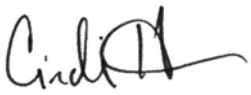
SUBJECT: NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR THE MOJAVE MICRO MILL BY PSGM3 HOLDINGS CORP (PACIFIC STEEL GROUP).

The Kern County Planning and Natural Resources Department as Lead Agency (per CEQA Guidelines Section 15062) has determined that preparation of an Environmental Impact Report (per CEQA Guidelines 15161) is necessary for the proposed project identified below. The Planning and Natural Resources Department solicits the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency may need to use the EIR prepared by our agency when considering your permit or other approval of the project.

You are invited to view the NOP and submit written comments regarding the scope and content of the environmental information in connection with the proposed project should you wish to do so. Due to the limits mandated by State law, your response must be received by **November 28, 2022 at 5:00 p.m**. Comments can be submitted to the Kern County Planning and Natural Resources Department, Attn: Mark Tolentino at the address shown above or to TolentinoM@kerncounty.com. A Scoping Meeting will be held on **Friday, November 18, 2022 at 1:00 p.m.**, at the address listed above.

PROJECT TITLE: Pacific Steel Group Mojave Micro Mill by PSGM3 Holdings Corp (PP22402); PLN21-00285: GPA No. 3, Map No. 213; ZCC No. 62, Map No. 213; PD No. 3, Map No. 213; ZV No. 24, Map No. 213.

PROJECT LOCATION: The proposed project site is located in the unincorporated area of southeastern Kern County, approximately five (5) miles northeast from the unincorporated community of Rosamond and approximately eight (8) miles southeast from the unincorporated community of Mojave.



The project site is bordered by Sopp Road to the north, State Route 14 (SR-14) and the Union Pacific Railroad to the west, and Edwards Air Force Base to the east, in Section 27 of Township 10 North, Range 12 West San Bernardino Meridian & Base.

PROJECT DESCRIPTION: The project proponent is proposing to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot micro mill facility with an additional 51,221 square feet of accessory buildings, for a total of 527,021 square feet, as well as

an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is included as part of the proposed project. Implementation of the project as proposed includes the following requests:

- General Plan Amendment No. 3, Map No. 213
    - From Map Code 8.5 (Resource Management) to 7.3 (Heavy Industrial), or a more restrictive map code designation
- Zone Change Case No. 62, Map No. 213
    - From zone classification A-1 (Limited Agriculture) to M-3 PD (Heavy Industrial - Precise Development Combining) on approximately 174 acres
- Approval for Precise Development Plan No. 3, Map No. 213
    - To allow for the construction and operation of an approximate 475,800 square-foot micro mill facility with an additional 51,221 square feet of accessory buildings, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres.
- Approval for Zone Variance No. 24, Map No. 213
    - To allow for a reduction in the required number parking spaces from 993 spaces to 246 spaces.

Documents can be viewed online at: https://kernplanning.com/planning/notices-of-preparation/

PLANNING AND NATURAL RESOURCES DEPARTMENT

Planning
Community Development
Administrative Operations

DATE: October 28, 2022

TO: Surrounding Property Owners within 1,000 Feet of Project Boundary; and Interested Parties

FROM: Kern County Planning and Natural Resources Department
2700 "M" Street, Suite 100
Bakersfield, CA 93311

SUBJECT: Notice of Preparation of an Environmental Impact Report – Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) (PP22402).

Dear Sir or Madam:

The Kern County Planning and Natural Resources Department has determined that preparation of an Environmental Impact Report (EIR) is necessary for the proposed project identified below. The purpose of this letter is to notify interested parties and surrounding property owners within 1,000 feet of the project boundaries of this determination. A copy of the Initial Study/Notice of Preparation (IS/NOP) prepared for this proposed project is available for viewing at the following Kern County website:

https://kernplanning.com/planning/notices-of-preparation/

The purpose of the IS/NOP is to describe the proposed project, specify the project location, and to identify the potential environmental impacts of the project so that Responsible Agencies and interested persons can provide a meaningful response related to potential environmental concerns that should be analyzed in the Environmental Impact Report.

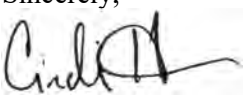
You are invited to view the NOP and submit written comments regarding the scope and content of the environmental information in connection with the proposed project should you wish to do so. Due to the limits mandated by State law, your response must be received by **November 28, 2022 at 5:00 p.m.** Comments can be submitted to the Kern County Planning and Natural Resources Department, Attn: Mark Tolentino at the address shown above or to TolentinoM@kerncounty.com. A Scoping meeting will be held on **Friday, November 18, 2022 at 1:00 p.m.**, at the address listed above.

Please be advised that any comments received after the dates listed above will still be included in the public record for this project and made available to decision makers when this project is scheduled for consideration at a public hearing. Please also be advised that you will receive an additional notice in the mail once a public hearing date is scheduled for this project. You will also be provided additional opportunities to submit comments at that time.

PROJECT TITLE: Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) (PP22402); PLN21-00285: GPA No. 3, Map No. 213; ZCC No. 62, Map No. 213; PD No. 3, Map No. 213; ZV No. 24, Map No. 213.

PROJECT LOCATION: The proposed project site is located in the unincorporated area of southeastern Kern County, approximately five (5) miles northeast from the unincorporated community of Rosamond and approximately eight (8) miles southeast from the unincorporated community of Mojave.

The project site is bordered by Sopp Road to the north, State Route 14 (SR-14) and the Union Pacific Railroad to the west, and Edwards Air Force Base to the east, in Section 27 of Township 10 North, Range 12 West San Bernardino Meridian & Base.

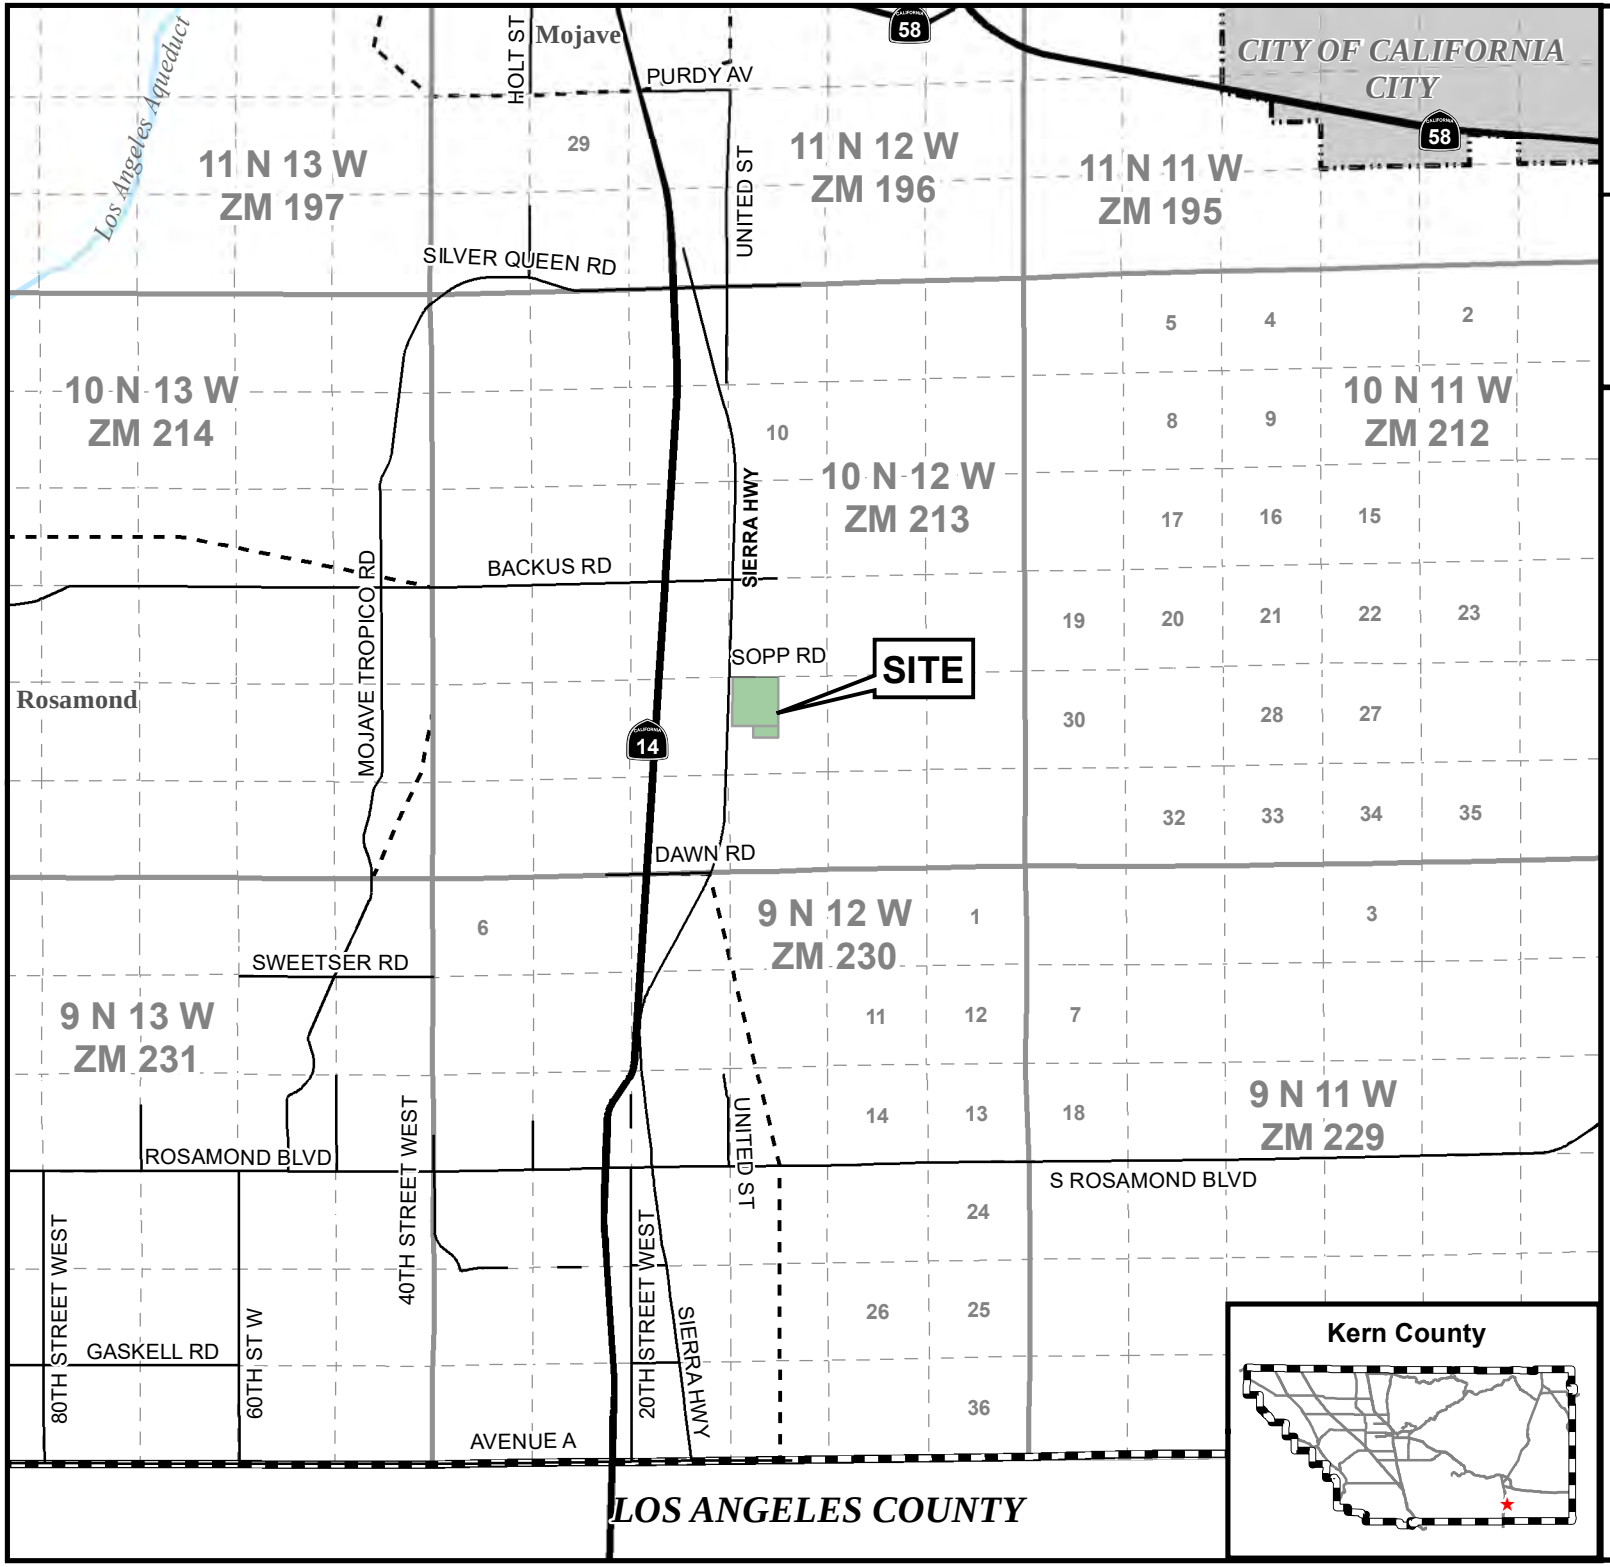


PROJECT DESCRIPTION: The project applicant is proposing to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot steel mill facility with an additional 51,221 square feet of accessory buildings and structures, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is proposed as part of the project.

Implementation of the project as proposed includes the following requests:

- General Plan Amendment No. 3, Map No. 213
    - From Map Code 8.5 (Resource Management) to 7.3 (Heavy Industrial), or a more restrictive map code designation
- Zone Change Case No. 62, Map No. 213
    - From zone classification A-1 (Limited Agriculture) to M-3 PD (Heavy Industrial - Precise Development Combining) on approximately 174 acres
- Approval for Precise Development Plan No. 3, Map No. 213
    - To allow for the construction and operation of an approximate 475,800 square-foot steel mill facility with an additional 51,221 square feet of accessory buildings and structures, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres.
- Approval for Zone Variance No. 24, Map No. 213
    - To allow for a reduction in the required number parking spaces from 993 spaces to 246 spaces.

Should you have any questions regarding this project, or the Initial Study/Notice of Preparation, please feel free to contact Mark Tolentino, Planner II, by phone at (661) 862-5041 or email TolentinoM@kerncounty.com.



Sincerely,

Cindi Hoover

Present Land Use/Zoning/General Plan Designation: Undeveloped / A-1 (Limited Agriculture) / 8.5 (Resource Management)

Project Description: The project applicant is proposing to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot steel mill facility with an additional 51,221 square feet of accessory buildings and structures, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is proposed as part of the project.

Implementation of the project as proposed includes the following requests:

- General Plan Amendment No. 3, Map No. 213

- From Map Code 8.5 (Resource Management) to 7.3 (Heavy Industrial), or a more restrictive map code designation

- Zone Change Case No. 62, Map No. 213
    - From zone classification A-1 (Limited Agriculture) to M-3 PD (Heavy Industrial - Precise Development Combining) on approximately 174 acres

- Approval for Precise Development Plan No. 3, Map No. 213
    - To allow for the construction and operation of an approximate 475,800 square-foot steel mill facility with an additional 51,221 square feet of accessory buildings and structures, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres.

- Approval for Zone Variance No. 24, Map No. 213
    - To allow for a reduction in the required number parking spaces from 993 spaces to 246 spaces.

Reviewing Agencies Checklist

INTRODUCTION

Pursuant to the California Environmental Quality Act (CEQA), the Kern County Planning and Natural Resources Department (County) will initiate the preparation of an Environmental Impact Report (EIR) for the PSG Mojave Micro Mill Project in the unincorporated area of southeastern Kern County, California.

1.0 PROJECT DESCRIPTION

1.1 Project Location

Pacific Steel Group, or PSGM3 Holdings Corp, (project proponent) proposes to develop the PSG Mojave Micro Mill Project (proposed project), a manufacturing facility to produce and fabricate reinforcing steel, commonly known as "rebar," which generally involves multiple smaller facilities designated for the import of scrap metal to be recycled, manufactured and ultimately exported as "rebar."

The project site is approximately 174 acres in size and is located at 860 Sopp Road, at the southeast corner of Sopp Road and Sierra Highway. **Figure 1** illustrates the regional location and surrounding vicinity of the proposed project and **Figure 2** depicts the project site boundary. The project site is bounded by the Union Pacific Railway and Sierra Highway (west), Sopp Road (north), vacant land (south) and Edwards Air Force Base (east). The Assessor's Parcel Numbers (APNs) for the project site are 431-010-02 and 431-030-02.

The project site is located in the United States Geological Survey (USGS) 7.5-minute Soledad Mountain quadrangle and is in Section 27 of Township 10 North, Range 12 West, San Bernardino Base and Mountain (Latitude 34° 56' 1.78" North; Longitude 118° 8' 41.15" West). The project site is approximately five miles northeast from the unincorporated community of Rosamond and approximately eight miles southeast from the unincorporated community of Mojave in unincorporated Kern County, California (refer to **Figure 1** and **Figure 2**).

Regional access to the project site is provided by State Route 14. The project site would be accessed by Dawn Road two miles south of the project site or Backus Road one mile north of the project site, from Sierra Highway to the east off of State Route 14.

1.2 Environmental Setting

The project site is situated in the southeastern corner of the desert region in unincorporated Kern County. Kern County is California's third largest County in land area and encompasses approximately 8,202 square miles. The County's geography includes, among other features, mountainous areas, agricultural lands, and deserts. Bakersfield is the largest city in Kern County and has a current estimated population of 397,392 residents (California Department of Finance [DOF]). The County's current estimated population is 914,193 residents.

Approximately 57 miles southeast of Bakersfield in the desert region near the unincorporated communities of Rosamond and Mojave, the proposed project site sits at the southeast corner of the Sopp Road and Sierra Highway intersection, approximately 1.25 miles southeast of the State Route 14 and Backus Road exit.

The project site is within the jurisdictional boundaries of the Kern County General Plan, and, as shown in **Figure 3** is designated as Map Code 8.5 (Resource Management). As shown in **Figure 4**, the project site is currently located within the A-1 (Limited Agriculture) zone district. The proposed project would require a General Plan Amendment to change the project site's Map Code Designation to 7.3 (Heavy Industrial), as

shown in **Figure 5**, and a Zoning Classification Change to change the project site's zoning designation to M-3 PD (Heavy Industrial - Precise Development Plan Combining), as shown in **Figure 6**. Although the project site is predominantly vacant land, the northwest corner was previously used as a seasonal farming operation with outdoor agricultural storage. An approximate 2.25-acre portion of the project site at the northern boundary had historically been used for unpermitted storage by the previous property owner, however, the project site is currently vacant and previous code violations on the project site have been abated.

1.2.1 Surrounding Land Uses

Surrounding land uses include the following:

North Shemshad Food Products Inc. production facility; Desert Block Co. Inc. manufacturing and distribution facility; sparse residential uses

South Vacant agricultural land

West Vacant agricultural land; Sierra Highway; Union Pacific railroad

East Edwards Air Force Base (EAFB)

As summarized above, existing land uses in the region include a mix of vacant agriculturally designated land, sparse industrial development immediately north of the project site such as warehouses and outdoor storage, Edwards Airforce Base to the east, and Sierra Highway and Union Pacific to the west. The immediate project area has few nearby residences. The nearest residence is approximately 1,000 feet to the northwest, however, clusters of unincorporated residences are located further from the project site near the State Route 14 and Backus Road exit, as well as approximately 1.25 miles west of the project site beyond State Route 14.

Table 1 below presents the existing land uses, General Plan designations, and Zoning classifications for the project site and surrounding area.

Table 1: Project Site and Surrounding Land Uses

	Existing Land Use	Existing Map Code Designation	Existing Zone Classification
Project Site	Agriculture – storage and seasonal	8.5 (Resource Management – min. 20 acres)	A-1 (Limited Agriculture)
North	Mixed Industrial	4.2/7.2 (Interim Rural Community Plan/Service Industrial) (Rosamond Specific Plan)	M-2 (Medium Industrial)
East	Edwards Air Force Base	1.1 (State and Federal Land)	A-1 (Limited Agriculture)
South	Vacant Ag land	8.5 (Resource Management – min. 20 acres)	A-1 (Limited Agriculture)
West	Vacant Ag land; Sierra Hwy; Union Pacific Railroad	8.5 (Resource Management – min. 20 acres)	A-1 (Limited Agriculture)

The elevation of the project site ranges between approximately 2,554 and 2,564 feet above mean sea level (AMSL). The project site is relatively flat with a gentle southeast-facing slope. The project site is not located within any critical habitat units for federally-listed species or any other designated conservation area.

Vegetation within the project site is typical of vegetation communities found throughout the surrounding western Mojave Desert region. Vegetation communities found in the area are generally characteristic of Mojave Desert scrub habitats and include creosote bush (*Larrea tridentata*), shadescale (*Atriplex confertifolia*), spinescale (*Atriplex spinifera*), burrobush (*Ambrosia dumosa*), and four-wing saltbush (*Atriplex canescens*). Joshua trees (*Yucca brevifolia*) are also common throughout the project site, with the potential of Joshua tree woodland overstory covering some of these desert scrub communities in undisturbed portions of the project site. Soils in the area are characterized as sandy to gravelly, with the northwest corner of the project site containing Rosamond composition whereas the balance of the project site contains the Adelanto composition.

As shown in **Figure 7**, the project site is designated as Zone "X" based upon the Flood Insurance Rate Map (FIRM) overlay as issued by the Federal Emergency Management Agency (FEMA), which indicates the project site is not in an area of flood hazard. The nearest flood hazards in the area are shown to be approximately one mile north and one mile south of the project site. The project site is not identified as a wetland area on the National Wetlands Inventory.

There are no identified State-designated Alquist-Priolo Earthquake Fault Zones on the project site and the nearest active fault is the Garlock Fault, which is located approximately 14 miles to the northwest of the project site.

Although the project site is located within the historical boundaries of Agricultural Preserve Number 24, the project site is not included in the Agriculture Preserve, nor is it designated as Prime Farmland and Unique Farmland by the Department of Conservation Farmland Mapping and Monitoring Program (FMMP). Further, there are no existing or active agricultural land use contracts on the project site.

The project site is not designated as a mineral resource zone. A portion of the mineral rights within the project site are owned separate from the surface rights. Based on a review of records maintained by the California Department of Conservation/California Department of Conservation Geologic Energy Management Division (CalGEM), there are no wells identified on site.

The proposed project is not located within an Airport Sphere of Influence (SOI) of any existing airport, per the Kern County Airport Land Use Compatibility Plan (ALUCP), with the nearest airports being the Rosamond Sky Park located approximately 5.5 miles southwest of the project site and the Mojave Air and Space Port located approximately 8 miles north of the project site.

The proposed project would be served by the Kern County Sherriff's Office (KCSO) for law enforcement and public safety, Kern County Fire Department (KCFD) for fire protection, and Kern County Medical Emergency Service for emergency medical and rescue services. The nearest KCSO substation and KCFD fire station (Station No. 15) that would serve the proposed project are both located in the community of Rosamond, approximately 5.5 miles southwest of the project site, specifically at 3179 35th Street West and 3219 35th Street West, respectively. The nearest hospitals are the Adventist Health Tehachapi Valley Hospital at 1100 Magellan Drive and the Dignity Health Hospital at 707 West Valley Boulevard in the city of Tehachapi, approximately 21.62 miles northwest of the project site. The nearest schools are approximately 5 miles south of the project site, which are Rosamond High School at 2925 Rosamond Boulevard and Abraham Lincoln Alternative school at 2601 Rosamond Boulevard.

1.3 Project Description

1.3.1 Project Overview

The project proponent is proposing to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot micro mill facility with an additional 51,221 square feet of accessory buildings, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is included as part of the proposed project.

As shown in **Figures 8a – 8f**, the proposed project would include the following components:

Micro Mill Facility - The approximate 475,800 square-foot facility includes 13 connected and standalone buildings, as follows:

Raw Material Handling

- 34,500 square foot scrap bay (approximately 75 feet high) for metal scrap storage areas;

Melt Shop Process

- 14,700 square foot electric arc furnace (EAF)/ladle metallurgy station (LMS) bay (approximately 110 feet high) with 3 bridge cranes (76 feet high);
- 12,500 square foot caster bay (approximately 100 feet high) with a 76-foot bridge crane;
- 6,600 square foot melt shop (MS) Complex structure (38 feet high);
- 8,700 square foot ladle maintenance bay (approximately 38 feet high);

Rolling Mill Process

- 61,000 square foot rolling mill bay (approximately 50 feet high);
- 18,700 square foot roll shop (approximately 35 feet high);
- 6,100 square foot service bay (approximately 40 feet high);
- 12,100 square foot spooler bay (approximately 35 feet high);
- 118,100 square foot finished goods bay (approximately 50 feet high);
- 400 square foot test bay (approximately 22 feet high);

Fabrication Shop Process

- 91,200 square foot stock bay (approximately 50 feet high); and
- 91,200 square foot fabrication bay (approximately 45 feet high).

Ancillary Buildings – The micro mill facility would be supported by seven ancillary structures that would serve the operation of the micro mill facility, as follows:

- 27,385 square foot storeroom and vehicle maintenance building (approximately 25 feet high);
- 10,500 square foot office building (approximately 21 feet high);
- 4,400 square foot locker room (approximately 18 feet high);
- 4,000 square foot slag processing office building;
- 4,000 square foot Containerized Power Control Room (PCR);

- 900 square foot guard shack/scale house; and
- 36 square foot Trucker Restroom Facility

Additional Site Components – Other notable components of the project site are as follows:

- Approximately 63 acres of ground-mounted solar panels;
- Substation to support ground-mounted solar panels;
- Fume Treatment Plant (approximately 120 feet high);
- A water treatment plant that includes a settling basin, cooling towers, pump pads, and heat exchangers;
- Slag Processing Plant;
- Dolomite and lime silos (approximately 40 feet high);
- Staging and spare parts storage;
- Numerous AC power unit substations throughout the project area in order to power the various buildings;
- On-site access corridors;
- 7 foot high perimeter security fencing (6 foot high chain link fence with 1 foot high barbed wire);
- On-site parking area including approximately 246 auto parking spaces, 17 truck stalls, and 50 trailer stalls;
- Road improvements along Sopp Road and future private road south of Lone Butte Road and Sopp Road corner;
- Landscaping; and
- New pavement, curb and gutter, and sidewalk.

Implementation of the proposed project includes the following requests:

- An amendment to the Land Use Element of the Kern County General Plan from Map Code 8.5 (Resource Management) to 7.3 (Heavy Industrial), or a more restrictive map code designation;
- A change in Zone Classification from A-1 (Limited Agriculture) to M-3 PD (Heavy Industrial - Precise Development Combining) District;
- A Precise Development Plan for conformity with the requested Zone Classification Change to M-3 PD.
- A Zone Variance for a reduction in the required number parking spaces from 993 spaces to 246 spaces.

1.3.2 Project Construction Activities

Grading of the proposed project is anticipated to start in Q2 of 2023, should commencement of construction be delayed, the start date of April 2023 represents a best-case scenario for the purposes of this Initial Study. Construction is proposed for completion in one phase with operation proposed to start Q2 of 2025.

The project frontage along Sopp Road and other roads would be improved as required by the Kern County Public Works Department and applicable development standards. Any required signing and marking would be constructed for the new pavement delineations (**Figures 8a – 8f**).

1.3.3 Project Operations and Maintenance

Within the 174-acre site, the proposed project would result in an approximate total-building coverage of 7 percent, or roughly 527,021 total-square feet, in addition to approximately 63 acres dedicated for ground-mounted solar panels to provide solar generated electricity to the direct current (DC) link feeding directly to the EAF and LMS. The following discussion provides the operational narrative, which supplements **Figure 9** – *Micro Mill Process Flow Chart*.

Micro Mill Facility

Raw Material Handling

Recycled scrap metal for the proposed project would be purchased from outside suppliers and transported into the facility by truck. Scrap metal to be received would include un-shredded and shredded scrap largely from crushed automobiles but also may include old appliances, machinery, sheet metal, rectangular bundles, and miscellaneous scrap metal. Un-shredded scrap metal would be processed by suppliers off-site to meet industry-standard size and cleanliness, arriving in a form either suitable for direct use in the steelmaking process or in larger sizes that would require cutting by a torch cutter, located in the scrap storage area, prior to its use in the process. The shredded and un-shredded scrap metal would either be stored at the 34,500-square-foot scrap bay, or if the proposed scrap bay is full, it would be stored at the proposed overflow scrap storage piles and then moved into the proposed scrap storage piles and then moved into the proposed scrap bay by front-end loader. Once the scrap metal is inside the proposed scrap bay, magnet cranes would be used to load it onto the primary conveyor feed system for transport to the proposed EAF. Approximately 1,200 tons per day would be processed within the micro mill facility.

In addition to the recycled scrap metal, the new micro mill facility would use raw materials in the steelmaking process, including imported carbon (petroleum coke) and fluxing agents (lime, dolomite, etc.). The carbon and fluxing agents would be delivered to the project site by truck and moved into storage silos via a blower system. The carbon and fluxing agents would be pneumatically transferred from these silos to the proposed EAF and proposed LMS, as needed. The carbon and fluxing agent silos would be equipped with fabric filter bin vents. The fabric filter bin vents are pulse jet style industrial dust collectors typically used to vent displaced air and harmful products in bins, silos or any other device or process that must contain or control dust particles.

Alloy aggregates will also be used in the proposed EAF and LMS for refining steel metallurgy. Alloys would be transported by truck to the project site in aggregate form and unloaded into storage bins. The alloys would be transferred by front-end loaders or forklift to the melt shop for use in the proposed EAF or LMS as needed. As part of the steel making process, Ferro Silicon 75, Ferro Silicon Manganese, Silicon Carbide, Calcium Carbide, Fluorspar, and Metallurgical carbon alloys will be used. Additionally, Ferro Vanadium, Ferro Chrome, and Calcium Silicon alloys may also be used as part of the steel making process.

Melt Shop Process

The Melt Shop (MS) process includes use of the EAF, LMS, casting operations, ladle and tundish preheat burners, and refractory repair. Scrap metal is pre-heated by the EAF exhaust heat and then fed into the EAF where molten steel is kept to further the melting process (also referred to as the "Hot Heel" practice), then chemical and electrical energy would be used to melt the entire batch of scrap metal. The melted steel is then transferred to the LMS via a ladle. The main emission control device for these proposed operations is the Fume Treatment Plan, as discussed further below, which captures emissions from the EAF and LMS.

Emissions from other processes within the melt shop are emitted through the caster roof distribution system. The following subsections describe each process that occurs during the melt shop process:

- ***Electric Arc Furnace (EAF):*** The steel making process begins with scrap metal being transported to the EAF, as discussed above, which is part of the 14,700-square-foot EAF/LMS bay. The EAF would be equipped with both electrodes and oxy-fuel burners. During the first use of the EAF after downtime, loading of scrap metal would be accomplished using charge buckets, which are transported into position over the EAF using overhead cranes. Once in position, the charge bucket would open, allowing scrap to fill the EAF. After the first batch of steel is made, scrap for subsequent batches would be fed to the EAF using a continuous conveyor (i.e., the endless charging system (ECS)). The conveyor would allow the continuous feeding of scrap metal to the EAF without opening the furnace, which would result considerable energy savings. In addition, the section of the ECS closest to the EAF would be enclosed to allow for pre-heating of the scrap metal using the off-gasses from the EAF.

  Once the EAF is filled with scrap metal, the furnace electrodes are lowered and energized. The energy from the electrodes is transferred to the scrap metal to raise the temperature to approximately 3,000 degrees Fahrenheit (ºF). A direct evacuation control (DEC) system would capture the EAF emissions and vent the emissions through a large duct to the Fume Treatment Plant. Off-gasses not captured by the Fume Treatment Plant or canopy are vented through the caster vent.

  During the melting process and refining processes that would take place in the EAF and the LMS, raw materials such as fluxing agents, metallurgic coal or coke, and oxygen would be added to the molten steel in order to achieve the desired product chemistry and properties and promote the formation of slag (a product of steelmaking, produced during the separation of the molten steel from impurities in the EAF, and is a complex solution of silicates and oxides that solidifies upon cooling). Flux, in metallurgy, is any substance introduced in the smelting of ores to promote fluidity and to remove objectionable impurities in the form of slag. Limestone and dolomite are commonly used for this purpose in smelting iron ores. Once the desired steel properties are reached in the EAF, the molten steel is poured (i.e., “tapped”) into a refractory-lined transport vessel referred to as a “ladle.” The molten steel is then transferred to the LMS via a ladle car.

  The slag formed in the EAF would be emptied by tipping the EAF to the side and allowing the hot slag to be poured into a pile within the EAF/LMS bay. As the slag cools, some limited combustion of residual coke in the slag may occur. The slag would be subsequently removed from the pit using a front-end loader, quenched using process water, and transported to an outdoor storage pile before being processed on-site.

- ***Ladle Metallurgy Station (LMS):*** The ladles filled with molten steel would be transferred from the EAF to the LMS via the ladle car. At the LMS, the steel would be subjected to additional heating by electrical energy in order to maintain its molten state. The molten steel would be further refined with the injection and mixing of raw materials such as fluxing agents, carbon, and alloys into the molten steel. Once the molten steel reaches the desired temperature and composition (dependent on the physical properties of the desired product), the ladle would transport the molten steel to the continuous casting machine.

Emissions from the LMS would be captured by the ladle ducts connected to the Fume Treatment Plant. Emissions not captured by the ladle ducts or melt shop canopy would be emitted through the caster vent.

- ***MS Complex structure***: The processes performed in the EAF and LMS, as described in detail above, are controlled in the 6,600-square-foot MS Complex structure, which would house the necessary transformers, hydraulics, programmable logic controller (PLCs), and personnel to run the processes.

- ***Casting Operations:*** After reaching the desired temperature of approximately 3,000° Fahrenheit (F) and composition in the LMS, the ladle is transported to a continuous casting machine within the 12,500-square-foot caster bay. During casting, steel flows out of the bottom of the ladle via a slide gate into a tundish. A tundish is a holding vessel used to ensure continuous casting while ladles are switched out. Emissions from the process would be emitted through the caster vent.

  From the tundish, the steel flows into a single mold. In the mold, the steel is water-cooled and formed into bars, referred to as billets.

- ***Ladle and Tundish Preheat Burners:*** Refractory materials would line the ladles and tundishes which must be dried completely prior to steel production. Additionally, the ladles and tundishes must be preheated prior to the transfer of molten steel in order to prevent heat losses. Eight natural gas-fired, low NO_x burners would be used to preheat the ladles and tundishes. Combustion emissions generated during preheating and drying of ladles and tundishes would be routed to the caster vent.

- ***Refractory Repair:*** Refractory is made up of a layer of refractory bricks (with manganese and calcium oxide bases) and would be used in the EAF, ladles, and tundishes. For the EAF, the refractory would be changed only when the furnace is replaced. For the ladles and tundishes, occasional refractory repairs and replacements would periodically be required. This would involve the use of organic binding agents (binder) to hold the refractory bricks in place. Emissions from the binder would be routed to the caster vent. When the refractory is replaced or repaired, spent refractory would be recycled or disposed of, along with other various wastes generated in the steel production process. The work of performing ladle maintenance including refractory repairs would be made in the 8,700-square-foot Ladle Maintenance Bay.

- ***Induction Furnace:*** An induction furnace is located between the caster and the rolling mill for temperature elevation and stabilization prior to entering the first stand.

Rolling Mill Process

The rolling mill process is a metal forming process in which metal stock is passed through one or more pairs of rolls to reduce the thickness and to make the thickness of the metal uniform. Roll stands, holding pairs of rolls, are grouped together into rolling mills that can quickly process steel, into rebar. The following subsections describe each process that occurs during the rolling mill process:

- ***Rolling Mill:*** After continuous casting, the steel is conveyed through a series of rolling mill stands within the 61,000-square-footrolling mill bay that reduce the cross-sectional area and hot-form final rolled steel reinforcing bar. The rolled steel is then cooled on natural convection cooling beds,

sheared to length, bundled and stored or fed directly into spooler machines which roll the reinforcing bar into a spool. As production for a particular size rebar has been completed, the rolling mill stands are taken to the 18,700-square-foot roll shop where employees would replace worn parts and insert a new set of mill rolls in each stand to be able to produce the next size product.

The 6,100-square-foot service bay would include the utility systems to feed the rolling mill. These utilities include electrical and automatic with programmable logic controllers, switchgear and motor control centers, an air oil system pumps and tank for lubrication of the rolls, grease unit pumps and tanks for roller bearings, lube oil system with pumps and tanks for oil in the rolling mill gearboxes, a hydraulic system include hydraulic fluid tank and pump to pressurize hydraulic lines, and air compressors and tanks.

- ***Spooler:*** The products that exit the rolling mill, if not directed to the cooling bed, are instead directed to the spooling machines. There would be two spoolers that would roll the reinforcing bar into spooled packages.

- ***Finishing and Transportation:*** After the products have cooled, a shear blade would cut the products to customer-requested lengths. Automated bundling systems would prepare products for movement by overhead crane to storage areas or directly to trucks.

- ***Cooling Beds:*** The products that exit the rolling mill would be water quenched for tempering (used to improve hardness, strength, toughness, as well as decrease brittleness in fully hardened steel) and directed to the cooling for time and space to cool in the ambient air. This process would take place in the 400-square-foot test bay.

Fabrication Process

Since all rebar must be cut to length and often bent before it can be "placed" in a construction project, the proposed project would include an on-site 245,000 ton per year "cut and bend" facility with equipment provided from consolidated locations. Typically, reinforcing steel is exported off site to a separate fabrication shop, many of which are at various locations on the West Coast.

The on-site location of the fabrication shop eliminates the need for the fabrication shop to maintain an independent inventory, reduces scrap (because of the mill's capability to cut the custom lengths) and ensures that what scrap is generated would be recycled. The following subsections describe each process that occurs during the fabrication process:

- ***Stock Bay:*** The 91,200-square-foot stock bay is the first bay of the fabrication shop that serves as a temporary rebar stock and feeding area for fabrication equipment.

- ***Fabrication Bay:*** After the rebar is fed into the fabrication equipment, it would be fabricated to customers specific requirements within the 91,200-square-foot fabrication bay. The finished product would be loaded on trucks for shipment.

Ancillary Buildings

Storeroom and Vehicle Maintenance Building

The 27,385-square-foot storeroom and vehicle maintenance building would be used as a place where on-site equipment and vehicles can be serviced. The equipment that would be serviced here includes trailers,

trucks, carts and forklifts. All maintenance conducted in this building would consists of general wear and tear maintenance such as oil changes, tire rotations, light repair/replacement, engine servicing, coolant and filter maintenance, etc. Autobody repairs would be made off site. Vehicles and equipment would be brought here on a routine basis as well as when problems arise. The storeroom and vehicle maintenance building would also include maintenance, repair, and spare parts. Items such as spare mill rolls, safety supplies, bearings, pumps, cylinders, fasteners, electrical and plumbing components. All storage of parts and consumable items would be stored on racks and in bins as appropriate.

Power Control Rooms (PCR)

A majority of the machines and electricity used on the project site will use alternating current (AC) power provided by the local utility (i.e., Southern California Edison). AC power at 13.8 kilovolts (KV) from the local utility would be distributed to the various buildings various substations installed on the project site. There are several power control rooms (PCRs) located around the project site that would receive power from the main substation and transform that power to usable voltage for the specific area the PCR is located. PCR's consist of transformer, motor control centers and programmable logic controllers for the operation of the facility equipment.

Office Building, Locker Room, Guard Shack/Scale House, and Trucker Restroom Facility

The project site would also include other buildings not part of the micro mill process, including: 1) a 10,500-square-foot office building, which would include administrative offices for the micro mill facility; 2) a 4,400-square-foot locker room, which would include showers, bathroom facilities, and lockers for the micro mill facility employees; and 3) a 900-square-foot guard shack/scale house which would be constructed at the trailer entrance of the project site off of the proposed private road along the eastern boundary, and 4) a trucker restroom facility that would be provided along the proposed private road, near the entrance to the project site.

Additional Site Components

Solar Array and Substation

The proposed project would include approximately 63 acres dedicated to ground-mounted solar panels. The proposed 63-acre solar array is intended to generate 10-megawatt hours (MWh) of electricity for on-site use to power the EAF and the LMS. Additional energy sourced from Southern California Edison (SCE) would be required to power the remaining portions of the facility. A substation would be installed on the project site to support the ground-mounted solar panels.

Fume Treatment Plant

Emissions captured in the melt shop are vented to the Fume Treatment Plant and captured by the furnace exhaust system. Dust collected by the Fume Treatment Plant would be transferred to a dust silo controlled with a bin vent filter. The dust would then be shipped off-site by truck for recycling.

Water Treatment Plant

Water that has direct contact with contaminants in the steel making process (contact water) would be treated on-site. Water that has run through the steel making process then flows to a settling basin where settleable matter is dropped out. An oil skimmer also removes oils from the water in the basin. Water is pumped to a sand filter for further treatment. Water is stored in a clarified water tank where chemical dosing units are

used to balance the water's chemistry. Cooling towers would be used to reduce the temperature of the system, then collect water in the basin before pumping cooled water back to the process.

Note that cooling water, which does not come into contact with contaminants (non-contact water) is used to control temperatures of the steel making process. This water is in an enclosed system as it runs through the building. Cooling towers to reduce the temperature of the system, then collect water in the basin and is chemically balanced and strained before pumping cooled water back to the process.

Slag Processing Plant

The function of the slag (mainly composed by lime CaO (Calcium Oxide)) is to refine the steel from Sulphur (desulfurization) and absorb the oxides, formed as a result of deoxidation (also known as killing process).

After the slag is removed from the melt shop, quenched, and stored in an outdoor storage pile, the slag is processed by an on-site Slag Processing Plant. As part of the proposed project, a slag processing area would be developed. At the Slag Processing Plant, large pieces of slag would first be reduced in size by a ball drop crushing process. Slag would be processed through a system consisting of conveyors, hoppers, a jaw crusher, and a double deck screen.

In addition to the transportation by the conveyor system, loaders would also transport slag to the various piles. The processed slag stored in the piles would be transported off-site by truck to be sold to consumers, disposed of, or recycled. EAF slag is widely used in the transportation industry, construction, and cement manufacturing as well as wastewater and water treatment. This makes slag an important substitute for natural resources, leading to significant minimization in natural resource utilization.

The Slag Processing Plant also includes the 4,000-square-foot slag processing office building where the Slag Processing Plant would be operated.

Dolomite and Lime Silos

Silos would be provided onsite that would provide storage for fluxing agents (i.e., dolomite and lime) used during the melt shop process.

Staging and Spare Parts Storage

Approximately 6 acres of the project site would be dedicated for staging and storage of spare parts for the micro mill facility.

Paved/Unpaved Roads

Vehicle traffic would occur on paved and unpaved roads located throughout the facility. On-site roads would be used by various vehicles, including haul trucks, trailers, Taylor trucks (fork lifts), loader trucks, Euclid/roll-off trucks, inert gas (nitrogen, argon, oxygen) trucks, forklifts/loaders, water trucks, and small forklifts.

Utilities and Miscellaneous

- ***Cooling Towers:*** Two non-contact cooling towers and one contact cooling tower would be used to remove heat from the cooling water used in the proposed operations. The contact cooling tower's

water would come into direct contact with the steel during the rolling mill process to provide cooling which may increase the solid content in water.

The cooling water, which does not come into contact with contaminants (non-contact water) would be used for controlling temperatures of the steel making process. This water is in an enclosed system as it runs through the building. Cooling towers reduce the temperature of the system, then collect water in the basin and is chemically balanced and strained before pumping cooled water back to the process.

- ***Fuel Storage Tank:*** The scrap and slag handling equipment (e.g., front end loaders) utilize diesel as part of their operation. A 5,000-gallon diesel fuel tank is used to supply fuel for this equipment.

- ***Other Miscellaneous Equipment:*** Operations at the proposed micro mill would include additional pieces of equipment such as comfort heaters, hot water heaters, parts washers, blast cleaning equipment, and hand-held tools.

Project Site Access and Parking

Access to the project site is currently provided by Sopp Road, however the proposed private on-site road along the eastern perimeter of the project site would be constructed to County standards and as requested by the Kern County Public Works Department. Regional access to the project site is provided by State Route 14, followed by exiting at Dawn Road two miles south of the project site or Backus Road one north of the project site, both of which lead to Sierra Highway.

As indicated on **Figures 8a – 8f**, *Site Plan,* primary point of ingress and egress for employees and visitors is proposed from Sopp Road near the northwestern corner of the project site. Points of ingress and egress dedicated for delivery trucks and trailer would be from the proposed private on-site road along the eastern project boundary, identified by proposed monument signage, and guard shack/scale house.

A parking lot providing 246 parking spaces for visitors and employees would be accessed from the driveway off Sopp Road. A parking area providing 50 spaces for trailer parking as well as golf cart parking would be accessed from the private on-site road along the eastern project boundary. A truck staging area providing parking for 17 trucks would also be accessed from the private on-site road.

Site Security

Site security would include a perimeter fence enclosing the entire developed area, and a security guardhouse at the new eastern perimeter road designated for truck entry. The proposed guardhouse would be adjacent to truck scales and monument signage as indicated on the site plan (**Figures 8a – 8f**). As noted previously, employee and visitor access would be provided near the northwestern corner of the project boundary. All visitors that need to enter the operational locations inside the security fence would require prior security clearance.

Landscaping

Landscaping would be provided in three distinct areas: 1) in the northwest corner of the project site, west of the proposed employee and visitor parking; 2) along the northern boundary of the project site, north of the trailer parking areas; and 3) in the northeast corner of the project site and would extend along 10th Street W to the trailer entrance of the project site.

Operational Details

- ***Proposed Hours and Days of Operation:*** The primary reinforcing steel manufacturing operations would operate three eight-hour shifts per day with the potential to operate seven days per week. The fabrication operations would consist of two eight-hour shifts Monday through Friday. Thirty truck drivers, on day shift and afternoon shift, would transport fabricated rebar from the site to construction projects primarily in Southern California with a small percentage of fabricated rebar being transported to the Northern California and south across the border into Mexico.

  Anticipated administrative office hours would be from 7:00 a.m. to 5:00 p.m. There would be designated parking spots for visitors close to the entrance of the Administration Office.

- ***Employees:*** The micro mill facility would employ approximately 417 hourly and salaried employees. In addition, the project would employ approximately 23 third-party employees for security on-site and slag processing services. In total, the project would employ approximately 440 employees.

- ***Delivery and Shipping Truck Activity:*** It is expected the location would receive 97 trucks per day delivering raw materials and supplies. Outbound product and co-product delivery truck trips are expected to be 74 per day.

- ***Operational Water Use:*** The proposed project would be served with potable water provided by Antelope Valley – Eastern Kern (AVEK) Water Agency. Water use would be required as part of the rebar production process, including used to quench slag produced as a byproduct of the rebar production process, to cool steel once it is molded, and as part of tempering the rebar. Industrial water required for these processes, in addition to domestic water demand, would consume approximately 717 acre-feet per year. Domestic water demand would also be generated from the office building, locker room building, guardhouse and trucker restroom facilities, equating to approximately 301 acre-feet per year. Total annual water consumption for all uses would be approximately 1,018 acre-feet per year.

1.4 Project Objectives

The proposed project has the following primary objectives:

- Provide an environmentally responsible, reliable, long-term method for disposing of junk cars and other iron and steel scrap materials;
- Provide a reliable, high quality and price-competitive supply of concrete reinforcing rebar to serve California's growing demand for rebar;
- Serve as the sole rebar manufacturing facility based in California that would oversee the implementation of clean and efficient recycling, importing and exporting methods for scrap metal;
- Develop an innovative industrial use on land with ready access to infrastructure and a major transportation corridor.
- Develop a visually appealing industrial project that is consistent with the provisions of the Kern County Zoning Ordinance, Land Division Ordinance, and Development Standards.
- Promote land use compatibility with adjacent industrial uses by developing a compatible industrial project with a secure perimeter.
- Positively contribute to the local economy through new capital investment, the creation of new employment opportunities, expansion of the tax base, economic growth and development.
- Improve circulation through the construction of new roads and improvement of existing roads west of SR-14 and Sierra Highway.
- Site an industrial project in a location that minimizes conflicts with residential, conservation, and agricultural land uses.

1.5 Proposed Discretionary Actions/Approvals

To implement this project, the following discretionary and ministerial permits/approvals may be required, including but not limited to the following:

Kern County

Kern County, as Lead Agency for the proposed project, has primary discretionary authority over the proposed project. As noted above, construction and operation of the proposed project would require certain discretionary actions and approvals from the County consisting of the following:

- Certification of Final Environmental Impact Report.
- Adoption of 15091 Findings of Fact and 15093 Statement of Overriding Considerations.
- Adoption of Mitigation Measure Monitoring Program (MMMP).
- Approval by the Kern County Board of Supervisors for the proposed General Plan Map Code Designation Amendment.
- Approval by the Kern County Board of Supervisors for the proposed Change in Zone Classification.
- Approval by the Kern County Board of Supervisors for the proposed Precise Development Plan.
- Approval by the Kern County Board of Supervisors for the proposed Zone Variance.
- Kern County Grading Permits.
- Kern County Building Permits.
- Kern County Fire Safety Plan.
- Kern County Environmental Health Permits.

Other Responsible/Trustee Agency Approval

- Central Valley Regional Water Quality Control Board (RWQCB) Water Quality Certification (401 Permit), Waste Discharge Requirements, and National Pollutant Discharge Elimination System (NPDES) Construction General Permit.
- California Department of Transportation (Caltrans) Oversized Loads Permit.
- California Department of Fish and Wildlife (CDFW) Section 1600 *et seq*. permits (Streambed Alteration Agreements) and Section 2081 Permit (State-listed endangered species).
- Eastern Kern Air Pollution Control District (EKAPCD) Permits.
- Any other permits as required.

Other additional permits or approvals from responsible agencies may be required for the proposed project.

LEGAL DESCRIPTION

FOR APN/PARCEL ID(S): 431-010-02, 431-030-02

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE UNINCORPORATED AREA IN COUNTY OF KERN, STATE OF CALIFORNIA AND DESCRIBED AS FOLLOWS:

PARCEL 1: APN 431-010-02
THE NORTHWEST QUARTER OF SECTION 27, TOWNSHIP 10 NORTH, RANGE 12 WEST, SAN BERNARDINO MERIDIAN, IN THE COUNTY OF KERN, STATE OF CALIFORNIA, ACCORDING TO THE OFFICIAL PLAT OF THE SAID LAND ON THE FILE IN THE BUREAU OF LAND MANAGEMENT.

EXCEPTING THEREFROM A STRIP OF LAND 200 FEET WIDE LYING EQUALLY ON EACH SIDE OF THE CENTERLINE OF THE SOUTHERN PACIFIC RAILROAD AS CONSTRUCTED ON AUGUST 26, 1952 UPON, ACROSS OR ADJACENT TO SAID LAND ABOVE DESCRIBED, AS EXCEPTED IN DEED FROM SOUTHERN PACIFIC LAND COMPANY, A CORPORATION AND SOUTHERN PACIFIC RAILROAD COMPANY, A CORPORATION, TO MINTO FARROW, RECORDED OCTOBER 7 ,1952, IN BOOK 1991, PAGE 300 OF OFFICIAL RECORDS.

EXCEPT THEREFROM FIFTY PERCENT (50%) OF ALL OIL, GAS AND MINERALS INCLUDING THORIUM, GOLD, URANIUM, OR ANY OTHER RADIO ACTIVE MATERIALS WITHIN OR UNDERLYING SAID LAND, OR THAT MAY BE PRODUCED AND SAVED THERE FROM AS RESERVED BY MINTO FARROW IN THE DEED RECORDED JUNE 11, 1957 IN BOOK 2799, PAGE 153 OF OFFICIAL RECORDS.

PARCEL 2: APN 431-030-02
THE NORTH HALF OF THE NORTHEAST QUARTER OF THE SOUTHWEST QUARTER OF SECTION 27, TOWNSHIP 10 NORTH, RANGE 12 WEST, SAN BERNARDINO MERIDIAN, IN THE COUNTY OF KERN, STATE OF CALIFORNIA.

EXCEPT THEREFROM FIFTY PERCENT (50%) OF ALL OIL, GAS AND MINERALS INCLUDING THROIUM, GOLD, URANIUM, OR ANY OTHER RADIO ACTIVE MATERIALS WITHIN OR UNDERLYING SAID LAND, OR THAT MAY BE PRODUCED AND SAVED THEREFROM AS RESERVED BY MINTO FARROW IN THE DEED RECORDED JUNE 11, 1957 IN BOOK 2799, PAGE 153 OF OFFICIAL RECORDS.

TOPOGRAPHY

ALTA SURVEY PERFORMED BY:

AARON G. BYRD, PLS 7972
NEXUS 3D CONSULTING
220 18TH STREET
BAKERSFIELD, CA 93301
JANUARY 20, 2021

GENERAL NOTES

1. FOR ALL PARKING LOTS CONTAINING TEN (10) OR MORE SPACES, AT LEAST FIVE PERCENT (5%) OF THE TOTAL INTERIOR AREA DEVELOPED TO PARKING SHALL BE LANDSCAPED. TREES SHALL BE PLANTED AND MAINTAINED THROUGHOUT THE PARKING AREA AT A MINIMUM RATION OF ONE (1) TREE PER SIX (6) PARKING SPACES PLACED AT A MAXIMUM OF SIXTY-FIVE (65) FOOT INTERVALS. MINIMUM TREE SIZE SHALL BE FIFTEEN (15) GALLON CONTAINER. AN IRRIGATION SYSTEM ADEQUATE FOR THE MAINTENANCE OF THE LANDSCAPING SHALL BE INSTALLED.

2. WHERE PARKING FACILITY CONTAINING FIVE (5) OR MORE SPACE INCLUDES DIAGONAL OR PERPENDICULAR PARKING SPACES THAT ABUT PUBLIC STREET OR ROAD, AN ORNAMENTAL FENCE, WALL, EVERGREEN LANDSCAPING OR BERM, OR ANY COMBINATION OF THE ABOVE, OF NOT MORE THAN FOUR (4) FEET IN TOTAL HEIGHT SHALL BE ERECTED BETWEEN THE PARKING FACILITY AND THE STREET OR ROAD TO ELIMINATE HEADLIGHT GLARE.

2.0 KERN COUNTY ENVIRONMENTAL CHECKLIST FORM

2.1 Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a Potentially Significant Impact" as indicated by the checklist on the following pages.

☒ Aesthetics	☒ Agriculture/Forestry	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Energy
☒ Geology/Soils	☒ Greenhouse Gas Emissions	☒ Hazards & Hazardous Materials
☒ Hydrology/Water Quality	☒ Land Use/Planning	☒ Mineral Resources
☒ Noise	☒ Population/Housing	☒ Public Services
☒ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☒ Utilities/Service Systems	☒ Wildfire	☒ Mandatory Findings of Significance

2.2 DETERMINATION

(To be completed by the Lead Agency)
On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a “potentially significant impact” or “potentially significant unless mitigated” impact on the environment, but at least one effect (a) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (b) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENT IMPACT REPORT (EIR) is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature	Date
Printed Name	Title

3.0 EVALUATION OF ENVIRONMENTAL IMPACTS

(1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a Lead Agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

(2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

(3) Once the Lead Agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.

(4) Negative Declaration: "Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The Lead Agency must describe the mitigation measure and briefly explain how they reduce the effect to a less than significant level.

(5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other California Environmental Quality Act (CEQA) process, an effect has been adequately analyzed in an earlier EIR or Negative Declaration, Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:

   (a) Earlier Analysis Used. Identify and state where they are available for review.

   (b) Impacts Adequately Addressed. Identify which effects from the above checklist where within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

   (c) Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

(6) Lead Agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

(7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion

(8) The adopted guidelines state "This is only a suggested form, and lead agencies are free to use different formats; however, Lead Agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected." Kern County has adopted this format and included all questions from Appendix G.

(9) The explanation of each issue should identify:

   (a) The significance criteria or threshold, if any, used to evaluate each question; and

   (b) The mitigation measure identified, if any, to reduce the impact to less than significance

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

I. AESTHETICS

Would the project:

a) Have a substantial adverse effect on a scenic vista?	☒	☐	☐	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway?	☐	☐	☒	☐
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage points) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☒	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?	☒	☐	☐	☐

RESPONSES:

a) A scenic vista is an area identified or known for high scenic quality. Scenic vistas may be designated by a federal, State, or local agency and may also include an area that is designated, signed, and accessible to the public for the express purposes of viewing and sightseeing. The California Department of Transportation (Caltrans) states that a highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscapes, and the extent to which development intrudes upon the traveler's enjoyment of the view. While not designated as scenic highways, State Route (SR) 14 and Sierra Highway to the west of the project site traverse Eastern Kern and into Los Angeles County, providing views of undisturbed desert landscapes to commuters, which could be identified as scenic vistas. The undeveloped portions of Edwards Air Force Base (EAFB) that span the eastern boundary of the project site could similarly be identified as scenic vistas that would be obstructed with the construction of the proposed 63-acre solar array, cooling towers and manufacturing buildings that may have maximum heights proposed to be upwards of 110 feet. Therefore, further analysis is warranted in the EIR.

b) There are currently no designated State Scenic Highways throughout the County; however, the California Scenic Highways Master Plan designates three State Highways in Kern County as

"Eligible State Scenic Highway(s):" (1) Route 1 consists of SR-14 and State Highway 395 from north of Mojave and continues to the Inyo County line; (2) Route 2 consists of SR-58 between Mojave and Boron; and (3) Route 3 consists of 5 miles of SR-41 in northwest Kern County. Although the proposed project is not in the vicinity of any designated State Scenic Highways, regional access would be provided by SR-14, which is listed above as an eligible State Scenic Highway. While impacts to scenic resources within State Scenic Highways are not anticipated to occur, this topic will be further evaluated in the EIR.

c) The project site is located in a sparsely developed area of Kern County. The project site is primarily surrounded by undisturbed land designated for agricultural use, with sparse industrial development to the north of the project site containing outdoor storage and production facilities. The existing visual character of the area also includes undisturbed desert landscapes extending southward and east into EAFB territory. Currently, disturbed areas of the project site are limited to the northwestern corner of the project site, which abuts Sopp Road and the Union Pacific Railroad right-of-way, leaving the balance of the proposed project area undeveloped. Placement of the proposed manufacturing, recycling and distribution facilities, along with 63 acres of solar panels and associated infrastructure on the project site would not only alter the existing visual character of the area but may also be visible from publicly accessible vantage points. Proposed development would impact the existing visual character and quality of public views of the project site and its surroundings, thereby warranting further analysis in the EIR.

d) The proposed project would create a new source of light and glare, which may affect day- and nighttime views of the area. During construction, nighttime lighting would be used in short durations and would be temporary, occurring only as construction lasted. During operation of the proposed project, the project site would be regularly illuminated at night due to the 24-hour manufacturing schedule, the use of security and overhead lighting for parking areas, and aviation obstruction lighting for the proposed cooling towers. The proposed 63-acre incidental solar array, once constructed, may also result in potential light and glare impacts that could impact EAFB overhead flight operations. All lighting for the proposed project would be designed to meet Kern County Zoning Ordinance Chapter 19.81- Outdoor Lighting-Dark Skies Ordinance requirements, as well as incorporate any design features requested by EAFB or other military review. Further analysis of the light and glare generated by the proposed project will be provided in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
II. AGRICULTURE AND FOREST RESOURCES				
Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or Williamson Act contract?	☐	☐	☒	☐
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)) or timberland (as defined in Public Resources Code Section 4526) or timberland zoned Timberland Production (as defined by Government Code Section 51104(g),	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒
f) Result in the cancelation of an open space contract made pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for any parcel of 100 or more acres (Section 15206(b)(3)) Public Resources Code?	☐	☐	☐	☒

RESPONSES:

a) According to the California Department of Conservation - California Important Farmland Finder, the project site appears to be within and/or abutting designations of “Semi-agricultural and Rural

Commercial Land" as well as "Nonagricultural and Natural Vegetation" as of available 2018 data and mapping layers. No Farmland of Statewide Importance has been identified within the project site boundary. Surrounding properties contain similar designations of "Nonagricultural and Natural Vegetation" and "Semi-agricultural and Rural Commercial Land," in addition to "Rural Residential Land" east of the project site. Given that the project site is not designated as Prime and Unique Farmland, construction and/or operation of the proposed project would not result in the conversion of designated farmland to a non-agricultural use and, therefore, no impact is anticipated, and further analysis is not warranted in the EIR.

e) As noted previously, the project site is located within Agricultural Preserve No. 24, is zoned A-1 (Limited Agriculture) by the Kern County Zoning Ordinance and is designated 8.5 (Resource Management) by the Kern County General Plan. The proposed project would require changes in zoning to M-3 PD (Heavy Industrial – Precise Development Combining) and map code designation to 7.3 (Heavy Industrial). Neither the project site nor surrounding land are encumbered by an active Williamson Act contract; however, the changes to existing zoning will be analyzed in the EIR.

f) No lands within or immediately adjacent to the proposed project are zoned forest land or timberland or timberland zoned Timberland Production and there are not such resources on the project site. Therefore, this topic will not be further discussed in the EIR.

g) As noted above, no lands within or immediately adjacent to the project site are zoned forest land or timberland and do not contain any forested areas. Due to a lack of forest land on the project site, the proposed project does not involve any changes to the existing environment that, due to their location or nature, could result in impacts resulting in the loss of forest land or conversion of forest land to non-forest use. Therefore, no impact is anticipated, and this topic will not be discussed further in the EIR.

h) Neither the project site nor surrounding properties are designated as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. Thus, there are potential changes to the existing environment stemming from the proposed project and potential conversion of surrounding Farmland to non-agricultural. Therefore, further analysis is not warranted in the EIR.

i) Neither the project site nor surrounding land near the project site are encumbered by an active Williamson Act Land Use Contract and therefore, further analysis is not warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

III. AIR QUALITY

The significance criteria established by the applicable Air pollution control district shall be relied upon to make the following determinations. Would the project:

a)	Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b)	Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard? Specifically, would implementation of the project (in a specific location) exceed any of the following adopted thresholds:	☒	☐	☐	☐
	i. San Joaquin Valley Unified Air Pollution Control District:				
	<u>Operational and Area Sources</u>				
	Reactive Organic Gases (ROG) 10 tons per year.	☐	☐	☐	☒
	Oxides of Nitrogen (NO_x) 10 tons per year.	☐	☐	☐	☒
	Particulate Matter (PM_{10}) 15 tons per year.	☐	☐	☐	☒
	<u>Stationary Sources as determined by District Rules</u>				
	Severe Nonattainment 25 tons per year.	☐	☐	☐	☒
	Extreme Nonattainment 10 tons per year.	☐	☐	☐	☒

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

III. AIR QUALITY

(Continued)

ii. Eastern Kern Air Pollution Control District.

Operational and Area Sources				
Reactive Organic Gases (ROG) 25 tons per year.	☒	☐	☐	☐
Oxides of nitrogen (NO_x) 25 tons per year.	☒	☐	☐	☐
Particulate Matter (PM_{10}) 15 tons per year.	☒	☐	☐	☐
Stationary Sources as determined by District Rules 25 tons per year.	☒	☐	☐	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	☒	☐	☐	☐

RESPONSES:

a) The proposed project is located entirely within the jurisdiction of the Eastern Kern Air Pollution Control District (EKAPCD), in the Mojave Desert Air Basin (MDAB). The MDAB is designated as a nonattainment area for both the State and federal ozone standards and the state particulate matter (PM_{10}) standard. Project construction would generate emissions of reactive organic gases (ROG) and oxides of nitrogen (NO_X), both of which are known as ozone precursors, and PM_{10} that could result in significant impacts to air quality in the area.

EKAPCD's most recently adopted air quality management plan is its Ozone Air Quality Attainment Plan (AQAP) (EKAPCD 2017). As the proposed project would generate gaseous emissions of ozone precursors (along with PM_{10}) during construction, the proposed project could potentially conflict with EKAPCD's Ozone AQAP or thresholds for emissions of other criteria pollutants. In addition, project operations are anticipated to generate emissions as a result from heavy equipment and truck trips facilitating import and export of materials, as well as new stationary sources due to heating and cooling processes during manufacturing. Therefore, further analysis of air quality impacts is warranted to determine whether the project would conflict with or obstruct implementation of the applicable plans for attainment and, if so, to determine the reasonable and

feasible mitigation measures that could be imposed. An Air Quality Study, including Greenhouse Gas Analysis and Health Risk Assessment is being prepared for the project and further analysis is warranted in the EIR.

b) The proposed project is not located within the San Joaquin Valley Air Pollution Control District and, therefore, its adopted thresholds do not apply. However, as noted in Response (a) above, the project is located within the jurisdiction of the EKAPCD and the MDAB, which is designated as a nonattainment area for the State and federal ozone standards and the State PM_{10} standard. As such, the emissions of ozone precursors (ROG and NO_X) and PM_{10} during construction and operation of the project could result in a cumulatively considerable net increase of these criteria pollutants in the MDAB. Thus, the proposed project's contribution to cumulative air quality impacts in the MDAB could be potentially significant. The proposed project's contribution of construction and operational emission to the MDAB will be analyzed in the EIR.

c) The nearest sensitive receptor appears to be an isolated residence located approximately 1000 feet northwest of the project site across the Union Pacific Railroad and Sierra Highway. The next nearest sensitive receptors would be clusters of unincorporated residences located 1.25 miles southeast of the project site near the State Route 14 and Backus Road exit, and approximately 1.25 west of the project site further beyond State Route 14. Sensitive receptors could be exposed to pollutant emissions during construction and operation of the proposed project. The proposed project's construction-related activities would result in diesel exhaust emissions and dust (also known as PM_{10}) that could adversely affect air quality for the nearest sensitive receptors. The fully operational project would result in stationary sources of air pollutant emissions generated by heating and cooling processes during fabrication, from vehicular exhaust emissions generated by the large number of employees and resultant traffic, as well as from the import and export of metal material. Therefore, potential significant concentrations of emissions from both project construction and operations may result in potentially significant impacts on the nearest sensitive receptor(s).

   Additionally, exposure to Valley Fever and COVID-19 concerns from fugitive dust generated during construction is a potentially significant impact. There is potential that increased exposure to dust, which release *Coccidioides immitis* (CI) spores (if present) could be stirred up during excavation, grading, and earth-moving activities, exposing construction workers and sensitive receptors to these spores, increasing the likelihood of Valley Fever infection and/or exacerbate health concerns related to COVID-19. Thus, impacts to sensitive receptors via pollutant concentrations is potentially significant and will be further evaluated in the EIR.

d) The proposed project's operation would involve regular vehicular emission from employee traffic and trucking imports and exports of materials. Furthermore, new stationary sources of emissions would result from the heating and cooling processes during the manufacturing process, such as emissions captured in the EAF/LMS bay that are vented to the Fume Treatment Plant including dust. Dust from the Fume Treatment Plant would be transferred to a dust silo controlled with a bin vent filter and subsequently be shipped off-site by truck for recycling. As discussed above, the nearest known sensitive receptor is located approximately 1,000 feet northwest of the project site, with the next nearest being clusters of rural residences located approximately 1.25 miles away. Any odors or emissions generated from regular operations would potentially disperse throughout the vicinity of the project site and may affect sensitive receptors in the area. Therefore, this potential outcome will be further evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES				
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?	☒	☐	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service?	☒	☐	☐	☐
c) Have a substantial adverse effect on federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☒	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan?	☐	☐	☒	☐

RESPONSES:

a) A database query of the CDFW California Natural Diversity Database (CNDDB) species was performed through the Online Quick Viewer by reviewing USGS 7.5-minute quadrangles that intersect a two-mile radius of the Project. A cursory search of USGS 7.5 quadrangles Soledad Mountain and Bissel identified the potential for species of special concern.

CNDDB species within the Soledad Mountain 7.5-minute quadrangle include golden eagle, prairie falcon, loggerhead shrike, Le Conte's thrasher, short-eared owl, burrowing owl, grasshopper mouse, San Joaquin pocket mouse, Townsend's big-eared bat, Mohave shoulderband, western Joshua tree, sagebrush loeflingia, alkali mariposa-lily, Mojave spineflower, and recurved larkspur.

CNDDB species within the Bissel 7.5-minute quadrangle include prairie falcon, loggerhead shrike, burrowing owl, Mohave ground squirrel, desert tortoise, western Joshua tree, alkali mariposa-lily, white pygmy-poppy and Mojave spineflower. Therefore, construction and operation of the proposed project could have a substantial adverse effect on species identified as a candidate, sensitive, or special-status species. Impacts are anticipated to be potentially significant and further analysis will be provided in the EIR.

b) The project site is primarily vacant land designated for limited agricultural use, with only the northwestern portion of the having been disturbed by previous human activity. Riparian habitats are found along rivers, creeks, streams, and lakes and generally consist of plant communities of woody vegetation, thus the project site does not contain any sensitive natural communities such as riparian habitats due to its location in the desert region of Kern County. However, impacts on any species identified as a candidate, sensitive, or special-status species and potential habitat modifications will be identified further in the EIR. Impacts are anticipated to be potentially significant and further analysis is warranted in the EIR.

c) Potential federal or state-protected water-based resources such as streams and washes could be present on the project site and might be impacted by project construction activities. Field surveys will be conducted to determine whether the project site contains features that are protected under federal or state regulations will be conducted as part of the EIR. Impacts to protected wetlands would be considered potentially significant. Further analysis of this issue will be included in the EIR.

d) The majority of the project site is vacant land. The project site and surrounding area may be used for land-based migration or dispersal by native wildlife species, such as migratory birds, (e.g., burrowing owl) and desert tortoise. There are no water bodies or water courses that could provide migratory habitat for fish and wildlife species. Project construction and operation could also remove foraging habitat while lighting from the project site could potentially affect movement of wildlife around the project site. Therefore, the project has the potential to significantly impact movement of native resident wildlife species. A Biological Resources/Biota Report will be prepared for the project will be incorporated in further analysis of impacts in the EIR.

e) The Kern County General Plan includes oak tree conservation policies; however, there are no oak trees present on the project site. Joshua trees (*Yucca brevifolia*) are protected under the California Desert Native Plants Act (CDNPA) and California Endangered Species Act (CESA) and have been documented within the project site through available databases. Implementation of the proposed project has the potential to impact Joshua trees, and given this potentially significant impact, this topic will be further evaluated in the EIR.

f) The proposed project is not situated within the boundaries of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat

Conservation Plan (HCP). Therefore, impacts are anticipated to be less than significant; however, this topic will be further evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

V. CULTURAL RESOURCES

Would the project:

a) Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☒	☐	☐	☐

RESPONSES:

(a-c) The proposed project site consists of predominantly undeveloped land, with the Northwest portion of the site having been disturbed for previous agriculturally related activities. Construction and development of the proposed project would require ground disturbance for grading, excavation, and clearing and installation of utilities; this development could potentially impact historical resources and archaeological resources. Although the Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was negative, pursuant to Senate Bill 18 (SB 18) and Assembly Bill 52 (AB 52), affected tribal organizations have been notified of the proposed project and have provided comments regarding interest in involvement with the permitting process as well as suggested mitigation measures. A Cultural Resources Phase 1 survey and Paleontological Resources Assessment will be conducted for the project. Therefore, further analysis is warranted in the EIR. Additionally, as ground-disturbing activities may result in the possible disturbance of human remains, impacts and mitigation will be further evaluated in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

VI. ENERGY

Would the project:

a)	Result in potentially significant environmental impact due to wasteful, inefficient or unnecessary consumption of energy resources, during project construction or operation?	☒	☐	☐	☐
b)	Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?	☒	☐	☐	☐

RESPONSES:

a) Construction of the proposed project would involve on-site energy demand and consumption related to use of fossil fuels in the form of gasoline and diesel fuel for construction worker vehicle trips, hauling and materials delivery truck trips, and operation of off-road construction equipment. In addition, diesel-fueled portable generators may be necessary to provide additional electricity demands for temporary on-site lighting, welding, and for supplying energy to areas of the project site where energy supply cannot be met via a hookup to the existing electricity grid.

Energy use associated with operation of the proposed project would be unique to Kern County and demand is anticipated to be significant relative to existing operations in the area. Operation of the project would result in on-site energy consumption for various aspects of manufacturing, including but not limited to heating and cooling processes, lighting, utilities, water use, etc. Although the proposal includes construction of an approximate 63-acre accessory solar array designated for the heating processes that take place within the electric arc furnace and ladle metallurgy station, net energy demand is expected to exceed on-site generation and would require connection to the grid. In addition to on-site energy use, the proposed project would result in transportation energy use associated with employee vehicle trips and truck trips generated by the proposed project. Further analysis is warranted in the EIR.

b) Due to the increased on-site consumption of energy during construction and operation, the project may have the potential to conflict with or obstruct a State or local plan for energy efficiency. Further analysis is warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS				
Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii. Strong seismic ground shaking?	☒	☐	☐	☐
iii. Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv. Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (19914), creating substantial risks to life or property?	☒	☐	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☒	☐
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	☒	☐	☐	☐

RESPONSES:

a) (i-iii) The project site is relatively flat and gradually slopes to the northeast, with ranges in elevation of approximately 2,554 to 2,564 feet above mean sea level (amsl). The project site is located in an area known for seismic activity and is referred to as the Eastern California Shear Zone (ECSZ). The ECSZ is dominated by a series of northwest-trending, right-lateral, strike-slip faults that cross the Mojave Desert province east of the San Andreas Fault. Although the project site is located on alluvial soils derived from granite, liquefaction is unlikely because the depth to water table is more than 80 inches below ground surface according to the USDA Natural Resources Conservation Service web soil survey database. Kern County has adopted the California Building Standards Code (CBC) 2016 Edition (California Code of Regulations [CCR] Title 24) effective January 1, 2017, which imposes substantially the same requirements as the International Building Code (IBC), 2015 Edition, with some modifications and amendments. Adherence to all applicable regulations would mitigate any potential impacts associated with the proposed project. Impacts are expected to be less than significant; however, a Site Geotechnical/Soils Characteristics study will be prepared to be incorporated into further analysis in the EIR.

(iv) As discussed above, the project site is relatively flat and therefore is not considered a high-risk area for landslides nor subject to movement of rock, debris, or soil. The project site does not contain any physical constraint map code designations as defined under the Kern County General Plan "Physical and Environmental Constraints" chapter, and although impacts are considered to be less than significant, further analysis is warranted in the EIR.

b) The proposed project would require grading and filling over most of the project site. As a result, project construction would have the potential to result in erosion, sedimentation, and discharge of construction debris from the project site. Vegetation clearing and grading activities, for example, could lead to exposed or stockpiled soils susceptible to stormwater runoff flows and wind forces. The compaction of soils by heavy equipment may reduce the infiltration capacity of soils (exposed during construction) and increase runoff or erosion potential. A Storm Water Pollution Prevention Plan (SWPPP) and/or Drainage Control Plan would be prepared that specifies Best Management Practices (BMPs) to prevent construction pollutants, including eroded soils (such as topsoil), from moving off the project site. Impacts are anticipated to be less than significant with implementation of the County and State requirements. However, further analysis is warranted in the EIR.

c) The project site lies in a relatively flat-lying plain where landslides, lateral spreading, subsidence, liquefaction, and collapse are not expected to occur. Liquefaction potential occurs when there is a combination of unconsolidated soil type and high groundwater combined with high potential seismic activity. Impacts related to geologic instability are not anticipated to occur or pose a hazard to the proposed project or surrounding area; however, further analysis is warranted in the EIR.

d) Expansive soils are fine-grained soils (generally high plasticity clays) that can undergo a significant increase in volume with an increase in water content and a significant decrease in volume with a decrease in water content. Soils that are considered expansive contain significant amounts of clay materials. A Site Geotechnical/Soils Characteristics study will be prepared for this project to confirm the presence or absence of expansive soils within the project area and further analysis is warranted in the EIR.

e) A Site Geotechnical/Soils Characteristics study of the project site will be conducted to determine the physical characteristics of the underlying soils to determine the capability of adequately

supporting the use of septic tanks or alternative wastewater disposal systems in the event the project is not able to connect to sewers for the disposal of wastewater, and thus will warrant further analysis in the EIR.

f) A Paleontological Resources Assessment for the project site will be prepared to determine the existence of any unique paleontological resources, sites or unique geologic feature that have the potential of being impacted by the resulting development. Thus, further analysis is warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

VIII. GREENHOUSE GAS EMISSIONS

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

RESPONSES:

a-b) Greenhouse gas (GHG) emissions emitted by human activity are implicated in global climate change or global warming. The principal GHGs are CO_2, methane (CH_4), NO_X, ozone, water vapor, and fluorinated gases. California has passed several bills and the governor has signed at least three Executive Orders regarding GHGs. Assembly Bill (AB) 32 (the Global Warming Solutions Act) was passed by the California legislature on August 31, 2006, which now requires the State's global warming emissions to be reduced to 40 percent below 1990 levels by 2030. The temporary construction activities associated with the proposed project, which would involve operation of heavy off-road equipment, on-road trucks (for deliveries and hauling), and construction worker commute trips, would generate GHGs. Proposed operations would also likely generate GHG emissions from metal heating and cooling processes during manufacturing, on-site stationary electricity consumption, as well as from mobile source emissions associated with employee trips and import/export-related truck trips. Furthermore, these emissions may have the potential to exceed established thresholds that are designed to ensure compliance with plans adopted for the purpose of reducing GHG emissions. Therefore, further analysis is warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS				
Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☒	☐	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☒	☐	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within ¼ mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e) For a project located within the adopted Kern County Airport Land Use Compatibility Plan, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☒	☐	☐	☐
f) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?	☒	☐	☐	☐

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS (Continued)				
h) Would implementation of the project generate vectors (flies, mosquitoes, rodents, etc.) or have a component that includes agricultural waste? Specifically, would the project exceed the following qualitative threshold: The presence of domestic flies, mosquitoes, cockroaches, rodents, and/or any other vectors associated with the project is significant when the applicable enforcement agency determines that any of the vectors:				
i. Occur as immature stages and adults in numbers considerably in excess of those found in the surrounding environment; and	☐	☐	☒	☐
ii. Are associated with design, layout, and management of project operations; and	☐	☐	☒	☐
iii. Disseminate widely from the property; and	☐	☐	☒	☐
iv. Cause detrimental effects on the public health or well-being of the majority of the surrounding population.	☐	☐	☒	☐

RESPONSES:

a) The proposed project's construction phase would likely generate waste that is considered non-hazardous, such as cardboard, wood pallets, copper wire, scrap steel, common trash, and wood wire spools. Although field equipment used during construction activities could contain various hazardous materials (i.e., hydraulic oil, diesel fuel, grease, lubricants, solvents, adhesives, paints, etc.), these materials are not considered to be acutely hazardous, would be used in accordance with the manufacturer's specifications, and all applicable regulations. In addition, hazardous fuels and lubricants used on field equipment would be subject to a Construction Waste Management Plan and, if required, a Spill Prevention, Containment and Countermeasure Plan.

Proposed operations, however, may result in residual wastes that could be considered hazardous due to the proposed regular import and use of raw materials used to support the steelmaking process. These materials would be transferred from delivery trucks to on-site in silos via a blower system; silos would be equipped with fabric filter bin vents. The carbon and fluxing agents would be pneumatically transferred from these silos to the proposed Electric Arc Furnace and ladle metallurgy station as needed. Although the finished manufactured steel "rebar" or "slag" byproducts are not considered hazardous materials, further analysis in warranted in the EIR.

With regard to the hazardous materials related to the proposed 63-acre solar array, photovoltaic (PV) solar panels are known to be composed of Cadmium Telluride (CdTe), a known hazardous material, and thus, its use during implementation of the project will be analyzed in the EIR to determine if it creates a significant hazard to the public or the environment.

b) The proposed project would be subject to all local, State, and federal laws pertaining to the use of hazardous materials on the project site and would be subject to review by the Kern County Public Health Services Department, Environmental Health Services Division. However, construction and operation of the proposed project may include the accidental release of stored raw materials (carbon and fluxing agents), imported scrap metal residuals, fabrication byproducts, cleaning fluids and petroleum products including lubricants, fuels, and solvents. Implementation of established construction controls and operational safety protocols would reduce the risk of hazardous materials spills and releases during project construction. Implementation of BMPs would ensure that hazardous materials used on-site during operation would neither be released into the environment nor expose operational personnel to hazardous materials. However, further analysis is warranted in the EIR.

c) The nearest schools, Rosamond High and Abraham Lincoln Alternative School, are both approximately 5 miles south of the project site in the community of Rosamond. It is unlikely that the project would emit hazardous materials or involve handling hazardous or acutely hazardous materials or substances in proximity to these school. However, further analysis is warranted in the EIR.

d) A review of the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC) latest list of parcels relating to hazardous wastes pursuant to Section 65962.5 of the California Government Code indicates the project site is not listed. Nonetheless, further analysis is warranted in the EIR.

e) The nearest aircraft operation facilities identified by the Kern County ALUCP are the Rosamond Sky Park, approximately 5.5 miles southwest of the project site and the Mojave Air and Space Port approximately 8 miles north of the project site. The project site is not within the Sphere Of Influence (SOI) of any airport identified by the Kern County ALUCP. In addition, Edwards Air Force Base is located directly east of the project site and structure heights as well as cooling tower emissions may impact overhead aircraft operations carried out by EAFB. Therefore, the impacts are potentially significant; however, further analysis is warranted in the EIR.

f) The proposed project would not interfere with any known existing emergency response plans, emergency vehicle access, or personnel access to the project site. The project site is located in a rural area with existing access roads available to access the property in the event of an emergency, as well as proposes new road improvements along the eastern boundary, which would provide new access to the project site. Although impacts related to impairment of the implementation of, or

physical interference with, an adopted emergency response plan or emergency evacuation plan are anticipated to be less than significant, this topic will be further analyzed in the EIR.

g) Construction of the proposed project would be temporary in nature and is not anticipated to result in a long-term, increased risk of wildfires in the area. Operations, however, would involve the use of high-heat generating machinery and equipment as part of the metallurgy process. Although the facilities and on-site production processes are designed to be entirely enclosed with adequate measures for cooling and are equipped with industry-standard fire suppressant designs, the potential for inadvertent release of flammable emissions in a worst-case scenario is considered low. The site is located near the Edwards Air Force Base Solar Project to the northeast, the Union Pacific Railway and Sierra Highway to the west, and upon completion of the project, 63 acres of accessory solar panels would provide a buffer from undisturbed lands to the south of the micro mill. Nonetheless, portions of undisturbed lands containing desert scrub vegetation would be near the site and the current rural setting would lack adequate emergency-response infrastructure, and thus the potential for increased risk of wildfires in the area would remain. The proposed project would comply with all applicable wildland fire management plans and policies established by the California Department of Forestry and Fire Protection (CAL FIRE) and the Kern County Fire Department. Impacts are expected to be less than significant; however, further analysis is warranted in the EIR.

h) (i-iv) Project-related infrastructure is not expected to result in features or conditions that could potentially provide habitat for vectors such as mosquitoes, flies, cockroaches, or rodents (such as standing water, agricultural products, or agricultural waste). During construction and operation, workers would generate small quantities of solid waste (i.e., trash, food containers, etc.) that would be stored in enclosed containers, then transported to and disposed of at approved disposal facilities. However, these types of waste would not likely support vectors and would not generate any standing water or other features that would attract nuisance pests or vectors. On-site facilities such as trash receptacles with regular site-servicing would be installed in conformity with County development standards and local services. Therefore, impacts that could potentially occur are anticipated to be less than significant; however, this topic will be further analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
X. HYDROLOGY AND WATER QUALITY				
Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	☒	☐	☐	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☒	☐	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would:	☒	☐	☐	☐
i. result in a substantial erosion or siltation on or off-site	☒	☐	☐	☐
ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	☒	☐	☐	☐
iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☒	☐	☐	☐
iv. Impede or redirect flood flows?	☒	☐	☐	☐
d) In flood hazard, tsunami, seiche zones, risk release of pollutants due to project inundation?	☐	☐	☒	☐
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☒	☐	☐	☐

RESPONSES:

a) Implementation of the proposed project would result in development and site runoff contributing pollutants to the drainages. The Lahontan Regional Water Quality Control Board (LRWQCB) regulates stormwater discharge in the area. A storm water pollution prevention plan (SWPPP) would be prepared for the proposed project, which would identify potential pollutant sources that may affect the quality of discharges associated with construction activity and incorporate BMPs to address erosion and sediment control, wind erosion, source controls, and waste management to effectively prevent the off-site migration of contaminant-laden stormwater.

