to the Class I significant impact level using AERMOD. Both the minimum and maximum receptor elevations at each of the respective Class I areas will be modeled.

If the modeled impacts are less than the applicable Class I significant impact levels, then the Project is assumed to be below the Class I Increment at the Class I areas. If the modeled impacts from the AERMOD analysis are above the Class I significant impact levels, then performing a PSD Class I Increment analysis with long-range transport models will be assessed, and a Class I modeling protocol will be submitted to FDEP.

5.0 SECONDARY FORMATION ANALYSIS

The Project is estimated to be significant for NO_x, SO_2, and VOC; therefore, an analysis of the impact of secondary formation of ozone (NO_x and VOC) and $PM_{2.5}$ (NO_x and SO_2) will be performed.

The NAAQS and modeling significance level threshold for ozone and $PM_{2.5}$ are shown in Table 5-1 and Table 3-2, respectively.

Table 5-1: Ozone NAAQS and Modeling Significance Levels

Pollutant	Averaging Period	Modeling Significance Level	NAAQS
		parts per billion (ppb)	parts per million (ppm)
Ozone	8-hour	1.0[a]	0.07[b]

Source: EPA Memorandum, April 17, 2018, "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program."
(a) 3-year average 4th high maximum
(b) 3-year average 4th high daily maximum

In December 2016, the EPA provided *Guidance on the Development of Modeled Emission Rates for Precursors (MERPS) as a Tier I Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program* (the Guidance) for consideration, review, and comment to local and state air agencies. While this guidance is not final, Nucor proposes to use the MERPS methodology to satisfy the compliance demonstration requirements for both ozone and secondary $PM_{2.5}$ for PSD purposes. The Tier 1 assessment will use existing empirical relationships between precursors and secondary impacts based on modeling performed by the EPA in the Guidance. MERPs will be used to describe an emission rate of a precursor that is expected to result in a change in ambient ozone or $PM_{2.5}$ that would be less than a specific air quality concentration threshold for ozone or $PM_{2.5}$ to determine whether an impact causes or contributes to a violation of the NAAQS for ozone or $PM_{2.5}$. The Guidance will be followed in determination of ozone and secondary $PM_{2.5}$ impacts.

6.0 ADDITIONAL IMPACT ANALYSIS

The additional impacts analysis requirement under PSD will include the ambient air quality impact analysis, soils and vegetation impacts, visibility impairment, and growth analysis on Class II areas. This analysis will follow EPA's guidance provided in the *New Source Review Workshop Manual* (October 1990 draft).

The growth analysis will quantify the number of employees, the availability of housing in the area, associated commercial and industrial growth, and construction related activities and mobile sources. The number of employees is not envisioned to be large enough to result in a quantifiable increase in emissions from residential, commercial, or industrial growth.

The Project will be located in a Class II area. With respect to visibility conditions around the facility, no known Class II screening visibility criteria have been recommended at this time. A visual plume blight analysis will be performed for sensitive areas within the region of the Project as identified and/or confirmed by the FDEP, if necessary. The visual plume blight analysis will be performed in accordance with the guidelines set forth in EPA-454/R-92-023, *Workbook for Plume Visual Impact Screening and Analysis (Revised)* (1992). In the EPA document, the model VISCREEN is recommended for plume visibility analysis.

Counsel for San Joaquin Valley Unified Air Pollution Control District

APPLICATION

Pursuant to California Rules of Court 8.520(f)(1), proposed Amicus Curiae San Joaquin Valley Unified Air Pollution Control District hereby requests permission from the Chief Justice to file an amicus brief in support of Defendant and Respondent, County of Fresno, and Defendant and Real Parties in Interest Friant Ranch, L.P. Pursuant to Rule 8.520(f)(5) of the California Rules of Court, the proposed amicus curiae brief is combined with this Application. The brief addresses the following issue certified by this Court for review:

> Is an EIR adequate when it identifies the health impacts of air pollution and quantifies a project's expected emissions, or does CEQA further require the EIR to *correlate* a project's air quality emissions to specific health impacts?

As of the date of this filing, the deadline for the final reply brief on the merits was March 5, 2015. Accordingly, under Rule 8.520(f)(2), this application and brief are timely.

1. Background and Interest of San Joaquin Valley Unified Air Pollution Control District

The San Joaquin Valley Unified Air Pollution Control District ("Air District") regulates air quality in the eight counties comprising the San Joaquin Valley ("Central Valley"): Kern, Tulare, Madera, Fresno, Merced, San Joaquin, Stanislaus, and Kings, and is primarily responsible for attaining air quality standards within its jurisdiction. After billions of dollars of investment by Central Valley businesses, pioneering air quality regulations, and consistent efforts by residents, the Central Valley air basin has made historic improvements in air quality.

The Central Valley's geographical, topographical and meteorological features create exceptionally challenging air quality

conditions. For example, it receives air pollution transported from the San Francisco Bay Area and northern Central Valley communities, and the southern portion of the Central Valley includes three mountain ranges (Sierra, Tehachapi, and Coastal) that, under some meteorological conditions, effectively trap air pollution. Central Valley air pollution is only a fraction of what the Bay Area and Los Angeles produce, but these natural conditions result in air quality conditions that are only marginally better than Los Angeles, even though about ten times more pollution is emitted in the Los Angeles region. Bay Area air quality is much better than the Central Valley's, even though the Bay Area produces about six times more pollution. The Central Valley also receives air pollution transported from the Bay Area and northern counties in the Central Valley, including Sacramento, and transboundary anthropogenic ozone from as far away as China.

Notwithstanding these challenges, the Central Valley has reduced emissions at the same or better rate than other areas in California and has achieved unparalleled milestones in protecting public health and the environment:

- In the last decade, the Central Valley became the first air basin classified by the federal government under the Clean Air Act as a "serious nonattainment" area to come into attainment of health-based National Ambient Air Quality Standard ("NAAQS") for coarse particulate matter (PM10), an achievement made even more notable given the Valley's extensive agricultural sector. Unhealthy levels of particulate matter can cause and exacerbate a range of chronic and acute illnesses.
- In 2013, the Central Valley became the first air basin in the country to improve from a federal designation of "extreme" nonattainment to

actually attain (and quality for an attainment designation) of the 1-hour ozone NAAQS; ozone creates "smog" and, like PM10, causes adverse health impacts.

- The Central Valley also is in full attainment of federal standards for lead, nitrogen dioxide, sulfur dioxide, and carbon monoxide.
- The Central Valley continues to make progress toward compliance with its last two attainment standards, with the number of exceedences for the 8-hour ozone NAAQS reduced by 74% (for the 1997 standard) and 38% (for the 2008 standard) since 1991, and for the small particulate matter (PM2.5) NAAQS reduced by 85% (for the 1997 standard) and 61% (for the 2006 standard).

Sustained improvement in Central Valley air quality requires a rigorous and comprehensive regulatory framework that includes prohibitions (e.g., on wood-burning fireplaces in new residences), mandates (e.g., requiring the installation of best available pollution reduction technologies on new and modified equipment and industrial operations), innovations (e.g., fees assessed against residential development to fund pollution reduction actions to "offset" vehicular emissions associated with new residences), incentive programs (e.g., funding replacements of older, more polluting heavy duty trucks and school buses)[1], ongoing planning for continued air quality improvements, and enforcement of Air District permits and regulations.

The Air District is also an expert air quality agency for the eight counties and cities in the San Joaquin Valley. In that capacity, the Air District has developed air quality emission guidelines for use by the Central

[1] San Joaquin's incentive program has been so successful that through 2012, it has awarded over $ 432 million in incentive funds and has achieved 93,349 tons of lifetime emissions reductions. *See* SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT, 2012 PM2.5 PLAN, 6-6 (2012) *available at* http://www.valleyair.org/Workshops/postings/2012/12-20-12PM25/FinalVersion/06%20Chapter%206%20Incentives.pdf.

Valley counties and cities that implement the California Environment Quality Act (CEQA).[2] In its guidance, the Air District has distinguished between toxic air contaminants and criteria air pollutants.[3] Recognizing this distinction, the Air District's CEQA Guidance has adopted distinct thresholds of significance for *criteria* pollutants (i.e., ozone, PM2.5 and their respective precursor pollutants) based upon scientific and factual data which demonstrates the level that can be accommodated on a cumulative basis in the San Joaquin Valley without affecting the attainment of the applicable NAAQS.[4] For *toxic air* pollutants, the District has adopted different thresholds of significance which scientific and factual data demonstrates has the potential to expose sensitive receptors (i.e., children, the elderly) to levels which may result in localized health impacts.[5]

The Air District's CEQA Guidance was followed by the County of Fresno in its environment review of the Friant Ranch project, for which the Air District also served as a commenting agency. The Court of Appeal's holding, however, requiring correlation between the project's criteria

---

[2] *See, e.g.*, SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT, PLANNING DIVISION, GUIDE FOR ASSESSING AND MITIGATING AIR QUALITY IMPACTS (2015), *available at* http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf ("CEQA Guidance").

[3] Toxic air contaminants, also known as hazardous air pollutants, are those pollutants that are known or suspected to cause cancer or other serious health effects, such as birth defects. There are currently 189 toxic air contaminants regulated by the United States Environmental Protection Agency ("EPA") and the states pursuant to the Clean Air Act. 42 U.S.C. § 7412. Common TACs include benzene, perchloroethylene and asbestos. *Id.* at 7412(b).

In contrast, there are only six (6) criteria air pollutants: ozone, particulate matter, carbon monoxide, nitrogen oxides, sulfur dioxide and lead. Although criteria air pollutants can also be harmful to human health, they are distinguishable from toxic air contaminants and are regulated separately. For instance, while criteria pollutants are regulated by numerous sections throughout Title I of the Clean Air Act, the regulation of toxic air contaminants occurs solely under section 112 of the Act. Compare 42 U.S.C. §§ 7407 – 7411 & 7501 – 7515 with 42 U.S.C. § 7411.

[4] See, e.g., CEQA Guidance at http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf, pp. 64-66, 80.

[5] See, e.g., CEQA Guidance at http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf, pp. 66, 99-101.

pollutants and local health impacts, departs from the Air District's Guidance and approved methodology for assessing criteria pollutants. A close reading of the administrative record that gave rise to this issue demonstrates that the Court's holding is based on a misunderstanding of the distinction between toxic air contaminants (for which a local health risk assessment is feasible and routinely performed) and criteria air pollutants (for which a local health risk assessment is not feasible and would result in speculative results).[6] The Air District has a direct interest in ensuring the lawfulness and consistent application of its CEQA Guidance, and will explain how the Court of Appeal departed from the Air District's long-standing CEQA Guidance in addressing criteria pollutants and toxic air contaminants in this amicus brief.

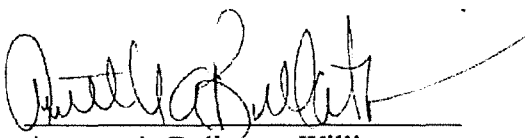
2. How the Proposed Amicus Curiae Brief Will Assist the Court

As counsel for the proposed amicus curiae, we have reviewed the briefs filed in this action. In addition to serving as a "commentary agency" for CEQA purposes over the Friant Ranch project, the Air District has a strong interest in assuring that CEQA is used for its intended purpose, and believes that this Court would benefit from additional briefing explaining the distinction between criteria pollutants and toxic air contaminants and the different methodologies employed by local air pollution control agencies such as the Air District to analyze these two categories of air pollutants under CEQA. The Air District will also explain how the Court of Appeal's opinion is based upon a fundamental misunderstanding of these two different approaches by requiring the County of Fresno to correlate the project's *criteria* pollution emissions with *local* health impacts. In doing

---

[6] CEQA does not require speculation. *See, e.g., Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.*, 6 Cal. 4th 1112, 1137 (1993) (upholding EIR that failed to evaluate cumulative toxic air emission increases given absence of any acceptable means for doing so).

so, the Air District will provide helpful analysis to support its position that at least insofar as criteria pollutants are concerned, CEQA does not require an EIR to correlate a project's air quality emissions to specific health impacts, because such an analysis is not reasonably feasible.



Rule 8.520 Disclosure

Pursuant to Cal. R. 8.520(f)(4), neither the Plaintiffs nor the Defendant or Real Party In Interest or their respective counsel authored this brief in whole or in part. Neither the Plaintiffs nor the Defendant or Real Party in Interest or their respective counsel made any monetary contribution towards or in support of the preparation of this brief.

CONCLUSION

On behalf of the San Joaquin Valley Unified Air Pollution Control District, we respectfully request that this Court accept the filing of the attached brief.

I. INTRODUCTION.

The San Joaquin Valley Unified Air Pollution Control District ("Air District") respectfully submits that the Court of Appeal erred when it held that the air quality analysis contained in the Environmental Impact Report ("EIR") for the Friant Ranch development project was inadequate under the California Environmental Quality Act ("CEQA") because it did not include an analysis of the correlation between the project's criteria air pollutants and the potential adverse human health impacts. A close reading of the portion of the administrative record that gave rise to this issue demonstrates that the Court's holding is based on a misunderstanding of the distinction between toxic air contaminants and criteria air pollutants.

Toxic air contaminants, also known as hazardous air pollutants, are those pollutants that are known or suspected to cause cancer or other serious health effects, such as birth defects. There are currently 189 toxic air contaminants (hereinafter referred to as "TACs") regulated by the United States Environmental Protection Agency ("EPA") and the states pursuant to the Clean Air Act. 42 U.S.C. § 7412. Common TACs include benzene, perchloroethylene and asbestos. *Id.* at 7412(b).

In contrast, there are only six (6) criteria air pollutants: ozone, particulate matter, carbon monoxide, nitrogen oxides, sulfur dioxide and lead. Although criteria air pollutants can also be harmful to human health,

they are distinguishable from TACs and are regulated separately. For instance, while criteria pollutants are regulated by numerous sections throughout Title I of the Clean Air Act, the regulation of TACs occurs solely under section 112 of the Act. *Compare* 42 U.S.C. §§ 7407 – 7411 & 7501 – 7515 *with* 42 U.S.C. § 7411.

The most relevant difference between criteria pollutants and TACs for purposes of this case is the manner in which human health impacts are accounted for. While it is common practice to analyze the correlation between an individual facility's TAC emissions and the expected localized human health impacts, such is not the case for criteria pollutants. Instead, the human health impacts associated with criteria air pollutants are analyzed and taken into consideration when EPA sets the national ambient air quality standard ("NAAQS") for each criteria pollutant. 42 U.S.C. § 7409(b)(1). The health impact of a particular criteria pollutant is analyzed on a regional and not a facility level based on how close the area is to complying with (attaining) the NAAQS. Accordingly, while the type of individual facility / health impact analysis that the Court of Appeal has required is a customary practice for TACs, it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task.

It is clear from a reading of both the administrative record and the Court of Appeal's decision that the Court did not have the expertise to fully

appreciate the difference between TACs and criteria air pollutants. As a result, the Court has ordered the County of Fresno to conduct an analysis that is not practicable and not likely yield valid information. The Air District respectfully requests that this portion of the Court of Appeal's decision be reversed.

II. THE COURT OF APPEAL ERRED IN FINDING THE FRIANT RANCH EIR INADEQUATE FOR FAILING TO ANALYZE THE SPECIFIC HUMAN HEALTH IMPACTS ASSOCIATED CRITERIA AIR POLLUTANTS.

Although the Air District does not take lightly the amount of air emissions at issue in this case, it submits that the Court of Appeal got it wrong when it required Fresno County to revise the Friant Ranch EIR to include an analysis correlating the criteria air pollutant emissions associated with the project with specific, localized health-impacts. The type of analysis the Court of Appeal has required will not yield reliable information because currently available modeling tools are not well suited for this task. Further, in reviewing this issue de novo, the Court of Appeal failed to appreciate that it lacked the scientific expertise to appreciate the significant differences between a health risk assessment commonly performed for toxic air contaminants and a similar type of analysis it felt should have been conducted for criteria air pollutants.

///

///

A. Currently Available Modeling Tools are not Equipped to Provide a Meaningful Analysis of the Correlation between an Individual Development Project's Air Emissions and Specific Human Health Impacts.

In order to appreciate the problematic nature of the Court of Appeals' decision requiring a health risk type analysis for criteria air pollutants, it is important to understand how the relevant criteria pollutants (ozone and particulate matter) are formed, dispersed and regulated.

Ground level ozone (smog) is not directly emitted into the air, but is formed when precursor pollutants such as oxides of nitrogen (NOx) and volatile organic compounds (VOCs) are emitted into the atmosphere and undergo complex chemical reactions in the process of sunlight.[1] Once formed, ozone can be transported long distances by wind.[2] Because of the complexity of ozone formation, a specific tonnage amount of NOx or VOCs emitted in a particular area does not equate to a particular concentration of ozone in that area. In fact, even rural areas that have relatively low tonnages of emissions of NOx or VOCs can have high levels of ozone concentration simply due to wind transport.[3] Conversely, the San Francisco Bay Area has six times more NOx and VOC emissions per square mile than the San Joaquin Valley, but experiences lower

[2] *Id.*
[3] *Id.*

concentrations of ozone (and better air quality) simply because sea breezes disperse the emissions.[4]

Particulate matter ("PM") can be divided into two categories: directly emitted PM and secondary PM.[5] While directly emitted PM can have a localized impact, the tonnage emitted does not always equate to the local PM concentration because it can be transported long distances by wind.[6] Secondary PM, like ozone, is formed via complex chemical reactions in the atmosphere between precursor chemicals such as sulfur dioxides (SOx) and NOx.[7] Because of the complexity of secondary PM formation, the tonnage of PM-forming precursor emissions in an area does not necessarily result in an equivalent concentration of secondary PM in that area.

The disconnect between the *tonnage* of precursor pollutants (NOx, SOx and VOCs) and the *concentration* of ozone or PM formed is important because it is not necessarily the tonnage of precursor pollutants that causes human health effects, but the concentration of resulting ozone or PM. Indeed, the national ambient air quality standards ("NAAQS"), which are statutorily required to be set by the United States Environmental Protection

[7] *Id.*

Agency ("EPA") at levels that are "requisite to protect the public health," 42 U.S.C. § 7409(b)(1), are established as concentrations of ozone or particulate matter and not as tonnages of their precursor pollutants.[8]

Attainment of a particular NAAQS occurs when the concentration of the relevant pollutant remains below a set threshold on a consistent basis throughout a particular region. For example, the San Joaquin Valley attained the 1-hour ozone NAAQS when ozone concentrations remained at or below 0.124 parts per million Valley-wide on 3 or fewer days over a 3-year period.[9] Because the NAAQS are focused on achieving a particular concentration of pollution region-wide, the Air District's tools and plans for attaining the NAAQS are regional in nature.

For instance, the computer models used to simulate and predict an attainment date for the ozone or particulate matter NAAQS in the San Joaquin Valley are based on regional inputs, such as regional inventories of precursor pollutants (NOx, SOx and VOCs) and the atmospheric chemistry and meteorology of the Valley.[10] At a very basic level, the models simulate future ozone or PM levels based on predicted changes in precursor

emissions Valley wide.[11] Because the NAAQS are set levels necessary to protect human health, the closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant.

The goal of these modeling exercises is not to determine whether the emissions generated by a particular factory or development project will affect the date that the Valley attains the NAAQS. Rather, the Air District's modeling and planning strategy is regional in nature and based on the extent to which *all* of the emission-generating sources in the Valley (current and future) must be controlled in order to reach attainment.[12]

Accordingly, the Air District has based its thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the Valley can accommodate without affecting the attainment date for the NAAQS.[13] The Air District has tied its CEQA significance thresholds to the level at which stationary pollution sources permitted by the Air District must "offset" their emissions.[14] This "offset"

---

[11] *Id.*

[12] Although the Air District does have a dispersion modeling tool used during its air permitting process that is used to predict whether a particular project's directly emitted PM will either cause an exceedance of the PM NAAQS or contribute to an existing exceedance, this model bases the prediction on a worst case scenario of emissions and meteorology and has no provision for predicting any associated human health impacts. Further, this analysis is only performed for stationary sources (factories, oil refineries, etc.) that are required to obtain a New Source Review permit from the Air District and not for development projects such as Friant Ranch over which the Air District has no preconstruction permitting authority. *See* San Joaquin Valley Unified Air Pollution Control District Rule 2201 §§ 2.0; 3.3.9; 4.14.1, available at: http://www.valleyair.org/rules/currntrules/Rule2201041l.pdf (visited March 19, 2015).

[13] *San Joaquin Valley Unified Air Pollution Control District Guide to Assessing and Mitigating Air Quality Impacts*, (March 19, 2015) p. 22, available at: http://www.valleyair.org/transportation/CEQA%20Rules/GAMAQI%20Jan%202002%20Rev.pdf (visited March 30, 2015).

[14] *Id.* at pp. 22, 25.

level allows for growth while keeping the cumulative effects of all new sources at a level that will not impede attainment of the NAAQS.[15] In the Valley, these thresholds are 15 tons per year of PM, and 10 tons of NOx or VOC per year. *Sierra Club, supra*, 172 Cal.Rptr.3d at 303; AR 4554. Thus, the CEQA air quality analysis for criteria pollutants is not really a localized, project-level impact analysis but one of regional, "cumulative impacts."

Accordingly, the significance thresholds applied in the Friant Ranch EIR (15 tons per year of PM and 10 tons of NOx or VOCs) are not intended to be indicative of any localized human health impact that the project may have. While the health effects of air pollution are of primary concern to the Air District (indeed, the NAAQS are established to protect human health), the Air District is simply not equipped to analyze whether and to what extent the criteria pollutant emissions of an individual CEQA project directly impact human health in a particular area. This is true even for projects with relatively high levels of emissions of criteria pollutant precursor emissions.

For instance, according to the EIR, the Friant Ranch project is estimated to emit 109.52 tons per year of ROG (VOC), 102.19 tons per year of NOx, and 117.38 tons per year of PM. Although these levels well

---

[15] [15] *San Joaquin Valley Unified Air Pollution Control District Environmental Review Guidelines* (Aug. 2000) p. 4-11, available at: http://www.valleyair.org/transportation/CEQA%20Rules/ERG%20Adopted%20_August%202000_.pdf (visited March 12, 2015).

exceed the Air District's CEQA significance thresholds, this does not mean that one can easily determine the concentration of ozone or PM that will be created at or near the Friant Ranch site on a particular day or month of the year, or what specific health impacts will occur. Meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone or PM. This is especially true for a project like Friant Ranch where most of the criteria pollutant emissions derive not from a single "point source," but from area wide sources (consumer products, paint, etc.) or mobile sources (cars and trucks) driving to, from and around the site.

In addition, it would be extremely difficult to model the impact on NAAQS attainment that the emissions from the Friant Ranch project may have. As discussed above, the currently available modeling tools are equipped to model the impact of *all* emission sources in the Valley on attainment. According to the most recent EPA-approved emission inventory, the NOx inventory for the Valley is for the year 2014 is 458.2 tons per day, or 167,243 tons per year and the VOC (or ROG) inventory is 361.7 tons per day, or 132,020.5 tons per year.[16] Running the photochemical grid model used for predicting ozone attainment with the

---

[16] *San Joaquin Valley Unified Air Pollution Control District 2007 Ozone Plan*, Appendix B pp. B-6, B-9,
available at:
http://www.valleyair.org/Air_Quality_Plans/docs/AQ_Ozone_2007_Adopted/19%20Appendix%20B%20April%202007.pdf (visited March 12, 2015).

emissions solely from the Friant Ranch project (which equate to less than one-tenth of one percent of the total NOx and VOC in the Valley) is not likely to yield valid information given the relative scale involved.

Finally, even once a model is developed to accurately ascertain local increases in concentrations of photochemical pollutants like ozone and some particulates, it remains impossible, using today's models, to correlate that increase in concentration to a specific health impact. The reason is the same: such models are designed to determine regional, population-wide health impacts, and simply are not accurate when applied at the local level.

For these reasons, it is not the norm for CEQA practitioners, including the Air District, to conduct an analysis of the localized health impacts associated with a project's criteria air pollutant emissions as part of the EIR process. When the accepted scientific method precludes a certain type of analysis, "the court cannot impose a legal standard to the contrary." *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 717 n. 8. However, that is exactly what the Court of Appeal has done in this case. Its decision upends the way CEQA air quality analysis of criteria pollutants occurs and should be reversed.

///

///

///

B. The Court of Appeal Improperly Extrapolated a Request for a Health Risk Assessment for Toxic Air Contaminants into a Requirement that the EIR contain an Analysis of Localized Health Impacts Associated with Criteria Air Pollutants.

The Court of Appeal's error in requiring the new health impact analysis for criteria air pollutants clearly stems from a misunderstanding of terms of art commonly used in the air pollution field. More specifically, the Court of Appeal (and Appellants Sierra Club et al.) appear to have confused the health risk analysis ("HRA") performed to determine the health impacts associated with a project's toxic air contaminants ("TACs"), with an analysis correlating a project's criteria air pollutants (ozone, PM and the like) with specific localized health impacts.

The first type of analysis, the HRA, is commonly performed during the Air District's stationary source permitting process for projects that emit TACs and is, thus, incorporated into the CEQA review process. An HRA is a comprehensive analysis to evaluate and predict the dispersion of TACs emitted by a project and the potential for exposure of human populations. It also assesses and quantifies both the individual and population-wide health risks associated with those levels of exposure. There is no similar analysis conducted for criteria air pollutants. Thus, the second type of analysis (required by the Court of Appeal), is not currently part of the Air District's process because, as outlined above, the health risks associated

with exposure to criteria pollutants are evaluated on a regional level based on the region's attainment of the NAAQS.

The root of this confusion between the types of analyses conducted for TACs versus criteria air pollutants appears to stem from a comment that was presented to Fresno County by the City of Fresno during the administrative process.

In its comments on the draft EIR, the City of Fresno (the only party to raise this issue) stated:

> [t]he EIR must disclose the human health related effects of the Project's air pollution impacts. (CEQA Guidelines section 15126.2(a).) The EIR fails completely in this area. The EIR should be revised to disclose and determine the significance of TAC impacts, and of human health risks due to exposure to Project-related air emissions.

(AR 4602.)

In determining that the issue regarding the correlation between the Friant Ranch project's criteria air pollutants and adverse health impacts was adequately exhausted at the administrative level, the Court of Appeal improperly read the first two sentences of the City of Fresno's comment in isolation rather than in the context of the entire comment. *See Sierra Club v. County of Fresno* (2014) 172 Cal.Rptr.3d 271, 306. Although the comment first speaks generally in terms of "human health related effects" and "air pollution," it requests only that the EIR be revised to disclose "the significance of TACs" and the "human health risks due to exposure."

The language of this request in the third sentence of the comment is significant because, to an air pollution practitioner, the language would only have indicated only that a HRA for TACs was requested, and not a separate analysis of the health impacts associated with the project's criteria air pollutants. Fresno County clearly read the comment as a request to perform an HRA for TACs and limited its response accordingly. (AR 4602.)[17] The Air District submits that it would have read the City's comment in the same manner as the County because the City's use of the terms "human health risks" and "TACs" signal that an HRA for TACs is being requested. Indeed, the Air District was also concerned that an HRA be conducted, but understood that it was not possible to conduct such an analysis until the project entered the phase where detailed site specific information, such as the types of emission sources and the proximity of the sources to sensitive receptors became available. (AR 4553.)[18] The City of Fresno was apparently satisfied with the County's discussion of human health risks, as it did not raise the issue again when it commented on the final EIR. (AR 8944 – 8960.)

---

[17] Appellants do not challenge the manner in which the County addressed TACs in the EIR. (Appellants' Answer Brief p. 28 fn. 7.)

[18] Appellants rely on the testimony of Air District employee, Dan Barber, as support for their position that the County should have conducted an analysis correlating the project's criteria air pollutant emissions with localized health impacts. (Appellants Answer Brief pp. 10-11; 28.) However, Mr. Barber's testimony simply reinforces the Air District's concern that a risk assessment (HRA) be conducted once the actual details of the project become available. (AR 8863.) As to criteria air pollutants, Mr. Barber's comments are aimed at the Air District's concern about the amount of emissions and the fact that the emissions will make it "more difficult for Fresno County and the Valley to reach attainment which means that the health of Valley residents maybe [sic] adversely impacted." Mr. Barber says nothing about conducting a separate analysis of the localized health impacts the project's emissions may have.

The Court of Appeal's holding, which incorrectly extrapolates a request for an HRA for TACs into a new analysis of the localized health impacts of the project's criteria air pollutants, highlights two additional errors in the Court's decision.

First, the Court of Appeal's holding illustrates why the Court should have applied the deferential substantial evidence standard of review to the issue of whether the EIR's air quality analysis was sufficient. The regulation of air pollution is a technical and complex field and the Court of Appeal lacked the expertise to fully appreciate the difference between TACs and criteria air pollutants and tools available for analyzing each type of pollutant.

Second, it illustrates that the Court likely got it wrong when it held that the issue regarding the criteria pollutant / localized health impact analysis was properly exhausted during the administrative process. In order to preserve an issue for the court, '[t]he "exact issue" must have been presented to the administrative agency....' [Citation.] *Citizens for Responsible Equitable Environmental Development v. City of San Diego*, (2011) 196 Cal.App.4th 515, 527 129 Cal.Rptr.3d 512, 521; *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 535, 78 Cal.Rptr.3d 1, 13. "'[T]he objections must be sufficiently specific so that the agency has the

opportunity to evaluate and respond to them.' [Citation.]" *Sierra Club v. City of Orange*,163 Cal.App.4th at 536.[19]

As discussed above, the City's comment, while specific enough to request a commonly performed HRA for TACs, provided the County with no notice that it should perform a new type of analysis correlating criteria pollutant tonnages to specific human health effects. Although the parties have not directly addressed the issue of failure to exhaust administrative remedies in their briefs, the Air District submits that the Court should consider how it affects the issues briefed by the parties since "[e]xhaustion of administrative remedies is a jurisdictional prerequisite to maintenance of a CEQA action." *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1199, 22 Cal.Rptr.3d 203.

III. CONCLUSION

For all of the foregoing reasons, the Air District respectfully requests that the portion of the Court of Appeal's decision requiring an analysis correlating the localized human health impacts associated with an individual project's criteria air pollutant emissions be reversed.

---

[19] *Sierra Club v. City of Orange*, is illustrative here. In that case, the plaintiffs challenged an EIR approved for a large planned community on the basis that the EIR improperly broke up the various environmental impacts by separate project components or "piecemealed" the analysis in violation of CEQA. In evaluating the defense that the plaintiffs had failed to adequately raise the issue at the administrative level, the Court held that comments such as *"the use of a single document for both a project-level and a program-level EIR [is] 'confusing',"* and *"[t]he lead agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project,"* were too vague to fairly raise the argument of piecemealing before the agency. *Sierra Club v. City of Orange*, 163 Cal.App.4th at 537.

correlating the localized human health impacts associated with an individual project's criteria air pollutant emissions be reversed.

Respectfully submitted,

CERTIFICATE OF WORD COUNT

Pursuant to Rule 8.204 of the California Rules of Court, I hereby certify that this document, based on the Word County feature of the Microsoft Word software program used to compose and print this document, contains, exclusive of caption, tables, certificate of word count, signature block and certificate of service, 3806 words.

Dated: April 2, 2015

Annette A. Ballatore-Williamson
District Counsel (SBN 192176)

Sierra Club et al, v. County of Fresno, et al
Supreme Court of California Case No.: S219783
Fifth District Court of Appeal Case No.: F066798
Fresno County Superior Court Case No.: 11CECG00726

PROOF OF SERVICE

I am over the age of 18 years and not a p[arty to the above-captioned action; that my business address is San Joaquin Valley Unified Air Pollution Control District located at 1990 E. Gettysburg Avenue, Fresno, California 93726.

On April 2, 2015, I served the document described below:

APPLICATION FOR LEAVE TO FILE AMICUS CURIAE BRIEF OF SAN JOAQUIN VALLEY UNIFIED AIR POLLUTION CONTROL DISTRICT IN SUPPORT OF DEFENDANT AND RESPONDENT, COUNTY OF FRESNO

On all parties to this action at the following addresses and in the following manner:

PLEASE SEE ATTACHED SERVICE LIST

(XX) **(BY MAIL)** I caused a true copy of each document(s) to be laced in a sealed envelope with first-class postage affixed and placed the envelope for collection. Mail is collected daily at my office and placed in a United State Postal Service collection box for pick-up and delivery that same day.

( ) **(BY ELECTRONIC MAIL)** I caused a true and correct scanned image (.PDF file) copy to be transmitted via electronic mail transfer system in place at the San Joaquin Valley Unified Air Pollution Control District ("District"), originating from the undersigned at 1990 E. Gettysburg Avenue, Fresno, CA, to the address(es) indicated below.

( ) **(BY OVERNIGHT MAIL)** I caused a true and correct copy to be delivered via Federal Express to the following person(s) or their representative at the address(es) listed below.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct and that I executed this document on April 2, 2015, at Fresno, California.

Esthela Soto

memorandum

date July 6, 2023

to Pacific Steel Group

cc

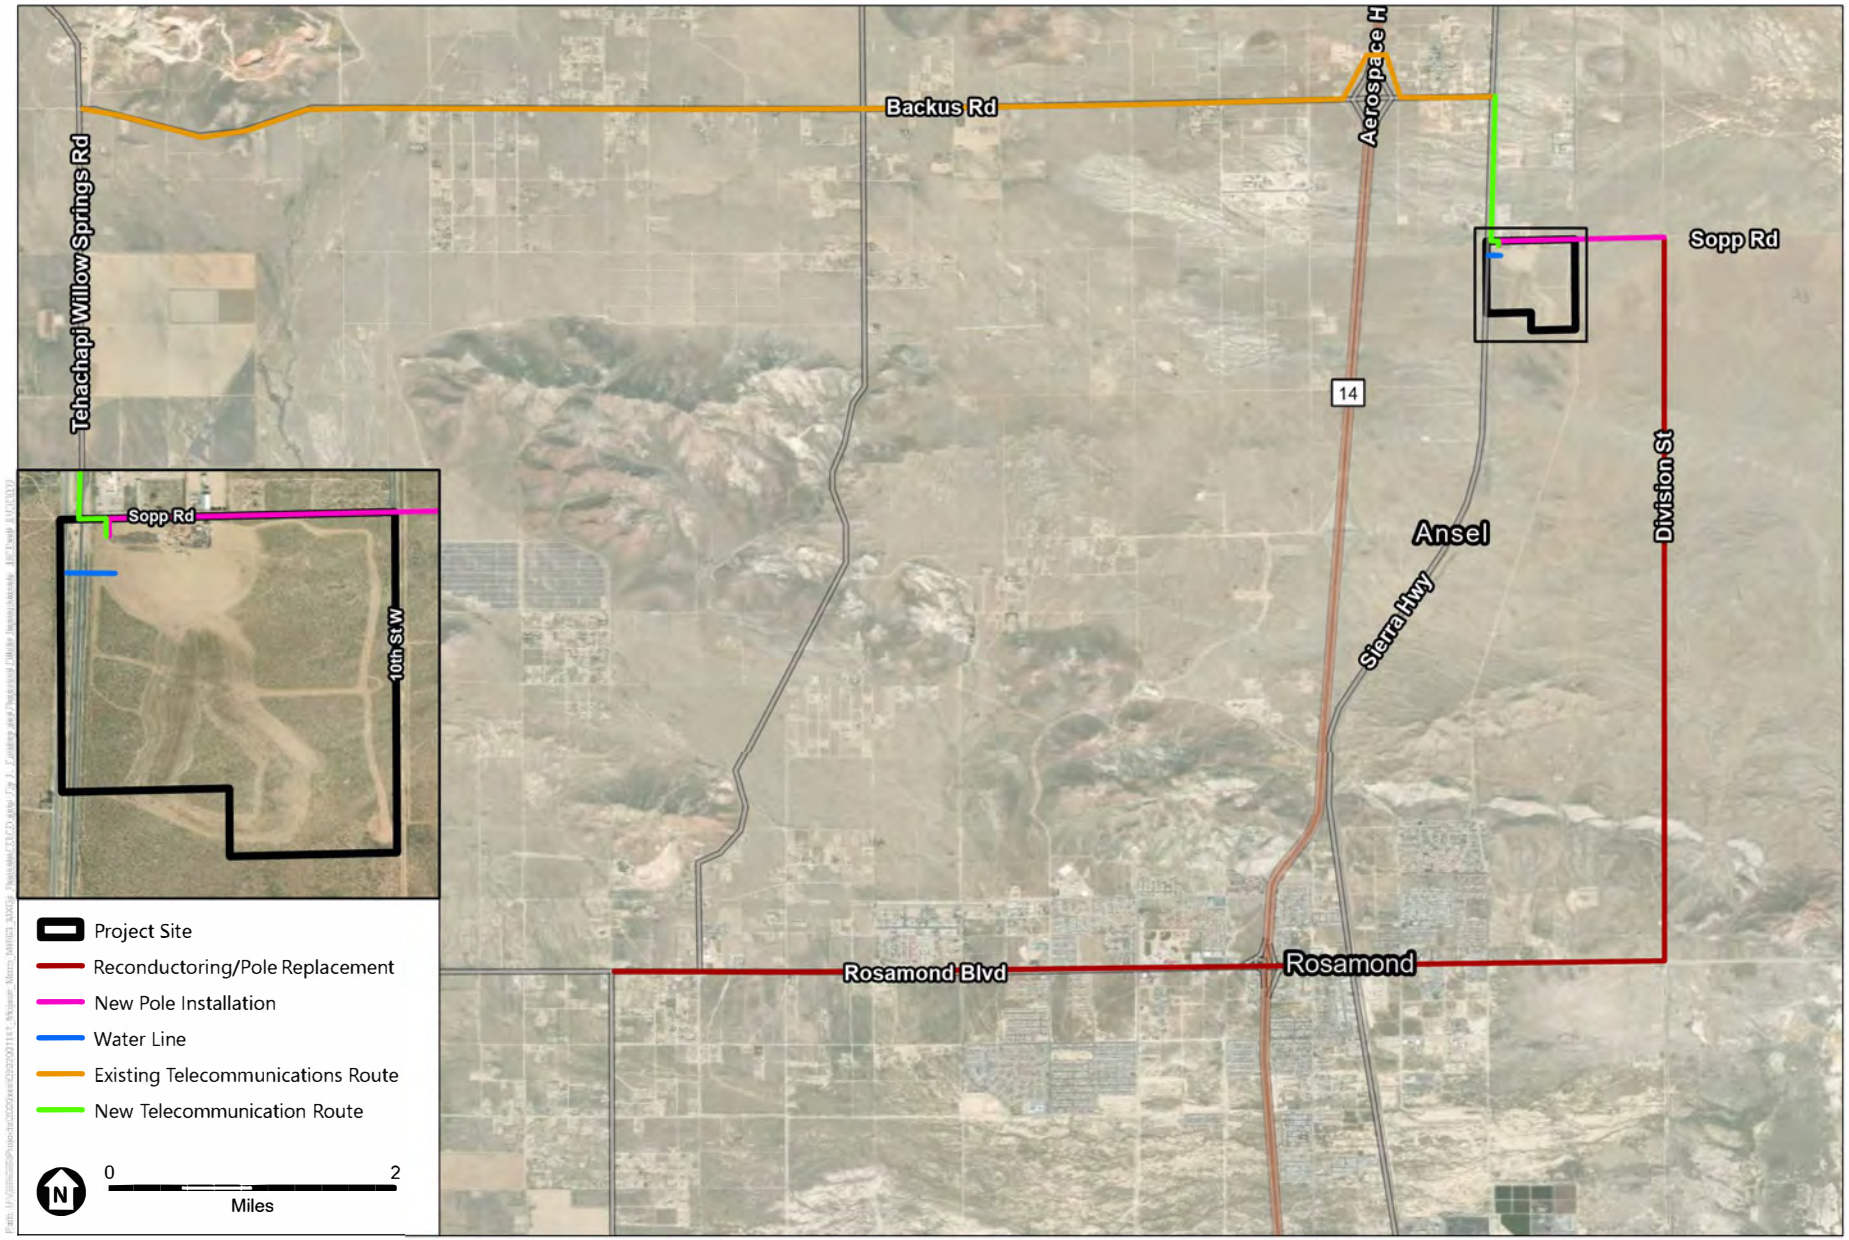
from Anitra Rice, ESA

subject Mojave Micro Mill Project – Air Quality Analysis of Off-Site Power Utilities

Introduction

The Pacific Steel Group (the "Applicant") is proposing to develop the Mojave Micro Mill Project (proposed Micro Mill), which consists of the construction of a micro mill facility and associated infrastructure necessary to produce reinforcing bar (rebar) from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. The proposed Micro Mill is located in unincorporated southeastern Kern County, in central California. The micro mill facility would be developed on two vacant parcels, totaling approximately 174 acres located at 860 Sopp Road, Mojave, California, along Sierra Highway in Kern County. The proposed Micro Mill is located approximately 57 miles southeast of the City of Bakersfield, approximately 4 miles north of the community of Rosamond and 8 miles south of Mojave.

