Subject: Sewer System Analysis for the Guajome Lake Road Project in the City of
Oceanside

Introduction

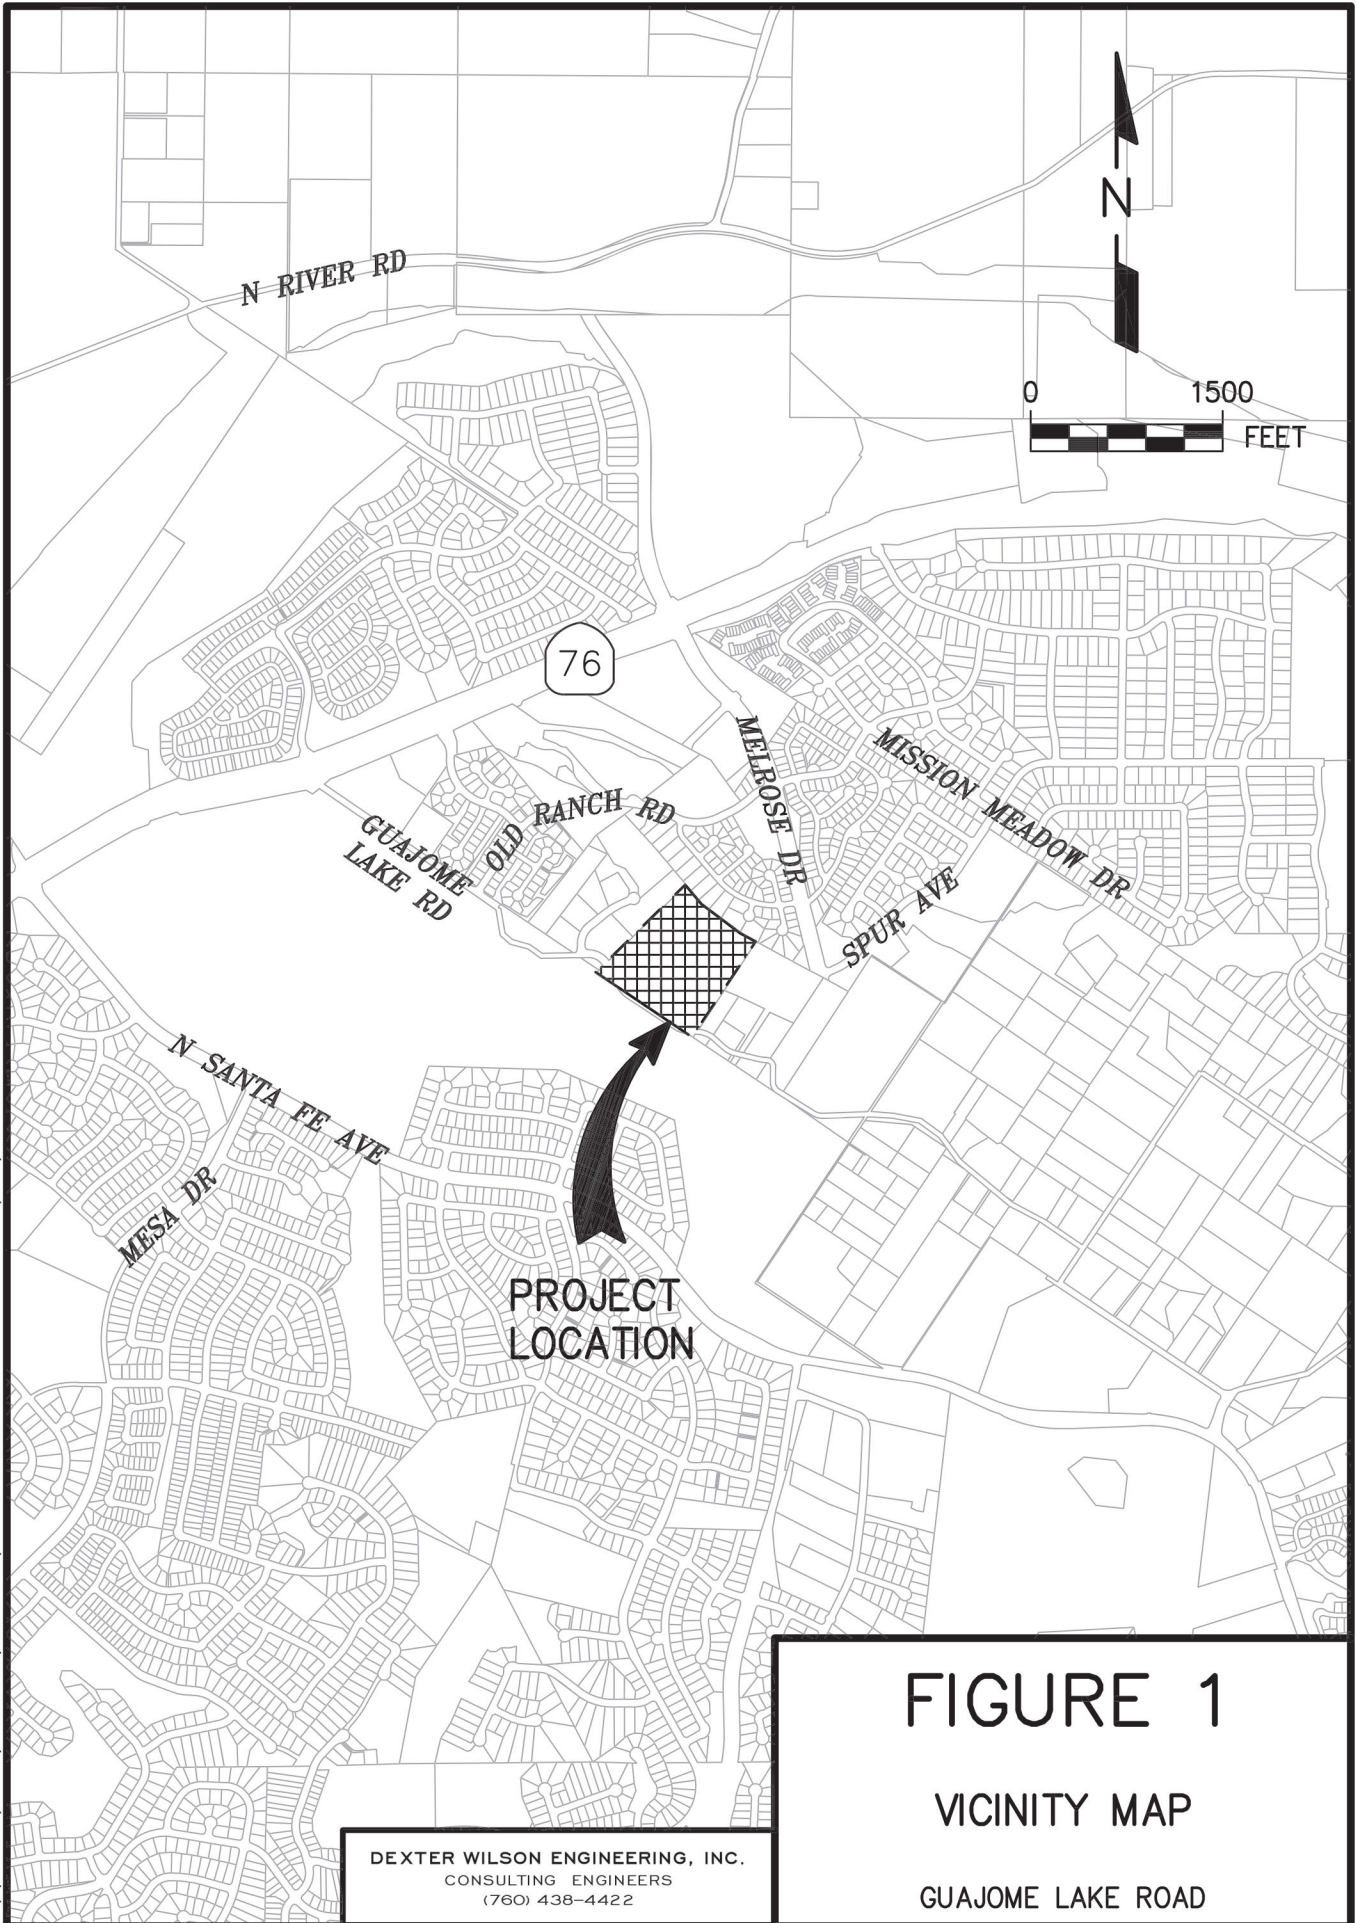

This letter-report provides a public sewer system analysis for the Guajome Lake Road project in the City of Oceanside (City). This letter-report will present the recommended onsite sizing of new private sewer infrastructure, as well as sizing of offsite extensions to connect the project to the existing public system. We will also present recommendations of sewer services.