Surface water and groundwater quality could also be affected through the accidental release of hazardous materials during construction activities. These materials may include hydraulic oil, diesel fuel, grease, lubricants, and other petroleum-based products contained in construction vehicles and heavy equipment. During project operations, accidental releases of stored raw materials (carbon and fluxing agents), imported scrap metal residuals, fabrication byproducts and cleaning fluids may occur in instances of inclement weather or runoff from heavy rains due to the increase in impervious surfaces. Material Safety Data Sheets would be made available to all site workers for cases of emergency. The SWPPP would be implemented to avoid potential impacts caused by spills and leaks and BMPs would be required during construction activities. However, potential impacts related to water quality will be further analyzed in the EIR.

b) During construction of the proposed project, water would be required for common construction-related purposes including but not limited to dust suppression, soil compaction, and grading. Dust control water may be used for ingress and egress of on-site construction vehicle equipment traffic. Although a sanitary water supply would not be required during construction because restroom facilities would likely be provided by portable units to be serviced by licensed providers, regular operations would require adequate facilities such as restrooms and showers within the locker room in order to serve the needs of regular employees and visitors. The proposed project would operate three eight-hour shifts per day with the potential to operate seven days a week, employing an approximately 440-person workforce. In addition, water is required during the manufacturing process for cooling beds as well as any proposed landscaping throughout the project site. The project proponent has provided a will serve letter from the Antelope Valley Eastern Kern water agency confirming the availability of potable water service to the project site. Furthermore, as required by SB610 a water supply assessment will be completed for the proposed project to analyze potential impacts to groundwater supplies. Therefore, further analysis is warranted in the EIR.

c) (i-iv) The proposed project would require significant soil disturbance within the project site during project construction. Development of the proposed project site would increase the impervious surface area of the project site and could result in increased sheet flow across the project site. A hydrology flood report will be prepared for the proposed project to analyze potential impacts to drainage patterns, and a biological resources assessment will be prepared to identify any potential wetlands or jurisdictional water bodies.

A drainage control plan would be prepared, if necessary, that would incorporate BMPs to limit erosion during construction and operation of the proposed project. A SWPPP would be prepared that would provide recommendations on the proper control and treatment of any stormwater prior to discharge. The proposed project would alter drainage patterns at the project site by developing a previously undeveloped site. With adherence to site-specific BMPs, potential pollutants would be minimized to the extent practicable and should not exceed numeric thresholds for water quality protection. The proposed project would be reviewed by the Kern County Public Works Department

for adherence to all floodplain management standards. Therefore, further analysis is warranted in the EIR.

d) The proposed project is not located near an ocean or enclosed body of water, and therefore would not be subject to inundation by seiche or tsunami. Mudflows are a type of mass wasting or landslide, where earth and surface materials are rapidly transported downhill under the force of gravity, and are often triggered by heavy rainfall and soil that is not able to sufficiently drain or absorb water and the super-saturation results in soil and rock materials to become unstable and slide away. Due to the relatively flat topography of the project site and surrounding area, the potential to be inundated by mudflow is considered remote. The project site is designated as Zone "X" on the Flood Insurance Rate Map (FIRM) as issued by the Federal Emergency Management Agency (FEMA), which indicates the project site is not in an area of flood hazard. The nearest flood hazards in the area are shown to be approximately one mile north and one mile south of the project site and furthermore, the project site is not identified as a wetland area on the National Wetlands Inventory. Nonetheless, further analysis is warranted in the EIR.

e) The California Department of Water Resources Groundwater Basin Boundary GIS tool indicates the project site lies within the Fremont Valley Groundwater Basin overlay, which has been identified as a "low priority" basin in Bulletin 118 and, therefore, is not subject to a sustainable groundwater management plan. Furthermore, a will serve letter from the Antelope Valley Eastern Kern water agency has been provided confirming the availability of potable water service to the project site, and a water supply assessment will be completed for the proposed project to analyze potential impacts to groundwater. Therefore, further analysis is warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

XI. LAND USE AND PLANNING

Would the project:

a) Physically divide an established community?	☐	☐	☒	☐
b) Cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐

RESPONSES:

a) The proposed project would be located on vacant, undeveloped land in rural southeastern Kern County and would not physically divide an established community. Although there are scattered rural residences in the project vicinity as close as 1000 feet away, with the nearest clusters approximately one mile to the north as well as one mile west of the project site, the project site is approximately five miles north of the nearest community, Rosamond. The proposed project would not physically divide or restrict access to the residential development or any other community. Therefore, impacts related to the physical division of an established community are not anticipated, however, this issue will be further analyzed in the EIR.

b) The project site is located within the Kern County General Plan area with an existing map code designation of 8.5 (Resource Management) and an existing zone district of A (Exclusive Agriculture) by the Kern County Zoning Ordinance. As discussed previously, the proposed project's request for a General Plan Amendment (GPA) to 7.3 (Heavy Industrial) with accompanying Zone Classification Change (ZCC) for the M-3 PD (Heavy Industrial – Precise Development Combining) District warrants further analysis in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

XII. MINERAL RESOURCES

Would the project:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?	☐	☐	☒	☐
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☒	☐

RESPONSES:

a) The project site is not located in a mineral resource zone according to the Kern County GIS Mapping system. Based on a review of records maintained by CalGEM, the project site does not have any existing or previous wells on site (https://maps.conservation.ca.gov/doggr/wellfinder/). County records indicate subsurface mineral rights holders exist for the project site, however construction and operation of the proposed project are not anticipated to interfere with mineral extraction and processing, and would not have significant impacts on future mineral development. Nonetheless, further analysis is warranted in the EIR.

b) As noted previously, the project site is not located within a designated mineral and petroleum resource site within the Kern County General Plan, nor is the project site located within the NR (Natural Resources) or PE (Petroleum Extraction) zoned districts. Based on a review of records maintained by CalGEM the project site does not appear to have any existing of previous wells on site (https://maps.conservation.ca.gov/doggr/wellfinder/). Impacts are expected to be less than significant; however, further analysis of this issue will be analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XIII. NOISE				
Would the project result in:				
a) Generation of a substantial temporary or permanent increase in the ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of, excessive ground borne vibration or ground borne noise levels?	☒	☐	☐	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
d) For a project located within the vicinity of a private airstrip or Kern County Airport Land Use Compatibility Plan, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

RESPONSES:

a) Land uses determined to be "sensitive" to noise as defined by the Kern County General Plan include residential areas, schools, convalescent and acute care hospitals, parks and recreational areas, and churches. Although there are scattered rural residences in the project vicinity as close as 1000 feet away, with the nearest clusters approximately one mile north or one mile west, the project site is approximately five miles north of the community of Rosamond which contains a greater density of sensitive receptors such as neighborhoods, churches and schools including the Rosamond High and Abraham Lincoln Alternative Schools.

Construction activity associated with the operation of heavy equipment has the potential for creating temporary increases in noise in the project vicinity. Operation of the proposed project would result in new stationary noise sources, including mechanical equipment operations, parking lot activity, and loading and unloading activity, which would result in permanent increases in noise levels in the project vicinity. The proposed project would also result in increased vehicle trips which would also result in an increase in traffic noise levels along access roadways in the project vicinity. A noise analysis will be included in the EIR to determine the proposed project's consistency with the Kern County Noise Ordinance (Kern County Code of Ordinances, Title 8, Chapter 8.36), and any other applicable regulations. Thus, further analysis is warranted in the EIR.

b) Groundborne vibration and groundborne noise could originate from the operation of heavy off-road equipment during the construction phase of the proposed project. The proposed project would be expected to comply with all applicable requirements for long-term operation, as well as with measures to reduce excessive groundborne vibration and noise to ensure that the proposed project would not expose persons or structures to excessive groundborne vibration. Further analysis of ground borne vibration and groundborne noise during construction and operation will be included in the EIR.

c) Due to the nature of the proposed project, project operation would result in an increase in employee and heavy-truck traffic on local roadways, as well as introduce new stationary noise sources, including outdoor scrap metal processing, outdoor slag piling, and mechanical equipment operations to the ambient noise environment in the project vicinity. Traffic during the operational phase of the manufacturing facility would primarily consist of delivery trucks and employees. The potential for a substantial increase in ambient noise levels resulting from these noise sources will be analyzed in the EIR to determine the proposed project's consistency with the Kern County Noise Ordinance (Kern County Code of Ordinances, Title 8, Chapter 8.36) and any other applicable regulations. Thus, further analysis is warranted in the EIR.

d) The project site is not located within the SOI of any airport as identified by the Kern County ALUCP. Thus, impacts are anticipated to be less than significant; however, further evaluation will be included in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

XIV. POPULATION AND HOUSING

Would the project:

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

RESPONSES:

a) The proposed project would provide new employment to the project vicinity. The number of construction workers needed during any given time period would largely depend on the specific stage of construction, but would likely be up to 150 employees. For the purposes of analysis, grading of the proposed project is anticipated to start in Q2 of 2023 with completion of construction in one phase proposed for completion by Q1 of 2025.

The primary reinforcing steel manufacturing operations would operate three eight-hour shifts per day with the potential to operate seven days per week. The fabrication operations would consist of two eight-hour shifts Monday through Friday. Administrative office hours are anticipated to be from 7:00 a.m. to 5:00 p.m.

It is anticipated that the construction workforce would commute to the project site from various local communities and the number of workers expected to relocate to the surrounding area is not expected to be substantial. If temporary housing should be necessary, it is expected that accommodations would be available in the nearby hotels. Therefore, the proposed project would not directly or indirectly induce unplanned population growth.

Typical established local thresholds of significance for housing and population growth pursuant to the CEQA Guidelines, Section 15064.7, include effects that would induce substantial growth or concentration of a population beyond County projections, alter the location, distribution, density, or growth rate of the population beyond that projected in the General Plan Housing Element, result in a substantial increase in demand for additional housing, or create a development that significantly reduces the ability of the County to meet housing objectives set forth in the General Plan Housing Element. The effects of the project in relation to these local thresholds are minimal. Therefore, impacts regarding substantial population growth are anticipated to be less than significant; however, this topic will be further analyzed in the EIR.

b) The proposed project is located on existing and predominantly undisturbed agricultural land with no existing housing or history of containing housing. As noted above, residences in the area are sparse and rural in nature, with the nearest residence approximately 1,000 feet northwest of the project site and the next nearest clusters located approximately one mile north and one mile west of the project site. As such, it is not anticipated the proposed project could potentially create an environmental impact such that it would necessitate the construction of replacement housing elsewhere. Nonetheless, this topic will be further analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

XV. PUBLIC SERVICES

Would the project**:**

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or to other performance objectives for any of the public services:

i.	Fire Protection?	☒	☐	☐	☐
ii.	Police Protection?	☒	☐	☐	☐
iii.	Schools?	☐	☐	☒	☐
iv.	Parks?	☐	☐	☒	☐
v.	Other Public Facilities?	☐	☐	☒	☐

RESPONSES:

a) (i) **Fire Protection:** Fire suppression and emergency medical services are provided by the Kern County Fire Department (KCFD). The nearest KCFD fire station that would serve the proposed project is Station No. 15, located at 3219 35th Street West, approximately 5.5 miles from the project site in Rosamond. Adherence to all applicable regulations would reduce wildfire ignitions and prevent the spread of wildfires. However, proposed project construction and operation activities may result in an increased need for fire-fighting personnel and facilities. Given the rural environment of the project location in and KCFD's obligation to respond to all structure fires in their jurisdiction, fire-fighting capacity in the project area could result in potential impacts on fire services from construction and operation of the proposed project. Therefore, further analysis is warranted in the EIR.

(ii) **Police Protection:** Law enforcement services in the project area are provided by the Kern County Sheriff's Office (KCSO). The nearest KCSO that would serve the proposed project is the Rosamond Substation located approximately 5.5 miles southwest of the project site at 3179 35th Street West. Although the potential is low, the proposed project may attract vandals or other security risks, and both construction and operational activities would result in increases in traffic volumes along surrounding roads, which could increase demand on law enforcement services. Due to the proposed project's impacts on Sheriff services being potentially significant, further analysis is warranted in the EIR.

(iii - v) **Schools, Parks and Other Public Facilities:** During project construction, a relatively large number of construction workers would be required, work both day and night shifts. Grading of the proposed project is anticipated to start in Q2 of 2023 with completion of construction in one phase proposed for completion by Q1 of 2025. There is potential for the proposed project to employ up to 150 construction workers on-site. It is expected most of these workers would live in the region and would commute to the project site from where their children are already enrolled in school. Even if workers came from out of the area, they would likely return to their out-of-town residences once the facilities were built and would not take their children out of their current schooling situation.

With regard to the anticipated operational workforce, there may be up to 440 regular employees that would be existing Kern County and Antelope Valley residents, as well as a minor number of employees (approximately 20), in addition to their families, relocating to the region. As a result, the surrounding communities and the respective school populations may be affected by the influx of new or relocated workforce and their accompanying families. Therefore, this topic will be further analyzed in the EIR.

Similarly, while temporary workers during the construction period would not result in a substantial additional demand for parks or other public facilities such as post office, courthouse, and/or library services, the approximately 440 full-time employees and their families may result in an increase in the number of users of local parks and other public facilities. This topic will be further analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

RESPONSES:

a-b) The proposed project itself does not include new recreational facilities and is not anticipated to appreciably increase demands on existing facilities. As mentioned previously, the number of construction workers needed during any given time period would largely depend on the specific stage of construction but would likely be up to 150 employees. Although the temporary increase in use of recreation facilities during construction that might be caused by an influx of workers would be minimal, operation of the proposed project would include approximately 440 fulltime employees that may be a mix of existing Kern County residents as well as employees relocated to Kern County, with the resulting addition of families to this area impacting the number of users at local parks. As a result, there is not anticipated to be a detectable increase in the use of parks or other recreational facilities; however, this will be further analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION AND TRAFFIC				
Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☒	☐	☐	☐
b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3 (b)?	☒	☐	☐	☐
c) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☒	☐	☐	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

RESPONSES:

a) Construction activities associated with the proposed project would temporarily contribute to traffic volumes on nearby roadways. During the construction phase, it is estimated there would be an increase in workers commuting to and from the project site with personal vehicles accounting for the majority of traffic trips to and from the project site. Operation of the proposed project would include approximately 440 fulltime employees that may be a mix of existing Kern County residents and employees relocated to or commuting to Kern County. In addition, delivery trucks importing and exporting materials are expected to contribute to increased traffic to and from the project site. Project-generated traffic would result in an increase of Vehicle Miles Traveled (VMT) and will therefore need to be analyzed for consistency with State and local guidance. In addition, the proposed project could conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. Therefore, further analysis is warranted in the EIR.

b) CEQA Guidelines section 15064.3, subdivision (b) was adopted in December 2018 by the California Natural Resources Agency. These revisions to the CEQA Guidelines criteria for determining the significance of transportation impacts are primarily focused on projects within transit priority areas and shift the focus from driver delay to reduction of vehicular greenhouse gas emissions through creation of multimodal networks, and creation of a mix of land uses that can facilitate fewer and shorter vehicle trips. Vehicle miles traveled (VMT) is a measure of the total number of miles driven for various purposes and is sometimes expressed as an average per trip or

per person. Construction traffic would be temporary and would not permanently affect VMT characteristics in this part of Kern County or elsewhere. However, long-term operations of the proposed project would generate traffic on the existing roadway network resulting from commutes to and from the project site by regular employees, visitors, as well as delivery operations. Given the potential for an increase in traffic, a traffic study will be prepared for the proposed project and this topic will be further analyzed in the EIR.

c) Primary access to the project site would be from existing Sopp Road by way of Sierra Highway, and as shown on the site plan, a new access road would be constructed along the eastern boundary of the project site to facilitate delivery operations. Each road would be two lanes and designed to accommodate heavy trucks. The proposed project would not include the development of sharp curves, dangerous intersections, or other hazardous design features. The proposed project would be set back from roadways as required by the Kern County Zoning Ordinance and approved to form by the Kern County Public Works Department. Additionally, all roadways, including off-site improvements, constructed in association with the proposed project would be subject to existing zoning standards and safety specifications for roadways. While the average daily workforce during construction of the proposed project would be dependent upon the state of construction and would likely up to 150 workers, the proposed operation anticipates a regular workforce of up to 440 employees. As a result, construction of the proposed project would result in the temporary increase of traffic to the project site relative to existing traffic from light industrial and limited agricultural uses that may be occurring at this time. Furthermore, regular operations are anticipated to contribute to a sustained increase of traffic on Sopp Road as well as existing roads in the area that lead to the project site. Given the increase, there is the potential for increase in hazards and this topic will be further discussed in the EIR.

d) The proposed project would be required to comply with all emergency access requirements adopted by the Kern County Fire Department. Access to the project site would be via Sopp Road, which is a County maintained roadway. Primary access for employees, visitors and, if necessary, first responders would be via Sopp Road, whereas secondary access would be provided by the proposed new private road along the eastern project boundary. All project design requirements, including emergency routes for first responders, shall be verified by the Fire Marshal prior to issuance of grading and building permits. Therefore, no adverse impacts related to emergency access are anticipated and impacts are considered less than significant, but this topic will be analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact

XVIII. TRIBAL CULTURAL RESOURCES

Would the project:

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources defined in Public Resources Code Section 5020.1 (k) or	☐	☐	☒	☐
ii. A recourse determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native America tribe.	☒	☐	☐	☐

RESPONSES:

a) (i-ii) The project site is not listed or eligible for listing in the California Register of Historical Resources. Since the majority of project site is undeveloped, there is potential for tribal cultural resources to exist on-site or on surrounding lands that may be impacted by development. Therefore, the proposed project has the potential to impact tribal cultural resources during site clearance and earthmoving activities. All tribes with possible cultural affiliation and interest within the project area have been notified, per Assembly Bill 52. Any requests for consultation submitted in response to the AB 52 notification will be carried out between the County and the Tribes. A Cultural Resources Phase 1 Survey and Paleontological Resources Assessment will be prepared and submitted for review in the EIR. Further evaluation in the EIR is warranted to identify potential impacts to tribal cultural resources and to formulate avoidance or mitigation measures, if applicable.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS				
Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☒	☐	☐	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☒	☐	☐	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☒	☐	☐	☐
e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?	☒	☐	☐	☐

RESPONSES:

a) During project construction, portable toilet facilities, serviced by licensed providers, would likely be used and delivered to the project site for the construction period. They would be pumped out periodically and waste would be held in holding tanks until disposed of off-site by appropriate means per the contracted sanitary service provider. An engineered septic system is proposed to be

installed on site to accommodate sewage and wastewater discharge from the facility. As such, impacts related to wastewater treatment facilities will be further addressed in the EIR.

The proposed project would create additional impervious surfaces on the project site and may require water for dust suppression during construction and washing of vehicles during operation. Due to the large development footprint of approximately 527,021 square-feet (approximately 7 percent building coverage across the 174 acres), these changes may substantially increase the amount of stormwater runoff. The pattern and concentration of runoff could be altered by project activities, such as grading of the project site and roads. However, a drainage plan would be required to be approved by the Kern County Public Works Department/Floodplain Management Section prior to issuance of building permits. With adherence to all applicable regulations, it is anticipated that the proposed project would not require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. Further analysis is warranted in the EIR.

b) During construction of the proposed project, water would be required for common construction-related purposes including but not limited to dust suppression, soil compaction, and grading. Dust control water may be used for ingress and egress of on-site construction vehicle equipment traffic. A sanitary water supply would not be required during construction because restroom facilities would be provided by portable units to be serviced by licensed providers.

Operations for the proposed project would require adequate sanitation facilities to meet the needs of regular employees and visitors, such as restrooms throughout the facility and showers within the locker room as required by typical health codes. In addition, water is required during the manufacturing process for cooling beds, any proposed landscaping throughout the project site, solar panel maintenance, and for fire-emergency purposes. The applicant has provided a will serve letter from the Antelope Valley Eastern Kern water agency confirming the availability of potable water service to the project site. Furthermore, an SB610 water supply assessment will be completed for the proposed project to analyze potential impacts to groundwater. Therefore, further analysis is warranted in the EIR.

c) The proposed project would be served by an on-site engineered septic system to accommodate the wastewater needs. Sources of wastewater include bathroom facilities and showers in locker rooms, landscape irrigation runoff, and cooling-bed water that is not emitted as steam into the atmosphere. Due to the proposed project having the potential to generate a significant amount of wastewater, further analysis is warranted in the EIR.

d) Solid waste generated by construction of the proposed project is not anticipated to be significant. Non-hazardous construction refuse, and solid waste would be either collected and recycled or disposed of at a local Class III landfill, while any hazardous waste generated during construction would be disposed of at an approved location.

Solid waste generated by operations may include residual from imported scrap metal that cannot be recycled into the manufacturing process, as well as metal byproducts from the manufacturing and fabrication processes that have the potential to be incapable of being recycled into product or exported for off-site processing (slag, dust from Fume Treatment Plant, etc.). Additional waste generated by employees and visitors on site is also anticipated, requiring appropriate facilities and receptacles throughout the developed area.

The closest Class III municipal landfill is the Mojave-Rosamond Sanitary Landfill located in approximately 3.7 miles northeast of the project site. It is not anticipated that the amount of solid

waste generated by the proposed project would exceed the capacity of local landfills, however, further analysis is warranted in the EIR.

e) The proposed project would generate solid waste during both construction and operation, thus requiring the consideration of waste reduction and recycling measures. The 1989 California Integrated Waste Management Act (AB 939) requires Kern County to attain specific waste diversion goals. In addition, the California Solid Waste Reuse and Recycling Access Act of 1991, as amended, requires expanded or new development projects to incorporate storage areas for recycling bins into the proposed project design. The proposed project would be required to comply with the 1989 California Integrated Waste Management Act and the 1991 California Solid Waste Reuse and Recycling Access Act of 1991. Further analysis is warranted in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XX. WILDFIRE				
If located in or near State responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, or other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☒	☐	☐	☐
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☒	☐
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☒	☐

RESPONSES:

a) According to the Fire Hazard Severity Zones map published by the California Department of Forestry and Fire Protection (CalFire), the proposed project is not located within a State Responsibility Area (SRA) nor within lands classified as very high fire hazard severity zone (VHFSZ) and is approximately 8.5 miles southeast of such designations. The project site is classified as Local Responsibility Area (LRA) Moderate; thus, the potential for wildfire on the project site exists, but is not considered high and is not anticipated to physically impede the existing emergency response plans, emergency vehicle access, or personnel access to the project site. The project site is generally located in a rural, sparsely developed area with limited population and development. The project site is not located along an identified emergency evacuation route and is not identified in any adopted emergency evacuation plan. Therefore, less than significant impacts related to impairment of the implementation of, or physical interference with, an adopted

emergency response plan or emergency evacuation plan are anticipated. Nevertheless, further analysis is warranted in the EIR.

b) Given the project site's flat topography, the project site is not anticipated to expose future occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, other land-form factors. However, prevailing winds in the area may result in the increased exposure of pollutant concentrations from a wildfire on the nearest sensitive receptors, or the uncontrolled spread of a wildfire given the rural nature of the area. Further analysis is warranted in the EIR.

c) Development of the proposed project is limited to approximately 527,021 square feet of building coverage with an approximately 63 acres of ground-mounted solar panels, all within the 174-acre project boundary. One new road would be constructed along the eastern boundary of the project site to provide an additional access point to the project site, although primarily designated for large trucks importing and exporting material to and from the project site. However, the installation of the new road and extension of existing utilities in the area are not anticipated to have the potential to exacerbate fire risk. Nonetheless, further analysis is warranted in the EIR.

d) The project site is not considered a high-risk area for landslides as it is relatively flat and is not subject to post-fire slope instability, or drainage changes that would expose people or structures to significant risks. However, this topic will be further analyzed in the EIR.

Issues (and Supporting Information Sources):	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

RESPONSES:

a) The EIR's biological, cultural and tribal cultural resources sections shall discuss specific project-level impacts on plants and wildlife including avian species and impacts to cultural and tribal cultural resources. The document shall also evaluate the proposed project's contribution to cumulative impacts on biological, cultural and tribal cultural resources. Mitigation measures will be included for both project-level and cumulative impacts that would be incorporated to reduce any potential impacts to less than significant levels, where necessary and feasible.

b) The proposed project may have the potential to cumulatively contribute to impacts on aesthetics, air quality, biological resources, cultural resources, tribal cultural resources, greenhouse gas emissions, traffic, and wildfire-related impacts. The EIR will evaluate the proposed project's contribution to cumulative impacts in these and other areas, as appropriate.

c) The proposed project could result in the long-term operation of an emission source that may adversely affect nearby sensitive receptors. Both short-term construction activities and long-term manufacturing operations could result in temporary increases in pollutant concentrations. Pollutants of primary concern commonly associated with construction-related activities include

toxic air contaminants (i.e., diesel particulate matter [DPM]), asbestos, and fugitive dust, whereas on-going operations are anticipated to contribute to pollutant emissions resulting from increased vehicle exhaust generated by traffic to and from the project site, release of vapors related to heating and cooling processes during the manufacturing process, and dust byproducts. Within the project area, the potential for increased occurrences of Valley Fever is also of concern due to the likely occurrence of dust emissions from use of un-paved roads during construction and operation. Human health impacts from the proposed project's short- and long-term cumulative contributions to air quality impacts will be further evaluated in the EIR.

SUMMARY OF PROCEEDINGS

KERN COUNTY AGENCY SCOPING MEETING

Kern County Planning and Natural Resources Department
2700 M Street, Suite 100
Bakersfield, California

Conference Room 1A

Date November 18, 2022

STAFF ATTENDANCE:
Cindi Hoover, AICP, Division Chief
Mark Tolentino, Planner II

The meeting convened at 1:00 p.m. with Staff and four (4) representatives of the PSG Mojave Micro Mill Project in attendance. Items were then discussed in order as identified on the agenda.

NOTICE OF PREPARATION PROJECT:

EIR – Notice of Preparation:
Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) (PP22402)
GPA 3, Map 213; ZCC 62, Map 213; PD 3, Map 213; ZV 24, Map 213.

No members of the public were present

Public testimony closed at approximately 1:05 p.m.

Notes prepared by
Mark Tolentino, Planner II

November 28, 2022

Mark Tolentino
Kern County Planning and Natural Resources Department
2700 "M" Street, Suite 100
Bakersfield, California 93301

Subject: Mojave Micro Mill by PSGM3 Holdings Corp
Notice of Preparation (NOP)
State Clearinghouse No. 2022100646

Dear Mark Tolentino:

The California Department of Fish and Wildlife (CDFW) received a NOP for an Environmental Impact Report (EIR) from the Kern County Planning and Natural Resources Department, as Lead Agency, for the Project pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, CDFW appreciates the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under Fish and Game Code.

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (*Id.*, § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

CDFW is also submitting comments as a **Responsible Agency** under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), related authorization as provided by the Fish and Game Code will be required.

Nesting Birds: CDFW has jurisdiction over actions with potential to result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Fish and Game Code sections that protect birds, their eggs and nests include, sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird).

PROJECT DESCRIPTION SUMMARY

Proponent: PSGM3 Holdings Corp

Objective: The project applicant is proposing to construct and operate a micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot steel mill facility with an additional 51,221 square feet of accessory buildings and structures, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is proposed as part of the project

Timeframe: Unspecified

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist the Kern County Planning and Natural Resources Department in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the CEQA document.

The Project area is within the geographic range of several special-status animal species including the State and Federally threatened desert tortoise (*Gopherus agassizii),* State threatened Swainson's hawk (*Buteo swainsoni*) and Mohave ground squirrel

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

(*Xerospermophilus mohavensis*), the State candidate endangered Crotch Bumblebee (*Bombus crotchii),* State candidate threatened western Joshua tree (*Yucca brevifolia*), special status plants such as the alkali Mariposa lily (*Calocortus striatus*) and recurved larkspur (*Delphinium recurvatum*), and the State species of special concern burrowing owl (*Athene cunicularia*), American badger (*Taxidea taxus*), Townsend's big-eared bat (*Corynorhinus townsendii*), short-eared owl (*Asio flammeus*), Le Conte's thrasher (*Taxostoma lecontei*), and loggerhead shrike (*Lanius ludovicianus*).

Swainson's Hawk (SWHA)

The habitat types present at and surrounding the Project site all provide suitable foraging habitat for SWHA, increasing the likelihood of SWHA occurrence within the vicinity. In addition, any trees in the Project vicinity have the potential to provide suitable nesting habitat. SWHA exhibit high nest-site fidelity year after year and lack of suitable nesting habitat limits their local distribution and abundance (CDFW 2016). If a potential nest site occurs in the Project vicinity, approval of the Project may lead to subsequent ground-disturbing activities that involve noise, groundwork, construction of structures, and movement of workers that could affect nests and has the potential to result in nest abandonment and/or loss of foraging habitat, significantly impacting local nesting SWHA. In addition, conversion of undeveloped land can directly influence distribution and abundance of SWHA, due to the reduction in foraging habitat.

To evaluate potential Projectrelated impacts, CDFW recommends that a qualified biologist conduct a habitat assessment as part of the scoping for biological studies conducted in support of the CEQA document, to determine if the Project site or the immediate vicinity contain suitable habitat for SWHA. If suitable foraging or nesting habitat is present, CDFW recommends that a qualified biologist conduct surveys for nesting SWHA following the entire survey methodology developed by the SWHA Technical Advisory Committee (SWHA TAC 2000) during CEQA analysis. The survey protocol includes early season surveys to assist the project proponent in implementing necessary avoidance and minimization measures, and in identifying active nest sites prior to initiating ground-disturbing activities. If ground-disturbing Project activities are to take place during breeding season (February 1 through September 15), CDFW recommends that additional pre-activity surveys for active nests be conducted by a qualified biologist no more than 10 days prior to the start of Project implementation. CDFW recommends a minimum no-disturbance buffer of ½ mile be delineated around active nests until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.

CDFW recommends compensation for the loss of SWHA foraging habitat as described in CDFW's "Staff Report Regarding Mitigation for Impacts to Swainson's

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

Hawks" (CDFG 1994) to reduce impacts to foraging habitat to less than significant. The Staff Report recommends that mitigation for habitat loss occur within a minimum distance of 10 miles from known nest sites. CDFW has the following recommendations based on the Staff Report:

- For projects within 1 mile of an active nest tree, a minimum of 1 acre of habitat management (HM) land for each acre of development is advised.
- For projects within 5 miles of an active nest but greater than 1 mile, a minimum of ¾ acre of HM land for each acre of development is advised.
- For projects within 10 miles of an active nest tree but greater than 5 miles from an active nest tree, a minimum of ½ acre of HM land for each acre of development is advised.

SWHA detection warrants consultation with CDFW to discuss how to avoid take or, if avoidance is not feasible, to acquire an Incidental Take Permit (ITP) prior to ground disturbing activities, pursuant to Fish and Game Code section 2081 subdivision (b).

Mohave Ground Squirrel

The Project site is within the range of MGS and based on aerial imagery, the Project site appears to contain suitable habitat for MGS. Without appropriate avoidance and minimization measure for MGS, potential significant impacts associated with the Project's construction include burrow collapse, inadvertent entrapment, reduced reproductive success, and mortality of individuals. Major threats to MGS are drought, habitat destruction, habitat fragmentation, and habitat degradation (Gustafson, 1993). MGS is restricted to a small geographic range and the greatest habitat loss has occurred near desert towns including California City (Gustafson, 1993). Natural cycling is anticipated in MGS populations therefore the true indicators of the status of the species are the quantity, pattern of distribution, and quality of habitat (Gustafson, 1993). Project activities may result in the loss of potential MGS habitat through conversion, may increase habitat fragmentation, and expand urbanization into the area.

CDFW recommends that a qualified biologist, with appropriate permits, conduct protocol surveys for MGS following the methods described in the "Mohave Ground Squirrel Survey Guidelines" (CDFG, 2003) during the appropriate survey season as part of the biological studies in support of the CEQA document. Survey methods include trapping by a qualified biologist up to three times per trapping season. Results of the MGS surveys are advised to be submitted to CDFW. Please note MGS surveys are valid for one year and may need to be conducted within a year of the start of ground-disturbing activities if there is suitable habitat but protocol surveys conducted for CEQA analysis conclude there is no MGS present on site.

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

If MGS are found within the Project area during preconstruction surveys or construction activities, consultation with CDFW is recommended to discuss how to implement the Project and avoid take; or if avoidance is not feasible, to acquire a State ITP pursuant to Fish and Game Code section 2081 subdivision (b) prior to any ground-disturbing activities. Any take of MGS without take authorization would be a violation of Fish and Game Code section 2080.

Desert Tortoise

Desert tortoise have been documented to occur approximately 5 miles north of the project site and as such CDFW recommends the project site be evaluated for potential impacts to the species (CDFW 2022). CDFW advises surveys for desert tortoise be conducted by a qualified wildlife biologist who understands the pre-project survey protocol as outlined in "Preparing for any action that may occur within the range of the desert tortoise (*Gopherus agassizii*)" (USFWS, 2010) and has previous experience surveying for desert tortoise. Survey results are advised to be submitted to both CDFW and the USFWS. Please note desert tortoise surveys are valid for one year and should be conducted within a year of the start of Project implementation. If conducting surveys is not feasible, the applicant can assume presence and acquire an ITP pursuant Fish and Game Code section 2081 subdivision (b) prior to initiating any vegetation- or ground-disturbing activities. If desert tortoise are found within the Project area during surveys or construction activities, consultation with CDFW is advised to discuss how to implement the Project and avoid take; or if avoidance is not feasible, to acquire a State ITP prior to any vegetation- or ground-disturbing activities. Any take of desert tortoise without take authorization would be a violation of Fish and Game Code section 2080.

Western Joshua Tree (WJT)

According to the Project document and aerial photography WJT are confirmed to occur on the Project site. CDFW recommends a no-disturbance buffer for individual western Joshua trees of 290 feet. A 290-foot buffer is warranted to not only avoid impacts to individual trees, but potential impacts to the seed bank as well. Vander Wall et. al. 2006 documented 290 feet as maximum distance of seeds dispersed carried by rodents. If 290-foot buffers cannot be maintained, then consultation with CDFW is warranted to determine if the Project can avoid take or if take authorization is necessary. If take cannot be avoided, including any disturbance within the 290 foot buffer area around each WJT, take authorization would need to occur through issuance of an ITP pursuant to Fish and Game section 2081 subdivision (b).

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

Crotch Bumblebee (CBB)

CNDDB records indicate that the Project site is within the habitat range of CBB. Suitable CBB habitat includes areas of grasslands and upland scrub that contain requisite habitat elements, such as small mammal burrows. CBB primarily nest in late February through late October underground in abandoned small mammal burrows but may also nest under perennial bunch grasses or thatched annual grasses, under brush piles, in old bird nests, and in dead trees or hollow logs (Williams et al. 2014; Hatfield et al. 2015). Overwintering sites utilized by CBB mated queens include soft, disturbed soil (Goulson 2010), or under leaf litter or other debris (Williams et al. 2014). Therefore, potential ground disturbance and vegetation removal associated with Project implementation may significantly impact local CBB populations. If suitable CBB habitat exists in areas of planned Project-related ground disturbance, equipment staging, or materials laydown, potential CBB nesting sites in these areas would have to be avoided in order to reduce to less-than-significant the Project-related impacts to the species.

CBB detection warrants consultation with CDFW to discuss how to avoid take or, if avoidance is not feasible, to acquire an ITP prior to ground disturbing activities, pursuant to Fish and Game Code section 2081 subdivision (b).

Burrowing Owl (BUOW)

BUOW have been documented to occur near the Project site (CDFW 2022). BUOW inhabit open grassland or adjacent canal banks, ROWs, vacant lots, etc. containing small mammal burrows, a requisite habitat feature used by BUOW for nesting and cover. Based on aerial photography, potential habitat occurs both within and bordering the Project sites. BUOW rely on burrow habitat year-round for their survival and reproduction. Habitat loss and degradation are considered the greatest threats to BUOW in California's Central Valley (Gervais et al. 2008).

CDFW recommends assessing presence/absence of BUOW by having a qualified biologist conduct surveys as part of the biological technical studies conducted in support of the CEQA document following the California Burrowing Owl Consortium's Burrowing Owl Survey Protocol and Mitigation Guidelines (CBOC 1993) and CDFW's Staff Report on Burrowing Owl Mitigation (CDFG 2012). Specifically, if suitable habitat is present at an individual Project site, CBOC and CDFW's Staff Report suggest three or more surveillance surveys conducted during daylight with each visit occurring at least three weeks apart during the peak breeding season (April 15 to July 15), when BUOW are most detectable.

If BUOW are detected, CDFW recommends no-disturbance buffers, as outlined in the Staff Report on Burrowing Owl Mitigation (CDFG 2012), be implemented prior to and during any ground-disturbing activities. Specifically, CDFW's Staff Report

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

recommends that impacts to occupied burrows be avoided in accordance with the following table unless a qualified biologist approved by CDFW verifies through non-invasive methods that either: 1) the birds have not begun egg laying and incubation; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting sites	April 1-Aug 15	200 m*	500 m	500 m
Nesting sites	Aug 16-Oct 15	200 m	200 m	500 m
Nesting sites	Oct 16-Mar 31	50 m	100 m	500 m

* meters (m)

If BUOW are found within these recommended buffers and avoidance is not possible, it is important to note that according to the Staff Report (CDFG 2012), exclusion is not a take avoidance, minimization, or mitigation method and is considered a potentially significant impact under CEQA. However, if necessary, CDFW recommends that burrow exclusion be conducted by qualified biologists and only during the non-breeding season, before breeding behavior is exhibited and after the burrow is confirmed empty through non-invasive methods, such as surveillance. CDFW recommends replacement of occupied burrows with artificial burrows at a ratio of 1 burrow collapsed to 1 artificial burrow constructed (1:1) as mitigation for the potentially significant impact of evicting BUOW. BUOW may attempt to colonize or re-colonize an area that will be impacted; thus, CDFW recommends ongoing surveillance, at a rate that is sufficient to detect BUOW if they return.

Other Special-Status Plant Species

Other plants listed pursuant to federal Endangered Species Act, CESA, and the Native Plant Protection Act, as well as other special status plants such as California Rare Plant Rank (CRPR) may also occur in the Project area. Special-status plant species are threatened with habitat loss and habitat fragmentation resulting from development, vehicle and foot traffic, and introduction of non-native plant species (CNPS 2020), all of which may be unintended impacts of the Project. Therefore, impacts of the Project have the potential to significantly impact populations of the species mentioned above if present in the project area.

CDFW recommends that a qualified botanist conduct a habitat assessment of individual Project sites well in advance of Project implementation, to determine if the Project area or its vicinity contains suitable habitat for special-status plant species. If suitable habitat is present, CDFW recommends that individual Project sites be surveyed for special-status plants by a qualified botanist following the “Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

Sensitive Natural Communities" (CDFW 2018). This protocol, which is intended to maximize detectability, includes identification of reference populations to facilitate the likelihood of field investigations occurring during the appropriate floristic period. In the absence of protocol-level surveys being performed, additional surveys may be necessary.

If special-status plants are detected, CDFW recommends special-status plant species be avoided whenever possible by delineating and observing a no-disturbance buffer of at least 50 feet from the outer edge of the plant population(s) or specific habitat type(s) required by special-status plant species. If buffers cannot be maintained, then consultation with CDFW is warranted to determine appropriate minimization and mitigation measures for impacts to special-status plant species.

If a State-listed plant species is identified during botanical surveys, consultation with CDFW is warranted to determine if the Project can avoid take of that species. If take cannot be avoided, take authorization would need to occur through issuance of an ITP by CDFW to comply with CESA and/or Fish and Game Code section 1900 and California Code of Regulations, title 14, section 786.9, subdivision (b).

State Species of Special Concern

American badger, Townsend's big-eared bat, short-eared owl, Le Conte's thrasher, and loggerhead shrike have the potential to occur in the Project area. These species have been documented to occur in the vicinity of the Project site, which supports requisite habitat elements (CDFW 2022).

CDFW recommends that a qualified biologist conduct a habitat assessment as part of the biological technical studies conducted in support of the CEQA document, to determine if project areas or their immediate vicinity contain potential habitat for the species mentioned above. If potential habitat is present, CDFW recommends that a qualified biologist conduct focused surveys for applicable species and their requisite habitat features to evaluate potential impacts resulting from ground and vegetation disturbance.

II. Editorial Comments and/or Suggestions

Desert Kit Fox: Desert kit fox (*Vulpes macrotis arsipus*) is protected under the California Code of Regulations, Chapter 5, Section 460, which prohibits "take" of the species for any reason. If any active or potential dens are found on the Project site, consultation with the Department would be warranted for guidance on take avoidance measures for the desert kit fox. CDFW also recommends that no den excavation occur during the pupping season. Kit fox are known to use multiple dens during this time and vacant dens may be needed when kit fox relocate their pups. In addition, CDFW

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

recommends all perimeter fencing be raised five to seven inches above ground level and knuckled under to allow desert kit fox movement into and out of the Project site.

Federally Listed Species: CDFW recommends consulting with the USFWS on potential impacts to federally listed species including, but not limited to, desert tortoise. Take under the federal Endangered Species Act (FESA) is more broadly defined than CESA; take under FESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting. Consultation with the USFWS in order to comply with FESA is advised well in advance of any ground-disturbing activities.

Nesting birds: CDFW encourages that Project implementation occur during the bird non-nesting season; however, if ground-disturbing or vegetation-disturbing activities must occur during the breeding season (February through mid-September), the Project applicant is responsible for ensuring that implementation of the Project does not result in violation of the Migratory Bird Treaty Act or relevant Fish and Game Codes as referenced above.

To evaluate Project-related impacts on nesting birds, CDFW recommends that a qualified wildlife biologist conduct pre-activity surveys for active nests no more than 10 days prior to the start of ground or vegetation disturbance to maximize the probability that nests that could potentially be impacted are detected. CDFW also recommends that surveys cover a sufficient area around the Project site to identify nests and determine their status. A sufficient area means any area potentially affected by the Project. In addition to direct impacts (i.e. nest destruction), noise, vibration, and movement of workers or equipment could also affect nests. Prior to initiation of construction activities, CDFW recommends that a qualified biologist conduct a survey to establish a behavioral baseline of all identified nests. Once construction begins, CDFW recommends having a qualified biologist continuously monitor nests to detect behavioral changes resulting from the Project. If behavioral changes occur, CDFW recommends halting the work causing that change and consulting with CDFW for additional avoidance and minimization measures.

If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, CDFW recommends a minimum no-disturbance buffer of 250 feet around active nests of non-listed bird species and a 500-foot no-disturbance buffer around active nests of non-listed raptors. These buffers are advised to remain in place until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or on-site parental care for survival. Variance from these no-disturbance buffers is possible when there is compelling biological or ecological reason to do so, such as when the construction area would be concealed from a nest site by topography. CDFW recommends that a qualified wildlife

DocuSign Envelope ID: 4B20AF8E-CCDC-4DCF-9001-345DA1D54D6D

biologist advise and support any variance from these buffers and notify CDFW in advance of implementing a variance.

CDFW appreciates the opportunity to comment on the NOP to assist the Kern County Planning and Natural Resources Department in identifying and mitigating Project impacts on biological resources. If you have any questions, please contact Jaime Marquez, Environmental Scientist, at the address provided on this letterhead, by telephone at (559) 580-3200, or by electronic mail at Jaime.Marquez@wildlife.ca.gov.

Sincerely,

NATIVE AMERICAN HERITAGE COMMISSION

Governor's Office of Planning & Research

NOV 4 2022

STATE CLEARING HOUSE

October 31, 2022

Mark Tolentino, Planner II
Kern County Planning and Natural Resources Department
2700 M Street Suite 100
Bakersfield, CA 93301

Re: 2022100646, Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) Project, Kern County

Dear Mr. Tolentino:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015. If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). Both SB 18 and AB 52 have tribal consultation requirements. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe. (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cameron.Vela@nahc.ca.gov.

Sincerely,

Cameron Vela

Subject: Notice of Preparation of an Environmental Impact Report – Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) (PP22402)

I have reviewed the above noted project Notice of Preparation of EIR and recommend the following conditions be placed on the Conditional Use Permits:

1. Prior to issuance of a building or grading permit: All survey monuments shall be tied out by a Licensed Land Surveyor. A corner record for each monument or record of survey shall be submitted to the County Surveyor for review and processing, per Section 8771 of the Professional Land Surveyor's (PLS) Act.

2. Prior to Final Inspection: All survey monuments that were destroyed during construction shall be re-set or have a suitable witness corner set. A post construction corner record for each monument re-set or a record of survey shall be submitted to the County Surveyor for processing, per Section 8771 of the Professional Land Surveyor's Act.

3. Upon completion of project: All survey monuments shall be accessible by a Licensed Land Surveyor or their representatives, with prior notice, per Section 8774 of the PLS Act and Civil Code 846.5 (a).

Thank you for the opportunity to review and comment on this project. Should you have any questions please contact me.

RE: Comments on the Notice of Preparation of Draft Environmental Impact Report for Mojave Micro Mill by PSGM3 Holding Corp (PP222402)

Mr. Tolentino,

The Kern County Public Works Department (Department) has reviewed the Notice of Preparation of a Draft Environmental Impact Report (EIR) for the Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) and has the following comments.

The Department has existing non-hazardous waste profiling procedures in place for Kern County owned and operated solid waste facilities. Kern County solid waste facilities cannot accept hazardous or designated waste. Waste is considered hazardous if it has properties that make it potentially dangerous or harmful to human health or the environment. It is the responsibility of the generator, this being the project proponent, to determine and demonstrate the waste proposed for disposal at a Kern County solid waste facility is neither hazardous nor designated. The generator is the most familiar with the waste generating process and should be familiar with the federal, state, and local regulations that govern their generating process.

Accordingly, the Department requests that the project proponent discuss in the Draft EIR the expected quantities and/or volumes of waste anticipated to be generated as a result of their processes, describe procedures to demonstrate the waste proposed for disposal is non-hazardous, and identify the facilities permitted to accept generated waste for disposal and recycling. Wastes, throughout the length of the project, that are determined to be hazardous or designated shall not be disposed of in a Kern County solid waste facility. Prior to accepting waste for disposal from the project proponent at a County owned and operated landfill, the generator shall provide information with the required waste profile forms and disclosure statements that will allow an evaluation of potential contaminants of concern by Department staff. The Department reserves the right to accept or reject the waste based on the determination of wastes being hazardous or designated.

The current phase of the Mojave-Rosamond Recycling & Sanitary Landfill has very limited projected capacity. Consequently, the Department reserves the right to accept or reject construction and future ongoing operational wastes based on the expected quantities and/or volumes proposed and described in the Draft EIR. To preserve landfill capacity and comply with existing daily tonnage limits, the Department may limit the tons per day of waste delivered to the Mojave landfill by the project proponent and may require wastes be transported to the Tehachapi Sanitary Landfill for disposal or recycling.

Construction waste recycling shall be addressed through the requirements of Assembly Bill 939 and the most recent and applicable construction waste management plans.

The Department appreciates the opportunity to provide these comments to the Kern County Planning & Natural Resources Department. If you have any questions, please contact me at (661) 862-8765 or at leed@kerncounty.com.

Sincerely,

Dave Lee
Waste Management Supervisor

Subject: Preparation of an Environmental Impact Report
Mojave Micro Mill Project

Our section has reviewed the attached subject documents and has the following comments:

The runoff of storm water from the site will be increased due to the increase in impervious surface generated by the proposed development.

Therefore, this section recommends the following be included as conditions of approval for this project:

The applicant shall provide a plan for the disposal of drainage waters originating on site and from adjacent road right-of-ways (if required), subject to approval of the Public Works Department.

Re: Kern County Fire Department Comments Regarding Planning Department Project

To Whom It May Concern:

The Kern County Fire Department (KCFD), as the local fire authority, has received a request for comments regarding Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the Mojave Micro Mill by PSGM3 Holdings Corp. (Pacific Steel Group). Upon initial review, it has been determined that all new construction will require fire water flowing a minimum 1,500 GPM for 2 hours with 20 PSI residual. All fire access roads to each parcel must meet specifications set forth in Section 503.2 of the California Fire Code and the applicable Appendix and Ordinance sections.

A more detailed review and project comments will be conducted when the building permit is pulled and plans are submitted to KCFD.

Please feel free to call our Fire Prevention Office at (661) 391-3310 with any questions.

Respectfully,
Regina Arriaga/Jim Killam
Fire Plans Examiner

Subject: **Notice of Preparation of a Draft Environmental Impact Report**
The PSG Mojave Micro Mill by PSGM3 Holdings Corp (proposed Project)

Dear Mr. Tolentino:

The Kern Audubon Society (KAS), an interested party, received a notice of availability concerning a Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) from the Kern County Planning and Natural Resources Department (County) for the above referenced Project pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines. KAS was founded in Bakersfield, CA in 1973 and incorporated in 1979. KAS is a thriving environmental organization in Kern County, and the chapter continually plans educational projects for the community. KAS conducts regular program meetings and field trips to both common and unique habitats in California. KAS would like to thank you for the opportunity to provide comments concerning the scope and content of the environmental analysis of the Project that may affect the diverse California wildlife within the Project's footprint and its cumulative impacts in the region.

The DEIR is for the proposed 174 acre project located in the Mojave Desert within unicorporated Kern County five miles northeast from the City of Rosamond and approximately 8 miles southeast of the unincorporated community of Mojave. The Project is proposed to utilize vacant agricultural lands and undeveloped Joshua tree and desert saltbush scrub areas. These areas have potential to support desert

kit fox, American badger, Western burrowing owl, Swainson's hawk, loggerhead shrike, Mohave ground squirrel, and desert tortoise. The biological site evaluation should be performed by qualified biological consultants using the appropriate survey protocols as established by both state and federal wildlife agencies.

It is imperative that all biological surveys be performed during the appropriate time of year to discern species presence for this eco-region. This is especially true for the desert tortoise and Mohave ground squirrel. Presence/absence surveys for both desert tortoise and Mohave ground squirrel can be negatively influenced by seasonal drought conditions so it is imperative that surveys be performed during years exhibiting average winter precipitation. Biological consultants should evaluate the Project's potential to subsidize and support local raven populations that depredate the endangered desert tortoises of the Mojave Desert region. Ravens represent a major threat to long term tortoise recovery in the Mojave. The proximity of the Desert Tortoise Preserve makes raven management a major concern.

In particular, KAS recognizes that the Swainson's hawk (SWHA) is a priority species for conservation in California, and has been pursuing efforts to conserve the hawk in comments on CEQA documents concerning projects in the Antelope Valley (AV) of Kern County. KAS is committed to ensuring that California meets its clean energy goals while conserving its important natural resources and wildlife, including SWHA. KAS believes that cumulative development over an extended period of time has contributed to the decline of SWHA breeding pairs in the AV and updated information about SWHA presence and use of the landscape is needed to inform better conservation and management of this species. KAS expects a detailed analysis of the Project's impacts (both direct and cumulative) on SWHA that may utilize this area.

KAS appreciates the opportunity to comment on the NOP for the Mojave Micro Mill Project and to assist the County in identifying Project impacts on sensitive biological resources endemic to the Kern County Mojave Desert area.

Sincerely,

Franklin Bedard
Conservation Chair

Re: CEQA and Land Use Notice Request for the Mojave Micro Mill

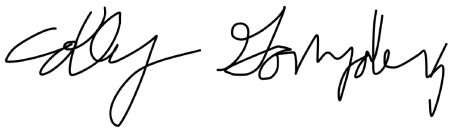
Dear Mr. Tolentino, Ms. Oviatt and Ms. Bedard,

I am writing on behalf of Supporters Alliance for Environmental Responsibility ("SAFER") regarding the Mojave Micro Mill project, including all actions related or referring to the proposed construction of a 475,800 square-foot steel mill facility, located at the cross streets of Sopp Road and Sierra Highway (APN: 431-010-02; 431-030-02) in Kern County ("Project").

We hereby request that Kern County send by electronic mail, if possible or U.S. mail to our firm at the address below notice of any and all actions or hearings related to activities undertaken, authorized, approved, permitted, licensed, or certified by the County and any of its subdivisions, and/or supported, in whole or in part, through contracts, grants, subsidies, loans or other forms of assistance from the County, including, but not limited to the following:

- Notice of any public hearing in connection with the Project as required by California Planning and Zoning Law pursuant to Government Code Section 65091.
- Any and all notices prepared for the Project pursuant to the California Environmental Quality Act ("CEQA"), including, but not limited to:
  - Notices of any public hearing held pursuant to CEQA.
  - Notices of determination that an Environmental Impact Report ("EIR") is required for the Project, prepared pursuant to Public Resources Code Section 21080.4.
  - Notices of any scoping meeting held pursuant to Public Resources Code Section 21083.9.
  - Notices of preparation of an EIR or a negative declaration for the Project, prepared pursuant to Public Resources Code Section 21092.
  - Notices of availability of an EIR or a negative declaration for the Project, prepared pursuant to Public Resources Code Section 21152 and Section 15087 of Title 14 of the California Code of Regulations.

- Notices of approval and/or determination to carry out the Project, prepared pursuant to Public Resources Code Section 21152 or any other provision of law.
- Notices of any addenda prepared to a previously certified or approved EIR.
- Notices of approval or certification of any EIR or negative declaration, prepared pursuant to Public Resources Code Section 21152 or any other provision of law.
- Notices of determination that the Project is exempt from CEQA, prepared pursuant to Public Resources Code section 21152 or any other provision of law.
- Notice of any Final EIR prepared pursuant to CEQA.
- Notice of determination, prepared pursuant to Public Resources Code Section 21108 or Section 21152.



Please note that we are requesting notices of CEQA actions and notices of any public hearings to be held under any provision of Title 7 of the California Government Code governing California Planning and Zoning Law. **This request is filed pursuant to Public Resources Code Sections 21092.2 and 21167(f), and Government Code Section 65092**, which require local counties to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

Please send notice by electronic mail or U.S. Mail to:

November 12, 2022

To: Planning and Natural Resources Department
Attn: Cindi Hoover and Mark Tolentino

Hello, my name is Alvaro Gutierrez, a resident of 8101 Sierra Highway, Mojave, CA 93501. I am in receipt of a Notice of Preparation letter for Mojave Micro Mill by PSGM3 Holdings Corp (Pacific Steel Group) (PP22402). I am not against the construction of the mill, the progress and the fact that this mill will bring employment to the community. My concern is about the environment contamination (regardless we are in this beautiful dessert) and the level of noise. As it is now, my property is suffering the effects of the explosions caused by the mines on Silver Queen and Tropical Road. My house already has cracks in the walls and windows. The stucco has suffered from cracks and there is a possibility that the house is no longer on even floor due to the dynamite explosions from last year and this year. Each explosion feels like there is an earthquake.

I am fully aware that I have been asked for my opinion about the construction of the mill. Yet, I am using the example of the mines because no one is going to come forward and compensate for the property damages. Therefore, I am really concern that the mill will add more risks that could add to the already damaged home.

My property is just across from the proposed construction; thus, if there are any environmental factors that will affect the environment, then I will be in a higher risk. I belong to a community composed of five properties and when talking to my neighbors, they are experiencing the same risks and concerns created by the mine explosions as I am.

I would like to be kept informed of any future correspondence and hearings as I want to continue expressing my concerns. I can be reached at 818 590-2397, or 818 744-7256 and/or by mail.

Yours truly,

Alvaro Gutierrez
Radio and TV Broadcaster

To: Judy Stonehill; Mark Tolentino
Subject: Proposed Mojave Micro Mill
Date: Thursday, November 3, 2022 12:35:51 PM

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Dear Mr. Tolentino -
I am following up with some questions related to the proposed steel mill that would be located just to the east of Sierra Hwy and just to the south of Sopp Rd. My sister and I own two adjacent tracts (see below) which I believe are at the northwest corner of the Sopp Rd and Lone Butte Rd intersection.

430 260 23 00 8 STONEHILL JUDY M
430 260 26 00 7 STONEHILL ROBERT

My questions are:

- Exactly how close to our property will the new steel mill be?
- Where will the proposed solar array be located? The notice only said "on private property." Are the mill developers (the Pacific Steel Group) proposing to buy or lease nearby property to locate the solar array?

Any additional information you provide would be welcome - thanks in advance.

Robert Stonehill

Environmental Assessment for Proposed Utility Corridors at Edwards Air Force Base, California

412th Test Wing
Civil Engineer Group
Environmental Management Division
Edwards Air Force Base, California

ENVIRONMENTAL ASSESSMENT FOR PROPOSED UTILITY CORRIDORS AT EDWARDS AIR FORCE BASE, CALIFORNIA

Final

July 2016

COVER SHEET

ENVIRONMENTAL ASSESSMENT FOR PROPOSED UTILITY CORRIDORS AT EDWARDS AIR FORCE BASE, CALIFORNIA

Lead Agency: U.S. Air Force

Cooperating Agency: None

Proposed Action: Identification and establishment of utility corridors at Edwards AFB.

Point of Contact: Inquiries on this document should be directed to the 412th Civil Engineer Group, Environmental Management Division, Assets Branch (412 CEG/CEVA), Attn: Thomas Rademacher, 120 N. Rosamond Boulevard (Suite A), Bldg. 3735, Edwards AFB CA 93524, (661) 277-1402, e-mail Thomas.Rademacher.2@us.af.mil

Report Designation: Draft Environmental Assessment (EA)

Abstract: The project proponent is the 412th Test Wing (TW), Civil Engineer Group. The Group's purpose and need for the Proposed Action are driven by requirements to promote the efficient and economical use of real property assets at Edwards AFB in accordance with Executive Order (EO) 13327, Federal Real Property Asset Management. DoD leasing tools such as 10 USC §2667, *Leases: Non-Excess Property of Military Departments and Defense Agencies* allow the Air Force to lease non-excess real property for terms that promote the national defense or are in the public interest. Concurrently, the proponent seeks to limit the locations of future utility installation routes on Edwards AFB to specific pre-selected routes that avert continued impacts to mission development and execution and minimize impacts to the installation's infrastructure and environmental resources.

Over the course of years, Edwards AFB has been increasingly approached from every direction by private and public utilities with requests to access/traverse the installation to install utilities, often in areas that could negatively impact the mission, infrastructure and environmental resources. This trend drives the need for Edwards AFB to identify specific corridors for its own use and the use of external utility companies that minimizes these impacts.

A Utility Corridor Area Development Plan (ADP) was developed as part of the Edwards AFB Installation Development Plan. The ADP identifies nine corridors that could potentially be used for the routing of utilities through the Base. Possible compatible functions for these corridors include existing easements, north-south and east-west traversing the Base and take into consideration current easements, communication cables, overhead power lines and existing infrastructure alignments.

Pursuant to the *National Environmental Policy Act of 1969*, this Environmental Assessment (EA) documents the potential qualitative impacts that could result from development within seven designated utility corridors at Edwards AFB.

FINDING OF NO SIGNIFICANT IMPACT /
FINDING OF NO PRACTICABLE ALTERNATIVE
PROPOSED UTILITY CORRIDORS
EDWARDS AIR FORCE BASE, CALIFORNIA

Pursuant to the Council on Environmental Quality regulation for implementing the procedural provisions of the National Environmental Policy Act (NEPA), Title 40 of the Code of Federal Regulations (CFR) §§ 1500–1508; Air Force Environmental Impact Analysis Process (EIAP) regulations 32 CFR § 989, the Air Force has prepared an environmental assessment (EA) to identify and assess the potential qualitative impacts on the natural and human environment that could result from development within seven designated utility corridors at Edwards Air Force Base (AFB), California.

PURPOSE OF AND NEED FOR PROPOSED ACTION (EA § 1.1, page 1) – The project proponent is the 412th Test Wing (TW) / Civil Engineer Group (CEG). The purpose and need for the Proposed Action are driven by requirements to promote efficient and economical use of real property assets at Edwards AFB in accordance with Executive Order (EO) 13327, *Federal Real Property Asset Management*. Department of Defense leasing tools such as 10 USC § 2667, *Leases: Non-Excess Property of Military Departments and Defense Agencies* allow the Air Force to lease non-excess real property for terms that promote national defense and/or are in the public's interest. Currently, the 412 TW/CEG is seeking to limit the locations of future utility installation routes on Edwards AFB to specific, pre-selected routes that avert impacts to mission development/execution and minimize impacts to the installation's infrastructure and environmental resources.

DESCRIPTION OF PROPOSED ACTION AND ALTERNATIVES

ALTERNATIVE 1 – CORRIDOR 1 (EA § 2.3, pages 13 to 14) – This utility corridor spans from Edward AFB's southern boundary (120th Street East) to it's northern boundary. It is approximately 20 miles long by 1,000 feet wide (about 2,424 acres). The corridor follows natural terrain contours and is within close proximity to several drop zones and utility/microwave data transmission lines-of sight. Portions of the corridor pass through several cultural sites eligible for listing on the National Register of Historic Places (NRHP) as well as sensitive natural resource areas. Suitable utilities for Corridor 1 include underground gas, water, communication, electric, or power transmission lines.

ALTERNATIVE 2 – CORRIDOR 2 (EA § 2.4, pages 14 to 15) – This utility corridor begins at the western boundary of the installation at Rosamond Boulevard (Blvd) and parallels this road. It is approximately 12 miles long and is 500 feet wide (about 727 acres) in order to maintain the integrity of the dry lake bed. This corridor is needed to provide an important east-west option for utility placement. It crosses the Combat Arms Training and Maintenance (CATM) firing fan, terminating at the intersection point of Corridor 1. Although Corridor 2 crosses the CATM firing fan, it follows an existing communications infrastructure utility corridor in the area. There are two NRHP-eligible sites along with several sensitive natural resource areas. The corridor also crosses a 100-year floodplain. Suitable utilities for Corridor 2 include buried communication, electric, transmission, and water lines.

ALTERNATIVE 3 – CORRIDOR 3 (EA § 2.5, page 15-16) – This utility corridor, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the installation. The corridor starts from Avenue E in the south and goes to Trotter Road in the north. The corridor is approximately 15.5 miles in length and 1,000 feet wide (about 1,879 acres). It passes through several NRHP-eligible sites as well as sensitive natural resource areas. Suitable utilities for Corridor 3 include underground gas, water, communication, electric, or power transmission lines.

ALTERNATIVE 4 – CORRIDOR 4 (EA § 2.6, page 16) – This utility corridor traverses the north eastern corner of the installation, paralleling U.S. Route 395 and remains east of both the highway and the eastern edge of the Precision Impact Range Area (PIRA). To the west is the active range. The corridor is approximately 2 miles in length and 1,000 feet wide (about 242 acres). While there are few known cultural resources within this corridor, it does cross sensitive natural resource areas. Suitable utilities for Corridor 4 include buried communication, electric, transmission, and water lines.

ALTERNATIVE 5 – CORRIDOR 5 (EA § 2.7, pages 16-17) – This utility corridor begins at the northern boundary of the installation, parallels State Route (SR) 58, and terminates at Kramer Junction along the north eastern corner. It is approximately 30 miles long and is 1,000 feet wide (about 3,636 acres). The corridor follows several active easements and passes through several NRHP-eligible sites and sensitive natural resource areas. Suitable utilities for Corridor 5 include buried communication, electric, transmission, and water lines.

ALTERNATIVE 6 – CORRIDOR 6 (EA § 2.8, pages 17-18) – This utility corridor runs from mid-Rosamond Blvd and connects to either Corridor 1 or Corridor 2. It is nearly 4 miles long depending on the terminus and 500 feet wide (about 242 acres). There are few known concerns with cultural/natural resources; however, it does cross desert tortoise habitat along with other sensitive state species. Because this utility corridor is within the departure pattern for the main runway, only underground utilities such as communication, electric, transmission, or water lines should be considered.

ALTERNATIVE 7 – CORRIDOR 9 (EA § 2.9, page 18) – This utility corridor would allow for connectivity to the northwest corner of the installation and would tie into Corridor 1. This corridor is nearly 11 miles in length and 1,000 feet wide (about 1,333 acres). There is at least one NRHP-eligible site within the corridor and it passes through sensitive natural resource areas. Because above ground poles could impact range telemetry or radio frequency (RF) propagation, suitable utilities for Corridor 9 include buried communication, electric, transmission, and water lines.

ALTERNATIVE 8 – NO ACTION ALTERNATIVE (EA § 2.10, pages 18-19) – Under the No Action Alternative (Alternative 8), the Air Force would continue to designate utility corridors by either using existing routes or designating new routes on a case-by-case basis. The new routes would require the installation to individually assess operational, environmental, and physical constraints each time, thus duplicating efforts for each new utility proposal. The No Action Alternative allows for limited utility route widths, rather than the wider widths identified within each of the alternatives. The No Action Alternative provides a baseline of the existing environmental, social, and economic conditions to compare the alternatives against.

ALTERNATIVES CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS (EA § 2.2, pages 10-13) – Two additional corridors were considered but eliminated from further study, because they did not meet operational and technical selection criteria. Corridor 7 runs along Lancaster Blvd from the south base boundary to the north base boundary. It is over 16 miles in length and 1,000 feet wide (about 1,939 acres). This route passes through the heart of the installation and would have over 40 existing utility/infrastructure crossings, including fuels and natural gas. Crossings are highly undesirable and would be extremely costly to install. In addition, this corridor would have potential mission encroachment conflicts, thereby making this corridor unsuitable for development. Corridor 8 parallels current roadways, including Mercury Blvd, which bounds the PIRA. This corridor is approximately 25 miles in length and 1,000 feet wide (about 3,030 acres). This route serves as a critical boundary for safety mitigation and mission support. Just the utility-related trenching and personnel presence could impact the daily high-tempo operations, thereby making this corridor unsuitable for development. In addition, construction in this area may be very intrusive to range operations and may encounter unexploded

ordnance (UXO). Attached are Figures 2-1 and 2-2, which identify the initial utility corridors evaluated and those alternatives carried forward for further environmental analyses.

ENVIRONMENTAL CONSEQUENCES

Some issues and concerns were initially considered, but subsequently eliminated from analysis in this EA because they are not applicable to this project. These issues are airspace, public safety/emergency services and environmental justice/protection of children (EA § 1.5, pages 5-6). The environmental analyses within the EA focused on the following areas: Air Quality and Greenhouse Gases (GHG), Cultural Resources, Geology and Soils, Hazardous Materials and Hazardous Waste, Infrastructure, Land Use, Natural Resources, Noise, Socioeconomics, and Water Resources.

AIR QUALITY AND GREENHOUSE GASES (EA § 4.1, pages 118-124) – Edwards AFB is located within portions of Kern, Los Angeles and San Bernardino Counties. Majority of the Proposed Action occurs within Kern County; however, Corridors 1 and 3 partially occur within Los Angeles County, Corridor 5 partially occurs within San Bernardino County, and all of Corridor 4 occurs within San Bernardino County. Both Kern and Los Angeles Counties are in attainment for all criteria air pollutants except for ozone and particulate matter less than 10 microns in diameter (PM-10) while San Bernardino County is in non-attainment for ozone, PM-2.5, and PM-10. There would be short-term, temporary fugitive dust, nitrogen oxide, volatile organic compounds and GHG emissions resulting from construction activities (i.e., backhoes, bulldozers, portable generators and cranes) within any of the corridors, which would terminate upon project completion. Long-term emissions would be generated by on-road (employee vehicles and vendor/delivery trucks) and off-road vehicles/equipment. Corridor 5 has the largest estimated project area; approximately 291 acres. Emissions from this corridor represent the greatest amount of emissions any of the corridors could emit and was used to evaluate significance for all corridors. Calculated construction emissions when compared against *de minimis* thresholds show Corridor 5 would not exceed significance thresholds for criteria pollutants nor would it result in an exceedance of GHG threshold (EA Table 4-1, page 121). Conformity analysis is not required. The 412 TW/CEG will ensure individual utility projects adhere to all federal, state, and local air quality regulations and obtain all necessary air quality permits. All earthwork activities shall incorporate best management practices (BMPs) to further control fugitive dust emissions such as covering stockpiles/ transported fill material, applying water/dust suppressants to roads/open areas, keeping equipment in good working order, etc. Disturbed areas will be revegetated to reduce long-term PM emissions. Additionally, for any future actions in these corridors, the effects of climate change on any proposed action and its environmental impacts must be analyzed in additional project specific NEPA. Based on this analysis, there would be no significant impact to air quality from the Proposed Action.

CULTURAL RESOURCES (EA § 4.2, pages 124-127) – There are numerous prehistoric and historic archaeological sites found throughout Edwards AFB; therefore, a cultural resources survey was conducted on the Area of Potential Effects (APE) based on past land use activities and prior cultural resources studies available. The results of this survey provided an inventory rather than a formal evaluation of the cultural resources identified within each corridor, which aided in risk assessment. A total of 341 archaeological sites were identified. In summary, Corridors 4 and 6 had the lowest frequency of sites and the least area covered by cultural resources. Corridor 5 had the highest frequency. Within Corridors 1 and 3 there are greater numbers of significant cultural resources found, with the majority being located in the areas south of Rosamond Blvd. Table 4-1 on page 126 of the EA summarizes the number of cultural sites within each corridor. Majority of the time, the 412 TW/CEG will avoid approving utility projects within these sensitive cultural sites. Based on this analysis, no significant impacts to cultural resources would occur in Corridors 2, 4, 5, 6, and 9 and within portions of Corridors 1 and 3, north of Rosamond Blvd. If avoidance is not possible, then cultural resources will need to be evaluated prior to approving

any Corridors 1 and 3 utility design and construction south of Rosamond Blvd through the National Historic Preservation Action, Section 106 Consultation process. Table 2-2 identifies the sections within Corridors 1 and 3 that require additional NEPA analysis.

GEOLOGY AND SOILS (EA § 4.3, pages 127-136) – Edwards AFB is located within the Mojave Desert, an arid region of California. Most of the soils are sandy loams with potential for wind and water erosion. Major faults located within 12 miles of the installation include the San Andreas Fault and the Garlock Fault. Construction in any of the corridors would not damage or destroy existing landforms. An access road running parallel to the utility line would be established to support follow-on maintenance activities. All alternatives have the potential to impact soil loss due to wind or water erosion. In order to minimize these impacts, the 412 TW/CEG will ensure proponants provide a geotechnical and engineering geology study from a qualified geologist/engineer, which identifies site specific geologic conditions and potential geologic hazards from each utility proposal. The proponants will also be required to implement a storm water pollution prevention plan (SWPPP) using BMPs to control soil erosion (i.e. application of water/dust suppression palliatives, use of silt fencing, employing a concrete wash out area, etc.). Based on this analysis, there would be no significant impacts related to soils for any of the alternatives.

HAZARDOUS MATERIALS AND HAZARDOUS WASTE (EA § 4.4, pages 136-138) – Construction within any of the corridors would not mobilize existing contaminants associated with identified environmental restoration program sites at Edwards AFB in groundwater or soil, or expose workers to contaminated soils or groundwater at levels in excess of those permitted by federal, state, and local laws. Groundwater, which is at least 20 feet deep, would not be encountered during construction. Minor amounts of hazardous material such as fuels and lubricants would be used by various equipment and these activities would require limited amounts of hazardous materials stored/used on-site. Hazardous materials necessary for project implementation requiring temporary storage will comply with relevant federal, state and local laws as well as Air Force policies. With development of an approved health and safety plan prior to construction, all impacts associated with hazardous materials and hazardous waste would be minimal.

INFRASTRUCTURE (EA § 4.5, pages 138-144) – Corridors were selected specifically to avoid base infrastructure. None of the alternatives would impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Above-ground structures associated with Corridors 1, 2, 3, 6 and 9 could have potential range impacts depending on height, utility type and proximity to microwave data transmission lines-of-sight. RF interference would also be considered for any wireless devices and should include, at a minimum, information on power, transmission characteristics and frequencies. Prior to final design selection, the proponent will be required to coordinate with 412 TW/CEG to ensure the utility layout does not conflict with current and future Air Force mission. Overall, there would be no significant impacts to infrastructure from the Proposed Action.

LAND USE (EA § 4.6, pages 144-148) – For all alternatives, above-ground poles or towers are not usually consistent with existing, mission-related uses at Edwards AFB. A portion of Corridor 1 is near the Farm Drop Zone; used routinely to support both AFMC test missions and Air National Guard sorties. Additional RF interference along Corridors 2 and 6 could potentially interfere with the Range Squadron's ability to transmit data from Point Mugu, China Lake, Palmdale, Nellis ranges, White Sands Missile Range and Vandenberg AFB. Corridor 4 is within the eastern edge of the PIRA so there is a potential for UXO contamination. No high towers can be placed along Corridors 3, 5, and 7 as aircraft often perform low altitiude target run-ins. Installing underground lines for power, water or fiber would have no impact to existing land uses at Edwards AFB. The proponent will be required to coordinate their utility proposes with the Edwards Airfield Management and Range Office, 412 TW Spectrum Office and 412 TW/CEG

prior to implementation to ensure land use impacts will be avoided. With this coordination in place, there would be no significant impacts to land use from the Proposed Action.

NATURAL RESOURCES (EA § 4.7, pages 148-164) – Vegetation communities found within the proposed utility corridors include Joshua tree woodland, creosote bush scrub, saltbush scrub, mequite woodland and playa/claypans. Wildlife within the area includes reptiles, birds, and mammals; no fish or amphibians naturally occur within the area. There are two federally listed species of concern; the threatened desert tortoise and the endangered California least tern as well as numerous state listed species of concern found on Edwards AFB. Potential direct and indirect impacts on natural resources would occur during utility installation. These include disruption, trampling or removal of rooted vegetation resulting in a reduction in the total acres of native vegetation, including desert tortoise critical habitat or the direct injury or death of individual plants or animals. Potential indirect impacts include introduction of invasive species that compete with native species and can result in habitat degradation. Most of the proposed corridors follow existing roads and right-of-ways to minimize impacts. Corridor 1 is the only alternative that would occur in undeveloped areas. All of Corridor 4 and sections of the other seven corridors occur within designated critical habitat for desert tortoise. It is estimated approximately 930 acres or less than 0.2 percent of the total critical habitat would be impacted. Table 4-12 on page 154 of the EA identifies all federal and state-listed species that could be impacted within each of the corridors depending on utility scope and design.

As required by the Sikes Act, Department of Defense Instruction 4715.03, *Natural Resources Conservation Program*, and Air Force Instruction 32-7064, *Integrated Natural Resources Management (INRM)*, Edwards AFB has revised their 5-year INRM Plan, which identifies avoidance and mitigation measures required for each species of concerns as well as employs ecosystem management principles for critical habitat areas. This document was recently signed by U.S. Fish and Wildlife Service (USFWS), the California Department of Fish and Wildlife (CDFW) and the 412 TW Commander in 2015 (EA Appendix D) as the guiding document for integrating natural resources stewardship within the Edwards AFB military mission. All utility projects within Corridors 2, 4, 5, 6, and 9 will incorporate these mitigation into their design; therefore, no significant impacts to natural resources would occur. Concerning Corridors 1 and 3, there would be no significant impacts to projects occurring north of Rosamond Blvd. However, for utility projects sited south of this boulvedard, Section 7 Consultations as required by the Endanger Species Act will be be completed with USFWS and CDFW to idenfty site-specific mitigations that may be required prior to developing the selected location. Table 2-2 identifies the sections within Corridors 1 and 3 that require additional NEPA analysis.

NOISE (EA § 4.8, pages 164-166) – The major sources of noise at Edwards AFB are vehicle traffic mainly on Lancaster and Rosamond Blvds and aircraft operations, including air traffic and engine testing. Noise impacts related to development of utility corridors would primarily be from construction operations. Once installed, only negligible noise impacts associated with maintenance activities would occur. Only corridors 1 and 5 have segments relatively close to sensitive receptors. Corridor 5 has segments where it is approximately 3,000 feet away from Muroc Unified School District and Corridor 1 has a segment adjacent to the west end of the family housing area. To minimize noise, the proponent will insure operation of construction equipment be limited to the hours between 0700 and 1700, Monday through Friday. Based on this analysis, exposure to noise would be short term and not significant.

SOCIOECONOMICS (EA § 4.9, pages 167-168) – Construction activities for each of the alternatives would result in a temporary, beneficial increase in local employment and the use of local goods and services; however, there would be no long-term, significant socioeconomic impacts from the Proposed Action.

WATER RESOURCES (EA § 4.10, pages 169-174) – Edwards AFB is located in a basin that is essentially closed to both surface drainage and groundwater movement. While there are no perennial streams on or near the installation, there are permanent playa lakebeds. These lakebeds are typically dry except during the rainy seasons when they are subject to significant flooding after heavy, seasonal storms. Storm water runoff is directed towards Rogers Dry Lake, Rosamond Dry Lake, and Buckhorn Dry Lake. There are no jurisdictional waters at Edwards AFB due to a lack of connectivity or adjacency to navigable waters or waters otherwise used for interstate commerce. All permanent surface water on base is a result of detention ponds and/or impoundments. None of the corridors cross a documented 100-year floodplain except for Corridor 2, where it crosses the northern portion of Rosamond Dry Lake. This corridor cannot be moved further north out of the floodplain because the terrain becomes too steep in Bissell Hills. If moved further south, the corridor would impact additional miles of floodplain within Rosamond Dry Lake. Because numeous unnamed ephemeral drainages bisect all corridors and individual projects could disturb more than one acre of land, the proponant will be required to obtain a Generic Permit for Storm Water Discharge for Large and Small Construction Activities under the National Pollutant Discharge Elimination System prior to project initiation. As part of this application, a storm water pollution prevention plan, which identifies the type of mitigations and BMPs to be implemented to control erosion, will be developed. If utilities are constructed within the floodplain, 412 TW will ensure the proponent incorporates required mitigations for reducing flooding hazards as identified by a qualified, state of California registered geologist or engineer into the final design. This may include prohibiting construction during the rainy season and adding design features in the project to minimize flooding impacts to the project. Once construction is complete, use of the corridor for a particular utility would not affect water flow, runoff, or the floodplain itself. None of the corridors would result in an increase in groundwater withdrawal at Edwards AFB.

ENVIRONMENTAL / LAND USE CONSTRAINTS

The primary objective of this EA was to assess the potential qualitative impacts on the natural and human environment that could result from development activities within seven designated utility corridors at Edwards AFB. This analysis utilized existing geographic information along with other environmental studies/reports to determine locations of both constrained and unconstrained areas. Edwards AFB identified the following constraints: mission impacts, wetlands/100-year floodplain, cultural restricted areas and habitat for threatened/endangered flora and fauna. Table 2-2 on pages 25 to 29 of the EA summarizes the types of mitigations that will be implemented within each of the corridor for future utility proposals. This EA does not authorize implementation of any proposed utility project occuring in an environmentally constrained area without additional NEPA analysis being conducted. With proper documentation and coordination with Edwards AFB personnel, some development activities may take place in areas where land use constraints occur. However, in every case, additional project specific NEPA will be required for any future actions in these corridors.

PUBLIC REVIEW / INTERAGENCY COORDINATION

Copies of the draft EA and draft FONSI/FONPA were mailed to six agencies, seven libraries, and the California State Clearinghouse. A notice was placed in the *Antelope Valley Press* of Lancaster, California on June 3, 2016 beginning public review period. The 30-day comment period ended on July 5, 2016 with no comments received. A scoping meeting on the draft environmental assessment was held in Mojave on June 22, 2016, soliciting public comments on the action occurring within the Rosamond Dry Lake 100-year floodplain. No one from the public attended.

FINDING OF NO SIGNIFICANT IMPACT

After consideration of relevant environmental consequences explained in the Final EA and summarized above, I conclude Alternatives 2, 4, 5, 6 and 7 and portions of Alternatives 1 and 3 north of Rosamond Blvd, would not have significant direct, indirect or cumulative impacts on the environment. Accordingly, the requirements of NEPA, regulations promulgated by the President's Council on Environmental Quality and 32 CFR Part 989 are fulfilled and an Environmental Impact Statement is not required for these areas at this time. Concerning the southern portions of Corridors 1 and Corridor 3 as annotated in Figure 2-2, a Finding of No Significant Impact cannot be determined. No action within the southern portions of Corridors 1 and 3, as annotated in Figure 2-2, will be taken at this time until further NEPA analysis is completed to determine impact significance to the cultural and natural resources.