The Air Quality Technical Report (Technical Report) for the project was completed in February 2023. At the time the Air Quality Technical Report was prepared, the off-site power and fiber-optic (telecommunication) lines were not included in the project description. The project description has since been updated to include the construction and installation of power and telecommunication connection lines that would serve the project. This memorandum provides an analysis of the air quality impacts associated with construction and installation of power and telecommunication connection lines for the proposed Micro Mill and includes a description of ESA's assumptions and the results of the analysis.



Power & Telecommunication

Southern California Edison (SCE) is the utility provider for the project site. In order to supply power to the project site, SCE would require the installation of two main components: a power line and a telecommunication line. The power line would consist of an upgrade to a portion of the Corum-Goldtown-Rosamond 66 kilovolt (kV) line, which runs from the Rosamond Substation (on the corner of Rosamond Boulevard and 60th Street W) parallel to Rosamond Boulevard before connecting to the north-south 66 kV line at approximately Rosamond Boulevard/Division Street, within the Edwards Air Force Base (EAFB) utility corridor. The connection would

continue north within EAFB's utility corridor approximately following the path of Division Street until Sopp Road. A new 66 kV power line would be erected from the corner of Sopp Road and Division Street to the project site at 860 Sopp Road. This new power line would be approximately 0.95 miles in length.

SCE estimates that the existing 66 kV line from Rosamond Substation to the corner of Sopp Road and Division Street would need to be reconductored (totaling approximately 13 miles), with all existing transmission poles requiring replacement with new poles installed for the section from the corner of Sopp Road and Division Street to the project site. SCE estimates that reconductoring would require the installation of 300 new poles and the removal of 275 existing poles.

The fiber-optic (telecommunication) line would tie-in to the existing telecommunications line from approximately Tehachapi Willow Springs Road following the route of Backus Road and routing around the north side of Exit 61 of State Route 14 to the Sierra Highway. SCE estimates the new fiber optic line would be installed on 18 new poles from Backus Road/Sierra Highway to the project site and would be approximately 1 mile in length. **Figure 1**, Existing and Proposed SCE Improvements, shows the location of the existing and proposed new power and telecommunication lines in relation to the proposed Micro Mill.

Regulatory Framework

A number of statutes, regulations, plans, and policies have been adopted that address the air quality concerns applicable to this project.

California Air Resources Board On-Road and Off-Road Vehicle Rules

In 2004, the California Air Resources Board (CARB) adopted an Airborne Toxic Control Measure (ATCM) to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter (DPM) and other Toxic Air Contaminants (TACs) (Title 13 California Code of Regulations [CCR], Section 2485). This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008, CARB approved the Truck and Bus regulation to reduce nitrogen oxides (NO_X), particulate matter with an aerodynamic diameter of 10 micrometers (µm) or less (PM10), and particulate matter with an aerodynamic diameter of 2.5 µm or less (PM2.5) emissions from existing diesel vehicles operating in California (13 CCR, Section 2025). The requirements were amended to apply to nearly all diesel-fueled trucks and buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. For the largest trucks in the fleet, those with a GVWR greater than 26,000 pounds must comply with a schedule by engine model year or owners can report to show compliance with more flexible options, such as the installation of DPM filters or low-use exemption.

In addition to limiting exhaust from idling trucks, CARB also promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower, such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The In-Use Off-Road Diesel Fueled Fleets regulation adopted by the CARB on July 26, 2007, aims to reduce emissions by the installation of DPM filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models (13 CCR, Section 2449). The compliance schedule requires that equipment turn overs or retrofits be fully implemented by 2023 in all equipment for large and medium fleets and by 2028 for small fleets.

California State Implementation Plan

The Clean Air Act (and its subsequent amendments) requires each state to prepare an air quality control plan referred to as the State Implementation Plan (or the SIP). The SIP is a living document that is periodically modified to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The Eastern Kern Air Pollution Control District (EKAPCD) has jurisdiction within the Mojave Desert Air Basin, where the project site is located. The EKAPCD approved the latest SIP, the 2023 Ozone Attainment Plan, in May 2023.

The 2023 Ozone Air Quality Attainment Plan (2023 AQAP) was adopted by EKAPCD on May 4, 2023. The 2023 AQAP includes required elements of an attainment plan, as well as the emissions reductions, and control measures necessary to demonstrate attainment with the 2008 and 2016 8-hour ozone National Ambient Air Quality Standards (NAAQS). Modeling completed by EKAPCD indicates that EKAPCD would not attain the 2015 8-hour Ozone (O_3) NAAQS (0.070 ppm) by the “Serious” nonattainment date of 2027, but could attain it by 2033, (attainment date for “Severe”). Pursuant to Clean Air Act Section 181(b)(3) “Voluntary Reclassification,” EKAPCD is petitioning CARB in the 2023 AQAP to formally submit a request to the U.S. Environmental

Protection Agency (USEPA) asking for the voluntary reclassification from Serious to Severe pursuant to the 2015 8-hour O_3 NAAQS. This will extend the attainment deadline to August 27, 2033. As of June 1, 2023, neither CARB nor the USEPA have approved the 2023 AQAP.[1]

Eastern Kern Air Pollution Control District

The project site lies within the Mojave Desert Air Basin (Air Basin) EKAPCD. The EKAPCD is responsible for air quality planning in its portion of the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished though air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and supporting and implementing measures to reduce emissions from motor vehicles. The EKAPCD has established a number of rules and regulations that apply to the project to ensure compliance with local, state, and federal air quality regulations. EKAPCD Rules 208.2, 210.1, 210.4, 210.5, 404, 402, 404.1, 410.4, 414, and 423 are applicable to the project. A summary of these rules can be found in Section 2 of the Air Quality Technical Report.[2]

Kern Council of Governments

Kern Council of Governments (KCOG) is the Metropolitan Planning Organization for the region in which the project is located. KCOG adopted the 2022 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS)[3] on December 16, 2022. The 2022 RTP/SCS serves as a blueprint that establishes a set of regional transportation goals, policies, and actions intended to guide development of the planned multimodal transportation systems in Kern County.

Kern County General Plan

The Kern County General Plan[4] was originally adopted on June 15, 2004, and was last amended on September 22, 2009. The Land Use, Open Space, and Conservation chapter contains the policies that relate to air quality. A list and description of the policies applicable to the project can be found in Section 2 of the Air Quality Technical Report.[5]

Methodology

The methodology to evaluate potential impacts to regional and local air quality that may result from the construction and long-term operations of the power and telecommunication lines is conducted as described below.

Project Emissions

The construction and operational emissions were estimated from several emission models, emissions factors, and references, depending on the source type and data availability. Project impacts were quantitatively assessed using conservative assumptions and the following resources:

- Construction equipment horsepower, load factors, and emission factors from the *California Emissions Estimator Model* (CalEEMod) model, version 2020.4.0.[6]
- Vehicle emission factors using EMFAC2021 (EMission FACtor model).
- Fugitive dust emission factors for grading, truck loading/dumping, and paved road travel from the CalEEMod model and particulate matter control efficiencies based on watering for construction dust control. Fugitive dust from travel on paved roads was calculated using AP-42 and CARB factors.[7]
- Mojave Micro Mill Project, Air Quality Technical Report, January 2023.
- California Public Utilities Commission, Circle City Substation and Mira Loma-Jefferson 66 kV line Project, May 2018.

The *Air Quality* section of the Circle City Substation and Mira Loma-Jefferson 66 KV Line EIR can be found in **Exhibit A**. More information related to the assumptions used in this technical analysis can be found in **Exhibit B**.

Construction Emissions

Construction and installation of the power and telecommunication connection lines for the project would generate temporary criteria pollutant emissions through the use of heavy-duty construction equipment, such as boom/crane truck, line puller, and loaders, and through worker vehicle trips and haul trucks traveling to and from the project site. Equipment such as helicopters were not assumed in the analysis. In addition, fugitive dust emissions would result from various soil-handling activities. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions. The majority of construction activities would be completed in a linear fashion and would not expose any one area for a long period of time.

At the time this memorandum was developed, Southern California Edison (SCE), the utility provider for the project site, had not developed a construction plan for the construction and installation of power and telecommunication connection lines for the Mojave Micro Mill Project. The known information provided by SCE was the number of poles to be constructed (300) and the rate of pole construction (one pole per day), which was used to develop a construction schedule of approximately 300 days. In the absence of a specific construction plan for power and telecommunications construction, technical information from a similar SCE project, including construction equipment, duration, and phasing, were used to develop construction assumptions for the power and telecommunication lines necessary to serve the Mojave Micro Mill Project.[8] The Circle City Substation and Mira Loma-Jefferson 66 KV Line Project (Circle City Project) was used as a project reference since the type of

---

6 CalEEMod version 2020.4.0 was used to calculate the emissions for the power and telecommunication lines, consistent with the CalEEMod version used in the Air Quality Technical Report for the Mojave Micro Mill Project.

7 CARB Miscellaneous Process Methodologies – Paved Road Dust, https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2018.pdf, March 2018. Accessed January 2023.

8 California Public Utilities Commission, Circle City Substation and Mira Loma-Jefferson 66 kV line Project, March 2016. Available at SCE's Circle City Substation and Mira Loma-Jefferson 66 kV Subtransmission Line Project (A.15-12-007): Home (ca.gov)

construction activities would be similar to those for the power and telecommunication connection lines for the Mojave Micro Mill Project. Detailed information provided in the technical appendices for the Circle City Project are publicly available and were analyzed to develop reasonably conservative and representative assumptions for this technical analysis.

Operational Emissions

Although the power and telecommunication lines would convey electricity and data, they would not generate emissions directly. During operation of the power and telecommunication lines, minimal amounts of emissions could be generated from indirect activities including periodic inspections and maintenance. Typical operational maintenance activities of power and telecommunication lines would include the use of service vehicles traveling on existing access roads with no surface disturbance. Thus, operational emissions would be generated from vehicle trips by worker staff for periodic inspections and maintenance purposes. The project would result in limited lengths of new power and telecommunications lines. The proposed new 66 kV power line would be approximately 0.95 miles in length and the proposed new telecommunication line would be approximately 1 mile in length. The reconductoring of the existing 66 kV line would be approximately 13 miles in length, however, as an existing line, this segment is already part of an existing inspection and maintenance schedule. Operational inspection and maintenance activities for the new power and telecommunication lines would be conducted as part of the overall inspection and maintenance activities of the existing lines. Thus, the net change in operational inspection and maintenance emissions from the project's new power and telecommunication lines would be minimal and are addressed qualitatively.

Health Risk Assessment

Construction of the power and telecommunication lines would emit TACs, including diesel particulate matter (DPM) being emitted from construction equipment and diesel trucks. Potential DPM emissions from the periodic operational inspections and maintenance activities would be negligible and were not quantified for a health risk assessment (HRA). An HRA was conducted to estimate cancer, non-cancer chronic (long-term), and non-cancer acute (short-term) impacts from construction of the power and telecommunication lines.

The HRA predicted the above health risks using a dispersion model to calculate ground-level concentrations of TACs based on the project's TAC emissions and toxicity and exposure factors provided by the California Office of Environmental Health Hazard Assessment (OEHHA). [9] EPA's AERMOD atmospheric dispersion model was used to simulate physical conditions and predict pollutant concentrations from construction and operational sources at sensitive receptors near the project site. AERMOD is EPA's preferred air dispersion model for near-field modeling from vented and non-vented sources. The model uses hourly meteorological observations and emission rates to determine hourly average concentrations from which other averaging periods (e.g., 24-hour, annual averages) are determined.

Cancer risk is quantified based on the OEHHA methodology based on a 30-year lifetime; the residential inhalation cancer risk from the annual average DPM concentrations is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor (ASF), the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. It

is important to note that exposure duration is based on the scheduled construction period. Cancer risk must be separately calculated for specified age groups, because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure.

Non-cancer chronic impacts are calculated by dividing the annual average concentration by the Reference Exposure level (REL) for that substance. REL is defined as the concentration at which no adverse noncancer health effects are anticipated. Based off OEHHA guidance, the current REL for DPM is 5 micrograms per cubic meter ($\mu g/m^3$).

For construction health risk, concentration outputs obtained from AERMOD were used with Microsoft Excel workbooks to calculate health risk at the nearby sensitive receptors. Dispersion modeling assumptions and results are provided in **Exhibit C**.

While the project site is relatively isolated, there are sensitive receptors located in the vicinity. The nearest residence to the power transmission line construction activity is on West Rosamond Blvd and the nearest residence to the telecommunications line construction activity is on Backus Road. There are other potential sensitive receptors at much greater distances that would observe lesser health risk impacts than the nearest residences.

Thresholds of Significance

The significance thresholds below are derived from the Environmental Checklist question in Appendix G of the California Environmental Quality Act (CEQA) Guidelines and EKAPCD's *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports*.[10]. Projects that produce emissions that exceed these thresholds shall be considered significant for a project level and/or cumulatively for impacts to air quality. These thresholds will be used to evaluate the significance of the impacts listed below.

A significant air quality impact would occur if the project would:

a) Conflict with or obstruct implementation of the applicable air quality plan.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

c) Expose sensitive receptors to substantial pollutant concentrations.

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

[10] Kern County Planning Department, *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports,* December 2006. Available at chrome-extension://efaidnbmnnnibpcajpcglclefindmkaj/http://www.kernair.org/Documents/CEQA/AirQualityAssessmentPreparationGuidelines.pdf, accessed January 5, 2023.

Environmental Impacts

Impact 1 – Conflict with or obstruct implementation of the applicable air quality plan.

Construction & Operational Emissions

Proposed Micro Mill

The EKAPCD's most recently adopted air quality management plan is the 2023 Ozone Attainment Plan. Eastern Kern County is currently in nonattainment for the O_3 California Ambient Air Quality Standards (CAAQS) and NAAQS, and the PM10 CAAQS. Certain individuals residing in Eastern Kern County could be exposed to pollutant concentrations that cause or aggregative acute and/or chronic health conditions (e.g., asthma, lost workdays, premature mortality). As stated in *Section 5.1, Consistency with Air Quality Plan* of the Air Quality Technical Report, with implementation of Mitigation Measure (MM) AQ-1 (Implement Diesel Emission Reduction Measures during Construction and Operation) and MM AQ-2 (Implement Fugitive Dust Control Plan during Construction and Operations), construction impacts would be less than significant.

Additionally, in general, a project would not interfere with the applicable air quality plan if it is consistent with growth assumptions used to form the 2023 AQAP. The land uses designated in the Kern County General Plan and the Kern Council of Government's Regional Transportation Plan/Sustainable Community Strategy (KCOG 2022 RTP/SCS)form the basis for the growth assumptions in the 2023 AQAP. The proposed Micro Mill proposes changing the general land use designation from resource management to heavy industrial and the zone classification from A-1 (Limited Agricultural) to M-3 PD (Heavy Industrial – Precise Development Combining. This change in land use designation and zone classification would bring additional jobs to the area.

Implementation of the proposed Micro Mill is consistent with the goals of the Kern County General Plan in providing an adequate and geographically balanced supply of land designated for a range of industrial purposes. The proposed Micro Mill site is geographically isolated from sensitive uses with the nearest residence located approximately 1,000 feet to the northwest of the project site promoting compatibility with land uses that may be affected by industrial operations while ensuring economic strength for Kern County and its residents. Furthermore, the project would not include any new residential growth/dwelling units and thus would not include a substantial increase in passenger vehicle and light duty truck trips and be consistent with the goals of the 2022 RTP/SCS.

As noted above, with implementation of MM AQ-1 and MM AQ-2 construction impacts would be less than significant. Regarding project operations, compliance with all applicable EKAPCD New Source Review (NSR) rules would reduce operational emissions, but emissions would still exceed the EKAPCD CEQA significance thresholds. Therefore, operational impacts would be significant and unavoidable.

Power and Telecommunication Lines

During construction, compliance with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment would be required. Although construction would be implemented by SCE, Kern County would be the lead agency. As such, construction and installation of the power and telecommunication lines will be required to implement MM AQ-1 and MM AQ-2. However, the analysis conservatively does not include MM AQ-1 or MM AQ-2.

As noted above, in general, a project would not interfere with the applicable air quality plan if it is consistent with the growth assumptions used to form the 2023 AQAP. The power and telecommunication lines do not include residential or commercial development and would not require daily staffing, but rather would require only periodic inspections and maintenance. No new employees would be required and implementation would not induce any additional growth. Since the addition of the power and telecommunication lines would not induce unplanned population or employment growth, implementation would not conflict with growth or employment projections in the 2023 AQAP. Although the power and telecommunication lines would convey electricity, they would not generate emissions. During operation of the power and telecommunication lines, minimal amounts of emissions could be generated from periodic inspections and maintenance (See Impact 2 for additional information). The operational emissions for the power and telecommunication lines would be negligible. Therefore, power and telecommunication lines would emit minimal emissions when compared to those identified in the Air Quality Technical Report. Although operational impacts from the proposed Micro Mill would remain significant and unavoidable, the impacts from the power and telecommunication lines would be less than significant.

Impact 2 – Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Construction Emissions

Criteria Air Pollutants

Proposed Micro Mill

As discussed in the Air Quality Technical Report, construction emissions for the proposed Micro Mill were estimated for each construction phase and were found to be less than significant with implementation of mitigation measures MM AQ-1 (Implement Diesel Emission Reduction Measures during Construction and Operation) and MM AQ-2 (Implement Fugitive Dust Control Plan during Construction and Operations). Refer to Table 1, below, for a summary of the proposed Micro Mill construction emissions.

Power and Telecommunication Lines

Construction of the power and telecommunication lines would result in the temporary addition of criteria pollutants to the local airshed caused by off-road construction equipment, such as boom/crane trucks, line pullers, and loaders and on-road vendor trucks, and worker vehicle trips. In addition, fugitive dust emissions would result from earthwork activities and entrained particulates that become airborne from vehicles traveling on paved and unpaved surfaces. Combustion emissions would result from the use of construction equipment. Construction emissions can vary substantially from day to day, depending on the level of activity and specific type of construction activity. Criteria air pollutant emissions associated with temporary construction activity were quantified using a combination of emission factors and methodologies from CalEEMod and EMFAC2021. Construction schedule details, including phase type, duration, and sequencing, were based on information provided by SCE and the Circle City Project to represent a conservative yet reasonable scenario based on the best information available. Default values provided in CalEEMod were used where detailed project information was not available. Details of the emission calculations are provided in **Exhibit B**.

Construction contractors are required to comply with the applicable provision of EKAPCD Rule 402 (Fugitive Dust) to control fugitive dust emissions. EKAPCD Rule 402 requires construction activities to control fugitive

dust emissions by complying with reasonably available control measures or bulk material control measures to limit visible dust emissions to more than 20 percent opacity. Since EKAPCD Rule 402 is a regulatory requirement applicable fugitive dust control measures are incorporated into the construction emissions modeling and are not considered mitigation .[11]

Project construction for both the power and telecommunication lines are conservatively assumed to start as early as January of 2024. If construction commences at a later date, construction emissions would be lower than those estimated in this memorandum due to the use of a more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase in less-polluting trucks. As a result, should the power and telecommunication line construction commence at a later date than analyzed in this memorandum, air quality impacts would be lower than the impacts disclosed herein.

As shown in **Table 1**, *Power and Telecommunication Construction Emission*, emissions associated with the power and telecommunication lines construction/installation emissions would be below the EKAPCD thresholds. As noted above, the analysis conservatively does not include MM AQ-1 or MM AQ-2.

Therefore, impacts from the power and telecommunication lines would not result in a substantial increase compared to those identified in the Air Quality Technical Report and impacts would be less than significant.

TABLE 1
POWER AND TELECOMMUNICATION UNMITIGATED CONSTRUCTION EMISSIONS

Exceeds Thresholds?	No	No	No	No	--

NOTES:

A Emissions presented are the maximum annual mitigated emissions for the proposed Micro Mill, which are assumed to occur in the year 2024. The combined maximum annual emissions (i.e. Power and Telecommunication plus the proposed Micro Mill) are less than EKAPCD thresholds.

SOURCE: ESA 2023.

[11] Air emissions scaled from the Circle City Project, are in the South Coast Basin under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SCAQMD has an equivalent fugitive dust rule, Rule 403, which requires dust suppression and was applied to the PM emissions within the Circle City Project. PM emissions for the proposed Micro Mill are equivalent to the emissions in the Circle City Project and may be conservative as the proposed Micro Mill is also required to comply with MM AQ-2.

Operational Emissions

Proposed Micro Mill

As discussed in the Air Quality Technical Report prepared for the proposed Micro Mill, operations would generate criteria air pollutants. Even with implementation of mitigation measure MM AQ-1, emissions would be above the EKAPCD criteria pollutant mass emission thresholds and the impact would be significant (see Table 2).

Power and Telecommunication Lines

As stated in the Methodology section above, although the power and telecommunication lines would convey electricity, they would not generate emissions directly. As such long-term operation of the power and telecommunication lines would not result in direct emissions of criteria pollutants. Rather during operation of the power and telecommunication lines, minimal amounts of emissions could be generated indirectly from periodic inspections and maintenance. Operational inspection and maintenance activities of the new power and telecommunication lines would be conducted using service vehicles traveling on existing access roads with no surface disturbance. In addition, operational inspection and maintenance activities for the new power and telecommunication lines would be included with current inspection and maintenance activities for the existing lines and conducted by existing employees. The project's new power and telecommunication lines would not require an increase in inspection and maintenance employees. As a result, minimal emissions would be generated from vehicle trips by worker staff for periodic inspections and maintenance purposes. Therefore, impacts from the power and telecommunication lines would not result in a substantial increase compared to those identified in the Air Quality Technical Report and impacts would be less than significant.

Impact 3 – Expose sensitive receptors to substantial pollutant concentrations.

Toxic Air Contaminants

Projects are evaluated for potential health risk impacts when a new or modified source of TACs is proposed for a location near an existing residential area or other sensitive receptor. A HRA was conducted for the power and telecommunication lines following Office of Environmental Health Hazard Assessment guidance for a 30-year lifetime exposure; additional information can be found in *Section 4.3 Health Risk Assessment* of the Air Quality Technical Report.

Proposed Micro Mill

Construction activities associated with development of the Mojave Micro Mill project would generate DPM emissions, which were evaluated in the HRA for the proposed Micro Mill. After completion of construction, operation of the proposed Micro Mill would also generate TAC emissions. Because cancer risk accumulates over time, the HRA evaluated lifetime cancer risk from the proposed Micro Mill's operations with exposure starting at the end of construction as well as lifetime cancer risk combining impacts from exposure to both construction and operation of the proposed Micro Mill. The HRA also evaluated cancer and non-cancer chronic health risks from TAC emissions during construction and operation. The worst-case health risk impacts of construction plus operations and 30-year lifetime operations results in an unmitigated cancer risk at the maximally exposed individual resident (MEIR) exceeding the EKAPCD threshold. The chronic hazard index was below the EKAPCD chronic hazard index threshold.

However, with implementation of Mitigation MM AQ-1, TAC emissions and corresponding health risk impacts for the Mojave Micro Mill Project would be reduced to below the EKAPCD threshold. These impacts are presented in Table 2, below. As such, the health risk impact attributed to the construction and operation of the proposed Micro Mill would be less than significant with incorporation of Mojave Micro Mill Project mitigation measure MM AQ-1.

Power and Telecommunication Lines

As with the proposed Micro Mill, the primary TAC concerns during project construction would be DPM emitted during construction activities for the power and telecommunication lines. During operation of the micro mill, DPM from on-road and off-road equipment and other TACs emitted during metal processing are of concern. As previously stated, negligible amounts of air emissions would be generated from maintenance operations for the power and telecommunication lines. The service vehicles conducting the maintenance operations would most likely be gasoline-fueled service trucks and would not generate DPM emissions. Therefore, negligible amounts of TACs would be generated from operational vehicle trips by worker staff for periodic inspections or maintenance. The anticipated health risk impacts from construction emissions from the power and telecommunications lines were quantified in the HRA.

The modeling domain for the health risk assessment, including air dispersion modeling, was much larger for the study of the power and telecommunication lines compared to the Mojave Micro Mill Project, which is generally limited to its project site location. The construction activities span a much larger area for the power lines, with line-volume sources representing construction activity along the construction path east along Sopp Rd, to the south along Division Street and west along West Rosamond Blvd. This is approximately 18,800 meters or 11.7 linear miles of construction activities, which corresponds to a much larger modeling domain when compared to the Mojave Micro Mill Project. For the purposes of air dispersion modeling, a line-volume source was used to represent the telecommunication line construction activities spanning approximately 9,300 meters or 5.8 linear miles primarily along Backus Road west of the Sierra Highway.

Health risk impacts were analyzed at two sets of sensitive receptors that are separated geographically by approximately 5 to 6 miles: the same sensitive receptors as the proposed Micro Mill to analyze the added impacts from the power and telecommunication lines as well as new sensitive receptors located along West Rosamond Blvd. New sensitive receptors were included in this analysis along West Rosamond Blvd to account for the nearby construction activities associated with the power line development that occurs approximately 5 miles south of the proposed Micro Mill site. It should be noted that this HRA conservatively assumes sensitive receptors along West Rosamond Blvd are continuously exposed to emissions along the entire path of power line construction. However, it is more realistic that due to the nature of pole installation, construction activities progress linearly on a daily basis and no single sensitive receptor would be exposed to nearby construction emissions for an extended period of time.

As shown in **Table 2**, *Maximum Health Risk Impacts for Off-Site Sensitive Receptors, Excluding the Proposed Micro Mill,* the maximum health risk to the sensitive receptors along West Rosemond Blvd from the construction of the power and telecommunication lines (approximately 5 miles from the proposed Micro Mill to the south) would be approximately 4.5 in one million, which is also less than the 10 in one million EKAPCD threshold of significance. The 4.5 in a million reflects the atmosphere dispersion of predicted pollutant concentrations from the power and telecommunication line construction to the sensitive receptors near the project site.

TABLE 2
MAXIMUM UNMITIGATED HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS, EXCLUDING THE PROPOSED MICRO MILL

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index[a]
Maximum Power and Telecommunication Line Impacts (*SCE Receptors along West Rosamond Blvd*)	4.5	0.01
Maximum Individual Risk Threshold	10	1.0
Exceeds Threshold?	**No**	**No**

[a] DPM is the primary TAC associated with construction, and it does not have an acute Reference Exposure Level; therefore, acute hazard was not quantified for the construction period.
[b] Maximum risk presented are the mitigated health risk impacts for the construction and operations of the proposed Micro Mill.

SOURCE: ESA, 2023.

The maximum mitigated cancer risk from construction and operation of the proposed Micro Mill at the maximally exposed individual resident (MEIR) would be approximately 8.29 in one million, as shown in **Table 3**, *Maximum Health Risk Impacts for Off-Site Sensitive Receptors, Including the Proposed Micro Mill*. The contribution to health risk from the construction of the power and telecommunication lines at the MEIR would be approximately 0.16 in one million for a total maximum risk of approximately 8.45 in one million. This risk level does not exceed the 10 in one million threshold of significance established by the EKAPCD. The MEIR for the project is located to the northwest of the project site.

TABLE 3
MAXIMUM UNMITIGATED HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS, INCLUDING THE PROPOSED MICRO MILL

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index[a]
Maximum Mitigated Proposed Micro Mill Impacts[b]	8.29	0.05
Maximum Power and Telecommunication Line Impacts (*near Proposed Micro Mill MEIR*)[c]	0.16	0.01
Total Health Risk Impacts	8.45	0.06
Maximum Individual Risk Threshold	10	1.0
Exceeds Threshold?	**No**	**No**

[a] DPM is the primary TAC associated with construction, and it does not have an acute Reference Exposure Level; therefore, acute hazard was not quantified for the construction period.
[b] Maximum risk presented are the mitigated health risk impacts for the construction and operations of the proposed Micro Mill.
[c] The maximum power and telecommunications line construction health risk impact was conservatively taken for any receptor near the MEIR and added to the MEIR from the proposed Micro Mill.

SOURCE: ESA, 2023.

As indicated in Tables 2 and 3, the construction activities associated with the power and telecommunication lines would not expose sensitive receptors to substantial TAC concentrations, and construction-related health impacts would not result in a substantial increase in the severity of impacts compared to those identified in the Air Quality Technical Report for the proposed Micro Mill. The contribution from the power and telecommunication lines health risk impacts to the MEIR as presented in Table 3 is much lower compared to the maximum impacts

presented in Table 2 since these sensitive receptors are located further away from the emission sources. Tables 2 and 3 provide context to the overall maximum health risk impacts associated with just the construction of the transmission and telecommunications lines, as well as the overall maximum health risk impacts when combining the construction of the transmission and telecommunications lines with the construction of the Mojave Micro Mill project.

Additionally, operation of the power and telecommunication lines would not expose sensitive receptors to TACs, and operation-related health impacts would be less than significant. As such, the health risk impact attributed to the power and telecommunication lines would be less than significant.

Impact 4 – Result in other emissions (such as those leading to odors) affecting a substantial number of people.

Other Emissions (Such as Odors)

Construction and Operations

Proposed Micro Mill

Land uses typically producing objectionable odors include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The proposed Micro Mill is a large industrial facility with the majority of the operations indoors. A wastewater treatment plant is part of the proposed Micro Mill to treat water that has direct contact with contaminants in the steel making process. The proposed Micro Mill would follow EKAPCD rules, including Rule 414 (Wastewater Separators) and 419 (Nuisance) during project operations.

Odors would come predominantly from construction equipment, which would cease immediately after construction is complete. The proposed Micro Mill would be required to comply with California Code of Regulations, Title 13, Sections 2449(d)(3) and 2485, which minimizes the idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. Additionally, the project would follow all applicable EKAPCD rules and regulation to keep odors down. Given the large project area and strong prevailing winds at the project site, these odors would be dispersed and would not create significant objectionable odors. As such, the proposed Micro Mill is not expected to result in adverse emissions affecting a substantial number of people and impacts related to odors would be less than significant.

Power and Telecommunication Lines

The SCE lines are not considered a land use that produces objectionable odors. During operation of the power and telecommunication lines, minimal amounts of emissions could be generated from periodic inspections and maintenance. Most regular operation and maintenance activities of overhead facilities are performed from service vehicles. Odors would come predominantly from construction equipment, which would cease immediately after construction is complete. Furthermore, as with the proposed Micro Mill, the construction of the power and telecommunication lines would be required to comply with CCR, Title 13, Sections 2449(d)(3) and 2485, which minimizes the idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than 5 minutes. This would further reduce the detectable odors from heavy-duty equipment exhaust. Additionally, the project would follow all applicable EKAPCD rules and regulations to keep odors down. As discussed, construction-related odors would be short-term and cease upon project completion.

The majority of construction activities would be linear in fashion and would not impact a substantial number of people. As such, the power and telecommunication lines are not expected to result in adverse emissions affecting a substantial number of people. Therefore, impacts related to odors would be less than significant.

Ambient Air Quality Analysis

Construction and Operations

Proposed Micro Mill

The Air Quality Technical Report indicated that the proposed Micro Mill would be required to comply with EKAPCD and USEPA permitting requirements. The proposed Micro Mill would require a permit application for an Authority to Construction with the EKAPCD, which would require purchase of offsets for non-attainment pollutants greater than the NSR thresholds indicated in Section 2.3 of the Air Quality Technical Report. An ambient air quality analysis must show less-than-significant impacts to the CAAQS and NAAQS. With implementation of MM AQ-3 (Conduct An Ambient Air Quality Analysis), which would require the proposed Micro Mill to meet the CAAQS and NAAQS by reducing emissions before permits are issued by the EKAPCD and USEPA, impacts would be less than significant with mitigation incorporated.

Power and Telecommunication Lines

As indicated in Table 1 and 2, emissions associated with the power and telecommunication lines would be below the thresholds of significance. Therefore, the power and telecommunication lines would meet the CAAQS and NAAQS and impacts would be less than significant.

CO Hotspots

Construction and Operations

Proposed Micro Mill

The project would have trip generation associated with construction worker vehicles and vendor trucks. As construction for the proposed Micro Mill is only expected to last approximately 24 months, it would be considered temporary and would not result in a long-term source of CO emissions. Therefore, impacts would be less than significant.

With the addition of project-generated traffic, the intersections of Backus Road and Sierra Highway, and Sopp Road and Sierra Highway, would all maintain a Level of Service (LOS) of C or better through 2042 and improvements are not warranted.[12] Highway 14 ramp intersections with Backus Road are anticipated to degrade to a LOS of F with project traffic. However, with implementation of MM AQ-4 (Implement Traffic Mitigation Improvement), installation of a traffic signal and expansion of the intersection at full buildout, LOS would be improved to C or better. Additionally, under year 2042 estimated traffic volumes the State Highway 14 southbound ramp intersection with Backus Road is anticipated to degrade to a LOS of F. However with MM AQ-4, the project would not result in intersections operating at or below LOS E. Therefore, the project would not have CO hotspot–related impacts and would not contribute a significant level of CO such that localized air quality and

[12] LAV/Pinnacle Engineering, Inc., Traffic Impact Study for Pacific Steel Group Reinforcing Bar Manufacturing Plant, October 10, 2022.

human health would be substantially degraded. Therefore, impacts would be less than significant with mitigation incorporated, and a CO hotspot analysis is not required.

Power and Telecommunication Lines

As previously mentioned, construction activities associated with the power and telecommunication lines is assumed to begin in January of 2024 to overlap with the peak emissions construction year for the proposed Micro Mill. Construction activities associated with the power and telecommunication lines would have trip generation associated with construction worker vehicles and vendor trucks. As with the proposed Micro Mill, construction of the power and telecommunication lines is expected to be temporary and would not result in a long-term source of Carbon Monoxide (CO) emissions. Therefore, construction impacts would be less than significant.

The SCE lines would not generate additional traffic with the exception of periodic visits from service vehicles for maintenance. Minimal additional trips would be generated from vehicle trips by worker staff to conduct the periodic inspections. Therefore, the power and telecommunication lines would not have CO hotspot–related impacts and would not contribute to a significant level of CO such that localized air quality and human health would be substantially degraded. Therefore, impacts would be less than significant.

Visibility Impacts

Construction and Operations

Proposed Micro Mill

The Air Quality Technical Report indicated that visibility at off-site locations may be impacted by emissions of airborne particulate matter from short-term construction activities and long-term operation of the project; however, with implementation of MM AQ-1, MM AQ-2, and MM AQ-5 (Complete a Visibility Impact Analysis), impacts would be less than significant with mitigation incorporated.

Power and Telecommunication Lines

As previously stated, construction would be considered temporary. Operation of the power and telecommunication lines would generate minimal amounts of emissions from maintenance operations, including from periodic visits from service vehicles. Therefore, impacts would not result in a substantial increase in the severity of impacts compared to those identified in the Air Quality Technical Report and impacts would be less than significant.

Valley Fever

Proposed Micro Mill

Ground-disturbing activities associated with the proposed Micro Mill mean that the potential exists that such activities could disturb dust particles and, if present, *Coccidioides immitis* (CI) spores, which could then be released into the air and potentially be inhaled by on-site workers and nearby sensitive receptors. Exposure to these spores can cause an illness in some individuals known as Valley Fever or Coccidioidomycosis. The Air Quality Impact Report concluded that with implementation of MM AQ-2 and MM AQ-6 (Minimize Exposure to Potential Airborne Valley Fever – Containing Dust), MM AQ-7 (COVID-19 Health and Safety Plan), and MM AQ-8 (Valley Fever Awareness), the potential for the release of CI spores, if present, and the associated potential for workers or nearby residents to contract Valley Fever would be minimized. Accordingly, the proposed Micro

Mill would not add significantly to the existing exposure level of construction workers or nearby residences to the CI fungus. Therefore, impacts would be less than significant with mitigation incorporated.

Power and Telecommunication Lines

Construction activities associated with the power and telecommunication lines would require minimal ground-disturbing activities compared to the proposed Micro Mill. The construction and installation of the power and telecommunication lines would be required to comply with EKAPCD Rule 402 to reduce man-made dust sources including those from construction activities, which would decrease the potential for the release of CI spores. Therefore, impacts would not result in a substantial increase in the severity of impacts compared to those identified in the Air Quality Technical Report and impacts would be less than significant.

Asbestos

Naturally occurring asbestos can be released from serpentinite and ultramafic rocks when the rock is broken or crushed. At the point of release, the asbestos fibers may become airborne, causing air quality and human health hazards. These rocks have commonly been used for unpaved gravel roads, landscaping, fill projects, and other improvement projects in some localities. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading of development projects, and at mining operations.

Proposed Micro Mill

As documented in the Air Quality Technical Report, the project site is not located in an area where naturally occurring asbestos is likely to be present. Therefore, impacts associated with exposure of construction workers and nearby sensitive receptors to asbestos would be less than significant.

Power and Telecommunication Lines

Although the power and telecommunication lines are in the same regional area as the proposed Micro Mill the power and telecommunication lines do cover a larger area. However, according to information provided by the Department of Conservation Division of Mines and Geology, the project site is not located in an area where naturally occurring asbestos is likely to be present.[13]. Therefore, impacts associated with exposure of construction workers and nearby sensitive receptors to asbestos would be less than significant.

4.3 Air Quality

This section evaluates the impacts of the Project, as well as the alternatives, on regional and local air quality due to sources of air pollutant emissions during construction, operation, and maintenance activities.

4.3.1 Setting

Air quality is affected by both the rate and location of pollutant emissions and by meteorological conditions, which influence movement and dispersal of pollutants. Atmospheric conditions such as wind speed, wind direction, and air temperature gradients, along with local topography, provide the link between air pollutant emissions and air quality.

The Project area lies between the San Jacinto Mountains to the south and the San Gabriel Mountains to the north within the inland valley of the South Coast Air Basin (Air Basin). The air above the Air Basin often exhibits weak vertical and horizontal dispersion characteristics, which limit the dispersion of emissions and cause increased ambient air pollutant levels. Persistent temperature inversions tend to prevent vertical dispersion. These inversions act as "ceilings" that prevent pollutants from rising and dispersing. The aforementioned mountain ranges act as "walls" that inhibit horizontal dispersion of air pollutants. This mix of topography and persistent weather patterns tends to retain pollutants for substantial periods and can contribute to poor local and regional air quality.