The Guajome Lake Road project is located south of the I-76 along Guajome Lake Road. The project is proposing a residential development that includes 83 single-family units on a 16.8 acre site. A vicinity map for the project is provided in Figure 1.

Sewer System Design Criteria

Sewer system planning and design criteria for the Guajome Lake Road project are based on Section 3 of the City of Oceanside Design and Construction Manual, revised August 1, 2017.

\\ARTIC\DWG\574021\REPORT\GLR_FIGURE-1_VCMAP.DWG 3/29/2023 12:20:23 PM LAYOUT:8x11 USER:Donald

Sewer Generation Rates and Peaking Factor. Section 3 of the City of Oceanside Design and Construction Manual, revised August 1, 2017 was used to develop average sewer flow for the Guajome Lake Road project.

Daily sewer generation rates based on land use are identified in the City's Design and Construction Manual. These values will be used to analyze the impact of the project's wastewater generation. The sewer generation rates for the Guajome Lake Road project are presented in Table 1.

TABLE 1 CITY OF OCEANSIDE SEWER GENERATION RATES	
Land Use	Generation Rate
Single Family Residential	170 gpd/DU

For residential developments with a population less than 500 the City's Design and Construction Manual requires a peaking factor of 3.5 to convert average dry weather flow to peak wet weather flow.

Manning's "n". The gravity sewer analysis is performed using a computer program which uses the Manning Equation for all of its calculations. The Manning's "n" used by the computer program is held as a constant for all depths in a circular conduit. The value of Manning's "n" used for this study is 0.013 which corresponds with the recommended value in the City's design manual.

Depth and Velocity of Flow in Gravity Sewers. Gravity sewer lines are designed to convey peak wet weather flow. Pipes that are 8-inches in diameter and smaller are designed to convey this flow with a maximum depth-to-diameter (d/D) ratio of 0.50. For public gravity sewer lines the design criteria for minimum velocity is 2.0 feet per second at peak flow or a minimum slope of 1.6 percent. For private gravity sewers, the 2019 California Plumbing Code (CPC) states the minimum slope is 1 percent.

Estimated Sewer Flows for the Guajome Lake Road Project

Based on the sewage generation factors presented in Table 1 the estimated average sewer generation for the project is calculated in Table 2.

TABLE 2 GUAJOME LAKE ROAD ESTIMATED AVERAGE SEWER FLOW				
Land Use	Land Use Description	Sewer Generation Factor	Units	Average Sewer Flow, gpd
Residential	Single Family	170 gpd/EDU	83	14,110
TOTAL				14,110 (9.8 gpm)

As previously mentioned, a peaking factor of 3.5 is used for this analysis. Thus, the peak daily sewage flow for the Guajome Lake Road project is 49,385 gpd (34.3 gpm).

Existing Sewer System

Figure 2 presents a schematic of the existing public sewer system in the vicinity of the project. As shown in Figure 2, the existing public sewer system consists of 8-inch diameter sewer lines in Old Ranch Road and Hitching Post Drive. The sewer in Hitching Post Drive continues northwest to a 15-inch trunk sewer in Highway 76. The closest existing public sewer to the project is approximately 2,000 feet away.