FINDING OF NO PRACTICABLE ALTERNATIVE

Pursuant to the requirements of Executive Order 11988, *Floodplain Management*, as amended by Executive Order 13690, *Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input*, and considering all supporting information, I find there is no practicable alternative but to locate Corridor 2 within the floodplain as described in the attached EA and that the Proposed Action includes all practicable measures to minimize harm to the environment. This finding both fulfills requirements of the referenced Executive Order and EIAP regulation 32 CFR § 989.14 for a Finding of No Practicable Alternative.

1.0 INTRODUCTION

This Environmental Assessment (EA) evaluates the potential qualitative environmental impacts associated with the identification and establishment of utility corridors on Edwards Air Force Base (AFB), California with the intent that they could be used by Air Force and non-Air Force proponents to traverse the installation and connect private feeds from the surrounding communities. The corridors could be used for electric, communication, natural gas, liquid fuel or water lines. The analysis provided in this EA is qualitative and at a programmatic level and, as such, is intended to identify potential environmental impacts associated with developing utilities in the proposed corridor areas and to facilitate decision-making on whether these areas are logical alternatives for utility corridors. Specific development in any of the corridors would require further, detailed environmental review and documentation specific to the type and location of utility lines proposed.

This EA was prepared in accordance with all applicable federal, state and local laws and regulations including the National Environmental Policy Act (NEPA) of 1969, as amended (42 United States Code [USC] 4321 *et seq*.); the Council on Environmental Quality (CEQ) Regulations for Implementing the Procedural Provisions of NEPA (40 Code of Federal Regulations [CFR] 1500–1508); and US Air Force Instruction (AFI) 32-7061, *The Environmental Impact Analysis Process (EIAP)*, as codified in 32 CFR Part 989. The 412th Civil Engineer Group (CEG) is representing the Department of Defense (DoD) as the lead agency.

1.1 PURPOSE OF AND NEED FOR PROPOSED ACTION

The project proponent is the 412th Test Wing (TW), Civil Engineer Group. The Group's purpose and need for the Proposed Action are driven by requirements to promote the efficient and economical use of real property assets at Edwards AFB in accordance with Executive Order (EO) 13327, Federal Real Property Asset Management. DoD leasing tools such as 10 USC §2667, *Leases: Non-Excess Property of Military Departments and Defense Agencies* allow the Air Force to lease non-excess real property for terms that promote the national defense or are in

the public interest. Concurrently, the proponent seeks to limit the locations of future utility installation routes on Edwards AFB to specific pre-selected routes that avert continued impacts to mission development and execution and minimize impacts to the installation's infrastructure and environmental resources.

1.2 BACKGROUND

Over the course of years, Edwards AFB has been increasingly approached from every direction by private and public utilities with requests to access/traverse the installation to install utilities, often in areas that could negatively impact the mission, infrastructure and environmental resources. This trend drives the need for the Base to identify specific corridors for its own use and the use of external utility companies that minimizes these impacts.

A *Utility Corridor Area Development Plan* (ADP) was developed as part of the Edwards AFB Installation Development Plan and is provided in Appendix A. The ADP identifies nine corridors that could potentially be used for the routing of utilities through the Base. Possible compatible functions for these corridors include existing easements, north-south and east-west traversing the Base and take into consideration current easements, communication cables, overhead power lines and existing infrastructure alignments. Initial natural and cultural resources evaluations of the routes in the ADP were completed using data previously collected by the Edwards AFB Environmental Management Division. Project-specific NEPA analysis to include cultural resources, natural resources and floodplain considerations and National Historic Preservation Act Section 106 consultation, will need to be conducted prior to any action or development in any corridors. Further, there is no approval to disturb the entire area within any of these corridors; Edwards AFB will evaluate each proposed project to determine the significance of the environmental impacts, including cumulative effects, prior to approval of any project, Edwards AFB reserves the right to refuse access to these corridors for installation of new utilities. In addition, Edwards AFB prefers new utility projects within these corridors be planned as underground developments as much as possible. A summary of the installation constraints considered in the analysis for acceptable utility corridors, both natural and manmade, is provided in the *Utility Corridor Area Development Plan*, provided in Appendix A (Edwards AFB, 2015).

1.3 LOCATION OF PROPOSED ACTION

The Proposed Action would occur on Edwards AFB which is located in the Antelope Valley region of the western Mojave Desert in Southern California, about 60 miles northeast of Los Angeles, California. Portions of the Base lie within Kern, Los Angeles and San Bernardino counties. The Base occupies an area of 307,517 acres or 470 square miles and consists of largely undeveloped or semi-improved land that is used predominantly for aircraft test ranges and maintained and unmaintained landing sites (i.e., dry lake beds). The Base is bounded by state highways 14 to the west and 58 to the north; and US Route 395 to the east; with county road Avenue E near the southern boundary of the Base. The developed portion of the Base includes approximately six percent of the total base area; it is concentrated on the west side of Rogers Dry Lake and includes North Base, South Base, Main Base and Family Housing areas (Figure 1-1).

Elevations on the Base range from approximately 692 to 1,038 meters (2,270 to 3,404 feet) above mean sea level (AMSL) with the lowest elevations found in the two major dry lakebeds, Rogers and Rosamond Dry Lakes. Higher elevation areas are found along ridges in the Rosamond and Bissell Hills in the northwest area of the Base, along Leuhman Ridge in the northeast and Haystack Butte in the southeast.

Edwards AFB lies in an extreme climate zone. The western Mojave Desert is characterized by both very high and very low temperatures, high winds and rainfall typically less than 3 inches per year. The local climate is characterized by two well-defined seasons, summer (hot and dry) and winter (mild and windy), with two short transitional periods in the spring and fall. Due to the relatively high altitude (2,300 feet above sea level) and dry atmosphere, there is a wide daily range in temperature during most seasons. Most precipitation occurs between November and March (Edwards, 2013).

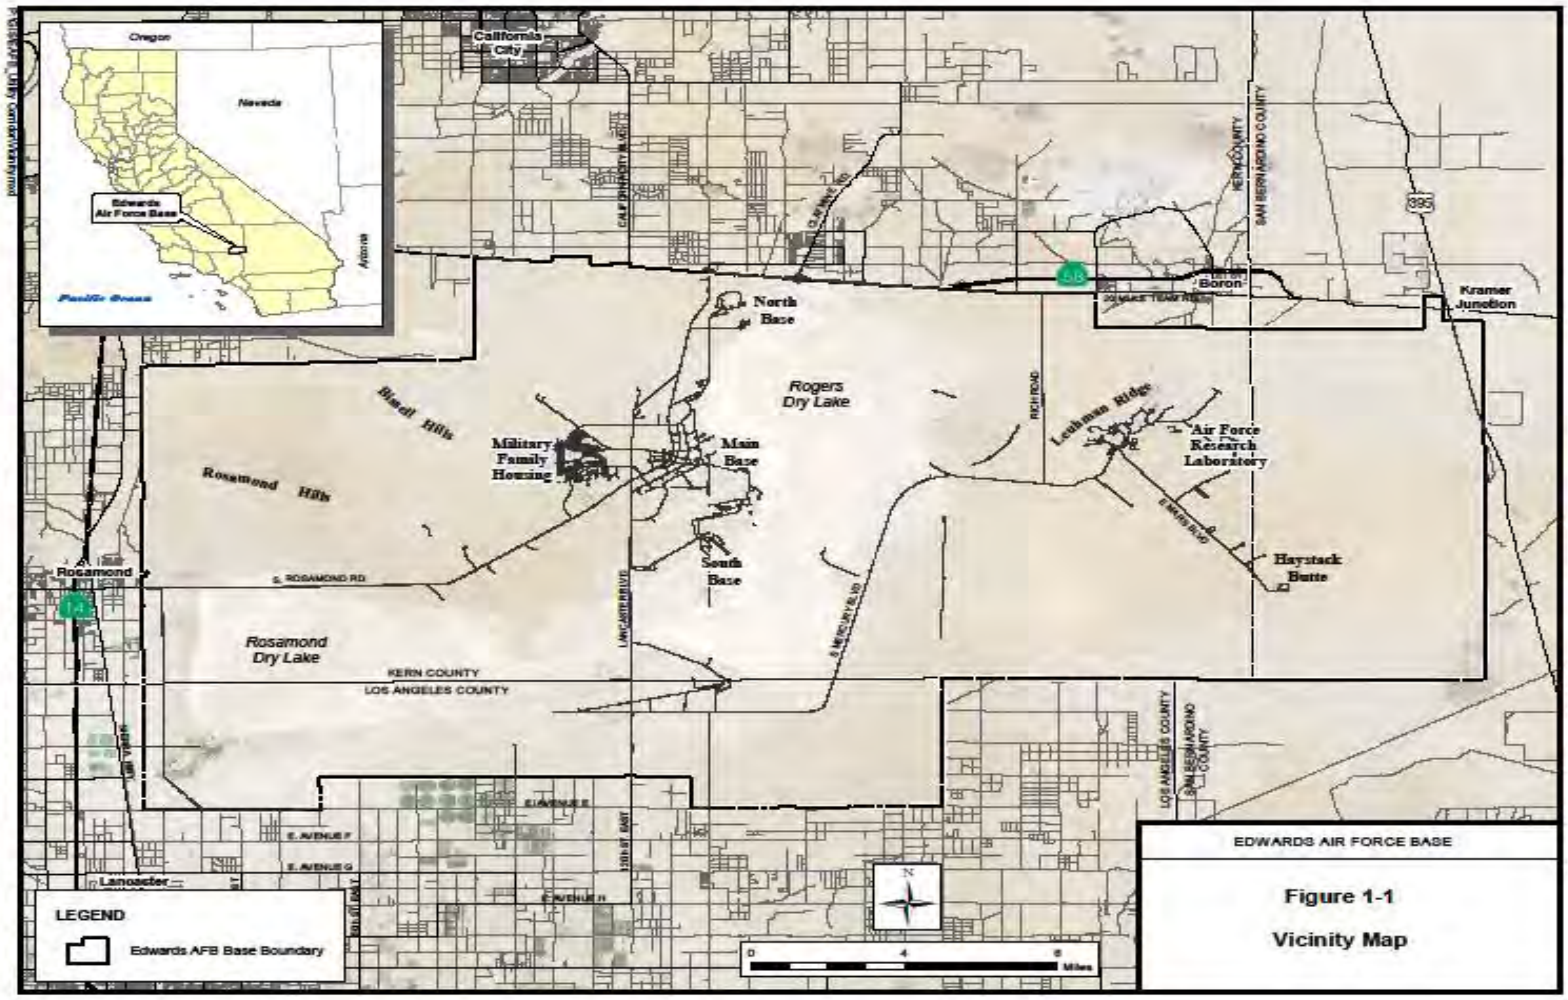

Figure 1-1 Vicinity Map

1.4 ISSUES AND CONCERNS CONSIDERED

During the scoping process, the following issues and concerns were identified as requiring assessment when considering the potential environmental impacts of the alternatives.

- Air Quality. Temporary, minor air pollutant emissions (primarily dust) would be generated during construction within each utility corridor.
- Cultural Resources. The Base contains numerous cultural resources which could be impacted during construction and operation of the utility corridors. Any proposed project would need to be evaluated for consistency with the existing Programmatic Agreement (PA) between Edwards AFB and the State Historic Preservation Office (SHPO).
- Geology and Soils. Construction within the utility corridors has the potential to involve ground-disturbing activities that may create soil erosion.
- Hazardous Materials and Waste. The generation, use, handling, transportation and disposal of hazardous materials and hazardous waste may occur as a result of construction activities.
- Infrastructure. Potential impacts to existing utilities may occur as a result of ground-disturbing activities.
- Land Use. Utility corridor management would be consistent with both mission operations and local/regional plans and development, including the Installation Development Plan.
- Natural Resources. Potential impacts to natural habitat may result during construction and operation of utility lines across the Base. Any proposed project would require a detailed evaluation/survey of the area for threatened and endangered species and coordination with the U.S. Fish and Wildlife Service (USFWS) on project-specific actions.
- Noise. Construction within the utility corridors has the potential to result in temporary and localized minor noise impacts.
- Socioeconomics. Construction of utilities within any of the corridors would result in a temporary, minor increase in employment.
- Water Resources. Water may be required during construction within any of the utility corridors for dust suppression.

1.5 ISSUES AND CONCERNS DISCUSSED BUT NOT CONSIDERED RELEVANT FOR FURTHER ANALYSIS

The following issues and concerns were initially considered, but subsequently eliminated from analysis in this EA because they are not applicable to this project or would not result in significant impacts. Consequently, they will not be addressed in Chapters 3 and 4.

- Airspace. The proposed utility corridor project would not have any effect on the management or use of the airspace at Edwards AFB or the surrounding area. No utilities would be approved that would have a negative effect on restricted airspace or installation military operating areas.
- Public Safety/Emergency Services. Construction of utilities within the corridors should not affect overall public safety at the Base, nor affect emergency services at the Base.
- Environmental Justice and Protection of Children. The EOs on Environmental Justice and the protection of children require federal agencies to identify and address disproportionately high adverse effects of their activities on minority and low-income populations and children. Given that the utility corridor construction activities would occur entirely on Edwards AFB, the Air Force has determined that this action would have no substantial, disproportionate impacts on minority and low-income populations and/or children.

1.6 PUBLIC NOTIFICATION PROCESS

Relevant federal and state resource agencies and Native American tribes and local document repositories are on the project mailing list and were sent notification on the development of designated Edwards AFB utility corridors.

This EA was published and made available for a 30-day public review period beginning 3 June 2016 through 5 July 2016. Edwards AFB accepted comments through 5 July 2016. The public had no comments on this EA.

A public meeting was also held at the Mojave Airport on 22 Jun 16. No one from the public attended.

2.0 DESCRIPTION OF THE PROPOSED ACTION AND ALTERNATIVES

This chapter describes the Proposed Action and Alternatives, including the No Action Alternative. The potential environmental impacts for each alternative are summarized in table form at the end of this chapter. The location of the Proposed Action and Alternatives is seven designated utility corridors on Edwards AFB. Initially, nine utility corridor alternatives were evaluated (Figure 2-1), with two eliminated from consideration (Corridors 7 and 8). The seven corridors carried forward for further analysis (Corridors 1, 2, 3, 4, 5, 6, and 9) as well as the No Action alternative, make up the corridor alternatives/Proposed Action (Figure 2-2).

2.1 CRITERIA FOR SELECTION OF A REASONABLE RANGE OF ALTERNATIVES

The criteria established here set the minimum requirements that must be met for an alternative to be considered viable. A more detailed explanation of the process by which the corridors were selected and evaluated with respect to these criteria is provided in the *Utility Corridor Area Development Plan*, in Appendix A (Edwards AFB, 2015). Those alternatives not meeting one or more of the selection criteria have been eliminated from further discussion. Explanation of eliminated alternatives is provided in Section 2.2. Descriptions of each alternative considered, including the No Action Alternative, are provided in Sections 2.3 through 2.10. Alternatives meeting all selection criteria are retained and analyzed in Chapter 4 (Environmental Consequences) of this EA.

The criteria used to select the alternatives discussed in this document are described below. Selection criteria have been separated into three categories: operational criteria which address Air Force operational and mission considerations, technical criteria which address utility purveyor requirements, and environmental criteria which address environmental considerations at Edwards AFB.

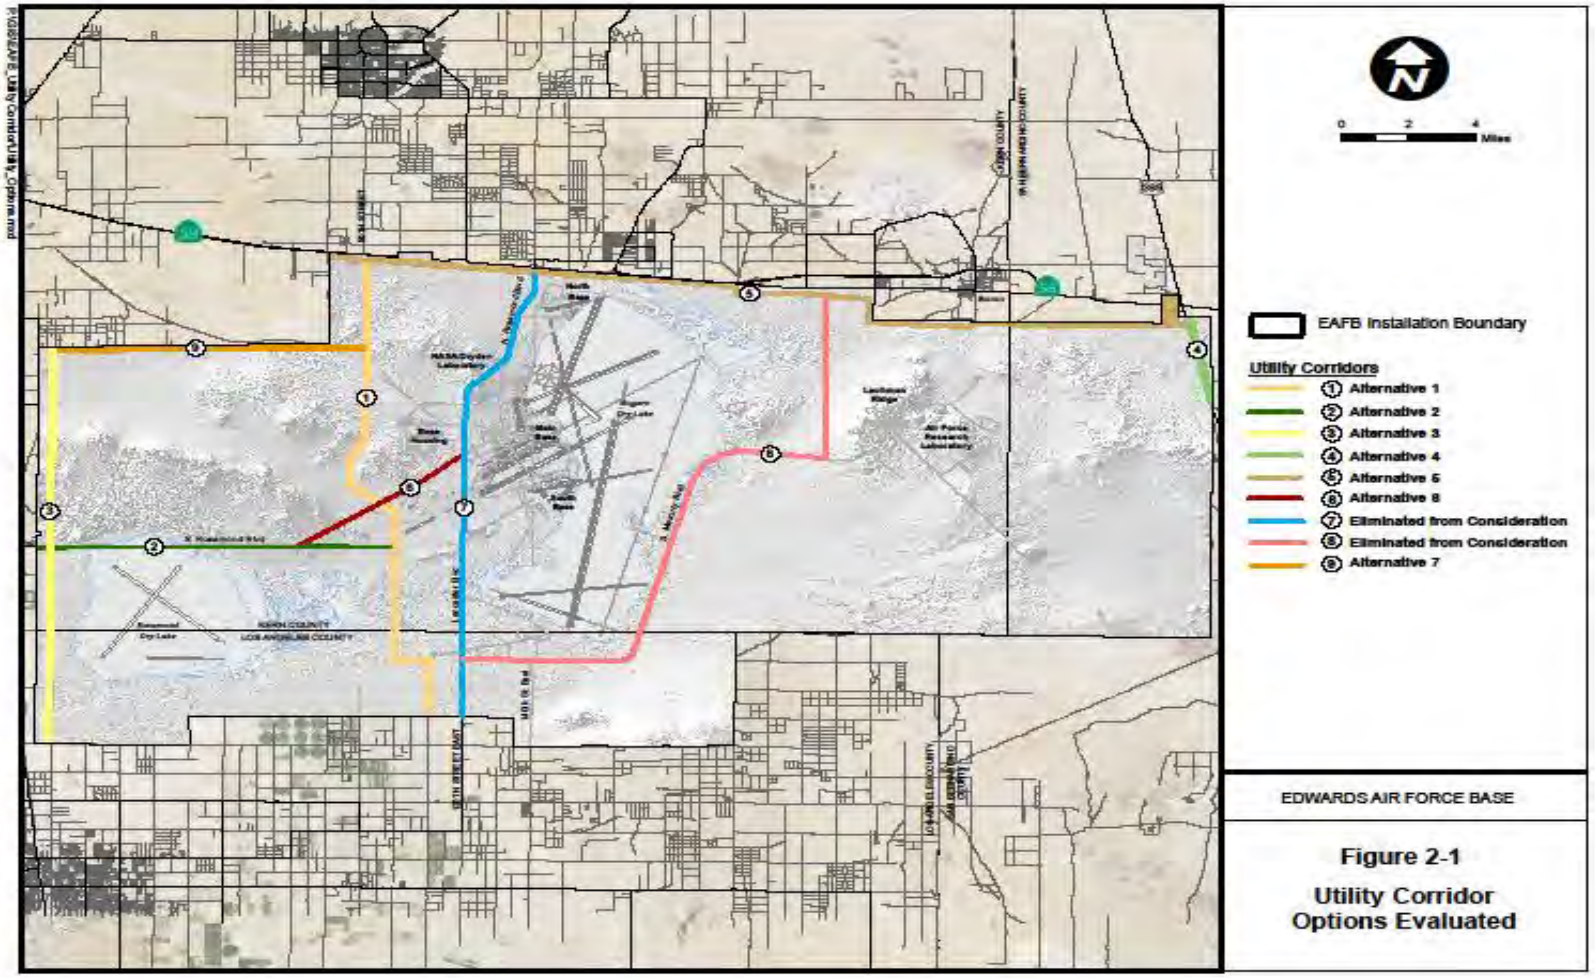

Figure 2-1 Utility Corridor Options Evaluated

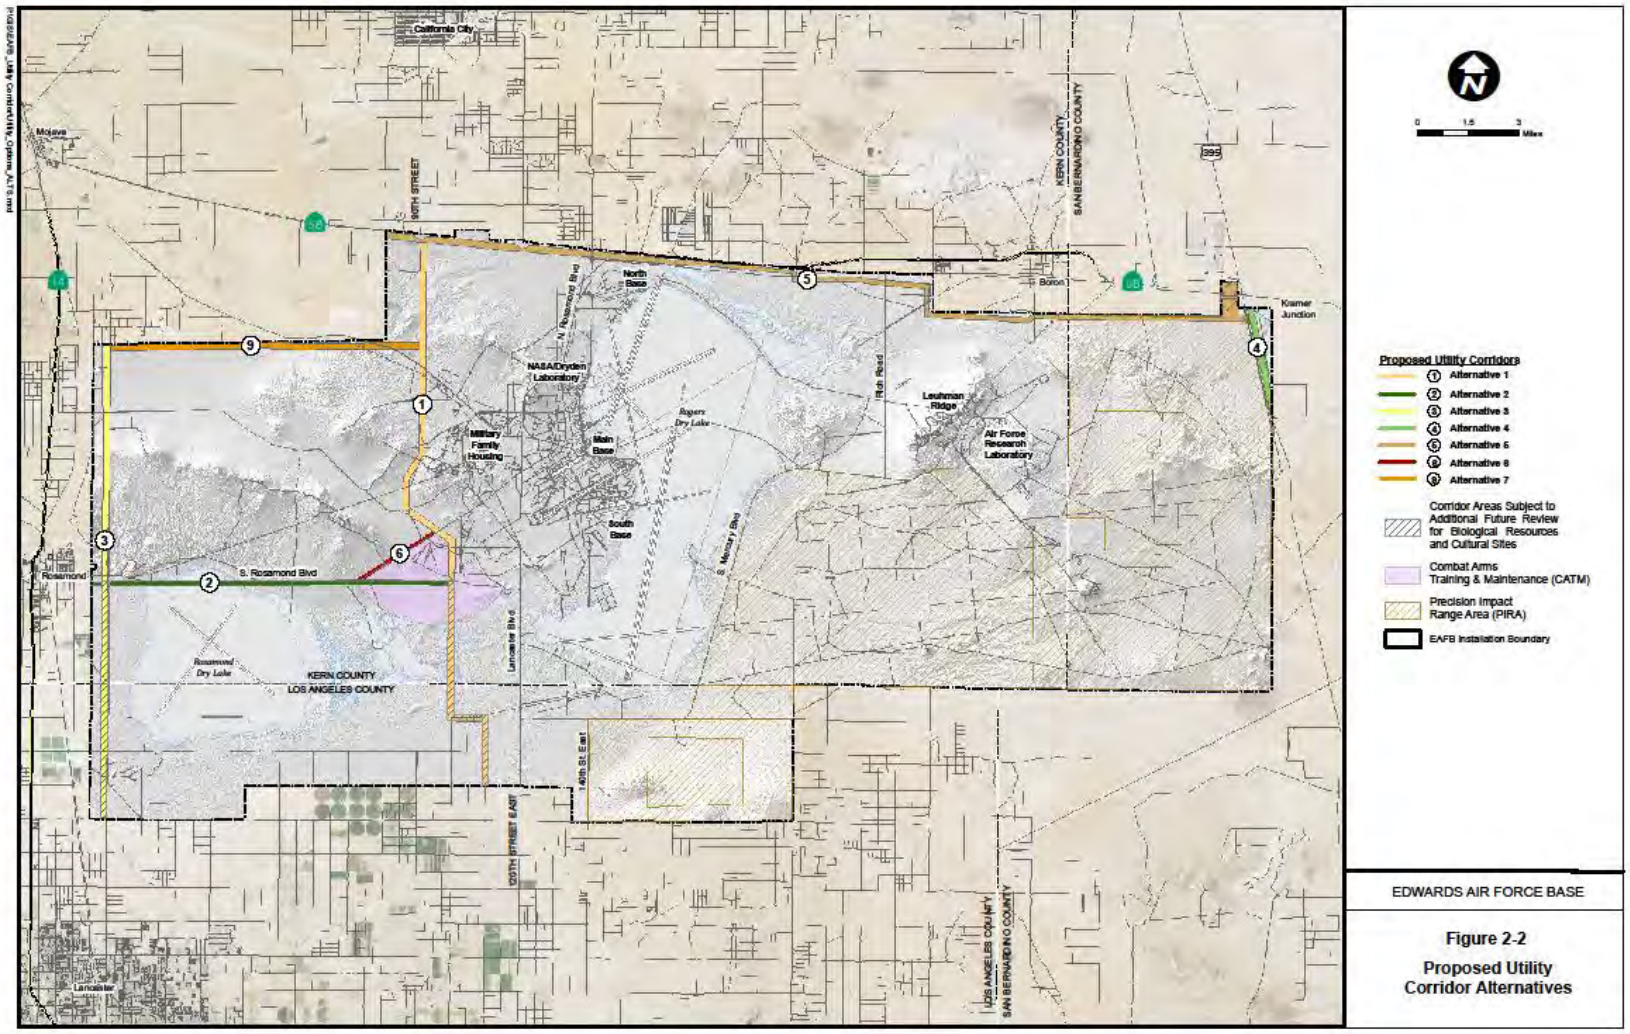

Figure 2-2 Proposed Utility Corridor Alternatives

Operational Criteria

1. Minimize mission encroachment or installation constraints (e.g., flight corridors, spin areas or zones, accident potential zones, range areas, roads and airfield surfaces, vertical height, surface water bodies, radio frequencies [RF], infra-red signature, proximity to ground-based systems land use, etc.).
2. Possibly use corridors as anti-terrorism/force protection boundaries, security zones, fire breaks or fire access roads.
3. Verify compatibility with current and future mission capabilities.

Technical Criteria

1. Identify technical limitations for utility purveyors including cathodic protection for pipelines, underground low-voltage power lines that transvers high-voltage lines, spacing pipelines and different types of power lines.
2. Verify compatibility with existing Base infrastructure and current easement configurations at Edwards AFB.

Environmental Criteria

1. Minimize impacts to sensitive biological and cultural resources, including desert tortoise critical habitat.
2. Minimize impacts to federally-listed species.
3. Eliminate access to potentially hazardous areas.

2.2 ALTERNATIVES CONSIDERED BUT DISMISSED FROM FURTHER CONSIDERATION

Corridors 7 and 8 were considered as part of the ADP planning process but were eliminated from consideration because they did not meet the selection criteria noted in Section 2.1. The two eliminated alternatives are described in this section.

2.2.1 Corridor 7

This route runs along Lancaster Boulevard from the South Base boundary to North Base boundary. It is over 16 miles in length and 1,000 feet wide (about 1,939 acres). This route

passes through the heart of the installation. This corridor would have over 40 existing utility/infrastructure crossings, to include fuels and natural gas. Crossings are highly undesirable and would be extremely costly to install, thereby making this corridor unsuitable for development.

In addition, above ground poles and towers could have potential range impacts depending on height, type of utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include (at a minimum) information on transmission characteristics, power and frequencies.

This alternative was also eliminated due to its proximity to the Camacho Reverse Drop Zone (DZ). This DZ, located west of Lancaster Boulevard in the Los Angeles County portion of the Base, is used on a fairly routine basis in support of both 412 TW missions as well as Air National Guard sorties. Container Delivery System (CDS) bundles are dropped from C-130 aircraft on this DZ with short scheduling notifications from time to time. Close coordination with Airfield Management and Range would be critical.

Corridor 7 is in the departure pattern for the main runway and is, therefore, not suitable for a new utility corridor.

In particular, the Corridor 7 alternative would not meet operational criteria 1 and 3, which are to minimize mission encroachment or installation constraints; nor would it meet technical selection criteria 1 and 2, which are to identify technical limitations for utility purveyors and verify compatibility with current utility easements on the Base. Due to these constraints, this corridor was eliminated from further consideration.

In addition, there were a number of potential environmental resource impacts. There is at least one National Register of Historic Places (NRHP)-eligible site within this proposed route and a number of sites that have not been evaluated. The route also crosses desert tortoise and mesquite habitat and burrowing owl areas.

2.2.2 Corridor 8

The Mercury Boulevard route parallels current roadways which bounds the Precision Impact Range Area (PIRA). This corridor is approximately 25 miles in length and 1,000 feet wide (about 3,030 acres).

Mercury Boulevard from 140th Street east to the Rich Road intersection serves as a critical boundary for safety mitigation and mission support. Mercury Boulevard is also used to provide a sterile environment for Time-Space-Position Information instrumented ground vehicles to traverse at moderate speeds as a ground target for Electro-Optical and Radar sensor flights. Mercury Boulevard closures and west range missions (mostly inert weapon drops and non-eye-safe laser operations) are routinely conducted. The PIRA supports over six missions daily and must have a sterile environment. Just the utility-related trenching and personnel presence could impact the daily high-tempo operations, thereby making this corridor unsuitable for development.

Above-ground poles or towers could also be very intrusive to range operations in that low-level approaches to the west gunnery ranges could pose a safety hazard. Further, any construction to the north/west of the current road may encounter Unexploded Ordnance (UXO); also to the south/east of the road is an active range area also subjected to potential UXOs. This would be the least desirable for the Range Squadron and pose the greatest encroachment to the 412 TW mission.

The Corridor 8 alternative would not meet operational criteria 1 and 3, which are to minimize mission encroachment or installation constraints; nor would it meet technical selection criteria 1 and 2, which are to identify technical limitations for utility purveyors and verify compatibility with current utility easements on the Base. Due to these constraints, this corridor was eliminated from further consideration.

In addition, there were a number of potential environmental resource impacts. There are several NRHP-eligible sites within this proposed route as well as a number of sites that have not been

evaluated. The route also crosses desert tortoise, Mohave ground squirrel and mesquite habitat and several sensitive plant areas.

2.3 ALTERNATIVE 1: CORRIDOR 1

This utility corridor spans from the Southern Base boundary (120th Street East) to the northern boundary. It is approximately 20 miles long, by 1,000 feet wide (about 2,424 acres). The corridor follows the natural contours of the terrain and avoids large and tall land masses.

There is some concern with this option as it relates to its proximity to the Camacho Reverse DZ and the Rowe East and West DZs immediately south of the Camacho Reverse DZ at the southern portion of the Base, west of Lancaster Boulevard. The Camacho Reverse DZ is used on a fairly routine basis in support of both Air Force (AF) test missions as well as Air National Guard sorties. CDS bundles are dropped from C-130 aircraft on this DZ with short scheduling notifications from time to time. Close coordination with Airfield Management and Range would be important. Underground power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 TW mission in this location. Though newly designated as drop zones, the Rowe East and West DZs have not yet been prepared or activated for use. Activation will occur at some future date.

In addition, above-ground poles or towers could have potential range impacts depending on height, type of utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on transmission characteristics, power and frequencies. This utility corridor area also crosses the Combat Arms Training and Maintenance (CATM) firing range area which is of concern for the construction phase of any project.

This proposed utility corridor passes through NRHP-eligible sites and crosses desert tortoise, burrowing owl, mesquite habitat and biological wetlands. This corridor also crosses the Los Angeles County-designated Antelope Valley Significant Ecological Area (SEA). The portion of Corridor 1 north of Rosamond Boulevard has fewer sensitive natural and cultural resources than the southern portion. In general, impacts to cultural/natural resources would be

avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS. At a future time when a specific utility project is proposed, a Finding of No Practicable Alternative (FONPA) may be required for crossing any biological wetlands. The SEA and wetlands issues are discussed in more detail in Section 3.7, Natural Resources, and Section 3.10, Water Resources.

Suitable utilities for Corridor 1 include underground gas, water, communication, electric or power transmission lines.

2.4 ALTERNATIVE 2: CORRIDOR 2

This utility corridor begins at the western boundary of the Base at Rosamond Boulevard and runs parallel to Rosamond Boulevard. It is approximately 12 miles long and is 500 feet wide (about 727 acres) in order to maintain the integrity of the dry lake bed. The corridor crosses the CATM firing fan, terminating at the intersection point of Corridor 1. Although Corridor 2 crosses the CATM firing fan, it does follow an existing communications infrastructure utility corridor in the area.

Above-ground poles or towers could have potential range impacts depending on height, utility type and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on power, transmission characteristics and frequencies. The Range Squadron routinely transports data (telemetry, voice and video) from Point Mugu, China Lake, Palmdale, Nellis ranges, White Sands Missile Range and Vandenberg AFB, so any RF in proximity to microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability.

The Range Squadron manages radar reflector arrays on the Rosamond Dry Lakebed. The south side of the Rosamond Dry Lakebed has a DZ. Dry lakebeds serve as emergency landing areas as well as unimproved landing strip testing sites. Any access or potential impact should be well coordinated with the Operation Support Squadron and Airfield Management. Underground power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 TW mission in this location.

From an environmental perspective, this utility corridor area contains two NRHP-eligible sites, and also crosses a 100-year floodplain, desert tortoise habitat and a burrowing owl area. However, impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS. A FONPA is required to cross the 100-year floodplain and is provided as part of this EA.

Suitable utilities for Corridor 2 include buried communication, electric, transmission and water lines.

2.5 ALTERNATIVE 3: CORRIDOR 3

This utility corridor, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the Base from Avenue E to the south, to the northern boundary of the Base at Trotter Road. The corridor is approximately 15.5 miles in length and 1,000 feet wide (about 1,879 acres).

This proposed utility corridor area passes through the Piute Ponds Complex, NRHP-eligible sites and a number of cultural sites that have not been evaluated. This corridor also crosses the Los Angeles County-designated Antelope Valley SEA. The portion of Corridor 3 north of Rosamond Boulevard has fewer sensitive natural and cultural resources than the southern portion. In general, impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS. At a future time when a specific utility project is proposed, a FONPA may be required for crossing any biological wetlands, such as those at the Piute Ponds Complex. The SEA and wetlands issues are discussed in more detail in Section 3.7, Natural Resources, and Section 3.10, Water Resources.

Above ground poles and towers could have potential range impacts depending on height, type utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on power, transmission characteristics and frequencies. Underground gas, water, communication, electric

or power transmission lines would have no impact on the Range Squadron or 412 TW mission in this location.

Suitable utilities for Corridor 3 include underground gas, water, communication, electric or power transmission lines.

2.6 ALTERNATIVE 4: CORRIDOR 4

This utility corridor traverses the north eastern corner of the Base, paralleling U.S. Route 395 and remains to the east of the eastern edge of the PIRA and on the east side of Highway 395. The corridor is approximately 2 miles in length and 1,000 feet wide (about 242 acres).

To the west of the utility corridor area is the active range area, where there is a potential for UXO, so any construction in this area may encounter UXO.

There are currently no known issues or concerns for range operations with the Corridor 4 area. However, there may be some future concerns should the AF consider Hawes Field to the east of the Installation as a potential small unmanned aircraft system (UAS) test area, in which case any poles or towers could cause an intrusion for ingress and egress to and from the east PIRA.

From a cultural resource perspective, there are few known concerns in this corridor and the corridor does cross critical desert tortoise habitat. However, impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS.

Suitable utilities for Corridor 4 include buried communication, electric, transmission and water lines.

2.7 ALTERNATIVE 5: CORRIDOR 5

This utility corridor begins at the northern boundary of the Base, parallels State Route (SR) 58, and terminates at the north eastern corner of the Base at Kramer Junction. It is approximately 30 miles long and is 1,000 feet wide (about 3,636 acres). This utility corridor follows other active easements and provides for minimum impact to the future mission of the installation.

Caution would need to be exercised on the east end from Rich Road to the Four Corners area (where U.S. 395 and SR 58 intersect). Aircraft performing bombing and laser missions on the east range perform the run-in to the targets from the north to the South often at low altitudes. It is imperative that there are no high towers along SR 58, which could cause a targeting solution problem as well as safety of flight issues.

This proposed utility corridor passes through NRHP-eligible sites and a number of sites that have not been evaluated. This utility corridor also crosses desert tortoise and Mohave ground squirrel habitat. However, impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS.

Suitable utilities for Corridor 5 include buried communication, electric, transmission and water lines.

2.8 ALTERNATIVE 6: CORRIDOR 6

This utility corridor runs from mid-Rosamond Boulevard and connects to either Corridor 1 or Corridor 2. It is nearly 4 miles long depending on the terminus and 500 feet wide (about 242 acres).

Since Corridor 6 is close to or along the same path as existing lines, the Range Squadron would not have any issue with this utility corridor area. However, this utility corridor area is in the departure pattern for the main runway and therefore only underground utilities should be considered. Underground power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 TW mission in this location.

Above-ground poles or towers could have potential range impacts depending on height, type of utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include information on power, transmission characteristics and frequencies at a minimum. The Range Squadron transports data (telemetry, voice and video) from Point Mugu, China Lake, Palmdale, Nellis AFB ranges, White Sands

Missile Range and Vandenberg AFB routinely, so any RF in proximity to the microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability.

From a cultural/natural resource perspective, there are few known concerns in this corridor, however, the corridor does cross desert tortoise habitat and burrowing owl areas. Impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS.

Suitable utilities for Corridor 6 include buried communication, electric, transmission and water lines.

2.9 ALTERNATIVE 7: CORRIDOR 9

This utility corridor is the northwestern connection from the northwestern edge of the Base to tie into Corridor 1. This utility corridor area would allow for connectivity to the northwest corner of the base. This corridor is nearly 11 miles in length and 1,000 feet wide (about 1,333 acres).

There is at least one NRHP-eligible site within this proposed utility corridor and a number of sites that have not been evaluated. This utility corridor also crosses desert tortoise habitat. However, impacts to cultural/natural resources would be avoided/minimized by limiting the degree or magnitude of the action taking place and/or by consultation with the SHPO, Native American Tribes and USFWS.

Above ground poles or towers could impact telemetry or RF propagation. No other range operation impacts are known at this time.

Suitable utilities for Corridor 9 include buried communication, electric, transmission and water lines.

2.10 ALTERNATIVE 8: NO ACTION ALTERNATIVE

The CEQ regulations require inclusion of a No Action Alternative in an EA. The No Action

Alternative serves as a baseline against which the impacts of the Proposed Action and Alternatives can be evaluated.

Under the No Action Alternative (Alternative 8), the Air Force would not provide for designated utility corridors, but would use existing routes or new, undesignated utility routes. New utility routes would continue to be considered on a case-by-case basis. Each new utility route would be required to assess all constraints, thus duplicating efforts for each new utility route being proposed. Status quo designation would continue to occur on a case-by-case basis and would result in potential redundant expenditure of time and effort to repeatedly analyze similar issues/constraints without integrated coordination and appropriate review. The No Action Alternative would allow for limited utility route widths, rather than the wider widths identified in the routes that comprise the Proposed Actions and Alternatives.

2.11 SUMMARY OF ENVIRONMENTAL IMPACTS

Table 2-1 presents a summary of anticipated environmental impacts for all alternatives. Table 2-2 presents a compilation of the avoidance and minimization measures proposed to reduce impacts to a level that is not significant.

Table 2-1 Summary of Potential Environmental Impacts

Resource	Alternative 1 Corridor 1	Alternative 2 Corridor 2	Alternative 3 Corridor 3	Alternative 4 Corridor 4	Alternative 5 Corridor 5	Alternative 6 Corridor 6	Alternative 7 Corridor 9	Alternative 8 No Action
Air Quality & Greenhouse Gases	Emissions would be below *de minimis* and significance thresholds and would not be expected to have a significant impact on the environment. Implementation of Mitigation Measures (MM) MM AIR-1 through MM AIR-13 would further reduce impacts to ensure that impacts remain less than significant.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	No impacts would occur.
Cultural & Paleontological Resources	Previous cultural resources surveys identified 65 archaeological sites (15 prehistoric and 50 historic period); 11 of these sites are considered significant (EAFB-79, EAFB-90, EAFB-100, EAFB-105, EAFB-108, EAFB-199, EAFB-206, EAFB-423, EAFB-854, EAFB-1000, and EAFB-3051). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 22 archaeological sites (4 prehistoric and 18 historic period); 2 of these are considered significant (EAFB-36 and EAFB-100). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 83 archaeological sites (33 prehistoric, 49 historic period, and one submodern); 13 of these are considered significant (EAFB-7, EAFB-8, EAFB-31, EAFB-34, EAFB-238, EAFB-835, EAFB-951, EAFB-1178, EAFB-1717, EAFB-3010, EAFB-3302, EAFB-4188, and EAFB-6083). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 11 archaeological sites (7 prehistoric and 4 historic period); 1 of these is considered significant (EAFB-558). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 106 archaeological sites (46 prehistoric and 60 historic period); 3 of these are considered significant (EAFB-216, EAFB-579, and EAFB-596). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 5 archaeological sites (2 prehistoric and 3 historic period); 1 of these is considered significant (EAFB-6123). Implementation of MM CUL would ensure that impacts would not be significant.	Previous cultural resources surveys identified 53 archaeological sites (34 prehistoric, 15 historic period, and 4 submodern); 2 of these are considered significant (EAFB-562 and EAFB-845). Implementation of MM CUL would ensure that impacts would not be significant.	No impacts would occur.
Geology & Soils	Construction would not damage existing landforms. New utilities could be affected by a seismic event. 	at Edwards AFB, but has the potential to affect the Air Force mission. Implementation of MM INF would ensure that impacts would not be significant.							
Natural Resources	Direct and indirect impacts could occur to vegetation communities which include mesquite woodland (5.0 acres), saltbush scrub (1,612.2 acres), and creosote bush scrub (571.2 acres). Impacts may also occur to wildlife communities, including desert tortoise and Mohave ground squirrel. Special-status plants have been mapped within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, desert horned lizard, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, mountain plover, northern harrier, and prairie falcon. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that	Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (285.9 acres), playa/claypan (145.1 acres), and creosote bush scrub (208.7 acres). Impacts to wildlife communities and wildlife species are the same as for Alternative 1. Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (1,231.6 acres) and creosote bush scrub (473.5 acres). Impacts to wildlife communities and wildlife species are the same as for Alternative 1, with the addition of tricolored blackbird and western snowy plover (associated with the Piute Ponds Complex). Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	Direct and indirect impacts could occur to saltbush scrub (2.5 acres), creosote bush scrub (312.5 acres), and Joshua tree woodland (27.6 acres) habitat. Impacts may also occur to wildlife communities. Impacts to wildlife communities and wildlife species are the same as for Alternative 1. Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (1,093.3 acres), Joshua tree woodland (712.3 acres), playa/claypans (137.0 acres) and creosote bush scrub (705.7 acres). Impacts to wildlife communities and wildlife species are the same as for Alternative 1. Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	Direct and indirect impacts could occur to vegetation communities which includes creosote bush scrub habitat (271.8 acres). Impacts to wildlife communities and wildlife species are the same as for Alternative 1. Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (884.7 acres) and Joshua tree woodland (215.9 acres). Impacts to wildlife communities and wildlife species are the same as for Alternative 1. Special-status plants have also been mapped within or adjacent to this corridor. Implementation of MM NAT-1 through MM NAT-18 would reduce impacts to ensure that impacts remain less than significant.	No impacts would occur.

	impacts remain less than significant.							
Noise	Noise impacts resulting from the operation of construction equipment would be short-term; no long-term impacts are anticipated. The operation of construction equipment during excavation/ earth moving would produce elevated noise levels in the immediate vicinity of the site. The nearest sensitive receptor to Corridor 1 is about 0.9 mile from the west end of the family housing area on the Base. Even though impacts would not be significant, implementation of MM INF would ensure that impacts would not be significant.	Noise impacts resulting from the operation of construction equipment would be short-term; no long-term impacts are anticipated. The operation of construction equipment during excavation/ earth moving would produce elevated noise levels in the immediate vicinity of the site. Even though impacts would not be significant, implementation of MM INF would ensure that impacts would not be significant.	Noise impacts resulting from the operation of construction equipment would be short-term; no long-term impacts are anticipated. The operation of construction equipment during excavation/ earth moving would produce elevated noise levels in the immediate vicinity of the site. The nearest sensitive receptor to Corridor 3 is about 0.9 mile from the nearest residences in Rosamond (off-base). Even though impacts would not be significant, implementation of MM INF would ensure that impacts would not be significant.	Same as Alternative 2.	Noise impacts resulting from the operation of construction equipment would be short-term; no long-term impacts are anticipated. The operation of construction equipment during excavation/ earth moving would produce elevated noise levels in the immediate vicinity of the site. The nearest sensitive receptor to Corridor 5 is about 3,000 feet from a school north of the Base. Even though impacts would not be significant, implementation of MM INF would ensure that impacts would not be significant.	Same as Alternative 2.	Same as Alternative 2.	No impacts would occur.
Socioeconomics	Socioeconomic impacts resulting from construction and installation activities would result in a temporary beneficial increase in local employment and the use of local goods and services and would be short-term; no long-term impacts are anticipated. No significant impacts are expected and no mitigation is required.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	No impacts would occur.

Table 2-2 Summary of Minimization Measures

Resource	Measures to Minimize or Reduce Impacts
Air Quality & Greenhouse Gases	**MM AIR-1:** Project activities shall comply with all applicable rules and regulations as identified in AFI 32-7040, *Air Quality Compliance and Resource Management* (2007). **MM AIR-2:** The project shall comply with all applicable EKAPCD, MDAQMD or AVAQMD rules and regulations and obtain the necessary air quality permits. Emissions from permitted devices and activities must be tracked and reported to the CARB, the appropriate air district and the U.S. EPA. Air quality permits, if required, shall be coordinated through the Environmental Management Division. The Environmental Management Division is the lead agency for the application and maintenance of air quality permits on Edwards AFB. Very few, if any, air quality permits would be required for this project as the majority of emissions will be due to mobile sources. **MM AIR-3:** Any internal combustion engine subject to NESHAP or New Source Performance Standards requirements must be permitted by the local AQMD/APCD. Based on recent revisions to the Reciprocating Internal Combustion Engine NESHAP, all stationary generators are now subject to the regulation regardless of size – this in turn makes them subject to permitting requirements. Permitting is also required (retroactively) for any non-road engine that fails the indicia of portability (i.e., exceeds the 12-month time limit). If such equipment is to remain on base less than 45 calendar days, a written exemption must be obtained from the local air agency. **MM AIR-4:** The proposed project shall not discharge from any source whatsoever, such quantities of air contaminants or other material that would: cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public; endanger the comfort, repose, health or safety of any such persons or the public; or cause or have a natural tendency to cause injury or damage to business or property. **MM AIR-5:** All earthwork activities shall be planned and conducted to minimize the duration that soils would be left unprotected. The extent of the area of disturbance necessary to accomplish the project shall be minimized. Exposed surfaces shall be periodically sprayed with water. **MM AIR-6:** Visible emissions (e.g., dust or smoke) from the proposed projects shall not exceed the limitations as outlined by the local air district. **MM AIR-7:** Apply water or dust suppressants to roads and open areas where dust is being generated. If winds produce excessive visible emissions, erect wind barriers. Do not grade or till compacted dirt without applying water or dust suppressant. **MM AIR-8:** Discontinue grading and other ground-disturbing activities at wind speeds exceeding 25 miles per hour. **MM AIR-9:** All vehicles transporting fill material or debris shall be covered to reduce $PM_{2.5}$ and PM_{10} emissions during transport. **MM AIR-10:** Temporary coverings must be installed over open storage piles. **MM AIR-11:** All mechanical and construction equipment shall be kept in good working order according to applicable technical orders and the manufacturer's equipment maintenance manuals to reduce emissions to acceptable levels. **MM AIR-12:** The following dust control measures will be implemented during land preparation (i.e., clearing, grading, etc.), excavation and/or post-construction: • All soil excavated or graded should be sufficiently watered to prevent excessive dust. Watering should occur as needed with complete coverage of disturbed soil areas. Watering should be a minimum of twice daily on unpaved/untreated roads and on disturbed soil areas with active operations. • All clearing, grading, earth moving and excavation activities shall cease during periods of winds greater than 20 miles per hour (mph) (averaged over one hour), if disturbed material is easily windblown or when dust plumes of 20% or greater opacity impact public roads, occupied structures or neighboring property. • All fine material transported off site should be either sufficiently watered or securely covered to prevent excessive dust. • All haul trucks should be required to exit the site via an access point where a gravel pad or grizzly has been installed. • Stockpiles of soil or other fine loose material shall be stabilized by watering or other appropriate method to prevent wind-blown fugitive dust. • Once clearing or grading has ceased, all inactive soil areas within the project area shall either be seeded and watered until plant growth is evident, treated with a dust

Resource	Measures to Minimize or Reduce Impacts
	palliative or watered twice daily until soil has sufficiently crusted to prevent fugitive dust emission. • On-site vehicle speed should be limited to 15 mph. • All areas with vehicle traffic should be paved, treated with dust palliatives or watered a minimum of twice daily. • Streets adjacent to the project site should be kept clean and accumulated silt removed. • Revegetation/restoration shall be required based on the level of disturbance created from project activities. Revegetation/restoration shall be in accordance with the *Edwards Air Force Base Revegetation Plan* (AFFTC/EM 1994). **MM AIR-13:** The following measures should be implemented to control construction vehicle tailpipe emissions: • Properly maintain and tune all internal combustion engine powered equipment; • Require employees and subcontractors to comply with the ARB idling restrictions for compression ignition engines; and • Use CARB diesel fuel.
Cultural Resources	**MM CUL:** Avoidance is the preferred treatment for NRHP-eligible cultural resources. If avoidance is not possible, then resources will need to be evaluated prior to any development and construction along a proposed corridor, and any potentially NRHP-eligible resources will require resolution of the adverse effects. Construction monitoring may be implemented in areas where subsurface cultural resources are anticipated. Additional site-specific mitigation may be implemented prior to developing the selected corridor.
Geology and Soils	**MM GEO-1:** Prior to final design of the Alternative, a combined geotechnical engineering and engineering geology study should be conducted by a qualified geologist/engineer to identify site-specific geologic conditions and potential geologic hazards in sufficient detail to support sound engineering. Appropriate mitigations for identified geological hazards would be identified in the geotechnical study **MM GEO-2:** Prepare and implement a construction SWPPP prior to the commencement of soil disturbance activities associated with construction. **MM GEO-3:** Use non-hazardous dust suppression palliatives approved by Edwards AFB and water on an as-needed basis to suppress wind-blown dust generated at the site during construction. Dust suppression palliatives are materials that work by either agglomerating the fine particles, adhering/binding the surface particles together, or increasing the density of the surface material. **MM GEO-4:** Implement erosion control measures during construction, including stabilization of construction areas, employing a concrete wash out area, as needed, and tire washes near the entrance to existing roadways. **MM GEO-5:** Use silt fences for erosion control in the event of a storm event. In addition, implementation of **MM AIR-12** (addressing dust-control as described for Air Quality) would further reduce erosion-related impacts.
Hazards and Hazardous Materials	**MM HAZ:** Prior to construction activities, a health and safety plan in compliance with 29 CFR 1910.120 will be prepared and approved by Edwards AFB. The site-specific health and safety plan will address all site-specific safety and environmental hazards that have the potential to be encountered during construction of the alternative, including physical hazards, biological hazards, and general safety hazards. Any training required by construction personnel will be identified.
Infrastructure	**MM INF:** Prior to final design selection, coordination will be required for current and future Air Force mission to ensure that the design does not cause conflict.
Land Use	**MM INF** as described for infrastructure
Natural Resources	**MM NAT-1:** Provide a worker environmental awareness program (WEAP) to all individuals that will be working on the project in the field (USFWS, 2014; EAFB, 2008).

Resource	Measures to Minimize or Reduce Impacts
	This program may consist of videos, brochures and briefings and will include information on: 1. The role of biological monitors and authority of monitors to stop work; 2. Locally known invasive weeds and limiting weed spread and colonization; 3. The MBTA and nest-avoidance measures; 4. Special status species present or potentially present within the corridors; 5. Desert tortoise history in the project area, desert tortoise ecology, threats to the species, and the protection measures described here and in the BO (USFWS 2014); 6. Mohave ground squirrel history in the project area, ecology and the avoidance and minimization measures described in this section for this species; 7. Other sensitive species that may be found throughout the construction of the project, and the avoidance and minimization measures described in this section for these species; and 8. Locations and designations of critical habitat and DWMA in the project area. All personnel will sign a statement that they have received, understand and will follow the regulations and protection measures presented in the program. Copies of signed statements will be on file at the Environmental Management Office. This measure fulfills or exceeds the requirements in the BO (USFWS, 2014). **MM NAT-2:** Wash all vehicles and equipment prior to bringing them on site if they have been used in areas off-base. **MM NAT-3:** All project-related construction activities will be conducted during daylight hours. If any activities are to disturb native habitat between dusk and dawn, they shall be limited to areas which have already been cleared of desert tortoises and other sensitive species by biological monitors and enclosed by a fence to exclude desert tortoises (USFWS, 2014). **MM NAT-4:** Ensure that qualified biological monitors are present during all construction-related activities to confirm avoidance and minimization of all biological resources is being conducted to the maximum extent practicable. These measures include: 1. Biological monitors will be available during site development activities which may result in injury or mortality of desert tortoises. The designated biologist will determine which activities require biological monitoring. 2. Any desert tortoises found during construction-related activities will be relocated to nearby safe areas, not more than 100 meters from the point of capture. When the area is considered safe, desert tortoises will be returned to their point of capture. 3. When handling desert tortoises, the qualified biologists and environmental monitors will follow the procedures described in *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Special status species present or potentially present within the corridors; 4. Only qualified biologists, as defined by the USFWS and the designated biologist will conduct preconstruction surveys for desert tortoises and remove animals from work areas to nearby suitable habitat. 5. The proponent shall employ the services of a qualified biologist if the proponent plans to install, repair, maintain or remove a utility during nesting season (1 February – 30 August). **MM NAT-5:** Limit disturbance areas during construction to the minimum needed to perform activities. During construction, activity areas will be clearly fenced, marked

Resource	Measures to Minimize or Reduce Impacts
	and flagged at the outer boundaries to define the limits of work areas. Installation of fencing along roadways will be implemented in areas deemed hazardous to desert tortoise to prevent injury or mortality. All workers will be instructed to confine their activities to the marked areas (USFWS, 2014). **MM NAT-6:** Laydown, parking, and staging areas will be restricted to previously disturbed areas to the maximum extent practicable (USFWS, 2014). **MM NAT-7:** Vehicles will, to the maximum extent practicable, remain on established roads. Equipment and vehicle operators will be alert for desert tortoises and other wildlife in and along access routes. When traveling off-road, speed limits will not exceed 5 miles per hour and shrubs will be avoided as much as possible. Speed limits on dirt roads within the project area shall be less than 20 mph unless otherwise posted. **MM NAT-8:** All personnel on the site will check under parked vehicles and equipment for desert tortoises and other wildlife species before moving vehicles. If a desert tortoise is discovered under a parked vehicle, an authorized biologist shall relocate the animal to a nearby, safe location. The authorized biologist shall use his or her best professional judgment to ensure that desert tortoises moved in this manner are not subjected to temperature extremes which could result in injury or death. Alternatively, the vehicle shall be left in place until the desert tortoise moves of its own volition (USFWS, 2014). **MM NAT-9:** All trash will be placed in closed and covered containers for proper disposal to reduce its attractiveness to desert tortoise predators (e.g., coyotes and common ravens). The containers must not be able to be opened by predators and must be emptied regularly to ensure adequate capacity is maintained. Water tanks and trucks will be maintained in good working order and free of leaks so common ravens and other predators will not be attracted to standing water (USFWS, 2014). **MM NAT-10:** If common raven presence increases locally as a result of the proposed project, perch deterrents will be placed on structures that are supporting perching (USFWS, 2014). **MM NAT-11:** Pre-construction surveys will be conducted by the biological monitor immediately in front of all equipment. During these surveys, the biological monitor will identify the following resources and complete the following activities: 1. Identify active nests that fall under the MBTA, and flag an avoidance area for each nest at a minimum of 50 meters from the nest. 2. Identify rare plant species occurrence. Avoid rare plant species locations whenever possible. 3. Identify potential desert tortoise burrows and flag for avoidance, if possible, at a minimum distance of 10 meters to avoid any activities affecting the burrow or any individuals underground. If avoidance of desert tortoise burrows is not possible, individual burrows will be scoped to determine if there is an animal underground. If no tortoise is using the burrow, the burrow will be excavated according to the *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Council, 1996). 4. Avoid the desert tortoise. However, if avoidance is not possible, individuals found above-ground within the project area will be temporarily moved out of harm's way by an authorized biologist according to the *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Council 1996). Desert tortoises shall not be released more than 100 meters from the point of capture (USFWS, 2014). **MM NAT-12:** All project personnel shall immediately report sightings of desert tortoises and other sensitive species and their burrows found within the project area to the biological monitor. **MM NAT-13:** Above ground utilities lines will be placed at least 18 inches aboveground when they traverse desert tortoise habitat. If at any time after installation, the height of the gas pipes above the ground has been reduced to less than 18 inches, the pipelines will either be raised or the materials causing the reduction will be removed (USFWS, 2014). **MM NAT-14:** Underground utilities will be located adjacent to or within previously disturbed areas when possible (USFWS 2014).

Resource	Measures to Minimize or Reduce Impacts
	MM NAT-15: Lands above utilities will be re-vegetated unless a road needs to be constructed and maintained for access and maintenance activities. Roads needed for utility maintenance will be concentrated in previously established corridors when possible (USFWS, 2014). **MM NAT-16:** Habitat restoration in the form of re-vegetation will be implemented as required. 1. Habitat restoration for ground disturbance will include techniques to control soil erosion that have been proven successful in the desert environment, and will include the use of native plants and seeds to mimic natural biodiversity 2. Habitat restoration activities will be conducted in accordance with the Edwards Air Force Base Revegetation Guide prepared by Edwards AFB (U.S. Air Force, 1994; U.S. Air Force, 2012c) 3. Monitoring success of efforts will be implemented for a longer period than the standard 5-year monitoring period due to slow recovery rates of re-vegetation areas in the desert. **MM NAT-17:** Open excavations will be checked three times a day and authorized personnel will remove any trapped animals. Open excavations will be covered, backfilled, or fenced at the end of each work day unless other methods of excluding desert tortoises ae employed. At the ends of a ditch or trench, a 3:1 slope will be created to allow wildlife to exit should they become trapped (USFWS, 2014). **MM NAT-18:** Any pipes left or stored on the ground in the project area will be capped on both ends to prevent entry by desert tortoises or other wildlife (USFWS, 2014).
Noise	**MM NOZ-1:** Noise levels could be reduced by limiting construction noise to daytime (e.g., 7:00 a.m. to 7:00 p.m.) and shortening work periods. In addition, noise levels would be minimized by keeping the construction activities at a distance from residential areas. Where noise may be a concern during construction, monitoring at the receptor location may be considered to minimize impact to sensitive receptors and communities. Noise levels would return to background levels once construction activities cease.
Socioeconomics	No significant impacts would occur and no mitigation is warranted.
Water Resources	**MMHYD 1**: If construction within a floodplain is required, appropriate mitigations for reducing flooding hazards as identified by a qualified, state of California registered geologist or engineer would be identified and incorporated into the final design of the selected alternative. This may include prohibiting construction during the rainy season and including design features in the project to minimize flooding impacts to the project. **MMHYD-2**: The selected alternative may require a SWPPP in support of a NPDES permit in connection with construction activities. Implementation of a SWPPP would ensure protection of downstream water quality, as sediment erosion would be controlled and sediment movement from the proposed alternative during construction would be reduced.

3.0 AFFECTED ENVIRONMENT

This chapter describes existing environmental conditions likely to be affected by the Proposed Alternatives, including the No Action Alternative. It provides the baseline information that was used to identify and evaluate potential environmental changes resulting from the implementation of the Proposed Alternatives. Resources identified that may be affected by the project include air quality and greenhouse gases, cultural and paleontological resources, geology and soils, hazardous materials and hazardous waste, infrastructure, land use, natural resources, noise, socioeconomics and water resources.

3.1 AIR QUALITY AND GREENHOUSE GASES

The Main Base at Edwards AFB is located in the eastern portion of Kern County, but portions of the Base extend to Los Angeles County in the south and San Bernardino County in the east. Eastern Kern County is located on the western edge of the Mojave Desert and is separated from populated valleys and coastal areas to the west and south by several mountain ranges. These valleys and coastal areas contain the major source of ozone precursor emissions affecting ozone exceedances within Kern County's part of the Mojave Desert Air Basin (MDAB). The Eastern Kern County region is largely impacted by ozone transport from both the San Joaquin Valley Air Basin and the South Coast Air Basin. Elevated levels of particulate matter are primarily associated with fugitive dust, which is produced through a combination of high winds, dry soil conditions resulting from an arid climate and ground-disturbing activities such as mining, agriculture and construction.

The Proposed Action would take place mostly within Kern County, but Utility Corridors 1 and 3 of Alternatives 1 and 3, respectively, would be partially within Los Angeles County; Utility Corridor 5 would be partially within San Bernardino County; and Utility Corridor 4 would be entirely within San Bernardino County. The Kern County portion of the Proposed Action is under the jurisdiction of the Eastern Kern Air Pollution Control District (EKAPCD). The Los Angeles County portion of the Proposed Action is under the jurisdiction of the Antelope Valley Air Quality Management District (AVAQMD). The San Bernardino County portion of the

Proposed Action is under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD). These three districts constitute most of the MDAB.

3.1.1 Air Quality

Air quality in a given location is defined by the concentration of various pollutants in the atmosphere. By comparing a pollutant concentration in the atmosphere to federal and/or state ambient air quality standards, the significance of its presence can be determined.

Pursuant to the Federal Clean Air Act Amendments of 1990 (CAA), the United States Environmental Protection Agency (USEPA) has established National Ambient Air Quality Standards (NAAQS) for pollutants considered harmful to public health and the environment. The NAAQS are classified as primary and secondary standards. Primary standards prescribe the maximum permissible concentration in the ambient air and are required to protect public health. Secondary standards specify the levels of air quality required to protect public welfare, including materials, soils, vegetation and wildlife, from any known or anticipated adverse effects. NAAQS are established for six pollutants (known as criteria pollutants): ozone (O_3), particle pollution (i.e., respirable particulate matter less than 10 microns in diameter [PM_{10}] and respirable particulate matter less than 2.5 microns in diameter [$PM_{2.5}$]), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2) and lead (Pb). Under the federal CAA, attainment and maintenance of NAAQS are required.

The California Air Resource Board (CARB) has also adopted its own air quality standards in the state of California, known as the California Ambient Air Quality Standards (CAAQS) under the California CAA. The CAAQS are generally more stringent than the NAAQS and include air quality standards for all the criteria pollutants listed under NAAQS plus sulfates (SO_4), hydrogen sulfide (H_2S), vinyl chloride and visibility-reducing particulate matter. The California CAA established California's air quality goals, planning mechanisms, regulatory strategies and standards of progress aimed at meeting and/or exceeding CAA requirements for air quality. The California CAA requires attainment of CAAQS for criteria pollutants by the earliest practicable date. A summary of federal and state ambient air quality standards is outlined in Table 3-1.

Table 3-1
National and State Ambient Air Quality Standards

Pollutant		Averaging Time	California Standards [1]	National Standards [2]	
			Concentration [3]	Primary [3,4]	Secondary
Ozone (O_3)		1 Hour	0.09 ppm (180 µg/m^3)	—	Same as Primary Standard
		8 Hour	0.070 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3)	
Particulate Matter (PM_{10})[6]		24 Hour	50 µg/m^3	150 µg/m^3	Same as Primary Standard
		Annual Arithmetic Mean	20 µg/m^3	—	
Fine Particulate Matter ($PM_{2.5}$)[6]		24 Hour	—	35 µg/m^3	Same as
		Annual Arithmetic Mean	12 µg/m^3	12.0 µg/m^3	15 µg/m^3
Carbon Monoxide (CO)		1 Hour	20 ppm (23 mg/m3)	35 ppm (40 mg/m^3)	—
		8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	—
Nitrogen Dioxide (NO_2)[7]		1 Hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	—
		Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as Primary Standard
Sulfur Dioxide (SO_2)[8]		1 Hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	—
		3 Hour	—	—	0.5 ppm
		24 Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (for certain areas)[8]	—
		Annual Arithmetic Mean	—	0.030 ppm (for certain areas)[8]	—
Lead[9,10]		30 Day Average	1.5 µg/m^3	—	—
		Calendar Quarter	—	1.5 µg/m^3 (for certain	Same as Primary Standard
		Rolling 3-Month Average	—	0.15 µg/m^3	
Visibility Reducing Particles[11]		8 Hour	See footnote 11	No National Standards	
Sulfates		24 Hour	25 µg/m^3		
Hydrogen Sulfide		1 Hour	0.03 ppm (42 µg/m^3)		
Vinyl Chloride9		24 Hour	0.01 ppm (26 µg/m^3)		

Sources:

1. Table extracted from http://www.arb.ca.gov/research/aaqs/aaqs2.pdf on June 2014 (California Air Resource Board, 2013).

Notes:

1. 1.California standards for ozone, carbon monoxide, sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms per cubic meter ($\mu g/m^3$) is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to parts per million (ppm) by volume, or micromoles of pollutant per mole of gas.
4. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health (USEPA, 1996).
5. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant (USEPA, 1996).
6. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg /m^3 to 12.0 µg /m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg /m^3, as was the annual secondary standard of 15 µg /m^3. The existing 24-hour PM10 standards (primary and secondary) of 150 µg /m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
7. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
8. On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. The USEPA has not made final designations on attainment status. Note that the 1-hour national standard is in units of ppb. California standards are in units of ppm. To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
9. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
10. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 j.tg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
11. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are “extinction of 0.23 per kilometer” and “extinction of 0.07 per kilometer” for the statewide and Lake Tahoe Air Basin standards, respectively.

Existing Conditions

The USEPA classifies the air quality within an Air Quality Control Region with regard to its attainment of federal primary and secondary NAAQS. Pursuant to USEPA guidelines, an area with air quality better than the NAAQS for a specific pollutant is designated as being in attainment for that pollutant. Any area not meeting the NAAQS is classified as a nonattainment area. Where there is a lack of data for the USEPA to make a determination regarding attainment or nonattainment, the area is designated as unclassified and is treated as an attainment area until proven otherwise. Similarly, California makes state area designations for the state criteria pollutants.

Pollutant concentrations are assessed relative to both the federal and state ambient air quality standards. To determine attainment of the NAAQS and CAAQS, air districts monitor air quality through a network of air monitoring stations within their boundaries. Data collected at the monitoring stations is compiled and used to track air quality conditions and support attainment efforts.

As of January 30, 2015, the USEPA listed Eastern Kern County as attainment for all standards except the 8-hour O_3 and PM_{10} standards, and designated San Bernardino County as attainment for all standards except the PM_{10} standard (USEPA, 2015). State attainment designations are listed in Table 3-2.

Table 3-2
State Attainment

CAAQS	Counties		
	Eastern Kern	**Los Angeles Portion of AVAQMD**	**San Bernardino Portion of MDAQMD**
O_3	Nonattainment	Nonattainment	Nonattainment
$PM_{2.5}$	Unclassified	Unclassified	Nonattainment
PM_{10}	Nonattainment	Nonattainment	Nonattainment
CO	Unclassified	Attainment	Attainment
NO_2	Attainment	Attainment	Attainment
SO_2	Attainment	Attainment	Attainment
Sulfates	Attainment	Attainment	Attainment
Pb	Attainment	Attainment	Attainment
H_2S	Unclassified	Unclassified	Unclassified
Visibility Reducing Particles	Unclassified	Unclassified	Unclassified

Notes:
CO Carbon monoxide
H_2S hydrogen sulfide
Pb lead
NO_2 nitrogen dioxide
O_3 ozone
$PM_{2.5}$ particulate matter less than 2.5 microns in diameter
PM_{10} particulate matter less than 10 microns in diameter
SO2 sulfur dioxide

General Conformity Requirements

Section 176(c) of the federal CAA contains requirements that apply specifically to federal agency actions, including actions receiving federal funding. This section of the CAA requires federal agencies to ensure that their actions are consistent with the CAA and with applicable

state air quality management plans. The general conformity regulation is codified in 40 CFR, Part 51, Subpart W, and Part 93, Subpart B.

Federal agencies are required to evaluate their proposed actions to ensure that they will not cause or contribute to new violations of any federal ambient air quality standards, that they will not increase the frequency or severity of any existing violations of federal ambient air quality standards and that they will not delay the timely attainment of federal ambient air quality standards. To this end, the USEPA general conformity rule requires a formal conformity determination document for federally sponsored or funded actions in nonattainment or maintenance areas when the net increase in direct and indirect emissions of nonattainment or maintenance pollutants exceeds specified *de minimis* thresholds.

A federal action is exempt from general conformity requirements if the total emissions resulting from the action are equal to or less than the *de minimis* thresholds. Thus, the action's calculated emissions are compared to established *de minimis* emission levels based on the nonattainment status for each applicable criteria pollutant in the area of concern to determine the relevant compliance requirements. Table 3-3 defines the *de minimis* thresholds that apply to Kern, Los Angeles, and San Bernardino counties. If the calculated emissions are equal to or greater than *de minimis* levels, then the requirements of air conformity apply to the action.

Table 3-3
De Minimis Thresholds in Nonattainment Areas

Pollutant	Degree of Non-attainment	*De Minimis* Level (tons/year)	Kern County	Los Angeles County	San Bernardino County
Ozone	Serious	50			
	Severe	25		X	
	Extreme	10			
	Marginal and Moderate (outside an ozone transport region)	100	X		
	Marginal and Moderate (inside an ozone transport region)	50 (VOC)			
		100 (NO_x)			
Carbon monoxide	All	100			
Particulate matter	Moderate	100			X
	Serious	70			
SO_2 or NO_2	All	100			

Pollutant	Degree of Non-attainment	*De Minimis* Level (tons/year)	Kern County	Los Angeles County	San Bernardino County
Lead	All	25			

Notes:
NO nitrogen monoxide
NO2 nitrogen dioxide
NO xnitrogen oxides (NO and NO2)
SO2 sulfur dioxide
VOC volatile organic compound

3.1.2 Greenhouse Gases

Background

Changes in global climate patterns have recently been associated with global warming, an average increase in the temperature of the atmosphere near the Earth's surface, attributed to accumulation of greenhouse gas (GHG) emissions in the atmosphere. Climate change refers to any significant change in measures of climate, such as average temperature, precipitation, or wind patterns over a period of time. Greenhouse gases trap solar heat in the atmosphere, which in turn heats the surface of the earth. Some GHGs occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities (e.g., combustion of fossil fuel). Common GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). GHGs are commonly quantified in the equivalent mass of CO_2, denoted CO2e, which takes into account the global warming potential (GWP) of each individual GHG compound. The most common GHG that results from human activity is carbon dioxide, followed by methane and nitrous oxide.

Carbon dioxide enters the atmosphere through burning fossil fuels (coal, natural gas and oil), solid waste, trees and wood products, and also as a result of certain chemical reactions (e.g., manufacture of cement). Carbon dioxide is removed from the atmosphere (or "sequestered") when it is absorbed by plants as part of the biological carbon cycle.

Methane is emitted during the production and transport of coal, natural gas and oil. Methane emissions also result from livestock and other agricultural practices and by the decay of organic waste in municipal solid waste landfills.

Nitrous oxide is emitted during agricultural and industrial activities, as well as during combustion of fossil fuels and solid waste.

Hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride are synthetic, powerful greenhouse gases that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for stratospheric ozone-depleting substances (e.g., chlorofluorocarbons, hydrochlorofluorocarbons and halons).

The following sections describe some approaches taken by federal agencies to address climate change:

Executive Order 13514, *Federal Leadership in Environmental, Energy, and Economic Performance*, issued in October of 2009, states that the policy of the U.S. is that federal agencies increase energy efficiency, measure, report and reduce their GHG emissions from direct and indirect activities.

Executive Order 13653, *Preparing the United States for the Impacts of Climate Change*, was signed in November 2013 to provide direction for federal agencies to take a series of steps to facilitate efforts for American communities to strengthen their resilience to climate change.

The USEPA is the agency responsible for writing and implementing federal regulation for the protection of the environment, including implementation of measures to address climate change. To this end, the USEPA pursues a number of efforts, including regulatory initiatives such as the GHG Reporting Program, standards for new motor vehicles, Renewable Fuel Standard Program, and landfill air pollution standards (USEPA, 2014).

The GHG Reporting Program (i.e., 40 CFR, Part 98) requires mandatory reporting of GHG emissions for certain industrial operations, most of which are large emitters of GHGs (e.g., electricity generation facilities, oil refineries, and manufacturing operations). Mandatory reporting is also required for facilities capable of emitting more than 25,000 metric tons of CO2-equivalents (MTCO2e) per year from all combined stationary fuel combustion sources (e.g., boilers and stationary engines).

The USEPA in coordination with the National Highway Traffic Safety Administration pursues efforts to enable the production of a new generation of clean vehicles through reduced greenhouse gas emissions and improved fuel use. Enacted and proposed standards are expected to reduce more than 3,100 million metric tons of carbon dioxide emissions by 2025.

Efforts to develop and implement regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel (i.e., the Renewable Fuel Standard program) are expected to reduce GHG emissions by 138 million metric tons by 2022

On July 1, 2014, the USEPA proposed updates to its air standards to new municipal solid waste (MSW) landfills, requiring certain landfills to capture additional landfill gas in an effort to reduce emissions of CH4.

Existing Conditions

Based on the 2014 update of the California GHG inventory for 2000 to 2012 prepared by the CARB, California emitted 458.68MMT CO2e in 2012 (CARB, 2014b). According to CARB, the potential impacts in California due to global climate change may include loss in snow pack; sea level rise; more extreme heat days per year; more high ozone days; more large forest fires; more drought years; increased erosion of California's coastlines; sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation. As previously mentioned, various measures are currently in effect to reduce GHG emissions in an effort to mitigate climate change effects resulting from anthropogenic activity.

3.2 CULTURAL AND PALEONTOLOGICAL RESOURCES

The following section provides the contextual background information for known cultural and paleontological resources within the proposed utility corridors (Corridors 1 through 6 and 9, which correspond to Alternatives 1 through 7), including paleontological, prehistoric, ethnographic and historical settings. This section also summarizes the results of previous cultural resource surveys of the project area.

3.2.1 Overview

The information provided here is based primarily on previous cultural resources studies (Boyer, 2005; Bupp et al., 1998; Crosby, 2010; Earle et al., 1997; Earle et al., 1998; ECORP Consulting, Inc., 2013; Edwards AFB, 2012a; Giambastiani et al., 2007; Giambastiani et al., 2013; Green et al., 2002; Hale and Hanten 2014; Hector et al., 1988; Holmes et al., 2004; Jones and Stokes, 1998; King and Spinney, 2010; King et al., 2010; Macko, 1993; McGetrick et al., 2002; Parker, 2001; Puckett et al., 2003; Puckett and Peyton, 2008; Puckett and Spinney, 2004, 2005; Ronning et al., 1997; Spinney and Mates, 2010; Spinney, 2004; Sutton and Robinson, 1977; and Wade and Hector, 1989). Over the last 37 years, these prior cultural resources studies were conducted in compliance with the National Environmental Policy Act (NEPA), the National Historic Preservation Act (NHPA, of 1966, as amended; see 16 USC 470f) and the California Environmental Quality Act (CEQA) to identify archaeological, historical built architectural resources and other cultural resources on Edwards AFB and provide a baseline for the types of archaeological sites that may be identified within the project area. [Due to the confidential nature of certain types of cultural resources information, the locations of cultural resources have been removed from these reports].

In accordance with Section 106 of the NHPA and NEPA, the US Air Force (USAF) will perform consultation with the federally-recognized Native American Tribes affiliated with Edwards AFB. There is also the potential for paleontological resources to be affected by the proposed project and therefore, it is discussed within this section.

3.2.2 Cultural and Paleontological Setting

This section presents a brief overview of the environmental setting and cultural history for the proposed project location. Understanding the environmental setting of a project area aids in identifying the types of resources that may be encountered during the proposed project, or that would be associated with a certain type of land use. Additional information pertaining to the environmental setting of the Antelope Valley and Mojave Desert may be found in the Edwards

AFB *Integrated Cultural Resources Management Plan* (ICRMP) (Edwards AFB, 2012a) and the Edwards AFB cultural overviews (Earle et al., 1997; Earle et al., 1998; Ronning et al., 1997).

The proposed project area is situated within the Antelope Valley which is in the Western Mojave Desert. The Mojave Desert is characterized by a region of isolated mountain ranges, separated by desert plains; it is wedged between the Garlock Fault and the San Andreas Fault, which have uplifted the surrounding mountains relatively rapidly. This uplift resulted in an isolation of the Mojave Desert from the Pacific Coast, creating the interior drainage basins of the Western Mojave Desert, such as the Antelope Valley. On the west end, the Antelope Valley is defined by the Tehachapi and San Gabriel mountains, which form a "v"-shaped basin along the western boundary of the Mojave Desert.

The Antelope Valley floor is comprised of thick deposits of Quaternary alluvial and lacustral (lakebed) sediments. The alluvial sediments are subdivided into two units: the older or Pleistocene Quaternary sediments, and the younger or Holocene alluvial surface deposits, both of which derive from nearby granitic mountains and have been deposited on the valley floor over thousands of years. These sediments include loosely consolidated mixtures of gravel, sand, and clay and extend to depths of 10 feet or greater beneath the surface.

Paleoenvironment and Paleontological Setting

Between 12,000 and 10,000 years ago, the western United States faced environmental change on a mass scale; the glaciers began to recede; the climate dramatically became warmer and drier; and vegetation and animals began inhabiting higher elevations (Earle et al., 1997; ECORP Consulting Inc., 2013; Sutton and Robinson, 1997).

Based on paleontological evidence, by the late Pleistocene age, the Antelope Valley was inhabited by numerous large mammalian species (e.g., sloths, horses, bears, mammoth, bison, camels, as well as prong-horned antelope), large carnivorous species (e.g., saber-toothed cats, wolves, mountain lions, desert coyotes and foxes), smaller animals (e.g., rodent, rabbits, squirrels) and a multitude of birds. The evidence also reveals that desert vegetation began replacing the low-elevation woodlands as early as 12,000 and 8,000 years ago and the types of

plants and animal communities present in the Antelope Valley today were not established until 4,300 years ago (Earle et al., 1997; ECORP Consulting Inc., 2013; Giambastiani et al., 2007; Giambastiani et al., 2013; Sutton and Robinson, 1997). Around that time, modern researchers have identified evidence of a large, fresh-water lake, Lake Thompson, which covered much of the Antelope Valley. Approximately 8,000 years ago, Lake Thompson receded, splitting into Rosamond, Buckhorn and Rogers lakes (Earle et al., 1997; ECORP Consulting Inc., 2013; Giambastiani et al., 2007; Giambastiani et al., 2013; Sutton and Robinson, 1997).

Paleontological resources are the mineralized (fossilized) remains of prehistoric plants and animals and the mineralized impressions (trace fossils) left as indirect evidence of the forma and activity of such organisms. These resources are located within sedimentary rocks or alluvium and are considered nonrenewable.

Formations that contain vertebrate fossils are considered more sensitive because vertebrate fossils tend to be rare and fragmentary. Formations containing microfossils, plant casts and invertebrate fossils are more common. A significant fossil deposit is a rock unit or formation that contains significant nonrenewable paleontological resources. This is defined as comprising one or more identifiable vertebrate fossils, large or small and any associated invertebrate and plant fossils, traces and other data that provide taphonomic, taxonomic, phylogenetic, ecologic and stratigraphic information (ichnites and trace fossils generated by vertebrate animals such as trackways or nests or middens), which provide datable material and climatic information. This definition excludes invertebrate or botanical fossils except when present within a given vertebrate assemblage. However, invertebrate and botanical fossils may be significant as environmental indicators associated with vertebrate fossils.

Prehistoric Setting

Since the 1980s, new archaeological research, relying upon radiocarbon dating, obsidian hydration and flaked stone technology profiles, has refined the prehistoric chronology of human occupation in the Mojave Desert, which suggests cultural resources dating to the Pleistocene, early Holocene, middle Holocene and the late Holocene. Additionally, it has been theorized that

a Pre-Clovis complex, pre-dating 12,000 years before present (BP), occupied portions of the Mojave Desert, although little to no solid archaeological evidence has been documented (Bupp et al., 1998; Earle et al., 1997; ECORP Consulting Inc., 2013; Giambastiani et al., 2007; Giambastiani et al., 2013; Holmes et al., 2004; Macko, 1993; and Sutton and Robinson, 1997). The chronology has been subdivided into the following:

- The Fluted Point or Late Pleistocene Period (12,000 to 10,000 BP)
- Lake Mojave Period or Early Holocene (10,000 to 7,000 BP)
- The Pinto Period or the Early to Middle Holocene (7,000 to 4,000 BP)
- Gypsum Period (4,000 to 1450 BP)
- Saratoga Spring/Rose Spring Period or the Late Holocene (1450 to 750 BP) and
- Late Prehistoric Period or Late Holocene (950 BP to Contact, circa 180 BP)

Ethnographic Setting

Ethnographic accounts indicate that the project area was used by two groups, the Kitanemuk and the Kawaiisu, each of which is briefly described in the following paragraphs.

The Kawaiisu occupied the Piute Mountains at the southern end of the Sierra Nevada Range and the northern part of the Tehachapi Mountains, as well as portions of the valley floors. Kawaiisu economy was based on hunting and gathering, with their primary food sources including acorns, deer, bighorn sheep, rabbits and pronghorn.

The Kitanemuk occupied the territory extending from the Tehachapi Mountains into the western end of the Antelope Valley. During cooler seasons or at least seasonally, it is believed they migrated into the arid valley floors; during the Late Prehistoric Period, the settlements became permanent along the desert floor. By the Mission Period (1769 to 1834), the Kitanemuk were moved to the missions of San Fernando, San Gabriel, and San Buenaventura. By the 1850s, some Kitanemuk settled at Fort Tejon and nearby Tejon Ranch, but were moved later onto the Tule Reservation.

Historic Context

Among the earliest non-native populations to occupy the area were Spanish explorers, who arrived in the Antelope Valley in the 1770s. By 1828, both Mexican traders and American trappers led by Jedediah Smith established two routes through the area providing access from the Mojave Desert to the coast, via the Old Spanish Trail near the Cajon Pass and the Owens Valley Road through the Tehachapi Pass. The routes were used later by Kit Carson and John C. Fremont (1844) and later by survey parties searching for an alternative route for the transcontinental railroad; it would not be until 1876 that the Southern Pacific Railroad extended through the Antelope Valley and until 1884 that the Atchison, Topeka & Santa Fe traversed through Mojave. By the mid-1860s and 1870s, the Antelope Valley was used extensively as an access route between Los Angeles and mining districts to the east, including mines in the Rosamond area.