The study area typically has average maximum and minimum winter (i.e., January) temperatures of 68 degrees Fahrenheit (ºF) and 55 ºF, respectively, while average summer (i.e., July) maximum and minimum temperatures are 92 ºF and 60 ºF, respectively. Rainfall averages approximately 12 inches per year (Weatherbase, 2016).

4.3.1.1 Criteria Air Pollutants

The U.S. Environmental Protection Agency (USEPA) has identified criteria air pollutants and has set National Ambient Air Quality Standards (NAAQS) for widespread pollutants from numerous and diverse sources that are a threat to public health and welfare. The USEPA has set NAAQS for seven principal pollutants, which are called "criteria" pollutants:

- Carbon monoxide (CO);
- Lead;
- Nitrogen dioxide (NO_2);
- Ozone;
- Particulate matter less than or equal to 10 microns in diameter (PM_{10});
- Particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$); and
- Sulfur dioxide (SO_2).

The State of California has established California Ambient Air Quality Standards (CAAQS) for these criteria pollutants, as well as ambient air quality standards for sulfates, hydrogen sulfide (H_2S), and vinyl chloride. NAAQS and CAAQS are summarized in Table 4.3-2.

Below are descriptions of criteria pollutants that are a concern for this EIR because they would be generated by the Project.

Ozone

Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and that can cause substantial damage to vegetation and other materials. Ozone is not emitted directly into the atmosphere, but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving volatile organic compounds (VOC) and nitrogen oxides (NO_x). VOC and NO_x are known as precursor compounds for ozone. Significant ozone production generally requires ozone precursors to be present in a stable atmosphere with strong sunlight for approximately 3 hours.

Ozone is a regional air pollutant because it is not emitted directly by sources, but is formed downwind of sources of VOC and NO_x under the influence of wind and sunlight. Ozone concentrations tend to be higher in the late spring, summer, and fall, when conditions, such as long sunny days and regional subsidence inversions, are conducive to the formation and accumulation of secondary photochemical compounds.

Nitrogen Dioxide

Nitrogen dioxide (NO_2) is an air quality pollutant of concern because it acts as a respiratory irritant. NO_2 is a major component of the group of gaseous nitrogen compounds commonly referred to as oxides of nitrogen (NO_x). A precursor to ozone formation, NO_x is produced by fuel combustion in motor vehicles, industrial stationary sources (such as industrial activities), ships, aircraft, and rail transit. Typically, NO_x emitted from fuel combustion is in the form of nitric oxide (NO) and NO_2. NO is often converted to NO_2 when it reacts with ozone or undergoes photochemical reactions in the atmosphere.

Carbon Monoxide

Carbon monoxide (CO) is a non-reactive pollutant that is a product of incomplete combustion and is mostly associated with motor vehicle traffic. High CO concentrations develop primarily during winter when periods of light winds combine with the formation of ground level temperature inversions (typically from the evening through early morning). These conditions result in reduced dispersion of vehicle emissions. Motor vehicles also exhibit increased CO emission rates at low air temperatures. When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces the oxygen-carrying capacity of the blood. This results in reduced oxygen reaching the brain, heart, and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease, or anemia.

Particulate Matter

Particulate matter less than 10 microns in diameter (PM_{10}) and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) represent fractions of particulate matter that can be inhaled into air passages and the lungs and can cause adverse health effects. Particulate matter in the atmosphere results from many kinds of dust- and fume-producing industrial and agricultural operations, fuel combustion, and atmospheric photochemical reactions. Some sources of particulate matter, such as demolition and construction activities, are more local in nature, while others, such as vehicular traffic, have a more regional effect. Particulates can damage materials and reduce visibility. Very small particles of certain substances (e.g., sulfates and nitrates) can cause lung damage directly, or can contain adsorbed gases (e.g., chlorides or ammonium) that may be injurious to health. According to a study by the California Air Resources Board (CARB), the estimated number of annual $PM_{2.5}$-related premature deaths in California is 9,200 (CARB, 2010).

Sulfur Dioxide

Sulfur Dioxide (SO_2) is a colorless acid gas with a pungent odor. It has potential to damage materials and it can have health effects at high concentrations. It is produced by the combustion of sulfur-containing fuels, such as oil, coal and diesel. SO_2 can irritate lung tissue and increase the risk of acute and chronic respiratory disease.

4.3.1.2 Toxic Air Contaminants

Toxic Air Contaminants (TACs) are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer-causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes nearly 200 compounds, including Diesel Particulate Matter (DPM) emissions from diesel-fueled engines (CARB, 2011).

4.3.1.3 Valley Fever

Valley Fever (formally known as Coccidioidomycosis) is an infectious disease caused by the fungus *Coccidioides immitis*. Valley Fever is also known as San Joaquin Valley Fever, Desert Fever, or Cocci. Infection is caused by inhalation of *Coccidioides immitis* and *Coccidioides posadasii* spores that have become airborne when dry, dusty soil or dirt is disturbed by natural processes such as wind or earthquakes, or by human induced ground disturbing activities such as construction, farming, etc.

The California Department of Public Health received reports of 16,108 incident cases of valley fever from 2009 through 2012. Coccidioidomycosis is highly endemic in the San Joaquin Valley and remains an important public health problem in California but is not as prevalent in San Bernardino and Riverside counties. There is currently no vaccine; efforts to develop a vaccine are ongoing (CDPH, 2014).

4.3.1.4 Existing Air Quality

The South Coast Air Quality Management District (SCAQMD) is the local air district responsible for air quality within the Air Basin including all of Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino counties. The Air Basin is a 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east.

The SCAQMD maintains a regional monitoring network that measures the ambient concentrations of criteria pollutants in the Air Basin. Ambient air quality measurements from air monitoring stations maintained by SCAQMD help to determine the level of air quality in the local area. The closest air quality monitoring station to the Project is the Mira Loma Van Buren station, approximately 5 miles to the east of Mira Loma Substation. **Table 4.3-1** shows a 5-year (2012 through 2016) summary of ozone, PM_{10}, and $PM_{2.5}$ data monitored at the Mira Loma Van Buren station. The data are compared to the CAAQS and NAAQS.

TABLE 4.3-1
AIR QUALITY DATA SUMMARY (2012–2016) FOR THE STUDY AREA

Pollutant	Standard	Monitoring Data by Year				
		2012	2013	2014	2015	2016
Ozone						
Highest 1 Hour Average (ppm)		0.124	0.118	0.138	0.127	0.140
Days over State Standard	0.09	31	11	17	29	34
Highest 8 Hour Average (ppm)		0.102	0.096	0.102	0.104	0.106
Days over National Standard*	0.070	70	31	52	51	65
Particulate Matter (PM_{10})						
Highest 24 Hour Average ($\mu g/m^3$)		76	143	83	109	**
Days over State Standard	50	15	12	15	20	**
State Annual Average ($\mu g/m^3$)	20	40	40	42	43	**
Particulate Matter ($PM_{2.5}$)						
Highest 24 Hour Average ($\mu g/m^3$)		39	57	74	57	72
Days over National Standard	35	7	9	9	17	7
State Annual Average ($\mu g/m^3$)	12	15	19	19	**	*14

NOTES: ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter;

* On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour ozone concentration per year, averaged over 3 years, is equal to or less than 0.070 ppm. USEPA will issue final designations by October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the ozone level in the area.

** insufficient data

SOURCE: CARB, 2017

As shown in **Table 4.3-1**, the State 1-hour ozone standard was exceeded 11 to 34 times per year during the 2012 through 2016 period. The national 8-hour ozone standard was exceeded 31 to 70 times per year during the 5-year period. The 24-hour State PM_{10} standard was exceeded 12 to 20 times each year during the 4 years with sufficient data. The annual average PM_{10} concentrations exceeded the State standard each of the 4 years with sufficient data. The national 24-hour $PM_{2.5}$

standard was exceeded 7 to 17 times per year during the 5-year period and the annual average $PM_{2.5}$ concentrations exceeded the State standard each of the 4 years with sufficient data.

4.3.1.5 Sensitive Receptors

For the purposes of this air quality analysis, sensitive receptors are generally defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples include schools, hospitals, and daycare centers. The reasons for greater than average sensitivity include pre-existing health problems, proximity to emissions sources, and/or duration of exposure to air pollutants. Schools, hospitals, and convalescent homes are considered to be relatively sensitive to poor air quality because children, elderly people, and the infirm are more susceptible to respiratory distress and other air quality-related health problems than the general public. Residential areas are considered sensitive to poor air quality because people usually stay home for extended periods of time, which results in greater exposure to ambient air quality.

Proposed Project

Sensitive receptors near the Project sites and routes include residences immediately adjacent to the source line routes and Mira Loma-Jefferson 66 kV Subtransmission Line route, and residences at Corona La Linda Mobile Home Park, east of South Temescal Street, approximately 800 feet from the proposed Circle City Substation fence line. The closest residences to Mira Loma Substation are approximately 300 feet to the north. These residences are approximately 2,000 feet from the nearest proposed substation upgrades and Mira Loma-Jefferson line components. There are also three schools in the vicinity of the Mira Loma-Jefferson subtransmission line alignment, including: Auburndale Intermediate School, located adjacent to the Mira Loma-Jefferson subtransmission line route along River Road; and Victress Bower Elementary and George Washington Elementary, both located approximately 500 feet from the Mira Loma-Jefferson subtransmission line alignment. In addition, a day care center is located approximately 800 feet southwest of the proposed Databank Source Lines alignment. There are also several parks within 1,000 feet of the source line and Mira Loma-Jefferson subtransmission line, including James C. Huber Park, Fairview Park, River Road Park, and City Park.

Subtransmission Line Alignment Alternatives

Alternative C1 (Underground Hellman Avenue) would expose the same sensitive receptors as the Project along the proposed Mira-Loma Jefferson subtransmission line alignment. Alternative C2 (Archibald Avenue) would occur adjacent to residential receptors along Archibald Avenue between Belgrave Avenue and the Santa Ana River. This route would also occur within 1,000 feet of several parks including James C. Huber Park, Deer Creek Park, McCune Family Park, and Dairyland Park. The route would occur in a southeasterly direction along the Mira Loma-Jefferson subtransmission line alignment exposing the same receptors as described for the Project. With regard to Alternative C3 (Subtransmission-Level Battery Storage), the 50 MW subtransmission-level battery storage facility would be located approximately 270 feet east-northeast of the Christian Heritage School and approximately 50 feet south of residences along Pleasant View Avenue; the 42 MW subtransmission-level battery storage facility would be located approximately 500 southwest of the closest building associated with Corona High School

and approximately 50 feet north, east, and west of residence along Fairmont Drive, Border Avenue, and Zircon Street, respectively. The subtransmission line alignment under Alternative C3 to connect the 42 MW facility to Jefferson Substation is within 50 feet of residences. The subtransmission line alignment to connect the 50 MW facility to Corona Substation is within 50 feet of apartments and a trailer park. The work at Jefferson Substation to accommodate the new 66 kV subtransmission line under Alternative C3 would occur within 50 feet of residences on Tabitha Way.

Substation Alternative Sites

Residences at Corona La Linda Mobile Home Park would be approximately 800 feet from the Distribution-Level Battery Storage Alternative (Alternative D1) site fence line. The northern boundary of the Substation Site Alternative (Alternative D2) would be approximately 100 feet to the closest residences at Corona La Linda Mobile Home Park in the City of Corona.

Alternative Source Lines

Alternative E1 (Quarry Street Segment) would be adjacent to residences along East Grand Boulevard and Quarry Street, and would pass adjacent to the north side of City Park. Alternative E2 (Underground Pedley Lines from Interstate 15 to Circle City Substation) would be adjacent to the same sensitive receptors as the Project just west of the Interstate 15 to the proposed substation site. Alternative E3 (Southern Route) would continue at the intersection of Cota Street and West Harrison Street approximately 640 feet away from the residences along Railroad Street. This route would then expose receptors such as workers in commercial and industrial uses along West Blaine Street, Joy Street, and East Grand Boulevard. The Southern Route would then expose the same sensitive receptors as Alternative E2 above.

4.3.1.6 Regulatory Setting

Air quality within the Air Basin is addressed through the efforts of various federal, State, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The air pollutants of concern and agencies primarily responsible for improving the air quality within the Air Basin and the pertinent regulations are discussed below.

Criteria Air Pollutants

Regulation of air pollution is achieved through both CAAQS and NAAQS as well as emission limits for individual sources of air pollutants. As required by the federal Clean Air Act (CAA), the USEPA has identified criteria pollutants and has established NAAQS to protect public health and welfare. NAAQS have been established for ozone, CO, NO_2, Sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$, and lead. These pollutants are called “criteria” air pollutants because standards have been established for each of them to meet specific public health and welfare criteria.

To protect human health and the environment, the USEPA has set “primary” and “secondary” maximum ambient thresholds for all six criteria pollutants. Primary thresholds were set to protect human health, particularly sensitive receptors such as children, the elderly, and individuals suffering from chronic lung conditions such as asthma and emphysema. Secondary standards

were set to protect the natural environment and prevent further deterioration of animals, crops, vegetation, and buildings.

The NAAQS are defined as the maximum acceptable concentration that may be reached, but not exceeded more than once per year. California has adopted more stringent ambient air quality standards (i.e., CAAQS) for most of the criteria air pollutants. **Table 4.3-2** presents both sets of ambient air quality standards (i.e., national and State) and provides the attainment status for each. California has also established State ambient air quality standards for sulfates, hydrogen sulfide, and vinyl chloride; however, air emissions of these pollutants are not expected under the Project or alternatives and are not further discussed in this EIR.

The Air Basin is classified as a non-attainment area for the State 1-hour ozone standards as well as the State and federal eight-hour ozone standards. The air basin is also a non-attainment area relative to the State and federal $PM_{2.5}$ standards, and the State PM_{10} and lead standards. For all other criteria pollutants, the Air Basin is classified as either unclassified or as attainment with respect to State and federal standards (SCAQMD, 2016).

Federal

The USEPA is responsible for implementing programs established under the federal Clean Air Act (CAA), such as establishing and reviewing the NAAQS and judging the adequacy of State Implementation Plans (SIPs), but has delegated the authority to implement many of the federal programs to the states while retaining an oversight role to ensure that the programs continue to be implemented.

State

CARB is responsible for establishing and reviewing the State standards, compiling the California SIP and securing approval of that plan from USEPA, conducting research and planning, and identifying toxic air contaminants. CARB also regulates mobile sources of emissions in California, such as construction equipment, trucks, and automobiles, and oversees the activities of California's air quality districts, which are organized at the county or regional level. County or regional air quality management districts are primarily responsible for regulating stationary sources at industrial and commercial facilities within their geographic areas and for preparing the air quality plans that are required under the federal CAA and California CAA.

California's Diesel Risk Reduction Plan / Diesel Fuel Regulations

As part of California's Diesel Risk Reduction Plan, CARB has passed numerous regulations to reduce diesel emissions from vehicles and equipment that are already in use. Combining these retrofit regulations with new engine standards for diesel fueled vehicles and equipment, CARB intends to reduce DPM emissions by 85 percent from year 2000 levels by 2020. California Diesel Fuel Regulations (13 Cal. Code Regs. §§2281-2285; 17 Cal. Code Regs. §93114) provide standards for diesel motor vehicle fuel and non-vehicular diesel fuel.

TABLE 4.3-2
NAAQS/CAAQS AND ATTAINMENT STATUS FOR THE AIR BASIN

Criteria Pollutant	Averaging Time	State Standard	South Coast Air Basin Attainment Status for California Standard	Federal Primary Standard	South Coast Air Basin Attainment Status for Federal Standard
Ozone	8 Hour	0.070 ppm	Non-Attainment	0.070 ppm[a]	Non-Attainment (Extreme)
	1 Hour	0.09 ppm	Non-Attainment	---	---
Carbon Monoxide	8 Hour	9.0 ppm	Attainment	9 ppm	Attainment (Maintenance)
	1 Hour	20 ppm	Attainment	35 ppm	Attainment (Maintenance)
Nitrogen Dioxide	Annual Average	0.030 ppm	Attainment	0.053 ppm	Attainment (Maintenance)
	1 Hour	0.18 ppm	Attainment	0.100 ppm	Unclassifiable/Attainment
Sulfur Dioxide[b]	Annual Average	---	---	0.030 ppm	Unclassifiable/Attainment
	24 Hour	---	---	0.14 ppm	Unclassifiable/Attainment
	1 Hour	---	---	0.075 ppm	Designations Pending (expect Uncl./Attainment)
Respirable Particulate Matter (PM_{10})	Annual Arithmetic Mean	20 mg/m^3	Non-Attainment	---	---
	24 Hour	50 mg/m^3	Non-Attainment	150 mg/m^3	Attainment (Maintenance)[g]
Fine Particulate Matter ($PM_{2.5}$)	Annual Arithmetic Mean	12 mg/m^3	Non-Attainment	12.0 mg/m^3	Nonattainment (Serious)
	24 Hour	---	---	35 mg/m^3	Nonattainment (Serious)
Lead	3-Month Rolling Average	---	---	0.15 mg/m^3	Nonattainment (Partial)[c]
Hydrogen Sulfide	1 Hour	0.03 ppm/ 42 $\mu g/m^3$	Attainment	---	---
Sulfates	24 Hour	25 mg/m^3	Attainment	---	---
Vinyl Chloride	24 Hour	0.01 ppm/ 26 $\mu g/m^3$	Attainment	---	---

NOTES:
ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; --- = no applicable standard;
PM_{10} = particulates of 10 microns or less; $PM_{2.5}$ = particulates of 2.5 microns or less;
a On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour ozone concentration per year, averaged over three years, is equal to or less than 0.070 ppm. USEPA will issue final designations October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the ozone level in the area.
b On February 15, 2013, USEPA published notice in the Federal Register of proposed nonattainment designations for the 2010 primary federal sulfur dioxide standards. No California areas are included in the proposal; all areas of the State remain undesignated (CARB, 2016).
c Partial Nonattainment designation – Los Angeles County portion of Basin only for near-source monitors. Expect to remain in attainment based on current monitoring data CARB, 2016).

SOURCE: SCAQMD, 2016

CARB has also adopted a regulation for in-use off-road diesel vehicles that is designed to reduce emissions from diesel-powered construction and mining vehicles by imposing idling limitations on owners, operators, renters, or lessees of off-road diesel vehicles. The regulation requires an operator of applicable off-road vehicles (self-propelled diesel-fueled vehicles 25 horsepower and up that were not designed to be driven on-road) to limit idling to no more than 5 minutes.

Local

South Coast Air Quality Management District

The Project and alternatives are located in the South Coast Air Basin, which includes all of Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino counties. SCAQMD is the local air district with jurisdiction within this region. SCAQMD programs include the adoption and enforcement of regulations and policies, as well as implementation of education and public outreach programs. SCAQMD is responsible for attaining and/or maintaining air quality in the Air Basin within federal and State air quality standards. Specifically, SCAQMD has the responsibility to monitor ambient air pollutant levels throughout the Air Basin and to develop and implement strategies to attain the applicable federal and State standards.

Regulation IV – Prohibitions, Rule 402 – Nuisance

This rule prohibits the discharge of air contaminants or other material in quantities that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public.

Regulation IV – Prohibitions, Rule 403 – Fugitive Dust

This rule limits the emissions of fugitive dust or particulate matter from a variety of activities and sources such as construction sites, bulk material hauling, unpaved parking lots, and disturbed soil in open areas and vacant lots. It includes a visible emissions property line standard, requirement to implement Best Available Control Measures, upwind/downwind PM_{10} concentrations standards, prevention of track-out on to paved public roads, and special control requirements for large operations.

Air Quality Management Plans

The 2012 SCAQMD Air Quality Management Plan (2012 AQMP) was adopted by the SCAQMD Board on December 7, 2012. It incorporates scientific and technological information and planning assumptions, including the 2012 Regional Transportation Plan/Sustainable Communities Strategy and updated emission inventory methodologies for various source categories. The 2012 AQMP included the new and changing federal requirements, implementation of new technology measures, and the continued development of economically sound, flexible compliance approaches. A Supplement to the 2012 AQMP was prepared to demonstrate attainment of the 24-hour $PM_{2.5}$ standard by 2015. The strategies incorporated into the plan were developed, in part, based on regional population, housing, and employment projections prepared by the Southern California Association of Governments (SCAG).

The 2012 AQMP was prepared to accommodate growth, reduce the high levels of pollutants within the areas under the jurisdiction of SCAQMD, return clean air to the region, and minimize the impact on the economy (SCAQMD, 2012). Projects that are consistent with the assumptions used in the AQMP do not interfere with attainment because the growth is included in the projections utilized in the formulation of the AQMP. Thus, projects, uses, and activities that are consistent with the applicable growth projections and control strategies used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP.

As part of its triennial assessment and plan update requirements under the California CAA, SCAQMD has prepared the 2016 Air Quality Management Plan (2016 AQMP), which is a

comprehensive and integrated plan focused on addressing the federal ozone and $PM_{2.5}$ standards. The 2016 AQMP is a regional and multi-agency effort consisting of SCAQMD, CARB, SCAG, USEPA, California Energy Commission, and CPUC. The 2016 AQMP is composed of stationary and mobile source emission reductions from traditional regulatory control measures, incentive-based programs, co-benefits from climate programs, mobile source strategies, and reductions from federal sources, which include aircraft, locomotives, and ocean-going vessels (SCAQMD, 2017).

The SCAQMD Governing Board adopted and CARB approved the 2016 AQMP in March 2017, but the USEPA has yet to approve it for inclusion in the SIP (SCAQMD, 2018). The strategies included in the 2016 AQMP are intended to demonstrate attainment of the NAAQS for the federal non-attainment pollutants ozone and $PM_{2.5}$ (SCAQMD, 2017). Until the 2016 AQMP is approved by the USEPA, the 2012 AQMP remains the effective AQMP.

Riverside County General Plan

The following air quality policies identified in the Riverside County General Plan would be applicable to the Project (County of Riverside, 2014).

> *Policy AQ 4.7:* To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, SOCAB, the Environmental Protection Agency and the California Air Resources Board.
>
> *Policy AQ 4.9:* Require compliance with SCAQMD Rules 403 and 403.1, and support appropriate future measures to reduce fugitive dust emanating from construction sites.
>
> *Policy AQ 4.10:* Coordinate with the SCAQMD and MDAQMD to create a communications plan to alert those conducting grading operations in the County of first, second, and third stage smog alerts, and when wind speeds exceed 25 miles per hour. During these instances all grading operations should be suspended.

City of Chino General Plan

The City of Chino General Plan contains the following policies regarding air quality that would be applicable to the Project (City of Chino, 2010).

> *AQ-1.2 P3:* The City shall utilize the CEQA process to identify and avoid or mitigate potentially significant air quality impacts associated with new development.
>
> *AQ-1.3 P2:* The City shall require best management practices to reduce air pollution associated with construction of development projects.

Other General Plans

The air quality policies of the City of Corona General Plan and City of Eastvale General Plan are not applicable to the Project (City of Corona, 2004; City of Eastvale, 2012). The City of Norco General Plan and City of Ontario General Plan do not contain policies regarding air quality that would be applicable to the Project (City of Norco, 2001; City of Ontario, 2010).

4.3.2 Significance Criteria

According to Appendix G of the CEQA *Guidelines*, a project would result in significant air quality effects on the environment if it would:

a) Conflict with or obstruct implementation of the applicable air quality plan;

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation;

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);

d) Expose sensitive receptors to substantial pollutant concentrations; or

e) Create objectionable odors affecting a substantial number of people.

The CPUC typically uses local air district thresholds for evaluating air quality impacts under CEQA. The SCAQMD has established air pollution emissions criteria for determining the significance of an impact during project construction and operation, and these thresholds have been used to evaluate the impacts of the Project on air quality (see **Table 4.3-3**).

TABLE 4.3-3
SCAQMD AIR QUALITY SIGNIFICANCE THRESHOLDS

Criteria Pollutant Thresholds		
Pollutant	**Mass Daily Thresholds (pounds/day)**	
	Construction	**Operation**
NO_x	100	55
VOC	75	55
PM_{10}	150	150
$PM_{2.5}$	55	55
SOx	150	150
CO	550	550
Lead	3	3
Toxic Air Contaminants (TACs) and Odor Thresholds		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Cancer Burden ≥ 0.5 (in areas ≥ 1 in 1 million) Chronic & Hazard Index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	

NOTES:
ppm = oxides of Nitrogen; VOC = volatile organic compounds; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; SO_x = oxides of Sulfur; Co = Carbon Monoxide

SOURCE: SCAQMD, 2015

4.3.3 Applicant Proposed Measures

Southern California Edison (SCE) has identified the following applicant proposed measures (APMs) to minimize impacts on air quality from the Project. The impact analysis assumes that the APMs would be implemented (i.e., part of the Project) to reduce impacts to air quality as discussed below.

APM AIR-01: Fugitive Dust. During construction, surfaces disturbed by construction activities would be covered or treated with a dust suppressant until completion of activities at each site of disturbance. On-site unpaved roads and off-site unpaved access roads utilized during construction within the Project area would be effectively stabilized (e.g., using water or chemical stabilizer/suppressant) to control dust emissions. On-road vehicle speeds on unpaved roadways would be restricted to 15 miles per hour.

APM AIR-02: Tier 3 Engines. Off-road diesel construction equipment with a rating between 100 and 750 horsepower would be required to use engines compliant with United States (U.S.) Environmental Protection Agency Tier 3 non-road engine standards. In the event that a Tier 3 engine is not available, the equipment would be equipped with a Tier 2 engine and documentation would be provided from a local rental company stating that the rental company does not currently have the required diesel-fueled off-road construction equipment or that the vehicle is specialized and is not available to rent. Similarly, if a Tier 2 engine is not available, that equipment would be equipped with a Tier 1 engine and documentation of the unavailability would be provided.

4.3.4 Impacts and Mitigation Measures

4.3.4.1 Approach to Analysis

The SCAQMD has adopted CEQA thresholds of significance for both short-term construction and long-term project operations as identified in Table 4.3-3, above. The SCAQMD has determined that an exceedance of the threshold for either NO_x or VOC or both of these precursors indicates that a project would individually and cumulatively jeopardize attainment of ozone standards, and would result in a significant adverse impact on air quality.

Criteria pollutant emissions from construction equipment and vehicle exhaust and generation of particulate matter in the form of fugitive dust are the primary concerns in evaluating short-term air quality impacts. While long-term impacts associated with criteria pollutants were also evaluated, these would not be significant since emission-related activities associated with Project operations and maintenance would be limited to periodic maintenance and inspection trips similar to what is occurring now along the existing subtransmission and transmission line ROWs.

Exhaust pollutants would be emitted during construction activities from a variety of construction and earth-moving equipment, including motor-driven construction equipment, construction vehicles, and workers' vehicles. Fugitive dust would be generated by ground disturbing activities as well as from heavy truck travel on paved and unpaved roads.

a) Conflict with or obstruct implementation of the applicable air quality plan.

Impact 4.3-1: Construction activities would generate pollutant emissions that would conflict or obstruct implementation of the applicable air quality plan. *Significant and unavoidable* (Class I)

The Project would be under the jurisdiction of the SCAQMD. The SCAQMD's most recently approved AQMP was adopted in December of 2012. Construction of the Project would be conducted in compliance with applicable federal, state, and local requirements. Project construction activities have the potential to generate temporary criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and graders, and through vehicle trips generated from worker trips and haul trucks traveling to and from the proposed Project sites. In addition, fugitive dust emissions would result from various soil-handling activities. Mobile source emissions, primarily NO_X, would result from the use of construction equipment. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions. The assessment of construction air quality impacts considers each of these potential sources (see Impact 4.3-2).

To determine if a project would conflict with or obstruct implementation of the applicable air quality plan, lead agencies must demonstrate that a project would not directly obstruct implementation of an applicable air quality plan and that a project be consistent with the assumptions (typically land-use related) upon which the air quality plan is based. The Project would result in an increase in short-term employment compared to existing conditions. Being relatively small in number (approximately 100 workers per day) and temporary in nature, construction jobs under the Project would not conflict with the long-term employment projections upon which the 2012 AQMP is based. Control strategies in the 2012 AQMP, potentially applicable to control temporary emissions from the proposed Project's construction activities, include ONRD-04 and OFFRD-01,[1] which are intended to reduce emissions from on-road and off-road heavy-duty vehicles and equipment by accelerating the replacement of older, emissions-prone engines with newer engines that meet more stringent emission standards.

As described under Impacts 4.3-2, 4.6-3, and 4.3-6, the Project would result in significant impacts associated with construction emissions of criteria pollutants. Even with implementation of Mitigation Measure 4.3-2a, which would require SCE to implement additional feasible fugitive dust controls beyond those required by SCAQMD Rule 403, and Mitigation Measures 4.3-2b, which would require SCE to use the cleanest available construction equipment, the CPUC cannot established that Project-related emissions of PM_{10} and NO_x during construction activities would be reduced to less than the applicable significance thresholds. Therefore, although the Project would not directly conflict with implementation of the 2012 AQMP measures, it could result in a violation of an air quality standard or contribute substantially to an existing or projected air quality violation, which would not be consistent with the intent of the 2012 AQMP. Since construction of the Project would have a negative effect on the regional and localized air quality

[1] 2012 AQMP measure ONRD-04 applies to on-road mobile sources and is the accelerated retirement of older on-road heavy-duty vehicles to reduce emissions of NO_X and particulate matter. 2012 AQMP measure OFFRD-01 applies to off-road mobile sources and is the extension of the Surplus Off-Road Opt-In for NO_X (SOON) provision for construction/industrial equipment to encourage the accelerated retirement of older off-road heavy-duty equipment to reduce emissions of NO_X.

in the Air Basin and exceed applicable significance thresholds, it would also conflict or obstruct implementation of the 2012 AQMP. This impact would be significant and unavoidable.

Long-term operation of the Project would result in insignificant air pollutant emissions from worker automobile trips once a month. Exhaust emissions from these trips would be less than significant (see Impact 4.3-3). Furthermore, operations of the Project would be consistent with the applicable growth projections and control strategies used in the development of the 2012 AQMP and would not jeopardize attainment of the air quality levels identified in the 2012 AQMP because it would not induce or cause long-term population growth (see Section 4.14, *Population and Housing*). For these reasons, long-term operations of the Project would not conflict with or obstruct the implementation of the 2012 AQMP.

> **Mitigation:** Implement Mitigation Measures 4.3-2a (Fugitive Dust Controls) and 4.3-2b (Construction Equipment Exhaust Reductions).
>
> **Significance after mitigation:** Significant and unavoidable.

---

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Impact 4.3-2: Construction activities would generate pollutant emissions that would contribute substantially to an existing or projected air quality violation. *Significant and unavoidable* (Class I)

Construction of the Project would generate emissions of criteria air pollutants over a construction period of approximately 18 months. Exhaust emissions would result from construction equipment and machinery as well as from vehicular traffic generated by construction activities. Fugitive Dust emissions would result from earthwork activities and entrained particulates that become airborne from vehicles traveling on paved and unpaved surfaces. Emission levels for the various construction activities would vary with the type of equipment, duration of use, operation schedules, and size of the construction labor force.

As part of the CPUC's Permit to Construct application process, SCE provided construction-related air pollutant emissions calculations and estimates for the construction activities that would be associated with the Project (see Appendix D, *Air Quality and Greenhouse Gas Calculations*). The Project emissions were estimated by SCE using the California Emissions Estimator Model (CalEEMod) version 2013.2.2 developed by the SCAQMD. This version of CalEEMod calculates the construction equipment exhaust and fugitive dust emissions based on CARB's OFFROAD2011 model equipment emission and load factors. The CalEEMod output in Appendix D presents the Project's emissions as reactive organic gases which references the same category of gases as VOCs.[2]

To estimate peak daily Project construction emissions, SCE identified the types of construction activities that could overlap in schedule, i.e., occur simultaneously, and contribute to the combined total estimated peak daily emissions. Based on SCE's emissions estimates, concurrent

[2] CARB and some California air districts utilize the term reactive organic gases while the SCAQMD and USEPA utilize the term VOC.

construction activities for each Project component that would emit the greatest amount of daily emissions would be as follows:

- ***Circle City Substation*:** fencing, temporary power pole installation, civil, construction of the mechanical and electrical equipment rooms, and electrical;
- ***Mira Loma Substation*:** electrical, maintenance commission, and testing;
- ***Source Lines*:** establishment of the marshaling yard, tubular steel pole (TSP) hauling, TSP assembly, TSP erection, installation of wood and light-weight steel (LWS) poles, installation of conductor, vault installation, and duct bank installation;
- ***Mira Loma-Jefferson subtransmission line*:** establishment of the marshaling yard, TSP hauling, TSP assembly, TSP erection, LWS and wood pole hauling, installation of wood and LWS poles, hybrid pole hauling, installation of H-frame hybrid pole structures; transfer and installation of conductor, vault installation, and duct bank installation; and
- ***Telecommunications*:** fiber optic cable installation and fiber optic cable splicing.

SCE's emission calculations were independently reviewed by the CPUC's consultant, Environmental Science Associates (ESA), and were found to be technically adequate with the following exception. SCE's emissions estimates included two scenarios: one assuming APM AIR-01 and AIR-02 would not be implemented, while the other assumed these APMs would be implemented. The assumptions related to implementation of APM AIR-01 for fugitive dust were found to be adequate, and appropriate for the estimation of proposed Project construction emissions. The assumption SCE used for implementation of APM AIR-02 was that construction equipment engines with ratings between 100 and 750 horsepower would all be Tier 3 compliant; however, APM AIR-02 allows for the use of lower-tiered engines in the event that Tier 3 engines are not available. Since APM AIR-02 includes contingencies in the event that equipment with Tier 3 compliant engines are not available, it would not be appropriate for this analysis to assume its implementation would result in the exclusive use of 100 to 750 horsepower engines that are Tier 3 compliant. Therefore, to be conservative this analysis assumes construction-related exhaust emissions that would be associated with the proposed Project would be uncontrolled, and associated equipment would not necessarily be Tier 3 compliant. Because SCE's total PM_{10} and $PM_{2.5}$ uncontrolled emissions summaries do not incorporate the reductions associated with implementation of APM AIR-01 for fugitive dust, ESA revised SCE's uncontrolled PM_{10} and $PM_{2.5}$ construction emission estimates to include those dust control assumptions (ESA, 2017a). See the Air Quality Supplement in Appendix D.

Table 4.3-4, *Project Peak Daily Construction Emissions*, presents the estimated peak daily construction emissions that would be associated with the Project. These emissions would be dispersed throughout the study area at the various Project component sites. Construction activity along the Mira Loma-Jefferson 66 kV Line would generate the most peak daily air pollutants among all the proposed construction components associated with the Project. For information on the types and amounts of construction equipment that would be used to construct the proposed Project components, refer to Table 2-7, *Construction Equipment and Workforce Estimates*, in Chapter 2. As discussed above, the construction emissions presented in Table 4.3-4 assume implementation of APM AIR-01, which would require the use of fugitive dust control measures,

but due to the uncertainty of equipment with Tier 3 compliant engines, no controls for equipment exhaust emissions are assumed for the proposed Project.

TABLE 4.3-4
PROJECT PEAK DAILY CONSTRUCTION EMISSIONS

Project Component	Peak Construction Emissions (pounds/day)					
	PM_{10}	$PM_{2.5}$	CO	NO_x	SO_x	VOC
Circle City Substation	24.66	7.85	96.31	139.54	0.24	13.11
Mira Loma Substation	2.87	0.95	9.51	21.95	0.03	1.81
Source Lines	49.54	12.17	114.61	229.38	0.33	19.69
Mira Loma-Jefferson 66 kV Line	185.95	28.74	153.18	290.55	0.43	26.73
Telecommunication Facilities	5.67	1.18	9.62	22.23	0.03	1.79
Total	**268.69**	**50.89**	**383.21**	**703.65**	**1.06**	**63.12**
Threshold	150	55	550	100	150	75
Threshold Exceeded?	**Yes**	No	No	**Yes**	No	No

SOURCES: SCE, 2015; 2016; and ESA, 2017a. See Appendix D.

With regard to the estimated $PM_{2.5}$, CO, SO_x, and VOC emissions presented in Table 4.3-4, these mass emissions would not exceed any of the significance thresholds. Therefore, $PM_{2.5}$, CO, SO_x, and VOC emissions generated by the Project would not be expected to result in a violation of any air quality standard or contribute substantially to an existing or projected air quality violation. Impacts associated with the generation of $PM_{2.5}$, CO, SO_x, and VOC emissions would therefore be less than significant.

As shown in Table 4.3-4, total emissions of PM_{10} would exceed the significance threshold, resulting in a significant impact. The Project would include implementation of fugitive dust control measures for disturbed areas, and paved and unpaved surfaces (see APM AIR-01 in Section 4.3.3, above), which would minimize fugitive PM_{10} emissions as required by the SCAQMD under Regulation IV, Rule 403. The PM_{10} emissions identified in Table 4.3-4 reflect a control efficiency of 55 percent to account for the proposed dust control measures during earthwork activities. However, even with the applicant proposed dust controls, PM_{10} emissions would exceed the significance threshold. Mitigation Measure 4.3-2a (see below), would require SCE to implement additional feasible fugitive dust controls beyond those required of APM AIR-01. Although these additional measures would further reduce the Project's construction-related PM_{10} emissions, SCE's emission estimates are not sufficiently detailed to the point that emission reductions associated with the additional measure can be estimated beyond the emission reductions identified for APM AIR-01. Therefore, it cannot be substantiated that the mitigated emissions would be reduced to below the significance threshold; hence, the impact relative to the potential for the Project to result in a violation of a PM_{10} standard or contribute substantially to an existing or projected PM_{10} violation would be significant and unavoidable.

As shown in Table 4.3-4, total emissions of NO_x would continue to exceed the significance threshold even with implementation of APM AIR-02, resulting in a significant impact. Therefore,

Mitigation Measure 4.3-2b would require SCE to implement Tier 4 construction equipment, if available. Since implementation of Mitigation Measure 4.3-2b would require SCE to use the cleanest available construction equipment beyond what is required under APM AIR-02, the Project-related NO_x exhaust emissions would be expected to be lower than what is presented in Table 4.3-4. While implementation of Mitigation Measure 4.3-2b would reduce NO_x emissions to the maximum extent feasible, the availability of construction equipment at the time of Project construction that meets the highest USEPA-certified tiered emission standards is currently unknown. As a result, it cannot be established at this time that implementation of Mitigation Measure 4.3-2b would reduce NO_x emissions to below the significance threshold. Therefore, the significant impact relative to the potential for the Project to result in a violation of an ozone or NO_2 standard or contribute substantially to an existing or projected ozone or NO_2 violation would be unavoidable even with incorporation of mitigation.