\\ARTIC\DWG\574021\REPORT\GLR_SWR\FIGURE-2_EXSEWER.DWG 3/29/2023 12:19:42 PM LAYOUT:11x17 USER:Donald

Proposed Sewer Facilities

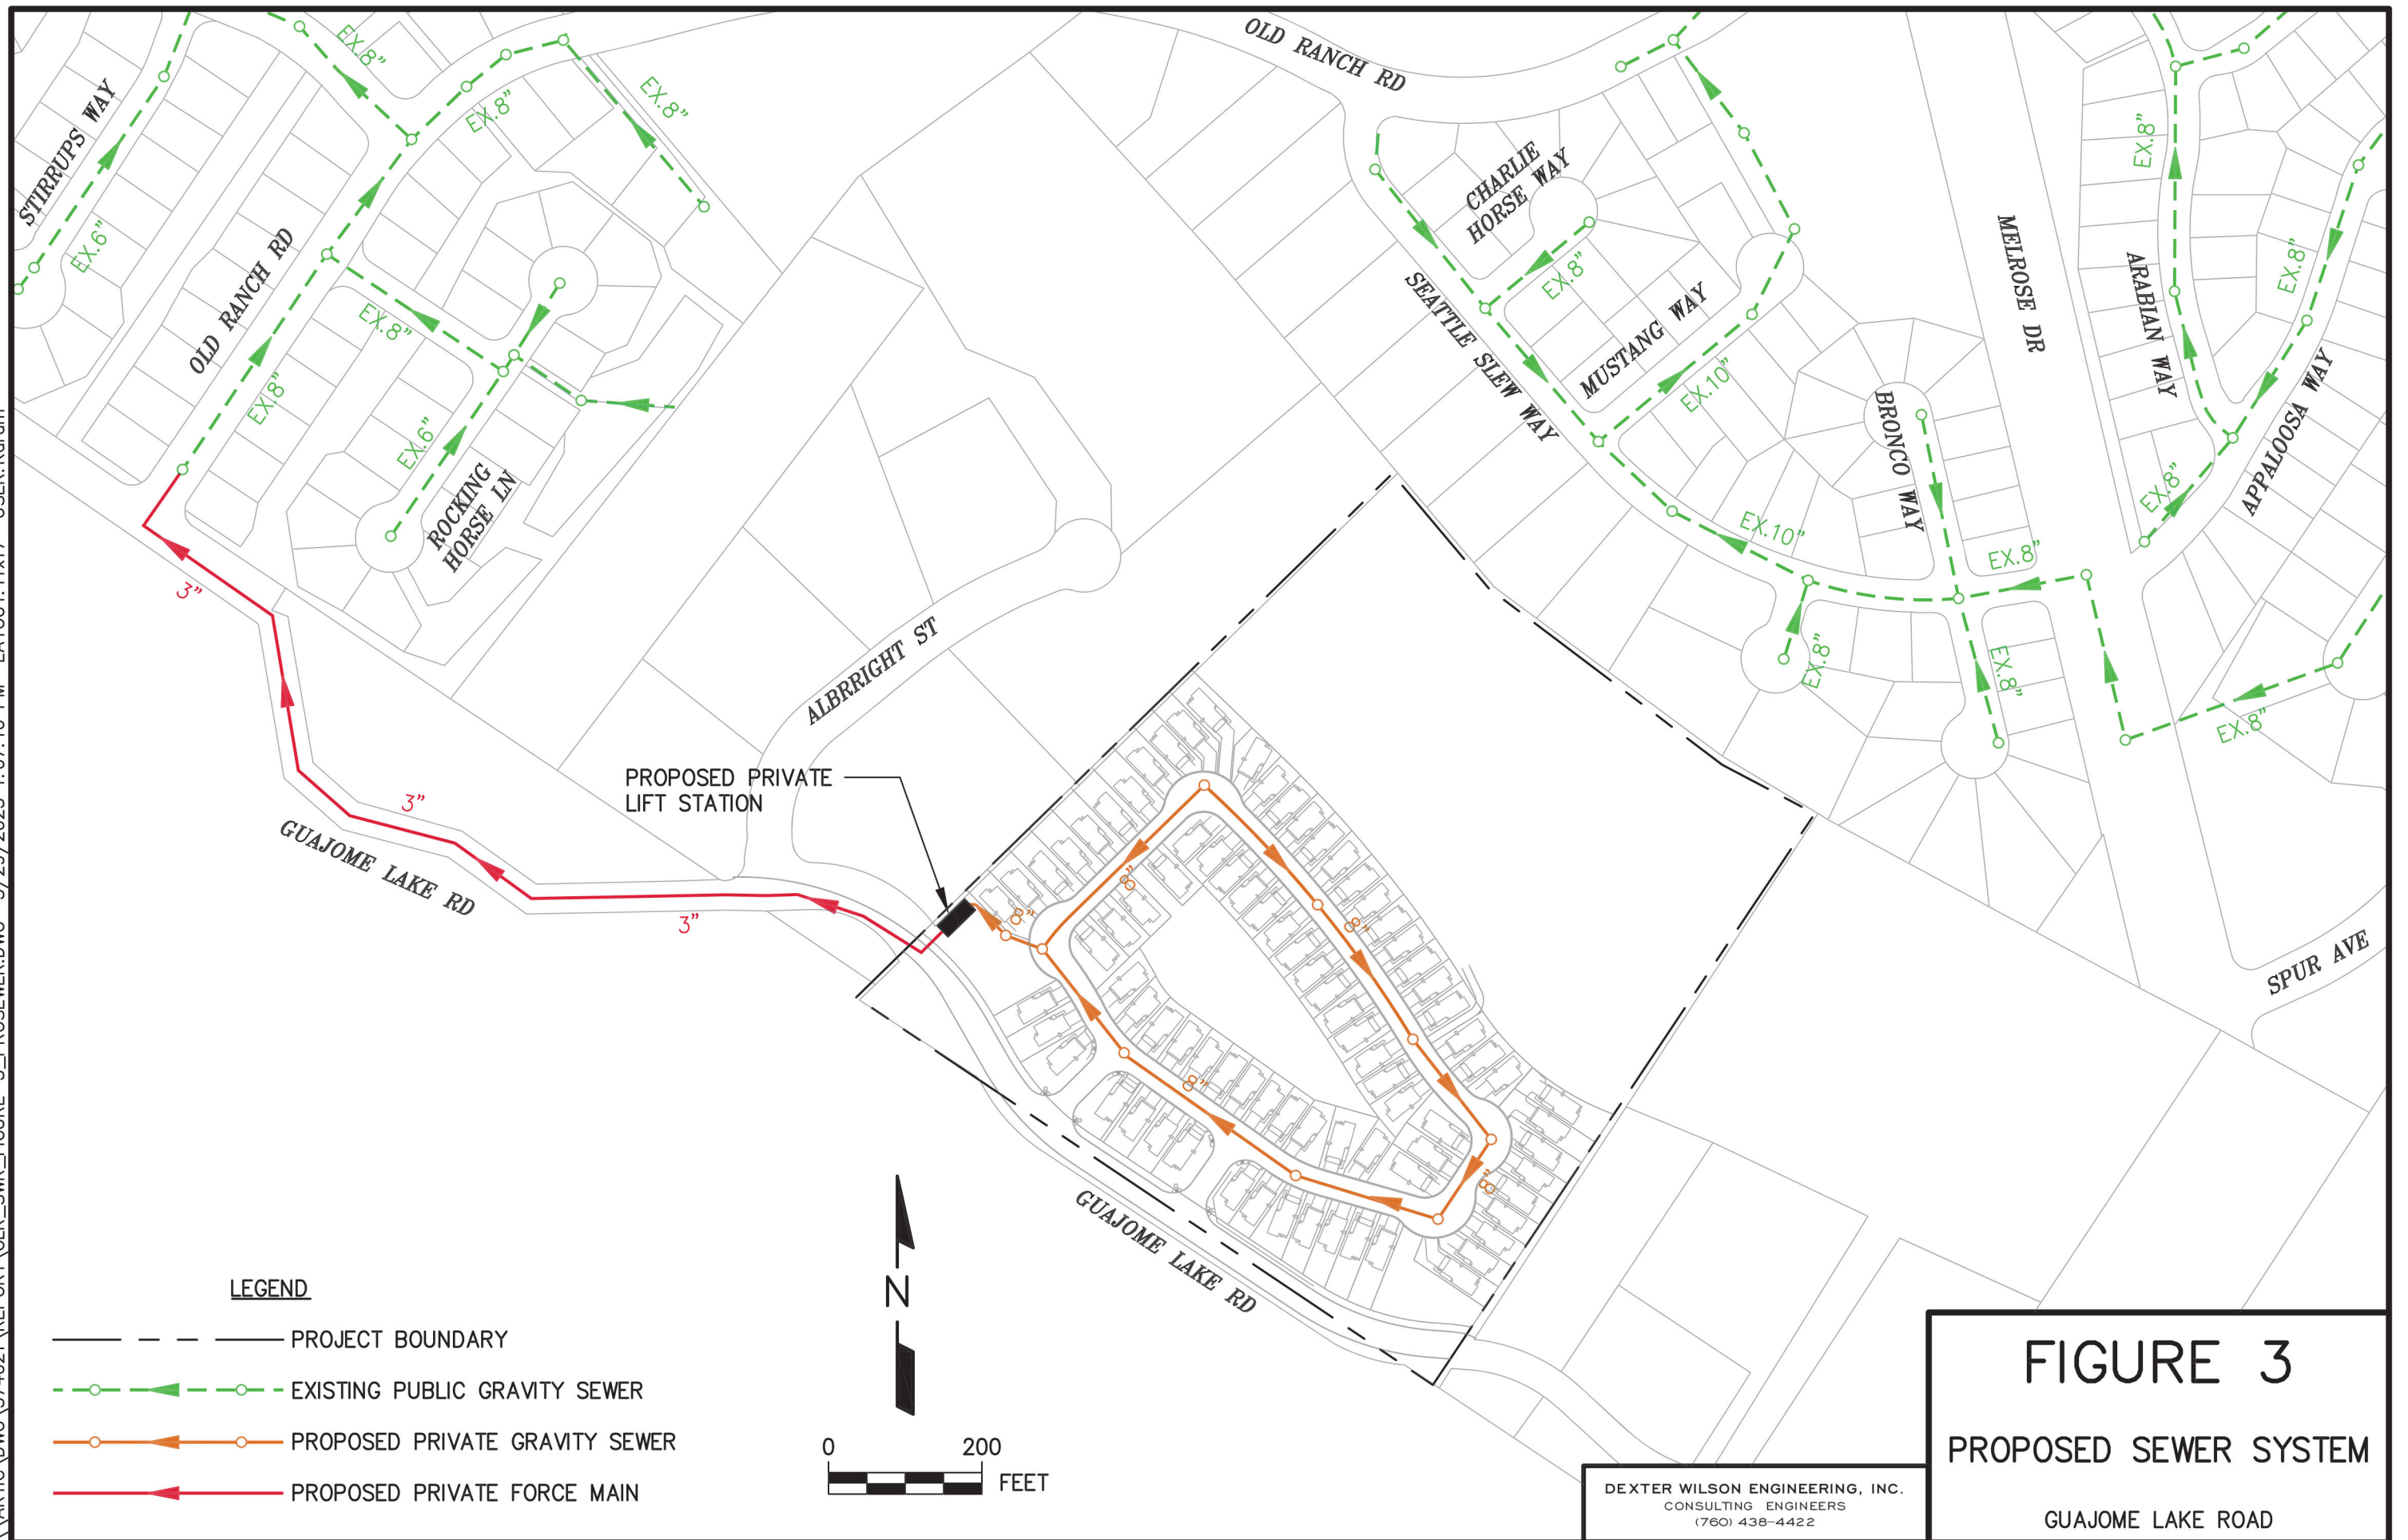

Figure 3 presents a schematic of the proposed sewer facilities required to serve the Guajome Lake Road project. All onsite sewer facilities for the project are proposed to be private. As shown in Table 2, the projected average flow from the site will be 14,110 gpd (9.8 gpm) and the projected peak flow is 49,385 gpd (34.3 gpm).

Each home within the Guajome Lake Road project will also have its own sewer lateral. The minimum sewer lateral size per the City of Oceanside Design and Construction Manual is 4-inches. The maximum capacity of a 4-inch service lateral at a 2 percent slope per the CPC is 216 drainage fixture units (DFUs). Each home within the project will have a drainage fixture unit count of 30 DFUs per the CPC, so a 4-inch lateral is sufficient for each home within the Guajome Lake Road project. Appendix A provides the calculations supporting the sewer lateral sizing.