Colonization companies representing Quakers, German Lutherans, Scots, English and others began to promote settlement of the southern Antelope Valley by the 1880s. Between 1880 and the early 1920s, farms in the Antelope Valley flourished, producing wheat, barley, grains, alfalfa, fruits and nuts, along with cattle and sheep rearing, with the one mile-square townsite of Lancaster being established between 1883 and 1884, southwest of the ADP area. Rural areas outside of Lancaster, including the proposed ADP vicinity, were settled by families who purchased lands from the federal government, railroad or obtained land patents. Between 1910 and the mid-1930s, hundreds of claims were filed for land within the Edwards AFB boundaries and the Antelope Valley. By the 1930s, however, intermittent droughts, flooding, extreme winds, high temperatures and the Dust Bowl – a worldwide economic depression – resulted in the failure of utopian colonies and homesteads, with many residents leaving the area and a decrease in the number of homestead claims being filed (Edwards AFB, 2012b; Earle et al., 1998; Puckett and Spinney 2004, 2005; Puckett et al., 2003; Puckett and Peyton, 2008; Spinney 2004).

With the onset of World War II, the Antelope Valley saw economic growth due to the arrival of the military. The War Department authorized construction of the Army Air Base at Muroc Lake

(the precursor to present-day Edwards AFB), which would play a strategic role in World War II, serving as the primary installation providing long-range air patrols from the Pacific Coast and training air crews for combat. The population of Lancaster jumped from 3,600 to 29,000 between 1950 and 1960. The 1980s and 1990s saw increased development with the National Aeronautical Space Administration (NASA), as the first space shuttle orbiter was assembled at an aerospace plant in Palmdale and transported to Edwards AFB. Today the installation serves as a flight test center for testing new aircraft and weaponry, along with an area which provides a suitable environment for testing propulsion systems and vehicles for space exploration.

3.2.3 Cultural Resources within the Proposed Utility Corridor Areas

Based on past land use activities in the Regional Area and prior cultural resources studies (Hale and Hanten 2014), the types of cultural resources that may be present in the proposed utility corridors include the following:

- Prehistoric Archaeological Sites: to include archaeological sites encompassing base camps or villages, lithic deposits, roasting pits or hearths and temporary camp sites;
- Historic-Period Archaeological Sites: to include archaeological sites such as agricultural features, homesites, refuse deposits, mining features, railroads or labor camps;
- Sub-Modern Archaeological Sites: to include archaeological sites that date between 45 and 50 years of age;
- Multi-component Archaeological Sites: to include archaeological sites containing both prehistoric and historic-period or sub-modern artifacts or features;
- Built-Environment/Structures: to include standing structures, buildings, or objects that are not in ruinous condition (otherwise considered archaeological remains); and
- Isolated Finds: to include one or two individual artifacts with no other associated cultural material. Isolated finds may include prehistoric, historic period or sub-modern artifacts.

The majority of these corridors have been surveyed for cultural resources previously, with the result that archaeological resources have been identified within the proposed project locations. The following summarizes the total numbers of resources identified for each corridor.

- Corridor 1: There are 65 known archaeological sites (15 prehistoric and 50 historic period). Of these, 11 archaeological sites are considered significant (EAFB-79, EAFB-90, EAFB-100, EAFB-105, EAFB-108, EAFB-199, EAFB-206, EAFB-423, EAFB-854, EAFB-1000 and EAFB-3051) (Hale and Hanten, 2014).
- Corridor 2: There are 22 archaeological sites (4 prehistoric and 18 historic period). Of these, two are considered significant (EAFB-36 and EAFB-100) (Hale and Hanten, 2014).
- Corridor 3: A total of 83 archaeological sites (33 prehistoric, 49 historic period and 1 submodern) have been identified along this route. Of these, 13 are considered significant (EAFB-7, EAFB-8, EAFB-31, EAFB-34, EAFB-238, EAFB-835, EAFB-951, EAFB-1178, EAFB-1717, EAFB-3010, EAFB-3302, EAFB-4188 and EAFB-6083) (Hale and Hanten, 2014).
- Corridor 4: A total of 11 archaeological sites (7 prehistoric and 4 historic period) have been recorded within this corridor. One is considered significant (EAFB-588) (Hale and Hanten, 2014).
- Corridor 5: A total of 106 archaeological sites (46 prehistoric and 60 historic period) have been identified. Of these, three are considered significant (EAFB-216, EAFB-579 and EAFB-596) (Hale and Hanten, 2014).
- Corridor 6: Cultural surveys identified a total of 5 archaeological sites (2 prehistoric and 3 historic period). Of these, one is considered significant (EAFB-6123) (Hale and Hanten, 2014).
- Corridor 9: A total of 53 archaeological sites (34 prehistoric, 15 historic period and 4 sub-modern) have been recorded along Corridor 9. Of these, two are considered significant (EAFB-562 and EAFB-845) (Hale and Hanten, 2014).
- Under Alternative 8, there would be no utility corridors established.

3.3 GEOLOGY AND SOILS

The following section provides background information for the topography, geology and potential seismic hazards and soils of Edwards AFB and specifically, the proposed utility corridor alternatives.

3.3.1 Overview

This section provides an overview of the project area's topography, geology, seismicity and soils.

Topography

Edwards AFB (Base) is located approximately five miles northeast of the City of Lancaster in the Antelope Valley of southern California. Edwards AFB covers portions of three different counties, Kern, Los Angeles and San Bernardino Counties, and encompasses approximately 470 square miles of the western Mojave Desert. The Base is located in a region of arid climate characterized by hot summers with maximum temperatures ranging from 110°F to 115°F. Winter temperatures vary from mild to cold with night temperatures sometimes falling below freezing. Precipitation is primarily in the form of rain that seldom exceeds 5 inches annually and falls predominately in the winter and spring months. Typical basin and range topography observed in southwestern deserts is found at Edwards AFB (Edwards Air Force Base, 2012a). These features include mountain ranges and hill systems, alluvial fans, valley floors and basins. Rocky, gravelly and sandy washes are found throughout the Base. Antelope Valley is a closed topographic basin characterized by an interior drainage where infrequent storm water flow to Rogers Dry Lake, Buckhorn Dry Lake and Rosemond Dry Lake. Elevations at Edwards AFB range from 2,267 feet above mean sea level (AMSL) at Rogers Dry Lake to 3,424 feet (AMSL) at Red Buttes located on the installation's eastern boundary.

Geology

Edwards AFB lies in the western portion of the Mojave Desert physiographic province which includes tertiary volcanic rocks and Quaternary alluvial sediments that overlie a basement complex consisting primarily of granitic intrusive rocks (Figure 3-1). Most of Edwards AFB is underlain by basement rock consisting primarily of quartz monzonite, an intrusive igneous rock similar to granite. Small, isolated exposures of carbonate rocks and volcanic tuff and basalt occur in the Bissel Hills found in the northwestern portion of the Base. Quaternary sediment deposits include older alluvium that is presumably of Pleistocene age, younger Holocene age, lacustrine sediments, and Holocene silt and sand deposits by wind and wave. Older alluvium consists of conglomerate,

gravel, sand, silt and clay in thicknesses up to 1,000 feet. It covers much of Edwards AFB, forming portions of alluvial fans that extend from the rock outcrops on the hills down to the basins. Lacustrine sediments are sand, silt and clay that occupy both the present-day lakebeds, such as Rogers Dry Lake. Eolian sediments cover sizeable areas extending mainly from south and southwest of Rosemond Dry Lake east, past Rogers Dry Lake up the broad west slopes of the hills east of Rogers Dry Lake as well as scattered in smaller areas.

Seismicity

Southern California where Edwards AFB is located is seismically active. The San Andreas Fault Zone is located approximately 12 miles southwest of the southwestern corner of Edwards AFB, and the Garlock Fault Zone is approximately 12 miles to the northwest of the northwestern corner. The Garlock Fault Zone trends southwest-northwest and meets the San Andreas Fault 45 miles west of the Base. During the last 20 years, major earthquakes recorded near Edwards AFB at greater than 5.0 on the Richter Magnitude Scale (United States Geological Survey 2009) include the Landers and Big Bear earthquakes in June 1992 and the Mojave earthquake in July 1992.

Major faults mapped at Edwards AFB are depicted on Figure 3-1. These faults are generally parallel, northwest-southeast trending normal faults that produce horst and graben features. Alluvial deposits generally conceal the surface traces of these faults. Although there are no large active fault zones on the Base, the relative motion of the San Andreas and Garlock fault zones are responsible for the formation of a series of minor faults in the Mojave Desert including the six fault zones on the Base (Figure 3-1).

There are no Alquist-Priolo Special Studies Zones within five miles of Edwards AFB. A delineation of seismic hazards was completed in 2005 for the Rosemond USGS 7.5-minute quadrangle which includes eastern-most portion of Edwards AFB (Department of Conservation, California Geologic Survey, 2005). This area is associated with the southern end of Rosamond Dry Lake and trending south with Division Street toward Lancaster. The seismic hazards report concluded that there are areas in the Rosamond 7.5-minute quadrangle that includes a minor portion of Edwards AFB where historical occurrence of liquefaction or

local geological, geotechnical and groundwater conditions that indicate a potential for permanent groundwater displacements can occur.

Soils

A basewide survey of soils at Edwards AFB has been completed by the Natural Resources Conservation Service (NRCS) (Figure 3-2) (Edwards Air Force Base, 2012b). Most of the soils at Edwards AFB are sandy loams and loamy sands. Some of the soils have a silt or clay component especially those associated with the dry lake beds. Many of the soils have been classified to a series level where only one taxonomic unit describes the soil. Much of the soils at Edwards AFB have been classified as complexes where two or more taxonomic units have been used to describe the soil (Figure 3-2). A soil complex consists of areas of two or more soils, so intricately mixed or so small in size that they cannot be shown separately on the soil map. Each area of a complex contains some of each of the two or more dominant soils, and the pattern and relative proportions are about the same in all areas. Potential erosion from wind and water to soils at Edwards AFB has been determined by the NRCS as part of the soil survey. For the soils at Edwards AFB, a Wind Erodibility Group (WEG) has been determined for those soils with similar properties that affect their susceptibility to wind erosion (NRCS, 2012).

The soils assigned to Group 1 are the most susceptible to wind erosion and those assigned to Group 8 are the least susceptible. Table 3-4 details WEG values and wind erodibility index for tons of soil loss per hectare (Hazelton and Murphy 2007). Refer to Section 4.3 for further discussion of soil erosion within each corridor.

The 2012 soil survey for Edwards AFB also has calculated the soil erosion factor loss of soil from sheet and rill erosion. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand and organic matter and on soil structure and saturated hydraulic conductivity (Ksat). Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water. Table 3-5 details K values and corresponding erodibility class (Coughlan et. al., 2002).

Table 3-5
K-Values and Erodibility Class for Loss of Soil due to Rill or Sheet Flow Erosion

K-Factor	**Erodibility Class (Tons/Hectare/Year per Unit of Rainfall Erosivity)**
<0.010	Very Low
0.010-0.020	Low
0.020-0.040	Moderate
0.040-0.060	High
>0.060	Very High

The flooding potential of a soil is indicated by its respective hydrologic soil group. Soils are classified into one of four hydrologic soil groups, A, B, C or D, with each based on the rate of water infiltration. Group A soils have a fast drainage rate when thoroughly wet. Group B soils have a moderate drainage rate when thoroughly wet. Group C soils have slow drainage rates

when thoroughly wet. Group D soils have very poor drainage rates when thoroughly wet (Soil Survey, 1996, page 122). Thus, soils in group A are less prone to flooding when compared to soils in the latter groups. Typically, flooding of soils does not occur in the hills and surrounding rock pediments or in the fan piedmonts and sand sheets due to water runoff and good drainage, respectively. Occasional ponding of water, however, may occur on the alluvial flats. Playas have poor drainage and are frequently subject to standing water (Soil Survey, 1996, pages 5-6).

3.3.2 Geology and Soils within each Corridor

Alternative 1 - Corridor 1

The Corridor 1 alternative runs from the Southern Base boundary (120th Street) to the northern boundary. It is approximately 20 miles long by 1,000 feet wide (about 2,424 acres). Quartz monzonite, Quaternary alluvium, Quaternary clay and Quaternary sand geologic formations are associated with this alternative (Figure 3-1). The Corridor 1 alternative bisects the El Mirage fault trace and faults associated with the Antelope Valley fault zone. Soils found within the Corridor 1 alternative are primarily the Helendale loamy sand with minor components of Muroc sand, Cajon-Challenger Complex, Leuhman-Challenger-Cajon Complex and Sparkhule very gravelly loam soils (Figure 3-2). All four hydrologic soil groups are found within this corridor. The flooding potential in this corridor ranges from not probable to a chance of more than 50 percent in any year (Soil Survey, 1996, page 122). The flooding potential in this corridor ranges from not probable to a chance of more than 50 percent in any year (Soil Survey, 1996, page 122).

Alternative 2 - Corridor 2

The Corridor 2 alternative begins at the western boundary of the Base at Rosamond Boulevard and runs parallel to Rosamond Boulevard. It is approximately 12 miles long by 500 feet wide (about 727 acres). Quaternary alluvium is the primary geologic formation associated with this alternative. Minor areas of quartz monzonite and Quaternary clay geologic formations are associated with this alternative (Figure 3-1). The Corridor 2 alternative bisects faults associated with the Antelope Valley fault zone and the Rosamond fault. Soils found within the Corridor 2 alternative are the Muroc sandy loam, Helendale-Randsburg Complex, Leuhman loamy sand,

Helendale find sandy loam and Lavic-Norob Complex (Figure 3-2). Hydrologic soil groups B, C and D are found in this corridor. The flooding potential in this corridor ranges from not probable to a chance of more than 50 percent in any year (Soil Survey, 1996, page 122).

Alternative 3 - Corridor 3

The Corridor 3 alternative, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the Base running from Avenue E to the south, to the northern boundary of the Base at Trotter Road. It is approximately 15.5 miles long by 1,000 feet wide (about 1,879 acres). Quartz monzonite, Tertiary tropic and a minor area of Quaternary sand and Quaternary old fan geologic formations are associated with this alternative (Figure 3-1). The Corridor 3 alternative bisects the Rosemond fault. Soils found with the Corridor 3 alternative are the Leuhman-Challenger-Cajon Complex, Leuhman-Cajon Complex, Leuhman loamy sand, Randsburg-Machone-Rock Outcrop Complex, Helendale-Cajon Complex and Destazo Complex (Figure 3-2). All four hydrologic soil groups are found within this corridor. The flooding potential in this corridor ranges from not probable to a chance of 5 to 50 percent in any year (Soil Survey, 1996, page 122).

Alternative 4 - Corridor 4

This utility corridor traverses the north eastern corner of the Base, following U.S. Route 395

where there are current electrical easements. It is approximately 2 miles long by 1,000 feet wide (about 242 acres). Quaternary alluvium, Quaternary old fan and Tertiary tropico geologic formations are associated with this alternative (Figure 3-1). Alternative 4 does not intersect any mapped fault and the Hi Vista sandy loam and Norob Complex overblown soils are associated with this alternative (Figure 3-2). Hydrologic soil groups A, B and C are found in this corridor. The flooding potential in this corridor ranges from not probable to a chance of 5 to 50 percent in any year (Soil Survey, 1996, page 122).

Alternative 5 - Corridor 5

This utility corridor begins at the northern boundary of the Base, parallels State Route 58 and terminates at the north eastern corner of the Base at Kramer Junction. It is approximately 30 miles long and is 1,000 feet wide (about 3,636 acres). Quaternary alluvium, Quaternary sand and Quaternary older alluvium are the geologic formations associated with this alternative (Figure 3-1). The Corridor 5 alternative bisects the Muroc fault and Spring fault. Helendale loamy sand, Helendale find sandy loam, Cajon-Norob Complex, Muroc-Randsburg Complex, Norob-Complex, overblown and Cajon loamy coarse sand soils are associated with this alternative (Figure 3-2). All four hydrologic soil groups are found within this corridor. The flooding potential in this corridor ranges from not probable to a chance of more than 50 percent in any year (Soil Survey, 1996, page 122).

Alternative 6 - Corridor 6

This utility corridor runs from mid-Rosamond Boulevard and connects to either Corridor 1 or Corridor 2. It is nearly 4 miles long depending on the terminus and 500 feet wide (about 242 acres). Quaternary alluvium and quartz monzonite are the geologic formations associated with this alternative (Figure 3-1). The Corridor 6 alternative bisects the Gloster fault. The Helendale-Randsburg Complex, Helendale loamy sand and the Helendale fine sandy loam soils are associated with this alternative (Figure 3-2). Hydrologic soil groups B, C and D are found in this corridor. The flooding potential in this corridor ranges from not probable to a chance of 0 to 5 percent in any year (Soil Survey, 1996, page 122).

Alternative 7 - Corridor 9

This utility corridor is the northwestern connection from the northwestern edge of Edwards AFB and would tie into Corridor 1. This corridor is nearly 11 miles in length and 1,000 feet wide (about 1,333 acres). Quaternary alluvium and quartz monzonite are the geologic formations associated with this alternative (Figure 3-1). Corridor 9 bisects the El Mirage fault. The Destazo Complex and Randsburg-Rock Outcrop Complex soils are associated with this alternative (Figure 3-2). Hydrologic soil groups A, B and D are found in this corridor. The flooding

potential in this corridor ranges from not probable to a chance of 5 to 50 percent in any year (Soil Survey, 1996, page 122).

3.4 HAZARDOUS MATERIALS AND HAZARDOUS WASTE

For purposes of this study, the terms "hazardous material" and "hazardous waste" are those substances defined by the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Resource Conservation and Recovery Act (RCRA). A hazardous material is any material whose physical, chemical or biological characteristics, quantity, or concentration may cause or contribute to adverse effects in organisms or their offspring; pose a substantial present or future danger to the environment; or result in damage to or loss of equipment, property or personnel. Hazardous wastes are substances that have been "abandoned, recycled, or are inherently waste like," and due to their quantity, concentration and/or characteristics, may cause increases in mortality or serious irreversible illness or pose a substantial hazard to human health or the environment if improperly treated, stored, transported or disposed of.

3.4.1 Overview

Hazardous Materials and Waste

A hazardous material is any material whose physical, chemical or biological characteristics, quantity or concentration may cause or contribute to adverse effects in organisms of their offspring; pose a substantial present or future danger to the environment; or result in damage to or loss of equipment, property or personnel. Hazardous materials and waste management activities at Edwards AFB are governed by specific environmental regulations including RCRA (42 United States Code [USC] 6901); CERCLA (42 USC 9601); the Federal Facility Compliance Act of 1992 (FFCA) (Public Law 102-386); AFI 327086, Hazardous Materials Management; 40 CFR 260-299, Storage, Treatment and Disposal of Waste; and 49 CFR 171-185, Waste Transportation and Packaging.

The use of hazardous materials results in generation of hazardous waste (e.g., paint waste, used oil, contaminated rags, etc.) and requires proper handling. The USEPA enforces the RCRA (40 CFR 260-272), which provides guidelines for the generation, storage, transportation and disposal of hazardous waste. The California Environmental Protection Agency (Cal-EPA) enforces hazardous waste laws embodied in 22 California Code of Regulations (CCR) Chapters 10-20 and the California Health and Safety Code (Section 25100). Environmental Management manages hazardous waste accumulation.

Guidelines used by Edwards AFB include the Edwards AFB Hazardous Waste Management Plan (USAF 2010b), which was prepared in accordance with AFI 32-7042, Waste Management. The Hazardous Waste Management Plan (HWMP) contains requirements for solid and hazardous waste characterization, training, accumulation, turn-in and disposal, as well as procedures for inspections, permits and recordkeeping. It is intended to ensure compliance with applicable federal, state and local regulations; simplify administrative procedures; and reduce pollution and environmental impacts through improved waste management practices.

3.5 INFRASTRUCTURE

3.5.1 Overview

Edwards AFB occupies approximately 470 square miles (over 301,000 acres) of land. The current working population is approximately 3,209 military personnel and 7,902 civilians. The Base has approximately 3,649 facilities of which approximately 870 are family housing units. The Base is generally divided into four major areas: Main Base, North Base, South Base and AFRL. The Main Base area includes Military Family Housing (MFH) areas and all other nonresidential areas (Temporary Lodging, Visiting Officers Quarters, unaccompanied housing and the cantonment area). The MFH area is subdivided into seven smaller areas (Joshua Acres, Juniper Ridge, Mesquite Meadows, Mountain View, Pacific Winds, Palo Verde Heights and Tamarisk Plains). The North Base area consists of buildings and facilities directly north and east of North Base Road. The South Base area is south of Runway 4/22 and includes areas commonly referred to as the B2 area, the area east of B2, and the Birk Flight Test Facility

(BFTF). The AFRL area is approximately 13 miles directly east of the Main Base area and houses specialized research facilities (U.S. Air Force, 2009).

Electrical

Southern California Edison (SCE) serves Edwards AFB with electrical power through its 115-kilovolt (kV) transmission system. SCE has a 230 kV–115 kV substation at Kramer Junction northeast of Edwards AFB. A 115-kV transmission line extends south to a SCE 26 Megavolt-ampere (MVA) 115–34.5 kV substation in the North Base area, adjacent to Switch Station 1. Switch Station 1 has a 34.5-kV feeder to Switch Station 1A, which has a 34.5-kV feeder to Switch Station 3. These switch stations feed the Main Base and North Base area substations (U.S. Air Force, 2009).

SCE's transmission line extends from the North Substation to a SCE 25 MVA, 115–34.5 kV substation in the South Base area, adjacent to Switch Station 4. Switch Station 4 has a 34.5-kV tie feeder to Switch Station 3 in the Main Base area. Switch Station 4 feeds the South Base and Main Base area substations, (U.S. Air Force, 2009).

A second 115-kV transmission line extends south from Kramer Junction to a SCE 50 MVA 115–34.5 kV substation in the AFRL area, adjacent to Switch Station 2. Switch Station 2 has three 34.5-kV tie feeders to Switch Station 1 in the North Base area. Switch Station 2 feeds the AFRL area substations (U.S. Air Force, 2009).

At each SCE substation, the point of demarcation is at the connection to the last insulator inside the SCE-owned and -operated substation. Electrical power is distributed on Base at 34.5 kV. The Air Force-owned distribution system is operated as a sub-transmission system. Some users take power at 34.5 kV, but the vast majority are fed through a 12.47-kV system. There are nineteen 34.5 - 12.47 kV substations and five 34.5 – 4.16 kV or 480 V substations at 16 locations throughout the Base.

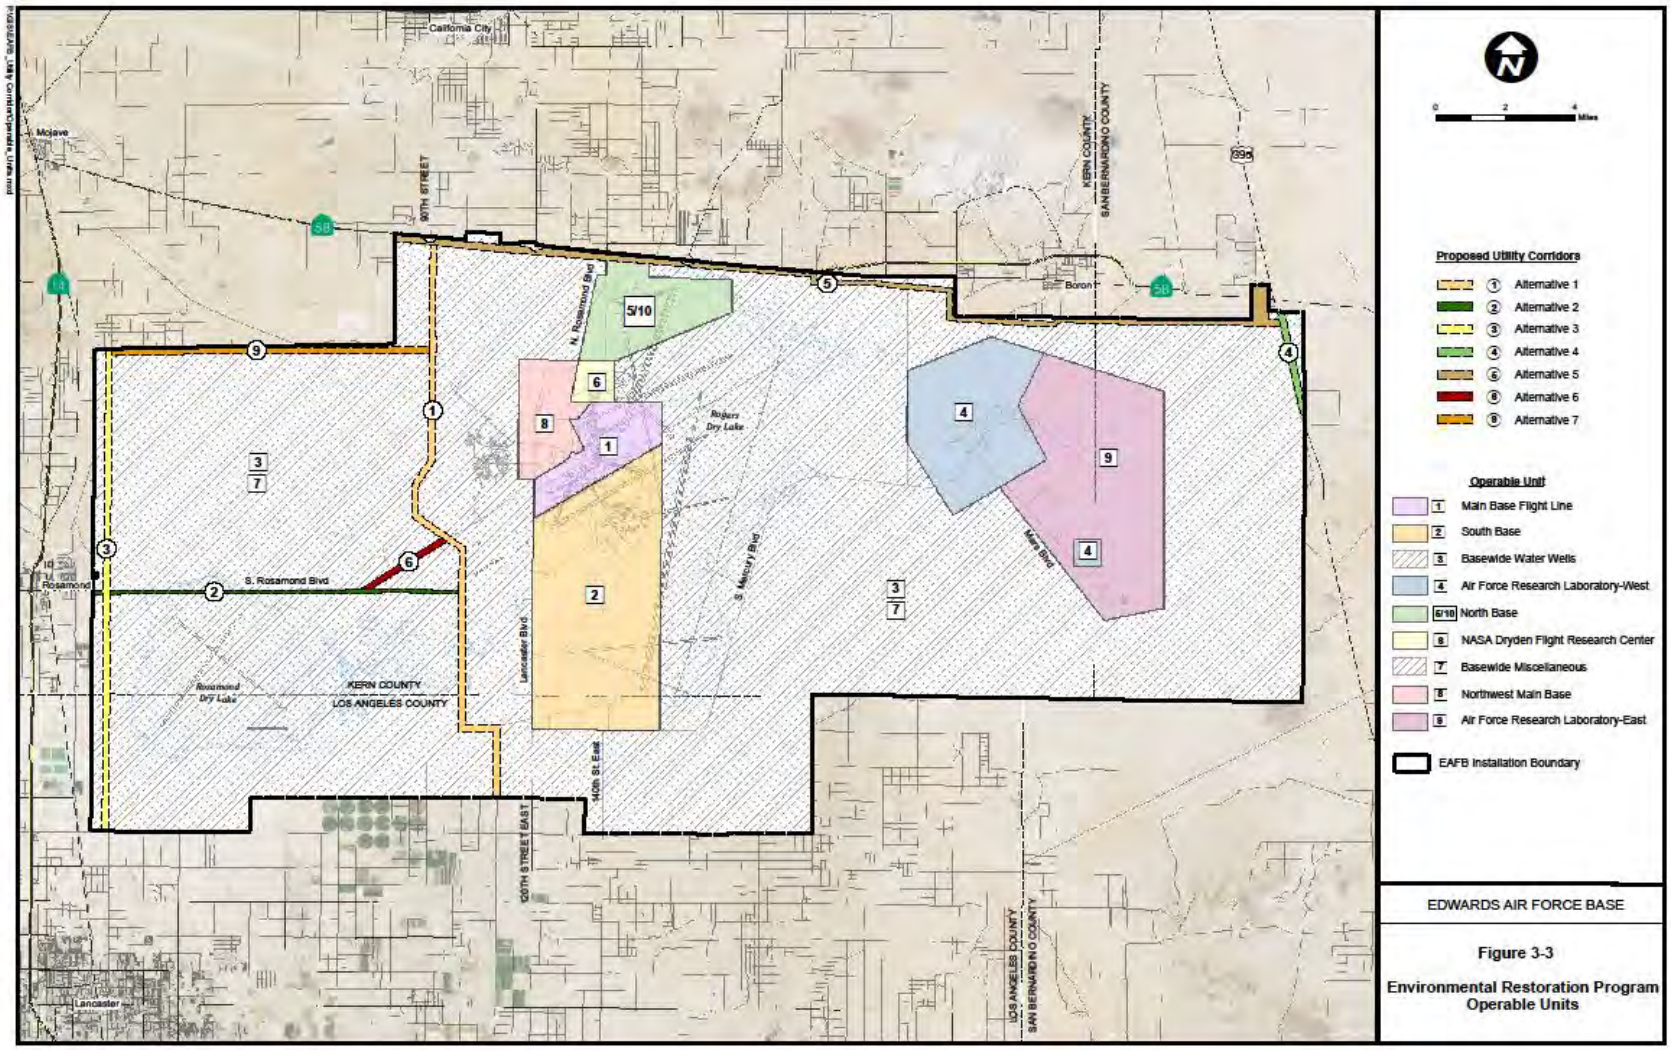

Figure 3-3 Environmental Restoration Program Operable Units

Natural Gas

Pacific Gas & Electric (PG&E) supplies odorized natural gas to Edwards AFB at four discrete locations across the Base through PG&E-owned pressure regulation and metering stations. Edwards AFB has four independent natural gas systems fed from each of the PG&E-owned regulator stations. These systems are the Main Base, the NASA Complex, North Base and AFRL. Natural gas is used to meet space- and water-heating requirements at Edwards AFB (U.S. Air Force 2009).

Natural gas utility mains and service lines vary from 2 to 10 feet below grade. Main Base natural gas utility mains and service lines are on average 4 feet below grade. The housing areas and the AFRL mains and service lines are on average three feet below grade. Tracer wire and marking tape are installed with the polyethylene pipe. At the Main Base and North Base, less than five percent of the natural gas system is located under paved surfaces. At the AFRL, approximately five percent of the natural gas system is located under paved surfaces.

Water

Edwards AFB obtains potable water from two primary sources: Antelope Valley East Kern (AVEK) Water Agency and groundwater from on-base wells. There are three independent water distribution systems at Edwards AFB. One of the systems serves the Main Base, North Base and South Base areas. The AVEK Water Agency supplies water to this first system from its water lines paralleling State Route 58 and Rosamond Boulevard, and through Pump Station 4004 south of the North Gate entrance. The second system serves the AFRL. The AVEK Water Agency supplies water to the AFRL system from a pump station near State Route 58 and north of the AFRL. The third system was added to the Main Base system in an amendment to the existing supply that serves the Gun Club area. The Gun Club water system is a small distribution system serving a transient population (U.S. Air Force 2009).

The existing Edwards Air Force Base water distribution system started as two separate systems (North Base and South Base). As housing areas and Main Base facilities were constructed, the systems were interconnected into one system.

Water for Edwards AFB is provided from two different sources: surface water and well water. The AVEK Water Agency provides surface water to Edwards AFB. In addition, the Base operates several water wells.

Distribution System. Construction of the Edwards AFB water distribution system began on South Base in the early 1940s, followed by the North Base, Main Base and housing area. After its initial construction, the system has periodically been upgraded and expanded to handle increased system demands. The water system also includes service laterals, main line valves (gate valves), service valves, valve pits, manholes, fire hydrants and elevated and ground storage facilities. Water main lines and service laterals are 4 to 8 feet below grade for the Main Base, North Base and South Base areas. The Edwards AFB water distribution system supplies water for residential, industrial and fire-fighting purposes. According to a permit application dated October 1994, it serves a population of approximately 9,400 with approximately 3,357 service connections.

Storage Tanks. The Edwards AFB water distribution systems also include water-storage tanks, which provide operational flexibility during peak-flow demand periods exerted on the system, equalize system pressure and provide emergency storage capacity. Water for the Main Base, North Base and South Base areas is stored in an elevated storage tank and ground-level storage tanks. The storage tanks have a combined storage volume of approximately 5.2 million gallons.

Fire Suppression. Fire-demand requirements for specific facilities are supported by four additional storage tanks and pump stations with a total capacity of 1.2 million gallons.

Groundwater Wells. Three wellfields furnish potable water to Edwards AFB. The South Base and Main Base areas draw water from two southern supply fields (South Base and South Track). Well pumps are typically line-shaft turbines. Automatic well controls are interconnected to the tank water-level gages for well operations. The southern supply fields provide approximately 70 percent of the water for the Main Base and South Base demand. The percentage of AVEK Water Agency versus well water is governed by the current Edwards/AVEK contract limits. Before well water enters the distribution system, chlorine and polyphosphate are added for disinfection

and corrosion control. For the southern supply fields, well water treatment facilities are housed in Pump Station 791.

Pump Stations. There are 12 pump stations on Edwards AFB, most of which lift water to storage tanks or modify static pressure in a portion of the water distribution system.

Air Force Research Laboratory. The AFRL obtains water from two primary sources: the AVEK Water Agency and groundwater from on-base wells. Water system serves the laboratory, with its non-transient-type population. The system consists of piping, valves, four water wells, 13 ground-level storage tanks, four booster stations and one chlorination facility. The AFRL system contains water-storage tanks, which provide operational flexibility during the peak-flow demand periods exerted on the system, equalize system pressure and provide emergency storage capacity. The AFRL area draws water from the AFRL supply field of four wells which are located approximately equidistant between the South Base and AFRL areas.

Wastewater Treatment

The wastewater collection and treatment system at Edwards AFB provides wastewater collection, onsite treatment, and onsite disposal of treated wastewater and sludge (which is disposed of offsite) for all base facilities. There are two independent wastewater collection and treatment systems at Edwards AFB. The first system serves the Main Base, North Base and the South Base areas. The second system serves the AFRL (U.S. Air Force 2009).

Main Base. The Main Base wastewater collection system includes gravity collection pipes, force main lines and seven lift stations. Wastewater generated in the NASA complex flows to the Main Base collection system and is treated by Edwards AFB. Wastewater collection mains and service connections are an average of 4 to 8 feet below grade for the Main Base, North Base and South Base areas. On all of Edwards AFB less than five percent of the wastewater collection and treatment system is located under paved surfaces.

South Base. The South Base wastewater collection system serves the hangars and smaller buildings along the flight line. The South Base system components include gravity flow lines,

force main lines, six lift stations, the Main Waste Water Treatment Plant (WWTP) and associated evaporation ponds and the reclaimed water distribution system.

The Main Base WWTP treats wastewater from the Main Base, North Base and South Base areas. The plant was designed to treat wastewater flows to a tertiary level of wastewater treatment. The treatment processes include mechanical screening, grit removal, carousel biological treatment for extended aeration and activated sludge removal, clarifiers, flocculation and filtration and chlorination by contact chamber.

The Main Base WWTP is regulated by the California Regional Water Quality Control Board (CRWQCB), Lahontan Region, under Board Order No. 6-01-41, and WDID No. 6B150700001. The current permit has been in effect since June 13, 2001. This permit lists the allowable concentrations of treated wastewater constituents for disposal and limits the discharge volume of treated water to 1.6 million gallons per day. The Main Base WWTP requires operator certification from the California State Water Resources Control Board for a class IV facility. Treated wastewater is disposed of by evaporation or is used for irrigation. During the non-irrigation season, the discharge from the plant is transferred to five active evaporation ponds covering an area of approximately 250 acres. During the irrigation season, primary flow is to the reclaimed water system, with excess effluent flowing to the evaporation ponds.

North Base. The North Base wastewater collection system components include gravity collection pipes, forced main lines and four lift stations. Wastewater from the North Base flows to four Lift Stations (4310, 4330, 4451 and 4505) and is pumped through a forced main along Rosamond Boulevard to the Main Base area, where it discharges into the gravity collection system for transport to the WWTP.

Air Force Research Laboratory. The AFRL wastewater collection and treatment system is independent of the Main Base wastewater collection and treatment system. The AFRL wastewater collection system consists of gravity collection pipes and a 125,000-gallon-per-day wastewater treatment facility. The depth of collection lines varies between 3 and 20 feet below grade (U.S. Air Force 2009).

The AFRL WWTP produces a tertiary effluent. After treatment, the effluent is pumped to one of four 100-foot by 200–foot evaporation ponds for disposal. Sludge produced at the AFRL is combined with the sludge from the Main Base Treatment Plant and disposed of off-site at a licensed facility.

The AFRL WWTP is regulated by the CRWQCB, under Board Order No. 6-99-33 and WDID No. 6B150700002. The current permit has been in effect since March 9, 1995. The AFRL WWTP requires operator certification from the California State Water Resources Control Board for a class III facility. The WWTP is operated by a private firm under contract to the Air Force. The Air Force maintains the permit and currently does the sampling and reporting. The Air force intends to transfer the permit if the system is privatized.

Storm Drainage System

Storm water is collected and transmitted through earthen channels and drainage structures. These structures direct surface water to either the dry lakebed or storm water retention ponds. The flightline storm water retention pond was eliminated due to bird airstrike hazard (BASH). With the exception of the AFRL area, most development has occurred in low-lying areas along the western perimeter of Rogers Dry Lake. Storm water runoff reaching these areas requires collection and removal (U.S. Air Force 2009).

The storm water drainage system consists primarily of drainage ditches with some storm sewer structures in the developed areas. These ditches and storm sewers generally flow west to east and empty into the Rogers Dry Lake, or the storm water retention ponds east of the Main Base flightline. Storm water runoff in undeveloped areas flows into the nearest dry lake.

The topography of Edwards AFB prevents the efficient use of traditional storm water drainage improvements. The level terrain prevents flows from achieving velocities sufficient to keep the channels clear. The easily eroded soil in the undeveloped, upstream areas of the base tends to cause the drainage channels to fill with silt, leading to flooding. Additionally, Rogers Dry Lake has bottom elevations only slightly lower than those of the storm water channels entering it; therefore, flooding must be anticipated. Areas prone to flooding include Rogers Dry Lake,

Rosamond Dry Lake, Mojave Creek and portions of the Military Family Housing area as well as low-lying areas in the Main Base industrial area.

Transportation Systems

Regional and Local Network

One U.S. highway and two state highways connect Edwards AFB to the local communities and the interstate highway system. U.S. Route 395 parallels and crosses into the eastern boundary of Edwards AFB and connects to Interstate 15, 40 miles to the south in San Bernardino county and Interstate 80, 380 miles to the north in Reno, Nevada. California State Route 58 parallels and crosses into the northern boundary and connects to Interstate 15, 50 miles east in Barstow, and Interstate 5, 77 miles west in Bakersfield. California State Route 14 (Antelope Valley Freeway) parallels the western boundary intersecting State Route 58 at Mojave at the northwestern corner of the installation and connects to Interstate 5, 53 miles to the south. The California Department of Transportation has developed plans for enhancing both U.S. Route 395 and State Route 58.

Commercial air transportation is available at seven airports within a 130-mile radius of the installation: Palmdale Regional Airport (35 miles), Burbank-Glendale-Pasadena Airport (83 miles), Ontario International Airport (87 miles), Bakersfield Municipal Airport (90 miles), Los Angeles International Airport (105 miles), Long Beach Airport (117 miles) and Oxnard Airport (127 miles). A commercial shuttle is available from Lancaster to the airports or privately owned vehicles may be used on a reimbursable basis.

Freight rail service is provided to the installation by the Burlington Northern & Santa Fe Rail Line from its main line paralleling the northern boundary. A rail spur from Edwards AFB Station connects the government-owned rail servicing the Main Base petroleum, oil, lubricant (POL) storage area. The base-owned rail spurs are required to be certified every two years.

Installation Network

Vehicular traffic accesses the installation through three gates. West Gate is located on Rosamond Boulevard approximately 9 miles from the western boundary and handles 47 percent of all base traffic. South Gate is located on Lancaster Boulevard approximately 2 miles from the

southern boundary and handles 18 percent of all base traffic. The North Gate is located on Rosamond Boulevard at the northern boundary and handles 35 percent of all base traffic. Figure 3-4 shows the current transportation network on and around the base.

Edwards AFB has two primary roads, Rosamond and Lancaster Boulevards, which carry the majority of base traffic. Four secondary roads distribute traffic from the primary roads to the residential areas, flightline areas, North and South. These are Forbes Avenue, Wolfe Avenue, Yeager Boulevard and Fitz-Gerald Boulevard. Fitz-Gerald Boulevard provides primary access to the Commissary, Army Air Force Exchange Service and base housing. Jones Road and North Base Road are the sole access routes from a primary road (Lancaster Boulevard) to existing activity areas. Mercury Boulevard and Rich Road are the two primary roads accessing the AFRL. All other roads are classified as tertiary, feeder or unpaved roads serving individual areas on the installation.

The Main Base rail spur connecting to the Burlington Northern & Santa Fe rail line is routed south along Rosamond Boulevard to the Base POL storage area. A separate spur services the Air Force Research Laboratory (AFRL). Edwards AFB and the AFRL are capable of handling cargo shipped by rail.

Communication Systems

The communication system throughout Edwards AFB is found in association with the existing electrical infrastructure and includes underground conduit, copper wire and fiber-optic lines, electrical transmission lines, switch stations and access manholes (United States Fish and Wildlife Service 1995).

3.5.2 Infrastructure within or near Each Corridor

Alternative 1 - Corridor 1

Corridor 1 spans from the Southern Base boundary (120th Street) to the northern boundary. It is approximately 20 miles long by 1,000 feet wide (about 2,424 acres). The corridor follows the natural contours of the terrain and avoids large and tall land masses. Suitable utilities that could

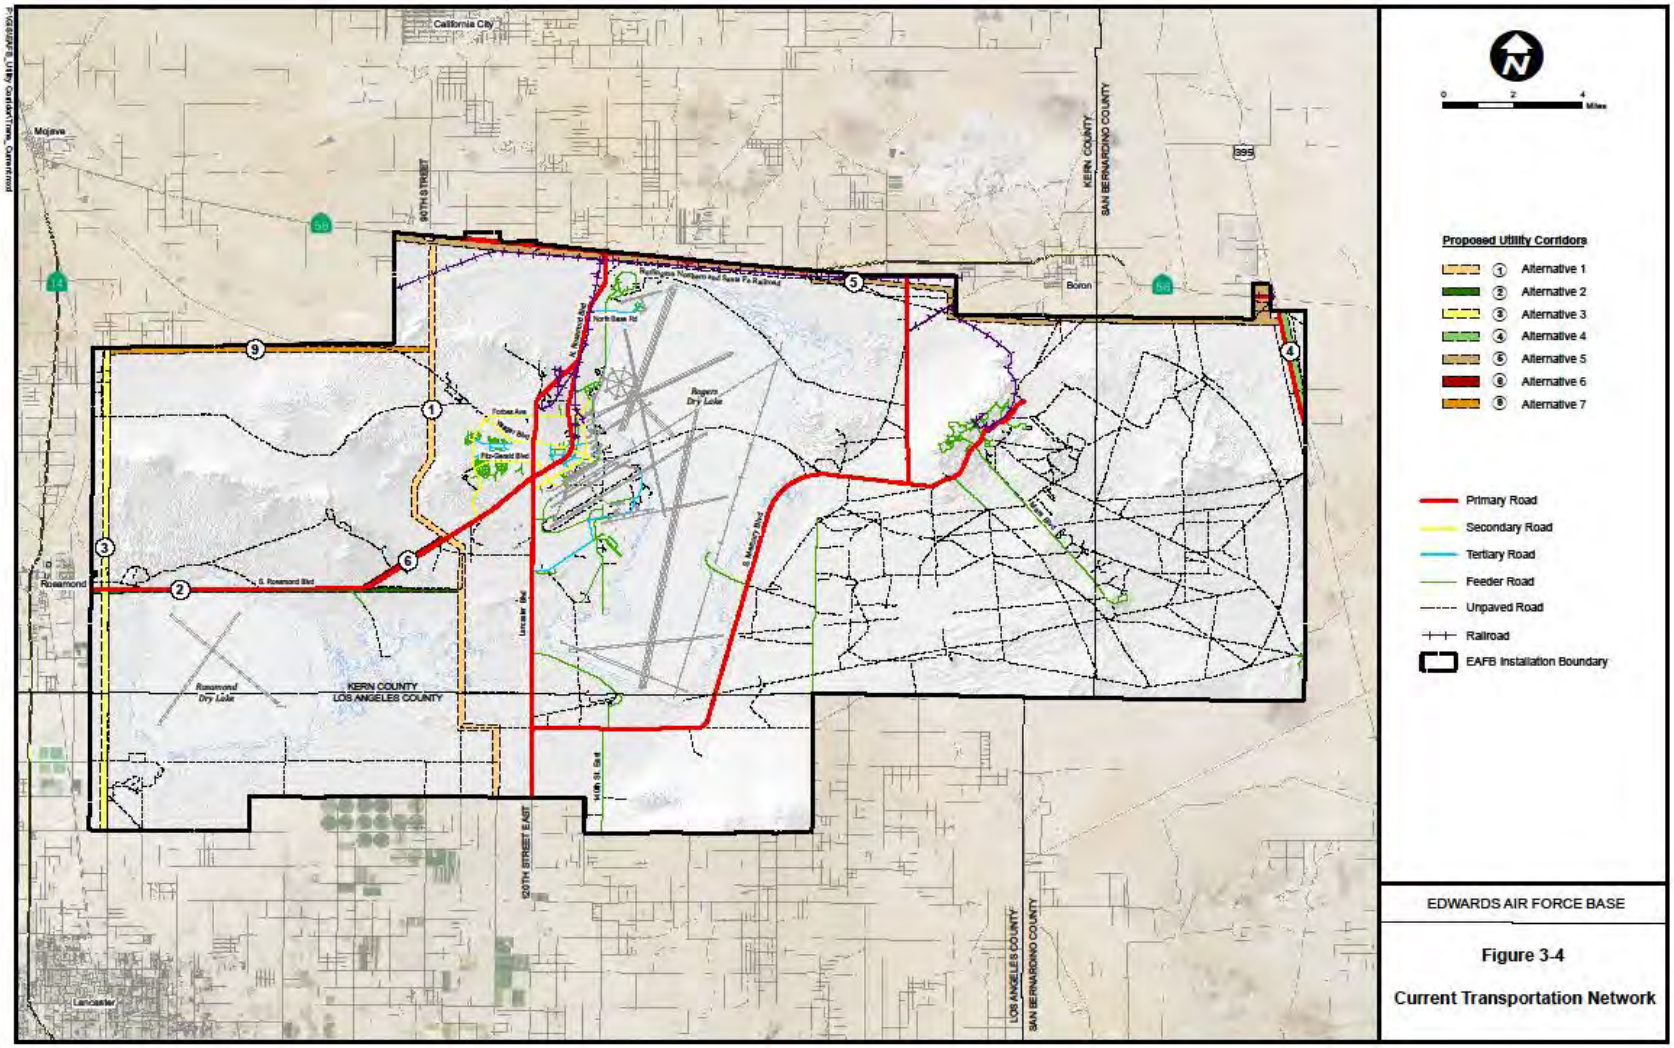

Figure 3-4 Current Transportation Network

be included in this alternative include underground natural gas, water, communication, and electrical or power transmission lines (EAFB, 2012b).

Alternative 2 - Corridor 2

Corridor 2 begins at the western boundary of the Base at Rosamond Boulevard and runs parallel to Rosamond Boulevard. It is approximately 12 miles long by 500 feet wide (about 727 acres) in order to maintain integrity where it crosses Rosamond Dry Lake. This corridor crosses the CATM firing fan but follows an existing communications infrastructure utility corridor. There are existing utilities present in this corridor and suitable utilities that may be included in this alternative are buried communication, electrical, power transmission, and waterlines (EAFB, 2012b).

Alternative 3 - Corridor 3

Corridor 3, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the Base running from Avenue E to the south, to the northern boundary of the Base at Trotter Road. It is approximately 15.5 miles long by 1,000 feet wide (about 1,879 acres). Suitable utilities that could be included in this corridor are underground gas, water, communication, electrical or power transmission lines (EAFB, 2012b).

Alternative 4 - Corridor 4

Corridor 4 traverses the northeastern corner of the Base, following U.S. Route 395 where there are current electrical easements. It is approximately 2 miles long by 1,000 feet wide (about 242 acres). Suitable utilities in this corridor are buried communication, electrical, power transmission and water lines (EAFB, 2012b).

Alternative 5 - Corridor 5

Corridor 5 begins at the northern boundary of the Base and parallels State Route 58 and terminates at the north eastern corner of the Base at Kramer Junction. It is approximately 30 miles long and is 1,000 feet wide (about 3,636 acres). This utility corridor follows other active

easements. Suitable utilities for this corridor include buried communication, electrical, power transmission and water lines (EAFB, 2012b).

Alternative 6 - Corridor 6

Corridor 6 runs from mid-Rosamond Boulevard and connects to either Corridor 1 or Corridor 2. It is nearly 4 miles long depending on the terminus and 500 feet wide (about 242 acres). Suitable utilities for this corridor include buried communication, electrical, power transmission and water lines (EAFB, 2012b).

Alternative 7 - Corridor 9

Corridor 9 is the northwestern connection from the northwestern edge of the Base to tie into Corridor 1. This corridor is nearly 11 miles in length and 1,000 feet wide (about 1,333 acres). Suitable utilities for this corridor include buried communication, electrical, power transmission and water lines (EAFB, 2012b).

3.6 LAND USE

This section provides an overview of the existing land use conditions at Edwards AFB and within each proposed utility corridor. The utility corridors are located within Kern County, Los Angeles County and San Bernardino County.

3.6.1 Overview

Regional Setting

Edwards AFB is located approximately 100 miles north of Los Angeles in the Antelope Valley on the western edge of the Mojave Desert. Portions of the installation are within three California counties. The majority of the installation is in Kern County, with smaller areas located within Los Angeles and San Bernardino Counties. The installation encompasses approximately 481 square miles (over 301,000 acres) and includes two major natural features, Rogers and Rosamond Dry Lakes (EAFB, 2012b).

Installation Land Use

Land use categories follow the Land Improvement Codes conforming to Department of Defense Instruction (DODI) 4165.14 which established real property inventory requirements (RPIR) in an effort to standardize operational definitions and business rules for all DOD real property assets. Only those RPIR land use categories applicable to Edwards AFB are listed in the following description. Each category of land use indicates the predominant use of the facilities or land within that area. A definition of these land uses is provided in Table 3-6, (EAFB, 2012b).

Table 3-6
Department of Defense Land Use Definitions

Name	Definition
Airfield	Land used for military air bases or air stations and military or civilian landing fields.
Communications System	Land used for telephone and telgraph lines, data transmission lines, satellite communications and other communications facilities or towers.
Forest and Wildlife	Conservation land primarily administered to preserve, protect, manage, or develop timber, wildlife, watershed and recreational resources including wetlands and floodplains.
Housing	Land used primarily for public housing projects, military personnel quarters and dewllings for other federal personnel.
Insitutional	Land used for institutional purposes such as hospitals, prisons, schools, libraries, chapels and museums.
Miscellaneous Military Land	DOD and U.S. Coast Guard (USCG) controlled land used for military functions that connot be classified elswhere.
Navigation and Traffic Aids	Land used for aircraft and ship navigation aids, such as beacon lights, antenna systems, control approach systems and obstructing lighting.
Office Building Locations	Land containing office buildings for future planned office buildings to include military headquarters buildings.
Other	Land that cannot be classifed elsewhere.
Parks and Historic Sites	Land administered for cemeteries, memorials, monuments, parks, parkways and recreation areas, excluding wilderness areas.
Post Office	Land used in conjuction with a Post Office and used predominantly as a general service and access area.
Research and Development	Land used directly in basic or applied research such as science, medicine and engineering.
Storage	Land used primarily for supply depots and other storage.
Training Land	Land containing training buildings or land that is used to conduct outdoor training, such as firefighting, weapons training or other military training activities.

Name	Definition
Vacant	Land not being used.

Off-Installation Land Use

The land adjacent to the installation consists of rapidly growing communities and arid desert. The communities of Boron, California City, Lancaster, Mojave, Palmdale and Rosamond pose potential encroachment threats if growth is not properly managed. The potential encroachment could interfere with the mission of Edwards AFB.

Coordinating with local communities will serve to ensure all communications towers, wind turbines, residential development and other potentially incompatible land uses within the R-2508 Complex do not conflict with military operations.

Transportation

Land use patterns set the need for transportation networks. Conversely, transportation networks provide accessibility between the local community and the installation and among the various land use areas on Base. Existing transportation systems are discussed in detail in Section 3.5.1.6.

3.6.2 Land Use Within or Near Each Corridor

Alternative 1 - Corridor 1

This utility corridor spans from the Southern Base boundary (120th Street) to the northern boundary. It is approximately 20 miles long, by 1,000 feet wide (about 2,424 acres). Corridor 1 is found in largely undeveloped lands that are designated as Parks and Historic Sites, Forest and Wildlife. Portions of this alternative are used as training lands.

Alternative 2 - Corridor 2

This utility corridor begins at the western boundary of the Base at Rosamond Boulevard and runs parallel to Rosamond Boulevard. It is approximately 12 miles long and is 500 feet wide (about

727 acres) so as to maintain the integrity of the dry lake bed. Corridor 2 parallels Rosamond Boulevard, but is found in largely undeveloped lands. A portion of these lands are used for training and predominate land use for this alternative is for research and development.

Alternative 3 - Corridor 3

This utility corridor, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the Base running from Avenue E to the south, to the northern boundary of the Base at Trotter Road. The corridor is approximately 15.5 miles in length and 1,000 feet wide (about 1,879 acres). Alternative 3, Corridor 3 would be located in undeveloped lands identified for use for research and development.

Alternative 4 - Corridor 4

This utility corridor traverses the north eastern corner of the base, following Highway 395 where there are current electrical easements. The corridor is approximately 2 miles long and 1,000 feet wide (about 242 acres). Corridor 4 parallels Highway 395 but is undeveloped. Lands in this alternative have been identified for use for research and development.

Alternative 5 - Corridor 5

This utility corridor begins at the northern boundary of the Base and parallels Highway 58 and terminates at the north eastern corner of the Base at Kramer Junction. It is approximately 30 miles long and is 1,000 feet wide (about 3,636 acres). Corridor 5 is in undeveloped lands that are designated as Forest and Wildlife.

Alternative 6 - Corridor 6

This utility corridor runs from mid-Rosamond Boulevard and connects to either Corridor 1 or Corridor 2. It is nearly 4 miles long depending on the terminus and 500 feet wide (about 242 acres). Corridor 6 is in undeveloped lands that are used for training and have been identified as miscellaneous military land. Lands within this corridor have also been identified as Parks and Historic sites plus Forest and Wildlife.

Alternative 7 - Corridor 9

This utility corridor is the northwestern connection from the northwestern edge of the Base to tie into Corridor 1. This corridor is nearly 11 miles in length and 1,000 feet wide (about 1,333 acres). Corridor 9 is in undeveloped lands that have been identified for use as research and development and also as Parks and Historic sites.

3.7 NATURAL RESOURCES

The following section provides information on the vegetation and wildlife occurring on Edwards AFB, including endangered, threatened and special-status species. The analysis of the proposed project's potential impacts on natural resources, as well as the recommendations for avoidance, reduction of, or mitigation measures necessary to address these potentially adverse impacts are provided in Section 4.7.

3.7.1 Overview

Edwards AFB lies in the southwestern Mojave Desert, which is located within the intermountain Semidesert and Desert Province and forms its own ecoregion (Bailey, 1994). The Mojave Desert ecoregion is bounded by other ecoregions; including the Great Basin to the north, Apache Highlands to the East, Sierra Nevada and South Coast to the west, and the Sonoran Desert to the south and southeast. The Mojave Desert is situated within the borders of four western states, extending from southwestern Utah across to southern Nevada to southeastern California, and over to western and northwestern Arizona (Edwards Air Force Base, 2015; The Nature Conservancy, 2001).

The information provided in this section is based primarily on previous field surveys of Edwards AFB and information in the Edwards AFB Integrated Natural Resources Management Plan (INRMP) (Edwards Air Force Base, 2008 and 2015). These surveys were conducted in order to identify endangered, threatened and special-status species on Edwards AFB and to provide a baseline for the species that could occur within the proposed utility corridors.

3.7.2 Vegetation

Edwards AFB vegetation communities are described in the 2015 Integrated Natural Resources Management Plan (INRMP) for the Base in terms of zonal and azonal communities (Edwards Air Force Base, 2015). Zonal plant communities are primarily based upon elevation and typically contain drier soils. At Edwards AFB, upland zonal plant communities consist of creosote bush scrub and Joshua tree woodland. Lowland zonal communities consist of alkali sink and saltbush communities. Azonal plant communities are communities of limited geographic area, but not necessarily limited by elevation. Edwards AFB also supports azonal habitats such as claypan, sand dunes and mesquite woodlands. Comprehensive lists of plant species found on the Base are located in Appendix B of the INRMP.

Vegetation communities on the portions Edwards AFB proposed for utility corridors are shown on Figure 3-5 and include Joshua tree woodland, creosote bush scrub, saltbush scrub (halophytic saltbush scrub and xerophytic saltbush scrub), mesquite woodland and playa and claypans. These vegetation communities are discussed below. The acreage of each vegetation community present in each utility corridor is presented in Table 3-7.

Table 3-7 Vegetation Community Acreage within Utility Corridors

	Joshua Tree Woodland	Creosote Bush Scrub (acres)	Saltbush Scrub (acres)	Mesquite Woodland (acres)	Playas and Claypans (acres)
Corridor 1	-	571.2	1,612.2	5.0	-
Corridor 2	-	208.7	285.9	-	145.1
Corridor 3	-	473.5	1,231.6	-	-
Corridor 4	27.6	312.5	2.5	-	-
Corridor 5	712.3	705.7	1,093.3	-	137.0
Corridor 6	-	271.8	-	-	-
Corridor 9	215.9	-	884.7	-	-

In addition to the vegetation communities described in the INRMP, the 1980 Los Angeles County General Plan (1980 Plan) established 61 Significant Ecological Areas (SEAs) that represent a wide variety of biological communities within the County. These areas have special management concerns. The 1980 Plan identified two SEAs on the Base, Edwards Air Force

Base (SEA 47) and Rosamond Lake (SEA 50). SEA 47 contains botanical features that are unique and limited in distribution in Los Angeles County. They include the only good stands of mesquite in Los Angeles County, which provide habitat for a variety of mammals, birds and reptiles. SEA 47 also contains fine examples of creosote bush scrub, alkali sink and the transition vegetation between the two. More information on mesquite woodlands and creosote bush scrub at Edwards AFB is provided below. SEA 50 is an example of the shadscale scrub and alkali sink biotic communities in Los Angeles County and encompasses Rosamond Dry Lake in the southwestern corner of the Base. Further discussion of playa and claypans at Edwards AFB, which include Rosamond and Rogers Dry Lakes is provided below. The southern portion of Corridor 1 crosses SEA 47 and the southern portion of Corridor 3 crosses SEA 50. In 2012, Los Angeles County revised the 1980 Plan as a draft; in this draft plan, SEA 47 and 50 are now combined under the larger Antelope Valley SEA (http://planning.lacounty.gov/sea/biological) (Figure 3-6).

Joshua Tree Woodland

Joshua trees (*Yucca brevifolia*) generally occur in deep, sandy soils or in shallow, rocky soils on steep hillsides. Joshua tree woodland occurs in the higher elevations of the east side of Edwards AFB, with the largest expanse in the PIRA. Joshua tree woodland does not have a distinctive understory of shrubs. The only difference between scrub and woodland is the presence of the trees in sufficient density to visually become woodland, which is defined on Edwards AFB as 10 trees per acre. The main understory shrub vegetation is saltbush or creosote. Annual plant diversity in this community is normally high. Guilds of wildlife species are specifically attracted to Joshua trees. These vary from insects, such as pollinators, to reptiles and many species of birds (Edwards Air Force Base, 2015). Special status species that occur in Joshua treewoodlands include white pygmy poppy (*Canbya candida*) and Mojave spineflower (*Chorizanthe spinosa*). Joshua tree woodlands are a rare and important feature of Edwards AFB (Edwards Air Force Base, 2008). Corridors 4, 5 and 9 pass through Joshua tree woodland.

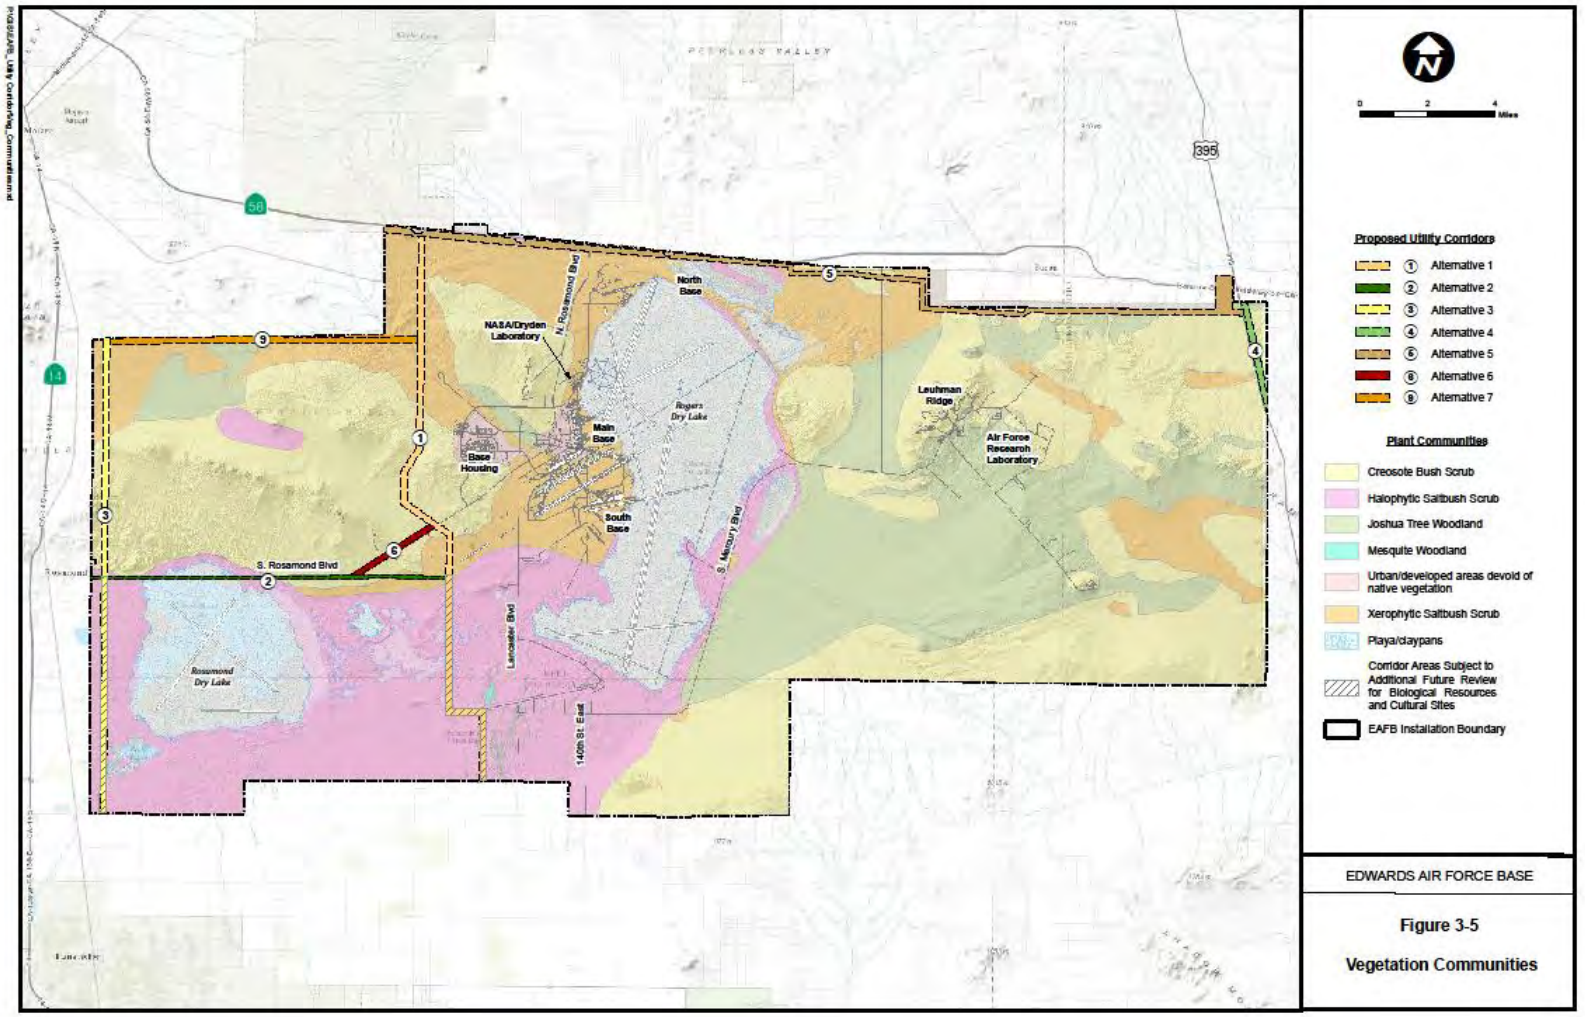

Figure 3-5 Vegetation Communities

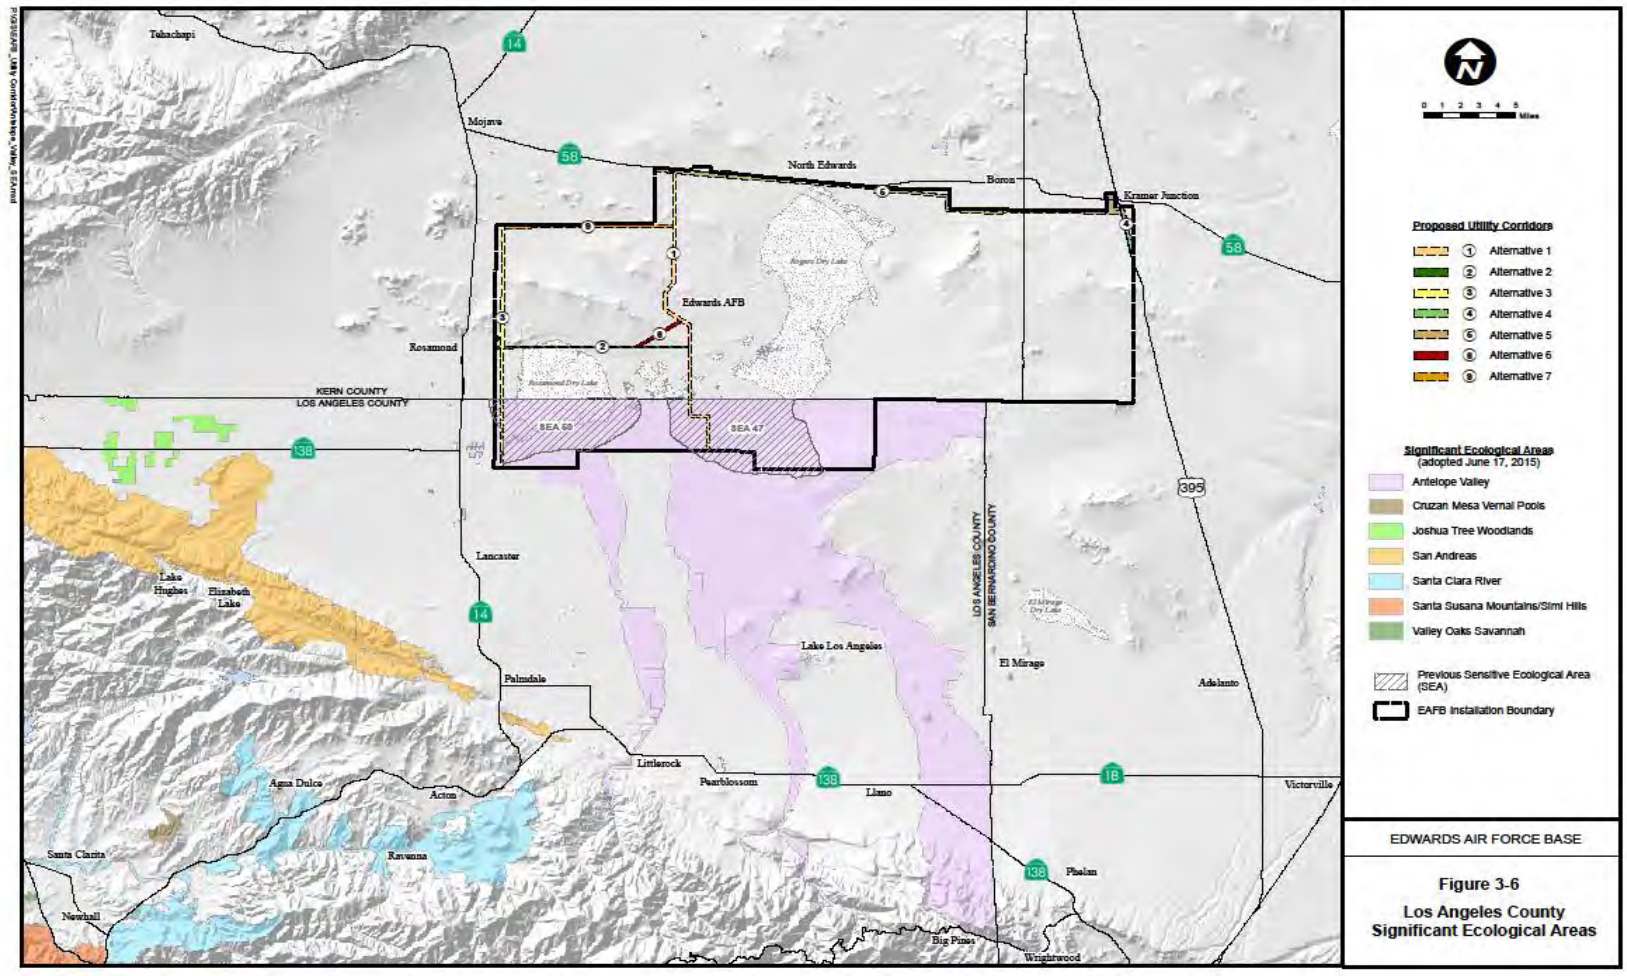

Figure 3-6 Los Angeles County Significant Ecological Areas

Creosote Bush Scrub

Approximately 40% of the natural vegetation community on Edwards AFB is creosote scrub. In general, the creosote scrub community tends to occur on soils that are well drained and range from sandy loam to rock and cobble. Shrub composition within this community varies widely and appears to be dependent on soil type. The creosote scrub community usually tends to have large shrub interspaces with a high density of annuals in the spring (Edwards Air Force Base, 2015).

Creosote bush scrub below 2,300 feet can be visually dominated by Joshua trees without having them form a woodland. In higher elevations, creosote bush scrub is dominated by creosote bush (*Larrea tridentata*) and burrobush (*Ambrosia dumosa*). Shrubs that begin appearing in sandy soils include winterfat (*Krascheninnikovia lanata*), spiny hopsage (*Grayia spinosa*), goldenheads (*Acamptopappus sphaerocephalus*), Mojave cottonthorn (*Tetradymia stenolepis*) and Cooper's goldenbush (*Ericameria cooperi*). Species more common in rocky soils on the hillsides include Mojave aster (*Xylorhiza tortifolia*), green rabbitbrush (*Ericameria teretifolia*), Anderson thornbush (*Lycium andersonii*) and Nevada Mormon tea (*Ephedra nevadensis*). Creosote bush scrub is present in Corridors 1, 2, 3, 4, 5 and 6.

Saltbush Scrub

Historically, saltbush scrub has been divided into two communities, xerophytic and halophytic. Halophytic communities occur at lower elevations adjacent to lakebeds, claypans and drainages. Xerophytic communities are generally located at slightly higher elevations than halophytic communities. Xerophytic communities are dominated by allscale (*Atriplex polycarpa*) and halophytic communities by shadscale (*Atriplex confertiflora*) or spinescale (*Atriplex spinifera*). The depth of sand deposits determines the diversity of plant species in the saltbush communities (U.S. Army Corps of Engineers [USACE], 2004). Highly eroded sandy hummocks are dominated by shadscale (*Atriplex confertifolia)* and alkali sacaton (*Sporobolus airoides*). Clay soils within saltbush scrub are dominated by native annual goldfields (*Lasthenia gracilis*), while the dunes contain numerous annual species, some primarily occurring on sand, such as dune

evening primrose (*Oenothera primiveris*), desert sand verbena (*Abronia villosa*), desert lupine (*Lupinus shockleyi*), California croton (*Croton californicus*), fanleaf crinklemat (*Tiquilia plicata*), hole-in-the-sand plant (*Nicolletia occidentalis*), scaly sandfood (*Pholisma arenarium*) and tickseed *(Dicoria canescens*). Several special-status plant species occur in the sand fields and dunes near the lakebed on Edwards AFB, such as sagebrush loeflingia (*Loeflingia squarrosa*), desert cymopterus (*Cymopterus deserticola*), yellow spiny cape (*Goodmania luteola*), Hoover's woollystar (*Eriastrum hooveri*), red rock poppy (*Eschscholzia minutiflora* ssp. *twisselmannii*), Barstow woolly sunflower (*Eriophyllum mohavense*) and Lancaster milkvetch (*Astragalus preussii*). A few special-status species are found in the clay drainages and sandy hummocks adjacent to the various small or large playas, such as the alkali mariposa lily (*Calochortus striatus*), Rosamond eriastrum (*Eriastrum rosamondense*) and Coves' cassia (*Senna covesii*). Saltbush scrub occurs along Corridors 1, 2, 3, 4, 5 and 9. More specifically, both xerophytic and halophytic communities are found in Corridors 1, 2, 3, 5 and 6. Corridors 4 and 9 only have the xerophytic saltbush scrub community.

Mesquite Woodland

Mesquite woodland (*Prosopis glandulosa*) visually dominates some of the largest drainages within Edwards AFB (Figure 3-7), as well as Big and Little Rock Creeks as they approach Rogers Dry Lake. The treelike spiny shrubs form habitat for some riparian woodland species of wildlife. This vegetation community is composed of Mojave rubber rabbitbrush (*Chrysothamnus nauseosus* ssp. *mohavensis*), alkali mariposa lily (*Calochortus striatus)* and the local endemic Parish's sagebrush (*Artemisia tridentata parishii*) (Edwards Air Force Base, 2015). The 2008 INRMP describes mesquite woodland as an important and rare feature of Edwards AFB (Edwards Air Force Base, 2008) and Los Angeles County has recognized the mesquite woodland as "the only good stands of mesquite (*Prosopis glandulosa*) in the County" (Los Angeles County General Plan, 1980). Mesquite woodland occurs within Corridor 1.

Playa and Claypan

During seasons with above average rainfall, playas and claypans provide habitat for aquatic invertebrates, such as fairy shrimp, that are eaten by migrating wading birds. Playas and claypans occur azonally within many of the vegetation communities listed above. Alkali mariposa lily is a special-status species that is limited to clay drainages and sandy hummocks adjacent to various small or large playas. The largest playas at Edwards AFB are Rosamond Dry Lake and Rogers Dry Lake. The special status species Rosamond eriastrum (*Eriastrum rosamondense*) occurs within the Rogers Dry Lake area along alkaline hummocks. The special status species Coves' cassia (*Senna covesii*) occurs within this habitat to the northwest of Rogers Dry Lake. Playa and claypan areas are found along Corridors 1, 2 and 5.

3.7.3 Wildlife Communities

Wildlife occurring in the areas of the utility corridors includes insects, reptiles, birds and mammals. No fish occur naturally on Edwards AFB and none are likely to be found in the area of the proposed project. Amphibians are not likely to be found at or adjacent to the proposed utility corridors due to a lack of potential habitat. Comprehensive lists of wildlife species found on the Base are found in Appendix B of the INRMP. Additional details on common wildlife species that may occur in or adjacent to the proposed utility corridors are provided below.

Insects and Arthropods

Commonly observed insects include wasps, ants, bees, flies, grasshoppers, moths, butterflies and beetles. Arthropods present on Edwards AFB typically include spiders (tarantulas and wolf spiders), scorpions and fairy shrimp. Based on numerous biological shrimp surveys, there are five common species of shrimp that occur in the playas and adjoining claypan areas where ponded water collects from rainfall. These include three species of fairy shrimp (*Branchinecta gigas*, *B. mackini* and *B. lindahli*); one species of tadpole shrimp (*Lepiduras lemmoni*); and one species of clam shrimp (*Eocyzicus digueti*). To date, there are no known threatened or endangered shrimp species on Base.

Mammals

Mammal species common to the area of Edwards AFB where the corridors are proposed include bats such as the California myotis (*Myotis californicus*) and Townsend's western big-eared bat (*Corynorhinus townsendii*); carnivores such as the coyote (*Canis latrans*), desert kit fox (*Vulpes macrotis*), bobcat (*Lynx rufus*) and American badger (*Taxidea taxus*); and rodents, rabbits and hares including the black-tailed jackrabbit (*Lepus californicus*), desert cottontail (*Sylvilagus audubonii*), desert woodrat (*Neotoma lepida*), Merriam's kangaroo rat (*Dipodomys merriami*), white-tailed antelope ground squirrel (*Ammospermophilus leucurus*) and Mohave ground squirrel (*Xerospermophilus mohavensis*; which is discussed further in Section 3.7.4 below).

Birds

Almost all bird species found on Edwards AFB are covered by the Migratory Bird Treaty Act (MBTA). The MBTA makes it illegal for anyone to take, possess, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter, any migratory bird, or the parts, nests, or eggs of such a bird except under the terms of a valid permit issued pursuant to Federal regulations. The migratory bird species protected by the Act are listed in 50 CFR 10.13. Bird species expected to be observed within the utility corridors include California quail (*Callipepla californica*), red-tailed hawk (*Buteo jamaicensis*), turkey vulture (*Cathartes aura*), American kestrel (*Falco sparverius*), burrowing owl (*Athene cunicularia;* discussed further in Section 3.7.4 below), mourning dove (*Zenaida macroura*), greater roadrunner (*Geococcyx californianus*), Anna's hummingbird (*Calypte anna*), ladder-backed woodpecker (*Picoides scalaris*), horned lark (*Eremophila alpestris*), common raven (*Corvus corax*), cactus wren (*Campylorhynchus brunneicapillus*) and white-crowned sparrow (*Zonotrichia leucophrys*).

Reptiles

Reptiles common to Edwards AFB that are likely to be found in the areas of the utility corridors include the desert horned lizard (*Phrynosoma blainvillii;* discussed further in Section 3.7.4

(*Callisaurus draconoides*), coachwhip (*Masticophis flagellum*), gopher snake (*Pituophis melanoleucus*), Mojave green rattlesnake (*Crotalus scutulatus*), sidewinder (*Crotalus cerastes*) and the desert tortoise (*Gopherus agassizii*; discussed further in Section 3.7.4 below).

3.7.4 Sensitive Species and Habitats

Sensitive species included in this document are those listed by the federal, state or local governments or those in planning processes as endangered, threated or otherwise of conservation concern, including:

- Species listed by the California Native Plant Society (CNPS);
- Species designated as either rare, threatened, or endangered by California Department of Fish and Wildlife (CDFW) or the US Fish and Wildlife Service (USFWS) and are protected under either the California or Federal Endangered Species Acts;
- Candidate species or species being considered or proposed for listing under these same Acts;
- Species listed as birds of conservation concern (BCC) by USFWS;
- California species of special concern (SSC) listed by CDFW; and/or
- Species addressed in the West Mojave Plan (WEMO).

Sensitive habitats include those listed by federal, state and/or local planning processes as being of local or regional conservation concern, including:

- Areas of designated critical habitat;
- Desert Wildlife Management Areas (DWMAs) and other Areas of Critical Environmental Concern (ACECs) designated by the US Department of the Interior, Bureau of Land Management (BLM);
- Plant communities listed as sensitive by CDFW and other resources agencies;
- Plant communities rare or declining and of concern to agencies or local jurisdictions;
- Significant Ecological Areas designated by Los Angeles County (refer to Section 3.7.2);
- Potential wildlife movement corridors; and

- Potential wetlands or other jurisdictional waters. While there are no jurisdictional wetlands or waters on Edwards AFB, there are biological wetlands, including at the Piute Ponds Complex.

Edwards AFB supports approximately 14 species of sensitive plants (Table 3-8) and 29 species of sensitive wildlife (Table 3-9) (Edwards Air Force Base, 2015). Not all of these species have the potential to be present in every proposed utility corridor based on habitats present in each corridor. Figure 3-7 shows the presence of some of these species in Edwards AFB and the surrounding area. Each species has been given a potential to occur based on the following criteria:

Present	Species was observed during a survey in the past five years.
High	Both a historical record exists of the species within the boundaries of the site or its immediate vicinity (approximately one mile) and the environmental conditions (including vegetation, soil type and elevation factors) associated with the species are found at the site.
Moderate	Either a historical record exists of the species within the immediate vicinity of the site or the environmental conditions associated with species are found at the site.
Low	No records exist of the species occurring within the site or its immediate vicinity and/or the environmental conditions associated with species presence are marginal within the site.
Absent	Species was not observed during focused surveys conducted within the site at an appropriate time and/or the environmental conditions associated with species presence do not exist on or adjacent to the site.