Mitigation Measure 4.3-2a: Fugitive Dust Controls. The following fugitive dust control measures shall be implemented during the construction phase by SCE and/or its construction contractors:

- Pre-grading/excavation activities shall include watering the area to be graded or excavated before commencement of grading or excavation operations. Application of water (preferably reclaimed, if available) should penetrate sufficiently to minimize fugitive dust during grading activities.
- Use a gravel apron on unpaved truck exit routes, 25 feet long by road width, to reduce mud/dirt trackout;
- Graded and/or excavated inactive areas of the construction site shall be monitored by SCAQMD air district or approved third party at least weekly for dust stabilization. Soil stabilization methods, such as water and roll-compaction, and environmentally-safe dust control materials, shall be periodically applied to portions of the construction site that are inactive for over four days. If no further grading or excavation operations are planned for the area, the area should be seeded and watered until grass growth is evident, or periodically treated with environmentally-safe dust suppressants, to prevent excessive fugitive dust;
- During periods of high winds (i.e., wind speed sufficient to cause fugitive dust to impact adjacent properties), all clearing, grading, earth moving, and excavation operations shall be curtailed to the degree necessary to prevent fugitive dust created by on-site activities and operations from being a nuisance or hazard off site. Dust emissions that are visible off site would be considered as one factor indicating a potential nuisance or hazard. The site superintendent/supervisor shall use his/her discretion in conjunction with the SCAQMD in determining when winds are excessive;
- Require paved streets that adjoin unpaved roads where vehicles would be entering and exiting to be swept by Rule 1186 compliant PM_{10} efficient vacuum units (14-day frequency);
- All trucks hauling dirt, sand, or other loose materials are to be tarped with a fabric cover and maintain a freeboard height of at least 12 inches;

- Personnel involved in grading operations, including contractors and subcontractors, should be advised to wear respiratory protection in accordance with California Division of Occupational Safety and Health regulations.

Mitigation Measure 4.3-2b: Construction Equipment Exhaust Reductions. For all diesel-fueled off-road construction equipment, SCE shall make a good faith effort to use available construction equipment that meets Tier 4, the highest USEPA-certified tiered emission standard. An Exhaust Emissions Control Plan-that identifies each off-road unit's certified tier specification and Best Available Control Technology (BACT) shall be submitted to the CPUC for review and approval at least 30 days prior to commencement of construction activities. Construction activities cannot commence until the Plan has been approved. For all pieces of equipment that would not meet Tier 4 emission standards, the Exhaust Emissions Control Plan shall include recent documentation from at least two local heavy construction equipment rental companies that indicates that the companies do not have access to higher-tiered equipment for the given class of equipment.

Significance after Mitigation: Significant and Unavoidable.

Impact 4.3-3: Operation and maintenance activities would generate pollutant emissions that could contribute to an existing or projected air quality violation. ***Less than significant*** **(Class III)**

Operation and maintenance of the Project would not result in new stationary sources of criteria pollutants nor would it increase criteria pollutant emissions from existing stationary sources. Mobile source emissions-related activities associated with the operation of the Project would occur related to annual inspections of the source lines, the Mira Loma-Jefferson line, and the telecommunication facilities, and weekly inspections at the substations. **Table 4.3-5** presents the estimated annual operation and maintenance emissions that would be associated with the Project. The emission estimates are based on the assumption that the Project would result in an increase of approximately 54 trips per year, and the trip distances would be 20 to 60 miles (see Appendix D).

TABLE 4.3-5
PROJECT PEAK DAILY OPERATION AND MAINTENANCE EMISSIONS

Project Component	Annual Operation and Maintenance Emissions (pounds)					
	PM_{10}	$PM_{2.5}$	CO	NO_x	SO_x	VOC
Circle City Substation Maintenance	2.67	0.82	16.78	1.60	0.03	1.88
Source Line Routes and Telecommunication Facilities Inspections	0.02	0.01	0.11	0.01	< 0.01	0.01
Mira Loma-Jefferson 66 kV Line Inspection	14.75	1.48	0.27	0.03	< 0.01	0.03
Total (pounds per year)	**17.44**	**2.31**	**17.16**	**1.64**	**0.03**	**1.92**
Threshold (pounds per day)	150	55	550	55	150	55
Threshold Exceeded?	No	No	No	No	No	No

SOURCE: SCE, 2015; 2016. See Appendix D.

These emissions would not exceed the SCAQMD operational significance thresholds (see Table 4.3-3). Therefore, criteria pollutant emissions that would be generated by operation and maintenance of the Project would not contribute substantially to a violation of an air quality standard. Impacts would be less than significant.

Mitigation: None required.

---

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

The Air Basin is classified as nonattainment for ozone, PM_{10}, and $PM_{2.5}$ ambient air quality standards. The SCAQMD has determined that an exceedance of a project-specific threshold set forth in Tables 4.3-4 or 4.3-5 indicates that a project would result in a cumulatively considerable net increase in emissions of the pollutant. As described below short-term Project construction emissions would be cumulatively considerable, while long-term Project emissions would not be cumulatively considerable.

Impact 4.3-4: Construction activities would result in emissions of PM_{10} and NO_x that would be cumulatively considerable. *Significant and unavoidable* (Class I)

Project construction emissions of $PM_{2.5}$ and VOC would not exceed the project-specific significance thresholds; therefore, Project-related $PM_{2.5}$ and VOC emissions would not be cumulatively considerable. Construction activities associated with the Project, as described in the Impact 4.3-2 discussion, would have an adverse effect on regional air quality through short-term increases in PM_{10} and NO_x exceeding SCAQMD significance thresholds (see Table 4.3-4, above). Impacts would be significant.

Mitigation: Implement Mitigation Measures 4.3-2a (Fugitive Dust Controls) and 4.3-2b (Construction Equipment Exhaust Reductions).

Implementation of Mitigation Measures 4.3-2a and 4.1-2b would reduce construction-related PM_{10} fugitive dust and NO_x emissions; however, PM_{10} and NO_x emissions would still exceed the SCAQMD significance thresholds. Therefore, emissions of PM_{10} and NO_x during construction of the Project would result in a cumulatively considerable net increase of PM_{10} and NO_x, both pollutants for which the region is in nonattainment. Impacts would remain significant.

Significance after mitigation: Significant and Unavoidable.

Impact 4.3-5: Operation and maintenance activities would result in emissions of criteria pollutants that would not be cumulatively considerable. *Less than significant* (Class III)

As demonstrated in Table 4.3-5, operation and maintenance of the Project would not result in criteria pollutant emissions above the SCAQMD's thresholds of significance for which the Project location is in nonattainment. Impacts would be less than significant.

Mitigation: None required.

---

d) Expose sensitive receptors to substantial pollutant concentrations.

Discussion for this criterion is divided into two different impact types. First is the impact related to sensitive receptor exposure to criteria pollutants and precursors, and second is the impact related to sensitive receptor exposure to TACs.

Impact 4.3-6: Construction activities would generate emissions of criteria pollutants and precursors, potentially exposing sensitive receptors to harmful pollutant concentrations. *Significant and unavoidable* (Class I)

The SCAQMD recommends that lead agencies use its Localized Significance Threshold (LST) Methodology to evaluate the impacts of criteria pollutants on sensitive receptors during construction of a project. As detailed in Appendix D, *Air Quality Calculations*, an analysis was conducted for the Project that consisted of comparing maximum daily on-site PM_{10}, $PM_{2.5}$, CO, and NO_x mass emissions at individual locations with maximum allowable mass emissions identified in look-up tables developed by SCAQMD. According to the Methodology, "off-site mobile emissions from the project should not be included in the emissions compared to the LSTs" (SCAQMD, 2009). Hauling of soils and construction materials associated with the Project construction is not expected to cause substantial air quality impacts to sensitive receptors along off-site roadways. Emissions from the trucks would be relatively brief in nature, would cease once the trucks pass through the main streets, and would not exceed the significance threshold.

The look-up table values are estimates of mass emissions that could result in a local exceedance of a CAAQS. The SCAQMD's methodology takes into consideration the location of the Project site within the Air Basin, the disturbed area at each site, and the distance from the site to the nearest sensitive receptor. It is assumed that the daily disturbed areas for the proposed source lines, Mira Loma-Jefferson subtransmission line, and the telecommunications facilities were 1 acre in size with receptors approximately 25 meters (82 feet) from the Project site, which is the shortest receptor distance in the look-up tables. The daily disturbed areas for Circle City Substation and Mira Loma Substation were assumed to be 5 acres in size with receptors approximately 100 meters and 500 meters from the Project site boundary, respectively.[3] **Table 4.3-6**, *Project Peak On-Site Construction Emissions*, compares the maximum daily on-site emissions for the construction of each project component with the maximum allowable emissions from the SCAQMD's look-up

[3]The SCAQMD LST mass-rate lookup tables provide thresholds for projects of 1, 2, and 5 acres in size.

tables (SCAQMD, 2009). See the Air Quality Supplement in Appendix D for all emission calculation assumptions, including construction equipment types and use parameters.

TABLE 4.3-6
PROJECT PEAK ON-SITE CONSTRUCTION EMISSIONS

Project Component	Peak On-Site Construction Emissions (pounds/day)			
	PM_{10}	$PM_{2.5}$	CO	NO_x
Circle City Substation	19.9	5.9	66.7	130.7
Threshold	58	18	3,964	378
Threshold Exceeded?	No	No	No	No
Mira Loma Substation	2.3	0.8	5.8	21.4
Threshold	228	113	22,490	778
Threshold Exceeded?	No	No	No	No
Source Lines	8.8	2.5	22.2	65.2
Threshold	4	3	674	118
Threshold Exceeded?	**Yes**	No	No	No
Mira Loma-Jefferson 66 kV Line	9.7	2.6	22.3	65.2
Threshold	4	3	647	118
Threshold Exceeded?	**Yes**	No	No	No
Telecommunication Facilities	2.8	0.6	3.9	17.9
Threshold	4	3	647	118
Threshold Exceeded?	No	No	No	No

SOURCES: SCE, 2015; 2016; and ESA, 2017a. See Appendix D.

As shown in Table 4.3-6, the Project would exceed applicable thresholds for PM_{10} with implementation of APMs AIR-01 and AIR-02 (see Section 4.3.3), above. As a result, sensitive receptors in these locations would be exposed to significant concentrations of PM_{10}. Impacts would be significant.

> **Mitigation:** Implement Mitigation Measures 4.3-2a (Fugitive Dust Controls) and 4.3-2b (Construction Equipment Exhaust Reductions).

Since implementation of Mitigation Measure 4.3-2a would require SCE to apply additional fugitive dust controls beyond APM AIR-01 and Mitigation Measure 4.3-2b would require SCE to use the cleanest available construction equipment beyond what is required under APM AIR-02, the actual Project-related PM_{10} emissions may be lower than what is presented in Table 4.3-6, *Project Peak On-Site Construction Emissions*. Implementation of Mitigation Measures 4.3-2a and 4.3-2b would reduce PM_{10} emissions to the maximum extent feasible; however, as described in the Impact 4.3-2 discussion, above, it is not possible to quantify the emissions reductions that would be associated with these mitigation measures or whether the Project emissions would be reduced to below the LST significance thresholds. As a result, it cannot be established at this time that implementation of Mitigation Measures 4.3-2a and 4.3-2b would reduce PM_{10} emissions to below the LST significance thresholds. The construction-related PM_{10} impact would remain significant and unavoidable even with incorporation of mitigation (Class I).

As indicated in Table 4.3-6, peak daily on-site construction emissions would not exceed the LSTs for $PM_{2.5}$, CO, or NO_x. Therefore, local sensitive receptors would not be exposed to substantial concentrations of these pollutants, and the associated impacts would be less than significant.

Significance after Mitigation: Significant and Unavoidable.

Impact 4.3-7: Construction activities would generate emissions of Toxic Air Contaminants, potentially exposing sensitive receptors to harmful pollutant concentrations. ***Less than significant with mitigation*** **(Class II)**

Diesel particulate matter (DPM) was identified as a TAC by CARB in 1998. Construction of the Project would result in temporary and short-term generation of DPM emissions from the use of off-road diesel equipment and from construction material deliveries and debris hauling using on-road heavy-duty trucks. Long-term sources of DPM emissions that would be associated with the Project would be insignificant and limited to a few vehicle trips per month related to inspection and maintenance activities.

The dose to which receptors are exposed is the primary factor affecting health risk from TACs. Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. According to the Office of Environmental Health Hazard Assessment (OEHHA), health risk assessments, which determine the exposure of sensitive receptors to TAC emissions, should be based on 9-, 30-, and/or 70-year exposure periods when assessing TACs (such as DPM) that have only cancer or chronic non-cancer health effects. However, such health risk assessments should be limited to the duration of the emission-producing activities associated with the project, unless the activities occur for less than six months. Activities that would last more than 2 months, but less than 6 months, are recommended to be evaluated as if they would last for 6 months. The OEHHA does not recommend assessing cancer risk for projects lasting less than 2 months at the maximum exposed individual resident (MEIR) (OEHHA, 2015).

The Project components that would take the longest to construct and would be closest to sensitive receptors would be the source lines and the Mira Loma-Jefferson 66 kV line, which would last for approximately 18 months. However, construction along these alignments would proceed at a linear pace and would not be expected to expose any one receptor along the corridors for longer than 2 to 3 weeks. The total emissions and duration of exposure at any one sensitive receptor location for the source lines and subtransmission line construction would be relatively minor compared to the exposure periods used in health risk assessments. Likewise, the proposed upgrades at Mira Loma Substation would last approximately 2 months and they would occur at a distance of approximately 2,000 feet from the nearest residences and would result in minor TAC exposure at those residences. Therefore, the health risk from the short-term DPM emissions that would be associated with construction of these Project components would be insignificant, and this impact would be less than significant.

Although construction of Circle City Substation would only take 12 months, it would result in the greatest TAC exposure to nearby residences compared to all of the other Project components. The

proposed Circle City Substation site is approximately 800 feet from the nearest residences at Corona La Linda Mobile Home Park. A health risk assessment (HRA) for construction activities at Circle City Substation was conducted by ESA using OEHHA's dose-response methodology to estimate the numeric health risk impact associated with inhaled TACs. Refer to Appendix D for the HRA, which includes a detailed description of the methodology used to evaluate the health risks from on-site construction activities.

The emissions estimates used in the HRA represent the total DPM exhaust emissions that would occur for each substation construction activity (see Table 2-7, *Construction Equipment and Workforce Estimates*, for types and duration of use of equipment that would be used to conduct the construction activities under the Project). SCE's exhaust emissions estimates included two scenarios: one with default emission factors for average composite equipment fleets for the years analyzed, while the other assumed all off-road equipment engines would have USEPA Tier 3 emissions ratings; however, APM AIR-02 allows for the use of lower-tiered engines in the event that Tier 3 engines are not available. Therefore, the HRA used SCE's PM_{10} exhaust emissions that incorporate default equipment emission factors to represent the DPM emissions. Based on the total emissions that would be generated at the substation site over a period of 12 months (i.e., 494 pounds), it is estimated that an average of approximately 0.02 grams DPM per second would be generated during the construction period. These emissions were then converted to maximum emissions concentrations, which were used to estimate health risks. Risk characterization combines the maximum annual average ground-level DPM concentration from the exposure assessment and the cancer potency factor and the chronic reference exposure level (REL) to estimate the potential inhalation cancer risk from exposure to Project DPM emissions. The lifetime exposure under OEHHA guidelines takes into account early life (infant and children) exposure.

Table 4.3-7 identifies the maximum increase in carcinogenic risk for sensitive receptors in the vicinity of Circle City Substation due to construction activities. The calculated cancer risk assumes sensitive receptors (residential uses) do not have mechanical filtration and exposure would occur with windows open. For carcinogenic exposures, the cancer risk to residences from DPM emissions for construction of the Project is estimated to result in a maximum incremental increase in carcinogenic risk of approximately 12.0 in one million. The maximum cancer risk that would occur at the residential land uses east of the site would exceed the maximum individual cancer risk threshold of 10 in one million. This represents a significant impact relative to exposure of sensitive receptors to substantial pollutant concentrations.

TABLE 4.3-7
MAXIMUM INCREASE IN CARCINOGENIC RISK FOR OFF-SITE SENSITIVE RECEPTORS

Sensitive Receptor	Maximum Cancer Risk (# in one million)	
	Proposed Project	Proposed Project with Mitigation
Residential Uses East of Circle City Substation Site	12.0	7.1
Maximum Individual Cancer Risk Threshold	10	10
Exceeds Threshold?	Yes	No

NOTE: See Appendix D for the Health Risk Assessment (ESA, 2017b)

However, implementation of **Mitigation Measure 4.3-7**, which would require all diesel-powered construction equipment to be equipped with engines that meet Tier 3 emissions standards and/or have diesel particulate filters that would reduce DPM emissions by at least 85 percent, would decrease the maximum incremental carcinogenic risk to 7.1 in one million for residents. The impact to sensitive receptors in the vicinity of Circle City Substation would be mitigated to a less-than-significant level.

> **Mitigation Measure 4.3-7: Use of Tier-3 Engines at the Circle City Substation Site.** SCE (and/or its construction contractor(s)) shall ensure that at all diesel-powered equipment used during construction activities at Circle City Substation meets at least USEPA-certified Tier 3 emissions standards, or is otherwise equipped with Level 3 diesel particulate filters (DPFs). An initial listing that identifies each off-road unit's certified tier specification and/or DPF status to be operated at the Circle City Substation shall be submitted to the CPUC for review and approval prior to commencement of construction activities at the Circle City Substation site. Construction activities at the Circle City Substation site shall not commence until the equipment listing has been approved by the CPUC. As SCE requires new or replacement construction equipment at the Circle City Substation site, SCE shall submit verification of the certified engine tier or Level 3 DPF retrofit prior to use at the site.
>
> **Significance after Mitigation:** Less than Significant.

Impact 4.3-8: Construction activities could expose local sensitive receptors to *Coccidioides immitis* spores. *Less than significant with mitigation* (Class II)

Construction activities that include ground disturbance would have the potential to release *Coccidioides immitis* spores, which can cause Valley Fever. However, it is likely that much of the population of Riverside and San Bernardino Counties has already been exposed to Valley Fever and would continue to be exposed because of the various earthmoving activities that have historically occurred and continue to occur as a result of agricultural and construction activities throughout the region. As a result of the endemic nature of the disease and the number of earthmoving activities in the area (e.g., grading and excavation for agriculture, as well as new residential, commercial, and industrial development, and surface mining operations), there are new cases of Valley Fever documented in these counties each year; however, many people who are exposed do not develop symptoms (CDPH, 2014).

Construction activities associated with the Project would result in similar localized ground disturbing activities to those that occur continually within the counties and the Project would not result in a substantial increase in spore release. In addition, based on analysis by the Centers for Disease Control and Prevention and U.S. Geological Survey of the Valley Fever outbreak associated with the January 1994 Northridge earthquake(USGS and CDCP, 1998), a major ground-disturbing event (e.g., another major earthquake) is required to release a large number of spores over a wide area for a significant outbreak of Valley Fever to occur. Construction of the Project would not be a major ground-disturbing event that could release a large number of spores. Nonetheless, construction activities could expose local sensitive receptors to Coccidioides immitis spores, resulting in a significant impact. Implementation of APM AIR-01 and Mitigation

Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible. Therefore, construction activities that could expose local sensitive receptors to *Coccidioides immitis* spores would result in impacts that would be mitigated to less than significant.

Mitigation: Implement Mitigation Measure 4.3-2a (Fugitive Dust Controls).

Significance after Mitigation: Less than Significant.

Impact 4.3-9: Operation and maintenance activities would generate emissions of Toxic Air Contaminants but would not expose sensitive receptors to harmful pollutant concentrations. *Less than significant* (Class III)

The only source of DPM associated with operation and maintenance would be two passenger-sized truck trips per month. These trips would be conducted for maintenance and inspection. Accordingly, long-term sources of TACs would be minimal. Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations, and impacts would be less than significant.

Mitigation: None required.

---

e) Create objectionable odors affecting a substantial number of people.

Impact 4.3-10: Construction and operation would not create objectionable odors. *Less than significant* (Class III)

Operation and maintenance of the Project would not create odorous emissions. However, Project construction would include sources, such as diesel equipment, which could result in the creation of objectionable odors. Since the construction activities would be temporary and spatially dispersed, and any associated odors would dissipate quickly from the sources, these activities would not affect a substantial number of people. Therefore, impacts from odors generated by construction of the Project would be less than significant.

Mitigation: None required.

4.3.5 Alternatives

4.3.5.1 Alternative A: No Project Alternative

Under the No Project Alternative, construction, operation, and maintenance-related impacts that would result under the Project, as discussed in Section 4.3.4, *Impacts and Mitigation Measures*, would not occur. Therefore, no impact to air quality would occur under the No Project Alternative (No Impact).

4.3.5.2 Subtransmission Service Objective Alternatives

The proposed Mira Loma-Jefferson 66 kV subtransmission line is shown on **Figure 2-6** in Chapter 2, *Project Description*. Alternatives C1 and C2 are shown on **Figure 3-2a** and Alternative C3 is shown on **Figure 3-2b**, in Chapter 3, *Project Alternatives.*

Alternative B: Mira Loma-Jefferson 66 kV Subtransmission Line Without Substation

Under Alternative B, the proposed Mira Loma-Jefferson 66 kV Subtransmission Line would be constructed and the proposed Circle City Substation, its source lines, and the associated telecommunications facilities would not be constructed. **Table 4.3-8**, *Alternative B Peak Daily Construction Emissions,* presents the estimated peak daily construction emissions that would be associated with Alternative B. Although emissions would be substantially decreased compared to the proposed Project, emissions of PM_{10} and NO_x would continue to exceed the respective significance thresholds, and would result in the same significant and unavoidable impacts (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6) to regional and local air quality even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I).

TABLE 4.3-8
ALTERNATIVE B PEAK DAILY CONSTRUCTION EMISSIONS

Project Component	Peak Construction Emissions (pounds/day)					
	PM_{10}	$PM_{2.5}$	CO	NO_x	SO_x	VOC
Mira Loma Substation	2.87	0.95	9.51	21.95	0.03	1.81
Mira Loma-Jefferson 66 kV Line	185.95	28.74	153.18	290.55	0.43	26.73
Total	**188.82**	**29.69**	**162.69**	**312.5**	**0.46**	**28.54**
Threshold	150	55	550	100	150	75
Threshold Exceeded?	**Yes**	No	No	**Yes**	No	No

SOURCES: SCE, 2015; 2016; and ESA, 2017a. See Appendix D.

Since Alternative B would not result in the construction of a substation, there would be no associated TAC emissions, and the residents at the Corona La Linda Mobile Home Park would not be exposed to an incremental carcinogenic health risk impact (Impact 4.3-7). The health risk associated with construction of the Mira Loma-Jefferson subtransmission line and upgrades at Mira Loma Substation would be less than significant (Class III).

In addition, construction of Alternative B would result in less ground disturbing activities compared to the Project, which would cause less of a potential to release a large number of *Coccidioides immitis* spores that could cause Valley Fever, although the impact would still be significant. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). In addition, construction of Alternative B would create less objectionable odors from construction equipment exhaust (Impact 4.3-10; Class III) compared to the Project.

Operation and maintenance of Alternative B would result less emissions of criteria pollutants and TACs compared to the proposed Project. The long-term operation and maintenance impacts (Impacts 4.3-3, 4.3-5, and 4.3-9) associated with this alternative would be less than significant (Class III).

Alternative C1: Underground 66 kV Subtransmission Line along Hellman Avenue

Alternative C1 would have the same alignment as the proposed Mira Loma-Jefferson subtransmission line; however, it would include a half-mile-long underground conduit installation within Hellman Avenue. Underground subtransmission line conduit and vault construction activities tend to be more labor intensive and generate more air pollutant emissions per given distance than installation of overhead subtransmission line facilities; therefore, construction activities associated with Alternative C1 would generate emissions that would be greater than those that would be generated by the proposed Project. However, it is unlikely that the alternative would result in an increase in maximum day construction emissions compared to the proposed Project as shown in Table 4.3-4, *Project Peak Daily Construction Emissions*, but would instead include an additional approximately 2 weeks of underground line installation work rather than having an additional underground line crew work concurrently with the other crew. Therefore, although construction emissions would be greater overall under this alternative the maximum daily emissions would be the same, and would result in the same significant and unavoidable impacts to regional and local air quality (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6) even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I).

Construction of Alternative C1 would result in more ground disturbing activities compared to the Project, which would cause a higher potential to release a large number of *Coccidioides immitis* spores that could cause Valley Fever and result in a significant impact. Implementation of Mitigation Measures 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). In addition, construction of Alternative C1 would create additional TACs and objectionable odors from construction equipment exhaust (Impacts 4.3-7 and 4.3-10, respectively) compared to the Project; however, the associated impacts would be the same (Classes II and III, respectively).

All other impacts (Impacts 4.3-3, 4.3-5, and 4.3-9) associated with Alternative C1 would be the same as the Project (Class III).

Alternative C2: 66 kV Subtransmission Line along Archibald Avenue

The Alternative C2 segment from the SCE ROW down to River Road would be approximately 3.9 miles in length (2.7 miles aboveground and 1.2 mile underground) and would replace approximately 5.4 miles of overhead line that would be associated with the proposed Mira Loma-Jefferson subtransmission line. This alternative would be constructed within a more densely populated area compared to the portion of the proposed subtransmission line it would replace.

As mentioned above, underground subtransmission line conduit and vault construction activities generate more air pollutant emissions per given distance than installation of overhead subtransmission line facilities; however, this alternative would be approximately 1.5 miles shorter

than the proposed subtransmission line. It is anticipated that the overall construction activities associated with Alternative C2 would generate emissions that would be similar to those that would be generated by the proposed Project. Therefore, the maximum daily emissions that would be associated with Alternative C2 would be the same as estimated for the proposed Project (see Table 4.3-4, *Project Peak Daily Construction Emissions)*, and would result in the same significant and unavoidable impacts (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6) to regional and local air quality even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I). This alternative would adversely affect more sensitive receptors compared to the proposed subtransmission line because it would be constructed within a more densely populated area.

Construction of Alternative C2 would result in more ground disturbing activities compared to the Project, which would cause a higher potential to release a large number of *Coccidioides immitis* spores that could cause Valley Fever and result in a significant impact. Implementation of Mitigation Measures 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). In addition, construction of Alternative C2 would create additional TACs and objectionable odors from construction equipment exhaust (Impacts 4.3-7 and 4.3-10, respectively) compared to the Project; however, the associated impacts would be the same (Classes II and III, respectively).

All operational impacts (Impacts 4.3-3, 4.3-5, and 4.3-9) associated with Alternative C2 would be the same as the Project (Class III).

Alternative C3: 66 kV Subtransmission-Level Battery Storage

Under Alternative C3, up to three subtransmission-level (66 kV) battery storage and substation facilities, associated subtransmission lines, and upgrades to existing Jefferson Substation, would be constructed and operated instead of the Mira Loma-Jefferson 66 kV line component of the Project.

Given the similarities of the infrastructure and site areas that would be required for the subtransmission-level battery storage and substation facilities under Alternative C3 and the proposed Circle City Substation, it is assumed that the peak daily construction emissions associated with each of the individual three subtransmission-level battery storage and substation facilities would be similar to the peak daily emissions that would be generated due to construction of the proposed Circle City Substation, and that up to two of the three facilities would be constructed concurrently. Similarly, it is also likely that construction related to the upgrades at existing Jefferson Substation would result in peak daily construction emissions similar to those that would be associated with the proposed upgrades for Mira Loma Substation under the Project, and that the substation upgrades (e.g., Corona and Chase substations) would occur during the peak daily emissions scenario. In addition, construction of the subtransmission lines that would be required to connect the subtransmission-level battery storage and substation facilities to the existing substations would result in similar peak daily emissions as construction of the proposed substation source lines, and that only one of the subtransmission lines would be constructed at a time during the peak daily emissions scenario.

Table 4.3-9, *Alternative C3 Peak Daily Construction Emissions*, presents the estimated peak daily construction emissions that would be associated with Alternative C3, assuming the

proposed Circle City Substation, its Source Lines, and the associated telecommunications facilities would also be constructed. Although PM_{10} and $PM_{2.5}$ emissions would decrease due to the high particulate matter levels that would not be generated associated with the proposed Mira Loma-Jefferson 66 kV line, CO, SO_x, NO_x, and VOC emissions would increase under this alternative compared to the proposed Project. Emissions of PM_{10} and NO_x would continue to exceed the respective significance thresholds, and unlike the proposed Project, emissions of VOC would exceed the significance threshold. Alternative C3 would result in significant and unavoidable impacts to regional air quality (Impacts 4.3-1, 4.3-2, 4.3-4) relative to PM_{10}, NO_x, and VOC even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I).

TABLE 4.3-9
ALTERNATIVE C3 PEAK DAILY CONSTRUCTION EMISSIONS

Project Component	Peak Construction Emissions (pounds/day)					
	PM_{10}	**$PM_{2.5}$**	**CO**	**NO_x**	**SO_x**	**VOC**

Threshold Exceeded?	**Yes**	No	No	**Yes**	No	**Yes**

SOURCE: SCE, 2015; 2016; and ESA, 2017a. See Appendix D.

With the exception of the 40 MW subtransmission-level battery storage and substation site off Leeson Lane near the proposed Circle City Substation site, which is approximately 800 feet from the closest residences, each of the other two subtransmission-level battery storage and substation sites are in the immediate vicinity (i.e., within 50 feet) of sensitive receptors. Given that construction of the subtransmission-level battery storage and substation facilities would generate approximately the same amount of on-site emissions as construction of the proposed Circle City Substation, and the 40 MW facility would be approximately the same distance from the Corona La Linda Mobile Home Park, peak on-site emissions and maximum allowable emissions thresholds for criteria pollutants would be the same as described in Table 4.3-6, Project Peak On-Site Construction Emissions, for Circle City Substation, and the impact would be less than significant (Impact 4.3-6; Class III). With regard to the 50 MW and 42 MW facility sites, the peak on-site emissions would be the same as for Circle City Substation, but due to the proximity (within 50 feet) to sensitive receptors, the maximum allowable emissions thresholds for NO_x, CO, PM_{10}, and $PM_{2.5}$ would drop to 270 pounds, 1,700 pounds, 12 pounds, and 8 pounds, respectively (SCAQMD, 2009). Using these thresholds, peak on-site construction emissions associated with

the 50 MW and 42 MW facilities would expose sensitive receptors to harmful concentrations of PM_{10}, resulting in significant and unavoidable impacts to local air quality (Impact 4.3-6) even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I).

As mentioned above, the on-site construction emissions of the 40 MW facility would be the same as the proposed Circle City Substation, and would be approximately the same distance from the Corona La Linda Mobile Home Park. Therefore, it is assumed that the maximum incremental increase in carcinogenic risk associated with construction of the 40 MW facility would be the same as for the proposed substation, approximately 12.0 in one million, which represents a significant impact (Impact 4.3-7). In addition, if the 40 MW facility and the Circle City Substation both are approved and constructed adjacent to the each other, the maximum incremental cancer risk at the nearest residences would increase to 24.0 in one million. Implementation of Mitigation Measure 4.3-7, which would require all diesel-powered construction equipment to be equipped with engines that meet Tier 3 emissions standards and/or have diesel particulate filters that would reduce DPM emissions by at least 85 percent, would decrease the maximum incremental carcinogenic risk to 14.2 in one million for residents, requiring additional mitigation in the form of Mitigation Measure 4.3-2b. While implementation of Mitigation Measure 4.3-2b would reduce diesel particulate emissions to the maximum extent feasible, the availability of construction equipment at the time of project construction that meets the highest USEPA-certified tiered emission standards (i.e., Tier 4 standards) is currently unknown. As a result, it cannot be established at this time that implementation of Mitigation Measure 4.3-2b would reduce health risk to below the 10 in one million significance threshold. The impact to sensitive receptors in the vicinity of the 40 MW subtransmission-level battery storage facility would be significant and unavoidable (Impact 4.3-7; Class I).

The other two subtransmission-level battery storage facilities (for the 50 MW and 42 MW facility sites) and the upgrades at Jefferson Substation would be about 750 feet closer to sensitive receptors compared to the sensitive receptors near the proposed substation site. This would result in a substantially higher maximum incremental construction-related increase in carcinogenic risk than 12 in one million at the closest sensitive receptors, which would represent a significant health risk impact. While implementation of Mitigation Measure 4.3-2b would reduce diesel particulate emissions to the maximum extent feasible, the availability of construction equipment at the time of project construction that meets the highest USEPA-certified tiered emission standards (i.e., Tier 4 standards) is currently unknown. As a result, it cannot be established at this time that implementation of Mitigation Measure 4.3-2b would reduce health risk to below the 10 in one million significance threshold. Therefore, the significant health risk impact associated with construction of the 50 MW and 42 MW facilities under Alternative C3 would be unavoidable even with incorporation of mitigation (Impact 4.3-7; Class I).

Construction along new subtransmission line alignments would proceed at a linear pace and would not be expected to expose any one receptor along the corridors for longer than 2 to 3 weeks. The total emissions and duration of exposure at any one sensitive receptor location for the subtransmission line construction would be relatively minor compared to the exposure periods used in health risk assessments. With regard to construction at Jefferson Substation to accommodate the new 66 kV subtransmission line, although the work would occur in the

immediate vicinity of residences, it would only be expected to take approximately 2 months to complete and would result in minor TAC exposure at those residences. The construction-related health risk impacts that would be associated with the subtransmission lines and Jefferson Substation would be less than significant (Impact 4.3-7; Class III).

In addition, although the proposed Mira Loma-Jefferson subtransmission line would likely result in a greater amount of disturbed soil over the length of its alignment, construction of Alternative C3 would result in more localized ground disturbing activities associated with the battery storage and substation facilities compared to the proposed subtransmission line, which would cause an increased potential to release a large number of *Coccidioides immitis* spores that could cause Valley Fever and result in a significant impact. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Construction of Alternative C3 would also expose residences to objectionable odors from construction equipment exhaust, resulting in the same less-than-significant impact as the Project (Impact 4.3-10; Class III).

Similar to operation and maintenance of the Project, Alternative C3 would result in insignificant emissions of criteria pollutants and TACs. The long-term operation and maintenance impacts (Impacts 4.3-3, 4.3-5, and 4.3-9) associated with this alternative would be less than significant (Class III).

4.3.5.3 Distribution Service Objective Alternatives

The proposed Pedley and Databank 66 kV source lines and the proposed Circle City Substation are shown on **Figure 2-5**, in Chapter 2, *Project Description*. Alternative D1 is shown on **Figures 3-3** and **3-4** and Alternatives D2, E1, E2, E3, and E4 are shown on **Figure 3-6** in Chapter 3, *Project Alternatives.*

Alternative D1: 12 kV Distribution-Level Battery Storage

Under Alternative D1, a distribution-level (12 kV) battery storage facility would be constructed and operated instead of the Circle City Substation and associated sources lines components of the Project. Given the reduced scope of the infrastructure (e.g., there would be no 66 kV facilities) and site area (i.e., the site would have an area roughly half as the proposed substation site) that would be required for the distribution-level battery storage facility under Alternative D1 compared to the proposed Circle City Substation, it is assumed that the peak daily construction emissions that would be associated with the distribution-level battery storage facility would generate roughly half the peak daily emissions that would be generated due to construction of the proposed Circle City Substation. **Table 4.3-10**, *Alternative D1 Peak Daily Construction Emissions*, presents the estimated peak daily construction emissions that would be associated with Alternative D1, assuming the proposed Mira Loma-Jefferson 66 kV Subtransmission Line and associated upgrades to Mira Loma Substation would also be constructed. Although total emissions would be decreased compared to the proposed Project, emissions of PM_{10} and NO_x would continue to exceed the respective significance thresholds, and would result in the same

significant and unavoidable impacts (Impacts 4.3-1, 4.3-2, 4.3-4) to regional and local air quality even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Class I).

TABLE 4.3-10
ALTERNATIVE D1 PEAK DAILY CONSTRUCTION EMISSIONS

Project Component	Peak Construction Emissions (pounds/day)					
	PM_{10}	$PM_{2.5}$	CO	NO_x	SO_x	VOC
Distribution-Level Battery Storage Facility	12.33	3.93	48.16	69.77	0.12	6.56
Mira Loma Substation	2.87	0.95	9.51	21.95	0.03	1.81
Mira Loma-Jefferson 66 kV Line	185.95	28.74	153.18	290.55	0.43	26.73
Telecommunication Facilities	5.67	1.18	9.62	22.23	0.03	1.79
Total	**206.82**	**34.80**	**220.47**	**404.5**	**0.61**	**36.89**
Threshold	150	55	550	100	150	75
Threshold Exceeded?	**Yes**	No	No	**Yes**	No	**Yes**

SOURCE: SCE, 2015; 2016; and ESA, 2017a. See Appendix D.

As with the proposed substation site, the distribution-level battery storage site is approximately 800 feet from the closest residences. Assuming a 2-acre site 200 meters from residences, the maximum allowable on-site emissions thresholds for NO_x, CO, PM_{10}, and $PM_{2.5}$ are 378 pounds, 5,183 pounds, 81 pounds, and 25 pounds, respectively (SCAQMD, 2009). As shown in Table 4.3-10, emissions associated with construction of the distribution-level battery storage facility would be well below these values, representing a less-than-significant local air quality impact to sensitive receptors (Impact 4.3-6; Class III). Given that the distribution-level battery storage facility construction emissions would be approximately half of the proposed Circle City Substation, it is estimated that the maximum incremental increase in carcinogenic risk associated with construction of the distribution-level battery storage facility would be roughly half as would occur for the proposed substation, equivalent to approximately 6.0 in one million, which represents a less-than-significant impact (Impact 4.3-7; Class III).

In addition, construction of Alternative D1 would result in less ground disturbing activities compared to the Project, which would cause less of a potential to release a large number of *Coccidioides immitis* spores that could cause Valley Fever. Nonetheless, the impact would be significant. Implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Construction of Alternative D1 would also expose residences to objectionable odors from construction equipment exhaust, resulting in the same less-than-significant impact as the Project (Impact 4.3-10; Class III).

Similar to operation and maintenance of the Project, Alternative D1 would result in insignificant emissions of criteria pollutants and TACs. The long-term operation and maintenance impacts (Impacts 4.3-3, 4.3-5, and 4.3-9) associated with this alternative would be less than significant (Class III).

Alternative D2: 66/12 kV Substation Site Alternative

The Alternative D2 substation site would be located within 200 feet of the Corona La Linda residential neighborhood, which would be approximately 600 feet closer to these residences than the proposed Circle City Substation site. The construction and operation would be the same in scope to that of the proposed Circle City Substation site. Impacts 4.3-1 through 4.3-5, and Impacts 4.3-9 and 4.3-10 would be the same as under the proposed Project (ranging from Class I to Class III). Due to the close proximity to the Corona La Linda neighborhood, the localized construction emissions concentrations associated with Alternative D2 would be greater than the proposed Project. **Table 4.3-11** compares peak on-site emissions that would be associated with construction of the substation under Alternative D2 to the maximum allowable emissions from the SCAQMD's look-up tables for a 5-acre site 50 meters from residences (SCAQMD, 2009). As shown in the table, on-site emissions would not exceed the more stringent maximum allowable emissions thresholds and the associated impact would be the same as for the proposed Project (Impact 4.3-6; Class III for the substation, Class I overall).

TABLE 4.3-11
ALTERNATIVE D2 PEAK ON-SITE CONSTRUCTION EMISSIONS

Project Component	Peak On-Site Construction Emissions (pounds/day)			
	PM_{10}	$PM_{2.5}$	CO	NO_x
Alternative D2 Circle City Substation	19.9	5.9	66.7	130.7
Threshold	37	11	2,470	302
Threshold Exceeded?	No	No	No	No

As mentioned above, the construction site would be much closer to sensitive receptors compared to the proposed substation site. This would result in a substantially higher maximum incremental construction-related increase in carcinogenic risk than 12 in one million at the closest sensitive receptors, which would represent a significant health risk impact. While implementation of Mitigation Measure 4.3-2b would reduce diesel particulate matter emissions to the maximum extent feasible, the availability of construction equipment at the time of project construction that meets the highest USEPA-certified tiered emission standards (i.e., Tier 4) is currently unknown. As a result, it cannot be established at this time that implementation of Mitigation Measure 4.3-2b would reduce health risk to below the 10 in one million significance threshold. Therefore, the significant health risk impact associated with Alternative D2 would be unavoidable even with incorporation of mitigation (Impact 4.3-7; Class I).