The project will require a private sewer lift station to deliver flows to the existing 8-inch public sewer line in Old Ranch Road. The lift station will be required to have a minimum capacity of 35 gpm to handle the project peak flow. Estimated Total Dynamic Head (TDH) from the lift station to the existing gravity sewer line is approximately 50 feet at 35 gpm. A submersible vortex pump capable of delivering 70 feet of head at 70 gpm is the initial recommendation for the private sewer lift station. The project proposes to construct approximately 2,000 feet of 3-inch force main, with a maximum velocity of 3.2 fps. See Appendix C for the manufacturers data sheet on this pump. Pipe sizing and pump selection are preliminary and will be further reviewed during the design process.

Sewer System Analysis

To analyze the Guajome Lake Road project's proposed sewer system, an onsite and offsite sewer system analysis was conducted. The analysis of the sewer system is provided in Appendix B. As built of the existing system were used to determine actual slopes. Exhibit A presents the Manhole Diagram for the proposed sewer analysis.

The results of the analysis indicate that the maximum depth-to-diameter (d/D) ratio for the Guajome Lake Road project is 0.34 under existing and proposed peak flow conditions. This occurs in the existing 8-inch sewer that connects the sewer line in Hitching Post Drive to the 15-inch trunk sewer in Highway 76. None of the analyzed sewer reaches exceed the maximum d/D design criteria of 0.5.

The velocities in the existing public gravity system range from 1.52 fps to 4.74 fps. The three pipe segments that are below 2 fps are below the City of Oceanside minimum slope of 1.6 percent. The proposed project flows will improve velocities from the existing condition.

The velocities in the proposed private system range from 1.45 fps to 3.07 fps. Where velocities are less than 2 fps, sewers are proposed to have a minimum slope of 1.7% in compliance with both City of Oceanside and California Plumbing Code requirements.

Conclusions

The following conclusions have been made related to providing sewer service to the Guajome Lake Road property.

1. The Guajome Lake Road project will receive sewer service from the City of Oceanside.
2. The existing sewer system near the Guajome Lake Road project is presented in Figure 2. The proposed sewer system for the Guajome Lake Road project is presented in Figure 3.
3. The private onsite sewer system will consist of all 8-inch sewer mains. All individual house laterals shall be 4-inch.
4. The project requires a private sewer lift station to connect the project to the existing public sewer system. The project proposes to construct an approximately 2,000 foot force main along Guajome Lake Road between the project and Old Ranch Road to serve the project. The private sewer lift station will be required to pump the projects peak flow of 49,385 gpd. An initial pump selection is available in Appendix C.

5. An analysis of the existing proposed sewer system was conducted (Appendix B) and the results indicate that the maximum depth-to-diameter ratio that is expected to occur in the proposed sewers is 0.34 during peak flow conditions which is less than the maximum allowable depth-to-diameter ratio of 0.5 for an 8-inch sewer.
6. With the addition of the project, velocities in the existing public system will range from 1.52 fps to 4.74 fps. The proposed project flows will improve velocities in the existing system where they currently don't meet the City of Oceanside criteria. The velocities in the proposed private system range from 1.45 fps to 3.07 fps. Where velocities are less than 2 fps, sewers are proposed to have a minimum slope of 1.7% in compliance with City of Oceanside and California Plumbing Code requirements.
7. The proposed sewer system shall be designed and constructed in accordance with the guidelines, standards, and approved materials of the City of Oceanside.

Thank you for the opportunity to provide sewer system planning services for the Guajome Lake Road project. Please feel free to contact us to further discuss any aspect of the information presented in this letter-report.

Liquid	Cold Water	Max Solid Size	3.15	Enclosure	Explosion Proof
Temperature	68.00 deg F	Efficiency	19.05 %	Voltage	460 V
NPSHr	4.86 ft	Suction	3 in.	Phase	3 Phase
Viscosity	1.00 cP	Discharge	3 in.	Cycle	60
Specific Gravity	1.000 SG			Full Load Amps	11.4
				Locked Rotor Amps	120
				Nema Code Ltr	K

Grundfos Series SL/SLV Sewage Pump with S-tube®/SuperVortex Impeller

NOT FOR CONSTRUCTION, unless certified and referenced on order