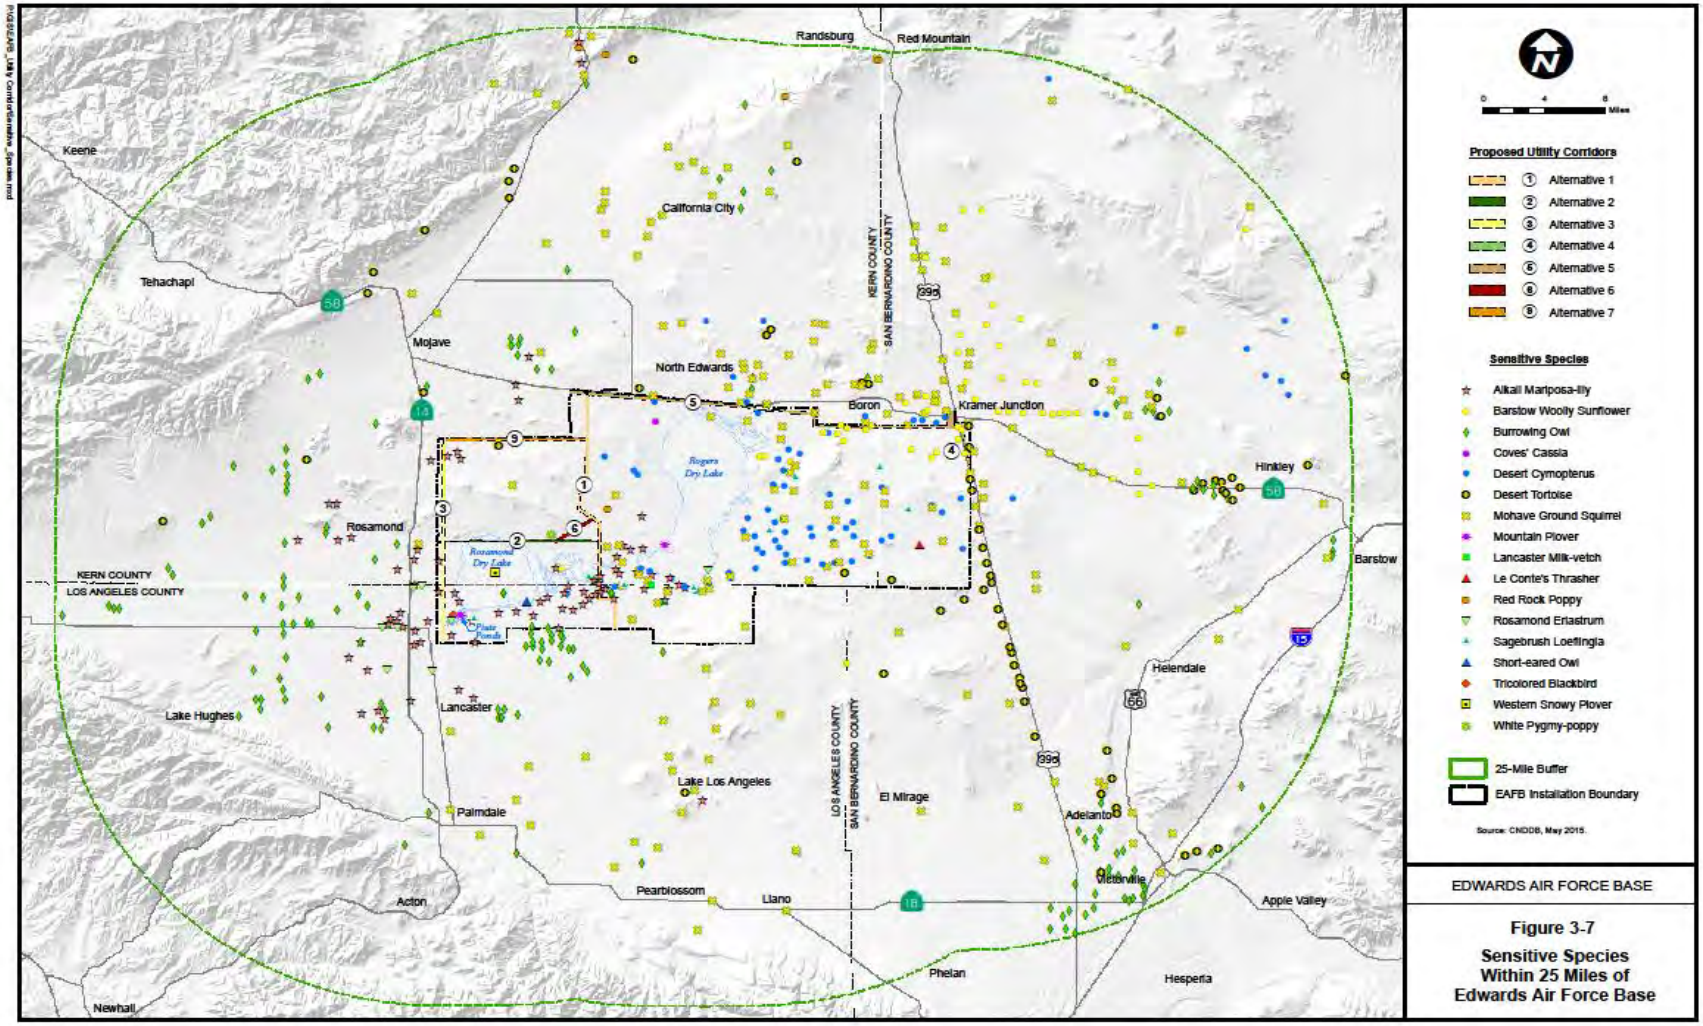

Figure 3-7 Sensitive Species Within 25 Miles of Edwards Air Force Base

Sensitive Plant Species

The CNPS documents sensitive plant species into California Rare Plant Ranks. Table 3-8 lists the species that fall under the California Rare Plant Ranks that may occur in the proposed utility corridors.

Figure 3-8 shows the locations of these rare species throughout Edwards AFB.

Further information on the presence of special-status plant species in each corridor is provided in Section 4.7.

Table 3-8 Special Status Species Potential for Occurrence - Plants

Scientific Name Common Name	Status	Flowering Period/ Habitat	Potential for Occurrence
Astragalus preussii Lancaster milkvetch	Federal: None State: None CNPS: 1B.1	March – May Areas of high water table in saltbush scrub; occurs in lowlands south of Rogers Dry Lakebed on Edwards AFB	Present
Calochortus striatus Alkali mariposa lily	Federal: None State: None CNPS: 1B.2	April – June Claypans and sand dunes in saltbush scrub, drainages	Present
Canbya candida White pygmy poppy	Federal: None State: None CNPS: 4.2	March – June Joshua tree woodlands; gravelly, sandy granitic soils; Mojave desert scrub	High
Chorizanthe spinosa Mojave spineflower*	Federal: None State: None CNPS: 4.2	March – May Joshua tree woodlands; sandy soils	Present
Cymopterus deserticola Desert cymopterus	Federal: None State: None CNPS: 1B.2	March – May Joshua tree woodlands; sandy soils	Present
Delphinium recurvatum Recurved larkspur	Federal: None State: None CNPS: 1B.2	March – June Alkaline soils, chenopod scrub, cismontane woodlands, grasslands; known to occur in northwest section of Edwards AFB	High
Eriastrum rosamondense Rosamond eriastrum	Federal: None State: None CNPS: 1B.1	April – July Known only from the general area southwest of Edwards AFB; occurs on alkaline hummocks and vernal pool edges	High

Scientific Name Common Name	Status	Flowering Period/ Habitat	Potential for Occurrence
Eriophyllum mohavense Barstow woolly sunflower	Federal: None State: None CNPS: 1B.2	March – May Prefer gravelly soils in scrub habitat and playas; populations on Edwards AFB are limited to the edges of bare areas in saltbush scrub	Present
Eschscholzia minutiflora ssp. *twisselmannii* Red rock poppy	Federal: None State: None CNPS: 1B.2	March – May Rare in Mojave desert scrub habitats adjacent to the Rand and El Paso Mountains; one record on Edwards AFB to the west of Rogers Dry Lake	High
Goodmania luteola Yellow spiny cape* (Golden goodmania)	Federal: None State: None CNPS: 4.2	April – August Prefers alkaline or clay soils within Mojave desert scrub, meadow sand seeps, playas, and grasslands; limited to salt-encrusted, rolling sandy areas southwest of Rogers Dry Lake	High
Loeflingia squarrosa var. *artemisiarum* Sagebrush loeflingia	Federal: None State: None CNPS: 2.2	April – May Dunes in saltbush scrub; on Edwards AFB in several locations	High
Muilla coronata Crowned onion	Federal: None State: None CNPS: 4.2	March – April Known to occur in northeast section of Edwards AFB and in the Kramer Junction area	Present
Nemacladus gracillis Slender threadplant	Federal: None State: None CNPS: 4.3	March – May Known to occur in northeast section of Edwards AFB, including the Leuhman Ridge area	Present
Senna covesii Coves' cassia	Federal: None State: None CNPS: 2B.2	May - June Sandy soil and gravely washes; open playas/claypan; one record on Edwards AFB to the northwest of Roger's Dry Lake	Moderate

Sources: Edwards AFB, 2015; CNPS, 2015

Notes: *Species is not shown on Figure 3-8 since locations have not been reported to the California Natural Diversity Database (CNDDB). However, the INRMP indicates it has been found on Base (Edwards AFB, 2015).

CNPS Status:

List 1A Plants presumed extinct in California.

List 1B Plants rare, threatened, or endangered in California and elsewhere.

List 2 Plants rare, threatened, or endangered in California but more common elsewhere.

List 3 Plants about which more information is needed, a review list.

List 4 Plants of limited distribution, a watch list.

CNPS includes a decimal threat ranking with the List ranks to parallel the nomenclature used by the CNDDB. This extension replaces the E (Endangerment) value from the R-E-D Code. CNPS ranks therefore read like this: 1B.1, 1B.2, etc. New Threat Code extensions and their meanings:

.1 – Seriously endangered in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2 – Fairly endangered in California (20-80% occurrences threatened)

.3 – Not very endangered in California (<20% of occurrences threatened or no current threats known)

Note that all List 1A (presumed extinct in California) and some List 3 plants lacking any threat information receive no threat code extension. Also, these Threat Code guidelines represent a starting point in the assessment of threat level. Other factors, such as habitat vulnerability and specificity, distribution, and condition of occurrences, are also considered in setting the Threat Code.

Each species with a potential to occur of moderate, high or present are discussed in further detail below. Those of low potential for occurrence are not discussed further.

Lancaster milkvetch is a perennial herb that belongs to the fabaceae (legume) family. Lancaster milkvetch prefers areas of high water table in saltbush scrub. Very few populations have been recorded in California. The most extensive populations occur in southern Nevada. It occurs in lowlands south of Rogers Dry Lakebed on Edwards AFB, which is in proximity to Corridor 1.

Alkali mariposa lily is a perennial bulbiferous herb belonging to the liliaceae (lily) family, which can be found between elevations of approximately 2,600 and 4,600 feet above mean sea level (MSL) (800 to 1,400 meters above MSL). Alkali mariposa lily is native to California and Nevada. It occurs primarily in claypans and sand dunes in halophytic saltbush scrub. The alkali mariposa lily occurs in the western section of Edwards AFB, and has been mapped along Corridors 1 and 3, and near Corridors 2, 5, 6 and 9.

White pygmy poppy is an annual herb belonging to the papaveraceae (poppy) family which can be found between elevations of approximately 1,968 and 4,790 feet above MSL (600 and 1,460 meters above MSL). The white pygmy poppy is widespread in sandy soils of the western Mojave Desert. It prefers to grow in Joshua tree woodlands and scrub. On Edwards AFB, it has been mapped in proximity to Corridors 2 and 6.

Mojave spineflower is an annual herb belonging to the polygonaceae (buckwheat) family and is found between elevations of approximately 20 and 4,300 feet above MSL (6 to 1,300 meters above MSL). The Mojave spineflower occurs primarily in bare areas in the saltbush scrubs of the Antelope Valley. It does well in disturbed soils and will grow in utility corridors and abandoned roads in saltbush scrub habitat. It occurs primarily southwest of Rogers Dry Lake in a similar habitat preferred by the Barstow woolly sunflower. On Edwards AFB it has been found near Corridor 1.

Desert cymopterus is a perennial herb belonging to the apiaceae (parsley) family and is found between elevations of approximately 2,100 and 5,000 feet above MSL (630 to 1,500 meters above MSL). Desert cymopterus is endemic to the western and central Mojave Desert in California. Desert cymopterus is a perennial with a long tap root on a caudex. Population boundaries for this species on Edwards AFB have been expanded as more intensive surveys were completed, but few new populations have been found. The plant is associated with Joshua tree woodland because plant diversity in general increases in sandy sites. There are 54 documented populations of desert cymopterus on Edwards AFB. This species often occurs in microtopography of swales in sand fields or where very weak drainages intersect. Desert cymopterus has rarely been observed in heavy or rocky soils at the base of hillsides. It has been mapped along Corridor 5 and near Corridors 1 and 4.

Recurved larkspur is a perennial herb that belongs to the ranunculaceae family that is found between elevations of approximately 59 and 2,034 feet above MSL (18 to 620 meters above MSL). Recurved larkspur prefer shadescale scrub, valley grassland and foothill woodland. They can occasionally be found in wetlands. Recurved larkspur have been observed on Edwards AFB, including one siting along Corridor 5.

Rosamond eriastrum is an annual herb similar to Hoover's woollystar that belongs to the phlox family and is found between elevations of approximately 2,297 and 2,345 feet above MSL (700 to 715 meters above MSL). This species prefers alkaline hummocks and vernal pool edges. It is known only to occur at the Rogers Dry Lake and Rosamond Dry Lake areas on Edwards AFB. It has been mapped along Corridor 3 and near Corridor 2.

Barstow woolly sunflower is a perennial herb belonging to the asteraceae (sunflower) family and is found between elevations of approximately 1,650 and 3,150 feet above MSL (500 to 960 meters above MSL). All populations on Edwards AFB are limited to the edges of bare areas in saltbush scrub. The Barstow woolly sunflower is one of several species of woolly daisies occurring on Edwards AFB. It is the smallest and most compact. A total of 47 populations are located on Edwards AFB, and it has been mapped along Corridors 4 and 5 and near Corridors 1, 2 and 6.

Red rock poppy is an annual herb belonging to the poppy family and is found between elevations of approximately 2,230 and 4,035 feet above MSL (680 to 1,230 meters above MSL). It is rare and occurs in scrub adjacent to the Rand and El Paso Mountains. One location of red rock poppy has been recorded on Edwards AFB adjacent to Corridors 1 and 6.

Yellow spiny cape is an annual herb that belongs to the buckwheat family and is found between elevations of approximately 66 and 7,218 feet above MSL (20 to 2,200 meters above MSL). Yellow spiny cape is found on alkaline or clay soils. It occurs in Edwards AFB on salt-encrusted, rolling sandy areas southwest on Rogers Dry Lake. This location is in proximity to Corridor 1.

Sagebrush loeflingia is an annual herb that that belongs to the caryophyllaceae (carnation) family and is found between elevations of approximately 2,297 and 5,299 feet above MSL (700 to 1,615 meters above MSL) Sagebrush loeflingia is found in sand dunes in halophytic saltbush scrub. On Edwards AFB, it is found in general area around Rogers Dry Lake. This species has been found near Corridors 1, 2, 3, 4 and 5.

Crowned onion is a perennial herb that belongs to the themidaceae family. It can be found between the elevations of approximately 1,640 and 6,759 feet above MSL (500 to 2060 meters above MSL). Crowned onion grows in sandy loam soil and prefers creosote bush scrub, Joshua Tree and Pinyon-Juniper woodlands. There is one record of this species on Edwards AFB to the northwest of US-395 near the Kramer Junction area, near Corridor 4.

Slender threadplant is an annual herb that belongs to the campanulaceae family. It can be found between the elevations of approximately 1,411 and 6,037 feet above MSL (430 to 1840 meters above MSL). Slender threadplant prefers rocky slopes, sandy washes and dunes. It has been found near Rich Road and in the Leuhman Ridge area of Edwards AFB. This species has been sighted on Edwards AFB to the south of State Route 58, near Corridor 5.

Coves' cassia is a perennial herb that belongs to the legume family. It can be found between the elevations of approximately 935 – 3,510 feet above MSL (285 – 1,070 meters above MSL). Coves' cassia grows in sandy and gravelly soils on open mesas, slopes, claypans, and playas.

There is one record of this species on Edwards AFB to the northwest of Roger's Dry Lake, near Corridor 5.

Sensitive Wildlife Species

Birds

Many species of sensitive birds recorded at Edwards AFB migrate through the installation but do not nest or linger in the area and are also unlikely to be found near the proposed utility corridor locations. The remaining bird species are addressed in Table 3-9, along with all sensitive reptile and mammal species previously identified through exhaustive surveys conducted on Edwards AFB over the past several decades. These birds may inhabit the Base, primarily during migration. They include peregrine falcon (*Falco peregrinus*), Swainson's hawk (*Buteo swainsoni*), bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*). Other bird special status species that have been observed on Base include the tricolored blackbird (*Agelaius tricolor*), short-eared owl (*Asio flammeus*), long-eared owl (*Asio otus*), western snowy plover (*Charadrius alexandrinus*), mountain plover (*Charadrius montanus*), northern harrier (*Circus cyaneus*), prairie falcon (*Falco mexicanus*), loggerhead shrike (*Lanius ludovicianus*), LeConte's thrasher (*Toxostoma lecontei*), and burrowing owl.

Reptiles

Two species of state or federal reptile of special interest occur on Edwards AFB with a likelihood of occurring within the utility corridors. They include the Western pond turtle and the desert tortoise.

Mammals

The only federal or state threatened mammal that occurs on Edwards AFB is the Mohave ground squirrel, which is a California threatened species. California species of special concern (SSC) that occur on Edwards AFB include the pallid bat (*Antrozous pallidus*), Townsend's western big-eared bat (*Corynorhinus townsendii*), California mastiff bat (*Eumops perotis californicus*), big free-tailed bat (*Nyctinomops macrotis*), and American badger.

Table 3-9 Special-Status Species Potential for Occurrence - Wildlife

Scientific Name Common Name	Status	Habitat	Potential for Occurrence
Reptiles			
Emys marmorata Western pond turtle	Federal: BLM Sensitive State: None	Throughout California, including areas of the Mojave Desert that have permanent or nearly permanent water sources	Present
Gopherus agassizii Desert tortoise	Federal: Threatened State: Threatened Local: None	Desert scrubs and wash vegetation with friable soils	Present
Birds			
Agelaius tricolor Tricolored blackbird	Federal: BCC; BLM Sensitive State: Endangered; Local: None	Central Valley of California and its vicinity and foothills; observed nesting on Base at Piute Ponds and Branch Memorial Park Pond	Nesting high; Foraging high
Aquila chrysaetos Golden eagle*	Federal: Bald and Golden Eagle Protection Act; BCC State: BLM Sensitive Fully protected Local: WEMO covered species	Migratory on Base; may nest on cliff faces; foraging on Base in winter	Nesting low, foraging high
Artemisiospiza belli belli Bell's sparrow	Federal: BCC State: None	California coast ranges; has been sighted in Jawbone Canyon, Kern County; found in sagebrush, saltbush and other low shrub habitats	Present
Asio flammeus Short-eared owl	Federal: None State: SSC Local: WEMO Covered Species	Marshes and seasonal wetlands; WEMO states that they appear to nest on Edwards AFB at Piute ponds	Nesting high, foraging high
Asio otus Long-eared owl*	Federal: None State: SSC Local: WEMO Covered Species	Nesting in large trees; foraging in most habitats; on Base in wooded areas such as woodlands near Haystack Butte and Mesquite woodlands; observed at the South Base evaporation ponds	Nesting high, foraging high
Athene cunicularia Burrowing owl	Federal: BCC; BLM Sensitive State: SSC	Nesting in burrows in the ground or open holes, pipes, etc.; foraging in most open habitats; has been observed on Base previously	Burrowing high, foraging high

Scientific Name Common Name	Status	Habitat	Potential for Occurrence
Aythya Americana Redhead	Federal: None State: SSC	Found throughout California, including the Central Valley and Eastern Kern County; nests primarily in wetland areas bordering open water	Present
Buteo swainsoni Swainson's hawk	Federal: None State: Threatened	Has been known to breed in the Antelope Valley; nests in large trees or utility poles	Present
Charadrius alexandrinus Western snowy plover (interior population)	Federal: None State: SSC Local: WEMO Covered Species	Nest on certain playas and wetlands in the Western Mohave; one record on Edwards AFB at Rosamond Dry Lake bed	Nesting moderate, foraging moderate
Charadrius montanus Mountain plover	Federal: BCC; BLM Sensitive State: SSC Local: WEMO Covered Species	Occasionally observed along edges of ponds and playas on Edwards AFB	Nesting high Foraging high
Circus cyaneus Northern harrier*	Federal: None State: None Local: WEMO Covered Species	May forage in all habitat zones; common in aquatic habitats; nest at Piute Ponds on Base	Nesting high, foraging moderate
Empidonax traillii Willow flycatcher	Federal: BLM Sensitive; BCC State: None Local:	Occurs throughout California during breeding season; nests in shrubs; feeds on insects and some berries	Present
Falco mexicanus Prairie falcon*	Federal: BCC State: None Local: WEMO Covered Species	Nesting on cliff faces; has been observed hunting throughout Edwards AFB, including portions of the cantonment area	Nesting moderate, foraging high
Falco peregrinus anatum Peregrine falcon	Federal: BCC State: None	Nests on high cliffs, banks, dunes and mounds; primarily hunts birds	Nesting moderate, foraging high
Lanius ludovicianus Loggerhead shrike*	Federal: BCC State: SSC	Nesting in dense desert shrubs and cactus; foraging in same areas; occur throughout Edwards AFB and the Mojave Desert	Nesting high, foraging high
Riparia riparia Bank swallow	Federal: None State: Threatened	Nesting on cliff faces; commonly found foraging for insects over grasslands	Present
Sterna antillarum browni California least tern	Federal: Endangered State: None	Common in aquatic habitats; feeds upon fish; nests near water	Present
Toxostoma lecontei LeConte's thrasher	Federal: BCC State: SSC Local: WEMO Covered Species	Occurs in Joshua tree woodland, saltbush scrub and creosote bush scrub; associated with washes Basewide	Nesting high, foraging high

Scientific Name Common Name	Status	Habitat	Potential for Occurrence
Xanthocephalus xanthocephalus Yellow-headed blackbird	Federal: None State: SSC	Nests along aquatic areas dense with vegetation; found year-round in the Central Valley	Present
Mammals			
Antrozous pallidus Pallid bat*	Federal: BLM Sensitive State: SSC Local: WEMO Covered Species	Roosts in caves and human developments such as mines and large buildings; forages on the ground	Moderate
Corynorhinus townsendii Townsend's western big-eared bat*	Federal: BLM Sensitive State: Candidate Threatened; SSC Local: WEMO Covered Species	Roosts in caves and human developments such as mines and large buildings	Moderate
Eumops perotis californicus California mastiff bat*	Federal: BLM Sensitive State: SSC	Roosts in cliffs and rock crevices	Moderate
Nyctinomops macrotis Big free-tailed bat*	Federal: None State: SSC	Roosts in rock crevices and on cliffs	Moderate
Onychomys torridus Southern grasshopper mouse	Federal: None State: SSC	Commonly found in the Mojave Desert and Central Valley; habitats include alkali desert scrub and desert scrub	Present
Perognathus longimembris Little pocket mouse	Federal: None State: SSC	Year-round resident of southern California deserts, including Kern County; habitats include desert scrub, desert wash, and sagebrush	Present
Taxidea taxus American badger*	Federal: None State: SSC	Open dry habitats with variable soils and rodents for prey; uncommon but has been found throughout Edwards AFB; entire Base is potential habitat	Moderate
Xerospermophilus mohavensis Mohave ground squirrel	Federal: BLM Sensitive State: Threatened	Most desert habitats with sandy or gravelly soils, found throughout Edwards AFB	Present

Source: Edwards AFB, 2015; CDFW, 2015

* Species is not shown on Figure 3-8 since locations have not been reported to the CNDDB. However, the INRMP indicates it has been found on Base (Edwards AFB, 2015).

Species Status:

BCC: Listed by USFWS as a bird of conservation concern

BLM Sensitive: Species listed as sensitive by the U.S. Bureau of Land Management

SSC: California state species of special concern

WEMO covered species: A species that is covered in the Western Mojave Plan

Each species with a potential to occur of moderate or high, or known to be present is discussed in further detail below. Those of low potential for occurrence are not discussed further.

Western pond turtle is a BLM-sensitive species and has been petitioned to be federally listed by USFWS. They are found throughout California aquatic habitat, including in the Mojave River located in the Mojave Desert. They prefer habitats with permanent or nearly permanent water. Western pond turtles like to bask on partially submerged items, such as rocks, logs, and floating vegetation. They are active year-round, but will hibernate during cold weather. They are most active from April to July. The western pond turtle has been observed in the Piute Ponds area and could occur within proposed Corridor 3.

Desert Tortoises are listed as threatened under both the federal and state Endangered Species Acts. It is the only species which resides on Edwards AFB that is listed as threatened under the Federal Endangered Species Act (ESA). Surveys for desert tortoise indicate the species occurs throughout the Base. However, the level of density varies, with the highest densities in the southcentral and southeastern areas. Figure 3-8 provides a map of the probability of encountering a desert tortoise, or the sign of a desert tortoise, on Edwards AFB. The southwestern and northwestern corners of the installation and the Main Base area contain the lowest density levels. Tortoises are absent from the lakebeds, including Rosamond Dry Lake. Desert tortoise habitat occurs along all of the proposed corridors and desert tortoise critical habitat occurs along Corridors 4 and 5.

Tricolored blackbirds are listed as a BCC species, a BLM sensitive species, has been emergency listed as endangered by the CDFW. They occur in a variety of habitats in California near water sources in the Central Valley and vicinity, but also occurs in the foothills surrounding the valley. Tricolored blackbirds occur in low abundances in southern and coastal California and sporadically in Oregon, northwestern Baja California and western Nevada. On Edwards AFB, tricolored blackbirds have been observed nesting at Piute Ponds and Branch Memorial Park Pond, but could occur at any pond with reeds such as the one on the Edwards AFB golf course. Potential habitats occur along Corridor 3.

Golden eagles are protected under the federal Bald and Golden Eagle Protection Act and inhabit a wide range of habitats ranging from arctic to desert. Urbanization and human-population growth have made areas historically used by eagles unsuitable, particularly in southern California. Extensive agricultural development reduces jackrabbit populations and makes areas less suitable for nesting and wintering eagles. Recreation and other human activity near nests can cause breeding failures. Golden eagle habitat could occur within all proposed corridors.

Bell's sparrows are listed as a BCC covered species. They are found in sagebrush, saltbush and other low shrub habitats. They range from the California Coast Ranges and Western Sierra Nevada to Baja California. They are active during the day, feeding on seeds. They could occur within all proposed corridors.

Short-eared owls are a California SSC and a WEMO covered species. Their preferred habitat is marshes and seasonal wetlands. The WEMO states that short-eared owls appear to nest on Edwards AFB at Piute Ponds, which are to the east of Corridor 3.

Long-eared owls are a WEMO covered species found throughout North America; they nest in trees, cavities, cliffs and occasionally on the ground, but hunt in open habitats. Long-eared owls have been recorded in wooded areas such as woodlands near Haystack Butte and Mesquite woodlands. They have also been observed at the South Base evaporation ponds, which are east of Corridor 3.

Burrowing owls are listed as a BCC, as a BLM sensitive species, and as a California SSC. They are small ground-dwelling owls that live in modified rodent holes and have been observed throughout Edwards AFB. They live primarily in dry, open scrub or grassland, are active day and night and frequently nest in loose colonies. Burrowing owls feed on a wide variety of prey, including small mammals, especially mice and rats, reptiles and amphibians, scorpions, bats and small birds. Burrowing owls have been previously found within and adjacent to Corridors 1, 2, 3 and 5 and could occur within or near all of the corridors.

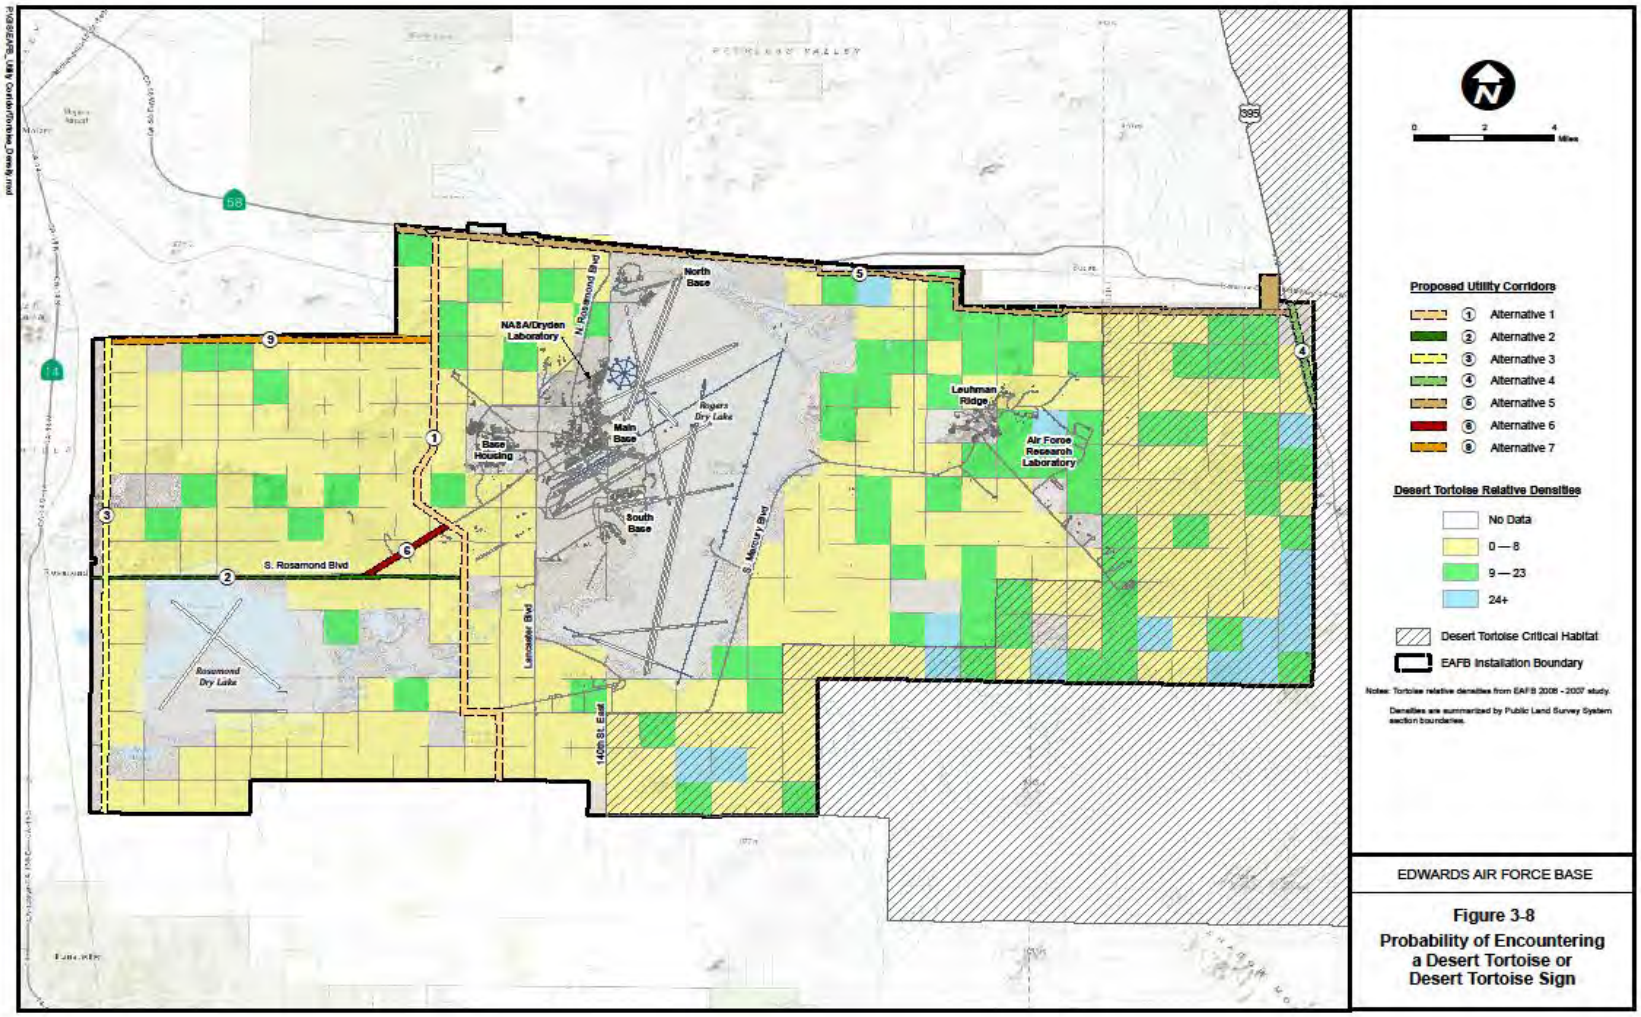

Figure 3-8 Probability of Encountering a Desert Tortoise or Desert Tortoise Sign

Redheads are a California SSC listed species. They prefer wetland areas that border open water. Redhead's breed primarily in northeastern California; but small numbers are also known to breed in the Central Valley and eastern Kern County. They are active day and night feeding mostly on leaves, stems and tubers. On Edwards AFB, they have been observed in the Piute Ponds and Branch Park areas. Redheads could occur within proposed Corridors 1 and 3.

Swainson's hawks are listed as threatened under the state Endangered Species Act. In

California, they are primarily found in the Central Valley, but have been known to breed in the Antelope Valley. They eat small rodents, amphibians and other birds. They live primarily in open desert or grassland and are active during the day. They could occur within all proposed corridors.

Western snowy plovers (interior population) are a California SSC and a WEMO listed species. They nest on playas and wetlands in the Western Mojave. On Edwards AFB there is a record of western snowy plovers at Rosamond Dry Lake Bed, which is adjacent to Corridor 3 and near Corridor 2.

Mountain plovers are a BLM sensitive species, a California SSC, and a WEMO covered species. Mountain plovers move into the southern deserts and California central valley for winter where they are found almost exclusively in agricultural fields. On Edwards AFB, mountain plovers have been observed near Corridors 1 and 3.

Northern harriers are a California SSC. Northern harriers can be found throughout the West Mojave in winter. Nesting is limited to locations with year-round marsh habitat. They nest on Edwards AFB at Piute Ponds, adjacent to Corridor 3, and have been observed foraging throughout the Base.

Willow flycatchers are listed as a BCC, as a BLM sensitive species. They are found nationwide, including throughout California during the breeding season. Their habitat includes shrubs and willow thickets. Their diet consists mainly of insects, but they have been known to

eat some berries. On Edwards AFB, they have been observed in the Piute Ponds and Branch Park areas. They could occur within proposed Corridors 1 and 3.

Prairie falcons are listed as a BCC and are a WEMO covered species. They are permanent residents in California within habitats that support open, dry, level or hilly terrain. They breed on cliffs and forage extremely large distances. Prairie falcons are an efficient and specialized predator of medium-sized desert mammals and birds. They seem to persist despite agricultural development, livestock-grazing, energy development, off-road vehicle use and military training. They could occur within all proposed corridors.

Peregrine falcons are listed as a BCC covered species. They can be found nationwide, including the coast and mountain areas of northern California. During the winter season, they migrate inland to Central Valley, California. They prey upon other birds, but have been known to occasionally prey upon small mammals, insects and fish. They could occur within all proposed corridors.

Loggerhead shrikes are listed as a BCC and a California SSC. They are small predatory birds that occur throughout Edwards AFB and the Mojave Desert. It is a resident in most of California, particularly roadsides, grasslands, agricultural fields, golf courses, and riparian areas. The bird is often seen perching on Joshua trees on Edwards AFB. Its primary food includes lizards, small rodents, large insects, amphibians, road-killed animals and carrion. They could occur within all proposed corridors.

Bank swallows are listed as threatened under the state Endangered Species Act. They are permanent residents of California, especially in lowland areas. A majority of the breeding population lives in the northern Central Valley. Nests are built in vertical banks and cliffs and require sandy soils. They have been observed nesting in the Piute Ponds area, but can be found foraging in brushland, grassland, wetlands and croplands. They could occur within all proposed corridors.

California least terns are listed as endangered under the federal Endangered Species Act. They feed in aquatic areas that are abundant with fish. Nests are close to water usually in open areas.

They are active during the day. On Edwards AFB, they have been observed in the Piute Ponds, Branch Park and dry lakebed areas. They could occur within proposed Corridors 1, 2, 3 and 5.

LeConte's thrashers are listed as a BCC, a California SSC, and as a WEMO listed species. They are endemic to the Mojave and Sonoran Deserts and are found throughout Edwards AFB in Joshua tree woodland, saltbush scrub and dense creosote bush scrub. This species requires an undisturbed soil surface under desert shrubs. Agriculture and urban development have eliminated much of its habitat. They feed on any ground-dwelling insect, small reptiles and some seeds. They could occur within all proposed corridors.

Yellow-headed blackbirds are a California SSC listed species. They are found throughout California, but are located year-round in the Central Valley area. They mainly eat seeds and grains, but also eat insects. Nests are located in dense vegetation near deep water. They are active during the day. On Edwards AFB, they have been observed in the Piute Ponds and Mesquite Woodland areas. They could occur within proposed Corridors 1and 3.

Pallid bats are listed as a BLM sensitive species, a California SSC, and as a WEMO Covered Species that occurs across much of western North America, along the coast from Mexico to Canada. Pallid bats are most likely migratory, although occasional individuals have been reported in the U.S. during the winter. They could occur within all proposed corridors.

Townsend's western big-eared bats are listed as a BLM sensitive species, a California SSC, and a WEMO covered species. They are also a California candidate threatened species. Townsend's western big-eared bats feed entirely on moths. Townsend's big-eared bats hibernate in tight clusters throughout their range during winter months. They could occur within all proposed corridors.

California Mastiff bats are a BLM sensitive species and a California state species of special concern. They are the largest North American bat and range from southern California and Arizona, south into Mexico. They could occur within all proposed corridors.

Big free-tailed bats are a California SSC. This species probably does not breed in California, but are residents. Big free-tailed bats frequents rocky or canyon areas where they roost in crevices. They could occur within all proposed corridors.

Southern grasshopper mouse is a California SSC. It is found in desert habitats, including the Mojave Desert and southern Central Valley. Feeds on scorpions, grasshoppers, crickets and other invertebrates. Uses nests that have been abandoned by other rodents. They are active at night. They could occur within all proposed corridors.

Little pocket mouse is a California SSC. It is found in desert habitats, including those in Kern County. They are active at night. They become inactive aboveground between fall and spring, staying underground to avoid cold temperatures. They could occur within all proposed corridors.

American badgers are listed as a California SSC. They are a widespread but uncommon burrowing animal throughout their range. Their primary prey is rodents and they commonly avoid people and urban or developed areas. Although they are an uncommon species, American badgers have been observed on Edwards AFB and the whole Base is potential habitat. They could occur in all proposed corridors.

Mohave ground squirrels are listed under the CESA as threatened. They are small ground squirrels that are active only during the spring and early summer, staying underground the remainder of the year to avoid periods of extreme heat and cold. Mohave ground squirrels have been found throughout Edwards AFB. This species has been found in or near Corridors 1, 2, 3, 4, 5 and 6 and all corridors could support Mohave ground squirrel (Figure 3-9).

Sensitive Habitats

The Fremont-Kramer desert tortoise critical habitat unit (a USFWS designation) and Desert Wildlife Management Area (DWMA, a BLM designation) were created for the protection of the federally- and state-threatened desert tortoise and overlap portions of the eastern area of Edwards AFB (Figure 3-10). The portion of the critical habitat for desert tortoise on Base consists of approximately 60,800 acres primarily located on the PIRA and the AFRL. Approximately 345

acres of critical habitat occur within Corridor 4 and 585 acres of critical habitat occur within Corridor 5.

The Mohave Ground Squirrel Conservation Area was developed through the West Mojave Plan (U.S. Department of the Interior, Bureau of Land Management, 2005), is located on non-military lands adjacent to Edwards AFB and is managed by the BLM for the protection of habitat for this state-threatened species. None of the utility corridors crosses this conservation area.

The Piute Ponds Complex, located in the southwestern corner of Edwards AFB, is bounded by the western base boundary, Avenue E to the south, and 50th Street East to the east. It contains the largest body of perennial surface water on Edwards AFB and is the largest freshwater marsh in Los Angeles County. The Piute Ponds Complex consists of lower Amargosa Creek, ponds, marshes, wetland meadows, low sand dunes, small clay pans and Rosamond Dry Lake. The upland and wetland area (excluding Rosamond Dry Lake) of the Piute Ponds Complex encompasses approximately 5,614 acres (Figure 3-11). Of the 5,614 acres, approximately 1,410 acres of ponds, wetlands, wet meadows and clay pans are in an area where the water flow/levels can be managed. These areas are subject to flow from Sanitation District 14 (D14) Lancaster Wastewater Treatment Plant, and depending on the area, are perennially or seasonally flooded. This is considered the Water Management Area (WMA). Other seasonally flooded wetlands exist outside of this WMA and receive water from natural ephemeral surface water as it flows to the lakebed. Other seasonally flooded wetlands exist around the active WMA and are fed from natural ephemeral surface/storm water as it flows to the lakebed. The Rosamond Dry Lake portion of the Piute Ponds Complex is approximately 13,800 acres (Edwards Air Force Base, 2015). The southern portion of Corridor 3 traverses the western piece of the Piute Ponds Complex.

3.8 NOISE

3.8.1 Overview

The major sources of noise at Edwards AFB are vehicle traffic on streets from staff, contractors and vendors traveling to and from the Base and aircraft operations, including air traffic and engine testing. Motor vehicle noise at Edwards AFB originates mainly at Lancaster Boulevard, Rosamond Boulevard and primary and secondary streets on Base.

The methodology for describing the statistical characteristics of community noise-level fluctuations is the percent of exceedance. For example, if the noise level during a certain time period exceeds 65 decibels on the A-weighted scale (dBA) for 25 percent of the time (e.g., 15 minutes out of 1 hour), the exceedance for 65 dBA is said to be 25 percent. Noise exceedance levels are denoted by L_{10}, L_{50}, L_{90} and so on, where the subscript represents the percent of the time that the noise level is exceeded. Additionally, environmental noise can be characterized by average levels such as the energy equivalent continuous noise levels (L_{eq}), which can be averaged over a 24-hour period or, for specific applications, it can be averaged over a portion of the day. The daytime noise level (L_d) refers to noise between 7 a.m. and 7 p.m. The day/night equivalent A-weighted noise level (L_{dn} or DNL) incorporates a 10-decibel (dB) penalty for nighttime noise between 10 p.m. and 7 a.m. to reflect the added likelihood of annoyance during this period. DNL is the standard federal metric for determining cumulative exposure of individuals to noise. DNL is the 24-hour average A-weighted dB sound level measure of noise.

Background noise monitoring conducted at Edwards AFB in May of 1993 (GRW Engineers and Tetra Tech, 1994), showed L_{dn} noise levels ranging as follows:

- From 37 dB to 68 dB at the housing area and vicinity where the maximum value (68 dB) occurred behind the hospital and resulted mainly from a continuous noise from an air conditioning system on the roof of the hospital;
- From 57 to 65 dB on North Base locations where the maximum value (65 dB) resulted from an air conditioning system on the roof of the Hazardous Waste Laboratory;

- From 69 to 76 dB in the Main Base where primary sources were aircraft operation near the facilities where noise monitoring was conducted;
- From 61 to 72 dB at the South Base where the maximum value (72 dB) was associated with aircraft operations (i.e., landings and takeoffs) at the runway;
- Noise levels at the Philips Laboratory area ranged from 46 dB to 55 dB where the maximum value (53 dB) originated from motor vehicles traveling on a near roadway.

The Community Noise Equivalent Level (CNEL) has been adopted by the state of California as the descriptor for measuring noise levels. The state recommends 60 CNEL as an acceptable level of exterior noise for residential uses, and the Air Force instruction for Air Installation Compatible Use Zone (AICUZ) directs installations in California to show those contours on their AICUZ maps. The decibel is the commonly accepted unit used to measure sound. The CNEL represents the average sound level during a 24-hour day with the addition of a 5 dB penalty for evening noise (7:00 p.m. to 10:00 p.m.) and a 10 dB penalty for nighttime noise (10:00 p.m. to 7:00 a.m.). An aircraft noise study conducted in February 2010 for Edwards AFB to provide detailed analysis of potential noise effects related to current and projected base operations showed a CNEL range of 60 dB to 85 dB. The noise sources included in the study were airfield flight operations, range air operations by aircraft, range land-based operations, supersonic air operations, and single event sonic booms. The study produced a noise map for Edwards AFB showing that all noise contours, CNEL 60 dB to CNEL 85dB, are contained within the Edwards AFB Base boundaries (Edwards AFB, 2013).

3.8.2 Noise Setting for Each Corridor

Noise associated with the Proposed Action would primarily result from on- and off-road motor vehicles and construction equipment used during land clearing, grading, excavating and trenching necessary for installation of underground utilities. The majority of the area covered by the Proposed Action Alternatives is separated from sensitive receptors. The Alternatives with the closest proximity to sensitive receptors and communities are as follows:

Alternative 1 – Corridor 1 has a segment approximately one mile west of the housing area.

Alternative 5 – Corridor 5 has a segment approximately 3,000 feet south of Muroc Unified School District in North Edwards and a segment approximately one mile south of West Boron Elementary School.

3.9 SOCIOECONOMICS

This section provides an overview of the applicable plans, policies and regulations, as well as existing socioeconomic conditions, including employment and income. The proposed project study area includes Kern County, Los Angeles County, San Bernardino County, as well as local communities. This section provides the contextual background information for known socioeconomic resources within the proposed utility corridors (Corridors 1 through 6 and 9) which correspond to Alternatives 1 through 7.

The analysis of the proposed project's potential impacts on identified socioeconomic resources, as well as the recommendations for avoidance, reduction of, or mitigation measures necessary to address these potentially adverse impacts, are provided in Section 4.

3.9.1 Overview

3.9.1.1 Regional Setting

Edwards AFB is located approximately 100 miles north of Los Angeles in the Antelope Valley on the western edge of the Mojave Desert. Portions of the installation are within three California counties. The majority of the installation is in Kern County, with smaller areas being located within Los Angeles and San Bernardino Counties. The installation encompasses approximately 481 square miles (over 301,000 acres) and includes two major natural features -- Rogers and Rosamond Dry Lakes (Edwards Air Force Base, 2012b).

3.9.1.2 Socioeconomic Resources

Socioeconomic resources are the economic, demographic, and social assets of a community. Key elements include fiscal growth, population, labor force and employment, housing stock and demand, and school enrollment.

As Edwards AFB straddles the boundaries of Kern, Los Angeles and San Bernardino counties, it is situated in the vicinity of a number of communities, including Boron, California City, Lancaster, Mojave, North Edwards, Palmdale and Rosamond. The activities of all counties and

communities are taken into consideration in the socioeconomic analysis of the proposed utility corridor and its alternatives.

Population

Population within the three counties varies. Population estimates are summarized in Table 3-10.

Table 3-10 Study Area Population Estimates (2010-2014)

County	2010 Population	2014 Population	Percent Change 2010-2014
Kern	839,631	874,589	4.2%
Los Angeles	9,818,664	10,167,705	3.0%
San Bernardino	2,035,215	2,112,619	3.8%
CALIFORNIA	37,253,956	38,802,500	4.2%

Source: US Census Bureau, 2015

Income and Unemployment

A summary of income and unemployment statistics are presented in Table 3-11

Table 3-11 Study Area Income and Unemployment

County	Per Capita Income 2013 ($)	Median Household Income 2013 ($)	Unemployment 2015 (%)
Kern	$20,295	$29,527	10%
Los Angeles	$27,749	$55,909	7.1%
San Bernardino	$21,332	$54,090	6.1%
CALIFORNIA	$48,552	$61,094	6.3%

Source: US Census Bureau, 2015; US Bureau of Labor Statistics 2015

Employment and Industry

Edwards AFB makes a substantial contribution to the economic status of the surrounding communities within the Antelope Valley. Major industries in the area include agriculture, mining and tourism, in addition to aerospace technology (Edwards Air Force Base, 2012d).

The Antelope Valley has a labor force of approximately 157,900 persons with an unemployment rate of 14.1 percent. The labor force is employed in a variety of industries, including services,

manufacturing, construction/mining, retail, government and agriculture, according to the Greater Antelope Valley Economic Alliance 2010. As of December 10, 2010, Edwards AFB employed approximately 11,285 military, civilian and contractor personnel, according to the City of Lancaster, 2012 (Edwards Air Force Base, 2012d).

Edwards AFB is one of the largest employers in the Antelope Valley. In 2012, there was a daily workforce of 10,647, and an annual economic impact of $1.52 billion to the local economy. A summary of the factors considered in estimating the total economic impact of Edwards AFB is shown in the Edwards Air Force Base Economic Impact Analysis (Edwards Air Force Base, 2012b).

Housing

Edwards AFB provides permanent housing for military members in the form of dormitories and military family housing. Edwards AFB has over 741 housing units with an occupancy rate goal of 98 percent. Housing is also available in the surrounding communities, including Lancaster, Palmdale, California City and Tehachapi.

Because the Proposed Action does not propose the addition or removal of housing, the analysis in this EA does not address impacts related to the availability of housing.

Community

Edwards AFB enjoys excellent relationships and support from the surrounding communities and local governments. Local cultural events, festivals, sports and other leisure pursuits, plus the attractions of the nearby Los Angeles metropolitan area make Edwards AFB a great jumping-off place for a myriad of activities. Numerous state and local parks and national parks are also close by (Edwards Air Force Base, 2012b).

Schools

There are 12 school districts within 100 miles of Edwards AFB. The ones that service Edwards AFB, North Edwards and Boron lie within the Muroc Unified School District, which has two

Kindergarten through 6th Grade elementary schools and two comprehensive junior/senior high schools with a total enrollment of about 2,000 students (Edwards Air Force Base, 2012b).

3.9.2 Socioeconomic Setting for Each Corridor

The Proposed Action effects on socioeconomic resources would primarily result from construction and installation activities, including land clearing, grading, excavating, trenching and installation of underground utilities. The majority of the area covered by the Alternatives is separated from sensitive receptors. The Alternatives with the closest proximity to sensitive receptors and communities are as follows:

Corridor 1 has a segment approximately one mile west of the housing area.

Corridor 5 has a segment approximately 3,000 feet south of Muroc Unified School District in North Edwards and a segment approximately one mile south of West Boron Elementary School.

3.10 WATER RESOURCES

3.10.1 Overview

Edwards AFB is located in a basin that is essentially closed with respect to both surface drainage and groundwater movement. Most of the precipitation of the region falls in higher elevations and any resulting storm water flow in ephemeral intermittent streambeds evaporates or infiltrates before it reaches lower elevations. There are no perennial streams on or near Edwards AFB.

Playa Lakebeds. Edwards AFB has permanent playa lake beds that are dry except during rainy seasons (Figure 3-12). The lakebeds and normally dry stream channels are subject to significant flooding after heavy, seasonal storms, as are claypan areas. Antelope Valley where Edwards AFB is located within is an approximate 2,400-square mile drainage basin in which storm water runoff is directed towards Rogers Dry Lake, Rosamond Dry Lake and Buckhorn Dry Lake. Any water that reaches these lakebeds remains until it evaporates.

Wetlands. Edwards AFB does not contain jurisdictional wetlands. Surface waters on the Base are primarily a result of constructed ponds and detention basins. Other aquatic habitats include

ephemeral clay playas and dry lakes. None of the aquatic features are jurisdictional due to a lack of connectivity or adjacency to navigable waters or waters otherwise used for interstate commerce. All permanent surface water on-base is a result of detention ponds and impoundments.

However, Edwards AFB does contain biological wetlands, primarily in the Piute Ponds Complex located in the southwestern corner of the Base. The Piute Ponds Complex (excluding Rosamond Dry Lake) encompasses approximately 5,614 acres. These areas are subject to flow from Sanitation District 14 (D14) Lancaster Wastewater Treatment Plant, and depending on the area, are perennially or seasonally flooded. Other seasonally flooded wetlands exist outside of this Water Management Area and receive water from natural ephemeral surface water as it flows to the lakebed. Additional wetland areas occur in some of the claypans on the Base.

Projects potentially impacting wetlands must comply with Executive Order (EO) 11990 *Protection of Wetlands*. EO 11990 requires agencies to avoid to the extent possible the long- and short-term adverse impacts associated with the destruction or modification of wetlands and to avoid direct or indirect support of new construction in wetlands wherever there is a practicable alternative. When Federally-owned wetlands or portions of wetlands are proposed for road, easement, right-of-way or disposal to non-Federal public or private parties, the Federal agency shall (a) reference in the conveyance those uses that are restricted under identified Federal, State or local wetlands regulations; and (b) attach other appropriate restrictions to the uses of properties by the grantee or purchaser and any successor except where prohibited by law; or (c) withhold such properties from disposal.

The southern portion of Corridor 3 crosses the Discovery Cove (19.69 acres), Coot Shoot (1.29 acres) and Mattquetty Marsh (45.09 acres) areas within the Piute Ponds Complex and is subject to EO 11990. These features are shown on Figure 3-11. The southern portion of Corridor 1 crosses some claypan areas that could be considered biological wetlands as well (Figure 3-13). Additional analysis would be required to fully assess potential impacts to wetlands and identify appropriate restrictions for the southern portion of Corridor 1 and Corridor 3.

Surface Water. The Antelope Valley drainage area is bounded by the San Gabriel and Tehachapi Mountain ranges. Major streams that drain this area include the Big Rock Wash, Little Rock Creek, Anaverde Creek, Amargosa Creek, Portal Ridge Wash and Fairmont Wash (Figure 3-12).

Flooding hazards have been determined at Edwards AFB and are illustrated on Figure 3-13 (EAFB, 2012b). The category of flood hazards is defined as follows:

- 100-Year Flood Plain where there is a 1 percent chance of a flood occurring in any given year;
- Inundated areas outside of the 100-Year Flood Plain and areas of 100-Year sheet flow with depths less than one foot; and
- Areas of possible inundation but with undetermined flood risk.

Flood hazards studies have been conducted at Edwards AFB for the most critical flood prone areas associated with Rogers Dry Lake and Rosamond Dry Lake. Mojave Creek is an ephemeral stream that originates from the Bissel Hills area found in the northeastern portion of the Base (Dinehart and Harmon, 1998). Flooding hazards from Mojave Creek have the potential for impacting areas near Main Base (Figure 3-13). Construction activities subsequent to the Mojave Creek floodplain delineation have likely altered the flooding hazard. A new Mojave Creek floodplain delineation is planned in the near future.

Groundwater. Edwards AFB overlies portions of the following groundwater basins that are part of the South Lahontan Hydrologic Region:

- Antelope Valley Groundwater Basin (No. 6-44);
- Fremont Valley Groundwater Basin (No. 6-46);
- Harper Valley Groundwater Basin (No. 6-47);and
- Middle Mojave River Valley Groundwater Basin (No. 6-41) (California Department of Water Resources 2004).

Edwards AFB also overlies portions of three groundwater subbasins as defined by the United States Geological Survey (USGS, 2005):

- Lancaster and North Muroc Subbasins within the boundary of the Antelope Valley Groundwater Basin; and

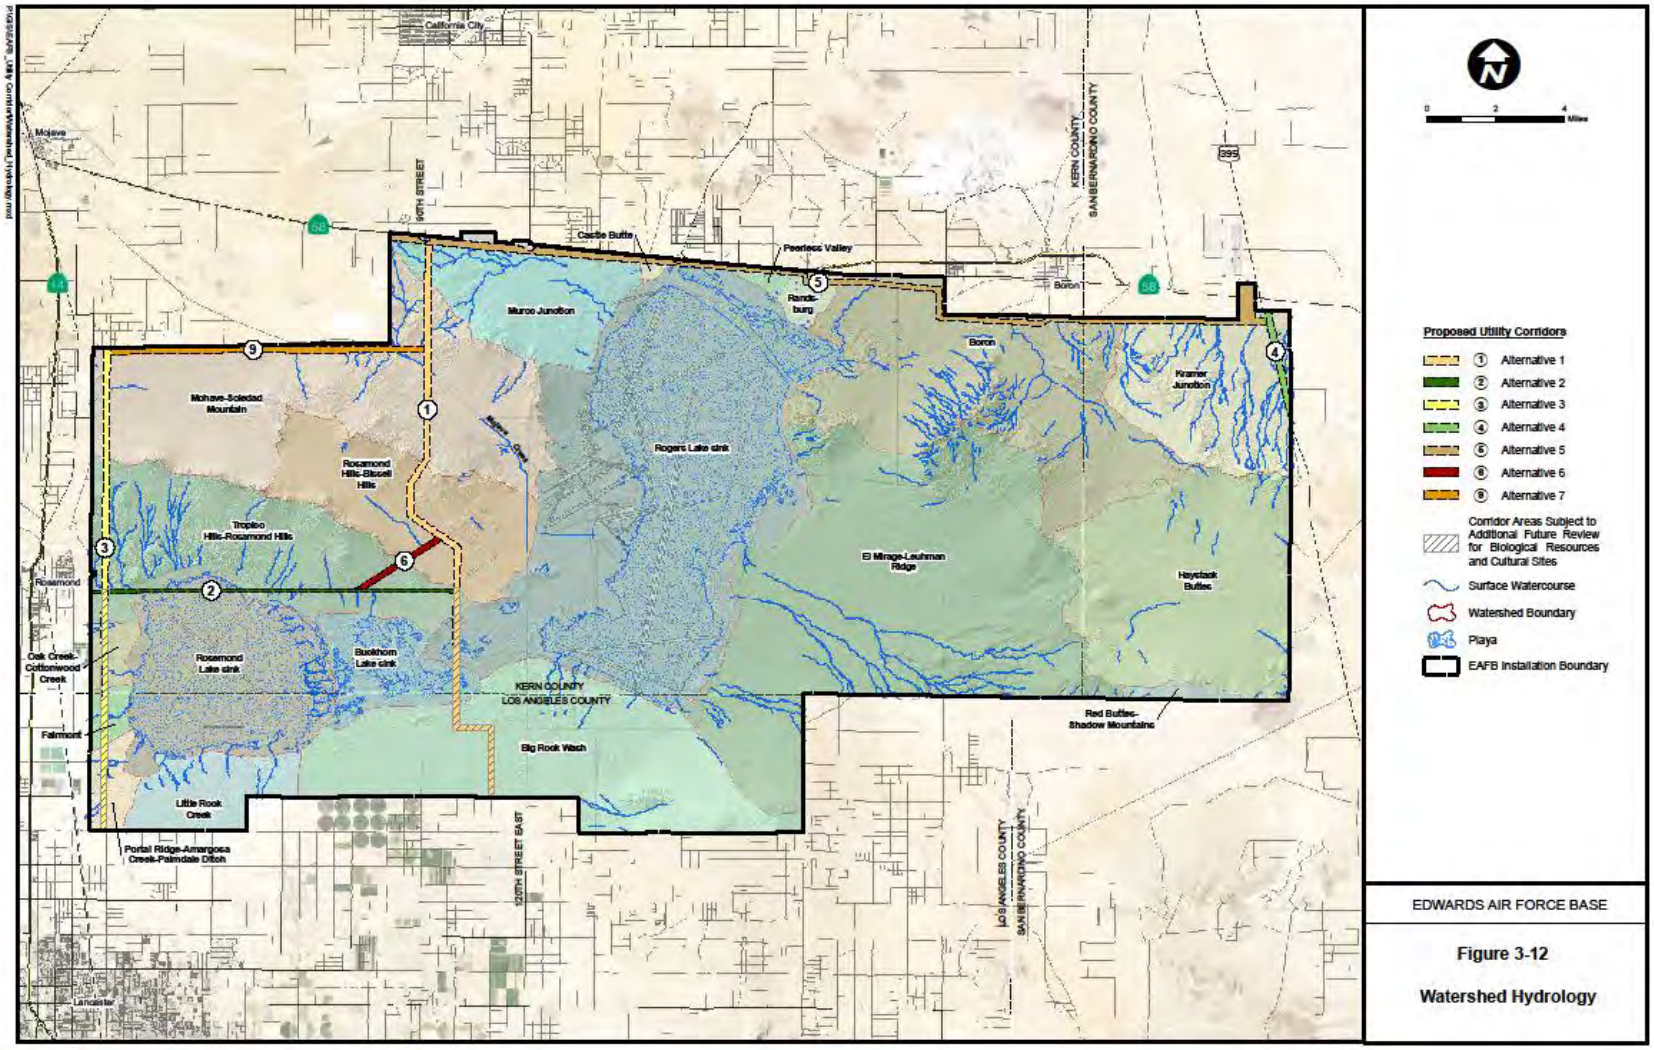

Figure 3-12 Watershed Hydrology

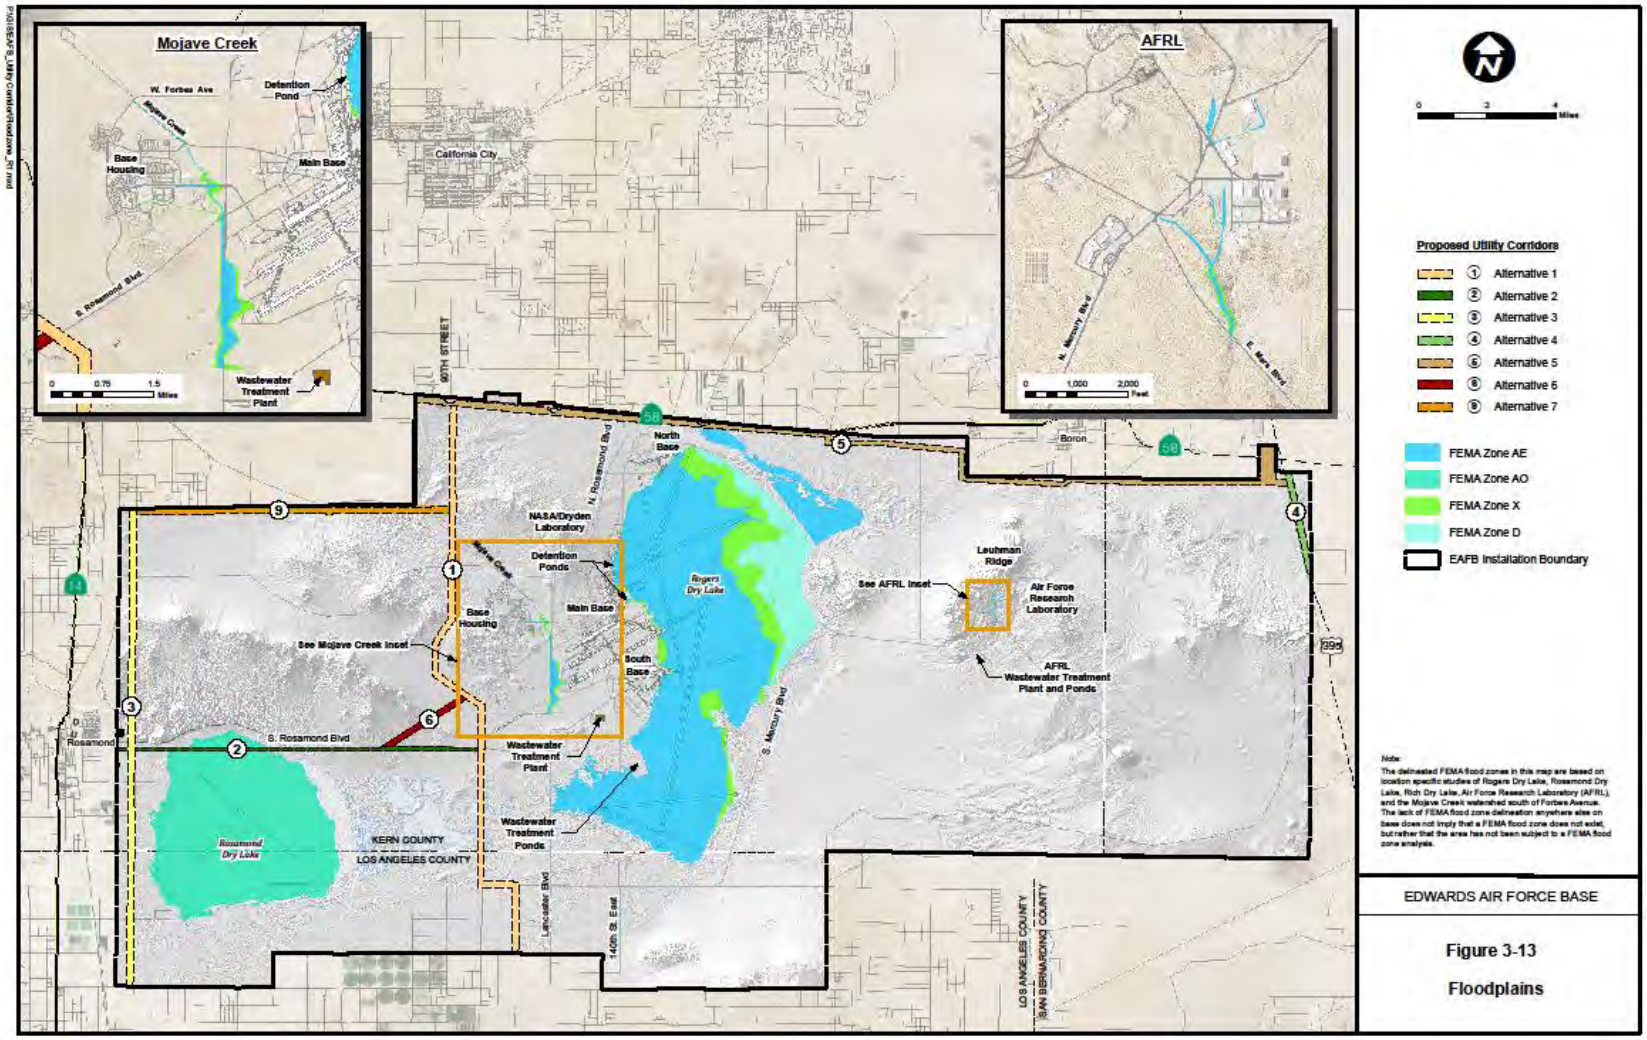

Figure 3-13 Floodplains

- Gloster Subbasin within the boundary of the Fremont Valley Groundwater Basin.

In addition to these subbasins, Edwards AFB also encompasses areas of bedrock outcrops and shallow bedrock in the Rosamond and Bissell Hills (west and northwest part of the Base), the Hi Vista Area (south central and southeast part of the Base) and Leuhman Ridge in the area of the AFRL.

Groundwater at Edwards AFB occurs mainly in unconsolidated alluvial deposits in these groundwater basins and subbasins. In the Lancaster Subbasin, the unconsolidated alluvial deposits are known to exceed thicknesses of 1,500 feet.

Depth to groundwater in a middle aquifer used for beneficial purposes from water supply wells on-Base is generally between 250 and 750 feet below ground surface (bgs).

3.10.2 Alternative 1 - Corridor 1

Playa Lake Bed. Corridor 1 spans from the Southern Base boundary (120th Street) to the northern boundary. The southern portion of this alternative crosses a portion of the playa complex associated with Buckhorn Dry Lake. Because of the potential for crossing biological wetlands in this playa complex, the southern portion of Corridor 1 would be subject to additional environmental analysis at the time a specific project is proposed and, therefore, is not subject to the FONSI or FONPA associated with the Proposed Project.

Surface Water. A small portion of the northern section of Corridor 1 crosses Mojave Creek. Other unnamed ephemeral drainages appear to be bisected by this alternative. There are no delineated floodplains associated with this corridor.

Groundwater. The following groundwater basins lie beneath Corridor 1:

- Muroc Junction;
- Mojave-Soledad Mountain;
- Rosamond Hills-Bissell Hills;

- Tropico Hills-Rosamond Hills;
- Rogers Lake Sink;
- Buckhorn Lake Sink; and
- Big Rock Wash.

3.10.3 Alternative 2 - Corridor 2

Playa Lake Bed: This utility corridor begins at the western boundary of the Base at Rosamond Boulevard and runs parallel to Rosamond Boulevard. The western portion of Corridor 2 crosses the northern portion of Rosamond Dry Lake within the current easement of Rosemond Boulevard.

Surface Water. Unnamed ephemeral drainages appear to be bisected by this alternative. This corridor passes through the northern end of the Rosamond Dry Lakebed, a designated 100-year floodplain; therefore a Finding of No Practicable Alternative will be required.

Groundwater. The following groundwater basins lie beneath Corridor 2:

- Tropico Hills-Rosamond Hills; and
- Rosamond Lake Sink.

3.10.4 Alternative 3 - Corridor 3

Playa Lake Bed. This utility corridor, also known as the Shuttle Road Corridor, follows Shuttle Road at the western-most edge of the Base running from Avenue E to the south, to the northern boundary of the Base at Trotter Road. It would not bisect any of the dry lake beds at Edwards AFB.

Surface Water. A number of unnamed ephemeral drainages appear to be bisected by this alternative. While there are no delineated floodplains associated with this corridor, it does cross three features that are part of the Piute Ponds Complex: Discovery Cove, Coot Shoot and Mattquetty Marsh, shown on Figure 3-11. Because of the potential for crossing biological wetlands in the Piute Ponds Complex, the southern portion of Corridor 3 would be subject to

additional environmental analysis at the time a specific project is proposed and, therefore, is not subject to the FONSI or FONPA associated with the Proposed Project.

Groundwater. The following groundwater basins lie beneath Corridor 3:

- Mojave-Soledad Mountain
- Tropico Hills-Rosamond Hills
- Oak Creek-Cottonwood Creek;
- Fairmont; and
- Portal Ridge-Amargosa Creek-Palmdale Creek.

3.10.5 Alternative 4 - Corridor 4

Playa Lake Beds. This utility corridor traverses the north eastern corner of the Base, following U.S. Route 395 where there are current electrical easements. It would not bisect any of the dry lake beds at Edwards AFB.

Surface Water. A number of unnamed ephemeral drainages appear to be bisected by this alternative. There are no delineated floodplains associated with this corridor.

Groundwater. The following groundwater basin lies beneath Corridor 4:

- Kramer Junction

3.10.6 Alternative 5 - Corridor 5

Playa Lake Beds. This utility corridor begins at the northern boundary of the Base and parallels State Route 58 and terminates at the north eastern corner of the Base at Kramer Junction. The northernmost portion of Rogers Dry Lake would be crossed by this alternative.

Surface Water. A number of unnamed ephemeral drainages appear to be bisected by this alternative. There are no delineated floodplains associated with this corridor.

Groundwater. The following groundwater basins lie beneath Corridor 5:

- Kramer Junction;
- Boron;

- Randsburg;
- Peerless Valley;
- Rogers Lake Sink;
- Castle Butte; and
- Muroc Junction.

3.10.7 Alternative 6 - Corridor 6

Playa Lake Beds. This utility corridor runs from mid-Rosamond Boulevard and connects to either Corridor 1 or Corridor 2. It would not bisect any of the dry lake beds at Edwards AFB.

Surface Water. A number of unnamed ephemeral drainages appear to be bisected by this alternative. There are no delineated floodplains associated with this corridor.

Groundwater. The following groundwater basins lie beneath Corridor 6:

- Rosamond Hills-Bissell Hills; and
- Tropico Hills-Rosamond Hills.

3.10.8 Alternative 7 - Corridor 9

Playa Lake Beds. This utility corridor is the northwestern connection from the northwestern edge of the Base to tie into Corridor 1. It would not bisect any of the dry lake beds at Edwards AFB.

Surface Water. A small portion of the eastern section Corridor 9 would cross Mojave Creek. Other unnamed ephemeral drainages appear to be bisected by this alternative. There are no delineated floodplains associated with this corridor.

Groundwater. The following groundwater basin lies beneath Corridor 9:

- Mojave-Soledad Mountain.

4.0 ENVIRONMENTAL CONSEQUENCES

This chapter presents the potential environmental consequences that could result from implementation of the various utility corridor alternatives. Possible changes to the natural and human environment that could result from the project alternatives were evaluated relative to existing environmental conditions described within Chapter 3.0. Mitigation measures are presented that would mitigate potentially significant adverse impacts to a level that is not significant. This chapter also provides a discussion of cumulative impacts, unavoidable adverse effects, short-term uses versus long-term productivity of the environment and the irreversible and irretrievable commitment of resources.

4.1 AIR QUALITY AND GREENHOUSE GASSES

Emissions resulting from the construction within most corridors would originate primarily within Kern County, but emissions resulting from construction within Corridors 1 and 3 would partially originate within Los Angeles County. Emissions resulting from Corridor 5 would partially originate within San Bernardino County and emissions resulting from Corridor 4 of would originate entirely within San Bernardino County. The Kern County portion of the Proposed Action is under the jurisdiction of the EKAPCD. The Los Angeles County portion of the Proposed Action is under the jurisdiction of the AVAQMD. The San Bernardino County portion of the Proposed Action is under the jurisdiction of the MDAQMD. Each of these air districts has set thresholds of significance for criteria pollutants and GHGs which must not be exceeded in order to ensure that the Proposed Action emissions are consistent with air quality management plans and GHG goals.

The air and GHG emissions resulting from the Proposed Action would be short-term construction emissions, which are temporary emissions generated during the construction of a project. Short-term emissions are typically generated by on-road (e.g., employee vehicles and vendor/delivery trucks) and off-road vehicles or equipment (e.g., backhoes, bulldozers, portable

generators and cranes), as well as dust generation due to clearing, grading, excavating and trenching activities. Short-term emissions end once the construction phase is completed.

Long-term or operational emissions are not expected to occur on a regular basis. After the construction phase is completed, areas of disturbance would be revegetated or restored. In addition, incidental unpredictable emissions are expected to result from maintenance-related activities, which may not occur for many years after the construction phase is completed. Consequently, long-term emissions are not addressed in this EA.

4.1.1 Methodology

All of the Proposed Action corridors, with the exception of the southern portions of Corridors 1 and 3, have been deemed suitable for underground installation of gas, water, communications, electric and power transmission lines. Therefore, construction emissions would result primarily from activities including land clearing, cut and fill, excavation, trenching and delivery of materials.

Once approved, the Proposed Action would likely be completed one corridor at a time and one or multiple projects at a time within each corridor. For the purpose of estimating air emissions in this EA, a project area was estimated for installation of up to five utility lines at a time for each corridor. The project area was estimated by calculating the product of the length of the corridor times a 20-foot width for each utility line type (i.e., gas, water, communications, electric and power transmission lines) for which the corridor has been deemed suitable. This approach assumes that installation of four to five utility lines takes place under one project at a time for each corridor and that the project area would undergo clearing, grading, excavation and trenching to accommodate vehicle and equipment access and for the installation of piping, conduit and cables. It is likely that with the use of horizontal directional boring, much of the clearing, grading, excavation and trenching would be significantly reduced. Additional emissions calculations and significance determination would need to be conducted at the project level for each specific project having different dynamics from those assumed this EA.

The short-term construction emissions in this EA were calculated using California Emissions Estimator Model (CalEEMod), which provides a platform for calculating emissions from a land use project. CalEEMod is designed to calculate both daily and annual emissions of criteria pollutants and GHGs. It also features built-in default values that can be used to calculate construction emissions. Default values are based on construction surveys conducted by the South Coast Air Quality Management District in order to develop default equipment usage and construction phase lengths. Calculated emissions and assumptions used in the calculations are included in Appendix C and are summarized in each of the Proposed Action's seven alternatives (i.e., one for each of seven corridors) addressed in the following sections.

4.1.2 Significance Criteria and Analysis

The alternative with the largest estimated project area is Corridor 5, having an estimated project area of 291 acres, 242 acres of which are located in Eastern Kern County and within the jurisdiction of EKAPCD. Since the largest amount of emissions generated would be for Corridor 5, it will be used to evaluate significance for all corridors. For the purposes of air analysis, Corridor 5 is assumed to be completed over a three- month period. Extending the construction period would further serve to minimize air emissions. Construction equipment specifics (e.g., type, hours of operation, horse power and length of use) and on road vehicles (e.g., construction crew and vendor vehicles) miles traveled used in the calculation of emissions are listed in Appendix C.

Calculated construction emissions are compared against *de minimis* thresholds to determine whether or not conformity determination is required and are compared against significance thresholds to determine whether or not each alternative may have any significance effect in the environment. Table 4-1 provides calculated emissions from Corridor 5, thresholds of significance published by each of the air districts affected by the Proposed Action, *de minimis* thresholds for conformity analysis, and significance status. For all pollutants, including dust-related pollutants (PM_{10} and $PM_{2.5}$), the proposed project would not exceed significance thresholds or *de minimis* thresholds.

Table 4-1 Project Air Emissions of Criteria Pollutants and GHGs and Thresholds

Project Phase and Thresholds	CO	VOC	NOx	SO_2	PM_{10}	$PM_{2.5}$	H_2S	Lead	CO2e
Construction Emissions in tpy (lb/day)	6.12 (47.61)	0.25 (1.94)	4.63 (35.59)	0.01 (.08)	1.21 (9.23)	0.61 (5.47)	0 (0)	0 (0)	1,044.74 (8,186.65)

PM2.5 particulate matter less than 2.5 microns in diameter
PM10 particulate matter less than 10 microns in diameter
SO_x sulfur dioxide
tpy tons per year
VOC volatile organic compound

Air emissions from alternatives 1, 2, 3, 4, 6 and 7 would be less than those calculated for Corridor 5 and, therefore, would also be *de minimis*. The implementation of Minimization Measures Air (MinMAIR) MinMAIR-1 through MinMAIR-13 would further reduce impacts to a less than significant level for all alternatives in Corridors 1, 2, 3, 4, 5, 6 and 9.

MinMAIR-1: Project activities shall comply with all applicable rules and regulations as identified in AFI 32-7040, *Air Quality Compliance and Resource Management* (2007).

MinMAIR-2: The project shall comply with all applicable EKAPCD, MDAQMD or AVAQMD rules and regulations and obtain the necessary air quality permits. Emissions from permitted devices and activities must be tracked and reported to the CARB, the appropriate air district and the U.S. EPA. Air quality permits, if required, shall be coordinated through the Environmental Management Division. The Environmental Management Division is the lead agency for the application and maintenance of air quality permits on Edwards AFB. Very few, if any, air quality permits would be required for this project as the majority of emissions will be due to mobile sources.

MinMAIR-3: Any internal combustion engine subject to NESHAP or New Source Performance Standards requirements must be permitted by the local AQMD/APCD. Based on recent revisions to the Reciprocating Internal Combustion Engine NESHAP, all stationary generators are now subject to the regulation regardless of size – this in turn makes them subject to permitting requirements. Permitting is also required (retroactively) for any non-road engine that fails the indicia of portability (i.e. exceeds the 12-month time limit). If such equipment is to remain on base less than 45 calendar days, a written exemption must be obtained from the local air agency.

MinMAIR-4: The proposed project shall not discharge from any source whatsoever, such quantities of air contaminants or other material that would: cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public; endanger the comfort, repose, health or safety of any such persons or the public; or cause or have a natural tendency to cause injury or damage to business or property.

MinMAIR-5: All earthwork activities shall be planned and conducted to minimize the duration that soils would be left unprotected. The extent of the area of disturbance necessary to accomplish the project shall be minimized. Exposed surfaces shall be periodically sprayed with water.

MinMAIR-6: Visible emissions (e.g., dust or smoke) from the proposed projects shall not exceed the limitations as outlined by the local air district.

MinMAIR-7: Apply water or dust suppressants to roads and open areas where dust is being generated. If winds produce excessive visible emissions, erect wind barriers.

- Do not grade or till compacted dirt without applying water or dust suppressant.

MinMAIR-8: Discontinue grading and other ground-disturbing activities at wind speeds exceeding 25 miles per hour.

MinMAIR-9: All vehicles transporting fill material or debris shall be covered to reduce $PM_{2.5}$ and PM_{10} emissions during transport.

MinMAIR-10: Temporary coverings must be installed over open storage piles.

MinMAIR-11: All mechanical and construction equipment shall be kept in good working order according to applicable technical orders and the manufacturer's equipment maintenance manuals to reduce emissions to acceptable levels.

MinMAIR-12: The following dust control measures will be implemented during land preparation (i.e., clearing, grading, etc.), excavation and/or post-construction:

- All soil excavated or graded should be sufficiently watered to prevent excessive dust. Watering should occur as needed with complete coverage of disturbed soil areas. Watering should be a minimum of twice daily on unpaved/untreated roads and on disturbed soil areas with active operations.
- All clearing, grading, earth moving and excavation activities shall cease during periods of winds greater than 20 miles per hour (mph) (averaged over one hour), if disturbed material is easily windblown or when dust plumes of 20% or greater opacity impact public roads, occupied structures or neighboring property.
- All fine material transported off site should be either sufficiently watered or securely covered to prevent excessive dust.
- All haul trucks should be required to exit the site via an access point where a gravel pad or grizzly has been installed.
- Stockpiles of soil or other fine loose material shall be stabilized by watering or other appropriate method to prevent wind-blown fugitive dust.
- Once clearing or grading has ceased, all inactive soil areas within the project area shall either be seeded and watered until plant growth is evident, treated with a dust palliative or watered twice daily until soil has sufficiently crusted to prevent fugitive dust emission.
- On-site vehicle speed should be limited to 15 mph.
- All areas with vehicle traffic should be paved, treated with dust palliatives or watered a minimum of twice daily.
- Streets adjacent to the project site should be kept clean and accumulated silt removed.
- Revegetation/restoration shall be required based on the level of disturbance created from project activities. Revegetation/restoration shall be in accordance with the *Edwards Air Force Base Revegetation Plan* (AFFTC/EM 1994).

MinMAIR-13: The following measures should be implemented to control construction vehicle tailpipe emissions:

- Properly maintain and tune all internal combustion engine powered equipment;
- Require employees and subcontractors to comply with the ARB idling restrictions for compression ignition engines; and
- Use CARB diesel fuel.

4.1.3 Alternative 8 - No Action Alternative

Under the No Action Alternative (Alternative 8), the Air Force would not provide for designated utility corridors, but would use existing routes or new, undesignated utility routes. New utility routes would continue to be considered on a case-by-case basis. Each new utility route would be required to assess all related air quality and GHG impacts on the environment. Mitigation measures would need to be reassessed based on the dynamics of project level actions.

4.2 CULTURAL RESOURCES

This section addresses resource types or cultural context (e.g., Prehistoric, Historic-period, Sub-modern) that have been identified in the general area, along with those resources deemed eligible under the NRHP, California Register of Historical Places (CRHP) or California Historic Landscape (CHL), or are considered of tribal interest. Impacts on cultural resources and paleontological resources could result from ground-disturbing activities and/or damage, destruction or alteration of historic structures. Ground-disturbing activities include project-related excavation, grading, trenching, vegetation clearance, the operation of heavy equipment, installation of utility poles or other surface and sub-surface disturbance that could damage or destroy surficial or buried cultural resources including prehistoric or historic period archaeological resources, paleontological resources or human burials.

Hale and Hanten (2014) conducted a cultural resources survey for the proposed Utility Corridor ADP; the project considered seven utility corridors as the Area of Potential Effect (APE) for the proposed undertaking. The APE encompassed a total of 9,276 acres (94.5 linear miles) of land, including much of the proposed Utility Corridors 1, 2, 3, 4, 5, 6 and 9 (Hale and Hanten, 2014). As indicated in Section 3.2.3, based on past land use activities in the Regional Area and prior cultural resources studies (Hale and Hanten, 2014), multiple types of cultural resources have been identified within the proposed utility corridors (Table 4-2).

Table 4-2
Types of Cultural Resources Identified within Proposed Utility Corridors

Site Type	Corridor 1	Corridor 2	Corridor 3	Corridor 4	Corridor 5	Corridor 6	Corridor 9
PREHISTORIC							
Base Camp/Village	X						
Lithic Deposits	X	X	X	X	X		X

BUILT ENVIRONMENT	X				X		
ISOLATED FINDS							

The results of the cultural resources survey provided an inventory rather than a formal evaluation of the cultural resources identified within each corridor; this aided in the assessment of the risk of adverse effects (Hale and Hanten, 2014). A total of 341 archaeological sites have been identified within the APE, encompassing a total of 1,820.02 acres (19.6%) of the proposed project acreage (Table 4-3).