In addition, construction of Alternative D2 would result in ground disturbing activities closer to residences compared to the Project, which would cause more of a potential for released *Coccidioides immitis* spores to cause Valley Fever and result in a significant impact. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II).

Alternative E1: Quarry Street 66 kV Source Line Segment

Alternative E1 would be approximately 300 feet longer and would include an additional 800 feet of underground line compared to the proposed Pedley Source Lines segment that it would replace.

Underground subtransmission line conduit and vault construction activities generate more air pollutant emissions than installation of overhead subtransmission line facilities per a given distance because underground installation requires more ground disturbance-related activities that generate more exhaust and dust emissions. Therefore, construction activities associated with Alternative E1 would generate emissions that would be greater than those that would be generated by the proposed Project. However, it is unlikely that the alternative would result in an increase in maximum day construction emissions compared to the proposed Project as shown in Table 4.3-4, *Project Peak Daily Construction Emissions*, but would instead include an additional week of underground line installation work rather than having an additional underground line crew work concurrently with the other crew. Therefore, although construction emissions would be greater overall under this alternative, the maximum daily emissions of criteria pollutants would be the same, and would result in the same significant and unavoidable impacts to regional air quality and to sensitive receptors even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6; Class I).

Alternative E1 would result in a higher potential for release of *Coccidioides immitis* spores that could cause Valley Fever due to the increased ground disturbance associated with underground line installation and the associated impact would be significant. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Odor impacts during construction and operation would be the same as the proposed Project, less than significant (Impact 4.3-10; Class III). The underground source line work under Alternative E1 would result in increased concentrations of diesel particulate matter compared to overhead line work; however, its duration of exposure would be less than 2 months at any one location resulting in the same less-than-significant health risk impact for underground line work as the Project (Impact 4.3-7; Class III related to underground line work; Class II overall).

As with the proposed Project, operation and maintenance of Alternative E1 would result in insignificant emissions of criteria pollutants related to annual inspections. The long-term operation and maintenance impacts associated with this alternative would be less than significant (Impacts 4.3-3, 4.3-5, and 4.3-9; Class III).

Alternative E2: Underground Pedley 66 kV Source Lines from I-15 to Circle City Substation

Alternative E2 would have the same alignment as the proposed Pedley Source Lines; however, it includes an underground line segment from just west of I-15 to the proposed Circle City Substation site. This alternative would include approximately 1.5 miles of additional underground line compared to the proposed Pedley Source Lines.

As mentioned above, underground subtransmission line conduit and vault construction activities generate more air pollutant emissions per a given distance than installation of overhead subtransmission line facilities; therefore, construction activities associated with Alternative E2 would generate emissions that would be greater than those that would be generated by the proposed Project. However, it is unlikely that the alternative would result in an increase in maximum day construction emissions compared to the proposed Project as shown in Table 4.3-4, *Project Peak Daily Construction Emissions*, but would instead include an additional approximately 4 to 7 weeks of underground line installation work rather than having an additional underground line crew work concurrently with the other crew. Therefore, although construction emissions of criteria pollutants would be greater overall under this alternative, the maximum daily emissions would be the same, and would result in the same significant and unavoidable impacts to regional air quality and to sensitive receptors even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6; Class I).

Alternative E2 would result in a higher potential for release of *Coccidioides immitis* spores that could cause Valley Fever due to the increased ground disturbance associated with underground line installation, and the associated impact would be significant. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Odor impacts during construction and operation would be the same as the proposed Project, less than significant (Impact 4.3-10; Class III). The underground source line work under Alternative E2 would result in increased concentrations of diesel particulate matter compared to overhead line work; however, its duration of exposure would be less than 2 months at any one location resulting in the same less-than-significant health risk impact for underground line work as the Project (Impact 4.3-7; Class III related to underground line work; Class II overall).

As with the proposed Project, operation and maintenance of Alternative E2 would result in insignificant emissions of criteria pollutants related to annual vault inspections. The long-term operation and maintenance impacts associated with this alternative would be less than significant (Impacts 4.3-3, 4.3-5, and 4.3-9; Class III).

Alternative E3: Southern 66 kV Source Lines Alignment

Alternative E3 would include 1.3 miles of overhead lines in a double circuit configuration, which would be 0.1 mile longer than the proposed Databank Source Lines. However, unlike the proposed Databank Source Lines, which would include nearly 0.5 mile of underground subtransmission line installation, this alternative would include no underground line installation activities. Similar to the proposed Databank Source Lines, where the southwest end of the lines would be installed immediately adjacent to residences, Alternative E3 would be constructed immediately adjacent to several residences along Bel Air Street and Laurel Canyon Way.

Because underground subtransmission line conduit and vault construction activities generate more air pollutant emissions per a given distance than installation of overhead subtransmission line facilities due to the substantial increase of ground disturbance required for underground installation, construction activities associated with the Alternative E3 overhead line would

generate less emissions than would be generated by the proposed Project. However, it is likely that the alternative would result in the same maximum day construction emissions compared to the proposed Project as shown in Table 4.3-4, *Project Peak Daily Construction Emissions*, but would instead include approximately 3 fewer weeks of underground line installation work rather than using less equipment on a daily basis, but having the same construction duration as the Project. Therefore, although construction emissions would be reduced overall under this alternative, the maximum daily emissions would be the same, and would result in the same significant and unavoidable impacts to regional air quality and to sensitive receptors even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6; Class I).

Alternative E3 would result in a lower potential for release of *Coccidioides immitis* spores that could cause Valley Fever due to the decreased ground disturbance associated with underground line installation. Nonetheless, the associated impact would be significant. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Odor impacts during construction and operation would be the same as the proposed Project, less than significant (Impact 4.3-10; Class III). The overhead line work under Alternative E3 would result in decreased concentrations of diesel particulate matter compared to underground line work that would be associated with the Databank Source Lines and the duration of exposure would be less than 2 months at any one location resulting in the same less-than-significant health risk impact for overhead line work as the Project (Impact 4.3-7; Class III related to underground line work; Class II overall).

As with the proposed Project, operation and maintenance of Alternative E3 would result in insignificant emissions of criteria pollutants related to annual vault inspections. The long-term operation and maintenance impacts associated with this alternative would be less than significant (Impacts 4.3-3, 4.3-5, and 4.3-9; Class III).

Alternative E4: Databank 66 kV Source Lines Only

Alternative E4 would result in only the proposed Databank Source Lines and the Circle City Substation to Corona Substation telecommunications line being connected to Circle City Substation and the Pedley Source Lines would not be constructed. Construction activities associated with the Alternative E4 would generate less emissions than would be generated by the proposed Project. However, it is likely that the alternative would result in the same maximum day construction emissions compared to the proposed Project as shown in Table 4.3-4, *Project Peak Daily Construction Emissions*, but would include fewer months of source line construction installation work. Therefore, although construction emissions would be reduced overall under this alternative, the maximum daily emissions would be the same, and would result in the same significant and unavoidable impacts to regional air quality and to sensitive receptors even with implementation of Mitigation Measures 4.3-2a and 4.3-2b (Impacts 4.3-1, 4.3-2, 4.3-4, and 4.3-6; Class I).

Alternative E4 would result in a lower potential for release of *Coccidioides immitis* spores that could cause Valley Fever due to the decreased ground disturbance. Nonetheless, the associated impact would be significant. However, implementation of Mitigation Measure 4.3-2a would ensure that fugitive dust that could contain *Coccidioides immitis* spores would be controlled to the maximum extent feasible, and the associated impact (Impact 4.3-8) would be mitigated to less than significant (Class II). Odor impacts during construction and operation would be the same as the proposed Project, less than significant (Impact 4.3-10; Class III). Sensitive receptors along the Pedley Source Lines alignment would not be exposed to diesel particulate matter under Alternative E4, and the duration of exposure associated with construction of the Databank Source Lines would be less than 2 months at any one location resulting in the same less-than-significant health risk impact as the Project (Impact 4.3-7; Class III related to source line work; Class II overall).

As with the proposed Project, operation and maintenance of Alternative E4 would result in insignificant emissions of criteria pollutants related to facility inspections. The long-term operation and maintenance impacts associated with this alternative would be less than significant (Impacts 4.3-3, 4.3-5, and 4.3-9; Class III).

Exhibit B

Pacific Steel Group Mojave Micro Mill -- SCE Transmission and Telecommunications Project Construction Analysis
Construction Assumptions

Total Construction Site Area: acres

PROJECT CHARACTERISTICS

Project Name	SCE Transmission and Telecommunications	Project Construction Analysis
Project Location	Mojave Desert Air Basin	
CEC Zone	7	Mojave
Start of Construction	Apr-23	
Operational Year	2025	
Select Utility Company	Los Angeles Department of Water & Power	

LAND USE

Land Use Type	Land Use Subtype	Unit Amount	Size Metric	Lot Acreage	Square Feet	Population	Notes:
Industrial	General Light Industry	1	1000 sq ft				Assuming 1000 sq ft per day (1 pole per day)

MITIGATION

Option	Yes/No	Frequency (per day)	PM10 % Reduction	PM2.5 % Reduction	
Soil Stabilizer for Unpaved Roads	No	n/a	n/a	n/a	
Water Exposed Area	Yes	2	55	55	*Default water mitigation*
Replace Ground Cover of Area Disturbed	No				
Tier 4 equipment	No				

From Data Request:

5. Construction Vehicles

Sources:

	Workers Per Day	Worker Trips (per day) *CalEEMod Defaults*	Vendor Trips (per day) *CalEEMod Defaults*	Haul Trips (max per day) *Assumption*	
Transmission	25	50		4	
Telecommunications	10	20		4	See *Material Imp_Exp* tab

Notes:

The CalEEMod default vendor trips assigned to the building construction phases (as well as assigning building construction phase types to electrical installation, etc.) is inherently conservative.

Haul trips for import/export and concrete/paving based on data request assumptions provided to ESA. Non-phase specific haul trips provided to ESA on a monthly schedule in the *Schedule_OFFROAD* tab.

Worker trips based on information provided to ESA.

Equipment Summary

Activity	CalEEMod Designation	Horsepower	New Equipment Quantity
Transmission	Air Compressor	120	2
Transmission	Aerial Lift	350	3
Transmission	Tractors/Loaders/Backhoes	200	1
Transmission	Crane	235	2
Transmission	other construction equipment	300	1
Transmission	Offhighway Truck	Default (402)	1
Telecommunications	Aerial Lift	350	1
Telecommunications	Generator Set	15	1
Telecommunications	Tractors/Loaders/Backhoes	200	1
Telecommunications	Offhighway Truck	Default (402)	1

Note: Based on Circle City DEIR information

Assuming 4 haul trips per day for any import/export.

Pacific Steel Group Mojave Micro Mill -- SCE Transmission and Telecommunications Project Construction Analysis

Construction Schedule - Offroad Equipment

Schedule Project 1 - Transmission Line

Phases	Phase Type	Number of Daily Workers	Start	Finish	# of Work Days	# of Days
Wood/H-Frame/LWS Pole Removal	Grading/Excavation	25	2024/01/01	2025/02/23	300	419
Install TSP Foundation	Grading/Excavation	25	2024/01/02	2025/02/24	300	419
TSP Haul	Grading/Excavation	25	2024/01/03	2025/02/25	300	419
TSP Erection	Grading/Excavation	25	2024/01/04	2025/02/26	300	419
Install Wood/LWS Pole	Grading/Excavation	25	2024/01/05	2025/02/27	300	419
Install Conductor	Grading/Excavation	25	2024/01/06	2025/02/28	300	419

Schedule Project 2 - Telecommunications Line

Phases	Phase Type	Number of Daily Workers	Start	Finish	# of Work Days	# of Days
Fiber Optic Cable Installation	Grading/Excavation	10	2024/01/01	2025/02/23	300	419
Fiber Optic Cable Splicing	Grading/Excavation	10	2024/01/02	2025/02/24	300	419
Underground Conduit	Grading/Excavation	10	2024/01/03	2025/02/25	300	419

Notes:

Assuming no demolition or architectural coating will be required based on information provided to ESA.

300 poles @ 1 pole per day

Pacific Steel Group Mojave Micro Mill -- SCE Transmission and Telecommunications Project Construction Analysis

Construction GHG Summary

Emission Source		CO_2e (Metric Tons)[a,b]
Power Transmission Lines		
	2024	1,135.07
	2025	206.69
Telecommunication Line		
	2024	363.65
	2025	60.98
Total Construction Emissions		**1,766**
Amortized Construction Emissions (30 years)		**58.9**

a Totals may not add up exactly due to rounding in the modeling calculations.

b CO_2e emissions are calculated using the GWP values from the IPCC Fourth Assessment Report.

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

EXECUTIVE SUMMARY

Environmental Science Associates (ESA) has prepared this Biological Technical Report (BTR) for Pacific Steel Group (PSG) in support of the Mojave Micro Mill Project (Project). The purpose of this BTR is to provide an inventory of biological resources occurring or potentially occurring within the Project area and to evaluate the relationship of those biological resources to the Project's construction and operational activities. This BTR describes the methodology of the study, existing conditions, potential impacts, and mitigation measures to address potential impacts resulting from implementation of the Project.

An analysis of potential Project impacts to biological resources and corresponding recommendations for avoidance, minimization, and mitigation are discussed below. It should be noted that while the overall Project design footprint is in its preliminary stages, final Project impacts will need to be determined upon a more finalized Project design. Potential impacts and corresponding avoidance, minimization, and mitigation are based on the current proposed Project design footprint.

The Project proposes to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., vehicles, bars, steel, and miscellaneous ferrous scrap materials) through various recycling processes on approximately 174 acres of privately-owned land in southeastern Kern County. The Project is located 4 miles north of the community of Rosamond and 8 miles south of the community of Mojave.

Biological Study Area

This BTR encompasses a biological study area (BSA) that includes the approximately 174-acre Project Site within Kern County and located at 860 Sopp Road, at the southeast corner of Sopp Road and Sierra Highway. Much of this area has a history of agricultural use but several areas within the BSA support disturbed natural habitat and wildlife.

Methodology

This BTR is based upon a review of existing literature and a field reconnaissance survey emphasizing on areas within the BSA with the highest likelihood of supporting biological resources. The biological resources reconnaissance field survey was conducted by ESA senior biologists Ryan Gilmore and Robert Sweet on March 17, 2021. The survey effort involved pedestrian access over the entire BSA. All species of plant and animals observed, including sign (e.g., presence of scat, etc.) as well as any audible detections of wildlife, were noted during the site visit. Wildlife observations and other features were mapped utilizing Collector for ArcGIS and representative photographs were taken. Vegetation mapping was conducted within the Project Site; notes were taken of vegetation communities observed. Vegetation communities noted were

generally classified using the systems provided in the Preliminary Descriptions of the Terrestrial Communities of California (Holland 1986), and modified using A Manual of California Vegetation, Second Edition (MCV) (Sawyer et al. 2009) as necessary to reflect the existing site conditions. Representative photographs of habitats that occur within the BSA are included in **Appendix A**, *Representative Site Photographs*.

A CDFW protocol survey was conducted for western Joshua tree (*Yucca brevifolia*) on May 3 and 18, 2022. The methodology and results of the western Joshua tree survey are available in **Appendix B**, *Western Joshua Tree Inventory, Preservation, and Relocation Plan*. Additionally, a CDFW protocol Mohave ground squirrel (*Xerospermophilus mohavensis*) visual and trapping surveys were conducted in the spring and summer of 2022. The methodology and results of the Mohave ground squirrel surveys are available in **Appendix C**, *Mohave Ground Squirrel Report*.

No other focused surveys for special-status species or aquatic resource delineations were conducted during these field surveys. The potential for special-status species and other sensitive biological resources to occur was based on observations and assessment of habitat suitability, such as soil type, vegetation, slope, aspect, hydrology, and the presence of any disturbances within or adjacent to the area. Areas where foot access was restricted were surveyed with the use of binoculars.

Additionally, consideration was given to the applicable federal, state, and local regulatory framework overlapping or adjacent to the BSA. Local regulatory framework included a review of county policies. Additionally, regional habitat conservation plans were considered.

The determination of the potential for special-status plant and wildlife species to occur within the BSA was based on observations of vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences, geographic ranges and a review of the biological databases such as the California Natural Diversity Database (CNDDB).

A formal jurisdictional delineation to locate potential natural drainage features and water bodies that may be under the jurisdiction of United States Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB) and/or California Department of Fish and Wildlife (CDFW) was not performed as no features are present within the BSA.

Results

The primary land cover of the BSA is red brome or Mediterranean grass grasslands with greatly diminished habitat values. However, some areas within the BSA contain native vegetation communities that provide suitable habitat for certain native flora and fauna, including special-status plant and wildlife species. Western Joshua tree was recorded within the BSA and is currently a candidate threatened species by the CDFW under the California Endangered Species Act (CESA). The candidate status of this species is currently under review by the California Fish and Game Commission at the time of the drafting of this BTR. There are no mapped or observed jurisdictional aquatic features within the project site.

General wildlife observed or detected during the habitat assessment primarily includes species that are adapted to agricultural and naturalized non-native grassland environments. A total of 13 special-status plants and 8 wildlife species were assessed for potential to occur within the BSA. Besides the presence of western Joshua tree there are three special-status plant species that have a low potential to occur within the BSA: alkali mariposa lily (*Calochortus striatus*), recurved larkspur (*Delphinium recurvatum*), and pale-yellow layia (*Layia heterotricha*). No focused rare plant surveys were conducted at this time. However, these species were not observed during surveys of western Joshua tree and for Mohave ground squirrel. Of the eight special-status wildlife species assessed, three have a low potential to occur within the BSA including: desert tortoise (*Gopherus agassizii*), burrowing owl (*Athene cunicularia*), and Mohave ground squirrel. The remainder of the species have a no potential or are not expected to occur within the BSA. Desert tortoise and burrowing owl were not detected within the BSA during all fieldwork activities. Based on habitat and records in the project site area, focused surveys were not warranted. No critical habitat for wildlife species is present within the BSA. Additionally, there are no "sensitive" natural communities located within the BSA. Western Joshua tree present within the project site do not reach the level of a western Joshua tree woodland based on their relative sparse density within the project site.

The CDFW protocol survey conducted for western Joshua trees resulted in the inventory of 136 trees located within the project site and 16 additional trees offsite within 290 feet of the project site limits. A total of 85 western Joshua trees will be removed as a result of implementation of the preliminary project design. An additional three (3) protected western Joshua trees will be encroached. The remaining 64 protected trees, inclusive of the 16 offsite western Joshua trees, will be preserved in place. Overall, a total of 76 western Joshua trees of the 85 protected trees proposed for removal will be relocated onsite. Additionally, nine (9) of the proposed removal western Joshua trees do not have relocation potential and will be mitigated at a 3:1 replacement ratio for a total of 27 replacement western Joshua trees. In total, 76 relocation trees and 27 replacement trees will be planted within two onsite receiver sites as shown on **Figure 5** of **Appendix B**.

The CDFW protocol Mohave ground squirrel visual and trapping surveys conducted resulted in negative results for presence. No detections or trapped Mohave ground squirrel individuals were made.

Construction and operation of the proposed Project would impact western Joshua tree a special-status plant species. However, in some areas, proximity of construction activities to natural habitats could result in effects to sensitive biological resources. Implementation of impact avoidance and minimization measures as proposed within this BTR would reduce impacts below a level of significance for special-status plants and wildlife, nesting birds, sensitive vegetation communities, protected wetlands, wildlife corridors, and protected ecological areas. With implementation of these proposed measures, impacts to biological resources are expected to be less than significant.

CHAPTER 1
Introduction

1.1 Project Overview

Pacific Steel Group (PSG) proposes to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., vehicles, steel, and miscellaneous ferrous scrap materials) through various recycling processes on approximately 174 acres of privately owned land in southeastern Kern County.

1.2 Project Location

The Project site is located in unincorporated southeastern Kern County, in central California as shown in **Figure 1**, *Regional Location Map*, and **Figure 2**, *Local Vicinity Map*. The project site is located approximately 57 miles southeast of the City of Bakersfield, approximately 4 miles north of the community of Rosamond and 8 miles south of the community of Mojave. The micro mill facility would be developed on two parcels (Assessor's Parcel Number [APN] 431-010-02 and 431-030-02) (project site) totaling approximately 174 acres located at 860 Sopp Road, Mojave, California, along Sierra Highway to the west, in Kern County.

1.3 Project Description

The proposed Project site is the construction and operation of a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Project development would include an approximately 475,800 square-foot micro mill facility within 13 connected and standalone buildings with an additional 51,185 square feet of accessory buildings, for a total of 526,985 square feet, as well as an approximately 63-acre accessory solar array on 174 acres of privately owned land. Outdoor storage for scrap materials and staging is included as part of the proposed project design.

CHAPTER 2
Methodology

This analysis is based on a literature review and a field reconnaissance survey emphasizing areas within the biological study area (BSA), the two parcels comprising the 174-acre Project Site, with the highest likelihood of supporting native or sensitive biological resources. A description of the methodologies used is provided below.

2.1 Existing Literature and Database Review

Prior to conducting the Project Site habitat assessment, a review of aerial maps and biological resource databases was conducted to identify biological resources potentially occurring within the BSA and broader vicinity of the proposed Project. Recent and historical aerial imagery were reviewed, as well as the topographic electronic copies of the applicable USGS 7.5-minute topographic quadrangle maps, centered around the Soledad Mountain quadrangle. Aerial imagery (Google Earth 2022) was reviewed to confirm the current locations of developed and undeveloped land, and unique landforms. A list of special-status plant and wildlife species and their habitats recorded to occur near the Project site was compiled primarily from the California Department of Fish and Wildlife (CDFW), California Natural Diversity Database (CNDDB) (2022a), and California Native Plant Society (CNPS) (2022) Inventory of Rare and Endangered Plants. ESA conducted a query of the CNDDB and CNPS records for the following USGS 7.5-minute topographic quadrangle maps: Bissell, Little Buttes, Mojave, Monolith, Rosamond, Rosamond Lake, Sanborn, Soledad Mountain, and Willow Springs. Specifically, the Project Site is located in the Soledad Mountain USGS 7.5-minute topographic quadrangle. Other data sources reviewed included the United States Department of Agriculture Natural Resources Conservation Service (NRCS) soils mapping (USDA 2022), U.S. Fish and Wildlife Service (USFWS) critical habitat maps (USFWS 2022a), the Information for Planning and Consultation (IPaC) (USFWS 2022b), and the National Wetlands Inventory (NWI) (USFWS 2022c).

2.2 Biological Field Surveys

The biological resources reconnaissance field survey was conducted by ESA senior biologists Ryan Gilmore and Robert Sweet on March 17, 2021. Weather conditions during the surveys consisted of an average temperature of 39-52° Fahrenheit, calm winds, and relatively clear skies. The survey effort involved pedestrian access over the entire site. All species of plant and animals observed, including sign (e.g., presence of scat, etc.) as well as any audible detections of wildlife, were noted during the site visit. Wildlife observations and other features were mapped utilizing Collector for ArcGIS and representative photographs were taken.

Vegetation mapping was conducted during the filed survey; notes were taken of vegetation communities observed. Vegetation communities noted were generally classified using the systems provided in the Preliminary Descriptions of the Terrestrial Communities of California (Holland 1986), and modified, where needed, using A Manual of California Vegetation, Second Edition (MCV) (Sawyer et al. 2009) as necessary to reflect the existing site conditions.

Plant communities and habitats within these areas were characterized to determine the extent of habitats on and adjacent to the Project Site that could support special-status plant and wildlife species. The potential for special-status species and other sensitive biological resources to occur was based on observation and assessment of habitat suitability, such as soil type, vegetation, slope, aspect, hydrology, and the presence of any disturbances within or adjacent to the area. Areas where foot access was prevented were surveyed with the use of binoculars. Representative photographs of habitats that occur within the BSA are included in **Appendix A,** *Representative Site Photographs*. No focused surveys for special-status species or aquatic resource delineations were conducted during these field surveys.

Methodologies and results of the project-specific, CDFW protocol western Joshua tree (*Yucca brevifolia*) and Mohave ground squirrel (*Xerospermophilus mohavensis*) surveys are available in **Appendix B,** *Western Joshua Tree Inventory, Preservation, and Relocation Plan,* and **Appendix C,** *Mohave Ground Squirrel Report,* respectively.

CHAPTER 3
Regulatory Framework

3.1 Federal

Endangered Species Act (USC, Title 16, Sections 1531 through 1543)

The federal Endangered Species Act (FESA) and subsequent amendments provides for the conservation and protection of wildlife and plant species that are listed or proposed for listing as endangered or threatened species and the ecosystems upon which they depend. The FESA also provides statutory framework for the conservation and recovery of threatened and endangered species as well as for the conservation of designated critical habitat that USFWS determines is required for the survival and recovery of these listed species.

Section 7 of the FESA requires federal agencies, in consultation with and assistance from the Secretary of the Interior or the Secretary of Commerce, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. The USFWS and National Marine Fisheries Service (NMFS) share responsibilities for administering the FESA. Regulations governing interagency cooperation under Section 7 are found in CCR Title 50, Part 402. The opinion issued at the conclusion of consultation will include a statement authorizing "take" (to harass, harm, pursue, hunt, wound, kill, etc.) that may occur incidental to an otherwise legal activity. Although federal funding is not expected, if the proposed Project were to receive federal funding the funding agency would be required to initiate a consultation with USFWS under Section 7. The consultation process would then lead to issuance of a Biological Opinion from USFWS. In most cases, a Biological Opinion addresses a project's potential to result in "take" of listed species (as defined below), and includes mandatory conditions that would allow for limited incidental take to occur subject to prescribed conditions.

Section 9 lists those actions that are prohibited under the FESA. Although take of a listed species is prohibited, it is allowed when it is incidental to an otherwise legal activity. Section 9 prohibits take of listed species of fish, wildlife, and plants without special exemption. The definition of "harm" includes significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns related to breeding, feeding, or shelter. "Harass" is defined as actions that create the likelihood of injury to listed species by disrupting normal behavioral patterns related to breeding, feeding, and shelter significantly.

Section 10 provides a means whereby a non-federal action with the potential to result in take of a listed species can be allowed under an incidental take permit which may be issued once an HCP

is approved. Application procedures are found at 50 CFR 13 and 17 for species under the jurisdiction of USFWS and 50 CFR 217, 220, and 222 for species under the jurisdiction of NMFS.

Migratory Bird Treaty Act (16 USC 703 through 711)

The Migratory Bird Treaty Act (MBTA) is the domestic law that affirms, or implements, a commitment by the U.S. to four international conventions (with Canada, Mexico, Japan, and Russia) for the protection of a shared migratory bird resource. The MBTA makes it unlawful at any time, by any means, or in any manner to pursue, hunt, take, capture, or kill migratory birds. "Migratory bird" means any bird protected by any of the treaties and currently includes 1,027 bird species in the United States (50 CFR 10.13), regardless of whether the particular species actually migrates. The law also applies to the removal of nests occupied by migratory birds during the breeding season. The MBTA makes it unlawful to take, pursue, molest, or disturb these species, their nests, or their eggs anywhere in the United States.

Bald and Golden Eagle Protection Act of 1940 (16 USC 668, enacted by 54 Stat. 250)

The Bald and Golden Eagle Protection Act of 1940 protects bald and golden eagles by prohibiting the taking, possession, and commerce of such birds and establishes civil penalties for violation of this act. Take of bald and golden eagles includes to ″pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb.″ 16 U.S.C. § 668c. Disturb means to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior. (Federal Register [FR], volume 72, page 31132; 50 CFR 22.3).

Federal Clean Water Act (33 USC 1251 through 1376)

The USACE regulates "discharge of dredged or fill material" into "waters" of the United States, which includes tidal waters, interstate waters, and "all other waters, interstate lakes, rivers, streams (including excluding ephemeral drainages), mud flats, sand flats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce or which are tributaries to waters subject to the ebb and flow of the tide" (33 C.F.R. 328.3(a)), pursuant to provisions of Section 404 of the Clean Water Act (CWA). The CWA also excludes certain features from this regulation, including "wastewater recycling facility constructed on dry land" (see 33 CFR Section 230.3 (o)(2)(vii)). Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not considered waters of the United States.

Fish and Wildlife Conservation Act

The Fish and Wildlife Conservation Act declares that fish and wildlife are of ecological, educational, esthetic, cultural, recreational, economic, and scientific value to the United States. The purposes of this Act are to encourage all federal departments and agencies to utilize their statutory and administrative authority, to the maximum extent practicable and consistent with each agency's statutory responsibilities and to conserve and to promote conservation of non-game fish and wildlife and their habitats. Another purpose is to provide financial and technical assistance to the states for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife.

3.2 State

California Endangered Species Act (CFG Code Section 2050 et seq.)

The California Endangered Species Act (CESA) establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. The CESA mandates that state agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. There are no state agency consultation procedures under the CESA. For projects that would affect a listed species under both the CESA and the FESA, compliance with the FESA would satisfy the CESA if CDFW determines that the federal incidental take authorization is "consistent" with the CESA under CFG Code Section 2080.1. For projects that would result in take of a species listed under the CESA only, the project operator would have to apply for a take permit under Section 2081(b).

California Fish and Game Code Section 1600 et seq.

CDFW is responsible for protecting and conserving fish and wildlife resources, and the habitats upon which they depend. Under Section 1600 of the California Fish and Game Code, CDFW administers the Lake and Streambed Alteration (LSA) Program and regulates all substantial diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake (which typically include reservoirs), which supports fish or wildlife.

Applicants proposing changes to such regulated water resources must submit a Lake or Streambed Alteration Notification to CDFW for such projects. CDFW will then determine if the proposed activity may substantially adversely affect an existing fish or wildlife resource and will issue a final agreement for the applicant's signature that includes reasonable measures necessary to protect the resource. Preliminary notification to CDFW, and project review by CDFW may occur during or after the California Environmental Quality Act (CEQA) environmental review process but prior to project implementation.

California Fish and Game Code Sections 2080 and 2081

Section 2080 of the California Fish and Game Code states that "No person shall import into this state [California], export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the Commission [State Fish and Game Commission] determines to be an endangered species or threatened species, or attempt any of those acts, except as otherwise provided in this chapter, or the Native Plant Protection Act, or the California Desert Native Plants Act." Pursuant to Section 2081, CDFW may authorize individuals or public agencies to import, export, take, or possess state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through Incidental Take permits or Memoranda of Understanding if the take is incidental to an otherwise lawful activity, impacts of the authorized take are minimized and fully mitigated, the permit is consistent with any regulations adopted pursuant to any recovery plan for the species, and the project operator ensures adequate funding to implement the measures required by CDFW, which makes this determination based on available scientific information and considers the ability of the species to survive and reproduce.

California Fish and Game Code Sections 3503, 3503.5, 3513, and 3800

Under these sections of the California Fish and Game Code, a project operator is not allowed to conduct activities that would result in the taking, possessing, or destroying of any birds of prey; the taking or possessing of any migratory nongame bird as designated in the MBTA; the taking, possessing, or needlessly destroying of the nest or eggs of any raptors or nongame birds protected by the MBTA; or the taking of any nongame bird pursuant to California Fish and Game Code Section 3800.

Section 3800 of the CFG Code affords protection to all nongame birds, which are all birds occurring naturally in California that are not resident game birds, migratory game birds, or fully protected birds. Section 3513 of the CFG Code upholds the MBTA by prohibiting any take or possession of birds that are designated by the MBTA as migratory nongame birds except as allowed by federal rules and regulations promulgated pursuant to the MBTA.

California Environmental Quality Act Guidelines Section 15380

Although threatened and endangered species are protected by specific federal and state statutes, California Environmental Quality Act (CEQA) Guidelines Section 15380(b) provides that a species not listed on the federal or state list of protected species may be considered rare or

endangered if the species can be shown to meet certain specified criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants or animals. This section is included in CEQA primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on, for example, a candidate species that has not been listed by either USFWS or CDFW. Thus, CEQA provides an agency with the ability to protect a species from the potential impacts of a project until the respective government agencies have an opportunity to designate the species as protected, if warranted. CEQA also calls for the protection of other locally or regionally significant resources, including natural communities. Although natural communities do not at present have legal protection of any kind, CEQA calls for an assessment of whether any such resources would be affected and requires findings of significance if there would be substantial losses. Natural communities listed by CNDDB as sensitive are considered by CDFW to be significant resources and fall under the State CEQA Guidelines for addressing impacts. Local planning documents such as General Plans often identify these resources as well.

California Water Quality Control Act (Porter-Cologne California Water Code Section 13260)

The State Water Resources Control Board and the RWQCB (together "Boards") are the principal state agencies with primary responsibility for the coordination and control of water quality. The Boards regulate activities pursuant to Section 401(a)(1) of the federal CWA as well as the Porter-Cologne Water Quality Control Act (Porter-Cologne) (Water Code Section 13260). Section 401 of the CWA specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State in which the discharge originates or will originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable water at the point where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

In Porter-Cologne, the Legislature declared that the "State must be prepared to exercise its full power and jurisdiction to protect the quality of the waters in the State from degradation..." (California Water Code Section 13000). Porter-Cologne grants the Boards the authority to implement and enforce the water quality laws, regulations, policies and plans to protect the groundwater and surface waters of the State. It is important to note that enforcement of the State's water quality requirements is not solely the purview of the Boards and their staff. Other agencies (e.g., CDFW) have the ability to enforce certain water quality provisions in state law.

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (procedures), adopted by the State Water Resources Control Board on April 2, 2019, became effective May 28, 2020. The Procedures include a definition for wetland waters of the state that include (1) all wetland waters of the U.S.; and (2) aquatic resources that meet both the soils and hydrology criteria for wetland waters of the U.S. but lack vegetation.

Native Plant Protection Act (CFG Code Sections 1900 through 1913)

The California's Native Plant Protection Act requires all state agencies to use their authority to carry out programs to conserve endangered and rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of CDFW at least 10 days in advance of any change in land use. This allows CDFW to salvage listed plant species that would otherwise be destroyed. The project operator is required to conduct botanical inventories and consult with CDFW during project planning to comply with the provisions of this act and sections of CEQA that apply to rare or endangered plants.

3.3 Regional or Local

Unincorporated Kern County

Kern County General Plan

The Kern County General Plan identifies the federal, State, and local statutes, ordinances, or policies that govern the conservation of biological resources that must be considered by Kern County during the decision-making process for any project that could affect biological resources.

The Land Use, Open Space, and Conservation Element of the Kern County General Plan states that the element provides for a variety of land uses for future economic growth while also ensuring the conservation of the County's agricultural, natural, and resource attributes. Section 1.10, General Provisions, provides goals, policies, and implementation measures that apply to all types of discretionary projects.

Chapter 1. Land Use, Open Space, and Conservation Element

General Goal 1. Ensure that the County can accommodate anticipated future growth and development while maintaining a safe and healthful environment and a prosperous economy by preserving valuable natural resources, guiding development away from hazardous areas, and assuring the provision of adequate public services.

1.10.5 Threatened and Endangered Species

Policies

Policy 27: Threatened or endangered plant and wildlife species should be protected in accordance with state and federal laws.

Policy 28: The County should work closely with state and federal agencies to assure that discretionary projects avoid or minimize impacts on fish, wildlife, and botanical resources.

Policy 29: The County will seek cooperative efforts with local, state, and federal agencies to protect listed threatened and endangered plant and wildlife species through the use of conservation plans and other methods promoting management and conservation of habitat lands.

Policy 30: The County will promote public awareness of endangered species laws to help educate property owners and the development community of local, State, and federal programs concerning endangered species conservation issues.

Policy 31: Under the provisions of CEQA, the County, as lead agency, will solicit comments from the CDFG and the USFWS when an environmental document (Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report) is prepared.

Policy 32: Riparian areas will be managed in accordance with the USACE and the CDFG rules and regulations to enhance the drainage, flood control, biological, recreational, and other beneficial uses while acknowledging existing land use patterns.

Implementation Measures

Measure Q: Discretionary projects shall consider effects to biological resources as required by the CEQA.

Measure R: Consult and consider the comments from responsible and trustee wildlife agencies when reviewing a discretionary project subject to the CEQA.

Measure S: Pursue the development and implementation of conservation programs with State and federal wildlife agencies for property owners desiring streamlined endangered species mitigation programs.

Kern County - CEQA

Kern County requires the development of a Joshua Tree Impact Plan or Joshua Tree Preservation Plan for developments that have the potential to impact the Joshua Trees. Plans shall include a comprehensive inventory of all Joshua tees within the Project Site, an impact analysis, avoidance and preservation measures, and mitigation measures including relocation. Additionally, Kern County requires a Transportation Plan when relocation of Joshua trees is proposed.

CHAPTER 4
Existing Conditions

The primary land cover within the BSA is non-native grassland; however, there are areas within the BSA that contain native vegetation communities, and that provide suitable habitat for special-status plant and wildlife species. Existing conditions in this section are discussed for the entirety of the BSA.

4.1 Topography and Watersheds

The BSA is located within Kern County in the Soledad Mountain USGS 7.5-minute topographic quadrangle map; at an elevation of ranging roughly between 2,545 feet to 2,560 feet above mean sea level. The BSA is within the western Mojave Desert. Land use surrounding the BSA and the surrounding region primarily consists of agriculture and military land uses with a mix of natural and commercial land uses. The BSA is within a basin that drains south into Rodgers Dry Lake and is isolated from the adjacent Mojave River Watershed.

4.2 Soils

The soils within the BSA show evidence of past disturbances related primarily to agricultural development. A majority of the soils in the BSA have been grubbed of vegetation with the exception of sporadically occurring western Joshua trees. Based in the most recent soil survey (NRCS 2021) the BSA contains three mapped soil types:

- Cajon loamy sand, 0 to 5 percent slopes
- DeStazo sandy loam, 0 to 2 percent slopes
- Garlock loamy sand. 2 to 9 percent slopes

The Cajon, DeStazo, and Garlock series consist of well to somewhat excessively drained soils formed in the recent alluvium (USDA 2021). In an undeveloped state, natural vegetation typically found on the types of soils include ephemeral grasses and forbs, and a sparse cover of bursage, creosote bush, saltbush, and other desert shrubs and weeds. None of these soils are considered hydric.

4.3 Natural Communities and Land Cover Types

The following discussion includes natural communities and land uses observed within or are immediately adjacent to the BSA (**Figure 3,** *Vegetation Communities and Land Cover Types*). Representative photographs were taken during the field surveys and are included in **Appendix A**.