Table 4-3
Summary of Cultural Resources Associated with Proposed Utility Corridors

Corridor	Length (Miles)	Width (Feet)	Acres	No Prior Survey (Acres)	Expired Surveys (Acres)	Required Survey (Acres)	Total Number of Cultural Resources	Total Cultural Site Acreage	% of Corridor Covered by Cultural Resources
1	20	1,000	2,195	97	1,076	1,173	65	931.42	42.4%
2	12	500	640	307	328	635	22	108.94	17%
3	15.5	1,000	1,706	1,009	261	1,270	83	218.23	12.8%
4	2	1,000	354	0	16	16	11	22.76	6.4%
5	30	1,000	3,115	721	406	406	106	374.66	12%
6	4	500	166	44	74	74	5	2.79	1.7%
9	11	1,000	1,100	n/a	n/a	n/a	53	161.22	14.6%
Total	**94.5**	**Varies**	**9,276**	**2,183**	**2,161**	**4,339**	**345**	**1,820.02**	**19.6%**

A discussion of the resources associated with each corridor is provided in the section below. In summary, Corridors 4 and 6 had the lowest frequency of sites and the least area covered by sites, while Corridor 5 had the highest frequency of sites (Hale and Hanten, 2014). Note that the cultural resources within Corridor 1 cover more acreage than other corridors (Hale and Hanten, 2014).

Mitigation Measure Cultural (MMCUL) would reduce impacts to a less than significant level for alternatives 1, 2, 3, 4, 5, 6 and 9, with the exception of the southern portions (from Rosamond Boulevard to southern Base boundary) of Corridors 1 and 3, where the density and sensitivity of

cultural resources is expected to be high and have not been formally evaluated for eligibility to be listed in the NRHP. Further analysis would be required prior to project approval and construction in these areas.

MMCUL: Avoidance is the preferred treatment for NRHP-eligible cultural resources. If avoidance is not possible, then resources will need to be evaluated prior to any development and construction along a proposed corridor, and any potentially NRHP-eligible resources will require resolution of the adverse effects. Construction monitoring may be implemented in areas where subsurface cultural resources are anticipated. Additional site-specific mitigation may be implemented prior to developing the selected corridor.

4.2.1 Alternative 8 – No Action Alternative

Under Alternative 8, there would be no action and no cultural resources would be affected by the proposed undertaking. Therefore, no mitigation for cultural resources would be warranted.

4.3 GEOLOGY AND SOILS

This section describes the geologic hazards and soil resources impacts that would occur with the implementation of any of the alternative utility corridors chosen. The analysis evaluates the impacts of construction plus operation and maintenance.

4.3.1 Methodology

The potential impacts resulting from geologic hazards were evaluated by assessing if there would be life/safety concerns or impacts to proper function of any alternative utility corridor as a result of a seismic event. The potential impact of loss of soils due to erosion by either water or wind was also evaluated. Available published resources were reviewed including journal articles and maps available on the internet and soils information provided by the NRCS.

4.3.2 Significance Criteria

The geology and soils resources found within each alternative under analysis includes geological features and soils. Other aspects of these resources include earthquakes, subsidence, unstable slopes and other hazards that limit siting and construction of any of the proposed alternatives.

The following criteria were used in evaluating the significance of impacts related to the geology and soil resources found within the alternative utility corridors.

- The degree to which unique or scenic landforms and topographic features would be damaged, destroyed, or rendered inaccessible by construction;
- The degree to which the stability of slopes and foundation substrates may be lessened by excavation or grading;
- The potential for naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes, to affect construction and the operation of the selected utility corridor;
- The amount of disruption of the ground surface and destruction of the soil profile through excavation and removal of rock and soil in the construction of any alternative selected;
- The potential for erosion caused by disturbance of the ground surface during the construction of any alternative selected particularly as a result of exposing construction areas and equipment routes to increased potential for wind or storm water soil loss; and
- The potential for soil conditions such as corrosivity and swell-shrink that may affect construction and operation of the selected utility corridor.

The following criterion was determined to be inapplicable or to result in no impact under all alternatives and, and therefore, is not discussed further in this section.

- Alquist-Priolo Earthquake Fault Zone:

No component associated with the Project has been identified within an Alquist-Priolo Earthquake Fault Zone. There would be no impacts under this criterion for project alternative.

4.3.3 Alternative 1 - Corridor 1

Construction of Corridor 1 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road

parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and operation of a utility line within Corridor 1.

Most of Corridor 1 has a high potential for soil loss due to wind erosion during construction of the project and a very high potential for soil loss due to rill and sheet flow erosion. However the southern portion of the alternative would be placed in Sparkhule very gravelly loam that has a very high WEG rating which corresponds to a low potential for wind-caused erosion (Table 4-4). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (provided in Section 4.1, Air Quality).

Table 4-4
Wind Erodibility Group plus Water Erosion Factor for Alternative 1, Corridor 1

Soil Type	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Helendale loamy sand	2	0.24
Muroc sandy loam	3	0.24
Cajon-Challenger Complex	2	0.24
Leuhman-Challenger-Cajon Complex	3	0.37
Sparkhule very gravelly loam	7	0.43

The following minimization measures would reduce potential impacts from a naturally-occurring seismic events and potential wind or storm water erosion of soils associated with development in Corridor 1.

MMGEO-1: Prior to final design of the Alternative, a combined geotechnical engineering and engineering geology study should be conducted by a qualified geologist/engineer to identify site-specific geologic conditions and potential geologic hazards in sufficient detail to support sound

engineering. Appropriate mitigations for identified geological hazards would be identified in the geotechnical study

MMGEO-2: Prepare and implement a construction SWPPP prior to the commencement of soil disturbance activities associated with construction.

MMGEO-3: Use non-hazardous dust suppression palliatives approved by Edwards AFB and water on an as-needed basis to suppress wind-blown dust generated at the site during construction. Dust suppression palliatives are materials that work by either agglomerating the fine particles, adhering/binding the surface particles together or increasing the density of the surface material.

MMGEO-4: Implement erosion control measures during construction, including stabilization of construction areas, employing a concrete wash out area, as needed, and tire washes near the entrance to existing roadways.

MMGEO-5: Use silt fences for erosion control in the event of a storm event.

In addition, implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality) would further reduce erosion-related impacts.

4.3.4 Alternative 2 - Corridor 2

Construction of Corridor 2 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and operation of a utility line within Corridor 2.

Corridor 2 has a high potential for soil loss due to wind erosion during construction and a very high potential for soil loss due to rill and sheet flow erosion (Table 4-5). Once construction has

concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-5
Wind Erodibility Group plus Water Erosion Factor, Alternative 2, Corridor 2

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Muroc sandy loam	3	0.24
Helendale-Randsburg Complex	2	0.24
Leuhman loamy sand	2	0.28
Helendale find sandy loam	3	0.28
Lavic-Norob Complex	2	0.24

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.5 Alternative 3 - Corridor 3

Construction of Corridor 3 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. In addition, the southern portion of Corridor 3 would be located in an area that has been determined historically to be subject to liquefaction. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and the operation of Corridor 3.

Corridor 3 has a high potential for soil loss due to wind erosion during construction and a very high potential for soil loss due to rill and sheet flow erosion (Table 4-6). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-6
Wind Erodibility Group plus Water Erosion Factor, Alternative 3, Corridor 3

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Leuhman-Challenger-Cajon Complex	3	0.37
Leuhman-Cajon Complex	2	0.28
Leuhman loamy sand	2	0.28
Randsburg-Machone-Rock Outcrop Complex	3	0.32
Helendale-Cajon Complex	2	0.24
Destazo Complex	3	0.28

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.6 Alternative 4 - Corridor 4

Construction of Corridor 4 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and the operation within Corridor 4.

Corridor 4 has a high potential for soil loss due to wind erosion during construction and has a very high potential for soil loss due to rill and sheet flow erosion (Table 4-7). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-7
Wind Erodibility Group plus Water Erosion Factor, Alternative 4, Corridor 4

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Hi Vista sandy loam	3	0.28
Norob Complex, overblown soils	1	0.15

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.7 Alternative 5 - Corridor 5

Construction of Corridor 5 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and operation of within Corridor 5.

Corridor 5 has a high potential for soil loss due to wind erosion during construction and has a very high potential for soil loss due to rill and sheet flow erosion (Table 4-8). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-8
Wind Erodibility Group plus Water Erosion Factor, Alternative 5, Corridor 5

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Helendale loamy sand	2	0.24
Helendale find sandy loam	3	0.28
Cajon-Norob Complex	2	0.24
Muroc-Randsburg Complex	3	0.24
Norob-Complex, overblown	1	0.15
Cajon loamy coarse sand	2	0.20

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.8 Alternative 6 - Corridor 6

Construction of Corridor 6 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and the operation within Corridor 6.

Corridor 6 has a high potential for soil loss due to wind erosion during construction and a very high potential for soil loss due to rill and sheet flow erosion (Table 4-9). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-9
Wind Erodibility Group plus Water Erosion Factor, Alternative 6, Corridor 6

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Helendale-Randsburg Complex	2	0.24
Helendale loamy sand	2	0.24
Helendale fine sandy loam	3	0.28

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.9 Alternative 7 - Corridor 9

Construction of Corridor 9 would not damage or destroy existing landforms found within this alignment. Construction and maintenance activities would require establishing an access road parallel to the utility line. This alternative has the potential to be impacted by geology that may be unstable during a seismic event. Naturally occurring geological events including subsidence, landslides and mudflows, and rupture and ground shaking during earthquakes have the potential to affect construction and operation of Corridor 9.

Corridor 9 has a high potential for soil loss due to wind erosion during construction and a very high potential for soil loss due to rill and sheet flow erosion (Table 4-10). Once construction has concluded, potential loss of soil due to wind or storm water erosion would not likely exceed current undeveloped conditions due to implementation of MinMAIR-12 (addressing dust-control and described in Section 4.1, Air Quality).

Table 4-10
Wind Erodibility Group plus Water Erosion Factor, Alternative 7, Corridor 9

Soil Type Present in Alternative	Wind Erodibility Group	Rill and Sheet Flow K-Factor
Destazo Complex	3	0.28
Randsburg-Rock Outcrop Complex	3	0.32

Incorporation of Mitigations MMGEO-1 through MMGEO-5 and MinMAIR-12 would reduce potential impact from a natural seismic event and wind or storm water erosion during construction to a level that is not significant.

4.3.10 No Action Alternative

Under the No Action Alternative, no utility corridor alternative would be selected. No potential impacts from naturally occurring seismic events would occur. As no construction would occur, no impacts to soils that would result in wind erosion or storm water erosion would occur. No mitigations would be necessary.

4.4 HAZARDOUS MATERIALS AND HAZARDOUS WASTE

4.4.1 Methodology

The thresholds applicable to the analysis of potential impacts on public health and safety from a proposed project under NEPA include reportable quantities of hazardous materials under CERCLA and quantitative exposure thresholds under the Federal Occupational Safety and Health Act (OSHA) and /or California Federal Occupational Safety and Health Act (CalOSHA). To evaluate impacts from existing hazardous waste within the proposed alternatives, a review was conducted of previously completed investigations associated with relevant OUs. The occupational safety and health impacts for the potential effects of construction of any alternative on public safety 40 CFR §1508.27(b)(2) and 32 CFR 989.27 were considered. Based on the undeveloped nature of the existing environments considered for the various alternatives, no impact to public safety would occur. The proposed alternatives were reviewed for their proposed actions during construction related to specific worker health and safety, hazardous materials management and spill prevention.

4.4.2 Significance Criteria

Edwards AFB has been engaged in a wide variety of operations that involve the use, storage and disposal of hazardous materials and hazardous waste. Although legally acceptable at the time,

procedures followed prior to the mid-1970s for managing and disposal of wastes have sometimes resulted in contamination of the environment. The resulting ERP program at Edwards AFB has been undertaken according to standards set forth in state and federal regulations including the following:

- CERCLA that established standards for containing and removing releases of hazardous substances and identifying and cleaning up contaminated sites;
- RCRA that regulates hazardous waste site recovery. RCRA also identifies hazardous wastes as ignitable, corrosive or reactive;
- Superfund Amendments and Reauthorization Act (SARA), which extends the requirements of CERCLA and modifies remediation goals and selection process;
- Toxic Substance Control Act (TOSCA) that designates certain chemicals as "imminently hazardous;"
- Clean Air Act which identifies toxic and hazardous pollutants and substances;
- Clean Water Act, Safe Water Act and Applicable or Relevant and Appropriate Requirements that identifies safe levels of contaminants for water use or reuse;
- California Code of Regulations (CCR) that establishes standards for the management of hazardous waste;
- Federal OSHA which develops and establishes occupational safety and health standards; and
- CalOSHA that identifies California occupational safety and health regulations.

Federal OSHA/CalOSHA regulations would apply for health and safety standards of workers employed during construction of any alternative selected.

4.4.3 Corridor Impacts

Environmental Restoration Program. Construction within Corridors 1, 2, 3, 4, 5, 6 and 9 would not mobilize existing contaminants associated with identified OUs at Edwards AFB in groundwater or soil, or expose workers to contaminated soils or groundwater at levels in excess of those permitted by federal and state law. The risk of exposure to contaminated groundwater by construction workers is unlikely as groundwater, which is at least 20 feet deep and usually much deeper, would not be encountered during construction.

Construction. Construction within Corridors 1, 2, 3, 4, 5, 6 and 9 would require use of minor amounts of hazardous materials such as fuels and lubricants for construction equipment. The selected construction crew would potentially require the use and storage of hazardous materials. Construction within Corridor 1 would generate minimal hazardous wastes during construction and there would be a limited amount of hazardous materials stored or used on-site during construction. Storage of these materials during construction would be likely in an identified area near the project. Hazardous materials necessary for project implementation that require temporary storage at the construction area would comply with relevant Edwards AFB requirements. The following Mitigation Measure Hazardous (MMHAZ) would reduce potential hazards to workers from hazardous materials or hazardous waste during construction.

MMHAZ: Prior to construction activities, a health and safety plan in compliance with 29 CFR 1910.120 will be prepared and approved by Edwards AFB. The site-specific health and safety plan will address all site-specific safety and environmental hazards that have the potential to be encountered during construction of the alternative, including physical hazards, biological hazards and general safety hazards. Any training required by construction personnel will be identified.

4.4.4 Alternative 8 - No Action Alternative

Under the No-Action Alternative, no impacts related to APs or ERP sites would occur. No hazardous materials would be used and no hazardous waste would be generated to construct a utility corridor. No impacts would occur.

4.5 INFRASTRUCTURE

4.5.1 Methodology

To evaluate project-related impacts to infrastructure from the proposed alternatives, a review was conducted of existing infrastructure including the existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation and communication systems currently in place at Edwards AFB. Effects may occur from physical changes to existing infrastructure

caused by implementing any of the proposed activities. The proposed alternatives were reviewed for their potential impacts to existing infrastructure.

4.5.2 Significance Criteria

The following criteria were used in evaluating significance of impacts on infrastructure.

- The degree to which a utility service or transportation system would have to alter operation practices and personnel requirements;
- The degree to which the increased demands from the proposed alternative would require the development of additional capacity or new facilities;
- The degree to which the increased demands from the proposed alternative would reduce the reliability of utility service or transportation systems or aggravate already existing adverse conditions in the affected region; and
- The degree of damage to underground utilities that could potentially be caused by construction or operation activities and/or the degree of environmental harm or personal injury resulting from that damage.

4.5.3 Alternative 1 - Corridor 1

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of natural gas, water, communication and electrical or power transmission.

Due to proximity of this alternative to the Camacho Reverse Drop Zone (DZ) and the Rowe East and West DZs immediately south of the Camacho DZ at the southern portion of the Base, close coordination with the Base would need to occur to ensure no impacts to any Air Force mission. Underground power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 Test Wing (TW) mission in this location.

Above-ground poles or towers could have potential range impacts depending on height, type utility and proximity to microwave data transmission lines-of-sight. RF interference must also

be considered for any wireless devices and should, at a minimum, include information on: transmission characteristics, power and frequencies. This utility corridor area also crosses the CATM firing range area which could be a concern for the construction phase of any project.

Implementation of Mitigation Measure Infrastructure (MMINF) would reduce potential impacts to the Air Force mission within Corridor 1 to a level that is not significant.

MMINF: Prior to final design selection, coordination will be required for current and future Air Force mission to ensure that the design does not cause conflict.

4.5.4 Alternative 2 - Corridor 2

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of communication, electrical, power transmission and waterlines.

Above-ground poles or towers associated with this alternative could have potential range impacts depending on height, utility type and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on power, transmission characteristics and frequencies. The Range Squadron routinely transports data (telemetry, voice and video) from Point Mugu, China Lake, Palmdale, Nellis ranges, White Sands Missile Range and Vandenberg AFB, so any RF in proximity to microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability.

The Range Squadron manages radar reflector arrays on the Rosamond Dry Lakebed. The south side of the Rosamond Dry Lakebed has a DZ. Dry lakebeds serve as emergency landing areas as well as unimproved landing strip testing sites. Any access or potential impact should be well coordinated with the Operation Support Squadron and Airfield Management. Underground

power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 TW mission in this location.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 2 to a level that is not significant.

4.5.5 Alternative 3 - Corridor 3

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of underground gas, water, communication, electric or power transmission lines.

Above-ground poles and towers could have potential range impacts depending on height, type utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on power, transmission and frequencies. Underground gas, water, communication, electric or power transmission lines would have no impact on the Range Squadron or 412 TW mission in this location.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 3 to a level that is not significant.

4.5.6 Alternative 4 - Corridor 4

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of buried communication, electric, transmission and water lines.

There may be some future concerns should the AF consider Hawes Field to the east as a potential UAS test area, in which case towers associated with this alternative could cause an intrusion for ingress and egress to and from the east PIRA.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 4 to a level that is not significant.

4.5.7 Alternative 5 - Corridor 5

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of buried communication, electric, transmission and water lines.

Caution would need to be exercised on the east end from Rich Road to the Four Corners area. Aircraft performing bombing and laser missions on the east range perform the run-in to the targets from the north to south, often at low altitudes. It is imperative that there are no high towers along State Route 58, which could cause a targeting solution problem as well as safety of flight issues.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 5 to a level that is not significant.

4.5.8 Alternative 6 - Corridor 6

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of buried communication, electric, transmission and water lines.

Since this corridor is close to or along the same path as existing lines, the Range would not have any issue with this utility corridor area. However, this is in the departure pattern for the main runway and therefore only underground utilities should be considered in this utility corridor area. Underground power transmission, gas, water or fiber would have no impact on the Range Squadron or 412 TW mission in this location.

Above-ground poles or towers could have potential range impacts depending on height, type utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include information on power, transmission characteristics and frequencies at a minimum. The Range Squadron transports data (telemetry, voice, and video) from Point Mugu, China Lake, Palmdale, Nellis AFB ranges, White Sands Missile Range and Vandenberg AFB routinely and so any RF in proximity to the microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability. This utility corridor area is also in the departure pattern for the main runway and therefore only underground utilities should be considered in this utility corridor.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 6 to a level that is not significant.

4.5.9 Alternative 7 - Corridor 9

This alternative would not impact existing electrical, natural gas, water, waste water treatment, storm drain systems, transportation or communication systems currently in place at Edwards AFB. Due to the remoteness of this corridor, no existing infrastructure components would be impacted. This alternative has the potential to enhance delivery of buried communication, electric, transmission, and water lines.

Above-ground poles or towers could impact telemetry or RF propagation. No other range operation impacts are known at this time.

Implementation of MMINF would reduce potential impacts to the Air Force mission within Corridor 9 to a level that is not significant.

4.5.10 Alternative 8 - No Action Alternative

Under the No Action Alternative, no utility corridor alternative would be selected. Existing infrastructure at Edwards AFB would not be enhanced nor adversely affected. No potential impacts to Air Force mission from construction of a utility corridor would occur.

4.6 LAND USE

4.6.1 Methodology

Land use impacts are related to the level of consistency with federal plans and policies and local land use plans (such as general plans, zoning ordinances, master plans and other specific land use policies). A significant impact would occur if proposed land uses would not be consistent with relevant federal or local plans and policies. Land use categories for this project follow the Land Improvement Codes conforming to DOD Instruction 4165.14, which established real property inventory requirements (RPIR) in an effort to standardize operational definitions and business rules for all DOD real property assets.

4.6.2 Significance Criteria

A NEPA evaluation must consider the context and intensity of the environmental effects that would be caused by, or result from, the EA Alternatives. There is no standard federal guidance or established threshold pertaining to land use. Therefore, other environmental assessment documents must be reviewed; the criteria described below are used for the selected evaluation.

An alternative would be considered to result in an adverse impact related to land use if it would:

- Conflict with established recreational, educational or scientific uses;
- Conflict with land use goals of the community; or,

- Be associated with the incompatibility of physical development to adjacent existing and planned uses.

4.6.3 Alternative 1 - Corridor 1

There is some concern with this option as it relates to its proximity to the Farm DZ at the south of the Base. This DZ is used on a fairly routine basis in support of both Air Force (AF) test missions as well as Air National Guard sorties. CDS bundles are dropped from C-130 aircraft on this DZ with short scheduling notifications from time to time. Close coordination with Airfield Management and Range would be important to avoid impacts. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission related impacts would not occur.

Above-ground poles or towers could have potential range impacts depending on height, type utility and proximately to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include, at a minimum, information on: transmission characteristics, power and frequencies. This utility corridor area also crosses the CATM firing fan range area which is of concern for the construction phase of any project.

Underground power transmission, gas, water or fiber would have no impact on the Range squadron or 412 Test Wing (TW) mission in this location.

4.6.4 Alternative 2 - Corridor 2

Currently, there are existing utilities along this corridor. This option basically expands on the existing path of utilities.

Aboveground poles or towers could have potential range impacts depending on height, utility type and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include information on power, transmission characteristics and frequencies at a minimum. The Range squadron routinely transports data (telemetry, voice and video) from Point Mugu, China Lake, Palmdale, Nellis ranges, White Sands Missile Range and Vandenberg AFB, so any additional RF in proximity to the microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability.

The Range squadron manages radar reflector arrays on the Rosamond dry lakebed. The south side of the Rosamond dry lakebed has a DZ. Dry lakebeds serve as emergency landing areas as well as unimproved landing strip testing sites. Any access or potential impact should be well coordinated with the Operation Support Squadron and Airfield Management. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission-related impacts would not occur.

Underground power transmission, gas, water or fiber would have no impact on the range squadron or 412 TW mission in this location.

4.6.5 Alternative 3 - Corridor 3

Above-ground poles and towers could have potential range impacts depending on height, type utility and proximately to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include information on power, transmission characteristics and frequencies at a minimum.

Underground gas, water, communication, electric or power transmission lines would have no impact on the range squadron or 412 TW mission in this location.

4.6.6 Alternative 4 - Corridor 4

This utility corridor parallels U.S. Route 395 and remains to the east of the eastern edge of the Precision Impact Range Area (PIRA) and on the east side of U.S. Route 395. Any construction in this area may have unexploded ordnance (UXO). To the west of the utility corridor area is the active range area, where there is a potential for UXO. There may be some future concerns should the AF consider Hawes Field to the east as a potential unmanned aircraft system (UAS) test area, in which case towers could cause an intrusion for ingress and egress to and from the east PIRA.

There are currently no known issues or concerns for range operations with this utility corridor area. However, there may be some future concerns should the AF consider Hawes Field to the

east of the installation as a potential small UAS test area, in which case, any poles or towers could cause an intrusion for ingress and egress to and from the east PIRA. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission related impacts would not occur.

4.6.7 Alternative 5 - Corridor 5

Caution would need to be exercised on the east end from Rich Road to the Four Corners area. Aircraft performing bombing and laser missions on the east range perform the run-in to the targets from the north to south often at low altitudes. It is imperative that there are no high towers along State Route 58, which could cause a targeting solution problem as well as safety of flight issues. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission related impacts would not occur.

4.6.8 Alternative 6 - Corridor 6

Since this corridor is close to or along the same path as existing lines, the range would not have any issue with this utility corridor area. However, this is in the departure pattern for the main runway and therefore only underground utilities should be considered in this utility corridor area.

Above-ground poles or towers could have potential range impacts depending on height, type utility and proximity to microwave data transmission lines-of-sight. RF interference must also be considered for any wireless devices and should include information on power, transmission characteristics and frequencies at a minimum. The Range squadron transports data (telemetry, voice and video) from Point Mugu, China Lake, Palmdale, Nellis ranges, White Sands Missile Range and Vandenberg AFB routinely and so any additional RF in proximity to the microwave systems would have to be analyzed by the 412 TW Spectrum Office to assess vulnerability. This utility corridor area is also in the departure pattern for the main runway and therefore only underground utilities should be considered in this utility corridor. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission-related impacts would not occur.

Underground power transmission, gas, water or fiber would have no impact on the range squadron or 412 TW mission in this location.

4.6.9 Alternative 7 - Corridor 9

Above-ground poles or towers could impact telemetry or RF propagation. No other range operation impacts are known at this time. Implementation of MMINF from Section 4.5 – Infrastructure would ensure that mission-related impacts would not occur.

4.6.10 Alternative 8 - No Action Alternative

Under the No Action Alternative (Alternative 8), the Air Force would not provide for designated utility corridors, but would use existing routes or new, undesignated utility routes. New utility routes would continue to be considered on a case-by-case basis. Each new utility route would require assessment of all land use-related impacts on sensitive receptors and local communities. Land Use resource mitigation measures would need to be assessed based on the dynamics of project level actions.

4.7 NATURAL RESOURCES

The potential direct and indirect impacts on vegetation and animals for the utility corridors are listed in Table 4-11. Direct impacts include the disruption, trampling, or removal of rooted vegetation resulting in a reduction in the total acres of native vegetation and habitat, including desert tortoise critical habitat, or the direct injury or death of individual plants or animals. Indirect impacts occur later in time or are farther removed in distance while still being reasonably foreseeable and related to the project. Potential indirect impacts include introduction of invasive species that compete with native species and can result in habitat degradation. Direct and indirect impacts will be the highest in corridors that do not follow roads or existing utility corridors, such as Corridor 1. All other proposed corridors will have fewer impacts because they follow existing roads and corridors.

In addition to the avoidance and minimization measures provided in this section, adverse impacts would be eliminated by the incorporation of reasonable and prudent measures as described in the various biological opinions covering activities at the Base, including the basewide Biological Opinion for the Operations and Activities at Edwards Air Force Base, California (8-8-14-F-14; USFWS 2014). All relevant biological opinions for development within the proposed utility corridors are provided in Appendix E.

Table 4-11
Natural Resources Summary of Impact Analysis

Resource of Concern	Potential Impacts
Vegetation Communities	*Direct Impacts*: acreage of habitats affected *Indirect Impacts*: introduction of invasive species
Wildlife Communities	*Direct Impacts*: direct injury or mortality to non-sensitive species; take of a nest protected under the MBTA *Indirect Impacts*: temporary noise and dust impacts during construction; degradation of localized vegetation and wildlife communities
Sensitive Species - Plants	*Direct Impacts*: direct removal of individual plants *Indirect Impacts*: habitat degradation, introduction of non-native invasive species
Sensitive Species – Wildlife	*Direct Impacts*: direct injury or mortality of individuals *Indirect Impacts*: temporary noise and dust impacts during construction; degradation of localized vegetation and wildlife communities
Sensitive Habitats	*Direct Impacts*: direct removal vegetation within critical habitat/DWMA *Indirect Impacts*: degradation of critical habitat/DWMA, introduction of non-native invasive species into critical habitat

MBTA=Migratory Bird Treaty Act

DWMA=Desert Wildlife Management Area

4.7.1 Vegetation Communities

Vegetation communities directly impacted by the proposed corridors change in composition and amount between each corridor. The vegetation types and acreages of each corridor are further discussed below. Direct impacts to vegetation communities are expected to be less than significant with the incorporation of avoidance and minimization measures in Section 4.7.5. Because they follow existing utility lines and roads, impacts in Corridors 2, 3, 4, 5, 6 and 9 are expected to be less than those generated by Corridor 1 which crosses the designated Los Angeles

County Antelope Valley Significant Ecological Area (SEA) containing biological wetlands and sensitive claypan and playa areas. In addition, although Corridor 3 follows an existing utility line and road, the southern portion of this corridor may have more impacts than other corridors because it traverses a portion of the Piute Ponds Complex and the Los Angeles County Antelope Valley SEA where there are biological wetlands that sustain some sensitive species.

Indirect impacts that may result from the removal of this vegetation include the increased potential for the spread of non-native invasive plant species, as defined by the BLM and California Invasive Plant Council (BLM 1992; Cal-IPC 2006). This impact is not expected to be significant with the incorporation of avoidance and minimization measures in Section 4.7.5.

4.7.2 Wildlife Communities

In each corridor, wildlife communities may be directly affected due to the potential injury and mortality of individuals of local populations of non-sensitive species. None of these effects represents a substantial portion of these wildlife communities either on Edwards AFB or regionally. This impact is expected to be less than significant and requires no avoidance and minimization measures. However, the southern portions of Corridors 1 and 3 traverse more sensitive natural resources (identified in the previous section), the development of which would likely require further analysis at the time that a specific project is proposed.

Direct impacts associated with the take of a nest protected under the MBTA would be considered a significant impact. Avoidance and minimization measures in Section 4.7.5 will be used to reduce these impacts to a less than significant level.

Indirect impacts associated with the construction of each utility corridor could include temporary effects of locally increased noise and dust. Because the Edwards AFB supports activities that create loud noise (sonic booms, rocket tests, etc.) and dust, the temporary increase of these factors in localized areas for construction in utility corridors is expected to be minimal. Impacts generated by all corridors are expected to be less than significant with the incorporation of avoidance and minimization measures described in Section 4.7.5.

Indirect impacts may also result from the localized degradation of vegetation and wildlife communities, not only in areas directly affected, but in edge areas. Because they follow existing utility lines and roads, impacts in Corridors 2, 3, 4, 5, 6 and 9 are expected to be less than those generated by Corridor 1. Impacts generated by all corridors are expected to be less than significant with the incorporation of avoidance and minimization measures described in Section 4.7.5.

A summary of the impacts in each corridor is described in Section 4.7.4.

4.7.3 Sensitive Species and Habitats

Sensitive plants, wildlife and habitats are discussed in Section 3.7 and shown in Figures 3-6 through 3-11. Types of impacts to these resources are discussed here.

Sensitive Species – Plants

Figure 3-7 illustrates where sensitive species on the Base have been found. Direct impacts to individuals and portions of populations of sensitive plants as the result of disturbance may result from construction activities within each corridor, including Alkali mariposa lily and Desert cymopterus along the southern portion of Corridor 1, Alkali mariposa lily and Rosamond eriastrum along the southern portion of Corridor 3 and Barstow woolly sunflower and Desert cymopterus along Corridor 5 and Corridor 9.

Indirect impacts to individuals and populations of sensitive plant that may result from the proposed utility corridors include the increased potential for the spread of non-native invasive plant species that can displace native species. With the exception of the southern portions of Corridors 1 and 3, where it is more likely to encounter sensitive plants, these impacts are not expected to be significant with the incorporation of the avoidance and minimization measures described in Section 4.7.5.

Sensitive Species – Wildlife

Desert Tortoise. Desert tortoise habitat occurs in all utility corridors with recent observations of desert tortoise and highest expected densities occurring in Corridor 4 and Corridor 5. Direct

impacts to desert tortoise could result from injury or mortality during utility corridor construction due to vehicles crushing individuals or burrows occupied by individuals. Because the desert tortoise is a federally and state listed threatened species, any injury or mortality to a desert tortoise would be considered an adverse impact. This adverse impact would be eliminated by the incorporation of reasonable and prudent measures as described in the Biological Opinion for the Operations and Activities at Edwards Air Force Base, California (8-8-14-F-14; USFWS 2014), as outlined in Section 4.7.5 and provided in Appendix E.

Indirect impacts to desert tortoise could include temporary effects of locally increased noise and dust. Because Edwards AFB currently supports activities that create loud noise (sonic booms, rocket tests, etc.) and dust, the temporary increase of these factors in localized areas for utility corridor construction is expected to be less than significant with the incorporation of avoidance and minimization measures described in Sections 4.7.5.

Indirect impacts from the degradation of burrowing and foraging habitat could occur as a result of the proposed action, not only in areas directly affected, but in edge areas. Due to the small size of these potential effects, this impact is expected to be less than significant with the incorporation of avoidance and minimization measures described in Section 4.7.5.

Additional indirect impacts could occur from providing perches for the common raven, a known predator of juvenile desert tortoise. This impact can be reduced to a less than significant level by the incorporation of reasonable and prudent measures as described in the USFWS Biological Opinion for Operations and Activities at Edwards Air Force Base, California (8-8-14-F-14; USFWS 2014), as outlined in Section 4.7.5.

Mohave Ground Squirrel. Mohave ground squirrel habitat occurs within all corridors, although highest densities are found in the middle and eastern portions of the Base which would affect development primarily in Corridors 1, 4 and 5. Direct impacts include the potential for injury and mortality of Mohave ground squirrels as part of the proposed project. These impacts are considered significant and would be reduced to a less than significant level with the incorporation of avoidance and minimization measures in Section 4.7.5.

Indirect impacts would include the results from temporary and localized increases in noise and dust. These impacts are expected to be less than significant due to their temporary nature and the presence of existing noise and dust from other activities in the area. These impacts would be less than significant with the incorporation of avoidance and minimization measures described in Section 4.7.5.

Other Sensitive Wildlife Species. Direct impacts include the potential for injury and mortality of other sensitive species (reptile, mammal and bird species listed in Table 3-9) as part of the proposed project. These impacts are not likely to be significant with the incorporation of avoidance and minimization measures in Section 4.7.5.

Indirect impacts would be to potential burrowing and foraging habitat for these species and would result from temporary and localized increases in noise and dust. These impacts would be less than significant with the incorporation of avoidance and minimization measures described in Section 4.7.5.

Sensitive Habitats

Corridor 4 and sections of Corridor 5 occur within designated critical desert tortoise habitat (Fremont-Kramer Recovery Unit). Approximately 1.0 percent of critical habitat and the Desert Wildlife Management Area (DWMA) for the desert tortoise are within Edwards AFB. The proposed corridors would affect up to 930 acres or less than 0.2 percent of the total designated critical habitat. Any adverse modification of critical habitat could be considered a significant impact and require formal consultation. However, the impacts would be reduced to less than significant by following the measures in Section 4.7.5.

The Mohave Ground Squirrel Conservation Area is located on non-military lands adjacent to Edwards AFB, and is managed by the BLM for the protection of habitat for this state-threatened species. None of the utility corridors crosses this conservation area.

The Piute Ponds Complex, located in the southwestern corner of Edwards AFB, consists of lower Amargosa Creek, ponds, marshes, wetland meadows, low sand dunes, small clay pans and

Rosamond Dry Lake. The southern portion of Corridor 3 traverses the western piece of the Piute Ponds Complex.

4.7.4 Impacts by Alternative

The following section discusses each corridor alternative, the potential impacts caused by each one and the mitigation that will be implemented to reduce potential impacts to less than significant. Table 4-12 shows the special-status species that could be impacted within each of the corridors. Avoidance and minimization of impacts will be achieved by Mitigation Measure Natural (MMNAT) -1through MMNAT-18 will apply to Corridors 1, 2, 3, 4, 5, 6 and 9.

Table 4-12
Potential Impacts to Sensitive Species within each Proposed Corridor

Species	Corridor 1	Corridor 2	Corridor 3	Corridor 4	Corridor 5	Corridor 6	Corridor 9
Alkali Mariposa Lily	X	X	X		X	X	X
American Badger	X	X	X	X	X	X	X
Bank Swallow	X	X	X	X	X	X	X
Barstow Woolly Sunflower	X	X		X	X	X	
Bat species	X	X	X	X	X	X	X
Bell's Sparrow	X	X	X	X	X	X	X
Burrowing Owl	X	X	X	X	X	X	X
California Least Tern	X	X	X		X		
Coves' Cassia					X		
Crowned Onion				X			
Desert Cymopterus	X			X	X		
Desert Tortoise	X	X	X	X	X	X	X
Golden Eagle	X	X	X	X	X	X	X
Lancaster Milkvetch	X						
LeConte's Thrasher	X	X	X	X	X	X	X
Loggerhead Shrike	X	X	X	X	X	X	X
Long-eared Owl			X				
Mohave Ground Squirrel	X	X	X	X	X	X	X
Mojave Spineflower	X						
Mountain Plover	X		X				
Northern Harrier	X	X	X	X	X	X	X
Peregrine Falcons	X	X	X	X	X	X	X

Species	Corridor 1	Corridor 2	Corridor 3	Corridor 4	Corridor 5	Corridor 6	Corridor 9
Pocket Mouse	X	X	X	X	X	X	X
Prairie Falcons	X	X	X	X	X	X	X
Recurved Larkspur					X		
Redhead	X		X				
Red Rock Poppy	X					X	
Rosamond Eriastrum		X	X				
Sagebrush loeflingia	X	X	X	X	X

Western Snowy Plover		X	X				
White Pygmy Poppy		X				X	
Willow Flycatcher	X		X				
Yellow-headed Blackbird	X		X				
Yellow Spiny Cape (golden goodmania)	X						

4.7.4.1 Alternative 1 - Corridor 1

Corridor 1 follows the natural contours of the terrain and does not follow any existing utility corridors or roads. For this reason, impacts would be greater along this corridor because roads would have to be developed and maintained to access new utility lines versus installing the lines in areas that already have utility lines and maintenance roads. Suitable utilities for this corridor include underground gas, water, communication, electric or power transmission lines.

Direct and indirect impacts could occur to vegetation communities which include mesquite woodland (5.0 acres), saltbush scrub (1,612.2 acres) and creosote bush scrub (571.2 acres). Impacts may also occur to wildlife communities, including desert tortoise, Mohave ground squirrel and burrowing owl habitats. The special-status plants alkali mariposa lily, Barstow woolly sunflower, desert cymopterus, Lancaster milkvetch, Mojave spineflower, red rock poppy, sagebrush loeflingia and yellow spiny cape have been mapped within or adjacent to this corridor.

Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, mountain plover, northern harrier and prairie falcon.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for the northern portion of the corridor. The southern portion of the corridor contains more sensitive species and may require further analysis at the time a specific project is proposed.

4.7.4.2 Alternative 2 - Corridor 2

Corridor 2 has existing utilities. Suitable utilities for this corridor include buried communication, electric, transmission and water lines.

Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (285.9 acres), playa/claypan (145.1 acres) and creosote bush scrub (208.7 acres). Impacts may also occur to wildlife communities, including desert tortoise, Mohave ground squirrel and burrowing owl habitat. The special status plants alkali mariposa lily, Barstow woolly sunflower, Rosamond eriastrum, sagebrush loeflingia and white pygmy poppy have been mapped within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, northern harrier, prairie falcon and western snowy plover.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for this corridor.

4.7.4.3 Alternative 3 - Corridor 3

Suitable utilities for Corridor 3 include underground gas, water, communication, electric or power transmission lines.

Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (1,231.6 acres) and creosote bush scrub (473.5 acres). Impacts may also occur to wildlife communities, including burrowing owl, desert tortoise and Mohave ground squirrel habitat. The special status plants alkali mariposa lily, Rosamond eriastrum and sagebrush loeflingia have been mapped within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, long-eared owl, Mohave ground squirrel, mountain plover, northern harrier, prairie falcon, short-eared owl, tricolored blackbird and western snowy plover.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for the northern portion of the corridor. The southern portion of the corridor contains more sensitive species and may require further analysis at the time a specific project is proposed.

4.7.4.4 Alternative 4 - Corridor 4

Suitable utilities for Corridor 4 include buried communication, electric, transmission and water lines.

Direct and indirect impacts could occur to saltbush scrub (2.5 acres), creosote bush scrub (312.5 acres) and Joshua tree woodland (27.6 acres) habitat. Impacts may also occur to wildlife communities. This corridor passes through burrowing owl, desert tortoise and Mohave ground squirrel habitats. The special status plants Barstow woolly sunflower, desert cymopterus and sagebrush loeflingia are within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, northern harrier and prairie falcon.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for this corridor.

4.7.4.5 Alternative 5 - Corridor 5

Corridor 5 follows existing active utility easements. Suitable utilities for this corridor include buried communication, electric, transmission and water lines.

Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (1,093.3 acres), Joshua tree woodland (712.3 acres), playa/claypans (137.0 acres) and creosote bush scrub (705.7 acres). Impacts may also occur to wildlife communities, including burrowing owl, desert tortoise and Mohave ground squirrel habitat. The special status plants alkali mariposa lily, Barstow woolly sunflower, Coves' cassia, desert cymopterus and sagebrush loeflingia occur within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, northern harrier and prairie falcon.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for this corridor.

4.7.4.6 Alternative 6 - Corridor 6

Corridor 6 includes an existing utility corridor. Suitable utilities for this corridor include buried communication, electric, transmission and water lines.

Impacts: Direct and indirect impacts could occur to vegetation communities which includes creosote bush scrub habitat (271.8 acres). Impacts may also occur to wildlife communities, including burrowing owl, desert tortoise and Mohave ground squirrel habitat. The special status plants alkali mariposa lily, Barstow woolly sunflower, red rock poppy and white pygmy poppy have been mapped within or adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, northern harrier and prairie falcon.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for this corridor.

4.7.4.7 Alternative 7 - Corridor 9

Corridor 9 is close to or along the same path as existing lines, which reduces the impact to natural resources. Suitable utilities for this corridor include buried communication, electric, transmission and water lines.

Direct and indirect impacts could occur to vegetation communities which include saltbush scrub (884.7 acres) and Joshua tree woodland (215.9 acres). Impacts may also occur to wildlife communities, including burrowing owl, desert tortoise and Mohave ground squirrel habitat. The special status plant alkali mariposa lily has been mapped adjacent to this corridor. Wildlife species that may be impacted include the American badger, special status bat species, burrowing owl, desert tortoise, golden eagle, LeConte's thrasher, loggerhead shrike, Mohave ground squirrel, northern harrier and prairie falcon.

Implementation of MMNAT-1 through MMNAT-18 will reduce impacts to a level that is not significant for this corridor.

4.7.4.8 Alternative 8 - No Action Alternative

Under Alternative 8, there would be no action and, therefore, no natural resources would be affected by the proposed undertaking. No mitigation for natural resources would be warranted.

4.7.5 Avoidance and Mitigation Measures

The following measures will be employed in each utility corridor to reduce any potential significant impacts to natural resources to less than significant levels, and as best management practices. These measures include those in the USFWS Biological Opinion for Operations and Activities at Edwards Air Force Base, California (8-8-14-F-14; USFWS, 2014), additional biological opinions (see Appendix E) and the INRMP (Edwards Air Force Base, 2015).

MMNAT-1: Provide a worker environmental awareness program (WEAP) to all individuals that will be working on the project in the field (USFWS, 2014; EAFB, 2008). This program may consist of videos, brochures and briefings and will include information on:

1. The role of biological monitors and authority of monitors to stop work;
2. Locally known invasive weeds and limiting weed spread and colonization;
3. The MBTA and nest-avoidance measures;
4. Special status species present or potentially present within the corridors;
5. Desert tortoise history in the project area, desert tortoise ecology, threats to the species and the protection measures described here and in the BO (USFWS 2014);
6. Mohave ground squirrel history in the project area, ecology and the avoidance and minimization measures described in this section for this species;
7. Other sensitive species that may be found throughout the construction of the project and the avoidance and minimization measures described in this section for these species; and
8. Locations and designations of critical habitat and DWMA in the project area.

All personnel will sign a statement that they have received, understand and will follow the regulations and protection measures presented in the program. Copies of signed statements will be on file at the Environmental Management Office. This measure fulfills or exceeds the requirements in the BO (USFWS, 2014).

MMNAT-2: Wash all vehicles and equipment prior to bringing them on site if they have been used in areas off-base.

MMNAT-3: All project-related construction activities will be conducted during daylight hours. If any activities are to disturb native habitat between dusk and dawn, they shall be limited to

areas which have already been cleared of desert tortoises and other sensitive species by biological monitors and enclosed by a fence to exclude desert tortoises (USFWS, 2014).

MMNAT-4: Ensure that qualified biological monitors are present during all construction-related activities to confirm avoidance and minimization of all biological resources is being conducted to the maximum extent practicable. These measures include:

1. Biological monitors will be available during site development activities which may result in injury or mortality of desert tortoises. The designated biologist will determine which activities require biological monitoring.

2. Any desert tortoises found during construction-related activities will be relocated to nearby safe areas, not more than 100 meters from the point of capture. When the area is considered safe, desert tortoises will be returned to their point of capture.

3. When handling desert tortoises, the qualified biologists and environmental monitors will follow the procedures described in *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Council 1996).

4. Only qualified biologists, as defined by the USFWS and the designated biologist will conduct preconstruction surveys for desert tortoises and remove animals from work areas to nearby suitable habitat.

5. The proponent shall employ the services of a qualified biologist if the proponent plans to install, repair, maintain or remove a utility during nesting season (1 February – 30 August).

MMNAT-5: Limit disturbance areas during construction to the minimum needed to perform activities. During construction, activity areas will be clearly fenced, marked and flagged at the outer boundaries to define the limits of work areas. Installation of fencing along roadways will be implemented in areas deemed hazardous to desert tortoise to prevent injury or mortality. All workers will be instructed to confine their activities to the marked areas (USFWS, 2014).

MMNAT-6: Laydown, parking and staging areas will be restricted to previously disturbed areas to the maximum extent practicable (USFWS, 2014).

MMNAT-7: Vehicles will, to the maximum extent practicable, remain on established roads. Equipment and vehicle operators will be alert for desert tortoises and other wildlife in and along access routes. When traveling off-road, speed limits will not exceed 5 miles per hour and shrubs will be avoided as much as possible. Speed limits on dirt roads within the project area shall be less than 20 mph unless otherwise posted.

MMNAT-8: All personnel on the site will check under parked vehicles and equipment for desert tortoises and other wildlife species before moving vehicles. If a desert tortoise is discovered under a parked vehicle, an authorized biologist shall relocate the animal to a nearby, safe location. The authorized biologist shall use his or her best professional judgment to ensure that desert tortoises moved in this manner are not subjected to temperature extremes which could result in injury or death. Alternatively, the vehicle shall be left in place until the desert tortoise moves of its own volition (USFWS, 2014).

MMNAT-9: All trash will be placed in closed and covered containers for proper disposal to reduce its attractiveness to desert tortoise predators (e.g., coyotes and common ravens). The containers must not be able to be opened by predators and must be emptied regularly to ensure adequate capacity is maintained. Water tanks and trucks will be maintained in good working order and free of leaks so common ravens and other predators will not be attracted to standing water (USFWS, 2014).

MMNAT-10: If common raven presence increases locally as a result of the proposed project, perch deterrents will be placed on structures that are supporting perching (USFWS, 2014).

MMNAT-11: Pre-construction surveys will be conducted by the biological monitor immediately in front of all equipment. During these surveys, the biological monitor will identify the following resources and complete the following activities:

1. Identify active nests that fall under the MBTA and flag an avoidance area for each nest at a minimum of 50 meters from the nest.

2. Identify rare plant species occurrence. Avoid rare plant species locations whenever possible.

3. Identify potential desert tortoise burrows and flag for avoidance, if possible, at a minimum distance of 10 meters to avoid any activities affecting the burrow or any individuals underground. If avoidance of desert tortoise burrows is not possible, individual burrows will be scoped to determine if there is an animal underground. If no tortoise is using the burrow, the burrow will be excavated according to the *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Council, 1996).

4. Avoid the desert tortoise. However, if avoidance is not possible, individuals found above-ground within the project area will be temporarily moved out of harm's way by an authorized biologist according to the *Guidelines for Handling Desert Tortoises During Construction Projects* (Desert Tortoise Council 1996). Desert tortoises shall not be released more than 100 meters from the point of capture (USFWS, 2014).

MMNAT-12: All project personnel shall immediately report sightings of desert tortoises and other sensitive species and their burrows found within the project area to the biological monitor.

MMNAT-13: Above ground utilities lines will be placed at least 18 inches aboveground when they traverse desert tortoise habitat. If at any time after installation, the height of the gas pipes above the ground has been reduced to less than 18 inches, the pipelines will either be raised or the materials causing the reduction will be removed (USFWS, 2014).

MMNAT-14: Underground utilities will be located adjacent to or within previously disturbed areas when possible (USFWS 2014).

MMNAT-15: Lands above utilities will be re-vegetated unless a road needs to be constructed and maintained for access and maintenance activities. Roads needed for utility maintenance will be concentrated in previously established corridors when possible (USFWS, 2014).

MMNAT-16: Habitat restoration in the form of re-vegetation will be implemented as required.

1. Habitat restoration for ground disturbance will include techniques to control soil erosion that have been proven successful in the desert environment and will include the use of native plants and seeds to mimic natural biodiversity

2. Habitat restoration activities will be conducted in accordance with the Edwards Air Force Base Revegetation Guide prepared by Edwards AFB (U.S. Air Force, 1994; U.S. Air Force, 2012c)

3. Monitoring success of efforts will be implemented for a longer period than the standard 5-year monitoring period due to slow recovery rates of re-vegetation areas in the desert.

MMNAT-17: Open excavations will be checked three times a day and authorized personnel will remove any trapped animals. Open excavations will be covered, backfilled or fenced at the end of each work day unless other methods of excluding desert tortoises ae employed. At the ends of a ditch or trench, a 3:1 slope will be created to allow wildlife to exit should they become trapped (USFWS, 2014).

MMNAT-18: Any pipes left or stored on the ground in the project area will be capped on both ends to prevent entry by desert tortoises or other wildlife (USFWS, 2014).

4.8 NOISE

4.8.1 Methodology

Noise may be generated from a point source, such as a piece of construction equipment or from a line source, such as a road containing moving vehicles. Because noise spreads in an ever-widening pattern, the given amount of noise reaching an object, such as an eardrum, is reduced

with distance from the source. For development of a utility corridor, the primary source of noise would be during construction. These impacts would be temporary. Operational noise would be negligible, as it would be limited to the occasional use of equipment and vehicles for maintenance purposes. Noise impacts would be significant if they affect sensitive receptors, such as residences, schools and hospitals. Most of the proposed corridors are not near any sensitive receptors. Some portions of Corridors 1, 3 and 5 cross closer to these receptors as described below.

4.8.2 Significance Criteria

A project would normally have a significant effect if it were to substantially increase the ambient noise levels for adjoining areas or if it conflicts with adopted plans and goals of the community where it is located. In general, temporary construction activities that are over one-quarter mile from a sensitive receptor would not result in significant impacts.

To protect the public health and welfare with an adequate margin of safety, the USEPA guidelines recommend a $L_{eq}(24)$ of 70 dBA as the noise threshold for hearing loss prevention (USEPA, 1974). The OSHA establishes workplace exposure guidelines that require hearing protection for people in close proximity to the noise levels, depending on exposure time, from 90 dBA to 115 dBA (OSHA, 2015).

4.8.3 Alternatives 1 through 7

The level of noise resulting from construction activities is presumed to be similar for each of the Alternatives 1 through 7 of the Proposed Action where the source of noise would originate from on- and off-road motor vehicles, including construction staff vehicles, construction tractors and equipment and delivery trucks. Therefore, each of these alternatives would have relatively uniform noise impacts and mitigation measures.

Noise impacts resulting from the operation of construction equipment would be short-term for Alternatives 1 through 7; no long-term impacts are anticipated. The operation of construction

equipment during excavation/earth moving would produce elevated noise levels in the immediate vicinity of the site. These noise levels and their impacts on sensitive receptors would be mostly mitigated by the gap between the construction site and receptors.

While, most of the Proposed Action alternatives are separated from sensitive receptors and communities, Alternatives 1, 3 and 5 have segments closest to sensitive receptors and communities. Alternative 5 has segments with sensitive receptors where the closest receptor is at approximately 3,000 feet (i.e., Muroc Unified School District) and may not have noise impacts on receptors. Alternative 1 has a segment approximately 0.9 miles (about 4,800 feet) from the west end of the housing area. It is unlikely that noise mitigation would be needed during construction due to this distance. Alternative 3, along the west side of the Base, passes near the community of Rosamond although it is approximately 0.9 miles (about 4,800 feet) from the nearest residence.

The following noise mitigation measure (MMNOZ) is proposed for these alternatives.

MMNOZ: Noise levels could be reduced by limiting construction noise to daytime (e.g., 7:00 a.m. to 7:00 p.m.) and shortening work periods. In addition, noise levels would be minimized by keeping the construction activities at a distance from residential areas. Where noise may be a concern during construction, monitoring at the receptor location may be considered to minimize impact to sensitive receptors and communities. Noise levels would return to background levels once construction activities cease.

4.8.4 Alternative 8 - No Action Alternative

Under the No Action Alternative (Alternative 8), the Air Force would not provide for designated utility corridors, but would use existing routes or new, undesignated utility routes. New utility routes would continue to be considered on a case-by-case basis. Each new utility route would require assessment of all noise-related impacts on sensitive receptors and local communities. Noise mitigation measures would need to be assessed based on the dynamics of project-level actions.

4.9 SOCIOECONOMICS

4.9.1 Methodology

When conducted in close proximity to residences and businesses, construction must be controlled as needed and monitored to avoid impacts on surrounding communities. Employment for construction and installation activities would likely be derived from local communities and from within Kern, Los Angeles and San Bernardino counties.

4.9.2 Significance Criteria

A socioeconomic impact assessment is designed to assist communities in making decisions that promote long-term sustainability, including economic prosperity, a healthy community and social well-being. One aspect of this challenge is deciding how much and what types of new development the community can accommodate, without compromising the day-to-day quality of life for residents.

Assessing socioeconomic impacts requires both quantitative and qualitative measurements of the impact of a proposed development. For example, a proposed development may increase employment in the community and create demand for more affordable housing. Both effects are easily quantifiable. Assessing community perceptions about development requires the use of methods capable of revealing often complex and unpredictable community values.

Socioeconomic impacts would be considered significant if long-term employment rates or Edwards AFB's annual total economic impact to the region decreased. Socioeconomic impacts would also be considered significant if they substantially altered the location and distribution of the population within the region of influence; caused the population to exceed historic growth rates; decreased jobs so as to substantially raise the regional unemployment rates or reduce income generation; substantially affected the local housing market and vacancy rates; or resulted in the need for new social services and support facilities.

4.9.3 Alternatives 1 through 7

Socioeconomic effects resulting from construction and installation activities are presumed to be similar for each of Alternatives 1 through 7 of the Proposed Action, including demographics, housing, schooling, employment, income levels, public services and aesthetic values. Therefore, each of these alternatives would have relatively uniform socioeconomic impacts.

Socioeconomic impacts resulting from the operation of construction equipment and installation activities would be short-term for Alternatives 1 through 7; no long-term impacts are anticipated. Construction and installation activities for each of the Alternatives 1 through 7 would result in a temporary increase in local employment and the use of local goods and services, hence, benefitting the local economy. Negative consequences related to aesthetic quality, noise and nuisances would be only temporary, and upon project completion, the benefits resulting from project activities would augment community perceptions and enhance the well-being of the community. However, no significant impacts would occur and no mitigation is warranted.

Most of the Proposed Action alternatives are separated from sensitive receptors and communities. As discussed in Section 4.8, Noise, only Alternatives 1, 3 and 5 have segments closest to sensitive receptors and communities. As discussed above, none of the sensitive receptors are close enough to the utility corridors to result in any negative impacts.

4.9.4 Alternative 8 - No Action Alternative

Under the No Action Alternative (Alternative 8), the Air Force would not provide for designated utility corridors, but would use existing routes or new, undesignated utility routes. New utility routes would continue to be considered on a case-by-case basis. Each new utility route would require assessment of all socioeconomic-related impacts on sensitive receptors and local communities. Socioeconomic mitigation measures would need to be assessed based on the dynamics of project-level actions.

4.10 WATER RESOURCES

4.10.1 Methodology

Development of the alternatives would not result in an increase in groundwater withdrawal at Edwards AFB. Therefore, none of the selected alternatives would substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. As a result, further analysis of groundwater resources is not necessary.

To evaluate project-related impacts to surface water resources from the proposed alternatives, a review was conducted of previously completed investigations associated with the playa lake beds and surface water. The proposed alternatives were reviewed for their actions related to potential impacts to water quality due to ephemeral drainages as well as potential flooding hazards.

The Finding of No Practicable Alternative (FONPA) for this EA considered all activities proposed within a delineated 100-year flood hazard area. This applies to Corridor 2 which crosses Rosamond Dry Lake, and has been designated as a 100-year floodplain.

4.10.2 Significance Criteria

The evaluation of potential impacts on water resources is based on the Alternative's potential to affect water quality, surface water runoff volumes and drainage patterns and flood hazards. Any selected alternative would have a significant impact on hydrology and water resources if it would:

- Violate any water quality standards or waste discharge requirements;
- Substantially alter the existing drainage pattern or hydrology of the site or area, including through the alteration of the course of a wash, in a manner that would result in substantial erosion or siltation on- or off-site;
- Substantially increase the potential for flooding or the amount of damage that could result from flooding; or
- Create or contribute runoff water which would exceed the capacity of existing or planned

storm water drainage systems or provide substantial additional sources of polluted runoff. The proposed Project could potentially cause a limited flood impact if:

- Structures which would impede or redirect flood flows within a 100-year flood hazard area; or
- It would expose people or structures to a significant risk of loss, injury or death involving flooding including flooding as a result of the failure of a levee or dam, inundation by seiche, tsunami or mudflow.

4.10.3 Alternative 1 - Corridor 1

Impacts

Playa Lake Bed. The southern portion of Corridor 1, Alternative 1 would cross a portion of the playa complex associated with Buckhorn Dry Lake. Buckhorn Dry Lake has not been delineated as a 100-year floodplain. However, the southern portion of Corridor 1 is within a flood prone area according to a 2002 United States Geological Survey (USGS) geomorphological assessment of flood hazards on Edwards AFB. No increase in flooding hazards or impacts associated with flooding for this portion of the alternative are expected.

Surface Water. A small portion the northern section of Corridor 1 would cross Mojave Creek that has not been delineated as a 100-year flood plain; however, a future study may result in delineation, and construction of this portion of the corridor within Mojave Creek has the potential for increasing down-stream flooding hazards. As unnamed ephemeral drainages appear to be bisected by this alternative, construction of Corridor 1 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

The following hydrology mitigation measures (MMHYD) would reduce potential impacts from the project for flooding hazards and water quality due to erosion.

MMHYD 1: If construction within a floodplain is required, appropriate mitigations for reducing flooding hazards as identified by a qualified, state of California registered geologist or engineer would be identified and incorporated into the final design of the selected alternative. This may include prohibiting construction during the rainy season and including design features in the project to minimize flooding impacts to the project.

MMHYD-2: The selected alternative may require a SWPPP in support of a NPDES permit in connection with construction activities. Implementation of a SWPPP would ensure protection of downstream water quality, as sediment erosion would be controlled and sediment movement from the proposed alternative during construction would be reduced.

4.10.4 Alternative 2 - Corridor 2

Impacts

Playa Lake Bed. The western portion of Corridor 2 would cross the northern portion of Rosamond Dry Lake within the current easement of Rosamond Boulevard. Rosamond Dry Lake has been identified as a 100-year floodplain. This alternative has the potential for increasing flooding hazards in the area, and for potentially affecting the integrity of the project itself. The FONPA associated with this EA provides an explanation of why this corridor cannot be realigned to avoid the floodplain.

Surface Water. Unnamed ephemeral drainages appear to be bisected by this alternative. Construction of Corridor 2 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-1 and MMHYD-2 would reduce potential impact from flooding hazards and from poor water quality due to erosion, respectively.

4.10.5 Alternative 3 - Corridor 3

Impacts

Playa Lake Bed. This utility corridor would not bisect any of the dry lake beds or other

designated 100-year floodplains at Edwards AFB. The southern portion of Corridor 3 is within a floodprone area according to a 2002 United States Geological Survey (USGS) geomorphological assessment of flood hazards on Edwards AFB.

Surface Water. As unnamed ephemeral drainages appear to be bisected by this alternative, construction of Corridor 3 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-2 would reduce potential impacts to water quality due to erosion.

4.10.6 Alternative 4 - Corridor 4

Impacts

Playa Lake Bed. This utility corridor does not bisect any of the dry lake beds or other designated 100-year floodplains at Edwards AFB. No increase in flooding hazards would occur. Unnamed ephemeral drainages appear to be bisected by this alternative. Construction of Corridor 4 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-2 would reduce potential impacts to water quality due to erosion.

4.10.7 Alternative 5 – Corridor 5

Impacts

Playa Lake Bed. This utility corridor does not bisect any of the dry lake beds or other designated 100-year floodplains at Edwards AFB. No increase in flooding hazards would occur.

Surface Water. Unnamed ephemeral drainages appear to be bisected by this alternative. Construction of Corridor 5 has the potential for increasing sediment due to storm water

movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-2 would reduce potential impact from flooding hazards and from poor water quality due to erosion.

4.10.8 Alternative 6 - Corridor 6

Impacts

Playa Lake Bed. This utility corridor does not bisect any of the dry lake beds or other designated 100-year floodplains at Edwards AFB. No increase in flooding hazards would occur.

Surface Water. Unnamed ephemeral drainages appear to be bisected by this alternative. Construction of Corridor 6 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-2 would reduce potential impacts to water quality due to erosion.

4.10.9 Alternative 7 - Corridor 9

Impacts

Playa Lake Bed. This utility corridor does not bisect any of the dry lake beds or other designated 100-year floodplains at Edwards AFB. No increase in flooding hazards would occur.

Surface Water. A small portion of the northern section Corridor 9 would cross Mojave Creek that has not been identified delineated as a 100-year flood plain; however, a future study may result in delineation and construction of this portion of the corridor within Mojave Creek has the potential for increasing down-stream flooding hazards.

Unnamed ephemeral drainages appear to be bisected by this alternative. Construction of Corridor 9 has the potential for increasing sediment due to storm water movement of disturbed sediments within the construction area.

Mitigation

Incorporation of MMHYD-1 and MMHYD-2 would reduce potential impact from flooding hazards and from poor water quality due to erosion, respectively.

4.10.10 Alternative 8 - No-Action Alternative

Under the No-Action Alternative, no alternative would be selected for construction. No increases to flooding hazards from construction within a 100-year floodplain would occur. No potential increases in uncontrolled sediments introduced into the numerous unnamed drainages would occur. No mitigations would be necessary.

4.11 CUMULATIVE IMPACTS

Air quality impacts would be considered significant if project emissions, including dust, were to increase ambient pollutant concentrations from below the NAAQS or CAAQS to above these

standards or if they were to contribute measurably to an existing or projected ambient air quality standard violation.

4.11.1 Air Quality and Greenhouse Gases

The Proposed Action would generate short-term temporary construction-related air and GHG emissions. Table 4-1 shows that the Proposed Action does not exceed established thresholds and would have no significant impact by itself. Implementation of MMINF and MMAIR-12 would ensure that significant impacts would not occur. The temporary nature of the project impacts, as well as the limited amount of emissions and the distance from sensitive receptors and other proposed projects would ensure that no significant cumulative impacts would occur.

Air Quality

The federal CAA requires states to develop plans, known as State Implementation Plans (SIPs), stating how they will attain or maintain NAAQS. SIPs are a compilation of new and previously approved plans, programs, district rules, state regulations and federal controls. States and local air quality management agencies prepare SIPs for approval by the USEPA.

The Kern County Air Pollution Control District's California Clean Air Act Ozone Air Quality Attainment Plan (Plan) was approved by CARB on February 18, 1993. To comply with section 40924(a) of the California Health and Safety Code EKAPCD prepared the Annual California Clean Air Act Ozone Air Quality Attainment Plan Implementation Progress Report Number 9 in 2005.

The Proposed Action is consistent with the Edwards AFB Installation Development Plan and, therefore, is presumed to be consistent with the Kern County Air Pollution Control District's California Clean Air Act Ozone Air Quality Attainment Plan. Local governments maintain the authority to determine the types of land use that are allowed within their jurisdiction. For example, in city General Plans, each parcel of land within that city is given a land use designation (i.e., residential, industrial, etc.). Land use types that do not fall within the General

Plan designation are inconsistent with the General Plan and are not allowed. A proposed project that is inconsistent with a local General Plan is also inconsistent with the applicable clean air plan. A proposed action would be inconsistent with a General Plan if it resulted in a land use re-designation, thereby requiring a general plan amendment. Pursuing a land use designation change has various impacts in air emissions and requires a general plan amendment.

The Proposed Action would be inconsistent with the General Plan if its operation were to result in a growth in population, emission source, or a change in general plan designation. Since none of these criteria is impacted, it is not anticipated that the project will have cumulative impacts.

A summary of emission inventories for the MDAB and the Kern County portion of the MDAB and a comparison of emissions from the Proposed Action against the emission inventories are provided in Tables 4-13 through 4-15 as prescribed in the Kern County's *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports* to address cumulative impact assessment (County of Kern, 2006). The data presented in Table 4-15 show that the emissions resulting from the proposed project are significantly less than projected emissions for the MDAB and the Kern County portion of the MDAB.

PM_{10} particulate matter less than 10 microns in diameter
ROG reactive organic gases (this term is interchangeable with volatile organic compounds [VOCs])

Greenhouse Gases

The Proposed Project annual emissions would be short-term, construction-related impacts, generated primarily from mobile sources and would be significantly below established thresholds (Table 4-16) and, therefore, would have a less than significant impact.

Past, Present and Future Projects

Implementation of the Proposed Action is anticipated to require extensive planning for multiple projects that may take place at separate locations and different timeframes. Compiling a list of

projects is required at both the project level and at the programmatic level. At the project level, the evaluation of localized impacts would be required in greater detail given that each specific project will have known requirements. At the programmatic level, a preliminary list of potential projects is provided in Table 4-16. However, any utility corridor project and potential cumulative project identified here may not be developed at the same time.

Table 4-16
List of Potential Projects with Cumulative Air Quality Impacts

Project Name	Description
Long Range Strategic Bomber	Requires construction of one building, renovation of four hangars, demolition and replacement of entire aircraft parking ramp area and pad 19 and demolition of buildings 1862, 1864A and 1866; will occur in approximately Fiscal Year 16
F-22 Relocation	Requires demolition of building 1636 and construction of new
Project Name	**Description**
F-22 Relocation	replacement and renovation 1630 hangar/offices and multiple small buildings in the complex; will occur in approximately Fiscal Year 16
Caltrans Kramer Junction Bypass	Construction includes overpass/on & off ramps and new Hwy 58 4-lane divided expressway approximately 13 miles long; will occur in approximately Jun 2019
Caltrans Median buffer	Caltrans Hwy 395 median buffer starting just south of Kramer Junction and continuing south for approximately 10 miles; will occur in approximately FY18

4.11.2 Cultural Resources

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking on known cultural resources are taken into consideration with past, present and future projects within the Antelope Valley; these include projects proposed for Edwards AFB, as well as surrounding counties (Kern, San Bernardino and Los Angeles).

Among the greatest cumulative impacts to cultural resources are the following projects:

- Federal Energy Regulatory Commission's proposed Kern River Gas Transmission Expansion Project included the 2011 construction of a 715.8-mile gas pipeline extending through California, Utah, Nevada and Wyoming. The project area extends through the proposed Utility Corridor study area. Multiple cultural resources were encountered through this project.

- California Department of Transportation (CALTRANS) Projects: Proposed Kramer Junction Bypass; State Route 58 Hinkley Expressway Project; median buffer along U.S. Route 395; and the proposed U.S. Route 395 Upgrades. Also, the National Telecommunication and Information Administration and California Public Utilities Commission proposes the installation of 583 miles of underground fiber optic cables within CALTRANS right-of-way easements along State Route 58. These projects propose to widen or establish new transportation routes in the general area. Multiple cultural resources may be encountered through these combined road and fiber optic projects.

- Large scale solar projects have been planned within the Antelope Valley including: Boulevard Associates, LLC, Solar Plant; High Desert Power Project; Kramer Junction Solar Electric Generating System and Lightsource Renewables, LLC, and Solar Plant. These projects encompass vast amounts of acreage and have the greatest potential for cumulative impacts to cultural resources.

Moderate cumulative impacts to cultural resources are identified with the following project:

- The proposed PG&E Hinkley Groundwater Remediation Project has the ability to impact cultural resources in areas where groundwater contamination has occurred.

Minor cumulative impacts to cultural resources are the following projects:

- At Edwards AFB, proposed projects include demolition and new construction in support of the CTF buildout and F-22 Relocation: Both projects are estimated as occurring in FY16. It is unknown whether or not these structures proposed for demolition are over 50 years of age; if the buildings are over 50 years in age, they should be inventoried and evaluated as cultural

resources. The proposed new construction area may require additional survey for subsurface archaeological resources, which may relate to the former military activities in addition to the contexts identified in Section 3.2.3. Any adverse effects to historic properties would need to be mitigated prior to the demolition and construction. In terms of cumulative affect in comparison to the proposed Utility Corridor project, the proposed impacts associated with the USAF project for the CTF buildout and F-22 Relocation appear to be minor.

- Miscellaneous Cellular Projects: AT&T Cellular Tower (San Bernardino County); and Metro PCS Cellular Tower (Boron, Kern County)
- Other Minor Impacts: Office Space for Tire Service Business; Pilot Travel Addition or Recyclable Collection at 12033 Gardiner Street in Boron.

Areas with Potential Cumulative Impacts

As noted above, impacts on cultural resources and paleontological resources associated with a utility corridor could result from ground-disturbing activities such as project-related excavation, grading, trenching, vegetation clearance, the operation of heavy equipment or other surface and sub-surface disturbance that could damage or destroy surficial or buried cultural resources including prehistoric or historic period archaeological resources, paleontological resources or human burials.

Most of the cultural resources identified within the APE (n=255 sites) have not been formally evaluated for eligibility for listing in the NRHP (See Table 4-17). Selecting to develop or construct any of the proposed options would require formal significance evaluation of those resources that have not yet been evaluated, if they would be adversely affected by the proposed undertaking. If adverse effects to the resources determined eligible for the NRHP cannot be avoided, then appropriate, site specific mitigation must occur prior to developing a selected corridor option. Construction monitoring may be required at all sites affected by the proposed

undertaking. Further, there is greater potential of discovering sites during construction in areas with more high complexity sites than in areas with few or no high complexity sites.

Table 4-17
Summary of Environmental Impacts with Regard to Cultural Resources Associated with the Proposed Action

Corridor	Total Number of Cultural Resources	NRHP-Eligible (Sites=n)	Not Eligible (Sites=n)	Not Evaluated (Sites=n)	Archaeological Sites of Concern
1	65	11	14	40	EAFB-79, EAFB-90, EAFB-100, EAFB-105, EAFB-108, EAFB-199, EAFB-206, EAFB-423, EAFB-854, EAFB-1000, EAFB-3051
2	22	2	2	18	EAFB-36, EAFB-100
3	83	9	16	58	EAFB-7, EAFB-8, EAFB-31, EAFB-34, EAFB-238, EAFB-835, EAFB-951, EAFB-1178, EAFB-1717, EAFB-3010, EAFB-3302, EAFB-4188, EAFB-6083
4	11	0	1	10	EAFB-588
5	106	2	15	89	EAFB-216, EAFB-579, EAFB-596
6	5	0	3	2	EAFB-6123
9	53	2	12	39	EAFB-562, EAFB-845
Total	345	25	61	255	EAFB-7, EAFB-8, EAFB-31, EAFB-34, EAFB-36, EAFB-79, EAFB-90, EAFB-100, EAFB-105, EAFB-108, EAFB-199, EAFB-206, EAFB-216, EAFB-238, EAFB-423, EAFB-562, EAFB-579, EAFB-588, EAFB-596, EAFB-835, EAFB-845, EAFB-854, EAFB-951, EAFB-1000, EAFB-1178, EAFB-3010, EAFB-3051, EAFB-3302, EAFB-4188, EAFB-6083, EAFB-6123

4.11.3 Geology and Soils

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking on geology and soils resources are taken into consideration with past, present and future projects within the Antelope Valley. These include proposed projects at Edwards AFB as well as in surrounding Kern, San Bernardino and Los Angeles counties. Hazards from regional seismic hazards have the potential to affect the region including Edwards AFB. Including appropriate building requirements would mitigate potential losses due to a seismic event.

Continued and future development in the Antelope Valley has the potential for increasing wind and storm water erosion of soils. Unmitigated ground disturbance during project implementation could add to wind and water erosion of soils.

Areas with Potential Cumulative Impacts

Impacts from a seismic event have the potential to cause impacts to Edwards AFB and the region. To reduce cumulative impacts from a seismic event, local municipalities require incorporation of appropriate building standards to mitigate losses.

Any area within the region currently under development or proposed for development has the potential for increasing wind and storm water erosion of soils.

4.11.4 Hazardous Materials and Hazardous Waste

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking from hazardous waste/hazardous materials are taken into consideration with past, present and future projects within the Antelope Valley. These include proposed projects at Edwards AFB as well as in surrounding Kern, San Bernardino and Los Angeles counties.

Past activities at Edwards AFB have resulted in the generation of hazardous waste that now require remediation. As part of the ERP, Edwards AFB is actively working to remediate a number of OUs. Current practices at Edwards AFB include managing hazardous materials to reduce waste generation to comply with regulations. The proposed undertaking has the potential for generating minor amounts of hazardous waste during construction that would not add significantly to the current waste stream being generated by Edwards AFB.

Areas with Potential Cumulative Impacts

During construction, necessary hazardous materials would be managed according to Air Force requirements. A site-specific health and safety plan would minimize worker health and safety

exposures. The proposed undertaking would generate minor levels of hazardous waste during construction that would not likely add significantly to the current waste stream being generated by Edwards AFB. No cumulative impacts would occur.

4.11.5 Infrastructure

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking for proposed infrastructure improvements are taken into consideration with past, present and future projects with the Antelope Valley. These include proposed projects at Edwards AFB as well as in surrounding Kern, San Bernardino and Los Angeles counties.

Past activities at Edwards AFB have required continued infrastructure improvements for present day uses at the Base. Future development at Edwards AFB will require additional improvements that would not cause conflicts with the existing infrastructure components.

Areas with Potential Cumulative Impacts

The proposed undertaking would enhance the infrastructure at the Base and reduce potential impacts to existing systems due to expanded uses. No cumulative impacts would occur.

4.11.6 Land Use

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking for proposed land use resource and zoning changes are taken into consideration with past, present and future projects with the Antelope Valley. These include proposed projects at Edwards AFB as well as in surrounding Kern, San Bernardino and Los Angeles counties.

In accordance with land use activities and zoning, past activities at Edwards AFB have required continued land use improvements for present day uses at the base. Future development at

Edwards AFB will require additional improvements that would not cause conflicts with the existing land use components.

Areas with Potential Cumulative Impacts

The proposed undertaking would enhance the land use at the base and expand potential impacts to existing land use systems due to expanded uses. No cumulative impacts would occur.

4.11.7 Natural Resources

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking on biological resources are taken into consideration with past, present and future projects within the Antelope Valley; these include projects proposed for Edwards AFB, as well as surrounding counties (Kern, San Bernardino and Los Angeles). Overall habitat in the Antelope Valley has been altered by human activities, resulting in conversion of undeveloped land and habitat loss, fragmentation and degradation. Reasonably foreseeable future projects that could impact biological resources in the cumulative impacts area characterize overall development trends in the Antelope Valley.

Areas with Potential Cumulative Impacts

Impacts on biological resources associated with a utility corridor could result from ground-disturbing activities such as project-related excavation, grading, trenching, vegetation clearance, the operation of heavy equipment or other surface disturbance that could directly or indirectly affect sensitive natural resources. Most of the impacts would be temporary and related to construction activities; habitat would likely return to pre-construction levels, with the exception of some permanent habitat loss for access roads and above-ground structures. Overall habitat loss associated with development in one of the utility corridors would be minimal and would be mitigated on a project by project basis.

4.11.8 Noise

Past, Present and Future Projects

Implementation of the Proposed Action is anticipated to require extensive planning for multiple projects that may take place at separate locations and different timeframes. Compiling a list of projects has a more practical application at the project level than at the programmatic level. Consequently, the evaluation of localized impacts will be required at the project level at the time of construction. Noise impacts from the Proposed Action would result in temporary ambient noise levels increases only during construction activities and are not anticipated to affect ambient noise levels permanently.

Areas with Potential Cumulative Impacts

Cumulative impacts would result if the Proposed Action caused a permanent increase in ambient noise levels. The Proposed Action would generate only short-term noise primarily from construction equipment and vehicles and it would not be expected to have a significant cumulative adverse effect when considered with other proposed projects occurring at the same time as the Proposed Action.

At the time of alternative selection, an evaluation of cumulative impacts from noise may be required at the project level for any existing construction projects within the corridor area of potential effect.

4.11.9 Socioeconomics

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking for the proposed project activities are taken into consideration with past, present and future projects within the Antelope Valley. These include proposed projects at Edwards AFB, as well as in surrounding Kern, San Bernardino and Los Angeles counties.

Past activities at Edwards AFB have required continued improvements for present day uses at the base. Future development at Edwards AFB will require additional improvements that would not cause conflicts with the existing socioeconomic components.

Areas with Potential Cumulative Impacts

The proposed undertaking would enhance the socioeconomic components at the base, as there will be a slight increase in employment. No adverse cumulative impacts would occur.

4.11.10 Water Resources

Past, Present and Future Projects

Cumulative impacts of the proposed undertaking from flooding hazards and potential decrease in water quality from soil erosion are taken into consideration with past, present and future projects with the Antelope Valley. These include proposed projects at Edwards AFB as well as in surrounding Kern, San Bernardino and Los Angeles counties.

Past activities at Edwards AFB have resulted in incorporation of design to reduce flooding hazards on base. Future projects at Edwards AFB would require consideration of the floodplain areas within the base and appropriate engineering needed to reduce flooding hazards.

Areas with Potential Cumulative Impacts

The proposed undertaking would require incorporation of appropriate engineering design to mitigate for potential flooding hazards where alternative selection included construction within a 100-year floodplain. Mitigations to reduce impacts from soil erosion to water quality would reduce potential impacts to a less than significant level. At the time of alternative selection, an evaluation of cumulative impacts from flooding hazards may be required at the project level for any existing construction projects within the corridor area of potential effect.

4.12 UNAVOIDABLE ADVERSE IMPACTS

4.12.1 Air Quality and Greenhouse Gases

Emissions resulting from construction equipment and vehicles would be below established significance and *de minimis* thresholds and would meet all local, state and federal regulations. Therefore, no unavoidable adverse air quality effects would occur as a result of the implementation of any of the project alternatives.

4.12.2 Cultural Resources

In terms of cultural resources, unavoidable significant adverse impacts would be those in which (1) no reasonably practicable mitigation measures can be taken to eliminate the impacts; and/or (2) in cases where no reasonable alternatives to the project would meet the purpose and need of the action, eliminate the impact and not cause other or similar significant adverse impacts.

A number of potential impacts identified for the proposed project on cultural resources could be mitigated (e.g., avoidance; selective placement of above-ground utility poles; placement of underground utility or fiber optic lines), although in some cases the impacts could not be fully mitigated. Examples of unavoidable adverse impacts include the demolition of NRHP-eligible architectural resources and the destruction of NRHP-eligible archaeological resources. Any ground disturbance that may encounter paleontological and/or cultural resources will result in the destruction of these nonrenewable resources.

4.12.3 Geology and Soils

With appropriate mitigations incorporated into the project design, potential impacts would be mitigated to a less than significant level. No unavoidable adverse impacts would occur from the proposed undertaking to geologic and soils resources.

4.12.4 Hazardous Materials and Hazardous Waste

With appropriate mitigations incorporated into the project design, potential impacts would be mitigated to a less than significant level. No unavoidable adverse impacts from the proposed undertaking from hazardous materials or hazardous waste would occur.

4.12.5 Infrastructure

With appropriate mitigations incorporated into the project design, potential impacts to various Air Force missions due to infrastructure expansion would be mitigated to a less than significant level. No unavoidable adverse impacts would occur from the proposed undertaking from the construction of any selected alternative.

4.12.6 Land Use

With appropriate mitigations incorporated into the project design, potential land use impacts would be mitigated to a less than significant level. No unavoidable adverse impacts from the proposed undertaking from the construction of any selected alternative.

4.12.7 Natural Resources

In terms of biological resources, unavoidable significant adverse impacts would be those in which (1) no reasonably practicable mitigation measures can be taken to eliminate the impacts; and/or (2) in cases where no reasonable alternatives to the project would meet the purpose and need of the action, eliminate the impact and not cause other or similar significant adverse impacts.

A number of potential impacts identified for the proposed project on biological resources could be mitigated (e.g., avoidance; selective placement of above-ground utility poles; placement of underground utility or fiber optic lines), although in some cases the impacts could not be fully mitigated. Examples of unavoidable adverse impacts include the removal of listed wildlife species or destruction of sensitive or rare plants.

However, all adverse impacts to natural resources associated with the proposed utility corridors would not be significant or would be reduced to a level that is not significant as discussed in Section 4.7.

4.12.8 Noise

No unavoidable adverse noise impacts would result from implementation of any alternative selected.

4.12.9 Socioeconomics

No unavoidable adverse socioeconomic impacts would occur from the proposed undertaking or from construction of any selected alternative.

4.12.10 Water Resources

For water resources, the primary concerns associated with the alternatives include effects on water quality during development-related construction activities as well as impacts to designated floodplain areas. Assuming that features to minimize effects of flooding are incorporated into the construction design of each project, no unavoidable adverse impacts should occur.

Therefore, with appropriate mitigations incorporated into the project design, potential impacts would be mitigated to a less than significant level. No unavoidable adverse impacts would occur from the proposed undertaking or from an increase in flooding hazards and a decrease in water quality due to erosion.

4.13 SHORT-TERM VERSUS LONG-TERM PRODUCTIVITY OF THE ENVIRONMENT

Examples of short-term uses of the environment include direct, construction-related disturbances and direct impacts associated with an increase in population and activity that occurs over a period typically less than 5 years. Long-term uses of the environment include impacts occurring over a period of more than 5 years, including permanent resource loss.

In the short-term, the project would result in minor, temporary, direct construction-related disturbances, but would not result in an increase in population in the area.

4.13.1 Air Quality and Greenhouse Gases

Short-term adverse impacts would result from dust and construction equipment and vehicles. However, such emissions would be below established significance and *de minimis* thresholds and would meet all local, state and federal regulations. No long-term impacts would occur with the implementation of minimization measures described in Section 4.1.2.

4.13.2 Cultural Resources

In accordance with Section 102 of NEPA, all archaeological field studies, data recovery and analyses associated with the proposed utility corridors would contribute to the present level of professional knowledge about cultural resources. As a result, information resulting from these surveys, identification, documentation of resources and the potential loss of one site should be useful in future efforts to interpret and educate the general public and archaeological community about the cultural resources of the Antelope Valley. In the absence of this project (or cumulative projects in the Antelope Valley), the recovery and interpretation of those sites is not expected to occur.

Likewise, similar documentation for paleontological resources in this area of the Antelope Valley would contribute to the greater understanding of fossil remains; it is anticipated that the proposed project would affect only a small percentage of paleontological resources and create no significant long-term loss of potential for exploration and recovery of these resources.

4.13.3 Geology and Soils

Regional seismic hazards have the potential to affect geologic resources in the short and the long terms. Temporary, minor, adverse impacts to soils would occur in the short term due to clearing and vegetation removal associated with the construction of any selected utility corridor alternative. With appropriate mitigation, including adherence to appropriate building

requirements, the proposed undertaking would reduce short-term or long-term impacts to geologic or soil resources to less than significant.

4.13.4 Hazardous Materials and Hazardous Waste

Short-term adverse impacts may result from the use of hazardous materials and subsequent disposal of hazardous waste during the construction of any selected utility corridor. The disposal of hazardous waste could result in potential impacts to the environment, as well the health and safety of personnel, if it is not properly handled. Compliance with all applicable Federal, State and local laws and regulations addressing hazardous material and waste management is required and would ensure proper handling, storage and disposal of hazardous materials and wastes, which would reduce the hazardous material and waste impacts to less than significant.

4.13.5 Infrastructure

Construction of any selected utility corridor alternative would not cause an increased or decreased use of infrastructure at Edwards AFB and, therefore, there would be no long-term changes in population or productivity of the environment as a result of this project. However, construction of any selected utility corridor alternative may result in long term positive impacts to infrastructure by enhancing the delivery of natural gas, water, communication and electrical or power transmission. With appropriate mitigation, the proposed undertaking would not result in short-term adverse impacts to infrastructure at Edwards AFB.

4.13.6 Land Use

Construction of any selected utility corridor alternative may cause short and long term adverse impacts to land use at Edwards AFB, if the design is not consistent with the Installation Development Plan. Prior to final design selection, coordination will be required to ensure that the design does not cause conflict. Maintaining compatibility with existing land uses established in the Installation Development Plan would eliminate short or long term adverse impacts to land use.

4.13.7 Natural Resources

In the short-term, the project would result in minor, temporary, direct construction-related disturbances to the natural resources in the project area. In the long-term, there would be no changes in productivity of the habitats on Edwards AFB or in the surrounding areas. It is anticipated that the proposed project would affect only a small percentage of biological resources in the area and would not create significant long-term loss of such resources. With appropriate mitigation, the proposed undertaking would not result in significant short-term or long-term impacts to biological resources at Edwards AFB or the surrounding area.

4.13.8 Noise

Noise generated during construction of the selected alternative would not cause short term or long term productivity changes to the adjacent environment. The selected alternative would be constructed in areas that are undeveloped and would generate short term temporary noise increases only during construction activities.

4.13.9 Socioeconomics

Project activities would provide a short-term incrementally, positive impact to the economic impact region from increased revenue generation. This increase in revenue is expected to occur as a result of money spent off base for the hiring of a labor force from the region and the expenditure of funds for materials and supplies. However, there would be no social impacts such as those related to relocation of residents or impacts on lifestyle.

4.13.10 Water Resources

.Construction of any selected utility corridor alternative would not cause any other changes in use at Edwards AFB and, therefore, there would be no long-term changes in population or productivity of the environment as a result of this project. With appropriate mitigation, the proposed undertaking would not result in short-term or long-term impacts from flooding hazards or a decrease in water quality due to soil erosion.

4.14 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENT OF RESOURCES

In accordance with NEPA (40 CFR 1502.16), this section includes a discussion of any irreversible and irretrievable commitment of resources associated with the proposed project. Irreversible and irretrievable resource commitments are related to the use of nonrenewable resources and the effects that the use of those resources will have on future generations. Irreversible effects primarily result from the use or destruction of a specific resource (e.g., energy and minerals) that cannot be replaced within a reasonable time frame. Irretrievable resource commitments involve the loss in value of an affected resource that cannot be restored as a result of implementing an action (e.g., extinction of a rare or threatened species, or the disturbance of an important cultural resource site). There would be no irreversible or irretrievable commitment of resources for any of the environmental resources analyzed in this EA, except possibly for cultural resources. Biological and water resources are also discussed here but are unlikely to result in the irreversible or irretrievable commitment of resources if appropriate mitigation measures are implemented.

A commitment of resources is irreversible when its primary or secondary impacts limit the future option for a resource. An irretrievable commitment refers to the use or consumption of resources that is neither renewable nor recoverable for later use by future generations, such as the loss of cultural, paleontological, biological or water resources. Thus, any ground disturbance that may encounter paleontological and/or cultural resources will result in the destruction of these nonrenewable resources. Ground disturbance could temporarily or permanently affect biological or water resources as well, although impacts are more likely to be temporary.

For good stewardship of the resources identified along the corridors, all previously unevaluated archaeological sites should be formally evaluated for inclusion to the NRHP, with site-specific mitigation being developed prior to the proposed construction activities. Under NHPA, cultural resources eligible for listing in the NRHP would be protected from development. Native American resources, once destroyed or altered, cannot be replaced; any loss of sacred sites or traditional cultural properties would be considered irreversible and irretrievable.

For natural resources, development of one or more utility corridors at Edwards AFB would result in temporary impacts associated with construction and long-term impacts associated with utility maintenance and access road construction. With proper mitigation, both temporary and permanent impacts can be mitigated such that there would be no irreversible or irretrievable commitment of natural resources.

For water resources, as discussed above in Section 4.12, Unavoidable Adverse Impacts, the primary concerns associated with the alternatives include effects on water quality during development-related construction activities as well as impacts to designated floodplain areas. Assuming that features to minimize effects of flooding are incorporated into the construction design of each project, no irreversible or irretrievable commitment of water resources should occur.

EXECUTIVE SUMMARY

The Pacific Steel Group (the "Applicant") is proposing the Mojave Micro Mill Project (the project) which consists of the construction of a micro mill facility and associated infrastructure necessary to produce reinforcing bar (rebar) from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. The project is located in unincorporated southeastern Kern County, in central California. The micro mill facility would be developed on two vacant parcels (project site) totaling approximately 174 acres located at 860 Sopp Road, Mojave, California, along Sierra Highway in Kern County. The project site is located approximately 57 miles southeast of the City of Bakersfield, approximately 4 miles north of the community of Rosamond and 8 miles south of Mojave.

The proposed project would include constructing and operating an all electric micro mill facility and associated infrastructure necessary to produce rebar from scrap metal (e.g., shredded automobiles, appliances, structural and sheet metal, and other pre-processed steel bundles) through various recycling processes. Development would include an approximate 475,800 square-foot micro mill facility and with an additional 51,221 square feet of accessory buildings, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land. Outdoor storage for scrap materials and staging is included as part of the proposed project.

In accordance with the requirements under the California Environmental Quality Act (CEQA), this Air Quality Technical Report (Technical Report) provides an estimate of air quality emissions for the project and the potential impacts from associated construction and operational activities. This Technical Report includes the categories and types of emission sources resulting from the project, the calculation procedures used in the analysis, and any assumptions or limitations.

This Technical Report summarizes the potential for the proposed project to conflict with an applicable air quality plan, to violate an air quality standard or threshold, to result in a cumulatively net increase of criteria pollutant emissions, to expose sensitive receptors to substantial pollutant concentrations, or to create objectionable odors affecting a substantial number of people. The findings of the analyses are as follows:

- The incremental increase in emissions from project operations of the project would exceed the emission thresholds set forth by the Eastern Kern Air Pollution Control District (EKAPCD). Thus, the project would conflict with applicable air quality standards or jeopardize the timely attainment of such standards in the Mojave Desert Air Basin (the Air Basin).
- Project construction and operations would not expose off-site receptors to significant levels of toxic air contaminants and would result in less than significant health risk impacts.

- Emissions from the increase in traffic due to operation of the proposed project would not contribute a significant level of carbon monoxide (CO) concentrations such that the proposed project would create a CO hotspot-related impact due to mobile source emissions.
- The proposed project would comply with EKAPCD and USEPA permitting requirements.
- Project construction and operations would not result in significant levels of odors.
- The project would result in a significant cumulative air quality impact during operations of the proposed project.

SECTION 1
Introduction

1.1 Existing Conditions

The Mojave Micro Mill Project ("project" or "proposed project") will be situated on a 174-acre site located at 860 Sopp Road, at the southeast corner of Sopp Road and Sierra Highway, in unincorporated southeastern Kern County, California. The project site is bounded by the Union Pacific Railway and Sierra Highway (west), Sopp Road (north), vacant land (south) and Edwards Air Force Base (east). The project site is located approximately 57 miles southeast of the City of Bakersfield, approximately 4 miles north of the unincorporated community of Rosamond and 8 miles south of the unincorporated community of Mojave in unincorporated Kern County, California. Regional access to the project site is provided by State Route 14. The project site would be accessed by Backus Road one mile north of the project site, from Sierra Highway to the east off of State Route 14. The proposed project is located in the western portion of the Mojave Desert, in the Antelope Valley area. The Mojave Desert is to the south and east of several low mountain ranges and is dominated by desert vegetation. Topography is mostly flat, but elevations gradually rise toward the west and northwest. The Tehachapi Mountains are to the north and west and the San Gabriel Mountains to the south. The project site is shown in **Figure 1**, *Regional and Site Location.*

Nearby uses surrounding the project site include vacant agriculturally designated land to the south, industrial development (Shemshad Food Products Inc.) to the north, the proposed Edwards Solar Facility followed by Edwards Airforce Base lie east of the project site, and vacant agricultural land, Sierra Highway, and Union Pacific lie to the west of the project site. The immediate area surrounding the project has a few nearby residences; the nearest residence is approximately 1,000 feet to the northwest. Farther away are a few clusters of unincorporated residences located near the State Route 14 and Backus Road exit, as well as approximately 1.25 miles west of the project site beyond State Route 14. Figure 1, Regional and Site Location, shows the project site and surrounding land uses.

The federal Clean Air Act (CAA) establishes a classification system for the level of protection from the impacts of air pollution in an area. Areas designated as Class I receive the greatest level of protection from the impacts of air pollution. There are three Class I areas within 62 miles (100 kilometers (km)) of the proposed project site. These include the Domeland Wilderness Area which is located approximately 85 km to the north, the San Gabriel Wilderness Area located approximately 67 km to the south, and the Cucamonga Wilderness Area located approximately 88 km to the south-southeast.

Mojave Micro Mill Project

Figure 1
Regional and Site Location

ESA

1.2 Project Description

The proposed project would include development of an approximate 475,800 square-foot all electric micro mill facility which would produce and fabricate reinforcing steel commonly known as “rebar”. The proposed project would also include an additional 51,221 square feet of accessory buildings, for a total of 527,021 square feet, as well as an approximate 63-acre accessory solar array on 174 total acres of privately owned land that is currently vacant. Outdoor storage for scrap materials and staging is included as part of the proposed project.

The 475,800 square-foot micro mill facility would include 13 connected and standalone buildings for raw materials handling, melt shop processes, rolling mill processes, and fabrication shop processes. The micro mill facility would support seven ancillary structures for storeroom and vehicle maintenance, office building, locker room, slag processing office building, containerized power control room, guard shack/scale house, and a trucker restroom facility. Additional site components would include: 63 acres of ground-mounted solar panels, substation to support solar panels, fume treatment plant, water treatment plant, slag processing plant, dolomite and lime silos, staging and spare parts storage, numerous AC power unit substations located throughout the project site to power the various buildings, on-site access corridors, perimeter security fencing, on-site parking area, road improvements along Sopp Road and future private road south of Lone Butte Road/Sopp Road corner, landscaping, and new pavement, and curb and gutter.

It is anticipated that construction activities would commence as early as the fourth quarter 2023 with full build-out occurring in fourth quarter 2025. Construction is anticipated to last approximately 24 months.

1.3 Existing Site Emissions

As discussed previously, the project site is currently vacant, thus there are no existing emissions. All project emissions would be new emissions.

1.4 Existing Air Quality Conditions

1.4.1 Regional Air Quality

Criteria Pollutants

Air pollution, especially the dispersion of air pollutants, is directly related to a region’s topographic features. Air quality is a function of both the rate and location of pollutant emissions and the meteorological conditions and topographic features that influence pollutant movement and dispersal. Atmospheric conditions such as wind speed, wind direction, atmospheric stability, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants, which affects ambient air quality.

The project is located within the Antelope Valley, approximately 8 miles south of the unincorporated community of Mojave in unincorporated Kern County within the Mojave Desert Air Basin (Basin). The Basin encompasses the eastern half of Kern County, the northern part of

Los Angeles County, most of San Bernardino County except for the southwest corner, and the eastern edge of Riverside County. It is separated from the South Coast Air Basin, to its south, by the San Gabriel and San Bernardino Mountains. It is separated from the San Joaquin Valley, to the northwest, by the Tehachapi Mountains and the south end of the Sierra Nevada. The Basin has four air districts which regulate air quality. The project site lies within the Eastern Kern Air Pollution Control District (EKAPCD).

The Antelope Valley is within the western portion of the Mojave Desert and is bounded by the Tehachapi Mountains to the northwest and the San Gabriel Mountains to the southwest. The Mojave Desert is bordered on the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass. A lesser valley lies between the San Bernardino Mountains and the Little San Bernardino Mountains (the Morongo Valley). The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley) whose primary channel is the San Gorgonio Pass between San Bernardino and San Jacinto Mountains.

The Basin is characterized by hot summers, cold winters, large diurnal ranges in temperature, low relative humidity, and irregular rainfall. The Basin is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. Many of the lower mountains rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the Basin are out of the west and southwest, due to the proximity of the Basin to the Pacific Ocean and the blocking nature of the Sierra Nevada Mountains to the north. Air masses pushed onshore in southern California by differential heating are channeled through the Basin. The Basin is separated from the southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet above mean sea level), the passes of which form the main channels for these air masses.

During the summer, the Basin is generally influenced by a Pacific Subtropical High cell that sits off the coast to the west, inhibiting cloud formation and encouraging daytime solar heating. The Basin is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. Average temperatures recorded in the Mojave area, range from a low of 35 degrees Fahrenheit (°F) in January to highs of 100°F in July and August.[1] Rainfall is light, averaging about seven inches a year.[2] The Basin averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The Basin is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, which indicates at least three months have maximum average temperatures over 100°F.

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their

[2] NOAA, 2022. National Weather Service https://www.weather.gov/wrh/climate?wfo=hnx. Accessed November 2022.

presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the United States Environmental Protection Agency (USEPA) and are subject to emissions control requirements adopted by federal, state and local regulatory agencies. These pollutants are referred to as "criteria air pollutants" as a result of the specific standards, or criteria, which have been adopted for them. A brief description of the health effects of these criteria air pollutants are provided below.

Ozone (O_3): Ozone is a regional air pollutant, which is generated over a large area and transported and spread by the wind. As the primary constituent of smog, ozone is the most complex, difficult to control, and pervasive of the criteria pollutants. Unlike other pollutants, it is not emitted directly into the air by specific sources but is created by sunlight acting on other air pollutants (the precursors), specifically nitrogen oxides (NOx) and reactive organic gases (ROG). Sources of precursor gases number in the thousands and include common sources such as consumer products, gasoline vapors, chemical solvents, and combustion byproducts of various fuels. Originating from gas stations, motor vehicles, large industrial facilities, and small businesses such as bakeries and dry cleaners, the ozone forming chemical reactions often take place in another location, catalyzed by sunlight and heat. Thus, high ozone concentrations can form over large regions when emissions from motor vehicles and stationary sources are carried hundreds of miles from their origins. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable.

According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath.[3] Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease.[4] Long-term exposure to ozone is linked to aggravation of asthma, and is likely to be one of many causes of asthma development and long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children.[5] According to the California Air Resource Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath.[6] The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers.[7] Children

3 United States Environmental Protection Agency (USEPA), 2022. Health Effects of Ozone Pollution, https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution, last updated June 14, 2022. Accessed November 2022.

7 USEPA, Health Effects of Ozone Pollution, 2022.

are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure.[8] According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults.[9] Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures.[10] Further research may be able to better distinguish between health effects in children and adults.[11] Elevated ozone concentrations also reduce crop and timber yields, damage native plants, and damage materials such as rubber, paints, fabric, and plastics.[12]

Volatile Organic Compounds (VOCs): VOCs are organic chemical compounds of carbon and are not "criteria" pollutants themselves; however, they contribute with NO_X to form ozone, and are regulated to prevent the formation of ozone.[13] According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone, other VOCs have adverse health effects, and in some cases, VOCs can be both highly reactive and have adverse health effects.[14] VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids, internal combustion associated with motor vehicle usage, and consumer products (e.g., architectural coatings, deodorants, hair spray, cleaning products, spray paint, insecticides, etc.).[15]

The primary health effects of hydrocarbons result from the formation of ozone and its related health effects. High levels of hydrocarbons in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. There are no separate federal or California ambient air quality standards for VOC. Carcinogenic forms of VOCs are considered toxic air contaminants (TACs). An example is benzene, which is a carcinogen. The health effects of individual VOCs are described under the "Toxic Air Contaminants" heading below.

Nitrogen Dioxide (NO_2) and Nitrogen Oxides (NO_X): NO_X is a term that refers to a group of compounds containing nitrogen and oxygen. The primary compounds of air quality concern include NO_2 and nitric oxide (NO). Ambient air quality standards have been promulgated for NO_2, which is a reddish-brown, reactive gas.[16] The principle form of NO_X produced by

combustion is NO, but NO reacts quickly in the atmosphere to form NO_2, creating the mixture of NO and NO_2 referred to as NO_X.[17] Major sources of NO_X include emissions from cars, trucks and buses, power plants, and off-road equipment.[18] The terms NO_X and NO_2 are sometimes used interchangeably. However, the term NO_X is typically used when discussing emissions, usually from combustion-related activities, and the term NO_2 is typically used when discussing ambient air quality standards. Where NO_X emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all NO_X emissions would oxidize in the atmosphere to form NO_2.

According to the USEPA, short-term exposures to NO_2 can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of NO_2 may contribute to the development of asthma and potentially increase susceptibility to respiratory infections.[19] According to CARB, controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics.[20] In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.[21] Infants and children are particularly at risk from exposure to NO_2 because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.[22] CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO_2 and there is only limited information for NO and NO_X, as well as large uncertainty in relating health effects to NO or NO_X exposure.[23]

NO_X contributes to a wide range of environmental effects both directly and indirectly when combined with other precursors in acid rain and ozone. NO_X can cause fading of textile dyes and additives, deterioration of cotton and nylon, and corrosion of metals due to the production of particulate nitrates. Airborne NO_X can also impair visibility. Increased nitrogen inputs to terrestrial and wetland systems can lead to changes in plant species composition and diversity. Similarly, direct nitrogen inputs to aquatic ecosystems such as those found in estuarine and coastal waters can lead to eutrophication (a condition that promotes excessive algae growth, which can lead to a severe depletion of dissolved oxygen and increased levels of toxins harmful to aquatic life). Nitrogen, alone or in acid rain, also can acidify soils and surface waters. Acidification of soils causes the loss of essential plant nutrients and increased levels of soluble

23 CARB, Nitrogen Dioxide & Health, 2022.

aluminum, which is toxic to plants. Acidification of surface waters creates conditions of low pH and levels of aluminum that are toxic to fish and other aquatic organisms. NOx also contributes to visibility impairment.[24]

Carbon Monoxide (CO): CO is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources.[25] According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death.[26] Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress.[27] In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina.[28] According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain.[29] For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance.[30] Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO.[31]

Sulfur Dioxide (SO_2): Sulfates are the fully oxidized ionic form of sulfur. Sulfates occur in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to sulfur dioxide (SO_2) during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California because of regional meteorological features. According to the USEPA, the largest source of SO_2 emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities while smaller sources of SO_2 emissions include industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicles and heavy

equipment that burn fuel with a high sulfur content.[32] In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion.[33] SO_2 is a colorless, irritating gas with a "rotten egg" smell that is formed primarily by the combustion of sulfur-containing fossil fuels. Historically, SO_2 was a pollutant of concern in Kern County, but with the successful implementation of regulations, the levels have been reduced significantly.

According to the USEPA, short-term exposures to SO_2 can harm the human respiratory system and make breathing difficult.[34] According to CARB, health effects at levels near the state one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO_2 (above 1 part per million (ppm)) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.[35] Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO_2.[36,37]

SO_2 tends to have more toxic effects when acidic pollutants, liquid or solid aerosols, and particulates are also present. Effects are more pronounced among "mouth breathers," e.g., people who are exercising or who have head colds. These effects include:

- Health problems, such as episodes of bronchitis requiring hospitalization associated with lower level acid concentrations;
- Self-reported respiratory conditions, such as chronic cough and difficult breathing, associated with acid aerosol concentrations (individuals with asthma are especially susceptible to these effects. The elderly and those with chronic respiratory conditions may also be affected at lower concentrations than the general population);
- Increased respiratory tract infections associated with longer term, lower level exposures to SO_2 and acid aerosols; and
- Subjective symptoms, such as headaches and nausea, in the absence of pathological abnormalities due to long-term exposure.

37 USEPA, Sulfur Dioxide (SO_2) Pollution, 2022.

SO_2 easily injures many plant species and varieties, both native and cultivated. Some of the most sensitive plants include various commercially valuable pines, legumes, red and black oaks, white ash, alfalfa, and blackberry. The effects include:

- Visible injury to the most sensitive plants at exposures as low as 0.12 ppm for eight hours;
- Visible injury to many other plant types of intermediate sensitivity at exposures of 0.30 ppm for eight hours; and
- Positive benefits from low levels in a very few species growing on sulfur-deficient soils.

Increases in SO_2 concentrations accelerate the corrosion of metals, probably through the formation of acids. SO_2 is a major precursor to acidic deposition. Sulfur oxides may also damage stone and masonry, paint, various fibers, paper, leather, and electrical components.

Increased SO_2 also contributes to impaired visibility. Particulate sulfate, much of which is derived from SO_2 emissions, is a major component of the complex total suspended particulate mixture.

Particulate Matter (PM10 and PM2.5): Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air.[38] Some particles, such as dust, dirt, soot, or smoke, are large or dark enough to be seen with the naked eye while other particles are so small they can only be detected using an electron microscope.[39] Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM10); and fine inhalable particles with diameters that are generally 2.5 micrometers and smaller (PM2.5).[40] Thus, PM2.5 comprises a portion or a subset of PM10. Sources of PM10 emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands.[41] Sources of PM2.5 emissions include combustion of gasoline, oil, diesel fuel, or wood.[42] PM10 and PM2.5 may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO_2, NO_X, and certain organic compounds.[43]

According to CARB, both PM10 and PM2.5 can be inhaled, with some depositing throughout the airways; PM10 is more likely to deposit on the surfaces of the larger airways of the upper region of the lung while PM2.5 is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation.[44] Short-term (up to 24 hours duration) exposure to PM10 has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and

emergency department visits.[45] The effects of long-term (months or years) exposure to PM10 are less clear, although studies suggest a link between long-term PM10 exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer.[46] Short-term exposure to PM2.5 has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days and long-term exposure to PM2.5 has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children.[47] According to CARB, populations most likely to experience adverse health effects with exposure to PM10 and PM2.5 include older adults with chronic heart or lung disease, children, and asthmatics and children and infants are more susceptible to harm from inhaling pollutants such as PM10 and PM2.5 compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems.[48] Research has shown that children living in communities with high levels of PM2.5 had slower lung growth, and had smaller lungs at age 18 compared to children who lived in communities with low PM2.5 levels.[49] CARB conducted a risk assessment of premature mortality associated with exposure to PM2.5 which indicated that PM2.5 exposure contributes to 5,400 (uncertainty range of 4,200 – 6,700) premature deaths due to cardiopulmonary causes per year in California.[50] Additionally, PM2.5 exposure contributes to approximately 2,800 hospitalizations for cardiovascular and respiratory diseases (uncertainty rage 350 – 5,100), and about 6,700 emergency room visits for asthma (uncertainty range 4,300 to 9,300) each year in California.[51]

Lead (Pb): Lead is a metal that is a natural constituent of air, water, and the biosphere. Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers.[52] In the past, leaded gasoline was a major source of lead emissions; however, the removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014.[53] EKAPCD no longer monitors lead ambient levels of atmospheric lead in the Air Basin.

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood.[54] The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or

kidney damage.[55] Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain.[56]

Other Criteria Pollutants (California Only)

The California Ambient Air Quality Standards (CAAQS) regulate the same criteria pollutants as the National Ambient Air Quality Standards (NAAQS) but in addition, regulate State-identified criteria pollutants, including sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride.[57] According to CARB, California law continues to mandate CAAQS, although attainment of the NAAQS has precedence over attainment of the CAAQS due to federal penalties for failure to meet federal attainment deadlines.[58] California law does not require that CAAQS be met by specified dates as is the case with NAAQS. Rather, it requires incremental progress toward attainment.[59]

With respect to the State-identified criteria pollutants (i.e., sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride), the project would either not emit them (i.e., hydrogen sulfide and vinyl chloride), or they would be accounted for as part of the pollutants estimated in this analysis (i.e., sulfates and visibility reducing particles). For example, visibility reducing particles are associated with particulate matter emissions and sulfates are associated with SO_X emissions. Both particulate matter and SO_X are included in the emissions estimates for the project. A description of the health effects of the State-identified criteria air pollutants is provided below.

Sulfates (SO_4^{2-}): Sulfates (SO_4^{2}) are particulate product that comes from the combustion of sulfur-containing fossil fuels. When sulfur monoxide or SO_2 is exposed to oxygen, it precipitates out into sulfates (SO_3 or SO_4). Sulfates are the fully oxidized ionic form of sulfur. Sulfates occur in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. [60] This sulfur is oxidized to SO_2 during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California because of regional meteorological features.

Exposure to SO_4^{2-}, which are part of PM2.5, results in health effects similar to those from exposure to PM2.5 including reduced lung function, aggravated asthmatic symptoms, and increased risk of emergency department visits, hospitalizations, and death in people who have chronic heart or lung diseases.[61] Population groups with higher risks of experiencing adverse

61 CARB, Sulfate & Health, 2022.

health effects with exposure to SO_4^{2-} include children, asthmatics, and older adults who have chronic heart or lung diseases.[62] CARB's sulfates standard is designed to prevent aggravation of respiratory symptoms. When acidic pollutants and particulates are also present, SO_2 tends to have an even more toxic effect. In addition to particulates, SO_3 and SO_4 are also precursors to acid rain. SO_X and NO_X are the leading precursors to acid rain. Acid rain can lead to corrosion of man-made structures and cause acidification of water bodies. Sulfates are particularly effective in degrading visibility and because they are usually acidic, can harm ecosystems and damage materials and property.

Hydrogen Sulfide (H_2S): H_2S is a colorless gas with a strong odor of rotten eggs. The most common sources of H_2S emissions are oil and natural gas extraction and processing, and natural emissions from geothermal fields. Industrial sources of H_2S include petrochemical plants and kraft paper mills. H_2S is also formed during bacterial decomposition of human and animal wastes, and is present in emissions from sewage treatment facilities and landfills.[63]

H_2S is regulated as a nuisance based on its odor detection level; if the standard were based on adverse health effects, it would be set at a much higher level.[64] According to CARB, there are insufficient data available to determine whether or not some groups are at greater risk than others.[65] Exposure to H_2S can induce tearing of the eyes and symptoms related to overstimulation of the sense of smell, including headache, nausea, or vomiting; additional health effects of eye irritation have only been reported with exposures greater than 50 ppm, which is considerably higher than the odor threshold.[66] Exposure to higher concentrations (above 100 ppm) can cause olfactory fatigue, respiratory paralysis, and death. Brief exposures to high concentrations of H_2S (greater than 500 ppm) can cause a loss of consciousness. In most cases, the person appears to regain consciousness without any other effects. However, in many individuals, there may be permanent or long-term effects such as headaches, poor attention span, poor memory, and poor motor function. No health effects have been found in humans exposed to typical environmental concentrations of H_2S (0.00011–0.00033 ppm). Deaths due to breathing in large amounts of H_2S have been reported in a variety of different work settings, including sewers, animal processing plants, waste dumps, sludge plants, oil and gas well drilling sites, and tanks and cesspools.

Visibility-Reducing Particles: Visibility-reducing particles come from a variety of natural and manmade sources and can vary greatly in shape, size and chemical composition. Visibility reduction is caused by the absorption and scattering of light by the particles in the atmosphere before it reaches the observer. Certain visibility-reducing particles are directly emitted to the air such as windblown dust and soot, while others are formed in the atmosphere through chemical transformations of gaseous pollutants (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of particulate matter. As the number of visibility reducing particles

increases, more light is absorbed and scattered, resulting in less clarity, color, and visual range.[67] Exposure to some haze-causing pollutants have been linked to adverse health impacts similar to PM10 and PM2.5 as discussed above.[68]

Vinyl Chloride: Vinyl chloride is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products and are generally emitted from industrial processes and other major sources of vinyl chloride have been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.[69]

Short-term health of effects of exposure to high levels of vinyl chloride in the air include central nervous system effects, such as dizziness, drowsiness, and headaches while long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage and has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans.[70] Most health data on vinyl chloride relate to carcinogenicity; thus, the people most at risk are those who have long-term exposure to elevated levels, which is more likely to occur in occupational or industrial settings; however, control methodologies applied to industrial facilities generally prevent emissions to the ambient air.[71]

Toxic Air Contaminants (TACs)

In addition to criteria pollutants, the EKAPCD periodically assesses levels of toxic air contaminants (TACs) in the Air Basin. A TAC is defined by California Health and Safety Code Section 39655:

> *"Toxic air contaminant" means an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412(b)) is a toxic air contaminant.*

Diesel particulate matter, which is emitted in the exhaust from diesel engines, was listed by the state as a toxic air contaminant in 1998. Most major sources of diesel emissions, such as ships, trains, and trucks operate in and around ports, railyards, and heavily traveled roadways. These areas are often located near highly populated areas resulting in greater health consequences for urban areas than rural areas.[72] Diesel particulate matter has historically been used as a surrogate measure of exposure for all diesel exhaust emissions. Diesel particulate matter consists of fine particles (fine particles have a diameter <2.5 μm), including a subgroup of ultrafine particles (ultrafine particles have a diameter <0.1 μm). Collectively, these particles have a large surface area which makes them an excellent medium for absorbing organics. The visible emissions in

diesel exhaust include carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and cancer-causing substances.

Exposure to diesel particulate matter may be a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Diesel particulate matter levels and resultant potential health effects may be higher in proximity to heavily traveled roadways with substantial truck traffic or near industrial facilities. According to CARB, diesel particulate matter exposure may lead to the following adverse health effects: (1) Aggravated asthma; (2) Chronic bronchitis; (3) Increased respiratory and cardiovascular hospitalizations; (4) Decreased lung function in children; (5) Lung cancer; and (6) Premature deaths for people with heart or lung disease.[73,74]

Airborne Fungus (Coccidioides immitits)

Coccidioidomycosis, commonly referred to as San Joaquin Valley Fever or Valley Fever, is one of the most studied and oldest known fungal infections. Valley Fever most commonly affects people who live in hot dry areas with alkaline soil and varies with the season. This disease, which affects both humans and animals, is caused by inhalation of arthroconidia (spores) of the fungus Coccidioides immitis.

Coccidioides immitis spores are found in the top few inches of soil. The cocci fungus lives as a saprophyte in dry, alkaline soil. When weather and moisture conditions are favorable, the fungus "blooms" and forms many tiny spores that lie dormant in the soil until they are stirred up by wind, vehicles, excavation, or other ground-moving activities and become airborne. Agricultural workers, construction workers, and other people who work outdoors and who are exposed to wind and dust are more likely to contract Valley Fever. Children and adults whose hobbies or sports activities expose them to wind and dust also are more likely to contract Valley Fever. After the fungal spores have settled in the lungs, they change into a multicellular structure called a spherule. Fungal growth in the lungs occurs as the spherule grows and bursts, releasing endospores, which then develop into more spherules.

Approximately 60 percent of Valley Fever cases are mild and display flu-like symptoms or no symptoms at all. Of those who are exposed and seek medical treatment, the most common symptoms include fatigue, cough, loss of appetite, rash, headache, and joint aches. In some cases, painful red bumps may develop on the skin. Because these symptoms are not unique to Valley Fever and also may be caused by other illnesses, identifying and confirming this disease requires specific laboratory tests, such as the following:[75]

- Microscopic identification of the fungal spherules in infected tissue, sputum or body fluid sample.

[73] CARB, Overview: Diesel and Health Research, 2022.

[74] CARB, Diesel Particulate Matter Health Risk Assessment Study for the West Oakland Community: Preliminary Summary of Results, 2008). http://www.arb.ca.gov/ch/communities/ra/westoakland/documents/factsheet0308.pdf. Accessed November 2022.

[75] Valley Fever Center for Excellence, Order the Right Tests, 2022. https://vfce.arizona.edu/valley-fever-people/order-right-tests. Accessed November 2022.

- Growing a culture of Coccidioides immitis from a tissue specimen, sputum, or body fluid.
- Detection of antibodies (serological tests specifically for Valley Fever) against the fungus in blood serum or other body fluids.
- Administering the Valley Fever Skin Test (called coccidioidin or spherulin), which indicate prior exposure to the fungus.

The highest incidence rate within California occurs in Kern County within the San Joaquin Valley Air Basin, with 3,045 annual cases reported for the year 2021.[76] Valley Fever is not contagious, and therefore cannot be passed on from person to person. Most of those who are infected recover without treatment within six months and thereafter have a lifelong immunity to the fungal spores. In severe cases, especially in those patients with rapid and extensive primary illness, those who are at risk for dissemination of disease, and those who have disseminated disease, antifungal drug therapy is used.

The type of medication used and the duration of drug therapy are determined by the severity of disease and response to the therapy. The medications used include ketoconazole, itraconazole, and fluconazole in chronic, mild-to-moderate disease, and amphotericin B, given intravenously or inserted into the spinal fluid, for rapidly progressive disease. Although these treatments are often helpful, evidence of disease may persist and years of treatment may be required (Valley Fever Center for Excellence 2022).[77] Approximately 60 percent of people infected are asymptomatic and do not seek medical attention. In the remaining 40 percent, symptoms range from mild to severe. A small percentage, approximately one percent, die as a result of the disease.[78]

The usual course of Valley Fever in healthy people is complete recovery within six months. In most cases, the body's immune response is effective, and no specific course of treatment is necessary. About five percent of cases result in pneumonia (infection of the lungs), while another 5 to 10 percent of patients develop lung cavities. These cavities occur most often in adults, usually without symptoms, and about 50 percent of them disappear within two years. Occasionally, these cavities rupture, causing chest pain and difficulty breathing which requires surgical repair. Only one to two percent of those exposed who seek medical attention would develop a disease that disseminates (spreads) to other parts of the body other than the lungs.[79]

Asbestos

Asbestos is a term used for several types of naturally-occurring fibrous minerals found in many parts of California. The three most common types of asbestos are chrysotile, amosite, and

[76] Kern County Public Health Services Department, Valley Fever Cases Dashboard, 2022. https://app.powerbigov.us/view?r=eyJrIjoiOWJjNTY0NDQtMGVhMC00OWFmLThiMzEtNjA1OTg4NzViYzAzIiwidCI6ImUwZjJlNGI1LTA1MTUtNDAyOC05OWYyLTJlN2E0M2ZlNTM3OSJ9&pageName=ReportSection. Accessed November 2022.

crocidolite. Chrysotile, also known as white asbestos, is the most common type of asbestos found in buildings. Chrysotile makes up approximately 90 to 95 percent of all asbestos contained in buildings in the United States. In addition, naturally occurring asbestos can be released from serpentinite and ultramafic rocks when the rock is broken or crushed. At the point of release, the asbestos fibers may become airborne, causing air quality and human health hazards. These rocks have been commonly used for unpaved gravel roads, landscaping, fill projects, and other improvement projects in some localities. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading for development projects, and at quarry operations. Serpentinite and/or ultramafic rock are known to be present in 44 of California's 58 counties. These rocks are particularly abundant in the counties associated with the Sierra Nevada foothills, the Klamath Mountains, and Coast Ranges. According to information provided by the Department of Conservation Division of Mines and Geology, the project site is not located in an area where naturally occurring asbestos is likely to be present.[80]

1.4.2 Local Air Quality

CARB has established and maintains a network of sampling stations (called the State and Local Air Monitoring Stations [SLAMS] network) that work in conjunction with local air pollution control districts and air quality management districts to monitor ambient pollutant levels. The SLAMS network in Kern County consists of eight stations that monitor various pollutant concentrations. The locations of these stations were chosen to meet monitoring objectives, which, for the SLAMS network, call for stations that monitor the highest pollutant concentrations, representative concentrations in areas of high population density, the impact of major pollution emissions sources, and general background concentration levels.

The EKAPCD is responsible for monitoring air quality in the Kern County portion of the MDAB to determine whether pollutant concentrations meet state and national air quality standards. The nearest air monitoring station to the project site is the Mojave air monitoring station, located approximately 7.5 miles north of the project site. The Mojave monitoring station monitors ambient concentrations of ozone, $PM_{10,}$ and $PM_{2.5}$. CO and NO_2 data were obtained from the Lancaster monitoring station and SO_2 data was obtained from the Victorville-Park Avenue monitoring station as these are the closest stations that monitors for these pollutants. data obtained for 2019 through 2021 is summarized below in **Table 1,** *Ambient Air Quality Data*.

[80] Department of Conservation, Division of Mines and Geology, A General Location Guide for Ultramafic Rocks in California - Areas More Likely to Contain Naturally Occurring Asbestos, August 2000. 1.5 Sensitive Receptors

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others. Sensitive land uses within ¼ mile of the project site are shown in **Figure 2**, *Sensitive Receptor Locations Nearest to the Project Site*, and include the following:

- Residential Uses: Single-family residences located approximately 1,000 feet to the northwest of the project site along Dobbs Road.

All other air quality sensitive receptors are located at greater distances from the project site, and would be less impacted by project emissions. Impacts are quantified for the sensitive receptors listed here.

SECTION 2
Regulatory Framework

A number of statutes, regulations, plans and policies have been adopted which address air quality concerns. The project site and vicinity is subject to air quality regulations developed and implemented at the federal, State, and local levels. At the federal level, the USEPA is responsible for implementation of the federal CAA. Some portions of the CAA (e.g., certain mobile source requirements and other requirements) are implemented directly by the USEPA. Other portions of the CAA (e.g., stationary source requirements) are implemented through delegation of authority to state and local agencies. A number of plans and policies have been adopted by various agencies that address air quality concerns. Those plans and policies that are relevant to the project are discussed below.

2.1 Federal

The federal CAA was enacted in 1955 and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990.[81] The CAA is the comprehensive federal law that regulates air emissions in order to protect public health and welfare.[82] The USEPA is responsible for the implementation and enforcement of the CAA, which establishes federal NAAQS, specifies future dates for achieving compliance, and requires USEPA to designate areas as attainment, nonattainment, or maintenance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for each criteria pollutant for which the state has not achieved the applicable NAAQS. The SIP includes pollution control measures that demonstrate how the standards for those pollutants will be met. The sections of the CAA most applicable to the project include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions).[83,84]

Title I requirements are implemented for the purpose of attaining NAAQS for criteria air pollutants. The NAAQS were amended in July 1997 to include an 8-hour standard for ozone and

81 42 United States Code §7401 et seq. (1970).

82 United States Environmental Protection Agency (USEPA) Summary of the Clean Air Act, last updated September 12,2022. https://www.epa.gov/laws-regulations/summary-clean-air-act. Accessed November 2022

83 USEPA, Clean Air Act Text, Clean Air Act Table of Contents by Title, last updated May 4, 2022, https://www.epa.gov/clean-air-act-overview/clean-air-act-text#toc. Accessed November 2022. As shown therein, Title I addresses nonattainment areas and Title II addresses mobile sources.

84 Mobile sources include on-road vehicles (e.g., cars, buses, motorcycles) and non-road vehicles e.g. aircraft, trains, construction equipment). Stationary sources are comprised of both point and area sources. Point sources are stationary facilities that emit large amount of pollutants (e.g. municipal waste incinerators, power plants). Area sources are smaller stationary sources that alone are not large emitters, but combined can account for large amounts of pollutants (e.g., consumer products, residential heating, dry cleaners).

to adopt a NAAQS for PM2.5. The NAAQS were also amended in September 2006 to include an established methodology for calculating PM2.5, as well to revoke the annual PM10 threshold.

Table 2, *Ambient Air Quality Standards*, shows the NAAQS currently in effect for each criteria pollutant. The NAAQS and the CAAQS for the California criteria air pollutants (discussed below) have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including against decreased visibility and damage to animals, crops, vegetation, and buildings.[85] In addition to criteria pollutants, Title I also includes air toxics provisions which require USEPA to develop and enforce regulations to protect the public from exposure to airborne contaminants that are known to be hazardous to human health. In accordance with Section 112, USEPA establishes National Emission Standards for Hazardous Air Pollutants. The list of hazardous air pollutants (HAPs), or air toxics, includes specific compounds that are known or suspected to cause cancer or other serious health effects. It also includes the requirements for the Prevention of Significant Deterioration (PSD) of Air Quality, which sets limits on sulfur oxide and particulate matter and other pollutants as outlined in Sections 163 and 166.

a California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

b National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms/per cubic meter (µg/m^3) is equal to or less than one. For $PM_{2.5}$, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.

c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

d Any equivalent procedure which can be shown to the satisfaction of the California Air Resources Board to give equivalent results at or near the level of the air quality standard may be used.

e National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

f National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

Pollutant	Average Time	California Standards[a]		National Standards[b]		
		Concentration[c]	Method[d]	Primary[c,e]	Secondary[c,f]	Method[g]

g Reference method as described by the USEPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the USEPA.
h On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
i To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
j On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
k On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3.
l The California Air Resources Board has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
m The national standard for lead was revised on October 15, 2008 to a rolling three-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
n In 1989, the California Air Resources Board converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Source: California Air Resources Board, Ambient Air Quality Standards (5/4/16). Available https://ww2.arb.ca.gov/resources/documents/ambient-air-quality-standards-0. Accessed November 2022.

Additionally, Title I also includes measures for the Prevention of Significant Deterioration (PSD) of Air Quality (40 CFR 52.21) which requires new and modified stationary sources to demonstrate that their allowable emissions will not cause or contribute to a violation of "any national ambient air quality standard in any air quality control region. Under the PSD, major sources located in a NAAQS attainment or unclassifiable area require the following: installation of Best Available Control Technology (BACT); an air quality analysis (specifically for the PSD permit which demonstrates that new emissions would not cause or contribute to a violation of any applicable NAAQS or PSD increment[86]); an additional impact analysis; and public involvement.[87] The PSD permit dos not prevent sources from increasing emissions, but is designed to:[88]

- Protect public health and welfare.
- Preserve, protect and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value.
- Ensure that economic growth will occur in a manner consistent with the preservation of existing clean air resources.
- Assure that emissions from any source in any state will not interfere with any portion of the applicable implementation plan to prevent significant deterioration of air quality for any other State.

86 A PSD increment is the amount of pollution an area is allowed to increase. PSD increments prevent the air quality in clean areas from deteriorating to the level set by the NAAQS.
87 USEPA, Prevention of Significant Deterioration Basic Information, last updated February 14, 2022. https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information. Accessed November 2022.
88 USEPA, Prevention of Significant Deterioration Basic Information, last updated February 14, 2022.

- Assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decision making process.

Title II requirements pertain to mobile sources, such as cars, trucks, buses, and planes. Reformulated gasoline, automobile pollution control devices, and vapor recovery nozzles on gas pumps are a few of the mechanisms the USEPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for NO_X emissions have been lowered substantially, and the specification requirements for cleaner burning gasoline are more stringent.

Table 3, *EKCAPCD Attainment Status*, shows the attainment status of the Air Basin for each criteria pollutant. As shown in Table 3, the Air Basin is designated under federal or state ambient air quality standards as nonattainment for ozone and PM10. As detailed in the EKCAPCD 2020-2021 Information Report[89], the major sources of air pollution in the Air Basin are mining, military, aerospace, farming, cannabis, renewable energy, and most recently the wildfires.

Title V of the CAA, as amended in 1990, creates an operating permit program for certain defined major sources. In general, owner/operators of defined industrial or commercial sources that emit more than 100 tons per year (tpy) of any pollutant must process a Title V permit. However, in non-attainment areas, lower thresholds apply as defined in the CAA. Additionally, major source thresholds for HAPs are 10 tpy for a single HAP or 25 tpy for any combination of HAPs. As EKAPCD is in severe non-attainment for ozone, the threshold changes from 100 tpy to 25 tpy.

Title V does not impose any new air pollution standards, require installation of any new controls on the affected facilities, or require reductions in emissions. Title V does enhance public and EPA participation in the permitting process and requires additional record keeping and reporting by businesses, which results in significant administrative requirements.

89 EKCAPCD, *2020 – 2021 Information Report*, 2021. http://www.kernair.org/Documents/Desert_Breeze/EKAPCD_2020-2021_Report.pdf. Accessed November 2022.

TABLE 3
EKAPCD ATTAINMENT STATUS

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
O_3 (1-hour standard)	Attainment/Maintenance [a b]	Non-attainment
O_3 (8-hour standard)	Non-attainment – Severe	Non-attainment
CO	Unclassified/Attainment	Unclassified
NO_2	Unclassified/Attainment	Attainment
SO_2	Unclassified/Attainment	Attainment
PM10	Unclassified/Attainment [d]	Non-attainment
PM2.5	Unclassified/Attainment	Unclassified
Lead (Pb)	Unclassified/Attainment	Attainment
Visibility Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride [c]	N/A	N/A

N/A = not applicable

[a] The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

[b] EKAPCD was in attainment for the 1-hour ozone NAAQS at time of revocation, the proposed Attainment Maintenance designation's effective date was June 21, 2005, therefore it did not become effective.

[c] In 1990, the California Air Resources Board identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, the California Air Resources Board does not monitor or make status designations for this pollutant.

[d] The proposed project area is located in the part of EKAPCD that is Unclassified/Attainment, the Kern River/Cummings Valleys area is classified as Non-attainment – Serious, and the Indian Wells Valley is classified at Attainment Maintenance.

2.1.1 New Source Review

New Source Review (NSR) is a Clean Air Act program that requires industrial facilities to install modern pollution control equipment when they are built or when making a change that increases emissions significantly.[90] The program accomplishes this when owners or operators obtain permits limiting air emissions before they begin construction.

There are three types of NSR permitting requirements: Prevention of Significant Deterioration (PSD), Nonattainment NSR, and Minor source permits. Most NSR permits are issued by state or local air pollution control agencies with the USEPA issues permits in some cases.[91]

[90] United States Environmental Protection Agency. Fact Sheet: New Source Review. Available: https://www.epa.gov/sites/default/files/2015-12/documents/nsrbasicsfactsheet103106.pdf.

[91] United States Environmental Protection Agency. New Source Review Permitting. https://www.epa.gov/nsr. Accessed on January 17, 2023.

2.1.2 Prevention of Significant Deterioration (PSD)

PSD applies to new major sources or major modifications at existing sources for pollutants where the area the source is located is in attainment or unclassified with the NAAQS.[92]

A PSD permit requires the following:

- Installation of the Best Available Control Technology;
- An air quality analysis
- An additional impact analysis; and
- Public involvement.

PSD does not prevent sources from increasing emissions.[93] Instead, PSD is designed to: Protect public health and welfare; preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value; insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources; and assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decision making process.[94]

2.2 State

2.2.1 California Air Resources Board

The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of California to achieve and maintain the CAAQS. CARB, a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the CAAQS, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's SIP, for which it

[92] United States Environmental Protection Agency. Prevention of Significant Deterioration Basic Information. Available at: https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information. Accessed on January 17, 2023.

[93] United States Environmental Protection Agency. Prevention of Significant Deterioration Basic Information. Available at: https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information. Accessed on January 17, 2023.

[94] United States Environmental Protection Agency. Prevention of Significant Deterioration Basic Information. Available at: https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information. Accessed on January 17, 2023.

works closely with the federal government and the local air districts. The SIP is required for the state to take over implementation of the federal CAA from USEPA.

2.2.2 California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. The CAAQS are established to protect the health of the most sensitive groups and apply to the same criteria pollutants as the federal Clean Air Act and also includes State-identified criteria pollutants, which are sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride.[95] CARB has primary responsibility for ensuring the implementation of the California Clean Air Act,[96] responding to the federal Clean Air Act planning requirements applicable to the state, and regulating emissions from motor vehicles and consumer products within the state.

Health and Safety Code Section 39607(e) requires CARB to establish and periodically review area designation criteria. Table 3 provides a summary of the attainment status of the Eastern Kern County portion of the Air Basin with respect to the state standards. The Air Basin is designated as attainment for the California standards for sulfates and unclassified for hydrogen sulfide and visibility-reducing particles. The Air Basin is currently in non-attainment for ozone and PM10 under the CAAQS. Since vinyl chloride is a carcinogenic toxic air contaminant, CARB does not classify attainment status for this pollutant.

2.2.3 California Code of Regulations

The California Code of Regulations (CCR) is the official compilation and publication of regulations adopted, amended or repealed by the state agencies pursuant to the Administrative Procedure Act. The CCR includes regulations that pertain to air quality emissions. Specifically, Section 2485 in Title 13 of the CCR states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location. In addition, Section 93115 in Title 17 of the CCR states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

2.2.4 California Air Resources Board On-Road and Off-Road Vehicle Rules

In 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs (Title 13 California Code of Regulations [CCR], Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time.

95 CARB, California Ambient Air Quality Standards (CAAQS), last reviewed August 10, 2017.
96 Chapter 1568 of the Statutes of 1988.

In 2008 CARB approved the Truck and Bus regulation to reduce NO_X, PM10, and PM2.5 emissions from existing diesel vehicles operating in California (13 CCR, Section 2025). The requirements were amended to apply to nearly all diesel-fueled trucks and busses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. For the largest trucks in the fleet, those with a GVWR greater than 26,000 pounds, there are 2 methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over 8 years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the state subject to this option would meet or exceed the 2010 engine emission standards for NO_X and PM by 2023. The second method, if chosen, required fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, with installation of diesel particulate filters (DPFs) for their entire fleet by January 1, 2016. However, DPFs do not typically lower NO_X emissions. Thus, fleet owners choosing the second option had until 2020 to comply with the 2010 engine emission standards for their trucks and busses.

In addition to limiting exhaust from idling trucks, CARB also promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by the CARB on July 26, 2007, aims to reduce emissions by the installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission controlled models (13 CCR, Section 2449). Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance in 2014, medium fleets in 2017, and small fleets in 2019. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (VDECS) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits (VDECS installation) be fully implemented by 2023 in all equipment for large and medium fleets and by 2028 for small fleets.

2.2.5 Toxic Air Contaminants

The California Air Toxics Program was established in 1983, when the California Legislature adopted Assembly Bill (AB) 1807 to establish a two-step process of risk identification and risk management to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and OEHHA determine if a substance should be formally identified, or “listed”, as a TAC in California. inception of the program, a number of such substances have been listed (https://ww2.arb.ca.gov/resources/documents/carb-identified-toxic-air-contaminants). In 1993, the California Legislature amended the program to identify the 189 federal HAPs as TACs.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on the results of that review, CARB has promulgated a number of ATCMs, both for mobile and stationary sources. As discussed above, in 2004, CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time.

In addition to limiting exhaust from idling trucks, as discussed above, CARB promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation, adopted by CARB on July 26, 2007, aims to reduce emissions by the installation of diesel particulate filters and encouraging the replacement of older, dirtier engines with newer emission controlled models. Reduction over time with occur as implementation is staggered based on fleet size, with the largest operators beginning compliance in 2014 with full implementation by 2023 for large and medium fleets and 2028 for small fleets.

The AB 1807 program is supplemented by the AB 2588 Air Toxics “Hot Spots” program, which was established by the California Legislature in 1987. Under this program, facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks if present. In 1992, the AB 2588 program was amended by Senate Bill (SB) 1731 to require facilities that pose a significant health risk to the community to reduce their risk through implementation of a risk management plan.

2.2.6 California State Implementation Plan

The CAA (and its subsequent amendments) requires each state to prepare an air quality control plan referred to as the SIP. The SIP is a living document that is periodically modified to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The CAA Amendments dictate that states containing areas violating the NAAQS revise their SIPs to include extra control measures to reduce air pollution. The SIP includes strategies and control measures to attain the NAAQS by deadlines established by the CAA. The USEPA has the responsibility to review all SIPs to determine if they conform to the requirements of the CAA. State law makes CARB the lead agency for all purposes related to the SIP. Local air districts and other agencies prepare SIP elements and submit them to CARB for review and approval. CARB then forwards SIP revisions to the EPA for approval and publication in the Federal Register. As discussed below, the *EKCAPCD 2017 Ozone Attainment Plan* informs the District’s portion of the SIP.

2.3 Regional

2.3.1 Eastern Kern Air Pollution Control District

The project site is located within the Mojave Desert Air Basin which encompasses the desert portions of Kern, Los Angeles, Riverside, and San Bernardino Counties. The Basin has four air

districts which regulate air quality. The project site lies within the EKAPCD. EKAPCD is responsible for air quality planning in its portion of the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished though air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles. The EKAPCD has established the following rules and regulations which apply to the project to ensure compliance with local, State, and federal air quality regulations:

Rule 201

Rule 201 establishes permitting requirements for stationary sources to operate. The proposed project must obtain Authority to Construct and Permit to Operate approval under Rule 201.

Rule 201.1

Rule 201.1 implements the requirements of Title V of the CAA for permits to operate for certain sources emitting regulated air pollutants, including attainment and non-attainment pollutants. This rule covers Title I requirements of the CAA, including: New Source Review, PSD, New Source Performance Standards; NAAQS; NESHAPs; Maximum Achievable Control Technologies; Risk Management Plan Preparation and Registration Requirements; Solid Waste Incineration requirements, Consumer and Commercial requirements; Tank Vessel requirements; District prohibitory rules approved by the SIP; Standards or regulation promulgated to a Federal Implementation Plan, and Enhanced Monitoring and Compliance Certification requirements.

Rule 208.2

This Rule establishes criteria by which a project under review by EKAPCD can be found to have no potential for causing a significant environmental impact, and, thus, be granted a general rule exemption pursuant to Section 15061(b)(3) of the State CEQA Guidelines.

For purposes of determining whether a proposed projects has no potential to cause a significant effect on the environment, a new or modified emissions unit (as defined in Rule 210.1, Subsection II.L.) at a facility shall be found to have no potential for causing a significant effect on the environment if the new or modified emissions unit meets all of the following requirements:

A. All answers to the KCAPCD "Environmental Information Form and Initial Study Evaluation" are "No";

B. The proposed new or modified emissions unit will comply with all applicable requirements and limits established in Regulation IV of the Kern County Air Pollution Control District Rules and Regulations, and all provisions of state and federal law and regulations which the Kern County Air Pollution Control District has authority to enforce;

C. Expected emissions from the proposed new or modified emissions unit are calculated using:

    1. Standardized emission factors from published CARB or U.S. EPA sources;

2. Source tests for the same or similar facilities conducted in accordance with CARB or U.S. EPA test methods;

3. Recognized formulas from published engineering and scientific handbooks, material safety data sheets, or other similar published literature;

4. Manufacturer's guarantees; and/or

5. Other fixed standards;

D. Best Available Control Technology (BACT) as required by Rule 210.1, Subsection III.A., is proposed and BACT is established based on:

1. The latest edition of the CARB/U.S. EPA BACT/LAER Clearinghouse;

2. The District's own compilations of BACT for specific types of sources; or

3. A more stringent BACT proposed by the project proponent;

E. Any emission reduction offsets required by Rule 210.1, Subsection III.B., are provided solely from emissions units within the facility at which the new or modified emissions unit is proposed to be constructed and the emission reductions from those units can be determined from source tests, production data, or other existing District records;

F. Any increase in the quantity or type of toxic air contaminants emitted from the facility is shown by a risk assessment prepared in accordance with current Cal-EPA guidelines to have increased cancer risk at any receptor outside the facility perimeter less than one in one million (1 x 10-6) and total hazard index at any receptor outside the facility perimeter less than 0.2; and G. The proposed project will not have a significant impact due to cumulative effects of successive projects of the same type at the same location.

Rule 210.1

Rule 210.1 is EKAPCD's New and Modified Stationary Source Review rule and establishes stationary source offset levels for new and modified stationary sources of air pollutants. Under this rule, the EKAPCD has established required offsets for when the emissions from a source exceed the following trigger levels:

- PM_{10} – 15 tons/year
- SO_X (as SO_2) – 27 tons/year
- VOCs – 25 tons/year
- NO_X (as NO_2) – 25 tons/year.

Additionally, this rule requires BACT for all affected pollutants expected to be emitted from a new emissions unit. Offsets are required for PM10, SOx, NOx, and VOC in federal or state designated PM10, SOx, NOx, or ozone non-attainment areas. After a stationary sources New Source Review (NSR) balance and/or stationary source potential to emit equals or exceeds these

trigger levels and offsets have been provided fully offsetting the NSR balance or the stationary source potential to emit, any additional future increase shall be offset.

Rule 210.4

The purpose of this Rule is to include the federal Prevention of Significant Deterioration rule requirements into the EKAPCD Rules and Regulations by incorporating the federal requirements by reference. The PSD program is a construction permitting program for new major source facilities and major modifications to existing major source facilities located in areas classified as attainment or in areas that are unclassifiable for any criteria air pollutant.

Rule 210.5

This rule prevents adverse impacts to Federal Class I areas. For any new major stationary source or major modification which would have the potential to emit NOx, SOx, or particulate matter in significant amounts and is required to utilize BACT for such pollutants, EKAPCD shall not issue an Authority to Construct unless the analysis required by this Rule demonstrates that an adverse impact on visibility will not occur.

Rule 401

Rule 401 states that a person shall not discharge into the atmosphere, from any single source of emissions whatsoever, any air contaminant from any single emissions source for a period or periods aggregating more than 3 minutes in any one hour which is:

- As dark or darker in shade as that designated as No. 1 on the Ringelmann Chart, as published by the United States Bureau of Mines, or

- Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in Subsection A [of the Rules].

Rule 402

Rule 402 of the EKAPCD's rules and regulations addresses significant man-made dust sources from active operations. An active operation is defined as "Activity capable of generating fugitive dust, including any open storage pile, earth-moving activity, construction/demolition activity, disturbed surface area, and nonemergency movement of motor vehicles on unpaved roadways and any parking lot served by an unpaved road subject to this Rule." Rule 402 applies to specified bulk storage, earthmoving, construction and demolition, and man-made conditions resulting in wind erosion, and includes the following requirements:

- A person shall not cause or allow emissions of fugitive dust from any active operation to remain visible in the atmosphere beyond the property line of the emission source.

- A person shall utilize one or more Reasonably Available Control Measures (RACM) or Bulk Material Control Measures (BMCM) to minimize fugitive dust emissions from each source type that is part of any active operation, including unpaved roadways.

- No person shall conduct a large operation without filing for and obtaining an approved fugitive dust emission control plan. Large operation is defined as "Any construction activity

on any site involving 10 or more contiguous acres of disturbed surface area, or any earthmoving activity exceeding a daily volume of 10,000 cubic yards or relocating more than 2,500 cubic yards per day of bulk materials at least three days per year."

- EKAPCD may require onsite PM10 monitoring for any large operation that causes downwind PM10 ambient concentrations to increase more than 50 micrograms per cubic meter above upwind concentrations as determined by utilizing high-volume particulate matter samplers, or other EPA approved equivalent method(s).

Rule 404.1

Rule 404.1 pertains to Particulate Matter Concentrations – Desert Basin and states:

- A person shall not discharge into the atmosphere from any single source operation, in service on the date this Rule is adopted, particulate matter in excess of 0.2 grains per cubic foot of gas at standard conditions.

- A person shall not discharge into the atmosphere from any single source operation, the construction or modification of which commenced after the adoption of this Rule, particulate matter in excess of 0.1 grains per cubic foot of gas at standard conditions.

Rule 410.1

This rule limits VOC emissions from architectural coatings by specifying VOC content limits, storage, cleanup, and labeling requirements.

Rule 410.4

The purpose of this rule is to limit VOC emissions from the coating of metal parts and products, large appliances parts and products, metal furniture, plastic parts and products, automotive/transportation and business machine plastic parts and products, and pleasure crafts, and from cleaning, storage, and disposal of organic solvents and waste solvent materials associated with such coating operations

Rule 414

Rule 414 states that a person shall not use any compartment of any vessel or device operated for the recovery of oil or tar from effluent water, from any equipment which processes, refines, stores or handles petroleum or coal tar products unless such compartments is equipped with one of the following:

- A solid cover with all openings sealed and totally enclosing the liquid contents of the compartment, except for such breathing vents as are structurally necessary; or

- A floating pontoon or double-deck type cover, equipped with closure seals that have no holes or tears, installed and maintained so that gaps between the compartment wall and seal shall not exceed 0.32 centimeters (1/8 inch) for an accumulative length of 97 percent of the perimeter of the tank, and shall not exceed 1.3 centimeters (1/2 inch) for an accumulative length of the remaining 3 percent of the perimeter of the tank. No gap between the compartment wall and the seal shall exceed 1.3 centimeters (1/2 inch); or

A vapor recovery system with a combined collection and control efficiency of at least 90 percent by weight; Rule 419

Rule 419 states that a person shall not discharge from any source whatsoever such quantities of contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public or that endanger the comfort, repose, health, or safety of such persons or the public or that cause or have a natural tendency to cause injury or damage to business or property.

Rule 423

Rule 423 adopts the EPA's National Emissions Standards for Hazardous Air Pollutants by reference, which grants EKAPCD the ability to ensure that all sources of hazardous air pollution would comply with applicable standards, criteria, and requirements set forth in Title 40, Chapter 1, Parts 61 and 63, of the Code of Federal Regulations that are in effect as of October 10, 2017.

2023 Ozone Air Quality Attainment Plan

In 2008, USEPA adopted a more stringent 8-hour ozone NAAQS of 0.075 ppm, and in 2015, adopted the 8-hour ozone NAAQS of 0.070 ppm. Although EKAPCD attained the 1997 8-hour ozone NAAQS, and the Indian Wells Valley planning area met the new (2008) ozone NAAQS, the EKAPCD's Design Value was higher than 0.075 ppm. In 2012, a portion of the EKAPCD was classified "marginal" nonattainment pursuant to the 2008, 8-hour Ozone NAAQS Air Quality Designations. However, EKAPCD failed to meet the 0.075 ppm standard by the applicable attainment date and was reclassified as "moderate" nonattainment, effective June 3, 2016. As a result, EKAPCD was required to submit a SIP revision for the nonattainment area by January 1, 2017, which showed compliance with statutory and regulatory conditions applicable to the "moderate" designation.[97]

EKAPCD, in partnership with CARB, conducted photochemical modeling along with supplemental analyses to determine whether the EKAPCD could attain the 2008 ozone NAAQS by the "moderate" nonattainment deadline. Modeling indicated EKAPCD would not meet the 0.075 ppm standard by the moderate deadline but could attain it by 2020, which is the attainment date for "serious" nonattainment areas. Pursuant to Section 181(b)(3) of the CAA "Voluntary Reclassification," EKAPCD requested CARB formally submit a request to USEPA asking for voluntary reclassification of EKAPCD from "moderate" to "serious" nonattainment for the 2008, 8-hour ozone NAAQS, and revise the attainment date to December 31, 2020.[98]

In response, on May 15, 2021, the District requested CARB submit documentation to EPA to reclassify the District's nonattainment area from Serious to Severe pursuant to the 2008, O3 NAAQS. On June 25, 2021, EPA approved/conditionally approved, all elements of the 2017, Eastern Kern Ozone SIP, except they deferred action on the Serious area attainment and

97 EKAPCD, *2023 Ozone Attainment Plan for the 2008 & 2015, 8-hour Ozone National Ambient Air Quality Standards (AAQS)*, May 4, 2023. http://www.kernair.org/Documents/Rules/2023%20Attainment%20Plan/EKAPCD_2023_Ozone_Plan_Adopted_5-4-23.pdf. Accessed June 2023.

98 Ibid.

reasonably available control measures (RACM) demonstrations. On July 7, 2021, EPA reclassified the District's nonattainment area to Severe nonattainment pursuant to the 2008, O3 NAAQS, and now required to attain by July 2027.[99]

The 2023 Ozone Air Quality Attainment Plan (2023 AQAP) was adopted by EKAPCD on May 4, 2023. The 2023 AQAP includes required elements of an attainment plan, as well as the emissions reductions, and control measures necessary to demonstrate attainment with the 2008 and 2016 8-hour ozone NAAQS. Modeling completed by EKAPCD indicates that EKAPCD would not attain the 2015, 8-hour O3 NAAQS (0.070 ppm) by the Serious nonattainment date of 2027, but could attain it by 2033, (attainment date for Severe). Pursuant to CAA Section 181(b)(3) "Voluntary Reclassification", EKAPCD is petitioning CARB in the 2023 AQAQP to formally submit a request to the USEPA asking for the voluntary reclassification from "Serious" to "Severe" pursuant to the 2015, 8-hour O3 NAAQS. This will extend the attainment deadline to August 27, 2033. As of June 1, 2023, neither CARB or the USEPA have approved the 2023 AQAP.[100]

EKAPCD Air Quality Guidance Documents

The EKAPCD published the *Guidelines For Preparing An Air Quality Assessment For Use In Environmental Impact Reports*[101] to assist with the preparation of the air quality assessments for use as a technical document in Environmental Impact Reports. These guidelines are intended to ensure that the assumptions and methodology used in the County's environmental documents are uniform from one project to the next to facilitate the comparison of air quality environmental effects. The *Guidelines For Preparing An Air Quality Assessment For Use In Environmental Impact Reports* provides standards, methodologies, and procedures for conducting air quality analyses in EIRs and was used extensively in the preparation of this analysis. EKAPCD recommends using the latest version of all models for the appropriate application.

2.3.2 Kern Council of Governments

Kern Council of Governments (KCOG) is the Metropolitan Planning Organization (MPO) for the region in which the project is located. In addition, on September 23, 2010, CARB adopted the GHG emissions reduction targets of 5 percent per capita reduction by 2020 and 10 percent per capita reduction by 2035 relative to 2005 levels for KCOG.[102] Under SB 375, the reduction target must be incorporated within that region's Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities would then need to be consistent with the SCS; however, Senate Bill 375 expressly provides that the SCS does not regulate the use of land,

99 Ibid.

100 Ibid.

101 EKAPCD, *Guidelines For Preparing An Air Quality Assessment For Use In Environmental Impact Reports*, December 1, 2006. http://www.kernair.org/Documents/CEQA/AirQualityAssessmentPreparationGuidelines.pdf. Accessed November 2022.

102 CARB, Executive Order G-19-203 Kern Council of Governments 2018 Sustainable Communities Strategy CARB Acceptance of GHG Quantification Determination, July 24, 2020. https://ww2.arb.ca.gov/sites/default/files/2020-07/Kern_COG_2018_SCS_Acceptance_of_GHG_Quantification_Determination_Executive_Order.pdf. Accessed October 2022.

and further provides that local land use plans and policies (e.g., general plan) are not required to be consistent with either the RTP or SCS.

Pursuant to Health & Safety Code Section 40460, KCOG is responsible for preparing and approving the portions of the AQMP relating to regional demographic projections and integrated regional land use, housing, employment and transportation programs, measures and strategies. With regard to air quality planning, KCOG adopted the 2018 Regional Transportation Plan and Sustainable Communities Strategy (2018 RTP/SCS)[103], which is an update to the previous 2014 RTP/SCS, on August 16, 2018. The 2018 RTP/SCS seeks to: improve economic vitality, improve air quality, improve the health of communities, improve transportation and public safety, promote the conservation of natural resources and undeveloped land, increase regional access to community services, increase regional and local energy independence and increase opportunities to help shape the communities' future, while successfully achieving the GHG-emission-reduction targets set by CARB. CARB approved that the KCOG 2018 RTP/SCS would achieve the 2020 and 2035 GHG reduction targets.[104] Kern COG makes conformity findings for each air basin. Kern County recently prepared a draft 8-hour ozone air quality conformity analysis to analyze Kern County's federally approved Federal Transportation Improvement Program (FTIP) and the 2018 RTP/SCS. The conformity findings conclude that all air quality conformity requirements have been met.[105]

KCOG adopted the 2022 RTP/SCS[106] on December 16, 2022. The 2022 RTP serves as a blueprint that establishes a set of regional transportation goals, policies, and actions intended to guide development of the planned multimodal transportation systems in Kern County. The 2022 SCS includes land use planning strategies and policies to reduce air emissions from passenger and light duty truck travel by better coordinating transportation expenditures with forecasted development patterns in order to meet the GHG emissions reduction target for the region by achieving a 9 percent reduction in per capita transportation GHG emissions by 2020 and a 15 percent reduction in per capita transportation emissions by 2035 compared to the 2005 level. [107] Compliance with and implementation of the 2022 RTP/SCS policies and strategies would have co-benefits of reducing per capita criteria air pollutant emissions (e.g., nitrogen dioxide, carbon monoxide, etc.) associated with reduced per capita vehicle miles traveled (VMT).

[103] Kern Council of Governments, 2018 Regional Transportation Plan and Sustainable Communities Strategy, August 16, 2018. https://www.kerncog.org/wp-content/uploads/2018/10/2018_RTP.pdf. Accessed October 2022.

[106] Kern Council of Governments, 2022 Regional Transportation Plan and Sustainable Communities Strategy, July 21, 2022. https://www.kerncog.org/category/docs/rtp/. Accessed October 2022.

[107] Kern Council of Governments, 2022 Regional Transportation Plan and Sustainable Communities Strategy, July 21, 2022. https://www.kerncog.org/category/docs/rtp/. Accessed October 2022.

The 2022 RTP/SCS states that Kern County region was home to approximately 927,500 people in 2020 and included approximately 272,900 homes and 341,000 jobs.[108] By 2050, the integrated growth forecast projects that these figures will increase by 299,700 people, with approximately 89,200 more homes and 61,200 more jobs.[109] KCOG's 2022 RTP/SCS provides specific strategies for implementation. These strategies include supporting projects that encourage diverse job opportunities for a variety of skills and education, recreation and cultures and a full-range of shopping, entertainment and services all within a relatively short distance; encouraging employment development around current and planned transit stations and neighborhood commercial centers; encouraging the implementation of a "Complete Streets" policy that meets the needs of all users of the streets, roads and highways including bicyclists, children, persons with disabilities, motorists, electric vehicles, movers of commercial goods, pedestrians, users of public transportation, and seniors; and supporting alternative fueled vehicles.[110]

In addition, the 2022 RTP/SCS includes strategies to promote active transportation; support local planning and projects that serve short trips; promote transportation investments, investments in active transportation, more walkable and bikeable communities that will result in improved air quality and public health and reduced GHG emissions; and support building physical infrastructure such as local and regional bikeways, sidewalk and safe routes to schools pedestrian improvements, regional greenways and first-last mile connections to transit, including to light rail and bus stations. The 2022 RTP/SCS aligns active transportation investments with land use and transportation strategies, increases competitiveness of local agencies for federal and state funding, and expands the potential for all people to use active transportation. CARB is in the process of reviewing the KCOG GHG quantification determination in the 2022 RTP/SCS for future GHG emission reduction targets. Although there are GHG emission reduction targets for passenger vehicles set by CARB for 2045, the 2022 RTP/SCS GHG emission reduction trajectory shows that more aggressive GHG emission reductions are needed for 2045. By meeting and exceeding the SB 375 targets for 2035, as well as achieving an additional 0.4 percent reduction in GHG from transportation-related sources in the ten years between 2035 and 2045, the 2022 RTP/SCS is expected to fulfill and exceed its portion of SB 375 compliance with respect to meeting the state's future GHG emission reduction goals.[111] The conformity findings conclude that all air quality conformity requirements have been met.[112]

2.4 Local

2.4.1 Kern County General Plan

The Kern County General Plan[113] was originally adopted on June 15, 2004 and was last amended on September 22, 2009. It contains the following policies that relate to air quality. The policies and implementation measures in the Kern County General Plan for air quality emissions that are applicable to the project are provided below. The Kern County General Plan contains additional policies, goals, and implementation measures that are more general in nature and are not specific to development such as the proposed project. Therefore, they are not listed below, but all policies, goals, and implementation measures in the Kern County General Plan are incorporated by reference.

Chapter 1: Land Use, Open Space, and Conservation

Policy 18: The air quality implications of new discretionary land use proposals shall be considered in approval of major developments. Special emphasis will be placed on minimizing air quality degradation in the desert to enable effective military operations and in the valley region to meet attainment goals.

Policy 19: In considering discretionary projects for which an Environmental Impact Report must be prepared pursuant to the California Environmental Quality Act, the appropriate decision-making body, as part of its deliberations, will ensure that:

a) All feasible mitigation to reduce significant adverse air quality impacts have been adopted; and

b) The benefits of the proposed project outweigh any unavoidable significant adverse effects on air quality found to exist after inclusion of all feasible mitigation. This finding shall be made in a statement of overriding considerations and shall be supported by factual evidence to the extent that such a statement is required pursuant to the California Environmental Quality Act.

Policy 20: The County shall include fugitive dust control measures as a requirement for discretionary projects and as required by the adopted rules and regulations of the Kern County Air Pollution Control District on ministerial permits.

Implementation Measure F: All discretionary permits shall be referred to the appropriate air district for review and comment.

Implementation Measure G: Discretionary development projects involving the use of tractor-trailer rigs shall incorporate diesel exhaust reduction strategies including, but not limited to: minimizing idling tine and electrical overnight plug-ins.

Implementation Measure H: Discretionary projects may use one or more of the following to reduce air quality effects:

a) Pave dirt roads within the development.

[113] Kern County Planning Department, Kern County General Plan, September 22, 2009. https://psbweb.co.kern.ca.us/planning/pdfs/kcgp/KCGP_Complete.pdf. Accessed October 2022.

b) Pave outside storage areas.

c) Provide additional low volatile organic compounds producing trees on landscape plans.

d) Use of alternative fuel fleet vehicles or hybrid vehicles.

e) Use of emission control devices on diesel equipment.

f) Develop residential neighborhoods without fireplaces or with the use of Environmental Protection Agency certified, low emission natural gas fireplaces.

g) Provide bicycle lockers and shower facilities on site.

h) Increasing the amount of landscaping beyond what is required in the Zoning Ordinance (Chapter 19.86).

i) The use and development of park and ride facilities in outlaying areas.

j) Other strategies that may be recommended by the local Air Pollution Control Districts.

Implementation Measure J: The County should include PM10 control measures as conditions of approval for subdivision maps, site plans, and grading permits.

Chapter 5: Energy Element – Solar Energy Development

Policy 1: The County shall encourage domestic and commercial solar energy uses to conserve fossil fuel and improve air quality.

Policy 2: The County should attempt to identify and remove disincentives to domestic and commercial solar energy development.

Policy 3: The County should permit solar energy development in the desert and valley planning regions that does not pose significant environmental or public health and safety hazards.

Policy 4: The County should encourage solar development in the desert and valley regions previously disturbed and discourage development of energy projects on undisturbed land supporting state or federally protected plant and wildlife species.

Implementation Measure A: The County shall continue to maintain, and update as necessary, provisions in the Kern County Zoning Ordinance to provide adequate development standards for commercial solar energy development.

Implementation Measure B: The County should work with affected state and federal agencies and interest groups to establish consistent policies for solar energy development.

2.4.2 Kern County Best Management Practices for Dust Management

In 2013, solar developers and planners from Los Angeles and Kern Counties began a series of meetings to discuss the best practices for protecting air quality and minimizing construction impacts from solar projects. The process incorporated feedback from the Mojave Air and Space Port, members of the Mojave Chamber of Commerce, Rosamond Municipal Advisory Council, and numerous other community leaders. Subsequent to these meetings, Kern County has developed a new approach to best control fugitive dust emissions and improve air quality in the high desert. The County's approach recognizes that effective dust control management must be site-specific and cannot be "one-size-fits-all" because standard methods do not adequately meet the challenges of such a unique environment as the Mojave Desert region. An effective strategy has to be based on soil conditions, topography, adjacent land uses, and wind direction.

Conditions imposed on the new solar projects in Kern County are more extensive and rigorous than ever before. These include:

- Development of a Site Specific Dust Control Plan that considers ongoing community stakeholder input, to the extent feasible and practicable.
- Use of Global Positioning System (GPS) or lasers to level posts, generally avoiding grading except when elevation changes exceed design requirements.
- When grading is unavoidable, it is to be phased and done with the application of approved chemical dust palliatives (chemical substances applied to a road surface to reduce airborne dust) that stabilize the earth.
- Use of dust suppression measures during road surface preparation activities, including grading and compaction.
- Final road surfaces must be stabilized to achieve a measurable threshold friction velocity (TFV – the wind speed at which erosion starts) equal to or greater than 100 centimeters per second.
- If ground is cleared, plant roots must be left in place where possible.
- Expanded onsite watering processes.
- Vehicle speed for all construction vehicles shall not exceed 15 mph on any unpaved (i.e., without asphalt) surface at the construction site.
- All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least 2 feet of freeboard.
- Sending mailings to residents within 1,000 feet of a project site.

Kern County is also carefully monitoring all solar construction activities to ensure that all mitigation measures are followed and are adequate to minimize dust-related health concerns.

SECTION 3
Thresholds of Significance

The significance thresholds below are derived from the Environmental Checklist question in Appendix G of the *State CEQA Guidelines* and EKAPCD's *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports*. Pursuant to the State CEQA Guidelines (Section 15064.7), a lead agency may consider using, when available, the significance criteria established by the applicable air quality management district or air pollution control district when making determinations of significance. The proposed project would be under the EKAPCD's jurisdiction, and they use air quality significance thresholds in the Kern County Planning Department *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports*.[114] Projects that produce emissions that exceed these thresholds shall be considered significant for a project level and/or cumulatively for impacts to air quality. These thresholds will be used to evaluate the significance of the impacts listed below.

A significant air quality impact would occur if the project would:

a) Conflict with or obstruct implementation of the applicable air quality plan;

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard;

c) Expose sensitive receptors to substantial pollutant concentrations;

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

3.1 Construction and Operational Emissions

Project construction and operational emissions were be modeled, and their significance is based on the adopted significance thresholds in the EKAPCD's and Kern County Planning Department's *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports,* as follows:

a) 25 tons per year ROG[115]/VOC

b) 25 tons per year NOx

[114] Kern County Planning Department, *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports,* December 2006. Available at chrome-extension://efaidnbmnnnibpcajpcglclefindmkaj/http://www.kernair.org/Documents/CEQA/AirQualityAssessmentPreparationGuidelines.pdf, accessed January 5, 2023.

[115] EPA formerly defined the regulated organic compounds in outdoor air as "Reactive Organic Gases" (ROG)). However, EPA changed that terminology to "VOC."

c) 15 tons per year PM10

3.2 Carbon Monoxide Hotspots

With respect to the formation of CO hotspots, the project would be considered significant if the following would occur:

- The project would cause or contribute to an exceedance of the CAAQS one-hour or eight-hour CO standards of 20 or 9.0 ppm, respectively within one-quarter mile of a sensitive receptor.[116]

3.3 Toxic Air Contaminants

Based on criteria set forth by the EKAPCD, the project would expose sensitive receptors to substantial concentrations of toxic air contaminants if any of the following were to occur:

1. Cancer Risk: Emit carcinogenic or toxic contaminants that exceed the maximum individual cancer risk or 10 in one million.
2. Non-Cancer Chronic or Acute Risk: Emit toxic contaminants that exceed the maximum hazard quotient of 1 (unitless).

As discussed further below in subsection 4, *Methodology,* construction impacts from TACs are evaluated quantitatively in a refined health risk assessment (HRA) due to use of heavy-duty, diesel equipment during construction activities. A quantitative HRA is also performed for operations due to the large volumes of scrap metal, rebar production, and the required operation of stationary and off-road sources of TAC emissions.

3.4 Visibility

The visibility threshold for concern is not exceeded if the 98th percentile change in light extinction is less than 5 percent for each year modeled, when compared to the annual average natural condition value for that Class I area.

3.5 Other Emissions (Such as Odors)

With respect to other emissions such as those leading to odors, the project would be considered significant if it created other emissions such as objectionable odors affecting a substantial number of people.

[116] The CAAQS are more conservative than the NAAQS (35 ppm for one-hour CO and 9.0 ppm for eight-hour CO).

SECTION 4
Methodology

The methodology to evaluate potential impacts to regional and local air quality that may result from the construction and long-term operations of the project is conducted as follows. Detailed modeling calculations are provided in **Appendix A** of this Technical Report.

4.1 Consistency with Air Quality Plan

The EKAPCD is required, pursuant to the CAA, to reduce emissions of criteria pollutants for which the Air Basin is in non-attainment of the NAAQS (e.g., ozone). The EKAPCD's 2023 AQAP contains a comprehensive list of RACM's directed at reducing emissions and achieving NAAQS related to these pollutants.[117] EKAPCD's *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports* states that the following should be included in the consistency determination for existing air quality plans:

- Discuss project in relation to Kern COG conformity and traffic analysis zones (TAZs).
- Quantify the emissions from similar projects in the Ozone Attainment Plan for the applicable basin. Discuss the Ozone Attainment Plan for the applicable air district, development, and relation to regional basin, Triennial Plan, and SIP.[118]

4.2 Emissions

4.2.1 Existing Site Emissions

As previously discussed, the project site currently vacant. Thus, there are no existing site emissions.