Based on the field reconnaissance, a total of five natural communities and land uses were determined to be present within the project site, depicted below in Figure 3. Acreages for natural communities observed are shown in **Table 1,** *Natural Communities and Land Cover Types within the Project Site***.**

TABLE 1
NATURAL COMMUNITIES AND LAND COVER TYPES WITHIN THE PROJECT SITE

Natural Community/Land Cover Type	Total (acres)
Terrestrial	
Allscale Scrub (*Atriplex polycarpa* Shrubland Alliance)	16.78
Creosote Bush Scrub (*Larrea tridentata* Shrubland Alliance)	14.40
Developed/Disturbed Land Cover Types	
Disturbed" Creosote Bush Scrub (*Larrea tridentata* Shrubland Alliance)	6.01
Red brome or Mediterranean grass grasslands (*Bromus rubens – Schismus* (*arabicus, barbatus*) Herbaceous Semi-Natural Alliance)	131.46
Disturbed/Developed	5.15
TOTAL	**173.80**

Allscale Scrub (*Atriplex polycarpa* Shrubland Alliance)

Allscale scrub occurs in small patches throughout the northern and southern portions of the project site, as well as, along its outer boundaries, where past disturbance has been less. This community is characterized by a sparse sub-shrub layer dominated by allscale (*Atriplex polycarpa*), interspersed with various other sub-shrub species that include shadescale (*Atriplex confertifolia*), sweetbush (*Bebbia juncea*), Nevada ephedra (*Ephedra nevadensis*), Cooper's goldenbush (*Ericameria cooperi*), Mojave rabbitbrush (*Ericameria paniculata*), winter fat (*Krascheninnikovia lanata*) and Mojave cottonthorn (*Tetradymia stenolepis*); and to a lesser extent with western Joshua trees. A dense herbaceous layer is present, as well, and consists of various grasses and forbs that include fiddleneck (*Amsinckia* species), foxtail brome (*Bromus rubens*), Russian thistle (*Salsola tragus*), Mediterranean grass (*Schismus* species) and desert needlegrass (*Stipa speciosa*). This land cover type comprises 16.78 acres of the Project Site.

SOURCE: ESA, 2022

Mojave Mills Project

Figure 3
Vegetation Communities and Land Cover Types

ESA

Creosote Bush Scrub (*Larrea tridentata* Shrubland Alliance)

Creosote bush scrub occurs along the western portion of the project site. This community is characterized by a sparse shrub/sub-shrub layer with a co-dominance of allscale and creosote bush (*Larrea tridentata*), and as with the allscale scrub, is interspersed with various other sub-shrubs that include Cooper's goldenbush, Mojave rabbitbrush, Mojave cottonthorn, Nevada ephedra, shadescale, sweet bush and winter fat; and to a lesser extent with western Joshua trees. Again, similar to the allscale scrub, the dense herbaceous layer consists of various grasses and forbs that include desert needlegrass, fiddleneck, foxtail brome, Mediterranean grass and Russian thistle. This land cover type comprises 14.40 acres of the Project Site.

"Disturbed" Creosote Bush Scrub (*Larrea tridentata* Shrubland Alliance)

"Disturbed" creosote bush scrub also occurs along the western portion of the project site where past disturbances have occurred. This community is similar in character to its undisturbed counterpart; however, has been altered as a result of recent grubbing activities. The grubbing activities have resulted in the near complete removal of the shrub/herbaceous cover; however, the creosote bush and western Joshua trees remain. This land cover type comprises 6.01 acres of the Project Site.

Red brome or Mediterranean grass grasslands (*Bromus rubens – Schismus* (*arabicus*, *barbatus*) Herbaceous Semi-Natural Alliance)

Red brome or Mediterranean grass grasslands occur throughout the central portion of the Project Site. As with the adjacent scrub communities, this community appears to have been disturbed as the result of recent, as well as, historic grubbing activities. This community consists of a dense, low-growing herbaceous layer dominated by Mediterranean grass and red brome, interspersed with various other forb species that include redstem filaree (*Erodium cicutarium*), Russian thistle and milkvetch (*Astragalus* species). This land cover type comprises the majority of the Project Site at 131.46 acres.

Disturbed/Developed

A small area within the north-central portion of the site, has been developed and is largely devoid of vegetation. This includes an existing commercial facility and associated infrastructure. The area immediately surrounding the facility; however, supports limited, weedy growth, dominated by non-native species such as red brome and Russian thistle. This land cover type comprises 5.15 acres of the Project Site.

4.4 General Plant and Wildlife Species

The BSA and surrounding areas contain suitable habitat for common wildlife species typically found throughout disturbed desert shrub vegetation types. Common avian species detected or observed during the biological reconnaissance include cactus wren (*Campylorhynchus*

brunneicapillus), common raven (*Corvus corax*), horned lark (*Eremophila alpestris*), house finch (*Haemorhous mexicanus*), barn swallow (*Hirundo rustica*), lesser goldfinch (*Spinus psaltria*), and European starling (*Sturnus vulgaris*). Common mammal species observed consisted of black-tailed jackrabbit (*Lepus californicus*) and desert cottontail (*Sylvilagus audubonii*). A comprehensive list of all plant and wildlife species observed is provided in **Appendix D**, *Floral and Faunal Compendium*.

4.5 Sensitive Biological Resources

Special-Status Plants

Special-status plants are defined as those plants that, because of their recognized rarity or vulnerability to various causes of habitat loss or population decline, are recognized by federal, state, or other agencies as under threat from human-associated developments. Some of these species receive specific protection that is defined by federal or state endangered species legislation. Others have been designated as special-status on the basis of adopted policies and expertise of state resource agencies or organizations with acknowledged expertise, or policies adopted by local governmental agencies such as counties, cities, and special districts to meet local conservation objectives. Special-status plants are defined as follows:

- Plants that are listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or the CESA
- Plants that meet the definitions of rare or endangered under State CEQA Guidelines Section 15380
- Plants covered under an adopted Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP)
- Plants considered by the CNPS to be rare, threatened, or endangered (California Rare Plant Rank [CRPR] 1A, 1B, 2A and 2B plants) in California
- Plants listed as rare under the California Native Plant Protection Act (Fish and Game Code 1900 et seq.)

The potential for special-status plant species to occur within the BSA is based on on-site vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences and geographic ranges. A review of the CNDDB (CDFW 2022a) and the CNPS Inventory of Rare and Endangered Plants (CNPS 2022) revealed that many special-status plant species have been recorded within the USGS quadrangle search area. However, based on the criteria listed below, it has been determined that many of these do not have the potential to occur because they lack necessary habitat requirements. They are listed in **Appendix E,** *Special-Status Plant Species – Potential to Occur*, and have been omitted from further discussion in this report.

A total of 13 special-status plants were determined to have varying levels of potential to occur however, nine plant species are associated with habitats and soils that do not occur in the BSA, or are outside the range of the species, including Tehachapi monardella (*Monardella linoides* ssp. *oblonga*); thus, these species are not discussed further. The remaining four plant species are discussed here in more general terms for the region, and are assessed for their potential to occur

within the BSA. There is one special-status plant species observed within the project site: western Joshua tree, a California candidate threatened species. The remaining three species have a low potential to occur within the BSA: alkali mariposa lily (*Calochortus striatus*), recurved larkspur (*Delphinium recurvatum*), and pale-yellow layia (*Layia heterotricha*). No focused rare plant surveys were conducted at this time. A detailed description of each of these plants and their potential to occur within the BSA is provided in **Table 2**. The criteria for potential to occur include:

- **Present:** Species was observed or detected during Project-specific biological surveys.
- **High Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present on the Project site. These species are generally common and/or widespread in the Project area and vicinity.
- **Moderate Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present within the Project site. These species are generally less common and/or widespread than species considered to have "high" potential to occur.
- **Low Potential:** Species identified in the literature search or known to occur in the region, but the habitat on site is of low or marginal quality and/or the Project site occurs outside the species known geographic or elevational range. Distance to nearest known occurrence and the age of last reported local occurrence are also considered. Limited to no suitable habitat present within the project site.
- **Not Expected:** Species identified in the literature search or known to occur in the region, but the habitat on site is not suitable for the species.

No special-status plant species other than western Joshua tree were observed within the BSA during 2021 or 2022 surveys.

TABLE 2
SPECIAL-STATUS PLANT SPECIES

Common Name ***Scientific Name***	**Flowering Period**	**Sensitivity Status**	**Preferred Habitat/Known Elevational Range**	**Presence/Potential to Occur within Biological Study Area**
Dicots				
Recurved larkspur *Delphinium recurvatum*	March-June	--/--/1B.2	Chenopod scrub, Cismontane woodland, Valley and foothill grassland. On alkaline soils; often in valley saltbush or valley chenopod scrub. Elevation range: 10-2,590 feet. (CNPS 2022).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There is two CNDDB records within one mile of the BSA (CNDDB 2022).
Pale-yellow layia *Layia heterotricha*	March-June	--/--/1B.1	Cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Elevation range: 985-5,595 feet. (CNPS 2022).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Monocots				

Common Name *Scientific Name*	Flowering Period	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within Biological Study Area
Alkali mariposa lily *Calochortus striatus*	April-June	--/--/1B.2	Occurs usually in wetlands, occasionally in non-wetlands. Meadows in shadscale scrub, chaparral, and wetland-riparian. Elevation range: 230–5,235 feet (CNPS 2022).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are four CNDDB records of this species within 5 miles of the BSA (CNDDB 2022). One record is located within the northwest corner of the BSA dated 1995.
Western Joshua tree *Yucca brevifolia*	March-June	--/SCT/--	Joshua tree woodlands. Elevation range: 1,300 – 6,560 feet (CNPS 2022).	**Present.** This species was observed within the project site.

SOURCE: Calflora, CNDDB, and CNPS 2022

Recurved Larkspur

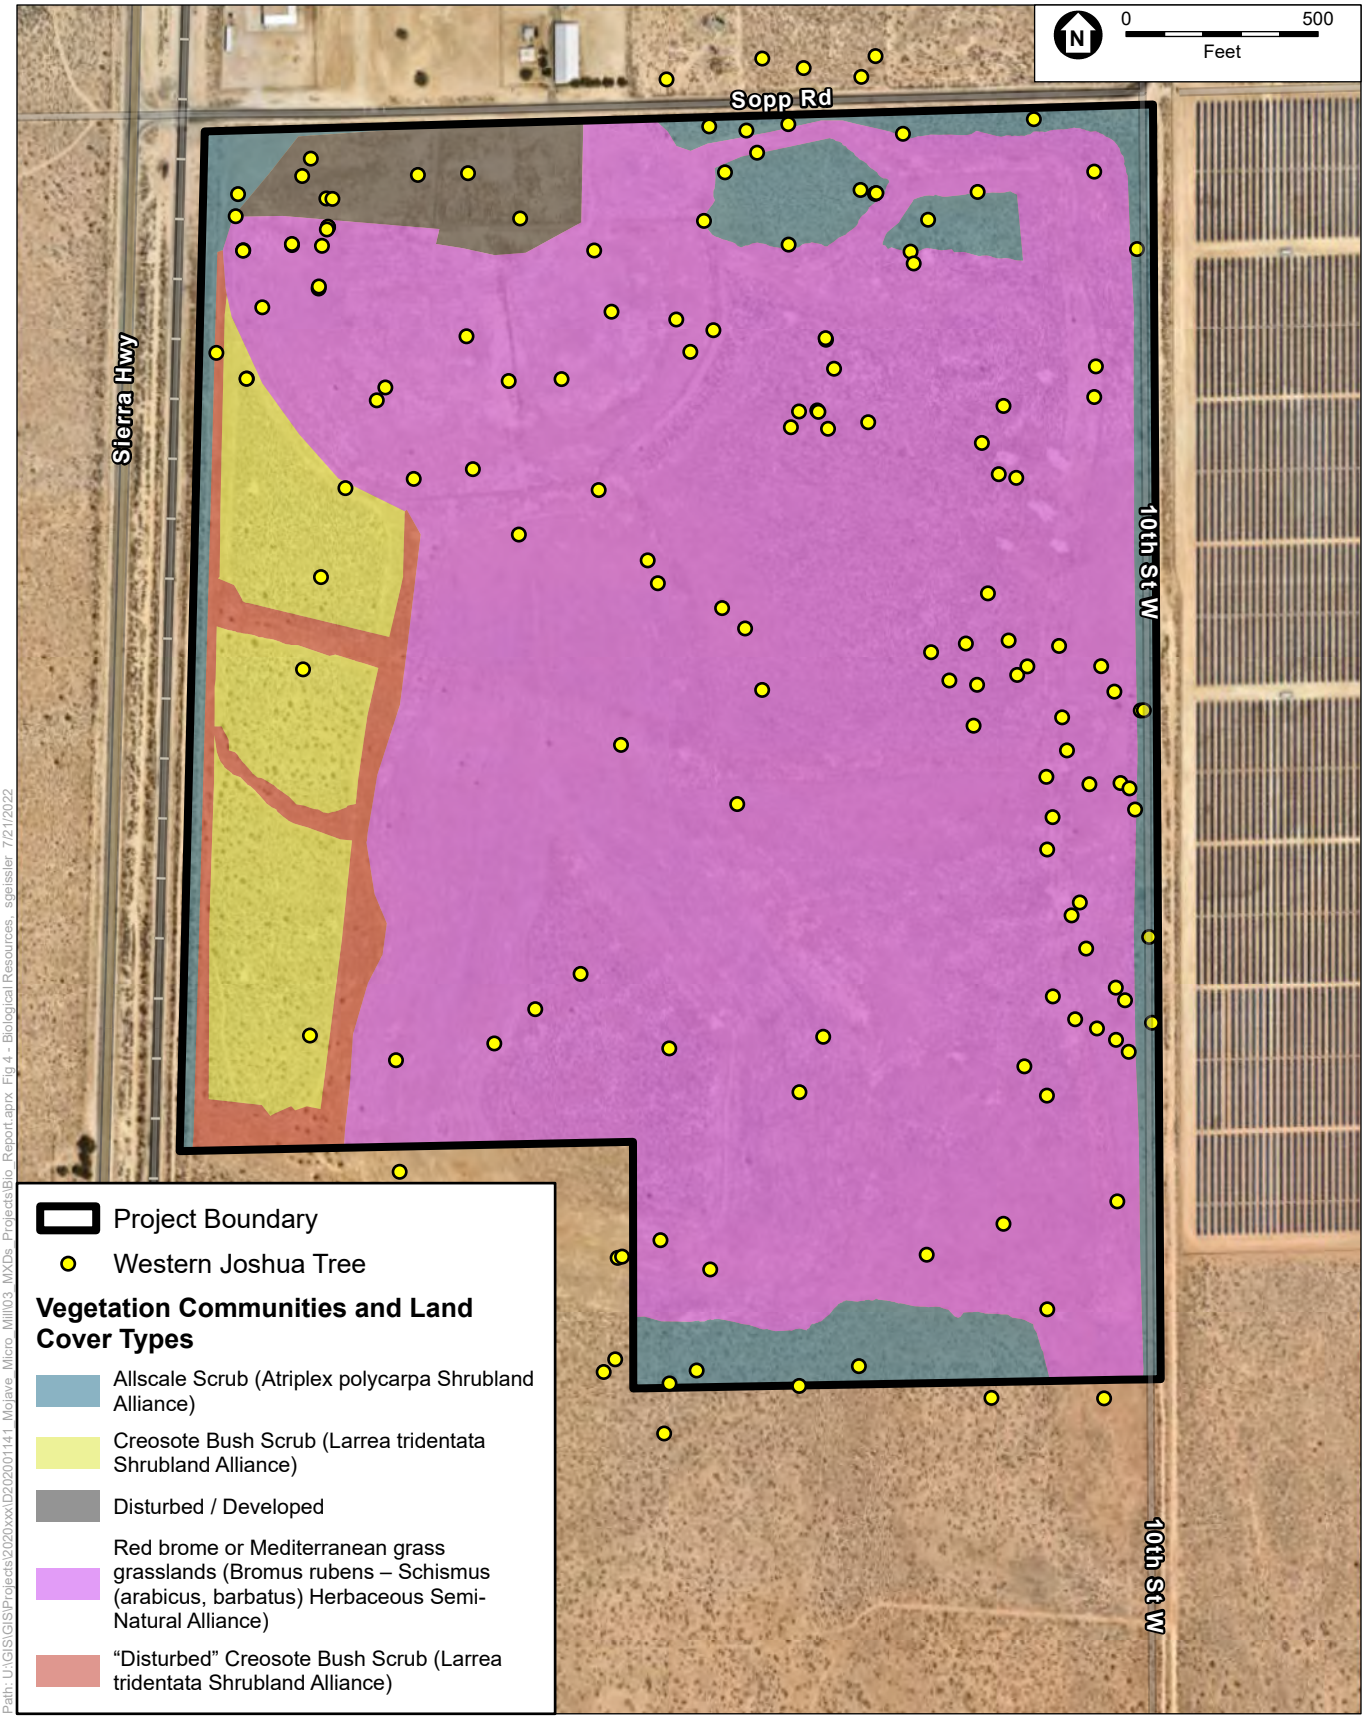
Recurved larkspur is a CRPR 1B.2 species that has a low potential to occur within the BSA. Limited suitable chenopod habitat exists within the BSA and what habitat is present is highly disturbed. There is two CNDDB records within one mile of the BSA (CNDDB 2022a). This species was not detected during the biological resources reconnaissance or the western Joshua tree surveys. These field visits were conducted within the flowering period for the species in both 2021 and 2022.

Pale-Yellow Layia

Pale-yellow layia is a CRPR 1B.1 species that has a low potential to occur within the BSA. Limited suitable chenopod habitat exists within the BSA and what habitat is present is highly disturbed. There are no CNDDB records of this species within five miles of the BSA (CNDDB 2022a). This species was not detected during the biological resources reconnaissance or the western Joshua tree surveys. These field visits were conducted within the flowering period for the species in both 2021 and 2022.

Alkali Mariposa Lily

Alkali mariposa lily is a CRPR 1B.2 species and has a low potential to occur within the BSA. Limited suitable chenopod habitat exists within the BSA and what habitat is present is highly disturbed. There are four CNDDB records of this species within five miles of the BSA (CNDDB 2022a). One record is located within the northwest corner of the BSA dated 1995. This species was not detected during the biological resources reconnaissance or the western Joshua tree surveys. These field visits were conducted within the flowering period for the species in both 2021 and 2022 and individuals would have been easily observed.



Western Joshua Tree

Western Joshua tree is a California candidate species for listing under the CESA that occurs within the Project Site. A focused tree inventory for this species was conducted in 2022, recording a total of 136 western Joshua trees within the Project Site (see **Figure 4,** *Biological Resources*). An additional 16 western Joshua trees were recorded within a 290-foot buffer around the Project Site. The trees are sparsely disturbed throughout the Project Site and do not constitute a Joshua tree woodland habitat. The focused western Joshua tree survey was conducted during the late spring with the highest potential of observing the trees in fruit. The standalone Western Joshua Tree Inventory, Preservation, and Relocation Plan (Plan) is presented in **Appendix B.**

Special-Status Wildlife

Special-status wildlife consists of those animals that, because of their recognized rarity or vulnerability to various forms of habitat loss or population decline, are considered by federal, state, or other agencies to be under threat from human-associated developments. Some of these species receive specific protection that is defined by federal or state endangered species legislation and others have been designated as special-status on the basis of adopted local policies (i.e., city and county) or the educated opinion of respected resource interest groups (e.g., Western Bat Working Group). Special-status wildlife is defined as follows:

- Wildlife listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or the CESA.
- Wildlife that meet the definitions of rare or endangered under California Environmental Quality Act (CEQA) Guidelines Section 15380.
- Wildlife covered under an adopted NCCP/HCP.
- Wildlife designated by CDFW as species of special concern, included on a Watch List, or are considered Special Animals.
- Wildlife “fully protected” in California (Fish and Game Code Sections 3511, 4700, and 5050).
- Bird species protected by the Migratory Bird Treaty Act (MBTA).
- Bat species considered priority by the Western Bat Working Group (WBWG).

SOURCE: ESA, 2022

Mojave Mills Project

Figure 4
Biological Resources

ESA

The potential for special-status wildlife species to occur within the BSA is based on on-site vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences and geographic ranges. A review of the CNDDB (CDFW 2022a) revealed that many special-status wildlife species have been recorded within USGS quadrangle search area. However, based on the criteria listed below, it has been determined that many of these wildlife species do not have the potential to occur because they lacked the necessary habitat requirements or do not have a range that overlaps within the BSA. A total of eight wildlife species have been recorded in the vicinity; however, five of these wildlife species are associated with habitats and soils that do not occur within the BSA, or are outside the range of the species and are not discussed further. They are listed in **Appendix F,** *Special-Status Wildlife Species – Potential to Occur*, and have been omitted from further discussion in this report. The remaining three wildlife species, each with a low potential to occur, are discussed here in more general terms for the region, and are assessed for their potential to occur within the BSA. Because of the lack of a perennial water source and habitat types present, no fish or amphibian species are expected in the BSA. The potential for these special-status wildlife species to occur within the BSA is based on the criteria described below:

- **Present:** The species was observed within the study area during the site assessment or has been documented within or immediately adjacent to the BSA during recent surveys (with 2 years).
- **High Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present on the BSA. These species are generally common and/or widespread in the BSA and vicinity.
- **Moderate Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present within the BSA. These species are generally less common and/or widespread than species considered to have "high" potential to occur.
- **Low Potential:** Species identified in the literature search or known to occur in the region, but the habitat on site is of low or marginal quality and/or the BSA occurs outside the species known geographic or elevational range. Distance to nearest known occurrence and the age of last reported local occurrence are also considered.

Of the three species presented below in **Table 3**, *Special-Status Wildlife Species*, none were detected within the BSA. Additionally, the three species, desert tortoise (*Gopherus agassizii*), burrowing owl (*Athene cunicularia*), and Mohave ground squirrel, have a low potential to occur within the BSA.

TABLE 3
SPECIAL-STATUS WILDLIFE SPECIES

Common Name ***Scientific Name***	**Sensitivity Status**	**Preferred Habitat/Known Elevational Range**	**Presence/Potential to Occur within Biological Study Area**
Reptiles			
Desert tortoise *Gopherus agassizii*	FT/ST	Inhabits semi-arid grasslands, gravelly desert washes, canyon bottoms and rocky hillsides within the Mojave Desert.	**Low.** Limited suitable habitat present within the BSA. No sign or burrows observed during 18 field visits. There are two CNDDB records within five miles of the BSA with the most recent in 2012.

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within Biological Study Area
Birds			
Burrowing owl *Athene cunicularia*	BCC/SSC	Inhabits coastal prairie, coastal scrub, Great Basin scrub, Mojavean desert scrub, Sonoran desert scrub, annual and perennial grasslands, bare ground, and disturbed habitats characterized by low-growing vegetation. A subterranean nester dependent upon burrowing mammals, particularly the California ground squirrel.	**Low.** Limited suitable foraging habitat located within the BSA. There are three CNDDB records located within five miles of the BSA with the most recent in 2007. There are no CNDDB records located within one mile of the BSA.
Mammals			
Mohave ground squirrel *Xerospermophilus mohavensis*	--/ST	Known to occur within Joshua tree woodlands, creosote scrub, saltbush scrub and Mojave mixed woody scrub vegetation. .	**Low.** Limited suitable habitat present within the BSA. No sign or burrows observed during field visits. CDFW protocol survey were conducted in 2022 and negative for the species. There is a single CNDDB record dated 1973 located within five miles of the BSA.

WL = Watch List (CDFW)
CNDDB Element Rankings
S1 = Less than 6 element occurrences (EOs) or 1,000 individuals or less than 2,000 acres (S1.1 very threatened, S1.2 threatened, S1.3 no current threats known)
S2 = 6-20 EOs or 1,000-3,000 individuals or 2,000-10,000 acres (S2.1 very threatened, S2.2 threatened, S2.3 no current threats known)
S3 = 21-100 EOs or 3,000-10,000 individuals or 10,000-50,000 acres (S3.1 very threatened, S3.2 threatened, S3.3 no current threats known)
S4 = Apparently secure; this rank is clearly lower than S3 but factors exist to cause some concerns; i.e., there is some threat, or somewhat narrow habitat.
? = indicates some uncertainty.

SOURCE: CNDDB 2022

Desert Tortoise

Desert tortoise is a federally and state listed Endangered species, with an S2S3 State Conservation Rank. The species occurs in semi-arid grasslands, gravelly desert washes, canyon bottoms and rocky hillsides within the Mojave Desert. Limited suitable habitat is present within the BSA. No sign or burrows were observed during 18 field visits, which includes the Mohave ground squirrel trapping effort. There are two CNDDB records within five miles of the BSA with the most recent recorded in 2012.

Burrowing Owl

Burrowing owl is a State species of special concern, with an S3 State Conservation Rank. Commonly associated vegetation for this species includes coastal prairie, coastal scrub, Great Basin scrub, Mojavean desert scrub, Sonoran desert scrub, annual and perennial grasslands, bare ground, and disturbed habitats characterized by low-growing vegetation. It is a subterranean nesting species, dependent upon burrowing mammals, particularly the California ground squirrel. No burrows were observed within the BSA. Limited suitable foraging habitat is located within the

BSA. There are three CNDDB records within five miles of the BSA with the most recent recorded in 2007. There are no CNDDB records located within one mile of the BSA (CNDDB 2022a).

Mohave Ground Squirrel

Mohave ground squirrel is state listed as Threatened, with an S2S3 State Conservation Rank. The species is known to occur within Joshua tree woodlands, creosote scrub, saltbush scrub and Mojave mixed woody scrub vegetation. Limited suitable habitat is present within the BSA. No sign or burrows were observed during 18 field visits, including trapping surveys, during the focused protocol surveys. CDFW protocol survey was conducted in 2022 and was negative for the species. There is a single CNDDB record dated 1973 located within five miles of the BSA (CNDDB 2022a). The standalone Mohave Ground Squirrel Report is presented in **Appendix C**.

Sensitive Natural Communities

Sensitive natural communities and habitats are defined by the CDFW as those natural communities that have a reduced range and/or are imperiled as a result of residential and commercial development, agriculture, energy production and mining, or an influx of invasive and other problematic species. Vegetation communities are evaluated using VegCAMP Heritage Methodology, which is based on the knowledge of range and distribution of a specific vegetation type and the proportion of occurrences that are of good ecological integrity. Evaluation is done at both global level (natural range within and outside of California [G]) and subnational level (state level for California [S]), each ranked from 1 (“critically imperiled,” or very rare and threatened) to 5 (demonstrably secure). Natural communities and habitats with state ranks of S1 through S3 are considered sensitive natural communities and require review when evaluating environmental impacts (CDFW 2022b).

According to the CNDDB, there are no sensitive natural communities located within the BSA. The field surveys also observed no sensitive natural communities.

Critical Habitat

Under FESA, to the extent feasible, the USFWS and NMFS are required to designate critical habitat for endangered and threatened species. Critical habitat is defined as areas of land, water, and air space containing the physical and biological features essential for the survival and recovery of endangered and threatened species. Designated critical habitat includes sites for breeding and rearing, movement or migration, feeding, roosting, cover, and shelter. Designated critical habitats require special management and protection of existing resources, including water quality and quantity, host animals and plants, food availability, pollinators, sunlight, and specific soil types. Critical habitat delineates all suitable habitat, occupied or not, essential to the survival and recovery of the species.

According to the CNDDB, and U.S. Fish and Wildlife Service (USFWS) critical habitat maps, there is no critical habitat mapped within the BSA.

Areas of Critical Environmental Concern

Areas of Critical Environmental Concern (ACEC) are designated areas by the Bureau of Land Management (BLM) where special management is provided for fish and wildlife or other natural resources. The Project is not located within or adjacent to any ACECs.

4.6 Aquatic Resources

A formal jurisdictional waters delineation was not conducted. No NWI features are mapped within 100-feet of the project site. Overall, no waters under the jurisdiction of United States Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB) and/or CDFW were identified during the biological field assessment.

4.7 Wildlife Movement

Effective wildlife movement is essential for dispersal, genetic exchange, migration, foraging, and breeding. Migration of wildlife either seasonally or in response to resource availability is vital for survival in virtually all ecosystems. Migration corridors are linkages between large open space areas. Top tier predators, mezzo predators and prey species alike utilize migration corridors for travel and refuge between open space areas, as well as for wintering and breeding grounds. Some migration corridors are created naturally by topography and have been used by wildlife for hundreds or thousands of years, and some have been constructed by humans to mitigate for the loss of existing natural corridors, such as bridge crossings, underpasses and culverts. Natural features commonly utilized for local wildlife movement and migration include creeks, rivers, canyons and valleys, because these low-lying riparian areas are generally flat and include an over story of vegetation that provides shelter from predators. Functional wildlife movement corridors are especially important in highly fragmented habitat, such as urbanized areas. Wildlife movement corridors are generally used by terrestrial animals, although they may also be important for aquatic species and avian dispersal.

The BSA is primarily located within the western Mojave Desert that is surrounded by small residential developments, small commercial developments, a solar field, and large fragmented undeveloped areas. The subject parcels are otherwise surrounded by mostly undeveloped land with sparse development, thus allowing for the local movement of wildlife species without obstruction. These undeveloped areas are contiguous west, south, east, and north of the Project. The Project Site does not function as a wildlife regional corridor between the two larger stands of wildlife habitat. Overall, the areas surrounding the Project create a large open corridor for wildlife movement with the exception of the solar field to the east.

CHAPTER 5
Project Impacts and Avoidance, Minimization, and Mitigation

An analysis of potential Project impacts to biological resources and corresponding recommendations for avoidance, minimization, and mitigation are discussed in this section. It should be noted that because the overall Project development footprint is preliminary at this time, impacts may need to be confirmed upon completion of a more finalized Project design. Potential impacts and corresponding avoidance, minimization, and mitigation based on the current proposed Project development footprint are discussed within this chapter.

5.1 Approach to the Analysis

Generally, impacts may be defined as direct or indirect, permanent or temporary. Definitions of these impact types are provided below.

- **Direct Impacts:** Any alteration, disturbance, or destruction of biological resources that would result from project-related activities is considered a direct impact. Examples include loss of individual species and/or their associated plant communities, diversion of surface water flows, and encroachment into wetlands. Under the FESA, direct impacts are defined as the immediate impacts of a project on a species or its habitat, including construction noise disturbance, sedimentation, or habitat loss.
- **Indirect Impacts:** As a result of project-related activities, biological resources may also be affected in an indirect manner. Under the FESA, indirect impacts are defined as those impacts that are caused by, or would result from, a proposed project but occur later in time and are reasonably certain to occur [50 C.F.R. Section 402-02]. An example of indirect impacts may include irrigation runoff from a developed area into surrounding natural vegetation. Indirect impacts could also include increased wildfire frequency as a result of power line failures.
- **Temporary Impacts:** Any impacts to biological resources that are considered reversible can be viewed as temporary. Examples include the generation of fugitive dust during construction activities and temporary access or staging areas that will be returned to pre-project conditions.
- **Permanent Impacts:** All impacts that result in the irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area with native vegetation, such that the native vegetation is permanent removed and replaced with a developed structure.

5.2 Thresholds of Significance

Based on 2022 State CEQA Guidelines Appendix G, the Project would result in a significant impact to biological resources if it would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW Game or USFWS.
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.
3. Have a substantial adverse effect on state or federally protected wetlands (including but not limited to marsh, vernal pool, coastal) through direct removal, filling, hydrological interruption, or other means.
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

5.3 Project Design Features

PDF-BIO-1: Nesting Birds. If construction and vegetation removal is proposed between February 1 and August 31, a qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors 30 days prior to the start of construction, and then weekly, within 500-feet of the construction limits to determine and map the location and extent of breeding birds that could be affected by the Project. Nesting bird surveys shall be conducted at appropriate nesting times. Weekly surveys will take place with the last survey being conducted no more than 3 days prior to the initiation of clearance/construction work." If Project activities are delayed or suspended for more than 7 days after the last survey, surveys shall be repeated before work can resume.

If an active nest is located, clearing and construction within appropriate buffers as determined by a qualified biological monitor, shall be postponed until the nest is vacated and juveniles have fledged and when there is no evidence of a second attempt at nesting. Due to the disturbed nature of the Project site, 300-feet for raptors and 150-feet for passerine birds could suffice for nesting bird buffers however it will be at the discretion of the qualified biologist. The buffer zone from the nest shall be established in the field with flagging and stakes. The qualified biologist shall retain the ability to increase buffers if needed to protect the nesting birds. Temporary fencing and signage shall be maintained for the duration of the Project. Construction personnel shall be instructed on the sensitivity of the area and be advised not to work, trespass, or engage in activities that would disturb nesting birds near or inside the buffer. On-site construction monitoring may also be required to ensure that no direct or indirect impacts occur to the active

nest. Project activities may encroach into the buffer only at the discretion of the qualified biologist.

5.4 Analysis of Potential Project Impacts

Included within this section is a discussion of potential impacts as relevant to Appendix G of the CEQA guidelines.

Species Impacts

Issue 1: Would the proposed Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS

Special-Status Plants

Western Joshua tree was observed within the Project Site and BSA. No other special-status plant species were observed within the BSA. Three additional special-status plant species were determined to have a low potential to occur within the BSA including: alkali mariposa lily, recurved larkspur, and pale-yellow layia. However, these species were not observed during the 2021 and 2022 field surveys, which occurred during the flowering period for each species.

For determining impacts to the 136 western Joshua tree within the Project Site, CDFW specifications were used (see **Appendix B**). The CDFW defines project impact area (tree protection zone; TPZ) as all areas where there will be permanent and temporary impacts to an individual live western Joshua tree and the area around it as delineated by a radius as measured from a single point at its trunk (CDFW 2020). Therefore, a total of 85 western Joshua trees will be removed as a result of implementation of the preliminary project design. The removal of western Joshua tree as a consequence of Project implementation is a potentially significant impact. A total of three (3) protected western Joshua trees will be encroached. The remaining 64 protected western Joshua trees, inclusive of the 16 offsite western Joshua trees within a 290-foot buffer, will be preserved in place. **Mitigation Measure BIO-1** would require the implementation of the Western Joshua Tree Census, Preservation, and Relocation Plan (see **Appendix B**) and is recommended to reduce the potentially significant impact to less-than-significant.

Special-Status Wildlife

No special-status wildlife species we observed within the BSA. Three special-status wildlife species have a low potential to occur within the BSA, based on the presence of suitable habitat: desert tortoise, burrowing owl, and Mohave ground squirrel. Habitat for these species occurs primarily within the Project Site with various levels of disturbance. Focused protocol surveys for Mohave ground squirrel were negative for presence. Additionally, no sign or potential burrows were observed for desert tortoise or burrowing during 18 site visits of Mohave ground squirrel surveys conducted in 2021 and 2022. Focused surveys for desert tortoise and burrowing owl are not recommended due to poor quality of habitat, no observation of sign, and limited CNDDB records within the project area. **Mitigation Measure BIO-2** is recommended to require pre-construction wildlife surveys within the BSA prior to ground disturbing construction activities.

Surveys will be conducted in suitable habitat within the BSA. If any of these species are present, potential direct or indirect impacts may occur to these species as a result of Project construction. Direct impacts may result n direct mortality of individuals, loss or degradation of habitat (short- or long-term), and introduction or increase in noise during the breeding season. Indirect impacts may occur from adjacent nighttime lighting that may introduce predation, habitat fragmentation/edge effects, introduction of non-natives/predators, and increased human disturbance. Impacts to special-status wildlife species would be less-than-significant with application of Mitigation Measure BIO-2.

Nesting Birds

The proposed Project would be constructed within vegetation areas that can provide suitable nesting habitat for birds protected under the MBTA and CFG Code Section 3500. Potential impacts to nesting birds may occur during the general avian nesting season from February 15 to August 31 for songbirds and January 15 to August 31 for raptors during construction. Impacts may include direct mortality to individuals, nests, or eggs, and loss of nesting habitat (i.e., tree removal). Indirect impacts to active nests may occur due to construction noise and vibration. During construction, nesting birds could be impacted if construction occurs during the nesting bird season. **PDF-BIO-**1 would require pre-construction nesting bird surveys and the implementation of avoidance measures during construction if nests are found to be active within 300 feet of construction activities. With implementation of **PDF-BIO-1**, impacts to nesting birds during construction would be considered less than significant.

Mitigation Measures

BIO-1: Western Joshua Tree Mitigation and Relocation. Prior to the start of construction activities, the Project proponent shall implement the Plan (see **Appendix B**). Implementation of the Plan requires a total of 76 western Joshua trees be relocated onsite. Additionally, nine (9) proposed removal western Joshua trees that do not have relocation potential will be mitigated at a 3:1 replacement ratio for a total of 27 replacement trees. In total, 76 relocation trees and 27 replacement trees will be planted within two receiver sites as shown on **Figure 5** of **Appendix B**. The two onsite receiver mitigation sites contain 6.3 acres of planting space to receive the 76 relocation and 27 replacement tree plantings. The success of the tree mitigation site will be based upon the successful survivorship of the relocated and replaced trees at the end of a five-year monitoring program. Monitoring will continue for five years until the County and CDFW concur the final survival performance standard has been met and monitoring is no longer necessary.

BIO-2: Pre-construction Wildlife Surveys. Prior to the start of construction activities, the Project proponent shall conduct pre-construction wildlife surveys, including for special-status wildlife species such as burrowing owl, desert tortoise, and Mohave ground squirrel, within 100 feet of construction activities. The pre-construction surveys shall be conducted 7 days prior the start of construction activities. If any of these species are present or determined to be within 100 feet of construction areas, construction best management practices (BMPs) and worker environmental awareness program (WEAP) training shall be implemented to avoid potential impacts to these species. BMPs shall include, but not be limited to, exclusion fencing (see **BIO-3**), work areas using temporary silt fencing, and cleaning up all trash and debris daily. Additional avoidance measures may include establishing a buffer around active nests or burrows and on-site monitoring

if individuals of a special-status wildlife species is observed. If present, CDFW and USFWS will be contacted for the potential to relocate listed species to suitable offsite habitat. Any relocation of wildlife will be completed by an appropriately permitted wildlife biologist.

WEAP training will be prepared by a qualified biologist to describe species that could be impacted and summarize the construction BMPs to be implemented. Construction personnel will be instructed to not directly harm any wildlife species on-site by halting activities until the species can move to off-site areas or contact a qualified biologist to move non-listed wildlife species out of harm's way.