4.2.2 Project Emissions

The construction and operational emissions were estimated from several emission models, emissions factors, and references, depending on the source type and data availability. Project impacts were quantitatively assessed using the following:

[117] EKAPCD, *2023 Ozone Attainment Plan for the 2008 & 2015, 8-hour Ozone National Ambient Air Quality Standards (AAQS)*, May 4, 2023. http://www.kernair.org/Documents/Rules/2023%20Attainment%20Plan/EKAPCD_2023_Ozone_Plan_Adopted_5-4-23.pdf. Accessed June 2023.

[118] The applicable Ozone Attainment Plan for this Project would be the 2023 AQAP, discussed above.

- Construction equipment horsepower, load factors, and emission factors from the *California Emissions Estimator Model* (CalEEMod) model, version 2020.4.0.

- Vehicle emission factors using EMFAC2021.

- Fugitive dust emission factors for grading, truck loading/dumping, and paved road travel from the CalEEMod model and particulate matter control efficiencies based on watering for construction dust control. Fugitive dust from travel on paved roads was calculated using AP-42 and CARB factors.[119]

- USEPA's AP-42 Compilation of Air Pollutant Emission Factors

  – Chapter 13 (Miscellaneous Sources)

    ▪ 13.4 Wet Cooling Towers

    ▪ 13.2.2 Unpaved Roads

- Burns & McDonnell, Prevention of Significant Deterioration Air Construction Permit Application, Nucor Steel Florida, Inc. August 2018.

- Kern County, Draft Environmental Impact Report, Aratina Solar Project, May 2021.

Construction Emissions

Construction of the project would generate temporary criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and loaders, and through worker vehicle trips and haul trucks traveling to and from the project site. In addition, fugitive dust emissions would result from various soil-handling activities. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions.

Micro Mill

Regional emissions during construction are forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors. Assuming an early date for construction activities is conservative because emission factors decrease in future years due to improvements in engine technology and the retirement of older, dirtier equipment and vehicles from the fleet.

The emissions have been estimated using the California Emissions Estimator Model (CalEEMod) version 2020.4.0, an emissions inventory software program developed by the California Pollution Control Officers Association (CAPCOA), and using the most recent version of CARB's on-road vehicle emissions factor model (EMFAC2021). Construction phasing would include site

[119] CARB Miscellaneous Process Methodologies – Paved Road Dust, https://ww3.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2018.pdf, March 2018. Accessed January 2023.

preparation, grading/excavation, drainage/utilities/trenching, electrical installation, foundations/concrete pour, building erection, mechanical equipment installation, process piping installation, paving and landscaping. The Applicant provided a resource loaded construction schedule, which included the construction phases with the number of equipment pieces allocated in the various subphases. Therefore, not all equipment would be operated during the entire phase but only during the specified subphase. The resource loaded schedule is provided in Appendix A.

Haul truck trips, worker trips, and vendor truck trip estimates were based on information obtained from the Applicant, and the corresponding on-road emissions were calculated using the EMFAC model and Excel spreadsheets. The CalEEMod model was used with project-specific inputs to determine off-road emissions occurring from construction-related activities. CalEEMod relies on emission factors from CARB's OFFROAD2011 model.

Solar Farm

Construction emissions for the solar farm were estimated from a similar solar farm in the same air district.[120] The emissions from the Aratina Solar project, which is larger in acres than that for the proposed project, were scaled based on its size and the size of the proposed solar farm of 64 acres.

Water Line

The construction activities associated with the water line connection from the Antelope Valley-East Kern Water Agency (AVEK) to the proposed site will be analyzed. The location of the water line connection within the project site will be between the employee and visitor car parking area and the solar fields on the western side of the property, continuing linearly due west under the railroad easement and to the edge of the Sierra Highway right-of-way, connecting at approximately 34°56'09.7"N, 118°08'58.0"W, approximately 1,500 ft in length.

Traffic Improvements

The Traffic Impact Study completed for the Project included traffic improvements including installation of traffic signals, a dedicated access lane from Backus Road to the northbound and southbound State Route (SR) 14 (identified as Traffic Mitigation Projects 1 and 2), a concrete overlay along Sopp Road (Traffic Mitigation Project 3), and the addition of one lane in each direction along Sierra Highway from Backus Road to Sopp Road (Traffic Mitigation Project 4). The construction activities associated with these traffic improvements will be analyzed. Construction emissions have been estimated using CalEEMod and EMFAC2021. Construction phasing would include site preparation, grading/excavation, electrical installation, and paving. Haul truck trips, worker trips, and vendor truck trip estimates were based on defaults within CalEEMod.

The yearly emissions from all construction activities were estimated by construction phase and compared to the EKAPCD significance thresholds.

[120] Kern County, Draft Environmental Impact Report, Aratina Solar Project, May 2021.

As stated above, fugitive dust emissions would result from various soil-handling activities during construction of the project. Construction contractors are required to comply with the applicable provision of EKAPCD Rule 402 (Fugitive Dust). As discussed in Section 2.3 above, EKAPCD Rule 402 requires construction activities to control fugitive dust emissions by complying with reasonably available control measures or bulk material control measures to limit visible dust emissions to more than 20 percent opacity. They must meet the conditions for a stabilized surface by creating a fugitive dust emission control plan (Mitigation Measure (MM) AQ-2). Applicable fugitive dust control measures are incorporated into the construction emissions modeling.

Project construction is assumed to start as early as fourth quarter of 2023 and require up to 24 months with full build-out occurring in the fourth quarter of 2025. The construction of the solar farm is not yet known but expected to occur in the future, after full buildout of the micro mill. The solar farm was conservatively assumed to occur over approximately 3 months at the conclusion of the micro mill construction schedule. If construction commences at a later date, construction emissions would be lower than those estimated in this Technical Report due to the use of a more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase-in less-polluting trucks. As a result, should project construction commence at a later date than analyzed in this Technical Report, air quality impacts would be lower than the impacts disclosed herein.

Operational Emissions

Micro Mill Facility

The exact equipment for the proposed project is not yet determined. Therefore, emissions from the micro mill portion of the proposed project, including raw (scrap) material handling, the electric arc furnace (EAF), the ladle metallurgy station (LMS), furnace, casting, rolling, slag, cooling towers, emergency engines, and fuel tanks were calculated using emissions from a similar facility.[121] The emissions from the Nucor facility were scaled based on the anticipated production rate for the project compared to a similar rebar facility's production rate of 450,000 tons of steel produced per year. The emissions from similar processes and equipment were scaled based on the anticipated production rate of 456,000 tons of steel produced per year for the proposed project. It should be noted, the Nucor facility is not an all-electric micro mill but rather does utilize natural gas. The emissions presented herein are considered conservative in nature as the all-electric micro mill will result in lower criteria air pollutant emissions, specifically NOx, VOCs, and SO_2 as well as a small reduction in toxic air containment emissions associated to natural gas combustion. The complete Nucor document can be found in **Appendix B**. Details of the processes and equipment associated with the proposed project are described below.

Raw Material Handling

Recycled shredded and un-shredded scrap metal (i.e. crushed automobiles, old appliances, machinery, sheet metal, rectangular bundles, etc.) for the proposed project would be purchased from outside suppliers and transported into the facility by truck. The scrap metal would be stored in the 34,500-square-foot scrap bay or at the overflow scrap storage piles. Scrap would be moved

[121] Burn & McDonnell Engineering Company, Inc., Prevention of Significant Deterioration Air Construction Permit Application, Nucor Steel Florida, Inc. August 2018.

using a front-end loader and loaded into a conveyor system using magnet cranes to the proposed Electric Arc Furnace (EAF). Approximately 1,373 tons per day would be processed within the micro mill facility. Particulate matter emissions would be generated during the indoor and outdoor scrap handling and storage, from the scrap storage piles and sweepings, and from vehicular traffic on the paved facility roads. A small amount of particulate matter and combustion emissions would also be formed from the torch cutting of larger pieces of scrap.

In addition to the recycled scrap metal, the project would use carbon and fluxing agents as raw materials in the steelmaking process. Raw materials would be delivered to the project site by truck and moved into storage silos. These raw materials would be pneumatically transferred from the silos to the EAF and LMS as needed. Particulate emissions will be generated during the storage and handling of carbon and fluxing agents. The silo would have a dust collector to control dust particles.

Alloy aggregates would be used in the EAF and LMS for refining steel metallurgy. Alloys would be transported by truck, unloaded into storage bins and eventually transferred by front-end loaders or forklift to the EAF/LMS bay for use in the EAF or LMS as needed. Ferro Silicon 75 (an alloy produced by combining 75 percent silicon and 25 percent iron), Ferro Silicon Manganese, Silicon Carbide, Calcium Carbide, Fluorspar, Metallurgical carbon alloys, Ferro Vanadium, Ferro Chrome, and Calcium Silicon alloys may be used as part of the steel making process. Particulate emissions will be generated during the storage and handling of alloy aggregates.

Melt Shop

The melt shop process includes use of the EAF, LMS, casting operations, ladle and tundish preheat burners, and refractory repair. Scrap metal is preheated by the EAF exhaust heat and then fed into the EAF. Chemical and electrical energy would be used to melt the entire batch of scrap metal. Electrical energy is supplied to the furnace interior, while chemical energy is supplied via oxy-fuel burners that burn natural gas mixed with oxygen and use convection and flame radiation to transfer heat to the scrap metal. The melted steel is then transferred to the LMS via a ladle. The main emission control device for the melt shop operations is baghouse called the Fume Treatment Plant which captures emissions from the processes via a Direct Evacuation Control (DEC) system and the Melt Shop building canopy. The melt shop processes would generate particulate matter emissions of metal dusts, while oxy-fuel and preheat burners would be sources of combustion emissions such as NOx and CO. The following subsections describe each process that occurs during the melt shop process:

- ***EAF:*** During the first use of the EAF after downtime, loading of scrap metal would be accomplished using charge buckets, which are transported into position over the EAF using overhead electric cranes. Once in position, the charge bucket would open, allowing scrap to fill the EAF. After the first batch of steel is made, scrap for subsequent batches would be fed to the EAF using a continuous conveyor (i.e., the endless charging system (ECS)). The heating and melting of the scrap metal would generate particulate matter emissions, while the oxy-fuel burners would be a source of combustion emissions.

During the melting, raw materials such as fluxing agents, metallurgic coal or coke, and oxygen would be added to the molten steel in order to achieve the desired product chemistry. Once the desired steel properties are reached in the EAF, the molten steel is poured (i.e., "tapped") into the ladle. The molten steel is then transferred to the LMS via a ladle car. The refining and tapping processes generate emissions of particulate matter.

The slag formed in the EAF would be emptied by tipping the EAF to the side and stored in a stockpile within the EAF/LMS bay. As the slag cools, some limited combustion of residual coke in the slag may occur resulting in emissions of NOx, CO, and SO2. The slag would be subsequently removed from the pit using a front-end loader, quenched using process water, and transported to an outdoor storage pile before being processed on-site.

- ***LMS:*** The ladles filled with molten steel would be transferred from the EAF to the LMS via the ladle car. The molten steel would be further refined with the injection and mixing of raw materials such as fluxing agents, carbon, and alloys into the molten steel. Once the molten steel reaches the desired temperature and composition, the ladle would transport the molten steel to the continuous casting machine. The refining of the molten steel would generate particulate matter emissions.

- ***Casting Operations:*** The ladle is transported to a continuous casting machine within the caster bay. During casting, steel flows out of the bottom of the ladle via a slide gate into a tundish. From the tundish, the steel flows into a single mold. In the mold, the steel is water-cooled and formed into bars (billets).

- ***Ladle and Tundish Preheating:*** All preheating required for the steel refining process will be completed with electric equipment.

Rolling Mill Process

The rolling mill process is a metal forming process in which metal stock is passed through one or more pairs of rolls to reduce the thickness and to make the thickness of the metal uniform. The rolling mill process includes an induction furnace located between the caster and the rolling mill for temperature elevation and stabilization, then a series of rolling mill stands that reduce the cross-sectional area and hot-form final rolled steel reinforcing bar. The products are water quenched for tempering and directed to the cooling beds to cool in the ambient air. The rolled steel is cooled then sheared to length, bundled and stored or fed directly into spooler machines which roll the reinforcing bar into a spool. Automated tying systems would then prepare products for movement by an overhead crane to storage areas, directly to trucks or transferred to the fabrication shop. Particulate emissions in the form of water droplets will be created from the water quenching, as well as VOC and HAP from the oil and grease contamination of the contact water. Rolling mill emissions will vent through the roll mill vent.

Cooling Towers

Two non-contact cooling towers and one contact cooling tower would be used to remove heat from the cooling water used in the proposed project. Cooling towers reduce the temperature of the system by relying on the latent heat of water evaporation to exchange heat between the cooling water and the air passing through the cooling tower. Because cooling towers provide direct contact between the cooling water and the air passing through the tower, some of the liquid water may be entrained in the air stream and be carried out of the tower into the atmosphere as "drift"

droplets. The dissolved solids within these water droplets are a source of particulate matter emissions.

Ancillary Buildings

Operational emission associated with the ancillary buildings part of the project were also calculated. The proposed project includes seven ancillary structures for storeroom and vehicle maintenance, office building, locker room, slag processing office building, containerized power control room, guard shack/scale house, and a trucker restroom facility. Emissions and energy consumption from the ancillary buildings were calculated using CalEEMod version 2020.4.0. Additional sources of emissions would include: 63 acres of ground-mounted solar panels, substation to support solar panels, and a water treatment plant. Mobile source emissions would be generated by vehicle trips traveling to and from the project site. Operational impacts were assessed for the proposed project buildout year of 2025 (i.e., as early as 2025 assuming construction begins at the earliest possible time in 2023).

The project's operational emissions for the ancillary buildings were estimated using CalEEMod to project regional emissions from area and energy sources that would occur during long-term project operations. Mobile source emissions were estimated based on CARB's EMFAC2021 to generate Air Basin-specific vehicle fleet emission factors in units of pounds per mile, and daily trip rates from the project's traffic study.[122]

Area source emissions for the ancillary buildings, including landscaping equipment and consumer products, such as solvents used in non-industrial applications which emit VOCs during their product use and cleaning supplies including aerosols, were calculated using the CalEEMod software. Energy source emissions for the buildings are based on an all-electric consumption. Natural gas will not be utilized at the project site and therefore is not included.

Solar Farm

The exact equipment for the solar farm project have yet to be determined. Therefore, emissions from the 64 acres solar farm were calculated using emissions from a similar facility.[123] The solar farm would consist of solar panels and a substation. No structures or emergency generators would be present on the solar farm. In addition, workers from the Mico Mill Facility would perform routine maintenance such as washing of the solar panels. As such, no area or additional mobile sources are included. Energy sources would be limited to water conveyance required for panel washing. Operational air quality impacts are assessed based on the incremental increase in emissions compared to baseline conditions. As discussed previously, the project site is currently vacant. Therefore, the project's operational emissions analysis would assume all air emissions associated with the project would be considered net new and compared to the EKAPCD annual significance thresholds.

[122] LAV/Pinnacle Engineering, Inc., Traffic Impact Study, Pacific Steel Group Reinforcing Bar Manufacturing Plant, October 10, 2022.

[123] Kern County, Draft Environmental Impact Report, Aratina Solar Project, May 2021.

4.3 Health Risk Assessment

The proposed project would emit TACs from several construction and operational sources. Diesel particulate matter (DPM) would be emitted from construction equipment and diesel trucks, and various toxic compounds from VOCs and metals would be emitting from the micro mill processing. An HRA was conducted to estimate cancer, non-cancer chronic (long-term), and non-cancer acute (short-term) impacts from the proposed project.

The HRA predicted the above health risks using a dispersion model to calculate ground-level concentrations of TACs based on the proposed project's TAC emissions and toxicity and exposure factors provided by the California Office of Environmental Health Hazard Assessment (OEHHA). [124]

EPA's AERMOD atmospheric dispersion model was used to simulate physical conditions and predict pollutant concentrations from construction and operational sources at sensitive receptors near the project site. AERMOD is EPA's preferred air dispersion model for near-field modeling from vented and non-vented sources. The model uses hourly meteorological observations and emission rates to determine hourly average concentrations from which other averaging periods (e.g., 24-hour, annual averages) are determined.

Cancer risk is quantified based on the OEHHA methodology, the residential inhalation cancer risk from the annual average DPM concentrations is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor (ASF), the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. It is important to note that exposure duration is based on a one-year construction period. Cancer risk must be separately calculated for specified age groups, because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure.

Non-cancer chronic impacts are calculated by dividing the annual average concentration by the Reference Exposure level (REL) for that substance. REL is defined as the concentration at which no adverse noncancer health effects are anticipated. Based off OEHHA guidance, the current REL for DPM is 5 $\mu g/m^3$.

For construction health risk, concentration outputs obtained from AERMOD were used with Microsoft Excel workbooks to calculate health risk at the nearby sensitive receptors. For operational health risk, the Hotspots Analysis and Reporting Program Version 2 (HARP2) Air Dispersion & Risk Tool (ADMRT) version 19121 was employed to calculate the health risks at nearby sensitive receptors. Dispersion modeling assumptions and results are provided in Appendix A.

While the project site is relatively isolated, there are sensitive receptors located in the vicinity. The nearest residence is approximately 1,000 feet to the northwest along Dobbs Road. There are other potential sensitive receptors as much greater distances that would observe lesser health risk impacts than the nearest residence.

4.4 Ambient Air Quality Analysis

The Kern County *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports*[125] require a dispersion modeling analysis of the maximum 24-hour average concentrations of PM10 and PM2.5 resulting from construction and operation in comparison to applicable ambient air quality standards and thresholds. The purpose of the AAQA is to determine whether the project's construction and operational emissions would cause or contribute to exceedances of any CAAQS or NAAQS during construction.

4.5 CO Hotspot

Heavy traffic congestion can contribute to high levels of CO. Individuals exposed to these CO "hot-spots" may have a greater likelihood of developing adverse health effects. The potential for the proposed project to result in localized CO impacts at intersections resulting from addition of its traffic volumes is assessed based on Kern County's suggested criteria, which recommends performing a localized CO impact analysis for intersections operating at or below level of service (LOS) E.

4.6 Visibility Impacts

The County guidance states that potential impacts to visibility should be evaluated for all industrial projects and any other projects, such as mining projects, that have components that could generates dust or emissions related to visibility.

The project's emissions to the Class I areas will be below the significance threshold established by USEPA and Federal Land Managers. The analysis will be demonstrated initially by the screening level Q/D approach. In this approach, all visibility-related emissions (SO_2, NO_X, PM10, and sulfuric acid mist) from the project based on 24-hour maximum allowable emissions prorated to annual emissions in units of tons per year will be summed (Q). The sum will be divided by the distance in km (D) from the site to the nearest receptor for each Class I area. If the ratio (Q/D) is less than 10, the project will be presumed to have negligible impact on Class I area visibility and no further analysis will be required. If the Q/D ratio is greater than 10, then long-range transport modeling will be conducted to demonstrate that the 98th percentile change in light extinction is less than 5 percent for each of the 3 years modeled, when compared to the annual average natural condition value for that Class I area.

[125] EKAPCD, *Guidelines For Preparing An Air Quality Assessment For Use In Environmental Impact Reports*, December 1, 2006. http://www.kernair.org/Documents/CEQA/AirQualityAssessmentPreparationGuidelines.pdf. Accessed November 2022.

4.7 Valley Fever (Coccidioides immitis Exposure)

While there are no specific thresholds for the evaluation of potential *Coccidioides immitis* (Valley Fever) exposure, the potential for workers or area residents contracting Valley Fever as a result of the project is evaluated based on the anticipated earth-moving activities, and considers applicant-proposed measures and compliance with Rule 8021, Section 6.3, which requires development and implementation of a dust control plan to help control the release of the *Coccidioides immitis* fungus during construction activities.

4.8 Asbestos

There are no quantitative thresholds related to receptor exposure to asbestos. However, EKAPCD Rule 423 (National Emission Standards for Hazardous Air Pollutants and Source Categories) requires all projects to comply with the provisions of Title 40, Chapter I, Parts 61 and 63, of the Code of Federal Regulations.

SECTION 5
Environmental Impacts

ImpactAIR-1 Conflict with or obstruct the implementation of the applicable air quality plan.

Impact AIR-1: Implementation of the proposed project would conflict with or obstruct implementation of the applicable air quality plan. (*Significant and Unavoidable)*

5.1 Consistency with Air Quality Plan

EKAPCD's most recently adopted air quality management plan is its 2023 AQAP. This AQAP covers the project area since it is located within the boundaries of the EKAPCD. The 2023 AQAP is a road map that demonstrates how the region will, in accordance with the requirements of the California Clean Air Act, implement all feasible measures to reduce ozone precursors (ROG/VOC and NOx) and reduce the transport of O_3 and its precursors to neighboring air basins, in order to achieve the 2008 and 2015 8-hour O_3 NAAQS.

Air quality impacts are controlled through policies and provisions of the EKAPCD, the Kern County General Plan, and the Kern County Code of Building Regulations. The California CAA requires air pollution control districts with severe or extreme air quality problems to provide for a 5 percent reduction in nonattainment emissions per year. The Attainment Plans prepared for the EKAPCD complies with this requirement. CARB reviewers approve or amend the document and forward the plan to USEPA for final review and approval within the SIP.

In determining consistency with the 2023 AQAP, this analysis considers whether the proposed project would (1) support the primary goals of the 2023 AQAP, and (2) include applicable control measures from the 2023 AQAP. The primary goals of the 2023 AQAP are: to protect air quality and public health at the regional and local scale by reducing regional ROG/VOC, NOX, and O_3 emissions and reducing local air-quality-related health risks by meeting the 2008 and 2015 8-hour O_3 NAAQS. Applicable control measures in the 2023 AQAP include the RACM from EKAPCD Rule 425.2 for boilers, steam generators, and process heaters.

In general, a project would not interfere with the applicable air quality plan if it is consistent with growth assumptions used to form the 2023 AQAP. The land uses designated in the Kern County General Plan and the KCOG 2022 RTP/SCS form the basis for the growth assumptions in the 2023 AQAP. The proposed project proposes changing the general land use designation from resource management to heavy industrial and the zone classification from limited agricultural to heavy industrial – precise development combining. This change in land use designation and zone classification would bring additional jobs to the area.

Implementation of the proposed project is consistent with the goals of the Kern County General Plan in providing an adequate and geographically balanced supply of land designated for a range of industrial purposes. The proposed project site is geographically isolated from sensitive uses with the nearest residence located approximately 1,000 feet to the northwest of the project site promoting compatibility with land uses that may be affected by industrial operations while ensuring economic strength for Kern County and its residents. Furthermore, the Project would not include any new residential growth/dwelling units and thus would not include a substantial increase in passenger vehicle and light duty truck trips and be consistent with the goals of the 2022 RTP/SCS.

2023 AQAP Rules

The proposed project, as a steel mill plant, would be considered a new major stationary source and would be subject to EKAPCD's NSR rule. This rule requires new major stationary sources that increase emissions in amounts exceeding specified thresholds to provide emission reduction offsets to mitigate their emissions growth. The applicability threshold for NOx and VOC in Rule 210.1 is 50 tons per year with an offset ratio of 1.2-to-1.0. As such, there should be no net effect on emissions inventories from future construction or modifications at major stationary sources due to offset requirements. To ensure construction or modification of major sources has no net effect on emission inventories used for demonstrating attainment, banked ERCs, which otherwise would not be included as emissions in the baseline and subsequent inventories, must be added back into the inventories, pursuant to federal requirements. The 2023 AQAP (Table 11) includes a list of banked ERCs currently in the EKAPCD's credit bank as of 2022. The banked ERCS would lead to an increase of 0.005 ppb in attainment year O3 design values and would not affect the attainment status. Thus, with compliance of EKAPCD Rule 210.1, construction and operation of the proposed project would comply with the 2023 AQAP rules.

Although the proposed project emissions were not included in the projections for the 2023 AQAP, compliance with EKAPCD's Rule 210.1, NSR would render the proposed project consistent with growth projections of the 2023 AQAP, since they would not increase emissions, over those allowed by the NSR, and would not jeopardize attainment of the 2023 AQAP. Therefore, the proposed project is consistent with the goals of the 2023 AQAP.

Proposed Project Emissions

The construction emissions for the proposed project were estimated for each construction phase and are discussed further below, under Impact 2, and shown in Tables 4 (Unmitigated Construction Emissions) and 5 (Mitigated Construction Emissions). With mitigation, construction emissions would be reduced to below the significance thresholds.

As previously stated, the proposed project would include development of an approximate 475,800 square-foot micro mill facility and with an additional 51,221 square feet of accessory buildings, and an approximate 63-acre accessory solar farm. Operation of the proposed project has the potential to generate emissions from emissions from the micro mill portion of the proposed project, including raw (scrap) material handling, the electric arc furnace (EAF), the ladle metallurgy station (LMS), furnace, casting, rolling, slag, cooling towers, emergency engines, and

fuel tanks.[126] Operational emissions would also be generated from the ancillary buildings and the solar farm. Mobile source emissions would be generated by vehicle trips traveling to and from the project site.

The solar farm portion of the proposed project could also function to reduce the air pollutant emissions within the MDAB to the extent that the power generated is used to offset power production from fossil fueled power plants within (or contributory to) the MDAB. This power production is not projected within the existing air quality plans, and so the solar farm could further aid in reducing air pollutant emissions and increase the potential for attainment of the 2023 AQAP.

As shown below in Impact 2, in Table 6, Unmitigated Proposed Project Long-term Operational Emissions, the proposed project's long-term operational emissions would exceed EKAPCD's applicable significance thresholds.

Mitigation Measures MM AQ-1 and MM AQ-2 would reduce construction emissions by implementing exhaust reduction measures and a Fugitive Dust Control Plan. In addition, compliance with all applicable EKAPCD NSR rules would reduce operational emissions. However as shown in Table 7, Mitigated Proposed Project Long-term Operational Emissions, operational emissions of the project would still exceed EKAPCD CEQA significance thresholds; therefore, impacts would be significant and unavoidable.

Impact AIR-2 Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Impact AIR-2: Implementation of the project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard. (Significant and Unavoidable)

5.2 Emissions

The proposed project is located within the Kern County portion of the MDAB, which is an area that is designated as non-attainment for federal and state ozone standards as well as state PM10 standards and is under the jurisdiction of the EKAPCD. The EKAPCD's approach for assessing cumulative impacts is based on the forecasts of attainment and ambient air quality standards in accordance with requirements of the federal and state clean air acts. With respect to determining the significance of a project's contribution to regional emissions, Kern County, in its *Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports* document, states that projects that produce emissions that exceed the adopted thresholds of the EKAPCD for

[126] Emissions from the micro mill portion of the proposed project were calculated using emissions from a similar facility. However, it should be noted, the Nucor facility is not an all-electric micro mill but rather utilizes natural gas. The emissions presented herein are considered conservative in nature as the all-electric micro mill will result in lower criteria air pollutant emissions, as well as eliminating TAC emissions associated with natural gas combustion.

ROG, NOx, and PM10 shall be considered significant for a project level and/or cumulatively for impacts to air quality. Thus, based on Kern County's guidance, if an individual project results in air pollutant emissions of ROG, NOx, and PM10 that exceed the EKAPCD's thresholds for project-specific impacts, then it would also result in a cumulatively considerable net increase of these pollutants for which the project region is in non-attainment under an applicable federal or state ambient air quality standard.

5.2.1 Construction

Construction of the proposed project would result in the temporary addition of pollutants to the local airshed caused by off-road construction equipment, soil disturbance and on-road haul trucks, vendor trucks, and worker vehicle trips. Criteria air pollutant emissions associated with temporary construction activity were quantified using a combination of emission factors and methodologies from CalEEMod and EMFAC2021. Construction schedule assumptions, including phase type, duration, and sequencing, were based on information provided by the project Applicant and is intended to represent a reasonable scenario based on the best information available. Default values provided in CalEEMod were used where detailed project information was not available. Details of the emission calculations are provided in Appendix A.

Table 4, *Unmitigated Proposed Project Construction Emissions*, presents the annual construction emission generated during construction of the project. As shown, construction-related unmitigated NOx emissions would exceed the EKAPCD numeric significance. Therefore, impacts would be potentially significant before mitigation.

As discussed previously, the project would implement Mitigation Measure AQ-1, which would reduce NOx emissions by implementing diesel exhaust reduction measures including equipment maintenance, Tier 4 equipment, idling restrictions, and alternative fueled equipment. As shown above in Table 5, mitigated construction-related emissions would be less than the EKAPCD numeric significance. Therefore, impacts would be less than significant with mitigation.

As shown in Table 4, temporary unmitigated emissions during construction would exceed the thresholds adopted by EKACPD for NOx.

TABLE 4
UNMITIGATED PROPOSED PROJECT CONSTRUCTION EMISSIONS

Phase and Year	ROG/VOC	NOX	SO2	PM10	PM2.5
Micro Mill [A]					
2023	4.07	35.84	0.19	1.79	1.29

Source: ESA, 2023.

Mitigation Measures MM AQ-1 and MM AQ-2 would be required to reduce fugitive dust emissions by implementing exhaust reduction measures and a Fugitive Dust Control Plan, respectively. Diesel exhaust reduction measures include equipment maintenance, Tier 4 equipment, idling restrictions, alternative fueled equipment, and compliance with CARB and EKAPCD rules. As depicted in **Table 5**, *Mitigated Proposed Project Construction Emissions*, mitigation measures MM AQ-1 and MM AQ-2 would reduce NOx construction emissions to below significance thresholds. Therefore, emissions from construction of the proposed project would be less than significant.

5.2.2 Operation

Operation of the proposed project would generate criteria air pollutants, which were analyzed according to the methodology described above. **Table 6**, *Unmitigated Proposed Project Long-Term Operational Emissions*, provides the annual operational emissions for the project. These emissions are above/below the EKAPCD criteria pollutant mass emissions thresholds, and the impact would be significant.

TABLE 6
UNMITIGATED PROPOSED PROJECT LONG-TERM OPERATIONAL EMISSIONS

Table 7, *Mitigated Proposed Project Long-Term Operational Emissions*, provides the annual operational emissions for the project after implementation of mitigation measure MM AQ-1. These emissions are above/below the EKAPCD criteria pollutant mass emissions thresholds, and the impact would be significant.

Eastern Kern County is currently in nonattainment for the O_3 CAAQS and NAAQS, and the PM_{10} CAAQS (see Table 3). Certain individuals residing in areas that do not meet the CAAQS or NAAQS could be exposed to pollutant concentrations that cause or aggregative acute and/or chronic health conditions (e.g., asthmas, lost work days, premature mortality). A description of the health effects of criteria pollutants can be found in Section 1.4, Existing Air Quality Conditions.

Mitigation Measures

MM AQ-1: Implement Diesel Emission Reduction Measures during Construction and Operation. To control NOx and PM emissions during construction and operation, the project proponent/operator and/or its contractor(s) shall implement the following measures during construction and operation of the project, subject to verification by the County:

a. Off-road equipment engines over 25 horsepower shall be equipped with EPA Tier 4 or higher.

b. All equipment shall be maintained in accordance with the manufacturer's specifications.

c. Heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 5 minutes.

d. Notification shall be provided to trucks and vehicles in loading or unloading queues that their engines shall be turned off when not in use for more than 5 minutes.

e. Electric equipment shall be used to the extent feasible in lieu of diesel or gasoline powered equipment.

f. All vehicles shall be equipped with proper emissions control equipment and kept in good and proper running order to substantially reduce NO_X emissions.

g. Existing electric power sources shall be used to the extent feasible. This measure would minimize the use of higher polluting gas or diesel generators.

h. The hours of operation of heavy-duty equipment and/or the quantity of equipment in use shall be limited to the extent feasible.

i. And any additional emission controls to reduce emissions of PM10 and PM2.5 such that the proposed project would achieve ambient concentration standards, as required by Mitigation Measure MM AQ-3.

MM AQ-2: Implement Fugitive Dust Control Plan during Construction and Operations. To control fugitive PM emissions during construction, prior to the issuance of grading or building permits and any earthwork activities, the project proponent shall prepare a comprehensive Fugitive Dust Control Plan for review by the Kern County Planning and Natural Resources Department. The plan shall include all EKAPCD recommended measures, including but not limited to, the following:

a. All soil being actively excavated or graded shall be sufficiently water to prevent excessive dust. Watering shall occur as needed with complete coverage of disturbed soils areas. Watering shall take place a minimum of three times daily where soil is being actively disturbed, unless dust is otherwise controlled by rainfall or use of a dust suppressant.

b. Vehicle speed for all on site (i.e., within the project boundary) construction vehicles shall not exceed 15 mph on any unpaved surface at the construction site. Signs identifying construction vehicle speed limits shall be posted along onsite roadways, at the site entrance/exit, and along unpaved site access roads.

c. Vehicle speeds on all offsite unpaved project-site access roads (i.e., outside the project boundary) construction vehicles shall not exceed 25 mph. Signs identifying vehicle speed limits shall be posted along unpaved site access roads and at the site entrance/exit.

d. All onsite unpaved roads and offsite unpaved public project-site access road(s) shall be effectively stabilized of dust emissions using water or EKAPCD-approved dust suppressants/palliatives, sufficient to prevent wind-blown dust exceeding 20 percent opacity at nearby residences or public roads. If water is used, watering shall occur a minimum of three times daily, sufficient to keep soil moist along actively used roadways. During the dry season, unpaved road surfaces and vehicle parking/staging areas shall be watered immediately prior to periods of high use (e.g., worker commute periods, truck convoys). Reclaimed (non-potable) water shall be used to the extent available and feasible.

e. The amount of the disturbed area (e.g., grading, excavation) shall be reduced and/or phased where possible.

f. All disturbed areas shall be sufficiently watered or stabilized by EKAPCD-approved methods to prevent excessive dust. On dry days, watering shall occur a minimum of three times daily on actively disturbed areas. Watering frequency shall be increased whenever wind speeds exceed 15 mph or, as necessary, to prevent wind-blown dust exceeding 20 percent opacity at nearby residences or public roads. Reclaimed (nonpotable) water shall be used to the extent available and feasible.

g. All clearing, grading, earth moving, and excavation activities shall cease during periods when dust plumes of 20 percent or greater opacity affect public roads or nearby occupied structures.

h. All disturbed areas anticipated to be inactive for periods of 30 days or more shall be treated to minimize wind-blown dust emissions. Treatment may include, but is not limited to, the application of an EKAPCD-approved chemical dust suppressant, gravel, hydro-mulch, revegetation/seeding, or wood chips.

i. All active and inactive disturbed surface areas shall be stabilized, where feasible.

j. Equipment and vehicle access to disturbed areas shall be limited to only those vehicles necessary to complete the construction activities.

k. Where applicable, permanent dust control measures shall be implemented as soon as possible following completion of any soil-disturbing activities.

l. Stockpiles of dirt or other fine loose material shall be stabilized by watering or other appropriate methods sufficient to reduce visible dust emissions to a limit of 20 percent opacity. If necessary and where feasible, three-sided barriers shall be constructed around storage piles and/or piles shall be covered by use of tarps, hydro-mulch, woodchips, or other materials sufficient to minimize wind-blown dust.

m. Water shall be applied prior to and during the demolition of onsite structures sufficient to minimize wind-blown dust.

n. Where acceptable to the fire department and feasible, weed control shall be accomplished by mowing instead of disking, thereby leaving the ground undisturbed and with a mulch covering.

o. All trucks hauling dirt, sand, soil, or other loose materials shall be covered or shall maintain at least six inches of freeboard (minimum vertical distance between top of the load and top of the trailer) in accordance with California Vehicle Code Section 23114.

p. Gravel pads, grizzly strips, or other material track-out control methods approved for use by EKAPCD shall be installed where vehicles enter or exit unpaved roads onto paved roadways.

q. Haul trucks and off-road equipment leaving the site shall be washed with water or high pressure air, and/or rocks/grates at the project entry points shall be used, when necessary, to remove soil deposits and minimize the track-out/deposition of soil onto nearby paved roadways.

r. During construction paved road surfaces adjacent to the site access road(s), including adjoining paved aprons, shall be cleaned, as necessary, to remove visible accumulations of track-out material. If dry sweepers are used, the area shall be sprayed with water prior to sweeping to minimize the entrainment of dust. Reclaimed water shall be used to the extent available.

s. Portable equipment, 50 horsepower or greater, used during construction activities (e.g., portable generators) shall require California statewide portable equipment registration (issued by CARB) or an EKAPCD permit.

t. The Fugitive Dust Control Plan shall identify a designated person or persons to monitor the fugitive dust emissions and enhance the implementation of the measures, as necessary, to minimize the transport of dust off site and to ensure compliance with identified fugitive dust control measures. Contact information for a hotline shall be

posted on site should any complaints or concerns be received during working hours and holidays and weekend periods when work may not be in progress. The names and telephone numbers of such persons shall be provided to the EKAPCD Compliance Division prior to the start of any grading or earthwork.

u. Signs shall be posted at the project site entrance and written notifications shall be provided a minimum of 30 days prior to initiation of project construction to residential land uses located within 1,000 feet of the project site. The signs and written notifications shall include the following information: (a) Project Name; (b) Anticipated Construction Schedule(s); and (c) Telephone Number(s) for designated construction activity monitor(s) or, if established, a complaint hotline.

v. The designated construction monitor shall document and immediately notify EKAPCD of any air quality complaints received. If necessary, the project operator and/or contractor will coordinate with EKAPCD to identify any additional feasible measures and/or strategies to be implemented to address public complaints.

w. And any additional emission controls to reduce emissions of PM10 and PM2.5 such that the proposed project would achieve ambient concentration standards, as required by Mitigation Measure MM AQ-3.

Level of Significance after Mitigation

With implementation of Mitigation Measures MM AQ-1 and MM AQ-2, construction impacts would be less than significant, but operational impacts would remain significant and unavoidable.

5.2.3 Project Heath Effects of Criteria Air Pollutants

The EPA and CARB have established AAQS at levels above which concentrations could be harmful to human health and welfare, with an adequate margin of safety. Further, California air districts, like the EKAPCD, have established emission-based thresholds that provide project-level estimates of criteria air pollutant quantities that air basins can accommodate without affecting the attainment dates for the AAQS. Accordingly, elevated levels of criteria air pollutants as a result of a project's emissions could cause adverse health effects associated with these pollutants. The EKAPCD is designated as attainment area for O_3 (one hour), PM 10 and $PM_{2.5}$ and nonattainment for O_3 (eight hours) under the NAAQS, and nonattainment for O_3, PM 10 and $PM_{2.5}$ under the CAAQS.

Regarding health effects of criteria air pollutants, implementation of AQ-1 through AQ-4 would reduce the projects potential to result in regional health effects associated with ROG, NO_X, PM_{10} and $PM_{2.5}$; however, localized health effects associated with NO_X, PM_{10}, and $PM_{2.5}$ could occur. However, implementation of the mitigation measures would reduce both localized and regional project generated construction and operational emissions.

In *Sierra Club v. County of Fresno* (S219783) (*Sierra Club*) the Supreme Court held that CEQA requires environmental impact reports to either (i) make a "reasonable effort" to substantively connect the estimated amount of a given air pollutant a project will produce and the health effects associated with that pollutant, or (ii) explain why such an analysis is infeasible (6 Cal.5th at 1165-66). However, the Court also clarified that that CEQA "does not mandate" that EIRs include "an in-depth risk assessment" that provides "a detailed comprehensive analysis … to evaluate and

predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population wide health risks associated with those levels of exposure." *Id.* at 1665. However, correlating the project's criteria air pollutant to specific health impacts, particularly with respect to O_3 is not possible because there is no feasible or established scientific method to perform such analysis. This

conclusion is supported by both the SJVAPCD and the South Coast Air Quality Management District (SCAQMD) who have determined that this type of analysis is speculative and infeasible and there are no unique issues for the EKAPCD that would make this analysis invalid.

Writing as amicus curiae in *Sierra Club,* the SJVAPCD explained that "[t]he health impact of a particular criteria pollutant is analyzed on a regional and not a facility level based on how close the area is to complying with (attaining) the National Ambient Air Quality Standards (NAAQS). Accordingly, while the type of individual facility/health impact analysis that the Court of Appeal has required is a customary practice for TACs, it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task" (SJVAPCD 2015).

Instead, the SJVAPCD explained that it assesses a project's potential to exceed AAQS by evaluating the project's compliance with district thresholds of significance, which are measured in mass emissions (SJVAPCD 2015). As explained by SJVAPCD, its thresholds are based on factual, scientific data and have been set at a level that ensures that AAQS will not be exceeded, taking into consideration all cumulative emission sources (SJVAPCD 2015). The SJVAPCD explained that attempting to connect criteria pollutant emissions to localized health impacts will "not yield reliable information because currently available modeling tools are not well suited for this task" (SJVAPCD 2015). Available models are only equipped to model the impact of all emissions sources on an air basin-wide or regional basis, not on a project-level basis, and "[r]unning the photochemical grid model used for predicting ozone attainment with emissions solely from one project would thus not be likely to yield valid information given the relative scale involved" (SJVAPCD 2015).

This inability to "accurately ascertain local increases in concentration" of mass emissions and then to further link emissions with health effects is particularly true for O_3 and its precursors NO_X and ROG/VOC; O_3 is not directly emitted into the air, but is instead formed as ozone precursors undergo complex chemical reactions through sunlight exposure (SJVAPCD 2015). Given the complex nature of this process, and the fact that O_3 can be transported by wind over long distances, "a specific tonnage amount of NO_X or VOCs emitted in a particular area does not equate to a particular concentration of ozone in that area" (SJVAPCD 2015). For this reason, the photochemical analysis for O_3 is done on a regional scale and it is inappropriate to analyze O_3 impacts at a local or project-level basis because a localized analysis would at most be speculative, and at worst be misleading. Speculative analysis is not required by CEQA (CEQA *Guidelines* Section 15145; *Laurel Heights Improvement Association v. Regents of the University of California* 1988).

The SJVAPCD also explained that the disconnect between the tonnage of precursor pollutants and the concentration of O_3 or particulate matter formed in a particular area is especially important to understand in considering potential health effects because it is the concentration, not the tonnage, that causes health effects (SJVAPCD 2015). The SJVAPCD explained that even if a model were developed that could accurately assess local increases in concentrations of pollutants like O_3 and particulates, it would still be "impossible, using today's models, to correlate that increase in concentration to a specific health impact" (SJVAPCD 2015). The SJVAPCD stated that even a project with criteria pollutant emissions above its CEQA thresholds does not necessarily cause localized human health impacts as, even with relatively high levels of emissions, the SJVAPCD cannot determine "whether and to what extent emissions from an individual project directly impact human health in a particular area" (SJVAPCD 2015). The SJVAPCD explained that this is particularly true for development projects like the proposed project, where most of the criteria pollutants derive from mobile and area sources and not stationary sources. The SCAQMD also, as amicus curiae in *Sierra Club,* made similar points, reiterating that "an agency should not be required to perform analyses that do not produce reliable or meaningful results" (SCAQMD 2015). SCAQMD agrees that it is very difficult to quantify health impacts with regard to O_3, opining that the only possible means of successfully doing so is for a project so large that emissions would essentially amount to *all* regional increases (SCAQMD 2015). With regard to particulate matter, the SCAQMD noted that while the CARB has created a methodology to predict expected mortality from large amount of $PM_{2.5}$, the primary author of the methodology has reported that it "may yield unreliable results due to various uncertainties" and CARB staff has been directed by its Governing Board to reassess and improve it, which factor "also counsels against setting any hard-and-fast rule" about conducting this type of analysis (SCAQMD 2015). The amicus briefs filed by SJVAPCD and SCAQMD in *Sierra Club* are attached as **Appendix C**.

Impact AIR-3 Expose sensitive receptors to substantial pollutant concentrations.

Impact AIR-3: Implementation of the project would not expose sensitive receptors to substantial pollutant concentrations. (Less than Significant)

5.3 Health Risk Assessment

Sensitive receptors are particularly sensitive to air pollution because they are persons that are ill, elderly, or have lungs that are not fully developed. Locations where such persons reside, spend considerable amount of time, or engage in strenuous activities are also referred to as sensitive receptors. Typical sensitive receptors include inhabitants of long-term healthcare facilities, rehabilitation centers, convalescent centers, retirement homes, residences, schools, playgrounds, childcare centers, and athletic facilities. As detailed in the sensitive receptors discussion under Section 4.3.2, the closest sensitive receptors are approximately 1,000 feet from the project borders. Implementation of Mitigation Measure MM AQ-1 would ensure that all readily available and feasible air quality control measures would be implemented to reduce emissions associated with construction and operation.

5.3.1 Toxic Air Contaminants

Projects are evaluated for potential health risk impacts when a new or modified source of TACs is proposed for a location near an existing residential area or other sensitive receptor. An HRA was conducted following OEHHA guidance, as discussed above. The HRA analyzed exposure to TACs starting with the construction period and continuing during operations, for a 30-year exposure period, per the guidance.[127]

The primary TAC concerns during project construction would be DPM emitted within the project site. During operation of the micro mill, DPM from on-road and off-road equipment and other TACs emitted during metal processing are of concern. Operation of the project processes would follow strict compliance with EKAPCD and CARB rules and regulations to limit emissions. The anticipated construction and operational emissions from the proposed project were quantified in the HRA.

Construction plus Operation

Construction activities would generate short-term DPM air quality impacts, which were evaluated in the HRA for the Micro Mill, traffic improvement, and the water line connection. Detailed assumptions and calculations are included in the project-specific *Health Risk Assessment Data* (Appendix A). The HRA evaluated cancer and non-cancer chronic health risks from construction. DPM is the primary TAC associated with construction, and it does not have an acute REL; therefore, acute hazard index was not quantified for construction impacts.

Exposure to TACs during the construction period was assumed to start with a fetus in the third trimester and continue for the 24 months of construction. Breathing rates and age sensitivity factors from the OEHHA guidance were assumed for the age bin from third-trimester fetus to 2 years of age.

Operation of the proposed project once construction is completed would also generate TAC emissions, as described above. Because cancer risk accumulates over time, the HRA evaluated cancer risk from the proposed project's operations with exposure starting at the end of construction. Exposure to TACs during the operational period was assumed to start with a 2-year old child and continue for 28 years, resulting in a total exposure period of 30 years. Breathing rates and age sensitivity factors from the OEHHA guidance for the 2-16 year and 16-30 year age bins were used for the operational exposure period.

Based on the results of the HRA for the construction plus operational period, the unmitigated cancer risk at the maximally exposed individual resident (MEIR) is 15.22 in one million, as shown in **Table 8**, *Maximum Unmitigated Health Risk Impacts for Off-Site Sensitive Receptors*.

[127] OEHHA, Air Toxics Hot Spots Program, Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments, Table 8.5, February 2015, https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf. Accessed January 9, 2023.

This risk level exceeds the 10 in one million threshold established by the EKAPCD.[128] The MEIR is located to the northwest of the project site.

TABLE 8
MAXIMUM UNMITIGATED HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index [a]
Unmitigated Construction	11.93	0.33
Traffic Improvement [b]	0.27	0.057
Water Line [b]	0.03	0.003
Unmitigated Operations	3.29	NA
TOTAL	15.52	0.33 [c]
Maximum Individual Risk Threshold	10	1.0
Exceeds Threshold?	**Yes**	**No**

[a] DPM is the primary TAC associated with construction, and it does not have an acute REL; therefore, acute hazard was not quantified for the construction period.

[b] The maximum risk impacts from these construction studies are added to the maximum risk from Micro Mill construction and operation. This is inherently conservative because the maximum impacts may occur at different receptors than those from the Micro Mill.

[c] The hazard index is not additive as it is not a cumulative impact and operations begin after completion of construction. The maximum chronic hazard index occurs in construction year 2024.

SOURCE: ESA, 2023.

The non-carcinogenic chronic hazard index associated with construction activities was also quantified for proposed project. The unmitigated chronic hazard index at the same MEIR as the cancer impact is 0.33. This value is well below the EKAPCD chronic hazard index threshold of 1.0.

Implementation of Mitigation Measure MM AQ-1 would reduce TAC emissions such that the cancer risk would be reduced to 8.29 in one million, which is below the 10 in one million threshold. The maximum mitigated chronic hazard index at the MEIR is 0.05. The mitigated risks are presented in **Table 9**, *Maximum Mitigated Health Risk Impacts for Off-Site Sensitive Receptors.*

TABLE 9
MAXIMUM MITIGATED HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index [a]
Mitigated Construction	6.4	0.05
Traffic Improvement [b]	0.27	0.057
Water Line [b]	0.03	0.003
Mitigated Operation	1.93	NA
TOTAL	8.59	0.06 [c]
Maximum Individual Risk Threshold	10	1.0
Exceeds Threshold?	**No**	**No**

[a] DPM is the primary TAC associated with construction, and it does not have an acute REL; therefore, acute hazard was not quantified for the construction period.

[b] The maximum risk impacts from these construction studies are added to the maximum risk from Micro Mill construction and operation. This is inherently conservative because the maximum impacts may occur at different receptors than those from the Micro Mill.

[c] The hazard index is not additive as it is not a cumulative impact.

SOURCE: ESA, 2023.

Operations

The HRA also evaluated the health risks from the 30-year exposure period of operations, with exposure starting once construction is completed. This was done to capture the effect of a 30-year exposure starting with the most vulnerable population in the third trimester fetus to 2-year age bin. Breathing rates and age sensitivity factors from the OEHHA guidance were assumed for the age bins including fetus to 2 years, 2 years to 16 years, and 16 years to 30 years. Detailed assumptions and calculations are included in the project specific *Health Risk Assessment Data* (Appendix A).

The modeled cancer risk at the MEIR is 9.97 in one million and is located northeast of the project site. This risk level would not exceed the 10 in one million threshold. The non-carcinogenic chronic and acute hazard impacts associated with project operations were also quantified. The chronic hazard index at the same MEIR as the cancer impact is 0.03 and would not exceed the threshold value of 1. The acute hazard index at the MEIR is 0.21, and would not exceed the threshold value of 1. The acute MEIR is located northwest of the project site. The unmitigated results are shown in **Table 10**, *Maximum Unmitigated 30-Year Operational Health Risk Impacts for Off-Site Sensitive Receptors.*

TABLE 10
MAXIMUM UNMITIGATED 30-YEAR OPERATIONAL HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index	Acute Hazard Index
30-Year Operation	9.97	0.03	0.21
Maximum Individual Risk Threshold	10	1.0	1.0
Exceeds Threshold?	**No**	**No**	**No**

SOURCE: ESA, 2023.

Implementation of Mitigation Measure MM AQ-1 would further reduce TAC emissions by requiring use of Tier 4 on-site heavy equipment such that the cancer risk would be reduced to 5.28 in one million, which is below the 10 in one million threshold. The mitigated results are shown in **Table 11**, *Maximum Mitigated 30-Year Operational Health Risk Impacts for Off-Site Sensitive Receptors*

TABLE 11
MAXIMUM MITIGATED 30-YEAR OPERATIONAL HEALTH RISK IMPACTS FOR OFF-SITE SENSITIVE RECEPTORS

Exposure Scenario	Maximum Cancer Risk (# in one million)	Chronic Hazard Index	Acute Hazard Index
Operation	5.28	0.02	0.21
Maximum Individual Threshold	10	1.0	1.0
Exceeds Threshold?	**No**	**No**	**No**

SOURCE: ESA, 2023.

As shown in Table 11, the cancer risk impacts related to project operations would not exceed the 10 in one million threshold at the MEIR and thus any other nearby sensitive receptors. Additionally, non-carcinogenic and acute hazards at the MEIR are also below EKAPCD thresholds. As such, the health risk impact attributed to the operation of the proposed project would be less than significant.

5.4 Ambient Air Quality Analysis

The proposed project would be required to comply with EKAPCD and USEPA permitting requirements. The project would require a permit application for an Authority to Construction with the EKAPCD, which would require purchase of offsets for non-attainment pollutants greater than the NSR thresholds shown above in Section 2.3. In addition, the proposed project would require a PSD application with the USEPA and undergo a PSD impact analysis of attainment pollutants. To obtain both of these permits, an ambient air quality analysis must show less than significant impacts to the CAAQS and NAAQS. Mitigation Measure AQ-3 would be implemented, which would require the proposed project to meet the CAAQs and NAAQs by reducing emissions before permits are issued by the EKAPCD and USEPA.

Mitigation Measures

No mitigation is required.

5.4.2 Level of Significance

Impacts would be less than significant.

5.5 CO Hotspots

A CO "hotspot" can occur when vehicles are idling at highly congested intersections. CO hotspots can adversely affect nearby sensitive receptors. The Kern County Planning Department's, Guidelines for Preparing an Air Quality Assessment for Use in Environmental Impact Reports (2006) states that CO hotspots must be analyzed when one of the following conditions occur: (a) a project increases traffic at an intersection or roadway that operates at a Level of Service (LOS) E or worse; (b) a project involves adding signalization and/or channelization to an intersection; or (c) sensitive receptors such as residences, schools, hospitals, etc., are located in the vicinity of the affected intersection or signalization.

The proposed project is not located in the vicinity of an intersection that is currently operating at level of service (LOS) C or worse. The project would have trip generation associated with construction worker vehicles and vendor trucks. As construction is only expected to last approximately 24 months, it would be considered temporary and would not result in a long-term source of CO emissions.

With the addition of project-generated traffic, the intersections of Backus Road and Sierra Highway, and Sopp Road and Sierra Highway, would all maintain an LOS of C or better through 2042 and improvements are not warranted.[129] Highway 14 ramp intersections with Backus Road are anticipated to degrade to a LOS of F with project traffic. However, with implementation of Mitigation Measure AQ-3, installation of a traffic signal and expansion of the intersection at full buildout, LOS would be improved to a C or better. Additionally, under year 2042 estimated traffic volumes the State Highway 14 southbound ramp intersection with Backus Road is anticipated to degrade to a LOS of F. With implementation of a traffic signal at SR 14 and the southbound ramp, the LOS would improve the LOS to better than C. Additionally, as previously noted, the traffic study used in the LOS determination includes both passenger vehicle and diesel trucks. However, passenger vehicles, which are predominantly gasoline-fueled, are the primary source of CO emissions at congested intersections. Regardless, with mitigation, the project would not result in intersections operating at or below LOS E. Therefore, the project would not have CO hotspot–related impacts and would not contribute a significant level of CO such that localized air quality and human health would be substantially degraded. Therefore, impacts would be less than significant, and a CO hotspot analysis is not required.

[129] LAV/Pinnacle Engineering, Inc., Traffic Impact Study for Pacific Steel Group Reinforcing Bar Manufacturing Plant, October 10, 2022.

Mitigation Measures

MM AQ-3: Implement Traffic Mitigation Improvement. To improve traffic during operation of the project, the following traffic improvements shall be implemented:

a. State Highway 14 (SR 14) and the northbound ramps Intersections: Installation of a traffic signal and expansion of the intersection to provide one dedicated lane for the westbound right turn on the ramp, and one dedicated lane for each turning movement at the northbound ramp termini at the buildout year of 2023.

b. SR 14 and Southbound Ramps Intersections: Installation of a traffic signal by 2042.

5.6 Visibility Impacts

Visibility at offsite locations may be impacted by emissions of airborne PM from short-term construction activities and long-term operation of the project. Federally designated Class I areas are of particular concern. These include many wilderness areas and national parks. The nearest Class I areas within 100 kilometers (km) of the proposed site include Domeland, San Gabriel, and the Cucamonga Wilderness areas.

Visibility impact analyses are intended for stationary sources of emissions which are subject to the PSD requirements in 40 CFR Part 60. To ensure visibility at offsite locations are not impacted by project emissions, Mitigation Measure AQ-5 would be required, so that the 98th percentile change in light extinction is less than 5 percent for each year modeled, when compared to the annual average natural condition value for that Class I area. Emissions reductions pursuant to Mitigation Measures AQ-1 and AQ-2 would also be implemented to reduce the potential for adverse visibility impacts.

Mitigation Measures

MM AQ-4: Complete a Visibility Impact analysis. Complete a screening procedure approved by the Federal Land Manager that demonstrates the 98th percentile change in light extinction is less than 5 percent for each modeled year, when compared to the annual average natural condition value for the Class I areas within 100 km of the proposed site.

5.6.2 Level of Significance after Mitigation

With implementation of Mitigation Measures AQ-1, AQ-2, and AQ-4, impacts would be less than significant.

5.7 Valley Fever

During the proposed ground disturbing activities associated with the proposed project, the potential exists that such activities could disturb dust particles and, if present, *Coccidioides immitis* (CI) spores, which could then be released into the air and potentially be inhaled by on-site workers and nearby sensitive receptors; exposure to these spores can cause an illness in some individuals known as Valley Fever. Because dust can be an indicator that increased efforts are needed to control other airborne particulates (including CI spores, if any), the project is required

to control dust and the potential for exposure to any CI spores as well as provide training and awareness of Valley Fever via Mitigation Measures AQ-2, and AQ-5 through AQ-7.

Mitigation Measure AQ-2 requires the project to have comprehensive site construction controls in place to proactively control the generation of fugitive dust as required and regulated by the EKAPCD Rule 402. This Rule also requires the site to have a designated dust monitor, as well as visible signage for nearby residents with the phone number for the site construction management and the EKAPKD for nearby residents use if they see blowing dust.

Mitigation Measure AQ-5 requires the project to provide training to construction workers on measures they must take to proactively control and reduce fugitive dust and the potential for the release of CI spores during their ground disturbing activities, training on specific worker/task safety procedures, and general information regarding symptoms testing and treatment options for Valley Fever. All workers are trained in and are expected to use their "stop work" authority if their activities are deemed to be causing the release of fugitive dust. This Mitigation Measure also requires the project to develop an educational Valley Fever Training Handout for distribution to onsite workers and nearby residents. This handout contains general information about the causes, symptoms, and treatment instructions regarding Valley Fever, including contact information of local health departments and clinics knowledgeable about Valley Fever. AQ-4 requires the implementation of a COVD-10 Health and Safety Plan. AQ-7 is proposed to ensure appropriate public awareness regarding Valley Fever.

With the implementation of Mitigation Measures AQ-2, and AQ-5 through AQ-7, the potential for the release of CI spores, if present, and the associated potential for workers or nearby residents to contract Valley Fever would be minimized; accordingly, the proposed project would not add significantly to the existing exposure level of construction workers or nearby residences to the CI fungus.

5.8 Asbestos

Naturally occurring asbestos can be released from serpentinite and ultramafic rocks when the rock is broken or crushed. At the point of release, the asbestos fibers may become airborne, causing air quality and human health hazards. These rocks have been commonly used for unpaved gravel roads, landscaping, fill projects, and other improvement projects in some localities. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading of development projects, and at mining operations.

Serpentinite and/or ultramafic rock are known to be present in 44 of California's 58 counties. These rocks are particularly abundant in the counties associated with the Sierra Nevada foothills, the Klamath Mountains, and Coast Ranges. However, according to information provided by the Department of Conservation Division of Mines and Geology, the project site is not located in an area where naturally occurring asbestos is likely to be present (MBI, 2020a). Therefore, impacts associated with exposure of construction workers and nearby sensitive receptors to asbestos would be less than significant.

5.8.1 Mitigation Measures

Implement Mitigation Measures AQ-1 and AQ-2 and:

MM AQ-5: Minimize Exposure to Potential Airborne Valley Fever–Containing Dust. To minimize personnel and public exposure to potential Valley Fever–containing dust on and off site, the following control measures shall be implemented during project construction:

a. Equipment, vehicles, and other items shall be thoroughly cleaned of dust before they are moved off site to other work locations.

b. Wherever possible, grading and trenching work shall be phased so that earth-moving equipment is working well ahead or downwind of workers on the ground.

c. The area immediately behind grading or trenching equipment shall be sprayed with water before ground workers move into the area.

d. In the event that a water truck runs out of water before dust is sufficiently dampened, ground workers being exposed to dust shall leave the area until a truck can resume water spraying.

e. To the greatest extent feasible, heavy-duty earth-moving vehicles shall be closed-cab and equipped with a HEP-filtered air system.

f. Workers shall receive training in procedures to minimize activities that may result in the release of airborne Coccidioides immitis (CI) spores, to recognize the symptoms of Valley Fever, and shall be instructed to promptly report suspected symptoms of work related Valley Fever to a supervisor. Evidence of training shall be provided to the Kern County Planning and Natural Resources Department within 5 days of the training session.

g. A Valley Fever informational handout shall be provided to all onsite construction personnel. The handout shall, at a minimum, provide information regarding the symptoms, health effects, preventative measures, and treatment. Additional information and handouts can be obtained by contacting the Kern County Public Health Services Department.

h. Onsite personnel shall be trained on the proper use of personal protective equipment, including respiratory equipment. National Institute for Occupational Safety and Health–approved respirators shall be provided to onsite personal, upon request. When exposure to dust is unavoidable, provide appropriate NIOSH-approved respiratory protection to affected workers. If respiratory protection is deemed necessary, employers must develop and implement a respiratory protection program in accordance with Cal/OSHA's Respiratory Protection standard (8 CCR 5144).

MM AQ-6: At the time of project implementation, a COVID-19 Health and Safety Plan should be prepared in accordance with the Kern County Public Health Services Department and Kern County Health Officer mandates. A copy of the COVID-19 Health and Safety Plan shall be submitted to the Kern County Planning and Natural Resources Department for review and approval.

MM AQ-7: Prior to the issuance of grading permits, a one-time fee shall be paid to the Kern County Public Health Services Department in the amount of $3,200 for Valley Fever public awareness programs.

5.8.2 Level of Significance after Mitigation

Toxic Air Contaminants Except Valley Fever

With implementation of Mitigation Measures AQ-1 through AQ-2, impacts would be less than significant.

Carbon Monoxide

With implementation of Mitigation Measure AQ-3, impacts would be less than significant.

Ambient Air Quality

Impacts would be less than significant.

Visibility

With implementation of Mitigation Measure AQ-4, impacts would be less than significant.

Valley Fever

With implementation of Mitigation Measures AQ-2, and AQ-4 through AQ-7, impacts would be less than significant.

Impact AIR-4 Result in other emissions (such as those leading to odors) affecting a substantial number of people.

Impact AIR-4: Implementation of the project would not result in other emissions (such as those leading to odors adversely affecting a substantial number of people). (Less than Significant)

5.9 Other Emissions (Such as Odors)

Land uses typically producing objectionable odors include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The proposed project is a large industrial facility. However, the majority of the operations would be indoors. Water that has direct contact with contaminants in the steel making process (contact water) would be treated in a wastewater treatment plant. Water that has run through the steel making process would flow to a settling basin where settleable matter is dropped out. An oil skimmer would remove oils from the water in the basin then pumped to a sand filter for further treatment. Treated water would then be stored in a clarified water tank where chemical dosing units are used to balance the water's chemistry. Sewage water would not be treated at the treatment plant. The proposed project would follow EKAPCD rules, including Rule 414 (Wastewater Separators) and 419 (Nuisance) during project operations.

Odors would come predominantly from construction equipment, which would cease immediately after construction is complete. Furthermore, the project would be required to comply with California Code of Regulations, Title 13, Sections 2449(d)(3) and 2485, which minimizes the

idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. This would further reduce the detectable odors from heavy-duty equipment exhaust. Additionally, the project would follow all applicable EKAPCD rules and regulation to keep odors down. Given the large project area and strong prevailing winds at the project site, these odors would be dispersed and would not create significant objectionable odors. As discussed, construction- related odors would be short-term and cease upon project completion. Sparse residences are located in the vicinity of the project site; therefore, short term fueling odors during construction and periodic refueling during long-term operations would not impact a substantial number of people. As such, the proposed project is not expected to result in adverse emissions affecting a substantial number of people.

5.9.1 Mitigation Measures

No mitigation would be required.

5.9.2 Level of Significance

Impacts would be less than significant.

5.10 Cumulative Analysis

Local Air Quality Impacts

By definition, regional air pollution is largely a cumulative impact in that no single project is sufficient in size, by itself, to cause nonattainment of air quality standards. The contribution of a project's air emissions to regional air quality impacts is, by its nature, a cumulative effect. Emissions from cumulative projects in the vicinity could also contribute to cumulative air quality conditions and potentially adverse regional air quality impacts. The project-level thresholds for criteria air pollutants identify levels of emissions for new sources that are not anticipated to result in a considerable net increase in nonattainment criteria air pollutants. Therefore, if a project's emissions are below the project-level thresholds, the project would not result in a considerable contribution to cumulative regional air quality impacts. However, if the project contribution is above the thresholds, then the project would contribute a considerable amount to the cumulative impact. This analysis was conducted under Impact 2, and the project contribution (due to operations) was found to exceed significance thresholds, resulting in a considerable contribution.

5.10.2 Cumulative Projects

There are a total of 35 projects within a six-mile radius of the project site. Of the 35 projects, 16 have been approved, 15 are in the application phase, 3 are in process stage, and 1 is completed/constructed. Since thresholds were exceeded with one approved project from each the 1-mile and the 6-mile, one of the 16 approved projects, and the completed/constructed were selected to demonstrate the localized construction impacts. The Edwards Air Force Base Solar Project is located adjacent and the east of the project site and has been completed and the Bellefield Solar Project (approved) located approximately 4.6 miles north of the project site are included in **Table 12**, *Cumulative Construction Emissions within 1-Mile and 6-Mile Radius*. As shown in Table 12, the combined construction emissions from the project and other potential

projects within 1-mile and 6-miles from the project site would exceed EKAPCD's significance thresholds for NOx and PM10. Under a conservative scenario where construction schedules for all projects would overlap with each other and with the project, the localized effect would result in cumulatively significant construction NO_X and PM_{10} emissions.

TABLE 12
CUMULATIVE CONSTRUCTION EMISSIONS WITHIN 1-MILE AND 6-MILE RADIUS

Project	VOC	NO_X	SOx	PM10
Proposed Project[a]	2.81	16.03	0.38	1.59
Projects within 1-Mile Radius				
Edwards Air Force Base Solar	2.57	23.31	0.08	17.57
Projects within 6-Mile Radius				
Bellefield Solar Project	3.4	23.6	0.1	13.9
EKAPCD Threshold (TPY)	**25**	**25**	**-**	**15**
Exceeds Thresholds?	No	**Yes**	**-**	**Yes**

Notes:

[a] Micro mill emissions calculations were calculated using information provided to ESA and CalEEMod software.

Source: ESA, 2022.

With regard to operations, several of the cumulative projects are renewable energy, residential, and some commercial projects. During operation, the only likely sources of emissions for renewable facilities would be limited to vehicular emissions associated with routine employee vehicle trips for maintenance and monitoring activities, the energy storage system facilities, and emergency backup generators. Additionally, employee trips may also be made for the washing of solar PV panels, which may only occur seasonally throughout the year. During operation of the residential and commercials uses, sources would include vehicular emissions associated with residents, visitors, and delivery vehicle trips to and from the residential uses. Addition emissions from on-sources such as natural gas combustion, landscaping equipment, and use of consumer products would also be emitted. However, as shown in Table 7, operational emissions of the project, even with mitigation, would exceed EKAPCD thresholds. As such, the project's contribution to the cumulative impact would be considerable.

Toxic Air Contaminants

TACs from the proposed project would be considered significant and unavoidable if project-specific risk exceeded cancer, chronic, and acute thresholds listed above. As discussed in Section 4.3.2, mitigated TAC impacts from construction and operation would result in less-than-significant cancer and non-cancer risk. Therefore, the contribution to health risk from project TAC emissions would not be cumulatively considerable, and impacts would be less than significant.

5.10.3 CO Hotspots

The project level discussion of CO hotspots, above, is in itself a cumulative analysis. There is no additional information to present for cumulative impacts. Therefore, as stated above, CO impacts would not be cumulatively considerable and impacts would be less than significant.

Mitigation Measures

See MM AQ-3, above.

Level of Significance after Mitigation

With implementation of Mitigation Measures MM AQ-3, impacts would be less than significant.

5.10.4 Cumulative Impacts Summary

As discussed in Impact Statement 1, the construction emissions generated by the project individually would not exceed EKAPCD thresholds. With regard to project level construction emissions, Mitigation Measures AQ-1, AQ-2, and AQ-5 through AQ-7 would reduce impacts related to NOx and PM_{10} from diesel emissions, reduce dust generation, and address potential Valley Fever risk by implementing fugitive dust control measures, establishing a public complaint protocol for excessive dust generation, and requiring Valley Fever-related training for construction workers. However, assuming on a worst-case basis that the construction schedules for all cumulative projects would overlap with each other and with the proposed project, cumulative impacts during construction could remain significant and unavoidable related to NO_x and PM_{10} emissions.

Operation of the proposed project would result in an overall net reduction of emissions by providing electricity that would displace energy produced from fossil fuels. Operation of the project does not exceed the project level regulatory thresholds and, therefore, would not contribute to a long-term cumulative increase in criteria pollutants. The project's incremental contribution to operational impacts would not be cumulatively considerable.

5.10.5 Mitigation Measures

Implement Mitigation Measures AQ-1 through AQ-6.

5.10.6 Level of Significance after Mitigation

Despite implementation of Mitigation Measures AQ-1 through AQ-6, construction emissions generated by the project and related projects could cumulatively combine and result in a temporary significant and unavoidable cumulative impact. Cumulative operational impacts would be less than significant.

APPENDIX A

Air Quality Calculations and Output Files

A.1
Construction

Pacific Steel Group Mojave Micro Mill
Construction Assumptions

Total Construction Site Area: 174 acres

PROJECT CHARACTERISTICS

Project Name	Mojave Micro Mill Project	
Project Location	Mojave Desert Air Basin	
CEC Zone	7	Mojave
Start of Construction	Apr-23	
Operational Year	2025	
Select Utility Company	Los Angeles Department of Water & Power	

LAND USE

Land Use Type	Land Use Subtype	Unit Amount	Size Metric	Lot Acreage	Square Feet	Population	Notes:
Industrial	General Heavy Industry	502.665	1000 sq ft	174	502,665	0	Lot acreage defaults to 234 acres
Industrial	General Light Industry		1000 sq ft				
Parking	Parking Lot	218	space	5.46	87200		Combine as parking spaces
	Truck Parking Area	50	trailer				
	Truck Staging Area	17	trailer				

MITIGATION

Option	Yes/No	Frequency (per day)	PM10 % Reduction	PM2.5 % Reduction	
Soil Stabilizer for Unpaved Roads	No	n/a	n/a	n/a	
Water Exposed Area	Yes	2	55	55	*Default water mitigation*
Replace Ground Cover of Area Disturbed	No				
Tier 4 equipment	Yes				

From Data Request:
1-2 EA – Road/Street Sweepers for duration
2 EA – Water Trucks for duration

5. Construction Vehicles

Sources:

	Workers Per Day	Worker Trips (per day) *Pacific Steel Data*	Vendor Trips (per day) *CalEEMod Defaults*	Haul Trips (max per day) *Pacific Steel Data*	
3.2 Site Preparation - 2023	24	48			See *Schedule_HAUL* tab for non-phase-specific haul trips
3.3 Grading/Excavation - 2023	45	90		3,200	See *Material Imp_Exp* tab
3.4 Drainage/Utilities/Trenching - 2023	30	60			
3.5 Electrical Installation - 2023	65	130	101		
3.5 Electrical Installation - 2024	65	130	101		
3.5 Electrical Installation - 2025	65	130	101		
3.6 Foundations/Concrete Pour - 2023	150	300	101	6,954	See *Concrete + Paving* tab & ratioed for work days per year
3.6 Foundations/Concrete Pour - 2024	150	300	101	15,714	See *Concrete + Paving* tab & ratioed for work days per year
3.7 Building Erection - 2024	105	210	101		
3.8 Mechanical Equipment Installation - 2024	85	170	101		
3.9 Process Piping Installation - 2024	75	150	101		
3.9 Process Piping Installation - 2025	75	150	101		
3.10 Paving - 2024	35	70			
3.11 Landscaping - 2024	20	40			

Notes:
The CalEEMod default vendor trips assigned to the building construction phases (as well as assigning building construction phase types to electrical installation, etc.) is inherently conservative.
Haul trips for import/export and concrete/paving based on data request assumptions provided to ESA. Non-phase specific haul trips provided to ESA on a monthly schedule in the *Schedule_OFFROAD* tab.
Worker trips based on information provided to ESA.

Pacific Steel Group Mojave Micro Mill
Solar Farm Construction Assumptions

General Notes

Project Size Acreage 63
Project Solar Construction Schedule 4/1/2025 - 6/30/2025

REGIONAL EMISSIONS

Aratina Solar Project

2021 & 2022	ROG	NOx	CO	SOx	PM10 (total)	PM2.5 (total)
Unmitigated Emissions, Tons	3.9	27	36.6	0.2	44.4	7.3
Mitigated Emissions, Tons	3.9	27	36.6	0.2	31	5.1

Note:
Source - Table 10, Aratina Solar Project DEIR, Vol 3 Appendix C, Air Quality and Greenhouse Gs Emissions Documentation

Mojave Micro Mill, Solar Farm Project Component

4/1/2025 - 6/30/2025	ROG	NOx	CO	SOx	PM10	PM2.5
Unmitigated Emissions, Tons	0.0921	0.6377	0.8645	0.0047	1.0487	0.1724
Mitigated Emissions, Tons	0.0921	0.6377	0.8645	0.0047	0.7322	0.1205

Note:
Project emissions scaled to Aratina Solar based on acreage (63 acres vs 2667.2 acres).

HEALTH RISK ASSESSMENT EMISSIONS

Aratina Solar Project

Emissions, PM10 Exhaust
Tons (total over 2021 - 2022)

	Acres	Off-road	On-road
Project Site 1, Table 5	372.6	0.2	0.2
Project Site 2, Table 6	957.3	0.4	0.3
Project Site 3, Table 7	646	0.3	0.3
Project Site 4, Table 8	442.3	0.2	0.2
Project Site 5, Table 9	249	0.2	0.2
Total:	**2667.2**	**1.3**	**1.2**

Note:
Emissions from Aratina Solar Project DEIR, Vol 3 Appendix C, Air Quality and Greenhouse Gs Emissions Documentation
Rounding and tables indicate often <0.1 tons, so using 0.1 tons as conservative

Mojave Micro Mill, Solar Farm Project Component

Emissions, PM10 Exhaust

	Acres	Off-road	On-road
Scaled PM10 emissions (tons):	63	0.031	0.028
Scaled PM10 emissions (lbs):		61.41	56.69

Note:
Project emissions scaled to Aratina Solar based on acreage.
Emissions conservative; potentially include redundant site prep and grading emissions

Pacific Steel Group Mojave Micro Mill
Construction Schedule - Offroad Equipment

Schedule 1 - From Pacific Steel

Phases	Phase Type	Number of Daily Workers	Start	Finish	# of Work Days	# of Days
Site Preparation	Site Preparation	24	2023/04/01	2023/06/30	78	91
Grading/Excavation	Grading	45	2023/05/01	2023/08/30	105	122
Drainage/Utilities/Trenching	Trenching	30	2023/06/01	2023/10/31	131	153
Foundations/Concrete Pour	Building Construction	150	2023/09/01	2024/09/30	339	396
Building Erection	Building Construction	105	2024/01/01	2024/08/30	209	243
Paving	Paving	35	2024/07/01	2024/10/31	106	123
Landscaping	Site Preparation	20	2024/10/01	2024/12/31	79	92
Mechanical Equipment Installation	Building Construction	85	2024/03/01	2024/05/31	79	92
Electrical Installation	Building Construction	65	2023/07/01	2025/03/31	548	640
Process Piping Installation	Building Construction	75	2024/06/01	2025/02/28	234	273
Solar Farm	n/a	n/a	2025/04/01	2025/06/30	78	91

Note:
Applying building construction as phase type will be conservative because it includes vendor trips in the analysis. Equipment and schedule were provided to ESA.
Solar Farm schedule is unknown, but conservatively assumed to follow Mill construction and last 3 months.

Schedule 2 - CalEEMod Order

Phases	Phase Type	Number of Daily Workers	Start	Finish	# of Work Days	# of Days
Site Preparation	Site Preparation	24	2023/04/01	2023/06/30	78	91
Grading/Excavation	Grading	45	2023/05/01	2023/08/30	105	122
Drainage/Utilities/Trenching	Trenching	30	2023/06/01	2023/10/31	131	153
Electrical Installation	Building Construction	65	2023/07/01	2025/03/31	548	640
Foundations/Concrete Pour	Building Construction	150	2023/09/01	2024/09/30	339	396
Building Erection	Building Construction	105	2024/01/01	2024/08/30	209	243
Mechanical Equipment Installation	Building Construction	85	2024/03/01	2024/05/31	79	92
Process Piping Installation	Building Construction	75	2024/06/01	2025/02/28	234	273
Paving	Paving	35	2024/07/01	2024/10/31	106	123
Landscaping	Site Preparation	20	2024/10/01	2024/12/31	79	92

Schedule 3 - CalEEMod Order By Year

Phase Type	Number of Daily Workers	Start	Finish	# of Work Days	# of Days
3.2 Site Preparation - 2023	24	2023/04/01	2023/06/30	78	91
3.3 Grading/Excavation - 2023	45	2023/05/01	2023/08/30	105	122
3.4 Drainage/Utilities/Trenching - 2023	30	2023/06/01	2023/10/31	131	153
3.5 Electrical Installation - 2023	65	2023/07/01	2023/12/31	157	184
3.5 Electrical Installation - 2024	65	2024/01/01	2024/12/31	314	366
3.5 Electrical Installation - 2025	65	2025/01/01	2025/03/31	77	90
3.6 Foundations/Concrete Pour - 2023	150	2023/09/01	2023/12/31	104	122
3.6 Foundations/Concrete Pour - 2024	150	2024/01/01	2024/09/30	235	274
3.7 Building Erection - 2024	105	2024/01/01	2024/08/30	209	243
3.8 Mechanical Equipment Installation - 2024	85	2024/03/01	2024/05/31	79	92
3.9 Process Piping Installation - 2024	75	2024/06/01	2024/12/31	183	214
3.9 Process Piping Installation - 2025	75	2025/01/01	2025/02/28	51	59
3.10 Paving - 2024	35	2024/07/01	2024/10/31	106	123
3.11 Landscaping - 2024	20	2024/10/01	2024/12/31	79	92

Notes:
Assuming no demolition or architectural coating will be required based on data provided to ESA.
The Project Description includes a potential solar farm installation; however it is unknown at this time if it will ever happen and it will not overlap with construction of the Mill.
Landscaping phase is categorized as Site Preparation since there is no "construction of building" and it is more earthwork
Applying building construction as phase type will be conservative because it includes vendor trips in the analysis. Equipment and schedule were provided to ESA.
Landscaping includes preparation of soil, import, digging holes for trees - delivery of Joshua trees

Daily Schedule

Monday through Friday:	6 AM - 5 PM
Saturday:	6 AM - 5 PM
Sunday:	N/A

Pacific Steel Group Mojave Micro Mill

Construction Schedule - Onroad Haul Trips

Haul Phase Schedule

	Estimated Total Trucks	Estimated Total Trucks 1-Way Trips	Estimated Max Trucks/Day During Period	Estimated Max 1-Way Truck Trips/Day During Period	Period from Start of Construction (months)	Start (month/year)	Finish (month/year)	Total Work Days	Days in 2023	Days in 2024	Total 2-Way Truck Trips 2023	Total 2-Way Truck Trips 2024
Construction equipment	250	500	25	50	0 thru 6	2023/04/01	2023/09/30	157	157	0	500	0

Piping Materials	250	500	15	30	4 thru 15	2023/08/01	2024/06/30	287	131	156	228	272
											8702	8078

Annual Haul Trip Schedule

Year	Work Days By Year	Total Trips By Year
2023	235	8702
2024	314	8078
2025	0	0

Pacific Steel Group Mojave Micro Mill
Construction Material Import and Export Assumptions

Would grading and excavation be required YES
Acres disturbed during grading on a maximum (worst-case) construction day 6 acres

3. Soil Import/Export

Acreage of field:	6.6	Reference: SK-100.pdf
Sqft of field:	287,497.15	
Depth in feet of material:	3	
Cu yd or material for field:	32,000.00	**<- Input into CalEEMod (import)**

LANDSCAPE

Information	Amount	Units
Material Import (if applicable):	32,000	Total Import Cubic Yards
Total Amount of vegetation and earthwork	405	Daily Import Cubic Yards
Maximum Number of Haul Trucks	1,600	Total Import Trucks
	20	Daily Import Trucks
Capacity of Haul Trucks	20	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
Distance to Import Site (if known)	20	Miles (default assumption is 20 mi.)
Haul Trips	3,200	Total Round Trip
	40	Daily Round Trips

Pacific Steel Group Mojave Micro Mill
Construction Material Concrete and Paving Assumptions

CONCRETE

Information	Amount	Units
Concrete Pouring Amount	80,620	Total Cubic Yards of Concrete
	217	Average Daily Cubic Yards of Concrete
	2400	Max Daily Cubic Yards of Concrete
Maximum Number of Haul Trucks	10,078	Total Import Trucks
	28	Average Daily Import Trucks
	300	Maximum Daily Import Trucks
Capacity of Haul Trucks	8	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
Distance to Import Site (if known)	20	Miles (default assumption is 20 mi.)
Haul Trips	20,156	Total Round Trip
	56	Average Daily Trips
	600	Maximum Daily Trips

PAVING

Information	Amount	Units
Total Area of Asphalt Paving	5.46	Total Acres
Total Area of Concrete Paving	20,090	CY
Total area of Gravel Area Paving	tbd	Total Acres
Maximum Number of Haul Trucks	1,256	Total Import Trucks
	12	Average Daily Import Trucks
Capacity of Haul Trucks	16	Cubic Yards (typically 10 to 20 cubic yards; Default is 16 cubic yards/20 tons)
Distance to Import Site (if known)	20	Miles (default assumption is 20 mi.)
Haul Trips	2,512	Total Round Trip
	24	Average Daily Trips

*** MODELOPTs: RegDFAULT CONC ELEV RURAL ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION. DRYDPLT = F
**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.

**Other Options Specified:
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: SO2

**Note that special processing requirements apply for the 1-hour SO2 NAAQS - check available guidance.
Model will process user-specified ranks of daily maximum 1-hour values averaged across the number of years modeled.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 176 Source(s); 5 Source Group(s); and 714 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 173 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with a total of 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 19191

**Output Options Selected:
Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 704.40 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 4.0 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: Pacific Steel CHRA.err
**File for Summary of Results: Pacific Steel CHRA.sum