BIO-3: Exclusion Fencing: Prior to issuance of grading or building permits, the project site shall be fenced with a temporary exclusion fence to prevent any special-status species that may be using habitat adjacent to the site from entering during construction phase. This exclusion fencing shall be constructed of metal flashing, plastic sheeting, or other materials that will prohibit desert tortoise, Mohave ground squirrel, and other special-status wildlife species from entering the Project Site. The fencing shall be buried a minimum of six inches below grade and extend a minimum of 30 inches above grade. The fencing shall be inspected by a qualified biologist on a daily basis during construction activities to ensure fence integrity. Any needed repairs to the fence shall be performed on the day of their discovery. Fencing shall be installed and maintained during all phases of construction and decommissioning but is only required where construction will occur within 200 feet of adjacent habitat suitable for supporting special-status reptiles, rodents, and mammals. Exclusion fencing shall be removed once construction or decommissioning activities are complete.

i. If any special-status species are found on the site during project construction, operation shall cease in the vicinity of the animal and the animal shall be passively restricted to the area encompassing its observed position on the construction site and its point of entry shall be determined, if possible. The Lead Biologist shall install a temporary exclusion fence around this area. Concurrent with this effort, USFWS and CDFW shall be consulted regarding any additional avoidance, minimization, or mitigation measures that may be necessary. Once the animal is observed leaving the exclusion area, work in the area can resume. A report shall be prepared by the Lead Biologist to document the activities of the animal within the site; all fence construction, modification, and repair efforts; and movements of the animal once outside the exclusion fence. This report shall be submitted to wildlife and resource agency representatives and the Kern County Planning and Community Development Department.

ii. The Lead Biologist or biological monitor will monitor ground-disturbance activities. Work shall only occur during daylight hours. Prior to conducting brushing or grading activities inside the temporarily fenced area, a Lead Biologist or biological monitor under the supervision of a Lead Biologist shall survey the area immediately prior to conducting these activities to ensure that no special-status animals are present.

iii. To prevent inadvertent entrapment of wildlife during construction, all excavated, steep-walled holes or trenches more than two feet deep shall be covered with plywood or similar materials at the close of each working day, or provided with one or more escape ramps constructed of earth fill or wooden planks. Before such

holes or trenches are filled, they shall be thoroughly inspected for trapped animals. If trapped animals are observed, escape ramps or structures shall be installed immediately to allow escape. If listed species are trapped, the USFWS and CDFW shall be contacted, as appropriate, for appropriate action such as relocation outside the project construction area.

iv. All construction pipes, culverts, or similar structures that are stored at a construction site for one or more overnight periods and with a diameter of four inches or more shall be thoroughly inspected for special-status wildlife before the pipe is subsequently buried, capped, or otherwise used or moved in any way. If a special-status animal is discovered inside or beneath a pipe, that section of pipe shall not be moved until the appropriate resource agency has been consulted and the animal is safely located out of harm's way. If necessary, under the direct supervision of the Lead Biologist, the pipe may be moved once to remove it from the path of construction activity until the animal has escaped.

v. Intentional killing or collection of either plant or wildlife species, including listed species, in the project site and surrounding areas shall be prohibited, unless authorized by approved permit or entitlement. The Lead Biologist, wildlife and resource agency representatives and Kern County Planning and Community Development Department shall be notified of any such non-permitted occurrences within 24 hours.

vi. Construction monitoring shall be conducted by either the Lead Biologist or by biological monitors under the Lead Biologist's supervision. The biological monitors shall have experience in monitoring for special-status wildlife.

vii. Initial ground disturbance activities should commence within the interior of the Project, as practicable, to allow for the wildlife escape to outside the active construction area. Working from the center of the project site out to the exclusion fenced areas.

viii. During construction, daily monitoring reports summarizing daily activities shall be prepared by the monitoring biologists. The Lead Biologist shall prepare a summary monitoring report for the wildlife and resource agencies and Kern County Planning and Community Development Department on a monthly basis, documenting the effectiveness and practicality of the protection measures that are in place and making recommendations for modifying the measures to enhance species protection, as needed. The report would also provide information on the overall biological resources-related activities conducted, including the worker awareness training, clearance/pre-activity surveys, monitoring activities, and any observed special-status species, including injuries and fatalities.

Significance Determination

Less than Significant with Mitigation Incorporated

Sensitive Natural Communities

Issue 2: Would the proposed Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the USFWS and CDFW?

No sensitive natural communities or riparian habitat occur within the BSA. Therefore, no potential direct or indirect impacts to riparian habitat or sensitive natural communities are anticipated.

Mitigation Measures:

None Required

Significance Determination:

No Impact

Aquatic Features

Issue 3: Would the proposed Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal) through direct removal, filling, hydrological interruption, or other means?

Based on the results of the field survey habitat assessment and a review of aerial photography (historic and current) and topographic maps, there are no natural drainage features or potentially jurisdictional resources located on or immediately adjacent to the BSA. Additionally, due to unsuitable soils and lack of surface hydrology, no wetlands including federally-protected wetlands occur or have the potential to occur within the proposed Project site. Construction would not result in any impacts (including alteration) to State or federally protected waters or wetlands, or to any jurisdictional features that would require mitigation and permitting from USACE, CDFW, or RWQCB. No impact would occur.

Mitigation Measures:

None Required

Significance Determination:

No Impact

Wildlife Corridors

Issue 4: Would the proposed Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The majority of the project area is previously disturbed from past agricultural use. The Project Site is not a designated wildlife movement corridor and does not function as a wildlife movement corridor within the region. Large areas of open space exist outside of the BSA in all directions,

The Project Site does not serve as a lone corridor between fragmented portions of open space. The site is physically confined by Edwards AFB security fencing to the east, railroad tracks and Sierra Highway to the west, and Sopp Road to the north. Areas outside of the BSA are natural open space and contains sparse native habitat. Additionally, the site contains western Joshua trees that have the potential to support nesting avian species. Implementation of **Mitigation Measures BIO-2 and BIO-3 and PDF-BIO-1** would mitigate potential impacts to these sensitive biological resources. With implementation of these measures, impacts would be below a level of significance.

Mitigation Measures:

Implementation of **Mitigation Measures BIO-2, BIO-3, and PDF-BIO-1**.

Significance Determination:

Less than Significant with Mitigation Incorporated.

Local Policies

Issue 5: Would the proposed Project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The Project Site is located within the Kern County, which requires the development of a Joshua Tree Impact Plan or Joshua Tree Preservation Plan for developments that have the potential to impact the western Joshua trees. Additionally, Kern County requires a Transportation Plan when relocation of western Joshua trees is proposed. **Mitigation Measure BIO-1** would require that Project proponent to prepare and implement a Joshua Tree Preservation and Relocation Plan (see **Appendix E**). With implementation of **Mitigation Measure BIO-1,** impacts to western Joshua trees would be reduced to less than significant.

Mitigation Measures:

Implementation of **Mitigation Measure BIO-1**.

Significance Determination:

Less than Significant with Mitigation Incorporated.

Habitat Conservation Plan

Issue 6: Would the proposed Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The proposed Project is not located within the boundaries of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan. No impact would occur from construction or operational use.

Mitigation Measures:

None Required.

Significance Determination:

No Impact.

MOJAVE MICRO MILL PROJECT

Western Joshua Tree Census, Preservation, and Relocation Plan

1.0 Introduction

This Western Joshua Tree Census, Preservation, and Relocation Plan (Plan) was prepared for the Pacific Steel Group (PSG) in support of the Mojave Micro Mill Project (Project). The purpose of the Plan is to census every western Joshua tree (*Yucca brevifolia*) located within the Project Site, to analyze the potential impacts to western Joshua tree by Project implementation, and to provide recommendations for relocation and other mitigation measures. The Project Site is located in Kern County, which requires the development of a Joshua Tree Preservation and Transportation Plan. Additionally, the western Joshua tree was designated a candidate state threatened species on October 9, 2020 by the California Department of Fish and Wildlife (CDFW). The candidate status of this species is currently under review during the development of this Plan. The CDFW provided Environmental Science Associates (ESA) a recommended western Joshua tree survey protocol via email on March 17, 2022 and this is presented in the Section 2.0 (CDFW 2022). This Plan is intended to inform and guide PSG on the long-term management and mitigation of western Joshua tree resources present within the Project Site.

1.1 Project Location and Setting

The Project Site is located in unincorporated southeastern Kern County, in the Mojave Desert of California as shown in **Figure 1**, Regional Location Map, and **Figure 2**, Local Vicinity Map. The project site is located approximately 57 miles southeast of the City of Bakersfield, approximately 4 miles north of the community of Rosamond and 8 miles south of Mojave. The micro mill facility would be developed on two parcels (Assessor's Parcel Number [APN] 431-010-02 and 431-030-02) (project site) totaling approximately 174 acres located at 860 Sopp Road, Mojave, California, along Sierra Highway in Kern County.

2.0 Methodology

Environmental Science Associates (ESA) biologist Ryan Gilmore who is an International Society of Arboriculture (ISA) Board Certified Master Arborist (WE-9009BM) and an American Society of Consulting Arborists (ASCA) Registered Consulting Arborist (RCA #769) conducted a western Joshua tree census inventory. The biologist is familiar with the species and utilized the California Department of Fish and Wildlife (CDFW) protocol as provided via consultation (CDFW 2022a).

Specifically, the CDFW protocol required the following data points:

- A comprehensive census inventory of every western Joshua tree within 290-feet of the Project Site utilizing 100% visual coverage.
- Estimated visual height and crown diameter.
- Mechanism of reproduction – Sexual (flowering and fruiting) or asexual/clonal (branch sprouts, basal sprouts).
- Number of branching terminal flower panicles.
- Individual tree photographs.
- Individual trees will be assessed for relocation potential.
- Conditions of habitat quality.

The trees were assigned a unique tree identification number and catalogued using Global Positioning System (GPS) coordinates to record its precise location within the Project Site. These digital records were used to prepare figures using Geographic Information Systems (GIS) applications. Additionally, each tree was assigned a subjective classification with ratings for overall health and structure. These ratings were used to prioritize recommended relocation potential (ISA 2019). Ratings are based on the criteria described in **Table 1**.

Comprehensive survey data collected for each tree and is provided in **Appendix A, Western Joshua Tree Matrix,** as a separate table. Individual photographs of each tree are located in **Appendix B, Western Joshua Tree Individual Photographs**.

TABLE 1
HEALTH AND STRUCTURAL CONDITIONS CLASSIFICATION AND RATINGS

Classifications with Ratings	Health	Structure
Excellent = 5	Trees exhibit high vigor and nearly perfect health with little to no branch dieback or discoloration. Flowering and fruiting expected.	Nearly ideal individual tree structure free of defects.
Good = 4	Trees exhibit vigor that is expected for species. No significant damage due to diseases or pests. Little to no branch dieback, defoliation, or discoloration is minor. Flowering and fruiting expected.	Tree has well developed branching and crown structure as expected for species. Defects are minor.
Fair = 3	Trees exhibit reduced vigor due to senescence and/or damage. Damage due to insects, diseases, and/or drought but not likely to be fatal. Branch dieback, defoliation, discoloration, and/or dead branches may comprise up to 50% of the crown.	Low number of defects present.
Poor = 2	Trees are unhealthy and declining in appearance with poor vigor, low foliage density, and poor foliage color. Potentially fatal pests, disease, and or drought stress conditions. Extensive dieback, defoliation, discoloration, and/or dead branches exceeding 50% of the crown. Not a candidate for relocation.	Presence of small number of serious defects or multiple significant defects. Not a candidate for relocation.
Very Poor/Dead = 1	Trees have poor vigor and are on the verge of dying. Little live foliage remains. Tree is dead. Not a candidate for relocation.	Presence of multiple serious to severe tree defects. Branch failures have occurred, are probable, or imminent. Standing or toppled dead trees. Not a candidate for relocation.

3.0 Results

A total of 136 western Joshua trees located and inventoried within the project site and 16 additional trees within 290 feet of the project site limits. **Figure 2**, presents the location and results of the western Joshua tree census inventory assessed on the Study Area. The results of the assessment ratings and summarized observations are presented in the following sections.

3.1 Western Joshua Tree Assessment Ratings

As presented in **Appendix A, Western Joshua Tree Matrix**, 84 of the trees exhibit Excellent to Good health, 55 trees exhibit Fair health, nine (9) trees show signs of Poor to Very Poor health, and four (4) trees are Dead. For structure ratings, 84 of the trees exhibit Excellent to Good structure, 55 trees exhibit Fair structure, nine (9) trees show signs of Poor to Very Poor structure, and four (4) trees are Dead. **Table 2** provides a summary of the tree assessment ratings.

TABLE 2
SUMMARY OF WESTERN JOSHUA TREE ASSESSMENT RATINGS

Assessment Rating Category	Good	Fair	Poor	Very Poor/Dead
Health	84	55	9	4
Structure	84	55	9	4

The majority of the assessment rating categories were rated Good to Fair for a total of 139 or 91.5% of the overall trees. The remainder of 13 trees were rated Poor to Very Poor/Dead. **Table 3** provides a summary of recorded tree heights. The majority of trees ranged six to ten feet in height with a total of 109 trees.

TABLE 3
SUMMARY OF WESTERN JOSHUA TREE HEIGHTS

Height Range in Feet	Total Trees
1’ to 5’	31
6’ to 10’	109
11’ to 16’	12

A total of 115 trees had recorded crown widths of one to five feet in width. A total of 36 trees had crown widths of six to ten feet. A single tree had a crown width of 18 feet. Of the 152 total trees a 120 have a single trunk and 20 have two trunks. The remaining 113 trees have three to eight trunks.

Observed indicators indicating trees potential for sexual reproduction included the recording of sign of fruiting and the existence of flower panicles. A total of 43 trees showed signs of fruiting and 84 trees contained recent or old flower panicles. A total of 68 trees had no signs of flower panicles. Additionally, 33 trees were recorded to be in a juvenile life stage.

SOURCE: ESA, 2022

Mojave Mills Project

Figure 3
Western Joshua Tree Location Map

ESA

In summary, the majority of the trees are in Good to Fair health and structure, but are younger in age due to observed tree heights, crown widths, fruiting, and signs of flowering. Western Joshua trees grow extremely slowly gaining about 3 to 4 cm of increased height annually (CDFW 2022b). It is estimated that western Joshua trees reached reproductive maturity around 50-70 years in age and a minimum height of around 2 meters or 6.6 feet (CDFW 2022b).

3.2 Relocation Assessment

The trees were assessed for the potential to be relocated. Trees that are dead or have poor health and structure were not selected for relocation. Additionally, trees too large for practical relocation and low likelihood of survival were not selected for relocation. The majority of the trees have the potential for relocation for a total of 123 trees. A total of 14 trees were dead or rated dead or poor for health and/or structure and are not relocation candidates. A total of 15 trees are offsite and not assigned a relocation potential. **Table 4** provides a summary of the tree relocation potential assignments.

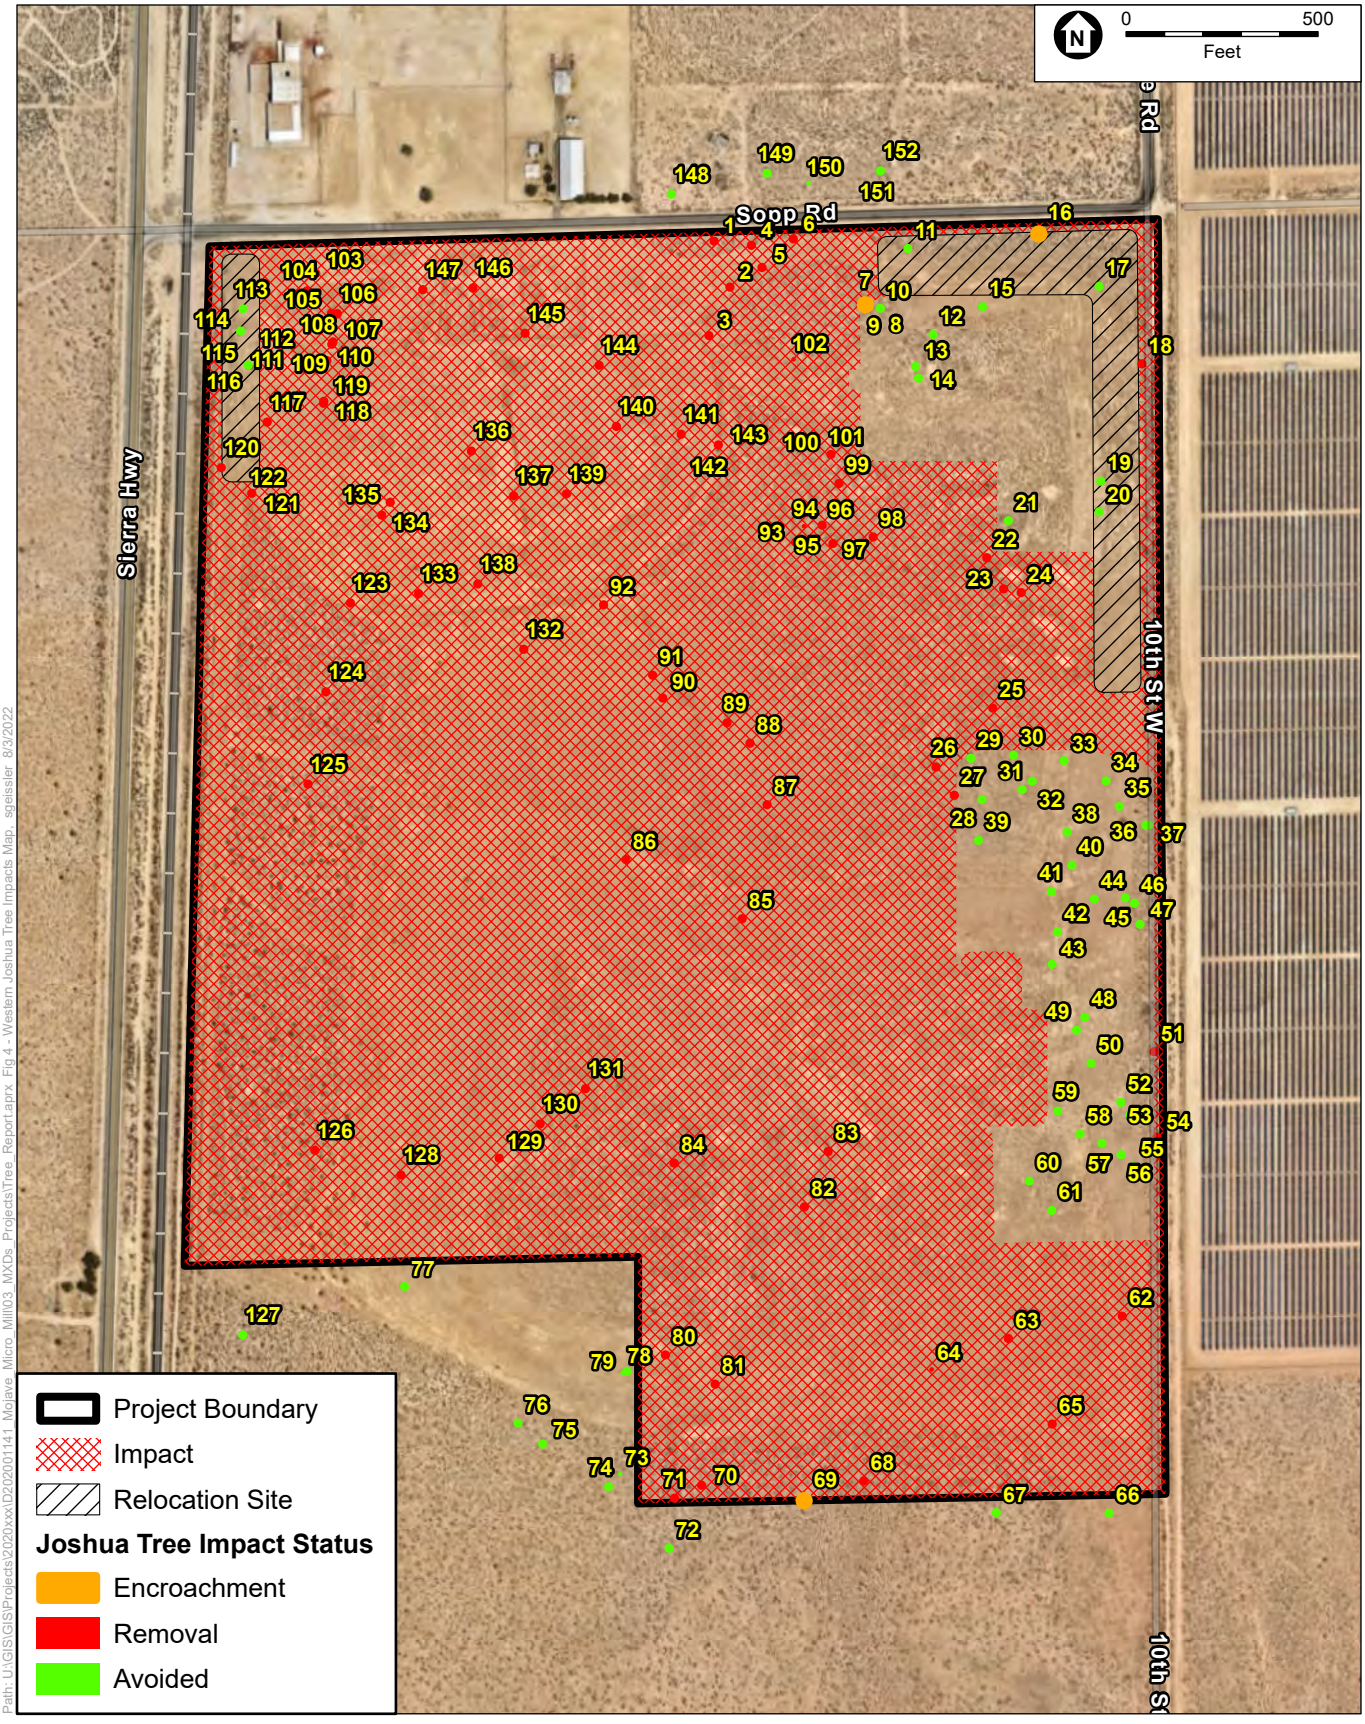
TABLE 4
SUMMARY OF RELOCATION POTENTIAL

Relocation Status	Number of Trees	Percentage of Trees
Yes	123	80.9%
No	14	9.2%
N/A	15	9.9%
Total	**152**	**100%**

In summary, the majority of the trees, 80.9% have the potential to be relocated due to observed health and structural conditions.

4.0 Impacts

This section addresses the western Joshua tree impacts due to the proposed Project implementation.



4.1 Western Joshua Tree Impacts

For the purposes of this Plan we utilized the CDFW specifications for determining western Joshua tree impacts. The CDFW defines project impact area (tree protection zone; TPZ) as all areas which there will be permanent and temporary impacts to an individual live western Joshua tree and the area around it as delineated by a radius as measured from a single point at its trunk (CDFW 2020). The radius measurement categories account for western Joshua tree height in meters as follows:

- 40 feet for western Joshua trees five (5) meters or greater in height.
- 12 feet for western Joshua tree one (1) meter or greater but less than five (5) meters in height.
- Six (6) feet for western Joshua tree less than one (1) meter in height.

Based on these radius measurement categories there are a total of 14 western Joshua trees that have an estimated height less than one (1) meter in height. The remaining 138 western Joshua trees have an estimated height that is one (1) meter or greater but less than five (5) meters in height.

A total of 85 western Joshua trees will be removed as a result of the preliminary project design. A total of three (3) protected trees will be encroached. The remaining 64 protected trees will be preserved in place. Overall, approximately 0.81-arcres of TPZ will be permanently impacted by project implementation. Of the 85 removals a total of 76 will be relocated onsite within two receiver sites. A depiction of western Joshua trees and their removal status is included on **Figure 4 – Western Joshua Tree Impacts Map**. Proposed tree removals are based on preliminary site plans and may not reflect final tree impacts once plans are finalized. A total of nine (9) or the proposed removal western Joshua trees were determined to not have relocation potential and will be mitigated at a 3:1 replacement tree ratio.

Western Joshua Tree Impacts Map

ESA

5.0 Mitigation and Relocation Plan

This section addresses the design and implementation of the Plan. Implementation of tree protection measures, mitigation and relocation activities involving planting, and ongoing maintenance of the relocated trees. The tree mitigation effort is designed for the western Joshua trees to be established and self-sustaining within five (5) years of implementation, and that they will persist over the long-term with the use of limited or no irrigation.

5.1 Arborist Qualifications

Overall supervision of the installation, maintenance, and monitoring of the relocation and replacement trees shall be the responsibility of a qualified Project Arborist. The Project Arborist shall at a minimum be an ISA Certified Arborist who possesses experience with replacement tree mitigation projects. The Project Arborist shall educate the landscape contractor and all applicable project staff with regard to mitigation goals and requirements. In addition, the Project Arborist shall conduct mitigation monitoring

5.2 Tree Protection Measures

As depicted in **Figure 4**, a total of 64 western Joshua trees will be preserved in place. A total of three (3) tree will be encroached. Per CDFW impact buffer specifications, the protection zone of the trees addressed by this Plan is the area within 12-feet or 24-feet of the trunk, based on the height of the tree. The following minimization measures are recommended.

- **Tree Protection Fencing.** Establish tree protection fencing around the protection zone as applicable to the CDFW impact buffer specifications. This area must be observed and respected during all construction activities near the trees. This will ensure preservation of the non-impacted trees. This protection area is to be clean and clear of any construction material, debris, equipment, portable toilets, and foot or equipment traffic. Fencing shall be installed prior to construction at the edge of the protection zone, and remain in place until the entire project is complete. The Project Arborist will verify that fencing is in place prior to construction activities.

- **Grading/Trenching in Protected Zone.** Where possible, grading/trenching should be restricted to areas outside the protected zone of the trees. All grubbing and clearing within the protection zone of a tree shall be done manually. All soil removal must be done with hand tools (shovels, picks, hand trowels, and similar equipment). The tool of choice is an air spade. The air spade excavates soil without damaging the roots. Jack hammers should not be used to remove the soil. When a root is encountered, soil removal is to be done without chipping, marring, or damaging the root bark in any way. Damaging the root bark will open up the bark barrier so that disease can enter the tree. This will allow rot to develop or fungus to take over, and can result in root death.

- **Avoiding Root Damage.** It is not recommended to cut roots larger than one inch. If any roots over one inch in diameter are damaged, they must be clean-cut with a sharp and sterilized hand tool. Any roots permanently exposed by grading or scraping of topsoil should be cleanly cut just below the new soil grade.

- **Soil Grade.** Soil levels must be returned to the original grade, at which trees' roots were first established. Existing fill soil above that original grade shall be removed to the extent possible; no additional fill soil shall be placed over the original grade. If soil is filled back to the original grade, compaction shall be done manually only (no equipment shall be used). Compaction shall be done in layers of three to six inches depending on soil structure. No gaps or pockets shall remain in the soil.

5.3 Western Joshua Tree Planting Methods and Specifications

For the purposes of this Plan, the following relocation methods and specifications are detailed below.

5.3.1 Relocated and Replacement Western Joshua Tree Quantities

Overall, a total of 76 western Joshua trees will be relocated onsite. Additionally, the nine (9) proposed removal western Joshua trees that do not have relocation potential will be mitigated at a 3:1 replacement ratio for a total of 27 replacement trees. In total, 76 relocation trees and 27 replacement trees will be planted within two receiver sites as shown on **Figure 5**. The two receiver mitigation sites contain 6.3-acres of planting space, which is more than adequate to receiver the 76 relocation and 27 replacement tree plantings.

5.3.2 Installation and Maintenance Landscape Contractor Qualifications

The Contractor must have documented successful experience planting and maintaining mitigation trees of like species. The Contractor will work under the direct supervision of the Project Arborist. The tree installation and five-years post-planting maintenance may be conducted by the same, or by a different Contractor; however, the Contractor must have the qualifications described herein. The qualifications will be verified by Kern County planning staff.

The Contractor shall be knowledgeable of the maintenance of western Joshua trees. The maintenance Contractor shall be responsible for site preparation, planting, invasive plant control, trash removal, watering, informative signs (as needed), replacement of dead mitigation trees during the five-year monitoring period, and any necessary remedial measures. All activities conducted by the Contractor shall be seasonally appropriate and approved by the Project Arborist. The Contractor shall meet the Project Arborist at the site when requested, and perform all checklist items within a mutually-agreed timeframe.

5.3.3 Relocation Specifications

The success of the relocation tree plantings hinges on proper implementation of the Plan specifications including site preparation, removal technique, proper timing of planting, installation procedures, irrigation, and monitoring.

SOURCE: ESA, 2022

Mojave Mills Project

Figure 5
Western Joshua Tree Receiver Sites Map

ESA

Timing

To increase tree survivorship, it is recommended that the trees be excavated in the cooler months preferably October through March. It is highly recommended to avoid salvage and planting activities during the warmer months of April through August.

Salvage Methods

Western Joshua tree root systems are quite susceptible to damage during relocation activities and it is important to keep intact as much of the rootball as possible. Tree salvage is best completed through the use of a hydraulic tree spade. General tree spade sizing guidelines as follows (Palmdale 2022):

- Forty-two (42) inch spade for trees under one meter in height.
- Fifty-four (54) inch spade for trees one to two meters in height.
- Ninety (90) inch spade for two to four and one-half meters in height.

Western Joshua trees shall be prepared by creating earthen berms around the perimeter of the tree for pre-soaking 24-hours prior salvage. The north side of each tree shall be marked at the base with spray paint or permanently marked tree tag to aid in proper orientation during relocation. The trees shall be orientated at the receiving site in the same direction as the original location.

Planting Technique

The Project Arborist will oversee the final layout of the trees in the field. All planting activities should be performed consistent with the ANSI A300 Standard Practices - Planting (ANSI 2018) and should adhere to the Best Management Practices – Tree Planting (ISA 2014). All trees are to be planted per the following specifications:

- Planting holes shall be, at a minimum, twice the size of the rootballs.
- The planting hole shall be filled to 50% with native soil salvaged from the disturbance areas and then backfilled.
- Prior to planting, the planting hole shall be filled with water, and allowed to drain completely prior to planting of the tree.
- The rootball shall be set in the planting hole so that the crown of the root ball is approximately one to two inches above finish grade and to account for settling. Under no circumstance should the tree root collar be buried.
- A watering basin shall be provided around each planting extending from 24 - 36 inches in radius from the stem of tree.
- Tree stabilization may be required to prevent relocated western Joshua trees from falling. Two common stabilization techniques are staking and guy wiring. Staking can consist of wooden braces attached at one-foot lengths of 2” x 4” s vertically strapped or banded around the trunk (Hodel 2012). The trunk is to be protected with nylon or burlap or other suitable

material wherever contact with the trunk and braces is made. Do not use nails to connect trunks to the braces. Alternatively, trees can be secured with the use of guy wires secured to the ground per specifications found in the Best Management Practices – Tree Planting (ISA 2014).

Individual Tree Placement

The relocated trees are to be installed within the two receiver sites as shown on **Figure 5** avoiding all western Joshua trees preserved in place at the receiver sites. Additionally, the relocated trees are to be installed using the CDFW specifications for impact buffers, specifically, 12- and 24-feet as shown in **Appendix A**. For the 27 replacement tree plantings the CDFW buffer of 12 feet is to be used. The planting locations shown on **Figure 5** are conceptual at the time of this Plan and actual locations will be determined during the construction phase in coordination with the Project Arborist and a landscape architect. In total, 76 relocation trees and the 27 replacement trees will be planted within the two receiver sites.

6.0 Five-Year Maintenance Program

Maintenance activities planned during the five-year maintenance and monitoring program will focus on maintaining conditions favorable for the establishment of trees to a self-sufficient state. Maintenance activities expected to be necessary during the five-year maintenance program include irrigation maintenance, pruning, fertilization, and dead tree replacement as-needed.

6.1 Responsible Parties

PSG is the Responsible Party for the implementation of this Plan. PSG will retain a qualified Project Arborist and Landscape Contractor to conduct the maintenance program.

6.1.1 Project Arborist

Overall supervision of the Landscape Contractor will be the responsibility of the Project Arborist. The Project Arborist will ensure the proper completion of monitoring reports and that appropriate landscape maintenance procedures are followed. The Project Arborist will provide the Landscape Contractor with a written checklist of tasks to be performed after each monitoring visit as-needed.

6.1.2 Landscape Maintenance Contractor

The Landscape Contractor will be retained for all five years for the maintenance (inclusive of the 120-day establishment period) after tree installation. The Landscape Contractor shall have previous experience on western Joshua tree establishment and maintenance projects.

6.2 Maintenance Schedule

The start of the five-year maintenance period begins when the installation has been verified as complete by the Project Arborist. At a minimum, landscape maintenance will be performed quarterly for Years 1 and 2 and bi-annually for Years 3 through 5 or until the mitigation has been signed off by the CDFW. The maintenance period is intended to allow enough time for the relocated western Joshua trees to become established, meet target performance standards, and achieve a self-sustaining state.

6.3 Maintenance Activities

6.3.1 Contractor Education

The Project Arborist will meet with the Landscape Contractor and support staff prior to the start of work, to ensure that they understand the maintenance provisions of the Plan as well as the recommendations for current maintenance procedures. The Landscape Contractor will also be given a copy of this Plan to help guide the maintenance. A copy of the Plan is to remain on the Project Site until mitigation compliance has been verified.

6.3.2 Year One Establishment Period

The tree establishment period will start after installation has been completed and will continue till the end of Year 1. The establishment period is intended to provide an observation and guarantee time, during which the Landscape Contractor is responsible for ensuring the mitigation trees

become properly established and that installation has been properly executed. During this period, problems that may threaten the overall survivability of the trees are likely to be detected, and the Landscape Contractor will be provided an opportunity to fix them. As a part of this period, the Landscape Contractor is contractually obligated to guarantee their workmanship and perform remedial measures if necessary. The Project Arborist will visit the site quarterly during this period, and will provide a list of items to be addressed by the Landscape Contractor, if necessary. The completion of this monitoring during the tree establishment period will help to ensure the success of the planted trees during the five-year maintenance and monitoring period and beyond. All care and maintenance activities will be recorded in a monitoring log.

6.3.3 Landscape Contractor Guarantees

The Landscape Contractor will be responsible for replacing dead or diseased trees during Year 1. The Project Arborist may recommend that replacement trees be installed in different locations within the landscaping area from those determined to be deceased. The Project Arborist will verify and document dead tree replacement for inclusion in Project reporting.

6.3.4 Pest and Disease Management

An Integrated Pest Management (IPM) approach will be taken towards pest control, with natural measures and prevention playing major roles in suppressing or reducing pest species populations. Insect plant pests, vertebrate pests, and tree diseases will be monitored by the Project Arborist and Landscape Contractor. Trees that are planted may need to be pruned to prevent pestilence spreading, or replaced if directed by the Project Arborist. Common chronic tree diseases will generally be ignored unless the infections are significant during the establishment phase.

Active pest control measures will be implemented if a pest species poses a competitive threat to tree establishment. The Contractor should consult a licensed Pest Control Advisor if specific pest control recommendations are necessary. All IPM management should be performed consistent with the ANSI A300 Integrated Pest Management (ANSI 2016) and should adhere to the Best Management Practices - Integrated Pest Management (ISA 2016).

6.3.5 Irrigation

The irrigation system should be thoroughly evaluated for functional use on at least an annual basis. Any damaged equipment shall be repaired or replaced. Irrigation should be oriented as to not create direct spray (overspray) onto the trunks of the trees. Irrigation amounts and frequency will need to be timed to seasonality and rainfall averages. Trees will need to dry out completely in-between watering cycles, typically one to two times per week. Irrigation system pressure should be checked and adjusted, if necessary, to ensure efficient operation of the irrigation system. Drip irrigation methods are highly recommended to reduce the waste of water.

6.3.6 Corrective Pruning

Any pruning/trimming should be performed consistent with the ANSI A300 Standard Practices - Pruning (ANSI 2017) and should adhere to the Best Management Practices – Pruning (ISA 2019). Pruning/trimming of protected trees will be limited to only what is necessary for corrective directional pruning or to remove damages limbs. However, the pruning of western Joshua trees is not likely to be needed and shall only be done under the supervision of the Project Arborist.

7.0 Five-Year Monitoring Program

Monitoring of the relocated and replacement western Joshua trees will extend for five years. Its purpose is to ensure success of tree relocation and replacement installation, maintenance, and establishment, thereby adequately offsetting the Project impacts to western Joshua trees.

The monitoring program specifies the monitoring schedule, monitoring report protocol and basic contents, and tree mitigation performance standards.

7.1 Monitoring Schedule

Monitoring of the tree mitigation site will begin after mitigation planting installation is completed, and will be conducted for five consecutive years. Monitoring visits will be conducted quarterly during Years 1 and 2 and bi-annually during Years 3 through 5 until the performance standards have been met. Monitoring visits will focus on qualitative observation by the Project Arborist who will identify problems observed during this period, and if appropriate, recommend remedial actions.

7.2 Annual Monitoring Reports

Annual monitoring reports will be provided to the County and CDFW as part of the program, describing the monitoring results. The first report will be submitted after the first year of maintenance and then thereafter each year until the mitigation maintenance period expires. Each annual report will contain the following information:

1. A list of names, titles, and companies of all persons who prepared the annual report and participated in monitoring activities for that year.

2. An overview of the tree maintenance effort.

3. A discussion of monitoring data (survival, health/growth, any remedial actions), in relation to the performance standards.

4. Figure(s) of the tree mitigation site. Color photographs of tree plantings and potential remedial actions.

5. Details of any replacement tree plantings and other remedial actions.

6. Description of any remedial action necessary to increase mitigation success.

7.3 Performance Standards

The success of the tree mitigation site will be based upon the successful survivorship of the relocated and replaced trees annually and at the end of five-years of monitoring. Monitoring will continue for five years until the County and CDFW concur the final survival performance standard has been met and monitoring is no longer necessary.

7.3.1 Success Criteria Based on General Site Characteristics

To be considered successful, the tree mitigation site must meet the following interim annual and final Year 5 standard as provided in **Table 5**.

TABLE 5
GENERAL PERFORMANCE STANDARDS AND POTENTIAL REMEDIAL MEASURES

Milestone	Performance Standards	Remedial Measures
Year 1	• 100% survivorship of trees.	Contractor responsible for plantings and tree maintenance. Corrective pruning. Irrigation maintenance. Replacement of dead mitigation trees.
Year 2	• 100% survivorship of trees.	Same as above, as necessary
Year 3	• 100% survivorship of trees.	Same as above, as necessary
Year 4	• 100% survivorship of trees for a minimum of 3 consecutive years	Same as above, as necessary
Year 5 (Final Success Criteria)	• 100% survivorship of trees for a minimum of 3 consecutive years.	Same as above, as necessary. Trees will be demonstrate survival without irrigation.

7.3.2 Monitoring Methods

Monitoring for purposes of documenting compliance with interim and the final survival performance standard will be conducted by the Project Arborist in conjunction with the Landscape Contractor. Continuity of monitoring personnel and methodology will be maintained as much as possible to maintain consistency of assessments during the monitoring period. Monitoring will begin following installation and will continue through the five-year post-installation period.

Qualitative Assessment

Qualitative assessments will be conducted to evaluate the overall condition of the tree mitigation site, and determine the effectiveness of maintenance activities and general development of the tree health establishment. Records of mortality and other problems such as insect damage, corrective pruning, fertilization, and irrigation repair, will be identified by the Project Arborist, as well as recommendations to address these problems and evaluate their resolution. The Project Arborist will determine remedial measures necessary to ensure compliance with performance standards. The Project Arborist will relay these findings to PSG and Landscape Contractor after each visit, as necessary, to address and correct problems as soon as they are discovered. Remedial measures undertaken will be discussed in annual monitoring reports.

Project Arborist Monitoring

Tree monitoring to determine the progress toward achieving the performance standards shall be performed by visual observation. The following data will be collected for mitigation site. These data will be used to assess the success of the mitigation site and to identify any necessary remedial actions:

1. The survivorship of 100% of the western Joshua trees.

2. The general health, growth rate, height, and mortality of trees will be noted.

Photo-documentation

Representative photographs will be taken throughout the monitoring period by the Project Arborist, to document the progress of the mitigation tree establishment. Photo-documentation will be taken quarterly for the initial two years and annually during remainder of the monitoring period to maintain consistency and as a means for comparison.

8.0 Completion of Compensatory Mitigation

8.1 Notification of Completion

PSG will notify the County in writing upon completion of the tree mitigation effort through the submittal of the final monitoring report. This report will include a summary of the five-year monitoring and maintenance period and a summary of the tree survivorship data confirming that the final performance standard has been met.

8.2 Contingency Measures

An integral part of a successful mitigation program is the ability to detect problems early in the process, determine the cause of the problem, and determine appropriate corrective actions. Problems such as vandalism, instances of tree mortality, corrective pruning, or small-scale pest infestations will be rectified as they are discovered during routine site monitoring.

More significant remedial actions or contingency measures will be triggered if there is significant tree mortality, widespread pest infestation or disease, if the site is not on track to attainment of the interim performance standard after the end of the second year, or if the site does not meet the final survival performance standard at the completion of the seventh monitoring year. Under these situations, the Project Arborist will recommend appropriate contingency measures. These measures may include replacement tree plantings, treatments for pests; or adjustment of the management of the site. If contingency measures are needed, it is possible the maintenance and monitoring program may be extended beyond seven years until the final survival performance standard is met.

Certification of Performance

I, Ryan Gilmore, certify:

- That I have personally inspected the tree(s) and/or the property referred to in this report, and have stated my findings accurately. The extent of the evaluation and appraisal is stated in the attached report and the Terms of Assignment;
- That I have no current or prospective interest in the vegetation or the property that is the subject of this report and have no personal interest or bias with respect to the parties involved;
- That the analysis, opinions, and conclusions stated herein are my own;
- That my analysis, opinions, and conclusions were developed and this report has been prepared according to commonly accepted arboricultural practices;
- The no one provided significant professional assistance to the consultant, except as indicated within the report;
- That my compensation is not contingent upon the reporting of a predetermined conclusion that favors the cause of the client or any other party.

I further certify that I am a member of the American Society of Consulting Arborists, Registered Consulting Arborist (RCA) #769, and acknowledge, accept, and adhere to the ASCA Standards of Professional Practice. I am an International Society of Arboriculture Board Certified Master Arborist (BCMA) WE-9009BM, and have been involved in the practice of arboriculture and the study of trees for over 23 years.

Signed:

Date: 8/19/2022

Ryan Gilmore
Principal Biologist/Urban Forester

Conditions represented in this study are limited to the field assessment date and time. Rating for health and structure do not constitute a health or structural guarantee beyond that date. Risk assessments were not performed for the purposes of this report.

Arborist Disclosure Statement

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the recommendations of the arborist, or to seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that fail in ways we do not fully understand. Conditions are often hidden within trees and belowground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time.

Treatment, pruning, and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, and other issues. Arborists cannot take such considerations into account unless complete and accurate information is disclosed to the arborist. An arborist should then be expected to reasonably rely upon the completeness and accuracy of the information provided.

Trees can be managed, but they cannot be controlled. To live near trees is to accept some degree of risk. The only way to eliminate all risk associated with trees is to eliminate all trees.

Formal risk assessments were neither requested nor performed on the trees in this report.

Mohave Ground Squirrel Report

September 27, 2022

Ryan Gilmore
Environmental Science Associates
80 South Lake Ave, Suite 570
Pasadena, California 91101

Subject: Mohave Ground Squirrel Survey for the Mojave Micro Mill project, Kern County, California

Dear Mr. Gilmore,

This report summarizes the results of a protocol survey for the Mohave ground squirrel (MGS, *Xerospermophilus mohavensis*) on the approximately 174-acre site of the proposed Mojave Micro Mill project site in the Antelope Valley in southeastern Kern County. The project site is located east of SR-14 and Sierra Highway between Rosamond and Mojave. Pacific Steel Group (PSG) proposes to construct and operate a micro mill facility to produce rebar from scrap metal through various recycling processes.

Figure 1 shows the project site on the 7'5 minute Soledad Mountain topographic map (T10N, R12W, $NW^{1/4}$ S 27). Figure 2 shows the project site on an aerial photograph (prior to disturbance of the site). The UTM coordinates for the approximate center of the survey area are 11S 395452, 3866298. Site photos are found in Appendix 1.

Background on the Mojave Ground Squirrel

The MGS is a small ground squirrel (approximately 9 inches long) that inhabits the Mojave Desert, in parts of Inyo, Kern, Los Angeles and San Bernardino counties. The historical range of the MGS covered approximately 5 million acres from Palmdale in the south to Owens Lake in the north, and from the eastern edge of the Sierra Nevada to the Mojave River Valley (Gustafson 1993, Leitner 2008).

MGS occur in a range of open desert habitats, most commonly in creosote scrub but also in Joshua tree woodland, desert saltbush scrub, desert sink scrub, desert greasewood scrub, and shadscale scrub (Gustafson, 1993). MGS typically occur in areas with open vegetative cover and small bushes (< 0.6 meter [2 feet] in height) spaced approximately 6 to 9 meters (20 to 30 feet) apart. MGS consume leaves, forbs, shrubs, and grasses of several species and genera, including creosote (*Larrea tridentata*), winter fat (*Krascheninnikovia lanata*), spiny hop-sage (*Grayia spinosa*), saltbush (*Atriplex* spp.), golden linanthus (*Linanthus aureus*), Mediterranean grass (*Schismus arabicus*), box thorn (*Lycium* spp.), and several other plant species (Best 1995). Winter fat, spiny hop-sage, and saltbush are thought to make up approximately 60% of the species' shrub diet, indicating that these are important food sources when forbs are unavailable. It has been suggested that habitats where winter fat and hop-sage are absent may be suboptimal for MGS (Desert Managers MGS Working Group, no date).

MGS dig burrows in sandy and gravelly soils on flat to moderately sloping terrain. The burrows are used to avoid predators and high temperatures, and for aestivating during winter months.

MGS are active only during the spring-summer months and spend most of the year (approximately seven months) below ground.

Site Description

The project site is bordered by commercial land use to the north, a solar field within Edwards Air Force base to the east, the BNSF railroad tracks and Sierra Highway to the west, and vacant lands with desert scrub to the south. The site is flat with Cajon loamy sand and DeStazo sandy loam soils (NRCS, 2022).

There are five land covers/plant communities on the site (from highest to lowest area):

Herbaceous semi-natural grassland (131.46 acres) is the dominant land cover on the project site. At the start of the live-trapping survey, this habitat ranged from moderately dense redstem filaree (*Erodium cicutarium*) in some areas (photo 1) or tumble mustard (*Sisybrium altissimum*) to sparse forb and grass cover (photo 2) or bare ground. Common plants include red brome (*Bromus rubens*), cheatgrass (*B. tectorum*), Mediterranean grass (*Schismus* sp.), Russian thistle (*Salsola tragus*), and milk vetch (*Astragalus* sp.) with scattered Joshua trees (*Yucca brevifolia*).

Allscale scrub **(**16.78 acres**)** occurs in patches around the periphery of the site (photo 3). This community is characterized by a sparse sub-shrub layer dominated by allscale (*Atriplex polycarpa*), interspersed with shadescale (*Atriplex confertifolia*), sweetbush (*Bebbia juncea*), Nevada ephedra (*Ephedra nevadensis*), Cooper's goldenbush (*Ericameria cooperi*), Mojave rabbitbrush (*Ericameria paniculata*), winter fat (*Krascheninnikovia lanata*) and Mojave cottonthorn (*Tetradymia stenolepis*), with scattered western Joshua trees. The grass and herb cover is dense and includes fiddleneck (*Amsinckia* spp.), red brome, Russian thistle, Mediterranean grass and desert needlegrass (*Stipa speciosa*).

Creosote bush scrub (14.40 acres) occurs in the western part of the project site (photo 4). This community is characterized by a sparse to moderate shrub/sub-shrub layer with a co-dominance of allscale and creosote bush (*Larrea tridentata*), interspersed with Cooper's goldenbush, Mojave rabbitbrush, Mojave cottonthorn, Nevada ephedra, shadescale, sweet bush and winter fat, with scattered Joshua trees. The grass and forb cover is similar to that described for allscale scrub.

Disturbed creosote bush scrub (6.01 acres) occurs along the western portion of the project site where past disturbances have occurred. This community is similar in character to its undisturbed counterpart; however, has been altered as a result of recent grubbing activities. The grubbing activities in the near complete removal of the shrub cover.

A small area (5.15 acres) in the north-central portion of the site has been developed and is largely devoid of vegetation with weedy growth, dominated by non-native species such as red brome and Russian thistle.

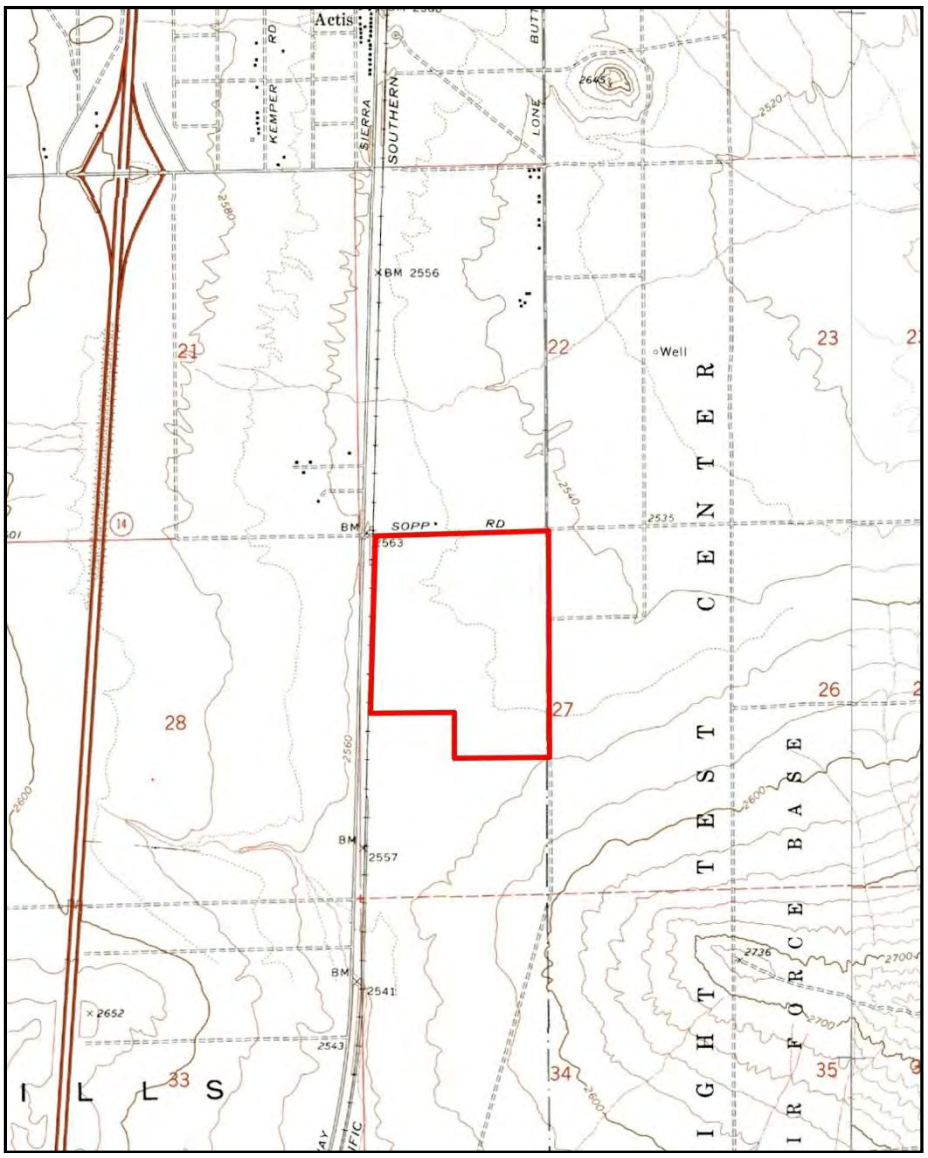

Figure 1. Project site on topographic map (red lines).

Methods

A literature review of MGS issues in the project area included the following:

- Records in the California Natural Diversity Database (CNDDB, California Department of Fish and Wildlife [CDFW] 2022);
- Summaries of MGS surveys in the project region for the periods 2013-2020, 2008-2012, and 1998-2007 (Leitner 2021, 2015, and 2008), and
- The California Department of Fish and Wildlife 2019 Mohave ground squirrel Conservation Strategy (CDFW 2019).

A visual/auditory survey for MGS and a habitat assessment was carried out on the project site on March 20, 2022 by Phil Brylski, Ph.D., who holds an MOU with CDFW for MGS surveys. The

habitat assessment concluded that potentially suitable habitat for the Mohave ground squirrel was present on part of the project site, and that a MGS protocol survey was recommended.

The CDFW was consulted on the MGS survey design. CDFW agreed that the MGS would consist of (1) one 100-trap live-trapping grid established around the existing native vegetation in the western side of the site and the adjoining areas, and (2) 27 wildlife cameras established across the site outside of the live-trapping grid (R. Robison, CDFW, pers.comm.).

Figure 2. Aerial photo of project site

The MGS survey grid was established using 100 large Sherman live traps (3 x 3.75 x 12") in creosote bush scrub habitat set along four parallel lines with 35-meter spacing with an additional string of five traps on the east-central part of the grid (Figure 4). Cardboard tents shielded the traps from sunlight. Traps were checked at least every four hours until they were closed at the end of each day (or until temperature reached 90°F, in accordance with the guideline).

The camera survey was carried out in accordance with the request by CDFW. The camera station survey used 27 wildlife cameras distributed across the site outside of the live-trapping grid and operated in accordance with recommendations in Delaney et al (unpublished). The cameras were operated from dawn to dusk for three 5-day sessions for a total of 405 camera days; bait was renewed every other day. The camera station locations are shown in Figure 4.

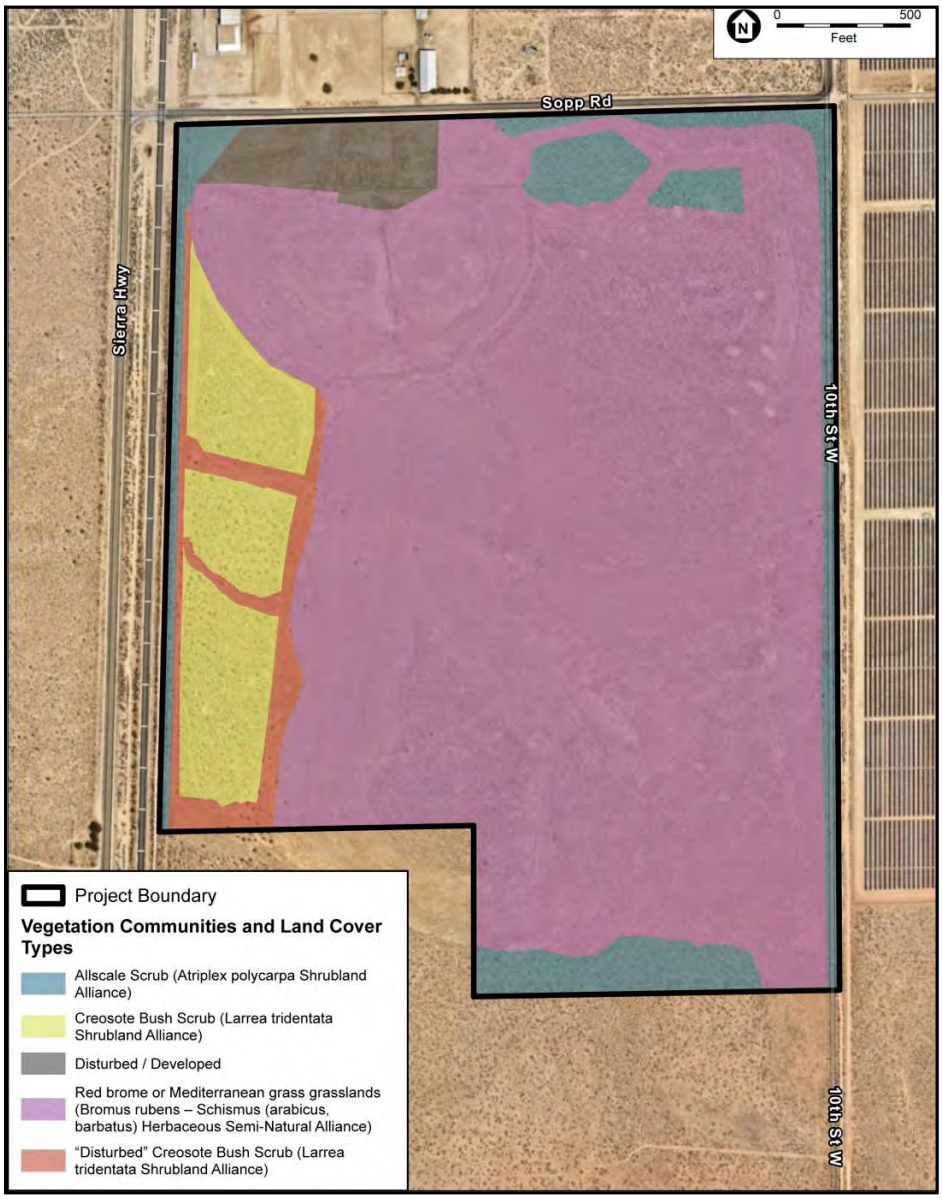

Figure 3. Plant communities.

Figure 4. Locations of trapping grid (yellow polygon) and camera stations (red circles) on the project site.

Results

Mohave ground squirrel habitat suitability

The disturbed habitats within the site are not suitable for MGS and cover approximately 146.2 acres. The small patches of allscale scrub along the northern and eastern borders that adjoin developed land uses are unlikely to be suitable for MGS due to their small size and isolation from distant potentially suitable habitats. The remaining creosote bush habitat (14.4 acres) and the small area of allscale scrub habitat along the southern border of the site, which are contiguous with allscale scrub habitat south of the site, are potentially suitable for MGS.

Live-Trapping Results

The survey consisted of 15 days of live-trapping (100 traps each day for a total trap effort of 1,500 trap-nights) in three sessions: April 25-29, May 27-31, and July 10-14, 2022. The weather conditions during the surveys are summarized in Appendix 2. Appendix 3 summarizes information on the grid.

No Mohave ground squirrels were captured during the survey and none were observed or heard onsite or in the adjoining area. One squirrel species, the Antelope ground squirrel (AGS; *Ammospermophilus leucurus*), was captured. Table 1 summarizes the day-survey captures. Based on the prevalence of juvenile and subadult AGS captures, reproduction was strong in 2022. Night-time small mammal captures in the first two sessions included the common Panamint kangaroo rat (*Dipodomys panamintinus*) and southern grasshopper mouse (*Onychomys torridus pulcher*).

Table 1. MGS Trapping Survey Results

Session	Dates	AGS	
		Adult	Subadult/Juvenile
1	April 25-29	9	21
2	May 27-31	15	32
3	July 10-14	10	19
	Subtotals	34	72
	Total		106

AGS, Antelope ground squirrel (*Ammospermophilus leucurus*)

Camera Study

No Mohave ground squirrels were detected. Antelope ground squirrels were recorded at some of the camera stations but many stations recorded no small mammals. Other species commonly recorded include the raven (*Corvus corax*) and horned lark (*Eremophila alpestris*).

Discussion

MGS Occurrences in Project Area

The site is located on the southwestern edge of the species' range. Figure 5 shows MGS occurrences from the project vicinity (green dots) and in the region further from the site (red dots) obtained from the CNDDB (CDFW 2022).

The nearest MGS occurrence to the project site is a 1977 record from Rosamond, approximately 5.9 miles south of the site. Three other nearby localities are:

- A live-trapping record in 1996, approximately 4.95 miles east of the site on Edwards AFB (occurrence 296 in Figure 4),
- A visual observation in 1998 approximately 10.5 miles north of the project site (occurrence 300 in Figure 4); and
- A 1963 museum record 12 miles north of the project site (occurrence 284 in Figure 4).

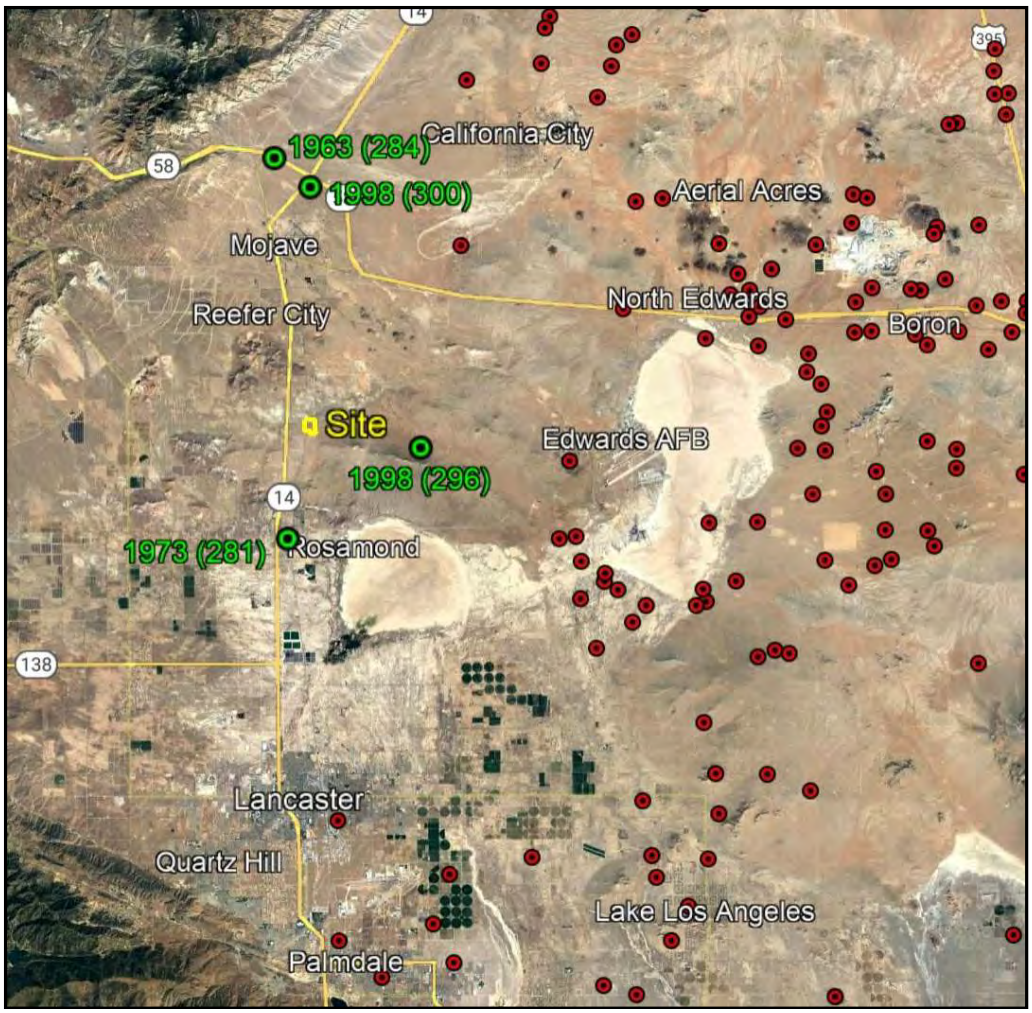

Figure 5. MGS occurrences around project site (yellow polygon). MGS records closer to project site shown as green circles (with year of record and CNDDB occurrence number), records further from project site shown as red circles.

MGS Survey Results in Project Area from 1998 to 2020

Leitner (2008, 2015, 2021) summarized the results from all MGS surveys across the species range over three time periods. The survey results for the project region are as follows:

- In the 1998-2007 period, Leitner (2008) showed 15 or more MGS live-trapping surveys in the Mojave area, four surveys in the east and southeast of Rosamond, and nine regional surveys in the western part of Edwards Air Force Base (AFB). No MGS occurrences were recorded in these surveys.

- In the 2008 to 2012 period, Leitner (2015) showed more than 25 MGS live-trapping surveys in the Mojave area, 10 regional surveys in the western part of AFB, and no surveys in the project vicinity (within 3 miles of the site). No MGS occurrences were recorded in these surveys; and

- In the 2013-2020 period, Leitner (2021) reported six MGS live-trapping surveys south of Mojave, four trapping surveys and one camera survey in the western part of EAB. No MGS occurrences were recorded in these surveys.

No Mohave Ground Squirrels were observed or trapped during the surveys conducted at the project site. According to the Mohave Ground Squirrel Survey Guidelines (CDFG 2010), "If a survey conducted according to these guidelines results in no capture or observation of the Mohave Ground Squirrel on a project site, this is not necessarily evidence that the Mohave Ground Squirrel does not exist on the site or that the site is not actual or potential habitat of the species. However, in the circumstance of such a negative result, the Department will stipulate that the project site harbors no Mohave Ground Squirrels. This stipulation will expire one year from the ending date of the last trapping on the project site conducted according these guidelines."

Part II –General Habitat Description	
Vegetation	
Dominant Perennials	creosote bush (*Larrea tridentata*), allscale (*Atriplex polycarpa*), Nevada ephedra (*Ephedra nevadensis*), winter fat (*Krascheninnikovia lanata*) and Mojave cottonthorn (*Tetradymia stenolepis*).
Other Perennials	Joshua tree (*Yucca brevifolia*), Cooper's goldenbush (*Ericameria cooperi*), Mojave rabbitbrush (*Ericameria paniculata*)
Dominant Annuals	red brome, cheatgrass, Mediterranean grass, redstem filaree
Other Annuals	fiddleneck (*Amsinckia* spp.), desert needlegrass (*Stipa speciosa*).

Land Forms (*i.e.*, bajadas, washes): desert plain

Soil Description: Cajon loamy sands and DeStazo sandy loam s

Elevation: 2560 ft Slope 0 %

Floral and Faunal Compendium

FLORAL COMPENDIUM

Family	Scientific Name	Common Name	Nativity	Status
GYMNOSPERMS				
EPHEDRACEAE – EPHEDRA FAMILY				
	Ephedra nevadensis	Nevada ephedra	native	
ANGIOSPERMS				
DICOTS				
ASTERACEAE – SUNFLOWER FAMILY				
	Bebbia juncea	sweetbush	native	
	Ericameria cooperi	Cooper's goldenbush	native	
	Ericameria nauseosa	rubber rabbitbrush	native	
	Ericameria paniculata	Mojave rabbitbrush	native	
	Tetradymia stenolepis	Mojave cotonthorn	native	
BORAGINACEAE – BORAGE FAMILY				
	Amsinckia sp.	fiddleneck	native	
CHENOPODIACEAE – GOOSEFOOT FAMILY				
	Atriplex confertifolia	spiny saltbush	native	
	Atriplex polycarpa	cattle spinach	native	
	Krascheninnikovia lanata	winter fat	native	
	Salsola sp.	Russian thistle	naturalized	
FABACEAE – LEGUME FAMILY				
	Astragalus sp.	milkvetch	native	
GERANIACEAE – GERANIUM FAMILY				
	Erodium cicutarium	redstem filaree	naturalized	
ZYGOPHYLLACEAE – CREOSOTE FAMILY				
	Larrea tridentata	creosote bush	native	
MONOCOTS				
AGAVACEAE – CENTURY PLANT FAMILY				
	Yucca brevifolia	Joshua tree	native	State Threatened (Candidate)
POACEAE – GRASS FAMILY				
	Bromus rubens	red brome	naturalized	
	Bromus tectorum	downy chess	naturalized	
	Schismus sp.	Mediterranean grass	naturalized	
	Stipa speciosa	desert needlegrass	native

Appendix E

Special-Status Plant Species – Potential to Occur

SPECIAL-STATUS PLANT SPECIES – POTENTIAL TO OCCUR WITHIN THE BIOLOGICAL STUDY AREA

Scientific Name	Common Name	Flowering Period	CNPS	State	Federal	Preferred Habitat	Potential For Occurrence[1]
Angiosperms (Dicotyledons)							
Astragalus hornii var. *hornii*	Horn's milk-vetch	May-Oct	1B.1	None	None	Meadows and seeps, Playas. Lake margins, alkaline sites. Elevation range: 195-2,790 feet. (CNPS 2021).	**Not Expected.** Suitable habitat is not present within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Delphinium recurvatum	recurved larkspur	Mar-Jun	1B.2	None	None	Chenopod scrub, Cismontane woodland, Valley and foothill grassland. On alkaline soils; often in valley saltbush or valley chenopod scrub. Elevation range: 10-2,590 feet. (CNPS 2021).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There is two CNDDB records within one mile of the BSA (CNDDB 2022).
Eriastrum rosamondense	Rosamond eriastrum	Apr-May(Jun-Jul)	1B.1	None	None	Chenopod scrub, vernal pools. Elevation range: 2,295-3,855 feet. (CNPS 2021).	**Not Expected.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are no vernal pools located within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Eriophyllum mohavense	Barstow woolly sunflower	Mar-May	1B.1	None	None	Chenopod scrub, Mojavean desert scrub, and playas Elevation range: 1,640-3,150 feet. (CNPS 2021).	**Not Expected.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are no playas located within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Layia heterotricha	pale-yellow layia	Mar-Jun	1B.1	None	None	Cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Elevation range: 985-5,595 feet. (CNPS 2021).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are no CNDDB records of this species within 5

1 **Present:** Species was observed or detected during Program-specific biological surveys. **High**: Species identified in the literature search and/or known to occur in the region and suitable habitat is present on the Program site. These species are generally common and/or widespread in the Program area and vicinity. **Moderate**: Species identified in the literature search and/or known to occur in the region and suitable habitat is present within the Program site. These species are generally less common and/or widespread than species considered to have "high" potential to occur. **Low**: Species identified in the literature search or known to occur in the region, but the habitat on site is of low or marginal quality and/or the Program site occurs outside the species known geographic or elevational range. Distance to nearest known occurrence and the age of last reported local occurrence are also considered. **Not Expected**: Species identified in the literature search or known to occur in the region, but the habitat on site is not suitable for the species.

							miles of the BSA (CNDDB 2022).
Loeflingia squarrosa var. *artemisiarum*	sagebrush loeflingia	Apr-May	2B.2	None	None	Desert dunes, Great Basin scrub, Sonoran Desert scrub. Elevation range: 2,295-5,300 feet. (CNPS 2021).	**Not Expected.** Suitable habitat is not present within the BSA. There is a single CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Monardella linoides ssp. *oblonga*	Tehachapi monardella	(May)Jun-Aug	1B.3	None	None	Lower montane coniferous forest, pinyon and juniper woodland, upper montane coniferous forest. Elevation Range: 2,295-8,105 feet. (CNPS 2021).	**Not Expected.** Suitable habitat is not present within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Nemacladus secundiflorus var. *robbinsii*	Robbins' nemacladus	Apr-Jun	1B.2	None	None	Chaparral, valley and foothill grassland. Elevation range: 1,150-5,580 feet. (CNPS 2021).	**Not Expected.** Suitable habitat is not present within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).
Opuntia basilaris var. *treleasei*	Bakersfield cactus	Apr-May	1B.1	SE	FE	Chenopod scrub, Cismontane woodland, Valley and foothill grassland. Elevation range: 330–4,755 feet (CNPS 2021).	**Not Expected**. Limited suitable chenopod habitat exists within the BSA. None were observed during the field assessment. There are no CNDDB records within five miles of the BSA (CNDDB 2022).
Saltugilia latimeri	Latimer's woodland-gilia	Mar-Jun	1B.2	None	None	Chaparral, Mojavean desert scrub, pinyon and juniper woodland. Elevation range: 1,310–6,235 feet (CNPS 2021).	**Not Expected.** Limited suitable chenopod habitat exists within the BSA. None were observed during the field assessment. There are no CNDDB records within five miles of the BSA (CNDDB 2022).
Angiosperms (Monocotyledons)							
Calochortus striatus	alkali mariposa lily	Apr-Jun	1B.2	None	None	Occurs usually in wetlands, occasionally in non wetlands. Meadows in shadscale scrub, chaparral, and wetland-riparian. Elevation range: 230–5,235 feet (CNPS 2021).	**Low.** Limited suitable chenopod habitat exists within the BSA. However, chenopod habitat present is highly disturbed. There are four CNDDB records of this species within 5 miles of the BSA (CNDDB 2021). One record is located within the northwest corner of the BSA dated 1995.
Puccinellia simplex	California alkali grass	Mar-May	1B.2	None	None	Meadows and seeps, chenopod scrub, valley and foothill grasslands, vernal pools. Alkaline, vernally mesic soils. Sinks, flats, and lake margins. Elevation range: 5 – 3,050 feet (CNPS 2021).	**Not Expected.** Suitable habitat is not present within the BSA. There are no CNDDB records of this species within 5 miles of the BSA (CNDDB 2022).

Yucca brevifolia	Western Joshua tree	Mar-Jun	None	None	SCT	Joshua tree woodlands. Elevation range: 1,300 – 6,560 feet (CNPS 2021).	**Present.** This species was observed within the project site.

Key to Species Listing Status Codes

FE	*Federally Endangered*	FD	*Federally Delisted*
FT	*Federally Threatened*	SE	*State Listed as Endangered*
FC	*Federal Candidate*	ST	*State Listed as Threatened*
FPE	*Federally Proposed as Endangered*	SCE	*State Candidate for Endangered*
FPT	*Federally Proposed as Threatened*	SCT	*State Candidate for Threatened*
FPD	*Federally Proposed for Delisting*	SFP	*State Fully Protected*

California Native Plant Society (CNPS)

Rank 1A: Presumed extirpated in California and either Rare or Extinct elsewhere.
Rank 1B: Rare, threatened, or endangered throughout their range.
Rank 2A: Presumed extirpated in California, but moare common elsewhere.
Rank 2B: Rare, threatened, or endangered in California, but more common in other states.
Rank 3: Plant species for which additional information is needed before rarity can be determined.
Rank 4: Species of limited distribution in California (i.e., naturally rare in the wild), but whose existence does not appear to be susceptible to threat.

Source: ESA 2022.

New Threat Code extensions and their meanings:
1 Seriously endangered in California (over 80% of occurrences threatened / high degree and immediacy of threat)
2 Fairly endangered in California (20-80% occurrences threatened
3 Not very endangered in California (<20% of occurrences threatened or no current threats known)

Appendix F

Special-Status Wildlife Species – Potential to Occur

SPECIAL-STATUS WILDLIFE SPECIES – POTENTIAL TO OCCUR WITHIN THE BIOLOGICAL STUDY AREA

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within Biological Study Area
Reptiles			
desert tortoise *Gopherus agassizii*	FT/ST	Inhabits semi-arid grasslands, gravelly desert washes, canyon bottoms and rocky hillsides within the Mojave Desert.	**Low.** Limited suitable habitat present within the BSA. No sign or burrows observed during 18 field visits. There are two CNDDB records within five miles of the BSA with the most recent in 2012.
Birds			
burrowing owl *Athene cunicularia*	BCC/SSC	Inhabits coastal prairie, coastal scrub, Great Basin scrub, Mojavean desert scrub, Sonoran desert scrub, annual and perennial grasslands, bare ground, and disturbed habitats characterized by low-growing vegetation. A subterranean nester dependent upon burrowing mammals, particularly the California ground squirrel.	**Low.** Limited suitable foraging habitat located within the BSA. There are three CNDDB records located within five miles of the BSA with the most recent in 2007. There are no CNDDB records located within one mile of the BSA.
golden eagle *Aquila chrysaetos*	--/WL	Species favors the mountains and coastal areas of California. They prefer to nest in chaparral and oak woodlands. They forage in open woodlands, savannas, and grasslands.	**Not Expected.** Marginal suitable foraging habitat located within the BSA. No suitable nesting habitat within the BSA. There is a single CNDDB record from 1969 located within five miles of the BSA.
western snowy plover *Charadrius nivosus nivosus*	FT/--	Found on sandy coasts and brackish inland lakes. It is a ground nesting species.	**Not Expected.** No suitable habitat exists located the BSA. No suitable nesting habitat within the BSA. There is a single CNDDB record from 1978 located within five miles of the BSA
prairie falcon *Falco mexicanus*	--/WL	Found in annual grasslands to alpine meadows, but associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields, and desert scrub areas.	**Not Expected.** Limited suitable foraging habitat located within the BSA. There is a single CNDDB record from 1982 located within five miles of the BSA.
Le Conte's thrasher *Toxostoma lecontei*	--/SSC	Known to occur on gentle to rolling, well-drained slopes bisected with dry washes, conditions found most often on bajadas or alluvial fans. The ground is bare to sparse with atriplex or low-growing grass.	**Not Expected**. Limited suitable habitat located within the BSA. There is a single CNDDB record from 1986 located within five miles of the BSA.
Mammals			
Townsend's big-eared bat *Corynorhinus townsendii*	--/SSC	Known to occur in coniferous forests, deserts, native prairies, riparian communities, active agricultural areas, and coastal habitat types. Distribution is strongly correlated with the availability of caves and cave-like roosting habitat.	**Not Expected.** No suitable habitat located within the BSA. There is three CNDDB records with the most recent from 1997 located within five miles of the BSA.
Mohave ground squirrel *Xerospermophilus mohavensis*	--/ST	Known to occur within Joshua tree woodlands, creosote scrub, saltbush scrub and Mojave mixed woody scrub vegetation.	**Low.** Limited suitable habitat present within the BSA. No sign or burrows observed during field visits. CDFW protocol survey were conducted in 2022 and negative for the species. There is a single CNDDB record dated 1973 located within five miles of the BSA.

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within Biological Study Area

Key:
Federal Listings
FE = Listed as endangered under the FESA
FT = Listed as threatened under the FESA
BCC = Birds of Conservation Concern (USFWS)
State Listings
SE = Listed as endangered under the CESA
ST= Listed as threatened under the CESA
SSC = Species of Special Concern (CDFW)
WL = Watch List (CDFW)
CNDDB Element Rankings
S1 = Less than 6 element occurrences (EOs) or 1,000 individuals or less than 2,000 acres (S1.1 very threatened, S1.2 threatened, S1.3 no current threats known)
S2 = 6-20 EOs or 1,000-3,000 individuals or 2,000-10,000 acres (S2.1 very threatened, S2.2 threatened, S2.3 no current threats known)
S3 = 21-100 EOs or 3,000-10,000 individuals or 10,000-50,000 acres (S3.1 very threatened, S3.2 threatened, S3.3 no current threats known)
S4 = Apparently secure; this rank is clearly lower than S3 but factors exist to cause some concerns; i.e., there is some threat, or somewhat narrow habitat.
? = indicates some uncertainty.

memorandum

date August 8, 2023

to Hugo Lopes
Mark Olson
Pacific Steel Group
4805 Murphy Canyon Road
San Diego, CA 92123

from Ryan Gilmore, Principal Arborist/Biologist – Environmental Science Associates

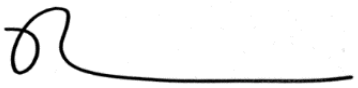
subject Western Joshua Tree Impact Table for the Mojave Micro Mill Project

Mr. Lopes and Mr. Olson:

On August 8, 2023, ESA International Society of Arboriculture (ISA) Board Certified Master Arborist (BCMA) and American Society of Consulting Arborist (ASCA) Registered Consulting Arborists (RCA) Ryan Gilmore (WE-9009BM/RCA #769) conducted a geospatial impact analysis of western Joshua trees located within the Mojave Micro Mill Project site. **Table 1** provides a summary of potential impacts due to project implementation per the currently proposed project design.

TABLE 1
SUMMARY OF WESTERN JOSHUA TREE IMPACT STATUS

Height Category	Preserved in Place	Encroached*	Removal	Total Trees
Five meters or greater in height	-	-	-	-
One meter or greater but less than five meters in height	44	3	90	137
Less than one meter in height	6	-	9	15
Total	**50**	**3**	**99**	**152**



- **Encroachments are expected when proposed construction extends into the five-foot buffer from the edge of an individual tree's dripline.**

Overall, 99 western Joshua trees will require removal due the proposed project design. A total of three (3) western Joshua trees will be encroached. The remaining 50 western Joshua trees will be preserved in place.

I further certify that I am a member of the ASCA and acknowledge, accept, and adhere to the ASCA Standards of Professional Practice. Additionally, I am an ISA BCMA, and have been involved in the practice of arboriculture

and the study of trees for over 25 years. Should you have any questions regarding the contents of this memorandum, please contact Ryan Gilmore at (909) 727-7634.
